[word: 1211, word: 2111, word: 221]
```

static YoungsLattice(*n*)

Return Young's Lattice up to rank n.

In other words, the poset of partitions of size less than or equal to n ordered by inclusion.

INPUT:

- `n` – positive integer

EXAMPLES:

```
sage: P = posets.YoungsLattice(3); P
Finite meet-semilattice containing 7 elements
sage: P.cover_relations()
[[[], [1]],
 [[1], [1, 1]],
 [[1], [2]],
 [[1, 1], [1, 1, 1]],
 [[1, 1], [2, 1]],
 [[2], [2, 1]],
 [[2], [3]]]
```

```
>>> from sage.all import *
>>> P = posets.YoungsLattice(Integer(3)); P
Finite meet-semilattice containing 7 elements
>>> P.cover_relations()
[[[], [1]],
 [[1], [1, 1]],
 [[1], [2]],
 [[1, 1], [1, 1, 1]],
 [[1, 1], [2, 1]],
 [[2], [2, 1]],
 [[2], [3]]]
```

static YoungsLatticePrincipalOrderIdeal(*lam*)

Return the principal order ideal of the partition lam in Young's Lattice.

INPUT:

- `lam` – a partition

EXAMPLES:

```
sage: P = posets.YoungsLatticePrincipalOrderIdeal(Partition([2,2]))
sage: P
Finite lattice containing 6 elements
sage: P.cover_relations()
[[[], [1]],
 [[1], [1, 1]],
 [[1], [2]],
 [[1, 1], [2, 1]],
 [[2], [2, 1]],
 [[2, 1], [2, 2]]]
```

```
>>> from sage.all import *
>>> P = posets.YoungsLatticePrincipalOrderIdeal(Partition([Integer(2),
↪Integer(2)]))
>>> P
Finite lattice containing 6 elements
>>> P.cover_relations()
[[[], [1]],
 [[1], [1, 1]],
 [[1], [2]],
 [[1, 1], [2, 1]],
 [[2], [2, 1]],
 [[2, 1], [2, 2]]]
```

sage = <module 'sage' (namespace) from ['/home/user/sage-git/src/sage']>

sage.combinat.posets.poset_examples.**check_int**(*n*, *minimum=0*)

Check that n is an integer at least equal to minimum.

This is a boilerplate function ensuring input safety.

INPUT:

- n – anything
- minimum – an optional integer (default: 0)

EXAMPLES:

```
sage: from sage.combinat.posets.poset_examples import check_int
sage: check_int(6, 3)
6
sage: check_int(6)
6

sage: check_int(-1)
Traceback (most recent call last):
...
ValueError: number of elements must be a nonnegative integer, not -1

sage: check_int(1, 3)
Traceback (most recent call last):
...
ValueError: number of elements must be an integer at least 3, not 1

sage: check_int('junk')
Traceback (most recent call last):
...
ValueError: number of elements must be a nonnegative integer, not junk
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.poset_examples import check_int
>>> check_int(Integer(6), Integer(3))
6
>>> check_int(Integer(6))
6
```

(continues on next page)

(continued from previous page)

```
>>> check_int(-Integer(1))
Traceback (most recent call last):
...
ValueError: number of elements must be a nonnegative integer, not -1

>>> check_int(Integer(1), Integer(3))
Traceback (most recent call last):
...
ValueError: number of elements must be an integer at least 3, not 1

>>> check_int('junk')
Traceback (most recent call last):
...
ValueError: number of elements must be a nonnegative integer, not junk
```

`sage.combinat.posets.poset_examples.`**`posets`**

alias of *Posets*

5.1.186 Finite posets

This module implements finite partially ordered sets. It defines:

FinitePoset	A class for finite posets
FinitePosets_n	A class for finite posets up to isomorphism (i.e. unlabeled posets)
Poset()	Construct a finite poset from various forms of input data.
is_poset()	Return `True` if a directed graph is acyclic and transitively reduced.

List of Poset methods

Comparing, intervals and relations

is_less_than()	Return `True` if x is strictly less than y in the poset.
is_greater_than()	Return `True` if x is strictly greater than y in the poset.
is_lequal()	Return `True` if x is less than or equal to y in the poset.
is_gequal()	Return `True` if x is greater than or equal to y in the poset.
compare_elements()	Compare two element of the poset.
closed_interval()	Return the list of elements in a closed interval of the poset.
open_interval()	Return the list of elements in an open interval of the poset.
relations()	Return the list of relations in the poset.
relations_iterator()	Return an iterator over relations in the poset.
order_filter()	Return the upper set generated by elements.
order_ideal()	Return the lower set generated by elements.

Covering

covers()	Return True if y covers x.
lower_covers()	Return elements covered by given element.
upper_covers()	Return elements covering given element.
cover_relations()	Return the list of cover relations.
lower_covers_iterator()	Return an iterator over elements covered by given element.
upper_covers_iterator()	Return an iterator over elements covering given element.
cover_relations_iterator()	Return an iterator over cover relations of the poset.
common_upper_covers()	Return the list of all common upper covers of the given elements.
common_lower_covers()	Return the list of all common lower covers of the given elements.
meet()	Return the meet of given elements if it exists; None otherwise.
join()	Return the join of given elements if it exists; None otherwise.

Properties of the poset

cardinality()	Return the number of elements in the poset.
height()	Return the number of elements in a longest chain of the poset.
width()	Return the number of elements in a longest antichain of the poset.
relations_number()	Return the number of relations in the poset.
dimension()	Return the dimension of the poset.
jump_number()	Return the jump number of the poset.
magnitude()	Return the magnitude of the poset.
has_bottom()	Return True if the poset has a unique minimal element.
has_top()	Return True if the poset has a unique maximal element.
is_bounded()	Return True if the poset has both unique minimal and unique maximal element.
is_chain()	Return True if the poset is totally ordered.
is_connected()	Return True if the poset is connected.
is_graded()	Return True if all maximal chains of the poset has same length.
is_ranked()	Return True if the poset has a rank function.
is_rank_symmetric()	Return True if the poset is rank symmetric.
is_series_parallel()	Return True if the poset can be built by ordinal sums and disjoint unions.
is_greedy()	Return True if all greedy linear extensions have equal number of jumps.
is_jump_critical()	Return True if removal of any element reduces the jump number.
is_eulerian()	Return True if the poset is Eulerian.
is_incomparable_chain_free()	Return True if the poset is (m+n)-free.
is_slender()	Return True if the poset is slender.
is_sperner()	Return True if the poset is Sperner.
is_join_semilattice()	Return True if the poset has a join operation.
is_meet_semilattice()	Return True if the poset has a meet operation.

Minimal and maximal elements

bottom()	Return the bottom element of the poset, if it exists.
top()	Return the top element of the poset, if it exists.
maximal_elements()	Return the list of the maximal elements of the poset.
minimal_elements()	Return the list of the minimal elements of the poset.

New posets from old ones

disjoint_union()	Return the disjoint union of the poset with other poset.
ordinal_sum()	Return the ordinal sum of the poset with other poset.
product()	Return the Cartesian product of the poset with other poset.
ordinal_product()	Return the ordinal product of the poset with other poset.
rees_product()	Return the Rees product of the poset with other poset.
lexicographic_sum()	Return the lexicographic sum of posets.
star_product()	Return the star product of the poset with other poset.
with_bounds()	Return the poset with bottom and top element adjoined.
without_bounds()	Return the poset with bottom and top element removed.
dual()	Return the dual of the poset.
completion_by_cuts()	Return the Dedekind-MacNeille completion of the poset.
intervals_poset()	Return the poset of intervals of the poset.
connected_components()	Return the connected components of the poset as subposets.
factor()	Return the decomposition of the poset as a Cartesian product.
ordinal_summands()	Return the ordinal summands of the poset.
subposet()	Return the subposet containing elements with partial order induced by this poset.
random_subposet()	Return a random subposet that contains each element with given probability.
relabel()	Return a copy of this poset with its elements relabelled.
canonical_label()	Return copy of the poset canonically (re)labelled to integers.
slant_sum()	Return the slant sum poset of two posets.

Chains, antichains & linear intervals

is_chain_of_poset()	Return `True` if elements in the given list are comparable.
is_antichain_of_poset()	Return `True` if elements in the given list are incomparable.
is_linear_interval()	Return whether the given interval is a total order.
chains()	Return the chains of the poset.
antichains()	Return the antichains of the poset.
maximal_chains()	Return the maximal chains of the poset.
maximal_antichains()	Return the maximal antichains of the poset.
maximal_chains_iterator()	Return an iterator over the maximal chains of the poset.
maximal_chain_length()	Return the maximum length of maximal chains of the poset.
antichains_iterator()	Return an iterator over the antichains of the poset.
random_maximal_chain()	Return a random maximal chain.
random_maximal_antichain()	Return a random maximal antichain.
linear_intervals_count()	Return the enumeration of linear intervals in the poset.

Drawing

show()	Display the Hasse diagram of the poset.
plot()	Return a Graphic object corresponding the Hasse diagram of the poset.
graphviz_string()	Return a representation in the DOT language, ready to render in graphviz.

Comparing posets

is_isomorphic()	Return `True` if both posets are isomorphic.
is_induced_subposet()	Return `True` if given poset is an induced subposet of this poset.

Polynomials

chain_polynomial()	Return the chain polynomial of the poset.
characteristic_polynomial()	Return the characteristic polynomial of the poset.
f_polynomial()	Return the f-polynomial of the poset.
flag_f_polynomial()	Return the flag f-polynomial of the poset.
h_polynomial()	Return the h-polynomial of the poset.
flag_h_polynomial()	Return the flag h-polynomial of the poset.
order_polynomial()	Return the order polynomial of the poset.
zeta_polynomial()	Return the zeta polynomial of the poset.
apozeta_polynomial()	Return the apozeta polynomial of the poset.
M_triangle()	Return the M-triangle of the poset.
kazhdan_lusztig_polynomial()	Return the Kazhdan-Lusztig polynomial of the poset.
coxeter_polynomial()	Return the characteristic polynomial of the Coxeter transformation.
degree_polynomial()	Return the generating polynomial of degrees of vertices in the Hasse diagram.
p_partition_enumerator()	Return a P-partition enumerator of the poset.

Polytopes

chain_polytope()	Return the chain polytope of the poset.
order_polytope()	Return the order polytope of the poset.

Graphs

hasse_diagram()	Return the Hasse diagram of the poset as a directed graph.
cover_relations_graph()	Return the (undirected) graph of cover relations.
comparability_graph()	Return the comparability graph of the poset.
incomparability_graph()	Return the incomparability graph of the poset.
frank_network()	Return Frank's network of the poset.
linear_extensions_graph()	Return the linear extensions graph of the poset.

Linear extensions

is_linear_extension()	Return `True` if the given list is a linear extension of the poset.
linear_extension()	Return a linear extension of the poset.
linear_extensions()	Return the enumerated set of all the linear extensions of the poset.
promotion()	Return the (extended) promotion on the linear extension of the poset.
evacuation()	Return evacuation on the linear extension associated to the poset.
with_linear_extension()	Return a copy of `self` with a different default linear extension.
random_linear_extension()	Return a random linear extension.

Matrices

lequal_matrix()	Compute the matrix whose `(i,j)` entry is 1 if `self.linear_extension()[i] < self.linear_extension()[j]` and 0 otherwise.
moebius_function()	Return the value of Möbius function of given elements in the poset.
moebius_function_matrix()	Return a matrix whose `(i,j)` entry is the value of the Möbius function evaluated at `self.linear_extension()[i]` and `self.linear_extension()[j]`.
coxeter_transformation()	Return the matrix of the Auslander-Reiten translation acting on the Grothendieck group of the derived category of modules.
coxeter_smith_form()	Return the Smith form of the Coxeter transformation.

Miscellaneous

sorted()	Return given list sorted by the poset.
isomorphic_subposets()	Return all subposets isomorphic to another poset.
isomorphic_subposets_iterator()	Return an iterator over the subposets isomorphic to another poset.
has_isomorphic_subposet()	Return `True` if the poset contains a subposet isomorphic to another poset.
list()	List the elements of the poset.
cuts()	Return the cuts of the given poset.
dilworth_decomposition()	Return a partition of the points into the minimal number of chains.
greene_shape()	Compute the Greene-Kleitman partition aka Greene shape of the poset `self`.
incidence_algebra()	Return the incidence algebra of `self`.
is_EL_labelling()	Return whether `f` is an EL labelling of the poset.
isomorphic_subposets_iterator()	Return an iterator over the subposets isomorphic to another poset.
isomorphic_subposets()	Return all subposets isomorphic to another poset.
level_sets()	Return elements grouped by maximal number of cover relations from a minimal element.
order_complex()	Return the order complex associated to this poset.
random_order_ideal()	Return a random order ideal of `self` with uniform probability.
rank()	Return the rank of an element, or the rank of the poset.
rank_function()	Return a rank function of the poset, if it exists.
unwrap()	Unwrap an element of this poset.
atkinson()	Return the a-spectrum of a poset whose undirected Hasse diagram is a forest.
spectrum()	Return the a-spectrum of this poset.

Classes and functions

class `sage.combinat.posets.posets.`**`FinitePoset`**(*hasse_diagram*, *elements*, *category*, *facade*, *key*)

Bases: `UniqueRepresentation`, `Parent`

A (finite) n-element poset constructed from a directed acyclic graph.

INPUT:

- `hasse_diagram` – an instance of *FinitePoset*, or a `DiGraph` that is transitively-reduced, acyclic, loop-free, and multiedge-free.
- `elements` – an optional list of elements, with `element[i]` corresponding to vertex `i`. If `elements` is `None`, then it is set to be the vertex set of the digraph. Note that if this option is set, then `elements` is considered as a specified linear extension of the poset and the `linear_extension` attribute is set.

- `category` – `FinitePosets`, or a subcategory thereof
- `facade` – boolean or `None` (default); whether the *`FinitePoset`*'s elements should be wrapped to make them aware of the Poset they belong to.
  - If `facade = True`, the *`FinitePoset`*'s elements are exactly those given as input.
  - If `facade = False`, the *`FinitePoset`*'s elements will become `PosetElement` objects.
  - If `facade = None` (default) the expected behaviour is the behaviour of `facade = True`, unless the opposite can be deduced from the context (i.e. for instance if a *`FinitePoset`* is built from another *`FinitePoset`*, itself built with `facade = False`)
- `key` – any hashable value (default: `None`)

EXAMPLES:

```
sage: uc = [[2,3], [], [1], [1], [1], [3,4]]
sage: from sage.combinat.posets.posets import FinitePoset
sage: P = FinitePoset(DiGraph(dict([[i,uc[i]] for i in range(len(uc))])),
↪facade=False); P
Finite poset containing 6 elements
sage: P.cover_relations()
[[5, 4], [5, 3], [4, 1], [0, 2], [0, 3], [2, 1], [3, 1]]
sage: TestSuite(P).run()
sage: P.category()
Category of finite enumerated posets
sage: P.__class__
<class 'sage.combinat.posets.posets.FinitePoset_with_category'>

sage: Q = sage.combinat.posets.posets.FinitePoset(P, facade = False); Q
Finite poset containing 6 elements

sage: Q is P
True
```

```
>>> from sage.all import *
>>> uc = [[Integer(2),Integer(3)], [], [Integer(1)], [Integer(1)], [Integer(1)],
↪[Integer(3),Integer(4)]]
>>> from sage.combinat.posets.posets import FinitePoset
>>> P = FinitePoset(DiGraph(dict([[i,uc[i]] for i in range(len(uc))])),
↪facade=False); P
Finite poset containing 6 elements
>>> P.cover_relations()
[[5, 4], [5, 3], [4, 1], [0, 2], [0, 3], [2, 1], [3, 1]]
>>> TestSuite(P).run()
>>> P.category()
Category of finite enumerated posets
>>> P.__class__
<class 'sage.combinat.posets.posets.FinitePoset_with_category'>

>>> Q = sage.combinat.posets.posets.FinitePoset(P, facade = False); Q
Finite poset containing 6 elements

>>> Q is P
True
```

We keep the same underlying Hasse diagram, but change the elements:

```
sage: Q = sage.combinat.posets.posets.FinitePoset(P, elements=[1,2,3,4,5,6],
↪facade=False); Q
Finite poset containing 6 elements with distinguished linear extension
sage: Q.cover_relations()
[[1, 2], [1, 5], [2, 6], [3, 4], [3, 5], [4, 6], [5, 6]]
```

```
>>> from sage.all import *
>>> Q = sage.combinat.posets.posets.FinitePoset(P, elements=[Integer(1),
↪Integer(2),Integer(3),Integer(4),Integer(5),Integer(6)], facade=False); Q
Finite poset containing 6 elements with distinguished linear extension
>>> Q.cover_relations()
[[1, 2], [1, 5], [2, 6], [3, 4], [3, 5], [4, 6], [5, 6]]
```

We test the facade argument:

```
sage: P = Poset(DiGraph({'a':['b'],'b':['c'],'c':['d']}), facade=False)
sage: P.category()
Category of finite enumerated posets
sage: parent(P[0]) is P
True

sage: Q = Poset(DiGraph({'a':['b'],'b':['c'],'c':['d']}), facade=True)
sage: Q.category()
Category of facade finite enumerated posets
sage: parent(Q[0]) is str
True
sage: TestSuite(Q).run(skip = ['_test_an_element']) # is_parent_of is not yet
↪implemented
```

```
>>> from sage.all import *
>>> P = Poset(DiGraph({'a':['b'],'b':['c'],'c':['d']}), facade=False)
>>> P.category()
Category of finite enumerated posets
>>> parent(P[Integer(0)]) is P
True

>>> Q = Poset(DiGraph({'a':['b'],'b':['c'],'c':['d']}), facade=True)
>>> Q.category()
Category of facade finite enumerated posets
>>> parent(Q[Integer(0)]) is str
True
>>> TestSuite(Q).run(skip = ['_test_an_element']) # is_parent_of is not yet
↪implemented
```

Changing a non facade poset to a facade poset:

```
sage: PQ = Poset(P, facade=True)
sage: PQ.category()
Category of facade finite enumerated posets
sage: parent(PQ[0]) is str
True
```

(continues on next page)

(continued from previous page)

```
sage: PQ is Q
True
```

```
>>> from sage.all import *
>>> PQ = Poset(P, facade=True)
>>> PQ.category()
Category of facade finite enumerated posets
>>> parent(PQ[Integer(0)]) is str
True
>>> PQ is Q
True
```

Changing a facade poset to a non facade poset:

```
sage: QP = Poset(Q, facade = False)
sage: QP.category()
Category of finite enumerated posets
sage: parent(QP[0]) is QP
True
```

```
>>> from sage.all import *
>>> QP = Poset(Q, facade = False)
>>> QP.category()
Category of finite enumerated posets
>>> parent(QP[Integer(0)]) is QP
True
```

Conversion to some other software is possible:

```
sage: P = posets.TamariLattice(3)
sage: libgap(P)                                         # optional - gap_package_
↪qpa
<A poset on 5 points>

sage: P = Poset({1:[2],2:[]})
sage: macaulay2('needsPackage "Posets"')    # optional - macaulay2
Posets
sage: macaulay2(P)    # optional - macaulay2
Relation Matrix: | 1 1 |
                 | 0 1 |
```

```
>>> from sage.all import *
>>> P = posets.TamariLattice(Integer(3))
>>> libgap(P)                                         # optional - gap_package_qpa
<A poset on 5 points>

>>> P = Poset({Integer(1):[Integer(2)],Integer(2):[]})
>>> macaulay2('needsPackage "Posets"')    # optional - macaulay2
Posets
>>> macaulay2(P)    # optional - macaulay2
Relation Matrix: | 1 1 |
                 | 0 1 |
```

Note

A class that inherits from this class needs to define `Element`. This is the class of the elements that the inheriting class contains. For example, for this class, `FinitePoset`, `Element` is `PosetElement`. It can also define `_dual_class` which is the class of dual posets of this class. E.g. `FiniteMeetSemilattice._dual_class` is `FiniteJoinSemilattice`.

Element

alias of *PosetElement*

M_triangle()

Return the M-triangle of the poset.

The poset is expected to be graded.

OUTPUT: an *M_triangle*

The M-triangle is the generating polynomial of the Möbius numbers

$$M(x, y) = \sum_{a \leq b} \mu(a, b) x^{|a|} y^{|b|}.$$

EXAMPLES:

```
sage: P = posets.DiamondPoset(5)
sage: P.M_triangle()                                                    #␣
↪needs sage.combinat
M: x^2*y^2 - 3*x*y^2 + 3*x*y + 2*y^2 - 3*y + 1
```

```
>>> from sage.all import *
>>> P = posets.DiamondPoset(Integer(5))
>>> P.M_triangle()                                                      #␣
↪needs sage.combinat
M: x^2*y^2 - 3*x*y^2 + 3*x*y + 2*y^2 - 3*y + 1
```

antichains(*element_constructor=None*)

Return the antichains of the poset.

An *antichain* of a poset is a set of elements of the poset that are pairwise incomparable.

INPUT:

- `element_constructor` – a function taking an iterable as argument (default: `list`)

OUTPUT:

The enumerated set (of type *PairwiseCompatibleSubsets*) of all antichains of the poset, each of which is given as an `element_constructor`.

EXAMPLES:

```
sage: A = posets.PentagonPoset().antichains(); A
Set of antichains of Finite lattice containing 5 elements
sage: list(A)
[[], [0], [1], [1, 2], [1, 3], [2], [3], [4]]
sage: A.cardinality()
8
```

(continues on next page)

(continued from previous page)

```
sage: A[3]
[1, 2]
```

```
>>> from sage.all import *
>>> A = posets.PentagonPoset().antichains(); A
Set of antichains of Finite lattice containing 5 elements
>>> list(A)
[[], [0], [1], [1, 2], [1, 3], [2], [3], [4]]
>>> A.cardinality()
8
>>> A[Integer(3)]
[1, 2]
```

To get the antichains as, say, sets, one may use the `element_constructor` option:

```
sage: list(posets.ChainPoset(3).antichains(element_constructor=set))
[set(), {0}, {1}, {2}]
```

```
>>> from sage.all import *
>>> list(posets.ChainPoset(Integer(3)).antichains(element_constructor=set))
[set(), {0}, {1}, {2}]
```

To get the antichains of a given size one can currently use:

```
sage: list(A.elements_of_depth_iterator(2))
[[1, 2], [1, 3]]
```

```
>>> from sage.all import *
>>> list(A.elements_of_depth_iterator(Integer(2)))
[[1, 2], [1, 3]]
```

Eventually the following syntax will be accepted:

```
sage: A.subset(size=2)                # not implemented
```

```
>>> from sage.all import *
>>> A.subset(size=Integer(2))              # not implemented
```

Note

Internally, this uses *sage.combinat.subsets_pairwise.PairwiseCompatibleSubsets* and `RecursivelyEnumeratedSet_forest`. At this point, iterating through this set is about twice slower than using *antichains_iterator()* (tested on `posets.AntichainPoset(15)`). The algorithm is the same (depth first search through the tree), but *antichains_iterator()* manually inlines things which apparently avoids some infrastructure overhead.

On the other hand, this returns a full featured enumerated set, with containment testing, etc.

See also

maximal_antichains(), *chains()*

antichains_iterator()

Return an iterator over the antichains of the poset.

EXAMPLES:

```
sage: it = posets.PentagonPoset().antichains_iterator(); it
<generator object ...antichains_iterator at ...>
sage: next(it), next(it)
([], [4])
```

```
>>> from sage.all import *
>>> it = posets.PentagonPoset().antichains_iterator(); it
<generator object ...antichains_iterator at ...>
>>> next(it), next(it)
([], [4])
```

See also:

antichains()

apozeta_polynomial()

Return the apozeta polynomial of the poset `self`.

The poset is assumed to be graded.

The apozeta polynomial of a poset is the unique polynomial $Z^a(q)$ such that for every integer $m > 1$, $Z^a(m)$ is the number of weakly increasing sequences $x_1 \leq x_2 \leq \cdots \leq x_{m-1}$ of elements of the poset whose largest element belongs to the top level of the poset.

When the poset P has a unique maximal element, this is equal to $Z(q-1)$ where Z is the zeta polynomial of P.

The name comes from the greek radical `apo`.

See also:

zeta_polynomial()

EXAMPLES:

```
sage: P = posets.NoncrossingPartitions(SymmetricGroup(4))
sage: P.apozeta_polynomial()
8/3*q^3 - 10*q^2 + 37/3*q - 5

sage: P = Poset({"a": "bc", "b": "d", "c": "de"})
sage: P.apozeta_polynomial()
3/2*q^2 - 5/2*q + 1
sage: P.zeta_polynomial()
3/2*q^2 - 1/2*q
```

```
>>> from sage.all import *
>>> P = posets.NoncrossingPartitions(SymmetricGroup(Integer(4)))
>>> P.apozeta_polynomial()
8/3*q^3 - 10*q^2 + 37/3*q - 5

>>> P = Poset({"a": "bc", "b": "d", "c": "de"})
>>> P.apozeta_polynomial()
3/2*q^2 - 5/2*q + 1
>>> P.zeta_polynomial()
3/2*q^2 - 1/2*q
```

atkinson(*a*)

Return the a-spectrum of a poset whose Hasse diagram is cycle-free as an undirected graph.

Given an element a in a poset P, the a-spectrum is the list of integers whose i-th term contains the number of linear extensions of P with element a located in the i-th position.

INPUT:

- `self` – a poset whose Hasse diagram is a forest
- `a` – an element of the poset

OUTPUT: the a-spectrum of this poset, returned as a list

EXAMPLES:

```
sage: P = Poset({0: [2], 1: [2], 2: [3, 4], 3: [], 4: []})
sage: P.atkinson(0)
[2, 2, 0, 0, 0]

sage: P = Poset({0: [1], 1: [2, 3], 2: [], 3: [], 4: [5, 6], 5: [], 6: []})
sage: P.atkinson(5)
[0, 10, 18, 24, 28, 30, 30]

sage: P = posets.AntichainPoset(10)
sage: P.atkinson(0)
[362880, 362880, 362880, 362880, 362880, 362880, 362880, 362880, 362880,␣
↪362880]
```

```
>>> from sage.all import *
>>> P = Poset({Integer(0): [Integer(2)], Integer(1): [Integer(2)],␣
↪Integer(2): [Integer(3), Integer(4)], Integer(3): [], Integer(4): []})
>>> P.atkinson(Integer(0))
[2, 2, 0, 0, 0]

>>> P = Poset({Integer(0): [Integer(1)], Integer(1): [Integer(2), Integer(3)],
↪ Integer(2): [], Integer(3): [], Integer(4): [Integer(5), Integer(6)],␣
↪Integer(5): [], Integer(6): []})
>>> P.atkinson(Integer(5))
[0, 10, 18, 24, 28, 30, 30]

>>> P = posets.AntichainPoset(Integer(10))
>>> P.atkinson(Integer(0))
[362880, 362880, 362880, 362880, 362880, 362880, 362880, 362880, 362880,␣
↪362880]
```

Note

This function is the implementation of the algorithm from [At1990].

bottom()

Return the unique minimal element of the poset, if it exists.

EXAMPLES:

```
sage: P = Poset({0:[3],1:[3],2:[3],3:[4],4:[]})
sage: P.bottom() is None
True
sage: Q = Poset({0:[1],1:[]})
sage: Q.bottom()
0
```

```
>>> from sage.all import *
>>> P = Poset({Integer(0):[Integer(3)],Integer(1):[Integer(3)],
↪Integer(2):[Integer(3)],Integer(3):[Integer(4)],Integer(4):[]})
>>> P.bottom() is None
True
>>> Q = Poset({Integer(0):[Integer(1)],Integer(1):[]})
>>> Q.bottom()
0
```

See also

has_bottom(), *top()*

canonical_label(*algorithm=None*)

Return the unique poset on the labels $\{0, \ldots, n-1\}$ (where n is the number of elements in the poset) that is isomorphic to this poset and invariant in the isomorphism class.

INPUT:

- algorithm – string (optional); a parameter forwarded to underlying graph function to select the algorithm to use

EXAMPLES:

```
sage: P = Poset((divisors(12), attrcall("divides")), linear_extension=True)
sage: P.list()
[1, 2, 3, 4, 6, 12]
sage: Q = P.canonical_label()
sage: sorted(Q.list())
[0, 1, 2, 3, 4, 5]
sage: Q.is_isomorphic(P)
True
```

```
>>> from sage.all import *
>>> P = Poset((divisors(Integer(12)), attrcall("divides")), linear_
↪extension=True)
```

(continues on next page)

(continued from previous page)

```
>>> P.list()
[1, 2, 3, 4, 6, 12]
>>> Q = P.canonical_label()
>>> sorted(Q.list())
[0, 1, 2, 3, 4, 5]
>>> Q.is_isomorphic(P)
True
```

Canonical labeling of (semi)lattice returns (semi)lattice:

```
sage: D = DiGraph({'a':['b','c']})
sage: P = Poset(D)
sage: ML = MeetSemilattice(D)
sage: P.canonical_label()
Finite poset containing 3 elements
sage: ML.canonical_label()
Finite meet-semilattice containing 3 elements
```

```
>>> from sage.all import *
>>> D = DiGraph({'a':['b','c']})
>>> P = Poset(D)
>>> ML = MeetSemilattice(D)
>>> P.canonical_label()
Finite poset containing 3 elements
>>> ML.canonical_label()
Finite meet-semilattice containing 3 elements
```

See also

- Canonical labeling of directed graphs: `canonical_label()`

cardinality()

Return the number of elements in the poset.

EXAMPLES:

```
sage: Poset([[1,2,3],[4],[4],[4],[]]).cardinality()
5
```

```
>>> from sage.all import *
>>> Poset([[Integer(1),Integer(2),Integer(3)],[Integer(4)],[Integer(4)],
↪[Integer(4)],[]]).cardinality()
5
```

See also

`degree_polynomial()` for a more refined invariant

chain_polynomial()

Return the chain polynomial of the poset.

The coefficient of q^k is the number of chains of k elements in the poset. List of coefficients of this polynomial is also called a *f-vector* of the poset.

Note

This is not what has been called the chain polynomial in [St1986]. The latter is identical with the order polynomial in SageMath (`order_polynomial()`).

See also

`f_polynomial()`, `order_polynomial()`

EXAMPLES:

```
sage: P = posets.ChainPoset(3)
sage: t = P.chain_polynomial(); t
q^3 + 3*q^2 + 3*q + 1
sage: t(1) == len(list(P.chains()))
True

sage: P = posets.BooleanLattice(3)
sage: P.chain_polynomial()
6*q^4 + 18*q^3 + 19*q^2 + 8*q + 1

sage: P = posets.AntichainPoset(5)
sage: P.chain_polynomial()
5*q + 1
```

```
>>> from sage.all import *
>>> P = posets.ChainPoset(Integer(3))
>>> t = P.chain_polynomial(); t
q^3 + 3*q^2 + 3*q + 1
>>> t(Integer(1)) == len(list(P.chains()))
True

>>> P = posets.BooleanLattice(Integer(3))
>>> P.chain_polynomial()
6*q^4 + 18*q^3 + 19*q^2 + 8*q + 1

>>> P = posets.AntichainPoset(Integer(5))
>>> P.chain_polynomial()
5*q + 1
```

chain_polytope()

Return the chain polytope of the poset `self`.

The chain polytope of a finite poset P is defined as the subset of $\mathbf{R}^P$ consisting of all maps $x : P \to \mathbf{R}$ satisfying

$$x(p) \geq 0 \text{ for all } p \in P,$$

and

$$x(p_1) + x(p_2) + \ldots + x(p_k) \leq 1 \text{ for all chains } p_1 < p_2 < \ldots < p_k \text{ in } P.$$

This polytope was defined and studied in [St1986].

EXAMPLES:

```
sage: P = posets.AntichainPoset(3)
sage: Q = P.chain_polytope(); Q                                              #␣
↪needs sage.geometry.polyhedron
A 3-dimensional polyhedron in ZZ^3 defined as the convex hull of 8 vertices
sage: P = posets.PentagonPoset()
sage: Q = P.chain_polytope(); Q                                              #␣
↪needs sage.geometry.polyhedron
A 5-dimensional polyhedron in ZZ^5 defined as the convex hull of 8 vertices
```

```
>>> from sage.all import *
>>> P = posets.AntichainPoset(Integer(3))
>>> Q = P.chain_polytope(); Q                                               #␣
↪needs sage.geometry.polyhedron
A 3-dimensional polyhedron in ZZ^3 defined as the convex hull of 8 vertices
>>> P = posets.PentagonPoset()
>>> Q = P.chain_polytope(); Q                                               #␣
↪needs sage.geometry.polyhedron
A 5-dimensional polyhedron in ZZ^5 defined as the convex hull of 8 vertices
```

chains(*element_constructor=None*, *exclude=None*)

Return the chains of the poset.

A *chain* of a poset is an increasing sequence of distinct elements of the poset.

INPUT:

- `element_constructor` – a function taking an iterable as argument (default: `list`)
- `exclude` – elements of the poset to be excluded (default: `None`)

OUTPUT:

The enumerated set (of type *PairwiseCompatibleSubsets*) of all chains of the poset, each of which is given as an `element_constructor`.

EXAMPLES:

```
sage: C = posets.PentagonPoset().chains(); C
Set of chains of Finite lattice containing 5 elements
sage: list(C)
[[], [0], [0, 1], [0, 1, 4], [0, 2], [0, 2, 3], [0, 2, 3, 4], [0, 2, 4],
 [0, 3], [0, 3, 4], [0, 4], [1], [1, 4], [2], [2, 3], [2, 3, 4], [2, 4],
 [3], [3, 4], [4]]
```

```
>>> from sage.all import *
>>> C = posets.PentagonPoset().chains(); C
Set of chains of Finite lattice containing 5 elements
>>> list(C)
[[], [0], [0, 1], [0, 1, 4], [0, 2], [0, 2, 3], [0, 2, 3, 4], [0, 2, 4],
```

(continues on next page)

(continued from previous page)

```
[0, 3], [0, 3, 4], [0, 4], [1], [1, 4], [2], [2, 3], [2, 3, 4], [2, 4],
[3], [3, 4], [4]]
```

Exclusion of elements, tuple (instead of list) as constructor:

```
sage: P = Poset({1: [2, 3], 2: [4], 3: [4, 5]})
sage: list(P.chains(element_constructor=tuple, exclude=[3]))
[(), (1,), (1, 2), (1, 2, 4), (1, 4), (1, 5), (2,), (2, 4), (4,), (5,)]
```

```
>>> from sage.all import *
>>> P = Poset({Integer(1): [Integer(2), Integer(3)], Integer(2): [Integer(4)],
↪ Integer(3): [Integer(4), Integer(5)]})
>>> list(P.chains(element_constructor=tuple, exclude=[Integer(3)]))
[(), (1,), (1, 2), (1, 2, 4), (1, 4), (1, 5), (2,), (2, 4), (4,), (5,)]
```

To get the chains of a given size one can currently use:

```
sage: list(C.elements_of_depth_iterator(2))
[[0, 1], [0, 2], [0, 3], [0, 4], [1, 4], [2, 3], [2, 4], [3, 4]]
```

```
>>> from sage.all import *
>>> list(C.elements_of_depth_iterator(Integer(2)))
[[0, 1], [0, 2], [0, 3], [0, 4], [1, 4], [2, 3], [2, 4], [3, 4]]
```

Eventually the following syntax will be accepted:

```
sage: C.subset(size=2)                # not implemented
```

```
>>> from sage.all import *
>>> C.subset(size=Integer(2))                # not implemented
```

See also

maximal_chains(), *antichains()*

characteristic_polynomial()

Return the characteristic polynomial of the poset.

The poset is expected to be graded and have a bottom element.

If P is a graded poset with rank n and a unique minimal element $\hat{0}$, then the characteristic polynomial of P is defined to be

$$\sum_{x\in P} \mu(\hat{0}, x) q^{n-\rho(x)} \in \mathbf{Z}[q],$$

where ρ is the rank function, and μ is the Möbius function of P.

See section 3.10 of [EnumComb1].

EXAMPLES:

```
sage: P = posets.DiamondPoset(5)
sage: P.characteristic_polynomial()
q^2 - 3*q + 2

sage: P = Poset({1: [2, 3], 2: [4], 3: [5], 4: [6], 5: [6], 6: [7]})
sage: P.characteristic_polynomial()
q^4 - 2*q^3 + q
```

```
>>> from sage.all import *
>>> P = posets.DiamondPoset(Integer(5))
>>> P.characteristic_polynomial()
q^2 - 3*q + 2

>>> P = Poset({Integer(1): [Integer(2), Integer(3)], Integer(2): [Integer(4)],
→ Integer(3): [Integer(5)], Integer(4): [Integer(6)], Integer(5):␣
→[Integer(6)], Integer(6): [Integer(7)]})
>>> P.characteristic_polynomial()
q^4 - 2*q^3 + q
```

closed_interval(*x*, *y*)

Return the list of elements z such that $x \leq z \leq y$ in the poset.

EXAMPLES:

```
sage: P = Poset((divisors(1000), attrcall("divides")))
sage: P.closed_interval(2, 100)
[2, 4, 10, 20, 50, 100]
```

```
>>> from sage.all import *
>>> P = Poset((divisors(Integer(1000)), attrcall("divides")))
>>> P.closed_interval(Integer(2), Integer(100))
[2, 4, 10, 20, 50, 100]
```

See also

open_interval()

common_lower_covers(*elmts*)

Return all of the common lower covers of the elements `elmts`.

EXAMPLES:

```
sage: P = Poset({0: [1,2], 1: [3], 2: [3], 3: []})
sage: P.common_lower_covers([1, 2])
[0]
```

```
>>> from sage.all import *
>>> P = Poset({Integer(0): [Integer(1),Integer(2)], Integer(1): [Integer(3)],␣
→Integer(2): [Integer(3)], Integer(3): []})
>>> P.common_lower_covers([Integer(1), Integer(2)])
[0]
```

common_upper_covers(*elmts*)

Return all of the common upper covers of the elements `elmts`.

EXAMPLES:

```
sage: P = Poset({0: [1,2], 1: [3], 2: [3], 3: []})
sage: P.common_upper_covers([1, 2])
[3]
```

```
>>> from sage.all import *
>>> P = Poset({Integer(0): [Integer(1),Integer(2)], Integer(1): [Integer(3)],␣
↪Integer(2): [Integer(3)], Integer(3): []})
>>> P.common_upper_covers([Integer(1), Integer(2)])
[3]
```

comparability_graph()

Return the comparability graph of the poset.

The comparability graph is an undirected graph where vertices are the elements of the poset and there is an edge between two vertices if they are comparable in the poset.

See Wikipedia article Comparability_graph

EXAMPLES:

```
sage: Y = Poset({1: [2], 2: [3, 4]})
sage: g = Y.comparability_graph(); g
Comparability graph on 4 vertices
sage: Y.compare_elements(1, 3) is not None
True
sage: g.has_edge(1, 3)
True
```

```
>>> from sage.all import *
>>> Y = Poset({Integer(1): [Integer(2)], Integer(2): [Integer(3), Integer(4)]}
↪)
>>> g = Y.comparability_graph(); g
Comparability graph on 4 vertices
>>> Y.compare_elements(Integer(1), Integer(3)) is not None
True
>>> g.has_edge(Integer(1), Integer(3))
True
```

See also

incomparability_graph(), `sage.graphs.comparability`

compare_elements(*x*, *y*)

Compare x and y in the poset.

- If $x < y$, return `-1`.
- If $x = y$, return `0`.
- If $x > y$, return `1`.

- If x and y are not comparable, return None.

EXAMPLES:

```
sage: P = Poset([[1, 2], [4], [3], [4], []])
sage: P.compare_elements(0, 0)
0
sage: P.compare_elements(0, 4)
-1
sage: P.compare_elements(4, 0)
1
sage: P.compare_elements(1, 2) is None
True
```

```
>>> from sage.all import *
>>> P = Poset([[Integer(1), Integer(2)], [Integer(4)], [Integer(3)],␣
↪[Integer(4)], []])
>>> P.compare_elements(Integer(0), Integer(0))
0
>>> P.compare_elements(Integer(0), Integer(4))
-1
>>> P.compare_elements(Integer(4), Integer(0))
1
>>> P.compare_elements(Integer(1), Integer(2)) is None
True
```

completion_by_cuts()

Return the completion by cuts of self.

This is the smallest lattice containing the poset. This is also called the Dedekind-MacNeille completion.

See the Wikipedia article Dedekind-MacNeille completion.

OUTPUT: a finite lattice

EXAMPLES:

```
sage: P = posets.PentagonPoset()
sage: P.completion_by_cuts().is_isomorphic(P)
True

sage: Y = Poset({1: [2], 2: [3, 4]})
sage: trafficsign = LatticePoset({1: [2], 2: [3, 4], 3: [5], 4: [5]})
sage: L = Y.completion_by_cuts()
sage: L.is_isomorphic(trafficsign)
True

sage: P = posets.SymmetricGroupBruhatOrderPoset(3)
sage: Q = P.completion_by_cuts(); Q
Finite lattice containing 7 elements
```

```
>>> from sage.all import *
>>> P = posets.PentagonPoset()
>>> P.completion_by_cuts().is_isomorphic(P)
True
```

(continues on next page)

(continued from previous page)

```
>>> Y = Poset({Integer(1): [Integer(2)], Integer(2): [Integer(3), Integer(4)]}
↪)
>>> trafficsign = LatticePoset({Integer(1): [Integer(2)], Integer(2):␣
↪[Integer(3), Integer(4)], Integer(3): [Integer(5)], Integer(4):␣
↪[Integer(5)]})
>>> L = Y.completion_by_cuts()
>>> L.is_isomorphic(trafficsign)
True

>>> P = posets.SymmetricGroupBruhatOrderPoset(Integer(3))
>>> Q = P.completion_by_cuts(); Q
Finite lattice containing 7 elements
```

See also

cuts(), irreducibles_poset()

connected_components()

Return the connected components of the poset as subposets.

EXAMPLES:

```
sage: P = Poset({1: [2, 3], 3: [4, 5], 6: [7, 8]})
sage: parts = sorted(P.connected_components(), key=len); parts
[Finite poset containing 3 elements,
 Finite poset containing 5 elements]
sage: parts[0].cover_relations()
[[6, 7], [6, 8]]
```

```
>>> from sage.all import *
>>> P = Poset({Integer(1): [Integer(2), Integer(3)], Integer(3): [Integer(4),␣
↪Integer(5)], Integer(6): [Integer(7), Integer(8)]})
>>> parts = sorted(P.connected_components(), key=len); parts
[Finite poset containing 3 elements,
 Finite poset containing 5 elements]
>>> parts[Integer(0)].cover_relations()
[[6, 7], [6, 8]]
```

See also

disjoint_union(), *is_connected()*

cover_relations()

Return the list of pairs `[x, y]` of elements of the poset such that `y` covers `x`.

EXAMPLES:

```
sage: P = Poset({0:[2], 1:[2], 2:[3], 3:[4], 4:[]})
sage: P.cover_relations()
```

(continues on next page)

(continued from previous page)

```
[[1, 2], [0, 2], [2, 3], [3, 4]]
```

```
>>> from sage.all import *
>>> P = Poset({Integer(0):[Integer(2)], Integer(1):[Integer(2)],␣
↪Integer(2):[Integer(3)], Integer(3):[Integer(4)], Integer(4):[]})
>>> P.cover_relations()
[[1, 2], [0, 2], [2, 3], [3, 4]]
```

cover_relations_graph()

Return the (undirected) graph of cover relations.

EXAMPLES:

```
sage: P = Poset({0: [1, 2], 1: [3], 2: [3]})
sage: G = P.cover_relations_graph(); G
Graph on 4 vertices
sage: G.has_edge(3, 1), G.has_edge(3, 0)
(True, False)
```

```
>>> from sage.all import *
>>> P = Poset({Integer(0): [Integer(1), Integer(2)], Integer(1): [Integer(3)],
↪ Integer(2): [Integer(3)]})
>>> G = P.cover_relations_graph(); G
Graph on 4 vertices
>>> G.has_edge(Integer(3), Integer(1)), G.has_edge(Integer(3), Integer(0))
(True, False)
```

See also

hasse_diagram()

cover_relations_iterator()

Return an iterator over the cover relations of the poset.

EXAMPLES:

```
sage: P = Poset({0:[2], 1:[2], 2:[3], 3:[4], 4:[]})
sage: type(P.cover_relations_iterator())
<class 'generator'>
sage: [z for z in P.cover_relations_iterator()]
[[1, 2], [0, 2], [2, 3], [3, 4]]
```

```
>>> from sage.all import *
>>> P = Poset({Integer(0):[Integer(2)], Integer(1):[Integer(2)],␣
↪Integer(2):[Integer(3)], Integer(3):[Integer(4)], Integer(4):[]})
>>> type(P.cover_relations_iterator())
<class 'generator'>
>>> [z for z in P.cover_relations_iterator()]
[[1, 2], [0, 2], [2, 3], [3, 4]]
```

covers(x, y)

Return `True` if `y` covers `x` and `False` otherwise.

Element y covers x if $x < y$ and there is no z such that $x < z < y$.

EXAMPLES:

```
sage: P = Poset([[1,5], [2,6], [3], [4], [], [6,3], [4]])
sage: P.covers(1, 6)
True
sage: P.covers(1, 4)
False
sage: P.covers(1, 5)
False
```

```
>>> from sage.all import *
>>> P = Poset([[Integer(1),Integer(5)], [Integer(2),Integer(6)], [Integer(3)],
↪ [Integer(4)], [], [Integer(6),Integer(3)], [Integer(4)]])
>>> P.covers(Integer(1), Integer(6))
True
>>> P.covers(Integer(1), Integer(4))
False
>>> P.covers(Integer(1), Integer(5))
False
```

coxeter_polynomial(*algorithm='sage'*)

Return the Coxeter polynomial of the poset.

INPUT:

- `algorithm` – optional (default: `"sage"`) ; the unique other option is `"magma"`

OUTPUT: a polynomial in one variable

The output is the characteristic polynomial of the Coxeter transformation. This polynomial only depends on the derived category of modules on the poset.

EXAMPLES:

```
sage: P = posets.PentagonPoset()
sage: P.coxeter_polynomial()                                          #␣
↪needs sage.libs.flint
x^5 + x^4 + x + 1

sage: p = posets.SymmetricGroupWeakOrderPoset(3)                      #␣
↪needs sage.groups
sage: p.coxeter_polynomial()                                          #␣
↪needs sage.groups sage.libs.flint
x^6 + x^5 - x^3 + x + 1
```

```
>>> from sage.all import *
>>> P = posets.PentagonPoset()
>>> P.coxeter_polynomial()                                          #␣
↪needs sage.libs.flint
x^5 + x^4 + x + 1
```

(continues on next page)

(continued from previous page)

```
>>> p = posets.SymmetricGroupWeakOrderPoset(Integer(3))
↪     # needs sage.groups
>>> p.coxeter_polynomial()                                                  #␣
↪needs sage.groups sage.libs.flint
x^6 + x^5 - x^3 + x + 1
```

See also

coxeter_transformation(), *coxeter_smith_form()*

coxeter_smith_form(*algorithm='singular'*)

Return the Smith normal form of x minus the Coxeter transformation matrix.

INPUT:

- `algorithm` – (default: `'singular'`) possible values are `'singular'`, `'sage'`, `'gap'`, `'pari'`, `'maple'`, `'magma'`, `'fricas'`

Beware that speed depends very much on the choice of algorithm. Sage is rather slow, Singular is faster and Pari is fast at least for small sizes.

OUTPUT: list of polynomials in one variable, each one dividing the next one

The output list is a refinement of the characteristic polynomial of the Coxeter transformation, which is its product. This list of polynomials only depends on the derived category of modules on the poset.

EXAMPLES:

```
sage: P = posets.PentagonPoset()
sage: P.coxeter_smith_form()
↪# needs sage.libs.singular
[1, 1, 1, 1, x^5 + x^4 + x + 1]

sage: P = posets.DiamondPoset(7)
sage: prod(P.coxeter_smith_form()) == P.coxeter_polynomial()
↪# needs sage.libs.singular
True
```

```
>>> from sage.all import *
>>> P = posets.PentagonPoset()
>>> P.coxeter_smith_form()                                                  #␣
↪needs sage.libs.singular
[1, 1, 1, 1, x^5 + x^4 + x + 1]

>>> P = posets.DiamondPoset(Integer(7))
>>> prod(P.coxeter_smith_form()) == P.coxeter_polynomial()                  #␣
↪needs sage.libs.singular
True
```

See also

coxeter_transformation(), `coxeter_matrix()`

coxeter_transformation()

Return the Coxeter transformation of the poset.

OUTPUT: a square matrix with integer coefficients

The output is the matrix of the Auslander-Reiten translation acting on the Grothendieck group of the derived category of modules on the poset, in the basis of simple modules. This matrix is usually called the Coxeter transformation.

EXAMPLES:

```
sage: posets.PentagonPoset().coxeter_transformation()                    #␣
↪needs sage.libs.flint
[ 0  0  0  0 -1]
[ 0  0  0  1 -1]
[ 0  1  0  0 -1]
[-1  1  1  0 -1]
[-1  1  0  1 -1]
```

```
>>> from sage.all import *
>>> posets.PentagonPoset().coxeter_transformation()                    #␣
↪needs sage.libs.flint
[ 0  0  0  0 -1]
[ 0  0  0  1 -1]
[ 0  1  0  0 -1]
[-1  1  1  0 -1]
[-1  1  0  1 -1]
```

See also

coxeter_polynomial(), *coxeter_smith_form()*

cuts()

Return the list of cuts of the poset `self`.

A cut is a subset A of `self` such that the set of lower bounds of the set of upper bounds of A is exactly A.

The cuts are computed as the smallest family of subsets of P containing its principal order filters, the whole set P and which is closed by intersection.

EXAMPLES:

```
sage: P = posets.AntichainPoset(3)
sage: Pc = P.cuts()
sage: Pc # random
[frozenset({2}),
 frozenset({1}),
 frozenset({0}),
 frozenset(),
 frozenset({0, 1, 2})]
sage: sorted(list(c) for c in Pc)
[[], [0], [0, 1, 2], [1], [2]]
```

```
>>> from sage.all import *
>>> P = posets.AntichainPoset(Integer(3))
>>> Pc = P.cuts()
>>> Pc # random
[frozenset({2}),
 frozenset({1}),
 frozenset({0}),
 frozenset(),
 frozenset({0, 1, 2})]
>>> sorted(list(c) for c in Pc)
[[], [0], [0, 1, 2], [1], [2]]
```

See also:

completion_by_cuts()

degree_polynomial()

Return the generating polynomial of degrees of vertices in `self`.

This is the sum

$$\sum_{v \in P} x^{\mathrm{in}(v)} y^{\mathrm{out}(v)},$$

where `in(v)` and `out(v)` are the number of incoming and outgoing edges at vertex v in the Hasse diagram of P.

Because this polynomial is multiplicative for Cartesian product of posets, it is useful to help see if the poset can be isomorphic to a Cartesian product.

EXAMPLES:

```
sage: P = posets.PentagonPoset()
sage: P.degree_polynomial()
x^2 + 3*x*y + y^2

sage: P = posets.BooleanLattice(4)
sage: P.degree_polynomial().factor()
(x + y)^4
```

```
>>> from sage.all import *
>>> P = posets.PentagonPoset()
>>> P.degree_polynomial()
x^2 + 3*x*y + y^2

>>> P = posets.BooleanLattice(Integer(4))
>>> P.degree_polynomial().factor()
(x + y)^4
```

See also:

cardinality() for the value at $(x, y) = (1, 1)$

diamonds()

Return the list of diamonds of `self`.

A diamond is the following subgraph of the Hasse diagram:

```
  z
 / \
x   y
 \ /
  w
```

Thus each edge represents a cover relation in the Hasse diagram. We represent this as the tuple (w, x, y, z).

OUTPUT: a tuple with

- a list of all diamonds in the Hasse Diagram,
- a boolean checking that every w, x, y that form a `V`, there is a unique element z, which completes the diamond.

EXAMPLES:

```
sage: P = Poset({0: [1,2], 1: [3], 2: [3], 3: []})
sage: P.diamonds()
([(0, 1, 2, 3)], True)

sage: P = posets.YoungDiagramPoset(Partition([3, 2, 2]))                    #␣
↪needs sage.combinat
sage: P.diamonds()                                                           #␣
↪needs sage.combinat
([((0, 0), (0, 1), (1, 0), (1, 1)), ((1, 0), (1, 1), (2, 0), (2, 1))], False)
```

```
>>> from sage.all import *
>>> P = Poset({Integer(0): [Integer(1),Integer(2)], Integer(1): [Integer(3)],␣
↪Integer(2): [Integer(3)], Integer(3): []})
>>> P.diamonds()
([(0, 1, 2, 3)], True)

>>> P = posets.YoungDiagramPoset(Partition([Integer(3), Integer(2),␣
↪Integer(2)]))                   # needs sage.combinat
>>> P.diamonds()                                                          #␣
↪needs sage.combinat
([((0, 0), (0, 1), (1, 0), (1, 1)), ((1, 0), (1, 1), (2, 0), (2, 1))], False)
```

dilworth_decomposition()

Return a partition of the points into the minimal number of chains.

According to Dilworth's theorem, the points of a poset can be partitioned into α chains, where α is the cardinality of its largest antichain. This method returns such a partition.

See Wikipedia article Dilworth%27s_theorem.

ALGORITHM:

We build a bipartite graph in which a vertex v of the poset is represented by two vertices v^-, v^+. For any two u, v such that $u < v$ in the poset we add an edge v^+u^-.

A matching in this graph is equivalent to a partition of the poset into chains: indeed, a chain $v_1...v_k$ gives rise to the matching $v_1^+v_2^-, v_2^+v_3^-, ...$, and from a matching one can build the union of chains.

According to Dilworth's theorem, the number of chains is equal to α (the posets' width).

EXAMPLES:

```
sage: p = posets.BooleanLattice(4)
sage: p.width()                                                         #␣
↪needs networkx
6
sage: p.dilworth_decomposition()  # random                              #␣
↪needs networkx
[[7, 6, 4], [11, 3], [12, 8, 0], [13, 9, 1], [14, 10, 2], [15, 5]]
```

```
>>> from sage.all import *
>>> p = posets.BooleanLattice(Integer(4))
>>> p.width()                                                         #␣
↪needs networkx
6
>>> p.dilworth_decomposition()  # random                              #␣
↪needs networkx
[[7, 6, 4], [11, 3], [12, 8, 0], [13, 9, 1], [14, 10, 2], [15, 5]]
```

See also

`level_sets()` to return elements grouped to antichains.

dimension(*certificate*, *solver*, *integrality_tolerance=False*)

Return the dimension of the Poset.

The (Dushnik-Miller) dimension of a poset is the minimal number of total orders so that the poset is their "intersection". More precisely, the dimension of a poset defined on a set X of points is the smallest integer n such that there exist linear extensions $P_1, ..., P_n$ of P satisfying:

$$u \leq_P v \text{ if and only if } \forall i, u \leq_{P_i} v$$

For more information, see the Wikipedia article Order_dimension.

INPUT:

- `certificate` – boolean (default: `False`); whether to return an integer (the dimension) or a certificate, i.e. a smallest set of linear extensions
- `solver` – (default: `None`) specify a Mixed Integer Linear Programming (MILP) solver to be used. If set to `None`, the default one is used. For more information on MILP solvers and which default solver is used, see the method `solve` of the class `MixedIntegerLinearProgram`.
- `integrality_tolerance` – parameter for use with MILP solvers over an inexact base ring; see `MixedIntegerLinearProgram.get_values()`

Note

The speed of this function greatly improves when more efficient MILP solvers (e.g. Gurobi, CPLEX) are installed. See `MixedIntegerLinearProgram` for more information.

Note

Prior to version 8.3 this returned only realizer with `certificate=True`. Now it returns a pair having a realizer as the second element. See Issue #25588 for details.

ALGORITHM:

As explained [FT00], the dimension of a poset is equal to the (weak) chromatic number of a hypergraph. More precisely:

> Let $inc(P)$ be the set of (ordered) pairs of incomparable elements of P, i.e. all uv and vu such that $u \not\leq_P v$ and $v \not\leq_P u$. Any linear extension of P is a total order on X that can be seen as the union of relations from P along with some relations from $inc(P)$. Thus, the dimension of P is the smallest number of linear extensions of P which *cover* all points of $inc(P)$.
>
> Consequently, $dim(P)$ is equal to the chromatic number of the hypergraph $\mathcal{H}_{inc}$, where $\mathcal{H}_{inc}$ is the hypergraph defined on $inc(P)$ whose sets are all $S \subseteq inc(P)$ such that $P \cup S$ is not acyclic.

We solve this problem through a `Mixed Integer Linear Program`.

The problem is known to be NP-complete.

EXAMPLES:

We create a poset, compute a set of linear extensions and check that we get back the poset from them:

```
sage: P = Poset([[1,4], [3], [4,5,3], [6], [], [6], []])
sage: P.dimension()                                                             #␣
↪needs networkx
3
sage: dim, L = P.dimension(certificate=True)                                    #␣
↪needs sage.numerical.mip
sage: L  # random -- architecture-dependent                                     #␣
↪needs sage.numerical.mip
[[0, 2, 4, 5, 1, 3, 6], [2, 5, 0, 1, 3, 4, 6], [0, 1, 2, 3, 5, 6, 4]]
sage: Poset( (L[0], lambda x, y: all(l.index(x) < l.index(y) for l in L)) )␣
↪== P         # needs sage.numerical.mip
True
```

```
>>> from sage.all import *
>>> P = Poset([[Integer(1),Integer(4)], [Integer(3)], [Integer(4),Integer(5),
↪Integer(3)], [Integer(6)], [], [Integer(6)], []])
>>> P.dimension()                                                             #␣
↪needs networkx
3
>>> dim, L = P.dimension(certificate=True)                                    #␣
↪needs sage.numerical.mip
>>> L  # random -- architecture-dependent                                     #␣
↪needs sage.numerical.mip
[[0, 2, 4, 5, 1, 3, 6], [2, 5, 0, 1, 3, 4, 6], [0, 1, 2, 3, 5, 6, 4]]
>>> Poset( (L[Integer(0)], lambda x, y: all(l.index(x) < l.index(y) for l in␣
↪L)) ) == P         # needs sage.numerical.mip
True
```

According to Schnyder's theorem, the incidence poset (of height 2) of a graph has dimension ≤ 3 if and only if the graph is planar:

```
sage: G = graphs.CompleteGraph(4)
sage: P = Poset(DiGraph({(u,v):[u,v] for u,v,_ in G.edges(sort=True)}))
sage: P.dimension()                                                     #␣
↪needs networkx
3

sage: G = graphs.CompleteBipartiteGraph(3,3)
sage: P = Poset(DiGraph({(u,v):[u,v] for u,v,_ in G.edges(sort=True)}))
sage: P.dimension()   # not tested (around 4s with CPLEX)
4
```

```
>>> from sage.all import *
>>> G = graphs.CompleteGraph(Integer(4))
>>> P = Poset(DiGraph({(u,v):[u,v] for u,v,_ in G.edges(sort=True)}))
>>> P.dimension()                                                     #␣
↪needs networkx
3

>>> G = graphs.CompleteBipartiteGraph(Integer(3),Integer(3))
>>> P = Poset(DiGraph({(u,v):[u,v] for u,v,_ in G.edges(sort=True)}))
>>> P.dimension()   # not tested (around 4s with CPLEX)
4
```

disjoint_union(*other*, *labels='pairs'*)

Return a poset isomorphic to disjoint union (also called direct sum) of the poset with `other`.

The disjoint union of P and Q is a poset that contains every element and relation from both P and Q, and where every element of P is incomparable to every element of Q.

Mathematically, it is only defined when P and Q have no common element; here we force that by giving them different names in the resulting poset.

INPUT:

- `other` – poset
- `labels` – (defaults to 'pairs') If set to 'pairs', each element `v` in this poset will be named `(0,v)` and each element `u` in `other` will be named `(1,u)` in the result. If set to 'integers', the elements of the result will be relabeled with consecutive integers.

EXAMPLES:

```
sage: P1 = Poset({'a': 'b'})
sage: P2 = Poset({'c': 'd'})
sage: P = P1.disjoint_union(P2); P
Finite poset containing 4 elements
sage: sorted(P.cover_relations())
[[(0, 'a'), (0, 'b')], [(1, 'c'), (1, 'd')]]
sage: P = P1.disjoint_union(P2, labels='integers')
sage: P.cover_relations()
[[2, 3], [0, 1]]

sage: N5 = posets.PentagonPoset(); N5
Finite lattice containing 5 elements
sage: N5.disjoint_union(N5)   # Union of lattices is not a lattice
Finite poset containing 10 elements
```

```
>>> from sage.all import *
>>> P1 = Poset({'a': 'b'})
>>> P2 = Poset({'c': 'd'})
>>> P = P1.disjoint_union(P2); P
Finite poset containing 4 elements
>>> sorted(P.cover_relations())
[[(0, 'a'), (0, 'b')], [(1, 'c'), (1, 'd')]]
>>> P = P1.disjoint_union(P2, labels='integers')
>>> P.cover_relations()
[[2, 3], [0, 1]]

>>> N5 = posets.PentagonPoset(); N5
Finite lattice containing 5 elements
>>> N5.disjoint_union(N5)  # Union of lattices is not a lattice
Finite poset containing 10 elements
```

We show how to get literally direct sum with elements untouched:

```
sage: P = P1.disjoint_union(P2).relabel(lambda x: x[1])
sage: sorted(P.cover_relations())
[['a', 'b'], ['c', 'd']]
```

```
>>> from sage.all import *
>>> P = P1.disjoint_union(P2).relabel(lambda x: x[Integer(1)])
>>> sorted(P.cover_relations())
[['a', 'b'], ['c', 'd']]
```

See also

connected_components()

dual()

Return the dual poset of the given poset.

In the dual of a poset P we have $x \leq y$ iff $y \leq x$ in P.

EXAMPLES:

```
sage: P = Poset({1: [2, 3], 3: [4]})
sage: P.cover_relations()
[[1, 2], [1, 3], [3, 4]]
sage: Q = P.dual()
sage: Q.cover_relations()
[[4, 3], [3, 1], [2, 1]]
```

```
>>> from sage.all import *
>>> P = Poset({Integer(1): [Integer(2), Integer(3)], Integer(3): [Integer(4)]}
↪)
>>> P.cover_relations()
[[1, 2], [1, 3], [3, 4]]
>>> Q = P.dual()
```

(continues on next page)

(continued from previous page)

```
>>> Q.cover_relations()
[[4, 3], [3, 1], [2, 1]]
```

Dual of a lattice is a lattice; dual of a meet-semilattice is join-semilattice and vice versa. Also the dual of a (non-)facade poset is again (non-)facade:

```
sage: V = MeetSemilattice({1: [2, 3]}, facade=False)
sage: A = V.dual(); A
Finite join-semilattice containing 3 elements
sage: A(2) < A(1)
True
```

```
>>> from sage.all import *
>>> V = MeetSemilattice({Integer(1): [Integer(2), Integer(3)]}, facade=False)
>>> A = V.dual(); A
Finite join-semilattice containing 3 elements
>>> A(Integer(2)) < A(Integer(1))
True
```

See also

`is_self_dual()`

evacuation()

Compute evacuation on the linear extension associated to the poset `self`.

OUTPUT: an isomorphic poset, with the same default linear extension

Evacuation is defined on a poset `self` of size n by applying the evacuation operator $(\tau_1 \cdots \tau_{n-1})(\tau_1 \cdots \tau_{n-2}) \cdots (\tau_1)$, to the default linear extension π of `self` (see *evacuation()*), and relabeling `self` accordingly. For more details see [Stan2009].

EXAMPLES:

```
sage: P = Poset(([1,2], [[1,2]]), linear_extension=True, facade=False)
sage: P.evacuation()
Finite poset containing 2 elements with distinguished linear extension
sage: P.evacuation() == P
True

sage: P = Poset(([1,2,3,4,5,6,7], [[1,2],[1,4],[2,3],[2,5],[3,6],[4,7],[5,
↪6]]), linear_extension=True, facade=False)
sage: P.list()
[1, 2, 3, 4, 5, 6, 7]
sage: Q = P.evacuation(); Q
Finite poset containing 7 elements with distinguished linear extension
sage: Q.cover_relations()
[[1, 2], [1, 3], [2, 5], [3, 4], [3, 6], [4, 7], [6, 7]]
```

```
>>> from sage.all import *
>>> P = Poset(([Integer(1),Integer(2)], [[Integer(1),Integer(2)]]), linear_
↪extension=True, facade=False)
```

(continues on next page)

(continued from previous page)

```
>>> P.evacuation()
Finite poset containing 2 elements with distinguished linear extension
>>> P.evacuation() == P
True

>>> P = Poset(([Integer(1),Integer(2),Integer(3),Integer(4),Integer(5),
↪Integer(6),Integer(7)], [[Integer(1),Integer(2)],[Integer(1),Integer(4)],
↪[Integer(2),Integer(3)],[Integer(2),Integer(5)],[Integer(3),Integer(6)],
↪[Integer(4),Integer(7)],[Integer(5),Integer(6)]]), linear_extension=True,␣
↪facade=False)
>>> P.list()
[1, 2, 3, 4, 5, 6, 7]
>>> Q = P.evacuation(); Q
Finite poset containing 7 elements with distinguished linear extension
>>> Q.cover_relations()
[[1, 2], [1, 3], [2, 5], [3, 4], [3, 6], [4, 7], [6, 7]]
```

Note that the results depend on the linear extension associated to the poset:

```
sage: P = Poset(([1,2,3,4,5,6,7], [[1,2],[1,4],[2,3],[2,5],[3,6],[4,7],[5,
↪6]]))
sage: P.list()
[1, 2, 3, 5, 6, 4, 7]
sage: Q = P.evacuation(); Q
Finite poset containing 7 elements with distinguished linear extension
sage: Q.cover_relations()
[[1, 2], [1, 5], [2, 3], [5, 6], [5, 4], [6, 7], [4, 7]]
```

```
>>> from sage.all import *
>>> P = Poset(([Integer(1),Integer(2),Integer(3),Integer(4),Integer(5),
↪Integer(6),Integer(7)], [[Integer(1),Integer(2)],[Integer(1),Integer(4)],
↪[Integer(2),Integer(3)],[Integer(2),Integer(5)],[Integer(3),Integer(6)],
↪[Integer(4),Integer(7)],[Integer(5),Integer(6)]]))
>>> P.list()
[1, 2, 3, 5, 6, 4, 7]
>>> Q = P.evacuation(); Q
Finite poset containing 7 elements with distinguished linear extension
>>> Q.cover_relations()
[[1, 2], [1, 5], [2, 3], [5, 6], [5, 4], [6, 7], [4, 7]]
```

Here is an example of a poset where the elements are not labelled by $\{1, 2, \ldots, n\}$:

```
sage: P = Poset((divisors(15), attrcall("divides")), linear_extension = True)
sage: P.list()
[1, 3, 5, 15]
sage: Q = P.evacuation(); Q
Finite poset containing 4 elements with distinguished linear extension
sage: Q.cover_relations()
[[1, 3], [1, 5], [3, 15], [5, 15]]
```

```
>>> from sage.all import *
>>> P = Poset((divisors(Integer(15)), attrcall("divides")), linear_extension␣
```

(continues on next page)

(continued from previous page)

```
↪= True)
>>> P.list()
[1, 3, 5, 15]
>>> Q = P.evacuation(); Q
Finite poset containing 4 elements with distinguished linear extension
>>> Q.cover_relations()
[[1, 3], [1, 5], [3, 15], [5, 15]]
```

AUTHOR:

- Anne Schilling (2012-02-18)

f_polynomial()

Return the f-polynomial of the poset.

The poset is expected to be bounded.

This is the f-polynomial of the order complex of the poset minus its bounds.

The coefficient of q^i is the number of chains of $i + 1$ elements containing both bounds of the poset.

Note

This is slightly different from the `fPolynomial` method in Macaulay2.

EXAMPLES:

```
sage: P = posets.DiamondPoset(5)
sage: P.f_polynomial()
3*q^2 + q

sage: P = Poset({1: [2, 3], 2: [4], 3: [5], 4: [6], 5: [7], 6: [7]})
sage: P.f_polynomial()
q^4 + 4*q^3 + 5*q^2 + q
```

```
>>> from sage.all import *
>>> P = posets.DiamondPoset(Integer(5))
>>> P.f_polynomial()
3*q^2 + q

>>> P = Poset({Integer(1): [Integer(2), Integer(3)], Integer(2): [Integer(4)],
↪ Integer(3): [Integer(5)], Integer(4): [Integer(6)], Integer(5):␣
↪[Integer(7)], Integer(6): [Integer(7)]})
```

(continues on next page)

(continued from previous page)

```
>>> P.f_polynomial()
q^4 + 4*q^3 + 5*q^2 + q
```

See also

is_bounded(), *h_polynomial()*, *order_complex()*, sage.topology.cell_complex.GenericCellComplex.f_vector()

factor()

Factor the poset as a Cartesian product of smaller posets.

This only works for connected posets.

The decomposition of a connected poset as a Cartesian product of posets (prime in the sense that they cannot be written as Cartesian products) is unique up to reordering and isomorphism.

OUTPUT: list of posets

EXAMPLES:

```
sage: P = posets.PentagonPoset()
sage: Q = P*P
sage: Q.factor()
[Finite poset containing 5 elements,
 Finite poset containing 5 elements]

sage: P1 = posets.ChainPoset(3)
sage: P2 = posets.ChainPoset(7)
sage: P1.factor()
[Finite lattice containing 3 elements]
sage: (P1 * P2).factor()

flag_f_polynomial()

Return the flag f-polynomial of the poset.

The poset is expected to be bounded and ranked.

This is the sum, over all chains containing both bounds, of a monomial encoding the ranks of the elements of the chain.

More precisely, if P is a bounded ranked poset, then the flag f-polynomial of P is defined as the polynomial

$$\sum_{\substack{p_0 < p_1 < \ldots < p_k, \\ p_0 = \min P,\ p_k = \max P}} x_{\rho(p_1)} x_{\rho(p_2)} \cdots x_{\rho(p_k)} \in \mathbf{Z}[x_1, x_2, \cdots, x_n],$$

where $\min P$ and $\max P$ are (respectively) the minimum and the maximum of P, where ρ is the rank function of P (normalized to satisfy $\rho(\min P) = 0$), and where n is the rank of $\max P$. (Note that the indeterminate x_0 does not actually appear in the polynomial.)

For technical reasons, the polynomial is returned in the slightly larger ring $\mathbf{Z}[x_0, x_1, x_2, \cdots, x_{n+1}]$ by this method.

See Wikipedia article h-vector.

EXAMPLES:

```
sage: P = posets.DiamondPoset(5)
sage: P.flag_f_polynomial()
3*x1*x2 + x2

sage: P = Poset({1: [2, 3], 2: [4], 3: [5], 4: [6], 5: [6]})
sage: fl = P.flag_f_polynomial(); fl
2*x1*x2*x3 + 2*x1*x3 + 2*x2*x3 + x3
sage: q = polygen(ZZ,'q')
sage: fl(q,q,q,q) == P.f_polynomial()
True

sage: P = Poset({1: [2, 3, 4], 2: [5], 3: [5], 4: [5], 5: [6]})
sage: P.flag_f_polynomial()
3*x1*x2*x3 + 3*x1*x3 + x2*x3 + x3
```

```
>>> from sage.all import *
>>> P = posets.DiamondPoset(Integer(5))
```

(continues on next page)

(continued from previous page)

```
>>> P.flag_f_polynomial()
3*x1*x2 + x2

>>> P = Poset({Integer(1): [Integer(2), Integer(3)], Integer(2): [Integer(4)],
↪ Integer(3): [Integer(5)], Integer(4): [Integer(6)], Integer(5):␣
↪[Integer(6)]})
>>> fl = P.flag_f_polynomial(); fl
2*x1*x2*x3 + 2*x1*x3 + 2*x2*x3 + x3
>>> q = polygen(ZZ,'q')
>>> fl(q,q,q,q) == P.f_polynomial()
True

>>> P = Poset({Integer(1): [Integer(2), Integer(3), Integer(4)], Integer(2):␣
↪[Integer(5)], Integer(3): [Integer(5)], Integer(4): [Integer(5)],␣
↪Integer(5): [Integer(6)]})
>>> P.flag_f_polynomial()
3*x1*x2*x3 + 3*x1*x3 + x2*x3 + x3
```

is_bounded(), *flag_h_polynomial()*

flag_h_polynomial()

Return the flag h-polynomial of the poset.

The poset is expected to be bounded and ranked.

If P is a bounded ranked poset whose maximal element has rank n (where the minimal element is set to have rank 0), then the flag h-polynomial of P is defined as the polynomial

$$\prod_{k=1}^{n}(1-x_k)\cdot f\left(\frac{x_1}{1-x_1},\frac{x_2}{1-x_2},\cdots,\frac{x_n}{1-x_n}\right)\in \mathbf{Z}[x_1,x_2,\cdots,x_n],$$

where f is the flag f-polynomial of P (see *flag_f_polynomial()*).

For technical reasons, the polynomial is returned in the slightly larger ring $\mathbf{Q}[x_0,x_1,x_2,\cdots,x_{n+1}]$ by this method.

See Wikipedia article h-vector.

EXAMPLES:

```
sage: P = posets.DiamondPoset(5)
sage: P.flag_h_polynomial()
2*x1*x2 + x2

sage: P = Poset({1: [2, 3], 2: [4], 3: [5], 4: [6], 5: [6]})
sage: fl = P.flag_h_polynomial(); fl
-x1*x2*x3 + x1*x3 + x2*x3 + x3
sage: q = polygen(ZZ,'q')
sage: fl(q,q,q,q) == P.h_polynomial()
True
```

is_bounded(), *flag_f_polynomial()*

frank_network()

Return Frank's network of the poset.

This is defined in Section 8 of [BF1999].

OUTPUT:

A pair (G, e), where G is Frank's network of P encoded as a `DiGraph`, and e is the cost function on its edges encoded as a dictionary (indexed by these edges, which in turn are encoded as tuples of 2 vertices).

Note

Frank's network of P is a certain directed graph with $2|P|+2$ vertices, defined in Section 8 of [BF1999]. Its set of vertices consists of two vertices $(0, p)$ and $(1, p)$ for each element p of P, as well as two vertices $(-1, 0)$ and $(2, 0)$. (These notations are not the ones used in [BF1999]; see the table below for their relation.) The edges are:

- for each p in P, an edge from $(-1, 0)$ to $(0, p)$;
- for each p in P, an edge from $(1, p)$ to $(2, 0)$;
- for each p and q in P such that $p \geq q$, an edge from $(0, p)$ to $(1, q)$.

We make this digraph into a network in the sense of flow theory as follows: The vertex $(-1, 0)$ is considered as the source of this network, and the vertex $(2, 0)$ as the sink. The cost function is defined to be 1 on the edge from $(0, p)$ to $(1, p)$ for each $p \in P$, and to be 0 on every other edge. The capacity is 1 on each edge. Here is how to translate this notations into that used in [BF1999]:

```
our notations                     [BF1999]
   (-1, 0)                          s
   (0, p)                          x_p
   (1, p)                          y_p
   (2, 0)                           t
    a[e]                           a(e)
```

EXAMPLES:

```
sage: ps = [[16,12,14,-13],[[12,14],[14,-13],[12,16],[16,-13]]]
sage: G, e = Poset(ps).frank_network()

AUTHOR:

- Darij Grinberg (2013-05-09)

ge (x, y)

Return `True` if x is greater than or equal to y in the poset, and `False` otherwise.

EXAMPLES:

```
sage: P = Poset({0:[2], 1:[2], 2:[3], 3:[4], 4:[]})
sage: P.is_gequal(3, 1)
True
sage: P.is_gequal(2, 2)
True
sage: P.is_gequal(0, 1)
False
```

```
>>> from sage.all import *
>>> P = Poset({Integer(0):[Integer(2)], Integer(1):[Integer(2)],␣
↪Integer(2):[Integer(3)], Integer(3):[Integer(4)], Integer(4):[]})
>>> P.is_gequal(Integer(3), Integer(1))
True
>>> P.is_gequal(Integer(2), Integer(2))
True
>>> P.is_gequal(Integer(0), Integer(1))
False
```

See also

is_greater_than(), *is_lequal()*.

graphviz_string (*graph_string='graph'*, *edge_string='--'*)

Return a representation in the DOT language, ready to render in graphviz.

See http://www.graphviz.org/doc/info/lang.html for more information about graphviz.

EXAMPLES:

```
sage: P = Poset({'a':['b'],'b':['d'],'c':['d'],'d':['f'],'e':['f'],'f':[]})
sage: print(P.graphviz_string())
graph {
"f";"d";"b";"a";"c";"e";
"f"--"e";"d"--"c";"b"--"a";"d"--"b";"f"--"d";
}
```

```
>>> from sage.all import *
>>> P = Poset({'a':['b'],'b':['d'],'c':['d'],'d':['f'],'e':['f'],'f':[]})
```

(continues on next page)

(continued from previous page)

```
>>> print(P.graphviz_string())
graph {
"f";"d";"b";"a";"c";"e";
"f"--"e";"d"--"c";"b"--"a";"d"--"b";"f"--"d";
}
```

greene_shape()

Return the Greene-Kleitman partition of `self`.

The Greene-Kleitman partition of a finite poset P is the partition $(c_1 - c_0, c_2 - c_1, c_3 - c_2, \ldots)$, where c_k is the maximum cardinality of a union of k chains of P. Equivalently, this is the conjugate of the partition $(a_1 - a_0, a_2 - a_1, a_3 - a_2, \ldots)$, where a_k is the maximum cardinality of a union of k antichains of P.

See many sources, e. g., [BF1999], for proofs of this equivalence.

EXAMPLES:

```
sage: # needs sage.combinat
sage: P = Poset([[3,2,1], [[3,1],[2,1]]])
sage: P.greene_shape()
[2, 1]
sage: P = Poset([[1,2,3,4], [[1,4],[2,4],[4,3]]])
sage: P.greene_shape()
[3, 1]
sage: P = Poset([[1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,17,18,19,20,21,22],
....:            [[1,4],[2,4],[4,3]]])
sage: P.greene_shape()
[3, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1]
sage: P = Poset([[],[]])
sage: P.greene_shape()
[]
```

```
>>> from sage.all import *
>>> # needs sage.combinat
>>> P = Poset([[Integer(3),Integer(2),Integer(1)], [[Integer(3),Integer(1)],
↪[Integer(2),Integer(1)]]])
>>> P.greene_shape()
[2, 1]
>>> P = Poset([[Integer(1),Integer(2),Integer(3),Integer(4)], [[Integer(1),
↪Integer(4)],[Integer(2),Integer(4)],[Integer(4),Integer(3)]]])
>>> P.greene_shape()
[3, 1]
>>> P = Poset([[Integer(1),Integer(2),Integer(3),Integer(4),Integer(5),
↪Integer(6),Integer(7),Integer(8),Integer(9),Integer(10),Integer(11),
↪Integer(12),Integer(13),Integer(14),Integer(15),Integer(16),Integer(17),
↪Integer(18),Integer(19),Integer(20),Integer(21),Integer(22)],
...            [[Integer(1),Integer(4)],[Integer(2),Integer(4)],[Integer(4),
↪Integer(3)]]])
>>> P.greene_shape()
[3, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1]
>>> P = Poset([[],[]])
>>> P.greene_shape()
[]
```

AUTHOR:

- Darij Grinberg (2013-05-09)

gt (x, y)

Return `True` if x is greater than but not equal to y in the poset, and `False` otherwise.

EXAMPLES:

```
sage: P = Poset({0:[2], 1:[2], 2:[3], 3:[4], 4:[]})
sage: P.is_greater_than(3, 1)
True
sage: P.is_greater_than(1, 2)
False
sage: P.is_greater_than(3, 3)
False
sage: P.is_greater_than(0, 1)
False
```

```
>>> from sage.all import *
>>> P = Poset({Integer(0):[Integer(2)], Integer(1):[Integer(2)],␣
↪Integer(2):[Integer(3)], Integer(3):[Integer(4)], Integer(4):[]})
>>> P.is_greater_than(Integer(3), Integer(1))
True
>>> P.is_greater_than(Integer(1), Integer(2))
False
>>> P.is_greater_than(Integer(3), Integer(3))
False
>>> P.is_greater_than(Integer(0), Integer(1))
False
```

For non-facade posets also > works:

```
sage: P = Poset({3: [1, 2]}, facade=False)
sage: P(2) > P(3)
True
```

```
>>> from sage.all import *
>>> P = Poset({Integer(3): [Integer(1), Integer(2)]}, facade=False)
>>> P(Integer(2)) > P(Integer(3))
True
```

See also

is_gequal(), *is_less_than()*.

h_polynomial()

Return the h-polynomial of a bounded poset `self`.

This is the h-polynomial of the order complex of the poset minus its bounds.

This is related to the f-polynomial by a simple change of variables:

$$h(q) = (1-q)^{\deg f} f\left(\frac{q}{1-q}\right),$$

where f and h denote the f-polynomial and the h-polynomial, respectively.

See Wikipedia article h-vector.

Warning

This is slightly different from the `hPolynomial` method in Macaulay2.

EXAMPLES:

```
sage: P = posets.AntichainPoset(3).order_ideals_lattice()
sage: P.h_polynomial()
q^3 + 4*q^2 + q
sage: P = posets.DiamondPoset(5)
sage: P.h_polynomial()
2*q^2 + q
sage: P = Poset({1: []})
sage: P.h_polynomial()
1
```

```
>>> from sage.all import *
>>> P = posets.AntichainPoset(Integer(3)).order_ideals_lattice()
>>> P.h_polynomial()
q^3 + 4*q^2 + q
>>> P = posets.DiamondPoset(Integer(5))
>>> P.h_polynomial()
2*q^2 + q
>>> P = Poset({Integer(1): []})
>>> P.h_polynomial()
1
```

See also

is_bounded(), *f_polynomial()*, *order_complex()*, `sage.topology.simplicial_complex.SimplicialComplex.h_vector()`

has_bottom()

Return `True` if the poset has a unique minimal element, and `False` otherwise.

EXAMPLES:

```
sage: P = Poset({0:[3], 1:[3], 2:[3], 3:[4], 4:[]})
sage: P.has_bottom()
False
sage: Q = Poset({0:[1], 1:[]})
sage: Q.has_bottom()
True
```

```
>>> from sage.all import *
>>> P = Poset({Integer(0):[Integer(3)], Integer(1):[Integer(3)],␣
↪Integer(2):[Integer(3)], Integer(3):[Integer(4)], Integer(4):[]})
```

(continues on next page)

(continued from previous page)

```
>>> P.has_bottom()
False
>>> Q = Poset({Integer(0):[Integer(1)], Integer(1):[]})
>>> Q.has_bottom()
True
```

See also

- Dual Property: *has_top()*
- Stronger properties: *is_bounded()*
- Other: *bottom()*

has_isomorphic_subposet(*other*)

Return `True` if the poset contains a subposet isomorphic to `other`.

By subposet we mean that there exist a set `X` of elements such that `self.subposet(X)` is isomorphic to `other`.

INPUT:

- `other` – a finite poset

EXAMPLES:

```
sage: D = Poset({1:[2,3], 2:[4], 3:[4]})
sage: T = Poset({1:[2,3], 2:[4,5], 3:[6,7]})
sage: N5 = posets.PentagonPoset()

sage: N5.has_isomorphic_subposet(T)
False
sage: N5.has_isomorphic_subposet(D)
True

sage: len([P for P in Posets(5) if P.has_isomorphic_subposet(D)])
11
```

```
>>> from sage.all import *
>>> D = Poset({Integer(1):[Integer(2),Integer(3)], Integer(2):[Integer(4)],␣
↪Integer(3):[Integer(4)]})
>>> T = Poset({Integer(1):[Integer(2),Integer(3)], Integer(2):[Integer(4),
↪Integer(5)], Integer(3):[Integer(6),Integer(7)]})
>>> N5 = posets.PentagonPoset()

>>> N5.has_isomorphic_subposet(T)
False
>>> N5.has_isomorphic_subposet(D)
True

>>> len([P for P in Posets(Integer(5)) if P.has_isomorphic_subposet(D)])
11
```

has_top()

Return True if the poset has a unique maximal element, and False otherwise.

EXAMPLES:

```
sage: P = Poset({0:[3], 1:[3], 2:[3], 3:[4, 5], 4:[], 5:[]})
sage: P.has_top()
False
sage: Q = Poset({0:[3], 1:[3], 2:[3], 3:[4], 4:[]})
sage: Q.has_top()
True
```

```
>>> from sage.all import *
>>> P = Poset({Integer(0):[Integer(3)], Integer(1):[Integer(3)],␣
↪Integer(2):[Integer(3)], Integer(3):[Integer(4), Integer(5)], Integer(4):[],
↪ Integer(5):[]})
>>> P.has_top()
False
>>> Q = Poset({Integer(0):[Integer(3)], Integer(1):[Integer(3)],␣
↪Integer(2):[Integer(3)], Integer(3):[Integer(4)], Integer(4):[]})
>>> Q.has_top()
True
```

See also

- Dual Property: *has_bottom()*
- Stronger properties: *is_bounded()*
- Other: *top()*

hasse_diagram()

Return the Hasse diagram of the poset as a Sage DiGraph.

The Hasse diagram is a directed graph where vertices are the elements of the poset and there is an edge from u to v whenever v covers u in the poset.

If dot2tex is installed, then this sets the Hasse diagram's latex options to use the dot2tex formatting.

EXAMPLES:

```
sage: P = posets.DivisorLattice(12)
sage: H = P.hasse_diagram(); H
Digraph on 6 vertices
sage: P.cover_relations()
[[1, 2], [1, 3], [2, 4], [2, 6], [3, 6], [4, 12], [6, 12]]
sage: H.edges(sort=True, labels=False)
[(1, 2), (1, 3), (2, 4), (2, 6), (3, 6), (4, 12), (6, 12)]
```

```
>>> from sage.all import *
>>> P = posets.DivisorLattice(Integer(12))
>>> H = P.hasse_diagram(); H
Digraph on 6 vertices
>>> P.cover_relations()
```

(continues on next page)

(continued from previous page)

```
[[1, 2], [1, 3], [2, 4], [2, 6], [3, 6], [4, 12], [6, 12]]
>>> H.edges(sort=True, labels=False)
[(1, 2), (1, 3), (2, 4), (2, 6), (3, 6), (4, 12), (6, 12)]
```

height (*certificate=False*)

Return the height (number of elements in a longest chain) of the poset.

INPUT:

- `certificate` – boolean (default: `False`); whether to return a certificate

OUTPUT:

- If `certificate=True` return `(h, c)`, where `h` is the height and `c` is a chain of maximum cardinality. If `certificate=False` return only the height.

EXAMPLES:

```
sage: P = Poset({0: [1], 2: [3, 4], 4: [5, 6]})
sage: P.height()
3
sage: posets.PentagonPoset().height(certificate=True)
(4, [0, 2, 3, 4])
```

```
>>> from sage.all import *
>>> P = Poset({Integer(0): [Integer(1)], Integer(2): [Integer(3), Integer(4)],
↪ Integer(4): [Integer(5), Integer(6)]})
>>> P.height()
3
>>> posets.PentagonPoset().height(certificate=True)
(4, [0, 2, 3, 4])
```

incidence_algebra (*R*, *prefix='I'*)

Return the incidence algebra of `self` over `R`.

OUTPUT: an instance of *sage.combinat.posets.incidence_algebras.IncidenceAlgebra*

EXAMPLES:

```
sage: P = posets.BooleanLattice(4)
sage: P.incidence_algebra(QQ)
Incidence algebra of Finite lattice containing 16 elements
 over Rational Field
```

```
>>> from sage.all import *
>>> P = posets.BooleanLattice(Integer(4))
>>> P.incidence_algebra(QQ)
Incidence algebra of Finite lattice containing 16 elements
 over Rational Field
```

incomparability_graph ()

Return the incomparability graph of the poset.

This is the complement of the comparability graph, i.e. an undirected graph where vertices are the elements of the poset and there is an edge between vertices if they are not comparable in the poset.

EXAMPLES:

```
sage: Y = Poset({1: [2], 2: [3, 4]})
sage: g = Y.incomparability_graph(); g
Incomparability graph on 4 vertices
sage: Y.compare_elements(1, 3) is not None
True
sage: g.has_edge(1, 3)
False
```

```
>>> from sage.all import *
>>> Y = Poset({Integer(1): [Integer(2)], Integer(2): [Integer(3), Integer(4)]}
↪)
>>> g = Y.incomparability_graph(); g
Incomparability graph on 4 vertices
>>> Y.compare_elements(Integer(1), Integer(3)) is not None
True
>>> g.has_edge(Integer(1), Integer(3))
False
```

See also

comparability_graph()

interval(*x*, *y*)

Return a list of the elements z such that $x \leq z \leq y$.

INPUT:

- x – any element of the poset
- y – any element of the poset

EXAMPLES:

```
sage: uc = [[1,3,2],[4],[4,5,6],[6],[7],[7],[7],[]]
sage: dag = DiGraph(dict(zip(range(len(uc)),uc)))
sage: P = Poset(dag)
sage: I = set(map(P,[2,5,6,4,7]))
sage: I == set(P.interval(2,7))
True
```

```
>>> from sage.all import *
>>> uc = [[Integer(1),Integer(3),Integer(2)],[Integer(4)],[Integer(4),
↪Integer(5),Integer(6)],[Integer(6)],[Integer(7)],[Integer(7)],[Integer(7)],
↪[]]
>>> dag = DiGraph(dict(zip(range(len(uc)),uc)))
>>> P = Poset(dag)
>>> I = set(map(P,[Integer(2),Integer(5),Integer(6),Integer(4),Integer(7)]))
>>> I == set(P.interval(Integer(2),Integer(7)))
True
```

```
sage: dg = DiGraph({"a":["b","c"], "b":["d"], "c":["d"]})
sage: P = Poset(dg, facade = False)
```

(continues on next page)

(continued from previous page)

```
sage: P.interval("a","d")
[a, b, c, d]
```

```
>>> from sage.all import *
>>> dg = DiGraph({"a":["b","c"], "b":["d"], "c":["d"]})
>>> P = Poset(dg, facade = False)
>>> P.interval("a","d")
[a, b, c, d]
```

intervals_number()

Return the number of relations in the poset.

A relation is a pair of elements x and y such that $x \leq y$ in the poset.

Relations are also often called intervals. The number of intervals is the dimension of the incidence algebra.

EXAMPLES:

```
sage: P = posets.PentagonPoset()
sage: P.relations_number()
13

sage: posets.TamariLattice(4).relations_number()
68
```

```
>>> from sage.all import *
>>> P = posets.PentagonPoset()
>>> P.relations_number()
13

>>> posets.TamariLattice(Integer(4)).relations_number()
68
```

See also

relations_iterator(), *relations()*

intervals_poset()

Return the natural partial order on the set of intervals of the poset.

OUTPUT: a finite poset

The poset of intervals of a poset P has the set of intervals $[x, y]$ in P as elements, endowed with the order relation defined by $[x_1, y_1] \leq [x_2, y_2]$ if and only if $x_1 \leq x_2$ and $y_1 \leq y_2$.

This is also called P to the power 2, meaning the poset of poset-morphisms from the 2-chain to P.

If P is a lattice, the result is also a lattice.

EXAMPLES:

```
sage: P = Poset({0:[1]})
sage: P.intervals_poset()
Finite poset containing 3 elements
```

(continues on next page)

(continued from previous page)

```
sage: P = posets.PentagonPoset()
sage: P.intervals_poset()
Finite lattice containing 13 elements
```

```
>>> from sage.all import *
>>> P = Poset({Integer(0):[Integer(1)]})
>>> P.intervals_poset()
Finite poset containing 3 elements

>>> P = posets.PentagonPoset()
>>> P.intervals_poset()
Finite lattice containing 13 elements
```

is_EL_labelling(*f*, *return_raising_chains=False*)

Return `True` if `f` is an EL labelling of `self`.

A labelling f of the edges of the Hasse diagram of a poset is called an EL labelling (edge lexicographic labelling) if for any two elements u and v with $u \leq v$,

- there is a unique f-raising chain from u to v in the Hasse diagram, and this chain is lexicographically first among all chains from u to v.

For more details, see [Bj1980].

INPUT:

- `f` – a function taking two elements `a` and `b` in `self` such that `b` covers `a` and returning elements in a totally ordered set.
- `return_raising_chains` (optional; default: `False`) if `True`, returns the set of all raising chains in `self`, if possible.

EXAMPLES:

Let us consider a Boolean poset:

```
sage: P = Poset([[(0,0),(0,1),(1,0),(1,1)],[[(0,0),(0,1)],[(0,0),(1,0)],[(0,
↪1),(1,1)],[(1,0),(1,1)]]],facade=True)
sage: label = lambda a,b: min( i for i in [0,1] if a[i] != b[i] )
sage: P.is_EL_labelling(label)
True
sage: P.is_EL_labelling(label,return_raising_chains=True)
{((0, 0), (0, 1)): [1],
 ((0, 0), (1, 0)): [0],
 ((0, 0), (1, 1)): [0, 1],
 ((0, 1), (1, 1)): [0],
 ((1, 0), (1, 1)): [1]}
```

```
>>> from sage.all import *
>>> P = Poset([[(Integer(0),Integer(0)),(Integer(0),Integer(1)),(Integer(1),
↪Integer(0)),(Integer(1),Integer(1))],[[(Integer(0),Integer(0)),(Integer(0),
↪Integer(1))],[(Integer(0),Integer(0)),(Integer(1),Integer(0))],[(Integer(0),
↪Integer(1)),(Integer(1),Integer(1))],[(Integer(1),Integer(0)),(Integer(1),
↪Integer(1))]]],facade=True)
```

(continues on next page)

(continued from previous page)

```
>>> label = lambda a,b: min( i for i in [Integer(0),Integer(1)] if a[i] !=␣
↪b[i] )
>>> P.is_EL_labelling(label)
True
>>> P.is_EL_labelling(label,return_raising_chains=True)
{((0, 0), (0, 1)): [1],
 ((0, 0), (1, 0)): [0],
 ((0, 0), (1, 1)): [0, 1],
 ((0, 1), (1, 1)): [0],
 ((1, 0), (1, 1)): [1]}
```

is_antichain_of_poset(*elms*)

Return `True` if `elms` is an antichain of the poset and `False` otherwise.

Set of elements are an *antichain* of a poset if they are pairwise incomparable.

EXAMPLES:

```
sage: P = posets.BooleanLattice(5)
sage: P.is_antichain_of_poset([3, 5, 7])
False
sage: P.is_antichain_of_poset([3, 5, 14])
True
```

```
>>> from sage.all import *
>>> P = posets.BooleanLattice(Integer(5))
>>> P.is_antichain_of_poset([Integer(3), Integer(5), Integer(7)])
False
>>> P.is_antichain_of_poset([Integer(3), Integer(5), Integer(14)])
True
```

is_bounded()

Return `True` if the poset is bounded, and `False` otherwise.

A poset is bounded if it contains both a unique maximal element and a unique minimal element.

EXAMPLES:

```
sage: P = Poset({0:[3], 1:[3], 2:[3], 3:[4, 5], 4:[], 5:[]})
sage: P.is_bounded()
False
sage: Q = posets.DiamondPoset(5)
sage: Q.is_bounded()
True
```

```
>>> from sage.all import *
>>> P = Poset({Integer(0):[Integer(3)], Integer(1):[Integer(3)],␣
↪Integer(2):[Integer(3)], Integer(3):[Integer(4), Integer(5)], Integer(4):[],
↪ Integer(5):[]})
>>> P.is_bounded()
False
>>> Q = posets.DiamondPoset(Integer(5))
>>> Q.is_bounded()
True
```

See also

- Weaker properties: *has_bottom()*, *has_top()*
- Other: *with_bounds()*, *without_bounds()*

is_chain()

Return `True` if the poset is totally ordered ("chain"), and `False` otherwise.

EXAMPLES:

```
sage: I = Poset({0:[1], 1:[2], 2:[3], 3:[4]})
sage: I.is_chain()
True

sage: II = Poset({0:[1], 2:[3]})
sage: II.is_chain()
False

sage: V = Poset({0:[1, 2]})
sage: V.is_chain()
False
```

```
>>> from sage.all import *
>>> I = Poset({Integer(0):[Integer(1)], Integer(1):[Integer(2)],␣
↪Integer(2):[Integer(3)], Integer(3):[Integer(4)]})
>>> I.is_chain()
True

>>> II = Poset({Integer(0):[Integer(1)], Integer(2):[Integer(3)]})
>>> II.is_chain()
False

>>> V = Poset({Integer(0):[Integer(1), Integer(2)]})
>>> V.is_chain()
False
```

is_chain_of_poset(*elms*, *ordered=False*)

Return `True` if `elms` is a chain of the poset, and `False` otherwise.

Set of elements are a *chain* of a poset if they are comparable to each other.

INPUT:

- `elms` – list or other iterable containing some elements of the poset
- `ordered` – boolean; if `True`, then return `True` only if elements in `elms` are strictly increasing in the poset. This makes no sense if `elms` is a set. If `False` (the default), then elements can be repeated and be in any order.

EXAMPLES:

```
sage: P = Poset((divisors(12), attrcall("divides")))
sage: sorted(P.list())
[1, 2, 3, 4, 6, 12]
```

(continues on next page)

(continued from previous page)

```
sage: P.is_chain_of_poset([12, 3])
True
sage: P.is_chain_of_poset({3, 4, 12})
False
sage: P.is_chain_of_poset([12, 3], ordered=True)
False
sage: P.is_chain_of_poset((1, 1, 3))
True
sage: P.is_chain_of_poset((1, 1, 3), ordered=True)
False
sage: P.is_chain_of_poset((1, 3), ordered=True)
True
```

```
>>> from sage.all import *
>>> P = Poset((divisors(Integer(12)), attrcall("divides")))
>>> sorted(P.list())
[1, 2, 3, 4, 6, 12]
>>> P.is_chain_of_poset([Integer(12), Integer(3)])
True
>>> P.is_chain_of_poset({Integer(3), Integer(4), Integer(12)})
False
>>> P.is_chain_of_poset([Integer(12), Integer(3)], ordered=True)
False
>>> P.is_chain_of_poset((Integer(1), Integer(1), Integer(3)))
True
>>> P.is_chain_of_poset((Integer(1), Integer(1), Integer(3)), ordered=True)
False
>>> P.is_chain_of_poset((Integer(1), Integer(3)), ordered=True)
True
```

is_connected()

Return `True` if the poset is connected, and `False` otherwise.

A poset is connected if its Hasse diagram is connected.

If a poset is not connected, then it can be divided to parts S_1 and S_2 so that every element of S_1 is incomparable to every element of S_2.

EXAMPLES:

```
sage: P = Poset({1:[2, 3], 3:[4, 5]})
sage: P.is_connected()
True

sage: P = Poset({1:[2, 3], 3:[4, 5], 6:[7, 8]})
sage: P.is_connected()
False
```

```
>>> from sage.all import *
>>> P = Poset({Integer(1):[Integer(2), Integer(3)], Integer(3):[Integer(4),␣
↪Integer(5)]})
>>> P.is_connected()
True
```

(continues on next page)

(continued from previous page)

```
>>> P = Poset({Integer(1):[Integer(2), Integer(3)], Integer(3):[Integer(4),␣
↪Integer(5)], Integer(6):[Integer(7), Integer(8)]})
>>> P.is_connected()
False
```

See also

connected_components()

is_d_complete()

Return `True` if a poset is d-complete and `False` otherwise.

See also

- *d_complete*

EXAMPLES:

```
sage: from sage.combinat.posets.posets import FinitePoset
sage: A = Poset({0: [1,2]})
sage: A.is_d_complete()
False

sage: from sage.combinat.posets.poset_examples import Posets
sage: B = Posets.DoubleTailedDiamond(3)
sage: B.is_d_complete()
True

sage: C = Poset({0: [2], 1: [2], 2: [3, 4], 3: [5], 4: [5], 5: [6]})
sage: C.is_d_complete()
False

sage: D = Poset({0: [1, 2], 1: [4], 2: [4], 3: [4]})
sage: D.is_d_complete()
False

sage: P = Posets.YoungDiagramPoset(Partition([3, 2, 2]), dual=True)          #␣
↪needs sage.combinat
sage: P.is_d_complete()                                                      #␣
↪needs sage.combinat
True
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.posets import FinitePoset
>>> A = Poset({Integer(0): [Integer(1),Integer(2)]})
>>> A.is_d_complete()
False
```

(continues on next page)

(continued from previous page)

```
>>> from sage.combinat.posets.poset_examples import Posets
>>> B = Posets.DoubleTailedDiamond(Integer(3))
>>> B.is_d_complete()
True

>>> C = Poset({Integer(0): [Integer(2)], Integer(1): [Integer(2)],␣
↪Integer(2): [Integer(3), Integer(4)], Integer(3): [Integer(5)], Integer(4):␣
↪[Integer(5)], Integer(5): [Integer(6)]})
>>> C.is_d_complete()
False

>>> D = Poset({Integer(0): [Integer(1), Integer(2)], Integer(1): [Integer(4)],
↪ Integer(2): [Integer(4)], Integer(3): [Integer(4)]})
>>> D.is_d_complete()
False

>>> P = Posets.YoungDiagramPoset(Partition([Integer(3), Integer(2),␣
↪Integer(2)]), dual=True)          # needs sage.combinat
>>> P.is_d_complete()                                                    #␣
↪needs sage.combinat
True
```

is_eulerian(*k=None*, *certificate=False*)

Return `True` if the poset is Eulerian, and `False` otherwise.

The poset is expected to be graded and bounded.

A poset is Eulerian if every non-trivial interval has the same number of elements of even rank as of odd rank. A poset is k-eulerian if every non-trivial interval up to rank k is Eulerian.

See Wikipedia article Eulerian_poset.

INPUT:

- `k` – integer; only check if the poset is k-eulerian. If `None` (the default), check if the poset is Eulerian.
- `certificate` – boolean (default: `False`); whether to return a certificate

OUTPUT:

- If `certificate=True` return either `True, None` or `False, (a, b)`, where the interval `(a, b)` is not Eulerian. If `certificate=False` return `True` or `False`.

EXAMPLES:

```
sage: P = Poset({0: [1, 2, 3], 1: [4, 5], 2: [4, 6], 3: [5, 6],
....:            4: [7, 8], 5: [7, 8], 6: [7, 8], 7: [9], 8: [9]})
sage: P.is_eulerian()                                                    #␣
↪needs sage.libs.flint
True
sage: P = Poset({0: [1, 2, 3], 1: [4, 5, 6], 2: [4, 6], 3: [5,6],
....:            4: [7], 5:[7], 6:[7]})
sage: P.is_eulerian()                                                    #␣
↪needs sage.libs.flint
False
```

```
>>> from sage.all import *
>>> P = Poset({Integer(0): [Integer(1), Integer(2), Integer(3)], Integer(1):␣
↪[Integer(4), Integer(5)], Integer(2): [Integer(4), Integer(6)], Integer(3):␣
↪[Integer(5), Integer(6)],
...             Integer(4): [Integer(7), Integer(8)], Integer(5): [Integer(7),␣
↪Integer(8)], Integer(6): [Integer(7), Integer(8)], Integer(7): [Integer(9)],
↪ Integer(8): [Integer(9)]})
>>> P.is_eulerian()                                                         #␣
↪needs sage.libs.flint
True
>>> P = Poset({Integer(0): [Integer(1), Integer(2), Integer(3)], Integer(1):␣
↪[Integer(4), Integer(5), Integer(6)], Integer(2): [Integer(4), Integer(6)],␣
↪Integer(3): [Integer(5),Integer(6)],
...             Integer(4): [Integer(7)], Integer(5):[Integer(7)],␣
↪Integer(6):[Integer(7)]})
>>> P.is_eulerian()                                                         #␣
↪needs sage.libs.flint
False
```

Canonical examples of Eulerian posets are the face lattices of convex polytopes:

```
sage: P = polytopes.cube().face_lattice()                                   #␣
↪needs sage.geometry.polyhedron
sage: P.is_eulerian()                                                       #␣
↪needs sage.geometry.polyhedron sage.libs.flint
True
```

```
>>> from sage.all import *
>>> P = polytopes.cube().face_lattice()                                     #␣
↪needs sage.geometry.polyhedron
>>> P.is_eulerian()                                                         #␣
↪needs sage.geometry.polyhedron sage.libs.flint
True
```

A poset that is 3- but not 4-eulerian:

```
sage: P = Poset(DiGraph('MWW@_?W?@_?W??@??O@_?W?@_?W?@??O??')); P
Finite poset containing 14 elements
sage: P.is_eulerian(k=3)                                                    #␣
↪needs sage.libs.flint
True
sage: P.is_eulerian(k=4)                                                    #␣
↪needs sage.libs.flint
False
```

```
>>> from sage.all import *
>>> P = Poset(DiGraph('MWW@_?W?@_?W??@??O@_?W?@_?W?@??O??')); P
Finite poset containing 14 elements
>>> P.is_eulerian(k=Integer(3))                                               ␣
↪      # needs sage.libs.flint
True
>>> P.is_eulerian(k=Integer(4))                                               ␣
```

(continues on next page)

(continued from previous page)

```
↪      # needs sage.libs.flint
False
```

Getting an interval that is not Eulerian:

```
sage: P = posets.DivisorLattice(12)
sage: P.is_eulerian(certificate=True)                                    #␣
↪needs sage.libs.flint
(False, (1, 4))
```

```
>>> from sage.all import *
>>> P = posets.DivisorLattice(Integer(12))
>>> P.is_eulerian(certificate=True)                                     #␣
↪needs sage.libs.flint
(False, (1, 4))
```

is_gequal(*x*, *y*)

Return `True` if x is greater than or equal to y in the poset, and `False` otherwise.

EXAMPLES:

```
sage: P = Poset({0:[2], 1:[2], 2:[3], 3:[4], 4:[]})
sage: P.is_gequal(3, 1)
True
sage: P.is_gequal(2, 2)
True
sage: P.is_gequal(0, 1)
False
```

```
>>> from sage.all import *
>>> P = Poset({Integer(0):[Integer(2)], Integer(1):[Integer(2)],␣
↪Integer(2):[Integer(3)], Integer(3):[Integer(4)], Integer(4):[]})
>>> P.is_gequal(Integer(3), Integer(1))
True
>>> P.is_gequal(Integer(2), Integer(2))
True
>>> P.is_gequal(Integer(0), Integer(1))
False
```

See also

is_greater_than(), *is_lequal()*.

is_graded()

Return `True` if the poset is graded, and `False` otherwise.

A poset is graded if all its maximal chains have the same length.

There are various competing definitions for graded posets (see Wikipedia article Graded_poset). This definition is from section 3.1 of Richard Stanley's *Enumerative Combinatorics, Vol. 1* [EnumComb1]. Some sources call these posets *tiered*.

Every graded poset is ranked. The converse is true for bounded posets, including lattices.

EXAMPLES:

```
sage: P = posets.PentagonPoset()  # Not even ranked
sage: P.is_graded()
False

sage: P = Poset({1:[2, 3], 3:[4]})  # Ranked, but not graded
sage: P.is_graded()
False

sage: P = Poset({1:[3, 4], 2:[3, 4], 5:[6]})
sage: P.is_graded()
True

sage: P = Poset([[1], [2], [], [4], []])
sage: P.is_graded()
False
```

```
>>> from sage.all import *
>>> P = posets.PentagonPoset()  # Not even ranked
>>> P.is_graded()
False

>>> P = Poset({Integer(1):[Integer(2), Integer(3)], Integer(3):[Integer(4)]})␣
↪ # Ranked, but not graded
>>> P.is_graded()
False

>>> P = Poset({Integer(1):[Integer(3), Integer(4)], Integer(2):[Integer(3),␣
↪Integer(4)], Integer(5):[Integer(6)]})
>>> P.is_graded()
True

>>> P = Poset([[Integer(1)], [Integer(2)], [], [Integer(4)], []])
>>> P.is_graded()
False
```

See also:

is_ranked(), *level_sets()*

is_greater_than(x, y)

Return True if x is greater than but not equal to y in the poset, and False otherwise.

EXAMPLES:

```
sage: P = Poset({0:[2], 1:[2], 2:[3], 3:[4], 4:[]})
sage: P.is_greater_than(3, 1)
True
sage: P.is_greater_than(1, 2)
False
sage: P.is_greater_than(3, 3)
```

(continues on next page)

(continued from previous page)

```
False
sage: P.is_greater_than(0, 1)
False
```

```
>>> from sage.all import *
>>> P = Poset({Integer(0):[Integer(2)], Integer(1):[Integer(2)],␣
↪Integer(2):[Integer(3)], Integer(3):[Integer(4)], Integer(4):[]})
>>> P.is_greater_than(Integer(3), Integer(1))
True
>>> P.is_greater_than(Integer(1), Integer(2))
False
>>> P.is_greater_than(Integer(3), Integer(3))
False
>>> P.is_greater_than(Integer(0), Integer(1))
False
```

For non-facade posets also > works:

```
sage: P = Poset({3: [1, 2]}, facade=False)
sage: P(2) > P(3)
True
```

```
>>> from sage.all import *
>>> P = Poset({Integer(3): [Integer(1), Integer(2)]}, facade=False)
>>> P(Integer(2)) > P(Integer(3))
True
```

See also:

is_gequal(), *is_less_than()*.

is_greedy(*certificate=False*)

Return `True` if the poset is greedy, and `False` otherwise.

A poset is *greedy* if every greedy linear extension has the same number of jumps.

INPUT:

- `certificate` – boolean (default: `False`); whether to return a certificate

OUTPUT:

- If `certificate=True` return either `(True, None)` or `(False, (A, B))` where A and B are greedy linear extension so that B has more jumps. If `certificate=False` return `True` or `False`.

EXAMPLES:

This is not a self-dual property:

```
sage: W = Poset({1: [3, 4], 2: [4, 5]})
sage: M = W.dual()
sage: W.is_greedy()
True
```

(continues on next page)

(continued from previous page)

```
sage: M.is_greedy()
False
```

```
>>> from sage.all import *
>>> W = Poset({Integer(1): [Integer(3), Integer(4)], Integer(2): [Integer(4),␣
↪Integer(5)]})
>>> M = W.dual()
>>> W.is_greedy()
True
>>> M.is_greedy()
False
```

Getting a certificate:

```
sage: N = Poset({1: [3], 2: [3, 4]})
sage: N.is_greedy(certificate=True)
(False, ([1, 2, 4, 3], [2, 4, 1, 3]))
```

```
>>> from sage.all import *
>>> N = Poset({Integer(1): [Integer(3)], Integer(2): [Integer(3), Integer(4)]}
↪)
>>> N.is_greedy(certificate=True)
(False, ([1, 2, 4, 3], [2, 4, 1, 3]))
```

is_incomparable_chain_free(*m*, *n=None*)

Return `True` if the poset is $(m + n)$-free, and `False` otherwise.

A poset is $(m + n)$-free if there is no incomparable chains of lengths m and n. Three cases have special name (see [EnumComb1], exercise 3.15):

- "interval order" is $(2 + 2)$-free
- "semiorder" (or "unit interval order") is $(1 + 3)$-free and $(2 + 2)$-free
- "weak order" is $(1 + 2)$-free.

INPUT:

- `m`, `n` – positive integers

It is also possible to give a list of integer pairs as argument. See below for an example.

EXAMPLES:

```
sage: B3 = posets.BooleanLattice(3)
sage: B3.is_incomparable_chain_free(1, 3)
True
sage: B3.is_incomparable_chain_free(2, 2)
False

sage: IP6 = posets.IntegerPartitions(6)                                    #␣
↪needs sage.combinat
sage: IP6.is_incomparable_chain_free(1, 3)                                 #␣
↪needs sage.combinat
False
sage: IP6.is_incomparable_chain_free(2, 2)                                 #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.combinat
True
```

```
>>> from sage.all import *
>>> B3 = posets.BooleanLattice(Integer(3))
>>> B3.is_incomparable_chain_free(Integer(1), Integer(3))
True
>>> B3.is_incomparable_chain_free(Integer(2), Integer(2))
False

>>> IP6 = posets.IntegerPartitions(Integer(6))                              ␣
↪     # needs sage.combinat
>>> IP6.is_incomparable_chain_free(Integer(1), Integer(3))                  ␣
↪              # needs sage.combinat
False
>>> IP6.is_incomparable_chain_free(Integer(2), Integer(2))                  ␣
↪              # needs sage.combinat
True
```

A list of pairs as an argument:

```
sage: B3.is_incomparable_chain_free([[1, 3], [2, 2]])
False
```

```
>>> from sage.all import *
>>> B3.is_incomparable_chain_free([[Integer(1), Integer(3)], [Integer(2),␣
↪Integer(2)]])
False
```

We show how to get an incomparable chain pair:

```
sage: P = posets.PentagonPoset()
sage: chains_1_2 = Poset({0:[], 1:[2]})
sage: incomps = P.isomorphic_subposets(chains_1_2)[0]
sage: sorted(incomps.list()), incomps.cover_relations()
([1, 2, 3], [[2, 3]])
```

```
>>> from sage.all import *
>>> P = posets.PentagonPoset()
>>> chains_1_2 = Poset({Integer(0):[], Integer(1):[Integer(2)]})
>>> incomps = P.isomorphic_subposets(chains_1_2)[Integer(0)]
>>> sorted(incomps.list()), incomps.cover_relations()
([1, 2, 3], [[2, 3]])
```

AUTHOR:

- Eric Rowland (2013-05-28)

is_induced_subposet(*other*)

Return `True` if the poset is an induced subposet of `other`, and `False` otherwise.

A poset P is an induced subposet of Q if every element of P is an element of Q, and $x \leq_P y$ iff $x \leq_Q y$. Note that “induced” here has somewhat different meaning compared to that of graphs.

INPUT:

- `other` – poset

> **Note**
>
> This method does not check whether the poset is a *isomorphic* (i.e., up to relabeling) subposet of `other`, but only if `other` directly contains the poset as an induced subposet. For isomorphic subposets see `has_isomorphic_subposet()`.

EXAMPLES:

```
sage: P = Poset({1:[2, 3]})
sage: Q = Poset({1:[2, 4], 2:[3]})
sage: P.is_induced_subposet(Q)
False
sage: R = Poset({0:[1], 1:[3, 4], 3:[5], 4:[2]})
sage: P.is_induced_subposet(R)
True
```

```
>>> from sage.all import *
>>> P = Poset({Integer(1):[Integer(2), Integer(3)]})
>>> Q = Poset({Integer(1):[Integer(2), Integer(4)], Integer(2):[Integer(3)]})
>>> P.is_induced_subposet(Q)
False
>>> R = Poset({Integer(0):[Integer(1)], Integer(1):[Integer(3), Integer(4)],
↪Integer(3):[Integer(5)], Integer(4):[Integer(2)]})
>>> P.is_induced_subposet(R)
True
```

is_isomorphic(*other*, ***kwds*)

Return `True` if both posets are isomorphic.

EXAMPLES:

```
sage: P = Poset(([1,2,3],[[1,3],[2,3]]))
sage: Q = Poset(([4,5,6],[[4,6],[5,6]]))
sage: P.is_isomorphic(Q)
True
```

```
>>> from sage.all import *
>>> P = Poset(([Integer(1),Integer(2),Integer(3)],[[Integer(1),Integer(3)],
↪[Integer(2),Integer(3)]]))
>>> Q = Poset(([Integer(4),Integer(5),Integer(6)],[[Integer(4),Integer(6)],
↪[Integer(5),Integer(6)]]))
>>> P.is_isomorphic(Q)
True
```

is_join_semilattice(*certificate=False*)

Return `True` if the poset has a join operation, and `False` otherwise.

A join is the least upper bound for given elements, if it exists.

INPUT:

- `certificate` – boolean (default: `False`); whether to return a certificate

OUTPUT:

- If `certificate=True` return either `(True, None)` or `(False, (a, b))` where elements a and b have no least upper bound. If `certificate=False` return `True` or `False`.

EXAMPLES:

```
sage: P = Poset([[1,3,2], [4], [4,5,6], [6], [7], [7], [7], []])
sage: P.is_join_semilattice()
True

sage: P = Poset({1:[3, 4], 2:[3, 4], 3:[5], 4:[5]})
sage: P.is_join_semilattice()
False
sage: P.is_join_semilattice(certificate=True)
(False, (2, 1))
```

```
>>> from sage.all import *
>>> P = Poset([[Integer(1),Integer(3),Integer(2)], [Integer(4)], [Integer(4),
↪Integer(5),Integer(6)], [Integer(6)], [Integer(7)], [Integer(7)],␣
↪[Integer(7)], []])
>>> P.is_join_semilattice()
True

>>> P = Poset({Integer(1):[Integer(3), Integer(4)], Integer(2):[Integer(3),␣
↪Integer(4)], Integer(3):[Integer(5)], Integer(4):[Integer(5)]})
>>> P.is_join_semilattice()
False
>>> P.is_join_semilattice(certificate=True)
(False, (2, 1))
```

See also

- Dual property: *`is_meet_semilattice()`*
- Stronger properties: `is_lattice()`

is_jump_critical(*certificate=False*)

Return `True` if the poset is jump-critical, and `False` otherwise.

A poset P is *jump-critical* if every proper subposet has smaller jump number.

INPUT:

- `certificate` – boolean (default: `False`); whether to return a certificate

OUTPUT:

- If `certificate=True` return either `(True, None)` or `(False, e)` so that removing element e from the poset does not decrease the jump number. If `certificate=False` return `True` or `False`.

EXAMPLES:

```
sage: P = Poset({1: [3, 6], 2: [3, 4, 5], 4: [6, 7], 5: [7]})
sage: P.is_jump_critical()
True

sage: P = posets.PentagonPoset()
sage: P.is_jump_critical()
False
sage: P.is_jump_critical(certificate=True)
(False, 3)
```

```
>>> from sage.all import *
>>> P = Poset({Integer(1): [Integer(3), Integer(6)], Integer(2): [Integer(3),
↪Integer(4), Integer(5)], Integer(4): [Integer(6), Integer(7)], Integer(5):
↪[Integer(7)]})
>>> P.is_jump_critical()
True

>>> P = posets.PentagonPoset()
>>> P.is_jump_critical()
False
>>> P.is_jump_critical(certificate=True)
(False, 3)
```

See also

jump_number()

is_lequal(*x*, *y*)

Return True if x is less than or equal to y in the poset, and False otherwise.

EXAMPLES:

```
sage: P = Poset({0:[2], 1:[2], 2:[3], 3:[4], 4:[]})
sage: P.is_lequal(2, 4)
True
sage: P.is_lequal(2, 2)
True
sage: P.is_lequal(0, 1)
False
sage: P.is_lequal(3, 2)
False
```

```
>>> from sage.all import *
>>> P = Poset({Integer(0):[Integer(2)], Integer(1):[Integer(2)],
↪Integer(2):[Integer(3)], Integer(3):[Integer(4)], Integer(4):[]})
>>> P.is_lequal(Integer(2), Integer(4))
True
>>> P.is_lequal(Integer(2), Integer(2))
True
>>> P.is_lequal(Integer(0), Integer(1))
False
```

(continues on next page)

(continued from previous page)

```
>>> P.is_lequal(Integer(3), Integer(2))
False
```

See also

is_less_than(), *is_gequal()*.

is_less_than(*x*, *y*)

Return True if x is less than but not equal to y in the poset, and False otherwise.

EXAMPLES:

```
sage: P = Poset({0:[2], 1:[2], 2:[3], 3:[4], 4:[]})
sage: P.is_less_than(1, 3)
True
sage: P.is_less_than(0, 1)
False
sage: P.is_less_than(2, 2)
False
```

```
>>> from sage.all import *
>>> P = Poset({Integer(0):[Integer(2)], Integer(1):[Integer(2)],␣
→Integer(2):[Integer(3)], Integer(3):[Integer(4)], Integer(4):[]})
>>> P.is_less_than(Integer(1), Integer(3))
True
>>> P.is_less_than(Integer(0), Integer(1))
False
>>> P.is_less_than(Integer(2), Integer(2))
False
```

For non-facade posets also < works:

```
sage: P = Poset({3: [1, 2]}, facade=False)
sage: P(1) < P(2)
False
```

```
>>> from sage.all import *
>>> P = Poset({Integer(3): [Integer(1), Integer(2)]}, facade=False)
>>> P(Integer(1)) < P(Integer(2))
False
```

See also

is_lequal(), *is_greater_than()*.

is_linear_extension(*l*)

Return whether l is a linear extension of self.

INPUT:

- l – list (or iterable) containing all of the elements of self exactly once

EXAMPLES:

```
sage: P = Poset((divisors(12), attrcall("divides")), facade=True, linear_
↪extension=True)
sage: P.list()
[1, 2, 3, 4, 6, 12]
sage: P.is_linear_extension([1, 2, 4, 3, 6, 12])
True
sage: P.is_linear_extension([1, 2, 4, 6, 3, 12])
False

sage: [p for p in Permutations(list(P)) if P.is_linear_extension(p)]
[[1, 2, 3, 4, 6, 12],
 [1, 2, 3, 6, 4, 12],
 [1, 2, 4, 3, 6, 12],
 [1, 3, 2, 4, 6, 12],
 [1, 3, 2, 6, 4, 12]]
sage: list(P.linear_extensions())
[[1, 2, 3, 4, 6, 12],
 [1, 2, 4, 3, 6, 12],
 [1, 3, 2, 4, 6, 12],
 [1, 3, 2, 6, 4, 12],
 [1, 2, 3, 6, 4, 12]]
```

```
>>> from sage.all import *
>>> P = Poset((divisors(Integer(12)), attrcall("divides")), facade=True,␣
↪linear_extension=True)
>>> P.list()
[1, 2, 3, 4, 6, 12]
>>> P.is_linear_extension([Integer(1), Integer(2), Integer(4), Integer(3),␣
↪Integer(6), Integer(12)])
True
>>> P.is_linear_extension([Integer(1), Integer(2), Integer(4), Integer(6),␣
↪Integer(3), Integer(12)])
False

>>> [p for p in Permutations(list(P)) if P.is_linear_extension(p)]
[[1, 2, 3, 4, 6, 12],
 [1, 2, 3, 6, 4, 12],
 [1, 2, 4, 3, 6, 12],
 [1, 3, 2, 4, 6, 12],
 [1, 3, 2, 6, 4, 12]]
>>> list(P.linear_extensions())
[[1, 2, 3, 4, 6, 12],
 [1, 2, 4, 3, 6, 12],
 [1, 3, 2, 4, 6, 12],
 [1, 3, 2, 6, 4, 12],
 [1, 2, 3, 6, 4, 12]]
```

Note

This is used and systematically tested in `LinearExtensionsOfPosets`

> **See also**
>
> *linear_extension()*, *linear_extensions()*

is_linear_interval(*x*, *y*)

Return whether the interval [x, y] is linear.

This means that this interval is a total order.

EXAMPLES:

```
sage: P = posets.PentagonPoset()
sage: P.is_linear_interval(0, 4)
False
sage: P.is_linear_interval(0, 3)
True
sage: P.is_linear_interval(1, 3)
False
```

```
>>> from sage.all import *
>>> P = posets.PentagonPoset()
>>> P.is_linear_interval(Integer(0), Integer(4))
False
>>> P.is_linear_interval(Integer(0), Integer(3))
True
>>> P.is_linear_interval(Integer(1), Integer(3))
False
```

is_meet_semilattice(*certificate=False*)

Return True if the poset has a meet operation, and False otherwise.

A meet is the greatest lower bound for given elements, if it exists.

INPUT:

- certificate – boolean (default: False); whether to return a certificate

OUTPUT:

- If certificate=True return either (True, None) or (False, (a, b)) where elements a and b have no greatest lower bound. If certificate=False return True or False.

EXAMPLES:

```
sage: P = Poset({1:[2, 3, 4], 2:[5, 6], 3:[6], 4:[6, 7]})
sage: P.is_meet_semilattice()
True

sage: Q = P.dual()
sage: Q.is_meet_semilattice()
False

sage: V = posets.IntegerPartitions(5)                                  #␣
↪needs sage.combinat
sage: V.is_meet_semilattice(certificate=True)                          #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.combinat
(False, ((2, 2, 1), (3, 1, 1)))
```

```
>>> from sage.all import *
>>> P = Poset({Integer(1):[Integer(2), Integer(3), Integer(4)],␣
↪Integer(2):[Integer(5), Integer(6)], Integer(3):[Integer(6)],␣
↪Integer(4):[Integer(6), Integer(7)]})
>>> P.is_meet_semilattice()
True

>>> Q = P.dual()
>>> Q.is_meet_semilattice()
False

>>> V = posets.IntegerPartitions(Integer(5))                                  ␣
↪     # needs sage.combinat
>>> V.is_meet_semilattice(certificate=True)                                 #␣
↪needs sage.combinat
(False, ((2, 2, 1), (3, 1, 1)))
```

See also:

- Dual property: *is_join_semilattice()*
- Stronger properties: `is_lattice()`

is_parent_of(*x*)

Return `True` if `x` is an element of the poset.

is_rank_symmetric()

Return `True` if the poset is rank symmetric, and `False` otherwise.

The poset is expected to be graded and connected.

A poset of rank h (maximal chains have $h + 1$ elements) is rank symmetric if the number of elements are equal in ranks i and $h - i$ for every i in $0, 1, \ldots, h$.

EXAMPLES:

```
sage: P = Poset({1:[3, 4, 5], 2:[3, 4, 5], 3:[6], 4:[7], 5:[7]})
sage: P.is_rank_symmetric()
True
sage: P = Poset({1:[2], 2:[3, 4], 3:[5], 4:[5]})
sage: P.is_rank_symmetric()
False
```

```
>>> from sage.all import *
>>> P = Poset({Integer(1):[Integer(3), Integer(4), Integer(5)],␣
↪Integer(2):[Integer(3), Integer(4), Integer(5)], Integer(3):[Integer(6)],␣
↪Integer(4):[Integer(7)], Integer(5):[Integer(7)]})
>>> P.is_rank_symmetric()
True
```

(continues on next page)

(continued from previous page)

```
>>> P = Poset({Integer(1):[Integer(2)], Integer(2):[Integer(3), Integer(4)],
↪Integer(3):[Integer(5)], Integer(4):[Integer(5)]})
>>> P.is_rank_symmetric()
False
```

is_ranked()

Return `True` if the poset is ranked, and `False` otherwise.

A poset is ranked if there is a function r from poset elements to integers so that $r(x) = r(y) + 1$ when x covers y.

Informally said a ranked poset can be "levelized": every element is on a "level", and every cover relation goes only one level up.

EXAMPLES:

```
sage: P = Poset( ([1, 2, 3, 4], [[1, 2], [2, 4], [3, 4]] ))
sage: P.is_ranked()
True

sage: P = Poset([[1, 5], [2, 6], [3], [4],[], [6, 3], [4]])
sage: P.is_ranked()
False
```

```
>>> from sage.all import *
>>> P = Poset( ([Integer(1), Integer(2), Integer(3), Integer(4)],
↪[[Integer(1), Integer(2)], [Integer(2), Integer(4)], [Integer(3),
↪Integer(4)]] ))
>>> P.is_ranked()
True

>>> P = Poset([[Integer(1), Integer(5)], [Integer(2), Integer(6)],
↪[Integer(3)], [Integer(4)],[], [Integer(6), Integer(3)], [Integer(4)]])
>>> P.is_ranked()
False
```

See also

rank_function(), *rank()*, *is_graded()*

is_series_parallel()

Return `True` if the poset is series-parallel, and `False` otherwise.

A poset is *series-parallel* if it can be built up from one-element posets using the operations of disjoint union and ordinal sum. This is also called *N-free* property: every poset that is not series-parallel contains a subposet isomorphic to the 4-element N-shaped poset where $a > c, d$ and $b > d$.

Note

Some papers use the term N-free for posets having no N-shaped poset as a *cover-preserving subposet*. This definition is not used here.

See Wikipedia article Series-parallel partial order.

EXAMPLES:

```
sage: VA = Poset({1: [2, 3], 4: [5], 6: [5]})
sage: VA.is_series_parallel()
True
sage: big_N = Poset({1: [2, 4], 2: [3], 4:[7], 5:[6], 6:[7]})
sage: big_N.is_series_parallel()
False
```

```
>>> from sage.all import *
>>> VA = Poset({Integer(1): [Integer(2), Integer(3)], Integer(4):␣
↪[Integer(5)], Integer(6): [Integer(5)]})
>>> VA.is_series_parallel()
True
>>> big_N = Poset({Integer(1): [Integer(2), Integer(4)], Integer(2):␣
↪[Integer(3)], Integer(4):[Integer(7)], Integer(5):[Integer(6)],␣
↪Integer(6):[Integer(7)]})
>>> big_N.is_series_parallel()
False
```

is_slender(*certificate=False*)

Return `True` if the poset is slender, and `False` otherwise.

A finite graded poset is *slender* if every rank 2 interval contains three or four elements, as defined in [Stan2009]. (This notion of "slender" is unrelated to the eponymous notion defined by Graetzer and Kelly in "The Free $\mathfrak{m}$-Lattice on the Poset H", Order 1 (1984), 47–65.)

This function *does not* check if the poset is graded or not. Instead it just returns `True` if the poset does not contain 5 distinct elements x, y, a, b and c such that $x \lessdot a, b, c \lessdot y$ where $\lessdot$ is the covering relation.

INPUT:

- `certificate` – boolean (default: `False`); whether to return a certificate

OUTPUT:

- If `certificate=True` return either `(True, None)` or `(False, (a, b))` so that the interval $[a, b]$ has at least five elements. If `certificate=False` return `True` or `False`.

EXAMPLES:

```
sage: P = Poset(([1, 2, 3, 4], [[1, 2], [1, 3], [2, 4], [3, 4]]))
sage: P.is_slender()
True
sage: P = Poset(([1,2,3,4,5],[[1,2],[1,3],[1,4],[2,5],[3,5],[4,5]]))
sage: P.is_slender()
False

sage: # needs sage.groups
sage: W = WeylGroup(['A', 2])
sage: G = W.bruhat_poset()
sage: G.is_slender()
True
sage: W = WeylGroup(['A', 3])
sage: G = W.bruhat_poset()
```

(continues on next page)

(continued from previous page)

```
sage: G.is_slender()
True

sage: P = posets.IntegerPartitions(6)                                         #␣
↪needs sage.combinat
sage: P.is_slender(certificate=True)                                          #␣
↪needs sage.combinat
(False, ((6,), (3, 2, 1)))
```

```
>>> from sage.all import *
>>> P = Poset(([Integer(1), Integer(2), Integer(3), Integer(4)], [[Integer(1),
↪ Integer(2)], [Integer(1), Integer(3)], [Integer(2), Integer(4)],␣
↪[Integer(3), Integer(4)]]))
>>> P.is_slender()
True
>>> P = Poset(([Integer(1),Integer(2),Integer(3),Integer(4),Integer(5)],
↪[[Integer(1),Integer(2)],[Integer(1),Integer(3)],[Integer(1),Integer(4)],
↪[Integer(2),Integer(5)],[Integer(3),Integer(5)],[Integer(4),Integer(5)]]))
>>> P.is_slender()
False

>>> # needs sage.groups
>>> W = WeylGroup(['A', Integer(2)])
>>> G = W.bruhat_poset()
>>> G.is_slender()
True
>>> W = WeylGroup(['A', Integer(3)])
>>> G = W.bruhat_poset()
>>> G.is_slender()
True

>>> P = posets.IntegerPartitions(Integer(6))                                  ␣
↪     # needs sage.combinat
>>> P.is_slender(certificate=True)                                         #␣
↪needs sage.combinat
(False, ((6,), (3, 2, 1)))
```

is_sperner()

Return `True` if the poset is Sperner, and `False` otherwise.

The poset is expected to be ranked.

A poset is Sperner, if no antichain is larger than the largest rank level (one of the sets of elements of the same rank) in the poset.

See Wikipedia article Sperner_property_of_a_partially_ordered_set

See also

width(), *dilworth_decomposition()*

EXAMPLES:

```
sage: posets.SetPartitions(3).is_sperner()                                  #␣
↪needs sage.combinat
True

sage: P = Poset({0: [3,4,5], 1: [5], 2: [5]})
sage: P.is_sperner()                                                        #␣
↪needs networkx
False
```

```
>>> from sage.all import *
>>> posets.SetPartitions(Integer(3)).is_sperner()                           ␣
↪     # needs sage.combinat
True

>>> P = Poset({Integer(0): [Integer(3),Integer(4),Integer(5)], Integer(1):␣
↪[Integer(5)], Integer(2): [Integer(5)]})
>>> P.is_sperner()                                                        #␣
↪needs networkx
False
```

isomorphic_subposets(*other*)

Return a list of subposets of `self` isomorphic to `other`.

By subposet we mean `self.subposet(X)` which is isomorphic to `other` and where `X` is a subset of elements of `self`.

INPUT:

- `other` – a finite poset

EXAMPLES:

```
sage: C2 = Poset({0:[1]})
sage: C3 = Poset({'a':['b'], 'b':['c']})
sage: L = sorted(x.cover_relations() for x in C3.isomorphic_subposets(C2))
sage: for x in L: print(x)
[['a', 'b']]
[['a', 'c']]
[['b', 'c']]

sage: D = Poset({1:[2,3], 2:[4], 3:[4]})
sage: N5 = posets.PentagonPoset()
sage: len(N5.isomorphic_subposets(D))
2
```

```
>>> from sage.all import *
>>> C2 = Poset({Integer(0):[Integer(1)]})
>>> C3 = Poset({'a':['b'], 'b':['c']})
>>> L = sorted(x.cover_relations() for x in C3.isomorphic_subposets(C2))
>>> for x in L: print(x)
[['a', 'b']]
[['a', 'c']]
[['b', 'c']]
```

(continues on next page)

(continued from previous page)

```
>>> D = Poset({Integer(1):[Integer(2),Integer(3)], Integer(2):[Integer(4)],␣
↪Integer(3):[Integer(4)]})
>>> N5 = posets.PentagonPoset()
>>> len(N5.isomorphic_subposets(D))
2
```

Note: If this function takes too much time, try using `isomorphic_subposets_iterator()`.

isomorphic_subposets_iterator(*other*)

Return an iterator over the subposets of `self` isomorphic to `other`.

By subposet we mean `self.subposet(X)` which is isomorphic to `other` and where `X` is a subset of elements of `self`.

INPUT:

- `other` – a finite poset

EXAMPLES:

```
sage: D = Poset({1:[2,3], 2:[4], 3:[4]})
sage: N5 = posets.PentagonPoset()
sage: for P in N5.isomorphic_subposets_iterator(D):
....:     print(P.cover_relations())
[[0, 1], [0, 2], [1, 4], [2, 4]]
[[0, 1], [0, 3], [1, 4], [3, 4]]
[[0, 1], [0, 2], [1, 4], [2, 4]]
[[0, 1], [0, 3], [1, 4], [3, 4]]
```

```
>>> from sage.all import *
>>> D = Poset({Integer(1):[Integer(2),Integer(3)], Integer(2):[Integer(4)],␣
↪Integer(3):[Integer(4)]})
>>> N5 = posets.PentagonPoset()
>>> for P in N5.isomorphic_subposets_iterator(D):
...     print(P.cover_relations())
[[0, 1], [0, 2], [1, 4], [2, 4]]
[[0, 1], [0, 3], [1, 4], [3, 4]]
[[0, 1], [0, 2], [1, 4], [2, 4]]
[[0, 1], [0, 3], [1, 4], [3, 4]]
```

Warning: This function will return same subposet as many times as there are automorphism on it. This is due to `subgraph_search_iterator()` returning labelled subgraphs. On the other hand, this function does not eat memory like `isomorphic_subposets()` does.

See also:

> *sage.combinat.posets.lattices.FiniteLatticePoset.isomorphic_sublattices_iterator()*.

join(*x*, *y*)

Return the join of two elements `x, y` in the poset if the join exists; and `None` otherwise.

EXAMPLES:

```
sage: D = Poset({1:[2,3], 2:[4], 3:[4]})
sage: D.join(2, 3)
4
sage: P = Poset({'e':['b'], 'f':['b', 'c', 'd'], 'g':['c', 'd'],
....:            'b':['a'], 'c':['a']})
sage: P.join('a', 'b')
'a'
sage: P.join('e', 'a')
'a'
sage: P.join('c', 'b')
'a'
sage: P.join('e', 'f')
'b'
sage: P.join('e', 'g')
'a'
sage: P.join('c', 'd') is None
True
sage: P.join('g', 'f') is None
True
```

```
>>> from sage.all import *
>>> D = Poset({Integer(1):[Integer(2),Integer(3)], Integer(2):[Integer(4)],␣
↪Integer(3):[Integer(4)]})
>>> D.join(Integer(2), Integer(3))
4
>>> P = Poset({'e':['b'], 'f':['b', 'c', 'd'], 'g':['c', 'd'],
...            'b':['a'], 'c':['a']})
>>> P.join('a', 'b')
'a'
>>> P.join('e', 'a')
'a'
>>> P.join('c', 'b')
'a'
>>> P.join('e', 'f')
'b'
>>> P.join('e', 'g')
'a'
>>> P.join('c', 'd') is None
True
>>> P.join('g', 'f') is None
True
```

jump_number(*certificate=False*)

Return the jump number of the poset.

A *jump* in a linear extension $[e_1, \ldots, e_n]$ of a poset P is a pair (e_i, e_{i+1}) so that e_{i+1} does not cover e_i in P. The jump number of a poset is the minimal number of jumps in linear extensions of a poset.

INPUT:

- `certificate` – boolean (default: `False`); whether to return a certificate

OUTPUT:

- If `certificate=True` return a pair (n, l) where n is the jump number and l is a linear extension with n jumps. If `certificate=False` return only the jump number.

EXAMPLES:

```
sage: B3 = posets.BooleanLattice(3)
sage: B3.jump_number()
3

sage: N = Poset({1: [3, 4], 2: [3]})
sage: N.jump_number(certificate=True)
(1, [1, 4, 2, 3])
```

```
>>> from sage.all import *
>>> B3 = posets.BooleanLattice(Integer(3))
>>> B3.jump_number()
3

>>> N = Poset({Integer(1): [Integer(3), Integer(4)], Integer(2): [Integer(3)]}
↪)
>>> N.jump_number(certificate=True)
(1, [1, 4, 2, 3])
```

ALGORITHM:

It is known that every poset has a greedy linear extension – an extension $[e_1, e_2, \dots, e_n]$ where every e_{i+1} is an upper cover of e_i if that is possible – with the smallest possible number of jumps; see [Sys1987].

Hence it suffices to test only those. We do that by backtracking.

The problem is proven to be NP-complete.

See also

is_jump_critical()

kazhdan_lusztig_polynomial(*x=None*, *y=None*, *q=None*, *canonical_labels=None*)

Return the Kazhdan-Lusztig polynomial $P_{x,y}(q)$ of the poset.

The poset is expected to be ranked.

We follow the definition given in [EPW14]. Let G denote a graded poset with unique minimal and maximal elements and χ_G denote the characteristic polynomial of G. Let I_x and F^x denote the principal order ideal and filter of x respectively. Define the *Kazhdan-Lusztig polynomial* of G as the unique polynomial $P_G(q)$ satisfying the following:

1. If $\operatorname{rank} G = 0$, then $P_G(q) = 1$.
2. If $\operatorname{rank} G > 0$, then $\deg P_G(q) < \frac{1}{2} \operatorname{rank} G$.
3. We have

$$q^{\operatorname{rank} G} P_G(q^{-1}) = \sum_{x \in G} \chi_{I_x}(q) P_{F^x}(q).$$

We then extend this to $P_{x,y}(q)$ by considering the subposet corresponding to the (closed) interval $[x, y]$. We also define $P_{\emptyset}(q) = 0$ (so if $x \not\leq y$, then $P_{x,y}(q) = 0$).

INPUT:

- `q` – (default: $q \in \mathbf{Z}[q]$) the indeterminate q
- `x` – (default: the minimal element) the element x
- `y` – (default: the maximal element) the element y
- `canonical_labels` – (optional) for subposets, use the canonical labeling (this can limit recursive calls for posets with large amounts of symmetry, but producing the labeling takes time); if not specified, this is `True` if `x` and `y` are both not specified and `False` otherwise

EXAMPLES:

```
sage: L = posets.BooleanLattice(3)
sage: L.kazhdan_lusztig_polynomial()
1
```

```
>>> from sage.all import *
>>> L = posets.BooleanLattice(Integer(3))
>>> L.kazhdan_lusztig_polynomial()
1
```

```
sage: L = posets.SymmetricGroupWeakOrderPoset(4)
sage: L.kazhdan_lusztig_polynomial()
1
sage: x = '2314'
sage: y = '3421'
sage: L.kazhdan_lusztig_polynomial(x, y)
-q + 1
sage: L.kazhdan_lusztig_polynomial(x, y, var('t'))                          #␣
↪needs sage.symbolic
-t + 1
```

```
>>> from sage.all import *
>>> L = posets.SymmetricGroupWeakOrderPoset(Integer(4))
>>> L.kazhdan_lusztig_polynomial()
1
>>> x = '2314'
>>> y = '3421'
>>> L.kazhdan_lusztig_polynomial(x, y)
-q + 1
>>> L.kazhdan_lusztig_polynomial(x, y, var('t'))                          #␣
↪needs sage.symbolic
-t + 1
```

AUTHORS:

- Travis Scrimshaw (27-12-2014)

le(*x*, *y*)

Return `True` if x is less than or equal to y in the poset, and `False` otherwise.

EXAMPLES:

```
sage: P = Poset({0:[2], 1:[2], 2:[3], 3:[4], 4:[]})
sage: P.is_lequal(2, 4)
True
sage: P.is_lequal(2, 2)
True
sage: P.is_lequal(0, 1)
False
sage: P.is_lequal(3, 2)
False
```

```
>>> from sage.all import *
>>> P = Poset({Integer(0):[Integer(2)], Integer(1):[Integer(2)],␣
↪Integer(2):[Integer(3)], Integer(3):[Integer(4)], Integer(4):[]})
>>> P.is_lequal(Integer(2), Integer(4))
True
>>> P.is_lequal(Integer(2), Integer(2))
True
>>> P.is_lequal(Integer(0), Integer(1))
False
>>> P.is_lequal(Integer(3), Integer(2))
False
```

See also

is_less_than(), *is_gequal()*.

lequal_matrix(*ring=Integer Ring*, *sparse=False*)

Compute the matrix whose `(i,j)` entry is 1 if `self.linear_extension()[i] < self.linear_extension()[j]` and 0 otherwise.

INPUT:

- `ring` – the ring of coefficients (default: `ZZ`)
- `sparse` – whether the returned matrix is sparse or not (default: `True`)

EXAMPLES:

```
sage: P = Poset([[1,3,2],[4],[4,5,6],[6],[7],[7],[7],[]], facade=False)
sage: LEQM = P.lequal_matrix(); LEQM
[1 1 1 1 1 1 1 1]
[0 1 0 1 0 0 0 1]
[0 0 1 1 1 0 1 1]
[0 0 0 1 0 0 0 1]
[0 0 0 0 1 0 0 1]
[0 0 0 0 0 1 1 1]
[0 0 0 0 0 0 1 1]
[0 0 0 0 0 0 0 1]
sage: LEQM[1,3]
1
sage: P.linear_extension()[1] < P.linear_extension()[3]
True
sage: LEQM[2,5]
```

(continues on next page)

(continued from previous page)

```
0
sage: P.linear_extension()[2] < P.linear_extension()[5]
False
```

```
>>> from sage.all import *
>>> P = Poset([[Integer(1),Integer(3),Integer(2)],[Integer(4)],[Integer(4),
↪Integer(5),Integer(6)],[Integer(6)],[Integer(7)],[Integer(7)],[Integer(7)],
↪[]], facade=False)
>>> LEQM = P.lequal_matrix(); LEQM
[1 1 1 1 1 1 1 1]
[0 1 0 1 0 0 0 1]
[0 0 1 1 1 0 1 1]
[0 0 0 1 0 0 0 1]
[0 0 0 0 1 0 0 1]
[0 0 0 0 0 1 1 1]
[0 0 0 0 0 0 1 1]
[0 0 0 0 0 0 0 1]
>>> LEQM[Integer(1),Integer(3)]
1
>>> P.linear_extension()[Integer(1)] < P.linear_extension()[Integer(3)]
True
>>> LEQM[Integer(2),Integer(5)]
0
>>> P.linear_extension()[Integer(2)] < P.linear_extension()[Integer(5)]
False
```

We now demonstrate the usage of the optional parameters:

```
sage: P.lequal_matrix(ring=QQ, sparse=False).parent()                          #␣
↪needs sage.libs.flint
Full MatrixSpace of 8 by 8 dense matrices over Rational Field
```

```
>>> from sage.all import *
>>> P.lequal_matrix(ring=QQ, sparse=False).parent()                          #␣
↪needs sage.libs.flint
Full MatrixSpace of 8 by 8 dense matrices over Rational Field
```

level_sets()

Return elements grouped by maximal number of cover relations from a minimal element.

This returns a list of lists `l` such that `l[i]` is the set of minimal elements of the poset obtained by removing the elements in `l[0], l[1], ..., l[i-1]`. (In particular, `l[0]` is the set of minimal elements of `self`.)

Every level is an antichain of the poset.

EXAMPLES:

```
sage: P = Poset({0:[1,2],1:[3],2:[3],3:[]})
sage: P.level_sets()
[[0], [1, 2], [3]]

sage: Q = Poset({0:[1,2], 1:[3], 2:[4], 3:[4]})
```

(continues on next page)

(continued from previous page)

```
sage: Q.level_sets()
[[0], [1, 2], [3], [4]]
```

```
>>> from sage.all import *
>>> P = Poset({Integer(0):[Integer(1),Integer(2)],Integer(1):[Integer(3)],
↪Integer(2):[Integer(3)],Integer(3):[]})
>>> P.level_sets()
[[0], [1, 2], [3]]

>>> Q = Poset({Integer(0):[Integer(1),Integer(2)], Integer(1):[Integer(3)],␣
↪Integer(2):[Integer(4)], Integer(3):[Integer(4)]})
>>> Q.level_sets()
[[0], [1, 2], [3], [4]]
```

See also

`dilworth_decomposition()` to return elements grouped to chains.

lexicographic_sum(P)

Return the lexicographic sum using this poset as index.

In the lexicographic sum of posets P_t by index poset T we have $x \leq y$ if either $x \leq y$ in P_t for some $t \in T$, or $x \in P_i$, $y \in P_j$ and $i \leq j$ in T.

Informally said we substitute every element of T by corresponding poset P_t.

Mathematically, it is only defined when all P_t have no common element; here we force that by giving them different names in the resulting poset.

`disjoint_union()` and `ordinal_sum()` are special cases of lexicographic sum where the index poset is an (anti)chain. `ordinal_product()` is a special case where every P_t is same poset.

INPUT:

- `P` – dictionary whose keys are elements of this poset, values are posets

EXAMPLES:

```
sage: N = Poset({1: [3, 4], 2: [4]})
sage: P = {1: posets.PentagonPoset(), 2: N,
....:      3: posets.ChainPoset(3), 4: posets.AntichainPoset(4)}
sage: NP = N.lexicographic_sum(P); NP
Finite poset containing 16 elements
sage: sorted(NP.minimal_elements())
[(1, 0), (2, 1), (2, 2)]
```

```
>>> from sage.all import *
>>> N = Poset({Integer(1): [Integer(3), Integer(4)], Integer(2): [Integer(4)]}
↪)
>>> P = {Integer(1): posets.PentagonPoset(), Integer(2): N,
...      Integer(3): posets.ChainPoset(Integer(3)), Integer(4): posets.
↪AntichainPoset(Integer(4))}
>>> NP = N.lexicographic_sum(P); NP
```

(continues on next page)

(continued from previous page)

```
Finite poset containing 16 elements
>>> sorted(NP.minimal_elements())
[(1, 0), (2, 1), (2, 2)]
```

linear_extension(*linear_extension=None*, *check=True*)

Return a linear extension of this poset.

A linear extension of a finite poset P of size n is a total ordering $\pi := \pi_0\pi_1\ldots\pi_{n-1}$ of its elements such that $i < j$ whenever $\pi_i < \pi_j$ in the poset P.

INPUT:

- `linear_extension` – (default: `None`) a list of the elements of `self`
- `check` – boolean (default: `True`); whether to check that `linear_extension` is indeed a linear extension of `self`

EXAMPLES:

```
sage: P = Poset((divisors(15), attrcall("divides")), facade=True)
```

```
>>> from sage.all import *
>>> P = Poset((divisors(Integer(15)), attrcall("divides")), facade=True)
```

Without optional argument, the default linear extension of the poset is returned, as a plain list:

```
sage: P.linear_extension()
[1, 3, 5, 15]
```

```
>>> from sage.all import *
>>> P.linear_extension()
[1, 3, 5, 15]
```

Otherwise, a full-featured linear extension is constructed as an element of `P.linear_extensions()`:

```
sage: l = P.linear_extension([1,5,3,15]); l
[1, 5, 3, 15]
sage: type(l)
<class 'sage.combinat.posets.linear_extensions.LinearExtensionsOfPoset_with_
↪category.element_class'>
sage: l.parent()
The set of all linear extensions of Finite poset containing 4 elements
```

```
>>> from sage.all import *
>>> l = P.linear_extension([Integer(1),Integer(5),Integer(3),Integer(15)]); l
[1, 5, 3, 15]
>>> type(l)
<class 'sage.combinat.posets.linear_extensions.LinearExtensionsOfPoset_with_
↪category.element_class'>
>>> l.parent()
The set of all linear extensions of Finite poset containing 4 elements
```

By default, the linear extension is checked for correctness:

```
sage: l = P.linear_extension([1,3,15,5])
Traceback (most recent call last):
...
ValueError: [1, 3, 15, 5] is not a linear extension of Finite poset␣
↪containing 4 elements
```

```
>>> from sage.all import *
>>> l = P.linear_extension([Integer(1),Integer(3),Integer(15),Integer(5)])
Traceback (most recent call last):
...
ValueError: [1, 3, 15, 5] is not a linear extension of Finite poset␣
↪containing 4 elements
```

This can be disabled (at your own risks!) with:

```
sage: P.linear_extension([1,3,15,5], check=False)
[1, 3, 15, 5]
```

```
>>> from sage.all import *
>>> P.linear_extension([Integer(1),Integer(3),Integer(15),Integer(5)],␣
↪check=False)
[1, 3, 15, 5]
```

See also

is_linear_extension(), *linear_extensions()*

Todo

- Is it acceptable to have those two features for a single method?
- In particular, we miss a short idiom to get the default linear extension

linear_extensions(*facade=False*)

Return the enumerated set of all the linear extensions of this poset.

INPUT:

- `facade` – boolean (default: `False`); whether to return the linear extensions as plain lists

Warning

The `facade` option is not yet fully functional:

```
sage: P = Poset((divisors(12), attrcall("divides")), linear_
↪extension=True)
sage: L = P.linear_extensions(facade=True); L
The set of all linear extensions of
 Finite poset containing 6 elements with distinguished linear extension
sage: L([1, 2, 3, 4, 6, 12])
Traceback (most recent call last):
```

```
...
TypeError: Cannot convert list to sage.structure.element.Element
>>> from sage.all import *
>>> P = Poset((divisors(Integer(12)), attrcall("divides")), linear_
↪extension=True)
>>> L = P.linear_extensions(facade=True); L
The set of all linear extensions of
 Finite poset containing 6 elements with distinguished linear extension
>>> L([Integer(1), Integer(2), Integer(3), Integer(4), Integer(6),␣
↪Integer(12)])
Traceback (most recent call last):
...
TypeError: Cannot convert list to sage.structure.element.Element
```

EXAMPLES:

```
sage: P = Poset((divisors(12), attrcall("divides")), linear_extension=True)
sage: P.list()
[1, 2, 3, 4, 6, 12]
sage: L = P.linear_extensions(); L
The set of all linear extensions of
 Finite poset containing 6 elements with distinguished linear extension
sage: l = L.an_element(); l
[1, 2, 3, 4, 6, 12]
sage: L.cardinality()
5
sage: L.list()
[[1, 2, 3, 4, 6, 12],
 [1, 2, 4, 3, 6, 12],
 [1, 3, 2, 4, 6, 12],
 [1, 3, 2, 6, 4, 12],
 [1, 2, 3, 6, 4, 12]]
```

```
>>> from sage.all import *
>>> P = Poset((divisors(Integer(12)), attrcall("divides")), linear_
↪extension=True)
>>> P.list()
[1, 2, 3, 4, 6, 12]
>>> L = P.linear_extensions(); L
The set of all linear extensions of
 Finite poset containing 6 elements with distinguished linear extension
>>> l = L.an_element(); l
[1, 2, 3, 4, 6, 12]
>>> L.cardinality()
5
>>> L.list()
[[1, 2, 3, 4, 6, 12],
 [1, 2, 4, 3, 6, 12],
 [1, 3, 2, 4, 6, 12],
 [1, 3, 2, 6, 4, 12],
 [1, 2, 3, 6, 4, 12]]
```

Each element is aware that it is a linear extension of P:

```
sage: type(l.parent())
<class 'sage.combinat.posets.linear_extensions.LinearExtensionsOfPoset_with_
↪category'>
```

```
>>> from sage.all import *
>>> type(l.parent())
<class 'sage.combinat.posets.linear_extensions.LinearExtensionsOfPoset_with_
↪category'>
```

With `facade=True`, the elements of `L` are plain lists instead:

```
sage: L = P.linear_extensions(facade=True)
sage: l = L.an_element()
sage: type(l)
<class 'list'>
```

```
>>> from sage.all import *
>>> L = P.linear_extensions(facade=True)
>>> l = L.an_element()
>>> type(l)
<class 'list'>
```

Warning

In Sage <= 4.8, this function used to return a plain list of lists. To recover the previous functionality, please use:

```
sage: L = list(P.linear_extensions(facade=True)); L
[[1, 2, 3, 4, 6, 12],
 [1, 2, 4, 3, 6, 12],
 [1, 3, 2, 4, 6, 12],
 [1, 3, 2, 6, 4, 12],
 [1, 2, 3, 6, 4, 12]]
sage: type(L[0])
<class 'list'>
```

```
>>> from sage.all import *
>>> L = list(P.linear_extensions(facade=True)); L
[[1, 2, 3, 4, 6, 12],
 [1, 2, 4, 3, 6, 12],
 [1, 3, 2, 4, 6, 12],
 [1, 3, 2, 6, 4, 12],
 [1, 2, 3, 6, 4, 12]]
>>> type(L[Integer(0)])
<class 'list'>
```

See also

linear_extension(), *is_linear_extension()*

linear_extensions_graph()

Return the linear extensions graph of the poset.

Vertices of the graph are linear extensions of the poset. Two vertices are connected by an edge if the linear extensions differ by only one adjacent transposition.

EXAMPLES:

```
sage: N = Poset({1: [3, 4], 2: [4]})
sage: G = N.linear_extensions_graph(); G
Graph on 5 vertices
sage: G.neighbors(N.linear_extension([1,2,3,4]))
[[2, 1, 3, 4], [1, 3, 2, 4], [1, 2, 4, 3]]

sage: chevron = Poset({1: [2, 6], 2: [3], 4: [3, 5], 6: [5]})
sage: G = chevron.linear_extensions_graph(); G
Graph on 22 vertices
sage: G.size()
36
```

```
>>> from sage.all import *
>>> N = Poset({Integer(1): [Integer(3), Integer(4)], Integer(2): [Integer(4)]}
↪)
>>> G = N.linear_extensions_graph(); G
Graph on 5 vertices
>>> G.neighbors(N.linear_extension([Integer(1),Integer(2),Integer(3),
↪Integer(4)]))
[[2, 1, 3, 4], [1, 3, 2, 4], [1, 2, 4, 3]]

>>> chevron = Poset({Integer(1): [Integer(2), Integer(6)], Integer(2):␣
↪[Integer(3)], Integer(4): [Integer(3), Integer(5)], Integer(6):␣
↪[Integer(5)]})
>>> G = chevron.linear_extensions_graph(); G
Graph on 22 vertices
>>> G.size()
36
```

linear_intervals_count()

Return the enumeration of linear intervals w.r.t. their cardinality.

An interval is linear if it is a total order.

OUTPUT: list of integers

See also

is_linear_interval()

EXAMPLES:

```
sage: P = posets.PentagonPoset()
sage: P.linear_intervals_count()
[5, 5, 2]
sage: P = posets.TamariLattice(4)
```

(continues on next page)

(continued from previous page)

```
sage: P.linear_intervals_count()
[14, 21, 12, 2]
```

```
>>> from sage.all import *
>>> P = posets.PentagonPoset()
>>> P.linear_intervals_count()
[5, 5, 2]
>>> P = posets.TamariLattice(Integer(4))
>>> P.linear_intervals_count()
[14, 21, 12, 2]
```

list()

List the elements of the poset. This just returns the result of *linear_extension()*.

EXAMPLES:

```
sage: D = Poset({ 0:[1,2], 1:[3], 2:[3,4] }, facade = False)
sage: D.list()
[0, 1, 2, 3, 4]
sage: type(D.list()[0])
<class 'sage.combinat.posets.posets.FinitePoset_with_category.element_class'>
```

```
>>> from sage.all import *
>>> D = Poset({ Integer(0):[Integer(1),Integer(2)], Integer(1):[Integer(3)],␣
↪Integer(2):[Integer(3),Integer(4)] }, facade = False)
>>> D.list()
[0, 1, 2, 3, 4]
>>> type(D.list()[Integer(0)])
<class 'sage.combinat.posets.posets.FinitePoset_with_category.element_class'>
```

lower_covers(x)

Return the list of lower covers of the element x.

A lower cover of x is an element y such that $y < x$ and there is no element z so that $y < z < x$.

EXAMPLES:

```
sage: P = Poset([[1,5], [2,6], [3], [4], [], [6,3], [4]])
sage: P.lower_covers(3)
[2, 5]
sage: P.lower_covers(0)
[]
```

```
>>> from sage.all import *
>>> P = Poset([[Integer(1),Integer(5)], [Integer(2),Integer(6)], [Integer(3)],
↪ [Integer(4)], [], [Integer(6),Integer(3)], [Integer(4)]])
>>> P.lower_covers(Integer(3))
[2, 5]
>>> P.lower_covers(Integer(0))
[]
```

See also

upper_covers()

lower_covers_iterator(*x*)

Return an iterator over the lower covers of the element `x`.

EXAMPLES:

```
sage: P = Poset({0:[2], 1:[2], 2:[3], 3:[]})
sage: l0 = P.lower_covers_iterator(3)
sage: type(l0)
<class 'generator'>
sage: next(l0)
2
```

```
>>> from sage.all import *
>>> P = Poset({Integer(0):[Integer(2)], Integer(1):[Integer(2)],␣
↪Integer(2):[Integer(3)], Integer(3):[]})
>>> l0 = P.lower_covers_iterator(Integer(3))
>>> type(l0)
<class 'generator'>
>>> next(l0)
2
```

lt(*x*, *y*)

Return `True` if x is less than but not equal to y in the poset, and `False` otherwise.

EXAMPLES:

```
sage: P = Poset({0:[2], 1:[2], 2:[3], 3:[4], 4:[]})
sage: P.is_less_than(1, 3)
True
sage: P.is_less_than(0, 1)
False
sage: P.is_less_than(2, 2)
False
```

```
>>> from sage.all import *
>>> P = Poset({Integer(0):[Integer(2)], Integer(1):[Integer(2)],␣
↪Integer(2):[Integer(3)], Integer(3):[Integer(4)], Integer(4):[]})
>>> P.is_less_than(Integer(1), Integer(3))
True
>>> P.is_less_than(Integer(0), Integer(1))
False
>>> P.is_less_than(Integer(2), Integer(2))
False
```

For non-facade posets also < works:

```
sage: P = Poset({3: [1, 2]}, facade=False)
sage: P(1) < P(2)
False
```

```
>>> from sage.all import *
>>> P = Poset({Integer(3): [Integer(1), Integer(2)]}, facade=False)
>>> P(Integer(1)) < P(Integer(2))
False
```

See also:

is_lequal(), *is_greater_than()*.

magnitude()

Return the magnitude of `self`.

The magnitude is an integer defined as the sum of all Möbius numbers, and can be seen as some kind of Euler characteristic of the poset. It is additive under disjoint union and multiplicative under Cartesian product.

REFERENCES:

- [Lein2008] Tom Leinster, *The Euler Characteristic of a Category*, Documenta Mathematica, Vol. 13 (2008), 21-49 https://www.math.uni-bielefeld.de/documenta/vol-13/02.html
- https://golem.ph.utexas.edu/category/2011/06/the_magnitude_of_an_enriched_c.html

EXAMPLES:

```
sage: # needs sage.groups sage.libs.flint
sage: P = posets.PentagonPoset()
sage: P.magnitude()
1
sage: W = SymmetricGroup(4)
sage: P = W.noncrossing_partition_lattice().without_bounds()
sage: P.magnitude()
-4
sage: P = posets.TamariLattice(4).without_bounds()
sage: P.magnitude()
0
```

```
>>> from sage.all import *
>>> # needs sage.groups sage.libs.flint
>>> P = posets.PentagonPoset()
>>> P.magnitude()
1
>>> W = SymmetricGroup(Integer(4))
>>> P = W.noncrossing_partition_lattice().without_bounds()
>>> P.magnitude()
-4
>>> P = posets.TamariLattice(Integer(4)).without_bounds()
>>> P.magnitude()
0
```

See also:

order_complex()

maximal_antichains()

Return the maximal antichains of the poset.

An antichain a of poset P is *maximal* if there is no element $e \in P \setminus a$ such that $a \cup \{e\}$ is an antichain.

EXAMPLES:

```
sage: P = Poset({'a':['b', 'c'], 'b':['d','e']})
sage: [sorted(anti) for anti in P.maximal_antichains()]
[['a'], ['b', 'c'], ['c', 'd', 'e']]

sage: posets.PentagonPoset().maximal_antichains()
[[0], [1, 2], [1, 3], [4]]
```

```
>>> from sage.all import *
>>> P = Poset({'a':['b', 'c'], 'b':['d','e']})
>>> [sorted(anti) for anti in P.maximal_antichains()]
[['a'], ['b', 'c'], ['c', 'd', 'e']]

>>> posets.PentagonPoset().maximal_antichains()
[[0], [1, 2], [1, 3], [4]]
```

See also

antichains(), *maximal_chains()*

maximal_chain_length()

Return the maximum length of a maximal chain in the poset.

The length here is the number of vertices.

EXAMPLES:

```
sage: P = posets.TamariLattice(5)
sage: P.maximal_chain_length()
11
```

```
>>> from sage.all import *
>>> P = posets.TamariLattice(Integer(5))
>>> P.maximal_chain_length()
11
```

See also

maximal_chains(), *maximal_chains_iterator()*

maximal_chains(*partial=None*)

Return all maximal chains of this poset.

Each chain is listed in increasing order.

INPUT:

- `partial` – list (optional); if given, the list `partial` is assumed to be the start of a maximal chain, and the function will find all maximal chains starting with the elements in `partial`

This is used in constructing the order complex for the poset.

EXAMPLES:

```
sage: P = posets.BooleanLattice(3)
sage: P.maximal_chains()
[[0, 1, 3, 7], [0, 1, 5, 7], [0, 2, 3, 7],
 [0, 2, 6, 7], [0, 4, 5, 7], [0, 4, 6, 7]]
sage: P.maximal_chains(partial=[0,2])
[[0, 2, 3, 7], [0, 2, 6, 7]]
sage: Q = posets.ChainPoset(6)
sage: Q.maximal_chains()
[[0, 1, 2, 3, 4, 5]]
```

```
>>> from sage.all import *
>>> P = posets.BooleanLattice(Integer(3))
>>> P.maximal_chains()
[[0, 1, 3, 7], [0, 1, 5, 7], [0, 2, 3, 7],
 [0, 2, 6, 7], [0, 4, 5, 7], [0, 4, 6, 7]]
>>> P.maximal_chains(partial=[Integer(0),Integer(2)])
[[0, 2, 3, 7], [0, 2, 6, 7]]
>>> Q = posets.ChainPoset(Integer(6))
>>> Q.maximal_chains()
[[0, 1, 2, 3, 4, 5]]
```

See also

maximal_antichains(), *chains()*

maximal_chains_iterator(*partial=None*)

Return an iterator over maximal chains.

Each chain is listed in increasing order.

INPUT:

- `partial` – list (optional); if given, the list `partial` is assumed to be the start of a maximal chain, and the function will yield all maximal chains starting with the elements in `partial`

EXAMPLES:

```
sage: P = posets.BooleanLattice(3)
sage: it = P.maximal_chains_iterator()
sage: next(it)
[0, 1, 3, 7]
```

```
>>> from sage.all import *
>>> P = posets.BooleanLattice(Integer(3))
>>> it = P.maximal_chains_iterator()
>>> next(it)
[0, 1, 3, 7]
```

See also

antichains_iterator()

maximal_elements()

Return the list of the maximal elements of the poset.

EXAMPLES:

```
sage: P = Poset({0:[3],1:[3],2:[3],3:[4],4:[]})
sage: P.maximal_elements()
[4]
```

```
>>> from sage.all import *
>>> P = Poset({Integer(0):[Integer(3)],Integer(1):[Integer(3)],
↪Integer(2):[Integer(3)],Integer(3):[Integer(4)],Integer(4):[]})
>>> P.maximal_elements()
[4]
```

See also

minimal_elements().

meet(*x*, *y*)

Return the meet of two elements `x, y` in the poset if the meet exists; and `None` otherwise.

EXAMPLES:

```
sage: D = Poset({1:[2,3], 2:[4], 3:[4]})
sage: D.meet(2, 3)
1
sage: P = Poset({'a':['b', 'c'], 'b':['e', 'f'], 'c':['f', 'g'],
....:             'd':['f', 'g']})
sage: P.meet('a', 'b')
'a'
sage: P.meet('e', 'a')
'a'
sage: P.meet('c', 'b')
'a'
sage: P.meet('e', 'f')
'b'
sage: P.meet('e', 'g')
'a'
sage: P.meet('c', 'd') is None
True
sage: P.meet('g', 'f') is None
True
```

```
>>> from sage.all import *
>>> D = Poset({Integer(1):[Integer(2),Integer(3)], Integer(2):[Integer(4)],␣
↪Integer(3):[Integer(4)]})
```

(continues on next page)

(continued from previous page)

```
>>> D.meet(Integer(2), Integer(3))
1
>>> P = Poset({'a':['b', 'c'], 'b':['e', 'f'], 'c':['f', 'g'],
...             'd':['f', 'g']})
>>> P.meet('a', 'b')
'a'
>>> P.meet('e', 'a')
'a'
>>> P.meet('c', 'b')
'a'
>>> P.meet('e', 'f')
'b'
>>> P.meet('e', 'g')
'a'
>>> P.meet('c', 'd') is None
True
>>> P.meet('g', 'f') is None
True
```

minimal_elements()

Return the list of the minimal elements of the poset.

EXAMPLES:

```
sage: P = Poset({0:[3],1:[3],2:[3],3:[4],4:[]})
sage: P(0) in P.minimal_elements()
True
sage: P(1) in P.minimal_elements()
True
sage: P(2) in P.minimal_elements()
True
```

```
>>> from sage.all import *
>>> P = Poset({Integer(0):[Integer(3)],Integer(1):[Integer(3)],
↪Integer(2):[Integer(3)],Integer(3):[Integer(4)],Integer(4):[]})
>>> P(Integer(0)) in P.minimal_elements()
True
>>> P(Integer(1)) in P.minimal_elements()
True
>>> P(Integer(2)) in P.minimal_elements()
True
```

See also

maximal_elements().

moebius_function(x, y)

Return the value of the Möbius function of the poset on the elements x and y.

EXAMPLES:

```
sage: P = Poset([[1,2,3],[4],[4],[4],[]])
sage: P.moebius_function(P(0),P(4))
2
sage: sum(P.moebius_function(P(0),v) for v in P)
0
sage: sum(abs(P.moebius_function(P(0),v))
....:     for v in P)
6
sage: for u,v in P.cover_relations_iterator():
....:     if P.moebius_function(u,v) != -1:
....:         print("Bug in moebius_function!")
```

```
>>> from sage.all import *
>>> P = Poset([[Integer(1),Integer(2),Integer(3)],[Integer(4)],[Integer(4)],
↪[Integer(4)],[]])
>>> P.moebius_function(P(Integer(0)),P(Integer(4)))
2
>>> sum(P.moebius_function(P(Integer(0)),v) for v in P)
0
>>> sum(abs(P.moebius_function(P(Integer(0)),v))
...     for v in P)
6
>>> for u,v in P.cover_relations_iterator():
...     if P.moebius_function(u,v) != -Integer(1):
...         print("Bug in moebius_function!")
```

```
sage: Q = Poset([[1,3,2],[4],[4,5,6],[6],[7],[7],[7],[]])
sage: Q.moebius_function(Q(0),Q(7))
0
sage: Q.moebius_function(Q(0),Q(5))
0
sage: Q.moebius_function(Q(2),Q(7))
2
sage: Q.moebius_function(Q(3),Q(3))
1
sage: sum([Q.moebius_function(Q(0),v) for v in Q])
0
```

```
>>> from sage.all import *
>>> Q = Poset([[Integer(1),Integer(3),Integer(2)],[Integer(4)],[Integer(4),
↪Integer(5),Integer(6)],[Integer(6)],[Integer(7)],[Integer(7)],[Integer(7)],
↪[]])
>>> Q.moebius_function(Q(Integer(0)),Q(Integer(7)))
0
>>> Q.moebius_function(Q(Integer(0)),Q(Integer(5)))
0
>>> Q.moebius_function(Q(Integer(2)),Q(Integer(7)))
2
>>> Q.moebius_function(Q(Integer(3)),Q(Integer(3)))
1
>>> sum([Q.moebius_function(Q(Integer(0)),v) for v in Q])
0
```

moebius_function_matrix(*ring=Integer Ring*, *sparse=False*)

Return a matrix whose `(i,j)` entry is the value of the Möbius function evaluated at `self.linear_extension()[i]` and `self.linear_extension()[j]`.

INPUT:

- `ring` – the ring of coefficients (default: `ZZ`)
- `sparse` – whether the returned matrix is sparse or not (default: `True`)

EXAMPLES:

```
sage: P = Poset([[4,2,3],[],[1],[1],[1]])
sage: x,y = (P.linear_extension()[0],P.linear_extension()[1])
sage: P.moebius_function(x,y)
-1
sage: M = P.moebius_function_matrix(); M                                    #␣
↪needs sage.libs.flint
[ 1 -1 -1 -1  2]
[ 0  1  0  0 -1]
[ 0  0  1  0 -1]
[ 0  0  0  1 -1]
[ 0  0  0  0  1]
sage: M[0,4]                                                                #␣
↪needs sage.libs.flint
2
sage: M[0,1]                                                                #␣
↪needs sage.libs.flint
-1
```

```
>>> from sage.all import *
>>> P = Poset([[Integer(4),Integer(2),Integer(3)],[],[Integer(1)],
↪[Integer(1)],[Integer(1)]])
>>> x,y = (P.linear_extension()[Integer(0)],P.linear_extension()[Integer(1)])
>>> P.moebius_function(x,y)
-1
>>> M = P.moebius_function_matrix(); M                                    #␣
↪needs sage.libs.flint
[ 1 -1 -1 -1  2]
[ 0  1  0  0 -1]
[ 0  0  1  0 -1]
[ 0  0  0  1 -1]
[ 0  0  0  0  1]
>>> M[Integer(0),Integer(4)]                                                ␣
↪                # needs sage.libs.flint
2
>>> M[Integer(0),Integer(1)]                                                ␣
↪                # needs sage.libs.flint
-1
```

We now demonstrate the usage of the optional parameters:

```
sage: P.moebius_function_matrix(ring=QQ, sparse=False).parent()            #␣
↪needs sage.libs.flint
Full MatrixSpace of 5 by 5 dense matrices over Rational Field
```

```
>>> from sage.all import *
>>> P.moebius_function_matrix(ring=QQ, sparse=False).parent()            #␣
↪needs sage.libs.flint
Full MatrixSpace of 5 by 5 dense matrices over Rational Field
```

open_interval(*x*, *y*)

Return the list of elements z such that $x < z < y$ in the poset.

EXAMPLES:

```
sage: P = Poset((divisors(1000), attrcall("divides")))
sage: P.open_interval(2, 100)
[4, 10, 20, 50]
```

```
>>> from sage.all import *
>>> P = Poset((divisors(Integer(1000)), attrcall("divides")))
>>> P.open_interval(Integer(2), Integer(100))
[4, 10, 20, 50]
```

See also

closed_interval()

order_complex(*on_ints=False*)

Return the order complex associated to this poset.

The order complex is the simplicial complex with vertices equal to the elements of the poset, and faces given by the chains.

INPUT:

- `on_ints` – boolean (default: `False`)

OUTPUT: an order complex of type `SimplicialComplex`

EXAMPLES:

```
sage: P = posets.BooleanLattice(3)
sage: S = P.order_complex(); S
Simplicial complex with vertex set (0, 1, 2, 3, 4, 5, 6, 7) and 6 facets
sage: S.f_vector()
[1, 8, 19, 18, 6]
sage: S.homology()       # S is contractible
{0: 0, 1: 0, 2: 0, 3: 0}
sage: Q = P.subposet([1,2,3,4,5,6])
sage: Q.order_complex().homology()     # a circle
{0: 0, 1: Z}

sage: P = Poset((divisors(15), attrcall("divides")), facade=True)
sage: P.order_complex()
Simplicial complex with vertex set (1, 3, 5, 15) and
 facets {(1, 3, 15), (1, 5, 15)}
```

```
>>> from sage.all import *
>>> P = posets.BooleanLattice(Integer(3))
>>> S = P.order_complex(); S
Simplicial complex with vertex set (0, 1, 2, 3, 4, 5, 6, 7) and 6 facets
>>> S.f_vector()
[1, 8, 19, 18, 6]
>>> S.homology()      # S is contractible
{0: 0, 1: 0, 2: 0, 3: 0}
>>> Q = P.subposet([Integer(1),Integer(2),Integer(3),Integer(4),Integer(5),
↪Integer(6)])
>>> Q.order_complex().homology()     # a circle
{0: 0, 1: Z}

>>> P = Poset((divisors(Integer(15)), attrcall("divides")), facade=True)
>>> P.order_complex()
Simplicial complex with vertex set (1, 3, 5, 15) and
 facets {(1, 3, 15), (1, 5, 15)}
```

If `on_ints`, then the elements of the poset are labelled $0, 1, \dots$ in the chain complex:

```
sage: P.order_complex(on_ints=True)
Simplicial complex with vertex set (0, 1, 2, 3) and
 facets {(0, 1, 3), (0, 2, 3)}
```

```
>>> from sage.all import *
>>> P.order_complex(on_ints=True)
Simplicial complex with vertex set (0, 1, 2, 3) and
 facets {(0, 1, 3), (0, 2, 3)}
```

order_filter(*elements*)

Return the order filter generated by the elements of an iterable `elements`.

I is an order filter if, for any x in I and y such that $y \geq x$, then y is in I. This is also called upper set or upset.

EXAMPLES:

```
sage: P = Poset((divisors(1000), attrcall("divides")))
sage: P.order_filter([20, 25])
[20, 40, 25, 50, 100, 200, 125, 250, 500, 1000]
```

```
>>> from sage.all import *
>>> P = Poset((divisors(Integer(1000)), attrcall("divides")))
>>> P.order_filter([Integer(20), Integer(25)])
[20, 40, 25, 50, 100, 200, 125, 250, 500, 1000]
```

See also

order_ideal(), `principal_order_filter()`.

order_ideal(*elements*)

Return the order ideal generated by the elements of an iterable `elements`.

I is an order ideal if, for any x in I and y such that $y \leq x$, then y is in I. This is also called lower set or downset.

EXAMPLES:

```
sage: P = Poset((divisors(1000), attrcall("divides")))
sage: P.order_ideal([20, 25])
[1, 2, 4, 5, 10, 20, 25]
```

```
>>> from sage.all import *
>>> P = Poset((divisors(Integer(1000)), attrcall("divides")))
>>> P.order_ideal([Integer(20), Integer(25)])
[1, 2, 4, 5, 10, 20, 25]
```

See also

order_filter(), principal_order_ideal().

order_ideal_cardinality(*elements*)

Return the cardinality of the order ideal generated by `elements`.

The elements I is an order ideal if, for any $x \in I$ and y such that $y \leq x$, then $y \in I$.

EXAMPLES:

```
sage: P = posets.BooleanLattice(4)
sage: P.order_ideal_cardinality([7,10])
10
```

```
>>> from sage.all import *
>>> P = posets.BooleanLattice(Integer(4))
>>> P.order_ideal_cardinality([Integer(7),Integer(10)])
10
```

order_ideal_plot(*elements*)

Return a plot of the order ideal generated by the elements of an iterable `elements`.

I is an order ideal if, for any x in I and y such that $y \leq x$, then y is in I. This is also called lower set or downset.

EXAMPLES:

```
sage: # needs sage.plot
sage: P = Poset((divisors(1000), attrcall("divides")))
sage: P.order_ideal_plot([20, 25])
Graphics object consisting of 41 graphics primitives
```

```
>>> from sage.all import *
>>> # needs sage.plot
>>> P = Poset((divisors(Integer(1000)), attrcall("divides")))
>>> P.order_ideal_plot([Integer(20), Integer(25)])
Graphics object consisting of 41 graphics primitives
```

order_polynomial()

Return the order polynomial of the poset.

The order polynomial $\Omega_P(q)$ of a poset P is defined as the unique polynomial S such that for each integer $m \geq 1$, $S(m)$ is the number of order-preserving maps from P to $\{1, \ldots, m\}$.

See sections 3.12 and 3.15 of [EnumComb1], and also [St1986].

EXAMPLES:

```
sage: P = posets.AntichainPoset(3)
sage: P.order_polynomial()
q^3

sage: P = posets.ChainPoset(3)
sage: f = P.order_polynomial(); f
1/6*q^3 + 1/2*q^2 + 1/3*q
sage: [f(i) for i in range(4)]
[0, 1, 4, 10]
```

```
>>> from sage.all import *
>>> P = posets.AntichainPoset(Integer(3))
>>> P.order_polynomial()
q^3

>>> P = posets.ChainPoset(Integer(3))
>>> f = P.order_polynomial(); f
1/6*q^3 + 1/2*q^2 + 1/3*q
>>> [f(i) for i in range(Integer(4))]
[0, 1, 4, 10]
```

See also:

order_polytope()

order_polytope()

Return the order polytope of the poset `self`.

The order polytope of a finite poset P is defined as the subset of $\mathbf{R}^P$ consisting of all maps $x : P \to \mathbf{R}$ satisfying

$$0 \leq x(p) \leq 1 \text{ for all } p \in P,$$

and

$$x(p) \leq x(q) \text{ for all } p, q \in P \text{ satisfying } p < q.$$

This polytope was defined and studied in [St1986].

EXAMPLES:

```
sage: P = posets.AntichainPoset(3)
sage: Q = P.order_polytope(); Q                                          #␣
↪needs sage.geometry.polyhedron
```

(continues on next page)

(continued from previous page)

>>> Q.contains((Integer(0),Integer(1),Integer(1)))                   ␣
↪                         # needs sage.geometry.polyhedron
True
```

ordinal_product(*other*, *labels='pairs'*)

Return the ordinal product of `self` and `other`.

