Sage Reference Manual: Algebraic Function Fields

Release 8.3

The Sage Development Team

Aug 04, 2018

CONTENTS

Sage allows basic computations with elements and ideals in orders of algebraic function fields over arbitrary constant fields.

CHAPTER

ONE

FUNCTION FIELDS

A function field is an extension field of transcendental degree one of a rational function field over a constant field. A function field in Sage is a rational function field, an extension of a rational function field, or of another function field.

EXAMPLES:

We create a rational function field:

```
sage: K.<x> = FunctionField(GF(5^2,'a')); K
Rational function field in x over Finite Field in a of size 5^2
sage: K.genus()
0
sage: f = (x^2 + x + 1) / (x^3 + 1)
sage: f
(x^2 + x + 1)/(x^3 + 1)
sage: f^3
(x^6 + 3*x^5 + x^4 + 2*x^3 + x^2 + 3*x + 1)/(x^9 + 3*x^6 + 3*x^3 + 1)
```

Then we create an extension of the rational function field, and do some simple arithmetic in it:

```
sage: R.<y> = K[]
sage: L.<y> = K.extension(y^3 - (x^3 + 2*x*y + 1/x)); L
Function field in y defined by y^3 + 3*x*y + (4*x^4 + 4)/x
sage: y^2
y^2
sage: y^3
2*x*y + (x^4 + 1)/x
sage: a = 1/y; a
(4*x/(4*x^4 + 4))*y^2 + 2*x^2/(4*x^4 + 4)
sage: a * y
1
```

We next make an extension of the above function field, illustrating that arithmetic with a tower of three fields is fully supported:

```
sage: S.<t> = L[]
sage: M.<t> = L.extension(t^2 - x*y)
sage: M
Function field in t defined by t^2 + 4*x*y
sage: t^2
x*y
sage: 1/t
((1/(x^4 + 1))*y^2 + 2*x/(4*x^4 + 4))*t
sage: M.base_field()
Function field in y defined by y^3 + 3*x*y + (4*x^4 + 4)/x
```

(continues on next page)

(continued from previous page)

```
sage: M.base_field().base_field()
Rational function field in x over Finite Field in a of size 5^2
```

It is also possible to construct function fields over an imperfect base field:

```
sage: N.<u> = FunctionField(K)
```

and inseparable extension function fields:

```
sage: J.<x> = FunctionField(GF(5)); J
Rational function field in x over Finite Field of size 5
sage: T.<v> = J[]
sage: O.<v> = J.extension(v^5 - x); O
Function field in v defined by v^5 + 4*x
```

AUTHORS:

- William Stein (2010): initial version
- Robert Bradshaw (2010-05-30): added is_finite()
- Julian Rüth (2011-06-08, 2011-09-14, 2014-06-23, 2014-06-24, 2016-11-13): fixed hom(), extension(); use @cached_method; added derivation(); added support for relative vector spaces; fixed conversion to base fields
- Maarten Derickx (2011-09-11): added doctests
- Syed Ahmad Lavasani (2011-12-16): added genus(), is_RationalFunctionField()
- Simon King (2014-10-29): Use the same generator names for a function field extension and the underlying polynomial ring.
- Kwankyu Lee (2017-04-30): added global function fields

class sage.rings.function_field.function_field.**FunctionField**(*base_field*, *names*, *category=Category of function fields*)

Bases: sage.rings.ring.Field

Abstract base class for all function fields.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ)
sage: K
Rational function field in x over Rational Field
```

characteristic()

Return the characteristic of the function field.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ)
sage: K.characteristic()
0
sage: K.<x> = FunctionField(GF(7))
sage: K.characteristic()
7
sage: R.<y> = K[]
sage: L.<y> = K.extension(y^2 - x)
sage: L.characteristic()
7
```

extension(*f*, *names=None*)

Create an extension $K(y)$ of this function field K extended with a root y of the univariate polynomial f over K.

INPUT:

- `f` – univariate polynomial over K
- `names` – string or tuple of length 1 that names the variable y

OUTPUT:

- a function field

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: K.extension(y^5 - x^3 - 3*x + x*y)
Function field in y defined by y^5 + x*y - x^3 - 3*x
```

A nonintegral defining polynomial:

```
sage: K.<t> = FunctionField(QQ); R.<y> = K[]
sage: K.extension(y^3 + (1/t)*y + t^3/(t+1), 'z')
Function field in z defined by z^3 + 1/t*z + t^3/(t + 1)
```

The defining polynomial need not be monic or integral:

```
sage: K.extension(t*y^3 + (1/t)*y + t^3/(t+1))
Function field in y defined by t*y^3 + 1/t*y + t^3/(t + 1)
```

is_finite()

Return whether the function field is finite, which is false.

EXAMPLES:

```
sage: R.<t> = FunctionField(QQ)
sage: R.is_finite()
False
sage: R.<t> = FunctionField(GF(7))
sage: R.is_finite()
False
```

is_global()

Return whether the function field is global, that is, whether the constant field is finite.

EXAMPLES:

```
sage: R.<t> = FunctionField(QQ)
sage: R.is_global()
False
sage: R.<t> = FunctionField(GF(7))
sage: R.is_global()
True
```

is_perfect()

Return whether the field is perfect, i.e., its characteristic p is zero or every element has a p-th root.

EXAMPLES:

```
sage: FunctionField(QQ, 'x').is_perfect()
True
sage: FunctionField(GF(2), 'x').is_perfect()
False
```

order (*x*, *check=True*)

Return the order generated by `x` over the base maximal order.

INPUT:

- `x` – element or list of elements of the function field
- `check` – boolean; if `True`, check that `x` really generates an order

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: L.<y> = K.extension(y^3 + x^3 + 4*x + 1)
sage: O = L.order(y); O
Order in Function field in y defined by y^3 + x^3 + 4*x + 1
sage: O.basis()
(1, y, y^2)

sage: Z = K.order(x); Z
Order in Rational function field in x over Rational Field
sage: Z.basis()
(1,)
```

Orders with multiple generators are not yet supported:

```
sage: Z = K.order([x,x^2]); Z
Traceback (most recent call last):
...
NotImplementedError
```

order_with_basis (*basis*, *check=True*)

Return the order with given basis over the maximal order of the base field.

INPUT:

- `basis` – list of elements of this function field
- `check` – boolean (default: `True`); if `True`, check that the basis is really linearly independent and that the module it spans is closed under multiplication, and contains the identity element.

OUTPUT:

- an order in the function field

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]; L.<y> = K.extension(y^3 + x^3 +␣
↪4*x + 1)
sage: O = L.order_with_basis([1, y, y^2]); O
Order in Function field in y defined by y^3 + x^3 + 4*x + 1
sage: O.basis()
(1, y, y^2)
```

Note that 1 does not need to be an element of the basis, as long it is in the module spanned by it:

```
sage: O = L.order_with_basis([1+y, y, y^2]); O
Order in Function field in y defined by y^3 + x^3 + 4*x + 1
sage: O.basis()
(y + 1, y, y^2)
```

The following error is raised when the module spanned by the basis is not closed under multiplication:

```
sage: O = L.order_with_basis([1, x^2 + x*y, (2/3)*y^2]); O
Traceback (most recent call last):
...
ValueError: The module generated by basis [1, x*y + x^2, 2/3*y^2] must be␣
↪closed under multiplication
```

and this happens when the identity is not in the module spanned by the basis:

```
sage: O = L.order_with_basis([x, x^2 + x*y, (2/3)*y^2])
Traceback (most recent call last):
...
ValueError: The identity element must be in the module spanned by basis [x,␣
↪x*y + x^2, 2/3*y^2]
```

rational_function_field()

Return the rational function field from which this field has been created as an extension.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ)
sage: K.rational_function_field()
Rational function field in x over Rational Field

sage: R.<y> = K[]
sage: L.<y> = K.extension(y^2-x)
sage: L.rational_function_field()
Rational function field in x over Rational Field

sage: R.<z> = L[]
sage: M.<z> = L.extension(z^2-y)
sage: M.rational_function_field()
Rational function field in x over Rational Field
```

some_elements()

Return some elements in this function field.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ)
sage: K.some_elements()
[1,
 x,
 2*x,
 x/(x^2 + 2*x + 1),
 1/x^2,
 x/(x^2 - 1),
 x/(x^2 + 1),
 x/(2*x^2 + 2),
 0,
 1/x,
 ...]
```

```
sage: R.<y> = K[]
sage: L.<y> = K.extension(y^2 - x)
sage: L.some_elements()
[1,
 y,
 1/x*y,
 ((1/4*x + 1/4)/(1/4*x^2 - 1/2*x + 1/4))*y - 1/2*x/(1/4*x^2 - 1/2*x + 1/4),
 -1/-x,
 (1/(x - 1))*y,
 (1/(x + 1))*y,
 (1/(2*x + 2))*y,
 0,
 ...]
```

valuation (*prime*)

Return the discrete valuation on this function field defined by `prime`.

INPUT:

- `prime` – a place of the function field, a valuation on a subring, or a valuation on another function field together with information for isomorphisms to and from that function field

EXAMPLES:

We create valuations that correspond to finite rational places of a function field:

```
sage: K.<x> = FunctionField(QQ)
sage: v = K.valuation(1); v
(x - 1)-adic valuation
sage: v(x)
0
sage: v(x - 1)
1
```

A place can also be specified with an irreducible polynomial:

```
sage: v = K.valuation(x - 1); v
(x - 1)-adic valuation
```

Similarly, for a finite non-rational place:

```
sage: v = K.valuation(x^2 + 1); v
(x^2 + 1)-adic valuation
sage: v(x^2 + 1)
1
sage: v(x)
0
```

Or for the infinite place:

```
sage: v = K.valuation(1/x); v
Valuation at the infinite place
sage: v(x)
-1
```

Instead of specifying a generator of a place, we can define a valuation on a rational function field by giving a discrete valuation on the underlying polynomial ring:

```
sage: R.<x> = QQ[]
sage: w = valuations.GaussValuation(R, valuations.TrivialValuation(QQ)).
↪augmentation(x - 1, 1)
sage: v = K.valuation(w); v
(x - 1)-adic valuation
```

Note that this allows us to specify valuations which do not correspond to a place of the function field:

```
sage: w = valuations.GaussValuation(R, QQ.valuation(2))
sage: v = K.valuation(w); v
2-adic valuation
```

The same is possible for valuations with $v(1/x) > 0$ by passing in an extra pair of parameters, an isomorphism between this function field and an isomorphic function field. That way you can, for example, indicate that the valuation is to be understood as a valuation on $K[1/x]$, i.e., after applying the substitution $x \mapsto 1/x$ (here, the inverse map is also $x \mapsto 1/x$):

