# Packages and Features

*Release 10.2*

**The Sage Development Team**

Dec 06, 2023

## CONTENTS

<b>1 Standard Packages</b>	<b>1</b>
<b>2 Optional Packages</b>	<b>9</b>
<b>3 Features</b>	<b>15</b>
<b>4 Distribution Packages of the Sage Library</b>	<b>53</b>
<b>5 Experimental Packages</b>	<b>55</b>
<b>6 All External Packages</b>	<b>57</b>
<b>Python Module Index</b>	<b>635</b>
<b>Index</b>	<b>637</b>

## STANDARD PACKAGES

The Sage distribution includes most programs and libraries on which Sage depends. It installs them automatically if it does not find equivalent system packages.

- *\_prereq*: Represents system packages required for installing SageMath from source
- *alabaster*: Default theme for the Sphinx documentation system
- *appdirs*: A small Python module for determining appropriate platform-specific dirs, e.g. a “user data dir”.
- *appnope*: Disable App Nap on macOS >= 10.9
- *arb*: Arbitrary-precision floating-point ball arithmetic
- *argon2\_cffi*: The secure Argon2 password hashing algorithm
- *argon2\_cffi\_bindings*: Low-level CFFI bindings for Argon2
- *asttokens*: Annotate AST trees with source code positions
- *attrs*: Decorator for Python classes with attributes
- *babel*: Internationalization utilities for Python
- *backcall*: Specifications for callback functions
- *beautifulsoup4*: Screen-scraping library
- *beniget*: Extract semantic information about static Python code
- *bleach*: An HTML-sanitizing tool
- *boost\_cropped*: Portable C++ libraries (subset needed for Sage)
- *brial*: Boolean Ring Algebra implementation using binary decision diagrams
- *bzip2*: High-quality data compressor
- *cachetools*: Extensible memoizing collections and decorators
- *calver*: Setuptools extension for CalVer package versions
- *cddlib*: Double description method for polyhedral representation conversion
- *certifi*: Python package for providing Mozilla’s CA Bundle
- *cffi*: Foreign Function Interface for Python calling C code
- *chardet*: Universal encoding detector for Python 3
- *charset\_normalizer*: The Real First Universal Charset Detector. Open, modern and actively maintained alternative to Chardet.
- *cliquer*: Routines for clique searching

- *cmake*: A cross-platform build system generator
- *colorama*: Cross-platform colored terminal text.
- *combinatorial\_designs*: Data from the Handbook of Combinatorial Designs
- *contourpy*: Python library for calculating contours of 2D quadrilateral grids
- *conway\_polynomials*: Tables of Conway polynomials over finite fields
- *cppy*: C++ headers for C extension development
- *curl*: Multiprotocol data transfer library and utility
- *cvxopt*: Python software for convex optimization
- *cycler*: Composable cycles
- *cypari2*: Python interface to the number theory library libpari
- *cysignals*: Interrupt and signal handling for Cython
- *cython*: C-Extensions for Python, an optimizing static compiler
- *dateutil*: Extensions to the standard Python module datetime
- *decorator*: Python library providing decorators
- *defusedxml*: Addresses vulnerabilities of XML parsers and XML libraries
- *deprecation*: A library to handle automated deprecations
- *distlib*: Distribution utilities
- *docutils*: Processing plaintext documentation into useful formats, such as HTML or LaTeX
- *ecl*: An implementation of the Common Lisp language
- *eclib*: Enumerating and computing with elliptic curves defined over the rational numbers
- *ecm*: Elliptic curve method for integer factorization
- *editables*: Editable installations
- *elliptic\_curves*: Databases of elliptic curves
- *entrypoints*: Discover and load entry points from installed Python packages
- *executing*: Get the currently executing AST node of a frame, and other information
- *fastjsonschema*: Fastest Python implementation of JSON schema
- *fflas\_ffpack*: Dense linear algebra over word-size finite fields
- *filelock*: A platform independent file lock
- *flint*: Fast Library for Number Theory
- *flit\_core*: Distribution-building parts of Flit. See flit package for more information
- *fonttools*: Tools to manipulate font files
- *fplll*: Lattice algorithms, including LLL with floating-point orthogonalization
- *fpylll*: Python interface for FPLLL
- *freetype*: A free, high-quality, and portable font engine
- *furo*: A clean customizable Sphinx documentation theme
- *gap*: Groups, Algorithms, Programming - a system for computational discrete algebra

- *gast*: Python AST that abstracts the underlying Python version
- *gc*: The Boehm-Demers-Weiser conservative garbage collector
- *gcc*: The GNU Compiler Collection or other suitable C and C++ compilers
- *gengetopt*: getopt\_long parser generator
- *gf2x*: Fast arithmetic in GF(2)[x] and searching for irreducible/primitive trinomials
- *gfan*: Groebner fans and tropical varieties
- *gfortran*: Fortran compiler from the GNU Compiler Collection
- *giac*: A general purpose computer algebra system
- *givaro*: C++ library for arithmetic and algebraic computations
- *glpk*: GNU Linear Programming Kit
- *gmp*: Library for arbitrary precision arithmetic
- *gmpy2*: Python interface to GMP/MPIR, MPFR, and MPC
- *gnulib*: Modules imported from Gnulib
- *graphs*: A database of combinatorial graphs
- *gsl*: The GNU Scientific Library
- *hatch\_fancy\_pypi\_readme*: Fancy PyPI READMEs with Hatch
- *hatch\_nodejs\_version*: Hatch plugin for versioning from a package.json file
- *hatch\_vcs*: Hatch plugin for versioning with your preferred VCS
- *hatchling*: Modern, extensible Python build backend
- *iconv*: Library for language/country-dependent character encodings
- *idna*: Internationalized Domain Names in Applications (IDNA)
- *imagesize*: Parser for image file metadata
- *iml*: Integer Matrix Library
- *importlib\_metadata*: Library to access the metadata for a Python package
- *importlib\_resources*: Read resources from Python packages
- *info*: stand-alone Info documentation reader
- *ipykernel*: IPython Kernel for Jupyter
- *ipython*: Interactive computing environment with an enhanced interactive Python shell
- *ipython\_genutils*: Vestigial utilities from IPython
- *ipywidgets*: Interactive HTML widgets for Jupyter notebooks and the IPython kernel
- *jedi*: Static analysis tool providing IDE support for Python
- *jinja2*: General purpose template engine for Python
- *jmol*: Java viewer for chemical structures in 3D
- *jsonschema*: Python implementation of JSON Schema
- *jupyter\_client*: Jupyter protocol implementation and client libraries
- *jupyter\_core*: Jupyter core package

- *jupyter\_jsmol: JSmol viewer widget for Jupyter*
- *jupyter\_sphinx: Jupyter Sphinx Extension*
- *jupyterlab\_pygments: Pygments theme using JupyterLab CSS variables*
- *jupyterlab\_widgets: Jupyter interactive widgets for JupyterLab*
- *kiwisolver: An implementation of the Cassowary constraint solving algorithm*
- *lcalc: L-function calculator*
- *libatomic\_ops: Access hardware-provided atomic memory update operations*
- *libbraiding: Computing with braids*
- *libffi: A portable foreign-function interface library*
- *libgd: Dynamic graphics generation tool*
- *libhomfly: Compute the homfly polynomial of knots and links*
- *liblzma: General-purpose data compression software*
- *libpng: Bitmap image support*
- *linbox: Linear algebra with dense, sparse, structured matrices over the integers and finite fields*
- *lrcalc: Littlewood-Richardson calculator*
- *lrcalc\_python: Littlewood-Richardson calculator*
- *m4ri: fast arithmetic with dense matrices over GF(2)*
- *m4rie: Arithmetic with dense matrices over GF(2^e)*
- *markupsafe: Safely add untrusted strings to HTML/XML markup*
- *mathjax: A JavaScript library for displaying mathematical formulas*
- *matplotlib: Python 2D plotting library*
- *matplotlib\_inline: Inline Matplotlib backend for Jupyter*
- *maxima: System for manipulating symbolic and numerical expressions*
- *memory\_allocator: An extension class to allocate memory easily with Cython*
- *meson: A high performance build system*
- *meson\_python: Meson Python build backend (PEP 517)*
- *mistune: A markdown parser in pure Python*
- *mpc: Arithmetic of complex numbers with arbitrarily high precision and correct rounding*
- *mpfi: Multiple precision interval arithmetic library based on MPFR*
- *mpfr: Multiple-precision floating-point computations with correct rounding*
- *mpmath: Pure Python library for multiprecision floating-point arithmetic*
- *nauty: Find automorphism groups of graphs, generate non-isomorphic graphs*
- *nbclient: A client library for executing notebooks. Formerly nbconvert's ExecutePreprocessor.*
- *nbconvert: Converting Jupyter Notebooks*
- *nbformat: Base implementation of the Jupyter notebook format*
- *ncurses: Classic terminal output library*

- *nest\_asyncio*: Patch `asyncio` to allow nested event loops
- *networkx*: Python package for complex networks
- *ninja\_build*: A build system with a focus on speed
- *notebook*: Jupyter notebook, a web-based notebook environment for interactive computing
- *ntl*: A library for doing number theory
- *numpy*: Package for scientific computing with Python
- *openblas*: An optimized implementation of BLAS (Basic Linear Algebra Subprograms)
- *openssl*: Implementation of the SSL and TLS protocols
- *packaging*: Core utilities for Python packages
- *palp*: A package for Analyzing Lattice Polytopes
- *pandocfilters*: A Python module for writing pandoc filters
- *pari*: Computer algebra system for fast computations in number theory
- *pari\_galdata*: PARI data package needed to compute Galois groups in degrees 8 through 11
- *pari\_seadata\_small*: PARI data package needed by `ellap` for large primes (small version)
- *parso*: A Python parser
- *patch*: Applies diff`s` and patches to files
- *patchelf*: A small utility to modify the dynamic linker and RPATH of ELF executables
- *pathspec*: Utility library for gitignore style pattern matching of file paths.
- *pexpect*: Python module for controlling and automating other programs
- *pickleshare*: A ‘shelve’ like datastore with concurrency support
- *pillow*: Python Imaging Library
- *pip*: Tool for installing and managing Python packages
- *pkgconf*: An implementation of the `pkg-config` spec
- *pkgconfig*: Python interface to `pkg-config`
- *planarity*: Planarity-related graph algorithms
- *platformdirs*: A small Python module for determining appropriate platform-specific dirs, e.g. a “user data dir”.
- *pluggy*: plugin and hook calling mechanisms for python
- *ply*: Python Lex & Yacc
- *polytopes\_db*: Databases of 2- and 3-dimensional reflexive polytopes
- *ppl*: Parma Polyhedra Library
- *pplpy*: Python interface to the Parma Polyhedra Library
- *pplpy\_doc*: Python interface to the Parma Polyhedra Library (documentation)
- *primecount*: Algorithms for counting primes
- *primecountpy*: Cython interface for C++ `primecount` library
- *primesieve*: CLI program and C/C++ library for generating primes
- *prometheus\_client*: Python client for the systems monitoring and alerting toolkit Prometheus

- *prompt\_toolkit: Interactive command lines for Python*
- *ptyprocess: Python interaction with subprocesses in a pseudoterminal*
- *pure\_eval: Safely evaluate AST nodes without side effects*
- *py: library with cross-python path, ini-parsing, io, code, log facilities*
- *pybind11: Create Python bindings to C++ code*
- *pycparser: Parser of the C language in Python*
- *pycygwin: Python bindings for Cygwin's C API*
- *pygments: Generic syntax highlighter*
- *pyparsing: A Python parsing module*
- *pyproject\_api: API to interact with the python pyproject.toml based projects*
- *pyproject\_metadata: PEP 621 metadata parsing*
- *pyrsistent: Persistent data structures in Python*
- *python3: The Python programming language*
- *pythran: Ahead of Time compiler for numeric kernels*
- *pytz: Timezone definitions for Python*
- *pytz\_deprecation\_shim: Shims to make deprecation of pytz easier*
- *pyzmq: Python bindings for the zeromq networking library*
- *qhull: Compute convex hulls, Delaunay triangulations, Voronoi diagrams*
- *readline: Command line editing library*
- *requests: An HTTP library for Python*
- *rpy2: Python interface to R*
- *rw: Compute rank-width and rank-decompositions*
- *sage\_conf: Configuration module for the SageMath library (distributable version)*
- *sage\_docbuild: Build system of the Sage documentation*
- *sage-setup: Build system of the SageMath library*
- *sagenb\_export: Convert legacy SageNB notebooks to Jupyter notebooks and other formats*
- *sagetex: Embed code, results of computations, and plots from Sage into LaTeX documents*
- *scipy: Scientific tools for Python*
- *send2trash: Send file to trash natively under Mac OS X, Windows and Linux*
- *setuptools: Build system for Python packages*
- *setuptools\_scm: Python build system extension to obtain package version from version control*
- *setuptools\_wheel: Build the setuptools package as a wheel*
- *singular: Computer algebra system for polynomial computations, algebraic geometry, singularity theory*
- *six: Python 2 and 3 compatibility utilities*
- *snowballstemmer: Stemmer algorithms for natural language processing in Python*
- *soupsieve: A modern CSS selector implementation for BeautifulSoup.*

- *sphinx*: Python documentation generator
- *sphinx\_basic\_ng*: A modern skeleton for Sphinx themes.
- *sphinx\_copybutton*: Add a copy button to each of your code cells.
- *sphinxcontrib\_applehelp*: Sphinx extension which outputs Apple help book
- *sphinxcontrib\_devhelp*: Sphinx extension which outputs Devhelp documents
- *sphinxcontrib\_htmlhelp*: Sphinx extension which outputs HTML help book
- *sphinxcontrib\_jsmath*: Sphinx extension which renders display math in HTML via JavaScript
- *sphinxcontrib\_qthelp*: Sphinx extension which outputs QtHelp documents
- *sphinxcontrib\_serializinghtml*: Sphinx extension which outputs serialized HTML files
- *sphinxcontrib\_websupport*: Sphinx API for Web apps
- *sqlite*: An SQL database engine
- *stack\_data*: Extract data from python stack frames and tracebacks for informative displays
- *suitesparse*: A suite of sparse matrix software
- *symmetrica*: Library for representation theory
- *sympow*: Computes special values of symmetric power elliptic curve L-functions
- *sympy*: Python library for symbolic mathematics
- *tachyon*: A ray tracing system
- *terminado*: Tornado websocket backend for the term.js Javascript terminal emulator library
- *threejs*: JavaScript library to display 3D graphics in the browser
- *tinycss2*: A tiny CSS parser
- *tomli*: A lil' TOML parser
- *tornado*: Python web framework and asynchronous networking library
- *tox*: tox is a generic virtualenv management and test command line tool
- *traitlets*: Traitlets Python configuration system
- *trove\_classifiers*: Canonical source for classifiers on PyPI (pypi.org).
- *typing\_extensions*: Backported and Experimental Type Hints for Python 3.5+
- *tzdata*: Provider of IANA time zone data
- *tzlocal*: Python timezone information for the local timezone
- *urllib3*: HTTP library with thread-safe connection pooling, file post, and more.
- *vcversioner*: Python build system extension to obtain package version from version control
- *virtualenv*: Virtual Python Environment builder
- *wcwidth*: Measures the displayed width of unicode strings in a terminal
- *webencodings*: Character encoding aliases for legacy web content
- *wheel*: A built-package format for Python
- *widgetsnbextension*: Jupyter interactive widgets for Jupyter Notebook
- *xz*: General-purpose data compression software

- *zeromq*: A modern networking library
- *zipp*: A *pathlib*-compatible *zipfile* object wrapper
- *zlib*: Data compression library

## OPTIONAL PACKAGES

For additional functionality, you can install some of the following optional packages.

- *4ti2*: Algebraic, geometric and combinatorial problems on linear spaces
- *\_bootstrap*: Represents system packages required for running the top-level bootstrap script
- *\_develop*: Represents system packages recommended for development
- *\_recommended*: Represents system packages recommended for additional functionality
- *\_sagemath*: Downstream package of Sage in distributions
- *admcycles*: Computation in the tautological ring of the moduli space of curves
- *antic*: Algebraic Number Theory In C
- *auditwheel\_or\_dlocate*: Repair wheels on Linux or macOS
- *benzene*: Generate fusenes and benzenoids with a given number of faces
- *biopython*: Tools for computational molecular biology
- *bliss*: Computing automorphism groups and canonical forms of graphs
- *buckygen*: Efficient generation of nonisomorphic fullerenes
- *cbc*: COIN-OR branch and cut solver for mixed-integer programs
- *ccache*: A compiler cache
- *coxeter3*: Library for Coxeter groups, Bruhat ordering, Kazhdan-Lusztig polynomials
- *cryptominisat*: A SAT solver
- *csdp*: Solver for semidefinite programs
- *cunningham\_tables*: List of the prime numbers occurring in the Cunningham table
- *cvxpy*: A domain-specific language for modeling convex optimization problems in Python.
- *cylp*: A Python interface for CLP, CBC, and CGL
- *d3js*: JavaScript library for manipulating documents based on data
- *database\_cremona\_ellcurve*: Database of elliptic curves
- *database\_cubic\_hecke*: Ivan Marin's representations of the cubic Hecke algebra
- *database\_jones\_numfield*: Table of number fields
- *database\_knotinfo*: Content of the KnotInfo and LinkInfo databases as lists of dictionaries
- *database\_kohel*: Database of modular and Hilbert polynomials

- *database\_mutation\_class*: Database of exceptional mutation classes of quivers
- *database\_odlyzko\_zeta*: Table of zeros of the Riemann zeta function
- *database\_stein\_watkins*: Database of elliptic curves (full version)
- *database\_stein\_watkins\_mini*: Database of elliptic curves (small version)
- *database\_symbolic\_data*: Database from the SymbolicData project
- *debugpy*: An implementation of the Debug Adapter Protocol for Python
- *dot2tex*: Create PGF/TikZ commands from Graphviz output
- *dsdp*: Semidefinite programming solver
- *e\_antic*: Real embedded number fields
- *ecos\_python*: Embedded Cone Solver (Python wrapper)
- *ffmpeg*: ffmpeg video converter
- *fricas*: A general purpose computer algebra system
- *frobby*: Computations on monomial ideals
- *gap\_jupyter*: Jupyter kernel for GAP
- *gap\_packages*: A collection of GAP packages
- *git*: Version control system
- *github\_cli*: Command-line interface for GitHub
- *gitpython*: GitPython is a python library used to interact with Git repositories
- *glucose*: A SAT solver
- *gp2c*: A compiler for translating GP routines to C
- *graphviz*: Graph visualization software
- *igraph*: A library for creating and manipulating graphs
- *ImageMagick*: A collection of tools and libraries for many image file formats
- *ipympl*: Matplotlib Jupyter Extension
- *isl*: Sets and relations of integer points bounded by affine constraints
- *jupymake*: A Python wrapper for the polymake shell
- *jupyterlab*: An extensible environment for interactive and reproducible computing
- *kenzo*: Construct topological spaces and compute homology groups
- *kissat*: SAT solver
- *latte\_int*: Count lattice points, compute volumes, and integrate over convex polytopes
- *libgraphviz*: Graph visualization software (callable library)
- *libjpeg*: JPEG image support
- *libnauty*: Find automorphism groups of graphs, generate non-isomorphic graphs (callable library)
- *libogg*: Library for the Ogg multimedia container format
- *libsemigroups*: Library for semigroups and monoids
- *libxml2*: XML parser and toolkit

- *lidia*: A library for computational number theory
- *llvm*: The LLVM Compiler Infrastructure, including the Clang C/C++/Objective-C compiler
- *lrslib*: Reverse search algorithm for vertex enumeration and convex hull problems
- *mathics*: A general-purpose computer algebra system
- *mathics\_scanner*: Character Tables and Tokenizer for Mathics and the Wolfram Language.
- *mcqd*: An exact algorithm for finding a maximum clique in an undirected graph
- *meataxe*: Library for computing with modular representations
- *p\_group\_cohomology*: Modular cohomology rings of finite groups
- *mpfrcx*: Arithmetic of univariate polynomials over arbitrary precision real or complex numbers
- *msolve*: Multivariate polynomial system solver
- *nibabel*: Access a multitude of neuroimaging data formats
- *nodeenv*: A tool to create isolated node.js environments
- *nodejs*: A JavaScript runtime built on Chrome's V8 JavaScript engine
- *normaliz*: Computations in affine monoids, vector configurations, lattice polytopes, and rational cones
- *notedown*: Create IPython notebooks from markdown
- *onetbb*: oneAPI Threading Building Blocks
- *ore\_algebra*: Ore algebra
- *osqp\_python*: The Operator Splitting QP Solver (Python wrapper)
- *p\_group\_cohomology*: Modular cohomology rings of finite groups
- *palettable*: Color palettes for Python
- *pandoc*: A document converter
- *pandoc\_attributes*: A parser and generator for pandoc block attributes
- *papilo*: Parallel presolve for integer and linear optimization
- *pari\_elldata*: PARI data package for elliptic curves
- *pari\_galpol*: PARI data package for polynomials defining Galois extensions of the rationals
- *pari\_jupyter*: A Jupyter kernel for PARI/GP
- *pari\_nftables*: PARI data package for number fields
- *pari\_seadata*: PARI data package needed by ellap for large primes (full version)
- *pdf2svg* - PDF to SVG convertor
- *perl\_cpan\_polytangle\_prereq*: Represents all Perl packages that are prerequisites for polymake
- *perl\_mongodb*: A prerequisite for polymake's PolyDB feature
- *perl\_term\_readline\_gnu*: Perl extension for the GNU Readline/History libraries
- *phitigra*: A graph editor for SageMath/Jupyter
- *pint*: Physical quantities module
- *plantri*: Generate non-isomorphic sphere-embedded graphs
- *polymake*: Computations with polyhedra, fans, simplicial complexes, matroids, graphs, tropical hypersurfaces

- *polytopes\_db\_4d*: Database of 4-dimensional reflexive polytopes
- *pybtex*: A BibTeX-compatible bibliography processor in Python
- *pycosat*: SAT solver picosat with Python bindings
- *pycryptosat*: Python module of cryptominisat
- *pygraphviz*: Python interface to Graphviz
- *pynormaliz*: Python bindings for the normaliz library
- *pypeteer*: Headless chrome/chromium automation library
- *pyscipopt*: Python interface and modeling environment for SCIP
- *pysingular*: A basic Python interface to Singular
- *pytest*: Simple powerful testing with Python
- *pytest\_mock*: Thin-wrapper around the mock package for easier use with pytest
- *pytest\_xdist*: pytest xdist plugin for distributed testing and loop-on-failing modes
- *python\_build*: A simple, correct PEP517 package builder
- *python\_igraph*: Python bindings for igraph
- *pyx*: Generate PostScript, PDF, and SVG files in Python
- *qdldl\_python*: QDLDL, a free LDL factorization routine (Python wrapper)
- *r*: A free software environment for statistical computing and graphics
- *retrolab*: JupyterLab Distribution with a retro look and feel
- *rst2ipynb*: Convert reStructuredText files to Jupyter notebooks
- *rubiks*: Programs for Rubik's cube
- *saclib*: Computations with real algebraic numbers
- *sage\_flatsurf*: computation with flat surfaces
- *sage\_numerical\_backends\_coin*: COIN-OR backend for Sage MixedIntegerLinearProgram
- *sage\_numerical\_backends\_cplex*: Cplex backend for Sage MixedIntegerLinearProgram
- *sage\_numerical\_backends\_gurobi*: Gurobi backend for Sage MixedIntegerLinearProgram
- *sage\_sws2rst*: Translate legacy Sage worksheet files (.sws) to reStructuredText (.rst) files
- *scip*: Mixed integer programming solver
- *scip\_sdp*: Mixed integer semidefinite programming plugin for SCIP
- *scs*: Splitting conic solver
- *singular\_jupyter*: Jupyter kernel for Singular
- *sirocco*: Compute topologically certified root continuation of bivariate polynomials
- *slabbe*: Sébastien Labb 's Research code
- *snappy*: Topology and geometry of 3-manifolds, with a focus on hyperbolic structures
- *soplex*: Linear optimization solver using the revised simplex method
- *sqlalchemy*: A database abstraction library

- *surface\_dynamics*: dynamics on surfaces (measured foliations, interval exchange transformation, Teichmüller flow, etc)
- *symengine*: A C++ symbolic manipulation library
- *tdlib*: Algorithms for computing tree decompositions
- *texlive*: A comprehensive TeX system
- *texttable*: Python module for creating simple ASCII tables
- *tides*: Integration of ODEs
- *topcom*: Compute triangulations of point configurations and oriented matroids

## FEATURES

### 3.1 Testing for features of the environment at runtime

A computation can require a certain package to be installed in the runtime environment. Abstractly such a package describes a *Feature* which can be tested for at runtime. It can be of various kinds, most prominently an *Executable* in the PATH, a *PythonModule*, or an additional package for some installed system such as a *GapPackage*.

AUTHORS:

- Julian Rüth (2016-04-07): Initial version
- Jeroen Demeyer (2018-02-12): Refactoring and clean up

EXAMPLES:

Some generic features are available for common cases. For example, to test for the existence of a binary, one can use an *Executable* feature:

```
sage: from sage.features import Executable
sage: Executable(name="sh", executable="sh").is_present()
FeatureTestResult('sh', True)
```

Here we test whether the grape GAP package is available:

```
sage: from sage.features.gap import GapPackage
sage: GapPackage("grape", spkg="gap_packages").is_present() # optional - gap_packages
FeatureTestResult('gap_package_grape', True)
```

Note that a *FeatureTestResult* acts like a bool in most contexts:

```
sage: if Executable(name="sh", executable="sh").is_present(): "present."
'present.'
```

When one wants to raise an error if the feature is not available, one can use the `require` method:

```
sage: Executable(name="sh", executable="sh").require()

sage: Executable(name="random", executable="randomOochoz6x", spkg="random", url="http://
...rand.om").require() # optional - sage_spkg
Traceback (most recent call last):
...
FeatureNotFoundError: random is not available.
Executable 'randomOochoz6x' not found on PATH.
```

(continues on next page)

(continued from previous page)

```
...try to run...sage -i random...
Further installation instructions might be available at http://random.
```

As can be seen above, features try to produce helpful error messages.

```
class sage.features.CythonFeature(*args, **kwds)
```

Bases: *Feature*

A *Feature* which describes the ability to compile and import a particular piece of Cython code.

To test the presence of `name`, the cython compiler is run on `test_code` and the resulting module is imported.

EXAMPLES:

```
sage: from sage.features import CythonFeature
sage: fabs_test_code = '''
....: cdef extern from "<math.h>":
....:     double fabs(double x)
....:
....: assert fabs(-1) == 1
....: '''
sage: fabs = CythonFeature("fabs", test_code=fabs_test_code, #_
    ↪needs sage.misc.cython
....:                         spkg="gcc", url="https://gnu.org",
....:                         type="standard")
sage: fabs.is_present() #_
    ↪needs sage.misc.cython
FeatureTestResult('fabs', True)
```

Test various failures:

```
sage: broken_code = '''this is not a valid Cython program'''
sage: broken = CythonFeature("broken", test_code=broken_code)
sage: broken.is_present()
FeatureTestResult('broken', False)
```

```
sage: broken_code = '''cdef extern from "no_such_header_file": pass'''
sage: broken = CythonFeature("broken", test_code=broken_code)
sage: broken.is_present()
FeatureTestResult('broken', False)
```

```
sage: broken_code = '''import no_such_python_module'''
sage: broken = CythonFeature("broken", test_code=broken_code)
sage: broken.is_present()
FeatureTestResult('broken', False)
```

```
sage: broken_code = '''raise AssertionError("sorry!")'''
sage: broken = CythonFeature("broken", test_code=broken_code)
sage: broken.is_present()
FeatureTestResult('broken', False)
```

```
class sage.features.Executable(*args, **kwds)
```

Bases: *FileFeature*

A feature describing an executable in the PATH.

In an installation of Sage with SAGE\_LOCAL different from SAGE\_VENV, the executable is searched first in SAGE\_VENV/bin, then in SAGE\_LOCAL/bin, then in PATH.

**Note:** Overwrite `is_functional()` if you also want to check whether the executable shows proper behaviour.

Calls to `is_present()` are cached. You might want to cache the `Executable` object to prevent unnecessary calls to the executable.

EXAMPLES:

```
sage: from sage.features import Executable
sage: Executable(name="sh", executable="sh").is_present()
FeatureTestResult('sh', True)
sage: Executable(name="does-not-exist", executable="does-not-exist-xxxxxyyy").is_
    ↪present()
FeatureTestResult('does-not-exist', False)
```

### `absolute_filename()`

The absolute path of the executable as a string.

EXAMPLES:

```
sage: from sage.features import Executable
sage: Executable(name="sh", executable="sh").absolute_filename()
'...bin/sh'
```

A `FeatureNotPresentError` is raised if the file cannot be found:

```
sage: Executable(name="does-not-exist", executable="does-not-exist-xxxxxyyy").
    ↪absolute_path()
Traceback (most recent call last):
...
sage.features.FeatureNotPresentError: does-not-exist is not available.
Executable 'does-not-exist-xxxxxyyy' not found on PATH.
```

### `is_functional()`

Return whether an executable in the path is functional.

This method is used internally and can be overridden in subclasses in order to implement a feature test. It should not be called directly. Use `Feature.is_present()` instead.

EXAMPLES:

The function returns True unless explicitly overwritten:

```
sage: from sage.features import Executable
sage: Executable(name="sh", executable="sh").is_functional()
FeatureTestResult('sh', True)
```

## `class sage.features.Feature(*args, **kwds)`

Bases: `TrivialUniqueRepresentation`

A feature of the runtime environment

INPUT:

- `name` – (string) name of the feature; this should be suitable as an optional tag for the Sage doctester, i.e., lowercase alphanumeric with underscores (`_`) allowed; features that correspond to Python modules/packages may use periods (`.`)
- `spkg` – (string) name of the SPKG providing the feature
- `description` – (string) optional; plain English description of the feature
- `url` – a URL for the upstream package providing the feature
- `type` – (string) one of '`standard`', '`optional`' (default), '`experimental`'

Overwrite `_is_present()` to add feature checks.

EXAMPLES:

```
sage: from sage.features.gap import GapPackage
sage: GapPackage("grape", spkg="gap_packages") # indirect doctest
Feature('gap_package_grape')
```

For efficiency, features are unique:

```
sage: GapPackage("grape") is GapPackage("grape")
True
```

### hide()

Hide this feature. For example this is used when the doctest option `--hide` is set. Setting an installed feature as hidden pretends that it is not available. To revert this use `unhide()`.

EXAMPLES:

Benzene is an optional SPKG. The following test fails if it is hidden or not installed. Thus, in the second invocation the optional tag is needed:

```
sage: from sage.features.graph_generators import Benzene
sage: Benzene().hide()
sage: len(list(graphs.fusenes(2)))
# needs sage.graphs
Traceback (most recent call last):
...
FeatureNotPresentError: benzene is not available.
Feature `benzene` is hidden.
Use method `unhide` to make it available again.

sage: Benzene().unhide()
sage: len(list(graphs.fusenes(2))) # optional - benzene, needs sage.graphs
1
```

### is\_optional()

Return whether this feature corresponds to an optional SPKG.

EXAMPLES:

```
sage: from sage.features.databases import DatabaseCremona,
... DatabaseConwayPolynomials
sage: DatabaseCremona().is_optional()
True
sage: DatabaseConwayPolynomials().is_optional()
False
```

**is\_present()**

Return whether the feature is present.

**OUTPUT:**

A *FeatureTestResult* which can be used as a boolean and contains additional information about the feature test.

**EXAMPLES:**

```
sage: from sage.features.gap import GapPackage
sage: GapPackage("grape", spkg="gap_packages").is_present() # optional - gap_
    ↪packages
FeatureTestResult('gap_package_grape', True)
sage: GapPackage("NOT_A_PACKAGE", spkg="gap_packages").is_present()
FeatureTestResult('gap_package_NOT_A_PACKAGE', False)
```

The result is cached:

```
sage: from sage.features import Feature
sage: class TestFeature(Feature):
....:     def _is_present(self):
....:         print("checking presence")
....:         return True
sage: TestFeature("test").is_present()
checking presence
FeatureTestResult('test', True)
sage: TestFeature("test").is_present()
FeatureTestResult('test', True)
sage: TestFeature("other").is_present()
checking presence
FeatureTestResult('other', True)
sage: TestFeature("other").is_present()
FeatureTestResult('other', True)
```

**is\_standard()**

Return whether this feature corresponds to a standard SPKG.

**EXAMPLES:**

```
sage: from sage.features.databases import DatabaseCremona,_
    ↪DatabaseConwayPolynomials
sage: DatabaseCremona().is_standard()
False
sage: DatabaseConwayPolynomials().is_standard()
True
```

**joined\_features()**

Return a list of features that *self* is the join of.

**OUTPUT:**

A (possibly empty) list of instances of *Feature*.

**EXAMPLES:**

```
sage: from sage.features.graphviz import Graphviz
sage: Graphviz().joined_features()
[Feature('dot'), Feature('neato'), Feature('twopi')]
sage: from sage.features.sagemath import sage_rings_function_field
sage: sage_rings_function_field().joined_features()
[Feature('sage.rings.function_field.function_field_mod'),
Feature('sage.libs.singular'),
Feature('sage.libs.singular.singular'),
Feature('sage.interfaces.singular')]
sage: from sage.features.interfaces import Mathematica
sage: Mathematica().joined_features()
[]
```

### `require()`

Raise a `FeatureNotPresentError` if the feature is not present.

#### EXAMPLES:

```
sage: from sage.features.gap import GapPackage
sage: GapPackage("ve1EeThu").require() #_
˓needs sage.libs.gap
Traceback (most recent call last):
...
FeatureNotPresentError: gap_package_ve1EeThu is not available.
`TestPackageAvailability("ve1EeThu")` evaluated to `fail` in GAP.
```

### `resolution()`

Return a suggestion on how to make `is_present()` pass if it did not pass.

#### OUTPUT:

A string.

#### EXAMPLES:

```
sage: from sage.features import Executable
sage: Executable(name="CSDP", spkg="csdp", executable="theta", url="https://
˓github.com/dimpase/csdp").resolution() # optional - sage_spkg
'...To install CSDP...you can try to run...sage -i csdp...Further installation
˓instructions might be available at https://github.com/dimpase/csdp.'
```

### `unhide()`

Revert what `hide()` does.

#### EXAMPLES:

Polycyclic is a standard GAP package since 4.10 (see [github issue #26856](#)). The following test just fails if it is hidden. Thus, in the second invocation no optional tag is needed:

```
sage: from sage.features.gap import GapPackage
sage: Polycyclic = GapPackage("polycyclic", spkg="gap_packages")
sage: Polycyclic.hide()
sage: libgap(AbelianGroup(3, [0,3,4], names="abc")) #_
˓needs sage.libs.gap
Traceback (most recent call last):
```

(continues on next page)

(continued from previous page)

```

...
FeatureNotPresentError: gap_package_polycyclic is not available.
Feature `gap_package_polycyclic` is hidden.
Use method `unhide` to make it available again.

sage: Polycyclic.unhide()
sage: libgap(AbelianGroup(3, [0,3,4], names="abc"))
# needs sage.libs.gap
Pcp-group with orders [ 0, 3, 4 ]

```

**exception sage.features.FeatureNotPresentError(feature, reason=None, resolution=None)**

Bases: `RuntimeError`

A missing feature error.

EXAMPLES:

```

sage: from sage.features import Feature, FeatureTestResult
sage: class Missing(Feature):
....:     def _is_present(self):
....:         return False

sage: Missing(name="missing").require()
Traceback (most recent call last):
...
FeatureNotPresentError: missing is not available.

```

#### property resolution

Initialize self. See `help(type(self))` for accurate signature.

**class sage.features.FeatureTestResult(feature, is\_present, reason=None, resolution=None)**

Bases: `object`

The result of a `Feature.is_present()` call.

Behaves like a boolean with some extra data which may explain why a feature is not present and how this may be resolved.

EXAMPLES:

```

sage: from sage.features.gap import GapPackage
sage: presence = GapPackage("NOT_A_PACKAGE").is_present(); presence # indirect doctest
FeatureTestResult('gap_package_NOT_A_PACKAGE', False)
sage: bool(presence)
False

```

Explanatory messages might be available as `reason` and `resolution`:

```

sage: presence.reason
# needs sage.libs.gap
``TestPackageAvailability("NOT_A_PACKAGE")`` evaluated to ``fail`` in GAP.
sage: bool(presence.resolution)
False

```

If a feature is not present, `resolution` defaults to `feature.resolution()` if this is defined. If you do not want to use this default you need explicitly set `resolution` to a string:

```
sage: from sage.features import FeatureTestResult
sage: package = GapPackage("NOT_A_PACKAGE", spkg="no_package")
sage: str(FeatureTestResult(package, True).resolution) # optional - sage_spkg
'...To install gap_package_NOT_A_PACKAGE...you can try to run...sage -i no_package..
˓→'
sage: str(FeatureTestResult(package, False).resolution) # optional - sage_spkg
'...To install gap_package_NOT_A_PACKAGE...you can try to run...sage -i no_package..
˓→'
sage: FeatureTestResult(package, False, resolution="rtm").resolution
'rtm'
```

### property `resolution`

Initialize self. See `help(type(self))` for accurate signature.

`class sage.features.FileFeature(*args, **kwds)`

Bases: `Feature`

Base class for features that describe a file or directory in the file system.

A subclass should implement a method `absolute_filename()`.

EXAMPLES:

Two direct concrete subclasses of `FileFeature` are defined:

```
sage: from sage.features import StaticFile, Executable, FileFeature
sage: issubclass(StaticFile, FileFeature)
True
sage: issubclass(Executable, FileFeature)
True
```

To work with the file described by the feature, use the method `absolute_filename()`. A `FeatureNotPresentError` is raised if the file cannot be found:

```
sage: Executable(name="does-not-exist", executable="does-not-exist-xxxxxyyyxyy").
˓→absolute_path()
Traceback (most recent call last):
...
sage.features.FeatureNotPresentError: does-not-exist is not available.
Executable 'does-not-exist-xxxxxyyyxyy' not found on PATH.
```

A `FileFeature` also provides the `is_present()` method to test for the presence of the file at run time. This is inherited from the base class `Feature`:

```
sage: Executable(name="sh", executable="sh").is_present()
FeatureTestResult('sh', True)
```

### `absolute_filename()`

The absolute path of the file as a string.

Concrete subclasses must override this abstract method.

### `absolute_path()`

Deprecated alias for `absolute_filename()`.

Deprecated to make way for a method of this name returning a Path.

EXAMPLES:

```
sage: from sage.features import Executable
sage: Executable(name="sh", executable="sh").absolute_path()
doctest:warning...
DeprecationWarning: method absolute_path has been replaced by absolute_filename
See https://github.com/sagemath/sage/issues/31292 for details.
'...bin/sh'
```

`class sage.features.PythonModule(*args, **kwds)`

Bases: *Feature*

A *Feature* which describes whether a python module can be imported.

EXAMPLES:

Not all builds of python include the `ssl` module, so you could check whether it is available:

```
sage: from sage.features import PythonModule
sage: PythonModule("ssl").require() # not tested - output depends on the python
→ build
```

`class sage.features.StaticFile(*args, **kwds)`

Bases: *FileFeature*

A *Feature* which describes the presence of a certain file such as a database.

EXAMPLES:

```
sage: from sage.features import StaticFile
sage: StaticFile(name="no_such_file", filename="KaT1aihu", search_path=("/",), spkg=
→ "some_spkg", url="http://rand.om").require() # optional - sage_spkg
Traceback (most recent call last):
...
FeatureNotFoundError: no_such_file is not available.
'KaT1aihu' not found in any of ['/']...
To install no_such_file...you can try to run...sage -i some_spkg...
Further installation instructions might be available at http://rand.om.
```

`absolute_filename()`

The absolute path of the file as a string.

EXAMPLES:

```
sage: from sage.features import StaticFile
sage: from sage.misc.temporary_file import tmp_dir
sage: dir_with_file = tmp_dir()
sage: file_path = os.path.join(dir_with_file, "file.txt")
sage: open(file_path, 'a').close() # make sure the file exists
sage: search_path = ('/foo/bar', dir_with_file) # file is somewhere in the
→ search path
sage: feature = StaticFile(name="file", filename="file.txt", search_path=search_
→ path)
sage: feature.absolute_filename() == file_path
True
```

A `FeatureNotPresentError` is raised if the file cannot be found:

```
sage: from sage.features import StaticFile
sage: StaticFile(name="no_such_file", filename="KaT1aihu", \
    search_path=(), spkg="some_spkg", \
    url="http://rand.om").absolute_filename() # optional - sage_\
    spkg
Traceback (most recent call last):
...
FeatureNotPresentError: no_such_file is not available.
'KaT1aihu' not found in any of []
To install no_such_file...you can try to run...sage -i some_spkg...
Further installation instructions might be available at http://rand.om.
```

### `class sage.features.TrivialClasscallMetaClass`

Bases: `type`

A trivial version of `sage.misc.classcall_metaclass.ClasscallMetaclass` without Cython dependencies.

### `class sage.features.TrivialUniqueRepresentation(*args, **kwds)`

Bases: `object`

A trivial version of `UniqueRepresentation` without Cython dependencies.

### `sage.features.package_systems()`

Return a list of `PackageSystem` objects representing the available package systems.

The list is ordered by decreasing preference.

EXAMPLES:

```
sage: from sage.features import package_systems
sage: package_systems() # random
[Feature('homebrew'), Feature('sage_spkg'), Feature('pip')]
```

## 3.2 Join features

### `class sage.features.join_feature.JoinFeature(*args, **kwds)`

Bases: `Feature`

Join of several `Feature` instances.

This creates a new feature as the union of the given features. Typically these are executables of an SPKG. For an example, see `Rubiks`.

Furthermore, this can be the union of a single feature. This is used to map the given feature to a more convenient name to be used in optional tags of doctests. Thus you can equip a feature such as a `PythonModule` with a tag name that differs from the systematic tag name. As an example for this use case, see `Meataxe`.

EXAMPLES:

```
sage: from sage.features import Executable
sage: from sage.features.join_feature import JoinFeature
sage: F = JoinFeature("shell-boolean",
```

(continues on next page)

(continued from previous page)

```

....:
        (Executable('shell-true', 'true'),
....:
        Executable('shell-false', 'false')))

sage: F.is_present()
FeatureTestResult('shell-boolean', True)
sage: F = JoinFeature("asdfghjkl",
....:
        (Executable('shell-true', 'true'),
....:
        Executable('xxxxxx', 'xxxxxx-does-not-exist')))

sage: F.is_present()
FeatureTestResult('xxxxxx', False)

```

**hide()**

Hide this feature and all its joined features.

EXAMPLES:

```

sage: from sage.features.sagemath import sage__groups
sage: f = sage__groups()
sage: f.hide()
sage: f._features[0].is_present()
FeatureTestResult('sage.groups.perm_gps.permgroup', False)

sage: f.require()
Traceback (most recent call last):
...
FeatureNotFoundError: sage.groups is not available.
Feature `sage.groups` is hidden.
Use method `unhide` to make it available again.

```

**is\_functional()**

Test whether the join feature is functional.

This method is deprecated. Use `Feature.is_present()` instead.

EXAMPLES:

```

sage: from sage.features.latte import Latte
sage: Latte().is_functional() # optional - latte_int
doctest:warning...
DeprecationWarning: method JoinFeature.is_functional; use is_present instead
See https://github.com/sagemath/sage/issues/33114 for details.
FeatureTestResult('latte_int', True)

```

**unhide()**

Revert what `hide()` does.

EXAMPLES:

```

sage: from sage.features.sagemath import sage__groups
sage: f = sage__groups()
sage: f.hide()
sage: f.is_present()
FeatureTestResult('sage.groups', False)
sage: f._features[0].is_present()
FeatureTestResult('sage.groups.perm_gps.permgroup', False)

```

(continues on next page)

(continued from previous page)

```
sage: f.unhide()
sage: f.is_present()      # optional sage.groups
FeatureTestResult('sage.groups', True)
sage: f._features[0].is_present() # optional sage.groups
FeatureTestResult('sage.groups.perm_gps.permgroup', True)
```

### 3.3 Enumeration of all defined features

`sage.features.all.all_features()`

Return an iterable of all features.

EXAMPLES:

```
sage: from sage.features.all import all_features
sage: sorted(all_features(), key=lambda f: f.name) # random
[...Feature('sage.combinat')...]
```

`sage.features.all.module_feature(module_name)`

Find a top-level Feature that provides the Python module of the given `module_name`.

Only features known to `all_features()` are considered.

INPUT:

- `module_name` – string

OUTPUT: a Feature or None.

EXAMPLES:

```
sage: from sage.features.all import module_feature
sage: module_feature('sage.combinat.tableau') #_
  ↵needs sage.combinat
Feature('sage.combinat')
sage: module_feature('sage.combinat.posets.poset') #_
  ↵needs sage.graphs
Feature('sage.graphs')
sage: module_feature('sage.schemes.toric.variety') #_
  ↵needs sage.geometry.polyhedron
Feature('sage.geometry.polyhedron')
sage: module_feature('scipy') #_
  ↵needs scipy
Feature('scipy')
sage: print(module_feature('sage.structure.element'))
None
sage: print(module_feature('sage.does_not_exist'))
None
```

`sage.features.all.name_feature(name, toplevel=None)`

Find a top-level Feature that provides the top-level name.

Only features known to `all_features()` are considered.

INPUT:

- name – string
- toplevel – a module or other namespace

OUTPUT: a Feature or None.

EXAMPLES:

```
sage: from sage.features.all import name_feature
sage: name_feature('QuadraticField')                                     #_
˓needs sage.rings.number_field
Feature('sage.rings.number_field')
sage: name_feature('line')                                              #_
˓needs sage.plot
Feature('sage.plot')
sage: print(name_feature('ZZ'))
None
sage: print(name_feature('does_not_exist'))
None
```

## 3.4 Features for testing the presence of Python modules in the Sage library

All of these features are present in a monolithic installation of the Sage library, such as the one made by the SageMath distribution.

The features are defined for the purpose of separately testing modularized distributions such as *sagemath-categories* and *sagemath-repl*.

Often, doctests in a module of the Sage library illustrate the interplay with a range of different objects; this is a form of integration testing. These objects may come from modules shipped in other distributions. For example, `sage.structure.element` (shipped by *sagemath-objects*, one of the most fundamental distributions) contains the doctest:

```
sage: G = SymmetricGroup(4)                                              #_
˓needs sage.groups
sage: g = G([2, 3, 4, 1])                                                 #_
˓needs sage.groups
sage: g.powers(4)                                                       #_
˓needs sage.groups
[(), (1,2,3,4), (1,3)(2,4), (1,4,3,2)]
```

This test cannot pass when the distribution *sagemath-objects* is tested separately (in a virtual environment): In this situation, `SymmetricGroup` is not defined anywhere (and thus not present in the top-level namespace). Hence, we conditionalize this doctest on the presence of the feature `sage.groups`.

`sage.features.sagemath.all_features()`

Return features corresponding to parts of the Sage library.

These features are named after Python packages/modules (e.g., `sage.symbolic`), not distribution packages (**sagemath-symbols**).

This design is motivated by a separation of concerns: The author of a module that depends on some functionality provided by a Python module usually already knows the name of the Python module, so we do not want to force the author to also know about the distribution package that provides the Python module.

Instead, we associate distribution packages to Python modules in `sage.features.sagemath` via the `spkg` parameter of `Feature`.

EXAMPLES:

```
sage: from sage.features.sagemath import all_features
sage: list(all_features())
[...Feature('sage.combinat'), ...]
```

```
class sage.features.sagemath.sage__combinat(*args, **kwds)
```

Bases: `JoinFeature`

A `Feature` describing the presence of `sage.combinat`.

EXAMPLES:

Python modules that provide elementary combinatorial objects such as `sage.combinat.subset`, `sage.combinat.composition`, `sage.combinat.permutation` are always available; there is no need for an `# optional/needs` tag:

```
sage: Permutation([1,2,3]).is_even()
True
sage: Permutation([6,1,4,5,2,3]).bruhat_inversions()
[[0, 1], [0, 2], [0, 3], [2, 4], [2, 5], [3, 4], [3, 5]]
```

Use `# needs sage.combinat` for doctests that use any other Python modules from `sage.combinat`, for example `sage.combinat.tableau_tuple`:

```
sage: TableauTuple([[[[7,8,9]],[],[[1,2,3],[4,5],[6]]]].shape() #_
˓needs sage.combinat
([3], [], [3, 2, 1])
```

Doctests that use Python modules from `sage.combinat` that involve trees, graphs, hypergraphs, posets, quivers, combinatorial designs, finite state machines etc. should be marked `# needs sage.combinat sage.graphs`:

```
sage: L = Poset({0: [1], 1: [2], 2:[3], 3:[4]}) #_
˓needs sage.combinat sage.graphs
sage: L.is_chain() #_
˓needs sage.combinat sage.graphs
True
```

Doctests that use combinatorial modules/algebras, or root systems should use the tag `# needs sage.combinat sage.modules`:

```
sage: # needs sage.combinat sage.modules
sage: A = SchurAlgebra(QQ, 2, 3)
sage: a = A.an_element(); a
2*S((1, 1, 1), (1, 1, 1)) + 2*S((1, 1, 1), (1, 1, 2))
+ 3*S((1, 1, 1), (1, 2, 2))
sage: L = RootSystem(['A',3,1]).root_lattice()
sage: PIR = L.positive_imaginary_roots(); PIR
Positive imaginary roots of type ['A', 3, 1]
```

Doctests that use lattices, semilattices, or Dynkin diagrams should use the tag `# needs sage.combinat sage.graphs sage.modules`:

```
sage: L = LatticePoset({0: [1,2], 1: [3], 2: [3,4], 3: [5], 4: [5]})          #
˓needs sage.combinat sage.graphs sage.modules
sage: L.meet_irreducibles()           #
˓needs sage.combinat sage.graphs sage.modules
[1, 3, 4]
```

**class sage.features.sagemath.sage\_\_geometry\_\_polyhedron(\*args, \*\*kwds)**

Bases: *JoinFeature*

A *Feature* describing the presence of `sage.geometry.polyhedron`.

EXAMPLES:

Doctests that use polyhedra, cones, geometric complexes, triangulations, etc. should use the tag `# needs sage.geometry.polyhedron`:

```
sage: co = polytopes.truncated_tetrahedron()          #
˓needs sage.geometry.polyhedron
sage: co.volume()           #
˓needs sage.geometry.polyhedron
184/3
```

Some constructions of polyhedra require additional tags:

```
sage: # needs sage.combinat sage.geometry.polyhedron sage.rings.number_field
sage: perm_a3_reg_nf = polytopes.generalized_permutahedron(
....:     ['A', 3], regular=True, backend='number_field'); perm_a3_reg_nf
A 3-dimensional polyhedron in AA^3 defined as the convex hull of 24 vertices
```

**class sage.features.sagemath.sage\_\_graphs(\*args, \*\*kwds)**

Bases: *JoinFeature*

A *Feature* describing the presence of `sage.graphs`.

EXAMPLES:

Doctests that use anything from `sage.graphs` (`Graph`, `DiGraph`, ...) should be marked `# needs sage.graphs`. The same applies to any doctest that uses a `Poset`, cluster algebra quiver, finite state machines, abelian sandpiles, or Dynkin diagrams:

```
sage: g = graphs.PetersenGraph()          #
˓needs sage.graphs
sage: r, s = g.is_weakly_chordal(certIFICATE=True); r           #
˓needs sage.graphs
False
```

Also any use of tree classes defined in `sage.combinat` (`BinaryTree`, `RootedTree`, ...) in doctests should be marked the same.

By way of generalization, any use of `SimplicialComplex` or other abstract complexes from `sage.topology`, hypergraphs, and combinatorial designs, should be marked `# needs sage.graphs` as well:

```
sage: X = SimplicialComplex([[0,1,2], [1,2,3]])          #
˓needs sage.graphs
sage: X.link(Simplex([0]))           #
˓needs sage.graphs
```

(continues on next page)

(continued from previous page)

```
Simplicial complex with vertex set (1, 2) and facets {(1, 2)}
```

```
sage: IncidenceStructure([[1,2,3],[1,4]]).degrees(2) #_
˓needs sage.graphs
{(1, 2): 1, (1, 3): 1, (1, 4): 1, (2, 3): 1, (2, 4): 0, (3, 4): 0}
```

On the other hand, matroids are not implemented as posets in Sage but are instead closely tied to linear algebra over fields; hence use `# needs sage.modules` instead:

```
sage: # needs sage.modules
sage: M = Matroid(Matrix(QQ, [[1, 0, 0, 0, 1, 1, 1],
....:                      [0, 1, 0, 1, 0, 1, 1],
....:                      [0, 0, 1, 1, 1, 0, 1]]))
sage: N = (M / [2]).delete([3, 4])
sage: sorted(N.groundset())
[0, 1, 5, 6]
```

However, many constructions (and some methods) of matroids do involve graphs:

```
sage: # needs sage.modules
sage: W = matroids.Wheel(3)      # despite the name, not created via graphs
˓needs sage.groups
sage: W.is_isomorphic(N)        # goes through a graph isomorphism test #_
˓needs sage.groups
False
sage: K4 = matroids.CompleteGraphic(4)    # this one is created via graphs
˓needs sage.groups
sage: K4.is_isomorphic(W)           #_
˓needs sage.groups
True
```

`class sage.features.sagemath.sage__groups(*args, **kwds)`

Bases: `JoinFeature`

A `Feature` describing the presence of `sage.groups`.

