CHAPTER ONE

THE ASYMPTOTIC RING

The asymptotic ring, as well as its main documentation is contained in the module

- Asymptotic Ring.
Some common asymptotic expansions can be generated in

- *Common Asymptotic Expansions.*
Behind the scenes of working with asymptotic expressions a couple of additional classes and tools turn up. For instance the growth of each summand is managed in growth groups, see below.

### 3.1 Growth Groups

The growth of a summand of an asymptotic expression is managed in

- (Asymptotic) Growth Groups and
- Cartesian Products of Growth Groups.

### 3.2 Term Monoids

A summand of an asymptotic expression is basically a term out of the following monoid:

- (Asymptotic) Term Monoids.

### 3.3 Miscellaneous

Various useful functions and tools are collected in

- Asymptotic Expansions — Miscellaneous.
4.1 Asymptotic Ring

This module provides a ring (called AsymptoticRing) for computations with asymptotic expansions.

4.1.1 (Informal) Definition

An asymptotic expansion is a sum such as

$$5z^3 + 4z^2 + O(z)$$

as $$z \to \infty$$ or

$$3x^2y^2 + 7x^3y^3 + O(x^2) + O(y)$$

as $$x$$ and $$y$$ tend to $$\infty$$. It is a truncated series (after a finite number of terms), which approximates a function.

The summands of the asymptotic expansions are partially ordered. In this module these summands are the following:

- Exact terms $$c \cdot g$$ with a coefficient $$c$$ and an element $$g$$ of a growth group (see below).
- $$O(g)$$ (see Big O notation; also called Bachmann–Landau notation) for a growth group element $$g$$ (again see below).

See the Wikipedia article on asymptotic expansions for more details. Further examples of such elements can be found here.

Growth Groups and Elements

The elements of a growth group are equipped with a partial order and usually contain a variable. Examples—the order is described below these examples—are

- elements of the form $$z^q$$ for some integer or rational $$q$$ (growth groups with description strings $$z^{ZZ}$$ or $$z^{QQ}$$),
- elements of the form $$\log(z)^q$$ for some integer or rational $$q$$ (growth groups $$\log(z)^{ZZ}$$ or $$\log(z)^{QQ}$$),
- elements of the form $$a^z$$ for some rational $$a$$ (growth group $$QQ^z$$), or
- more sophisticated constructions like products $$x^r \cdot \log(x)^s \cdot a^y \cdot y^q$$ (this corresponds to an element of the growth group $$x^{QQ} \cdot \log(x)^{ZZ} \cdot QQ^y \cdot y^{QQ}$$).

The order in all these examples is induced by the magnitude of the elements as $$x$$, $$y$$, or $$z$$ (independently) tend to $$\infty$$. For elements only using the variable $$z$$ this means that $$g_1 \leq g_2$$ if

$$\lim_{z \to \infty} \frac{g_1}{g_2} \leq 1.$$
Asymptotic Expansions, Release 10.2

Note: Asymptotic rings where the variable tend to some value distinct from \(\infty\) are not yet implemented.

To find out more about

- growth groups,
- on how they are created and
- about the above used descriptions strings

see the top of the module *growth group*.

### 4.1.2 Introductory Examples

We start this series of examples by defining two asymptotic rings.

**Two Rings**

**A Univariate Asymptotic Ring**

First, we construct the following (very simple) asymptotic ring in the variable \(z\):

```sage
A.<z> = AsymptoticRing(growth_group='z^QQ', coefficient_ring=ZZ); A
Asymptotic Ring <z^QQ> over Integer Ring
```

A typical element of this ring is

```sage
A.an_element()
z^(3/2) + O(z^(1/2))
```

This element consists of two summands: the exact term with coefficient 1 and growth \(z^{3/2}\) and the \(O\)-term \(O(z^{1/2})\).

Note that the growth of \(z^{3/2}\) is larger than the growth of \(z^{1/2}\) as \(z \to \infty\), thus this expansion cannot be simplified (which would be done automatically, see below).

Elements can be created via the generator \(z\) and the function \(O()\), for example

```sage
4*z^2 + O(z)
```

**A Multivariate Asymptotic Ring**

Next, we construct a more sophisticated asymptotic ring in the variables \(x\) and \(y\) by

```sage
B.<x, y> = AsymptoticRing(growth_group='x^QQ * log(x)^ZZ * (QQ_+)^y * y^QQ', coefficient_ring=QQ); B
Asymptotic Ring <x^QQ * log(x)^ZZ * QQ^y * y^QQ> over Rational Field
```

Again, we can look at a typical (nontrivial) element:

```sage
B.an_element()
1/8*x^(3/2)*log(x)^3*(1/8)^y*y^(3/2) + O(x^(1/2)*log(x)*(1/2)^y*y^(1/2))
```

Again, elements can be created using the generators \(x\) and \(y\), as well as the function \(O()\):
Arithmetical Operations

In this section we explain how to perform various arithmetical operations with the elements of the asymptotic rings constructed above.

The Ring Operations Plus and Times

We start our calculations in the ring

```
sage: A
Asymptotic Ring <z^QQ> over Integer Ring
```

Of course, we can perform the usual ring operations `+` and `*`:

```
sage: z^2 + 3*z*(1-z)
-2*z^2 + 3*z

sage: (3*z + 2)^3
27*z^3 + 54*z^2 + 36*z + 8
```

In addition to that, special powers—our growth group $z^{\mathbb{Q}}$ allows the exponents to be out of $\mathbb{Q}$—can also be computed:

```
sage: (z^(5/2)+z^(1/7)) * z^(-1/5)
z^(23/10) + z^(-2/35)
```

The central concepts of computations with asymptotic expansions is that the $O$-notation can be used. For example, we have

```
sage: z^3 + z^2 + z + O(z^2)
z^3 + O(z^2)
```

where the result is simplified automatically. A more sophisticated example is

```
sage: (z+2*z^2+3*z^3+4*z^4) * (O(z)+z^2)
4*z^6 + O(z^5)
```

Division

The asymptotic expansions support division. For example, we can expand $1/(z - 1)$ to a geometric series:

```
sage: 1 / (z-1)
z^(-1) + z^(-2) + z^(-3) + z^(-4) + ... + z^(-20) + O(z^(-21))
```

A default precision (parameter `default_prec` of `AsymptoticRing`) is predefined. Thus, only the first 20 summands are calculated. However, if we only want the first 5 exact terms, we cut of the rest by using

```
sage: (1 / (z-1)).truncate(5)
z^(-1) + z^(-2) + z^(-3) + z^(-4) + 0(z^(-5))
```

4.1. Asymptotic Ring
Asymptotic Expansions, Release 10.2

or

\[
\text{sage: } \frac{1}{z-1} + O(z^{-6}) \\
\frac{z^{-1} + z^{-2} + z^{-3} + z^{-4} + z^{-5} + O(z^{-6})}{z^{-1}}
\]

Of course, we can work with more complicated expansions as well:

\[
\text{sage: } \frac{4z+1}{z^3+z^2+z+O(z^0)} \\
4z^{-2} - 3z^{-3} - z^{-4} + O(z^{-5})
\]

Not all elements are invertible, for instance,

\[
\text{sage: } \frac{1}{O(z)}
\]

Traceback (most recent call last):
...
ZeroDivisionError: Cannot invert O(z).

is not invertible, since it includes 0.

Powers, Exponentials and Logarithms

It works as simple as it can be; just use the usual operators \(^\), \(\exp\) and \(\log\). For example, we obtain the usual series expansion of the logarithm

\[
\text{sage: } -\log(1-1/z) \\
z^{-1} + \frac{1}{2}z^{-2} + \frac{1}{3}z^{-3} + \ldots + O(z^{-21})
\]

as \(z \to \infty\).

Similarly, we can apply the exponential function of an asymptotic expansion:

\[
\text{sage: } \exp(1/z) \\
1 + z^{-1} + \frac{1}{2}z^{-2} + \frac{1}{6}z^{-3} + \frac{1}{24}z^{-4} + \ldots + O(z^{-20})
\]

Arbitrary powers work as well; for example, we have

\[
\text{sage: } (1 + 1/z + O(1/z^5))^{1 + 1/z} \\
1 + z^{-1} + z^{-2} + \frac{1}{2}z^{-3} + \frac{1}{3}z^{-4} + O(z^{-5})
\]

Multivariate Arithmetic

Now let us move on to arithmetic in the multivariate ring

\[
\text{sage: } B \\
\text{Asymptotic Ring } \langle x^{QQ} \ast \log(x)^{ZZ} \ast QQ^{y} \ast y^{QQ} \rangle \text{ over Rational Field}
\]

Todo: write this part
4.1.3 More Examples

The mathematical constant $e$ as a limit

The base of the natural logarithm $e$ satisfies the equation

$$e = \lim_{n \to \infty} \left(1 + \frac{1}{n}\right)^n$$

By using asymptotic expansions, we obtain the more precise result

\[
\text{sage: } E.<n> = AsymptoticRing(growth_group='n^ZZ', coefficient_ring=SR, default_prec=5); E
\]
\[
\text{Asymptotic Ring } n^\text{ZZ} \text{ over Symbolic Ring}
\]
\[
\text{sage: } (1 + 1/n)^n \text{ e - 1/2*e*n^(-1) + 11/24*e*n^(-2) - 7/16*e*n^(-3) + 2447/5760*e*n^(-4) + O(n^(-5))}
\]

4.1.4 Selected Technical Details

Coercions and Functorial Constructions

The \texttt{AsymptoticRing} fully supports coercion. For example, the coefficient ring is automatically extended when needed:

\[
\text{sage: } A
\]
\[
\text{Asymptotic Ring } z^\text{QQ} \text{ over Integer Ring}
\]
\[
\text{sage: } (z + 1/2).parent()
\]
\[
\text{Asymptotic Ring } z^\text{QQ} \text{ over Rational Field}
\]

Here, the coefficient ring was extended to allow $1/2$ as a coefficient. Another example is

\[
\text{sage: } C.<c> = AsymptoticRing(growth_group='c^ZZ', coefficient_ring=ZZ['e'])
\]
\[
\text{sage: } C.an_element()
\]
\[
e^3*c^3 + O(c)
\]
\[
\text{sage: } C.an_element() / 7
\]
\[
1/7*e^3*c^3 + O(c)
\]

Here the result’s coefficient ring is the newly found

\[
\text{sage: } (C.an_element() / 7).parent()
\]
\[
\text{Asymptotic Ring } c^\text{ZZ} \text{ over Univariate Polynomial Ring in e over Rational Field}
\]

Not only the coefficient ring can be extended, but the growth group as well. For example, we can add/multiply elements of the asymptotic rings $A$ and $C$ to get an expansion of new asymptotic ring:

\[
\text{sage: } r = c*z + c/2 + O(z); r
\]
\[
c*z + 1/2*c + O(z)
\]
\[
\text{sage: } r.parent()
\]
\[
\text{Asymptotic Ring } c^\text{ZZ} * z^\text{QQ} \text{ over Univariate Polynomial Ring in e over Rational Field}
\]
Data Structures

The summands of an asymptotic expansion are wrapped growth group elements. This wrapping is done by the term monoid module. However, inside an asymptotic expansion these summands (terms) are stored together with their growth-relationship, i.e., each summand knows its direct predecessors and successors. As a data structure a special poset (namely a mutable poset) is used. We can have a look at this:

```python
sage: b = x^3*y + x^2*y + x*y^2 + O(x) + O(y)
sage: print(b.summands.repr_full(reverse=True))
poset(x^3*y^2, x^3*y, x^2*y^2, 0(x), 0(y))
    |    |    |    |    |    |
    |    |    |    +-- oo
    |    |      |    |    +-- no successors
    |    |      |    |    |    +-- predecessors: x*y^2, x^3*y
    |    |      +-- x*y^2
    |    |          |    |    |    +-- successors: oo
    |    |          |    |    |    |    +-- predecessors: 0(x), 0(y)
    |    +-- x^3*y
    |          |    |    |    +-- successors: oo
    |          |    |    |    |    +-- predecessors: x^2*y
    |          |    +-- x^2*y
    |              |    |    |    +-- successors: x^3*y
    |              |    |    |    |    +-- predecessors: 0(x), 0(y)
    +-- 0(x)
        |    |    |    |    |    |
        |    |    |    +-- successors: x*y^2, x^2*y
        |    |    |    |    +-- predecessors: null
        |    |    +-- 0(y)
        |          |    |    |    |    |
        |          |    |    |    +-- successors: x*y^2, x^2*y
        |          |    |    |    |    |    +-- predecessors: null
        +-- null
            |    |    |    |    |
            |    |    |    +-- successors: 0(x), 0(y)
            |    |    +-- no predecessors
```

4.1.6 Classes and Methods

class sage.rings.asymptotic.asymptotic_ring.AsymptoticExpansion(parent, summands, 
    simplify=True, convert=True)

Bases: CommutativeAlgebraElement

Class for asymptotic expansions, i.e., the elements of an AsymptoticRing.

INPUT:

- **parent** – the parent of the asymptotic expansion.
- **summands** – the summands as a MutablePoset, which represents the underlying structure.
- **simplify** – a boolean (default: True). It controls automatic simplification (absorption) of the asymptotic expansion.
- **convert** – a boolean (default: True). If set, then the summands are converted to the asymptotic ring (the parent of this expansion). If not, then the summands are taken as they are. In that case, the caller must ensure that the parent of the terms is set correctly.

EXAMPLES:

There are several ways to create asymptotic expansions; usually this is done by using the corresponding asymptotic rings:

```
sage: R_x.<x> = AsymptoticRing(growth_group='x^QQ', coefficient_ring=QQ); R_x
Asymptotic Ring <x^QQ> over Rational Field
sage: R_y.<y> = AsymptoticRing(growth_group='y^ZZ', coefficient_ring=ZZ); R_y
Asymptotic Ring <y^ZZ> over Integer Ring
```

At this point, \( x \) and \( y \) are already asymptotic expansions:

```
sage: type(x)
<class 'sage.rings.asymptotic.asymptotic_ring.AsymptoticRing_with_category.element_class'>
```

The usual ring operations, but allowing rational exponents (growth group \( x^\text{QQ} \)) can be performed:

```
sage: x^2 + 3*(x - x^(2/5))
x^2 + 3*x - 3*x^(2/5)
sage: (3*x^(1/3) + 2)^3
27*x + 54*x^(2/3) + 36*x^(1/3) + 8
```

One of the central ideas behind computing with asymptotic expansions is that the \( O \)-notation (see Wikipedia article Big_O_notation) can be used. For example, we have:

```
sage: (x+2*x^2+3*x^3+4*x^4) * (O(x)+x^2)
4*x^6 + O(x^5)
```

In particular, \( O() \) can be used to construct the asymptotic expansions. With the help of the `summands()`, we can also have a look at the inner structure of an asymptotic expansion:

```
sage: expr1 = x + 2*x^2 + 3*x^3 + 4*x^4; expr2 = O(x) + x^2
sage: print(expr1.summands.repr_full())
poset(x, 2*x^2, 3*x^3, 4*x^4)
  +-- null
  |   +-- no predecessors
```

(continues on next page)
In addition to the monomial growth elements from above, we can also compute with logarithmic terms (simply by constructing the appropriate growth group):

```python
sage: R_log = AsymptoticRing(growth_group='log(x)^QQ', coefficient_ring=QQ)
sage: lx = R_log(log(SR.var('x')))
sage: (O(lx) + lx^3)^4
log(x)^12 + O(log(x)^10)
```
See also:

\texttt{B(valid\_from=0)}

Convert all terms in this asymptotic expansion to \( B \)-terms.

INPUT:

- \texttt{valid\_from} – dictionary mapping variable names to lower bounds for the corresponding variable. The bound implied by this term is valid when all variables are at least their corresponding lower bound. If a number is passed to \texttt{valid\_from}, then the lower bounds for all variables of the asymptotic expansion are set to this number.

OUTPUT:

An asymptotic expansion.

EXAMPLES:

\begin{verbatim}
sage: AR.<x, z> = AsymptoticRing(growth_group='x^ZZ * z^ZZ', coefficient_ring=ZZ)
sage: AR.B(2*x^2, {x: 10})  # indirect doctest
B(2*x^2, x >= 10)
sage: expr = 42*x^42 + x^10 + AR.B(x^2, 20); expr  # indirect doctest
42*x^42 + x^10 + B(x^2, x >= 20, z >= 20)
sage: type(AR.B(x, 10))  # indirect doctest
<class 'sage.rings.asymptotic.asymptotic_ring.AsymptoticRing_with_category.element_class'>
sage: 2*z^3 + AR.B(5*z^2, {z: 20})  # indirect doctest
2*z^3 + B(5*z^2, z >= 20)
sage: (2*x).B({x: 20})
B(2*x, x >= 20)
sage: AR.B(4*x^2*z^3, valid\_from=10)  # indirect doctest
B(4*x^2*z^3, x >= 10, z >= 10)
sage: AR.B(42*x^2)  # indirect doctest
B(42*x^2, x >= 0, z >= 0)
\end{verbatim}

\texttt{O()}

Convert all terms in this asymptotic expansion to \( O \)-terms.

INPUT:

Nothing.

OUTPUT:

An asymptotic expansion.

EXAMPLES:

\begin{verbatim}
sage: AR.<x> = AsymptoticRing(growth_group='x^ZZ', coefficient_ring=ZZ)
sage: O(x)  # indirect doctest
O(x)
sage: type(O(x))
<class 'sage.rings.asymptotic.asymptotic_ring.AsymptoticRing_with_category.element_class'>
sage: expr = 42*x^42 + x^10 + O(x^2); expr  # indirect doctest
42*x^42 + x^10 + O(x^2)
\end{verbatim}

`sage.rings.power_series_ring.PowerSeriesRing()`  
`sage.rings.laurent_series_ring.LaurentSeriesRing()`.

**compare_with_values**(variable, function, values, rescaled=True, ring=Real Interval Field with 53 bits of precision)

Compute the (rescaled) difference between this asymptotic expansion and the given values.

**INPUT:**

- **variable** – an asymptotic expansion or a string.
- **function** – a callable or symbolic expression giving the comparison values.
- **values** – a list or iterable of values where the comparison shall be carried out.
- **rescaled** – (default: True) determines whether the difference is divided by the error term of the asymptotic expansion.
- **ring** – (default: RIF) the parent into which the difference is converted.

**OUTPUT:**

A list of pairs containing comparison points and (rescaled) difference values.

**EXAMPLES:**

```python
sage: assume(SR.an_element() > 0)
sage: A.<n> = AsymptoticRing('QQ^n * n^ZZ', SR)
sage: catalan = binomial(2*x, x)/(x+1)
sage: expansion = 4^n*(1/sqrt(pi)*n^(-3/2)
....: - 9/8/sqrt(pi)*n^(-5/2)
....: + 145/128/sqrt(pi)*n^(-7/2) + O(n^(-9/2)))
sage: expansion.compare_with_values(n, catalan, srange(5, 10))
[(5, 0.5303924444775?), (6, 0.5455279498787?), (7, 0.556880411050?), (8, 0.565710587724?), (9, 0.572775029098?)]
sage: expansion.exact_part().compare_with_values(n, catalan, [5, 10, 20])
Traceback (most recent call last):
... Not Implemented Error: exactly one error term required
sage: expansion.exact_part().compare_with_values(n, catalan, [5, 10, 20], rescaled=False)
[(5, 0.3886263699387?), (10, 19.1842458318?), (20, 931314.63637?)]
sage: expansion.compare_with_values(n, catalan, [5, 10, 20], rescaled=False, ring=SR)
[(5, 168/5*sqrt(5)/sqrt(pi) - 42), (10, 1178112/125*sqrt(10)/sqrt(pi) - 16796), (20, 650486218752/125*sqrt(5)/sqrt(pi) - 6564120420)]
```
Instead of a symbolic expression, a callable function can be specified as well:

```python
sage: A.<n> = AsymptoticRing('n^ZZ * log(n)^ZZ', SR)
sage: def H(n):
    ....: return sum(1/k for k in srange(1, n+1))
sage: H_expansion = (log(n) + euler_gamma + 1/(2*n)
    ....: - 1/(12*n^2) + O(n^-4))
sage: H_expansion.compare_with_values(n, H, srange(25, 30)) # rel tol 1e-6
[(25, -0.008326995?),
 (26, -0.008327472?),
 (27, -0.008327898?),
 (28, -0.008328287?),
 (29, -0.008328627?)]
sage: forget()
```

See also:

- `plot_comparison()`

**error_part()**

Return the expansion consisting of all error terms of this expansion.

**INPUT:**

Nothing

**OUTPUT:**

An asymptotic expansion.

**EXAMPLES:**

```python
sage: R.<x,y> = AsymptoticRing('x^QQ * log(x)^QQ * y^QQ', QQ)
sage: (x*log(x) + y^2 + O(x) + O(y)).error_part()
O(x) + O(y)
```

**exact_part()**

Return the expansion consisting of all exact terms of this expansion.

**INPUT:**

Nothing

**OUTPUT:**

An asymptotic expansion.

**EXAMPLES:**

```python
sage: R.<x> = AsymptoticRing('x^QQ * log(x)^QQ', QQ)
sage: (x^2 + O(x)).exact_part()
x^2
sage: (x + log(x)/2 + O(log(x)/x)).exact_part()
1/2*log(x) + x
```

**exp** (`precision=None`)

Return the exponential of (i.e., the power of $e$ to) this asymptotic expansion.

**INPUT:**

Nothing

**OUTPUT:**

An asymptotic expansion.
• precision – the precision used for truncating the expansion. If None (default value) is used, the
default precision of the parent is used.

OUTPUT:
An asymptotic expansion.

**Note:** The exponential function of this expansion can only be computed exactly if the respective growth
element can be constructed in the underlying growth group.

**ALGORITHM:**
If the corresponding growth can be constructed, return the exact exponential function. Otherwise, if this
term is \( o(1) \), try to expand the series and truncate according to the given precision.

**Todo:** As soon as \( L \)-terms are implemented, this implementation has to be adapted as well in order to
yield correct results.

**EXAMPLES:**

```python
sage: A.<x> = AsymptoticRing('(e^x)^ZZ * x^ZZ * log(x)^ZZ', SR)
sage: exp(x)  # e^x
sage: exp(2*x)  # (e^x)^2
sage: exp(x + log(x))  # e^x*x
sage: (x^(-1)).exp(precision=7)  # 1 + x^(-1) + 1/2*x^(-2) + 1/6*x^(-3) + ... + O(x^(-7))
```

**factorial()**
Return the factorial of this asymptotic expansion.

**OUTPUT:**
An asymptotic expansion.

**EXAMPLES:**

```python
sage: A.<n> = AsymptoticRing(growth_group='n^ZZ * log(n)^ZZ', coefficient_ring=ZZ, default_prec=5)
sage: n.factorial()  # sqrt(2)*sqrt(pi)*e^(n*log(n))*n^(-1/2) + 1/12*sqrt(2)*sqrt(pi)*e^(n*log(n))*n^(-1/2)
```

Catalan numbers \( \frac{1}{n+1} \binom{2n}{n} \):

Asymptotic Expansions, Release 10.2

\[ \frac{(2^n).factorial()}{n.factorial()^2 \cdot (n+1)} \quad \text{# long time} \]
\[ \frac{1}{\sqrt{\pi}} \cdot (e^n)^{2 \log(2)} \cdot n^{-3/2} \]
\[ - \frac{9}{8} \cdot \frac{1}{\sqrt{\pi}} \cdot (e^n)^{2 \log(2)} \cdot n^{-5/2} \]
\[ + \frac{145}{128} \cdot \frac{1}{\sqrt{\pi}} \cdot (e^n)^{2 \log(2)} \cdot n^{-7/2} \]
\[ + \text{O}((e^n)^{2 \log(2)} \cdot n^{-9/2}) \]

Note that this method substitutes the asymptotic expansion into Stirling’s formula. This substitution has to be possible which is not always guaranteed:

\[ S.<s> = \text{AsymptoticRing}(\text{growth_group}=\{'s^{\mathbb{Q} \cdot \log(s)^{\mathbb{Q}'}, \text{coefficient_}\rightarrow \mathbb{Q}, \text{default_prec}=4\}) \]
\[ S.log(s).factorial() \]

Traceback (most recent call last):
...
TypeError: Cannot apply the substitution rules \{s: \log(s)\} on
\[ \frac{1}{\sqrt{\pi}} \cdot (e^n)^{2 \log(2)} \cdot n^{-3/2} \]
\[ - \frac{9}{8} \cdot \frac{1}{\sqrt{\pi}} \cdot (e^n)^{2 \log(2)} \cdot n^{-5/2} \]
\[ + \frac{145}{128} \cdot \frac{1}{\sqrt{\pi}} \cdot (e^n)^{2 \log(2)} \cdot n^{-7/2} \]
\[ + \text{O}((e^n)^{2 \log(2)} \cdot n^{-9/2}) \]
over Symbolic Constants Subring.
...

See also:

\texttt{Stirling()}\]

\texttt{has_same_summands}(other)

Return whether this asymptotic expansion and other have the same summands.

INPUT:

* other – an asymptotic expansion.

OUTPUT:

A boolean.

\textbf{Note:} While for example \texttt{O(x) == O(x)} yields \texttt{False}, these expansions \textit{do} have the same summands and this method returns \texttt{True}.

Moreover, this method uses the coercion model in order to find a common parent for this asymptotic expansion and other.

**EXAMPLES:**

\[ S.R_{\mathbb{Z} \cdot \langle x_{\mathbb{Z} \cdot \rangle} = \text{AsymptoticRing}(\{'x^{\mathbb{Z} \cdot \rangle, \mathbb{Z})} \]
\[ S.R_{\mathbb{Q} \cdot \langle x_{\mathbb{Q} \cdot \rangle} = \text{AsymptoticRing}(\{'x^{\mathbb{Q} \cdot \rangle, \mathbb{Q})} \]
\[ S.sum(x_{\mathbb{Z} \cdot \langle} \text{for } k \text{ in range(5))} = S.sum(x_{\mathbb{Q} \cdot \langle} \text{for } k \text{ in range(5))} \quad \text{# } \]
\[ \text{\_} \]
\[ \text{\_} \]
\[ \text{\_} \]
\[ \text{\_} \]
\[ \text{\_} \]
\[ \text{\_} \]
\[ \text{\_} \]
\[ \text{\_} \]
\[ \text{\_} \]
\[ \text{\_} \]

\texttt{invert}(\texttt{precision}=None)

Return the multiplicative inverse of this element.

INPUT:
• **precision** – the precision used for truncating the expansion. If `None` (default value) is used, the default precision of the parent is used.

**OUTPUT:**
An asymptotic expansion.

---

**Warning:** Due to truncation of infinite expansions, the element returned by this method might not fulfill `e1 * ~e1 == 1`.

---

**Todo:** As soon as \( L \)-terms are implemented, this implementation has to be adapted as well in order to yield correct results.

---

**EXAMPLES:**

```python
sage: R.<x> = AsymptoticRing(growth_group='x^ZZ', coefficient_ring=QQ, default_prec=4)
sage: ~x
x^(-1)
sage: ~(x^42)
x^(-42)
sage: ex = ~(1 + x); ex
x^(-1) - x^(-2) + x^(-3) - x^(-4) + O(x^(-5))
sage: ex * (1+x)
1 + O(x^(-4))
sage: ~(1 + O(1/x))
1 + O(x^(-1))
```

---

**is_exact()**

Return whether all terms of this expansion are exact.

**OUTPUT:**
A boolean.

**EXAMPLES:**

```python
sage: A.<x> = AsymptoticRing('x^QQ * log(x)^QQ', QQ)
sage: (x^2 + O(x)).is_exact()
False
sage: (x^2 - x).is_exact()
True
```

---

**is_little_o_of_one()**

Return whether this expansion is of order \( o(1) \).

**INPUT:**
Nothing.

**OUTPUT:**
A boolean.

**EXAMPLES:**
sage: A.<x> = AsymptoticRing('x^ZZ * log(x)^ZZ', QQ)
sage: (x^4 * log(x)^(-2) + x^(1-4) * log(x)^2).is_little_o_of_one()
False
sage: (x^(-1) * log(x)^1234 + x^(-2) + O(x^(-3))).is_little_o_of_one()
True
sage: (log(x) - log(x-1)).is_little_o_of_one()
True

sage: A.<x, y> = AsymptoticRing('x^QQ * y^QQ * log(y)^ZZ', QQ)
sage: (x^(-1/16) * y^32 + x^32 * y^(-1/16)).is_little_o_of_one()
False
sage: (x^(-1) * y^(-3) + x^(-3) * y^(-1)).is_little_o_of_one()
True
sage: (x^(-1) * y / log(y)).is_little_o_of_one()
False
sage: (log(y-1)/log(y) - 1).is_little_o_of_one()
True

See also:

limit()

Compute the limit of this asymptotic expansion.

OUTPUT:
An element of the coefficient ring.

EXAMPLES:

sage: A.<s> = AsymptoticRing("s^ZZ", SR, default_prec=3)
sage: (3 + 1/s + O(1/s^2)).limit()
3
sage: ((1+1/s)^s).limit()
e
sage: (1/s).limit()
0
sage: (s + 3 + 1/s + O(1/s^2)).limit()
Traceback (most recent call last):
... ValueError: Cannot determine limit of s + 3 + s^(-1) + O(s^(-2))
sage: (O(s^0)).limit()
Traceback (most recent call last):
... ValueError: Cannot determine limit of 0(1)

See also:

is_little_o_of_one()

log(base=None, precision=None, locals=None)
The logarithm of this asymptotic expansion.

INPUT:

• base – the base of the logarithm. If None (default value) is used, the natural logarithm is taken.
• precision – the precision used for truncating the expansion. If None (default value) is used, the default precision of the parent is used.

• locals – a dictionary which may contain the following keys and values:
  – 'log' – value: a function. If not used, then the usual log is taken.

OUTPUT:
An asymptotic expansion.

**Note:** Computing the logarithm of an asymptotic expansion is possible if and only if there is exactly one maximal summand in the expansion.

**ALGORITHM:**
If the expansion has more than one summand, the asymptotic expansion for \( \log(1 + t) \) as \( t \) tends to 0 is used.

**Todo:** As soon as \( L \)-terms are implemented, this implementation has to be adapted as well in order to yield correct results.

**EXAMPLES:**

```sage
sage: R.<x> = AsymptoticRing(growth_group='x^ZZ * log(x)^ZZ', coefficient_˓→ring=QQ)
sage: log(x)
log(x)
sage: log(x^2)
2*log(x)
sage: log(x-1)
log(x) - x^(-1) - 1/2*x^(-2) - 1/3*x^(-3) - ... + O(x^(-21))
```

The coefficient ring is automatically extended if needed:

```sage
sage: R.<x> = AsymptoticRing(growth_group='x^ZZ * log(x)^ZZ', coefficient_˓→ring=ZZ, default_prec=3)
sage: (49*x^3-1).log()
3*log(x) + 2*log(7) - 1/49*x^(-3) - 1/4802*x^(-6) ... + O(x^(-12))
sage: _.parent()
Asymptotic Ring <x^ZZ * log(x)^ZZ> over Symbolic Ring
```

If one wants to avoid this extending to the Symbolic Ring, then the following helps:

```sage
sage: L.<log7> = ZZ[]
sage: def mylog(z, base=None):
    ....:     try:
    ....:         if ZZ(z).is_power_of(7):
    ....:             return log(ZZ(z), 7) * log7
    ....:     except (TypeError, ValueError):
    ....:         pass
    ....:     return log(z, base)
sage: R.<x> = AsymptoticRing(growth_group='x^ZZ * log(x)^ZZ', coefficient_˓→ring=L, default_prec=3)
```

(continues on next page)
A log-function can also be specified to always be used with the asymptotic ring:

```python
sage: R.<x> = AsymptoticRing(growth_group='x^ZZ * log(x)^ZZ', coefficient_ring=L, default_prec=3, locals={'log': mylog})
sage: log(49*x^3-1)
3*log(x) + 2*log7 - 1/49*x^(-3) - 1/4802*x^(-6) - 1/352947*x^(-9) + O(x^(-12))
```

**map_coefficients** *(f, new_coefficient_ring=None)*

Return the asymptotic expansion obtained by applying *f* to each coefficient of this asymptotic expansion.

**INPUT:**
- *f* – a callable. A coefficient *c* will be mapped to *f(c)*.
- *new_coefficient_ring* – (default: None) a ring.

**OUTPUT:**
An asymptotic expansion.

**EXAMPLES:**

```python
sage: A.<n> = AsymptoticRing(growth_group='n^ZZ', coefficient_ring=ZZ)
sage: a = n^4 + 2*n^3 + 3*n^2 + O(n)
sage: a.map_coefficients(lambda c: c+1)
2*n^4 + 3*n^3 + 4*n^2 + O(n)
sage: a.map_coefficients(lambda c: c-2)
-n^4 + n^2 + O(n)
```

**monomial_coefficient** *(monomial)*

Return the coefficient in the base ring of the given monomial in this expansion.

**INPUT:**
- *monomial* – a monomial element which can be converted into the asymptotic ring of this element

**OUTPUT:**
An element of the coefficient ring.

**EXAMPLES:**

```python
sage: R.<m, n> = AsymptoticRing("m^QQ\n^QQ", QQ)
sage: ae = 13 + 42/n + 2/n/m + O(n^-2)
sage: ae.monomial_coefficient(1/n)
42
sage: ae.monomial_coefficient(1/n^3)
0
sage: R.<n> = AsymptoticRing("n^QQ", ZZ)
sage: ae.monomial_coefficient(1/n)
42
sage: ae.monomial_coefficient(1)
13
```
plot_comparison((variable, function, values, rescaled=True, ring=Real Interval Field with 53 bits of precision, relative_tolerance=0.025, **kwargs))

Plot the (rescaled) difference between this asymptotic expansion and the given values.

INPUT:

- variable – an asymptotic expansion or a string.
- function – a callable or symbolic expression giving the comparison values.
- values – a list or iterable of values where the comparison shall be carried out.
- rescaled – (default: True) determines whether the difference is divided by the error term of the asymptotic expansion.
- ring – (default: RIF) the parent into which the difference is converted.
- relative_tolerance – (default: 0.025). Raise error when relative error exceeds this tolerance.