The ordinal product of two posets P and Q is a partial order on the Cartesian product of the underlying sets of P and Q, defined as follows (see [EnumComb1], p. 284).

In the ordinal product, $(p, q) \leq (p', q')$ if either $p \leq p'$ or $p = p'$ and $q \leq q'$.

This construction is not symmetric in P and Q. Informally said we put a copy of Q in place of every element of P.

INPUT:

- `other` – a poset
- `labels` – either `'integers'` or `'pairs'` (default); how the resulting poset will be labeled

EXAMPLES:

```
sage: P1 = Poset((['a', 'b'], [['a', 'b']]))
sage: P2 = Poset((['c', 'd'], [['c', 'd']]))
sage: P = P1.ordinal_product(P2); P
Finite poset containing 4 elements
sage: sorted(P.cover_relations())
[[('a', 'c'), ('a', 'd')], [('a', 'd'), ('b', 'c')],
[('b', 'c'), ('b', 'd')]]
```

```
>>> from sage.all import *
>>> P1 = Poset((['a', 'b'], [['a', 'b']]))
>>> P2 = Poset((['c', 'd'], [['c', 'd']]))
>>> P = P1.ordinal_product(P2); P
Finite poset containing 4 elements
>>> sorted(P.cover_relations())
[[('a', 'c'), ('a', 'd')], [('a', 'd'), ('b', 'c')],
[('b', 'c'), ('b', 'd')]]
```

See also

product(), *ordinal_sum()*

ordinal_sum(*other*, *labels='pairs'*)

Return a poset or (semi)lattice isomorphic to ordinal sum of the poset with `other`.

The ordinal sum of P and Q is a poset that contains every element and relation from both P and Q, and where every element of P is smaller than any element of Q.

Mathematically, it is only defined when P and Q have no common element; here we force that by giving them different names in the resulting poset.

The ordinal sum on lattices is a lattice; resp. for meet- and join-semilattices.

INPUT:

- `other` – poset
- `labels` – (defaults to 'pairs') If set to 'pairs', each element `v` in this poset will be named `(0,v)` and each element `u` in `other` will be named `(1,u)` in the result. If set to 'integers', the elements of the result will be relabeled with consecutive integers.

EXAMPLES:

```
sage: P1 = Poset( ([1, 2, 3, 4], [[1, 2], [1, 3], [1, 4]]) )
sage: P2 = Poset( ([1, 2, 3,], [[2,1], [3,1]]) )
sage: P3 = P1.ordinal_sum(P2); P3
Finite poset containing 7 elements
sage: len(P1.maximal_elements())*len(P2.minimal_elements())
6
sage: len(P1.cover_relations()+P2.cover_relations())
5
sage: len(P3.cover_relations()) # Every element of P2 is greater than␣
↪elements of P1.
11
sage: P3.list()  # random
```

(continues on next page)

(continued from previous page)

```
[(0, 1), (0, 2), (0, 4), (0, 3), (1, 2), (1, 3), (1, 1)]
sage: P4 = P1.ordinal_sum(P2, labels='integers')
sage: P4.list()  # random
[0, 1, 2, 3, 5, 6, 4]
```

```
>>> from sage.all import *
>>> P1 = Poset( ([Integer(1), Integer(2), Integer(3), Integer(4)],␣
↪[[Integer(1), Integer(2)], [Integer(1), Integer(3)], [Integer(1),␣
↪Integer(4)]]) )
>>> P2 = Poset( ([Integer(1), Integer(2), Integer(3),], [[Integer(2),
↪Integer(1)], [Integer(3),Integer(1)]]) )
>>> P3 = P1.ordinal_sum(P2); P3
Finite poset containing 7 elements
>>> len(P1.maximal_elements())*len(P2.minimal_elements())
6
>>> len(P1.cover_relations()+P2.cover_relations())
5
>>> len(P3.cover_relations()) # Every element of P2 is greater than elements␣
↪of P1.
11
>>> P3.list()  # random
[(0, 1), (0, 2), (0, 4), (0, 3), (1, 2), (1, 3), (1, 1)]
>>> P4 = P1.ordinal_sum(P2, labels='integers')
>>> P4.list()  # random
[0, 1, 2, 3, 5, 6, 4]
```

Return type depends on input types:

```
sage: P = Poset({1:[2]}); P
Finite poset containing 2 elements
sage: JL = JoinSemilattice({1:[2]}); JL
Finite join-semilattice containing 2 elements
sage: L = LatticePoset({1:[2]}); L
Finite lattice containing 2 elements
sage: P.ordinal_sum(L)
Finite poset containing 4 elements
sage: L.ordinal_sum(JL)
Finite join-semilattice containing 4 elements
sage: L.ordinal_sum(L)
Finite lattice containing 4 elements
```

```
>>> from sage.all import *
>>> P = Poset({Integer(1):[Integer(2)]}); P
Finite poset containing 2 elements
>>> JL = JoinSemilattice({Integer(1):[Integer(2)]}); JL
Finite join-semilattice containing 2 elements
>>> L = LatticePoset({Integer(1):[Integer(2)]}); L
Finite lattice containing 2 elements
>>> P.ordinal_sum(L)
Finite poset containing 4 elements
>>> L.ordinal_sum(JL)
Finite join-semilattice containing 4 elements
```

(continues on next page)

(continued from previous page)

```
>>> L.ordinal_sum(L)
Finite lattice containing 4 elements
```

See also:

ordinal_summands(), *disjoint_union()*, *sage.combinat.posets.lattices.FiniteLatticePoset.vertical_composition()*

ordinal_summands()

Return the ordinal summands of the poset as subposets.

The ordinal summands of a poset P is the longest list of non-empty subposets $P_1, \ldots, P_n$ whose ordinal sum is P. This decomposition is unique.

EXAMPLES:

```
sage: P = Poset({'a': ['c', 'd'], 'b': ['d'], 'c': ['x', 'y'],
....: 'd': ['x', 'y']})
sage: parts = P.ordinal_summands(); parts
[Finite poset containing 4 elements, Finite poset containing 2 elements]
sage: sorted(parts[0])
['a', 'b', 'c', 'd']
sage: Q = parts[0].ordinal_sum(parts[1])
sage: Q.is_isomorphic(P)
True
```

```
>>> from sage.all import *
>>> P = Poset({'a': ['c', 'd'], 'b': ['d'], 'c': ['x', 'y'],
... 'd': ['x', 'y']})
>>> parts = P.ordinal_summands(); parts
[Finite poset containing 4 elements, Finite poset containing 2 elements]
>>> sorted(parts[Integer(0)])
['a', 'b', 'c', 'd']
>>> Q = parts[Integer(0)].ordinal_sum(parts[Integer(1)])
>>> Q.is_isomorphic(P)
True
```

See also:

ordinal_sum()

ALGORITHM:

Suppose that a poset P is the ordinal sum of posets L and U. Then P contains maximal antichains l and u such that every element of u covers every element of l; they correspond to maximal elements of L and minimal elements of U.

We consider a linear extension $x_1, \ldots, x_n$ of the poset's elements.

We keep track of the maximal elements of subposet induced by elements $0, \ldots, x_i$ and minimal elements of subposet induced by elements $x_{i+1}, \ldots, x_n$, incrementing i one by one. We then check if l and u fit the previous description.

p_partition_enumerator(*tup*, *R*, *weights=None*, *check=False*)

Return a P-partition enumerator of `self`.

Given a total order $\prec$ on the elements of a finite poset P (the order of P and the total order $\prec$ can be unrelated; in particular, the latter does not have to extend the former), a P-partition enumerator is the quasisymmetric function $\sum_f \prod_{p \in P} x_{f(p)}$, where the first sum is taken over all P-partitions f.

A P-partition is a function $f : P \to \{1, 2, 3, ...\}$ satisfying the following properties for any two elements i and j of P satisfying $i <_P j$:

- if $i \prec j$ then $f(i) \leq f(j)$,
- if $j \prec i$ then $f(i) < f(j)$.

The optional argument `weights` allows constructing a generalized ("weighted") version of the P-partition enumerator. Namely, `weights` should be a dictionary whose keys are the elements of `P`. Then, the generalized P-partition enumerator corresponding to weights `weights` is $\sum_f \prod_{p \in P} x_{f(p)}^{w(p)}$, where the sum is again over all P-partitions f. Here, $w(p)$ is `weights[p]`. The classical P-partition enumerator is the particular case obtained when all p satisfy $w(p) = 1$.

In the language of [Grinb2016a], the generalized P-partition enumerator is the quasisymmetric function $\Gamma(\mathbf{E}, w)$, where $\mathbf{E}$ is the special double poset $(P, <_P, \prec)$, and where w is the dictionary `weights` (regarded as a function from P to the positive integers).

INPUT:

- `tup` – the tuple containing all elements of P (each of them exactly once), in the order dictated by the total order $\prec$
- `R` – a commutative ring
- `weights` – (optional) a dictionary of positive integers, indexed by elements of P; any missing item will be understood as 1

OUTPUT:

The P-partition enumerator of `self` according to `tup` in the algebra $QSym$ of quasisymmetric functions over the base ring R.

EXAMPLES:

```
sage: # needs sage.combinat
sage: P = Poset([[1,2,3,4],[[1,4],[2,4],[4,3]]])
sage: FP = P.p_partition_enumerator((3,1,2,4), QQ, check=True); FP
2*M[1, 1, 1, 1] + 2*M[1, 2, 1] + M[2, 1, 1] + M[3, 1]
sage: expansion = FP.expand(5)
sage: xs = expansion.parent().gens()
sage: expansion == sum(xs[a]*xs[b]*xs[c]*xs[d]
....:                  for a in range(5) for b in range(5)
....:                  for c in range(5) for d in range(5)
....:                  if a <= b and c <= b and b < d)
True

sage: P = Poset([[],[]])
sage: FP = P.p_partition_enumerator((), QQ, check=True); FP                     #␣
↪needs sage.combinat
M[]
```

```
>>> from sage.all import *
>>> # needs sage.combinat
>>> P = Poset([[Integer(1),Integer(2),Integer(3),Integer(4)],[[Integer(1),
↪Integer(4)],[Integer(2),Integer(4)],[Integer(4),Integer(3)]]])
>>> FP = P.p_partition_enumerator((Integer(3),Integer(1),Integer(2),
↪Integer(4)), QQ, check=True); FP
2*M[1, 1, 1, 1] + 2*M[1, 2, 1] + M[2, 1, 1] + M[3, 1]
>>> expansion = FP.expand(Integer(5))
>>> xs = expansion.parent().gens()
>>> expansion == sum(xs[a]*xs[b]*xs[c]*xs[d]
...                      for a in range(Integer(5)) for b in range(Integer(5))
...                      for c in range(Integer(5)) for d in range(Integer(5))
...                      if a <= b and c <= b and b < d)
True

>>> P = Poset([[],[]])
>>> FP = P.p_partition_enumerator((), QQ, check=True); FP                    #␣
↪needs sage.combinat

...           weights={'a': Integer(3), 'b': Integer(5), 'c': Integer(7)},␣
↪check=True); FP
M[3, 5, 7] + M[3, 12] + M[5, 3, 7] + M[5, 10] + M[8, 7] + M[15]
```

plot(*label_elements=True*, *element_labels=None*, *layout='acyclic'*, *cover_labels=None*, ***kwds*)

Return a Graphic object for the Hasse diagram of the poset.

If the poset is ranked, the plot uses the rank function for the heights of the elements.

INPUT:

- Options to change element look:
  - `element_colors` – dictionary where keys are colors and values are lists of elements
  - `element_color` – a color for elements not set in `element_colors`
  - `element_shape` – the shape of elements, like `'s'` for square; see https://matplotlib.org/api/markers_api.html for the list
  - `element_size` – (default: 200) the size of elements
  - `label_elements` – boolean (default: `True`); whether to display element labels
  - `element_labels` (default: `None`); a dictionary where keys are elements and values are labels to show
- Options to change cover relation look:
  - `cover_colors` – dictionary where keys are colors and values are lists of cover relations given as pairs of elements
  - `cover_color` – a color for elements not set in `cover_colors`
  - `cover_style` – style for cover relations: `'solid'`, `'dashed'`, `'dotted'` or `'dashdot'`

   - `cover_labels` – dictionary, list or function representing labels of the covers of the poset. When set to `None` (default) no label is displayed on the edges of the Hasse Diagram.
   - `cover_labels_background` – a background color for cover relations. The default is "white". To achieve a transparent background use "transparent".
- Options to change overall look:
   - `figsize` – (default: 8) size of the whole plot
   - `title` – a title for the plot
   - `fontsize` – fontsize for the title
   - `border` – (default: `False`) whether to draw a border over the plot

Note

All options of `GenericGraph.plot` are also available through this function.

EXAMPLES:

This function can be used without any parameters:

```
sage: # needs sage.plot
sage: D12 = posets.DivisorLattice(12)
sage: D12.plot()
Graphics object consisting of 14 graphics primitives
```

```
>>> from sage.all import *
>>> # needs sage.plot
>>> D12 = posets.DivisorLattice(Integer(12))
>>> D12.plot()
Graphics object consisting of 14 graphics primitives
```

Just the abstract form of the poset; examples of relabeling:

```
sage: # needs sage.plot
sage: D12.plot(label_elements=False)
Graphics object consisting of 8 graphics primitives
sage: d = {1: 0, 2: 'a', 3: 'b', 4: 'c', 6: 'd', 12: 1}
sage: D12.plot(element_labels=d)
Graphics object consisting of 14 graphics primitives
sage: d = {i: str(factor(i)) for i in D12}
sage: D12.plot(element_labels=d)
Graphics object consisting of 14 graphics primitives
```

```
>>> from sage.all import *
>>> # needs sage.plot
>>> D12.plot(label_elements=False)
Graphics object consisting of 8 graphics primitives
>>> d = {Integer(1): Integer(0), Integer(2): 'a', Integer(3): 'b',␣
↪Integer(4): 'c', Integer(6): 'd', Integer(12): Integer(1)}
>>> D12.plot(element_labels=d)
Graphics object consisting of 14 graphics primitives
```

(continues on next page)

(continued from previous page)

```
>>> d = {i: str(factor(i)) for i in D12}
>>> D12.plot(element_labels=d)
Graphics object consisting of 14 graphics primitives
```

Some settings for coverings:

```
sage: # needs sage.plot
sage: d = {(a, b): b/a for a, b in D12.cover_relations()}
sage: D12.plot(cover_labels=d, cover_color='gray', cover_style='dotted')
Graphics object consisting of 21 graphics primitives
```

```
>>> from sage.all import *
>>> # needs sage.plot
>>> d = {(a, b): b/a for a, b in D12.cover_relations()}
>>> D12.plot(cover_labels=d, cover_color='gray', cover_style='dotted')
Graphics object consisting of 21 graphics primitives
```

To emphasize some elements and show some options:

```
sage: # needs sage.plot
sage: L = LatticePoset({0: [1, 2, 3, 4], 1: [12], 2: [6, 7],
....:                   3: [5, 9], 4: [5, 6, 10, 11], 5: [13],
....:                   6: [12], 7: [12, 8, 9], 8: [13], 9: [13],
....:                   10: [12], 11: [12], 12: [13]})
sage: F = L.frattini_sublattice()
sage: F_internal = [c for c in F.cover_relations()
....:               if c in L.cover_relations()]
sage: L.plot(figsize=12, border=True, element_shape='s',
....:        element_size=400, element_color='white',
....:        element_colors={'blue': F, 'green': L.double_irreducibles()},
....:        cover_color='lightgray', cover_colors={'black': F_internal},
....:        title='The Frattini\nsublattice in blue', fontsize=10)
Graphics object consisting of 39 graphics primitives
```

```
>>> from sage.all import *
>>> # needs sage.plot
>>> L = LatticePoset({Integer(0): [Integer(1), Integer(2), Integer(3),␣
↪Integer(4)], Integer(1): [Integer(12)], Integer(2): [Integer(6),␣
↪Integer(7)],
...                   Integer(3): [Integer(5), Integer(9)], Integer(4):␣
↪[Integer(5), Integer(6), Integer(10), Integer(11)], Integer(5):␣
↪[Integer(13)],
...                   Integer(6): [Integer(12)], Integer(7): [Integer(12),␣
↪Integer(8), Integer(9)], Integer(8): [Integer(13)], Integer(9):␣
↪[Integer(13)],
...                   Integer(10): [Integer(12)], Integer(11): [Integer(12)],␣
↪Integer(12): [Integer(13)]})
>>> F = L.frattini_sublattice()
>>> F_internal = [c for c in F.cover_relations()
...               if c in L.cover_relations()]
>>> L.plot(figsize=Integer(12), border=True, element_shape='s',
...        element_size=Integer(400), element_color='white',
```

(continues on next page)

(continued from previous page)

```
...         element_colors={'blue': F, 'green': L.double_irreducibles()},
...         cover_color='lightgray', cover_colors={'black': F_internal},
...         title='The Frattini\nsublattice in blue', fontsize=Integer(10))
Graphics object consisting of 39 graphics primitives
```

product (*other*)

Return the Cartesian product of the poset with `other`.

The Cartesian (or 'direct') product of P and Q is defined by $(p, q) \leq (p', q')$ iff $p \leq p'$ in P and $q \leq q'$ in Q.

Product of (semi)lattices are returned as a (semi)lattice.

EXAMPLES:

```
sage: P = posets.ChainPoset(3)
sage: Q = posets.ChainPoset(4)
sage: PQ = P.product(Q) ; PQ
Finite lattice containing 12 elements
sage: len(PQ.cover_relations())
17
sage: Q.product(P).is_isomorphic(PQ)
True

sage: P = posets.BooleanLattice(2)
sage: Q = P.product(P)
sage: Q.is_isomorphic(posets.BooleanLattice(4))
True
```

```
>>> from sage.all import *
>>> P = posets.ChainPoset(Integer(3))
>>> Q = posets.ChainPoset(Integer(4))
>>> PQ = P.product(Q) ; PQ
Finite lattice containing 12 elements
>>> len(PQ.cover_relations())
17
>>> Q.product(P).is_isomorphic(PQ)
True

>>> P = posets.BooleanLattice(Integer(2))
>>> Q = P.product(P)
>>> Q.is_isomorphic(posets.BooleanLattice(Integer(4)))
True
```

One can also simply use $*$:

```
sage: P = posets.ChainPoset(2)
sage: Q = posets.ChainPoset(3)
sage: P*Q
Finite lattice containing 6 elements
```

```
>>> from sage.all import *
>>> P = posets.ChainPoset(Integer(2))
>>> Q = posets.ChainPoset(Integer(3))
```

(continues on next page)

(continued from previous page)

```
>>> P*Q
Finite lattice containing 6 elements
```

CartesianProductPoset, *factor()*

promotion(*i=1*)

Compute the (extended) promotion on the linear extension of the poset `self`.

INPUT:

- `i` – integer between 1 and n (default: 1)

OUTPUT: an isomorphic poset, with the same default linear extension

The extended promotion is defined on a poset `self` of size n by applying the promotion operator $\tau_i \tau_{i+1} \cdots \tau_{n-1}$ to the default linear extension π of `self` (see *promotion()*), and relabeling `self` accordingly. For more details see [Stan2009].

When the elements of the poset `self` are labelled by $\{1, 2, \ldots, n\}$, the linear extension is the identity, and $i = 1$, the above algorithm corresponds to the promotion operator on posets defined by Schützenberger as follows. Remove 1 from `self` and replace it by the minimum j of all labels covering 1 in the poset. Then, remove j and replace it by the minimum of all labels covering j, and so on. This process ends when a label is a local maximum. Place the label $n + 1$ at this vertex. Finally, decrease all labels by 1.

EXAMPLES:

```
sage: P = Poset(([1,2], [[1,2]]), linear_extension=True, facade=False)
sage: P.promotion()
Finite poset containing 2 elements with distinguished linear extension
sage: P == P.promotion()
True

sage: P = Poset(([1,2,3,4,5,6,7], [[1,2],[1,4],[2,3],[2,5],[3,6],[4,7],[5,
→6]]))
sage: P.list()
[1, 2, 3, 5, 6, 4, 7]
sage: Q = P.promotion(4); Q
Finite poset containing 7 elements with distinguished linear extension
sage: Q.cover_relations()
[[1, 2], [1, 6], [2, 3], [2, 5], [3, 7], [5, 7], [6, 4]]
```

```
>>> from sage.all import *
>>> P = Poset(([Integer(1),Integer(2)], [[Integer(1),Integer(2)]]), linear_
→extension=True, facade=False)
>>> P.promotion()
Finite poset containing 2 elements with distinguished linear extension
>>> P == P.promotion()
True

>>> P = Poset(([Integer(1),Integer(2),Integer(3),Integer(4),Integer(5),
→Integer(6),Integer(7)], [[Integer(1),Integer(2)],[Integer(1),Integer(4)],
```

(continues on next page)

(continued from previous page)

```
↪[Integer(2),Integer(3)],[Integer(2),Integer(5)],[Integer(3),Integer(6)],
↪[Integer(4),Integer(7)],[Integer(5),Integer(6)]]))
>>> P.list()
[1, 2, 3, 5, 6, 4, 7]
>>> Q = P.promotion(Integer(4)); Q
Finite poset containing 7 elements with distinguished linear extension
>>> Q.cover_relations()
[[1, 2], [1, 6], [2, 3], [2, 5], [3, 7], [5, 7], [6, 4]]
```

Note that if one wants to obtain the promotion defined by Schützenberger's algorithm directly on the poset, one needs to make sure the linear extension is the identity:

```
sage: P = P.with_linear_extension([1,2,3,4,5,6,7])
sage: P.list()
[1, 2, 3, 4, 5, 6, 7]
sage: Q = P.promotion(4); Q
Finite poset containing 7 elements with distinguished linear extension
sage: Q.cover_relations()
[[1, 2], [1, 6], [2, 3], [2, 4], [3, 5], [4, 5], [6, 7]]
sage: Q = P.promotion()
sage: Q.cover_relations()
[[1, 2], [1, 3], [2, 4], [2, 5], [3, 6], [4, 7], [5, 7]]
```

```
>>> from sage.all import *
>>> P = P.with_linear_extension([Integer(1),Integer(2),Integer(3),Integer(4),
↪Integer(5),Integer(6),Integer(7)])
>>> P.list()
[1, 2, 3, 4, 5, 6, 7]
>>> Q = P.promotion(Integer(4)); Q
Finite poset containing 7 elements with distinguished linear extension
>>> Q.cover_relations()
[[1, 2], [1, 6], [2, 3], [2, 4], [3, 5], [4, 5], [6, 7]]
>>> Q = P.promotion()
>>> Q.cover_relations()
[[1, 2], [1, 3], [2, 4], [2, 5], [3, 6], [4, 7], [5, 7]]
```

Here is an example for a poset not labelled by $\{1, 2, \ldots, n\}$:

```
sage: P = Poset((divisors(30), attrcall("divides")), linear_extension=True)
sage: P.list()
[1, 2, 3, 5, 6, 10, 15, 30]
sage: P.cover_relations()
[[1, 2], [1, 3], [1, 5], [2, 6], [2, 10], [3, 6], [3, 15],
 [5, 10], [5, 15], [6, 30], [10, 30], [15, 30]]
sage: Q = P.promotion(4); Q
Finite poset containing 8 elements with distinguished linear extension
sage: Q.cover_relations()
[[1, 2], [1, 3], [1, 6], [2, 5], [2, 15], [3, 5], [3, 10],
 [5, 30], [6, 10], [6, 15], [10, 30], [15, 30]]
```

```
>>> from sage.all import *
>>> P = Poset((divisors(Integer(30)), attrcall("divides")), linear_
```

(continues on next page)

(continued from previous page)

```
↪extension=True)
>>> P.list()
[1, 2, 3, 5, 6, 10, 15, 30]
>>> P.cover_relations()
[[1, 2], [1, 3], [1, 5], [2, 6], [2, 10], [3, 6], [3, 15],
 [5, 10], [5, 15], [6, 30], [10, 30], [15, 30]]
>>> Q = P.promotion(Integer(4)); Q
Finite poset containing 8 elements with distinguished linear extension
>>> Q.cover_relations()
[[1, 2], [1, 3], [1, 6], [2, 5], [2, 15], [3, 5], [3, 10],
 [5, 30], [6, 10], [6, 15], [10, 30], [15, 30]]
```

AUTHOR:

- Anne Schilling (2012-02-18)

random_linear_extension()

Return a random linear extension of the poset.

The distribution is not uniform.

EXAMPLES:

```
sage: set_random_seed(0)  # results are reproducible
sage: P = posets.BooleanLattice(4)
sage: P.random_linear_extension()
[0, 4, 1, 2, 3, 8, 10, 5, 12, 9, 13, 11, 6, 14, 7, 15]
```

```
>>> from sage.all import *
>>> set_random_seed(Integer(0))  # results are reproducible
>>> P = posets.BooleanLattice(Integer(4))
>>> P.random_linear_extension()
[0, 4, 1, 2, 3, 8, 10, 5, 12, 9, 13, 11, 6, 14, 7, 15]
```

random_maximal_antichain()

Return a random maximal antichain of the poset.

The distribution is not uniform.

EXAMPLES:

```
sage: set_random_seed(0)  # results are reproducible
sage: P = posets.BooleanLattice(4)
sage: P.random_maximal_antichain()
[1, 8, 2, 4]
```

```
>>> from sage.all import *
>>> set_random_seed(Integer(0))  # results are reproducible
>>> P = posets.BooleanLattice(Integer(4))
>>> P.random_maximal_antichain()
[1, 8, 2, 4]
```

random_maximal_chain()

Return a random maximal chain of the poset.

The distribution is not uniform.

EXAMPLES:

```
sage: set_random_seed(0)  # results are reproducible
sage: P = posets.BooleanLattice(4)
sage: P.random_maximal_chain()
[0, 4, 5, 7, 15]
```

```
>>> from sage.all import *
>>> set_random_seed(Integer(0))  # results are reproducible
>>> P = posets.BooleanLattice(Integer(4))
>>> P.random_maximal_chain()
[0, 4, 5, 7, 15]
```

random_order_ideal(*direction='down'*)

Return a random order ideal with uniform probability.

INPUT:

- `direction` – `'up'`, `'down'` or `'antichain'` (default: `'down'`)

OUTPUT:

A randomly selected order ideal (or order filter if `direction='up'`, or antichain if `direction='antichain'`) where all order ideals have equal probability of occurring.

ALGORITHM:

Uses the coupling from the past algorithm described in [Propp1997].

EXAMPLES:

```
sage: P = posets.BooleanLattice(3)
sage: P.random_order_ideal()  # random
[0, 1, 2, 3, 4, 5, 6]
sage: P.random_order_ideal(direction='up')  # random
[6, 7]
sage: P.random_order_ideal(direction='antichain')  # random
[1, 2]

sage: P = posets.TamariLattice(5)
sage: a = P.random_order_ideal('antichain')
sage: P.is_antichain_of_poset(a)
True
sage: a = P.random_order_ideal('up')
sage: P.is_order_filter(a)
True
```

(continues on next page)

(continued from previous page)

```
sage: a = P.random_order_ideal('down')
sage: P.is_order_ideal(a)
True
```

```
>>> from sage.all import *
>>> P = posets.BooleanLattice(Integer(3))
>>> P.random_order_ideal()  # random
[0, 1, 2, 3, 4, 5, 6]
>>> P.random_order_ideal(direction='up')  # random
[6, 7]
>>> P.random_order_ideal(direction='antichain')  # random
[1, 2]

>>> P = posets.TamariLattice(Integer(5))
>>> a = P.random_order_ideal('antichain')
>>> P.is_antichain_of_poset(a)
True
>>> a = P.random_order_ideal('up')
>>> P.is_order_filter(a)
True
>>> a = P.random_order_ideal('down')
>>> P.is_order_ideal(a)
True
```

random_subposet (*p*)

Return a random subposet that contains each element with probability `p`.

EXAMPLES:

```
sage: P = posets.BooleanLattice(3)
sage: set_random_seed(0)  # Results are reproducible
sage: Q = P.random_subposet(0.5)
sage: Q.cover_relations()
[[0, 2], [0, 5], [2, 3], [3, 7], [5, 7]]
```

```
>>> from sage.all import *
>>> P = posets.BooleanLattice(Integer(3))
>>> set_random_seed(Integer(0))  # Results are reproducible
>>> Q = P.random_subposet(RealNumber('0.5'))
>>> Q.cover_relations()
[[0, 2], [0, 5], [2, 3], [3, 7], [5, 7]]
```

rank (*element=None*)

Return the rank of an element `element` in the poset `self`, or the rank of the poset if `element` is `None`.

(The rank of a poset is the length of the longest chain of elements of the poset. This is sometimes called the length of a poset.)

EXAMPLES:

```
sage: P = Poset([[1,3,2],[4],[4,5,6],[6],[7],[7],[7],[]], facade = False)
sage: P.rank(5)
2
```

(continues on next page)

(continued from previous page)

```
sage: P.rank()
3
sage: Q = Poset([[1,2],[3],[],[]])

sage: P = posets.SymmetricGroupBruhatOrderPoset(4)
sage: [(v,P.rank(v)) for v in P]
[('1234', 0),
 ('1243', 1),
...
 ('4312', 5),
 ('4321', 6)]
```

```
>>> from sage.all import *
>>> P = Poset([[Integer(1),Integer(3),Integer(2)],[Integer(4)],[Integer(4),
↪Integer(5),Integer(6)],[Integer(6)],[Integer(7)],[Integer(7)],[Integer(7)],
↪[]], facade = False)
>>> P.rank(Integer(5))
2
>>> P.rank()
3
>>> Q = Poset([[Integer(1),Integer(2)],[Integer(3)],[],[]])

>>> P = posets.SymmetricGroupBruhatOrderPoset(Integer(4))
>>> [(v,P.rank(v)) for v in P]
[('1234', 0),
 ('1243', 1),
...
 ('4312', 5),
 ('4321', 6)]
```

rank_function()

Return the (normalized) rank function of the poset, if it exists.

A *rank function* of a poset P is a function r that maps elements of P to integers and satisfies: $r(x) = r(y)+1$ if x covers y. The function r is normalized such that its minimum value on every connected component of the Hasse diagram of P is 0. This determines the function r uniquely (when it exists).

OUTPUT:

- a lambda function, if the poset admits a rank function
- `None`, if the poset does not admit a rank function

EXAMPLES:

```
sage: P = Poset(([1,2,3,4],[[1,4],[2,3],[3,4]]), facade=True)
sage: P.rank_function() is not None
True
sage: P = Poset(([1,2,3,4,5],[[1,2],[2,3],[3,4],[1,5],[5,4]]), facade=True)
sage: P.rank_function() is not None
False
sage: P = Poset(([1,2,3,4,5,6,7,8],[[1,4],[2,3],[3,4],[5,7],[6,7]]),␣
↪facade=True)
sage: f = P.rank_function(); f is not None
```

(continues on next page)

(continued from previous page)

```
True
sage: f(5)
0
sage: f(2)
0
```

```
>>> from sage.all import *
>>> P = Poset(([Integer(1),Integer(2),Integer(3),Integer(4)],[[Integer(1),
↪Integer(4)],[Integer(2),Integer(3)],[Integer(3),Integer(4)]]), facade=True)
>>> P.rank_function() is not None
True
>>> P = Poset(([Integer(1),Integer(2),Integer(3),Integer(4),Integer(5)],
↪[[Integer(1),Integer(2)],[Integer(2),Integer(3)],[Integer(3),Integer(4)],
↪[Integer(1),Integer(5)],[Integer(5),Integer(4)]]), facade=True)
>>> P.rank_function() is not None
False
>>> P = Poset(([Integer(1),Integer(2),Integer(3),Integer(4),Integer(5),
↪Integer(6),Integer(7),Integer(8)],[[Integer(1),Integer(4)],[Integer(2),
↪Integer(3)],[Integer(3),Integer(4)],[Integer(5),Integer(7)],[Integer(6),
↪Integer(7)]]), facade=True)
>>> f = P.rank_function(); f is not None
True
>>> f(Integer(5))
0
>>> f(Integer(2))
0
```

rees_product (*other*)

Return the Rees product of `self` and `other`.

This is only defined if both posets are graded.

The underlying set is the set of pairs (p, q) in the Cartesian product such that $\mathrm{rk}(p) \geq \mathrm{rk}(q)$.

This operation was defined by Björner and Welker in [BjWe2005]. Other references are [MBRe2011] and [LSW2012].

EXAMPLES:

```
sage: B3 = posets.BooleanLattice(3)
sage: B3t = B3.subposet(list(range(1,8)))
sage: C3 = posets.ChainPoset(3)
sage: D = B3t.rees_product(C3); D
Finite poset containing 12 elements
sage: sorted(D.minimal_elements())
[(1, 0), (2, 0), (4, 0)]
sage: sorted(D.maximal_elements())
[(7, 0), (7, 1), (7, 2)]
sage: D.with_bounds().moebius_function('bottom','top')
2
```

```
>>> from sage.all import *
>>> B3 = posets.BooleanLattice(Integer(3))
```

(continues on next page)

(continued from previous page)

```
>>> B3t = B3.subposet(list(range(Integer(1),Integer(8))))
>>> C3 = posets.ChainPoset(Integer(3))
>>> D = B3t.rees_product(C3); D
Finite poset containing 12 elements
>>> sorted(D.minimal_elements())
[(1, 0), (2, 0), (4, 0)]
>>> sorted(D.maximal_elements())
[(7, 0), (7, 1), (7, 2)]
>>> D.with_bounds().moebius_function('bottom','top')
2
```

product(), *ordinal_product()*, *star_product()*

relabel(*relabeling=None*)

Return a copy of this poset with its elements relabeled.

INPUT:

- `relabeling` – a function, dictionary, list or tuple

The given function or dictionary must map each (non-wrapped) element of `self` to some distinct object. The given list or tuple must be made of distinct objects.

When the input is a list or a tuple, the relabeling uses the total ordering of the elements of the poset given by `list(self)`.

If no relabeling is given, the poset is relabeled by integers from 0 to $n - 1$ according to one of its linear extensions. This means that $i < j$ as integers whenever $i < j$ in the relabeled poset.

EXAMPLES:

Relabeling using a function:

```
sage: P = Poset((divisors(12), attrcall("divides")), linear_extension=True)
sage: P.list()
[1, 2, 3, 4, 6, 12]
sage: P.cover_relations()
[[1, 2], [1, 3], [2, 4], [2, 6], [3, 6], [4, 12], [6, 12]]
sage: Q = P.relabel(lambda x: x+1)
sage: Q.list()
[2, 3, 4, 5, 7, 13]
sage: Q.cover_relations()
[[2, 3], [2, 4], [3, 5], [3, 7], [4, 7], [5, 13], [7, 13]]
```

```
>>> from sage.all import *
>>> P = Poset((divisors(Integer(12)), attrcall("divides")), linear_
↪extension=True)
>>> P.list()
[1, 2, 3, 4, 6, 12]
>>> P.cover_relations()
[[1, 2], [1, 3], [2, 4], [2, 6], [3, 6], [4, 12], [6, 12]]
>>> Q = P.relabel(lambda x: x+Integer(1))
```

(continues on next page)

(continued from previous page)

```
>>> Q.list()
[2, 3, 4, 5, 7, 13]
>>> Q.cover_relations()
[[2, 3], [2, 4], [3, 5], [3, 7], [4, 7], [5, 13], [7, 13]]
```

Relabeling using a dictionary:

```
sage: P = Poset((divisors(12), attrcall("divides")), linear_extension=True,␣
↪facade=False)
sage: relabeling = {c.element:i for (i,c) in enumerate(P)}
sage: relabeling
{1: 0, 2: 1, 3: 2, 4: 3, 6: 4, 12: 5}
sage: Q = P.relabel(relabeling)
sage: Q.list()
[0, 1, 2, 3, 4, 5]
sage: Q.cover_relations()
[[0, 1], [0, 2], [1, 3], [1, 4], [2, 4], [3, 5], [4, 5]]
```

```
>>> from sage.all import *
>>> P = Poset((divisors(Integer(12)), attrcall("divides")), linear_
↪extension=True, facade=False)
>>> relabeling = {c.element:i for (i,c) in enumerate(P)}
>>> relabeling
{1: 0, 2: 1, 3: 2, 4: 3, 6: 4, 12: 5}
>>> Q = P.relabel(relabeling)
>>> Q.list()
[0, 1, 2, 3, 4, 5]
>>> Q.cover_relations()
[[0, 1], [0, 2], [1, 3], [1, 4], [2, 4], [3, 5], [4, 5]]
```

Mind the `c.element`; this is because the relabeling is applied to the elements of the poset without the wrapping. Thanks to this convention, the same relabeling function can be used both for facade or non facade posets.

Relabeling using a list:

```
sage: P = posets.PentagonPoset()
sage: list(P)
[0, 1, 2, 3, 4]
sage: P.cover_relations()
[[0, 1], [0, 2], [1, 4], [2, 3], [3, 4]]
sage: Q = P.relabel(list('abcde'))
sage: Q.cover_relations()
[['a', 'b'], ['a', 'c'], ['b', 'e'], ['c', 'd'], ['d', 'e']]
```

```
>>> from sage.all import *
>>> P = posets.PentagonPoset()
>>> list(P)
[0, 1, 2, 3, 4]
>>> P.cover_relations()
[[0, 1], [0, 2], [1, 4], [2, 3], [3, 4]]
>>> Q = P.relabel(list('abcde'))
```

(continues on next page)

(continued from previous page)

```
>>> Q.cover_relations()
[['a', 'b'], ['a', 'c'], ['b', 'e'], ['c', 'd'], ['d', 'e']]
```

Default behaviour is increasing relabeling:

```
sage: a2 = posets.ChainPoset(2)
sage: P = a2 * a2
sage: Q = P.relabel()
sage: Q.cover_relations()
[[0, 1], [0, 2], [1, 3], [2, 3]]
```

```
>>> from sage.all import *
>>> a2 = posets.ChainPoset(Integer(2))
>>> P = a2 * a2
>>> Q = P.relabel()
>>> Q.cover_relations()
[[0, 1], [0, 2], [1, 3], [2, 3]]
```

Relabeling a (semi)lattice gives a (semi)lattice:

```
sage: P = JoinSemilattice({0: [1]})
sage: P.relabel(lambda n: n + 1)
Finite join-semilattice containing 2 elements
```

```
>>> from sage.all import *
>>> P = JoinSemilattice({Integer(0): [Integer(1)]})
>>> P.relabel(lambda n: n + Integer(1))
Finite join-semilattice containing 2 elements
```

Note

As can be seen in the above examples, the default linear extension of `Q` is that of `P` after relabeling. In particular, `P` and `Q` share the same internal Hasse diagram.

relations()

Return the list of all relations of the poset.

A relation is a pair of elements x and y such that $x \leq y$ in the poset.

The number of relations is the dimension of the incidence algebra.

OUTPUT:

A list of pairs (each pair is a list), where the first element of the pair is less than or equal to the second element.

EXAMPLES:

```
sage: P = Poset({0:[2], 1:[2], 2:[3], 3:[4], 4:[]})
sage: P.relations()
[[1, 1], [1, 2], [1, 3], [1, 4], [0, 0], [0, 2], [0, 3],
[0, 4], [2, 2], [2, 3], [2, 4], [3, 3], [3, 4], [4, 4]]
```

```
>>> from sage.all import *
>>> P = Poset({Integer(0):[Integer(2)], Integer(1):[Integer(2)],␣
↪Integer(2):[Integer(3)], Integer(3):[Integer(4)], Integer(4):[]})
>>> P.relations()
[[1, 1], [1, 2], [1, 3], [1, 4], [0, 0], [0, 2], [0, 3],
[0, 4], [2, 2], [2, 3], [2, 4], [3, 3], [3, 4], [4, 4]]
```

relations_number(), *relations_iterator()*

AUTHOR:

- Rob Beezer (2011-05-04)

relations_iterator(*strict=False*)

Return an iterator for all the relations of the poset.

A relation is a pair of elements x and y such that $x \leq y$ in the poset.

INPUT:

- `strict` – boolean (default: `False`); if `True`, return an iterator over relations $x < y$, excluding all relations $x \leq x$

OUTPUT:

A generator that produces pairs (each pair is a list), where the first element of the pair is less than or equal to the second element.

EXAMPLES:

```
sage: P = Poset({0:[2], 1:[2], 2:[3], 3:[4], 4:[]})
sage: it = P.relations_iterator()
sage: type(it)
<class 'generator'>
sage: next(it), next(it)
([1, 1], [1, 2])

sage: P = posets.PentagonPoset()
sage: list(P.relations_iterator(strict=True))
[[0, 1], [0, 2], [0, 4], [0, 3], [1, 4], [2, 3], [2, 4], [3, 4]]
```

```
>>> from sage.all import *
>>> P = Poset({Integer(0):[Integer(2)], Integer(1):[Integer(2)],␣
↪Integer(2):[Integer(3)], Integer(3):[Integer(4)], Integer(4):[]})
>>> it = P.relations_iterator()
>>> type(it)
<class 'generator'>
>>> next(it), next(it)
([1, 1], [1, 2])

>>> P = posets.PentagonPoset()
>>> list(P.relations_iterator(strict=True))
[[0, 1], [0, 2], [0, 4], [0, 3], [1, 4], [2, 3], [2, 4], [3, 4]]
```

See also:

relations_number(), *relations()*.

AUTHOR:

- Rob Beezer (2011-05-04)

relations_number()

Return the number of relations in the poset.

A relation is a pair of elements x and y such that $x \leq y$ in the poset.

Relations are also often called intervals. The number of intervals is the dimension of the incidence algebra.

EXAMPLES:

```
sage: P = posets.PentagonPoset()
sage: P.relations_number()
13

sage: posets.TamariLattice(4).relations_number()
68
```

```
>>> from sage.all import *
>>> P = posets.PentagonPoset()
>>> P.relations_number()
13

>>> posets.TamariLattice(Integer(4)).relations_number()
68
```

See also:

relations_iterator(), *relations()*

show(*label_elements=True*, *element_labels=None*, *cover_labels=None*, ***kwds*)

Displays the Hasse diagram of the poset.

INPUT:

- `label_elements` – boolean (default: `True`); whether to display element labels
- `element_labels` – dictionary (default: `None`) of element labels
- `cover_labels` – dictionary, list or function representing labels of the covers of `self`; when set to `None` (default) no label is displayed on the edges of the Hasse Diagram

Note: This method also accepts:

- All options of `GenericGraph.plot`
- All options of `Graphics.show`

EXAMPLES:

```
sage: # needs sage.plot
sage: D = Poset({ 0:[1,2], 1:[3], 2:[3,4] })
sage: D.plot(label_elements=False)
Graphics object consisting of 6 graphics primitives
sage: D.show()
sage: elm_labs = {0:'a', 1:'b', 2:'c', 3:'d', 4:'e'}
sage: D.show(element_labels=elm_labs)
```

```
>>> from sage.all import *
>>> # needs sage.plot
>>> D = Poset({ Integer(0):[Integer(1),Integer(2)], Integer(1):[Integer(3)],␣
↪Integer(2):[Integer(3),Integer(4)] })
>>> D.plot(label_elements=False)
Graphics object consisting of 6 graphics primitives
>>> D.show()
>>> elm_labs = {Integer(0):'a', Integer(1):'b', Integer(2):'c', Integer(3):'d
↪', Integer(4):'e'}
>>> D.show(element_labels=elm_labs)
```

One more example with cover labels:

```
sage: # needs sage.plot
sage: P = posets.PentagonPoset()
sage: P.show(cover_labels=lambda a, b: a - b)
```

```
>>> from sage.all import *
>>> # needs sage.plot
>>> P = posets.PentagonPoset()
>>> P.show(cover_labels=lambda a, b: a - b)
```

slant_sum(*p*, *element*, *p_element*)

Return the slant sum poset of posets `self` and `p` by connecting them with a cover relation `(p_element, element)`.

Note

The element names of `self` and `p` must be distinct.

INPUT:

- `p` – the poset used for the slant sum
- `element` – the element of `self` that is the top of the new cover relation
- `p_element` – the element of `p` that is the bottom of the new cover relation

EXAMPLES:

```
sage: R = posets.RibbonPoset(5, [1,2])
sage: H = Poset([[5, 6, 7], [(5, 6), (6,7)]])
sage: SS = R.slant_sum(H, 3, 7)
sage: all(cr in SS.cover_relations() for cr in R.cover_relations())
```

(continues on next page)

(continued from previous page)

```
True
sage: all(cr in SS.cover_relations() for cr in H.cover_relations())
True
sage: SS.covers(7, 3)
True
```

```
>>> from sage.all import *
>>> R = posets.RibbonPoset(Integer(5), [Integer(1),Integer(2)])
>>> H = Poset([[Integer(5), Integer(6), Integer(7)], [(Integer(5),
↪Integer(6)), (Integer(6),Integer(7))]])
>>> SS = R.slant_sum(H, Integer(3), Integer(7))
>>> all(cr in SS.cover_relations() for cr in R.cover_relations())
True
>>> all(cr in SS.cover_relations() for cr in H.cover_relations())
True
>>> SS.covers(Integer(7), Integer(3))
True
```

sorted(*l*, *allow_incomparable=True*, *remove_duplicates=False*)

Return the list l sorted by the poset.

INPUT:

- `l` – list of elements of the poset
- `allow_incomparable` – boolean (default: `True`); if `True`, return incomparable elements in some order. If `False`, raise an error if `l` is not a chain of the poset.
- `remove_duplicates` – boolean (default: `False`); if `True`, remove duplicates from the output list

EXAMPLES:

```
sage: P = posets.DivisorLattice(36)
sage: P.sorted([1, 4, 1, 6, 2, 12])  # Random order for 4 and 6
[1, 1, 2, 4, 6, 12]
sage: P.sorted([1, 4, 1, 6, 2, 12], remove_duplicates=True)
[1, 2, 4, 6, 12]
sage: P.sorted([1, 4, 1, 6, 2, 12], allow_incomparable=False)
Traceback (most recent call last):
...
ValueError: the list contains incomparable elements

sage: P = Poset({7:[1, 5], 1:[2, 6], 5:[3], 6:[3, 4]})
sage: P.sorted([4, 1, 4, 5, 7])  # Random order for 1 and 5
[7, 1, 5, 4, 4]
sage: P.sorted([1, 4, 4, 7], remove_duplicates=True)
[7, 1, 4]
sage: P.sorted([4, 1, 4, 5, 7], allow_incomparable=False)
Traceback (most recent call last):
...
ValueError: the list contains incomparable elements
```

```
>>> from sage.all import *
>>> P = posets.DivisorLattice(Integer(36))
```

(continues on next page)

(continued from previous page)

```
>>> P.sorted([Integer(1), Integer(4), Integer(1), Integer(6), Integer(2),␣
↪Integer(12)])  # Random order for 4 and 6
[1, 1, 2, 4, 6, 12]
>>> P.sorted([Integer(1), Integer(4), Integer(1), Integer(6), Integer(2),␣
↪Integer(12)], remove_duplicates=True)
[1, 2, 4, 6, 12]
>>> P.sorted([Integer(1), Integer(4), Integer(1), Integer(6), Integer(2),␣
↪Integer(12)], allow_incomparable=False)
Traceback (most recent call last):
...
ValueError: the list contains incomparable elements

>>> P = Poset({Integer(7):[Integer(1), Integer(5)], Integer(1):[Integer(2),␣
↪Integer(6)], Integer(5):[Integer(3)], Integer(6):[Integer(3), Integer(4)]})
>>> P.sorted([Integer(4), Integer(1), Integer(4), Integer(5), Integer(7)])   #␣
↪Random order for 1 and 5
[7, 1, 5, 4, 4]
>>> P.sorted([Integer(1), Integer(4), Integer(4), Integer(7)], remove_
↪duplicates=True)
[7, 1, 4]
>>> P.sorted([Integer(4), Integer(1), Integer(4), Integer(5), Integer(7)],␣
↪allow_incomparable=False)
Traceback (most recent call last):
...
ValueError: the list contains incomparable elements
```

spectrum(a)

Return the a-spectrum of this poset.

The a-spectrum in a poset P is the list of integers whose i-th position contains the number of linear extensions of P that have a in the i-th location.

INPUT:

- a – an element of this poset

OUTPUT:

The a-spectrum of this poset, returned as a list.

EXAMPLES:

```
sage: P = posets.ChainPoset(5)
sage: P.spectrum(2)
[0, 0, 1, 0, 0]

sage: P = posets.BooleanLattice(3)
sage: P.spectrum(5)
[0, 0, 0, 4, 12, 16, 16, 0]

sage: P = posets.YoungDiagramPoset(Partition([3,2,1]))                        #␣
↪needs sage.combinat
sage: P.spectrum((0,1))                                                       #␣
↪needs sage.combinat
[0, 8, 6, 2, 0, 0]
```

(continues on next page)

(continued from previous page)

```
sage: P = posets.AntichainPoset(4)
sage: P.spectrum(3)
[6, 6, 6, 6]
```

```
>>> from sage.all import *
>>> P = posets.ChainPoset(Integer(5))
>>> P.spectrum(Integer(2))
[0, 0, 1, 0, 0]

>>> P = posets.BooleanLattice(Integer(3))
>>> P.spectrum(Integer(5))
[0, 0, 0, 4, 12, 16, 16, 0]

>>> P = posets.YoungDiagramPoset(Partition([Integer(3),Integer(2),
↪Integer(1)]))                          # needs sage.combinat
>>> P.spectrum((Integer(0),Integer(1)))                                    ␣
↪               # needs sage.combinat
[0, 8, 6, 2, 0, 0]

>>> P = posets.AntichainPoset(Integer(4))
>>> P.spectrum(Integer(3))
[6, 6, 6, 6]
```

star_product(*other*, *labels='pairs'*)

Return a poset isomorphic to the star product of the poset with `other`.

Both this poset and `other` are expected to be bounded and have at least two elements.

Let P be a poset with top element $\top_P$ and Q be a poset with bottom element $\bot_Q$. The star product of P and Q is the ordinal sum of $P \setminus \top_P$ and $Q \setminus \bot_Q$.

Mathematically, it is only defined when P and Q have no common elements; here we force that by giving them different names in the resulting poset.

INPUT:

- `other` – a poset
- `labels` – string (default: `'pairs'`); if set to 'pairs', each element `v` in this poset will be named `(0, v)` and each element `u` in `other` will be named `(1, u)` in the result. If set to 'integers', the elements of the result will be relabeled with consecutive integers.

EXAMPLES:

This is mostly used to combine two Eulerian posets to third one, and makes sense for graded posets only:

```
sage: B2 = posets.BooleanLattice(2)
sage: B3 = posets.BooleanLattice(3)
sage: P = B2.star_product(B3); P
Finite poset containing 10 elements
sage: P.is_eulerian()                                                     #␣
↪needs sage.libs.flint
True
```

```
>>> from sage.all import *
>>> B2 = posets.BooleanLattice(Integer(2))
>>> B3 = posets.BooleanLattice(Integer(3))
>>> P = B2.star_product(B3); P
Finite poset containing 10 elements
>>> P.is_eulerian()                                                         #␣
↪needs sage.libs.flint
True
```

We can get elements as pairs or as integers:

```
sage: ABC = Poset({'a': ['b'], 'b': ['c']})
sage: XYZ = Poset({'x': ['y'], 'y': ['z']})
sage: ABC.star_product(XYZ).list()
[(0, 'a'), (0, 'b'), (1, 'y'), (1, 'z')]
sage: sorted(ABC.star_product(XYZ, labels='integers'))
[0, 1, 2, 3]
```

```
>>> from sage.all import *
>>> ABC = Poset({'a': ['b'], 'b': ['c']})
>>> XYZ = Poset({'x': ['y'], 'y': ['z']})
>>> ABC.star_product(XYZ).list()
[(0, 'a'), (0, 'b'), (1, 'y'), (1, 'z')]
>>> sorted(ABC.star_product(XYZ, labels='integers'))
[0, 1, 2, 3]
```

subposet (*elements*)

Return the poset containing given elements with partial order induced by this poset.

EXAMPLES:

```
sage: P = Poset({'a': ['c', 'd'], 'b': ['d','e'], 'c': ['f'],
....:            'd': ['f'], 'e': ['f']})
sage: Q = P.subposet(['a', 'b', 'f']); Q
Finite poset containing 3 elements
sage: Q.cover_relations()
[['b', 'f'], ['a', 'f']]
```

```
>>> from sage.all import *
>>> P = Poset({'a': ['c', 'd'], 'b': ['d','e'], 'c': ['f'],
...            'd': ['f'], 'e': ['f']})
>>> Q = P.subposet(['a', 'b', 'f']); Q
Finite poset containing 3 elements
>>> Q.cover_relations()
[['b', 'f'], ['a', 'f']]
```

A subposet of a non-facade poset is again a non-facade poset:

```
sage: P = posets.PentagonPoset(facade=False)
sage: Q = P.subposet([0, 1, 2, 4])
sage: Q(1) < Q(2)
False
```

```
>>> from sage.all import *
>>> P = posets.PentagonPoset(facade=False)
>>> Q = P.subposet([Integer(0), Integer(1), Integer(2), Integer(4)])
>>> Q(Integer(1)) < Q(Integer(2))
False
```

top()

Return the unique maximal element of the poset, if it exists.

EXAMPLES:

```
sage: P = Poset({0:[3],1:[3],2:[3],3:[4,5],4:[],5:[]})
sage: P.top() is None
True
sage: Q = Poset({0:[1],1:[]})
sage: Q.top()
1
```

```
>>> from sage.all import *
>>> P = Poset({Integer(0):[Integer(3)],Integer(1):[Integer(3)],
↪Integer(2):[Integer(3)],Integer(3):[Integer(4),Integer(5)],Integer(4):[],
↪Integer(5):[]})
>>> P.top() is None
True
>>> Q = Poset({Integer(0):[Integer(1)],Integer(1):[]})
>>> Q.top()
1
```

See also

has_top(), *bottom()*

unwrap(*element*)

Return the element `element` of the poset `self` in unwrapped form.

INPUT:

- `element` – an element of `self`

EXAMPLES:

```
sage: P = Poset((divisors(15), attrcall("divides")), facade = False)
sage: x = P.an_element(); x
1
sage: x.parent()
Finite poset containing 4 elements
sage: P.unwrap(x)
1
sage: P.unwrap(x).parent()
Integer Ring
```

```
>>> from sage.all import *
>>> P = Poset((divisors(Integer(15)), attrcall("divides")), facade = False)
```

(continues on next page)

(continued from previous page)

```
>>> x = P.an_element(); x
1
>>> x.parent()
Finite poset containing 4 elements
>>> P.unwrap(x)
1
>>> P.unwrap(x).parent()
Integer Ring
```

For a non facade poset, this is equivalent to using the `.element` attribute:

```
sage: P.unwrap(x) is x.element
True
```

```
>>> from sage.all import *
>>> P.unwrap(x) is x.element
True
```

For a facade poset, this does nothing:

```
sage: P = Poset((divisors(15), attrcall("divides")), facade=True)
sage: x = P.an_element()
sage: P.unwrap(x) is x
True
```

```
>>> from sage.all import *
>>> P = Poset((divisors(Integer(15)), attrcall("divides")), facade=True)
>>> x = P.an_element()
>>> P.unwrap(x) is x
True
```

This method is useful in code where we do not know if `P` is a facade poset or not.

upper_covers(*x*)

Return the list of upper covers of the element `x`.

An upper cover of x is an element y such that $x < y$ and there is no element z so that $x < z < y$.

EXAMPLES:

```
sage: P = Poset([[1,5], [2,6], [3], [4], [], [6,3], [4]])
sage: P.upper_covers(1)
[2, 6]
```

```
>>> from sage.all import *
>>> P = Poset([[Integer(1),Integer(5)], [Integer(2),Integer(6)], [Integer(3)],
↪ [Integer(4)], [], [Integer(6),Integer(3)], [Integer(4)]])
>>> P.upper_covers(Integer(1))
[2, 6]
```

See also

lower_covers()

upper_covers_iterator(*x*)

Return an iterator over the upper covers of the element x.

EXAMPLES:

```
sage: P = Poset({0:[2], 1:[2], 2:[3], 3:[]})
sage: type(P.upper_covers_iterator(0))
<class 'generator'>
```

```
>>> from sage.all import *
>>> P = Poset({Integer(0):[Integer(2)], Integer(1):[Integer(2)],␣
→Integer(2):[Integer(3)], Integer(3):[]})
>>> type(P.upper_covers_iterator(Integer(0)))
<class 'generator'>
```

width(*certificate=False*)

Return the width of the poset (the size of its longest antichain).

It is computed through a matching in a bipartite graph; see Wikipedia article Dilworth%27s_theorem for more information. The width is also called Dilworth number.

INPUT:

- certificate – boolean (default: False); whether to return a certificate

OUTPUT:

- If certificate=True return (w, a), where w is the width of a poset and a is an antichain of maximum cardinality. If certificate=False return only width of the poset.

EXAMPLES:

```
sage: P = posets.BooleanLattice(4)
sage: P.width()                                                         #␣
→needs networkx
6

sage: w, max_achain = P.width(certificate=True)
sage: sorted(max_achain)
[3, 5, 6, 9, 10, 12]
```

```
>>> from sage.all import *
>>> P = posets.BooleanLattice(Integer(4))
>>> P.width()                                                         #␣
→needs networkx
6

>>> w, max_achain = P.width(certificate=True)
>>> sorted(max_achain)
[3, 5, 6, 9, 10, 12]
```

with_bounds(*labels=('bottom', 'top')*)

Return the poset with bottom and top elements adjoined.

This function adds top and bottom elements to the poset. It will always add elements, it does not check if the poset already has a bottom or a top element.

For lattices and semilattices this function returns a lattice.

INPUT:

- `labels` – a pair of elements to use as a bottom and top element of the poset. Default is strings `'bottom'` and `'top'`. Either of them can be `None`, and then a new bottom or top element will not be added.

EXAMPLES:

```
sage: V = Poset({0: [1, 2]})
sage: trafficsign = V.with_bounds(); trafficsign
Finite poset containing 5 elements
sage: trafficsign.list()
['bottom', 0, 1, 2, 'top']
sage: trafficsign = V.with_bounds(labels=(-1, -2))
sage: trafficsign.cover_relations()
[[-1, 0], [0, 1], [0, 2], [1, -2], [2, -2]]

sage: Y = V.with_bounds(labels=(-1, None))
sage: Y.cover_relations()
[[-1, 0], [0, 1], [0, 2]]

sage: P = posets.PentagonPoset()   # A lattice
sage: P.with_bounds()
Finite lattice containing 7 elements

sage: P = posets.PentagonPoset(facade=False)
sage: P.with_bounds()
Finite lattice containing 7 elements
```

```
>>> from sage.all import *
>>> V = Poset({Integer(0): [Integer(1), Integer(2)]})
>>> trafficsign = V.with_bounds(); trafficsign
Finite poset containing 5 elements
>>> trafficsign.list()
['bottom', 0, 1, 2, 'top']
>>> trafficsign = V.with_bounds(labels=(-Integer(1), -Integer(2)))
>>> trafficsign.cover_relations()
[[-1, 0], [0, 1], [0, 2], [1, -2], [2, -2]]

>>> Y = V.with_bounds(labels=(-Integer(1), None))
>>> Y.cover_relations()
[[-1, 0], [0, 1], [0, 2]]

>>> P = posets.PentagonPoset()   # A lattice
>>> P.with_bounds()
Finite lattice containing 7 elements

>>> P = posets.PentagonPoset(facade=False)
>>> P.with_bounds()
Finite lattice containing 7 elements
```

See also

`without_bounds()` for the reverse operation

with_linear_extension(*linear_extension*)

Return a copy of `self` with a different default linear extension.

EXAMPLES:

```
sage: P = Poset((divisors(12), attrcall("divides")), linear_extension=True)
sage: P.cover_relations()
[[1, 2], [1, 3], [2, 4], [2, 6], [3, 6], [4, 12], [6, 12]]
sage: list(P)
[1, 2, 3, 4, 6, 12]
sage: Q = P.with_linear_extension([1,3,2,6,4,12])
sage: list(Q)
[1, 3, 2, 6, 4, 12]
sage: Q.cover_relations()
[[1, 3], [1, 2], [3, 6], [2, 6], [2, 4], [6, 12], [4, 12]]
```

```
>>> from sage.all import *
>>> P = Poset((divisors(Integer(12)), attrcall("divides")), linear_
↪extension=True)
>>> P.cover_relations()
[[1, 2], [1, 3], [2, 4], [2, 6], [3, 6], [4, 12], [6, 12]]
>>> list(P)
[1, 2, 3, 4, 6, 12]
>>> Q = P.with_linear_extension([Integer(1),Integer(3),Integer(2),Integer(6),
↪Integer(4),Integer(12)])
>>> list(Q)
[1, 3, 2, 6, 4, 12]
>>> Q.cover_relations()
[[1, 3], [1, 2], [3, 6], [2, 6], [2, 4], [6, 12], [4, 12]]
```

Note

With the current implementation, this requires relabeling the internal `DiGraph` which is $O(n+m)$, where n is the number of elements and m the number of cover relations.

without_bounds()

Return the poset without its top and bottom elements.

This is useful as an input for the method *order_complex()*.

If there is either no top or no bottom element, this raises a `TypeError`.

EXAMPLES:

```
sage: P = posets.PentagonPoset()
sage: Q = P.without_bounds(); Q
Finite poset containing 3 elements
sage: Q.cover_relations()
[[2, 3]]

sage: P = posets.DiamondPoset(5)
sage: Q = P.without_bounds(); Q
Finite poset containing 3 elements
```

(continues on next page)

(continued from previous page)

```
sage: Q.cover_relations()
[]
```

```
>>> from sage.all import *
>>> P = posets.PentagonPoset()
>>> Q = P.without_bounds(); Q
Finite poset containing 3 elements
>>> Q.cover_relations()
[[2, 3]]

>>> P = posets.DiamondPoset(Integer(5))
>>> Q = P.without_bounds(); Q
Finite poset containing 3 elements
>>> Q.cover_relations()
[]
```

See also

with_bounds() for the reverse operation

zeta_polynomial()

Return the zeta polynomial of the poset.

The zeta polynomial of a poset is the unique polynomial $Z(q)$ such that for every integer $m > 1$, $Z(m)$ is the number of weakly increasing sequences $x_1 \leq x_2 \leq \cdots \leq x_{m-1}$ of elements of the poset.

The polynomial $Z(q)$ is integral-valued, but generally does not have integer coefficients. It can be computed as

$$Z(q) = \sum_{k \geq 1} \binom{q-2}{k-1} c_k,$$

where c_k is the number of all chains of length k in the poset.

For more information, see section 3.12 of [EnumComb1].

In particular, $Z(2)$ is the number of vertices and $Z(3)$ is the number of intervals.

See also

apozeta_polynomial()

EXAMPLES:

```
sage: posets.ChainPoset(2).zeta_polynomial()
q
sage: posets.ChainPoset(3).zeta_polynomial()
1/2*q^2 + 1/2*q

sage: P = posets.PentagonPoset()
sage: P.zeta_polynomial()
1/6*q^3 + q^2 - 1/6*q
```

(continues on next page)

(continued from previous page)

```
sage: P = posets.DiamondPoset(5)
sage: P.zeta_polynomial()
3/2*q^2 - 1/2*q
```

```
>>> from sage.all import *
>>> posets.ChainPoset(Integer(2)).zeta_polynomial()
q
>>> posets.ChainPoset(Integer(3)).zeta_polynomial()
1/2*q^2 + 1/2*q

>>> P = posets.PentagonPoset()
>>> P.zeta_polynomial()
1/6*q^3 + q^2 - 1/6*q

>>> P = posets.DiamondPoset(Integer(5))
>>> P.zeta_polynomial()
3/2*q^2 - 1/2*q
```

class sage.combinat.posets.posets.**FinitePosets_n**(*n*)

Bases: UniqueRepresentation, Parent

The finite enumerated set of all posets on n elements, up to an isomorphism.

EXAMPLES:

```
sage: P = Posets(3)
sage: P.cardinality()
5
sage: for p in P: print(p.cover_relations())
[[1, 2], [0, 2]]
[[0, 1], [0, 2]]
[[0, 2]]
[[0, 1], [1, 2]]
[]
```

```
>>> from sage.all import *
>>> P = Posets(Integer(3))
>>> P.cardinality()
5
>>> for p in P: print(p.cover_relations())
[[1, 2], [0, 2]]
[[0, 1], [0, 2]]
[[0, 2]]
[[0, 1], [1, 2]]
[]
```

cardinality(*from_iterator=False*)

Return the cardinality of this object.

Note

By default, this returns pre-computed values obtained from the On-Line Encyclopedia of Integer Sequences (OEIS sequence A000112). To override this, pass the argument `from_iterator=True`.

EXAMPLES:

```
sage: P = Posets(3)
sage: P.cardinality()
5
sage: P.cardinality(from_iterator=True)
5
```

```
>>> from sage.all import *
>>> P = Posets(Integer(3))
>>> P.cardinality()
5
>>> P.cardinality(from_iterator=True)
5
```

`sage.combinat.posets.posets.Poset`(*data=None*, *element_labels=None*, *cover_relations=False*, *linear_extension=False*, *category=None*, *facade=None*, *key=None*)

Construct a finite poset from various forms of input data.

INPUT:

- `data` – different input are accepted by this constructor:
  1. A two-element list or tuple `(E, R)`, where `E` is a collection of elements of the poset and `R` is a collection of relations `x <= y`, each represented as a two-element list/tuple/iterable such as `[x, y]`. The poset is then the transitive closure of the provided relations. If `cover_relations=True`, then `R` is assumed to contain exactly the cover relations of the poset. If `E` is empty, then `E` is taken to be the set of elements appearing in the relations `R`.
  2. A two-element list or tuple `(E, f)`, where `E` is the set of elements of the poset and `f` is a function such that, for any pair `x, y` of elements of `E`, `f(x, y)` returns whether `x <= y`. If `cover_relations=True`, then `f(x, y)` should instead return whether `x` is covered by `y`.
  3. A dictionary of upper covers: `data[x]` is a list of the elements that cover the element x in the poset.
  4. A list or tuple of upper covers: `data[x]` is a list of the elements that cover the element x in the poset.

     If the set of elements is not a set of consecutive integers starting from zero, then:

     – every element must appear in the data, for example in its own entry.

     – `data` must be ordered in the same way as sorted elements.

     Warning

     If data is a list or tuple of length 2, then it is handled by the case 2 above.

  5. An acyclic, loop-free and multi-edge free `DiGraph`. If `cover_relations` is `True`, then the edges of the digraph are assumed to correspond to the cover relations of the poset. Otherwise, the cover relations are computed.
  6. A previously constructed poset (the poset itself is returned).
- `element_labels` – (default: `None`) an optional list or dictionary of objects that label the poset elements

- `cover_relations` – boolean (default: `False`); whether the data can be assumed to describe a directed acyclic graph whose arrows are cover relations. Otherwise, the cover relations are first computed.
- `linear_extension` – boolean (default: `False`); whether to use the provided list of elements as default linear extension for the poset. Otherwise a linear extension is computed. If the data is given as the pair `(E, f)`, then `E` is taken to be the linear extension.
- `facade` – boolean or `None` (default); whether the `Poset()`'s elements should be wrapped to make them aware of the Poset they belong to.
  - If `facade = True`, the `Poset()`'s elements are exactly those given as input.
  - If `facade = False`, the `Poset()`'s elements will become `PosetElement` objects.
  - If `facade = None` (default) the expected behaviour is the behaviour of `facade = True`, unless the opposite can be deduced from the context (i.e. for instance if a `Poset()` is built from another `Poset()`, itself built with `facade = False`)

OUTPUT:

`FinitePoset` – an instance of the `FinitePoset` class.

If `category` is specified, then the poset is created in this category instead of `FinitePosets`.

See also

`Posets`, `Posets`, `FinitePosets`

EXAMPLES:

1. Elements and cover relations:

```
sage: elms = [1,2,3,4,5,6,7]
sage: rels = [[1,2],[3,4],[4,5],[2,5]]
sage: Poset((elms, rels), cover_relations = True, facade = False)
Finite poset containing 7 elements
```

```
>>> from sage.all import *
>>> elms = [Integer(1),Integer(2),Integer(3),Integer(4),Integer(5),Integer(6),
↪Integer(7)]
>>> rels = [[Integer(1),Integer(2)],[Integer(3),Integer(4)],[Integer(4),
↪Integer(5)],[Integer(2),Integer(5)]]
>>> Poset((elms, rels), cover_relations = True, facade = False)
Finite poset containing 7 elements
```

Elements and non-cover relations:

```
sage: elms = [1,2,3,4]
sage: rels = [[1,2],[1,3],[1,4],[2,3],[2,4],[3,4]]
sage: P = Poset( [elms,rels] ,cover_relations=False); P
Finite poset containing 4 elements
sage: P.cover_relations()
[[1, 2], [2, 3], [3, 4]]
```

```
>>> from sage.all import *
>>> elms = [Integer(1),Integer(2),Integer(3),Integer(4)]
>>> rels = [[Integer(1),Integer(2)],[Integer(1),Integer(3)],[Integer(1),
```

(continues on next page)

(continued from previous page)

```
↪Integer(4)],[Integer(2),Integer(3)],[Integer(2),Integer(4)],[Integer(3),
↪Integer(4)]]
>>> P = Poset( [elms,rels] ,cover_relations=False); P
Finite poset containing 4 elements
>>> P.cover_relations()
[[1, 2], [2, 3], [3, 4]]
```

2. Elements and function: the standard permutations of [1, 2, 3, 4] with the Bruhat order:

```
sage: elms = Permutations(4)
sage: fcn = lambda p,q : p.bruhat_lequal(q)
sage: Poset((elms, fcn))
Finite poset containing 24 elements
```

```
>>> from sage.all import *
>>> elms = Permutations(Integer(4))
>>> fcn = lambda p,q : p.bruhat_lequal(q)
>>> Poset((elms, fcn))
Finite poset containing 24 elements
```

With a function that identifies the cover relations: the set partitions of $\{1, 2, 3\}$ ordered by refinement:

```
sage: # needs sage.combinat
sage: elms = SetPartitions(3)
sage: def fcn(A, B):
....:     if len(A) != len(B)+1:
....:         return False
....:     for a in A:
....:         if not any(set(a).issubset(b) for b in B):
....:             return False
....:     return True
sage: Poset((elms, fcn), cover_relations=True)
Finite poset containing 5 elements
```

```
>>> from sage.all import *
>>> # needs sage.combinat
>>> elms = SetPartitions(Integer(3))
>>> def fcn(A, B):
...     if len(A) != len(B)+Integer(1):
...         return False
...     for a in A:
...         if not any(set(a).issubset(b) for b in B):
...             return False
...     return True
>>> Poset((elms, fcn), cover_relations=True)
Finite poset containing 5 elements
```

3. A dictionary of upper covers:

```
sage: Poset({'a':['b','c'], 'b':['d'], 'c':['d'], 'd':[]})
Finite poset containing 4 elements
```

```
>>> from sage.all import *
>>> Poset({'a':['b','c'], 'b':['d'], 'c':['d'], 'd':[]})
Finite poset containing 4 elements
```

4. A list of upper covers, with range(5) as set of vertices:

```
sage: Poset([[1,2],[4],[3],[4],[]])
Finite poset containing 5 elements
```

```
>>> from sage.all import *
>>> Poset([[Integer(1),Integer(2)],[Integer(4)],[Integer(3)],[Integer(4)],[]])
Finite poset containing 5 elements
```

A list of upper covers, with letters as vertices:

```
sage: Poset([["a","b"],["b","c"],["c"]])
Finite poset containing 3 elements
```

```
>>> from sage.all import *
>>> Poset([["a","b"],["b","c"],["c"]])
Finite poset containing 3 elements
```

A list of upper covers and a dictionary of labels:

```
sage: elm_labs = {0:"a",1:"b",2:"c",3:"d",4:"e"}
sage: P = Poset([[1,2],[4],[3],[4],[]], elm_labs, facade=False)
sage: P.list()
[a, b, c, d, e]
```

```
>>> from sage.all import *
>>> elm_labs = {Integer(0):"a",Integer(1):"b",Integer(2):"c",Integer(3):"d",
↪Integer(4):"e"}
>>> P = Poset([[Integer(1),Integer(2)],[Integer(4)],[Integer(3)],[Integer(4)],
↪[]], elm_labs, facade=False)
>>> P.list()
[a, b, c, d, e]
```

Warning

The special case where the argument data is a list or tuple of length 2 is handled by the case 2. So you cannot use this method to input a 2-element poset.

5. An acyclic DiGraph.

```
sage: dag = DiGraph({0:[2,3], 1:[3,4], 2:[5], 3:[5], 4:[5]})
sage: Poset(dag)
Finite poset containing 6 elements
```

```
>>> from sage.all import *
>>> dag = DiGraph({Integer(0):[Integer(2),Integer(3)], Integer(1):[Integer(3),
↪Integer(4)], Integer(2):[Integer(5)], Integer(3):[Integer(5)],␣
```

(continues on next page)

(continued from previous page)

```
↪Integer(4):[Integer(5)]})
>>> Poset(dag)
Finite poset containing 6 elements
```

Any directed acyclic graph without loops or multiple edges, as long as `cover_relations=False`:

```
sage: dig = DiGraph({0:[2,3], 1:[3,4,5], 2:[5], 3:[5], 4:[5]})
sage: dig.allows_multiple_edges()
False
sage: dig.allows_loops()
False
sage: dig.transitive_reduction() == dig
False
sage: Poset(dig, cover_relations=False)
Finite poset containing 6 elements
sage: Poset(dig, cover_relations=True)
Traceback (most recent call last):
...
ValueError: Hasse diagram is not transitively reduced
```

```
>>> from sage.all import *
>>> dig = DiGraph({Integer(0):[Integer(2),Integer(3)], Integer(1):[Integer(3),
↪Integer(4),Integer(5)], Integer(2):[Integer(5)], Integer(3):[Integer(5)],␣
↪Integer(4):[Integer(5)]})
>>> dig.allows_multiple_edges()
False
>>> dig.allows_loops()
False
>>> dig.transitive_reduction() == dig
False
>>> Poset(dig, cover_relations=False)
Finite poset containing 6 elements
>>> Poset(dig, cover_relations=True)
Traceback (most recent call last):
...
ValueError: Hasse diagram is not transitively reduced
```

Default Linear extension

Every poset P obtained with `Poset` comes equipped with a default linear extension, which is also used for enumerating its elements. By default, this linear extension is computed, and has no particular significance:

```
sage: P = Poset((divisors(12), attrcall("divides")))
sage: P.list()
[1, 2, 4, 3, 6, 12]
sage: P.linear_extension()
[1, 2, 4, 3, 6, 12]
```

```
>>> from sage.all import *
>>> P = Poset((divisors(Integer(12)), attrcall("divides")))
>>> P.list()
[1, 2, 4, 3, 6, 12]
```

(continues on next page)

(continued from previous page)

```
>>> P.linear_extension()
[1, 2, 4, 3, 6, 12]
```

You may enforce a specific linear extension using the `linear_extension` option:

```
sage: P = Poset((divisors(12), attrcall("divides")), linear_extension=True)
sage: P.list()
[1, 2, 3, 4, 6, 12]
sage: P.linear_extension()
[1, 2, 3, 4, 6, 12]
```

```
>>> from sage.all import *
>>> P = Poset((divisors(Integer(12)), attrcall("divides")), linear_extension=True)
>>> P.list()
[1, 2, 3, 4, 6, 12]
>>> P.linear_extension()
[1, 2, 3, 4, 6, 12]
```

Depending on popular request, `Poset` might eventually get modified to always use the provided list of elements as default linear extension, when it is one.

See also

FinitePoset.linear_extensions()

Facade posets

When `facade = False`, the elements of a poset are wrapped so as to make them aware that they belong to that poset:

```
sage: P = Poset(DiGraph({'d':['c','b'],'c':['a'],'b':['a']}), facade = False)
sage: d,c,b,a = list(P)
sage: a.parent() is P
True
```

```
>>> from sage.all import *
>>> P = Poset(DiGraph({'d':['c','b'],'c':['a'],'b':['a']}), facade = False)
>>> d,c,b,a = list(P)
>>> a.parent() is P
True
```

This allows for comparing elements according to P:

```
sage: c < a
True
```

```
>>> from sage.all import *
>>> c < a
True
```

However, this may have surprising effects:

```
sage: my_elements = ['a','b','c','d']
sage: any(x in my_elements for x in P)
False
```

```
>>> from sage.all import *
>>> my_elements = ['a','b','c','d']
>>> any(x in my_elements for x in P)
False
```

and can be annoying when one wants to manipulate the elements of the poset:

```
sage: a + b
Traceback (most recent call last):
...
TypeError: unsupported operand parent(s) for +: 'Finite poset containing 4␣
↪elements' and 'Finite poset containing 4 elements'
sage: a.element + b.element
'ab'
```

```
>>> from sage.all import *
>>> a + b
Traceback (most recent call last):
...
TypeError: unsupported operand parent(s) for +: 'Finite poset containing 4␣
↪elements' and 'Finite poset containing 4 elements'
>>> a.element + b.element
'ab'
```

By default, facade posets are constructed instead:

```
sage: P = Poset(DiGraph({'d':['c','b'],'c':['a'],'b':['a']}))
```

```
>>> from sage.all import *
>>> P = Poset(DiGraph({'d':['c','b'],'c':['a'],'b':['a']}))
```

In this example, the elements of the poset remain plain strings:

```
sage: d,c,b,a = list(P)
sage: type(a)
<class 'str'>
```

```
>>> from sage.all import *
>>> d,c,b,a = list(P)
>>> type(a)
<class 'str'>
```

Of course, those strings are not aware of P. So to compare two such strings, one needs to query P:

```
sage: a < b
True
sage: P.lt(a,b)
False
```

```
>>> from sage.all import *
>>> a < b
True
>>> P.lt(a,b)
False
```

which models the usual mathematical notation $a <_P b$.

Most operations seem to still work, but at this point there is no guarantee whatsoever:

```
sage: P.list()
['d', 'c', 'b', 'a']
sage: P.principal_order_ideal('a')
['d', 'c', 'b', 'a']
sage: P.principal_order_ideal('b')
['d', 'b']
sage: P.principal_order_ideal('d')
['d']
sage: TestSuite(P).run()
```

```
>>> from sage.all import *
>>> P.list()
['d', 'c', 'b', 'a']
>>> P.principal_order_ideal('a')
['d', 'c', 'b', 'a']
>>> P.principal_order_ideal('b')
['d', 'b']
>>> P.principal_order_ideal('d')
['d']
>>> TestSuite(P).run()
```

Warning

`DiGraph` is used to construct the poset, and the vertices of a `DiGraph` are converted to plain Python `int`'s if they are `Integer`'s:

```
sage: G = DiGraph({0:[2,3], 1:[3,4], 2:[5], 3:[5], 4:[5]})
sage: type(G.vertices(sort=True)[0])
<class 'int'>
```

```
>>> from sage.all import *
>>> G = DiGraph({Integer(0):[Integer(2),Integer(3)], Integer(1):[Integer(3),
↪Integer(4)], Integer(2):[Integer(5)], Integer(3):[Integer(5)],
↪Integer(4):[Integer(5)]})
>>> type(G.vertices(sort=True)[Integer(0)])
<class 'int'>
```

This is worked around by systematically converting back the vertices of a poset to `Integer`'s if they are `int`'s:

```
sage: P = Poset((divisors(15), attrcall("divides")), facade = False)
sage: type(P.an_element().element)
<class 'sage.rings.integer.Integer'>

sage: P = Poset((divisors(15), attrcall("divides")), facade=True)
sage: type(P.an_element())
<class 'sage.rings.integer.Integer'>
```

```
>>> from sage.all import *
>>> P = Poset((divisors(Integer(15)), attrcall("divides")), facade = False)
>>> type(P.an_element().element)
<class 'sage.rings.integer.Integer'>

>>> P = Poset((divisors(Integer(15)), attrcall("divides")), facade=True)
>>> type(P.an_element())
<class 'sage.rings.integer.Integer'>
```

This may be abusive:

```
sage: P = Poset((range(5), operator.le), facade = True)
sage: P.an_element().parent()
Integer Ring
```

```
>>> from sage.all import *
>>> P = Poset((range(Integer(5)), operator.le), facade = True)
>>> P.an_element().parent()
Integer Ring
```

Unique representation

As most parents, *Poset* have unique representation (see `UniqueRepresentation`). Namely if two posets are created from two equal data, then they are not only equal but actually identical:

```
sage: data1 = [[1,2],[3],[3]]
sage: data2 = [[1,2],[3],[3]]
sage: P1 = Poset(data1)
sage: P2 = Poset(data2)
sage: P1 == P2
True
sage: P1 is P2
True
```

```
>>> from sage.all import *
>>> data1 = [[Integer(1),Integer(2)],[Integer(3)],[Integer(3)]]
>>> data2 = [[Integer(1),Integer(2)],[Integer(3)],[Integer(3)]]
>>> P1 = Poset(data1)
>>> P2 = Poset(data2)
>>> P1 == P2
True
>>> P1 is P2
True
```

In situations where this behaviour is not desired, one can use the `key` option:

```
sage: P1 = Poset(data1, key = "foo")
sage: P2 = Poset(data2, key = "bar")
sage: P1 is P2
False
sage: P1 == P2
False
```

```
>>> from sage.all import *
>>> P1 = Poset(data1, key = "foo")
>>> P2 = Poset(data2, key = "bar")
>>> P1 is P2
False
>>> P1 == P2
False
```

key can be any hashable value and is passed down to UniqueRepresentation. It is otherwise ignored by the poset constructor.

sage.combinat.posets.posets.**is_poset**(*dig*)

Return True if a directed graph is acyclic and transitively reduced, and False otherwise.

EXAMPLES:

```
sage: from sage.combinat.posets.posets import is_poset
sage: dig = DiGraph({0:[2, 3], 1:[3, 4, 5], 2:[5], 3:[5], 4:[5]})
sage: is_poset(dig)
False
sage: is_poset(dig.transitive_reduction())
True
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.posets import is_poset
>>> dig = DiGraph({Integer(0):[Integer(2), Integer(3)], Integer(1):[Integer(3),␣
↪Integer(4), Integer(5)], Integer(2):[Integer(5)], Integer(3):[Integer(5)],␣
↪Integer(4):[Integer(5)]})
>>> is_poset(dig)
False
>>> is_poset(dig.transitive_reduction())
True
```

5.1.187 q-Analogues

sage.combinat.q_analogues.**gaussian_binomial**(*n*, *k*, *q=None*, *algorithm='auto'*)

This is an alias of *q_binomial()*.

See *q_binomial()* for the full documentation.

EXAMPLES:

```
sage: gaussian_binomial(4,2)
q^4 + q^3 + 2*q^2 + q + 1
```

```
>>> from sage.all import *
>>> gaussian_binomial(Integer(4),Integer(2))
q^4 + q^3 + 2*q^2 + q + 1
```

sage.combinat.q_analogues.**gaussian_multinomial**(*seq*, *q=None*, *binomial_algorithm='auto'*)

Return the q-multinomial coefficient.

This is also known as the Gaussian multinomial coefficient, and is defined by

$$\binom{n}{k_1, k_2, \ldots, k_m}_q = \frac{[n]_q!}{[k_1]_q![k_2]_q! \cdots [k_m]_q!}$$

where $n = k_1 + k_2 + \cdots + k_m$.

If q is unspecified, then the variable is the generator q for a univariate polynomial ring over the integers.

INPUT:

- `seq` – an iterable of the values k_1 to k_m defined above
- `q` – (default: `None`) the variable q; if `None`, then use a default variable in $\mathbf{Z}[q]$
- `binomial_algorithm` – (default: `'auto'`) the algorithm to use in `q_binomial()`; see possible values there

ALGORITHM:

We use the equivalent formula

$$\binom{k_1 + \cdots + k_m}{k_1, \ldots, k_m}_q = \prod_{i=1}^{m} \binom{\sum_{j=1}^{i} k_j}{k_i}_q.$$

EXAMPLES:

```
sage: from sage.combinat.q_analogues import q_multinomial
sage: q_multinomial([1,2,1])
q^5 + 2*q^4 + 3*q^3 + 3*q^2 + 2*q + 1
sage: q_multinomial([1,2,1], q=1) == multinomial([1,2,1])
True
sage: q_multinomial((3,2)) == q_binomial(5,3)
True
sage: q_multinomial([])
1
```

```
>>> from sage.all import *
>>> from sage.combinat.q_analogues import q_multinomial
>>> q_multinomial([Integer(1),Integer(2),Integer(1)])
q^5 + 2*q^4 + 3*q^3 + 3*q^2 + 2*q + 1
>>> q_multinomial([Integer(1),Integer(2),Integer(1)], q=Integer(1)) ==␣
↪multinomial([Integer(1),Integer(2),Integer(1)])
True
>>> q_multinomial((Integer(3),Integer(2))) == q_binomial(Integer(5),Integer(3))
True
>>> q_multinomial([])
1
```

`sage.combinat.q_analogues.`**`number_of_irreducible_polynomials`**`(`*n*, *q=None*, *m=1*`)`

Return the number of monic irreducible polynomials of degree `n` in `m` variables over the finite field with `q` elements.

If `q` is not given, the result is returned as an integer-valued polynomial in $\mathbf{Q}[q]$.

INPUT:

- `n` – positive integer
- `q` – `None` (default) or a prime power

- m – positive integer (default: 1)

OUTPUT: integer or integer-valued polynomial over **Q**

EXAMPLES:

```
sage: number_of_irreducible_polynomials(8, q=2)
30
sage: number_of_irreducible_polynomials(9, q=9)
43046640
sage: number_of_irreducible_polynomials(5, q=11, m=3)
2079650567184059145647246367401741345157369643207055703168
```

```
>>> from sage.all import *
>>> number_of_irreducible_polynomials(Integer(8), q=Integer(2))
30
>>> number_of_irreducible_polynomials(Integer(9), q=Integer(9))
43046640
>>> number_of_irreducible_polynomials(Integer(5), q=Integer(11), m=Integer(3))
2079650567184059145647246367401741345157369643207055703168
```

```
sage: poly = number_of_irreducible_polynomials(12); poly
1/12*q^12 - 1/12*q^6 - 1/12*q^4 + 1/12*q^2
sage: poly(5) == number_of_irreducible_polynomials(12, q=5)
True
sage: poly = number_of_irreducible_polynomials(5, m=3); poly
q^55 + q^54 + q^53 + q^52 + q^51 + q^50 + ... + 1/5*q^5 - 1/5*q^3 - 1/5*q^2 - 1/
↪5*q
sage: poly(11) == number_of_irreducible_polynomials(5, q=11, m=3)
True
```

```
>>> from sage.all import *
>>> poly = number_of_irreducible_polynomials(Integer(12)); poly
1/12*q^12 - 1/12*q^6 - 1/12*q^4 + 1/12*q^2
>>> poly(Integer(5)) == number_of_irreducible_polynomials(Integer(12),␣
↪q=Integer(5))
True
>>> poly = number_of_irreducible_polynomials(Integer(5), m=Integer(3)); poly
q^55 + q^54 + q^53 + q^52 + q^51 + q^50 + ... + 1/5*q^5 - 1/5*q^3 - 1/5*q^2 - 1/
↪5*q
>>> poly(Integer(11)) == number_of_irreducible_polynomials(Integer(5),␣
↪q=Integer(11), m=Integer(3))
True
```

This function is *much* faster than enumerating the polynomials:

```
sage: num = number_of_irreducible_polynomials(99, q=101)
sage: num.bit_length()
653
```

```
>>> from sage.all import *
>>> num = number_of_irreducible_polynomials(Integer(99), q=Integer(101))
>>> num.bit_length()
653
```

ALGORITHM:

In the univariate case, classical formula $\frac{1}{n}\sum_{d|n}\mu(n/d)q^d$ using the Möbius function μ; see `moebius()`.

In the multivariate case, formula from [Bodin2007], independently [Alekseyev2006].

`sage.combinat.q_analogues.q_binomial(n, k, q=None, algorithm='auto')`

Return the q-binomial coefficient.

This is also known as the Gaussian binomial coefficient, and is defined by

$$\binom{n}{k}_q = \frac{(1-q^n)(1-q^{n-1})\cdots(1-q^{n-k+1})}{(1-q)(1-q^2)\cdots(1-q^k)}.$$

See Wikipedia article Gaussian_binomial_coefficient.

If q is unspecified, then the variable is the generator q for a univariate polynomial ring over the integers.

INPUT:

- `n`, `k` – the values n and k defined above
- `q` – (default: `None`) the variable q; if `None`, then use a default variable in $\mathbf{Z}[q]$
- `algorithm` – (default: `'auto'`) the algorithm to use and can be one of the following:
  - `'auto'` – automatically choose the algorithm; see the algorithm section below
  - `'naive'` – use the naive algorithm
  - `'cyclotomic'` – use cyclotomic algorithm

ALGORITHM:

The naive algorithm uses the product formula. The cyclotomic algorithm uses a product of cyclotomic polynomials (cf. [CH2006]).

When the algorithm is set to `'auto'`, we choose according to the following rules:

- If `q` is a polynomial:

  When `n` is small or `k` is small with respect to `n`, one uses the naive algorithm. When both `n` and `k` are big, one uses the cyclotomic algorithm.
- If `q` is in the symbolic ring (or a symbolic subring), one uses the cyclotomic algorithm.
- Otherwise one uses the naive algorithm, unless `q` is a root of unity, then one uses the cyclotomic algorithm.

EXAMPLES:

By default, the variable is the generator of $\mathbf{Z}[q]$:

```
sage: from sage.combinat.q_analogues import q_binomial
sage: g = q_binomial(5,1) ; g
q^4 + q^3 + q^2 + q + 1
sage: g.parent()
Univariate Polynomial Ring in q over Integer Ring
```

```
>>> from sage.all import *
>>> from sage.combinat.q_analogues import q_binomial
>>> g = q_binomial(Integer(5),Integer(1)) ; g
q^4 + q^3 + q^2 + q + 1
>>> g.parent()
Univariate Polynomial Ring in q over Integer Ring
```

For $n \geq 0$, the q-binomial coefficient vanishes unless $0 \leq k \leq n$:

```
sage: q_binomial(4,5)
0
sage: q_binomial(5,-1)
0
```

```
>>> from sage.all import *
>>> q_binomial(Integer(4),Integer(5))
0
>>> q_binomial(Integer(5),-Integer(1))
0
```

For $k \geq 0$, the q-binomial coefficient is extended as a polynomial in n:

```
sage: q_binomial(-4,1)
-q^-4 - q^-3 - q^-2 - q^-1
sage: q_binomial(-2,3)
-q^-9 - q^-8 - q^-7 - q^-6
```

```
>>> from sage.all import *
>>> q_binomial(-Integer(4),Integer(1))
-q^-4 - q^-3 - q^-2 - q^-1
>>> q_binomial(-Integer(2),Integer(3))
-q^-9 - q^-8 - q^-7 - q^-6
```

Other variables can be used, given as third parameter:

```
sage: p = ZZ['p'].gen()
sage: q_binomial(4,2,p)
p^4 + p^3 + 2*p^2 + p + 1
```

```
>>> from sage.all import *
>>> p = ZZ['p'].gen()
>>> q_binomial(Integer(4),Integer(2),p)
p^4 + p^3 + 2*p^2 + p + 1
```

The third parameter can also be arbitrary values:

```
sage: q_binomial(5,1,2) == g.subs(q=2)
True
sage: q_binomial(5,1,1)
5
sage: q_binomial(4,2,-1)
2
sage: q_binomial(4,2,3.14)
152.030056160000
sage: R = GF((5, 2), 't')
sage: t = R.gen(0)
sage: q_binomial(6, 3, t)
2*t + 3
```

```
>>> from sage.all import *
>>> q_binomial(Integer(5),Integer(1),Integer(2)) == g.subs(q=Integer(2))
True
>>> q_binomial(Integer(5),Integer(1),Integer(1))
5
>>> q_binomial(Integer(4),Integer(2),-Integer(1))
2
>>> q_binomial(Integer(4),Integer(2),RealNumber('3.14'))
152.030056160000
>>> R = GF((Integer(5), Integer(2)), 't')
>>> t = R.gen(Integer(0))
>>> q_binomial(Integer(6), Integer(3), t)
2*t + 3
```

We can also do this for more complicated objects such as matrices or symmetric functions:

```
sage: q_binomial(4,2,matrix([[2,1],[-1,3]]))
[ -6  84]
[-84  78]
sage: Sym = SymmetricFunctions(QQ)
sage: s = Sym.schur()
sage: q_binomial(4,1, s[2]+s[1])
s[] + s[1] + s[1, 1] + s[1, 1, 1] + 2*s[2] + 4*s[2, 1] + 3*s[2, 1, 1]
 + 4*s[2, 2] + 3*s[2, 2, 1] + s[2, 2, 2] + 3*s[3] + 7*s[3, 1] + 3*s[3, 1, 1]
 + 6*s[3, 2] + 2*s[3, 2, 1] + s[3, 3] + 4*s[4] + 6*s[4, 1] + s[4, 1, 1]
 + 3*s[4, 2] + 3*s[5] + 2*s[5, 1] + s[6]
```

```
>>> from sage.all import *
>>> q_binomial(Integer(4),Integer(2),matrix([[Integer(2),Integer(1)],[-Integer(1),
↪Integer(3)]]))
[ -6  84]
[-84  78]
>>> Sym = SymmetricFunctions(QQ)
>>> s = Sym.schur()
>>> q_binomial(Integer(4),Integer(1), s[Integer(2)]+s[Integer(1)])
s[] + s[1] + s[1, 1] + s[1, 1, 1] + 2*s[2] + 4*s[2, 1] + 3*s[2, 1, 1]
 + 4*s[2, 2] + 3*s[2, 2, 1] + s[2, 2, 2] + 3*s[3] + 7*s[3, 1] + 3*s[3, 1, 1]
 + 6*s[3, 2] + 2*s[3, 2, 1] + s[3, 3] + 4*s[4] + 6*s[4, 1] + s[4, 1, 1]
 + 3*s[4, 2] + 3*s[5] + 2*s[5, 1] + s[6]
```

- Frédéric Chapoton, David Joyner and William Stein

sage.combinat.q_analogues.**q_catalan_number**(*n*, *q=None*, *m=1*)

Return the q-Catalan number of index n.

INPUT:

- `q` – (optional) variable
- `m` – (optional) integer; to get instead the `m`-Fuss-Catalan numbers

If q is unspecified, then it defaults to using the generator q for a univariate polynomial ring over the integers.

There are several q-Catalan numbers. This procedure returns the one which can be written using the q-binomial coefficients.

EXAMPLES:

```
sage: from sage.combinat.q_analogues import q_catalan_number
sage: q_catalan_number(4)
q^12 + q^10 + q^9 + 2*q^8 + q^7 + 2*q^6 + q^5 + 2*q^4 + q^3 + q^2 + 1

sage: p = ZZ['p'].0
sage: q_catalan_number(4, p)
p^12 + p^10 + p^9 + 2*p^8 + p^7 + 2*p^6 + p^5 + 2*p^4 + p^3 + p^2 + 1

sage: q_catalan_number(3, m=2)
q^12 + q^10 + q^9 + q^8 + q^7 + 2*q^6 + q^5 + q^4 + q^3 + q^2 + 1
```

```
>>> from sage.all import *
>>> from sage.combinat.q_analogues import q_catalan_number
>>> q_catalan_number(Integer(4))
q^12 + q^10 + q^9 + 2*q^8 + q^7 + 2*q^6 + q^5 + 2*q^4 + q^3 + q^2 + 1

>>> p = ZZ['p'].gen(0)
>>> q_catalan_number(Integer(4), p)
p^12 + p^10 + p^9 + 2*p^8 + p^7 + 2*p^6 + p^5 + 2*p^4 + p^3 + p^2 + 1

>>> q_catalan_number(Integer(3), m=Integer(2))
q^12 + q^10 + q^9 + q^8 + q^7 + 2*q^6 + q^5 + q^4 + q^3 + q^2 + 1
```

sage.combinat.q_analogues.**q_factorial**(*n*, *q=None*)

Return the q-analogue of the factorial $n!$.

This is the product

$$[1]_q[2]_q \cdots [n]_q = 1 \cdot (1+q) \cdot (1+q+q^2) \cdots (1+q+q^2+\cdots+q^{n-1}).$$

If q is unspecified, then this function defaults to using the generator q for a univariate polynomial ring over the integers.

EXAMPLES:

```
sage: from sage.combinat.q_analogues import q_factorial
sage: q_factorial(3)
q^3 + 2*q^2 + 2*q + 1
sage: p = ZZ['p'].0
sage: q_factorial(3, p)
p^3 + 2*p^2 + 2*p + 1
```

```
>>> from sage.all import *
>>> from sage.combinat.q_analogues import q_factorial
>>> q_factorial(Integer(3))
q^3 + 2*q^2 + 2*q + 1
>>> p = ZZ['p'].gen(0)
>>> q_factorial(Integer(3), p)
p^3 + 2*p^2 + 2*p + 1
```

The q-analogue of $n!$ is only defined for n a nonnegative integer (Issue #11411):

```
sage: q_factorial(-2)
Traceback (most recent call last):
...
ValueError: argument (-2) must be a nonnegative integer
```

```
>>> from sage.all import *
>>> q_factorial(-Integer(2))
Traceback (most recent call last):
...
ValueError: argument (-2) must be a nonnegative integer
```

sage.combinat.q_analogues.**q_int**(*n*, *q=None*)

Return the q-analogue of the integer n.

The q-analogue of the integer n is given by

$$[n]_q = \begin{cases} 1 + q + \cdots + q^{n-1}, & \text{if } n \geq 0, \\ -q^{-n}[-n]_q, & \text{if } n \leq 0. \end{cases}$$

Consequently, if $q = 1$ then $[n]_1 = n$ and if $q \neq 1$ then $[n]_q = (q^n - 1)/(q - 1)$.

If the argument q is not specified then it defaults to the generator q of the univariate polynomial ring over the integers.

EXAMPLES:

```
sage: from sage.combinat.q_analogues import q_int
sage: q_int(3)
q^2 + q + 1
sage: q_int(-3)
-q^-3 - q^-2 - q^-1
sage: p = ZZ['p'].0
sage: q_int(3,p)
p^2 + p + 1
sage: q_int(3/2)
Traceback (most recent call last):
...
ValueError: 3/2 must be an integer
```

```
>>> from sage.all import *
>>> from sage.combinat.q_analogues import q_int
>>> q_int(Integer(3))
q^2 + q + 1
>>> q_int(-Integer(3))
-q^-3 - q^-2 - q^-1
>>> p = ZZ['p'].gen(0)
>>> q_int(Integer(3),p)
p^2 + p + 1
>>> q_int(Integer(3)/Integer(2))
Traceback (most recent call last):
...
ValueError: 3/2 must be an integer
```

sage.combinat.q_analogues.**q_jordan**(*q=None*)

Return the q-Jordan number of t.

If q is the power of a prime number, the output is the number of complete flags in $\mathbf{F}_q^N$ (where N is the size of t) stable under a linear nilpotent endomorphism f_t whose Jordan type is given by t, i.e. such that for all i:

$$\dim(\ker f_t^i) = t[0] + \cdots + t[i-1]$$

If q is unspecified, then it defaults to using the generator q for a univariate polynomial ring over the integers.

The result is cached.

INPUT:

- t – integer partition, or an argument accepted by *Partition*
- q – (default: None) the variable q; if None, then use a default variable in $\mathbf{Z}[q]$

EXAMPLES:

```
sage: from sage.combinat.q_analogues import q_jordan
sage: [q_jordan(mu, 2) for mu in Partitions(5)]
[9765, 1029, 213, 93, 29, 9, 1]
sage: [q_jordan(mu, 2) for mu in Partitions(6)]
[615195, 40635, 5643, 2331, 1491, 515, 147, 87, 47, 11, 1]
sage: q_jordan([3,2,1])
16*q^4 + 24*q^3 + 14*q^2 + 5*q + 1
sage: q_jordan([2,1], x)                                                    #␣
↪needs sage.symbolic
2*x + 1
```

```
>>> from sage.all import *
>>> from sage.combinat.q_analogues import q_jordan
>>> [q_jordan(mu, Integer(2)) for mu in Partitions(Integer(5))]
[9765, 1029, 213, 93, 29, 9, 1]
>>> [q_jordan(mu, Integer(2)) for mu in Partitions(Integer(6))]
[615195, 40635, 5643, 2331, 1491, 515, 147, 87, 47, 11, 1]
>>> q_jordan([Integer(3),Integer(2),Integer(1)])
16*q^4 + 24*q^3 + 14*q^2 + 5*q + 1
>>> q_jordan([Integer(2),Integer(1)], x)                                    ␣
↪              # needs sage.symbolic
2*x + 1
```

If the partition is trivial (i.e. has only one part), we get the q-factorial (in this case, the nilpotent endomorphism is necessarily 0):

```
sage: from sage.combinat.q_analogues import q_factorial
sage: q_jordan([5]) == q_factorial(5)
True
sage: q_jordan([11], 5) == q_factorial(11, 5)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.q_analogues import q_factorial
>>> q_jordan([Integer(5)]) == q_factorial(Integer(5))
True
```

(continues on next page)

(continued from previous page)

```
>>> q_jordan([Integer(11)], Integer(5)) == q_factorial(Integer(11), Integer(5))
True
```

sage.combinat.q_analogues.**q_multinomial**(*seq*, *q=None*, *binomial_algorithm='auto'*)

Return the q-multinomial coefficient.

This is also known as the Gaussian multinomial coefficient, and is defined by

$$\binom{n}{k_1, k_2, \ldots, k_m}_q = \frac{[n]_q!}{[k_1]_q![k_2]_q! \cdots [k_m]_q!}$$

where $n = k_1 + k_2 + \cdots + k_m$.

If q is unspecified, then the variable is the generator q for a univariate polynomial ring over the integers.

INPUT:

- `seq` – an iterable of the values k_1 to k_m defined above
- `q` – (default: `None`) the variable q; if `None`, then use a default variable in $\mathbf{Z}[q]$
- `binomial_algorithm` – (default: `'auto'`) the algorithm to use in `q_binomial()`; see possible values there

ALGORITHM:

We use the equivalent formula

$$\binom{k_1 + \cdots + k_m}{k_1, \ldots, k_m}_q = \prod_{i=1}^{m} \binom{\sum_{j=1}^{i} k_j}{k_i}_q.$$

EXAMPLES:

```
sage: from sage.combinat.q_analogues import q_multinomial
sage: q_multinomial([1,2,1])
q^5 + 2*q^4 + 3*q^3 + 3*q^2 + 2*q + 1
sage: q_multinomial([1,2,1], q=1) == multinomial([1,2,1])
True
sage: q_multinomial((3,2)) == q_binomial(5,3)
True
sage: q_multinomial([])
1
```

```
>>> from sage.all import *
>>> from sage.combinat.q_analogues import q_multinomial
>>> q_multinomial([Integer(1),Integer(2),Integer(1)])
q^5 + 2*q^4 + 3*q^3 + 3*q^2 + 2*q + 1
>>> q_multinomial([Integer(1),Integer(2),Integer(1)], q=Integer(1)) ==␣
↪multinomial([Integer(1),Integer(2),Integer(1)])
True
>>> q_multinomial((Integer(3),Integer(2))) == q_binomial(Integer(5),Integer(3))
True
>>> q_multinomial([])
1
```

sage.combinat.q_analogues.**q_pochhammer**(*n*, *a*, *q=None*)

Return the q-Pochhammer $(a;q)_n$.

The q-Pochhammer symbol is defined by

$$(a;q)_n = \prod_{k=0}^{n-1}(1 - aq^k)$$

with $(a;q)_0 = 1$ for all a, q and $n \in \mathbf{N}$. By using the identity

$$(a;q)_n = \frac{(a;q)_\infty}{(aq^n;q)_\infty},$$

we can extend the definition to $n < 0$ by

$$(a;q)_n = \frac{1}{(aq^n;q)_{-n}} = \prod_{k=1}^{-n}\frac{1}{1 - a/q^k}.$$

EXAMPLES:

```
sage: from sage.combinat.q_analogues import q_pochhammer
sage: q_pochhammer(3, 1/7)
6/343*q^3 - 6/49*q^2 - 6/49*q + 6/7
sage: q_pochhammer(3, 3)
-18*q^3 + 6*q^2 + 6*q - 2
sage: q_pochhammer(3, 1)
0

sage: R.<q> = ZZ[]
sage: q_pochhammer(4, q)
q^10 - q^9 - q^8 + 2*q^5 - q^2 - q + 1
sage: q_pochhammer(4, q^2)
q^14 - q^12 - q^11 - q^10 + q^8 + 2*q^7 + q^6 - q^4 - q^3 - q^2 + 1
sage: q_pochhammer(-3, q)
1/(-q^9 + q^7 + q^6 + q^5 - q^4 - q^3 - q^2 + 1)
```

```
>>> from sage.all import *
>>> from sage.combinat.q_analogues import q_pochhammer
>>> q_pochhammer(Integer(3), Integer(1)/Integer(7))
6/343*q^3 - 6/49*q^2 - 6/49*q + 6/7
>>> q_pochhammer(Integer(3), Integer(3))
-18*q^3 + 6*q^2 + 6*q - 2
>>> q_pochhammer(Integer(3), Integer(1))
0

>>> R = ZZ['q']; (q,) = R._first_ngens(1)
>>> q_pochhammer(Integer(4), q)
q^10 - q^9 - q^8 + 2*q^5 - q^2 - q + 1
>>> q_pochhammer(Integer(4), q**Integer(2))
q^14 - q^12 - q^11 - q^10 + q^8 + 2*q^7 + q^6 - q^4 - q^3 - q^2 + 1
>>> q_pochhammer(-Integer(3), q)
1/(-q^9 + q^7 + q^6 + q^5 - q^4 - q^3 - q^2 + 1)
```

sage.combinat.q_analogues.**q_stirling_number1**(*k*, *q=None*)

Return the (unsigned) q-Stirling number of the first kind.

This is a q-analogue of `sage.combinat.combinat.stirling_number1()` .

INPUT:

- `n`, `k` – integers with $1 \leq k \leq n$
- `q` – variable (default: q)

OUTPUT: a polynomial in the variable q

These polynomials satisfy the recurrence

$$s_{n,k} = s_{n-1,k-1} + [n-1]_q s_{n-1,k}.$$

EXAMPLES:

```
sage: from sage.combinat.q_analogues import q_stirling_number1
sage: q_stirling_number1(4,2)
q^3 + 3*q^2 + 4*q + 3

sage: all(stirling_number1(6,k) == q_stirling_number1(6,k)(1)                #␣
↪needs sage.libs.gap
....:     for k in range(1,6))
True

sage: x = polygen(QQ['q'],'x')
sage: S = sum(q_stirling_number1(5,k)*x**k for k in range(1, 6))
sage: factor(S)                                                               #␣
↪needs sage.libs.singular
x * (x + 1) * (x + q + 1) * (x + q^2 + q + 1) * (x + q^3 + q^2 + q + 1)
```

```
>>> from sage.all import *
>>> from sage.combinat.q_analogues import q_stirling_number1
>>> q_stirling_number1(Integer(4),Integer(2))
q^3 + 3*q^2 + 4*q + 3

>>> all(stirling_number1(Integer(6),k) == q_stirling_number1(Integer(6),
↪k)(Integer(1))                     # needs sage.libs.gap
...     for k in range(Integer(1),Integer(6)))
True

>>> x = polygen(QQ['q'],'x')
>>> S = sum(q_stirling_number1(Integer(5),k)*x**k for k in range(Integer(1),␣
↪Integer(6)))
>>> factor(S)                                                               #␣
↪needs sage.libs.singular
x * (x + 1) * (x + q + 1) * (x + q^2 + q + 1) * (x + q^3 + q^2 + q + 1)
```

sage.combinat.q_analogues.**q_stirling_number2**(*k*, *q=None*)

Return the (unsigned) q-Stirling number of the second kind.

This is a q-analogue of *sage.combinat.combinat.stirling_number2()*.

INPUT:

- n, k – integers with $1 \leq k \leq n$
- q – variable (default: q)

OUTPUT: a polynomial in the variable q

These polynomials satisfy the recurrence

$$S_{n,k} = q^{k-1} S_{n-1,k-1} + [k]_q s_{n-1,k}.$$

EXAMPLES:

```
sage: from sage.combinat.q_analogues import q_stirling_number2
sage: q_stirling_number2(4,2)
q^3 + 3*q^2 + 3*q

sage: all(stirling_number2(6,k) == q_stirling_number2(6,k)(1)
....:     for k in range(7))
True
```

```
>>> from sage.all import *
>>> from sage.combinat.q_analogues import q_stirling_number2
>>> q_stirling_number2(Integer(4),Integer(2))
q^3 + 3*q^2 + 3*q

>>> all(stirling_number2(Integer(6),k) == q_stirling_number2(Integer(6),
↪k)(Integer(1))
...     for k in range(Integer(7)))
True
```

- [Mil1978]

sage.combinat.q_analogues.**q_subgroups_of_abelian_group**(*la*, *mu*, *q=None*, *algorithm='birkhoff'*)

Return the q-number of subgroups of type mu in a finite abelian group of type la.

INPUT:

- la – type of the ambient group as a *Partition*
- mu – type of the subgroup as a *Partition*
- q – (default: None) an indeterminate or a prime number; if None, this defaults to $q \in \mathbf{Z}[q]$
- algorithm – (default: 'birkhoff') the algorithm to use can be one of the following:
  - 'birkhoff – use the Birkhoff formula from [Bu87]
  - 'delsarte' – use the formula from [Delsarte48]

OUTPUT:

The number of subgroups of type mu in a group of type la as a polynomial in q.

ALGORITHM:

Let q be a prime number and $\lambda = (\lambda_1, \ldots, \lambda_l)$ be a partition. A finite abelian q-group is of type λ if it is isomorphic to

$$\mathbf{Z}/q^{\lambda_1}\mathbf{Z} \times \cdots \times \mathbf{Z}/q^{\lambda_l}\mathbf{Z}.$$

The formula from [Bu87] works as follows: Let λ and μ be partitions. Let λ' and μ' denote the conjugate partitions to λ and μ, respectively. The number of subgroups of type μ in a group of type λ is given by

$$\prod_{i=1}^{\mu_1} q^{\mu'_{i+1}(\lambda'_i - \mu'_i)} \binom{\lambda'_i - \mu'_{i+1}}{\mu'_i - \mu'_{i+1}}_q$$

The formula from [Delsarte48] works as follows: Let λ and μ be partitions. Let $(s_1, s_2, \ldots, s_l)$ and $(r_1, r_2, \ldots, r_k)$ denote the parts of the partitions conjugate to λ and μ respectively. Let

$$\mathfrak{F}(\xi_1, \ldots, \xi_k) = \xi_1^{r_2} \xi_2^{r_3} \cdots \xi_{k-1}^{r_k} \prod_{i_1=r_2}^{r_1-1} (\xi_1 - q^{i_1}) \prod_{i_2=r_3}^{r_2-1} (\xi_2 - q^{i_2}) \cdots \prod_{i_k=0}^{r_k-1} (\xi_k - q^{-i_k}).$$

Then the number of subgroups of type μ in a group of type λ is given by

$$\frac{\mathfrak{F}(q^{s_1}, q^{s_2}, \ldots, q^{s_k})}{\mathfrak{F}(q^{r_1}, q^{r_2}, \ldots, q^{r_k})}.$$

EXAMPLES:

```
sage: from sage.combinat.q_analogues import q_subgroups_of_abelian_group
sage: q_subgroups_of_abelian_group([1,1], [1])
q + 1
sage: q_subgroups_of_abelian_group([3,3,2,1], [2,1])

sage.combinat.q_analogues.**qt_catalan_number**(n)

Return the q, t-Catalan number of index n.

EXAMPLES:

```
sage: from sage.combinat.q_analogues import qt_catalan_number
sage: qt_catalan_number(1)
1
sage: qt_catalan_number(2)
q + t
sage: qt_catalan_number(3)
q^3 + q^2*t + q*t^2 + t^3 + q*t
sage: qt_catalan_number(4)
q^6 + q^5*t + q^4*t^2 + q^3*t^3 + q^2*t^4 + q*t^5 + t^6 + q^4*t + q^3*t^2 + q^2*t^
↪3 + q*t^4 + q^3*t + q^2*t^2 + q*t^3
```

```
>>> from sage.all import *
>>> from sage.combinat.q_analogues import qt_catalan_number
>>> qt_catalan_number(Integer(1))
1
>>> qt_catalan_number(Integer(2))
q + t
>>> qt_catalan_number(Integer(3))
q^3 + q^2*t + q*t^2 + t^3 + q*t
>>> qt_catalan_number(Integer(4))
q^6 + q^5*t + q^4*t^2 + q^3*t^3 + q^2*t^4 + q*t^5 + t^6 + q^4*t + q^3*t^2 + q^2*t^
↪3 + q*t^4 + q^3*t + q^2*t^2 + q*t^3
```

The q, t-Catalan number of index n is only defined for n a nonnegative integer (Issue #11411):

```
sage: qt_catalan_number(-2)
Traceback (most recent call last):
...
ValueError: argument (-2) must be a nonnegative integer
```

```
>>> from sage.all import *
>>> qt_catalan_number(-Integer(2))
Traceback (most recent call last):
...
ValueError: argument (-2) must be a nonnegative integer
```

5.1.188 q-Bernoulli Numbers and Polynomials

sage.combinat.q_bernoulli.**q_bernoulli**(*p=None*)

Compute Carlitz's q-analogue of the Bernoulli numbers.

For every nonnegative integer m, the q-Bernoulli number β_m is a rational function of the indeterminate q whose value at $q = 1$ is the usual Bernoulli number B_m.

INPUT:

- m – nonnegative integer
- p – (default: None) an optional value for q

OUTPUT:

A rational function of the indeterminate q (if p is None)

Otherwise, the rational function is evaluated at p.

EXAMPLES:

```
sage: from sage.combinat.q_bernoulli import q_bernoulli
sage: q_bernoulli(0)
1
sage: q_bernoulli(1)
-1/(q + 1)
sage: q_bernoulli(2)
q/(q^3 + 2*q^2 + 2*q + 1)
sage: all(q_bernoulli(i)(q=1) == bernoulli(i) for i in range(12))              #␣
↪needs sage.libs.flint
True
```

```
>>> from sage.all import *
>>> from sage.combinat.q_bernoulli import q_bernoulli
>>> q_bernoulli(Integer(0))
1
>>> q_bernoulli(Integer(1))
-1/(q + 1)
>>> q_bernoulli(Integer(2))
q/(q^3 + 2*q^2 + 2*q + 1)
>>> all(q_bernoulli(i)(q=Integer(1)) == bernoulli(i) for i in range(Integer(12)))␣
↪              # needs sage.libs.flint
True
```

One can evaluate the rational function by giving a second argument:

```
sage: x = PolynomialRing(GF(2),'x').gen()
sage: q_bernoulli(5,x)
x/(x^6 + x^5 + x + 1)
```

```
>>> from sage.all import *
>>> x = PolynomialRing(GF(Integer(2)),'x').gen()
>>> q_bernoulli(Integer(5),x)
x/(x^6 + x^5 + x + 1)
```

The function does not accept negative arguments:

```
sage: q_bernoulli(-1)
Traceback (most recent call last):
...
ValueError: the argument must be a nonnegative integer
```

```
>>> from sage.all import *
>>> q_bernoulli(-Integer(1))
Traceback (most recent call last):
...
ValueError: the argument must be a nonnegative integer
```

REFERENCES:

sage.combinat.q_bernoulli.**q_bernoulli_polynomial**()

Compute Carlitz's q-analogue of the Bernoulli polynomials.

For every nonnegative integer m, the q-Bernoulli polynomial is a polynomial in one variable x with coefficients in $\mathbf{Q}(q)$ whose value at $q = 1$ is the usual Bernoulli polynomial $B_m(x)$.

The original q-Bernoulli polynomials introduced by Carlitz were polynomials in q^y with coefficients in $\mathbf{Q}(q)$. This function returns these polynomials but expressed in the variable $x = (q^y - 1)/(q - 1)$. This allows to let $q = 1$ to recover the classical Bernoulli polynomials.

INPUT:

- m – nonnegative integer

OUTPUT: a polynomial in one variable x

EXAMPLES:

```
sage: from sage.combinat.q_bernoulli import q_bernoulli_polynomial, q_bernoulli
sage: q_bernoulli_polynomial(0)
1
sage: q_bernoulli_polynomial(1)
(2/(q + 1))*x - 1/(q + 1)
sage: x = q_bernoulli_polynomial(1).parent().gen()
sage: all(q_bernoulli_polynomial(i)(q=1) == bernoulli_polynomial(x,i)          #␣
↪needs sage.libs.flint
....:     for i in range(12))
True
sage: all(q_bernoulli_polynomial(i)(x=0) == q_bernoulli(i)
....:     for i in range(12))
True
```

```
>>> from sage.all import *
>>> from sage.combinat.q_bernoulli import q_bernoulli_polynomial, q_bernoulli
>>> q_bernoulli_polynomial(Integer(0))
1
>>> q_bernoulli_polynomial(Integer(1))
(2/(q + 1))*x - 1/(q + 1)
>>> x = q_bernoulli_polynomial(Integer(1)).parent().gen()
>>> all(q_bernoulli_polynomial(i)(q=Integer(1)) == bernoulli_polynomial(x,i)     ␣
↪     # needs sage.libs.flint
...     for i in range(Integer(12)))
True
>>> all(q_bernoulli_polynomial(i)(x=Integer(0)) == q_bernoulli(i)
...     for i in range(Integer(12)))
True
```

The function does not accept negative arguments:

```
sage: q_bernoulli_polynomial(-1)
Traceback (most recent call last):
...
ValueError: the argument must be a nonnegative integer
```

```
>>> from sage.all import *
>>> q_bernoulli_polynomial(-Integer(1))
Traceback (most recent call last):
...
ValueError: the argument must be a nonnegative integer
```

True
sage: WordMorphism('a->ab,b->a').fixed_point('a')
word: abaababaabaababaababaabaababaabaababaaba...
```

```
>>> from sage.all import *
>>> Words('abc', Integer(4)).list()
[word: aaaa, ..., word: cccc]

>>> Word('aabcacbaa').is_palindrome()
True
>>> WordMorphism('a->ab,b->a').fixed_point('a')
word: abaababaabaababaababaabaababaabaababaaba...
```

Polytopes:

```
sage: points = random_matrix(ZZ, 6, 3, x=7).rows()                          #␣
↪needs sage.modules
sage: L = LatticePolytope(points)                                           #␣
↪needs sage.geometry.polyhedron sage.modules
sage: L.npoints(); L.plot3d()                           # random            #␣
↪needs sage.geometry.polyhedron sage.modules sage.plot
```

```
>>> from sage.all import *
>>> points = random_matrix(ZZ, Integer(6), Integer(3), x=Integer(7)).rows()          ␣
↪                   # needs sage.modules
>>> L = LatticePolytope(points)                                           #␣
↪needs sage.geometry.polyhedron sage.modules
>>> L.npoints(); L.plot3d()                           # random            #␣
↪needs sage.geometry.polyhedron sage.modules sage.plot
```

Root systems, Coxeter and Weyl groups:

```
sage: WeylGroup(["B",3]).bruhat_poset()                                     #␣
↪needs sage.graphs sage.modules
Finite poset containing 48 elements
sage: RootSystem(["A",2,1]).weight_lattice().plot()         # not tested    #␣
↪needs sage.graphs sage.modules sage.plot
```

```
>>> from sage.all import *
>>> WeylGroup(["B",Integer(3)]).bruhat_poset()                                      ␣
↪     # needs sage.graphs sage.modules
Finite poset containing 48 elements
>>> RootSystem(["A",Integer(2),Integer(1)]).weight_lattice().plot()         # not␣
↪tested            # needs sage.graphs sage.modules sage.plot
```

Crystals:

```
sage: CrystalOfTableaux(["A",3], shape=[3,2]).some_flashy_feature()   # not tested
```

```
>>> from sage.all import *
>>> CrystalOfTableaux(["A",Integer(3)], shape=[Integer(3),Integer(2)]).some_flashy_
↪feature()    # not tested
```

Symmetric functions and combinatorial Hopf algebras:

```
sage: Sym = SymmetricFunctions(QQ); Sym.inject_shorthands(verbose=False)          #␣
↪needs sage.sage.modules
sage: m( ( h[2,1] * (1 + 3 * p[2,1]) ) + s[2](s[3]) )                              #␣
↪needs sage.sage.modules
3*m[1, 1, 1] + ... + 10*m[5, 1] + 4*m[6]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ); Sym.inject_shorthands(verbose=False)          #␣
↪needs sage.sage.modules
>>> m( ( h[Integer(2),Integer(1)] * (Integer(1) + Integer(3) * p[Integer(2),
↪Integer(1)]) ) + s[Integer(2)](s[Integer(3)]) )                                #␣
↪needs sage.sage.modules
3*m[1, 1, 1] + ... + 10*m[5, 1] + 4*m[6]
```

Discrete groups, Permutation groups:

```
sage: S = SymmetricGroup(4)                                                        #␣
↪needs sage.groups
sage: M = PolynomialRing(QQ, 'x0,x1,x2,x3')
sage: M.an_element() * S.an_element()                                              #␣
↪needs sage.groups
x0
```

```
>>> from sage.all import *
>>> S = SymmetricGroup(Integer(4))                                                 ␣
↪      # needs sage.groups
>>> M = PolynomialRing(QQ, 'x0,x1,x2,x3')
>>> M.an_element() * S.an_element()                                             #␣
↪needs sage.groups
x0
```

Graph theory, posets, lattices (Graph Theory, *Posets*):

```
sage: Poset({1: [2,3], 2: [4], 3: [4]}).linear_extensions().cardinality()          #␣
↪needs sage.graphs sage.modules
2
```

```
>>> from sage.all import *
>>> Poset({Integer(1): [Integer(2),Integer(3)], Integer(2): [Integer(4)], Integer(3):␣
↪[Integer(4)]}).linear_extensions().cardinality()          # needs sage.graphs sage.
↪modules
2
```

5.1.190 Rankers

`sage.combinat.ranker.from_list(l)`

Return a ranker from the list l.

INPUT:

- `l` – list

OUTPUT: `[rank, unrank]` – functions

EXAMPLES:

```
sage: import sage.combinat.ranker as ranker
sage: l = [1,2,3]
sage: r,u = ranker.from_list(l)
sage: r(1)
0
sage: r(3)
2
sage: u(2)
3
sage: u(0)
1
```

```
>>> from sage.all import *
>>> import sage.combinat.ranker as ranker
>>> l = [Integer(1),Integer(2),Integer(3)]
>>> r,u = ranker.from_list(l)
>>> r(Integer(1))
0
>>> r(Integer(3))
2
>>> u(Integer(2))
3
>>> u(Integer(0))
1
```

`sage.combinat.ranker.on_fly()`

Return a pair of enumeration functions rank / unrank.

rank assigns on the fly an integer, starting from 0, to any object passed as argument. The object should be hashable. unrank is the inverse function; it returns None for indices that have not yet been assigned.

EXAMPLES:

```
sage: [rank, unrank] = sage.combinat.ranker.on_fly()
sage: rank('a')
0
sage: rank('b')
1
sage: rank('c')
2
sage: rank('a')
0
sage: unrank(2)
```

(continues on next page)

(continued from previous page)

```
'c'
sage: unrank(3)
sage: rank('d')
3
sage: unrank(3)
'd'
```

```
>>> from sage.all import *
>>> [rank, unrank] = sage.combinat.ranker.on_fly()
>>> rank('a')
0
>>> rank('b')
1
>>> rank('c')
2
>>> rank('a')
0
>>> unrank(Integer(2))
'c'
>>> unrank(Integer(3))
>>> rank('d')
3
>>> unrank(Integer(3))
'd'
```

Todo

add tests as in combinat::rankers

`sage.combinat.ranker.`**`rank_from_list`**`(`*l*`)`

Return a rank function for the elements of `l`.

INPUT:

- `l` – a duplicate free list (or iterable) of hashable objects

OUTPUT:

- a function from the elements of `l` to `0,...,len(l)`

EXAMPLES:

```
sage: import sage.combinat.ranker as ranker
sage: l = ['a', 'b', 'c']
sage: r = ranker.rank_from_list(l)
sage: r('a')
0
sage: r('c')
2
```

```
>>> from sage.all import *
>>> import sage.combinat.ranker as ranker
```

(continues on next page)

(continued from previous page)

```
>>> l = ['a', 'b', 'c']
>>> r = ranker.rank_from_list(l)
>>> r('a')
0
>>> r('c')
2
```

For non elements a `ValueError` is raised, as with the usual `index` method of lists:

```
sage: r('blah')
Traceback (most recent call last):
...
ValueError: 'blah' is not in dict
```

```
>>> from sage.all import *
>>> r('blah')
Traceback (most recent call last):
...
ValueError: 'blah' is not in dict
```

Currently, the rank function is a `CallableDict`; but this is an implementation detail:

```
sage: type(r)
<class 'sage.misc.callable_dict.CallableDict'>
sage: r
{'a': 0, 'b': 1, 'c': 2}
```

```
>>> from sage.all import *
>>> type(r)
<class 'sage.misc.callable_dict.CallableDict'>
>>> r
{'a': 0, 'b': 1, 'c': 2}
```

With the current implementation, no error is issued in case of duplicate value in `l`. Instead, the rank function returns the position of some of the duplicates:

```
sage: r = ranker.rank_from_list(['a', 'b', 'a', 'c'])
sage: r('a')
2
```

```
>>> from sage.all import *
>>> r = ranker.rank_from_list(['a', 'b', 'a', 'c'])
>>> r('a')
2
```

Constructing the rank function itself is of complexity `O(len(l))`. Then, each call to the rank function consists of an essentially constant time dictionary lookup.

`sage.combinat.ranker.`**`unrank`**`(`L, i`)`

Return the i-th element of L.

INPUT:

- `L` – list, tuple, finite enumerated set, etc.

- `i` – integer

The purpose of this utility is to give a uniform idiom to recover the i-th element of an object `L`, whether `L` is a list, tuple (or more generally a `collections.abc.Sequence`), an enumerated set, some old parent of Sage still implementing unranking in the method `__getitem__`, or an iterable (see `collections.abc.Iterable`). See Issue #15919.

EXAMPLES:

Lists, tuples, and other `sequences`:

```
sage: from sage.combinat.ranker import unrank
sage: unrank(['a','b','c'], 2)
'c'
sage: unrank(('a','b','c'), 1)
'b'
sage: unrank(range(3,13,2), 1)
5
```

```
>>> from sage.all import *
>>> from sage.combinat.ranker import unrank
>>> unrank(['a','b','c'], Integer(2))
'c'
>>> unrank(('a','b','c'), Integer(1))
'b'
>>> unrank(range(Integer(3),Integer(13),Integer(2)), Integer(1))
5
```

Enumerated sets:

```
sage: unrank(GF(7), 2)
2
sage: unrank(IntegerModRing(29), 10)
10
```

```
>>> from sage.all import *
>>> unrank(GF(Integer(7)), Integer(2))
2
>>> unrank(IntegerModRing(Integer(29)), Integer(10))
10
```

An iterable:

```
sage: unrank(NN,4)
4
```

```
>>> from sage.all import *
>>> unrank(NN,Integer(4))
4
```

An iterator:

```
sage: unrank(('a{}'.format(i) for i in range(20)), 0)
'a0'
```

(continues on next page)

(continued from previous page)

```
sage: unrank(('a{}'.format(i) for i in range(20)), 2)
'a2'
```

```
>>> from sage.all import *
>>> unrank(('a{}'.format(i) for i in range(Integer(20))), Integer(0))
'a0'
>>> unrank(('a{}'.format(i) for i in range(Integer(20))), Integer(2))
'a2'
```

Warning: When unranking an iterator, it returns the `i`-th element beyond where it is currently at:

```
sage: from sage.combinat.ranker import unrank
sage: it = iter(range(20))
sage: unrank(it, 2)
2
sage: unrank(it, 2)
5
```

```
>>> from sage.all import *
>>> from sage.combinat.ranker import unrank
>>> it = iter(range(Integer(20)))
>>> unrank(it, Integer(2))
2
>>> unrank(it, Integer(2))
5
```

sage.combinat.ranker.**unrank_from_list**(*l*)

Return an unrank function from a list.

EXAMPLES:

```
sage: import sage.combinat.ranker as ranker
sage: l = [1,2,3]
sage: u = ranker.unrank_from_list(l)
sage: u(2)
3
sage: u(0)
1
```

```
>>> from sage.all import *
>>> import sage.combinat.ranker as ranker
>>> l = [Integer(1),Integer(2),Integer(3)]
>>> u = ranker.unrank_from_list(l)
>>> u(Integer(2))
3
>>> u(Integer(0))
1
```

5.1.191 Recognizable Series

Let A be an alphabet and K a semiring. Then a formal series S with coefficients in K and indices in the words A^* is called recognizable if it has a linear representation, i.e., there exists

- a nonnegative integer n

and there exist

- two vectors *left* and *right* of dimension n and
- a morphism of monoids μ from A^* to $n \times n$ matrices over K

such that the coefficient corresponding to a word $w \in A^*$ equals

$$\mathit{left}\, \mu(w)\, \mathit{right}.$$

Note

Whenever a minimization (`minimized()`) of a series needs to be computed, it is required that K is a field. In particular, minimization is called before checking if a series is nonzero.

Various

See also

k-regular sequence, `sage.rings.cfinite_sequence`, `sage.combinat.binary_recurrence_sequences`.

Classes and Methods

class `sage.combinat.recognizable_series.`**`PrefixClosedSet`**`(`*words*`)`

Bases: `object`

A prefix-closed set.

Creation of this prefix-closed set is interactive iteratively.

INPUT:

- `words` – a class of words (instance of `Words`)

EXAMPLES:

```
sage: from sage.combinat.recognizable_series import PrefixClosedSet
sage: P = PrefixClosedSet(Words([0, 1], infinite=False)); P
[word: ]

sage: P = PrefixClosedSet.create_by_alphabet([0, 1]); P
[word: ]
```

```
>>> from sage.all import *
>>> from sage.combinat.recognizable_series import PrefixClosedSet
>>> P = PrefixClosedSet(Words([Integer(0), Integer(1)], infinite=False)); P
[word: ]

>>> P = PrefixClosedSet.create_by_alphabet([Integer(0), Integer(1)]); P
[word: ]
```

See `iterate_possible_additions()` for further examples.

add(*w*, *check=True*)

Add a word to this prefix-closed set.

INPUT:

- `w` – a word
- `check` – boolean (default: `True`); if set, then it is verified whether all proper prefixes of `w` are already in this prefix-closed set

OUTPUT:

Nothing, but a RuntimeError is raised if the check fails.

EXAMPLES:

```
sage: from sage.combinat.recognizable_series import PrefixClosedSet
sage: P = PrefixClosedSet.create_by_alphabet([0, 1])
sage: W = P.words
sage: P.add(W([0])); P
[word: , word: 0]
sage: P.add(W([0, 1])); P
[word: , word: 0, word: 01]
sage: P.add(W([1, 1]))
Traceback (most recent call last):
...
ValueError: cannot add as not all prefixes of 11 are included yet
```

```
>>> from sage.all import *
>>> from sage.combinat.recognizable_series import PrefixClosedSet
>>> P = PrefixClosedSet.create_by_alphabet([Integer(0), Integer(1)])
>>> W = P.words
>>> P.add(W([Integer(0)])); P
[word: , word: 0]
>>> P.add(W([Integer(0), Integer(1)])); P
[word: , word: 0, word: 01]
>>> P.add(W([Integer(1), Integer(1)]))
Traceback (most recent call last):
...
ValueError: cannot add as not all prefixes of 11 are included yet
```

classmethod create_by_alphabet(*alphabet*)

A prefix-closed set.

This is a convenience method for the creation of prefix-closed sets by specifying an alphabet.

INPUT:

- `alphabet` – finite words over this `alphabet` will used

EXAMPLES:

```
sage: from sage.combinat.recognizable_series import PrefixClosedSet
sage: P = PrefixClosedSet.create_by_alphabet([0, 1]); P
[word: ]
```

```
>>> from sage.all import *
>>> from sage.combinat.recognizable_series import PrefixClosedSet
>>> P = PrefixClosedSet.create_by_alphabet([Integer(0), Integer(1)]); P
[word: ]
```

iterate_possible_additions()

Return an iterator over all elements including possible new elements.

OUTPUT: an iterator

EXAMPLES:

```
sage: from sage.combinat.recognizable_series import PrefixClosedSet
sage: P = PrefixClosedSet.create_by_alphabet([0, 1]); P
[word: ]
sage: for n, p in enumerate(P.iterate_possible_additions()):
....:     print('{}?'.format(p))
....:     if n in (0, 2, 3, 5):
....:         P.add(p)
....:         print('...added')
0?
...added
1?
00?
...added
01?
...added
000?
001?
...added
010?
011?
0010?
0011?
sage: P.elements
[word: , word: 0, word: 00, word: 01, word: 001]
```

```
>>> from sage.all import *
>>> from sage.combinat.recognizable_series import PrefixClosedSet
>>> P = PrefixClosedSet.create_by_alphabet([Integer(0), Integer(1)]); P
[word: ]
>>> for n, p in enumerate(P.iterate_possible_additions()):
...     print('{}?'.format(p))
...     if n in (Integer(0), Integer(2), Integer(3), Integer(5)):
...         P.add(p)
...         print('...added')
```

(continues on next page)

(continued from previous page)

```
0?
...added
1?
00?
...added
01?
...added
000?
001?
...added
010?
011?
0010?
0011?
>>> P.elements
[word: , word: 0, word: 00, word: 01, word: 001]
```

Calling the iterator once more, returns all elements:

```
sage: list(P.iterate_possible_additions())
[word: 0,
 word: 1,
 word: 00,
 word: 01,
 word: 000,
 word: 001,
 word: 010,
 word: 011,
 word: 0010,
 word: 0011]
```

```
>>> from sage.all import *
>>> list(P.iterate_possible_additions())
[word: 0,
 word: 1,
 word: 00,
 word: 01,
 word: 000,
 word: 001,
 word: 010,
 word: 011,
 word: 0010,
 word: 0011]
```

The method `iterate_possible_additions()` is roughly equivalent to

```
sage: list(p + a
....:      for p in P.elements
....:      for a in P.words.iterate_by_length(1))
[word: 0,
 word: 1,
 word: 00,
```

(continues on next page)

(continued from previous page)

```
 word: 01,
 word: 000,
 word: 001,
 word: 010,
 word: 011,
 word: 0010,
 word: 0011]
```

```
>>> from sage.all import *
>>> list(p + a
...      for p in P.elements
...      for a in P.words.iterate_by_length(Integer(1)))
[word: 0,
 word: 1,
 word: 00,
 word: 01,
 word: 000,
 word: 001,
 word: 010,
 word: 011,
 word: 0010,
 word: 0011]
```

However, the above does not allow to add elements during iteration, whereas `iterate_possible_additions()` does.

prefix_set()

Return the set of minimal (with respect to prefix ordering) elements of the complement of this prefix closed set.

See also Proposition 2.3.1 of [BR2010a].

OUTPUT: list

EXAMPLES:

```
sage: from sage.combinat.recognizable_series import PrefixClosedSet
sage: P = PrefixClosedSet.create_by_alphabet([0, 1]); P
[word: ]
sage: for n, p in enumerate(P.iterate_possible_additions()):
....:     if n in (0, 1, 2, 4, 6):
....:         P.add(p)
sage: P
[word: , word: 0, word: 1, word: 00, word: 10, word: 000]
sage: P.prefix_set()
[word: 01, word: 11, word: 001, word: 100,
 word: 101, word: 0000, word: 0001]
```

```
>>> from sage.all import *
>>> from sage.combinat.recognizable_series import PrefixClosedSet
>>> P = PrefixClosedSet.create_by_alphabet([Integer(0), Integer(1)]); P
[word: ]
>>> for n, p in enumerate(P.iterate_possible_additions()):
```

(continues on next page)

(continued from previous page)

```
...     if n in (Integer(0), Integer(1), Integer(2), Integer(4), Integer(6)):
...         P.add(p)
>>> P
[word: , word: 0, word: 1, word: 00, word: 10, word: 000]
>>> P.prefix_set()
[word: 01, word: 11, word: 001, word: 100,
 word: 101, word: 0000, word: 0001]
```

class sage.combinat.recognizable_series.**RecognizableSeries**(*parent*, *mu*, *left*, *right*)

Bases: ModuleElement

A recognizable series.

- parent – an instance of *RecognizableSeriesSpace*
- mu – a family of square matrices, all of which have the same dimension. The indices of this family are the elements of the alphabet. mu may be a list or tuple of the same cardinality as the alphabet as well. See also *mu*.
- left – a vector. When evaluating a coefficient, this vector is multiplied from the left to the matrix obtained from *mu* applying on a word. See also *left*.
- right – a vector. When evaluating a coefficient, this vector is multiplied from the right to the matrix obtained from *mu* applying on a word. See also *right*.

When created via the parent *RecognizableSeriesSpace*, then the following option is available.

EXAMPLES:

```
sage: Rec = RecognizableSeriesSpace(ZZ, [0, 1])
sage: S = Rec((Matrix([[3, 6], [0, 1]]), Matrix([[0, -6], [1, 5]])),
....:         vector([0, 1]), vector([1, 0])).transposed(); S
[1] + 3*[01] + [10] + 5*[11] + 9*[001] + 3*[010] + ...
```

```
>>> from sage.all import *
>>> Rec = RecognizableSeriesSpace(ZZ, [Integer(0), Integer(1)])
>>> S = Rec((Matrix([[Integer(3), Integer(6)], [Integer(0), Integer(1)]]),␣
↪Matrix([[Integer(0), -Integer(6)], [Integer(1), Integer(5)]])),
...         vector([Integer(0), Integer(1)]), vector([Integer(1), Integer(0)])).
↪transposed(); S
[1] + 3*[01] + [10] + 5*[11] + 9*[001] + 3*[010] + ...
```

We can access coefficients by

```
sage: W = Rec.indices()
sage: S[W([0, 0, 1])]
9
```

```
>>> from sage.all import *
>>> W = Rec.indices()
>>> S[W([Integer(0), Integer(0), Integer(1)])]
9
```

See also

recognizable series, `RecognizableSeriesSpace`.

coefficient_of_word(*w*, *multiply_left=True*, *multiply_right=True*)

Return the coefficient to word w of this series.

INPUT:

- `w` – a word over the parent's `alphabet()`
- `multiply_left` – boolean (default: `True`); if `False`, then multiplication by `left` is skipped
- `multiply_right` – boolean (default: `True`); if `False`, then multiplication by `right` is skipped

OUTPUT:

An element in the parent's `coefficient_ring()`

EXAMPLES:

```
sage: Rec = RecognizableSeriesSpace(ZZ, [0, 1])
sage: W = Rec.indices()
sage: S = Rec((Matrix([[1, 0], [0, 1]]), Matrix([[0, -1], [1, 2]])),
....:          left=vector([0, 1]), right=vector([1, 0]))
sage: S[W(7.digits(2))]  # indirect doctest
3
```

```
>>> from sage.all import *
>>> Rec = RecognizableSeriesSpace(ZZ, [Integer(0), Integer(1)])
>>> W = Rec.indices()
>>> S = Rec((Matrix([[Integer(1), Integer(0)], [Integer(0), Integer(1)]]),␣
↪Matrix([[Integer(0), -Integer(1)], [Integer(1), Integer(2)]])),
...          left=vector([Integer(0), Integer(1)]), right=vector([Integer(1),␣
↪Integer(0)]))
>>> S[W(Integer(7).digits(Integer(2)))]  # indirect doctest
3
```

dimension()

Return the dimension of this recognizable series.

EXAMPLES:

```
sage: Rec = RecognizableSeriesSpace(ZZ, [0, 1])
sage: Rec((Matrix([[1, 0], [0, 1]]), Matrix([[1, 0], [0, 1]])),
....:     left=vector([0, 1]), right=vector([1, 0])).dimension()
2
```

```
>>> from sage.all import *
>>> Rec = RecognizableSeriesSpace(ZZ, [Integer(0), Integer(1)])
>>> Rec((Matrix([[Integer(1), Integer(0)], [Integer(0), Integer(1)]]),␣
↪Matrix([[Integer(1), Integer(0)], [Integer(0), Integer(1)]])),
...     left=vector([Integer(0), Integer(1)]), right=vector([Integer(1),␣
↪Integer(0)])).dimension()
2
```

hadamard_product(**args*, ***kwds*)

Return the Hadamard product of this recognizable series and the `other` recognizable series, i.e., multiply the two series coefficient-wise.

INPUT:

- `other` – a *RecognizableSeries* with the same parent as this recognizable series
- `minimize` – (default: `None`) a boolean or `None`. If `True`, then *minimized()* is called after the operation, if `False`, then not. If this argument is `None`, then the default specified by the parent's `minimize_results` is used.

OUTPUT: a *RecognizableSeries*

EXAMPLES:

```
sage: Seq2 = RegularSequenceRing(2, ZZ)

sage: E = Seq2((Matrix([[0, 1], [0, 1]]), Matrix([[0, 0], [0, 1]])),
....:          vector([1, 0]), vector([1, 1]))
sage: E
2-regular sequence 1, 0, 1, 0, 1, 0, 1, 0, 1, 0, ...

sage: O = Seq2((Matrix([[0, 0], [0, 1]]), Matrix([[0, 1], [0, 1]])),
....:          vector([1, 0]), vector([0, 1]))
sage: O
2-regular sequence 0, 1, 0, 1, 0, 1, 0, 1, 0, 1, ...

sage: C = Seq2((Matrix([[2, 0], [2, 1]]), Matrix([[0, 1], [-2, 3]])),
....:          vector([1, 0]), vector([0, 1]))
sage: C
2-regular sequence 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, ...
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)

>>> E = Seq2((Matrix([[Integer(0), Integer(1)], [Integer(0), Integer(1)]]),␣
↪Matrix([[Integer(0), Integer(0)], [Integer(0), Integer(1)]])),
...          vector([Integer(1), Integer(0)]), vector([Integer(1),␣
↪Integer(1)]))
>>> E
2-regular sequence 1, 0, 1, 0, 1, 0, 1, 0, 1, 0, ...

>>> O = Seq2((Matrix([[Integer(0), Integer(0)], [Integer(0), Integer(1)]]),␣
↪Matrix([[Integer(0), Integer(1)], [Integer(0), Integer(1)]])),
...          vector([Integer(1), Integer(0)]), vector([Integer(0),␣
↪Integer(1)]))
>>> O
2-regular sequence 0, 1, 0, 1, 0, 1, 0, 1, 0, 1, ...

>>> C = Seq2((Matrix([[Integer(2), Integer(0)], [Integer(2), Integer(1)]]),␣
↪Matrix([[Integer(0), Integer(1)], [-Integer(2), Integer(3)]])),
...          vector([Integer(1), Integer(0)]), vector([Integer(0),␣
↪Integer(1)]))
>>> C
2-regular sequence 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, ...
```

```
sage: CE = C.hadamard_product(E)
sage: CE
2-regular sequence 0, 0, 2, 0, 4, 0, 6, 0, 8, 0, ...
sage: CE.linear_representation()
((1, 0, 0),
 Finite family {0: [0 1 0]
                   [0 2 0]
                   [0 2 1],
                1: [ 0  0  0]
                   [ 0  0  1]
                   [ 0 -2  3]},
 (0, 0, 2))

sage: Z = E.hadamard_product(O)
sage: Z
2-regular sequence 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, ...
sage: Z.linear_representation()
((),
 Finite family {0: [],
                1: []},
 ())
```

```
>>> from sage.all import *
>>> CE = C.hadamard_product(E)
>>> CE
2-regular sequence 0, 0, 2, 0, 4, 0, 6, 0, 8, 0, ...
>>> CE.linear_representation()
((1, 0, 0),
 Finite family {0: [0 1 0]
                   [0 2 0]
                   [0 2 1],
                1: [ 0  0  0]
                   [ 0  0  1]
                   [ 0 -2  3]},
 (0, 0, 2))

>>> Z = E.hadamard_product(O)
>>> Z
2-regular sequence 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, ...
>>> Z.linear_representation()
((),
 Finite family {0: [],
                1: []},
 ())
```

is_trivial_zero()

Return whether this recognizable series is trivially equal to zero (without any *minimization*).

EXAMPLES:

```
sage: Rec = RecognizableSeriesSpace(ZZ, [0, 1])
sage: Rec((Matrix([[1, 0], [0, 1]]), Matrix([[1, 0], [0, 1]])),
....:     left=vector([0, 1]), right=vector([1, 0])).is_trivial_zero()
```

(continues on next page)

(continued from previous page)

```
False
sage: Rec((Matrix([[1, 0], [0, 1]]), Matrix([[1, 0], [0, 1]])),
....:     left=vector([0, 0]), right=vector([1, 0])).is_trivial_zero()
True
sage: Rec((Matrix([[1, 0], [0, 1]]), Matrix([[1, 0], [0, 1]])),
....:     left=vector([0, 1]), right=vector([0, 0])).is_trivial_zero()
True
```

```
>>> from sage.all import *
>>> Rec = RecognizableSeriesSpace(ZZ, [Integer(0), Integer(1)])
>>> Rec((Matrix([[Integer(1), Integer(0)], [Integer(0), Integer(1)]]),
↪Matrix([[Integer(1), Integer(0)], [Integer(0), Integer(1)]])),
...     left=vector([Integer(0), Integer(1)]), right=vector([Integer(1),
↪Integer(0)])).is_trivial_zero()
False
>>> Rec((Matrix([[Integer(1), Integer(0)], [Integer(0), Integer(1)]]),
↪Matrix([[Integer(1), Integer(0)], [Integer(0), Integer(1)]])),
...     left=vector([Integer(0), Integer(0)]), right=vector([Integer(1),
↪Integer(0)])).is_trivial_zero()
True
>>> Rec((Matrix([[Integer(1), Integer(0)], [Integer(0), Integer(1)]]),
↪Matrix([[Integer(1), Integer(0)], [Integer(0), Integer(1)]])),
...     left=vector([Integer(0), Integer(1)]), right=vector([Integer(0),
↪Integer(0)])).is_trivial_zero()
True
```

The following two differ in the coefficient of the empty word:

```
sage: Rec((Matrix([[0, 0], [0, 0]]), Matrix([[0, 0], [0, 0]])),
....:     left=vector([0, 1]), right=vector([1, 0])).is_trivial_zero()
True
sage: Rec((Matrix([[0, 0], [0, 0]]), Matrix([[0, 0], [0, 0]])),
....:     left=vector([1, 1]), right=vector([1, 1])).is_trivial_zero()
False
```

```
>>> from sage.all import *
>>> Rec((Matrix([[Integer(0), Integer(0)], [Integer(0), Integer(0)]]),
↪Matrix([[Integer(0), Integer(0)], [Integer(0), Integer(0)]])),
...     left=vector([Integer(0), Integer(1)]), right=vector([Integer(1),
↪Integer(0)])).is_trivial_zero()
True
>>> Rec((Matrix([[Integer(0), Integer(0)], [Integer(0), Integer(0)]]),
↪Matrix([[Integer(0), Integer(0)], [Integer(0), Integer(0)]])),
...     left=vector([Integer(1), Integer(1)]), right=vector([Integer(1),
↪Integer(1)])).is_trivial_zero()
False
```

property left

When evaluating a coefficient, this vector is multiplied from the left to the matrix obtained from *mu* applied on a word.

linear_representation()

Return the linear representation of this series.

OUTPUT:

A triple `(left, mu, right)` containing the vectors `left` and `right`, and the family of matrices `mu`.

EXAMPLES:

```
sage: Rec = RecognizableSeriesSpace(ZZ, [0, 1])
sage: Rec((Matrix([[3, 6], [0, 1]]), Matrix([[0, -6], [1, 5]])),
....:      vector([0, 1]), vector([1, 0])
....:     ).transposed().linear_representation()
((1, 0),
 Finite family {0: [3 0]
                   [6 1],
                1: [ 0  1]
                   [-6  5]},
 (0, 1))
```

```
>>> from sage.all import *
>>> Rec = RecognizableSeriesSpace(ZZ, [Integer(0), Integer(1)])
>>> Rec((Matrix([[Integer(3), Integer(6)], [Integer(0), Integer(1)]]),
↪Matrix([[Integer(0), -Integer(6)], [Integer(1), Integer(5)]])),
...      vector([Integer(0), Integer(1)]), vector([Integer(1), Integer(0)])
...     ).transposed().linear_representation()
((1, 0),
 Finite family {0: [3 0]
                   [6 1],
                1: [ 0  1]
                   [-6  5]},
 (0, 1))
```

minimized()

Return a recognizable series equivalent to this series, but with a minimized linear representation.

The coefficients of the involved matrices need be in a field. If this is not the case, then the coefficients are automatically coerced to their fraction field.

OUTPUT: a `RecognizableSeries`

ALGORITHM:

This method implements the minimization algorithm presented in Chapter 2 of [BR2010a].

> **Note**
>
> Due to the algorithm, the left vector of the result is always $(1, 0, \ldots, 0)$, i.e., the first vector of the standard basis.

EXAMPLES:

```
sage: from itertools import islice
sage: Rec = RecognizableSeriesSpace(ZZ, [0, 1])

sage: S = Rec((Matrix([[3, 6], [0, 1]]), Matrix([[0, -6], [1, 5]])),
....:          vector([0, 1]), vector([1, 0])).transposed()
sage: S
```

(continues on next page)

(continued from previous page)

```
[1] + 3*[01] + [10] + 5*[11] + 9*[001] + 3*[010]
    + 15*[011] + [100] + 11*[101] + 5*[110] + ...
sage: M = S.minimized()
sage: M.mu[0], M.mu[1], M.left, M.right
(
[3 0]  [ 0  1]
[6 1], [-6  5], (1, 0), (0, 1)
)
sage: M.left == vector([1, 0])
True
sage: all(c == d and v == w
....:     for (c, v), (d, w) in islice(zip(iter(S), iter(M)), 20))
True

sage: S = Rec((Matrix([[2, 0], [1, 1]]), Matrix([[2, 0], [2, 1]])),
....:         vector([1, 0]), vector([1, 1]))
sage: S
[] + 2*[0] + 2*[1] + 4*[00] + 4*[01] + 4*[10] + 4*[11]
   + 8*[000] + 8*[001] + 8*[010] + ...
sage: M = S.minimized()
sage: M.mu[0], M.mu[1], M.left, M.right
([2], [2], (1), (1))

   + 8*[000] + 8*[001] + 8*[010] + ...
>>> M = S.minimized()
>>> M.mu[Integer(0)], M.mu[Integer(1)], M.left, M.right
([2], [2], (1), (1))
>>> all(c == d and v == w
...     for (c, v), (d, w) in islice(zip(iter(S), iter(M)), Integer(20)))
True
```

property mu

When evaluating a coefficient, this is applied on each letter of a word; the result is a matrix. This extends *mu* to words over the parent's *alphabet()*.

property right

When evaluating a coefficient, this vector is multiplied from the right to the matrix obtained from *mu* applied on a word.

transposed()

Return the transposed series.

OUTPUT: a *RecognizableSeries*

Each of the matrices in *mu* is transposed. Additionally the vectors *left* and *right* are switched.

EXAMPLES:

```
sage: Rec = RecognizableSeriesSpace(ZZ, [0, 1])
sage: S = Rec((Matrix([[3, 6], [0, 1]]), Matrix([[0, -6], [1, 5]])),
....:          vector([0, 1]), vector([1, 0])).transposed()
sage: S
[1] + 3*[01] + [10] + 5*[11] + 9*[001] + 3*[010]
    + 15*[011] + [100] + 11*[101] + 5*[110] + ...
sage: S.mu[0], S.mu[1], S.left, S.right
(
[3 0]  [ 0  1]
[6 1], [-6  5], (1, 0), (0, 1)
)
sage: T = S.transposed()
sage: T
[1] + [01] + 3*[10] + 5*[11] + [001] + 3*[010]
    + 5*[011] + 9*[100] + 11*[101] + 15*[110] + ...
sage: T.mu[0], T.mu[1], T.left, T.right
(
[3 6]  [ 0 -6]
[0 1], [ 1  5], (0, 1), (1, 0)
)
```

```
>>> from sage.all import *
>>> Rec = RecognizableSeriesSpace(ZZ, [Integer(0), Integer(1)])
>>> S = Rec((Matrix([[Integer(3), Integer(6)], [Integer(0), Integer(1)]]),␣
↪Matrix([[Integer(0), -Integer(6)], [Integer(1), Integer(5)]])),
...         vector([Integer(0), Integer(1)]), vector([Integer(1),␣
```

(continues on next page)

(continued from previous page)

```
↪Integer(0)])).transposed()
>>> S
[1] + 3*[01] + [10] + 5*[11] + 9*[001] + 3*[010]
    + 15*[011] + [100] + 11*[101] + 5*[110] + ...
>>> S.mu[Integer(0)], S.mu[Integer(1)], S.left, S.right
(
[3 0]  [ 0  1]
[6 1], [-6  5], (1, 0), (0, 1)
)
>>> T = S.transposed()
>>> T
[1] + [01] + 3*[10] + 5*[11] + [001] + 3*[010]
    + 5*[011] + 9*[100] + 11*[101] + 15*[110] + ...
>>> T.mu[Integer(0)], T.mu[Integer(1)], T.left, T.right
(
[3 6]  [ 0 -6]
[0 1], [ 1  5], (0, 1), (1, 0)
)
```

class sage.combinat.recognizable_series.**RecognizableSeriesSpace**(*coefficient_ring*, *indices*, *category*, *minimize_results*)

Bases: UniqueRepresentation, Parent

The space of recognizable series on the given alphabet and with the given coefficients.

INPUT:

- `coefficient_ring` – a (semi-)ring
- `alphabet` – tuple, list or TotallyOrderedFiniteSet. If specified, then the `indices` are the finite words over this `alphabet`. `alphabet` and `indices` cannot be specified at the same time.
- `indices` – a SageMath-parent of finite words over an alphabet. `alphabet` and `indices` cannot be specified at the same time.
- `category` – (default: `None`) the category of this space

EXAMPLES:

We create a recognizable series that counts the number of ones in each word:

```
sage: Rec = RecognizableSeriesSpace(ZZ, [0, 1])
sage: Rec
Space of recognizable series on {0, 1} with coefficients in Integer Ring
sage: Rec((Matrix([[1, 0], [0, 1]]), Matrix([[1, 1], [0, 1]])),
....:     vector([1, 0]), vector([0, 1]))
[1] + [01] + [10] + 2*[11] + [001] + [010] + 2*[011] + [100] + 2*[101] + 2*[110]␣
↪+ ...
```

```
>>> from sage.all import *
>>> Rec = RecognizableSeriesSpace(ZZ, [Integer(0), Integer(1)])
>>> Rec
Space of recognizable series on {0, 1} with coefficients in Integer Ring
>>> Rec((Matrix([[Integer(1), Integer(0)], [Integer(0), Integer(1)]]),␣
↪Matrix([[Integer(1), Integer(1)], [Integer(0), Integer(1)]])),
...     vector([Integer(1), Integer(0)]), vector([Integer(0), Integer(1)]))
```

(continues on next page)

(continued from previous page)

```
[1] + [01] + [10] + 2*[11] + [001] + [010] + 2*[011] + [100] + 2*[101] + 2*[110]␣
↪+ ...
```

All of the following examples create the same space:

```
sage: Rec1 = RecognizableSeriesSpace(ZZ, [0, 1])
sage: Rec1
Space of recognizable series on {0, 1} with coefficients in Integer Ring
sage: Rec2 = RecognizableSeriesSpace(coefficient_ring=ZZ, alphabet=[0, 1])
sage: Rec2
Space of recognizable series on {0, 1} with coefficients in Integer Ring
sage: Rec3 = RecognizableSeriesSpace(ZZ, indices=Words([0, 1], infinite=False))
sage: Rec3
Space of recognizable series on {0, 1} with coefficients in Integer Ring
```

```
>>> from sage.all import *
>>> Rec1 = RecognizableSeriesSpace(ZZ, [Integer(0), Integer(1)])
>>> Rec1
Space of recognizable series on {0, 1} with coefficients in Integer Ring
>>> Rec2 = RecognizableSeriesSpace(coefficient_ring=ZZ, alphabet=[Integer(0),␣
↪Integer(1)])
>>> Rec2
Space of recognizable series on {0, 1} with coefficients in Integer Ring
>>> Rec3 = RecognizableSeriesSpace(ZZ, indices=Words([Integer(0), Integer(1)],␣
↪infinite=False))
>>> Rec3
Space of recognizable series on {0, 1} with coefficients in Integer Ring
```

See also

recognizable series, `RecognizableSeries`.

Element

alias of `RecognizableSeries`

alphabet()

Return the alphabet of this recognizable series space.

OUTPUT: a totally ordered set

EXAMPLES:

```
sage: RecognizableSeriesSpace(ZZ, [0, 1]).alphabet()
{0, 1}
```

```
>>> from sage.all import *
>>> RecognizableSeriesSpace(ZZ, [Integer(0), Integer(1)]).alphabet()
{0, 1}
```

coefficient_ring()

Return the coefficients of this recognizable series space.