EXAMPLES:

Permutations and sets of permutations are always available, but permutation groups are implemented in Sage using the `GAP` system and require the tag `# needs sage.groups`:

```
sage: p = Permutation([2,1,4,3])
sage: p.to_permutation_group_element() #_
˓needs sage.groups
(1,2)(3,4)
```

`class sage.features.sagemath.sage__libs__ecl(*args, **kwds)`

Bases: `PythonModule`

A `Feature` describing the presence of `sage.libs.ecl`.

EXAMPLES:

```
sage: from sage.features.sagemath import sage__libs__ecl
sage: sage__libs__ecl().is_present() # optional - sage.libs.
```

(continues on next page)

(continued from previous page)

[←ecl](#)

FeatureTestResult('sage.libs.ecl', True)

**class sage.features.sagemath.sage\_\_libs\_\_flint(\*args, \*\*kwds)**Bases: *JoinFeature*

A *sage.features.Feature* describing the presence of `sage.libs.flint` and other modules depending on FLINT and arb.

In addition to the modularization purposes that this tag serves, it also provides attribution to the upstream project.

**class sage.features.sagemath.sage\_\_libs\_\_gap(\*args, \*\*kwds)**Bases: *JoinFeature*

A *sage.features.Feature* describing the presence of `sage.libs.gap` (the library interface to *GAP*) and `sage.interfaces.gap` (the pexpect interface to GAP). By design, we do not distinguish between these two, in order to facilitate the conversion of code from the pexpect interface to the library interface.

**See also:**[Features for GAP packages](#)**class sage.features.sagemath.sage\_\_libs\_\_linbox(\*args, \*\*kwds)**Bases: *JoinFeature*

A *sage.features.Feature* describing the presence of `sage.libs.linbox` and other modules depending on Givaro, FFLAS-FFPACK, LinBox.

In addition to the modularization purposes that this tag serves, it also provides attribution to the upstream project.

**class sage.features.sagemath.sage\_\_libs\_\_m4ri(\*args, \*\*kwds)**Bases: *JoinFeature*

A *sage.features.Feature* describing the presence of Cython modules depending on the M4RI and/or M4RIe libraries.

In addition to the modularization purposes that this tag serves, it also provides attribution to the upstream project.

**class sage.features.sagemath.sage\_\_libs\_\_ntl(\*args, \*\*kwds)**Bases: *JoinFeature*

A *sage.features.Feature* describing the presence of `sage.libs.ntl` and other modules depending on NTL.

In addition to the modularization purposes that this tag serves, it also provides attribution to the upstream project.

**class sage.features.sagemath.sage\_\_libs\_\_pari(\*args, \*\*kwds)**Bases: *JoinFeature*

A *Feature* describing the presence of `sage.libs.pari`.

SageMath uses the *PARI* library (via `cypari2`) for numerous purposes. Doctests that involves such features should be marked `# needs sage.libs.pari`.

In addition to the modularization purposes that this tag serves, it also provides attribution to the upstream project.

**EXAMPLES:**

```
sage: R.<a> = QQ[]
sage: S.<x> = R[]
sage: f = x^2 + a; g = x^3 + a
sage: r = f.resultant(g); r
# needs sage.libs.pari
a^3 + a^2
```

**class sage.features.sagemath.sage\_\_libs\_\_singular(\*args, \*\*kwds)**

Bases: *JoinFeature*

A [sage.features.Feature](#) describing the presence of `sage.libs.singular` (the library interface to Singular) and `sage.interfaces.singular` (the pexpect interface to Singular). By design, we do not distinguish between these two, in order to facilitate the conversion of code from the pexpect interface to the library interface.

**See also:**

[Feature singular](#)

**class sage.features.sagemath.sage\_\_modular(\*args, \*\*kwds)**

Bases: *JoinFeature*

A [Feature](#) describing the presence of `sage.modular`.

**class sage.features.sagemath.sage\_\_modules(\*args, \*\*kwds)**

Bases: *JoinFeature*

A [Feature](#) describing the presence of `sage.modules`.

**EXAMPLES:**

All uses of implementations of vector spaces / free modules in SageMath, whether `sage.modules.free_module.FreeModule`, `sage.combinat.free_module.CombinatorialFreeModule`, `sage.tensor.modules.finite_rank_free_module.FiniteRankFreeModule`, or additive abelian groups, should be marked `# needs sage.modules`.

The same holds for matrices, tensors, algebras, quadratic forms, point lattices, root systems, matrix/affine/Weyl/Coxeter groups, matroids, and ring derivations.

Likewise, all uses of `sage.coding`, `sage.crypto`, and `sage.homology` in doctests should be marked `# needs sage.modules`.

**class sage.features.sagemath.sage\_\_numerical\_mip(\*args, \*\*kwds)**

Bases: *PythonModule*

A [Feature](#) describing the presence of `sage.numerical.mip`.

**class sage.features.sagemath.sage\_\_plot(\*args, \*\*kwds)**

Bases: *JoinFeature*

A [Feature](#) describing the presence of `sage.plot`.

**class sage.features.sagemath.sage\_\_rings\_\_complex\_double(\*args, \*\*kwds)**

Bases: *PythonModule*

A [Feature](#) describing the presence of `sage.rings.complex_double`.

**class sage.features.sagemath.sage\_\_rings\_\_finite\_rings(\*args, \*\*kwds)**

Bases: *JoinFeature*

A [Feature](#) describing the presence of `sage.rings.finite_rings`; specifically, the element implementations using the `PARI` library.

```
class sage.features.sagemath.sage__rings__function_field(*args, **kwds)
```

Bases: *JoinFeature*

A *Feature* describing the presence of `sage.rings.function_field`.

EXAMPLES:

Rational function fields are always available:

```
sage: K.<x> = FunctionField(QQ)
sage: K.maximal_order()
Maximal order of Rational function field in x over Rational Field
```

Use the tag `# needs sage.rings.function_field` whenever extensions of function fields (by adjoining a root of a univariate polynomial) come into play:

```
sage: R.<y> = K[]
sage: L.<y> = K.extension(y^5 - (x^3 + 2*x*y + 1/x)); L
# needs sage.rings.function_field
Function field in y defined by y^5 - 2*x*y + (-x^4 - 1)/x
```

Such extensions of function fields are implemented using Gröbner bases of polynomial rings; Sage makes essential use of the *Singular* system for this. (It is not necessary to use the tag `# needs sage.libs.singular`; it is implied by `# needs sage.rings.function_field`.)

```
class sage.features.sagemath.sage__rings__number_field(*args, **kwds)
```

Bases: *JoinFeature*

A *Feature* describing the presence of `sage.rings.number_field`.

Number fields are implemented in Sage using a complicated mixture of various libraries, including *arb*, *FLINT*, *GAP*, *MPFI*, *NTL*, and *PARI*.

EXAMPLES:

Rational numbers are, of course, always available:

```
sage: QQ in NumberFields()
True
```

Doctests that construct algebraic number fields should be marked `# needs sage.rings.number_field`:

```
sage: # needs sage.rings.number_field
sage: K.<cuberoot2> = NumberField(x^3 - 2)
sage: L.<cuberoot3> = K.extension(x^3 - 3)
sage: S.<sqrt2> = L.extension(x^2 - 2); S
Number Field in sqrt2 with defining polynomial x^2 - 2 over its base field

sage: # needs sage.rings.number_field
sage: K.<zeta> = CyclotomicField(15)
sage: CC(zeta)
0.913545457642601 + 0.406736643075800*I
```

Doctests that make use of the algebraic field `QQbar` or the algebraic real field `AA` should be marked likewise:

```
sage: # needs sage.rings.number_field
sage: AA(-1)^(1/3)
-1
```

(continues on next page)

(continued from previous page)

```
sage: QQbar(-1)^(1/3)
0.500000000000000? + 0.866025403784439?*I
```

Use of the universal cyclotomic field should be marked # needs sage.libs.gap sage.rings.number\_field.

```
sage: # needs sage.libs.gap sage.rings.number_field sage: UCF = UniversalCyclotomicField(); UCF
Universal Cyclotomic Field sage: E = UCF.gen sage: f = E(2) + E(3); f^2*E(3) + E(3)^2 sage:
f.galois_conjugates() [2*E(3) + E(3)^2, E(3) + 2*E(3)^2]
```

**class sage.features.sagemath.sage\_\_rings\_\_padics(\*args, \*\*kwds)**

Bases: *JoinFeature*

A *Feature* describing the presence of sage.rings.padics.

**class sage.features.sagemath.sage\_\_rings\_\_polynomial\_\_pbori(\*args, \*\*kwds)**

Bases: *JoinFeature*

A *sage.features.Feature* describing the presence of sage.rings.polynomial.pbori.

**class sage.features.sagemath.sage\_\_rings\_\_real\_double(\*args, \*\*kwds)**

Bases: *PythonModule*

A *Feature* describing the presence of sage.rings.real\_double.

EXAMPLES:

The Real Double Field is basically always available, and no # optional/needs tag is needed:

```
sage: RDF.characteristic()
0
```

The feature exists for use in doctests of Python modules that are shipped by the most fundamental distributions.

**class sage.features.sagemath.sage\_\_rings\_\_real\_mpfr(\*args, \*\*kwds)**

Bases: *JoinFeature*

A *Feature* describing the presence of sage.rings.real\_mpfr.

**class sage.features.sagemath.sage\_\_sat(\*args, \*\*kwds)**

Bases: *JoinFeature*

A *Feature* describing the presence of sage.sat.

**class sage.features.sagemath.sage\_\_schemes(\*args, \*\*kwds)**

Bases: *JoinFeature*

A *Feature* describing the presence of sage.schemes.

**class sage.features.sagemath.sage\_\_symbolic(\*args, \*\*kwds)**

Bases: *JoinFeature*

A *Feature* describing the presence of sage.symbolic.

EXAMPLES:

The symbolics subsystem of Sage will be provided by the distribution sagemath-symbolics, in preparation at [github issue #35095](#). If it is not installed, Sage will be able to provide installation advice:

```
sage: from sage.features.sagemath import sage_symbolic
sage: print(sage_symbolic().resolution())
˓→optional - sage_spkg, not tested
...To install sagemath_symbolics...you can try to run...
pip install sagemath-symbolics
...
```

**class sage.features.sagemath.sagemath\_doc\_html(\*args, \*\*kwds)**

Bases: *StaticFile*

A *Feature* which describes the presence of the documentation of the Sage library in HTML format.

Developers often use `make build` instead of `make` to avoid the long time it takes to compile the documentation. Although commands such as `make ptest` build the documentation before testing, other test commands such as `make ptestlong-nodoc` or `./sage -t --all` do not.

All doctests that refer to the built documentation need to be marked `# needs sagemath_doc_html`.

## 3.5 Features for testing the presence of package systems sage\_spkg, conda, pip, debian, fedora etc.

**class sage.features.pkg\_systems.PackageSystem(\*args, \*\*kwds)**

Bases: *Feature*

A *Feature* describing a system package manager.

EXAMPLES:

```
sage: from sage.features.pkg_systems import PackageSystem
sage: PackageSystem('conda')
Feature('conda')
```

**spkg\_installation\_hint(spkgs, prompt, feature)**

Return a string that explains how to install feature.

EXAMPLES:

```
sage: from sage.features.pkg_systems import PackageSystem
sage: homebrew = PackageSystem('homebrew')
sage: homebrew.spkg_installation_hint('openblas') # optional - SAGE_ROOT
'To install openblas using the homebrew package manager, you can try to run:\n!
˓→brew install openblas'
```

**class sage.features.pkg\_systems.PipPackageSystem(\*args, \*\*kwds)**

Bases: *PackageSystem*

A *Feature* describing the Pip package manager.

EXAMPLES:

```
sage: from sage.features.pkg_systems import PipPackageSystem
sage: PipPackageSystem()
Feature('pip')
```

```
class sage.features.pkg_systems.SagePackageSystem(*args, **kwds)
```

Bases: *PackageSystem*

A *Feature* describing the package manager of the SageMath distribution.

EXAMPLES:

```
sage: from sage.features.pkg_systems import SagePackageSystem
sage: SagePackageSystem()
Feature('sage_spkg')
```

## 3.6 Features for testing the presence of bliss

```
class sage.features.bliss.Bliss(*args, **kwds)
```

Bases: *JoinFeature*

A *Feature* which describes whether the `sage.graphs.bliss` module is available in this installation of Sage.

EXAMPLES:

```
sage: from sage.features.bliss import Bliss
sage: Bliss().require() # optional - bliss
```

```
class sage.features.bliss.BlissLibrary(*args, **kwds)
```

Bases: *CythonFeature*

A *Feature* which describes whether the *Bliss library* is present and functional.

EXAMPLES:

```
sage: from sage.features.bliss import BlissLibrary
sage: BlissLibrary().require() # optional - libbliss
```

```
sage.features.bliss.all_features()
```

## 3.7 Feature for testing the presence of csdp

```
class sage.features.csdp.CSDP(*args, **kwds)
```

Bases: *Executable*

A *Feature* which checks for the theta binary of *CSDP*.

EXAMPLES:

```
sage: from sage.features.csdp import CSDP
sage: CSDP().is_present() # optional - csdp
FeatureTestResult('csdp', True)
```

```
is_functional()
```

Check whether theta works on a trivial example.

EXAMPLES:

```
sage: from sage.features.csdp import CSDP
sage: CSDP().is_functional() # optional - csdp
FeatureTestResult('csdp', True)
```

`sage.features.csdp.all_features()`

## 3.8 Features for testing the presence of various databases

`class sage.features.databases.DatabaseConwayPolynomials(*args, **kwds)`

Bases: `StaticFile`

A *Feature* which describes the presence of *Frank Luebeck's database of Conway polynomials*.

EXAMPLES:

```
sage: from sage.features.databases import DatabaseConwayPolynomials
sage: DatabaseConwayPolynomials().is_present()
FeatureTestResult('conway_polynomials', True)
```

`class sage.features.databases.DatabaseCremona(*args, **kwds)`

Bases: `StaticFile`

A *Feature* which describes the presence of *John Cremona's database of elliptic curves*.

INPUT:

- name – either 'cremona' (the default) for the full large database or 'cremona\_mini' for the small database.

EXAMPLES:

```
sage: from sage.features.databases import DatabaseCremona
sage: DatabaseCremona('cremona_mini').is_present()
FeatureTestResult('database_cremona_mini_ellcurve', True)
sage: DatabaseCremona().is_present() # optional - database_cremona_ellcurve
FeatureTestResult('database_cremona_ellcurve', True)
```

`class sage.features.databases.DatabaseCubicHecke(*args, **kwds)`

Bases: `PythonModule`

A *Feature* which describes the presence of the *Cubic Hecke algebra database package*.

The home of this database is the web-page *Cubic Hecke algebra on 4 strands* of Ivan Marin.

EXAMPLES:

```
sage: from sage.features.databases import DatabaseCubicHecke
sage: DatabaseCubicHecke().is_present() # optional - database_cubic_hecke
FeatureTestResult('database_cubic_hecke', True)
```

`class sage.features.databases.DatabaseJones(*args, **kwds)`

Bases: `StaticFile`

A *Feature* which describes the presence of *John Jones's tables of number fields*.

EXAMPLES:

```
sage: from sage.features.databases import DatabaseJones
sage: bool(DatabaseJones().is_present()) # optional - database_jones_numfield
True
```

```
class sage.features.databases.DatabaseKnotInfo(*args, **kwds)
```

Bases: *PythonModule*

A *Feature* which describes the presence of the *package providing the KnotInfo and LinkInfo databases*.

The homes of these databases are the web-pages [KnotInfo](#) and [LinkInfo](#).

EXAMPLES:

```
sage: from sage.features.databases import DatabaseKnotInfo
sage: DatabaseKnotInfo().is_present() # optional - database_knotinfo
FeatureTestResult('database_knotinfo', True)
```

```
class sage.features.databases.DatabaseReflexivePolytopes(*args, **kwds)
```

Bases: *StaticFile*

A *Feature* which describes the presence of the *PALP databases of reflexive three-dimensional and four-dimensional lattice polytopes*.

EXAMPLES:

```
sage: from sage.features.databases import DatabaseReflexivePolytopes
sage: bool(DatabaseReflexivePolytopes().is_present())
→# optional - polytopes_db
True
sage: bool(DatabaseReflexivePolytopes('polytopes_db_4d', 'Hodge4d').is_present())
→# optional - polytopes_db_4d
True
```

```
sage.features.databases.all_features()
```

## 3.9 Feature for testing the presence of dvipng

```
sage.features.dvipng.all_features()
```

```
class sage.features.dvipng.dvipng(*args, **kwds)
```

Bases: *Executable*

A *Feature* describing the presence of dvipng

EXAMPLES:

```
sage: from sage.features.dvipng import dvipng
sage: dvipng().is_present() # optional - dvipng
FeatureTestResult('dvipng', True)
```

## 3.10 Feature for testing the presence of `ffmpeg`

```
class sage.features.ffmpeg.FFmpeg(*args, **kwds)
```

Bases: *Executable*

A *Feature* describing the presence of *ffmpeg*.

EXAMPLES:

```
sage: from sage.features.ffmpeg import FFmpeg
sage: FFmpeg().is_present() # optional - ffmpeg
FeatureTestResult('ffmpeg', True)
```

`is_functional()`

Return whether command `ffmpeg` in the path is functional.

EXAMPLES:

```
sage: from sage.features.ffmpeg import FFmpeg
sage: FFmpeg().is_functional() # optional - ffmpeg
FeatureTestResult('ffmpeg', True)
```

`sage.features.ffmpeg.all_features()`

## 3.11 Features for testing the presence of `4ti2`

```
class sage.features.four_ti_2.FourTi2(*args, **kwds)
```

Bases: *JoinFeature*

A *Feature* describing the presence of all *4ti2* executables.

EXAMPLES:

```
sage: from sage.features.four_ti_2 import FourTi2
sage: FourTi2().is_present() # optional - 4ti2
FeatureTestResult('4ti2', True)
```

`class sage.features.four_ti_2.FourTi2Executable(*args, **kwds)`

Bases: *Executable*

A *Feature* for the *4ti2* executables.

`sage.features.four_ti_2.all_features()`

## 3.12 Features for testing the presence of the SageMath interfaces to gap and of GAP packages

```
class sage.features.gap.GapPackage(*args, **kwds)
```

Bases: *Feature*

A *Feature* describing the presence of a GAP package.

See also:

Feature sage.libs.gap

EXAMPLES:

```
sage: from sage.features.gap import GapPackage
sage: GapPackage("grape", spkg="gap_packages")
Feature('gap_package_grape')
```

```
sage.features.gap.all_features()
```

## 3.13 Features for testing the presence of graph generator programs benzene, buckygen, plantri

```
class sage.features.graph_generators.Benzene(*args, **kwds)
```

Bases: *Executable*

A *Feature* which checks for the *benzene* binary.

EXAMPLES:

```
sage: from sage.features.graph_generators import Benzene
sage: Benzene().is_present() # optional - benzene
FeatureTestResult('benzene', True)
```

**is\_functional()**

Check whether benzene works on trivial input.

EXAMPLES:

```
sage: from sage.features.graph_generators import Benzene
sage: Benzene().is_functional() # optional - benzene
FeatureTestResult('benzene', True)
```

```
class sage.features.graph_generators.Buckygen(*args, **kwds)
```

Bases: *Executable*

A *Feature* which checks for the *buckygen* binary.

EXAMPLES:

```
sage: from sage.features.graph_generators import Buckygen
sage: Buckygen().is_present() # optional - buckygen
FeatureTestResult('buckygen', True)
```

**is\_functional()**

Check whether buckygen works on trivial input.

EXAMPLES:

```
sage: from sage.features.graph_generators import Buckygen
sage: Buckygen().is_functional() # optional - buckygen
FeatureTestResult('buckygen', True)
```

**class sage.features.graph\_generators.Plantri(\*args, \*\*kwds)**

Bases: *Executable*

A *Feature* which checks for the *plantri* binary.

EXAMPLES:

```
sage: from sage.features.graph_generators import Plantri
sage: Plantri().is_present() # optional - plantri
FeatureTestResult('plantri', True)
```

**is\_functional()**

Check whether plantri works on trivial input.

EXAMPLES:

```
sage: from sage.features.graph_generators import Plantri
sage: Plantri().is_functional() # optional - plantri
FeatureTestResult('plantri', True)
```

**sage.features.graph\_generators.all\_features()**

## 3.14 Features for testing the presence of graphviz

**class sage.features.graphviz.Graphviz(\*args, \*\*kwds)**

Bases: *JoinFeature*

A *Feature* describing the presence of the *dot*, *neato*, and *twopi* executables from the *graphviz* package.

EXAMPLES:

```
sage: from sage.features.graphviz import Graphviz
sage: Graphviz().is_present() # optional - graphviz
FeatureTestResult('graphviz', True)
```

**sage.features.graphviz.all\_features()****class sage.features.graphviz.dot(\*args, \*\*kwds)**

Bases: *Executable*

A *Feature* describing the presence of dot.

**class sage.features.graphviz.neato(\*args, \*\*kwds)**

Bases: *Executable*

A *Feature* describing the presence of neato.

```
class sage.features.graphviz.twopi(*args, **kwds)
```

Bases: *Executable*

A *Feature* describing the presence of twopi.

## 3.15 Feature for testing the presence of `imagemagick`

Currently we only check for the presence of convert. When needed, other commands like magick, magick-script, convert, mogrify, identify, composite, montage, compare, etc. could be also checked in this module.

```
class sage.features.imagemagick.Convert(*args, **kwds)
```

Bases: *Executable*

A *Feature* describing the presence of convert.

EXAMPLES:

```
sage: from sage.features.imagemagick import Convert
sage: Convert().is_present() # optional - imagemagick
FeatureTestResult('convert', True)
```

`is_functional()`

Return whether command convert in the path is functional.

EXAMPLES:

```
sage: from sage.features.imagemagick import Convert
sage: Convert().is_functional() # optional - imagemagick
FeatureTestResult('convert', True)
```

```
class sage.features.imagemagick.ImageMagick(*args, **kwds)
```

Bases: *JoinFeature*

A *Feature* describing the presence of *ImageMagick*

Currently, only the availability of the convert program is checked.

EXAMPLES:

```
sage: from sage.features.imagemagick import ImageMagick
sage: ImageMagick().is_present() # optional - imagemagick
FeatureTestResult('imagemagick', True)
```

`sage.features.imagemagick.all_features()`

## 3.16 Features for testing whether interpreter interfaces to `magma`, `maple`, `mathematica` etc. are functional

```
class sage.features.interfaces.InterfaceFeature(*args, **kwds)
```

Bases: *Feature*

A *Feature* describing whether an *Interface* is present and functional.

```
class sage.features.interfaces.Macaulay2(*args, **kwds)
```

Bases: *InterfaceFeature*

A *Feature* describing whether `sage.interfaces.macaulay2.Macaulay2` is present and functional.

EXAMPLES:

```
sage: from sage.features.interfaces import Macaulay2
sage: Macaulay2().is_present() # random
FeatureTestResult('macaulay2', False)
```

```
class sage.features.interfaces.Magma(*args, **kwds)
```

Bases: *InterfaceFeature*

A *Feature* describing whether `sage.interfaces.magma.Magma` is present and functional.

EXAMPLES:

```
sage: from sage.features.interfaces import Magma
sage: Magma().is_present() # random
FeatureTestResult('magma', False)
```

```
class sage.features.interfaces.Maple(*args, **kwds)
```

Bases: *InterfaceFeature*

A *Feature* describing whether `sage.interfaces.maple.Maple` is present and functional.

EXAMPLES:

```
sage: from sage.features.interfaces import Maple
sage: Maple().is_present() # random
FeatureTestResult('maple', False)
```

```
class sage.features.interfaces.Mathematica(*args, **kwds)
```

Bases: *InterfaceFeature*

A *Feature* describing whether `sage.interfaces.mathematica.Mathematica` is present and functional.

EXAMPLES:

```
sage: from sage.features.interfaces import Mathematica
sage: Mathematica().is_present() # not tested
FeatureTestResult('mathematica', False)
```

```
class sage.features.interfaces.Matlab(*args, **kwds)
```

Bases: *InterfaceFeature*

A *Feature* describing whether `sage.interfaces.matlab.Matlab` is present and functional.

EXAMPLES:

```
sage: from sage.features.interfaces import Matlab
sage: Matlab().is_present() # random
FeatureTestResult('matlab', False)
```

```
class sage.features.interfaces.Octave(*args, **kwds)
```

Bases: *InterfaceFeature*

A *Feature* describing whether `sage.interfaces.octave.Octave` is present and functional.

EXAMPLES:

```
sage: from sage.features.interfaces import Octave
sage: Octave().is_present() # random
FeatureTestResult('octave', False)
```

```
class sage.features.interfaces.Scilab(*args, **kwds)
```

Bases: *InterfaceFeature*

A *Feature* describing whether `sage.interfaces.scilab.Scilab` is present and functional.

EXAMPLES:

```
sage: from sage.features.interfaces import Scilab
sage: Scilab().is_present() # random
FeatureTestResult('scilab', False)
```

```
sage.features.interfaces.all_features()
```

Return features corresponding to interpreter interfaces.

EXAMPLES:

```
sage: from sage.features.interfaces import all_features
sage: list(all_features())
[Feature('magma'),
 Feature('matlab'),
 Feature('mathematica'),
 Feature('maple'),
 Feature('macaulay2'),
 Feature('octave'),
 Feature('scilab')]
```

## 3.17 Feature for testing if the Internet is available

```
class sage.features.internet.Internet(*args, **kwds)
```

Bases: *Feature*

A *Feature* describing if Internet is available.

Failure of connecting to the site “<https://www.sagemath.org>” within a second is regarded as internet being not available.

EXAMPLES:

```
sage: from sage.features.internet import Internet
sage: Internet()
Feature('internet')
```

```
sage.features.internet.all_features()
```

## 3.18 Feature for testing the presence of kenzo

```
class sage.features.kenzo.Kenzo(*args, **kwds)
```

Bases: *Feature*

A *Feature* describing the presence of *Kenzo*.

EXAMPLES:

```
sage: from sage.features.kenzo import Kenzo
sage: Kenzo().is_present() # optional - kenzo
FeatureTestResult('kenzo', True)
```

```
sage.features.kenzo.all_features()
```

## 3.19 Features for testing the presence of latex and equivalent programs

```
class sage.features.latex.LaTeX(*args, **kwds)
```

Bases: *Executable*

A *Feature* describing the presence of *latex*

EXAMPLES:

```
sage: from sage.features.latex import latex
sage: latex().is_present() # optional - latex
FeatureTestResult('latex', True)
```

**is\_functional()**

Return whether *latex* in the path is functional.

EXAMPLES:

```
sage: from sage.features.latex import latex
sage: latex().is_functional() # optional - latex
FeatureTestResult('latex', True)
```

When the feature is not functional, more information on the reason can be obtained as follows:

```
sage: result = latex().is_functional() # not tested
sage: print(result.reason) # not tested
Running latex on a sample file
(with command='latex -interaction=nonstopmode tmp_wmpos8ak.tex')
returned non-zero exit status='1' with stderr=''
and stdout='This is pdfTeX,
...
Runaway argument?
{document
! File ended while scanning use of \end.
...
No pages of output.
Transcript written on tmp_wmpos8ak.log.'
```

```
class sage.features.latex.LaTeXPackage(*args, **kwds)
```

Bases: *TeXFile*

A *sage.features.Feature* describing the presence of a LaTeX package (.sty file).

EXAMPLES:

```
sage: from sage.features.latex import LaTeXPackage
sage: LaTeXPackage('graphics').is_present() # optional - latex
FeatureTestResult('latex_package_graphics', True)
```

```
class sage.features.latex.TeXFile(*args, **kwds)
```

Bases: *StaticFile*

A *sage.features.Feature* describing the presence of a TeX file

EXAMPLES:

```
sage: from sage.features.latex import TeXFile
sage: TeXFile('x', 'x.tex').is_present() # optional - latex
FeatureTestResult('x', True)
```

**absolute\_filename()**

The absolute path of the file.

EXAMPLES:

```
sage: from sage.features.latex import TeXFile
sage: feature = TeXFile('latex_class_article', 'article.cls')
sage: feature.absolute_filename() # optional - latex
'.../latex/base/article.cls'
```

*sage.features.latex.all\_features()*

```
class sage.features.latex.dvips(*args, **kwds)
```

Bases: *Executable*

A *Feature* describing the presence of dvips

EXAMPLES:

```
sage: from sage.features.latex import dvips
sage: dvips().is_present() # optional - dvips
FeatureTestResult('dvips', True)
```

```
class sage.features.latex.latex(*args, **kwds)
```

Bases: *LaTeX*

A *Feature* describing the presence of latex

EXAMPLES:

```
sage: from sage.features.latex import latex
sage: latex().is_present() # optional - latex
FeatureTestResult('latex', True)
```

```
class sage.features.latex.lualatex(*args, **kwds)
```

Bases: *LaTeX*

A *Feature* describing the presence of lualatex

EXAMPLES:

```
sage: from sage.features.latex import lualatex
sage: lualatex().is_present() # optional - lualatex
FeatureTestResult('lualatex', True)
```

```
class sage.features.latex.pdflatex(*args, **kwds)
```

Bases: *LaTeX*

A *Feature* describing the presence of pdflatex

EXAMPLES:

```
sage: from sage.features.latex import pdflatex
sage: pdflatex().is_present() # optional - pdflatex
FeatureTestResult('pdflatex', True)
```

```
class sage.features.latex.xelatex(*args, **kwds)
```

Bases: *LaTeX*

A *Feature* describing the presence of xelatex

EXAMPLES:

```
sage: from sage.features.latex import xelatex
sage: xelatex().is_present() # optional - xelatex
FeatureTestResult('xelatex', True)
```

## 3.20 Features for testing the presence of latte\_int

```
class sage.features.latte.Latte(*args, **kwds)
```

Bases: *JoinFeature*

A *Feature* describing the presence of executables from *LattE integrale*.

EXAMPLES:

```
sage: from sage.features.latte import Latte
sage: Latte().is_present() # optional - latte_int
FeatureTestResult('latte_int', True)
```

```
class sage.features.latte.Latte_count(*args, **kwds)
```

Bases: *Executable*

Feature for the executable count from *LattE integrale*.

```
class sage.features.latte.Latte_integrate(*args, **kwds)
```

Bases: *Executable*

Feature for the executable integrate from *LattE integrale*.

```
sage.features.latte.all_features()
```

### 3.21 Feature for testing the presence of `lrslib`

```
class sage.features.lrs.Lrs(*args, **kwds)
```

Bases: `Executable`

A `Feature` describing the presence of the `lrs` binary which comes as a part of `lrslib`.

EXAMPLES:

```
sage: from sage.features.lrs import Lrs
sage: Lrs().is_present() # optional - lrslib
FeatureTestResult('lrs', True)
```

`is_functional()`

Test whether `lrs` works on a trivial input.

EXAMPLES:

```
sage: from sage.features.lrs import Lrs
sage: Lrs().is_functional() # optional - lrslib
FeatureTestResult('lrs', True)
```

```
class sage.features.lrs.LrsNash(*args, **kwds)
```

Bases: `Executable`

A `Feature` describing the presence of the `lrsnash` binary which comes as a part of `lrslib`.

EXAMPLES:

```
sage: from sage.features.lrs import LrsNash
sage: LrsNash().is_present() # optional - lrslib
FeatureTestResult('lrsnash', True)
```

`is_functional()`

Test whether `lrsnash` works on a trivial input.

EXAMPLES:

```
sage: from sage.features.lrs import LrsNash
sage: LrsNash().is_functional() # optional - lrslib
FeatureTestResult('lrsnash', True)
```

```
class sage.features.lrs.Lrslib(*args, **kwds)
```

Bases: `JoinFeature`

A `Feature` describing the presence of the executables `lrs` and `lrsnash` provided by the `lrslib` package.

EXAMPLES:

```
sage: from sage.features.lrs import Lrslib
sage: Lrslib().is_present() # optional - lrslib
FeatureTestResult('lrslib', True)
```

`sage.features.lrs.all_features()`

## 3.22 Features for testing the presence of `mcqd`

```
class sage.features.mcqd.Mcqd(*args, **kwds)
```

Bases: `JoinFeature`

A `Feature` describing the presence of the `mcqd` module, which is the SageMath interface to the `mcqd` library

EXAMPLES:

```
sage: from sage.features.mcqd import Mcqd
sage: Mcqd().is_present() # optional - mcqd
FeatureTestResult('mcqd', True)
```

```
sage.features.mcqd.all_features()
```

## 3.23 Feature for testing the presence of `meataxe`

```
class sage.features.meataxe.Meataxe(*args, **kwds)
```

Bases: `JoinFeature`

A `Feature` describing the presence of the Sage modules that depend on the `meataxe` library.

EXAMPLES:

```
sage: from sage.features.meataxe import Meataxe
sage: Meataxe().is_present() # optional - meataxe
FeatureTestResult('meataxe', True)
```

```
sage.features.meataxe.all_features()
```

## 3.24 Features for testing the presence of `MixedIntegerLinearProgram` backends

```
class sage.features.mip_backends.COIN(*args, **kwds)
```

Bases: `JoinFeature`

A `Feature` describing whether the `MixedIntegerLinearProgram` backend COIN is available.

```
class sage.features.mip_backends.CPLEX(*args, **kwds)
```

Bases: `MIPBackend`

A `Feature` describing whether the `MixedIntegerLinearProgram` backend CPLEX is available.

```
class sage.features.mip_backends.CVXOPT(*args, **kwds)
```

Bases: `JoinFeature`

A `Feature` describing whether the `MixedIntegerLinearProgram` backend CVXOPT is available.

```
class sage.features.mip_backends.Gurobi(*args, **kwds)
```

Bases: `MIPBackend`

A `Feature` describing whether the `MixedIntegerLinearProgram` backend Gurobi is available.

```
class sage.features.mip_backends.MIPBackend(*args, **kwds)
Bases: Feature
A Feature describing whether a MixedIntegerLinearProgram backend is available.

sage.features.mip_backends.all_features()
```

### 3.25 Feature for testing the presence of pynormaliz

```
class sage.features.normaliz.PyNormaliz(*args, **kwds)
Bases: JoinFeature
A Feature describing the presence of the Python package PyNormaliz.
```

EXAMPLES:

```
sage: from sage.features.normaliz import PyNormaliz
sage: PyNormaliz().is_present()                      # optional - pynormaliz
FeatureTestResult('pynormaliz', True)
```

```
sage.features.normaliz.all_features()
```

### 3.26 Feature for testing the presence of pandoc

```
class sage.features.pandoc.Pandoc(*args, **kwds)
Bases: Executable
A Feature describing the presence of pandoc.
```

EXAMPLES:

```
sage: from sage.features.pandoc import Pandoc
sage: Pandoc().is_present()  # optional - pandoc
FeatureTestResult('pandoc', True)
```

```
sage.features.pandoc.all_features()
```

### 3.27 Feature for testing the presence of pdf2svg

```
sage.features.pdf2svg.all_features()

class sage.features.pdf2svg.pdf2svg(*args, **kwds)
Bases: Executable
A Feature describing the presence of pdf2svg.
```

EXAMPLES:

```
sage: from sage.features.pdf2svg import pdf2svg
sage: pdf2svg().is_present()                      # optional - pdf2svg
FeatureTestResult('pdf2svg', True)
```

## 3.28 Feature for testing the presence of `jupymake`, the Python interface to polymake

```
class sage.features.polymake.JuPyMake(*args, **kwds)
```

Bases: *JoinFeature*

A *Feature* describing the presence of the `JuPyMake` module, a Python interface to the `polymake` library.

EXAMPLES:

```
sage: from sage.features.polymake import JuPyMake
sage: JuPyMake().is_present() # optional - jupymake
FeatureTestResult('jupymake', True)
```

```
sage.features.polymake.all_features()
```

## 3.29 Features for testing the presence of rubiks

```
class sage.features.rubiks.Rubiks(*args, **kwds)
```

Bases: *JoinFeature*

A *Feature* describing the presence of the `cu2`, `cubex`, `dikcube`, `mcube`, `optimal`, and `size222` programs from the `rubiks` package.

EXAMPLES:

```
sage: from sage.features.rubiks import Rubiks
sage: Rubiks().is_present() # optional - rubiks
FeatureTestResult('rubiks', True)
```

```
sage.features.rubiks.all_features()
```

```
class sage.features.rubiks.cu2(*args, **kwds)
```

Bases: *Executable*

A *Feature* describing the presence of cu2.

EXAMPLES:

```
sage: from sage.features.rubiks import cu2
sage: cu2().is_present() # optional - rubiks
FeatureTestResult('cu2', True)
```

```
class sage.features.rubiks.cubex(*args, **kwds)
```

Bases: *Executable*

A *Feature* describing the presence of cubex.

EXAMPLES:

```
sage: from sage.features.rubiks import cubex
sage: cubex().is_present() # optional - rubiks
FeatureTestResult('cubex', True)
```

```
class sage.features.rubiks.dikcube(*args, **kwds)
```

Bases: *Executable*

A *Feature* describing the presence of dikcube.

EXAMPLES:

```
sage: from sage.features.rubiks import dikcube
sage: dikcube().is_present() # optional - rubiks
FeatureTestResult('dikcube', True)
```

```
class sage.features.rubiks.mcube(*args, **kwds)
```

Bases: *Executable*

A *Feature* describing the presence of mcube.

EXAMPLES:

```
sage: from sage.features.rubiks import mcube
sage: mcube().is_present() # optional - rubiks
FeatureTestResult('mcube', True)
```

```
class sage.features.rubiks.optimal(*args, **kwds)
```

Bases: *Executable*

A *Feature* describing the presence of optimal.

EXAMPLES:

```
sage: from sage.features.rubiks import optimal
sage: optimal().is_present() # optional - rubiks
FeatureTestResult('optimal', True)
```

```
class sage.features.rubiks.size222(*args, **kwds)
```

Bases: *Executable*

A *Feature* describing the presence of size222.

EXAMPLES:

```
sage: from sage.features.rubiks import size222
sage: size222().is_present() # optional - rubiks
FeatureTestResult('size222', True)
```

### 3.30 Features for testing the presence of *tdlib*

```
class sage.features.tdlib.Tdlib(*args, **kwds)
```

Bases: *JoinFeature*

A *Feature* describing the presence of the SageMath interface to the *tdlib* library.

```
sage.features.tdlib.all_features()
```

## DISTRIBUTION PACKAGES OF THE SAGE LIBRARY

- *sagemath\_bliss*: Graph (iso/auto)morphisms with *bliss*
- *sagemath\_categories*: Sage categories and basic rings
- *sagemath\_coxeter3*: Coxeter groups, Bruhat ordering, Kazhdan-Lusztig polynomials with *coxeter3*
- *sagemath\_doc\_html*: SageMath documentation in HTML format
- *sagemath\_doc\_pdf*: SageMath documentation in PDF format
- *sagemath\_environment*: System and software environment
- *sagemath\_mcqd*: Finding maximum cliques with *mcqd*
- *sagemath\_meataxe*: Matrices over small finite fields with *meataxe*
- *sagemath\_objects*: Sage objects, elements, parents, categories, coercion, metaclasses
- *sagemath\_repl*: IPython kernel, Sage preparser, doctester
- *sagemath\_siropco*: Certified root continuation with *siropco*
- *sagemath\_tdlib*: Tree decompositions with *tdlib*

## EXPERIMENTAL PACKAGES

Some packages that provide additional functionality are marked as “experimental”. Developers are needed in order to improve the integration of these packages into the Sage distribution.

- *awali*: Computation of/with finite state machines
- *barvinok*: Projections of integer point sets of parametric polytopes
- *cocoalib*: Computations in commutative algebra
- *deformation*: Count points on hypersurfaces using the deformation method
- *gambit*: Computations on finite, noncooperative games
- *gap3*: A minimal distribution of GAP 3 containing packages that have no equivalent in GAP 4
- *gdb*: The GNU Project debugger
- *libtheora*: Library for the Theora video codec
- *lie*: Library for the representation theory of complex semisimple Lie groups and algebras
- *modular\_decomposition*: A modular decomposition algorithm
- *polylib*: Operations on unions of polyhedra
- *qepcad*: Quantifier elimination by partial cylindrical algebraic decomposition
- *r\_jupyter*: Jupyter kernel for R
- *surf*: Visualization of algebraic curves, algebraic surfaces and hyperplane sections of surfaces
- *symengine\_py*: Python wrappers for SymEngine
- *valgrind*: Memory error detector, call graph generator, runtime profiler

## ALL EXTERNAL PACKAGES

### 6.1 Details of external packages

Packages are in alphabetical order.

#### 6.1.1 4ti2: Algebraic, geometric and combinatorial problems on linear spaces

##### Description

A software package for algebraic, geometric and combinatorial problems on linear spaces. Available at <https://4ti2.github.io/>.

##### License

4ti2 is released under a GPL v2 license.

##### Upstream Contact

- <https://4ti2.github.io/>
- Raymond Hemmecke, TU Munich, Germany
- Matthias Köppe, UC Davis, CA, USA

##### Type

optional

##### Dependencies

- *zlib: Data compression library*
- *\$(MP\_LIBRARY)*
- *glpk: GNU Linear Programming Kit*

### Version Information

package-version.txt:

```
1.6.10
```

### Equivalent System Packages

arch:

```
$ sudo pacman -S 4ti2
```

conda:

```
$ conda install 4ti2
```

cygwin:

```
$ apt-cyg install lib4ti2_0 lib4ti2-devel
```

Debian/Ubuntu:

```
$ sudo apt-get install 4ti2
```

Fedora/Redhat/CentOS:

```
$ sudo yum install 4ti2
```

freebsd:

```
$ sudo pkg install math/4ti2
```

gentoo:

```
$ sudo emerge sci-mathematics/4ti2
```

opensuse:

```
$ sudo zypper install 4ti2 4ti2-devel
```

See <https://repology.org/project/4ti2/versions>

If the system package is installed, ./configure will check if it can be used.

### 6.1.2 `_bootstrap`: Represents system packages required for running the top-level bootstrap script

#### Description

This optional script package represents the requirements (system packages) that are needed in addition to those represented by the `_prereq` package in order to run the top-level `bootstrap` script.

**Type**

optional

**Dependencies****Version Information****Equivalent System Packages**

alpine:

```
$ apk add bash gettext-dev autoconf automake libtool pkgconf
```

arch:

```
$ sudo pacman -S autoconf automake libtool pkgconf
```

conda:

```
$ conda install autoconf automake libtool pkg-config
```

cygwin:

```
$ apt-cyg install autoconf automake libtool
```

Debian/Ubuntu:

```
$ sudo apt-get install autoconf automake libtool pkg-config
```

Fedora/Redhat/CentOS:

```
$ sudo yum install autoconf automake libtool pkg-config
```

freebsd:

```
$ sudo pkg install autoconf automake libtool pkg-config
```

gentoo:

```
$ sudo emerge sys-devel/autoconf sys-devel/automake sys-devel/libtool
```

homebrew:

```
$ brew install autoconf automake libtool pkg-config
```

nix:

```
$ nix-env --install autoconf automake libtool pkg-config
```

opensuse:

```
$ sudo zypper install autoconf automake libtool pkgconfig
```

slackware:

```
$ sudo slackpkg install autoconf automake libtool pkg-config
```

void:

```
$ sudo xbps-install autoconf automake libtool xtools mk-configure pkg-config
```

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

### 6.1.3 `_develop`: Represents system packages recommended for development

#### Description

Script package representing a list of system packages recommended for developers.

#### Type

optional

#### Dependencies

- `_bootstrap`: Represents system packages required for running the top-level bootstrap script
- `git`: Version control system
- `pytest`: Simple powerful testing with Python
- `pytest_xdist`: pytest xdist plugin for distributed testing and loop-on-failing modes
- `github_cli`: Command-line interface for GitHub

#### Version Information

#### Equivalent System Packages

alpine:

```
$ apk add gnupg-gpgconf openssh-client
```

arch:

```
$ sudo pacman -S gnupg openssh
```

conda:

```
$ conda install openssh pycodestyle esbonio
```

cygwin:

```
$ apt-cyg install gnupg2
```

Debian/Ubuntu:

```
$ sudo apt-get install gpgconf openssh-client
```

Fedora/Redhat/CentOS:

```
$ sudo yum install gnupg2 openssh
```

freebsd:

```
$ sudo pkg install security/gnupg security/openssh-portable
```

gentoo:

```
$ sudo emerge app-crypt/gnupg net-misc/openssh
```

homebrew:

```
$ brew install gnupg
```

macports: install the following packages: gnupg2

nix:

```
$ nix-env --install gnupg openssh
```

opensuse:

```
$ sudo zypper install gpg2 openssh
```

slackware:

```
$ sudo slackpkg install gnupg2 openssh
```

void:

```
$ sudo xbps-install gnupg2 openssh
```

See <https://repology.org/project/gnupg/versions>, <https://repology.org/project/openssh/versions>

If the system package is installed, ./configure will check if it can be used.

## 6.1.4 **\_prereq**: Represents system packages required for installing SageMath from source

### Description

This dummy package represents the minimal requirements (system packages) for installing SageMath from source.

In addition to standard **POSIX** utilities and the **bash** shell, the following standard command-line development tools must be installed on your computer:

- **make**: GNU make, version 3.80 or later. Version 3.82 or later is recommended.
- **m4**: GNU m4 1.4.2 or later (non-GNU or older versions might also work).
- **perl**: version 5.8.0 or later.
- **ar** and **ranlib**: can be obtained as part of GNU binutils.

- **tar**: GNU tar version 1.17 or later, or BSD tar (as provided on macOS).
- **python**: Python 3.4 or later, or Python 2.7. (This range of versions is a minimal requirement for internal purposes of the SageMath build system, which is referred to as `sage-bootstrap-python`.)

Other versions of these may work, but they are untested.

On macOS, suitable versions of all of these tools are provided by the Xcode Command Line Tools. To install them, open a terminal window and run `xcode-select --install`; then click “Install” in the pop-up window. If the Xcode Command Line Tools are already installed, you may want to check if they need to be updated by typing `softwareupdate -l`.

On Linux, `ar` and `ranlib` are in the `binutils` package. The other programs are usually located in packages with their respective names.

On Redhat-derived systems not all perl components are installed by default and you might have to install the `perl-ExtUtils-MakeMaker` package.

To check if you have the above prerequisites installed, for example `perl`, type:

```
$ command -v perl
```

or:

```
$ which perl
```

on the command line. If it gives an error (or returns nothing), then either `perl` is not installed, or it is installed but not in your `PATH`.

### Type

standard

### Dependencies

#### Version Information

#### Equivalent System Packages

alpine:

```
$ apk add binutils make m4 perl python3 tar bc gcc g++ ca-certificates coreutils
```

arch:

```
$ sudo pacman -S binutils make m4 perl python tar bc gcc which
```

conda:

```
$ conda install compilers make m4 perl python tar bc
```

cygwin:

```
$ apt-cyg install binutils make m4 python39-urllib3 python39 perl perl-ExtUtils-  
MakeMaker tar gcc-core gcc-g++ findutils which libcrypt-devel libiconv-devel
```

Debian/Ubuntu:

```
$ sudo apt-get install binutils make m4 perl python3 tar bc gcc g++ ca-certificates
```

Fedora/Redhat/CentOS:

```
$ sudo yum install binutils make m4 python3 perl perl-ExtUtils-MakeMaker tar gcc gcc-
→c++ findutils which diffutils perl-IPC-Cmd
```

freebsd:

```
$ sudo pkg install gmake automake bash dash python
```

gentoo:

→11 libmpc glibc kernel-headers perl m4 bc python-2.7 python3 flex ca-certificates_
→libxml2 cyrus-sasl
```

void:

```
$ sudo xbps-install bc binutils gcc libgomp-devel m4 make perl python3 tar which
```

If the system package is installed, ./configure will check if it can be used.

### 6.1.5 recommended: Represents system packages recommended for additional functionality

#### Description

Script package representing a list of system packages recommended to be installed for additional functionality.

### Type

optional

### Dependencies

- *pandoc: A document converter*
- *ffmpeg: ffmpeg video converter*
- *ImageMagick: A collection of tools and libraries for many image file formats*
- *texlive: A comprehensive TeX system*
- *git: Version control system*
- *libjpeg: JPEG image support*

### Version Information

#### Equivalent System Packages

Debian/Ubuntu:

```
$ sudo apt-get install default-jdk libavdevice-dev
```

homebrew:

```
$ brew install texinfo
```

macports: install the following packages: texinfo

If the system package is installed, ./configure will check if it can be used.

### 6.1.6 \_sagemath: Downstream package of Sage in distributions

SageMath is available from various distributions and can be installed by package managers.

This dummy package records the names of the system packages that should be installed to provide a standard installation of SageMath, including documentation and Jupyter.

### Downstream Contact

See Trac wiki page Distribution

**Type**

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.7 admcycles: Computation in the tautological ring of the moduli space of curves

### Description

The SageMath package `admcycles` offers the possibility to compute in the tautological ring of the Deligne-Mumford compactification of the moduli space of curves. Construction for standard generators are provided (`psi`, `kappa` and `lambda` classes) as well as more advanced algebraic construction (double ramification cycle, strata of differentials).

### License

GPLv2+

### Upstream Contact

<https://pypi.org/project/admcycles/>

### Type

optional

### Dependencies

- `$(PYTHON_TOOLCHAIN)`
- `$(PYTHON)`

### Version Information

requirements.txt:

admcycles

### Equivalent System Packages

(none known)

## 6.1.8 alabaster: Default theme for the Sphinx documentation system

### Description

Alabaster is a visually (c)lean, responsive, configurable theme for the Sphinx documentation system. It is Python 2+3 compatible.

It began as a third-party theme, and is still maintained separately, but as of Sphinx 1.3, Alabaster is an install-time dependency of Sphinx and is selected as the default theme.

Live examples of this theme can be seen on [paramiko.org](http://paramiko.org), [fabfile.org](http://fabfile.org) and [pyinvoke.org](http://pyinvoke.org).

## Upstream Contact

<https://alabaster.readthedocs.io/en/latest/>

## Type

standard

## Dependencies

- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

## Version Information

package-version.txt:

```
0.7.12
```

install-requires.txt:

```
alabaster >=0.7.12
```

## Equivalent System Packages

conda:

```
$ conda install alabaster
```

gentoo:

```
$ sudo emerge dev-python/alabaster
```

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-alabaster
```

void:

```
$ sudo xbps-install python3-alabaster
```

See <https://repology.org/project/alabaster/versions>

If the system package is installed and if the (experimental) option --enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.

## 6.1.9 antic: Algebraic Number Theory In C

### Description

Algebraic Number Theory In C

### License

LGPL 2.1

### Upstream Contact

<https://github.com/wbhart/antic>

### Type

optional

### Dependencies

- \$(MP\_LIBRARY)
- *mpfr*: *Multiple-precision floating-point computations with correct rounding*
- *flint*: *Fast Library for Number Theory*

### Version Information

appnope >=0.1.0
```

## Equivalent System Packages

conda:

```
$ conda install appnope
```

macports: install the following packages: py-appnope

See <https://repology.org/project/python:appnope/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

## 6.1.12 arb: Arbitrary-precision floating-point ball arithmetic

### Description

Arb is a C library for arbitrary-precision floating-point ball arithmetic, developed by Fredrik Johansson ([fredrik.johansson@gmail.com](mailto:fredrik.johansson@gmail.com)). It supports efficient high-precision computation with polynomials, power series, matrices and special functions over the real and complex numbers, with automatic, rigorous error control.

### License

GNU General Public License v2+

### Upstream Contact

- Fredrik Johansson: [fredrik.johansson@gmail.com](mailto:fredrik.johansson@gmail.com)
- <https://arblib.org/>
- <http://github.com/fredrik-johansson/arb/>

### Type

standard

### Dependencies

- \$(MP\_LIBRARY)
- *mpfr*: *Multiple-precision floating-point computations with correct rounding*
- *flint*: *Fast Library for Number Theory*

## Version Information

package-version.txt:

```
2.23.0
```

## Equivalent System Packages

arch:

```
$ sudo pacman -S arb
```

conda:

```
$ conda install arb
```

Debian/Ubuntu:

```
$ sudo apt-get install libflint-arb-dev
```

Fedora/Redhat/CentOS:

```
$ sudo yum install arb arb-devel
```

freebsd:

```
$ sudo pkg install math/arb
```

gentoo:

```
$ sudo emerge sci-mathematics/arb
```

homebrew:

```
$ brew install arb
```

nix:

```
$ nix-env --install arb
```

opensuse:

```

$ sudo xbps-install arb-devel
```

See <https://repology.org/project/arbfp/versions>

If the system package is installed, ./configure will check if it can be used.

### 6.1.13 argon2\_cffi: The secure Argon2 password hashing algorithm

#### Description

The secure Argon2 password hashing algorithm.

#### License

MIT

#### Upstream Contact

<https://pypi.org/project/argon2-cffi/>

#### Type

standard

#### Dependencies

- *argon2\_cffi\_bindings*: Low-level CFFI bindings for Argon2
- \$(PYTHON\_TOOLCHAIN)
- *flit\_core*: Distribution-building parts of Flit. See flit package for more information
- \$(PYTHON)

#### Version Information

package-version.txt:

```
21.3.0
```

install-requirements.txt:

```
argon2-cffi
```

#### Equivalent System Packages

conda:

```
$ conda install argon2-cffi
```

gentoo:

```
$ sudo emerge dev-python/argon2-cffi
```

macports: install the following packages: py-argon2-cffi

void:

```
$ sudo xbps-install python3-argon2
```

See <https://repology.org/project/argon2-cffi/versions>, <https://repology.org/project/python:argon2-cffi/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.14 argon2\_cffi\_bindings: Low-level CFFI bindings for Argon2

#### Description

Low-level CFFI bindings for Argon2

#### License

MIT

#### Upstream Contact

<https://pypi.org/project/argon2-cffi-bindings/>

#### Type

standard

#### Dependencies

- `$(PYTHON_TOOLCHAIN)`
- `ffi: Foreign Function Interface for Python calling C code`
- `setuptools_scm: Python build system extension to obtain package version from version control`
- `$(PYTHON)`

#### Version Information

package-version.txt:

```
21.2.0
```

install-requires.txt:

```
argon2-cffi-bindings
```

## Equivalent System Packages

alpine:

```
$ apk add py3-argon2-cffi-bindings
```

arch:

```
$ sudo pacman -S python-argon2-cffi-bindings
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-argon2-cffi-bindings
```

freebsd:

```
$ sudo pkg install security/py-argon2-cffi-bindings
```

gentoo:

```
$ sudo emerge dev-python/argon2-cffi-bindings
```

macports: install the following packages: py-argon2-cffi-bindings

opensuse:

```
$ sudo zypper install python-argon2-cffi-bindings
```

If the system package is installed and if the (experimental) option –enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.

### 6.1.15 asttokens: Annotate AST trees with source code positions

#### Description

Annotate AST trees with source code positions

#### License

Apache 2.0

#### Upstream Contact

<https://pypi.org/project/asttokens/>

## Type

standard

## Dependencies

- \${PYTHON\_TOOLCHAIN}
- \${PYTHON}

## Version Information

package-version.txt:

```
2.1.0
```

install-requires.txt:

```
asttokens
```

## Equivalent System Packages

conda:

$ conda install asttokens
```

gentoo:

```
$ sudo emerge dev-python/asttokens
```

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.16 attrs: Decorator for Python classes with attributes

#### Description

attrs is the Python package that will bring back the joy of writing classes by relieving you from the drudgery of implementing object protocols (aka dunder methods).