```
sage: w = valuations.GaussValuation(R, QQ.valuation(2)).augmentation(x, 1)
sage: w = K.valuation(w)
sage: v = K.valuation((w, K.hom([~K.gen()]), K.hom([~K.gen()]))); v
Valuation on rational function field induced by [ Gauss valuation induced by␣
↪2-adic valuation, v(x) = 1 ] (in Rational function field in x over Rational␣
↪Field after x |--> 1/x)
```

Note that classical valuations at finite places or the infinite place are always normalized such that the uniformizing element has valuation 1:

```
sage: K.<t> = FunctionField(GF(3))
sage: M.<x> = FunctionField(K)
sage: v = M.valuation(x^3 - t)
sage: v(x^3 - t)
1
```

However, if such a valuation comes out of a base change of the ground field, this is not the case anymore. In the example below, the unique extension of `v` to `L` still has valuation 1 on $x^3 - t$ but it has valuation `1/3` on its uniformizing element $x - w$:

```
sage: R.<w> = K[]
sage: L.<w> = K.extension(w^3 - t)
sage: N.<x> = FunctionField(L)
sage: w = v.extension(N) # missing factorization, :trac:`16572`
Traceback (most recent call last):
...
NotImplementedError
sage: w(x^3 - t) # not tested
1
sage: w(x - w) # not tested
1/3
```

There are several ways to create valuations on extensions of rational function fields:

```
sage: K.<x> = FunctionField(QQ)
sage: R.<y> = K[]
sage: L.<y> = K.extension(y^2 - x); L
Function field in y defined by y^2 - x
```

A place that has a unique extension can just be defined downstairs:

```
sage: v = L.valuation(x); v
(x)-adic valuation
```

class sage.rings.function_field.function_field.**FunctionField_global**(*polynomial*, *names*)

Bases: *sage.rings.function_field.function_field.FunctionField_polymod*

Global function fields.

class sage.rings.function_field.function_field.**FunctionField_global_integral**(*polynomial*, *names*)

Bases: *sage.rings.function_field.function_field.FunctionField_global*

Global function fields defined by an irreducible and separable polynomial, which is integral over the maximal order of the base rational function field with a finite constant field.

class sage.rings.function_field.function_field.**FunctionField_polymod**(*polynomial*, *names*, *element_class=<type 'sage.rings.function_field.functi*, *category=Category of function fields*)

Bases: *sage.rings.function_field.function_field.FunctionField*

Function fields defined by a univariate polynomial, as an extension of the base field.

EXAMPLES:

We make a function field defined by a degree 5 polynomial over the rational function field over the rational numbers:

```
sage: K.<x> = FunctionField(QQ)
sage: R.<y> = K[]
sage: L.<y> = K.extension(y^5 - (x^3 + 2*x*y + 1/x)); L
Function field in y defined by y^5 - 2*x*y + (-x^4 - 1)/x
```

We next make a function field over the above nontrivial function field L:

```
sage: S.<z> = L[]
sage: M.<z> = L.extension(z^2 + y*z + y); M
Function field in z defined by z^2 + y*z + y
sage: 1/z
((x/(-x^4 - 1))*y^4 - 2*x^2/(-x^4 - 1))*z - 1
sage: z * (1/z)
1
```

We drill down the tower of function fields:

```
sage: M.base_field()
Function field in y defined by y^5 - 2*x*y + (-x^4 - 1)/x
sage: M.base_field().base_field()
Rational function field in x over Rational Field
sage: M.base_field().base_field().constant_field()
Rational Field
sage: M.constant_base_field()
Rational Field
```

Warning: It is not checked if the polynomial used to define the function field is irreducible Hence it is not guaranteed that this object really is a field! This is illustrated below.

```
sage: K.<x>=FunctionField(QQ)
sage: R.<y> = K[]
sage: L.<y>=K.extension(x^2-y^2)
sage: (y-x)*(y+x)
0
sage: 1/(y-x)
1
sage: y-x==0; y+x==0
False
False
```

base_field()

Return the base field of the function field. This function field is presented as $L = K[y]/(f(y))$, and the base field is by definition the field K.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: L.<y> = K.extension(y^5 - (x^3 + 2*x*y + 1/x))
sage: L.base_field()
Rational function field in x over Rational Field
```

change_variable_name(*name*)

Return a field isomorphic to this field with variable(s) `name`.

INPUT:

- `name` – a string or a tuple consisting of a strings, the names of the new variables starting with a generator of this field and going down to the rational function field.

OUTPUT:

A triple `F,f,t` where `F` is a function field, `f` is an isomorphism from `F` to this field, and `t` is the inverse of `f`.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ)
sage: R.<y> = K[]
sage: L.<y> = K.extension(y^2 - x)
sage: R.<z> = L[]
sage: M.<z> = L.extension(z^2 - y)

sage: M.change_variable_name('zz')
(Function field in zz defined by zz^2 - y,
 Function Field morphism:
  From: Function field in zz defined by zz^2 - y
  To:   Function field in z defined by z^2 - y
  Defn: zz |--> z
        y |--> y
        x |--> x,
 Function Field morphism:
  From: Function field in z defined by z^2 - y
  To:   Function field in zz defined by zz^2 - y
  Defn: z |--> zz
```

(continues on next page)

(continued from previous page)

```
        y |--> y
        x |--> x)
sage: M.change_variable_name(('zz','yy'))
(Function field in zz defined by zz^2 - yy, Function Field morphism:
  From: Function field in zz defined by zz^2 - yy
  To:   Function field in z defined by z^2 - y
  Defn: zz |--> z
        yy |--> y
        x |--> x, Function Field morphism:
  From: Function field in z defined by z^2 - y
  To:   Function field in zz defined by zz^2 - yy
  Defn: z |--> zz
        y |--> yy
        x |--> x)
sage: M.change_variable_name(('zz','yy','xx'))
(Function field in zz defined by zz^2 - yy,
 Function Field morphism:
  From: Function field in zz defined by zz^2 - yy
  To:   Function field in z defined by z^2 - y
  Defn: zz |--> z
        yy |--> y
        xx |--> x,
 Function Field morphism:
  From: Function field in z defined by z^2 - y
  To:   Function field in zz defined by zz^2 - yy
  Defn: z |--> zz
        y |--> yy
        x |--> xx)
```

constant_base_field()

Return the constant field of the base rational function field.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: L.<y> = K.extension(y^5 - (x^3 + 2*x*y + 1/x)); L
Function field in y defined by y^5 - 2*x*y + (-x^4 - 1)/x
sage: L.constant_base_field()
Rational Field
sage: S.<z> = L[]
sage: M.<z> = L.extension(z^2 - y)
sage: M.constant_base_field()
Rational Field
```

constant_field()

Return the algebraic closure of the constant field of the base field in the function field.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: L.<y> = K.extension(y^5 - (x^3 + 2*x*y + 1/x))
sage: L.constant_field()
Traceback (most recent call last):
...
NotImplementedError
```

degree(*base=None*)

Return the degree of the function field over the function field `base`.

INPUT:

- `base` – a function field (default: `None`), a function field from which this field has been constructed as a finite extension.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ)
sage: R.<y> = K[]
sage: L.<y> = K.extension(y^5 - (x^3 + 2*x*y + 1/x)); L
Function field in y defined by y^5 - 2*x*y + (-x^4 - 1)/x
sage: L.degree()
5
sage: L.degree(L)
1

sage: R.<z> = L[]
sage: M.<z> = L.extension(z^2 - y)
sage: M.degree(L)
2
sage: M.degree(K)
10
```

derivation()

Return a derivation of the function field over the constant base field.

A derivation on R is a map $R \to R$ satisfying $D(\alpha+\beta) = D(\alpha)+D(\beta)$ and $D(\alpha\beta) = \beta D(\alpha)+\alpha D(\beta)$ for all $\alpha, \beta \in R$. For a function field which is a finite extension of $K(x)$ with K perfect, the derivations form a one-dimensional K-vector space generated by the derivation returned by this method.

EXAMPLES:

```
sage: K.<x> = FunctionField(GF(3))
sage: R.<y> = K[]
sage: L.<y> = K.extension(y^2 - x)
sage: d = L.derivation(); d
Derivation map:
    From: Function field in y defined by y^2 + 2*x
    To:   Function field in y defined by y^2 + 2*x
    Defn: y |--> 2/x*y
sage: d(x)
1
sage: d(x^3)
0
sage: d(x*y)
0
sage: d(y)
2/x*y
```

Derivations are linear and satisfy Leibniz's law:

```
sage: d(x+y) == d(x) + d(y)
True
sage: d(x*y) == x*d(y) + y*d(x)
True
```

If the field is a separable extension of the base field, the derivation extending a derivation of the base function field is uniquely determined. Proposition 11 of [GT1996] describes how to compute the extension. We apply the formula described there to the generator of the space of derivations on the base field.

The general inseparable case is not implemented yet (see trac ticket #16562, trac ticket #16564.)‘

equation_order()

Return the equation order of the function field.

If we view the function field as being presented as $K[y]/(f(y))$, then the order generated by the class of y is returned. If f is not monic, then `_make_monic_integral()` is called, and instead we get the order generated by some integral multiple of a root of f.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: L.<y> = K.extension(y^5 - (x^3 + 2*x*y + 1/x))
sage: O = L.equation_order()
sage: O.basis()
(1, x*y, x^2*y^2, x^3*y^3, x^4*y^4)
```

We try an example, in which the defining polynomial is not monic and is not integral:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: L.<y> = K.extension(x^2*y^5 - 1/x); L
Function field in y defined by x^2*y^5 - 1/x
sage: O = L.equation_order()
sage: O.basis()
(1, x^3*y, x^6*y^2, x^9*y^3, x^12*y^4)
```

gen(*n=0*)

Return the n-th generator of the function field. By default, n is 0; any other value of n leads to an error. The generator is the class of y, if we view the function field as being presented as $K[y]/(f(y))$.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: L.<y> = K.extension(y^5 - (x^3 + 2*x*y + 1/x))
sage: L.gen()
y
sage: L.gen(1)
Traceback (most recent call last):
...
IndexError: Only one generator.
```

genus()

Return the genus of the function field.

For now, the genus is computed using Singular.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: L.<y> = K.extension(y^3 - (x^3 + 2*x*y + 1/x))
sage: L.genus()
3
```

hom(*im_gens*, *base_morphism=None*)

Create a homomorphism from the function field to another function field.

INPUT:

- `im_gens` – list of images of the generators of the function field and of successive base rings.