OUTPUT:

A (semi-)ring

EXAMPLES:

```
sage: RecognizableSeriesSpace(ZZ, [0, 1]).coefficient_ring()
Integer Ring
```

```
>>> from sage.all import *
>>> RecognizableSeriesSpace(ZZ, [Integer(0), Integer(1)]).coefficient_ring()
Integer Ring
```

indices()

Return the indices of the recognizable series.

OUTPUT: the set of finite words over the alphabet

EXAMPLES:

```
sage: RecognizableSeriesSpace(ZZ, [0, 1]).indices()
Finite words over {0, 1}
```

```
>>> from sage.all import *
>>> RecognizableSeriesSpace(ZZ, [Integer(0), Integer(1)]).indices()
Finite words over {0, 1}
```

property minimize_results

A boolean indicating whether `RecognizableSeries.minimized()` is automatically called after performing operations.

one()

Return the one element of this `RecognizableSeriesSpace`, i.e. the embedding of the one of the coefficient ring into this `RecognizableSeriesSpace`.

EXAMPLES:

```
sage: Rec = RecognizableSeriesSpace(ZZ, [0, 1])
sage: O = Rec.one(); O
[] + ...
sage: O.linear_representation()
((1), Finite family {0: [0], 1: [0]}, (1))
```

```
>>> from sage.all import *
>>> Rec = RecognizableSeriesSpace(ZZ, [Integer(0), Integer(1)])
>>> O = Rec.one(); O
[] + ...
>>> O.linear_representation()
((1), Finite family {0: [0], 1: [0]}, (1))
```

one_hadamard()

Return the identity with respect to the `hadamard_product()`, i.e. the coefficient-wise multiplication.

OUTPUT: a `RecognizableSeries`

EXAMPLES:

```
sage: Rec = RecognizableSeriesSpace(ZZ, [0, 1])
sage: Rec.one_hadamard()
[] + [0] + [1] + [00] + [01] + [10]
   + [11] + [000] + [001] + [010] + ...
```

```
>>> from sage.all import *
>>> Rec = RecognizableSeriesSpace(ZZ, [Integer(0), Integer(1)])
>>> Rec.one_hadamard()
[] + [0] + [1] + [00] + [01] + [10]
   + [11] + [000] + [001] + [010] + ...
```

some_elements(***kwds*)

Return some elements of this recognizable series space.

See `TestSuite` for a typical use case.

INPUT:

- `kwds` are passed on to the element constructor

OUTPUT: an iterator

EXAMPLES:

```
sage: tuple(RecognizableSeriesSpace(ZZ, [0, 1]).some_elements())
([1] + [01] + [10] + 2*[11] + [001] + [010]
     + 2*[011] + [100] + 2*[101] + 2*[110] + ...,
 [] + [1] + [11] + [111] + [1111] + [11111] + [111111] + ...,
 [] + [0] + [1] + [00] + [10] + [11]
    + [000] - 1*[001] + [100] + [110] + ...,
 2*[] - 1*[1] + 2*[10] - 1*[101]
      + 2*[1010] - 1*[10101] + 2*[101010] + ...,
 [] + [1] + 6*[00] + [11] - 39*[000] + 5*[001] + 6*[100] + [111]
    + 288*[0000] - 33*[0001] + ...,
 -5*[] + ...,
 ...
 210*[] + ...,
 2210*[] - 170*[0] + 170*[1] + ...)
```

```
>>> from sage.all import *
>>> tuple(RecognizableSeriesSpace(ZZ, [Integer(0), Integer(1)]).some_
↪elements())
([1] + [01] + [10] + 2*[11] + [001] + [010]

```

`sage.combinat.recognizable_series.minimize_result(operation)`

A decorator for operations that enables control of automatic minimization on the result.

INPUT:

- `operation` – a method

OUTPUT: a method with the following additional argument:

- `minimize` – (default: `None`) a boolean or `None`. If `True`, then `minimized()` is called after the operation, if `False`, then not. If this argument is `None`, then the default specified by the parent's `minimize_results` is used.

Note

If the result of `operation` is `self`, then minimization is not applied unless `minimize=True` is explicitly set, in particular, independent of the parent's `minimize_results`.

5.1.192 k-regular sequences

An introduction and formal definition of k-regular sequences can be found, for example, on the Wikipedia article k-regular_sequence or in [AS2003].

```
sage: import logging
sage: logging.basicConfig()
```

```
>>> from sage.all import *
>>> import logging
>>> logging.basicConfig()
```

Examples

Binary sum of digits

The binary sum of digits $S(n)$ of a nonnegative integer n satisfies $S(2n) = S(n)$ and $S(2n+1) = S(n)+1$. We model this by the following:

```
sage: Seq2 = RegularSequenceRing(2, ZZ)
sage: S = Seq2((Matrix([[1, 0], [0, 1]]), Matrix([[1, 0], [1, 1]])),
....:           left=vector([0, 1]), right=vector([1, 0]))
sage: S
2-regular sequence 0, 1, 1, 2, 1, 2, 2, 3, 1, 2, ...
sage: all(S[n] == sum(n.digits(2)) for n in srange(10))
True
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)
>>> S = Seq2((Matrix([[Integer(1), Integer(0)], [Integer(0), Integer(1)]]),
↪Matrix([[Integer(1), Integer(0)], [Integer(1), Integer(1)]])),
...           left=vector([Integer(0), Integer(1)]), right=vector([Integer(1),
↪Integer(0)]))
>>> S
2-regular sequence 0, 1, 1, 2, 1, 2, 2, 3, 1, 2, ...
```

(continues on next page)

(continued from previous page)

```
>>> all(S[n] == sum(n.digits(Integer(2))) for n in srange(Integer(10)))
True
```

Number of odd entries in Pascal's triangle

Let us consider the number of odd entries in the first n rows of Pascals's triangle:

```
sage: @cached_function
....: def u(n):
....:     if n <= 1:
....:         return n
....:     return 2 * u(n // 2) + u((n+1) // 2)
sage: tuple(u(n) for n in srange(10))
(0, 1, 3, 5, 9, 11, 15, 19, 27, 29)
```

```
>>> from sage.all import *
>>> @cached_function
... def u(n):
...     if n <= Integer(1):
...         return n
...     return Integer(2) * u(n // Integer(2)) + u((n+Integer(1)) // Integer(2))
>>> tuple(u(n) for n in srange(Integer(10)))
(0, 1, 3, 5, 9, 11, 15, 19, 27, 29)
```

There is a 2-regular sequence describing the numbers above as well:

```
sage: U = Seq2((Matrix([[3, 0], [2, 1]]), Matrix([[2, 1], [0, 3]])),
....:          left=vector([1, 0]), right=vector([0, 1]))
sage: all(U[n] == u(n) for n in srange(30))
True
```

```
>>> from sage.all import *
>>> U = Seq2((Matrix([[Integer(3), Integer(0)], [Integer(2), Integer(1)]]),
↪Matrix([[Integer(2), Integer(1)], [Integer(0), Integer(3)]])),
...          left=vector([Integer(1), Integer(0)]), right=vector([Integer(0),
↪Integer(1)]))
>>> all(U[n] == u(n) for n in srange(Integer(30)))
True
```

Classes and Methods

exception sage.combinat.regular_sequence.**DegeneratedSequenceError**

Bases: RuntimeError

Exception raised if a degenerated sequence (see *is_degenerated()*) is detected.

EXAMPLES:

```
sage: Seq2 = RegularSequenceRing(2, ZZ)
sage: Seq2((Matrix([2]), Matrix([3])), vector([1]), vector([1]))
Traceback (most recent call last):
...
DegeneratedSequenceError: degenerated sequence: mu[0]*right != right.
Using such a sequence might lead to wrong results.
You can use 'allow_degenerated_sequence=True' followed
by a call of method .regenerated() for correcting this.
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)
>>> Seq2((Matrix([Integer(2)]), Matrix([Integer(3)])), vector([Integer(1)]),␣
↪vector([Integer(1)]))
Traceback (most recent call last):
...
DegeneratedSequenceError: degenerated sequence: mu[0]*right != right.
Using such a sequence might lead to wrong results.
You can use 'allow_degenerated_sequence=True' followed
by a call of method .regenerated() for correcting this.
```

class sage.combinat.regular_sequence.**RecurrenceParser**(*k*, *coefficient_ring*)

Bases: object

A parser for recurrence relations that allow the construction of a k-linear representation for the sequence satisfying these recurrence relations.

This is used by *RegularSequenceRing.from_recurrence()* to construct a *RegularSequence*.

ind(*M*, *m*, *ll*, *uu*)

Determine the index operator corresponding to the recursive sequence as defined in [HKL2022].

INPUT:

- M, m – parameters of the recursive sequences, see [HKL2022], Definition 3.1
- ll, uu – parameters of the resulting linear representation, see [HKL2022], Theorem A

OUTPUT:

A dictionary which maps both row numbers to subsequence parameters and vice versa, i.e.,

- ind[i] – a pair (j, d) representing the sequence $x(k^j n + d)$ in the i-th component (0-based) of the resulting linear representation
- ind[(j, d)] – the (0-based) row number of the sequence $x(k^j n + d)$ in the linear representation

EXAMPLES:

```
sage: from sage.combinat.regular_sequence import RecurrenceParser
sage: RP = RecurrenceParser(2, ZZ)
sage: RP.ind(3, 1, -3, 3)
{(0, 0): 0, (1, -1): 3, (1, -2): 2, (1, -3): 1,
(1, 0): 4, (1, 1): 5, (1, 2): 6, (1, 3): 7, (2, -1): 10,
(2, -2): 9, (2, -3): 8, (2, 0): 11, (2, 1): 12, (2, 2): 13,
(2, 3): 14, (2, 4): 15, (2, 5): 16, 0: (0, 0), 1: (1, -3),
10: (2, -1), 11: (2, 0), 12: (2, 1), 13: (2, 2), 14: (2, 3),
15: (2, 4), 16: (2, 5), 2: (1, -2), 3: (1, -1), 4: (1, 0),
5: (1, 1), 6: (1, 2), 7: (1, 3), 8: (2, -3), 9: (2, -2)}
```

```
>>> from sage.all import *
>>> from sage.combinat.regular_sequence import RecurrenceParser
>>> RP = RecurrenceParser(Integer(2), ZZ)
>>> RP.ind(Integer(3), Integer(1), -Integer(3), Integer(3))
{(0, 0): 0, (1, -1): 3, (1, -2): 2, (1, -3): 1,
(1, 0): 4, (1, 1): 5, (1, 2): 6, (1, 3): 7, (2, -1): 10,
(2, -2): 9, (2, -3): 8, (2, 0): 11, (2, 1): 12, (2, 2): 13,
(2, 3): 14, (2, 4): 15, (2, 5): 16, 0: (0, 0), 1: (1, -3),
10: (2, -1), 11: (2, 0), 12: (2, 1), 13: (2, 2), 14: (2, 3),
15: (2, 4), 16: (2, 5), 2: (1, -2), 3: (1, -1), 4: (1, 0),
5: (1, 1), 6: (1, 2), 7: (1, 3), 8: (2, -3), 9: (2, -2)}
```

See also

RegularSequenceRing.from_recurrence()

left(*recurrence_rules*)

Construct the vector `left` of the linear representation of recursive sequences.

INPUT:

- `recurrence_rules` – a namedtuple generated by *parameters()*; it only needs to contain a field `dim` (a positive integer)

OUTPUT: a vector

EXAMPLES:

```
sage: from collections import namedtuple
sage: from sage.combinat.regular_sequence import RecurrenceParser
sage: RP = RecurrenceParser(2, ZZ)
sage: RRD = namedtuple('recurrence_rules_dim',
....:                  ['dim', 'inhomogeneities'])
sage: recurrence_rules = RRD(dim=5, inhomogeneities={})
sage: RP.left(recurrence_rules)
(1, 0, 0, 0, 0)
```

```
>>> from sage.all import *
>>> from collections import namedtuple
>>> from sage.combinat.regular_sequence import RecurrenceParser
```

(continues on next page)

(continued from previous page)

```
>>> RP = RecurrenceParser(Integer(2), ZZ)
>>> RRD = namedtuple('recurrence_rules_dim',
...                  ['dim', 'inhomogeneities'])
>>> recurrence_rules = RRD(dim=Integer(5), inhomogeneities={})
>>> RP.left(recurrence_rules)
(1, 0, 0, 0, 0)
```

```
sage: Seq2 = RegularSequenceRing(2, ZZ)
sage: RRD = namedtuple('recurrence_rules_dim',
....:                  ['M', 'm', 'll', 'uu', 'dim', 'inhomogeneities'])
sage: recurrence_rules = RRD(M=3, m=2, ll=0, uu=9, dim=5,
....:                        inhomogeneities={0: Seq2.one_hadamard()})
sage: RP.left(recurrence_rules)
(1, 0, 0, 0, 0, 0, 0, 0)
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)
>>> RRD = namedtuple('recurrence_rules_dim',
...                  ['M', 'm', 'll', 'uu', 'dim', 'inhomogeneities'])
>>> recurrence_rules = RRD(M=Integer(3), m=Integer(2), ll=Integer(0),␣
↪uu=Integer(9), dim=Integer(5),
...                        inhomogeneities={Integer(0): Seq2.one_hadamard()})
>>> RP.left(recurrence_rules)
(1, 0, 0, 0, 0, 0, 0, 0)
```

See also

RegularSequenceRing.from_recurrence()

matrix(*recurrence_rules*, *rem*, *correct_offset=True*)

Construct the matrix for remainder `rem` of the linear representation of the sequence represented by `recurrence_rules`.

INPUT:

- `recurrence_rules` – a namedtuple generated by *parameters()*
- `rem` – integer between 0 and $k - 1$
- `correct_offset` – boolean (default: `True`); if `True`, then the resulting linear representation has no offset. See [HKL2022] for more information.

OUTPUT: a matrix

EXAMPLES:

The following example illustrates how the coefficients in the right-hand sides of the recurrence relations correspond to the entries of the matrices.

```
sage: from sage.combinat.regular_sequence import RecurrenceParser
sage: RP = RecurrenceParser(2, ZZ)
sage: var('n')
n
```

(continues on next page)

(continued from previous page)

```
sage: function('f')
f
sage: M, m, coeffs, initial_values = RP.parse_recurrence([
....:     f(8*n) == -1*f(2*n - 1) + 1*f(2*n + 1),
....:     f(8*n + 1) == -11*f(2*n - 1) + 10*f(2*n) + 11*f(2*n + 1),
....:     f(8*n + 2) == -21*f(2*n - 1) + 20*f(2*n) + 21*f(2*n + 1),
....:     f(8*n + 3) == -31*f(2*n - 1) + 30*f(2*n) + 31*f(2*n + 1),
....:     f(8*n + 4) == -41*f(2*n - 1) + 40*f(2*n) + 41*f(2*n + 1),
....:     f(8*n + 5) == -51*f(2*n - 1) + 50*f(2*n) + 51*f(2*n + 1),
....:     f(8*n + 6) == -61*f(2*n - 1) + 60*f(2*n) + 61*f(2*n + 1),
....:     f(8*n + 7) == -71*f(2*n - 1) + 70*f(2*n) + 71*f(2*n + 1),
....:     f(0) == 0, f(1) == 1, f(2) == 2, f(3) == 3, f(4) == 4,
....:     f(5) == 5, f(6) == 6, f(7) == 7], f, n)
sage: rules = RP.parameters(
....:     M, m, coeffs, initial_values, 0)
sage: RP.matrix(rules, 0, False)

RegularSequenceRing.from_recurrence()

parameters(*M*, *m*, *coeffs*, *initial_values*, *offset=0*, *inhomogeneities={}*)

Determine parameters from recurrence relations as admissible in *RegularSequenceRing.from_recurrence()*.

INPUT:

All parameters are explained in the high-level method *RegularSequenceRing.from_recurrence()*.

OUTPUT: a namedtuple `recurrence_rules` consisting of

- `M`, `m`, `l`, `u`, `offset` – parameters of the recursive sequences, see [HKL2022], Definition 3.1
- `ll`, `uu`, `n1`, `dim` – parameters and dimension of the resulting linear representation, see [HKL2022], Theorem A
- `coeffs` – dictionary mapping `(r, j)` to the coefficients $c_{r,j}$ as given in [HKL2022], Equation (3.1). If `coeffs[(r, j)]` is not given for some `r` and `j`, then it is assumed to be zero.
- `initial_values` – dictionary mapping integers `n` to the `n`-th value of the sequence
- `inhomogeneities` – dictionary mapping integers `r` to the inhomogeneity g_r as given in [HKL2022], Corollary D

EXAMPLES:

```
sage: from sage.combinat.regular_sequence import RecurrenceParser
sage: RP = RecurrenceParser(2, ZZ)
sage: RP.parameters(2, 1,
....: {(0, -2): 3, (0, 0): 1, (0, 1): 2, (1, -2): 6, (1, 0): 4,
....: (1, 1): 5, (2, -2): 9, (2, 0): 7, (2, 1): 8, (3, -2): 12,
....: (3, 0): 10, (3, 1): 11}, {0: 1, 1: 2, 2: 1, 3: 4}, 0, {0: 1})
recurrence_rules(M=2, m=1, ll=-2, u=1, ll=-6, uu=3, dim=14,

RegularSequenceRing.from_recurrence()

parse_direct_arguments(*M*, *m*, *coeffs*, *initial_values*)

Check whether the direct arguments as admissible in *RegularSequenceRing.from_recurrence()* are valid.

INPUT:

All parameters are explained in the high-level method *RegularSequenceRing.from_recurrence()*.

OUTPUT: a tuple consisting of the input parameters

EXAMPLES:

```
sage: from sage.combinat.regular_sequence import RecurrenceParser
sage: RP = RecurrenceParser(2, ZZ)
sage: RP.parse_direct_arguments(2, 1,
....:     {(0, -2): 3, (0, 0): 1, (0, 1): 2,
....:      (1, -2): 6, (1, 0): 4, (1, 1): 5,
....:      (2, -2): 9, (2, 0): 7, (2, 1): 8,
....:      (3, -2): 12, (3, 0): 10, (3, 1): 11},
....:     {0: 1, 1: 2, 2: 1})
(2, 1, {(0, -2): 3, (0, 0): 1, (0, 1): 2,
(1, -2): 6, (1, 0): 4, (1, 1): 5,
(2, -2): 9, (2, 0): 7, (2, 1): 8,
```

RegularSequenceRing.from_recurrence()

parse_recurrence(*equations*, *function*, *var*)

Parse recurrence relations as admissible in *RegularSequenceRing.from_recurrence()*.

INPUT:

All parameters are explained in the high-level method *RegularSequenceRing.from_recurrence()*.

OUTPUT: a tuple consisting of

- M, m – see *RegularSequenceRing.from_recurrence()*
- coeffs – see *RegularSequenceRing.from_recurrence()*

- `initial_values` – see *RegularSequenceRing.from_recurrence()*

EXAMPLES:

```
sage: from sage.combinat.regular_sequence import RecurrenceParser
sage: RP = RecurrenceParser(2, ZZ)
sage: var('n')
n
sage: function('f')
f
sage: RP.parse_recurrence([
....:     f(4*n) == f(2*n) + 2*f(2*n + 1) + 3*f(2*n - 2),
....:     f(4*n + 1) == 4*f(2*n) + 5*f(2*n + 1) + 6*f(2*n - 2),
....:     f(4*n + 2) == 7*f(2*n) + 8*f(2*n + 1) + 9*f(2*n - 2),
....:     f(4*n + 3) == 10*f(2*n) + 11*f(2*n + 1) + 12*f(2*n - 2),
....:     f(0) == 1, f(1) == 2, f(2) == 1], f, n)
(2, 1, {(0, -2): 3, (0, 0): 1, (0, 1): 2, (1, -2): 6, (1, 0): 4,
(1, 1): 5, (2, -2): 9, (2, 0): 7, (2, 1): 8, (3, -2): 12, (3, 0): 10,
(3, 1): 11}, {0: 1, 1: 2, 2: 1})
```

```
>>> from sage.all import *
>>> from sage.combinat.regular_sequence import RecurrenceParser
>>> RP = RecurrenceParser(Integer(2), ZZ)
>>> var('n')
n
>>> function('f')
f
>>> RP.parse_recurrence([
...     f(Integer(4)*n) == f(Integer(2)*n) + Integer(2)*f(Integer(2)*n +␣
↪Integer(1)) + Integer(3)*f(Integer(2)*n - Integer(2)),
...     f(Integer(4)*n + Integer(1)) == Integer(4)*f(Integer(2)*n) +␣
↪Integer(5)*f(Integer(2)*n + Integer(1)) + Integer(6)*f(Integer(2)*n -␣
↪Integer(2)),

```

(continues on next page)

(continued from previous page)

```
...     f(Integer(2)*n) == f(n), f(Integer(2)*n + Integer(1)) == f(n) + f(n +␣
↪Integer(1)),
...     f(Integer(0)) == Integer(0), f(Integer(1)) == Integer(1)], f, n)
(1, 0, {(0, 0): 1, (1, 0): 1, (1, 1): 1}, {0: 0, 1: 1})
```

See also:

RegularSequenceRing.from_recurrence()

right(*recurrence_rules*)

Construct the vector `right` of the linear representation of the sequence induced by `recurrence_rules`.

INPUT:

- `recurrence_rules` – a namedtuple generated by *parameters()*

OUTPUT: a vector

See also:

RegularSequenceRing.from_recurrence()

shifted_inhomogeneities(*recurrence_rules*)

Return a dictionary of all needed shifted inhomogeneities as described in the proof of Corollary D in [HKL2022].

INPUT:

- `recurrence_rules` – a namedtuple generated by *parameters()*

OUTPUT:

A dictionary mapping r to the regular sequence $\sum_i g_r(n+i)$ for g_r as given in [HKL2022], Corollary D, and i between $\lfloor \ell'/k^M \rfloor$ and $\lfloor (k^{M-1} - k^m + u')/k^M \rfloor + 1$; see [HKL2022], proof of Corollary D. The first blocks of the corresponding vector-valued sequence (obtained from its linear representation) correspond to the sequences $g_r(n+i)$ where i is as in the sum above; the remaining blocks consist of other shifts which are required for the regular sequence.

EXAMPLES:

```
sage: from collections import namedtuple
sage: from sage.combinat.regular_sequence import RecurrenceParser
sage: RP = RecurrenceParser(2, ZZ)
sage: Seq2 = RegularSequenceRing(2, ZZ)
sage: S = Seq2((Matrix([[1, 0], [0, 1]]), Matrix([[1, 0], [1, 1]])),
....:           left=vector([0, 1]), right=vector([1, 0]))
sage: S
2-regular sequence 0, 1, 1, 2, 1, 2, 2, 3, 1, 2, ...
sage: RR = namedtuple('recurrence_rules',
....:                  ['M', 'm', 'll', 'uu', 'inhomogeneities'])
sage: recurrence_rules = RR(M=3, m=0, ll=-14, uu=14,
....:                         inhomogeneities={0: S, 1: S})
sage: SI = RP.shifted_inhomogeneities(recurrence_rules)
```

(continues on next page)

(continued from previous page)

```
sage: SI
{0: 2-regular sequence 4, 5, 7, 9, 11, 11, 11, 12, 13, 13, ...,
 1: 2-regular sequence 4, 5, 7, 9, 11, 11, 11, 12, 13, 13, ...}
```

```
>>> from sage.all import *
>>> from collections import namedtuple
>>> from sage.combinat.regular_sequence import RecurrenceParser
>>> RP = RecurrenceParser(Integer(2), ZZ)
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)
>>> S = Seq2((Matrix([[Integer(1), Integer(0)], [Integer(0), Integer(1)]]),␣
↪Matrix([[Integer(1), Integer(0)], [Integer(1), Integer(1)]])),
...           left=vector([Integer(0), Integer(1)]), right=vector([Integer(1),␣
↪Integer(0)]))
>>> S
2-regular sequence 0, 1, 1, 2, 1, 2, 2, 3, 1, 2, ...
>>> RR = namedtuple('recurrence_rules',
...                 ['M', 'm', 'll', 'uu', 'inhomogeneities'])
>>> recurrence_rules = RR(M=Integer(3), m=Integer(0), ll=-Integer(14),␣
↪uu=Integer(14),
...                       inhomogeneities={Integer(0): S, Integer(1): S})
>>> SI = RP.shifted_inhomogeneities(recurrence_rules)
>>> SI
{0: 2-regular sequence 4, 5, 7, 9, 11, 11, 11, 12, 13, 13, ...,
 1: 2-regular sequence 4, 5, 7, 9, 11, 11, 11, 12, 13, 13, ...}
```

The first blocks of the corresponding vector-valued sequence correspond to the corresponding shifts of the inhomogeneity. In this particular case, there are no other blocks:

```
sage: lower = -2
sage: upper = 3
sage: SI[0].dimension() == S.dimension() * (upper - lower + 1)
True
sage: all(
....:     Seq2(
....:         SI[0].mu,
....:         vector((i - lower)*[0, 0] + list(S.left) + (upper - i)*[0, 0]),
....:         SI[0].right)
....:     == S.subsequence(1, i)
....:     for i in range(lower, upper+1))
True
```

```
>>> from sage.all import *
>>> lower = -Integer(2)
>>> upper = Integer(3)
>>> SI[Integer(0)].dimension() == S.dimension() * (upper - lower + Integer(1))
True
>>> all(
...     Seq2(
...         SI[Integer(0)].mu,
...         vector((i - lower)*[Integer(0), Integer(0)] + list(S.left) +␣
↪(upper - i)*[Integer(0), Integer(0)]),
...         SI[Integer(0)].right)
```

(continues on next page)

(continued from previous page)

```
...         == S.subsequence(Integer(1), i)
...         for i in range(lower, upper+Integer(1)))
True
```

See also:

RegularSequenceRing.from_recurrence()

v_eval_n (*recurrence_rules*, *n*)

Return the vector $v(n)$ as given in [HKL2022], Theorem A.

INPUT:

- `recurrence_rules` – a namedtuple generated by *parameters()*
- `n` – integer

OUTPUT: a vector

EXAMPLES:

Stern–Brocot Sequence:

```
sage: from sage.combinat.regular_sequence import RecurrenceParser
sage: RP = RecurrenceParser(2, ZZ)
sage: SB_rules = RP.parameters(
....:     1, 0, {(0, 0): 1, (1, 0): 1, (1, 1): 1},
....:     {0: 0, 1: 1, 2: 1}, 0)
sage: RP.v_eval_n(SB_rules, 0)
(0, 1, 1)
```

```
>>> from sage.all import *
>>> from sage.combinat.regular_sequence import RecurrenceParser
>>> RP = RecurrenceParser(Integer(2), ZZ)
>>> SB_rules = RP.parameters(
...     Integer(1), Integer(0), {(Integer(0), Integer(0)): Integer(1),␣
↪(Integer(1), Integer(0)): Integer(1), (Integer(1), Integer(1)): Integer(1)},
...     {Integer(0): Integer(0), Integer(1): Integer(1), Integer(2):␣
↪Integer(1)}, Integer(0))
>>> RP.v_eval_n(SB_rules, Integer(0))
(0, 1, 1)
```

See also:

RegularSequenceRing.from_recurrence()

values (*M*, *m*, *l*, *u*, *ll*, *coeffs*, *initial_values*, *last_value_needed*, *offset*, *inhomogeneities*)

Determine enough values of the corresponding recursive sequence by applying the recurrence relations given in *RegularSequenceRing.from_recurrence()* to the values given in `initial_values`.

INPUT:

- `M`, `m`, `l`, `u`, `offset` – parameters of the recursive sequences, see [HKL2022], Definition 3.1

- `ll` – parameter of the resulting linear representation, see [HKL2022], Theorem A
- `coeffs` – dictionary where `coeffs[(r, j)]` is the coefficient $c_{r,j}$ as given in `RegularSequenceRing.from_recurrence()`. If `coeffs[(r, j)]` is not given for some `r` and `j`, then it is assumed to be zero.
- `initial_values` – dictionary mapping integers `n` to the `n`-th value of the sequence
- `last_value_needed` – last initial value which is needed to determine the linear representation
- `inhomogeneities` – dictionary mapping integers `r` to the inhomogeneity g_r as given in [HKL2022], Corollary D

OUTPUT:

A dictionary mapping integers `n` to the `n`-th value of the sequence for all `n` up to `last_value_needed`.

EXAMPLES:

Stern–Brocot Sequence:

```
sage: from sage.combinat.regular_sequence import RecurrenceParser
sage: RP = RecurrenceParser(2, ZZ)
sage: RP.values(M=1, m=0, l=0, u=1, ll=0,
....:     coeffs={(0, 0): 1, (1, 0): 1, (1, 1): 1},
....:     initial_values={0: 0, 1: 1, 2: 1}, last_value_needed=20,
....:     offset=0, inhomogeneities={})
{0: 0, 1: 1, 2: 1, 3: 2, 4: 1, 5: 3, 6: 2, 7: 3, 8: 1, 9: 4, 10: 3,
11: 5, 12: 2, 13: 5, 14: 3, 15: 4, 16: 1, 17: 5, 18: 4, 19: 7, 20: 3}
```

```
>>> from sage.all import *
>>> from sage.combinat.regular_sequence import RecurrenceParser
>>> RP = RecurrenceParser(Integer(2), ZZ)
>>> RP.values(M=Integer(1), m=Integer(0), l=Integer(0), u=Integer(1),␣
↪ll=Integer(0),
...     coeffs={(Integer(0), Integer(0)): Integer(1), (Integer(1),␣
↪Integer(0)): Integer(1), (Integer(1), Integer(1)): Integer(1)},
...     initial_values={Integer(0): Integer(0), Integer(1): Integer(1),␣
↪Integer(2): Integer(1)}, last_value_needed=Integer(20),
...     offset=Integer(0), inhomogeneities={})
{0: 0, 1: 1, 2: 1, 3: 2, 4: 1, 5: 3, 6: 2, 7: 3, 8: 1, 9: 4, 10: 3,
11: 5, 12: 2, 13: 5, 14: 3, 15: 4, 16: 1, 17: 5, 18: 4, 19: 7, 20: 3}
```

See also

`RegularSequenceRing.from_recurrence()`

class `sage.combinat.regular_sequence.`**`RegularSequence`**(*parent*, *mu*, *left=None*, *right=None*)

Bases: `RecognizableSeries`

A k-regular sequence.

INPUT:

- `parent` – an instance of `RegularSequenceRing`
- `mu` – a family of square matrices, all of which have the same dimension. The indices of this family are $0, ..., k-1$. `mu` may be a list or tuple of cardinality k as well. See also `mu()`.

- `left` – (default: `None`) a vector. When evaluating the sequence, this vector is multiplied from the left to the matrix product. If `None`, then this multiplication is skipped.
- `right` – (default: `None`) a vector. When evaluating the sequence, this vector is multiplied from the right to the matrix product. If `None`, then this multiplication is skipped.

When created via the parent `RegularSequenceRing`, then the following option is available.

- `allow_degenerated_sequence` – boolean (default: `False`); if set, then there will be no check if the input is a degenerated sequence (see `is_degenerated()`). Otherwise the input is checked and a `DegeneratedSequenceError` is raised if such a sequence is detected.

EXAMPLES:

```
sage: Seq2 = RegularSequenceRing(2, ZZ)
sage: S = Seq2((Matrix([[3, 0], [6, 1]]), Matrix([[0, 1], [-6, 5]])),
....:          vector([1, 0]), vector([0, 1])); S
2-regular sequence 0, 1, 3, 5, 9, 11, 15, 19, 27, 29, ...
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)
>>> S = Seq2((Matrix([[Integer(3), Integer(0)], [Integer(6), Integer(1)]]),
↪Matrix([[Integer(0), Integer(1)], [-Integer(6), Integer(5)]])),
...          vector([Integer(1), Integer(0)]), vector([Integer(0), Integer(1)]));
↪S
2-regular sequence 0, 1, 3, 5, 9, 11, 15, 19, 27, 29, ...
```

We can access the coefficients of a sequence by

```
sage: S[5]
11
```

```
>>> from sage.all import *
>>> S[Integer(5)]
11
```

or iterating over the first, say 10, by

```
sage: from itertools import islice
sage: list(islice(S, 10))
[0, 1, 3, 5, 9, 11, 15, 19, 27, 29]
```

```
>>> from sage.all import *
>>> from itertools import islice
>>> list(islice(S, Integer(10)))
[0, 1, 3, 5, 9, 11, 15, 19, 27, 29]
```

See also

k-regular sequence, `RegularSequenceRing`.

backward_differences(***kwds*)

Return the sequence of backward differences of this k-regular sequence.

INPUT:

- `minimize` – (default: `None`) a boolean or `None`. If `True`, then `minimized()` is called after the operation, if `False`, then not. If this argument is `None`, then the default specified by the parent's `minimize_results` is used.

OUTPUT: a `RegularSequence`

Note: The coefficient to the index -1 is 0.

EXAMPLES:

```
sage: Seq2 = RegularSequenceRing(2, ZZ)
sage: C = Seq2((Matrix([[2, 0], [2, 1]]), Matrix([[0, 1], [-2, 3]])),
....:           vector([1, 0]), vector([0, 1]))
sage: C
2-regular sequence 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, ...
sage: C.backward_differences()
2-regular sequence 0, 1, 1, 1, 1, 1, 1, 1, 1, 1, ...
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)
>>> C = Seq2((Matrix([[Integer(2), Integer(0)], [Integer(2), Integer(1)]]),
↪Matrix([[Integer(0), Integer(1)], [-Integer(2), Integer(3)]])),
...           vector([Integer(1), Integer(0)]), vector([Integer(0),
↪Integer(1)]))
>>> C
2-regular sequence 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, ...
>>> C.backward_differences()
2-regular sequence 0, 1, 1, 1, 1, 1, 1, 1, 1, 1, ...
```

```
sage: E = Seq2((Matrix([[0, 1], [0, 1]]), Matrix([[0, 0], [0, 1]])),
....:           vector([1, 0]), vector([1, 1]))
sage: E
2-regular sequence 1, 0, 1, 0, 1, 0, 1, 0, 1, 0, ...
sage: E.backward_differences()
2-regular sequence 1, -1, 1, -1, 1, -1, 1, -1, 1, -1, ...
```

```
>>> from sage.all import *
>>> E = Seq2((Matrix([[Integer(0), Integer(1)], [Integer(0), Integer(1)]]),
↪Matrix([[Integer(0), Integer(0)], [Integer(0), Integer(1)]])),
...           vector([Integer(1), Integer(0)]), vector([Integer(1),
↪Integer(1)]))
>>> E
2-regular sequence 1, 0, 1, 0, 1, 0, 1, 0, 1, 0, ...
>>> E.backward_differences()
2-regular sequence 1, -1, 1, -1, 1, -1, 1, -1, 1, -1, ...
```

coefficient_of_n(*n*, ***kwds*)

Return the n-th entry of this sequence.

INPUT:

- `n` – nonnegative integer

OUTPUT: an element of the universe of the sequence

EXAMPLES:

```
sage: Seq2 = RegularSequenceRing(2, ZZ)
sage: S = Seq2((Matrix([[1, 0], [0, 1]]), Matrix([[0, -1], [1, 2]])),
....:          left=vector([0, 1]), right=vector([1, 0]))
sage: S[7]
3
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)
>>> S = Seq2((Matrix([[Integer(1), Integer(0)], [Integer(0), Integer(1)]]),␣
↪Matrix([[Integer(0), -Integer(1)], [Integer(1), Integer(2)]])),
...          left=vector([Integer(0), Integer(1)]), right=vector([Integer(1),␣
↪Integer(0)]))
>>> S[Integer(7)]
3
```

This is equivalent to:

```
sage: S.coefficient_of_n(7)
3
```

```
>>> from sage.all import *
>>> S.coefficient_of_n(Integer(7))
3
```

convolution(**args*, ***kwds*)

Return the product of this k-regular sequence with `other`, where the multiplication is convolution of power series.

The operator $*$ is mapped to *convolution()*.

INPUT:

- `other` – a *RegularSequence*
- `minimize` – (default: `None`) a boolean or `None`. If `True`, then *minimized()* is called after the operation, if `False`, then not. If this argument is `None`, then the default specified by the parent's `minimize_results` is used.

OUTPUT: a *RegularSequence*

ALGORITHM:

See pdf attached to github pull request #35894 which contains a draft describing the details of the used algorithm.

EXAMPLES:

```
sage: Seq2 = RegularSequenceRing(2, ZZ)
sage: E = Seq2((Matrix([[0, 1], [0, 1]]), Matrix([[0, 0], [0, 1]])),
....:          vector([1, 0]), vector([1, 1]))
sage: E
2-regular sequence 1, 0, 1, 0, 1, 0, 1, 0, 1, 0, ...
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)
>>> E = Seq2((Matrix([[Integer(0), Integer(1)], [Integer(0), Integer(1)]]),␣
↪Matrix([[Integer(0), Integer(0)], [Integer(0), Integer(1)]])),
...           vector([Integer(1), Integer(0)]), vector([Integer(1),␣
↪Integer(1)]))
>>> E
2-regular sequence 1, 0, 1, 0, 1, 0, 1, 0, 1, 0, ...
```

We can build the convolution (in the sense of power-series) of E by itself via:

```
sage: E.convolution(E)
2-regular sequence 1, 0, 2, 0, 3, 0, 4, 0, 5, 0, ...
```

```
>>> from sage.all import *
>>> E.convolution(E)
2-regular sequence 1, 0, 2, 0, 3, 0, 4, 0, 5, 0, ...
```

This is the same as using multiplication operator:

```
sage: E * E
2-regular sequence 1, 0, 2, 0, 3, 0, 4, 0, 5, 0, ...
```

```
>>> from sage.all import *
>>> E * E
2-regular sequence 1, 0, 2, 0, 3, 0, 4, 0, 5, 0, ...
```

Building `partial_sums()` can also be seen as a convolution:

```
sage: o = Seq2.one_hadamard()
sage: E * o
2-regular sequence 1, 1, 2, 2, 3, 3, 4, 4, 5, 5, ...
sage: E * o == E.partial_sums(include_n=True)
True
```

```
>>> from sage.all import *
>>> o = Seq2.one_hadamard()
>>> E * o
2-regular sequence 1, 1, 2, 2, 3, 3, 4, 4, 5, 5, ...
>>> E * o == E.partial_sums(include_n=True)
True
```

forward_differences(***kwds*)

Return the sequence of forward differences of this k-regular sequence.

INPUT:

- `minimize` – (default: `None`) a boolean or `None`. If `True`, then `minimized()` is called after the operation, if `False`, then not. If this argument is `None`, then the default specified by the parent's `minimize_results` is used.

OUTPUT: a `RegularSequence`

EXAMPLES:

```
sage: Seq2 = RegularSequenceRing(2, ZZ)
sage: C = Seq2((Matrix([[2, 0], [2, 1]]), Matrix([[0, 1], [-2, 3]])),
....:          vector([1, 0]), vector([0, 1]))
sage: C
2-regular sequence 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, ...
sage: C.forward_differences()
2-regular sequence 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, ...
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)
>>> C = Seq2((Matrix([[Integer(2), Integer(0)], [Integer(2), Integer(1)]]),␣
↪Matrix([[Integer(0), Integer(1)], [-Integer(2), Integer(3)]])),
...          vector([Integer(1), Integer(0)]), vector([Integer(0),␣
↪Integer(1)]))
>>> C
2-regular sequence 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, ...
>>> C.forward_differences()
2-regular sequence 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, ...
```

```
sage: E = Seq2((Matrix([[0, 1], [0, 1]]), Matrix([[0, 0], [0, 1]])),
....:          vector([1, 0]), vector([1, 1]))
sage: E
2-regular sequence 1, 0, 1, 0, 1, 0, 1, 0, 1, 0, ...
sage: E.forward_differences()
2-regular sequence -1, 1, -1, 1, -1, 1, -1, 1, -1, 1, ...
```

```
>>> from sage.all import *
>>> E = Seq2((Matrix([[Integer(0), Integer(1)], [Integer(0), Integer(1)]]),␣
↪Matrix([[Integer(0), Integer(0)], [Integer(0), Integer(1)]])),
...          vector([Integer(1), Integer(0)]), vector([Integer(1),␣
↪Integer(1)]))
>>> E
2-regular sequence 1, 0, 1, 0, 1, 0, 1, 0, 1, 0, ...
>>> E.forward_differences()
2-regular sequence -1, 1, -1, 1, -1, 1, -1, 1, -1, 1, ...
```

is_degenerated()

Return whether this k-regular sequence is degenerated, i.e., whether this k-regular sequence does not satisfy $\mu[0]\mathit{right} = \mathit{right}$.

EXAMPLES:

```
sage: Seq2 = RegularSequenceRing(2, ZZ)
sage: Seq2((Matrix([2]), Matrix([3])), vector([1]), vector([1]))  # indirect␣
↪doctest
Traceback (most recent call last):
...
DegeneratedSequenceError: degenerated sequence: mu[0]*right != right.
Using such a sequence might lead to wrong results.
You can use 'allow_degenerated_sequence=True' followed
by a call of method .regenerated() for correcting this.
sage: S = Seq2((Matrix([2]), Matrix([3])), vector([1]), vector([1]),
```

(continues on next page)

(continued from previous page)

```
....:           allow_degenerated_sequence=True)
sage: S
2-regular sequence 1, 3, 6, 9, 12, 18, 18, 27, 24, 36, ...
sage: S.is_degenerated()
True
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)
>>> Seq2((Matrix([Integer(2)]), Matrix([Integer(3)])), vector([Integer(1)]),␣
↪vector([Integer(1)]))  # indirect doctest
Traceback (most recent call last):
...
DegeneratedSequenceError: degenerated sequence: mu[0]*right != right.
Using such a sequence might lead to wrong results.
You can use 'allow_degenerated_sequence=True' followed
by a call of method .regenerated() for correcting this.
>>> S = Seq2((Matrix([Integer(2)]), Matrix([Integer(3)])),␣
↪vector([Integer(1)]), vector([Integer(1)]),
...          allow_degenerated_sequence=True)
>>> S
2-regular sequence 1, 3, 6, 9, 12, 18, 18, 27, 24, 36, ...
>>> S.is_degenerated()
True
```

```
sage: C = Seq2((Matrix([[2, 0], [2, 1]]), Matrix([[0, 1], [-2, 3]])),
....:           vector([1, 0]), vector([0, 1]))
sage: C.is_degenerated()
False
```

```
>>> from sage.all import *
>>> C = Seq2((Matrix([[Integer(2), Integer(0)], [Integer(2), Integer(1)]]),␣
↪Matrix([[Integer(0), Integer(1)], [-Integer(2), Integer(3)]])),
...          vector([Integer(1), Integer(0)]), vector([Integer(0),␣
↪Integer(1)]))
>>> C.is_degenerated()
False
```

partial_sums(**args*, ***kwds*)

Return the sequence of partial sums of this k-regular sequence. That is, the n-th entry of the result is the sum of the first n entries in the original sequence.

INPUT:

- `include_n` – boolean (default: `False`); if set, then the n-th entry of the result is the sum of the entries up to index n (included)
- `minimize` – (default: `None`) a boolean or `None`. If `True`, then `minimized()` is called after the operation, if `False`, then not. If this argument is `None`, then the default specified by the parent's `minimize_results` is used.

OUTPUT: a `RegularSequence`

EXAMPLES:

```
sage: Seq2 = RegularSequenceRing(2, ZZ)

sage: E = Seq2((Matrix([[0, 1], [0, 1]]), Matrix([[0, 0], [0, 1]])),
....:           vector([1, 0]), vector([1, 1]))
sage: E
2-regular sequence 1, 0, 1, 0, 1, 0, 1, 0, 1, 0, ...
sage: E.partial_sums()
2-regular sequence 0, 1, 1, 2, 2, 3, 3, 4, 4, 5, ...
sage: E.partial_sums(include_n=True)
2-regular sequence 1, 1, 2, 2, 3, 3, 4, 4, 5, 5, ...
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)

>>> E = Seq2((Matrix([[Integer(0), Integer(1)], [Integer(0), Integer(1)]]),␣
↪Matrix([[Integer(0), Integer(0)], [Integer(0), Integer(1)]])),
...           vector([Integer(1), Integer(0)]), vector([Integer(1),␣
↪Integer(1)]))
>>> E
2-regular sequence 1, 0, 1, 0, 1, 0, 1, 0, 1, 0, ...
>>> E.partial_sums()
2-regular sequence 0, 1, 1, 2, 2, 3, 3, 4, 4, 5, ...
>>> E.partial_sums(include_n=True)
2-regular sequence 1, 1, 2, 2, 3, 3, 4, 4, 5, 5, ...
```

```
sage: C = Seq2((Matrix([[2, 0], [2, 1]]), Matrix([[0, 1], [-2, 3]])),
....:           vector([1, 0]), vector([0, 1]))
sage: C
2-regular sequence 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, ...
sage: C.partial_sums()
2-regular sequence 0, 0, 1, 3, 6, 10, 15, 21, 28, 36, ...
sage: C.partial_sums(include_n=True)
2-regular sequence 0, 1, 3, 6, 10, 15, 21, 28, 36, 45, ...
```

```
>>> from sage.all import *
>>> C = Seq2((Matrix([[Integer(2), Integer(0)], [Integer(2), Integer(1)]]),␣
↪Matrix([[Integer(0), Integer(1)], [-Integer(2), Integer(3)]])),
...           vector([Integer(1), Integer(0)]), vector([Integer(0),␣
↪Integer(1)]))
>>> C
2-regular sequence 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, ...
>>> C.partial_sums()
2-regular sequence 0, 0, 1, 3, 6, 10, 15, 21, 28, 36, ...
>>> C.partial_sums(include_n=True)
2-regular sequence 0, 1, 3, 6, 10, 15, 21, 28, 36, 45, ...
```

The following linear representation of S is chosen badly (is degenerated, see `is_degenerated()`), as $\mu(0)$ applied on *right* does not equal *right*:

```
sage: S = Seq2((Matrix([2]), Matrix([3])), vector([1]), vector([1]),
....:           allow_degenerated_sequence=True)
sage: S
```

(continues on next page)

(continued from previous page)

```
2-regular sequence 1, 3, 6, 9, 12, 18, 18, 27, 24, 36, ...
```

```
>>> from sage.all import *
>>> S = Seq2((Matrix([Integer(2)]), Matrix([Integer(3)])),␣
↪vector([Integer(1)]), vector([Integer(1)]),
...          allow_degenerated_sequence=True)
>>> S
2-regular sequence 1, 3, 6, 9, 12, 18, 18, 27, 24, 36, ...
```

Therefore, building partial sums produces a wrong result:

```
sage: H = S.partial_sums(include_n=True, minimize=False)
sage: H
2-regular sequence 1, 5, 16, 25, 62, 80, 98, 125, 274, 310, ...
sage: H = S.partial_sums(minimize=False)
sage: H
2-regular sequence 0, 2, 10, 16, 50, 62, 80, 98, 250, 274, ...
```

```
>>> from sage.all import *
>>> H = S.partial_sums(include_n=True, minimize=False)
>>> H
2-regular sequence 1, 5, 16, 25, 62, 80, 98, 125, 274, 310, ...
>>> H = S.partial_sums(minimize=False)
>>> H
2-regular sequence 0, 2, 10, 16, 50, 62, 80, 98, 250, 274, ...
```

We can `guess()` the correct representation:

```
sage: from itertools import islice
sage: L = []; ps = 0
sage: for s in islice(S, 110):
....:     ps += s
....:     L.append(ps)
sage: G = Seq2.guess(lambda n: L[n])
sage: G
2-regular sequence 1, 4, 10, 19, 31, 49, 67, 94, 118, 154, ...
sage: G.linear_representation()
((1, 0, 0, 0),
 Finite family {0: [  0   1   0   0]
                   [  0   0   0   1]
                   [ -5   5   1   0]
                   [ 10 -17   0   8],
                1: [  0   0   1   0]
                   [ -5   3   3   0]
                   [ -5   0   6   0]
                   [-30  21  10   0]},
 (1, 1, 4, 1))
sage: G.minimized().dimension() == G.dimension()
True
```

```
>>> from sage.all import *
>>> from itertools import islice
```

(continues on next page)

(continued from previous page)

```
>>> L = []; ps = Integer(0)
>>> for s in islice(S, Integer(110)):
...     ps += s
...     L.append(ps)
>>> G = Seq2.guess(lambda n: L[n])
>>> G
2-regular sequence 1, 4, 10, 19, 31, 49, 67, 94, 118, 154, ...
>>> G.linear_representation()
((1, 0, 0, 0),
 Finite family {0: [  0   1   0   0]
                   [  0   0   0   1]
                   [ -5   5   1   0]
                   [ 10 -17   0   8],
                1: [  0   0   1   0]
                   [ -5   3   3   0]
                   [ -5   0   6   0]
                   [-30  21  10   0]},
 (1, 1, 4, 1))
>>> G.minimized().dimension() == G.dimension()
True
```

Or we regenerate the sequence S first:

```
sage: S.regenerated().partial_sums(include_n=True, minimize=False)
2-regular sequence 1, 4, 10, 19, 31, 49, 67, 94, 118, 154, ...
sage: S.regenerated().partial_sums(minimize=False)
2-regular sequence 0, 1, 4, 10, 19, 31, 49, 67, 94, 118, ...
```

```
>>> from sage.all import *
>>> S.regenerated().partial_sums(include_n=True, minimize=False)
2-regular sequence 1, 4, 10, 19, 31, 49, 67, 94, 118, 154, ...
>>> S.regenerated().partial_sums(minimize=False)
2-regular sequence 0, 1, 4, 10, 19, 31, 49, 67, 94, 118, ...
```

regenerated(**args*, ***kwds*)

Return a k-regular sequence that satisfies $\mu[0] right = right$ with the same values as this sequence.

INPUT:

- `minimize` – (default: `None`) a boolean or `None`. If `True`, then *`minimized()`* is called after the operation, if `False`, then not. If this argument is `None`, then the default specified by the parent's `minimize_results` is used.

OUTPUT: a *`RegularSequence`*

ALGORITHM:

Theorem B of [HKL2022] with $n_0 = 1$.

EXAMPLES:

```
sage: Seq2 = RegularSequenceRing(2, ZZ)
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)
```

The following linear representation of S is chosen badly (is degenerated, see `is_degenerated()`), as $\mu(0)$ applied on *right* does not equal *right*:

```
sage: S = Seq2((Matrix([2]), Matrix([3])), vector([1]), vector([1]),
....:          allow_degenerated_sequence=True)
sage: S
2-regular sequence 1, 3, 6, 9, 12, 18, 18, 27, 24, 36, ...
sage: S.is_degenerated()
True
```

```
>>> from sage.all import *
>>> S = Seq2((Matrix([Integer(2)]), Matrix([Integer(3)])),␣
↪vector([Integer(1)]), vector([Integer(1)]),
...          allow_degenerated_sequence=True)
>>> S
2-regular sequence 1, 3, 6, 9, 12, 18, 18, 27, 24, 36, ...
>>> S.is_degenerated()
True
```

However, we can regenerate the sequence S:

```
sage: H = S.regenerated()
sage: H
2-regular sequence 1, 3, 6, 9, 12, 18, 18, 27, 24, 36, ...
sage: H.linear_representation()
((1, 0),
 Finite family {0: [ 0  1]
                   [-2  3],
                1: [3 0]
                   [6 0]},
 (1, 1))
sage: H.is_degenerated()
False
```

```
>>> from sage.all import *
>>> H = S.regenerated()
>>> H
2-regular sequence 1, 3, 6, 9, 12, 18, 18, 27, 24, 36, ...
>>> H.linear_representation()
((1, 0),
 Finite family {0: [ 0  1]
                   [-2  3],
                1: [3 0]
                   [6 0]},
 (1, 1))
>>> H.is_degenerated()
False
```

shift_left(*b=1*, ***kwds*)

Return the sequence obtained by shifting this k-regular sequence b steps to the left.

INPUT:

- `b` – integer

- `minimize` – (default: `None`) a boolean or `None`. If `True`, then *minimized()* is called after the operation, if `False`, then not. If this argument is `None`, then the default specified by the parent's `minimize_results` is used.

OUTPUT: a *RegularSequence*

Note

If b is negative (i.e., actually a right-shift), then the coefficients when accessing negative indices are 0.

EXAMPLES:

```
sage: Seq2 = RegularSequenceRing(2, ZZ)
sage: C = Seq2((Matrix([[2, 0], [0, 1]]), Matrix([[2, 1], [0, 1]])),
....:          vector([1, 0]), vector([0, 1])); C
2-regular sequence 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, ...

sage: C.shift_left()
2-regular sequence 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, ...
sage: C.shift_left(3)
2-regular sequence 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, ...
sage: C.shift_left(-2)
2-regular sequence 0, 0, 0, 1, 2, 3, 4, 5, 6, 7, ...
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)
>>> C = Seq2((Matrix([[Integer(2), Integer(0)], [Integer(0), Integer(1)]]),␣
↪Matrix([[Integer(2), Integer(1)], [Integer(0), Integer(1)]])),
...          vector([Integer(1), Integer(0)]), vector([Integer(0),␣
↪Integer(1)])); C
2-regular sequence 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, ...

>>> C.shift_left()
2-regular sequence 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, ...
>>> C.shift_left(Integer(3))
2-regular sequence 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, ...
>>> C.shift_left(-Integer(2))
2-regular sequence 0, 0, 0, 1, 2, 3, 4, 5, 6, 7, ...
```

shift_right(*b=1*, ***kwds*)

Return the sequence obtained by shifting this k-regular sequence b steps to the right.

INPUT:

- `b` – integer
- `minimize` – (default: `None`) a boolean or `None`. If `True`, then *minimized()* is called after the operation, if `False`, then not. If this argument is `None`, then the default specified by the parent's `minimize_results` is used.

OUTPUT: a *RegularSequence*

Note

If b is positive (i.e., indeed a right-shift), then the coefficients when accessing negative indices are 0.

EXAMPLES:

```
sage: Seq2 = RegularSequenceRing(2, ZZ)
sage: C = Seq2((Matrix([[2, 0], [0, 1]]), Matrix([[2, 1], [0, 1]])),
....:          vector([1, 0]), vector([0, 1])); C
2-regular sequence 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, ...

sage: C.shift_right()
2-regular sequence 0, 0, 1, 2, 3, 4, 5, 6, 7, 8, ...
sage: C.shift_right(3)
2-regular sequence 0, 0, 0, 0, 1, 2, 3, 4, 5, 6, ...
sage: C.shift_right(-2)
2-regular sequence 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, ...
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)
>>> C = Seq2((Matrix([[Integer(2), Integer(0)], [Integer(0), Integer(1)]]),
↪Matrix([[Integer(2), Integer(1)], [Integer(0), Integer(1)]])),
...          vector([Integer(1), Integer(0)]), vector([Integer(0),
↪Integer(1)])); C
2-regular sequence 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, ...

>>> C.shift_right()
2-regular sequence 0, 0, 1, 2, 3, 4, 5, 6, 7, 8, ...
>>> C.shift_right(Integer(3))
2-regular sequence 0, 0, 0, 0, 1, 2, 3, 4, 5, 6, ...
>>> C.shift_right(-Integer(2))
2-regular sequence 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, ...
```

subsequence(**args*, ***kwds*)

Return the subsequence with indices $an + b$ of this k-regular sequence.

INPUT:

- `a` – nonnegative integer
- `b` – integer

  Alternatively, this is allowed to be a dictionary $b_j \mapsto c_j$. If so and applied on $f(n)$, the result will be the sum of all $c_j \cdot f(an + b_j)$.
- `minimize` – (default: `None`) a boolean or `None`. If `True`, then `minimized()` is called after the operation, if `False`, then not. If this argument is `None`, then the default specified by the parent's `minimize_results` is used.

OUTPUT: a `RegularSequence`

Note

If b is negative (i.e., right-shift), then the coefficients when accessing negative indices are 0.

EXAMPLES:

```
sage: Seq2 = RegularSequenceRing(2, ZZ)
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)
```

We consider the sequence C with $C(n) = n$ and the following linear representation corresponding to the vector $(n, 1)$:

```
sage: C = Seq2((Matrix([[2, 0], [0, 1]]), Matrix([[2, 1], [0, 1]])),
....:           vector([1, 0]), vector([0, 1])); C
2-regular sequence 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, ...
```

```
>>> from sage.all import *
>>> C = Seq2((Matrix([[Integer(2), Integer(0)], [Integer(0), Integer(1)]]),␣
↪Matrix([[Integer(2), Integer(1)], [Integer(0), Integer(1)]])),
...           vector([Integer(1), Integer(0)]), vector([Integer(0),␣
↪Integer(1)])); C
2-regular sequence 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, ...
```

We now extract various subsequences of C:

```
sage: C.subsequence(2, 0)
2-regular sequence 0, 2, 4, 6, 8, 10, 12, 14, 16, 18, ...

sage: S31 = C.subsequence(3, 1); S31
2-regular sequence 1, 4, 7, 10, 13, 16, 19, 22, 25, 28, ...
sage: S31.linear_representation()
((1, 0),
 Finite family {0: [ 0  1]
                   [-2  3],
                1: [ 6 -2]
                   [10 -3]},
 (1, 1))

sage: C.subsequence(3, 2)
2-regular sequence 2, 5, 8, 11, 14, 17, 20, 23, 26, 29, ...
```

```
>>> from sage.all import *
>>> C.subsequence(Integer(2), Integer(0))
2-regular sequence 0, 2, 4, 6, 8, 10, 12, 14, 16, 18, ...

>>> S31 = C.subsequence(Integer(3), Integer(1)); S31
2-regular sequence 1, 4, 7, 10, 13, 16, 19, 22, 25, 28, ...
>>> S31.linear_representation()
((1, 0),
 Finite family {0: [ 0  1]
                   [-2  3],
                1: [ 6 -2]
                   [10 -3]},
 (1, 1))

>>> C.subsequence(Integer(3), Integer(2))
2-regular sequence 2, 5, 8, 11, 14, 17, 20, 23, 26, 29, ...
```

```
sage: Srs = C.subsequence(1, -1); Srs
2-regular sequence 0, 0, 1, 2, 3, 4, 5, 6, 7, 8, ...
sage: Srs.linear_representation()
((1, 0, 0),
 Finite family {0: [ 0  1  0]
                   [-2  3  0]
                   [-4  4  1],
                1: [ -2   2   0]
                   [  0   0   1]
                   [ 12 -12   5]},
 (0, 0, 1))
```

```
>>> from sage.all import *
>>> Srs = C.subsequence(Integer(1), -Integer(1)); Srs
2-regular sequence 0, 0, 1, 2, 3, 4, 5, 6, 7, 8, ...
>>> Srs.linear_representation()
((1, 0, 0),
 Finite family {0: [ 0  1  0]
                   [-2  3  0]
                   [-4  4  1],
                1: [ -2   2   0]
                   [  0   0   1]
                   [ 12 -12   5]},
 (0, 0, 1))
```

We can build *backward_differences()* manually by passing a dictionary for the parameter `b`:

```
sage: Sbd = C.subsequence(1, {0: 1, -1: -1}); Sbd
2-regular sequence 0, 1, 1, 1, 1, 1, 1, 1, 1, 1, ...
```

```
>>> from sage.all import *
>>> Sbd = C.subsequence(Integer(1), {Integer(0): Integer(1), -Integer(1): -
↪Integer(1)}); Sbd
2-regular sequence 0, 1, 1, 1, 1, 1, 1, 1, 1, 1, ...
```

transposed(*allow_degenerated_sequence=False*)

Return the transposed sequence.

INPUT:

- `allow_degenerated_sequence` – boolean (default: `False`); if set, then there will be no check if the transposed sequence is a degenerated sequence (see *is_degenerated()*). Otherwise the transposed sequence is checked and a *DegeneratedSequenceError* is raised if such a sequence is detected.

OUTPUT: a *RegularSequence*

Each of the matrices in `mu` is transposed. Additionally the vectors `left` and `right` are switched.

EXAMPLES:

```
sage: Seq2 = RegularSequenceRing(2, ZZ)
sage: U = Seq2((Matrix([[3, 2], [0, 1]]), Matrix([[2, 0], [1, 3]])),
....:          left=vector([0, 1]), right=vector([1, 0]),
....:          allow_degenerated_sequence=True)
sage: U.is_degenerated()
```

(continues on next page)

(continued from previous page)

```
True
sage: Ut = U.transposed()
sage: Ut.linear_representation()
((1, 0),
 Finite family {0: [3 0]
                   [2 1],
                1: [2 1]
                   [0 3]},
 (0, 1))
sage: Ut.is_degenerated()
False

sage: Ut.transposed()
Traceback (most recent call last):
...
DegeneratedSequenceError: degenerated sequence: mu[0]*right != right.
Using such a sequence might lead to wrong results.
You can use 'allow_degenerated_sequence=True' followed
by a call of method .regenerated() for correcting this.
sage: Utt = Ut.transposed(allow_degenerated_sequence=True)
sage: Utt.is_degenerated()
True
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)
>>> U = Seq2((Matrix([[Integer(3), Integer(2)], [Integer(0), Integer(1)]]),␣
↪Matrix([[Integer(2), Integer(0)], [Integer(1), Integer(3)]])),
...           left=vector([Integer(0), Integer(1)]), right=vector([Integer(1),␣
↪Integer(0)]),
...           allow_degenerated_sequence=True)
>>> U.is_degenerated()
True
>>> Ut = U.transposed()
>>> Ut.linear_representation()
((1, 0),
 Finite family {0: [3 0]
                   [2 1],
                1: [2 1]
                   [0 3]},
 (0, 1))
>>> Ut.is_degenerated()
False

>>> Ut.transposed()
Traceback (most recent call last):

RecognizableSeries.transposed

class sage.combinat.regular_sequence.**RegularSequenceRing**(*k*, **args*, ***kwds*)

Bases: *RecognizableSeriesSpace*

The space of k-regular Sequences over the given coefficient_ring.

INPUT:

- k – integer at least 2 specifying the base
- coefficient_ring – a (semi-)ring
- category – (default: None) the category of this space

EXAMPLES:

```
sage: RegularSequenceRing(2, ZZ)
Space of 2-regular sequences over Integer Ring
sage: RegularSequenceRing(3, ZZ)
Space of 3-regular sequences over Integer Ring
```

```
>>> from sage.all import *
>>> RegularSequenceRing(Integer(2), ZZ)
Space of 2-regular sequences over Integer Ring
>>> RegularSequenceRing(Integer(3), ZZ)
Space of 3-regular sequences over Integer Ring
```

See also

k-regular sequence, *RegularSequence*.

Element

alias of *RegularSequence*

from_recurrence(**args*, ***kwds*)

Construct the unique k-regular sequence which fulfills the given recurrence relations and initial values. The recurrence relations have to have the specific shape of k-recursive sequences as described in [HKL2022], and are either given as symbolic equations, e.g.,

```
sage: Seq2 = RegularSequenceRing(2, ZZ)
sage: var('n')
n
sage: function('f')
f
sage: Seq2.from_recurrence([
....:     f(2*n) == 2*f(n), f(2*n + 1) == 3*f(n) + 4*f(n - 1),
....:     f(0) == 0, f(1) == 1], f, n)
2-regular sequence 0, 0, 0, 1, 2, 3, 4, 10, 6, 17, ...
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)
>>> var('n')
n
>>> function('f')
f
>>> Seq2.from_recurrence([
...     f(Integer(2)*n) == Integer(2)*f(n), f(Integer(2)*n + Integer(1)) ==␣
↪Integer(3)*f(n) + Integer(4)*f(n - Integer(1)),
...     f(Integer(0)) == Integer(0), f(Integer(1)) == Integer(1)], f, n)
2-regular sequence 0, 0, 0, 1, 2, 3, 4, 10, 6, 17, ...
```

or via the parameters of the k-recursive sequence as described in the input block below:

```
sage: Seq2.from_recurrence(M=1, m=0,
....:     coeffs={(0, 0): 2, (1, 0): 3, (1, -1): 4},
....:     initial_values={0: 0, 1: 1})
2-regular sequence 0, 0, 0, 1, 2, 3, 4, 10, 6, 17, ...
```

```
>>> from sage.all import *
>>> Seq2.from_recurrence(M=Integer(1), m=Integer(0),
...     coeffs={(Integer(0), Integer(0)): Integer(2), (Integer(1),␣
↪Integer(0)): Integer(3), (Integer(1), -Integer(1)): Integer(4)},
...     initial_values={Integer(0): Integer(0), Integer(1): Integer(1)})
2-regular sequence 0, 0, 0, 1, 2, 3, 4, 10, 6, 17, ...
```

INPUT:

Positional arguments:

If the recurrence relations are represented by symbolic equations, then the following arguments are required:

- `equations` – list of equations where the elements have either the form
  - $f(k^M n + r) = c_{r,l} f(k^m n + l) + c_{r,l+1} f(k^m n + l + 1) + ... + c_{r,u} f(k^m n + u)$ for some integers $0 \leq r < k^M$, $M > m \geq 0$ and $l \leq u$, and some coefficients $c_{r,j}$ from the (semi)ring `coefficients` of the corresponding `RegularSequenceRing`, valid for all integers $n \geq$ offset for some integer offset $\geq \max(-l/k^m, 0)$ (default: `0`), and there is an equation of this form (with the same parameters M and m) for all r

  or the form

  - `f(k) == t` for some integer `k` and some `t` from the (semi)ring `coefficient_ring`.

  The recurrence relations above uniquely determine a k-regular sequence; see [HKL2022] for further information.

- `function` – symbolic function `f` occurring in the equations
- `var` – symbolic variable (`n` in the above description of `equations`)

The following second representation of the recurrence relations is particularly useful for cases where `coefficient_ring` is not compatible with `sage.symbolic.ring.SymbolicRing`. Then the following arguments are required:

- `M` – parameter of the recursive sequences, see [HKL2022], Definition 3.1, as well as in the description of `equations` above

- `m` – parameter of the recursive sequences, see [HKL2022], Definition 3.1, as well as in the description of `equations` above
- `coeffs` – dictionary where `coeffs[(r, j)]` is the coefficient $c_{r,j}$ as given in the description of `equations` above. If `coeffs[(r, j)]` is not given for some `r` and `j`, then it is assumed to be zero.
- `initial_values` – dictionary mapping integers `n` to the `n`-th value of the sequence

Optional keyword-only argument:

- `offset` – integer (default: 0); see explanation of `equations` above
- `inhomogeneities` – (default: `{}`) a dictionary mapping integers `r` to the inhomogeneity g_r as given in [HKL2022], Corollary D. All inhomogeneities have to be regular sequences from `self` or elements of `coefficient_ring`.

OUTPUT: a *RegularSequence*

EXAMPLES:

Stern–Brocot Sequence:

```
sage: Seq2 = RegularSequenceRing(2, ZZ)
sage: var('n')
n
sage: function('f')
f
sage: SB = Seq2.from_recurrence([
....:     f(2*n) == f(n), f(2*n + 1) == f(n) + f(n + 1),
....:     f(0) == 0, f(1) == 1], f, n)
sage: SB
2-regular sequence 0, 1, 1, 2, 1, 3, 2, 3, 1, 4, ...
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)
>>> var('n')
n
>>> function('f')
f
>>> SB = Seq2.from_recurrence([
...     f(Integer(2)*n) == f(n), f(Integer(2)*n + Integer(1)) == f(n) + f(n +␣
↪Integer(1)),
...     f(Integer(0)) == Integer(0), f(Integer(1)) == Integer(1)], f, n)
>>> SB
2-regular sequence 0, 1, 1, 2, 1, 3, 2, 3, 1, 4, ...
```

Number of Odd Entries in Pascal's Triangle:

```
sage: Seq2.from_recurrence([
....:     f(2*n) == 3*f(n), f(2*n + 1) == 2*f(n) + f(n + 1),
....:     f(0) == 0, f(1) == 1], f, n)
2-regular sequence 0, 1, 3, 5, 9, 11, 15, 19, 27, 29, ...
```

```
>>> from sage.all import *
>>> Seq2.from_recurrence([
...     f(Integer(2)*n) == Integer(3)*f(n), f(Integer(2)*n + Integer(1)) ==␣
↪Integer(2)*f(n) + f(n + Integer(1)),
```

(continues on next page)

(continued from previous page)

```
...     f(Integer(0)) == Integer(0), f(Integer(1)) == Integer(1)], f, n)
2-regular sequence 0, 1, 3, 5, 9, 11, 15, 19, 27, 29, ...
```

Number of Unbordered Factors in the Thue–Morse Sequence:

```
sage: UB = Seq2.from_recurrence([
....:     f(8*n) == 2*f(4*n),
....:     f(8*n + 1) == f(4*n + 1),
....:     f(8*n + 2) == f(4*n + 1) + f(4*n + 3),
....:     f(8*n + 3) == -f(4*n + 1) + f(4*n + 2),
....:     f(8*n + 4) == 2*f(4*n + 2),
....:     f(8*n + 5) == f(4*n + 3),
....:     f(8*n + 6) == -f(4*n + 1) + f(4*n + 2) + f(4*n + 3),
....:     f(8*n + 7) == 2*f(4*n + 1) + f(4*n + 3),
....:     f(0) == 1, f(1) == 2, f(2) == 2, f(3) == 4, f(4) == 2,
....:     f(5) == 4, f(6) == 6, f(7) == 0, f(8) == 4, f(9) == 4,
....:     f(10) == 4, f(11) == 4, f(12) == 12, f(13) == 0, f(14) == 4,
....:     f(15) == 4, f(16) == 8, f(17) == 4, f(18) == 8, f(19) == 0,
....:     f(20) == 8, f(21) == 4, f(22) == 4, f(23) == 8], f, n, offset=3)
sage: UB
2-regular sequence 1, 2, 2, 4, 2, 4, 6, 0, 4, 4, ...
```

```
>>> from sage.all import *
>>> UB = Seq2.from_recurrence([
...     f(Integer(8)*n) == Integer(2)*f(Integer(4)*n),
...     f(Integer(8)*n + Integer(1)) == f(Integer(4)*n + Integer(1)),
...     f(Integer(8)*n + Integer(2)) == f(Integer(4)*n + Integer(1)) +␣
↪f(Integer(4)*n + Integer(3)),
...     f(Integer(8)*n + Integer(3)) == -f(Integer(4)*n + Integer(1)) +␣
↪f(Integer(4)*n + Integer(2)),
...     f(Integer(8)*n + Integer(4)) == Integer(2)*f(Integer(4)*n +␣
↪Integer(2)),
...     f(Integer(8)*n + Integer(5)) == f(Integer(4)*n + Integer(3)),
...     f(Integer(8)*n + Integer(6)) == -f(Integer(4)*n + Integer(1)) +␣
↪f(Integer(4)*n + Integer(2)) + f(Integer(4)*n + Integer(3)),
...     f(Integer(8)*n + Integer(7)) == Integer(2)*f(Integer(4)*n +␣
↪Integer(1)) + f(Integer(4)*n + Integer(3)),
...     f(Integer(0)) == Integer(1), f(Integer(1)) == Integer(2),␣
↪f(Integer(2)) == Integer(2), f(Integer(3)) == Integer(4), f(Integer(4)) ==␣

↪f(Integer(12)) == Integer(12), f(Integer(13)) == Integer(0), f(Integer(14))␣
↪== Integer(4),
...     f(Integer(15)) == Integer(4), f(Integer(16)) == Integer(8),␣
↪f(Integer(17)) == Integer(4), f(Integer(18)) == Integer(8), f(Integer(19))␣
↪== Integer(0),
...     f(Integer(20)) == Integer(8), f(Integer(21)) == Integer(4),␣
↪f(Integer(22)) == Integer(4), f(Integer(23)) == Integer(8)], f, n,␣
↪offset=Integer(3))
```

(continues on next page)

(continued from previous page)

```
>>> UB
2-regular sequence 1, 2, 2, 4, 2, 4, 6, 0, 4, 4, ...
```

Binary sum of digits $S(n)$, characterized by the recurrence relations $S(4n) = S(2n)$, $S(4n+1) = S(2n+1)$, $S(4n+2) = S(2n+1)$ and $S(4n+3) = -S(2n) + 2S(2n+1)$:

```
sage: S = Seq2.from_recurrence([
....:     f(4*n) == f(2*n),
....:     f(4*n + 1) == f(2*n + 1),
....:     f(4*n + 2) == f(2*n + 1),
....:     f(4*n + 3) == -f(2*n) + 2*f(2*n + 1),
....:     f(0) == 0, f(1) == 1], f, n)
sage: S
2-regular sequence 0, 1, 1, 2, 1, 2, 2, 3, 1, 2, ...
```

```
>>> from sage.all import *
>>> S = Seq2.from_recurrence([
...     f(Integer(4)*n) == f(Integer(2)*n),
...     f(Integer(4)*n + Integer(1)) == f(Integer(2)*n + Integer(1)),
...     f(Integer(4)*n + Integer(2)) == f(Integer(2)*n + Integer(1)),
...     f(Integer(4)*n + Integer(3)) == -f(Integer(2)*n) +␣
↪Integer(2)*f(Integer(2)*n + Integer(1)),
...     f(Integer(0)) == Integer(0), f(Integer(1)) == Integer(1)], f, n)
>>> S
2-regular sequence 0, 1, 1, 2, 1, 2, 2, 3, 1, 2, ...
```

In order to check if this sequence is indeed the binary sum of digits, we construct it directly via its linear representation and compare it with `S`:

```
sage: S2 = Seq2(
....:     (Matrix([[1, 0], [0, 1]]), Matrix([[1, 0], [1, 1]])),
....:     left=vector([0, 1]), right=vector([1, 0]))
sage: (S - S2).is_trivial_zero()
True
```

```
>>> from sage.all import *
>>> S2 = Seq2(
...     (Matrix([[Integer(1), Integer(0)], [Integer(0), Integer(1)]]),␣
↪Matrix([[Integer(1), Integer(0)], [Integer(1), Integer(1)]])),
...     left=vector([Integer(0), Integer(1)]), right=vector([Integer(1),␣
↪Integer(0)]))
>>> (S - S2).is_trivial_zero()
True
```

Alternatively, we can also use the simpler but inhomogeneous recurrence relations $S(2n) = S(n)$ and $S(2n+1) = S(n) + 1$ via direct parameters:

```
sage: S3 = Seq2.from_recurrence(M=1, m=0,
....:     coeffs={(0, 0): 1, (1, 0): 1},
....:     initial_values={0: 0, 1: 1},
....:     inhomogeneities={1: 1})
sage: S3
```

(continues on next page)

(continued from previous page)

```
2-regular sequence 0, 1, 1, 2, 1, 2, 2, 3, 1, 2, ...
sage: (S3 - S2).is_trivial_zero()
True
```

```
>>> from sage.all import *
>>> S3 = Seq2.from_recurrence(M=Integer(1), m=Integer(0),
...     coeffs={(Integer(0), Integer(0)): Integer(1), (Integer(1),
↪Integer(0)): Integer(1)},
...     initial_values={Integer(0): Integer(0), Integer(1): Integer(1)},
...     inhomogeneities={Integer(1): Integer(1)})
>>> S3
2-regular sequence 0, 1, 1, 2, 1, 2, 2, 3, 1, 2, ...
>>> (S3 - S2).is_trivial_zero()
True
```

Number of Non-Zero Elements in the Generalized Pascal's Triangle (see [LRS2017]):

```
sage: Seq2 = RegularSequenceRing(2, QQ)
sage: P = Seq2.from_recurrence([
....:     f(4*n) == 5/3*f(2*n) - 1/3*f(2*n + 1),
....:     f(4*n + 1) == 4/3*f(2*n) + 1/3*f(2*n + 1),
....:     f(4*n + 2) == 1/3*f(2*n) + 4/3*f(2*n + 1),
....:     f(4*n + 3) == -1/3*f(2*n) + 5/3*f(2*n + 1),
....:     f(0) == 1, f(1) == 2], f, n)
sage: P
2-regular sequence 1, 2, 3, 3, 4, 5, 5, 4, 5, 7, ...
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), QQ)
>>> P = Seq2.from_recurrence([
...     f(Integer(4)*n) == Integer(5)/Integer(3)*f(Integer(2)*n) - Integer(1)/
↪Integer(3)*f(Integer(2)*n + Integer(1)),
...     f(Integer(4)*n + Integer(1)) == Integer(4)/Integer(3)*f(Integer(2)*n)
↪+ Integer(1)/Integer(3)*f(Integer(2)*n + Integer(1)),
...     f(Integer(4)*n + Integer(2)) == Integer(1)/Integer(3)*f(Integer(2)*n)
↪+ Integer(4)/Integer(3)*f(Integer(2)*n + Integer(1)),
...     f(Integer(4)*n + Integer(3)) == -Integer(1)/
↪Integer(3)*f(Integer(2)*n) + Integer(5)/Integer(3)*f(Integer(2)*n +
↪Integer(1)),
...     f(Integer(0)) == Integer(1), f(Integer(1)) == Integer(2)], f, n)
>>> P
2-regular sequence 1, 2, 3, 3, 4, 5, 5, 4, 5, 7, ...
```

Finally, the same sequence can also be obtained via direct parameters without symbolic equations:

```
sage: Seq2.from_recurrence(M=2, m=1,
....:     coeffs={(0, 0): 5/3, (0, 1): -1/3,
....:             (1, 0): 4/3, (1, 1): 1/3,
....:             (2, 0): 1/3, (2, 1): 4/3,
....:             (3, 0): -1/3, (3, 1): 5/3},
....:     initial_values={0: 1, 1: 2})
2-regular sequence 1, 2, 3, 3, 4, 5, 5, 4, 5, 7, ...
```

```
>>> from sage.all import *
>>> Seq2.from_recurrence(M=Integer(2), m=Integer(1),
...     coeffs={(Integer(0), Integer(0)): Integer(5)/Integer(3), (Integer(0),␣
↪Integer(1)): -Integer(1)/Integer(3),
...             (Integer(1), Integer(0)): Integer(4)/Integer(3), (Integer(1),␣
↪Integer(1)): Integer(1)/Integer(3),
...             (Integer(2), Integer(0)): Integer(1)/Integer(3), (Integer(2),␣
↪Integer(1)): Integer(4)/Integer(3),
...             (Integer(3), Integer(0)): -Integer(1)/Integer(3), (Integer(3),
↪ Integer(1)): Integer(5)/Integer(3)},
...     initial_values={Integer(0): Integer(1), Integer(1): Integer(2)})
2-regular sequence 1, 2, 3, 3, 4, 5, 5, 4, 5, 7, ...
```

guess (*f*, *n_verify=100*, *max_exponent=10*, *sequence=None*)

Guess a k-regular sequence whose first terms coincide with $(f(n))_{n\geq 0}$.

INPUT:

- `f` – a function (callable) which determines the sequence. It takes nonnegative integers as an input
- `n_verify` – (default: `100`) a positive integer. The resulting k-regular sequence coincides with f on the first `n_verify` terms.
- `max_exponent` – (default: `10`) a positive integer specifying the maximum exponent of k which is tried when guessing the sequence, i.e., relations between $f(k^t n + r)$ are used for $0 \leq t \leq$ `max_exponent` and $0 \leq r < k^j$
- `sequence` – (default: `None`) a k-regular sequence used for bootstrapping the guessing by adding information of the linear representation of `sequence` to the guessed representation

OUTPUT: a *RegularSequence*

ALGORITHM:

For the purposes of this description, the right vector valued sequence associated with a regular sequence consists of the corresponding matrix product multiplied by the right vector, but without the left vector of the regular sequence.

The algorithm maintains a right vector valued sequence consisting of the right vector valued sequence of the argument `sequence` (replaced by an empty tuple if `sequence` is `None`) plus several components of the shape $m \mapsto f(k^t \cdot m + r)$ for suitable `t` and `r`.

Implicitly, the algorithm also maintains a $d \times n_{\mathrm{verify}}$ matrix `A` (where `d` is the dimension of the right vector valued sequence) whose columns are the current right vector valued sequence evaluated at the nonnegative integers less than n_{verify} and ensures that this matrix has full row rank.

EXAMPLES:

Binary sum of digits:

```
sage: @cached_function
....: def s(n):
....:     if n == 0:
....:         return 0
....:     return s(n//2) + ZZ(is_odd(n))
sage: all(s(n) == sum(n.digits(2)) for n in srange(10))
True
sage: [s(n) for n in srange(10)]
[0, 1, 1, 2, 1, 2, 2, 3, 1, 2]
```

```
>>> from sage.all import *
>>> @cached_function
... def s(n):
...     if n == Integer(0):
...         return Integer(0)
...     return s(n//Integer(2)) + ZZ(is_odd(n))
>>> all(s(n) == sum(n.digits(Integer(2))) for n in srange(Integer(10)))
True
>>> [s(n) for n in srange(Integer(10))]
[0, 1, 1, 2, 1, 2, 2, 3, 1, 2]
```

Let us guess a 2-linear representation for $s(n)$:

```
sage: Seq2 = RegularSequenceRing(2, ZZ)
sage: import logging
sage: logging.getLogger().setLevel(logging.INFO)
sage: S1 = Seq2.guess(s); S1
INFO:...:including f_{1*m+0}
INFO:...:including f_{2*m+1}
2-regular sequence 0, 1, 1, 2, 1, 2, 2, 3, 1, 2, ...
sage: S1.linear_representation()
((1, 0),
 Finite family {0: [1 0]
                   [0 1],
                1: [ 0  1]
                   [-1  2]},
 (0, 1))
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)
>>> import logging
>>> logging.getLogger().setLevel(logging.INFO)
>>> S1 = Seq2.guess(s); S1
INFO:...:including f_{1*m+0}
INFO:...:including f_{2*m+1}
2-regular sequence 0, 1, 1, 2, 1, 2, 2, 3, 1, 2, ...
>>> S1.linear_representation()
((1, 0),
 Finite family {0: [1 0]
                   [0 1],
                1: [ 0  1]
                   [-1  2]},
 (0, 1))
```

The `INFO` messages mean that the right vector valued sequence is the sequence $(s(n), s(2n+1))^\top$.

We guess again, but this time, we use a constant sequence for bootstrapping the guessing process:

```
sage: C = Seq2.one_hadamard(); C
2-regular sequence 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, ...
sage: S2 = Seq2.guess(s, sequence=C); S2
INFO:...:including 2-regular sequence 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, ...
INFO:...:including f_{1*m+0}
```

(continues on next page)

(continued from previous page)

```
2-regular sequence 0, 1, 1, 2, 1, 2, 2, 3, 1, 2, ...
sage: S2.linear_representation()
((0, 1),
 Finite family {0: [1 0]
                   [0 1],
                1: [1 0]
                   [1 1]},
 (1, 0))
sage: S1 == S2
True
```

```
>>> from sage.all import *
>>> C = Seq2.one_hadamard(); C
2-regular sequence 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, ...
>>> S2 = Seq2.guess(s, sequence=C); S2
INFO:...:including 2-regular sequence 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, ...
INFO:...:including f_{1*m+0}
2-regular sequence 0, 1, 1, 2, 1, 2, 2, 3, 1, 2, ...
>>> S2.linear_representation()
((0, 1),
 Finite family {0: [1 0]
                   [0 1],
                1: [1 0]
                   [1 1]},
 (1, 0))
>>> S1 == S2
True
```

The sequence of all natural numbers:

```
sage: S = Seq2.guess(lambda n: n); S
INFO:...:including f_{1*m+0}
INFO:...:including f_{2*m+1}
2-regular sequence 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, ...
sage: S.linear_representation()
((1, 0),
 Finite family {0: [2 0]
                   [2 1],
                1: [ 0  1]
                   [-2  3]},
 (0, 1))
```

```
>>> from sage.all import *
>>> S = Seq2.guess(lambda n: n); S
INFO:...:including f_{1*m+0}
INFO:...:including f_{2*m+1}
2-regular sequence 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, ...
>>> S.linear_representation()
((1, 0),
 Finite family {0: [2 0]
                   [2 1],
                1: [ 0  1]
```

(continues on next page)

(continued from previous page)

```
                    [-2  3]},
 (0, 1))
```

The indicator function of the even integers:

```
sage: S = Seq2.guess(lambda n: ZZ(is_even(n))); S
INFO:...:including f_{1*m+0}
INFO:...:including f_{2*m+0}
2-regular sequence 1, 0, 1, 0, 1, 0, 1, 0, 1, 0, ...
sage: S.linear_representation()
((1, 0),
 Finite family {0: [0 1]
                   [0 1],
                1: [0 0]
                   [0 1]},
 (1, 1))
```

```
>>> from sage.all import *
>>> S = Seq2.guess(lambda n: ZZ(is_even(n))); S
INFO:...:including f_{1*m+0}
INFO:...:including f_{2*m+0}
2-regular sequence 1, 0, 1, 0, 1, 0, 1, 0, 1, 0, ...
>>> S.linear_representation()
((1, 0),
 Finite family {0: [0 1]
                   [0 1],
                1: [0 0]
                   [0 1]},
 (1, 1))
```

The indicator function of the odd integers:

```
sage: S = Seq2.guess(lambda n: ZZ(is_odd(n))); S
INFO:...:including f_{1*m+0}
INFO:...:including f_{2*m+1}
2-regular sequence 0, 1, 0, 1, 0, 1, 0, 1, 0, 1, ...
sage: S.linear_representation()
((1, 0),
 Finite family {0: [0 0]
                   [0 1],
                1: [0 1]
                   [0 1]},
 (0, 1))
sage: logging.getLogger().setLevel(logging.WARN)
```

```
>>> from sage.all import *
>>> S = Seq2.guess(lambda n: ZZ(is_odd(n))); S
INFO:...:including f_{1*m+0}
INFO:...:including f_{2*m+1}
2-regular sequence 0, 1, 0, 1, 0, 1, 0, 1, 0, 1, ...
>>> S.linear_representation()
((1, 0),
```

(continues on next page)

(continued from previous page)

```
 Finite family {0: [0 0]
                   [0 1],
                1: [0 1]
                   [0 1]},
 (0, 1))
>>> logging.getLogger().setLevel(logging.WARN)
```

The following linear representation of S is chosen badly (is degenerated, see `is_degenerated()`), as $\mu(0)$ applied on *right* does not equal *right*:

```
sage: S = Seq2((Matrix([2]), Matrix([3])), vector([1]), vector([1]),
....:          allow_degenerated_sequence=True)
sage: S
2-regular sequence 1, 3, 6, 9, 12, 18, 18, 27, 24, 36, ...
sage: S.is_degenerated()
True
```

```
>>> from sage.all import *
>>> S = Seq2((Matrix([Integer(2)]), Matrix([Integer(3)])),␣
↪vector([Integer(1)]), vector([Integer(1)]),
...          allow_degenerated_sequence=True)
>>> S
2-regular sequence 1, 3, 6, 9, 12, 18, 18, 27, 24, 36, ...
>>> S.is_degenerated()
True
```

However, we can `guess()` a 2-regular sequence of dimension 2:

```
sage: G = Seq2.guess(lambda n: S[n])
sage: G
2-regular sequence 1, 3, 6, 9, 12, 18, 18, 27, 24, 36, ...
sage: G.linear_representation()
((1, 0),
 Finite family {0: [ 0  1]
                   [-2  3],
                1: [3 0]
                   [6 0]},
 (1, 1))

sage: G == S.regenerated()
True
```

```
>>> from sage.all import *
>>> G = Seq2.guess(lambda n: S[n])
>>> G
2-regular sequence 1, 3, 6, 9, 12, 18, 18, 27, 24, 36, ...
>>> G.linear_representation()
((1, 0),
 Finite family {0: [ 0  1]
                   [-2  3],
                1: [3 0]
                   [6 0]},
```

(continues on next page)

(continued from previous page)

```
 (1, 1))

>>> G == S.regenerated()
True
```

one()

Return the one element of this `RegularSequenceRing`, i.e. the unique neutral element for $*$ and also the embedding of the one of the coefficient ring into this `RegularSequenceRing`.

EXAMPLES:

```
sage: Seq2 = RegularSequenceRing(2, ZZ)
sage: O = Seq2.one(); O
2-regular sequence 1, 0, 0, 0, 0, 0, 0, 0, 0, 0, ...
sage: O.linear_representation()
((1), Finite family {0: [1], 1: [0]}, (1))
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)
>>> O = Seq2.one(); O
2-regular sequence 1, 0, 0, 0, 0, 0, 0, 0, 0, 0, ...
>>> O.linear_representation()
((1), Finite family {0: [1], 1: [0]}, (1))
```

some_elements()

Return some elements of this k-regular sequence.

See `TestSuite` for a typical use case.

OUTPUT: an iterator

EXAMPLES:

```
sage: tuple(RegularSequenceRing(2, ZZ).some_elements())
(2-regular sequence 0, 1, 1, 2, 1, 2, 2, 3, 1, 2, ...,
 2-regular sequence 1, 1, 0, 1, 0, 0, 0, 1, 0, 0, ...,
 2-regular sequence 1, 1, 0, 1, -1, 0, 0, 1, -2, -1, ...,
 2-regular sequence 2, -1, 0, 0, 0, -1, 0, 0, 0, 0, ...,
 2-regular sequence 1, 1, 0, 1, 5, 0, 0, 1, -33, 5, ...,
 2-regular sequence -5, 0, 0, 0, 0, 0, 0, 0, 0, 0, ...,
 2-regular sequence -59, -20, 0, -20, 0, 0, 0, -20, 0, 0, ...,
 ...
 2-regular sequence 2210, 170, 0, 0, 0, 0, 0, 0, 0, 0, ...)
```

```
>>> from sage.all import *
>>> tuple(RegularSequenceRing(Integer(2), ZZ).some_elements())
(2-regular sequence 0, 1, 1, 2, 1, 2, 2, 3, 1, 2, ...,
 2-regular sequence 1, 1, 0, 1, 0, 0, 0, 1, 0, 0, ...,
 2-regular sequence 1, 1, 0, 1, -1, 0, 0, 1, -2, -1, ...,
 2-regular sequence 2, -1, 0, 0, 0, -1, 0, 0, 0, 0, ...,
 2-regular sequence 1, 1, 0, 1, 5, 0, 0, 1, -33, 5, ...,
 2-regular sequence -5, 0, 0, 0, 0, 0, 0, 0, 0, 0, ...,
 2-regular sequence -59, -20, 0, -20, 0, 0, 0, -20, 0, 0, ...,
```

(continues on next page)

(continued from previous page)

```
...
2-regular sequence 2210, 170, 0, 0, 0, 0, 0, 0, 0, 0, ...)
```

sage.combinat.regular_sequence.**pad_right**(*T*, *length*, *zero=0*)

Pad `T` to the right by using `zero` to have at least the given `length`.

INPUT:

- `T` – tuple, list or other iterable
- `length` – nonnegative integer
- `zero` – (default: `0`) the elements to pad with

OUTPUT: an object of the same type as `T`

EXAMPLES:

```
sage: from sage.combinat.regular_sequence import pad_right
sage: pad_right((1, 2, 3), 10)
(1, 2, 3, 0, 0, 0, 0, 0, 0, 0)
sage: pad_right((1, 2, 3), 2)
(1, 2, 3)
sage: pad_right([(1, 2), (3, 4)], 4, (0, 0))
[(1, 2), (3, 4), (0, 0), (0, 0)]
```

```
>>> from sage.all import *
>>> from sage.combinat.regular_sequence import pad_right
>>> pad_right((Integer(1), Integer(2), Integer(3)), Integer(10))
(1, 2, 3, 0, 0, 0, 0, 0, 0, 0)
>>> pad_right((Integer(1), Integer(2), Integer(3)), Integer(2))
(1, 2, 3)
>>> pad_right([(Integer(1), Integer(2)), (Integer(3), Integer(4))], Integer(4),
→(Integer(0), Integer(0)))
[(1, 2), (3, 4), (0, 0), (0, 0)]
```

sage.combinat.regular_sequence.**value**(*D*, *k*)

Return the value of the expansion with digits D in base k, i.e.

$$\sum_{0\leq j<\operatorname{len} D} D[j]k^j.$$

INPUT:

- `D` – tuple or other iterable
- `k` – the base

OUTPUT:

An element in the common parent of the base k and of the entries of D

EXAMPLES:

```
sage: from sage.combinat.regular_sequence import value
sage: value(42.digits(7), 7)
42
```

```
>>> from sage.all import *
>>> from sage.combinat.regular_sequence import value
>>> value(Integer(42).digits(Integer(7)), Integer(7))
42
```

5.1.193 Restricted growth arrays

These combinatorial objects are in bijection with set partitions.

class sage.combinat.restricted_growth.**RestrictedGrowthArrays**(*n*)

Bases: UniqueRepresentation, Parent

EXAMPLES:

```
sage: from sage.combinat.restricted_growth import RestrictedGrowthArrays
sage: R = RestrictedGrowthArrays(3)
sage: R == loads(dumps(R))
True
sage: TestSuite(R).run(skip=['_test_an_element',                              #␣
↪needs sage.libs.flint
....:   '_test_enumerated_set_contains', '_test_some_elements'])
```

```
>>> from sage.all import *
>>> from sage.combinat.restricted_growth import RestrictedGrowthArrays
>>> R = RestrictedGrowthArrays(Integer(3))
>>> R == loads(dumps(R))
True
>>> TestSuite(R).run(skip=['_test_an_element',                              # needs␣
↪sage.libs.flint
...   '_test_enumerated_set_contains', '_test_some_elements'])
```

cardinality()

EXAMPLES:

```
sage: from sage.combinat.restricted_growth import RestrictedGrowthArrays
sage: R = RestrictedGrowthArrays(6)
sage: R.cardinality()                                                        #␣
↪needs sage.libs.flint
203
```

```
>>> from sage.all import *
>>> from sage.combinat.restricted_growth import RestrictedGrowthArrays
>>> R = RestrictedGrowthArrays(Integer(6))
>>> R.cardinality()                                                      #␣
↪needs sage.libs.flint
203
```

5.1.194 Ribbons

5.1.195 Ribbon Shaped Tableaux

class sage.combinat.ribbon_shaped_tableau.**RibbonShapedTableau**(*parent*, *t*)

Bases: *SkewTableau*

A ribbon shaped tableau.

For the purposes of this class, a ribbon shaped tableau is a skew tableau whose shape is a skew partition which:

- has at least one cell in row 1;
- has at least one cell in column 1;
- has exactly one cell in each of q consecutive diagonals, for some nonnegative integer q.

A ribbon is given by a list of the rows from top to bottom.

EXAMPLES:

```
sage: x = RibbonShapedTableau([[None, None, None, 2, 3], [None, 1, 4, 5], [3,␣
↪2]]); x
[[None, None, None, 2, 3], [None, 1, 4, 5], [3, 2]]
sage: x.pp()
  .  .  .  2  3
  .  1  4  5
  3  2
sage: x.shape()
[5, 4, 2] / [3, 1]
```

```
>>> from sage.all import *
>>> x = RibbonShapedTableau([[None, None, None, Integer(2), Integer(3)], [None,␣
↪Integer(1), Integer(4), Integer(5)], [Integer(3), Integer(2)]]); x
[[None, None, None, 2, 3], [None, 1, 4, 5], [3, 2]]
>>> x.pp()
  .  .  .  2  3
  .  1  4  5
  3  2
>>> x.shape()
[5, 4, 2] / [3, 1]
```

The entries labeled by `None` correspond to the inner partition. Using `None` is optional; the entries will be shifted accordingly.

```
sage: x = RibbonShapedTableau([[2,3],[1,4,5],[3,2]]); x.pp()
  .  .  .  2  3
  .  1  4  5
  3  2
```

```
>>> from sage.all import *
>>> x = RibbonShapedTableau([[Integer(2),Integer(3)],[Integer(1),Integer(4),
↪Integer(5)],[Integer(3),Integer(2)]]); x.pp()
  .  .  .  2  3
  .  1  4  5
  3  2
```

height()

Return the height of `self`.

The height is given by the number of rows in the outer partition.

EXAMPLES:

```
sage: RibbonShapedTableau([[2,3],[1,4,5]]).height()
2
```

```
>>> from sage.all import *
>>> RibbonShapedTableau([[Integer(2),Integer(3)],[Integer(1),Integer(4),
↪Integer(5)]]).height()
2
```

spin()

Return the spin of `self`.

EXAMPLES:

```
sage: RibbonShapedTableau([[2,3],[1,4,5]]).spin()
1/2
```

```
>>> from sage.all import *
>>> RibbonShapedTableau([[Integer(2),Integer(3)],[Integer(1),Integer(4),
↪Integer(5)]]).spin()
1/2
```

width()

Return the width of the ribbon.

This is given by the length of the longest row in the outer partition.

EXAMPLES:

```
sage: RibbonShapedTableau([[2,3],[1,4,5]]).width()
4
sage: RibbonShapedTableau([]).width()
0
```

```
>>> from sage.all import *
>>> RibbonShapedTableau([[Integer(2),Integer(3)],[Integer(1),Integer(4),
↪Integer(5)]]).width()
4
>>> RibbonShapedTableau([]).width()
0
```

class sage.combinat.ribbon_shaped_tableau.**RibbonShapedTableaux**(*category=None*)

Bases: *SkewTableaux*

The set of all ribbon shaped tableaux.

Element

alias of *RibbonShapedTableau*

from_shape_and_word(*shape*, *word*)

Return the ribbon corresponding to the given ribbon shape and word.

EXAMPLES:

```
sage: RibbonShapedTableaux().from_shape_and_word([1,3],[1,3,3,7])
[[None, None, 1], [3, 3, 7]]
```

```
>>> from sage.all import *
>>> RibbonShapedTableaux().from_shape_and_word([Integer(1),Integer(3)],
↪[Integer(1),Integer(3),Integer(3),Integer(7)])
[[None, None, 1], [3, 3, 7]]
```

options = Current options for Tableaux - ascii_art: repr - convention: English - display: list - latex: diagram

class sage.combinat.ribbon_shaped_tableau.**Ribbon_class**(*parent*, *t*)

Bases: *RibbonShapedTableau*

This exists solely for unpickling `Ribbon_class` objects.

class sage.combinat.ribbon_shaped_tableau.**StandardRibbonShapedTableaux**(*category=None*)

Bases: *StandardSkewTableaux*

The set of all standard ribbon shaped tableaux.

INPUT:

- `shape` – (optional) the composition shape of the rows

Element

alias of *RibbonShapedTableau*

from_permutation(*p*)

Return a standard ribbon of size `len(p)` from a permutation `p`. The lengths of each row are given by the distance between the descents of the permutation `p`.

EXAMPLES:

```
sage: import sage.combinat.ribbon_shaped_tableau as rst
sage: [StandardRibbonShapedTableaux().from_permutation(p)
....:  for p in Permutations(3)]
[[[1, 2, 3]],
 [[None, 2], [1, 3]],
 [[1, 3], [2]],
 [[None, 1], [2, 3]],
 [[1, 2], [3]],
 [[1], [2], [3]]]
```

```
>>> from sage.all import *
>>> import sage.combinat.ribbon_shaped_tableau as rst
>>> [StandardRibbonShapedTableaux().from_permutation(p)
...  for p in Permutations(Integer(3))]
[[[1, 2, 3]],
 [[None, 2], [1, 3]],
 [[1, 3], [2]],
 [[None, 1], [2, 3]],
 [[1, 2], [3]],
 [[1], [2], [3]]]
```

from_shape_and_word(*shape*, *word*)

Return the ribbon corresponding to the given ribbon shape and word.

EXAMPLES:

```
sage: StandardRibbonShapedTableaux().from_shape_and_word([2,3],[1,2,3,4,5])
[[None, None, 1, 2], [3, 4, 5]]
```

```
>>> from sage.all import *
>>> StandardRibbonShapedTableaux().from_shape_and_word([Integer(2),
↪Integer(3)],[Integer(1),Integer(2),Integer(3),Integer(4),Integer(5)])
[[None, None, 1, 2], [3, 4, 5]]
```

options = Current options for Tableaux - ascii_art: repr - convention: English - display: list - latex: diagram

class sage.combinat.ribbon_shaped_tableau.**StandardRibbonShapedTableaux_shape**(*shape*)

Bases: *StandardRibbonShapedTableaux*

Class of standard ribbon shaped tableaux of ribbon shape `shape`.

EXAMPLES:

```
sage: StandardRibbonShapedTableaux([2,2])
Standard ribbon shaped tableaux of shape [2, 2]
sage: StandardRibbonShapedTableaux([2,2]).first()
[[None, 2, 4], [1, 3]]
sage: StandardRibbonShapedTableaux([2,2]).last()
[[None, 1, 2], [3, 4]]

sage: # needs sage.graphs sage.modules
sage: StandardRibbonShapedTableaux([2,2]).cardinality()
5
sage: StandardRibbonShapedTableaux([2,2]).list()
[[[None, 1, 3], [2, 4]],
 [[None, 1, 2], [3, 4]],
 [[None, 2, 3], [1, 4]],
 [[None, 2, 4], [1, 3]],
 [[None, 1, 4], [2, 3]]]
sage: StandardRibbonShapedTableaux([3,2,2]).cardinality()
155
```

```
>>> from sage.all import *
>>> StandardRibbonShapedTableaux([Integer(2),Integer(2)])
Standard ribbon shaped tableaux of shape [2, 2]
>>> StandardRibbonShapedTableaux([Integer(2),Integer(2)]).first()
[[None, 2, 4], [1, 3]]
>>> StandardRibbonShapedTableaux([Integer(2),Integer(2)]).last()
[[None, 1, 2], [3, 4]]

>>> # needs sage.graphs sage.modules
>>> StandardRibbonShapedTableaux([Integer(2),Integer(2)]).cardinality()
5
>>> StandardRibbonShapedTableaux([Integer(2),Integer(2)]).list()
[[[None, 1, 3], [2, 4]],
 [[None, 1, 2], [3, 4]],
 [[None, 2, 3], [1, 4]],
 [[None, 2, 4], [1, 3]],
```

(continues on next page)

(continued from previous page)

```
[[None, 1, 4], [2, 3]]
>>> StandardRibbonShapedTableaux([Integer(3),Integer(2),Integer(2)]).cardinality()
155
```

first()

Return the first standard ribbon of `self`.

EXAMPLES:

```
sage: StandardRibbonShapedTableaux([2,2]).first()
[[None, 2, 4], [1, 3]]
```

```
>>> from sage.all import *
>>> StandardRibbonShapedTableaux([Integer(2),Integer(2)]).first()
[[None, 2, 4], [1, 3]]
```

last()

Return the last standard ribbon of `self`.

EXAMPLES:

```
sage: StandardRibbonShapedTableaux([2,2]).last()
[[None, 1, 2], [3, 4]]
```

```
>>> from sage.all import *
>>> StandardRibbonShapedTableaux([Integer(2),Integer(2)]).last()
[[None, 1, 2], [3, 4]]
```

5.1.196 Ribbon Tableaux

class sage.combinat.ribbon_tableau.**MultiSkewTableau**(*parent*, **args*, ***kwds*)

Bases: *CombinatorialElement*

A multi skew tableau which is a tuple of skew tableaux.

EXAMPLES:

```
sage: s = MultiSkewTableau([ [[None,1],[2,3]], [[1,2],[2]] ])
sage: s.size()
6
sage: s.weight()
[2, 3, 1]
sage: s.shape()
[[2, 2] / [1], [2, 1] / []]
```

```
>>> from sage.all import *
>>> s = MultiSkewTableau([ [[None,Integer(1)],[Integer(2),Integer(3)]],
↪[[Integer(1),Integer(2)],[Integer(2)]] ])
>>> s.size()
6
>>> s.weight()
[2, 3, 1]
```

(continues on next page)

(continued from previous page)

```
>>> s.shape()
[[2, 2] / [1], [2, 1] / []]
```

inversion_pairs()

Return a list of the inversion pairs of `self`.

EXAMPLES:

```
sage: s = MultiSkewTableau([ [[2,3],[5,5]], [[1,1],[3,3]], [[2],[6]] ])
sage: s.inversion_pairs()
[((0, (0, 0)), (1, (0, 0))),
 ((0, (1, 0)), (1, (0, 1))),
 ((0, (1, 1)), (1, (0, 0))),
 ((0, (1, 1)), (1, (1, 1))),
 ((0, (1, 1)), (2, (0, 0))),
 ((1, (0, 1)), (2, (0, 0))),
 ((1, (1, 1)), (2, (0, 0)))]
```

```
>>> from sage.all import *
>>> s = MultiSkewTableau([ [[Integer(2),Integer(3)],[Integer(5),Integer(5)]],␣
↪[[Integer(1),Integer(1)],[Integer(3),Integer(3)]], [[Integer(2)],
↪[Integer(6)]] ])
>>> s.inversion_pairs()
[((0, (0, 0)), (1, (0, 0))),
 ((0, (1, 0)), (1, (0, 1))),
 ((0, (1, 1)), (1, (0, 0))),
 ((0, (1, 1)), (1, (1, 1))),
 ((0, (1, 1)), (2, (0, 0))),
 ((1, (0, 1)), (2, (0, 0))),
 ((1, (1, 1)), (2, (0, 0)))]
```

inversions()

Return the number of inversion pairs of `self`.

EXAMPLES:

```
sage: t1 = SkewTableau([[1]])
sage: t2 = SkewTableau([[2]])
sage: MultiSkewTableau([t1,t1]).inversions()
0
sage: MultiSkewTableau([t1,t2]).inversions()
0
sage: MultiSkewTableau([t2,t2]).inversions()
0
sage: MultiSkewTableau([t2,t1]).inversions()
1
sage: s = MultiSkewTableau([ [[2,3],[5,5]], [[1,1],[3,3]], [[2],[6]] ])
sage: s.inversions()
7
```

```
>>> from sage.all import *
>>> t1 = SkewTableau([[Integer(1)]])
```

(continues on next page)

(continued from previous page)

```
>>> t2 = SkewTableau([[Integer(2)]])
>>> MultiSkewTableau([t1,t1]).inversions()
0
>>> MultiSkewTableau([t1,t2]).inversions()
0
>>> MultiSkewTableau([t2,t2]).inversions()
0
>>> MultiSkewTableau([t2,t1]).inversions()
1
>>> s = MultiSkewTableau([ [[Integer(2),Integer(3)],[Integer(5),Integer(5)]],
→[[Integer(1),Integer(1)],[Integer(3),Integer(3)]], [[Integer(2)],
→[Integer(6)]] ])
>>> s.inversions()
7
```

shape()

Return the shape of `self`.

EXAMPLES:

```
sage: s = SemistandardSkewTableaux([[2,2],[1]]).list()
sage: a = MultiSkewTableau([s[0],s[1],s[2]])
sage: a.shape()
[[2, 2] / [1], [2, 2] / [1], [2, 2] / [1]]
```

```
>>> from sage.all import *
>>> s = SemistandardSkewTableaux([[Integer(2),Integer(2)],[Integer(1)]]).
→list()
>>> a = MultiSkewTableau([s[Integer(0)],s[Integer(1)],s[Integer(2)]])
>>> a.shape()
[[2, 2] / [1], [2, 2] / [1], [2, 2] / [1]]
```

size()

Return the size of `self`.

This is the sum of the sizes of the skew tableaux in `self`.

EXAMPLES:

```
sage: s = SemistandardSkewTableaux([[2,2],[1]]).list()
sage: a = MultiSkewTableau([s[0],s[1],s[2]])
sage: a.size()
9
```

```
>>> from sage.all import *
>>> s = SemistandardSkewTableaux([[Integer(2),Integer(2)],[Integer(1)]]).
→list()
>>> a = MultiSkewTableau([s[Integer(0)],s[Integer(1)],s[Integer(2)]])
>>> a.size()
9
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: s = SemistandardSkewTableaux([[2,2],[1]]).list()
sage: a = MultiSkewTableau([s[0],s[1],s[2]])
sage: a.weight()
[5, 3, 1]
```

```
>>> from sage.all import *
>>> s = SemistandardSkewTableaux([[Integer(2),Integer(2)],[Integer(1)]]).
↪list()
>>> a = MultiSkewTableau([s[Integer(0)],s[Integer(1)],s[Integer(2)]])
>>> a.weight()
[5, 3, 1]
```

class sage.combinat.ribbon_tableau.**MultiSkewTableaux**(*category=None*)

Bases: `UniqueRepresentation`, `Parent`

Multiskew tableaux.

Element

alias of *MultiSkewTableau*

class sage.combinat.ribbon_tableau.**RibbonTableau**(*parent*, *st*)

Bases: *SkewTableau*

A ribbon tableau.

A ribbon is a connected skew shape which does not contain any 2×2 boxes. A ribbon tableau is a skew tableau whose shape is partitioned into ribbons, each of which is filled with identical entries.

EXAMPLES:

```
sage: rt = RibbonTableau([[None, 1],[2,3]]); rt
[[None, 1], [2, 3]]
sage: rt.inner_shape()
[1]
sage: rt.outer_shape()
[2, 2]

sage: rt = RibbonTableau([[None, None, 0, 0, 0], [None, 0, 0, 2], [1, 0, 1]]); rt.
↪pp()
  .  .  0  0  0
  .  0  0  2
  1  0  1
```

```
>>> from sage.all import *
>>> rt = RibbonTableau([[None, Integer(1)],[Integer(2),Integer(3)]]); rt
[[None, 1], [2, 3]]
>>> rt.inner_shape()
[1]
>>> rt.outer_shape()
[2, 2]

>>> rt = RibbonTableau([[None, None, Integer(0), Integer(0), Integer(0)], [None,␣
↪Integer(0), Integer(0), Integer(2)], [Integer(1), Integer(0), Integer(1)]]); rt.
```

(continues on next page)

(continued from previous page)

```
↪pp()
  .  .  0  0  0
  .  0  0  2
  1  0  1
```

In the previous example, each ribbon is uniquely determined by a nonzero entry. The 0 entries are used to fill in the rest of the skew shape.

Note

Sanity checks are not performed; lists can contain any object.

```
sage: RibbonTableau(expr=[[1,1],[[5],[3,4],[1,2]]])
[[None, 1, 2], [None, 3, 4], [5]]
```

```
>>> from sage.all import *
>>> RibbonTableau(expr=[[Integer(1),Integer(1)],[[Integer(5)],[Integer(3),
↪Integer(4)],[Integer(1),Integer(2)]]])
[[None, 1, 2], [None, 3, 4], [5]]
```

length()

Return the length of the ribbons into a ribbon tableau.

EXAMPLES:

```
sage: RibbonTableau([[None, 1],[2,3]]).length()
1
sage: RibbonTableau([[1,0],[2,0]]).length()
2
```

```
>>> from sage.all import *
>>> RibbonTableau([[None, Integer(1)],[Integer(2),Integer(3)]]).length()
1
>>> RibbonTableau([[Integer(1),Integer(0)],[Integer(2),Integer(0)]]).length()
2
```

to_word()

Return a word obtained from a row reading of `self`.

Warning

Unlike the `to_word` method on skew tableaux (which are a superclass of this), this method does not filter out `None` entries.

EXAMPLES:

```
sage: R = RibbonTableau([[0, 0, 3, 0], [1, 1, 0], [2, 0, 4]])
sage: R.to_word()
word: 2041100030
```

```
>>> from sage.all import *
>>> R = RibbonTableau([[Integer(0), Integer(0), Integer(3), Integer(0)],
↪[Integer(1), Integer(1), Integer(0)], [Integer(2), Integer(0), Integer(4)]])
>>> R.to_word()
word: 2041100030
```

class sage.combinat.ribbon_tableau.**RibbonTableau_class**(*parent*, *st*)

Bases: *RibbonTableau*

This exists solely for unpickling `RibbonTableau_class` objects.

class sage.combinat.ribbon_tableau.**RibbonTableaux**

Bases: `UniqueRepresentation`, `Parent`

Ribbon tableaux.

A ribbon tableau is a skew tableau whose skew shape `shape` is tiled by ribbons of length `length`. The weight `weight` is calculated from the labels on the ribbons.

Note

Here we impose the condition that the ribbon tableaux are semistandard.

INPUT(Optional):

- `shape` – skew shape as a list of lists or an object of type SkewPartition
- `length` – integer; `shape` is partitioned into ribbons of length `length`
- `weight` – list of integers; computed from the values of nonzero entries labeling the ribbons

EXAMPLES:

```
sage: RibbonTableaux([[2,1],[]], [1,1,1], 1)
Ribbon tableaux of shape [2, 1] / [] and weight [1, 1, 1] with 1-ribbons

sage: R = RibbonTableaux([[5,4,3],[2,1]], [2,1], 3)
sage: for i in R: i.pp(); print("\n")
  .  .  0  0  0
  .  0  0  2
  1  0  1

  .  .  1  0  0
  .  0  0  0
  1  0  2

  .  .  0  0  0
  .  1  0  1
  2  0  0
```

```
>>> from sage.all import *
>>> RibbonTableaux([[Integer(2),Integer(1)],[]], [Integer(1),Integer(1),
↪Integer(1)], Integer(1))
Ribbon tableaux of shape [2, 1] / [] and weight [1, 1, 1] with 1-ribbons
```

(continues on next page)

(continued from previous page)

```
>>> R = RibbonTableaux([[Integer(5),Integer(4),Integer(3)],[Integer(2),
↪Integer(1)]], [Integer(2),Integer(1)], Integer(3))
>>> for i in R: i.pp(); print("\n")
  .  .  0  0  0
  .  0  0  2
  1  0  1
<BLANKLINE>
  .  .  1  0  0
  .  0  0  0
  1  0  2
<BLANKLINE>
  .  .  0  0  0
  .  1  0  1
  2  0  0
<BLANKLINE>
```

REFERENCES:

Element

alias of *RibbonTableau*

from_expr(*l*)

Return a *RibbonTableau* from a MuPAD-Combinat expr for a skew tableau. The first list in `expr` is the inner shape of the skew tableau. The second list are the entries in the rows of the skew tableau from bottom to top.

Provided primarily for compatibility with MuPAD-Combinat.

EXAMPLES:

```
sage: RibbonTableaux().from_expr([[1,1],[[5],[3,4],[1,2]]])
[[None, 1, 2], [None, 3, 4], [5]]
```

```
>>> from sage.all import *
>>> RibbonTableaux().from_expr([[Integer(1),Integer(1)],[[Integer(5)],
↪[Integer(3),Integer(4)],[Integer(1),Integer(2)]]])
[[None, 1, 2], [None, 3, 4], [5]]
```

options = Current options for Tableaux - ascii_art: repr - convention: English - display: list - latex: diagram

class sage.combinat.ribbon_tableau.**RibbonTableaux_shape_weight_length**(*shape*, *weight*, *length*)

Bases: *RibbonTableaux*

Ribbon tableaux of a given shape, weight, and length.

cardinality()

Return the cardinality of `self`.

EXAMPLES:

```
sage: RibbonTableaux([[2,1],[]],[1,1,1],1).cardinality()
2
sage: RibbonTableaux([[2,2],[]],[1,1],2).cardinality()
2
```

(continues on next page)

(continued from previous page)

```
sage: RibbonTableaux([[4,3,3],[]],[2,1,1,1],2).cardinality()
5
```

```
>>> from sage.all import *
>>> RibbonTableaux([[Integer(2),Integer(1)],[]],[Integer(1),Integer(1),
↪Integer(1)],Integer(1)).cardinality()
2
>>> RibbonTableaux([[Integer(2),Integer(2)],[]],[Integer(1),Integer(1)],
↪Integer(2)).cardinality()
2
>>> RibbonTableaux([[Integer(4),Integer(3),Integer(3)],[]],[Integer(2),
↪Integer(1),Integer(1),Integer(1)],Integer(2)).cardinality()
5
```

class sage.combinat.ribbon_tableau.**SemistandardMultiSkewTableaux**(*shape*, *weight*)

Bases: *MultiSkewTableaux*

Semistandard multi skew tableaux.

A multi skew tableau is a k-tuple of skew tableaux of given shape with a specified total weight.

EXAMPLES:

```
sage: S = SemistandardMultiSkewTableaux([ [[2,1],[]], [[2,2],[1]] ], [2,2,2]); S
Semistandard multi skew tableaux of shape [[2, 1] / [], [2, 2] / [1]] and weight␣
↪[2, 2, 2]
sage: S.list()
[[[[1, 1], [2]], [[None, 2], [3, 3]]],
 [[[1, 2], [2]], [[None, 1], [3, 3]]],
 [[[1, 3], [2]], [[None, 2], [1, 3]]],
 [[[1, 3], [2]], [[None, 1], [2, 3]]],
 [[[1, 1], [3]], [[None, 2], [2, 3]]],
 [[[1, 2], [3]], [[None, 2], [1, 3]]],
 [[[1, 2], [3]], [[None, 1], [2, 3]]],
 [[[2, 2], [3]], [[None, 1], [1, 3]]],
 [[[1, 3], [3]], [[None, 1], [2, 2]]],
 [[[2, 3], [3]], [[None, 1], [1, 2]]]]
```

```
>>> from sage.all import *
>>> S = SemistandardMultiSkewTableaux([ [[Integer(2),Integer(1)],[]],␣
↪[[Integer(2),Integer(2)],[Integer(1)]] ], [Integer(2),Integer(2),Integer(2)]); S
Semistandard multi skew tableaux of shape [[2, 1] / [], [2, 2] / [1]] and weight␣
↪[2, 2, 2]
>>> S.list()
[[[[1, 1], [2]], [[None, 2], [3, 3]]],
 [[[1, 2], [2]], [[None, 1], [3, 3]]],
 [[[1, 3], [2]], [[None, 2], [1, 3]]],
 [[[1, 3], [2]], [[None, 1], [2, 3]]],
 [[[1, 1], [3]], [[None, 2], [2, 3]]],
 [[[1, 2], [3]], [[None, 2], [1, 3]]],
 [[[1, 2], [3]], [[None, 1], [2, 3]]],
 [[[2, 2], [3]], [[None, 1], [1, 3]]],
 [[[1, 3], [3]], [[None, 1], [2, 2]]],
```

(continues on next page)

(continued from previous page)

```
[[[2, 3], [3]], [[None, 1], [1, 2]]]]
```

sage.combinat.ribbon_tableau.**cospin_polynomial**(*part*, *weight*, *length*)

Return the cospin polynomial associated to `part`, `weight`, and `length`.

EXAMPLES:

```
sage: from sage.combinat.ribbon_tableau import cospin_polynomial
sage: cospin_polynomial([6,6,6],[4,2],3)
t^4 + t^3 + 2*t^2 + t + 1
sage: cospin_polynomial([3,3,3,2,1], [3,1], 3)
1
sage: cospin_polynomial([3,3,3,2,1], [2,2], 3)
t + 1
sage: cospin_polynomial([3,3,3,2,1], [2,1,1], 3)
t^2 + 2*t + 2
sage: cospin_polynomial([3,3,3,2,1], [1,1,1,1], 3)
t^3 + 3*t^2 + 5*t + 3
sage: cospin_polynomial([5,4,3,2,1,1,1], [2,2,1], 3)
2*t^2 + 6*t + 2
sage: cospin_polynomial([[6]*6, [3,3]], [4,4,2], 3)
3*t^4 + 6*t^3 + 9*t^2 + 5*t + 3
```

```
>>> from sage.all import *
>>> from sage.combinat.ribbon_tableau import cospin_polynomial
>>> cospin_polynomial([Integer(6),Integer(6),Integer(6)],[Integer(4),Integer(2)],
↪Integer(3))
t^4 + t^3 + 2*t^2 + t + 1
>>> cospin_polynomial([Integer(3),Integer(3),Integer(3),Integer(2),Integer(1)],␣

```

sage.combinat.ribbon_tableau.**count_rec**(*nexts*, *current*, *part*, *weight*, *length*)

INPUT:

- `nexts, current, part` – skew partitions
- `weight` – nonnegative integer list

- `length` – integer

`sage.combinat.ribbon_tableau.`**`graph_implementation_rec`**(*skp*, *weight*, *length*, *function*)

`sage.combinat.ribbon_tableau.`**`insertion_tableau`**(*skp*, *perm*, *evaluation*, *tableau*, *length*)

INPUT:

- `skp` – skew partitions
- `perm, evaluation` – nonnegative integers
- `tableau` – skew tableau
- `length` – integer

`sage.combinat.ribbon_tableau.`**`list_rec`**(*nexts*, *current*, *part*, *weight*, *length*)

INPUT:

- `nexts, current, part` – skew partitions
- `weight` – nonnegative integer list
- `length` – integer

`sage.combinat.ribbon_tableau.`**`spin_polynomial`**(*part*, *weight*, *length*)

Return the spin polynomial associated to `part`, `weight`, and `length`.

EXAMPLES:

```
sage: # needs sage.symbolic
sage: from sage.combinat.ribbon_tableau import spin_polynomial
sage: spin_polynomial([6,6,6],[4,2],3)
t^6 + t^5 + 2*t^4 + t^3 + t^2
sage: spin_polynomial([6,6,6],[4,1,1],3)
t^6 + 2*t^5 + 3*t^4 + 2*t^3 + t^2
sage: spin_polynomial([3,3,3,2,1], [2,2], 3)
t^(7/2) + t^(5/2)
sage: spin_polynomial([3,3,3,2,1], [2,1,1], 3)
2*t^(7/2) + 2*t^(5/2) + t^(3/2)
sage: spin_polynomial([3,3,3,2,1], [1,1,1,1], 3)
3*t^(7/2) + 5*t^(5/2) + 3*t^(3/2) + sqrt(t)
sage: spin_polynomial([5,4,3,2,1,1,1], [2,2,1], 3)
2*t^(9/2) + 6*t^(7/2) + 2*t^(5/2)
sage: spin_polynomial([[6]*6, [3,3]], [4,4,2], 3)
3*t^9 + 5*t^8 + 9*t^7 + 6*t^6 + 3*t^5
```

```
>>> from sage.all import *
>>> # needs sage.symbolic
>>> from sage.combinat.ribbon_tableau import spin_polynomial
>>> spin_polynomial([Integer(6),Integer(6),Integer(6)],[Integer(4),Integer(2)],
↪Integer(3))
t^6 + t^5 + 2*t^4 + t^3 + t^2
>>> spin_polynomial([Integer(6),Integer(6),Integer(6)],[Integer(4),Integer(1),
↪Integer(1)],Integer(3))
t^6 + 2*t^5 + 3*t^4 + 2*t^3 + t^2
>>> spin_polynomial([Integer(3),Integer(3),Integer(3),Integer(2),Integer(1)],␣
↪[Integer(2),Integer(2)], Integer(3))
t^(7/2) + t^(5/2)
```

(continues on next page)

(continued from previous page)

```
>>> spin_polynomial([Integer(3),Integer(3),Integer(3),Integer(2),Integer(1)],␣
↪[Integer(2),Integer(1),Integer(1)], Integer(3))
2*t^(7/2) + 2*t^(5/2) + t^(3/2)
>>> spin_polynomial([Integer(3),Integer(3),Integer(3),Integer(2),Integer(1)],␣
↪[Integer(1),Integer(1),Integer(1),Integer(1)], Integer(3))
3*t^(7/2) + 5*t^(5/2) + 3*t^(3/2) + sqrt(t)
>>> spin_polynomial([Integer(5),Integer(4),Integer(3),Integer(2),Integer(1),
↪Integer(1),Integer(1)], [Integer(2),Integer(2),Integer(1)], Integer(3))
2*t^(9/2) + 6*t^(7/2) + 2*t^(5/2)
>>> spin_polynomial([[Integer(6)]*Integer(6), [Integer(3),Integer(3)]],␣
↪[Integer(4),Integer(4),Integer(2)], Integer(3))
3*t^9 + 5*t^8 + 9*t^7 + 6*t^6 + 3*t^5
```

sage.combinat.ribbon_tableau.**spin_polynomial_square**(*part*, *weight*, *length*)

Return the spin polynomial associated with `part`, `weight`, and `length`, with the substitution $t \to t^2$ made.

EXAMPLES:

```
sage: from sage.combinat.ribbon_tableau import spin_polynomial_square
sage: spin_polynomial_square([6,6,6],[4,2],3)
t^12 + t^10 + 2*t^8 + t^6 + t^4
sage: spin_polynomial_square([6,6,6],[4,1,1],3)
t^12 + 2*t^10 + 3*t^8 + 2*t^6 + t^4
sage: spin_polynomial_square([3,3,3,2,1], [2,2], 3)
t^7 + t^5
sage: spin_polynomial_square([3,3,3,2,1], [2,1,1], 3)
2*t^7 + 2*t^5 + t^3
sage: spin_polynomial_square([3,3,3,2,1], [1,1,1,1], 3)
3*t^7 + 5*t^5 + 3*t^3 + t
sage: spin_polynomial_square([5,4,3,2,1,1,1], [2,2,1], 3)
2*t^9 + 6*t^7 + 2*t^5
sage: spin_polynomial_square([[6]*6, [3,3]], [4,4,2], 3)
3*t^18 + 5*t^16 + 9*t^14 + 6*t^12 + 3*t^10
```

```
>>> from sage.all import *
>>> from sage.combinat.ribbon_tableau import spin_polynomial_square
>>> spin_polynomial_square([Integer(6),Integer(6),Integer(6)],[Integer(4),
↪Integer(2)],Integer(3))
t^12 + t^10 + 2*t^8 + t^6 + t^4
>>> spin_polynomial_square([Integer(6),Integer(6),Integer(6)],[Integer(4),
↪Integer(1),Integer(1)],Integer(3))
t^12 + 2*t^10 + 3*t^8 + 2*t^6 + t^4
>>> spin_polynomial_square([Integer(3),Integer(3),Integer(3),Integer(2),
↪Integer(1)], [Integer(2),Integer(2)], Integer(3))
t^7 + t^5
>>> spin_polynomial_square([Integer(3),Integer(3),Integer(3),Integer(2),
↪Integer(1)], [Integer(2),Integer(1),Integer(1)], Integer(3))
2*t^7 + 2*t^5 + t^3
>>> spin_polynomial_square([Integer(3),Integer(3),Integer(3),Integer(2),
↪Integer(1)], [Integer(1),Integer(1),Integer(1),Integer(1)], Integer(3))
3*t^7 + 5*t^5 + 3*t^3 + t
>>> spin_polynomial_square([Integer(5),Integer(4),Integer(3),Integer(2),
```

(continues on next page)

(continued from previous page)

```
↪Integer(1),Integer(1),Integer(1)], [Integer(2),Integer(2),Integer(1)],␣
↪Integer(3))
2*t^9 + 6*t^7 + 2*t^5
>>> spin_polynomial_square([[Integer(6)]*Integer(6), [Integer(3),Integer(3)]],␣
↪[Integer(4),Integer(4),Integer(2)], Integer(3))
3*t^18 + 5*t^16 + 9*t^14 + 6*t^12 + 3*t^10
```

sage.combinat.ribbon_tableau.**spin_rec**(*t*, *nexts*, *current*, *part*, *weight*, *length*)

Routine used for constructing the spin polynomial.

INPUT:

- `weight` – list of nonnegative integers
- `length` – the length of the ribbons we're tiling with
- `t` – the variable

EXAMPLES:

```
sage: from sage.combinat.ribbon_tableau import spin_rec
sage: sp = SkewPartition
sage: t = ZZ['t'].gen()
sage: spin_rec(t, [], [[[], [3, 3]]], sp([[2, 2, 2], []]), [2], 3)
[t^4]
sage: spin_rec(t, [[0], [t^4]], [[[2, 1, 1, 1, 1], [0, 3]], [[2, 2, 2], [3, 0]]],␣
↪sp([[2, 2, 2, 2, 1], []]), [2, 1], 3)
[t^5]
sage: spin_rec(t, [], [[[], [3, 3, 0]]], sp([[3, 3], []]), [2], 3)
[t^2]
sage: spin_rec(t, [[t^4], [t^3], [t^2]], [[[2, 2, 2], [0, 0, 3]], [[3, 2, 1], [0,␣
↪3, 0]], [[3, 3], [3, 0, 0]]], sp([[3, 3, 3], []]), [2, 1], 3)
[t^6 + t^4 + t^2]
sage: spin_rec(t, [[t^5], [t^4], [t^6 + t^4 + t^2]], [[[2, 2, 2, 2, 1], [0, 0,␣
↪3]], [[3, 3, 1, 1, 1], [0, 3, 0]], [[3, 3, 3], [3, 0, 0]]], sp([[3, 3, 3, 2, 1],
↪ []]), [2, 1, 1], 3)
[2*t^7 + 2*t^5 + t^3]
```

```
>>> from sage.all import *
>>> from sage.combinat.ribbon_tableau import spin_rec
>>> sp = SkewPartition
>>> t = ZZ['t'].gen()
>>> spin_rec(t, [], [[[], [Integer(3), Integer(3)]]], sp([[Integer(2), Integer(2),
↪ Integer(2)], []]), [Integer(2)], Integer(3))
[t^4]
>>> spin_rec(t, [[Integer(0)], [t**Integer(4)]], [[[Integer(2), Integer(1),␣
↪Integer(1), Integer(1), Integer(1)], [Integer(0), Integer(3)]], [[Integer(2),␣
↪Integer(2), Integer(2)], [Integer(3), Integer(0)]]], sp([[Integer(2),␣
↪Integer(2), Integer(2), Integer(2), Integer(1)], []]), [Integer(2), Integer(1)],
↪ Integer(3))
[t^5]
>>> spin_rec(t, [], [[[], [Integer(3), Integer(3), Integer(0)]]], sp([[Integer(3),
↪ Integer(3)], []]), [Integer(2)], Integer(3))
[t^2]
```

(continues on next page)

(continued from previous page)

```
>>> spin_rec(t, [[t**Integer(4)], [t**Integer(3)], [t**Integer(2)]],␣
↪[[[Integer(2), Integer(2), Integer(2)], [Integer(0), Integer(0), Integer(3)]],␣
↪[[Integer(3), Integer(2), Integer(1)], [Integer(0), Integer(3), Integer(0)]],␣
↪[[Integer(3), Integer(3)], [Integer(3), Integer(0), Integer(0)]]],␣
↪sp([[Integer(3), Integer(3), Integer(3)], []]), [Integer(2), Integer(1)],␣
↪Integer(3))
[t^6 + t^4 + t^2]
>>> spin_rec(t, [[t**Integer(5)], [t**Integer(4)], [t**Integer(6) + t**Integer(4)␣
↪+ t**Integer(2)]], [[[Integer(2), Integer(2), Integer(2), Integer(2),␣
↪Integer(1)], [Integer(0), Integer(0), Integer(3)]], [[Integer(3), Integer(3),␣
↪Integer(1), Integer(1), Integer(1)], [Integer(0), Integer(3), Integer(0)]],␣
↪[[Integer(3), Integer(3), Integer(3)], [Integer(3), Integer(0), Integer(0)]]],␣
↪sp([[Integer(3), Integer(3), Integer(3), Integer(2), Integer(1)], []]),␣
↪[Integer(2), Integer(1), Integer(1)], Integer(3))
[2*t^7 + 2*t^5 + t^3]
```

5.1.198 Abstract classes for the rigged configuration bijections

This file contains two sets of classes, one for the bijection from KR tableaux to rigged configurations and the other for the reverse bijection. We do this for two reasons, one is because we can store a state in the bijection locally, so we do not have to constantly pass it around between functions. The other is because it makes the code easier to read in the *_element.py files.

These classes are not meant to be used by the user and are only supposed to be used internally to perform the bijections between `TensorProductOfKirillovReshetikhinTableaux` and `RiggedConfigurations`.

AUTHORS:

- Travis Scrimshaw (2011-04-15): Initial version

class sage.combinat.rigged_configurations.bij_abstract_class.**KRTToRCBijectionAbstract**(*tp_krt*)

Bases: `object`

Root abstract class for the bijection from KR tableaux to rigged configurations.

This class holds the state of the bijection and generates the next state. This class should never be created directly.

next_state(*val*)

Build the next state in the bijection.

INPUT:

- `val` – the value we are adding

run(*verbose=False*)

Run the bijection from a tensor product of KR tableaux to a rigged configuration.

INPUT:

- `tp_krt` – a tensor product of KR tableaux
- `verbose` – (default: `False`) display each step in the bijection

EXAMPLES:

```
sage: KRT = crystals.TensorProductOfKirillovReshetikhinTableaux(['A', 4, 1],
→[[2, 1]])
sage: from sage.combinat.rigged_configurations.bij_type_A import
→KRTToRCBijectionTypeA
sage: KRTToRCBijectionTypeA(KRT(pathlist=[[5,2]])).run()

<BLANKLINE>
```

class sage.combinat.rigged_configurations.bij_abstract_class.**RCToKRTBijectionAbstract**(*RC_element*)

Bases: object

Root abstract class for the bijection from rigged configurations to tensor product of Kirillov-Reshetikhin tableaux.

This class holds the state of the bijection and generates the next state. This class should never be created directly.

next_state(*height*)

Build the next state in the bijection.

run(*verbose=False*, *build_graph=False*)

Run the bijection from rigged configurations to tensor product of KR tableaux.

INPUT:

- verbose – boolean (default: False); display each step in the bijection
- build_graph – boolean (default: False); build the graph of each step of the bijection

EXAMPLES:

```
sage: RC = RiggedConfigurations(['A', 4, 1], [[2, 1]])
sage: x = RC(partition_list=[[1],[1],[1],[1]])
sage: from sage.combinat.rigged_configurations.bij_type_A import␣
↪RCToKRTBijectionTypeA
sage: RCToKRTBijectionTypeA(x).run()
[[2], [5]]
sage: bij = RCToKRTBijectionTypeA(x)
sage: bij.run(build_graph=True)
[[2], [5]]
sage: bij._graph
Digraph on 3 vertices
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['A', Integer(4), Integer(1)], [[Integer(2),␣
↪Integer(1)]])
>>> x = RC(partition_list=[[Integer(1)],[Integer(1)],[Integer(1)],
↪[Integer(1)]])
```

>>> bij = RCToKRTBijectionTypeA(x)
>>> bij.run(build_graph=True)
[[2], [5]]
>>> bij._graph
Digraph on 3 vertices
```

5.1.199 Bijection between rigged configurations for $B(\infty)$ and marginally large tableaux

AUTHORS:

- Travis Scrimshaw (2015-07-01): Initial version

REFERENCES:

class sage.combinat.rigged_configurations.bij_infinity.**FromRCIsomorphism**

Bases: Morphism

Crystal isomorphism of $B(\infty)$ in the rigged configuration model to the tableau model.

class sage.combinat.rigged_configurations.bij_infinity.**FromTableauIsomorphism**

Bases: Morphism

Crystal isomorphism of $B(\infty)$ in the tableau model to the rigged configuration model.

class sage.combinat.rigged_configurations.bij_infinity.**MLTToRCBijectionTypeB**(*tp_krt*)

Bases: *KRTToRCBijectionTypeB*

run()

Run the bijection from a marginally large tableaux to a rigged configuration.

EXAMPLES:

```
sage: vct = CartanType(['B',4]).as_folding()
sage: RC = crystals.infinity.RiggedConfigurations(vct)
sage: T = crystals.infinity.Tableaux(['B',4])
sage: Psi = T.crystal_morphism({T.module_generators[0]: RC.module_
↪generators[0]})
sage: TS = [x.value for x in T.subcrystal(max_depth=4)]
sage: all(Psi(b) == RC(b) for b in TS) # long time # indirect doctest
True
```

```
>>> from sage.all import *
>>> vct = CartanType(['B',Integer(4)]).as_folding()
>>> RC = crystals.infinity.RiggedConfigurations(vct)
>>> T = crystals.infinity.Tableaux(['B',Integer(4)])
>>> Psi = T.crystal_morphism({T.module_generators[Integer(0)]: RC.module_
↪generators[Integer(0)]})
>>> TS = [x.value for x in T.subcrystal(max_depth=Integer(4))]
>>> all(Psi(b) == RC(b) for b in TS) # long time # indirect doctest
True
```

class sage.combinat.rigged_configurations.bij_infinity.**MLTToRCBijectionTypeD**(*tp_krt*)

Bases: *KRTToRCBijectionTypeD*

run()

Run the bijection from a marginally large tableaux to a rigged configuration.

EXAMPLES:

```
sage: RC = crystals.infinity.RiggedConfigurations(['D',4])
sage: T = crystals.infinity.Tableaux(['D',4])
sage: Psi = T.crystal_morphism({T.module_generators[0]: RC.module_
↪generators[0]})
sage: TS = [x.value for x in T.subcrystal(max_depth=4)]
sage: all(Psi(b) == RC(b) for b in TS) # long time # indirect doctest
True
```

```
>>> from sage.all import *
>>> RC = crystals.infinity.RiggedConfigurations(['D',Integer(4)])
>>> T = crystals.infinity.Tableaux(['D',Integer(4)])
>>> Psi = T.crystal_morphism({T.module_generators[Integer(0)]: RC.module_
↪generators[Integer(0)]})
>>> TS = [x.value for x in T.subcrystal(max_depth=Integer(4))]
>>> all(Psi(b) == RC(b) for b in TS) # long time # indirect doctest
True
```

class sage.combinat.rigged_configurations.bij_infinity.**RCToMLTBijectionTypeB**(*RC_element*)

Bases: *RCToKRTBijectionTypeB*

run()

Run the bijection from rigged configurations to a marginally large tableau.

EXAMPLES:

```
sage: vct = CartanType(['B',4]).as_folding()
sage: RC = crystals.infinity.RiggedConfigurations(vct)
sage: T = crystals.infinity.Tableaux(['B',4])
sage: Psi = RC.crystal_morphism({RC.module_generators[0]: T.module_
↪generators[0]})
sage: RCS = [x.value for x in RC.subcrystal(max_depth=4)]
sage: all(Psi(nu) == T(nu) for nu in RCS) # long time # indirect doctest
True
```

```
>>> from sage.all import *
>>> vct = CartanType(['B',Integer(4)]).as_folding()
>>> RC = crystals.infinity.RiggedConfigurations(vct)
>>> T = crystals.infinity.Tableaux(['B',Integer(4)])
>>> Psi = RC.crystal_morphism({RC.module_generators[Integer(0)]: T.module_
↪generators[Integer(0)]})
>>> RCS = [x.value for x in RC.subcrystal(max_depth=Integer(4))]
>>> all(Psi(nu) == T(nu) for nu in RCS) # long time # indirect doctest
True
```

class sage.combinat.rigged_configurations.bij_infinity.**RCToMLTBijectionTypeD**(*RC_element*)

Bases: *RCToKRTBijectionTypeD*

run()

Run the bijection from rigged configurations to a marginally large tableau.

EXAMPLES:

```
sage: RC = crystals.infinity.RiggedConfigurations(['D',4])
sage: T = crystals.infinity.Tableaux(['D',4])
sage: Psi = RC.crystal_morphism({RC.module_generators[0]: T.module_
↪generators[0]})
sage: RCS = [x.value for x in RC.subcrystal(max_depth=4)]
sage: all(Psi(nu) == T(nu) for nu in RCS) # long time # indirect doctest
True
```

```
>>> from sage.all import *
>>> RC = crystals.infinity.RiggedConfigurations(['D',Integer(4)])
>>> T = crystals.infinity.Tableaux(['D',Integer(4)])
>>> Psi = RC.crystal_morphism({RC.module_generators[Integer(0)]: T.module_
↪generators[Integer(0)]})
>>> RCS = [x.value for x in RC.subcrystal(max_depth=Integer(4))]
>>> all(Psi(nu) == T(nu) for nu in RCS) # long time # indirect doctest
True
```

5.1.200 Bijection classes for type $A_n^{(1)}$

Part of the (internal) classes which run the bijection between rigged configurations and tensor products of Kirillov-Reshetikhin tableaux of type $A_n^{(1)}$.

AUTHORS:

- Travis Scrimshaw (2011-04-15): Initial version

class sage.combinat.rigged_configurations.bij_type_A.**KRTToRCBijectionTypeA**(*tp_krt*)

Bases: *KRTToRCBijectionAbstract*

Specific implementation of the bijection from KR tableaux to rigged configurations for type $A_n^{(1)}$.

next_state(*val*)

Build the next state for type $A_n^{(1)}$.

EXAMPLES:

```
sage: KRT = crystals.TensorProductOfKirillovReshetikhinTableaux(['A', 4, 1],␣
↪[[2,1]])
sage: from sage.combinat.rigged_configurations.bij_type_A import␣
↪KRTToRCBijectionTypeA
sage: bijection = KRTToRCBijectionTypeA(KRT(pathlist=[[4,3]]))
sage: bijection.cur_path.insert(0, [])
sage: bijection.cur_dims.insert(0, [0, 1])
sage: bijection.cur_path[0].insert(0, [3])
sage: bijection.next_state(3)
```

```
>>> from sage.all import *
>>> KRT = crystals.TensorProductOfKirillovReshetikhinTableaux(['A',␣
↪Integer(4), Integer(1)], [[Integer(2),Integer(1)]])
>>> from sage.combinat.rigged_configurations.bij_type_A import␣
```

(continues on next page)

(continued from previous page)

```
↪KRTToRCBijectionTypeA
>>> bijection = KRTToRCBijectionTypeA(KRT(pathlist=[[Integer(4),Integer(3)]]))
>>> bijection.cur_path.insert(Integer(0), [])
>>> bijection.cur_dims.insert(Integer(0), [Integer(0), Integer(1)])
>>> bijection.cur_path[Integer(0)].insert(Integer(0), [Integer(3)])
>>> bijection.next_state(Integer(3))
```

class sage.combinat.rigged_configurations.bij_type_A.**RCToKRTBijectionTypeA**(*RC_element*)

Bases: *RCToKRTBijectionAbstract*

Specific implementation of the bijection from rigged configurations to tensor products of KR tableaux for type $A_n^{(1)}$.

next_state(*height*)

Build the next state for type $A_n^{(1)}$.

EXAMPLES:

```
sage: RC = RiggedConfigurations(['A', 4, 1], [[2, 1]])
sage: from sage.combinat.rigged_configurations.bij_type_A import␣
↪RCToKRTBijectionTypeA
sage: bijection = RCToKRTBijectionTypeA(RC(partition_list=[[1],[1],[1],[1]]))
sage: bijection.next_state(1)
5
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['A', Integer(4), Integer(1)], [[Integer(2),␣
↪Integer(1)]])
>>> from sage.combinat.rigged_configurations.bij_type_A import␣
↪RCToKRTBijectionTypeA
>>> bijection = RCToKRTBijectionTypeA(RC(partition_list=[[Integer(1)],
↪[Integer(1)],[Integer(1)],[Integer(1)]]))
>>> bijection.next_state(Integer(1))
5
```

5.1.201 Bijection classes for type $A_{2n}^{(2)\dagger}$

Part of the (internal) classes which runs the bijection between rigged configurations and KR tableaux of type $A_{2n}^{(2)\dagger}$.

AUTHORS:

- Travis Scrimshaw (2012-12-21): Initial version

class sage.combinat.rigged_configurations.bij_type_A2_dual.**KRTToRCBijectionTypeA2Dual**(*tp_krt*)

Bases: *KRTToRCBijectionTypeC*

Specific implementation of the bijection from KR tableaux to rigged configurations for type $A_{2n}^{(2)\dagger}$.

This inherits from type $C_n^{(1)}$ because we use the same methods in some places.

next_state(*val*)

Build the next state for type $A_{2n}^{(2)\dagger}$.

class sage.combinat.rigged_configurations.bij_type_A2_dual.**RCToKRTBijectionTypeA2Dual**(*RC_element*)

Bases: *RCToKRTBijectionTypeC*

Specific implementation of the bijection from rigged configurations to tensor products of KR tableaux for type $A_{2n}^{(2)\dagger}$.

next_state(*height*)

Build the next state for type $A_{2n}^{(2)\dagger}$.

5.1.202 Bijection classes for type $A_{2n}^{(2)}$

Part of the (internal) classes which runs the bijection between rigged configurations and KR tableaux of type $A_{2n}^{(2)}$.

AUTHORS:

- Travis Scrimshaw (2012-12-21): Initial version

class sage.combinat.rigged_configurations.bij_type_A2_even.**KRTToRCBijectionTypeA2Even**(*tp_krt*)

Bases: *KRTToRCBijectionTypeC*

Specific implementation of the bijection from KR tableaux to rigged configurations for type $A_{2n}^{(2)}$.

This inherits from type $C_n^{(1)}$ because we use the same methods in some places.

next_state(*val*)

Build the next state for type $A_{2n}^{(2)}$.

class sage.combinat.rigged_configurations.bij_type_A2_even.**RCToKRTBijectionTypeA2Even**(*RC_element*)

Bases: *RCToKRTBijectionTypeC*

Specific implementation of the bijection from rigged configurations to tensor products of KR tableaux for type $A_{2n}^{(2)}$.

next_state(*height*)

Build the next state for type $A_{2n}^{(2)}$.

5.1.203 Bijection classes for type $A_{2n-1}^{(2)}$.

Part of the (internal) classes which runs the bijection between rigged configurations and KR tableaux of type $A_{2n-1}^{(2)}$.

AUTHORS:

- Travis Scrimshaw (2012-12-21): Initial version

class sage.combinat.rigged_configurations.bij_type_A2_odd.**KRTToRCBijectionTypeA2Odd**(*tp_krt*)

Bases: *KRTToRCBijectionTypeA*

Specific implementation of the bijection from KR tableaux to rigged configurations for type $A_{2n-1}^{(2)}$.

This inherits from type $A_n^{(1)}$ because we use the same methods in some places.

next_state(*val*)

Build the next state for type $A_{2n-1}^{(2)}$.

class sage.combinat.rigged_configurations.bij_type_A2_odd.**RCToKRTBijectionTypeA2Odd**(*RC_element*)

Bases: *RCToKRTBijectionTypeA*

Specific implementation of the bijection from rigged configurations to tensor products of KR tableaux for type $A_{2n-1}^{(2)}$.

next_state(*height*)

Build the next state for type $A_{2n-1}^{(2)}$.

5.1.204 Bijection classes for type $B_n^{(1)}$

Part of the (internal) classes which runs the bijection between rigged configurations and KR tableaux of type $B_n^{(1)}$.

AUTHORS:

- Travis Scrimshaw (2012-12-21): Initial version

class sage.combinat.rigged_configurations.bij_type_B.**KRTToRCBijectionTypeB**(*tp_krt*)

Bases: *KRTToRCBijectionTypeC*

Specific implementation of the bijection from KR tableaux to rigged configurations for type $B_n^{(1)}$.

next_state(*val*)

Build the next state for type $B_n^{(1)}$.

other_outcome(*rc*, *pos_val*, *width_n*)

Do the other case (QS) possibility.

This arises from the ambiguity when we found a singular string at the max width in $\nu^{(n)}$. We had first attempted case (S), and if that resulted in an invalid rigged configuration, we now finish the bijection using case (QS).

EXAMPLES:

```
sage: RC = RiggedConfigurations(['B',3,1], [[2,1],[1,2]])
sage: rc = RC(partition_list=[[2,1], [2,1,1], [5,1]])
sage: t = rc.to_tensor_product_of_kirillov_reshetikhin_tableaux()
sage: t.to_rigged_configuration() == rc # indirect doctest
True
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['B',Integer(3),Integer(1)], [[Integer(2),
→Integer(1)],[Integer(1),Integer(2)]])
>>> rc = RC(partition_list=[[Integer(2),Integer(1)], [Integer(2),Integer(1),
→Integer(1)], [Integer(5),Integer(1)]])
>>> t = rc.to_tensor_product_of_kirillov_reshetikhin_tableaux()
>>> t.to_rigged_configuration() == rc # indirect doctest
True
```

run(*verbose=False*)

Run the bijection from a tensor product of KR tableaux to a rigged configuration.

INPUT:

- tp_krt – a tensor product of KR tableaux

- `verbose` – (default: `False`) display each step in the bijection

EXAMPLES:

```
sage: from sage.combinat.rigged_configurations.bij_type_B import␣
↪KRTToRCBijectionTypeB
sage: KRT = crystals.TensorProductOfKirillovReshetikhinTableaux(['B', 3, 1],␣
↪[[2, 1]])
sage: KRTToRCBijectionTypeB(KRT(pathlist=[[0,3]])).run()

0[]0
<BLANKLINE>
```

class `sage.combinat.rigged_configurations.bij_type_B.`**`RCToKRTBijectionTypeB`**(*RC_element*)

Bases: `RCToKRTBijectionTypeC`

Specific implementation of the bijection from rigged configurations to tensor products of KR tableaux for type $B_n^{(1)}$.

next_state(*height*)

Build the next state for type $B_n^{(1)}$.

run(*verbose=False*, *build_graph=False*)

Run the bijection from rigged configurations to tensor product of KR tableaux for type $B_n^{(1)}$.

INPUT:

- `verbose` – boolean (default: `False`); display each step in the bijection
- `build_graph` – boolean (default: `False`); build the graph of each step of the bijection

EXAMPLES:

```
sage: RC = RiggedConfigurations(['B', 3, 1], [[2, 1]])
sage: from sage.combinat.rigged_configurations.bij_type_B import
↪RCToKRTBijectionTypeB
sage: RCToKRTBijectionTypeB(RC(partition_list=[[1],[1,1],[1]])).run()
[[3], [0]]

sage: RC = RiggedConfigurations(['B', 3, 1], [[3, 1]])
sage: x = RC(partition_list=[[],[1],[1]])
sage: RCToKRTBijectionTypeB(x).run()
[[1], [3], [-2]]
sage: bij = RCToKRTBijectionTypeB(x)
sage: bij.run(build_graph=True)
[[1], [3], [-2]]
sage: bij._graph
Digraph on 6 vertices
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['B', Integer(3), Integer(1)], [[Integer(2),
↪Integer(1)]])
>>> from sage.combinat.rigged_configurations.bij_type_B import
↪RCToKRTBijectionTypeB
>>> RCToKRTBijectionTypeB(RC(partition_list=[[Integer(1)],[Integer(1),
↪Integer(1)],[Integer(1)]])).run()
[[3], [0]]

>>> RC = RiggedConfigurations(['B', Integer(3), Integer(1)], [[Integer(3),
↪Integer(1)]])
>>> x = RC(partition_list=[[],[Integer(1)],[Integer(1)]])
>>> RCToKRTBijectionTypeB(x).run()
[[1], [3], [-2]]
>>> bij = RCToKRTBijectionTypeB(x)
>>> bij.run(build_graph=True)
[[1], [3], [-2]]
>>> bij._graph
Digraph on 6 vertices
```

5.1.205 Bijection classes for type $C_n^{(1)}$

Part of the (internal) classes which runs the bijection between rigged configurations and KR tableaux of type $C_n^{(1)}$.

AUTHORS:

- Travis Scrimshaw (2012-12-21): Initial version

class sage.combinat.rigged_configurations.bij_type_C.**KRTToRCBijectionTypeC**(*tp_krt*)

Bases: *KRTToRCBijectionTypeA*

Specific implementation of the bijection from KR tableaux to rigged configurations for type $C_n^{(1)}$.

This inherits from type $A_n^{(1)}$ because we use the same methods in some places.

next_state(*val*)

Build the next state for type $C_n^{(1)}$.

class sage.combinat.rigged_configurations.bij_type_C.**RCToKRTBijectionTypeC**(*RC_element*)

Bases: *RCToKRTBijectionTypeA*

Specific implementation of the bijection from rigged configurations to tensor products of KR tableaux for type $C_n^{(1)}$.

next_state(*height*)

Build the next state for type $C_n^{(1)}$.

5.1.206 Bijection classes for type $D_n^{(1)}$

Part of the (internal) classes which runs the bijection between rigged configurations and KR tableaux of type $D_n^{(1)}$.

AUTHORS:

- Travis Scrimshaw (2011-04-15): Initial version

class sage.combinat.rigged_configurations.bij_type_D.**KRTToRCBijectionTypeD**(*tp_krt*)

Bases: *KRTToRCBijectionTypeA*

Specific implementation of the bijection from KR tableaux to rigged configurations for type $D_n^{(1)}$.

This inherits from type $A_n^{(1)}$ because we use the same methods in some places.

doubling_map()

Perform the doubling map of the rigged configuration at the current state of the bijection.

This is the map $B(\Lambda) \hookrightarrow B(2\Lambda)$ which doubles each of the rigged partitions and updates the vacancy numbers accordingly.

halving_map()

Perform the halving map of the rigged configuration at the current state of the bijection.

This is the inverse map to $B(\Lambda) \hookrightarrow B(2\Lambda)$ which halves each of the rigged partitions and updates the vacancy numbers accordingly.

next_state(*val*)

Build the next state for type $D_n^{(1)}$.

run(*verbose=False*)

Run the bijection from a tensor product of KR tableaux to a rigged configuration for type $D_n^{(1)}$.

INPUT:

- `tp_krt` – a tensor product of KR tableaux
- `verbose` – (default: `False`) display each step in the bijection

EXAMPLES:

```
sage: KRT = crystals.TensorProductOfKirillovReshetikhinTableaux(['D', 4, 1],
↪[[2,1]])
sage: from sage.combinat.rigged_configurations.bij_type_D import
↪KRTToRCBijectionTypeD
sage: KRTToRCBijectionTypeD(KRT(pathlist=[[-3,2]])).run()

-1[ ]-1

2[ ]2

-1[ ]-1

-1[ ]-1
```

```
>>> from sage.all import *
>>> KRT = crystals.TensorProductOfKirillovReshetikhinTableaux(['D',
↪Integer(4), Integer(1)], [[Integer(2),Integer(1)]])
>>> from sage.combinat.rigged_configurations.bij_type_D import
↪KRTToRCBijectionTypeD
>>> KRTToRCBijectionTypeD(KRT(pathlist=[[-Integer(3),Integer(2)]])).run()
<BLANKLINE>

<BLANKLINE>
-1[ ]-1
<BLANKLINE>
-1[ ]-1
<BLANKLINE>
```

class sage.combinat.rigged_configurations.bij_type_D.**RCToKRTBijectionTypeD**(*RC_element*)

Bases: *RCToKRTBijectionTypeA*

Specific implementation of the bijection from rigged configurations to tensor products of KR tableaux for type $D_n^{(1)}$.

doubling_map()

Perform the doubling map of the rigged configuration at the current state of the bijection.

This is the map $B(\Lambda) \hookrightarrow B(2\Lambda)$ which doubles each of the rigged partitions and updates the vacancy numbers accordingly.

halving_map()

Perform the halving map of the rigged configuration at the current state of the bijection.

This is the inverse map to $B(\Lambda) \hookrightarrow B(2\Lambda)$ which halves each of the rigged partitions and updates the vacancy numbers accordingly.

next_state(*height*)

Build the next state for type $D_n^{(1)}$.

run(*verbose=False*, *build_graph=False*)

Run the bijection from rigged configurations to tensor product of KR tableaux for type $D_n^{(1)}$.

INPUT:

- `verbose` – boolean (default: `False`); display each step in the bijection
- `build_graph` – boolean (default: `False`); build the graph of each step of the bijection

EXAMPLES:

```
sage: RC = RiggedConfigurations(['D', 4, 1], [[2, 1]])
sage: x = RC(partition_list=[[1],[1],[1],[1]])
sage: from sage.combinat.rigged_configurations.bij_type_D import␣
↪RCToKRTBijectionTypeD
sage: RCToKRTBijectionTypeD(x).run()
[[2], [-3]]
sage: bij = RCToKRTBijectionTypeD(x)
sage: bij.run(build_graph=True)
[[2], [-3]]
sage: bij._graph
Digraph on 3 vertices
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['D', Integer(4), Integer(1)], [[Integer(2),␣
↪Integer(1)]])
>>> x = RC(partition_list=[[Integer(1)],[Integer(1)],[Integer(1)],
↪[Integer(1)]])
>>> from sage.combinat.rigged_configurations.bij_type_D import␣
↪RCToKRTBijectionTypeD
>>> RCToKRTBijectionTypeD(x).run()
[[2], [-3]]
>>> bij = RCToKRTBijectionTypeD(x)
>>> bij.run(build_graph=True)
[[2], [-3]]
>>> bij._graph
Digraph on 3 vertices
```

5.1.207 Bijection classes for type $D_{n+1}^{(2)}$

Part of the (internal) classes which runs the bijection between rigged configurations and KR tableaux of type $D_{n+1}^{(2)}$.

AUTHORS:

- Travis Scrimshaw (2011-04-15): Initial version

class sage.combinat.rigged_configurations.bij_type_D_twisted.**KRTToRCBijectionTypeDTwisted**(*tp_krt*)

Bases: *KRTToRCBijectionTypeD*, *KRTToRCBijectionTypeA2Even*

Specific implementation of the bijection from KR tableaux to rigged configurations for type $D_{n+1}^{(2)}$.

This inherits from type $C_n^{(1)}$ and $D_n^{(1)}$ because we use the same methods in some places.

next_state(*val*)

Build the next state for type $D_{n+1}^{(2)}$.

run(*verbose=False*)

Run the bijection from a tensor product of KR tableaux to a rigged configuration for type $D_{n+1}^{(2)}$.

INPUT:

- `tp_krt` – a tensor product of KR tableaux
- `verbose` – (default: `False`) display each step in the bijection

EXAMPLES:

```
sage: KRT = crystals.TensorProductOfKirillovReshetikhinTableaux(['D', 4, 2],
↪[[3,1]])
sage: from sage.combinat.rigged_configurations.bij_type_D_twisted import
↪KRTToRCBijectionTypeDTwisted
sage: KRTToRCBijectionTypeDTwisted(KRT(pathlist=[[-1,3,2]])).run()

-1[ ]-1

0[ ]0

1[ ]1
```

```
>>> from sage.all import *

-1[ ]-1
<BLANKLINE>
0[ ]0
<BLANKLINE>
1[ ]1
<BLANKLINE>
```

class sage.combinat.rigged_configurations.bij_type_D_twisted.**RCToKRTBijectionTypeDTwisted**(*RC_element*)

Bases: *RCToKRTBijectionTypeD*, *RCToKRTBijectionTypeA2Even*

Specific implementation of the bijection from rigged configurations to tensor products of KR tableaux for type $D_{n+1}^{(2)}$.

next_state(*height*)

Build the next state for type $D_{n+1}^{(2)}$.

run(*verbose=False*, *build_graph=False*)

Run the bijection from rigged configurations to tensor product of KR tableaux for type $D_{n+1}^{(2)}$.

INPUT:

- `verbose` – boolean (default: `False`); display each step in the bijection
- `build_graph` – boolean (default: `False`); build the graph of each step of the bijection

EXAMPLES:

```
sage: RC = RiggedConfigurations(['D', 4, 2], [[3, 1]])
sage: x = RC(partition_list=[[],[1],[1]])
sage: from sage.combinat.rigged_configurations.bij_type_D_twisted import␣
↪RCToKRTBijectionTypeDTwisted
sage: RCToKRTBijectionTypeDTwisted(x).run()
[[1], [3], [-2]]
sage: bij = RCToKRTBijectionTypeDTwisted(x)
sage: bij.run(build_graph=True)
[[1], [3], [-2]]
sage: bij._graph
Digraph on 6 vertices
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['D', Integer(4), Integer(2)], [[Integer(3),␣
↪Integer(1)]])
>>> x = RC(partition_list=[[],[Integer(1)],[Integer(1)]])

>>> bij = RCToKRTBijectionTypeDTwisted(x)
>>> bij.run(build_graph=True)
[[1], [3], [-2]]
>>> bij._graph
Digraph on 6 vertices
```

5.1.208 Bijection classes for type $D_4^{(3)}$

Part of the (internal) classes which runs the bijection between rigged configurations and KR tableaux of type $D_4^{(3)}$.

AUTHORS:

- Travis Scrimshaw (2014-09-10): Initial version

class `sage.combinat.rigged_configurations.bij_type_D_tri.`**`KRTToRCBijectionTypeDTri`**(*tp_krt*)

Bases: *KRTToRCBijectionTypeA*

Specific implementation of the bijection from KR tableaux to rigged configurations for type $D_4^{(3)}$.

This inherits from type $A_n^{(1)}$ because we use the same methods in some places.

`next_state`(*val*)

Build the next state for type $D_4^{(3)}$.

class `sage.combinat.rigged_configurations.bij_type_D_tri.`**`RCToKRTBijectionTypeDTri`**(*RC_element*)

Bases: *RCToKRTBijectionTypeA*

Specific implementation of the bijection from rigged configurations to tensor products of KR tableaux for type $D_4^{(3)}$.

next_state(*height*)

Build the next state for type $D_4^{(3)}$.

5.1.209 Bijection between rigged configurations and KR tableaux

Functions which are big switch statements to create the bijection class of the correct type.

AUTHORS:

- Travis Scrimshaw (2011-04-15): Initial version
- Travis Scrimshaw (2012-12-21): Added all non-exceptional bijection types
- Travis Scrimshaw (2014-09-10): Added type $D_4^{(3)}$

sage.combinat.rigged_configurations.bijection.**KRTToRCBijection**(*tp_krt*)

Return the correct KR tableaux to rigged configuration bijection helper class.

sage.combinat.rigged_configurations.bijection.**RCToKRTBijection**(*rigged_configuration_elt*)

Return the correct rigged configuration to KR tableaux bijection helper class.

5.1.210 Kleber Trees

A Kleber tree is a tree of weights generated by Kleber's algorithm [Kleber1]. The nodes correspond to the weights in the positive Weyl chamber obtained by subtracting a (nonzero) positive root. The edges are labeled by the coefficients of the roots of the difference.

AUTHORS:

- Travis Scrimshaw (2011-05-03): Initial version
- Travis Scrimshaw (2013-02-13): Added support for virtual trees and improved LaTeX output

EXAMPLES:

```
sage: from sage.combinat.rigged_configurations.kleber_tree import KleberTree
sage: KleberTree(['A', 3, 1], [[3,2], [2,1], [1,1], [1,1]])
Kleber tree of Cartan type ['A', 3, 1] and B = ((3, 2), (2, 1), (1, 1), (1, 1))
sage: KleberTree(['D', 4, 1], [[2,2]])
Kleber tree of Cartan type ['D', 4, 1] and B = ((2, 2),)
```

```
>>> from sage.all import *
>>> from sage.combinat.rigged_configurations.kleber_tree import KleberTree
>>> KleberTree(['A', Integer(3), Integer(1)], [[Integer(3),Integer(2)], [Integer(2),
→Integer(1)], [Integer(1),Integer(1)], [Integer(1),Integer(1)]])
Kleber tree of Cartan type ['A', 3, 1] and B = ((3, 2), (2, 1), (1, 1), (1, 1))
>>> KleberTree(['D', Integer(4), Integer(1)], [[Integer(2),Integer(2)]])
Kleber tree of Cartan type ['D', 4, 1] and B = ((2, 2),)
```

class sage.combinat.rigged_configurations.kleber_tree.**KleberTree**(*cartan_type*, *B*, *classical_ct*)

Bases: UniqueRepresentation, Parent

The tree that is generated by Kleber's algorithm.

A Kleber tree is a tree of weights generated by Kleber's algorithm [Kleber1]. It is used to generate the set of all admissible rigged configurations for the simply-laced affine types $A_n^{(1)}$, $D_n^{(1)}$, $E_6^{(1)}$, $E_7^{(1)}$, and $E_8^{(1)}$.

See also

There is a modified version for non-simply-laced affine types at *VirtualKleberTree*.

The nodes correspond to the weights in the positive Weyl chamber obtained by subtracting a (nonzero) positive root. The edges are labeled by the coefficients of the roots, and X is a child of Y if Y is the root else if the edge label of Y to its parent Z is greater (in every component) than the label from X to Y.

For a Kleber tree, one needs to specify an affine (simply-laced) Cartan type and a sequence of pairs (r, s), where s is any positive integer and r is a node in the Dynkin diagram. Each (r, s) can be viewed as a rectangle of width s and height r.

INPUT:

- `cartan_type` – an affine simply-laced Cartan type
- `B` – list of dimensions of rectangles by $[r, c]$ where r is the number of rows and c is the number of columns

REFERENCES:

EXAMPLES:

Simply-laced example:

```
sage: from sage.combinat.rigged_configurations.kleber_tree import KleberTree
sage: KT = KleberTree(['A', 3, 1], [[3,2], [1,1]])
sage: KT.list()
[Kleber tree node with weight [1, 0, 2] and upwards edge root [0, 0, 0],
 Kleber tree node with weight [0, 0, 1] and upwards edge root [1, 1, 1]]
sage: KT = KleberTree(['A', 3, 1], [[3,2], [2,1], [1,1], [1,1]])
sage: KT.cardinality()
10
sage: KT = KleberTree(['D', 4, 1], [[2,2]])
sage: KT.cardinality()
3
sage: KT = KleberTree(['D', 4, 1], [[4,5]])
sage: KT.cardinality()
1
```

```
>>> from sage.all import *
>>> from sage.combinat.rigged_configurations.kleber_tree import KleberTree
>>> KT = KleberTree(['A', Integer(3), Integer(1)], [[Integer(3),Integer(2)],
↪[Integer(1),Integer(1)]])
>>> KT.list()
[Kleber tree node with weight [1, 0, 2] and upwards edge root [0, 0, 0],
 Kleber tree node with weight [0, 0, 1] and upwards edge root [1, 1, 1]]
>>> KT = KleberTree(['A', Integer(3), Integer(1)], [[Integer(3),Integer(2)],
↪[Integer(2),Integer(1)], [Integer(1),Integer(1)], [Integer(1),Integer(1)]])
>>> KT.cardinality()
10
>>> KT = KleberTree(['D', Integer(4), Integer(1)], [[Integer(2),Integer(2)]])
>>> KT.cardinality()
3
>>> KT = KleberTree(['D', Integer(4), Integer(1)], [[Integer(4),Integer(5)]])
>>> KT.cardinality()
1
```

From [Kleber2]:

```
sage: KT = KleberTree(['E', 6, 1], [[4, 2]])  # long time (9s on sage.math, 2012)
sage: KT.cardinality()  # long time
12
```

```
>>> from sage.all import *
>>> KT = KleberTree(['E', Integer(6), Integer(1)], [[Integer(4), Integer(2)]])  #␣
↪long time (9s on sage.math, 2012)
>>> KT.cardinality()  # long time
12
```

We check that relabelled types work (Issue #16876):

```
sage: ct = CartanType(['A',3,1]).relabel(lambda x: x+2)
sage: kt = KleberTree(ct, [[3,1],[5,1]])
sage: list(kt)
[Kleber tree node with weight [1, 0, 1] and upwards edge root [0, 0, 0],
 Kleber tree node with weight [0, 0, 0] and upwards edge root [1, 1, 1]]
sage: kt = KleberTree(['A',3,1], [[1,1],[3,1]])
sage: list(kt)
[Kleber tree node with weight [1, 0, 1] and upwards edge root [0, 0, 0],
 Kleber tree node with weight [0, 0, 0] and upwards edge root [1, 1, 1]]
```

```
>>> from sage.all import *
>>> ct = CartanType(['A',Integer(3),Integer(1)]).relabel(lambda x: x+Integer(2))
>>> kt = KleberTree(ct, [[Integer(3),Integer(1)],[Integer(5),Integer(1)]])
>>> list(kt)
[Kleber tree node with weight [1, 0, 1] and upwards edge root [0, 0, 0],
 Kleber tree node with weight [0, 0, 0] and upwards edge root [1, 1, 1]]
>>> kt = KleberTree(['A',Integer(3),Integer(1)], [[Integer(1),Integer(1)],
↪[Integer(3),Integer(1)]])
>>> list(kt)
[Kleber tree node with weight [1, 0, 1] and upwards edge root [0, 0, 0],
 Kleber tree node with weight [0, 0, 0] and upwards edge root [1, 1, 1]]
```

Element

alias of *KleberTreeNode*

breadth_first_iter()

Iterate over all nodes in the tree following a breadth-first traversal.

EXAMPLES:

```
sage: from sage.combinat.rigged_configurations.kleber_tree import KleberTree
sage: KT = KleberTree(['A', 3, 1], [[2, 2], [2, 3]])
sage: for x in KT.breadth_first_iter(): x
Kleber tree node with weight [0, 5, 0] and upwards edge root [0, 0, 0]
Kleber tree node with weight [1, 3, 1] and upwards edge root [0, 1, 0]
Kleber tree node with weight [0, 3, 0] and upwards edge root [1, 2, 1]
Kleber tree node with weight [2, 1, 2] and upwards edge root [0, 1, 0]
Kleber tree node with weight [1, 1, 1] and upwards edge root [0, 1, 0]
Kleber tree node with weight [0, 1, 0] and upwards edge root [1, 2, 1]
```

```
>>> from sage.all import *
>>> from sage.combinat.rigged_configurations.kleber_tree import KleberTree
>>> KT = KleberTree(['A', Integer(3), Integer(1)], [[Integer(2), Integer(2)],
→[Integer(2), Integer(3)]])
>>> for x in KT.breadth_first_iter(): x
Kleber tree node with weight [0, 5, 0] and upwards edge root [0, 0, 0]
Kleber tree node with weight [1, 3, 1] and upwards edge root [0, 1, 0]
Kleber tree node with weight [0, 3, 0] and upwards edge root [1, 2, 1]
Kleber tree node with weight [2, 1, 2] and upwards edge root [0, 1, 0]
Kleber tree node with weight [1, 1, 1] and upwards edge root [0, 1, 0]
Kleber tree node with weight [0, 1, 0] and upwards edge root [1, 2, 1]
```

cartan_type()

Return the Cartan type of this Kleber tree.