#### License

MIT License

## Upstream Contact

Home page: <https://www.attrs.org>

## Type

standard

## Dependencies

- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

## Version Information

package-version.txt:

```
23.1.0
```

install-requires.txt:

```
attrs >=19.3.0
```

## Equivalent System Packages

conda:

```
$ conda install attrs
```

gentoo:

```
$ sudo emerge dev-python/attrs
```

macports: install the following packages: py-attrs

void:

```
$ sudo xbps-install python3-attrs
```

See <https://repology.org/project/python:attrs/versions>

If the system package is installed and if the (experimental) option --enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.

### 6.1.17 auditwheel\_or\_delocate: Repair wheels on Linux or macOS

#### Description

This package represents `auditwheel` on Linux and `delocate` on macOS.

(Actually, we install `delocate` also on Linux because our script `make -j list-broken-packages` uses a small subroutine of `delocate` even on Linux.)

#### License

MIT

BSD 2-clause

#### Upstream Contact

<https://pypi.org/project/auditwheel/>

<https://pypi.org/project/delocate/>

#### Type

optional

#### Dependencies

- `$(PYTHON_TOOLCHAIN)`
- `$(PYTHON)`

#### Version Information

`requirements.txt`:

```
delocate
auditwheel; sys_platform != 'darwin'
```

#### Equivalent System Packages

(none known)

## 6.1.18 awali: Computation of/with finite state machines

### Description

Awali is a software platform dedicated to the computation of, and with, finite state machines. Here finite state machines is to be understood in the broadest possible sense: finite automata with output — often called transducers then — or even more generally finite automata with multiplicity, that is, automata that not only accept, or recognize, sequences of symbols but compute for every such sequence a ‘value’ that is associated with it and which can be taken in any semiring. Hence the variety of situations that can thus be modelled.

### License

- GPL 3.0

### Upstream Contact

- Website: <http://vauclans-project.org/Awali/index.html>
- Releases: <http://files.vauclans-project.org/tarballs/>

### Dependencies

- graphviz must be installed from your distro, and available in the path.

### Type

experimental

### Dependencies

- *cmake*: A cross-platform build system generator
- *cython*: C-Extensions for Python, an optimizing static compiler
- *nbconvert*: Converting Jupyter Notebooks
- *ncurses*: Classic terminal output library
- *\$(PYTHON)*

### Version Information

package-version.txt:

1.0.2-190218
--------------

### Equivalent System Packages

See <https://repology.org/project/awali/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.19 babel: Internationalization utilities for Python

### Description

A collection of tools for internationalizing Python applications.

### Upstream Contact

<http://babel.pocoo.org/en/latest/>

### Type

standard

### Dependencies

- \$(PYTHON\_TOOLCHAIN)
- *pytz: Timezone definitions for Python*
- \$(PYTHON)

### Version Information

package-version.txt:

2.12.1

install-requires.txt:

babel >=2.11.0

### Equivalent System Packages

arch:

```
$ sudo pacman -S python-babel
```

conda:

```
$ conda install babel
```

Debian/Ubuntu:

```
$ sudo apt-get install python3-babel
```

Fedora/Redhat/CentOS:

```
$ sudo yum install babel
```

gentoo:

```
$ sudo emerge dev-python/Babel
```

macports: install the following packages: py-babel

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-Babel
```

void:

```
$ sudo xbps-install python3-Babel
```

See <https://repology.org/project/python:babel/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

## 6.1.20 backcall: Specifications for callback functions

### Description

Specifications for callback functions passed in to an API

### Type

standard

### Dependencies

- `$(PYTHON_TOOLCHAIN)`
- *flit\_core*: Distribution-building parts of Flit. See `flit` package for more information
- `$(PYTHON)`

### Version Information

package-version.txt:

```
0.2.0
```

install-requires.txt:

```
backcall >=0.1.0
```

### Equivalent System Packages

conda:

```
$ conda install backcall
```

gentoo:

```
$ sudo emerge dev-python/backcall
```

macports: install the following packages: py-backcall

void:

```
$ sudo xbps-install python3-backcall
```

See <https://repology.org/project/python:backcall/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.21 barvinok: Projections of integer point sets of parametric polytopes

#### Description

barvinok is a library for counting the number of integer points in parametric and non-parametric polytopes as well as projections of such sets.

#### License

GPL v2

#### Upstream Contact

- <https://sourceforge.net/projects/barvinok/>
- <https://groups.google.com/group/isl-development>

#### Type

experimental

#### Dependencies

- *ntl: A library for doing number theory*
- *isl: Sets and relations of integer points bounded by affine constraints*
- *polylib: Operations on unions of polyhedra*

## Version Information

package-version.txt:

```
0.41.7
```

## Equivalent System Packages

freebsd:

```
$ sudo pkg install math/barvinok
```

openSUSE:

```
$ sudo zypper install barvinok "pkgconfig(barvinok)"
```

See <https://repology.org/project/barvinok/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.22 beautifulsoup4: Screen-scraping library

### Description

Screen-scraping library

### License

MIT

### Upstream Contact

<https://pypi.org/project/beautifulsoup4/>

### Type

standard

### Dependencies

- *soupsieve: A modern CSS selector implementation for Beautiful Soup.*
- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

### Version Information

package-version.txt:

```
4.11.1
```

install-requirements.txt:

```
beautifulsoup4
```

### Equivalent System Packages

alpine:

```
$ apk add py3-beautifulsoup4
```

arch:

```
$ sudo pacman -S python-beautifulsoup4
```

conda:

```
$ conda install beautifulsoup4
```

Debian/Ubuntu:

```
$ sudo apt-get install beautifulsoup4
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-beautifulsoup4
```

gentoo:

```
$ sudo emerge dev-python/beautifulsoup4
```

macports: install the following packages: py-beautifulsoup4

opensuse:

```
$ sudo zypper install python-beautifulsoup4
```

void:

```
$ sudo xbps-install python3-BeautifulSoup4
```

See <https://repology.org/project/python:beautifulsoup4/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.23 beniget: Extract semantic information about static Python code

#### Description

Extract semantic information about static Python code

#### License

BSD 3-Clause

#### Upstream Contact

<https://pypi.org/project/beniget/>

#### Type

standard

#### Dependencies

- *gast: Python AST that abstracts the underlying Python version*
- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

#### Version Information

package-version.txt:

```
0.4.1
```

install-requires.txt:

```
beniget
```

#### Equivalent System Packages

conda:

```
$ conda install beniget
```

gentoo:

```
$ sudo emerge dev-python/beniget
```

void:

```
$ sudo xbps-install python3-beniget
```

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

## 6.1.24 benzene: Generate fusenes and benzenoids with a given number of faces

### Description

Benzene is a program for the efficient generation of all nonisomorphic fusenes and benzenoids with a given number of faces. Fusenes are planar polycyclic hydrocarbons with all bounded faces hexagons. Benzenoids are fusenes that are subgraphs of the hexagonal lattice.

### License

Benzene is licensed under the GNU General Public License v2 or later (June 2007)

### Upstream Contact

Benzene was written by Gunnar Brinkmann and Gilles Caporossi. This version was adapted by Gunnar Brinkmann and Nico Van Cleemput for Grinvin.

<http://www.grinvin.org/>

### Type

optional

### Dependencies

### Version Information

package-version.txt:

20130630

### Equivalent System Packages

arch:

```
$ sudo pacman -S benzene
```

opensuse:

```
$ sudo zypper install benzene
```

See <https://repology.org/project/benzene/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.25 biopython: Tools for computational molecular biology

### Description

Freely available tools for computational molecular biology.

### License

### Upstream Contact

<https://pypi.org/project/biopython/>

<http://biopython.org/>

### Type

optional

### Dependencies

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.26 bleach: An HTML-sanitizing tool

### Description

An easy safelist-based HTML-sanitizing tool.

### License

Apache License v2

### Upstream Contact

Home Page: <https://github.com/mozilla/bleach>

### Type

standard

### Dependencies

- *packaging*: Core utilities for Python packages
- *six*: Python 2 and 3 compatibility utilities
- *webencodings*: Character encoding aliases for legacy web content
- \${PYTHON\_TOOLCHAIN}
- \${PYTHON}

### Version Information

package-version.txt:

```
5.0.1
```

install-requires.txt:

```
bleach >=3.1.5
```

### Equivalent System Packages

arch:

```
$ sudo pacman -S python-bleach
```

conda:

```
$ conda install bleach
```

Debian/Ubuntu:

```
$ sudo apt-get install python3-bleach
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-bleach
```

gentoo:

```
$ sudo emerge dev-python/bleach
```

macports: install the following packages: py-bleach

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-bleach
```

void:

```
$ sudo xbps-install python3-bleach
```

See <https://repology.org/project/python:bleach/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

## 6.1.27 bliss: Computing automorphism groups and canonical forms of graphs

### Description

bliss is an open source tool for computing automorphism groups and canonical forms of graphs.

### License

LGPL3

### Upstream Contact

Bliss is currently being maintained by Tommi Junttila at

<https://users.aalto.fi/~tjunttil/bliss/index.html>

Bliss used to be maintained by Tommi Junttila and Petteri Kaski up to version 0.73 at

<http://www.tcs.tkk.fi/Software/bliss/index.html>

### Dependencies

None

### Type

optional

### Dependencies

- *cmake: A cross-platform build system generator*

### Version Information

package-version.txt:

```
0.77
```

### Equivalent System Packages

arch:

```
$ sudo pacman -S bliss
```

conda:

```
$ conda install bliss
```

```

See <https://repology.org/project/bliss-graphs/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

### 6.1.28 boost\_cropped: Portable C++ libraries (subset needed for Sage)

#### Description

Boost provides free peer-reviewed portable C++ source libraries.

We emphasize libraries that work well with the C++ Standard Library. Boost libraries are intended to be widely useful, and usable across a broad spectrum of applications. The Boost license encourages both commercial and non-commercial use.

We aim to establish “existing practice” and provide reference implementations so that Boost libraries are suitable for eventual standardization. Ten Boost libraries are already included in the C++ Standards Committee’s Library Technical Report (TR1) and will be in the new C++0x Standard now being finalized. C++0x will also include several more Boost libraries in addition to those from TR1. More Boost libraries are proposed for TR2.

## License

Boost Software License - see <http://www.boost.org/users/license.html>

## Upstream Contact

Website: <http://www.boost.org/>

See mailing list page at <http://www.boost.org/community/groups.html>

## Type

```

slackware:

```
$ sudo slackpkg install boost
```

void:

```
$ sudo xbps-install boost-devel
```

See <https://repology.org/project/boost/versions>

If the system package is installed, `./configure` will check if it can be used.

### 6.1.29 brial: Boolean Ring Algebra implementation using binary decision diagrams

#### Description

BRiAl (“Boolean Ring Algebra”) is the successor to PolyBoRi.

The core of PolyBoRi is a C++ library, which provides high-level data types for Boolean polynomials and monomials, exponent vectors, as well as for the underlying polynomial rings and subsets of the powerset of the Boolean variables. As a unique approach, binary decision diagrams are used as internal storage type for polynomial structures. On top of this C++-library we provide a Python interface. This allows parsing of complex polynomial systems, as well as sophisticated and extendable strategies for Gröbner base computation. PolyBoRi features a powerful reference implementation for Gröbner basis computation.

#### License

GPL version 2 or later

#### Upstream Contact

<https://github.com/BRiAl/BRiAl>

#### Type

standard

## Dependencies

- *boost\_cropped*: Portable C++ libraries (subset needed for Sage)
- *m4ri*: fast arithmetic with dense matrices over GF(2)
- *libpng*: Bitmap image support
- *pkgconf*: An implementation of the pkg-config spec

## Version Information

package-version.txt:

```
1.2.8
```

## Equivalent System Packages

arch:

```
$ sudo pacman -S brial
```

conda:

```
$ conda install brial
```

Debian/Ubuntu:

$ nix-env --install brial
```

opensuse:

```
$ sudo zypper install brial-devel
```

void:

```
$ sudo xbps-install brial-devel
```

See <https://repology.org/project/brial/versions>

If the system package is installed, ./configure will check if it can be used.

## 6.1.30 buckygen: Efficient generation of nonisomorphic fullerenes

### Description

Buckygen is a program for the efficient generation of all nonisomorphic fullerenes. These are triangulations where all vertices have degree 5 or 6. Or if the dual representation is used: cubic plane graphs where all faces are pentagons or hexagons.

### License

Buckygen is licensed under the GNU General Public License v3 (June 2007)

### Upstream Contact

Buckygen was mainly written by Jan Goedgebeur, jan.goedgebeur[at]ugent.be.

<http://caagt.ugent.be/buckygen/>

### Type

optional

### Dependencies

#### Version Information

package-version.txt:

```
1.1
```

### Equivalent System Packages

arch:

```
$ sudo pacman -S buckygen
```

opensuse:

```
$ sudo zypper install buckygen
```

See <https://repology.org/project/buckygen/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

### 6.1.31 bzip2: High-quality data compressor

#### Description

bzip2 is a freely available, patent free, high-quality data compressor.

It typically compresses files to within 10% to 15% of the best available techniques (the PPM family of statistical compressors), whilst being around twice as fast at compression and six times faster at decompression.

#### License

BSD-style

#### Upstream Contact

- Website <http://bzip.org/>
- Author: Julian Seward <julian@bzip.org>

#### Special Update/Build Instructions

This package must not be bzip2 compressed, so create it using

```
tar c bzip2-1.0.6 | gzip --best >bzip2-1.0.6.spkg
```

The build system has been autotoolized based on a patch by the Suse folk at [http://ftp.uni-kl.de/pub/linux/suse/people/srabec/bzip2/for\\_downstream/bzip2-1.0.6-autoconfiscated.patch](http://ftp.uni-kl.de/pub/linux/suse/people/srabec/bzip2/for_downstream/bzip2-1.0.6-autoconfiscated.patch)

See patches/autotools and spkg-src for details.

#### Type

standard

#### Dependencies

- *pkgconf*: An implementation of the *pkg-config* spec

#### Version Information

package-version.txt:

```
1.0.6-20150304.p0
```

## Equivalent System Packages

alpine:

```
$ apk add bzip2
```

conda:

```
$ conda install bzip2
```

cygwin:

```
$ apt-cyg install bzip2 libbz2-devel
```

Debian/Ubuntu:

```
$ sudo apt-get install libbz2-dev bzip2
```

Fedora/Redhat/CentOS:

```
$ sudo yum install bzip2 bzip2-devel
```

homebrew:

```
$ brew install bzip2
```

opensuse:

```
$ sudo zypper install bzip2 "pkgconfig(bzip2)"
```

slackware:

```
$ sudo slackpkg install bzip2
```

void:

```
$ sudo xbps-install bzip2-devel
```

See <https://repology.org/project/bzip2/versions>

If the system package is installed, ./configure will check if it can be used.

### 6.1.34 cbc: COIN-OR branch and cut solver for mixed-integer programs

#### Description

The Computational Infrastructure for Operations Research (COIN-OR\*\*, or simply COIN) project is an initiative to spur the development of open-source software for the operations research community.

The COIN Branch and Cut solver (CBC) is an open-source mixed-integer program (MIP) solver written in C++. CBC is intended to be used primarily as a callable library to create customized branch-and-cut solvers. A basic, stand-alone executable version is also available.

```

See <https://repology.org/project/ccache/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

### 6.1.36 cddlib: Double description method for polyhedral representation conversion

**Description**

The C-library cddlib is a C implementation of the Double Description Method of Motzkin et al. for generating all vertices (i.e. extreme points) and extreme rays of a general convex polyhedron in  $R^d$  given by a system of linear inequalities:

$$P = \{ x = (x_1, \dots, x_d)^T : b - Ax \geq 0 \}$$

where A is a given  $m \times d$  real matrix, b is a given  $m$ -vector and 0 is the  $m$ -vector of all zeros.

The program can be used for the reverse operation (i.e. convex hull computation). This means that one can move back and forth between an inequality representation and a generator (i.e. vertex and ray) representation of a polyhedron

## Packages and Features, Release 10.2

---

with cdd. Also, cdd can solve a linear programming problem, i.e. a problem of maximizing and minimizing a linear function over P.

If the system package is installed, ./configure will check if it can be used.

### 6.1.42 cmake: A cross-platform build system generator

#### Description

The “cmake” executable is the CMake command-line interface. It may be used to configure projects in scripts. Project configuration settings may be specified on the command line with the -D option. The -i option will cause cmake to interactively prompt for such settings.

CMake is a cross-platform build system generator. Projects specify their build process with platform-independent CMake listfiles included in each directory of a source tree with the name CMakeLists.txt. Users build a project by using CMake to generate a build system for a native tool on their platform.

### License

CMake is distributed under the OSI-approved BSD 3-clause License.

```

See <https://repology.org/project/sagemath-conway-polynomials/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.49 coxeter3: Library for Coxeter groups, Bruhat ordering, Kazhdan-Lusztig polynomials

### Description

This package wraps Fokko Ducloux's Coxeter 3 C++ library

Features:

- General Coxeter groups, implemented through the combinatorics of reduced words;
- Reduced expression and normal form computations;
- Bruhat ordering;
- Ordinary Kazhdan-Lusztig polynomials;
- Kazhdan-Lusztig polynomials with unequal parameters;
- Inverse Kazhdan-Lusztig polynomials;
- Cells and W-graphs;

[http://math.univ-lyon1.fr/~ducloux/coxeter/coxeter3/english/coxeter3\\_e.html](http://math.univ-lyon1.fr/~ducloux/coxeter/coxeter3/english/coxeter3_e.html)

This is a patched version done by Mike Hansen 2009-2013 and some fixes by Nicolas M. Thiéry and Jean-Pierre Flori.

### License

GPL

### Upstream Contact

github: <https://github.com/tscrim/coxeter>

Alas, Fokko Ducloux passed away in 2006.

[http://math.univ-lyon1.fr/~ducloux/du\\_Cloux.html](http://math.univ-lyon1.fr/~ducloux/du_Cloux.html)

### Special Update/Build Instructions

The source package was created by running

```
commit=8ac9c71723c8ca57a836d6381aed125261e44e9e  
git clone https://github.com/tscrim/coxeter.git  
cd coxeter

```

If the system package is installed and if the (experimental) option –enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.

## 6.1.51 cryptominisat: A SAT solver

### Description

CryptoMiniSat is a SAT solver that aims to become a premiere SAT solver with all the features and speed of successful SAT solvers, such as MiniSat and PrecoSat. The long-term goals of CryptoMiniSat are to be an efficient sequential, parallel and distributed solver. There are solvers that are good at one or the other, e.g. ManySat (parallel) or PSolver (distributed), but we wish to excel at all.

CryptoMiniSat 2.5 won the SAT Race 2010 among 20 solvers submitted by researchers and industry.

- Releases: <https://github.com/msoos/cryptominisat/releases>

### Special Update/Build Instructions

CryptoMiniSat's tarball downloaded from github is called VERSION.tar.gz and should be renamed to cryptominisat-VERSION.tar.gz Its Python module is installed by the pycryptosat spkg.

### Type

optional

### Dependencies

- *m4ri: fast arithmetic with dense matrices over GF(2)*
- *zlib: Data compression library*
- *libpng: Bitmap image support*
- *cmake: A cross-platform build system generator*
- *boost\_cropped: Portable C++ libraries (subset needed for Sage)*
- \$(PYTHON)

### Version Information

package-version.txt:

```
5.8.0
```

### Equivalent System Packages

conda:

```
$ conda install cryptominisat
```

homebrew:

```
$ brew install cryptominisat
```

See <https://repology.org/project/cryptominisat/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.52 csdp: Solver for semidefinite programs

### Description

This is a fast SDP solver written in C, with a callable library namely, an autotool'ed version of CSDP, by Brian Borchers, see <https://projects.coin-or.org/Csdp>

### License

Common Public License Version 1.0

### Upstream Contact

Dmitrii Pasechnik <[dimpase+sage@gmail.com](mailto:dimpase+sage@gmail.com)>

### Special Update/Build Instructions

csdp is an autotool'ed version of CSDP, see <https://projects.coin-or.org/Csdp>, developed in its own repository at <https://github.com/dimpase/csdp>.

To update to a new version, you need to bump the version number in configure.ac and rerun autotools (autoreconf -fiv). Any changes should be merged to the upstream repo.

The build is done with NOSHORTS variable defined; this makes it compatible with packages, where NOSHORTS must be defined, e.g. <https://github.com/dimpase/pycsdp>; also the Sage Cython interface needs NOSHORTS defined.

Detailed steps to build the spkg are as follows. You need

- git
- autotools and libtool (the full autohell suite, version at least 2.67)

With these ready:

- ./spkg-src
- copy the resulting csdp-<version>.tar.gz to SAGE\_ROOT/upstream, or somewhere else appropriate

### Type

optional

### Dependencies

- \$(BLAS)

### Version Information

package-version.txt:

```
6.2.p1
```

### Equivalent System Packages

arch:

```
$ sudo pacman -S coin-or-csdp
```

See <https://repology.org/project/coin-or-csdp/versions>, <https://repology.org/project/csdp/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.53 cunningham\_tables: List of the prime numbers occuring in the Cunningham table

The script `read_cunningham_prime_factors.py` was used to generate the data set from the file <http://cage.ugent.be/~jdemeyer/cunningham/main.gz>. We include a local copy, `main.gz` (see comments in the file for details)

### Type

optional

### Dependencies

### Version Information

package-version.txt:

```
1.0
```

### Equivalent System Packages

See <https://repology.org/project/cunningham-tables/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.54 curl: Multiprotocol data transfer library and utility

### Description

Multiprotocols data transfer library (and utility).

### License

“MIT style license” : see file “COPYING” at the root of the source tarball, explanations at <https://curl.haxx.se/docs/copyright.html>.

### Upstream Contact

According to the file README at the root of the tarball, contact is done by mailing <https://curl.haxx.se/mail/>

### Type

standard

### Dependencies

- *openssl: Implementation of the SSL and TLS protocols*

### Version Information

package-version.txt:

```
7.84.0
```

### Equivalent System Packages

alpine:

```
$ apk add curl
```

conda:

```
$ conda install curl

$ sudo slackpkg install curl cyrus-sasl openldap-client libssh2
```

void:

```
$ sudo xbps-install curl libcurl-devel
```

See <https://repology.org/project/curl/versions>

If the system package is installed, ./configure will check if it can be used.

### 6.1.55 cvxopt: Python software for convex optimization

#### Description

CVXOPT is a free software package for convex optimization based on the Python programming language. It can be used with the interactive Python interpreter, on the command line by executing Python scripts, or integrated in other software via Python extension modules. Its main purpose is to make the development of software for convex optimization applications straightforward by building on Python's extensive standard library and on the strengths of Python as a high-level programming language.

freebsd:

```
$ sudo pkg install math/py-cvxopt
```

gentoo:

```
$ sudo emerge dev-python/cvxopt
```

macports: install the following packages: py-cvxopt

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-cvxopt
```

See <https://repology.org/project/python:cvxopt/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.56 cvxpy: A domain-specific language for modeling convex optimization problems in Python.

#### Description

A domain-specific language for modeling convex optimization problems in Python.

#### License

Apache License, Version 2.0

#### Upstream Contact

<https://pypi.org/project/cvxpy/>

#### Type

optional

#### Dependencies

- *numpy: Package for scientific computing with Python*
- *scipy: Scientific tools for Python*
- *glpk: GNU Linear Programming Kit*
- *cvxopt: Python software for convex optimization*
- *osqp\_python: The Operator Splitting QP Solver (Python wrapper)*
- *ecos\_python: Embedded Cone Solver (Python wrapper)*
- *scs: Splitting conic solver*
- *\$(PYTHON\_TOOLCHAIN)*

- \$(PYTHON)

## Version Information

package-version.txt:

```
1.3.0
```

install-requires.txt:

```
cvxpy
```

## Equivalent System Packages

conda:

```
$ conda install cvxpy
```

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

### 6.1.57 cycler: Composable cycles

#### Description

Cycler is a small break-off of matplotlib to deal with “composable cycles”. It is a required dependency of matplotlib 1.5.0.

#### License

BSD

#### Upstream Contact

cycler is developed on github: <https://github.com/matplotlib/cycler>

A more informative webpage about cycler, its motivation and usage is at <http://tacaswell.github.io/cycler/>

#### Type

standard

### Dependencies

- \${PYTHON\_TOOLCHAIN}
- \${PYTHON}

### Version Information

package-version.txt:

```
0.11.0
```

install-requires.txt:

```
cycler >=0.10.0
```

### Equivalent System Packages

arch:

```
$ sudo pacman -S python-cycler
```

conda:

```
$ conda install cycler
```

Debian/Ubuntu:

```
$ sudo apt-get install python3-cycler
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-cycler
```

freebsd:

```
$ sudo pkg install devel/py-cycler
```

gentoo:

```
$ sudo emerge dev-python/cycler
```

macports: install the following packages: py-cycler

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-Cycler
```

void:

```
$ sudo xbps-install python3-cycler
```

See <https://repology.org/project/cycler/versions>, <https://repology.org/project/python:cycler/versions>

If the system package is installed and if the (experimental) option --enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.

## 6.1.58 cylp: A Python interface for CLP, CBC, and CGL

### Description

A Python interface for CLP, CBC, and CGL

### License

Eclipse Public License (EPL) version 2 (without a Secondary Licenses Notice).

## Equivalent System Packages

(none known)

## 6.1.59 cypari2: Python interface to the number theory library libpari

### Description

A Python interface to the number theory library libpari.

### License

GPL version 2 or later

### Upstream Contact

<https://github.com/defeo/cypari2>

### Type

standard

### Dependencies

- *cython: C-Extensions for Python, an optimizing static compiler*
- *pari: Computer algebra system for fast computations in number theory*
- *cysignals: Interrupt and signal handling for Cython*
- *\$(PYTHON\_TOOLCHAIN)*
- *\$(PYTHON)*

### Version Information

package-version.txt:

2.1.4

install-requires.txt:

cypari2 >=2.1.1

## Equivalent System Packages

conda:

```
$ conda install cypari2
```

gentoo:

```
$ sudo emerge dev-python/cypari2
```

See <https://repology.org/project/python:cypari2/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

## 6.1.60 cysignals: Interrupt and signal handling for Cython

### Description

Interrupt and signal handling for Cython

### License

LGPL version 3 or later

### Upstream Contact

<https://github.com/sagemath/cysignals>

### Type

standard

### Dependencies

- *cython: C-Extensions for Python, an optimizing static compiler*
- *pari: Computer algebra system for fast computations in number theory*
- `$(PYTHON_TOOLCHAIN)`
- `$(PYTHON)`

### Version Information

package-version.txt:

```
1.11.4
```

install-requirements.txt:

```
cysignals >=1.10.2
```

### Equivalent System Packages

conda:

```
$ conda install cysignals
```

gentoo:

```
$ sudo emerge dev-python/cysignals
```

See <https://repology.org/project/cysignals/versions>, <https://repology.org/project/python:cysignals/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

## 6.1.61 cython: C-Extensions for Python, an optimizing static compiler

### Description

Cython is a language that makes writing C extensions for the Python language as easy as Python itself. Cython is based on the well-known Pyrex, but supports more cutting edge functionality and optimizations.

The Cython language is very close to the Python language, but Cython additionally supports calling C functions and declaring C types on variables and class attributes. This allows the compiler to generate very efficient C code from Cython code.

This makes Cython the ideal language for wrapping for external C libraries, and for fast C modules that speed up the execution of Python code.

### License

Apache License, Version 2.0

### Upstream Contact

```

See <https://repology.org/project/python:cython/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.62 d3js: JavaScript library for manipulating documents based on data

#### Description

D3.js is a JavaScript library for manipulating documents based on data. The file `d3.min.js` will be placed into the `$(SAGE_SHARE)/d3js/` directory.

#### License

BSD 3-Clause License

#### Upstream Contact

- Author: Mike Bostock (<http://bostocks.org/mike/>)
- Home page: <http://d3js.org/>

#### Special Update/Build Instructions

Two kind of archives can be downloaded from d3.js website: one with all source code and tests that weights 2,9M (both in zip and tar.gz formats) and one with the final javascript scripts which weights 121K (zip format only). Since testing requires node.js that is not shipped with Sage, we currently ship the final js only. Hence we have to transform it from zip to tar.gz format. Running sage-src should do all the repackaging job.

#### Type

optional

## Dependencies

### Version Information

package-version.txt:

3.4.8
-------

## Equivalent System Packages

See <https://repology.org/project/node:d3/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.63 database\_cremona\_ellcurve: Database of elliptic curves

### Description

John Cremona's database of elliptic curves

See <https://github.com/JohnCremona/ecdata>

This is an optional package, not included by default.

### License

Public Domain

### Upstream Contact

- Author: John Cremona
- Email: [john.cremona@gmail.com](mailto:john.cremona@gmail.com)
- Website: <http://homepages.warwick.ac.uk/staff/J.E.Cremona/>

### Update Instructions

Get an up-to-date copy of the git repository ecdata from <https://github.com/JohnCremona/ecdata>.

If the cremona database has already been installed, remove `SAGE_DATA/cremona/cremona.db`. Then run

The build script expects to find the files in subfolders `allcurves`, `allgens`, `degphi` and `allbsd` of the `ecdata` folder. It extracts them and builds the new `cremona.db` file from the contents.

Finally, copy `SAGE_DATA/cremona/cremona.db` to the `src` directory of the spkg.

## Type

optional

## Dependencies

### Version Information

package-version.txt:

20190911

## Equivalent System Packages

See <https://repology.org/project/sage-data-cremona-ellcurve/versions>, <https://repology.org/project/sagemath-database-cremona-elliptic-curves/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.64 database\_cubic\_hecke: Ivan Marin’s representations of the cubic Hecke algebra

### Description

Ivan Marin’s representations of the cubic Hecke algebra on 4 strands as Python dictionaries

### License

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

### 6.1.68 database\_mutation\_class: Database of exceptional mutation classes of quivers

#### Description

Contains a database of all exceptional mutation classes of quivers.

Every file in the database is of the form `mutation_classes_n.dig6` for some `n` and

- contains a `cPickle.dump` of a dictionary where
- the keys are tuples representing irreducible exceptional quiver mutation types of rank `n`, and
- the values are all quivers in the given mutation class stored in canonical form as `(dig6, edges)` where
- `dig6` is the `dig6` data of the given `DiGraph`, and
- `edges` are the non-simply-laced edges thereof.

- is obtained by running the function

```
sage.combinat.cluster_algebra_quiver.quiver_mutation_type._save_data_dig6(n,  
types='Exceptional', verbose=False)
```

### SPKG Maintainers

- C. Stump <christian.stump@gmail.com>

### Type

optional

### Dependencies

### Version Information

package-version.txt:

## 6.1.72 database\_symbolic\_data: Database from the SymbolicData project

### Description

The SymbolicData project is set out

- to develop concepts and tools for profiling, testing and benchmarking Computer Algebra Software (CAS) and
- to collect and interlink relevant data and activities from different Computer Algebra Communities.

SymbolicData is an

- inter-community project that has its roots in the activities of different Computer Algebra Communities and

- aims at interlinking these activities using modern Semantic Web concepts.

Tools and data are designed to be used both

- on a local site for special testing and profiling purposes
- and to manage a central repository at [www.symbolicdata.org](http://www.symbolicdata.org).

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.81 dot2tex: Create PGF/TikZ commands from Graphviz output

#### Description

dot2tex is a Python module, whose purpose is to give graphs generated by Graphviz a more LaTeX friendly look and feel. This is accomplished by converting xdot output from Graphviz to a series of PSTricks or PGF/TikZ commands.

See <https://github.com/kjellmf/dot2tex/>

#### License

- MIT

#### Upstream Contact

- Kjell Magne Fauske, [km@fauskes.net](mailto:km@fauskes.net)

#### Dependencies

graphviz ([www.graphviz.org](http://www.graphviz.org)) should be installed and in the path (for example via the graphviz spkg).

preview, a LaTeX package for extracting parts of a document.

Self-tests dependencies:

- graphviz
- texlive-latex-base
- texlive-pictures
- texlive-pstricks

### Patches

- remove\_test\_semicolon.patch:

Remove the failing semicolon test for the open dot2tex issue #5 - <https://github.com/kjellmf/dot2tex/issues/5>

### Special Update/Build Instructions

Make sure corresponding optional doctests still pass:

```
sage -t --long --optional=dot2tex,graphviz,sage src/
```

### Type

optional

### Dependencies

- \$(PYTHON\_TOOLCHAIN)
- *pyparsing: A Python parsing module*
- \$(PYTHON)

### Version Information

package-version.txt:

```
2.11.3.p0
```

install-requires.txt:

```
dot2tex >=2.11.3
```

$ conda install dot2tex
```

macports: install the following packages: dot2tex

See <https://repology.org/project/dot2tex/versions>, <https://repology.org/project/python:dot2tex/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.82 dsdp: Semidefinite programming solver

### Description

Implementation of an interior-point method for semidefinite programming. It provides primal and dual solutions, exploits low-rank structure and sparsity in the data, and has relatively low memory requirements for an interior-point method. It allows feasible and infeasible starting points and provides approximate certificates of infeasibility when no feasible solution exists. The dual-scaling algorithm implemented in this package has a convergence proof and worst-case polynomial complexity under mild assumptions on the data.

### License

$ sudo emerge sci-libs/dsdp
```

macports: install the following packages: DSDP

See <https://repology.org/project/dsdp/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

### 6.1.83 e\_antic: Real embedded number fields

#### Description

e-antic is a C library for exact computations with real embedded number field maintained by Vincent Delecroix.

Website: <https://github.com/videlec/e-antic>

#### License

e-antic is licensed GPL v3.

#### Upstream Contact

- <https://github.com/videlec/e-antic>

#### Type

optional

#### Dependencies

- \$(MP\_LIBRARY)
- *flint: Fast Library for Number Theory*
- *arb: Arbitrary-precision floating-point ball arithmetic*
- *antic: Algebraic Number Theory In C*
- *boost\_cropped: Portable C++ libraries (subset needed for Sage)*

## Version Information

package-version.txt:

```
1.3.0
```

## Equivalent System Packages

arch:

```
$ sudo pacman -S e-antic
```

conda:

```
$ conda install libeantic
```

Debian/Ubuntu:

```
$ sudo apt-get install libeantic-dev
```

Fedora/Redhat/CentOS:

```
$ sudo yum install e-antic-devel
```

freebsd:

```
$ sudo pkg install math/e-antic
```

opensuse:

```
$ sudo zypper install e-antic-devel
```

See <https://repology.org/project/e-antic/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.84 ecl: An implementation of the Common Lisp language

### Description

ECL is an implementation of the Common Lisp language as defined by the ANSI X3J13 specification. The most relevant features:

- A bytecodes compiler and interpreter.
- Compiles Lisp also with any C/C++ compiler.
- It can build standalone executables and libraries.
- ASDF, Sockets, Gray streams, MOP, and other useful components.
- Extremely portable.
- A reasonable license.

ECL supports the operating systems Linux, FreeBSD, NetBSD, OpenBSD, Solaris and Windows, running on top of the Intel, Sparc, Alpha and PowerPC processors. Porting to other architectures should be rather easy.

Website: <https://common-lisp.net/project/ecl/>

### License

- LGPL V2+ or compatible - for details see  
<https://common-lisp.net/project/ecl/static/manual/Copyrights.html#Copyright-of-ECL>

### Upstream Contact

- the ECL mailing list - see <https://mailman.common-lisp.net/listinfo/ecl-devel>

### Special Update/Build Instructions

- Note: for the time being, ECL is built single threaded library as it seems to interact badly with the pexpect interface and Sage's signal handling when built multithreaded.
- Do NOT quote SAGE\_LOCAL when setting CPPFLAGS and/or LDFLAGS, in spkg-install as this caused the build to break. See [github issue #10187#comment:117](#)
- TODO: Add the ECL test suite, and an spkg-check file to run it.
- TODO: Make ECL use Sage's Boehm GC on MacOS X as well (but perhaps put some changes from ECL's into Sage's Boehm GC), then remove the src/src/gc directory, too.

### Type

standard

### Dependencies

- \$(MP\_LIBRARY)
- *readline*: Command line editing library
- *gc*: The Boehm-Demers-Weiser conservative garbage collector
- *libffi*: A portable foreign-function interface library
- *info*: stand-alone Info documentation reader

### Version Information

package-version.txt:

21.2.1

```

macports: install the following packages: ecl

nix:

```
$ nix-env --install ecl
```

void:

```
$ sudo xbps-install ecl
```

See <https://repology.org/project/ecl/versions>

If the system package is installed, ./configure will check if it can be used.

## 6.1.85 `eclib`: Enumerating and computing with elliptic curves defined over the rational numbers

### Description

John Cremona's programs for enumerating and computing with elliptic curves defined over the rational numbers.

`mwrank` is a program written in C++ for computing Mordell-Weil groups of elliptic curves over  $\mathbb{Q}$  via 2-descent. It is available as source code in the `eclib` package, which may be distributed under the GNU General Public License, version 2, or any later version.

`mwrank` is now only distributed as part of `eclib`. `eclib` is also included in Sage, and for most potential users the easiest way to run `mwrank` is to install Sage (which also of course gives you much more). I no longer provide a source code distribution of `mwrank` by itself: use `eclib` instead.

### License

`eclib` is licensed GPL v2+.

### Upstream Contact

- Author: John Cremona
- Email: [john.cremona@gmail.com](mailto:john.cremona@gmail.com)
- Website: <http://homepages.warwick.ac.uk/staff/J.E.Cremona/mwrank/index.html>
- Repository: <https://github.com/JohnCremona/eclib>

### Type

```

See <https://repology.org/project/eclib/versions>

If the system package is installed, ./configure will check if it can be used.

### 6.1.86 ecm: Elliptic curve method for integer factorization

#### Description

GMP-ECM - Elliptic Curve Method for Integer Factorization

Sources can be obtained from <https://gitlab.inria.fr/zimmerma/ecm>

### License

LGPL V3+

### Upstream Contact

- [ecm-discuss@inria.fr](mailto:ecm-discuss@inria.fr)

### Special Update/Build Instructions

- GMP-ECM comes with a self-tuning feature; we could support that as an option (\$SAGE\_TUNE\_\*=yes) in the future.
- ECM currently does not (by itself) use the CC and CFLAGS settings from ‘gmp.h’ since we pass (other) options in CFLAGS, and CC is set by Sage and might get set by the user. We now at least partially fix that such that “optimized” code generation options ('-mcpu=...', '-mtune=...') are used by gcc. Of course a user can also manually enable them by setting the “global” CFLAGS to e.g. ‘-march=native’ on x86[\_64] systems, or ‘-mcpu=...' and ‘-mtune=...' on other architectures where “native” isn’t supported. Note that this doesn’t affect the packages’ selection of processor-specific optimized [assembly] code. ‘spkg-install’ already reads the settings from Sage’s and also a system-wide GMP now, but doesn’t (yet) use all of them. If SAGE\_FAT\_BINARY=”yes”, we should avoid too specific settings of “-mcpu=...”, and perhaps pass a more generic “–host=...” to ‘configure’.
- We currently work around a linker bug on MacOS X 10.5 PPC (with GCC 4.2.1) which breaks ‘configure’ if debug symbols are enabled. This \*might\* get fixed in later upstream releases.
- We could save some space by removing the `src/build.vc10/` directory which isn’t used in Sage. (It gets probably more worth in case also directories / files for later versions of Microsoft Visual C get added.)

### Type

standard

### Dependencies

- \$(MP\_LIBRARY)

### Version Information

package-version.txt:

7.0.5
-------

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

## 6.1.101 freetype: A free, high-quality, and portable font engine

### Description

From the documentation:

FreeType is a software font engine that is designed to be small, efficient, highly customizable, and portable while capable of producing high-quality output (glyph images). It can be used in graphics libraries, display servers, font conversion tools, text image generation tools, and many other products as well.

Note that FreeType is a font service and doesn't provide APIs to perform higher-level features like text layout or graphics processing (e.g., colored text rendering, 'hollowing', etc.). However, it greatly simplifies these tasks by providing a simple, easy to use, and uniform interface to access the content of font files.

Please note that 'FreeType' is also called 'FreeType 2', to distinguish it from the old, deprecated 'FreeType 1' library, a predecessor no longer maintained and supported.

The package in Sage is called `freetype` (in lowercase).

### License

- FreeType (BSD-like)
- GNU Public License v2

From the documentation:

FreeType is released under two open-source licenses: our own BSD-like FreeType License and the GNU Public License, Version 2. It can thus be used by any kind of projects, be they proprietary or not.

### Upstream Contact

- home: <https://www.freetype.org>

- *bzip2: High-quality data compressor*

### Version Information

package-version.txt:

```
2.10.4
```

### Equivalent System Packages

alpine:

```
$ apk add freetype-dev
```

conda:

```
$ conda install freetype
```

cygwin:

```
$ apt-cyg install libfreetype-devel
```

Debian/Ubuntu:

```
$ sudo apt-get install libfreetype-dev
```

freebsd:

```
$ sudo pkg install print/freetype2
```

homebrew:

```
$ brew install freetype
```

macports: install the following packages: freetype

nix:

```
$ nix-env --install freetype
```

opensuse:

```
$ sudo zypper install "pkgconfig(freetype2)"
```

slackware:

```
$ sudo slackpkg install freetype harfbuzz glib glib2
```

void:

```
$ sudo xbps-install freetype-devel
```

See <https://repology.org/project/freetype/versions>

If the system package is installed, ./configure will check if it can be used.

### 6.1.102 fricas: A general purpose computer algebra system

#### Description

FriCAS is a general purpose computer algebra system.

#### License

Modified BSD license.

#### Upstream Contact

<http://fricas.sourceforge.net/>

#### Type

optional

#### Dependencies

- *ecl: An implementation of the Common Lisp language*

#### Version Information

package-version.txt:

```
1.3.8.p1
```

#### Equivalent System Packages

macports: install the following packages: fricas

See <https://repology.org/project/fricas/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

### 6.1.103 frobby: Computations on monomial ideals

#### Description

The software package Frobby provides a number of computations on monomial ideals. The current main feature is the socle of a monomial ideal, which is largely equivalent to computing the maximal standard monomials, the Alexander dual or the irreducible decomposition.

Operations on monomial ideals are much faster than algorithms designed for ideals in general, which is what makes a specialized library for these operations on monomial ideals useful.

#### License

- GPL version 2.0 or later

#### Upstream Contact

- <http://www.broune.com/frobby/>
- <https://github.com/Macaulay2/frobby>

#### Special Update/Build instructions

Download Frobby at [www.broune.com/](http://www.broune.com/) and then type “make spkg VER=blah” which wil create an spkg named frobby-VER.spkg in bin/. The files related to doing this is in the sage/ sub-directory of the Frobby source distribution.

#### Type

optional

#### Dependencies

- \$(MP\_LIBRARY)

#### Version Information

package-version.txt:

```
0.9.0.p2
```

#### Equivalent System Packages

See <https://repology.org/project/frobby/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.104 furo: A clean customizable Sphinx documentation theme

### Description

A clean customizable Sphinx documentation theme.

### License

#### Upstream Contact

<https://pypi.org/project/furo/>

### Type

standard

### Dependencies

- *beautifulsoup4: Screen-scraping library*
- *sphinx: Python documentation generator*
- *pygments: Generic syntax highlighter*
- *sphinx\_basic\_ng: A modern skeleton for Sphinx themes.*
- *\$(PYTHON\_TOOLCHAIN)*
- *\$(PYTHON)*

### Version Information

package-version.txt:

```
2022.9.29
```

install-requirements.txt:

```
furo
```

### Equivalent System Packages

arch:

```
$ sudo pacman -S python-sphinx-furo
```

conda:

```
$ conda install furo
```

Debian/Ubuntu:

```
$ sudo apt-get install furo
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-furo
```

freebsd:

```
$ sudo pkg install textproc/py-furo
```

gentoo:

```
$ sudo emerge dev-python/furo
```

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.105 **gambit**: Computations on finite, noncooperative games

#### Description

Gambit is a set of software tools for doing computation on finite, noncooperative games. The Gambit Project was founded in the mid-1980s by Richard McKelvey at the California Institute of Technology.

#### License

GPL v2+

#### Upstream Contact

- Website: <http://www.gambit-project.org/>
- Mailing List: <http://sourceforge.net/p/gambit/mailman/gambit-devel/>

#### Dependencies

- python
- cython
- setuptools
- IPython
- scipy

**Type**

experimental

**Dependencies**

- *cython: C-Extensions for Python, an optimizing static compiler*
- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

**Version Information**

package-version.txt:

$ brew install gambit
```

See <https://repology.org/project/gambit-game-theory/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.106 gap: Groups, Algorithms, Programming - a system for computational discrete algebra

**Description**

GAP is a system for computational discrete algebra, with particular emphasis on Computational Group Theory. GAP provides a programming language, a library of thousands of functions implementing algebraic algorithms written in the GAP language as well as large data libraries of algebraic objects. See also the overview and the description of the mathematical capabilities. GAP is used in research and teaching for studying groups and their representations, rings, vector spaces, algebras, combinatorial structures, and more. The system, including source, is distributed freely. You can study and easily modify or extend it for your special use.

This is a stripped-down version of GAP. The databases, which are architecture-independent, are in a separate package.

### Upstream Contact

<https://www.gap-system.org>

Mailing list at <https://mail.gap-system.org/mailman/listinfo/gap>

### Special Update/Build Instructions

This is a stripped-down version of GAP. The downloading of the sources and removal of unneeded parts is done by the script spkg-src. When you update GAP, please also update and use the spkg-src script.

- Do we really want to copy everything from the build directory???

You need the full GAP tree to compile/install many GAP packages.

- There's apparently a command missing (in spkg-install) building the (HTML?) documentation. Earlier changelog entries as well as the description above state the documentation was removed from the upstream sources... Since the (pre-)built HTML documentation is currently included, I've commented out some lines in that part of spkg-install. -leif

### Patches

#### Type

standard

### Dependencies

- *ncurses*: Classic terminal output library
- *readline*: Command line editing library
- *zlib*: Data compression library
- \$(MP\_LIBRARY)

### Version Information

package-version.txt:

```
4.12.2
```

### Equivalent System Packages

arch:

```
$ sudo pacman -S gap
```

conda:

```
$ conda install gap-defaults>=4.12.2
```

Debian/Ubuntu:

```
$ sudo apt-get install libgap-dev
```

freebsd:

```
$ sudo pkg install math/gap
```

nix:

```
$ nix-env --install gap
```

See <https://repology.org/project/gap/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

### 6.1.107 gap3: A minimal distribution of GAP 3 containing packages that have no equivalent in GAP 4

#### Description

This package installs Jean Michel's pre-packaged GAP3, which is a minimal GAP3 distribution containing packages that have no equivalent in GAP4.

Below is the full description from Jean Michel's webpage (accessed 23 July 2015).

A pre-packaged GAP3 with everything you need

To help people who are just interested in GAP3 because they need a package which has not been ported to GAP4, I have prepared an easy-to install minimal GAP3 distribution containing an up-to-date versions of the packages:

anusq, arep, autag, chevie, cryst, dce, grim, matrix, meataxe, monoid, nq, pcqa, sisyphos, specht, ve, vkcurve.

These packages have been chosen since most have no equivalent in GAP4. They are autoloaded when starting gap.

This distribution includes only partial lists of small groups, 2-groups, 3-groups, character tables from the Atlas and tables of marks. It does not include either the packages:

anupq, grape, kbmag, xgap, cohomolo, gliss, guava, xmod

which have some equivalent in GAP4. You can get these extra features at

<http://www.math.rwth-aachen.de/~Frank.Luebeck/gap/GAP3>

In this distribution:

- The on-line help includes the documentation of the included packages.
- The html documentation (htm/index.html) also does.
- The manual (manual.pdf) also does.

### License

Most parts of the GAP distribution, including the core part of the GAP system, are distributed under the terms of the GNU General Public License (see <http://www.gnu.org/licenses/gpl.html> or the file GPL in the etc directory of the GAP installation).

### SPKG Maintainers

- Christian Stump <christian.stump@gmail.com>

### Upstream Contact

Jean Michel <jmichel@math.jussieu.fr> <http://webusers.imj-prg.fr/~jean.michel/>

### Special Update/Build Instructions

The difference between the distributed tarball and Jean Michel's original tarball also contains the binaries

```

### Equivalent System Packages

(none known)

## 6.1.108 gap\_jupyter: Jupyter kernel for GAP

### Description

Jupyter kernel for GAP

This wrapper-kernel is a Jupyter kernel for the GAP Computer Algebra System based on the same ideas as the bash wrapper kernel.

## License

3-Clause BSD License

## Upstream Contact

- <https://github.com/gap-packages/jupyter-gap>

## Type

optional

## Dependencies

- \$(PYTHON\_TOOLCHAIN)
- *ipython*: Interactive computing environment with an enhanced interactive Python shell
- *gap*: Groups, Algorithms, Programming - a system for computational discrete algebra
- \$(PYTHON)

## Version Information

package-version.txt:

```
0.9
```

install-requires.txt:

```
gap_jupyter >=0.9
```

## Equivalent System Packages

conda:

```
$ conda install gap
```

See <https://repology.org/project/gap-jupyterkernel/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.109 gap\_packages: A collection of GAP packages

### Description

Several “official” and “undeposited” GAP packages available from <https://www.gap-system.org/Packages/packages.html>

### Upstream Contact

Mailing list at <https://mail.gap-system.org/mailman/listinfo/gap>

### Dependencies

- GAP (a standard spkg)

### TODO

The crystallographic group packages are untested/untestable. They rely on polymake and the dependency “cryst” is missing. This needs to be cleaned up.

### Notes

A brief description of each package follows:

cohomolo - The cohomolo package is a GAP interface to some C programs for computing Schur multipliers and covering groups of finite groups and first and second cohomology groups of finite groups acting on finite modules. (Author: Max Horn, Markus Pfeiffer)

CoReLG - Contains functionality for working with real semisimple Lie algebras. (Author: Heiko Dietrich, Paolo Faccin, Willem Adriaan de Graaf)

crime - package to compute the cohomology ring of finite p-groups, induced maps, and Massey products. (Author: Marcus Bishop)

cryst - Computing with crystallographic groups (Authors: Bettina Eick, Franz Gähler, Werner Nickel)

CTblLib - The GAP Character Table Library (Author: Thomas Breuer)

DESIGN is a package for classifying, partitioning and studying block designs. (Author: Leonard H. Soicher)

FactInt is a package providing routines for factoring integers, in particular:

- Pollard’s p-1
- Williams’ p+1
- Elliptic Curves Method (ECM)
- Continued Fraction Algorithm (CFRAC)
- Multiple Polynomial Quadratic Sieve (MPQS)

(Author: Stefan Kohl)

GAPDoc is a package containing a definition of a structure for GAP documentation, based on XML. It also contains conversion programs for producing text-, DVI-, PDF- or HTML-versions of such documents, with hyperlinks if possible. (Authors: Frank Luebeck, Max Neunhoeffer)

GBNP - The GBNP package provides algorithms for computing Grobner bases of noncommutative polynomials with coefficients from a field implemented in GAP and with respect to the “total degree first then lexicographical” ordering. Further provided are some variations, such as a weighted and truncated version and a tracing facility. The word “algorithm” is to be interpreted loosely here: in general one cannot expect such an algorithm to terminate, as it would imply solvability of the word problem for finitely presented (semi)groups. (Authors: A.M. Cohen, J.W. Knopper)

GRAPE is a package for computing with graphs and groups, and is primarily designed for constructing and analysing graphs related to groups, finite geometries, and designs. (Author: Leonard H. Soicher)

GUAVA is included here, and with Sage standard.