- `base_morphism` – homomorphism of the base ring, after the `im_gens` are used. Thus if `im_gens` has length 2, then `base_morphism` should be a morphism from the base ring of the base ring of the function field.

EXAMPLES:

We create a rational function field, and a quadratic extension of it:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: L.<y> = K.extension(y^2 - x^3 - 1)
```

We make the field automorphism that sends y to -y:

```
sage: f = L.hom(-y); f
Function Field endomorphism of Function field in y defined by y^2 - x^3 - 1
  Defn: y |--> -y
```

Evaluation works:

```
sage: f(y*x - 1/x)
-x*y - 1/x
```

We try to define an invalid morphism:

```
sage: f = L.hom(y+1)
Traceback (most recent call last):
...
ValueError: invalid morphism
```

We make a morphism of the base rational function field:

```
sage: phi = K.hom(x+1); phi
Function Field endomorphism of Rational function field in x over Rational␣
↪Field
  Defn: x |--> x + 1
sage: phi(x^3 - 3)
x^3 + 3*x^2 + 3*x - 2
sage: (x+1)^3-3
x^3 + 3*x^2 + 3*x - 2
```

We make a morphism by specifying where the generators and the base generators go:

```
sage: L.hom([-y, x])
Function Field endomorphism of Function field in y defined by y^2 - x^3 - 1
  Defn: y |--> -y
        x |--> x
```

You can also specify a morphism on the base:

```
sage: R1.<r> = K[]
sage: L1.<r> = K.extension(r^2 - (x+1)^3 - 1)
sage: L.hom(r, base_morphism=phi)
Function Field morphism:
  From: Function field in y defined by y^2 - x^3 - 1
  To:   Function field in r defined by r^2 - x^3 - 3*x^2 - 3*x - 2
  Defn: y |--> r
        x |--> x + 1
```

We make another extension of a rational function field:

```
sage: K2.<t> = FunctionField(QQ); R2.<w> = K2[]
sage: L2.<w> = K2.extension((4*w)^2 - (t+1)^3 - 1)
```

We define a morphism, by giving the images of generators:

```
sage: f = L.hom([4*w, t+1]); f
Function Field morphism:
  From: Function field in y defined by y^2 - x^3 - 1
  To:   Function field in w defined by 16*w^2 - t^3 - 3*t^2 - 3*t - 2
  Defn: y |--> 4*w
        x |--> t + 1
```

Evaluation works, as expected:

```
sage: f(y+x)
4*w + t + 1
sage: f(x*y + x/(x^2+1))
(4*t + 4)*w + (t + 1)/(t^2 + 2*t + 2)
```

We make another extension of a rational function field:

```
sage: K3.<yy> = FunctionField(QQ); R3.<xx> = K3[]
sage: L3.<xx> = K3.extension(yy^2 - xx^3 - 1)
```

This is the function field L with the generators exchanged. We define a morphism to L:

```
sage: g = L3.hom([x,y]); g
Function Field morphism:
  From: Function field in xx defined by -xx^3 + yy^2 - 1
  To:   Function field in y defined by y^2 - x^3 - 1
  Defn: xx |--> x
        yy |--> y
```

is_separable()

Return whether the defining polynomial of the function field is separable, i.e., whether the gcd of the defining polynomial and its derivative is constant.

EXAMPLES:

```
sage: K.<x> = FunctionField(GF(5)); R.<y> = K[]
sage: L.<y> = K.extension(y^5 - (x^3 + 2*x*y + 1/x))
sage: L.is_separable()
True

sage: K.<x> = FunctionField(GF(5)); R.<y> = K[]
sage: L.<y> = K.extension(y^5 - 1)
sage: L.is_separable()
False
```

maximal_order()

Return the maximal order of the function field.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: L.<y> = K.extension(y^5 - (x^3 + 2*x*y + 1/x))
sage: L.maximal_order()  # todo: not implemented
```

maximal_order_infinite()
Return the maximal infinite order of the function field.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: L.<y> = K.extension(y^5 - (x^3 + 2*x*y + 1/x))
sage: L.maximal_order_infinite()  # todo: not implemented
```

monic_integral_model(*names=None*)
Return a function field isomorphic to this field but which is an extension of a rational function field with defining polynomial that is monic and integral over the constant base field.

INPUT:

- `names` – a string or a tuple of up to two strings (default: `None`), the name of the generator of the field, and the name of the generator of the underlying rational function field (if a tuple); if not given, then the names are chosen automatically.

OUTPUT:

A triple `(F,f,t)` where `F` is a function field, `f` is an isomorphism from `F` to this field, and `t` is the inverse of `f`.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ)
sage: R.<y> = K[]
sage: L.<y> = K.extension(x^2*y^5 - 1/x); L
Function field in y defined by x^2*y^5 - 1/x
sage: A, from_A, to_A = L.monic_integral_model('z')
sage: A
Function field in z defined by z^5 - x^12
sage: from_A
Function Field morphism:
  From: Function field in z defined by z^5 - x^12
  To:   Function field in y defined by x^2*y^5 - 1/x
  Defn: z |--> x^3*y
        x |--> x
sage: to_A
Function Field morphism:
  From: Function field in y defined by x^2*y^5 - 1/x
  To:   Function field in z defined by z^5 - x^12
  Defn: y |--> 1/x^3*z
        x |--> x
sage: to_A(y)
1/x^3*z
sage: from_A(to_A(y))
y
sage: from_A(to_A(1/y))
x^3*y^4
sage: from_A(to_A(1/y)) == 1/y
True
```

This also works for towers of function fields:

```
sage: R.<z> = L[]
sage: M.<z> = L.extension(z^2*y - 1/x)
sage: M.monic_integral_model()
(Function field in z_ defined by z_^10 - x^18, Function Field morphism:
```

(continues on next page)

(continued from previous page)

```
  From: Function field in z_ defined by z_^10 - x^18
  To:   Function field in z defined by y*z^2 - 1/x
  Defn: z_ |--> x^2*z
        x |--> x, Function Field morphism:
  From: Function field in z defined by y*z^2 - 1/x
  To:   Function field in z_ defined by z_^10 - x^18
  Defn: z |--> 1/x^2*z_
        y |--> 1/x^15*z_^8
        x |--> x)
```

ngens()

Return the number of generators of the function field over its base field. This is by definition 1.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: L.<y> = K.extension(y^5 - (x^3 + 2*x*y + 1/x))
sage: L.ngens()
1
```

polynomial()

Return the univariate polynomial that defines the function field, that is, the polynomial $f(y)$ so that the function field is of the form $K[y]/(f(y))$.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: L.<y> = K.extension(y^5 - (x^3 + 2*x*y + 1/x))
sage: L.polynomial()
y^5 - 2*x*y + (-x^4 - 1)/x
```

polynomial_ring()

Return the polynomial ring used to represent elements of the function field. If we view the function field as being presented as $K[y]/(f(y))$, then this function returns the ring $K[y]$.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: L.<y> = K.extension(y^5 - (x^3 + 2*x*y + 1/x))
sage: L.polynomial_ring()
Univariate Polynomial Ring in y over Rational function field in x over␣
↪Rational Field
```

primitive_element()

Return a primitive element over the underlying rational function field.

If this is a finite extension of a rational function field $K(x)$ with K perfect, then this is a simple extension of $K(x)$, i.e., there is a primitive element y which generates this field over $K(x)$. This method returns such an element y.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ)
sage: R.<y> = K[]
sage: L.<y> = K.extension(y^2-x)
sage: R.<z> = L[]
sage: M.<z> = L.extension(z^2-y)
```

(continues on next page)

(continued from previous page)

```
sage: R.<z> = L[]
sage: N.<u> = L.extension(z^2-x-1)
sage: N.primitive_element()
u + y
sage: M.primitive_element()
z
sage: L.primitive_element()
y
```

This also works for inseparable extensions:

```
sage: K.<x> = FunctionField(GF(2))
sage: R.<Y> = K[]
sage: L.<y> = K.extension(Y^2-x)
sage: R.<Z> = L[]
sage: M.<z> = L.extension(Z^2-y)
sage: M.primitive_element()
z
```

random_element(**args*, ***kwds*)

Create a random element of the function field. Parameters are passed onto the random_element method of the base_field.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: L.<y> = K.extension(y^2 - (x^2 + x))
sage: L.random_element() # random
((x^2 - x + 2/3)/(x^2 + 1/3*x - 1))*y^2 + ((-1/4*x^2 + 1/2*x - 1)/(-5/2*x + 2/
↪3))*y
+ (-1/2*x^2 - 4)/(-12*x^2 + 1/2*x - 1/95)
```

simple_model(*name=None*)

Return a function field isomorphic to this field which is a simple extension of a rational function field.

INPUT:

- `name` – a string (default: `None`), the name of generator of the simple extension. If `None`, then the name of the generator will be the same as the name of the generator of this function field.

OUTPUT:

A triple `(F,f,t)` where `F` is a field isomorphic to this field, `f` is an isomorphism from `F` to this function field and `t` is the inverse of `f`.

EXAMPLES:

A tower of four function fields:

```
sage: K.<x> = FunctionField(QQ); R.<z> = K[]
sage: L.<z> = K.extension(z^2-x); R.<u> = L[]
sage: M.<u> = L.extension(u^2-z); R.<v> = M[]
sage: N.<v> = M.extension(v^2-u)
```

The fields N and M as simple extensions of K:

```
sage: N.simple_model()
(Function field in v defined by v^8 - x,
```

(continues on next page)

(continued from previous page)

```
 Function Field morphism:
  From: Function field in v defined by v^8 - x
  To:   Function field in v defined by v^2 - u
  Defn: v |--> v,
 Function Field morphism:
  From: Function field in v defined by v^2 - u
  To:   Function field in v defined by v^8 - x
  Defn: v |--> v
        u |--> v^2
        z |--> v^4
        x |--> x)
sage: M.simple_model()
(Function field in u defined by u^4 - x,
 Function Field morphism:
  From: Function field in u defined by u^4 - x
  To:   Function field in u defined by u^2 - z
  Defn: u |--> u,
 Function Field morphism:
  From: Function field in u defined by u^2 - z
  To:   Function field in u defined by u^4 - x
  Defn: u |--> u
        z |--> u^2
        x |--> x)
```

An optional parameter `name` can be used to set the name of the generator of the simple extension:

```
sage: M.simple_model(name='t')
(Function field in t defined by t^4 - x, Function Field morphism:
  From: Function field in t defined by t^4 - x
  To:   Function field in u defined by u^2 - z
  Defn: t |--> u, Function Field morphism:
  From: Function field in u defined by u^2 - z
  To:   Function field in t defined by t^4 - x
  Defn: u |--> t
        z |--> t^2
        x |--> x)
```

An example with higher degrees:

```
sage: K.<x> = FunctionField(GF(3)); R.<y> = K[]
sage: L.<y> = K.extension(y^5-x); R.<z> = L[]
sage: M.<z> = L.extension(z^3-x)
sage: M.simple_model()
(Function field in z defined by z^15 + x*z^12 + x^2*z^9 + 2*x^3*z^6 + 2*x^4*z^
↪3 + 2*x^5 + 2*x^3,
 Function Field morphism:
   From: Function field in z defined by z^15 + x*z^12 + x^2*z^9 + 2*x^3*z^6 +␣
↪2*x^4*z^3 + 2*x^5 + 2*x^3
   To:   Function field in z defined by z^3 + 2*x
   Defn: z |--> z + y,
 Function Field morphism:
   From: Function field in z defined by z^3 + 2*x
   To:   Function field in z defined by z^15 + x*z^12 + x^2*z^9 + 2*x^3*z^6 +␣
↪2*x^4*z^3 + 2*x^5 + 2*x^3
   Defn: z |--> 2/x*z^6 + 2*z^3 + z + 2*x
         y |--> 1/x*z^6 + z^3 + x
         x |--> x)
```

This also works for inseparable extensions:

```
sage: K.<x> = FunctionField(GF(2)); R.<y> = K[]
sage: L.<y> = K.extension(y^2-x); R.<z> = L[]
sage: M.<z> = L.extension(z^2-y)
sage: M.simple_model()
(Function field in z defined by z^4 + x, Function Field morphism:
   From: Function field in z defined by z^4 + x
   To:   Function field in z defined by z^2 + y
   Defn: z |--> z, Function Field morphism:
   From: Function field in z defined by z^2 + y
   To:   Function field in z defined by z^4 + x
   Defn: z |--> z
         y |--> z^2
         x |--> x)
```

vector_space(*base=None*)

Return a vector space and isomorphisms from the field to and from the vector space.

This function allows us to identify the elements of this field with elements of a vector space over the base field, which is useful for representation and arithmetic with orders, ideals, etc.

INPUT:

- `base` – a function field (default: `None`), the returned vector space is over `base` which defaults to the base field of this function field.

OUTPUT:

- a vector space over the base function field
- an isomorphism from the vector space to the field
- an isomorphism from the field to the vector space

EXAMPLES:

We define a function field:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: L.<y> = K.extension(y^5 - (x^3 + 2*x*y + 1/x)); L
Function field in y defined by y^5 - 2*x*y + (-x^4 - 1)/x
```

We get the vector spaces, and maps back and forth:

```
sage: V, from_V, to_V = L.vector_space()
sage: V
Vector space of dimension 5 over Rational function field in x over Rational␣
↪Field
sage: from_V
Isomorphism:
  From: Vector space of dimension 5 over Rational function field in x over␣
↪Rational Field
  To:   Function field in y defined by y^5 - 2*x*y + (-x^4 - 1)/x
sage: to_V
Isomorphism:
  From: Function field in y defined by y^5 - 2*x*y + (-x^4 - 1)/x
  To:   Vector space of dimension 5 over Rational function field in x over␣
↪Rational Field
```

We convert an element of the vector space back to the function field:

```
sage: from_V(V.1)
y
```

We define an interesting element of the function field:

```
sage: a = 1/L.0; a
(-x/(-x^4 - 1))*y^4 + 2*x^2/(-x^4 - 1)
```

We convert it to the vector space, and get a vector over the base field:

```
sage: to_V(a)
(2*x^2/(-x^4 - 1), 0, 0, 0, -x/(-x^4 - 1))
```

We convert to and back, and get the same element:

```
sage: from_V(to_V(a)) == a
True
```

In the other direction:

```
sage: v = x*V.0 + (1/x)*V.1
sage: to_V(from_V(v)) == v
True
```

And we show how it works over an extension of an extension field:

```
sage: R2.<z> = L[]; M.<z> = L.extension(z^2 -y)
sage: M.vector_space()
(Vector space of dimension 2 over Function field in y defined by y^5 - 2*x*y␣
↪+ (-x^4 - 1)/x, Isomorphism:
  From: Vector space of dimension 2 over Function field in y defined by y^5 -␣
↪2*x*y + (-x^4 - 1)/x
  To:   Function field in z defined by z^2 - y, Isomorphism:
  From: Function field in z defined by z^2 - y
  To:   Vector space of dimension 2 over Function field in y defined by y^5 -␣
↪2*x*y + (-x^4 - 1)/x)
```

We can also get the vector space of `M` over `K`:

```
sage: M.vector_space(K)
(Vector space of dimension 10 over Rational function field in x over Rational␣
↪Field, Isomorphism:
  From: Vector space of dimension 10 over Rational function field in x over␣
↪Rational Field
  To:   Function field in z defined by z^2 - y, Isomorphism:
  From: Function field in z defined by z^2 - y
  To:   Vector space of dimension 10 over Rational function field in x over␣
↪Rational Field)
```

class sage.rings.function_field.function_field.**RationalFunctionField**(*constant_field*, *names*, *element_class=<type 'sage.rings.function_field.functi*, *category=Category of function fields*)

Bases: *sage.rings.function_field.function_field.FunctionField*

Rational function field $K(t)$ in one variable, over an arbitrary base field.

EXAMPLES:

```
sage: K.<t> = FunctionField(GF(3)); K
Rational function field in t over Finite Field of size 3
sage: K.gen()
t
sage: 1/t + t^3 + 5
(t^4 + 2*t + 1)/t
```

There are various ways to get at the underlying fields and rings associated to a rational function field:

```
sage: K.<t> = FunctionField(GF(7))
sage: K.base_field()
Rational function field in t over Finite Field of size 7
sage: K.field()
Fraction Field of Univariate Polynomial Ring in t over Finite Field of size 7
sage: K.constant_field()
Finite Field of size 7
sage: K.maximal_order()
Maximal order in Rational function field in t over Finite Field of size 7
```

We define a morphism:

```
sage: K.<t> = FunctionField(QQ)
sage: L = FunctionField(QQ, 'tbar') # give variable name as second input
sage: K.hom(L.gen())
Function Field morphism:
  From: Rational function field in t over Rational Field
  To:   Rational function field in tbar over Rational Field
  Defn: t |--> tbar
```

base_field()

Return the base field of the rational function field, which is just the function field itself.

EXAMPLES:

```
sage: K.<t> = FunctionField(GF(7))
sage: K.base_field()
Rational function field in t over Finite Field of size 7
```

change_variable_name(*name*)

Return a field isomorphic to this field with variable `name`.

INPUT:

- `name` – a string or a tuple consisting of a single string, the name of the new variable

OUTPUT:

A triple `F, f, t` where `F` is a rational function field, `f` is an isomorphism from `F` to this field, and `t` is the inverse of `f`.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ)
sage: L,f,t = K.change_variable_name('y')
sage: L,f,t
(Rational function field in y over Rational Field,
 Function Field morphism:
  From: Rational function field in y over Rational Field
  To:   Rational function field in x over Rational Field
  Defn: y |--> x,
 Function Field morphism:
  From: Rational function field in x over Rational Field
  To:   Rational function field in y over Rational Field
  Defn: x |--> y)
sage: L.change_variable_name('x')[0] is K
True
```

constant_base_field()

Return the field that this rational function field is a transcendental extension of.

EXAMPLES:

```
sage: K.<t> = FunctionField(QQ)
sage: K.constant_field()
Rational Field
```

constant_field()

Return the field that this rational function field is a transcendental extension of.

EXAMPLES:

```
sage: K.<t> = FunctionField(QQ)
sage: K.constant_field()
Rational Field
```

degree(*base=None*)

Return the degree over the base field of the rational function field. Since the base field is the rational function field itself, the degree is 1.

INPUT:

- `base` – the base field of the vector space; must be the function field itself (the default)

EXAMPLES:

```
sage: K.<t> = FunctionField(QQ)
sage: K.degree()
1
```

derivation()

Return a derivation of the rational function field over the constant base field.

The derivation maps the generator of the rational function field to 1.

EXAMPLES:

```
sage: K.<x> = FunctionField(GF(3))
sage: m = K.derivation(); m
Derivation map:
  From: Rational function field in x over Finite Field of size 3
  To:   Rational function field in x over Finite Field of size 3
sage: m(x)
1
```

equation_order()

Return the maximal order of this function field. Since this is a rational function field it is of the form K(t), and the maximal order is by definition K[t].

EXAMPLES:

```
sage: K.<t> = FunctionField(QQ)
sage: K.maximal_order()
Maximal order in Rational function field in t over Rational Field
sage: K.equation_order()
Maximal order in Rational function field in t over Rational Field
```

extension(*f*, *names=None*)

Create an extension $L = K[y]/(f(y))$ of the rational function field.

INPUT:

- `f` – univariate polynomial over self
- `names` – string or length-1 tuple

OUTPUT:

- a function field

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: K.extension(y^5 - x^3 - 3*x + x*y)
Function field in y defined by y^5 + x*y - x^3 - 3*x
```

A nonintegral defining polynomial:

```
sage: K.<t> = FunctionField(QQ); R.<y> = K[]
sage: K.extension(y^3 + (1/t)*y + t^3/(t+1))
Function field in y defined by y^3 + 1/t*y + t^3/(t + 1)
```

The defining polynomial need not be monic or integral:

```
sage: K.extension(t*y^3 + (1/t)*y + t^3/(t+1))
Function field in y defined by t*y^3 + 1/t*y + t^3/(t + 1)
```

field()

Return the underlying field, forgetting the function field structure.

EXAMPLES:

```
sage: K.<t> = FunctionField(GF(7))
sage: K.field()
Fraction Field of Univariate Polynomial Ring in t over Finite Field of size 7
```

See also:

sage.rings.fraction_field.FractionField_1poly_field.function_field()

gen(*n=0*)

Return the n-th generator of the function field. If n is not 0, then an IndexError is raised.