EXAMPLES:

```
sage: from sage.combinat.rigged_configurations.kleber_tree import KleberTree
sage: KT = KleberTree(['A', 3, 1], [[1,1]])
sage: KT.cartan_type()
['A', 3, 1]
```

```
>>> from sage.all import *
>>> from sage.combinat.rigged_configurations.kleber_tree import KleberTree
>>> KT = KleberTree(['A', Integer(3), Integer(1)], [[Integer(1),Integer(1)]])
>>> KT.cartan_type()
['A', 3, 1]
```

depth_first_iter()

Iterate (recursively) over the nodes in the tree following a depth-first traversal.

EXAMPLES:

```
sage: from sage.combinat.rigged_configurations.kleber_tree import KleberTree
sage: KT = KleberTree(['A', 3, 1], [[2, 2], [2, 3]])
sage: for x in KT.depth_first_iter(): x
Kleber tree node with weight [0, 5, 0] and upwards edge root [0, 0, 0]
Kleber tree node with weight [1, 3, 1] and upwards edge root [0, 1, 0]
Kleber tree node with weight [2, 1, 2] and upwards edge root [0, 1, 0]
Kleber tree node with weight [0, 3, 0] and upwards edge root [1, 2, 1]
Kleber tree node with weight [1, 1, 1] and upwards edge root [0, 1, 0]
Kleber tree node with weight [0, 1, 0] and upwards edge root [1, 2, 1]
```

```
>>> from sage.all import *
>>> from sage.combinat.rigged_configurations.kleber_tree import KleberTree
>>> KT = KleberTree(['A', Integer(3), Integer(1)], [[Integer(2), Integer(2)],
→[Integer(2), Integer(3)]])
>>> for x in KT.depth_first_iter(): x
Kleber tree node with weight [0, 5, 0] and upwards edge root [0, 0, 0]
Kleber tree node with weight [1, 3, 1] and upwards edge root [0, 1, 0]
Kleber tree node with weight [2, 1, 2] and upwards edge root [0, 1, 0]
Kleber tree node with weight [0, 3, 0] and upwards edge root [1, 2, 1]
```

(continues on next page)

(continued from previous page)

```
Kleber tree node with weight [1, 1, 1] and upwards edge root [0, 1, 0]
Kleber tree node with weight [0, 1, 0] and upwards edge root [1, 2, 1]
```

digraph()

Return a DiGraph representation of this Kleber tree.

EXAMPLES:

```
sage: from sage.combinat.rigged_configurations.kleber_tree import KleberTree
sage: KT = KleberTree(['D', 4, 1], [[2, 2]])
sage: KT.digraph()
Digraph on 3 vertices
```

```
>>> from sage.all import *
>>> from sage.combinat.rigged_configurations.kleber_tree import KleberTree
>>> KT = KleberTree(['D', Integer(4), Integer(1)], [[Integer(2), Integer(2)]])
>>> KT.digraph()
Digraph on 3 vertices
```

latex_options(***options*)

Return the current latex options if no arguments are passed, otherwise set the corresponding latex option.

OPTIONS:

- `hspace` – (default: 2.5) the horizontal spacing of the tree nodes
- `vspace` – (default: `x`) the vertical spacing of the tree nodes, here `x` is the minimum of -2.5 or $-.75n$ where n is the rank of the classical type
- `edge_labels` – boolean (default: `True`); display edge labels
- `use_vector_notation` – boolean (default: `False`); display edge labels using vector notation instead of a linear combination

EXAMPLES:

```
sage: from sage.combinat.rigged_configurations.kleber_tree import KleberTree
sage: KT = KleberTree(['D', 3, 1], [[2,1], [2,1]])
sage: KT.latex_options(vspace=-4, use_vector_notation=True)
sage: sorted(KT.latex_options().items())
[('edge_labels', True), ('hspace', 2.5), ('use_vector_notation', True), (
↪'vspace', -4)]
```

```
>>> from sage.all import *
>>> from sage.combinat.rigged_configurations.kleber_tree import KleberTree
>>> KT = KleberTree(['D', Integer(3), Integer(1)], [[Integer(2),Integer(1)],␣
↪[Integer(2),Integer(1)]])
>>> KT.latex_options(vspace=-Integer(4), use_vector_notation=True)
>>> sorted(KT.latex_options().items())
[('edge_labels', True), ('hspace', 2.5), ('use_vector_notation', True), (
↪'vspace', -4)]
```

plot(***options*)

Return the plot of `self` as a directed graph.

EXAMPLES:

```
sage: from sage.combinat.rigged_configurations.kleber_tree import KleberTree
sage: KT = KleberTree(['D', 4, 1], [[2, 2]])
sage: print(KT.plot())                                                  #␣
↪needs sage.plot
Graphics object consisting of 8 graphics primitives
```

```
>>> from sage.all import *
>>> from sage.combinat.rigged_configurations.kleber_tree import KleberTree
>>> KT = KleberTree(['D', Integer(4), Integer(1)], [[Integer(2), Integer(2)]])
>>> print(KT.plot())                                                    #␣
↪needs sage.plot
Graphics object consisting of 8 graphics primitives
```

class sage.combinat.rigged_configurations.kleber_tree.**KleberTreeNode**(*parent_obj*, *node_weight*, *dominant_root*, *parent_node=None*)

Bases: Element

A node in the Kleber tree.

This class is meant to be used internally by the Kleber tree class and should not be created directly by the user.

For more on the Kleber tree and the nodes, see *KleberTree*.

The dominating root is the up_root which is the difference between the parent node's weight and this node's weight.

INPUT:

- parent_obj – the parent object of this element
- node_weight – the weight of this node
- dominant_root – the dominating root
- parent_node – (default: None) the parent node of this node

depth()

Return the depth of this node in the tree.

EXAMPLES:

```
sage: from sage.combinat.rigged_configurations.kleber_tree import KleberTree
sage: RS = RootSystem(['A', 2])
sage: WS = RS.weight_lattice()
sage: R = RS.root_lattice()
sage: KT = KleberTree(['A', 2, 1], [[1,1]])
sage: n = KT(WS.sum_of_terms([(1,5), (2,2)]), R.zero())
sage: n.depth
0
sage: n2 = KT(WS.sum_of_terms([(1,5), (2,2)]), R.zero(), n)
sage: n2.depth
1
```

```
>>> from sage.all import *
>>> from sage.combinat.rigged_configurations.kleber_tree import KleberTree
```

(continues on next page)

(continued from previous page)

```
>>> RS = RootSystem(['A', Integer(2)])
>>> WS = RS.weight_lattice()
>>> R = RS.root_lattice()
>>> KT = KleberTree(['A', Integer(2), Integer(1)], [[Integer(1),Integer(1)]])
>>> n = KT(WS.sum_of_terms([(Integer(1),Integer(5)), (Integer(2),
↪Integer(2))]), R.zero())
>>> n.depth
0
>>> n2 = KT(WS.sum_of_terms([(Integer(1),Integer(5)), (Integer(2),
↪Integer(2))]), R.zero(), n)
>>> n2.depth
1
```

multiplicity()

Return the multiplicity of `self`.

The multiplicity of a node x of depth d weight λ in a simply-laced Kleber tree is equal to:

$$\prod_{i>0}\prod_{a\in\overline{I}}\binom{p_i^{(a)}+m_i^{(a)}}{p_i^{(a)}}$$

Recall that

$$\begin{aligned} m_i^{(a)} &= \left(\lambda^{(i-1)} - 2\lambda^{(i)} + \lambda^{(i+1)} \mid \overline{\Lambda}_a\right), \\ p_i^{(a)} &= \left(\alpha_a \mid \lambda^{(i)}\right) - \sum_{j>i}(j-i)L_j^{(a)}, \end{aligned}$$

where $\lambda^{(i)}$ is the weight node at depth i in the path to x from the root and we set $\lambda^{(j)} = \lambda$ for all $j \geq d$.

Note that $m_i^{(a)} = 0$ for all $i > d$.

EXAMPLES:

```
sage: from sage.combinat.rigged_configurations.kleber_tree import KleberTree
sage: KT = KleberTree(['A',3,1], [[3,2],[2,1],[1,1],[1,1]])
sage: for x in KT: x, x.multiplicity()
(Kleber tree node with weight [2, 1, 2] and upwards edge root [0, 0, 0], 1)
(Kleber tree node with weight [3, 0, 1] and upwards edge root [0, 1, 1], 1)
(Kleber tree node with weight [0, 2, 2] and upwards edge root [1, 0, 0], 1)
(Kleber tree node with weight [1, 0, 3] and upwards edge root [1, 1, 0], 2)
(Kleber tree node with weight [1, 1, 1] and upwards edge root [1, 1, 1], 4)
(Kleber tree node with weight [0, 0, 2] and upwards edge root [2, 2, 1], 2)
(Kleber tree node with weight [2, 0, 0] and upwards edge root [0, 1, 1], 2)
(Kleber tree node with weight [0, 0, 2] and upwards edge root [1, 1, 0], 1)
(Kleber tree node with weight [0, 1, 0] and upwards edge root [1, 1, 1], 2)
(Kleber tree node with weight [0, 1, 0] and upwards edge root [0, 0, 1], 1)
```

```
>>> from sage.all import *
>>> from sage.combinat.rigged_configurations.kleber_tree import KleberTree
>>> KT = KleberTree(['A',Integer(3),Integer(1)], [[Integer(3),Integer(2)],
↪[Integer(2),Integer(1)],[Integer(1),Integer(1)],[Integer(1),Integer(1)]])
>>> for x in KT: x, x.multiplicity()
```

(continues on next page)

(continued from previous page)

```
(Kleber tree node with weight [2, 1, 2] and upwards edge root [0, 0, 0], 1)
(Kleber tree node with weight [3, 0, 1] and upwards edge root [0, 1, 1], 1)
(Kleber tree node with weight [0, 2, 2] and upwards edge root [1, 0, 0], 1)
(Kleber tree node with weight [1, 0, 3] and upwards edge root [1, 1, 0], 2)
(Kleber tree node with weight [1, 1, 1] and upwards edge root [1, 1, 1], 4)
(Kleber tree node with weight [0, 0, 2] and upwards edge root [2, 2, 1], 2)
(Kleber tree node with weight [2, 0, 0] and upwards edge root [0, 1, 1], 2)
(Kleber tree node with weight [0, 0, 2] and upwards edge root [1, 1, 0], 1)
(Kleber tree node with weight [0, 1, 0] and upwards edge root [1, 1, 1], 2)
(Kleber tree node with weight [0, 1, 0] and upwards edge root [0, 0, 1], 1)
```

class sage.combinat.rigged_configurations.kleber_tree.**KleberTreeTypeA2Even**(*cartan_type*, *B*)

Bases: *VirtualKleberTree*

Kleber tree for types $A_{2n}^{(2)}$ and $A_{2n}^{(2)\dagger}$.

Note that here for $A_{2n}^{(2)}$ we use $\tilde{\gamma}_a$ in place of γ_a in constructing the virtual Kleber tree, and so we end up selecting all nodes since $\tilde{\gamma}_a = 1$ for all $a \in \overline{I}$. For type $A_{2n}^{(2)\dagger}$, we have $\gamma_a = 1$ for all $a \in \overline{I}$.

See also

VirtualKleberTree

breadth_first_iter(*all_nodes=False*)

Iterate over all nodes in the tree following a breadth-first traversal.

INPUT:

- `all_nodes` – boolean (default: `False`); if `True`, output all nodes in the tree

EXAMPLES:

```
sage: from sage.combinat.rigged_configurations.kleber_tree import VirtualKleberTree
sage: KT = VirtualKleberTree(['A', 4, 2], [[2,1]])
sage: for x in KT.breadth_first_iter(): x
Kleber tree node with weight [0, 2, 0] and upwards edge root [0, 0, 0]
Kleber tree node with weight [1, 0, 1] and upwards edge root [0, 1, 0]
Kleber tree node with weight [0, 0, 0] and upwards edge root [1, 2, 1]
sage: for x in KT.breadth_first_iter(True): x
Kleber tree node with weight [0, 2, 0] and upwards edge root [0, 0, 0]
Kleber tree node with weight [1, 0, 1] and upwards edge root [0, 1, 0]
Kleber tree node with weight [0, 0, 0] and upwards edge root [1, 2, 1]
```

```
>>> from sage.all import *
>>> from sage.combinat.rigged_configurations.kleber_tree import VirtualKleberTree
>>> KT = VirtualKleberTree(['A', Integer(4), Integer(2)], [[Integer(2), Integer(1)]])
>>> for x in KT.breadth_first_iter(): x
Kleber tree node with weight [0, 2, 0] and upwards edge root [0, 0, 0]
Kleber tree node with weight [1, 0, 1] and upwards edge root [0, 1, 0]
Kleber tree node with weight [0, 0, 0] and upwards edge root [1, 2, 1]
```

(continues on next page)

(continued from previous page)

```
>>> for x in KT.breadth_first_iter(True): x
Kleber tree node with weight [0, 2, 0] and upwards edge root [0, 0, 0]
Kleber tree node with weight [1, 0, 1] and upwards edge root [0, 1, 0]
Kleber tree node with weight [0, 0, 0] and upwards edge root [1, 2, 1]
```

depth_first_iter(*all_nodes=False*)

Iterate (recursively) over the nodes in the tree following a depth-first traversal.

INPUT:

- `all_nodes` – boolean (default: `False`); if `True`, output all nodes in the tree

EXAMPLES:

```
sage: from sage.combinat.rigged_configurations.kleber_tree import␣
↪VirtualKleberTree
sage: KT = VirtualKleberTree(['A', 4, 2], [[2,1]])
sage: for x in KT.depth_first_iter(): x
Kleber tree node with weight [0, 2, 0] and upwards edge root [0, 0, 0]
Kleber tree node with weight [1, 0, 1] and upwards edge root [0, 1, 0]
Kleber tree node with weight [0, 0, 0] and upwards edge root [1, 2, 1]
sage: for x in KT.depth_first_iter(True): x
Kleber tree node with weight [0, 2, 0] and upwards edge root [0, 0, 0]
Kleber tree node with weight [1, 0, 1] and upwards edge root [0, 1, 0]
Kleber tree node with weight [0, 0, 0] and upwards edge root [1, 2, 1]
```

```
>>> from sage.all import *
>>> from sage.combinat.rigged_configurations.kleber_tree import␣
↪VirtualKleberTree
>>> KT = VirtualKleberTree(['A', Integer(4), Integer(2)], [[Integer(2),
↪Integer(1)]])
>>> for x in KT.depth_first_iter(): x
Kleber tree node with weight [0, 2, 0] and upwards edge root [0, 0, 0]
Kleber tree node with weight [1, 0, 1] and upwards edge root [0, 1, 0]
Kleber tree node with weight [0, 0, 0] and upwards edge root [1, 2, 1]
>>> for x in KT.depth_first_iter(True): x
Kleber tree node with weight [0, 2, 0] and upwards edge root [0, 0, 0]
Kleber tree node with weight [1, 0, 1] and upwards edge root [0, 1, 0]
Kleber tree node with weight [0, 0, 0] and upwards edge root [1, 2, 1]
```

class sage.combinat.rigged_configurations.kleber_tree.**VirtualKleberTree**(*cartan_type*, *B*)

Bases: *KleberTree*

A virtual Kleber tree.

We can use a modified version of the Kleber algorithm called the virtual Kleber algorithm [OSS03] to compute all admissible rigged configurations for non-simply-laced types. This uses the following embeddings into the simply-laced types:

$$\begin{aligned} C_n^{(1)}, A_{2n}^{(2)}, A_{2n}^{(2)\dagger}, D_{n+1}^{(2)} &\hookrightarrow A_{2n-1}^{(1)} \\ A_{2n-1}^{(2)}, B_n^{(1)} &\hookrightarrow D_{n+1}^{(1)} \\ E_6^{(2)}, F_4^{(1)} &\hookrightarrow E_6^{(1)} \\ D_4^{(3)}, G_2^{(1)} &\hookrightarrow D_4^{(1)} \end{aligned}$$

One then selects the subset of admissible nodes which are translates of the virtual requirements. In the graph, the selected nodes are indicated by brackets [].

Note: Because these are virtual nodes, all information is given in the corresponding simply-laced type.

See also:

For more on the Kleber algorithm, see `KleberTree`.

REFERENCES:

INPUT:

- `cartan_type` – an affine non-simply-laced Cartan type
- `B` – list of dimensions of rectangles by $[r, c]$ where r is the number of rows and c is the number of columns

EXAMPLES:

```
sage: from sage.combinat.rigged_configurations.kleber_tree import␣
↪VirtualKleberTree
sage: KT = VirtualKleberTree(['C', 4, 1], [[2,2]])
sage: KT.cardinality()
3
sage: KT.base_tree().cardinality()
6
sage: KT = VirtualKleberTree(['C', 4, 1], [[4,5]])
sage: KT.cardinality()
1
sage: KT = VirtualKleberTree(['D', 5, 2], [[2,1], [1,1]])
sage: KT.cardinality()
8
sage: KT = VirtualKleberTree(CartanType(['A', 4, 2]).dual(), [[1,1], [2,2]])
sage: KT.cardinality()
15
```

```
>>> from sage.all import *
>>> from sage.combinat.rigged_configurations.kleber_tree import VirtualKleberTree
>>> KT = VirtualKleberTree(['C', Integer(4), Integer(1)], [[Integer(2),
↪Integer(2)]])
>>> KT.cardinality()
3
>>> KT.base_tree().cardinality()
6
>>> KT = VirtualKleberTree(['C', Integer(4), Integer(1)], [[Integer(4),
↪Integer(5)]])
>>> KT.cardinality()
1
>>> KT = VirtualKleberTree(['D', Integer(5), Integer(2)], [[Integer(2),
↪Integer(1)], [Integer(1),Integer(1)]])
>>> KT.cardinality()
```

(continues on next page)

(continued from previous page)

```
8
>>> KT = VirtualKleberTree(CartanType(['A', Integer(4), Integer(2)]).dual(),␣
↪[[Integer(1),Integer(1)], [Integer(2),Integer(2)]])
>>> KT.cardinality()
15
```

base_tree()

Return the underlying virtual Kleber tree associated to `self`.

EXAMPLES:

```
sage: from sage.combinat.rigged_configurations.kleber_tree import␣
↪VirtualKleberTree
sage: KT = VirtualKleberTree(['C', 4, 1], [[2,2]])
sage: KT.base_tree()
Kleber tree of Cartan type ['A', 7, 1] and B = ((2, 2), (6, 2))
```

```
>>> from sage.all import *
>>> from sage.combinat.rigged_configurations.kleber_tree import␣
↪VirtualKleberTree
>>> KT = VirtualKleberTree(['C', Integer(4), Integer(1)], [[Integer(2),
↪Integer(2)]])
>>> KT.base_tree()
Kleber tree of Cartan type ['A', 7, 1] and B = ((2, 2), (6, 2))
```

breadth_first_iter(*all_nodes=False*)

Iterate over all nodes in the tree following a breadth-first traversal.

INPUT:

- `all_nodes` – boolean (default: `False`); if `True`, output all nodes in the tree

EXAMPLES:

```
sage: from sage.combinat.rigged_configurations.kleber_tree import␣
↪VirtualKleberTree
sage: KT = VirtualKleberTree(['C', 2, 1], [[1,1], [2,1]])
sage: for x in KT.breadth_first_iter(): x
Kleber tree node with weight [1, 2, 1] and upwards edge root [0, 0, 0]
Kleber tree node with weight [1, 0, 1] and upwards edge root [0, 1, 0]
sage: for x in KT.breadth_first_iter(True): x
Kleber tree node with weight [1, 2, 1] and upwards edge root [0, 0, 0]
Kleber tree node with weight [0, 2, 0] and upwards edge root [1, 1, 1]
Kleber tree node with weight [1, 0, 1] and upwards edge root [0, 1, 0]
```

```
>>> from sage.all import *
>>> from sage.combinat.rigged_configurations.kleber_tree import␣
↪VirtualKleberTree
>>> KT = VirtualKleberTree(['C', Integer(2), Integer(1)], [[Integer(1),
↪Integer(1)], [Integer(2),Integer(1)]])
>>> for x in KT.breadth_first_iter(): x
Kleber tree node with weight [1, 2, 1] and upwards edge root [0, 0, 0]
Kleber tree node with weight [1, 0, 1] and upwards edge root [0, 1, 0]
```

(continues on next page)

(continued from previous page)

```
>>> for x in KT.breadth_first_iter(True): x
Kleber tree node with weight [1, 2, 1] and upwards edge root [0, 0, 0]
Kleber tree node with weight [0, 2, 0] and upwards edge root [1, 1, 1]
Kleber tree node with weight [1, 0, 1] and upwards edge root [0, 1, 0]
```

depth_first_iter(*all_nodes=False*)

Iterate (recursively) over the nodes in the tree following a depth-first traversal.

INPUT:

- `all_nodes` – boolean (default: `False`); if `True`, output all nodes in the tree

EXAMPLES:

```
sage: from sage.combinat.rigged_configurations.kleber_tree import␣
↪VirtualKleberTree
sage: KT = VirtualKleberTree(['C', 2, 1], [[1,1], [2,1]])
sage: for x in KT.depth_first_iter(): x
Kleber tree node with weight [1, 2, 1] and upwards edge root [0, 0, 0]
Kleber tree node with weight [1, 0, 1] and upwards edge root [0, 1, 0]
sage: for x in KT.depth_first_iter(True): x
Kleber tree node with weight [1, 2, 1] and upwards edge root [0, 0, 0]
Kleber tree node with weight [0, 2, 0] and upwards edge root [1, 1, 1]
Kleber tree node with weight [1, 0, 1] and upwards edge root [0, 1, 0]
```

```
>>> from sage.all import *
>>> from sage.combinat.rigged_configurations.kleber_tree import␣
↪VirtualKleberTree
>>> KT = VirtualKleberTree(['C', Integer(2), Integer(1)], [[Integer(1),
↪Integer(1)], [Integer(2),Integer(1)]])
>>> for x in KT.depth_first_iter(): x
Kleber tree node with weight [1, 2, 1] and upwards edge root [0, 0, 0]
Kleber tree node with weight [1, 0, 1] and upwards edge root [0, 1, 0]
>>> for x in KT.depth_first_iter(True): x
Kleber tree node with weight [1, 2, 1] and upwards edge root [0, 0, 0]
Kleber tree node with weight [0, 2, 0] and upwards edge root [1, 1, 1]
Kleber tree node with weight [1, 0, 1] and upwards edge root [0, 1, 0]
```

5.1.211 Kirillov-Reshetikhin Tableaux

Kirillov-Reshetikhin tableaux are rectangular tableaux with r rows and s columns that naturally arise under the bijection between rigged configurations and tableaux [RigConBijection]. They are in bijection with the elements of the Kirillov-Reshetikhin crystal $B^{r,s}$ under the (inverse) filling map [OSS13] [SS2015]. They do not have to satisfy the semistandard row or column restrictions. These tensor products are the result from the bijection from rigged configurations [RigConBijection].

For more information, see *KirillovReshetikhinTableaux* and *TensorProductOfKirillovReshetikhinTableaux*.

AUTHORS:

- Travis Scrimshaw (2012-01-03): Initial version
- Travis Scrimshaw (2012-11-14): Added bijection to KR crystals

REFERENCES:

class sage.combinat.rigged_configurations.kr_tableaux.**KRTableauxBn**(*cartan_type*, *r*, *s*)

Bases: *KRTableauxTypeHorizonal*

Kirillov-Reshetkhin tableaux $B^{n,s}$ of type $B_n^{(1)}$.

Element

alias of *KRTableauxSpinElement*

from_kirillov_reshetikhin_crystal(*krc*)

Construct an element of `self` from the Kirillov-Reshetikhin crystal element `krc`.

EXAMPLES:

```
sage: KR = crystals.KirillovReshetikhin(['B',3,1], 3, 3, model='KR')
sage: C = crystals.KirillovReshetikhin(['B',3,1], 3, 3, model='KN')
sage: krc = C.module_generators[1].f_string([3,2,3,1,3,3]); krc
[++-, [[2], [0], [-3]]]
sage: KR.from_kirillov_reshetikhin_crystal(krc)
[[1, 1, 2], [2, 2, -3], [-3, -3, -1]]
```

```
>>> from sage.all import *
>>> KR = crystals.KirillovReshetikhin(['B',Integer(3),Integer(1)], Integer(3),
→ Integer(3), model='KR')
>>> C = crystals.KirillovReshetikhin(['B',Integer(3),Integer(1)], Integer(3),␣
→Integer(3), model='KN')
>>> krc = C.module_generators[Integer(1)].f_string([Integer(3),Integer(2),
→Integer(3),Integer(1),Integer(3),Integer(3)]); krc
[++-, [[2], [0], [-3]]]
>>> KR.from_kirillov_reshetikhin_crystal(krc)
[[1, 1, 2], [2, 2, -3], [-3, -3, -1]]
```

class sage.combinat.rigged_configurations.kr_tableaux.**KRTableauxDTwistedSpin**(*cartan_type*, *r*, *s*)

Bases: *KRTableauxRectangle*

Kirillov-Reshetikhin tableaux $B^{r,s}$ of type $D_n^{(2)}$ with $r = n$.

EXAMPLES:

```
sage: KRT = crystals.KirillovReshetikhin(['D', 4, 2], 1, 1, model='KR')
sage: KRT.cardinality()
8
sage: KRC = crystals.KirillovReshetikhin(['D', 4, 2], 1, 1, model='KN')
sage: KRT.cardinality() == KRC.cardinality()
True
```

```
>>> from sage.all import *
>>> KRT = crystals.KirillovReshetikhin(['D', Integer(4), Integer(2)], Integer(1),␣
→Integer(1), model='KR')
>>> KRT.cardinality()
8
>>> KRC = crystals.KirillovReshetikhin(['D', Integer(4), Integer(2)], Integer(1),␣
→Integer(1), model='KN')
>>> KRT.cardinality() == KRC.cardinality()
True
```

Element

alias of *KRTableauxSpinElement*

class sage.combinat.rigged_configurations.kr_tableaux.**KRTableauxRectangle**(*cartan_type*, *r*, *s*)

Bases: *KirillovReshetikhinTableaux*

Kirillov-Reshetkhin tableaux $B^{r,s}$ whose module generator is a single $r \times s$ rectangle.

These are Kirillov-Reshetkhin tableaux $B^{r,s}$ of type:

- $A_n^{(1)}$ for all $1 \leq r \leq n$,
- $C_n^{(1)}$ when $r = n$.

from_kirillov_reshetikhin_crystal(*krc*)

Construct a *KirillovReshetikhinTableauxElement*.

EXAMPLES:

```
sage: KRT = crystals.KirillovReshetikhin(['A', 4, 1], 2, 1, model='KR')
sage: C = crystals.KirillovReshetikhin(['A',4,1], 2, 1, model='KN')
sage: krc = C(4,3); krc
[[3], [4]]
sage: KRT.from_kirillov_reshetikhin_crystal(krc)
[[3], [4]]
```

```
>>> from sage.all import *
>>> KRT = crystals.KirillovReshetikhin(['A', Integer(4), Integer(1)],␣
↪Integer(2), Integer(1), model='KR')
>>> C = crystals.KirillovReshetikhin(['A',Integer(4),Integer(1)], Integer(2),␣
↪Integer(1), model='KN')
>>> krc = C(Integer(4),Integer(3)); krc
[[3], [4]]
>>> KRT.from_kirillov_reshetikhin_crystal(krc)
[[3], [4]]
```

class sage.combinat.rigged_configurations.kr_tableaux.**KRTableauxSpin**(*cartan_type*, *r*, *s*)

Bases: *KRTableauxRectangle*

Kirillov-Reshetikhin tableaux $B^{r,s}$ of type $D_n^{(1)}$ with $r = n, n-1$.

Element

alias of *KRTableauxSpinElement*

class sage.combinat.rigged_configurations.kr_tableaux.**KRTableauxSpinElement**(*parent*, *list*, ***options*)

Bases: *KirillovReshetikhinTableauxElement*

Kirillov-Reshetikhin tableau for spinors.

Here we are in the embedding $B(\Lambda_n) \hookrightarrow B(2\Lambda_n)$, so e_i and f_i act by e_i^2 and f_i^2 respectively for all $i \neq 0$. We do this so our columns are full width (as opposed to half width and/or uses a $\pm$ representation).

classical_weight()

Return the classical weight of `self`.

EXAMPLES:

```
sage: KRT = crystals.KirillovReshetikhin(['D', 4, 1], 4, 1, model='KR')
sage: KRT.module_generators[0].classical_weight()
(1/2, 1/2, 1/2, 1/2)
```

```
>>> from sage.all import *
>>> KRT = crystals.KirillovReshetikhin(['D', Integer(4), Integer(1)],␣
↪Integer(4), Integer(1), model='KR')
>>> KRT.module_generators[Integer(0)].classical_weight()
(1/2, 1/2, 1/2, 1/2)
```

e(*i*)

Calculate the action of e_i on `self`.

EXAMPLES:

```
sage: KRT = crystals.KirillovReshetikhin(['D',4,1], 4, 1, model='KR')
sage: KRT(-1, -4, 3, 2).e(1)
[[1], [3], [-4], [-2]]
sage: KRT(-1, -4, 3, 2).e(3)
```

```
>>> from sage.all import *
>>> KRT = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)],␣
↪Integer(4), Integer(1), model='KR')
>>> KRT(-Integer(1), -Integer(4), Integer(3), Integer(2)).e(Integer(1))
[[1], [3], [-4], [-2]]
>>> KRT(-Integer(1), -Integer(4), Integer(3), Integer(2)).e(Integer(3))
```

epsilon(*i*)

Compute ε_i of `self`.

EXAMPLES:

```
sage: KRT = crystals.KirillovReshetikhin(['D',4,1], 4, 1, model='KR')
sage: KRT(-1, -4, 3, 2).epsilon(1)
1
sage: KRT(-1, -4, 3, 2).epsilon(3)
0
```

```
>>> from sage.all import *
>>> KRT = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)],␣
↪Integer(4), Integer(1), model='KR')
>>> KRT(-Integer(1), -Integer(4), Integer(3), Integer(2)).epsilon(Integer(1))
1
>>> KRT(-Integer(1), -Integer(4), Integer(3), Integer(2)).epsilon(Integer(3))
0
```

f(*i*)

Calculate the action of f_i on `self`.

EXAMPLES:

```
sage: KRT = crystals.KirillovReshetikhin(['D',4,1], 4, 1, model='KR')
sage: KRT(-1, -4, 3, 2).f(1)
```

(continues on next page)

(continued from previous page)

```
sage: KRT(-1, -4, 3, 2).f(3)
[[2], [4], [-3], [-1]]
```

```
>>> from sage.all import *
>>> KRT = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)],␣
↪Integer(4), Integer(1), model='KR')
>>> KRT(-Integer(1), -Integer(4), Integer(3), Integer(2)).f(Integer(1))
>>> KRT(-Integer(1), -Integer(4), Integer(3), Integer(2)).f(Integer(3))
[[2], [4], [-3], [-1]]
```

left_split()

Return the image of `self` under the left column splitting map.

EXAMPLES:

```
sage: KRT = crystals.KirillovReshetikhin(['D', 4, 1], 4, 3, model='KR')
sage: elt = KRT(-3,-4,2,1,-3,-4,2,1,-2,-4,3,1); elt.pp()
  1  1  1
  2  2  3
 -4 -4 -4
 -3 -3 -2
sage: elt.left_split().pp()
  1 (X)   1  1
  2       2  3
 -4      -4 -4
 -3      -3 -2
```

```
>>> from sage.all import *
>>> KRT = crystals.KirillovReshetikhin(['D', Integer(4), Integer(1)],␣
↪Integer(4), Integer(3), model='KR')
>>> elt = KRT(-Integer(3),-Integer(4),Integer(2),Integer(1),-Integer(3),-
↪Integer(4),Integer(2),Integer(1),-Integer(2),-Integer(4),Integer(3),
↪Integer(1)); elt.pp()
  1  1  1
  2  2  3
 -4 -4 -4
 -3 -3 -2
>>> elt.left_split().pp()
  1 (X)   1  1
  2       2  3
 -4      -4 -4
 -3      -3 -2
```

phi(i)

Compute φ_i of `self`.

EXAMPLES:

```
sage: KRT = crystals.KirillovReshetikhin(['D',4,1], 4, 1, model='KR')
sage: KRT(-1, -4, 3, 2).phi(1)
0
sage: KRT(-1, -4, 3, 2).phi(3)
1
```

```
>>> from sage.all import *
>>> KRT = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)],␣
↪Integer(4), Integer(1), model='KR')
>>> KRT(-Integer(1), -Integer(4), Integer(3), Integer(2)).phi(Integer(1))
0
>>> KRT(-Integer(1), -Integer(4), Integer(3), Integer(2)).phi(Integer(3))
1
```

to_array(*rows=True*)

Return a 2-dimensional array representation of this Kirillov-Reshetikhin element.

If the output is in rows, then it outputs the top row first (in the English convention) from left to right.

For example: if the reading word is $[2, 1, 4, 3]$, so as a 2×2 tableau:

```
1 3
2 4
```

we output `[[1, 3], [2, 4]]`.

If the output is in columns, then it outputs the leftmost column first with the bottom element first. In other words this parses the reading word into its columns.

Continuing with the previous example, the output would be `[[2, 1], [4, 3]]`.

INPUT:

- `rows` – boolean (default: `True`); set to `True` if the resulting array is by row, otherwise it is by column

EXAMPLES:

```
sage: KRT = crystals.KirillovReshetikhin(['D', 4, 1], 4, 3, model='KR')
sage: elt = KRT(-3,-4,2,1,-3,-4,2,1,-2,-4,3,1)
sage: elt.to_array()
[[1, 1, 1], [2, 2, 3], [-4, -4, -4], [-3, -3, -2]]
sage: elt.to_array(False)
[[-3, -4, 2, 1], [-3, -4, 2, 1], [-2, -4, 3, 1]]
```

```
>>> from sage.all import *
>>> KRT = crystals.KirillovReshetikhin(['D', Integer(4), Integer(1)],␣
↪Integer(4), Integer(3), model='KR')
>>> elt = KRT(-Integer(3),-Integer(4),Integer(2),Integer(1),-Integer(3),-
↪Integer(4),Integer(2),Integer(1),-Integer(2),-Integer(4),Integer(3),
↪Integer(1))
>>> elt.to_array()
[[1, 1, 1], [2, 2, 3], [-4, -4, -4], [-3, -3, -2]]
>>> elt.to_array(False)
[[-3, -4, 2, 1], [-3, -4, 2, 1], [-2, -4, 3, 1]]
```

class sage.combinat.rigged_configurations.kr_tableaux.**KRTableauxTypeBox**(*cartan_type*, *r*, *s*)

Bases: *KRTableauxTypeVertical*

Kirillov-Reshetikhin tableaux $B^{r,s}$ of type:

- $A_{2n}^{(2)}$ for all $r \leq n$,
- $D_{n+1}^{(2)}$ for all $r < n$,

- $D_4^{(3)}$ for $r = 1$.

class sage.combinat.rigged_configurations.kr_tableaux.**KRTableauxTypeFromRC**(*cartan_type*, *r*, *s*)

Bases: *KirillovReshetikhinTableaux*

Kirillov-Reshetikhin tableaux $B^{r,s}$ constructed from rigged configurations under the bijection Φ.

Warning

The Kashiwara-Nakashima version is not implemented due to the non-trivial multiplicities of classical components, so classical_decomposition() does not work.

Element

alias of *KRTableauxTypeFromRCElement*

module_generators()

The module generators of self.

EXAMPLES:

```
sage: KRT = crystals.KirillovReshetikhin(['D',4,3], 2, 1, model='KR')
sage: KRT.module_generators
([[1], [2]], [[1], [0]], [[1], [E]], [[E], [E]])
```

```
>>> from sage.all import *
>>> KRT = crystals.KirillovReshetikhin(['D',Integer(4),Integer(3)],␣
↪Integer(2), Integer(1), model='KR')
>>> KRT.module_generators
([[1], [2]], [[1], [0]], [[1], [E]], [[E], [E]])
```

class sage.combinat.rigged_configurations.kr_tableaux.**KRTableauxTypeFromRCElement**(*parent*, *list*, ***options*)

Bases: *KirillovReshetikhinTableauxElement*

A Kirillov-Reshetikhin tableau constructed from rigged configurations under the bijection Φ.

e(*i*)

Perform the action of e_i on self.

Todo

Implement a direct action of e_0 without moving to rigged configurations.

EXAMPLES:

```
sage: KRT = crystals.KirillovReshetikhin(['D',4,3], 2, 1, model='KR')
sage: KRT.module_generators[0].e(0)
[[2], [E]]
```

```
>>> from sage.all import *
>>> KRT = crystals.KirillovReshetikhin(['D',Integer(4),Integer(3)],
↪Integer(2), Integer(1), model='KR')
>>> KRT.module_generators[Integer(0)].e(Integer(0))
[[2], [E]]
```

epsilon(*i*)

Compute ε_i of `self`.

Todo

Implement a direct action of ϵ_0 without moving to KR crystals.

EXAMPLES:

```
sage: KRT = crystals.KirillovReshetikhin(['D',4,3], 2, 2, model='KR')
sage: KRT.module_generators[0].epsilon(0)
6
```

```
>>> from sage.all import *
>>> KRT = crystals.KirillovReshetikhin(['D',Integer(4),Integer(3)],
↪Integer(2), Integer(2), model='KR')
>>> KRT.module_generators[Integer(0)].epsilon(Integer(0))
6
```

f(*i*)

Perform the action of f_i on `self`.

Todo

Implement a direct action of f_0 without moving to rigged configurations.

EXAMPLES:

```
sage: KRT = crystals.KirillovReshetikhin(['D',4,3], 2, 1, model='KR')
sage: KRT.module_generators[0].f(0)
sage: KRT.module_generators[3].f(0)
[[1], [0]]
```

```
>>> from sage.all import *
>>> KRT = crystals.KirillovReshetikhin(['D',Integer(4),Integer(3)],
↪Integer(2), Integer(1), model='KR')
>>> KRT.module_generators[Integer(0)].f(Integer(0))
>>> KRT.module_generators[Integer(3)].f(Integer(0))
[[1], [0]]
```

phi(*i*)

Compute φ_i of `self`.

Todo

Compute ϕ_0 without moving to KR crystals.

EXAMPLES:

```
sage: KRT = crystals.KirillovReshetikhin(['D',4,3], 2, 2, model='KR')
sage: KRT.module_generators[0].phi(0)
0
```

```
>>> from sage.all import *
>>> KRT = crystals.KirillovReshetikhin(['D',Integer(4),Integer(3)],␣
↪Integer(2), Integer(2), model='KR')
>>> KRT.module_generators[Integer(0)].phi(Integer(0))
0
```

class sage.combinat.rigged_configurations.kr_tableaux.**KRTableauxTypeHorizonal**(*cartan_type*, *r*, *s*)

Bases: *KirillovReshetikhinTableaux*

Kirillov-Reshetikhin tableaux $B^{r,s}$ of type:

- $C_n^{(1)}$ for $1 \leq r < n$,
- $A_{2n}^{(2)\dagger}$ for $1 \leq r \leq n$.

from_kirillov_reshetikhin_crystal(*krc*)

Construct an element of `self` from the Kirillov-Reshetikhin crystal element `krc`.

EXAMPLES:

```
sage: KRT = crystals.KirillovReshetikhin(['C',4,1], 2, 3, model='KR')
sage: C = crystals.KirillovReshetikhin(['C',4,1], 2, 3, model='KN')
sage: krc = C(4,3); krc
[[3], [4]]
sage: KRT.from_kirillov_reshetikhin_crystal(krc)
[[3, -2, 1], [4, -1, 2]]
```

```
>>> from sage.all import *
>>> KRT = crystals.KirillovReshetikhin(['C',Integer(4),Integer(1)],␣
↪Integer(2), Integer(3), model='KR')
>>> C = crystals.KirillovReshetikhin(['C',Integer(4),Integer(1)], Integer(2),␣
↪Integer(3), model='KN')
>>> krc = C(Integer(4),Integer(3)); krc
[[3], [4]]
>>> KRT.from_kirillov_reshetikhin_crystal(krc)
[[3, -2, 1], [4, -1, 2]]
```

class sage.combinat.rigged_configurations.kr_tableaux.**KRTableauxTypeVertical**(*cartan_type*, *r*, *s*)

Bases: *KirillovReshetikhinTableaux*

Kirillov-Reshetkihn tableaux $B^{r,s}$ of type:

- $D_n^{(1)}$ for all $1 \leq r < n-1$,

- $B_n^{(1)}$ for all $1 \leq r < n$,
- $A_{2n-1}^{(2)}$ for all $1 \leq r \leq n$.

from_kirillov_reshetikhin_crystal(*krc*)

Construct an element of `self` from the Kirillov-Reshetikhin crystal element `krc`.

EXAMPLES:

```
sage: KRT = crystals.KirillovReshetikhin(['D',4,1], 2, 3, model='KR')
sage: C = crystals.KirillovReshetikhin(['D',4,1], 2, 3, model='KN')
sage: krc = C(4,3); krc
[[3], [4]]
sage: KRT.from_kirillov_reshetikhin_crystal(krc)
[[3, -2, 1], [4, -1, 2]]
```

```
>>> from sage.all import *
>>> KRT = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)],␣
↪Integer(2), Integer(3), model='KR')
>>> C = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)], Integer(2),␣
↪Integer(3), model='KN')
>>> krc = C(Integer(4),Integer(3)); krc
[[3], [4]]
>>> KRT.from_kirillov_reshetikhin_crystal(krc)
[[3, -2, 1], [4, -1, 2]]
```

class sage.combinat.rigged_configurations.kr_tableaux.**KirillovReshetikhinTableaux**(*cartan_type*, *r*, *s*)

Bases: `CrystalOfWords`

Kirillov-Reshetikhin tableaux.

Kirillov-Reshetikhin tableaux are rectangular tableaux with r rows and s columns that naturally arise under the bijection between rigged configurations and tableaux [RigConBijection]. They are in bijection with the elements of the Kirillov-Reshetikhin crystal $B^{r,s}$ under the (inverse) filling map.

Whenever $B^{r,s} \cong B(s\Lambda_r)$ as a classical crystal (which is the case for $B^{r,s}$ in type $A_n^{(1)}$, $B^{n,s}$ in type $C_n^{(1)}$ and $D_{n+1}^{(2)}$, $B^{n,s}$ and $B^{n-1,s}$ in type $D_n^{(1)}$) then the filling map is trivial.

For $B^{r,s}$ in:

- type $D_n^{(1)}$ when $r \leq n-2$,
- type $B_n^{(1)}$ when $r < n$,
- type $A_{2n-1}^{(2)}$ for all r,

the filling map is defined in [OSS2011].

For the spinor cases in type $D_n^{(1)}$, the crystal $B^{k,s}$ where $k = n-1, n$, is isomorphic as a classical crystal to $B(s\Lambda_k)$, and here we consider the Kirillov-Reshetikhin tableaux as living in $B(2s\Lambda_k)$ under the natural doubling map. In this case, the crystal operators e_i and f_i act as e_i^2 and f_i^2 respectively. See [BijectionDn].

For the spinor case in type $B_n^{(1)}$, the crystal $B^{n,s}$, we consider the images under the natural doubling map into $B^{n,2s}$. The classical components of this crystal are now given by removing 2×2 boxes. The filling map is the same as below (see the non-spin type $C_n^{(1)}$).

For $B^{r,s}$ in:

- type $C_n^{(1)}$ when $r < n$,
- type $A_{2n}^{(2)\dagger}$ for all r,

the filling map is given as follows. Suppose we are considering the (classically) highest weight element in the classical component $B(\lambda)$. Then we fill it in with the horizontal dominoes $[\bar{\imath}, i]$ in the i-th row from the top (in English notation) and reordering the columns so that they are increasing. Recall from above that $B^{n,s} \cong B(s\Lambda_n)$ in type $C_n^{(1)}$.

For $B^{r,s}$ in:

- type $A_{2n}^{(2)}$ for all r,
- type $D_{n+1}^{(2)}$ when $r < n$,
- type $D_4^{(3)}$ when $r = 1$,

the filling map is the same as given in [OSS2011] except for the rightmost column which is given by the column $[1, 2, \ldots, k, \emptyset, \ldots \emptyset]$ where $k = (r + x - 1)/2$ in Step 3 of [OSS2011].

For the spinor case in type $D_{n+1}^{(2)}$, the crystal $B^{n,s}$, we define the filling map in the same way as in type $D_n^{(1)}$.

Note: The filling map and classical decompositions in non-spinor cases can be classified by how the special node 0 connects with the corresponding classical diagram.

The classical crystal structure is given by the usual Kashiwara-Nakashima tableaux rules. That is to embed this into $B(\Lambda_1)^{\otimes ns}$ by using the reading word and then applying the classical crystal operator. The affine crystal structure is given by converting to the corresponding KR crystal element, performing the affine crystal operator, and pulling back to a KR tableau.

For more information about the bijection between rigged configurations and tensor products of Kirillov-Reshetikhin tableaux, see `TensorProductOfKirillovReshetikhinTableaux`.

Note: The tableaux for all non-simply-laced types are provably correct if the bijection with `rigged configurations` holds. Therefore this is currently only proven for $B^{r,1}$ or $B^{1,s}$ and in general for types $A_n^{(1)}$ and $D_n^{(1)}$.

INPUT:

- `cartan_type` – the Cartan type
- `r` – the Dynkin diagram index (typically the number of rows)
- `s` – the number of columns

EXAMPLES:

```
sage: KRT = crystals.KirillovReshetikhin(['A', 4, 1], 2, 1, model='KR')
sage: elt = KRT(4, 3); elt
[[3], [4]]

sage: KRT = crystals.KirillovReshetikhin(['D', 4, 1], 2, 1, model='KR')
sage: elt = KRT(-1, 1); elt
[[1], [-1]]
```

```
>>> from sage.all import *
>>> KRT = crystals.KirillovReshetikhin(['A', Integer(4), Integer(1)], Integer(2),␣
→Integer(1), model='KR')
>>> elt = KRT(Integer(4), Integer(3)); elt
[[3], [4]]

>>> KRT = crystals.KirillovReshetikhin(['D', Integer(4), Integer(1)], Integer(2),␣
→Integer(1), model='KR')
>>> elt = KRT(-Integer(1), Integer(1)); elt
[[1], [-1]]
```

We can create highest weight crystals from a given shape or weight:

```
sage: KRT = crystals.KirillovReshetikhin(['D', 4, 1], 2, 2, model='KR')
sage: KRT.module_generator(shape=[1,1])
[[1, 1], [2, -1]]
sage: KRT.module_generator(column_shape=[2])
[[1, 1], [2, -1]]
sage: WS = RootSystem(['D',4,1]).weight_space()
sage: KRT.module_generator(weight=WS.sum_of_terms([[0,-2],[2,1]]))
[[1, 1], [2, -1]]
sage: WSC = RootSystem(['D',4]).weight_space()
sage: KRT.module_generator(classical_weight=WSC.fundamental_weight(2))
[[1, 1], [2, -1]]
```

```
>>> from sage.all import *
>>> KRT = crystals.KirillovReshetikhin(['D', Integer(4), Integer(1)], Integer(2),␣
→Integer(2), model='KR')
>>> KRT.module_generator(shape=[Integer(1),Integer(1)])
[[1, 1], [2, -1]]
>>> KRT.module_generator(column_shape=[Integer(2)])
[[1, 1], [2, -1]]
>>> WS = RootSystem(['D',Integer(4),Integer(1)]).weight_space()
>>> KRT.module_generator(weight=WS.sum_of_terms([[Integer(0),-Integer(2)],
→[Integer(2),Integer(1)]]))
[[1, 1], [2, -1]]
>>> WSC = RootSystem(['D',Integer(4)]).weight_space()
>>> KRT.module_generator(classical_weight=WSC.fundamental_weight(Integer(2)))
[[1, 1], [2, -1]]
```

We can go between *KashiwaraNakashimaTableaux()* and *KirillovReshetikhinTableaux* elements:

```
sage: KRCrys = crystals.KirillovReshetikhin(['D', 4, 1], 2, 2, model='KN')
sage: KRTab = crystals.KirillovReshetikhin(['D', 4, 1], 2, 2, model='KR')
sage: elt = KRCrys(3, 2); elt
[[2], [3]]
sage: k = KRTab(elt); k
[[2, 1], [3, -1]]
sage: KRCrys(k)
[[2], [3]]
```

```
>>> from sage.all import *
>>> KRCrys = crystals.KirillovReshetikhin(['D', Integer(4), Integer(1)],␣
```

(continues on next page)

(continued from previous page)

```
↪Integer(2), Integer(2), model='KN')
>>> KRTab = crystals.KirillovReshetikhin(['D', Integer(4), Integer(1)],␣
↪Integer(2), Integer(2), model='KR')
>>> elt = KRCrys(Integer(3), Integer(2)); elt
[[2], [3]]
>>> k = KRTab(elt); k
[[2, 1], [3, -1]]
>>> KRCrys(k)
[[2], [3]]
```

We check that the classical weights in the classical decompositions agree in a few different type:

```
sage: KRCrys = crystals.KirillovReshetikhin(['D', 4, 1], 2, 2, model='KN')
sage: KRTab = crystals.KirillovReshetikhin(['D', 4, 1], 2, 2, model='KR')
sage: all(t.classical_weight() == KRCrys(t).classical_weight() for t in KRTab)
True
sage: KRCrys = crystals.KirillovReshetikhin(['B', 3, 1], 2, 2, model='KN')
sage: KRTab = crystals.KirillovReshetikhin(['B', 3, 1], 2, 2, model='KR')
sage: all(t.classical_weight() == KRCrys(t).classical_weight() for t in KRTab)
True
sage: KRCrys = crystals.KirillovReshetikhin(['C', 3, 1], 2, 2, model='KN')
sage: KRTab = crystals.KirillovReshetikhin(['C', 3, 1], 2, 2, model='KR')
sage: all(t.classical_weight() == KRCrys(t).classical_weight() for t in KRTab)
True
sage: KRCrys = crystals.KirillovReshetikhin(['D', 4, 2], 2, 2, model='KN')
sage: KRTab = crystals.KirillovReshetikhin(['D', 4, 2], 2, 2, model='KR')
sage: all(t.classical_weight() == KRCrys(t).classical_weight() for t in KRTab)
True
sage: KRCrys = crystals.KirillovReshetikhin(['A', 4, 2], 2, 2, model='KN')
sage: KRTab = crystals.KirillovReshetikhin(['A', 4, 2], 2, 2, model='KR')
sage: all(t.classical_weight() == KRCrys(t).classical_weight() for t in KRTab)
True
```

```
>>> from sage.all import *
>>> KRCrys = crystals.KirillovReshetikhin(['D', Integer(4), Integer(1)],␣
↪Integer(2), Integer(2), model='KN')
>>> KRTab = crystals.KirillovReshetikhin(['D', Integer(4), Integer(1)],␣
↪Integer(2), Integer(2), model='KR')
>>> all(t.classical_weight() == KRCrys(t).classical_weight() for t in KRTab)
True
>>> KRCrys = crystals.KirillovReshetikhin(['B', Integer(3), Integer(1)],␣
↪Integer(2), Integer(2), model='KN')
>>> KRTab = crystals.KirillovReshetikhin(['B', Integer(3), Integer(1)],␣
↪Integer(2), Integer(2), model='KR')
>>> all(t.classical_weight() == KRCrys(t).classical_weight() for t in KRTab)
True
>>> KRCrys = crystals.KirillovReshetikhin(['C', Integer(3), Integer(1)],␣
↪Integer(2), Integer(2), model='KN')
>>> KRTab = crystals.KirillovReshetikhin(['C', Integer(3), Integer(1)],␣
↪Integer(2), Integer(2), model='KR')
>>> all(t.classical_weight() == KRCrys(t).classical_weight() for t in KRTab)
True
```

(continues on next page)

(continued from previous page)

```
>>> KRCrys = crystals.KirillovReshetikhin(['D', Integer(4), Integer(2)],␣
↪Integer(2), Integer(2), model='KN')
>>> KRTab = crystals.KirillovReshetikhin(['D', Integer(4), Integer(2)],␣
↪Integer(2), Integer(2), model='KR')
>>> all(t.classical_weight() == KRCrys(t).classical_weight() for t in KRTab)
True
>>> KRCrys = crystals.KirillovReshetikhin(['A', Integer(4), Integer(2)],␣
↪Integer(2), Integer(2), model='KN')
>>> KRTab = crystals.KirillovReshetikhin(['A', Integer(4), Integer(2)],␣
↪Integer(2), Integer(2), model='KR')
>>> all(t.classical_weight() == KRCrys(t).classical_weight() for t in KRTab)
True
```

Element

alias of *KirillovReshetikhinTableauxElement*

classical_decomposition()

Return the classical crystal decomposition of `self`.

EXAMPLES:

```
sage: crystals.KirillovReshetikhin(['D', 4, 1], 2, 2, model='KR').classical_
↪decomposition()
The crystal of tableaux of type ['D', 4] and shape(s) [[], [1, 1], [2, 2]]
```

```
>>> from sage.all import *
>>> crystals.KirillovReshetikhin(['D', Integer(4), Integer(1)], Integer(2),␣
↪Integer(2), model='KR').classical_decomposition()
The crystal of tableaux of type ['D', 4] and shape(s) [[], [1, 1], [2, 2]]
```

from_kirillov_reshetikhin_crystal(*krc*)

Construct an element of `self` from the Kirillov-Reshetikhin crystal element `krc`.

EXAMPLES:

```
sage: KRT = crystals.KirillovReshetikhin(['A', 4, 1], 2, 1, model='KR')
sage: C = crystals.KirillovReshetikhin(['A',4,1], 2, 1, model='KN')
sage: krc = C(4,3); krc
[[3], [4]]
sage: KRT.from_kirillov_reshetikhin_crystal(krc)
[[3], [4]]
```

```
>>> from sage.all import *
>>> KRT = crystals.KirillovReshetikhin(['A', Integer(4), Integer(1)],␣
↪Integer(2), Integer(1), model='KR')
>>> C = crystals.KirillovReshetikhin(['A',Integer(4),Integer(1)], Integer(2),␣
↪Integer(1), model='KN')
>>> krc = C(Integer(4),Integer(3)); krc
[[3], [4]]
>>> KRT.from_kirillov_reshetikhin_crystal(krc)
[[3], [4]]
```

kirillov_reshetikhin_crystal()

Return the corresponding KR crystal in the `Kashiwara-Nakashima model`.

EXAMPLES:

```
sage: crystals.KirillovReshetikhin(['A', 4, 1], 2, 1, model='KR').kirillov_
↪reshetikhin_crystal()
Kirillov-Reshetikhin crystal of type ['A', 4, 1] with (r,s)=(2,1)
```

```
>>> from sage.all import *
>>> crystals.KirillovReshetikhin(['A', Integer(4), Integer(1)], Integer(2),␣
↪Integer(1), model='KR').kirillov_reshetikhin_crystal()
Kirillov-Reshetikhin crystal of type ['A', 4, 1] with (r,s)=(2,1)
```

module_generator(*i=None*, ***options*)

Return the specified module generator.

INPUT:

- `i` – the index of the module generator

We can also get a module generator by using one of the following optional arguments:

- `shape` – the associated shape
- `column_shape` – the shape given as columns (a column of length k correspond to a classical weight ω_k)
- `weight` – the weight
- `classical_weight` – the classical weight

If no arguments are specified, then return the unique module generator of classical weight $s\Lambda_r$.

EXAMPLES:

```
sage: KRT = crystals.KirillovReshetikhin(['D', 4, 1], 2, 2, model='KR')
sage: KRT.module_generator(1)
[[1, 1], [2, -1]]
sage: KRT.module_generator(shape=[1,1])
[[1, 1], [2, -1]]
sage: KRT.module_generator(column_shape=[2])
[[1, 1], [2, -1]]
sage: WS = RootSystem(['D',4,1]).weight_space()
sage: KRT.module_generator(weight=WS.sum_of_terms([[0,-2],[2,1]]))
[[1, 1], [2, -1]]
sage: WSC = RootSystem(['D',4]).weight_space()
sage: KRT.module_generator(classical_weight=WSC.fundamental_weight(2))
[[1, 1], [2, -1]]
sage: KRT.module_generator()
[[1, 1], [2, 2]]

sage: KRT = crystals.KirillovReshetikhin(['A', 3, 1], 2, 2, model='KR')
sage: KRT.module_generator()
[[1, 1], [2, 2]]
```

```
>>> from sage.all import *
>>> KRT = crystals.KirillovReshetikhin(['D', Integer(4), Integer(1)],␣
↪Integer(2), Integer(2), model='KR')
```

(continues on next page)

(continued from previous page)

```
>>> KRT.module_generator(Integer(1))
[[1, 1], [2, -1]]
>>> KRT.module_generator(shape=[Integer(1),Integer(1)])
[[1, 1], [2, -1]]
>>> KRT.module_generator(column_shape=[Integer(2)])
[[1, 1], [2, -1]]
>>> WS = RootSystem(['D',Integer(4),Integer(1)]).weight_space()
>>> KRT.module_generator(weight=WS.sum_of_terms([[Integer(0),-Integer(2)],
↪[Integer(2),Integer(1)]]))
[[1, 1], [2, -1]]
>>> WSC = RootSystem(['D',Integer(4)]).weight_space()
>>> KRT.module_generator(classical_weight=WSC.fundamental_weight(Integer(2)))
[[1, 1], [2, -1]]
>>> KRT.module_generator()
[[1, 1], [2, 2]]

>>> KRT = crystals.KirillovReshetikhin(['A', Integer(3), Integer(1)],␣
↪Integer(2), Integer(2), model='KR')
>>> KRT.module_generator()
[[1, 1], [2, 2]]
```

r()

Return the value r for this tableaux class which corresponds to the number of rows.

EXAMPLES:

```
sage: KRT = crystals.KirillovReshetikhin(['A', 4, 1], 2, 1, model='KR')
sage: KRT.r()
2
```

```
>>> from sage.all import *
>>> KRT = crystals.KirillovReshetikhin(['A', Integer(4), Integer(1)],␣
↪Integer(2), Integer(1), model='KR')
>>> KRT.r()
2
```

s()

Return the value s for this tableaux class which corresponds to the number of columns.

EXAMPLES:

```
sage: KRT = crystals.KirillovReshetikhin(['A', 4, 1], 2, 1, model='KR')
sage: KRT.s()
1
```

```
>>> from sage.all import *
>>> KRT = crystals.KirillovReshetikhin(['A', Integer(4), Integer(1)],␣
↪Integer(2), Integer(1), model='KR')
>>> KRT.s()
1
```

tensor(**crystals*, ***options*)

Return the tensor product of `self` with `crystals`.

If `crystals` is a list of (a tensor product of) KR tableaux, this returns a *TensorProductOfKirillovReshetikhinTableaux*.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['A', 3, 1], 2, 2, model='KR')
sage: TP = crystals.TensorProductOfKirillovReshetikhinTableaux(['A', 3, 1],
→[[1,3],[3,1]])
sage: K.tensor(TP, K)
Tensor product of Kirillov-Reshetikhin tableaux of type ['A', 3, 1]
 and factor(s) ((2, 2), (1, 3), (3, 1), (2, 2))

sage: C = crystals.KirillovReshetikhin(['A',3,1], 3, 1, model='KN')
sage: K.tensor(K, C)
Full tensor product of the crystals
 [Kirillov-Reshetikhin tableaux of type ['A', 3, 1] and shape (2, 2),
  Kirillov-Reshetikhin tableaux of type ['A', 3, 1] and shape (2, 2),
  Kirillov-Reshetikhin crystal of type ['A', 3, 1] with (r,s)=(3,1)]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A', Integer(3), Integer(1)],
→Integer(2), Integer(2), model='KR')
>>> TP = crystals.TensorProductOfKirillovReshetikhinTableaux(['A', Integer(3),
→ Integer(1)], [[Integer(1),Integer(3)],[Integer(3),Integer(1)]])
>>> K.tensor(TP, K)
Tensor product of Kirillov-Reshetikhin tableaux of type ['A', 3, 1]
 and factor(s) ((2, 2), (1, 3), (3, 1), (2, 2))

>>> C = crystals.KirillovReshetikhin(['A',Integer(3),Integer(1)], Integer(3),
→Integer(1), model='KN')
>>> K.tensor(K, C)
Full tensor product of the crystals
 [Kirillov-Reshetikhin tableaux of type ['A', 3, 1] and shape (2, 2),
  Kirillov-Reshetikhin tableaux of type ['A', 3, 1] and shape (2, 2),
  Kirillov-Reshetikhin crystal of type ['A', 3, 1] with (r,s)=(3,1)]
```

class `sage.combinat.rigged_configurations.kr_tableaux.`**`KirillovReshetikhinTableauxElement`**(*parent*, *list*, ***options*)

Bases: *TensorProductOfRegularCrystalsElement*

A Kirillov-Reshetikhin tableau.

For more information, see *KirillovReshetikhinTableaux* and *TensorProductOfKirillovReshetikhinTableaux*.

`classical_weight()`

Return the classical weight of `self`.

EXAMPLES:

```
sage: KRT = crystals.KirillovReshetikhin(['D',4,1], 2, 2, model='KR')
sage: elt = KRT(3,2,-1,1); elt
```

(continues on next page)

(continued from previous page)

```
[[2, 1], [3, -1]]
sage: elt.classical_weight()
(0, 1, 1, 0)
```

```
>>> from sage.all import *
>>> KRT = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)],
↪Integer(2), Integer(2), model='KR')
>>> elt = KRT(Integer(3),Integer(2),-Integer(1),Integer(1)); elt
[[2, 1], [3, -1]]
>>> elt.classical_weight()
(0, 1, 1, 0)
```

e(i)

Perform the action of e_i on `self`.

Todo

Implement a direct action of e_0 without moving to KR crystals.

EXAMPLES:

```
sage: KRT = crystals.KirillovReshetikhin(['D',4,1], 2, 2, model='KR')
sage: KRT.module_generators[0].e(0)
[[-2, 1], [-1, -1]]
```

```
>>> from sage.all import *
>>> KRT = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)],
↪Integer(2), Integer(2), model='KR')
>>> KRT.module_generators[Integer(0)].e(Integer(0))
[[-2, 1], [-1, -1]]
```

epsilon(i)

Compute ε_i of `self`.

Todo

Implement a direct action of ε_0 without moving to KR crystals.

EXAMPLES:

```
sage: KRT = crystals.KirillovReshetikhin(['D',4,1], 2, 2, model='KR')
sage: KRT.module_generators[0].epsilon(0)
2
```

```
>>> from sage.all import *
>>> KRT = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)],
↪Integer(2), Integer(2), model='KR')
>>> KRT.module_generators[Integer(0)].epsilon(Integer(0))
2
```

f(*i*)

Perform the action of f_i on `self`.

Todo

Implement a direct action of f_0 without moving to KR crystals.

EXAMPLES:

```
sage: KRT = crystals.KirillovReshetikhin(['D',4,1], 2, 2, model='KR')
sage: KRT.module_generators[0].f(0)
[[1, 1], [2, -1]]
```

```
>>> from sage.all import *
>>> KRT = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)],␣
↪Integer(2), Integer(2), model='KR')
>>> KRT.module_generators[Integer(0)].f(Integer(0))
[[1, 1], [2, -1]]
```

left_split()

Return the image of `self` under the left column splitting map.

EXAMPLES:

```
sage: KRT = crystals.KirillovReshetikhin(['D',4,1], 2, 3, model='KR')
sage: mg = KRT.module_generators[1]; mg.pp()
  1 -2  1
  2 -1  2
sage: ls = mg.left_split(); ls.pp()
  1 (X)  -2  1
  2      -1  2
sage: ls.parent()
Tensor product of Kirillov-Reshetikhin tableaux of type ['D', 4, 1] and␣
↪factor(s) ((2, 1), (2, 2))
```

```
>>> from sage.all import *
>>> KRT = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)],␣
↪Integer(2), Integer(3), model='KR')
>>> mg = KRT.module_generators[Integer(1)]; mg.pp()
  1 -2  1
  2 -1  2
>>> ls = mg.left_split(); ls.pp()
  1 (X)  -2  1
  2      -1  2
>>> ls.parent()
Tensor product of Kirillov-Reshetikhin tableaux of type ['D', 4, 1] and␣
↪factor(s) ((2, 1), (2, 2))
```

phi(*i*)

Compute φ_i of `self`.

Todo

Compute φ_0 without moving to KR crystals.

EXAMPLES:

```
sage: KRT = crystals.KirillovReshetikhin(['D',4,1], 2, 2, model='KR')
sage: KRT.module_generators[0].phi(0)
2
```

```
>>> from sage.all import *
>>> KRT = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)],␣
↪Integer(2), Integer(2), model='KR')
>>> KRT.module_generators[Integer(0)].phi(Integer(0))
2
```

pp()

Pretty print self.

EXAMPLES:

```
sage: KRT = crystals.KirillovReshetikhin(['A', 4, 1], 2, 2, model='KR')
sage: elt = KRT(2, 1, 4, 3); elt
[[1, 3], [2, 4]]
sage: elt.pp()
1  3
2  4
```

```
>>> from sage.all import *
>>> KRT = crystals.KirillovReshetikhin(['A', Integer(4), Integer(1)],␣
↪Integer(2), Integer(2), model='KR')
>>> elt = KRT(Integer(2), Integer(1), Integer(4), Integer(3)); elt
[[1, 3], [2, 4]]
>>> elt.pp()
1  3
2  4
```

right_split()

Return the image of self under the right column splitting map.

Let $*$ denote the Lusztig involution, and ls as the *left splitting map*. The right splitting map is defined as $\mathrm{rs} := * \circ \mathrm{ls} \circ *$.

EXAMPLES:

```
sage: KRT = crystals.KirillovReshetikhin(['D',4,1], 2, 3, model='KR')
sage: mg = KRT.module_generators[1]; mg.pp()
  1 -2  1
  2 -1  2
sage: ls = mg.right_split(); ls.pp()
 -2  1 (X)    1
 -1  2        2
sage: ls.parent()
```

(continues on next page)

(continued from previous page)

```
Tensor product of Kirillov-Reshetikhin tableaux of type ['D', 4, 1] and␣
↪factor(s) ((2, 2), (2, 1))
```

```
>>> from sage.all import *
>>> KRT = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)],␣
↪Integer(2), Integer(3), model='KR')
>>> mg = KRT.module_generators[Integer(1)]; mg.pp()
  1 -2  1
  2 -1  2
>>> ls = mg.right_split(); ls.pp()
 -2  1 (X)   1
 -1  2       2
>>> ls.parent()
Tensor product of Kirillov-Reshetikhin tableaux of type ['D', 4, 1] and␣
↪factor(s) ((2, 2), (2, 1))
```

to_array(*rows=True*)

Return a 2-dimensional array representation of this Kirillov-Reshetikhin element.

If the output is in rows, then it outputs the top row first (in the English convention) from left to right.

For example: if the reading word is $[2, 1, 4, 3]$, so as a 2×2 tableau:

```
1 3
2 4
```

we output `[[1, 3], [2, 4]]`.

If the output is in columns, then it outputs the leftmost column first with the bottom element first. In other words this parses the reading word into its columns.

Continuing with the previous example, the output would be `[[2, 1], [4, 3]]`.

INPUT:

- `rows` – boolean (default: `True`); set to `True` if the resulting array is by row, otherwise it is by column

EXAMPLES:

```
sage: KRT = crystals.KirillovReshetikhin(['A', 4, 1], 2, 2, model='KR')
sage: elt = KRT(2, 1, 4, 3)
sage: elt.to_array()
[[1, 3], [2, 4]]
sage: elt.to_array(False)
[[2, 1], [4, 3]]
```

```
>>> from sage.all import *
>>> KRT = crystals.KirillovReshetikhin(['A', Integer(4), Integer(1)],␣
↪Integer(2), Integer(2), model='KR')
>>> elt = KRT(Integer(2), Integer(1), Integer(4), Integer(3))
>>> elt.to_array()
[[1, 3], [2, 4]]
>>> elt.to_array(False)
[[2, 1], [4, 3]]
```

to_classical_highest_weight(*index_set=None*)

Return the classical highest weight element corresponding to `self`.

INPUT:

- `index_set` – (default: `None`) return the highest weight with respect to the index set; if `None` is passed in, then this uses the classical index set

OUTPUT:

A pair `[H, f_str]` where `H` is the highest weight element and `f_str` is a list of a_i of f_{a_i} needed to reach `H`.

EXAMPLES:

```
sage: KRTab = crystals.KirillovReshetikhin(['D',4,1], 2, 2, model='KR')
sage: elt = KRTab(3,2,-1,1); elt
[[2, 1], [3, -1]]
sage: elt.to_classical_highest_weight()
[[[1, 1], [2, -1]], [1, 2]]
```

```
>>> from sage.all import *
>>> KRTab = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)],␣
↪Integer(2), Integer(2), model='KR')
>>> elt = KRTab(Integer(3),Integer(2),-Integer(1),Integer(1)); elt
[[2, 1], [3, -1]]
>>> elt.to_classical_highest_weight()
[[[1, 1], [2, -1]], [1, 2]]
```

to_kirillov_reshetikhin_crystal()

Construct a `KashiwaraNakashimaTableaux()` element from `self`.

We construct the Kirillov-Reshetikhin crystal element as follows:

1. Determine the shape λ of the KR crystal from the weight.
2. Determine a path $e_{i_1} e_{i_2} \cdots e_{i_k}$ to the highest weight.
3. Apply $f_{i_k} \cdots f_{i_2} f_{i_1}$ to a highest weight KR crystal of shape λ.

EXAMPLES:

```
sage: KRT = crystals.KirillovReshetikhin(['D',4,1], 2, 2, model='KR')
sage: elt = KRT(3,2,-1,1); elt
[[2, 1], [3, -1]]
sage: elt.to_kirillov_reshetikhin_crystal()
[[2], [3]]
```

```
>>> from sage.all import *
>>> KRT = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)],␣
↪Integer(2), Integer(2), model='KR')
>>> elt = KRT(Integer(3),Integer(2),-Integer(1),Integer(1)); elt
[[2, 1], [3, -1]]
>>> elt.to_kirillov_reshetikhin_crystal()
[[2], [3]]
```

to_tableau()

Return a *Tableau* object of `self`.

EXAMPLES:

```
sage: KRT = crystals.KirillovReshetikhin(['A', 4, 1], 2, 2, model='KR')
sage: elt = KRT(2, 1, 4, 3); elt
[[1, 3], [2, 4]]
sage: t = elt.to_tableau(); t
[[1, 3], [2, 4]]
sage: type(t)
<class 'sage.combinat.tableau.Tableaux_all_with_category.element_class'>
```

```
>>> from sage.all import *
>>> KRT = crystals.KirillovReshetikhin(['A', Integer(4), Integer(1)],␣
↪Integer(2), Integer(2), model='KR')
>>> elt = KRT(Integer(2), Integer(1), Integer(4), Integer(3)); elt
[[1, 3], [2, 4]]
>>> t = elt.to_tableau(); t
[[1, 3], [2, 4]]
>>> type(t)
<class 'sage.combinat.tableau.Tableaux_all_with_category.element_class'>
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: KR = crystals.KirillovReshetikhin(['D',4,1], 2, 2, model='KR')
sage: KR.module_generators[1].weight()
-2*Lambda[0] + Lambda[2]
```

```
>>> from sage.all import *
>>> KR = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)], Integer(2),
↪ Integer(2), model='KR')
>>> KR.module_generators[Integer(1)].weight()
-2*Lambda[0] + Lambda[2]
```

5.1.212 Crystal of Rigged Configurations

AUTHORS:

- Travis Scrimshaw (2010-09-26): Initial version

We only consider the highest weight crystal structure, not the Kirillov-Reshetikhin structure, and we extend this to symmetrizable types.

class sage.combinat.rigged_configurations.rc_crystal.**CrystalOfNonSimplyLacedRC**(*vct*, *wt*, *WLR*)

Bases: *CrystalOfRiggedConfigurations*

Highest weight crystal of rigged configurations in non-simply-laced type.

Element

alias of *RCHWNonSimplyLacedElement*

from_virtual(*vrc*)

Convert `vrc` in the virtual crystal into a rigged configuration of the original Cartan type.

INPUT:

- `vrc` – a virtual rigged configuration

EXAMPLES:

```
sage: La = RootSystem(['C', 3]).weight_lattice().fundamental_weights()
sage: vct = CartanType(['C', 3]).as_folding()
sage: RC = crystals.RiggedConfigurations(vct, La[2])
sage: elt = RC(partition_list=[[0], [1], [1]])
sage: elt == RC.from_virtual(RC.to_virtual(elt))
True
```

```
>>> from sage.all import *
>>> La = RootSystem(['C', Integer(3)]).weight_lattice().fundamental_weights()
>>> vct = CartanType(['C', Integer(3)]).as_folding()
>>> RC = crystals.RiggedConfigurations(vct, La[Integer(2)])
>>> elt = RC(partition_list=[[Integer(0)], [Integer(1)], [Integer(1)]])
>>> elt == RC.from_virtual(RC.to_virtual(elt))
True
```

to_virtual(*rc*)

Convert `rc` into a rigged configuration in the virtual crystal.

INPUT:

- `rc` – a rigged configuration element

EXAMPLES:

```
sage: La = RootSystem(['C', 3]).weight_lattice().fundamental_weights()
sage: vct = CartanType(['C', 3]).as_folding()
sage: RC = crystals.RiggedConfigurations(vct, La[2])
sage: elt = RC(partition_list=[[], [1], [1]]); elt

(/)

<BLANKLINE>
0[ ]0
<BLANKLINE>
-2[ ][ ]-2
<BLANKLINE>
0[ ]0
<BLANKLINE>
(/)
<BLANKLINE>
```

virtual()

Return the corresponding virtual crystal.

EXAMPLES:

```
sage: La = RootSystem(['C', 2, 1]).weight_lattice().fundamental_weights()
sage: vct = CartanType(['C', 2, 1]).as_folding()
sage: RC = crystals.RiggedConfigurations(vct, La[0])
sage: RC
Crystal of rigged configurations of type ['C', 2, 1] and weight Lambda[0]
sage: RC.virtual
Crystal of rigged configurations of type ['A', 3, 1] and weight 2*Lambda[0]
```

```
>>> from sage.all import *
>>> La = RootSystem(['C', Integer(2), Integer(1)]).weight_lattice().
↪fundamental_weights()
>>> vct = CartanType(['C', Integer(2), Integer(1)]).as_folding()
>>> RC = crystals.RiggedConfigurations(vct, La[Integer(0)])
>>> RC
Crystal of rigged configurations of type ['C', 2, 1] and weight Lambda[0]
>>> RC.virtual
Crystal of rigged configurations of type ['A', 3, 1] and weight 2*Lambda[0]
```

class sage.combinat.rigged_configurations.rc_crystal.**CrystalOfRiggedConfigurations**(*wt*, *WLR*)

Bases: UniqueRepresentation, Parent

A highest weight crystal of rigged configurations.

The crystal structure for finite simply-laced types is given in [CrysStructSchilling06]. These were then shown to be the crystal operators in all finite types in [SS2015], all simply-laced and a large class of foldings of simply-laced types in [SS2015II], and all symmetrizable types (uniformly) in [SS2017].

INPUT:

- `cartan_type` – (optional) a Cartan type or a Cartan type given as a folding
- `wt` – the highest weight vector in the weight lattice

EXAMPLES:

For simplicity, we display the rigged configurations horizontally:

```
sage: RiggedConfigurations.options.display='horizontal'
```

```
>>> from sage.all import *
>>> RiggedConfigurations.options.display='horizontal'
```

We start with a simply-laced finite type:

```
sage: La = RootSystem(['A', 2]).weight_lattice().fundamental_weights()
sage: RC = crystals.RiggedConfigurations(La[1] + La[2])
sage: mg = RC.highest_weight_vector()
sage: mg.f_string([1,2])
0[ ]0   0[ ]-1
sage: mg.f_string([1,2,2])
0[ ]0   -2[ ][ ]-2
sage: mg.f_string([1,2,2,2])
sage: mg.f_string([2,1,1,2])
-1[ ][ ]-1   -1[ ][ ]-1
sage: RC.cardinality()
8
sage: T = crystals.Tableaux(['A', 2], shape=[2,1])
sage: RC.digraph().is_isomorphic(T.digraph(), edge_labels=True)
True
```

```
>>> from sage.all import *
>>> La = RootSystem(['A', Integer(2)]).weight_lattice().fundamental_weights()
>>> RC = crystals.RiggedConfigurations(La[Integer(1)] + La[Integer(2)])
>>> mg = RC.highest_weight_vector()
>>> mg.f_string([Integer(1),Integer(2)])
0[ ]0   0[ ]-1
>>> mg.f_string([Integer(1),Integer(2),Integer(2)])
0[ ]0   -2[ ][ ]-2
>>> mg.f_string([Integer(1),Integer(2),Integer(2),Integer(2)])
>>> mg.f_string([Integer(2),Integer(1),Integer(1),Integer(2)])
-1[ ][ ]-1   -1[ ][ ]-1
>>> RC.cardinality()
8
>>> T = crystals.Tableaux(['A', Integer(2)], shape=[Integer(2),Integer(1)])
>>> RC.digraph().is_isomorphic(T.digraph(), edge_labels=True)
True
```

We construct a non-simply-laced affine type:

```
sage: La = RootSystem(['C', 3]).weight_lattice().fundamental_weights()
sage: RC = crystals.RiggedConfigurations(La[2])
sage: mg = RC.highest_weight_vector()
```

(continues on next page)

(continued from previous page)

```
sage: mg.f_string([2,3])
(/)   1[ ]1   -1[ ]-1
sage: T = crystals.Tableaux(['C', 3], shape=[1,1])
sage: RC.digraph().is_isomorphic(T.digraph(), edge_labels=True)
True
```

```
>>> from sage.all import *
>>> La = RootSystem(['C', Integer(3)]).weight_lattice().fundamental_weights()
>>> RC = crystals.RiggedConfigurations(La[Integer(2)])
>>> mg = RC.highest_weight_vector()
>>> mg.f_string([Integer(2),Integer(3)])
(/)   1[ ]1   -1[ ]-1
>>> T = crystals.Tableaux(['C', Integer(3)], shape=[Integer(1),Integer(1)])
>>> RC.digraph().is_isomorphic(T.digraph(), edge_labels=True)
True
```

We can construct rigged configurations using a diagram folding of a simply-laced type. This yields an equivalent but distinct crystal:

```
sage: vct = CartanType(['C', 3]).as_folding()
sage: RC = crystals.RiggedConfigurations(vct, La[2])
sage: mg = RC.highest_weight_vector()
sage: mg.f_string([2,3])
(/)   0[ ]0   -1[ ]-1
sage: T = crystals.Tableaux(['C', 3], shape=[1,1])
sage: RC.digraph().is_isomorphic(T.digraph(), edge_labels=True)
True
```

```
>>> from sage.all import *
>>> vct = CartanType(['C', Integer(3)]).as_folding()
>>> RC = crystals.RiggedConfigurations(vct, La[Integer(2)])
>>> mg = RC.highest_weight_vector()
>>> mg.f_string([Integer(2),Integer(3)])
(/)   0[ ]0   -1[ ]-1
>>> T = crystals.Tableaux(['C', Integer(3)], shape=[Integer(1),Integer(1)])
>>> RC.digraph().is_isomorphic(T.digraph(), edge_labels=True)
True
```

We reset the global options:

```
sage: RiggedConfigurations.options._reset()
```

```
>>> from sage.all import *
>>> RiggedConfigurations.options._reset()
```

Element

alias of *RCHighestWeightElement*

options = Current options for RiggedConfigurations - convention: English - display: vertical - element_ascii_art: True - half_width_boxes_type_B: True

weight_lattice_realization()

Return the weight lattice realization used to express the weights of elements in `self`.

EXAMPLES:

```
sage: La = RootSystem(['A', 2, 1]).weight_lattice(extended=True).fundamental_
↪weights()
sage: RC = crystals.RiggedConfigurations(La[0])
sage: RC.weight_lattice_realization()
Extended weight lattice of the Root system of type ['A', 2, 1]
```

```
>>> from sage.all import *
>>> La = RootSystem(['A', Integer(2), Integer(1)]).weight_
↪lattice(extended=True).fundamental_weights()
>>> RC = crystals.RiggedConfigurations(La[Integer(0)])
>>> RC.weight_lattice_realization()
Extended weight lattice of the Root system of type ['A', 2, 1]
```

5.1.213 Rigged Configurations of $\mathcal{B}(\infty)$

AUTHORS:

- Travis Scrimshaw (2013-04-16): Initial version

class sage.combinat.rigged_configurations.rc_infinity.**InfinityCrystalOfNonSimplyLacedRC**(*vct*)

Bases: *InfinityCrystalOfRiggedConfigurations*

Rigged configurations for $\mathcal{B}(\infty)$ in non-simply-laced types.

class Element(*parent*, *rigged_partitions=[]*, ***options*)

Bases: *RCNonSimplyLacedElement*

A rigged configuration in $\mathcal{B}(\infty)$ in non-simply-laced types.

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: vct = CartanType(['C', 3]).as_folding()
sage: RC = crystals.infinity.RiggedConfigurations(vct)
sage: elt = RC(partition_list=[[1],[1,1],[1]], rigging_list=[[0],[-1,-1],
↪[0]])
sage: elt.weight()
(-1, -1, 0)

sage: vct = CartanType(['F', 4, 1]).as_folding()
sage: RC = crystals.infinity.RiggedConfigurations(vct)
sage: mg = RC.highest_weight_vector()
sage: elt = mg.f_string([1,0,3,4,2,2]); ascii_art(elt)
```

(continues on next page)

(continued from previous page)

```
-1[ ]-1   0[ ]1   -2[ ][ ]-2   0[ ]1   -1[ ]-1
sage: wt = elt.weight(); wt
-Lambda[0] + Lambda[1] - 2*Lambda[2] + 3*Lambda[3] - Lambda[4] - delta
sage: al = RC.weight_lattice_realization().simple_roots()
sage: wt == -(al[0] + al[1] + 2*al[2] + al[3] + al[4])
True
```

```
>>> from sage.all import *
>>> vct = CartanType(['C', Integer(3)]).as_folding()
>>> RC = crystals.infinity.RiggedConfigurations(vct)
>>> elt = RC(partition_list=[[Integer(1)],[Integer(1),Integer(1)],
↪[Integer(1)]], rigging_list=[[Integer(0)],[-Integer(1),-Integer(1)],
↪[Integer(0)]])
>>> elt.weight()
(-1, -1, 0)

>>> vct = CartanType(['F', Integer(4), Integer(1)]).as_folding()
>>> RC = crystals.infinity.RiggedConfigurations(vct)
>>> mg = RC.highest_weight_vector()
>>> elt = mg.f_string([Integer(1),Integer(0),Integer(3),Integer(4),
↪Integer(2),Integer(2)]); ascii_art(elt)
-1[ ]-1   0[ ]1   -2[ ][ ]-2   0[ ]1   -1[ ]-1
>>> wt = elt.weight(); wt
-Lambda[0] + Lambda[1] - 2*Lambda[2] + 3*Lambda[3] - Lambda[4] - delta
>>> al = RC.weight_lattice_realization().simple_roots()
>>> wt == -(al[Integer(0)] + al[Integer(1)] + Integer(2)*al[Integer(2)] +␣
↪al[Integer(3)] + al[Integer(4)])
True
```

from_virtual(*vrc*)

Convert `vrc` in the virtual crystal into a rigged configuration of the original Cartan type.

INPUT:

- `vrc` – a virtual rigged configuration

EXAMPLES:

```
sage: vct = CartanType(['C', 2]).as_folding()
sage: RC = crystals.infinity.RiggedConfigurations(vct)
sage: elt = RC(partition_list=[[3],[2]], rigging_list=[[-2],[0]])
sage: vrc_elt = RC.to_virtual(elt)
sage: ret = RC.from_virtual(vrc_elt); ret

-3[ ][ ][ ]-2

-1[ ][ ]0

sage: ret == elt
True
```

```
>>> from sage.all import *
>>> vct = CartanType(['C', Integer(2)]).as_folding()
```

(continues on next page)

(continued from previous page)

```
>>> RC = crystals.infinity.RiggedConfigurations(vct)
>>> elt = RC(partition_list=[[Integer(3)],[Integer(2)]], rigging_list=[[-
↪Integer(2)],[Integer(0)]])
>>> vrc_elt = RC.to_virtual(elt)
>>> ret = RC.from_virtual(vrc_elt); ret
<BLANKLINE>
-3[ ][ ][ ]-2
<BLANKLINE>
-1[ ][ ]0
<BLANKLINE>
>>> ret == elt
True
```

to_virtual(*rc*)

Convert rc into a rigged configuration in the virtual crystal.

INPUT:

- rc – a rigged configuration element

EXAMPLES:

```
sage: vct = CartanType(['C', 2]).as_folding()
sage: RC = crystals.infinity.RiggedConfigurations(vct)
sage: mg = RC.highest_weight_vector()
sage: elt = mg.f_string([1,2,2,1,1]); elt

-3[ ][ ][ ]-2

-1[ ][ ]0

sage: velt = RC.to_virtual(elt); velt

-3[ ][ ][ ]-2

-2[ ][ ][ ][ ]0

-3[ ][ ][ ]-2

sage: velt.parent()
The infinity crystal of rigged configurations of type ['A', 3]
```

```
>>> from sage.all import *
>>> vct = CartanType(['C', Integer(2)]).as_folding()
>>> RC = crystals.infinity.RiggedConfigurations(vct)
>>> mg = RC.highest_weight_vector()
>>> elt = mg.f_string([Integer(1),Integer(2),Integer(2),Integer(1),
↪Integer(1)]); elt
<BLANKLINE>
-3[ ][ ][ ]-2
<BLANKLINE>
-1[ ][ ]0
<BLANKLINE>
```

(continues on next page)

(continued from previous page)

```
>>> velt = RC.to_virtual(elt); velt
<BLANKLINE>
-3[ ][ ][ ]-2
<BLANKLINE>
-2[ ][ ][ ][ ]0
<BLANKLINE>
-3[ ][ ][ ]-2
<BLANKLINE>
>>> velt.parent()
The infinity crystal of rigged configurations of type ['A', 3]
```

virtual()

Return the corresponding virtual crystal.

EXAMPLES:

```
sage: vct = CartanType(['C', 3]).as_folding()
sage: RC = crystals.infinity.RiggedConfigurations(vct)
sage: RC
The infinity crystal of rigged configurations of type ['C', 3]
sage: RC.virtual
The infinity crystal of rigged configurations of type ['A', 5]
```

```
>>> from sage.all import *
>>> vct = CartanType(['C', Integer(3)]).as_folding()
>>> RC = crystals.infinity.RiggedConfigurations(vct)
>>> RC
The infinity crystal of rigged configurations of type ['C', 3]
>>> RC.virtual
The infinity crystal of rigged configurations of type ['A', 5]
```

class sage.combinat.rigged_configurations.rc_infinity.**InfinityCrystalOfRiggedConfigurations**(*cartan_type*)

Bases: `UniqueRepresentation`, `Parent`

Rigged configuration model for $\mathcal{B}(\infty)$.

The crystal is generated by the empty rigged configuration with the same crystal structure given by the *highest weight model* except we remove the condition that the resulting rigged configuration needs to be valid when applying f_a.

INPUT:

- `cartan_type` – a Cartan type

EXAMPLES:

For simplicity, we display all of the rigged configurations horizontally:

```
sage: RiggedConfigurations.options(display='horizontal')
```

```
>>> from sage.all import *
>>> RiggedConfigurations.options(display='horizontal')
```

We begin with a simply-laced finite type:

```
sage: RC = crystals.infinity.RiggedConfigurations(['A', 3]); RC
The infinity crystal of rigged configurations of type ['A', 3]

sage: RC.options(display='horizontal')

sage: mg = RC.highest_weight_vector(); mg
(/)   (/)   (/)
sage: elt = mg.f_string([2,1,3,2]); elt
0[ ]0   -2[ ]-1   0[ ]0
        -2[ ]-1
sage: elt.e(1)
sage: elt.e(3)
sage: mg.f_string([2,1,3,2]).e(2)
-1[ ]-1  0[ ]1  -1[ ]-1
sage: mg.f_string([2,3,2,1,3,2])
0[ ]0  -3[ ][ ]-1  -1[ ][ ]-1
       -2[ ]-1
```

```
>>> from sage.all import *
>>> RC = crystals.infinity.RiggedConfigurations(['A', Integer(3)]); RC
The infinity crystal of rigged configurations of type ['A', 3]

>>> RC.options(display='horizontal')

>>> mg = RC.highest_weight_vector(); mg
(/)   (/)   (/)
>>> elt = mg.f_string([Integer(2),Integer(1),Integer(3),Integer(2)]); elt
0[ ]0   -2[ ]-1   0[ ]0
        -2[ ]-1
>>> elt.e(Integer(1))
>>> elt.e(Integer(3))
>>> mg.f_string([Integer(2),Integer(1),Integer(3),Integer(2)]).e(Integer(2))
-1[ ]-1  0[ ]1  -1[ ]-1
>>> mg.f_string([Integer(2),Integer(3),Integer(2),Integer(1),Integer(3),
↪Integer(2)])
0[ ]0  -3[ ][ ]-1  -1[ ][ ]-1
       -2[ ]-1
```

Next we consider a non-simply-laced finite type:

```
sage: RC = crystals.infinity.RiggedConfigurations(['C', 3])
sage: mg = RC.highest_weight_vector()
sage: mg.f_string([2,1,3,2])
0[ ]0   -1[ ]0    0[ ]0
        -1[ ]-1
sage: mg.f_string([2,3,2,1,3,2])
0[ ]-1   -1[ ][ ]-1   -1[ ][ ]0
         -1[ ]0
```

```
>>> from sage.all import *
>>> RC = crystals.infinity.RiggedConfigurations(['C', Integer(3)])
>>> mg = RC.highest_weight_vector()
```

(continues on next page)

(continued from previous page)

```
>>> mg.f_string([Integer(2),Integer(1),Integer(3),Integer(2)])
0[ ]0   -1[ ]0    0[ ]0
        -1[ ]-1
>>> mg.f_string([Integer(2),Integer(3),Integer(2),Integer(1),Integer(3),
↪Integer(2)])
0[ ]-1   -1[ ][ ]-1   -1[ ][ ]0
         -1[ ]0
```

We can construct rigged configurations using a diagram folding of a simply-laced type. This yields an equivalent but distinct crystal:

```
sage: vct = CartanType(['C', 3]).as_folding()
sage: VRC = crystals.infinity.RiggedConfigurations(vct)
sage: mg = VRC.highest_weight_vector()
sage: mg.f_string([2,1,3,2])
0[ ]0   -2[ ]-1   0[ ]0
        -2[ ]-1
sage: mg.f_string([2,3,2,1,3,2])
-1[ ]-1  -2[ ][ ][ ]-1  -1[ ][ ]0

sage: G = RC.subcrystal(max_depth=5).digraph()
sage: VG = VRC.subcrystal(max_depth=5).digraph()
sage: G.is_isomorphic(VG, edge_labels=True)
True
```

```
>>> from sage.all import *
>>> vct = CartanType(['C', Integer(3)]).as_folding()
>>> VRC = crystals.infinity.RiggedConfigurations(vct)
>>> mg = VRC.highest_weight_vector()
>>> mg.f_string([Integer(2),Integer(1),Integer(3),Integer(2)])
0[ ]0   -2[ ]-1   0[ ]0
        -2[ ]-1
>>> mg.f_string([Integer(2),Integer(3),Integer(2),Integer(1),Integer(3),
↪Integer(2)])
-1[ ]-1  -2[ ][ ][ ]-1  -1[ ][ ]0

>>> G = RC.subcrystal(max_depth=Integer(5)).digraph()
>>> VG = VRC.subcrystal(max_depth=Integer(5)).digraph()
>>> G.is_isomorphic(VG, edge_labels=True)
True
```

We can also construct $B(\infty)$ using rigged configurations in affine types:

```
sage: RC = crystals.infinity.RiggedConfigurations(['A', 3, 1])
sage: mg = RC.highest_weight_vector()
sage: mg.f_string([0,1,2,3,0,1,3])
-1[ ]0  -1[ ]-1  1[ ]1  -1[ ][ ]-1
-1[ ]0  -1[ ]-1

sage: RC = crystals.infinity.RiggedConfigurations(['C', 3, 1])
sage: mg = RC.highest_weight_vector()
sage: mg.f_string([1,2,3,0,1,2,3,3,0])
```

(continues on next page)

(continued from previous page)

```
-2[ ][ ]-1   0[ ]1   0[ ]0    -4[ ][ ][ ]-2
             0[ ]0   0[ ]-1

sage: RC = crystals.infinity.RiggedConfigurations(['A', 6, 2])
sage: mg = RC.highest_weight_vector()
sage: mg.f_string([1,2,3,0,1,2,3,3,0])
0[ ]-1   0[ ]1   0[ ]0    -4[ ][ ][ ]-2
0[ ]-1   0[ ]1   0[ ]-1
```

```
>>> from sage.all import *
>>> RC = crystals.infinity.RiggedConfigurations(['A', Integer(3), Integer(1)])
>>> mg = RC.highest_weight_vector()
>>> mg.f_string([Integer(0),Integer(1),Integer(2),Integer(3),Integer(0),
↪Integer(1),Integer(3)])
-1[ ]0  -1[ ]-1  1[ ]1  -1[ ][ ]-1
-1[ ]0  -1[ ]-1

>>> RC = crystals.infinity.RiggedConfigurations(['C', Integer(3), Integer(1)])
>>> mg = RC.highest_weight_vector()
>>> mg.f_string([Integer(1),Integer(2),Integer(3),Integer(0),Integer(1),
↪Integer(2),Integer(3),Integer(3),Integer(0)])
-2[ ][ ]-1   0[ ]1   0[ ]0    -4[ ][ ][ ]-2
             0[ ]0   0[ ]-1

>>> RC = crystals.infinity.RiggedConfigurations(['A', Integer(6), Integer(2)])
>>> mg = RC.highest_weight_vector()
>>> mg.f_string([Integer(1),Integer(2),Integer(3),Integer(0),Integer(1),
↪Integer(2),Integer(3),Integer(3),Integer(0)])
0[ ]-1   0[ ]1   0[ ]0    -4[ ][ ][ ]-2
0[ ]-1   0[ ]1   0[ ]-1
```

We reset the global options:

```
sage: RiggedConfigurations.options._reset()
```

```
>>> from sage.all import *
>>> RiggedConfigurations.options._reset()
```

class Element(*parent*, *rigged_partitions=[]*, ***options*)

Bases: `RiggedConfigurationElement`

A rigged configuration in $\mathcal{B}(\infty)$ in simply-laced types.

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: RC = crystals.infinity.RiggedConfigurations(['A', 3, 1])
sage: elt = RC(partition_list=[[1,1]]*4, rigging_list=[[1,1], [0,0], [0,
↪0], [-1,-1]])
sage: elt.weight()
-2*delta
```

```
>>> from sage.all import *
>>> RC = crystals.infinity.RiggedConfigurations(['A', Integer(3),␣
↪Integer(1)])
>>> elt = RC(partition_list=[[Integer(1),Integer(1)]]*Integer(4), rigging_
↪list=[[Integer(1),Integer(1)], [Integer(0),Integer(0)], [Integer(0),
↪Integer(0)], [-Integer(1),-Integer(1)]])
>>> elt.weight()
-2*delta
```

options = Current options for RiggedConfigurations - convention: English - display: vertical - element_ascii_art: True - half_width_boxes_type_B: True

weight_lattice_realization()

Return the weight lattice realization used to express the weights of elements in `self`.

EXAMPLES:

```
sage: RC = crystals.infinity.RiggedConfigurations(['A', 2, 1])
sage: RC.weight_lattice_realization()
Extended weight lattice of the Root system of type ['A', 2, 1]
```

```
>>> from sage.all import *
>>> RC = crystals.infinity.RiggedConfigurations(['A', Integer(2), Integer(1)])
>>> RC.weight_lattice_realization()
Extended weight lattice of the Root system of type ['A', 2, 1]
```

5.1.214 Rigged Configuration Elements

A rigged configuration element is a sequence of *RiggedPartition* objects.

AUTHORS:

- Travis Scrimshaw (2010-09-26): Initial version
- Travis Scrimshaw (2012-10-25): Added virtual rigged configurations

class sage.combinat.rigged_configurations.rigged_configuration_element.**KRRCNonSimplyLacedElement**(*parent*, *rigged_partitions*, ***options*)

Bases: *KRRiggedConfigurationElement*, *RCNonSimplyLacedElement*

$U'_q(\mathfrak{g})$ rigged configurations in non-simply-laced types.

cc()

Compute the cocharge statistic.

Computes the cocharge statistic [OSS03] on this rigged configuration (ν, J) by computing the cocharge as a virtual rigged configuration $(\hat{\nu}, \hat{J})$ and then using the identity $cc(\hat{\nu}, \hat{J}) = \gamma_0 cc(\nu, J)$.

EXAMPLES:

```
sage: RC = RiggedConfigurations(['C', 3, 1], [[2,1], [1,1]])
sage: RC(partition_list=[[1,1],[2,1],[1,1]]).cocharge()
1
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['C', Integer(3), Integer(1)], [[Integer(2),
↪Integer(1)], [Integer(1),Integer(1)]])
>>> RC(partition_list=[[Integer(1),Integer(1)],[Integer(2),Integer(1)],
↪[Integer(1),Integer(1)]]).cocharge()
1
```

cocharge()

Compute the cocharge statistic.

Computes the cocharge statistic [OSS03] on this rigged configuration (ν, J) by computing the cocharge as a virtual rigged configuration $(\hat{\nu}, \hat{J})$ and then using the identity $cc(\hat{\nu}, \hat{J}) = \gamma_0 cc(\nu, J)$.

EXAMPLES:

```
sage: RC = RiggedConfigurations(['C', 3, 1], [[2,1], [1,1]])
sage: RC(partition_list=[[1,1],[2,1],[1,1]]).cocharge()
1
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['C', Integer(3), Integer(1)], [[Integer(2),
↪Integer(1)], [Integer(1),Integer(1)]])
>>> RC(partition_list=[[Integer(1),Integer(1)],[Integer(2),Integer(1)],
↪[Integer(1),Integer(1)]]).cocharge()
1
```

e(a)

Return the action of e_a on `self`.

This works by lifting into the virtual configuration, then applying

$$e_a^v = \prod_{j \in \iota(a)} \hat{e}_j^{\gamma_j}$$

and pulling back.

EXAMPLES:

```
sage: RC = RiggedConfigurations(['A',6,2], [[1,1]]*7)
sage: elt = RC(partition_list=[[1]*5,[2,1,1],[3,2]])
sage: elt.e(3)

class sage.combinat.rigged_configurations.rigged_configuration_element.**KRRCSimplyLacedElement**(*parent*, *rigged_partitions=[]*, ***options*)

Bases: *KRRiggedConfigurationElement*

$U_q'(\mathfrak{g})$ rigged configurations in simply-laced types.

cc()

Compute the cocharge statistic of `self`.

Computes the cocharge statistic [CrysStructSchilling06] on this rigged configuration (ν, J). The cocharge statistic is defined as:

$$cc(\nu, J) = \frac{1}{2} \sum_{a,b \in I_0} \sum_{j,k>0} (\alpha_a \mid \alpha_b) \min(j,k) m_j^{(a)} m_k^{(b)} + \sum_{a \in I} \sum_{i>0} \left| J^{(a,i)} \right|.$$

EXAMPLES:

```
sage: RC = RiggedConfigurations(['A', 3, 1], [[3, 2], [2,1], [1,1]])
sage: RC(partition_list=[[1], [1], []]).cocharge()
1
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['A', Integer(3), Integer(1)], [[Integer(3),␣
```

(continues on next page)

(continued from previous page)

```
↪Integer(2)], [Integer(2),Integer(1)], [Integer(1),Integer(1)]])
>>> RC(partition_list=[[Integer(1)], [Integer(1)], []]).cocharge()
1
```

charge()

Compute the charge statistic of `self`.

Let B denote a set of rigged configurations. The *charge* c of a rigged configuration b is computed as

$$c(b) = \max(cc(b) \mid b \in B) - cc(b).$$

EXAMPLES:

```
sage: RC = RiggedConfigurations(['A', 3, 1], [[3, 2], [2,1], [1,1]])
sage: RC(partition_list=[[],[],[]]).charge()
2
sage: RC(partition_list=[[1], [1], []]).charge()
1
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['A', Integer(3), Integer(1)], [[Integer(3),
↪Integer(2)], [Integer(2),Integer(1)], [Integer(1),Integer(1)]])
>>> RC(partition_list=[[],[],[]]).charge()
2
>>> RC(partition_list=[[Integer(1)], [Integer(1)], []]).charge()
1
```

cocharge()

Compute the cocharge statistic of `self`.

Computes the cocharge statistic [CrysStructSchilling06] on this rigged configuration (ν, J). The cocharge statistic is defined as:

$$cc(\nu, J) = \frac{1}{2} \sum_{a,b \in I_0} \sum_{j,k>0} (\alpha_a \mid \alpha_b) \min(j,k) m_j^{(a)} m_k^{(b)} + \sum_{a \in I} \sum_{i>0} \left| J^{(a,i)} \right|.$$

EXAMPLES:

```
sage: RC = RiggedConfigurations(['A', 3, 1], [[3, 2], [2,1], [1,1]])
sage: RC(partition_list=[[1], [1], []]).cocharge()
1
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['A', Integer(3), Integer(1)], [[Integer(3),
↪Integer(2)], [Integer(2),Integer(1)], [Integer(1),Integer(1)]])
>>> RC(partition_list=[[Integer(1)], [Integer(1)], []]).cocharge()
1
```

class sage.combinat.rigged_configurations.rigged_configuration_element.**KRRCTypeA2DualElement**(*parent*, *rigged_partitions=[]*, ***options*)

Bases: *KRRCNonSimplyLacedElement*

$U'_q(\mathfrak{g})$ rigged configurations in type $A_{2n}^{(2)\dagger}$.

cc()

Compute the cocharge statistic.

Computes the cocharge statistic [RigConBijection] on this rigged configuration (ν, J). The cocharge statistic is computed as:

$$cc(\nu, J) = \frac{1}{2} \sum_{a \in I_0} \sum_{i > 0} t_a^{\vee} m_i^{(a)} \left(\sum_{j > 0} \min(i, j) L_j^{(a)} - p_i^{(a)} \right) + \sum_{a \in I} t_a^{\vee} \sum_{i > 0} \left| J^{(a,i)} \right|.$$

EXAMPLES:

```
sage: RC = RiggedConfigurations(CartanType(['A',4,2]).dual(), [[1,1],[2,2]])
sage: sc = RC.cartan_type().as_folding().scaling_factors()
sage: all(mg.cocharge() * sc[0] == mg.to_virtual_configuration().cocharge()
....:     for mg in RC.module_generators)
True
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(CartanType(['A',Integer(4),Integer(2)]).dual(),
↪[[Integer(1),Integer(1)],[Integer(2),Integer(2)]])
>>> sc = RC.cartan_type().as_folding().scaling_factors()
>>> all(mg.cocharge() * sc[Integer(0)] == mg.to_virtual_configuration().
↪cocharge()
...     for mg in RC.module_generators)
True
```

cocharge()

Compute the cocharge statistic.

Computes the cocharge statistic [RigConBijection] on this rigged configuration (ν, J). The cocharge statistic is computed as:

$$cc(\nu, J) = \frac{1}{2} \sum_{a \in I_0} \sum_{i > 0} t_a^{\vee} m_i^{(a)} \left(\sum_{j > 0} \min(i, j) L_j^{(a)} - p_i^{(a)} \right) + \sum_{a \in I} t_a^{\vee} \sum_{i > 0} \left| J^{(a,i)} \right|.$$

EXAMPLES:

```
sage: RC = RiggedConfigurations(CartanType(['A',4,2]).dual(), [[1,1],[2,2]])
sage: sc = RC.cartan_type().as_folding().scaling_factors()
sage: all(mg.cocharge() * sc[0] == mg.to_virtual_configuration().cocharge()
....:     for mg in RC.module_generators)
True
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(CartanType(['A',Integer(4),Integer(2)]).dual(),
↪[[Integer(1),Integer(1)],[Integer(2),Integer(2)]])
>>> sc = RC.cartan_type().as_folding().scaling_factors()
>>> all(mg.cocharge() * sc[Integer(0)] == mg.to_virtual_configuration().
```

(continues on next page)

(continued from previous page)

```
↪cocharge()
...     for mg in RC.module_generators)
True
```

epsilon(*a*)

Return the value of ε_a of `self`.

Here we need to modify the usual definition by $\varepsilon_n' := 2\varepsilon_n$.

EXAMPLES:

```
sage: RC = RiggedConfigurations(CartanType(['A',4,2]).dual(), [[1,1], [2,2]])
sage: def epsilon(x, i):
....:     x = x.e(i)
....:     eps = 0
....:     while x is not None:
....:         x = x.e(i)
....:         eps = eps + 1
....:     return eps
sage: all(epsilon(rc, 2) == rc.epsilon(2) for rc in RC)
True
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(CartanType(['A',Integer(4),Integer(2)]).dual(),␣
↪[[Integer(1),Integer(1)], [Integer(2),Integer(2)]])
>>> def epsilon(x, i):
...     x = x.e(i)
...     eps = Integer(0)
...     while x is not None:
...         x = x.e(i)
...         eps = eps + Integer(1)
...     return eps
>>> all(epsilon(rc, Integer(2)) == rc.epsilon(Integer(2)) for rc in RC)
True
```

phi(*a*)

Return the value of φ_a of `self`.

Here we need to modify the usual definition by $\varphi_n' := 2\varphi_n$.

EXAMPLES:

```
sage: RC = RiggedConfigurations(CartanType(['A',4,2]).dual(), [[1,1], [2,2]])
sage: def phi(x, i):
....:     x = x.f(i)
....:     ph = 0
....:     while x is not None:
....:         x = x.f(i)
....:         ph = ph + 1
....:     return ph
sage: all(phi(rc, 2) == rc.phi(2) for rc in RC)
True
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(CartanType(['A',Integer(4),Integer(2)]).dual(),
↪[[Integer(1),Integer(1)], [Integer(2),Integer(2)]])
>>> def phi(x, i):
...     x = x.f(i)
...     ph = Integer(0)
...     while x is not None:
...         x = x.f(i)
...         ph = ph + Integer(1)
...     return ph
>>> all(phi(rc, Integer(2)) == rc.phi(Integer(2)) for rc in RC)
True
```

class sage.combinat.rigged_configurations.rigged_configuration_element.**KRRiggedConfigurationElement**(p

Bases: *RiggedConfigurationElement*

$U_q'(\mathfrak{g})$ rigged configurations.

EXAMPLES:

We can go between *rigged configurations* and tensor products of *tensor products of KR tableaux*:

```
sage: RC = RiggedConfigurations(['D', 4, 1], [[1,1], [2,1]])
sage: rc_elt = RC(partition_list=[[1], [1,1], [1], [1]])
sage: tp_krtab = rc_elt.to_tensor_product_of_kirillov_reshetikhin_tableaux(); tp_
↪krtab
[[-2]] (X) [[1], [2]]
sage: tp_krcrys = rc_elt.to_tensor_product_of_kirillov_reshetikhin_crystals(); tp_
↪krcrys
[[[-2]], [[1], [2]]]
sage: tp_krcrys == tp_krtab.to_tensor_product_of_kirillov_reshetikhin_crystals()
True
sage: RC(tp_krcrys) == rc_elt
True
sage: RC(tp_krtab) == rc_elt
True
sage: tp_krtab.to_rigged_configuration() == rc_elt
True
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['D', Integer(4), Integer(1)], [[Integer(1),
↪Integer(1)], [Integer(2),Integer(1)]])
>>> rc_elt = RC(partition_list=[[Integer(1)], [Integer(1),Integer(1)],
↪[Integer(1)], [Integer(1)]])
>>> tp_krtab = rc_elt.to_tensor_product_of_kirillov_reshetikhin_tableaux(); tp_
↪krtab
[[-2]] (X) [[1], [2]]
>>> tp_krcrys = rc_elt.to_tensor_product_of_kirillov_reshetikhin_crystals(); tp_
```

(continues on next page)

(continued from previous page)

```
↪krcrys
[[[-2]], [[1], [2]]]
>>> tp_krcrys == tp_krtab.to_tensor_product_of_kirillov_reshetikhin_crystals()
True
>>> RC(tp_krcrys) == rc_elt
True
>>> RC(tp_krtab) == rc_elt
True
>>> tp_krtab.to_rigged_configuration() == rc_elt
True
```

check()

Make sure all of the riggings are less than or equal to the vacancy number.

classical_weight()

Return the classical weight of `self`.

The classical weight Λ of a rigged configuration is

$$\Lambda = \sum_{a \in \overline{I}} \sum_{i > 0} i L_i^{(a)} \Lambda_a - \sum_{a \in \overline{I}} \sum_{i > 0} i m_i^{(a)} \alpha_a.$$

EXAMPLES:

```
sage: RC = RiggedConfigurations(['D',4,1], [[2,2]])
sage: elt = RC(partition_list=[[2],[2,1],[1],[1]])
sage: elt.classical_weight()
(0, 1, 1, 0)
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['D',Integer(4),Integer(1)], [[Integer(2),
↪Integer(2)]])
>>> elt = RC(partition_list=[[Integer(2)],[Integer(2),Integer(1)],
↪[Integer(1)],[Integer(1)]])
>>> elt.classical_weight()
(0, 1, 1, 0)
```

This agrees with the corresponding classical weight as KR tableaux:

```
sage: krt = elt.to_tensor_product_of_kirillov_reshetikhin_tableaux(); krt
[[2, 1], [3, -1]]
sage: krt.classical_weight() == elt.classical_weight()
True
```

```
>>> from sage.all import *
>>> krt = elt.to_tensor_product_of_kirillov_reshetikhin_tableaux(); krt
[[2, 1], [3, -1]]
>>> krt.classical_weight() == elt.classical_weight()
True
```

complement_rigging(*reverse_factors=False*)

Apply the complement rigging morphism θ to `self`.

Consider a highest weight rigged configuration (ν, J), the complement rigging morphism $\theta : RC(L) \to RC(L)$ is given by sending $(\nu, J) \mapsto (\nu, J')$, where J' is obtained by taking the coriggings $x' = p_i^{(a)} - x$, and then extending as a crystal morphism. (The name comes from taking the complement partition for the riggings in a $m_i^{(a)} \times p_i^{(a)}$ box.)

INPUT:

- `reverse_factors` – boolean (default: `False`); if `True`, then this returns an element in $RC(B')$ where B' is the tensor factors of `self` in reverse order

EXAMPLES:

```
sage: RC = RiggedConfigurations(['D',4,1], [[1,1],[2,2]])
sage: mg = RC.module_generators[-1]
sage: ascii_art(mg)
1[ ][ ]1  0[ ][ ]0  0[ ][ ]0  0[ ][ ]0
          0[ ][ ]0
sage: ascii_art(mg.complement_rigging())
1[ ][ ]0  0[ ][ ]0  0[ ][ ]0  0[ ][ ]0
          0[ ][ ]0

sage: lw = mg.to_lowest_weight([1,2,3,4])[0]
sage: ascii_art(lw)
-1[ ][ ]-1  0[ ][ ]0  0[ ][ ]0  0[ ][ ]0
-1[ ]-1     0[ ][ ]0  0[ ]0     0[ ]0
-1[ ]-1     0[ ]0
            0[ ]0
sage: ascii_art(lw.complement_rigging())
-1[ ][ ][ ]-1  0[ ][ ][ ]0  0[ ][ ][ ]0  0[ ][ ][ ]0
-1[ ]-1        0[ ][ ][ ]0
sage: lw.complement_rigging() == mg.complement_rigging().to_lowest_weight([1,
↪2,3,4])[0]
True

sage: mg.complement_rigging(True).parent()
Rigged configurations of type ['D', 4, 1] and factor(s) ((2, 2), (1, 1))
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['D',Integer(4),Integer(1)], [[Integer(1),
↪Integer(1)],[Integer(2),Integer(2)]])
>>> mg = RC.module_generators[-Integer(1)]
>>> ascii_art(mg)
1[ ][ ]1  0[ ][ ]0  0[ ][ ]0  0[ ][ ]0
          0[ ][ ]0
>>> ascii_art(mg.complement_rigging())
1[ ][ ]0  0[ ][ ]0  0[ ][ ]0  0[ ][ ]0
          0[ ][ ]0

>>> lw = mg.to_lowest_weight([Integer(1),Integer(2),Integer(3),
↪Integer(4)])[Integer(0)]
>>> ascii_art(lw)
-1[ ][ ]-1  0[ ][ ]0  0[ ][ ]0  0[ ][ ]0
-1[ ]-1     0[ ][ ]0  0[ ]0     0[ ]0
-1[ ]-1     0[ ]0
```

(continues on next page)

(continued from previous page)

```
            0[ ]0
>>> ascii_art(lw.complement_rigging())
-1[ ][ ][ ]-1  0[ ][ ][ ]0  0[ ][ ][ ]0  0[ ][ ][ ]0
-1[ ]-1        0[ ][ ][ ]0
>>> lw.complement_rigging() == mg.complement_rigging().to_lowest_
↪weight([Integer(1),Integer(2),Integer(3),Integer(4)])[Integer(0)]
True

>>> mg.complement_rigging(True).parent()
Rigged configurations of type ['D', 4, 1] and factor(s) ((2, 2), (1, 1))
```

We check that the Lusztig involution (under the modification of also mapping to the highest weight element) intertwines with the complement map θ (that reverses the tensor factors) under the bijection Φ:

```
sage: RC = RiggedConfigurations(['D', 4, 1], [[2, 2], [2, 1], [1, 2]])
sage: for mg in RC.module_generators: # long time
....:     y = mg.to_tensor_product_of_kirillov_reshetikhin_tableaux()
....:     hw = y.lusztig_involution().to_highest_weight([1,2,3,4])[0]
....:     c = mg.complement_rigging(True)
....:     hwc = c.to_tensor_product_of_kirillov_reshetikhin_tableaux()
....:     assert hw == hwc
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['D', Integer(4), Integer(1)], [[Integer(2),␣
↪Integer(2)], [Integer(2), Integer(1)], [Integer(1), Integer(2)]])
>>> for mg in RC.module_generators: # long time
...     y = mg.to_tensor_product_of_kirillov_reshetikhin_tableaux()
...     hw = y.lusztig_involution().to_highest_weight([Integer(1),Integer(2),
↪Integer(3),Integer(4)])[Integer(0)]
...     c = mg.complement_rigging(True)
...     hwc = c.to_tensor_product_of_kirillov_reshetikhin_tableaux()
...     assert hw == hwc
```

delta(*return_b=False*)

Return the image of `self` under the left box removal map δ.

The map $\delta : RC(B^{r,1} \otimes B) \to RC(B^{r-1,1} \otimes B)$ (if $r = 1$, then we remove the left-most factor) is the basic map in the bijection Φ between rigged configurations and tensor products of Kirillov-Reshetikhin tableaux. For more information, see `to_tensor_product_of_kirillov_reshetikhin_tableaux()`. We can extend δ when the left-most factor is not a single column by precomposing with a `left_split()`.

Note

Due to the special nature of the bijection for the spinor cases in types $D_n^{(1)}$, $B_n^{(1)}$, and $A_{2n-1}^{(2)}$, this map is not defined in these cases.

INPUT:

- `return_b` – boolean (default: `False`); whether to return the resulting letter from δ

OUTPUT:

The resulting rigged configuration or if `return_b` is `True`, then a tuple of the resulting rigged configuration and the letter.

EXAMPLES:

```
sage: RC = RiggedConfigurations(['C',4,1], [[3,2]])
sage: mg = RC.module_generators[-1]
sage: ascii_art(mg)
0[ ][ ]0  0[ ][ ]0  0[ ][ ]0  0[ ]0
          0[ ][ ]0  0[ ][ ]0  0[ ]0
                    0[ ][ ]0  0[ ]0
sage: ascii_art(mg.left_box())
0[ ]0  0[ ][ ]0  0[ ][ ]0  0[ ]0
       0[ ]0     0[ ][ ]0  0[ ]0
sage: x,b = mg.left_box(True)
sage: b
-1
sage: b.parent()
The crystal of letters for type ['C', 4]
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['C',Integer(4),Integer(1)], [[Integer(3),
↪Integer(2)]])
>>> mg = RC.module_generators[-Integer(1)]
>>> ascii_art(mg)
0[ ][ ]0  0[ ][ ]0  0[ ][ ]0  0[ ]0
          0[ ][ ]0  0[ ][ ]0  0[ ]0
                    0[ ][ ]0  0[ ]0
>>> ascii_art(mg.left_box())
0[ ]0  0[ ][ ]0  0[ ][ ]0  0[ ]0
       0[ ]0     0[ ][ ]0  0[ ]0
>>> x,b = mg.left_box(True)
>>> b
-1
>>> b.parent()
The crystal of letters for type ['C', 4]
```

e(a)

Return the action of the crystal operator e_a on `self`.

For the classical operators, this implements the method defined in [CrysStructSchilling06]. For e_0, this converts the class to a tensor product of KR tableaux and does the corresponding e_0 and pulls back.

Todo

Implement e_0 without appealing to tensor product of KR tableaux.

INPUT:

- `a` – the index of the partition to remove a box

OUTPUT: the resulting rigged configuration element

EXAMPLES:

```
sage: RC = RiggedConfigurations(['A', 4, 1], [[2,1]])
sage: elt = RC(partition_list=[[1], [1], [1], [1]])
sage: elt.e(3)
sage: elt.e(1)

(/)

0[ ]0

0[ ]0

-1[ ]-1
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['A', Integer(4), Integer(1)], [[Integer(2),
↪Integer(1)]])
>>> elt = RC(partition_list=[[Integer(1)], [Integer(1)], [Integer(1)],
↪[Integer(1)]])
>>> elt.e(Integer(3))
>>> elt.e(Integer(1))
<BLANKLINE>
(/)
<BLANKLINE>
0[ ]0
<BLANKLINE>
0[ ]0
<BLANKLINE>
-1[ ]-1
<BLANKLINE>
```

epsilon(*a*)

Return ε_a of `self`.

EXAMPLES:

```
sage: RC = RiggedConfigurations(['D', 4, 1], [[2, 2]])
sage: I = RC.index_set()
sage: matrix([[mg.epsilon(i) for i in I] for mg in RC.module_generators])
[4 0 0 0 0]
[3 0 0 0 0]
[2 0 0 0 0]
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['D', Integer(4), Integer(1)], [[Integer(2),
↪Integer(2)]])
>>> I = RC.index_set()
>>> matrix([[mg.epsilon(i) for i in I] for mg in RC.module_generators])
[4 0 0 0 0]
[3 0 0 0 0]
[2 0 0 0 0]
```

f(*a*)

Return the action of the crystal operator f_a on `self`.

For the classical operators, this implements the method defined in [CrysStructSchilling06]. For f_0, this converts the class to a tensor product of KR tableaux and does the corresponding f_0 and pulls back.

Todo

Implement f_0 without appealing to tensor product of KR tableaux.

INPUT:

- `a` – the index of the partition to add a box

OUTPUT: the resulting rigged configuration element

EXAMPLES:

```
sage: RC = RiggedConfigurations(['A', 4, 1], [[2,1]])
sage: elt = RC(partition_list=[[1], [1], [1], [1]])
sage: elt.f(1)
sage: elt.f(2)

0[ ]0

-1[ ]-1
-1[ ]-1

1[ ]1

-1[ ]-1
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['A', Integer(4), Integer(1)], [[Integer(2),
↪Integer(1)]])

```

left_box(*return_b=False*)

Return the image of `self` under the left box removal map δ.

The map $\delta : RC(B^{r,1} \otimes B) \to RC(B^{r-1,1} \otimes B)$ (if $r = 1$, then we remove the left-most factor) is the basic map in the bijection Φ between rigged configurations and tensor products of Kirillov-Reshetikhin tableaux. For more information, see *to_tensor_product_of_kirillov_reshetikhin_tableaux()*. We can extend δ when the left-most factor is not a single column by precomposing with a *left_split()*.

Note

Due to the special nature of the bijection for the spinor cases in types $D_n^{(1)}$, $B_n^{(1)}$, and $A_{2n-1}^{(2)}$, this map is not defined in these cases.

INPUT:

- `return_b` – boolean (default: `False`); whether to return the resulting letter from δ

OUTPUT:

The resulting rigged configuration or if `return_b` is `True`, then a tuple of the resulting rigged configuration and the letter.

EXAMPLES:

```
sage: RC = RiggedConfigurations(['C',4,1], [[3,2]])
sage: mg = RC.module_generators[-1]
sage: ascii_art(mg)
0[ ][ ]0  0[ ][ ]0  0[ ][ ]0  0[ ]0
          0[ ][ ]0  0[ ][ ]0  0[ ]0
                    0[ ][ ]0  0[ ]0
sage: ascii_art(mg.left_box())
0[ ]0  0[ ][ ]0  0[ ][ ]0  0[ ]0
       0[ ]0     0[ ][ ]0  0[ ]0
sage: x,b = mg.left_box(True)
sage: b
-1
sage: b.parent()
The crystal of letters for type ['C', 4]
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['C',Integer(4),Integer(1)], [[Integer(3),
↪Integer(2)]])
>>> mg = RC.module_generators[-Integer(1)]
>>> ascii_art(mg)
0[ ][ ]0  0[ ][ ]0  0[ ][ ]0  0[ ]0
          0[ ][ ]0  0[ ][ ]0  0[ ]0
                    0[ ][ ]0  0[ ]0
>>> ascii_art(mg.left_box())
0[ ]0  0[ ][ ]0  0[ ][ ]0  0[ ]0
       0[ ]0     0[ ][ ]0  0[ ]0
>>> x,b = mg.left_box(True)
>>> b
-1
>>> b.parent()
The crystal of letters for type ['C', 4]
```

left_column_box()

Return the image of `self` under the left column box splitting map γ.

Consider the map $\gamma : RC(B^{r,1} \otimes B) \to RC(B^{1,1} \otimes B^{r-1,1} \otimes B)$ for $r > 1$, which is a natural strict classical crystal injection. On rigged configurations, the map γ adds a singular string of length 1 to $\nu^{(a)}$.

We can extend γ when the left-most factor is not a single column by precomposing with a *left_split()*.

EXAMPLES:

```
sage: RC = RiggedConfigurations(['C',3,1], [[3,1], [2,1]])
sage: mg = RC.module_generators[-1]
sage: ascii_art(mg)
0[ ]0  0[ ][ ]0  0[ ]0
       0[ ]0     0[ ]0
sage: ascii_art(mg.left_column_box())
0[ ]0  0[ ][ ]0  0[ ]0
0[ ]0  0[ ]0     0[ ]0
       0[ ]0

sage: RC = RiggedConfigurations(['C',3,1], [[2,1], [1,1], [3,1]])
sage: mg = RC.module_generators[7]
sage: ascii_art(mg)
1[ ]0  0[ ][ ]0  0[ ]0
       0[ ]0     0[ ]0
sage: ascii_art(mg.left_column_box())
1[ ]1  0[ ][ ]0  0[ ]0
1[ ]0  0[ ]0     0[ ]0
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['C',Integer(3),Integer(1)], [[Integer(3),
↪Integer(1)], [Integer(2),Integer(1)]])
>>> mg = RC.module_generators[-Integer(1)]
>>> ascii_art(mg)
0[ ]0  0[ ][ ]0  0[ ]0
       0[ ]0     0[ ]0
>>> ascii_art(mg.left_column_box())
0[ ]0  0[ ][ ]0  0[ ]0
0[ ]0  0[ ]0     0[ ]0
       0[ ]0

>>> RC = RiggedConfigurations(['C',Integer(3),Integer(1)], [[Integer(2),
↪Integer(1)], [Integer(1),Integer(1)], [Integer(3),Integer(1)]])
>>> mg = RC.module_generators[Integer(7)]
>>> ascii_art(mg)
1[ ]0  0[ ][ ]0  0[ ]0
       0[ ]0     0[ ]0
>>> ascii_art(mg.left_column_box())
1[ ]1  0[ ][ ]0  0[ ]0
1[ ]0  0[ ]0     0[ ]0
```

left_split()

Return the image of `self` under the left column splitting map β.

Consider the map $\beta : RC(B^{r,s} \otimes B) \to RC(B^{r,1} \otimes B^{r,s-1} \otimes B)$ for $s > 1$ which is a natural classical crystal injection. On rigged configurations, the map β does nothing (except possibly changing the vacancy numbers).

EXAMPLES:

```
sage: RC = RiggedConfigurations(['C',4,1], [[3,3]])
sage: mg = RC.module_generators[-1]
```

(continues on next page)

(continued from previous page)

```
sage: ascii_art(mg)
0[ ][ ]0  0[ ][ ]0  0[ ][ ]0  0[ ]0
          0[ ][ ]0  0[ ][ ]0  0[ ]0
                    0[ ][ ]0  0[ ]0
sage: ascii_art(mg.left_split())
0[ ][ ]0  0[ ][ ]0  1[ ][ ]0  0[ ]0
          0[ ][ ]0  1[ ][ ]0  0[ ]0
                    1[ ][ ]0  0[ ]0
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['C',Integer(4),Integer(1)], [[Integer(3),
↪Integer(3)]])
>>> mg = RC.module_generators[-Integer(1)]
>>> ascii_art(mg)
0[ ][ ]0  0[ ][ ]0  0[ ][ ]0  0[ ]0
          0[ ][ ]0  0[ ][ ]0  0[ ]0
                    0[ ][ ]0  0[ ]0
>>> ascii_art(mg.left_split())
0[ ][ ]0  0[ ][ ]0  1[ ][ ]0  0[ ]0
          0[ ][ ]0  1[ ][ ]0  0[ ]0
                    1[ ][ ]0  0[ ]0
```

phi(a)

Return φ_a of `self`.

EXAMPLES:

```
sage: RC = RiggedConfigurations(['D', 4, 1], [[2, 2]])
sage: I = RC.index_set()
sage: matrix([[mg.phi(i) for i in I] for mg in RC.module_generators])
[0 0 2 0 0]
[1 0 1 0 0]
[2 0 0 0 0]
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['D', Integer(4), Integer(1)], [[Integer(2),
↪Integer(2)]])
>>> I = RC.index_set()
>>> matrix([[mg.phi(i) for i in I] for mg in RC.module_generators])
[0 0 2 0 0]
[1 0 1 0 0]
[2 0 0 0 0]
```

right_column_box()

Return the image of `self` under the right column box splitting map γ^*.

Consider the map $\gamma^* : RC(B \otimes B^{r,1}) \to RC(B \otimes B^{r-1,1} \otimes B^{1,1})$ for $r > 1$, which is a natural strict classical crystal injection. On rigged configurations, the map γ adds a string of length 1 with rigging 0 to $\nu^{(a)}$ for all $a < r$ to a classically highest weight element and extended as a classical crystal morphism.

We can extend γ^* when the right-most factor is not a single column by precomposing with a *right_split()*.

EXAMPLES:

```
sage: RC = RiggedConfigurations(['C',3,1], [[2,1], [1,1], [3,1]])
sage: mg = RC.module_generators[7]
sage: ascii_art(mg)
1[ ]0  0[ ][ ]0  0[ ]0
       0[ ]0     0[ ]0
sage: ascii_art(mg.right_column_box())
1[ ]0  0[ ][ ]0  0[ ]0
1[ ]0  0[ ]0     0[ ]0
       0[ ]0
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['C',Integer(3),Integer(1)], [[Integer(2),
↪Integer(1)], [Integer(1),Integer(1)], [Integer(3),Integer(1)]])
>>> mg = RC.module_generators[Integer(7)]
>>> ascii_art(mg)
1[ ]0  0[ ][ ]0  0[ ]0
       0[ ]0     0[ ]0
>>> ascii_art(mg.right_column_box())
1[ ]0  0[ ][ ]0  0[ ]0
1[ ]0  0[ ]0     0[ ]0
       0[ ]0
```

right_split()

Return the image of `self` under the right column splitting map β^*.

Let θ denote the *complement rigging map* which reverses the tensor factors and β denote the *left splitting map*, we define the right splitting map by $\beta^* := \theta \circ \beta \circ \theta$.

EXAMPLES:

```
sage: RC = RiggedConfigurations(['C',4,1], [[3,3]])
sage: mg = RC.module_generators[-1]
sage: ascii_art(mg)
0[ ][ ]0  0[ ][ ]0  0[ ][ ]0  0[ ]0
          0[ ][ ]0  0[ ][ ]0  0[ ]0
                    0[ ][ ]0  0[ ]0
sage: ascii_art(mg.right_split())
0[ ][ ]0  0[ ][ ]0  1[ ][ ]1  0[ ]0
          0[ ][ ]0  1[ ][ ]1  0[ ]0
                    1[ ][ ]1  0[ ]0

sage: RC = RiggedConfigurations(['D',4,1], [[2,2],[1,2]])
sage: elt = RC(partition_list=[[3,1], [2,2,1], [2,1], [2]])
sage: ascii_art(elt)
-1[ ][ ][ ]-1  0[ ][ ]0  -1[ ][ ]-1  1[ ][ ]1
 0[ ]0         0[ ][ ]0  -1[ ]-1
               0[ ]0
sage: ascii_art(elt.right_split())
-1[ ][ ][ ]-1  0[ ][ ]0  -1[ ][ ]-1  1[ ][ ]1
 1[ ]0         0[ ][ ]0  -1[ ]-1
               0[ ]0
```

```
>>> from sage.all import *
```

(continues on next page)

(continued from previous page)

```
>>> RC = RiggedConfigurations(['C',Integer(4),Integer(1)], [[Integer(3),
↪Integer(3)]])
>>> mg = RC.module_generators[-Integer(1)]
>>> ascii_art(mg)
0[ ][ ]0  0[ ][ ]0  0[ ][ ]0  0[ ]0
          0[ ][ ]0  0[ ][ ]0  0[ ]0
                    0[ ][ ]0  0[ ]0
>>> ascii_art(mg.right_split())
0[ ][ ]0  0[ ][ ]0  1[ ][ ]1  0[ ]0
          0[ ][ ]0  1[ ][ ]1  0[ ]0
                    1[ ][ ]1  0[ ]0

>>> RC = RiggedConfigurations(['D',Integer(4),Integer(1)], [[Integer(2),
↪Integer(2)],[Integer(1),Integer(2)]])
>>> elt = RC(partition_list=[[Integer(3),Integer(1)], [Integer(2),Integer(2),
↪Integer(1)], [Integer(2),Integer(1)], [Integer(2)]])
>>> ascii_art(elt)
-1[ ][ ][ ]-1  0[ ][ ]0  -1[ ][ ]-1  1[ ][ ]1
 0[ ]0         0[ ][ ]0  -1[ ]-1
               0[ ]0
>>> ascii_art(elt.right_split())
-1[ ][ ][ ]-1  0[ ][ ]0  -1[ ][ ]-1  1[ ][ ]1
 1[ ]0         0[ ][ ]0  -1[ ]-1
               0[ ]0
```

We check that the bijection commutes with the right splitting map:

```
sage: RC = RiggedConfigurations(['A', 3, 1], [[1,1], [2,2]])
sage: all(rc.right_split().to_tensor_product_of_kirillov_reshetikhin_
↪tableaux()
....:     == rc.to_tensor_product_of_kirillov_reshetikhin_tableaux().right_
↪split() for rc in RC)
True
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['A', Integer(3), Integer(1)], [[Integer(1),
↪Integer(1)], [Integer(2),Integer(2)]])
>>> all(rc.right_split().to_tensor_product_of_kirillov_reshetikhin_tableaux()
...     == rc.to_tensor_product_of_kirillov_reshetikhin_tableaux().right_
↪split() for rc in RC)
True
```

to_tensor_product_of_kirillov_reshetikhin_crystals(*display_steps=False*, *build_graph=False*)

Return the corresponding tensor product of Kirillov-Reshetikhin crystals.

This is a composition of the map to a tensor product of KR tableaux, and then to a tensor product of KR crystals.

INPUT:

- `display_steps` – boolean (default: `False`); indicates whether to print each step in the algorithm
- `build_graph` – boolean (default: `False`); indicates whether to construct and return a graph of the bijection whose vertices are rigged configurations obtained at each step and edges are labeled by either the return value of δ or the doubling/halving map

EXAMPLES:

```
sage: RC = RiggedConfigurations(['D', 4, 1], [[2, 2]])
sage: elt = RC(partition_list=[[2], [2,2], [1], [1]])
sage: krc = elt.to_tensor_product_of_kirillov_reshetikhin_crystals(); krc
[[[2, 3], [3, -2]]]
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['D', Integer(4), Integer(1)], [[Integer(2),␣
↪Integer(2)]])
>>> elt = RC(partition_list=[[Integer(2)], [Integer(2),Integer(2)],␣
↪[Integer(1)], [Integer(1)]])
>>> krc = elt.to_tensor_product_of_kirillov_reshetikhin_crystals(); krc
[[[2, 3], [3, -2]]]
```

We can recover the rigged configuration:

```
sage: ret = RC(krc); ret

0[ ][ ]0

-2[ ][ ]-2
-2[ ][ ]-2

0[ ]0

0[ ]0

sage: elt == ret
True
```

```
>>> from sage.all import *
>>> ret = RC(krc); ret
<BLANKLINE>
0[ ][ ]0
<BLANKLINE>
-2[ ][ ]-2
-2[ ][ ]-2
<BLANKLINE>
0[ ]0
<BLANKLINE>
0[ ]0
<BLANKLINE>
>>> elt == ret
True
```

We can also construct and display a graph of the bijection as follows:

```
sage: ret, G = elt.to_tensor_product_of_kirillov_reshetikhin_crystals(build_
↪graph=True)
sage: view(G) # not tested
```

```
>>> from sage.all import *
>>> ret, G = elt.to_tensor_product_of_kirillov_reshetikhin_crystals(build_
↪graph=True)
>>> view(G) # not tested
```

to_tensor_product_of_kirillov_reshetikhin_tableaux(*display_steps=False*, *build_graph=False*)

Perform the bijection from this rigged configuration to a tensor product of Kirillov-Reshetikhin tableaux given in [RigConBijection] for single boxes and with [BijectionLRT] and [BijectionDn] for multiple columns and rows.

Note: This is only proven to be a bijection in types $A_n^{(1)}$ and $D_n^{(1)}$, as well as $\bigotimes_i B^{r_i,1}$ and $\bigotimes_i B^{1,s_i}$ for general affine types.

INPUT:

- `display_steps` – boolean (default: `False`); indicates whether to print each step in the algorithm
- `build_graph` – boolean (default: `False`); indicates whether to construct and return a graph of the bijection whose vertices are rigged configurations obtained at each step and edges are labeled by either the return value of δ or the doubling/halving map

OUTPUT:

- The tensor product of KR tableaux element corresponding to this rigged configuration.

EXAMPLES:

```
sage: RC = RiggedConfigurations(['A', 4, 1], [[2, 2]])
sage: RC(partition_list=[[2], [2,2], [2], [2]]).to_tensor_product_of_kirillov_
↪reshetikhin_tableaux()
[[3, 3], [5, 5]]
sage: RC = RiggedConfigurations(['D', 4, 1], [[2, 2]])
sage: elt = RC(partition_list=[[2], [2,2], [1], [1]])
sage: tp_krt = elt.to_tensor_product_of_kirillov_reshetikhin_tableaux(); tp_
↪krt
[[2, 3], [3, -2]]
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['A', Integer(4), Integer(1)], [[Integer(2),␣
↪Integer(2)]])
>>> RC(partition_list=[[Integer(2)], [Integer(2),Integer(2)], [Integer(2)],␣
↪[Integer(2)]]).to_tensor_product_of_kirillov_reshetikhin_tableaux()
[[3, 3], [5, 5]]
>>> RC = RiggedConfigurations(['D', Integer(4), Integer(1)], [[Integer(2),␣
↪Integer(2)]])
>>> elt = RC(partition_list=[[Integer(2)], [Integer(2),Integer(2)],␣
↪[Integer(1)], [Integer(1)]])
>>> tp_krt = elt.to_tensor_product_of_kirillov_reshetikhin_tableaux(); tp_krt
[[2, 3], [3, -2]]
```

This is invertible by calling *to_rigged_configuration()*:

```
sage: ret = tp_krt.to_rigged_configuration(); ret

0[ ][ ]0

-2[ ][ ]-2
-2[ ][ ]-2

0[ ]0

0[ ]0

sage: elt == ret
True
```

```
>>> from sage.all import *
>>> ret = tp_krt.to_rigged_configuration(); ret
<BLANKLINE>
0[ ][ ]0
<BLANKLINE>
-2[ ][ ]-2
-2[ ][ ]-2
<BLANKLINE>
0[ ]0
<BLANKLINE>
0[ ]0
<BLANKLINE>
>>> elt == ret
True
```

To view the steps of the bijection in the output, run with the `display_steps=True` option:

```
sage: elt.to_tensor_product_of_kirillov_reshetikhin_tableaux(True)
====================
...
====================

0[ ]0

-2[ ][ ]-2
 0[ ]0

0[ ]0

0[ ]0

--------------------
[[3, 2]]
--------------------
...
[[2, 3], [3, -2]]
```

```
>>> from sage.all import *
```

(continues on next page)

(continued from previous page)

```
>>> elt.to_tensor_product_of_kirillov_reshetikhin_tableaux(True)
====================
...
====================
<BLANKLINE>
0[ ]0
<BLANKLINE>
-2[ ][ ]-2
 0[ ]0
<BLANKLINE>
0[ ]0
<BLANKLINE>
0[ ]0
<BLANKLINE>
--------------------
[[3, 2]]
--------------------
...
[[2, 3], [3, -2]]
```

We can also construct and display a graph of the bijection as follows:

```
sage: ret, G = elt.to_tensor_product_of_kirillov_reshetikhin_tableaux(build_
→graph=True)
sage: view(G) # not tested
```

```
>>> from sage.all import *
>>> ret, G = elt.to_tensor_product_of_kirillov_reshetikhin_tableaux(build_
→graph=True)
>>> view(G) # not tested
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: RC = RiggedConfigurations(['E', 6, 1], [[2,2]])
sage: [x.weight() for x in RC.module_generators]
[-4*Lambda[0] + 2*Lambda[2], -2*Lambda[0] + Lambda[2], 0]
sage: KR = crystals.KirillovReshetikhin(['E',6,1], 2,2)
sage: [x.weight() for x in KR.module_generators]  # long time
[0, -2*Lambda[0] + Lambda[2], -4*Lambda[0] + 2*Lambda[2]]

sage: RC = RiggedConfigurations(['D', 6, 1], [[4,2]])
sage: [x.weight() for x in RC.module_generators]
[-4*Lambda[0] + 2*Lambda[4], -4*Lambda[0] + Lambda[2] + Lambda[4],
 -2*Lambda[0] + Lambda[4], -4*Lambda[0] + 2*Lambda[2],
 -2*Lambda[0] + Lambda[2], 0]
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['E', Integer(6), Integer(1)], [[Integer(2),
→Integer(2)]])
```

(continues on next page)

(continued from previous page)

```
>>> [x.weight() for x in RC.module_generators]
[-4*Lambda[0] + 2*Lambda[2], -2*Lambda[0] + Lambda[2], 0]
>>> KR = crystals.KirillovReshetikhin(['E',Integer(6),Integer(1)], Integer(2),
↪Integer(2))
>>> [x.weight() for x in KR.module_generators]  # long time
[0, -2*Lambda[0] + Lambda[2], -4*Lambda[0] + 2*Lambda[2]]

>>> RC = RiggedConfigurations(['D', Integer(6), Integer(1)], [[Integer(4),
↪Integer(2)]])
>>> [x.weight() for x in RC.module_generators]
[-4*Lambda[0] + 2*Lambda[4], -4*Lambda[0] + Lambda[2] + Lambda[4],
 -2*Lambda[0] + Lambda[4], -4*Lambda[0] + 2*Lambda[2],
 -2*Lambda[0] + Lambda[2], 0]
```

class sage.combinat.rigged_configurations.rigged_configuration_element.**RCHWNonSimplyLacedElement**(*parent*, *rigged_partitions*, ***options*)

Bases: *RCNonSimplyLacedElement*

Rigged configurations in highest weight crystals.

check()

Make sure all of the riggings are less than or equal to the vacancy number.

f(a)

Return the action of f_a on `self`.

This works by lifting into the virtual configuration, then applying

$$f_a^v = \prod_{j \in \iota(a)} \hat{f}_j^{\gamma_j}$$

and pulling back.

EXAMPLES:

```
sage: La = RootSystem(['C',2,1]).weight_lattice(extended=True).fundamental_
↪weights()
sage: vct = CartanType(['C',2,1]).as_folding()
sage: RC = crystals.RiggedConfigurations(vct, La[0])
sage: elt = RC(partition_list=[[1,1],[2],[2]])
sage: elt.f(0)
sage: ascii_art(elt.f(1))
0[ ]0   0[ ][ ]0  -1[ ][ ]-1
0[ ]0  -1[ ]-1
sage: elt.f(2)
```

```
>>> from sage.all import *
>>> La = RootSystem(['C',Integer(2),Integer(1)]).weight_
↪lattice(extended=True).fundamental_weights()
```

(continues on next page)

(continued from previous page)

```
>>> vct = CartanType(['C',Integer(2),Integer(1)]).as_folding()
>>> RC = crystals.RiggedConfigurations(vct, La[Integer(0)])
>>> elt = RC(partition_list=[[Integer(1),Integer(1)],[Integer(2)],
↪[Integer(2)]])
>>> elt.f(Integer(0))
>>> ascii_art(elt.f(Integer(1)))
0[ ]0   0[ ][ ]0  -1[ ][ ]-1
0[ ]0  -1[ ]-1
>>> elt.f(Integer(2))
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: La = RootSystem(['C',2,1]).weight_lattice(extended=True).fundamental_
↪weights()
sage: vct = CartanType(['C',2,1]).as_folding()
sage: B = crystals.RiggedConfigurations(vct, La[0])
sage: mg = B.module_generators[0]
sage: mg.f_string([0,1,2]).weight()
2*Lambda[1] - Lambda[2] - delta
```

```
>>> from sage.all import *
>>> La = RootSystem(['C',Integer(2),Integer(1)]).weight_
↪lattice(extended=True).fundamental_weights()
>>> vct = CartanType(['C',Integer(2),Integer(1)]).as_folding()
>>> B = crystals.RiggedConfigurations(vct, La[Integer(0)])
>>> mg = B.module_generators[Integer(0)]
>>> mg.f_string([Integer(0),Integer(1),Integer(2)]).weight()
2*Lambda[1] - Lambda[2] - delta
```

class sage.combinat.rigged_configurations.rigged_configuration_element.**RCHighestWeightElement**(*parent*, *rigged_partitions=[]*, ***options*)

Bases: *RiggedConfigurationElement*

Rigged configurations in highest weight crystals.

check()

Make sure all of the riggings are less than or equal to the vacancy number.

f(*a*)

Return the action of the crystal operator f_a on `self`.

This implements the method defined in [CrysStructSchilling06] which finds the value k which is the length of the string with the smallest nonpositive rigging of largest length. Then it adds a box from a string of length k in the a-th rigged partition, keeping all colabels fixed and decreasing the new label by one. If no such string exists, then it adds a new string of length 1 with label -1. If any of the resulting vacancy numbers are larger than the labels (i.e. it is an invalid rigged configuration), then f_a is undefined.

INPUT:

- `a` – the index of the partition to add a box

OUTPUT: the resulting rigged configuration element

EXAMPLES:

```
sage: La = RootSystem(['A',2,1]).weight_lattice(extended=True).fundamental_
↪weights()
sage: RC = crystals.RiggedConfigurations(['A',2,1], La[0])
sage: elt = RC(partition_list=[[1,1],[1],[2]])
sage: elt.f(0)

-2[ ][ ]-2

```

(continues on next page)

(continued from previous page)

```
-1[ ]-1
<BLANKLINE>
0[ ][ ]0
<BLANKLINE>
>>> elt.f(Integer(2))
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: La = RootSystem(['A',2,1]).weight_lattice(extended=True).fundamental_
↪weights()
sage: B = crystals.RiggedConfigurations(['A',2,1], La[0])
sage: mg = B.module_generators[0]
sage: mg.f_string([0,1,2,0]).weight()
-Lambda[0] + Lambda[1] + Lambda[2] - 2*delta
```

```
>>> from sage.all import *
>>> La = RootSystem(['A',Integer(2),Integer(1)]).weight_
↪lattice(extended=True).fundamental_weights()
>>> B = crystals.RiggedConfigurations(['A',Integer(2),Integer(1)],␣
↪La[Integer(0)])
>>> mg = B.module_generators[Integer(0)]
>>> mg.f_string([Integer(0),Integer(1),Integer(2),Integer(0)]).weight()
-Lambda[0] + Lambda[1] + Lambda[2] - 2*delta
```

class sage.combinat.rigged_configurations.rigged_configuration_element.**RCNonSimplyLacedElement**(*parent*, *rigged_partitions=[]*, ***options*)

Bases: *RiggedConfigurationElement*

Rigged configuration elements for non-simply-laced types.

e(a)

Return the action of e_a on `self`.

This works by lifting into the virtual configuration, then applying

$$e^v_a = \prod_{j \in \iota(a)} \hat{e}_j^{\gamma_j}$$

and pulling back.

EXAMPLES:

```
sage: vct = CartanType(['C',2,1]).as_folding()
sage: RC = crystals.infinity.RiggedConfigurations(vct)
sage: elt = RC(partition_list=[[2],[1,1],[2]], rigging_list=[[-1],[-1,-1],[-
↪1]])
```

(continues on next page)

(continued from previous page)

```
sage: ascii_art(elt.e(0))
0[ ]0  -2[ ]-1  -2[ ][ ]-1
       -2[ ]-1
sage: ascii_art(elt.e(1))
-3[ ][ ]-2  0[ ]1  -3[ ][ ]-2
sage: ascii_art(elt.e(2))
-2[ ][ ]-1  -2[ ]-1  0[ ]0
            -2[ ]-1
```

```
>>> from sage.all import *
>>> vct = CartanType(['C',Integer(2),Integer(1)]).as_folding()
>>> RC = crystals.infinity.RiggedConfigurations(vct)
>>> elt = RC(partition_list=[[Integer(2)],[Integer(1),Integer(1)],
↪[Integer(2)]], rigging_list=[[-Integer(1)],[-Integer(1),-Integer(1)],[-
↪Integer(1)]])
>>> ascii_art(elt.e(Integer(0)))
0[ ]0  -2[ ]-1  -2[ ][ ]-1
       -2[ ]-1
>>> ascii_art(elt.e(Integer(1)))
-3[ ][ ]-2  0[ ]1  -3[ ][ ]-2
>>> ascii_art(elt.e(Integer(2)))
-2[ ][ ]-1  -2[ ]-1  0[ ]0
            -2[ ]-1
```

f(a)

Return the action of f_a on `self`.

This works by lifting into the virtual configuration, then applying

$$f_a^v = \prod_{j \in \iota(a)} \hat{f}_j^{\gamma_j}$$

and pulling back.

EXAMPLES:

```
sage: vct = CartanType(['C',2,1]).as_folding()
sage: RC = crystals.infinity.RiggedConfigurations(vct)
sage: elt = RC(partition_list=[[2],[1,1],[2]], rigging_list=[[-1],[-1,-1],[-
↪1]])
sage: ascii_art(elt.f(0))

-2[ ][ ]-1  -2[ ]-1  -4[ ][ ][ ]-2
            -2[ ]-1
```

to_virtual_configuration()

Return the corresponding rigged configuration in the virtual crystal.

EXAMPLES:

```
sage: RC = RiggedConfigurations(['C',2,1], [[1,2],[1,1],[2,1]])
sage: elt = RC(partition_list=[[3],[2]]); elt

0[ ][ ][ ]0

0[ ][ ]0

<BLANKLINE>
0[ ][ ][ ]0
<BLANKLINE>
0[ ][ ][ ][ ]0
<BLANKLINE>
0[ ][ ][ ]0
```

class sage.combinat.rigged_configurations.rigged_configuration_element.**RiggedConfigurationElement**(*parent, rigged_partitions, **options*)

Bases: ClonableArray

A rigged configuration for simply-laced types.

For more information on rigged configurations, see *RiggedConfigurations*. For rigged configurations for non-simply-laced types, use *RCNonSimplyLacedElement*.

Typically to create a specific rigged configuration, the user will pass in the optional argument `partition_list` and if the user wants to specify the rigging values, give the optional argument `rigging_list` as well. If `rigging_list` is not passed, the rigging values are set to the corresponding vacancy numbers.

INPUT:

- `parent` – the parent of this element
- `rigged_partitions` – list of rigged partitions

There are two optional arguments to explicitly construct a rigged configuration. The first is `partition_list` which gives a list of partitions, and the second is `rigging_list` which is a list of corresponding lists of riggings. If only partition_list is specified, then it sets the rigging equal to the calculated vacancy numbers.

If we are constructing a rigged configuration from a rigged configuration (say of another type) and we don't want to recompute the vacancy numbers, we can use the `use_vacancy_numbers` to avoid the recomputation.

EXAMPLES:

Type $A_n^{(1)}$ examples:

```
sage: RC = RiggedConfigurations(['A', 4, 1], [[2, 2]])

```

check()

Check the rigged configuration is properly defined.

There is nothing to check here.

EXAMPLES:

```
sage: RC = crystals.infinity.RiggedConfigurations(['A', 4])
sage: b = RC.module_generators[0].f_string([1,2,1,1,2,4,2,3,3,2])
sage: b.check()
```

```
>>> from sage.all import *
>>> RC = crystals.infinity.RiggedConfigurations(['A', Integer(4)])
>>> b = RC.module_generators[Integer(0)].f_string([Integer(1),Integer(2),
→Integer(1),Integer(1),Integer(2),Integer(4),Integer(2),Integer(3),
→Integer(3),Integer(2)])
>>> b.check()
```

e(a)

Return the action of the crystal operator e_a on `self`.

This implements the method defined in [CrysStructSchilling06] which finds the value k which is the length of the string with the smallest negative rigging of smallest length. Then it removes a box from a string of length

k in the a-th rigged partition, keeping all colabels fixed and increasing the new label by one. If no such string exists, then e_a is undefined.

This method can also be used when the underlying Cartan matrix is a Borcherds-Cartan matrix. In this case, then method of [SS2018] is used, where the new label is increased by half of the a-th diagonal entry of the underlying Borcherds-Cartan matrix. This method will also return `None` if a is imaginary and the smallest rigging in the a-th rigged partition is not exactly half of the a-th diagonal entry of the Borcherds-Cartan matrix.

INPUT:

- `a` – the index of the partition to remove a box

OUTPUT: the resulting rigged configuration element

EXAMPLES:

```
sage: RC = RiggedConfigurations(['A', 4, 1], [[2,1]])
sage: elt = RC(partition_list=[[1], [1], [1], [1]])
sage: elt.e(3)
sage: elt.e(1)

(/)

0[ ]0

0[ ]0

-1[ ]-1

sage: A = CartanMatrix([[-2,-1],[-1,-2]], borcherds=True)
sage: RC = crystals.infinity.RiggedConfigurations(A)
sage: nu0 = RC(partition_list=[[],[]])
sage: nu = nu0.f_string([1,0,0,0])
sage: ascii_art(nu.e(0))
5[ ]3  4[ ]3
5[ ]1
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['A', Integer(4), Integer(1)], [[Integer(2),
↪Integer(1)]])
>>> elt = RC(partition_list=[[Integer(1)], [Integer(1)], [Integer(1)],␣
↪[Integer(1)]])
>>> elt.e(Integer(3))
>>> elt.e(Integer(1))
<BLANKLINE>
(/)
<BLANKLINE>
0[ ]0
<BLANKLINE>
0[ ]0
<BLANKLINE>
-1[ ]-1
<BLANKLINE>
```

(continues on next page)

(continued from previous page)

```
>>> A = CartanMatrix([[-Integer(2),-Integer(1)],[-Integer(1),-Integer(2)]],
↪borcherds=True)
>>> RC = crystals.infinity.RiggedConfigurations(A)
>>> nu0 = RC(partition_list=[[],[]])
>>> nu = nu0.f_string([Integer(1),Integer(0),Integer(0),Integer(0)])
>>> ascii_art(nu.e(Integer(0)))
5[ ]3  4[ ]3
5[ ]1
```

epsilon(*a*)

Return ε_a of `self`.

Let x_ℓ be the smallest string of $\nu^{(a)}$ or 0 if $\nu^{(a)} = \emptyset$, then we have $\varepsilon_a = -\min(0, x_\ell)$.

EXAMPLES:

```
sage: La = RootSystem(['B',2]).weight_lattice().fundamental_weights()
sage: RC = crystals.RiggedConfigurations(La[1]+La[2])
sage: I = RC.index_set()
sage: matrix([[rc.epsilon(i) for i in I] for rc in RC[:4]])
[0 0]
[1 0]
[0 1]
[0 2]
```

```
>>> from sage.all import *
>>> La = RootSystem(['B',Integer(2)]).weight_lattice().fundamental_weights()
>>> RC = crystals.RiggedConfigurations(La[Integer(1)]+La[Integer(2)])
>>> I = RC.index_set()
>>> matrix([[rc.epsilon(i) for i in I] for rc in RC[:Integer(4)]])
[0 0]
[1 0]
[0 1]
[0 2]
```

f(*a*)

Return the action of the crystal operator f_a on `self`.

This implements the method defined in [CrysStructSchilling06] which finds the value k which is the length of the string with the smallest nonpositive rigging of largest length. Then it adds a box from a string of length k in the a-th rigged partition, keeping all colabels fixed and decreasing the new label by one. If no such string exists, then it adds a new string of length 1 with label -1. However we need to modify the definition to work for $B(\infty)$ by removing the condition that the resulting rigged configuration is valid.

This method can also be used when the underlying Cartan matrix is a Borcherds-Cartan matrix. In this case, then method of [SS2018] is used, where the new label is decreased by half of the a-th diagonal entry of the underlying Borcherds-Cartan matrix.

INPUT:

- `a` – the index of the partition to add a box

OUTPUT: the resulting rigged configuration element

EXAMPLES:

```
sage: RC = crystals.infinity.RiggedConfigurations(['A', 3])
sage: nu0 = RC.module_generators[0]
sage: nu0.f(2)

(/)

-2[ ]-1

(/)

sage: A = CartanMatrix([[-2,-1],[-1,-2]], borcherds=True)
sage: RC = crystals.infinity.RiggedConfigurations(A)
sage: nu0 = RC(partition_list=[[],[]])
sage: nu = nu0.f_string([1,0,0,0])
sage: ascii_art(nu.f(0))
9[ ]7  6[ ]5
9[ ]5
9[ ]3
9[ ]1
```

```
>>> from sage.all import *
>>> RC = crystals.infinity.RiggedConfigurations(['A', Integer(3)])
>>> nu0 = RC.module_generators[Integer(0)]
>>> nu0.f(Integer(2))
<BLANKLINE>
(/)
<BLANKLINE>
-2[ ]-1
<BLANKLINE>
(/)
<BLANKLINE>

>>> A = CartanMatrix([[-Integer(2),-Integer(1)],[-Integer(1),-Integer(2)]],
↪borcherds=True)
>>> RC = crystals.infinity.RiggedConfigurations(A)
>>> nu0 = RC(partition_list=[[],[]])
>>> nu = nu0.f_string([Integer(1),Integer(0),Integer(0),Integer(0)])
>>> ascii_art(nu.f(Integer(0)))
9[ ]7  6[ ]5
9[ ]5
9[ ]3
9[ ]1
```

nu()

Return the list ν of rigged partitions of this rigged configuration element.

OUTPUT: the ν array as a list

EXAMPLES:

```
sage: RC = RiggedConfigurations(['A', 4, 1], [[2, 2]])
sage: RC(partition_list=[[2], [2,2], [2], [2]]).nu()
```

(continues on next page)

(continued from previous page)

>>> RC(partition_list=[[Integer(2)], [Integer(2),Integer(2)], [Integer(2)],
→[Integer(2)]]).nu()
[0[ ][ ]0
 , -2[ ][ ]-2
 -2[ ][ ]-2
 , 2[ ][ ]2
 , -2[ ][ ]-2
 ]
```

partition_rigging_lists()

Return the list of partitions and the associated list of riggings of `self`.

EXAMPLES:

```
sage: RC = RiggedConfigurations(['A',3,1], [[1,2],[2,2]])
sage: rc = RC(partition_list=[[2],[1],[1]], rigging_list=[[-1],[0],[-1]]); rc

-1[ ][ ]-1

[[[2], [1], [1]], [[-1], [0], [-1]]]
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['A',Integer(3),Integer(1)], [[Integer(1),
→Integer(2)],[Integer(2),Integer(2)]])
>>> rc = RC(partition_list=[[Integer(2)],[Integer(1)],[Integer(1)]], rigging_
→list=[[-Integer(1)],[Integer(0)],[-Integer(1)]]); rc
<BLANKLINE>
-1[ ][ ]-1
<BLANKLINE>
1[ ]0
<BLANKLINE>
-1[ ]-1
<BLANKLINE>
>>> rc.partition_rigging_lists()
[[[2], [1], [1]], [[-1], [0], [-1]]]
```

phi(*a*)

Return φ_a of `self`.

Let x_ℓ be the smallest string of $\nu^{(a)}$ or 0 if $\nu^{(a)} = \emptyset$, then we have $\varepsilon_a = p_\infty^{(a)} - \min(0, x_\ell)$.

EXAMPLES:

```
sage: La = RootSystem(['B',2]).weight_lattice().fundamental_weights()
sage: RC = crystals.RiggedConfigurations(La[1]+La[2])
sage: I = RC.index_set()
sage: matrix([[rc.phi(i) for i in I] for rc in RC[:4]])
[1 1]
[0 3]
[0 2]
[1 1]
```

```
>>> from sage.all import *
>>> La = RootSystem(['B',Integer(2)]).weight_lattice().fundamental_weights()
>>> RC = crystals.RiggedConfigurations(La[Integer(1)]+La[Integer(2)])
>>> I = RC.index_set()
>>> matrix([[rc.phi(i) for i in I] for rc in RC[:Integer(4)]])
[1 1]
[0 3]
[0 2]
[1 1]
```

vacancy_number(a, i)

Return the vacancy number $p_i^{(a)}$.

INPUT:

- a – the index of the rigged partition
- i – the row of the rigged partition

EXAMPLES:

```
sage: RC = RiggedConfigurations(['A', 4, 1], [[2, 2]])
sage: elt = RC(partition_list=[[1], [2,1], [1], []])
sage: elt.vacancy_number(2, 3)
-2
sage: elt.vacancy_number(2, 2)
-2
sage: elt.vacancy_number(2, 1)
-1

sage: RC = RiggedConfigurations(['D',4,1], [[2,1], [2,1]])

5.1.215 Rigged Configurations

AUTHORS:

- Travis Scrimshaw (2010-09-26): Initial version

`sage.combinat.rigged_configurations.rigged_configurations.`**`KirillovReshetikhinCrystal`**(*cartan_type*, *r*, *s*)

Return the KR crystal $B^{r,s}$ using *rigged configurations*.

This is the rigged configuration $RC(B^{r,s})$ or $RC(L)$ with $L = (L_i^{(a)})$ and $L_i^{(a)} = \delta_{a,r}\delta_{i,s}$.

EXAMPLES:

```
sage: K1 = crystals.kirillov_reshetikhin.RiggedConfigurations(['A',6,2], 2, 1)
sage: K2 = crystals.kirillov_reshetikhin.LSPaths(['A',6,2], 2, 1)
sage: K1.digraph().is_isomorphic(K2.digraph(), edge_labels=True)
True
```

```
>>> from sage.all import *
>>> K1 = crystals.kirillov_reshetikhin.RiggedConfigurations(['A',Integer(6),
↪Integer(2)], Integer(2), Integer(1))
>>> K2 = crystals.kirillov_reshetikhin.LSPaths(['A',Integer(6),Integer(2)],␣
↪Integer(2), Integer(1))
>>> K1.digraph().is_isomorphic(K2.digraph(), edge_labels=True)
True
```

class `sage.combinat.rigged_configurations.rigged_configurations.`**`RCNonSimplyLaced`**(*cartan_type*, *dims*)

Bases: *RiggedConfigurations*

Rigged configurations in non-simply-laced types.

These are rigged configurations which lift to virtual rigged configurations in a simply-laced type.

For more on rigged configurations, see *RiggedConfigurations*.

Element

alias of *KRRCNonSimplyLacedElement*

from_virtual(*vrc*)

Convert `vrc` in the virtual crystal into a rigged configuration of the original Cartan type.

INPUT:

- `vrc` – a virtual rigged configuration

EXAMPLES:

```
sage: RC = RiggedConfigurations(['C',2,1], [[1,2],[1,1],[2,1]])
sage: elt = RC(partition_list=[[3],[2]])
sage: vrc_elt = RC.to_virtual(elt)
sage: ret = RC.from_virtual(vrc_elt); ret

0[ ][ ][ ]0

0[ ][ ]0
sage: ret == elt
True
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['C',Integer(2),Integer(1)], [[Integer(1),
↪Integer(2)],[Integer(1),Integer(1)],[Integer(2),Integer(1)]])
>>> elt = RC(partition_list=[[Integer(3)],[Integer(2)]])
>>> vrc_elt = RC.to_virtual(elt)
>>> ret = RC.from_virtual(vrc_elt); ret
<BLANKLINE>
0[ ][ ][ ]0
<BLANKLINE>
0[ ][ ]0
>>> ret == elt
True
```

kleber_tree()

Return the underlying (virtual) Kleber tree used to generate all highest weight rigged configurations.

EXAMPLES:

```
sage: RC = RiggedConfigurations(['C',3,1], [[1,1], [2,1]])
sage: RC.kleber_tree()
Virtual Kleber tree of Cartan type ['C', 3, 1] and B = ((1, 1), (2, 1))
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['C',Integer(3),Integer(1)], [[Integer(1),
↪Integer(1)], [Integer(2),Integer(1)]])
>>> RC.kleber_tree()
Virtual Kleber tree of Cartan type ['C', 3, 1] and B = ((1, 1), (2, 1))
```

module_generators()

Module generators for this set of rigged configurations.

Iterate over the highest weight rigged configurations by moving through the `KleberTree` and then setting appropriate values of the partitions.

EXAMPLES:

```
sage: RC = RiggedConfigurations(['C', 3, 1], [[1,2]])
sage: for x in RC.module_generators: x

(/)

(/)

(/)

)
```

to_virtual(*rc*)

Convert `rc` into a rigged configuration in the virtual crystal.

INPUT:

- `rc` – a rigged configuration element

EXAMPLES:

```
sage: RC = RiggedConfigurations(['C',2,1], [[1,2],[1,1],[2,1]])
sage: elt = RC(partition_list=[[3],[2]]); elt

0[ ][ ][ ]0

0[ ][ ]0
sage: velt = RC.to_virtual(elt); velt

0[ ][ ][ ]0

0[ ][ ][ ][ ]0

0[ ][ ][ ]0
sage: velt.parent()
Rigged configurations of type ['A', 3, 1] and factor(s) ((1, 2), (3, 2), (1,␣
↪1), (3, 1), (2, 2))
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['C',Integer(2),Integer(1)], [[Integer(1),
↪Integer(2)],[Integer(1),Integer(1)],[Integer(2),Integer(1)]])
>>> elt = RC(partition_list=[[Integer(3)],[Integer(2)]]); elt

<BLANKLINE>
0[ ][ ][ ][ ]0
<BLANKLINE>
0[ ][ ][ ]0
>>> velt.parent()
Rigged configurations of type ['A', 3, 1] and factor(s) ((1, 2), (3, 2), (1,␣
```

(continues on next page)

(continued from previous page)

```
↪1), (3, 1), (2, 2))
```

virtual()

Return the corresponding virtual crystal.

EXAMPLES:

```
sage: RC = RiggedConfigurations(['C',2,1], [[1,2],[1,1],[2,1]])
sage: RC
Rigged configurations of type ['C', 2, 1] and factor(s) ((1, 2), (1, 1), (2,␣
↪1))
sage: RC.virtual
Rigged configurations of type ['A', 3, 1] and factor(s) ((1, 2), (3, 2), (1,␣
↪1), (3, 1), (2, 2))
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['C',Integer(2),Integer(1)], [[Integer(1),
↪Integer(2)],[Integer(1),Integer(1)],[Integer(2),Integer(1)]])
>>> RC
Rigged configurations of type ['C', 2, 1] and factor(s) ((1, 2), (1, 1), (2,␣
↪1))
>>> RC.virtual
Rigged configurations of type ['A', 3, 1] and factor(s) ((1, 2), (3, 2), (1,␣
↪1), (3, 1), (2, 2))
```

class sage.combinat.rigged_configurations.rigged_configurations.**RCTypeA2Dual**(*cartan_type*, *dims*)

Bases: *RCTypeA2Even*

Rigged configurations of type $A_{2n}^{(2)\dagger}$.

For more on rigged configurations, see *RiggedConfigurations*.

EXAMPLES:

```
sage: RC = RiggedConfigurations(CartanType(['A',4,2]).dual(), [[1,2],[1,1],[2,1]])
sage: RC
Rigged configurations of type ['BC', 2, 2]^* and factor(s) ((1, 2), (1, 1), (2,␣
↪1))
sage: RC.cardinality()
750
sage: RC.virtual
Rigged configurations of type ['A', 3, 1] and factor(s) ((1, 2), (3, 2), (1, 1),␣
↪(3, 1), (2, 1), (2, 1))
sage: RC = RiggedConfigurations(CartanType(['A',2,2]).dual(), [[1,1]])
sage: RC.cardinality()
3
sage: RC = RiggedConfigurations(CartanType(['A',2,2]).dual(), [[1,2],[1,1]])
sage: TestSuite(RC).run() # long time
sage: RC = RiggedConfigurations(CartanType(['A',4,2]).dual(), [[2,1]])
sage: TestSuite(RC).run() # long time
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(CartanType(['A',Integer(4),Integer(2)]).dual(),
↪[[Integer(1),Integer(2)],[Integer(1),Integer(1)],[Integer(2),Integer(1)]])
>>> RC
Rigged configurations of type ['BC', 2, 2]^* and factor(s) ((1, 2), (1, 1), (2,
↪1))
>>> RC.cardinality()
750
>>> RC.virtual
Rigged configurations of type ['A', 3, 1] and factor(s) ((1, 2), (3, 2), (1, 1),
↪(3, 1), (2, 1), (2, 1))
>>> RC = RiggedConfigurations(CartanType(['A',Integer(2),Integer(2)]).dual(),
↪[[Integer(1),Integer(1)]])
>>> RC.cardinality()
3
>>> RC = RiggedConfigurations(CartanType(['A',Integer(2),Integer(2)]).dual(),
↪[[Integer(1),Integer(2)],[Integer(1),Integer(1)]])
>>> TestSuite(RC).run() # long time
>>> RC = RiggedConfigurations(CartanType(['A',Integer(4),Integer(2)]).dual(),
↪[[Integer(2),Integer(1)]])
>>> TestSuite(RC).run() # long time
```

Element

alias of *KRRCTypeA2DualElement*

from_virtual(*vrc*)

Convert `vrc` in the virtual crystal into a rigged configuration of the original Cartan type.

INPUT:

- `vrc` – a virtual rigged configuration element

EXAMPLES:

```
sage: RC = RiggedConfigurations(CartanType(['A',4,2]).dual(), [[2,2]])
sage: elt = RC(partition_list=[[1],[1]])
sage: velt = RC.to_virtual(elt)
sage: ret = RC.from_virtual(velt); ret

-1[ ]-1

1[ ]1

sage: ret == elt
True
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(CartanType(['A',Integer(4),Integer(2)]).dual(),
↪[[Integer(2),Integer(2)]])
>>> elt = RC(partition_list=[[Integer(1)],[Integer(1)]])
>>> velt = RC.to_virtual(elt)
>>> ret = RC.from_virtual(velt); ret
<BLANKLINE>
-1[ ]-1
```

(continues on next page)

(continued from previous page)

```
<BLANKLINE>
1[ ]1
<BLANKLINE>
>>> ret == elt
True
```

module_generators()

Module generators for rigged configurations of type $A_{2n}^{(2)\dagger}$.