Other keyword arguments are passed to list_plot().

OUTPUT:

A graphics object.

Note: If rescaled (i.e. divided by the error term), the output should be bounded.

This method is mainly meant to have an easily usable plausibility check for asymptotic expansion created in some way.

EXAMPLES:

We want to check the quality of the asymptotic expansion of the harmonic numbers:

```sage
sage: A.<n> = AsymptoticRing('n^ZZ * log(n)^ZZ', SR)
sage: def H(n):
    ....:     return sum(1/k for k in srange(1, n+1))
sage: H_expansion = (log(n) + euler_gamma + 1/(2*n) - 1/(12*n^2) + O(n^-4))
sage: H_expansion.plot_comparison(n, H, srange(1, 30))
Graphics object consisting of 1 graphics primitive

Alternatively, the unscaled (absolute) difference can be plotted as well:

```sage
sage: H_expansion.plot_comparison(n, H, srange(1, 30), rescaled=False)
Graphics object consisting of 1 graphics primitive
```

Additional keywords are passed to list_plot():

```sage
sage: H_expansion.plot_comparison(n, H, srange(1, 30),
    ....:     plotjoined=True, marker='o',
    ....:     color='green')
Graphics object consisting of 1 graphics primitive
```

See also:

compare_with_values()
**pow**(exponent, precision=None)

Calculate the power of this asymptotic expansion to the given exponent.

**INPUT:**

- exponent – an element.
- precision – the precision used for truncating the expansion. If None (default value) is used, the default precision of the parent is used.

**OUTPUT:**

An asymptotic expansion.

**EXAMPLES:**

```python
sage: Q.<x> = AsymptoticRing(growth_group='x^QQ', coefficient_ring=QQ)
sage: x^(1/7)
x^1/7
sage: (x^(1/2) + O(x^0))^15
x^(15/2) + O(x^7)

sage: Z.<y> = AsymptoticRing(growth_group='y^ZZ', coefficient_ring=ZZ)
sage: y^(1/7)
y^1/7
sage: _.parent()
Asymptotic Ring <y^QQ> over Rational Field

sage: (y^2 + O(y))^(1/2)
y + O(1)
sage: (y^2 + O(y))^(-2)
y^(-4) + O(y^(-5))
sage: (1 + 1/y + O(1/y^3))^pi
1 + pi*y^(-1) + (1/2*pi*(pi - 1))*y^(-2) + O(y^(-3))

sage: B.<z> = AsymptoticRing(growth_group='z^QQ * log(z)^QQ', coefficient_ring=QQ)
sage: (z^2 + O(z))^(1/2)
z + O(1)

sage: A.<x> = AsymptoticRing('QQ^x * x^SR * log(x)^ZZ', QQ)
sage: x * 2^x
2^x*x
sage: 5^x * 2^x
10^x
sage: 2^log(x)
x^(log(2))
sage: 2^(x + 1/x)
2^x + log(2)*2^x*x^(-1) + 1/2*log(2)^2*2^x*x^(-2) + ... + O(2^x*x^(-20))

sage: C.<c> = AsymptoticRing(growth_group='QQ^c * c^QQ', coefficient_ring=QQ, default_prec=5)
sage: (3 + 1/c^2)*c
3*c + 1/3*3*c*c^(-1) + 1/18*3*c*c^(-2) - 4/81*3*c*c^(-3)
```

(continues on next page)
\[ - \frac{35}{1944} \times 3^c \times c^{(-4)} + O(3^c \times c^{(-5)}) \]

```
sage: _.parent()
Asymptotic Ring \(<\mathbb{Q}^c \times c^\mathbb{Q} \times \text{Signs}^c>\) over Rational Field
sage: (2 + (1/3)^c)^c
2^c + \frac{1}{2}(2/3)^c \times c + \frac{1}{8}(2/9)^c \times c^2 - \frac{1}{8}(2/9)^c \times c^c
+ \frac{1}{48}(2/27)^c \times c^3 + O((2/27)^c \times c^2)
sage: _.parent()
Asymptotic Ring \(<\mathbb{Q}^c \times c^\mathbb{Q} \times \text{Signs}^c>\) over Rational Field
```

**rpow**

Return the power of `base` to this asymptotic expansion.

**INPUT:**

- `base` – an element or `e`.
- `precision` – the precision used for truncating the expansion. If `None` (default value) is used, the default precision of the parent is used.
- `locals` – a dictionary which may contain the following keys and values:
  - `'log'` – value: a function. If not used, then the usual `log` is taken.

**OUTPUT:**

An asymptotic expansion.

**EXAMPLES:**

```
sage: A.<x> = AsymptoticRing('x^ZZ', QQ)
sage: (1/x).rpow('e', precision=5)
1 + x^(-1) + \frac{1}{2}x^(-2) + \frac{1}{6}x^(-3) + \frac{1}{24}x^(-4) + O(x^(-5))
```

**show()**

Pretty-print this asymptotic expansion.

**OUTPUT:**

Nothing, the representation is printed directly on the screen.

**EXAMPLES:**

```
sage: A.<x> = AsymptoticRing('QQ^x \times x^QQ \times \log(x)^QQ', SR.subring(no_˓→variables=True))
sage: (pi/2 * 5^x * x^(42/17) - sqrt(euler_gamma) * log(x)^(-7/8)).show()
1/2*pi*5^x*x^(42/17) - sqrt(euler_gamma)*log(x)^(-7/8)
```

**sqrt**

Return the square root of this asymptotic expansion.

**INPUT:**

- `precision` – the precision used for truncating the expansion. If `None` (default value) is used, the default precision of the parent is used.

**OUTPUT:**

An asymptotic expansion.

**EXAMPLES:**
sage: A.<s> = AsymptoticRing(growth_group='s^QQ', coefficient_ring=QQ)
sage: s.sqrt()
s^1/2
sage: a = (1 + 1/s).sqrt(precision=6); a
1 + 1/2*s^(-1) - 1/8*s^(-2) + 1/16*s^(-3) - 5/128*s^(-4) + 7/256*s^(-5) + O(s^(-6))

See also:

\texttt{pow()}, \texttt{rpow()}, \texttt{exp()}.

\textbf{\texttt{subs}(rules=\text{None}, domain=\text{None}, **\text{kwds})}

Substitute the given rules in this asymptotic expansion.

\textbf{INPUT:}

- \texttt{rules} – a dictionary.
- \texttt{kwds} – keyword arguments will be added to the substitution \texttt{rules}.
- \texttt{domain} – (default: \text{None}) a parent. The neutral elements 0 and 1 (rules for the keys '\_zero\_' and '\_one\_' see notebox below) are taken out of this domain. If \text{None}, then this is determined automatically.

\textbf{OUTPUT:}

An object.

\textbf{Note:} The neutral element of the asymptotic ring is replaced by the value to the key '\_zero\_'; the neutral element of the growth group is replaced by the value to the key '\_one\_'.

\textbf{EXAMPLES:}

sage: A.<x> = AsymptoticRing(growth_group='(e^x)^QQ * x^ZZ * log(x)^ZZ', coefficient_ring=QQ, default_prec=5)
sage: (e^x * x^2 + log(x)).subs(x=SR('s'))

See also:

sage.symbolic.expression.Expression.subs()

\texttt{substitute}(\texttt{rules}=None, \texttt{domain}=None, **\texttt{kwds})

Substitute the given \texttt{rules} in this asymptotic expansion.

\textbf{INPUT:}

- \texttt{rules} – a dictionary.
- \texttt{kwds} – keyword arguments will be added to the substitution \texttt{rules}.
- \texttt{domain} – (default: None) a parent. The neutral elements 0 and 1 (rules for the keys \\texttt{'_zero_' } and \\texttt{'_one_'} , see note box below) are taken out of this domain. If None, then this is determined automatically.

\textbf{OUTPUT:}

An object.

\textbf{Note:} The neutral element of the asymptotic ring is replaced by the value to the key \\texttt{'_zero_'} ; the neutral element of the growth group is replaced by the value to the key \\texttt{'_one_'} .

\textbf{EXAMPLES:}

\begin{verbatim}
sage: A.<x> = AsymptoticRing(growth_group=\texttt{'(e^x)^QQ * x^ZZ * log(x)^ZZ', })\texttt{˓→coefficient_ring=QQ, default_prec=5})

sage: (e^x * x^2 + log(x)).subs(x=RIF(pi))
229.534211738584?
sage: _.parent()
Real Interval Field with 53 bits of precision
```

See also:

```
sage.symbolic.expression.Expression.subs()
```

**property summands**

The summands of this asymptotic expansion stored in the underlying data structure (a `MutablePoset`).

**EXAMPLES:**

```
sage: R.<x> = AsymptoticRing(growth_group='x^ZZ', coefficient_ring=ZZ)
sage: expr = 7*x^12 + x^5 + O(x^3)
sage: expr.summands
poset(O(x^3), x^5, 7*x^12)
```

See also:

```
sage.data_structures.mutable_poset.MutablePoset
```

**symbolic_expression** (*R=None*)

Return this asymptotic expansion as a symbolic expression.

**INPUT:**

- `R` – (a subring of) the symbolic ring or `None`. The output will be an element of `R`. If `None`, then the symbolic ring is used.

**OUTPUT:**

A symbolic expression.

**EXAMPLES:**

```
sage: A.<x, y, z> = AsymptoticRing(growth_group='x^ZZ * y^QQ * log(y)^QQ * (QQ˓→+)^z * z^QQ', coefficient_ring=QQ)
sage: SR(A.an_element())  # indirect doctest
1/8*(1/8)^z*x^3*y^(3/2)*z^(3/2)*log(y)^(3/2) + Order((1/2)^z*x*sqrt(y)*sqrt(z)*sqrt(log(y)))
sage: A.<x, y, z> = AsymptoticRing(growth_group='x^ZZ * y^QQ * log(y)^QQ * (QQ˓→+)^z * z^QQ', coefficient_ring=QQ)
sage: SR(A.an_element())  # indirect doctest
1/8*(1/8)^z*x^3*y^(3/2)*z^(3/2)*log(y)^(3/2) + Order((1/2)^z*x*sqrt(y)*sqrt(z)*sqrt(log(y)))
```

**truncate** (*precision=None*)

Truncate this asymptotic expansion.

**INPUT:**

- `precision` – a positive integer or `None`. Number of summands that are kept. If `None` (default value) is given, then `default_prec` from the parent is used.

**OUTPUT:**

An asymptotic expansion.
Note: For example, truncating an asymptotic expansion with precision=20 does not yield an expansion with exactly 20 summands! Rather than that, it keeps the 20 summands with the largest growth, and adds appropriate $O$-Terms.

EXAMPLES:

```
sage: R.<x> = AsymptoticRing('x^ZZ', QQ)
sage: ex = sum(x^k for k in range(5)); ex
x^4 + x^3 + x^2 + x + 1
sage: ex.truncate(precision=2)
x^4 + x^3 + O(x^2)
sage: ex.truncate(precision=0)
O(x^4)
sage: ex.truncate()
x^4 + x^3 + x^2 + x + 1
```

variable_names()

Return the names of the variables of this asymptotic expansion.

OUTPUT:
A tuple of strings.

EXAMPLES:

```
sage: A.<m, n> = AsymptoticRing('QQ^m * m^QQ * n^ZZ * log(n)^ZZ', QQ)
sage: (4*2^m*m^4*log(n)).variable_names()
('m', 'n')
sage: (4*2^m*m^4).variable_names()
('m',)
sage: (4*log(n)).variable_names()
('n',)
sage: (4*m^3).variable_names()
('m',)
sage: (4*m^0).variable_names()
()
sage: (4*2^m*m^4 + log(n)).variable_names()
('m', 'n')
sage: (2^m + m^4 + log(n)).variable_names()
('m', 'n')
sage: (2^m + m^4).variable_names()
('m',)
```

class sage.rings.asymptotic.asymptotic_ring.AsymptoticRing(growth_group, coefficient_ring, category, default_prec, term_monoid_factory, locals)

Bases: Algebra, UniqueRepresentation, WithLocals

A ring consisting of asymptotic expansions.

INPUT:

- **growth_group** – either a partially ordered group (see (Asymptotic) Growth Groups) or a string describing such a growth group (see GrowthGroupFactory).
- **coefficient_ring** – the ring which contains the coefficients of the expansions.
• default_prec – a positive integer. This is the number of summands that are kept before truncating an infinite series.

• category – the category of the parent can be specified in order to broaden the base structure. It has to be a subcategory of Category of rings. This is also the default category if None is specified.

• term_monoid_factory – a TermMonoidFactory. If None, then DefaultTermMonoidFactory is used.

• locals – a dictionary which may contain the following keys and values:
  – 'log' – value: a function. If not given, then the usual log is taken. (See also AsymptoticExpansion.log().)

EXAMPLES:

We begin with the construction of an asymptotic ring in various ways. First, we simply pass a string specifying the underlying growth group:

```
sage: R1_x.<x> = AsymptoticRing(growth_group='x^QQ', coefficient_ring=QQ); R1_x
Asymptotic Ring <x^QQ> over Rational Field
sage: x
x
```

This is equivalent to the following code, which explicitly specifies the underlying growth group:

```
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: G_QQ = GrowthGroup('x^QQ')
sage: R2_x.<x> = AsymptoticRing(growth_group=G_QQ, coefficient_ring=QQ); R2_x
Asymptotic Ring <x^QQ> over Rational Field
```

Of course, the coefficient ring of the asymptotic ring and the base ring of the underlying growth group do not need to coincide:

```
sage: R_ZZ_x.<x> = AsymptoticRing(growth_group='x^QQ', coefficient_ring=ZZ); R_ZZ_x
Asymptotic Ring <x^QQ> over Integer Ring
```

Note, we can also create and use logarithmic growth groups:

```
sage: R_log = AsymptoticRing(growth_group='log(x)^ZZ', coefficient_ring=QQ); R_log
Asymptotic Ring <log(x)^ZZ> over Rational Field
```

Other growth groups are available. See Asymptotic Ring for more examples.

Below there are some technical details.

According to the conventions for parents, uniqueness is ensured:

```
sage: R1_x is R2_x
True
```

Furthermore, the coercion framework is also involved. Coercion between two asymptotic rings is possible (given that the underlying growth groups and coefficient rings are chosen appropriately):

```
sage: R1_x.has_coerce_map_from(R_ZZ_x)
True
```

Additionally, for the sake of convenience, the coefficient ring also coerces into the asymptotic ring (representing constant quantities):
It is possible to customize the terms in an asymptotic expansion:

```python
sage: from sage.rings.asymptotic.term_monoid import ExactTermMonoid, OTermMonoid
sage: from sage.rings.asymptotic.term_monoid import TermMonoidFactory
sage: class MyExactTermMonoid(ExactTermMonoid):
    ....: pass
sage: class MyOTermMonoid(OTermMonoid):
    ....: pass
sage: MyTermMonoid = TermMonoidFactory('MyTermMonoid',
    ....:     exact_term_monoid_class=MyExactTermMonoid,
    ....:     O_term_monoid_class=MyOTermMonoid)

sage: G = GrowthGroup('x^ZZ')
sage: A.<n> = AsymptoticRing(growth_group=G, coefficient_ring=QQ, term_monoid_factory=MyTermMonoid)
sage: a = A.an_element(); a
1/8*x^3 + O(x)
sage: for t in a.summands.elements_topological(reverse=True):
    ....: print(t, type(t))
1/8*x^3 <class '__main__.MyExactTermMonoid_with_category.element_class'>
O(x) <class '__main__.MyOTermMonoid_with_category.element_class'>
```

```python
static B(expression, valid_from=0)

"" Create a B-term.

INPUT:

- valid_from – dictionary mapping variable names to lower bounds for the corresponding variable. The bound implied by this term is valid when all variables are at least their corresponding lower bound. If a number is passed to valid_from, then the lower bounds for all variables of the asymptotic expansion are set to this number

OUTPUT:

A B-term

EXAMPLES:

```python
sage: A.<x> = AsymptoticRing(growth_group='x^ZZ * QQ^y', coefficient_ring=QQ)
sage: A.B(2*x^3, {x: 5})
B(2*x^3, x >= 5)
```
```

Element

alias of AsymptoticExpansion

change_parameter(**kwds)

Return an asymptotic ring with a change in one or more of the given parameters.

INPUT:

- growth_group – (default: None) the new growth group.
- coefficient_ring – (default: None) the new coefficient ring.
- category – (default: None) the new category.
- default_prec – (default: None) the new default precision.
OUTPUT:
An asymptotic ring.

EXAMPLES:

```sage
A = AsymptoticRing(growth_group='x^ZZ', coefficient_ring=ZZ)
sage: A.change_parameter(coefficient_ring=QQ)
Asymptotic Ring <x^ZZ> over Rational Field
```

**property coefficient_ring**

The coefficient ring of this asymptotic ring.

EXAMPLES:

```sage
AR = AsymptoticRing(growth_group='x^ZZ', coefficient_ring=ZZ)
sage: AR.coefficient_ring
Integer Ring
```

**coefficients_of_generating_function**

```sage`

Return the asymptotic growth of the coefficients of some generating function by means of Singularity Analysis.

INPUT:

- `function` – a callable function in one variable.
- `singularities` – list of dominant singularities of the function.
- `precision` – (default: None) an integer. If None, then the default precision of the asymptotic ring is used.
- `return_singular_expansions` – (default: False) a boolean. If set, the singular expansions are also returned.
- `error_term` – (default: None) an asymptotic expansion. If None, then this is interpreted as zero. The contributions of the coefficients are added to `error_term` during Singularity Analysis.

OUTPUT:

- If `return_singular_expansions=False`: An asymptotic expansion from this ring.
- If `return_singular_expansions=True`: A named tuple with components `asymptotic_expansion` and `singular_expansions`. The former contains an asymptotic expansion from this ring, the latter is a dictionary which contains the singular expansions around the singularities.

**Todo:** Make this method more usable by implementing the processing of symbolic expressions.

EXAMPLES:

Catalan numbers:

```sage
def catalan(z):
    ....:    return (1-(1-4*z)^(1/2))/(2*z)
sage: B.<n> = AsymptoticRing('QQ^n * n^QQ', QQ)
sage: B.coefficients_of_generating_function(catalan, (1/4,), precision=3)
1/sqrt(pi)*4^n*n^(-3/2) - 9/8/sqrt(pi)*4^n*n^(-5/2)
```

(continues on next page)
+ 145/128/sqrt(pi)*4^n*n^(-7/2) + O(4^n*n^(-4))

sage: B.coefficients_of_generating_function(catalan, (1/4,), precision=2, ...
....: return_singular_expansions=True)
SingularityAnalysisResult(asympotic_expansion=1/sqrt(pi)*4^n*n^(-3/2) - 9/8/sqrt(pi)*4^n*n^(-5/2) + O(4^n*n^(-3)),
singular_expansions={1/4: 2 - 2*T^(-1/2) + 2*T^(-1) - 2*T^(-3/2) + O(T^(-2))})

Unit fractions:

sage: def logarithmic(z):
....:     return -log(1-z)
sage: B.coefficients_of_generating_function(logarithmic, (1,), precision=5)
n^(-1) + O(n^(-3))

Harmonic numbers:

sage: def harmonic(z):
....:     return -log(1-z)/(1-z)
sage: B.<n> = AsymptoticRing('QQ^n * n^QQ * log(n)^QQ', QQ)
sage: ex = B.coefficients_of_generating_function(harmonic, (1,), precision=13);
˓→ex
log(n) + euler_gamma + 1/2*n^(-1) - 1/12*n^(-2) + 1/120*n^(-4) + O(n^(-6))
sage: ex.has_same_summands(asympotic_expansions.HarmonicNumber( .....: 'n', precision=5))
True

Warning: Once singular expansions around points other than infinity are implemented (github issue #20050), the output in the case return_singular_expansions will change to return singular expansions around the singularities.

In the following example, the result is an exact asymptotic expression for sufficiently large $n$ (i.e., there might be finitely many exceptional values). This is encoded by an $O(0)$ error term:

sage: def f(z):
....:     return z/(1-z)
sage: B.coefficients_of_generating_function(f, (1,), precision=3)
Traceback (most recent call last):
...
NotImplementedOZero: got 1 + O(0)
The error term $O(0)$ means $0$ for sufficiently large $n$.

In this case, we can manually intervene by adding an error term that suits us:

sage: B.coefficients_of_generating_function(f, (1,), precision=3, ...
....: error_term=O(n^(-100)))
1 + O(n^(-100))

construction()
Return the construction of this asymptotic ring.
OUTPUT:

A pair whose first entry is an asymptotic ring construction functor and its second entry the coefficient ring.

EXAMPLES:

```python
sage: A = AsymptoticRing(growth_group='x^ZZ * QQ^y', coefficient_ring=QQ)
sage: A.construction()
(AsymptoticRing<x^ZZ * QQ^y * Signs^y>, Rational Field)
```

See also:

Asymptotic Ring, AsymptoticRing, AsymptoticRingFunctor.

```python
create_summand(type, data=None, **kwds)
```

Create a simple asymptotic expansion consisting of a single summand.

INPUT:

- `type` – 'O' or 'exact'.
- `data` – the element out of which a summand has to be created.
- `growth` – an element of the `growth_group()`.
- `coefficient` – an element of the `coefficient_ring()`.

Note: Either `growth` and `coefficient` or `data` have to be specified.

OUTPUT:

An asymptotic expansion.

Note: This method calls the factory `TermMonoid` with the appropriate arguments.

EXAMPLES:

```python
sage: R = AsymptoticRing(growth_group='x^ZZ', coefficient_ring=ZZ)
sage: R.create_summand('O', x^2)
O(x^2)
sage: R.create_summand('exact', growth=x^456, coefficient=123)
123*x^456
sage: R.create_summand('exact', data=12*x^13)
12*x^13
```

```python
property default_prec
```

The default precision of this asymptotic ring.

This is the parameter used to determine how many summands are kept before truncating an infinite series (which occur when inverting asymptotic expansions).

EXAMPLES:

```python
sage: AR = AsymptoticRing(growth_group='x^ZZ', coefficient_ring=ZZ)
sage: AR.default_prec
20
```

(continues on next page)
sage: AR = AsymptoticRing('x^ZZ', ZZ, default_prec=123)
sage: AR.default_prec
123

**gen**(n=0)
Return the n-th generator of this asymptotic ring.

**INPUT:**
- n – (default: 0) a non-negative integer.

**OUTPUT:**
An asymptotic expansion.

**EXAMPLES:**

```python
sage: R.<x> = AsymptoticRing(growth_group='x^ZZ', coefficient_ring=ZZ)
sage: R.gen()
x
```

**gens()**
Return a tuple with generators of this asymptotic ring.

**INPUT:**
Nothing.

**OUTPUT:**
A tuple of asymptotic expansions.

**Note:** Generators do not necessarily exist. This depends on the underlying growth group. For example, monomial growth groups have a generator, and exponential growth groups do not.

**EXAMPLES:**

```python
sage: AR.<x> = AsymptoticRing(growth_group='x^ZZ', coefficient_ring=ZZ)
sage: AR.gens()
(x,)
sage: B.<y,z> = AsymptoticRing(growth_group='y^ZZ * z^ZZ', coefficient_ring=QQ)
sage: B.gens()
(y, z)
```

**property growth_group**
The growth group of this asymptotic ring.

**EXAMPLES:**

```python
sage: AR = AsymptoticRing(growth_group='x^ZZ', coefficient_ring=ZZ)
sage: AR.growth_group
Growth Group x^ZZ
```

**See also:**

*(Asymptotic) Growth Groups*
\texttt{ngens()}

Return the number of generators of this asymptotic ring.

\textbf{INPUT:}

Nothing.

\textbf{OUTPUT:}

An integer.

\textbf{EXAMPLES:}

\begin{verbatim}
sage: AR.<x> = AsymptoticRing(growth_group='x^ZZ', coefficient_ring=ZZ)
sage: AR.ngens()
1
\end{verbatim}

\texttt{some_elements()}

Return some elements of this term monoid.

See \texttt{TestSuite} for a typical use case.

\textbf{INPUT:}

Nothing.

\textbf{OUTPUT:}

An iterator.

\textbf{EXAMPLES:}

\begin{verbatim}
sage: from itertools import islice
sage: A = AsymptoticRing(growth_group='z^QQ', coefficient_ring=ZZ)
sage: tuple(islice(A.some_elements(), int(10)))
(z^(3/2) + O(z^(1/2)),
 0(z^(1/2)),
z^(3/2) + O(z^(-1/2)),
-z^(3/2) + O(z^(1/2)),
0(z^(-1/2)),
0(z^2),
z^6 + O(z^(1/2)),
-z^6 + O(z^(-1/2)),
0(z^2),
z^(3/2) + O(z^(-2)))
\end{verbatim}

\texttt{term_monoid(type)}

Return the term monoid of this asymptotic ring of specified \texttt{type}.

\textbf{INPUT:}

\begin{itemize}
  \item \texttt{type} – ‘O’ or ‘exact’, or an instance of an existing term monoid. See \texttt{TermMonoidFactory} for more details.
\end{itemize}

\textbf{OUTPUT:}

A term monoid object derived from \texttt{GenericTermMonoid}.

\textbf{EXAMPLES:}
Asymptotic Expansions, Release 10.2

```python
sage: AR = AsymptoticRing(growth_group='x^ZZ', coefficient_ring=ZZ)
sage: AR.term_monoid('exact')
Exact Term Monoid x^ZZ with coefficients in Integer Ring
sage: AR.term_monoid('O')
O-Term Monoid x^ZZ with implicit coefficients in Integer Ring
sage: AR.term_monoid(AR.term_monoid('exact'))
Exact Term Monoid x^ZZ with coefficients in Integer Ring
```

**property term_monoid_factory**

The term monoid factory of this asymptotic ring.

**EXAMPLES:**

```python
sage: AR = AsymptoticRing(growth_group='x^ZZ', coefficient_ring=ZZ)
sage: AR.term_monoid_factory
Term Monoid Factory 'sage.rings.asymptotic.term_monoid.DefaultTermMonoidFactory'
```

See also:

*(Asymptotic) Term Monoids*

**variable_names()**

Return the names of the variables.

**OUTPUT:**

A tuple of strings.

**EXAMPLES:**

```python
sage: A = AsymptoticRing(growth_group='x^ZZ * QQ^y', coefficient_ring=QQ)
sage: A.variable_names()
('x', 'y')
```

**class** `sage.rings.asymptotic.asymptotic_ring.AsymptoticRingFunctor` *(growth_group, default_prec=None, category=None, term_monoid_factory=None, locals=None, cls=None)*

**Bases:** `ConstructionFunctor`

A **construction functor** for **asymptotic rings**.

**INPUT:**

- `growth_group` – a partially ordered group (see `AsymptoticRing` or *(Asymptotic) Growth Groups* for details).
- `default_prec` – None (default) or an integer.
- `category` – None (default) or a category.
- `term_monoid_factory` – `AsymptoticRing` (default) or a derived class.

**EXAMPLES:**

```python
sage: AsymptoticRing(growth_group='x^ZZ', coefficient_ring=QQ).construction()  # indirect doctest
(AsymptoticRing<x^ZZ>, Rational Field)
```
merge(other)
    Merge this functor with other if possible.

    INPUT:
    • other – a functor.
    
    OUTPUT:
    A functor or None.

    EXAMPLES:

    sage: X = AsymptoticRing(growth_group='x^ZZ', coefficient_ring=QQ)
    sage: Y = AsymptoticRing(growth_group='y^ZZ', coefficient_ring=QQ)
    sage: F_X = X.construction()[0]
    sage: F_Y = Y.construction()[0]
    sage: F_X.merge(F_X)
    AsymptoticRing<x^ZZ>
    sage: F_X.merge(F_Y)
    AsymptoticRing<x^ZZ * y^ZZ>

    rank = 13

    exception sage.rings.asymptotic.asymptotic_ring.NoConvergenceError
        Bases: RuntimeError
        A special RuntimeError which is raised when an algorithm does not converge/stop.

4.2 Common Asymptotic Expansions

Asymptotic expansions in SageMath can be built through the asymptotic_expansions object. It contains generators for common asymptotic expressions. For example,

    sage: asymptotic_expansions.Stirling('n', precision=5)
    sqrt(2)*sqrt(pi)*e^(n*log(n))*(e^n)^(-1)*n^(1/2) +
    1/12*sqrt(2)*sqrt(pi)*e^(n*log(n))*(e^n)^(-1)*n^(-1/2) +
    1/288*sqrt(2)*sqrt(pi)*e^(n*log(n))*(e^n)^(-1)*n^(-3/2) +
    O(e^(n*log(n))*(e^n)^(-1)*n^(-5/2))

generates the first 5 summands of Stirling's approximation formula for factorials.

To construct an asymptotic expression manually, you can use the class AsymptoticRing. See asymptotic ring for more details and a lot of examples.

4.2.1 Classes and Methods

```python
class sage.rings.asymptotic.asymptotic_expansion_generators.AsymptoticExpansionGenerators
    Bases: SageObject

    A collection of constructors for several common asymptotic expansions.

    A list of all asymptotic expansions in this database is available via tab completion. Type
    “asymptotic_expansions.” and then hit tab to see which expansions are available.

    The asymptotic expansions currently in this class include:
    - HarmonicNumber()
    - Stirling()
    - log_Stirling()
    - Binomial_kn_over_n()
    - SingularityAnalysis()
    - ImplicitExpansion()
    - ImplicitExpansionPeriodicPart()
    - InverseFunctionAnalysis()

static Binomial_kn_over_n(var, k, precision=None, skip_constant_factor=False)

    Return the asymptotic expansion of the binomial coefficient $k\binom{n}{k}$.