HAP (Homological Algebra Programming) is a GAP package providing some functions for group cohomology computation. (Author: Graham Ellis)

HAPcryst - an extension package for HAP, which allows for group cohomology computation for a wider class of groups. (Author: Marc Roeder)

hecke - Provides functions for calculating decomposition matrices of Hecke algebras of the symmetric groups and q-Schur algebras. Hecke is a port of the GAP 3 package Specht 2.4 to GAP 4. (Author: Dmitriy Traytel)

LAGUNA - this package provides functionality for calculation of the normalized unit group of the modular group algebra of the finite p-group and for investigation of Lie algebra associated with group algebras and other associative algebras. (Authors :Victor Bovdi, Alexander Konovalov, Richard Rossmanith, Csaba Schneider)

liealgdb - A database of Lie algebras (Author: Serena Cicalo', Willem Adriaan de Graaf, Csaba Schneider)

LiePRing - Database and algorithms for Lie p-rings (Author: Michael Vaughan-Lee, Bettina Eick)

LieRing - contains functionality for working with finitely presented Lie rings and the Lazard correspondence. (Author: Serena Cicalo', Willem Adriaan de Graaf)

loops - Provides researchers in nonassociative algebra with a computational tool that integrates standard notions of loop theory with libraries of loops and group-theoretical algorithms of GAP. The package also expands GAP toward nonassociative structures. (Authors: Gabor Nagy, Petr Vojtechovsky)

mapclass - The package calculates the mapping class group orbits for a given finite group. (Authors: Adam James, Kay Magaard, Sergey Shpectorov, Helmut Volklein)

polymake - an interface with the (standalone) polymake program used by HAPcryst. (Author: Marc Roeder)

qpa - Quivers and Path Algebras provides data structures and algorithms for doing computations with finite dimensional quotients of path algebras, and finitely generated modules over such algebras. The current version of the QPA package has data structures for quivers, quotients of path algebras, and modules, homomorphisms and complexes of modules over quotients of path algebras. (Authors: Edward Green, Oeyvind Solberg)

quagroup - Contains functionality for working with quantized enveloping algebras of finite-dimensional semisimple Lie algebras. (Author: Willem Adriaan de Graaf)

repsn - The package provides GAP functions for computing characteristic zero matrix representations of finite groups. (Author: Vahid Dabbaghian)

sla - a package for doing computations with simple Lie algebras (Author: Willem Adriaan de Graaf)

SONATA (“System Of Nearrings And Their Applications”) is a package which constructs finite nearrings and related objects. (Authors: Erhard Aichinger, Franz Binder, Jürgen Ecker, Peter Mayr, Christof Noebauer)

TORIC is a GAP package for computing with toric varieties. (Author: David Joyner)

## Type

optional

## Dependencies

- *gap: Groups, Algorithms, Programming - a system for computational discrete algebra*
- *libsemigroups: Library for semigroups and monoids*
- *planarity: Planarity-related graph algorithms*
- *\$(SAGERUNTIME)*

## Version Information

package-version.txt:

```

void:

```
$ sudo xbps-install gc-devel
```

See <https://repology.org/project/boehm-gc/versions>

If the system package is installed, ./configure will check if it can be used.

## 6.1.112 gcc: The GNU Compiler Collection or other suitable C and C++ compilers

### Description

This package represents the required C and C++ compilers.

- GCC (GNU Compiler Collection) versions 8.x ( $\geq 8.4.0$ ) to 13.x are supported.
- Clang (LLVM) is also supported.

The required Fortran compiler is represented by the package `gfortran`.

You can pass the names of compilers to use to `./configure` using the environment variables `CC`, `CXX`, and `FC`, for C, C++, and Fortran compilers, respectively.

For example, if your C compiler is `clang`, your C++ compiler is `clang++`, and your Fortran compiler is `flang`, then you would need to run:

```
$ ./configure CC=clang CXX=clang++ FC=flang
```

Vendor and versions of the C and C++ compilers should match.

Users of older Linux distributions (in particular, `ubuntu-xenial` or older, `debian-buster` or older, `linuxmint-18` or older) should upgrade their systems before attempting to install Sage from source. Users of `ubuntu-bionic`, `linuxmint-19.x`, and `opensuse-15.x` can install a versioned `gcc` system package and then use:

```
$ ./configure CC=gcc-8 CXX=g++-8 FC=gfortran-8
```

or similar. Users on ubuntu can also install a modern compiler toolchain using the [ubuntu-toolchain-r ppa](#). On [ubuntu-trusty](#), also the package `binutils-2.26` is required; after installing it, make it available using `export PATH="/usr/lib/binutils-2.26/bin:$PATH"`. Instead of upgrading their distribution, users of [centos-7](#) can install a modern compiler toolchain using Redhat's [devtoolset](#).

This package uses the non-standard default `configure --with-system-gcc=force`, giving an error at `configure` time when no suitable system compilers are configured.

You can override this using `./configure --without-system-gcc`. In this case, Sage builds and installs the GNU Compiler Collection, including the C, C++ and Fortran compiler. This is not recommended. You will need suitable C and C++ compilers from which GCC can bootstrap itself. There are some known problems with old assemblers, in particular when building the `ecm` and `fflas_ffpack` packages. You should ensure that your assembler understands all instructions for your processor. On Linux, this means you need a recent version of `binutils` (not provided by an SPKG); on macOS you need a recent version of Xcode.

(Installing the `gfortran` SPKG becomes a no-op in this case.)

Building Sage from source on Apple Silicon (M1/M2) requires the use of Apple's Command Line Tools, and those tools include a suitable compiler. Sage's `gcc` SPKG is not suitable for M1/M2; building it will likely fail.

```

void:

```
$ sudo xbps-install gengetopt
```

See <https://repology.org/project/gengetopt/versions>

If the system package is installed, ./configure will check if it can be used.

### 6.1.115 gf2x: Fast arithmetic in GF(2)[x] and searching for irreducible/primitive trinomials

#### Description

gf2x is a C/C++ software package containing routines for fast arithmetic in GF(2)[x] (multiplication, squaring, GCD) and searching for irreducible/primitive trinomials.

Website: <https://gitlab.inria.fr/gf2x/gf2x>

#### License

- GNU GPLv2+.

#### Upstream Contact

- Richard Brent
- Pierrick Gaudry
- Emmanuel Thomé
- Paul Zimmermann

## Special Update/Build Instructions

- As some patches touch config/acinclude.m4, we have to touch aclocal.m4, configure, Makefile.in and gf2x/gf2x-config.h.in to prevent autotools to try to regenerate these files.

## Patches

- 0001-Trac-15014-Let-gf2x-build-a-shared-library-on-Cygwin.patch: pass -no-undefined flag to libtool.
- 0002-tr-portability.patch: backport upstream fix for non-portable tr use
- 0003-Improve-detection-of-sse2-support.patch: backport upstream improved check for sse2
- 0004-Add-disable-hardware-specific-code.patch: add option -disable-hardware-specific-code to build system. This is partly backported from upstream.
- 0005-Update-autotooled-files.patch: the above patches make changes to code used by autotools for generation of the build system. This patches those files, so that autotools need not be installed.
- 0006-Fix\_make\_check\_not\_failing\_on\_errors.patch: (upstream patch) Fix bug in shell script such that ‘make check’ always fails upon errors.

## Type

standard

## Dependencies

### Version Information

package-version.txt:

If the system package is installed, ./configure will check if it can be used.

### 6.1.116 gfan: Groebner fans and tropical varieties

#### Description

Gfan is a software package for computing Groebner fans and tropical varieties.

These are polyhedral fans associated to polynomial ideals. The maximal cones of a Groebner fan are in bijection with the marked reduced Groebner bases of its defining ideal. The software computes all marked reduced Groebner bases of an ideal. Their union is a universal Groebner basis. The tropical variety of a polynomial ideal is a certain subcomplex of the Groebner fan. Gfan contains algorithms for computing this complex for general ideals and specialized algorithms for tropical curves, tropical hypersurfaces and tropical varieties of prime ideals. In addition to the above core functions the package contains many tools which are useful in the study of Groebner bases, initial ideals and tropical geometry. The full list of commands can be found in Appendix B of the manual. For ordinary Groebner basis computations Gfan is not competitive in speed compared to programs such as CoCoA, Singular and Macaulay2.

#### License

- GPL version 2 or version 3 (according to the gfan website)

#### Upstream Contact

## Special Update/Build Instructions

Remove the doc, homepage, and examples subdirectories, which take up most of the space.

### Type

standard

### Dependencies

- \$(MP\_LIBRARY)
- *cddlib*: Double description method for polyhedral representation conversion

### Version Information

package-version.txt:

```
0.6.2.p1
```

### Equivalent System Packages

arch:

```
$ sudo pacman -S gfan
```

conda:

```
$ conda install gfan
```

Debian/Ubuntu:

```
$ sudo apt-get install gfan
```

Fedora/Redhat/CentOS:

```
$ sudo yum install gfan
```

freebsd:

```
$ sudo pkg install math/gfan
```

gentoo:

```
$ sudo emerge sci-mathematics/gfan
```

nix:

```
$ nix-env --install gfan
```

opensuse:

```
$ sudo zypper install gfan
```

void:

```
$ sudo xbps-install gfan
```

See <https://repology.org/project/gfan/versions>

If the system package is installed, `./configure` will check if it can be used.

### 6.1.117 gfortran: Fortran compiler from the GNU Compiler Collection

#### Description

This package represents the required Fortran compiler.

Officially we support `gfortran` from [GNU Compiler Collection \(GCC\)](#). It has also been reported that using `flang` (from LLVM) might work.

You can pass the names of compilers to use to `./configure` using the environment variables `CC`, `CXX`, and `FC`, for C, C++, and Fortran compilers, respectively.

For example, if your C compiler is `clang`, your C++ compiler is `clang++`, and your Fortran compiler is `flang`, then you would need to run:

```
$ ./configure CC=clang CXX=clang++ FC=flang
```

#### License

GPL version 2 or version 3

#### Upstream Contact

<http://gcc.gnu.org/>

#### Special Update/Build Instructions

None.

#### Type

standard

## Dependencies

- \$(MP\_LIBRARY)
- *mpfr*: *Multiple-precision floating-point computations with correct rounding*
- *mpc*: *Arithmetic of complex numbers with arbitrarily high precision and correct rounding*
- *zlib*: *Data compression library*
- *xz*: *General-purpose data compression software*

## Version Information

package-version.txt:

```
12.2.0
```

## Equivalent System Packages

alpine:

```
$ apk add gfortran
```

arch:

```
$ sudo pacman -S gcc-fortran
```

conda:

```
$ conda install fortran-compiler
```

cygwin:

```
$ apt-cyg install gcc-fortran
```

Debian/Ubuntu:

```
$ sudo apt-get install gfortran
```

Fedor/Redhat/CentOS:

```
$ sudo yum install gcc-gfortran
```

freebsd:

```
$ sudo pkg install lang/gcc9
```

homebrew:

```
$ brew install gfortran
```

macports: install the following packages: gcc10 +gfortran

opensuse:

```
$ sudo zypper install gcc-fortran
```

slackware:

```
$ sudo slackpkg install gcc-gfortran
```

void:

```
$ sudo xbps-install gcc-fortran
```

See <https://repology.org/project/gfortran/versions>

If the system package is installed, ./configure will check if it can be used.

### 6.1.118 giac: A general purpose computer algebra system

#### Description

- Giac is a general purpose Computer algebra system by Bernard Parisse. It consists of:
  - a C++ library (libgiac).
  - a command line interpreter (icas or giac).
  - the built of the FLTK-based GUI (xcas) has been disabled in the spkg-install file.
  - The english documentation will be installed in:  
    \$SAGE\_LOCAL/share/giac/doc/en/cascmd\_en/index.html
- Author's website with debian, ubuntu, macosx, windows package:  
<http://www-fourier.ujf-grenoble.fr/~parisse/giac.html>
- The Freebsd port is math/giacxcas

#### Licence

GPLv3+

Note: except the french html documentation which is freely redistributable for non commercial only purposes. This doc has been removed in the Sage package, see spkg-src

#### Upstream Contact

- Bernard Parisse: <http://www-fourier.ujf-grenoble.fr/~parisse/giac.html>
- Source file (giac-x.y.z-t.tar.gz) in:  
<http://www-fourier.ujf-grenoble.fr/~parisse/debian/dists/stable/main/source/>

## Dependencies

- gettext, readline
- giac will benefit of ntl, pari, mpfr, gsl, lapack but they should be already installed by sage.
- giac can also benefit of mpfi for arithmetic on intervals.
- The Documentation is pre-built, hevea or latex or ... are not needed to install the package.

## Special Update/Build Instructions

- Use spkg-src to update this package

## Type

standard

## Dependencies

- *readline*: Command line editing library
- *libpng*: Bitmap image support
- \$(MP\_LIBRARY)
- *mpfr*: Multiple-precision floating-point computations with correct rounding
- *mpfi*: Multiple precision interval arithmetic library based on MPFR
- *ntl*: A library for doing number theory
- *gsl*: The GNU Scientific Library
- *pari*: Computer algebra system for fast computations in number theory
- *glpk*: GNU Linear Programming Kit
- *curl*: Multiprotocol data transfer library and utility
- *cliquer*: Routines for clique searching
- *ecm*: Elliptic curve method for integer factorization
- \$(findstring
- libnauty,\$(OPTIONAL\_INSTALLED\_PACKAGES))

## Version Information

package-version.txt:

1.9.0.15p0
------------

## Equivalent System Packages

arch:

```
$ sudo pacman -S libgiac giac
```

conda:

```
$ conda install giac
```

Debian/Ubuntu:

```
$ sudo apt-get install libgiac-dev xcas
```

Fedora/Redhat/CentOS:

```
$ sudo yum install giac giac-devel
```

freebsd:

```
$ sudo pkg install math/giacxcas
```

nix:

```
$ nix-env --install giac
```

opensuse:

```
$ sudo zypper install giac-devel
```

void:

```
$ sudo xbps-install giac-devel
```

See <https://repology.org/project/giac/versions>

If the system package is installed, ./configure will check if it can be used.

### 6.1.119 git: Version control system

#### Description

Git is a fast, scalable, distributed revision control system with an unusually rich command set that provides both high-operations and full access to internals.

- `man git`

## Upstream Contact

- Website: <https://git-scm.com/>

## Type

optional

## Dependencies

### Version Information

### Equivalent System Packages

arch:

```
$ sudo pacman -S git
```

conda:

```

requirements.txt:

GitPython

### Equivalent System Packages

(none known)

## 6.1.122 givaro: C++ library for arithmetic and algebraic computations

### Description

Givaro is a C++ library for arithmetic and algebraic computations. Its main features are implementations of the basic arithmetic of many mathematical entities: Primes fields, Extensions Fields, Finite Fields, Finite Rings, Polynomials, Algebraic numbers, Arbitrary precision integers and rationals (C++ wrappers over gmp) It also provides data-structures and templated classes for the manipulation of basic algebraic objects, such as vectors, matrices (dense, sparse, structured), univariate polynomials (and therefore recursive multivariate).

```

void:

```
$ sudo xbps-install givaro-devel
```

See <https://repology.org/project/givaro/versions>

If the system package is installed, ./configure will check if it can be used.

## 6.1.123 glpk: GNU Linear Programming Kit

### Description

The GLPK (GNU Linear Programming Kit) package is intended for solving large-scale linear programming (LP), mixed integer programming (MIP), and other related problems. It is a set of routines written in ANSI C and organized in the form of a callable library.

GLPK supports the GNU MathProg modelling language, which is a subset of the AMPL language.

The GLPK package includes the following main components:

- primal and dual simplex methods
- primal-dual interior-point method
- branch-and-cut method
- translator for GNU MathProg
- application program interface (API)
- stand-alone LP/MIP solver

### License

The GLPK package is GPL version 3.

### Upstream Contact

GLPK is currently being maintained by:

- Andrew Makhorin ([mao@gnu.org](mailto:mao@gnu.org), [mao@mai2.rcnet.ru](mailto:mao@mai2.rcnet.ru))

<http://www.gnu.org/software/glpk/#maintainer>

### Special Update/Build Instructions

- `configure` doesn't support specifying the location of the GMP library to use; only `--with-gmp[=yes]` or `--with-gmp=no` are valid options. (So we \*have to\* add Sage's include and library directories to CPPFLAGS and LDFLAGS, respectively.)
- Do we need the `--disable-static`? The stand-alone solver presumably runs faster when built with a static library; also other (stand-alone) programs using it would. (Instead, we should perhaps use `--enable-static --enable-shared` to go safe.)

### Patches

- All patches below are currently used by spkg-src
- `src/01-zlib.patch`: don't build the included zlib library.
- `src/02-cygwin_sharedlib.patch`: Let a shared library be built on Cygwin by passing the `-no-undefined` flag to libtool.

The numbering reflect the order in which they have been created from glpk pristine's sources

**Type**

standard

**Dependencies**

- \$(MP\_LIBRARY)
- *zlib: Data compression library*

**Version Information**

package-version.txt:

```
5.0.p0
```

**Equivalent System Packages**

alpine:

```
$ apk add glpk-dev
```

arch:

```
$ sudo pacman -S glpk
```

conda:

```
$ conda install glpk
```

```

void:

```
$ sudo xbps-install glpk-devel
```

See <https://repology.org/project/glpk/versions>

If the system package is installed, ./configure will check if it can be used.

### 6.1.124 glucose: A SAT solver

#### Description

Glucose is a SAT solver.

Citing its website:

The name of the solver is a contraction of the concept of “glue clauses”, a particular kind of clauses that glucose detects and preserves during search. Glucose is heavily based on Minisat, so please do cite Minisat also if you want to cite Glucose.

#### License

- nonparallel glucose: MIT
- parallel glucose-syrup: MIT modified with:

The parallel version of Glucose (all files modified since Glucose 3.0 releases, 2013) cannot be used in any competitive event (sat competitions/evaluations) without the express permission of the authors (Gilles Audemard / Laurent Simon). This is also the case for any competitive event using Glucose Parallel as an embedded SAT engine (single core or not).

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.125 gmp: Library for arbitrary precision arithmetic

### Description

GMP is a free library for arbitrary precision arithmetic, operating on signed integers, rational numbers, and floating-point numbers. There is no practical limit to the precision except the ones implied by the available memory in the machine GMP runs on. GMP has a rich set of functions, and the functions have a regular interface.

### License

If the system package is installed, ./configure will check if it can be used.

## 6.1.126 gmpy2: Python interface to GMP/MPIR, MPFR, and MPC

### Description

GMP/MPIR, MPFR, and MPC interface to Python 2.6+ and 3.x

gmpy2 is a C-coded Python extension module that supports multiple-precision arithmetic. In addition to supporting GMP or MPIR for multiple-precision integer and rational arithmetic, gmpy2 adds support for the MPFR (correctly rounded real floating-point arithmetic) and MPC (correctly rounded complex floating-point arithmetic) libraries.

### Type

standard

### Dependencies

- \$(MP\_LIBRARY)
- *mpfr*: *Multiple-precision floating-point computations with correct rounding*
- *mpc*: *Arithmetic of complex numbers with arbitrarily high precision and correct rounding*
- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

### Version Information

```

See <https://repology.org/project/graphviz/versions>

If the system package is installed, ./configure will check if it can be used.

### 6.1.131 gsl: The GNU Scientific Library

#### Description

The GNU Scientific Library

Website: <http://www.gnu.org/software/gsl/>

From the website above: The GNU Scientific Library (GSL) is a numerical library for C and C++ programmers. It is free software under the GNU General Public License.

The library provides a wide range of mathematical routines such as random number generators, special functions and least-squares fitting. There are over 1000 functions in total with an extensive test suite. If the variable SAGE\_CHECK is exported to the value “yes” when building Sage, GSL’s test suite is run.

#### License

- GPL V3

#### Upstream Contact

0.3.0
```

install-requires.txt:

```
hatch-vcs
```

### Equivalent System Packages

alpine:

```
$ apk add py3-hatch-vcs
```

arch:

```
$ sudo pacman -S python-hatch-vcs
```

Debian/Ubuntu:

```
$ sudo apt-get install hatch-vcs
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-hatch-vcs
```

freebsd:

```
$ sudo pkg install devel/py-hatch-vcs
```

gentoo:

```
$ sudo emerge dev-python/hatch-vcs
```

macports: install the following packages: py-hatch-vcs

opensuse:

```
$ sudo zypper install python-hatch_vcs
```

void:

```
$ sudo xbps-install hatch-vcs
```

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.135 hatchling: Modern, extensible Python build backend

#### Description

Modern, extensible Python build backend

#### License

MIT

#### Upstream Contact

<https://pypi.org/project/hatchling/>

#### Type

standard

#### Dependencies

- *pathspec*: Utility library for gitignore style pattern matching of file paths.
- *tomli*: A lil' TOML parser
- *editables*: Editable installations
- *pluggy*: plugin and hook calling mechanisms for python
- *packaging*: Core utilities for Python packages
- *trove\_classifiers*: Canonical source for classifiers on PyPI (pypi.org).
- `$(PYTHON_TOOLCHAIN)`
- `$(PYTHON)`

### Version Information

package-version.txt:

```
1.18.0
```

install-requires.txt:

```
hatchling
```

### Equivalent System Packages

conda:

```
$ conda install hatchling
```

gentoo:

```
$ sudo emerge dev-python/hatchling
```

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

## 6.1.136 `iconv`: Library for language/country-dependent character encodings

### Description

GNU libiconv is a library that is used to enable different languages, with different characters to be handled properly.

### License

- GPL 3 and LGPL 3. So we can safely link against the library in Sage.

### Upstream Contact

- <http://www.gnu.org/software/libiconv/>
- Bug reports to [bug-gnu-libiconv@gnu.org](mailto:bug-gnu-libiconv@gnu.org)

### Special Update/Build Instructions

- None, other than anyone updating this package should be familiar with how to write shell scripts.

**Type**

standard

**Dependencies**

**Version Information**

package-version.txt:

```
1.15
```

**Equivalent System Packages**

cygwin:

```
$ apt-cyg install libiconv-devel
```

homebrew:

```
$ brew install libiconv
```

macports: install the following packages: libiconv

See <https://repology.org/project/libiconv/versions>

If the system package is installed, ./configure will check if it can be used.

## 6.1.137 idna: Internationalized Domain Names in Applications (IDNA)

**Description**

Internationalized Domain Names in Applications (IDNA)

**License**

BSD-3-Clause

**Upstream Contact**

<https://pypi.org/project/idna/>

### Type

standard

### Dependencies

- \${PYTHON\_TOOLCHAIN}
- \${PYTHON}

### Version Information

package-version.txt:

```
3.4
```

install-requires.txt:

```
idna
```

### Equivalent System Packages

arch:

```
$ sudo pacman -S python-idna
```

conda:

```
$ conda install idna
```

Debian/Ubuntu:

```
$ sudo apt-get install python3-idna
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-idna
```

gentoo:

```
$ sudo emerge dev-python/idna
```

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-idna
```

void:

```
$ sudo xbps-install python3-idna
```

If the system package is installed and if the (experimental) option –enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.

## 6.1.138 igraph: A library for creating and manipulating graphs

### Description

igraph is a library for creating and manipulating graphs. It is intended to be as powerful (ie. fast) as possible to enable the analysis of large graphs.

### License

GPL version 2

### Upstream Contact

<http://igraph.org/c/>

### Dependencies

igraph can optionally use libxml2 for providing a GraphML importer.

### Special Update/Build Instructions

#### Type

optional

### Dependencies

- \$(MP\_LIBRARY)
- *glpk: GNU Linear Programming Kit*
- \$(BLAS)
- *cmake: A cross-platform build system generator*

### Version Information

package-version.txt:

0.10.4
--------

## Equivalent System Packages

arch:

```
$ sudo pacman -S igraph
```

conda:

```
$ conda install igraph
```

Debian/Ubuntu:

```
$ sudo apt-get install libigraph-dev
```

Fedora/Redhat/CentOS:

```
$ sudo yum install igraph igraph-devel
```

freebsd:

```
$ sudo pkg install math/igraph
```

gentoo:

```
$ sudo emerge dev-libs/igraph
```

homebrew:

```
$ brew install igraph
```

macports: install the following packages: igraph

void:

```
$ sudo xbps-install igraph-devel
```

See <https://repology.org/project/igraph/versions>

If the system package is installed, ./configure will check if it can be used.

### 6.1.139 ImageMagick: A collection of tools and libraries for many image file formats

#### Description

A collection of tools and libraries for many image file formats

## License

### Equivalent System Packages

alpine:

```
$ apk add imagemagick
```

arch:

```
$ sudo pacman -S imagemagick
```

conda:

```
$ conda install imagemagick
```

cygwin:

```
$ apt-cyg install ImageMagick
```

Debian/Ubuntu:

```
$ sudo apt-get install imagemagick
```

Fedora/Redhat/CentOS:

```
$ sudo yum install ImageMagick
```

freebsd:

```
$ sudo pkg install graphics/ImageMagick7
```

homebrew:

```
$ brew install imagemagick
```

macports: install the following packages: ImageMagick

nix:

```
$ nix-env --install imagemagick
```

opensuse:

```
$ sudo zypper install ImageMagick
```

void:

```
$ sudo xbps-install ImageMagick
```

See <https://repology.org/project/imagemagick/versions>

If the system package is installed, ./configure will check if it can be used.

### 6.1.140 imagesize: Parser for image file metadata

#### Description

It parses image files' header and return image size.

#### Type

standard

#### Dependencies

- \${PYTHON\_TOOLCHAIN}
- \${PYTHON}

#### Version Information

package-version.txt:

```
1.4.1
```

install-requires.txt:

```
imagesize >=1.1.0
```

## Equivalent System Packages

conda:

```
$ conda install imagesize
```

gentoo:

```
$ sudo emerge dev-python/imagesize
```

macports: install the following packages: py-imagesize

void:

```
$ sudo xbps-install python3-imagesize
```

See <https://repology.org/project/python:imagesize/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

## 6.1.141 iml: Integer Matrix Library

### Description

IML is a free library of C source code which implements algorithms for computing exact solutions to dense systems of linear equations over the integers. IML is designed to be used with the ATLAS/BLAS library and GMP bignum library.

Written in portable C, IML can be used on both 32-bit and 64-bit machines. It can be called from C++.

Website: <https://www.cs.uwaterloo.ca/~astorjoh/iml.html>

### License

- GPLv2+

### Upstream Contact

- Zhuliang Chen [z4chen@uwaterloo.ca](mailto:z4chen@uwaterloo.ca)
- Arne Storjohann [astorjoh@uwaterloo.ca](mailto:astorjoh@uwaterloo.ca)

### Special Update/Build Instructions

- As of version 1.0.4, you need to repackage the upstream tarball using the `spkg-src` script because there was a bugfix version of 1.0.4 reposted upstream without version number bump.

### Patches

- examples.patch: Modified some of the examples.

### Type

standard

### Dependencies

- `$(MP_LIBRARY)`
- `$(BLAS)`
- pkgconf: An implementation of the pkg-config spec*

### Version Information

package-version.txt:

```
1.0.4p2.p2
```

### Equivalent System Packages

arch:

```
$ sudo pacman -S iml
```

conda:

```
$ conda install iml
```

Debian/Ubuntu:

```
$ sudo apt-get install libiml-dev
```

Fedora/Redhat/CentOS:

```
$ sudo yum install iml iml-devel
```

freebsd:

```
$ sudo pkg install math/iml
```

gentoo:

```
$ sudo emerge sci-libs/iml
```

nix:

```
$ nix-env --install iml
```

opensuse:

```
$ sudo zypper install iml-devel
```

void:

```
$ sudo xbps-install iml-devel
```

See <https://repology.org/project/iml/versions>

If the system package is installed, `./configure` will check if it can be used.

## 6.1.142 importlib\_metadata: Library to access the metadata for a Python package

### Description

This is a backport package, supplying access to the functionality of `importlib.metadata` including improvements added to subsequent Python versions.

### License

Apache Software License

### Upstream Contact

- <https://pypi.org/project/importlib-metadata/>
- <http://importlib-metadata.readthedocs.io/>

### Type

standard

### Dependencies

- *zipp: A pathlib-compatible zipfile object wrapper*
- *typing\_extensions: Backported and Experimental Type Hints for Python 3.5+*
- `$(PYTHON_TOOLCHAIN)`
- *tomli: A lil' TOML parser*
- `$(PYTHON)`

### Version Information

package-version.txt:

```
6.8.0
```

install-requires.txt:

```
# According to https://pypi.org/project/importlib-metadata/,  
# 4.13 provides the features of Python 3.11 importlib.metadata  
importlib_metadata >=4.13
```

### Equivalent System Packages

arch:

```
$ sudo pacman -S python-importlib-metadata
```

conda:

```
$ conda install importlib_metadata
```

Debian/Ubuntu:

```
$ sudo apt-get install python3-importlib-metadata
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-importlib-metadata
```

freebsd:

```
$ sudo pkg install devel/py-importlib-metadata
```

gentoo:

```
$ sudo emerge dev-python/importlib_metadata
```

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-importlib-metadata
```

void:

```
$ sudo xbps-install python3-importlib_metadata
```

See <https://repology.org/project/python:importlib-metadata/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

## 6.1.143 importlib\_resources: Read resources from Python packages

### Description

Read resources from Python packages

### License

Apache2

### Upstream Contact

<https://pypi.org/project/importlib-resources/>

### Type

standard

### Dependencies

- *zipp: A pathlib-compatible zipfile object wrapper*
- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

### Version Information

package-version.txt:

6.0.1

install-requires.txt:

```
# According to https://pypi.org/project/importlib-resources/,  
# version 5.7 provides the features of Python 3.11 importlib.resources  
importlib_resources >= 5.7
```

### Equivalent System Packages

conda:

```
$ conda install importlib-resources
```

gentoo:

```
$ sudo emerge dev-python/importlib_resources
```

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.144 info: stand-alone Info documentation reader

#### Description

GNU Info is the stand-alone “info” reader that is part of the GNU Texinfo suite of tools. Several packages (Maxima, Singular, ...) install documentation in “info” format, which can be read either with Emacs, the stand-alone “info” reader, and some other software. In particular, the interactive help system of `singular_console()` uses the `info` program in environments in which a web browser is not available; if `info` is not installed, it falls back to a basic pager with limited capabilities.

Website: <https://www.gnu.org/software/texinfo/manual/info-stnd/info-stnd.html>

#### License

GPL-3+ (`info/*.c` comments in the source repository)

#### Type

standard

#### Dependencies

- `ncurses`: *Classic terminal output library*
- `xz`: *General-purpose data compression software*

#### Version Information

package-version.txt:

```
6.8
```

#### Equivalent System Packages

conda:

```
$ conda install texinfo
```

cygwin:

```
$ apt-cyg install info
```

Debian/Ubuntu:

```
$ sudo apt-get install texinfo
```

Fedora/Redhat/CentOS:

```
$ sudo yum install texinfo info
```

gentoo:

```
$ sudo emerge sys-apps/texinfo
```

homebrew:

```
$ brew install texinfo
```

macports: install the following packages: texinfo

nix:

```
$ nix-env --install texinfo
```

opensuse:

```
$ sudo zypper install texinfo
```

void:

```
$ sudo xbps-install texinfo
```

See <https://repology.org/project/texinfo/versions>

If the system package is installed, ./configure will check if it can be used.

## 6.1.145 ipykernel: IPython Kernel for Jupyter

### Description

This package provides the IPython kernel for Jupyter.

### Type

standard

### Dependencies

- *ipython\_genutils*: Vestigial utilities from IPython
- *importlib\_metadata*: Library to access the metadata for a Python package
- *matplotlib\_inline*: Inline Matplotlib backend for Jupyter
- *ipython*: Interactive computing environment with an enhanced interactive Python shell
- *jupyter\_client*: Jupyter protocol implementation and client libraries
- *tornado*: Python web framework and asynchronous networking library
- *appnope*: Disable App Nap on macOS >= 10.9
- *traitlets*: Traitlets Python configuration system
- *executing*: Get the currently executing AST node of a frame, and other information
- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

### Version Information

package-version.txt:

```
6.6.0
```

install-requirements.txt:

```
ipykernel >=5.2.1
```

### Equivalent System Packages

arch:

```
$ sudo pacman -S python-ipykernel
```

conda:

```
$ conda install ipykernel
```

Debian/Ubuntu:

```
$ sudo apt-get install ipykernel
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-ipykernel
```

freebsd:

```
$ sudo pkg install devel/py-ipykernel
```

gentoo:

```
$ sudo emerge dev-python/ipykernel
```

macports: install the following packages: py-ipykernel

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-ipykernel
```

void:

```
$ sudo xbps-install python3-ipython_ipykernel
```

See <https://repology.org/project/python:ipykernel/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

## 6.1.146 ipympl: Matplotlib Jupyter Extension

### Description

Matplotlib Jupyter Extension

### License

BSD License

### Upstream Contact

<https://pypi.org/project/ipympl/>

### Type

optional

### Dependencies

- *ipython: Interactive computing environment with an enhanced interactive Python shell*
- *numpy: Package for scientific computing with Python*
- *ipython\_genutils: Vestigial utilities from IPython*
- *pillow: Python Imaging Library*
- *traitlets: Traitlets Python configuration system*
- *ipywidgets: Interactive HTML widgets for Jupyter notebooks and the IPython kernel*
- *matplotlib: Python 2D plotting library*
- *\$(PYTHON\_TOOLCHAIN)*
- *\$(PYTHON)*

### Version Information

package-version.txt:

```
0.9.3
```

install-requirements.txt:

```
ipympl
```

## Equivalent System Packages

arch:

```
$ sudo pacman -S python-ipympl
```

conda:

```
$ conda install ipympl
```

freebsd:

```
$ sudo pkg install devel/py-ipympl
```

macports: install the following packages: py-ipympl

See <https://repology.org/project/python:ipympl/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.147 ipython: Interactive computing environment with an enhanced interactive Python shell

#### Description

Interactive computing environment with an enhanced interactive Python shell

From the IPython website:

IPython is a multiplatform, Free Software project (BSD licensed) that offers:

- An enhanced Python shell designed for efficient interactive work. It includes many enhancements over the default Python shell, including the ability for controlling interactively all major GUI toolkits in a non-blocking manner.
- A library to build customized interactive environments using Python as the basic language (but with the possibility of having extended or alternate syntaxes).
- A system for interactive distributed and parallel computing (this is part of IPython's new development).

#### License

BSD

#### Upstream Contact

<http://ipython.org>

[ipython-dev@scipy.org](mailto:ipython-dev@scipy.org)

[ipython-user@scipy.org](mailto:ipython-user@scipy.org)

**Type**

standard

**Dependencies**

- *tornado*: Python web framework and asynchronous networking library
- *pyzmq*: Python bindings for the zeromq networking library
- *pickleshare*: A ‘shelve’ like datastore with concurrency support
- *traitlets*: Traitlets Python configuration system
- *decorator*: Python library providing decorators
- *wcwidth*: Measures the displayed width of unicode strings in a terminal
- *prompt\_toolkit*: Interactive command lines for Python
- *pygments*: Generic syntax highlighter
- *pexpect*: Python module for controlling and automating other programs
- *appnope*: Disable App Nap on macOS >= 10.9
- *backcall*: Specifications for callback functions
- *jedi*: Static analysis tool providing IDE support for Python
- *stack\_data*: Extract data from python stack frames and tracebacks for informative displays
- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

**Version Information**

package-version.txt:

```
8.6.0
```

install-requires.txt:

```
ipython >=7.13.0, <8.9.0
# ipython >= 8.9.0 requires prompt_toolkit too new for Sage
```

**Equivalent System Packages**

arch:

```
$ sudo pacman -S ipython
```

conda:

```
$ conda install ipython
```

Debian/Ubuntu:

```
$ sudo apt-get install python3-ipython
```

Fedora/Redhat/CentOS:

```
$ sudo yum install ipython
```

freebsd:

```
$ sudo pkg install devel/ipython
```

gentoo:

```
$ sudo emerge dev-python/ipython
```

homebrew:

```
$ brew install ipython
```

macports: install the following packages: py-ipython

openSUSE:

```
$ sudo zypper install python3${PYTHON_MINOR}-ipython
```

void:

```
$ sudo xbps-install python3-ipython
```

See <https://repology.org/project/ipython/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.148 ipython\_genutils: Vestigial utilities from IPython

#### Description

Vestigial utilities from IPython

#### Type

standard

#### Dependencies

- \${PYTHON\_TOOLCHAIN}
- \${PYTHON}

## Version Information

package-version.txt:

```
0.2.0
```

install-requires.txt:

```
ipython_genutils >=0.2.0
```

## Equivalent System Packages

conda:

```
$ conda install ipython_genutils
```

gentoo:

```
$ sudo emerge dev-python/ipython_genutils
```

macports: install the following packages: py-ipython\_genutils

void:

```
$ sudo xbps-install python3-ipython_genutils
```

See <https://repology.org/project/python:ipython-genutils/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

## 6.1.149 ipywidgets: Interactive HTML widgets for Jupyter notebooks and the IPython kernel

### Description

Interactive HTML widgets for Jupyter notebooks and the IPython kernel.

### Type

standard

### Dependencies

- *widgetsnbextension*: Jupyter interactive widgets for Jupyter Notebook
- *jupyterlab\_widgets*: Jupyter interactive widgets for JupyterLab
- `$(PYTHON_TOOLCHAIN)`
- *ipykernel*: IPython Kernel for Jupyter
- *ipython*: Interactive computing environment with an enhanced interactive Python shell
- *traitlets*: Traitlets Python configuration system

- \$(PYTHON)

### Version Information

package-version.txt:

```
8.0.2
```

install-requires.txt:

```
ipywidgets >=7.5.1
```

### Equivalent System Packages

conda:

```
$ conda install ipywidgets>=7.5.1
```

gentoo:

```
$ sudo emerge dev-python/ipywidgets
```

macports: install the following packages: py-ipywidgets

void:

```
$ sudo xbps-install python3-jupyter_ipywidgets
```

See <https://repology.org/project/python:ipywidgets/versions>

If the system package is installed and if the (experimental) option --enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.

## 6.1.150 isl: Sets and relations of integer points bounded by affine constraints

### Description

isl is a thread-safe C library for manipulating sets and relations of integer points bounded by affine constraints. The descriptions of the sets and relations may involve both parameters and existentially quantified variables. All computations are performed in exact integer arithmetic using GMP.

### License

isl is released under the MIT license, but depends on the LGPL GMP library.

opensuse:

```
$ sudo zypper install "pkgconfig(isl)"
```

void:

```
$ sudo xbps-install isl-devel
```

See <https://repology.org/project/isl/versions>

If the system package is installed, ./configure will check if it can be used.

### 6.1.151 jedi: Static analysis tool providing IDE support for Python

#### Description

Jedi is a static analysis tool for Python that is typically used in IDEs/editors plugins. Jedi has a focus on autocompletion and goto functionality. Other features include refactoring, code search and finding references.

#### Type

standard

#### Dependencies

- *parso: A Python parser*
- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

## Version Information

package-version.txt:

```
0.18.1
```

install-requires.txt:

```
jedi >=0.17.0
```

## Equivalent System Packages

conda:

```
$ conda install jedi
```

gentoo:

```
$ sudo emerge dev-python/jedi
```

macports: install the following packages: py-jedi

void:

```
$ sudo xbps-install python3-jedi
```

See <https://repology.org/project/jedi/versions>, <https://repology.org/project/python:jedi/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

## 6.1.152 jinja2: General purpose template engine for Python

### Description

Jinja2 is a library for Python 2.4 and onwards that is designed to be flexible, fast and secure.

If you have any exposure to other text-based template languages, such as Smarty or Django, you should feel right at home with Jinja2. It's both designer and developer friendly by sticking to Python's principles and adding functionality useful for templating environments.

### License

Modified BSD License

### Upstream Contact

Author: Pocoo Team <<http://pocoo.org>>

Homepage: <http://jinja.pocoo.org/>

### Special Update/Build Instructions

None. (Just make sure its prerequisites are new enough in Sage, to avoid downloads during the build / installation.)

### Type

standard

### Dependencies

- *markupsafe*: Safely add untrusted strings to HTML/XML markup
- *docutils*: Processing plaintext documentation into useful formats, such as HTML or LaTeX
- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

### Version Information

package-version.txt:

```
3.1.2
```

install-requires.txt:

```
jinja2 >=3.0
# for sphinx
```

### Equivalent System Packages

conda:

```
$ conda install jinja2
```

Debian/Ubuntu:

```
$ sudo apt-get install python3-jinja2
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-jinja2
```

gentoo:

```
$ sudo emerge dev-python/jinja
```

macports: install the following packages: py-jinja2

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-jinja2
```

void:

```
$ sudo xbps-install python3-Jinja2
```

See <https://repology.org/project/python:jinja2/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

## 6.1.153 jmol: Java viewer for chemical structures in 3D

### Description

Java viewer for chemical structures in 3D.

This provides files necessary for Jmol (java).

This package does not install JSmol (javascript), which upstream bundles with Jmol.

### License

GPLv2+

### Upstream Contact

- <http://jmol.sourceforge.net>
- Bob Hanson
- e-mail: [hansonr@stolaf.edu](mailto:hansonr@stolaf.edu)
- Homepage: <https://www.stolaf.edu/people/hansonr/>
- Development page: <https://github.com/BobHanson/Jmol-SwingJS>
- Download page: <https://sourceforge.net/projects/jmol/files/Jmol/>

### Dependencies

No build-time dependencies.

The commandline jmol requires java at runtime.

### Special Build Instructions

To avoid depending on `unzip` at build time, we have to repack the tarball, see `spkg-src`. We take the opportunity to remove some unnecessary subdirectories, see [http://wiki.jmol.org/index.php/Jmol\\_JavaScript\\_Object#In\\_detail](http://wiki.jmol.org/index.php/Jmol_JavaScript_Object#In_detail)

### Type

standard

### Dependencies

#### Version Information

package-version.txt:

```
14.29.52
```

### Equivalent System Packages

arch:

```
$ sudo pacman -S jmol
```

conda:

```
$ conda install jmol
```

macports: install the following packages: jmol

nix:

```
$ nix-env --install jmol
```

opensuse:

```
$ sudo zypper install jmol
```

void:

```
$ sudo xbps-install jmol
```

See <https://repology.org/project/jmol/versions>

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see [github issue #27330](#)

## 6.1.154 jsonschema: Python implementation of JSON Schema

### Description

jsonschema is an implementation of JSON Schema for Python

### License

MIT License

### Upstream Contact

Home page: <http://github.com/J Julian/jsonschema>

### Type

standard

### Dependencies

- *vcversioner: Python build system extension to obtain package version from version control*
- *attrs: Decorator for Python classes with attributes*
- *importlib\_metadata: Library to access the metadata for a Python package*
- *pyrsistent: Persistent data structures in Python*
- *\$(PYTHON\_TOOLCHAIN)*
- *hatchling: Modern, extensible Python build backend*
- *hatch\_vcs: Hatch plugin for versioning with your preferred VCS*
- *hatch\_fancy\_pypi\_readme: Fancy PyPI READMEs with Hatch*
- *\$(PYTHON)*

### Version Information

package-version.txt:

```
4.17.1
```

install-requirements.txt:

```
jsonschema >=3.2.0
```

### Equivalent System Packages

arch:

```
$ sudo pacman -S python-jsonschema
```

conda:

```
$ conda install jsonschema
```

Debian/Ubuntu:

```
$ sudo apt-get install python3-jsonschema
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-jsonschema
```

gentoo:

```
$ sudo emerge dev-python/jsonschema
```

macports: install the following packages: py-jsonschema

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-jsonschema
```

void:

```
$ sudo xbps-install python3-jsonschema
```

See <https://repology.org/project/python:jsonschema/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.155 jupymake: A Python wrapper for the polymake shell

#### Description

The Python module JuPyMake provides an interface to polymake.

#### License

- GPL v2

## Upstream Contact

<https://github.com/polymake/JuPyMake>

## Special Update/Build Instructions

### Type

optional

## Dependencies

- *polymake: Computations with polyhedra, fans, simplicial complexes, matroids, graphs, tropical hypersurfaces*
- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

## Version Information

package-version.txt:

```
0.9
```

install-requires.txt:

```
jupymake >=0.9
```

## Equivalent System Packages

See <https://repology.org/project/jupymake/versions>, <https://repology.org/project/python:jupymake/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.156 jupyter\_client: Jupyter protocol implementation and client libraries

### Description

jupyter\_client contains the reference implementation of the Jupyter protocol. It also provides client and kernel management APIs for working with kernels.

It also provides the jupyter kernelspec entrypoint for installing kernelspecs for use with Jupyter frontends.

### Type

standard

### Dependencies

- *jupyter\_core*: Jupyter core package
- \$(PYTHON\_TOOLCHAIN)
- *pyzmq*: Python bindings for the zeromq networking library
- *dateutil*: Extensions to the standard Python module `datetime`
- *nest\_asyncio*: Patch `asyncio` to allow nested event loops
- *tornado*: Python web framework and asynchronous networking library
- *traitlets*: Traitlets Python configuration system
- *entrypoints*: Discover and load entry points from installed Python packages
- *hatchling*: Modern, extensible Python build backend
- \$(PYTHON)

### Version Information

package-version.txt:

7.4.4

install-requirements.txt:

jupyter\_client >=6.1.6

### Equivalent System Packages

conda:

```
$ conda install jupyter_client
```

gentoo:

```
$ sudo emerge dev-python/jupyter_client
```

macports: install the following packages: py-jupyter\_client

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-jupyter-client
```

void:

```
$ sudo xbps-install python3-jupyter_client
```

See <https://repology.org/project/jupyter-client/versions>, <https://repology.org/project/python:jupyter-client/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

## 6.1.157 jupyter\_core: Jupyter core package

### Description

Jupyter core package. A base package on which Jupyter projects rely.

### Type

standard

### Dependencies

- *traitlets*: Traitlets Python configuration system
- \$(PYTHON\_TOOLCHAIN)
- *hatchling*: Modern, extensible Python build backend
- \$(PYTHON)

### Version Information

package-version.txt:

```
4.12.0
```

install-requires.txt:

```
jupyter_core >=4.6.3
```

### Equivalent System Packages

conda:

```
$ conda install jupyter_core
```

gentoo:

```
$ sudo emerge dev-python/jupyter_core
```

macports: install the following packages: py-jupyter\_core

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-jupyter-core
```

void:

```
$ sudo xbps-install python3-jupyter_core
```

See <https://repology.org/project/jupyter-core/versions>, <https://repology.org/project/python:jupyter-core/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.158 jupyter\_jsmol: JSmol viewer widget for Jupyter

#### Description

JSmol viewer widget for Jupyter

#### License

MIT

#### Upstream Contact

<https://pypi.org/project/jupyter-jsmol/>

#### Type

standard

#### Dependencies

- *ipywidgets: Interactive HTML widgets for Jupyter notebooks and the IPython kernel*
- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

#### Version Information

package-version.txt:

```
2022.1.0
```

install-requires.txt:

```
jupyter-jsmol
```

## Equivalent System Packages

arch:

```
$ sudo pacman -S jupyter-jsmol
```

conda:

```
$ conda install jupyter-jsmol
```

freebsd:

```
$ sudo pkg install science/py-jupyter_jsmol
```

See <https://repology.org/project/jupyter-jsmol/versions>, <https://repology.org/project/python:jupyter-jsmol/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

## 6.1.159 jupyter\_sphinx: Jupyter Sphinx Extension

### Description

Jupyter Sphinx Extension

### License

BSD

### Upstream Contact

<https://pypi.org/project/jupyter-sphinx/>

### Type

standard

### Dependencies

- *sphinx: Python documentation generator*
- *ipywidgets: Interactive HTML widgets for Jupyter notebooks and the IPython kernel*
- *ipython: Interactive computing environment with an enhanced interactive Python shell*
- *nbconvert: Converting Jupyter Notebooks*
- *nbformat: Base implementation of the Jupyter notebook format*
- `$(PYTHON_TOOLCHAIN)`
- `$(PYTHON)`

## Version Information

package-version.txt:

```
0.4.0.p0
```

install-requires.txt:

```
jupyter-sphinx
```

## Equivalent System Packages

arch:

```
$ sudo pacman -S python-jupyter-sphinx
```

conda:

```
$ conda install jupyter_sphinx
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-jupyter-sphinx
```

freebsd:

```
$ sudo pkg install textproc/py-jupyter_sphinx
```

macports: install the following packages: py-jupyter\_sphinx

openSUSE:

```
$ sudo zypper install python-jupyter-sphinx
```

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

## 6.1.160 jupyterlab: An extensible environment for interactive and reproducible computing

### Description

An extensible environment for interactive and reproducible computing, based on the Jupyter Notebook and Architecture.

## License

BSD License

## Upstream Contact

Home page: <https://jupyter.org/>

## Type

optional

## Dependencies

- *vcversioner: Python build system extension to obtain package version from version control*
- *jupyter\_core: Jupyter core package*
- *jupyter\_client: Jupyter protocol implementation and client libraries*
- *jinja2: General purpose template engine for Python*
- *tornado: Python web framework and asynchronous networking library*
- *ipython: Interactive computing environment with an enhanced interactive Python shell*
- *packaging: Core utilities for Python packages*
- *terminado: Tornado websocket backend for the term.js Javascript terminal emulator library*
- *traitlets: Traitlets Python configuration system*
- *nbconvert: Converting Jupyter Notebooks*
- *send2trash: Send file to trash natively under Mac OS X, Windows and Linux*
- *nbformat: Base implementation of the Jupyter notebook format*
- *prometheus\_client: Python client for the systems monitoring and alerting toolkit Prometheus*
- *ipython\_genutils: Vestigial utilities from IPython*
- *argon2\_cffi: The secure Argon2 password hashing algorithm*
- *pymq: Python bindings for the zeromq networking library*
- *idna: Internationalized Domain Names in Applications (IDNA)*
- *requests: An HTTP library for Python*
- *jsonschema: Python implementation of JSON Schema*
- *babel: Internationalization utilities for Python*
- *notebook: Jupyter notebook, a web-based notebook environment for interactive computing*
- *\$(PYTHON\_TOOLCHAIN)*
- *\$(PYTHON)*

### Version Information

requirements.txt:

```
jupyterlab ~= 3.3
# See :issue:`33607`
jupyterlab-server < 2.11
```

### Equivalent System Packages

conda:

```
$ conda install jupyterlab
```

homebrew:

```
$ brew install jupyterlab
```

macports: install the following packages: py-jupyterlab

void:

```
$ sudo xbps-install jupyterlab
```

macports: install the following packages: py-jupyterlab\_widgets

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-jupyterlab-widgets
```

See <https://repology.org/project/jupyterlab-widgets/versions>

If the system package is installed and if the (experimental) option --enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.

## 6.1.163 kenzo: Construct topological spaces and compute homology groups

### Description

Kenzo is a package to compute properties (mainly homology groups) of topological spaces. It allows defining spaces created from others by constructions like loop spaces, classifying spaces and so on.

### License

GPL

### Upstream Contact

- <https://github.com/gheber/kenzo>
- <https://github.com/miguelmarco/kenzo/>

### Type

optional

### Dependencies

- *ecl: An implementation of the Common Lisp language*

### Version Information

package-version.txt:

1.1.10

### Equivalent System Packages

See <https://repology.org/project/kenzo/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.164 kissat: SAT solver

### Description

From the package README:

KISSAT is a "keep it simple and clean bare metal SAT solver" written in C. It is a port of CaDiCaL back to C with improved data structures, better scheduling of inprocessing and optimized algorithms and implementation.

Coincidentally 'kissat' also means 'cats' in Finnish.

From the website:

The Kissat SAT solver is a condensed and improved reimplementation of CaDiCaL in C.

Kissat won first place in the main track of the SAT Competition 2020 and first place on unsatisfiable instances.

### License

MIT license.

### Upstream Contact

Website: <http://fmv.jku.at/kissat/>

### Type

optional

### Dependencies

### Version Information

package-version.txt:

3.1.0

### Equivalent System Packages

Fedora/Redhat/CentOS:

```
$ sudo yum install kissat
```

gentoo:

```
$ sudo emerge sci-mathematics/kissat
```

nix:

```
$ nix-env --install kissat
```

See <https://repology.org/project/kissat/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.165 `kiwisolver`: An implementation of the Cassowary constraint solving algorithm

### Description

From <https://pypi.org/project/kiwisolver/>

A fast implementation of the Cassowary constraint solver

Kiwi is an efficient C++ implementation of the Cassowary constraint solving algorithm. Kiwi is an implementation of the algorithm based on the seminal Cassowary paper. It is not a refactoring of the original C++ solver. Kiwi has been designed from the ground up to be lightweight and fast. Kiwi ranges from 10x to 500x faster than the original Cassowary solver with typical use cases gaining a 40x improvement. Memory savings are consistently > 5x.

In addition to the C++ solver, Kiwi ships with hand-rolled Python bindings.

### License

Modified BSD License

### Upstream Contact

<https://github.com/nucleic/kiwi>

### Type

standard

### Dependencies

- `cppy: C++ headers for C extension development`
- `$(PYTHON_TOOLCHAIN)`
- `$(PYTHON)`

### Version Information

package-version.txt:

```
1.4.5
```

install-requirements.txt:

```
kiwisolver >=1.0.1
```

### Equivalent System Packages

conda:

```
$ conda install kiwisolver
```

gentoo:

```
$ sudo emerge dev-python/kiwisolver
```

macports: install the following packages: py-kiwisolver

void:

```
$ sudo xbps-install python3-kiwisolver
```

See <https://repology.org/project/python:kiwisolver/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.166 latte\_int: Count lattice points, compute volumes, and integrate over convex polytopes

#### Description

LattE (Lattice point Enumeration) Integrale solves the problems of counting lattice points in and integration over convex polytopes.

#### License

GPLv2

#### Upstream Contact

Matthias Köppe, UC Davis, CA, USA

#### Type

optional

#### Dependencies

- `$(MP_LIBRARY)`
- *ntl: A library for doing number theory*
- *4ti2: Algebraic, geometric and combinatorial problems on linear spaces*
- *cddlib: Double description method for polyhedral representation conversion*
- *lidia: A library for computational number theory*

## Version Information

package-version.txt:

```
1.7.6
```

## Equivalent System Packages

arch:

```
$ sudo pacman -S latte-integrale
```

conda:

```
$ conda install latte-integrale
```

opensuse:

```
$ sudo zypper install latte
```

See <https://repology.org/project/latte-integrale/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

### 6.1.167 lcalc: L-function calculator

#### Description

Michael Rubinstein's L-function calculator.

#### License

- LGPL V2+

#### Upstream contact

Michael Rubinstein <[mrubinst@uwaterloo.ca](mailto:mrubinst@uwaterloo.ca)>

Sources: [http://oto.math.uwaterloo.ca/~mrubinst/L\\_function\\_public/L.html](http://oto.math.uwaterloo.ca/~mrubinst/L_function_public/L.html)

Newer beta version 1.3 (not yet in Sage): <http://code.google.com/p/l-calc/>

### Dependencies

- GMP/MPIR
- MPFR
- PARI
- GNU patch

### Special Update/Build Instructions

- There is some garbage in the upstream sources which should be removed:

```
src/include/.Lexplicit_formula.h.swp
src/include/.Lvalue.h.swp
src/include/._.DS_Store
src/include/.DS_Store
src/include/Lexplicit_formula.h.swap.crap
src/include/Lvalue.h.bak
src/src/Makefile.old
src/src/.Makefile.old.swp
src/src/._.DS_Store
src/src/.DS_Store
src/src/.Lcommandline.ggo.swp
src/src/libLfunction.a
```

- We (and apparently also upstream) currently don't build Lcalc's tests (see Makefile), hence there's no spkg-check. This might change in newer upstream versions.
- The original Makefile uses \$(CC) to compile C++ (also using \$(CCFLAGS)), which it defines to 'g++', and hardcodes 'g++' when linking the shared library. (It should use \$(CXX) instead, which might \*default\* to 'g++'.) We now (lcalc-1.23.p10) patch the Makefile also to use \$(CXX) for compiling and linking C++; \$(CXX) now \*defaults\* to 'g++', and \$(CC) to 'gcc', but both can be overridden by simply setting their respective environment variables. (Same for \$(INSTALL\_DIR) btw.)

### Patches

- Makefile.patch:

We change a lot there, since Lcalc doesn't have a 'configure' script, and hence the Makefile is supposed to be edited to customize Lcalc (build options, locations of headers and libraries etc.). Besides that, we

- put CXXFLAGS into Lcalc's "CCFLAGS" used for compiling C++,
- remove some stuff involving LDFLAGS1 and LDFLAGS2, setting just LDFLAGS,
- use \$(MAKE) instead of 'make' in the crude build receipts,
- use CXXFLAG64 when linking the shared library,
- now use \$(CXX) for compiling and linking C++, which \*defaults\* to 'g++', but can be overridden by setting the environment variable of the same name. (\$(CC) now \*defaults\* to 'gcc', although currently not really used as far as I can see.)
- \$(INSTALL\_DIR) can now be overridden by simply setting the environment variable of the same name.

- Lcommon.h.patch:

Uncomment the definition of lcalc\_to\_double(const long double& x). (Necessary for GCC >= 4.6.0, cf. #10892.) Comment from there: The reason is the following code horror from src/src/include/Lcommon.h: [...] But somebody who is familiar with the codebase should really rewrite lcalc to not redefine the double() cast, that's just fragile and will sooner or later again fail inside some system headers.

- pari-2.7.patch:

Various changes to port to newer versions of PARI.

- time.h.patch:

(Patches src/include/Lcommandline\_numbertheory.h) Include also <time.h> in Lcommandline\_numbertheory.h (at least required on Cygwin, cf. #9845). This should get reported upstream.

- lcalc-1.23\_default\_parameters\_1.patch: Make Lcalc (1.23) build with GCC 4.9

## Type

standard

## Dependencies

- *pari*: Computer algebra system for fast computations in number theory
- *gengetopt*: getopt\_long parser generator

## Version Information

package-version.txt:

```
2.0.5
```

## Equivalent System Packages

arch:

```

See <https://repology.org/project/libbraiding/versions>

If the system package is installed, ./configure will check if it can be used.