Iterate over the highest weight rigged configurations by moving through the `KleberTree` and then setting appropriate values of the partitions. This also skips rigged configurations where $P_i^{(n)} < 1$ when i is odd.

EXAMPLES:

```
sage: RC = RiggedConfigurations(CartanType(['A', 4, 2]).dual(), [[1,1]])
sage: for x in RC.module_generators: x

(/)

(/)
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(CartanType(['A', Integer(4), Integer(2)]).
↪dual(), [[Integer(1),Integer(1)]])
>>> for x in RC.module_generators: x
<BLANKLINE>
(/)
<BLANKLINE>
(/)
<BLANKLINE>
```

to_virtual(*rc*)

Convert `rc` into a rigged configuration in the virtual crystal.

INPUT:

- `rc` – a rigged configuration element

EXAMPLES:

```
sage: RC = RiggedConfigurations(CartanType(['A',4,2]).dual(), [[2,2]])
sage: elt = RC(partition_list=[[1],[1]]); elt

-1[ ]-1

1[ ]1

sage: velt = RC.to_virtual(elt); velt

-1[ ]-1

2[ ]2

-1[ ]-1
```

(continues on next page)

(continued from previous page)

```
sage: velt.parent()
Rigged configurations of type ['A', 3, 1] and factor(s) ((2, 2), (2, 2))
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(CartanType(['A',Integer(4),Integer(2)]).dual(),␣
↪[[Integer(2),Integer(2)]])
>>> elt = RC(partition_list=[[Integer(1)],[Integer(1)]]); elt
<BLANKLINE>
-1[ ]-1
<BLANKLINE>
1[ ]1
<BLANKLINE>
>>> velt = RC.to_virtual(elt); velt
<BLANKLINE>
-1[ ]-1
<BLANKLINE>
2[ ]2
<BLANKLINE>
-1[ ]-1
<BLANKLINE>
>>> velt.parent()
Rigged configurations of type ['A', 3, 1] and factor(s) ((2, 2), (2, 2))
```

class sage.combinat.rigged_configurations.rigged_configurations.**RCTypeA2Even**(*cartan_type*, *dims*)

Bases: *RCNonSimplyLaced*

Rigged configurations for type $A_{2n}^{(2)}$.

For more on rigged configurations, see *RiggedConfigurations*.

EXAMPLES:

```
sage: RC = RiggedConfigurations(['A',4,2], [[2,1], [1,2]])
sage: RC.cardinality()
150
sage: RC = RiggedConfigurations(['A',2,2], [[1,1]])
sage: RC.cardinality()
3
sage: RC = RiggedConfigurations(['A',2,2], [[1,2],[1,1]])
sage: TestSuite(RC).run() # long time
sage: RC = RiggedConfigurations(['A',4,2], [[2,1]])
sage: TestSuite(RC).run() # long time
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['A',Integer(4),Integer(2)], [[Integer(2),
↪Integer(1)], [Integer(1),Integer(2)]])
>>> RC.cardinality()
150
>>> RC = RiggedConfigurations(['A',Integer(2),Integer(2)], [[Integer(1),
↪Integer(1)]])
>>> RC.cardinality()
```

(continues on next page)

(continued from previous page)

```
3
>>> RC = RiggedConfigurations(['A',Integer(2),Integer(2)], [[Integer(1),
↪Integer(2)],[Integer(1),Integer(1)]])
>>> TestSuite(RC).run() # long time
>>> RC = RiggedConfigurations(['A',Integer(4),Integer(2)], [[Integer(2),
↪Integer(1)]])
>>> TestSuite(RC).run() # long time
```

cardinality()

Return the cardinality of `self`.

EXAMPLES:

```
sage: RC = RiggedConfigurations(['A',4,2], [[1,1], [2,2]])
sage: RC.cardinality()
250
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['A',Integer(4),Integer(2)], [[Integer(1),
↪Integer(1)], [Integer(2),Integer(2)]])
>>> RC.cardinality()
250
```

from_virtual(*vrc*)

Convert `vrc` in the virtual crystal into a rigged configuration of the original Cartan type.

INPUT:

- `vrc` – a virtual rigged configuration element

EXAMPLES:

```
sage: RC = RiggedConfigurations(['A',4,2], [[2,2]])
sage: elt = RC(partition_list=[[1],[1]])
sage: velt = RC.to_virtual(elt)
sage: ret = RC.from_virtual(velt); ret

-1[ ]-1

1[ ]1

sage: ret == elt
True
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['A',Integer(4),Integer(2)], [[Integer(2),
↪Integer(2)]])
>>> elt = RC(partition_list=[[Integer(1)],[Integer(1)]])
>>> velt = RC.to_virtual(elt)
>>> ret = RC.from_virtual(velt); ret
<BLANKLINE>
-1[ ]-1
<BLANKLINE>
```

(continues on next page)

(continued from previous page)

```
1[ ]1
<BLANKLINE>
>>> ret == elt
True
```

to_virtual(*rc*)

Convert `rc` into a rigged configuration in the virtual crystal.

INPUT:

- `rc` – a rigged configuration element

EXAMPLES:

```
sage: RC = RiggedConfigurations(['A',4,2], [[2,2]])
sage: elt = RC(partition_list=[[1],[1]]); elt

-1[ ]-1

1[ ]1

sage: velt = RC.to_virtual(elt); velt

-1[ ]-1

2[ ]2

-1[ ]-1

sage: velt.parent()
Rigged configurations of type ['A', 3, 1] and factor(s) ((2, 2), (2, 2))
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['A',Integer(4),Integer(2)], [[Integer(2),
↪Integer(2)]])
>>> elt = RC(partition_list=[[Integer(1)],[Integer(1)]]); elt
<BLANKLINE>
-1[ ]-1
<BLANKLINE>
1[ ]1
<BLANKLINE>
>>> velt = RC.to_virtual(elt); velt
<BLANKLINE>
-1[ ]-1
<BLANKLINE>
2[ ]2
<BLANKLINE>
-1[ ]-1
<BLANKLINE>
>>> velt.parent()
Rigged configurations of type ['A', 3, 1] and factor(s) ((2, 2), (2, 2))
```

virtual()

Return the corresponding virtual crystal.

EXAMPLES:

```
sage: RC = RiggedConfigurations(['A',4,2], [[1,2],[1,1],[2,1]])
sage: RC
Rigged configurations of type ['BC', 2, 2] and factor(s) ((1, 2), (1, 1), (2,
↪1))
sage: RC.virtual
Rigged configurations of type ['A', 3, 1] and factor(s) ((1, 2), (3, 2), (1,
↪1), (3, 1), (2, 1), (2, 1))
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['A',Integer(4),Integer(2)], [[Integer(1),
↪Integer(2)],[Integer(1),Integer(1)],[Integer(2),Integer(1)]])
>>> RC
Rigged configurations of type ['BC', 2, 2] and factor(s) ((1, 2), (1, 1), (2,
↪1))
>>> RC.virtual
Rigged configurations of type ['A', 3, 1] and factor(s) ((1, 2), (3, 2), (1,
↪1), (3, 1), (2, 1), (2, 1))
```

class sage.combinat.rigged_configurations.rigged_configurations.**RiggedConfigurations**(*cartan_type*, *B*)

Bases: UniqueRepresentation, Parent

Rigged configurations as $U_q'(\mathfrak{g})$-crystals.

Let $\overline{I}$ denote the classical index set associated to the Cartan type of the rigged configurations. A rigged configuration of multiplicity array $L_i^{(a)}$ and dominant weight Λ is a sequence of partitions $\{\nu^{(a)} \mid a \in \overline{I}\}$ such that

$$\sum_{\overline{I} \times \mathbf{Z}_{>0}} i m_i^{(a)} \alpha_a = \sum_{\overline{I} \times \mathbf{Z}_{>0}} i L_i^{(a)} \Lambda_a - \Lambda$$

where α_a is a simple root, Λ_a is a fundamental weight, and $m_i^{(a)}$ is the number of rows of length i in the partition $\nu^{(a)}$.

Each partition $\nu^{(a)}$, in the sequence also comes with a sequence of statistics $p_i^{(a)}$ called *vacancy numbers* and a weakly decreasing sequence $J_i^{(a)}$ of length $m_i^{(a)}$ called *riggings*. Vacancy numbers are computed based upon the partitions and $L_i^{(a)}$, and the riggings must satisfy $\max J_i^{(a)} \leq p_i^{(a)}$. We call such a partition a *rigged partition*. For more, see [RigConBijection] [CrysStructSchilling06] [BijectionLRT].

Rigged configurations form combinatorial objects first introduced by Kerov, Kirillov and Reshetikhin that arose from studies of statistical mechanical models using the Bethe Ansatz. They are sequences of rigged partitions. A rigged partition is a partition together with a label associated to each part that satisfy certain constraints. The labels are also called riggings.

Rigged configurations exist for all affine Kac-Moody Lie algebras. See for example [HKOTT2002]. In Sage they are specified by providing a Cartan type and a list of rectangular shapes B. The list of all (highest weight) rigged configurations for given B is computed via the (virtual) Kleber algorithm (see also *KleberTree* and *VirtualKleberTree*).

Rigged configurations in simply-laced types all admit a classical crystal structure [CrysStructSchilling06]. For non-simply-laced types, the crystal is given by using virtual rigged configurations [OSS03]. The highest weight rigged configurations are those where all riggings are nonnegative. The list of all rigged configurations is computed from the highest weight ones using the crystal operators.

Rigged configurations are conjecturally in bijection with `TensorProductOfKirillovReshetikhinTableaux` of non-exceptional affine types where the list B corresponds to the tensor factors $B^{r,s}$. The bijection has been proven in types $A_n^{(1)}$ and $D_n^{(1)}$ and when the only nonzero entries of $L_i^{(a)}$ are either only $L_1^{(a)}$ or only $L_i^{(1)}$ (corresponding to single columns or rows respectively) [RigConBijection], [BijectionLRT], [BijectionDn].

KR crystals are implemented in Sage, see `KirillovReshetikhinCrystal()`, however, in the bijection with rigged configurations a different realization of the elements in the crystal are obtained, which are coined KR tableaux, see `KirillovReshetikhinTableaux`. For more details see [OSS2011].

Note

All non-simply-laced rigged configurations have not been proven to give rise to aligned virtual crystals (i.e. have the correct crystal structure or isomorphic as affine crystals to the tensor product of KR tableaux).

INPUT:

- `cartan_type` – a Cartan type
- `B` – list of positive integer tuples (r, s) corresponding to the tensor factors in the bijection with tensor product of Kirillov-Reshetikhin tableaux or equivalently the sequence of width s and height r rectangles

    ,         ,         ,         ,         ,
]
```

A rigged configuration element with all riggings equal to the vacancy numbers can be created as follows:

```
sage: RC = RiggedConfigurations(['A', 3, 1], [[3,2], [2,1], [1,1], [1,1]]); RC
Rigged configurations of type ['A', 3, 1] and factor(s) ((3, 2), (2, 1), (1, 1),␣
↪(1, 1))
sage: elt = RC(partition_list=[[1],[],[]]); elt

0[ ]0

(/)

(/)
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['A', Integer(3), Integer(1)], [[Integer(3),
↪Integer(2)], [Integer(2),Integer(1)], [Integer(1),Integer(1)], [Integer(1),
↪Integer(1)]]); RC
Rigged configurations of type ['A', 3, 1] and factor(s) ((3, 2), (2, 1), (1, 1),␣
↪(1, 1))
>>> elt = RC(partition_list=[[Integer(1)],[],[]]); elt
<BLANKLINE>
0[ ]0
<BLANKLINE>
(/)
<BLANKLINE>
(/)
<BLANKLINE>
```

If on the other hand we also want to specify the riggings, this can be achieved as follows:

```
sage: RC = RiggedConfigurations(['A', 3, 1], [[3, 2], [1, 2], [1, 1]])
sage: RC(partition_list=[[2],[2],[2]])

To obtain the KR tableau under the bijection between rigged configurations and KR tableaux, we can type the following. This example was checked against Reiho Sakamoto's Mathematica program on rigged configurations:

```
sage: output = elt.to_tensor_product_of_kirillov_reshetikhin_tableaux(); output
[[1, 1, 1], [2, 3, 3], [3, 4, -5]] (X) [[1, 1], [2, 2], [3, 3], [5, -6], [6, -5]]
↪(X)
[[1, 1, 2], [2, 2, 3], [3, 3, 7], [4, 4, -7]] (X) [[1, 1, 1], [2, 2, 2]] (X)
[[1, 1, 1, 3], [2, 2, 3, 4], [3, 3, 4, 5], [4, 4, 5, 6]] (X) [[1], [2], [3]] (X)
↪[[1, 1, 1, 1]] (X) [[1, 1], [2, 2]]
sage: elt.to_tensor_product_of_kirillov_reshetikhin_tableaux().to_rigged_
↪configuration() == elt
True
sage: output.to_rigged_configuration().to_tensor_product_of_kirillov_reshetikhin_
↪tableaux() == output
True
```

```
>>> from sage.all import *
>>> output = elt.to_tensor_product_of_kirillov_reshetikhin_tableaux(); output
[[1, 1, 1], [2, 3, 3], [3, 4, -5]] (X) [[1, 1], [2, 2], [3, 3], [5, -6], [6, -5]]
↪(X)
[[1, 1, 2], [2, 2, 3], [3, 3, 7], [4, 4, -7]] (X) [[1, 1, 1], [2, 2, 2]] (X)
[[1, 1, 1, 3], [2, 2, 3, 4], [3, 3, 4, 5], [4, 4, 5, 6]] (X) [[1], [2], [3]] (X)
↪[[1, 1, 1, 1]] (X) [[1, 1], [2, 2]]
>>> elt.to_tensor_product_of_kirillov_reshetikhin_tableaux().to_rigged_
↪configuration() == elt
True
>>> output.to_rigged_configuration().to_tensor_product_of_kirillov_reshetikhin_
↪tableaux() == output
True
```

We can also convert between rigged configurations and tensor products of KR crystals:

```
sage: RC = RiggedConfigurations(['D', 4, 1], [[2, 1]])
```

(continues on next page)

(continued from previous page)

```
sage: elt = RC(partition_list=[[1],[1,1],[1],[1]])
sage: tp_krc = elt.to_tensor_product_of_kirillov_reshetikhin_crystals(); tp_krc
[[]]
sage: ret = RC(tp_krc)
sage: ret == elt
True
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['D', Integer(4), Integer(1)], [[Integer(2),
↪Integer(1)]])
>>> elt = RC(partition_list=[[Integer(1)],[Integer(1),Integer(1)],[Integer(1)],
↪[Integer(1)]])
>>> tp_krc = elt.to_tensor_product_of_kirillov_reshetikhin_crystals(); tp_krc
[[]]
>>> ret = RC(tp_krc)
>>> ret == elt
True
```

```
sage: RC = RiggedConfigurations(['D', 4, 1], [[4,1], [3,3]])
sage: KR1 = crystals.KirillovReshetikhin(['D', 4, 1], 4, 1)
sage: KR2 = crystals.KirillovReshetikhin(['D', 4, 1], 3, 3)
sage: T = crystals.TensorProduct(KR1, KR2)
sage: t = T[1]; t
[[++++, []], [+++-, [[1], [2], [4], [-4]]]]
sage: ret = RC(t)
sage: ret.to_tensor_product_of_kirillov_reshetikhin_crystals()
[[++++, []], [+++-, [[1], [2], [4], [-4]]]]
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['D', Integer(4), Integer(1)], [[Integer(4),
↪Integer(1)], [Integer(3),Integer(3)]])
>>> KR1 = crystals.KirillovReshetikhin(['D', Integer(4), Integer(1)], Integer(4),
↪Integer(1))
>>> KR2 = crystals.KirillovReshetikhin(['D', Integer(4), Integer(1)], Integer(3),
↪Integer(3))
>>> T = crystals.TensorProduct(KR1, KR2)
>>> t = T[Integer(1)]; t
[[++++, []], [+++-, [[1], [2], [4], [-4]]]]
>>> ret = RC(t)
>>> ret.to_tensor_product_of_kirillov_reshetikhin_crystals()
[[++++, []], [+++-, [[1], [2], [4], [-4]]]]
```

Element

alias of *KRRCSimplyLacedElement*

classically_highest_weight_vectors()

Return the classically highest weight elements of `self`.

fermionic_formula(*q=None*, *only_highest_weight=False*, *weight=None*)

Return the fermionic formula associated to `self`.

Given a set of rigged configurations $RC(\lambda, L)$, the fermionic formula is defined as:

$$M(\lambda, L; q) = \sum_{(\nu, J)} q^{cc(\nu, J)}$$

where we sum over all (classically highest weight) rigged configurations of weight λ where cc is the `cocharge statistic`. This is known to reduce to

$$M(\lambda, L; q) = \sum_{\nu} q^{cc(\nu)} \prod_{(a,i) \in I \times \mathbf{Z}} \begin{bmatrix} p_i^{(a)} + m_i^{(a)} \\ m_i^{(a)} \end{bmatrix}_q .$$

The generating function of $M(\lambda, L; q)$ in the weight algebra subsumes all fermionic formulas:

$$M(L; q) = \sum_{\lambda \in P} M(\lambda, L; q) \lambda.$$

This is conjecturally equal to the `one dimensional configuration sum` of the corresponding tensor product of Kirillov-Reshetikhin crystals, see [HKOTT2002]. This has been proven in general for type $A_n^{(1)}$ [BijectionLRT], single factors $B^{r,s}$ in type $D_n^{(1)}$ [OSS2011] with the result from [Sakamoto13], as well as for a tensor product of single columns [OSS2003], [BijectionDn] or a tensor product of single rows [OSS03] for all non-exceptional types.

INPUT:

- `q` – the variable q
- `only_highest_weight` – use only the classically highest weight rigged configurations
- `weight` – return the fermionic formula $M(\lambda, L; q)$ where λ is the classical weight `weight`

```

kleber_tree()

Return the underlying Kleber tree used to generate all highest weight rigged configurations.

EXAMPLES:

```
sage: RC = RiggedConfigurations(['A',3,1], [[1,1], [2,1]])
sage: RC.kleber_tree()
Kleber tree of Cartan type ['A', 3, 1] and B = ((1, 1), (2, 1))
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['A',Integer(3),Integer(1)], [[Integer(1),
↪Integer(1)], [Integer(2),Integer(1)]])
>>> RC.kleber_tree()
Kleber tree of Cartan type ['A', 3, 1] and B = ((1, 1), (2, 1))
```

module_generators()

Module generators for this set of rigged configurations.

Iterate over the highest weight rigged configurations by moving through the `KleberTree` and then setting appropriate values of the partitions.

EXAMPLES:

```
sage: RC = RiggedConfigurations(['D', 4, 1], [[2,1]])
sage: for x in RC.module_generators: x

(/)

(/)

(/)

(/)

0[ ]0

0[ ]0
0[ ]0

0[ ]0

0[ ]0

0[ ]0
<BLANKLINE>
```

options = Current options for RiggedConfigurations - convention: English - display: vertical - element_ascii_art: True - half_width_boxes_type_B: True

tensor(**crystals*, ***options*)

Return the tensor product of `self` with `crystals`.

If `crystals` is a list of rigged configurations of the same Cartan type, then this returns a new *RiggedConfigurations*.

EXAMPLES:

```
sage: RC = RiggedConfigurations(['A', 3, 1], [[2,1],[1,3]])
sage: RC2 = RiggedConfigurations(['A', 3, 1], [[1,1], [3,3]])
sage: RC.tensor(RC2, RC2)
Rigged configurations of type ['A', 3, 1]
 and factor(s) ((2, 1), (1, 3), (1, 1), (3, 3), (1, 1), (3, 3))

sage: K = crystals.KirillovReshetikhin(['A', 3, 1], 2, 2, model='KR')
sage: RC.tensor(K)
Full tensor product of the crystals
 [Rigged configurations of type ['A', 3, 1] and factor(s) ((2, 1), (1, 3)),
  Kirillov-Reshetikhin tableaux of type ['A', 3, 1] and shape (2, 2)]
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['A', Integer(3), Integer(1)], [[Integer(2),
↪Integer(1)],[Integer(1),Integer(3)]])
>>> RC2 = RiggedConfigurations(['A', Integer(3), Integer(1)], [[Integer(1),
↪Integer(1)], [Integer(3),Integer(3)]])
>>> RC.tensor(RC2, RC2)
Rigged configurations of type ['A', 3, 1]
 and factor(s) ((2, 1), (1, 3), (1, 1), (3, 3), (1, 1), (3, 3))

>>> K = crystals.KirillovReshetikhin(['A', Integer(3), Integer(1)],
↪Integer(2), Integer(2), model='KR')
>>> RC.tensor(K)
Full tensor product of the crystals
 [Rigged configurations of type ['A', 3, 1] and factor(s) ((2, 1), (1, 3)),
  Kirillov-Reshetikhin tableaux of type ['A', 3, 1] and shape (2, 2)]
```

tensor_product_of_kirillov_reshetikhin_crystals()

Return the corresponding tensor product of Kirillov-Reshetikhin crystals.

EXAMPLES:

```
sage: RC = RiggedConfigurations(['A', 3, 1], [[3,1],[2,2]])
sage: RC.tensor_product_of_kirillov_reshetikhin_crystals()
Full tensor product of the crystals
[Kirillov-Reshetikhin crystal of type ['A', 3, 1] with (r,s)=(3,1),
 Kirillov-Reshetikhin crystal of type ['A', 3, 1] with (r,s)=(2,2)]
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['A', Integer(3), Integer(1)], [[Integer(3),
↪Integer(1)],[Integer(2),Integer(2)]])
>>> RC.tensor_product_of_kirillov_reshetikhin_crystals()
Full tensor product of the crystals
[Kirillov-Reshetikhin crystal of type ['A', 3, 1] with (r,s)=(3,1),
 Kirillov-Reshetikhin crystal of type ['A', 3, 1] with (r,s)=(2,2)]
```

tensor_product_of_kirillov_reshetikhin_tableaux()

Return the corresponding tensor product of Kirillov-Reshetikhin tableaux.

EXAMPLES:

```
sage: RC = RiggedConfigurations(['A', 3, 1], [[3, 2], [1, 2]])
sage: RC.tensor_product_of_kirillov_reshetikhin_tableaux()
Tensor product of Kirillov-Reshetikhin tableaux of type ['A', 3, 1] and
↪factor(s) ((3, 2), (1, 2))
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['A', Integer(3), Integer(1)], [[Integer(3),
↪Integer(2)], [Integer(1), Integer(2)]])
>>> RC.tensor_product_of_kirillov_reshetikhin_tableaux()
Tensor product of Kirillov-Reshetikhin tableaux of type ['A', 3, 1] and
↪factor(s) ((3, 2), (1, 2))
```

5.1.216 Rigged Partitions

Class and methods of the rigged partition which are used by the rigged configuration class. This is an internal class used by the rigged configurations and KR tableaux during the bijection, and is not to be used by the end-user.

We hold the partitions as a 1-dim array of positive integers where each value corresponds to the length of the row. This is the shape of the partition which can be accessed by the regular index.

The data for the vacancy number is also stored in a 1-dim array which each entry corresponds to the row of the tableau, and similarly for the partition values.

AUTHORS:

- Travis Scrimshaw (2010-09-26): Initial version

Todo

Convert this to using multiplicities m_i (perhaps with a dictionary?)?

class sage.combinat.rigged_configurations.rigged_partition.**RiggedPartition**

Bases: SageObject

The RiggedPartition class which is the data structure of a rigged (i.e. marked or decorated) Young diagram of a partition.

Note that this class as a stand-alone object does not make sense since the vacancy numbers are calculated using the entire rigged configuration. For more, see *RiggedConfigurations*.

EXAMPLES:

```
sage: RC = RiggedConfigurations(['A', 4, 1], [[2, 2]])
sage: RP = RC(partition_list=[[2],[2,2],[2,1],[2]])[2]
sage: RP

>>> RP
 0[ ][ ]0
-1[ ]-1
<BLANKLINE>
```

get_num_cells_to_column(*end_column*, *t=1*)

Get the number of cells in all columns before the `end_column`.

INPUT:

- `end_column` – the index of the column to end at
- `t` – the scaling factor

OUTPUT: the number of cells

EXAMPLES:

```
sage: RC = RiggedConfigurations(['A', 4, 1], [[2, 2]])
sage: RP = RC(partition_list=[[2],[2,2],[2,1],[2]])[2]
sage: RP.get_num_cells_to_column(1)
2
sage: RP.get_num_cells_to_column(2)
3
sage: RP.get_num_cells_to_column(3)
3
sage: RP.get_num_cells_to_column(3, 2)
5
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['A', Integer(4), Integer(1)], [[Integer(2),␣
↪Integer(2)]])
>>> RP = RC(partition_list=[[Integer(2)],[Integer(2),Integer(2)],[Integer(2),
↪Integer(1)],[Integer(2)]])[Integer(2)]
>>> RP.get_num_cells_to_column(Integer(1))
2
>>> RP.get_num_cells_to_column(Integer(2))
3
>>> RP.get_num_cells_to_column(Integer(3))
3
>>> RP.get_num_cells_to_column(Integer(3), Integer(2))
5
```

insert_cell(*max_width*)

Insert a cell given at a singular value as long as its less than the specified width.

Note that *insert_cell()* does not update riggings or vacancy numbers, but it does prepare the space for them. Returns the width of the row we inserted at.

INPUT:

- `max_width` – the maximum width (i.e. row length) that we can insert the cell at

OUTPUT: the width of the row we inserted at

EXAMPLES:

```
sage: RC = RiggedConfigurations(['A', 4, 1], [[2, 2]])
sage: RP = RC(partition_list=[[2],[2,2],[2,1],[2]])[2]
sage: RP.insert_cell(2)
2
sage: RP
 0[ ][ ][ ]None
-1[ ]-1
```

```
>>> from sage.all import *
>>> RC = RiggedConfigurations(['A', Integer(4), Integer(1)], [[Integer(2),␣
→Integer(2)]])
>>> RP = RC(partition_list=[[Integer(2)],[Integer(2),Integer(2)],[Integer(2),
→Integer(1)],[Integer(2)]])[Integer(2)]
>>> RP.insert_cell(Integer(2))
2
>>> RP
 0[ ][ ][ ]None
-1[ ]-1
<BLANKLINE>
```

remove_cell(*row*, *num_cells=1*)

Removes a cell at the specified `row`.

Note that *remove_cell()* does not set/update the vacancy numbers or the riggings, but guarantees that the location has been allocated in the returned index.

INPUT:

- `row` – the row to remove the cell from
- `num_cells` – (default: 1) the number of cells to remove

OUTPUT:

- The location of the newly constructed row or `None` if unable to remove row or if deleted a row.

EXAMPLES:

```
sage: RC = RiggedConfigurations(['A', 4, 1], [[2, 2]])
sage: RP = RC(partition_list=[[2],[2,2],[2,1],[2]])[2]
sage: RP.remove_cell(0)
0
sage: RP
 None[ ]None

vacancy_numbers

class sage.combinat.rigged_configurations.rigged_partition.**RiggedPartitionTypeB**

Bases: *RiggedPartition*

Rigged partitions for type $B_n^{(1)}$ which has special printing rules which comes from the fact that the n-th partition can have columns of width $\frac{1}{2}$.

5.1.217 Tensor Product of Kirillov-Reshetikhin Tableaux

A tensor product of *KirillovReshetikhinTableaux* which are tableaux of r rows and s columns which naturally arise in the bijection between rigged configurations and tableaux and which are in bijection with the elements of the Kirillov-Reshetikhin crystal $B^{r,s}$, see *KirillovReshetikhinCrystal()*.

AUTHORS:

- Travis Scrimshaw (2010-09-26): Initial version

EXAMPLES:

Type $A_n^{(1)}$ examples:

```
sage: KRT = crystals.TensorProductOfKirillovReshetikhinTableaux(['A',3,1], [[3,1], [2,
↪1]])
sage: KRT
Tensor product of Kirillov-Reshetikhin tableaux of type ['A', 3, 1] and factor(s) ((3,
↪ 1), (2, 1))
sage: KRT.cardinality()
24
sage: KRT = crystals.TensorProductOfKirillovReshetikhinTableaux(['A',3,1], [[1,1], [2,
↪1], [3,1]])
sage: KRT
Tensor product of Kirillov-Reshetikhin tableaux of type ['A', 3, 1] and factor(s) ((1,
↪ 1), (2, 1), (3, 1))
sage: len(KRT.module_generators)

>>> T2
[[1]] (X) [[-2], [2]] (X) [[1]]
>>> T == T2
False
```

class sage.combinat.rigged_configurations.tensor_product_kr_tableaux.**HighestWeightTensorKRT**(*tp_krt*)

Bases: UniqueRepresentation

Class so we do not have to build the module generators for *TensorProductOfKirillovReshetikhinTableaux* at initialization.

Warning

This class is for internal use only!

cardinality()

Return the cardinality of `self`, which is the number of highest weight elements.

EXAMPLES:

```
sage: KRT = crystals.TensorProductOfKirillovReshetikhinTableaux(['D',4,1],
↪[[2,2]])
sage: from sage.combinat.rigged_configurations.tensor_product_kr_tableaux
↪import HighestWeightTensorKRT
sage: HW = HighestWeightTensorKRT(KRT)
sage: HW.cardinality()
3
sage: len(HW)
3
sage: len(KRT.module_generators)
3
```

```
>>> from sage.all import *
>>> KRT = crystals.TensorProductOfKirillovReshetikhinTableaux(['D',Integer(4),
↪Integer(1)], [[Integer(2),Integer(2)]])
>>> from sage.combinat.rigged_configurations.tensor_product_kr_tableaux
↪import HighestWeightTensorKRT
>>> HW = HighestWeightTensorKRT(KRT)
>>> HW.cardinality()
3
>>> len(HW)
3
>>> len(KRT.module_generators)
3
```

class sage.combinat.rigged_configurations.tensor_product_kr_tableaux.**TensorProductOfKirillovReshetikh**

Bases: *FullTensorProductOfRegularCrystals*

A tensor product of *KirillovReshetikhinTableaux*.

Through the bijection with rigged configurations, the tableaux that are produced in all nonexceptional types are all of rectangular shapes and do not necessarily obey the usual strict increase in columns and weak increase in rows. The relation between the elements of the Kirillov-Reshetikhin crystal, given by the Kashiwara-Nakashima tableaux, and the Kirillov-Reshetikhin tableaux is given by a filling map.

Note

The tableaux for all non-simply-laced types are provably correct if the bijection with *rigged configurations* holds. Therefore this is currently only proven for $B^{r,1}$ or $B^{1,s}$ and in general for types $A_n^{(1)}$ and $D_n^{(1)}$.

For more information see [OSS2011] and *KirillovReshetikhinTableaux*.

For more information on KR crystals, see `sage.combinat.crystals.kirillov_reshetikhin`.

INPUT:

- `cartan_type` – a Cartan type
- `B` – an (ordered) list of pairs (r, s) which give the dimension of a rectangle with r rows and s columns and corresponds to a Kirillov-Reshetikhin tableaux factor of $B^{r,s}$.

REFERENCES:

EXAMPLES:

We can go between tensor products of KR crystals and rigged configurations:

```
sage: KRT = crystals.TensorProductOfKirillovReshetikhinTableaux(['A',3,1], [[3,1],
↪[2,2]])
sage: tp_krt = KRT(pathlist=[[3,2,1],[3,2,3,2]]); tp_krt
[[1], [2], [3]] (X) [[2, 2], [3, 3]]
sage: RC = RiggedConfigurations(['A',3,1], [[3,1],[2,2]])
sage: rc_elt = tp_krt.to_rigged_configuration(); rc_elt

-2[ ][ ]-2

0[ ][ ]0

(/)

sage: tp_krc = tp_krt.to_tensor_product_of_kirillov_reshetikhin_crystals(); tp_krc
[[[1], [2], [3]], [[2, 2], [3, 3]]]
sage: KRT(tp_krc) == tp_krt
True
sage: rc_elt == tp_krt.to_rigged_configuration()
True
sage: KR1 = crystals.KirillovReshetikhin(['A',3,1], 3,1)
sage: KR2 = crystals.KirillovReshetikhin(['A',3,1], 2,2)
sage: T = crystals.TensorProduct(KR1, KR2)
sage: t = T(KR1(3,2,1), KR2(3,2,3,2))
sage: KRT(t) == tp_krt
True
sage: t == tp_krc
True
```

```
>>> from sage.all import *
>>> KRT = crystals.TensorProductOfKirillovReshetikhinTableaux(['A',Integer(3),
↪Integer(1)], [[Integer(3),Integer(1)],[Integer(2),Integer(2)]])
>>> tp_krt = KRT(pathlist=[[Integer(3),Integer(2),Integer(1)],[Integer(3),
↪Integer(2),Integer(3),Integer(2)]]); tp_krt
[[1], [2], [3]] (X) [[2, 2], [3, 3]]
>>> RC = RiggedConfigurations(['A',Integer(3),Integer(1)], [[Integer(3),
↪Integer(1)],[Integer(2),Integer(2)]])
>>> rc_elt = tp_krt.to_rigged_configuration(); rc_elt
<BLANKLINE>
-2[ ][ ]-2
<BLANKLINE>
0[ ][ ]0
```

(continues on next page)

(continued from previous page)

```
<BLANKLINE>
(/)
<BLANKLINE>
>>> tp_krc = tp_krt.to_tensor_product_of_kirillov_reshetikhin_crystals(); tp_krc
[[[1], [2], [3]], [[2, 2], [3, 3]]]
>>> KRT(tp_krc) == tp_krt
True
>>> rc_elt == tp_krt.to_rigged_configuration()
True
>>> KR1 = crystals.KirillovReshetikhin(['A',Integer(3),Integer(1)], Integer(3),
↪Integer(1))
>>> KR2 = crystals.KirillovReshetikhin(['A',Integer(3),Integer(1)], Integer(2),
↪Integer(2))
>>> T = crystals.TensorProduct(KR1, KR2)
>>> t = T(KR1(Integer(3),Integer(2),Integer(1)), KR2(Integer(3),Integer(2),
↪Integer(3),Integer(2)))
>>> KRT(t) == tp_krt
True
>>> t == tp_krc
True
```

We can get the highest weight elements by using the attribute `module_generators`:

```
sage: KRT = crystals.TensorProductOfKirillovReshetikhinTableaux(['A',3,1], [[3,1],
↪ [2,1]])
sage: list(KRT.module_generators)
[[[1], [2], [3]] (X) [[1], [2]], [[1], [3], [4]] (X) [[1], [2]]]
```

```
>>> from sage.all import *
>>> KRT = crystals.TensorProductOfKirillovReshetikhinTableaux(['A',Integer(3),
↪Integer(1)], [[Integer(3),Integer(1)], [Integer(2),Integer(1)]])
>>> list(KRT.module_generators)
[[[1], [2], [3]] (X) [[1], [2]], [[1], [3], [4]] (X) [[1], [2]]]
```

To create elements directly (i.e. not passing in KR tableaux elements), there is the **pathlist** option will receive a list of lists which contain the reversed far-eastern reading word of the tableau. That is to say, in English notation, the word obtain from reading bottom-to-top, left-to-right.

```
sage: KRT = crystals.TensorProductOfKirillovReshetikhinTableaux(['A',3,1], [[3,2],
↪ [1,2], [2,1]])
sage: elt = KRT(pathlist=[[3, 2, 1, 4, 2, 1], [1, 3], [3, 1]])
sage: elt.pp()
  1  1 (X)   1  3 (X)   1
  2  2                  3
  3  4
```

```
>>> from sage.all import *
>>> KRT = crystals.TensorProductOfKirillovReshetikhinTableaux(['A',Integer(3),
↪Integer(1)], [[Integer(3),Integer(2)], [Integer(1),Integer(2)], [Integer(2),
↪Integer(1)]])
>>> elt = KRT(pathlist=[[Integer(3), Integer(2), Integer(1), Integer(4),␣
↪Integer(2), Integer(1)], [Integer(1), Integer(3)], [Integer(3), Integer(1)]])
```

(continues on next page)

(continued from previous page)

```
>>> elt.pp()
  1  1 (X)   1  3 (X)   1
  2  2                  3
  3  4
```

One can still create elements in the same way as tensor product of crystals:

```
sage: K1 = crystals.KirillovReshetikhin(['A',3,1], 3, 2, model='KR')
sage: K2 = crystals.KirillovReshetikhin(['A',3,1], 1, 2, model='KR')
sage: K3 = crystals.KirillovReshetikhin(['A',3,1], 2, 1, model='KR')
sage: eltlong = KRT(K1(3, 2, 1, 4, 2, 1), K2(1, 3), K3(3, 1))
sage: eltlong == elt
True
```

```
>>> from sage.all import *
>>> K1 = crystals.KirillovReshetikhin(['A',Integer(3),Integer(1)], Integer(3),␣
↪Integer(2), model='KR')
>>> K2 = crystals.KirillovReshetikhin(['A',Integer(3),Integer(1)], Integer(1),␣
↪Integer(2), model='KR')
>>> K3 = crystals.KirillovReshetikhin(['A',Integer(3),Integer(1)], Integer(2),␣
↪Integer(1), model='KR')
>>> eltlong = KRT(K1(Integer(3), Integer(2), Integer(1), Integer(4), Integer(2),␣
↪Integer(1)), K2(Integer(1), Integer(3)), K3(Integer(3), Integer(1)))
>>> eltlong == elt
True
```

Element

alias of *TensorProductOfKirillovReshetikhinTableauxElement*

rigged_configurations()

Return the corresponding set of rigged configurations.

EXAMPLES:

```
sage: KRT = crystals.TensorProductOfKirillovReshetikhinTableaux(['A',3,1],␣
↪[[1,3], [2,1]])
sage: KRT.rigged_configurations()
Rigged configurations of type ['A', 3, 1] and factor(s) ((1, 3), (2, 1))
```

```
>>> from sage.all import *
>>> KRT = crystals.TensorProductOfKirillovReshetikhinTableaux(['A',Integer(3),
↪Integer(1)], [[Integer(1),Integer(3)], [Integer(2),Integer(1)]])
>>> KRT.rigged_configurations()
Rigged configurations of type ['A', 3, 1] and factor(s) ((1, 3), (2, 1))
```

tensor(**crystals*, ***options*)

Return the tensor product of `self` with `crystals`.

If `crystals` is a list of (a tensor product of) KR tableaux, this returns a *TensorProductOfKirillovReshetikhinTableaux*.

EXAMPLES:

```
sage: TP = crystals.TensorProductOfKirillovReshetikhinTableaux(['A', 3, 1],
↪[[1,3],[3,1]])
sage: K = crystals.KirillovReshetikhin(['A', 3, 1], 2, 2, model='KR')
sage: TP.tensor(K, TP)
Tensor product of Kirillov-Reshetikhin tableaux of type ['A', 3, 1]
 and factor(s) ((1, 3), (3, 1), (2, 2), (1, 3), (3, 1))

sage: C = crystals.KirillovReshetikhin(['A',3,1], 3, 1, model='KN')
sage: TP.tensor(K, C)
Full tensor product of the crystals
 [Kirillov-Reshetikhin tableaux of type ['A', 3, 1] and shape (1, 3),
  Kirillov-Reshetikhin tableaux of type ['A', 3, 1] and shape (3, 1),
  Kirillov-Reshetikhin tableaux of type ['A', 3, 1] and shape (2, 2),
  Kirillov-Reshetikhin crystal of type ['A', 3, 1] with (r,s)=(3,1)]
```

```
>>> from sage.all import *
>>> TP = crystals.TensorProductOfKirillovReshetikhinTableaux(['A', Integer(3),
↪ Integer(1)], [[Integer(1),Integer(3)],[Integer(3),Integer(1)]])
>>> K = crystals.KirillovReshetikhin(['A', Integer(3), Integer(1)],
↪Integer(2), Integer(2), model='KR')
>>> TP.tensor(K, TP)
Tensor product of Kirillov-Reshetikhin tableaux of type ['A', 3, 1]
 and factor(s) ((1, 3), (3, 1), (2, 2), (1, 3), (3, 1))

>>> C = crystals.KirillovReshetikhin(['A',Integer(3),Integer(1)], Integer(3),
↪Integer(1), model='KN')
>>> TP.tensor(K, C)
Full tensor product of the crystals
 [Kirillov-Reshetikhin tableaux of type ['A', 3, 1] and shape (1, 3),
  Kirillov-Reshetikhin tableaux of type ['A', 3, 1] and shape (3, 1),
  Kirillov-Reshetikhin tableaux of type ['A', 3, 1] and shape (2, 2),
  Kirillov-Reshetikhin crystal of type ['A', 3, 1] with (r,s)=(3,1)]
```

tensor_product_of_kirillov_reshetikhin_crystals()

Return the corresponding tensor product of Kirillov-Reshetikhin crystals.

EXAMPLES:

```
sage: KRT = crystals.TensorProductOfKirillovReshetikhinTableaux(['A',3,1],
↪[[3,1],[2,2]])
sage: KRT.tensor_product_of_kirillov_reshetikhin_crystals()
Full tensor product of the crystals [Kirillov-Reshetikhin crystal of type ['A
↪', 3, 1] with (r,s)=(3,1),
Kirillov-Reshetikhin crystal of type ['A', 3, 1] with (r,s)=(2,2)]
```

```
>>> from sage.all import *
>>> KRT = crystals.TensorProductOfKirillovReshetikhinTableaux(['A',Integer(3),
↪Integer(1)], [[Integer(3),Integer(1)],[Integer(2),Integer(2)]])
>>> KRT.tensor_product_of_kirillov_reshetikhin_crystals()
Full tensor product of the crystals [Kirillov-Reshetikhin crystal of type ['A
↪', 3, 1] with (r,s)=(3,1),
Kirillov-Reshetikhin crystal of type ['A', 3, 1] with (r,s)=(2,2)]
```

5.1.218 Tensor Product of Kirillov-Reshetikhin Tableaux Elements

A tensor product of *KirillovReshetikhinTableauxElement*.

AUTHORS:

- Travis Scrimshaw (2010-09-26): Initial version

class sage.combinat.rigged_configurations.tensor_product_kr_tableaux_element.**TensorProductOfKirillovR**

Bases: *TensorProductOfRegularCrystalsElement*

An element in a tensor product of Kirillov-Reshetikhin tableaux.

For more on tensor product of Kirillov-Reshetikhin tableaux, see *TensorProductOfKirillovReshetikhinTableaux*.

The most common way to construct an element is to specify the option `pathlist` which is a list of lists which will be used to generate the individual factors of *KirillovReshetikhinTableauxElement*.

EXAMPLES:

Type $A_n^{(1)}$ examples:

```
sage: KRT = crystals.TensorProductOfKirillovReshetikhinTableaux(['A', 3, 1], [[1,
→1], [2,1], [1,1], [2,1], [2,1], [2,1]])
sage: T = KRT(pathlist=[[2], [4,1], [3], [4,2], [3,1], [2,1]])
sage: T

```

classical_weight()

Return the classical weight of `self`.

EXAMPLES:

```
sage: KRT = crystals.TensorProductOfKirillovReshetikhinTableaux(['D',4,1],␣
↪[[2,2]])
sage: elt = KRT(pathlist=[[3,2,-1,1]]); elt
[[2, 1], [3, -1]]
sage: elt.classical_weight()
(0, 1, 1, 0)
sage: KRT = crystals.TensorProductOfKirillovReshetikhinTableaux(['A',3,1],␣
↪[[2,2],[1,3]])
sage: elt = KRT(pathlist=[[2,1,3,2],[1,4,4]]); elt
[[1, 2], [2, 3]] (X) [[1, 4, 4]]
sage: elt.classical_weight()
(2, 2, 1, 2)
```

```
>>> from sage.all import *
>>> KRT = crystals.TensorProductOfKirillovReshetikhinTableaux(['D',Integer(4),
↪Integer(1)], [[Integer(2),Integer(2)]])
>>> elt = KRT(pathlist=[[Integer(3),Integer(2),-Integer(1),Integer(1)]]); elt
[[2, 1], [3, -1]]
>>> elt.classical_weight()
(0, 1, 1, 0)
>>> KRT = crystals.TensorProductOfKirillovReshetikhinTableaux(['A',Integer(3),
↪Integer(1)], [[Integer(2),Integer(2)],[Integer(1),Integer(3)]])
>>> elt = KRT(pathlist=[[Integer(2),Integer(1),Integer(3),Integer(2)],
↪[Integer(1),Integer(4),Integer(4)]]); elt
[[1, 2], [2, 3]] (X) [[1, 4, 4]]
>>> elt.classical_weight()
(2, 2, 1, 2)
```

left_split()

Return the image of `self` under the left column splitting map.

EXAMPLES:

```
sage: KRT = crystals.TensorProductOfKirillovReshetikhinTableaux(['A',3,1],
↪[[2,2],[1,3]])
sage: elt = KRT(pathlist=[[2,1,3,2],[1,4,4]]); elt.pp()
  1  2 (X)   1  4  4
  2  3
sage: elt.left_split().pp()
  1 (X)   2 (X)   1  4  4
  2       3
```

```
>>> from sage.all import *
>>> KRT = crystals.TensorProductOfKirillovReshetikhinTableaux(['A',Integer(3),
↪Integer(1)], [[Integer(2),Integer(2)],[Integer(1),Integer(3)]])
>>> elt = KRT(pathlist=[[Integer(2),Integer(1),Integer(3),Integer(2)],
↪[Integer(1),Integer(4),Integer(4)]]); elt.pp()
  1  2 (X)   1  4  4
  2  3
>>> elt.left_split().pp()
  1 (X)   2 (X)   1  4  4
  2       3
```

lusztig_involution()

Return the result of the classical Lusztig involution on `self`.

EXAMPLES:

```
sage: KRT = crystals.TensorProductOfKirillovReshetikhinTableaux(['A',3,1],
↪[[2,2],[1,3]])
sage: elt = KRT(pathlist=[[2,1,3,2],[1,4,4]])
sage: li = elt.lusztig_involution(); li
[[1, 1, 4]] (X) [[2, 3], [3, 4]]
sage: li.parent()
Tensor product of Kirillov-Reshetikhin tableaux of type ['A', 3, 1] and
↪factor(s) ((1, 3), (2, 2))
```

```
>>> from sage.all import *
>>> KRT = crystals.TensorProductOfKirillovReshetikhinTableaux(['A',Integer(3),
↪Integer(1)], [[Integer(2),Integer(2)],[Integer(1),Integer(3)]])
>>> elt = KRT(pathlist=[[Integer(2),Integer(1),Integer(3),Integer(2)],
↪[Integer(1),Integer(4),Integer(4)]])
>>> li = elt.lusztig_involution(); li
[[1, 1, 4]] (X) [[2, 3], [3, 4]]
>>> li.parent()
Tensor product of Kirillov-Reshetikhin tableaux of type ['A', 3, 1] and
↪factor(s) ((1, 3), (2, 2))
```

pp()

Pretty print `self`.

EXAMPLES:

```
sage: TPKRT = crystals.TensorProductOfKirillovReshetikhinTableaux(['A',4,1],
↪[[2,2],[3,1],[3,3]])
sage: TPKRT.module_generators[0].pp()
```

(continues on next page)

(continued from previous page)

```
  1  1 (X)   1 (X)   1  1  1
  2  2       2       2  2  2
             3       3  3  3
```

```
>>> from sage.all import *
>>> TPKRT = crystals.TensorProductOfKirillovReshetikhinTableaux(['A',
↪Integer(4),Integer(1)], [[Integer(2),Integer(2)],[Integer(3),Integer(1)],
↪[Integer(3),Integer(3)]])
>>> TPKRT.module_generators[Integer(0)].pp()
  1  1 (X)   1 (X)   1  1  1
  2  2       2       2  2  2
             3       3  3  3
```

right_split()

Return the image of `self` under the right column splitting map.

EXAMPLES:

```
sage: KRT = crystals.TensorProductOfKirillovReshetikhinTableaux(['A',3,1],
↪[[2,2],[1,3]])
sage: elt = KRT(pathlist=[[2,1,3,2],[1,4,4]]); elt.pp()
  1  2 (X)   1  4  4
  2  3
sage: elt.right_split().pp()
  1  2 (X)   1  4 (X)   4
  2  3
```

```
>>> from sage.all import *
>>> KRT = crystals.TensorProductOfKirillovReshetikhinTableaux(['A',Integer(3),
↪Integer(1)], [[Integer(2),Integer(2)],[Integer(1),Integer(3)]])
>>> elt = KRT(pathlist=[[Integer(2),Integer(1),Integer(3),Integer(2)],
↪[Integer(1),Integer(4),Integer(4)]]); elt.pp()
  1  2 (X)   1  4  4
  2  3
>>> elt.right_split().pp()
  1  2 (X)   1  4 (X)   4
  2  3
```

Let $*$ denote the `Lusztig involution`, we check that $* \circ \mathrm{ls} \circ * = \mathrm{rs}$:

```
sage: all(x.lusztig_involution().left_split().lusztig_involution() == x.right_
↪split() for x in KRT)
True
```

```
>>> from sage.all import *
>>> all(x.lusztig_involution().left_split().lusztig_involution() == x.right_
↪split() for x in KRT)
True
```

to_rigged_configuration(*display_steps=False*)

Perform the bijection from `self` to a `rigged configuration` which is described in [RigConBijection], [BijectionLRT], and [BijectionDn].

> **Note**
>
> This is only proven to be a bijection in types $A_n^{(1)}$ and $D_n^{(1)}$, as well as $\bigotimes_i B^{r_i,1}$ and $\bigotimes_i B^{1,s_i}$ for general affine types.

INPUT:

- `display_steps` – boolean (default: `False`); whether to output each step in the algorithm

OUTPUT: the rigged configuration corresponding to `self`

EXAMPLES:

Type $A_n^{(1)}$ example:

```
sage: KRT = crystals.TensorProductOfKirillovReshetikhinTableaux(['A', 3, 1],␣
↪[[2,1], [2,1], [2,1]])
sage: T = KRT(pathlist=[[4, 2], [3, 1], [2, 1]])
sage: T
[[2], [4]] (X) [[1], [3]] (X) [[1], [2]]
sage: T.to_rigged_configuration()

0[ ]0
<BLANKLINE>
0[ ][ ]0
0[ ]0
<BLANKLINE>
0[ ]0
<BLANKLINE>
0[ ][ ]0
<BLANKLINE>
```

This is invertible by calling `to_tensor_product_of_kirillov_reshetikhin_tableaux()`:

```
sage: KRT = crystals.TensorProductOfKirillovReshetikhinTableaux(['D', 4, 1],␣
↪[[2,2]])
sage: T = KRT(pathlist=[[2,1,4,3]])
sage: rc = T.to_rigged_configuration()
sage: ret = rc.to_tensor_product_of_kirillov_reshetikhin_tableaux(); ret
[[1, 3], [2, 4]]
sage: ret == T
True
```

```
>>> from sage.all import *
>>> KRT = crystals.TensorProductOfKirillovReshetikhinTableaux(['D',␣
↪Integer(4), Integer(1)], [[Integer(2),Integer(2)]])
>>> T = KRT(pathlist=[[Integer(2),Integer(1),Integer(4),Integer(3)]])
>>> rc = T.to_rigged_configuration()
>>> ret = rc.to_tensor_product_of_kirillov_reshetikhin_tableaux(); ret
[[1, 3], [2, 4]]
>>> ret == T
True
```

to_tensor_product_of_kirillov_reshetikhin_crystals()

Return a tensor product of Kirillov-Reshetikhin crystals corresponding to `self`.

This works by performing the filling map on each individual factor. For more on the filling map, see *KirillovReshetikhinTableaux*.

EXAMPLES:

```
sage: KRT = crystals.TensorProductOfKirillovReshetikhinTableaux(['D',4,1],␣
↪[[1,1],[2,2]])
sage: elt = KRT(pathlist=[[-1],[-1,2,-1,1]]); elt
```

(continues on next page)

(continued from previous page)

```
[[-1]] (X) [[2, 1], [-1, -1]]
sage: tp_krc = elt.to_tensor_product_of_kirillov_reshetikhin_crystals(); tp_
↪krc
[[[-1]], [[2], [-1]]]
```

```
>>> from sage.all import *
>>> KRT = crystals.TensorProductOfKirillovReshetikhinTableaux(['D',Integer(4),
↪Integer(1)], [[Integer(1),Integer(1)],[Integer(2),Integer(2)]])
>>> elt = KRT(pathlist=[[-Integer(1)],[-Integer(1),Integer(2),-Integer(1),
↪Integer(1)]]); elt
[[-1]] (X) [[2, 1], [-1, -1]]
>>> tp_krc = elt.to_tensor_product_of_kirillov_reshetikhin_crystals(); tp_krc
[[[-1]], [[2], [-1]]]
```

We can recover the original tensor product of KR tableaux:

```
sage: ret = KRT(tp_krc); ret
[[-1]] (X) [[2, 1], [-1, -1]]
sage: ret == elt
True
```

```
>>> from sage.all import *
>>> ret = KRT(tp_krc); ret
[[-1]] (X) [[2, 1], [-1, -1]]
>>> ret == elt
True
```

5.1.220 Ambient lattices and ambient spaces

class sage.combinat.root_system.ambient_space.**AmbientSpace**(*root_system*, *base_ring*, *index_set=None*)

Bases: *CombinatorialFreeModule*

Abstract class for ambient spaces.

All subclasses should implement a class method `smallest_base_ring` taking a Cartan type as input, and a method `dimension` working on a partially initialized instance with just `root_system` as attribute. There is no safe default implementation for the later, so none is provided.

EXAMPLES:

```
sage: AL = RootSystem(['A',2]).ambient_lattice()
```

```
>>> from sage.all import *
>>> AL = RootSystem(['A',Integer(2)]).ambient_lattice()
```

Note

This is only used so far for finite root systems.

Caveat: Most of the ambient spaces currently have a basis indexed by $0, \ldots, n$, unlike the usual mathematical convention:

```
sage: e = AL.basis()
sage: e[0], e[1], e[2]
((1, 0, 0), (0, 1, 0), (0, 0, 1))
```

```
>>> from sage.all import *
>>> e = AL.basis()
>>> e[Integer(0)], e[Integer(1)], e[Integer(2)]
((1, 0, 0), (0, 1, 0), (0, 0, 1))
```

This will be cleaned up!

- *sage.combinat.root_system.type_affine.AmbientSpace*

Element

alias of *AmbientSpaceElement*

coroot_lattice()

EXAMPLES:

```
sage: e = RootSystem(["A", 3]).ambient_lattice()
sage: e.coroot_lattice()
Ambient lattice of the Root system of type ['A', 3]
```

```
>>> from sage.all import *
>>> e = RootSystem(["A", Integer(3)]).ambient_lattice()
>>> e.coroot_lattice()
Ambient lattice of the Root system of type ['A', 3]
```

dimension()

Return the dimension of this ambient space.

EXAMPLES:

```
sage: from sage.combinat.root_system.ambient_space import AmbientSpace
sage: e = RootSystem(['F',4]).ambient_space()
sage: AmbientSpace.dimension(e)
Traceback (most recent call last):
...
NotImplementedError
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.ambient_space import AmbientSpace
>>> e = RootSystem(['F',Integer(4)]).ambient_space()
>>> AmbientSpace.dimension(e)
Traceback (most recent call last):
...
NotImplementedError
```

from_vector_notation(*weight*, *style='lattice'*)

INPUT:

- `weight` – a vector or tuple representing a weight

Returns an element of `self`. If the weight lattice is not of full rank, it coerces it into the weight lattice, or its ambient space by orthogonal projection. This arises in two cases: for SL(r+1), the weight lattice is contained in a hyperplane of codimension one in the ambient, space, and for types E6 and E7, the weight lattice is contained in a subspace of codimensions 2 or 3, respectively.

If style="coroots" and the data is a tuple of integers, it is assumed that the data represent a linear combination of fundamental weights. If style='coroots', and the root lattice is not of full rank in the ambient space, it is projected into the subspace corresponding to the semisimple derived group. This arises with Cartan type A, E6 and E7.

EXAMPLES:

```
sage: RootSystem("A2").ambient_space().from_vector_notation((1,0,0))
(1, 0, 0)
sage: RootSystem("A2").ambient_space().from_vector_notation([1,0,0])
```

(continues on next page)

(continued from previous page)

```
(1, 0, 0)
sage: RootSystem("A2").ambient_space().from_vector_notation((1,0),style=
↪'coroots')
(2/3, -1/3, -1/3)
```

```
>>> from sage.all import *
>>> RootSystem("A2").ambient_space().from_vector_notation((Integer(1),
↪Integer(0),Integer(0)))
(1, 0, 0)
>>> RootSystem("A2").ambient_space().from_vector_notation([Integer(1),
↪Integer(0),Integer(0)])
(1, 0, 0)
>>> RootSystem("A2").ambient_space().from_vector_notation((Integer(1),
↪Integer(0)),style='coroots')
(2/3, -1/3, -1/3)
```

fundamental_weight (*i*)

Return the fundamental weight Λ_i in `self`.

In several of the ambient spaces, it is more convenient to construct all fundamental weights at once. To support this, we provide this default implementation of `fundamental_weight` using the method `fundamental_weights`. Beware that this will cause a loop if neither `fundamental_weight` nor `fundamental_weights` is implemented.

EXAMPLES:

```
sage: e =  RootSystem(['F',4]).ambient_space()
sage: e.fundamental_weight(3)
(3/2, 1/2, 1/2, 1/2)

sage: e =  RootSystem(['G',2]).ambient_space()
sage: e.fundamental_weight(1)
(1, 0, -1)

sage: e =  RootSystem(['E',6]).ambient_space()
sage: e.fundamental_weight(3)
(-1/2, 1/2, 1/2, 1/2, 1/2, -5/6, -5/6, 5/6)
```

```
>>> from sage.all import *
>>> e =  RootSystem(['F',Integer(4)]).ambient_space()
>>> e.fundamental_weight(Integer(3))
(3/2, 1/2, 1/2, 1/2)

>>> e =  RootSystem(['G',Integer(2)]).ambient_space()
>>> e.fundamental_weight(Integer(1))
(1, 0, -1)

>>> e =  RootSystem(['E',Integer(6)]).ambient_space()
>>> e.fundamental_weight(Integer(3))
(-1/2, 1/2, 1/2, 1/2, 1/2, -5/6, -5/6, 5/6)
```

reflection (*root*, *coroot=None*)

EXAMPLES:

```
sage: e = RootSystem(["A", 3]).ambient_lattice()
sage: a = e.simple_root(0); a
(-1, 0, 0, 0)
sage: b = e.simple_root(1); b
(1, -1, 0, 0)
sage: s_a = e.reflection(a)
sage: s_a(b)
(0, -1, 0, 0)
```

```
>>> from sage.all import *
>>> e = RootSystem(["A", Integer(3)]).ambient_lattice()
>>> a = e.simple_root(Integer(0)); a
(-1, 0, 0, 0)
>>> b = e.simple_root(Integer(1)); b
(1, -1, 0, 0)
>>> s_a = e.reflection(a)
>>> s_a(b)
(0, -1, 0, 0)
```

simple_coroot(*i*)

Return the i-th simple coroot, as an element of this space.

EXAMPLES:

```
sage: R = RootSystem(["A",3])
sage: L = R.ambient_lattice()
sage: L.simple_coroot(1)
(1, -1, 0, 0)
sage: L.simple_coroot(2)
(0, 1, -1, 0)
sage: L.simple_coroot(3)
(0, 0, 1, -1)
```

```
>>> from sage.all import *
>>> R = RootSystem(["A",Integer(3)])
>>> L = R.ambient_lattice()
>>> L.simple_coroot(Integer(1))
(1, -1, 0, 0)
>>> L.simple_coroot(Integer(2))
(0, 1, -1, 0)
>>> L.simple_coroot(Integer(3))
(0, 0, 1, -1)
```

classmethod smallest_base_ring(*cartan_type=None*)

Return the smallest ground ring over which the ambient space can be realized.

This class method will get called with the Cartan type as input. This default implementation returns $\mathbf{Q}$; subclasses should override it as appropriate.

EXAMPLES:

```
sage: e = RootSystem(['F',4]).ambient_space()
sage: e.smallest_base_ring()
Rational Field
```

```
>>> from sage.all import *
>>> e = RootSystem(['F',Integer(4)]).ambient_space()
>>> e.smallest_base_ring()
Rational Field
```

to_ambient_space_morphism()

Return the identity map on `self`.

This is present for uniformity of use; the corresponding method for abstract root and weight lattices/spaces, is not trivial.

EXAMPLES:

```
sage: P = RootSystem(['A',2]).ambient_space()
sage: f = P.to_ambient_space_morphism()
sage: p = P.an_element()
sage: p
(2, 2, 3)
sage: f(p)
(2, 2, 3)
sage: f(p)==p
True
```

```
>>> from sage.all import *
>>> P = RootSystem(['A',Integer(2)]).ambient_space()
>>> f = P.to_ambient_space_morphism()
>>> p = P.an_element()
>>> p
(2, 2, 3)
>>> f(p)
(2, 2, 3)
>>> f(p)==p
True
```

class sage.combinat.root_system.ambient_space.**AmbientSpaceElement**

Bases: `IndexedFreeModuleElement`

associated_coroot()

EXAMPLES:

```
sage: e = RootSystem(['F',4]).ambient_space()
sage: a = e.simple_root(0); a
(1/2, -1/2, -1/2, -1/2)
sage: a.associated_coroot()
(1, -1, -1, -1)
```

```
>>> from sage.all import *
>>> e = RootSystem(['F',Integer(4)]).ambient_space()
>>> a = e.simple_root(Integer(0)); a
(1/2, -1/2, -1/2, -1/2)
>>> a.associated_coroot()
(1, -1, -1, -1)
```

coerce_to_e6()

For type E7 or E8, orthogonally projects an element of the root lattice into the E6 root lattice. This operation on weights corresponds to intersection with the semisimple subgroup E6.

EXAMPLES:

```
sage: [b.coerce_to_e6() for b in RootSystem("E8").ambient_space().basis()]
[(1, 0, 0, 0, 0, 0, 0, 0), (0, 1, 0, 0, 0, 0, 0, 0), (0, 0, 1, 0, 0, 0, 0, 0),
(0, 0, 0, 1, 0, 0, 0, 0), (0, 0, 0, 0, 1, 0, 0, 0), (0, 0, 0, 0, 0, 1/3, 1/3,
↪-1/3),
(0, 0, 0, 0, 0, 1/3, 1/3, -1/3), (0, 0, 0, 0, 0, -1/3, -1/3, 1/3)]
```

```
>>> from sage.all import *
>>> [b.coerce_to_e6() for b in RootSystem("E8").ambient_space().basis()]
[(1, 0, 0, 0, 0, 0, 0, 0), (0, 1, 0, 0, 0, 0, 0, 0), (0, 0, 1, 0, 0, 0, 0, 0),
(0, 0, 0, 1, 0, 0, 0, 0), (0, 0, 0, 0, 1, 0, 0, 0), (0, 0, 0, 0, 0, 1/3, 1/3,
↪-1/3),
(0, 0, 0, 0, 0, 1/3, 1/3, -1/3), (0, 0, 0, 0, 0, -1/3, -1/3, 1/3)]
```

coerce_to_e7()

For type E8, this orthogonally projects the given element of the E8 root lattice into the E7 root lattice. This operation on weights corresponds to intersection with the semisimple subgroup E7.

EXAMPLES:

```
sage: [b.coerce_to_e7() for b in RootSystem("E8").ambient_space().basis()]
[(1, 0, 0, 0, 0, 0, 0, 0), (0, 1, 0, 0, 0, 0, 0, 0),
 (0, 0, 1, 0, 0, 0, 0, 0), (0, 0, 0, 1, 0, 0, 0, 0),
 (0, 0, 0, 0, 1, 0, 0, 0), (0, 0, 0, 0, 0, 1, 0, 0),
 (0, 0, 0, 0, 0, 0, 1/2, -1/2), (0, 0, 0, 0, 0, 0, -1/2, 1/2)]
```

```
>>> from sage.all import *
>>> [b.coerce_to_e7() for b in RootSystem("E8").ambient_space().basis()]
[(1, 0, 0, 0, 0, 0, 0, 0), (0, 1, 0, 0, 0, 0, 0, 0),
 (0, 0, 1, 0, 0, 0, 0, 0), (0, 0, 0, 1, 0, 0, 0, 0),
 (0, 0, 0, 0, 1, 0, 0, 0), (0, 0, 0, 0, 0, 1, 0, 0),
 (0, 0, 0, 0, 0, 0, 1/2, -1/2), (0, 0, 0, 0, 0, 0, -1/2, 1/2)]
```

coerce_to_sl()

For type ['A',r], this coerces the element of the ambient space into the root space by orthogonal projection. The root space has codimension one and corresponds to the Lie algebra of SL(r+1,CC), whereas the full weight space corresponds to the Lie algebra of GL(r+1,CC). So this operation corresponds to multiplication by a (possibly fractional) power of the determinant to give a weight determinant one.

EXAMPLES:

```
sage: [fw.coerce_to_sl() for fw in RootSystem("A2").ambient_space().
↪fundamental_weights()]
[(2/3, -1/3, -1/3), (1/3, 1/3, -2/3)]
sage: L = RootSystem("A2xA3").ambient_space()
sage: L([1,2,3,4,5,0,0]).coerce_to_sl()
(-1, 0, 1, 7/4, 11/4, -9/4, -9/4)
```

```
>>> from sage.all import *
>>> [fw.coerce_to_sl() for fw in RootSystem("A2").ambient_space().fundamental_
↪weights()]
[(2/3, -1/3, -1/3), (1/3, 1/3, -2/3)]
>>> L = RootSystem("A2xA3").ambient_space()
>>> L([Integer(1),Integer(2),Integer(3),Integer(4),Integer(5),Integer(0),
↪Integer(0)]).coerce_to_sl()
(-1, 0, 1, 7/4, 11/4, -9/4, -9/4)
```

dot_product(*lambdacheck*)

The scalar product with elements of the ambient space.

EXAMPLES:

```
sage: e = RootSystem(['A',2]).ambient_space()
sage: a = e.simple_root(0); a
(-1, 0, 0)
sage: a.inner_product(a)
2
```

```
>>> from sage.all import *
>>> e = RootSystem(['A',Integer(2)]).ambient_space()
>>> a = e.simple_root(Integer(0)); a
(-1, 0, 0)
>>> a.inner_product(a)
2
```

inner_product(*lambdacheck*)

The scalar product with elements of the ambient space.

EXAMPLES:

```
sage: e = RootSystem(['A',2]).ambient_space()
sage: a = e.simple_root(0); a
(-1, 0, 0)
sage: a.inner_product(a)
2
```

```
>>> from sage.all import *
>>> e = RootSystem(['A',Integer(2)]).ambient_space()
>>> a = e.simple_root(Integer(0)); a
(-1, 0, 0)
>>> a.inner_product(a)
2
```

is_positive_root()

EXAMPLES:

```
sage: R = RootSystem(['A',3]).ambient_space()
sage: r=R.simple_root(1)+R.simple_root(2)
sage: r.is_positive_root()
True
sage: r=R.simple_root(1)-R.simple_root(2)
```

(continues on next page)

(continued from previous page)

```
sage: r.is_positive_root()
False
```

```
>>> from sage.all import *
>>> R = RootSystem(['A',Integer(3)]).ambient_space()
>>> r=R.simple_root(Integer(1))+R.simple_root(Integer(2))
>>> r.is_positive_root()
True
>>> r=R.simple_root(Integer(1))-R.simple_root(Integer(2))
>>> r.is_positive_root()
False
```

scalar(*lambdacheck*)

The scalar product with elements of the ambient space.

EXAMPLES:

```
sage: e = RootSystem(['A',2]).ambient_space()
sage: a = e.simple_root(0); a
(-1, 0, 0)
sage: a.inner_product(a)
2
```

```
>>> from sage.all import *
>>> e = RootSystem(['A',Integer(2)]).ambient_space()
>>> a = e.simple_root(Integer(0)); a
(-1, 0, 0)
>>> a.inner_product(a)
2
```

to_ambient()

Map `self` to the ambient space.

This exists for uniformity. Its analogue for root and weight lattice realizations, is not trivial.

EXAMPLES:

```
sage: v = CartanType(['C',3]).root_system().ambient_space().an_element(); v
(2, 2, 3)
sage: v.to_ambient()
(2, 2, 3)
```

```
>>> from sage.all import *
>>> v = CartanType(['C',Integer(3)]).root_system().ambient_space().an_
↪element(); v
(2, 2, 3)
>>> v.to_ambient()
(2, 2, 3)
```

5.1.221 Associahedron

Todo

- fix adjacency matrix
- edit graph method to get proper vertex labellings
- UniqueRepresentation?

AUTHORS:

- Christian Stump

`sage.combinat.root_system.associahedron.`**`Associahedra`**(*base_ring*, *ambient_dim*, *backend='ppl'*)

Construct a parent class of Associahedra according to `backend`.

See also

Associahedra_base.

class `sage.combinat.root_system.associahedron.`**`Associahedra_base`**

Bases: `object`

Base class of parent of Associahedra of specified dimension

EXAMPLES:

```
sage: from sage.combinat.root_system.associahedron import Associahedra
sage: parent = Associahedra(QQ,2,'ppl');  parent
Polyhedra in QQ^2
sage: type(parent)
<class 'sage.combinat.root_system.associahedron.Associahedra_ppl_with_category'>
sage: parent(['A',2])
Generalized associahedron of type ['A', 2] with 5 vertices
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.associahedron import Associahedra
>>> parent = Associahedra(QQ,Integer(2),'ppl');  parent
Polyhedra in QQ^2
>>> type(parent)
<class 'sage.combinat.root_system.associahedron.Associahedra_ppl_with_category'>
>>> parent(['A',Integer(2)])
Generalized associahedron of type ['A', 2] with 5 vertices
```

Importantly, the parent knows the dimension of the ambient space. If you try to construct an associahedron of a different dimension, a `ValueError` is raised:

```
sage: parent(['A',3])
Traceback (most recent call last):
...
ValueError: V-representation data requires a list of length ambient_dim
```

```
>>> from sage.all import *
>>> parent(['A',Integer(3)])
Traceback (most recent call last):
...
ValueError: V-representation data requires a list of length ambient_dim
```

class sage.combinat.root_system.associahedron.**Associahedra_cdd**(*base_ring*, *ambient_dim*, *backend*)

Bases: *Associahedra_base*, Polyhedra_QQ_normaliz

Element

alias of *Associahedron_class_normaliz*

class sage.combinat.root_system.associahedron.**Associahedra_polymake**(*base_ring*, *ambient_dim*, *backend*)

Bases: *Associahedra_base*, Polyhedra_polymake

Element

alias of *Associahedron_class_polymake*

class sage.combinat.root_system.associahedron.**Associahedra_ppl**(*base_ring*, *ambient_dim*, *backend*)

Bases: *Associahedra_base*, Polyhedra_QQ_ppl

Element

alias of *Associahedron_class_ppl*

sage.combinat.root_system.associahedron.**Associahedron**(*cartan_type*, *backend='ppl'*)

Construct an associahedron.

The generalized associahedron is a polytopal complex with vertices in one-to-one correspondence with clusters in the cluster complex, and with edges between two vertices if and only if the associated two clusters intersect in codimension 1.

The associahedron of type A_n is one way to realize the classical associahedron as defined in the Wikipedia article Associahedron.

A polytopal realization of the associahedron can be found in [CFZ2002]. The implementation is based on [CFZ2002], Theorem 1.5, Remark 1.6, and Corollary 1.9.

INPUT:

- cartan_type – a cartan type according to *sage.combinat.root_system.cartan_type.CartanTypeFactory*

- backend – string ('ppl'); the backend to use; see sage.geometry.polyhedron.constructor.Polyhedron()

EXAMPLES:

```
sage: Asso = polytopes.associahedron(['A',2]); Asso
Generalized associahedron of type ['A', 2] with 5 vertices

sage: sorted(Asso.Hrepresentation(), key=repr)
[An inequality (-1, 0) x + 1 >= 0,
 An inequality (0, -1) x + 1 >= 0,
 An inequality (0, 1) x + 1 >= 0,
 An inequality (1, 0) x + 1 >= 0,
 An inequality (1, 1) x + 1 >= 0]

sage: Asso.Vrepresentation()
(A vertex at (1, -1), A vertex at (1, 1), A vertex at (-1, 1),
 A vertex at (-1, 0), A vertex at (0, -1))

sage: polytopes.associahedron(['B',2])
Generalized associahedron of type ['B', 2] with 6 vertices
```

```
>>> from sage.all import *
>>> Asso = polytopes.associahedron(['A',Integer(2)]); Asso
Generalized associahedron of type ['A', 2] with 5 vertices

>>> sorted(Asso.Hrepresentation(), key=repr)
[An inequality (-1, 0) x + 1 >= 0,
 An inequality (0, -1) x + 1 >= 0,
 An inequality (0, 1) x + 1 >= 0,
 An inequality (1, 0) x + 1 >= 0,
 An inequality (1, 1) x + 1 >= 0]

>>> Asso.Vrepresentation()
(A vertex at (1, -1), A vertex at (1, 1), A vertex at (-1, 1),
 A vertex at (-1, 0), A vertex at (0, -1))

>>> polytopes.associahedron(['B',Integer(2)])
Generalized associahedron of type ['B', 2] with 6 vertices
```

The two pictures of [CFZ2002] can be recovered with:

```
sage: Asso = polytopes.associahedron(['A',3]); Asso
Generalized associahedron of type ['A', 3] with 14 vertices
sage: Asso.plot()   # long time
Graphics3d Object

sage: Asso = polytopes.associahedron(['B',3]); Asso
Generalized associahedron of type ['B', 3] with 20 vertices
sage: Asso.plot()   # long time
Graphics3d Object
```

```
>>> from sage.all import *
>>> Asso = polytopes.associahedron(['A',Integer(3)]); Asso
```

(continues on next page)

(continued from previous page)

```
Generalized associahedron of type ['A', 3] with 14 vertices
>>> Asso.plot()  # long time
Graphics3d Object

>>> Asso = polytopes.associahedron(['B',Integer(3)]); Asso
Generalized associahedron of type ['B', 3] with 20 vertices
>>> Asso.plot()  # long time
Graphics3d Object
```

class sage.combinat.root_system.associahedron.**Associahedron_class_base**(*parent=None*, *Vrep=None*, *Hrep=None*, *cartan_type=None*, ***kwds*)

Bases: `object`

The base class of the Python class of an associahedron

You should use the *Associahedron()* convenience function to construct associahedra from the Cartan type.

cartan_type()

Return the Cartan type of `self`.

EXAMPLES:

```
sage: polytopes.associahedron(['A',3]).cartan_type()
['A', 3]
```

```
>>> from sage.all import *
>>> polytopes.associahedron(['A',Integer(3)]).cartan_type()
['A', 3]
```

vertices_in_root_space()

Return the vertices of `self` as elements in the root space.

EXAMPLES:

```
sage: Asso = polytopes.associahedron(['A',2])
sage: Asso.vertices()
(A vertex at (1, -1), A vertex at (1, 1),
 A vertex at (-1, 1), A vertex at (-1, 0),
 A vertex at (0, -1))

sage: Asso.vertices_in_root_space()
(alpha[1] - alpha[2], alpha[1] + alpha[2], -alpha[1] + alpha[2],
-alpha[1], -alpha[2])
```

```
>>> from sage.all import *
>>> Asso = polytopes.associahedron(['A',Integer(2)])
>>> Asso.vertices()
(A vertex at (1, -1), A vertex at (1, 1),
 A vertex at (-1, 1), A vertex at (-1, 0),
 A vertex at (0, -1))
```

(continues on next page)

(continued from previous page)

```
>>> Asso.vertices_in_root_space()
(alpha[1] - alpha[2], alpha[1] + alpha[2], -alpha[1] + alpha[2],
-alpha[1], -alpha[2])
```

class sage.combinat.root_system.associahedron.**Associahedron_class_cdd**(*parent=None*, *Vrep=None*, *Hrep=None*, *cartan_type=None*, ***kwds*)

Bases: *Associahedron_class_base*, Polyhedron_QQ_cdd

class sage.combinat.root_system.associahedron.**Associahedron_class_field**(*parent=None*, *Vrep=None*, *Hrep=None*, *cartan_type=None*, ***kwds*)

Bases: *Associahedron_class_base*, Polyhedron_field

class sage.combinat.root_system.associahedron.**Associahedron_class_normaliz**(*parent=None*, *Vrep=None*, *Hrep=None*, *cartan_type=None*, ***kwds*)

Bases: *Associahedron_class_base*, Polyhedron_QQ_normaliz

class sage.combinat.root_system.associahedron.**Associahedron_class_polymake**(*parent=None*, *Vrep=None*, *Hrep=None*, *cartan_type=None*, ***kwds*)

Bases: *Associahedron_class_base*, Polyhedron_polymake

class sage.combinat.root_system.associahedron.**Associahedron_class_ppl**(*parent=None*, *Vrep=None*, *Hrep=None*, *cartan_type=None*, ***kwds*)

Bases: *Associahedron_class_base*, Polyhedron_QQ_ppl

5.1.222 Braid Move Calculator

AUTHORS:

- Dinakar Muthiah (2014-06-03): initial version

class sage.combinat.root_system.braid_move_calculator.**BraidMoveCalculator**(*coxeter_group*)

Bases: object

Helper class to compute braid moves.

chain_of_reduced_words(*start_word*, *end_word*)

Compute the chain of reduced words from `stard_word` to `end_word`.

INPUT:

- `start_word`, `end_word` – two reduced expressions for the long word

EXAMPLES:

```
sage: from sage.combinat.root_system.braid_move_calculator import␣
↪BraidMoveCalculator
sage: W = CoxeterGroup(['A',5])
sage: B = BraidMoveCalculator(W)
sage: B.chain_of_reduced_words((1,2,1,3,2,1,4,3,2,1,5,4,3,2,1), # not tested
....:                          (5,4,5,3,4,5,2,3,4,5,1,2,3,4,5))
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.braid_move_calculator import␣
↪BraidMoveCalculator
>>> W = CoxeterGroup(['A',Integer(5)])
>>> B = BraidMoveCalculator(W)
>>> B.chain_of_reduced_words((Integer(1),Integer(2),Integer(1),Integer(3),
↪Integer(2),Integer(1),Integer(4),Integer(3),Integer(2),Integer(1),
↪Integer(5),Integer(4),Integer(3),Integer(2),Integer(1)), # not tested
...                          (Integer(5),Integer(4),Integer(5),Integer(3),
↪Integer(4),Integer(5),Integer(2),Integer(3),Integer(4),Integer(5),
↪Integer(1),Integer(2),Integer(3),Integer(4),Integer(5)))
```

put_in_front(*k*, *input_word*)

Return a list of reduced words starting with `input_word` and ending with a reduced word whose first letter is `k`.

There still remains an issue with 0 indices.

EXAMPLES:

```
sage: from sage.combinat.root_system.braid_move_calculator import␣
↪BraidMoveCalculator
sage: W = CoxeterGroup(['C',3])
sage: B = BraidMoveCalculator(W)
sage: B.put_in_front(2, (3, 2, 3, 1, 2, 3, 1, 2, 1))
((3, 2, 3, 1, 2, 3, 1, 2, 1),
 (3, 2, 3, 1, 2, 1, 3, 2, 1),
 (3, 2, 3, 2, 1, 2, 3, 2, 1),
 (2, 3, 2, 3, 1, 2, 3, 2, 1))
sage: B.put_in_front(1, (3, 2, 3, 1, 2, 3, 1, 2, 1))
((3, 2, 3, 1, 2, 3, 1, 2, 1),
 (3, 2, 1, 3, 2, 3, 1, 2, 1),
 (3, 2, 1, 3, 2, 3, 2, 1, 2),
 (3, 2, 1, 2, 3, 2, 3, 1, 2),
 (3, 1, 2, 1, 3, 2, 3, 1, 2),
 (1, 3, 2, 1, 3, 2, 3, 1, 2))
sage: B.put_in_front(1, (1, 3, 2, 3, 2, 1, 2, 3, 2))
((1, 3, 2, 3, 2, 1, 2, 3, 2),)
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.braid_move_calculator import␣
↪BraidMoveCalculator
>>> W = CoxeterGroup(['C',Integer(3)])
>>> B = BraidMoveCalculator(W)
>>> B.put_in_front(Integer(2), (Integer(3), Integer(2), Integer(3),␣
↪Integer(1), Integer(2), Integer(3), Integer(1), Integer(2), Integer(1)))
((3, 2, 3, 1, 2, 3, 1, 2, 1),
 (3, 2, 3, 1, 2, 1, 3, 2, 1),
 (3, 2, 3, 2, 1, 2, 3, 2, 1),
 (2, 3, 2, 3, 1, 2, 3, 2, 1))
>>> B.put_in_front(Integer(1), (Integer(3), Integer(2), Integer(3),␣
↪Integer(1), Integer(2), Integer(3), Integer(1), Integer(2), Integer(1)))
((3, 2, 3, 1, 2, 3, 1, 2, 1),
 (3, 2, 1, 3, 2, 3, 1, 2, 1),
 (3, 2, 1, 3, 2, 3, 2, 1, 2),
 (3, 2, 1, 2, 3, 2, 3, 1, 2),
 (3, 1, 2, 1, 3, 2, 3, 1, 2),
 (1, 3, 2, 1, 3, 2, 3, 1, 2))
>>> B.put_in_front(Integer(1), (Integer(1), Integer(3), Integer(2),␣
↪Integer(3), Integer(2), Integer(1), Integer(2), Integer(3), Integer(2)))
((1, 3, 2, 3, 2, 1, 2, 3, 2),)
```

5.1.223 Braid Orbit

Cython function to compute the orbit of the braid moves on a reduced word.

`sage.combinat.root_system.braid_orbit.`**`BraidOrbit`**`(`*word*, *rels*`)`

Return the orbit of `word` by all replacements given by `rels`.

INPUT:

- `word` – list of integers
- `rels` – list of pairs `(A, B)`, where `A` and `B` are lists of integers the same length

EXAMPLES:

```
sage: from sage.combinat.root_system.braid_orbit import BraidOrbit
sage: word = [1,2,1,3,2,1]
sage: rels = [[[2, 1, 2], [1, 2, 1]], [[3, 1], [1, 3]], [[3, 2, 3], [2, 3, 2]]]
sage: sorted(BraidOrbit(word, rels))
[(1, 2, 1, 3, 2, 1),
 (1, 2, 3, 1, 2, 1),
 (1, 2, 3, 2, 1, 2),
 (1, 3, 2, 1, 3, 2),
 (1, 3, 2, 3, 1, 2),
 (2, 1, 2, 3, 2, 1),
 (2, 1, 3, 2, 1, 3),
 (2, 1, 3, 2, 3, 1),
 (2, 3, 1, 2, 1, 3),
 (2, 3, 1, 2, 3, 1),
 (2, 3, 2, 1, 2, 3),
 (3, 1, 2, 1, 3, 2),
 (3, 1, 2, 3, 1, 2),
```

(continues on next page)

(continued from previous page)

```
 (3, 2, 1, 2, 3, 2),
 (3, 2, 1, 3, 2, 3),
 (3, 2, 3, 1, 2, 3)]
sage: len(_)
16
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.braid_orbit import BraidOrbit
>>> word = [Integer(1),Integer(2),Integer(1),Integer(3),Integer(2),Integer(1)]
>>> rels = [[[Integer(2), Integer(1), Integer(2)], [Integer(1), Integer(2),␣
↪Integer(1)]], [[Integer(3), Integer(1)], [Integer(1), Integer(3)]],␣
↪[[Integer(3), Integer(2), Integer(3)], [Integer(2), Integer(3), Integer(2)]]]
>>> sorted(BraidOrbit(word, rels))
[(1, 2, 1, 3, 2, 1),
 (1, 2, 3, 1, 2, 1),
 (1, 2, 3, 2, 1, 2),
 (1, 3, 2, 1, 3, 2),
 (1, 3, 2, 3, 1, 2),
 (2, 1, 2, 3, 2, 1),
 (2, 1, 3, 2, 1, 3),
 (2, 1, 3, 2, 3, 1),
 (2, 3, 1, 2, 1, 3),
 (2, 3, 1, 2, 3, 1),
 (2, 3, 2, 1, 2, 3),
 (3, 1, 2, 1, 3, 2),
 (3, 1, 2, 3, 1, 2),
 (3, 2, 1, 2, 3, 2),
 (3, 2, 1, 3, 2, 3),
 (3, 2, 3, 1, 2, 3)]
>>> len(_)
16
```

sage.combinat.root_system.braid_orbit.**is_fully_commutative**(*word*, *rels*)

Check if the braid orbit of `word` is using a braid relation.

INPUT:

- `word` – list of integers
- `rels` – list of pairs `(A, B)`, where `A` and `B` are lists of integers the same length

EXAMPLES:

```
sage: from sage.combinat.root_system.braid_orbit import is_fully_commutative
sage: rels = [[[2, 1, 2], [1, 2, 1]], [[3, 1], [1, 3]], [[3, 2, 3], [2, 3, 2]]]
sage: word = [1,2,1,3,2,1]
sage: is_fully_commutative(word, rels)
False
sage: word = [1,2,3]
sage: is_fully_commutative(word, rels)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.braid_orbit import is_fully_commutative
>>> rels = [[[Integer(2), Integer(1), Integer(2)], [Integer(1), Integer(2),␣
↪Integer(1)]], [[Integer(3), Integer(1)], [Integer(1), Integer(3)]],␣
↪[[Integer(3), Integer(2), Integer(3)], [Integer(2), Integer(3), Integer(2)]]]
>>> word = [Integer(1),Integer(2),Integer(1),Integer(3),Integer(2),Integer(1)]
>>> is_fully_commutative(word, rels)
False
>>> word = [Integer(1),Integer(2),Integer(3)]
>>> is_fully_commutative(word, rels)
True
```

5.1.224 Branching Rules

class sage.combinat.root_system.branching_rules.**BranchingRule**(*R*, *S*, *f*, *name='default'*, *intermediate_types=[]*, *intermediate_names=[]*)

Bases: `SageObject`

A class for branching rules.

Rtype()

In a branching rule R => S, returns the Cartan Type of the ambient group R.

EXAMPLES:

```
sage: branching_rule("A3","A2","levi").Rtype()
['A', 3]
```

```
>>> from sage.all import *
>>> branching_rule("A3","A2","levi").Rtype()
['A', 3]
```

Stype()

In a branching rule R => S, returns the Cartan Type of the subgroup S.

EXAMPLES:

```
sage: branching_rule("A3","A2","levi").Stype()
['A', 2]
```

```
>>> from sage.all import *
>>> branching_rule("A3","A2","levi").Stype()
['A', 2]
```

branch(*chi*, *style=None*)

INPUT:

- `chi` – a character of the WeylCharacterRing with Cartan type self.Rtype()

Returns the branched character.

EXAMPLES:

```
sage: G2=WeylCharacterRing("G2",style='coroots')
sage: chi=G2(1,1); chi.degree()
64
sage: b=G2.maximal_subgroup("A2"); b
extended branching rule G2 => A2
sage: b.branch(chi)
A2(0,1) + A2(1,0) + A2(0,2) + 2*A2(1,1) + A2(2,0) + A2(1,2) + A2(2,1)
sage: A2=WeylCharacterRing("A2",style='coroots'); A2
The Weyl Character Ring of Type A2 with Integer Ring coefficients
sage: chi.branch(A2,rule=b)
A2(0,1) + A2(1,0) + A2(0,2) + 2*A2(1,1) + A2(2,0) + A2(1,2) + A2(2,1)
```

```
>>> from sage.all import *
>>> G2=WeylCharacterRing("G2",style='coroots')
>>> chi=G2(Integer(1),Integer(1)); chi.degree()
64
>>> b=G2.maximal_subgroup("A2"); b
extended branching rule G2 => A2
>>> b.branch(chi)
A2(0,1) + A2(1,0) + A2(0,2) + 2*A2(1,1) + A2(2,0) + A2(1,2) + A2(2,1)
>>> A2=WeylCharacterRing("A2",style='coroots'); A2
The Weyl Character Ring of Type A2 with Integer Ring coefficients
>>> chi.branch(A2,rule=b)
A2(0,1) + A2(1,0) + A2(0,2) + 2*A2(1,1) + A2(2,0) + A2(1,2) + A2(2,1)
```

describe(*verbose=False*, *debug=False*, *no_r=False*)

Describe how extended roots restrict under `self`.

EXAMPLES:

```
sage: branching_rule("G2","A2","extended").describe()

3
O=<=O---O
1   2   0
G2~

root restrictions G2 => A2:

O---O
1   2
A2

0 => 2
2 => 1

For more detailed information use verbose=True
```

```
>>> from sage.all import *
>>> branching_rule("G2","A2","extended").describe()
<BLANKLINE>
3
O=<=O---O
```

(continues on next page)

(continued from previous page)

```
1   2   0
G2~
<BLANKLINE>
root restrictions G2 => A2:
<BLANKLINE>
O---O
1   2
A2
<BLANKLINE>
0 => 2
2 => 1
<BLANKLINE>
For more detailed information use verbose=True
```

In this example, 0 is the affine root, that is, the negative of the highest root, for "$G2$". If $i \geq j$ is printed, this means that the i-th simple (or affine) root of the ambient group restricts to the j-th simple root of the subgroup. For reference the Dynkin diagrams are also printed. The extended Dynkin diagram of the ambient group is printed if the affine root restricts to a simple root. More information is printed if the parameter $verbose$ is true.

`sage.combinat.root_system.branching_rules.`**`branch_weyl_character`**`(`*chi*, *R*, *S*, *rule='default'*`)`

A branching rule describes the restriction of representations from a Lie group or algebra G to a subgroup H. See for example, R. C. King, Branching rules for classical Lie groups using tensor and spinor methods. J. Phys. A 8 (1975), 429-449, Howe, Tan and Willenbring, Stable branching rules for classical symmetric pairs, Trans. Amer. Math. Soc. 357 (2005), no. 4, 1601-1626, McKay and Patera, Tables of Dimensions, Indices and Branching Rules for Representations of Simple Lie Algebras (Marcel Dekker, 1981), and Fauser, Jarvis, King and Wybourne, New branching rules induced by plethysm. J. Phys. A 39 (2006), no. 11, 2611–2655. If $H \subset G$ we will write $G \Rightarrow H$ to denote the branching rule, which is a homomorphism of WeylCharacterRings.

INPUT:

- `chi` – a character of G
- `R` – the Weyl Character Ring of G
- `S` – the Weyl Character Ring of H
- `rule` – an element of the `BranchingRule` class or one (most usually) a keyword such as:
  - `'levi'`
  - `'automorphic'`
  - `'symmetric'`
  - `'extended'`
  - `'orthogonal_sum'`
  - `'tensor'`
  - `'triality'`
  - `'miscellaneous'`

The *`BranchingRule`* class is a wrapper for functions from the weight lattice of G to the weight lattice of H. An instance of this class encodes an embedding of H into G. The usual way to specify an embedding is to supply a keyword, which tells Sage to use one of the built-in rules. We will discuss these first.

To explain the predefined rules, we survey the most important branching rules. These may be classified into several cases, and once this is understood, the detailed classification can be read off from the Dynkin diagrams. Dynkin classified the maximal subgroups of Lie groups in Mat. Sbornik N.S. 30(72):349-462 (1952).

We will list give predefined rules that cover most cases where the branching rule is to a maximal subgroup. For convenience, we also give some branching rules to subgroups that are not maximal. For example, a Levi subgroup may or may not be maximal.

For example, there is a "levi" branching rule defined from $SL(5)$ (with Cartan type A_4) to $SL(4)$ (with Cartan type A_3), so we may compute the branching rule as follows:

EXAMPLES:

```
sage: A3=WeylCharacterRing("A3",style='coroots')
sage: A2=WeylCharacterRing("A2",style='coroots')
sage: [A3(fw).branch(A2,rule='levi') for fw in A3.fundamental_weights()]
[A2(0,0) + A2(1,0), A2(0,1) + A2(1,0), A2(0,0) + A2(0,1)]
```

```
>>> from sage.all import *
>>> A3=WeylCharacterRing("A3",style='coroots')
>>> A2=WeylCharacterRing("A2",style='coroots')
>>> [A3(fw).branch(A2,rule='levi') for fw in A3.fundamental_weights()]
[A2(0,0) + A2(1,0), A2(0,1) + A2(1,0), A2(0,0) + A2(0,1)]
```

In this case the Levi branching rule is the default branching rule so we may omit the specification rule="levi".

If a subgroup is not maximal, you may specify a branching rule by finding a chain of intermediate subgroups. For this purpose, branching rules may be multiplied as in the following example.

EXAMPLES:

```
sage: A4=WeylCharacterRing("A4",style='coroots')
sage: A2=WeylCharacterRing("A2",style='coroots')
sage: br=branching_rule("A4","A3")*branching_rule("A3","A2")
sage: A4(1,0,0,0).branch(A2,rule=br)
2*A2(0,0) + A2(1,0)
```

```
>>> from sage.all import *
>>> A4=WeylCharacterRing("A4",style='coroots')
>>> A2=WeylCharacterRing("A2",style='coroots')
>>> br=branching_rule("A4","A3")*branching_rule("A3","A2")
>>> A4(Integer(1),Integer(0),Integer(0),Integer(0)).branch(A2,rule=br)
2*A2(0,0) + A2(1,0)
```

You may try omitting the rule if it is "obvious". Default rules are provided for the following cases:

$$\begin{aligned} A_{2s} &\Rightarrow B_s, \\ A_{2s-1} &\Rightarrow C_s, \\ A_{2*s-1} &\Rightarrow D_s. \end{aligned}$$

The above default rules correspond to embedding the group $SO(2s+1)$, $Sp(2s)$ or $SO(2s)$ into the corresponding general or special linear group by the standard representation. Default rules are also specified for the following cases:

$$\begin{aligned} B_{s+1} &\Rightarrow D_s, \\ D_s &\Rightarrow B_s. \end{aligned}$$

These correspond to the embedding of $O(n)$ into $O(n+1)$ where $n = 2s$ or $2s+1$. Finally, the branching rule for the embedding of a Levi subgroup is also implemented as a default rule.

EXAMPLES:

```
sage: A1 = WeylCharacterRing("A1", style='coroots')
sage: A2 = WeylCharacterRing("A2", style='coroots')
sage: D4 = WeylCharacterRing("D4", style='coroots')
sage: B3 = WeylCharacterRing("B3", style='coroots')
sage: B4 = WeylCharacterRing("B4", style='coroots')
sage: A6 = WeylCharacterRing("A6", style='coroots')
sage: A7 = WeylCharacterRing("A7", style='coroots')
sage: def try_default_rule(R, S): return [R(f).branch(S) for f in R.fundamental_
↪weights()]
sage: try_default_rule(A2,A1)
[A1(0) + A1(1), A1(0) + A1(1)]
sage: try_default_rule(D4,B3)
[B3(0,0,0) + B3(1,0,0), B3(1,0,0) + B3(0,1,0), B3(0,0,1), B3(0,0,1)]
sage: try_default_rule(B4,D4)
[D4(0,0,0,0) + D4(1,0,0,0), D4(1,0,0,0) + D4(0,1,0,0),
D4(0,1,0,0) + D4(0,0,1,1), D4(0,0,1,0) + D4(0,0,0,1)]
sage: try_default_rule(A7,D4)
[D4(1,0,0,0), D4(0,1,0,0), D4(0,0,1,1), D4(0,0,2,0) + D4(0,0,0,2),
D4(0,0,1,1),
D4(0,1,0,0),
D4(1,0,0,0)]
sage: try_default_rule(A6,B3)
[B3(1,0,0), B3(0,1,0), B3(0,0,2), B3(0,0,2), B3(0,1,0), B3(1,0,0)]
```

```
>>> from sage.all import *
>>> A1 = WeylCharacterRing("A1", style='coroots')
>>> A2 = WeylCharacterRing("A2", style='coroots')
>>> D4 = WeylCharacterRing("D4", style='coroots')
>>> B3 = WeylCharacterRing("B3", style='coroots')
>>> B4 = WeylCharacterRing("B4", style='coroots')
>>> A6 = WeylCharacterRing("A6", style='coroots')
>>> A7 = WeylCharacterRing("A7", style='coroots')
>>> def try_default_rule(R, S): return [R(f).branch(S) for f in R.fundamental_
↪weights()]
>>> try_default_rule(A2,A1)
[A1(0) + A1(1), A1(0) + A1(1)]
>>> try_default_rule(D4,B3)
[B3(0,0,0) + B3(1,0,0), B3(1,0,0) + B3(0,1,0), B3(0,0,1), B3(0,0,1)]
>>> try_default_rule(B4,D4)
[D4(0,0,0,0) + D4(1,0,0,0), D4(1,0,0,0) + D4(0,1,0,0),
D4(0,1,0,0) + D4(0,0,1,1), D4(0,0,1,0) + D4(0,0,0,1)]
>>> try_default_rule(A7,D4)
[D4(1,0,0,0), D4(0,1,0,0), D4(0,0,1,1), D4(0,0,2,0) + D4(0,0,0,2),
D4(0,0,1,1),
D4(0,1,0,0),
D4(1,0,0,0)]
>>> try_default_rule(A6,B3)
[B3(1,0,0), B3(0,1,0), B3(0,0,2), B3(0,0,2), B3(0,1,0), B3(1,0,0)]
```

If a default rule is not known, you may cue Sage as to what the Lie group embedding is by supplying a rule from the list of predefined rules. We will treat these next.

Levi Type

These can be read off from the Dynkin diagram. If removing a node from the Dynkin diagram produces another Dynkin diagram, there is a branching rule. A Levi subgroup may or may not be maximal. If it is maximal, there may or may not be a built-in branching rule for but you may obtain the Levi branching rule by first branching to a suitable maximal subgroup. For these rules use the option `rule="levi"`:

$$
\begin{aligned}
A_r &\Rightarrow A_{r-1} \\
B_r &\Rightarrow A_{r-1} \\
B_r &\Rightarrow B_{r-1} \\
C_r &\Rightarrow A_{r-1} \\
C_r &\Rightarrow C_{r-1} \\
D_r &\Rightarrow A_{r-1} \\
D_r &\Rightarrow D_{r-1} \\
E_r &\Rightarrow A_{r-1} \quad r = 7, 8 \\
E_r &\Rightarrow D_{r-1} \quad r = 6, 7, 8 \\
E_r &\Rightarrow E_{r-1} \\
F_4 &\Rightarrow B_3 \\
F_4 &\Rightarrow C_3 \\
G_2 &\Rightarrow A_1 (\text{short root})
\end{aligned}
$$

Not all Levi subgroups are maximal subgroups. If the Levi is not maximal there may or may not be a preprogrammed `rule="levi"` for it. If there is not, the branching rule may still be obtained by going through an intermediate subgroup that is maximal using rule="extended". Thus the other Levi branching rule from $G_2 \Rightarrow A_1$ corresponding to the long root is available by first branching $G_2 \Rightarrow A_2$ then $A_2 \Rightarrow A_1$. Similarly the branching rules to the Levi subgroup:

$$E_r \Rightarrow A_{r-1} \quad r = 6, 7, 8$$

may be obtained by first branching $E_6 \Rightarrow A_5 \times A_1$, $E_7 \Rightarrow A_7$ or $E_8 \Rightarrow A_8$.

EXAMPLES:

```
sage: A1 = WeylCharacterRing("A1")
sage: A2 = WeylCharacterRing("A2")
sage: A3 = WeylCharacterRing("A3")
sage: A4 = WeylCharacterRing("A4")
sage: A5 = WeylCharacterRing("A5")
sage: B2 = WeylCharacterRing("B2")
sage: B3 = WeylCharacterRing("B3")
sage: B4 = WeylCharacterRing("B4")
sage: C2 = WeylCharacterRing("C2")
sage: C3 = WeylCharacterRing("C3")
sage: D3 = WeylCharacterRing("D3")
sage: D4 = WeylCharacterRing("D4")
sage: G2 = WeylCharacterRing("G2")
sage: F4 = WeylCharacterRing("F4",style='coroots')
sage: E6=WeylCharacterRing("E6",style='coroots')
sage: E7=WeylCharacterRing("E7",style='coroots')
sage: D5=WeylCharacterRing("D5",style='coroots')
sage: D6=WeylCharacterRing("D6",style='coroots')
sage: [B3(w).branch(A2,rule='levi') for w in B3.fundamental_weights()]
```

(continues on next page)

(continued from previous page)

```
[A2(0,0,0) + A2(1,0,0) + A2(0,0,-1),
A2(0,0,0) + A2(1,0,0) + A2(1,1,0) + A2(1,0,-1) + A2(0,-1,-1) + A2(0,0,-1),
A2(-1/2,-1/2,-1/2) + A2(1/2,-1/2,-1/2) + A2(1/2,1/2,-1/2) + A2(1/2,1/2,1/2)]
```

```
>>> from sage.all import *
>>> A1 = WeylCharacterRing("A1")
>>> A2 = WeylCharacterRing("A2")
>>> A3 = WeylCharacterRing("A3")
>>> A4 = WeylCharacterRing("A4")
>>> A5 = WeylCharacterRing("A5")
>>> B2 = WeylCharacterRing("B2")
>>> B3 = WeylCharacterRing("B3")
>>> B4 = WeylCharacterRing("B4")
>>> C2 = WeylCharacterRing("C2")
>>> C3 = WeylCharacterRing("C3")
>>> D3 = WeylCharacterRing("D3")
>>> D4 = WeylCharacterRing("D4")
>>> G2 = WeylCharacterRing("G2")
>>> F4 = WeylCharacterRing("F4",style='coroots')
>>> E6=WeylCharacterRing("E6",style='coroots')
>>> E7=WeylCharacterRing("E7",style='coroots')
>>> D5=WeylCharacterRing("D5",style='coroots')
>>> D6=WeylCharacterRing("D6",style='coroots')
>>> [B3(w).branch(A2,rule='levi') for w in B3.fundamental_weights()]
[A2(0,0,0) + A2(1,0,0) + A2(0,0,-1),
A2(0,0,0) + A2(1,0,0) + A2(1,1,0) + A2(1,0,-1) + A2(0,-1,-1) + A2(0,0,-1),
A2(-1/2,-1/2,-1/2) + A2(1/2,-1/2,-1/2) + A2(1/2,1/2,-1/2) + A2(1/2,1/2,1/2)]
```

The last example must be understood as follows. The representation of B_3 being branched is spin, which is not a representation of $SO(7)$ but of its double cover spin(7). The group A_2 is really GL(3) and the double cover of $SO(7)$ induces a cover of $GL(3)$ that is trivial over $SL(3)$ but not over the center of $GL(3)$. The weight lattice for this $GL(3)$ consists of triples (a, b, c) of half integers such that $a - b$ and $b - c$ are in **Z**, and this is reflected in the last decomposition.

```
sage: [C3(w).branch(A2,rule='levi') for w in C3.fundamental_weights()]
[A2(1,0,0) + A2(0,0,-1),
A2(1,1,0) + A2(1,0,-1) + A2(0,-1,-1),
A2(-1,-1,-1) + A2(1,-1,-1) + A2(1,1,-1) + A2(1,1,1)]
sage: [D4(w).branch(A3,rule='levi') for w in D4.fundamental_weights()]
[A3(1,0,0,0) + A3(0,0,0,-1),
A3(0,0,0,0) + A3(1,1,0,0) + A3(1,0,0,-1) + A3(0,0,-1,-1),
A3(1/2,-1/2,-1/2,-1/2) + A3(1/2,1/2,1/2,-1/2),
A3(-1/2,-1/2,-1/2,-1/2) + A3(1/2,1/2,-1/2,-1/2) + A3(1/2,1/2,1/2,1/2)]
sage: [B3(w).branch(B2,rule='levi') for w in B3.fundamental_weights()]
[2*B2(0,0) + B2(1,0), B2(0,0) + 2*B2(1,0) + B2(1,1), 2*B2(1/2,1/2)]
sage: C3 = WeylCharacterRing(['C',3])
sage: [C3(w).branch(C2,rule='levi') for w in C3.fundamental_weights()]
[2*C2(0,0) + C2(1,0),
 C2(0,0) + 2*C2(1,0) + C2(1,1),
 C2(1,0) + 2*C2(1,1)]
sage: [D5(w).branch(D4,rule='levi') for w in D5.fundamental_weights()]
[2*D4(0,0,0,0) + D4(1,0,0,0),
```

(continues on next page)

(continued from previous page)

```
 D4(0,0,0,0) + 2*D4(1,0,0,0) + D4(1,1,0,0),
 D4(1,0,0,0) + 2*D4(1,1,0,0) + D4(1,1,1,0),
 D4(1/2,1/2,1/2,-1/2) + D4(1/2,1/2,1/2,1/2),
 D4(1/2,1/2,1/2,-1/2) + D4(1/2,1/2,1/2,1/2)]
sage: G2(1,0,-1).branch(A1,rule='levi')
A1(1,0) + A1(1,-1) + A1(0,-1)
sage: E6=WeylCharacterRing("E6",style='coroots')
sage: D5=WeylCharacterRing("D5",style='coroots')
sage: fw = E6.fundamental_weights()
sage: [E6(fw[i]).branch(D5,rule='levi') for i in [1,2,6]]

```

Automorphic Type

If the Dynkin diagram has a symmetry, then there is an automorphism that is a special case of a branching rule. There is also an exotic "triality" automorphism of D_4 having order 3. Use `rule="automorphic"` (or for D_4 `rule="triality"`):

$$A_r \Rightarrow A_r$$
$$D_r \Rightarrow D_r$$
$$E_6 \Rightarrow E_6$$

EXAMPLES:

```
sage: [A3(chi).branch(A3,rule='automorphic') for chi in A3.fundamental_weights()]
[A3(0,0,0,-1), A3(0,0,-1,-1), A3(0,-1,-1,-1)]
```

(continues on next page)

(continued from previous page)

```
sage: [D4(chi).branch(D4,rule='automorphic') for chi in D4.fundamental_weights()]
[D4(1,0,0,0), D4(1,1,0,0), D4(1/2,1/2,1/2,1/2), D4(1/2,1/2,1/2,-1/2)]
```

```
>>> from sage.all import *
>>> [A3(chi).branch(A3,rule='automorphic') for chi in A3.fundamental_weights()]
[A3(0,0,0,-1), A3(0,0,-1,-1), A3(0,-1,-1,-1)]
>>> [D4(chi).branch(D4,rule='automorphic') for chi in D4.fundamental_weights()]
[D4(1,0,0,0), D4(1,1,0,0), D4(1/2,1/2,1/2,1/2), D4(1/2,1/2,1/2,-1/2)]
```

Here is an example with D_4 triality:

```
sage: [D4(chi).branch(D4,rule='triality') for chi in D4.fundamental_weights()]
[D4(1/2,1/2,1/2,-1/2), D4(1,1,0,0), D4(1/2,1/2,1/2,1/2), D4(1,0,0,0)]
```

```
>>> from sage.all import *
>>> [D4(chi).branch(D4,rule='triality') for chi in D4.fundamental_weights()]
[D4(1/2,1/2,1/2,-1/2), D4(1,1,0,0), D4(1/2,1/2,1/2,1/2), D4(1,0,0,0)]
```

Symmetric Type

Related to the automorphic type, when G admits an outer automorphism (usually of degree 2) we may consider the branching rule to the isotropy subgroup H. Outer automorphisms correspond to symmetries of the Dynkin diagram. For such isotropy subgroups use `rule="symmetric"`. We may thus obtain the following branching rules.

$$\begin{aligned} A_{2r} &\Rightarrow B_r \\ A_{2r-1} &\Rightarrow C_r \\ A_{2r-1} &\Rightarrow D_r \\ D_r &\Rightarrow B_{r-1} \\ E_6 &\Rightarrow F_4 \\ E_6 &\Rightarrow C_4 \\ D_4 &\Rightarrow G_2 \end{aligned}$$

The last branching rule, $D_4 \Rightarrow G_2$ is not to a maximal subgroup since $D_4 \Rightarrow B_3 \Rightarrow G_2$, but it is included for convenience.

In some cases, two outer automorphisms that differ by an inner automorphism may have different fixed subgroups. Thus, while the Dynkin diagram of E_6 has a single involutory automorphism, there are two involutions of the group (differing by an inner automorphism) with fixed subgroups F_4 and C_4. Similarly $SL(2r)$, of Cartan type A_{2r-1}, has subgroups $SO(2r)$ and $Sp(2r)$, both fixed subgroups of outer automorphisms that differ from each other by an inner automorphism.

In many cases the Dynkin diagram of H can be obtained by folding the Dynkin diagram of G.

EXAMPLES:

```

Extended Type

If removing a node from the extended Dynkin diagram results in a Dynkin diagram, then there is a branching rule. Use `rule="extended"` for these. We will also use this classification for some rules that are not of this type, mainly involving type B, such as $D_6 \Rightarrow B_3 \times B_3$.

Here is the extended Dynkin diagram for D_6:

```
    0       6
    O       O
    |       |
    |       |
O---O---O---O---O
1   2   3   4   6
```

Removing the node 3 results in an embedding $D_3 \times D_3 \Rightarrow D_6$. This corresponds to the embedding $SO(6) \times SO(6) \Rightarrow SO(12)$, and is of extended type. On the other hand the embedding $SO(5) \times SO(7) \Rightarrow SO(12)$ (e.g. $B_2 \times B_3 \Rightarrow D_6$) cannot be explained this way but for uniformity is implemented under `rule="extended"`.

The following rules are implemented as special cases of `rule="extended"`:

$$\begin{aligned}
E_6 &\Rightarrow A_5 \times A_1, A_2 \times A_2 \times A_2 \\
E_7 &\Rightarrow A_7, D_6 \times A_1, A_3 \times A_3 \times A_1 \\
E_8 &\Rightarrow A_8, D_8, E_7 \times A_1, A_4 \times A_4, D_5 \times A_3, E_6 \times A_2 \\
F_4 &\Rightarrow B_4, C_3 \times A_1, A_2 \times A_2, A_3 \times A_1 \\
G_2 &\Rightarrow A_1 \times A_1
\end{aligned}$$

Note that E_8 has only a limited number of representations of reasonably low degree.

EXAMPLES:

```
sage: [B3(x).branch(D3,rule='extended') for x in B3.fundamental_weights()]
[D3(0,0,0) + D3(1,0,0),
 D3(1,0,0) + D3(1,1,0),

Orthogonal Sum

Using `rule="orthogonal_sum"`, for $n = a + b + c + \cdots$, you can get any branching rule

$$\begin{aligned} SO(n) &\Rightarrow SO(a) \times SO(b) \times SO(c) \times \cdots, \\ Sp(2n) &\Rightarrow Sp(2a) \times Sp(2b) \times Sp(2c)x \times \cdots, \end{aligned}$$

where $O(a)$ is type D_r for $a = 2r$ or B_r for $a = 2r + 1$ and $Sp(2r)$ is type C_r. In some cases these are also of extended type, as in the case $D_3 \times D_3 \Rightarrow D_6$ discussed above. But in other cases, for example $B_3 \times B_3 \Rightarrow D_7$, they are not of extended type.

Tensor

There are branching rules:

$$\begin{aligned} A_{rs-1} &\Rightarrow A_{r-1} \times A_{s-1}, \\ B_{2rs+r+s} &\Rightarrow B_r \times B_s, \\ D_{2rs+s} &\Rightarrow B_r \times D_s, \\ D_{2rs} &\Rightarrow D_r \times D_s, \\ D_{2rs} &\Rightarrow C_r \times C_s, \\ C_{2rs+s} &\Rightarrow B_r \times C_s, \\ C_{2rs} &\Rightarrow C_r \times D_s. \end{aligned}$$

corresponding to the tensor product homomorphism. For type A, the homomorphism is $GL(r) \times GL(s) \Rightarrow GL(rs)$. For the classical types, the relevant fact is that if V, W are orthogonal or symplectic spaces, that is, spaces endowed with symmetric or skew-symmetric bilinear forms, then $V \otimes W$ is also an orthogonal space (if V and W are both orthogonal or both symplectic) or symplectic (if one of V and W is orthogonal and the other symplectic).

The corresponding branching rules are obtained using `rule="tensor"`.

EXAMPLES:

```
sage: A5=WeylCharacterRing("A5", style='coroots')
sage: A2xA1=WeylCharacterRing("A2xA1", style='coroots')

[B1xC1(2,1), B1xC1(2,2) + B1xC1(4,0), B1xC1(4,1) + B1xC1(0,3)]
```

Symmetric Power

The k-th symmetric and exterior power homomorphisms map

$$GL(n) \Rightarrow GL\left(\binom{n+k-1}{k}\right) \times GL\left(\binom{n}{k}\right).$$

The corresponding branching rules are not implemented but a special case is. The k-th symmetric power homomorphism $SL(2) \Rightarrow GL(k+1)$ has its image inside of $SO(2r+1)$ if $k = 2r$ and inside of $Sp(2r)$ if $k = 2r-1$. Hence there are branching rules:

$$B_r \Rightarrow A_1$$
$$C_r \Rightarrow A_1$$

and these may be obtained using the rule "symmetric_power".

EXAMPLES:

```
sage: A1=WeylCharacterRing("A1",style='coroots')
sage: B3=WeylCharacterRing("B3",style='coroots')
sage: C3=WeylCharacterRing("C3",style='coroots')
sage: [B3(fw).branch(A1,rule='symmetric_power') for fw in B3.fundamental_
↪weights()]
[A1(6), A1(2) + A1(6) + A1(10), A1(0) + A1(6)]
sage: [C3(fw).branch(A1,rule='symmetric_power') for fw in C3.fundamental_
↪weights()]
[A1(5), A1(4) + A1(8), A1(3) + A1(9)]
```

```
>>> from sage.all import *
>>> A1=WeylCharacterRing("A1",style='coroots')
>>> B3=WeylCharacterRing("B3",style='coroots')
>>> C3=WeylCharacterRing("C3",style='coroots')
>>> [B3(fw).branch(A1,rule='symmetric_power') for fw in B3.fundamental_weights()]
[A1(6), A1(2) + A1(6) + A1(10), A1(0) + A1(6)]
>>> [C3(fw).branch(A1,rule='symmetric_power') for fw in C3.fundamental_weights()]
[A1(5), A1(4) + A1(8), A1(3) + A1(9)]
```

Miscellaneous

Use `rule="miscellaneous"` for the following embeddings of maximal subgroups, all involving exceptional groups.

$$\begin{aligned}
B_3 &\Rightarrow G_2,\\
E_6 &\Rightarrow G_2,\\
E_6 &\Rightarrow A_2,\\
F_4 &\Rightarrow G_2 \times A_1,\\
E_6 &\Rightarrow G_2 \times A_2,\\
E_7 &\Rightarrow G_2 \times C_3,\\
E_7 &\Rightarrow F_4 \times A_1,\\
E_7 &\Rightarrow A_1 \times A_1,\\
E_7 &\Rightarrow G_2 \times A_1,\\
E_8 &\Rightarrow G_2 \times F_4.\\
E_8 &\Rightarrow A2 \times A_1.\\
E_8 &\Rightarrow B2.
\end{aligned}$$

Except for those embeddings available by `rule="extended"`, these are the only embeddings of these groups as maximal subgroups. There may be other embeddings besides these. For example, there are other more obvious embeddings of A_2 and G_2 into E_6. However the embeddings in this table are characterized as embeddings as maximal subgroups. Regarding the embeddings of A_2 and G_2 in E_6, the embeddings in question may be characterized by the condition that the 27-dimensional representations of E_6 restrict irreducibly to A_2 or G_2. Since G_2 has a subgroup isomorphic to A_2, it is worth mentioning that the composite branching rules:

```
branching_rule("E6","G2","miscellaneous")*branching_rule("G2","A2","extended")
branching_rule("E6","A2","miscellaneous")
```

are distinct.

These embeddings are described more completely (with references to the literature) in the thematic tutorial at:

https://doc.sagemath.org/html/en/thematic_tutorials/lie.html

EXAMPLES:

```
sage: G2 = WeylCharacterRing("G2")
sage: [fw1, fw2, fw3] = B3.fundamental_weights()
sage: B3(fw1+fw3).branch(G2, rule='miscellaneous')
G2(1,0,-1) + G2(2,-1,-1) + G2(2,0,-2)
sage: E6 = WeylCharacterRing("E6",style='coroots')
sage: G2 = WeylCharacterRing("G2",style='coroots')
sage: E6(1,0,0,0,0,0).branch(G2,"miscellaneous")
G2(2,0)
sage: A2=WeylCharacterRing("A2",style='coroots')
sage: E6(1,0,0,0,0,0).branch(A2,rule='miscellaneous')
A2(2,2)
sage: E6(0,1,0,0,0,0).branch(A2,rule='miscellaneous')
A2(1,1) + A2(1,4) + A2(4,1)
sage: E6(0,0,0,0,0,2).branch(G2,"miscellaneous") # long time (0.59s)
G2(0,0) + G2(2,0) + G2(1,1) + G2(0,2) + G2(4,0)
sage: F4=WeylCharacterRing("F4",style='coroots')
sage: G2xA1=WeylCharacterRing("G2xA1",style='coroots')
```

(continues on next page)

(continued from previous page)

```
sage: F4(0,0,1,0).branch(G2xA1,rule='miscellaneous')
G2xA1(1,0,0) + G2xA1(1,0,2) + G2xA1(1,0,4) + G2xA1(1,0,6) + G2xA1(0,1,4) +

A1 maximal subgroups of exceptional groups

There are seven cases where the exceptional group G_2, F_4, E_7 or E_8 contains a maximal subgroup of type A_1. These are tabulated in Theorem 1 of Testerman, The construction of the maximal A1's in the exceptional algebraic groups, Proc. Amer. Math. Soc. 116 (1992), no. 3, 635-644. The names of these branching rules are roman numerals referring to the seven cases of her Theorem 1. Use these branching rules as in the following examples.

EXAMPLES:

```
sage: A1=WeylCharacterRing("A1",style='coroots')
sage: G2=WeylCharacterRing("G2",style='coroots')
sage: F4=WeylCharacterRing("F4",style='coroots')
sage: E7=WeylCharacterRing("E7",style='coroots')
sage: E8=WeylCharacterRing("E8",style='coroots')
sage: [G2(f).branch(A1,rule='i') for f in G2.fundamental_weights()]
[A1(6), A1(2) + A1(10)]
sage: F4(1,0,0,0).branch(A1,rule='ii')
A1(2) + A1(10) + A1(14) + A1(22)
sage: E7(0,0,0,0,0,0,1).branch(A1,rule='iii')
A1(9) + A1(17) + A1(27)
sage: E7(0,0,0,0,0,0,1).branch(A1,rule='iv')
A1(5) + A1(11) + A1(15) + A1(21)
sage: E8(0,0,0,0,0,0,0,1).branch(A1,rule='v') # long time (0.6s)
A1(2) + A1(14) + A1(22) + A1(26) + A1(34) + A1(38) + A1(46) + A1(58)
sage: E8(0,0,0,0,0,0,0,1).branch(A1,rule='vi') # long time (0.6s)
A1(2) + A1(10) + A1(14) + A1(18) + A1(22) + A1(26) + A1(28) + A1(34) + A1(38) +
↪A1(46)
sage: E8(0,0,0,0,0,0,0,1).branch(A1,rule='vii') # long time (0.6s)
A1(2) + A1(6) + A1(10) + A1(14) + A1(16) + A1(18) + 2*A1(22) + A1(26) + A1(28) +
↪A1(34) + A1(38)
```

```
>>> from sage.all import *

↪Integer(0),Integer(1)).branch(A1,rule='vii') # long time (0.6s)
A1(2) + A1(6) + A1(10) + A1(14) + A1(16) + A1(18) + 2*A1(22) + A1(26) + A1(28) +␣
↪A1(34) + A1(38)
```

Branching Rules From Plethysms

Nearly all branching rules $G \Rightarrow H$ where G is of type A, B, C or D are covered by the preceding rules. The function *branching_rule_from_plethysm()* covers the remaining cases.

This is a general rule that includes any branching rule from types A, B, C, or D as a special case. Thus it could be used in place of the above rules and would give the same results. However it is most useful when branching from G to a maximal subgroup H such that $\mathrm{rank}(H) < \mathrm{rank}(G) - 1$.

We consider a homomorphism $H \Rightarrow G$ where G is one of $SL(r+1)$, $SO(2r+1)$, $Sp(2r)$ or $SO(2r)$. The function *branching_rule_from_plethysm()* produces the corresponding branching rule. The main ingredient is the character χ of the representation of H that is the homomorphism to $GL(r+1)$, $GL(2r+1)$ or $GL(2r)$.

This rule is so powerful that it contains the other rules implemented above as special cases. First let us consider the symmetric fifth power representation of $SL(2)$.

```
sage: A1=WeylCharacterRing("A1",style='coroots')
sage: chi=A1([5])
sage: chi.degree()
 6
sage: chi.frobenius_schur_indicator()
-1
```

```
>>> from sage.all import *
>>> A1=WeylCharacterRing("A1",style='coroots')
>>> chi=A1([Integer(5)])
>>> chi.degree()
 6
>>> chi.frobenius_schur_indicator()
-1
```

This confirms that the character has degree 6 and is symplectic, so it corresponds to a homomorphism $SL(2) \Rightarrow Sp(6)$, and there is a corresponding branching rule $C_3 \Rightarrow A_1$.

```
sage: C3 = WeylCharacterRing("C3",style='coroots')
sage: sym5rule = branching_rule_from_plethysm(chi,"C3")
sage: [C3(hwv).branch(A1,rule=sym5rule) for hwv in C3.fundamental_weights()]
[A1(5), A1(4) + A1(8), A1(3) + A1(9)]
```

```
>>> from sage.all import *
>>> C3 = WeylCharacterRing("C3",style='coroots')
>>> sym5rule = branching_rule_from_plethysm(chi,"C3")
>>> [C3(hwv).branch(A1,rule=sym5rule) for hwv in C3.fundamental_weights()]
[A1(5), A1(4) + A1(8), A1(3) + A1(9)]
```

This is identical to the results we would obtain using `rule="symmetric_power"`. The next example gives a branching not available by other standard rules.

```
sage: G2 = WeylCharacterRing("G2",style='coroots')
sage: D7 = WeylCharacterRing("D7",style='coroots')
sage: ad=G2(0,1); ad.degree(); ad.frobenius_schur_indicator()
 14
 1
sage: spin = D7(0,0,0,0,0,1,0); spin.degree()
 64
sage: spin.branch(G2, rule=branching_rule_from_plethysm(ad, "D7"))
 G2(1,1)
```

```
>>> from sage.all import *
>>> G2 = WeylCharacterRing("G2",style='coroots')
>>> D7 = WeylCharacterRing("D7",style='coroots')
>>> ad=G2(Integer(0),Integer(1)); ad.degree(); ad.frobenius_schur_indicator()
 14
 1
>>> spin = D7(Integer(0),Integer(0),Integer(0),Integer(0),Integer(0),Integer(1),
↪Integer(0)); spin.degree()
 64
>>> spin.branch(G2, rule=branching_rule_from_plethysm(ad, "D7"))
 G2(1,1)
```

We have confirmed that the adjoint representation of G_2 gives a homomorphism into $SO(14)$, and that the pullback of the one of the two 64 dimensional spin representations to $SO(14)$ is an irreducible representation of G_2.

We do not actually have to create the character or its parent WeylCharacterRing to create the branching rule:

```
sage: b = branching_rule("C7","C3(0,0,1)","plethysm"); b
plethysm (along C3(0,0,1)) branching rule C7 => C3
```

```
>>> from sage.all import *
>>> b = branching_rule("C7","C3(0,0,1)","plethysm"); b
plethysm (along C3(0,0,1)) branching rule C7 => C3
```

Isomorphic Type

Although not usually referred to as a branching rule, the effects of the accidental isomorphisms may be handled using `rule="isomorphic"`:

$$B_2 \Rightarrow C_2$$
$$C_2 \Rightarrow B_2$$
$$A_3 \Rightarrow D_3$$
$$D_3 \Rightarrow A_3$$
$$D_2 \Rightarrow A_1 \Rightarrow A_1$$
$$B_1 \Rightarrow A_1$$
$$C_1 \Rightarrow A_1$$

EXAMPLES:

```
sage: B2 = WeylCharacterRing("B2")
sage: C2 = WeylCharacterRing("C2")
sage: [B2(x).branch(C2, rule='isomorphic') for x in B2.fundamental_weights()]
[C2(1,1), C2(1,0)]
sage: [C2(x).branch(B2, rule='isomorphic') for x in C2.fundamental_weights()]
[B2(1/2,1/2), B2(1,0)]
sage: D3 = WeylCharacterRing("D3")
sage: A3 = WeylCharacterRing("A3")
sage: [A3(x).branch(D3,rule='isomorphic') for x in A3.fundamental_weights()]
[D3(1/2,1/2,1/2), D3(1,0,0), D3(1/2,1/2,-1/2)]
sage: [D3(x).branch(A3,rule='isomorphic') for x in D3.fundamental_weights()]
[A3(1/2,1/2,-1/2,-1/2), A3(1/4,1/4,1/4,-3/4), A3(3/4,-1/4,-1/4,-1/4)]
```

```
>>> from sage.all import *
>>> B2 = WeylCharacterRing("B2")
>>> C2 = WeylCharacterRing("C2")
>>> [B2(x).branch(C2, rule='isomorphic') for x in B2.fundamental_weights()]
[C2(1,1), C2(1,0)]
>>> [C2(x).branch(B2, rule='isomorphic') for x in C2.fundamental_weights()]
[B2(1/2,1/2), B2(1,0)]
>>> D3 = WeylCharacterRing("D3")
>>> A3 = WeylCharacterRing("A3")
>>> [A3(x).branch(D3,rule='isomorphic') for x in A3.fundamental_weights()]
[D3(1/2,1/2,1/2), D3(1,0,0), D3(1/2,1/2,-1/2)]
>>> [D3(x).branch(A3,rule='isomorphic') for x in D3.fundamental_weights()]
[A3(1/2,1/2,-1/2,-1/2), A3(1/4,1/4,1/4,-3/4), A3(3/4,-1/4,-1/4,-1/4)]
```

Here $A_3(x,y,z,w)$ can be understood as a representation of $SL(4)$. The weights x,y,z,w and $x+t,y+t,z+t,w+t$ represent the same representation of $SL(4)$ - though not of $GL(4)$ - since $A_3(x+t,y+t,z+t,w+t)$ is the same as $A_3(x,y,z,w)$ tensored with $\det^t$. So as a representation of $SL(4)$, `A3(1/4,1/4,1/4,-3/4)` is the same as `A3(1,1,1,0)`. The exterior square representation $SL(4) \Rightarrow GL(6)$ admits an invariant symmetric bilinear form, so is a representation $SL(4) \Rightarrow SO(6)$ that lifts to an isomorphism $SL(4) \Rightarrow \mathrm{Spin}(6)$. Conversely, there are two isomorphisms $SO(6) \Rightarrow SL(4)$, of which we've selected one.

In cases like this you might prefer `style="coroots"`:

```
sage: A3 = WeylCharacterRing("A3",style='coroots')
sage: D3 = WeylCharacterRing("D3",style='coroots')
sage: [D3(fw) for fw in D3.fundamental_weights()]
[D3(1,0,0), D3(0,1,0), D3(0,0,1)]
sage: [D3(fw).branch(A3,rule='isomorphic') for fw in D3.fundamental_weights()]
[A3(0,1,0), A3(0,0,1), A3(1,0,0)]
sage: D2 = WeylCharacterRing("D2", style='coroots')
sage: A1xA1 = WeylCharacterRing("A1xA1", style='coroots')
sage: [D2(fw).branch(A1xA1,rule='isomorphic') for fw in D2.fundamental_weights()]
[A1xA1(1,0), A1xA1(0,1)]
```

```
>>> from sage.all import *
>>> A3 = WeylCharacterRing("A3",style='coroots')
>>> D3 = WeylCharacterRing("D3",style='coroots')
>>> [D3(fw) for fw in D3.fundamental_weights()]
[D3(1,0,0), D3(0,1,0), D3(0,0,1)]
>>> [D3(fw).branch(A3,rule='isomorphic') for fw in D3.fundamental_weights()]
```

(continues on next page)

(continued from previous page)

```
[A3(0,1,0), A3(0,0,1), A3(1,0,0)]
>>> D2 = WeylCharacterRing("D2", style='coroots')
>>> A1xA1 = WeylCharacterRing("A1xA1", style='coroots')
>>> [D2(fw).branch(A1xA1,rule='isomorphic') for fw in D2.fundamental_weights()]
[A1xA1(1,0), A1xA1(0,1)]
```

Branching From a Reducible WeylCharacterRing

If the Cartan Type of R is reducible, we may project a character onto any of the components, or any combination of components. The rule to project on the first component is specified by the string `'proj1'`, the rule to project on the second component is `"proj2". To project on the first and third components, use ``'proj13'` and so on.

EXAMPLES:

```
sage: A2xG2=WeylCharacterRing("A2xG2",style='coroots')
sage: A2=WeylCharacterRing("A2",style='coroots')
sage: G2=WeylCharacterRing("G2",style='coroots')
sage: A2xG2(1,0,1,0).branch(A2,rule='proj1')
7*A2(1,0)
sage: A2xG2(1,0,1,0).branch(G2,rule='proj2')
3*G2(1,0)
sage: A2xA2xG2=WeylCharacterRing("A2xA2xG2",style='coroots')
sage: A2xA2xG2(0,1,1,1,0,1).branch(A2xG2,rule='proj13')
8*A2xG2(0,1,0,1)
```

```
>>> from sage.all import *
>>> A2xG2=WeylCharacterRing("A2xG2",style='coroots')
>>> A2=WeylCharacterRing("A2",style='coroots')
>>> G2=WeylCharacterRing("G2",style='coroots')
>>> A2xG2(Integer(1),Integer(0),Integer(1),Integer(0)).branch(A2,rule='proj1')
7*A2(1,0)
>>> A2xG2(Integer(1),Integer(0),Integer(1),Integer(0)).branch(G2,rule='proj2')
3*G2(1,0)
>>> A2xA2xG2=WeylCharacterRing("A2xA2xG2",style='coroots')
>>> A2xA2xG2(Integer(0),Integer(1),Integer(1),Integer(1),Integer(0),Integer(1)).
↪branch(A2xG2,rule='proj13')
8*A2xG2(0,1,0,1)
```

A more general way of specifying a branching rule from a reducible type is to supply a *list* of rules, one *component rule* for each component type in the root system. In the following example, we branch the fundamental representations of D_4 down to $A_1 \times A_1 \times A_1 \times A_1$ through the intermediate group $D_2 \times D_2$. We use multiplicative notation to compose the branching rules. There is no need to construct the intermediate WeylCharacterRing with type $D_2 \times D_2$.

EXAMPLES:

```
sage: D4 = WeylCharacterRing("D4",style='coroots')
sage: A1xA1xA1xA1 = WeylCharacterRing("A1xA1xA1xA1",style='coroots')
sage: b = branching_rule("D2","A1xA1","isomorphic")
sage: br = branching_rule("D4","D2xD2","extended")*branching_rule("D2xD2",
↪"A1xA1xA1xA1",[b,b])
sage: [D4(fw).branch(A1xA1xA1xA1,rule=br) for fw in D4.fundamental_weights()]
```

(continues on next page)

A1xA1xA1xA1(1,0,1,0) + A1xA1xA1xA1(0,1,0,1)]
```

In the list of rules to be supplied in branching from a reducible root system, we may use two key words "omit" and "identity". The term "omit" means that we omit one factor, projecting onto the remaining factors. The term "identity" is supplied when the irreducible factor Cartan Types of both the target and the source are the same, and the component branching rule is to be the identity map. For example, we have projection maps from $A_3 \times A_2$ to A_3 and A_2, and the corresponding branching may be accomplished as follows. In this example the same could be accomplished using `rule="proj2"`.

EXAMPLES:

```
sage: A3xA2=WeylCharacterRing("A3xA2",style='coroots')
sage: A3=WeylCharacterRing("A3",style='coroots')
sage: chi = A3xA2(0,1,0,1,0)
sage: chi.branch(A3,rule=["identity","omit"])
3*A3(0,1,0)
sage: A2=WeylCharacterRing("A2",style='coroots')
sage: chi.branch(A2,rule=["omit","identity"])
6*A2(1,0)
```

```
>>> from sage.all import *
>>> A3xA2=WeylCharacterRing("A3xA2",style='coroots')
>>> A3=WeylCharacterRing("A3",style='coroots')
>>> chi = A3xA2(Integer(0),Integer(1),Integer(0),Integer(1),Integer(0))
>>> chi.branch(A3,rule=["identity","omit"])
3*A3(0,1,0)
>>> A2=WeylCharacterRing("A2",style='coroots')
>>> chi.branch(A2,rule=["omit","identity"])
6*A2(1,0)
```

Yet another way of branching from a reducible root system with repeated Cartan types is to embed along the diagonal. The branching rule is equivalent to the tensor product, as the example shows:

```
sage: G2=WeylCharacterRing("G2",style='coroots')
sage: G2xG2=WeylCharacterRing("G2xG2",style='coroots')
```

(continues on next page)

(continued from previous page)

```
sage: G2=WeylCharacterRing("G2",style='coroots')
sage: G2xG2(1,0,0,1).branch(G2,rule='diagonal')
G2(1,0) + G2(2,0) + G2(1,1)
sage: G2xG2(1,0,0,1).branch(G2,rule='diagonal') == G2(1,0)*G2(0,1)
True
```

```
>>> from sage.all import *
>>> G2=WeylCharacterRing("G2",style='coroots')
>>> G2xG2=WeylCharacterRing("G2xG2",style='coroots')
>>> G2=WeylCharacterRing("G2",style='coroots')
>>> G2xG2(Integer(1),Integer(0),Integer(0),Integer(1)).branch(G2,rule='diagonal')
G2(1,0) + G2(2,0) + G2(1,1)
>>> G2xG2(Integer(1),Integer(0),Integer(0),Integer(1)).branch(G2,rule='diagonal')␣
↪== G2(Integer(1),Integer(0))*G2(Integer(0),Integer(1))
True
```

Writing Your Own (Branching) Rules

Suppose you want to branch from a group G to a subgroup H. Arrange the embedding so that a Cartan subalgebra U of H is contained in a Cartan subalgebra T of G. There is thus a mapping from the weight spaces $\mathrm{Lie}(T)^* \Rightarrow \mathrm{Lie}(U)^*$. Two embeddings will produce identical branching rules if they differ by an element of the Weyl group of H.

The *rule* is this map $\mathrm{Lie}(T)^*$, which is `G.space()`, to $\mathrm{Lie}(U)^*$, which is `H.space()`, which you may implement as a function. As an example, let us consider how to implement the branching rule $A_3 \Rightarrow C_2$. Here $H = C_2 = Sp(4)$ embedded as a subgroup in $A_3 = GL(4)$. The Cartan subalgebra U consists of diagonal matrices with eigenvalues $u_1, u_2, -u_2, -u_1$. The `C2.space()` is the two dimensional vector spaces consisting of the linear functionals u_1 and u_2 on U. On the other hand $\mathrm{Lie}(T)$ is $\mathbf{R}^4$. A convenient way to see the restriction is to think of it as the adjoint of the map $(u_1, u_2) \mapsto (u_1, u_2, -u_2, -u_1)$, that is, $(x_0, x_1, x_2, x_3) \Rightarrow (x_0 - x_3, x_1 - x_2)$. Hence we may encode the rule as follows:

```
def rule(x):
    return [x[0]-x[3],x[1]-x[2]]
```

or simply:

```
rule = lambda x: [x[0]-x[3],x[1]-x[2]]
```

We may now make and use the branching rule as follows.

EXAMPLES:

```
sage: br = BranchingRule("A3", "C2", lambda x: [x[0]-x[3],x[1]-x[2]], "homemade");
↪ br
homemade branching rule A3 => C2
sage: [A3,C2]=[WeylCharacterRing(x,style='coroots') for x in ["A3","C2"]]
sage: A3(0,1,0).branch(C2,rule=br)
C2(0,0) + C2(0,1)
```

```
>>> from sage.all import *
>>> br = BranchingRule("A3", "C2", lambda x: [x[Integer(0)]-x[Integer(3)],
↪x[Integer(1)]-x[Integer(2)]], "homemade"); br
homemade branching rule A3 => C2
```

(continues on next page)

(continued from previous page)

```
>>> [A3,C2]=[WeylCharacterRing(x,style='coroots') for x in ["A3","C2"]]
>>> A3(Integer(0),Integer(1),Integer(0)).branch(C2,rule=br)
C2(0,0) + C2(0,1)
```

sage.combinat.root_system.branching_rules.**branching_rule**(*Rtype*, *Stype*, *rule='default'*)

Create a branching rule.

INPUT:

- R – the Weyl Character Ring of G
- S – the Weyl Character Ring of H
- rule – string describing the branching rule as a map from the weight space of S to the weight space of R

If the rule parameter is omitted, in some cases, a default rule is supplied. See *branch_weyl_character()*.

EXAMPLES:

```
sage: rule = branching_rule(CartanType("A3"),CartanType("C2"),"symmetric")
sage: [rule(x) for x in WeylCharacterRing("A3").fundamental_weights()]
[[1, 0], [1, 1], [1, 0]]
```

```
>>> from sage.all import *
>>> rule = branching_rule(CartanType("A3"),CartanType("C2"),"symmetric")
>>> [rule(x) for x in WeylCharacterRing("A3").fundamental_weights()]
[[1, 0], [1, 1], [1, 0]]
```

sage.combinat.root_system.branching_rules.**branching_rule_from_plethysm**(*chi*, *cartan_type*, *return_matrix=False*)

Create the branching rule of a plethysm.

INPUT:

- chi – the character of an irreducible representation π of a group G
- cartan_type – a classical Cartan type (A,`B`,`C` or D)

It is assumed that the image of the irreducible representation pi naturally has its image in the group G.

Returns a branching rule for this plethysm.

EXAMPLES:

The adjoint representation $SL(3) \to GL(8)$ factors through $SO(8)$. The branching rule in question will describe how representations of $SO(8)$ composed with this homomorphism decompose into irreducible characters of $SL(3)$:

```
sage: A2 = WeylCharacterRing("A2")
sage: A2 = WeylCharacterRing("A2", style='coroots')
sage: ad = A2.adjoint_representation(); ad
A2(1,1)
sage: ad.degree()
8
sage: ad.frobenius_schur_indicator()
1
```

```
>>> from sage.all import *
>>> A2 = WeylCharacterRing("A2")
>>> A2 = WeylCharacterRing("A2", style='coroots')
>>> ad = A2.adjoint_representation(); ad
A2(1,1)
>>> ad.degree()
8
>>> ad.frobenius_schur_indicator()
1
```

This confirms that ad has degree 8 and is orthogonal, hence factors through $SO(8)$ which is type D_4:

```
sage: br = branching_rule_from_plethysm(ad,"D4")
sage: D4 = WeylCharacterRing("D4")
sage: [D4(f).branch(A2,rule = br) for f in D4.fundamental_weights()]
[A2(1,1), A2(0,3) + A2(1,1) + A2(3,0), A2(1,1), A2(1,1)]
```

```
>>> from sage.all import *
>>> br = branching_rule_from_plethysm(ad,"D4")
>>> D4 = WeylCharacterRing("D4")
>>> [D4(f).branch(A2,rule = br) for f in D4.fundamental_weights()]
[A2(1,1), A2(0,3) + A2(1,1) + A2(3,0), A2(1,1), A2(1,1)]
```

sage.combinat.root_system.branching_rules.**get_branching_rule**(*Rtype*, *Stype*, *rule='default'*)

Create a branching rule.

INPUT:

- R – the Weyl Character Ring of G
- S – the Weyl Character Ring of H
- rule – string describing the branching rule as a map from the weight space of S to the weight space of R

If the rule parameter is omitted, in some cases, a default rule is supplied. See *branch_weyl_character()*.

EXAMPLES:

```
sage: rule = branching_rule(CartanType("A3"),CartanType("C2"),"symmetric")
sage: [rule(x) for x in WeylCharacterRing("A3").fundamental_weights()]
[[1, 0], [1, 1], [1, 0]]
```

```
>>> from sage.all import *
>>> rule = branching_rule(CartanType("A3"),CartanType("C2"),"symmetric")
>>> [rule(x) for x in WeylCharacterRing("A3").fundamental_weights()]
[[1, 0], [1, 1], [1, 0]]
```

sage.combinat.root_system.branching_rules.**maximal_subgroups**(*ct*, *mode='print_rules'*)

Given a classical Cartan type (of rank less than or equal to 8) this prints the Cartan types of maximal subgroups, with a method of obtaining the branching rule. The string to the right of the colon in the output is a command to create a branching rule.

INPUT:

- ct – a classical irreducible Cartan type

Returns a list of maximal subgroups of ct.

EXAMPLES:

```
sage: from sage.combinat.root_system.branching_rules import maximal_subgroups
sage: maximal_subgroups("D4")
B3:branching_rule("D4","B3","symmetric")
A2:branching_rule("D4","A2(1,1)","plethysm")
A1xC2:branching_rule("D4","C1xC2","tensor")*branching_rule("C1xC2","A1xC2",
↪[branching_rule("C1","A1","isomorphic"),"identity"])
A1xA1xA1xA1:branching_rule("D4","D2xD2","orthogonal_sum")*branching_rule("D2xD2",
↪"A1xA1xA1xA1",[branching_rule("D2","A1xA1","isomorphic"),branching_rule("D2",
↪"A1xA1","isomorphic")])
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.branching_rules import maximal_subgroups
>>> maximal_subgroups("D4")
B3:branching_rule("D4","B3","symmetric")
A2:branching_rule("D4","A2(1,1)","plethysm")
A1xC2:branching_rule("D4","C1xC2","tensor")*branching_rule("C1xC2","A1xC2",
↪[branching_rule("C1","A1","isomorphic"),"identity"])
A1xA1xA1xA1:branching_rule("D4","D2xD2","orthogonal_sum")*branching_rule("D2xD2",
↪"A1xA1xA1xA1",[branching_rule("D2","A1xA1","isomorphic"),branching_rule("D2",
↪"A1xA1","isomorphic")])
```

5.1.225 Cartan matrices

AUTHORS:

- Travis Scrimshaw (2012-04-22): Nicolas M. Thiery moved matrix creation to *CartanType* to prepare `cartan_matrix()` for deprecation.
- Christian Stump, Travis Scrimshaw (2013-04-13): Created *CartanMatrix*.
- Ben Salisbury (2018-08-07): Added Borcherds-Cartan matrices.

class `sage.combinat.root_system.cartan_matrix.`**`CartanMatrix`**

Bases: `Matrix_integer_sparse`, *CartanType_abstract*

A (generalized) Cartan matrix.

A matrix $A = (a_{ij})_{i,j \in I}$ for some index set I is a generalized Cartan matrix if it satisfies the following properties:

- $a_{ii} = 2$ for all i,
- $a_{ij} \leq 0$ for all $i \neq j$,
- $a_{ij} = 0$ if and only if $a_{ji} = 0$ for all $i \neq j$.

Additionally some reference assume that a Cartan matrix is *symmetrizable* (see `is_symmetrizable()`). However following Kac, we do not make that assumption here.

An even, integral Borcherds–Cartan matrix is an integral matrix $A = (a_{ij})_{i,j \in I}$ for some countable index set I which satisfies the following properties:

- $a_{ii} \in \{2\} \cup 2\mathbf{Z}_{<0}$ for all i,

- $a_{ij} \leq 0$ for all $i \neq j$,
- $a_{ij} = 0$ if and only if $a_{ji} = 0$ for all $i \neq j$.

INPUT:

Can be anything which is accepted by `CartanType` or a matrix.

If given a matrix, one can also use the keyword `cartan_type` when giving a matrix to explicitly state the type. Otherwise this will try to check the input matrix against possible standard types of Cartan matrices. To disable this check, use the keyword `cartan_type_check = False`.

If one wants to initialize a Borcherds-Cartan matrix using matrix data, use the keyword `borcherds=True`. To specify the diagonal entries of corresponding to a Cartan type (a Cartan matrix is treated as matrix data), use `borcherds` with a list of the diagonal entries.

EXAMPLES:

```

[ 2  0 -1]
[ 0  2 -3]
[-1 -1  2]
```

Examples of Borcherds-Cartan matrices:

```
sage: CartanMatrix([[2,-1],[-1,-2]], borcherds=True)                          #␣
↪needs sage.graphs
[ 2 -1]
[-1 -2]
sage: CartanMatrix('B3', borcherds=[-4,-6,2])                                 #␣
↪needs sage.graphs
[-4 -1  0]
[-1 -6 -1]
[ 0 -2  2]
```

```
>>> from sage.all import *
>>> CartanMatrix([[Integer(2),-Integer(1)],[-Integer(1),-Integer(2)]],␣
↪borcherds=True)                              # needs sage.graphs
[ 2 -1]
[-1 -2]
>>> CartanMatrix('B3', borcherds=[-Integer(4),-Integer(6),Integer(2)])        ␣
↪                          # needs sage.graphs
[-4 -1  0]
[-1 -6 -1]
[ 0 -2  2]
```

> **Note**
>
> Since this is a matrix, `row()` and `column()` will return the standard row and column respectively. To get the row with the indices as in Dynkin diagrams/Cartan types, use *row_with_indices()* and *column_with_indices()* respectively.

cartan_matrix()

Return the Cartan matrix of `self`.

EXAMPLES:

```
sage: CartanMatrix(['C',3]).cartan_matrix()                                   #␣
↪needs sage.graphs
[ 2 -1  0]
[-1  2 -2]
[ 0 -1  2]
```

```
>>> from sage.all import *
>>> CartanMatrix(['C',Integer(3)]).cartan_matrix()                            ␣
↪      # needs sage.graphs
[ 2 -1  0]
[-1  2 -2]
[ 0 -1  2]
```

cartan_type()

Return the Cartan type of `self` or `self` if unknown.

EXAMPLES:

```
sage: C = CartanMatrix(['A',4,1])                                             #␣
↪needs sage.graphs
```

(continues on next page)

(continued from previous page)

```
sage: C.cartan_type()                                                   #␣
↪needs sage.graphs
['A', 4, 1]
```

```
>>> from sage.all import *
>>> C = CartanMatrix(['A',Integer(4),Integer(1)])                      ␣
↪               # needs sage.graphs
>>> C.cartan_type()                                                   #␣
↪needs sage.graphs
['A', 4, 1]
```

If the Cartan type is unknown:

```
sage: C = CartanMatrix([[2,-1,-2], [-1,2,-1], [-2,-1,2]])               #␣
↪needs sage.graphs
sage: C.cartan_type()                                                   #␣
↪needs sage.graphs
[ 2 -1 -2]
[-1  2 -1]
[-2 -1  2]
```

```
>>> from sage.all import *
>>> C = CartanMatrix([[Integer(2),-Integer(1),-Integer(2)], [-Integer(1),
↪Integer(2),-Integer(1)], [-Integer(2),-Integer(1),Integer(2)]])        ␣
↪       # needs sage.graphs
>>> C.cartan_type()                                                   #␣
↪needs sage.graphs
[ 2 -1 -2]
[-1  2 -1]
[-2 -1  2]
```

column_with_indices(j)

Return the j-th column $(a_{i,j})_i$ of `self` as a container (or iterator) of tuples $(i, a_{i,j})$

EXAMPLES:

```
sage: M = CartanMatrix(['B',4])                                         #␣
↪needs sage.graphs
sage: [ (i,a) for (i,a) in M.column_with_indices(3) ]                   #␣
↪needs sage.graphs
[(3, 2), (2, -1), (4, -2)]
```

```
>>> from sage.all import *
>>> M = CartanMatrix(['B',Integer(4)])                                  ␣
↪      # needs sage.graphs
>>> [ (i,a) for (i,a) in M.column_with_indices(Integer(3)) ]            ␣
↪      # needs sage.graphs
[(3, 2), (2, -1), (4, -2)]
```

coxeter_diagram()

Construct the Coxeter diagram of `self`.

See also:

CartanType_abstract.coxeter_diagram()

EXAMPLES:

```
sage: # needs sage.graphs
sage: cm = CartanMatrix([[2,-5,0],[-2,2,-1],[0,-1,2]])
sage: G = cm.coxeter_diagram(); G
Graph on 3 vertices
sage: G.edges(sort=True)
[(0, 1, +Infinity), (1, 2, 3)]
sage: ct = CartanType([['A',2,2], ['B',3]])
sage: ct.coxeter_diagram()
Graph on 5 vertices
sage: ct.cartan_matrix().coxeter_diagram() == ct.coxeter_diagram()
True
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> cm = CartanMatrix([[Integer(2),-Integer(5),Integer(0)],[-Integer(2),
↪Integer(2),-Integer(1)],[Integer(0),-Integer(1),Integer(2)]])
>>> G = cm.coxeter_diagram(); G
Graph on 3 vertices
>>> G.edges(sort=True)
[(0, 1, +Infinity), (1, 2, 3)]
>>> ct = CartanType([['A',Integer(2),Integer(2)], ['B',Integer(3)]])
>>> ct.coxeter_diagram()
Graph on 5 vertices
>>> ct.cartan_matrix().coxeter_diagram() == ct.coxeter_diagram()
True
```

coxeter_matrix()

Return the Coxeter matrix for `self`.

See also:

CartanType_abstract.coxeter_matrix()

EXAMPLES:

```
sage: # needs sage.graphs
sage: cm = CartanMatrix([[2,-5,0],[-2,2,-1],[0,-1,2]])
sage: cm.coxeter_matrix()
[ 1 -1  2]
[-1  1  3]
[ 2  3  1]
sage: ct = CartanType([['A',2,2], ['B',3]])
sage: ct.coxeter_matrix()
[ 1 -1  2  2  2]
[-1  1  2  2  2]
```

(continues on next page)

(continued from previous page)

```
[ 2  2  1  3  2]
[ 2  2  3  1  4]
[ 2  2  2  4  1]
sage: ct.cartan_matrix().coxeter_matrix() == ct.coxeter_matrix()
True
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> cm = CartanMatrix([[Integer(2),-Integer(5),Integer(0)],[-Integer(2),
↪Integer(2),-Integer(1)],[Integer(0),-Integer(1),Integer(2)]])
>>> cm.coxeter_matrix()
[ 1 -1  2]
[-1  1  3]
[ 2  3  1]
>>> ct = CartanType([['A',Integer(2),Integer(2)], ['B',Integer(3)]])
>>> ct.coxeter_matrix()
[ 1 -1  2  2  2]
[-1  1  2  2  2]
[ 2  2  1  3  2]
[ 2  2  3  1  4]
[ 2  2  2  4  1]
>>> ct.cartan_matrix().coxeter_matrix() == ct.coxeter_matrix()
True
```

dual()

Return the dual Cartan matrix of `self`, which is obtained by taking the transpose.

EXAMPLES:

```
sage: # needs sage.graphs
sage: ct = CartanType(['C',3])
sage: M = CartanMatrix(ct); M
[ 2 -1  0]
[-1  2 -2]
[ 0 -1  2]
sage: M.dual()
[ 2 -1  0]
[-1  2 -1]
[ 0 -2  2]
sage: M.dual() == CartanMatrix(ct.dual())
True
sage: M.dual().cartan_type() == ct.dual()
True
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> ct = CartanType(['C',Integer(3)])
>>> M = CartanMatrix(ct); M
[ 2 -1  0]
[-1  2 -2]
[ 0 -1  2]
>>> M.dual()
```

(continues on next page)

(continued from previous page)

```
[ 2 -1  0]
[-1  2 -1]
[ 0 -2  2]
>>> M.dual() == CartanMatrix(ct.dual())
True
>>> M.dual().cartan_type() == ct.dual()
True
```

An example with arbitrary Cartan matrices:

```
sage: # needs sage.graphs
sage: cm = CartanMatrix([[2,-5], [-2, 2]]); cm
[ 2 -5]
[-2  2]
sage: cm.dual()
[ 2 -2]
[-5  2]
sage: cm.dual() == CartanMatrix(cm.transpose())
True
sage: cm.dual().dual() == cm
True
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> cm = CartanMatrix([[Integer(2),-Integer(5)], [-Integer(2), Integer(2)]]);
↪cm
[ 2 -5]
[-2  2]
>>> cm.dual()
[ 2 -2]
[-5  2]
>>> cm.dual() == CartanMatrix(cm.transpose())
True
>>> cm.dual().dual() == cm
True
```

dynkin_diagram()

Return the Dynkin diagram corresponding to `self`.

EXAMPLES:

```
sage: # needs sage.graphs
sage: C = CartanMatrix(['A',2])
sage: C.dynkin_diagram()
O---O
1   2
A2
sage: C = CartanMatrix(['F',4,1])
sage: C.dynkin_diagram()
O---O---O=>=O---O
0   1   2   3   4
F4~
```

(continues on next page)

(continued from previous page)

```
sage: C = CartanMatrix([[2,-4],[-4,2]])
sage: C.dynkin_diagram()
Dynkin diagram of rank 2
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> C = CartanMatrix(['A',Integer(2)])
>>> C.dynkin_diagram()
O---O
1   2
A2
>>> C = CartanMatrix(['F',Integer(4),Integer(1)])
>>> C.dynkin_diagram()
O---O---O=>=O---O
0   1   2   3   4
F4~
>>> C = CartanMatrix([[Integer(2),-Integer(4)],[-Integer(4),Integer(2)]])
>>> C.dynkin_diagram()
Dynkin diagram of rank 2
```

indecomposable_blocks()

Return a tuple of all indecomposable blocks of `self`.

EXAMPLES:

```
sage: # needs sage.graphs
sage: M = CartanMatrix(['A',2])
sage: M.indecomposable_blocks()
(
[ 2 -1]
[-1  2]
)
sage: M = CartanMatrix([['A',2,1],['A',3,1]])
sage: M.indecomposable_blocks()
(
[ 2 -1  0 -1]
[-1  2 -1  0]  [ 2 -1 -1]
[ 0 -1  2 -1]  [-1  2 -1]
[-1  0 -1  2], [-1 -1  2]
)
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> M = CartanMatrix(['A',Integer(2)])
>>> M.indecomposable_blocks()
(
[ 2 -1]
[-1  2]
)
>>> M = CartanMatrix([['A',Integer(2),Integer(1)],['A',Integer(3),
↪Integer(1)]])
>>> M.indecomposable_blocks()
```

(continues on next page)

(continued from previous page)

```
(
[ 2 -1  0 -1]
[-1  2 -1  0]  [ 2 -1 -1]
[ 0 -1  2 -1]  [-1  2 -1]
[-1  0 -1  2], [-1 -1  2]
)
```

index_set()

Return the index set of `self`.

EXAMPLES:

```
sage: # needs sage.graphs
sage: C = CartanMatrix(['A',1,1])
sage: C.index_set()
(0, 1)
sage: C = CartanMatrix(['E',6])
sage: C.index_set()
(1, 2, 3, 4, 5, 6)
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> C = CartanMatrix(['A',Integer(1),Integer(1)])
>>> C.index_set()
(0, 1)
>>> C = CartanMatrix(['E',Integer(6)])
>>> C.index_set()
(1, 2, 3, 4, 5, 6)
```

is_affine()

Return `True` if `self` is an affine type or `False` otherwise.

A generalized Cartan matrix is affine if all of its indecomposable blocks are either finite (see *is_finite()*) or have zero determinant with all proper principal minors positive.

EXAMPLES:

```
sage: # needs sage.graphs
sage: M = CartanMatrix(['C',4])
sage: M.is_affine()
False
sage: M = CartanMatrix(['D',4,1])
sage: M.is_affine()
True
sage: M = CartanMatrix([[2, -4], [-3, 2]])
sage: M.is_affine()
False
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> M = CartanMatrix(['C',Integer(4)])
>>> M.is_affine()
False
```

(continues on next page)

(continued from previous page)

```
>>> M = CartanMatrix(['D',Integer(4),Integer(1)])
>>> M.is_affine()
True
>>> M = CartanMatrix([[Integer(2), -Integer(4)], [-Integer(3), Integer(2)]])
>>> M.is_affine()
False
```

is_crystallographic()

Implement *CartanType_abstract.is_crystallographic()*.

A Cartan matrix is crystallographic if it is symmetrizable.

EXAMPLES:

```
sage: CartanMatrix(['F',4]).is_crystallographic()                    #␣
↪needs sage.graphs
True
```

```
>>> from sage.all import *
>>> CartanMatrix(['F',Integer(4)]).is_crystallographic()              ␣
↪     # needs sage.graphs
True
```

is_finite()

Return True if self is a finite type or False otherwise.

A generalized Cartan matrix is finite if the determinant of all its principal submatrices (see *principal_submatrices()*) is positive. Such matrices have a positive definite symmetrized matrix. Note that a finite matrix may consist of multiple blocks of Cartan matrices each having finite Cartan type.

EXAMPLES:

```
sage: # needs sage.graphs
sage: M = CartanMatrix(['C',4])
sage: M.is_finite()
True
sage: M = CartanMatrix(['D',4,1])
sage: M.is_finite()
False
sage: M = CartanMatrix([[2, -4], [-3, 2]])
sage: M.is_finite()
False
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> M = CartanMatrix(['C',Integer(4)])
>>> M.is_finite()
True
>>> M = CartanMatrix(['D',Integer(4),Integer(1)])
>>> M.is_finite()
False
>>> M = CartanMatrix([[Integer(2), -Integer(4)], [-Integer(3), Integer(2)]])
>>> M.is_finite()
False
```

is_hyperbolic(*compact=False*)

Return if `True` if `self` is a (compact) hyperbolic type or `False` otherwise.

An indecomposable generalized Cartan matrix is hyperbolic if it has negative determinant and if any proper connected subdiagram of its Dynkin diagram is of finite or affine type. It is compact hyperbolic if any proper connected subdiagram has finite type.

INPUT:

- `compact` – if `True`, check if matrix is compact hyperbolic

EXAMPLES:

```
sage: # needs sage.graphs
sage: M = CartanMatrix([[2,-2,0],[-2,2,-1],[0,-1,2]])
sage: M.is_hyperbolic()
True
sage: M.is_hyperbolic(compact=True)
False
sage: M = CartanMatrix([[2,-3],[-3,2]])
sage: M.is_hyperbolic()
True
sage: M = CartanMatrix(['C',4])
sage: M.is_hyperbolic()
False
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> M = CartanMatrix([[Integer(2),-Integer(2),Integer(0)],[-Integer(2),
↪Integer(2),-Integer(1)],[Integer(0),-Integer(1),Integer(2)]])
>>> M.is_hyperbolic()
True
>>> M.is_hyperbolic(compact=True)
False
>>> M = CartanMatrix([[Integer(2),-Integer(3)],[-Integer(3),Integer(2)]])
>>> M.is_hyperbolic()
True
>>> M = CartanMatrix(['C',Integer(4)])
>>> M.is_hyperbolic()
False
```

is_indecomposable()

Return if `self` is an indecomposable matrix or `False` otherwise.

EXAMPLES:

```
sage: # needs sage.graphs
sage: M = CartanMatrix(['A',5])
sage: M.is_indecomposable()
True
sage: M = CartanMatrix([[2,-1,0],[-1,2,0],[0,0,2]])
sage: M.is_indecomposable()
False
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> M = CartanMatrix(['A',Integer(5)])
>>> M.is_indecomposable()
True
>>> M = CartanMatrix([[Integer(2),-Integer(1),Integer(0)],[-Integer(1),
↪Integer(2),Integer(0)],[Integer(0),Integer(0),Integer(2)]])
>>> M.is_indecomposable()
False
```

is_indefinite()

Return if `self` is an indefinite type or `False` otherwise.

EXAMPLES:

```
sage: # needs sage.graphs
sage: M = CartanMatrix([[2,-3],[-3,2]])
sage: M.is_indefinite()
True
sage: M = CartanMatrix("A2")
sage: M.is_indefinite()
False
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> M = CartanMatrix([[Integer(2),-Integer(3)],[-Integer(3),Integer(2)]])
>>> M.is_indefinite()
True
>>> M = CartanMatrix("A2")
>>> M.is_indefinite()
False
```

is_lorentzian()

Return `True` if `self` is a Lorentzian type or `False` otherwise.

A generalized Cartan matrix is Lorentzian if it has negative determinant and exactly one negative eigenvalue.

EXAMPLES:

```
sage: # needs sage.graphs
sage: M = CartanMatrix([[2,-3],[-3,2]])
sage: M.is_lorentzian()
True
sage: M = CartanMatrix([[2,-1],[-1,2]])
sage: M.is_lorentzian()
False
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> M = CartanMatrix([[Integer(2),-Integer(3)],[-Integer(3),Integer(2)]])
>>> M.is_lorentzian()
True
>>> M = CartanMatrix([[Integer(2),-Integer(1)],[-Integer(1),Integer(2)]])
```

(continues on next page)

(continued from previous page)

```
>>> M.is_lorentzian()
False
```

is_simply_laced()

Implement `CartanType_abstract.is_simply_laced()`.

A Cartan matrix is simply-laced if all non diagonal entries are 0 or -1.

EXAMPLES:

```
sage: cm = CartanMatrix([[2, -1, -1, -1], [-1, 2, -1, -1],                    #␣
↪needs sage.graphs
....:                    [-1, -1, 2, -1], [-1, -1, -1, 2]])
sage: cm.is_simply_laced()                                                      #␣
↪needs sage.graphs
True
```

```
>>> from sage.all import *
>>> cm = CartanMatrix([[Integer(2), -Integer(1), -Integer(1), -Integer(1)], [-
↪Integer(1), Integer(2), -Integer(1), -Integer(1)],                       # needs␣
↪sage.graphs
...                    [-Integer(1), -Integer(1), Integer(2), -Integer(1)], [-
↪Integer(1), -Integer(1), -Integer(1), Integer(2)]])
>>> cm.is_simply_laced()                                                        #␣
↪needs sage.graphs
True
```

matrix_space(*nrows=None*, *ncols=None*, *sparse=None*)

Return a matrix space over the integers.

INPUT:

- `nrows` – number of rows
- `ncols` – number of columns
- `sparse` – boolean

EXAMPLES:

```
sage: # needs sage.graphs
sage: cm = CartanMatrix(['A', 3])
sage: cm.matrix_space()
Full MatrixSpace of 3 by 3 sparse matrices over Integer Ring
sage: cm.matrix_space(2, 2)
Full MatrixSpace of 2 by 2 sparse matrices over Integer Ring
sage: cm[:2,1:]    # indirect doctest
[-1  0]
[ 2 -1]
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> cm = CartanMatrix(['A', Integer(3)])
>>> cm.matrix_space()
Full MatrixSpace of 3 by 3 sparse matrices over Integer Ring
```

(continues on next page)

(continued from previous page)

```
>>> cm.matrix_space(Integer(2), Integer(2))
Full MatrixSpace of 2 by 2 sparse matrices over Integer Ring
>>> cm[:Integer(2),Integer(1):]    # indirect doctest
[-1  0]
[ 2 -1]
```

principal_submatrices(*proper=False*)

Return a list of all principal submatrices of `self`.

INPUT:

- `proper` – if `True`, return only proper submatrices

EXAMPLES:

```
sage: M = CartanMatrix(['A',2])                                               #␣
↪needs sage.graphs
sage: M.principal_submatrices()                                               #␣
↪needs sage.graphs
[
              [ 2 -1]
[], [2], [2], [-1  2]
]
sage: M.principal_submatrices(proper=True)                                    #␣
↪needs sage.graphs
[[], [2], [2]]
```

```
>>> from sage.all import *
>>> M = CartanMatrix(['A',Integer(2)])                                         ␣
↪     # needs sage.graphs
>>> M.principal_submatrices()                                                #␣
↪needs sage.graphs
[
              [ 2 -1]
[], [2], [2], [-1  2]
]
>>> M.principal_submatrices(proper=True)                                     #␣
↪needs sage.graphs
[[], [2], [2]]
```

rank()

Return the rank of `self`.

EXAMPLES:

```
sage: CartanMatrix(['C',3]).rank()                                            #␣
↪needs sage.graphs
3
sage: CartanMatrix(["A2","B2","F4"]).rank()                                   #␣
↪needs sage.graphs
8
```

```
>>> from sage.all import *
>>> CartanMatrix(['C',Integer(3)]).rank()                                          ␣
↪     # needs sage.graphs
3
>>> CartanMatrix(["A2","B2","F4"]).rank()                                        #␣
↪needs sage.graphs
8
```

reflection_group(*type='matrix'*)

Return the reflection group corresponding to `self`.

EXAMPLES:

```
sage: C = CartanMatrix(['A',3])                                                  #␣
↪needs sage.graphs
sage: C.reflection_group()                                                       #␣
↪needs sage.graphs sage.libs.gap
Weyl Group of type ['A', 3] (as a matrix group acting on the root space)
```

```
>>> from sage.all import *
>>> C = CartanMatrix(['A',Integer(3)])                                           ␣
↪     # needs sage.graphs
>>> C.reflection_group()                                                         #␣
↪needs sage.graphs sage.libs.gap
Weyl Group of type ['A', 3] (as a matrix group acting on the root space)
```

relabel(*relabelling*)

Return the relabelled Cartan matrix.

EXAMPLES:

```
sage: # needs sage.graphs
sage: CM = CartanMatrix(['C',3])
sage: R = CM.relabel({1:0, 2:4, 3:1}); R
[ 2  0 -1]
[ 0  2 -1]
[-1 -2  2]
sage: R.index_set()
(0, 1, 4)
sage: CM
[ 2 -1  0]
[-1  2 -2]
[ 0 -1  2]
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> CM = CartanMatrix(['C',Integer(3)])
>>> R = CM.relabel({Integer(1):Integer(0), Integer(2):Integer(4),␣
↪Integer(3):Integer(1)}); R
[ 2  0 -1]
[ 0  2 -1]
[-1 -2  2]
>>> R.index_set()
```

(continues on next page)

(continued from previous page)

```
(0, 1, 4)
>>> CM
[ 2 -1  0]
[-1  2 -2]
[ 0 -1  2]
```

root_space()

Return the root space corresponding to `self`.

EXAMPLES:

```
sage: C = CartanMatrix(['A',3])                                                 #␣
↪needs sage.graphs
sage: C.root_space()                                                            #␣
↪needs sage.graphs
Root space over the Rational Field of the Root system of type ['A', 3]
```

```
>>> from sage.all import *
>>> C = CartanMatrix(['A',Integer(3)])                                          ␣
↪     # needs sage.graphs
>>> C.root_space()                                                            #␣
↪needs sage.graphs
Root space over the Rational Field of the Root system of type ['A', 3]
```

root_system()

Return the root system corresponding to `self`.

EXAMPLES:

```
sage: C = CartanMatrix(['A',3])                                                 #␣
↪needs sage.graphs
sage: C.root_system()                                                           #␣
↪needs sage.graphs
Root system of type ['A', 3]
```

```
>>> from sage.all import *
>>> C = CartanMatrix(['A',Integer(3)])                                          ␣
↪     # needs sage.graphs
>>> C.root_system()                                                           #␣
↪needs sage.graphs
Root system of type ['A', 3]
```

row_with_indices(i)

Return the i-th row $(a_{i,j})_j$ of `self` as a container (or iterator) of tuples $(j, a_{i,j})$

EXAMPLES:

```
sage: M = CartanMatrix(['C',4])                                                 #␣
↪needs sage.graphs
sage: [ (i,a) for (i,a) in M.row_with_indices(3) ]                              #␣
↪needs sage.graphs
[(3, 2), (2, -1), (4, -2)]
```

```
>>> from sage.all import *
>>> M = CartanMatrix(['C',Integer(4)])                                    ␣
↪     # needs sage.graphs
>>> [ (i,a) for (i,a) in M.row_with_indices(Integer(3)) ]                 ␣
↪     # needs sage.graphs
[(3, 2), (2, -1), (4, -2)]
```

subtype(*index_set*)

Return a subtype of `self` given by `index_set`.

A subtype can be considered the Dynkin diagram induced from the Dynkin diagram of `self` by `index_set`.

EXAMPLES:

```
sage: # needs sage.graphs
sage: C = CartanMatrix(['F',4])
sage: S = C.subtype([1,2,3])
sage: S
[ 2 -1  0]
[-1  2 -1]
[ 0 -2  2]
sage: S.index_set()
(1, 2, 3)
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> C = CartanMatrix(['F',Integer(4)])
>>> S = C.subtype([Integer(1),Integer(2),Integer(3)])
>>> S
[ 2 -1  0]
[-1  2 -1]
[ 0 -2  2]
>>> S.index_set()
(1, 2, 3)
```

symmetrized_matrix()

Return the symmetrized matrix of `self` if symmetrizable.