    INPUT:
    - var – a string for the variable name.
    - k – a number or symbolic constant.
    - precision – (default: None) an integer. If None, then the default precision of the asymptotic ring is used.
```

40 Chapter 4. Asymptotic Expansions — Table of Contents
• skip_constant_factor – (default: False) a boolean. If set, then the constant factor \( \sqrt{\frac{k}{2\pi(k-1)}} \) is left out. As a consequence, the coefficient ring of the output changes from Symbolic Constants Subring (if False) to Rational Field (if True).

OUTPUT:
An asymptotic expansion.

EXAMPLES:

```
sage: asymptotic_expansions.Binomial_kn_over_n('n', k=2, precision=3)
1/sqrt(pi)*4^n*n^(-1/2)
- 1/8/sqrt(pi)*4^n*n^(-3/2)
+ 1/128/sqrt(pi)*4^n*n^(-5/2)
+ 0(4^n*n^(-7/2))
sage: _.parent()
Asymptotic Ring <QQ^n * n^QQ> over Symbolic Constants Subring
```

```
sage: asymptotic_expansions.Binomial_kn_over_n('n', k=3, precision=3)
1/2*sqrt(3)/sqrt(pi)*(27/4)^n*n^(-1/2)
- 7/144*sqrt(3)/sqrt(pi)*(27/4)^n*n^(-3/2)
+ 49/20736*sqrt(3)/sqrt(pi)*(27/4)^n*n^(-5/2)
+ 0((27/4)^n*n^(-7/2))
sage: _.parent()
Asymptotic Ring <(Symbolic Constants Subring)^n * n^QQ>
over Symbolic Constants Subring
```

```
sage: asymptotic_expansions.Binomial_kn_over_n('n', k=7/5, precision=3)
1/2*sqrt(7)/sqrt(pi)*(7/10*7^(2/5)*2^(3/5))^n*n^(-1/2)
- 13/112*sqrt(7)/sqrt(pi)*(7/10*7^(2/5)*2^(3/5))^n*n^(-3/2)
+ 169/12544*sqrt(7)/sqrt(pi)*(7/10*7^(2/5)*2^(3/5))^n*n^(-5/2)
+ 0((7/10*7^(2/5)*2^(3/5))^n*n^(-7/2))
sage: _.parent()
Asymptotic Ring <(Symbolic Constants Subring)^n * n^QQ>
over Symbolic Constants Subring
```

static HarmonicNumber(var, precision=None, skip_constant_summand=False)

Return the asymptotic expansion of a harmonic number.

INPUT:
• var – a string for the variable name.
• precision – (default: None) an integer. If None, then the default precision of the asymptotic ring is used.
• skip_constant_summand – (default: False) a boolean. If set, then the constant summand euler_gamma is left out. As a consequence, the coefficient ring of the output changes from Symbolic Constants Subring (if False) to Rational Field (if True).

OUTPUT:
An asymptotic expansion.

EXAMPLES:

```
sage: asymptotic_expansions.HarmonicNumber('n', precision=5)
log(n) + euler_gamma + 1/2*n^(-1) - 1/12*n^(-2) + 1/120*n^(-4) + O(n^(-6))
```

static ImplicitExpansion(var, phi, tau=None, precision=None)

Return the singular expansion for a function \( y(z) \) defined implicitly by \( y(z) = z \Phi(y(z)) \).

4.2. Common Asymptotic Expansions 41
The function $\Phi$ is assumed to be analytic around 0. Furthermore, $\Phi$ is not allowed to be an affine-linear function and we require $\Phi(0) \neq 0$.

Furthermore, it is assumed that there is a unique positive solution $\tau$ of $\Phi(\tau) - \tau \Phi'(\tau) = 0$.

All details are given in Chapter VI.7 of [FS2009].

**INPUT:**

- `var` – a string for the variable name.
- `phi` – the function $\Phi$. See the extended description for assumptions on $\Phi$.
- `tau` – (default: None) the fundamental constant described in the extended description. If None, then $\tau$ is determined automatically if possible.
- `precision` – (default: None) an integer. If None, then the default precision of the asymptotic ring is used.

**OUTPUT:**

An asymptotic expansion.

**Note:** In the given case, the radius of convergence of the function of interest is known to be $\rho = \tau / \Phi(\tau)$. Until github issue #20050 is implemented, the variable in the returned asymptotic expansion represents a singular element of the form $(1 - z/\rho)^{-1}$, for the variable $z \to \rho$.

**EXAMPLES:**

We can, for example, determine the singular expansion of the well-known tree function $T$ (which satisfies $T(z) = z \exp(T(z))$):

```python
sage: asymptotic_expansions.ImplicitExpansion('Z', phi=exp, precision=8)
```

```
1 - sqrt(2)*Z^(-1/2) + 2/3*Z^(-1) - 11/36*sqrt(2)*Z^(-3/2) + 43/135*Z^(-2) - 769/4320*sqrt(2)*Z^(-5/2) + 1768/8505*Z^(-3) + O(Z^(-7/2))
```

Another classical example in this context is the generating function $B(z)$ enumerating binary trees with respect to the number of inner nodes. The function satisfies $B(z) = z(1 + 2B(z) + B(z)^2)$, which can also be solved explicitly, yielding $B(z) = \frac{1 - \sqrt{1 - 4z}}{2z} - 1$. We compare the expansions from both approaches:

```python
sage: def B(z):
....:     return (1 - sqrt(1 - 4*z))/(2*z) - 1
sage: A.<Z> = AsymptoticRing('Z^QQ', QQ, default_prec=3)
sage: B((1-1/Z)/4)
```

```
1 - 2*Z^(-1/2) + 2*Z^(-1) - 2*Z^(-3/2) + 2*Z^(-2) - 2*Z^(-5/2) + O(Z^(-3))
```

```python
sage: asymptotic_expansions.ImplicitExpansion(Z, phi=lambda u: 1 + 2*u + u^2, ...
```

```
1 - 2*Z^(-1/2) + 2*Z^(-1) - 2*Z^(-3/2) + 2*Z^(-2) - 2*Z^(-5/2) + O(Z^(-3))
```

Neither $\tau$ nor $\Phi$ have to be known explicitly, they can also be passed symbolically:
Asymptotic Expansions, Release 10.2

sage: tau = var('tau')
sage: phi = function('phi')
sage: asymptotic_expansions.ImplicitExpansion('Z', phi=phi, tau=tau, precision=3)  # long time
tau + (-sqrt(2)*sqrt(-tau*phi(tau)^2/(2*tau*diff(phi(tau), tau)^2 - tau*phi(tau)*diff(phi(tau), tau, tau) - 2*phi(tau)*diff(phi(tau), tau))))*Z^(-1/2) + O(Z^(-1))

Note that we do not check whether a passed \(\tau\) actually satisfies the requirements. Only the first of the following expansions is correct:

sage: asymptotic_expansions.ImplicitExpansion('Z', phi=lambda u: 1 + 2*u + u^2, precision=5)  # correct expansion
1 - 2*Z^(-1/2) + 2*Z^(-1) - 2*Z^(-3/2) + O(Z^(-2))

sage: asymptotic_expansions.ImplicitExpansion('Z', phi=lambda u: 1 + 2*u + u^2, tau=2, precision=5)
Traceback (most recent call last):
...:
ZeroDivisionError: symbolic division by zero
sage: asymptotic_expansions.ImplicitExpansion('Z', phi=lambda u: 1 + 2*u + u^2, tau=3, precision=5)
3 - 4*I*sqrt(3)*Z^(-1/2) + 6*I*sqrt(3)*Z^(-3/2) + O(Z^(-2))

See also:

ImplicitExpansionPeriodicPart(), InverseFunctionAnalysis().

static ImplicitExpansionPeriodicPart(var, phi, period, tau=None, precision=None)

Return the singular expansion for the periodic part of a function \(y(z)\) defined implicitly by \(y(z) = z\Phi(y(z))\).

The function \(\Phi\) is assumed to be analytic around 0. Furthermore, \(\Phi\) is not allowed to be an affine-linear function and we require \(\Phi(0) \neq 0\). For an integer \(p\), \(\Phi\) is called \(p\)-periodic if we have \(\Psi(u^p) = \Phi(u)\) for a power series \(\Psi\) where \(p\) is maximal.

Furthermore, it is assumed that there is a unique positive solution \(\tau\) of \(\Phi(\tau) - \tau\Phi'\) \(= 0\).

If \(\Phi\) is \(p\)-periodic, then we have \(y(z) = zg(z^p)\). This method returns the singular expansion of \(g(z)\).

INPUT:

- var – a string for the variable name.
- phi – the function \(\Phi\). See the extended description for assumptions on \(\Phi\).
- period – the period of the function \(\Phi\). See the extended description for details.
- tau – (default: None) the fundamental constant described in the extended description. If None, then \(\tau\) is determined automatically if possible.
- precision – (default: None) an integer. If None, then the default precision of the asymptotic ring is used.

OUTPUT:

An asymptotic expansion.

Note: In the given case, the radius of convergence of the function of interest is known to be \(\rho = \tau/\Phi(\tau)\). Until github issue #20050 is implemented, the variable in the returned asymptotic expansion represents a
sage: asymptotic_expansions.ImplicitExpansionPeriodicPart('Z', phi=lambda u: u**2, period=2, precision=7)

sage: def g(z):
....: return (1 - sqrt(1 - 4*z))/(2*z)
sage: A.<Z> = AsymptoticRing('Z^QQ', QQ, default_prec=3)
sage: g((1 - 1/Z)/4)

2 - 2*Z^(-1/2) + 2*Z^(-1) - 2*Z^(-3/2) + 2*Z^(-2) - 2*Z^(-5/2) + O(Z^(-3))

static InverseFunctionAnalysis(var, phi, tau=None, period=1, precision=None)
Return the coefficient growth of a function \( y(z) \) defined implicitly by \( y(z) = z \Phi(y(z)) \).

The function \( \Phi \) is assumed to be analytic around 0. Furthermore, \( \Phi \) is not allowed to be an affine-linear function and we require \( \Phi(0) \neq 0 \). For an integer \( p \), \( \Phi \) is called \( p \)-periodic if we have \( \Psi(u^p) = \Phi(u) \) for a power series \( \Psi \) where \( p \) is maximal.

Furthermore, it is assumed that there is a unique positive solution \( \tau \) of \( \Phi(\tau) - \tau \Phi'(\tau) = 0 \).

INPUT:

- var – a string for the variable name.
- phi – the function \( \Phi \). See the extended description for assumptions on \( \Phi \).
- tau – (default: None) the fundamental constant described in the extended description. If None, then \( \tau \) is determined automatically if possible.
- period – (default: 1) the period of the function \( \Phi \). See the extended description for details.
- precision – (default: None) an integer. If None, then the default precision of the asymptotic ring is used.

OUTPUT:

An asymptotic expansion.

Note: It is not checked that the passed period actually fits to the passed function \( \Phi \).

The resulting asymptotic expansion is only valid for \( n \equiv 1 \mod p \), where \( p \) is the period. All other coefficients are 0.
EXAMPLES:

There are $C_n$ (the $n$-th Catalan number) different binary trees of size $2n + 1$, and there are no binary trees with an even number of nodes. The corresponding generating function satisfies $B(z) = z(1 + B(z)^2)$, which allows us to compare the asymptotic expansions for the number of binary trees of size $n$ obtained via $C_n$ and obtained via the analysis of $B(z)$:

```
sage: assume(SR.an_element() > 0)
sage: A.<n> = AsymptoticRing('QQ^n * n^QQ', SR)
sage: binomial_expansion = asymptotic_expansions.Binomial_kn_over_n(n, k=2, precision=3)
sage: catalan_expansion = binomial_expansion / (n+1)
sage: catalan_expansion.subs(n=(n-1)/2)
2*sqrt(1/2)/sqrt(pi)*2^n*n^(-3/2) - 3/2*sqrt(1/2)/sqrt(pi)*2^n*n^(-5/2)
+ 25/16*sqrt(1/2)/sqrt(pi)*2^n*n^(-7/2) + O(2^n*n^(-9/2))
sage: asymptotic_expansions.InverseFunctionAnalysis(n, phi=lambda u: 1 + u^2, tau=1, precision=8)
2*sqrt(1/2)/sqrt(pi)*2^n*n^(-3/2) - 3/2*sqrt(1/2)/sqrt(pi)*2^n*n^(-5/2)
+ 25/16*sqrt(1/2)/sqrt(pi)*2^n*n^(-7/2) + O(2^n*n^(-9/2))
sage: forget()
```

The code in the aperiodic case is more efficient, however. Therefore, it is recommended to use combinatorial identities to reduce to the aperiodic case. In the example above, this is well-known: we now count binary trees with $n$ internal nodes. The corresponding generating function satisfies $B(z) = z(1+2B(z)+B(z)^2)$:

```
sage: catalan_expansion
1/sqrt(pi)*4^n*n^(-3/2) - 9/8/sqrt(pi)*4^n*n^(-5/2)
+ 145/128/sqrt(pi)*4^n*n^(-7/2) + 0(4^n*n^(-9/2))
sage: asymptotic_expansions.InverseFunctionAnalysis(n, phi=lambda u: 1 + 2*u + u^2, tau=1, precision=8)
1/sqrt(pi)*4^n*n^(-3/2) - 9/8/sqrt(pi)*4^n*n^(-5/2)
+ 145/128/sqrt(pi)*4^n*n^(-7/2) + 0(4^n*n^(-9/2))
sage: forget()
```

* `ImplicitExpansion()`, `ImplicitExpansionPeriodicPart()`.

static `SingularityAnalysis(var, zeta=1, alpha=0, beta=0, delta=0, precision=None, normalized=True)`

Return the asymptotic expansion of the coefficients of an power series with specified pole and logarithmic singularity.

More precisely, this extracts the $n$-th coefficient

$$\left[ z^n \right] \left( \frac{1}{1 - z/\zeta} \right)^\alpha \left( \frac{1}{z/\zeta} \log \frac{1}{1 - z/\zeta} \right)^\beta \left( \frac{1}{z/\zeta} \log \left( \frac{1}{z/\zeta} \log \frac{1}{1 - z/\zeta} \right) \right)^\delta$$

(if normalized=True, the default) or

$$\left[ z^n \right] \left( \frac{1}{1 - z/\zeta} \right)^\alpha \left( \log \frac{1}{1 - z/\zeta} \right)^\beta \left( \log \left( \frac{1}{z/\zeta} \log \frac{1}{1 - z/\zeta} \right) \right)^\delta$$

(if normalized=False).

INPUT:
• var – a string for the variable name.
• zeta – (default: 1) the location of the singularity.
• alpha – (default: 0) the pole order of the singularity.
• beta – (default: 0) the order of the logarithmic singularity.
• delta – (default: 0) the order of the log-log singularity. Not yet implemented for delta != 0.
• precision – (default: None) an integer. If None, then the default precision of the asymptotic ring is used.
• normalized – (default: True) a boolean, see above.

OUTPUT:
An asymptotic expansion.

EXAMPLES:

```
sage: asymptotic_expansions.SingularityAnalysis('n', alpha=1)
1
sage: asymptotic_expansions.SingularityAnalysis('n', alpha=2)

\textbf{static Stirling}(\text{var, precision=None, skip_constant_factor=False}) \\
\text{Return Stirling's approximation formula for factorials.} \\
\text{INPUT: } \\
\text{• var -- a string for the variable name.}
• **precision** – (default: None) an integer ≥ 3. If None, then the default precision of the asymptotic ring is used.

• **skip_constant_factor** – (default: False) a boolean. If set, then the constant factor $\sqrt{2\pi}$ is left out. As a consequence, the coefficient ring of the output changes from Symbolic Constants Subring (if False) to Rational Field (if True).

**OUTPUT:**
An asymptotic expansion.

**EXAMPLES:**

```sage
sage: asymptotic_expansions.Stirling('n', precision=5)
sqrt(2)*sqrt(pi)*e^(n*log(n))*(e^n)^(-1)*n^(1/2) +
1/12*sqrt(2)*sqrt(pi)*e^(n*log(n))*(e^n)^(-1)*n^(-1/2) +
1/288*sqrt(2)*sqrt(pi)*e^(n*log(n))*(e^n)^(-1)*n^(-3/2) +
0(e^(n*log(n))*(e^n)^(-1)*n^(-5/2))
```

**sage:** `_.parent()`

Asymptotic Ring `<(e^(n*log(n)))^QQ * (e^n)^QQ * n^QQ * log(n)^QQ>`

over Symbolic Constants Subring

See also:

`log_Stirling()`, `factorial()`.

**static log_Stirling**(var, precision=None, skip_constant_summand=False)

Return the logarithm of Stirling’s approximation formula for factorials.

**INPUT:**

• **var** – a string for the variable name.

• **precision** – (default: None) an integer. If None, then the default precision of the asymptotic ring is used.

• **skip_constant_summand** – (default: False) a boolean. If set, then the constant summand $\log(2\pi)/2$ is left out. As a consequence, the coefficient ring of the output changes from Symbolic Constants Subring (if False) to Rational Field (if True).

**OUTPUT:**
An asymptotic expansion.

**EXAMPLES:**

```sage
sage: asymptotic_expansions.log_Stirling('n', precision=7)
n*log(n) - n + 1/2*log(n) + 1/2*log(2*pi) + 1/12*n^(-1) -
1/360*n^(-3) + 1/1260*n^(-5) + 0(n^(-7))
```

See also:

`Stirling()`, `factorial()`.

sage.rings.asymptotic.asymptotic_expansion_generators.asymptotic_expansions =
<sage.rings.asymptotic.asymptotic_expansion_generators.AsymptoticExpansionGenerators object>

A collection of several common asymptotic expansions.

This is an instance of `AsymptoticExpansionGenerators` whose documentation provides more details.
4.3 (Asymptotic) Growth Groups

This module provides support for (asymptotic) growth groups.

Such groups are equipped with a partial order: the elements can be seen as functions, and the behavior as their argument (or arguments) gets large (tend to $\infty$) is compared.

Growth groups are used for the calculations done in the asymptotic ring. There, take a look at the informal definition, where examples of growth groups and elements are given as well.

4.3.1 Description of Growth Groups

Many growth groups can be described by a string, which can also be used to create them. For example, the string '$x^{QQ} \cdot \log(x)^{ZZ} \cdot y^{QQ}$' represents a growth group with the following properties:

- It is a growth group in the two variables $x$ and $y$.
- Its elements are of the form
  \[ x^r \cdot \log(x)^s \cdot a^y \cdot y^q \]
  for $r \in \mathbb{Q}$, $s \in \mathbb{Z}$, $a \in \mathbb{Q}$ and $q \in \mathbb{Q}$.
- The order is with respect to $x \to \infty$ and $y \to \infty$ independently of each other.
- To compare such elements, they are split into parts belonging to only one variable. In the example above,
  \[ x^{r_1} \cdot \log(x)^{s_1} \leq x^{r_2} \cdot \log(x)^{s_2} \]
  if $(r_1, s_1) \leq (r_2, s_2)$ lexicographically. This reflects the fact that elements $x^r$ are larger than elements $\log(x)^s$ as $x \to \infty$. The factors belonging to the variable $y$ are compared analogously.

The results of these comparisons are then put together using the product order, i.e., $\leq$ if each component satisfies $\leq$.

Each description string consists of ordered factors—yes, this means * is noncommutative—of strings describing “elementary” growth groups (see the examples below). As stated in the example above, these factors are split by their variable; factors with the same variable are grouped. Reading such factors from left to right determines the order: Comparing elements of two factors (growth groups) $L$ and $R$, then all elements of $L$ are considered to be larger than each element of $R$.

4.3.2 Creating a Growth Group

For many purposes the factory GrowthGroup (see GrowthGroupFactory) is the most convenient way to generate a growth group.

```
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
```

Here are some examples:

```
sage: GrowthGroup('z^ZZ')
Growth Group z^ZZ
sage: M = GrowthGroup('z^QQ'); M
Growth Group z^QQ
```
Each of these two generated groups is a *MonomialGrowthGroup*, whose elements are powers of a fixed symbol (above 'z'). For the order of the elements it is assumed that \( z \to \infty \).

**Note:** Growth groups where the variable tend to some value distinct from \( \infty \) are not yet implemented.

To create elements of \( M \), a generator can be used:

```python
sage: z = M.gen()
sage: z^(3/5)
z^(3/5)
```

Strings can also be parsed:

```python
sage: M('z^7')
z^7
```

Similarly, we can construct logarithmic factors by:

```python
sage: GrowthGroup('log(z)^QQ')
Growth Group log(z)^QQ
```

which again creates a *MonomialGrowthGroup*. An *ExponentialGrowthGroup* is generated in the same way. Our factory gives

```python
sage: E = GrowthGroup('(QQ_+)^z'); E
Growth Group QQ^z
```

and a typical element looks like this:

```python
sage: E.an_element()
(1/2)^z
```

More complex groups are created in a similar fashion. For example

```python
sage: C = GrowthGroup('(QQ_+)^z * z^QQ * log(z)^QQ'); C
Growth Group QQ^z * z^QQ * log(z)^QQ
```

This contains elements of the form

```python
sage: C.an_element()
(1/2)^z z^(1/2) log(z)^(1/2)
```

The group \( C \) itself is a Cartesian product; to be precise a *UnivariateProduct*. We can see its factors:

```python
sage: C.cartesian_factors()
(Growth Group QQ^z, Growth Group z^QQ, Growth Group log(z)^QQ)
```

Multivariate constructions are also possible:

```python
sage: GrowthGroup('(x^QQ * y^QQ)')
Growth Group x^QQ * y^QQ
```

This gives a *MultivariateProduct*.

Both these Cartesian products are derived from the class *GenericProduct*. Moreover all growth groups have the abstract base class *GenericGrowthGroup* in common.
Some Examples

```python
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: G_x = GrowthGroup('x^ZZ'); G_x
Growth Group x^ZZ
sage: G_xy = GrowthGroup('x^ZZ * y^ZZ'); G_xy
Growth Group x^ZZ * y^ZZ
sage: G_xy.an_element()
x*y
sage: x = G_xy('x'); y = G_xy('y')
x^2
sage: elem = x^21*y^21; elem^2
x^42*y^42
```

A monomial growth group itself is totally ordered, all elements are comparable. However, this does not hold for Cartesian products:

```python
sage: e1 = x^2*y; e2 = x*y^2
sage: e1 <= e2 or e2 <= e1
False
```

In terms of uniqueness, we have the following behaviour:

```python
sage: GrowthGroup('x^ZZ * y^ZZ') is GrowthGroup('y^ZZ * x^ZZ')
True
```

The above is True since the order of the factors does not play a role here; they use different variables. But when using the same variable, it plays a role:

```python
sage: GrowthGroup('x^ZZ * log(x)^ZZ') is GrowthGroup('log(x)^ZZ * x^ZZ')
False
```

In this case the components are ordered lexicographically, which means that in the second growth group, \( \log(x) \) is assumed to grow faster than \( x \) (which is nonsense, mathematically). See \texttt{CartesianProduct} for more details or see above for a more extensive description.

Short notation also allows the construction of more complicated growth groups:

```python
sage: G = GrowthGroup('(QQ_+)^x * x^ZZ * log(x)^QQ * y^QQ')
```

4.3.3 Classes and Methods

class sage.rings.asymptotic.growth_group.AbstractGrowthGroupFunctor(var, domain)

Bases: ConstructionFunctor

A base class for the functors constructing growth groups.

INPUT:

• var – a string or list of strings (or anything else Variable accepts).

• domain – a category.

EXAMPLES:

sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: GrowthGroup('z^QQ').construction()[0] # indirect doctest
MonomialGrowthGroup[z]

See also:

merge(other)

Merge this functor with other of possible.

INPUT:

• other – a functor.

OUTPUT:

A functor or None.

EXAMPLES:

sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: F = GrowthGroup('(QQ_+)^t').construction()[0]

sage: G = GrowthGroup('t^QQ').construction()[0]

sage: F.merge(F)
ExponentialGrowthGroup[t]

sage: F.merge(G) is None
True

rank = 13

exception sage.rings.asymptotic.growth_group.DecreasingGrowthElementError(element, *args, **kwds)

Bases: ValueError

A special ValueError which is raised when a growth element is less than one.

INPUT:

• element – a GenericGrowthElement

The remaining arguments are passed on to ValueError.
class sage.rings.asymptotic.growth_group.ExponentialGrowthElement(parent, raw_element)

Bases: GenericGrowthElement

An implementation of exponential growth elements.

INPUT:

- `parent` – an ExponentialGrowthGroup.
- `raw_element` – an element from the base ring of the parent.

This raw_element is the base of the created exponential growth element.

An exponential growth element represents a term of the type $\text{base}^{\text{variable}}$. The multiplication corresponds to the multiplication of the bases.

EXAMPLES:

```
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: P = GrowthGroup('(ZZ_+)^x')
sage: e1 = P(1); e1
1
sage: e2 = P(raw_element=2); e2
2^x
sage: e1 == e2
False
sage: P.le(e1, e2)
True
sage: P.le(e1, P(1)) and P.le(P(1), e2)
True
```

property base

The base of this exponential growth element.

EXAMPLES:

```
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: P = GrowthGroup('(ZZ_+)^x')
sage: P(42^x).base
42
```

class sage.rings.asymptotic.growth_group.ExponentialGrowthGroup(base, *args, **kwds)

Bases: GenericGrowthGroup

A growth group dealing with expressions involving a fixed variable/symbol as the exponent.

The elements ExponentialGrowthElement of this group represent exponential functions with bases from a fixed base ring; the group law is the multiplication.

INPUT:

- `base` – one of SageMath’s parents, out of which the elements get their data (raw_element).

As exponential expressions are represented by this group, the elements in base are the bases of these exponentials.

- `var` – an object.

The string representation of var acts as an exponent of the elements represented by this group.

4.3. (Asymptotic) Growth Groups
• **category** – (default: `None`) the category of the newly created growth group. It has to be a subcategory of `Join of Category of groups` and `Category of posets`. This is also the default category if `None` is specified.

**EXAMPLES:**

```
sage: from sage.rings.asymptotic.growth_group import ExponentialGrowthGroup
sage: P = ExponentialGrowthGroup(QQ, 'x'); P
Growth Group QQ^x
```

See also:

- `GenericGrowthGroup`
- `DivisionRings` (alias of `DivisionRings`)
- `Element` (alias of `ExponentialGrowthElement`)
- `Groups` (alias of `Groups`)
- `Magmas` (alias of `Magmas`)
- `Posets` (alias of `Posets`)
- `Sets` (alias of `Sets`)

**construction()**

Return the construction of this growth group.

**OUTPUT:**

A pair whose first entry is an *exponential construction functor* and its second entry the base.

**EXAMPLES:**

```
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: GrowthGroup('(QQ_+)^x').construction()
(ExponentialGrowthGroup[x], Rational Field)
```

**classmethod factory(base, var, extend_by_non_growth_group=True, return_factors=False, **kwds)**

Create an exponential growth group.

This factory takes care of the splitting of the bases into their absolute values and arguments.

**INPUT:**

- `base`, `var`, keywords – use in the initialization of the exponential growth group; see `ExponentialGrowthGroup` for details.
- `extend_by_non_growth_group` – a boolean (default `True`). If set, then the growth group consists of two parts, one part dealing with the absolute values of the bases and one for their arguments.
- `return_factors` – a boolean (default: `False`). If set, then a tuple of the (cartesian) factors of this growth group is returned.
OUTPUT:
A growth group or tuple of growth groups.

EXAMPLES:

```
sage: from sage.rings.asymptotic.growth_group import ExponentialGrowthGroup
sage: ExponentialGrowthGroup.factory(QQ, 'n')
Growth Group QQ^n * Signs^n
```

gens()
Return a tuple of all generators of this exponential growth group.

INPUT:
Nothing.

OUTPUT:
An empty tuple.

EXAMPLES:

```
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: E = GrowthGroup('(ZZ_+)^x')
sage: E.gens()
() 
```

non_growth_group()
Return a non-growth group (with an argument group, e.g. roots of unity, as base) compatible with this exponential growth group.

OUTPUT:
A group group.

EXAMPLES:

```
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: GrowthGroup('(QQ_+)^x').non_growth_group()
Growth Group Signs^x
sage: GrowthGroup('(RR_+)^x').non_growth_group()
Growth Group Signs^x
sage: GrowthGroup('(RIF_+)^x').non_growth_group()
Growth Group Signs^x
sage: GrowthGroup('(RBF_+)^x').non_growth_group()
Growth Group Signs^x
sage: GrowthGroup('(CC_+)^x').non_growth_group()
Growth Group UU_RR^x
sage: GrowthGroup('(CIF_+)^x').non_growth_group()
Growth Group UU_RIF^x
sage: GrowthGroup('(CBF_+)^x').non_growth_group()
Growth Group UU_RBF^x
```

some_elements()
Return some elements of this exponential growth group.

See TestSuite for a typical use case.

INPUT:
class sage.rings.asymptotic.growth_group.ExponentialGrowthGroupFunctor(var)

    Bases: AbstractGrowthGroupFunctor

    A construction functor for exponential growth groups.

    INPUT:

    • var – a string or list of strings (or anything else Variable accepts).

    EXAMPLES:

    sage: from sage.rings.asymptotic.growth_group import GrowthGroup
    sage: tuple(GrowthGroup('(QQ_+)^z').some_elements())
    (1/2^z, 2^z, 1, 42^z, (2/3)^z, (3/2)^z, ...)

See also:

    Asymptotic Ring, AbstractGrowthGroupFunctor, MonomialGrowthGroupFunctor, sage.
    rings.asymptotic.asymptotic_ring.AsymptoticRingFunctor, sage.categories.pushout.
    ConstructionFunctor.

class sage.rings.asymptotic.growth_group.ExponentialNonGrowthElement(parent, raw_element)

    Bases: GenericNonGrowthElement, ExponentialGrowthElement

    An element of ExponentialNonGrowthGroup.

class sage.rings.asymptotic.growth_group.ExponentialNonGrowthGroup(base, *args, **kwds)

    Bases: GenericNonGrowthGroup, ExponentialGrowthGroup

    A growth group whose base is an argument group.

    EXAMPLES:

    sage: from sage.groups.misc_gps.argument_groups import RootsOfUnityGroup
    sage: from sage.rings.asymptotic.growth_group import ExponentialNonGrowthGroup
    sage: UU = ExponentialNonGrowthGroup(RootsOfUnityGroup(), 'n')
    sage: UU(-1)^n
    (-1)^n

    Element

    alias of ExponentialNonGrowthElement

    construction()

    Return the construction of this growth group.

    OUTPUT:

    A pair whose first entry is an ExponentialNonGrowthGroupFunctor and its second entry the base.
**Examples:**

```python
g = GrowthGroup('x^ZZ').an_element(); g
GrowthElement(x^2)
```

```python
g.parent() GrowthGroup(x^ZZ)
g.GrowthGroup(x^ZZ)
```

```python
g(*g).is_one() True
```

```python
factors() (x^2)
```

```python
is_one() False
```

```python
is_lt_one() False
```

### 4.3. (Asymptotic) Growth Groups

**Examples:**

```python
from sage.rings.asymptotic.growth_group import GrowthGroup
growth = GrowthGroup('x^ZZ').construction()
(ExponentialGrowthGroup[x], Group of Roots of Unity)
```

```python
class sage.rings.asymptotic.growth_group.ExponentialNonGrowthGroupFunctor(var)
Bases: ExponentialGrowthGroupFunctor
A construction functor for ExponentialNonGrowthGroup.

class sage.rings.asymptotic.growth_group.GenericGrowthElement(parent, raw_element)
Bases: MultiplicativeGroupElement
A basic implementation of a generic growth element.
Growth elements form a group by multiplication, and (some of) the elements can be compared to each other, i.e., all elements form a poset.

**Input:**

- `raw_element` – an element from the base of the parent.

**Examples:**

```python
from sage.rings.asymptotic.growth_group import GenericGrowthGroup, GenericGrowthElement
G = GenericGrowthGroup(ZZ)
g = GenericGrowthElement(G, 42); g
(GrowthElement(42), True)
```

```python
g.factors() (x^2)
```

```python
g.is_one() False
```

```python
g.is_lt_one() False
```

```python
g.is_lte_one() True
```

```python
GrowthGroup(ZZ)
```
Asymptotic Expansions, Release 10.2

OUTPUT:
A boolean.

EXAMPLES:

```python
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: G = GrowthGroup('x^ZZ'); x = G(x)
(sage: (x^42).is_lt_one()  # indirect doctest False
sage: (x^(-42)).is_lt_one()  # indirect doctest True
```

log(

Return the logarithm of this element.

INPUT:

• base – the base of the logarithm. If None (default value) is used, the natural logarithm is taken.

OUTPUT:
A growth element.

EXAMPLES:

```python
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: G = GrowthGroup('x^ZZ * log(x)^ZZ')
sage: x, = G.gens_monomial()
sage: log(x)  # indirect doctest log(x)
sage: log(x^5)  # indirect doctest Traceback (most recent call last):
... ArithmeticError: When calculating log(x^5) a factor 5 != 1 appeared, which is not contained in Growth Group x^ZZ * log(x)^ZZ.
sage: G = GrowthGroup('(QQ_+)^x * x^ZZ')
sage: x, = G.gens_monomial()
sage: el = x.rpow(2); el
2^x
sage: log(el)  # indirect doctest Traceback (most recent call last):
... ArithmeticError: When calculating log(2^x) a factor log(2) != 1 appeared, which is not contained in Growth Group QQ^x * x^ZZ.
sage: log(el, base=2)  # indirect doctest x
```

```
Unable to determine logarithmized factorization of
GenericGrowthElement(1) in abstract base class.
```
sage: x = GrowthGroup('x^ZZ').an_element()
sage: log(x)  # indirect doctest
Traceback (most recent call last):
...  
ArithmeticError: Cannot build log(x) since log(x) is not in Growth Group x^ZZ.

\textbf{log\_factor}(base=\text{None}, locals=\text{None})

Return the logarithm of the factorization of this element.

INPUT:

• base – the base of the logarithm. If \text{None} (default value) is used, the natural logarithm is taken.
• locals – a dictionary which may contain the following keys and values:
  – 'log' – value: a function. If not used, then the usual log is taken.

OUTPUT:

A tuple of pairs, where the first entry is a growth element and the second a multiplicative coefficient.

ALGORITHM:

This function factors the given element and calculates the logarithm of each of these factors.

EXAMPLES:

sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: G = GrowthGroup('(\mathbb{Q}_+)^x * x^ZZ * \log(x)^ZZ * y^ZZ * \log(y)^ZZ')
sage: x, y = G.gens_monomial()
sage: (x * y).log_factor()  # indirect doctest
((\log(x), 1), (\log(y), 1))
sage: (x^123).log_factor()  # indirect doctest
((\log(x), 123),)
sage: (G('2^x') * x^2).log_factor(base=2)  # indirect doctest
((x, 1), (\log(x), 2/\log(2)))

sage: G(1).log_factor()
()

sage: log(x).log_factor()  # indirect doctest
Traceback (most recent call last):
...  
ArithmeticError: Cannot build \log(\log(x)) since \log(\log(x)) is not in Growth Group \mathbb{Q}^x * x^ZZ * \log(x)^ZZ * y^ZZ * \log(y)^ZZ.

See also:

\texttt{factors()}, \texttt{log()}, \texttt{rpow(base)}

\textbf{rpow}(base)

Calculate the power of base to this element.

INPUT:

• base – an element.
OUTPUT:
A growth element.

EXAMPLES:

```
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: G = GrowthGroup('(QQ_+)^x * x^ZZ')
sage: x = G('x')
sage: x.rpow(2)  # indirect doctest
2^x
sage: x.rpow(1/2)  # indirect doctest
(1/2)^x
```

```
sage: x.rpow(0)  # indirect doctest
Traceback (most recent call last):
  ... ValueError: 0 is not an allowed base for calculating the power to x.
sage: (x^2).rpow(2)  # indirect doctest
Traceback (most recent call last):
  ... ArithmeticError: Cannot construct 2^(x^2) in Growth Group QQ^x * x^ZZ
>  *previous* TypeError: unsupported operand parent(s) for *:
   'Growth Group QQ^x * x^ZZ' and 'Growth Group ZZ^(x^2)'
```

```
sage: G = GrowthGroup('QQ^(x*log(x)) * x^ZZ * log(x)^ZZ')
sage: x = G('x')
sage: (x * log(x)).rpow(2)  # indirect doctest
2^(x*log(x))
```

```
sage: n = GrowthGroup('(QQ_+)^n * n^QQ')('n')
sage: n.rpow(2)
2^n
sage: _.parent()
Growth Group QQ^n * n^QQ
```

```
sage: n = GrowthGroup('QQ^n * n^QQ')('n')
sage: n.rpow(-2)
2^n*(-1)^n
```

variable_names()

Return the names of the variables of this growth element.

OUTPUT:
A tuple of strings.

EXAMPLES:

```
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: G = GrowthGroup('m^QQ')
sage: G('m^2').variable_names()
('m',)
sage: G('m^0').variable_names()
()```
class sage.rings.asymptotic.growth_group.GenericGrowthGroup(base, var, category)

Bases: UniqueRepresentation, Parent, WithLocals

A basic implementation for growth groups.

INPUT:

- **base** – one of SageMath’s parents, out of which the elements get their data (raw_element).
- **category** – (default: None) the category of the newly created growth group. It has to be a subcategory of Join of Category of groups and Category of posets. This is also the default category if None is specified.
- **ignore_variables** – (default: None) a tuple (or other iterable) of strings. The specified names are not considered as variables.

Note: This class should be derived for concrete implementations.

EXAMPLES:

```sage
sage: from sage.rings.asymptotic.growth_group import GenericGrowthGroup
sage: G = GenericGrowthGroup(ZZ); G
Growth Group Generic(ZZ)
```

See also:

MonomialGrowthGroup, ExponentialGrowthGroup

AdditiveMagmas

alias of AdditiveMagmas

CartesianProduct =
<sage.rings.asymptotic.growth_group_cartesian.CartesianProductFactory object>

Element

alias of GenericGrowthElement

Magmas

alias of Magmas

Posets

alias of Posets

Sets

alias of Sets

extended_by_non_growth_group()

Extend to a cartesian product of this growth group and a suitable non growth group.

OUTPUT:

A group group.