### 6.1.170 libffi: A portable foreign-function interface library

#### Description

Compilers for high level languages generate code that follow certain conventions. These conventions are necessary, in part, for separate compilation to work. One such convention is the “calling convention”. The “calling convention” is essentially a set of assumptions made by the compiler about where function arguments will be found on entry to a function. A “calling convention” also specifies where the return value for a function is found.

Some programs may not know at the time of compilation what arguments are to be passed to a function. For instance, an interpreter may be told at run-time about the number and types of arguments used to call a given function. Libffi can be used in such programs to provide a bridge from the interpreter program to compiled code.

The libffi library provides a portable, high level programming interface to various calling conventions. This allows a programmer to call any function specified by a call interface description at run time.

FFI stands for Foreign Function Interface. A foreign function interface is the popular name for the interface that allows code written in one language to call code written in another language. The libffi library really only provides the lowest, machine dependent layer of a fully featured foreign function interface. A layer must exist above libffi that handles type conversions for values passed between the two languages.

If the system package is installed, ./configure will check if it can be used.

## 6.1.171 libgd: Dynamic graphics generation tool

### Description

GD is an open source code library for the dynamic creation of images by programmers. GD is written in C, and “wrappers” are available for Perl, PHP and other languages. GD creates PNG, JPEG, GIF, WebP, XPM, BMP images, among other formats. GD is commonly used to generate charts, graphics, thumbnails, and most anything else, on the fly. While not restricted to use on the web, the most common applications of GD involve website development.

### License

- Custom (BSD-ish)

### Upstream Contact

```

See <https://repology.org/project/libogg/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.178 libpng: Bitmap image support

### Description

libpng is the official PNG reference library. It supports almost all PNG features, is extensible, and has been extensively tested for over 13 years. The home site for development versions (i.e., may be buggy or subject to change or include experimental features) is <http://libpng.sourceforge.net/>, and the place to go for questions about the library is the png-mng-implement mailing list.

Website: <http://www.libpng.org/pub/png/libpng.html>

## License

The libpng license - see <http://www.libpng.org/pub/png/src/libpng-LICENSE.txt>

## Upstream Contact

<https://libpng.sourceforge.io>

The png mailing lists - see <http://www.libpng.org/pub/png/pngmisc.html#lists>

## Special Update/Build Instructions

- On old versions of Darwin, the symbolic links libpng.\* created by libpng16 may interfere with a system-wide libPng.dylib.

– the following is very likely to be obsolete in 2014 —

This system-wide library is likely to be a different version and on top of that, the symbols exported there are prefixed with “\_cg” (for “Core Graphics”). So even if by chance the functionalities of the two libraries were interchangeable, libraries or applications looking for one and being presented the other won’t find the symbols they expect. Note the uppercase “P” which could prevent this conflict; unfortunately, the default filesystem used by Apple is case-insensitive.

Note there would be no problem if the system-wide library was not looked for when Sage is being built or run, but that’s not the case either; it is at least looked for by the “ImageIO” framework:

- when Python is built with Mac OS extensions, fixed in #4008;
  - when Mercurial is built because it uses \$EDITOR, cf. #4678;
  - when R is built and it finds -1png, cf. #4409 and #11696.
- this is no longer done, as of #27186 —

As not all of these problems are easily dealt with and new ones may arise, we chose to delete the \$SAGE\_LOCAL/lib/libpng.\* symlinks. Therefore, some packages like Tachyon, which by default look for -1png are patched to look for -1png16 instead.

## Type

standard

## Dependencies

- *zlib: Data compression library*

## Version Information

package-version.txt:

```
1.6.29.p1
```

## Equivalent System Packages

alpine:

```

### Equivalent System Packages

See <https://repology.org/project/lidia/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.183 lie: Library for the representation theory of complex semisimple Lie groups and algebras

### Description

LiE is the name of a software package that enables mathematicians and physicists to perform computations of a Lie group theoretic nature. It focuses on the representation theory of complex semisimple (reductive) Lie groups and algebras, and on the structure of their Weyl groups and root systems.

LiE does not compute directly with elements of the Lie groups and algebras themselves; it rather computes with weights, roots, characters and similar objects. Some specialities of LiE are: tensor product decompositions, branching to subgroups, Weyl group orbits, reduced elements in Weyl groups, distinguished coset representatives and much more. These operations have been compiled into the program which results in fast execution: typically one or two orders of magnitude faster than similar programs written in a general purpose program.

The LiE programming language makes it possible to customise and extend the package with more mathematical functions. A user manual is provided containing many examples.

LiE establishes an interactive environment from which commands can be given that involve basic programming primitives and powerful built-in functions. These commands are read by an interpreter built into the package and passed to the core of the system. This core consists of programs representing some 100 mathematical functions. The interpreter offers on-line facilities which explain operations and functions, and which give background information about Lie group theoretical concepts and about currently valid definitions and values.

(from <http://www-math.univ-poitiers.fr/~maavl/LiE/description.html> )

```

If the system package is installed, ./configure will check if it can be used.

### 6.1.186 lrCalc: Littlewood-Richardson calculator

#### Description

Littlewood-Richardson Calculator

<http://sites.math.rutgers.edu/~asbuch/lrcalc/>

#### License

GNU General Public License V2+

#### Upstream Contact

Anders S. Buch ([asbuch@math.rutgers.edu](mailto:asbuch@math.rutgers.edu))

<https://bitbucket.org/asbuch/lrcalc>

#### Type

standard

#### Dependencies

#### Version Information

package-version.txt:

```
2.1
```

#### Equivalent System Packages

arch:

```
$ sudo pacman -S lrCalc
```

conda:

```
$ conda install lrCalc
```

Debian/Ubuntu:

```
$ sudo apt-get install liblrCalc-dev
```

Fedora/Redhat/CentOS:

```
$ sudo yum install lrcalc-devel
```

freebsd:

```
$ sudo pkg install math/lrcalc
```

gentoo:

```
$ sudo emerge sci-mathematics/lrcalc
```

nix:

```
$ nix-env --install lrcalc
```

void:

```
$ sudo xbps-install lrcalc-devel
```

See <https://repology.org/project/lrcalc/versions>

If the system package is installed, ./configure will check if it can be used.

### 6.1.187 lrcalc\_python: Littlewood-Richardson calculator

#### Description

Python bindings for the Littlewood-Richardson Calculator

<http://sites.math.rutgers.edu/~asbuch/lrcalc/>

#### License

GNU General Public License V3

#### Upstream Contact

Anders S. Buch ([asbuch@math.rutgers.edu](mailto:asbuch@math.rutgers.edu))

<https://bitbucket.org/asbuch/lrcalc>

#### Type

standard

### Dependencies

- *lrcalc*: Littlewood-Richardson calculator
- \$(PYTHON\_TOOLCHAIN)
- *cython*: C-Extensions for Python, an optimizing static compiler
- \$(PYTHON)

### Version Information

package-version.txt:

```
2.1
```

install-requires.txt:

```
lrcalc ~=2.1
```

### Equivalent System Packages

conda:

```
$ conda install python-lrcalc~=2.1
```

If the system package is installed and if the (experimental) option –enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.

## 6.1.188 Irlib: Reverse search algorithm for vertex enumeration and convex hull problems

### Description

Irlib implements the linear reverse search algorithm of Avis and Fukuda.

See the homepage (<http://cgm.cs.mcgill.ca/~avis/C/lrs.html>) for details.

We use an autotoolized version from <https://github.com/mkoeppe/Irlib/tree/autoconfiscation>

### License

Irlib is released under a GPL v2+ license.

## Upstream Contact

David Avis, avis at cs dot mcgill dot edu.

## Dependencies

To build and install the “plrs” binary, a multi-thread version of lrs, need to first install the full Boost package (“sage -i boost”).

If the package finds an MPI C++ compiler script (mpic++), it also builds and installs the “mplrs” binary, a distributed version of lrs using MPI.

(Sage currently does not make use of plrs and mplrs.)

## Special Update/Build Instructions

### Type

optional

## Dependencies

- \$(MP\_LIBRARY)

## Version Information

package-version.txt:

```
071b+autotools-2021-07-13
```

## Equivalent System Packages

arch:

```
$ sudo pacman -S lrs
```

conda:

```
$ conda install lrslib
```

Debian/Ubuntu:

```
$ sudo apt-get install lrslib
```

Fedora/Redhat/CentOS:

```
$ sudo yum install lrslib
```

freebsd:

```
$ sudo pkg install math/lrslib
```

gentoo:

```
$ sudo emerge sci-libs/lrslib
```

nix:

```
$ nix-env --install lrs
```

opensuse:

```
$ sudo zypper install lrslib lrslib-devel
```

See <https://repology.org/project/lrslib/versions>

If the system package is installed, ./configure will check if it can be used.

### 6.1.189 m4ri: fast arithmetic with dense matrices over GF(2)

#### Description

M4RI: Library for matrix multiplication, reduction and inversion over GF(2). (See also m4ri/README for a brief overview.)

#### License

- GNU General Public License Version 2 or later (see src/COPYING)

#### Upstream Contact

- Authors: Martin Albrecht et al.
- Email: <[m4ri-devel@googlegroups.com](mailto:m4ri-devel@googlegroups.com)>
- Website: <https://bitbucket.org/malb/m4ri>

#### Special Update/Build Instructions

- Delete the upstream Mercurial repositories (file m4ri/.hgtags, directory m4ri/.hg).
- Delete the directory m4ri/autom4te.cache (if present).
- Delete m4ri.vcproj (and perhaps other unnecessary baggage).
- Touch m4ri/configure to make sure it is newer than its sources.

**Type**

standard

**Dependencies**

- *libpng*: Bitmap image support

**Version Information**

package-version.txt:

opensuse:

```
$ sudo zypper install "pkgconfig(m4rie)"
```

void:

```
$ sudo xbps-install m4rie-devel
```

See <https://repology.org/project/libm4rie/versions>

If the system package is installed, ./configure will check if it can be used.

## 6.1.191 markupsafe: Safely add untrusted strings to HTML/XML markup

### Description

Implements a XML/HTML/XHTML Markup safe string for Python

### License

Simplified BSD

### Upstream Contact

Home page: <http://github.com/mitsuhiko/markupsafe>

### Type

standard

### Dependencies

- \${PYTHON\_TOOLCHAIN}
- \${PYTHON}

### Version Information

package-version.txt:

```
2.1.3
```

install-requires.txt:

```
markupsafe >=2.0
```

### Equivalent System Packages

conda:

```
$ conda install markupsafe
```

gentoo:

```
$ sudo emerge dev-python/markupsafe
```

macports: install the following packages: py-markupsafe

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-MarkupSafe
```

void:

```
$ sudo xbps-install python3-MarkupSafe
```

See <https://repology.org/project/python:markupsafe/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

## 6.1.192 mathics: A general-purpose computer algebra system

### Description

A general-purpose computer algebra system.

### License

GPL

### Upstream Contact

<https://pypi.org/project/Mathics3/>

### Type

optional

### Dependencies

- \$(PYTHON\_TOOLCHAIN)
- *pint: Physical quantities module*
- *palettable: Color palettes for Python*
- *mathics\_scanner: Character Tables and Tokenizer for Mathics and the Wolfram Language.*
- \$(PYTHON)

### Version Information

package-version.txt:

```
4.0.0
```

install-requires.txt:

```
Mathics3
```

### Equivalent System Packages

conda:

```
$ conda install mathics3
```

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.193 mathics\_scanner: Character Tables and Tokenizer for Mathics and the Wolfram Language.

### Description

Character Tables and Tokenizer for Mathics and the Wolfram Language.

### License

GPL-3.0-only

### Upstream Contact

<https://pypi.org/project/Mathics-Scanner/>

### Type

optional

### Dependencies

- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

### Version Information

package-version.txt:

1.2.4

install-requires.txt:

Mathics-Scanner

### Equivalent System Packages

(none known)

## 6.1.194 mathjax: A JavaScript library for displaying mathematical formulas

### Description

MathJax is a JavaScript library for displaying mathematical formulas.

MathJax is used in the Sage documentation built by Sphinx.

## License

Apache License, version 2.0

## Upstream Contact

Home page: <https://www.mathjax.org/>

## Type

standard

## Dependencies

### Version Information

package-version.txt:

```
3.2.0
```

## Equivalent System Packages

conda:

```
$ conda install mathjax
```

gentoo:

```
$ sudo emerge ">=dev-libs/mathjax-3"
```

opensuse:

```
$ sudo zypper install mathjax
```

void:

```
$ sudo xbps-install mathjax
```

See <https://repology.org/project/mathjax/versions>

If the system package is installed, ./configure will check if it can be used.

## 6.1.195 matplotlib: Python 2D plotting library

### Description

From the Matplotlib website: matplotlib is a python 2D plotting library which produces publication quality figures in a variety of hardcopy formats and interactive environments across platforms. matplotlib can be used in python scripts, the python and ipython shell (ala matlab or mathematica), web application servers, and six graphical user interface toolkits.

### License

The Matplotlib license - see <http://matplotlib.sourceforge.net/users/license.html>: Matplotlib only uses BSD compatible code, and its license is based on the PSF license. See the Open Source Initiative licenses page for details on individual licenses. Non-BSD compatible licenses (eg LGPL) are acceptable in matplotlib Toolkits. For a discussion of the motivations behind the licencing choice, see Licenses.

### Upstream Contact

<https://matplotlib.org>

The matplotlib mailing lists: see <http://sourceforge.net/projects/matplotlib>

### Dependencies

- python
- numpy
- setuptools ( $\geq 0.7$ )
- freetype
- patch (used in spkg-install)
- dateutil
- pyparsing
- tornado
- kiwisolver

### Build Instructions/Changes

- NOTE: To drastically cut down on spkg size, we delete the internal testing images. To do this, we repackage the tarball by removing the contents of `lib/matplotlib/tests/baseline_images/*`, this is done by the `spkg-src` script.
- `setup.py.patch`: disable loading of Tests. Otherwise, `setup.py` raises an error because it can't find the deleted files from `src/lib/matplotlib/tests/baseline_images/*`
- NOTE: as of matplotlib-1.0.0 and Sage 4.6, Sage does not use `$HOME/.matplotlib` by default. Instead, it sets `MPLCONFIGDIR` to a subdirectory in `$DOT_SAGE`, see `src/bin/sage-env`

**Type**

standard

**Dependencies**

- *numpy: Package for scientific computing with Python*
- *freetype: A free, high-quality, and portable font engine*
- *pillow: Python Imaging Library*
- *dateutil: Extensions to the standard Python module datetime*
- *pyparsing: A Python parsing module*
- *tornado: Python web framework and asynchronous networking library*
- *cycler: Composable cycles*
- *qhull: Compute convex hulls, Delaunay triangulations, Voronoi diagrams*
- *fonttools: Tools to manipulate font files*
- *contourpy: Python library for calculating contours of 2D quadrilateral grids*
- *\$(PYTHON\_TOOLCHAIN)*
- *kiwisolver: An implementation of the Cassowary constraint solving algorithm*
- *certifi: Python package for providing Mozilla's CA Bundle*
- *setuptools\_scm: Python build system extension to obtain package version from version control*
- *\$(PYTHON)*

**Version Information**

package-version.txt:

```
3.8.0
```

install-requires.txt:

```
# Trac #33642: Set lower bound for use of matplotlib color maps introduced in #33491,
# and to suppress deprecation warnings (https://github.com/matplotlib/matplotlib/pull/
# 21073)
matplotlib >=3.5.1
```

**Equivalent System Packages**

arch:

```
$ sudo pacman -S python-matplotlib
```

conda:

```
$ conda install matplotlib>=3.5.1
```

Debian/Ubuntu:

```
$ sudo apt-get install python3-matplotlib
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-matplotlib
```

gentoo:

```
$ sudo emerge dev-python/matplotlib
```

macports: install the following packages: py-matplotlib

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-matplotlib
```

void:

```
$ sudo xbps-install python3-matplotlib
```

See <https://repology.org/project/python:matplotlib/versions>

If the system package is installed and if the (experimental) option --enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.

### 6.1.196 matplotlib\_inline: Inline Matplotlib backend for Jupyter

#### Description

Inline Matplotlib backend for Jupyter

#### License

BSD 3-Clause

#### Upstream Contact

<https://pypi.org/project/matplotlib-inline/>

#### Type

standard

## Dependencies

- *traitlets*: *Traitlets Python configuration system*
- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

## Version Information

package-version.txt:

```
0.1.6
```

install-requires.txt:

```
matplotlib-inline
```

## Equivalent System Packages

conda:

```
$ conda install matplotlib-inline
```

gentoo:

```
$ sudo emerge dev-python/matplotlib-inline
```

void:

```
$ sudo xbps-install python3-matplotlib-inline
```

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

## 6.1.197 maxima: System for manipulating symbolic and numerical expressions

### Description

Maxima is a system for the manipulation of symbolic and numerical expressions, including differentiation, integration, Taylor series, Laplace transforms, ordinary differential equations, systems of linear equations, polynomials, and sets, lists, vectors, matrices, and tensors. Maxima yields high precision numeric results by using exact fractions, arbitrary precision integers, and variable precision floating point numbers. Maxima can plot functions and data in two and three dimensions.

For more information, see the Maxima web site

<http://maxima.sourceforge.net>

### License

Maxima is distributed under the GNU General Public License, with some export restrictions from the U.S. Department of Energy. See the file COPYING.

### Upstream Contact

- The Maxima mailing list - see <http://maxima.sourceforge.net/maximalist.html>

### Special Update/Build Instructions

1. Go to <http://sourceforge.net/projects/maxima/files/Maxima-source/> and download the source tarball maxima-x.y.z.tar.gz; place it in the upstream/ directory.
2. Update package-version.txt and run ‘sage –package fix-checksum’.
3. Make sure the patches still apply cleanly, and update them if necessary.
4. Test the resulting package.

All patch files in the patches/ directory are applied. Descriptions of these patches are either in the patch files themselves or below.

- 0001-taylor2-Avoid-blowing-the-stack-when-diff-expand-isn.patch: Fix for Maxima bug #2520 (abs\_integrate fails on abs(sin(x)) and abs(cos(x))). Introduced in Trac #13364 (Upgrade Maxima to 5.29.1).
- build-fasl.patch: Build a fasl library for ecl in addition to an executable program. Introduced in Trac #16178 (Build maxima fasl without asdf).
- infodir.patch: Correct the path to the Info directory. Introduced in Trac #11348 (maxima test fails when install tree is moved).
- matrixexp.patch: Fix matrixexp(matrix([%i\*%pi])), which broke after Maxima 5.29.1. Introduced in Trac #13973.
- maxima.system.patch: Set c::\*:compile-in-constants\* to t. Introduced in Trac #11966 (OS X 10.7 Lion: Maxima fails to build).
- undoing\_true\_false\_printing\_patch.patch: Revert an upstream change causing ‘?’ to be printed around some words. Introduced in Trac #13364 (Upgrade Maxima to 5.29.1).

### Type

standard

### Dependencies

- *ecl: An implementation of the Common Lisp language*
- *info: stand-alone Info documentation reader*

## Version Information

package-version.txt:

```
5.46.0
```

## Equivalent System Packages

arch:

```
$ sudo pacman -S maxima-fas
```

conda:

```
$ conda install maxima
```

cygwin:

```
$ apt-cyg install maxima
```

Debian/Ubuntu:

```
$ sudo apt-get install maxima-sage maxima
```

freebsd:

```
$ sudo pkg install math/maxima
```

gentoo:

```
$ sudo emerge sci-mathematics/maxima[ecl]
```

homebrew:

```
$ brew install maxima
```

macports: install the following packages: maxima

nix:

```
$ nix-env --install maxima-ecl
```

opensuse:

```
$ sudo zypper install maxima-exec-clisp
```

void:

```
$ sudo xbps-install maxima-ecl
```

See <https://repology.org/project/maxima/versions>, <https://repology.org/project/maxima-ecl/versions>, <https://repology.org/project/maxima-sage/versions>

If the system package is installed, ./configure will check if it can be used.

## 6.1.198 mcqd: An exact algorithm for finding a maximum clique in an undirected graph

### Description

MaxCliqueDyn is a fast exact algorithm for finding a maximum clique in an undirected graph.

### License

GPL 3

### Upstream Contact

MCQD is currently being maintained by Janez Konc. <https://gitlab.com/janezkonc/mcqcd>

### Type

optional

### Dependencies

### Version Information

package-version.txt:

```
1.0.p0
```

### Equivalent System Packages

arch:

```
$ sudo pacman -S mcqd
```

opensuse:

```
$ sudo zypper install mcqd
```

See <https://repology.org/project/mcqcd/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.199 `meataxe`: Library for computing with modular representations

### Description

SharedMeatAxe 1.0 is an autotoolized shared library version of C MeatAxe 2.4.24, a set of programs for computing with modular representations. The package comprises a shared library “`libmtx`”, as well as several executables.

See <http://users.minet.uni-jena.de/~king/SharedMeatAxe/> for the package documentation.

### Licence

The Shared Meat-Axe is free software: you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation, either version 2 of the License, or (at your option) any later version. See the file `COPYING`.

### Upstream contact

- Simon King <[simon.king@uni-jena.de](mailto:simon.king@uni-jena.de)>

### Type

optional

### Dependencies

### Version Information

package-version.txt:

```
1.0.1
```

### Equivalent System Packages

arch:

```
$ sudo pacman -S shared_meataxe
```

Fedora/Redhat/CentOS:

```
$ sudo yum install sharedmeataxe
```

See <https://repology.org/project/shared-meataxe/versions>, <https://repology.org/project/sharedmeataxe/versions>

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see [github issue #27330](#)

## 6.1.200 `memory_allocator`: An extension class to allocate memory easily with Cython

This extension class started as part of the Sage software.

### Description

development website: [https://github.com/sagemath/memory\\_allocator](https://github.com/sagemath/memory_allocator)

PyPI page: [https://pypi.org/project/memory\\_allocator](https://pypi.org/project/memory_allocator)

### License

GPL-3.0

### Upstream Contact

[https://github.com/sagemath/memory\\_allocator](https://github.com/sagemath/memory_allocator)

### Type

standard

### Dependencies

- *cython: C-Extensions for Python, an optimizing static compiler*
- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

### Version Information

package-version.txt:

```
0.1.3
```

install-requires.txt:

```
memory_allocator
```

## Equivalent System Packages

conda:

```
$ conda install memory-allocator
```

gentoo:

```
$ sudo emerge dev-python/memory-allocator
```

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

## 6.1.201 meson: A high performance build system

### Description

A high performance build system

### License

Apache License, Version 2.0

### Upstream Contact

## SPKG Maintainers

Simon A. King <[simon.king@uni-jena.de](mailto:simon.king@uni-jena.de)>

## Upstream Contact

Simon A. King <[simon.king@uni-jena.de](mailto:simon.king@uni-jena.de)> David J. Green <[david.green@uni-jena.de](mailto:david.green@uni-jena.de)>

## Acknowledgements

The development of the initial version of this SPKG was funded by the German Science Foundation, DFG project GR 1585/4.1, and was accomplished at the Friedrich Schiller University Jena.

Since version 1.0.1, the further work on this SPKG was funded by Marie Curie grant MTKD-CT-2006-042685 and was pursued at the National University of Ireland, Galway. Since November 2010, it is moved back to Jena.

We thank William Stein for giving us access to various computers on which we could build test the SPKG and on which some huge computations could be completed, and acknowledge the support by National Science Foundation Grant No. DMS-0821725.

We thank Mathieu Dutour Sikirić for hints on how to use GAP more efficiently.

We owe Peter Symonds the idea of using the Poincaré series in a rather efficient completeness criterion.

We are grateful to John Palmieri for his help on making p\_group\_cohomology work with python-3.

## Dependencies

- The SharedMeatAxe needs to be installed, as a build time dependency.

This can be met by installing the meataxe spkg

## Testing

Our package provides a very short test suite for David Green's routines for the computation of minimal projective resolutions. The majority of this package's tests is formed by doc tests in the Cython code. In fact, any class, method and function is covered by tests.

Note that internet access is required for these tests, as it is attempted to download cohomology rings from a public data base in the web.

The script spkg-check calls sage -t --force\_lib on the files in pGroupCohomology.

## Documentation

The documentation of this package is automatically built, if the environment variable SAGE\_SPKG\_INSTALL\_DOCS is yes (do “export SAGE\_SPKG\_INSTALL\_DOCS=yes” on the command line before installation). The documents are put into SAGE\_ROOT/local/share/doc/p\_group\_cohomology/.

### Type

optional

### Dependencies

### Equivalent System Packages

(none known)

## 6.1.206 mpc: Arithmetic of complex numbers with arbitrarily high precision and correct rounding

### Description

From <https://www.multiprecision.org/mpc>: GNU MPC is a C library for the arithmetic of complex numbers with arbitrarily high precision and correct rounding of the result. It extends the principles of the IEEE-754 standard for fixed precision real floating point numbers to complex numbers, providing well-defined semantics for every operation. At the same time, speed of operation at high precision is a major design goal.

### License

LGPLv3+ for the code and GFDLv1.3+ (with no invariant sections) for the documentation.

### Upstream Contact

The MPC website is located at <https://www.multiprecision.org/mpc>.

The MPC team can be contacted via the MPC mailing list: [mpc-discuss@inria.fr](mailto:mpc-discuss@inria.fr)

## Special Update/Build Instructions

- mpc\_mul\_faster.patch: Patch from Paul Zimmermann to speed up MPC multiplication (for small precisions) by reducing overhead in MPFR operations.

### Type

standard

### Dependencies

- \$(MP\_LIBRARY)
- *mpfr*: *Multiple-precision floating-point computations with correct rounding*

```

See <https://repology.org/project/libmpc/versions>

If the system package is installed, ./configure will check if it can be used.

### 6.1.207 mpfi: Multiple precision interval arithmetic library based on MPFR

#### Description

MPFI is a library for interval arithmetic, which is built upon the MPFR multiple precision floating-point arithmetic.

MPFI is intended to be a portable library written in C for arbitrary precision interval arithmetic with intervals represented using MPFR reliable floating-point numbers. It is based on the GNU MP library and on the MPFR library. The purpose of an arbitrary precision interval arithmetic is on the one hand to get “guaranteed” results, thanks to interval computation, and on the other hand to obtain accurate results, thanks to multiple precision arithmetic. The MPFI library is built upon MPFR in order to benefit from the correct rounding provided, for each operation or function, by MPFR. Further advantages of using MPFR are its portability and compliance with the IEEE 754 standard for floating-point arithmetic.

#### License

This version of MPFI is released under the GNU Lesser General Public License. It is permitted to link MPFI to non-free programs, as long as when distributing them the MPFI source code and a means to re-link with a modified MPFI is provided.

#### Upstream Contact

<http://perso.ens-lyon.fr/nathalie.revol/software.html>

The MPFI website is located at <https://gitlab.inria.fr/mpfi/mpfi>

The MPFI team can be contacted via the MPFI mailing list: [mpfi-users@inria.fr](mailto:mpfi-users@inria.fr)

```
$ sudo xbps-install mpfi-devel
```

See <https://repology.org/project/mpfi/versions>

If the system package is installed, ./configure will check if it can be used.

## 6.1.208 mpfr: Multiple-precision floating-point computations with correct rounding

### Description

The MPFR library is a C library for multiple-precision floating-point computations with correct rounding. MPFR has continuously been supported by the INRIA and the current main authors come from the Caramba and AriC project-teams at Loria (Nancy, France) and LIP (Lyon, France) respectively; see more on the credit page. MPFR is based on the GMP multiple-precision library.

The main goal of MPFR is to provide a library for multiple-precision floating-point computation which is both efficient and has a well-defined semantics. It copies the good ideas from the ANSI/IEEE-754 standard for double-precision floating-point arithmetic (53-bit significand).

### License

MPFR is free. It is distributed under the GNU Lesser General Public License (GNU Lesser GPL), version 3 or later (2.1 or later for MPFR versions until 2.4.x). The library has been registered in France by the Agence de Protection des Programmes under the number IDDN FR 001 120020 00 R P 2000 000 10800, on 15 March 2000. This license guarantees your freedom to share and change MPFR, to make sure MPFR is free for all its users. Unlike the ordinary General Public License, the Lesser GPL enables developers of non-free programs to use MPFR in their programs. If you have written a new function for MPFR or improved an existing one, please share your work!

### Upstream Contact

The MPFR website is located at <http://mpfr.org/>

The MPFR team can be contacted via the MPFR mailing list: [mpfr@loria.fr](mailto:mpfr@loria.fr)

### Special Update/Build Instructions

- Make sure MPFR's settings of CC and CFLAGS still get properly extracted, currently from its config.log in the src/ directory.
- We should remove the configure option --disable-thread-safe in case the issues without that have meanwhile been fixed. (Then we should actually pass --enable-thread-safe.)

### TODO

- --disable-thread-safe should be switched to --enable-thread-safe, need to check that this works on the buildbot machines

### Type

standard

## Dependencies

- \$(MP\_LIBRARY)

## Version Information

package-version.txt:

```
4.0.1.p0
```

## Equivalent System Packages

alpine:

```
$ sudo xbps-install mpfr-devel
```

See <https://repology.org/project/mpfr/versions>

If the system package is installed, ./configure will check if it can be used.

### 6.1.209 mpfrcx: Arithmetic of univariate polynomials over arbitrary precision real or complex numbers

#### Description

Mpfrcx is a library for the arithmetic of univariate polynomials over arbitrary precision real (Mpfr) or complex (Mpc) numbers, without control on the rounding. For the time being, only the few functions needed to implement the floating point approach to complex multiplication are implemented. On the other hand, these comprise asymptotically fast multiplication routines such as Toom–Cook and the FFT.

#### License

MPFRCX is distributed under the Gnu Lesser General Public License, either version 2.1 of the licence, or (at your option) any later version (LGPLv2.1+).

#### Upstream Contact

The MPFRCX website is located at <http://www.multiprecision.org/mpfrcx>.

#### Type

optional

#### Dependencies

- \$(MP\_LIBRARY)
- *mpfr*: *Multiple-precision floating-point computations with correct rounding*
- *mpc*: *Arithmetic of complex numbers with arbitrarily high precision and correct rounding*

#### Version Information

package-version.txt:

```
0.5
```

## Equivalent System Packages

opensuse:

```
$ sudo zypper install mpfrcx-devel
```

See <https://repology.org/project/mpfrcx/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.210 mpmath: Pure Python library for multiprecision floating-point arithmetic

### Description

Mpmath is a pure-Python library for multiprecision floating-point arithmetic. It provides an extensive set of transcendental functions, unlimited exponent sizes, complex numbers, interval arithmetic, numerical integration and differentiation, root-finding, linear algebra, and much more. Almost any calculation can be performed just as well at 10-digit or 1000-digit precision, and in many cases mpmath implements asymptotically fast algorithms that scale well for extremely high precision work. If available, mpmath will (optionally) use gmpy to speed up high precision operations.

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.216 ncurses: Classic terminal output library

#### Description

Ncurses (new curses, pronounced “enn-curses”) started as a freely distributable “clone” of System V Release 4.0 (SVr4) curses. It has outgrown the “clone” description, and now contains many features which are not in SVr4 curses. Curses is a pun on the term “cursor optimization”. It is a library of functions that manage an application’s display on character-cell terminals (e.g., VT100).

The name “ncurses” was first used as the name of the curses library in Pavel Curtis’s pcurses, dated 1982. It was apparently developed on a BSD 4.4 system, at Cornell. Parts of pcurses are readily identifiable in ncurses, including the basics for the terminfo compiler (named `compile` in that package):

- the Caps, used to define the terminfo capabilities
- awk scripts `MKcaptab.awk`, `MKnames.awk`
- the library modules used for the terminfo compiler.

Besides ncurses, parts of pcurses still survive in 2010, in recognizable form in Solaris.

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.222 nodejs: A JavaScript runtime built on Chrome's V8 JavaScript engine

### Description

Node.js® is a JavaScript runtime built on Chrome's V8 JavaScript engine.

It is installed into an isolated nodeenv.

### License

MIT License

### Upstream Contact

Home page: <https://nodejs.org/>

### Type

optional

### Dependencies

- *nodeenv: A tool to create isolated node.js environments*

### Version Information

package-version.txt:

```
12.18.3
```

### Equivalent System Packages

conda:

```
$ conda install nodejs
```

homebrew:

```
$ brew install node
```

openSUSE:

```
$ sudo zypper install nodejs
```

void:

```
$ sudo xbps-install nodejs
```

See <https://repology.org/project/nodejs/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

### 6.1.223 normaliz: Computations in affine monoids, vector configurations, lattice polytopes, and rational cones

#### Description

Normaliz is a tool for computations in affine monoids, vector configurations, lattice polytopes, and rational cones.

For more details see <http://www.mathematik.uni-osnabrueck.de/normaliz/>

## License

- GPL v3

## Upstream Contact

- [normaliz@uos.de](mailto:normaliz@uos.de)
- Winfried Bruns <[wbruns@uos.de](mailto:wbruns@uos.de)>
- Christof Söger <[csoeger@uos.de](mailto:csoeger@uos.de)>
- see also <https://www.normaliz.uni-osnabrueck.de/home/contact/>  
and <https://github.com/Normaliz>

## Special Update/Build Instructions

- The spkg currently disables features that require packages SCIP and CoCoA, for which we don't have packages (yet).

## Type

optional

## Dependencies

- \$(MP\_LIBRARY)
- *flint: Fast Library for Number Theory*
- *e\_antic: Real embedded number fields*
- *libnautu: Find automorphism groups of graphs, generate non-isomorphic graphs (callable library)*

## Version Information

package-version.txt:

```
3.10.1
```

## Equivalent System Packages

arch:

```
$ sudo pacman -S normaliz
```

conda:

```
$ conda install normaliz
```

Debian/Ubuntu:

```
$ sudo apt-get install libnormaliz-dev
```

Fedora/Redhat/CentOS:

```
$ sudo yum install libnormaliz-devel
```

gentoo:

```
$ sudo emerge sci-mathematics/normaliz
```

openSUSE:

```
$ sudo zypper install normaliz-devel
```

See <https://repology.org/project/normaliz/versions>, <https://repology.org/project/libnormaliz/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

### 6.1.224 notebook: Jupyter notebook, a web-based notebook environment for interactive computing

#### Description

The Jupyter HTML notebook is a web-based notebook environment for interactive computing.

#### Type

standard

#### Dependencies

- \$(PYTHON\_TOOLCHAIN)
- *ipython*: Interactive computing environment with an enhanced interactive Python shell
- *jupyter\_client*: Jupyter protocol implementation and client libraries
- *ipykernel*: IPython Kernel for Jupyter
- *nbconvert*: Converting Jupyter Notebooks
- *nbformat*: Base implementation of the Jupyter notebook format
- *jinja2*: General purpose template engine for Python
- *tornado*: Python web framework and asynchronous networking library
- *terminado*: Tornado websocket backend for the term.js Javascript terminal emulator library
- *send2trash*: Send file to trash natively under Mac OS X, Windows and Linux
- *prometheus\_client*: Python client for the systems monitoring and alerting toolkit Prometheus
- *argon2\_cffi*: The secure Argon2 password hashing algorithm
- \$(PYTHON)

## Version Information

package-version.txt:

```
6.4.12
```

install-requires.txt:

```
notebook >=6.1.1
```

## Equivalent System Packages

arch:

```
$ sudo pacman -S jupyter-notebook
```

conda:

```
$ conda install notebook
```

gentoo:

```
$ sudo emerge dev-python/notebook
```

macports: install the following packages: py-notebook

void:

```
$ sudo xbps-install python3-jupyter_notebook
```

See <https://repology.org/project/python:notebook/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

## 6.1.225 notetown: Create IPython notebooks from markdown

### Description

Notetown is a simple tool to create IPython notebooks from markdown.

### License

BSD 2-Clause License

### Upstream Contact

Author: Aaron O'Leary Home page: <https://github.com/aaren/notedown>

### Type

optional

### Dependencies

- \$(PYTHON\_TOOLCHAIN)
- *pip: Tool for installing and managing Python packages*
- *nbformat: Base implementation of the Jupyter notebook format*
- *nbconvert: Converting Jupyter Notebooks*
- *six: Python 2 and 3 compatibility utilities*
- *pandoc\_attributes: A parser and generator for pandoc block attributes*
- \$(PYTHON)

### Version Information

package-version.txt:

```
1.5.1
```

install-requires.txt:

```
notedown >=1.5.1
```

### Equivalent System Packages

conda:

```
$ conda install notedown
```

See <https://repology.org/project/python:notedown/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.226 ntl: A library for doing number theory

### Description

NTL is a high-performance, portable C++ library providing data structures and algorithms for manipulating signed, arbitrary length integers, and for vectors, matrices, and polynomials over the integers and over finite fields.

Website: <http://www.shoup.net/ntl/>

### License

- GNU LGPLv2.1+

### Upstream Contact

- Victor Shoup - for contact info see <http://www.shoup.net/>

### Special Update/Build Instructions

- None

### Type

standard

### Dependencies

- \$(MP\_LIBRARY)
- *gf2x: Fast arithmetic in GF(2)[x] and searching for irreducible/primitive trinomials*

### Version Information

package-version.txt:

```
11.4.3
```

### Equivalent System Packages

conda:

```
$ conda install ntl
```

cygwin:

```
$ apt-cyg install libntl-devel
```

Debian/Ubuntu:

```
$ sudo apt-get install libntl-dev
```

Fedora/Redhat/CentOS:

```
$ sudo yum install ntl-devel
```

freebsd:

```
$ sudo pkg install math/ntl
```

gentoo:

```
$ sudo emerge dev-libs/ntl
```

homebrew:

```
$ brew install ntl
```

macports: install the following packages: ntl

nix:

```
$ nix-env --install ntl
```

opensuse:

```
$ sudo zypper install ntl-devel
```

void:

```
$ sudo xbps-install ntl-devel
```

See <https://repology.org/project/ntl/versions>

If the system package is installed, ./configure will check if it can be used.

### 6.1.227 numpy: Package for scientific computing with Python

#### Description

This package adds numerical linear algebra and other numerical computing capabilities to python.

#### Upstream Contact

- <https://numpy.org/>
- Travis Oliphant
- Fernando Perez
- Brian Granger

## Special Update/Build Instructions

- Scipy uses numpy's distutils to control its compilation of fortran code.  
Whenever numpy is updated it is necessary to make sure that scipy still builds ok.

### Type

standard

## Dependencies

- \$(BLAS)
- *gfortran: Fortran compiler from the GNU Compiler Collection*
- \$(PYTHON\_TOOLCHAIN)
- *pkgconfig: Python interface to pkg-config*
- *cython: C-Extensions for Python, an optimizing static compiler*
- *meson\_python: Meson Python build backend (PEP 517)*
- \$(PYTHON)

## Version Information

package-version.txt:

```
1.26.1
```

install-requirements.txt:

```
numpy >=1.19
```

## Equivalent System Packages

arch:

```
$ sudo pacman -S python-numpy
```

conda:

```
$ conda install numpy
```

Debian/Ubuntu:

```
$ sudo apt-get install python3-numpy
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-numpy
```

gentoo:

```
$ sudo emerge dev-python/numpy
```

homebrew:

```
$ brew install numpy
```

macports: install the following packages: py-numpy

opensuse:

```
$ sudo zypper install python3${{PYTHON_MINOR}}-numpy
```

void:

```
$ sudo xbps-install python3-numpy
```

See <https://repology.org/project/python:numpy/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.228 onetbb: oneAPI Threading Building Blocks

#### Description

C++ parallelization library

#### License

Apache License, Version 2.0

#### Upstream Contact

<https://github.com/oneapi-src/oneTBB>

#### Type

optional

#### Dependencies

- *cmake: A cross-platform build system generator*

## Version Information

package-version.txt:

```
2021.9.0
```

## Equivalent System Packages

alpine:

```
$ apk add libtbb-dev
```

arch:

```
$ sudo pacman -S intel-oneapi-tbb
```

conda:

```
$ conda install tbb
```

Debian/Ubuntu:

```
$ sudo apt-get install libtbb-dev
```

Fedora/Redhat/CentOS:

```
$ sudo yum install tbb-devel
```

freebsd:

```
$ sudo pkg install devel/onetbb
```

gentoo:

```
$ sudo emerge dev-cpp/tbb
```

homebrew:

```
$ brew install tbb
```

macports: install the following packages: onetbb

nix:

```
$ nix-env --install tbb
```

opensuse:

```
$ sudo zypper install tbb
```

void:

```
$ sudo xbps-install tbb-devel
```

If the system package is installed, ./configure will check if it can be used.

## 6.1.229 openblas: An optimized implementation of BLAS (Basic Linear Algebra Subprograms)

### Description

OpenBLAS is an optimized open library implementing the Basic Linear Algebra Subprograms (BLAS) specification. It is based on GotoBLAS2 1.13 BSD version.

### License

3-clause BSD license

### SPKG Repository

<https://www.openblas.net>

GitHub page: <https://github.com/xianyi/OpenBLAS>

```
$ nix-env --install blas lapack
```

opensuse:

```
$ sudo zypper install openblas-devel
```

void:

```
$ sudo xbps-install openblas-devel
```

See <https://repology.org/project/openblas/versions>

If the system package is installed, ./configure will check if it can be used.

## 6.1.230 openssl: Implementation of the SSL and TLS protocols

### Description

From wikipedia: OpenSSL is an open source implementation of the SSL and TLS protocols. The core library (written in the C programming language) implements the basic cryptographic functions and provides various utility functions. Wrappers allowing the use of the OpenSSL library in a variety of computer languages are available.

### License

- Apache License v2 (considered compatible with GPL v3)

### Upstream Contact

- <http://openssl.org/>

### Type

standard

### Dependencies

### Version Information

package-version.txt:

```
3.0.12
```

### Equivalent System Packages

alpine:

```
$ apk add openssl-dev
```

arch:

```
$ sudo pacman -S openssl
```

conda:

```
$ conda install openssl
```

cygwin:

```
$ apt-cyg install libssl-devel
```

Debian/Ubuntu:

```
$ sudo apt-get install openssl libssl-dev
```

Fedor/Redhat/CentOS:

```
$ sudo yum install openssl openssl-devel
```

freebsd:

```
$ sudo pkg install security/openssl
```

homebrew:

```
$ brew install openssl
```

macports: install the following packages: openssl

nix:

```
$ nix-env --install openssl
```

opensuse:

```
$ sudo zypper install libopenssl-3-devel
```

slackware:

```
$ sudo slackpkg install openssl openssl-solibs
```

void:

```
$ sudo xbps-install openssl-devel
```

See <https://repology.org/project/openssl/versions>

If the system package is installed, ./configure will check if it can be used.

## 6.1.231 ore\_algebra: Ore algebra

### Description

A Sage implementation of Ore algebras, Ore polynomials, and differentially finite functions.

Main features for the most common algebras include basic arithmetic and actions; gcd and lcm; D-finite closure properties; creative telescoping; natural transformations between related algebras; guessing; desingularization; solvers for polynomials, rational functions and (generalized) power series. Univariate differential operators also support the numerical computation of analytic solutions with rigorous error bounds and related features.

### License

- GPL-2.0+

## Upstream Contact

- Website: [https://github.com/mkauers/ore\\_algebra/](https://github.com/mkauers/ore_algebra/)
- Sage accounts: mkauers, mmezzarobba

## Type

optional

## Dependencies

- \$(PYTHON\_TOOLCHAIN)
- \$(SAGERUNTIME)
- \$(PYTHON)

## Version Information

requirements.txt:

```

### Acknowledgements

The development of the initial version of this SPKG was funded by the German Science Foundation, DFG project GR 1585/4.1, and was accomplished at the Friedrich Schiller University Jena.

Since version 1.0.1, the further work on this SPKG was funded by Marie Curie grant MTKD-CT-2006-042685 and was pursued at the National University of Ireland, Galway. Since November 2010, it is moved back to Jena.

We thank William Stein for giving us access to various computers on which we could build test the SPKG and on which some huge computations could be completed, and acknowledge the support by National Science Foundation Grant No. DMS-0821725.

We thank Mathieu Dutour Sikirić for hints on how to use GAP more efficiently.

We owe Peter Symonds the idea of using the Poincaré series in a rather efficient completeness criterion.

We are grateful to John Palmieri for his help on making p\_group\_cohomology work with python-3.

## Dependencies

- The SharedMeatAxe needs to be installed, as a build time dependency.

This can be met by installing the meataxe spkg

## Testing

Our package provides a very short test suite for David Green's routines for the computation of minimal projective resolutions. The majority of this package's tests is formed by doc tests in the Cython code. In fact, any class, method and function is covered by tests.

Note that internet access is required for these tests, as it is attempted to download cohomology rings from a public data base in the web.

The script `spkg-check` calls `sage -t --force_lib` on the files in `pGroupCohomology`.

## Documentation

The documentation of this package is automatically built, if the environment variable `SAGE_SPKG_INSTALL_DOCS` is yes (do “`export SAGE_SPKG_INSTALL_DOCS=yes`” on the command line before installation). The documents are put into `SAGE_ROOT/local/share/doc/p_group_cohomology/`.

## Type

optional

## Dependencies

- `cython`: *C-Extensions for Python, an optimizing static compiler*
- `cysignals`: *Interrupt and signal handling for Cython*
- `singular`: *Computer algebra system for polynomial computations, algebraic geometry, singularity theory*
- `meataxe`: *Library for computing with modular representations*
- `p_group_cohomology`: *Modular cohomology rings of finite groups*
- `$(PYTHON_TOOLCHAIN)`
- `matplotlib`: *Python 2D plotting library*
- `gap`: *Groups, Algorithms, Programming - a system for computational discrete algebra*
- `xz`: *General-purpose data compression software*
- `$(SAGERUNTIME)`
- `ipywidgets`: *Interactive HTML widgets for Jupyter notebooks and the IPython kernel*
- `$(PYTHON)`

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.236 `palp`: A package for Analyzing Lattice Polytopes

**Description**

A Package for Analyzing Lattice Polytopes (PALP) is a set of C programs for calculations with lattice polytopes and applications to toric geometry.

It contains routines for vertex and facet enumeration, computation of incidences and symmetries, as well as completion of the set of lattice points in the convex hull of a given set of points. In addition, there are procedures specialised to reflexive polytopes such as the enumeration of reflexive subpolytopes, and applications to toric geometry and string theory, like the computation of Hodge data and fibration structures for toric Calabi-Yau varieties. The package is well tested and optimised in speed as it was used for time consuming tasks such as the classification of reflexive polyhedra in 4 dimensions and the creation and manipulation of very large lists of 5-dimensional polyhedra.

While originally intended for low-dimensional applications, the algorithms work in any dimension and our key routine for vertex and facet enumeration compares well with existing packages.

## License

- When released, GPL 2 was in force.
- There is a link to a web page, which now points to GPL 3, but would have pointed to GPL 2 at the time the package was released.
- Therefore one can deduce the authors were happy for this to be released under GPL 2 or a later version.

If the system package is installed, ./configure will check if it can be used.

### 6.1.237 pandoc: A document converter

#### Description

This dummy package represents the document converter pandoc.

We do not have an SPKG for it. The purpose of this dummy package is to associate system package lists with it.

#### Type

optional

#### Dependencies

#### Version Information

#### Equivalent System Packages

alpine:

```
$ apk add pandoc
```

arch:

```
$ sudo pacman -S pandoc
```

conda:

```
$ conda install pandoc
```

Debian/Ubuntu:

```
$ sudo apt-get install pandoc
```

Fedora/Redhat/CentOS:

```
$ sudo yum install pandoc
```

freebsd:

```
$ sudo pkg install textproc/hs-pandoc
```

gentoo:

```
$ sudo emerge app-text/pandoc
```

homebrew:

```
$ brew install pandoc
```

macports: install the following packages: pandoc

opensuse:

```
$ sudo zypper install pandoc
```

void:

```
$ sudo xbps-install pandoc
```

See <https://repology.org/project/pandoc/versions>

If the system package is installed, ./configure will check if it can be used.

## **6.1.238 pandoc\_attributes: A parser and generator for pandoc block attributes**

### **Description**

This is a simple parser / emitter for pandoc block attributes, intended for use with pandocfilters.

### **License**

BSD 2-Clause License

### **Upstream Contact**

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.239 pandocfilters: A Python module for writing pandoc filters

### Description

A python module for writing pandoc filters.

### License

BSD 3-Clause License

### Upstream Contact

Author: John MacFarlane Home page: <https://github.com/jgm/pandocfilters>

### Special Update/Build Instructions

Download the last release from <https://pypi.python.org/pypi/pandocfilters>

### Type

standard

## Dependencies

- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

## Version Information

package-version.txt:

```
1.5.0
```

install-requires.txt:

```
pandocfilters >=1.4.2
```

## Equivalent System Packages

arch:

```
$ sudo pacman -S python-pandocfilters
```

conda:

```
$ conda install pandocfilters
```

Debian/Ubuntu:

```
$ sudo apt-get install python3-pandocfilters
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-pandocfilters
```

gentoo:

```
$ sudo emerge dev-python/pandocfilters
```

macports: install the following packages: py-pandocfilters

opensuse:

```
$ sudo zypper install python3${{PYTHON_MINOR}}-pandocfilters
```

void:

```
$ sudo xbps-install python3-pandocfilters
```

See <https://repology.org/project/python:pandocfilters/versions>

If the system package is installed and if the (experimental) option --enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.

## 6.1.240 papilo: Parallel presolve for integer and linear optimization

### Description

parallel presolve routines for (mixed integer) linear programming problems. The routines are implemented using templates which allows switching to higher precision or rational arithmetic using the boost multiprecision package.

### License

LGPL 3.0

### Upstream Contact

<https://github.com/scipopt/papilo/>

### Type

optional

### Dependencies

- \$(MP\_LIBRARY)
- *boost\_cropped*: Portable C++ libraries (subset needed for Sage)
- *onetbb*: oneAPI Threading Building Blocks
- \$(BLAS)
- *gfortran*: Fortran compiler from the GNU Compiler Collection
- *cmake*: A cross-platform build system generator

### Version Information

package-version.txt:

2.1.1

### Equivalent System Packages

(none known)

## 6.1.241 pari: Computer algebra system for fast computations in number theory

### Description

PARI/GP is a widely used computer algebra system designed for fast computations in number theory (factorizations, algebraic number theory, elliptic curves...), but also contains a large number of other useful functions to compute with mathematical entities such as matrices, polynomials, power series, algebraic numbers etc., and a lot of transcendental functions. PARI is also available as a C library to allow for faster computations.

Originally developed by Henri Cohen and his co-workers (Université Bordeaux I, France), PARI is now under the GPL and maintained by Karim Belabas with the help of many volunteer contributors.

### License

GPL version 2+

### Upstream Contact

- <http://pari.math.u-bordeaux.fr/>

### Dependencies

- Perl
- MPIR or GMP
- Readline
- GNU patch (shipped with Sage)

### Special Update/Build Instructions

See patches/README.txt for a list of patches.

The current upstream tarball was created from the PARI git repository by running “make snapshot”.

### Type

standard

### Dependencies

- *readline: Command line editing library*
- *\$(MP\_LIBRARY)*
- *pari\_galdata: PARI data package needed to compute Galois groups in degrees 8 through 11*
- *pari\_seadata\_small: PARI data package needed by ellap for large primes (small version)*

### Version Information

package-version.txt:

```
2.15.4
```

### Equivalent System Packages

alpine:

```
$ apk add pari-dev
```

arch:

```
$ sudo pacman -S pari pari-galdata pari-seadata pari-elldata pari-galpol
```

conda:

```
$ conda install pari=*-*_pthread pari-elldata pari-galdata pari-galpol pari-seadata
```

Debian/Ubuntu:

```
$ sudo apt-get install pari-gp2c libpari-dev pari-doc pari-elldata pari-galdata pari-  
galpol pari-seadata
```

Fedora/Redhat/CentOS:

```
$ sudo yum install pari-devel pari-gp --setopt=tsflags= pari-galdata pari-galpol pari-  
seadata pari-elldata
```

freebsd:

```
$ sudo pkg install math/pari
```

gentoo:

```
$ sudo emerge sci-mathematics/pari sci-mathematics/pari-data
```

homebrew:

```
$ brew install pari pari-elldata pari-galdata pari-galpol pari-seadata
```

macports: install the following packages: pari

nix:

```
$ nix-env --install pari
```

opensuse:

```
$ sudo zypper install pari-devel pari-gp
```

void:

```
$ sudo xbps-install pari pari-devel pari-elldata-small pari-galdata pari-galpol-small  
- pari-seadata
```

See <https://repology.org/project/pari/versions>, <https://repology.org/project/pari-gp/versions>, <https://repology.org/project/pari-data/versions>, <https://repology.org/project/pari-elldata/versions>, <https://repology.org/project/pari-galdata/versions>, <https://repology.org/project/pari-galpol/versions>, <https://repology.org/project/pari-nftables/versions>, <https://repology.org/project/pari-seadata/versions>, <https://repology.org/project/pari-seadata-big/versions>

If the system package is installed, ./configure will check if it can be used.

## 6.1.242 pari\_elldata: PARI data package for elliptic curves

### Description

PARI/GP version of J. E. Cremona Elliptic Curve Data, needed by ellsearch and ellidentify.

### License

GNU General Public License (GPL version 2 or any later version).

### Upstream Contact

<http://pari.math.u-bordeaux.fr/>

### Dependencies

- Installation: None
- Runtime: PARI/GP

### Type

optional

### Dependencies

```

void:

```
$ sudo xbps-install pari-galpol-small
```

See <https://repology.org/project/pari-galpol/versions>

If the system package is installed, ./configure will check if it can be used.