EXAMPLES:

```
sage: cm = CartanMatrix(['B',4,1])                                         #␣
↪needs sage.graphs
sage: cm.symmetrized_matrix()                                              #␣
↪needs sage.graphs
[ 4  0 -2  0  0]
[ 0  4 -2  0  0]
[-2 -2  4 -2  0]
[ 0  0 -2  4 -2]
[ 0  0  0 -2  2]
```

```
>>> from sage.all import *
>>> cm = CartanMatrix(['B',Integer(4),Integer(1)])                        ␣
↪              # needs sage.graphs
>>> cm.symmetrized_matrix()                                              #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.graphs
[ 4  0 -2  0  0]
[ 0  4 -2  0  0]
[-2 -2  4 -2  0]
[ 0  0 -2  4 -2]
[ 0  0  0 -2  2]
```

symmetrizer()

Return the symmetrizer of `self`.

EXAMPLES:

```
sage: cm = CartanMatrix([[2,-5],[-2,2]])                                  #␣
↪needs sage.graphs
sage: cm.symmetrizer()                                                    #␣
↪needs sage.graphs
Finite family {0: 2, 1: 5}
```

```
>>> from sage.all import *
>>> cm = CartanMatrix([[Integer(2),-Integer(5)],[-Integer(2),Integer(2)]])  ␣
↪                                  # needs sage.graphs
>>> cm.symmetrizer()                                                     #␣
↪needs sage.graphs
Finite family {0: 2, 1: 5}
```

sage.combinat.root_system.cartan_matrix.**find_cartan_type_from_matrix**(*CM*)

Find a Cartan type by direct comparison of Dynkin diagrams given from the generalized Cartan matrix `CM` and return `None` if not found.

INPUT:

- `CM` – a generalized Cartan matrix

EXAMPLES:

```
sage: # needs sage.graphs
sage: from sage.combinat.root_system.cartan_matrix import find_cartan_type_from_
↪matrix
sage: CM = CartanMatrix([[2,-1,-1], [-1,2,-1], [-1,-1,2]])
sage: find_cartan_type_from_matrix(CM)
['A', 2, 1]
sage: CM = CartanMatrix([[2,-1,0], [-1,2,-2], [0,-1,2]])
sage: find_cartan_type_from_matrix(CM)
['C', 3] relabelled by {1: 0, 2: 1, 3: 2}
sage: CM = CartanMatrix([[2,-1,-2], [-1,2,-1], [-2,-1,2]])
sage: find_cartan_type_from_matrix(CM)
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> from sage.combinat.root_system.cartan_matrix import find_cartan_type_from_
↪matrix
>>> CM = CartanMatrix([[Integer(2),-Integer(1),-Integer(1)], [-Integer(1),
↪Integer(2),-Integer(1)], [-Integer(1),-Integer(1),Integer(2)]])
```

(continues on next page)

(continued from previous page)

```
>>> find_cartan_type_from_matrix(CM)
['A', 2, 1]
>>> CM = CartanMatrix([[Integer(2),-Integer(1),Integer(0)], [-Integer(1),
↪Integer(2),-Integer(2)], [Integer(0),-Integer(1),Integer(2)]])
>>> find_cartan_type_from_matrix(CM)
['C', 3] relabelled by {1: 0, 2: 1, 3: 2}
>>> CM = CartanMatrix([[Integer(2),-Integer(1),-Integer(2)], [-Integer(1),
↪Integer(2),-Integer(1)], [-Integer(2),-Integer(1),Integer(2)]])
>>> find_cartan_type_from_matrix(CM)
```

sage.combinat.root_system.cartan_matrix.**is_borcherds_cartan_matrix**(*M*)

Return `True` if `M` is an even, integral Borcherds-Cartan matrix. For a definition of such a matrix, see *CartanMatrix*.

EXAMPLES:

```
sage: from sage.combinat.root_system.cartan_matrix import is_borcherds_cartan_
↪matrix
sage: M = Matrix([[2,-1],[-1,2]])
sage: is_borcherds_cartan_matrix(M)
True
sage: N = Matrix([[2,-1],[-1,0]])
sage: is_borcherds_cartan_matrix(N)
False
sage: O = Matrix([[2,-1],[-1,-2]])
sage: is_borcherds_cartan_matrix(O)
True
sage: O = Matrix([[2,-1],[-1,-3]])
sage: is_borcherds_cartan_matrix(O)
False
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.cartan_matrix import is_borcherds_cartan_matrix
>>> M = Matrix([[Integer(2),-Integer(1)],[-Integer(1),Integer(2)]])
>>> is_borcherds_cartan_matrix(M)
True
>>> N = Matrix([[Integer(2),-Integer(1)],[-Integer(1),Integer(0)]])
>>> is_borcherds_cartan_matrix(N)
False
>>> O = Matrix([[Integer(2),-Integer(1)],[-Integer(1),-Integer(2)]])
>>> is_borcherds_cartan_matrix(O)
True
>>> O = Matrix([[Integer(2),-Integer(1)],[-Integer(1),-Integer(3)]])
>>> is_borcherds_cartan_matrix(O)
False
```

sage.combinat.root_system.cartan_matrix.**is_generalized_cartan_matrix**(*M*)

Return `True` if `M` is a generalized Cartan matrix. For a definition of a generalized Cartan matrix, see *CartanMatrix*.

EXAMPLES:

```
sage: from sage.combinat.root_system.cartan_matrix import is_generalized_cartan_
↪matrix
sage: M = matrix([[2,-1,-2], [-1,2,-1], [-2,-1,2]])
sage: is_generalized_cartan_matrix(M)
True
sage: M = matrix([[2,-1,-2], [-1,2,-1], [0,-1,2]])
sage: is_generalized_cartan_matrix(M)
False
sage: M = matrix([[1,-1,-2], [-1,2,-1], [-2,-1,2]])
sage: is_generalized_cartan_matrix(M)
False
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.cartan_matrix import is_generalized_cartan_
↪matrix
>>> M = matrix([[Integer(2),-Integer(1),-Integer(2)], [-Integer(1),Integer(2),-
↪Integer(1)], [-Integer(2),-Integer(1),Integer(2)]])
>>> is_generalized_cartan_matrix(M)
True
>>> M = matrix([[Integer(2),-Integer(1),-Integer(2)], [-Integer(1),Integer(2),-
↪Integer(1)], [Integer(0),-Integer(1),Integer(2)]])
>>> is_generalized_cartan_matrix(M)
False
>>> M = matrix([[Integer(1),-Integer(1),-Integer(2)], [-Integer(1),Integer(2),-
↪Integer(1)], [-Integer(2),-Integer(1),Integer(2)]])
>>> is_generalized_cartan_matrix(M)
False
```

A non-symmetrizable example:

```
sage: M = matrix([[2,-1,-2], [-1,2,-1], [-1,-1,2]])
sage: is_generalized_cartan_matrix(M)
True
```

```
>>> from sage.all import *
>>> M = matrix([[Integer(2),-Integer(1),-Integer(2)], [-Integer(1),Integer(2),-
↪Integer(1)], [-Integer(1),-Integer(1),Integer(2)]])
>>> is_generalized_cartan_matrix(M)
True
```

5.1.226 Cartan types

Todo

Why does sphinx complain if I use sections here?

Introduction

Loosely speaking, Dynkin diagrams (or equivalently Cartan matrices) are graphs which are used to classify root systems, Coxeter and Weyl groups, Lie algebras, Lie groups, crystals, etc. up to an isomorphism. *Cartan types* are a standard set of names for those Dynkin diagrams (see Wikipedia article Dynkin_diagram).

Let us consider, for example, the Cartan type A_4:

```
sage: T = CartanType(['A', 4]); T
['A', 4]
```

```
>>> from sage.all import *
>>> T = CartanType(['A', Integer(4)]); T
['A', 4]
```

It is the name of the following Dynkin diagram:

```
sage: DynkinDiagram(T)                                                        #␣
↪needs sage.graphs
O---O---O---O
1   2   3   4
A4
```

```
>>> from sage.all import *
>>> DynkinDiagram(T)                                                        #␣
↪needs sage.graphs
O---O---O---O
1   2   3   4
A4
```

Note

For convenience, the following shortcuts are available:

```
sage: DynkinDiagram(['A',4])                                                 #␣
↪needs sage.graphs
O---O---O---O
1   2   3   4
A4
sage: DynkinDiagram('A4')                                                    #␣
↪needs sage.graphs
O---O---O---O
1   2   3   4
A4
sage: T.dynkin_diagram()                                                     #␣
↪needs sage.graphs
O---O---O---O
1   2   3   4
A4
```

```
>>> from sage.all import *
>>> DynkinDiagram(['A',Integer(4)])                                            ␣
↪    # needs sage.graphs
O---O---O---O
1   2   3   4
A4
>>> DynkinDiagram('A4')                                                    #␣
↪needs sage.graphs
O---O---O---O
1   2   3   4
A4
>>> T.dynkin_diagram()                                                     #␣
↪needs sage.graphs
O---O---O---O
1   2   3   4
A4
```

See `DynkinDiagram` for how to further manipulate Dynkin diagrams.

From this data (the *Cartan datum*), one can construct the associated root system:

```
sage: RootSystem(T)
Root system of type ['A', 4]
```

```
>>> from sage.all import *
>>> RootSystem(T)
Root system of type ['A', 4]
```

The associated Weyl group of A_n is the symmetric group S_{n+1}:

```
sage: W = WeylGroup(T); W                                                  #␣
↪needs sage.libs.gap
Weyl Group of type ['A', 4] (as a matrix group acting on the ambient space)
sage: W.cardinality()                                                      #␣
↪needs sage.libs.gap
120
```

```
>>> from sage.all import *
>>> W = WeylGroup(T); W                                                  #␣
↪needs sage.libs.gap
Weyl Group of type ['A', 4] (as a matrix group acting on the ambient space)
>>> W.cardinality()                                                      #␣
↪needs sage.libs.gap
120
```

while the Lie algebra is sl_{n+1}, and the Lie group SL_{n+1} (TODO: illustrate this once this is implemented).

One may also construct crystals associated to various Dynkin diagrams. For example:

```
sage: C = crystals.Letters(T); C                                           #␣
↪needs sage.combinat
The crystal of letters for type ['A', 4]
sage: C.list()                                                             #␣
↪needs sage.combinat
[1, 2, 3, 4, 5]

sage: C = crystals.Tableaux(T, shape=[2]); C                               #␣
↪needs sage.combinat
The crystal of tableaux of type ['A', 4] and shape(s) [[2]]
sage: C.cardinality()                                                      #␣
↪needs sage.combinat
15
```

```
>>> from sage.all import *
>>> C = crystals.Letters(T); C                                           #␣
↪needs sage.combinat
The crystal of letters for type ['A', 4]
>>> C.list()                                                             #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.combinat
[1, 2, 3, 4, 5]

>>> C = crystals.Tableaux(T, shape=[Integer(2)]); C                              ␣
↪     # needs sage.combinat
The crystal of tableaux of type ['A', 4] and shape(s) [[2]]
>>> C.cardinality()                                                            #␣
↪needs sage.combinat
15
```

Here is a sample of all the finite irreducible crystallographic Cartan types:

```
sage: CartanType.samples(finite=True, crystallographic=True)
[['A', 1], ['A', 5], ['B', 1], ['B', 5], ['C', 1], ['C', 5], ['D', 2], ['D', 3], ['D',
↪ 5],
 ['E', 6], ['E', 7], ['E', 8], ['F', 4], ['G', 2]]
```

```
>>> from sage.all import *
>>> CartanType.samples(finite=True, crystallographic=True)
[['A', 1], ['A', 5], ['B', 1], ['B', 5], ['C', 1], ['C', 5], ['D', 2], ['D', 3], ['D',
↪ 5],
 ['E', 6], ['E', 7], ['E', 8], ['F', 4], ['G', 2]]
```

One can also get latex representations of the crystallographic Cartan types and their corresponding Dynkin diagrams:

```
sage: [latex(ct) for ct in CartanType.samples(crystallographic=True)]
[A_{1}, A_{5}, B_{1}, B_{5}, C_{1}, C_{5}, D_{2}, D_{3}, D_{5},
 E_6, E_7, E_8, F_4, G_2,
 A_{1}^{(1)}, A_{5}^{(1)}, B_{1}^{(1)}, B_{5}^{(1)},
 C_{1}^{(1)}, C_{5}^{(1)}, D_{3}^{(1)}, D_{5}^{(1)},
 E_6^{(1)}, E_7^{(1)}, E_8^{(1)}, F_4^{(1)}, G_2^{(1)},
 BC_{1}^{(2)}, BC_{5}^{(2)},
 B_{5}^{(1)\vee}, C_{4}^{(1)\vee}, F_4^{(1)\vee},
 G_2^{(1)\vee}, BC_{1}^{(2)\vee}, BC_{5}^{(2)\vee}]
sage: view([DynkinDiagram(ct) for ct in CartanType.samples(crystallographic=True)]) #␣
↪not tested
```

```
>>> from sage.all import *
>>> [latex(ct) for ct in CartanType.samples(crystallographic=True)]
[A_{1}, A_{5}, B_{1}, B_{5}, C_{1}, C_{5}, D_{2}, D_{3}, D_{5},
 E_6, E_7, E_8, F_4, G_2,
 A_{1}^{(1)}, A_{5}^{(1)}, B_{1}^{(1)}, B_{5}^{(1)},
 C_{1}^{(1)}, C_{5}^{(1)}, D_{3}^{(1)}, D_{5}^{(1)},
 E_6^{(1)}, E_7^{(1)}, E_8^{(1)}, F_4^{(1)}, G_2^{(1)},
 BC_{1}^{(2)}, BC_{5}^{(2)},
 B_{5}^{(1)\vee}, C_{4}^{(1)\vee}, F_4^{(1)\vee},
 G_2^{(1)\vee}, BC_{1}^{(2)\vee}, BC_{5}^{(2)\vee}]
>>> view([DynkinDiagram(ct) for ct in CartanType.samples(crystallographic=True)]) #␣
↪not tested
```

Non-crystallographic Cartan types are also partially supported:

```
sage: CartanType.samples(finite=True, crystallographic=False)
[['I', 5], ['H', 3], ['H', 4]]
```

```
>>> from sage.all import *
>>> CartanType.samples(finite=True, crystallographic=False)
[['I', 5], ['H', 3], ['H', 4]]
```

In Sage, a Cartan type is used as a database of type-specific information and algorithms (see e.g. `sage.combinat.root_system.type_A`). This database includes how to construct the Dynkin diagram, the ambient space for the root system (see Wikipedia article Root_system), and further mathematical properties:

```
sage: T.is_finite(), T.is_simply_laced(), T.is_affine(), T.is_crystallographic()
(True, True, False, True)
```

```
>>> from sage.all import *
>>> T.is_finite(), T.is_simply_laced(), T.is_affine(), T.is_crystallographic()
(True, True, False, True)
```

In particular, a Sage Cartan type is endowed with a fixed choice of labels for the nodes of the Dynkin diagram. This choice follows the conventions of Nicolas Bourbaki, Lie Groups and Lie Algebras: Chapter 4-6, Elements of Mathematics, Springer (2002). ISBN 978-3540426509. For example:

```
sage: T = CartanType(['D', 4])
sage: DynkinDiagram(T)                                                         #␣
↪needs sage.graphs
    O 4
    |
    |
O---O---O
1   2   3
D4

sage: E6 = CartanType(['E',6])
sage: DynkinDiagram(E6)                                                        #␣
↪needs sage.graphs
        O 2
        |
        |
O---O---O---O---O
1   3   4   5   6
E6
```

```
>>> from sage.all import *
>>> T = CartanType(['D', Integer(4)])
>>> DynkinDiagram(T)                                                           #␣
↪needs sage.graphs
    O 4
    |
    |
O---O---O
1   2   3
D4
```

(continues on next page)

(continued from previous page)

```
>>> E6 = CartanType(['E',Integer(6)])
>>> DynkinDiagram(E6)                                                    #␣
↪needs sage.graphs
        O 2
        |
        |
O---O---O---O---O
1   3   4   5   6
E6
```

Note

The direction of the arrows is the **opposite** (i.e. the transpose) of Bourbaki's convention, but agrees with Kac's.

For example, in type C_2, we have:

```
sage: C2 = DynkinDiagram(['C',2]); C2                                    #␣
↪needs sage.graphs
O=<=O
1   2
C2
sage: C2.cartan_matrix()                                                 #␣
↪needs sage.graphs
[ 2 -2]
[-1  2]
```

```
>>> from sage.all import *
>>> C2 = DynkinDiagram(['C',Integer(2)]); C2                              ␣
↪    # needs sage.graphs
O=<=O
1   2
C2
>>> C2.cartan_matrix()                                                  #␣
↪needs sage.graphs
[ 2 -2]
[-1  2]
```

However Bourbaki would have the Cartan matrix as:

$$\begin{bmatrix} 2 & -1 \\ -2 & 2 \end{bmatrix}.$$

If desired, other node labelling conventions can be achieved. For example the Kac labelling for type E_6 can be obtained via:

```
sage: E6.relabel({1:1,2:6,3:2,4:3,5:4,6:5}).dynkin_diagram()            #␣
↪needs sage.graphs
        O 6
        |
        |
O---O---O---O---O
```

(continues on next page)

(continued from previous page)

```
1   2   3   4   5
E6 relabelled by {1: 1, 2: 6, 3: 2, 4: 3, 5: 4, 6: 5}
```

```
>>> from sage.all import *
>>> E6.relabel({Integer(1):Integer(1),Integer(2):Integer(6),Integer(3):Integer(2),
↪Integer(4):Integer(3),Integer(5):Integer(4),Integer(6):Integer(5)}).dynkin_
↪diagram()                              # needs sage.graphs
        O 6
        |
        |
O---O---O---O---O
1   2   3   4   5
E6 relabelled by {1: 1, 2: 6, 3: 2, 4: 3, 5: 4, 6: 5}
```

Contributions implementing other conventions are very welcome.

Another option is to build from scratch a new Dynkin diagram. The architecture has been designed to make it fairly easy to add other labelling conventions. In particular, we strived at choosing type free algorithms whenever possible, so in principle most features should remain available even with custom Cartan types. This has not been used much yet, so some rough corners certainly remain.

Here, we construct the hyperbolic example of Exercise 4.9 p. 57 of Kac, Infinite Dimensional Lie Algebras. We start with an empty Dynkin diagram, and add a couple nodes:

```
sage: g = DynkinDiagram()                                                    #␣
↪needs sage.graphs
sage: g.add_vertices([1,2,3])                                                #␣
↪needs sage.graphs
```

```
>>> from sage.all import *
>>> g = DynkinDiagram()                                                    #␣
↪needs sage.graphs
>>> g.add_vertices([Integer(1),Integer(2),Integer(3)])                        ␣
↪                    # needs sage.graphs
```

Note that the diagonal of the Cartan matrix is already initialized:

```
sage: g.cartan_matrix()                                                      #␣
↪needs sage.graphs
[2 0 0]
[0 2 0]
[0 0 2]
```

```
>>> from sage.all import *
>>> g.cartan_matrix()                                                      #␣
↪needs sage.graphs
[2 0 0]
[0 2 0]
[0 0 2]
```

Then we add a couple edges:

```
sage: g.add_edge(1,2,2)                                                   #␣
↪needs sage.graphs
sage: g.add_edge(1,3)                                                     #␣
↪needs sage.graphs
sage: g.add_edge(2,3)                                                     #␣
↪needs sage.graphs
```

```
>>> from sage.all import *
>>> g.add_edge(Integer(1),Integer(2),Integer(2))                           ␣
↪                     # needs sage.graphs
>>> g.add_edge(Integer(1),Integer(3))                                      ␣
↪              # needs sage.graphs
>>> g.add_edge(Integer(2),Integer(3))                                      ␣
↪              # needs sage.graphs
```

and we get the desired Cartan matrix:

```
sage: g.cartan_matrix()                                                   #␣
↪needs sage.graphs
[2 0 0]
[0 2 0]
[0 0 2]
```

```
>>> from sage.all import *
>>> g.cartan_matrix()                                                   #␣
↪needs sage.graphs
[2 0 0]
[0 2 0]
[0 0 2]
```

Oops, the Cartan matrix did not change! This is because it is cached for efficiency (see `cached_method`). In general, a Dynkin diagram should not be modified after having been used.

Warning: this is not checked currently

Todo: add a method `set_mutable()` as, say, for matrices

Here, we can work around this by clearing the cache:

```
sage: delattr(g, 'cartan_matrix')                                         #␣
↪needs sage.graphs
```

```
>>> from sage.all import *
>>> delattr(g, 'cartan_matrix')                                         #␣
↪needs sage.graphs
```

Now we get the desired Cartan matrix:

```
sage: g.cartan_matrix()                                                  #␣
↪needs sage.graphs
[ 2 -1 -1]
[-2  2 -1]
[-1 -1  2]
```

```
>>> from sage.all import *
>>> g.cartan_matrix()                                                  #␣
↪needs sage.graphs
[ 2 -1 -1]
[-2  2 -1]
[-1 -1  2]
```

Note that backward edges have been automatically added:

```
sage: g.edges(sort=True)                                                 #␣
↪needs sage.graphs
[(1, 2, 2), (1, 3, 1), (2, 1, 1), (2, 3, 1), (3, 1, 1), (3, 2, 1)]
```

```
>>> from sage.all import *
>>> g.edges(sort=True)                                                 #␣
↪needs sage.graphs
[(1, 2, 2), (1, 3, 1), (2, 1, 1), (2, 3, 1), (3, 1, 1), (3, 2, 1)]
```

Reducible Cartan types

Reducible Cartan types can be specified by passing a sequence or list of irreducible Cartan types:

```
sage: CartanType(['A',2],['B',2])
A2xB2
sage: CartanType([['A',2],['B',2]])
A2xB2
sage: CartanType(['A',2],['B',2]).is_reducible()
True
```

```
>>> from sage.all import *
>>> CartanType(['A',Integer(2)],['B',Integer(2)])
A2xB2
>>> CartanType([['A',Integer(2)],['B',Integer(2)]])
A2xB2
>>> CartanType(['A',Integer(2)],['B',Integer(2)]).is_reducible()
True
```

or using the following short hand notation:

```
sage: CartanType("A2xB2")
A2xB2
sage: CartanType("A2","B2") == CartanType("A2xB2")
True
```

```
>>> from sage.all import *
>>> CartanType("A2xB2")
A2xB2
>>> CartanType("A2","B2") == CartanType("A2xB2")
True
```

Degenerate cases

When possible, type I_n is automatically converted to the isomorphic crystallographic Cartan types (any reason not to do so?):

```
sage: CartanType(["I",1])
A1xA1
sage: CartanType(["I",3])
['A', 2]
sage: CartanType(["I",4])
['C', 2]
sage: CartanType(["I",6])
['G', 2]
```

```
>>> from sage.all import *
>>> CartanType(["I",Integer(1)])
A1xA1
>>> CartanType(["I",Integer(3)])
['A', 2]
>>> CartanType(["I",Integer(4)])
['C', 2]
>>> CartanType(["I",Integer(6)])
['G', 2]
```

The Dynkin diagrams for types B_1, C_1, D_2, and D_3 are isomorphic to that for A_1, A_1, $A_1 \times A_1$, and A_3, respectively. However their natural ambient space realizations (stemming from the corresponding infinite families of Lie groups) are different. Therefore, the Cartan types are considered as distinct:

```
sage: CartanType(['B',1])
['B', 1]
sage: CartanType(['C',1])
['C', 1]
sage: CartanType(['D',2])
['D', 2]
sage: CartanType(['D',3])
['D', 3]
```

```
>>> from sage.all import *
>>> CartanType(['B',Integer(1)])
['B', 1]
>>> CartanType(['C',Integer(1)])
['C', 1]
>>> CartanType(['D',Integer(2)])
['D', 2]
>>> CartanType(['D',Integer(3)])
['D', 3]
```

Affine Cartan types

For affine types, we use the usual conventions for affine Coxeter groups: each affine type is either untwisted (that is arise from the natural affinisation of a finite Cartan type):

```
sage: CartanType(["A", 4, 1]).dynkin_diagram()                              #␣
↪needs sage.graphs
0
O-----------+
|           |
|           |
O---O---O---O
1   2   3   4
A4~
sage: CartanType(["B", 4, 1]).dynkin_diagram()                              #␣
↪needs sage.graphs
    O 0
    |
    |
O---O---O=>=O
1   2   3   4
B4~
```

```
>>> from sage.all import *
>>> CartanType(["A", Integer(4), Integer(1)]).dynkin_diagram()               ␣
↪               # needs sage.graphs
0
O-----------+
|           |
|           |
O---O---O---O
1   2   3   4
A4~
>>> CartanType(["B", Integer(4), Integer(1)]).dynkin_diagram()               ␣
↪               # needs sage.graphs
    O 0
    |
    |
O---O---O=>=O
1   2   3   4
B4~
```

or dual thereof:

```
sage: CartanType(["B", 4, 1]).dual().dynkin_diagram()                       #␣
↪needs sage.graphs
    O 0
    |
    |
O---O---O=<=O
1   2   3   4
B4~*
```

```
>>> from sage.all import *
>>> CartanType(["B", Integer(4), Integer(1)]).dual().dynkin_diagram()
↪                # needs sage.graphs
    O 0
    |
    |
O---O---O=<=O
1   2   3   4
B4~*
```

or is of type $\widetilde{BC}_n$ (which yields an irreducible, but nonreduced root system):

```
sage: CartanType(["BC", 4, 2]).dynkin_diagram()                          #␣
↪needs sage.graphs
O=<=O---O---O=<=O
0   1   2   3   4
BC4~
```

```
>>> from sage.all import *
>>> CartanType(["BC", Integer(4), Integer(2)]).dynkin_diagram()
↪                # needs sage.graphs
O=<=O---O---O=<=O
0   1   2   3   4
BC4~
```

This includes the two degenerate cases:

```
sage: CartanType(["A", 1, 1]).dynkin_diagram()                           #␣
↪needs sage.graphs
O<=>O
0   1
A1~
sage: CartanType(["BC", 1, 2]).dynkin_diagram()                          #␣
↪needs sage.graphs
  4
O=<=O
0   1
BC1~
```

```
>>> from sage.all import *
>>> CartanType(["A", Integer(1), Integer(1)]).dynkin_diagram()
↪                # needs sage.graphs
O<=>O
0   1
A1~
>>> CartanType(["BC", Integer(1), Integer(2)]).dynkin_diagram()
↪                # needs sage.graphs
  4
O=<=O
0   1
BC1~
```

For the user convenience, Kac's notations for twisted affine types are automatically translated into the previous ones:

```
sage: # needs sage.graphs
sage: CartanType(["A", 9, 2])
['B', 5, 1]^*
sage: CartanType(["A", 9, 2]).dynkin_diagram()
    O 0
    |
    |
O---O---O---O=<=O
1   2   3   4   5
B5~*
sage: CartanType(["A", 10, 2]).dynkin_diagram()
O=<=O---O---O---O=<=O
0   1   2   3   4   5
BC5~
sage: CartanType(["D", 5, 2]).dynkin_diagram()
O=<=O---O---O=>=O
0   1   2   3   4
C4~*
sage: CartanType(["D", 4, 3]).dynkin_diagram()
  3
O=>=O---O
2   1   0
G2~* relabelled by {0: 0, 1: 2, 2: 1}
sage: CartanType(["E", 6, 2]).dynkin_diagram()
O---O---O=<=O---O
0   1   2   3   4
F4~*
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> CartanType(["A", Integer(9), Integer(2)])
['B', 5, 1]^*
>>> CartanType(["A", Integer(9), Integer(2)]).dynkin_diagram()
    O 0
    |
    |
O---O---O---O=<=O
1   2   3   4   5
B5~*
>>> CartanType(["A", Integer(10), Integer(2)]).dynkin_diagram()
O=<=O---O---O---O=<=O
0   1   2   3   4   5
BC5~
>>> CartanType(["D", Integer(5), Integer(2)]).dynkin_diagram()
O=<=O---O---O=>=O
0   1   2   3   4
C4~*
>>> CartanType(["D", Integer(4), Integer(3)]).dynkin_diagram()
  3
O=>=O---O
2   1   0
G2~* relabelled by {0: 0, 1: 2, 2: 1}
```

(continues on next page)

(continued from previous page)

```
>>> CartanType(["E", Integer(6), Integer(2)]).dynkin_diagram()
O---O---O=<=O---O
0   1   2   3   4
F4~*
```

Additionally one can set the notation option to use Kac's notation:

```
sage: # needs sage.graphs
sage: CartanType.options['notation'] = 'Kac'
sage: CartanType(["A", 9, 2])
['A', 9, 2]
sage: CartanType(["A", 9, 2]).dynkin_diagram()
    O 0
    |
    |
O---O---O---O=<=O
1   2   3   4   5
A9^2
sage: CartanType(["A", 10, 2]).dynkin_diagram()
O=<=O---O---O---O=<=O
0   1   2   3   4   5
A10^2
sage: CartanType(["D", 5, 2]).dynkin_diagram()
O=<=O---O---O=>=O
0   1   2   3   4
D5^2
sage: CartanType(["D", 4, 3]).dynkin_diagram()
  3
O=>=O---O
2   1   0
D4^3
sage: CartanType(["E", 6, 2]).dynkin_diagram()
O---O---O=<=O---O

```

Infinite Cartan types

There are minimal implementations of the Cartan types A_∞ and $A_{+\infty}$. In sage oo is the same as $+Infinity$, so NN and ZZ are used to differentiate between the $A_{+\infty}$ and A_∞ root systems:

```
sage: CartanType(['A', NN])
['A', NN]
sage: print(CartanType(['A', NN]).ascii_art())
O---O---O---O---O---O---O---..
0   1   2   3   4   5   6
sage: CartanType(['A', ZZ])
['A', ZZ]
sage: print(CartanType(['A', ZZ]).ascii_art())
..---O---O---O---O---O---O---O---..
    -3  -2  -1   0   1   2   3
```

```
>>> from sage.all import *
>>> CartanType(['A', NN])
['A', NN]
>>> print(CartanType(['A', NN]).ascii_art())
O---O---O---O---O---O---O---..
0   1   2   3   4   5   6
>>> CartanType(['A', ZZ])
['A', ZZ]
>>> print(CartanType(['A', ZZ]).ascii_art())
..---O---O---O---O---O---O---O---..
    -3  -2  -1   0   1   2   3
```

There are also the following shorthands:

```
sage: CartanType("Aoo")
['A', ZZ]
sage: CartanType("A+oo")
['A', NN]
```

```
>>> from sage.all import *
>>> CartanType("Aoo")
['A', ZZ]
>>> CartanType("A+oo")
['A', NN]
```

Abstract classes for Cartan types

- *CartanType_abstract*
- *CartanType_crystallographic*
- *CartanType_simply_laced*
- *CartanType_simple*
- *CartanType_finite*
- *CartanType_affine* (see also *Root system data for affine Cartan types*)
- *sage.combinat.root_system.cartan_type.CartanType*
- *Root system data for dual Cartan types*
- *Root system data for reducible Cartan types*

Todo

Should those indexes come before the introduction?

`sage.combinat.root_system.cartan_type.`**`CartanType`**`(*args)`

Cartan types

Todo

Why does sphinx complain if I use sections here?

Introduction

Loosely speaking, Dynkin diagrams (or equivalently Cartan matrices) are graphs which are used to classify root systems, Coxeter and Weyl groups, Lie algebras, Lie groups, crystals, etc. up to an isomorphism. *Cartan types* are a standard set of names for those Dynkin diagrams (see Wikipedia article Dynkin_diagram).

Let us consider, for example, the Cartan type A_4:

```
sage: T = CartanType(['A', 4]); T
['A', 4]
```

```
>>> from sage.all import *
>>> T = CartanType(['A', Integer(4)]); T
['A', 4]
```

It is the name of the following Dynkin diagram:

```
sage: DynkinDiagram(T)                                                    
↪  # needs sage.graphs
O---O---O---O
1   2   3   4
A4
```

```
>>> from sage.all import *
>>> DynkinDiagram(T)
↪# needs sage.graphs
O---O---O---O
1   2   3   4
A4
```

Note

For convenience, the following shortcuts are available:

```
sage: DynkinDiagram(['A',4])
↪ # needs sage.graphs
O---O---O---O
1   2   3   4
A4
sage: DynkinDiagram('A4')
↪ # needs sage.graphs
O---O---O---O
1   2   3   4
A4
sage: T.dynkin_diagram()
↪ # needs sage.graphs
O---O---O---O
1   2   3   4
A4
```

```
>>> from sage.all import *
>>> DynkinDiagram(['A',Integer(4)])
↪         # needs sage.graphs
O---O---O---O
1   2   3   4
A4
>>> DynkinDiagram('A4')
↪# needs sage.graphs
O---O---O---O
1   2   3   4
A4
>>> T.dynkin_diagram()
↪# needs sage.graphs
O---O---O---O
1   2   3   4
A4
```

See *DynkinDiagram* for how to further manipulate Dynkin diagrams.

From this data (the *Cartan datum*), one can construct the associated root system:

```
sage: RootSystem(T)
Root system of type ['A', 4]
```

```
>>> from sage.all import *
>>> RootSystem(T)
Root system of type ['A', 4]
```

The associated Weyl group of A_n is the symmetric group S_{n+1}:

```
sage: W = WeylGroup(T); W
↪  # needs sage.libs.gap
Weyl Group of type ['A', 4] (as a matrix group acting on the ambient space)
```

(continues on next page)

(continued from previous page)

```
sage: W.cardinality()                                                          ␣
↪   # needs sage.libs.gap
120
```

```
>>> from sage.all import *
>>> W = WeylGroup(T); W
↪# needs sage.libs.gap
Weyl Group of type ['A', 4] (as a matrix group acting on the ambient space)
>>> W.cardinality()
↪# needs sage.libs.gap
120
```

while the Lie algebra is sl_{n+1}, and the Lie group SL_{n+1} (TODO: illustrate this once this is implemented).

One may also construct crystals associated to various Dynkin diagrams. For example:

```
sage: C = crystals.Letters(T); C                                               ␣
↪   # needs sage.combinat
The crystal of letters for type ['A', 4]
sage: C.list()                                                                 ␣
↪   # needs sage.combinat
[1, 2, 3, 4, 5]

sage: C = crystals.Tableaux(T, shape=[2]); C                                   ␣
↪   # needs sage.combinat
The crystal of tableaux of type ['A', 4] and shape(s) [[2]]
sage: C.cardinality()                                                          ␣
↪   # needs sage.combinat
15
```

```
>>> from sage.all import *
>>> C = crystals.Letters(T); C
↪# needs sage.combinat
The crystal of letters for type ['A', 4]
>>> C.list()
↪# needs sage.combinat
[1, 2, 3, 4, 5]

>>> C = crystals.Tableaux(T, shape=[Integer(2)]); C                            ␣
↪          # needs sage.combinat
The crystal of tableaux of type ['A', 4] and shape(s) [[2]]
>>> C.cardinality()
↪# needs sage.combinat
15
```

Here is a sample of all the finite irreducible crystallographic Cartan types:

```
sage: CartanType.samples(finite=True, crystallographic=True)
[['A', 1], ['A', 5], ['B', 1], ['B', 5], ['C', 1], ['C', 5], ['D', 2], ['D', 3], [
↪'D', 5],
 ['E', 6], ['E', 7], ['E', 8], ['F', 4], ['G', 2]]
```

```
>>> from sage.all import *
>>> CartanType.samples(finite=True, crystallographic=True)
[['A', 1], ['A', 5], ['B', 1], ['B', 5], ['C', 1], ['C', 5], ['D', 2], ['D', 3], [
↪'D', 5],
 ['E', 6], ['E', 7], ['E', 8], ['F', 4], ['G', 2]]
```

One can also get latex representations of the crystallographic Cartan types and their corresponding Dynkin diagrams:

```
sage: [latex(ct) for ct in CartanType.samples(crystallographic=True)]
[A_{1}, A_{5}, B_{1}, B_{5}, C_{1}, C_{5}, D_{2}, D_{3}, D_{5},
 E_6, E_7, E_8, F_4, G_2,
 A_{1}^{(1)}, A_{5}^{(1)}, B_{1}^{(1)}, B_{5}^{(1)},
 C_{1}^{(1)}, C_{5}^{(1)}, D_{3}^{(1)}, D_{5}^{(1)},
 E_6^{(1)}, E_7^{(1)}, E_8^{(1)}, F_4^{(1)}, G_2^{(1)},
 BC_{1}^{(2)}, BC_{5}^{(2)},
 B_{5}^{(1)\vee}, C_{4}^{(1)\vee}, F_4^{(1)\vee},
 G_2^{(1)\vee}, BC_{1}^{(2)\vee}, BC_{5}^{(2)\vee}]
sage: view([DynkinDiagram(ct) for ct in CartanType.
↪samples(crystallographic=True)]) # not tested
```

```
>>> from sage.all import *
>>> [latex(ct) for ct in CartanType.samples(crystallographic=True)]
[A_{1}, A_{5}, B_{1}, B_{5}, C_{1}, C_{5}, D_{2}, D_{3}, D_{5},
 E_6, E_7, E_8, F_4, G_2,
 A_{1}^{(1)}, A_{5}^{(1)}, B_{1}^{(1)}, B_{5}^{(1)},
 C_{1}^{(1)}, C_{5}^{(1)}, D_{3}^{(1)}, D_{5}^{(1)},
 E_6^{(1)}, E_7^{(1)}, E_8^{(1)}, F_4^{(1)}, G_2^{(1)},
 BC_{1}^{(2)}, BC_{5}^{(2)},
 B_{5}^{(1)\vee}, C_{4}^{(1)\vee}, F_4^{(1)\vee},
 G_2^{(1)\vee}, BC_{1}^{(2)\vee}, BC_{5}^{(2)\vee}]
>>> view([DynkinDiagram(ct) for ct in CartanType.samples(crystallographic=True)])
↪# not tested
```

Non-crystallographic Cartan types are also partially supported:

```
sage: CartanType.samples(finite=True, crystallographic=False)
[['I', 5], ['H', 3], ['H', 4]]
```

```
>>> from sage.all import *
>>> CartanType.samples(finite=True, crystallographic=False)
[['I', 5], ['H', 3], ['H', 4]]
```

In Sage, a Cartan type is used as a database of type-specific information and algorithms (see e.g. *sage.combinat.root_system.type_A*). This database includes how to construct the Dynkin diagram, the ambient space for the root system (see Wikipedia article Root_system), and further mathematical properties:

```
sage: T.is_finite(), T.is_simply_laced(), T.is_affine(), T.is_crystallographic()
(True, True, False, True)
```

```
>>> from sage.all import *
>>> T.is_finite(), T.is_simply_laced(), T.is_affine(), T.is_crystallographic()
(True, True, False, True)
```

In particular, a Sage Cartan type is endowed with a fixed choice of labels for the nodes of the Dynkin diagram. This choice follows the conventions of Nicolas Bourbaki, Lie Groups and Lie Algebras: Chapter 4-6, Elements of Mathematics, Springer (2002). ISBN 978-3540426509. For example:

```
sage: T = CartanType(['D', 4])
sage: DynkinDiagram(T)
↪ # needs sage.graphs
    O 4
    |
    |
O---O---O
1   2   3
D4

sage: E6 = CartanType(['E',6])
sage: DynkinDiagram(E6)
↪ # needs sage.graphs
        O 2
        |
        |
O---O---O---O---O
1   3   4   5   6
E6
```

```
>>> from sage.all import *
>>> T = CartanType(['D', Integer(4)])
>>> DynkinDiagram(T)
↪# needs sage.graphs
    O 4
    |
    |
O---O---O
1   2   3
D4

>>> E6 = CartanType(['E',Integer(6)])
>>> DynkinDiagram(E6)
↪# needs sage.graphs
        O 2
        |
        |
O---O---O---O---O
1   3   4   5   6
E6
```

Note

The direction of the arrows is the **opposite** (i.e. the transpose) of Bourbaki's convention, but agrees with Kac's.

For example, in type C_2, we have:

```
sage: C2 = DynkinDiagram(['C',2]); C2
↪ # needs sage.graphs
O=<=O
```

```
1   2
C2
sage: C2.cartan_matrix()                                                    ␣
↪ # needs sage.graphs
[ 2 -2]
[-1  2]
```

```
>>> from sage.all import *
>>> C2 = DynkinDiagram(['C',Integer(2)]); C2                                ␣
↪         # needs sage.graphs
O=<=O
1   2
C2
>>> C2.cartan_matrix()
↪# needs sage.graphs
[ 2 -2]
[-1  2]
```

However Bourbaki would have the Cartan matrix as:

$$\begin{bmatrix} 2 & -1 \\ -2 & 2 \end{bmatrix}.$$

If desired, other node labelling conventions can be achieved. For example the Kac labelling for type E_6 can be obtained via:

```
sage: E6.relabel({1:1,2:6,3:2,4:3,5:4,6:5}).dynkin_diagram()                ␣
↪ # needs sage.graphs
        O 6
        |
        |
O---O---O---O---O
1   2   3   4   5
E6 relabelled by {1: 1, 2: 6, 3: 2, 4: 3, 5: 4, 6: 5}
```

```
>>> from sage.all import *
>>> E6.relabel({Integer(1):Integer(1),Integer(2):Integer(6),Integer(3):Integer(2),
↪Integer(4):Integer(3),Integer(5):Integer(4),Integer(6):Integer(5)}).dynkin_
↪diagram()                        # needs sage.graphs
        O 6
        |
        |
O---O---O---O---O
1   2   3   4   5
E6 relabelled by {1: 1, 2: 6, 3: 2, 4: 3, 5: 4, 6: 5}
```

Contributions implementing other conventions are very welcome.

Another option is to build from scratch a new Dynkin diagram. The architecture has been designed to make it fairly easy to add other labelling conventions. In particular, we strived at choosing type free algorithms whenever possible, so in principle most features should remain available even with custom Cartan types. This has not been used much yet, so some rough corners certainly remain.

Here, we construct the hyperbolic example of Exercise 4.9 p. 57 of Kac, Infinite Dimensional Lie Algebras. We start with an empty Dynkin diagram, and add a couple nodes:

```
sage: g = DynkinDiagram()
↪ # needs sage.graphs
sage: g.add_vertices([1,2,3])
↪ # needs sage.graphs
```

```
>>> from sage.all import *
>>> g = DynkinDiagram()
↪# needs sage.graphs
>>> g.add_vertices([Integer(1),Integer(2),Integer(3)])
↪                         # needs sage.graphs
```

Note that the diagonal of the Cartan matrix is already initialized:

```
sage: g.cartan_matrix()
↪ # needs sage.graphs
[2 0 0]
[0 2 0]
[0 0 2]
```

```
>>> from sage.all import *
>>> g.cartan_matrix()
↪# needs sage.graphs
[2 0 0]
[0 2 0]
[0 0 2]
```

Then we add a couple edges:

```
sage: g.add_edge(1,2,2)
↪ # needs sage.graphs
sage: g.add_edge(1,3)
↪ # needs sage.graphs
sage: g.add_edge(2,3)
↪ # needs sage.graphs
```

```
>>> from sage.all import *
>>> g.add_edge(Integer(1),Integer(2),Integer(2))
↪                         # needs sage.graphs
>>> g.add_edge(Integer(1),Integer(3))
↪                    # needs sage.graphs
>>> g.add_edge(Integer(2),Integer(3))
↪                    # needs sage.graphs
```

and we get the desired Cartan matrix:

```
sage: g.cartan_matrix()
↪ # needs sage.graphs
[2 0 0]
[0 2 0]
[0 0 2]
```

```
>>> from sage.all import *
>>> g.cartan_matrix()
↪# needs sage.graphs
[2 0 0]
[0 2 0]
[0 0 2]
```

Oops, the Cartan matrix did not change! This is because it is cached for efficiency (see `cached_method`). In general, a Dynkin diagram should not be modified after having been used.

Warning: this is not checked currently

Todo: add a method `set_mutable()` as, say, for matrices

Here, we can work around this by clearing the cache:

```
sage: delattr(g, 'cartan_matrix')
↪    # needs sage.graphs
```

```
>>> from sage.all import *
>>> delattr(g, 'cartan_matrix')
↪# needs sage.graphs
```

Now we get the desired Cartan matrix:

```
sage: g.cartan_matrix()
↪    # needs sage.graphs
[ 2 -1 -1]
[-2  2 -1]
[-1 -1  2]
```

```
>>> from sage.all import *
>>> g.cartan_matrix()
↪# needs sage.graphs
[ 2 -1 -1]
[-2  2 -1]
[-1 -1  2]
```

Note that backward edges have been automatically added:

```
sage: g.edges(sort=True)
↪    # needs sage.graphs
[(1, 2, 2), (1, 3, 1), (2, 1, 1), (2, 3, 1), (3, 1, 1), (3, 2, 1)]
```

```
>>> from sage.all import *
>>> g.edges(sort=True)
```

(continues on next page)

(continued from previous page)

```
↪# needs sage.graphs
[(1, 2, 2), (1, 3, 1), (2, 1, 1), (2, 3, 1), (3, 1, 1), (3, 2, 1)]
```

Reducible Cartan types

Reducible Cartan types can be specified by passing a sequence or list of irreducible Cartan types:

```
sage: CartanType(['A',2],['B',2])
A2xB2
sage: CartanType([['A',2],['B',2]])
A2xB2
sage: CartanType(['A',2],['B',2]).is_reducible()
True
```

```
>>> from sage.all import *
>>> CartanType(['A',Integer(2)],['B',Integer(2)])
A2xB2
>>> CartanType([['A',Integer(2)],['B',Integer(2)]])
A2xB2
>>> CartanType(['A',Integer(2)],['B',Integer(2)]).is_reducible()
True
```

or using the following short hand notation:

```
sage: CartanType("A2xB2")
A2xB2
sage: CartanType("A2","B2") == CartanType("A2xB2")
True
```

```
>>> from sage.all import *
>>> CartanType("A2xB2")
A2xB2
>>> CartanType("A2","B2") == CartanType("A2xB2")
True
```

Degenerate cases

When possible, type I_n is automatically converted to the isomorphic crystallographic Cartan types (any reason not to do so?):

```
sage: CartanType(["I",1])
A1xA1
sage: CartanType(["I",3])
['A', 2]
sage: CartanType(["I",4])
['C', 2]
sage: CartanType(["I",6])
['G', 2]
```

```
>>> from sage.all import *
>>> CartanType(["I",Integer(1)])
```

(continues on next page)

(continued from previous page)

```
A1xA1
>>> CartanType(["I",Integer(3)])
['A', 2]
>>> CartanType(["I",Integer(4)])
['C', 2]
>>> CartanType(["I",Integer(6)])
['G', 2]
```

The Dynkin diagrams for types B_1, C_1, D_2, and D_3 are isomorphic to that for A_1, A_1, $A_1 \times A_1$, and A_3, respectively. However their natural ambient space realizations (stemming from the corresponding infinite families of Lie groups) are different. Therefore, the Cartan types are considered as distinct:

```
sage: CartanType(['B',1])
['B', 1]
sage: CartanType(['C',1])
['C', 1]
sage: CartanType(['D',2])
['D', 2]
sage: CartanType(['D',3])
['D', 3]
```

```
>>> from sage.all import *
>>> CartanType(['B',Integer(1)])
['B', 1]
>>> CartanType(['C',Integer(1)])
['C', 1]
>>> CartanType(['D',Integer(2)])
['D', 2]
>>> CartanType(['D',Integer(3)])
['D', 3]
```

Affine Cartan types

For affine types, we use the usual conventions for affine Coxeter groups: each affine type is either untwisted (that is arise from the natural affinisation of a finite Cartan type):

```
sage: CartanType(["A", 4, 1]).dynkin_diagram()
↪ # needs sage.graphs
0
O-----------+
|           |
|           |
O---O---O---O
1   2   3   4
A4~
sage: CartanType(["B", 4, 1]).dynkin_diagram()
↪ # needs sage.graphs
    O 0
    |
    |
O---O---O=>=O
1   2   3   4
```

(continues on next page)

(continued from previous page)

```
B4~
```

```
>>> from sage.all import *
>>> CartanType(["A", Integer(4), Integer(1)]).dynkin_diagram()                    # needs sage.graphs
0
O-----------+
|           |
|           |
O---O---O---O
1   2   3   4
A4~
>>> CartanType(["B", Integer(4), Integer(1)]).dynkin_diagram()                    # needs sage.graphs
    O 0
    |
    |
O---O---O=>=O
1   2   3   4
B4~
```

or dual thereof:

```
sage: CartanType(["B", 4, 1]).dual().dynkin_diagram()                             # needs sage.graphs
    O 0
    |
    |
O---O---O=<=O
1   2   3   4
B4~*
```

```
>>> from sage.all import *
>>> CartanType(["B", Integer(4), Integer(1)]).dual().dynkin_diagram()             # needs sage.graphs
    O 0
    |
    |
O---O---O=<=O
1   2   3   4
B4~*
```

or is of type $\widetilde{BC}_n$ (which yields an irreducible, but nonreduced root system):

```
sage: CartanType(["BC", 4, 2]).dynkin_diagram()                                   # needs sage.graphs
O=<=O---O---O=<=O
0   1   2   3   4
BC4~
```

```
>>> from sage.all import *
>>> CartanType(["BC", Integer(4), Integer(2)]).dynkin_diagram()
```

(continues on next page)

(continued from previous page)

```
↪                   # needs sage.graphs
O=<=O---O---O=<=O
0   1   2   3   4
BC4~
```

This includes the two degenerate cases:

```
sage: CartanType(["A", 1, 1]).dynkin_diagram()                              ␣
↪ # needs sage.graphs
O<=>O
0   1
A1~
sage: CartanType(["BC", 1, 2]).dynkin_diagram()                             ␣
↪ # needs sage.graphs
  4
O=<=O
0   1
BC1~
```

```
>>> from sage.all import *
>>> CartanType(["A", Integer(1), Integer(1)]).dynkin_diagram()              ␣
↪                   # needs sage.graphs
O<=>O
0   1
A1~
>>> CartanType(["BC", Integer(1), Integer(2)]).dynkin_diagram()             ␣
↪                   # needs sage.graphs
  4
O=<=O
0   1
BC1~
```

For the user convenience, Kac's notations for twisted affine types are automatically translated into the previous ones:

```
sage: # needs sage.graphs
sage: CartanType(["A", 9, 2])
['B', 5, 1]^*
sage: CartanType(["A", 9, 2]).dynkin_diagram()
    O 0
    |
    |
O---O---O---O=<=O
1   2   3   4   5
B5~*
sage: CartanType(["A", 10, 2]).dynkin_diagram()
O=<=O---O---O---O=<=O
0   1   2   3   4   5
BC5~
sage: CartanType(["D", 5, 2]).dynkin_diagram()
O=<=O---O---O=>=O
0   1   2   3   4
```

(continues on next page)

(continued from previous page)

```
C4~*
sage: CartanType(["D", 4, 3]).dynkin_diagram()
  3
O=>=O---O
2   1   0
G2~* relabelled by {0: 0, 1: 2, 2: 1}
sage: CartanType(["E", 6, 2]).dynkin_diagram()
O---O---O=<=O---O
0   1   2   3   4
F4~*
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> CartanType(["A", Integer(9), Integer(2)])
['B', 5, 1]^*
>>> CartanType(["A", Integer(9), Integer(2)]).dynkin_diagram()
    O 0
    |
    |
O---O---O---O=<=O
1   2   3   4   5
B5~*
>>> CartanType(["A", Integer(10), Integer(2)]).dynkin_diagram()
O=<=O---O---O---O=<=O
0   1   2   3   4   5
BC5~
>>> CartanType(["D", Integer(5), Integer(2)]).dynkin_diagram()
O=<=O---O---O=>=O
0   1   2   3   4
C4~*
>>> CartanType(["D", Integer(4), Integer(3)]).dynkin_diagram()
  3
O=>=O---O
2   1   0
G2~* relabelled by {0: 0, 1: 2, 2: 1}
>>> CartanType(["E", Integer(6), Integer(2)]).dynkin_diagram()
O---O---O=<=O---O
0   1   2   3   4
F4~*
```

Additionally one can set the notation option to use Kac's notation:

```
sage: # needs sage.graphs
sage: CartanType.options['notation'] = 'Kac'
sage: CartanType(["A", 9, 2])
['A', 9, 2]
sage: CartanType(["A", 9, 2]).dynkin_diagram()
    O 0
    |
    |
O---O---O---O=<=O
1   2   3   4   5
```

(continues on next page)

(continued from previous page)

```
A9^2
sage: CartanType(["A", 10, 2]).dynkin_diagram()
O=<=O---O---O---O=<=O
0   1   2   3   4   5
A10^2
sage: CartanType(["D", 5, 2]).dynkin_diagram()
O=<=O---O---O=>=O
0   1   2   3   4
D5^2
sage: CartanType(["D", 4, 3]).dynkin_diagram()
  3

O---O---O=<=O---O
0   1   2   3   4
E6^2
>>> CartanType.options['notation'] = 'BC'
```

Infinite Cartan types

There are minimal implementations of the Cartan types A_∞ and $A_{+\infty}$. In sage oo is the same as $+Infinity$, so NN and ZZ are used to differentiate between the $A_{+\infty}$ and A_∞ root systems:

```
sage: CartanType(['A', NN])
['A', NN]
sage: print(CartanType(['A', NN]).ascii_art())
O---O---O---O---O---O---O---..
0   1   2   3   4   5   6
sage: CartanType(['A', ZZ])
['A', ZZ]
sage: print(CartanType(['A', ZZ]).ascii_art())
..---O---O---O---O---O---O---O---..
    -3  -2  -1   0   1   2   3
```

```
>>> from sage.all import *
>>> CartanType(['A', NN])
['A', NN]
>>> print(CartanType(['A', NN]).ascii_art())
O---O---O---O---O---O---O---..
0   1   2   3   4   5   6
>>> CartanType(['A', ZZ])
['A', ZZ]
>>> print(CartanType(['A', ZZ]).ascii_art())
..---O---O---O---O---O---O---O---..
    -3  -2  -1   0   1   2   3
```

There are also the following shorthands:

```
sage: CartanType("Aoo")
['A', ZZ]
sage: CartanType("A+oo")
['A', NN]
```

```
>>> from sage.all import *
>>> CartanType("Aoo")
['A', ZZ]
>>> CartanType("A+oo")
['A', NN]
```

Abstract classes for Cartan types

- *CartanType_abstract*
- *CartanType_crystallographic*
- *CartanType_simply_laced*
- *CartanType_simple*
- *CartanType_finite*
- *CartanType_affine* (see also *Root system data for affine Cartan types*)
- *sage.combinat.root_system.cartan_type.CartanType*
- *Root system data for dual Cartan types*

- *Root system data for reducible Cartan types*
- *Root system data for relabelled Cartan types*

Concrete classes for Cartan types

- *CartanType_standard*
- *CartanType_standard_finite*
- *CartanType_standard_affine*
- *CartanType_standard_untwisted_affine*

Type specific data

The data essentially consists of a description of the Dynkin/Coxeter diagram and, when relevant, of the natural embedding of the root system in a Euclidean space. Everything else is reconstructed from this data.

- *Root system data for type A*
- *Root system data for type B*
- *Root system data for type C*
- *Root system data for type D*
- *Root system data for type E*
- *Root system data for type F*
- *Root system data for type G*
- *Root system data for type H*
- *Root system data for type I*
- *Root system data for super type A*
- *Root system data for type Q*
- *Root system data for (untwisted) type A affine*
- *Root system data for (untwisted) type B affine*
- *Root system data for (untwisted) type C affine*
- *Root system data for (untwisted) type D affine*
- *Root system data for (untwisted) type E affine*
- *Root system data for (untwisted) type F affine*
- *Root system data for (untwisted) type G affine*
- *Root system data for type BC affine*
- *Root system data for type A infinity*

Todo

Should those indexes come before the introduction?

class sage.combinat.root_system.cartan_type.**CartanTypeFactory**

Bases: SageObject

classmethod color(*i*)

Default color scheme for the vertices of a Dynkin diagram (and associated objects).

EXAMPLES:

```
sage: CartanType.color(1)
'blue'
sage: CartanType.color(2)
'red'
sage: CartanType.color(3)
'green'
```

```
>>> from sage.all import *
>>> CartanType.color(Integer(1))
'blue'
>>> CartanType.color(Integer(2))
'red'
>>> CartanType.color(Integer(3))
'green'
```

The default color is black:

```
sage: CartanType.color(0)
'black'
```

```
>>> from sage.all import *
>>> CartanType.color(Integer(0))
'black'
```

Negative indices get the same color as their positive counterparts:

```
sage: CartanType.color(-1)
'blue'
sage: CartanType.color(-2)
'red'
sage: CartanType.color(-3)
'green'
```

```
>>> from sage.all import *
>>> CartanType.color(-Integer(1))
'blue'
>>> CartanType.color(-Integer(2))
'red'
>>> CartanType.color(-Integer(3))
'green'
```

options = Current options for CartanType - dual_latex: \vee - dual_str: * - latex_marked: True - latex_relabel: True - mark_special_node: none - marked_node_str: X - notation: Stembridge - special_node_str: @

samples(*finite=None*, *affine=None*, *crystallographic=None*)

Return a sample of the available Cartan types.

INPUT:

- `finite` – boolean or `None` (default: `None`)
- `affine` – boolean or `None` (default: `None`)
- `crystallographic` – boolean or `None` (default: `None`)

The sample contains all the exceptional finite and affine Cartan types, as well as typical representatives of the infinite families.

EXAMPLES:

```
sage: CartanType.samples()
[['A', 1], ['A', 5], ['B', 1], ['B', 5], ['C', 1], ['C', 5], ['D', 2], ['D',␣
→3], ['D', 5],
 ['E', 6], ['E', 7], ['E', 8], ['F', 4], ['G', 2], ['I', 5], ['H', 3], ['H',␣
→4],
 ['A', 1, 1], ['A', 5, 1], ['B', 1, 1], ['B', 5, 1],
 ['C', 1, 1], ['C', 5, 1], ['D', 3, 1], ['D', 5, 1],
 ['E', 6, 1], ['E', 7, 1], ['E', 8, 1], ['F', 4, 1], ['G', 2, 1], ['BC', 1,␣
→2], ['BC', 5, 2],
 ['B', 5, 1]^*, ['C', 4, 1]^*, ['F', 4, 1]^*, ['G', 2, 1]^*, ['BC', 1, 2]^*, [
→'BC', 5, 2]^*]
```

```
>>> from sage.all import *
>>> CartanType.samples()
[['A', 1], ['A', 5], ['B', 1], ['B', 5], ['C', 1], ['C', 5], ['D', 2], ['D',␣
→3], ['D', 5],
 ['E', 6], ['E', 7], ['E', 8], ['F', 4], ['G', 2], ['I', 5], ['H', 3], ['H',␣
→4],
 ['A', 1, 1], ['A', 5, 1], ['B', 1, 1], ['B', 5, 1],
 ['C', 1, 1], ['C', 5, 1], ['D', 3, 1], ['D', 5, 1],
 ['E', 6, 1], ['E', 7, 1], ['E', 8, 1], ['F', 4, 1], ['G', 2, 1], ['BC', 1,␣
→2], ['BC', 5, 2],
 ['B', 5, 1]^*, ['C', 4, 1]^*, ['F', 4, 1]^*, ['G', 2, 1]^*, ['BC', 1, 2]^*, [
→'BC', 5, 2]^*]
```

The finite, affine and crystallographic options allow respectively for restricting to (non) finite, (non) affine, and (non) crystallographic Cartan types:

```
sage: CartanType.samples(finite=True)
[['A', 1], ['A', 5], ['B', 1], ['B', 5], ['C', 1], ['C', 5], ['D', 2], ['D',␣
→3], ['D', 5],
 ['E', 6], ['E', 7], ['E', 8], ['F', 4], ['G', 2], ['I', 5], ['H', 3], ['H',␣
→4]]

sage: CartanType.samples(affine=True)
[['A', 1, 1], ['A', 5, 1], ['B', 1, 1], ['B', 5, 1],
 ['C', 1, 1], ['C', 5, 1], ['D', 3, 1], ['D', 5, 1],
 ['E', 6, 1], ['E', 7, 1], ['E', 8, 1], ['F', 4, 1], ['G', 2, 1], ['BC', 1,␣
→2], ['BC', 5, 2],
 ['B', 5, 1]^*, ['C', 4, 1]^*, ['F', 4, 1]^*, ['G', 2, 1]^*, ['BC', 1, 2]^*, [
→'BC', 5, 2]^*]

sage: CartanType.samples(crystallographic=True)
[['A', 1], ['A', 5], ['B', 1], ['B', 5], ['C', 1], ['C', 5], ['D', 2], ['D',␣
```

(continues on next page)

(continued from previous page)

```

Todo

add some reducible Cartan types (suggestions?)

class `sage.combinat.root_system.cartan_type.`**`CartanType_abstract`**

Bases: `object`

Abstract class for Cartan types

Subclasses should implement:

- dynkin_diagram()
- cartan_matrix()
- *is_finite()*
- *is_affine()*
- *is_irreducible()*

as_folding(*folding_of=None*, *sigma=None*)

Return self realized as a folded Cartan type.

For finite and affine types, this is realized by the Dynkin diagram foldings:

$$\begin{array}{ccl} C_n^{(1)}, A_{2n}^{(2)}, A_{2n}^{(2)\dagger}, D_{n+1}^{(2)} & \hookrightarrow & A_{2n-1}^{(1)}, \\ A_{2n-1}^{(2)}, B_n^{(1)} & \hookrightarrow & D_{n+1}^{(1)}, \\ E_6^{(2)}, F_4^{(1)} & \hookrightarrow & E_6^{(1)}, \\ D_4^{(3)}, G_2^{(1)} & \hookrightarrow & D_4^{(1)}, \\ C_n & \hookrightarrow & A_{2n-1}, \\ B_n & \hookrightarrow & D_{n+1}, \\ F_4 & \hookrightarrow & E_6, \\ G_2 & \hookrightarrow & D_4. \end{array}$$

For general types, this returns self as a folded type of self with σ as the identity map.

For more information on these foldings and folded Cartan types, see *sage.combinat.root_system.type_folded.CartanTypeFolded*.

If the optional inputs folding_of and sigma are specified, then this returns the folded Cartan type of self in folding_of given by the automorphism sigma.

EXAMPLES:

```
sage: CartanType(['B', 3, 1]).as_folding()
['B', 3, 1] as a folding of  ['D', 4, 1]
sage: CartanType(['F', 4]).as_folding()
['F', 4] as a folding of  ['E', 6]
sage: CartanType(['BC', 3, 2]).as_folding()
['BC', 3, 2] as a folding of  ['A', 5, 1]
sage: CartanType(['D', 4, 3]).as_folding()
['G', 2, 1]^* relabelled by {0: 0, 1: 2, 2: 1} as a folding of ['D', 4, 1]
```

```
>>> from sage.all import *
>>> CartanType(['B', Integer(3), Integer(1)]).as_folding()
['B', 3, 1] as a folding of  ['D', 4, 1]
>>> CartanType(['F', Integer(4)]).as_folding()
['F', 4] as a folding of  ['E', 6]
>>> CartanType(['BC', Integer(3), Integer(2)]).as_folding()
['BC', 3, 2] as a folding of  ['A', 5, 1]
>>> CartanType(['D', Integer(4), Integer(3)]).as_folding()
['G', 2, 1]^* relabelled by {0: 0, 1: 2, 2: 1} as a folding of ['D', 4, 1]
```

coxeter_diagram()

Return the Coxeter diagram for self.

EXAMPLES:

```
sage: # needs sage.graphs
sage: CartanType(['B',3]).coxeter_diagram()
Graph on 3 vertices
sage: CartanType(['A',3]).coxeter_diagram().edges(sort=True)
[(1, 2, 3), (2, 3, 3)]
sage: CartanType(['B',3]).coxeter_diagram().edges(sort=True)
[(1, 2, 3), (2, 3, 4)]
sage: CartanType(['G',2]).coxeter_diagram().edges(sort=True)
[(1, 2, 6)]
sage: CartanType(['F',4]).coxeter_diagram().edges(sort=True)
[(1, 2, 3), (2, 3, 4), (3, 4, 3)]
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> CartanType(['B',Integer(3)]).coxeter_diagram()
Graph on 3 vertices
>>> CartanType(['A',Integer(3)]).coxeter_diagram().edges(sort=True)
[(1, 2, 3), (2, 3, 3)]
>>> CartanType(['B',Integer(3)]).coxeter_diagram().edges(sort=True)
[(1, 2, 3), (2, 3, 4)]
>>> CartanType(['G',Integer(2)]).coxeter_diagram().edges(sort=True)
[(1, 2, 6)]
>>> CartanType(['F',Integer(4)]).coxeter_diagram().edges(sort=True)
[(1, 2, 3), (2, 3, 4), (3, 4, 3)]
```

coxeter_matrix()

Return the Coxeter matrix for `self`.

EXAMPLES:

```
sage: CartanType(['A', 4]).coxeter_matrix()                                    #␣
↪needs sage.graphs
[1 3 2 2]
[3 1 3 2]
[2 3 1 3]
[2 2 3 1]
```

```
>>> from sage.all import *
>>> CartanType(['A', Integer(4)]).coxeter_matrix()                            ␣
↪      # needs sage.graphs
[1 3 2 2]
[3 1 3 2]
[2 3 1 3]
[2 2 3 1]
```

coxeter_type()

Return the Coxeter type for `self`.

EXAMPLES:

```
sage: CartanType(['A', 4]).coxeter_type()
Coxeter type of ['A', 4]
```

```
>>> from sage.all import *
>>> CartanType(['A', Integer(4)]).coxeter_type()
Coxeter type of ['A', 4]
```

dual()

Return the dual Cartan type, possibly just as a formal dual.

EXAMPLES:

```
sage: CartanType(['A',3]).dual()
['A', 3]
sage: CartanType(["B", 3]).dual()
['C', 3]
sage: CartanType(['C',2]).dual()
['B', 2]
sage: CartanType(['D',4]).dual()
['D', 4]
sage: CartanType(['E',8]).dual()
['E', 8]
sage: CartanType(['F',4]).dual()
['F', 4] relabelled by {1: 4, 2: 3, 3: 2, 4: 1}
```

```
>>> from sage.all import *
>>> CartanType(['A',Integer(3)]).dual()
['A', 3]
>>> CartanType(["B", Integer(3)]).dual()
['C', 3]
>>> CartanType(['C',Integer(2)]).dual()
['B', 2]
>>> CartanType(['D',Integer(4)]).dual()
['D', 4]
>>> CartanType(['E',Integer(8)]).dual()
['E', 8]
>>> CartanType(['F',Integer(4)]).dual()
['F', 4] relabelled by {1: 4, 2: 3, 3: 2, 4: 1}
```

index_set()

Return the index set for `self`.

This is the list of the nodes of the associated Coxeter or Dynkin diagram.

EXAMPLES:

```
sage: CartanType(['A', 3, 1]).index_set()
(0, 1, 2, 3)
sage: CartanType(['D', 4]).index_set()
(1, 2, 3, 4)
sage: CartanType(['A', 7, 2]).index_set()
(0, 1, 2, 3, 4)
sage: CartanType(['A', 7, 2]).index_set()
(0, 1, 2, 3, 4)
sage: CartanType(['A', 6, 2]).index_set()
(0, 1, 2, 3)
sage: CartanType(['D', 6, 2]).index_set()
```

(continues on next page)

(continued from previous page)

```
(0, 1, 2, 3, 4, 5)
sage: CartanType(['E', 6, 1]).index_set()
(0, 1, 2, 3, 4, 5, 6)
sage: CartanType(['E', 6, 2]).index_set()
(0, 1, 2, 3, 4)
sage: CartanType(['A', 2, 2]).index_set()
(0, 1)
sage: CartanType(['G', 2, 1]).index_set()
(0, 1, 2)
sage: CartanType(['F', 4, 1]).index_set()
(0, 1, 2, 3, 4)
```

```
>>> from sage.all import *
>>> CartanType(['A', Integer(3), Integer(1)]).index_set()
(0, 1, 2, 3)
>>> CartanType(['D', Integer(4)]).index_set()
(1, 2, 3, 4)
>>> CartanType(['A', Integer(7), Integer(2)]).index_set()
(0, 1, 2, 3, 4)
>>> CartanType(['A', Integer(7), Integer(2)]).index_set()
(0, 1, 2, 3, 4)
>>> CartanType(['A', Integer(6), Integer(2)]).index_set()
(0, 1, 2, 3)
>>> CartanType(['D', Integer(6), Integer(2)]).index_set()
(0, 1, 2, 3, 4, 5)
>>> CartanType(['E', Integer(6), Integer(1)]).index_set()
(0, 1, 2, 3, 4, 5, 6)
>>> CartanType(['E', Integer(6), Integer(2)]).index_set()
(0, 1, 2, 3, 4)
>>> CartanType(['A', Integer(2), Integer(2)]).index_set()
(0, 1)
>>> CartanType(['G', Integer(2), Integer(1)]).index_set()
(0, 1, 2)
>>> CartanType(['F', Integer(4), Integer(1)]).index_set()
(0, 1, 2, 3, 4)
```

is_affine()

Return whether `self` is affine.

EXAMPLES:

```
sage: CartanType(['A', 3]).is_affine()
False
sage: CartanType(['A', 3, 1]).is_affine()
True
```

```
>>> from sage.all import *
>>> CartanType(['A', Integer(3)]).is_affine()
False
>>> CartanType(['A', Integer(3), Integer(1)]).is_affine()
True
```

is_atomic()

This method is usually equivalent to *is_reducible()*, except for the Cartan type D_2.

D_2 is not a standard Cartan type. It is equivalent to type $A_1 \times A_1$ which is reducible; however the isomorphism from its ambient space (for the orthogonal group of degree 4) to that of $A_1 \times A_1$ is non trivial, and it is useful to have it.

From a programming point of view its implementation is more similar to the irreducible types, and so the method *is_atomic()* is supplied.

EXAMPLES:

```
sage: CartanType("D2").is_atomic()
True
sage: CartanType("D2").is_irreducible()
False
```

```
>>> from sage.all import *
>>> CartanType("D2").is_atomic()
True
>>> CartanType("D2").is_irreducible()
False
```

is_compound()

A short hand for not *is_atomic()*.

is_crystallographic()

Return whether this Cartan type is crystallographic.

This returns `False` by default. Derived class should override this appropriately.

EXAMPLES:

```
sage: [ [t, t.is_crystallographic() ] for t in CartanType.
↪samples(finite=True) ]
[[['A', 1], True], [['A', 5], True],
 [['B', 1], True], [['B', 5], True],
 [['C', 1], True], [['C', 5], True],
 [['D', 2], True], [['D', 3], True], [['D', 5], True],
 [['E', 6], True], [['E', 7], True], [['E', 8], True],
 [['F', 4], True], [['G', 2], True],
 [['I', 5], False], [['H', 3], False], [['H', 4], False]]
```

```
>>> from sage.all import *
>>> [ [t, t.is_crystallographic() ] for t in CartanType.samples(finite=True) ]
[[['A', 1], True], [['A', 5], True],
 [['B', 1], True], [['B', 5], True],
 [['C', 1], True], [['C', 5], True],
 [['D', 2], True], [['D', 3], True], [['D', 5], True],
 [['E', 6], True], [['E', 7], True], [['E', 8], True],
 [['F', 4], True], [['G', 2], True],
 [['I', 5], False], [['H', 3], False], [['H', 4], False]]
```

is_finite()

Return whether this Cartan type is finite.

EXAMPLES:

```
sage: from sage.combinat.root_system.cartan_type import CartanType_abstract
sage: C = CartanType_abstract()
sage: C.is_finite()
Traceback (most recent call last):
...
NotImplementedError: <abstract method is_finite at ...>
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.cartan_type import CartanType_abstract
>>> C = CartanType_abstract()
>>> C.is_finite()
Traceback (most recent call last):
...
NotImplementedError: <abstract method is_finite at ...>
```

```
sage: CartanType(['A',4]).is_finite()
True
sage: CartanType(['A',4, 1]).is_finite()
False
```

```
>>> from sage.all import *
>>> CartanType(['A',Integer(4)]).is_finite()
True
>>> CartanType(['A',Integer(4), Integer(1)]).is_finite()
False
```

is_implemented()

Check whether the Cartan datum for `self` is actually implemented.

EXAMPLES:

```
sage: CartanType(["A",4,1]).is_implemented()                                   #␣
↪needs sage.graphs
True
sage: CartanType(['H',3]).is_implemented()
True
```

```
>>> from sage.all import *
>>> CartanType(["A",Integer(4),Integer(1)]).is_implemented()                   ␣
↪               # needs sage.graphs
True
>>> CartanType(['H',Integer(3)]).is_implemented()
True
```

is_irreducible()

Report whether this Cartan type is irreducible (i.e. simple). This should be overridden in any subclass.

This returns `False` by default. Derived class should override this appropriately.

EXAMPLES:

```
sage: from sage.combinat.root_system.cartan_type import CartanType_abstract
sage: C = CartanType_abstract()
```

(continues on next page)

(continued from previous page)

```
sage: C.is_irreducible()
False
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.cartan_type import CartanType_abstract
>>> C = CartanType_abstract()
>>> C.is_irreducible()
False
```

is_reducible()

Report whether the root system is reducible (i.e. not simple), that is whether it can be factored as a product of root systems.

EXAMPLES:

```
sage: CartanType("A2xB3").is_reducible()
True
sage: CartanType(['A',2]).is_reducible()
False
```

```
>>> from sage.all import *
>>> CartanType("A2xB3").is_reducible()
True
>>> CartanType(['A',Integer(2)]).is_reducible()
False
```

is_simply_laced()

Return whether this Cartan type is simply laced.

This returns `False` by default. Derived class should override this appropriately.

EXAMPLES:

```
sage: [ [t, t.is_simply_laced() ] for t in CartanType.samples() ]
[[['A', 1], True], [['A', 5], True],
 [['B', 1], True], [['B', 5], False],
 [['C', 1], True], [['C', 5], False],
 [['D', 2], True], [['D', 3], True], [['D', 5], True],
 [['E', 6], True], [['E', 7], True], [['E', 8], True],
 [['F', 4], False], [['G', 2], False], [['I', 5], False],
 [['H', 3], False], [['H', 4], False],
 [['A', 1, 1], False], [['A', 5, 1], True],
 [['B', 1, 1], False], [['B', 5, 1], False],
 [['C', 1, 1], False], [['C', 5, 1], False],
 [['D', 3, 1], True], [['D', 5, 1], True],
 [['E', 6, 1], True], [['E', 7, 1], True], [['E', 8, 1], True],
 [['F', 4, 1], False], [['G', 2, 1], False],
 [['BC', 1, 2], False], [['BC', 5, 2], False],
 [['B', 5, 1]^*, False], [['C', 4, 1]^*, False],
 [['F', 4, 1]^*, False], [['G', 2, 1]^*, False],
 [['BC', 1, 2]^*, False], [['BC', 5, 2]^*, False]]
```

```
>>> from sage.all import *
>>> [ [t, t.is_simply_laced() ] for t in CartanType.samples() ]
[[['A', 1], True], [['A', 5], True],
 [['B', 1], True], [['B', 5], False],
 [['C', 1], True], [['C', 5], False],
 [['D', 2], True], [['D', 3], True], [['D', 5], True],
 [['E', 6], True], [['E', 7], True], [['E', 8], True],
 [['F', 4], False], [['G', 2], False], [['I', 5], False],
 [['H', 3], False], [['H', 4], False],
 [['A', 1, 1], False], [['A', 5, 1], True],
 [['B', 1, 1], False], [['B', 5, 1], False],
 [['C', 1, 1], False], [['C', 5, 1], False],
 [['D', 3, 1], True], [['D', 5, 1], True],
 [['E', 6, 1], True], [['E', 7, 1], True], [['E', 8, 1], True],
 [['F', 4, 1], False], [['G', 2, 1], False],
 [['BC', 1, 2], False], [['BC', 5, 2], False],
 [['B', 5, 1]^*, False], [['C', 4, 1]^*, False],
 [['F', 4, 1]^*, False], [['G', 2, 1]^*, False],
 [['BC', 1, 2]^*, False], [['BC', 5, 2]^*, False]]
```

marked_nodes(*marked_nodes*)

Return a Cartan type with the nodes `marked_nodes` marked.

INPUT:

- `marked_nodes` – list of nodes to mark

EXAMPLES:

```
sage: CartanType(['F',4]).marked_nodes([1, 3]).dynkin_diagram()                 #␣
↪needs sage.graphs
X---O=>=X---O
1   2   3   4
F4 with nodes (1, 3) marked
```

```
>>> from sage.all import *
>>> CartanType(['F',Integer(4)]).marked_nodes([Integer(1), Integer(3)]).
↪dynkin_diagram()                # needs sage.graphs
X---O=>=X---O
1   2   3   4
F4 with nodes (1, 3) marked
```

options = Current options for CartanType - dual_latex: \vee - dual_str: * - latex_marked: True - latex_relabel: True - mark_special_node: none - marked_node_str: X - notation: Stembridge - special_node_str: @

rank()

Return the rank of `self`.

This is the number of nodes of the associated Coxeter or Dynkin diagram.

EXAMPLES:

```
sage: CartanType(['A', 4]).rank()
4
```

(continues on next page)

(continued from previous page)

```
sage: CartanType(['A', 7, 2]).rank()
5
sage: CartanType(['I', 8]).rank()
2
```

```
>>> from sage.all import *
>>> CartanType(['A', Integer(4)]).rank()
4
>>> CartanType(['A', Integer(7), Integer(2)]).rank()
5
>>> CartanType(['I', Integer(8)]).rank()
2
```

relabel(*relabelling*)

Return a relabelled copy of this Cartan type.

INPUT:

- `relabelling` – a function (or a list or dictionary)

OUTPUT:

an isomorphic Cartan type obtained by relabelling the nodes of the Dynkin diagram. Namely, the node with label `i` is relabelled `f(i)` (or, by `f[i]` if `f` is a list or dictionary).

EXAMPLES:

```
sage: CartanType(['F',4]).relabel({ 1:4, 2:3, 3:2, 4:1 }).dynkin_diagram()
↪# needs sage.graphs
O---O=>=O---O
4   3   2   1
F4 relabelled by {1: 4, 2: 3, 3: 2, 4: 1}
```

```
>>> from sage.all import *
>>> CartanType(['F',Integer(4)]).relabel({ Integer(1):Integer(4),␣
↪Integer(2):Integer(3), Integer(3):Integer(2), Integer(4):Integer(1) }).
↪dynkin_diagram()    # needs sage.graphs
O---O=>=O---O
4   3   2   1
F4 relabelled by {1: 4, 2: 3, 3: 2, 4: 1}
```

root_system()

Return the root system associated to `self`.

EXAMPLES:

```
sage: CartanType(['A',4]).root_system()
Root system of type ['A', 4]
```

```
>>> from sage.all import *
>>> CartanType(['A',Integer(4)]).root_system()
Root system of type ['A', 4]
```

subtype(*index_set*)

Return a subtype of `self` given by `index_set`.

A subtype can be considered the Dynkin diagram induced from the Dynkin diagram of `self` by `index_set`.

EXAMPLES:

```
sage: ct = CartanType(['A',6,2])
sage: ct.dynkin_diagram()                                               #␣
↪needs sage.graphs
O=<=O---O=<=O
0   1   2   3
BC3~
sage: ct.subtype([1,2,3])                                               #␣
↪needs sage.graphs
['C', 3]
```

```
>>> from sage.all import *
>>> ct = CartanType(['A',Integer(6),Integer(2)])
>>> ct.dynkin_diagram()                                               #␣
↪needs sage.graphs
O=<=O---O=<=O
0   1   2   3
BC3~
>>> ct.subtype([Integer(1),Integer(2),Integer(3)])                      ␣
↪                      # needs sage.graphs
['C', 3]
```

type()

Return the type of `self`, or `None` if unknown.

This method should be overridden in any subclass.

EXAMPLES:

```
sage: from sage.combinat.root_system.cartan_type import CartanType_abstract
sage: C = CartanType_abstract()
sage: C.type() is None
True
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.cartan_type import CartanType_abstract
>>> C = CartanType_abstract()
>>> C.type() is None
True
```

class sage.combinat.root_system.cartan_type.**CartanType_affine**

Bases: *CartanType_simple*, *CartanType_crystallographic*

An abstract class for simple affine Cartan types

AmbientSpace

alias of *AmbientSpace*

a()

Return the unique minimal non trivial annihilating linear combination of $\alpha_0^\vee, \alpha^\vee, \ldots, \alpha^\vee$ with nonnegative coefficients (or alternatively, the unique minimal non trivial annihilating linear combination of the columns of the Cartan matrix with nonnegative coefficients).

Throw an error if the existence or uniqueness does not hold

FIXME: the current implementation assumes that the Cartan matrix is indexed by $[0, 1, ...]$, in the same order as the index set.

EXAMPLES:

```
sage: # needs sage.graphs
sage: RootSystem(['C',2,1]).cartan_type().a()
Finite family {0: 1, 1: 2, 2: 1}
sage: RootSystem(['D',4,1]).cartan_type().a()
Finite family {0: 1, 1: 1, 2: 2, 3: 1, 4: 1}
sage: RootSystem(['F',4,1]).cartan_type().a()
Finite family {0: 1, 1: 2, 2: 3, 3: 4, 4: 2}
sage: RootSystem(['BC',4,2]).cartan_type().a()
Finite family {0: 2, 1: 2, 2: 2, 3: 2, 4: 1}
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> RootSystem(['C',Integer(2),Integer(1)]).cartan_type().a()
Finite family {0: 1, 1: 2, 2: 1}
>>> RootSystem(['D',Integer(4),Integer(1)]).cartan_type().a()
Finite family {0: 1, 1: 1, 2: 2, 3: 1, 4: 1}
>>> RootSystem(['F',Integer(4),Integer(1)]).cartan_type().a()
Finite family {0: 1, 1: 2, 2: 3, 3: 4, 4: 2}
>>> RootSystem(['BC',Integer(4),Integer(2)]).cartan_type().a()
Finite family {0: 2, 1: 2, 2: 2, 3: 2, 4: 1}
```

`a` is a shortcut for col_annihilator:

```
sage: RootSystem(['BC',4,2]).cartan_type().col_annihilator()                    #␣
↪needs sage.graphs
Finite family {0: 2, 1: 2, 2: 2, 3: 2, 4: 1}
```

```
>>> from sage.all import *
>>> RootSystem(['BC',Integer(4),Integer(2)]).cartan_type().col_annihilator() ␣
↪               # needs sage.graphs
Finite family {0: 2, 1: 2, 2: 2, 3: 2, 4: 1}
```

acheck(*m=None*)

Return the unique minimal non trivial annihilating linear combination of $\alpha_0, \alpha_1, \ldots, \alpha_n$ with nonnegative coefficients (or alternatively, the unique minimal non trivial annihilating linear combination of the rows of the Cartan matrix with nonnegative coefficients).

Throw an error if the existence of uniqueness does not hold

The optional argument `m` is for internal use only.

EXAMPLES:

```
sage: # needs sage.graphs
sage: RootSystem(['C',2,1]).cartan_type().acheck()
Finite family {0: 1, 1: 1, 2: 1}
```

(continues on next page)

(continued from previous page)

```
sage: RootSystem(['D',4,1]).cartan_type().acheck()
Finite family {0: 1, 1: 1, 2: 2, 3: 1, 4: 1}
sage: RootSystem(['F',4,1]).cartan_type().acheck()
Finite family {0: 1, 1: 2, 2: 3, 3: 2, 4: 1}
sage: RootSystem(['BC',4,2]).cartan_type().acheck()
Finite family {0: 1, 1: 2, 2: 2, 3: 2, 4: 2}
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> RootSystem(['C',Integer(2),Integer(1)]).cartan_type().acheck()
Finite family {0: 1, 1: 1, 2: 1}
>>> RootSystem(['D',Integer(4),Integer(1)]).cartan_type().acheck()
Finite family {0: 1, 1: 1, 2: 2, 3: 1, 4: 1}
>>> RootSystem(['F',Integer(4),Integer(1)]).cartan_type().acheck()
Finite family {0: 1, 1: 2, 2: 3, 3: 2, 4: 1}
>>> RootSystem(['BC',Integer(4),Integer(2)]).cartan_type().acheck()
Finite family {0: 1, 1: 2, 2: 2, 3: 2, 4: 2}
```

`acheck` is a shortcut for row_annihilator:

```
sage: RootSystem(['BC',4,2]).cartan_type().row_annihilator()                  #␣
↪needs sage.graphs
Finite family {0: 1, 1: 2, 2: 2, 3: 2, 4: 2}
```

```
>>> from sage.all import *
>>> RootSystem(['BC',Integer(4),Integer(2)]).cartan_type().row_annihilator() ␣
↪              # needs sage.graphs
Finite family {0: 1, 1: 2, 2: 2, 3: 2, 4: 2}
```

FIXME:

- The current implementation assumes that the Cartan matrix is indexed by $[0, 1, ...]$, in the same order as the index set.
- This really should be a method of *CartanMatrix*.

basic_untwisted()

Return the basic untwisted Cartan type associated with this affine Cartan type.

Given an affine type $X_n^{(r)}$, the basic untwisted type is X_n. In other words, it is the classical Cartan type that is twisted to obtain `self`.

EXAMPLES:

```
sage: CartanType(['A', 1, 1]).basic_untwisted()
['A', 1]
sage: CartanType(['A', 3, 1]).basic_untwisted()
['A', 3]
sage: CartanType(['B', 3, 1]).basic_untwisted()
['B', 3]
sage: CartanType(['E', 6, 1]).basic_untwisted()
['E', 6]
sage: CartanType(['G', 2, 1]).basic_untwisted()
['G', 2]
```

(continues on next page)

(continued from previous page)

```
sage: CartanType(['A', 2, 2]).basic_untwisted()
['A', 2]
sage: CartanType(['A', 4, 2]).basic_untwisted()
['A', 4]
sage: CartanType(['A', 11, 2]).basic_untwisted()
['A', 11]
sage: CartanType(['D', 5, 2]).basic_untwisted()
['D', 5]
sage: CartanType(['E', 6, 2]).basic_untwisted()
['E', 6]
sage: CartanType(['D', 4, 3]).basic_untwisted()
['D', 4]
```

```
>>> from sage.all import *
>>> CartanType(['A', Integer(1), Integer(1)]).basic_untwisted()
['A', 1]
>>> CartanType(['A', Integer(3), Integer(1)]).basic_untwisted()
['A', 3]
>>> CartanType(['B', Integer(3), Integer(1)]).basic_untwisted()
['B', 3]
>>> CartanType(['E', Integer(6), Integer(1)]).basic_untwisted()
['E', 6]
>>> CartanType(['G', Integer(2), Integer(1)]).basic_untwisted()
['G', 2]

>>> CartanType(['A', Integer(2), Integer(2)]).basic_untwisted()
['A', 2]
>>> CartanType(['A', Integer(4), Integer(2)]).basic_untwisted()
['A', 4]
>>> CartanType(['A', Integer(11), Integer(2)]).basic_untwisted()
['A', 11]
>>> CartanType(['D', Integer(5), Integer(2)]).basic_untwisted()
['D', 5]
>>> CartanType(['E', Integer(6), Integer(2)]).basic_untwisted()
['E', 6]
>>> CartanType(['D', Integer(4), Integer(3)]).basic_untwisted()
['D', 4]
```

c()

Return the family (c_i)_i of integer coefficients defined by $c_i = max(1, a_i/a^vee_i)$ (see e.g. [FSS07] p. 3)

FIXME: the current implementation assumes that the Cartan matrix is indexed by $[0, 1, ...]$, in the same order as the index set.

EXAMPLES:

```
sage: # needs sage.graphs
sage: RootSystem(['C',2,1]).cartan_type().c()
Finite family {0: 1, 1: 2, 2: 1}
sage: RootSystem(['D',4,1]).cartan_type().c()
Finite family {0: 1, 1: 1, 2: 1, 3: 1, 4: 1}
sage: RootSystem(['F',4,1]).cartan_type().c()
```

(continues on next page)

(continued from previous page)

```
Finite family {0: 1, 1: 1, 2: 1, 3: 2, 4: 2}
sage: RootSystem(['BC',4,2]).cartan_type().c()
Finite family {0: 2, 1: 1, 2: 1, 3: 1, 4: 1}
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> RootSystem(['C',Integer(2),Integer(1)]).cartan_type().c()
Finite family {0: 1, 1: 2, 2: 1}
>>> RootSystem(['D',Integer(4),Integer(1)]).cartan_type().c()
Finite family {0: 1, 1: 1, 2: 1, 3: 1, 4: 1}
>>> RootSystem(['F',Integer(4),Integer(1)]).cartan_type().c()
Finite family {0: 1, 1: 1, 2: 1, 3: 2, 4: 2}
>>> RootSystem(['BC',Integer(4),Integer(2)]).cartan_type().c()
Finite family {0: 2, 1: 1, 2: 1, 3: 1, 4: 1}
```

REFERENCES:

classical()

Return the classical Cartan type associated with this affine Cartan type.

EXAMPLES:

```
sage: CartanType(['A', 1, 1]).classical()
['A', 1]
sage: CartanType(['A', 3, 1]).classical()
['A', 3]
sage: CartanType(['B', 3, 1]).classical()
['B', 3]

sage: CartanType(['A', 2, 2]).classical()
['C', 1]
sage: CartanType(['BC', 1, 2]).classical()
['C', 1]
sage: CartanType(['A', 4, 2]).classical()
['C', 2]
sage: CartanType(['BC', 2, 2]).classical()
['C', 2]
sage: CartanType(['A', 10, 2]).classical()
['C', 5]
sage: CartanType(['BC', 5, 2]).classical()
['C', 5]

sage: CartanType(['D', 5, 2]).classical()
['B', 4]
sage: CartanType(['E', 6, 1]).classical()
['E', 6]
sage: CartanType(['G', 2, 1]).classical()
['G', 2]
sage: CartanType(['E', 6, 2]).classical()
['F', 4] relabelled by {1: 4, 2: 3, 3: 2, 4: 1}
sage: CartanType(['D', 4, 3]).classical()
['G', 2]
```

```
>>> from sage.all import *
>>> CartanType(['A', Integer(1), Integer(1)]).classical()
['A', 1]
>>> CartanType(['A', Integer(3), Integer(1)]).classical()
['A', 3]
>>> CartanType(['B', Integer(3), Integer(1)]).classical()
['B', 3]

>>> CartanType(['A', Integer(2), Integer(2)]).classical()
['C', 1]
>>> CartanType(['BC', Integer(1), Integer(2)]).classical()
['C', 1]
>>> CartanType(['A', Integer(4), Integer(2)]).classical()
['C', 2]
>>> CartanType(['BC', Integer(2), Integer(2)]).classical()
['C', 2]
>>> CartanType(['A', Integer(10), Integer(2)]).classical()
['C', 5]
>>> CartanType(['BC', Integer(5), Integer(2)]).classical()
['C', 5]

>>> CartanType(['D', Integer(5), Integer(2)]).classical()
['B', 4]
>>> CartanType(['E', Integer(6), Integer(1)]).classical()
['E', 6]
>>> CartanType(['G', Integer(2), Integer(1)]).classical()
['G', 2]
>>> CartanType(['E', Integer(6), Integer(2)]).classical()
['F', 4] relabelled by {1: 4, 2: 3, 3: 2, 4: 1}
>>> CartanType(['D', Integer(4), Integer(3)]).classical()
['G', 2]
```

We check that `classical()`, `sage.combinat.root_system.cartan_type.CartanType_crystallographic.dynkin_diagram()`, and `special_node()` are consistent:

```
sage: for ct in CartanType.samples(affine=True):                            #␣
↪needs sage.graphs
....:     g1 = ct.classical().dynkin_diagram()
....:     g2 = ct.dynkin_diagram()
....:     g2.delete_vertex(ct.special_node())
....:     assert g1.vertices(sort=True) == g2.vertices(sort=True)
....:     assert g1.edges(sort=True) == g2.edges(sort=True)
```

```
>>> from sage.all import *
>>> for ct in CartanType.samples(affine=True):                              #␣
↪needs sage.graphs
...     g1 = ct.classical().dynkin_diagram()
...     g2 = ct.dynkin_diagram()
...     g2.delete_vertex(ct.special_node())
...     assert g1.vertices(sort=True) == g2.vertices(sort=True)
...     assert g1.edges(sort=True) == g2.edges(sort=True)
```

col_annihilator()

Return the unique minimal non trivial annihilating linear combination of $\alpha_0^\vee, \alpha^\vee, \ldots, \alpha^\vee$ with nonnegative coefficients (or alternatively, the unique minimal non trivial annihilating linear combination of the columns of the Cartan matrix with nonnegative coefficients).

Throw an error if the existence or uniqueness does not hold

FIXME: the current implementation assumes that the Cartan matrix is indexed by $[0, 1, ...]$, in the same order as the index set.

EXAMPLES:

```
sage: # needs sage.graphs
sage: RootSystem(['C',2,1]).cartan_type().a()
Finite family {0: 1, 1: 2, 2: 1}
sage: RootSystem(['D',4,1]).cartan_type().a()
Finite family {0: 1, 1: 1, 2: 2, 3: 1, 4: 1}
sage: RootSystem(['F',4,1]).cartan_type().a()
Finite family {0: 1, 1: 2, 2: 3, 3: 4, 4: 2}
sage: RootSystem(['BC',4,2]).cartan_type().a()
Finite family {0: 2, 1: 2, 2: 2, 3: 2, 4: 1}
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> RootSystem(['C',Integer(2),Integer(1)]).cartan_type().a()
Finite family {0: 1, 1: 2, 2: 1}
>>> RootSystem(['D',Integer(4),Integer(1)]).cartan_type().a()
Finite family {0: 1, 1: 1, 2: 2, 3: 1, 4: 1}
>>> RootSystem(['F',Integer(4),Integer(1)]).cartan_type().a()
Finite family {0: 1, 1: 2, 2: 3, 3: 4, 4: 2}
>>> RootSystem(['BC',Integer(4),Integer(2)]).cartan_type().a()
Finite family {0: 2, 1: 2, 2: 2, 3: 2, 4: 1}
```

`a` is a shortcut for col_annihilator:

```
sage: RootSystem(['BC',4,2]).cartan_type().col_annihilator()                    #␣
↪needs sage.graphs
Finite family {0: 2, 1: 2, 2: 2, 3: 2, 4: 1}
```

```
>>> from sage.all import *
>>> RootSystem(['BC',Integer(4),Integer(2)]).cartan_type().col_annihilator() ␣
↪              # needs sage.graphs
Finite family {0: 2, 1: 2, 2: 2, 3: 2, 4: 1}
```

is_affine()

EXAMPLES:

```
sage: CartanType(['A', 3, 1]).is_affine()
True
```

```
>>> from sage.all import *
>>> CartanType(['A', Integer(3), Integer(1)]).is_affine()
True
```

is_finite()

EXAMPLES:

```
sage: CartanType(['A', 3, 1]).is_finite()
False
```

```
>>> from sage.all import *
>>> CartanType(['A', Integer(3), Integer(1)]).is_finite()
False
```

is_untwisted_affine()

Return whether `self` is untwisted affine.

A Cartan type is untwisted affine if it is the canonical affine extension of some finite type. Every affine type is either untwisted affine, dual thereof, or of type `BC`.

EXAMPLES:

```
sage: CartanType(['A', 3, 1]).is_untwisted_affine()
True
sage: CartanType(['A', 3, 1]).dual().is_untwisted_affine()   # this one is␣
↪self dual!
True
sage: CartanType(['B', 3, 1]).dual().is_untwisted_affine()
False
sage: CartanType(['BC', 3, 2]).is_untwisted_affine()
False
```

```
>>> from sage.all import *
>>> CartanType(['A', Integer(3), Integer(1)]).is_untwisted_affine()
True
>>> CartanType(['A', Integer(3), Integer(1)]).dual().is_untwisted_affine()   #␣
↪this one is self dual!
True
>>> CartanType(['B', Integer(3), Integer(1)]).dual().is_untwisted_affine()
False
>>> CartanType(['BC', Integer(3), Integer(2)]).is_untwisted_affine()
False
```

other_affinization()

Return the other affinization of the same classical type.

EXAMPLES:

```
sage: CartanType(["A", 3, 1]).other_affinization()
['A', 3, 1]
sage: CartanType(["B", 3, 1]).other_affinization()
['C', 3, 1]^*
sage: CartanType(["C", 3, 1]).dual().other_affinization()
['B', 3, 1]
```

```
>>> from sage.all import *
>>> CartanType(["A", Integer(3), Integer(1)]).other_affinization()
['A', 3, 1]
>>> CartanType(["B", Integer(3), Integer(1)]).other_affinization()
['C', 3, 1]^*
```

(continues on next page)

(continued from previous page)

```
>>> CartanType(["C", Integer(3), Integer(1)]).dual().other_affinization()
['B', 3, 1]
```

Is this what we want?:

```
sage: CartanType(["BC", 3, 2]).dual().other_affinization()
['B', 3, 1]
```

```
>>> from sage.all import *
>>> CartanType(["BC", Integer(3), Integer(2)]).dual().other_affinization()
['B', 3, 1]
```

row_annihilator(*m=None*)

Return the unique minimal non trivial annihilating linear combination of $\alpha_0, \alpha_1, \ldots, \alpha_n$ with nonnegative coefficients (or alternatively, the unique minimal non trivial annihilating linear combination of the rows of the Cartan matrix with nonnegative coefficients).

Throw an error if the existence of uniqueness does not hold

The optional argument `m` is for internal use only.

EXAMPLES:

```
sage: # needs sage.graphs
sage: RootSystem(['C',2,1]).cartan_type().acheck()
Finite family {0: 1, 1: 1, 2: 1}
sage: RootSystem(['D',4,1]).cartan_type().acheck()
Finite family {0: 1, 1: 1, 2: 2, 3: 1, 4: 1}
sage: RootSystem(['F',4,1]).cartan_type().acheck()
Finite family {0: 1, 1: 2, 2: 3, 3: 2, 4: 1}
sage: RootSystem(['BC',4,2]).cartan_type().acheck()
Finite family {0: 1, 1: 2, 2: 2, 3: 2, 4: 2}
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> RootSystem(['C',Integer(2),Integer(1)]).cartan_type().acheck()
Finite family {0: 1, 1: 1, 2: 1}
>>> RootSystem(['D',Integer(4),Integer(1)]).cartan_type().acheck()
Finite family {0: 1, 1: 1, 2: 2, 3: 1, 4: 1}
>>> RootSystem(['F',Integer(4),Integer(1)]).cartan_type().acheck()
Finite family {0: 1, 1: 2, 2: 3, 3: 2, 4: 1}
>>> RootSystem(['BC',Integer(4),Integer(2)]).cartan_type().acheck()
Finite family {0: 1, 1: 2, 2: 2, 3: 2, 4: 2}
```

`acheck` is a shortcut for row_annihilator:

```
sage: RootSystem(['BC',4,2]).cartan_type().row_annihilator()                #
↪needs sage.graphs
Finite family {0: 1, 1: 2, 2: 2, 3: 2, 4: 2}
```

```
>>> from sage.all import *
>>> RootSystem(['BC',Integer(4),Integer(2)]).cartan_type().row_annihilator()
```

(continues on next page)

(continued from previous page)

```
↪                # needs sage.graphs
Finite family {0: 1, 1: 2, 2: 2, 3: 2, 4: 2}
```

FIXME:

- The current implementation assumes that the Cartan matrix is indexed by $[0, 1, ...]$, in the same order as the index set.
- This really should be a method of `CartanMatrix`.

special_node()

Return a special node of the Dynkin diagram.

A *special* node is a node of the Dynkin diagram such that pruning it yields a Dynkin diagram for the associated classical type (see `classical()`).

This method returns the label of some special node. This is usually 0 in the standard conventions.

EXAMPLES:

```
sage: CartanType(['A', 3, 1]).special_node()
0
```

```
>>> from sage.all import *
>>> CartanType(['A', Integer(3), Integer(1)]).special_node()
0
```

The choice is guaranteed to be consistent with the indexing of the nodes of the classical Dynkin diagram:

```
sage: CartanType(['A', 3, 1]).index_set()
(0, 1, 2, 3)
sage: CartanType(['A', 3, 1]).classical().index_set()
(1, 2, 3)
```

```
>>> from sage.all import *
>>> CartanType(['A', Integer(3), Integer(1)]).index_set()
(0, 1, 2, 3)
>>> CartanType(['A', Integer(3), Integer(1)]).classical().index_set()
(1, 2, 3)
```

special_nodes()

Return the set of special nodes of the affine Dynkin diagram.

EXAMPLES:

```
sage: # needs sage.graphs sage.groups
sage: CartanType(['A',3,1]).special_nodes()
(0, 1, 2, 3)
sage: CartanType(['C',2,1]).special_nodes()
(0, 2)
sage: CartanType(['D',4,1]).special_nodes()
(0, 1, 3, 4)
sage: CartanType(['E',6,1]).special_nodes()
(0, 1, 6)
sage: CartanType(['D',3,2]).special_nodes()
```

(continues on next page)

(continued from previous page)

```
(0, 2)
sage: CartanType(['A',4,2]).special_nodes()
(0,)
```

```
>>> from sage.all import *
>>> # needs sage.graphs sage.groups
>>> CartanType(['A',Integer(3),Integer(1)]).special_nodes()
(0, 1, 2, 3)
>>> CartanType(['C',Integer(2),Integer(1)]).special_nodes()
(0, 2)
>>> CartanType(['D',Integer(4),Integer(1)]).special_nodes()
(0, 1, 3, 4)
>>> CartanType(['E',Integer(6),Integer(1)]).special_nodes()
(0, 1, 6)
>>> CartanType(['D',Integer(3),Integer(2)]).special_nodes()
(0, 2)
>>> CartanType(['A',Integer(4),Integer(2)]).special_nodes()
(0,)
```

translation_factors()

Return the translation factors for `self`.

Those are the smallest factors t_i such that the translation by $t_i\alpha_i$ maps the fundamental polygon to another polygon in the alcove picture.

OUTPUT:

a dictionary from `self.index_set()` to $\mathbf{Z}$ (or $\mathbf{Q}$ for affine type BC)

Those coefficients are all 1 for dual untwisted, and in particular for simply laced. They coincide with the usual c_i coefficients (see `c()`) for untwisted and dual thereof. See the discussion below for affine type BC.

Note

One usually realizes the alcove picture in the coweight lattice, with translations by coroots; in that case, one will use the translation factors for the dual Cartan type.

FIXME: the current implementation assumes that the Cartan matrix is indexed by $[0, 1, ...]$, in the same order as the index set.

EXAMPLES:

```
sage: # needs sage.graphs
sage: CartanType(['C',2,1]).translation_factors()
Finite family {0: 1, 1: 2, 2: 1}
sage: CartanType(['C',2,1]).dual().translation_factors()
Finite family {0: 1, 1: 1, 2: 1}
sage: CartanType(['D',4,1]).translation_factors()
Finite family {0: 1, 1: 1, 2: 1, 3: 1, 4: 1}
sage: CartanType(['F',4,1]).translation_factors()
Finite family {0: 1, 1: 1, 2: 1, 3: 2, 4: 2}
sage: CartanType(['BC',4,2]).translation_factors()
Finite family {0: 1, 1: 1, 2: 1, 3: 1, 4: 1/2}
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> CartanType(['C',Integer(2),Integer(1)]).translation_factors()
Finite family {0: 1, 1: 2, 2: 1}
>>> CartanType(['C',Integer(2),Integer(1)]).dual().translation_factors()
Finite family {0: 1, 1: 1, 2: 1}
>>> CartanType(['D',Integer(4),Integer(1)]).translation_factors()
Finite family {0: 1, 1: 1, 2: 1, 3: 1, 4: 1}
>>> CartanType(['F',Integer(4),Integer(1)]).translation_factors()
Finite family {0: 1, 1: 1, 2: 1, 3: 2, 4: 2}
>>> CartanType(['BC',Integer(4),Integer(2)]).translation_factors()
Finite family {0: 1, 1: 1, 2: 1, 3: 1, 4: 1/2}
```

We proceed with systematic tests taken from MuPAD-Combinat's testsuite:

```
sage: # needs sage.graphs
sage: list(CartanType(["A", 1, 1]).translation_factors())
[1, 1]
sage: list(CartanType(["A", 5, 1]).translation_factors())
[1, 1, 1, 1, 1, 1]
sage: list(CartanType(["B", 5, 1]).translation_factors())
[1, 1, 1, 1, 1, 2]
sage: list(CartanType(["C", 5, 1]).translation_factors())
[1, 2, 2, 2, 2, 1]
sage: list(CartanType(["D", 5, 1]).translation_factors())
[1, 1, 1, 1, 1, 1]
sage: list(CartanType(["E", 6, 1]).translation_factors())
[1, 1, 1, 1, 1, 1, 1]
sage: list(CartanType(["E", 7, 1]).translation_factors())
[1, 1, 1, 1, 1, 1, 1, 1]
sage: list(CartanType(["E", 8, 1]).translation_factors())
[1, 1, 1, 1, 1, 1, 1, 1, 1]
sage: list(CartanType(["F", 4, 1]).translation_factors())
[1, 1, 1, 2, 2]
sage: list(CartanType(["G", 2, 1]).translation_factors())
[1, 3, 1]
sage: list(CartanType(["A", 2, 2]).translation_factors())
[1, 1/2]
sage: list(CartanType(["A", 2, 2]).dual().translation_factors())
[1/2, 1]
sage: list(CartanType(["A", 10, 2]).translation_factors())
[1, 1, 1, 1, 1, 1/2]
sage: list(CartanType(["A", 10, 2]).dual().translation_factors())
[1/2, 1, 1, 1, 1, 1]
sage: list(CartanType(["A", 9, 2]).translation_factors())
[1, 1, 1, 1, 1, 1]
sage: list(CartanType(["D", 5, 2]).translation_factors())
[1, 1, 1, 1, 1]
sage: list(CartanType(["D", 4, 3]).translation_factors())
[1, 1, 1]
sage: list(CartanType(["E", 6, 2]).translation_factors())
[1, 1, 1, 1, 1]
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> list(CartanType(["A", Integer(1), Integer(1)]).translation_factors())
[1, 1]
>>> list(CartanType(["A", Integer(5), Integer(1)]).translation_factors())
[1, 1, 1, 1, 1, 1]
>>> list(CartanType(["B", Integer(5), Integer(1)]).translation_factors())
[1, 1, 1, 1, 1, 2]
>>> list(CartanType(["C", Integer(5), Integer(1)]).translation_factors())
[1, 2, 2, 2, 2, 1]
>>> list(CartanType(["D", Integer(5), Integer(1)]).translation_factors())
[1, 1, 1, 1, 1, 1]
>>> list(CartanType(["E", Integer(6), Integer(1)]).translation_factors())
[1, 1, 1, 1, 1, 1, 1]
>>> list(CartanType(["E", Integer(7), Integer(1)]).translation_factors())
[1, 1, 1, 1, 1, 1, 1, 1]
>>> list(CartanType(["E", Integer(8), Integer(1)]).translation_factors())
[1, 1, 1, 1, 1, 1, 1, 1, 1]
>>> list(CartanType(["F", Integer(4), Integer(1)]).translation_factors())
[1, 1, 1, 2, 2]
>>> list(CartanType(["G", Integer(2), Integer(1)]).translation_factors())
[1, 3, 1]
>>> list(CartanType(["A", Integer(2), Integer(2)]).translation_factors())
[1, 1/2]
>>> list(CartanType(["A", Integer(2), Integer(2)]).dual().translation_
↪factors())
[1/2, 1]
>>> list(CartanType(["A", Integer(10), Integer(2)]).translation_factors())
[1, 1, 1, 1, 1, 1/2]
>>> list(CartanType(["A", Integer(10), Integer(2)]).dual().translation_
↪factors())
[1/2, 1, 1, 1, 1, 1]
>>> list(CartanType(["A", Integer(9), Integer(2)]).translation_factors())
[1, 1, 1, 1, 1, 1]
>>> list(CartanType(["D", Integer(5), Integer(2)]).translation_factors())
[1, 1, 1, 1, 1]
>>> list(CartanType(["D", Integer(4), Integer(3)]).translation_factors())
[1, 1, 1]
>>> list(CartanType(["E", Integer(6), Integer(2)]).translation_factors())
[1, 1, 1, 1, 1]
```

We conclude with a discussion of the appropriate value for affine type BC. Let us consider the alcove picture realized in the weight lattice. It is obtained by taking the level-1 affine hyperplane in the weight lattice, and projecting it along Λ_0:

```
sage: R = RootSystem(["BC",2,2])
sage: alpha = R.weight_space().simple_roots()                              #␣
↪needs sage.graphs
sage: alphacheck = R.coroot_space().simple_roots()
sage: Lambda = R.weight_space().fundamental_weights()
```

```
>>> from sage.all import *
>>> R = RootSystem(["BC",Integer(2),Integer(2)])
```

(continues on next page)

(continued from previous page)

```
>>> alpha = R.weight_space().simple_roots()                                    #␣
↪needs sage.graphs
>>> alphacheck = R.coroot_space().simple_roots()
>>> Lambda = R.weight_space().fundamental_weights()
```

Here are the levels of the fundamental weights:

```
sage: Lambda[0].level(), Lambda[1].level(), Lambda[2].level()                  #␣
↪needs sage.graphs
(1, 2, 2)
```

```
>>> from sage.all import *
>>> Lambda[Integer(0)].level(), Lambda[Integer(1)].level(),␣
↪Lambda[Integer(2)].level()                         # needs sage.graphs
(1, 2, 2)
```

So the "center" of the fundamental polygon at level 1 is:

```
sage: O = Lambda[0]
sage: O.level()                                                                #␣
↪needs sage.graphs
1
```

```
>>> from sage.all import *
>>> O = Lambda[Integer(0)]
>>> O.level()                                                                  #␣
↪needs sage.graphs
1
```

We take the projection ω_1 at level 0 of Λ_1 as unit vector on the x-axis, and the projection ω_2 at level 0 of Λ_2 as unit vector of the y-axis:

```
sage: omega1 = Lambda[1] - 2*Lambda[0]
sage: omega2 = Lambda[2] - 2*Lambda[0]
sage: omega1.level(), omega2.level()                                           #␣
↪needs sage.graphs
(0, 0)
```

```
>>> from sage.all import *
>>> omega1 = Lambda[Integer(1)] - Integer(2)*Lambda[Integer(0)]
>>> omega2 = Lambda[Integer(2)] - Integer(2)*Lambda[Integer(0)]
>>> omega1.level(), omega2.level()                                             #␣
↪needs sage.graphs
(0, 0)
```

The projections of the simple roots can be read off:

```
sage: alpha[0]                                                                 #␣
↪needs sage.graphs
2*Lambda[0] - Lambda[1]
sage: alpha[1]                                                                 #␣
↪needs sage.graphs
```

(continues on next page)

(continued from previous page)

```
-2*Lambda[0] + 2*Lambda[1] - Lambda[2]
sage: alpha[2]                                                                    #␣
↪needs sage.graphs
-2*Lambda[1] + 2*Lambda[2]
```

```
>>> from sage.all import *
>>> alpha[Integer(0)]                                                             ␣
↪     # needs sage.graphs
2*Lambda[0] - Lambda[1]
>>> alpha[Integer(1)]                                                             ␣
↪     # needs sage.graphs
-2*Lambda[0] + 2*Lambda[1] - Lambda[2]
>>> alpha[Integer(2)]                                                             ␣
↪     # needs sage.graphs
-2*Lambda[1] + 2*Lambda[2]
```

Namely $\alpha_0 = -\omega_1$, $\alpha_1 = 2\omega_1 - \omega_2$ and $\alpha_2 = -2\omega_1 + 2\omega_2$.

The reflection hyperplane defined by $\alpha_0^\vee$ goes through the points $O + 1/2\omega_1$ and $O + 1/2\omega_2$:

```
sage: (O+(1/2)*omega1).scalar(alphacheck[0])
0
sage: (O+(1/2)*omega2).scalar(alphacheck[0])
0
```

```
>>> from sage.all import *
>>> (O+(Integer(1)/Integer(2))*omega1).scalar(alphacheck[Integer(0)])
0
>>> (O+(Integer(1)/Integer(2))*omega2).scalar(alphacheck[Integer(0)])
0
```

Hence, the fundamental alcove is the triangle $(O, O + 1/2\omega_1, O + 1/2\omega_2)$. By successive reflections, one can tile the full plane. This induces a tiling of the full plane by translates of the fundamental polygon.

Todo

Add the picture here, once root system plots in the weight lattice will be implemented. In the mean time, the reader may look up the dual picture on Figure 2 of [HST09] which was produced by MuPAD-Combinat.

From this picture, one can read that translations by α_0, α_1, and $1/2\alpha_2$ map the fundamental polygon to translates of it in the alcove picture, and are smallest with this property. Hence, the translation factors for affine type BC are $t_0 = 1, t_1 = 1, t_2 = 1/2$:

```
sage: CartanType(['BC',2,2]).translation_factors()                                #␣
↪needs sage.graphs
Finite family {0: 1, 1: 1, 2: 1/2}
```

```
>>> from sage.all import *
>>> CartanType(['BC',Integer(2),Integer(2)]).translation_factors()                ␣
↪             # needs sage.graphs
Finite family {0: 1, 1: 1, 2: 1/2}
```

REFERENCES:

class sage.combinat.root_system.cartan_type.**CartanType_crystallographic**

Bases: *CartanType_abstract*

An abstract class for crystallographic Cartan types.

ascii_art(*label='lambda x: x'*, *node=None*)

Return an ascii art representation of the Dynkin diagram.

INPUT:

- label – (default: the identity) a relabeling function for the nodes
- node – (optional) a function which returns the character for a node

EXAMPLES:

```
sage: cartan_type = CartanType(['B',5,1])
sage: print(cartan_type.ascii_art())
    O 0
    |
    |
O---O---O---O=>=O
1   2   3   4   5
```

```
>>> from sage.all import *
>>> cartan_type = CartanType(['B',Integer(5),Integer(1)])
>>> print(cartan_type.ascii_art())
    O 0
    |
    |
O---O---O---O=>=O
1   2   3   4   5
```

The label option is useful to visualize various statistics on the nodes of the Dynkin diagram:

```
sage: a = cartan_type.col_annihilator(); a                                    #␣
↪needs sage.graphs
Finite family {0: 1, 1: 1, 2: 2, 3: 2, 4: 2, 5: 2}
sage: print(CartanType(['B',5,1]).ascii_art(label=a.__getitem__))             #␣
↪needs sage.graphs
    O 1
    |
    |
O---O---O---O=>=O
1   2   2   2   2
```

```
>>> from sage.all import *
>>> a = cartan_type.col_annihilator(); a                                    #␣
↪needs sage.graphs
Finite family {0: 1, 1: 1, 2: 2, 3: 2, 4: 2, 5: 2}
>>> print(CartanType(['B',Integer(5),Integer(1)]).ascii_art(label=a.__getitem_
↪_))           # needs sage.graphs
    O 1
    |
```

(continues on next page)

(continued from previous page)

```
    |
O---O---O---O=>=O
1   2   2   2   2
```

cartan_matrix()

Return the Cartan matrix associated with `self`.

EXAMPLES:

```
sage: CartanType(['A',4]).cartan_matrix()                                    #␣
↪needs sage.graphs
[ 2 -1  0  0]
[-1  2 -1  0]
[ 0 -1  2 -1]
[ 0  0 -1  2]
```

```
>>> from sage.all import *
>>> CartanType(['A',Integer(4)]).cartan_matrix()                            ␣
↪     # needs sage.graphs
[ 2 -1  0  0]
[-1  2 -1  0]
[ 0 -1  2 -1]
[ 0  0 -1  2]
```

coxeter_diagram()

Return the Coxeter diagram for `self`.

This implementation constructs it from the Dynkin diagram.

> **See also**
>
> *CartanType_abstract.coxeter_diagram()*

EXAMPLES:

```
sage: # needs sage.graphs
sage: CartanType(['A',3]).coxeter_diagram()
Graph on 3 vertices
sage: CartanType(['A',3]).coxeter_diagram().edges(sort=True)
[(1, 2, 3), (2, 3, 3)]
sage: CartanType(['B',3]).coxeter_diagram().edges(sort=True)
[(1, 2, 3), (2, 3, 4)]
sage: CartanType(['G',2]).coxeter_diagram().edges(sort=True)
[(1, 2, 6)]
sage: CartanType(['F',4]).coxeter_diagram().edges(sort=True)
[(1, 2, 3), (2, 3, 4), (3, 4, 3)]
sage: CartanType(['A',2,2]).coxeter_diagram().edges(sort=True)
[(0, 1, +Infinity)]
```

```
>>> from sage.all import *
>>> # needs sage.graphs
```

(continues on next page)

(continued from previous page)

```
>>> CartanType(['A',Integer(3)]).coxeter_diagram()
Graph on 3 vertices
>>> CartanType(['A',Integer(3)]).coxeter_diagram().edges(sort=True)
[(1, 2, 3), (2, 3, 3)]
>>> CartanType(['B',Integer(3)]).coxeter_diagram().edges(sort=True)
[(1, 2, 3), (2, 3, 4)]
>>> CartanType(['G',Integer(2)]).coxeter_diagram().edges(sort=True)
[(1, 2, 6)]
>>> CartanType(['F',Integer(4)]).coxeter_diagram().edges(sort=True)
[(1, 2, 3), (2, 3, 4), (3, 4, 3)]
>>> CartanType(['A',Integer(2),Integer(2)]).coxeter_diagram().edges(sort=True)
[(0, 1, +Infinity)]
```

dynkin_diagram()

Return the Dynkin diagram associated with `self`.

EXAMPLES:

```
sage: CartanType(['A',4]).dynkin_diagram()                              #␣
↪needs sage.graphs
O---O---O---O
1   2   3   4
A4
```

```
>>> from sage.all import *
>>> CartanType(['A',Integer(4)]).dynkin_diagram()                       ␣
↪     # needs sage.graphs
O---O---O---O
1   2   3   4
A4
```

> **Note**
>
> Derived subclasses should typically implement this as a cached method.

index_set_bipartition()

Return a bipartition $\{L, R\}$ of the vertices of the Dynkin diagram.

For i and j both in L (or both in R), the simple reflections s_i and s_j commute.

Of course, the Dynkin diagram should be bipartite. This is always the case for all finite types.

EXAMPLES:

```
sage: CartanType(['A',5]).index_set_bipartition()                       #␣
↪needs sage.graphs
({1, 3, 5}, {2, 4})

sage: CartanType(['A',2,1]).index_set_bipartition()                     #␣
↪needs sage.graphs
Traceback (most recent call last):
...
ValueError: the Dynkin diagram must be bipartite
```

```
>>> from sage.all import *
>>> CartanType(['A',Integer(5)]).index_set_bipartition()                    ␣
↪     # needs sage.graphs
({1, 3, 5}, {2, 4})

>>> CartanType(['A',Integer(2),Integer(1)]).index_set_bipartition()         ␣
↪               # needs sage.graphs
Traceback (most recent call last):
...
ValueError: the Dynkin diagram must be bipartite
```

is_crystallographic()

Implement *CartanType_abstract.is_crystallographic()* by returning `True`.

EXAMPLES:

```
sage: CartanType(['A', 3, 1]).is_crystallographic()
True
```

```
>>> from sage.all import *
>>> CartanType(['A', Integer(3), Integer(1)]).is_crystallographic()
True
```

symmetrizer()

Return the symmetrizer of the Cartan matrix of `self`.

A Cartan matrix M is symmetrizable if there exists a non trivial diagonal matrix D such that DM is a symmetric matrix, that is $DM = M^t D$. In that case, D is unique, up to a scalar factor for each connected component of the Dynkin diagram.

This method computes the unique minimal such D with positive integral coefficients. If D exists, it is returned as a family. Otherwise `None` is returned.

The coefficients are coerced to `base_ring`.

EXAMPLES:

```
sage: CartanType(["B",5]).symmetrizer()                                    #␣
↪needs sage.graphs
Finite family {1: 2, 2: 2, 3: 2, 4: 2, 5: 1}
```

```
>>> from sage.all import *
>>> CartanType(["B",Integer(5)]).symmetrizer()                              ␣
↪     # needs sage.graphs
Finite family {1: 2, 2: 2, 3: 2, 4: 2, 5: 1}
```

Here is a neat trick to visualize it better:

```
sage: T = CartanType(["B",5])
sage: print(T.ascii_art(T.symmetrizer().__getitem__))                      #␣
↪needs sage.graphs
O---O---O---O=>=O
2   2   2   2   1

sage: T = CartanType(["BC",5, 2])
```

(continues on next page)

(continued from previous page)

```
sage: print(T.ascii_art(T.symmetrizer().__getitem__))                       #␣
↪needs sage.graphs
O=<=O---O---O---O=<=O
1   2   2   2   2   4
```

```
>>> from sage.all import *
>>> T = CartanType(["B",Integer(5)])
>>> print(T.ascii_art(T.symmetrizer().__getitem__))                       #␣
↪needs sage.graphs
O---O---O---O=>=O
2   2   2   2   1

>>> T = CartanType(["BC",Integer(5), Integer(2)])
>>> print(T.ascii_art(T.symmetrizer().__getitem__))                       #␣
↪needs sage.graphs
O=<=O---O---O---O=<=O
1   2   2   2   2   4
```

Here is the symmetrizer of some reducible Cartan types:

```
sage: T = CartanType(["D", 2])
sage: print(T.ascii_art(T.symmetrizer().__getitem__))                       #␣
↪needs sage.graphs
O   O
1   1

sage: T = CartanType(["B",5],["BC",5, 2])
sage: print(T.ascii_art(T.symmetrizer().__getitem__))                       #␣
↪needs sage.graphs
O---O---O---O=>=O
2   2   2   2   1
O=<=O---O---O---O=<=O
1   2   2   2   2   4
```

```
>>> from sage.all import *
>>> T = CartanType(["D", Integer(2)])
>>> print(T.ascii_art(T.symmetrizer().__getitem__))                       #␣
↪needs sage.graphs
O   O
1   1

>>> T = CartanType(["B",Integer(5)],["BC",Integer(5), Integer(2)])
>>> print(T.ascii_art(T.symmetrizer().__getitem__))                       #␣
↪needs sage.graphs
O---O---O---O=>=O
2   2   2   2   1
O=<=O---O---O---O=<=O
1   2   2   2   2   4
```

Property: up to an overall scalar factor, this gives the norm of the simple roots in the ambient space:

```
sage: T = CartanType(["C",5])
sage: print(T.ascii_art(T.symmetrizer().__getitem__))                          #␣
↪needs sage.graphs
O---O---O---O=<=O
1   1   1   1   2

sage: alpha = RootSystem(T).ambient_space().simple_roots()
sage: print(T.ascii_art(lambda i: alpha[i].scalar(alpha[i])))
O---O---O---O=<=O
2   2   2   2   4
```

```
>>> from sage.all import *
>>> T = CartanType(["C",Integer(5)])
>>> print(T.ascii_art(T.symmetrizer().__getitem__))                          #␣
↪needs sage.graphs
O---O---O---O=<=O
1   1   1   1   2

>>> alpha = RootSystem(T).ambient_space().simple_roots()
>>> print(T.ascii_art(lambda i: alpha[i].scalar(alpha[i])))
O---O---O---O=<=O
2   2   2   2   4
```

class sage.combinat.root_system.cartan_type.**CartanType_decorator**(*ct*)

Bases: UniqueRepresentation, SageObject, *CartanType_abstract*

Concrete base class for Cartan types that decorate another Cartan type.

index_set()

EXAMPLES:

```
sage: ct = CartanType(['F', 4, 1]).dual()
sage: ct.index_set()
(0, 1, 2, 3, 4)
```

```
>>> from sage.all import *
>>> ct = CartanType(['F', Integer(4), Integer(1)]).dual()
>>> ct.index_set()
(0, 1, 2, 3, 4)
```

is_affine()

EXAMPLES:

```
sage: ct = CartanType(['G', 2]).relabel({1:2,2:1})
sage: ct.is_affine()
False
```

```
>>> from sage.all import *
>>> ct = CartanType(['G', Integer(2)]).relabel({Integer(1):Integer(2),
↪Integer(2):Integer(1)})
>>> ct.is_affine()
False
```

is_crystallographic()

EXAMPLES:

```
sage: ct = CartanType(['G', 2]).relabel({1:2,2:1})
sage: ct.is_crystallographic()
True
```

```
>>> from sage.all import *
>>> ct = CartanType(['G', Integer(2)]).relabel({Integer(1):Integer(2),
↪Integer(2):Integer(1)})
>>> ct.is_crystallographic()
True
```

is_finite()

EXAMPLES:

```
sage: ct = CartanType(['G', 2]).relabel({1:2,2:1})
sage: ct.is_finite()
True
```

```
>>> from sage.all import *
>>> ct = CartanType(['G', Integer(2)]).relabel({Integer(1):Integer(2),
↪Integer(2):Integer(1)})
>>> ct.is_finite()
True
```

is_irreducible()

EXAMPLES:

```
sage: ct = CartanType(['G', 2]).relabel({1:2,2:1})
sage: ct.is_irreducible()
True
```

```
>>> from sage.all import *
>>> ct = CartanType(['G', Integer(2)]).relabel({Integer(1):Integer(2),
↪Integer(2):Integer(1)})
>>> ct.is_irreducible()
True
```

rank()

EXAMPLES:

```
sage: ct = CartanType(['G', 2]).relabel({1:2,2:1})
sage: ct.rank()
2
```

```
>>> from sage.all import *
>>> ct = CartanType(['G', Integer(2)]).relabel({Integer(1):Integer(2),
↪Integer(2):Integer(1)})
>>> ct.rank()
2
```

class sage.combinat.root_system.cartan_type.**CartanType_finite**

Bases: *CartanType_abstract*

An abstract class for simple affine Cartan types.

is_affine()

EXAMPLES:

```
sage: CartanType(["A", 3]).is_affine()
False
```

```
>>> from sage.all import *
>>> CartanType(["A", Integer(3)]).is_affine()
False
```

is_finite()

EXAMPLES:

```
sage: CartanType(["A", 3]).is_finite()
True
```

```
>>> from sage.all import *
>>> CartanType(["A", Integer(3)]).is_finite()
True
```

class sage.combinat.root_system.cartan_type.**CartanType_simple**

Bases: *CartanType_abstract*

An abstract class for simple Cartan types.

is_irreducible()

Return whether `self` is irreducible, which is `True`.

EXAMPLES:

```
sage: CartanType(['A', 3]).is_irreducible()
True
```

```
>>> from sage.all import *
>>> CartanType(['A', Integer(3)]).is_irreducible()
True
```

class sage.combinat.root_system.cartan_type.**CartanType_simply_laced**

Bases: *CartanType_crystallographic*

An abstract class for simply laced Cartan types.

dual()

Simply laced Cartan types are self-dual, so return `self`.

EXAMPLES:

```
sage: CartanType(["A", 3]).dual()
['A', 3]
sage: CartanType(["A", 3, 1]).dual()
```

(continues on next page)

(continued from previous page)

```
['A', 3, 1]
sage: CartanType(["D", 3]).dual()
['D', 3]
sage: CartanType(["D", 4, 1]).dual()
['D', 4, 1]
sage: CartanType(["E", 6]).dual()
['E', 6]
sage: CartanType(["E", 6, 1]).dual()
['E', 6, 1]
```

```
>>> from sage.all import *
>>> CartanType(["A", Integer(3)]).dual()
['A', 3]
>>> CartanType(["A", Integer(3), Integer(1)]).dual()
['A', 3, 1]
>>> CartanType(["D", Integer(3)]).dual()
['D', 3]
>>> CartanType(["D", Integer(4), Integer(1)]).dual()
['D', 4, 1]
>>> CartanType(["E", Integer(6)]).dual()
['E', 6]
>>> CartanType(["E", Integer(6), Integer(1)]).dual()
['E', 6, 1]
```

is_simply_laced()

Return whether `self` is simply laced, which is `True`.

EXAMPLES:

```
sage: CartanType(['A',3,1]).is_simply_laced()
True
sage: CartanType(['A',2]).is_simply_laced()
True
```

```
>>> from sage.all import *
>>> CartanType(['A',Integer(3),Integer(1)]).is_simply_laced()
True
>>> CartanType(['A',Integer(2)]).is_simply_laced()
True
```

class sage.combinat.root_system.cartan_type.**CartanType_standard**

Bases: `UniqueRepresentation`, `SageObject`

class sage.combinat.root_system.cartan_type.**CartanType_standard_affine**(*letter*, *n*, *affine=1*)

Bases: *CartanType_standard*, *CartanType_affine*

A concrete class for affine simple Cartan types.

index_set()

Implement *CartanType_abstract.index_set()*.

The index set for all standard affine Cartan types is of the form $\{0, \ldots, n\}$.

EXAMPLES:

```
sage: CartanType(['A', 5, 1]).index_set()
(0, 1, 2, 3, 4, 5)
```

```
>>> from sage.all import *
>>> CartanType(['A', Integer(5), Integer(1)]).index_set()
(0, 1, 2, 3, 4, 5)
```

rank()

Return the rank of `self` which for type $X_n^{(1)}$ is $n + 1$.

EXAMPLES:

```
sage: CartanType(['A', 4, 1]).rank()
5
sage: CartanType(['B', 4, 1]).rank()
5
sage: CartanType(['C', 3, 1]).rank()
4
sage: CartanType(['D', 4, 1]).rank()
5
sage: CartanType(['E', 6, 1]).rank()
7
sage: CartanType(['E', 7, 1]).rank()
8
sage: CartanType(['F', 4, 1]).rank()
5
sage: CartanType(['G', 2, 1]).rank()
3
sage: CartanType(['A', 2, 2]).rank()
2
sage: CartanType(['A', 6, 2]).rank()
4
sage: CartanType(['A', 7, 2]).rank()
5
sage: CartanType(['D', 5, 2]).rank()
5
sage: CartanType(['E', 6, 2]).rank()
5
sage: CartanType(['D', 4, 3]).rank()
3
```

```
>>> from sage.all import *
>>> CartanType(['A', Integer(4), Integer(1)]).rank()
5
>>> CartanType(['B', Integer(4), Integer(1)]).rank()
5
>>> CartanType(['C', Integer(3), Integer(1)]).rank()
4
>>> CartanType(['D', Integer(4), Integer(1)]).rank()
5
>>> CartanType(['E', Integer(6), Integer(1)]).rank()
7
```

(continues on next page)

(continued from previous page)

```
>>> CartanType(['E', Integer(7), Integer(1)]).rank()
8
>>> CartanType(['F', Integer(4), Integer(1)]).rank()
5
>>> CartanType(['G', Integer(2), Integer(1)]).rank()
3
>>> CartanType(['A', Integer(2), Integer(2)]).rank()
2
>>> CartanType(['A', Integer(6), Integer(2)]).rank()
4
>>> CartanType(['A', Integer(7), Integer(2)]).rank()
5
>>> CartanType(['D', Integer(5), Integer(2)]).rank()
5
>>> CartanType(['E', Integer(6), Integer(2)]).rank()
5
>>> CartanType(['D', Integer(4), Integer(3)]).rank()
3
```

special_node()

Implement `CartanType_abstract.special_node()`.

With the standard labelling conventions, 0 is always a special node.

EXAMPLES:

```
sage: CartanType(['A', 3, 1]).special_node()
0
```

```
>>> from sage.all import *
>>> CartanType(['A', Integer(3), Integer(1)]).special_node()
0
```

type()

Return the type of `self`.

EXAMPLES:

```
sage: CartanType(['A', 4, 1]).type()
'A'
```

```
>>> from sage.all import *
>>> CartanType(['A', Integer(4), Integer(1)]).type()
'A'
```

class sage.combinat.root_system.cartan_type.**CartanType_standard_finite**(*letter*, *n*)

Bases: *CartanType_standard*, *CartanType_finite*

A concrete base class for the finite standard Cartan types.

This includes for example A_3, D_4, or E_8.

affine()

Return the corresponding untwisted affine Cartan type.

EXAMPLES:

```
sage: CartanType(['A',3]).affine()
['A', 3, 1]
```

```
>>> from sage.all import *
>>> CartanType(['A',Integer(3)]).affine()
['A', 3, 1]
```

coxeter_number()

Return the Coxeter number associated with `self`.

The Coxeter number is the order of a Coxeter element of the corresponding Weyl group.

See Bourbaki, Lie Groups and Lie Algebras V.6.1 or Wikipedia article Coxeter_element for more information.

EXAMPLES:

```
sage: CartanType(['A',4]).coxeter_number()
5
sage: CartanType(['B',4]).coxeter_number()
8
sage: CartanType(['C',4]).coxeter_number()
8
```

```
>>> from sage.all import *
>>> CartanType(['A',Integer(4)]).coxeter_number()
5
>>> CartanType(['B',Integer(4)]).coxeter_number()
8
>>> CartanType(['C',Integer(4)]).coxeter_number()
8
```

dual_coxeter_number()

Return the Coxeter number associated with `self`.

EXAMPLES:

```
sage: CartanType(['A',4]).dual_coxeter_number()
5
sage: CartanType(['B',4]).dual_coxeter_number()
7
sage: CartanType(['C',4]).dual_coxeter_number()
5
```

```
>>> from sage.all import *
>>> CartanType(['A',Integer(4)]).dual_coxeter_number()
5
>>> CartanType(['B',Integer(4)]).dual_coxeter_number()
7
>>> CartanType(['C',Integer(4)]).dual_coxeter_number()
5
```

index_set()

Implement *CartanType_abstract.index_set()*.

The index set for all standard finite Cartan types is of the form $\{1, \ldots, n\}$. (See *type_I* for a slight abuse of this).

EXAMPLES:

```
sage: CartanType(['A', 5]).index_set()
(1, 2, 3, 4, 5)
```

```
>>> from sage.all import *
>>> CartanType(['A', Integer(5)]).index_set()
(1, 2, 3, 4, 5)
```

opposition_automorphism()

Return the opposition automorphism.

The *opposition automorphism* is the automorphism $i \mapsto i^*$ of the vertices Dynkin diagram such that, for w_0 the longest element of the Weyl group, and any simple root α_i, one has $\alpha_{i^*} = -w_0(\alpha_i)$.

The automorphism is returned as a Family.

EXAMPLES:

```
sage: ct = CartanType(['A', 5])
sage: ct.opposition_automorphism()                                          #␣
↪needs sage.libs.gap
Finite family {1: 5, 2: 4, 3: 3, 4: 2, 5: 1}

sage: ct = CartanType(['D', 4])
sage: ct.opposition_automorphism()                                          #␣
↪needs sage.libs.gap
Finite family {1: 1, 2: 2, 3: 3, 4: 4}

sage: ct = CartanType(['D', 5])
sage: ct.opposition_automorphism()                                          #␣
↪needs sage.libs.gap
Finite family {1: 1, 2: 2, 3: 3, 4: 5, 5: 4}

sage: ct = CartanType(['C', 4])
sage: ct.opposition_automorphism()                                          #␣
↪needs sage.libs.gap
Finite family {1: 1, 2: 2, 3: 3, 4: 4}
```

```
>>> from sage.all import *
>>> ct = CartanType(['A', Integer(5)])
>>> ct.opposition_automorphism()                                          #␣
↪needs sage.libs.gap
Finite family {1: 5, 2: 4, 3: 3, 4: 2, 5: 1}

>>> ct = CartanType(['D', Integer(4)])
>>> ct.opposition_automorphism()                                          #␣
↪needs sage.libs.gap
Finite family {1: 1, 2: 2, 3: 3, 4: 4}
```

(continues on next page)

(continued from previous page)

```
>>> ct = CartanType(['D', Integer(5)])
>>> ct.opposition_automorphism()                                    #␣
↪needs sage.libs.gap
Finite family {1: 1, 2: 2, 3: 3, 4: 5, 5: 4}

>>> ct = CartanType(['C', Integer(4)])
>>> ct.opposition_automorphism()                                    #␣
↪needs sage.libs.gap
Finite family {1: 1, 2: 2, 3: 3, 4: 4}
```

rank()

Return the rank of `self` which for type X_n is n.

EXAMPLES:

```
sage: CartanType(['A', 3]).rank()
3
sage: CartanType(['B', 3]).rank()
3
sage: CartanType(['C', 3]).rank()
3
sage: CartanType(['D', 4]).rank()
4
sage: CartanType(['E', 6]).rank()
6
```

```
>>> from sage.all import *
>>> CartanType(['A', Integer(3)]).rank()
3
>>> CartanType(['B', Integer(3)]).rank()
3
>>> CartanType(['C', Integer(3)]).rank()
3
>>> CartanType(['D', Integer(4)]).rank()
4
>>> CartanType(['E', Integer(6)]).rank()
6
```

type()

Return the type of `self`.

EXAMPLES:

```
sage: CartanType(['A', 4]).type()
'A'
sage: CartanType(['A', 4, 1]).type()
'A'
```

```
>>> from sage.all import *
>>> CartanType(['A', Integer(4)]).type()
'A'
```

(continues on next page)

(continued from previous page)

```
>>> CartanType(['A', Integer(4), Integer(1)]).type()
'A'
```

class sage.combinat.root_system.cartan_type.**CartanType_standard_untwisted_affine**(*letter*, *n*, *affine=1*)

Bases: *CartanType_standard_affine*

A concrete class for the standard untwisted affine Cartan types.

basic_untwisted()

Return the basic_untwisted Cartan type associated with this affine Cartan type.

Given an affine type $X_n^{(r)}$, the basic_untwisted type is X_n. In other words, it is the classical Cartan type that is twisted to obtain self.

EXAMPLES:

```
sage: CartanType(['A', 1, 1]).basic_untwisted()
['A', 1]
sage: CartanType(['A', 3, 1]).basic_untwisted()
['A', 3]
sage: CartanType(['B', 3, 1]).basic_untwisted()
['B', 3]
sage: CartanType(['E', 6, 1]).basic_untwisted()
['E', 6]
sage: CartanType(['G', 2, 1]).basic_untwisted()
['G', 2]
```

```
>>> from sage.all import *
>>> CartanType(['A', Integer(1), Integer(1)]).basic_untwisted()
['A', 1]
>>> CartanType(['A', Integer(3), Integer(1)]).basic_untwisted()
['A', 3]
>>> CartanType(['B', Integer(3), Integer(1)]).basic_untwisted()
['B', 3]
>>> CartanType(['E', Integer(6), Integer(1)]).basic_untwisted()
['E', 6]
>>> CartanType(['G', Integer(2), Integer(1)]).basic_untwisted()
['G', 2]
```

classical()

Return the classical Cartan type associated with self.

EXAMPLES:

```
sage: CartanType(['A', 3, 1]).classical()
['A', 3]
sage: CartanType(['B', 3, 1]).classical()
['B', 3]
sage: CartanType(['C', 3, 1]).classical()
['C', 3]
sage: CartanType(['D', 4, 1]).classical()
['D', 4]
sage: CartanType(['E', 6, 1]).classical()
```

(continues on next page)

(continued from previous page)

```
['E', 6]
sage: CartanType(['F', 4, 1]).classical()
['F', 4]
sage: CartanType(['G', 2, 1]).classical()
['G', 2]
```

```
>>> from sage.all import *
>>> CartanType(['A', Integer(3), Integer(1)]).classical()
['A', 3]
>>> CartanType(['B', Integer(3), Integer(1)]).classical()
['B', 3]
>>> CartanType(['C', Integer(3), Integer(1)]).classical()
['C', 3]
>>> CartanType(['D', Integer(4), Integer(1)]).classical()
['D', 4]
>>> CartanType(['E', Integer(6), Integer(1)]).classical()
['E', 6]
>>> CartanType(['F', Integer(4), Integer(1)]).classical()
['F', 4]
>>> CartanType(['G', Integer(2), Integer(1)]).classical()
['G', 2]
```

is_untwisted_affine()

Implement `CartanType_affine.is_untwisted_affine()` by returning `True`.

EXAMPLES:

```
sage: CartanType(['B', 3, 1]).is_untwisted_affine()
True
```

```
>>> from sage.all import *
>>> CartanType(['B', Integer(3), Integer(1)]).is_untwisted_affine()
True
```

class sage.combinat.root_system.cartan_type.**SuperCartanType_standard**

Bases: `UniqueRepresentation`, `SageObject`

options = Current options for CartanType - dual_latex: \vee - dual_str: * - latex_marked: True - latex_relabel: True - mark_special_node: none - marked_node_str: X - notation: Stembridge - special_node_str: @

5.1.227 Coxeter Groups

sage.combinat.root_system.coxeter_group.**CoxeterGroup**(*data*, *implementation='reflection'*, *base_ring=None*, *index_set=None*)

Return an implementation of the Coxeter group given by `data`.

INPUT:

- `data` – a Cartan type (or coercible into; see `CartanType`) or a Coxeter matrix or graph
- `implementation` – (default: `'reflection'`) can be one of the following:
  - `'permutation'` – as a permutation representation

- 'matrix' – as a Weyl group (as a matrix group acting on the root space); if this is not implemented, this uses the "reflection" implementation
- 'coxeter3' – using the coxeter3 package
- 'reflection' – as elements in the reflection representation; see CoxeterMatrixGroup

* base_ring – (optional) the base ring for the 'reflection' implementation
* index_set – (optional) the index set for the 'reflection' implementation

EXAMPLES:

Now assume that data represents a Cartan type. If implementation is not specified, the reflection representation is returned:

```
sage: W = CoxeterGroup(["A",2]); W                                          #␣
↪needs sage.libs.gap
Finite Coxeter group over Integer Ring with Coxeter matrix:
[1 3]
[3 1]

sage: W = CoxeterGroup(["A",3,1]); W                                        #␣
↪needs sage.libs.gap
Coxeter group over Integer Ring with Coxeter matrix:
[1 3 2 3]
[3 1 3 2]
[2 3 1 3]
[3 2 3 1]

sage: W = CoxeterGroup(['H',3]); W                                          #␣
↪needs sage.libs.gap
Finite Coxeter group over Number Field in a with defining polynomial x^2 - 5
 with a = 2.236067977499790? with Coxeter matrix:
[1 3 2]
[3 1 5]
[2 5 1]
```

```
>>> from sage.all import *
>>> W = CoxeterGroup(["A",Integer(2)]); W                                    ␣
↪     # needs sage.libs.gap
Finite Coxeter group over Integer Ring with Coxeter matrix:
[1 3]
[3 1]

>>> W = CoxeterGroup(["A",Integer(3),Integer(1)]); W                         ␣
↪              # needs sage.libs.gap
Coxeter group over Integer Ring with Coxeter matrix:
[1 3 2 3]
[3 1 3 2]
[2 3 1 3]
[3 2 3 1]

>>> W = CoxeterGroup(['H',Integer(3)]); W                                    ␣
↪     # needs sage.libs.gap
Finite Coxeter group over Number Field in a with defining polynomial x^2 - 5
```

(continues on next page)

(continued from previous page)

```
 with a = 2.236067977499790? with Coxeter matrix:
[1 3 2]
[3 1 5]
[2 5 1]
```

We now use the `implementation` option:

```
sage: W = CoxeterGroup(["A",2], implementation='permutation'); W    # optional -␣
↪gap3
Permutation Group with generators [(1,4)(2,3)(5,6), (1,3)(2,5)(4,6)]
sage: W.category()                                                  # optional -␣
↪gap3
Join of Category of finite enumerated permutation groups
    and Category of finite Weyl groups
    and Category of well generated finite irreducible complex reflection groups

sage: W = CoxeterGroup(["A",2], implementation='matrix'); W                   #␣
↪needs sage.libs.gap
Weyl Group of type ['A', 2] (as a matrix group acting on the ambient space)

sage: W = CoxeterGroup(["H",3], implementation='matrix'); W                   #␣
↪needs sage.libs.gap sage.rings.number_field
Finite Coxeter group over Number Field in a with defining polynomial x^2 - 5
 with a = 2.236067977499790? with Coxeter matrix:
[1 3 2]
[3 1 5]
[2 5 1]

sage: W = CoxeterGroup(["H",3], implementation='reflection'); W               #␣
↪needs sage.libs.gap sage.rings.number_field
Finite Coxeter group over Number Field in a with defining polynomial x^2 - 5
 with a = 2.236067977499790? with Coxeter matrix:
[1 3 2]
[3 1 5]
[2 5 1]

sage: W = CoxeterGroup(["A",4,1], implementation='permutation')               #␣
↪needs sage.libs.gap
Traceback (most recent call last):
...
ValueError: the type must be finite

sage: W = CoxeterGroup(["A",4], implementation='chevie'); W         # optional -␣
↪gap3
Irreducible real reflection group of rank 4 and type A4
```

```
>>> from sage.all import *
>>> W = CoxeterGroup(["A",Integer(2)], implementation='permutation'); W    #␣
↪optional - gap3
Permutation Group with generators [(1,4)(2,3)(5,6), (1,3)(2,5)(4,6)]
>>> W.category()                                                  # optional -␣
↪gap3
```

(continues on next page)

(continued from previous page)

```
Join of Category of finite enumerated permutation groups
    and Category of finite Weyl groups
    and Category of well generated finite irreducible complex reflection groups

>>> W = CoxeterGroup(["A",Integer(2)], implementation='matrix'); W                  ␣
↪     # needs sage.libs.gap
Weyl Group of type ['A', 2] (as a matrix group acting on the ambient space)

>>> W = CoxeterGroup(["H",Integer(3)], implementation='matrix'); W                  ␣
↪     # needs sage.libs.gap sage.rings.number_field
Finite Coxeter group over Number Field in a with defining polynomial x^2 - 5
 with a = 2.236067977499790? with Coxeter matrix:
[1 3 2]
[3 1 5]
[2 5 1]

>>> W = CoxeterGroup(["H",Integer(3)], implementation='reflection'); W              ␣
↪     # needs sage.libs.gap sage.rings.number_field
Finite Coxeter group over Number Field in a with defining polynomial x^2 - 5
 with a = 2.236067977499790? with Coxeter matrix:
[1 3 2]
[3 1 5]
[2 5 1]

>>> W = CoxeterGroup(["A",Integer(4),Integer(1)], implementation='permutation')  ␣
↪              # needs sage.libs.gap
Traceback (most recent call last):
...
ValueError: the type must be finite

>>> W = CoxeterGroup(["A",Integer(4)], implementation='chevie'); W          #␣
↪optional - gap3
Irreducible real reflection group of rank 4 and type A4
```

We use the different options for the “reflection” implementation:

```
sage: W = CoxeterGroup(["H",3], implementation='reflection', base_ring=RR); W    #␣
↪needs sage.libs.gap
Finite Coxeter group over Real Field with 53 bits of precision with Coxeter␣
↪matrix:
[1 3 2]
[3 1 5]
[2 5 1]
sage: W = CoxeterGroup([[1,10],[10,1]], implementation='reflection',            #␣
↪needs sage.symbolics
....:                  index_set=['a','b'], base_ring=SR); W
Finite Coxeter group over Symbolic Ring with Coxeter matrix:
[ 1 10]
[10  1]
```

```
>>> from sage.all import *
>>> W = CoxeterGroup(["H",Integer(3)], implementation='reflection', base_ring=RR);
```

(continues on next page)

(continued from previous page)

```
↪ W   # needs sage.libs.gap
Finite Coxeter group over Real Field with 53 bits of precision with Coxeter␣
↪matrix:
[1 3 2]
[3 1 5]
[2 5 1]
>>> W = CoxeterGroup([[Integer(1),Integer(10)],[Integer(10),Integer(1)]],␣
↪implementation='reflection',            # needs sage.symbolics
...                      index_set=['a','b'], base_ring=SR); W
Finite Coxeter group over Symbolic Ring with Coxeter matrix:
[ 1 10]
[10  1]
```

5.1.228 Coxeter Matrices

class sage.combinat.root_system.coxeter_matrix.**CoxeterMatrix**(*parent*, *data*, *coxeter_type*, *index_set*)

Bases: *CoxeterType*

A Coxeter matrix.

A Coxeter matrix $M = (m_{ij})_{i,j \in I}$ is a matrix encoding a Coxeter system (W, S), where the relations are given by $(s_i s_j)^{m_{ij}}$. Thus M is symmetric and has entries in $\{1, 2, 3, \ldots, \infty\}$ with $m_{ij} = 1$ if and only if $i = j$.

We represent $m_{ij} = \infty$ by any number $m_{ij} \leq -1$. In particular, we can construct a bilinear form $B = (b_{ij})_{i,j \in I}$ from M by

$$b_{ij} = \begin{cases} m_{ij} & m_{ij} < 0 \text{ (i.e., } m_{ij} = \infty\text{)}, \\ -\cos\left(\frac{\pi}{m_{ij}}\right) & \text{otherwise.} \end{cases}$$

EXAMPLES:

```
sage: CoxeterMatrix(['A', 4])
[1 3 2 2]
[3 1 3 2]
[2 3 1 3]
[2 2 3 1]
sage: CoxeterMatrix(['B', 4])
[1 3 2 2]
[3 1 3 2]
[2 3 1 4]
[2 2 4 1]
sage: CoxeterMatrix(['C', 4])
[1 3 2 2]
[3 1 3 2]
[2 3 1 4]
[2 2 4 1]
sage: CoxeterMatrix(['D', 4])
[1 3 2 2]
[3 1 3 3]
[2 3 1 2]
[2 3 2 1]
```

(continues on next page)

(continued from previous page)

```
sage: CoxeterMatrix(['E', 6])
[1 2 3 2 2 2]
[2 1 2 3 2 2]
[3 2 1 3 2 2]
[2 3 3 1 3 2]
[2 2 2 3 1 3]
[2 2 2 2 3 1]

sage: CoxeterMatrix(['F', 4])
[1 3 2 2]
[3 1 4 2]
[2 4 1 3]
[2 2 3 1]

sage: CoxeterMatrix(['G', 2])
[1 6]
[6 1]
```

```
>>> from sage.all import *
>>> CoxeterMatrix(['A', Integer(4)])
[1 3 2 2]
[3 1 3 2]
[2 3 1 3]
[2 2 3 1]
>>> CoxeterMatrix(['B', Integer(4)])
[1 3 2 2]
[3 1 3 2]
[2 3 1 4]
[2 2 4 1]
>>> CoxeterMatrix(['C', Integer(4)])
[1 3 2 2]
[3 1 3 2]
[2 3 1 4]
[2 2 4 1]
>>> CoxeterMatrix(['D', Integer(4)])
[1 3 2 2]
[3 1 3 3]
[2 3 1 2]
[2 3 2 1]

>>> CoxeterMatrix(['E', Integer(6)])
[1 2 3 2 2 2]
[2 1 2 3 2 2]
[3 2 1 3 2 2]
[2 3 3 1 3 2]
[2 2 2 3 1 3]
[2 2 2 2 3 1]

>>> CoxeterMatrix(['F', Integer(4)])
[1 3 2 2]
[3 1 4 2]
[2 4 1 3]
```

(continues on next page)

(continued from previous page)

```
[2 2 3 1]

>>> CoxeterMatrix(['G', Integer(2)])
[1 6]
[6 1]
```

By default, entries representing ∞ are given by -1 in the Coxeter matrix:

```
sage: G = Graph([(0,1,None), (1,2,4), (0,2,oo)])
sage: CoxeterMatrix(G)
[ 1  3 -1]
[ 3  1  4]
[-1  4  1]
```

```
>>> from sage.all import *
>>> G = Graph([(Integer(0),Integer(1),None), (Integer(1),Integer(2),Integer(4)),␣
↪(Integer(0),Integer(2),oo)])
>>> CoxeterMatrix(G)
[ 1  3 -1]
[ 3  1  4]
[-1  4  1]
```

It is possible to give a number ≤ -1 to represent an infinite label:

```
sage: CoxeterMatrix([[1,-1],[-1,1]])
[ 1 -1]
[-1  1]
sage: CoxeterMatrix([[1,-3/2],[-3/2,1]])
[   1 -3/2]
[-3/2    1]
```

```
>>> from sage.all import *
>>> CoxeterMatrix([[Integer(1),-Integer(1)],[-Integer(1),Integer(1)]])
[ 1 -1]
[-1  1]
>>> CoxeterMatrix([[Integer(1),-Integer(3)/Integer(2)],[-Integer(3)/Integer(2),
↪Integer(1)]])
[   1 -3/2]
[-3/2    1]
```

bilinear_form(*R=None*)

Return the bilinear form of `self`.

EXAMPLES:

```
sage: # needs sage.libs.gap
sage: CoxeterType(['A', 2, 1]).bilinear_form()
[   1 -1/2 -1/2]
[-1/2    1 -1/2]
[-1/2 -1/2    1]
sage: CoxeterType(['H', 3]).bilinear_form()
[                      1                    -1/2                       0]
```

(continues on next page)

(continued from previous page)

```
[                    -1/2                       1 1/2*E(5)^2 + 1/2*E(5)^3]
[                       0 1/2*E(5)^2 + 1/2*E(5)^3                       1]
sage: C = CoxeterMatrix([[1,-1,-1],[-1,1,-1],[-1,-1,1]])
sage: C.bilinear_form()
[ 1 -1 -1]
[-1  1 -1]
[-1 -1  1]
```

```
>>> from sage.all import *
>>> # needs sage.libs.gap
>>> CoxeterType(['A', Integer(2), Integer(1)]).bilinear_form()
[   1 -1/2 -1/2]
[-1/2    1 -1/2]
[-1/2 -1/2    1]
>>> CoxeterType(['H', Integer(3)]).bilinear_form()
[                       1                    -1/2                       0]
[                    -1/2                       1 1/2*E(5)^2 + 1/2*E(5)^3]
[                       0 1/2*E(5)^2 + 1/2*E(5)^3                       1]
>>> C = CoxeterMatrix([[Integer(1),-Integer(1),-Integer(1)],[-Integer(1),
↪Integer(1),-Integer(1)],[-Integer(1),-Integer(1),Integer(1)]])
>>> C.bilinear_form()
[ 1 -1 -1]
[-1  1 -1]
[-1 -1  1]
```

coxeter_graph()

Return the Coxeter graph of `self`.

EXAMPLES:

```
sage: C = CoxeterMatrix(['A',3])
sage: C.coxeter_graph()
Graph on 3 vertices

sage: C = CoxeterMatrix([['A',3],['A',1]])
sage: C.coxeter_graph()
Graph on 4 vertices
```

```
>>> from sage.all import *
>>> C = CoxeterMatrix(['A',Integer(3)])
>>> C.coxeter_graph()
Graph on 3 vertices

>>> C = CoxeterMatrix([['A',Integer(3)],['A',Integer(1)]])
>>> C.coxeter_graph()
Graph on 4 vertices
```

coxeter_matrix()

Return the Coxeter matrix of `self`.

EXAMPLES:

```
sage: CoxeterMatrix(['C',3]).coxeter_matrix()
[1 3 2]
[3 1 4]
[2 4 1]
```

```
>>> from sage.all import *
>>> CoxeterMatrix(['C',Integer(3)]).coxeter_matrix()
[1 3 2]
[3 1 4]
[2 4 1]
```

coxeter_type()

Return the Coxeter type of `self` or `self` if unknown.

EXAMPLES:

```
sage: C = CoxeterMatrix(['A',4,1])
sage: C.coxeter_type()
Coxeter type of ['A', 4, 1]
```

```
>>> from sage.all import *
>>> C = CoxeterMatrix(['A',Integer(4),Integer(1)])
>>> C.coxeter_type()
Coxeter type of ['A', 4, 1]
```

If the Coxeter type is unknown:

```
sage: C = CoxeterMatrix([[1,3,4], [3,1,-1], [4,-1,1]])
sage: C.coxeter_type()
[ 1  3  4]
[ 3  1 -1]
[ 4 -1  1]
```

```
>>> from sage.all import *
>>> C = CoxeterMatrix([[Integer(1),Integer(3),Integer(4)], [Integer(3),
↪Integer(1),-Integer(1)], [Integer(4),-Integer(1),Integer(1)]])
>>> C.coxeter_type()
[ 1  3  4]
[ 3  1 -1]
[ 4 -1  1]
```

index_set()

Return the index set of `self`.

EXAMPLES:

```
sage: C = CoxeterMatrix(['A',1,1])
sage: C.index_set()
(0, 1)
sage: C = CoxeterMatrix(['E',6])
sage: C.index_set()
(1, 2, 3, 4, 5, 6)
```

```
>>> from sage.all import *
>>> C = CoxeterMatrix(['A',Integer(1),Integer(1)])
>>> C.index_set()
(0, 1)
>>> C = CoxeterMatrix(['E',Integer(6)])
>>> C.index_set()
(1, 2, 3, 4, 5, 6)
```

is_affine()

Return if `self` is an affine type or `False` if unknown.

EXAMPLES:

```
sage: M = CoxeterMatrix(['C',4])
sage: M.is_affine()
False
sage: M = CoxeterMatrix(['D',4,1])
sage: M.is_affine()
True
sage: M = CoxeterMatrix([[1, 3],[3,1]])
sage: M.is_affine()
False
sage: M = CoxeterMatrix([[1, -1, 7], [-1, 1, 3], [7, 3, 1]])
sage: M.is_affine()
False
```

```
>>> from sage.all import *
>>> M = CoxeterMatrix(['C',Integer(4)])
>>> M.is_affine()
False
>>> M = CoxeterMatrix(['D',Integer(4),Integer(1)])
>>> M.is_affine()
True
>>> M = CoxeterMatrix([[Integer(1), Integer(3)],[Integer(3),Integer(1)]])
>>> M.is_affine()
False
>>> M = CoxeterMatrix([[Integer(1), -Integer(1), Integer(7)], [-Integer(1),␣
↪Integer(1), Integer(3)], [Integer(7), Integer(3), Integer(1)]])
>>> M.is_affine()
False
```

is_crystallographic()

Return whether `self` is crystallographic.

A Coxeter matrix is crystallographic if all non-diagonal entries are either 2, 3, 4, or 6.

EXAMPLES:

```
sage: CoxeterMatrix(['F',4]).is_crystallographic()
True
sage: CoxeterMatrix(['H',3]).is_crystallographic()
False
```

```
>>> from sage.all import *
>>> CoxeterMatrix(['F',Integer(4)]).is_crystallographic()
True
>>> CoxeterMatrix(['H',Integer(3)]).is_crystallographic()
False
```

is_finite()

Return if `self` is a finite type or `False` if unknown.

EXAMPLES:

```
sage: M = CoxeterMatrix(['C',4])
sage: M.is_finite()
True
sage: M = CoxeterMatrix(['D',4,1])
sage: M.is_finite()
False
sage: M = CoxeterMatrix([[1, -1], [-1, 1]])
sage: M.is_finite()
False
```

```
>>> from sage.all import *
>>> M = CoxeterMatrix(['C',Integer(4)])
>>> M.is_finite()
True
>>> M = CoxeterMatrix(['D',Integer(4),Integer(1)])
>>> M.is_finite()
False
>>> M = CoxeterMatrix([[Integer(1), -Integer(1)], [-Integer(1), Integer(1)]])
>>> M.is_finite()
False
```

is_irreducible()

Return whether `self` is irreducible.

A Coxeter matrix is irreducible if the Coxeter graph is connected.

EXAMPLES:

```
sage: CoxeterMatrix([['F',4],['A',1]]).is_irreducible()
False
sage: CoxeterMatrix(['H',3]).is_irreducible()
True
```

```
>>> from sage.all import *
>>> CoxeterMatrix([['F',Integer(4)],['A',Integer(1)]]).is_irreducible()
False
>>> CoxeterMatrix(['H',Integer(3)]).is_irreducible()
True
```

is_simply_laced()

Return if `self` is simply-laced.

A Coxeter matrix is simply-laced if all non-diagonal entries are either 2 or 3.

EXAMPLES:

```
sage: cm = CoxeterMatrix([[1,3,3,3], [3,1,3,3], [3,3,1,3], [3,3,3,1]])
sage: cm.is_simply_laced()
True
```

```
>>> from sage.all import *
>>> cm = CoxeterMatrix([[Integer(1),Integer(3),Integer(3),Integer(3)],␣
↪[Integer(3),Integer(1),Integer(3),Integer(3)], [Integer(3),Integer(3),
↪Integer(1),Integer(3)], [Integer(3),Integer(3),Integer(3),Integer(1)]])
>>> cm.is_simply_laced()
True
```

rank()

Return the rank of `self`.

EXAMPLES:

```
sage: CoxeterMatrix(['C',3]).rank()
3
sage: CoxeterMatrix(["A2","B2","F4"]).rank()
8
```

```
>>> from sage.all import *
>>> CoxeterMatrix(['C',Integer(3)]).rank()
3
>>> CoxeterMatrix(["A2","B2","F4"]).rank()
8
```

relabel(*relabelling*)

Return a relabelled copy of this Coxeter matrix.

INPUT:

- `relabelling` – a function (or dictionary)

OUTPUT:

an isomorphic Coxeter type obtained by relabelling the nodes of the Coxeter graph. Namely, the node with label `i` is relabelled `f(i)` (or, by `f[i]` if `f` is a dictionary).

EXAMPLES:

```
sage: CoxeterMatrix(['F',4]).relabel({ 1:2, 2:3, 3:4, 4:1})
[1 4 2 3]
[4 1 3 2]
[2 3 1 2]
[3 2 2 1]
sage: CoxeterMatrix(['F',4]).relabel(lambda x: x+1 if x<4 else 1)
[1 4 2 3]
[4 1 3 2]
[2 3 1 2]
[3 2 2 1]
```

```
>>> from sage.all import *
>>> CoxeterMatrix(['F',Integer(4)]).relabel({ Integer(1):Integer(2),␣
↪Integer(2):Integer(3), Integer(3):Integer(4), Integer(4):Integer(1)})
[1 4 2 3]
[4 1 3 2]
[2 3 1 2]
[3 2 2 1]
>>> CoxeterMatrix(['F',Integer(4)]).relabel(lambda x: x+Integer(1) if x
↪<Integer(4) else Integer(1))
[1 4 2 3]
[4 1 3 2]
[2 3 1 2]
[3 2 2 1]
```

classmethod samples(*finite=None*, *affine=None*, *crystallographic=None*, *higher_rank=None*)

Return a sample of the available Coxeter types.

INPUT:

- `finite` – (default: `None`) a boolean or `None`
- `affine` – (default: `None`) a boolean or `None`
- `crystallographic` – (default: `None`) a boolean or `None`
- `higher_rank` – (default: `None`) a boolean or `None`

The sample contains all the exceptional finite and affine Coxeter types, as well as typical representatives of the infinite families.

Here the `higher_rank` term denotes non-finite, non-affine, Coxeter groups (including hyperbolic types).

Todo

Implement the hyperbolic and compact hyperbolic in the samples.

EXAMPLES:

```
sage: [CM.coxeter_type() for CM in CoxeterMatrix.samples()]
[
Coxeter type of ['A', 1], Coxeter type of ['A', 5],

Coxeter type of ['B', 5], Coxeter type of ['D', 4],

Todo

add some reducible Coxeter types (suggestions?)

sage.combinat.root_system.coxeter_matrix.**check_coxeter_matrix**(*m*)

Check if m represents a generalized Coxeter matrix and raise and error if not.

EXAMPLES:

```
sage: from sage.combinat.root_system.coxeter_matrix import check_coxeter_matrix
sage: m = matrix([[1,3,2],[3,1,-1],[2,-1,1]])
sage: check_coxeter_matrix(m)

sage: m = matrix([[1,3],[3,1],[2,-1]])
sage: check_coxeter_matrix(m)
Traceback (most recent call last):
...
ValueError: not a square matrix

sage: m = matrix([[1,3,2],[3,1,-1],[2,-1,2]])
sage: check_coxeter_matrix(m)
Traceback (most recent call last):
...
ValueError: the matrix diagonal is not all 1
```

(continues on next page)

(continued from previous page)

```
sage: m = matrix([[1,3,3],[3,1,-1],[2,-1,1]])
sage: check_coxeter_matrix(m)
Traceback (most recent call last):
...
ValueError: the matrix is not symmetric

sage: m = matrix([[1,3,1/2],[3,1,-1],[1/2,-1,1]])
sage: check_coxeter_matrix(m)
Traceback (most recent call last):
...
ValueError: invalid Coxeter label 1/2

sage: m = matrix([[1,3,1],[3,1,-1],[1,-1,1]])
sage: check_coxeter_matrix(m)
Traceback (most recent call last):
...
ValueError: invalid Coxeter label 1
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.coxeter_matrix import check_coxeter_matrix
>>> m = matrix([[Integer(1),Integer(3),Integer(2)],[Integer(3),Integer(1),-
↪Integer(1)],[Integer(2),-Integer(1),Integer(1)]])
>>> check_coxeter_matrix(m)

>>> m = matrix([[Integer(1),Integer(3)],[Integer(3),Integer(1)],[Integer(2),-
↪Integer(1)]])
>>> check_coxeter_matrix(m)
Traceback (most recent call last):
...
ValueError: not a square matrix

>>> m = matrix([[Integer(1),Integer(3),Integer(2)],[Integer(3),Integer(1),-
↪Integer(1)],[Integer(2),-Integer(1),Integer(2)]])
>>> check_coxeter_matrix(m)
Traceback (most recent call last):
...
ValueError: the matrix diagonal is not all 1

>>> m = matrix([[Integer(1),Integer(3),Integer(3)],[Integer(3),Integer(1),-
↪Integer(1)],[Integer(2),-Integer(1),Integer(1)]])
>>> check_coxeter_matrix(m)
Traceback (most recent call last):
...
ValueError: the matrix is not symmetric

>>> m = matrix([[Integer(1),Integer(3),Integer(1)/Integer(2)],[Integer(3),
↪Integer(1),-Integer(1)],[Integer(1)/Integer(2),-Integer(1),Integer(1)]])
>>> check_coxeter_matrix(m)
Traceback (most recent call last):
...
ValueError: invalid Coxeter label 1/2
```

(continues on next page)

(continued from previous page)

```
>>> m = matrix([[Integer(1),Integer(3),Integer(1)],[Integer(3),Integer(1),-
↪Integer(1)],[Integer(1),-Integer(1),Integer(1)]])
>>> check_coxeter_matrix(m)
Traceback (most recent call last):
...
ValueError: invalid Coxeter label 1
```

sage.combinat.root_system.coxeter_matrix.**coxeter_matrix_as_function**(*t*)

Return the Coxeter matrix, as a function.

INPUT:

- t – a Cartan type

EXAMPLES:

```
sage: from sage.combinat.root_system.coxeter_matrix import coxeter_matrix_as_
↪function
sage: f = coxeter_matrix_as_function(['A',4])
sage: matrix([[f(i,j) for j in range(1,5)] for i in range(1,5)])
[1 3 2 2]
[3 1 3 2]
[2 3 1 3]
[2 2 3 1]
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.coxeter_matrix import coxeter_matrix_as_
↪function
>>> f = coxeter_matrix_as_function(['A',Integer(4)])
>>> matrix([[f(i,j) for j in range(Integer(1),Integer(5))] for i in␣
↪range(Integer(1),Integer(5))])
[1 3 2 2]
[3 1 3 2]
[2 3 1 3]
[2 2 3 1]
```

sage.combinat.root_system.coxeter_matrix.**recognize_coxeter_type_from_matrix**(*coxeter_matrix*, *index_set*)

Return the Coxeter type of coxeter_matrix if known, otherwise return None.

EXAMPLES:

Some infinite ones:

```
sage: C = CoxeterMatrix([[1,3,2],[3,1,-1],[2,-1,1]])
sage: C.is_finite()  # indirect doctest
False
sage: C = CoxeterMatrix([[1,-1,-1],[-1,1,-1],[-1,-1,1]])
sage: C.is_finite()  # indirect doctest
False
```

```
>>> from sage.all import *
>>> C = CoxeterMatrix([[Integer(1),Integer(3),Integer(2)],[Integer(3),Integer(1),-
↪Integer(1)],[Integer(2),-Integer(1),Integer(1)]])
>>> C.is_finite()  # indirect doctest
False
>>> C = CoxeterMatrix([[Integer(1),-Integer(1),-Integer(1)],[-Integer(1),
↪Integer(1),-Integer(1)],[-Integer(1),-Integer(1),Integer(1)]])
>>> C.is_finite()  # indirect doctest
False
```

Some finite ones:

```
sage: m = matrix(CoxeterMatrix(['D', 4]))
sage: CoxeterMatrix(m).is_finite()  # indirect doctest
True
sage: m = matrix(CoxeterMatrix(['H', 4]))
sage: CoxeterMatrix(m).is_finite()  # indirect doctest
True

sage: CoxeterMatrix(CoxeterType(['A',10]).coxeter_graph()).coxeter_type()
Coxeter type of ['A', 10]

```

5.1.229 Coxeter Types

class sage.combinat.root_system.coxeter_type.**CoxeterType**

Bases: SageObject

Abstract class for Coxeter types.

bilinear_form(*R=None*)

Return the bilinear form over R associated to self.