4.3. (Asymptotic) Growth Groups

61
Asymptotic Expansions, Release 10.2

EXAMPLES:

```
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: GrowthGroup('(QQ_+)^x').extended_by_non_growth_group()
Growth Group QQ^x * Signs^x
sage: GrowthGroup('(RR_+)^x').extended_by_non_growth_group()
Growth Group RR^x * Signs^x
sage: GrowthGroup('(RIF_+)^x').extended_by_non_growth_group()
Growth Group RIF^x * Signs^x
sage: GrowthGroup('(RBF_+)^x').extended_by_non_growth_group()
Growth Group RBF^x * Signs^x
sage: GrowthGroup('(CC_+)^x').extended_by_non_growth_group()
Growth Group CC^x * UU_RR^x
sage: GrowthGroup('(CIF_+)^x').extended_by_non_growth_group()
Growth Group CIF^x * UU_RIF^x
sage: GrowthGroup('(CBF_+)^x').extended_by_non_growth_group()
Growth Group CBF^x * UU_RBF^x
```

`gen(n=0)`

Return the $n$-th generator (as a group) of this growth group.

INPUT:

* $n$ – default: 0.

OUTPUT:

A `MonomialGrowthElement`.

EXAMPLES:

```
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: P = GrowthGroup('x^ZZ')
sage: P.gen()
x
```

```
sage: P = GrowthGroup('(QQ_+)^x')
sage: P.gen()
Traceback (most recent call last):
  ... IndexError: tuple index out of range
```

`gens()`

Return a tuple of all generators of this growth group.

INPUT:

Nothing.

OUTPUT:

A tuple whose entries are growth elements.

EXAMPLES:

```
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: P = GrowthGroup('x^ZZ')
sage: P.gens()
```

(continues on next page)
Asymptotic Expansions, Release 10.2

(x,
\sage: GrowthGroup('log(x)^ZZ').gens()
\(\log(x),\)

gens_monomial()
Return a tuple containing monomial generators of this growth group.
INPUT:
Nothing.
OUTPUT:
An empty tuple.

**Note:** A generator is called monomial generator if the variable of the underlying growth group is a valid identifier. For example, \(x^ZZ\) has \(x\) as a monomial generator, while \(\log(x)^ZZ\) or \(icecream(x)^ZZ\) do not have monomial generators.

is_compatible\(\text{(other)}\)
Return whether this growth group is compatible with \(\text{other}\) meaning that both are of the same type and have the same variables, but maybe a different base.

INPUT:
• \(\text{other}\) – a growth group

EXAMPLES:

\sage: from sage.rings.asymptotic.growth_group import ExponentialGrowthGroup,
\ => ExponentialNonGrowthGroup
\sage: from sage.groups.misc_gps.argument_groups import RootsOfUnityGroup
\sage: EQ = ExponentialGrowthGroup(QQ, 'n')
\sage: EZ = ExponentialGrowthGroup(ZZ, 'n')
\sage: UU = ExponentialNonGrowthGroup(RootsOfUnityGroup(), 'n')
\sage: for a in (EQ, EZ, UU):
\....: for b in (EQ, EZ, UU):
\....: print('{} is {}compatible with {}'.format(
\....: a, ' if a.is_compatible(b) else 'not ', b))
Growth Group QQ^n is compatible with Growth Group QQ^n
Growth Group QQ^n is compatible with Growth Group ZZ^n
Growth Group QQ^n is compatible with Growth Group UU^n
Growth Group ZZ^n is compatible with Growth Group QQ^n
Growth Group ZZ^n is compatible with Growth Group ZZ^n
Growth Group ZZ^n is not compatible with Growth Group UU^n
Growth Group UU^n is not compatible with Growth Group QQ^n
Growth Group UU^n is not compatible with Growth Group ZZ^n
Growth Group UU^n is compatible with Growth Group UU^n

le\(\text{(left, right)}\)
Return whether the growth of \(\text{left}\) is at most (less than or equal to) the growth of \(\text{right}\).

INPUT:
• \(\text{left}\) – an element.

4.3. (Asymptotic) Growth Groups 63
• right – an element.

OUTPUT:
A boolean.

Note: This function uses the coercion model to find a common parent for the two operands.

EXAMPLES:

```python
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
g: G = GrowthGroup('x^ZZ')
x = G.gen()
g: G.le(x, x^2)
True

sage: G.le(x^2, x)
False

sage: G.le(x^0, 1)
True
```

`ngens()`
Return the number of generators (as a group) of this growth group.

INPUT:
Nothing.

OUTPUT:
A Python integer.

EXAMPLES:

```python
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
P = GrowthGroup('x^ZZ')
P.ngens()
1

sage: GrowthGroup('log(x)^ZZ').ngens()
1

sage: P = GrowthGroup('(QQ_+)^x')
P.ngens()
0
```

`non_growth_group()`
Return a non-growth group compatible with this growth group.

OUTPUT:
A group group.

EXAMPLES:

```python
sage: from sage.rings.asymptotic.growth_group import GenericGrowthGroup
GenericGrowthGroup(ZZ, 'n').non_growth_group()
Traceback (most recent call last):
... NotImplementedError: only implemented in concrete realizations
```
some_elements()
Return some elements of this growth group.
See TestSuite for a typical use case.
INPUT:
Nothing.
OUTPUT:
An iterator.
EXAMPLES:
```
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
da: tuple(GrowthGroup(\'z^ZZ\').some_elements())
(1, z, z^(-1), z^2, z^(-2), z^3, z^(-3),
 z^4, z^(-4), z^5, z^(-5), ...
)
sage: tuple(GrowthGroup(\'z^QQ\').some_elements())
(z^(1/2), z^(-1/2), z^2, z^(-2),
 1, z, z^(-1), z^42,
z^(2/3), z^(-2/3), z^(3/2), z^(-3/2),
z^(4/5), z^(-4/5), z^(5/4), z^(-5/4), ...
)
```

variable_names()
Return the names of the variables of this growth group.
OUTPUT:
A tuple of strings.
EXAMPLES:
```
sage: from sage.rings.asymptotic.growth_group import GenericGrowthGroup
da: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: GenericGrowthGroup(ZZ).variable_names()
()  
```

4.3. (Asymptotic) Growth Groups
sage.rings.asymptotic.growth_group.GrowthGroup =
   <sage.rings.asymptotic.growth_group.GrowthGroupFactory object>

A factory for growth groups. This is an instance of GrowthGroupFactory whose
documentation provides more details.

class sage.rings.asymptotic.growth_group.GrowthGroupFactor(cls, base, var,
   extend_by_non_growth_group)

   Bases: tuple

   base
   Alias for field number 1

   cls
   Alias for field number 0

   extend_by_non_growth_group
   Alias for field number 3

   var
   Alias for field number 2

class sage.rings.asymptotic.growth_group.GrowthGroupFactory

   Bases: UniqueFactory

   A factory creating asymptotic growth groups.

   INPUT:
   - specification – a string.
   - keyword arguments are passed on to the growth group constructor. If the keyword
     ignore_variables is not specified, then ignore_variables=(‘e’,) (to ignore e as a variable name)
     is used.

   OUTPUT:
   An asymptotic growth group.

   Note: An instance of this factory is available as GrowthGroup.

   EXAMPLES:

   sage: from sage.rings.asymptotic.growth_group import GrowthGroup
   sage: GrowthGroup(‘x^ZZ’)
   Growth Group x^ZZ
   sage: GrowthGroup(‘log(x)^QQ’)
   Growth Group log(x)^QQ
   sage: GrowthGroup(‘x^ZZ * y^QQ’)
   Growth Group x^ZZ * y^QQ
   sage: GrowthGroup(‘(QQ_+)^x * x^ZZ * y^QQ * (QQ_+)^z’)
   Growth Group QQ^x * x^ZZ * y^QQ * QQ^z

   This factory can also be used to construct Cartesian products of growth groups:

   sage: GrowthGroup(‘x^ZZ * y^ZZ’)
   Growth Group x^ZZ * y^ZZ
   sage: GrowthGroup(‘x^ZZ * log(x)^ZZ’)
   Growth Group x^ZZ * log(x)^ZZ
   sage: GrowthGroup(‘x^ZZ * log(x)^ZZ + y^QQ’)
   Growth Group x^ZZ * log(x)^ZZ + y^QQ
   sage: GrowthGroup(‘(QQ_+)^x * x^ZZ * y^QQ + (QQ_+)^z’)
   Growth Group QQ^x * x^ZZ * y^QQ + QQ^z
sage: GrowthGroup('QQ^x * x^ZZ * y^QQ * QQ^z')
Growth Group QQ^x * x^ZZ * Signs^x * y^QQ * QQ^z * Signs^z
sage: GrowthGroup('exp(x)^ZZ * x^ZZ')
Growth Group exp(x)^ZZ * x^ZZ
sage: GrowthGroup('(e^x)^ZZ * x^ZZ')
Growth Group (e^x)^ZZ * x^ZZ

sage: GrowthGroup('QQ^n * n^ZZ')
Growth Group QQ^n * n^ZZ * Signs^n
sage: GrowthGroup('(QQ_+)^n * n^ZZ * UU^n')
Growth Group QQ^n * n^ZZ * UU^n
sage: GrowthGroup('(QQ_+)^n * n^ZZ')
Growth Group QQ^n * n^ZZ

create_key_and_extra_args(specification, **kwds)
Given the arguments and keyword, create a key that uniquely determines this object.

create_object(version, factors, **kwds)
Create an object from the given arguments.

class sage.rings.asymptotic.growth_group.MonomialGrowthElement(parent, raw_element)
Bases: GenericGrowthElement
An implementation of monomial growth elements.

INPUT:

• parent – a MonomialGrowthGroup.
• raw_element – an element from the base ring of the parent.

This raw_element is the exponent of the created monomial growth element.

A monomial growth element represents a term of the type \text{variable}^{\text{exponent}}. The multiplication corresponds to the addition of the exponents.

EXAMPLES:

sage: from sage.rings.asymptotic.growth_group import MonomialGrowthGroup
sage: P = MonomialGrowthGroup(ZZ, 'x')
sage: e1 = P(1); e1
\text{1}
sage: e2 = P(raw_element=2); e2
x^2
sage: e1 == e2
False

(continues on next page)
sage: P.le(e1, e2)
True
sage: P.le(e1, P.gen()) and P.le(P.gen(), e2)
True

**property exponent**

The exponent of this growth element.

**EXAMPLES:**

```python
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: P = GrowthGroup('x^ZZ')
sage: P(x^42).exponent
42
```

**class** `sage.rings.asymptotic.growth_group.MonomialGrowthGroup(base, var, category)`

Bases: `GenericGrowthGroup`

A growth group dealing with powers of a fixed object/symbol.

The elements `MonomialGrowthElement` of this group represent powers of a fixed base; the group law is the multiplication, which corresponds to the addition of the exponents of the monomials.

**INPUT:**

- `base` – one of SageMath’s parents, out of which the elements get their data (raw_element).
  
  As monomials are represented by this group, the elements in `base` are the exponents of these monomials.
- `var` – an object.
  
  The string representation of `var` acts as a base of the monomials represented by this group.
- `category` – (default: None) the category of the newly created growth group. It has to be a subcategory of `Join of Category of groups and Category of posets`. This is also the default category if None is specified.

**EXAMPLES:**

```python
sage: from sage.rings.asymptotic.growth_group import MonomialGrowthGroup
sage: P = MonomialGrowthGroup(ZZ, 'x'); P
Growth Group x^ZZ
sage: P(x^42) * P(x^2)
(x^44)
```

See also:

- `GenericGrowthGroup`
- `AdditiveMagmas`
  
  alias of `AdditiveMagmas`
- `Element`
  
  alias of `MonomialGrowthElement`
- `Magmas`
  
  alias of `Magmas`
**Posets**

alias of **Posets**

**Sets**

alias of **Sets**

**construction()**

Return the construction of this growth group.

**OUTPUT:**

A pair whose first entry is a *monomial construction functor* and its second entry the base.

**EXAMPLES:**

```
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: GrowthGroup('x^ZZ').construction()
(MonomialGrowthGroup[x], Integer Ring)
```

**classmethod factory**(base, var, extend_by_non_growth_group=False, return_factors=False, **kwds)

Create a monomial growth group.

**INPUT:**

- base, var, keywords – use in the initialization of the exponential growth group; see **MonomialGrowthGroup** for details.
- extend_by_non_growth_group – a boolean (default False). If set, then the growth group consists of two parts, one part dealing with the absolute values of the bases and one for their arguments.
- return_factors – a boolean (default: False). If set, then a tuple of the (cartesian) factors of this growth group is returned.

**OUTPUT:**

A growth group or tuple of growth groups.

**EXAMPLES:**

```
sage: from sage.rings.asymptotic.growth_group import MonomialGrowthGroup
sage: from sage.groups.misc_gps.imaginary_groups import ImaginaryGroup
sage: MonomialGrowthGroup.factory(ZZ, 'n')
Growth Group n^ZZ
sage: MonomialGrowthGroup.factory(ImaginaryGroup(ZZ), 'n')
Growth Group n^(ZZ*I)
```

**gens_logarithmic()**

Return a tuple containing logarithmic generators of this growth group.

**INPUT:**

Nothing.

**OUTPUT:**

A tuple containing elements of this growth group.

**Note:** A generator is called logarithmic generator if the variable of the underlying growth group is the logarithm of a valid identifier. For example, $x^{\mathbb{Z}}$ has no logarithmic generator, while $\log(x)^{\mathbb{Z}}$ has $\log(x)$ as logarithmic generator.

---

4.3. (Asymptotic) Growth Groups 69
gens_monomial()

Return a tuple containing monomial generators of this growth group.

INPUT:
Nothing.

OUTPUT:
A tuple containing elements of this growth group.

Note: A generator is called monomial generator if the variable of the underlying growth group is a valid identifier. For example, \(x^{\mathbb{Z}}\) has \(x\) as a monomial generator, while \(\log(x)^{\mathbb{Z}}\) or \(\text{icecream}(x)^{\mathbb{Z}}\) do not have monomial generators.

non_growth_group()

Return a non-growth group (with an imaginary group as base) compatible with this monomial growth group.

OUTPUT:
A group group.

EXAMPLES:

```sage
definitions = from sage.rings.asymptotic.growth_group import GrowthGroup
sage: GrowthGroup('n^{\mathbb{Z}}').non_growth_group()
Growth Group n^{\mathbb{Z} \cdot \mathbb{I}}
```

class sage.rings.asymptotic.growth_group.MonomialGrowthGroupFunctor(var)

Bases: AbstractGrowthGroupFunctor

A construction functor for monomial growth groups.

INPUT:

- var – a string or list of strings (or anything else Variable accepts).

EXAMPLES:

```sage
definitions = from sage.rings.asymptotic.growth_group import GrowthGroup,
               MonomialGrowthGroupFunctor
sage: GrowthGroup('z^{\mathbb{Q}}').construction()[0]
MonomialGrowthGroup[z]
```

See also:

Asymptotic Ring, AbstractGrowthGroupFunctor, ExponentialGrowthGroupFunctor, sage.

rings.asymptotic.asymptotic_ring.AsymptoticRingFunctor, sage.categories.pushout.

ConstructionFunctor.

class sage.rings.asymptotic.growth_group.MonomialNonGrowthElement(parent, raw_element)

Bases: GenericNonGrowthElement, MonomialGrowthElement

An element of MonomialNonGrowthGroup.

class sage.rings.asymptotic.growth_group.MonomialNonGrowthGroup(base, var, category)

Bases: GenericNonGrowthGroup, MonomialGrowthGroup

A growth group whose base is an imaginary group.

EXAMPLES:
Element

alias of MonomialNonGrowthElement

collection()

Return the construction of this growth group.

OUTPUT:

A pair whose first entry is an MonomialNonGrowthGroupFunctor and its second entry the base.

EXAMPLES:

```
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
dsage: GrowthGroup('x^(QQ*I)').construction()
(MonomialNonGrowthGroup[x], Imaginary Group over Rational Field)
```

class sage.rings.asymptotic.growth_group.MonomialNonGrowthGroupFunctor(var)

Bases: MonomialGrowthGroupFunctor

A construction functor for MonomialNonGrowthGroup.

class sage.rings.asymptotic.growth_group.PartialConversionElement(growth_group, raw_element)

Bases: SageObject

A not converted element of a growth group.

INPUT:

• growth_group – a group group

• raw_element – an object

A PartialConversionElement is an element growth_group(raw_element) which usually appears in conjunction with PartialConversionValueError. In this case, it was to possible to create that element, although the conversion went partially well in the sense that a raw_element (e.g. an exponent for MonomialGrowthElement or a base for ExponentialGrowthElement) could be extracted.

Its main purpose is to carry data used during the creation of elements of cartesian products of growth groups.

is_compatible(other)

Wrapper to GenericGrowthGroup.is_compatible().

split()

Split the contained raw_element according to the growth group’s GrowthGroup._split_raw_element()

EXAMPLES:

```
sage: from sage.rings.asymptotic.growth_group import ExponentialGrowthGroup,
    →PartialConversionValueError
sage: E = ExponentialGrowthGroup(ZZ, 'x')
sage: try:
    pass
```

(continues on next page)
....: E((-2)^x)
....: except PartialConversionValueError as e:
....: e.element.split()
(2^x, element with parameter -1 (<class 'int'>) in Growth Group ZZ^x)

**exception** `sage.rings.asymptotic.growth_group.PartialConversionValueError(element, *args, **kwds)`

Bases: `ValueError`

A special `ValueError` which is raised when (partial) conversion fails.

**INPUT:**

- `element` – a `PartialConversionElement`

The remaining argument passed on to `ValueError`.

**class** `sage.rings.asymptotic.growth_group.Variable(var, repr=None, latex_name=None, ignore=None)`

Bases: `CachedRepresentation`, `SageObject`

A class managing the variable of a growth group.

**INPUT:**

- `var` – an object whose representation string is used as the variable. It has to be a valid Python identifier. `var` can also be a tuple (or other iterable) of such objects.
- `repr` – (default: `None`) if specified, then this string will be displayed instead of `var`. Use this to get e.g. `log(x)`^ZZ: `var` is then used to specify the variable `x`.
- `latex_name` – (default: `None`) if specified, then this string will be used as LaTeX-representation of `var`.
- `ignore` – (default: `None`) a tuple (or other iterable) of strings which are not variables.

**static** `extract_variable_names(s)`

Determine the name of the variable for the given string.

**INPUT:**

- `s` – a string.

**OUTPUT:**

A tuple of strings.

**EXAMPLES:**

```python
sage: from sage.rings.asymptotic.growth_group import Variable
sage: Variable.extract_variable_names('')
()  
sage: Variable.extract_variable_names('x')
('x',)  
sage: Variable.extract_variable_names('exp(x)')
('x',)  
sage: Variable.extract_variable_names('sin(cos(ln(x)))')
('x',)  

sage: Variable.extract_variable_names('log(77w)')
('w',)
```
4.3. (Asymptotic) Growth Groups

Return whether this is a monomial variable.

OUTPUT:
A boolean.

EXAMPLES:
variable_names()

Return the names of the variables.

OUTPUT:

A tuple of strings.

EXAMPLES:

sage: from sage.rings.asymptotic.growth_group import Variable
sage: Variable('x').variable_names()
('x',)
sage: Variable('log(x)').variable_names()
('x',)

4.4 Cartesian Products of Growth Groups

See (Asymptotic) Growth Groups for a description.

4.4.1 Classes and Methods

class sage.rings.asymptotic.growth_group_cartesian.CartesianProductFactory

Bases: UniqueFactory

Create various types of Cartesian products depending on its input.

INPUT:

• growth_groups – a tuple (or other iterable) of growth groups.
• order – (default: None) if specified, then this order is taken for comparing two Cartesian product elements. If order is None this is determined automatically.

Note: The Cartesian product of growth groups is again a growth group. In particular, the resulting structure is partially ordered.
The order on the product is determined as follows:

- Cartesian factors with respect to the same variable are ordered lexicographically. This causes GrowthGroup('x^ZZ * log(x)^ZZ') and GrowthGroup('log(x)^ZZ * x^ZZ') to produce two different growth groups.
- Factors over different variables are equipped with the product order (i.e. the comparison is component-wise).

Also, note that the sets of variables of the Cartesian factors have to be either equal or disjoint.

EXAMPLES:

```python
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: A = GrowthGroup('x^ZZ'); A
Growth Group x^ZZ
sage: B = GrowthGroup('log(x)^ZZ'); B
Growth Group log(x)^ZZ
sage: C = cartesian_product([A, B]); C  # indirect doctest
Growth Group x^ZZ * log(x)^ZZ
sage: C._le_ == C.le_lex
True
sage: D = GrowthGroup('y^ZZ'); D
Growth Group y^ZZ
sage: E = cartesian_product([A, D]); E  # indirect doctest
Growth Group x^ZZ * y^ZZ
sage: E._le_ == E.le_product
True
sage: F = cartesian_product([C, D]); F  # indirect doctest
Growth Group x^ZZ * log(x)^ZZ * y^ZZ
sage: F._le_ == F.le_product
True
sage: cartesian_product([A, E]); G  # indirect doctest
Traceback (most recent call last):
... ValueError: The growth groups (Growth Group x^ZZ, Growth Group x^ZZ * y^ZZ) need to have pairwise disjoint or equal variables.
```

create_key_and_extra_args(growth_groups, category, **kwds)

Given the arguments and keywords, create a key that uniquely determines this object.

create_object(version, args, **kwds)

Create an object from the given arguments.

class sage.rings.asymptotic.growth_group_cartesian.GenericProduct

A Cartesian product of growth groups.

EXAMPLES:
sage: C = cartesian_product([P, L], order='lex'); C  # indirect doctest
Growth Group x^QQ * log(x)^ZZ
sage: C.an_element()
x^(1/2)*log(x)

sage: Px = GrowthGroup('x^QQ')
sage: Lx = GrowthGroup('log(x)^ZZ')
sage: Cx = cartesian_product([Px, Lx], order='lex')  # indirect doctest
sage: Py = GrowthGroup('y^QQ')
sage: C = cartesian_product([Cx, Py], order='product'); C  # indirect doctest
Growth Group x^QQ * log(x)^ZZ * y^QQ
sage: C.an_element()
x^(1/2)*log(x)*y^(1/2)

See also:
CartesianProduct, CartesianProductPoset.

CartesianProduct =
<sage.rings.asymptotic.growth_group_cartesian.CartesianProductFactory object>

class Element
    Bases: Element

    exp()
    The exponential of this element.
    INPUT:
    Nothing.
    OUTPUT:
    A growth element.
    EXAMPLES:

    sage: from sage.rings.asymptotic.growth_group import GrowthGroup
    sage: G = GrowthGroup('x^ZZ * log(x)^ZZ * log(log(x))^ZZ')
    sage: x = G('x')
    sage: exp(log(x))
    x
    sage: exp(log(log(x)))
    log(x)

    sage: exp(x)
    Traceback (most recent call last):
    ... ArithmeticError: Cannot construct e^x in Growth Group x^ZZ * log(x)^ZZ * log(log(x))^ZZ
    > *previous* TypeError: unsupported operand parent(s) for *:
    'Growth Group x^ZZ * log(x)^ZZ * log(log(x))^ZZ' and 'Growth Group (e^x)^ZZ'
factors()

Return the atomic factors of this growth element. An atomic factor cannot be split further and is not the identity (1).

INPUT:
Nothing.

OUTPUT:
A tuple of growth elements.

EXAMPLES:

```python
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: G = GrowthGroup('x^ZZ * log(x)^ZZ * y^ZZ')
sage: x, y = G.gens_monomial()
sage: x.factors()
(x,)
sage: f = (x * y).factors(); f
(x, y)
sage: tuple(factor.parent() for factor in f)
(Growth Group x^ZZ, Growth Group y^ZZ)
sage: f = (x * log(x)).factors(); f
(x, log(x))
sage: tuple(factor.parent() for factor in f)
(Growth Group x^ZZ, Growth Group log(x)^ZZ)
```

is_lt_one()

Return whether this element is less than 1.

INPUT:
Nothing.

OUTPUT:
A boolean.

EXAMPLES:

```python
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: G = GrowthGroup('x^ZZ * log(x)^ZZ * log(log(x))^ZZ * y^QQ')
sage: x, y = G.gens_monomial()
sage: f = (x * log(x) * y).factors(); f
(x, log(x), y)
sage: tuple(factor.parent() for factor in f)
(Growth Group x^ZZ, Growth Group log(x)^ZZ, Growth Group y^QQ)
```

```python
sage: G = GrowthGroup('x^ZZ'); x = G(x)
sage: (x^42).is_lt_one()  # indirect doctest
False
sage: (x^(-42)).is_lt_one()  # indirect doctest
True
```
\texttt{log(base=None)}

Return the logarithm of this element.

INPUT:

\begin{itemize}
\item base – the base of the logarithm. If None (default value) is used, the natural logarithm is taken.
\end{itemize}

OUTPUT:

A growth element.

EXAMPLES:

\begin{verbatim}
from sage.rings.asymptotic.growth_group import GrowthGroup
G = GrowthGroup('x^ZZ * log(x)^ZZ')
x, = G.gens_monomial()
log(x)  # indirect doctest
log(x^5)  # indirect doctest
Traceback (most recent call last):
... ArithmeticError: When calculating log(x^5) a factor 5 != 1 appeared, which is not contained in Growth Group x^ZZ * log(x)^ZZ.

G = GrowthGroup('(QQ_+)^x * x^ZZ')
x, = G.gens_monomial()
el = x.rpow(2); el
2^x
log(el)  # indirect doctest
Traceback (most recent call last):
... ArithmeticError: When calculating log(2^x) a factor \log(2) != 1 appeared, which is not contained in Growth Group QQ^x * x^ZZ.
log(el, base=2)  # indirect doctest
x

from sage.rings.asymptotic.growth_group import GenericGrowthGroup
x = GenericGrowthGroup(ZZ).an_element()
log(x)  # indirect doctest
Traceback (most recent call last):
... ArithmeticError: Cannot determine logarithmized factorization of GenericGrowthElement(1) in abstract base class.

x = GrowthGroup('x^ZZ').an_element()
log(x)  # indirect doctest
Traceback (most recent call last):
... ArithmeticError: Cannot build log(x) since log(x) is not in Growth Group x^ZZ.
\end{verbatim}

\texttt{log_factor(base=None, locals=None)}

Return the logarithm of the factorization of this element.

INPUT:

\begin{itemize}
\item base – the base of the logarithm. If None (default value) is used, the natural logarithm is taken.
\item locals – a dictionary which may contain the following keys and values:
\end{itemize}
Asymptotic Expansions, Release 10.2

- `log` – value: a function. If not used, then the usual log is taken.

OUTPUT:
A tuple of pairs, where the first entry is a growth element and the second a multiplicative coefficient.

ALGORITHM:
This function factors the given element and calculates the logarithm of each of these factors.

EXAMPLES:

```
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: G = GrowthGroup('(QQ_+)^x * x^ZZ * log(x)^ZZ * y^ZZ * log(y)^ZZ')
sage: x, y = G.gens_monomial()
sage: (x * y).log_factor()  # indirect doctest
((log(x), 1), (log(y), 1))
sage: (x^123).log_factor()  # indirect doctest
((log(x), 123),)
sage: (G('2^x') * x^2).log_factor(base=2)  # indirect doctest
((x, 1), (log(x), 2/log(2)))
```

```
sage: G(1).log_factor()
()  # indirect doctest
```

```
sage: log(x).log_factor()  # indirect doctest
Traceback (most recent call last):
  ... ArithmeticError: Cannot build log(log(x)) since log(log(x)) is not in Growth Group QQ^x * x^ZZ * log(x)^ZZ * y^ZZ * log(y)^ZZ.
```

See also:
`factors()`, `log()`.

```
rpow(base)
```

Calculate the power of `base` to this element.

INPUT:
• `base` – an element.

OUTPUT:
A growth element.

EXAMPLES:

```
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: G = GrowthGroup('(QQ_+)^x * x^ZZ')
sage: x = G('x')
sage: x.rpow(2)  # indirect doctest
2^x
sage: x.rpow(1/2)  # indirect doctest
(1/2)^x
```

```
sage: x.rpow(0)  # indirect doctest
Traceback (most recent call last):
  ... ValueError: 0 is not an allowed base for calculating the power to x.
sage: (x^2).rpow(2)  # indirect doctest
```

(continues on next page)

4.4. Cartesian Products of Growth Groups
Traceback (most recent call last):
  ...
ArithmeticError: Cannot construct \(2^{x^2}\) in Growth Group \(\mathbb{Q}^x * x^{\mathbb{Z}}\)
> *previous* TypeError: unsupported operand parent(s) for *:
  'Growth Group \(\mathbb{Q}^x * x^{\mathbb{Z}}\)' and 'Growth Group \(\mathbb{Z}^x(x^2)\)'

sage: G = GrowthGroup('\(\mathbb{Q}^x(x*\log(x)) * x^{\mathbb{Z}} * \log(x)^{\mathbb{Z}}\)')
sage: x = G('x')
sage: (x * log(x)).rpow(2)  # indirect doctest
2^{x * \log(x)}

sage: n = GrowthGroup('\((\mathbb{Q}_+)^n * n^{\mathbb{Q}}\)')('n')
sage: n.rpow(2)
2^nn
sage: _.parent()
Growth Group \(\mathbb{Q}^n * n^{\mathbb{Q}}\)

sage: n = GrowthGroup('\(\mathbb{Q}^n * n^{\mathbb{Q}}\)')('n')
sage: n.rpow(-2)
2^n(-1)^n

variable_names()

Return the names of the variables of this growth element.

OUTPUT:

A tuple of strings.

EXAMPLES:

sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: G = GrowthGroup('\(\mathbb{Q}^m * m^{\mathbb{Q}} * \log(n)^{\mathbb{Z}}\)')
\('m', 'n')
sage: G('2^m * m^4 * \log(n)').variable_names()
\('m', 'n')
sage: G('2^m * m^4').variable_names()
\('m', 'n', 'n')
sage: G('\log(n)').variable_names()
\('n', 'n')
sage: G('m^3').variable_names()
\('m', 'n', 'm^3')
sage: G('m^0').variable_names()
()

cartesian_injection(factor, element)

Inject the given element into this Cartesian product at the given factor.

INPUT:

- factor – a growth group (a factor of this Cartesian product).
- element – an element of factor.

OUTPUT:

An element of this Cartesian product.
gens_monomial()

Return a tuple containing monomial generators of this growth group.

INPUT:
Nothing.

OUTPUT:
A tuple containing elements of this growth group.

Note: This method calls the gens_monomial() method on the individual factors of this Cartesian product and concatenates the respective outputs.

EXAMPLES:

```python
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: G = GrowthGroup('x^ZZ * log(x)^ZZ * y^QQ * log(z)^ZZ')
```

sage: G.gens_monomial()
(x, y)

some_elements()

Return some elements of this Cartesian product of growth groups.

See TestSuite for a typical use case.

OUTPUT:
An iterator.