EXAMPLES:

```
sage: K.<t> = FunctionField(QQ); K.gen()
t
sage: K.gen().parent()
Rational function field in t over Rational Field
sage: K.gen(1)
Traceback (most recent call last):
...
IndexError: Only one generator.
```

genus()

Return the genus of the function field, namely 0.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ)
sage: K.genus()
0
```

hom(*im_gens*, *base_morphism=None*)

Create a homomorphism from self to another ring.

INPUT:

- im_gens – exactly one element of some ring. It must be invertible and transcendental over the image of base_morphism; this is not checked.
- base_morphism – a homomorphism from the base field into the other ring. If None, try to use a coercion map.

OUTPUT:

- a map between function fields

EXAMPLES:

We make a map from a rational function field to itself:

```
sage: K.<x> = FunctionField(GF(7))
sage: K.hom( (x^4 + 2)/x)
Function Field endomorphism of Rational function field in x over Finite Field␣
↪of size 7
  Defn: x |--> (x^4 + 2)/x
```

We construct a map from a rational function field into a non-rational extension field:

```
sage: K.<x> = FunctionField(GF(7)); R.<y> = K[]
sage: L.<y> = K.extension(y^3 + 6*x^3 + x)
sage: f = K.hom(y^2 + y  + 2); f
Function Field morphism:
  From: Rational function field in x over Finite Field of size 7
  To:   Function field in y defined by y^3 + 6*x^3 + x
  Defn: x |--> y^2 + y + 2
sage: f(x)
y^2 + y + 2
```

(continues on next page)

(continued from previous page)

```
sage: f(x^2)
5*y^2 + (x^3 + 6*x + 4)*y + 2*x^3 + 5*x + 4
```

maximal_order()

Return the maximal order of this function field. Since this is a rational function field it is of the form K(t), and the maximal order is by definition K[t].

EXAMPLES:

```
sage: K.<t> = FunctionField(QQ)
sage: K.maximal_order()
Maximal order in Rational function field in t over Rational Field
sage: K.equation_order()
Maximal order in Rational function field in t over Rational Field
```

ngens()

Return the number of generators, which is 1.

EXAMPLES:

```
sage: K.<t> = FunctionField(QQ)
sage: K.ngens()
1
```

polynomial_ring(*var='x'*)

Return a polynomial ring in one variable over the rational function field.

INPUT:

- `var` – string; name of the variable

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ)
sage: K.polynomial_ring()
Univariate Polynomial Ring in x over Rational function field in x over␣
↪Rational Field
sage: K.polynomial_ring('T')
Univariate Polynomial Ring in T over Rational function field in x over␣
↪Rational Field
```

random_element(**args*, ***kwds*)

Create a random element of the rational function field.

Parameters are passed to the random_element method of the underlying fraction field.

EXAMPLES:

```
sage: FunctionField(QQ,'alpha').random_element()    # random
(-1/2*alpha^2 - 4)/(-12*alpha^2 + 1/2*alpha - 1/95)
```

vector_space(*base=None*)

Return a vector space V and isomorphisms from the field to V and from V to the field.

This function allows us to identify the elements of this field with elements of a one-dimensional vector space over the field itself. This method exists so that all function fields (rational or not) have the same interface.

INPUT:

- `base` – the base field of the vector space; must be the function field itself (the default)

OUTPUT:

- a vector space V over base field
- an isomorphism from V to the field
- the inverse isomorphism from the field to V

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ)
sage: K.vector_space()
(Vector space of dimension 1 over Rational function field in x over Rational␣
↪Field, Isomorphism:
  From: Vector space of dimension 1 over Rational function field in x over␣
↪Rational Field
  To:   Rational function field in x over Rational Field, Isomorphism:
  From: Rational function field in x over Rational Field
  To:   Vector space of dimension 1 over Rational function field in x over␣
↪Rational Field)
```

class sage.rings.function_field.function_field.**RationalFunctionField_global**(*constant_field*, *names*, *element_class=<type 'sage.rings.function_f*, *category=Category of function fields*)

Bases: *sage.rings.function_field.function_field.RationalFunctionField*

Rational function field over finite fields.

sage.rings.function_field.function_field.**is_FunctionField**(*x*)

Return `True` if `x` is a function field.

EXAMPLES:

```
sage: from sage.rings.function_field.function_field import is_FunctionField
sage: is_FunctionField(QQ)
False
sage: is_FunctionField(FunctionField(QQ, 't'))
True
```

sage.rings.function_field.function_field.**is_RationalFunctionField**(*x*)

Return `True` if `x` is a rational function field.

EXAMPLES:

```
sage: from sage.rings.function_field.function_field import is_
↪RationalFunctionField
sage: is_RationalFunctionField(QQ)
False
```

(continues on next page)

(continued from previous page)

```
sage: is_RationalFunctionField(FunctionField(QQ, 't'))
True
```

CHAPTER

TWO

ELEMENTS OF FUNCTION FIELDS

Sage provides arithmetic with elements of function fields.

EXAMPLES:

Arithmetic with rational functions:

```
sage: K.<t> = FunctionField(QQ)
sage: f = t - 1
sage: g = t^2 - 3
sage: h = f^2/g^3
```

AUTHORS:

- William Stein: initial version
- Robert Bradshaw (2010-05-27): cythonize function field elements
- Julian Rueth (2011-06-28): treat zero correctly
- Maarten Derickx (2011-09-11): added doctests, fixed pickling
- Kwankyu Lee (2017-04-30): added elements for global function fields

class sage.rings.function_field.function_field_element.**FunctionFieldElement**

Bases: sage.structure.element.FieldElement

Abstract base class for function field elements.

EXAMPLES:

```
sage: t = FunctionField(QQ,'t').gen()
sage: isinstance(t, sage.rings.function_field.function_field_element.
↪FunctionFieldElement)
True
```

characteristic_polynomial(**args*, ***kwds*)

Return the characteristic polynomial of the element. Give an optional input string to name the variable in the characteristic polynomial.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: L.<y> = K.extension(y^2 - x*y + 4*x^3); R.<z> = L[]
sage: M.<z> = L.extension(z^3 - y^2*z + x)
sage: x.characteristic_polynomial('W')
W - x
sage: y.characteristic_polynomial('W')
```

(continues on next page)

(continued from previous page)

```
W^2 - x*W + 4*x^3
sage: z.characteristic_polynomial('W')
W^3 + (-x*y + 4*x^3)*W + x
```

charpoly(**args*, ***kwds*)

Return the characteristic polynomial of the element. Give an optional input string to name the variable in the characteristic polynomial.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: L.<y> = K.extension(y^2 - x*y + 4*x^3); R.<z> = L[]
sage: M.<z> = L.extension(z^3 - y^2*z + x)
sage: x.characteristic_polynomial('W')
W - x
sage: y.characteristic_polynomial('W')
W^2 - x*W + 4*x^3
sage: z.characteristic_polynomial('W')
W^3 + (-x*y + 4*x^3)*W + x
```

is_integral()

Determine if the element is integral over the maximal order of the base field.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: L.<y> = K.extension(y^2 - x*y + 4*x^3)
sage: y.is_integral()
True
sage: (y/x).is_integral()
True
sage: (y/x)^2 - (y/x) + 4*x
0
sage: (y/x^2).is_integral()
False
sage: (y/x).minimal_polynomial('W')
W^2 - W + 4*x
```

matrix(*base=None*)

Return the matrix of multiplication by this element, interpreting this element as an element of a vector space over `base`.

INPUT:

- `base` – a function field (default: `None`), if `None`, then the matrix is formed over the base field of this function field.

EXAMPLES:

A rational function field:

```
sage: K.<t> = FunctionField(QQ)
sage: t.matrix()
[t]
sage: (1/(t+1)).matrix()
[1/(t + 1)]
```

Now an example in a nontrivial extension of a rational function field:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: L.<y> = K.extension(y^2 - x*y + 4*x^3)
sage: y.matrix()
[     0      1]
[-4*x^3      x]
sage: y.matrix().charpoly('Z')
Z^2 - x*Z + 4*x^3
```

An example in a relative extension, where neither function field is rational:

```
sage: K.<x> = FunctionField(QQ)
sage: R.<y> = K[]
sage: L.<y> = K.extension(y^2 - x*y + 4*x^3)
sage: M.<T> = L[]
sage: Z.<alpha> = L.extension(T^3 - y^2*T + x)
sage: alpha.matrix()
[          0           1           0]
[          0           0           1]
[         -x x*y - 4*x^3           0]
sage: alpha.matrix(K)
[           0            0            1            0            0
↪0]
[           0            0            0            1            0
↪0]
[           0            0            0            0            1
↪0]
[           0            0            0            0            0
↪1]
[          -x            0       -4*x^3            x            0
↪0]
[           0           -x       -4*x^4 -4*x^3 + x^2            0
↪0]
sage: alpha.matrix(Z)
[alpha]
```

We show that this matrix does indeed work as expected when making a vector space from a function field:

```
sage: K.<x> = FunctionField(QQ)
sage: R.<y> = K[]
sage: L.<y> = K.extension(y^5 - (x^3 + 2*x*y + 1/x))
sage: V, from_V, to_V = L.vector_space()
sage: y5 = to_V(y^5); y5
((x^4 + 1)/x, 2*x, 0, 0, 0)
sage: y4y = to_V(y^4) * y.matrix(); y4y
((x^4 + 1)/x, 2*x, 0, 0, 0)
sage: y5 == y4y
True
```

minimal_polynomial(**args*, ***kwds*)

Return the minimal polynomial of the element. Give an optional input string to name the variable in the characteristic polynomial.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: L.<y> = K.extension(y^2 - x*y + 4*x^3); R.<z> = L[]
sage: M.<z> = L.extension(z^3 - y^2*z + x)
```

(continues on next page)

(continued from previous page)

```
sage: x.minimal_polynomial('W')
W - x
sage: y.minimal_polynomial('W')
W^2 - x*W + 4*x^3
sage: z.minimal_polynomial('W')
W^3 + (-x*y + 4*x^3)*W + x
```

minpoly(**args*, ***kwds*)

Return the minimal polynomial of the element. Give an optional input string to name the variable in the characteristic polynomial.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: L.<y> = K.extension(y^2 - x*y + 4*x^3); R.<z> = L[]
sage: M.<z> = L.extension(z^3 - y^2*z + x)
sage: x.minimal_polynomial('W')
W - x
sage: y.minimal_polynomial('W')
W^2 - x*W + 4*x^3
sage: z.minimal_polynomial('W')
W^3 + (-x*y + 4*x^3)*W + x
```

norm()

Return the norm of the element.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: L.<y> = K.extension(y^2 - x*y + 4*x^3)
sage: y.norm()
4*x^3
```

The norm is relative:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: L.<y> = K.extension(y^2 - x*y + 4*x^3); R.<z> = L[]
sage: M.<z> = L.extension(z^3 - y^2*z + x)
sage: z.norm()
-x
sage: z.norm().parent()
Function field in y defined by y^2 - x*y + 4*x^3
```

trace()

Return the trace of the element.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: L.<y> = K.extension(y^2 - x*y + 4*x^3)
sage: y.trace()
x
```

class sage.rings.function_field.function_field_element.**FunctionFieldElement_global**

Bases: *sage.rings.function_field.function_field_element.FunctionFieldElement_polymod*

Elements of global function fields

class sage.rings.function_field.function_field_element.**FunctionFieldElement_polymod**
Bases: *sage.rings.function_field.function_field_element.FunctionFieldElement*

Elements of a finite extension of a function field.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: L.<y> = K.extension(y^2 - x*y + 4*x^3)
sage: x*y + 1/x^3
x*y + 1/x^3
```

element()
Return the underlying polynomial that represents the element.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ); R.<T> = K[]
sage: L.<y> = K.extension(T^2 - x*T + 4*x^3)
sage: f = y/x^2 + x/(x^2+1); f
1/x^2*y + x/(x^2 + 1)
sage: f.element()
1/x^2*y + x/(x^2 + 1)
```

list()
Return the list of the coefficients prepresenting the element.