## 6.1.245 pari\_jupyter: A Jupyter kernel for PARI/GP

### Description

A Jupyter kernel for PARI/GP

### License

GPL version 3 or later

### Upstream Contact

- <https://github.com/sagemath/pari-jupyter>

### Dependencies

- Python >= 3.6.1
- Jupyter 4
- PARI version 2.13 or later
- Readline (any version which works with PARI)
- Optional: Cython version 0.25 or later

### Type

optional

### Dependencies

- *pari: Computer algebra system for fast computations in number theory*
- *\$(PYTHON\_TOOLCHAIN)*
- *cython: C-Extensions for Python, an optimizing static compiler*
- *notebook: Jupyter notebook, a web-based notebook environment for interactive computing*
- *jupyter\_core: Jupyter core package*
- *\$(PYTHON)*

### Version Information

package-version.txt:

```
1.4.0
```

install-requires.txt:

```
pari_jupyter >=1.3.2
```

### Equivalent System Packages

conda:

```
$ conda install pari_jupyter
```

See <https://repology.org/project/pari-jupyter/versions>, <https://repology.org/project/python:pari-jupyter/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.246 pari\_nftables: PARI data package for number fields

### Description

Repackaging of the historical megrez number field tables (errors fixed, 1/10th the size, easier to use).

### License

GNU General Public License (GPL version 2 or any later version).

### Upstream Contact

<http://pari.math.u-bordeaux.fr/>

### Dependencies

- Installation: None
- Runtime: PARI/GP

### Type

optional

## Dependencies

### Version Information

package-version.txt:

```
20080929
```

### Equivalent System Packages

conda:

```
$ conda install pari-nftables
```

freebsd:

```
$ sudo pkg install math/pari_nftables
```

opensuse:

```
$ sudo zypper install pari-nftables
```

void:

```
$ sudo xbps-install pari-nftables
```

See <https://repology.org/project/pari-nftables/versions>

If the system package is installed, ./configure will check if it can be used.

## 6.1.247 pari\_seadata: PARI data package needed by ellap for large primes (full version)

### Description

Needed by ellap for large primes. These polynomials were extracted from the ECHIDNA databases and computed by David R. Kohel. This covers finite fields of cardinality  $q$  up to 750 bits. PARI/GP 2.9 contains fallback code to go on when all modular polynomials in the database have been exhausted and can handle larger fields (with an important slowdown).

### License

GNU General Public License (GPL version 2 or any later version).

## Upstream Contact

<http://pari.math.u-bordeaux.fr/>

## Dependencies

- Installation: None
- Runtime: PARI/GP

## Type

optional

## Dependencies

### Version Information

package-version.txt:

```
20090618
```

## Equivalent System Packages

arch:

```
$ sudo pacman -S pari-seadata
```

conda:

```
$ conda install pari-seadata
```

Fedora/Redhat/CentOS:

```
$ sudo yum install pari-seadata
```

freebsd:

```
$ sudo pkg install math/pari_seadata
```

openuse:

```
$ sudo zypper install pari-seadata
```

void:

```
$ sudo xbps-install pari-seadata
```

See <https://repology.org/project/pari-seadata/versions>, <https://repology.org/project/pari-seadata-big/versions>

If the system package is installed, ./configure will check if it can be used.

## 6.1.248 pari\_seadata\_small: PARI data package needed by ellap for large primes (small version)

### Description

PARI package “seadata\_small”: Needed by ellap for large primes. This “small” one is a much smaller version that should be suitable for primes up to 350 bits. These polynomials were extracted from the ECHIDNA databases and computed by David R. Kohel.

### License

GPL version 2+

### Upstream Contact

<http://pari.math.u-bordeaux.fr/>

### Type

standard

### Dependencies

#### Version Information

package-version.txt:

```
20090618.p0
```

### Equivalent System Packages

arch:

```
$ sudo pacman -S pari-seadata
```

conda:

```
$ conda install pari-seadata-small
```

freebsd:

```
$ sudo pkg install math/pari_seadata
```

void:

```
$ sudo xbps-install pari-seadata
```

See <https://repology.org/project/pari-seadata-small/versions>

If the system package is installed, ./configure will check if it can be used.

## 6.1.249 parso: A Python parser

### Description

Parso is a Python parser that supports error recovery and round-trip parsing for different Python versions (in multiple Python versions). Parso is also able to list multiple syntax errors in your python file.

### Type

standard

### Dependencies

- \${PYTHON\_TOOLCHAIN}
- \${PYTHON}

### Version Information

package-version.txt:

```
0.8.3
```

install-requires.txt:

```
parso >=0.7.0
```

### Equivalent System Packages

conda:

```
$ conda install parso
```

gentoo:

```
$ sudo emerge dev-python/parso
```

macports: install the following packages: py-parso

void:

```
$ sudo xbps-install python3-parso
```

See <https://repology.org/project/python:parso/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

## **6.1.250 patch: Applies diffs and patches to files**

### **Description**

‘patch’ takes a patch file containing a difference listing produced by the ‘diff’ program and applies those differences to one or more original files, producing patched versions.

The version of ‘patch’ included is the GNU one. Some of the ‘diff’ files produced by GNU ‘diff’ are not acceptable to some versions of the ‘patch’ command, such as the ‘patch’ command that comes with Solaris.

### **License**

This program is free software: you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 2, or (at your option) any later version.

### **Upstream Contact**

Main web site: <http://savannah.gnu.org/projects/patch/>

Bug database: <http://savannah.gnu.org/bugs/?group=patch>

Submit bugs: <http://savannah.gnu.org/bugs/?func=additem&group=patch>

Mailing lists: [bug-patch@gnu.org](mailto:bug-patch@gnu.org)

### **Special Update/Build Instructions**

In the event patches ever need to be made to this package, the method of applying the patches should not rely on the ‘patch’ existing on the system.

### **Type**

standard

### **Dependencies**

### **Version Information**

package-version.txt:

2.7.5
-------

## Equivalent System Packages

alpine:

```

- *numpy*: Package for scientific computing with Python
- `$(PYTHON_TOOLCHAIN)`
- `$(PYTHON)`

#### Version Information

requirements.txt:

```
phitigra>=0.2.6
```

#### Equivalent System Packages

(none known)

## 6.1.259 pickleshare: A ‘shelve’ like datastore with concurrency support

### Description

PickleShare - a small ‘shelve’ like datastore with concurrency support

Like shelve, a PickleShareDB object acts like a normal dictionary. Unlike shelve, many processes can access the database simultaneously. Changing a value in database is immediately visible to other processes accessing the same database.

Concurrency is possible because the values are stored in separate files. Hence the “database” is a directory where all files are governed by PickleShare.

### Type

standard

### Dependencies

- \${PYTHON\_TOOLCHAIN}
- \${PYTHON}

### Version Information

package-version.txt:

```
0.7.5
```

install-requires.txt:

```
pickleshare >=0.7.5
```

### Equivalent System Packages

arch:

```
$ sudo pacman -S python-pickleshare
```

conda:

```

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.260 pillow: Python Imaging Library

#### Description

Pillow is the “friendly” PIL fork by Alex Clark and Contributors.

The Python Imaging Library (PIL) adds powerful image processing and graphics capabilities to Python. The library supports many file formats.

#### License

Standard PIL License

#### Upstream Contact

- Author: Alex Clark <[aclark@aclark.net](mailto:aclark@aclark.net)>
- <https://python-pillow.org/>
- Homepage: <http://python-imaging.github.io/>

#### Type

standard

#### Dependencies

- *zlib: Data compression library*
- *freetype: A free, high-quality, and portable font engine*
- *\$(PYTHON\_TOOLCHAIN)*
- *pkgconf: An implementation of the pkg-config spec*
- *\$(PYTHON)*

## Version Information

package-version.txt:

```
10.1.0
```

install-requirements.txt:

```
pillow >=7.2.0
```

## Equivalent System Packages

arch:

```
$ sudo pacman -S python-pillow
```

conda:

```
$ conda install pillow
```

Debian/Ubuntu:

```
$ sudo apt-get install python3-pillow
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-pillow
```

gentoo:

```
$ sudo emerge dev-python/pillow
```

macports: install the following packages: py-Pillow

opensuse:

```
$ sudo zypper install python3${{PYTHON_MINOR}}-Pillow
```

void:

```
$ sudo xbps-install python3-Pillow
```

See <https://repology.org/project/python:pillow/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

## 6.1.261 pint: Physical quantities module

### Description

Physical quantities module

### License

BSD

### Upstream Contact

<https://pypi.org/project/Pint/>

### Type

optional

### Dependencies

- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

### Version Information

package-version.txt:

0.20.1

install-requires.txt:

Pint

### Equivalent System Packages

conda:

```
$ conda install pint
```

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.262 pip: Tool for installing and managing Python packages

### Description

This package installs pip, the tool for installing and managing Python packages, such as those found in the Python Package Index. It's a replacement for easy\_install.

### License

MIT

### Upstream Contact

### Type

standard

### Dependencies

- *setuptools*: Build system for Python packages
- *wheel*: A built-package format for Python
- \$(PYTHON)

### Version Information

package-version.txt:

```
23.3.1
```

install-requirements.txt:

```
pip >=23.1.0
# for use of the "in-tree-build" feature, default since 21.3, by the Sage distribution
# for use of --config-settings, 22.1
# for use of -C as a shortcut for --config-settings, 23.1.0
```

### Equivalent System Packages

arch:

```
$ sudo pacman -S python-pip
```

conda:

```
$ conda install pip
```

Debian/Ubuntu:

```
$ sudo apt-get install python3-pip
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-pip
```

freebsd:

```
$ sudo pkg install devel/py-pip
```

gentoo:

```
$ sudo emerge dev-python/pip
```

macports: install the following packages: py-pip

openSUSE:

```
$ sudo zypper install python3${PYTHON_MINOR}-pip
```

void:

```
$ sudo xbps-install python3-pip
```

See <https://repology.org/project/pip3/versions>, <https://repology.org/project/python:pip/versions>, <https://repology.org/project/python3x-pip/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.263 pkgconf: An implementation of the pkg-config spec

#### Description

Pkgconf is an implementation of the pkg-config spec with minimal dependencies.

## License

ISC License (equivalent to Simplified BSD)

## Upstream Contact

<https://github.com/pkgconf/pkgconf>

## Special Update/Build Instructions

- `install.patch`: Use install script from `AC_PROG_INSTALL`

Pkgconf is used in bzip2, so we must not use the bzip2-compressed tarball.

## Type

standard

## Dependencies

- `patch`: Applies diffs and patches to files
- `xz`: General-purpose data compression software

## Version Information

package-version.txt:

```
1.8.0
```

## Equivalent System Packages

arch:

```
$ sudo pacman -S pkgconf
```

conda:

```
$ conda install pkg-config
```

Debian/Ubuntu:

```
$ sudo apt-get install pkg-config
```

Fedora/Redhat/CentOS:

```
$ sudo yum install pkg-config
```

freebsd:

```
$ sudo pkg install devel/pkgconf
```

homebrew:

```
$ brew install pkg-config
```

macports: install the following packages: pkgconfig

opensuse:

```
$ sudo zypper install pkgconf
```

void:

```
$ sudo xbps-install pkgconf
```

See <https://repology.org/project/pkgconf/versions>, <https://repology.org/project/pkg-config/versions>

If the system package is installed, ./configure will check if it can be used.

### 6.1.264 pkgconfig: Python interface to pkg-config

#### Description

Pkgconfig is a Python module to interface with the pkg-config command line tool.

#### License

MIT License

#### Upstream Contact

<https://github.com/matze/pkgconfig>

#### Type

standard

#### Dependencies

- *pkgconf: An implementation of the pkg-config spec*
- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

## Version Information

package-version.txt:

```
1.5.5
```

install-requires.txt:

```
pkgconfig
```

## Equivalent System Packages

arch:

```
$ sudo pacman -S python-pkgconfig
```

conda:

```
$ conda install pkgconfig
```

Debian/Ubuntu:

```
$ sudo apt-get install python3-pkgconfig
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-pkgconfig
```

freebsd:

```
$ sudo pkg install devel/py-pkgconfig
```

gentoo:

```
$ sudo emerge dev-python/pkgconfig
```

macports: install the following packages: py-pkgconfig

opensuse:

```
$ sudo zypper install pkg-config
```

void:

```
$ sudo xbps-install python3-pkgconfig
```

See <https://repology.org/project/python:pkgconfig/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

## 6.1.265 planarity: Planarity-related graph algorithms

### Description

This code project provides a library for implementing graph algorithms as well as implementations of several planarity-related graph algorithms. The origin of this project is the reference implementation for the Edge Addition Planarity Algorithm [1], which is now the fastest and simplest linear-time method for planar graph embedding and planarity obstruction isolation (i.e. Kuratowski subgraph isolation).

[1] <http://dx.doi.org/10.7155/jgaa.00091>

### License

New BSD License

### Upstream Contact

- <https://github.com/graph-algorithms/edge-addition-planarity-suite/>

```

void:

```
$ sudo xbps-install planarity-devel
```

See <https://repology.org/project/planarity/versions>

If the system package is installed, ./configure will check if it can be used.

## 6.1.266 plantri: Generate non-isomorphic sphere-embedded graphs

### Description

Plantri is a program that generates certain types of graphs that are imbedded on the sphere.

Exactly one member of each isomorphism class is output, using an amount of memory almost independent of the number of graphs produced. This, together with the exceptionally fast operation and careful validation, makes the program suitable for processing very large numbers of graphs.

Isomorphisms are defined with respect to the embeddings, so in some cases outputs may be isomorphic as abstract graphs.

### License

Plantri is distributed without a license.

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

## 6.1.270 polylib: Operations on unions of polyhedra

### Description

The Polyhedral Library (PolyLib for short) operates on objects made up of unions of polyhedra of any dimension. polylib is a C library.

### License

GPL v3

### Upstream Contact

- <https://groups.google.com/forum/#!forum/isl-development>

**Type**

experimental

**Dependencies**

- \$(MP\_LIBRARY)
- *mpfr*: *Multiple-precision floating-point computations with correct rounding*
- *ntl*: *A library for doing number theory*

**Version Information**

package-version.txt:

5.22.5
--------

**Equivalent System Packages**

macports: install the following packages: polylib

openSUSE:

\$ sudo zypper install polylib "pkgconfig(polylibgmp)"
--

See <https://repology.org/project/polylib/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.271 **polymake: Computations with polyhedra, fans, simplicial complexes, matroids, graphs, tropical hypersurfaces**

**Description**

polymake is open source software for research in polyhedral geometry. It deals with polytopes, polyhedra and fans as well as simplicial complexes, matroids, graphs, tropical hypersurfaces, and other objects. Supported platforms include various flavors of Linux, Free BSD and Mac OS.

**License**

- GPL v3

### Upstream Contact

- <https://polymake.org/>

### Dependencies

Polymake needs a working installation of Perl, including its shared library and some modules (XML::Writer XML::LibXML XML::LibXSLT Term::ReadLine::Gnu JSON SVG). The Polymake interface in Sage additionally needs File::Slurp. For full functionality including polymake's polyDB, also the Perl module MongoDB is needed.

These are not provided by a Sage package. The script package perl\_cpan\_polymake\_prereq will signal an error at build time if the required prerequisites are not met.

The configure script will inform you about the equivalent system packages that you should install. Otherwise, you can use CPAN (see below).

Sage might install the Term::ReadLine::Gnu module, however, when you install polymake, if it is not provided by the system, or if Sage installs its own readline library.

A distribution-independent way to install Perl modules (into a user's home directory or /usr/local) is using CPAN. This is also the way to install the modules on macOS. For this, if you don't have root access, you will need the local::lib Perl module installed:

```
cpan -i XML::Writer XML::LibXML XML::LibXSLT File::Slurp Term::ReadLine::Gnu JSON SVG  
    ↳MongoDB
```

Several Sage packages should be installed before installing the polymake package to give a more featureful Polymake installation:

```
sage -i 4ti2 latte_int topcom qhull
```

Software that would need to be installed manually (no Sage package available) for a more featureful Polymake installation: azove, porta, vinci, SplitsTree4.

Information on missing Polymake prerequisites after installing polymake:

```
$ sage -sh  
(sage-sh) $ polymake  
polytope> show_unconfigured;
```

In order to Polymake from Sage, you will need the JuPyMake:

```
sage -i jupymake
```

### Debugging polymake install problems

```
# apt-get install libdevel-trace-perl  
$ cd src  
$ perl -d:Trace support/configure.pl
```

**Type**

optional

**Dependencies**

- \$(MP\_LIBRARY)
- *bliss*: Computing automorphism groups and canonical forms of graphs
- *cddlib*: Double description method for polyhedral representation conversion
- *normaliz*: Computations in affine monoids, vector configurations, lattice polytopes, and rational cones
- *perl\_term\_readline\_gnu*: Perl extension for the GNU Readline/History libraries
- *ppl*: Parma Polyhedra Library
- *perl\_cpan\_polymake\_prereq*: Represents all Perl packages that are prerequisites for polymake
- *libxml2*: XML parser and toolkit
- *lrslib*: Reverse search algorithm for vertex enumeration and convex hull problems
- *ninja\_build*: A build system with a focus on speed

**Version Information**

package-version.txt:

```
4.9
```

**Equivalent System Packages**

arch:

```
$ sudo pacman -S polymake
```

Debian/Ubuntu:

```
$ sudo apt-get install polymake libpolymake-dev
```

Fedora/Redhat/CentOS:

```
$ sudo yum install polymake
```

homebrew:

```
$ brew install apaffenholz/polymake/polymake
```

nix:

```
$ nix-env --install polymake
```

opensuse:

```
$ sudo zypper install polymake
```

See <https://repology.org/project/polymake/versions>

If the system package is installed, ./configure will check if it can be used.

### 6.1.272 polytopes\_db: Databases of 2- and 3-dimensional reflexive polytopes

#### Description

This package includes lists of 2- and 3-dimensional reflexive polytopes.

The list of polygons is quite easy to get and it has been known for a while. The list of 3-polytopes was originally obtained by Maximilian Kreuzer and Harald Skarke using their software PALP, which is included into the standard distribution of Sage. To work with lattice and reflexive polytopes from Sage you can use sage.geometry.lattice\_polytope module, which relies on PALP for some of its functionality. To get access to the databases of this package, use ReflexivePolytope and ReflexivePolytopes commands.

## **6.1.274 ppl: Parma Polyhedra Library**

### **Description**

The Parma Polyhedra Library (PPL) provides numerical abstractions especially targeted at applications in the field of analysis and verification of complex systems. These abstractions include convex polyhedra, defined as the intersection of a finite number of (open or closed) halfspaces, each described by a linear inequality (strict or non-strict) with rational coefficients; some special classes of polyhedra shapes that offer interesting complexity/precision tradeoffs; and grids which represent regularly spaced points that satisfy a set of linear congruence relations. The library also supports finite powersets and products of (any kind of) polyhedra and grids, a mixed integer linear programming problem solver using

## Packages and Features, Release 10.2

---

an exact-arithmetic version of the simplex algorithm, a parametric integer programming solver, and primitives for the termination analysis via the automatic synthesis of linear ranking functions.

It is written in C++, but comes with interfaces to C, Java, OCaml, and Prolog. PPL is one of the fastest implementations of polyhedral computations.

Benchmarks are included in this paper: [arXiv cs/0612085](https://arxiv.org/abs/cs/0612085)

Fedora/Redhat/CentOS:

```
$ sudo yum install primesieve-devel primesieve
```

gentoo:

```
$ sudo emerge sci-mathematics/primesieve
```

homebrew:

```
$ brew install primesieve
```

opensuse:

```
$ sudo zypper install primesieve
```

void:

```
$ sudo xbps-install primesieve-devel
```

See <https://repology.org/project/primesieve/versions>

If the system package is installed, ./configure will check if it can be used.

### 6.1.280 prometheus\_client: Python client for the systems monitoring and alerting toolkit Prometheus

#### Description

The official Python 2 and 3 client for Prometheus (see <https://prometheus.io>), an open-source systems monitoring and alerting toolkit.

#### Type

standard

#### Dependencies

- \${PYTHON\_TOOLCHAIN}
- \${PYTHON}

#### Version Information

package-version.txt:

```
0.14.1
```

install-requires.txt:

```
prometheus_client >=0.8.0
```

## Equivalent System Packages

conda:

```
$ conda install prometheus_client
```

gentoo:

```
$ sudo emerge dev-python/prometheus_client
```

macports: install the following packages: py-prometheus\_client

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-prometheus_client
```

void:

```
$ sudo xbps-install python3-prometheus_client
```

See <https://repology.org/project/python:prometheus-client/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

## 6.1.281 prompt\_toolkit: Interactive command lines for Python

### Description

Library for building powerful interactive command lines in Python

[https://pypi.python.org/pypi/prompt\\_toolkit](https://pypi.python.org/pypi/prompt_toolkit)

### Type

standard

### Dependencies

- *six: Python 2 and 3 compatibility utilities*
- *wcwidth: Measures the displayed width of unicode strings in a terminal*
- `$(PYTHON_TOOLCHAIN)`
- `$(PYTHON)`

### Version Information

package-version.txt:

```
3.0.24
```

install-requires.txt:

```
# :issue:`33428` - prompt_toolkit 3.0.25+ breaks Ctrl-C
prompt_toolkit >=3.0.5, <3.0.25
```

### Equivalent System Packages

arch:

```
$ sudo pacman -S python-importlib_resources
```

conda:

```
$ conda install prompt_toolkit>=3.0.5,<3.0.25
```

Debian/Ubuntu:

```
$ sudo apt-get install importlib-resources
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-prompt-toolkit
```

freebsd:

```
$ sudo pkg install devel/py-importlib-resources
```

gentoo:

```
$ sudo emerge dev-python/prompt_toolkit
```

macports: install the following packages: py-prompt\_toolkit

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-importlib_resources
```

void:

```
$ sudo xbps-install python3-prompt_toolkit
```

See <https://repology.org/project/python:prompt-toolkit/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

## 6.1.282 ptyprocess: Python interaction with subprocesses in a pseudoterminal

### Description

Launch a subprocess in a pseudo terminal (pty), and interact with both the process and its pty.

Sometimes, piping stdin and stdout is not enough. There might be a password prompt that doesn't read from stdin, output that changes when it's going to a pipe rather than a terminal, or curses-style interfaces that rely on a terminal. If you need to automate these things, running the process in a pseudo terminal (pty) is the answer.

### License

Ptyprocess is under the ISC license, as code derived from Pexpect.

<http://opensource.org/licenses/ISC>

### Upstream Contact

<https://github.com/pexpect/ptyprocess>

### Type

standard

### Dependencies

- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

### Version Information

package-version.txt:

0.7.0

install-requires.txt:

ptyprocess > 0.5

### Equivalent System Packages

arch:

```
$ sudo pacman -S python-ptyprocess
```

conda:

Fedora/Redhat/CentOS:

```
$ sudo yum install python-ptyprocess
```

freebsd:

```
$ sudo pkg install sysutils/py-ptyprocess
```

gentoo:

```
$ sudo emerge dev-python/ptyprocess
```

macports: install the following packages: py-ptyprocess

opensuse:

```
$ sudo zypper install python3${{PYTHON_MINOR}}-ptyprocess
```

void:

```
$ sudo xbps-install python3-ptyprocess
```

See <https://repology.org/project/ptyprocess/versions>, <https://repology.org/project/python:ptyprocess/versions>

If the system package is installed and if the (experimental) option --enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.

### 6.1.283 pure\_eval: Safely evaluate AST nodes without side effects

#### Description

Safely evaluate AST nodes without side effects

#### License

MIT

#### Upstream Contact

<https://pypi.org/project/pure-eval/>

#### Type

standard

#### Dependencies

- \${PYTHON\_TOOLCHAIN}
- \${PYTHON}

## Version Information

package-version.txt:

```
0.2.2
```

install-requires.txt:

```
pure-eval
```

## Equivalent System Packages

conda:

```
$ conda install pure_eval
```

gentoo:

```
$ sudo emerge dev-python/pure_eval
```

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

## 6.1.284 py: library with cross-python path, ini-parsing, io, code, log facilities

### Description

library with cross-python path, ini-parsing, io, code, log facilities

### License

MIT license

### Upstream Contact

<https://pypi.org/project/py/>

### Type

standard

### Dependencies

- \${PYTHON\_TOOLCHAIN}
- *setuptools\_scm*: Python build system extension to obtain package version from version control
- \${PYTHON}

### Version Information

package-version.txt:

```
1.11.0
```

install-requires.txt:

```
py
```

### Equivalent System Packages

arch:

```
$ sudo pacman -S python-py
```

conda:

```
$ conda install py
```

Debian/Ubuntu:

```
$ sudo apt-get install python3-py
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-py
```

gentoo:

```
$ sudo emerge dev-python/py
```

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-py
```

void:

```
$ sudo xbps-install python3-py
```

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

## 6.1.285 pybind11: Create Python bindings to C++ code

### Description

**pybind11** is a lightweight header-only library that exposes C++ types in Python and vice versa, mainly to create Python bindings of existing C++ code. Its goals and syntax are similar to the excellent [Boost.Python]([http://www.boost.org/doc/libs/1\\_58\\_0/libs/python/doc/](http://www.boost.org/doc/libs/1_58_0/libs/python/doc/)) library by David Abrahams: to minimize boilerplate code in traditional extension modules by inferring type information using compile-time introspection.

### License

pybind11 is provided under a BSD-style license that can be found in the LICENSE file. By using, distributing, or contributing to this project, you agree to the terms and conditions of this license.

### Upstream Contact

<https://github.com/pybind/pybind11>

### Type

standard

### Dependencies

- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

### Version Information

package-version.txt:

2.11.1

install-requires.txt:

pybind11 >=2.6

### Equivalent System Packages

conda:

\$ conda install pybind11

gentoo:

\$ sudo emerge dev-python/pybind11

homebrew:

```
$ brew install pybind11
```

macports: install the following packages: py-pybind11

void:

```
$ sudo xbps-install python3-pybind11
```

See <https://repology.org/project/python:pybind11/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.286 pybtex: A BibTeX-compatible bibliography processor in Python

#### Description

A BibTeX-compatible bibliography processor in Python

#### License

MIT

#### Upstream Contact

<https://pypi.org/project/pybtex/>

#### Type

optional

#### Dependencies

#### Version Information

requirements.txt:

```
pybtex
```

#### Equivalent System Packages

conda:

```
$ conda install pybtex
```

macports: install the following packages: py-pybtex

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-pybtex
```

See <https://repology.org/project/python:pybtex/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.287 pycosat: SAT solver picosat with Python bindings

### Description

PicoSAT is a popular SAT solver written by Armin Biere in pure C. This package provides efficient Python bindings to picosat on the C level, i.e. when importing pycosat, the picosat solver becomes part of the Python process itself. For ease of deployment, the picosat source (namely picosat.c and picosat.h) is included in this project. These files have been extracted from the picosat source.

### License

MIT

### Upstream Contact

- PicoSAT: <http://fmv.jku.at/picosat/>
- pycosat: <https://github.com/ContinuumIO/pycosat>

### Special Update/Build Instructions

None.

### Type

optional

### Dependencies

- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

### Version Information

package-version.txt:

```
0.6.3
```

install-requires.txt:

```
pycosat >=0.6.3
```

## Equivalent System Packages

alpine:

```
$ apk add py3-pycosat
```

arch:

```
$ sudo pacman -S python-pycosat
```

conda:

```
$ conda install pycosat
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-pycosat
```

freebsd:

```
$ sudo pkg install math/py-pycosat
```

See <https://repology.org/project/pycosat/versions>, <https://repology.org/project/python:pycosat/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.288 pycparser: Parser of the C language in Python

### Description

development website: <https://github.com/eliben/pycparser>

PyPI page: <https://pypi.org/project/pycparser/>

### License

BSD

### Upstream Contact

<https://github.com/eliben/pycparser>

### Type

standard

## Dependencies

- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

## Version Information

package-version.txt:

```
2.21
```

install-requires.txt:

```
pyparser >=2.20
```

## Equivalent System Packages

conda:

```
$ conda install pyparser
```

gentoo:

```
$ sudo emerge dev-python/pyparser
```

macports: install the following packages: py-pyparser

opensuse:

```
$ sudo zypper install python3${{PYTHON_MINOR}}-pyparser
```

void:

```
$ sudo xbps-install python3-pyparser
```

See <https://repology.org/project/pyparser/versions>, <https://repology.org/project/python:pyparser/versions>

If the system package is installed and if the (experimental) option –enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.

## 6.1.289 pycryptosat: Python module of cryptominisat

### Description

Build and install pycryptosat into appropriate venv. See cryptominisat for more details.

### License

MIT License

### Upstream Contact

- Authors: Mate Soos
- Email: soos.mate@gmail.com
- Website: <http://www.msoos.org/>
- Releases: <https://github.com/msoos/cryptominisat/releases>

### Type

optional

### Dependencies

- *m4ri: fast arithmetic with dense matrices over GF(2)*
- *zlib: Data compression library*
- *libpng: Bitmap image support*
- *cryptominisat: A SAT solver*
- *cmake: A cross-platform build system generator*
- *boost\_cropped: Portable C++ libraries (subset needed for Sage)*
- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

### Version Information

package-version.txt:

```
5.8.0
```

install-requirements.txt:

```
pycryptosat
```

## Equivalent System Packages

conda:

```
$ conda install cryptominisat
```

homebrew:

```
$ brew install cryptominisat
```

See <https://repology.org/project/cryptominisat/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.290 pycygwin: Python bindings for Cygwin's C API

### Description

Python bindings for Cygwin's C API. Provides some utilities to help with the Cygwin port. Naturally, this package should only be installed on Cygwin—for other platforms its installation is a no-op.

### Website

<https://github.com/embray/PyCygwin>

### Type

standard

### Dependencies

- *cython: C-Extensions for Python, an optimizing static compiler*
- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

### Version Information

package-version.txt:

```
0.1
```

install-requires.txt:

```
pycygwin >=0.1
```

### Equivalent System Packages

See <https://repology.org/project/python:pycygwin/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.291 pygments: Generic syntax highlighter

### Description

Pygments is a syntax highlighting package written in Python.

It is a generic syntax highlighter suitable for use in code hosting, forums, wikis or other applications that need to prettify source code. Highlights are:

- a wide range of over 300 languages and other text formats is supported
- special attention is paid to details, increasing quality by a fair amount
- support for new languages and formats are added easily
- a number of output formats, presently HTML, LaTeX, RTF, SVG, all image formats that PIL supports and ANSI sequences
- it is usable as a command-line tool and as a library

### License

Modified BSD

### Upstream Contact

- Author: Georg Brandl
- Home Page: <https://pygments.org>

### Special Update/Build Instructions

Patches included:

- sage\_prompt.patch: patch pygments/lexers/agile.py to treat the “sage:” prompt like Python’s “>>>” prompt. This allows a very kludgy patch to be removed from the Sphinx package (see #10118).

### Type

standard

## Dependencies

- \${PYTHON\_TOOLCHAIN}
- \${PYTHON}

## Version Information

package-version.txt:

```
2.13.0
```

install-requires.txt:

```
pygments >=2.12
```

## Equivalent System Packages

arch:

```
$ sudo pacman -S python-pygments
```

conda:

```
$ conda install pygments
```

Debian/Ubuntu:

```
$ sudo apt-get install python3-pygments
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-pygments
```

gentoo:

```
$ sudo emerge dev-python/pygments
```

homebrew:

```
$ brew install pygments
```

macports: install the following packages: py-pygments

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-pygments
```

void:

```
$ sudo xbps-install python3-Pygments
```

See <https://repology.org/project/pygments/versions>, <https://repology.org/project/python:pygments/versions>

If the system package is installed and if the (experimental) option --enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.

## 6.1.292 pygraphviz: Python interface to Graphviz

### Description

Python interface to Graphviz

### License

BSD

### Upstream Contact

<https://pypi.org/project/pygraphviz/>

### Type

optional

### Dependencies

- *libgraphviz: Graph visualization software (callable library)*
- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

### Version Information

requirements.txt:

```
pygraphviz
```

install-requires.txt:

```
pygraphviz
```

### Equivalent System Packages

conda:

```
$ conda install pygraphviz
```

macports: install the following packages: py-pygraphviz

See <https://repology.org/project/python:pygraphviz/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.293 pynormaliz: Python bindings for the normaliz library

### Description

The Python module PyNormaliz provides wrappers for normaliz.

### License

- GPL v2 or later

### Upstream Contact

<https://github.com/sebasguts/PyNormaliz>

### Special Update/Build Instructions

#### Type

optional

#### Dependencies

- *normaliz: Computations in affine monoids, vector configurations, lattice polytopes, and rational cones*
- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

### Version Information

package-version.txt:

```
2.18
```

install-requires.txt:

```
pynormaliz ==2.18
```

### Equivalent System Packages

arch:

```
$ sudo pacman -S python-pynormaliz
```

conda:

```
$ conda install pynormaliz
```

See <https://repology.org/project/pynormaliz/versions>, <https://repology.org/project/python:pynormaliz/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.294 pyparsing: A Python parsing module

### Description

A Python Parsing Module

### License

MIT License

### Upstream Contact

- Author: Paul McGuire
- Home page: <http://pyparsing.wikispaces.com>

### Type

standard

### Dependencies

- *pip: Tool for installing and managing Python packages*
- *wheel: A built-package format for Python*
- *flit\_core: Distribution-building parts of Flit. See flit package for more information*
- \$(PYTHON)

### Version Information

package-version.txt:

```
3.1.1
```

install-requirements.txt:

```
pyparsing >=2.3.0
```

### Equivalent System Packages

arch:

```
$ sudo pacman -S python-pyparsing
```

conda:

```
$ conda install pyparsing
```

freebsd:

```
$ sudo pkg install devel/py-pyparsing
```

gentoo:

```
$ sudo emerge dev-python/pyparsing
```

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-pyparsing
```

void:

```
$ sudo xbps-install python3-parsing
```

See <https://repology.org/project/pyparsing/versions>, <https://repology.org/project/python:pyparsing/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

## 6.1.295 pypeteer: Headless chrome/chromium automation library

### Description

Headless chrome/chromium automation library (unofficial port of puppeteer)

### License

MIT

### Upstream Contact

<https://pypi.org/project/puppeteer/>

### Type

optional

### Dependencies

- *appdirs*: A small Python module for determining appropriate platform-specific dirs, e.g. a “user data dir”.
- *importlib\_metadata*: Library to access the metadata for a Python package
- *urllib3*: HTTP library with thread-safe connection pooling, file post, and more.
- *certifi*: Python package for providing Mozilla’s CA Bundle
- `$(PYTHON_TOOLCHAIN)`
- `$(PYTHON)`

## Version Information

requirements.txt:

```
pypeteer
```

## Equivalent System Packages

conda:

```
$ conda install pypeteer
```

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.296 pyproject\_api: API to interact with the python pyproject.toml based projects

### Description

API to interact with the python pyproject.toml based projects

### License

### Upstream Contact

<https://pypi.org/project/pyproject-api/>

### Type

standard

### Dependencies

- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

## Version Information

package-version.txt:

```
1.6.1
```

install-requires.txt:

```
pyproject-api
```

## Equivalent System Packages

(none known)

## 6.1.297 pyproject\_metadata: PEP 621 metadata parsing

### Description

PEP 621 metadata parsing

### License

MIT

### Upstream Contact

<https://pypi.org/project/pyproject-metadata/>

### Type

standard

### Dependencies

- *packaging: Core utilities for Python packages*
- *pyparsing: A Python parsing module*
- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

### Version Information

package-version.txt:

```
0.7.1
```

install-requires.txt:

```
pyproject-metadata
```

## Equivalent System Packages

gentoo:

```
$ sudo emerge dev-python/pyproject-metadata
```

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.298 `pyrsistent`: Persistent data structures in Python

#### Description

`Pyrsistent` is a number of persistent collections (by some referred to as functional data structures). Persistent in the sense that they are immutable.

#### License

MIT License

#### Upstream Contact

Home page: <http://github.com/tobgu/pyrsistent/>

#### Dependencies

- Python
- Setuptools
- hypothesis
- memory-profiler
- pyperform
- pytest
- Sphinx
- sphinx-rtd-theme
- tox

#### Type

standard

## Dependencies

- *vcversioner*: Python build system extension to obtain package version from version control
- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

## Version Information

package-version.txt:

```
0.19.2
```

install-requires.txt:

```
pyrsistent >=0.16.0
```

## Equivalent System Packages

conda:

```
$ conda install pyrsistent
```

gentoo:

```
$ sudo emerge dev-python/pyrsistent
```

macports: install the following packages: py-pyrsistent

void:

```
$ sudo xbps-install python3-pyrsistent
```

See <https://repology.org/project/pyrsistent/versions>, <https://repology.org/project/python:pyrsistent/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

## 6.1.299 pscipopt: Python interface and modeling environment for SCIP

### Description

Python interface and modeling environment for SCIP

### License

MIT

### Upstream Contact

<https://pypi.org/project/PySCIPOpt/>

### Dependencies

scipoptsuite

### Type

optional

### Dependencies

- *scip: Mixed integer programming solver*
- \$(PYTHON\_TOOLCHAIN)
- *cython: C-Extensions for Python, an optimizing static compiler*
- \$(PYTHON)

### Version Information

package-version.txt:

```
4.3.0
```

install-requires.txt:

```
PySCIPOpt
```

### Equivalent System Packages

conda:

```
$ conda install pycipopt
```

freebsd:

```
$ sudo pkg install math/py-PySCIPOpt
```

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.300 pysingular: A basic Python interface to Singular

### Description

A basic interface to call Singular from python

This python module is meant to be used in Singulars Jupyter interface.

### License

GPL version 2 or later

### Upstream Contact

- <https://github.com/sebasguts/SingularPython>

### Type

optional

### Dependencies

- *singular: Computer algebra system for polynomial computations, algebraic geometry, singularity theory*
- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

### Version Information

package-version.txt:

```
0.9.7
```

install-requires.txt:

```
pysingular >=0.9.5
```

### Equivalent System Packages

conda:

```
$ conda install pysingular
```

See <https://repology.org/project/pysingular/versions>, <https://repology.org/project/python:pysingular/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.301 pytest: Simple powerful testing with Python

### Description

pytest: simple powerful testing with Python

### License

MIT

### Upstream Contact

<https://pypi.org/project/pytest/>

### Type

optional

### Dependencies

- *pluggy: plugin and hook calling mechanisms for python*
- *packaging: Core utilities for Python packages*
- *attrs: Decorator for Python classes with attributes*
- *py: library with cross-python path, ini-parsing, io, code, log facilities*
- *pyparsing: A Python parsing module*
- *importlib\_metadata: Library to access the metadata for a Python package*
- *tomli: A lil' TOML parser*
- *\$(PYTHON\_TOOLCHAIN)*
- *\$(PYTHON)*

### Version Information

requirements.txt:

```
pytest
```

## Equivalent System Packages

conda:

```
$ conda install pytest
```

macports: install the following packages: py-pytest

void:

```
$ sudo xbps-install python3-pytest
```

See <https://repology.org/project/python:pytest/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

### 6.1.302 `pytest_mock`: Thin-wrapper around the mock package for easier use with pytest

#### Description

Thin-wrapper around the mock package for easier use with pytest

#### License

MIT

#### Upstream Contact

<https://pypi.org/project/pytest-mock/>

#### Type

optional

#### Dependencies

- *pytest: Simple powerful testing with Python*
- *packaging: Core utilities for Python packages*
- *attrs: Decorator for Python classes with attributes*
- *pluggy: plugin and hook calling mechanisms for python*
- *tomli: A lil' TOML parser*
- *py: library with cross-python path, ini-parsing, io, code, log facilities*
- *pyparsing: A Python parsing module*
- *\$(PYTHON\_TOOLCHAIN)*
- *\$(PYTHON)*

## Version Information

requirements.txt:

```
pytest-mock
```

## Equivalent System Packages

(none known)

## 6.1.303 pytest\_xdist: pytest xdist plugin for distributed testing and loop-on-failing modes

### Description

pytest xdist plugin for distributed testing and loop-on-failing modes

### License

MIT

### Upstream Contact

<https://pypi.org/project/pytest-xdist/>

### Type

optional

### Dependencies

- *pytest: Simple powerful testing with Python*
- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

## Version Information

requirements.txt:

```
pytest-xdist
```

## Equivalent System Packages

conda:

```
$ conda install pytest-xdist
```

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

### 6.1.304 python3: The Python programming language

#### Description

By default, Sage will try to use system's python3 to set up a virtual environment, a.k.a. `venv` rather than building a Python 3 installation from scratch.

Sage will accept versions 3.9.x to 3.10.x.

You can also use `--with-python=/path/to/python3_binary` to tell Sage to use `/path/to/python3_binary` to set up the `venv`. Note that setting up the `venv` requires a number of Python modules to be available within the Python in question. Currently, as of Sage 9.7, these modules are as follows: `sqlite3`, `ctypes`, `math`, `hashlib`, `crypt`, `socket`, `zlib`, `distutils.core`, `ssl` - they will be checked for by the `configure` script.

Use the `configure` option `--without-system-python3` in case you want Python 3 built from scratch.

#### Upstream Contact

<https://www.python.org>

#### Type

standard

#### Dependencies

- `zlib`: Data compression library
- `readline`: Command line editing library
- `sqlite`: An SQL database engine
- `libpng`: Bitmap image support
- `bzip2`: High-quality data compressor
- `liblzma`: General-purpose data compression software
- `xz`: General-purpose data compression software
- `libffi`: A portable foreign-function interface library
- `openssl`: Implementation of the SSL and TLS protocols

## Version Information

package-version.txt:

```
3.11.1
```

## Equivalent System Packages

alpine:

```
$ apk add python3-dev
```

cygwin:

```
$ apt-cyg install python39-devel python-pip-wheel python-setuptools-wheel
```

Debian/Ubuntu:

```
$ sudo apt-get install python3 libpython3-dev python3-distutils python3-venv
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python3-devel
```

freebsd:

```
$ sudo pkg install lang/python
```

homebrew:

```
$ brew install python3
```

macports: install the following packages: python39

opensuse:

```
$ sudo zypper install python3${{PYTHON_MINOR}}-devel
```

void:

```
$ sudo xbps-install python3-devel
```

See <https://repology.org/project/python/versions>

If the system package is installed, ./configure will check if it can be used.

## 6.1.305 python\_build: A simple, correct PEP517 package builder

### Description

build is a simple, correct PEP517 package builder

### License

MIT

### Upstream Contact

<https://pypi.org/project/build/>

### Type

optional

### Dependencies

- *pyparsing: A Python parsing module*
- *tomli: A lil' TOML parser*
- *packaging: Core utilities for Python packages*
- `$(PYTHON_TOOLCHAIN)`
- `$(PYTHON)`

### Version Information

requirements.txt:

```
build
```

### Equivalent System Packages

conda:

```
$ conda install build
```

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.306 python\_igraph: Python bindings for igraph

### Description

igraph is a library for creating and manipulating graphs. It is intended to be as powerful (ie. fast) as possible to enable the analysis of large graphs.

### License

GPL version 2

### Upstream Contact

<http://igraph.org/python/>

### Special Update/Build Instructions

#### Type

optional

#### Dependencies

- *igraph: A library for creating and manipulating graphs*
- *texttable: Python module for creating simple ASCII tables*
- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

#### Version Information

package-version.txt:

```
0.10.4
```

install-requires.txt:

```
igraph
```

#### Equivalent System Packages

arch:

```
$ sudo pacman -S python-igraph
```

conda:

```
$ conda install python-igraph
```

Debian/Ubuntu:

```
$ sudo apt-get install python3-igraph
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-igraph
```

freebsd:

```
$ sudo pkg install math/py-igraph
```

macports: install the following packages: py-igraph

See <https://repology.org/project/python:igraph/versions>, <https://repology.org/project/python:python-igraph/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

### 6.1.307 pythran: Ahead of Time compiler for numeric kernels

#### Description

Ahead of Time compiler for numeric kernels

#### License

BSD 3-Clause

#### Upstream Contact

<https://pypi.org/project/pythran/>

#### Type

standard

#### Dependencies

- *beniget*: Extract semantic information about static Python code
- *gast*: Python AST that abstracts the underlying Python version
- *ply*: Python Lex & Yacc
- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

## Version Information

package-version.txt:

```
0.14.0
```

install-requirements.txt:

```
pythran >=0.12.1
```

## Equivalent System Packages

conda:

```
$ conda install pythran
```

gentoo:

```
$ sudo emerge dev-python/pythran
```

void:

```
$ sudo xbps-install pythran
```

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.308 pytz: Timezone definitions for Python

#### Description

World Timezone Definitions for Python See <https://pypi.org/project/pytz/>

#### Special Update/Build Instructions

The upstream tarball was repackaged after sanitizing the file permissions with

```
$ chmod go-w
```

#### Type

standard

## Dependencies

- \${PYTHON\_TOOLCHAIN}
- \${PYTHON}

## Version Information

package-version.txt:

```
2023.3.post1
```

install-requires.txt:

```
pytz >=2020.1
```

## Equivalent System Packages

arch:

```
$ sudo pacman -S python-pytz
```

conda:

```
$ conda install pytz
```

Debian/Ubuntu:

```
$ sudo apt-get install python3-tz
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-pytz
```

gentoo:

```
$ sudo emerge dev-python/pytz
```

macports: install the following packages: py-tz

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-pytz
```

void:

```
$ sudo xbps-install python3-pytz
```

See <https://repology.org/project/python:pytz/versions>

If the system package is installed and if the (experimental) option --enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.