EXAMPLES:

```python
sage: from itertools import islice
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: G = GrowthGroup('(QQ_+)^y * x^QQ * log(x)^ZZ')
```

sage: tuple(islice(G.some_elements(), 10r))
(x^(1/2)*(1/2)^y,
 x^(-1/2)*log(x)*2^y,
 x^2*log(x)^(-1),
 log(x)^(-2)*(2/3)^y,
 x^3*log(x)^3*(3/2)^y,
 x^(-1)*log(x)^(-3)^y*(4/5)^y,
 x^42*log(x)^4*(5/4)^y,
 x^2/3*log(x)^(-4)^y*(6/7)^y,
 x^(-2/3)*log(x)^5*(7/6)^y)
```

variable_names()

Return the names of the variables.

OUTPUT:
A tuple of strings.

EXAMPLES:
class sage.rings.asymptotic.growth_group_cartesian.MultivariateProduct(sets, category, **kwargs)

Bases: GenericProduct

A Cartesian product of growth groups with pairwise disjoint (or equal) variable sets.

Note: A multivariate product of growth groups is ordered by means of the product order, i.e. component-wise. This is motivated by the assumption that different variables are considered to be independent (e.g. $x^{\mathbb{Z}} \cdot y^{\mathbb{Z}}$).

See also: UnivariateProduct, GenericProduct.

 CartesianProduct =
< sage.rings.asymptotic.growth_group_cartesian.CartesianProductFactory object >

class sage.rings.asymptotic.growth_group_cartesian.UnivariateProduct(sets, category, **kwargs)

Bases: GenericProduct

A Cartesian product of growth groups with the same variables.

Note: A univariate product of growth groups is ordered lexicographically. This is motivated by the assumption that univariate growth groups can be ordered in a chain with respect to the growth they model (e.g. $x^{\mathbb{Z}} \cdot \log(x)^{\mathbb{Z}}$: polynomial growth dominates logarithmic growth).

See also: MultivariateProduct, GenericProduct.

 CartesianProduct =
< sage.rings.asymptotic.growth_group_cartesian.CartesianProductFactory object >

4.5 (Asymptotic) Term Monoids

This module implements asymptotic term monoids. The elements of these monoids are used behind the scenes when performing calculations in an asymptotic ring.

The monoids build upon the (asymptotic) growth groups. While growth elements only model the growth of a function as it tends towards infinity (or tends towards another fixed point; see (Asymptotic) Growth Groups for more details), an asymptotic term additionally specifies its "type" and performs the actual arithmetic operations (multiplication and partial addition/absorption of terms).

Besides an abstract base term GenericTerm, this module implements the following types of terms:

- **OTerm** – $O$-terms at infinity, see Wikipedia article Big_O_notation.
- **TermWithCoefficient** – abstract base class for asymptotic terms with coefficients.
- **ExactTerm** – this class represents a growth element multiplied with some non-zero coefficient from a coefficient ring.
A characteristic property of asymptotic terms is that some terms are able to “absorb” other terms (see `absorb()`). For instance, $O(x^2)$ is able to absorb $O(x)$ (with result $O(x^2)$), and $3 \cdot x^5$ is able to absorb $-2 \cdot x^5$ (with result $x^5$). Essentially, absorption can be interpreted as the addition of “compatible” terms (partial addition).

### 4.5.1 Absorption of Asymptotic Terms

A characteristic property of asymptotic terms is that some terms are able to “absorb” other terms. This is realized with the method `absorb()`.

For instance, $O(x^2)$ is able to absorb $O(x)$ (with result $O(x^2)$). This is because the functions bounded by linear growth are bounded by quadratic growth as well. Another example would be that $3x^5$ is able to absorb $-2x^5$ (with result $x^5$), which simply corresponds to addition.

Essentially, absorption can be interpreted as the addition of “compatible” terms (partial addition).

We want to show step by step which terms can be absorbed by which other terms. We start by defining the necessary term monoids and some terms:

```plaintext
sage: from sage.rings.asymptotic.term_monoid import OTermMonoid, ExactTermMonoid
sage: from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory as ...
...
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: G = GrowthGroup('x^ZZ'); x = G.gen()

sage: OT = OTermMonoid(TermMonoid, growth_group=G, coefficient_ring=QQ)

sage: et1 = ET(x^2, coefficient=2)

sage: ot1 = OT(x); ot2 = OT(x^2)

sage: ot1, ot2
(O(x), O(x^2))

sage: ot1.can_absorb(ot2), ot2.can_absorb(ot1)
(False, True)

sage: et1
2*x^2

sage: et1.can_absorb(ot1)
False

sage: et1.can_absorb(ot2)
True

sage: ot1.absorb(ot1)
O(x)

sage: ot2.absorb(ot1)
O(x^2)

sage: ot2.absorb(et1)
O(x^2)
```

Because of the definition of $O$-terms (see Wikipedia article Big_O_notation), $OTerm$ are able to absorb all other asymptotic terms with weaker or equal growth. In our implementation, this means that $OTerm$ is able to absorb other $OTerm$, as well as $ExactTerm$, as long as the growth of the other term is less than or equal to the growth of this element:

```plaintext
sage: ot1, ot2
(0(x), 0(x^2))

sage: ot1.can_absorb(ot2), ot2.can_absorb(ot1)
(False, True)

sage: et1
2*x^2

sage: ot1.can_absorb(et1)
False

sage: ot2.can_absorb(et1)
True
```

The result of this absorption always is the dominant (absorbing) $OTerm$:

```plaintext
sage: ot1.absorb(ot1)
O(x)

sage: ot2.absorb(ot1)
O(x^2)

sage: ot2.absorb(et1)
O(x^2)
```

These examples correspond to $O(x) + O(x) = O(x)$, $O(x^2) + O(x) = O(x^2)$, and $O(x^2) + 2x^2 = O(x^2)$.

- $ExactTerm$ can only absorb another $ExactTerm$ if the growth coincides with the growth of this element:
Asymptotic Expansions, Release 10.2

```
sage: et1.can_absorb(ET(x^2, coefficient=5))
True
sage: any(et1.can_absorb(t) for t in [ot1, ot2])
False
```

As mentioned above, absorption directly corresponds to addition in this case:

```
sage: et1.absorb(ET(x^2, coefficient=5))
7*x^2
```

When adding two exact terms, they might cancel out. For technical reasons, `None` is returned in this case:

```
sage: ET(x^2, coefficient=5).can_absorb(ET(x^2, coefficient=-5))
True
sage: ET(x^2, coefficient=5).absorb(ET(x^2, coefficient=-5)) is None
True
```

- The abstract base terms `GenericTerm` and `TermWithCoefficient` can neither absorb any other term, nor be absorbed by any other term.

If `absorb` is called on a term that cannot be absorbed, an `ArithmeticError` is raised:

```
sage: ot1.absorb(ot2)
Traceback (most recent call last):
  ... ArithmeticError: O(x) cannot absorb O(x^2)
```

This would only work the other way around:

```
sage: ot2.absorb(ot1)
O(x^2)
```

### 4.5.2 Comparison

The comparison of asymptotic terms with \( \leq \) is implemented as follows:

- When comparing \( t1 \leq t2 \), the coercion framework first tries to find a common parent for both terms. If this fails, `False` is returned.
- In case the coerced terms do not have a coefficient in their common parent (e.g. `OTerm`), the growth of the two terms is compared.
- Otherwise, if the coerced terms have a coefficient (e.g. `ExactTerm`), we compare whether \( t1 \) has a growth that is strictly weaker than the growth of \( t2 \). If so, we return `True`. If the terms have equal growth, then we return `True` if and only if the coefficients coincide as well.
- In all other cases, we return `False`.

Long story short: we consider terms with different coefficients that have equal growth to be incomparable.
4.5.3 Various

**Warning:** The code for B-Terms is experimental, so a warning is thrown when a BTerm is created for the first time in a session (see `sage.misc.superseded.experimental`).

```python
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory as _
    TermMonoid
sage: T = TermMonoid('B', growth_group=GrowthGroup('x^ZZ'), coefficient_ring=QQ)
doctest:warning
... FutureWarning: This class/method/function is marked as experimental. It, its functionality or its interface might change without a formal deprecation. See https://github.com/sagemath/sage/issues/31922 for details.
```

**Todo:**
- Implementation of more term types (e.g. Ω terms, o terms, Θ terms).

**AUTHORS:**
- Benjamin Hackl (2015)
- Daniel Krenn (2015)
- Clemens Heuberger (2016)
- Thomas Hagelmayer (2021)

**ACKNOWLEDGEMENT:**
- Benjamin Hackl, Clemens Heuberger and Daniel Krenn are supported by the Austrian Science Fund (FWF): P 24644-N26.
- Benjamin Hackl is supported by Google Summer of Code 2015.
- Thomas Hagelmayer is supported by Google Summer of Code 2021.

4.5.4 Classes and Methods

```python
class sage.rings.asymptotic.term_monoid.BTerm(parent, growth, valid_from, **kwds)
    Bases: TermWithCoefficient

Class for asymptotic B-terms.
A B-term represents all functions which (in absolute value) are bounded by the given growth and coefficient for the parameters given by valid_from. For example, we have terms that represent functions
- bounded by $5|x|^2$ for $|x| \geq 3$,
- bounded by $42|x|^3$ for $|x| \geq 15$ and $|y| \geq 15$, or
- bounded by $42|x|^3|y|^2$ for $|x| \geq 10$ and $|y| \geq 20$ (see below for the actual examples).

**INPUT:**
- parent – the parent of the asymptotic term
```
• **growth** – an asymptotic growth element of the parent’s growth group

• **coefficient** – an element of the parent’s coefficient ring

• **valid_from** – dictionary mapping variable names to lower bounds for the corresponding variable. The bound implied by this term is valid when all variables are at least their corresponding lower bound. If a number is passed to `valid_from`, then the lower bounds for all variables of the asymptotic expansion are set to this number

**EXAMPLES:**

We revisit the examples from the introduction:

```python
sage: from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory as _
˓→TermMonoid
growth
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
growth
sage: G = GrowthGroup('x^ZZ * y^ZZ')
growth
sage: T = TermMonoid('B', growth_group=G, coefficient_ring=ZZ)
growth
sage: x, y = G('x'), G('y')
growth
```

This is a term bounded by $5|x|^2$ for $|x| \geq 3$:

```python
sage: T(x^2, coefficient=5, valid_from={'x': 3})
B(5*x^2, x >= 3)
growth
```

This is a term bounded by $42|x|^3$ for $|x| \geq 15$ and $|y| \geq 15$:

```python
sage: T(x^3, coefficient=42, valid_from={'x': 15, 'y': 15})
B(42*x^3, x >= 15, y >= 15)
growth
```

This is a term bounded by $42|x|^3|y|^2$ for $|x| \geq 10$ and $|y| \geq 20$:

```python
sage: T(x^3*y^2, coefficient=42, valid_from={'x': 10, 'y': 20})
B(42*x^3*y^2, x >= 10, y >= 20)
growth
```

can_absorb(other)

Check whether this B-term can absorb other.

**INPUT:**

• **other** – an asymptotic term

**OUTPUT:**

A boolean

**Note:** A `BTerm` can absorb another `BTerm` with weaker or equal growth.

See the module description for a detailed explanation of absorption.

**EXAMPLES:**

```python
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
growth
sage: from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory as _
˓→TermMonoid
growth
sage: BT = TermMonoid('B', GrowthGroup('x^ZZ'), QQ)
growth
sage: t1 = BT(x^3, coefficient=3, valid_from={'x': 20})
growth
```
sage: t2 = BT(x^2, coefficient=1, valid_from={'x': 10})
sage: t3 = BT(x^3, coefficient=10, valid_from={'x': 10})
sage: t1.can_absorb(t2)
True
sage: t2.can_absorb(t1)
False
sage: t1.can_absorb(t3)
True
sage: t3.can_absorb(t1)
True
sage: ET = TermMonoid('exact', GrowthGroup('x^ZZ'), QQ)
sage: t4 = ET(x^3, coefficient=5)
sage: t1.can_absorb(t4)
True

construction()

Return a construction of this term.

INPUT:
Nothing.

OUTPUT:
A pair (cls, kwds) such that cls(**kwds) equals this term.

EXAMPLES:

sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: from sage.rings.asymptotic.term_monoid import TermMonoidFactory
sage: TermMonoid = TermMonoidFactory('__main__.TermMonoid')
sage: T = TermMonoid('B', GrowthGroup('x^ZZ'), QQ)
sage: a = T.an_element(); a
B(1/2*x, x >= 42)
sage: cls, kwds = a.construction(); cls, kwds
(<class 'sage.rings.asymptotic.term_monoid.BTermMonoid_with_category.element_class'>,
 {'coefficient': 1/2,
  'growth': x,
  'parent': B-Term Monoid x^ZZ with coefficients in Rational Field,
  'valid_from': {'x': 42}})
sage: cls(**kwds) == a
True

See also:
GenericTerm.construction(), TermWithCoefficient.construction(), GenericTermMonoid.from_construction()

class sage.rings.asymptotic.term_monoid.BTermMonoid(term_monoid_factory, growth_group, coefficient_ring, category)

Bases: TermWithCoefficientMonoid

Parent for asymptotic B-terms.

INPUT:
• \texttt{growth\_group} – a growth group
• \texttt{coefficient\_ring} – the ring which contains the coefficients of the elements
• \texttt{category} – The category of the parent can be specified in order to broaden the base structure. It has to be a subcategory of \texttt{Join of Category of monoids and Category of posets}. This is also the default category if \texttt{None} is specified.

\textbf{EXAMPLES:}

\begin{Verbatim}
\texttt{sage: from sage.rings.asymptotic.growth_group import MonomialGrowthGroup}
\texttt{sage: from sage.rings.asymptotic.term_monoid import BTermMonoid}
\texttt{sage: from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory as _}
\texttt{˓→TermMonoid}
\texttt{sage: G = MonomialGrowthGroup(ZZ, 'x')}
\texttt{sage: BT = TermMonoid('B', G, QQ)}
\texttt{sage: BT}
\texttt{B-Term Monoid x^{ZZ} with coefficients in Rational Field}
\texttt{sage: BT is BTermMonoid(TermMonoid, G, QQ)}
\texttt{True}
\end{Verbatim}

\textbf{Element}

alias of \texttt{BTerm}

\textbf{some\_elements()}\texttt{()}

Return some elements of this B-term monoid.

See \texttt{TestSuite} for a typical use case.

\textbf{INPUT:}

Nothing.

\textbf{OUTPUT:}

An iterator.

\textbf{EXAMPLES:}

\begin{Verbatim}
\texttt{sage: from itertools import islice}
\texttt{sage: from sage.rings.asymptotic.term_monoid import TermMonoidFactory}
\texttt{sage: TermMonoid = TermMonoidFactory('\_\_main\_.\_\_TermMonoid')}
\texttt{sage: from sage.rings.asymptotic.growth_group import GrowthGroup}
\texttt{sage: G = GrowthGroup('z^{QQ}')}
\texttt{sage: T = TermMonoid('B', G, ZZ)}
\texttt{sage: tuple(islice(T.some_elements(), int(10)))}
\texttt{(B(z^{(1/2)}, z >= 0), B(z^{(-1/2)}, z >= 1), B(z^{(1/2)}, z >= 3), B(z^{2}, z >= 42), B(z^{(-1/2)}, z >= 0), B(2*z^{(1/2)}, z >= 1), B(z^{(-2)}, z >= 3), B(z^{2}, z >= 42), B(2*z^{(-1/2)}, z >= 0), B(2*z^{(1/2)}, z >= 1))}
\end{Verbatim}
A factory for asymptotic term monoids. This is an instance of TermMonoidFactory whose documentation provides more details.

class sage.rings.asymptotic.term_monoid.ExactTerm(parent, growth, coefficient)

Bases: TermWithCoefficient

Class for asymptotic exact terms. These terms primarily consist of an asymptotic growth element as well as a coefficient.

INPUT:

- parent – the parent of the asymptotic term.
- growth – an asymptotic growth element from parent.growth_group.
- coefficient – an element from parent.coefficient_ring.

EXAMPLES:

```python
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory
sage: from sage.rings.asymptotic.term_monoid import ExactTermMonoid
sage: G = GrowthGroup('x^ZZ'); x = G.gen()
sage: ET = ExactTermMonoid(TermMonoid, G, QQ)

Asymptotic exact terms may be multiplied (with the usual rules applying):

```python
sage: ET(x^2, coefficient=3) * ET(x, coefficient=-1)
-3*x^3
sage: ET(x^0, coefficient=4) * ET(x^5, coefficient=2)
8*x^5
```

They may also be multiplied with O-terms:

```python
sage: OT = TermMonoid('O', G, QQ)
sage: ET(x^2, coefficient=42) * OT(x)
O(x^3)
```

Absorption for asymptotic exact terms relates to addition:

```python
sage: ET(x^2, coefficient=5).can_absorb(ET(x^5, coefficient=12))
False
sage: ET(x^2, coefficient=5).can_absorb(ET(x^2, coefficient=1))
True
sage: ET(x^2, coefficient=5).absorb(ET(x^2, coefficient=1))
6*x^2
```

Note that, as for technical reasons, 0 is not allowed as a coefficient for an asymptotic term with coefficient. Instead None is returned if two asymptotic exact terms cancel out each other during absorption:

```python
sage: ET(x^2, coefficient=42).can_absorb(ET(x^2, coefficient=-42))
True
sage: ET(x^2, coefficient=42).absorb(ET(x^2, coefficient=-42)) is None
True
```
Exact terms can also be created by converting monomials with coefficient from the symbolic ring, or a suitable polynomial or power series ring:

```
sage: x = var('x'); x.parent()
Symbolic Ring
sage: ET(5*x^2)
5*x^2
```

`can_absorb(other)`

Check whether this exact term can absorb `other`.

**INPUT:**

- `other` – an asymptotic term.

**OUTPUT:**

A boolean.

**Note:** For `ExactTerm`, absorption corresponds to addition. This means that an exact term can absorb only other exact terms with the same growth.

See the module description for a detailed explanation of absorption.

**EXAMPLES:**

```
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory as _
TermMonoid
sage: ET = TermMonoid('exact', GrowthGroup('x^ZZ'), ZZ)
sage: t1 = ET(x^21, coefficient=1); t2 = ET(x^21, coefficient=2); t3 = ET(x^42,
    coefficient=1)
sage: t1.can_absorb(t2)
True
sage: t2.can_absorb(t1)
True
sage: t1.can_absorb(t3) or t3.can_absorb(t1)
False
```

`is_constant()`

Return whether this term is an (exact) constant.

**INPUT:**

Nothing.

**OUTPUT:**

A boolean.

**Note:** Only `ExactTerm` with constant growth (1) are constant.

**EXAMPLES:**
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory as TermMonoid
sage: T = TermMonoid('exact', GrowthGroup('x^ZZ * log(x)^ZZ'), QQ)
sage: T('x * log(x)').is_constant()
False
sage: T('3*x').is_constant()
False
sage: T(1/2).is_constant()
True
sage: T(42).is_constant()
True

is_exact()

Return whether this term is an exact term.

OUTPUT:
A boolean.

EXAMPLES:

sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory as TermMonoid
sage: T = TermMonoid('exact', GrowthGroup('x^ZZ * log(x)^ZZ'), QQ)
sage: T('x * log(x)').is_exact()
True
sage: T('3 * x^2').is_exact()
True

is_little_o_of_one()

Return whether this exact term is of order \(o(1)\).

INPUT:
Nothing.

OUTPUT:
A boolean.

EXAMPLES:

sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory as TermMonoid
sage: T = TermMonoid('exact', GrowthGroup('x^ZZ'), QQ)
sage: T(x).is_little_o_of_one()
False
sage: T(1).is_little_o_of_one()
False
sage: T(x^(-1)).is_little_o_of_one()
True

4.5. (Asymptotic) Term Monoids
sage: T = TermMonoid('exact', GrowthGroup('x^ZZ * y^ZZ'), QQ)
sage: T('x * y^(-1)').is_little_o_of_one()
False
sage: T('x^(1/100) * y^(1000/7)').is_little_o_of_one()
True

sage: T = TermMonoid('exact', GrowthGroup('x^QQ * log(x)^QQ'), QQ)
sage: T('x * log(x)^2').is_little_o_of_one()
False
sage: T('x^(1/100) * log(x)^1000/7').is_little_o_of_one()
True

log_term(base=None, locals=None)

Determine the logarithm of this exact term.

INPUT:

• base – the base of the logarithm. If None (default value) is used, the natural logarithm is taken.

• locals – a dictionary which may contain the following keys and values:
  – 'log' – value: a function. If not used, then the usual log is taken.

OUTPUT:

A tuple of terms.

Note: This method returns a tuple with the summands that come from applying the rule \( \log(x \cdot y) = \log(x) + \log(y) \).

EXAMPLES:

sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory as _
   TermMonoid
sage: T = TermMonoid('exact', GrowthGroup('x^ZZ * log(x)^ZZ'), SR)
sage: T(3*x^2).log_term()
(\log(3), 2*\log(x))
sage: T(x^1234).log_term()
(1234*\log(x),)
sage: T(49*x^7).log_term(base=7)
(2, 7/\log(7)*\log(x))

sage: T = TermMonoid('exact', GrowthGroup('x^ZZ * log(x)^ZZ * y^ZZ * log(y)^ZZ'), SR)
sage: T('x * y').log_term()
(\log(x), \log(y))

(continues on next page)
sage: T('4 * x * y').log_term(base=2)
(2, 1/log(2)*log(x), 1/log(2)*log(y))

See also:

OTerm.log_term().

rpow(base)

Return the power of base to this exact term.

INPUT:

• base – an element or 'e'.

OUTPUT:

A term.

EXAMPLES:

sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory as_
˓→TermMonoid
sage: T = TermMonoid('exact', GrowthGroup('QQ^x * x^ZZ * log(x)^ZZ'), QQ)
sage: T('x').rpow(2)
2^x
sage: T('log(x)').rpow('e')
x
sage: T('42*log(x)').rpow('e')
x^{42}
sage: T('3*x').rpow(2)
8^x

sage: T('3*x^2').rpow(2)
 Traceback (most recent call last):
   ...

   'Growth Group ZZ^(x^2)'

sage: T = TermMonoid('exact', GrowthGroup('(QQ_+)^n * n^QQ'), SR)
sage: n = T('n')
sage: n.rpow(2)
2^n
sage: _.parent()
Exact Term Monoid QQ^n * n^QQ with coefficients in Symbolic Ring

class sage.rings.asymptotic.term_monoid.ExactTermMonoid(term_monoid_factory, growth_group, coefficient_ring, category)

Bases: TermWithCoefficientMonoid

Parent for asymptotic exact terms, implemented in ExactTerm.

INPUT:
• growth_group – a growth group.

• category – The category of the parent can be specified in order to broaden the base structure. It has to be a subcategory of Join of Category of monoids and Category of posets. This is also the default category if None is specified.

• coefficient_ring – the ring which contains the coefficients of the elements.

EXAMPLES:

```
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: from sage.rings.asymptotic.term_monoid import ExactTermMonoid
sage: from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory

sage: G_ZZ = GrowthGroup('x^ZZ'); x_ZZ = G_ZZ.gen()
sage: G_QQ = GrowthGroup('x^QQ'); x_QQ = G_QQ.gen()
sage: ET_ZZ = ExactTermMonoid(TermMonoid, G_ZZ, ZZ); ET_ZZ
Exact Term Monoid x^ZZ with coefficients in Integer Ring
sage: ET_QQ = ExactTermMonoid(TermMonoid, G_QQ, QQ); ET_QQ
Exact Term Monoid x^QQ with coefficients in Rational Field
sage: ET_QQ.coerce_map_from(ET_ZZ)
Coercion map:
  From: Exact Term Monoid x^ZZ with coefficients in Integer Ring
  To:   Exact Term Monoid x^QQ with coefficients in Rational Field
```

Exact term monoids can also be created using the term factory:

```
sage: TermMonoid('exact', G_ZZ, ZZ) is ET_ZZ
True
sage: TermMonoid('exact', GrowthGroup('x^ZZ'), QQ)
Exact Term Monoid x^ZZ with coefficients in Rational Field
```

Element

alias of ExactTerm

class sage.rings.asymptotic.term_monoid.GenericTermMonoid(parent, growth)

Bases: MultiplicativeGroupElement

Base class for asymptotic terms. Mainly the structure and several properties of asymptotic terms are handled here.

INPUT:

- parent – the parent of the asymptotic term.

- growth – an asymptotic growth element.

EXAMPLES:

```
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: from sage.rings.asymptotic.term_monoid import GenericTermMonoid
sage: from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory

sage: G = GrowthGroup('x^ZZ'); x = G.gen()
sage: T = GenericTermMonoid(TermMonoid, G, QQ)
sage: t1 = T(x); t2 = T(x^2); (t1, t2)
```
absorb(other, check=True)
Absorb the asymptotic term other and return the resulting asymptotic term.

INPUT:

• other – an asymptotic term.

• check – a boolean. If check is True (default), then can_absorb is called before absorption.

OUTPUT:
An asymptotic term or None if a cancellation occurs. If no absorption can be performed, an ArithmeticError is raised.

Note: Setting check to False is meant to be used in cases where the respective comparison is done externally (in order to avoid duplicate checking).

For a more detailed explanation of the absorption of asymptotic terms see the module description.

EXAMPLES:

We want to demonstrate in which cases an asymptotic term is able to absorb another term, as well as explain the output of this operation. We start by defining some parents and elements:

```python
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory as _TermMonoid
sage: G_QQ = GrowthGroup('x^QQ'); x = G_QQ.gen()
        OT = _TermMonoid('O', G_QQ, coefficient_ring=QQ)
        ET = _TermMonoid('exact', G_QQ, coefficient_ring=QQ)
        ot1 = OT(x); ot2 = OT(x^2)
        et1 = ET(x, coefficient=100); et2 = ET(x^2, coefficient=2)
        et3 = ET(x^2, coefficient=1); et4 = ET(x^2, coefficient=-2)
```

\(O\)-Terms are able to absorb other \(O\)-terms and exact terms with weaker or equal growth.

```python
sage: otl.absorb(ot1)
0(x)
sage: otl.absorb(et1)
0(x)
sage: otl.absorb(et1) is ot1
True
```
**ExactTerm** is able to absorb another **ExactTerm** if the terms have the same growth. In this case, **absorption** is nothing else than an addition of the respective coefficients:

```
sage: et2.absorb(et3)
3*x^2
sage: et3.absorb(et2)
3*x^2
sage: et3.absorb(et4)
-x^2
```

Note that, for technical reasons, the coefficient 0 is not allowed, and thus **None** is returned if two exact terms cancel each other out:

```
sage: et2.absorb(et4)
sage: et4.absorb(et2) is None
True
```

**can_absorb**(other)
Check whether this asymptotic term is able to absorb the asymptotic term other.

INPUT:
- **other** – an asymptotic term.

OUTPUT:
A boolean.

**Note:** A **GenericTerm** cannot absorb any other term.

See the **module description** for a detailed explanation of absorption.

**construction()**
Return a construction of this term.

INPUT:
Nothing.

OUTPUT:
A pair (cls, kwds) such that cls(**kwds) equals this term.
EXAMPLES:

```python
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory as TermMonoid

sage: T = TermMonoid('O', GrowthGroup('x^ZZ'), QQ)
sage: a = T.an_element(); a
O(x)
sage: cls, kwds = a.construction(); cls, kwds
(<class 'sage.rings.asymptotic.term_monoid.OTermMonoid_with_category.element_class'>,
 {'growth': x, 'parent': O-Term Monoid x^ZZ with implicit coefficients in Rational Field})
sage: cls(**kwds) == a
True
```

See also:

`TermWithCoefficient.construction()`, `GenericTermMonoid.from_construction()`

**is_constant()**

Return whether this term is an (exact) constant.

**INPUT:**

Nothing.

**OUTPUT:**

A boolean.

**Note:** Only `ExactTerm` with constant growth (1) are constant.

EXAMPLES:

```python
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: from sage.rings.asymptotic.term_monoid import GenericTermMonoid
sage: from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory as TermMonoid

sage: T = GenericTermMonoid(TermMonoid, GrowthGroup('x^ZZ * log(x)^ZZ'), QQ)
sage: t = T.an_element(); t
Generic Term with growth x*log(x)
sage: t.is_constant()
False

sage: T = TermMonoid('O', GrowthGroup('x^ZZ'), QQ)
sage: T('x').is_constant()
False
sage: T(1).is_constant()
False
```

**is_exact()**

Return whether this term is an exact term.

**OUTPUT:**
A boolean.

EXAMPLES:

```python
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: from sage.rings.asymptotic.term_monoid import GenericTermMonoid
sage: from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory as TermMonoid
sage: T = GenericTermMonoid(TermMonoid, GrowthGroup('x^ZZ * log(x)^ZZ'), QQ)
sage: T.an_element().is_exact()
False
```

**is_little_o_of_one()**

Return whether this generic term is of order \( o(1) \).

**INPUT:**

Nothing.

**OUTPUT:**

A boolean.

**EXAMPLES:**

```python
sage: from sage.rings.asymptotic.growth_group import (GenericTermMonoid, TermWithCoefficientMonoid)
sage: from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory as TermMonoid
sage: T = GenericTermMonoid(TermMonoid, GrowthGroup('x^ZZ'), QQ)
sage: T.an_element().is_little_o_of_one()
Traceback (most recent call last):
... Not ImplementedError: Cannot check whether Generic Term with growth x is o(1)
in the abstract base class Generic Term Monoid x^ZZ with (implicit) coefficients in Rational Field.
```

**log_term**\( \text{base=\text{None}, locals=\text{None}} \)

Determine the logarithm of this term.

**INPUT:**

- `base` – the base of the logarithm. If `None` (default value) is used, the natural logarithm is taken.
- `locals` – a dictionary which may contain the following keys and values:
  - `'log'` – value: a function. If not used, then the usual `log` is taken.

**OUTPUT:**

A tuple of terms.
Note: This abstract method raises a `NotImplementedError`. See `ExactTerm` and `OTerm` for a concrete implementation.

**EXAMPLES:**

```python
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: from sage.rings.asymptotic.term_monoid import GenericTermMonoid
sage: from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory as...
˓→TermMonoid
sage: T = GenericTermMonoid(TermMonoid, GrowthGroup('x^ZZ'), QQ)
sage: T.an_element().log_term()
Traceback (most recent call last):
... Not Implemented: This method is not implemented in this abstract base class.
```

```python
sage: from sage.rings.asymptotic.term_monoid import TermWithCoefficientMonoid
sage: T = TermWithCoefficientMonoid(TermMonoid, GrowthGroup('x^ZZ'), QQ)
sage: T.an_element().log_term()
Traceback (most recent call last):
... Not Implemented: This method is not implemented in this abstract base class.
```

See also:

* `ExactTerm.log_term()`, `OTerm.log_term()`.

**rpow** *(base)*

Return the power of `base` to this generic term.

**INPUT:**

* `base` – an element or 'e'.

**OUTPUT:**

A term.

**EXAMPLES:**

```python
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: from sage.rings.asymptotic.term_monoid import GenericTermMonoid
sage: from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory as...
˓→TermMonoid
sage: T = GenericTermMonoid(TermMonoid, GrowthGroup('x^ZZ * log(x)^ZZ'), QQ)
sage: T.an_element().rpow('e')
Traceback (most recent call last):
... Not Implemented: Cannot take e to the exponent
Generic Term with growth x*log(x) in the abstract base class
Generic Term Monoid x^ZZ * log(x)^ZZ with (implicit) coefficients in Rational˓→Field.
```
variable_names()

Return the names of the variables of this term.

OUTPUT:

A tuple of strings.

EXAMPLES:

```
sage: from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory as T
sage: T('4 * 2^m * m^4 * log(n)^ZZ', QQ)
('m', 'n')
sage: T('4 * log(n)').variable_names()
('n',)
sage: T('4 * m^3').variable_names()
('m',)
sage: T('4 * m^0').variable_names()
()```

class sage.rings.asymptotic.term_monoid.GenericTermMonoid(term_monoid_factory, growth_group, coefficient_ring, category)

Bases: UniqueRepresentation, Parent, WithLocals

Parent for generic asymptotic terms.

INPUT:

• growth_group – a growth group (i.e. an instance of GenericGrowthGroup).

• coefficient_ring – a ring which contains the (maybe implicit) coefficients of the elements.

• category – The category of the parent can be specified in order to broaden the base structure. It has to be a subcategory of Join of Category of Monoids and Category of posets. This is also the default category if None is specified.

In this class the base structure for asymptotic term monoids will be handled. These monoids are the parents of asymptotic terms (for example, see GenericTerm or OTerm). Basically, asymptotic terms consist of a growth (which is an asymptotic growth group element, for example MonomialGrowthElement); additional structure and properties are added by the classes inherited from GenericTermMonoid.

EXAMPLES:

```
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: from sage.rings.asymptotic.term_monoid import GenericTermMonoid
sage: from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory as T
sage: G_x = GrowthGroup('x^ZZ'); x = G_x.gen()
sage: G_y = GrowthGroup('y^QQ'); y = G_y.gen()
sage: T_x_ZZ = GenericTermMonoid(TermMonoid, G_x, QQ)
sage: T_y_QQ = GenericTermMonoid(TermMonoid, G_y, QQ)
sage: T_x_ZZ
GenericTerm Monoid x^ZZ with (implicit) coefficients in Rational Field
```
Element

alias of GenericTerm

change_parameter(growth_group=None, coefficient_ring=None)

Return a term monoid with a change in one or more of the given parameters.

INPUT:

• growth_group – (default: None) the new growth group.

• coefficient_ring – (default: None) the new coefficient ring.

OUTPUT:

A term monoid.

EXAMPLES:

sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory as TermMonoid
sage: E = TermMonoid('exact', GrowthGroup('n^ZZ'), ZZ)
sage: E.change_parameter(coefficient_ring=QQ)
Exact Term Monoid n^ZZ with coefficients in Rational Field
sage: E.change_parameter(growth_group=GrowthGroup('n^QQ'))
Exact Term Monoid n^QQ with coefficients in Integer Ring

property coefficient_ring

The coefficient ring of this term monoid, i.e. the ring where the coefficients are from.

EXAMPLES:

sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: from sage.rings.asymptotic.term_monoid import GenericTermMonoid
sage: from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory as TermMonoid
sage: GenericTermMonoid(TermMonoid, GrowthGroup('x^ZZ'), ZZ).coefficient_ring
Integer Ring

from_construction(construction, **kwds_overrides)

Create a term from the construction of another term.

INPUT:

• construction – a pair (cls, kwds_construction)

• kwds_overrides – a dictionary

OUTPUT:

A term.

EXAMPLES:
We use a construction directly as input:

```python
sage: T.from_construction(o.construction())
O(x)
```

We can override the given data:

```python
sage: T.from_construction(o.construction(), growth=x^2)
O(x^2)
```

A minimalistic example:

```python
sage: T.from_construction((None, {'growth': x}))
O(x)
```

See also:

```
GenericTerm.construction(), TermWithCoefficient.construction()
```

**property growth_group**

The growth group underlying this term monoid.