If the function field is $K[y]/(f(y))$, then return the coefficients of the reduced presentation of the element as a polynomial in $K[y]$.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: L.<y> = K.extension(y^2 - x*y + 4*x^3)
sage: a = ~(2*y + 1/x); a
(-x^2/(8*x^5 + x^2 + 1/2))*y + (2*x^3 + x)/(16*x^5 + 2*x^2 + 1)
sage: a.list()
[(2*x^3 + x)/(16*x^5 + 2*x^2 + 1), -x^2/(8*x^5 + x^2 + 1/2)]
sage: (x*y).list()
[0, x]
```

class sage.rings.function_field.function_field_element.**FunctionFieldElement_rational**
Bases: *sage.rings.function_field.function_field_element.FunctionFieldElement*

Elements of a rational function field.

EXAMPLES:

```
sage: K.<t> = FunctionField(QQ); K
Rational function field in t over Rational Field
sage: t^2 + 3/2*t
t^2 + 3/2*t
sage: FunctionField(QQ,'t').gen()^3
t^3
```

denominator()
Return the denominator of the rational function.

EXAMPLES:

```
sage: K.<t> = FunctionField(QQ)
sage: f = (t+1) / (t^2 - 1/3); f
(t + 1)/(t^2 - 1/3)
sage: f.denominator()
t^2 - 1/3
```

element()

Return the underlying fraction field element that represents the element.

EXAMPLES:

```
sage: K.<t> = FunctionField(GF(7))
sage: t.element()
t
sage: type(t.element())
<type 'sage.rings.fraction_field_FpT.FpTElement'>

sage: K.<t> = FunctionField(GF(131101))
sage: t.element()
t
sage: type(t.element())
<class 'sage.rings.fraction_field_element.FractionFieldElement_1poly_field'>
```

factor()

Factor the rational function.

EXAMPLES:

```
sage: K.<t> = FunctionField(QQ)
sage: f = (t+1) / (t^2 - 1/3)
sage: f.factor()
(t + 1) * (t^2 - 1/3)^-1
sage: (7*f).factor()
(7) * (t + 1) * (t^2 - 1/3)^-1
sage: ((7*f).factor()).unit()
7
sage: (f^3).factor()
(t + 1)^3 * (t^2 - 1/3)^-3
```

inverse_mod(I)

Return an inverse of the element modulo the integral ideal I, if I and the element together generate the unit ideal.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ)
sage: O = K.maximal_order(); I = O.ideal(x^2+1)
sage: t = O(x+1).inverse_mod(I); t
-1/2*x + 1/2
sage: (t*(x+1) - 1) in I
True
```

is_square()

Returns whether self is a square.

EXAMPLES:

```
sage: K.<t> = FunctionField(QQ)
sage: t.is_square()
False
sage: (t^2/4).is_square()
True
sage: f = 9 * (t+1)^6 / (t^2 - 2*t + 1); f.is_square()
True

sage: K.<t> = FunctionField(GF(5))
sage: (-t^2).is_square()
True
sage: (-t^2).sqrt()
2*t
```

list()

Return a list with just the element.

The list represents the element when the rational function field is viewed as a (one-dimensional) vector space over itself.

EXAMPLES:

```
sage: K.<t> = FunctionField(QQ)
sage: t.list()
[t]
```

numerator()

Return the numerator of the rational function.

EXAMPLES:

```
sage: K.<t> = FunctionField(QQ)
sage: f = (t+1) / (t^2 - 1/3); f
(t + 1)/(t^2 - 1/3)
sage: f.numerator()
t + 1
```

sqrt(*all=False*)

Return the square root of the rational function.

EXAMPLES:

```
sage: K.<t> = FunctionField(QQ)
sage: f = t^2 - 2 + 1/t^2; f.sqrt()
(t^2 - 1)/t
sage: f = t^2; f.sqrt(all=True)
[t, -t]
```

valuation(*v*)

EXAMPLES:

```
sage: K.<t> = FunctionField(QQ)
sage: f = (t-1)^2 * (t+1) / (t^2 - 1/3)^3
sage: f.valuation(t-1)
2
sage: f.valuation(t)
0
sage: f.valuation(t^2 - 1/3)
-3
```

sage.rings.function_field.function_field_element.**is_FunctionFieldElement**(*x*)

Return `True` if `x` is any type of function field element.

EXAMPLES:

```
sage: t = FunctionField(QQ,'t').gen()
sage: sage.rings.function_field.function_field_element.is_FunctionFieldElement(t)
True
sage: sage.rings.function_field.function_field_element.is_FunctionFieldElement(0)
False
```

sage.rings.function_field.function_field_element.**make_FunctionFieldElement**(*parent*, *element_class*, *representing_element*)

Used for unpickling FunctionFieldElement objects (and subclasses).

EXAMPLES:

```
sage: from sage.rings.function_field.function_field_element import make_
↪FunctionFieldElement
sage: K.<x> = FunctionField(QQ)
sage: make_FunctionFieldElement(K, K._element_class, (x+1)/x)
(x + 1)/x
```

CHAPTER

THREE

ORDERS OF FUNCTION FIELDS

AUTHORS:

- William Stein (2010): initial version
- Maarten Derickx (2011-09-14): fixed ideal_with_gens_over_base() for rational function fields
- Julian Rueth (2011-09-14): added check in _element_constructor_

EXAMPLES:

Maximal orders in rational function fields:

```
sage: K.<x> = FunctionField(QQ)
sage: O = K.maximal_order()
sage: I = O.ideal(1/x); I
Ideal (1/x) of Maximal order in Rational function field in x over Rational Field
sage: 1/x in O
False
```

Equation orders in extensions of rational function fields:

```
sage: K.<x> = FunctionField(GF(3)); R.<y> = K[]
sage: L.<y> = K.extension(y^3-y-x)
sage: O = L.equation_order()
sage: 1/y in O
False
sage: x/y in O
True
```

class sage.rings.function_field.function_field_order.**FunctionFieldOrder**(*fraction_field*)

Bases: sage.rings.ring.IntegralDomain

Base class for orders in function fields.

fraction_field()

Returns the function field in which this is an order.

EXAMPLES:

```
sage: FunctionField(QQ,'y').maximal_order().fraction_field()
Rational function field in y over Rational Field
```

function_field()

Returns the function field in which this is an order.

EXAMPLES:

```
sage: FunctionField(QQ,'y').maximal_order().fraction_field()
Rational function field in y over Rational Field
```

ideal(**gens*)

Returns the fractional ideal generated by the elements in `gens`.

INPUT:

- **gens – a list of generators or an ideal in a ring which** coerces to this order.

EXAMPLES:

```
sage: K.<y> = FunctionField(QQ)
sage: O = K.maximal_order()
sage: O.ideal(y)
Ideal (y) of Maximal order in Rational function field in y over Rational Field
sage: O.ideal([y,1/y]) == O.ideal(y,1/y) # multiple generators may be given␣
↪as a list
True
```

A fractional ideal of a nontrivial extension:

```
sage: K.<x> = FunctionField(GF(7)); R.<y> = K[]
sage: O = K.maximal_order()
sage: I = O.ideal(x^2-4)
sage: L.<y> = K.extension(y^2 - x^3 - 1)
sage: S = L.equation_order()
sage: S.ideal(1/y)
Ideal (1, (6/(x^3 + 1))*y) of Order in Function field in y defined by y^2 +␣
↪6*x^3 + 6
sage: I2 = S.ideal(x^2-4); I2
Ideal (x^2 + 3, (x^2 + 3)*y) of Order in Function field in y defined by y^2 +␣
↪6*x^3 + 6
sage: I2 == S.ideal(I)
True
```

ideal_with_gens_over_base(*gens*)

Returns the fractional ideal with basis `gens` over the maximal order of the base field. That this is really an ideal is not checked.

INPUT:

- `gens` – list of elements that are a basis for the ideal over the maximal order of the base field

EXAMPLES:

We construct an ideal in a rational function field:

```
sage: K.<y> = FunctionField(QQ)
sage: O = K.maximal_order()
sage: I = O.ideal_with_gens_over_base([y]); I
Ideal (y) of Maximal order in Rational function field in y over Rational Field
sage: I*I
Ideal (y^2) of Maximal order in Rational function field in y over Rational␣
↪Field
```

We construct some ideals in a nontrivial function field:

```
sage: K.<x> = FunctionField(GF(7)); R.<y> = K[]
sage: L.<y> = K.extension(y^2 - x^3 - 1)
sage: O = L.equation_order(); O
Order in Function field in y defined by y^2 + 6*x^3 + 6
sage: I = O.ideal_with_gens_over_base([1, y]);  I
Ideal (1, y) of Order in Function field in y defined by y^2 + 6*x^3 + 6
sage: I.module()
Free module of degree 2 and rank 2 over Maximal order in Rational function␣
↪field in x over Finite Field of size 7
Echelon basis matrix:
[1 0]
[0 1]
```

There is no check if the resulting object is really an ideal:

```
sage: K.<x> = FunctionField(GF(7)); R.<y> = K[]
sage: L.<y> = K.extension(y^2 - x^3 - 1)
sage: O = L.equation_order()
sage: I = O.ideal_with_gens_over_base([y]); I
Ideal (y) of Order in Function field in y defined by y^2 + 6*x^3 + 6
sage: y in I
True
sage: y^2 in I
False
```

is_field(*proof=True*)

Returns False since orders are never fields.

EXAMPLES:

```
sage: FunctionField(QQ,'y').maximal_order().is_field()
False
```

is_finite()

Returns False since orders are never finite.