INPUT:

- R – (default: universal cyclotomic field) a ring used to compute the bilinear form

EXAMPLES:

```
sage: # needs sage.graphs sage.libs.gap
sage: CoxeterType(['A', 2, 1]).bilinear_form()
[   1 -1/2 -1/2]
[-1/2    1 -1/2]
[-1/2 -1/2    1]
sage: CoxeterType(['H', 3]).bilinear_form()
[                      1                    -1/2                       0]
[                   -1/2                       1 1/2*E(5)^2 + 1/2*E(5)^3]
[                      0 1/2*E(5)^2 + 1/2*E(5)^3                       1]
sage: C = CoxeterMatrix([[1,-1,-1],[-1,1,-1],[-1,-1,1]])
sage: C.bilinear_form()
```

(continues on next page)

(continued from previous page)

```
[ 1 -1 -1]
[-1  1 -1]
[-1 -1  1]
```

```
>>> from sage.all import *
>>> # needs sage.graphs sage.libs.gap
>>> CoxeterType(['A', Integer(2), Integer(1)]).bilinear_form()
[   1 -1/2 -1/2]
[-1/2    1 -1/2]
[-1/2 -1/2    1]
>>> CoxeterType(['H', Integer(3)]).bilinear_form()
[                      1                    -1/2                       0]
[                   -1/2                       1 1/2*E(5)^2 + 1/2*E(5)^3]
[                      0 1/2*E(5)^2 + 1/2*E(5)^3                       1]
>>> C = CoxeterMatrix([[Integer(1),-Integer(1),-Integer(1)],[-Integer(1),
↪Integer(1),-Integer(1)],[-Integer(1),-Integer(1),Integer(1)]])
>>> C.bilinear_form()
[ 1 -1 -1]
[-1  1 -1]
[-1 -1  1]
```

coxeter_graph()

Return the Coxeter graph associated to self.

EXAMPLES:

```
sage: CoxeterType(['A', 3]).coxeter_graph()                                 #␣
↪needs sage.graphs
Graph on 3 vertices
sage: CoxeterType(['A', 3, 1]).coxeter_graph()                              #␣
↪needs sage.graphs
Graph on 4 vertices
```

```
>>> from sage.all import *
>>> CoxeterType(['A', Integer(3)]).coxeter_graph()                         ␣
↪     # needs sage.graphs
Graph on 3 vertices
>>> CoxeterType(['A', Integer(3), Integer(1)]).coxeter_graph()             ␣
↪              # needs sage.graphs
Graph on 4 vertices
```

coxeter_matrix()

Return the Coxeter matrix associated to self.

EXAMPLES:

```
sage: CoxeterType(['A', 3]).coxeter_matrix()                                #␣
↪needs sage.graphs
[1 3 2]
[3 1 3]
[2 3 1]
sage: CoxeterType(['A', 3, 1]).coxeter_matrix()                             #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.graphs
[1 3 2 3]
[3 1 3 2]
[2 3 1 3]
[3 2 3 1]
```

```
>>> from sage.all import *
>>> CoxeterType(['A', Integer(3)]).coxeter_matrix()                    ␣
↪      # needs sage.graphs
[1 3 2]
[3 1 3]
[2 3 1]
>>> CoxeterType(['A', Integer(3), Integer(1)]).coxeter_matrix()        ␣
↪               # needs sage.graphs
[1 3 2 3]
[3 1 3 2]
[2 3 1 3]
[3 2 3 1]
```

index_set()

Return the index set for `self`.

This is the list of the nodes of the associated Coxeter graph.

EXAMPLES:

```
sage: CoxeterType(['A', 3, 1]).index_set()
(0, 1, 2, 3)
sage: CoxeterType(['D', 4]).index_set()
(1, 2, 3, 4)
sage: CoxeterType(['A', 7, 2]).index_set()
(0, 1, 2, 3, 4)
sage: CoxeterType(['A', 7, 2]).index_set()
(0, 1, 2, 3, 4)
sage: CoxeterType(['A', 6, 2]).index_set()
(0, 1, 2, 3)
sage: CoxeterType(['D', 6, 2]).index_set()
(0, 1, 2, 3, 4, 5)
sage: CoxeterType(['E', 6, 1]).index_set()
(0, 1, 2, 3, 4, 5, 6)
sage: CoxeterType(['E', 6, 2]).index_set()
(0, 1, 2, 3, 4)
sage: CoxeterType(['A', 2, 2]).index_set()
(0, 1)
sage: CoxeterType(['G', 2, 1]).index_set()
(0, 1, 2)
sage: CoxeterType(['F', 4, 1]).index_set()
(0, 1, 2, 3, 4)
```

```
>>> from sage.all import *
>>> CoxeterType(['A', Integer(3), Integer(1)]).index_set()
(0, 1, 2, 3)
```

(continues on next page)

(continued from previous page)

```
>>> CoxeterType(['D', Integer(4)]).index_set()
(1, 2, 3, 4)
>>> CoxeterType(['A', Integer(7), Integer(2)]).index_set()
(0, 1, 2, 3, 4)
>>> CoxeterType(['A', Integer(7), Integer(2)]).index_set()
(0, 1, 2, 3, 4)
>>> CoxeterType(['A', Integer(6), Integer(2)]).index_set()
(0, 1, 2, 3)
>>> CoxeterType(['D', Integer(6), Integer(2)]).index_set()
(0, 1, 2, 3, 4, 5)
>>> CoxeterType(['E', Integer(6), Integer(1)]).index_set()
(0, 1, 2, 3, 4, 5, 6)
>>> CoxeterType(['E', Integer(6), Integer(2)]).index_set()
(0, 1, 2, 3, 4)
>>> CoxeterType(['A', Integer(2), Integer(2)]).index_set()
(0, 1)
>>> CoxeterType(['G', Integer(2), Integer(1)]).index_set()
(0, 1, 2)
>>> CoxeterType(['F', Integer(4), Integer(1)]).index_set()
(0, 1, 2, 3, 4)
```

is_affine()

Return whether `self` is affine.

EXAMPLES:

```
sage: CoxeterType(['A', 3]).is_affine()
False
sage: CoxeterType(['A', 3, 1]).is_affine()
True
```

```
>>> from sage.all import *
>>> CoxeterType(['A', Integer(3)]).is_affine()
False
>>> CoxeterType(['A', Integer(3), Integer(1)]).is_affine()
True
```

is_crystallographic()

Return whether `self` is crystallographic.

This returns `False` by default. Derived class should override this appropriately.

EXAMPLES:

```
sage: [ [t, t.is_crystallographic() ] for t in CartanType.
↪samples(finite=True) ]
[[['A', 1], True], [['A', 5], True],
 [['B', 1], True], [['B', 5], True],
 [['C', 1], True], [['C', 5], True],
 [['D', 2], True], [['D', 3], True], [['D', 5], True],
 [['E', 6], True], [['E', 7], True], [['E', 8], True],
 [['F', 4], True], [['G', 2], True],
 [['I', 5], False], [['H', 3], False], [['H', 4], False]]
```

```
>>> from sage.all import *
>>> [ [t, t.is_crystallographic() ] for t in CartanType.samples(finite=True) ]
[[['A', 1], True], [['A', 5], True],
 [['B', 1], True], [['B', 5], True],
 [['C', 1], True], [['C', 5], True],
 [['D', 2], True], [['D', 3], True], [['D', 5], True],
 [['E', 6], True], [['E', 7], True], [['E', 8], True],
 [['F', 4], True], [['G', 2], True],
 [['I', 5], False], [['H', 3], False], [['H', 4], False]]
```

is_finite()

Return whether `self` is finite.

EXAMPLES:

```
sage: CoxeterType(['A',4]).is_finite()
True
sage: CoxeterType(['A',4, 1]).is_finite()
False
```

```
>>> from sage.all import *
>>> CoxeterType(['A',Integer(4)]).is_finite()
True
>>> CoxeterType(['A',Integer(4), Integer(1)]).is_finite()
False
```

is_simply_laced()

Return whether `self` is simply laced.

This returns `False` by default. Derived class should override this appropriately.

EXAMPLES:

```
sage: [ [t, t.is_simply_laced() ] for t in CartanType.samples() ]
[[['A', 1], True], [['A', 5], True],
 [['B', 1], True], [['B', 5], False],
 [['C', 1], True], [['C', 5], False],
 [['D', 2], True], [['D', 3], True], [['D', 5], True],
 [['E', 6], True], [['E', 7], True], [['E', 8], True],
 [['F', 4], False], [['G', 2], False],
 [['I', 5], False], [['H', 3], False], [['H', 4], False],
 [['A', 1, 1], False], [['A', 5, 1], True],
 [['B', 1, 1], False], [['B', 5, 1], False],
 [['C', 1, 1], False], [['C', 5, 1], False],
 [['D', 3, 1], True], [['D', 5, 1], True],
 [['E', 6, 1], True], [['E', 7, 1], True], [['E', 8, 1], True],
 [['F', 4, 1], False], [['G', 2, 1], False],
 [['BC', 1, 2], False], [['BC', 5, 2], False],
 [['B', 5, 1]^*, False], [['C', 4, 1]^*, False],
 [['F', 4, 1]^*, False], [['G', 2, 1]^*, False],
 [['BC', 1, 2]^*, False], [['BC', 5, 2]^*, False]]
```

```
>>> from sage.all import *
>>> [ [t, t.is_simply_laced() ] for t in CartanType.samples() ]
```

(continues on next page)

(continued from previous page)

```
[[['A', 1], True], [['A', 5], True],
 [['B', 1], True], [['B', 5], False],
 [['C', 1], True], [['C', 5], False],
 [['D', 2], True], [['D', 3], True], [['D', 5], True],
 [['E', 6], True], [['E', 7], True], [['E', 8], True],
 [['F', 4], False], [['G', 2], False],
 [['I', 5], False], [['H', 3], False], [['H', 4], False],
 [['A', 1, 1], False], [['A', 5, 1], True],
 [['B', 1, 1], False], [['B', 5, 1], False],
 [['C', 1, 1], False], [['C', 5, 1], False],
 [['D', 3, 1], True], [['D', 5, 1], True],
 [['E', 6, 1], True], [['E', 7, 1], True], [['E', 8, 1], True],
 [['F', 4, 1], False], [['G', 2, 1], False],
 [['BC', 1, 2], False], [['BC', 5, 2], False],
 [['B', 5, 1]^*, False], [['C', 4, 1]^*, False],
 [['F', 4, 1]^*, False], [['G', 2, 1]^*, False],
 [['BC', 1, 2]^*, False], [['BC', 5, 2]^*, False]]
```

rank()

Return the rank of `self`.

This is the number of nodes of the associated Coxeter graph.

EXAMPLES:

```
sage: CoxeterType(['A', 4]).rank()
4
sage: CoxeterType(['A', 7, 2]).rank()
5
sage: CoxeterType(['I', 8]).rank()
2
```

```
>>> from sage.all import *
>>> CoxeterType(['A', Integer(4)]).rank()
4
>>> CoxeterType(['A', Integer(7), Integer(2)]).rank()
5
>>> CoxeterType(['I', Integer(8)]).rank()
2
```

classmethod samples(*finite=None*, *affine=None*, *crystallographic=None*)

Return a sample of the available Coxeter types.

INPUT:

- `finite` – boolean or `None` (default: `None`)
- `affine` – boolean or `None` (default: `None`)
- `crystallographic` – boolean or `None` (default: `None`)

The sample contains all the exceptional finite and affine Coxeter types, as well as typical representatives of the infinite families.

EXAMPLES:

```
sage: CoxeterType.samples()
[Coxeter type of ['A', 1], Coxeter type of ['A', 5],
 Coxeter type of ['B', 1], Coxeter type of ['B', 5],
 Coxeter type of ['C', 1], Coxeter type of ['C', 5],
 Coxeter type of ['D', 4], Coxeter type of ['D', 5],
 Coxeter type of ['E', 6], Coxeter type of ['E', 7],
 Coxeter type of ['E', 8], Coxeter type of ['F', 4],
 Coxeter type of ['H', 3], Coxeter type of ['H', 4],
 Coxeter type of ['I', 10], Coxeter type of ['A', 2, 1],
 Coxeter type of ['B', 5, 1], Coxeter type of ['C', 5, 1],
 Coxeter type of ['D', 5, 1], Coxeter type of ['E', 6, 1],
 Coxeter type of ['E', 7, 1], Coxeter type of ['E', 8, 1],
 Coxeter type of ['F', 4, 1], Coxeter type of ['G', 2, 1],
 Coxeter type of ['A', 1, 1]]
```

```
>>> from sage.all import *
>>> CoxeterType.samples()
[Coxeter type of ['A', 1], Coxeter type of ['A', 5],
 Coxeter type of ['B', 1], Coxeter type of ['B', 5],
 Coxeter type of ['C', 1], Coxeter type of ['C', 5],
 Coxeter type of ['D', 4], Coxeter type of ['D', 5],
 Coxeter type of ['E', 6], Coxeter type of ['E', 7],
 Coxeter type of ['E', 8], Coxeter type of ['F', 4],
 Coxeter type of ['H', 3], Coxeter type of ['H', 4],
 Coxeter type of ['I', 10], Coxeter type of ['A', 2, 1],
 Coxeter type of ['B', 5, 1], Coxeter type of ['C', 5, 1],
 Coxeter type of ['D', 5, 1], Coxeter type of ['E', 6, 1],
 Coxeter type of ['E', 7, 1], Coxeter type of ['E', 8, 1],
 Coxeter type of ['F', 4, 1], Coxeter type of ['G', 2, 1],
 Coxeter type of ['A', 1, 1]]
```

The finite, affine and crystallographic options allow respectively for restricting to (non) finite, (non) affine, and (non) crystallographic Cartan types:

```
sage: CoxeterType.samples(finite=True)
[Coxeter type of ['A', 1], Coxeter type of ['A', 5],
 Coxeter type of ['B', 1], Coxeter type of ['B', 5],
 Coxeter type of ['C', 1], Coxeter type of ['C', 5],
 Coxeter type of ['D', 4], Coxeter type of ['D', 5],
 Coxeter type of ['E', 6], Coxeter type of ['E', 7],
 Coxeter type of ['E', 8], Coxeter type of ['F', 4],
 Coxeter type of ['H', 3], Coxeter type of ['H', 4],
 Coxeter type of ['I', 10]]

sage: CoxeterType.samples(affine=True)
[Coxeter type of ['A', 2, 1], Coxeter type of ['B', 5, 1],
 Coxeter type of ['C', 5, 1], Coxeter type of ['D', 5, 1],
 Coxeter type of ['E', 6, 1], Coxeter type of ['E', 7, 1],
 Coxeter type of ['E', 8, 1], Coxeter type of ['F', 4, 1],
 Coxeter type of ['G', 2, 1], Coxeter type of ['A', 1, 1]]

sage: CoxeterType.samples(crystallographic=True)
[Coxeter type of ['A', 1], Coxeter type of ['A', 5],
```

(continues on next page)

(continued from previous page)

```
 Coxeter type of ['B', 1], Coxeter type of ['B', 5],
 Coxeter type of ['C', 1], Coxeter type of ['C', 5],
 Coxeter type of ['D', 4], Coxeter type of ['D', 5],
 Coxeter type of ['E', 6], Coxeter type of ['E', 7],
 Coxeter type of ['E', 8], Coxeter type of ['F', 4],
 Coxeter type of ['A', 2, 1], Coxeter type of ['B', 5, 1],
 Coxeter type of ['C', 5, 1], Coxeter type of ['D', 5, 1],
 Coxeter type of ['E', 6, 1], Coxeter type of ['E', 7, 1],
 Coxeter type of ['E', 8, 1], Coxeter type of ['F', 4, 1],
 Coxeter type of ['G', 2, 1], Coxeter type of ['A', 1, 1]]

sage: CoxeterType.samples(crystallographic=False)
[Coxeter type of ['H', 3],
 Coxeter type of ['H', 4],
 Coxeter type of ['I', 10]]
```

```
>>> from sage.all import *
>>> CoxeterType.samples(finite=True)
[Coxeter type of ['A', 1], Coxeter type of ['A', 5],
 Coxeter type of ['B', 1], Coxeter type of ['B', 5],
 Coxeter type of ['C', 1], Coxeter type of ['C', 5],
 Coxeter type of ['D', 4], Coxeter type of ['D', 5],
 Coxeter type of ['E', 6], Coxeter type of ['E', 7],
 Coxeter type of ['E', 8], Coxeter type of ['F', 4],
 Coxeter type of ['H', 3], Coxeter type of ['H', 4],
 Coxeter type of ['I', 10]]

>>> CoxeterType.samples(affine=True)

```

Todo

add some reducible Coxeter types (suggestions?)

class sage.combinat.root_system.coxeter_type.**CoxeterTypeFromCartanType**(*cartan_type*)

Bases: UniqueRepresentation, *CoxeterType*

A Coxeter type associated to a Cartan type.

cartan_type()

Return the Cartan type used to construct self.

EXAMPLES:

```
sage: C = CoxeterType(['C',3])
sage: C.cartan_type()
['C', 3]
```

```
>>> from sage.all import *
>>> C = CoxeterType(['C',Integer(3)])
>>> C.cartan_type()
['C', 3]
```

component_types()

A list of Coxeter types making up the reducible type.

EXAMPLES:

```
sage: CoxeterType(['A',2],['B',2]).component_types()
[Coxeter type of ['A', 2], Coxeter type of ['B', 2]]

sage: CoxeterType('A4xB3').component_types()
[Coxeter type of ['A', 4], Coxeter type of ['B', 3]]

sage: CoxeterType(['A', 2]).component_types()
Traceback (most recent call last):
...
ValueError: component types only defined for reducible types
```

```
>>> from sage.all import *
>>> CoxeterType(['A',Integer(2)],['B',Integer(2)]).component_types()
[Coxeter type of ['A', 2], Coxeter type of ['B', 2]]

>>> CoxeterType('A4xB3').component_types()
[Coxeter type of ['A', 4], Coxeter type of ['B', 3]]

>>> CoxeterType(['A', Integer(2)]).component_types()
Traceback (most recent call last):
...
ValueError: component types only defined for reducible types
```

coxeter_graph()

Return the Coxeter graph of self.

EXAMPLES:

```
sage: C = CoxeterType(['H',3])
sage: C.coxeter_graph().edges(sort=True)                                    #␣
↪needs sage.graphs
[(1, 2, 3), (2, 3, 5)]
```

```
>>> from sage.all import *
>>> C = CoxeterType(['H',Integer(3)])
>>> C.coxeter_graph().edges(sort=True)                                    #␣
↪needs sage.graphs
[(1, 2, 3), (2, 3, 5)]
```

coxeter_matrix()

Return the Coxeter matrix associated to `self`.

EXAMPLES:

```
sage: C = CoxeterType(['H',3])
sage: C.coxeter_matrix()                                                    #␣
↪needs sage.graphs
[1 3 2]
[3 1 5]
[2 5 1]
```

```
>>> from sage.all import *
>>> C = CoxeterType(['H',Integer(3)])
>>> C.coxeter_matrix()                                                    #␣
↪needs sage.graphs
[1 3 2]
[3 1 5]
[2 5 1]
```

index_set()

Return the index set of `self`.

EXAMPLES:

```
sage: C = CoxeterType(['A', 4])
sage: C.index_set()
(1, 2, 3, 4)
```

```
>>> from sage.all import *
>>> C = CoxeterType(['A', Integer(4)])
>>> C.index_set()
(1, 2, 3, 4)
```

is_affine()

Return if `self` is an affine type.

EXAMPLES:

```
sage: C = CoxeterType(['F', 4, 1])
sage: C.is_affine()
True
```

```
>>> from sage.all import *
>>> C = CoxeterType(['F', Integer(4), Integer(1)])
>>> C.is_affine()
True
```

is_crystallographic()

Return if `self` is crystallographic.

EXAMPLES:

```
sage: C = CoxeterType(['C', 3])
sage: C.is_crystallographic()
True

sage: C = CoxeterType(['H', 3])
sage: C.is_crystallographic()
False
```

```
>>> from sage.all import *
>>> C = CoxeterType(['C', Integer(3)])
>>> C.is_crystallographic()
True

>>> C = CoxeterType(['H', Integer(3)])
>>> C.is_crystallographic()
False
```

is_finite()

Return if `self` is a finite type.

EXAMPLES:

```
sage: C = CoxeterType(['E', 6])
sage: C.is_finite()
True
```

```
>>> from sage.all import *
>>> C = CoxeterType(['E', Integer(6)])
>>> C.is_finite()
True
```

is_irreducible()

Return if `self` is irreducible.

EXAMPLES:

```
sage: C = CoxeterType(['A', 5])
sage: C.is_irreducible()
True

sage: C = CoxeterType('B3xB3')
sage: C.is_irreducible()
False
```

```
>>> from sage.all import *
>>> C = CoxeterType(['A', Integer(5)])
>>> C.is_irreducible()
True

>>> C = CoxeterType('B3xB3')
>>> C.is_irreducible()
False
```

is_reducible()

Return if `self` is reducible.

EXAMPLES:

```
sage: C = CoxeterType(['A', 5])
sage: C.is_reducible()
False

sage: C = CoxeterType('A2xA2')
sage: C.is_reducible()
True
```

```
>>> from sage.all import *
>>> C = CoxeterType(['A', Integer(5)])
>>> C.is_reducible()
False

>>> C = CoxeterType('A2xA2')
>>> C.is_reducible()
True
```

is_simply_laced()

Return if `self` is simply-laced.

EXAMPLES:

```
sage: C = CoxeterType(['A', 5])
sage: C.is_simply_laced()
True

sage: C = CoxeterType(['B', 3])
sage: C.is_simply_laced()
False
```

```
>>> from sage.all import *
>>> C = CoxeterType(['A', Integer(5)])
>>> C.is_simply_laced()
True

>>> C = CoxeterType(['B', Integer(3)])
>>> C.is_simply_laced()
False
```

rank()

Return the rank of self.

EXAMPLES:

```
sage: C = CoxeterType(['I', 16])
sage: C.rank()
2
```

```
>>> from sage.all import *
>>> C = CoxeterType(['I', Integer(16)])
>>> C.rank()
2
```

relabel(*relabelling*)

Return a relabelled copy of self.

EXAMPLES:

```
sage: ct = CoxeterType(['A',2])
sage: ct.relabel({1:-1, 2:-2})
Coxeter type of ['A', 2] relabelled by {1: -1, 2: -2}
```

```
>>> from sage.all import *
>>> ct = CoxeterType(['A',Integer(2)])
>>> ct.relabel({Integer(1):-Integer(1), Integer(2):-Integer(2)})
Coxeter type of ['A', 2] relabelled by {1: -1, 2: -2}
```

type()

Return the type of self.

EXAMPLES:

```
sage: C = CoxeterType(['A', 4])
sage: C.type()
'A'
```

```
>>> from sage.all import *
>>> C = CoxeterType(['A', Integer(4)])
>>> C.type()
'A'
```

5.1.230 Dynkin diagrams

AUTHORS:

- Travis Scrimshaw (2012-04-22): Nicolas M. Thiery moved Cartan matrix creation to here and I cached results for speed.
- Travis Scrimshaw (2013-06-11): Changed inputs of Dynkin diagrams to handle other Dynkin diagrams and graphs. Implemented remaining Cartan type methods.
- Christian Stump, Travis Scrimshaw (2013-04-11): Added Cartan matrix as possible input for Dynkin diagrams.

sage.combinat.root_system.dynkin_diagram.**DynkinDiagram**(**args*, ***kwds*)

Return the Dynkin diagram corresponding to the input.

INPUT:

The input can be one of the following:

- empty to obtain an empty Dynkin diagram
- a Cartan type
- a Cartan matrix
- a Cartan matrix and an indexing set

One can also input an indexing set by passing a tuple using the optional argument `index_set`.

The edge multiplicities are encoded as edge labels. For the corresponding Cartan matrices, this uses the convention in Hong and Kang, Kac, Fulton and Harris, and crystals. This is the **opposite** convention in Bourbaki and Wikipedia's Dynkin diagram (Wikipedia article Dynkin_diagram). That is for $i \neq j$:

```
i <--k-- j <==> a_ij = -k
           <==> -scalar(coroot[i], root[j]) = k
           <==> multiple arrows point from the longer root
                to the shorter one
```

For example, in type C_2, we have:

```
sage: C2 = DynkinDiagram(['C',2]); C2
O=<=O
1   2
C2
sage: C2.cartan_matrix()
[ 2 -2]
[-1  2]
```

```
>>> from sage.all import *
>>> C2 = DynkinDiagram(['C',Integer(2)]); C2
O=<=O
1   2
C2
>>> C2.cartan_matrix()
[ 2 -2]
[-1  2]
```

However Bourbaki would have the Cartan matrix as:

$$\begin{bmatrix} 2 & -1 \\ -2 & 2 \end{bmatrix}.$$

EXAMPLES:

```
sage: DynkinDiagram(['A', 4])
O---O---O---O
1   2   3   4
A4

sage: DynkinDiagram(['A',1],['A',1])
```

[ 0  0  0  0  0 -2  2 -1]
[ 0  0  0  0  0  0 -1  2]
```

We can also create Dynkin diagrams from arbitrary Cartan matrices:

```
sage: C = CartanMatrix([[2, -3], [-4, 2]])
sage: DynkinDiagram(C)
Dynkin diagram of rank 2
```

(continues on next page)

(continued from previous page)

```
sage: C.index_set()
(0, 1)
sage: CI = CartanMatrix([[2, -3], [-4, 2]], [3, 5])
sage: DI = DynkinDiagram(CI)
sage: DI.index_set()
(3, 5)
sage: CII = CartanMatrix([[2, -3], [-4, 2]])
sage: DII = DynkinDiagram(CII, ('y', 'x'))
sage: DII.index_set()
('x', 'y')
```

```
>>> from sage.all import *
>>> C = CartanMatrix([[Integer(2), -Integer(3)], [-Integer(4), Integer(2)]])
>>> DynkinDiagram(C)
Dynkin diagram of rank 2
>>> C.index_set()
(0, 1)
>>> CI = CartanMatrix([[Integer(2), -Integer(3)], [-Integer(4), Integer(2)]],
↪[Integer(3), Integer(5)])
>>> DI = DynkinDiagram(CI)
>>> DI.index_set()
(3, 5)
>>> CII = CartanMatrix([[Integer(2), -Integer(3)], [-Integer(4), Integer(2)]])
>>> DII = DynkinDiagram(CII, ('y', 'x'))
>>> DII.index_set()
('x', 'y')
```

See also:

`CartanType()` for a general discussion on Cartan types and in particular node labeling conventions.

class `sage.combinat.root_system.dynkin_diagram.`**`DynkinDiagram_class`**(*t=None*, *index_set=None*, *odd_isotropic_roots=[]*, ***options*)

Bases: `DiGraph`, `CartanType_abstract`

A Dynkin diagram.

See also:

`DynkinDiagram()`

INPUT:

- `t` – a Cartan type, Cartan matrix, or `None`

EXAMPLES:

```
sage: DynkinDiagram(['A', 3])
O---O---O
1   2   3
```

(continues on next page)

(continued from previous page)

```
A3
sage: C = CartanMatrix([[2, -3], [-4, 2]])
sage: DynkinDiagram(C)
Dynkin diagram of rank 2
sage: C.dynkin_diagram().cartan_matrix() == C
True
```

```
>>> from sage.all import *
>>> DynkinDiagram(['A', Integer(3)])
O---O---O
1   2   3
A3
>>> C = CartanMatrix([[Integer(2), -Integer(3)], [-Integer(4), Integer(2)]])
>>> DynkinDiagram(C)
Dynkin diagram of rank 2
>>> C.dynkin_diagram().cartan_matrix() == C
True
```

add_edge(*i*, *j*, *label=1*)

EXAMPLES:

```
sage: from sage.combinat.root_system.dynkin_diagram import DynkinDiagram_class
sage: d = DynkinDiagram_class(CartanType(['A',3]))
sage: sorted(d.edges(sort=True))
[]
sage: d.add_edge(2, 3)
sage: sorted(d.edges(sort=True))
[(2, 3, 1), (3, 2, 1)]
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.dynkin_diagram import DynkinDiagram_class
>>> d = DynkinDiagram_class(CartanType(['A',Integer(3)]))
>>> sorted(d.edges(sort=True))
[]
>>> d.add_edge(Integer(2), Integer(3))
>>> sorted(d.edges(sort=True))
[(2, 3, 1), (3, 2, 1)]
```

static an_instance()

Return an example of Dynkin diagram.

EXAMPLES:

```
sage: from sage.combinat.root_system.dynkin_diagram import DynkinDiagram_class
sage: g = DynkinDiagram_class.an_instance()
sage: g
Dynkin diagram of rank 3
sage: g.cartan_matrix()
[ 2 -1 -1]
[-2  2 -1]
[-1 -1  2]
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.dynkin_diagram import DynkinDiagram_class
>>> g = DynkinDiagram_class.an_instance()
>>> g
Dynkin diagram of rank 3
>>> g.cartan_matrix()
[ 2 -1 -1]
[-2  2 -1]
[-1 -1  2]
```

cartan_matrix()

Return the Cartan matrix for this Dynkin diagram.

EXAMPLES:

```
sage: DynkinDiagram(['C',3]).cartan_matrix()
[ 2 -1  0]
[-1  2 -2]
[ 0 -1  2]
```

```
>>> from sage.all import *
>>> DynkinDiagram(['C',Integer(3)]).cartan_matrix()
[ 2 -1  0]
[-1  2 -2]
[ 0 -1  2]
```

cartan_type()

EXAMPLES:

```
sage: DynkinDiagram("A2","B2","F4").cartan_type()
A2xB2xF4
```

```
>>> from sage.all import *
>>> DynkinDiagram("A2","B2","F4").cartan_type()
A2xB2xF4
```

column(j)

Return the j-th column $(a_{i,j})_i$ of the Cartan matrix corresponding to this Dynkin diagram, as a container (or iterator) of tuples $(i, a_{i,j})$.

EXAMPLES:

```
sage: g = DynkinDiagram(["B",4])
sage: [ (i,a) for (i,a) in g.column(3) ]
[(3, 2), (2, -1), (4, -2)]
```

```
>>> from sage.all import *
>>> g = DynkinDiagram(["B",Integer(4)])
>>> [ (i,a) for (i,a) in g.column(Integer(3)) ]
[(3, 2), (2, -1), (4, -2)]
```

coxeter_diagram()

Construct the Coxeter diagram of `self`.

See also

CartanType_abstract.coxeter_diagram()

EXAMPLES:

```
sage: cm = CartanMatrix([[2,-5,0],[-2,2,-1],[0,-1,2]])
sage: D = cm.dynkin_diagram()
sage: G = D.coxeter_diagram(); G
Graph on 3 vertices
sage: G.edges(sort=True)
[(0, 1, +Infinity), (1, 2, 3)]

sage: ct = CartanType([['A',2,2], ['B',3]])
sage: ct.coxeter_diagram()
Graph on 5 vertices
sage: ct.dynkin_diagram().coxeter_diagram() == ct.coxeter_diagram()
True
```

```
>>> from sage.all import *
>>> cm = CartanMatrix([[Integer(2),-Integer(5),Integer(0)],[-Integer(2),
→Integer(2),-Integer(1)],[Integer(0),-Integer(1),Integer(2)]])
>>> D = cm.dynkin_diagram()
>>> G = D.coxeter_diagram(); G
Graph on 3 vertices
>>> G.edges(sort=True)
[(0, 1, +Infinity), (1, 2, 3)]

>>> ct = CartanType([['A',Integer(2),Integer(2)], ['B',Integer(3)]])
>>> ct.coxeter_diagram()
Graph on 5 vertices
>>> ct.dynkin_diagram().coxeter_diagram() == ct.coxeter_diagram()
True
```

dual()

Return the dual Dynkin diagram, obtained by reversing all edges.

EXAMPLES:

```
sage: D = DynkinDiagram(['C',3])
sage: D.edges(sort=True)
[(1, 2, 1), (2, 1, 1), (2, 3, 1), (3, 2, 2)]
sage: D.dual()
O---O=>=O
1   2   3
B3
sage: D.dual().edges(sort=True)
[(1, 2, 1), (2, 1, 1), (2, 3, 2), (3, 2, 1)]
sage: D.dual() == DynkinDiagram(['B',3])
True
```

```
>>> from sage.all import *
>>> D = DynkinDiagram(['C',Integer(3)])
```

(continues on next page)

(continued from previous page)

```
>>> D.edges(sort=True)
[(1, 2, 1), (2, 1, 1), (2, 3, 1), (3, 2, 2)]
>>> D.dual()
O---O=>=O
1   2   3
B3
>>> D.dual().edges(sort=True)
[(1, 2, 1), (2, 1, 1), (2, 3, 2), (3, 2, 1)]
>>> D.dual() == DynkinDiagram(['B',Integer(3)])
True
```

dynkin_diagram()

EXAMPLES:

```
sage: DynkinDiagram(['C',3]).dynkin_diagram()
O---O=<=O
1   2   3
C3
```

```
>>> from sage.all import *
>>> DynkinDiagram(['C',Integer(3)]).dynkin_diagram()
O---O=<=O
1   2   3
C3
```

index_set()

EXAMPLES:

```
sage: DynkinDiagram(['C',3]).index_set()
(1, 2, 3)
sage: DynkinDiagram("A2","B2","F4").index_set()
(1, 2, 3, 4, 5, 6, 7, 8)
```

```
>>> from sage.all import *
>>> DynkinDiagram(['C',Integer(3)]).index_set()
(1, 2, 3)
>>> DynkinDiagram("A2","B2","F4").index_set()
(1, 2, 3, 4, 5, 6, 7, 8)
```

is_affine()

Check if `self` corresponds to an affine root system.

EXAMPLES:

```
sage: CartanType(['F',4]).dynkin_diagram().is_affine()
False
sage: D = DynkinDiagram(CartanMatrix([[2, -4], [-3, 2]]))
sage: D.is_affine()
False
```

```
>>> from sage.all import *
>>> CartanType(['F',Integer(4)]).dynkin_diagram().is_affine()
```

(continues on next page)

(continued from previous page)

```
False
>>> D = DynkinDiagram(CartanMatrix([[Integer(2), -Integer(4)], [-Integer(3),␣
↪Integer(2)]]))
>>> D.is_affine()
False
```

is_crystallographic()

Implement *CartanType_abstract.is_crystallographic()*.

A Dynkin diagram always corresponds to a crystallographic root system.

EXAMPLES:

```
sage: CartanType(['F',4]).dynkin_diagram().is_crystallographic()
True
```

```
>>> from sage.all import *
>>> CartanType(['F',Integer(4)]).dynkin_diagram().is_crystallographic()
True
```

is_finite()

Check if `self` corresponds to a finite root system.

EXAMPLES:

```
sage: CartanType(['F',4]).dynkin_diagram().is_finite()
True
sage: D = DynkinDiagram(CartanMatrix([[2, -4], [-3, 2]]))
sage: D.is_finite()
False
```

```
>>> from sage.all import *
>>> CartanType(['F',Integer(4)]).dynkin_diagram().is_finite()
True
>>> D = DynkinDiagram(CartanMatrix([[Integer(2), -Integer(4)], [-Integer(3),␣
↪Integer(2)]]))
>>> D.is_finite()
False
```

is_irreducible()

Check if `self` corresponds to an irreducible root system.

EXAMPLES:

```
sage: CartanType(['F',4]).dynkin_diagram().is_irreducible()
True
sage: CM = CartanMatrix([[2,-6],[-4,2]])
sage: CM.dynkin_diagram().is_irreducible()
True
sage: CartanType("A2xB3").dynkin_diagram().is_irreducible()
False
sage: CM = CartanMatrix([[2,-6,0],[-4,2,0],[0,0,2]])
sage: CM.dynkin_diagram().is_irreducible()
False
```

```
>>> from sage.all import *
>>> CartanType(['F',Integer(4)]).dynkin_diagram().is_irreducible()
True
>>> CM = CartanMatrix([[Integer(2),-Integer(6)],[-Integer(4),Integer(2)]])
>>> CM.dynkin_diagram().is_irreducible()
True
>>> CartanType("A2xB3").dynkin_diagram().is_irreducible()
False
>>> CM = CartanMatrix([[Integer(2),-Integer(6),Integer(0)],[-Integer(4),
↪Integer(2),Integer(0)],[Integer(0),Integer(0),Integer(2)]])
>>> CM.dynkin_diagram().is_irreducible()
False
```

odd_isotropic_roots()

Return the odd isotropic roots of `self`.

EXAMPLES:

```
sage: g = DynkinDiagram(['A',4])
sage: g.odd_isotropic_roots()
()
sage: g = DynkinDiagram(['A',[4,3]])
sage: g.odd_isotropic_roots()
(0,)
```

```
>>> from sage.all import *
>>> g = DynkinDiagram(['A',Integer(4)])
>>> g.odd_isotropic_roots()
()
>>> g = DynkinDiagram(['A',[Integer(4),Integer(3)]])
>>> g.odd_isotropic_roots()
(0,)
```

rank()

Return the index set for this Dynkin diagram.

EXAMPLES:

```
sage: DynkinDiagram(['C',3]).rank()
3
sage: DynkinDiagram("A2","B2","F4").rank()
8
```

```
>>> from sage.all import *
>>> DynkinDiagram(['C',Integer(3)]).rank()
3
>>> DynkinDiagram("A2","B2","F4").rank()
8
```

relabel(**args*, ***kwds*)

Return the relabelled Dynkin diagram of `self`.

INPUT: see `relabel()`

There is one difference: the default value for `inplace` is `False` instead of `True`.

EXAMPLES:

```
sage: D = DynkinDiagram(['C',3])
sage: D.relabel({1:0, 2:4, 3:1})
O---O=<=O
0   4   1
C3 relabelled by {1: 0, 2: 4, 3: 1}
sage: D
O---O=<=O
1   2   3
C3

sage: _ = D.relabel({1:0, 2:4, 3:1}, inplace=True)
sage: D
O---O=<=O
0   4   1
C3 relabelled by {1: 0, 2: 4, 3: 1}

sage: D = DynkinDiagram(['A', [1,2]])
sage: Dp = D.relabel({-1:4, 0:-3, 1:3, 2:2})
sage: Dp
O---X---O---O
4   -3  3   2
A1|2 relabelled by {-1: 4, 0: -3, 1: 3, 2: 2}
sage: Dp.odd_isotropic_roots()
(-3,)

sage: D = DynkinDiagram(['D', 5])
sage: G, perm = D.relabel(range(5), return_map=True)
sage: G
        O 4
        |
        |
O---O---O---O
0   1   2   3
D5 relabelled by {1: 0, 2: 1, 3: 2, 4: 3, 5: 4}
sage: perm
{1: 0, 2: 1, 3: 2, 4: 3, 5: 4}

sage: perm = D.relabel(range(5), return_map=True, inplace=True)
sage: D
        O 4
        |
        |
O---O---O---O
0   1   2   3
D5 relabelled by {1: 0, 2: 1, 3: 2, 4: 3, 5: 4}
sage: perm
{1: 0, 2: 1, 3: 2, 4: 3, 5: 4}
```

```
>>> from sage.all import *
>>> D = DynkinDiagram(['C',Integer(3)])
>>> D.relabel({Integer(1):Integer(0), Integer(2):Integer(4),␣
```

(continues on next page)

(continued from previous page)

```
↪Integer(3):Integer(1)})
O---O=<=O
0   4   1
C3 relabelled by {1: 0, 2: 4, 3: 1}
>>> D
O---O=<=O
1   2   3
C3

>>> _ = D.relabel({Integer(1):Integer(0), Integer(2):Integer(4),␣
↪Integer(3):Integer(1)}, inplace=True)
>>> D
O---O=<=O
0   4   1
C3 relabelled by {1: 0, 2: 4, 3: 1}

>>> D = DynkinDiagram(['A', [Integer(1),Integer(2)]])
>>> Dp = D.relabel({-Integer(1):Integer(4), Integer(0):-Integer(3),␣
↪Integer(1):Integer(3), Integer(2):Integer(2)})
>>> Dp
O---X---O---O
4   -3  3   2
A1|2 relabelled by {-1: 4, 0: -3, 1: 3, 2: 2}
>>> Dp.odd_isotropic_roots()
(-3,)

>>> D = DynkinDiagram(['D', Integer(5)])
>>> G, perm = D.relabel(range(Integer(5)), return_map=True)
>>> G
        O 4
        |
        |
O---O---O---O
0   1   2   3
D5 relabelled by {1: 0, 2: 1, 3: 2, 4: 3, 5: 4}
>>> perm
{1: 0, 2: 1, 3: 2, 4: 3, 5: 4}

>>> perm = D.relabel(range(Integer(5)), return_map=True, inplace=True)
>>> D
        O 4
        |
        |
O---O---O---O
0   1   2   3
D5 relabelled by {1: 0, 2: 1, 3: 2, 4: 3, 5: 4}
>>> perm
{1: 0, 2: 1, 3: 2, 4: 3, 5: 4}
```

row(i)

Return the i-th row $(a_{i,j})_j$ of the Cartan matrix corresponding to this Dynkin diagram, as a container (or iterator) of tuples $(j, a_{i,j})$.

EXAMPLES:

```
sage: g = DynkinDiagram(["C",4])
sage: [ (i,a) for (i,a) in g.row(3) ]
[(3, 2), (2, -1), (4, -2)]
```

```
>>> from sage.all import *
>>> g = DynkinDiagram(["C",Integer(4)])
>>> [ (i,a) for (i,a) in g.row(Integer(3)) ]
[(3, 2), (2, -1), (4, -2)]
```

subtype(*index_set*)

Return a subtype of `self` given by `index_set`.

A subtype can be considered the Dynkin diagram induced from the Dynkin diagram of `self` by `index_set`.

EXAMPLES:

```
sage: D = DynkinDiagram(['A',6,2]); D
O=<=O---O=<=O
0   1   2   3
BC3~
sage: D.subtype([1,2,3])
Dynkin diagram of rank 3
```

```
>>> from sage.all import *
>>> D = DynkinDiagram(['A',Integer(6),Integer(2)]); D
O=<=O---O=<=O
0   1   2   3
BC3~
>>> D.subtype([Integer(1),Integer(2),Integer(3)])
Dynkin diagram of rank 3
```

symmetrizer()

Return the symmetrizer of the corresponding Cartan matrix.

EXAMPLES:

```
sage: d = DynkinDiagram()
sage: d.add_edge(1,2,3)
sage: d.add_edge(2,3)
sage: d.add_edge(3,4,3)
sage: d.symmetrizer()
Finite family {1: 9, 2: 3, 3: 3, 4: 1}
```

```
>>> from sage.all import *
>>> d = DynkinDiagram()
>>> d.add_edge(Integer(1),Integer(2),Integer(3))
>>> d.add_edge(Integer(2),Integer(3))
>>> d.add_edge(Integer(3),Integer(4),Integer(3))
>>> d.symmetrizer()
Finite family {1: 9, 2: 3, 3: 3, 4: 1}
```

`sage.combinat.root_system.dynkin_diagram.`**precheck**(*t*, *letter=None*, *length=None*, *affine=None*, *n_ge=None*, *n=None*)

EXAMPLES:

```
sage: from sage.combinat.root_system.dynkin_diagram import precheck
sage: ct = CartanType(['A',4])
sage: precheck(ct, letter='C')
Traceback (most recent call last):
...
ValueError: t[0] must be = 'C'
sage: precheck(ct, affine=1)
Traceback (most recent call last):
...
ValueError: t[2] must be = 1
sage: precheck(ct, length=3)
Traceback (most recent call last):
...
ValueError: len(t) must be = 3
sage: precheck(ct, n=3)
Traceback (most recent call last):
...
ValueError: t[1] must be = 3
sage: precheck(ct, n_ge=5)
Traceback (most recent call last):
...
ValueError: t[1] must be >= 5
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.dynkin_diagram import precheck
>>> ct = CartanType(['A',Integer(4)])
>>> precheck(ct, letter='C')
Traceback (most recent call last):
...
ValueError: t[0] must be = 'C'
>>> precheck(ct, affine=Integer(1))
Traceback (most recent call last):
...
ValueError: t[2] must be = 1
>>> precheck(ct, length=Integer(3))
Traceback (most recent call last):
...
ValueError: len(t) must be = 3
>>> precheck(ct, n=Integer(3))
Traceback (most recent call last):
...
ValueError: t[1] must be = 3
>>> precheck(ct, n_ge=Integer(5))
Traceback (most recent call last):
...
ValueError: t[1] must be >= 5
```

5.1.231 Hecke algebra representations

class sage.combinat.root_system.hecke_algebra_representation.**CherednikOperatorsEigenvectors**(*T*, *T_Y=None*, *normalized=True*)

Bases: UniqueRepresentation, SageObject

A class for the family of eigenvectors of the Y Cherednik operators for a module over a (Double) Affine Hecke algebra

INPUT:

- T – a family $(T_i)_{i\in I}$ implementing the action of the generators of an affine Hecke algebra on self. The intertwiner operators are built from these.
- T_Y – a family $(T_i^Y)_{i\in I}$ implementing the action of the generators of an affine Hecke algebra on self. By default, this is T. But this can be used to get the action of the full Double Affine Hecke Algebra. The Y operators are built from the T_Y.

This returns a function $\mu \mapsto E_\mu$ which uses intertwining operators to calculate recursively eigenvectors E_μ for the action of the torus of the affine Hecke algebra with eigenvalue given by f. Namely:

$$E_\mu.Y^{\lambda^\vee} = f(\lambda^\vee, \mu)E_\mu$$

Assumptions:

- seed(mu) initializes the recurrence by returning an appropriate eigenvector E_μ for μ trivial enough. For example, for nonsymmetric Macdonald polynomials seed(mu) returns the monomial X^μ for a minuscule weight μ.
- f is almost equivariant. Namely, $f(\lambda^\vee, \mu) = f(\lambda^\vee s_i, twist(\mu, i))$ whenever i is a descent of μ.
- $twist(\mu, i)$ maps μ closer to the dominant chamber whenever i is a descent of μ.

Todo

Add tests for the above assumptions, and also that the classical operators $T_1, \ldots, T_n$ from T and T_Y coincide.

Y()

Return the Cherednik operators.

EXAMPLES:

```
sage: W = WeylGroup(["B",2])
sage: K = QQ['q1,q2'].fraction_field()
sage: q1, q2 = K.gens()
sage: KW = W.algebra(K)
sage: E = KW.demazure_lusztig_eigenvectors(q1, q2)
sage: E.Y()
Lazy family (...)_{i in Coroot lattice of the Root system of type ['B', 2, 1]}
```

```
>>> from sage.all import *
>>> W = WeylGroup(["B",Integer(2)])
>>> K = QQ['q1,q2'].fraction_field()
>>> q1, q2 = K.gens()
```

(continues on next page)

(continued from previous page)

```
>>> KW = W.algebra(K)
>>> E = KW.demazure_lusztig_eigenvectors(q1, q2)
>>> E.Y()
Lazy family (...)_{i in Coroot lattice of the Root system of type ['B', 2, 1]}
```

affine_lift(*mu*)

Lift the index `\mu` to a space admitting an action of the affine Weyl group.

INPUT:

- `mu` – an element μ of the indexing set

In this space, one should have `first_descent` and `apply_simple_reflection` act properly.

EXAMPLES:

```
sage: W = WeylGroup(["A",3])
sage: W.element_class._repr_=lambda x: "".join(str(i) for i in x.reduced_
↪word())
sage: K = QQ['q1,q2']
sage: q1, q2 = K.gens()
sage: KW = W.algebra(K)
sage: E = KW.demazure_lusztig_eigenvectors(q1, q2)
sage: w = W.an_element(); w
123
sage: E.affine_lift(w)
121
```

```
>>> from sage.all import *
>>> W = WeylGroup(["A",Integer(3)])
>>> W.element_class._repr_=lambda x: "".join(str(i) for i in x.reduced_word())
>>> K = QQ['q1,q2']
>>> q1, q2 = K.gens()
>>> KW = W.algebra(K)
>>> E = KW.demazure_lusztig_eigenvectors(q1, q2)
>>> w = W.an_element(); w
123
>>> E.affine_lift(w)
121
```

affine_retract(*mu*)

Retract μ from a space admitting an action of the affine Weyl group.

EXAMPLES:

```
sage: W = WeylGroup(["A",3])
sage: W.element_class._repr_=lambda x: "".join(str(i) for i in x.reduced_
↪word())
sage: K = QQ['q1,q2']
sage: q1, q2 = K.gens()
sage: KW = W.algebra(K)
sage: E = KW.demazure_lusztig_eigenvectors(q1, q2)
sage: w = W.an_element(); w
123
```

(continues on next page)

(continued from previous page)

```
sage: E.affine_retract(E.affine_lift(w)) == w
True
```

```
>>> from sage.all import *
>>> W = WeylGroup(["A",Integer(3)])
>>> W.element_class._repr_=lambda x: "".join(str(i) for i in x.reduced_word())
>>> K = QQ['q1,q2']
>>> q1, q2 = K.gens()
>>> KW = W.algebra(K)
>>> E = KW.demazure_lusztig_eigenvectors(q1, q2)
>>> w = W.an_element(); w
123
>>> E.affine_retract(E.affine_lift(w)) == w
True
```

cartan_type()

Return Cartan type of `self`.

EXAMPLES:

```
sage: W = WeylGroup(["B",3])
sage: K = QQ['q1,q2']
sage: q1, q2 = K.gens()
sage: KW = W.algebra(K)
sage: E = KW.demazure_lusztig_eigenvectors(q1, q2)
sage: E.cartan_type()
['B', 3, 1]

sage: NonSymmetricMacdonaldPolynomials(["B", 2, 1]).cartan_type()          #␣
↪needs sage.graphs
['B', 2, 1]
```

```
>>> from sage.all import *
>>> W = WeylGroup(["B",Integer(3)])
>>> K = QQ['q1,q2']
>>> q1, q2 = K.gens()
>>> KW = W.algebra(K)
>>> E = KW.demazure_lusztig_eigenvectors(q1, q2)
>>> E.cartan_type()
['B', 3, 1]

>>> NonSymmetricMacdonaldPolynomials(["B", Integer(2), Integer(1)]).cartan_
↪type()           # needs sage.graphs
['B', 2, 1]
```

domain()

The module on which the affine Hecke algebra acts.

EXAMPLES:

```
sage: W = WeylGroup(["B",3])
sage: K = QQ['q1,q2']
```

(continues on next page)

(continued from previous page)

```
sage: q1, q2 = K.gens()
sage: KW = W.algebra(K)
sage: E = KW.demazure_lusztig_eigenvectors(q1, q2)
sage: E.domain()
Algebra of Weyl Group of type ['B', 3]
 (as a matrix group acting on the ambient space)
 over Multivariate Polynomial Ring in q1, q2 over Rational Field
```

```
>>> from sage.all import *
>>> W = WeylGroup(["B",Integer(3)])
>>> K = QQ['q1,q2']
>>> q1, q2 = K.gens()
>>> KW = W.algebra(K)
>>> E = KW.demazure_lusztig_eigenvectors(q1, q2)
>>> E.domain()
Algebra of Weyl Group of type ['B', 3]
 (as a matrix group acting on the ambient space)
 over Multivariate Polynomial Ring in q1, q2 over Rational Field
```

eigenvalue(*mu*, *l*)

Return the eigenvalue of $Y_{\lambda^\vee}$ on E_μ computed by applying $Y_{\lambda^\vee}$ on E_μ.

INPUT:

- `mu` – the index μ of an eigenvector, or a tentative eigenvector
- `l` – the index $\lambda^\vee$ of a Cherednik operator in `self.Y_index_set()`

This default implementation applies explicitly Y_μ to E_λ.

EXAMPLES:

```
sage: W = WeylGroup(["B",2])
sage: K = QQ['q1,q2'].fraction_field()
sage: q1, q2 = K.gens()
sage: KW = W.algebra(K)
sage: E = KW.demazure_lusztig_eigenvectors(q1, q2)
sage: w0 = W.long_element()
sage: Y = E.Y()
sage: alphacheck = Y.keys().simple_roots()
sage: E.eigenvalue(w0, alphacheck[1])
q1/(-q2)
sage: E.eigenvalue(w0, alphacheck[2])
q1/(-q2)
sage: E.eigenvalue(w0, alphacheck[0])
q2^2/q1^2
```

```
>>> from sage.all import *
>>> W = WeylGroup(["B",Integer(2)])
>>> K = QQ['q1,q2'].fraction_field()
>>> q1, q2 = K.gens()
>>> KW = W.algebra(K)
>>> E = KW.demazure_lusztig_eigenvectors(q1, q2)
>>> w0 = W.long_element()
```

(continues on next page)

(continued from previous page)

```
>>> Y = E.Y()
>>> alphacheck = Y.keys().simple_roots()
>>> E.eigenvalue(w0, alphacheck[Integer(1)])
q1/(-q2)
>>> E.eigenvalue(w0, alphacheck[Integer(2)])
q1/(-q2)
>>> E.eigenvalue(w0, alphacheck[Integer(0)])
q2^2/q1^2
```

The following checks that all E_w are eigenvectors, with eigenvalue given by Lemma 7.5 of [HST2008] (checked for A_2, A_3):

```
sage: Pcheck = Y.keys()
sage: Wcheck = Pcheck.weyl_group()
sage: P0check = Pcheck.classical()
sage: def height(root):
....:     return sum(P0check(root).coefficients())
sage: def eigenvalue(w, mu):
....:     return (-q2/q1)^height(Wcheck.from_reduced_word(w.reduced_word()).
↪action(mu))
sage: all(E.eigenvalue(w, a) == eigenvalue(w, a) for w in E.keys() for a in Y.
↪keys().simple_roots()) # long time (2.5s)
True
```

```
>>> from sage.all import *
>>> Pcheck = Y.keys()
>>> Wcheck = Pcheck.weyl_group()
>>> P0check = Pcheck.classical()
>>> def height(root):
...     return sum(P0check(root).coefficients())
>>> def eigenvalue(w, mu):
...     return (-q2/q1)**height(Wcheck.from_reduced_word(w.reduced_word()).
↪action(mu))
>>> all(E.eigenvalue(w, a) == eigenvalue(w, a) for w in E.keys() for a in Y.
↪keys().simple_roots()) # long time (2.5s)
True
```

eigenvalues(*mu*)

Return the eigenvalues of $Y_{\alpha_0}, \dots, Y_{\alpha_n}$ on E_μ.

INPUT:

- `mu` – the index μ of an eigenvector or a tentative eigenvector

EXAMPLES:

```
sage: W = WeylGroup(["B",2])
sage: K = QQ['q1,q2'].fraction_field()
sage: q1, q2 = K.gens()
sage: KW = W.algebra(K)
sage: E = KW.demazure_lusztig_eigenvectors(q1, q2)
sage: w0 = W.long_element()
sage: E.eigenvalues(w0)
```

(continues on next page)

(continued from previous page)

```
[q2^2/q1^2, q1/(-q2), q1/(-q2)]
sage: w = W.an_element()
sage: E.eigenvalues(w)
[(-q2)/q1, (-q2^2)/(-q1^2), q1^3/(-q2^3)]
```

```
>>> from sage.all import *
>>> W = WeylGroup(["B",Integer(2)])
>>> K = QQ['q1,q2'].fraction_field()
>>> q1, q2 = K.gens()
>>> KW = W.algebra(K)
>>> E = KW.demazure_lusztig_eigenvectors(q1, q2)
>>> w0 = W.long_element()
>>> E.eigenvalues(w0)
[q2^2/q1^2, q1/(-q2), q1/(-q2)]
>>> w = W.an_element()
>>> E.eigenvalues(w)
[(-q2)/q1, (-q2^2)/(-q1^2), q1^3/(-q2^3)]
```

hecke_parameters(*i*)

Return the Hecke parameters for index `i`.

EXAMPLES:

```
sage: W = WeylGroup(["B",3])
sage: K = QQ['q1,q2']
sage: q1, q2 = K.gens()
sage: KW = W.algebra(K)
sage: T = KW.demazure_lusztig_operators(q1, q2, affine=True)
sage: E = T.Y_eigenvectors()
sage: E.hecke_parameters(1)
(q1, q2)
sage: E.hecke_parameters(2)
(q1, q2)
sage: E.hecke_parameters(0)
(q1, q2)
```

```
>>> from sage.all import *
>>> W = WeylGroup(["B",Integer(3)])
>>> K = QQ['q1,q2']
>>> q1, q2 = K.gens()
>>> KW = W.algebra(K)
>>> T = KW.demazure_lusztig_operators(q1, q2, affine=True)
>>> E = T.Y_eigenvectors()
>>> E.hecke_parameters(Integer(1))
(q1, q2)
>>> E.hecke_parameters(Integer(2))
(q1, q2)
>>> E.hecke_parameters(Integer(0))
(q1, q2)
```

keys()

The index set for the eigenvectors.

By default, this assumes that the eigenvectors span the full affine Hecke algebra module and that the eigenvectors have the same indexing as the basis of this module.

EXAMPLES:

```
sage: W = WeylGroup(["A",3])
sage: K = QQ['q1,q2']
sage: q1, q2 = K.gens()
sage: KW = W.algebra(K)
sage: E = KW.demazure_lusztig_eigenvectors(q1, q2)
sage: E.keys()
Weyl Group of type ['A', 3] (as a matrix group acting on the ambient space)
```

```
>>> from sage.all import *
>>> W = WeylGroup(["A",Integer(3)])
>>> K = QQ['q1,q2']
>>> q1, q2 = K.gens()
>>> KW = W.algebra(K)
>>> E = KW.demazure_lusztig_eigenvectors(q1, q2)
>>> E.keys()
Weyl Group of type ['A', 3] (as a matrix group acting on the ambient space)
```

recursion(*mu*)

Return the indices used in the recursion.

INPUT:

- mu – the index μ of an eigenvector

EXAMPLES:

```
sage: W = WeylGroup(["A",3])
sage: W.element_class._repr_=lambda x: "".join(str(i) for i in x.reduced_
↪word())
sage: K = QQ['q1,q2'].fraction_field()
sage: q1, q2 = K.gens()
sage: KW = W.algebra(K)
sage: E = KW.demazure_lusztig_eigenvectors(q1, q2)
sage: w0 = W.long_element()
sage: E.recursion(w0)
[]
sage: w = W.an_element(); w
123
sage: E.recursion(w)
[1, 2, 1]
```

```
>>> from sage.all import *
>>> W = WeylGroup(["A",Integer(3)])
>>> W.element_class._repr_=lambda x: "".join(str(i) for i in x.reduced_word())
>>> K = QQ['q1,q2'].fraction_field()
>>> q1, q2 = K.gens()
>>> KW = W.algebra(K)
>>> E = KW.demazure_lusztig_eigenvectors(q1, q2)
>>> w0 = W.long_element()
>>> E.recursion(w0)
```

(continues on next page)

(continued from previous page)

```
[]
>>> w = W.an_element(); w
123
>>> E.recursion(w)
[1, 2, 1]
```

seed(*mu*)

Return the eigenvector for μ minuscule.

INPUT:

- `mu` – an element μ of the indexing set

OUTPUT: an element of `T.domain()`

This default implementation returns the monomial indexed by μ.

EXAMPLES:

```
sage: W = WeylGroup(["A",3])
sage: W.element_class._repr_=lambda x: "".join(str(i) for i in x.reduced_
↪word())
sage: K = QQ['q1,q2']
sage: q1, q2 = K.gens()
sage: KW = W.algebra(K)
sage: E = KW.demazure_lusztig_eigenvectors(q1, q2)
sage: E.seed(W.long_element())
123121
```

```
>>> from sage.all import *
>>> W = WeylGroup(["A",Integer(3)])
>>> W.element_class._repr_=lambda x: "".join(str(i) for i in x.reduced_word())
>>> K = QQ['q1,q2']
>>> q1, q2 = K.gens()
>>> KW = W.algebra(K)
>>> E = KW.demazure_lusztig_eigenvectors(q1, q2)
>>> E.seed(W.long_element())
123121
```

twist(*mu*, *i*)

Act by s_i on μ.

By default, this calls the method `apply_simple_reflection`.

EXAMPLES:

```
sage: W = WeylGroup(["B",3])
sage: W.element_class._repr_=lambda x: "".join(str(i) for i in x.reduced_
↪word())
sage: K = QQ['q1,q2']
sage: q1, q2 = K.gens()
sage: KW = W.algebra(K)
sage: T = KW.demazure_lusztig_operators(q1, q2, affine=True)
sage: E = T.Y_eigenvectors()
sage: w = W.an_element(); w
```

(continues on next page)

(continued from previous page)

```
123
sage: E.twist(w,1)
1231
```

```
>>> from sage.all import *
>>> W = WeylGroup(["B",Integer(3)])
>>> W.element_class._repr_=lambda x: "".join(str(i) for i in x.reduced_word())
>>> K = QQ['q1,q2']
>>> q1, q2 = K.gens()
>>> KW = W.algebra(K)
>>> T = KW.demazure_lusztig_operators(q1, q2, affine=True)
>>> E = T.Y_eigenvectors()
>>> w = W.an_element(); w
123
>>> E.twist(w,Integer(1))
1231
```

class sage.combinat.root_system.hecke_algebra_representation.**HeckeAlgebraRepresentation**(*domain*, *on_basis*, *cartan_type*, *q1*, *q2*, *q=1*, *side='right'*)

Bases: WithEqualityById, SageObject

A representation of an (affine) Hecke algebra given by the action of the T generators.

Let F_i be a family of operators implementing an action of the operators $(T_i)_{i\in I}$ of the Hecke algebra on some vector space domain, given by their action on the basis of domain. This constructs the family of operators $(F_w)_{w\in W}$ describing the action of all elements of the basis $(T_w)_{w\in W}$ of the Hecke algebra. This is achieved by linearity on the first argument, and applying recursively the F_i along a reduced word for $w = s_{i_1}\cdots s_{i_k}$:

$$F_w(x) = F_{i_k}\circ\cdots\circ F_{i_1}(x).$$

INPUT:

- domain – a vector space
- f – a function f(l,i) taking a basis element l of domain and an index i, and returning F_i
- cartan_type – the Cartan type of the Hecke algebra
- q1, q2 – the eigenvalues of the generators T of the Hecke algebra
- side – 'left' or 'right' (default: 'right') whether this is a left or right representation

EXAMPLES:

```
sage: K = QQ['q1,q2'].fraction_field()
sage: q1, q2 = K.gens()
sage: KW = WeylGroup(["A",3]).algebra(QQ)
sage: H = KW.demazure_lusztig_operators(q1,q2); H
```

(continues on next page)

(continued from previous page)

```
A representation of the (q1, q2)-Hecke algebra of type ['A', 3, 1]
on Algebra of Weyl Group of type ['A', 3]
(as a matrix group acting on the ambient space)
over Rational Field
```

```
>>> from sage.all import *
>>> K = QQ['q1,q2'].fraction_field()
>>> q1, q2 = K.gens()
>>> KW = WeylGroup(["A",Integer(3)]).algebra(QQ)
>>> H = KW.demazure_lusztig_operators(q1,q2); H
A representation of the (q1, q2)-Hecke algebra of type ['A', 3, 1]
on Algebra of Weyl Group of type ['A', 3]
(as a matrix group acting on the ambient space)
over Rational Field
```

Among other things, it implements the T_w operators, their inverses and compositions thereof:

```
sage: H.Tw((1,2))
Generic endomorphism of Algebra of Weyl Group of type ['A', 3]
(as a matrix group acting on the ambient space) over Rational Field
```

```
>>> from sage.all import *
>>> H.Tw((Integer(1),Integer(2)))
Generic endomorphism of Algebra of Weyl Group of type ['A', 3]
(as a matrix group acting on the ambient space) over Rational Field
```

and the Cherednik operators $Y^{\lambda^\vee}$:

```
sage: H.Y()
Lazy family (...)_{i in Coroot lattice of the Root system of type ['A', 3, 1]}
```

```
>>> from sage.all import *
>>> H.Y()
Lazy family (...)_{i in Coroot lattice of the Root system of type ['A', 3, 1]}
```

REFERENCES:

- [HST2008]

Ti_inverse_on_basis (x, i)

The T_i^{-1} operators, on basis elements.

INPUT:

- `x` – the index of a basis element
- `i` – the index of a generator

EXAMPLES:

```
sage: W = WeylGroup("A3")
sage: W.element_class._repr_=lambda x: "".join(str(i) for i in x.reduced_
↪word())
sage: K = QQ['q1,q2'].fraction_field()
```

(continues on next page)

(continued from previous page)

```
sage: q1, q2 = K.gens()
sage: KW = W.algebra(K)
sage: rho = KW.demazure_lusztig_operators(q1,q2)
sage: w = W.an_element()
sage: rho.Ti_inverse_on_basis(w, 1)
-1/q2*1231 + ((q1+q2)/(q1*q2))*123
```

```
>>> from sage.all import *
>>> W = WeylGroup("A3")
>>> W.element_class._repr_=lambda x: "".join(str(i) for i in x.reduced_word())
>>> K = QQ['q1,q2'].fraction_field()
>>> q1, q2 = K.gens()
>>> KW = W.algebra(K)
>>> rho = KW.demazure_lusztig_operators(q1,q2)
>>> w = W.an_element()
>>> rho.Ti_inverse_on_basis(w, Integer(1))
-1/q2*1231 + ((q1+q2)/(q1*q2))*123
```

Ti_on_basis(*x*, *i*)

The T_i operators, on basis elements.

INPUT:

- x – the index of a basis element
- i – the index of a generator

EXAMPLES:

```
sage: W = WeylGroup("A3")
sage: W.element_class._repr_=lambda x: "".join(str(i) for i in x.reduced_
↪word())
sage: K = QQ['q1,q2'].fraction_field()
sage: q1, q2 = K.gens()
sage: KW = W.algebra(K)
sage: rho = KW.demazure_lusztig_operators(q1,q2)
sage: w = W.an_element()
sage: rho.Ti_on_basis(w,1)
q1*1231
```

```
>>> from sage.all import *
>>> W = WeylGroup("A3")
>>> W.element_class._repr_=lambda x: "".join(str(i) for i in x.reduced_word())
>>> K = QQ['q1,q2'].fraction_field()
>>> q1, q2 = K.gens()
>>> KW = W.algebra(K)
>>> rho = KW.demazure_lusztig_operators(q1,q2)
>>> w = W.an_element()
>>> rho.Ti_on_basis(w,Integer(1))
q1*1231
```

Tw(*word*, *signs=None*, *scalar=None*)

Return T_w.

INPUT:

- `word` – a word $i_1, \ldots, i_k$ for some element w of the Weyl group See `straighten_word()` for how this word can be specified
- `signs` – list $\epsilon_1, \ldots, \epsilon_k$ of the same length as `word` with $\epsilon_i = \pm 1$ or `None` for $1, \ldots, 1$ (default: `None`)
- `scalar` – an element c of the base ring or `None` for 1 (default: `None`)

OUTPUT: a module morphism implementing

$$T_w = T_{i_k} \circ \cdots \circ T_{i_1}$$

in left action notation; that is T_{i_1} is applied first, then T_{i_2}, etc.

More generally, if `scalar` or `signs` is specified, the morphism implements

$$cT_{i_k}^{\epsilon_k} \circ \cdots \circ T_{i_1}^{\epsilon_k}.$$

EXAMPLES:

```
sage: W = WeylGroup("A3")
sage: W.element_class._repr_=lambda x: ('e' if not x.reduced_word()
....:                   else "".join(str(i) for i in x.reduced_word()))
sage: K = QQ['q1,q2'].fraction_field()
sage: q1, q2 = K.gens()
sage: KW = W.algebra(K)
sage: x = KW.an_element(); x
123 + 3*2312 + 2*31 + e

sage: T = KW.demazure_lusztig_operators(q1,q2)
sage: T12 = T.Tw( (1,2) )
sage: T12(KW.one())
q1^2*12
```

```
>>> from sage.all import *
>>> W = WeylGroup("A3")
>>> W.element_class._repr_=lambda x: ('e' if not x.reduced_word()
...                   else "".join(str(i) for i in x.reduced_word()))
>>> K = QQ['q1,q2'].fraction_field()
>>> q1, q2 = K.gens()
>>> KW = W.algebra(K)
>>> x = KW.an_element(); x
123 + 3*2312 + 2*31 + e

>>> T = KW.demazure_lusztig_operators(q1,q2)
>>> T12 = T.Tw( (Integer(1),Integer(2)) )
>>> T12(KW.one())
q1^2*12
```

This is $T_2 \circ T_1$:

```
sage: T[2](T[1](KW.one()))
q1^2*12
sage: T[1](T[2](KW.one()))
q1^2*21
sage: T12(x) == T[2](T[1](x))
True
```

```
>>> from sage.all import *
>>> T[Integer(2)](T[Integer(1)](KW.one()))
q1^2*12
>>> T[Integer(1)](T[Integer(2)](KW.one()))
q1^2*21
>>> T12(x) == T[Integer(2)](T[Integer(1)](x))
True
```

Now with signs and scalar coefficient we construct $3T_2 \circ T_1^{-1}$:

```
sage: phi = T.Tw((1,2), (-1,1), 3)
sage: phi(KW.one())
-3*q1/q2*12 + ((3*q1+3*q2)/q2)*2
sage: phi(T[1](x)) == 3*T[2](x)
True
```

```
>>> from sage.all import *
>>> phi = T.Tw((Integer(1),Integer(2)), (-Integer(1),Integer(1)), Integer(3))
>>> phi(KW.one())
-3*q1/q2*12 + ((3*q1+3*q2)/q2)*2
>>> phi(T[Integer(1)](x)) == Integer(3)*T[Integer(2)](x)
True
```

For debugging purposes, one can recover the input data:

```
sage: phi.word
(1, 2)
sage: phi.signs
(-1, 1)
sage: phi.scalar
3
```

```
>>> from sage.all import *
>>> phi.word
(1, 2)
>>> phi.signs
(-1, 1)
>>> phi.scalar
3
```

Tw_inverse(*word*)

Return T_w^{-1}.

This is essentially a shorthand for *Tw()* with all minus signs.

Todo

Add an example where $T_i \neq T_i^{-1}$

EXAMPLES:

```
sage: W = WeylGroup(["A",3])
sage: W.element_class._repr_ = lambda x: "".join(str(i) for i in x.reduced_
↪word())
sage: KW = W.algebra(QQ)
sage: rho = KW.demazure_lusztig_operators(1, -1)
sage: x = KW.monomial(W.an_element()); x
123
sage: word = [1,2]
sage: rho.Tw(word)(x)
12312
sage: rho.Tw_inverse(word)(x)
12321

sage: K = QQ['q1,q2'].fraction_field()
sage: q1, q2 = K.gens()
sage: KW = W.algebra(K)
sage: rho = KW.demazure_lusztig_operators(q1, q2)
sage: x = KW.monomial(W.an_element()); x
123
sage: rho.Tw_inverse(word)(x)
1/q2^2*12321 - ((q1+q2)/(q1*q2^2))*1231 - ((q1+q2)/(q1*q2^2))*1232
+ ((q1^2+2*q1*q2+q2^2)/(q1^2*q2^2))*123
sage: rho.Tw(word)(_)
123
```

```
>>> from sage.all import *
>>> W = WeylGroup(["A",Integer(3)])
>>> W.element_class._repr_ = lambda x: "".join(str(i) for i in x.reduced_
↪word())
>>> KW = W.algebra(QQ)
>>> rho = KW.demazure_lusztig_operators(Integer(1), -Integer(1))
>>> x = KW.monomial(W.an_element()); x
123
>>> word = [Integer(1),Integer(2)]
>>> rho.Tw(word)(x)
12312
>>> rho.Tw_inverse(word)(x)
12321

>>> K = QQ['q1,q2'].fraction_field()
>>> q1, q2 = K.gens()
>>> KW = W.algebra(K)
>>> rho = KW.demazure_lusztig_operators(q1, q2)
>>> x = KW.monomial(W.an_element()); x
123
>>> rho.Tw_inverse(word)(x)
1/q2^2*12321 - ((q1+q2)/(q1*q2^2))*1231 - ((q1+q2)/(q1*q2^2))*1232
+ ((q1^2+2*q1*q2+q2^2)/(q1^2*q2^2))*123
>>> rho.Tw(word)(_)
123
```

Y(*base_ring=Integer Ring*)

Return the Cherednik operators Y for this representation of an affine Hecke algebra.

INPUT:

- `self` – a representation of an affine Hecke algebra
- `base_ring` – the base ring of the coroot lattice

This is a family of operators indexed by the coroot lattice for this Cartan type. In practice this is currently indexed instead by the affine coroot lattice, even if this indexing is not one to one, in order to allow for $Y[\alpha_0^\vee]$.

EXAMPLES:

```
sage: W = WeylGroup(["A",3])
sage: K = QQ['q1,q2'].fraction_field()
sage: q1, q2 = K.gens()
sage: KW = W.algebra(K)
sage: rho = KW.demazure_lusztig_operators(q2, q1)
sage: Y = rho.Y(); Y
Lazy family (...(i))_{i in Coroot lattice of the Root system of type ['A', 3,␣
↪1]}
```

```
>>> from sage.all import *
>>> W = WeylGroup(["A",Integer(3)])
>>> K = QQ['q1,q2'].fraction_field()
>>> q1, q2 = K.gens()
>>> KW = W.algebra(K)
>>> rho = KW.demazure_lusztig_operators(q2, q1)
>>> Y = rho.Y(); Y
Lazy family (...(i))_{i in Coroot lattice of the Root system of type ['A', 3,␣
↪1]}
```

Y_eigenvectors()

Return the family of eigenvectors for the Cherednik operators Y of this representation of an affine Hecke algebra.

INPUT:

- `self` – a representation of an affine Hecke algebra
- `base_ring` – the base ring of the coroot lattice

EXAMPLES:

```
sage: W = WeylGroup(["B",2])
sage: W.element_class._repr_=lambda x: "".join(str(i) for i in x.reduced_
↪word())
sage: K = QQ['q1,q2'].fraction_field()
sage: q1, q2 = K.gens()
sage: KW = W.algebra(K)
sage: rho = KW.demazure_lusztig_operators(q1, q2, affine=True)
sage: E = rho.Y_eigenvectors()
sage: E.keys()
Weyl Group of type ['B', 2] (as a matrix group acting on the ambient space)
sage: w0 = W.long_element()
```

```
>>> from sage.all import *
>>> W = WeylGroup(["B",Integer(2)])
>>> W.element_class._repr_=lambda x: "".join(str(i) for i in x.reduced_word())
```

(continues on next page)

(continued from previous page)

```
>>> K = QQ['q1,q2'].fraction_field()
>>> q1, q2 = K.gens()
>>> KW = W.algebra(K)
>>> rho = KW.demazure_lusztig_operators(q1, q2, affine=True)
>>> E = rho.Y_eigenvectors()
>>> E.keys()
Weyl Group of type ['B', 2] (as a matrix group acting on the ambient space)
>>> w0 = W.long_element()
```

To set the recurrence up properly, one often needs to customize the *CherednikOperatorsEigenvectors.affine_lift()* and *CherednikOperatorsEigenvectors.affine_retract()* methods. This would usually be done by subclassing *CherednikOperatorsEigenvectors*; here we just override the methods directly.

In this particular case, we multiply by w_0 to take into account that w_0 is the seed for the recursion:

```
sage: E.affine_lift = w0._mul_
sage: E.affine_retract = w0._mul_

sage: E[w0]
2121
sage: E.eigenvalues(E[w0])
[q2^2/q1^2, q1/(-q2), q1/(-q2)]
```

```
>>> from sage.all import *
>>> E.affine_lift = w0._mul_
>>> E.affine_retract = w0._mul_

>>> E[w0]
2121
>>> E.eigenvalues(E[w0])
[q2^2/q1^2, q1/(-q2), q1/(-q2)]
```

This step is taken care of automatically if one instead calls the specialization `sage.coxeter_groups.CoxeterGroups.Algebras.demazure_lusztig_eigenvectors()`.

Now we can compute all eigenvectors:

```
sage: [E[w] for w in W]
[2121 - 121 - 212 + 12 + 21 - 1 - 2 + ,
 -2121 + 212,
 (q2/(q1-q2))*2121 + (q2/(-q1+q2))*121 + (q2/(-q1+q2))*212 - 12 - (q2/(-
↪q1+q2))*21 + 2,
 -(q2^2/(-q1^2+q1*q2-q2^2))*2121 - 121 + (q2^2/(-q1^2+q1*q2-q2^2))*212 + 21,
 -((q1^2+q2^2)/(q1^2-q1*q2+q2^2))*2121 - ((q1^2+q2^2)/(-q1^2+q1*q2-q2^2))*121
 - (q2^2/(-q1^2+q1*q2-q2^2))*212 + (q2^2/(-q1^2+q1*q2-q2^2))*12 - 21 + 1,
 2121,
 (q2/(-q1+q2))*2121 - (q2/(-q1+q2))*121 - 212 + 12,
 -2121 + 121]
```

```
>>> from sage.all import *
>>> [E[w] for w in W]
[2121 - 121 - 212 + 12 + 21 - 1 - 2 + ,
```

(continues on next page)

(continued from previous page)

```
-2121 + 212,
(q2/(q1-q2))*2121 + (q2/(-q1+q2))*121 + (q2/(-q1+q2))*212 - 12 - (q2/(-
↪q1+q2))*21 + 2,
-(q2^2/(-q1^2+q1*q2-q2^2))*2121 - 121 + (q2^2/(-q1^2+q1*q2-q2^2))*212 + 21,
-((q1^2+q2^2)/(q1^2-q1*q2+q2^2))*2121 - ((q1^2+q2^2)/(-q1^2+q1*q2-q2^2))*121
- (q2^2/(-q1^2+q1*q2-q2^2))*212 + (q2^2/(-q1^2+q1*q2-q2^2))*12 - 21 + 1,
2121,
(q2/(-q1+q2))*2121 - (q2/(-q1+q2))*121 - 212 + 12,
-2121 + 121]
```

Y_lambdacheck(*lambdacheck*)

Return the Cherednik operators $Y^{\lambda^\vee}$ for this representation of an affine Hecke algebra.

INPUT:

- `lambdacheck` – an element of the coroot lattice for this Cartan type

EXAMPLES:

```
sage: W = WeylGroup(["B",2])
sage: W.element_class._repr_=lambda x: "".join(str(i) for i in x.reduced_
↪word())
sage: K = QQ['q1,q2'].fraction_field()
sage: q1, q2 = K.gens()
sage: KW = W.algebra(K)
```

```
>>> from sage.all import *
>>> W = WeylGroup(["B",Integer(2)])
>>> W.element_class._repr_=lambda x: "".join(str(i) for i in x.reduced_word())
>>> K = QQ['q1,q2'].fraction_field()
>>> q1, q2 = K.gens()
>>> KW = W.algebra(K)
```

We take q_2 and q_1 as eigenvalues to match with the notations of [HST2008]

```
sage: rho = KW.demazure_lusztig_operators(q2, q1)
sage: L = rho.Y().keys()
sage: alpha = L.simple_roots()
sage: Y0 = rho.Y_lambdacheck(alpha[0])
sage: Y1 = rho.Y_lambdacheck(alpha[1])
sage: Y2 = rho.Y_lambdacheck(alpha[2])

sage: x = KW.monomial(W.an_element()); x
12
sage: Y1(x)
-((q1^2+2*q1*q2+q2^2)/(-q2^2))*2121
+ ((q1^3+q1^2*q2+q1*q2^2+q2^3)/(-q1*q2^2))*121
+ ((q1^2+q1*q2)/(-q2^2))*212 - (q1^2/(-q2^2))*12
sage: Y2(x)
-((q1^4+q1^3*q2+q1*q2^3+q2^4)/(-q1^3*q2))*2121
+ ((q1^3+q1^2*q2+q1*q2^2+q2^3)/(-q1^2*q2))*121
+ (q2^3/(-q1^3))*12
sage: Y1(Y2(x))
```

(continues on next page)

(continued from previous page)

```
((q1*q2+q2^2)/q1^2)*212 - q2/q1*12
sage: Y2(Y1(x))
((q1*q2+q2^2)/q1^2)*212 - q2/q1*12
```

```
>>> from sage.all import *
>>> rho = KW.demazure_lusztig_operators(q2, q1)
>>> L = rho.Y().keys()
>>> alpha = L.simple_roots()
>>> Y0 = rho.Y_lambdacheck(alpha[Integer(0)])
>>> Y1 = rho.Y_lambdacheck(alpha[Integer(1)])
>>> Y2 = rho.Y_lambdacheck(alpha[Integer(2)])

>>> x = KW.monomial(W.an_element()); x
12
>>> Y1(x)
-((q1^2+2*q1*q2+q2^2)/(-q2^2))*2121
+ ((q1^3+q1^2*q2+q1*q2^2+q2^3)/(-q1*q2^2))*121
+ ((q1^2+q1*q2)/(-q2^2))*212 - (q1^2/(-q2^2))*12
>>> Y2(x)
-((q1^4+q1^3*q2+q1*q2^3+q2^4)/(-q1^3*q2))*2121
+ ((q1^3+q1^2*q2+q1*q2^2+q2^3)/(-q1^2*q2))*121
+ (q2^3/(-q1^3))*12
>>> Y1(Y2(x))
((q1*q2+q2^2)/q1^2)*212 - q2/q1*12
>>> Y2(Y1(x))
((q1*q2+q2^2)/q1^2)*212 - q2/q1*12
```

The Y operators commute:

```
sage: Y0(Y1(x)) - Y1(Y0(x))
0
sage: Y2(Y1(x)) - Y1(Y2(x))
0
```

```
>>> from sage.all import *
>>> Y0(Y1(x)) - Y1(Y0(x))
0
>>> Y2(Y1(x)) - Y1(Y2(x))
0
```

In the classical root lattice, $\alpha_0 + \alpha_1 + \alpha_2 = 0$:

```
sage: Y0(Y1(Y2(x)))
12
```

```
>>> from sage.all import *
>>> Y0(Y1(Y2(x)))
12
```

Lemma 7.2 of [HST2008]:

```
sage: w0 = KW.monomial(W.long_element())
sage: rho.Tw(0)(w0)
q2
sage: rho.Tw_inverse(1)(w0)
1/q2*212
sage: rho.Tw_inverse(2)(w0)
1/q2*121
```

```
>>> from sage.all import *
>>> w0 = KW.monomial(W.long_element())
>>> rho.Tw(Integer(0))(w0)
q2
>>> rho.Tw_inverse(Integer(1))(w0)
1/q2*212
>>> rho.Tw_inverse(Integer(2))(w0)
1/q2*121
```

Lemma 7.5 of [HST2008]:

```
sage: Y0(w0)
q1^2/q2^2*2121
sage: Y1(w0)
(q2/(-q1))*2121
sage: Y2(w0)
(q2/(-q1))*2121
```

```
>>> from sage.all import *
>>> Y0(w0)
q1^2/q2^2*2121
>>> Y1(w0)
(q2/(-q1))*2121
>>> Y2(w0)
(q2/(-q1))*2121
```

Todo

Add more tests

Add tests in type BC affine where the null coroot $\delta^\vee$ can have non trivial coefficient in term of α_0

See also:

- [HST2008] for the formula in terms of q_1, q_2

cartan_type()

Return the Cartan type of `self`.

EXAMPLES:

```
sage: from sage.combinat.root_system.hecke_algebra_representation import␣
↪HeckeAlgebraRepresentation
sage: KW = SymmetricGroup(3).algebra(QQ)
sage: action = lambda x,i: KW.monomial(x.apply_simple_reflection(i, side=
↪'right'))
sage: H = HeckeAlgebraRepresentation(KW, action, CartanType(["A",2]), 1, -1)
sage: H.cartan_type()
['A', 2]

sage: H = WeylGroup(["A",3]).algebra(QQ).demazure_lusztig_operators(-1,1)
sage: H.cartan_type()
['A', 3, 1]
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.hecke_algebra_representation import␣
↪HeckeAlgebraRepresentation
>>> KW = SymmetricGroup(Integer(3)).algebra(QQ)
>>> action = lambda x,i: KW.monomial(x.apply_simple_reflection(i, side='right
↪'))
>>> H = HeckeAlgebraRepresentation(KW, action, CartanType(["A",Integer(2)]),␣
↪Integer(1), -Integer(1))
>>> H.cartan_type()
['A', 2]

>>> H = WeylGroup(["A",Integer(3)]).algebra(QQ).demazure_lusztig_operators(-
↪Integer(1),Integer(1))
>>> H.cartan_type()
['A', 3, 1]
```

domain()

Return the domain of `self`.

EXAMPLES:

```
sage: H = WeylGroup(["A",3]).algebra(QQ).demazure_lusztig_operators(-1,1)
sage: H.domain()
Algebra of Weyl Group of type ['A', 3] (as a matrix group
 acting on the ambient space) over Rational Field
```

```
>>> from sage.all import *
>>> H = WeylGroup(["A",Integer(3)]).algebra(QQ).demazure_lusztig_operators(-
↪Integer(1),Integer(1))
>>> H.domain()
Algebra of Weyl Group of type ['A', 3] (as a matrix group
 acting on the ambient space) over Rational Field
```

on_basis(*x*, *word*, *signs=None*, *scalar=None*)

Action of product of T_i and T_i^{-1} on x.

INPUT:

- `x` – the index of a basis element
- `word` – word of indices of generators

- `signs` – (default: `None`) sequence of signs of same length as `word`; determines which operators are supposed to be taken as inverses.
- `scalar` – (default: `None`) scalar to multiply the answer by

EXAMPLES:

```
sage: from sage.combinat.root_system.hecke_algebra_representation import␣
↪HeckeAlgebraRepresentation
sage: W = SymmetricGroup(3)
sage: domain = W.algebra(QQ)
sage: action = lambda x,i: domain.monomial(x.apply_simple_reflection(i, side=
↪'right'))
sage: rho = HeckeAlgebraRepresentation(domain, action, CartanType(["A",2]), 1,
↪ -1)

sage: rho.on_basis(W.one(), (1,2,1))
(1,3)

sage: word = (1,2)
sage: u = W.from_reduced_word(word)
sage: for w in W:  assert rho.on_basis(w, word) == domain.monomial(w*u)
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.hecke_algebra_representation import␣
↪HeckeAlgebraRepresentation
>>> W = SymmetricGroup(Integer(3))
>>> domain = W.algebra(QQ)
>>> action = lambda x,i: domain.monomial(x.apply_simple_reflection(i, side=
↪'right'))
>>> rho = HeckeAlgebraRepresentation(domain, action, CartanType(["A",
↪Integer(2)]), Integer(1), -Integer(1))

>>> rho.on_basis(W.one(), (Integer(1),Integer(2),Integer(1)))
(1,3)

>>> word = (Integer(1),Integer(2))
>>> u = W.from_reduced_word(word)
>>> for w in W:  assert rho.on_basis(w, word) == domain.monomial(w*u)
```

The next example tests the signs:

```
sage: W = WeylGroup("A3")
sage: W.element_class._repr_=lambda x: "".join(str(i) for i in x.reduced_
↪word())
sage: K = QQ['q1,q2'].fraction_field()
sage: q1, q2 = K.gens()
sage: KW = W.algebra(K)
sage: rho = KW.demazure_lusztig_operators(q1,q2)
sage: w = W.an_element(); w
123
sage: rho.on_basis(w, (1,),  signs=(-1,))
-1/q2*1231 + ((q1+q2)/(q1*q2))*123
sage: rho.on_basis(w, (1,),  signs=( 1,))
```

(continues on next page)

(continued from previous page)

```
q1*1231
sage: rho.on_basis(w, (1,1), signs=(1,-1))
123
sage: rho.on_basis(w, (1,1), signs=(-1,1))
123
```

```
>>> from sage.all import *
>>> W = WeylGroup("A3")
>>> W.element_class._repr_=lambda x: "".join(str(i) for i in x.reduced_word())
>>> K = QQ['q1,q2'].fraction_field()
>>> q1, q2 = K.gens()
>>> KW = W.algebra(K)
>>> rho = KW.demazure_lusztig_operators(q1,q2)
>>> w = W.an_element(); w
123
>>> rho.on_basis(w, (Integer(1),),  signs=(-Integer(1),))
-1/q2*1231 + ((q1+q2)/(q1*q2))*123
>>> rho.on_basis(w, (Integer(1),),  signs=( Integer(1),))
q1*1231
>>> rho.on_basis(w, (Integer(1),Integer(1)), signs=(Integer(1),-Integer(1)))
123
>>> rho.on_basis(w, (Integer(1),Integer(1)), signs=(-Integer(1),Integer(1)))
123
```

parameters(i)

Return q_1, q_2 such that $(T_i - q_1)(T_i - q_2) = 0$.

EXAMPLES:

```
sage: K = QQ['q1,q2'].fraction_field()
sage: q1, q2 = K.gens()
sage: KW = WeylGroup(["A",3]).algebra(QQ)
sage: H = KW.demazure_lusztig_operators(q1,q2)
sage: H.parameters(1)
(q1, q2)

sage: H = KW.demazure_lusztig_operators(1,-1)
sage: H.parameters(1)
(1, -1)
```

```
>>> from sage.all import *
>>> K = QQ['q1,q2'].fraction_field()
>>> q1, q2 = K.gens()
>>> KW = WeylGroup(["A",Integer(3)]).algebra(QQ)
>>> H = KW.demazure_lusztig_operators(q1,q2)
>>> H.parameters(Integer(1))
(q1, q2)

>>> H = KW.demazure_lusztig_operators(Integer(1),-Integer(1))
>>> H.parameters(Integer(1))
(1, -1)
```

Todo

At this point, this method is constant. It's meant as a starting point for implementing parameters depending on the node i of the Dynkin diagram.

straighten_word(*word*)

Return a tuple of indices of generators after some straightening.

INPUT:

- `word` – a list/tuple of indices of generators, the index of a generator, or an object with a reduced word method

OUTPUT: a tuple of indices of generators

EXAMPLES:

```
sage: W = WeylGroup(["A",3])
sage: H = W.algebra(QQ).demazure_lusztig_operators(-1,1)
sage: H.straighten_word(1)
(1,)
sage: H.straighten_word((2,1))
(2, 1)
sage: H.straighten_word([2,1])
(2, 1)
sage: H.straighten_word(W.an_element())
(1, 2, 3)
```

```
>>> from sage.all import *
>>> W = WeylGroup(["A",Integer(3)])
>>> H = W.algebra(QQ).demazure_lusztig_operators(-Integer(1),Integer(1))
>>> H.straighten_word(Integer(1))
(1,)
>>> H.straighten_word((Integer(2),Integer(1)))
(2, 1)
>>> H.straighten_word([Integer(2),Integer(1)])
(2, 1)
>>> H.straighten_word(W.an_element())
(1, 2, 3)
```

5.1.232 Integrable Representations of Affine Lie Algebras

class sage.combinat.root_system.integrable_representations.**IntegrableRepresentation**(*Lam*)

Bases: `UniqueRepresentation`, `CategoryObject`

An irreducible integrable highest weight representation of an affine Lie algebra.

INPUT:

- `Lam` – a dominant weight in an extended weight lattice of affine type

REFERENCES:

- [Ka1990]

If Λ is a dominant integral weight for an affine root system, there exists a unique integrable representation $V = V_\Lambda$ of highest weight Λ. If μ is another weight, let $m(\mu)$ denote the multiplicity of the weight μ in this representation.

The set supp(V) of μ such that $m(\mu) > 0$ is contained in the paraboloid

$$(\Lambda + \rho|\Lambda + \rho) - (\mu + \rho|\mu + \rho) \geq 0$$

where $(|)$ is the invariant inner product on the weight lattice and ρ is the Weyl vector. Moreover if $m(\mu) > 0$ then $\mu \in$ supp(V) differs from Λ by an element of the root lattice ([Ka1990], Propositions 11.3 and 11.4).

Let δ be the nullroot, which is the lowest positive imaginary root. Then by [Ka1990], Proposition 11.3 or Corollary 11.9, for fixed μ the function $m(\mu - k\delta)$ is a monotone increasing function of k. It is useful to take μ to be such that this function is nonzero if and only if $k \geq 0$. Therefore we make the following definition. If μ is such that $m(\mu) \neq 0$ but $m(\mu + \delta) = 0$ then μ is called *maximal*.

Since δ is fixed under the action of the affine Weyl group, and since the weight multiplicities are Weyl group invariant, the function $k \mapsto m(\mu - k\delta)$ is unchanged if μ is replaced by an equivalent weight. Therefore in tabulating these functions, we may assume that μ is dominant. There are only a finite number of dominant maximal weights.

Since every nonzero weight multiplicity appears in the string $\mu - k\delta$ for one of the finite number of dominant maximal weights μ, it is important to be able to compute these. We may do this as follows.

EXAMPLES:

```

↪1155717 2777795
```

In this example, we construct the extended weight lattice of Cartan type $A_3^{(1)}$, then define `Lambda` to be the fundamental weights $(\Lambda_i)_{i\in I}$. We find there are 5 maximal dominant weights in irreducible representation of highest weight $\Lambda_1 + \Lambda_2 + \Lambda_3$, and we determine their strings.

It was shown in [KacPeterson] that each string is the set of Fourier coefficients of a modular form.

Every weight μ such that the weight multiplicity $m(\mu)$ is nonzero has the form

$$\Lambda - n_0\alpha_0 - n_1\alpha_1 - \cdots,$$

where the n_i are nonnegative integers. This is represented internally as a tuple $(n_0, n_1, n_2, \ldots)$. If you want an individual multiplicity you use the method *m()* and supply it with this tuple:

```
sage: Lambda = RootSystem(['C',2,1]).weight_lattice(extended=true).fundamental_
↪weights()
sage: V = IntegrableRepresentation(2*Lambda[0]); V
Integrable representation of ['C', 2, 1] with highest weight 2*Lambda[0]
sage: V.m((3,5,3))
18
```

```
>>> from sage.all import *
>>> Lambda = RootSystem(['C',Integer(2),Integer(1)]).weight_
↪lattice(extended=true).fundamental_weights()
>>> V = IntegrableRepresentation(Integer(2)*Lambda[Integer(0)]); V
Integrable representation of ['C', 2, 1] with highest weight 2*Lambda[0]
>>> V.m((Integer(3),Integer(5),Integer(3)))
18
```

The *IntegrableRepresentation* class has methods *to_weight()* and *from_weight()* to convert between this internal representation and the weight lattice:

```
sage: delta = V.weight_lattice().null_root()
sage: V.to_weight((4,3,2))
-3*Lambda[0] + 6*Lambda[1] - Lambda[2] - 4*delta
sage: V.from_weight(-3*Lambda[0] + 6*Lambda[1] - Lambda[2] - 4*delta)
(4, 3, 2)
```

```
>>> from sage.all import *
>>> delta = V.weight_lattice().null_root()
>>> V.to_weight((Integer(4),Integer(3),Integer(2)))
-3*Lambda[0] + 6*Lambda[1] - Lambda[2] - 4*delta
>>> V.from_weight(-Integer(3)*Lambda[Integer(0)] + Integer(6)*Lambda[Integer(1)] -
↪ Lambda[Integer(2)] - Integer(4)*delta)
(4, 3, 2)
```

To get more values, use the depth parameter:

```
sage: L0 = RootSystem(["A",1,1]).weight_lattice(extended=true).fundamental_
↪weight(0); L0
Lambda[0]
sage: IntegrableRepresentation(4*L0).print_strings(depth=20)
4*Lambda[0]: 1 1 3 6 13 23 44 75 131 215 354 561 889 1368 2097 3153 4712 6936␣
↪10151 14677
2*Lambda[0] + 2*Lambda[1] - delta: 1 2 5 10 20 36 66 112 190 310 501 788 1230␣
↪1880 2850 4256 6303 9222 13396 19262
4*Lambda[1] - 2*delta: 1 2 6 11 23 41 75 126 215 347 561 878 1368 2082 3153 4690␣
↪6936 10121 14677 21055
```

```
>>> from sage.all import *
>>> L0 = RootSystem(["A",Integer(1),Integer(1)]).weight_lattice(extended=true).
↪fundamental_weight(Integer(0)); L0
Lambda[0]
>>> IntegrableRepresentation(Integer(4)*L0).print_strings(depth=Integer(20))
4*Lambda[0]: 1 1 3 6 13 23 44 75 131 215 354 561 889 1368 2097 3153 4712 6936␣
↪10151 14677
2*Lambda[0] + 2*Lambda[1] - delta: 1 2 5 10 20 36 66 112 190 310 501 788 1230␣
↪1880 2850 4256 6303 9222 13396 19262
4*Lambda[1] - 2*delta: 1 2 6 11 23 41 75 126 215 347 561 878 1368 2082 3153 4690␣
↪6936 10121 14677 21055
```

An example in type $C_2^{(1)}$:

```
sage: Lambda = RootSystem(['C',2,1]).weight_lattice(extended=true).fundamental_
↪weights()
sage: V = IntegrableRepresentation(2*Lambda[0])
sage: V.print_strings()     # long time
2*Lambda[0]: 1 2 9 26 77 194 477 1084 2387 5010 10227 20198
Lambda[0] + Lambda[2] - delta: 1 5 18 55 149 372 872 1941 4141 8523 17005 33019
2*Lambda[1] - delta: 1 4 15 44 122 304 721 1612 3469 7176 14414 28124
2*Lambda[2] - 2*delta: 2 7 26 72 194 467 1084 2367 5010 10191 20198 38907
```

```
>>> from sage.all import *
>>> Lambda = RootSystem(['C',Integer(2),Integer(1)]).weight_
↪lattice(extended=true).fundamental_weights()
>>> V = IntegrableRepresentation(Integer(2)*Lambda[Integer(0)])
>>> V.print_strings()     # long time
2*Lambda[0]: 1 2 9 26 77 194 477 1084 2387 5010 10227 20198
Lambda[0] + Lambda[2] - delta: 1 5 18 55 149 372 872 1941 4141 8523 17005 33019
2*Lambda[1] - delta: 1 4 15 44 122 304 721 1612 3469 7176 14414 28124
2*Lambda[2] - 2*delta: 2 7 26 72 194 467 1084 2367 5010 10191 20198 38907
```

Examples for twisted affine types:

```
sage: Lambda = RootSystem(["A",2,2]).weight_lattice(extended=True).fundamental_
→weights()
sage: IntegrableRepresentation(Lambda[0]).strings()
{Lambda[0]: [1, 1, 2, 3, 5, 7, 11, 15, 22, 30, 42, 56]}
sage: Lambda = RootSystem(['G',2,1]).dual.weight_lattice(extended=true).

branch(*i=None*, *weyl_character_ring=None*, *sequence=None*, *depth=5*)

Return the branching rule on `self`.

Removing any node from the extended Dynkin diagram of the affine Lie algebra results in the Dynkin diagram of a classical Lie algebra, which is therefore a Lie subalgebra. For example removing the 0 node from the Dynkin diagram of type `[X, r, 1]` produces the classical Dynkin diagram of `[X, r]`.

Thus for each i in the index set, we may restrict `self` to the corresponding classical subalgebra. Of course `self` is an infinite dimensional representation, but each weight μ is assigned a grading by the number of times the simple root α_i appears in $\Lambda - \mu$. Thus the branched representation is graded and we get sequence of finite-dimensional representations which this method is able to compute.

OPTIONAL:

- `i` – (default: 0) an element of the index set
- `weyl_character_ring` – a WeylCharacterRing
- `sequence` – dictionary
- `depth` – (default: 5) an upper bound for k determining how many terms to give

In the default case where $i = 0$, you do not need to specify anything else, though you may want to increase the depth if you need more terms.

EXAMPLES:

```
sage: Lambda = RootSystem(['A',2,1]).weight_lattice(extended=true).
↪fundamental_weights()
```

(continues on next page)

(continued from previous page)

```
sage: V = IntegrableRepresentation(2*Lambda[0])
sage: b = V.branch(); b                                                 #␣
↪needs sage.libs.gap
[A2(0,0),
 A2(1,1),
 A2(0,0) + 2*A2(1,1) + A2(2,2),
 2*A2(0,0) + 2*A2(0,3) + 4*A2(1,1) + 2*A2(3,0) + 2*A2(2,2),
 4*A2(0,0) + 3*A2(0,3) + 10*A2(1,1) + 3*A2(3,0) + A2(1,4) + 6*A2(2,2) + A2(4,
↪1),
 6*A2(0,0) + 9*A2(0,3) + 20*A2(1,1) + 9*A2(3,0) + 3*A2(1,4) + 12*A2(2,2) +␣
↪3*A2(4,1) + A2(3,3)]
```

```
>>> from sage.all import *
>>> Lambda = RootSystem(['A',Integer(2),Integer(1)]).weight_
↪lattice(extended=true).fundamental_weights()
>>> V = IntegrableRepresentation(Integer(2)*Lambda[Integer(0)])
>>> b = V.branch(); b                                                   #␣
↪needs sage.libs.gap
[A2(0,0),
 A2(1,1),
 A2(0,0) + 2*A2(1,1) + A2(2,2),
 2*A2(0,0) + 2*A2(0,3) + 4*A2(1,1) + 2*A2(3,0) + 2*A2(2,2),
 4*A2(0,0) + 3*A2(0,3) + 10*A2(1,1) + 3*A2(3,0) + A2(1,4) + 6*A2(2,2) + A2(4,
↪1),
 6*A2(0,0) + 9*A2(0,3) + 20*A2(1,1) + 9*A2(3,0) + 3*A2(1,4) + 12*A2(2,2) +␣
↪3*A2(4,1) + A2(3,3)]
```

If the parameter `weyl_character_ring` is omitted, the ring may be recovered as the parent of one of the branched coefficients:

```
sage: A2 = b[0].parent(); A2                                            #␣
↪needs sage.libs.gap
The Weyl Character Ring of Type A2 with Integer Ring coefficients
```

```
>>> from sage.all import *
>>> A2 = b[Integer(0)].parent(); A2                                      ␣
↪     # needs sage.libs.gap
The Weyl Character Ring of Type A2 with Integer Ring coefficients
```

If i is not zero then you should specify the `WeylCharacterRing` that you are branching to. This is determined by the Dynkin diagram:

```
sage: Lambda = RootSystem(['B',3,1]).weight_lattice(extended=true).
↪fundamental_weights()
sage: V = IntegrableRepresentation(Lambda[0])
sage: V.cartan_type().dynkin_diagram()
    O 0
    |
    |
O---O=>=O
1   2   3
B3~
```

```
>>> from sage.all import *
>>> Lambda = RootSystem(['B',Integer(3),Integer(1)]).weight_
↪lattice(extended=true).fundamental_weights()
>>> V = IntegrableRepresentation(Lambda[Integer(0)])
>>> V.cartan_type().dynkin_diagram()
    O 0
    |
    |
O---O=>=O
1   2   3
B3~
```

In this example, we observe that removing the $i = 2$ node from the Dynkin diagram produces a reducible diagram of type `A1xA1xA1`. Thus we have a branching to $\mathfrak{sl}(2) \times \mathfrak{sl}(2) \times \mathfrak{sl}(2)$:

```
sage: A1xA1xA1 = WeylCharacterRing("A1xA1xA1",style='coroots')            #␣
↪needs sage.libs.gap
sage: V.branch(i=2,weyl_character_ring=A1xA1xA1)                          #␣
↪needs sage.libs.gap
[A1xA1xA1(1,0,0),
 A1xA1xA1(0,1,2),
 A1xA1xA1(1,0,0) + A1xA1xA1(1,2,0) + A1xA1xA1(1,0,2),
 A1xA1xA1(2,1,2) + A1xA1xA1(0,1,0) + 2*A1xA1xA1(0,1,2),
 3*A1xA1xA1(1,0,0) + 2*A1xA1xA1(1,2,0) + A1xA1xA1(1,2,2) + 2*A1xA1xA1(1,0,2)␣
↪+ A1xA1xA1(1,0,4) + A1xA1xA1(3,0,0),
 A1xA1xA1(2,1,0) + 3*A1xA1xA1(2,1,2) + 2*A1xA1xA1(0,1,0) + 5*A1xA1xA1(0,1,2)␣
↪+ A1xA1xA1(0,1,4) + A1xA1xA1(0,3,2)]
```

```
>>> from sage.all import *
>>> A1xA1xA1 = WeylCharacterRing("A1xA1xA1",style='coroots')            #␣
↪needs sage.libs.gap
>>> V.branch(i=Integer(2),weyl_character_ring=A1xA1xA1)                 ␣
↪     # needs sage.libs.gap
[A1xA1xA1(1,0,0),
 A1xA1xA1(0,1,2),
 A1xA1xA1(1,0,0) + A1xA1xA1(1,2,0) + A1xA1xA1(1,0,2),
 A1xA1xA1(2,1,2) + A1xA1xA1(0,1,0) + 2*A1xA1xA1(0,1,2),
 3*A1xA1xA1(1,0,0) + 2*A1xA1xA1(1,2,0) + A1xA1xA1(1,2,2) + 2*A1xA1xA1(1,0,2)␣
↪+ A1xA1xA1(1,0,4) + A1xA1xA1(3,0,0),
 A1xA1xA1(2,1,0) + 3*A1xA1xA1(2,1,2) + 2*A1xA1xA1(0,1,0) + 5*A1xA1xA1(0,1,2)␣
↪+ A1xA1xA1(0,1,4) + A1xA1xA1(0,3,2)]
```

If the nodes of the two Dynkin diagrams are not in the same order, you must specify an additional parameter, `sequence` which gives a dictionary to the affine Dynkin diagram to the classical one.

EXAMPLES:

```
sage: Lambda = RootSystem(['F',4,1]).weight_lattice(extended=true).
↪fundamental_weights()
sage: V = IntegrableRepresentation(Lambda[0])
sage: V.cartan_type().dynkin_diagram()
O---O---O=>=O---O
0   1   2   3   4
```

(continues on next page)

(continued from previous page)

```
F4~
sage: A1xC3=WeylCharacterRing("A1xC3",style='coroots')
sage: A1xC3.dynkin_diagram()
O
1
O---O=<=O
2   3   4
A1xC3
```

```
>>> from sage.all import *
>>> Lambda = RootSystem(['F',Integer(4),Integer(1)]).weight_
↪lattice(extended=true).fundamental_weights()
>>> V = IntegrableRepresentation(Lambda[Integer(0)])
>>> V.cartan_type().dynkin_diagram()
O---O---O=>=O---O
0   1   2   3   4
F4~
>>> A1xC3=WeylCharacterRing("A1xC3",style='coroots')
>>> A1xC3.dynkin_diagram()
O
1
O---O=<=O
2   3   4
A1xC3
```

Observe that removing the $i = 1$ node from the `F4~` Dynkin diagram gives the `A1xC3` diagram, but the roots are in a different order. The nodes $0, 2, 3, 4$ of `F4~` correspond to `1, 4, 3, 2` of `A1xC3` and so we encode this in a dictionary:

```
sage: V.branch(i=1, weyl_character_ring=A1xC3, sequence={0:1,2:4,3:3,4:2})   #␣
↪long time
[A1xC3(1,0,0,0),
 A1xC3(0,0,0,1),
 A1xC3(1,0,0,0) + A1xC3(1,2,0,0),
 A1xC3(2,0,0,1) + A1xC3(0,0,0,1) + A1xC3(0,1,1,0),
 2*A1xC3(1,0,0,0) + A1xC3(1,0,1,0) + 2*A1xC3(1,2,0,0) + A1xC3(1,0,2,0) +␣
↪A1xC3(3,0,0,0),
 2*A1xC3(2,0,0,1) + A1xC3(2,1,1,0) + A1xC3(0,1,0,0) + 3*A1xC3(0,0,0,1) +␣
↪2*A1xC3(0,1,1,0) + A1xC3(0,2,0,1)]
```

```
>>> from sage.all import *
>>> V.branch(i=Integer(1), weyl_character_ring=A1xC3, sequence=
↪{Integer(0):Integer(1),Integer(2):Integer(4),Integer(3):Integer(3),
↪Integer(4):Integer(2)})   # long time
[A1xC3(1,0,0,0),
 A1xC3(0,0,0,1),
 A1xC3(1,0,0,0) + A1xC3(1,2,0,0),
 A1xC3(2,0,0,1) + A1xC3(0,0,0,1) + A1xC3(0,1,1,0),
 2*A1xC3(1,0,0,0) + A1xC3(1,0,1,0) + 2*A1xC3(1,2,0,0) + A1xC3(1,0,2,0) +␣
↪A1xC3(3,0,0,0),
 2*A1xC3(2,0,0,1) + A1xC3(2,1,1,0) + A1xC3(0,1,0,0) + 3*A1xC3(0,0,0,1) +␣
↪2*A1xC3(0,1,1,0) + A1xC3(0,2,0,1)]
```

The branch method gives a way of computing the graded dimension of the integrable representation:

```
sage: Lambda = RootSystem("A1~").weight_lattice(extended=true).fundamental_
↪weights()
sage: V=IntegrableRepresentation(Lambda[0])
sage: r = [x.degree() for x in V.branch(depth=15)]; r
[1, 3, 4, 7, 13, 19, 29, 43, 62, 90, 126, 174, 239, 325, 435, 580]
sage: oeis(r)                                                             #␣
↪optional -- internet
0: A029552: Expansion of phi(x) / f(-x) in powers of x where phi(), f() are␣
↪Ramanujan theta functions.
```

```
>>> from sage.all import *
>>> Lambda = RootSystem("A1~").weight_lattice(extended=true).fundamental_
↪weights()
>>> V=IntegrableRepresentation(Lambda[Integer(0)])
>>> r = [x.degree() for x in V.branch(depth=Integer(15))]; r
[1, 3, 4, 7, 13, 19, 29, 43, 62, 90, 126, 174, 239, 325, 435, 580]
>>> oeis(r)                                                    # optional␣
↪-- internet
0: A029552: Expansion of phi(x) / f(-x) in powers of x where phi(), f() are␣
↪Ramanujan theta functions.
```

cartan_type()

Return the Cartan type of `self`.

EXAMPLES:

```
sage: Lambda = RootSystem(['F',4,1]).weight_lattice(extended=true).
↪fundamental_weights()
sage: V = IntegrableRepresentation(Lambda[0])
sage: V.cartan_type()
['F', 4, 1]
```

```
>>> from sage.all import *
>>> Lambda = RootSystem(['F',Integer(4),Integer(1)]).weight_
↪lattice(extended=true).fundamental_weights()
>>> V = IntegrableRepresentation(Lambda[Integer(0)])
>>> V.cartan_type()
['F', 4, 1]
```

coxeter_number()

Return the Coxeter number of the Cartan type of `self`.

The Coxeter number is defined in [Ka1990] Chapter 6, and commonly denoted h.

EXAMPLES:

```
sage: Lambda = RootSystem(['F',4,1]).weight_lattice(extended=true).
↪fundamental_weights()
sage: V = IntegrableRepresentation(Lambda[0])
sage: V.coxeter_number()
12
```

```
>>> from sage.all import *
>>> Lambda = RootSystem(['F',Integer(4),Integer(1)]).weight_
↪lattice(extended=true).fundamental_weights()
>>> V = IntegrableRepresentation(Lambda[Integer(0)])
>>> V.coxeter_number()
12
```

dominant_maximal_weights()

Return the dominant maximal weights of `self`.

A weight μ is *maximal* if it has nonzero multiplicity but $\mu + \delta$` has multiplicity zero. There are a finite number of dominant maximal weights. Indeed, [Ka1990] Proposition 12.6 shows that the dominant maximal weights are in bijection with the classical weights in $k \cdot F$ where F is the fundamental alcove and k is the level. The construction used in this method is based on that Proposition.

EXAMPLES:

```
sage: Lambda = RootSystem(['C',3,1]).weight_lattice(extended=true).
↪fundamental_weights()
sage: IntegrableRepresentation(2*Lambda[0]).dominant_maximal_weights()
(2*Lambda[0],
 Lambda[0] + Lambda[2] - delta,
 2*Lambda[1] - delta,
 Lambda[1] + Lambda[3] - 2*delta,
 2*Lambda[2] - 2*delta,
 2*Lambda[3] - 3*delta)
```

```
>>> from sage.all import *
>>> Lambda = RootSystem(['C',Integer(3),Integer(1)]).weight_
↪lattice(extended=true).fundamental_weights()
>>> IntegrableRepresentation(Integer(2)*Lambda[Integer(0)]).dominant_maximal_
↪weights()
(2*Lambda[0],
 Lambda[0] + Lambda[2] - delta,
 2*Lambda[1] - delta,
 Lambda[1] + Lambda[3] - 2*delta,
 2*Lambda[2] - 2*delta,
 2*Lambda[3] - 3*delta)
```

dual_coxeter_number()

Return the dual Coxeter number of the Cartan type of `self`.

The dual Coxeter number is defined in [Ka1990] Chapter 6, and commonly denoted $h^\vee$.

EXAMPLES:

```
sage: Lambda = RootSystem(['F',4,1]).weight_lattice(extended=true).
↪fundamental_weights()
sage: V = IntegrableRepresentation(Lambda[0])
sage: V.dual_coxeter_number()
9
```

```
>>> from sage.all import *
>>> Lambda = RootSystem(['F',Integer(4),Integer(1)]).weight_
```

(continues on next page)

(continued from previous page)

```
↪lattice(extended=true).fundamental_weights()
>>> V = IntegrableRepresentation(Lambda[Integer(0)])
>>> V.dual_coxeter_number()
9
```

from_weight(*mu*)

Return the tuple $(n_0, n_1, ...)$` such that `mu` equals $\Lambda - \sum_{i\in I} n_i\alpha_i$ in `self`, where $\Lambda$ is the highest weight of `self`.

EXAMPLES:

```
sage: Lambda = RootSystem(['A',2,1]).weight_lattice(extended=true).
↪fundamental_weights()
sage: V = IntegrableRepresentation(2*Lambda[2])
sage: V.to_weight((1,0,0))
-2*Lambda[0] + Lambda[1] + 3*Lambda[2] - delta
sage: delta = V.weight_lattice().null_root()
sage: V.from_weight(-2*Lambda[0] + Lambda[1] + 3*Lambda[2] - delta)
(1, 0, 0)
```

```
>>> from sage.all import *
>>> Lambda = RootSystem(['A',Integer(2),Integer(1)]).weight_
↪lattice(extended=true).fundamental_weights()
>>> V = IntegrableRepresentation(Integer(2)*Lambda[Integer(2)])
>>> V.to_weight((Integer(1),Integer(0),Integer(0)))
-2*Lambda[0] + Lambda[1] + 3*Lambda[2] - delta
>>> delta = V.weight_lattice().null_root()
>>> V.from_weight(-Integer(2)*Lambda[Integer(0)] + Lambda[Integer(1)] +␣
↪Integer(3)*Lambda[Integer(2)] - delta)
(1, 0, 0)
```

highest_weight()

Return the highest weight of `self`.

EXAMPLES:

```
sage: Lambda = RootSystem(['D',4,1]).weight_lattice(extended=true).
↪fundamental_weights()
sage: IntegrableRepresentation(Lambda[0]+2*Lambda[2]).highest_weight()
Lambda[0] + 2*Lambda[2]
```

```
>>> from sage.all import *
>>> Lambda = RootSystem(['D',Integer(4),Integer(1)]).weight_
↪lattice(extended=true).fundamental_weights()
>>>␣
↪IntegrableRepresentation(Lambda[Integer(0)]+Integer(2)*Lambda[Integer(2)]).
↪highest_weight()
Lambda[0] + 2*Lambda[2]
```

level()

Return the level of `self`.

The level of a highest weight representation V_Λ is defined as $(\Lambda|\delta)$ See [Ka1990] section 12.4.

EXAMPLES:

```
sage: Lambda = RootSystem(['G',2,1]).weight_lattice(extended=true).
↪fundamental_weights()
sage: [IntegrableRepresentation(Lambda[i]).level() for i in [0,1,2]]
[1, 1, 2]
```

```
>>> from sage.all import *
>>> Lambda = RootSystem(['G',Integer(2),Integer(1)]).weight_
↪lattice(extended=true).fundamental_weights()
>>> [IntegrableRepresentation(Lambda[i]).level() for i in [Integer(0),
↪Integer(1),Integer(2)]]
[1, 1, 2]
```

m(*n*)

Return the multiplicity of the weight μ in `self`, where $\mu = \Lambda - \sum_i n_i \alpha_i$.

INPUT:

- `n` – tuple representing a weight μ

EXAMPLES:

```
sage: Lambda = RootSystem(['E',6,1]).weight_lattice(extended=true).
↪fundamental_weights()
sage: V = IntegrableRepresentation(Lambda[0])
sage: u = V.highest_weight() - V.weight_lattice().null_root()
sage: V.from_weight(u)
(1, 1, 2, 2, 3, 2, 1)
sage: V.m(V.from_weight(u))
6
```

```
>>> from sage.all import *
>>> Lambda = RootSystem(['E',Integer(6),Integer(1)]).weight_
↪lattice(extended=true).fundamental_weights()
>>> V = IntegrableRepresentation(Lambda[Integer(0)])
>>> u = V.highest_weight() - V.weight_lattice().null_root()
>>> V.from_weight(u)
(1, 1, 2, 2, 3, 2, 1)
>>> V.m(V.from_weight(u))
6
```

modular_characteristic(*mu=None*)

Return the modular characteristic of `self`.

The modular characteristic is a rational number introduced by Kac and Peterson [KacPeterson], required to interpret the string functions as Fourier coefficients of modular forms. See [Ka1990] Section 12.7. Let k be the level, and let $h^\vee$ be the dual Coxeter number. Then

$$m_\Lambda = \frac{|\Lambda+\rho|^2}{2(k+h^\vee)} - \frac{|\rho|^2}{2h^\vee}$$

If μ is a weight, then

$$m_{\Lambda,\mu} = m_\Lambda - \frac{|\mu|^2}{2k}.$$

OPTIONAL:

- mu – a weight, or alternatively,
- n – tuple representing a weight μ

If no optional parameter is specified, this returns m_Λ. If mu is specified, it returns $m_{\Lambda,\mu}$. You may use the tuple n to specify μ. If you do this, μ is $\Lambda - \sum_i n_i\alpha_i$.

EXAMPLES:

```
sage: Lambda = RootSystem(['A',1,1]).weight_lattice(extended=true).
↪fundamental_weights()
sage: V = IntegrableRepresentation(3*Lambda[0]+2*Lambda[1])
sage: [V.modular_characteristic(x) for x in V.dominant_maximal_weights()]
[11/56, -1/280, 111/280]
```

```
>>> from sage.all import *
>>> Lambda = RootSystem(['A',Integer(1),Integer(1)]).weight_
↪lattice(extended=true).fundamental_weights()
>>> V = IntegrableRepresentation(Integer(3)*Lambda[Integer(0)]+Integer(2)*Lamb
↪da[Integer(1)])
>>> [V.modular_characteristic(x) for x in V.dominant_maximal_weights()]
[11/56, -1/280, 111/280]
```

mult(*mu*)

Return the weight multiplicity of mu.

INPUT:

- mu – an element of the weight lattice

EXAMPLES:

```
sage: # needs sage.libs.gap
sage: L = RootSystem("B3~").weight_lattice(extended=True)
sage: Lambda = L.fundamental_weights()
sage: delta = L.null_root()
sage: W = L.weyl_group(prefix='s')
sage: [s0,s1,s2,s3] = W.simple_reflections()
sage: V = IntegrableRepresentation(Lambda[0])
sage: V.mult(Lambda[2] - 2*delta)
3
sage: V.mult(Lambda[2] - Lambda[1])
0
sage: weights = [w.action(Lambda[1] - 4*delta) for w in [s1,s2,s0*s1*s2*s3]]
sage: weights
[-Lambda[1] + Lambda[2] - 4*delta,
 Lambda[1] - 4*delta,
 -Lambda[1] + Lambda[2] - 4*delta]
sage: [V.mult(mu) for mu in weights]
[35, 35, 35]
```

```
>>> from sage.all import *
>>> # needs sage.libs.gap
>>> L = RootSystem("B3~").weight_lattice(extended=True)
>>> Lambda = L.fundamental_weights()
>>> delta = L.null_root()
```

(continues on next page)

(continued from previous page)

```
>>> W = L.weyl_group(prefix='s')
>>> [s0,s1,s2,s3] = W.simple_reflections()
>>> V = IntegrableRepresentation(Lambda[Integer(0)])
>>> V.mult(Lambda[Integer(2)] - Integer(2)*delta)
3
>>> V.mult(Lambda[Integer(2)] - Lambda[Integer(1)])
0
>>> weights = [w.action(Lambda[Integer(1)] - Integer(4)*delta) for w in [s1,
↪s2,s0*s1*s2*s3]]
>>> weights
[-Lambda[1] + Lambda[2] - 4*delta,
 Lambda[1] - 4*delta,
 -Lambda[1] + Lambda[2] - 4*delta]
>>> [V.mult(mu) for mu in weights]
[35, 35, 35]
```

print_strings(*depth=12*)

Print the strings of `self`.

> **See also**
>
> *strings()*

EXAMPLES:

```
sage: Lambda = RootSystem(['A',1,1]).weight_lattice(extended=true).
↪fundamental_weights()
sage: V = IntegrableRepresentation(2*Lambda[0])
sage: V.print_strings(depth=25)
2*Lambda[0]: 1 1 3 5 10 16 28 43 70 105 161 236 350 501 722 1016 1431 1981␣
↪2741 3740 5096 6868 9233 12306 16357
2*Lambda[1] - delta: 1 2 4 7 13 21 35 55 86 130 196 287 420 602 858 1206 1687␣
↪2331 3206 4368 5922 7967 10670 14193 18803
```

```
>>> from sage.all import *
>>> Lambda = RootSystem(['A',Integer(1),Integer(1)]).weight_
↪lattice(extended=true).fundamental_weights()
>>> V = IntegrableRepresentation(Integer(2)*Lambda[Integer(0)])
>>> V.print_strings(depth=Integer(25))
2*Lambda[0]: 1 1 3 5 10 16 28 43 70 105 161 236 350 501 722 1016 1431 1981␣
↪2741 3740 5096 6868 9233 12306 16357
2*Lambda[1] - delta: 1 2 4 7 13 21 35 55 86 130 196 287 420 602 858 1206 1687␣
↪2331 3206 4368 5922 7967 10670 14193 18803
```

root_lattice()

Return the root lattice associated to `self`.

EXAMPLES:

```
sage: V=IntegrableRepresentation(RootSystem(['F',4,1]).weight_
↪lattice(extended=true).fundamental_weight(0))
```

(continues on next page)

(continued from previous page)

```
sage: V.root_lattice()
Root lattice of the Root system of type ['F', 4, 1]
```

```
>>> from sage.all import *
>>> V=IntegrableRepresentation(RootSystem(['F',Integer(4),Integer(1)]).weight_
↪lattice(extended=true).fundamental_weight(Integer(0)))
>>> V.root_lattice()
Root lattice of the Root system of type ['F', 4, 1]
```

s (*n*, *i*)

Return the action of the `i`-th simple reflection on the internal representation of weights by tuples `n` in `self`.

EXAMPLES:

```
sage: V = IntegrableRepresentation(RootSystem(['A',2,1]).weight_
↪lattice(extended=true).fundamental_weight(0))
sage: [V.s((0,0,0),i) for i in V._index_set]
[(1, 0, 0), (0, 0, 0), (0, 0, 0)]
```

```
>>> from sage.all import *
>>> V = IntegrableRepresentation(RootSystem(['A',Integer(2),Integer(1)]).
↪weight_lattice(extended=true).fundamental_weight(Integer(0)))
>>> [V.s((Integer(0),Integer(0),Integer(0)),i) for i in V._index_set]
[(1, 0, 0), (0, 0, 0), (0, 0, 0)]
```

string (*max_weight*, *depth=12*)

Return the list of multiplicities $m(\Lambda - k\delta)$ in `self`, where Λ is `max_weight` and k runs from 0 to `depth`.

INPUT:

- `max_weight` – a dominant maximal weight
- `depth` – (default: 12) the maximum value of k

EXAMPLES:

```
sage: Lambda = RootSystem(['A',2,1]).weight_lattice(extended=true).
↪fundamental_weights()
sage: V = IntegrableRepresentation(2*Lambda[0])
sage: V.string(2*Lambda[0])
[1, 2, 8, 20, 52, 116, 256, 522, 1045, 1996, 3736, 6780]
sage: V.string(Lambda[1] + Lambda[2])
[0, 1, 4, 12, 32, 77, 172, 365, 740, 1445, 2736, 5041]
```

```
>>> from sage.all import *
>>> Lambda = RootSystem(['A',Integer(2),Integer(1)]).weight_
↪lattice(extended=true).fundamental_weights()
>>> V = IntegrableRepresentation(Integer(2)*Lambda[Integer(0)])
>>> V.string(Integer(2)*Lambda[Integer(0)])
[1, 2, 8, 20, 52, 116, 256, 522, 1045, 1996, 3736, 6780]
>>> V.string(Lambda[Integer(1)] + Lambda[Integer(2)])
[0, 1, 4, 12, 32, 77, 172, 365, 740, 1445, 2736, 5041]
```

strings(*depth=12*)

Return the set of dominant maximal weights of `self`, together with the string coefficients for each.

OPTIONAL:

- `depth` – (default: 12) a parameter indicating how far to push computations

EXAMPLES:

```
sage: Lambda = RootSystem(['A',1,1]).weight_lattice(extended=true).
↪fundamental_weights()
sage: V = IntegrableRepresentation(2*Lambda[0])
sage: S = V.strings(depth=25)
sage: for k in S:
....:     print("{}: {}".format(k, ' '.join(str(x) for x in S[k])))
2*Lambda[0]: 1 1 3 5 10 16 28 43 70 105 161 236 350 501 722 1016 1431 1981␣
↪2741 3740 5096 6868 9233 12306 16357
2*Lambda[1] - delta: 1 2 4 7 13 21 35 55 86 130 196 287 420 602 858 1206 1687␣
↪2331 3206 4368 5922 7967 10670 14193 18803
```

```
>>> from sage.all import *
>>> Lambda = RootSystem(['A',Integer(1),Integer(1)]).weight_
↪lattice(extended=true).fundamental_weights()
>>> V = IntegrableRepresentation(Integer(2)*Lambda[Integer(0)])
>>> S = V.strings(depth=Integer(25))
>>> for k in S:
...     print("{}: {}".format(k, ' '.join(str(x) for x in S[k])))
2*Lambda[0]: 1 1 3 5 10 16 28 43 70 105 161 236 350 501 722 1016 1431 1981␣
↪2741 3740 5096 6868 9233 12306 16357
2*Lambda[1] - delta: 1 2 4 7 13 21 35 55 86 130 196 287 420 602 858 1206 1687␣
↪2331 3206 4368 5922 7967 10670 14193 18803
```

to_dominant(*n*)

Return the dominant weight in `self` equivalent to `n` under the affine Weyl group.

EXAMPLES:

```
sage: Lambda = RootSystem(['A',2,1]).weight_lattice(extended=true).
↪fundamental_weights()
sage: V = IntegrableRepresentation(3*Lambda[0])
sage: n = V.to_dominant((13,11,7)); n
(4, 3, 3)
sage: V.to_weight(n)
Lambda[0] + Lambda[1] + Lambda[2] - 4*delta
```

```
>>> from sage.all import *
>>> Lambda = RootSystem(['A',Integer(2),Integer(1)]).weight_
↪lattice(extended=true).fundamental_weights()
>>> V = IntegrableRepresentation(Integer(3)*Lambda[Integer(0)])
>>> n = V.to_dominant((Integer(13),Integer(11),Integer(7))); n
(4, 3, 3)
>>> V.to_weight(n)
Lambda[0] + Lambda[1] + Lambda[2] - 4*delta
```

to_weight(*n*)

Return the weight associated to the tuple `n` in `self`.

If `n` is the tuple $(n_1, n_2, \ldots)$, then the associated weight is $\Lambda - \sum_i n_i \alpha_i$, where Λ is the weight of the representation.

INPUT:

- `n` – tuple representing a weight

EXAMPLES:

```
sage: Lambda = RootSystem(['A',2,1]).weight_lattice(extended=true).
↪fundamental_weights()
sage: V = IntegrableRepresentation(2*Lambda[2])
sage: V.to_weight((1,0,0))
-2*Lambda[0] + Lambda[1] + 3*Lambda[2] - delta
```

```
>>> from sage.all import *
>>> Lambda = RootSystem(['A',Integer(2),Integer(1)]).weight_
↪lattice(extended=true).fundamental_weights()
>>> V = IntegrableRepresentation(Integer(2)*Lambda[Integer(2)])
>>> V.to_weight((Integer(1),Integer(0),Integer(0)))
-2*Lambda[0] + Lambda[1] + 3*Lambda[2] - delta
```

weight_lattice()

Return the weight lattice associated to `self`.

EXAMPLES:

```
sage: V=IntegrableRepresentation(RootSystem(['E',6,1]).weight_
↪lattice(extended=true).fundamental_weight(0))
sage: V.weight_lattice()
Extended weight lattice of the Root system of type ['E', 6, 1]
```

```
>>> from sage.all import *
>>> V=IntegrableRepresentation(RootSystem(['E',Integer(6),Integer(1)]).weight_
↪lattice(extended=true).fundamental_weight(Integer(0)))
>>> V.weight_lattice()
Extended weight lattice of the Root system of type ['E', 6, 1]
```

5.1.233 Nonsymmetric Macdonald polynomials

AUTHORS:

- Anne Schilling and Nicolas M. Thiéry (2013): initial version

ACKNOWLEDGEMENTS:

The initial version of this code (together with *root_lattice_realization_algebras.Algebras* and *hecke_algebra_representation.HeckeAlgebraRepresentation*) was written by Anne Schilling and Nicolas M. Thiery during the ICERM Semester Program on “Automorphic Forms, Combinatorial Representation Theory and Multiple Dirichlet Series” (January 28, 2013 - May 3, 2013) with the help of Dan Bump, Ben Brubaker, Bogdan Ion, Dan Orr, Arun Ram, Siddhartha Sahi, and Mark Shimozono. Special thanks go to Bogdan Ion and Mark Shimozono for their patient explanations and hand computations to check the code.

class sage.combinat.root_system.non_symmetric_macdonald_polynomials.**NonSymmetricMacdonaldPolynomials**

Bases: *CherednikOperatorsEigenvectors*

Nonsymmetric Macdonald polynomials.

INPUT:

- KL – an affine Cartan type or the group algebra of a realization of the affine weight lattice
- q, q1, q2 – parameters in the base ring of the group algebra (default: q, q1, q2)
- normalized – boolean (default: True); whether to normalize the result to have leading coefficient 1

This implementation covers all reduced affine root systems. The polynomials are constructed recursively by the application of intertwining operators.

Todo

- Non-reduced case (Koornwinder polynomials).
- Non-equal parameters for the affine Hecke algebra.
- Choice of convention (dominant/anti-dominant, …).
- More uniform implementation of the $T_0^\vee$ operator.
- Optimizations, in particular in the calculation of the eigenvalues for the recursion.

EXAMPLES:

We construct the family of nonsymmetric Macdonald polynomials in three variables in type A:

```
sage: E = NonSymmetricMacdonaldPolynomials(["A",2,1])
```

```
>>> from sage.all import *
>>> E = NonSymmetricMacdonaldPolynomials(["A",Integer(2),Integer(1)])
```

They are constructed as elements of the group algebra of the classical weight lattice L_0 (or one of its realizations, such as the ambient space, which is used here) and indexed by elements of L_0:

```
sage: L0 = E.keys(); L0
Ambient space of the Root system of type ['A', 2]
```

```
>>> from sage.all import *
>>> L0 = E.keys(); L0
Ambient space of the Root system of type ['A', 2]
```

Here is the nonsymmetric Macdonald polynomial with leading term $[2, 0, 1]$:

```
sage: E[L0([2,0,1])]                                                    #␣
↪needs sage.libs.gap
```

(continues on next page)

(continued from previous page)

```
-((q*q1+q*q2)/(-q*q1-q2))*B[(1, 1, 1)]
- ((q1+q2)/(-q*q1-q2))*B[(2, 1, 0)] + B[(2, 0, 1)]
```

```
>>> from sage.all import *
>>> E[L0([Integer(2),Integer(0),Integer(1)])]                              ␣
↪                        # needs sage.libs.gap
-((q*q1+q*q2)/(-q*q1-q2))*B[(1, 1, 1)]
- ((q1+q2)/(-q*q1-q2))*B[(2, 1, 0)] + B[(2, 0, 1)]
```

It can be seen as a polynomial (or in general a Laurent polynomial) by interpreting each term as an exponent vector. The parameter q is the exponential of the null (co)root, whereas q_1 and q_2 are the two eigenvalues of each generator T_i of the affine Hecke algebra (see the background section for details).

By setting $q_1 = t$, $q_2 = -1$ and using the *root_lattice_realization_algebras.Algebras.ElementMethods.expand()* method, we recover the nonsymmetric Macdonald polynomial as computed by [HHL06]'s combinatorial formula:

```
sage: K = QQ['q,t'].fraction_field()
sage: q,t = K.gens()
sage: E = NonSymmetricMacdonaldPolynomials(["A",2,1], q=q, q1=t, q2=-1)
sage: vars = K['x0,x1,x2'].gens()
sage: E[L0([2,0,1])].expand(vars)                                        #␣
↪needs sage.libs.gap
(t - 1)/(q*t - 1)*x0^2*x1 + x0^2*x2 + (q*t - q)/(q*t - 1)*x0*x1*x2

sage: from sage.combinat.sf.ns_macdonald import E                        #␣
↪needs sage.combinat
sage: E([2,0,1])                                                         #␣
↪needs sage.combinat sage.groups
(t - 1)/(q*t - 1)*x0^2*x1 + x0^2*x2 + (q*t - q)/(q*t - 1)*x0*x1*x2
```

```
>>> from sage.all import *
>>> K = QQ['q,t'].fraction_field()
>>> q,t = K.gens()
>>> E = NonSymmetricMacdonaldPolynomials(["A",Integer(2),Integer(1)], q=q, q1=t,␣
↪q2=-Integer(1))
>>> vars = K['x0,x1,x2'].gens()
>>> E[L0([Integer(2),Integer(0),Integer(1)])].expand(vars)                 ␣
↪                        # needs sage.libs.gap
(t - 1)/(q*t - 1)*x0^2*x1 + x0^2*x2 + (q*t - q)/(q*t - 1)*x0*x1*x2

>>> from sage.combinat.sf.ns_macdonald import E                          #␣
↪needs sage.combinat
>>> E([Integer(2),Integer(0),Integer(1)])                                  ␣
↪                        # needs sage.combinat sage.groups
(t - 1)/(q*t - 1)*x0^2*x1 + x0^2*x2 + (q*t - q)/(q*t - 1)*x0*x1*x2
```

Here is a type $G_2^{(1)}$ nonsymmetric Macdonald polynomial:

```
sage: E = NonSymmetricMacdonaldPolynomials(["G",2,1])
sage: L0 = E.keys()
sage: omega = L0.fundamental_weights()
```

(continues on next page)

(continued from previous page)

```
sage: E[omega[2] - omega[1]]
-((q*q1^3*q2+q*q1^2*q2^2)/(q*q1^4-q2^4))*B[(0, 0, 0)] + B[(1, -1, 0)]
- ((q1*q2^3+q2^4)/(q*q1^4-q2^4))*B[(1, 0, -1)]
```

```
>>> from sage.all import *
>>> E = NonSymmetricMacdonaldPolynomials(["G",Integer(2),Integer(1)])
>>> L0 = E.keys()
>>> omega = L0.fundamental_weights()
>>> E[omega[Integer(2)] - omega[Integer(1)]]
-((q*q1^3*q2+q*q1^2*q2^2)/(q*q1^4-q2^4))*B[(0, 0, 0)] + B[(1, -1, 0)]
- ((q1*q2^3+q2^4)/(q*q1^4-q2^4))*B[(1, 0, -1)]
```

Many more examples are given after the background section.

Background

The polynomial module

The nonsymmetric Macdonald polynomials are a distinguished basis of the "polynomial" module of the affine Hecke algebra. Given:

```
- a ground ring `K`, which contains the input parameters `q, q_1, q_2`
- an affine root system, specified by a Cartan type `C`
- a realization `L` of the weight lattice of type `C`
```

the polynomial module is the group algebra $K[L_0]$ of the classical weight lattice L_0 with coefficients in K. It is isomorphic to the Laurent polynomial ring over K generated by the formal exponentials of any basis of L_0.

In our running example L is the ambient space of type $C_2^{(1)}$:

```
sage: K = QQ['q,q1,q2'].fraction_field()
sage: q, q1, q2 = K.gens()
sage: C = CartanType(["C",2,1])
sage: L = RootSystem(C).ambient_space(); L
Ambient space of the Root system of type ['C', 2, 1]

sage: L.simple_roots()
Finite family {0: -2*e[0] + e['delta'], 1: e[0] - e[1], 2: 2*e[1]}
sage: omega = L.fundamental_weights(); omega
Finite family {0: e['deltacheck'],
               1: e[0] + e['deltacheck'],
               2: e[0] + e[1] + e['deltacheck']}

sage: L0 = L.classical(); L0
Ambient space of the Root system of type ['C', 2]
sage: KL0 = L0.algebra(K); KL0
```

(continues on next page)

>>> KL0 = L0.algebra(K); KL0
Algebra of the Ambient space of the Root system of type ['C', 2]
over Fraction Field of Multivariate Polynomial Ring in q, q1, q2 over Rational
↪Field
```

Affine Hecke algebra

The affine Hecke algebra is generated by elements T_i for `i` in the set of affine Dynkin nodes. They satisfy the same braid relations as the simple reflections s_i of the affine Weyl group. The T_i satisfy the quadratic relation

$$(T_i - q_1) \circ (T_i - q_2) = 0,$$

where q_1 and q_2 are the input parameters. Some of the representation theory requires that q_1 and q_2 satisfy additional relations; typically one uses the specializations $q_1 = u$ and $q_2 = -1/u$ or $q_1 = t$ and $q_2 = -1$). This can be achieved by constructing an appropriate field and passing q_1 and q_2 appropriately; see the examples. In principle, the parameter(s) could further depend on `i`; this is not yet implemented but the code has been designed in such a way that this feature is easy to add.

Demazure-Lusztig operators

The `i`-th Demazure-Lusztig operator is an operator on $K[L]$ which interpolates between the reflection s_i and the Demazure operator π_i (see `root_lattice_realization.RootLatticeRealization.Algebras.ParentMethods.demazure_lusztig_operators()`).:

```
sage: KL = L.algebra(K); KL
Algebra of the Ambient space of the Root system of type ['C', 2, 1]
over Fraction Field of Multivariate Polynomial Ring in q, q1, q2 over Rational
↪Field
sage: T = KL.demazure_lusztig_operators(q1, q2)
sage: x = KL.monomial(omega[1]); x
B[e[0] + e['deltacheck']]
sage: T[2](x)
```

(continues on next page)

(continued from previous page)

```
q1*B[e[0] + e['deltacheck']]
sage: T[1](x)
(q1+q2)*B[e[0] + e['deltacheck']] + q1*B[e[1] + e['deltacheck']]
sage: T[0](x)
q1*B[e[0] + e['deltacheck']]
```

```
>>> from sage.all import *
>>> KL = L.algebra(K); KL
Algebra of the Ambient space of the Root system of type ['C', 2, 1]
over Fraction Field of Multivariate Polynomial Ring in q, q1, q2 over Rational␣
↪Field
>>> T = KL.demazure_lusztig_operators(q1, q2)
>>> x = KL.monomial(omega[Integer(1)]); x
B[e[0] + e['deltacheck']]
>>> T[Integer(2)](x)
q1*B[e[0] + e['deltacheck']]
>>> T[Integer(1)](x)
(q1+q2)*B[e[0] + e['deltacheck']] + q1*B[e[1] + e['deltacheck']]
>>> T[Integer(0)](x)
q1*B[e[0] + e['deltacheck']]
```

The affine Hecke algebra acts on $K[L]$ by letting the generators T_i act by the Demazure-Lusztig operators. The class *sage.combinat.root_system.hecke_algebra_representation.HeckeAlgebraRepresentation* implements some simple generic features for representations of affine Hecke algebras defined by the action of their T-generators.:

```
sage: T
A representation of the (q1, q2)-Hecke algebra of type ['C', 2, 1] on
 Algebra of the Ambient space of the Root system of type ['C', 2, 1] over
 Fraction Field of Multivariate Polynomial Ring in q, q1, q2 over Rational Field
sage: type(T)
<class 'sage.combinat.root_system.hecke_algebra_representation.
↪HeckeAlgebraRepresentation'>
sage: T._test_relations()                    # long time (1.3s)
```

```
>>> from sage.all import *
>>> T
A representation of the (q1, q2)-Hecke algebra of type ['C', 2, 1] on
 Algebra of the Ambient space of the Root system of type ['C', 2, 1] over
 Fraction Field of Multivariate Polynomial Ring in q, q1, q2 over Rational Field
>>> type(T)
<class 'sage.combinat.root_system.hecke_algebra_representation.
↪HeckeAlgebraRepresentation'>
>>> T._test_relations()                    # long time (1.3s)
```

Here we construct the operator $q_1 T_2^{-1} \circ T_1^{-1} T_0$ from a signed reduced word:

```
sage: T.Tw([0,1,2],[1,-1,-1], q1^2)
Generic endomorphism of Algebra of the Ambient space of the Root system of type [
↪'C', 2, 1]
over Fraction Field of Multivariate Polynomial Ring in q, q1, q2 over Rational␣
↪Field
```

```
>>> from sage.all import *
>>> T.Tw([Integer(0),Integer(1),Integer(2)],[Integer(1),-Integer(1),-Integer(1)],
↪q1**Integer(2))
Generic endomorphism of Algebra of the Ambient space of the Root system of type [
↪'C', 2, 1]
over Fraction Field of Multivariate Polynomial Ring in q, q1, q2 over Rational
↪Field
```

(note the reversal of the word). Inverses are computed using the quadratic relation.

Cherednik operators

The affine Hecke algebra contains elements Y_λ indexed by the coroot lattice. Their action on $K[L]$ is implemented in Sage:

```
sage: Y = T.Y(); Y
Lazy family (...)_{i in Coroot lattice of the Root system of type ['C', 2, 1]}
sage: alphacheck = Y.keys().simple_roots()
sage: Y1 = Y[alphacheck[1]]
sage: Y1(x)
((q1^2+2*q1*q2+q2^2)/(-q1*q2))*B[e[0] + e['deltacheck']]
- ((q1^2+2*q1*q2+q2^2)/(-q2^2))*B[-e[1] + e['deltacheck']]
- ((q1^2+q1*q2)/(-q2^2))*B[2*e[0] - e[1] - e['delta'] + e['deltacheck']]
+ ((q1^3+q1^2*q2)/(-q2^3))*B[e[0] - e['delta'] + e['deltacheck']]
+ ((q1^3+q1^2*q2)/(-q2^3))*B[e[0] - 2*e[1] - e['delta'] + e['deltacheck']]
+ ((q1+q2)/(-q2))*B[e[1] + e['deltacheck']]
+ ((q1^3+2*q1^2*q2+q1*q2^2)/(-q2^3))*B[-e[1] - e['delta'] + e['deltacheck']]
+ ((q1^3+q1^2*q2)/(-q2^3))*B[2*e[0] - e[1] - 2*e['delta'] + e['deltacheck']]
+ ((q1^3+2*q1^2*q2+q1*q2^2)/(-q2^3))*B[-e[0] - e['delta'] + e['deltacheck']]
+ ((q1^3+2*q1^2*q2+q1*q2^2)/(-q2^3))*B[e[0] - 2*e['delta'] + e['deltacheck']]
+ ((q1^3+q1^2*q2)/(-q2^3))*B[3*e[0] - 3*e['delta'] + e['deltacheck']]
+ ((q1^3+q1^2*q2)/(-q2^3))*B[-e[0] - 2*e[1] - e['delta'] + e['deltacheck']]
+ ((q1^3+q1^2*q2)/(-q2^3))*B[e[0] - 2*e[1] - 2*e['delta'] + e['deltacheck']]
+ (q1^3/(-q2^3))*B[3*e[0] - 2*e[1] - 3*e['delta'] + e['deltacheck']]
```

```
>>> from sage.all import *
>>> Y = T.Y(); Y
Lazy family (...)_{i in Coroot lattice of the Root system of type ['C', 2, 1]}
>>> alphacheck = Y.keys().simple_roots()
>>> Y1 = Y[alphacheck[Integer(1)]]
>>> Y1(x)
((q1^2+2*q1*q2+q2^2)/(-q1*q2))*B[e[0] + e['deltacheck']]
- ((q1^2+2*q1*q2+q2^2)/(-q2^2))*B[-e[1] + e['deltacheck']]
- ((q1^2+q1*q2)/(-q2^2))*B[2*e[0] - e[1] - e['delta'] + e['deltacheck']]
+ ((q1^3+q1^2*q2)/(-q2^3))*B[e[0] - e['delta'] + e['deltacheck']]
+ ((q1^3+q1^2*q2)/(-q2^3))*B[e[0] - 2*e[1] - e['delta'] + e['deltacheck']]
+ ((q1+q2)/(-q2))*B[e[1] + e['deltacheck']]
+ ((q1^3+2*q1^2*q2+q1*q2^2)/(-q2^3))*B[-e[1] - e['delta'] + e['deltacheck']]
+ ((q1^3+q1^2*q2)/(-q2^3))*B[2*e[0] - e[1] - 2*e['delta'] + e['deltacheck']]
+ ((q1^3+2*q1^2*q2+q1*q2^2)/(-q2^3))*B[-e[0] - e['delta'] + e['deltacheck']]
+ ((q1^3+2*q1^2*q2+q1*q2^2)/(-q2^3))*B[e[0] - 2*e['delta'] + e['deltacheck']]
+ ((q1^3+q1^2*q2)/(-q2^3))*B[3*e[0] - 3*e['delta'] + e['deltacheck']]
+ ((q1^3+q1^2*q2)/(-q2^3))*B[-e[0] - 2*e[1] - e['delta'] + e['deltacheck']]
```

(continues on next page)

(continued from previous page)

```
+ ((q1^3+q1^2*q2)/(-q2^3))*B[e[0] - 2*e[1] - 2*e['delta'] + e['deltacheck']]
+ (q1^3/(-q2^3))*B[3*e[0] - 2*e[1] - 3*e['delta'] + e['deltacheck']]
```

The Cherednik operators span a Laurent polynomial ring inside the affine Hecke algebra; namely $\lambda \mapsto Y_\lambda$ is a group isomorphism from the classical root lattice (viewed additively) to the affine Hecke algebra (viewed multiplicatively). In practice, Y_λ is constructed by computing combinatorially its signed reduced word (and an overall scalar factor) using the periodic orientation of the alcove model in the coweight lattice (see `hecke_algebra_representation.HeckeAlgebraRepresentation.Y_lambdacheck()`):

```
sage: Lcheck = L.root_system.coweight_lattice()
sage: w = Lcheck.reduced_word_of_translation(Lcheck(alphacheck[1])); w
[0, 2, 1, 0, 2, 1]
sage: Lcheck.signs_of_alcovewalk(w)
[1, -1, 1, -1, 1, 1]
```

```
>>> from sage.all import *
>>> Lcheck = L.root_system.coweight_lattice()
>>> w = Lcheck.reduced_word_of_translation(Lcheck(alphacheck[Integer(1)])); w
[0, 2, 1, 0, 2, 1]
>>> Lcheck.signs_of_alcovewalk(w)
[1, -1, 1, -1, 1, 1]
```

Level zero representation of the affine Hecke algebra

The action of the affine Hecke algebra on $K[L]$ induces an action on $K[L_0]$: the action of T_i on X^λ for λ a classical weight in L_0 is obtained by embedding the weight at level zero in the affine weight lattice (see `weight_lattice_realizations.WeightLatticeRealizations.ParentMethods.embed_at_level()`) applying the Demazure-Lusztig operator there, and projecting from $K[L] \rightarrow K[L_0]$ mapping the exponential of δ to q (see `root_lattice_realization_algebras.Algebras.ParentMethods.q_project()`). This is implemented in `root_lattice_realization_algebras.Algebras.ParentMethods.demazure_lusztig_operators_on_classical()`:

```
sage: T = KL.demazure_lusztig_operators_on_classical(q, q1,q2)
sage: omega = L0.fundamental_weights()
sage: x = KL0.monomial(omega[1])
sage: T[0](x)
-q*q2*B[(-1, 0)]
```

```
>>> from sage.all import *
>>> T = KL.demazure_lusztig_operators_on_classical(q, q1,q2)
>>> omega = L0.fundamental_weights()
>>> x = KL0.monomial(omega[Integer(1)])
>>> T[Integer(0)](x)
-q*q2*B[(-1, 0)]
```

For classical nodes these are the usual Demazure-Lusztig operators:

```
sage: T[1](x)
(q1+q2)*B[(1, 0)] + q1*B[(0, 1)]
```

```
>>> from sage.all import *
>>> T[Integer(1)](x)
(q1+q2)*B[(1, 0)] + q1*B[(0, 1)]
```

Nonsymmetric Macdonald polynomials

We can now finally define the nonsymmetric Macdonald polynomials. Because the Cherednik operators commute (and there is no radical), they can be simultaneously diagonalized; namely, $K[L_0]$ admits a K-basis of joint eigenvectors for the Y_λ. For $\mu \in L_0$, the nonsymmetric Macdonald polynomial E_μ is the unique eigenvector of the family of Cherednik operators Y_λ having μ as leading term:

```
sage: E = NonSymmetricMacdonaldPolynomials(KL, q, q1, q2); E
The family of the Macdonald polynomials of type ['C', 2, 1]
 with parameters q, q1, q2
```

```
>>> from sage.all import *
>>> E = NonSymmetricMacdonaldPolynomials(KL, q, q1, q2); E
The family of the Macdonald polynomials of type ['C', 2, 1]
 with parameters q, q1, q2
```

Or for short:

```
sage: E = NonSymmetricMacdonaldPolynomials(C)
```

```
>>> from sage.all import *
>>> E = NonSymmetricMacdonaldPolynomials(C)
```

Recursive construction of the nonsymmetric Macdonald polynomials

The generators T_i of the affine Hecke algebra almost skew commute with the Cherednik operators. More precisely, one can deform them into the so-called intertwining operators:

$$\tau_i = T_i - (q_1 + q_2)\frac{Y_i^{a-1}}{1 - Y_i^a} .$$

(where $a = 1$ except for $i = 0$ in type BC where $a = a_0 = 2$) which satisfy the following skew commutation relations:

$$\tau_i Y_\lambda = \tau_i Y_{s_i\lambda} .$$

If $s_i\mu \neq \mu$, applying τ_i on an eigenvector E_μ produces a new eigenvector (essentially $E_{s_i\mu}$) with a distinct eigenvalue. It follows that the eigenvectors indexed by an affine Weyl orbit of weights, may be recursively computed from a single weight in the orbit.

In the case at hand, there is a little complication: namely, the simple reflections s_i acting at level 0 do not act transitively on classical weights; in fact the orbits for the classical Weyl group and for the affine Weyl group are the same. Thus, one can construct the nonsymmetric Macdonald polynomials for all weights from those for the classical dominant weights, but one is lacking a creation operator to construct the nonsymmetric Macdonald polynomials for dominant weights.

Twisted Demazure-Lusztig operators

To compensate for this, one needs to consider another affinization of the action of the classical Demazure-Lusztig operators $T_1, \ldots, T_n$, which gives rise to the double affine Hecke algebra. Following Cherednik, one adds another operator $T_0^\vee$ implemented in: *root_lattice_realization_algebras.Algebras.ParentMethods.T0_check_on_basis()*. See also: *root_lattice_realization_algebras.Algebras.ParentMethods.twisted_demazure_lusztig_operators()*.

Depending on the type (untwisted or not), this is a representation of the affine Hecke algebra for another affinization of the classical Cartan type. The corresponding action of the affine Weyl group – which is used to compute the recursion on μ – occurs in the corresponding weight lattice realization:

```
sage: E.L()
Ambient space of the Root system of type ['C', 2, 1]
sage: E.L_prime()
Coambient space of the Root system of type ['B', 2, 1]
sage: E.L_prime().classical()
Ambient space of the Root system of type ['C', 2]
```

```
>>> from sage.all import *
>>> E.L()
Ambient space of the Root system of type ['C', 2, 1]
>>> E.L_prime()
Coambient space of the Root system of type ['B', 2, 1]
>>> E.L_prime().classical()
Ambient space of the Root system of type ['C', 2]
```

See *L_prime()* and *cartan_type.CartanType_affine.other_affinization()*.

More examples

We show how to create the nonsymmetric Macdonald polynomials in two different ways and check that they are the same:

```
sage: K = QQ['q,u'].fraction_field()
sage: q, u = K.gens()
sage: E = NonSymmetricMacdonaldPolynomials(['D',3,1], q, u, -1/u)
sage: omega = E.keys().fundamental_weights()
sage: E[omega[1]+omega[3]]
-((q*u^2-q)/(-q*u^4+1))*B[(1/2, -1/2, 1/2)]
- ((q*u^2-q)/(-q*u^4+1))*B[(1/2, 1/2, -1/2)] + B[(3/2, 1/2, 1/2)]

sage: KL = RootSystem(["D",3,1]).ambient_space().algebra(K)
sage: P = NonSymmetricMacdonaldPolynomials(KL, q, u, -1/u)
sage: E[omega[1]+omega[3]] == P[omega[1]+omega[3]]
True
sage: E[E.keys()((0,1,-1))]
-((q*u^2-q)/(-q*u^2+1))*B[(0, 0, 0)] - ((u^2-1)/(-q*u^2+1))*B[(1, 1, 0)]
- ((u^2-1)/(-q*u^2+1))*B[(1, 0, -1)] + B[(0, 1, -1)]
```

```
>>> from sage.all import *
>>> K = QQ['q,u'].fraction_field()
>>> q, u = K.gens()
>>> E = NonSymmetricMacdonaldPolynomials(['D',Integer(3),Integer(1)], q, u, -
↪Integer(1)/u)
>>> omega = E.keys().fundamental_weights()
```

(continues on next page)

(continued from previous page)

```
>>> E[omega[Integer(1)]+omega[Integer(3)]]
-((q*u^2-q)/(-q*u^4+1))*B[(1/2, -1/2, 1/2)]
- ((q*u^2-q)/(-q*u^4+1))*B[(1/2, 1/2, -1/2)] + B[(3/2, 1/2, 1/2)]

>>> KL = RootSystem(["D",Integer(3),Integer(1)]).ambient_space().algebra(K)
>>> P = NonSymmetricMacdonaldPolynomials(KL, q, u, -Integer(1)/u)
>>> E[omega[Integer(1)]+omega[Integer(3)]] ==␣
↪P[omega[Integer(1)]+omega[Integer(3)]]
True
>>> E[E.keys()((Integer(0),Integer(1),-Integer(1)))]
-((q*u^2-q)/(-q*u^2+1))*B[(0, 0, 0)] - ((u^2-1)/(-q*u^2+1))*B[(1, 1, 0)]
- ((u^2-1)/(-q*u^2+1))*B[(1, 0, -1)] + B[(0, 1, -1)]
```

In type A, there is also a combinatorial implementation of the nonsymmetric Macdonald polynomials in terms of augmented diagram fillings as in [HHL06]. See *sage.combinat.sf.ns_macdonald.E()*. First we check that these polynomials are indeed eigenvectors of the Cherednik operators:

```
sage: K = QQ['q,t'].fraction_field()
sage: q,t = K.gens()
sage: q1 = t; q2 = -1
sage: KL = RootSystem(["A",2,1]).ambient_space().algebra(K)
sage: KL0 = KL.classical()
sage: E = NonSymmetricMacdonaldPolynomials(KL,q, q1, q2)
sage: omega = E.keys().fundamental_weights()
sage: w = omega[1]

sage: # needs sage.combinat sage.groups
sage: import sage.combinat.sf.ns_macdonald as NS
sage: p = NS.E([1,0,0]); p
x0
sage: pp = KL0.from_polynomial(p)
sage: E.eigenvalues(KL0.from_polynomial(p))
[t, (-1)/(-q*t^2), t]

sage: def eig(l): return E.eigenvalues(KL0.from_polynomial(NS.E(l)))

sage: # needs sage.combinat sage.groups
sage: eig([1,0,0])
[t, (-1)/(-q*t^2), t]
sage: eig([2,0,0])
[q*t, (-1)/(-q^2*t^2), t]
sage: eig([3,0,0])
[q^2*t, (-1)/(-q^3*t^2), t]
sage: eig([2,0,4])
[(-1)/(-q^3*t), 1/(q^2*t), q^4*t^2]
```

```
>>> from sage.all import *
>>> K = QQ['q,t'].fraction_field()
>>> q,t = K.gens()
>>> q1 = t; q2 = -Integer(1)
>>> KL = RootSystem(["A",Integer(2),Integer(1)]).ambient_space().algebra(K)
>>> KL0 = KL.classical()
```

(continues on next page)

(continued from previous page)

```
>>> E = NonSymmetricMacdonaldPolynomials(KL,q, q1, q2)
>>> omega = E.keys().fundamental_weights()
>>> w = omega[Integer(1)]

>>> # needs sage.combinat sage.groups
>>> import sage.combinat.sf.ns_macdonald as NS
>>> p = NS.E([Integer(1),Integer(0),Integer(0)]); p
x0
>>> pp = KL0.from_polynomial(p)
>>> E.eigenvalues(KL0.from_polynomial(p))
[t, (-1)/(-q*t^2), t]

>>> def eig(l): return E.eigenvalues(KL0.from_polynomial(NS.E(l)))

>>> # needs sage.combinat sage.groups
>>> eig([Integer(1),Integer(0),Integer(0)])
[t, (-1)/(-q*t^2), t]
>>> eig([Integer(2),Integer(0),Integer(0)])
[q*t, (-1)/(-q^2*t^2), t]
>>> eig([Integer(3),Integer(0),Integer(0)])
[q^2*t, (-1)/(-q^3*t^2), t]
>>> eig([Integer(2),Integer(0),Integer(4)])
[(-1)/(-q^3*t), 1/(q^2*t), q^4*t^2]
```

Next we check explicitly that they agree with the current implementation:

```
sage: K = QQ['q','t'].fraction_field()
sage: q,t = K.gens()
sage: KL = RootSystem(["A",1,1]).ambient_lattice().algebra(K)
sage: E = NonSymmetricMacdonaldPolynomials(KL,q, t, -1)
sage: L0 = E.keys()
sage: KL0 = KL.classical()
sage: P = K['x0,x1']
sage: def EE(weight): return E[L0(weight)].expand(P.gens())

sage: # needs sage.combinat
sage: import sage.combinat.sf.ns_macdonald as NS
sage: EE([0,0])
1
sage: NS.E([0,0])                                                    #␣
↪needs sage.groups
1
sage: EE([1,0])
x0
sage: NS.E([1,0])                                                    #␣
↪needs sage.groups
x0
sage: EE([0,1])
(t - 1)/(q*t - 1)*x0 + x1
sage: NS.E([0,1])                                                    #␣
↪needs sage.groups
(t - 1)/(q*t - 1)*x0 + x1
```

(continues on next page)

(continued from previous page)

```
sage: EE([2,0])
x0^2 + (q*t - q)/(q*t - 1)*x0*x1
sage: NS.E([2,0])                                                    #␣
↪needs sage.groups
x0^2 + (q*t - q)/(q*t - 1)*x0*x1
```

```
>>> from sage.all import *
>>> K = QQ['q','t'].fraction_field()
>>> q,t = K.gens()
>>> KL = RootSystem(["A",Integer(1),Integer(1)]).ambient_lattice().algebra(K)
>>> E = NonSymmetricMacdonaldPolynomials(KL,q, t, -Integer(1))
>>> L0 = E.keys()
>>> KL0 = KL.classical()
>>> P = K['x0,x1']
>>> def EE(weight): return E[L0(weight)].expand(P.gens())

>>> # needs sage.combinat
>>> import sage.combinat.sf.ns_macdonald as NS
>>> EE([Integer(0),Integer(0)])
1
>>> NS.E([Integer(0),Integer(0)])                                     ␣
↪               # needs sage.groups
1
>>> EE([Integer(1),Integer(0)])
x0
>>> NS.E([Integer(1),Integer(0)])                                     ␣
↪               # needs sage.groups
x0
>>> EE([Integer(0),Integer(1)])
(t - 1)/(q*t - 1)*x0 + x1
>>> NS.E([Integer(0),Integer(1)])                                     ␣
↪               # needs sage.groups
(t - 1)/(q*t - 1)*x0 + x1
>>> EE([Integer(2),Integer(0)])
x0^2 + (q*t - q)/(q*t - 1)*x0*x1
>>> NS.E([Integer(2),Integer(0)])                                     ␣
↪               # needs sage.groups
x0^2 + (q*t - q)/(q*t - 1)*x0*x1
```

The same, directly in the ambient lattice with several shifts:

```
sage: E[L0([2,0])]                                                   #␣
↪needs sage.combinat
-((q*t-q)/(-q*t+1))*B[(1, 1)] + B[(2, 0)]
sage: E[L0([1,-1])]                                                  #␣
↪needs sage.combinat
-((q*t-q)/(-q*t+1))*B[(0, 0)] + B[(1, -1)]
sage: E[L0([0,-2])]                                                  #␣
↪needs sage.combinat
-((q*t-q)/(-q*t+1))*B[(-1, -1)] + B[(0, -2)]
```

```
>>> from sage.all import *
>>> E[L0([Integer(2),Integer(0)])]                                              ␣
↪               # needs sage.combinat
-((q*t-q)/(-q*t+1))*B[(1, 1)] + B[(2, 0)]
>>> E[L0([Integer(1),-Integer(1)])]                                             ␣
↪               # needs sage.combinat
-((q*t-q)/(-q*t+1))*B[(0, 0)] + B[(1, -1)]
>>> E[L0([Integer(0),-Integer(2)])]                                             ␣
↪               # needs sage.combinat
-((q*t-q)/(-q*t+1))*B[(-1, -1)] + B[(0, -2)]
```

Systematic checks with Sage's implementation of [HHL06]:

```
sage: assert all(EE([x,y]) == NS.E([x,y])                                       #␣
↪needs sage.combinat
....:            for d in range(5) for x,y in IntegerVectors(d,2))
```

```
>>> from sage.all import *
>>> assert all(EE([x,y]) == NS.E([x,y])                                         #␣
↪needs sage.combinat
...            for d in range(Integer(5)) for x,y in IntegerVectors(d,Integer(2)))
```

With the current implementation, we can compute nonsymmetric Macdonald polynomials for any type, for example for type $E_6^{(1)}$:

```
sage: K = QQ['q,u'].fraction_field()
sage: q, u = K.gens()
sage: KL = RootSystem(["E",6,1]).weight_space(extended=True).algebra(K)
sage: E = NonSymmetricMacdonaldPolynomials(KL,q,u,-1/u)
sage: L0 = E.keys()

sage: E[L0.fundamental_weight(1).weyl_action([2,4,3,2,1])]
-((u^2-1)/(-q*u^16+1))*B[-Lambda[1] + Lambda[3]]
- ((u^2-1)/(-q*u^16+1))*B[Lambda[1]] + B[-Lambda[2] + Lambda[5]]
- ((u^2-1)/(-q*u^16+1))*B[Lambda[2]
- Lambda[4] + Lambda[5]] - ((u^2-1)/(-q*u^16+1))*B[-Lambda[3] + Lambda[4]]

sage: E[L0.fundamental_weight(2).weyl_action([2,5,3,4,2])]      # long time (6s)
-((q^2*u^20-q^2*u^18-q*u^2+q)/(-q^2*u^32+2*q*u^16-1))*B[0]
+ B[Lambda[1] - Lambda[3] + Lambda[4] - Lambda[5] + Lambda[6]]
- ((u^2-1)/(-q*u^16+1))*B[Lambda[1] - Lambda[3] + Lambda[5]]
- ((q*u^20-q*u^18-u^2+1)/(-q^2*u^32+2*q*u^16-1))*B[-Lambda[2] + Lambda[4]]
- ((q*u^20-q*u^18-u^2+1)/(-q^2*u^32+2*q*u^16-1))*B[Lambda[2]]
+ ((u^4-2*u^2+1)/(q^2*u^32-2*q*u^16+1))*B[Lambda[3] - Lambda[4] + Lambda[5]]
- ((u^2-1)/(-q*u^16+1))*B[Lambda[3] - Lambda[5] + Lambda[6]]
sage: E[L0.fundamental_weight(1)+L0.fundamental_weight(6)]      # long time (13s)

Comparison with the energy function of crystals

Next we test that the nonsymmetric Macdonald polynomials at $t = 0$ match with the one-dimensional configuration sums involving Kirillov-Reshetikhin crystals for various types. See [LNSSS12]:

```
sage: K = QQ['q,t'].fraction_field()
sage: q,t = K.gens()

1/(-q1*q2)
```

Checking the provided nonsymmetric Macdonald polynomial:

```
sage: E10 = KL0.monomial(L0((1,0))) + KL0( q*(1-(-q1/q2)) / (1-q^2*(-q1/q2)^4) )
sage: E10 == E[omega[1]]
True
sage: E.eigenvalues(E10)  # not checked
[q*q1^2/q2^2, q2^3/(-q^2*q1^3), q1/(-q2)]
```

```
>>> from sage.all import *
>>> E10 = KL0.monomial(L0((Integer(1),Integer(0)))) + KL0( q*(Integer(1)-(-q1/
↪q2)) / (Integer(1)-q**Integer(2)*(-q1/q2)**Integer(4)) )
>>> E10 == E[omega[Integer(1)]]
True
>>> E.eigenvalues(E10)  # not checked
[q*q1^2/q2^2, q2^3/(-q^2*q1^3), q1/(-q2)]
```

Checking T0check:

```
sage: T0check_on_basis = KL.T0_check_on_basis(q1,q2, convention='dominant')
sage: T0check_on_basis.phi  # note: this is in fact a0 phi
(2, 0)
sage: T0check_on_basis.v    # what to match it with?
(1,)
sage: T0check_on_basis.j    # what to match it with?
```

(continues on next page)

(continued from previous page)

```
2
sage: T0check_on_basis(KL0.basis().keys().zero())
-q1^2/q2*B[(1, 0)]

sage: T0check = E._T[0]
sage: T0check(KL0.one())
-q1^2/q2*B[(1, 0)]
```

```
>>> from sage.all import *
>>> T0check_on_basis = KL.T0_check_on_basis(q1,q2, convention='dominant')
>>> T0check_on_basis.phi  # note: this is in fact a0 phi
(2, 0)
>>> T0check_on_basis.v    # what to match it with?

+ (q*t - q)/(q*t - 1)*x1*x2
```

Systematic checks with Sage's implementation of [HHL06]:

```
sage: import sage.combinat.sf.ns_macdonald as NS                              #␣
↪needs sage.combinat
sage: assert all(EE([x,y,z]) == NS.E([x,y,z]) for d in range(5)          # long␣
↪time (9s), needs sage.combinat
....:                for x,y,z in IntegerVectors(d,3))
```

```
>>> from sage.all import *
>>> import sage.combinat.sf.ns_macdonald as NS                              #␣
↪needs sage.combinat
>>> assert all(EE([x,y,z]) == NS.E([x,y,z]) for d in range(Integer(5))          #␣
↪long time (9s), needs sage.combinat
...                for x,y,z in IntegerVectors(d,Integer(3)))
```

We check that we get eigenvectors for generic q_1, q_2:

```
sage: K = QQ['q,q1,q2'].fraction_field()
sage: q,q1,q2 = K.gens()
sage: KL = RootSystem(["A",2,1]).ambient_space().algebra(K)
sage: E = NonSymmetricMacdonaldPolynomials(KL, q, q1, q2)
sage: L0 = E.keys()
sage: omega = L0.fundamental_weights()
sage: E[2*omega[2]]
-((q*q1+q*q2)/(-q*q1-q2))*B[(1, 2, 1)] - ((q*q1+q*q2)/(-q*q1-q2))*B[(2, 1, 1)] +␣
↪B[(2, 2, 0)]
sage: for d in range(4):                          # long time (9s)
....:     for weight in IntegerVectors(d,3).map(list).map(L0):
....:         eigenvalues = E.eigenvalues(E[L0(weight)])
```

```
>>> from sage.all import *
>>> K = QQ['q,q1,q2'].fraction_field()

```

The following computations were calculated by hand:

```
sage: KL0 = KL.classical()
sage: E11 = KL0.sum_of_terms([[L0([1,1]), 1], [L0([0,0]), (-q*t^2 + q*t)/(1-q*t^
↪3)]])
sage: E11 == E[omega[2]]
True
sage: E.eigenvalues(E11)
[q*t^3, t, (-1)/(-q*t^2)]

sage: E1m1 = KL0.sum_of_terms([[L0([1,-1]), 1], [L0([1,1]), (1-t)/(1-q*t^2)],
....:                            [L0([0,0]), q*t*(1-t)/(1-q*t^2)]])
sage: E1m1 == E[2*omega[1]-omega[2]]
True
sage: E.eigenvalues(E1m1)
[1/(q*t), 1/(q^2*t^3), q*t^2]
```

```
>>> from sage.all import *
>>> KL0 = KL.classical()
>>> E11 = KL0.sum_of_terms([[L0([Integer(1),Integer(1)]), Integer(1)],␣
↪[L0([Integer(0),Integer(0)]), (-q*t**Integer(2) + q*t)/(Integer(1)-
↪q*t**Integer(3))]])
>>> E11 == E[omega[Integer(2)]]
True
>>> E.eigenvalues(E11)
[q*t^3, t, (-1)/(-q*t^2)]

>>> E1m1 = KL0.sum_of_terms([[L0([Integer(1),-Integer(1)]), Integer(1)],␣
↪[L0([Integer(1),Integer(1)]), (Integer(1)-t)/(Integer(1)-q*t**Integer(2))],
...                            [L0([Integer(0),Integer(0)]), q*t*(Integer(1)-t)/
↪(Integer(1)-q*t**Integer(2))]])
>>> E1m1 == E[Integer(2)*omega[Integer(1)]-omega[Integer(2)]]
True
>>> E.eigenvalues(E1m1)
[1/(q*t), 1/(q^2*t^3), q*t^2]
```

Now we present an example for a twisted affine root system. The results are eigenvectors:

```
sage: K = QQ['q','t'].fraction_field()
sage: q, t = K.gens()
```

Type BC dual, comparison with hand calculations by Bogdan Ion:

```
sage: K = QQ['q,q1,q2'].fraction_field()
sage: q,q1,q2 = K.gens()
sage: ct = CartanType(["BC",2,2]).dual()
sage: E = NonSymmetricMacdonaldPolynomials(ct, q=q, q1=q1, q2=q2)
sage: KL = E.domain(); KL
Algebra of the Ambient space of the Root system of type ['B', 2]
over Fraction Field of Multivariate Polynomial Ring in q, q1, q2 over Rational␣
↪Field
sage: alpha = E.keys().simple_roots(); alpha
Finite family {1: (1, -1), 2: (0, 1)}
sage: omega=E.keys().fundamental_weights(); omega
Finite family {1: (1, 0), 2: (1/2, 1/2)}
sage: epsilon = E.keys().basis(); epsilon
Finite family {0: (1, 0), 1: (0, 1)}
```

```
>>> from sage.all import *
>>> K = QQ['q,q1,q2'].fraction_field()
>>> q,q1,q2 = K.gens()
>>> ct = CartanType(["BC",Integer(2),Integer(2)]).dual()
>>> E = NonSymmetricMacdonaldPolynomials(ct, q=q, q1=q1, q2=q2)
>>> KL = E.domain(); KL
Algebra of the Ambient space of the Root system of type ['B', 2]
over Fraction Field of Multivariate Polynomial Ring in q, q1, q2 over Rational␣
↪Field
>>> alpha = E.keys().simple_roots(); alpha
Finite family {1: (1, -1), 2: (0, 1)}
```

(continues on next page)

(continued from previous page)

```
>>> omega=E.keys().fundamental_weights(); omega
Finite family {1: (1, 0), 2: (1/2, 1/2)}
>>> epsilon = E.keys().basis(); epsilon
Finite family {0: (1, 0), 1: (0, 1)}
```

Note: Sage's q is the usual q^2:

```
sage: E.L().null_root()
e['delta']
sage: E.L().null_coroot()
2*e['deltacheck']
```

```
>>> from sage.all import *
>>> E.L().null_root()
e['delta']
>>> E.L().null_coroot()
2*e['deltacheck']
```

Some eigenvectors:

```
sage: E[0*omega[1]]
B[(0, 0)]
sage: E[omega[1]]
-((q^2*q1^3*q2+q^2*q1^2*q2^2)/(q^2*q1^4-q2^4))*B[(0, 0)] + B[(1, 0)]
sage: Eomega1 = (KL.one() * (q^2*(-q1/q2)^2*(1-(-q1/q2))) / (1-q^2*(-q1/q2)^4)
....:            + KL.monomial(omega[1]))
sage: E[omega[1]] == Eomega1
True
```

```
>>> from sage.all import *
>>> E[Integer(0)*omega[Integer(1)]]
B[(0, 0)]
>>> E[omega[Integer(1)]]
-((q^2*q1^3*q2+q^2*q1^2*q2^2)/(q^2*q1^4-q2^4))*B[(0, 0)] + B[(1, 0)]
>>> Eomega1 = (KL.one() * (q**Integer(2)*(-q1/q2)**Integer(2)*(Integer(1)-(-q1/
↪q2))) / (Integer(1)-q**Integer(2)*(-q1/q2)**Integer(4))
...            + KL.monomial(omega[Integer(1)]))
>>> E[omega[Integer(1)]] == Eomega1
True
```

Checking the Y s:

```
sage: Y = E.Y()
sage: alphacheck = Y.keys().simple_roots()
sage: Y0 = Y[alphacheck[0]]
sage: Y1 = Y[alphacheck[1]]
sage: Y2 = Y[alphacheck[2]]

sage: Y0.word, Y0.signs, Y0.scalar
((0, 1, 2, 1, 0, 1, 2, 1), (-1, -1, -1, -1, -1, -1, -1, -1), q1^4*q2^4/q^2)
sage: Y1.word, Y1.signs, Y1.scalar
((1, 2, 0, 1, 2, 0), (1, 1, -1, 1, -1, 1), 1/(-q1*q2))
```

(continues on next page)

(continued from previous page)

```
sage: Y2.word, Y2.signs, Y2.scalar
((2, 1, 0, 1), (1, 1, 1, -1), 1/(-q1*q2))

sage: E.eigenvalues(0*omega[1])
[q2^4/(q^2*q1^4), q1/(-q2), q1/(-q2)]
```

```
>>> from sage.all import *
>>> Y = E.Y()
>>> alphacheck = Y.keys().simple_roots()
>>> Y0 = Y[alphacheck[Integer(0)]]
>>> Y1 = Y[alphacheck[Integer(1)]]
>>> Y2 = Y[alphacheck[Integer(2)]]

>>> Y0.word, Y0.signs, Y0.scalar
((0, 1, 2, 1, 0, 1, 2, 1), (-1, -1, -1, -1, -1, -1, -1, -1), q1^4*q2^4/q^2)
>>> Y1.word, Y1.signs, Y1.scalar
((1, 2, 0, 1, 2, 0), (1, 1, -1, 1, -1, 1), 1/(-q1*q2))
>>> Y2.word, Y2.signs, Y2.scalar
((2, 1, 0, 1), (1, 1, 1, -1), 1/(-q1*q2))

>>> E.eigenvalues(Integer(0)*omega[Integer(1)])
[q2^4/(q^2*q1^4), q1/(-q2), q1/(-q2)]
```

Checking the T and T^{-1} s:

```
sage: T = E._T_Y
sage: Tinv0 = T.Tw_inverse([0])
sage: Tinv1 = T.Tw_inverse([1])
sage: Tinv2 = T.Tw_inverse([2])

sage: for x in [0*epsilon[0], -epsilon[0], -epsilon[1], epsilon[0], epsilon[1]]:
....:     x = KL.monomial(x)
....:     assert Tinv0(T[0](x)) == x and T[0](Tinv0(x)) == x
....:     assert Tinv1(T[1](x)) == x and T[1](Tinv1(x)) == x
....:     assert Tinv2(T[2](x)) == x and T[2](Tinv2(x)) == x

sage: start = E[omega[1]]; start
-((q^2*q1^3*q2+q^2*q1^2*q2^2)/(q^2*q1^4-q2^4))*B[(0, 0)] + B[(1, 0)]
sage: Tinv1(Tinv2(Tinv1(Tinv0(Tinv1(Tinv2(Tinv1(Tinv0(start)))))))) * (q1*q2)^4/q^
↪2 == Y0(start)
True
sage: Y0(start) == q^2*q1^4/q2^4 * start
True
```

```
>>> from sage.all import *
>>> T = E._T_Y
>>> Tinv0 = T.Tw_inverse([Integer(0)])
>>> Tinv1 = T.Tw_inverse([Integer(1)])
>>> Tinv2 = T.Tw_inverse([Integer(2)])

>>> for x in [Integer(0)*epsilon[Integer(0)], -epsilon[Integer(0)], -
↪epsilon[Integer(1)], epsilon[Integer(0)], epsilon[Integer(1)]]:
```

(continues on next page)

(continued from previous page)

```
...     x = KL.monomial(x)
...     assert Tinv0(T[Integer(0)](x)) == x and T[Integer(0)](Tinv0(x)) == x
...     assert Tinv1(T[Integer(1)](x)) == x and T[Integer(1)](Tinv1(x)) == x
...     assert Tinv2(T[Integer(2)](x)) == x and T[Integer(2)](Tinv2(x)) == x

>>> start = E[omega[Integer(1)]]; start
-((q^2*q1^3*q2+q^2*q1^2*q2^2)/(q^2*q1^4-q2^4))*B[(0, 0)] + B[(1, 0)]
>>> Tinv1(Tinv2(Tinv1(Tinv0(Tinv1(Tinv2(Tinv1(Tinv0(start)))))))) *␣
↪(q1*q2)**Integer(4)/q**Integer(2) == Y0(start)
True
>>> Y0(start) == q**Integer(2)*q1**Integer(4)/q2**Integer(4) * start
True
```

Checking the relation between the Y s:

```
sage: q^2 * Y0(Y1(Y1(Y2(Y2(start))))) == start
True
sage: for x in [0*epsilon[0], -epsilon[0], -epsilon[1], epsilon[0], epsilon[1]]:
....:     x = KL.monomial(x)
....:     assert q^2 * Y0(Y1(Y1(Y2(Y2(start))))) == start
```

```
>>> from sage.all import *
>>> q**Integer(2) * Y0(Y1(Y1(Y2(Y2(start))))) == start
True
>>> for x in [Integer(0)*epsilon[Integer(0)], -epsilon[Integer(0)], -
↪epsilon[Integer(1)], epsilon[Integer(0)], epsilon[Integer(1)]]:
...     x = KL.monomial(x)
...     assert q**Integer(2) * Y0(Y1(Y1(Y2(Y2(start))))) == start
```

KL0()

Return the group algebra where the nonsymmetric Macdonald polynomials live.