```python
sage: T.growth_group
Growth Group x^ZZ
```

**le(left, right)**

Return whether the term left is at most (less than or equal to) the term right.

**INPUT:**

- left – an element.
- right – an element.

**OUTPUT:**

A boolean.

**EXAMPLES:**

```
sage: T.le(left, right)
```
sage: G = GrowthGroup('x^{ZZ}'); x = G.gen()
sage: T = GenericTermMonoid(TermMonoid, G, QQ)
sage: t1 = T(x); t2 = T(x^2)
sage: T.le(t1, t2)
True

some_elements()

Return some elements of this term monoid.

See TestSuite for a typical use case.

INPUT:
Nothing.

OUTPUT:
An iterator.

EXAMPLES:

sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory as...
˓→TermMonoid
sage: G = GrowthGroup('x^{ZZ}')
sage: tuple(TermMonoid('O', G, QQ).some_elements())
(0(1), O(x), O(x^(-1)), O(x^2), O(x^(-2)), O(x^3), ...)

term_monoid(type)

Return the term monoid of specified type.

INPUT:

• type – ‘O’ or ‘exact’, or an instance of an existing term monoid. See TermMonoidFactory for more details.

OUTPUT:

A term monoid object derived from GenericTermMonoid.

EXAMPLES:

sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory as...
˓→TermMonoid
sage: E = TermMonoid('exact', GrowthGroup('x^{ZZ}'), ZZ); E
Exact Term Monoid x^{ZZ} with coefficients in Integer Ring
sage: E.term_monoid('O')
O-Term Monoid x^{ZZ} with implicit coefficients in Integer Ring

property term_monoid_factory

The term monoid factory capable of creating this term monoid.

EXAMPLES:

sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory
(continues on next page)
class sage.rings.asymptotic.term_monoid.OTerm(parent, growth)

Bases: GenericTerm

Class for an asymptotic term representing an $O$-term with specified growth. For the mathematical properties of $O$-terms see Wikipedia article Big_O_Notation.

$O$-terms can absorb terms of weaker or equal growth.

INPUT:
- parent – the parent of the asymptotic term.
- growth – a growth element.

EXAMPLES:

```python
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: from sage.rings.asymptotic.term_monoid import OTermMonoid
sage: from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory as TermMonoid

sage: G = GrowthGroup('x^ZZ'); x = G.gen()
sage: OT = OTermMonoid(TermMonoid, G, QQ)
sage: t1, t2, t3 = OT(x^-7), OT(x^5), OT(x^42)

sage: t1.can_absorb(t2)
False

sage: t2.can_absorb(t1)
True

sage: t2.absorb(t1)
O(x^5)

sage: t1 <= t2 and t2 <= t3
True

sage: t3 <= t1
False
```

The conversion of growth elements also works for the creation of $O$-terms:

```python
sage: x = SR('x'); x.parent()
Symbolic Ring
sage: OT(x^17)
O(x^17)
```

can_absorb(other)

Check whether this $O$-term can absorb other.
Asymptotic Expansions, Release 10.2

INPUT:
  • other – an asymptotic term.

OUTPUT:
A boolean.

Note: An $O$Term can absorb any other asymptotic term with weaker or equal growth.
See the module description for a detailed explanation of absorption.

EXAMPLES:

```python
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory as_
    TermMonoid
sage: OT = TermMonoid('O', GrowthGroup('x^ZZ'), QQ)
sage: t1 = OT(x^21); t2 = OT(x^42)
sage: t1.can_absorb(t2)
False
sage: t2.can_absorb(t1)
True
```

`is_little_o_of_one()`
Return whether this O-term is of order $o(1)$.

INPUT:
Nothing.

OUTPUT:
A boolean.

EXAMPLES:

```python
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory as_
    TermMonoid
sage: T = TermMonoid('O', GrowthGroup('x^ZZ'), QQ)
sage: T(x).is_little_o_of_one()
False
sage: T(1).is_little_o_of_one()
False
sage: T(x^(-1)).is_little_o_of_one()
True
```

```python
sage: T = TermMonoid('O', GrowthGroup('x^ZZ * y^ZZ'), QQ)
sage: T('x * y^(-1)').is_little_o_of_one()
False
sage: T('x^(-1) * y').is_little_o_of_one()
False
sage: T('x^(-2) * y^(-3)').is_little_o_of_one()
True
```
sage: T = TermMonoid('O', GrowthGroup('x^QQ * log(x)^QQ'), QQ)
sage: T('x * log(x)^2').is_little_o_of_one()
False
sage: T('x^2 * log(x)^(-1234)').is_little_o_of_one()
False
sage: T('x^(-1) * log(x)^4242').is_little_o_of_one()
True
sage: T('x^(-1/100) * log(x)^{(1000/7)}').is_little_o_of_one()
True

log_term(base=None, locals=None)

Determine the logarithm of this O-term.

INPUT:

- base – the base of the logarithm. If None (default value) is used, the natural logarithm is taken.
- locals – a dictionary which may contain the following keys and values:
  - 'log' – value: a function. If not used, then the usual log is taken.

OUTPUT:

A tuple of terms.

Note: This method returns a tuple with the summands that come from applying the rule \( \log(x \cdot y) = \log(x) + \log(y) \).

EXAMPLES:

sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory as...
  TermMonoid
sage: T = TermMonoid('O', GrowthGroup('x^ZZ * log(x)^ZZ'), QQ)
sage: T(x^2).log_term()
(0(log(x)),)
sage: T(x^1234).log_term()
(0(log(x)),)

sage: from sage.rings.asymptotic.term_monoid import TermWithCoefficientMonoid
sage: T = TermMonoid('O', GrowthGroup('x^ZZ * log(x)^ZZ * y^ZZ * log(y)^ZZ'),...
  QQ)
sage: T('x * y').log_term()
(0(log(x)), 0(log(y)));

See also:

ExactTerm.log_term().

rpow(base)

Return the power of base to this O-term.

INPUT:

- base – an element or 'e'.

OUTPUT:
A term.

**Note:** For $O(Term)$, the powers can only be constructed for exponents $O(1)$ or if base is 1.

**EXAMPLES:**

```python
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
da: from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory as _, TermMonoid
da: T = TermMonoid('O', GrowthGroup('x^ZZ * log(x)^ZZ'), QQ)
da: T(1).rpow('e')
O(1)
da: T(1).rpow(2)
O(1)

sage: T.an_element().rpow(1)
l
sage: T('x^2').rpow(1)
l

sage: T.an_element().rpow('e')
Traceback (most recent call last):
  ... ValueError: Cannot take e to the exponent $O(x\log(x))$ in
O-Term Monoid $x^ZZ * \log(x)^ZZ$ with implicit coefficients in Rational Field
sage: T('\log(x)').rpow('e')
Traceback (most recent call last):
  ... ValueError: Cannot take e to the exponent $O(\log(x))$ in
O-Term Monoid $x^ZZ * \log(x)^ZZ$ with implicit coefficients in Rational Field
```

**class** `sage.rings.asymptotic.term_monoid.OTermMonoid`(`term_monoid_factory, growth_group, coefficient_ring, category`)

Bases: `GenericTermMonoid`

Parent for asymptotic big $O$-terms.

**INPUT:**

- `growth_group` – a growth group.
- `category` – The category of the parent can be specified in order to broaden the base structure. It has to be a subcategory of `Join of Category of monoids and Category of posets` and `Category of posets`. This is also the default category if `None` is specified.

**EXAMPLES:**

```python
da: from sage.rings.asymptotic.growth_group import GrowthGroup
da: from sage.rings.asymptotic.term_monoid import OTermMonoid
da: from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory as_, TermMonoid
da: G_x_ZZ = GrowthGroup('x^ZZ')
da: G_y_QQ = GrowthGroup('y^QQ')
da: OT_x_ZZ = OTermMonoid(TermMonoid, G_x_ZZ, QQ); OT_x_ZZ

(continues on next page)```
O-term monoids can also be created by using the term factory:

```python
sage: TermMonoid('O', G_x_ZZ, QQ) is OT_x_ZZ
True
sage: TermMonoid('O', GrowthGroup('x^QQ'), QQ)
O-Term Monoid x^QQ with implicit coefficients in Rational Field
```

**Element**
alias of `OTerm`

**class** `sage.rings.asymptotic.term_monoid.TermMonoidFactory`

Factory for asymptotic term monoids. It can generate the following term monoids:

- `OTermMonoid`,
- `ExactTermMonoid`,
- `BTermMonoid`.

**Note:** An instance of this factory is available as `DefaultTermMonoidFactory`.

**INPUT:**

- `term_monoid` – the kind of terms held in the new term monoid. Either a string 'exact', 'O' (capital letter O) or 'B' or an existing instance of a term monoid.
- `growth_group` – a growth group or a string describing a growth group.
- `coefficient_ring` – a ring.
- `asymptotic_ring` – if specified, then `growth_group` and `coefficient_ring` are taken from this asymptotic ring.

**OUTPUT:**

An asymptotic term monoid.

**EXAMPLES:**

```python
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory
˓→TermMonoid
sage: G = GrowthGroup('x^ZZ')
sage: TermMonoid('O', G, QQ)
O-Term Monoid x^ZZ with implicit coefficients in Rational Field
sage: TermMonoid('exact', G, ZZ)
Exact Term Monoid x^ZZ with coefficients in Integer Ring
```
```python
sage: R = AsymptoticRing(growth_group=G, coefficient_ring=QQ)
sage: TermMonoid('exact', asymptotic_ring=R)
Exact Term Monoid x^ZZ with coefficients in Rational Field
sage: TermMonoid('O', asymptotic_ring=R)
O-Term Monoid x^ZZ with implicit coefficients in Rational Field
sage: TermMonoid('exact', 'QQ^m * m^QQ * log(n)^ZZ', ZZ)
Exact Term Monoid QQ^m * m^QQ * Signs^m * log(n)^ZZ with coefficients in Integer Ring
```

`create_key_and_extra_args(term_monoid, growth_group=None, coefficient_ring=None, asymptotic_ring=None, **kwds)`

Given the arguments and keyword, create a key that uniquely determines this object.

**EXAMPLES:**

```python
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
def create_key_and_extra_args(
    term_monoid,
    growth_group=None,
    coefficient_ring=None,
    asymptotic_ring=None,
    **kwds
)
```

```python
sage: from sage.rings.asymptotic.growth_group import GrowthGroup;
    from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory as_
    →TermMonoid
sage: G = GrowthGroup('x^ZZ')
sage: TermMonoid.create_key_and_extra_args('O', G, QQ)
((<class 'sage.rings.asymptotic.term_monoid.OTermMonoid'>,
  Growth Group x^ZZ, Rational Field), {})
sage: TermMonoid.create_key_and_extra_args('exact', G, ZZ)
((<class 'sage.rings.asymptotic.term_monoid.ExactTermMonoid'>,
  Growth Group x^ZZ, Integer Ring), {})
sage: TermMonoid.create_key_and_extra_args('exact', G)
Traceback (most recent call last):
... ValueError: A coefficient ring has to be specified
to create a term monoid of type 'exact'
```

`create_object(version, key, **kwds)`

Create a object from the given arguments.

**EXAMPLES:**

```python
sage: from sage.rings.asymptotic.growth_group import GrowthGroup;
    from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory as_
    →TermMonoid
sage: G = GrowthGroup('x^ZZ')
sage: TermMonoid('O', G, QQ)  # indirect doctest
O-Term Monoid x^ZZ with implicit coefficients in Rational Field
sage: TermMonoid('exact', G, ZZ)  # indirect doctest
Exact Term Monoid x^ZZ with coefficients in Integer Ring
```

`class sage.rings.asymptotic.term_monoid.TermWithCoefficient(parent, growth, coefficient)`

Base class for asymptotic terms possessing a coefficient. For example, `ExactTerm` directly inherits from this class.

**INPUT:**

- `parent` – the parent of the asymptotic term.
• growth – an asymptotic growth element of the parent's growth group.
• coefficient – an element of the parent's coefficient ring.

EXAMPLES:

```python
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: from sage.rings.asymptotic.term_monoid import TermWithCoefficientMonoid
sage: from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory as 
˓→TermMonoid

sage: G = GrowthGroup('.x^ZZ'); x = G.gen()
sage: CT_ZZ = TermWithCoefficientMonoid(TermMonoid, G, ZZ)
sage: CT_QQ = TermWithCoefficientMonoid(TermMonoid, G, QQ)
sage: CT_ZZ(x^2, coefficient=5)
Term with coefficient 5 and growth x^2
sage: CT_QQ(x^3, coefficient=3/8)
Term with coefficient 3/8 and growth x^3
```

`construction()`

Return a construction of this term.

INPUT:

Nothing.

OUTPUT:

A pair (cls, kwds) such that cls(**kwds) equals this term.

EXAMPLES:

```python
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory as 
˓→TermMonoid

sage: T = TermMonoid('exact', GrowthGroup('x^ZZ'), QQ)
sage: a = T.an_element(); a
1/2*x
sage: cls, kwds = a.construction(); cls, kwds
((<class 'sage.rings.asymptotic.term_monoid.ExactTermMonoid_with_category. 
˓→element_class'>),
 {'coefficient': 1/2,
 'growth': x,
 'parent': Exact Term Monoid x^ZZ with coefficients in Rational Field})
sage: cls(**kwds) == a
True
```

See also:

`GenericTerm.construction()`, `GenericTermMonoid.from_construction()`

class sage.rings.asymptotic.term_monoid.TermWithCoefficientMonoid( 
  term_monoid_factory, growth_group, coefficient_ring, category)

Bases: GenericTermMonoid

This class implements the base structure for parents of asymptotic terms possessing a coefficient from some coefficient ring. In particular, this is also the parent for `TermWithCoefficient`. 
INPUT:

- `growth_group` – a growth group.
- `category` – The category of the parent can be specified in order to broaden the base structure. It has to be a subcategory of `Join of Category of monoids and Category of posets`. This is also the default category if `None` is specified.
- `coefficient_ring` – the ring which contains the coefficients of the elements.

EXAMPLES:

```python
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: from sage.rings.asymptotic.term_monoid import TermWithCoefficientMonoid
sage: from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory as _
   TermMonoid

sage: G_ZZ = GrowthGroup(‘x^ZZ’); x_ZZ = G_ZZ.gen()
```

Element

alias of `TermWithCoefficient`

`some_elements()`

Return some elements of this term with coefficient monoid.

See `TestSuite` for a typical use case.

INPUT:

Nothing.

OUTPUT:

An iterator.

EXAMPLES:

```python
sage: from itertools import islice
sage: from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory as _,
   TermMonoid
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: G = GrowthGroup(‘z^QQ’)
sage: T = TermMonoid(‘exact’, G, ZZ)
sage: tuple(islice(T.some_elements(), int(10)))
(z^(1/2), z^(-1/2), -z^(1/2), z^2, -z^(-1/2), 2*z^(1/2),
 z^(-2), -z^2, 2*z^(-1/2), -2*z^(1/2))
```
exception sage.rings.asymptotic.term_monoid.ZeroCoefficientError

Bases: ValueError

sage.rings.asymptotic.term_monoid.absorption(left, right)

Let one of the two passed terms absorb the other.

Helper function used by AsymptoticExpansion.

Note: If neither of the terms can absorb the other, an ArithmeticError is raised.

See the module description for a detailed explanation of absorption.

INPUT:

• left – an asymptotic term.
• right – an asymptotic term.

OUTPUT:

An asymptotic term or None.

EXAMPLES:

```
sage: from sage.rings.asymptotic.growth_group import GrowthGroup
sage: from sage.rings.asymptotic.term_monoid import DefaultTermMonoidFactory as _, TermMonoid
sage: from sage.rings.asymptotic.term_monoid import absorption
sage: T = TermMonoid('O', GrowthGroup('x^ZZ'), ZZ)
sage: absorption(T(x^2), T(x^3))
O(x^3)
sage: absorption(T(x^3), T(x^2))
O(x^3)
sage: T = TermMonoid('exact', GrowthGroup('x^ZZ'), ZZ)
sage: absorption(T(x^2), T(x^3))
Traceback (most recent call last):
... ArithmeticError: Absorption between x^2 and x^3 is not possible.
```

sage.rings.asymptotic.term_monoid.can_absorb(left, right)

Return whether one of the two input terms is able to absorb the other.

Helper function used by AsymptoticExpansion.

INPUT:

• left – an asymptotic term.
• right – an asymptotic term.

OUTPUT:

A boolean.

Note: See the module description for a detailed explanation of absorption.

EXAMPLES:
4.6 Asymptotic Expansions — Miscellaneous

AUTHORS:

- Daniel Krenn (2015)

ACKNOWLEDGEMENT:

- Benjamin Hackl, Clemens Heuberger and Daniel Krenn are supported by the Austrian Science Fund (FWF): P 24644-N26.
- Benjamin Hackl is supported by the Google Summer of Code 2015.

4.6.1 Functions, Classes and Methods

class sage.rings.asymptotic.misc.Locals
Bases: dict

A frozen dictionary-like class for storing locals of an AsymptoticRing.

EXAMPLES:

```
sage: from sage.rings.asymptotic.misc import Locals
sage: locals = Locals({'a': 42})
sage: locals['a']
42
```

The object contains default values (see default_locals()) for some keys:

```
sage: locals['log']
<function log at 0x...>
```

default_locals()

Return the default locals used in the AsymptoticRing.

OUTPUT:

A dictionary.

EXAMPLES:

```
sage: from sage.rings.asymptotic.misc import Locals
sage: locals = Locals({'a': 2, 'b': 1})
sage: locals
{...}
```

(continues on next page)
Asymptotic Expansions, Release 10.2

\{'a\': 2, 'b': 1\}

sage: locals.default_locals()
\{'log\': <function log at 0x...>\}
sage: locals[\'log\']
<function log at 0x...>

**exception** sage.rings.asymptotic.misc.NotImplementedBZero

Bases: NotImplementedError

A special NotImplementedError which is raised when the result is B(0) which means 0 for sufficiently large values of the variable.

**exception** sage.rings.asymptotic.misc.NotImplementedOZero

Bases: NotImplementedError

A special NotImplementedError which is raised when the result is O(0) which means 0 for sufficiently large values of the variable.

**class** sage.rings.asymptotic.misc.WithLocals

Bases: SageObject

A class extensions for handling local values; see also Locals.

This is used in the AsymptoticRing.

**EXAMPLES:**

```python
sage: A.<n> = AsymptoticRing('n^ZZ', QQ, locals={'a': 42})
sage: A.locals()
\{'a\': 42\}
```

**locals(locals=None)**

Return the actual Locals object to be used.

**INPUT:**

- locals – an object

If locals is not None, then a Locals object is created and returned. If locals is None, then a stored Locals object, if any, is returned. Otherwise, an empty (i.e. no values except the default values) Locals object is created and returned.

**OUTPUT:**

A Locals object.

sage.rings.asymptotic.misc.bidirectional_merge_overlapping(A, B, key=None)

Merge the two overlapping tuples/lists.

**INPUT:**

- A – a list or tuple (type has to coincide with type of B).
- B – a list or tuple (type has to coincide with type of A).
- key – (default: None) a function. If None, then the identity is used. This key-function applied on an element of the list/tuple is used for comparison. Thus elements with the same key are considered as equal.
OUTPUT:
A pair of lists or tuples (depending on the type of A and B).

Note: Suppose we can decompose the list \( A = ac \) and \( B = cb \) with lists \( a, b, c \), where \( c \) is nonempty. Then bidirectional_merge_overlapping() returns the pair \((acb, acb)\).

Suppose a key-function is specified and \( A = ac_A \) and \( B = c_Bb \), where the list of keys of the elements of \( c_A \) equals the list of keys of the elements of \( c_B \). Then bidirectional_merge_overlapping() returns the pair \((ac_Ab, ac_Bb)\).

After unsuccessfully merging \( A = ac \) and \( B = cb \), a merge of \( A = ca \) and \( B = bc \) is tried.

sage.rings.asymptotic.misc.bidirectional_merge_sorted(A, B, key=None)
Merge the two tuples/lists, keeping the orders provided by them.

INPUT:
• A – a list or tuple (type has to coincide with type of B).
• B – a list or tuple (type has to coincide with type of A).
• key – (default: None) a function. If None, then the identity is used. This key-function applied on an element of the list/tuple is used for comparison. Thus elements with the same key are considered as equal.

Note: The two tuples/list need to overlap, i.e. need at least one key in common.

OUTPUT:
A pair of lists containing all elements totally ordered. (The first component uses A as a merge base, the second component B.)

If merging fails, then a RuntimeError is raised.

sage.rings.asymptotic.misc.combine_exceptions(e, *f)
Helper function which combines the messages of the given exceptions.

INPUT:
• e – an exception.
• *f – exceptions.

OUTPUT:
An exception.

EXAMPLES:

sage: from sage.rings.asymptotic.misc import combine_exceptions
sage: raise combine_exceptions(ValueError('Outer.'), TypeError('Inner.'))
Traceback (most recent call last):
  ...
ValueError: Outer.
> *previous* TypeError: Inner.
sage: raise combine_exceptions(ValueError('Outer.'),
                             TypeError('Inner1.'), TypeError('Inner2.'))
Traceback (most recent call last):
  ...
(continues on next page)
ValueError: Outer.
> *previous* TypeError: Inner1.
> *and* TypeError: Inner2.
sage: raise combine_exceptions(ValueError('Outer.'),
....:     combine_exceptions(TypeError('Middle.'),
....:     TypeError('Inner.')))
Traceback (most recent call last):
...:
ValueError: Outer.
> *previous* TypeError: Middle.
>> *previous* TypeError: Inner.

sage.rings.asymptotic.misc.log_string(element, base=None)

Return a representation of the log of the given element to the given base.

INPUT:

- element – an object.
- base – an object or None.

OUTPUT:

A string.

EXAMPLES:

sage: from sage.rings.asymptotic.misc import log_string
sage: log_string(3)
'\log(3)'
sage: log_string(3, base=42)
'\log(3, base=42)'

sage.rings.asymptotic.misc.parent_to_repr_short(P)

Helper method which generates a short(er) representation string out of a parent.

INPUT:

- P – a parent.

OUTPUT:

A string.

EXAMPLES:

sage: from sage.rings.asymptotic.misc import parent_to_repr_short
sage: parent_to_repr_short(ZZ)
'ZZ'
sage: parent_to_repr_short(QQ)
'QQ'
sage: parent_to_repr_short(SR)
'SR'
sage: parent_to_repr_short(RR)
'RR'
sage: parent_to_repr_short(CC)
'CC'
sage: parent_to_repr_short(ZZ['x'])
'ZZ[x]'
sage: parent_to_repr_short(QQ['d, k'])
'QQ[d, k]'
sage: parent_to_repr_short(QQ['e'])
'QQ[e]'
sage: parent_to_repr_short(SR[['a, r']])
'SR[['a, r']]'
sage: parent_to_repr_short(Zmod(3))
'Ring of integers modulo 3'
sage: parent_to_repr_short(Zmod(3)['g'])
'Univariate Polynomial Ring in g over Ring of integers modulo 3'

sage.rings.asymptotic.misc.repr_op(left, op, right=None, latex=False)
Create a string \texttt{left op right} with taking care of parentheses in its operands.

\textbf{INPUT:}
- \texttt{left} – an element.
- \texttt{op} – a string.
- \texttt{right} – an element.
- \texttt{latex} – (default: \texttt{False}) a boolean. If set, then LaTeX-output is returned.

\textbf{OUTPUT:}
A string.

\textbf{EXAMPLES:}

sage: from sage.rings.asymptotic.misc import repr_op
sage: repr_op('a^b', '^', 'c')
'(a^b)^c'

sage.rings.asymptotic.misc.repr_short_to_parent(s)
Helper method for the growth group factory, which converts a short representation string to a parent.

\textbf{INPUT:}
- \texttt{s} – a string, short representation of a parent.

\textbf{OUTPUT:}
A parent.

The possible short representations are shown in the examples below.

\textbf{EXAMPLES:}

sage: from sage.rings.asymptotic.misc import repr_short_to_parent
sage: repr_short_to_parent('ZZ')
Integer Ring
sage: repr_short_to_parent('QQ')
Rational Field
sage: repr_short_to_parent('SR')
Symbolic Ring
sage: repr_short_to_parent('NN')
Non negative integer semiring
sage: repr_short_to_parent('UU')
Group of Roots of Unity

sage.rings.asymptotic.misc.split_str_by_op(string, op, strip_parentheses=True)
Split the given string into a tuple of substrings arising by splitting by op and taking care of parentheses.

INPUT:
- string – a string.
- op – a string. This is used by str.split. Thus, if this is None, then any whitespace string is a separator and empty strings are removed from the result.
- strip_parentheses – (default: True) a boolean.

OUTPUT:
A tuple of strings.

sage.rings.asymptotic.misc.strip_symbolic(expression)
Return, if possible, the underlying (numeric) object of the symbolic expression.
If expression is not symbolic, then expression is returned.

INPUT:
- expression – an object

OUTPUT:
An object.

EXAMPLES:

```python
sage: from sage.rings.asymptotic.misc import strip_symbolic
sage: strip_symbolic(SR(2)); _.parent()
2
Integer Ring
sage: strip_symbolic(SR(2/3)); _.parent()
2/3
Rational Field
sage: strip_symbolic(SR('x')); _.parent()
x
Symbolic Ring
sage: strip_symbolic(pi); _.parent()
pi
Symbolic Ring
```

sage.rings.asymptotic.misc.substitute_raise_exception(element, e)
Raise an error describing what went wrong with the substitution.

INPUT:
- element – an element.
- e – an exception which is included in the raised error message.

OUTPUT:
Raise an exception of the same type as e.
sage.rings.asymptotic.misc.transform_category(category, subcategory_mapping, axiom_mapping, initial_category=None)

Transform category to a new category according to the given mappings.

**INPUT:**
- **category** – a category.
- **subcategory_mapping** – a list (or other iterable) of triples (**from**, **to**, **mandatory**), where
  - **from** and **to** are categories and
  - **mandatory** is a boolean.
- **axiom_mapping** – a list (or other iterable) of triples (**from**, **to**, **mandatory**), where
  - **from** and **to** are strings describing axioms and
  - **mandatory** is a boolean.
- **initial_category** – (default: None) a category. When transforming the given category, this initial_category is used as a starting point of the result. This means the resulting category will be a subcategory of initial_category. If initial_category is None, then the category of objects is used.

**OUTPUT:**
A category.

**Note:** Consider a subcategory mapping (**from**, **to**, **mandatory**). If category is a subcategory of **from**, then the returned category will be a subcategory of **to**. Otherwise and if mandatory is set, then an error is raised.

Consider an axiom mapping (**from**, **to**, **mandatory**). If category is has axiom **from**, then the returned category will have axiom **to**. Otherwise and if mandatory is set, then an error is raised.

**EXAMPLES:**

```python
sage: from sage.rings.asymptotic.misc import transform_category
sage: from sage.categories.additive_semigroups import AdditiveSemigroups
sage: from sage.categories.additive_monoids import AdditiveMonoids
sage: from sage.categories.additive_groups import AdditiveGroups

4.7 Asymptotics of Multivariate Generating Series

Let $F(x) = \sum_{\nu \in \mathbb{N}^d} F_{r\alpha} x^\nu$ be a multivariate power series with complex coefficients that converges in a neighborhood of the origin. Assume that $F = G/H$ for some functions $G$ and $H$ holomorphic in a neighborhood of the origin. Assume also that $H$ is a polynomial.

This computes asymptotics for the coefficients $F_{r\alpha}$ as $r \to \infty$ with $r\alpha \in \mathbb{N}^d$ for $\alpha$ in a permissible subset of $d$-tuples of positive reals. More specifically, it computes arbitrary terms of the asymptotic expansion for $F_{r\alpha}$ when the asymptotics are controlled by a strictly minimal multiple point of the algebraic variety $H = 0$.

The algorithms and formulas implemented here come from [RW2008] and [RW2012]. For a general reference take a look in the book [PW2013].
4.7.1 Introductory Examples

```
sage: from sage.rings.asymptotic.asymptotics_multivariate_generating_functions import...
˓→FractionWithFactoredDenominatorRing

A univariate smooth point example:
```
sage: R.<x> = PolynomialRing(QQ)
sage: FFPD = FractionWithFactoredDenominatorRing(R, SR)
sage: H = (x - 1/2)^3
sage: Hfac = H.factor()
sage: G = -1/(x + 3)/Hfac.unit()
sage: F = FFPD(G, Hfac)
sage: F
(-1/(x + 3), [(x - 1/2, 3)])
sage: alpha = [1]
sage: decomp = F.asymptotic_decomposition(alpha)
sage: decomp
(0, []) + (-1/2*r^2*(x^2/(x^5 + 9*x^4 + 27*x^3 + 27*x^2) + 6*r*x/(x^5 + 9*x^4 + 27*x^3 + 27*x^2) + 9/(x^5 + 9*x^4 + 27*x^3 + 27*x^2))
- 1/2*r*(5*x^2/(x^5 + 9*x^4 + 27*x^3 + 27*x^2) + 24*r*x/(x^5 + 9*x^4 + 27*x^3 + 27*x^2) + 27/(x^5 + 9*x^4 + 27*x^3 + 27*x^2))
- 3*x^2/(x^5 + 9*x^4 + 27*x^3 + 27*x^2)
- 9/2*r*(5*x^2/(x^5 + 9*x^4 + 27*x^3 + 27*x^2) + 24*r*x/(x^5 + 9*x^4 + 27*x^3 + 27*x^2) + 27/(x^5 + 9*x^4 + 27*x^3 + 27*x^2))
- 3*x^2/(x^5 + 9*x^4 + 27*x^3 + 27*x^2)
- 9/2*r*(5*x^2/(x^5 + 9*x^4 + 27*x^3 + 27*x^2) + 24*r*x/(x^5 + 9*x^4 + 27*x^3 + 27*x^2) + 27/(x^5 + 9*x^4 + 27*x^3 + 27*x^2))
- 3*x^2/(x^5 + 9*x^4 + 27*x^3 + 27*x^2)
[(x - 1/2, 1)])
sage: F1 = decomp[1]
sage: p = {x: 1/2}
sage: asy = F1.asymptotics(p, alpha, 3)
sage: asy
(8/343*(49*r^2 + 161*r + 114)*2^r, 2, 8/7*r^2 + 184/49*r + 912/343)
sage: F.relative_error(asy[0], alpha, [1, 2, 4, 8, 16], asy[1])
[((1,), 7.555555556, [7.556851312], [-0.0001714971672]),
 ((2,), 14.74074074, [14.74052478], [0.00001465051901]),
 ((4,), 35.96502058, [35.96501458], [1.667911934e-7]),

 ((16,), 355.3119534, [355.3119534], [0.0000000000])]```

Another smooth point example (Example 5.4 of [RW2008]):
```
sage: R.<x,y> = PolynomialRing(QQ)
sage: FFPD = FractionWithFactoredDenominatorRingRing(R)
sage: q = 1/2
sage: qq = q.denominator()
sage: H = 1 - q^x + q^x*y - x^2*y
sage: Hfac = H.factor()
sage: G = (1 - q^x)/Hfac.unit()
sage: F = FFPD(G, Hfac)
sage: alpha = list(qq^vector([2, 1 - q]))
sage: alpha
```
sage: I = F.smooth_critical_ideal(alpha)
sage: I
Ideal (y^2 - 2*y + 1, x + 1/4*y - 5/4) of
Multivariate Polynomial Ring in x, y over Rational Field
sage: s = solve([SR(z) for z in I.gens()],
       ....: [SR(z) for z in R.gens()], solution_dict=true)
sage: s == [{SR(x): 1, SR(y): 1}
True
sage: p = s[0]
sage: asy = F.asymptotics(p, alpha, 1, verbose=True)

4.7.2 Various

AUTHORS:
• Alexander Raichev (2008)
• Daniel Krenn (2014, 2016)

4.7.3 Classes and Methods

class sage.rings.asymptotic.asymptotics_multivariate_generating_functions.FractionWithFactoredDenominator

Bases: RingElement

This element represents a fraction with a factored polynomial denominator. See also its parent FractionWithFactoredDenominatorRing for details.

Represents a fraction with factored polynomial denominator (FFPD) \( p/(q_1^{e_1} \cdots q_n^{e_n}) \) by storing the parts \( p \) and \( [(q_1, e_1), \ldots, (q_n, e_n)] \). Here \( q_1, \ldots, q_n \) are elements of a 0- or multi-variate factorial polynomial ring \( R \), \( q_1, \ldots, q_n \) are distinct irreducible elements of \( R \), \( e_1, \ldots, e_n \) are positive integers, and \( p \) is a function of the indeterminates of \( R \) (e.g., a Sage symbolic expression). An element \( r \) with no polynomial denominator is represented as \( (r, []) \).
INPUT:

- numerator – an element \( p \); this can be of any ring from which parent’s base has coercion in
- denominator_factored – a list of the form \([ (q_1, e_1), \ldots, (q_n, e_n) \] \), where the \( q_1, \ldots, q_n \) are distinct irreducible elements of \( R \) and the \( e_i \) are positive integers
- reduce – (optional) if True, then represent \( p/((q_1^{e_1} \cdots q_n^{e_n}) \) in lowest terms, otherwise this won’t attempt to divide \( p \) by any of the \( q_i \)

OUTPUT:

An element representing the rational expression \( p/((q_1^{e_1} \cdots q_n^{e_n}) \).

EXAMPLES:

```
sage: from sage.rings.asymptotic.asymptotics_multivariate_generating_functions import FractionWithFactoredDenominatorRing
sage: R.<x,y> = PolynomialRing(QQ)
sage: FFPD = FractionWithFactoredDenominatorRing(R)
sage: df = [(x, 1), (y, 1), (x*y+1, 1)]
sage: f = FFPD(x, df)
sage: f
(1, [(y, 1), (x*y + 1, 1)])
sage: ff = FFPD(x, df, reduce=False)
sage: ff
(x, [(y, 1), (x, 1), (x*y + 1, 1)])
sage: f = FFPD(x + y, [(x + y, 1)])
sage: f
(1, [])
sage: R.<x> = PolynomialRing(QQ)
sage: FFPD = FractionWithFactoredDenominatorRing(R)
sage: f = 5*x^3 + 1/x + 1/(x-1) + 1/(3*x^2 + 1)
sage: FFPD(f)
(5*x^7 - 5*x^6 + 5/3*x^5 - 5/3*x^4 + 2*x^3 - 2/3*x^2 + 1/3*x - 1/3, [(x - 1, 1), (x, 1), (x^2 + 1/3, 1)])
sage: R.<x,y> = PolynomialRing(QQ)
sage: FFPD = FractionWithFactoredDenominatorRing(R, SR)
sage: f = 2*y/(5*(x^3 - 1)*(y + 1))
sage: FFPD(f)
(2/5*y, [(y + 1, 1), (x - 1, 1), (x^2 + x + 1, 1)])
sage: p = 1/x^2
sage: q = 3*x*y^2
sage: qs = q.factor()
sage: f = FFPD(p/qs.unit(), qs)
sage: f
(1/3/x^2, [(y, 1), (x, 2)])
sage: f = FFPD(cos(x)*x*y^2, [(x, 2), (y, 1)])
sage: f
(x*y^2*cos(x), [(y, 1), (x, 2)])
```
sage: G = exp(x + y)
sage: H = (1 - 2*x - y) * (1 - x - 2*y)
sage: a = FFPD(G/H)
sage: a
(e^(x + y), [(x + 2*y - 1, 1), (2*x + y - 1, 1)])
sage: a.denominator_ring
Multivariate Polynomial Ring in x, y over Rational Field
sage: b = FFPD(G, H.factor())
sage: b
(e^(x + y), [(x + 2*y - 1, 1), (2*x + y - 1, 1)])
sage: b.denominator_ring
Multivariate Polynomial Ring in x, y over Rational Field

Singular throws a ‘not implemented’ error when trying to factor in a multivariate polynomial ring over an inexact field:

sage: R.<x,y> = PolynomialRing(CC)
sage: FFPD = FractionWithFactoredDenominatorRing(R)
sage: f = (x + 1)/(x*y*(x*y + 1)^2)
sage: FFPD(f)
Traceback (most recent call last):
...TypeError: Singular error:
  ? not implemented
  ? error occurred in or before STDIN line ...
  'def sage...=factorize(sage...);'

AUTHORS:
• Alexander Raichev (2012-07-26)
• Daniel Krenn (2014-12-01)

algebraic_dependence_certificate()

Return the algebraic dependence certificate of self.

The algebraic dependence certificate is the ideal \( J \) of annihilating polynomials for the set of polynomials \([q^e \text{ for } (q, e) \in \text{self.denominator_factored()}]\), which could be the zero ideal. The ideal \( J \) lies in a polynomial ring over the field \( \text{self.denominator_ring.base_ring()} \) that has \( m = \text{len(self.denominator_factored())} \) indeterminates.

OUTPUT:
An ideal.

EXAMPLES:

sage: from sage.rings.asymptotic.asymptotics_multivariate_generating_functions import FractionWithFactoredDenominatorRing
sage: R.<x,y> = PolynomialRing(QQ)
sage: FFPD = FractionWithFactoredDenominatorRing(R)
sage: f = 1/(x^2 * (x*y + 1) * y^3)
sage: ff = FFPD(f)
sage: J = ff.algebraic_dependence_certificate(); J
Ideal (1 - 6*T2 + 15*T2^2 - 20*T2^3 + 15*T2^4 - T0^2*T1^3 - 6*T2^5 + T2^6) of Multivariate Polynomial Ring in
Asymptotic Expansions, Release 10.2

(continued from previous page)