## 6.1.309 pytz\_deprecation\_shim: Shims to make deprecation of pytz easier

### Description

Shims to make deprecation of pytz easier

### License

Apache-2.0

### Upstream Contact

<https://pypi.org/project/pytz-deprecation-shim/>

### Type

standard

### Dependencies

- *tzdata*: Provider of IANA time zone data
- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

### Version Information

package-version.txt:

```
0.1.0.post0
```

install-requires.txt:

```
pytz-deprecation-shim
```

### Equivalent System Packages

conda:

```
$ conda install pytz-deprecation-shim
```

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.310 pyx: Generate PostScript, PDF, and SVG files in Python

### Description

Python package for the generation of PostScript, PDF, and SVG files

<https://pypi.python.org/pypi/PyX>

### Type

optional

### Dependencies

#### Version Information

requirements.txt:

```
pyx
```

### Equivalent System Packages

macports: install the following packages: py-pyx

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-PyX
```

void:

```
$ sudo xbps-install python3-pyx
```

See <https://repology.org/project/python:pyx/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.311 pyzmq: Python bindings for the zeromq networking library

### Description

Python bindings for the zeromq networking library.

### License

LGPLv3+

### Upstream Contact

<http://www.zeromq.org>

### Special Update/Build Instructions

None.

### Type

standard

### Dependencies

- *cython: C-Extensions for Python, an optimizing static compiler*
- *zeromq: A modern networking library*
- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

### Version Information

package-version.txt:

```
25.1.1
```

install-requires.txt:

```
pyzmq >=19.0.2
```

### Equivalent System Packages

arch:

```
$ sudo pacman -S python-pyzmq
```

conda:

```
$ conda install pyzmq
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-pyzmq
```

gentoo:

```
$ sudo emerge dev-python/pyzmq
```

opensuse:

```
$ sudo zypper install python3${{PYTHON_MINOR}}-pyzmq
```

void:

```
$ sudo xbps-install python3-pyzmq
```

See <https://repology.org/project/pyzmq/versions>, <https://repology.org/project/python:pyzmq/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `.configure` will check if the system package can be used.

### 6.1.312 qdldl\_python: QDLDL, a free LDL factorization routine (Python wrapper)

#### Description

QDLDL, a free LDL factorization routine.

#### License

Apache 2.0

#### Upstream Contact

<https://pypi.org/project/qdldl/>

#### Type

optional

#### Dependencies

- *pybind11: Create Python bindings to C++ code*
- *numpy: Package for scientific computing with Python*
- *scipy: Scientific tools for Python*
- *\$(PYTHON\_TOOLCHAIN)*
- *cmake: A cross-platform build system generator*
- *\$(PYTHON)*

### Version Information

package-version.txt:

```
0.1.5.post3
```

install-requirements.txt:

```
qdldl
```

### Equivalent System Packages

conda:

```
$ conda install qdldl-python
```

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

### 6.1.313 qepcad: Quantifier elimination by partial cylindrical algebraic decomposition

#### Description

Qepcad is an implementation of quantifier elimination by partial cylindrical algebraic decomposition

#### License

QEPCAD B Copyright (c) 1990, 2008, Hoon Hong & Chris Brown (contact [wcbrown@usna.edu](mailto:wcbrown@usna.edu))

#### Upstream Contact

- Website: <http://www.usna.edu/CS/qepcadweb/B/QEPCAD.html>
- Alternative location (sometimes more up-to-date):  
<https://www.usna.edu/Users/cs/wcbrown/qepcad/B/QEPCAD.html>

## Special Update/Build Instructions

One might need to set MAKE to “make -j1” for this to be built successfully.

### Type

experimental

### Dependencies

- *readline: Command line editing library*
- *saclib: Computations with real algebraic numbers*

### Version Information

package-version.txt:

B . 1 . 72

### Equivalent System Packages

See <https://repology.org/project/qepcad-b/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.314 qhull: Compute convex hulls, Delaunay triangulations, Voronoi diagrams

### Description

From the README.txt of Qhull:

Qhull computes convex hulls, Delaunay triangulations, Voronoi diagrams, furthest-site Voronoi diagrams, and halfspace intersections about a point. It runs in 2-d, 3-d, 4-d, or higher. It implements the Quickhull algorithm for computing convex hulls. Qhull handles round-off errors from floating point arithmetic. It can approximate a convex hull.

The program includes options for hull volume, facet area, partial hulls, input transformations, randomization, tracing, multiple output formats, and execution statistics.

Further notes:

The qhull library is already shipped with the Python library scipy (from version 1.4), see

- <http://docs.scipy.org/doc/scipy/reference/generated/scipy.spatial.ConvexHull.html>
- <http://docs.scipy.org/doc/scipy/reference/generated/scipy.spatial.Delaunay.html>
- <http://docs.scipy.org/doc/scipy/reference/generated/scipy.spatial.Voronoi.html>

There is also the Python interface Pyhull available on PyPI <https://pypi.python.org/pypi/pyhull> (see also documentation at <http://pythonhosted.org/pyhull/>).

### Upstream Contact

<http://www.qhull.org/html>

C. Bradford Barber [bradb@shore.net](mailto:bradb@shore.net) or [qhull@qhull.org](mailto:qhull@qhull.org)

### Dependencies

Can be compiled with Qt support, but the Sage version currently doesn't try to do this.

### License

Not a standard license, but Sage compatible. See the COPYING.txt file in the source directory for details.

### Type

standard

### Dependencies

- *cmake: A cross-platform build system generator*

### Version Information

package-version.txt:

```
2020-src-8.0.2
```

### Equivalent System Packages

alpine:

```
$ apk add qhull-dev qhull
```

arch:

```
$ sudo pacman -S qhull
```

conda:

```
$ conda install qhull
```

cygwin:

```
$ apt-cyg install qhull
```

Debian/Ubuntu:

```
$ sudo apt-get install libqhull-dev
```

Fedora/Redhat/CentOS:

```
$ sudo yum install qhull qhull-devel
```

freebsd:

```
$ sudo pkg install math/qhull
```

gentoo:

```
$ sudo emerge media-libs/qhull
```

homebrew:

```
$ brew install qhull
```

macports: install the following packages: qhull

nix:

```
$ nix-env --install qhull
```

opensuse:

```
$ sudo zypper install qhull-devel
```

void:

```
$ sudo xbps-install qhull libqhull-devel
```

See <https://repology.org/project/qhull/versions>

If the system package is installed, ./configure will check if it can be used.

## 6.1.315 r: A free software environment for statistical computing and graphics

### Description

R is a language and environment for statistical computing and graphics. It is a GNU project which is similar to the S language and environment which was developed at Bell Laboratories (formerly AT&T, now Lucent Technologies) by John Chambers and colleagues. R can be considered as a different implementation of S. There are some important differences, but much code written for S runs unaltered under R.

(taken from <http://www.r-project.org/>)

### License

- GPL v2 or GPL v3

### Upstream Contact

- <https://www.r-project.org>
- R mailing list, #R in IRC

### Type

optional

### Dependencies

#### Version Information

#### Equivalent System Packages

alpine:

```
$ apk add R-dev R
```

arch:

```
$ sudo pacman -S r
```

conda:

```
$ conda install r r-essentials
```

cygwin:

```
$ apt-cyg install R libtirpc-devel
```

Debian/Ubuntu:

```
$ sudo apt-get install r-base-dev r-cran-lattice
```

Fedora/Redhat/CentOS:

```
$ sudo yum install R R-devel
```

freebsd:

```
$ sudo pkg install math/R
```

gentoo:

```
$ sudo emerge dev-lang/R
```

homebrew:

```
$ brew install r
```

macports: install the following packages: R

nix:

```
$ nix-env --install R
```

opensuse:

```
$ sudo zypper install R-base
```

void:

```
$ sudo xbps-install R
```

See <https://repology.org/project/r/versions>

If the system package is installed, ./configure will check if it can be used.

## 6.1.316 r\_jupyter: Jupyter kernel for R

### Description

This package installs IRkernel, the R Jupyter kernel.

It gets installed via R's package installer on top of Jupyter.

### License

MIT

### Upstream Contact

- <https://github.com/IRkernel/IRkernel>
- <https://irkernel.github.io/>

### Dependencies

- R
- notebook

### Type

experimental

### Dependencies

- *notebook*: Jupyter notebook, a web-based notebook environment for interactive computing
- *r*: A free software environment for statistical computing and graphics

### Version Information

### Equivalent System Packages

See <https://repology.org/project/r:irkernel/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.317 readline: Command line editing library

### Description

The GNU Readline library provides a set of functions for use by applications that allow users to edit command lines as they are typed in. Both Emacs and vi editing modes are available. The Readline library includes additional functions to maintain a list of previously-entered command lines, to recall and perhaps reedit those lines, and perform csh-like history expansion on previous commands.

Website: <http://tiswww.case.edu/php/chet/readline/rltop.html>

### License

- GPL V3+

### Upstream Contact

- Chet Ramey at <http://cnswww.cns.cwru.edu/~chet>

### Special Update/Build Instructions

We build readline using ncurses. Readline needs to be told to link with libtinfo (part of ncurses), this is what the patch 0002-ltinfo.patch does.

### Patches

- 0001-macports.patch: Changes to shobj.conf for OS/X, from macports:  
<https://trac.macports.org/browser/trunk/dports-devel/readline/files/patch-shobj-conf.diff>
- 0002-ltinfo.patch: We build readline using ncurses, and for that it needs to be told to link with libtinfo (part of ncurses).

**Type**

standard

**Dependencies**

- *ncurses: Classic terminal output library*

**Version Information**

package-version.txt:

```
8.1.2
```

**Equivalent System Packages**

arch:

```
$ sudo pacman -S readline
```

conda:

```
$ conda install readline
```

cygwin:

```
$ apt-cyg install libreadline-devel
```

Debian/Ubuntu:

```
$ sudo apt-get install libreadline-dev
```

Fedora/Redhat/CentOS:

```
$ sudo yum install readline-devel
```

freebsd:

```
$ sudo pkg install devel/readline
```

homebrew:

```
$ brew install readline
```

macports: install the following packages: readline

nix:

```
$ nix-env --install readline
```

opensuse:

```
$ sudo zypper install readline-devel "pkgconfig(readline)"
```

slackware:

```
$ sudo slackpkg install readline
```

void:

```
$ sudo xbps-install readline-devel
```

See <https://repology.org/project/readline/versions>

If the system package is installed, ./configure will check if it can be used.

### 6.1.318 requests: An HTTP library for Python

#### Description

Python HTTP for Humans.

#### License

Apache 2.0

#### Upstream Contact

<https://pypi.org/project/requests/>

#### Type

standard

#### Dependencies

- \$(PYTHON\_TOOLCHAIN)
- *idna: Internationalized Domain Names in Applications (IDNA)*
- *urllib3: HTTP library with thread-safe connection pooling, file post, and more.*
- *certifi: Python package for providing Mozilla's CA Bundle*
- *charset\_normalizer: The Real First Universal Charset Detector. Open, modern and actively maintained alternative to Chardet.*
- \$(PYTHON)

## Version Information

package-version.txt:

```
2.28.1
```

install-requires.txt:

```
requests >=2.13.0
```

## Equivalent System Packages

arch:

```
$ sudo pacman -S python-requests
```

conda:

```
$ conda install requests
```

Debian/Ubuntu:

```
$ sudo apt-get install python3-requests
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-requests
```

gentoo:

```
$ sudo emerge dev-python/requests
```

macports: install the following packages: py-requests

openSUSE:

```
$ sudo zypper install python3${{PYTHON_MINOR}}-requests
```

void:

```
$ sudo xbps-install python3-requests
```

See <https://repology.org/project/requests/versions>, <https://repology.org/project/python:requests/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

## 6.1.319 `retrolab`: JupyterLab Distribution with a retro look and feel

### Description

JupyterLab Distribution with a retro look and feel

### License

### Upstream Contact

<https://pypi.org/project/retrolab/>

### Type

optional

### Dependencies

- *jupyterlab: An extensible environment for interactive and reproducible computing*
- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

### Version Information

requirements.txt:

```
retrolab ~= 0.3
```

### Equivalent System Packages

conda:

```
$ conda install retrolab
```

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.320 `rpy2`: Python interface to R

### Description

rpy2 is a redesign and rewrite of rpy. It is providing a low-level interface to R, a proposed high-level interface, including wrappers to graphical libraries, as well as R-like structures and functions.

## License

- GPL 2+
- Note that we have deleted references to Mozilla PL as an option, which we are allowed to do by the full rpy2 license in order to remain GPL-compatible

## Upstream Contact

- <https://rpy2.bitbucket.io>

## Special Update/Build Instructions

### Patches

- setup.patch: takes care of a few parsing issues.
- cygwin.patch: let rpy2 build on Cygwin.

### Type

standard

## Dependencies

- *r: A free software environment for statistical computing and graphics*
- *cffi: Foreign Function Interface for Python calling C code*
- *tzlocal: Python timezone information for the local timezone*
- *pytz: Timezone definitions for Python*
- *jinja2: General purpose template engine for Python*
- *\$(PYTHON\_TOOLCHAIN)*
- *pycparser: Parser of the C language in Python*
- *\$(PYTHON)*

## Version Information

package-version.txt:

```
3.4.5
```

install-requirements.txt:

```
rpy2 >=3.3
```

### Equivalent System Packages

arch:

```
$ sudo pacman -S python-rpy2
```

conda:

```
$ conda install rpy2
```

Debian/Ubuntu:

```
$ sudo apt-get install rpy2
```

freebsd:

```
$ sudo pkg install math/py-rpy2
```

macports: install the following packages: py-rpy2

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-rpy2
```

See <https://repology.org/project/rpy2/versions>

If the system package is installed and if the (experimental) option –enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.

### 6.1.321 `rst2ipynb`: Convert reStructuredText files to Jupyter notebooks

#### Description

The `rst2ipynb` program converts a standalone reStructuredText file to a Jupyter notebook file.

This is currently achieved by converting to markdown with pandoc and then to Jupyter notebook using notedown, plus some configuration and tweaks.

#### License

BSD 3-Clause License

#### Upstream Contact

Authors: Scott Sievert and Nicolas M. Thiéry Home page: <https://github.com/nthiery/rst-to-ipynb>

## Special Update/Build Instructions

Fetch tarball from <https://pypi.python.org/pypi/rst2ipynb/>

As it is written in Haskell, pandoc must be installed from the distro.

The main rationale for having a notedown package in Sage (rather than just let pip fetch it) is that the version on pip (1.5.0, 2015-10-07) is outdated and lacks important features / fixes for us.

### Type

optional

### Dependencies

- *pandoc: A document converter*
- \$(PYTHON\_TOOLCHAIN)
- *notedown: Create IPython notebooks from markdown*
- \$(PYTHON)

### Version Information

package-version.txt:

0.2.3

install-requires.txt:

rst2ipynb >=0.2.2

### Equivalent System Packages

See <https://repology.org/project/python:rst2ipynb/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.322 rubiks: Programs for Rubik's cube

### Description

There are several programs for working with Rubik's cubes, by three different people. Look inside the directories under /src to see specific info and licensing. In summary the three contributors are:

Michael Reid (GPL) [http://www.cflmath.com/~reid/Rubik/optimal\\_solver.html](http://www.cflmath.com/~reid/Rubik/optimal_solver.html)

- optimal - uses many pre-computed tables to find an optimal solution to the 3x3x3 Rubik's cube

Dik T. Winter (MIT License)

- cube - uses Kociemba's algorithm to iteratively find a short solution to the 3x3x3 Rubik's cube

## Packages and Features, Release 10.2

---

- size222 - solves a 2x2x2 Rubik's cube

Eric Dietz (GPL) <https://web.archive.org/web/20121212175710/http://www.wrongway.org/?rubiksource>

- cu2 - A fast, non-optimal 2x2x2 solver
- cubex - A fast, non-optimal 3x3x3 solver
- mcube - A fast, non-optimal 4x4x4 solver

### Type

optional

### Dependencies

### Version Information

package-version.txt:

```
20070912.p21
```

### Equivalent System Packages

arch:

```
$ sudo pacman -S rubiks
```

conda:

```
$ conda install rubiks
```

Debian/Ubuntu:

```
$ sudo apt-get install rubiks
```

Fedora/Redhat/CentOS:

```
$ sudo yum install rubiks
```

freebsd:

```
$ sudo pkg install math/rubiks
```

nix:

```
$ nix-env --install rubiks
```

See <https://repology.org/project/rubiks/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.323 rw: Compute rank-width and rank-decompositions

### Description

rw is a program that calculates rank-width and rank-decompositions.

<https://sourceforge.net/projects/rankwidth/>

### License

GPL version 2 or later

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.325 sage\_conf: Configuration module for the SageMath library (distributable version)

### Description

This distribution package provides:

- a single Python module, `sage_conf`, providing configuration information to the SageMath library at the time of its installation and at its runtime
- a console script `sage-config`, for querying the variables of `sage_conf` from the shell
- a sourcable shell script `sage-env-config`, providing additional configuration information in the form of environment variables

The `sage_conf` distribution package is polymorphic: It has several implementations.

### sage\_conf sdist on PyPI

This implementation of the `sage_conf` distribution package comes from [github issue #29039](#), which added the directory `pkgs/sage-conf_pypi`.

To install, use `pip install -v sage_conf`. Using `-v` ensures that diagnostic messages are displayed.

On installation (or building a wheel), it invokes `sage_bootstrap` to establish a build tree (`SAGE_ROOT`) and installation tree (`SAGE_LOCAL`) for the SageMath distribution. By default, it uses a subdirectory of `$HOME/.sage` that is specific to the version of the distribution and the version of Python in use. If several virtual environments over the same version of Python install `sage_conf`, they will share these trees.

After installation of `sage_conf`, a wheelhouse containing wheels of various libraries is available; type `ls $(sage-config SAGE_SPKG_WHEELS)` to list them and `pip install $(sage-config SAGE_SPKG_WHEELS)/*.whl` to install them. After this, you can install the Sage library, for example, using `pip install sagemath-standard`.

### sage\_conf wheels

Prebuilt binary wheels of the sage\_conf distribution package are available at <https://github.com/sagemath/sage-wheels/releases/>

This implementation of sage\_conf comes from github issue #31396, which adds the directory pkgs/sage-conf\_relocatable/.

On building a wheel, it invokes sage\_bootstrap to establish a build and installation tree (SAGE\_ROOT, SAGE\_LOCAL) in a subdirectory of the directory /var/tmp/, whose name is specific to the version of the distribution and the version of Python in use.

The wheel distributes a copy of the prebuilt SAGE\_ROOT and SAGE\_LOCAL. Importing sage\_conf (or using the installed sage-config script), makes sure that a symlink from the /var/tmp location to the actual persistent installation location is created. As the relocated libraries and programs contain the hardcoded path SAGE\_LOCAL in various ways (including as rpaths), this symlink is necessary for the prebuilt libraries and programs to work.

/var/tmp is a sticky directory on all Linux distributions following the Filesystem Hierarchy Standard, as well as on macOS and on Cygwin. On multi-user systems, only one user can use a given version of the distribution; other installation schemes are recommended for systems with multiple Sage users.

### sage\_conf in the SageMath distribution

The original version of the distribution package sage\_conf is used internally in the SageMath distribution. It is provided in the directory pkgs/sage-conf. This version of the package is generated by the Sage distribution's ./configure script.

### sage\_conf for conda

The version of the distribution package in the directory pkgs/sage-conf\_conda is used in an experimental installation method of SageMath, where all packages are provided by conda. This method is described in <https://doc.sagemath.org/html/en/installation/conda.html#using-conda-to-provide-all-dependencies-for-the-sage-library-experimental>

### sage\_conf in downstream distributions

Downstream packagers and advanced developers and users may want to provide their own implementation of the distribution package to support the intended deployment of the SageMath library.

## 6.1.326 sage\_docbuild: Build system of the Sage documentation

### About SageMath

“Creating a Viable Open Source Alternative to  
Magma, Maple, Mathematica, and MATLAB”

Copyright (C) 2005-2020 The Sage Development Team

<https://www.sagemath.org>

SageMath fully supports all major Linux distributions, recent versions of macOS, and Windows (using Cygwin or Windows Subsystem for Linux).

The traditional and recommended way to install SageMath is from source via Sage-the-distribution (<https://www.sagemath.org/download-source.html>). Sage-the-distribution first builds a large number of open source packages from source (unless it finds suitable versions installed in the system) and then installs the Sage Library (sagelib, implemented in Python and Cython).

### About this pip-installable source distribution

This is the build system of the Sage documentation, based on Sphinx.

#### Type

standard

#### Dependencies

- *sphinx: Python documentation generator*
- \$(PYTHON\_TOOLCHAIN)
- sagelib
- \$(PYTHON)

#### Version Information

package-version.txt:

```
10.2
```

install-requires.txt:

```
# This file is updated on every release by the sage-update-version script
sage-docbuild ~= 10.2
```

# This file is updated on every release by the sage-update-version script
sage-setup ~ 10.2
```

#### Equivalent System Packages

(none known)

### 6.1.332 sage\_sws2rst: Translate legacy Sage worksheet files (.sws) to reStructuredText (.rst) files

#### Description

Provides a script *sage – sws2rst*, which translates a Sage worksheet file (.sws) into a reStructuredText (.rst) file.

Sage worksheet files (.sws) are a file format that was used by the now-obsolete Sage notebook (<https://github.com/sagemath/sagenb>), superseded by the Jupyter notebook. SageNB was dropped in the course of the transition of SageMath to Python 3.

This package was extracted from the SageNB sources in github issue #28838 to provide a way to convert pedagogical material written available in Sage worksheet format.

### Type

optional

### Dependencies

- *beautifulsoup4: Screen-scraping library*
- `$(PYTHON_TOOLCHAIN)`
- `$(PYTHON)`

### Version Information

package-version.txt:

```
10.2
```

install-requirements.txt:

```
# This file is updated on every release by the sage-update-version script
sage-sws2rst ~= 10.2
```

### Equivalent System Packages

(none known)

## 6.1.333 sagemath\_bliss: Graph (iso/auto)morphisms with bliss

### About SageMath

“Creating a Viable Open Source Alternative to  
Magma, Maple, Mathematica, and MATLAB”

Copyright (C) 2005-2023 The Sage Development Team

<https://www.sagemath.org>

SageMath fully supports all major Linux distributions, recent versions of macOS, and Windows (using Cygwin or Windows Subsystem for Linux).

The traditional and recommended way to install SageMath is from source via Sage-the-distribution (<https://www.sagemath.org/download-source.html>). Sage-the-distribution first builds a large number of open source packages from source (unless it finds suitable versions installed in the system) and then installs the Sage Library (sagelib, implemented in Python and Cython).

## About this pip-installable source distribution

This pip-installable source distribution `sagemath-bliss` is a small optional distribution for use with `sagemath-standard`.

It provides a Cython interface to the `bliss` library for the purpose of computing graph (iso/auto)morphisms.

### Type

optional

### Dependencies

- `bliss`: Computing automorphism groups and canonical forms of graphs
- `cysignals`: Interrupt and signal handling for Cython
- `$(PYTHON_TOOLCHAIN)`
- `sage-setup`: Build system of the SageMath library
- `sage_conf`: Configuration module for the SageMath library (distributable version)
- `sagemath_environment`: System and software environment
- `cython`: C-Extensions for Python, an optimizing static compiler
- `pkgconfig`: Python interface to pkg-config
- `$(PYTHON)`

### Version Information

package-version.txt:

```
10.2
```

install-requires.txt:

```
# This file is updated on every release by the sage-update-version script
sagemath-bliss ~= 10.2
```

### Equivalent System Packages

conda:

```
$ conda install sagemath-bliss
```

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see [github issue #27330](#)

## 6.1.334 sagemath\_categories: Sage categories and basic rings

### About SageMath

“Creating a Viable Open Source Alternative to  
Magma, Maple, Mathematica, and MATLAB”

Copyright (C) 2005-2023 The Sage Development Team

<https://www.sagemath.org>

SageMath fully supports all major Linux distributions, recent versions of macOS, and Windows (using Cygwin or Windows Subsystem for Linux).

The traditional and recommended way to install SageMath is from source via Sage-the-distribution (<https://www.sagemath.org/download-source.html>). Sage-the-distribution first builds a large number of open source packages from source (unless it finds suitable versions installed in the system) and then installs the Sage Library (sagelib, implemented in Python and Cython).

### About this experimental pip-installable source distribution

This pip-installable source distribution *sagemath – categories* is an experimental distribution of a small part of the Sage Library. Use at your own risk. It provides a small subset of the modules of the Sage library (“sagelib”, *sagemath – standard*). It is a superset of the *sagemath – objects* (providing Sage objects, the element/parent framework, categories, the coercion system and the related metaclasses), making various additional categories available without introducing dependencies on additional mathematical libraries.

### Dependencies

When building from source, development packages of *gmp*, *mpfr*, and *mpc* are needed.

### Documentation

- Categories
- Structure
- Coercion
- Classes, Metaclasses

### Type

experimental

## Dependencies

- *sagemath\_objects*: Sage objects, elements, parents, categories, coercion, metaclasses
- \$(PYTHON\_TOOLCHAIN)
- *sagemath\_environment*: System and software environment
- *sage-setup*: Build system of the SageMath library
- *cython*: C-Extensions for Python, an optimizing static compiler
- *pkgconfig*: Python interface to pkg-config
- *python\_build*: A simple, correct PEP517 package builder
- \$(PYTHON)

## Version Information

package-version.txt:

```
10.2
```

install-requires.txt:

```
# This file is updated on every release by the sage-update-version script
sagemath-categories ~= 10.2
```

## Equivalent System Packages

(none known)

### 6.1.335 sagemath\_coxeter3: Coxeter groups, Bruhat ordering, Kazhdan-Lusztig polynomials with coxeter3

#### About SageMath

“Creating a Viable Open Source Alternative to  
Magma, Maple, Mathematica, and MATLAB”

Copyright (C) 2005-2023 The Sage Development Team

<https://www.sagemath.org>

SageMath fully supports all major Linux distributions, recent versions of macOS, and Windows (using Cygwin or Windows Subsystem for Linux).

The traditional and recommended way to install SageMath is from source via Sage-the-distribution (<https://www.sagemath.org/download-source.html>). Sage-the-distribution first builds a large number of open source packages from source (unless it finds suitable versions installed in the system) and then installs the Sage Library (sagelib, implemented in Python and Cython).

### About this pip-installable source distribution

This pip-installable source distribution `sagemath-coxeter3` is a small optional distribution for use with `sagemath-standard`.

It provides a Cython interface to the `coxeter3` library.

#### Type

optional

#### Dependencies

- *coxeter3: Library for Coxeter groups, Bruhat ordering, Kazhdan-Lusztig polynomials*
- `$(PYTHON_TOOLCHAIN)`
- *sage-setup: Build system of the SageMath library*
- *sagemath\_environment: System and software environment*
- *cython: C-Extensions for Python, an optimizing static compiler*
- *pkgconfig: Python interface to pkg-config*
- `$(PYTHON)`

#### Version Information

package-version.txt:

```
10.2
```

install-requires.txt:

```
# This file is updated on every release by the sage-update-version script
sagemath-coxeter3 ~= 10.2
```

#### Equivalent System Packages

(none known)

### 6.1.336 sagemath\_doc\_html: SageMath documentation in HTML format

Upon installation, this package builds the SageMath documentation in HTML format.

It is a standard package. It is built on every invocation of `make` or `make all`, but not on `make build`. The documentation build can also be run separately using `make doc-html`.

**Type**

standard

**Dependencies**

- *sagelib*
- *sphinx*: Python documentation generator
- *sphinx\_copybutton*: Add a copy button to each of your code cells.
- *pplpy\_doc*: Python interface to the Parma Polyhedra Library (documentation)
- *\$(SAGERUNTIME)*
- *maxima*: System for manipulating symbolic and numerical expressions
- *networkx*: Python package for complex networks
- *scipy*: Scientific tools for Python
- *sympy*: Python library for symbolic mathematics
- *matplotlib*: Python 2D plotting library
- *pillow*: Python Imaging Library
- *mathjax*: A JavaScript library for displaying mathematical formulas
- *mpmath*: Pure Python library for multiprecision floating-point arithmetic
- *ipykernel*: IPython Kernel for Jupyter
- *jupyter\_client*: Jupyter protocol implementation and client libraries
- *conway\_polynomials*: Tables of Conway polynomials over finite fields
- *tachyon*: A ray tracing system
- *jmol*: Java viewer for chemical structures in 3D
- *ipywidgets*: Interactive HTML widgets for Jupyter notebooks and the IPython kernel
- *jupyter\_sphinx*: Jupyter Sphinx Extension
- *sage\_docbuild*: Build system of the Sage documentation
- *elliptic\_curves*: Databases of elliptic curves
- *furo*: A clean customizable Sphinx documentation theme
- *fpylll*: Python interface for FPLLL

**Version Information****Equivalent System Packages**

(none known)

## 6.1.337 sagemath\_doc\_pdf: SageMath documentation in PDF format

Upon installation, this package builds the SageMath documentation in PDF format.

It is an optional package. It can be enabled at configuration time using `./configure --enable-sagemath_doc_pdf`. Alternatively, it can be installed by using `make doc-pdf`.

### Type

optional

### Dependencies

- *sagemath\_doc\_html*: SageMath documentation in HTML format
- *texlive*: A comprehensive TeX system

### Version Information

### Equivalent System Packages

(none known)

## 6.1.338 sagemath\_environment: System and software environment

### About SageMath

“Creating a Viable Open Source Alternative to  
Magma, Maple, Mathematica, and MATLAB”

Copyright (C) 2005-2023 The Sage Development Team

<https://www.sagemath.org>

SageMath fully supports all major Linux distributions, recent versions of macOS, and Windows (using Cygwin or Windows Subsystem for Linux).

The traditional and recommended way to install SageMath is from source via Sage-the-distribution (<https://www.sagemath.org/download-source.html>). Sage-the-distribution first builds a large number of open source packages from source (unless it finds suitable versions installed in the system) and then installs the Sage Library (`sagelib`, implemented in Python and Cython).

### About this experimental pip-installable source distribution

This pip-installable source distribution *sagemath – environment* is an experimental distribution of a small part of the Sage Library. Use at your own risk. It provides a small, fundamental subset of the modules of the Sage library (“`sagelib`”, *sagemath – standard*), providing the connection to the system and software environment. It also includes the `sage` script for launching the Sage REPL and accessing various developer tools (see `sage --help`).

**Type**

experimental

**Dependencies**

- \$(PYTHON\_TOOLCHAIN)
- *python\_build*: A simple, correct PEP517 package builder
- \$(PYTHON)

**Version Information**

### 6.1.339 sagemath\_mcqd: Finding maximum cliques with mcqd

**About SageMath**

“Creating a Viable Open Source Alternative to  
Magma, Maple, Mathematica, and MATLAB”

Copyright (C) 2005-2023 The Sage Development Team

<https://www.sagemath.org>

SageMath fully supports all major Linux distributions, recent versions of macOS, and Windows (using Cygwin or Windows Subsystem for Linux).

The traditional and recommended way to install SageMath is from source via Sage-the-distribution (<https://www.sagemath.org/download-source.html>). Sage-the-distribution first builds a large number of open source packages from source (unless it finds suitable versions installed in the system) and then installs the Sage Library (sagelib, implemented in Python and Cython).

### About this pip-installable source distribution

This pip-installable source distribution `sagemath-mcqd` is a small optional distribution for use with `sagemath-standard`.

It provides a Cython interface to the `mcqd` library, providing a fast exact algorithm for finding a maximum clique in an undirected graph.

#### Type

optional

#### Dependencies

- *mcqd: An exact algorithm for finding a maximum clique in an undirected graph*
- *memory\_allocator: An extension class to allocate memory easily with Cython*
- *cysignals: Interrupt and signal handling for Cython*
- `$(PYTHON_TOOLCHAIN)`
- *sage-setup: Build system of the SageMath library*
- *cython: C-Extensions for Python, an optimizing static compiler*
- *pkgconfig: Python interface to pkg-config*
- `$(PYTHON)`

#### Version Information

package-version.txt:

```
10.2
```

install-requires.txt:

```
# This file is updated on every release by the sage-update-version script
sagemath-mcqd ~ 10.2
```

#### Equivalent System Packages

(none known)

## 6.1.340 sagemath\_meataxe: Matrices over small finite fields with meataxe

### About SageMath

“Creating a Viable Open Source Alternative to  
Magma, Maple, Mathematica, and MATLAB”

Copyright (C) 2005-2023 The Sage Development Team

<https://www.sagemath.org>

SageMath fully supports all major Linux distributions, recent versions of macOS, and Windows (using Cygwin or Windows Subsystem for Linux).

The traditional and recommended way to install SageMath is from source via Sage-the-distribution (<https://www.sagemath.org/download-source.html>). Sage-the-distribution first builds a large number of open source packages from source (unless it finds suitable versions installed in the system) and then installs the Sage Library (sagelib, implemented in Python and Cython).

### About this pip-installable source distribution

This pip-installable source distribution `sagemath-meataxe` is a small optional distribution for use with `sagemath-standard`.

This distribution provides the SageMath modules `sage.libs.meataxe` and `sage.matrix.matrix_gfpn_dense`.

It provides a specialized implementation of matrices over the finite field  $F_q$ , where  $q \leq 255$ , using the *SharedMeatAxe* <<http://users.minet.uni-jena.de/~king/SharedMeatAxe/>> library.

### Type

optional

### Dependencies

- *meataxe: Library for computing with modular representations*
- `$(PYTHON_TOOLCHAIN)`
- *sage-setup: Build system of the SageMath library*
- *sagemath\_environment: System and software environment*
- *cython: C-Extensions for Python, an optimizing static compiler*
- *pkgconfig: Python interface to pkg-config*
- `$(PYTHON)`

### Version Information

## 6.1.342 sagemath\_repl: IPython kernel, Sage preparser, doctester

### About SageMath

“Creating a Viable Open Source Alternative to  
Magma, Maple, Mathematica, and MATLAB”

Copyright (C) 2005-2023 The Sage Development Team

<https://www.sagemath.org>

SageMath fully supports all major Linux distributions, recent versions of macOS, and Windows (using Cygwin or Windows Subsystem for Linux).

The traditional and recommended way to install SageMath is from source via Sage-the-distribution (<https://www.sagemath.org/download-source.html>). Sage-the-distribution first builds a large number of open source packages from source (unless it finds suitable versions installed in the system) and then installs the Sage Library (sagelib, implemented in Python and Cython).

### About this experimental pip-installable source distribution

This pip-installable source distribution *sagemath – repl* is an experimental distribution of a small part of the Sage Library. Use at your own risk. It provides a small, fundamental subset of the modules of the Sage library (“sagelib”, *sagemath – standard*), providing the IPython kernel, Sage preparser, and doctester.

### Type

experimental

### Dependencies

- *sagemath\_objects*: Sage objects, elements, parents, categories, coercion, metaclasses
- *sagemath\_environment*: System and software environment
- *ipython*: Interactive computing environment with an enhanced interactive Python shell
- *ipywidgets*: Interactive HTML widgets for Jupyter notebooks and the IPython kernel
- \$(PYTHON\_TOOLCHAIN)
- *python\_build*: A simple, correct PEP517 package builder
- \$(PYTHON)

### Version Information

package-version.txt:

10.2

install-requires.txt:

```
# This file is updated on every release by the sage-update-version script
sagemath-repl ~= 10.2
```

## Equivalent System Packages

(none known)

### 6.1.343 `sagemath_siropco`: Certified root continuation with sirocco

#### About SageMath

“Creating a Viable Open Source Alternative to  
Magma, Maple, Mathematica, and MATLAB”

Copyright (C) 2005-2023 The Sage Development Team

<https://www.sagemath.org>

SageMath fully supports all major Linux distributions, recent versions of macOS, and Windows (using Cygwin or Windows Subsystem for Linux).

The traditional and recommended way to install SageMath is from source via Sage-the-distribution (<https://www.sagemath.org/download-source.html>). Sage-the-distribution first builds a large number of open source packages from source (unless it finds suitable versions installed in the system) and then installs the Sage Library (sagelib, implemented in Python and Cython).

#### About this pip-installable source distribution

This pip-installable source distribution `sagemath-sirocco` is a small optional distribution for use with `sagemath-standard`.

It provides a Cython interface to the `sirocco` library for the purpose of compute topologically certified root continuation of bivariate polynomials.

#### Type

optional

#### Dependencies

- `sirocco`: Compute topologically certified root continuation of bivariate polynomials
- `cypari2`: Python interface to the number theory library `libpari`
- `cysignals`: Interrupt and signal handling for Cython
- `mpfr`: Multiple-precision floating-point computations with correct rounding
- `$(PYTHON_TOOLCHAIN)`
- `sage-setup`: Build system of the SageMath library
- `sagemath_environment`: System and software environment
- `cython`: C-Extensions for Python, an optimizing static compiler
- `pkgconfig`: Python interface to `pkg-config`
- `$(PYTHON)`

### Version Information

package-version.txt:

```
10.2
```

install-requires.txt:

```
# This file is updated on every release by the sage-update-version script
sagemath-sirocco ~= 10.2
```

### Equivalent System Packages

conda:

```
$ conda install sagemath-sirocco
```

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

### 6.1.344 sagemath\_tdlb: Tree decompositions with tdlb

#### About SageMath

“Creating a Viable Open Source Alternative to  
Magma, Maple, Mathematica, and MATLAB”

Copyright (C) 2005-2023 The Sage Development Team

<https://www.sagemath.org>

SageMath fully supports all major Linux distributions, recent versions of macOS, and Windows (using Cygwin or Windows Subsystem for Linux).

The traditional and recommended way to install SageMath is from source via Sage-the-distribution (<https://www.sagemath.org/download-source.html>). Sage-the-distribution first builds a large number of open source packages from source (unless it finds suitable versions installed in the system) and then installs the Sage Library (sagelib, implemented in Python and Cython).

#### About this pip-installable source distribution

This pip-installable source distribution `sagemath-tdlb` is a small optional distribution for use with `sagemath-standard`.

It provides a Cython interface to the `tdlib` library, providing algorithms concerning tree decompositions.

**Type**

optional

**Dependencies**

- *tdlib: Algorithms for computing tree decompositions*
- *cysignals: Interrupt and signal handling for Cython*
- *\$(PYTHON\_TOOLCHAIN)*
- *sage-setup: Build system of the SageMath library*
- *sagemath\_environment: System and software environment*
- *cython: C-Extensions for Python, an optimizing static compiler*
- *pkgconfig: Python interface to pkg-config*
- *\$(PYTHON)*

**Version Information**

package-version.txt:

```
10.2
```

install-requires.txt:

```
# This file is updated on every release by the sage-update-version script
sagemath-tdlib ~= 10.2
```

**Equivalent System Packages**

(none known)

**6.1.345 sagenb\_export: Convert legacy SageNB notebooks to Jupyter notebooks and other formats****Description**

This is a tool to convert SageNB notebooks to other formats, in particular IPython/Jupyter notebooks.

It includes a Jupyter notebook extension to provide a UI for the import of SageNB notebooks.

## Upstream Contact

<https://github.com/vbraun/ExportSageNB>

## Type

standard

## Dependencies

- *notebook*: Jupyter notebook, a web-based notebook environment for interactive computing
- *nbconvert*: Converting Jupyter Notebooks
- *ipython*: Interactive computing environment with an enhanced interactive Python shell
- *six*: Python 2 and 3 compatibility utilities
- *\$(PYTHON\_TOOLCHAIN)*
- *\$(PYTHON)*

## Version Information

package-version.txt:

```
3.3
```

install-requires.txt:

```
git+https://github.com/vbraun/ExportSageNB.git#egg=sagenb_export
```

## Equivalent System Packages

See <https://repology.org/project/sagenb-export/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.346 sagetex: Embed code, results of computations, and plots from Sage into LaTeX documents

### Description

The SageTeX package allows you to embed code, results of computations, and plots from Sage into LaTeX documents.

## License

The *source code* of the SageTeX package may be redistributed and/or modified under the terms of the GNU General Public License as published by the Free Software Foundation, either version 2 of the License, or (at your option) any later version. To view a copy of this license, see <http://www.gnu.org/licenses/> or send a letter to the Free Software Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston, MA 02110-1301, USA.

The *documentation* of the SageTeX package is licensed under the Creative Commons Attribution-Share Alike 3.0 License. To view a copy of this license, visit <http://creativecommons.org/licenses/by-sa/3.0/> or send a letter to Creative Commons, 171 Second Street, Suite 300, San Francisco, California, 94105, USA.

## SPKG Maintainers

Dan Drake (dr.dan.drake at gmail) and SageMath developers ([sage-devel@googlegroups.com](mailto:sage-devel@googlegroups.com))

## Upstream Contact

Author: Dan Drake.

Web: <https://github.com/sagemath/sagetex>

## Dependencies

To install, nothing more than a standard Sage install. The `spkg-check` script will exit without actually testing anything if it cannot find “`latex`” in your path.

## Notes

To use SageTeX, both Sage and LaTeX need to know about it. SageTeX comes standard with Sage, so you only need to make sure LaTeX can find what it needs. Full details are in the Sage installation guide at <http://doc.sagemath.org/html/en/installation/> and <http://doc.sagemath.org/html/en/tutorial/sagetex.html>.

The directory `$SAGE_ROOT/venv/share/doc/sagetex` contains documentation and an example file. See `$SAGE_ROOT/venv/share/texmf/tex/latex/sagetex` for the source code and some possibly useful scripts. If you have problems or suggestions see the sage-support group.

If you want to help develop SageTeX, please clone the github repository (see the “Upstream Contact” above) and send me patches based on that.

## Type

standard

### Dependencies

- *maxima: System for manipulating symbolic and numerical expressions*
- *scipy: Scientific tools for Python*
- *matplotlib: Python 2D plotting library*
- *pillow: Python Imaging Library*
- *tachyon: A ray tracing system*
- *pyparsing: A Python parsing module*
- *\$(PYTHON)*

### Version Information

package-version.txt:

```
3.6.1
```

install-requires.txt:

```
sagetex >=3.5
```

### Equivalent System Packages

conda:

```
$ conda install sagetex
```

See <https://repology.org/project/sagetex/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.347 scip: Mixed integer programming solver

### Description

SCIP is currently one of the fastest open source mixed integer programming (MIP) solvers. It is also a framework for constraint integer programming and branch-cut-and-price. It allows total control of the solution process and the access of detailed information down to the guts of the solver.

## License

Apache 2.0

## Upstream Contact

<https://scipopt.org/#scipoptsuite>

## Dependencies

scip brings its own patched version of the bliss library. This will conflict with the optional package bliss.

## Type

optional

## Dependencies

- \$(MP\_LIBRARY)
- *readline: Command line editing library*
- *soplex: Linear optimization solver using the revised simplex method*
- *papilo: Parallel presolve for integer and linear optimization*
- *zlib: Data compression library*
- *cmake: A cross-platform build system generator*

## Version Information

package-version.txt:

```
802
```

## Equivalent System Packages

conda:

```
$ conda install scip
```

See <https://repology.org/project/scipoptsuite/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.348 scip\_sdp: Mixed integer semidefinite programming plugin for SCIP

### Description

SCIP-SDP allows to solve MISDPs using a nonlinear branch-and-bound approach or a linear programming cutting-plane approach.

- In the first case (the default), the semidefinite programming (SDP) relaxations are solved using interior-point SDP-solvers.
- In the second case, cutting planes based on eigenvector are generated.

SCIP-SDP is based on the branch-and-cut framework SCIP. In addition to providing a constraint handler for SDP-constraints and a relaxator to solve continuous SDP-relaxations using interior-point solvers, SCIP-SDP adds several heuristics and propagators to SCIP.

### License

Apache 2.0

### Upstream Contact

<http://www.opt.tu-darmstadt.de/scipsdp/>

<https://github.com/scipopt/SCIP-SDP>

### Type

optional

### Dependencies

- *scip: Mixed integer programming solver*
- *dsdp: Semidefinite programming solver*
- *cmake: A cross-platform build system generator*

### Version Information

package-version.txt:

4.1.0
-------

## Equivalent System Packages

(none known)

### 6.1.349 **scipy: Scientific tools for Python**

#### Description

SciPy (pronounced “Sigh Pie”) is open-source software for mathematics, science, and engineering. The SciPy library depends on NumPy, which provides convenient and fast N-dimensional array manipulation. The SciPy library is built to work with NumPy arrays, and provides many user-friendly and efficient numerical routines such as routines for numerical integration and optimization. Together, they run on all popular operating systems, are quick to install, and are free of charge. NumPy and SciPy are easy to use, but powerful enough to be depended upon by some of the world’s leading scientists and engineers.

#### License

SciPy’s license is free for both commercial and non-commercial use, under the BSD terms. See [http://www.scipy.org/License\\_Compatibility](http://www.scipy.org/License_Compatibility)

#### Upstream Contact

<https://www.scipy.org/>

#### Dependencies

- Python, which in Sage has numerous dependencies
- Numpy
- Fortran
- GNU patch

#### Special Update/Build Instructions

- None.

#### Type

standard

### Dependencies

- `$(BLAS)`
- `gfortran`: Fortran compiler from the GNU Compiler Collection
- `numpy`: Package for scientific computing with Python
- `pybind11`: Create Python bindings to C++ code
- `cython`: C-Extensions for Python, an optimizing static compiler
- `pythran`: Ahead of Time compiler for numeric kernels
- `$(PYTHON_TOOLCHAIN)`
- `meson_python`: Meson Python build backend (PEP 517)
- `$(PYTHON)`

### Version Information

package-version.txt:

```
1.11.3
```

install-requires.txt:

```
# 1.8 is known good version.  
# Per https://docs.scipy.org/doc/scipy/dev/core-dev/index.html#version-numbering  
# and https://docs.scipy.org/doc/scipy/dev/core-dev/index.html#deprecations,  
# deprecations cannot be introduced in micro releases.  
# SciPy devs wait "at least 6 months", "in practice two (minor) releases"  
# from deprecation to removal of a feature.  
scipy >=1.5, <1.12
```

### Equivalent System Packages

arch:

```
$ sudo pacman -S python-scipy
```

conda:

```
$ conda install scipy<1.12,>=1.5
```

Debian/Ubuntu:

```
$ sudo apt-get install python3-scipy
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-scipy
```

gentoo:

```
$ sudo emerge dev-python/scipy
```

homebrew:

```
$ brew install scipy
```

macports: install the following packages: py-scipy

opensuse:

```
$ sudo zypper install python3${{PYTHON_MINOR}}-scipy
```

void:

```
$ sudo xbps-install python3-scipy
```

See <https://repology.org/project/python:scipy/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.350 scs: Splitting conic solver

#### Description

scs: splitting conic solver

#### License

MIT

#### Upstream Contact

<https://pypi.org/project/scs/>

#### Type

optional

#### Dependencies

- *numpy: Package for scientific computing with Python*
- *\$(PYTHON\_TOOLCHAIN)*
- *cmake: A cross-platform build system generator*
- *\$(PYTHON)*

## Version Information

package-version.txt:

```
3.2.2
```

install-requires.txt:

```
scs
```

## Equivalent System Packages

conda:

```
$ conda install scs
```

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

### 6.1.351 send2trash: Send file to trash natively under Mac OS X, Windows and Linux

#### Description

Send file to trash natively under Mac OS X, Windows and Linux.

#### License

BSD License

#### Upstream Contact

<https://pypi.org/project/Send2Trash/>

#### Type

standard

#### Dependencies

- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

## Version Information

package-version.txt:

```
1.8.2
```

install-requires.txt:

```
send2trash >=1.5.0
```

## Equivalent System Packages

conda:

```
$ conda install send2trash
```

gentoo:

```
$ sudo emerge dev-python/send2trash
```

macports: install the following packages: py-send2trash

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-Send2Trash
```

void:

```
$ sudo xbps-install python3-send2trash
```

See <https://repology.org/project/send2trash/versions>, <https://repology.org/project/python:send2trash/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.352 setuptools: Build system for Python packages

#### Description

setuptools is the classical build system for Python packages, a collection of enhancements to the Python distutils.

#### License

MIT License

### Upstream Contact

<http://pypi.python.org/pypi/setuptools/>

<https://github.com/pypa/setuptools>

### Type

standard

$ sudo yum install python-setuptools
```

gentoo:

```
$ sudo emerge dev-python/setuptools
```

macports: install the following packages: py-setuptools

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-setuptools
```

void:

```
$ sudo xbps-install python3-setuptools
```

See <https://repology.org/project/python:setuptools/versions>

If the system package is installed and if the (experimental) option --enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.

### 6.1.353 setuptools\_scm: Python build system extension to obtain package version from version control

#### Description

the blessed package to manage your versions by scm tags

#### License

MIT

#### Upstream Contact

<https://pypi.org/project/setuptools-scm/>

#### Type

standard

#### Dependencies

- *packaging: Core utilities for Python packages*
- *setuptools: Build system for Python packages*
- *tomli: A lil' TOML parser*
- *typing\_extensions: Backported and Experimental Type Hints for Python 3.5+*
- *pip: Tool for installing and managing Python packages*
- \$(PYTHON)

### Version Information

package-version.txt:

```
8.0.4
```

install-requires.txt:

```
# matplotlib-3.6.2 needs >= 7
setuptools_scm >=7
```

### Equivalent System Packages

arch:

```
$ sudo pacman -S python-setuptools-scm
```

conda:

```
$ conda install setuptools_scm
```

Debian/Ubuntu:

```
$ sudo apt-get install setuptools-scm
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-setuptools_scm
```

freebsd:

```
$ sudo pkg install devel/py-setuptools_scm
```

gentoo:

```
$ sudo emerge dev-python/setuptools-scm
```

macports: install the following packages: py-setuptools\_scm

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-setuptools_scm
```

void:

```
$ sudo xbps-install python3-setuptools_scm
```

See <https://repology.org/project/python:setuptools-scm/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.354 setuptools\_wheel: Build the setuptools package as a wheel

After installing setuptools and wheel, we build a wheel of setuptools to complete the set of wheels stored in our wheelhouse.

#### Type

standard

#### Dependencies

- *setuptools: Build system for Python packages*
- *wheel: A built-package format for Python*
- \$(PYTHON)

#### Version Information

package-version.txt:

```
68.2.2
```

install-requires.txt:

```
# 68.1.0 Promote pyproject.toml's [tool.setuptools] out of beta.  
# 68.1.1 Fix editable install finder handling of nested packages  
setuptools >= 68.1.1
```

#### Equivalent System Packages

arch:

```
$ sudo pacman -S python-setuptools
```

conda:

```
$ conda install setuptools
```

Debian/Ubuntu:

```
$ sudo apt-get install python3-setuptools
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-setuptools
```

gentoo:

```
$ sudo emerge dev-python/setuptools
```

macports: install the following packages: py-setuptools

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-setuptools
```

void:

```
$ sudo xbps-install python3-setuptools
```

See <https://repology.org/project/python:setuptools/versions>

If the system package is installed and if the (experimental) option –enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.

### 6.1.355 singular: Computer algebra system for polynomial computations, algebraic geometry, singularity theory

#### Description

Singular is a computer algebra system for polynomial computations, with special emphasis on commutative and non-commutative algebra, algebraic geometry, and singularity theory.

#### License

GPLv2 or GPLv3

#### Upstream Contact

libsingular-devel@mathematik.uni-kl.de

<https://www.singular.uni-kl.de/>

#### Special Update/Build Instructions

Other notes:

- If the environment variable SAGE\_DEBUG is set to “yes”, then omalloc will be replaced by xalloc. The resulting Singular executable and libsingular library will be slower than with omalloc, but allow for easier debugging of memory corruptions.

#### Type

standard

## Dependencies

- \$(MP\_LIBRARY)
- *ntl*: A library for doing number theory
- *flint*: Fast Library for Number Theory
- *readline*: Command line editing library
- *mpfr*: Multiple-precision floating-point computations with correct rounding
- *cddlib*: Double description method for polyhedral representation conversion

## Version Information

package-version.txt:

```
4.3.2p8
```

## Equivalent System Packages

arch:

```
$ sudo pacman -S singular
```

conda:

```
$ conda install singular
```

cygwin:

```
$ apt-cyg install singular-devel singular
```

Debian/Ubuntu:

```
$ sudo apt-get install singular singular-doc libsingular4-dev
```

Fedora/Redhat/CentOS:

```
$ sudo yum install Singular Singular-devel
```

freebsd:

```
$ sudo pkg install math/singular
```

gentoo:

```
$ sudo emerge sci-mathematics/singular[readline]
```

homebrew:

```
$ brew install singular
```

macports: install the following packages: singular

nix:

```
$ nix-env --install singular
```

void:

```
$ sudo xbps-install singular
```

See <https://repology.org/project/singular/versions>

If the system package is installed, `./configure` will check if it can be used.

### 6.1.356 singular\_jupyter: Jupyter kernel for Singular

#### Description

This is a beta version of a jupyter kernel for Singular.

#### License

GPL version 2 or later

#### Upstream Contact

- [https://github.com/sebasguts/jupyter\\_kernel\\_singular](https://github.com/sebasguts/jupyter_kernel_singular)

#### Type

optional

#### Dependencies

- *jupyter\_client*: Jupyter protocol implementation and client libraries
- *\$(PYTHON\_TOOLCHAIN)*
- *pysingular*: A basic Python interface to Singular
- *ipython*: Interactive computing environment with an enhanced interactive Python shell
- *ipywidgets*: Interactive HTML widgets for Jupyter notebooks and the IPython kernel
- *\$(PYTHON)*

#### Version Information

package-version.txt:

```
0.9.7
```

install-requires.txt:

```
singular_jupyter >=0.9.7
```

## Equivalent System Packages

conda:

```
$ conda install jupyter-kernel-singular
```

See <https://repology.org/project/jupyter-singular/versions>, <https://repology.org/project/python-jupyter-kernel-singular/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.357 sirocco: Compute topologically certified root continuation of bivariate polynomials

### Equivalent System Packages

(none known)

## 6.1.361 snowballstemmer: Stemmer algorithms for natural language processing in Python

### Description

This package provides 29 stemmers for 28 languages generated from Snowball algorithms.

### License

BSD-3-Clause

### Upstream Contact

<https://pypi.org/project/snowballstemmer/>

This is a pure Python stemming library. If PyStemmer is available, this module uses it to accelerate.

### Type

standard

### Dependencies

- \${PYTHON\_TOOLCHAIN}
- \${PYTHON}

### Version Information

package-version.txt:

```
2.2.0
```

install-requires.txt:

```
snowballstemmer >=1.2.1
```

## Equivalent System Packages

conda:

```
$ conda install snowballstemmer
```

gentoo:

```
$ sudo emerge dev-python/snowballstemmer
```

macports: install the following packages: py-snowballstemmer

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-snowballstemmer
```

void:

```
$ sudo xbps-install python3-snowballstemmer
```

See <https://repology.org/project/python:snowballstemmer/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

## 6.1.362 soplex: Linear optimization solver using the revised simplex method

### Description

SoPlex is an optimization package for solving linear programming problems (LPs) based on an advanced implementation of the primal and dual revised simplex algorithm. It provides special support for the exact solution of LPs with rational input data.

### License

Apache License, Version 2.0

### Upstream Contact

<https://github.com/scipopt/soplex>

### Type

optional

### Dependencies

- `$(MP_LIBRARY)`
- *mpfr*: *Multiple-precision floating-point computations with correct rounding*
- *boost\_cropped*: *Portable C++ libraries (subset needed for Sage)*
- *zlib*: *Data compression library*
- *papilo*: *Parallel presolve for integer and linear optimization*
- *cmake*: *A cross-platform build system generator*

### Version Information

package-version.txt:

```
602
```

### Equivalent System Packages

conda:

```
$ conda install soplex
```

freebsd:

```
$ sudo pkg install math/SoPlex
```

See <https://repology.org/project/soplex/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

### 6.1.363 soupsieve: A modern CSS selector implementation for Beautiful Soup.

#### Description

A modern CSS selector implementation for Beautiful Soup.

#### License

#### Upstream Contact

<https://pypi.org/project/soupsieve/>

**Type**

standard

**Dependencies**

- \$(PYTHON\_TOOLCHAIN)
- *hatchling: Modern, extensible Python build backend*
- \$(PYTHON)

**Version Information**

package-version.txt:

```
2.3.2.post1
```

install-requires.txt:

```
soupsieve
```

**Equivalent System Packages**

conda:

```
$ conda install soupsieve
```

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.364 sphinx: Python documentation generator

**Description**

Sphinx is a tool that makes it easy to create intelligent and beautiful documentation for Python projects (or other documents consisting of multiple reStructuredText sources), written by Georg Brandl. It was originally created to translate the new Python documentation, but has now been cleaned up in the hope that it will be useful to many other projects.

**License**

Modified BSD; see e.g. its egg-info file for other options

### Upstream Contact

- Author: Georg Brandl
- Home Page: <http://www.sphinx-doc.org>
- see also <http://pypi.python.org/pypi/Sphinx>

### Dependencies

- Jinja2 >= 2.3
- Pygments >= 2.0
- docutils < 0.18
- snowballstemmer >= 1.1
- babel >= 1.3
- setuptools / distribute
- Python
- GNU patch (shipped with Sage)

### Type

standard

### Dependencies

- \$(PYTHON\_TOOLCHAIN)
- *docutils*: Processing plaintext documentation into useful formats, such as HTML or LaTeX
- *jinja2*: General purpose template engine for Python
- *pygments*: Generic syntax highlighter
- *snowballstemmer*: Stemmer algorithms for natural language processing in Python
- *imagesize*: Parser for image file metadata
- *babel*: Internationalization utilities for Python
- *alabaster*: Default theme for the Sphinx documentation system
- *requests*: An HTTP library for Python
- *sphinxcontrib\_websupport*: Sphinx API for Web apps
- *sphinxcontrib\_applehelp*: Sphinx extension which outputs Apple help book
- *sphinxcontrib\_devhelp*: Sphinx extension which outputs Devhelp documents
- *sphinxcontrib\_htmlhelp*: Sphinx extension which outputs HTML help book
- *sphinxcontrib\_jsmath*: Sphinx extension which renders display math in HTML via JavaScript
- *sphinxcontrib\_qthelp*: Sphinx extension which outputs QtHelp documents
- *sphinxcontrib\_serializinghtml*: Sphinx extension which outputs serialized HTML files

- *packaging*: Core utilities for Python packages
- *importlib\_metadata*: Library to access the metadata for a Python package
- \${PYTHON}

## Version Information

package-version.txt:

```
5.2.3
```

install-requires.txt:

```
sphinx >=5.2, <8
```

## Equivalent System Packages

arch:

```
$ sudo pacman -S python-sphinx
```

conda:

```
$ conda install sphinx<8,>=5.2
```

Debian/Ubuntu:

```
$ sudo apt-get install sphinx
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-sphinx
```

freebsd:

```
$ sudo pkg install textproc/py-sphinx
```

gentoo:

```
$ sudo emerge dev-python/sphinx
```

homebrew:

```
$ brew install sphinx-doc
```

macports: install the following packages: py-sphinx

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-Sphinx
```

void:

```
$ sudo xbps-install python3-Sphinx
```

See <https://repology.org/project/python:sphinx/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.365 `sphinx_basic_ng`: A modern skeleton for Sphinx themes.