EXAMPLES:

```
sage: FunctionField(QQ,'y').maximal_order().is_finite()
False
```

is_noetherian()

Returns True since orders in function fields are noetherian.

EXAMPLES:

```
sage: FunctionField(QQ,'y').maximal_order().is_noetherian()
True
```

class sage.rings.function_field.function_field_order.**FunctionFieldOrder_basis**(*basis*, *check=True*)

Bases: *sage.rings.function_field.function_field_order.FunctionFieldOrder*

An order given by a basis over the maximal order of the base field.

basis()

Returns a basis of self over the maximal order of the base field.

EXAMPLES:

```
sage: K.<x> = FunctionField(GF(7)); R.<y> = K[]
sage: L.<y> = K.extension(y^4 + x*y + 4*x + 1)
sage: O = L.equation_order()
sage: O.basis()
(1, y, y^2, y^3)
```

fraction_field()
Returns the function field in which this is an order.

EXAMPLES:

```
sage: K.<x> = FunctionField(GF(7)); R.<y> = K[]
sage: L.<y> = K.extension(y^4 + x*y + 4*x + 1)
sage: O = L.equation_order()
sage: O.fraction_field()
Function field in y defined by y^4 + x*y + 4*x + 1
```

free_module()
Returns the free module formed by the basis over the maximal order of the base field.

EXAMPLES:

```
sage: K.<x> = FunctionField(GF(7)); R.<y> = K[]
sage: L.<y> = K.extension(y^4 + x*y + 4*x + 1)
sage: O = L.equation_order()
sage: O.free_module()
Free module of degree 4 and rank 4 over Maximal order in Rational function␣
↪field in x over Finite Field of size 7
Echelon basis matrix:
[1 0 0 0]
[0 1 0 0]
[0 0 1 0]
[0 0 0 1]
```

polynomial()
Returns the defining polynomial of the function field of which this is an order.

EXAMPLES:

```
sage: K.<x> = FunctionField(GF(7)); R.<y> = K[]
sage: L.<y> = K.extension(y^4 + x*y + 4*x + 1)
sage: O = L.equation_order()
sage: O.polynomial()
y^4 + x*y + 4*x + 1
```

class sage.rings.function_field.function_field_order.**FunctionFieldOrder_rational**(*function_field*
Bases: sage.rings.ring.PrincipalIdealDomain, *sage.rings.function_field.function_field_order.FunctionFieldOrder*

The maximal order in a rational function field.

basis()
Returns the basis (=1) for this order as a module over the polynomial ring.

EXAMPLES:

```
sage: K.<t> = FunctionField(GF(19))
sage: O = K.maximal_order()
sage: O.basis()
```

(continues on next page)

(continued from previous page)

```
(1,)
sage: parent(O.basis()[0])
Maximal order in Rational function field in t over Finite Field of size 19
```

gen(*n=0*)

Returns the n-th generator of self. Since there is only one generator n must be 0.

EXAMPLES:

```
sage: O = FunctionField(QQ,'y').maximal_order()
sage: O.gen()
y
sage: O.gen(1)
Traceback (most recent call last):
...
IndexError: Only one generator.
```

ideal(**gens*)

Returns the fractional ideal generated by gens.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ)
sage: O = K.maximal_order()
sage: O.ideal(x)
Ideal (x) of Maximal order in Rational function field in x over Rational Field
sage: O.ideal([x,1/x]) == O.ideal(x,1/x) # multiple generators may be given␣
↪as a list
True
sage: O.ideal(x^3+1,x^3+6)
Ideal (1) of Maximal order in Rational function field in x over Rational Field
sage: I = O.ideal((x^2+1)*(x^3+1),(x^3+6)*(x^2+1)); I
Ideal (x^2 + 1) of Maximal order in Rational function field in x over␣
↪Rational Field
sage: O.ideal(I)
Ideal (x^2 + 1) of Maximal order in Rational function field in x over␣
↪Rational Field
```

ngens()

Returns 1, the number of generators of self.

EXAMPLES:

```
sage: FunctionField(QQ,'y').maximal_order().ngens()
1
```

CHAPTER

FOUR

IDEALS OF FUNCTION FIELDS

Ideals of an order of a function field include all fractional ideals of the order. Sage provides basic arithmetic with fractional ideals.

AUTHORS:

- William Stein (2010): initial version
- Maarten Derickx (2011-09-14): fixed ideal_with_gens_over_base()

EXAMPLES:

Ideals in the maximal order of a rational function field:

```
sage: K.<x> = FunctionField(QQ)
sage: O = K.maximal_order()
sage: I = O.ideal(x^3+1); I
Ideal (x^3 + 1) of Maximal order in Rational function field in x over Rational Field
sage: I^2
Ideal (x^6 + 2*x^3 + 1) of Maximal order in Rational function field in x over␣
↪Rational Field
sage: ~I
Ideal (1/(x^3 + 1)) of Maximal order in Rational function field in x over Rational␣
↪Field
sage: ~I * I
Ideal (1) of Maximal order in Rational function field in x over Rational Field
```

Ideals in the equation order of an extension of a rational function field:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: L.<y> = K.extension(y^2-x^3-1)
sage: O = L.equation_order()
sage: I = O.ideal(y); I
Ideal (x^3 + 1, -y) of Order in Function field in y defined by y^2 - x^3 - 1
sage: I^2
Ideal (x^3 + 1, (-x^3 - 1)*y) of Order in Function field in y defined by y^2 - x^3 - 1
sage: ~I
Ideal (-1, (1/(x^3 + 1))*y) of Order in Function field in y defined by y^2 - x^3 - 1
sage: ~I * I
Ideal (1, y) of Order in Function field in y defined by y^2 - x^3 - 1
sage: I.intersection(~I)
Ideal (x^3 + 1, -y) of Order in Function field in y defined by y^2 - x^3 - 1
```

class sage.rings.function_field.function_field_ideal.**FunctionFieldIdeal**(*ring*, *gens*, *coerce=True*)

Bases: sage.rings.ideal.Ideal_generic

A fractional ideal of a function field.

EXAMPLES:

```
sage: K.<x> = FunctionField(GF(7))
sage: O = K.maximal_order()
sage: I = O.ideal(x^3+1)
sage: isinstance(I, sage.rings.function_field.function_field_ideal.
↪FunctionFieldIdeal)
True
```

class sage.rings.function_field.function_field_ideal.**FunctionFieldIdeal_module**(*ring*, *module*)

Bases: *sage.rings.function_field.function_field_ideal.FunctionFieldIdeal*

A fractional ideal specified by a finitely generated module over the integers of the base field.

EXAMPLES:

An ideal in an extension of a rational function field:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: L.<y> = K.extension(y^2 - x^3 - 1)
sage: O = L.equation_order()
sage: I = O.ideal(y)
sage: I
Ideal (x^3 + 1, -y) of Order in Function field in y defined by y^2 - x^3 - 1
sage: I^2
Ideal (x^3 + 1, (-x^3 - 1)*y) of Order in Function field in y defined by y^2 - x^
↪3 - 1
```

intersection(*other*)

Return the intersection of the ideals self and other.

EXAMPLES:

```
sage: K.<x> = FunctionField(GF(7)); R.<y> = K[]
sage: L.<y> = K.extension(y^2 - x^3 - 1)
sage: O = L.equation_order()
sage: I = O.ideal(y^3); J = O.ideal(y^2)
sage: Z = I.intersection(J); Z
Ideal (x^6 + 2*x^3 + 1, (6*x^3 + 6)*y) of Order in Function field in y␣
↪defined by y^2 + 6*x^3 + 6
sage: y^2 in Z
False
sage: y^3 in Z
True
```

module()

Return module over the maximal order of the base field that underlies self.

The formation of this module is compatible with the vector space corresponding to the function field.

OUTPUT:

- a module over the maximal order of the base field of self

EXAMPLES:

```
sage: K.<x> = FunctionField(GF(7))
sage: O = K.maximal_order(); O
Maximal order in Rational function field in x over Finite Field of size 7
sage: K.polynomial_ring()
Univariate Polynomial Ring in x over Rational function field in x over Finite␣
↪Field of size 7
sage: I = O.ideal_with_gens_over_base([x^2 + 1, x*(x^2+1)])
sage: I.gens()
(x^2 + 1,)
sage: I.module()
Free module of degree 1 and rank 1 over Maximal order in Rational function␣
↪field in x over Finite Field of size 7
User basis matrix:
[x^2 + 1]
sage: V, from_V, to_V = K.vector_space(); V
Vector space of dimension 1 over Rational function field in x over Finite␣
↪Field of size 7
sage: I.module().is_submodule(V)
True
```

sage.rings.function_field.function_field_ideal.**ideal_with_gens**(*R*, *gens*)

Return fractional ideal in the order `R` with generators `gens` over `R`.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: L.<y> = K.extension(y^2 - x^3 - 1)
sage: O = L.equation_order()
sage: sage.rings.function_field.function_field_ideal.ideal_with_gens(O, [y])
Ideal (x^3 + 1, -y) of Order in Function field in y defined by y^2 - x^3 - 1
```

sage.rings.function_field.function_field_ideal.**ideal_with_gens_over_base**(*R*, *gens*)

Return fractional ideal in the order `R` with generators `gens` over the maximal order of the base field.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: L.<y> = K.extension(y^2 - x^3 - 1)
sage: O = L.equation_order()
sage: sage.rings.function_field.function_field_ideal.ideal_with_gens_over_base(O,␣
↪[x^3+1,-y])
Ideal (x^3 + 1, -y) of Order in Function field in y defined by y^2 - x^3 - 1
```

CHAPTER

FIVE

MORPHISMS OF FUNCTION FIELDS

Maps and morphisms useful for computations with function fields.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: K.hom(1/x)
Function Field endomorphism of Rational function field in x over Rational Field
  Defn: x |--> 1/x
sage: L.<y> = K.extension(y^2 - x)
sage: K.hom(y)
Function Field morphism:
  From: Rational function field in x over Rational Field
  To:   Function field in y defined by y^2 - x
  Defn: x |--> y
sage: L.hom([y,x])
Function Field endomorphism of Function field in y defined by y^2 - x
  Defn: y |--> y
        x |--> x
sage: L.hom([x,y])
Traceback (most recent call last):
...
ValueError: invalid morphism
```

AUTHORS:

- William Stein (2010): initial version
- Julian Rüth (2011-09-14, 2014-06-23, 2017-08-21): refactored class hierarchy; added derivation classes; morphisms to/from fraction fields

class sage.rings.function_field.maps.**FractionFieldToFunctionField**

Bases: *sage.rings.function_field.maps.FunctionFieldVectorSpaceIsomorphism*

Isomorphism from a fraction field of a polynomial ring to the isomorphic function field.