```python
sage: g = J.gens()[0]
sage: df = ff.denominator_factored()
sage: g(*(q**e for q, e in df)) == 0
True
```

```python
sage: R.<x,y> = PolynomialRing(QQ)
sage: FFPD = FractionWithFactoredDenominatorRing(R, SR)
sage: G = exp(x + y)
sage: H = x**2 * (x*y + 1) * y**3
sage: ff = FFPD(G, H.factor())
sage: J = ff.algebraic_dependence_certificate(); J
Ideal (1 - 6*T2 + 15*T2^2 - 20*T2^3 + 15*T2^4 - T0^2*T1^3 - 6*T2^5 + T2^6) of Multivariate Polynomial Ring in T0, T1, T2 over Rational Field
sage: g = J.gens()[0]
sage: df = ff.denominator_factored()
sage: g(*(q**e for q, e in df)) == 0
True
```

```python
sage: f = 1/(x^3 * y^2)
sage: J = FFPD(f).algebraic_dependence_certificate()
sage: J
Ideal (0) of Multivariate Polynomial Ring in T0, T1 over Rational Field
```

```python
sage: f = sin(1)/(x^3 * y^2)
sage: J = FFPD(f).algebraic_dependence_certificate()
sage: J
Ideal (0) of Multivariate Polynomial Ring in T0, T1 over Rational Field
```

#### algebraic_dependence_decomposition(whole_and_parts=True)

Return an algebraic dependence decomposition of self.

Let \( f = p/q \) where \( q \) lies in a \( d \)-variate polynomial ring \( K[X] \) for some field \( K \). Let \( q_1 \cdots q_n \) be the unique factorization of \( q \) in \( K[X] \) into irreducible factors and let \( V_i \) be the algebraic variety \( \{ x \in L^d \mid q_i(x) = 0 \} \) of \( q_i \) over the algebraic closure \( L \) of \( K \). By [Rai2012], \( f \) can be written as

\[
(*) \sum_A \frac{p_A}{\prod_{i \in A} q_{i}^{b_i}},
\]

where the \( b_i \) are positive integers, each \( p_A \) is a product of \( p \) and an element in \( K[X] \), and the sum is taken over all subsets \( A \subseteq \{1, \ldots, m\} \) such that \( |A| \leq d \) and \( \{q_i \mid i \in A\} \) is algebraically independent.

We call (*) an algebraic dependence decomposition of \( f \). Algebraic dependence decompositions are not unique.

The algorithm used comes from [Rai2012].

OUTPUT:

An instance of \texttt{FractionWithFactoredDenominatorSum}.

EXAMPLES:
sage: from sage.rings.asymptotic.asymptotics_multivariate_generating_functions import FractionWithFactoredDenominatorRing
sage: R.<x,y> = PolynomialRing(QQ)

sage: FFPD = FractionWithFactoredDenominatorRing(R)

sage: f = 1/(x^2 * (x*y + 1) * y^3)

sage: ff = FFPD(f)

sage: decomp = ff.algebraic_dependence_decomposition()

sage: decomp
(0, []) + (-x, [(x*y + 1, 1)]) +
(x^2*y^2 - x*y + 1, [(y, 3), (x, 2)])

sage: decomp.sum().quotient() == f
True

sage: for r in decomp:
    ...:    J = r.algebraic_dependence_certificate()
    ...:    J is None or J == J.ring().ideal()
    # The zero ideal
    True
    True
    True

sage: R.<x,y> = PolynomialRing(QQ)

sage: FFPD = FractionWithFactoredDenominatorRing(R, SR)

sage: G = sin(x)

sage: H = x^2 * (x*y + 1) * y^3

sage: f = FFPD(G, H.factor())

sage: decomp = f.algebraic_dependence_decomposition()

sage: decomp
(0, []) + (x^4*y^3*sin(x), [(x*y + 1, 1)]) +
(-(x^5*y^5 - x^4*y^4 + x^3*y^3 - x^2*y^2 + x*y - 1)*sin(x),
[(y, 3), (x, 2)])

sage: bool(decomp.sum().quotient() == G/H)
True

sage: for r in decomp:
    ...:    J = r.algebraic_dependence_certificate()
    ...:    J is None or J == J.ring().ideal()
    True
    True
    True

asymptotic_decomposition(alpha, asy_var=None)

Return the asymptotic decomposition of self.

The asymptotic decomposition of $F$ is a sum that has the same asymptotic expansion as $f$ in the direction $alpha$ but each summand has a denominator factorization of the form $[(q_1, 1), \ldots, (q_n, 1)]$, where $n$ is at most the $dimension()$ of $F$.

INPUT:

- $alpha$ – a $d$-tuple of positive integers or symbolic variables
- $asy_var$ – (default: None) a symbolic variable with respect to which to compute asymptotics; if None is given, we set $asy_var = \text{var}('r')$

OUTPUT:

An instance of $\text{FractionWithFactoredDenominatorSum}$.
The output results from a Leinartas decomposition followed by a cohomology decomposition.

EXAMPLES:

```
sage: from sage.rings.asymptotic.asymptotics_multivariate_generating_functions import FractionWithFactoredDenominatorRing

sage: R.<x> = PolynomialRing(QQ)
sage: FFPD = FractionWithFactoredDenominatorRing(R, SR)
sage: f = (x^2 + 1)/((x - 1)^3*(x + 2))
sage: F = FFPD(f)
sage: alpha = [var('a')]
sage: F.asymptotic_decomposition(alpha)

(0, [(1/54*(5*a^2 + 2*a^2/x + 11*a^2/x^2)*r^2
       - 1/54*(5*a - 2*a/x - 33*a/x^2)*r + 11/27/x^2,
       [(x - 1, 1)]) + (-5/27, [(x + 2, 1)])])
```

```
sage: R.<x,y> = PolynomialRing(QQ)
sage: FFPD = FractionWithFactoredDenominatorRing(R, SR)
sage: H = (1 - 2*x - y)*(1 - x - 2*y)**2
sage: Hfac = H.factor()
sage: G = 1/Hfac.unit()
sage: F = FFPD(G, Hfac)
sage: alpha = var('a, b')
sage: F.asymptotic_decomposition(alpha)

(0, [(1/3*r*(a/x - 2*b/y) - 1/3/x + 2/3/y,
       [(x + 2*y - 1, 1), (2*x + y - 1, 1)])])
```

`asymptotics(p, alpha, N, asy_var=None, numerical=0, verbose=False)`

Return the asymptotics in the given direction.

This function returns the first \(N\) terms (some of which could be zero) of the asymptotic expansion of the Maclaurin ray coefficients \(F_{r\alpha}\) of the function \(F\) represented by \(\text{self}\) as \(r \to \infty\), where \(r\) is \(\text{asy\_var}\) and \(\alpha\) is a tuple of positive integers of length \(d\) which is \(\text{self\_dimension}\). Assume that

- \(F\) is holomorphic in a neighborhood of the origin;
- the unique factorization of the denominator \(H\) of \(F\) in the local algebraic ring at \(p\) equals its unique factorization in the local analytic ring at \(p\);
- the unique factorization of \(H\) in the local algebraic ring at \(p\) has at most \(d\) irreducible factors, none of which are repeated (one can reduce to this case via \(\text{asymptotic\_decomposition()}\));
- \(p\) is a convenient strictly minimal smooth or multiple point with all nonzero coordinates that is critical and nondegenerate for \(\alpha\).

The algorithms used here come from [RW2008] and [RW2012].

INPUT:

- \(p\) – a dictionary with keys that can be coerced to equal \(\text{self\_denominator\_ring\_gens()}\)
- \(\alpha\) – a tuple of length \(\text{self\_dimension()}\) of positive integers or, if \(p\) is a smooth point, possibly of symbolic variables
- \(N\) – a positive integer
- \(\text{asy\_var}\) – (default: None) a symbolic variable for the asymptotic expansion; if None is given, then \(\text{var('r')}\) will be assigned
• **numerical** – (default: 0) a natural number; if numerical is greater than 0, then return a numerical approximation of $F_{r\alpha}$ with numerical digits of precision; otherwise return exact values

• **verbose** – (default: False) print the current state of the algorithm

**OUTPUT:**

The tuple $(asy, \text{exp\_scale}, \text{subexp\_part})$. Here $asy$ is the sum of the first $N$ terms (some of which might be 0) of the asymptotic expansion of $F_{r\alpha}$ as $r \to \infty$; $\text{exp\_scale}^r$ is the exponential factor of $asy$; $\text{subexp\_part}$ is the subexponential factor of $asy$.

**EXAMPLES:**

```python
sage: from sage.rings.asymptotic.asymptotics_multivariate_generating_functions
    import FractionWithFactoredDenominatorRing

A smooth point example:

```python
sage: R.<x,y> = PolynomialRing(QQ)
sage: FFPD = FractionWithFactoredDenominatorRing(R, SR)
sage: H = (1 - x - y - x*y)**2
sage: Hfac = H.factor()
sage: G = 1/Hfac.unit()
sage: F = FFPD(G, Hfac); print(F)
(1, [(x*y + x + y - 1, 2)])
sage: alpha = [4, 3]
sage: decomp = F.asymptotic_decomposition(alpha); decomp
(0, [(0, 1)]) + (... - 1/2, [(x*y + x + y - 1, 1)])
sage: F1 = decomp[1]
sage: p = {y: 1/3, x: 1/2}
sage: asy = F1.asymptotics(p, alpha, 2, verbose=True)

asymptotics_multiple(p, alpha, N, asy_var, coordinate=None, numerical=0, verbose=False)
Return the asymptotics in the given direction of a multiple point nondegenerate for alpha.

This is the same as asymptotics(), but only in the case of a convenient multiple point nondegenerate for alpha. Assume also that self.dimension >= 2 and that the p.values() are not symbolic variables.

The formulas used for computing the asymptotic expansion are Theorem 3.4 and Theorem 3.7 of [RW2012].

INPUT:
• p – a dictionary with keys that can be coerced to equal self.denominator_ring.gens()
• alpha – a tuple of length d = self.dimension() of positive integers or, if p is a smooth point, possibly of symbolic variables
• N – a positive integer
• asy_var – (optional; default: None) a symbolic variable; the variable of the asymptotic expansion, if none is given, var('r') will be assigned
• coordinate – (optional; default: None) an integer in {0,...,d-1} indicating a convenient coordinate to base the asymptotic calculations on; if None is assigned, then choose coordinate=d-1
• numerical – (optional; default: 0) a natural number; if numerical is greater than 0, then return a numerical approximation of the Maclaurin ray coefficients of self with numerical digits of precision; otherwise return exact values
• verbose – (default: False) print the current state of the algorithm

OUTPUT:
The asymptotic expansion.

EXAMPLES:
```
sage: from sage.rings.asymptotic.asymptotics_multivariate_generating_functions import FractionWithFactoredDenominatorRing
sage: R.<x,y,z>= PolynomialRing(QQ)
sage: FFPD = FractionWithFactoredDenominatorRing(R)
sage: H = (4 - 2*x - y - z)*(4 - x - 2*y - z)
sage: Hfac = H.factor()
sage: G = 16/Hfac.unit()
sage: F = FFPD(G, Hfac)
sage: F
(16, [(x + 2*y + z - 4, 1), (2*x + y + z - 4, 1)])

asymptotics_smooth($p$, $alpha$, $N$, $asy\_var$, $coordinate=None$, numerical=0, $verbose=False$)

Return the asymptotics in the given direction of a smooth point.

This is the same as asymptotics(), but only in the case of a convenient smooth point.

The formulas used for computing the asymptotic expansions are Theorems 3.2 and 3.3 [RW2008] with the exponent of $H$ equal to 1. Theorem 3.2 is a specialization of Theorem 3.4 of [RW2012] with $n = 1$.

**INPUT:**

- $p$ – a dictionary with keys that can be coerced to equal self.denominator_ring.gens()
- $alpha$ – a tuple of length $d = self.dimension()$ of positive integers or, if $p$ is a smooth point, possibly of symbolic variables
- $N$ – a positive integer
- $asy\_var$ – (optional; default: None) a symbolic variable; the variable of the asymptotic expansion, if none is given, var('r') will be assigned
- $coordinate$ – (optional; default: None) an integer in $\{0, \ldots, d-1\}$ indicating a convenient coordinate to base the asymptotic calculations on; if None is assigned, then choose coordinate=d-1
- $numerical$ – (optional; default: 0) a natural number; if numerical is greater than 0, then return a numerical approximation of the Maclaurin ray coefficients of self with numerical digits of precision; otherwise return exact values
- $verbose$ – (default: False) print the current state of the algorithm

**OUTPUT:**

The asymptotic expansion.

**EXAMPLES:**

```python
sage: from sage.rings.asymptotic.asymptotics_multivariate_generating_functions import FractionWithFactoredDenominatorRing
sage: R.<x> = PolynomialRing(QQ)
sage: FFPD = FractionWithFactoredDenominatorRing(R)
sage: H = 2 - 3*x
sage: Hfac = H.factor()
sage: G = 1/Hfac.unit()
sage: F = FFPD(G, Hfac)
sage: alpha = [2]
sage: p = {x: 2/3}
sage: asy = F.asymptotics_smooth(p, alpha, 3, asy_var=var('r'))
sage: asy
(1/2*(9/4)^r, 9/4, 1/2)
```

```python
sage: R.<x,y> = PolynomialRing(QQ)
sage: FFPD = FractionWithFactoredDenominatorRing(R)
sage: H = 1-x-y-x*y
sage: Hfac = H.factor()
sage: G = 1/Hfac.unit()
sage: F = FFPD(G, Hfac)
sage: alpha = [3, 2]
sage: p = {y: 1/2*sqrt(13) - 3/2, x: 1/3*sqrt(13) - 2/3}
```

(continues on next page)

(1/12*sqrt(3)*2^(2/3)*gamma(1/3)/(pi*r^(1/3)) - 1/96*sqrt(3)*2^(1/3)*gamma(2/3)/(pi*r^(5/3)), 1, 1/12*sqrt(3)*2^(2/3)*gamma(1/3)/(pi*r^(1/3)) - 1/96*sqrt(3)*2^(1/3)*gamma(2/3)/(pi*r^(5/3)))

cohomology_decomposition()

Return the cohomology decomposition of self.

Let \( p/(q_1^{\alpha_1} \cdots q_n^{\alpha_n}) \) be the fraction represented by self and let \( K[x_1, \ldots, x_d] \) be the polynomial ring in which the \( q_i \) lie. Assume that \( n \leq d \) and that the gradients of the \( q_i \) are linearly independent at all points in the intersection \( V_1 \cap \cdots \cap V_n \) of the algebraic varieties \( V_i = \{ x \in L^d \mid q_i(x) = 0 \} \), where \( L \) is the algebraic closure of the field \( K \). Return a \( FractionWithFactoredDenominatorSum \) \( f \) such that the differential form \( f dx_1 \wedge \cdots \wedge dx_d \) is de Rham cohomologous to the differential form \( p/(q_1^{\alpha_1} \cdots q_n^{\alpha_n}) dx_1 \wedge \cdots \wedge dx_d \) and such that the denominator of each summand of \( f \) contains no repeated irreducible factors.

The algorithm used here comes from the proof of Theorem 17.4 of [AY1983].

OUTPUT:
An instance of \( FractionWithFactoredDenominatorSum \).

EXAMPLES:

sage: from sage.rings.asymptotic.asymptotics_multivariate_generating_functions import FractionWithFactoredDenominatorRing
sage: R.<x> = PolynomialRing(QQ)
sage: FFPD = FractionWithFactoredDenominatorRing(R)
sage: f = 1/(x^2 + x + 1)^3
sage: decomp = FFPD(f).cohomology_decomposition()
sage: decomp
(0, []) + (2/3, [(x^2 + x + 1, 1)])

sage: R.<x,y> = PolynomialRing(QQ)
sage: FFPD = FractionWithFactoredDenominatorRing(R)
sage: FFPD(1, [(x, 1), (y, 2)]).cohomology_decomposition()
(0, [])

The following example was fixed in github issue #29465:

sage: p = 1
sage: qs = [(x*y - 1, 1), (x**2 + y**2 - 1, 2)]
sage: f = FFPD(p, qs)
sage: f.cohomology_decomposition()
(0, []) + (-4/3*x*y, [(x**2 + y**2 - 1, 1)]) +
(1/3, [(x*y - 1, 1), (x**2 + y**2 - 1, 1)])

critical_cone(p, coordinate=None)

Return the critical cone of the convenient multiple point $p$.

INPUT:

- $p$ – a dictionary with keys that can be coerced to equal `self.denominator_ring.gens()` and values in a field
- coordinate – (optional; default: None) a natural number

OUTPUT:

A list of vectors.

This list of vectors generate the critical cone of p and the cone itself, which is None if the values of p don’t lie in $\mathbb{Q}$. Divide logarithmic gradients by their component coordinate entries. If coordinate = None, then search from $d-1$ down to 0 for the first index $j$ such that for all $i$ we have `self.log_grads()[i][j]` != 0 and set coordinate = j.

EXAMPLES:

sage: from sage.rings.asymptotic.asymptotics_multivariate_generating_functions
˓→import FractionWithFactoredDenominatorRing
sage: R.<x,y,z> = PolynomialRing(QQ)
sage: FFPD = FractionWithFactoredDenominatorRing(R)
sage: G = 1
sage: H = (1 - x*(1 + y)) * (1 - z*x**2*(1 + 2*y))
sage: Hfac = H.factor()
sage: G = 1/Hfac.unit()
sage: F = FFPD(G, Hfac)
sage: p = {x: 1/2, y: 1, z: 4/3}
sage: F.critical_cone(p)
([(2, 1, 0), (3, 1, 3/2)], 2-d cone in 3-d lattice N)

denominator()

Return the denominator of `self`.

OUTPUT:

The denominator (i.e., the product of the factored denominator).
EXAMPLES:

```python
sage: from sage.rings.asymptotic.asymptotics_multivariate_generating_functions import FractionWithFactoredDenominatorRing
sage: R.<x,y> = PolynomialRing(QQ)
sage: FFPD = FractionWithFactoredDenominatorRing(R, SR)
sage: H = (1 - x - y - x*y)**2*(1-x)
sage: Hfac = H.factor()
sage: G = exp(y)/Hfac.unit()
sage: F = FFPD(G, Hfac)
sage: F.denominator()
x^3*y^2 + 2*x^3*y + x^2*y^2 + x^3 - 2*x^2*y - x*y^2 - 3*x^2 - 2*x*y
- y^2 + 3*x + 2*y - 1
```

denominator_factored()

Return the factorization in self.denominator_ring of the denominator of self but without the unit part.

OUTPUT:

The factored denominator as a list of tuple $(f, m)$, where $f$ is a factor and $m$ its multiplicity.

EXAMPLES:

```python
sage: from sage.rings.asymptotic.asymptotics_multivariate_generating_functions import FractionWithFactoredDenominatorRing
sage: R.<x,y> = PolynomialRing(QQ)
sage: FFPD = FractionWithFactoredDenominatorRing(R, SR)
sage: H = (1 - x - y - x*y)**2*(1-x)
sage: Hfac = H.factor()
sage: G = exp(y)/Hfac.unit()
sage: F = FFPD(G, Hfac)
sage: F.denominator_factored()
[(x - 1, 1), (x*y + x + y - 1, 2)]
```

property denominator_ring

Return the ring of the denominator.

OUTPUT:

A ring.

EXAMPLES:

```python
sage: from sage.rings.asymptotic.asymptotics_multivariate_generating_functions import FractionWithFactoredDenominatorRing
sage: R.<x,y> = PolynomialRing(QQ)
sage: FFPD = FractionWithFactoredDenominatorRing(R, SR)
sage: H = (1 - x - y - x*y)**2*(1-x)
sage: Hfac = H.factor()
sage: G = exp(y)/Hfac.unit()
sage: F = FFPD(G, Hfac)
sage: F.denominator_ring
Multivariate Polynomial Ring in x, y over Rational Field
sage: F = FFPD(G/H)
sage: F
```
(continues on next page)
(e^y, [(x - 1, 1), (x*y + x + y - 1, 2)])

sage: F.denominator_ring
Multivariate Polynomial Ring in x, y over Rational Field

dimension()

Return the number of indeterminates of self.denominator_ring.

OUTPUT:
An integer.

EXAMPLES:

sage: from sage.rings.asymptotic.asymptotics_multivariate_generating_functions import FractionWithFactoredDenominatorRing
sage: R.<x,y> = PolynomialRing(QQ)
sage: FFPD = FractionWithFactoredDenominatorRing(R, SR)
sage: H = (1 - x - y - x*y)**2*(1-x)
sage: Hfac = H.factor()
sage: G = exp(y)/Hfac.unit()
sage: F = FFPD(G, Hfac)
sage: F.dimension()
2

grads(p)

Return a list of the gradients of the polynomials [q for (q, e) in self.denominator_factored()] evaluated at p.

INPUT:
• p – (optional; default: None) a dictionary whose keys are the generators of self.denominator_ring

OUTPUT:
A list.

EXAMPLES:

sage: from sage.rings.asymptotic.asymptotics_multivariate_generating_functions import FractionWithFactoredDenominatorRing
sage: R.<x,y> = PolynomialRing(QQ)
sage: FFPD = FractionWithFactoredDenominatorRing(R, SR)
sage: p = exp(x)
sage: df = [(x^3 + 3*y^2, 5), (x*y, 2), (y, 1)]
sage: f = FFPD(p, df)
sage: f
e^x, [(y, 1), (x*y, 2), (x^3 + 3*y^2, 5)]
sage: R.gens()
(x, y)
sage: p = None
sage: f.grads(p)
[(0, 1), (y, x), (3*x^2, 6*y)]
sage: p = {x: sqrt(2), y: var('a')}
sage: f.grads(p)
[(0, 1), (a, sqrt(2)), (6, 6*a)]
is_convenient_multiple_point(p)
Tests if \( p \) is a convenient multiple point of self.

In case \( p \) is a convenient multiple point, verdict = True and comment is a string stating which variables it's convenient to use. In case \( p \) is not, verdict = False and comment is a string explaining why \( p \) fails to be a convenient multiple point.

See [RW2012] for more details.

INPUT:
• \( p \) – a dictionary with keys that can be coerced to equal self.denominator_ring.gens()

OUTPUT:
A pair (verdict, comment).

EXAMPLES:

```python
sage: from sage.rings.asymptotic.asymptotics_multivariate_generating_functions import FractionWithFactoredDenominatorRing
sage: R.<x,y,z> = PolynomialRing(QQ)
sage: FFPD = FractionWithFactoredDenominatorRing(R)
sage: H = (1 - x*(1 + y)) * (1 - z*x**2*(1 + 2*y))
sage: df = H.factor()
sage: G = 1 / df.unit()
sage: F = FFPD(G, df)
sage: p1 = {x: 1/2, y: 1, z: 4/3}
sage: p2 = {x: 1, y: 2, z: 1/2}
sage: F.is_convenient_multiple_point(p1)
(True, 'convenient in variables [x, y]')
sage: F.is_convenient_multiple_point(p2)
(False, 'not a singular point')
```

leinartas_decomposition()
Return a Leinartas decomposition of self.

Let \( f = \frac{p}{q} \) where \( q \) lies in a \( d \)-variate polynomial ring \( K[X] \) for some field \( K \). Let \( q_1 \cdots q_n \) be the unique factorization of \( q \) in \( K[X] \) into irreducible factors and let \( V_i \) be the algebraic variety \( \{ x \in L^d \mid q_i(x) = 0 \} \) of \( q_i \) over the algebraic closure \( L \) of \( K \). By [Rai2012], \( f \) can be written as

\[
(*) \quad \sum_A \frac{p_A}{\prod_{i \in A} q_i^{b_i}},
\]

where the \( b_i \) are positive integers, each \( p_A \) is a product of \( p \) and an element of \( K[X] \), and the sum is taken over all subsets \( A \subseteq \{1, \ldots, m\} \) such that

1. \( |A| \leq d \),
2. \( \bigcap_{i \in A} T_i \neq \emptyset \), and
3. \( \{q_i \mid i \in A\} \) is algebraically independent.

In particular, any rational expression in \( d \) variables can be represented as a sum of rational expressions whose denominators each contain at most \( d \) distinct irreducible factors.

We call (*) a Leinartas decomposition of \( f \). Leinartas decompositions are not unique.

The algorithm used comes from [Rai2012].

OUTPUT:
An instance of `FractionWithFactoredDenominatorSum`.

EXAMPLES:

```python
sage: from sage.rings.asymptotic.asymptotics_multivariate_generating_functions import FractionWithFactoredDenominatorRing
sage: R.<x> = PolynomialRing(QQ)
sage: FFPD = FractionWithFactoredDenominatorRing(R)
sage: f = (x^2 + 1)/((x + 2)*(x - 1)*(x^2 + x + 1))
sage: decomp = FFPD(f).leinartas_decomposition()
sage: decomp
(0, []) + (2/9, [(x - 1, 1)]) + (-5/9, [(x + 2, 1)]) + (1/3*x, [(x^2 + x + 1, 1)])
sage: decomp.sum().quotient() == f
True
sage: R.<x,y> = PolynomialRing(QQ)
sage: FFPD = FractionWithFactoredDenominatorRing(R)
sage: f = 1/x + 1/y + 1/(x*y + 1)
sage: decomp = FFPD(f).leinartas_decomposition()
sage: decomp
(0, []) + (1, [(x*y + 1, 1)]) + (x + y, [(y, 1), (x, 1)])
sage: decomp.sum().quotient() == f
True
sage: def check_decomp(r):
....:     L = r.nullstellensatz_certificate()
....:     J = r.algebraic_dependence_certificate()
....:     return L is None and (J is None or J == J.ring().ideal())
sage: all(check_decomp(r) for r in decomp)
True
```

```python
sage: R.<x,y> = PolynomialRing(QQ)
sage: FFPD = FractionWithFactoredDenominatorRing(R, SR)
sage: f = sin(x)/x + 1/y + 1/(x*y + 1)
sage: G = f.numerator()
sage: H = R(f.denominator())
sage: ff = FFPD(G, H.factor())
sage: decomp = ff.leinartas_decomposition()
```

(continues on next page)
\((0, []) + (1, [(z, 2), (x*y + z, 1)]) + \\
(1, [(z, 2), (y, 1), (x, 1)])\)

\[
sage: \text{decomp.sum().quotient()} == f \\
True
\]

**log_grads**\((p)\)

Return a list of the logarithmic gradients of the polynomials \([q \text{ for } (q, e) \text{ in } \text{self.denumerator_factored()}] \) evaluated at \(p\).

The logarithmic gradient of a function \(f\) at point \(p\) is the vector \((x_1 \partial_1 f(x), \ldots, x_d \partial_d f(x))\) evaluated at \(p\).

**INPUT:**

- \(p\) – (optional; default: None) a dictionary whose keys are the generators of \(\text{self.denumerator_ring}\)

**OUTPUT:**

A list.

**EXAMPLES:**

\[
sage: \text{from sage.rings.asymptotic.asymptotics_multivariate_generating_functions import FractionWithFactoredDenominatorRing} \\
\text{sage: } R.<x,y> = \text{PolynomialRing(QQ)} \\
\text{sage: } \text{FFPD} = \text{FractionWithFactoredDenominatorRing}(R, SR) \\
\text{sage: } p = \exp(x) \\
\text{sage: } \text{df} = [(x^3 + 3*y^2, 5), (x*y, 2), (y, 1)] \\
\text{sage: } f = \text{FFPD}(p, \text{df}) \\
\text{sage: } f \\
(e^x, [(y, 1), (x*y, 2), (x^3 + 3*y^2, 5)]) \\
\text{sage: } \text{R.gens()} \\
(x, y) \\
\text{sage: } p = \text{None} \\
\text{sage: } f.\text{log_grads}(p) \\
[(0, y), (x*y, x*y), (3*x^3, 6*y^2)]
\]

\[
\text{sage: } p = \{x: \sqrt{2}, y: \text{var('a')}\} \\
\text{sage: } f.\text{log_grads}(p) \\
[(0, a), (\sqrt{2}^2*a, \sqrt{2}^2*a), (6*\sqrt{2}, 6*a^2)]
\]

**maclaurin_coefficients**(\(multi_indices, numerical=0\))

Return the Maclaurin coefficients of \(self\) with given \(multi_indices\).

**INPUT:**

- \(multi_indices\) – a list of tuples of positive integers, where each tuple has length \(self.denumerator()\)

- \(numerical\) – (optional; default: 0) a natural number; if positive, return numerical approximations of coefficients with \(numerical\) digits of accuracy

**OUTPUT:**

A dictionary whose value of the key \(nu\) are the Maclaurin coefficient of index \(nu\) of \(self\).

**Note:** Uses iterated univariate Maclaurin expansions. Slow.
EXAMPLES:

```python
sage: from sage.rings.asymptotic.asymptotics_multivariate_generating_functions import FractionWithFactoredDenominatorRing
sage: R.<x> = PolynomialRing(QQ)
sage: FFPD = FractionWithFactoredDenominatorRing(R)
sage: H = 2 - 3*x
sage: Hfac = H.factor()
sage: G = 1 / Hfac.unit()
sage: F = FFPD(G, Hfac)
sage: F
(-1/3, [(x - 2/3, 1)])
sage: F.maclaurin_coefficients([(2*k,) for k in range(6)])
{(0,): 1/2,
 (2,): 9/8,
 (4,): 81/32,
 (6,): 729/128,
 (8,): 6561/512,
 (10,): 59049/2048}
```

```python
sage: R.<x,y,z> = PolynomialRing(QQ)
sage: FFPD = FractionWithFactoredDenominatorRing(R)
sage: H = (4 - 2*x - y - z) * (4 - x - 2*y - z)
sage: Hfac = H.factor()
sage: G = 16 / Hfac.unit()
sage: F = FFPD(G, Hfac)
sage: alpha = vector([3, 3, 2])
sage: interval = [1, 2, 4]
sage: S = [r*alpha for r in interval]
sage: F.maclaurin_coefficients(S, numerical=10) # long time
{(3, 3, 2): 0.7849731445,
 (6, 6, 4): 0.7005249476,
(12, 12, 8): 0.5847732654}
```

### nullstellensatz_certificate()####

Return a Nullstellensatz certificate of `self` if it exists.

Let \([q_1, e_1, \ldots, q_n, e_n]\) be the denominator factorization of `self`. The Nullstellensatz certificate is a list of polynomials \(h_1, \ldots, h_m\) in `self.denominator_ring` that satisfies \(h_1 q_1 + \cdots + h_m q_n = 1\) if it exists.

**Note:** Only works for multivariate base rings.

**OUTPUT:**

A list of polynomials or `None` if no Nullstellensatz certificate exists.

**EXAMPLES:**

```python
sage: from sage.rings.asymptotic.asymptotics_multivariate_generating_functions import FractionWithFactoredDenominatorRing
sage: R.<x,y> = PolynomialRing(QQ)
sage: FFPD = FractionWithFactoredDenominatorRing(R)
sage: G = sin(x)
```

(continues on next page)
nullstellensatz_decomposition()

Return a Nullstellensatz decomposition of self.

Let \( f = \frac{p}{q} \) where \( q \) lies in a \( d \)-variate polynomial ring \( K[\mathbf{X}] \) for some field \( K \) and \( d \geq 1 \). Let \( q_1^{e_1} \cdots q_m^{e_m} \) be the unique factorization of \( q \) in \( K[\mathbf{X}] \) into irreducible factors and let \( \mathcal{V}_i \) be the algebraic variety \( \{ x \in L^d \mid q_i(x) = 0 \} \) of \( q_i \) over the algebraic closure \( L \) of \( K \). By [Rai2012], \( f \) can be written as

\[
(*) \sum_A \prod_{i \in A} p_A q_i^{e_i},
\]

where the \( p_A \) are products of \( p \) and elements in \( K[\mathbf{X}] \) and the sum is taken over all subsets \( A \subseteq \{1, \ldots, m\} \) such that \( \bigcap_{i \in A} T_i \neq \emptyset \).

We call (*) a Nullstellensatz decomposition of \( f \). Nullstellensatz decompositions are not unique.

The algorithm used comes from [Rai2012].

Note: Recursive. Only works for multivariate self.

OUTPUT:

An instance of FractionWithFactoredDenominatorSum.