#### Description

A modern skeleton for Sphinx themes.

#### License

#### Upstream Contact

<https://pypi.org/project/sphinx-basic-ng/>

#### Type

standard

#### Dependencies

- *sphinx: Python documentation generator*
- `$(PYTHON_TOOLCHAIN)`
- `$(PYTHON)`

#### Version Information

package-version.txt:

0.0.1a12

install-requires.txt:

sphinx-basic-ng

#### Equivalent System Packages

arch:

```
$ sudo pacman -S python-sphinx-basic-ng
```

conda:

```
$ conda install sphinx-basic-ng
```

Debian/Ubuntu:

```
$ sudo apt-get install sphinx-basic-ng
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-sphinx-basic-ng
```

freebsd:

```
$ sudo pkg install textproc/py-sphinx-basic-ng
```

gentoo:

```
$ sudo emerge dev-python/sphinx-basic-ng
```

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.366 sphinx\_copybutton: Add a copy button to each of your code cells.

#### Description

Add a copy button to each of your code cells.

#### License

MIT License

#### Upstream Contact

<https://pypi.org/project/sphinx-copybutton/>

#### Type

standard

#### Dependencies

- *sphinx: Python documentation generator*
- `$(PYTHON_TOOLCHAIN)`
- `$(PYTHON)`

## Version Information

package-version.txt:

```
0.5.1
```

install-requires.txt:

```
sphinx-copybutton
```

## Equivalent System Packages

alpine:

```
$ apk add py3-sphinx-copybutton
```

arch:

```
$ sudo pacman -S python-sphinx-copybutton
```

conda:

```
$ conda install sphinx-copybutton
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-sphinx-copybutton
```

freebsd:

```
$ sudo pkg install textproc/py-sphinx-copybutton
```

gentoo:

```
$ sudo emerge dev-python/sphinx-copybutton
```

void:

```
$ sudo xbps-install python3-sphinx-copybutton
```

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

## 6.1.367 `sphinxcontrib_applehelp`: Sphinx extension which outputs Apple help book

### Description

Sphinx extension which outputs Apple help book

**License**

BSD

**Type**

standard

**Dependencies**

- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

**Version Information**

package-version.txt:

1.0.2

install-requires.txt:

sphinxcontrib\_applehelp &gt;=1.0.2

**Equivalent System Packages**

arch:

\$ sudo pacman -S python-sphinxcontrib-applehelp

conda:

\$ conda install sphinxcontrib-applehelp

Fedora/Redhat/CentOS:

\$ sudo yum install python-sphinxcontrib-applehelp

freebsd:

\$ sudo pkg install textproc/py-sphinxcontrib-applehelp

gentoo:

\$ sudo emerge dev-python/sphinxcontrib-applehelp

macports: install the following packages: py-sphinxcontrib-applehelp

opensuse:

\$ sudo zypper install python3\${PYTHON\_MINOR}-sphinxcontrib-applehelp

void:

```
$ sudo xbps-install python3-sphinxcontrib-applehelp
```

See <https://repology.org/project/python:sphinxcontrib-applehelp/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.368 sphinxcontrib\_devhelp: Sphinx extension which outputs Devhelp documents

#### Description

Sphinx extension which outputs Devhelp documents

#### License

BSD

#### Type

standard

#### Dependencies

- `$(PYTHON_TOOLCHAIN)`
- `$(PYTHON)`

#### Version Information

package-version.txt:

```
1.0.2
```

install-requires.txt:

```
sphinxcontrib_devhelp >=1.0.2
```

#### Equivalent System Packages

arch:

```
$ sudo pacman -S python-sphinxcontrib-devhelp
```

conda:

```
$ conda install sphinxcontrib-devhelp
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-sphinxcontrib-devhelp
```

freebsd:

```
$ sudo pkg install textproc/py-sphinxcontrib-devhelp
```

gentoo:

```
$ sudo emerge dev-python/sphinxcontrib-devhelp
```

macports: install the following packages: py-sphinxcontrib-devhelp

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-sphinxcontrib-devhelp
```

void:

```
$ sudo xbps-install python3-sphinxcontrib-devhelp
```

See <https://repology.org/project/python:sphinxcontrib-devhelp/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

## 6.1.369 sphinxcontrib\_htmlhelp: Sphinx extension which outputs HTML help book

### Description

Sphinx extension which outputs HTML help book

### License

BSD

### Type

standard

### Dependencies

- \${PYTHON\_TOOLCHAIN}
- \${PYTHON}

### Version Information

package-version.txt:

```
2.0.0
```

install-requirements.txt:

```
sphinxcontrib_htmlhelp >=1.0.3
```

### Equivalent System Packages

arch:

```
$ sudo pacman -S python-sphinxcontrib-htmlhelp
```

conda:

```
$ conda install sphinxcontrib-htmlhelp
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-sphinxcontrib-htmlhelp
```

freebsd:

```
$ sudo pkg install textproc/py-sphinxcontrib-htmlhelp
```

gentoo:

```
$ sudo emerge dev-python/sphinxcontrib-htmlhelp
```

macports: install the following packages: py-sphinxcontrib-htmlhelp

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-sphinxcontrib-htmlhelp
```

void:

```
$ sudo xbps-install python3-sphinxcontrib-htmlhelp
```

See <https://repology.org/project/python:sphinxcontrib-htmlhelp/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

## 6.1.370 sphinxcontrib\_jsmath: Sphinx extension which renders display math in HTML via JavaScript

### Description

Sphinx extension which renders display math in HTML via JavaScript

### License

BSD

### Type

standard

### Dependencies

- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

### Version Information

package-version.txt:

```
1.0.1
```

install-requires.txt:

```
sphinxcontrib_jsmath >=1.0.1
```

### Equivalent System Packages

arch:

```
$ sudo pacman -S python-sphinxcontrib-jsmath
```

conda:

```
$ conda install sphinxcontrib-jsmath
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-sphinxcontrib-jsmath
```

freebsd:

```
$ sudo pkg install textproc/py-sphinxcontrib-jsmath
```

gentoo:

```
$ sudo emerge dev-python/sphinxcontrib-jsmath
```

macports: install the following packages: py37-sphinxcontrib-jsmath

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-sphinxcontrib-jsmath
```

void:

```
$ sudo xbps-install python3-sphinxcontrib-jsmath
```

See <https://repology.org/project/python:sphinxcontrib-jsmath/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.371 sphinxcontrib\_qthelp: Sphinx extension which outputs QtHelp documents

#### Description

Sphinx extension which outputs QtHelp documents

#### License

BSD

#### Type

standard

#### Dependencies

- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

#### Version Information

package-version.txt:

```
1.0.3
```

install-requirements.txt:

```
sphinxcontrib_qthelp >=1.0.3
```

## Equivalent System Packages

arch:

```
$ sudo pacman -S python-sphinxcontrib-qthelp
```

conda:

```
$ conda install sphinxcontrib-qthelp
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-sphinxcontrib-qthelp
```

freebsd:

```
$ sudo pkg install textproc/py-sphinxcontrib-qthelp
```

gentoo:

```
$ sudo emerge dev-python/sphinxcontrib-qthelp
```

macports: install the following packages: py-sphinxcontrib-qthelp

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-sphinxcontrib-qthelp
```

void:

```
$ sudo xbps-install python3-sphinxcontrib-qthelp
```

See <https://repology.org/project/python:sphinxcontrib-qthelp/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.372 `sphinxcontrib_serializinghtml`: Sphinx extension which outputs serialized HTML files

#### Description

Sphinx extension which outputs serialized HTML files

#### License

BSD

### Type

standard

### Dependencies

- \${PYTHON\_TOOLCHAIN}
- \${PYTHON}

### Version Information

package-version.txt:

```
1.1.5
```

install-requires.txt:

```
sphinxcontrib_serializinghtml >=1.1.5
```

### Equivalent System Packages

arch:

```
$ sudo pacman -S python-sphinxcontrib-serializinghtml
```

conda:

```
$ conda install sphinxcontrib-serializinghtml
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-sphinxcontrib-serializinghtml
```

freebsd:

```
$ sudo pkg install textproc/py-sphinxcontrib-serializinghtml
```

gentoo:

```
$ sudo emerge dev-python/sphinxcontrib-serializinghtml
```

macports: install the following packages: py-sphinxcontrib-serializinghtml

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-sphinxcontrib-serializinghtml
```

void:

```
$ sudo xbps-install python3-sphinxcontrib-serializinghtml
```

See <https://repology.org/project/python:sphinxcontrib-serializinghtml/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

## 6.1.373 sphinxcontrib\_websupport: Sphinx API for Web apps

### Description

`sphinxcontrib-websupport` provides a Python API to easily integrate Sphinx documentation into your Web application.

### License

BSD

### Type

standard

### Dependencies

- *sphinxcontrib\_serializinghtml: Sphinx extension which outputs serialized HTML files*
- `$(PYTHON_TOOLCHAIN)`
- `$(PYTHON)`

### Version Information

package-version.txt:

```
1.2.4
```

install-requires.txt:

```
sphinxcontrib_websupport >=1.2.1
```

### Equivalent System Packages

alpine:

```
$ apk add py3-sphinxcontrib-websupport
```

arch:

```
$ sudo pacman -S python-sphinxcontrib-websupport
```

conda:

```
$ conda install sphinxcontrib-websupport
```

Debian/Ubuntu:

```
$ sudo apt-get install sphinxcontrib-websupport
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-sphinxcontrib-websupport
```

freebsd:

```
$ sudo pkg install textproc/py-sphinxcontrib-websupport
```

gentoo:

```
$ sudo emerge dev-python/sphinxcontrib-websupport
```

macports: install the following packages: py-sphinxcontrib-websupport

openuse:

```
$ sudo zypper install python3${{PYTHON_MINOR}}-sphinxcontrib-websupport
```

See <https://repology.org/project/python:sphinxcontrib-websupport/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.374 sqlalchemy: A database abstraction library

#### Description

Database Abstraction Library

#### License

MIT

#### Upstream Contact

<https://pypi.org/project/SQLAlchemy/>

#### Type

optional

## Dependencies

### Version Information

requirements.txt:

```
sqlalchemy
```

## Equivalent System Packages

conda:

```
$ conda install sqlalchemy
```

macports: install the following packages: py-sqlalchemy

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-SQLAlchemy
```

void:

```
$ sudo xbps-install python3-SQLAlchemy
```

See <https://repology.org/project/python:sqlalchemy/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.375 sqlite: An SQL database engine

### Description

SQLite is a software library that implements a self-contained, serverless, zero-configuration, transactional SQL database engine.

### License

Public Domain

### Upstream contact

- <https://www.sqlite.org>

### Dependencies

- readline

### Special Update/Build Instructions

- Use the autoconf version of sqlite.

### Type

standard

### Dependencies

- *readline: Command line editing library*

### Version Information

package-version.txt:

```
3.36.0
```

### Equivalent System Packages

alpine:

```
$ apk add sqlite-dev
```

arch:

```
$ sudo pacman -S sqlite3
```

conda:

```
$ conda install sqlite
```

cygwin:

```
$ apt-cyg install libsqlite3-devel sqlite3
```

Debian/Ubuntu:

```
$ sudo apt-get install libsqlite3-dev sqlite3
```

Fedora/Redhat/CentOS:

```
$ sudo yum install sqlite-devel sqlite
```

freebsd:

```
$ sudo pkg install databases/sqlite3
```

gentoo:

```
$ sudo emerge dev-db/sqlite
```

homebrew:

```
$ brew install sqlite
```

macports: install the following packages: sqlite3

nix:

```
$ nix-env --install sqlite
```

openSUSE:

```
$ sudo zypper install "pkgconfig(sqlite3)"
```

slackware:

```
$ sudo slackpkg install sqlite icu4c
```

void:

```
$ sudo xbps-install sqlite-devel
```

See <https://repology.org/project/sqlite/versions>

If the system package is installed, ./configure will check if it can be used.

## 6.1.376 stack\_data: Extract data from python stack frames and tracebacks for informative displays

### Description

Extract data from python stack frames and tracebacks for informative displays

### License

MIT

### Upstream Contact

<https://pypi.org/project/stack-data/>

### Type

standard

### Dependencies

- *executing*: Get the currently executing AST node of a frame, and other information
- *asttokens*: Annotate AST trees with source code positions
- *pure\_eval*: Safely evaluate AST nodes without side effects
- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

### Version Information

package-version.txt:

```
0.6.1
```

install-requires.txt:

```
stack-data
```

### Equivalent System Packages

conda:

```
$ conda install stack_data
```

gentoo:

```
$ sudo emerge dev-python/stack-data
```

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.377 suitesparse: A suite of sparse matrix software

SuiteSparse is a collection of software to deal with sparse matrix. It is hosted at <http://faculty.cse.tamu.edu/davis/suitesparse.html>

This spkg does a minimal install of suitesparse disabling the following

- metis
- GraphBLAS (need cmake)
- Mongoose (need cmake)

An external metis package can be used but we just disable its use.

Patches:

- The first patch disable the building of package using cmake.

- The second patch make sure we use sage's blas/lapack on OS X. By default suitesparse discard any configurations to use the accelerate framework.

The building of metis is disabled by passing MY\_METIS\_LIB=none to make (any value would have done) We also configure cholmod so it doesn't require metis by passing CHOLMOD\_CONFIG=-DNPARTITION to make.

Other configurations are self explanatory.

License: because SuiteSparse is a collection, it comes with a variety of licenses. Find below a copy of the "LICENSES.txt" shipped with SuiteSparse.

**==Core/License.txt==**

CHOLMOD/Core Module. Copyright (C) 2005-2006, Univ. of Florida. Author: Timothy A. Davis. CHOLMOD is also available under other licenses; contact authors for details. <http://www.suitesparse.com>

Note that this license is for the CHOLMOD/Core module only. All CHOLMOD modules are licensed separately.

This Module is free software; you can redistribute it and/or modify it under the terms of the GNU Lesser General Public License as published by the Free Software Foundation; either version 2.1 of the License, or (at your option) any later version.

This Module is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU Lesser General Public License for more details.

You should have received a copy of the GNU Lesser General Public License along with this Module; if not, write to the Free Software Foundation, Inc., 51 Franklin St, Fifth Floor, Boston, MA 02110-1301 USA

**==Demo/License.txt==**

CHOLMOD/Demo Module. Copyright (C) 2005-2006, Timothy A. Davis. CHOLMOD is also available under other licenses; contact authors for details. <http://www.suitesparse.com>

Note that this license is for the CHOLMOD/Demo module only. All CHOLMOD modules are licensed separately.

This Module is free software; you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 2 of the License, or (at your option) any later version.

This Module is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

You should have received a copy of the GNU General Public License along with this Module; if not, write to the Free Software Foundation, Inc., 51 Franklin St, Fifth Floor, Boston, MA 02110-1301, USA.

**==Include/License.txt==**

CHOLMOD/Include/\* files. Copyright (C) 2005-2006, either Univ. of Florida or T. Davis, depending on the file.

Each file is licensed separately, according to the Module for which it contains definitions and prototypes:

Include/cholmod.h LGPL  
Include/cholmod\_blas.h LGPL  
Include/cholmod\_camd.h part of Partition module  
Include/cholmod\_check.h part of Check module  
Include/cholmod\_cholesky.h part of Cholesky module  
Include/cholmod\_complexity.h LGPL  
Include/cholmod\_config.h LGPL  
Include/cholmod\_core.h part of Core module  
Include/cholmod\_function.h no license; freely usable, no restrictions  
Include/cholmod\_gpu.h part of GPU module  
Include/cholmod\_gpu\_kernels.h part of GPU module  
Include/cholmod\_internal.h LGPL  
Include/cholmod\_io64.h LGPL  
Include/cholmod\_matrixops.h part of MatrixOps module  
Include/cholmod\_modify.h part of Modify module  
Include/cholmod\_partition.h part of Partition module  
Include/cholmod\_supernodal.h part of Supernodal module  
Include/cholmod\_template.h LGPL

**==MATLAB/License.txt==**

CHOLMOD/MATLAB Module. Copyright (C) 2005-2006, Timothy A. Davis. CHOLMOD is also available under other licenses; contact authors for details. MATLAB(tm) is a Registered Trademark of The MathWorks, Inc. <http://www.suitesparse.com>

Note that this license is for the CHOLMOD/MATLAB module only. All CHOLMOD modules are licensed separately.

This Module is free software; you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 2 of the License, or (at your option) any later version.

This Module is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

You should have received a copy of the GNU General Public License along with this Module; if not, write to the Free Software Foundation, Inc., 51 Franklin St, Fifth Floor, Boston, MA 02110-1301, USA.

**==MatrixOps/License.txt==**

CHOLMOD/MatrixOps Module. Copyright (C) 2005-2006, Timothy A. Davis. CHOLMOD is also available under other licenses; contact authors for details. <http://www.suitesparse.com>

Note that this license is for the CHOLMOD/MatrixOps module only. All CHOLMOD modules are licensed separately.

This Module is free software; you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 2 of the License, or (at your option) any later version.

This Module is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

You should have received a copy of the GNU General Public License along with this Module; if not, write to the Free Software Foundation, Inc., 51 Franklin St, Fifth Floor, Boston, MA 02110-1301, USA.

**==Modify/License.txt==**

CHOLMOD/Modify Module. Copyright (C) 2005-2006, Timothy A. Davis and William W. Hager. CHOLMOD is also available under other licenses; contact authors for details. <http://www.suitesparse.com>

Note that this license is for the CHOLMOD/Modify module only. All CHOLMOD modules are licensed separately.

This Module is free software; you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 2 of the License, or (at your option) any later version.

This Module is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

You should have received a copy of the GNU General Public License along with this Module; if not, write to the Free Software Foundation, Inc., 51 Franklin St, Fifth Floor, Boston, MA 02110-1301, USA.

**==Partition/License.txt==**

CHOLMOD/Partition Module. Copyright (C) 2005-2006, Univ. of Florida. Author: Timothy A. Davis CHOLMOD is also available under other licenses; contact authors for details. <http://www.suitesparse.com>

Note that this license is for the CHOLMOD/Partition module only. All CHOLMOD modules are licensed separately.

This Module is free software; you can redistribute it and/or modify it under the terms of the GNU Lesser General Public License as published by the Free Software Foundation; either version 2.1 of the License, or (at your option) any later version.

This Module is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU Lesser General Public License for more details.

You should have received a copy of the GNU Lesser General Public License along with this Module; if not, write to the Free Software Foundation, Inc., 51 Franklin St, Fifth Floor, Boston, MA 02110-1301 USA

**==Supernodal/License.txt==**

CHOLMOD/Supernodal Module. Copyright (C) 2005-2006, Timothy A. Davis CHOLMOD is also available under other licenses; contact authors for details. <http://www.suitesparse.com>

Note that this license is for the CHOLMOD/Supernodal module only. All CHOLMOD modules are licensed separately.

This Module is free software; you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 2 of the License, or (at your option) any later version.

This Module is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

You should have received a copy of the GNU General Public License along with this Module; if not, write to the Free Software Foundation, Inc., 51 Franklin St, Fifth Floor, Boston, MA 02110-1301, USA.

**==Tcov/License.txt==**

CHOLMOD/Tcov Module. Copyright (C) 2005-2006, Timothy A. Davis CHOLMOD is also available under other licenses; contact authors for details. <http://www.suitesparse.com>

Note that this license is for the CHOLMOD/Tcov module only. All CHOLMOD modules are licensed separately.

This Module is free software; you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 2 of the License, or (at your option) any later version.

This Module is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

You should have received a copy of the GNU General Public License along with this Module; if not, write to the Free Software Foundation, Inc., 51 Franklin St, Fifth Floor, Boston, MA 02110-1301, USA.

**==Valgrind/License.txt==**

CHOLMOD/Valgrind Module. Copyright (C) 2005-2006, Timothy A. Davis. CHOLMOD is also available under other licenses; contact authors for details. <http://www.suitesparse.com>

Note that this license is for the CHOLMOD/Valgrind module only. All CHOLMOD modules are licensed separately.

This Module is free software; you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 2 of the License, or (at your option) any later version.

This Module is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

You should have received a copy of the GNU General Public License along with this Module; if not, write to the Free Software Foundation, Inc., 51 Franklin St, Fifth Floor, Boston, MA 02110-1301, USA.

gentoo:

```
$ sudo emerge sci-libs/amd sci-libs/cholmod sci-libs/suitesparseconfig sci-libs/umfpack
```

homebrew:

```
$ brew install suite-sparse
```

macports: install the following packages: SuiteSparse

opensuse:

```
$ sudo zypper install suitesparse-devel
```

void:

```
$ sudo xbps-install SuiteSparse-devel
```

See <https://repology.org/project/suitesparse/versions>

If the system package is installed, ./configure will check if it can be used.

## 6.1.378 surf: Visualization of algebraic curves, algebraic surfaces and hyperplane sections of surfaces

### Description

surf is a tool to visualize some real algebraic geometry: plane algebraic curves, algebraic surfaces and hyperplane sections of surfaces. surf is script driven and has (optionally) a nifty GUI using the Gtk widget set.

This is used by the Singular Jupyter kernel to produce 3D plots.

### License

GPL version 2 or later

### Upstream Contact

<http://surf.sourceforge.net> (although the project is essentially dead)

### Dependencies

- cups (optional)
- GNU flex Version 2.5 or higher
- GTK+ Version 1.2.0 or higher (optional)
- POSIX Threads
- GNU MP(gmp) Version 2 or higher
- lib-tiff
- lib-jpeg
- zlib
- ps2pdf (optional)

This package is “experimental” because not all of these dependencies are packaged with Sage.

## Type

experimental

## Dependencies

- \$(MP\_LIBRARY)

## Version Information

package-version.txt:

```
1.0.6-gcc6
```

## Equivalent System Packages

openSUSE:

```
$ sudo zypper install surf
```

See <https://repology.org/project/surf-alggeo/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.379 surface\_dynamics: dynamics on surfaces (measured foliations, interval exchange transformation, Teichmüller flow, etc)

### Description

Dynamics on surfaces.

### License

GPLv2+

### Upstream Contact

[https://gitlab.com/videlec/surface\\_dynamics](https://gitlab.com/videlec/surface_dynamics) <https://pypi.org/project/surface-dynamics/>

**Type**

optional

**Dependencies**

- *cysignals: Interrupt and signal handling for Cython*
- *pplpy: Python interface to the Parma Polyhedra Library*
- \$(PYTHON\_TOOLCHAIN)
- \$(SAGERUNTIME)
- \$(PYTHON)

**Version Information**

requirements.txt:

surface_dynamics
------------------

**Equivalent System Packages**

See <https://repology.org/project/python:surface-dynamics/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.380 symengine: A C++ symbolic manipulation library

**Description**

SymEngine is a standalone fast C++ symbolic manipulation library.

**License**

BSD 3-clause

**Upstream Contact**

<https://github.com/symengine/symengine>

### Type

optional

### Dependencies

- \$(MP\_LIBRARY)
- *arb*: Arbitrary-precision floating-point ball arithmetic
- *ecm*: Elliptic curve method for integer factorization
- *flint*: Fast Library for Number Theory
- *mpc*: Arithmetic of complex numbers with arbitrarily high precision and correct rounding
- *mpfr*: Multiple-precision floating-point computations with correct rounding
- *cmake*: A cross-platform build system generator

### Version Information

package-version.txt:

```
0.10.1
```

### Equivalent System Packages

conda:

```
$ conda install symengine
```

freebsd:

```
$ sudo pkg install math/symengine
```

gentoo:

```
$ sudo emerge sci-libs/symengine
```

macports: install the following packages: symengine

nix:

```
$ nix-env --install symengine
```

opensuse:

```
$ sudo zypper install symengine
```

See <https://repology.org/project/symengine/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.381 symengine\_py: Python wrappers for SymEngine

### Description

Python wrappers for SymEngine

### License

symengine.py is MIT licensed and uses several LGPL, BSD-3 and MIT licensed libraries

### Upstream Contact

<https://github.com/symengine/symengine.py>

### Type

experimental

### Dependencies

- *symengine: A C++ symbolic manipulation library*
- *cmake: A cross-platform build system generator*
- *cython: C-Extensions for Python, an optimizing static compiler*
- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

### Version Information

package-version.txt:

```
0.10.0
```

install-requirements.txt:

```
symengine.py >= 0.6.1
```

### Equivalent System Packages

conda:

```
$ conda install python-symengine
```

See <https://repology.org/project/python:symengine/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.382 **symmetrica**: Library for representation theory

### Description

Symmetrica is a Collection of C routines for representation theory.

It is a program developed by Lehrstuhl Mathematik II of the University of Bayreuth. It has routines to handle the following topics:

- ordinary representation theory of the symmetric group and related groups (2/11/04)
- ordinary representation theory of the classical groups
- modular representation theory of the symmetric group
- projective representation theory of the symmetric group
- combinatorics of tableaux
- symmetric functions and polynomials (7/22/04)
- commutative and non commutative Schubert polynomials
- operations of finite groups.
- ordinary representation theory of Hecke algebras of type A<sub>n</sub>

For more details check <http://www.algorithm.uni-bayreuth.de/en/research/SYMMETRICA>

Updated package on <https://gitlab.com/sagemath/symmetrica/-/releases> with changes to modernize the source and the build system.

### License

Public Domain (see the above web site)

### Upstream Contact

- (passed away in 2013) Axel Kohnert - see <http://www.mathe2.uni-bayreuth.de/axel/>

### Type

standard

### Dependencies

- *xz*: General-purpose data compression software

## Version Information

package-version.txt:

```
3.0.1
```

## Equivalent System Packages

arch:

```
$ sudo pacman -S symmetrica
```

conda:

```
$ conda install symmetrica
```

Debian/Ubuntu:

```
$ sudo apt-get install libsymmetrica2-dev
```

Fedora/Redhat/CentOS:

```
$ sudo yum install symmetrica-devel
```

freebsd:

```
$ sudo pkg install math/symmetrica
```

gentoo:

```
$ sudo emerge sci-libs/symmetrica
```

nix:

```
$ nix-env --install symmetrica
```

void:

```
$ sudo xbps-install symmetrica-devel
```

See <https://repology.org/project/symmetrica/versions>

If the system package is installed, ./configure will check if it can be used.

### 6.1.383 sympow: Computes special values of symmetric power elliptic curve L-functions

#### Description

SYMPOW is a package to compute special values of symmetric power elliptic curve L-functions. It can compute up to about 64 digits of precision.

### License

- See the file src/COPYING

### Upstream Contact

SYMPOW does not appear to be maintained any longer. Mark Watkins, the package author, now works at Magma. Previous (possibly still usable) email is [watkins@maths.usyd.edu.au](mailto:watkins@maths.usyd.edu.au)

New upstream: <https://gitlab.com/rezozer/forks/sympow>

### Dependencies

- GNU patch

### Special Update/Build Instructions

- Some of the code is very dubious, and it is anyone's guess really what the compiler does with it. For example, the following line exists in src/eulerfactors.c:

```
if ((HECKE) && (d==1)) return hecke_good(p,ap,m,v);
```

But since hecke\_good is defined as returning void, it's hard to know exactly how this code behaves. I would not be surprised by any bugs that might show up. I (David Kirkby) would personally not trust this code much at all.

- This is a difficult package to maintain. A GitHub issue (#9758) has been opened to implement Watkins-Delaunay's algorithm for computing modular degrees in Sage. Once implemented, it should be possible to remove this package.
- The package is configured such that the data files are in a directory below where 'sympow' is installed. If Sage is installed globally, then it will be impossible to create the data files without being root. This has been fixed in the Gentoo Linux distribution. Some information from Christopher can be seen on [GitHub issue #9703](#). This package will generate binary versions of all shipped datafiles, so these will work. However, creating totally new datafiles from scratch will not work.

### Type

standard

### Dependencies

- *pari*: Computer algebra system for fast computations in number theory

## Version Information

package-version.txt:

```
2.023.6
```

## Equivalent System Packages

arch:

```
$ sudo pacman -S sympow
```

conda:

```
$ conda install sympow
```

Debian/Ubuntu:

```
$ sudo apt-get install sympow
```

Fedora/Redhat/CentOS:

```
$ sudo yum install sympow
```

gentoo:

```
$ sudo emerge sci-mathematics/sympow
```

nix:

```
$ nix-env --install sympow
```

opensuse:

```
$ sudo zypper install sympow
```

void:

```
$ sudo xbps-install sympow
```

See <https://repology.org/project/sympow/versions>

If the system package is installed, ./configure will check if it can be used.

## 6.1.384 sympy: Python library for symbolic mathematics

### Description

SymPy is a Python library for symbolic mathematics. It aims to become a full-featured computer algebra system (CAS) while keeping the code as simple as possible in order to be comprehensible and easily extensible. SymPy is written entirely in Python and does not require any external libraries, except optionally for plotting support.

### Website

<https://sympy.org/>

### License

New BSD: <http://www.opensource.org/licenses/bsd-license.php>

### Upstream Contact

sympy mailinglist: <http://groups.google.com/group/sympy>

### Dependencies

- Python 2.5 or later

### Special Update/Build Instructions

- A simple script can be used to ease the updating of the SPKG. See the README.

### Type

standard

### Dependencies

- *mpmath: Pure Python library for multiprecision floating-point arithmetic*
- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

### Version Information

package-version.txt:

```
1.12
```

install-requires.txt:

```
sympy >=1.6, <2.0
```

## Equivalent System Packages

arch:

```
$ sudo pacman -S python-sympy
```

conda:

```
$ conda install sympy
```

Debian/Ubuntu:

```
$ sudo apt-get install python3-sympy
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-sympy
```

gentoo:

```
$ sudo emerge dev-python/sympy
```

macports: install the following packages: py-sympy

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-sympy
```

void:

```
$ sudo xbps-install python3-sympy
```

See <https://repology.org/project/python:sympy/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.385 tachyon: A ray tracing system

#### Description

Tachyon is a raytracer developed by John E. Stone. Tachyon supports the typical ray tracer features, most of the common geometric primitives, shading and texturing modes, etc. It also supports less common features such as HDR image output, ambient occlusion lighting, and support for various triangle mesh and volumetric texture formats beneficial for molecular visualization (e.g. rendering VMD scenes).

Currently not all of Tachyon's functionality is exported by the Sage interface.

### License

- <http://jedi.ks.uiuc.edu/~johns/raytracer/>
- <http://www.photonlimited.com/~johns/raytracer/>
- John Stone <[johns@ks.uiuc.edu](mailto:johns@ks.uiuc.edu)>

### Dependencies

This spkg depends on:

- libpng

### Special Update/Build Instructions

- Delete the scenes directory, which has lots of cool examples.
- Delete the msvc directory, which is also large and not used within Sage.
- The CVS subdirectories are currently (almost) empty, but should otherwise be deleted.
- The upstream files had strange permissions, i.e. some source files were executable, while almost all files weren't world-readable.
- There's seems to be some crap like `tachyon.html.tar.gz` and a few `.#*` files I haven't [yet] deleted, since they're not that large.
- TODO: Check whether building multi-threaded versions on MacOS X meanwhile works. (This was said to fail with an old beta.)
- TODO: Use `patch` instead of copying over pre-patched files.
- TODO: [Optionally] also install some of the documentation.
- TODO: I doubt the `CFLAGS` set for AIX and HP-UX won't get overridden by the created Makefile, but that's a minor issue. -leif

**Type**

standard

**Dependencies**

- *libpng*: Bitmap image support

**Version Information**

package-version.txt:

```
0.98.9.p7
```

**Equivalent System Packages**

## 6.1.387 terminado: Tornado websocket backend for the term.js Javascript terminal emulator library

### Description

This is a Tornado websocket backend for the term.js Javascript terminal emulator library.

It evolved out of pyxterm, which was part of GraphTerm (as lineterm.py), v0.57.0 (2014-07-18), and ultimately derived from the public-domain Ajaxterm code, v0.11 (2008-11-13) (also on Github as part of QWeb).

### Type

standard

### Dependencies

- *ptyprocess: Python interaction with subprocesses in a pseudoterminal*
- *tornado: Python web framework and asynchronous networking library*
- \$(PYTHON\_TOOLCHAIN)
- *hatchling: Modern, extensible Python build backend*
- \$(PYTHON)

### Version Information

package-version.txt:

```
0.17.0
```

install-requirements.txt:

```
terminado >=0.8.3
```

### Equivalent System Packages

conda:

```
$ conda install terminado
```

gentoo:

```
$ sudo emerge dev-python/terminado
```

macports: install the following packages: py-terminado

void:

$ sudo xbps-install python3-terminado
```

See <https://repology.org/project/terminado/versions>, <https://repology.org/project/python:terminado/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.388 texlive: A comprehensive TeX system

#### Description

TeX Live is an easy way to get up and running with the TeX document production system. It provides a comprehensive TeX system with binaries for most flavors of Unix, including GNU/Linux, and also Windows. It includes all the major TeX-related programs, macro packages, and fonts that are free software, including support for many languages around the world.

This package installs all texlive packages required to build Sage. If necessary, texlive itself is installed.

#### License

Various FSF-approved free software licenses. See <https://www.tug.org/texlive/copying.html> for details.

#### Upstream Contact

Home page: <https://www.tug.org/texlive>

#### Dependencies

- python

#### Special Update/Build Instructions

This package requires internet access to download texlive packages for the TeX mirrors.

#### Type

optional

#### Dependencies

#### Version Information

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.391 tides: Integration of ODEs

### Description

TIDES is a library for integration of ODEs with high precision.

### License

GPLv3+

### Upstream Contact

- Marcos Rodriguez ([marcos@unizar.es](mailto:marcos@unizar.es))

### Dependencies

- gcc
- mpfr
- gmp

## Special Update/Build Instructions

minc\_tides.patch changes the size of the name of the temporal files, so there is no problem in systems that use long names. Also solves a bug in the inverse function.

### Type

optional

### Dependencies

- \$(MP\_LIBRARY)
- *mpfr*: *Multiple-precision floating-point computations with correct rounding*

### Version Information

package-version.txt:

2.0.p0

### Equivalent System Packages

See <https://repology.org/project/tides/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.392 tinycss2: A tiny CSS parser

### Description

A tiny CSS parser

### License

### Upstream Contact

<https://pypi.org/project/tinycss2/>

### Type

standard

### Dependencies

- *webencodings*: Character encoding aliases for legacy web content
- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

### Version Information

package-version.txt:

```

```

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.394 topcom: Compute triangulations of point configurations and oriented matroids

#### Description

TOPCOM is a collection of clients to compute Triangulations Of Point Configurations and Oriented Matroids, resp.

The algorithms use only combinatorial data of the point configuration as is given by its oriented matroid. Some basic commands for computing and manipulating oriented matroids can also be accessed by the user.

It was very much inspired by the maple program PUNTOS, which was written by Jesus de Loera. TOPCOM is entirely written in C++, so there is a significant speed up compared to PUNTOS.

#### License

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

## 6.1.396 tox: tox is a generic virtualenv management and test command line tool

### Description

tox is a generic virtualenv management and test command line tool

### License

MIT

### Upstream Contact

<https://pypi.org/project/tox/>

### Type

standard

### Dependencies

- *cachetools: Extensible memoizing collections and decorators*
- *chardet: Universal encoding detector for Python 3*
- *colorama: Cross-platform colored terminal text.*
- *filelock: A platform independent file lock*
- *packaging: Core utilities for Python packages*
- *platformdirs: A small Python module for determining appropriate platform-specific dirs, e.g. a “user data dir”.*
- *pluggy: plugin and hook calling mechanisms for python*
- *pyproject\_api: API to interact with the python pyproject.toml based projects*
- *tomli: A lil’ TOML parser*
- *virtualenv: Virtual Python Environment builder*
- *\$(PYTHON\_TOOLCHAIN)*
- *\$(PYTHON)*

### Version Information

package-version.txt:

```
4.11.1
```

install-requirements.txt:

```
# see spkg-configure.m4
tox >= 4.2.7
```

## Equivalent System Packages

arch:

```
$ sudo pacman -S python-tox
```

conda:

```
$ conda install tox
```

Debian/Ubuntu:

```
$ sudo apt-get install tox
```

Fedora/Redhat/CentOS:

```
$ sudo yum install tox
```

freebsd:

```
$ sudo pkg install tox
```

gentoo:

```
$ sudo emerge dev-python/tox
```

homebrew:

```
$ brew install tox
```

macports: install the following packages: py-tox

slackware:

```
$ sudo slackpkg install tox
```

void:

```
$ sudo xbps-install tox
```

See <https://repology.org/project/python:tox/versions>

If the system package is installed, ./configure will check if it can be used.

### 6.1.397 traitlets: Traitlets Python configuration system

#### Description

Traitlets Python configuration system

## License

BSD

## Upstream Contact

<https://pypi.org/project/traitlets/>

## Type

standard

## Dependencies

- \$(PYTHON\_TOOLCHAIN)
- *ipython\_genutils*: Vestigial utilities from IPython
- *hatchling*: Modern, extensible Python build backend
- \$(PYTHON)

## Version Information

package-version.txt:

```
5.9.0
```

install-requires.txt:

```
traitlets >=4.3.3
```

## Equivalent System Packages

conda:

```
$ conda install traitlets
```

gentoo:

```
$ sudo emerge dev-python/traitlets
```

macports: install the following packages: py-traitlets

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-traitlets
```

void:

```
$ sudo xbps-install python3-traitlets
```

See <https://repology.org/project/traitlets/versions>, <https://repology.org/project/python:traitlets/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.398 `trove_classifiers`: Canonical source for classifiers on PyPI (pypi.org).

#### Description

Canonical source for classifiers on PyPI (pypi.org).

#### License

#### Upstream Contact

<https://pypi.org/project/trove-classifiers/>

#### Type

standard

#### Dependencies

- `$(PYTHON)`
- *calver*: *Setuptools extension for CalVer package versions*
- `$(PYTHON_TOOLCHAIN)`

#### Version Information

package-version.txt:

2023.8.7

install-requires.txt:

trove-classifiers

#### Equivalent System Packages

alpine:

```
$ apk add py3-trove-classifiers
```

arch:

```
$ sudo pacman -S python-trove-classifiers
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-trove-classifiers
```

freebsd:

```
$ sudo pkg install devel/py-trove-classifiers
```

gentoo:

```
$ sudo emerge dev-python/trove-classifiers
```

macports: install the following packages: py-trove-classifiers

If the system package is installed and if the (experimental) option –enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.

## 6.1.399 typing\_extensions: Backported and Experimental Type Hints for Python 3.5+

### Description

Backported and Experimental Type Hints for Python 3.5+

### License

PSF

### Upstream Contact

<https://pypi.org/project/typing-extensions/>

### Type

standard

### Dependencies

- *flit\_core*: Distribution-building parts of Flit. See *flit* package for more information
- \$(PYTHON)

### Version Information

package-version.txt:

```
4.7.1
```

install-requires.txt:

```
# According to https://github.com/python/typing_extensions/blob/main/CHANGELOG.md,
# version 4.4.0 adds another Python 3.11 typing backport
typing_extensions >= 4.4.0
```

### Equivalent System Packages

arch:

```
$ sudo pacman -S python-typing_extensions
```

conda:

```
$ conda install typing_extensions
```

Debian/Ubuntu:

```
$ sudo apt-get install python3-typing-extensions
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-typing_extensions
```

freebsd:

```
$ sudo pkg install devel/py-typing-extensions
```

gentoo:

```
$ sudo emerge dev-python/typing_extensions
```

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-typing_extensions
```

void:

```
$ sudo xbps-install python3-typing_extensions
```

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.400 tzdata: Provider of IANA time zone data

#### Description

Provider of IANA time zone data

## License

Apache-2.0

## Upstream Contact

<https://pypi.org/project/tzdata/>

## Type

standard

## Dependencies

- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

## Version Information

package-version.txt:

```
2022.6
```

install-requires.txt:

```
tzdata
```

## Equivalent System Packages

conda:

```
$ conda install tzdata
```

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

### 6.1.401 tzlocal: Python timezone information for the local timezone

#### Description

tzinfo object for the local timezone

### Type

standard

### Dependencies

- *pytz\_deprecation\_shim: Shims to make deprecation of pytz easier*
- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

### Version Information

package-version.txt:

```
5.0.1
```

install-requirements.txt:

```
tzlocal >=2.1
```

### Equivalent System Packages

arch:

```
$ sudo pacman -S python-tzlocal
```

conda:

```
$ conda install tzlocal
```

Debian/Ubuntu:

```
$ sudo apt-get install python3-tzlocal
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-tzlocal
```

freebsd:

```
$ sudo pkg install devel/py-tzlocal
```

gentoo:

```
$ sudo emerge dev-python/tzlocal
```

macports: install the following packages: py-tzlocal

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-tzlocal
```

void:

```
$ sudo xbps-install python3-tzlocal
```

See <https://repology.org/project/tzlocal/versions>, <https://repology.org/project/python:tzlocal/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

## 6.1.402 urllib3: HTTP library with thread-safe connection pooling, file post, and more.

### Description

HTTP library with thread-safe connection pooling, file post, and more.

### License

MIT

### Upstream Contact

<https://pypi.org/project/urllib3/>

### Type

standard

### Dependencies

- `$(PYTHON_TOOLCHAIN)`
- `$(PYTHON)`

### Version Information

package-version.txt:

```
1.26.12
```

install-requires.txt:

```
urllib3
```

### Equivalent System Packages

arch:

```
$ sudo pacman -S python-urllib3
```

conda:

```
$ conda install urllib3
```

Debian/Ubuntu:

```
$ sudo apt-get install python3-urllib3
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-urllib3
```

freebsd:

```
$ sudo pkg install net/py-urllib3
```

gentoo:

```
$ sudo emerge dev-python/urllib3
```

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-urllib3
```

void:

```
$ sudo xbps-install python3-urllib3
```

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.403 valgrind: Memory error detector, call graph generator, runtime profiler

#### Description

This is an optional spkg. It supports Linux on x86, x86-64, ppc, ppc64 and ARM as well as Darwin (Mac OS X 10.5 and 10.6) on x86 and x86-64.

Valgrind is an instrumentation framework for building dynamic analysis tools. There are Valgrind tools that can automatically detect many memory management and threading bugs, and profile your programs in detail. You can also use Valgrind to build new tools.

The Valgrind distribution currently includes six production-quality tools: a memory error detector, two thread error detectors, a cache and branch-prediction profiler, a call-graph generating cache and branch-prediction profiler, and a heap profiler. It also includes three experimental tools: a heap/stack/global array overrun detector, a second heap profiler that examines how heap blocks are used, and a SimPoint basic block vector generator. It runs on the following platforms: X86/Linux, AMD64/Linux, ARM/Linux, PPC32/Linux, PPC64/Linux, S390X/Linux, ARM/Android (2.3.x), X86/Darwin and AMD64/Darwin (Mac OS X 10.6 and 10.7).

## License

Valgrind is Open Source / Free Software, and is freely available under the GNU General Public License, version 2.

## Upstream Contact

- <http://www.valgrind.org/>
- valgrind-user, valgrind-devel mailing lists

## Dependencies

- None

## Special Build Instructions

- To build on OS X, you need to use Apple's compiler. FSF GCC is unsupported.

## Patches

- None.

## Type

experimental

## Dependencies

## Version Information

package-version.txt:

```
3.14.0
```

## Equivalent System Packages

alpine:

```
$ apk add valgrind
```

homebrew:

```
$ brew install valgrind
```

macports: install the following packages: valgrind

opensuse:

```
$ sudo zypper install valgrind
```

void:

```
$ sudo xbps-install valgrind
```

See <https://repology.org/project/valgrind/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

### 6.1.404 vcversioner: Python build system extension to obtain package version from version control

#### Description

Write a setup.py with no version information specified, and vcversioner will find a recent, properly-formatted VCS tag and extract a version from it.

#### License

Python Software Foundation License

#### Upstream Contact

Home page: <https://pypi.python.org/pypi/vcversioner/>

#### Dependencies

Python, Setuptools

#### Type

standard

#### Dependencies

- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

#### Version Information

package-version.txt:

```
2.16.0.0.p0
```

install-requires.txt:

```
vcversioner >=2.16.0.0
```

## Equivalent System Packages

conda:

```
$ conda install vcversioner
```

macports: install the following packages: py-vcversioner

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-vcversioner
```

See <https://repology.org/project/vcversioner/versions>, <https://repology.org/project/python:vcversioner/versions>

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see [github issue #27330](#)

## 6.1.405 virtualenv: Virtual Python Environment builder

### Description

Virtual Python Environment builder

### License

MIT

### Upstream Contact

<https://pypi.org/project/virtualenv/>

### Type

standard

### Dependencies

- *distlib: Distribution utilities*
- *filelock: A platform independent file lock*
- *platformdirs: A small Python module for determining appropriate platform-specific dirs, e.g. a “user data dir”.*
- \${PYTHON\_TOOLCHAIN}
- \${PYTHON}

## Version Information

package-version.txt:

```
20.24.4
```

install-requires.txt:

```
virtualenv
```

## Equivalent System Packages

conda:

```
$ conda install virtualenv
```

void:

```
$ sudo xbps-install python3-virtualenv
```

If the system package is installed, ./configure will check if it can be used.

## 6.1.406 wcwidth: Measures the displayed width of unicode strings in a terminal

### Description

Measures the displayed width of unicode strings in a terminal

### License

MIT

### Upstream Contact

<https://pypi.org/project/wcwidth/>

### Type

standard

### Dependencies

- \${PYTHON\_TOOLCHAIN}
- \${PYTHON}

## Version Information

package-version.txt:

```
0.2.5
```

install-requires.txt:

```
wcwidth >=0.1.7
```

## Equivalent System Packages

conda:

```
$ conda install wcwidth
```

gentoo:

```
$ sudo emerge dev-python/wcwidth
```

macports: install the following packages: py-wcwidth

opensuse:

```
$ sudo zypper install python3${{PYTHON_MINOR}}-wcwidth
```

void:

```
$ sudo xbps-install python3-wcwidth
```

See <https://repology.org/project/wcwidth/versions>, <https://repology.org/project/python:wctype/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.407 webencodings: Character encoding aliases for legacy web content

#### Description

Character encoding aliases for legacy web content.

#### License

BSD License

### Upstream Contact

Home Page: <https://github.com/gsnedders/python-webencodings>

### Dependencies

Python

#### Type

standard

### Dependencies

- \${PYTHON\_TOOLCHAIN}
- \${PYTHON}

### Version Information

package-version.txt:

```
0.5.1
```

install-requirements.txt:

```
webencodings >=0.5.1
```

### Equivalent System Packages

arch:

```
$ sudo pacman -S python-webencodings
```

conda:

```
$ conda install webencodings
```

Debian/Ubuntu:

```
$ sudo apt-get install python3-webencodings
```

Fedor/Redhat/CentOS:

```
$ sudo yum install python-webencodings
```

gentoo:

```
$ sudo emerge dev-python/webencodings
```

macports: install the following packages: py-webencodings

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-webencodings
```

void:

```
$ sudo xbps-install python3-webencodings
```

See <https://repology.org/project/python:webencodings/versions>

If the system package is installed and if the (experimental) option --enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.

## 6.1.408 wheel: A built-package format for Python

### Description

A built-package format for Python

### License

MIT

### Upstream Contact

<https://pypi.org/project/wheel/>

### Type

standard

### Dependencies

- *setuptools: Build system for Python packages*
- \${PYTHON}

### Version Information

package-version.txt:

```
0.41.2
```

install-requires.txt:

```
# :issue:`31050` - version constraint for macOS Big Sur support
wheel >=0.36.2
```

### Equivalent System Packages

arch:

```
$ sudo pacman -S python-wheel
```

conda:

```
$ conda install wheel
```

Debian/Ubuntu:

```
$ sudo apt-get install python3-wheel
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-wheel
```

gentoo:

```
$ sudo emerge dev-python/wheel
```

macports: install the following packages: py-wheel

opensuse:

```
$ sudo zypper install python3${PYTHON_MINOR}-wheel
```

void:

```
$ sudo xbps-install python3-wheel
```

See <https://repology.org/project/wheel/versions>, <https://repology.org/project/python:wheel/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.409 `widgetsnbextension`: Jupyter interactive widgets for Jupyter Notebook

#### Description

Jupyter interactive widgets for Jupyter Notebook

#### License

BSD 3-Clause License

## Upstream Contact

<https://pypi.org/project/widgetsnbextension/>

## Type

standard

## Dependencies

- *jupyter\_core*: Jupyter core package
- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

## Version Information

package-version.txt:

```
4.0.8
```

install-requires.txt:

```
widgetsnbextension
```

## Equivalent System Packages

arch:

```
$ sudo pacman -S jupyter-widgetsnbextension
```

conda:

```
$ conda install widgetsnbextension
```

Fedora/Redhat/CentOS:

```
$ sudo yum install python-widgetsnbextension
```

freebsd:

```
$ sudo pkg install devel/py-widgetsnbextension
```

gentoo:

```
$ sudo emerge dev-python/widgetsnbextension
```

macports: install the following packages: py-widgetsnbextension

opensuse:

```
$ sudo zypper install jupyter-widgetsnbextension
```

void:

```
$ sudo xbps-install python3-jupyter_widgetsnbextension
```

See <https://repology.org/project/python:widgetsnbextension/versions>, <https://repology.org/project/jupyter-widgetsnbextension/versions>, <https://repology.org/project/python:jupyter-widgetsnbextension/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.410 xz: General-purpose data compression software

#### Description

XZ Utils is free general-purpose data compression software with a high compression ratio.

#### License

Some parts public domain, other parts GNU LGPLv2.1, GNU GPLv2, or GNU GPLv3.

#### Upstream Contact

<http://tukaani.org/xz/>

#### Dependencies

##### Type

standard

#### Dependencies

#### Version Information

package-version.txt:

```
5.2.5
```

#### Equivalent System Packages

alpine:

```
$ apk add xz
```

conda:

```
$ conda install xz
```

cygwin:

```
$ apt-cyg install xz
```

Debian/Ubuntu:

```
$ sudo apt-get install xz-utils
```

Fedora/Redhat/CentOS:

```
$ sudo yum install xz
```

homebrew:

```
$ brew install xz
```

macports: install the following packages: xz

opensuse:

```
$ sudo zypper install xz
```

slackware:

```
$ sudo slackpkg install xz
```

void:

```
$ sudo xbps-install xz
```

See <https://repology.org/project/xz/versions>

If the system package is installed, ./configure will check if it can be used.

## 6.1.411 zeromq: A modern networking library

### Description

A modern networking library. Also known as 0mq or zmq. The same API is provided by <http://www.crossroads.io>, though we currently use the <http://www.zeromq.org> implementation.

### License

LGPLv3+

### Upstream Contact

<http://www.zeromq.org>

### Dependencies

A working compiler.

### Special Update/Build Instructions

N/A

### Type

standard

### Dependencies

### Version Information

package-version.txt:

```
4.3.5
```

### Equivalent System Packages

alpine:

```
$ apk add zeromq-dev
```

arch:

```
$ sudo pacman -S zeromq
```

conda:

```
$ conda install zeromq
```

cygwin:

```
$ apt-cyg install libzmq-devel
```

Debian/Ubuntu:

```
$ sudo apt-get install libzmq3-dev
```

Fedora/Redhat/CentOS:

```
$ sudo yum install zeromq zeromq-devel
```

freebsd:

```
$ sudo pkg install net/libzmq4
```

gentoo:

```
$ sudo emerge net-libs/zeromq
```

homebrew:

```
$ brew install zeromq
```

macports: install the following packages: zmq-devel

opensuse:

```
$ sudo zypper install "pkgconfig(libzmq)"
```

void:

```
$ sudo xbps-install zeromq-devel
```

See <https://repology.org/project/zeromq/versions>

If the system package is installed, ./configure will check if it can be used.

## 6.1.412 zipp: A pathlib-compatible zipfile object wrapper

### Description

A pathlib-compatible Zipfile object wrapper. A backport of the Path object.

### License

MIT License

### Upstream Contact

Home page: <https://github.com/jaraco/zipp>

### Dependencies

Python, Setuptools

### Type

standard

### Dependencies

- *vcversioner*: Python build system extension to obtain package version from version control
- \$(PYTHON\_TOOLCHAIN)
- \$(PYTHON)

### Version Information

package-version.txt:

```
3.11.0
```

install-requires.txt:

```
zipp >=0.5.2
```

### Equivalent System Packages

conda:

```
$ conda install zipp
```

gentoo:

```
$ sudo emerge dev-python/zipp
```

macports: install the following packages: py-zipp

void:

```
$ sudo xbps-install python3-zipp
```

See <https://repology.org/project/python:zipp/versions>

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.413 zlib: Data compression library

#### Description

Massively Spiffy Yet Delicately Unobtrusive Compression Library (Also Free, Not to Mention Unencumbered by Patents)

## License

- Modified BSD.

## Upstream Contact

- <http://www.zlib.net/>

## Special Update/Build Instructions

### Patches

- cygwin\_symbols.patch: remove undefined symbols on Cygwin.

### Type

standard

## Dependencies

### Version Information

package-version.txt:

```
1.2.11.p0
```

## Equivalent System Packages

alpine:

```
$ apk add zlib-dev
```

conda:

```
$ conda install zlib
```

cygwin:

```
$ apt-cyg install zlib-devel
```

Debian/Ubuntu:

```
$ sudo apt-get install libz-dev
```

Fedora/Redhat/CentOS:

```
$ sudo yum install zlib-devel
```

homebrew:

```
$ brew install zlib
```

macports: install the following packages: zlib

opensuse:

```
$ sudo zypper install "pkgconfig(zlib)"
```

slackware:

```
$ sudo slackpkg install zlib
```

void:

```
$ sudo xbps-install zlib-devel
```

See <https://repology.org/project/zlib/versions>

If the system package is installed, ./configure will check if it can be used.