EXAMPLES:

```
sage: K = QQ['x'].fraction_field()
sage: L = K.function_field()
sage: f = L.coerce_map_from(K); f
Isomorphism:
    From: Fraction Field of Univariate Polynomial Ring in x over Rational Field
    To:   Rational function field in x over Rational Field
```

See also:

FunctionFieldToFractionField

section()
Return the inverse map of this isomorphism.

EXAMPLES:

```
sage: K = QQ['x'].fraction_field()
sage: L = K.function_field()
sage: f = L.coerce_map_from(K)
sage: f.section()
Isomorphism:
    From: Rational function field in x over Rational Field
    To:   Fraction Field of Univariate Polynomial Ring in x over Rational␣
↪Field
```

class sage.rings.function_field.maps.**FunctionFieldConversionToConstantBaseField**(*parent*)
Bases: sage.categories.map.Map

Conversion map from the function field to its constant base field.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ)
sage: QQ.convert_map_from(K)
Conversion map:
  From: Rational function field in x over Rational Field
  To:   Rational Field
```

class sage.rings.function_field.maps.**FunctionFieldDerivation**(*K*)
Bases: sage.categories.map.Map

Base class for derivations on function fields.

A derivation on R is a map $R \to R$ with $D(\alpha + \beta) = D(\alpha) + D(\beta)$ and $D(\alpha\beta) = \beta D(\alpha) + \alpha D(\beta)$ for all $\alpha, \beta \in R$.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ)
sage: d = K.derivation()
sage: d
Derivation map:
  From: Rational function field in x over Rational Field
  To:   Rational function field in x over Rational Field
```

is_injective()
Return `False` since a derivation is never injective.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ)
sage: d = K.derivation()
sage: d.is_injective()
False
```

class sage.rings.function_field.maps.**FunctionFieldDerivation_rational**(*K*, *u*)
Bases: *sage.rings.function_field.maps.FunctionFieldDerivation*

Derivations on rational function fields.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ)
sage: K.derivation()
Derivation map:
  From: Rational function field in x over Rational Field
  To:   Rational function field in x over Rational Field
```

class sage.rings.function_field.maps.**FunctionFieldDerivation_separable**(*L*, *d*)

Bases: *sage.rings.function_field.maps.FunctionFieldDerivation*

Derivations of separable extensions.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ)
sage: R.<y> = K[]
sage: L.<y> = K.extension(y^2 - x)
sage: L.derivation()
Derivation map:
  From: Function field in y defined by y^2 - x
  To:   Function field in y defined by y^2 - x
  Defn: y |--> (-1/2/-x)*y
```

class sage.rings.function_field.maps.**FunctionFieldMorphism**(*parent*, *im_gen*, *base_morphism*)

Bases: sage.rings.morphism.RingHomomorphism

Base class for morphisms between function fields.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ)
sage: f = K.hom(1/x); f
Function Field endomorphism of Rational function field in x over Rational Field
  Defn: x |--> 1/x
```

class sage.rings.function_field.maps.**FunctionFieldMorphism_polymod**(*parent*, *im_gen*, *base_morphism*)

Bases: *sage.rings.function_field.maps.FunctionFieldMorphism*

Morphism from a finite extension of a function field to a function field.

EXAMPLES:

```
sage: K.<x> = FunctionField(GF(7)); R.<y> = K[]
sage: L.<y> = K.extension(y^3 + 6*x^3 + x)
sage: f = L.hom(y*2); f
Function Field endomorphism of Function field in y defined by y^3 + 6*x^3 + x
  Defn: y |--> 2*y
sage: factor(L.polynomial())
y^3 + 6*x^3 + x
sage: f(y).charpoly('y')
y^3 + 6*x^3 + x
```

class sage.rings.function_field.maps.**FunctionFieldMorphism_rational**(*parent*, *im_gen*, *base_morphism*)

Bases: *sage.rings.function_field.maps.FunctionFieldMorphism*

Morphism from a rational function field to a function field.

class sage.rings.function_field.maps.**FunctionFieldToFractionField**
Bases: *sage.rings.function_field.maps.FunctionFieldVectorSpaceIsomorphism*

Isomorphism from rational function field to the isomorphic fraction field of a polynomial ring.

EXAMPLES:

```
sage: K = QQ['x'].fraction_field()
sage: L = K.function_field()
sage: f = K.coerce_map_from(L); f
Isomorphism:
  From: Rational function field in x over Rational Field
  To:   Fraction Field of Univariate Polynomial Ring in x over Rational Field
```

See also:

FractionFieldToFunctionField

section()
Return the inverse map of this isomorphism.

EXAMPLES:

```
sage: K = QQ['x'].fraction_field()
sage: L = K.function_field()
sage: f = K.coerce_map_from(L)
sage: f.section()
Isomorphism:
    From: Fraction Field of Univariate Polynomial Ring in x over Rational␣
↪Field
    To:   Rational function field in x over Rational Field
```

class sage.rings.function_field.maps.**FunctionFieldVectorSpaceIsomorphism**
Bases: sage.categories.morphism.Morphism

Base class for isomorphisms between function fields and vector spaces.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: L.<y> = K.extension(y^2 - x*y + 4*x^3)
sage: V, f, t = L.vector_space()
sage: isinstance(f, sage.rings.function_field.maps.
↪FunctionFieldVectorSpaceIsomorphism)
True
```

is_injective()
Return True, since the isomorphism is injective.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: L.<y> = K.extension(y^2 - x*y + 4*x^3)
sage: V, f, t = L.vector_space()
sage: f.is_injective()
True
```

is_surjective()
Return True, since the isomorphism is surjective.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: L.<y> = K.extension(y^2 - x*y + 4*x^3)
sage: V, f, t = L.vector_space()
sage: f.is_surjective()
True
```

class sage.rings.function_field.maps.**MapFunctionFieldToVectorSpace**(*K*, *V*)

Bases: *sage.rings.function_field.maps.FunctionFieldVectorSpaceIsomorphism*

Isomorphism from a function field to a vector space.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: L.<y> = K.extension(y^2 - x*y + 4*x^3)
sage: V, f, t = L.vector_space(); t
Isomorphism:
  From: Function field in y defined by y^2 - x*y + 4*x^3
  To:   Vector space of dimension 2 over Rational function field in x over␣
↪Rational Field
```

class sage.rings.function_field.maps.**MapVectorSpaceToFunctionField**(*V*, *K*)

Bases: *sage.rings.function_field.maps.FunctionFieldVectorSpaceIsomorphism*

Isomorphism from a vector space to a function field.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: L.<y> = K.extension(y^2 - x*y + 4*x^3)
sage: V, f, t = L.vector_space(); f
Isomorphism:
  From: Vector space of dimension 2 over Rational function field in x over␣
↪Rational Field
  To:   Function field in y defined by y^2 - x*y + 4*x^3
```

codomain()

Return the function field which is the codomain of the isomorphism.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: L.<y> = K.extension(y^2 - x*y + 4*x^3)
sage: V, f, t = L.vector_space()
sage: f.codomain()
Function field in y defined by y^2 - x*y + 4*x^3
```

domain()

Return the vector space which is the domain of the isomorphism.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ); R.<y> = K[]
sage: L.<y> = K.extension(y^2 - x*y + 4*x^3)
sage: V, f, t = L.vector_space()
sage: f.domain()
Vector space of dimension 2 over Rational function field in x over Rational␣
↪Field
```

CHAPTER

SIX

FACTORIES TO CONSTRUCT FUNCTION FIELDS

This module provides factories to construct function fields. These factories are only for internal use.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ); K
Rational function field in x over Rational Field
sage: L.<x> = FunctionField(QQ); L
Rational function field in x over Rational Field
sage: K is L
True
```

AUTHORS:

- William Stein (2010): initial version
- Maarten Derickx (2011-09-11): added `FunctionField_polymod_Constructor`, use `@cached_function`
- Julian Rueth (2011-09-14): replaced `@cached_function` with `UniqueFactory`

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ); K
Rational function field in x over Rational Field
sage: L.<x> = FunctionField(QQ); L
Rational function field in x over Rational Field
sage: K is L
True
```

class sage.rings.function_field.constructor.**FunctionFieldExtensionFactory**

Bases: sage.structure.factory.UniqueFactory

Create a function field defined as an extension of another function field by adjoining a root of a univariate polynomial. The returned function field is unique in the sense that if you call this function twice with an equal `polynomial` and `names` it returns the same python object in both calls.

INPUT:

- `polynomial` – univariate polynomial over a function field
- `names` – variable names (as a tuple of length 1 or string)
- `category` – category (defaults to category of function fields)

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ)
sage: R.<y>=K[]
sage: y2 = y*1
sage: y2 is y
False
sage: L.<w>=K.extension(x-y^2)
sage: M.<w>=K.extension(x-y2^2)
sage: L is M
True
```

create_key(*polynomial*, *names*)

Given the arguments and keywords, create a key that uniquely determines this object.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ)
sage: R.<y>=K[]
sage: L.<w> = K.extension(x-y^2) # indirect doctest
```

create_object(*version*, *key*, ***extra_args*)

Create the object from the key and extra arguments. This is only called if the object was not found in the cache.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ)
sage: R.<y>=K[]
sage: L.<w> = K.extension(x-y^2) # indirect doctest
sage: y2 = y*1
sage: M.<w> = K.extension(x-y2^2) # indirect doctest
sage: L is M
True
```

class sage.rings.function_field.constructor.**FunctionFieldFactory**

Bases: sage.structure.factory.UniqueFactory

Return the function field in one variable with constant field `F`. The function field returned is unique in the sense that if you call this function twice with the same base field and name then you get the same python object back.

INPUT:

- `F` – field
- `names` – name of variable as a string or a tuple containing a string

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ); K
Rational function field in x over Rational Field
sage: L.<y> = FunctionField(GF(7)); L
Rational function field in y over Finite Field of size 7
sage: R.<z> = L[]
sage: M.<z> = L.extension(z^7-z-y); M
Function field in z defined by z^7 + 6*z + 6*y
```

create_key(*F*, *names*)

Given the arguments and keywords, create a key that uniquely determines this object.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ)  # indirect doctest
```

create_object(*version*, *key*, ***extra_args*)

Create the object from the key and extra arguments. This is only called if the object was not found in the cache.

EXAMPLES:

```
sage: K.<x> = FunctionField(QQ)   # indirect doctest
sage: L.<x> = FunctionField(QQ)   # indirect doctest
sage: K is L
True
```