EXAMPLES:

```python
sage: from sage.rings.asymptotic.asymptotics_multivariate_generating_functions import *

sage: R.<x,y> = PolynomialRing(QQ)

sage: FFPD = FractionWithFactoredDenominatorRing(R)

sage: f = 1/(x^2(x^2*y + 1))

sage: decomp = FFPD(f).nullstellensatz_decomposition()

sage: decomp

(\emptyset, [] \ 0) \ + \ (1, \ [(x, 1)]) \ + \ (-y, \ [(x^2*y + 1, 1)])

sage: decomp.sum().quotient() == f

True

sage: [r.nullstellensatz_certificate() is None for r in decomp]

[True, True, True]
```
sage: R.<x,y> = PolynomialRing(QQ)
sage: FFPD = FractionWithFactoredDenominatorRing(R, SR)
sage: G = sin(y)
sage: H = x*(x*y + 1)
sage: f = FFPD(G, H.factor())
sage: decomp = f.nullstellensatz_decomposition()
sage: decomp
(0, []) + (sin(y), [(x, 1)]) + (-y*\sin(y), [(x*y + 1, 1)])
sage: bool(decomp.sum().quotient() == G/H)
True
sage: [r.nullstellensatz_certificate() is None for r in decomp]
[True, True, True]

**numerator()**

Return the numerator of self.

**OUTPUT:**

The numerator.

**EXAMPLES:**

```python
sage: from sage.rings.asymptotic.asymptotics_multivariate_generating_functions import FractionWithFactoredDenominatorRing
sage: R.<x,y> = PolynomialRing(QQ)
sage: FFPD = FractionWithFactoredDenominatorRing(R, SR)
sage: H = (1 - x - y - x*y)**2*(1-x)
sage: Hfac = H.factor()
sage: G = exp(y)/Hfac.unit()
sage: F = FFPD(G, Hfac)
sage: F.numerator()
-e^y
```

**property numerator_ring**

Return the ring of the numerator.

**OUTPUT:**

A ring.

**EXAMPLES:**

```python
sage: from sage.rings.asymptotic.asymptotics_multivariate_generating_functions import FractionWithFactoredDenominatorRing
sage: R.<x,y> = PolynomialRing(QQ)
sage: FFPD = FractionWithFactoredDenominatorRing(R, SR)
sage: H = (1 - x - y - x*y)**2*(1-x)
sage: Hfac = H.factor()
sage: G = exp(y)/Hfac.unit()
sage: F = FFPD(G, Hfac)
sage: F.numerator_ring
Symbolic Ring
sage: F = FFPD(G/H)
sage: F
(e^y, [(x - 1, 1), (x^y + x + y - 1, 2)])
```

(continues on next page)
quotient()  
Convert self into a quotient.  
OUTPUT:  
An element.  
EXAMPLES:

```python
sage: F.numerator_ring
Symbolic Ring
```

relative_error(approx, alpha, interval, exp_scale=1, digits=10)  
Return the relative error between the values of the Maclaurin coefficients of self with multi-indices \( r \) alpha for \( r \) in interval and the values of the functions (of the variable \( r \)) in approx.  

INPUT:  
• approx – an individual or list of symbolic expressions in one variable  
• alpha - a list of positive integers of length self.denominator_ring.ngens()  
• interval – a list of positive integers  
• exp_scale – (optional; default: 1) a number

OUTPUT:  
A list of tuples with properties described below.  

This outputs a list whose entries are a tuple \((r^*\alpha, a_r, b_r, err_r)\) for \( r \) in interval. Here \( r^*\alpha \) is a tuple; \( a_r \) is the \( r^*\alpha \) (multi-index) coefficient of the Maclaurin series for self divided by \( \exp_scale^{**r} \); \( b_r \) is a list of the values of the functions in approx evaluated at \( r \) and divided by \( \exp_scale^{**m} \); \( err_r \) is the list of relative errors \((a_r - f)/a_r\) for \( f \) in \( b_r \).  

All outputs are decimal approximations.  

EXAMPLES:

```python
sage: from sage.rings.asymptotic.asymptotics_multivariate_generating_functions
    import FractionWithFactoredDenominatorRing
sage: R.<x,y> = PolynomialRing(QQ)
sage: FFPD = FractionWithFactoredDenominatorRing(R)
sage: H = 1 - x - y - x*y
sage: Hfac = H.factor()
sage: G = exp(y)/Hfac.unit()
sage: F = FFPD(G, Hfac)
sage: F
(-e^y, [(x - 1, 1), (x*y + x + y - 1, 2)])
```

```python
sage: F.quotient()
-e^y/(x^3*y^2 + 2*x^3*y + x^2*y^2 + x^3 - 2*x^2*y - x*y^2 - 3*x^2 - 2*x*y - y^2 + 3*x + 2*y - 1)
```

```python
sage: from sage.rings.asymptotic.asymptotics_multivariate_generating_functions
    import FractionWithFactoredDenominatorRing
sage: R.<x,y> = PolynomialRing(QQ)
sage: FFPD = FractionWithFactoredDenominatorRing(R)
sage: H = 1 - x - y - x*y
sage: Hfac = H.factor()
sage: G = exp(y)/Hfac.unit()
sage: F = FFPD(G, Hfac)
```

```python
sage: F
(-e^y, [(x - 1, 1), (x*y + x + y - 1, 2)])
```

```python
sage: F.quotient()
-e^y/(x^3*y^2 + 2*x^3*y + x^2*y^2 + x^3 - 2*x^2*y - x*y^2 - 3*x^2 - 2*x*y - y^2 + 3*x + 2*y - 1)
```

4.7. Asymptotics of Multivariate Generating Series
sage: G = 1 / Hfac.unit()
sage: F = FFPD(G, Hfac)
sage: alpha = [1, 1]
sage: r = var('r')
sage: a1 = (0.573/sqrt(r))*5.83^r
sage: a2 = (0.573/sqrt(r) - 0.0674/r^(3/2))*5.83^r
sage: es = 5.83
sage: F.relative_error([a1, a2], alpha, [1, 2, 4, 8], es) # long time
[((1, 1), 0.5145797599, [0.5730000000, 0.5056000000], [-0.1135300000, 0.0174506667]),
 (2, 2), 0.3824778089, [0.4051721856, 0.3813426871], [-0.05933514614, 0.002967810973]),
 (4, 4), 0.2778630595, [0.2865000000, 0.2780750000], [-0.03108344267, -0.0007627515584]),
 (8, 8), 0.1991088276, [0.2025860928, 0.1996074055], [-0.01746414394, -0.002504047242])

sage: from sage.rings.asymptotic.asymptotics_multivariate_generating_functions import FractionWithFactoredDenominatorRing

sage: R.<x,y,z> = PolynomialRing(QQ)
sage: FFPD = FractionWithFactoredDenominatorRing(R)
sage: H = (1 - x*(1 + y))^3 * (1 - z*x^2*(1 + 2*y))
sage: df = H.factor()
sage: G = 1 / df.unit()
sage: F = FFPD(G, df)
sage: F.singular_ideal()  
Ideal (x*y + x - 1, y^2 - 2*y*z + 2*y - z + 1, x*z + y - 2*z + 1) of Multivariate Polynomial Ring in x, y, z over Rational Field

smooth_critical_ideal(alpha)

Return the smooth critical ideal of self.

Let $R$ be the ring of self and $H$ its denominator. Return the ideal in $R$ of smooth critical points of the variety of $H$ for the direction alpha. If the variety $V$ of $H$ has no smooth points, then return the ideal in $R$ of $V$.

See [RW2012] for more details.

**INPUT:**

- alpha – a tuple of positive integers and/or symbolic entries of length self.denominator_ring.ngens()

**OUTPUT:**
An ideal.

EXAMPLES:

```python
sage: from sage.rings.asymptotic.asymptotics_multivariate_generating_functions import FractionWithFactoredDenominatorRing
sage: R.<x,y> = PolynomialRing(QQ)
sage: FFPD = FractionWithFactoredDenominatorRing(R)
sage: H = (1 - x - y - x*y)^2
sage: Hfac = H.factor()
sage: G = 1/Hfac.unit()
sage: F = FFPD(G, Hfac)
sage: alpha = var('a1, a2')
sage: F.smooth_critical_ideal(alpha)
Ideal (y^2 + (2*a1)/a2*y - 1, x + (-a2)/a1*y + (-a1 + a2)/a1) of Multivariate Polynomial Ring in x, y over Fraction Field of Multivariate Polynomial Ring in a1, a2 over Rational Field

sage: H = (1-x-y-x*y)^2
sage: Hfac = H.factor()
sage: G = 1/Hfac.unit()
sage: F = FFPD(G, Hfac)
sage: alpha = [7/3, var('a')]
sage: F.smooth_critical_ideal(alpha)
Ideal (y^2 + 14/(3*a)*y - 1, x + (-3*a)/7*y + (3*a - 7)/7) of Multivariate Polynomial Ring in x, y over Fraction Field of Univariate Polynomial Ring in a over Rational Field
```

**univariate_decomposition()**

Return the usual univariate partial fraction decomposition of self.

Assume that the numerator of self lies in the same univariate factorial polynomial ring as the factors of the denominator.

Let $f = \frac{p}{q}$ be a rational expression where $p$ and $q$ lie in a univariate factorial polynomial ring $R$. Let $q_1^{e_1} \cdots q_n^{e_n}$ be the unique factorization of $q$ in $R$ into irreducible factors. Then $f$ can be written uniquely as:

$$\sum_{i=1}^{m} \frac{p_i}{q_i^{e_i}} + p_0$$

for some $p_j \in R$. We call this the usual partial fraction decomposition of $f$.

**Note:** This partial fraction decomposition can be computed using `partial_fraction()` or `partial_fraction_decomposition()` as well. However, here we use the already obtained/cached factorization of the denominator. This gives a speed up for non-small instances.

**OUTPUT:**

An instance of `FractionWithFactoredDenominatorSum`.

**EXAMPLES:**

```python
sage: from sage.rings.asymptotic.asymptotics_multivariate_generating_functions import FractionWithFactoredDenominatorRing

One variable:
```
sage: R.<x> = PolynomialRing(QQ)
sage: FFPD = FractionWithFactoredDenominatorRing(R)
sage: f = 5*x^3 + 1/x + 1/(x-1) + 1/(3*x^2 + 1)
sage: f
(5*x^7 - 5*x^6 + 5/3*x^5 + 5/3*x^4 + 2*x^3 - 2/3*x^2 + 1/3*x - 1/3)/(x^4 - x^3 + 1/3*x^2 - 1/3*x)
sage: decomp = FFPD(f).univariate_decomposition()
sage: decomp
(5*x^3, []) + (1, [(x - 1, 1)]) + (1, [(x, 1)]) + (1/3, [(x^2 + 1/3, 1)])
sage: decomp.sum().quotient() == f
True

One variable with numerator in symbolic ring:

sage: R.<x> = PolynomialRing(QQ)
sage: FFPD = FractionWithFactoredDenominatorRing(R, SR)
sage: f = 5*x^3 + 1/x + 1/(x-1) + exp(x)/(3*x^2 + 1)
sage: f
(5*x^5 - 5*x^4 + 2*x - 1)/(x^2 - x) + e^x/(3*x^2 + 1)
sage: decomp = FFPD(f).univariate_decomposition()
sage: decomp
(0, []) + (15/4*x^7 - 15/4*x^6 + 5/4*x^5 - 5/4*x^4 + 3/2*x^3 + 1/4*x^2*e^x -
3/4*x^2 - 1/4*x*e^x + 1/2*x - 1/4, [(x - 1, 1)]) +
(-15*x^7 + 15*x^6 - 5*x^5 + 5*x^4 - 6*x^3 -
x^2*e^x + 3*x^2 + x*e^x - 2*x + 1, [(x, 1)]) +
(1/4*(15*x^7 - 15*x^6 + 5*x^5 - 5*x^4 + 6*x^3 + x^2*e^x -
3*x^2 - x*e^x + 2*x - 1)*e^x, [(x^2 + 1/3, 1)])

One variable over a finite field:

sage: R.<x> = PolynomialRing(GF(2))
sage: FFPD = FractionWithFactoredDenominatorRing(R)
sage: f = 5*x^3 + 1/x + 1/(x-1) + 1/(3*x^2 + 1)
sage: f
(x^6 + x^4 + 1)/(x^3 + x)
sage: decomp = FFPD(f).univariate_decomposition()
sage: decomp
(x^3, []) + (1, [(x, 1)]) + (x, [(x + 1, 2)])
sage: decomp.sum().quotient() == f
True

One variable over an inexact field:

sage: R.<x> = PolynomialRing(CC)
sage: FFPD = FractionWithFactoredDenominatorRing(R)
sage: f = 5*x^3 + 1/x + 1/(x-1) + 1/(3*x^2 + 1)
sage: f
(5.00000000000000*x^7 - 5.00000000000000*x^6 + 5.00000000000000*x^5 + 2.00000000000000*x^4 +
1.66666666666667*x^3 - 0.66666666666667*x^2 + 0.000000000000000*x + 0.66666666666667)/
(x^4 - x^3 + 1/3*x^2 - 1/3*x)
sage: decomp = FFPD(f).univariate_decomposition()
sage: decomp
(5.00000000000000*x^3, []) + (1.00000000000000, [(x - 1, 1)]) +
(1.00000000000000, [(x, 1)]) +
(0.333333333333333, [(x^2 + 1/3, 1)])

(continues on next page)
\[ \frac{\ldots x - 0.333333333333333}{x^4 - x^3 + 0.333333333333333x^2 - 0.333333333333333x} \]

\[ \text{sage:} \text{ decomp = FFPD(f).univariate_decomposition()} \]
\[ \text{sage:} \text{ decomp} \]
\[ (5.00000000000000 \cdot x^3, []) + (1.00000000000000, [(x - 1.00000000000000, 1)]) + (-0.288675134594813 \cdot I, [(x - 0.577350269189626 \cdot I, 1)]) + (1.00000000000000, [(x, 1)]) + (0.288675134594813 \cdot I, [(x + 0.577350269189626 \cdot I, 1)]) \]
\[ \text{sage:} \text{ decomp.sum().quotient() == f} \] # Rounding error coming
\[ \text{False} \]

AUTHORS:
- Daniel Krenn (2014-12-01)

class sage.rings.asymptotic.asymptotics_multivariate_generating_functions.FractionWithFactoredDenominatorRing

Bases: UniqueRepresentation, Ring

This is the ring of fractions with factored denominator.

INPUT:

- denominator_ring – the base ring (a polynomial ring)
- numerator_ring – (optional) the numerator ring; the default is the denominator_ring
- category – (default: Rings) the category

See also:
FractionWithFactoredDenominator, asymptotics_multivariate_generating_functions

EXAMPLES:

\[ \text{sage:} \text{ from sage.rings.asymptotic.asymptotics_multivariate_generating_functions import FractionWithFactoredDenominatorRing} \]
\[ \text{sage:} \text{ R.<x,y> = PolynomialRing(QQ)} \]
\[ \text{sage:} \text{ FFPD = FractionWithFactoredDenominatorRing(R)} \]
\[ \text{sage:} \text{ df = [x, 1], [y, 1], [x*y+1, 1]} \]
\[ \text{sage:} \text{ f = FFPD(x, df)} \] # indirect doctest
\[ \text{sage:} \text{ f} \]
\[ (1, [(y, 1), (x*y + 1, 1)]) \]

AUTHORS:
- Daniel Krenn (2014-12-01)
Element
alias of :class:`FractionWithFactoredDenominator`

**base_ring()**
Returns the base ring.

**OUTPUT:**
A ring.

**EXAMPLES:**

```python
sage: from sage.rings.asymptotic.asymptotics_multivariate_generating_functions
    import FractionWithFactoredDenominatorRing
sage: P.<X, Y> = ZZ[]
sage: F = FractionWithFactoredDenominatorRing(P); F
Ring of fractions with factored denominator
over Multivariate Polynomial Ring in X, Y over Integer Ring
sage: F.base_ring()
Integer Ring
sage: F.base()
Multivariate Polynomial Ring in X, Y over Integer Ring
```

**class** `sage.rings.asymptotic.asymptotics_multivariate_generating_functions.FractionWithFactoredDenominatorSum`

**Bases:** list

A list representing the sum of :class:`FractionWithFactoredDenominator` objects with distinct denominator factorizations.

**AUTHORS:**
- Daniel Krenn (2014-12-01)

**property denominator_ring**
Return the polynomial ring of the denominators of self.

**OUTPUT:**
A ring or `None` if the list is empty.

**EXAMPLES:**

```python
sage: from sage.rings.asymptotic.asymptotics_multivariate_generating_functions
    import FractionWithFactoredDenominatorRing, FractionWithFactoredDenominatorSum
sage: R.<x,y> = PolynomialRing(QQ)
sage: FFPD = FractionWithFactoredDenominatorRing(R)
sage: f = FFPD(x + y, [(y, 1), (x, 1)])
sage: s = FractionWithFactoredDenominatorSum([f])
sage: s.denominator_ring
Multivariate Polynomial Ring in x, y over Rational Field
sage: g = FFPD(x + y, [])
sage: t = FractionWithFactoredDenominatorSum([g])
sage: t.denominator_ring
Multivariate Polynomial Ring in x, y over Rational Field
```
Return the sum of the elements in self.

OUTPUT:

An instance of \( \texttt{FractionWithFactoredDenominator} \).

EXAMPLES:

```python
sage: from sage.rings.asymptotic.asymptotics_multivariate_generating_functions import FractionWithFactoredDenominatorRing, FractionWithFactoredDenominatorSum
sage: R.<x,y> = PolynomialRing(QQ)
sage: FFPD = FractionWithFactoredDenominatorRing(R, SR)
sage: df = (x, 1), (y, 1), (x^y + 1, 1)
sage: f = FFPD(2, df)
sage: g = FFPD(2*x*y, df)
sage: FractionWithFactoredDenominatorSum([f, g]).sum()
(2, [(y, 1), (x, 1)])
sage: f = FFPD(cos(x), [(x, 2)])
sage: g = FFPD(cos(y), [(x, 1), (y, 2)])
sage: FractionWithFactoredDenominatorSum([f, g]).sum()
(0, []) + (x*y*cos(x)^2 + 3*x*y^2 + x + y, [(y, 1), (x, 1)])
```

Rewrite self as a sum of a (possibly zero) polynomial followed by reduced rational expressions.

OUTPUT:

An instance of \( \texttt{FractionWithFactoredDenominatorSum} \).

Only useful for multivariate decompositions.

EXAMPLES:

```python
sage: f = x^2 + 3*y + 1/x + 1/y
sage: f = FFPD(f); f
(x^3*y + 3*x*y^2 + x + y, [(y, 1), (x, 1)])
sage: FractionWithFactoredDenominatorSum([f]).whole_and_parts()
(x^2 + 3*y, []) + (x + y, [(y, 1), (x, 1)])
sage: f = cos(x)^2 + 3*y + 1/x + 1/y
sage: G = f.numerator()
sage: H = R(f.denominator())
sage: f = FFPD(G, H.factor()); f
(x^y*cos(x)^2 + 3*x^y^2 + x + y, [(y, 1), (x, 1)])
sage: FractionWithFactoredDenominatorSum([f]).whole_and_parts()
(0, []) + (x*y*cos(x)^2 + 3*x*y^2 + x + y, [(y, 1), (x, 1)])
```
sage.rings.asymptotic.asymptotics_multivariate_generating_functions.coerce_point(R, p)

Coerce the keys of the dictionary p into the ring R.

**Warning:** This method assumes that it is possible.

**EXAMPLES:**

```python
sage: from sage.rings.asymptotic.asymptotics_multivariate_generating_functions import FractionWithFactoredDenominatorRing, coerce_point
sage: R.<x,y> = PolynomialRing(QQ)
sage: FFPD = FractionWithFactoredDenominatorRing(R)
sage: f = FFPD()
sage: p = {SR(x): 1, SR(y): 7/8}
sage: for k in sorted(p, key=str):
    ....:     print("{} {} {}".format(k, k.parent(), p[k]))
x Symbolic Ring 1
y Symbolic Ring 7/8
sage: q = coerce_point(R, p)
sage: for k in sorted(q, key=str):
    ....:     print("{} {} {}".format(k, k.parent(), q[k]))
x Multivariate Polynomial Ring in x, y over Rational Field 1
y Multivariate Polynomial Ring in x, y over Rational Field 7/8
```

sage.rings.asymptotic.asymptotics_multivariate_generating_functions.diff_all(f, V, n,
                                 ending=[],
                                 sub=None,
                                 sub_final=None,
                                 zero_order=0,
                                 rekey=None)

Return a dictionary of representative mixed partial derivatives of f from order 1 up to order n with respect to the variables in V.

The default is to key the dictionary by all nondecreasing sequences in V of length 1 up to length n.

**INPUT:**

- \( f \) – an individual or list of \( C^{n+1} \) functions
- \( V \) – a list of variables occurring in \( f \)
- \( n \) – a natural number
- \( \text{ending} \) – a list of variables in \( V \)
- \( \text{sub} \) – an individual or list of dictionaries
- \( \text{sub_final} \) – an individual or list of dictionaries
- \( \text{rekey} \) – a callable symbolic function in \( V \) or list thereof
- \( \text{zero_order} \) – a natural number

**OUTPUT:**

The dictionary \{s_1:deriv_1, ..., sr:deriv_r\}.

Here \( s_1, ..., s_r \) is a listing of all nondecreasing sequences of length 1 up to length \( n \) over the alphabet \( V \), where \( w > v \) in \( X \) if and only if \( \text{str}(w) > \text{str}(v) \), and \text{deriv}_j \) is the derivative of \( f \) with respect to the derivative sequence \( s_j \) and simplified with respect to the substitutions in \text{sub} and evaluated at \text{sub_final}. 

150 Chapter 4. Asymptotic Expansions — Table of Contents
Moreover, all derivatives with respect to sequences of length less than \texttt{zero_order} (derivatives of order less than \texttt{zero_order}) will be made zero.

If \texttt{rekey} is nonempty, then \textit{s_1, \ldots, s_r} will be replaced by the symbolic derivatives of the functions in \texttt{rekey}.

If \texttt{ending} is nonempty, then every derivative sequence \textit{s_j} will be suffixed by \texttt{ending}.

\textbf{EXAMPLES:}

```python
sage: from sage.rings.asymptotic.asymptotics_multivariate_generating_functions import diff_all
sage: f = function('f')(x)
sage: dd = diff_all(f, [x], 3)
sage: diff(f(x), x, x, x)
sage: d1 = {diff(f, x): 4*x^3}
sage: dd = diff_all(f, [x], 3, sub=d1)
sage: dd[(x, x, x)]
24*x

sage: dd = diff_all(f, [x], 3, sub=d1, rekey=f)
sage: dd[diff(f, x, 3)]
24*x

sage: a = {x:1}
sage: dd = diff_all(f, [x], 3, sub=d1, rekey=f, sub_final=a)
sage: dd[diff(f, x, 3)]
24

sage: X = var('x, y, z')
sage: f = function('f')(*X)
sage: dd = diff_all(f, X, 2, ending=[y, y, y])
sage: diff(f(x, y, z), y, y, y)

sage: g = function('g')(*X)
sage: dd = diff_all([f, g], X, 2)
sage: diff(f(x, y, z), y, z)
sage: dd[(1, z, z)]
diff(g(x, y, z), z, z)

sage: f = exp(x*y*z)
sage: ff = function('ff')(*X)
sage: dd = diff_all(f, X, 2, rekey=ff)
sage: dd[diff(ff, x, z)]
x*y^2*z*e^(x*y*z) + y*e^(x*y*z)
```

```
Return the derivatives $DD^{(l+k)}(A[j]B^l)$ evaluated at a point $p$ for various natural numbers $j, k, l$ which depend on $r$ and $N$.
```

\textbf{4.7. Asymptotics of Multivariate Generating Series}
Here $DD$ is a specific second-order linear differential operator that depends on $M$, $A$ is a list of symbolic functions, $B$ is symbolic function, and $AB\_derivs$ contains all the derivatives of $A$ and $B$ evaluated at $p$ that are necessary for the computation.

**INPUT:**
- $A$ – a single or length $r$ list of symbolic functions in the variables $V$
- $B$ – a symbolic function in the variables $V$
- $AB\_derivs$ – a dictionary whose keys are the (symbolic) derivatives of $A[j]$, $\ldots$, $A[r-1]$ up to order $2 \times N - 2$ and the (symbolic) derivatives of $B$ up to order $2 \times N$; the values of the dictionary are complex numbers that are the keys evaluated at a common point $p$
- $V$ – the variables of the $A[j]$ and $B$
- $M$ – a symmetric $l \times l$ matrix, where $l$ is the length of $V$
- $r$, $N$ – natural numbers

**OUTPUT:**
A dictionary.

The output is a dictionary whose keys are natural number tuples of the form $(j, k, l)$, where $l \leq 2k$, $j \leq r - 1$, and $j + k \leq N - 1$, and whose values are $DD(l + k)(A[j]B^l)$ evaluated at a point $p$, where $DD$ is the linear second-order differential operator $- \sum_{i=0}^{l-1} \sum_{j=0}^{l-1} M[i][j] \frac{\partial^2}{\partial V[j] \partial V[i]}$.

**Note:** For internal use by `FractionWithFactoredDenominator.asymptotics_smooth()` and `FractionWithFactoredDenominator.asymptotics_multiple()`.

**EXAMPLES:**

```python
sage: from sage.rings.asymptotic.asymptotics_multivariate_generating_functions import diff_op
sage: T = var('x, y')
sage: A = function('A')(tuple(T))
sage: B = function('B')(tuple(T))
sage: AB_derivs = {}
sage: M = matrix([[1, 2], [2, 1]])
sage: DD = diff_op(A, B, AB_derivs, T, M, 1, 2)  # long time (see :trac:`35207`
```

```python
sage: sorted(DD)
```

```python
sage: sorted(DD)  # long time

```

Return $DD(ek + vl)(AB^l)$ evaluated at a point $p$ for various natural numbers $e, k, l$ that depend on $v$ and $N$.

Here $DD$ is a specific linear differential operator that depends on $a$ and $v$, $A$ and $B$ are symbolic functions, and $AB\_derivs$ contains all the derivatives of $A$ and $B$ evaluated at $p$ that are necessary for the computation.

**Note:** For internal use by the function `FractionWithFactoredDenominator.asymptotics_smooth()`.
Asymptotic Expansions, Release 10.2

INPUT:

• A, B – Symbolic functions in the variable x
• AB_derivs - a dictionary whose keys are the (symbolic) derivatives of A up to order 2 * N if v is even or N if v is odd and the (symbolic) derivatives of B up to order 2 * N + v if v is even or N + v if v is odd; the values of the dictionary are complex numbers that are the keys evaluated at a common point p
• x – a symbolic variable
• a – a complex number
• v, N – natural numbers

OUTPUT:

A dictionary. The output is a dictionary whose keys are natural number pairs of the form (k, l), where k < N and l ≤ 2k and whose values are DD(e_k + v_l)(A B^l) evaluated at a point p. Here e = 2 if v is even, e = 1 if v is odd, and DD is the linear differential operator (a^{-1/v}d/dt) if v is even and (|a|^{-1/v}isgn(a)d/dt) if v is odd.

EXAMPLES:

```python
sage: from sage.rings.asymptotic.asymptotics_multivariate_generating_functions import diff_op_simple
sage: A = function('A')(x)
sage: B = function('B')(x)
sage: AB_derivs = {}
sage: sorted(diff_op_simple(A, B, AB_derivs, x, 3, 2, 2).items())
[((0, 0), A(x)), ((1, 0), 1/2*I*2^(2/3)*diff(A(x), x)), ((1, 1), 1/4*2^(2/3)*(B(x)*diff(A(x), x, x, x, x) + 4*diff(A(x), x, x, x)*diff(B(x), x) + 6*diff(A(x), x, x)*diff(B(x), x, x) + 4*diff(A(x), x)*diff(B(x), x, x, x) + A(x)*diff(B(x), x, x, x, x))]
```

```
sage.rings.asymptotic.asymptotics_multivariate_generating_functions.diff_prod(f_derivs, u, g, X, interval, end, uderivs, atc)
```

Take various derivatives of the equation \( f = u g \), evaluate them at a point \( c \), and solve for the derivatives of \( u \).

INPUT:

• f_derivs – a dictionary whose keys are all tuples of the form s + end, where s is a sequence of variables from X whose length lies in interval, and whose values are the derivatives of a function \( f \) evaluated at \( c \)
• u – a callable symbolic function
• g – an expression or callable symbolic function
• X – a list of symbolic variables
• interval – a list of positive integers Call the first and last values \( n \) and \( nn \), respectively
• end – a possibly empty list of repetitions of the variable \( z \), where \( z \) is the last element of \( X \)
• uderivs – a dictionary whose keys are the symbolic derivatives of order 0 to order \( n - 1 \) of \( u \) evaluated at \( c \) and whose values are the corresponding derivatives evaluated at \( c \)
• atc – a dictionary whose keys are the keys of \( c \) and all the symbolic derivatives of order 0 to order \( nn \) of \( g \) evaluated \( c \) and whose values are the corresponding derivatives evaluated at \( c \)
OUTPUT:

A dictionary whose keys are the derivatives of $u$ up to order $n$ and whose values are those derivatives evaluated at $c$.

This function works by differentiating the equation $f = u g$ with respect to the variable sequence $s + \text{end}$, for all tuples $s$ of $X$ of lengths in interval, evaluating at the point $c$, and solving for the remaining derivatives of $u$. This function assumes that $u$ never appears in the differentiations of $f = u g$ after evaluating at $c$.

**Note:** For internal use by `FractionWithFactoredDenominator.asymptotics_multiple()`.

EXAMPLES:

```python
sage: from sage.rings.asymptotic.asymptotics_multivariate_generating_functions import diff_prod
sage: u = function('u')(x)
sage: g = function('g')(x)
sage: fd = {(x,):1,(x, x):1}
sage: ud = {u(x=2): 1}
sage: atc = {x: 2, g(x=2): 3, diff(g, x)(x=2): 5}
sage: atc[diff(g, x, x)(x=2)] = 7
sage: dd = diff_prod(fd, u, g, [x], [1, 2], [], ud, atc)
sage: dd[diff(u, x, 2)(x=2)]
22/9
```

`sage.rings.asymptotic.asymptotics_multivariate_generating_functions.diff_seq(V, s)``

Given a list $s$ of tuples of natural numbers, return the list of elements of $V$ with indices the elements of the elements of $s$.

**INPUT:**

- $V$ – a list
- $s$ – a list of tuples of natural numbers in the interval $\text{range}(\text{len}(V))$

**OUTPUT:**

The tuple $([V[tt] \text{ for } tt \text{ in } \text{sorted}(t)])$, where $t$ is the list of elements of the elements of $s$.

**EXAMPLES:**

```python
sage: from sage.rings.asymptotic.asymptotics_multivariate_generating_functions import diff_seq
sage: V = list(var('x, t, z'))
sage: diff_seq(V,(2,),(0, 1),(0, 2, 1),(0, 0))
(x, x, x, t, t, z)
```

**Note:** This function is for internal use by `diff_op()`.

`sage.rings.asymptotic.asymptotics_multivariate_generating_functions.direction(v, coordinate=None)``

Return $[vv/v[coordinate] \text{ for } vv \text{ in } v]$ where coordinate is the last index of $v$ if not specified otherwise.

**INPUT:**
• \( v \) – a vector

• coordinate – (optional; default: None) an index for \( v \)

**EXAMPLES:**

```python
sage: from sage.rings.asymptotic.asymptotics_multivariate_generating_functions import direction
sage: direction([2, 3, 5])
(2/5, 3/5, 1)
sage: direction([2, 3, 5], 0)
(1, 3/2, 5/2)
```

sage.rings.asymptotic.asymptotics_multivariate_generating_functions.permutation_sign(s, u)

This function returns the sign of the permutation on 1, ..., \( \text{len}(u) \) that is induced by the sublist \( s \) of \( u \).

**Note:** This function was intended for internal use and is deprecated now (github issue #29465).

**INPUT:**

• \( s \) – a sublist of \( u \)

• \( u \) – a list

**OUTPUT:**

The sign of the permutation obtained by taking indices within \( u \) of the list \( s + sc \), where \( sc \) is \( u \) with the elements of \( s \) removed.

**EXAMPLES:**

```python
sage: from sage.rings.asymptotic.asymptotics_multivariate_generating_functions import permutation_sign
sage: u = ['a', 'b', 'c', 'd', 'e']
sage: s = ['b', 'd']
sage: permutation_sign(s, u)
-1
decl:...: DeprecationWarning: the function permutation_sign is deprecated
See https://github.com/sagemath/sage/issues/29465 for details.
-1
```

sage.rings.asymptotic.asymptotics_multivariate_generating_functions.subs_all(f, sub, simplify=False)

Return the items of \( f \) substituted by the dictionaries of \( sub \) in order of their appearance in \( sub \).

**INPUT:**

• \( f \) – an individual or list of symbolic expressions or dictionaries

• \( sub \) – an individual or list of dictionaries

• simplify – (default: False) boolean; set to \( True \) to simplify the result

**OUTPUT:**

The items of \( f \) substituted by the dictionaries of \( sub \) in order of their appearance in \( sub \). The \( \text{subs}() \) command is used. If \( \text{simplify} \) is \( True \), then \( \text{simplify}() \) is used after substitution.
EXAMPLES:

```python
sage: from sage.rings.asymptotic.asymptotics_multivariate_generating_functions import subs_all
sage: var('x, y, z')
(x, y, z)
sage: a = {x:1}
sage: b = {y:2}
sage: c = {z:3}
sage: subs_all(x + y + z, a)
y + z + 1
sage: subs_all(x + y + z, [c, a])
y + 4
sage: subs_all([x + y + z, y^2], b)
[x + z + 2, 4]
sage: subs_all([x + y + z, y^2], [b, c])
[x + 5, 4]
```

```python
sage: var('x, y')
(x, y)
sage: a = {'foo': x**2 + y**2, 'bar': x - y}
sage: b = {x: 1, y: 2}
sage: subs_all(a, b)
{'bar': -1, 'foo': 5}
```