EXAMPLES:

```
sage: NonSymmetricMacdonaldPolynomials("B2~").KL0()
Algebra of the Ambient space of the Root system of type ['B', 2]
over Fraction Field of Multivariate Polynomial Ring in q, q1, q2 over␣
↪Rational Field
sage: NonSymmetricMacdonaldPolynomials("B2~*").KL0()
Algebra of the Ambient space of the Root system of type ['C', 2]
over Fraction Field of Multivariate Polynomial Ring in q, q1, q2 over␣
↪Rational Field
```

```
>>> from sage.all import *
>>> NonSymmetricMacdonaldPolynomials("B2~").KL0()
Algebra of the Ambient space of the Root system of type ['B', 2]
over Fraction Field of Multivariate Polynomial Ring in q, q1, q2 over␣
↪Rational Field
>>> NonSymmetricMacdonaldPolynomials("B2~*").KL0()
Algebra of the Ambient space of the Root system of type ['C', 2]
over Fraction Field of Multivariate Polynomial Ring in q, q1, q2 over␣
↪Rational Field
```

L()

Return the affinization of the classical weight space.

EXAMPLES:

```
sage: NonSymmetricMacdonaldPolynomials(["B", 2, 1]).L()
Ambient space of the Root system of type ['B', 2, 1]
```

```
>>> from sage.all import *
>>> NonSymmetricMacdonaldPolynomials(["B", Integer(2), Integer(1)]).L()
Ambient space of the Root system of type ['B', 2, 1]
```

L0()

Return the space indexing the monomials of the nonsymmetric Macdonald polynomials.

EXAMPLES:

```
sage: NonSymmetricMacdonaldPolynomials("B2~").L0()
Ambient space of the Root system of type ['B', 2]
sage: NonSymmetricMacdonaldPolynomials("B2~*").L0()
Ambient space of the Root system of type ['C', 2]
```

```
>>> from sage.all import *
>>> NonSymmetricMacdonaldPolynomials("B2~").L0()
Ambient space of the Root system of type ['B', 2]
>>> NonSymmetricMacdonaldPolynomials("B2~*").L0()
Ambient space of the Root system of type ['C', 2]
```

L_check()

Return the other affinization of the classical weight space.

Todo

should this just return L in the simply laced case?

EXAMPLES:

```
sage: NonSymmetricMacdonaldPolynomials(["B", 2, 1]).L_check()
Coambient space of the Root system of type ['C', 2, 1]
sage: NonSymmetricMacdonaldPolynomials(["B", 2, 1]).L_check().classical()
Ambient space of the Root system of type ['B', 2]
```

```
>>> from sage.all import *
>>> NonSymmetricMacdonaldPolynomials(["B", Integer(2), Integer(1)]).L_check()
Coambient space of the Root system of type ['C', 2, 1]
>>> NonSymmetricMacdonaldPolynomials(["B", Integer(2), Integer(1)]).L_check().
↪classical()
Ambient space of the Root system of type ['B', 2]
```

L_prime()

The affine space where classical weights are lifted for the recursion.

Also the parent of ρ'.

EXAMPLES:

In the twisted case, this is the affinization of the classical ambient space:

```
sage: NonSymmetricMacdonaldPolynomials("B2~*").L()
Ambient space of the Root system of type ['B', 2, 1]^*
sage: NonSymmetricMacdonaldPolynomials("B2~*").L().classical()
Ambient space of the Root system of type ['C', 2]

sage: NonSymmetricMacdonaldPolynomials("B2~*").L_prime()
Ambient space of the Root system of type ['B', 2, 1]^*
sage: NonSymmetricMacdonaldPolynomials("B2~*").L_prime().classical()
Ambient space of the Root system of type ['C', 2]
```

```
>>> from sage.all import *
>>> NonSymmetricMacdonaldPolynomials("B2~*").L()
Ambient space of the Root system of type ['B', 2, 1]^*
>>> NonSymmetricMacdonaldPolynomials("B2~*").L().classical()
Ambient space of the Root system of type ['C', 2]

>>> NonSymmetricMacdonaldPolynomials("B2~*").L_prime()
Ambient space of the Root system of type ['B', 2, 1]^*
>>> NonSymmetricMacdonaldPolynomials("B2~*").L_prime().classical()
Ambient space of the Root system of type ['C', 2]
```

In the untwisted case, this is the other affinization of the classical ambient space:

```
sage: NonSymmetricMacdonaldPolynomials("B2~").L()
Ambient space of the Root system of type ['B', 2, 1]
sage: NonSymmetricMacdonaldPolynomials("B2~").L().classical()
Ambient space of the Root system of type ['B', 2]

sage: NonSymmetricMacdonaldPolynomials("B2~").L_prime()
Coambient space of the Root system of type ['C', 2, 1]
sage: NonSymmetricMacdonaldPolynomials("B2~").L_prime().classical()
Ambient space of the Root system of type ['B', 2]
```

```
>>> from sage.all import *
>>> NonSymmetricMacdonaldPolynomials("B2~").L()
Ambient space of the Root system of type ['B', 2, 1]
>>> NonSymmetricMacdonaldPolynomials("B2~").L().classical()
Ambient space of the Root system of type ['B', 2]

>>> NonSymmetricMacdonaldPolynomials("B2~").L_prime()
Coambient space of the Root system of type ['C', 2, 1]
>>> NonSymmetricMacdonaldPolynomials("B2~").L_prime().classical()
Ambient space of the Root system of type ['B', 2]
```

For simply laced, the two affinizations coincide:

```
sage: NonSymmetricMacdonaldPolynomials("A2~").L()
Ambient space of the Root system of type ['A', 2, 1]
sage: NonSymmetricMacdonaldPolynomials("A2~").L().classical()
Ambient space of the Root system of type ['A', 2]
```

(continues on next page)

(continued from previous page)

```
sage: NonSymmetricMacdonaldPolynomials("A2~").L_prime()
Coambient space of the Root system of type ['A', 2, 1]
sage: NonSymmetricMacdonaldPolynomials("A2~").L_prime().classical()
Ambient space of the Root system of type ['A', 2]
```

```
>>> from sage.all import *
>>> NonSymmetricMacdonaldPolynomials("A2~").L()
Ambient space of the Root system of type ['A', 2, 1]
>>> NonSymmetricMacdonaldPolynomials("A2~").L().classical()
Ambient space of the Root system of type ['A', 2]

>>> NonSymmetricMacdonaldPolynomials("A2~").L_prime()
Coambient space of the Root system of type ['A', 2, 1]
>>> NonSymmetricMacdonaldPolynomials("A2~").L_prime().classical()
Ambient space of the Root system of type ['A', 2]
```

Note

do we want the coambient space of type $A_2^{(1)}$ instead?

For type BC:

```
sage: NonSymmetricMacdonaldPolynomials(["BC",3,2]).L_prime()
Ambient space of the Root system of type ['BC', 3, 2]
```

```
>>> from sage.all import *
>>> NonSymmetricMacdonaldPolynomials(["BC",Integer(3),Integer(2)]).L_prime()
Ambient space of the Root system of type ['BC', 3, 2]
```

Q_to_Qcheck()

The reindexing of the index set of the Y's by the coroot lattice.

EXAMPLES:

```
sage: E = NonSymmetricMacdonaldPolynomials("C2~")
sage: alphacheck = E.Y().keys().simple_roots()
sage: E.Q_to_Qcheck(alphacheck[0])
alphacheck[0] - alphacheck[2]
sage: E.Q_to_Qcheck(alphacheck[1])
alphacheck[1]
sage: E.Q_to_Qcheck(alphacheck[2])
alphacheck[2]

sage: x = alphacheck[1] + 2*alphacheck[2]
sage: x.parent()
Root lattice of the Root system of type ['B', 2, 1]
sage: E.Q_to_Qcheck(x)
alphacheck[1] + 2*alphacheck[2]
sage: _.parent()
Coroot lattice of the Root system of type ['C', 2, 1]
```

```
>>> from sage.all import *
>>> E = NonSymmetricMacdonaldPolynomials("C2~")
>>> alphacheck = E.Y().keys().simple_roots()
>>> E.Q_to_Qcheck(alphacheck[Integer(0)])
alphacheck[0] - alphacheck[2]
>>> E.Q_to_Qcheck(alphacheck[Integer(1)])
alphacheck[1]
>>> E.Q_to_Qcheck(alphacheck[Integer(2)])
alphacheck[2]

>>> x = alphacheck[Integer(1)] + Integer(2)*alphacheck[Integer(2)]
>>> x.parent()
Root lattice of the Root system of type ['B', 2, 1]
>>> E.Q_to_Qcheck(x)
alphacheck[1] + 2*alphacheck[2]
>>> _.parent()
Coroot lattice of the Root system of type ['C', 2, 1]
```

Y()

Return the family of Y operators whose eigenvectors are the nonsymmetric Macdonald polynomials.

EXAMPLES:

```
sage: NonSymmetricMacdonaldPolynomials("C2~").Y()
Lazy family (<lambda>(i))_{i in Root lattice of the Root system of type ['B',␣
↪2, 1]}
sage: _.keys().classical()
Root lattice of the Root system of type ['B', 2]
sage: NonSymmetricMacdonaldPolynomials("C2~*").Y()
Lazy family (<...Y_lambdacheck...>(i))_{i in Coroot lattice of the Root␣
↪system of type ['C', 2, 1]^*}
sage: _.keys().classical()
Root lattice of the Root system of type ['C', 2]
sage: NonSymmetricMacdonaldPolynomials(["BC", 3, 2]).Y()
Lazy family (<...Y_lambdacheck...>(i))_{i in Coroot lattice of the Root␣
↪system of type ['BC', 3, 2]}
sage: _.keys().classical()
Root lattice of the Root system of type ['B', 3]
```

```
>>> from sage.all import *
>>> NonSymmetricMacdonaldPolynomials("C2~").Y()
Lazy family (<lambda>(i))_{i in Root lattice of the Root system of type ['B',␣
↪2, 1]}
>>> _.keys().classical()
Root lattice of the Root system of type ['B', 2]
>>> NonSymmetricMacdonaldPolynomials("C2~*").Y()
Lazy family (<...Y_lambdacheck...>(i))_{i in Coroot lattice of the Root␣
↪system of type ['C', 2, 1]^*}
>>> _.keys().classical()
Root lattice of the Root system of type ['C', 2]
>>> NonSymmetricMacdonaldPolynomials(["BC", Integer(3), Integer(2)]).Y()
Lazy family (<...Y_lambdacheck...>(i))_{i in Coroot lattice of the Root␣
↪system of type ['BC', 3, 2]}
```

(continues on next page)

(continued from previous page)

```
>>> _.keys().classical()
Root lattice of the Root system of type ['B', 3]
```

affine_lift(*mu*)

Return the affinization of μ in L'.

INPUT:

- `mu` – a classical weight μ

See also

- *hecke_algebra_representation.CherednikOperatorsEigenvectors.affine_lift()*
- *affine_retract()*
- *L_prime()*

EXAMPLES:

In the untwisted case, this is the other affinization at level 1:

```
sage: E = NonSymmetricMacdonaldPolynomials("B2~")
sage: L0 = E.keys(); L0
Ambient space of the Root system of type ['B', 2]
sage: omega = L0.fundamental_weights()
sage: E.affine_lift(omega[1])
e[0] + e['deltacheck']
sage: E.affine_lift(omega[1]).parent()
Coambient space of the Root system of type ['C', 2, 1]
```

```
>>> from sage.all import *
>>> E = NonSymmetricMacdonaldPolynomials("B2~")
>>> L0 = E.keys(); L0
Ambient space of the Root system of type ['B', 2]
>>> omega = L0.fundamental_weights()
>>> E.affine_lift(omega[Integer(1)])
e[0] + e['deltacheck']
>>> E.affine_lift(omega[Integer(1)]).parent()
Coambient space of the Root system of type ['C', 2, 1]
```

In the twisted case, this is the usual affinization at level 1:

```
sage: E = NonSymmetricMacdonaldPolynomials("B2~*")
sage: L0 = E.keys(); L0
Ambient space of the Root system of type ['C', 2]
sage: omega = L0.fundamental_weights()
sage: E.affine_lift(omega[1])
e[0] + e['deltacheck']
sage: E.affine_lift(omega[1]).parent()
Ambient space of the Root system of type ['B', 2, 1]^*
```

```
>>> from sage.all import *
>>> E = NonSymmetricMacdonaldPolynomials("B2~*")
>>> L0 = E.keys(); L0
Ambient space of the Root system of type ['C', 2]
>>> omega = L0.fundamental_weights()
>>> E.affine_lift(omega[Integer(1)])
e[0] + e['deltacheck']
>>> E.affine_lift(omega[Integer(1)]).parent()
Ambient space of the Root system of type ['B', 2, 1]^*
```

affine_retract(*mu*)

Retract the affine weight μ into a classical weight.

INPUT:

- mu – an affine weight μ in L'

See also

- hecke_algebra_representation.HeckeAlgebraRepresentation.affine_retract()
- *affine_lift()*
- *L_prime()*

EXAMPLES:

```
sage: E = NonSymmetricMacdonaldPolynomials("B2~")
sage: L0 = E.keys(); L0
Ambient space of the Root system of type ['B', 2]
sage: omega = L0.fundamental_weights()
sage: E.affine_lift(omega[1])
e[0] + e['deltacheck']
sage: E.affine_retract(E.affine_lift(omega[1]))
(1, 0)
```

```
>>> from sage.all import *
>>> E = NonSymmetricMacdonaldPolynomials("B2~")
>>> L0 = E.keys(); L0
Ambient space of the Root system of type ['B', 2]
>>> omega = L0.fundamental_weights()
>>> E.affine_lift(omega[Integer(1)])
e[0] + e['deltacheck']
>>> E.affine_retract(E.affine_lift(omega[Integer(1)]))
(1, 0)
```

cartan_type()

Return Cartan type of self.

EXAMPLES:

```
sage: NonSymmetricMacdonaldPolynomials(["B", 2, 1]).cartan_type()
['B', 2, 1]
```

```
>>> from sage.all import *
>>> NonSymmetricMacdonaldPolynomials(["B", Integer(2), Integer(1)]).cartan_
→type()
['B', 2, 1]
```

eigenvalue_experimental(*mu*, *l*)

Return the eigenvalue of $Y^{\lambda^\vee}$ acting on the macdonald polynomial E_μ.

INPUT:

- `mu` – the index μ of an eigenvector
- `l` – an index $\lambda^\vee$ of some Y

Note

- This method is currently not used; most tests below even test the naive method. They are left here as a basis for a future implementation.
- This is actually equivariant, as long as s_i does not fix λ.
- This method is only really needed for $\lambda^\vee = \alpha_i^\vee$ with $i = 0, ..., n$.

See Corollary 6.11 of [Haiman06].

EXAMPLES:

```
sage: K = QQ['q,t'].fraction_field()
sage: q,t = K.gens()
sage: q1 = t
sage: q2 = -1
sage: KL = RootSystem(["A",1,1]).ambient_space().algebra(K)
sage: E = NonSymmetricMacdonaldPolynomials(KL,q, q1, q2)
sage: L0 = E.keys()
sage: E.eigenvalues(L0([0,0]))   # Checked by hand by Mark and Arun           #␣
→needs sage.libs.gap
[1/(q*t), t]
sage: alpha = E.Y().keys().simple_roots()
sage: E.eigenvalue_experimental(L0([0,0]), alpha[0]) # todo: not implemented
1/(q*t)
sage: E.eigenvalue_experimental(L0([0,0]), alpha[1])
t
```

```
>>> from sage.all import *
>>> K = QQ['q,t'].fraction_field()
>>> q,t = K.gens()
>>> q1 = t
>>> q2 = -Integer(1)
>>> KL = RootSystem(["A",Integer(1),Integer(1)]).ambient_space().algebra(K)
>>> E = NonSymmetricMacdonaldPolynomials(KL,q, q1, q2)
>>> L0 = E.keys()
>>> E.eigenvalues(L0([Integer(0),Integer(0)]))   # Checked by hand by Mark and␣
→Arun          # needs sage.libs.gap
[1/(q*t), t]
```

(continues on next page)

(continued from previous page)

```
>>> alpha = E.Y().keys().simple_roots()
>>> E.eigenvalue_experimental(L0([Integer(0),Integer(0)]), alpha[Integer(0)])
↪# todo: not implemented
1/(q*t)
>>> E.eigenvalue_experimental(L0([Integer(0),Integer(0)]), alpha[Integer(1)])
t
```

Some examples of eigenvalues (not mathematically checked!!!):

```
sage: # needs sage.libs.gap
sage: E.eigenvalues(L0([1,0]))
[t, 1/(q*t)]
sage: E.eigenvalues(L0([0,1]))
[1/(q^2*t), q*t]
sage: E.eigenvalues(L0([1,1]))
[1/(q*t), t]
sage: E.eigenvalues(L0([2,1]))
[t, 1/(q*t)]
sage: E.eigenvalues(L0([-1,1]))
[(-1)/(-q^3*t), q^2*t]
sage: E.eigenvalues(L0([-2,1]))
[(-1)/(-q^4*t), q^3*t]
sage: E.eigenvalues(L0([-2,0]))
[(-1)/(-q^3*t), q^2*t]
```

```
>>> from sage.all import *
>>> # needs sage.libs.gap
>>> E.eigenvalues(L0([Integer(1),Integer(0)]))
[t, 1/(q*t)]
>>> E.eigenvalues(L0([Integer(0),Integer(1)]))
[1/(q^2*t), q*t]
>>> E.eigenvalues(L0([Integer(1),Integer(1)]))
[1/(q*t), t]
>>> E.eigenvalues(L0([Integer(2),Integer(1)]))
[t, 1/(q*t)]
>>> E.eigenvalues(L0([-Integer(1),Integer(1)]))
[(-1)/(-q^3*t), q^2*t]
>>> E.eigenvalues(L0([-Integer(2),Integer(1)]))
[(-1)/(-q^4*t), q^3*t]
>>> E.eigenvalues(L0([-Integer(2),Integer(0)]))
[(-1)/(-q^3*t), q^2*t]
```

Some type B examples:

```
sage: K = QQ['q,t'].fraction_field()
sage: q,t = K.gens()
sage: q1 = t
sage: q2 = -1
sage: L = RootSystem(["B",2,1]).ambient_space()
sage: KL = L.algebra(K)
sage: E = NonSymmetricMacdonaldPolynomials(KL,q, q1, q2)
sage: L0 = E.keys()
```

(continues on next page)

(continued from previous page)

```
sage: alpha = L.simple_coroots()

sage: # not tested
sage: E.eigenvalue(L0((0,0)), alpha[0])  # not checked
q/t
sage: E.eigenvalue(L0((1,0)), alpha[1])  # What Mark got by hand
q
sage: E.eigenvalue(L0((1,0)), alpha[2])  # not checked
t
sage: E.eigenvalue(L0((1,0)), alpha[0])  # not checked
1

sage: L = RootSystem("B2~*").ambient_space()
sage: KL = L.algebra(K)
sage: E = NonSymmetricMacdonaldPolynomials(KL,q, q1, q2)
sage: L0 = E.keys()
sage: alpha = L.simple_coroots()
sage: E.eigenvalue(L0((0,0)), alpha[0]) # assuming Mark's calculation is␣
↪correct, one should get # not tested
1/(q*t^2)
```

```
>>> from sage.all import *
>>> K = QQ['q,t'].fraction_field()
>>> q,t = K.gens()
>>> q1 = t
>>> q2 = -Integer(1)
>>> L = RootSystem(["B",Integer(2),Integer(1)]).ambient_space()
>>> KL = L.algebra(K)
>>> E = NonSymmetricMacdonaldPolynomials(KL,q, q1, q2)
>>> L0 = E.keys()
>>> alpha = L.simple_coroots()

>>> # not tested
>>> E.eigenvalue(L0((Integer(0),Integer(0))), alpha[Integer(0)])  # not␣
↪checked
q/t
>>> E.eigenvalue(L0((Integer(1),Integer(0))), alpha[Integer(1)])  # What Mark␣
↪got by hand
q
>>> E.eigenvalue(L0((Integer(1),Integer(0))), alpha[Integer(2)])  # not␣
↪checked
t
>>> E.eigenvalue(L0((Integer(1),Integer(0))), alpha[Integer(0)])  # not␣
↪checked
1

>>> L = RootSystem("B2~*").ambient_space()
>>> KL = L.algebra(K)
>>> E = NonSymmetricMacdonaldPolynomials(KL,q, q1, q2)
>>> L0 = E.keys()
>>> alpha = L.simple_coroots()
>>> E.eigenvalue(L0((Integer(0),Integer(0))), alpha[Integer(0)]) # assuming␣
```

(continues on next page)

(continued from previous page)

```
↪Mark's calculation is correct, one should get # not tested
1/(q*t^2)
```

The expected value can more or less be read off from equation (37), Corollary 6.15 of [Haiman06]

Todo

- Use proposition 6.9 of [Haiman06] to check the action of the Y s on monomials.
- Generalize to any q_1, q_2.
- Check claim by Mark: all scalar products should occur in the finite weight lattice, with alpha 0 being the appropriate projection of the affine alpha 0. Question: can this be emulated by being at level 0?

rho_prime()

Return the level 0 sum of the classical fundamental weights in L'.

See also

L_prime()

EXAMPLES:

Untwisted case:

```
sage: NonSymmetricMacdonaldPolynomials("B2~").rho_prime()   # CHECKME
3/2*e[0] + 1/2*e[1]
sage: NonSymmetricMacdonaldPolynomials("B2~").rho_prime().parent()
Coambient space of the Root system of type ['C', 2, 1]
```

```
>>> from sage.all import *
>>> NonSymmetricMacdonaldPolynomials("B2~").rho_prime()   # CHECKME
3/2*e[0] + 1/2*e[1]
>>> NonSymmetricMacdonaldPolynomials("B2~").rho_prime().parent()
Coambient space of the Root system of type ['C', 2, 1]
```

Twisted case:

```
sage: NonSymmetricMacdonaldPolynomials("B2~*").rho_prime()   # CHECKME
2*e[0] + e[1]
sage: NonSymmetricMacdonaldPolynomials("B2~*").rho_prime().parent()
Ambient space of the Root system of type ['B', 2, 1]^*
```

```
>>> from sage.all import *
>>> NonSymmetricMacdonaldPolynomials("B2~*").rho_prime()   # CHECKME
2*e[0] + e[1]
>>> NonSymmetricMacdonaldPolynomials("B2~*").rho_prime().parent()
Ambient space of the Root system of type ['B', 2, 1]^*
```

seed(*mu*)

Return E_μ for μ minuscule, i.e. in the fundamental alcove.

INPUT:

- mu – the index μ of an eigenvector

EXAMPLES:

```
sage: E = NonSymmetricMacdonaldPolynomials(["A",2,1])
sage: omega = E.keys().fundamental_weights()
sage: E.seed(omega[1])
B[(1, 0, 0)]
```

```
>>> from sage.all import *
>>> E = NonSymmetricMacdonaldPolynomials(["A",Integer(2),Integer(1)])
>>> omega = E.keys().fundamental_weights()
>>> E.seed(omega[Integer(1)])
B[(1, 0, 0)]
```

symmetric_macdonald_polynomial(*mu*)

Return the symmetric Macdonald polynomial indexed by μ.

INPUT:

- mu – a dominant weight μ

> **Warning**
>
> The result is Weyl-symmetric only for Hecke parameters of the form $q_1 = v$ and $q_2 = -1/v$. In general the value of v below, should be the square root of $-q_1/q_2$, but the use of $q_1 = t$ and $q_2 = -1$ results in nonintegral powers of t.

EXAMPLES:

```
sage: K = QQ['q,v,t'].fraction_field()
sage: q,v,t = K.gens()
sage: E = NonSymmetricMacdonaldPolynomials(['A',2,1], q, v, -1/v)
sage: om = E.L0().fundamental_weights()
sage: E.symmetric_macdonald_polynomial(om[2])                          #␣
↪needs sage.libs.gap
B[(1, 1, 0)] + B[(1, 0, 1)] + B[(0, 1, 1)]
sage: E.symmetric_macdonald_polynomial(2*om[1])                        #␣
↪needs sage.libs.gap
((q*v^2+v^2-q-1)/(q*v^2-1))*B[(1, 1, 0)]
+ ((q*v^2+v^2-q-1)/(q*v^2-1))*B[(1, 0, 1)] + B[(2, 0, 0)]
+ ((q*v^2+v^2-q-1)/(q*v^2-1))*B[(0, 1, 1)] + B[(0, 2, 0)] + B[(0, 0, 2)]
sage: f = E.symmetric_macdonald_polynomial(E.L0()((2,1,0))); f        #␣
↪needs sage.libs.gap
((2*q*v^4+v^4-q*v^2+v^2-q-2)/(q*v^4-1))*B[(1, 1, 1)] + B[(1, 2, 0)]
+ B[(1, 0, 2)] + B[(2, 1, 0)] + B[(2, 0, 1)] + B[(0, 1, 2)] + B[(0, 2, 1)]
```

```
>>> from sage.all import *
>>> K = QQ['q,v,t'].fraction_field()
>>> q,v,t = K.gens()
>>> E = NonSymmetricMacdonaldPolynomials(['A',Integer(2),Integer(1)], q, v, -
↪Integer(1)/v)
```

(continues on next page)

(continued from previous page)

```
>>> om = E.L0().fundamental_weights()
>>> E.symmetric_macdonald_polynomial(om[Integer(2)])                    ␣
↪     # needs sage.libs.gap
B[(1, 1, 0)] + B[(1, 0, 1)] + B[(0, 1, 1)]
>>> E.symmetric_macdonald_polynomial(Integer(2)*om[Integer(1)])         ␣
↪              # needs sage.libs.gap

twist (*mu*, *i*)

Act by s_i on the affine weight μ.

This calls `simple_reflection`; which is semantically the same as the default implementation.

EXAMPLES:

```
sage: # needs sage.libs.gap
sage: W = WeylGroup(["B",3])
sage: W.element_class._repr_ = lambda x: "".join(str(i)
....:                                            for i in x.reduced_word())
```

(continues on next page)

(continued from previous page)

```
sage: K = QQ['q1,q2']
sage: q1, q2 = K.gens()
sage: KW = W.algebra(K)
sage: T = KW.demazure_lusztig_operators(q1, q2, affine=True)
sage: E = T.Y_eigenvectors()
sage: w = W.an_element(); w
123
sage: E.twist(w,1)
1231
```

```
>>> from sage.all import *
>>> # needs sage.libs.gap
>>> W = WeylGroup(["B",Integer(3)])
>>> W.element_class._repr_ = lambda x: "".join(str(i)
...                                            for i in x.reduced_word())
>>> K = QQ['q1,q2']

>>> KW = W.algebra(K)
>>> T = KW.demazure_lusztig_operators(q1, q2, affine=True)
>>> E = T.Y_eigenvectors()
>>> w = W.an_element(); w
123
>>> E.twist(w,Integer(1))
1231
```

5.1.234 Pieri Factors

class sage.combinat.root_system.pieri_factors.**PieriFactors**

Bases: UniqueRepresentation, Parent

An abstract class for sets of Pieri factors, used for constructing Stanley symmetric functions. The set of Pieri factors for a given type can be realized as an order ideal of the Bruhat order poset generated by a certain set of maximal elements.

See also

- WeylGroups.ParentMethods.pieri_factors()
- WeylGroups.ElementMethods.stanley_symmetric_function()

EXAMPLES:

```
sage: W = WeylGroup(['A',4])
sage: PF = W.pieri_factors()
sage: PF.an_element().reduced_word()
[4, 3, 2, 1]
sage: Waff = WeylGroup(['A',4,1])
sage: PFaff = Waff.pieri_factors()
sage: Waff.from_reduced_word(PF.an_element().reduced_word()) in PFaff
True
```

(continues on next page)

(continued from previous page)

```
sage: W = WeylGroup(['B',3,1])
sage: PF = W.pieri_factors()
sage: W.from_reduced_word([2,3,2]) in PF.elements()
True
sage: PF.cardinality()
47

sage: W = WeylGroup(['C',3,1])
sage: PF = W.pieri_factors()
sage: PF.generating_series()
6*z^6 + 14*z^5 + 18*z^4 + 15*z^3 + 9*z^2 + 4*z + 1
sage: sorted(w.reduced_word() for w in PF if w.length() == 2)
[[0, 1], [1, 0], [1, 2], [2, 0], [2, 1],
[2, 3], [3, 0], [3, 1], [3, 2]]
```

```
>>> from sage.all import *
>>> W = WeylGroup(['A',Integer(4)])
>>> PF = W.pieri_factors()
>>> PF.an_element().reduced_word()
[4, 3, 2, 1]
>>> Waff = WeylGroup(['A',Integer(4),Integer(1)])
>>> PFaff = Waff.pieri_factors()
>>> Waff.from_reduced_word(PF.an_element().reduced_word()) in PFaff
True

>>> W = WeylGroup(['B',Integer(3),Integer(1)])
>>> PF = W.pieri_factors()
>>> W.from_reduced_word([Integer(2),Integer(3),Integer(2)]) in PF.elements()
True
>>> PF.cardinality()
47

>>> W = WeylGroup(['C',Integer(3),Integer(1)])
>>> PF = W.pieri_factors()
>>> PF.generating_series()
6*z^6 + 14*z^5 + 18*z^4 + 15*z^3 + 9*z^2 + 4*z + 1
>>> sorted(w.reduced_word() for w in PF if w.length() == Integer(2))
[[0, 1], [1, 0], [1, 2], [2, 0], [2, 1],
[2, 3], [3, 0], [3, 1], [3, 2]]
```

REFERENCES:

- [FoSta1994]
- [BH1994]

- [Lam2008]
- [LSS2009]
- [Pon2010]

default_weight()

Return the function $i \mapsto z^i$, where z is the generator of `QQ['z']`.

EXAMPLES:

```
sage: W = WeylGroup(["A", 3, 1])
sage: weight = W.pieri_factors().default_weight()
sage: weight(1)
z
sage: weight(5)
z^5
```

```
>>> from sage.all import *
>>> W = WeylGroup(["A", Integer(3), Integer(1)])
>>> weight = W.pieri_factors().default_weight()
>>> weight(Integer(1))
z
>>> weight(Integer(5))
z^5
```

elements()

Return the elements of `self`.

Those are constructed as the elements below the maximal elements of `self` in Bruhat order.

OUTPUT: a `RecursivelyEnumeratedSet_generic` object

EXAMPLES:

```
sage: PF = WeylGroup(['A',3]).pieri_factors()
sage: sorted(w.reduced_word() for w in PF.elements())
[[], [1], [2], [2, 1], [3], [3, 1], [3, 2], [3, 2, 1]]
```

```
>>> from sage.all import *
>>> PF = WeylGroup(['A',Integer(3)]).pieri_factors()
>>> sorted(w.reduced_word() for w in PF.elements())
[[], [1], [2], [2, 1], [3], [3, 1], [3, 2], [3, 2, 1]]
```

See also

`maximal_elements()`

Todo

Possibly remove this method and instead have this class inherit from `RecursivelyEnumeratedSet_generic`.

generating_series(*weight=None*)

Return a length generating series for the elements of `self`.

EXAMPLES:

```
sage: PF = WeylGroup(['C',3,1]).pieri_factors()
sage: PF.generating_series()
6*z^6 + 14*z^5 + 18*z^4 + 15*z^3 + 9*z^2 + 4*z + 1
```

(continues on next page)

(continued from previous page)

```
sage: PF = WeylGroup(['B',4]).pieri_factors()
sage: PF.generating_series()
z^7 + 6*z^6 + 14*z^5 + 18*z^4 + 15*z^3 + 9*z^2 + 4*z + 1
```

```
>>> from sage.all import *
>>> PF = WeylGroup(['C',Integer(3),Integer(1)]).pieri_factors()
>>> PF.generating_series()
6*z^6 + 14*z^5 + 18*z^4 + 15*z^3 + 9*z^2 + 4*z + 1

>>> PF = WeylGroup(['B',Integer(4)]).pieri_factors()
>>> PF.generating_series()
z^7 + 6*z^6 + 14*z^5 + 18*z^4 + 15*z^3 + 9*z^2 + 4*z + 1
```

max_length()

Return the maximal length of a Pieri factor.

EXAMPLES:

In type A and A affine, this is n:

```
sage: WeylGroup(['A',5]).pieri_factors().max_length()
5
sage: WeylGroup(['A',5,1]).pieri_factors().max_length()
5
```

```
>>> from sage.all import *
>>> WeylGroup(['A',Integer(5)]).pieri_factors().max_length()
5
>>> WeylGroup(['A',Integer(5),Integer(1)]).pieri_factors().max_length()
5
```

In type B and B affine, this is $2n - 1$:

```
sage: WeylGroup(['B',5,1]).pieri_factors().max_length()
9
sage: WeylGroup(['B',5]).pieri_factors().max_length()
9
```

```
>>> from sage.all import *
>>> WeylGroup(['B',Integer(5),Integer(1)]).pieri_factors().max_length()
9
>>> WeylGroup(['B',Integer(5)]).pieri_factors().max_length()
9
```

In type C affine this is $2n$:

```
sage: WeylGroup(['C',5,1]).pieri_factors().max_length()
10
```

```
>>> from sage.all import *
>>> WeylGroup(['C',Integer(5),Integer(1)]).pieri_factors().max_length()
10
```

In type D affine this is $2n - 2$:

```
sage: WeylGroup(['D',5,1]).pieri_factors().max_length()
8
```

```
>>> from sage.all import *
>>> WeylGroup(['D',Integer(5),Integer(1)]).pieri_factors().max_length()
8
```

class sage.combinat.root_system.pieri_factors.**PieriFactors_affine_type**

Bases: *PieriFactors*

maximal_elements()

Return the maximal elements of `self` with respect to Bruhat order.

The current implementation is via a conjectural type-free formula. Use `maximal_elements_combinatorial()` for proven type-specific implementations. To compare type-free and type-specific (combinatorial) implementations, use method `_test_maximal_elements()`.

EXAMPLES:

```
sage: W = WeylGroup(['A',4,1])
sage: PF = W.pieri_factors()
sage: sorted([w.reduced_word() for w in PF.maximal_elements()], key=str)
[[0, 4, 3, 2], [1, 0, 4, 3], [2, 1, 0, 4], [3, 2, 1, 0], [4, 3, 2, 1]]

sage: W = WeylGroup(RootSystem(["C",3,1]).weight_space())
sage: PF = W.pieri_factors()
sage: sorted([w.reduced_word() for w in PF.maximal_elements()], key=str)
[[0, 1, 2, 3, 2, 1], [1, 0, 1, 2, 3, 2], [1, 2, 3, 2, 1, 0],
 [2, 1, 0, 1, 2, 3], [2, 3, 2, 1, 0, 1], [3, 2, 1, 0, 1, 2]]

sage: W = WeylGroup(RootSystem(["B",3,1]).weight_space())
sage: PF = W.pieri_factors()
sage: sorted([w.reduced_word() for w in PF.maximal_elements()], key=str)
[[0, 2, 3, 2, 0], [1, 0, 2, 3, 2], [1, 2, 3, 2, 1],
 [2, 1, 0, 2, 3], [2, 3, 2, 1, 0], [3, 2, 1, 0, 2]]

sage: W = WeylGroup(['D',4,1])
sage: PF = W.pieri_factors()
sage: sorted([w.reduced_word() for w in PF.maximal_elements()], key=str)
[[0, 2, 4, 3, 2, 0], [1, 0, 2, 4, 3, 2], [1, 2, 4, 3, 2, 1],
 [2, 1, 0, 2, 4, 3], [2, 4, 3, 2, 1, 0], [3, 2, 1, 0, 2, 3],
 [4, 2, 1, 0, 2, 4], [4, 3, 2, 1, 0, 2]]
```

```
>>> from sage.all import *
>>> W = WeylGroup(['A',Integer(4),Integer(1)])
>>> PF = W.pieri_factors()
>>> sorted([w.reduced_word() for w in PF.maximal_elements()], key=str)
[[0, 4, 3, 2], [1, 0, 4, 3], [2, 1, 0, 4], [3, 2, 1, 0], [4, 3, 2, 1]]

>>> W = WeylGroup(RootSystem(["C",Integer(3),Integer(1)]).weight_space())
>>> PF = W.pieri_factors()
>>> sorted([w.reduced_word() for w in PF.maximal_elements()], key=str)
```

(continues on next page)

(continued from previous page)

```
[[0, 1, 2, 3, 2, 1], [1, 0, 1, 2, 3, 2], [1, 2, 3, 2, 1, 0],
 [2, 1, 0, 1, 2, 3], [2, 3, 2, 1, 0, 1], [3, 2, 1, 0, 1, 2]]

>>> W = WeylGroup(RootSystem(["B",Integer(3),Integer(1)]).weight_space())
>>> PF = W.pieri_factors()
>>> sorted([w.reduced_word() for w in PF.maximal_elements()], key=str)
[[0, 2, 3, 2, 0], [1, 0, 2, 3, 2], [1, 2, 3, 2, 1],
 [2, 1, 0, 2, 3], [2, 3, 2, 1, 0], [3, 2, 1, 0, 2]]

>>> W = WeylGroup(['D',Integer(4),Integer(1)])
>>> PF = W.pieri_factors()
>>> sorted([w.reduced_word() for w in PF.maximal_elements()], key=str)
[[0, 2, 4, 3, 2, 0], [1, 0, 2, 4, 3, 2], [1, 2, 4, 3, 2, 1],
 [2, 1, 0, 2, 4, 3], [2, 4, 3, 2, 1, 0], [3, 2, 1, 0, 2, 3],
 [4, 2, 1, 0, 2, 4], [4, 3, 2, 1, 0, 2]]
```

class sage.combinat.root_system.pieri_factors.**PieriFactors_finite_type**

Bases: *PieriFactors*

The Pieri factors of finite type A are the restriction of the Pieri factors of affine type A to finite permutations (under the canonical embedding of finite type A into the affine Weyl group), and the Pieri factors of finite type B are the restriction of the Pieri factors of affine type C. The finite type D Pieri factors are (weakly) conjectured to be the restriction of the Pieri factors of affine type D.

maximal_elements()

The current algorithm uses the fact that the maximal Pieri factors of affine type A,B,C, or D either contain a finite Weyl group element, or contain an affine Weyl group element whose reflection by s_0 gets a finite Weyl group element, and that either of these finite group elements will serve as a maximal element for finite Pieri factors. A better algorithm is desirable.

EXAMPLES:

```
sage: PF = WeylGroup(['A',5]).pieri_factors()
sage: [v.reduced_word() for v in PF.maximal_elements()]
[[5, 4, 3, 2, 1]]

sage: WeylGroup(['B',4]).pieri_factors().maximal_elements()
[
[-1  0  0  0]
[ 0  1  0  0]
[ 0  0  1  0]
[ 0  0  0  1]
]
```

```
>>> from sage.all import *
>>> PF = WeylGroup(['A',Integer(5)]).pieri_factors()
>>> [v.reduced_word() for v in PF.maximal_elements()]
[[5, 4, 3, 2, 1]]

>>> WeylGroup(['B',Integer(4)]).pieri_factors().maximal_elements()
[
[-1  0  0  0]
[ 0  1  0  0]
```

(continues on next page)

(continued from previous page)

```
[ 0  0  1  0]
[ 0  0  0  1]
]
```

class sage.combinat.root_system.pieri_factors.**PieriFactors_type_A**(*W*)

Bases: *PieriFactors_finite_type*

The set of Pieri factors for finite type A.

This is the set of elements of the Weyl group that have a reduced word that is strictly decreasing. This may also be viewed as the restriction of affine type A Pieri factors to finite Weyl group elements.

maximal_elements_combinatorial()

Return the maximal Pieri factors, using the type A combinatorial description.

EXAMPLES:

```
sage: W = WeylGroup(['A',4])
sage: PF = W.pieri_factors()
sage: PF.maximal_elements_combinatorial()[0].reduced_word()
[4, 3, 2, 1]
```

```
>>> from sage.all import *
>>> W = WeylGroup(['A',Integer(4)])
>>> PF = W.pieri_factors()
>>> PF.maximal_elements_combinatorial()[Integer(0)].reduced_word()
[4, 3, 2, 1]
```

stanley_symm_poly_weight(*w*)

EXAMPLES:

```
sage: W = WeylGroup(['A',4])
sage: PF = W.pieri_factors()
sage: PF.stanley_symm_poly_weight(W.from_reduced_word([3,1]))
0
```

```
>>> from sage.all import *
>>> W = WeylGroup(['A',Integer(4)])
>>> PF = W.pieri_factors()
>>> PF.stanley_symm_poly_weight(W.from_reduced_word([Integer(3),Integer(1)]))
0
```

class sage.combinat.root_system.pieri_factors.**PieriFactors_type_A_affine**(*W*, *min_length*, *max_length*, *min_support*, *max_support*)

Bases: *PieriFactors_affine_type*

The set of Pieri factors for type A affine, that is the set of elements of the Weyl Group which are cyclically decreasing.

Those are used for constructing (affine) Stanley symmetric functions.

The Pieri factors are in bijection with the proper subsets of the `index_set`. The bijection is given by the support. Namely, let f be a Pieri factor, and red a reduced word for f. No simple reflection appears twice in red, and the support S of red (that is the i such that s_i appears in red) does not depend on the reduced word).

cardinality()

Return the cardinality of `self`.

EXAMPLES:

```
sage: WeylGroup(["A", 3, 1]).pieri_factors().cardinality()
15
```

```
>>> from sage.all import *
>>> WeylGroup(["A", Integer(3), Integer(1)]).pieri_factors().cardinality()
15
```

generating_series(*weight=None*)

Return a length generating series for the elements of `self`.

EXAMPLES:

```
sage: W = WeylGroup(["A", 3, 1])
sage: W.pieri_factors().cardinality()
15
sage: W.pieri_factors().generating_series()
4*z^3 + 6*z^2 + 4*z + 1
```

```
>>> from sage.all import *
>>> W = WeylGroup(["A", Integer(3), Integer(1)])
>>> W.pieri_factors().cardinality()
15
>>> W.pieri_factors().generating_series()
4*z^3 + 6*z^2 + 4*z + 1
```

maximal_elements_combinatorial()

Return the maximal Pieri factors, using the affine type A combinatorial description.

EXAMPLES:

```
sage: W = WeylGroup(['A',4,1])
sage: PF = W.pieri_factors()
sage: [w.reduced_word() for w in PF.maximal_elements_combinatorial()]
[[3, 2, 1, 0], [2, 1, 0, 4], [1, 0, 4, 3], [0, 4, 3, 2], [4, 3, 2, 1]]
```

```
>>> from sage.all import *
>>> W = WeylGroup(['A',Integer(4),Integer(1)])
>>> PF = W.pieri_factors()
>>> [w.reduced_word() for w in PF.maximal_elements_combinatorial()]
[[3, 2, 1, 0], [2, 1, 0, 4], [1, 0, 4, 3], [0, 4, 3, 2], [4, 3, 2, 1]]
```

stanley_symm_poly_weight(*w*)

Weight used in computing (affine) Stanley symmetric polynomials for affine type A.

EXAMPLES:

```
sage: W = WeylGroup(['A',5,1])
sage: PF = W.pieri_factors()
```

(continues on next page)

(continued from previous page)

```
sage: PF.stanley_symm_poly_weight(W.one())
0
sage: PF.stanley_symm_poly_weight(W.from_reduced_word([5,4,2,1,0]))
0
```

```
>>> from sage.all import *
>>> W = WeylGroup(['A',Integer(5),Integer(1)])
>>> PF = W.pieri_factors()
>>> PF.stanley_symm_poly_weight(W.one())
0
>>> PF.stanley_symm_poly_weight(W.from_reduced_word([Integer(5),Integer(4),
↪Integer(2),Integer(1),Integer(0)]))
0
```

subset(*length*)

Return the subset of the elements of `self` of length `length`.

INPUT:

- `length` – nonnegative integer

EXAMPLES:

```
sage: PF = WeylGroup(["A", 3, 1]).pieri_factors(); PF
Pieri factors for Weyl Group of type ['A', 3, 1] (as a matrix group acting on␣
↪the root space)
sage: PF3 = PF.subset(length = 2)
sage: PF3.cardinality()
6
```

```
>>> from sage.all import *
>>> PF = WeylGroup(["A", Integer(3), Integer(1)]).pieri_factors(); PF
Pieri factors for Weyl Group of type ['A', 3, 1] (as a matrix group acting on␣
↪the root space)
>>> PF3 = PF.subset(length = Integer(2))
>>> PF3.cardinality()
6
```

class sage.combinat.root_system.pieri_factors.**PieriFactors_type_B**(*W*)

Bases: *PieriFactors_finite_type*

The type B finite Pieri factors are realized as the set of elements that have a reduced word that is a subword of $12...(n-1)n(n-1)...21$. They are the restriction of the type C affine Pieri factors to the set of finite Weyl group elements under the usual embedding.

maximal_elements_combinatorial()

Return the maximal Pieri factors, using the type B combinatorial description.

EXAMPLES:

```
sage: PF = WeylGroup(['B',4]).pieri_factors()
sage: PF.maximal_elements_combinatorial()[0].reduced_word()
[1, 2, 3, 4, 3, 2, 1]
```

```
>>> from sage.all import *
>>> PF = WeylGroup(['B',Integer(4)]).pieri_factors()
>>> PF.maximal_elements_combinatorial()[Integer(0)].reduced_word()
[1, 2, 3, 4, 3, 2, 1]
```

stanley_symm_poly_weight(*w*)

Weight used in computing Stanley symmetric polynomials of type B.

The weight for finite type B is the number of components of the support of an element minus the number of occurrences of n in a reduced word.

EXAMPLES:

```
sage: W = WeylGroup(['B',5])
sage: PF = W.pieri_factors()
sage: PF.stanley_symm_poly_weight(W.from_reduced_word([3,1,5]))
2
sage: PF.stanley_symm_poly_weight(W.from_reduced_word([3,4,5]))
0
sage: PF.stanley_symm_poly_weight(W.from_reduced_word([1,2,3,4,5,4]))
0
```

```
>>> from sage.all import *
>>> W = WeylGroup(['B',Integer(5)])
>>> PF = W.pieri_factors()
>>> PF.stanley_symm_poly_weight(W.from_reduced_word([Integer(3),Integer(1),
↪Integer(5)]))
2
>>> PF.stanley_symm_poly_weight(W.from_reduced_word([Integer(3),Integer(4),
↪Integer(5)]))
0
>>> PF.stanley_symm_poly_weight(W.from_reduced_word([Integer(1),Integer(2),
↪Integer(3),Integer(4),Integer(5),Integer(4)]))
0
```

class sage.combinat.root_system.pieri_factors.**PieriFactors_type_B_affine**(*W*)

Bases: *PieriFactors_affine_type*

The type B affine Pieri factors are realized as the order ideal (in Bruhat order) generated by the following elements:

- cyclic rotations of the element with reduced word $234...(n-1)n(n-1)...3210$, except for $123...n...320$ and $023...n...321$.
- $123...(n-1)n(n-1)...321$
- $023...(n-1)n(n-1)...320$

EXAMPLES:

```
sage: W = WeylGroup(['B',4,1])
sage: PF = W.pieri_factors()
sage: W.from_reduced_word([2,3,4,3,2,1,0]) in PF.maximal_elements()
True
sage: W.from_reduced_word([0,2,3,4,3,2,1]) in PF.maximal_elements()
False
sage: W.from_reduced_word([1,0,2,3,4,3,2]) in PF.maximal_elements()
```

(continues on next page)

(continued from previous page)

```
True
sage: W.from_reduced_word([0,2,3,4,3,2,0]) in PF.maximal_elements()
True
sage: W.from_reduced_word([0,2,0]) in PF
True
```

```
>>> from sage.all import *
>>> W = WeylGroup(['B',Integer(4),Integer(1)])
>>> PF = W.pieri_factors()
>>> W.from_reduced_word([Integer(2),Integer(3),Integer(4),Integer(3),Integer(2),
↪Integer(1),Integer(0)]) in PF.maximal_elements()
True
>>> W.from_reduced_word([Integer(0),Integer(2),Integer(3),Integer(4),Integer(3),
↪Integer(2),Integer(1)]) in PF.maximal_elements()
False
>>> W.from_reduced_word([Integer(1),Integer(0),Integer(2),Integer(3),Integer(4),
↪Integer(3),Integer(2)]) in PF.maximal_elements()
True
>>> W.from_reduced_word([Integer(0),Integer(2),Integer(3),Integer(4),Integer(3),
↪Integer(2),Integer(0)]) in PF.maximal_elements()
True
>>> W.from_reduced_word([Integer(0),Integer(2),Integer(0)]) in PF
True
```

maximal_elements_combinatorial()

Return the maximal Pieri factors, using the affine type B combinatorial description.

EXAMPLES:

```
sage: W = WeylGroup(['B',4,1])
sage: [u.reduced_word() for u in W.pieri_factors().maximal_elements_
↪combinatorial()]
[[1, 0, 2, 3, 4, 3, 2], [2, 1, 0, 2, 3, 4, 3], [3, 2, 1, 0, 2, 3, 4], [4, 3,␣
↪2, 1, 0, 2, 3], [3, 4, 3, 2, 1, 0, 2], [2, 3, 4, 3, 2, 1, 0], [1, 2, 3, 4,␣
↪3, 2, 1], [0, 2, 3, 4, 3, 2, 0]]
```

```
>>> from sage.all import *
>>> W = WeylGroup(['B',Integer(4),Integer(1)])
>>> [u.reduced_word() for u in W.pieri_factors().maximal_elements_
↪combinatorial()]
[[1, 0, 2, 3, 4, 3, 2], [2, 1, 0, 2, 3, 4, 3], [3, 2, 1, 0, 2, 3, 4], [4, 3,␣
↪2, 1, 0, 2, 3], [3, 4, 3, 2, 1, 0, 2], [2, 3, 4, 3, 2, 1, 0], [1, 2, 3, 4,␣
↪3, 2, 1], [0, 2, 3, 4, 3, 2, 0]]
```

stanley_symm_poly_weight(*w*)

Return the weight of a Pieri factor to be used in the definition of Stanley symmetric functions.

For type B, this weight involves the number of components of the complement of the support of an element, where we consider 0 and 1 to be one node – if 1 is in the support, then we pretend 0 in the support, and vice versa. We also consider 0 and 1 to be one node for the purpose of counting components of the complement (as if the Dynkin diagram were that of type C). Let n be the rank of the affine Weyl group in question (if type `['B',k,1]` then we have n = k+1). Let `chi(v.length() < n-1)` be the indicator function that is 1 if the length of v is smaller than n-1, and 0 if the length of v is greater than or equal to n-1. If we call `c'(v)` the number of components of the complement of the support of v, then the type B weight is given by `weight = c'(v) - chi(v.length() < n-1)`.

EXAMPLES:

```
sage: W = WeylGroup(['B',5,1])
sage: PF = W.pieri_factors()
sage: PF.stanley_symm_poly_weight(W.from_reduced_word([0,3]))
1
sage: PF.stanley_symm_poly_weight(W.from_reduced_word([0,1,3]))
1
sage: PF.stanley_symm_poly_weight(W.from_reduced_word([2,3]))
1
sage: PF.stanley_symm_poly_weight(W.from_reduced_word([2,3,4,5]))
0
sage: PF.stanley_symm_poly_weight(W.from_reduced_word([0,5]))
0
sage: PF.stanley_symm_poly_weight(W.from_reduced_word([2,4,5,4,3,0]))
-1
sage: PF.stanley_symm_poly_weight(W.from_reduced_word([4,5,4,3,0]))
0
```

```
>>> from sage.all import *
>>> W = WeylGroup(['B',Integer(5),Integer(1)])
>>> PF = W.pieri_factors()
>>> PF.stanley_symm_poly_weight(W.from_reduced_word([Integer(0),Integer(3)]))
1
>>> PF.stanley_symm_poly_weight(W.from_reduced_word([Integer(0),Integer(1),
↪Integer(3)]))
1
>>> PF.stanley_symm_poly_weight(W.from_reduced_word([Integer(2),Integer(3)]))
1
>>> PF.stanley_symm_poly_weight(W.from_reduced_word([Integer(2),Integer(3),
↪Integer(4),Integer(5)]))
0
>>> PF.stanley_symm_poly_weight(W.from_reduced_word([Integer(0),Integer(5)]))
0
>>> PF.stanley_symm_poly_weight(W.from_reduced_word([Integer(2),Integer(4),
↪Integer(5),Integer(4),Integer(3),Integer(0)]))
-1
>>> PF.stanley_symm_poly_weight(W.from_reduced_word([Integer(4),Integer(5),
↪Integer(4),Integer(3),Integer(0)]))
0
```

class `sage.combinat.root_system.pieri_factors.`**`PieriFactors_type_C_affine`**`(W)`

Bases: *PieriFactors_affine_type*

The type C affine Pieri factors are realized as the order ideal (in Bruhat order) generated by cyclic rotations of the element with unique reduced word $123...(n-1)n(n-1)...3210$.

EXAMPLES:

```
sage: W = WeylGroup(['C',3,1])
sage: PF = W.pieri_factors()
sage: sorted([u.reduced_word() for u in PF.maximal_elements()], key=str)
```

(continues on next page)

(continued from previous page)

```
[[0, 1, 2, 3, 2, 1], [1, 0, 1, 2, 3, 2], [1, 2, 3, 2, 1, 0],
 [2, 1, 0, 1, 2, 3], [2, 3, 2, 1, 0, 1], [3, 2, 1, 0, 1, 2]]
```

```
>>> from sage.all import *
>>> W = WeylGroup(['C',Integer(3),Integer(1)])
>>> PF = W.pieri_factors()
>>> sorted([u.reduced_word() for u in PF.maximal_elements()], key=str)
[[0, 1, 2, 3, 2, 1], [1, 0, 1, 2, 3, 2], [1, 2, 3, 2, 1, 0],
 [2, 1, 0, 1, 2, 3], [2, 3, 2, 1, 0, 1], [3, 2, 1, 0, 1, 2]]
```

maximal_elements_combinatorial()

Return the maximal Pieri factors, using the affine type C combinatorial description.

EXAMPLES:

```
sage: PF = WeylGroup(['C',3,1]).pieri_factors()
sage: [w.reduced_word() for w in PF.maximal_elements_combinatorial()]
[[0, 1, 2, 3, 2, 1], [1, 0, 1, 2, 3, 2], [2, 1, 0, 1, 2, 3], [3, 2, 1, 0, 1,
↪2], [2, 3, 2, 1, 0, 1], [1, 2, 3, 2, 1, 0]]
```

```
>>> from sage.all import *
>>> PF = WeylGroup(['C',Integer(3),Integer(1)]).pieri_factors()
>>> [w.reduced_word() for w in PF.maximal_elements_combinatorial()]
[[0, 1, 2, 3, 2, 1], [1, 0, 1, 2, 3, 2], [2, 1, 0, 1, 2, 3], [3, 2, 1, 0, 1,
↪2], [2, 3, 2, 1, 0, 1], [1, 2, 3, 2, 1, 0]]
```

stanley_symm_poly_weight(w)

Return the weight of a Pieri factor to be used in the definition of Stanley symmetric functions.

For type C, this weight is the number of connected components of the support (the indices appearing in a reduced word) of an element.

EXAMPLES:

```
sage: W = WeylGroup(['C',5,1])
sage: PF = W.pieri_factors()
sage: PF.stanley_symm_poly_weight(W.from_reduced_word([1,3]))
2
sage: PF.stanley_symm_poly_weight(W.from_reduced_word([1,3,2,0]))
1
sage: PF.stanley_symm_poly_weight(W.from_reduced_word([5,3,0]))
3
sage: PF.stanley_symm_poly_weight(W.one())
0
```

```
>>> from sage.all import *
>>> W = WeylGroup(['C',Integer(5),Integer(1)])
>>> PF = W.pieri_factors()
>>> PF.stanley_symm_poly_weight(W.from_reduced_word([Integer(1),Integer(3)]))
2
>>> PF.stanley_symm_poly_weight(W.from_reduced_word([Integer(1),Integer(3),
↪Integer(2),Integer(0)]))
1
```

(continues on next page)

(continued from previous page)

```
>>> PF.stanley_symm_poly_weight(W.from_reduced_word([Integer(5),Integer(3),
↪Integer(0)]))
3
>>> PF.stanley_symm_poly_weight(W.one())
0
```

class sage.combinat.root_system.pieri_factors.**PieriFactors_type_D_affine**(*W*)

Bases: *PieriFactors_affine_type*

The type D affine Pieri factors are realized as the order ideal (in Bruhat order) generated by the following elements:

- cyclic rotations of the element with reduced word $234...(n-2)n(n-1)(n-2)...3210$ such that 1 and 0 are always adjacent and (n-1) and n are always adjacent.
- $123...(n-2)n(n-1)(n-2)...321$
- $023...(n-2)n(n-1)(n-2)...320$
- $n(n-2)...2102...(n-2)n$
- $(n-1)(n-2)...2102...(n-2)(n-1)$

EXAMPLES:

```
sage: W = WeylGroup(['D',5,1])
sage: PF = W.pieri_factors()
sage: W.from_reduced_word([3,2,1,0]) in PF
True
sage: W.from_reduced_word([0,3,2,1]) in PF
False
sage: W.from_reduced_word([0,1,3,2]) in PF
True
sage: W.from_reduced_word([2,0,1,3]) in PF
True
sage: sorted([u.reduced_word() for u in PF.maximal_elements()], key=str)
[[0, 2, 3, 5, 4, 3, 2, 0], [1, 0, 2, 3, 5, 4, 3, 2], [1, 2, 3, 5, 4, 3, 2, 1],
 [2, 1, 0, 2, 3, 5, 4, 3], [2, 3, 5, 4, 3, 2, 1, 0], [3, 2, 1, 0, 2, 3, 5, 4],
 [3, 5, 4, 3, 2, 1, 0, 2], [4, 3, 2, 1, 0, 2, 3, 4], [5, 3, 2, 1, 0, 2, 3, 5],
 [5, 4, 3, 2, 1, 0, 2, 3]]
```

```
>>> from sage.all import *
>>> W = WeylGroup(['D',Integer(5),Integer(1)])
>>> PF = W.pieri_factors()
>>> W.from_reduced_word([Integer(3),Integer(2),Integer(1),Integer(0)]) in PF
True
>>> W.from_reduced_word([Integer(0),Integer(3),Integer(2),Integer(1)]) in PF
False
>>> W.from_reduced_word([Integer(0),Integer(1),Integer(3),Integer(2)]) in PF
True
>>> W.from_reduced_word([Integer(2),Integer(0),Integer(1),Integer(3)]) in PF
True
>>> sorted([u.reduced_word() for u in PF.maximal_elements()], key=str)
[[0, 2, 3, 5, 4, 3, 2, 0], [1, 0, 2, 3, 5, 4, 3, 2], [1, 2, 3, 5, 4, 3, 2, 1],
 [2, 1, 0, 2, 3, 5, 4, 3], [2, 3, 5, 4, 3, 2, 1, 0], [3, 2, 1, 0, 2, 3, 5, 4],
```

(continues on next page)

(continued from previous page)

```
[3, 5, 4, 3, 2, 1, 0, 2], [4, 3, 2, 1, 0, 2, 3, 4], [5, 3, 2, 1, 0, 2, 3, 5],
[5, 4, 3, 2, 1, 0, 2, 3]]
```

maximal_elements_combinatorial()

Return the maximal Pieri factors, using the affine type D combinatorial description.

EXAMPLES:

```
sage: W = WeylGroup(['D',5,1])
sage: PF = W.pieri_factors()
sage: set(PF.maximal_elements_combinatorial()) == set(PF.maximal_elements())
True
```

```
>>> from sage.all import *
>>> W = WeylGroup(['D',Integer(5),Integer(1)])
>>> PF = W.pieri_factors()
>>> set(PF.maximal_elements_combinatorial()) == set(PF.maximal_elements())
True
```

stanley_symm_poly_weight(w)

Return the weight of w, to be used in the definition of Stanley symmetric functions.

INPUT:

- `w` – a Pieri factor for this type

For type D, this weight involves the number of components of the complement of the support of an element, where we consider 0 and 1 to be one node – if 1 is in the support, then we pretend 0 in the support, and vice versa. Similarly with $n-1$ and n. We also consider 0 and 1, $n-1$ and n to be one node for the purpose of counting components of the complement (as if the Dynkin diagram were that of type C).

Type D Stanley symmetric polynomial weights are still conjectural. The given weight comes from conditions on elements of the affine Fomin-Stanley subalgebra, but work is needed to show this weight is correct for affine Stanley symmetric functions – see [LSS2009, Pon2010]_ for details.

EXAMPLES:

```
sage: W = WeylGroup(['D', 5, 1])
sage: PF = W.pieri_factors()
sage: PF.stanley_symm_poly_weight(W.from_reduced_word([5,2,1]))
0
sage: PF.stanley_symm_poly_weight(W.from_reduced_word([5,2,1,0]))
0
sage: PF.stanley_symm_poly_weight(W.from_reduced_word([5,2]))
1
sage: PF.stanley_symm_poly_weight(W.from_reduced_word([]))
0

sage: W = WeylGroup(['D',7,1])
sage: PF = W.pieri_factors()
sage: PF.stanley_symm_poly_weight(W.from_reduced_word([2,4,6]))
2
```

```
>>> from sage.all import *
>>> W = WeylGroup(['D', Integer(5), Integer(1)])
>>> PF = W.pieri_factors()
>>> PF.stanley_symm_poly_weight(W.from_reduced_word([Integer(5),Integer(2),
↪Integer(1)]))
0
>>> PF.stanley_symm_poly_weight(W.from_reduced_word([Integer(5),Integer(2),
↪Integer(1),Integer(0)]))
0
>>> PF.stanley_symm_poly_weight(W.from_reduced_word([Integer(5),Integer(2)]))
1
>>> PF.stanley_symm_poly_weight(W.from_reduced_word([]))
0

>>> W = WeylGroup(['D',Integer(7),Integer(1)])
>>> PF = W.pieri_factors()
>>> PF.stanley_symm_poly_weight(W.from_reduced_word([Integer(2),Integer(4),
↪Integer(6)]))
2
```

5.1.235 Tutorial: visualizing root systems

Root systems encode the positions of collections of hyperplanes in space, and form the fundamental combinatorial data underlying Coxeter and Weyl groups, Lie algebras and groups, etc. The theory can be a bit intimidating at first because of the many technical gadgets (roots, coroots, weights, …). Visualizing them goes a long way toward building a geometric intuition.

This tutorial starts from simple plots and guides you all the way to advanced plots with your own combinatorial data drawn on top of it.

See also

- *Root systems* – An overview of root systems in Sage
- `RootLatticeRealizations.ParentMethods.plot()` – the main plotting function, with pointers to all the subroutines

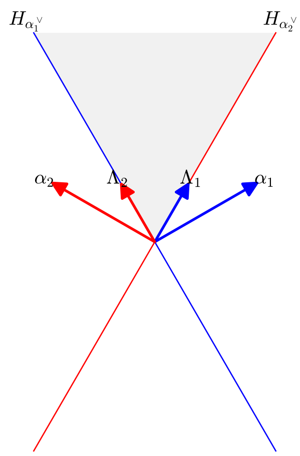
First plots

In this first plot, we draw the root system for type A_2 in the ambient space. It is generated from two hyperplanes at a 120 degree angle:

```
sage: L = RootSystem(["A",2]).ambient_space()
sage: L.plot()
Graphics object consisting of 13 graphics primitives
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(2)]).ambient_space()
>>> L.plot()
Graphics object consisting of 13 graphics primitives
```

Each of those hyperplane $H_{\alpha_i^\vee}$ is described by a linear form $\alpha_i^\vee$ called simple coroot. To each such hyperplane corresponds a reflection along a vector called root. In this picture, the reflections are orthogonal and the two simple roots α_1 and α_2

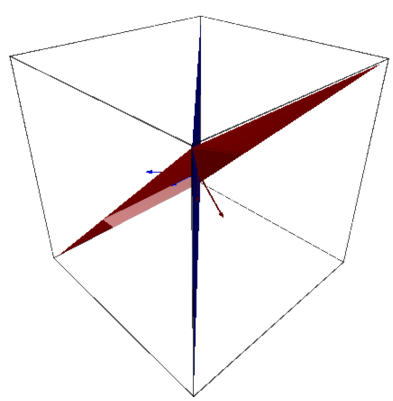


are vectors which are normal to the reflection hyperplanes. The same color code is used uniformly: blue for 1, red for 2, green for 3, … (see `CartanType.color()`). The fundamental weights, Λ_1 and Λ_2 form the dual basis of the coroots.

The two reflections generate a group of order six which is nothing but the usual symmetric group S_3, in its natural action by permutations of the coordinates of the ambient space. Wait, but the ambient space should be of dimension 3 then? That's perfectly right. Here is the full picture in 3D:

```
sage: L = RootSystem(["A",2]).ambient_space()
sage: L.plot(projection=False)
Graphics3d Object
```

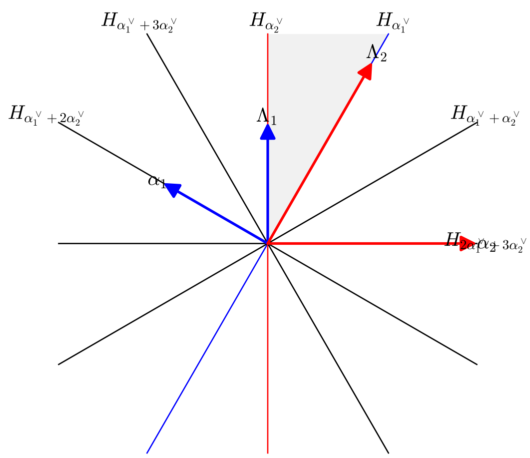
```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(2)]).ambient_space()
>>> L.plot(projection=False)
Graphics3d Object
```



However in this space, the line $(1, 1, 1)$ is fixed by the action of the group. Therefore, the so called barycentric projection orthogonal to $(1, 1, 1)$ gives a convenient 2D picture which contains all the essential information. The same projection is used by default in type G_2:

```
sage: L = RootSystem(["G",2]).ambient_space()
sage: L.plot(reflection_hyperplanes='all')
Graphics object consisting of 21 graphics primitives
```

```
>>> from sage.all import *
>>> L = RootSystem(["G",Integer(2)]).ambient_space()
>>> L.plot(reflection_hyperplanes='all')
Graphics object consisting of 21 graphics primitives
```



The group is now the dihedral group of order 12, generated by the two reflections s_1 and s_2. The picture displays the hyperplanes for all 12 reflections of the group. Those reflections delimit 12 chambers which are in one to one correspondence with the elements of the group. The fundamental chamber, which is grayed out, is associated with the identity of the group.

Warning

The fundamental chamber is currently plotted as the cone generated by the fundamental weights. As can be seen on the previous 3D picture this is not quite correct if the fundamental weights do not span the space.

Another caveat is that some plotting features may require manipulating elements with rational coordinates which will fail if one is working in, say, the weight lattice. It is therefore recommended to use the root, weight, or ambient spaces for plotting purposes rather than their lattice counterparts.

Coming back to the symmetric group, here is the picture in the weight space, with all roots and all reflection hyperplanes; remark that, unlike in the ambient space, a root is not necessarily orthogonal to its corresponding reflection hyperplane:

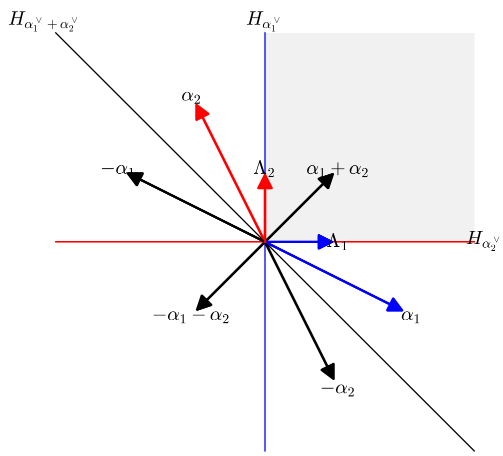
```
sage: L = RootSystem(["A",2]).weight_space()
sage: L.plot(roots='all', reflection_hyperplanes='all').show(figsize=15)
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(2)]).weight_space()
>>> L.plot(roots='all', reflection_hyperplanes='all').show(figsize=Integer(15))
```

Note

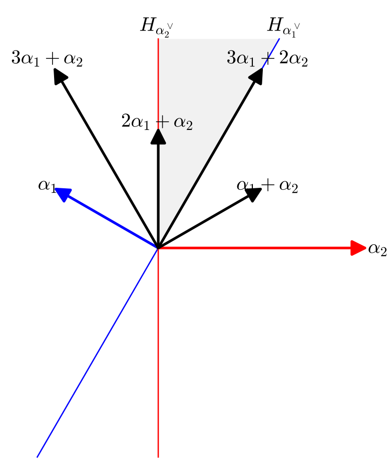
Setting a larger figure size as above can help reduce the overlap between the text labels when the figure gets crowded.

One can further customize which roots to display, as in the following example showing the positive roots in the weight space for type ['G',2], labelled by their coordinates in the root lattice:



```
sage: Q = RootSystem(["G",2]).root_space()
sage: L = RootSystem(["G",2]).ambient_space()
sage: L.plot(roots=list(Q.positive_roots()), fundamental_weights=False)
Graphics object consisting of 17 graphics primitives
```

```
>>> from sage.all import *
>>> Q = RootSystem(["G",Integer(2)]).root_space()
>>> L = RootSystem(["G",Integer(2)]).ambient_space()
>>> L.plot(roots=list(Q.positive_roots()), fundamental_weights=False)
Graphics object consisting of 17 graphics primitives
```



One can also customize the projection by specifying a function. Here, we display all the roots for type E_8 using the projection from its eight dimensional ambient space onto 3D described on Wikipedia%27s E8 3D picture:

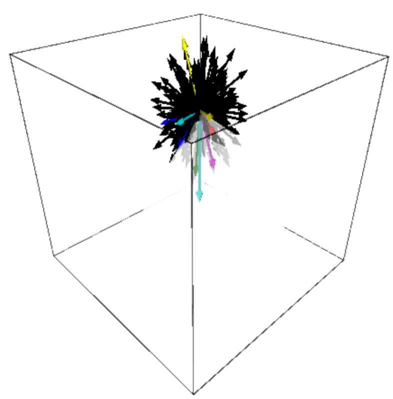
```
sage: M = matrix([[0., -0.556793440452, 0.19694925177, -0.19694925177, 0.
↪0805477263944, -0.385290876171, 0., 0.385290876171],
....:             [0.180913155536, 0., 0.160212955043, 0.160212955043, 0., 0.
↪0990170516545, 0.766360424875, 0.0990170516545],
....:             [0.338261212718, 0, 0, -0.338261212718, 0.672816364803, 0.
↪171502564281, 0, -0.171502564281]])
sage: L = RootSystem(["E",8]).ambient_space()
```

(continues on next page)

(continued from previous page)

```
sage: L.dimension()
8
sage: L.plot(roots='all', reflection_hyperplanes=False,            # long time
....:        projection=lambda v: M*vector(v), labels=False)
Graphics3d Object
```

```
>>> from sage.all import *
>>> M = matrix([[RealNumber('0.'), -RealNumber('0.556793440452'), RealNumber('0.
↪19694925177'), -RealNumber('0.19694925177'), RealNumber('0.0805477263944'), -
↪RealNumber('0.385290876171'), RealNumber('0.'), RealNumber('0.385290876171')],
...             [RealNumber('0.180913155536'), RealNumber('0.'), RealNumber('0.
↪160212955043'), RealNumber('0.160212955043'), RealNumber('0.'), RealNumber('0.
↪0990170516545'), RealNumber('0.766360424875'), RealNumber('0.0990170516545')],
...             [RealNumber('0.338261212718'), Integer(0), Integer(0), -RealNumber('0.
↪338261212718'), RealNumber('0.672816364803'), RealNumber('0.171502564281'),␣
↪Integer(0), -RealNumber('0.171502564281')]])
>>> L = RootSystem(["E",Integer(8)]).ambient_space()
>>> L.dimension()
8
>>> L.plot(roots='all', reflection_hyperplanes=False,            # long time
...        projection=lambda v: M*vector(v), labels=False)
Graphics3d Object
```



The projection function should be linear or affine, and return a vector with rational coordinates. The rationale for the later constraint is to allow for using the PPL exact library for manipulating polytopes. Indeed exact calculations give cleaner pictures (adjacent objects, intersection with the bounding box, …). Besides the interface to PPL is indeed currently faster than that for CDD, and it is likely to become even more so.

Exercise

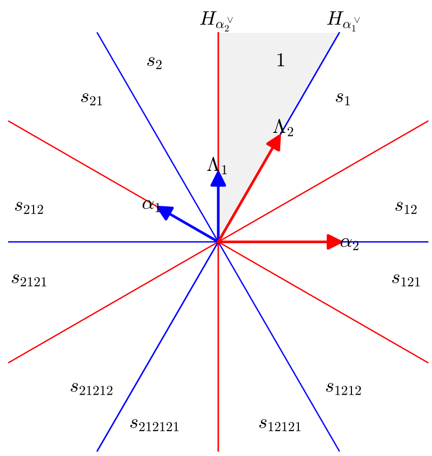
Draw all finite root systems in 2D, using the canonical projection onto their Coxeter plane. See Stembridge's page.

Alcoves and chambers

We now draw the root system for type G_2, with its alcoves (in finite type, those really are the chambers) and the corresponding elements of the Weyl group. We enlarge a bit the bounding box to make sure everything fits in the picture:

```
sage: RootSystem(["G",2]).ambient_space().plot(alcoves=True,
....:                                          alcove_labels=True, bounding_box=5)
Graphics object consisting of 37 graphics primitives
```

```
>>> from sage.all import *
>>> RootSystem(["G",Integer(2)]).ambient_space().plot(alcoves=True,
...                                              alcove_labels=True, bounding_
↪box=Integer(5))
Graphics object consisting of 37 graphics primitives
```



The same picture in 3D, for type B_3:

```
sage: RootSystem(["B",3]).ambient_space().plot(alcoves=True, alcove_labels=True)
Graphics3d Object
```

```
>>> from sage.all import *
>>> RootSystem(["B",Integer(3)]).ambient_space().plot(alcoves=True, alcove_
↪labels=True)
Graphics3d Object
```

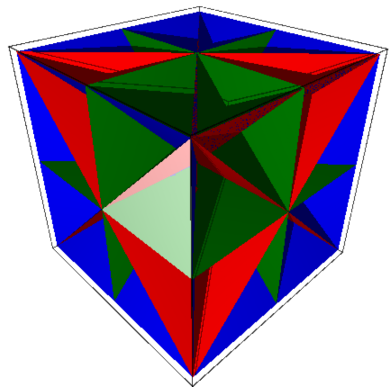
Exercise

Can you spot the fundamental chamber? The fundamental weights? The simple roots? The longest element of the Weyl group?

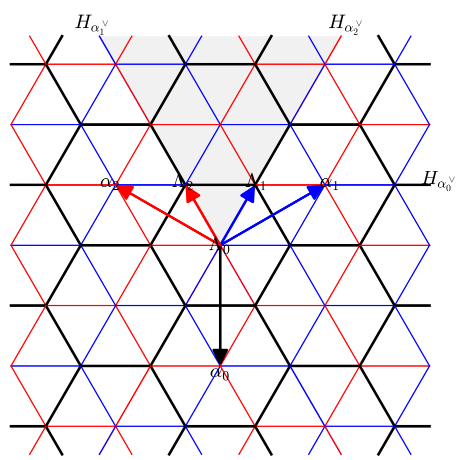
Alcove pictures for affine types

We now draw the usual alcove picture for affine type $A_2^{(1)}$:

```
sage: L = RootSystem(["A",2,1]).ambient_space()
sage: L.plot()                              # long time
Graphics object consisting of 160 graphics primitives
```



```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(2),Integer(1)]).ambient_space()
>>> L.plot()                                   # long time
Graphics object consisting of 160 graphics primitives
```



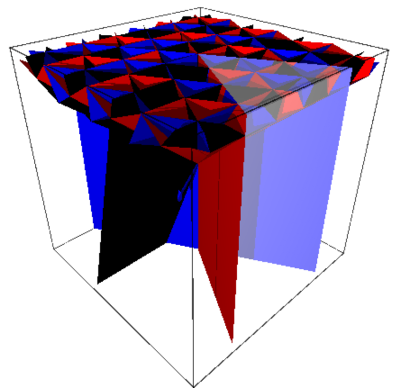
This picture is convenient because it is low dimensional and contains most of the relevant information. Beside, by choosing the ambient space, the elements of the Weyl group act as orthogonal affine maps. In particular, reflections are usual (affine) orthogonal reflections. However this is in fact only a slice of the real picture: the Weyl group actually acts by linear maps on the full ambient space. Those maps stabilize the so-called level l hyperplanes, and we are visualizing here what's happening at level 1. Here is the full picture in 3D:

```
sage: L.plot(bounding_box=[[-3,3],[-3,3],[-1,1]], affine=False)      # long time
Graphics3d Object
```

```
>>> from sage.all import *
>>> L.plot(bounding_box=[[-Integer(3),Integer(3)],[-Integer(3),Integer(3)],[-
↪Integer(1),Integer(1)]], affine=False)      # long time
Graphics3d Object
```

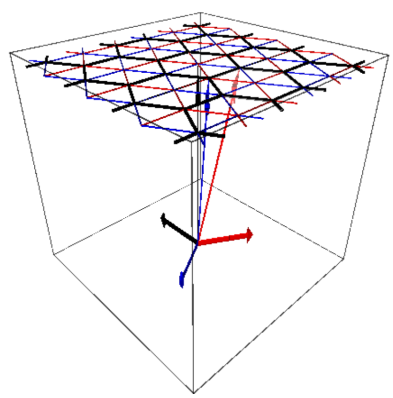
In fact, in type A, this really is a picture in 4D, but as usual the barycentric projection kills the boring extra dimension for us.

It's usually more readable to only draw the intersection of the reflection hyperplanes with the level 1 hyperplane:



```
sage: L.plot(affine=False, level=1)                          # long time
Graphics3d Object
```

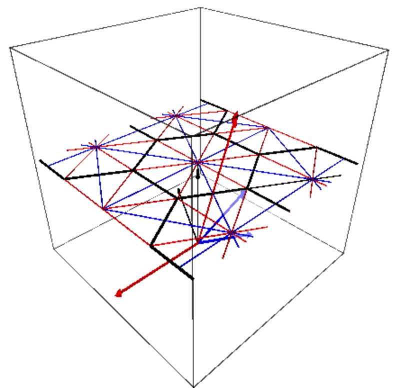
```
>>> from sage.all import *
>>> L.plot(affine=False, level=Integer(1))                          # long time
Graphics3d Object
```



Such 3D pictures are useful to better understand technicalities, like the fact that the fundamental weights do not necessarily all live at level 1:

```
sage: L = RootSystem(["G",2,1]).ambient_space()
sage: L.plot(affine=False, level=1)
Graphics3d Object
```

```
>>> from sage.all import *
>>> L = RootSystem(["G",Integer(2),Integer(1)]).ambient_space()
>>> L.plot(affine=False, level=Integer(1))
Graphics3d Object
```



Note

Such pictures may tend to be a bit flat, and it may be helpful to play with the aspect_ratio and more generally with the various options of the `show()` method:

```
sage: p = L.plot(affine=False, level=1)
sage: p.show(aspect_ratio=[1,1,2], frame=False)
```

```
>>> from sage.all import *
>>> p = L.plot(affine=False, level=Integer(1))
>>> p.show(aspect_ratio=[Integer(1),Integer(1),Integer(2)], frame=False)
```

Exercise

Draw the alcove picture at level 1, and compare the position of the fundamental weights and the vertices of the fundamental alcove.

As for finite root systems, the alcoves are indexed by the elements of the Weyl group W. Two alcoves indexed by u and v respectively share a wall if u and v are neighbors in the right Cayley graph: $u = vs_i$; the color of that wall is given by i:

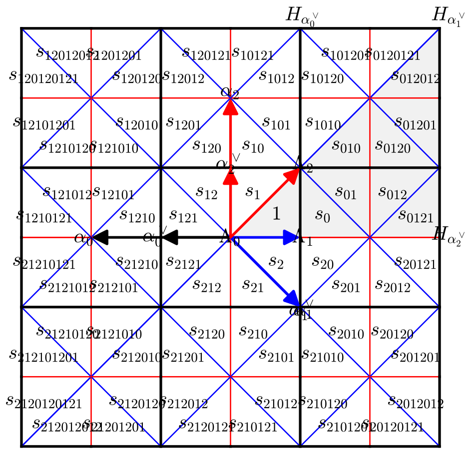
```
sage: L = RootSystem(["C",2,1]).ambient_space()
sage: L.plot(coroots='simple', alcove_labels=True)                  # long time
Graphics object consisting of 216 graphics primitives
```

```
>>> from sage.all import *
>>> L = RootSystem(["C",Integer(2),Integer(1)]).ambient_space()
>>> L.plot(coroots='simple', alcove_labels=True)                  # long time
Graphics object consisting of 216 graphics primitives
```

Even 2D pictures of the rank $1 + 1$ cases can give some food for thought. Here, we draw the root lattice, with the positive roots of small height in the root poset:

```
sage: L = RootSystem(["A",1,1]).root_lattice()
sage: seed = L.simple_roots()
sage: succ = attrcall("pred")
sage: positive_roots = RecursivelyEnumeratedSet(seed, succ, structure='graded')
```

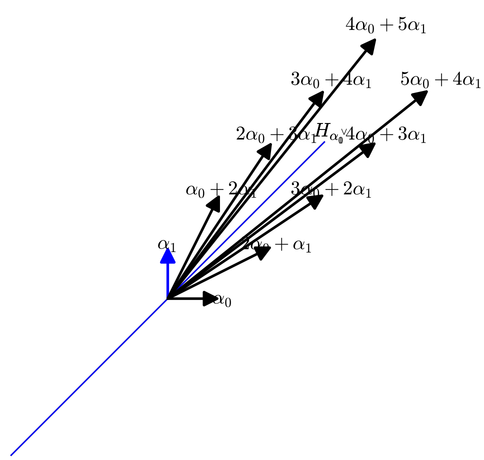
(continues on next page)



(continued from previous page)

```
sage: it = iter(positive_roots)
sage: first_positive_roots = [next(it) for i in range(10)]
sage: L.plot(roots=first_positive_roots, affine=False, alcoves=False)
Graphics object consisting of 24 graphics primitives
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(1),Integer(1)]).root_lattice()
>>> seed = L.simple_roots()
>>> succ = attrcall("pred")
>>> positive_roots = RecursivelyEnumeratedSet(seed, succ, structure='graded')
>>> it = iter(positive_roots)
>>> first_positive_roots = [next(it) for i in range(Integer(10))]
>>> L.plot(roots=first_positive_roots, affine=False, alcoves=False)
Graphics object consisting of 24 graphics primitives
```



Exercises

1. Use the same trick to draw the reflection hyperplanes in the weight lattice for the coroots of small height. Add the indexing of the alcoves by elements of the Weyl group. See below for a solution.

2. Draw the positive roots in the weight lattice and in the extended weight lattice.
3. Draw the reflection hyperplanes in the root lattice
4. Recreate John Stembridge's "Sandwich" arrangement pictures by choosing appropriate coroots for the reflection hyperplanes.

Here is a polished solution for the first exercise:

```
sage: L = RootSystem(["A",1,1]).weight_space()
sage: seed = L.simple_coroots()
sage: succ = attrcall("pred")
sage: positive_coroots = RecursivelyEnumeratedSet(seed, succ, structure='graded')
sage: it = iter(positive_coroots)
sage: first_positive_coroots = [next(it) for i in range(20)]
sage: p = L.plot(fundamental_chamber=True,
....:            reflection_hyperplanes=first_positive_coroots,
....:            affine=False, alcove_labels=1,
....:            bounding_box=[[-9,9],[-1,2]],
....:            projection=lambda x: matrix([[1,-1],[1,1]])*vector(x))
sage: p.show(figsize=20)                                        # long time
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(1),Integer(1)]).weight_space()
>>> seed = L.simple_coroots()
>>> succ = attrcall("pred")
>>> positive_coroots = RecursivelyEnumeratedSet(seed, succ, structure='graded')
>>> it = iter(positive_coroots)
>>> first_positive_coroots = [next(it) for i in range(Integer(20))]
>>> p = L.plot(fundamental_chamber=True,
...            reflection_hyperplanes=first_positive_coroots,
...            affine=False, alcove_labels=Integer(1),
...            bounding_box=[[-Integer(9),Integer(9)],[-Integer(1),Integer(2)]],
...            projection=lambda x: matrix([[Integer(1),-Integer(1)],[Integer(1),
↪Integer(1)]])*vector(x))
>>> p.show(figsize=Integer(20))                                 # long time
```

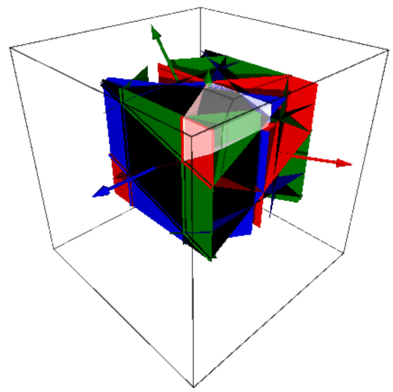
Higher dimension affine pictures

We now do some plots for rank 4 affine types, at level 1. The space is tiled by the alcoves, each of which is a 3D simplex:

```
sage: L = RootSystem(["A",3,1]).ambient_space()
sage: L.plot(reflection_hyperplanes=False, bounding_box=85/100)     # long time
Graphics3d Object
```

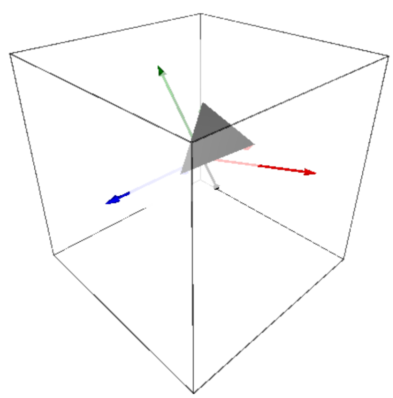
```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(3),Integer(1)]).ambient_space()
>>> L.plot(reflection_hyperplanes=False, bounding_box=Integer(85)/Integer(100))     #␣
↪long time
Graphics3d Object
```

It is recommended to use a small bounding box here, for otherwise the number of simplices grows quicker than what Sage can handle smoothly. It can help to specify explicitly which alcoves to visualize. Here is the fundamental alcove, specified by an element of the Weyl group:



```
sage: W = L.weyl_group()
sage: L.plot(reflection_hyperplanes=False, alcoves=[W.one()], bounding_box=2)
Graphics3d Object
```

```
>>> from sage.all import *
>>> W = L.weyl_group()
>>> L.plot(reflection_hyperplanes=False, alcoves=[W.one()], bounding_box=Integer(2))
Graphics3d Object
```

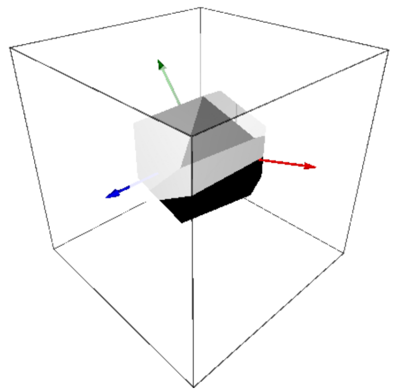


and the fundamental polygon, specified by the coordinates of its center in the root lattice:

```
sage: W = L.weyl_group()
sage: L.plot(reflection_hyperplanes=False, alcoves=[[0,0]], bounding_box=2)
Graphics3d Object
```

```
>>> from sage.all import *
>>> W = L.weyl_group()
>>> L.plot(reflection_hyperplanes=False, alcoves=[[Integer(0),Integer(0)]], bounding_
↪box=Integer(2))
Graphics3d Object
```

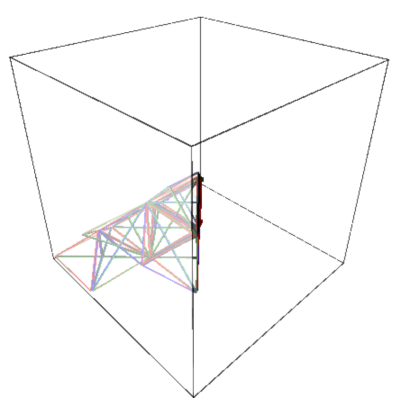
Finally, we draw the alcoves in the classical fundamental chambers, using that those are indexed by the elements of the



Weyl group having no other left descent than 0. In order to see the inner structure, we only draw the wireframe of the facets of the alcoves. Specifying the `wireframe` option requires a more flexible syntax for plots which will be explained later on in this tutorial:

```
sage: L = RootSystem(["B",3,1]).ambient_space()
sage: W = L.weyl_group()
sage: alcoves = [~w for d in range(12)
....:            for w in W.affine_grassmannian_elements_of_given_length(d)]
sage: p = L.plot_fundamental_chamber("classical")
sage: p += L.plot_alcoves(alcoves=alcoves, wireframe=True)
sage: p += L.plot_fundamental_weights()
sage: p.show(frame=False)
```

```
>>> from sage.all import *
>>> L = RootSystem(["B",Integer(3),Integer(1)]).ambient_space()
>>> W = L.weyl_group()
>>> alcoves = [~w for d in range(Integer(12))
...            for w in W.affine_grassmannian_elements_of_given_length(d)]
>>> p = L.plot_fundamental_chamber("classical")
>>> p += L.plot_alcoves(alcoves=alcoves, wireframe=True)
>>> p += L.plot_fundamental_weights()
>>> p.show(frame=False)
```



Exercises

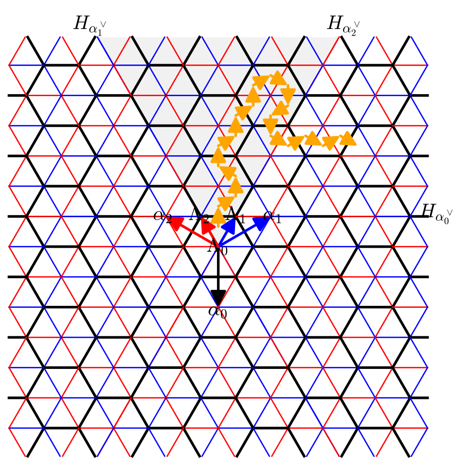
1. Draw the fundamental alcove in the ambient space, just by itself (no reflection hyperplane, root, ...). The automorphism group of the Dynkin diagram for $A_3^{(1)}$ (a cycle of length 4) is the dihedral group. Visualize the corresponding symmetries of the fundamental alcove.
2. Draw the fundamental alcoves for the other rank 4 affine types, and recover the automorphism groups of their Dynkin diagram from the pictures.

Drawing on top of a root system plot

The root system plots have been designed to be used as wallpaper on top of which to draw more information. In the following example, we draw an alcove walk, specified by a word of indices of simple reflections, on top of the weight lattice in affine type $A_{2,1}$:

```
sage: L = RootSystem(["A",2,1]).ambient_space()
sage: w1 = [0,2,1,2,0,2,1,0,2,1,2,1,2,0,2,0,1,2,0]
sage: L.plot(alcove_walk=w1, bounding_box=6)        # long time
Graphics object consisting of 535 graphics primitives
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(2),Integer(1)]).ambient_space()
>>> w1 = [Integer(0),Integer(2),Integer(1),Integer(2),Integer(0),Integer(2),
↪Integer(1),Integer(0),Integer(2),Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(0),Integer(2),Integer(0),Integer(1),Integer(2),Integer(0)]
>>> L.plot(alcove_walk=w1, bounding_box=Integer(6))        # long time
Graphics object consisting of 535 graphics primitives
```



Now, what about drawing several alcove walks, and specifying some colors? A single do-it-all plot method would be cumbersome; so instead, it is actually built on top of many methods (see the list below) that can be called independently and combined at will:

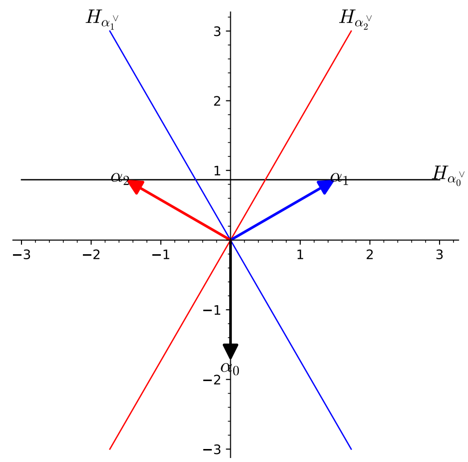
```
sage: L.plot_roots() + L.plot_reflection_hyperplanes()
Graphics object consisting of 12 graphics primitives
```

```
>>> from sage.all import *
>>> L.plot_roots() + L.plot_reflection_hyperplanes()
```

(continues on next page)

(continued from previous page)

```
Graphics object consisting of 12 graphics primitives
```

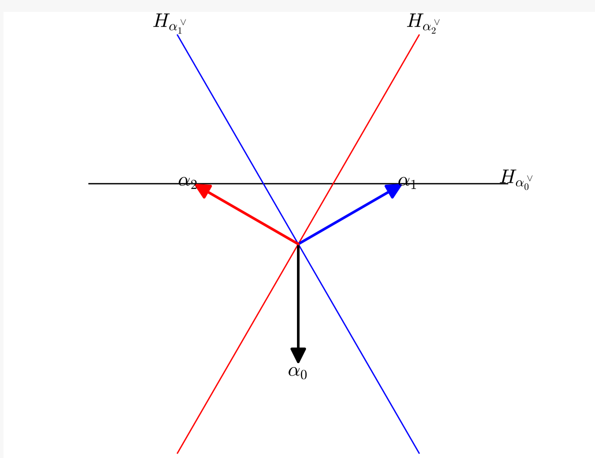


Note

By default the axes are disabled in root system plots since they tend to pollute the picture. Annoyingly they come back when combining them. Here is a workaround:

```
sage: p = L.plot_roots() + L.plot_reflection_hyperplanes()
sage: p.axes(False)
sage: p
Graphics object consisting of 12 graphics primitives
```

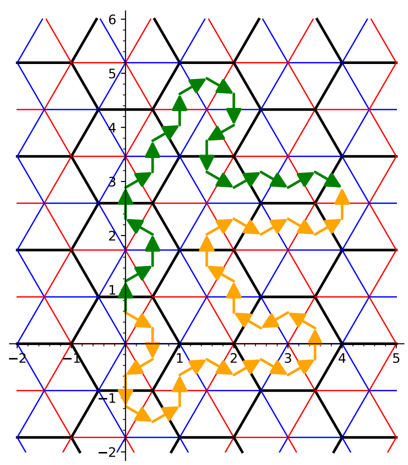
```
>>> from sage.all import *
>>> p = L.plot_roots() + L.plot_reflection_hyperplanes()
>>> p.axes(False)
>>> p
Graphics object consisting of 12 graphics primitives
```



In order to specify common information for all the pieces of a root system plot (choice of projection, bounding box, color code for the index set, ...), the easiest is to create an option object using `plot_parse_options()`, and pass it down to each piece. We use this to plot our two walks:

```
sage: # long time
sage: plot_options = L.plot_parse_options(bounding_box=[[-2,5],[-2,6]])
sage: w2 = [2,1,2,0,2,0,2,1,2,0,1,2,1,2,1,0,1,2,0,2,0,1,2,0,2]
sage: p = L.plot_alcoves(plot_options=plot_options)
sage: p += L.plot_alcove_walk(w1, color='green',
....:                         plot_options=plot_options)
sage: p += L.plot_alcove_walk(w2, color='orange',
....:                         plot_options=plot_options)
sage: p
Graphics object consisting of ... graphics primitives
```

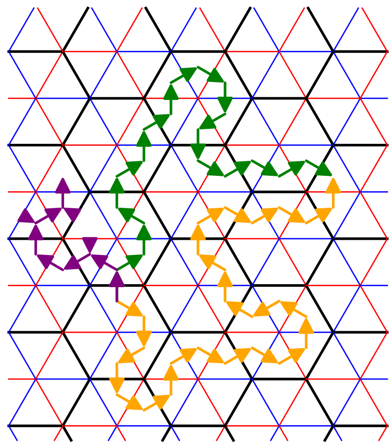
```
>>> from sage.all import *
>>> # long time
>>> plot_options = L.plot_parse_options(bounding_box=[[-Integer(2),Integer(5)],[-
↪Integer(2),Integer(6)]])
>>> w2 = [Integer(2),Integer(1),Integer(2),Integer(0),Integer(2),Integer(0),
↪Integer(2),Integer(1),Integer(2),Integer(0),Integer(1),Integer(2),Integer(1),
↪Integer(2),Integer(1),Integer(0),Integer(1),Integer(2),Integer(0),Integer(2),
↪Integer(0),Integer(1),Integer(2),Integer(0),Integer(2)]
>>> p = L.plot_alcoves(plot_options=plot_options)
>>> p += L.plot_alcove_walk(w1, color='green',
...                         plot_options=plot_options)
>>> p += L.plot_alcove_walk(w2, color='orange',
...                         plot_options=plot_options)
>>> p
Graphics object consisting of ... graphics primitives
```



And another with some foldings:

```
sage: p += L.plot_alcove_walk([0,1,2,0,2,0,1,2,0,1],
....:                         foldings=[False, False, True, False, False,
....:                                   False, True, False, True, False],
....:                         color='purple')
sage: p.axes(False)
sage: p.show(figsize=20)
```

```
>>> from sage.all import *
>>> p += L.plot_alcove_walk([Integer(0),Integer(1),Integer(2),Integer(0),Integer(2),
↪Integer(0),Integer(1),Integer(2),Integer(0),Integer(1)],
...                          foldings=[False, False, True, False, False,
...                                    False, True, False, True, False],
...                          color='purple')
>>> p.axes(False)
>>> p.show(figsize=Integer(20))
```



Here we show a weight at level 0 and the reduced word implementing the translation by this weight:

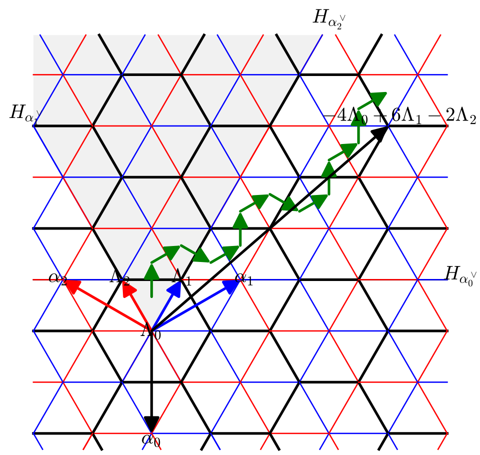
```
sage: # long time
sage: L = RootSystem(["A",2,1]).ambient_space()
sage: P = RootSystem(["A",2,1]).weight_space(extended=True)
sage: Lambda = P.fundamental_weights()
sage: t = 6*Lambda[1] - 2*Lambda[2] - 4*Lambda[0]
sage: walk = L.reduced_word_of_translation(L(t))
sage: plot_options = L.plot_parse_options(bounding_box=[[-2,5],[-2,5]])
sage: p = L.plot(plot_options=plot_options)
sage: p += L.plot_alcove_walk(walk, color='green',
....:                         plot_options=plot_options)
sage: p += plot_options.family_of_vectors({t: L(t)})
sage: plot_options.finalize(p)
Graphics object consisting of ... graphics primitives
sage: p
Graphics object consisting of ... graphics primitives
```

```
>>> from sage.all import *
>>> # long time
>>> L = RootSystem(["A",Integer(2),Integer(1)]).ambient_space()
>>> P = RootSystem(["A",Integer(2),Integer(1)]).weight_space(extended=True)
>>> Lambda = P.fundamental_weights()
>>> t = Integer(6)*Lambda[Integer(1)] - Integer(2)*Lambda[Integer(2)] -␣
↪Integer(4)*Lambda[Integer(0)]
>>> walk = L.reduced_word_of_translation(L(t))
>>> plot_options = L.plot_parse_options(bounding_box=[[-Integer(2),Integer(5)],[-
↪Integer(2),Integer(5)]])
```

(continues on next page)

(continued from previous page)

```
>>> p = L.plot(plot_options=plot_options)
>>> p += L.plot_alcove_walk(walk, color='green',
...                         plot_options=plot_options)
>>> p += plot_options.family_of_vectors({t: L(t)})
>>> plot_options.finalize(p)
Graphics object consisting of ... graphics primitives
>>> p
Graphics object consisting of ... graphics primitives
```



Note that the coloring of the translated alcove does not match with that of the fundamental alcove: the translation actually lives in the extended Weyl group and is the composition of the simple reflections indexed by the alcove walk together with a rotation implementing an automorphism of the Dynkin diagram.

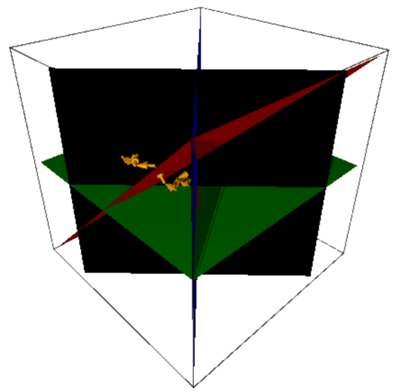
We conclude with a rank $3 + 1$ alcove walk:

```
sage: L = RootSystem(["B",3,1]).ambient_space()
sage: w3 = [0,2,1,3,2,0,2,1,0,2,3,1,2,1,3,2,0,2,0,1,2,0]
sage: (L.plot_fundamental_weights()
....:   + L.plot_reflection_hyperplanes(bounding_box=2) + L.plot_alcove_walk(w3))
Graphics3d Object
```

```
>>> from sage.all import *
>>> L = RootSystem(["B",Integer(3),Integer(1)]).ambient_space()
>>> w3 = [Integer(0),Integer(2),Integer(1),Integer(3),Integer(2),Integer(0),
↪Integer(2),Integer(1),Integer(0),Integer(2),Integer(3),Integer(1),Integer(2),
↪Integer(1),Integer(3),Integer(2),Integer(0),Integer(2),Integer(0),Integer(1),
↪Integer(2),Integer(0)]
>>> (L.plot_fundamental_weights()
...   + L.plot_reflection_hyperplanes(bounding_box=Integer(2)) + L.plot_alcove_
↪walk(w3))
Graphics3d Object
```

Exercise

1. Draw the tiling of 3D space by the fundamental polygons for types A,B,C,D. Hints: use the `wireframe` option of *RootLatticeRealizations.ParentMethods.plot_alcoves()* and the `color` option of `plot()`

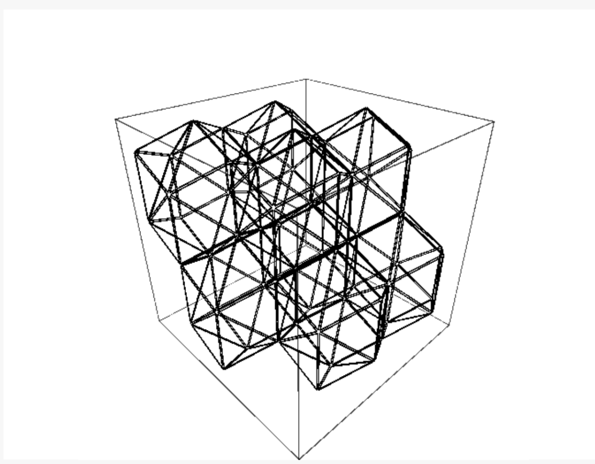


to only draw the alcove facets indexed by 0.

Solution

```
sage: L = RootSystem(["A",3,1]).ambient_space()
sage: alcoves = cartesian_product([[0,1],[0,1],[0,1]])
sage: color = lambda i: "black" if i==0 else None
sage: L.plot_alcoves(alcoves=alcoves, color=color,              # long time
....:                bounding_box=10, wireframe=True).show(frame=False)
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(3),Integer(1)]).ambient_space()
>>> alcoves = cartesian_product([[Integer(0),Integer(1)],[Integer(0),Integer(1)],
↪[Integer(0),Integer(1)]])
>>> color = lambda i: "black" if i==Integer(0) else None
>>> L.plot_alcoves(alcoves=alcoves, color=color,              # long time
...                bounding_box=Integer(10), wireframe=True).show(frame=False)
```



Hand drawing on top of a root system plot (aka Coxeter graph paper)

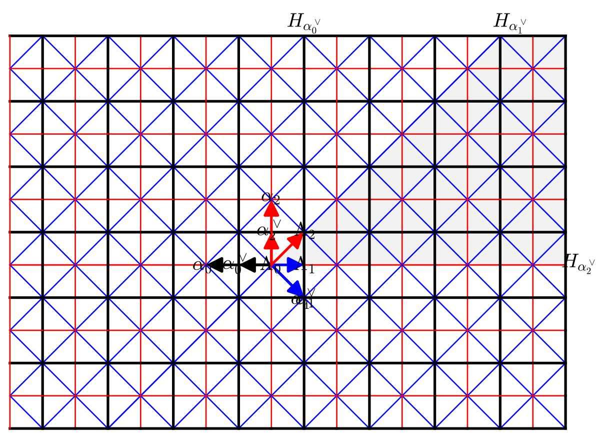
Taken from John Stembridge's excellent data archive:

"If you've ever worked with affine reflection groups, you've probably wasted lots of time drawing the reflecting hyperplanes of the rank 2 groups on scraps of paper. You may also have wished you had pads of graph paper with these lines drawn in for you. If so, you've come to the right place. Behold! Coxeter graph paper!".

Now you can create your own customized color Coxeter graph paper:

```
sage: L = RootSystem(["C",2,1]).ambient_space()
sage: p = L.plot(bounding_box=[[-8,9],[-5,7]],       # long time (10 s)
....:            coroots='simple')
sage: p                                              # long time
Graphics object consisting of ... graphics primitives
```

```
>>> from sage.all import *
>>> L = RootSystem(["C",Integer(2),Integer(1)]).ambient_space()
>>> p = L.plot(bounding_box=[[-Integer(8),Integer(9)],[-Integer(5),Integer(7)]],
↪# long time (10 s)
...            coroots='simple')
>>> p                                              # long time
Graphics object consisting of ... graphics primitives
```



By default Sage's plot are bitmap pictures which would come out ugly if printed on paper. Instead, we recommend saving the picture in postscript or svg before printing it:

```
sage: p.save("C21paper.eps")                  # not tested
```

```
>>> from sage.all import *
>>> p.save("C21paper.eps")                  # not tested
```

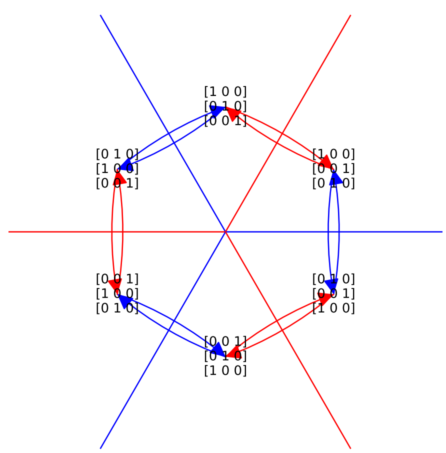
> **Note:** Drawing pictures with a large number of alcoves is currently somewhat ridiculously slow. This is due to the use of generic code that works uniformly in all dimension rather than taylor-made code for 2D. Things should improve with the fast interface to the PPL library (see e.g. Issue #12553).

Drawing custom objects on top of a root system plot

So far so good. Now, what if one wants to draw, on top of a root system plot, some object for which there is no preexisting plot method? Again, the `plot_options` object come in handy, as it can be used to compute appropriate coordinates. Here we draw the permutohedron, that is the Cayley graph of the symmetric group W, by positioning each element w at $w(\rho)$, where ρ is in the fundamental alcove:

```
sage: L = RootSystem(["A",2]).ambient_space()
sage: rho = L.rho()
sage: plot_options = L.plot_parse_options()
sage: W = L.weyl_group()
sage: g = W.cayley_graph(side='right')
sage: positions = {w: plot_options.projection(w.action(rho)) for w in W}
sage: p = L.plot_alcoves()
sage: p += g.plot(pos=positions, vertex_size=0,
....:             color_by_label=plot_options.color)
sage: p.axes(False)
sage: p
Graphics object consisting of 30 graphics primitives
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(2)]).ambient_space()
>>> rho = L.rho()
>>> plot_options = L.plot_parse_options()
>>> W = L.weyl_group()
>>> g = W.cayley_graph(side='right')
>>> positions = {w: plot_options.projection(w.action(rho)) for w in W}
>>> p = L.plot_alcoves()
>>> p += g.plot(pos=positions, vertex_size=Integer(0),
...             color_by_label=plot_options.color)
>>> p.axes(False)
>>> p
Graphics object consisting of 30 graphics primitives
```



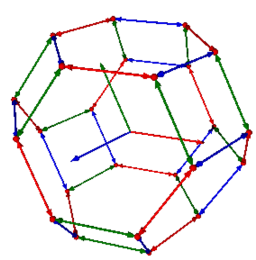
Todo

Could we have nice LaTeX labels in this graph?

The same picture for A_3 gives a nice 3D permutohedron:

```
sage: L = RootSystem(["A",3]).ambient_space()
sage: rho = L.rho()
sage: plot_options = L.plot_parse_options()
sage: W = L.weyl_group()
sage: g = W.cayley_graph(side='right')
sage: positions = {w: plot_options.projection(w.action(rho)) for w in W}
sage: p = L.plot_roots()
sage: p += g.plot3d(pos3d=positions, color_by_label=plot_options.color)
sage: p
Graphics3d Object
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(3)]).ambient_space()
>>> rho = L.rho()
>>> plot_options = L.plot_parse_options()
>>> W = L.weyl_group()
>>> g = W.cayley_graph(side='right')
>>> positions = {w: plot_options.projection(w.action(rho)) for w in W}
>>> p = L.plot_roots()
>>> p += g.plot3d(pos3d=positions, color_by_label=plot_options.color)
>>> p
Graphics3d Object
```



Exercises

1. Locate the identity element of W in the previous picture
2. Rotate the picture appropriately to highlight the various symmetries of the permutohedron.
3. Make a function out of the previous example, and explore the Cayley graphs of all rank 2 and 3 Weyl groups.
4. Draw the root poset for type B_2 and B_3
5. Draw the root poset for type E_8 to recover the picture from Wikipedia article File:E8_3D.png

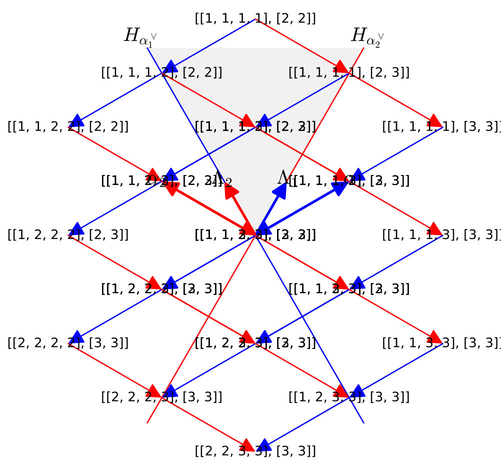
Similarly, we display a crystal graph by positioning each element according to its weight:

```
sage: C = crystals.Tableaux(["A",2], shape=[4,2])
sage: L = C.weight_lattice_realization()
sage: plot_options = L.plot_parse_options()

sage: g = C.digraph()
sage: positions = {x: plot_options.projection(x.weight()) for x in C}
sage: p = L.plot()
sage: p += g.plot(pos=positions,
....:             color_by_label=plot_options.color, vertex_size=0)
sage: p.axes(False)
sage: p.show(figsize=15)
```

```
>>> from sage.all import *
>>> C = crystals.Tableaux(["A",Integer(2)], shape=[Integer(4),Integer(2)])
>>> L = C.weight_lattice_realization()
>>> plot_options = L.plot_parse_options()

>>> g = C.digraph()
>>> positions = {x: plot_options.projection(x.weight()) for x in C}
>>> p = L.plot()
>>> p += g.plot(pos=positions,
...             color_by_label=plot_options.color, vertex_size=Integer(0))
>>> p.axes(False)
>>> p.show(figsize=Integer(15))
```



Note

In the above picture, many pairs of tableaux have the same weight and are thus superposed (look for example near the center). Some more layout logic would be needed to separate those nodes properly, but the foundations are laid firmly and uniformly across all types of root systems for writing such extensions.

Here is an analogue picture in 3D:

```
sage: C = crystals.Tableaux(["A",3], shape=[3,2,1])
sage: L = C.weight_lattice_realization()
sage: plot_options = L.plot_parse_options()
```

(continues on next page)

(continued from previous page)

```
sage: g = C.digraph()
sage: positions = {x: plot_options.projection(x.weight()) for x in C}
sage: p = L.plot(reflection_hyperplanes=False, fundamental_weights=False)
sage: p += g.plot3d(pos3d=positions, vertex_labels=True,
....:               color_by_label=plot_options.color, edge_labels=True)
sage: p
Graphics3d Object
```

```
>>> from sage.all import *
>>> C = crystals.Tableaux(["A",Integer(3)], shape=[Integer(3),Integer(2),Integer(1)])
>>> L = C.weight_lattice_realization()
>>> plot_options = L.plot_parse_options()
>>> g = C.digraph()
>>> positions = {x: plot_options.projection(x.weight()) for x in C}
>>> p = L.plot(reflection_hyperplanes=False, fundamental_weights=False)
>>> p += g.plot3d(pos3d=positions, vertex_labels=True,
...               color_by_label=plot_options.color, edge_labels=True)
>>> p
Graphics3d Object
```

Exercise

Explore the previous picture and notice how the edges of the crystal graph are parallel to the simple roots.

Enjoy and please post your best pictures on the Sage-Combinat wiki.

class sage.combinat.root_system.plot.**PlotOptions**(*space*, *projection=True*, *bounding_box=3*, *color=<bound method CartanTypeFactory.color of <class 'sage.combinat.root_system.cartan_type.CartanTypeFactory'>>*, *labels=True*, *level=None*, *affine=None*, *arrowsize=5*)

Bases: object

A class for plotting options for root lattice realizations.

See also

- *RootLatticeRealizations.ParentMethods.plot()* for a description of the plotting options
- *Tutorial: visualizing root systems* for a tutorial on root system plotting

color(i)

Return the color to be used for objects indexed by i.

INPUT:

- i – an index

See also

index_of_object()

EXAMPLES:

```
sage: L = RootSystem(["A",2]).root_lattice()
sage: options = L.plot_parse_options(labels=False)
sage: alpha = L.simple_roots()
sage: options.color(1)
'blue'
sage: options.color(2)
'red'
sage: for alpha in L.roots():
....:     print("{} {}".format(alpha, options.color(alpha)))
alpha[1]             blue
alpha[2]             red
alpha[1] + alpha[2]  black
-alpha[1]            black
-alpha[2]            black
-alpha[1] - alpha[2] black
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(2)]).root_lattice()
>>> options = L.plot_parse_options(labels=False)
>>> alpha = L.simple_roots()
>>> options.color(Integer(1))
'blue'
>>> options.color(Integer(2))
'red'
>>> for alpha in L.roots():
...     print("{} {}".format(alpha, options.color(alpha)))
alpha[1]             blue
alpha[2]             red
alpha[1] + alpha[2]  black
-alpha[1]            black
-alpha[2]            black
-alpha[1] - alpha[2] black
```

cone (*rays=[]*, *lines=[]*, *color='black'*, *thickness=1*, *alpha=1*, *wireframe=False*, *label=None*, *draw_degenerate=True*, *as_polyhedron=False*)

Return the cone generated by the given rays and lines.

INPUT:

- `rays`, `lines` – lists of elements of the root lattice realization (default: `[]`)
- `color` – a color (default: `'black'`)
- `alpha` – a number in the interval $[0, 1]$ (default: 1) the desired transparency
- `label` – an object to be used as the label for this cone The label itself will be constructed by calling `latex()` or `repr()` on the object depending on the graphics backend.
- `draw_degenerate` – boolean (default: `True`) whether to draw cones with a degenerate intersection with the bounding box
- `as_polyhedron` – boolean (default: `False`) whether to return the result as a polyhedron, without clipping it to the bounding box, and without making a plot out of it (for testing purposes)

OUTPUT: a graphic object, a polyhedron, or `0`

EXAMPLES:

```
sage: L = RootSystem(["A",2]).root_lattice()
sage: options = L.plot_parse_options()
sage: alpha = L.simple_roots()
sage: p = options.cone(rays=[alpha[1]], lines=[alpha[2]],
....:                  color='green', label=2); p
Graphics object consisting of 2 graphics primitives
sage: list(p)
[Polygon defined by 4 points,
 Text '$2$' at the point (3.15...,3.15...)]
sage: options.cone(rays=[alpha[1]], lines=[alpha[2]],
....:              color='green', label=2, as_polyhedron=True)
A 2-dimensional polyhedron in ZZ^2 defined as the convex hull of 1 vertex, 1␣
↪ray, 1 line
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(2)]).root_lattice()
>>> options = L.plot_parse_options()
>>> alpha = L.simple_roots()
>>> p = options.cone(rays=[alpha[Integer(1)]], lines=[alpha[Integer(2)]],
...                  color='green', label=Integer(2)); p
Graphics object consisting of 2 graphics primitives
>>> list(p)
[Polygon defined by 4 points,
 Text '$2$' at the point (3.15...,3.15...)]
>>> options.cone(rays=[alpha[Integer(1)]], lines=[alpha[Integer(2)]],
...              color='green', label=Integer(2), as_polyhedron=True)
A 2-dimensional polyhedron in ZZ^2 defined as the convex hull of 1 vertex, 1␣
↪ray, 1 line
```

An empty result, being outside of the bounding box:

```
sage: options = L.plot_parse_options(labels=True,
....:                                bounding_box=[[-10,-9]]*2)
sage: options.cone(rays=[alpha[1]], lines=[alpha[2]],
....:              color='green', label=2)
0
```

```
>>> from sage.all import *
>>> options = L.plot_parse_options(labels=True,
...                                bounding_box=[[-Integer(10),-
↪Integer(9)]]*Integer(2))
>>> options.cone(rays=[alpha[Integer(1)]], lines=[alpha[Integer(2)]],
...              color='green', label=Integer(2))
0
```

Test that the options are properly passed down:

```
sage: L = RootSystem(["A",2]).root_lattice()
sage: options = L.plot_parse_options()
sage: p = options.cone(rays=[alpha[1] + alpha[2]],
....:                  color='green', label=2, thickness=4, alpha=.5)
```

(continues on next page)

(continued from previous page)

```
sage: list(p)
[Line defined by 2 points, Text '$2$' at the point (3.15...,3.15...)]
sage: sorted(p[0].options().items())
[('alpha', 0.500000000000000), ('legend_color', None),
 ('legend_label', None), ('rgbcolor', 'green'), ('thickness', 4),
 ('zorder', 1)]
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(2)]).root_lattice()
>>> options = L.plot_parse_options()
>>> p = options.cone(rays=[alpha[Integer(1)] + alpha[Integer(2)]],
...                  color='green', label=Integer(2), thickness=Integer(4),␣
↪alpha=RealNumber('.5'))
>>> list(p)
[Line defined by 2 points, Text '$2$' at the point (3.15...,3.15...)]
>>> sorted(p[Integer(0)].options().items())
[('alpha', 0.500000000000000), ('legend_color', None),
 ('legend_label', None), ('rgbcolor', 'green'), ('thickness', 4),
 ('zorder', 1)]
```

This method is tested indirectly but extensively by the various plot methods of root lattice realizations.

empty(**args*)

Return an empty plot.

EXAMPLES:

```
sage: L = RootSystem(["A",2]).root_lattice()
sage: options = L.plot_parse_options(labels=True)
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(2)]).root_lattice()
>>> options = L.plot_parse_options(labels=True)
```

This currently returns `int(0)`:

```
sage: options.empty()
0
```

```
>>> from sage.all import *
>>> options.empty()
0
```

This is not a plot, so may cause some corner cases. On the other hand, 0 behaves as a fast neutral element, which is important given the typical idioms used in the plotting code:

```
sage: p = point([0,0])
sage: p + options.empty() is p
True
```

```
>>> from sage.all import *
>>> p = point([Integer(0),Integer(0)])
```

(continues on next page)

(continued from previous page)

```
>>> p + options.empty() is p
True
```

family_of_vectors(*vectors*)

Return a plot of a family of vectors.

INPUT:

- `vectors` – family or vectors in `self`

The vectors are labelled by their index.

EXAMPLES:

```
sage: L = RootSystem(["A",2]).root_lattice()
sage: options = L.plot_parse_options()
sage: alpha = L.simple_roots()
sage: p = options.family_of_vectors(alpha); p
Graphics object consisting of 4 graphics primitives
sage: list(p)
[Arrow from (0.0,0.0) to (1.0,0.0),
 Text '$1$' at the point (1.05,0.0),
 Arrow from (0.0,0.0) to (0.0,1.0),
 Text '$2$' at the point (0.0,1.05)]
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(2)]).root_lattice()
>>> options = L.plot_parse_options()
>>> alpha = L.simple_roots()
>>> p = options.family_of_vectors(alpha); p
Graphics object consisting of 4 graphics primitives
>>> list(p)
[Arrow from (0.0,0.0) to (1.0,0.0),
 Text '$1$' at the point (1.05,0.0),
 Arrow from (0.0,0.0) to (0.0,1.0),
 Text '$2$' at the point (0.0,1.05)]
```

Handling of colors and labels:

```
sage: def color(i):
....:     return "purple" if i==1 else None
sage: options = L.plot_parse_options(labels=False, color=color)
sage: p = options.family_of_vectors(alpha)
sage: list(p)
[Arrow from (0.0,0.0) to (1.0,0.0)]
sage: p[0].options()['rgbcolor']
'purple'
```

```
>>> from sage.all import *
>>> def color(i):
...     return "purple" if i==Integer(1) else None
>>> options = L.plot_parse_options(labels=False, color=color)
>>> p = options.family_of_vectors(alpha)
>>> list(p)
```

(continues on next page)

(continued from previous page)

```
[Arrow from (0.0,0.0) to (1.0,0.0)]
>>> p[Integer(0)].options()['rgbcolor']
'purple'
```

Matplotlib emits a warning for arrows of length 0 and draws nothing anyway. So we do not draw them at all:

```
sage: L = RootSystem(["A",2,1]).ambient_space()
sage: options = L.plot_parse_options()
sage: Lambda = L.fundamental_weights()
sage: p = options.family_of_vectors(Lambda); p
Graphics object consisting of 5 graphics primitives
sage: list(p)
[Text '$0$' at the point (0.0,0.0),
 Arrow from (0.0,0.0) to (0.5,0.86602451838...),
 Text '$1$' at the point (0.525,0.909325744308...),
 Arrow from (0.0,0.0) to (-0.5,0.86602451838...),
 Text '$2$' at the point (-0.525,0.909325744308...)]
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(2),Integer(1)]).ambient_space()
>>> options = L.plot_parse_options()
>>> Lambda = L.fundamental_weights()
>>> p = options.family_of_vectors(Lambda); p
Graphics object consisting of 5 graphics primitives
>>> list(p)
[Text '$0$' at the point (0.0,0.0),
 Arrow from (0.0,0.0) to (0.5,0.86602451838...),
 Text '$1$' at the point (0.525,0.909325744308...),
 Arrow from (0.0,0.0) to (-0.5,0.86602451838...),
 Text '$2$' at the point (-0.525,0.909325744308...)]
```

finalize(G)

Finalize a root system plot.

INPUT:

- `G` – a root system plot or `0`

This sets the aspect ratio to 1 and remove the axes. This should be called by all the user-level plotting methods of root systems. This will become mostly obsolete when customization options won't be lost anymore upon addition of graphics objects and there will be a proper empty object for 2D and 3D plots.

EXAMPLES:

```
sage: L = RootSystem(["B",2,1]).ambient_space()
sage: options = L.plot_parse_options()
sage: p = L.plot_roots(plot_options=options)
sage: p += L.plot_coroots(plot_options=options)
sage: p.axes()
True
sage: p = options.finalize(p)
sage: p.axes()
False
sage: p.aspect_ratio()
```

(continues on next page)

(continued from previous page)

```
1.0

sage: options = L.plot_parse_options(affine=False)
sage: p = L.plot_roots(plot_options=options)
sage: p += point([[1,1,0]])
sage: p = options.finalize(p)
sage: p.aspect_ratio()
[1.0, 1.0, 1.0]
```

```
>>> from sage.all import *
>>> L = RootSystem(["B",Integer(2),Integer(1)]).ambient_space()
>>> options = L.plot_parse_options()
>>> p = L.plot_roots(plot_options=options)
>>> p += L.plot_coroots(plot_options=options)
>>> p.axes()
True
>>> p = options.finalize(p)
>>> p.axes()
False
>>> p.aspect_ratio()
1.0

>>> options = L.plot_parse_options(affine=False)
>>> p = L.plot_roots(plot_options=options)
>>> p += point([[Integer(1),Integer(1),Integer(0)]])
>>> p = options.finalize(p)
>>> p.aspect_ratio()
[1.0, 1.0, 1.0]
```

If the input is `0`, this returns an empty graphics object:

```
sage: type(options.finalize(0))
<class 'sage.plot.plot3d.base.Graphics3dGroup'>

sage: options = L.plot_parse_options()
sage: type(options.finalize(0))
<class 'sage.plot.graphics.Graphics'>
sage: list(options.finalize(0))
[]
```

```
>>> from sage.all import *
>>> type(options.finalize(Integer(0)))
<class 'sage.plot.plot3d.base.Graphics3dGroup'>

>>> options = L.plot_parse_options()
>>> type(options.finalize(Integer(0)))
<class 'sage.plot.graphics.Graphics'>
>>> list(options.finalize(Integer(0)))
[]
```

in_bounding_box(*x*)

Return whether `x` is in the bounding box.

INPUT:

- `x` – an element of the root lattice realization

This method is currently one of the bottlenecks, and therefore cached.

EXAMPLES:

```
sage: L = RootSystem(["A",2,1]).ambient_space()
sage: options = L.plot_parse_options()
sage: alpha = L.simple_roots()
sage: options.in_bounding_box(alpha[1])
True
sage: options.in_bounding_box(3*alpha[1])
False
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(2),Integer(1)]).ambient_space()
>>> options = L.plot_parse_options()
>>> alpha = L.simple_roots()
>>> options.in_bounding_box(alpha[Integer(1)])
True
>>> options.in_bounding_box(Integer(3)*alpha[Integer(1)])
False
```

index_of_object(*i*)

Try to return the node of the Dynkin diagram indexing the object i.

OUTPUT: a node of the Dynkin diagram or `None`

EXAMPLES:

```
sage: L = RootSystem(["A",3]).root_lattice()
sage: alpha = L.simple_roots()
sage: omega = RootSystem(["A",3]).weight_lattice().fundamental_weights()
sage: options = L.plot_parse_options(labels=False)
sage: options.index_of_object(3)
3
sage: options.index_of_object(alpha[1])
1
sage: options.index_of_object(omega[2])
2
sage: options.index_of_object(omega[2]+omega[3])
sage: options.index_of_object(30)
sage: options.index_of_object("bla")
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(3)]).root_lattice()
>>> alpha = L.simple_roots()
>>> omega = RootSystem(["A",Integer(3)]).weight_lattice().fundamental_
→weights()
>>> options = L.plot_parse_options(labels=False)
>>> options.index_of_object(Integer(3))
3
>>> options.index_of_object(alpha[Integer(1)])
```

(continues on next page)

(continued from previous page)

```
1
>>> options.index_of_object(omega[Integer(2)])
2
>>> options.index_of_object(omega[Integer(2)]+omega[Integer(3)])
>>> options.index_of_object(Integer(30))
>>> options.index_of_object("bla")
```

intersection_at_level_1(*x*)

Return x scaled at the appropriate level, if level is set; otherwise return x.

INPUT:

- x – an element of the root lattice realization

EXAMPLES:

```
sage: L = RootSystem(["A",2,1]).weight_space()
sage: options = L.plot_parse_options()
sage: options.intersection_at_level_1(L.rho())
1/3*Lambda[0] + 1/3*Lambda[1] + 1/3*Lambda[2]

sage: options = L.plot_parse_options(affine=False, level=2)
sage: options.intersection_at_level_1(L.rho())
2/3*Lambda[0] + 2/3*Lambda[1] + 2/3*Lambda[2]
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(2),Integer(1)]).weight_space()
>>> options = L.plot_parse_options()
>>> options.intersection_at_level_1(L.rho())
1/3*Lambda[0] + 1/3*Lambda[1] + 1/3*Lambda[2]

>>> options = L.plot_parse_options(affine=False, level=Integer(2))
>>> options.intersection_at_level_1(L.rho())
2/3*Lambda[0] + 2/3*Lambda[1] + 2/3*Lambda[2]
```

When level is not set, x is returned:

```
sage: options = L.plot_parse_options(affine=False)
sage: options.intersection_at_level_1(L.rho())
Lambda[0] + Lambda[1] + Lambda[2]
```

```
>>> from sage.all import *
>>> options = L.plot_parse_options(affine=False)
>>> options.intersection_at_level_1(L.rho())
Lambda[0] + Lambda[1] + Lambda[2]
```

projection(*v*)

Return the projection of v.

INPUT:

- x – an element of the root lattice realization

OUTPUT: an immutable vector with integer or rational coefficients

EXAMPLES:

```
sage: L = RootSystem(["A",2,1]).ambient_space()
sage: options = L.plot_parse_options()
sage: options.projection(L.rho())
(0, 989/571)

sage: options = L.plot_parse_options(projection=False)
sage: options.projection(L.rho())
(2, 1, 0)
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(2),Integer(1)]).ambient_space()
>>> options = L.plot_parse_options()
>>> options.projection(L.rho())
(0, 989/571)

>>> options = L.plot_parse_options(projection=False)
>>> options.projection(L.rho())
(2, 1, 0)
```

reflection_hyperplane(*coroot*, *as_polyhedron=False*)

Return a plot of the reflection hyperplane indexed by this coroot.

- `coroot` – a coroot

EXAMPLES:

```
sage: L = RootSystem(["B",2]).weight_space()
sage: alphacheck = L.simple_coroots()
sage: options = L.plot_parse_options()
sage: H = options.reflection_hyperplane(alphacheck[1]); H
Graphics object consisting of 2 graphics primitives
```

```
>>> from sage.all import *
>>> L = RootSystem(["B",Integer(2)]).weight_space()
>>> alphacheck = L.simple_coroots()
>>> options = L.plot_parse_options()
>>> H = options.reflection_hyperplane(alphacheck[Integer(1)]); H
Graphics object consisting of 2 graphics primitives
```

Todo

Display the periodic orientation by adding a $+$ and a $-$ sign close to the label. Typically by using the associated root to shift a bit from the vertex upon which the hyperplane label is attached.

text(*label*, *position*, *rgbcolor=(0, 0, 0)*)

Return text widget with label `label` at position `position`.

INPUT:

- `label` – string or Sage object upon which latex will be called
- `position` – a position
- `rgbcolor` – the color as an RGB tuple

EXAMPLES:

```
sage: L = RootSystem(["A",2]).root_lattice()
sage: options = L.plot_parse_options()
sage: list(options.text("coucou", [0,1]))
[Text 'coucou' at the point (0.0,1.0)]
sage: list(options.text(L.simple_root(1), [0,1]))
[Text '$\alpha_{1}$' at the point (0.0,1.0)]
sage: list(options.text(L.simple_root(2), [1,0], rgbcolor=(1,0.5,0)))
[Text '$\alpha_{2}$' at the point (1.0,0.0)]

sage: options = L.plot_parse_options(labels=False)
sage: options.text("coucou", [0,1])
0

sage: options = RootSystem(["B",3]).root_lattice().plot_parse_options()
sage: print(options.text("coucou", [0,1,2]).x3d_str())
<Transform translation='0 1 2'>
<Shape><Text string='coucou' solid='true'/><Appearance><Material diffuseColor=
↪'0.0 0.0 0.0' shininess='1.0' specularColor='0.0 0.0 0.0'/></Appearance></
↪Shape>

</Transform>
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(2)]).root_lattice()
>>> options = L.plot_parse_options()
>>> list(options.text("coucou", [Integer(0),Integer(1)]))
[Text 'coucou' at the point (0.0,1.0)]
>>> list(options.text(L.simple_root(Integer(1)), [Integer(0),Integer(1)]))
[Text '$\alpha_{1}$' at the point (0.0,1.0)]
>>> list(options.text(L.simple_root(Integer(2)), [Integer(1),Integer(0)],␣
↪rgbcolor=(Integer(1),RealNumber('0.5'),Integer(0))))
[Text '$\alpha_{2}$' at the point (1.0,0.0)]

>>> options = L.plot_parse_options(labels=False)
>>> options.text("coucou", [Integer(0),Integer(1)])
0

>>> options = RootSystem(["B",Integer(3)]).root_lattice().plot_parse_options()
>>> print(options.text("coucou", [Integer(0),Integer(1),Integer(2)]).x3d_
↪str())
<Transform translation='0 1 2'>
<Shape><Text string='coucou' solid='true'/><Appearance><Material diffuseColor=
↪'0.0 0.0 0.0' shininess='1.0' specularColor='0.0 0.0 0.0'/></Appearance></
↪Shape>
<BLANKLINE>
</Transform>
```

thickness(*i*)

Return the thickness to be used for lines indexed by i.

INPUT:

- `i` – an index

See also

index_of_object()

EXAMPLES:

```
sage: L = RootSystem(["A",2,1]).root_lattice()
sage: options = L.plot_parse_options(labels=False)
sage: alpha = L.simple_roots()
sage: options.thickness(0)
2
sage: options.thickness(1)
1
sage: options.thickness(2)
1
sage: for alpha in L.simple_roots():
....:     print("{} {}".format(alpha, options.thickness(alpha)))
alpha[0] 2
alpha[1] 1
alpha[2] 1
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(2),Integer(1)]).root_lattice()
>>> options = L.plot_parse_options(labels=False)
>>> alpha = L.simple_roots()
>>> options.thickness(Integer(0))
2
>>> options.thickness(Integer(1))
1
>>> options.thickness(Integer(2))
1
>>> for alpha in L.simple_roots():
...     print("{} {}".format(alpha, options.thickness(alpha)))
alpha[0] 2
alpha[1] 1
alpha[2] 1
```

sage.combinat.root_system.plot.**barycentric_projection_matrix**(*angle=0*)

Return a family of $n+1$ vectors evenly spaced in a real vector space of dimension n.

Those vectors are of norm 1, the scalar product between any two vector is $1/n$, thus the distance between two tips is constant.

The family is built recursively and uniquely determined by the following property: the last vector is $(0,\dots,0,-1)$, and the projection of the first n vectors in dimension $n-1$, after appropriate rescaling to norm 1, retrieves the family for $n-1$.

OUTPUT:

A matrix with $n+1$ columns of height n with rational or symbolic coefficients.

EXAMPLES:

One vector in dimension 0:

```
sage: from sage.combinat.root_system.root_lattice_realizations import barycentric_
↪projection_matrix
sage: m = barycentric_projection_matrix(0); m
[]
sage: matrix(QQ,0,1).nrows()
0
sage: matrix(QQ,0,1).ncols()
1
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.root_lattice_realizations import barycentric_
↪projection_matrix
>>> m = barycentric_projection_matrix(Integer(0)); m
[]
>>> matrix(QQ,Integer(0),Integer(1)).nrows()
0
>>> matrix(QQ,Integer(0),Integer(1)).ncols()
1
```

Two vectors in dimension 1:

```
sage: barycentric_projection_matrix(1)
[ 1 -1]
```

```
>>> from sage.all import *
>>> barycentric_projection_matrix(Integer(1))
[ 1 -1]
```

Three vectors in dimension 2:

```
sage: barycentric_projection_matrix(2)
[ 1/2*sqrt(3) -1/2*sqrt(3)            0]
[         1/2          1/2           -1]
```

```
>>> from sage.all import *
>>> barycentric_projection_matrix(Integer(2))
[ 1/2*sqrt(3) -1/2*sqrt(3)            0]
[         1/2          1/2           -1]
```

Four vectors in dimension 3:

```
sage: m = barycentric_projection_matrix(3); m
[ 1/3*sqrt(3)*sqrt(2) -1/3*sqrt(3)*sqrt(2)                    0                    ␣
↪ 0]
[         1/3*sqrt(2)          1/3*sqrt(2)         -2/3*sqrt(2)                    ␣
↪ 0]
[                 1/3                  1/3                  1/3                    ␣
↪-1]
```

```
>>> from sage.all import *
>>> m = barycentric_projection_matrix(Integer(3)); m
[ 1/3*sqrt(3)*sqrt(2) -1/3*sqrt(3)*sqrt(2)                    0                    ␣
```

(continues on next page)

(continued from previous page)

```
↪ 0]
[           1/3*sqrt(2)            1/3*sqrt(2)          -2/3*sqrt(2)                 ␣
↪ 0]
[                   1/3                    1/3                    1/3                ␣
↪-1]
```

The columns give four vectors that sum up to zero:

```
sage: sum(m.columns())
(0, 0, 0)
```

```
>>> from sage.all import *
>>> sum(m.columns())
(0, 0, 0)
```

and have regular mutual angles:

```
sage: m.transpose()*m
[   1 -1/3 -1/3 -1/3]
[-1/3    1 -1/3 -1/3]
[-1/3 -1/3    1 -1/3]
[-1/3 -1/3 -1/3    1]
```

```
>>> from sage.all import *
>>> m.transpose()*m
[   1 -1/3 -1/3 -1/3]
[-1/3    1 -1/3 -1/3]
[-1/3 -1/3    1 -1/3]
[-1/3 -1/3 -1/3    1]
```

Here is a plot of them:

```
sage: sum(arrow((0,0,0),x) for x in m.columns())
Graphics3d Object
```

```
>>> from sage.all import *
>>> sum(arrow((Integer(0),Integer(0),Integer(0)),x) for x in m.columns())
Graphics3d Object
```

For 2D drawings of root systems, it is desirable to rotate the result to match with the usual conventions:

```
sage: barycentric_projection_matrix(2, angle=2*pi/3)
[         1/2           -1          1/2]
[ 1/2*sqrt(3)            0 -1/2*sqrt(3)]
```

```
>>> from sage.all import *
>>> barycentric_projection_matrix(Integer(2), angle=Integer(2)*pi/Integer(3))
[         1/2           -1          1/2]
[ 1/2*sqrt(3)            0 -1/2*sqrt(3)]
```

5.1.236 Finite complex reflection groups

Let V be a finite-dimensional complex vector space. A reflection of V is an operator $r \in \mathrm{GL}(V)$ that has finite order and fixes pointwise a hyperplane in V.

For more definitions and classification types of finite complex reflection groups, see Wikipedia article Complex_reflection_group.

The point of entry to work with reflection groups is `ReflectionGroup()` which can be used with finite Cartan-Killing types:

```
sage: ReflectionGroup(['A',2])
Irreducible real reflection group of rank 2 and type A2
sage: ReflectionGroup(['F',4])
Irreducible real reflection group of rank 4 and type F4
sage: ReflectionGroup(['H',3])
Irreducible real reflection group of rank 3 and type H3
```

```
>>> from sage.all import *
>>> ReflectionGroup(['A',Integer(2)])
Irreducible real reflection group of rank 2 and type A2
>>> ReflectionGroup(['F',Integer(4)])
Irreducible real reflection group of rank 4 and type F4
>>> ReflectionGroup(['H',Integer(3)])
Irreducible real reflection group of rank 3 and type H3
```

or with Shephard-Todd types:

```
sage: ReflectionGroup((1,1,3))
Irreducible real reflection group of rank 2 and type A2
sage: ReflectionGroup((2,1,3))
Irreducible real reflection group of rank 3 and type B3
sage: ReflectionGroup((3,1,3))
Irreducible complex reflection group of rank 3 and type G(3,1,3)
sage: ReflectionGroup((4,2,3))
Irreducible complex reflection group of rank 3 and type G(4,2,3)
sage: ReflectionGroup(4)
Irreducible complex reflection group of rank 2 and type ST4
sage: ReflectionGroup(31)
Irreducible complex reflection group of rank 4 and type ST31
```

```
>>> from sage.all import *
>>> ReflectionGroup((Integer(1),Integer(1),Integer(3)))
Irreducible real reflection group of rank 2 and type A2
>>> ReflectionGroup((Integer(2),Integer(1),Integer(3)))
Irreducible real reflection group of rank 3 and type B3
>>> ReflectionGroup((Integer(3),Integer(1),Integer(3)))
Irreducible complex reflection group of rank 3 and type G(3,1,3)
>>> ReflectionGroup((Integer(4),Integer(2),Integer(3)))
Irreducible complex reflection group of rank 3 and type G(4,2,3)
>>> ReflectionGroup(Integer(4))
Irreducible complex reflection group of rank 2 and type ST4
```

(continues on next page)

(continued from previous page)

```
>>> ReflectionGroup(Integer(31))
Irreducible complex reflection group of rank 4 and type ST31
```

Also reducible types are allowed using concatenation:

```
sage: ReflectionGroup(['A',3],(4,2,3))
Reducible complex reflection group of rank 6 and type A3 x G(4,2,3)
```

```
>>> from sage.all import *
>>> ReflectionGroup(['A',Integer(3)],(Integer(4),Integer(2),Integer(3)))
Reducible complex reflection group of rank 6 and type A3 x G(4,2,3)
```

Some special cases also occur, among them are:

```
sage: W = ReflectionGroup((2,2,2)); W
Reducible real reflection group of rank 2 and type A1 x A1
sage: W = ReflectionGroup((2,2,3)); W
Irreducible real reflection group of rank 3 and type A3
```

```
>>> from sage.all import *
>>> W = ReflectionGroup((Integer(2),Integer(2),Integer(2))); W
Reducible real reflection group of rank 2 and type A1 x A1
>>> W = ReflectionGroup((Integer(2),Integer(2),Integer(3))); W
Irreducible real reflection group of rank 3 and type A3
```

Warning

Uses the GAP3 package *Chevie* which is available as an experimental package (installed by `sage -i gap3`) or to download by hand from Jean Michel's website.

A guided tour

We start with the example type B_2:

```
sage: W = ReflectionGroup(['B',2]); W
Irreducible real reflection group of rank 2 and type B2
```

```
>>> from sage.all import *
>>> W = ReflectionGroup(['B',Integer(2)]); W
Irreducible real reflection group of rank 2 and type B2
```

Most importantly, observe that the group elements are usually represented by permutations of the roots:

```
sage: for w in W: print(w)
()
(1,3)(2,6)(5,7)
(1,5)(2,4)(6,8)
(1,7,5,3)(2,4,6,8)
(1,3,5,7)(2,8,6,4)
(2,8)(3,7)(4,6)
```

(continues on next page)

(continued from previous page)

```
(1,7)(3,5)(4,8)
(1,5)(2,6)(3,7)(4,8)
```

```
>>> from sage.all import *
>>> for w in W: print(w)
()
(1,3)(2,6)(5,7)
(1,5)(2,4)(6,8)
(1,7,5,3)(2,4,6,8)
(1,3,5,7)(2,8,6,4)
(2,8)(3,7)(4,6)
(1,7)(3,5)(4,8)
(1,5)(2,6)(3,7)(4,8)
```

This has the drawback that one can hardly see anything. Usually, one would look at elements with either of the following methods:

```
sage: for w in W: w.reduced_word()
[]
[2]
[1]
[1, 2]

The standard references for actions of complex reflection groups have the matrices acting on the right, so:

```
sage: W.simple_reflection(1).to_matrix()
[-1  0]
[ 2  1]
```

```
>>> from sage.all import *
>>> W.simple_reflection(Integer(1)).to_matrix()
[-1  0]
[ 2  1]
```

sends the simple root α_0, or `(1,0)` in vector notation, to its negative, while sending α_1 to $2\alpha_0 + \alpha_1$.

Todo

- properly provide root systems for real reflection groups
- element class should be unique to be able to work with large groups without creating elements multiple times
- `is_shephard_group`, `is_generalized_coxeter_group`
- exponents and coexponents
- coinvariant ring:
  - fake degrees from Torsten Hoge
  - operation of linear characters on all characters
  - harmonic polynomials
- linear forms for hyperplanes
- field of definition
- intersection lattice and characteristic polynomial:

```
X = [ alpha(t) for t in W.distinguished_reflections() ]
X = Matrix(CF,X).transpose()
Y = Matroid(X)
```

- linear characters
- permutation pi on irreducibles
- hyperplane orbits (76.13 in Gap Manual)
- improve invariant_form with a code similar to the one in `reflection_group_real.py`
- add a method `reflection_to_root` or `distinguished_reflection_to_positive_root`
- diagrams in ASCII-art (76.15)
- standard (BMR) presentations
- character table directly from Chevie
- `GenericOrder` (76.20), `TorusOrder` (76.21)
- correct fundamental invariants for G_34, check the others
- copy hardcoded data (degrees, invariants, braid relations…) into sage
- add other hardcoded data from the tables in chevie (location is SAGEDIR/local/gap3/gap-jm5-2015-02-01/gap3/pkg/chevie/tbl): basic derivations, discriminant, …
- transfer code for `reduced_word_in_reflections` into Gap4 or Sage
- list of reduced words for an element
- list of reduced words in reflections for an element
- Hurwitz action?
- `is_crystallographic()` should be hardcoded

AUTHORS:

- Christian Stump (2015): initial version

class sage.combinat.root_system.reflection_group_complex.**ComplexReflectionGroup**(*W_types*, *index_set=None*, *hyperplane_index_set=None*, *reflection_index_set=None*)

Bases: `UniqueRepresentation`, `PermutationGroup_generic`

A complex reflection group given as a permutation group.

See also

ReflectionGroup()

class Element

Bases: `ComplexReflectionGroupElement`

conjugacy_class()

Return the conjugacy class of `self`.

EXAMPLES:

```
sage: W = ReflectionGroup((1,1,3))
sage: for w in W: sorted(w.conjugacy_class())
[()]
[(1,3)(2,5)(4,6), (1,4)(2,3)(5,6), (1,5)(2,4)(3,6)]
[(1,3)(2,5)(4,6), (1,4)(2,3)(5,6), (1,5)(2,4)(3,6)]
[(1,2,6)(3,4,5), (1,6,2)(3,5,4)]
[(1,2,6)(3,4,5), (1,6,2)(3,5,4)]
[(1,3)(2,5)(4,6), (1,4)(2,3)(5,6), (1,5)(2,4)(3,6)]
```

```
>>> from sage.all import *
>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(3)))
>>> for w in W: sorted(w.conjugacy_class())
[()]
[(1,3)(2,5)(4,6), (1,4)(2,3)(5,6), (1,5)(2,4)(3,6)]
[(1,3)(2,5)(4,6), (1,4)(2,3)(5,6), (1,5)(2,4)(3,6)]
[(1,2,6)(3,4,5), (1,6,2)(3,5,4)]
[(1,2,6)(3,4,5), (1,6,2)(3,5,4)]
[(1,3)(2,5)(4,6), (1,4)(2,3)(5,6), (1,5)(2,4)(3,6)]
```

conjugacy_class_representative()

Return a representative of the conjugacy class of `self`.

EXAMPLES:

```
sage: W = ReflectionGroup((1,1,3))
sage: for w in W:
....:     print('%s %s'%(w.reduced_word(), w.conjugacy_class_
↪representative().reduced_word()))
[] []
[2] [1]
[1] [1]
[1, 2] [1, 2]
[2, 1] [1, 2]
[1, 2, 1] [1]
```

```
>>> from sage.all import *
>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(3)))
>>> for w in W:
...     print('%s %s'%(w.reduced_word(), w.conjugacy_class_
↪representative().reduced_word()))
[] []
[2] [1]
[1] [1]
[1, 2] [1, 2]
[2, 1] [1, 2]
[1, 2, 1] [1]
```

reflection_length(*in_unitary_group=False*)

Return the reflection length of `self`.

This is the minimal numbers of reflections needed to obtain `self`.

INPUT:

- `in_unitary_group` – boolean (default: `False`); if `True`, the reflection length is computed in the unitary group which is the dimension of the move space of `self`

EXAMPLES:

```
sage: W = ReflectionGroup((1,1,3))
sage: sorted([t.reflection_length() for t in W])
[0, 1, 1, 1, 2, 2]

sage: W = ReflectionGroup((2,1,2))
sage: sorted([t.reflection_length() for t in W])
[0, 1, 1, 1, 1, 2, 2, 2]

sage: W = ReflectionGroup((2,2,2))
sage: sorted([t.reflection_length() for t in W])
[0, 1, 1, 2]

sage: W = ReflectionGroup((3,1,2))
sage: sorted([t.reflection_length() for t in W])
[0, 1, 1, 1, 1, 1, 1, 1, 2, 2, 2, 2, 2, 2, 2, 2, 2, 2]
```

```
>>> from sage.all import *
>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(3)))
>>> sorted([t.reflection_length() for t in W])
[0, 1, 1, 1, 2, 2]

>>> W = ReflectionGroup((Integer(2),Integer(1),Integer(2)))
>>> sorted([t.reflection_length() for t in W])
[0, 1, 1, 1, 1, 2, 2, 2]

>>> W = ReflectionGroup((Integer(2),Integer(2),Integer(2)))
>>> sorted([t.reflection_length() for t in W])
[0, 1, 1, 2]

>>> W = ReflectionGroup((Integer(3),Integer(1),Integer(2)))
>>> sorted([t.reflection_length() for t in W])
[0, 1, 1, 1, 1, 1, 1, 1, 2, 2, 2, 2, 2, 2, 2, 2, 2, 2]
```

apply_vector_field(*f*, *vf=None*)

Return a rational function obtained by applying the vector field `vf` to the rational function `f`.

If `vf` is not given, the primitive vector field is used.

EXAMPLES:

```
sage: W = ReflectionGroup(['A',2])
sage: for x in W.primitive_vector_field()[0].parent().gens():
....:     print(W.apply_vector_field(x))
3*x1/(6*x0^2 - 6*x0*x1 - 12*x1^2)
1/(6*x0^2 - 6*x0*x1 - 12*x1^2)
```

```
>>> from sage.all import *
>>> W = ReflectionGroup(['A',Integer(2)])
>>> for x in W.primitive_vector_field()[Integer(0)].parent().gens():
...     print(W.apply_vector_field(x))
3*x1/(6*x0^2 - 6*x0*x1 - 12*x1^2)
1/(6*x0^2 - 6*x0*x1 - 12*x1^2)
```

braid_relations()

Return the braid relations of `self`.

EXAMPLES:

```
sage: W = ReflectionGroup((1,1,3))
sage: W.braid_relations()
[[[1, 2, 1], [2, 1, 2]]]

sage: W = ReflectionGroup((2,1,3))
sage: W.braid_relations()
[[[1, 2, 1, 2], [2, 1, 2, 1]], [[1, 3], [3, 1]], [[2, 3, 2], [3, 2, 3]]]

sage: W = ReflectionGroup((2,2,3))
sage: W.braid_relations()
[[[1, 2, 1], [2, 1, 2]], [[1, 3], [3, 1]], [[2, 3, 2], [3, 2, 3]]]
```

```
>>> from sage.all import *
>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(3)))
>>> W.braid_relations()
[[[1, 2, 1], [2, 1, 2]]]

>>> W = ReflectionGroup((Integer(2),Integer(1),Integer(3)))
>>> W.braid_relations()
[[[1, 2, 1, 2], [2, 1, 2, 1]], [[1, 3], [3, 1]], [[2, 3, 2], [3, 2, 3]]]

>>> W = ReflectionGroup((Integer(2),Integer(2),Integer(3)))
>>> W.braid_relations()
[[[1, 2, 1], [2, 1, 2]], [[1, 3], [3, 1]], [[2, 3, 2], [3, 2, 3]]]
```

cartan_matrix()

Return the Cartan matrix associated with `self`.

If `self` is crystallographic, the returned Cartan matrix is an instance of *CartanMatrix*, and a normal matrix otherwise.

Let $s_1, \ldots, s_n$ be a set of reflections which generate `self` with associated simple roots $s_1, \ldots, s_n$ and simple coroots $s_i^\vee$. Then the Cartan matrix $C = (c_{ij})$ is given by $s_i^\vee(s_j)$. The Cartan matrix completely determines the reflection representation if the s_i are linearly independent.

EXAMPLES:

```
sage: ReflectionGroup(['A',4]).cartan_matrix()
[ 2 -1  0  0]
[-1  2 -1  0]
[ 0 -1  2 -1]
[ 0  0 -1  2]
```

(continues on next page)

(continued from previous page)

```
sage: ReflectionGroup(['H',4]).cartan_matrix()
[              2 E(5)^2 + E(5)^3               0               0]
[E(5)^2 + E(5)^3               2              -1               0]
[              0              -1               2              -1]
[              0               0              -1               2]

sage: ReflectionGroup(4).cartan_matrix()
[-2*E(3) - E(3)^2           E(3)^2]
[         -E(3)^2 -2*E(3) - E(3)^2]

sage: ReflectionGroup((4,2,2)).cartan_matrix()
[       2  -2*E(4)       -2]
[    E(4)        2 1 - E(4)]
[      -1 1 + E(4)        2]
```

```
>>> from sage.all import *
>>> ReflectionGroup(['A',Integer(4)]).cartan_matrix()
[ 2 -1  0  0]
[-1  2 -1  0]
[ 0 -1  2 -1]
[ 0  0 -1  2]

>>> ReflectionGroup(['H',Integer(4)]).cartan_matrix()
[              2 E(5)^2 + E(5)^3               0               0]
[E(5)^2 + E(5)^3               2              -1               0]
[              0              -1               2              -1]
[              0               0              -1               2]

>>> ReflectionGroup(Integer(4)).cartan_matrix()
[-2*E(3) - E(3)^2           E(3)^2]
[         -E(3)^2 -2*E(3) - E(3)^2]

>>> ReflectionGroup((Integer(4),Integer(2),Integer(2))).cartan_matrix()
[       2  -2*E(4)       -2]
[    E(4)        2 1 - E(4)]
[      -1 1 + E(4)        2]
```

codegrees()

Return the codegrees of `self` ordered within each irreducible component of `self`.

EXAMPLES:

```
sage: W = ReflectionGroup((1,1,4))
sage: W.codegrees()
(2, 1, 0)

sage: W = ReflectionGroup((2,1,4))
sage: W.codegrees()
(6, 4, 2, 0)

sage: W = ReflectionGroup((4,1,4))
```

(continues on next page)

(continued from previous page)

```
sage: W.codegrees()
(12, 8, 4, 0)

sage: W = ReflectionGroup((4,2,4))
sage: W.codegrees()
(12, 8, 4, 0)

sage: W = ReflectionGroup((4,4,4))
sage: W.codegrees()
(8, 8, 4, 0)

sage: W = ReflectionGroup((1,1,4), (3,1,2))
sage: W.codegrees()
(2, 1, 0, 3, 0)

sage: W = ReflectionGroup((1,1,4), (6,1,12), 23)
sage: W.codegrees()
(2, 1, 0, 66, 60, 54, 48, 42, 36, 30, 24, 18, 12, 6, 0, 8, 4, 0)
```

```
>>> from sage.all import *
>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(4)))
>>> W.codegrees()
(2, 1, 0)

>>> W = ReflectionGroup((Integer(2),Integer(1),Integer(4)))
>>> W.codegrees()
(6, 4, 2, 0)

>>> W = ReflectionGroup((Integer(4),Integer(1),Integer(4)))
>>> W.codegrees()
(12, 8, 4, 0)

>>> W = ReflectionGroup((Integer(4),Integer(2),Integer(4)))
>>> W.codegrees()
(12, 8, 4, 0)

>>> W = ReflectionGroup((Integer(4),Integer(4),Integer(4)))
>>> W.codegrees()
(8, 8, 4, 0)

>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(4)), (Integer(3),
↪Integer(1),Integer(2)))
>>> W.codegrees()
(2, 1, 0, 3, 0)

>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(4)), (Integer(6),
↪Integer(1),Integer(12)), Integer(23))
>>> W.codegrees()
(2, 1, 0, 66, 60, 54, 48, 42, 36, 30, 24, 18, 12, 6, 0, 8, 4, 0)
```

conjugacy_classes()

Return the conjugacy classes of `self`.

EXAMPLES:

```
sage: W = ReflectionGroup((1,1,3))
sage: for C in W.conjugacy_classes(): sorted(C)
[()]
[(1,3)(2,5)(4,6), (1,4)(2,3)(5,6), (1,5)(2,4)(3,6)]
[(1,2,6)(3,4,5), (1,6,2)(3,5,4)]

sage: W = ReflectionGroup((1,1,4))
sage: sum(len(C) for C in W.conjugacy_classes()) == W.cardinality()
True

sage: W = ReflectionGroup((3,1,2))
sage: sum(len(C) for C in W.conjugacy_classes()) == W.cardinality()
True

sage: W = ReflectionGroup(23)
sage: sum(len(C) for C in W.conjugacy_classes()) == W.cardinality()
True
```

```
>>> from sage.all import *
>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(3)))
>>> for C in W.conjugacy_classes(): sorted(C)
[()]
[(1,3)(2,5)(4,6), (1,4)(2,3)(5,6), (1,5)(2,4)(3,6)]
[(1,2,6)(3,4,5), (1,6,2)(3,5,4)]

>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(4)))
>>> sum(len(C) for C in W.conjugacy_classes()) == W.cardinality()
True

>>> W = ReflectionGroup((Integer(3),Integer(1),Integer(2)))
>>> sum(len(C) for C in W.conjugacy_classes()) == W.cardinality()
True

>>> W = ReflectionGroup(Integer(23))
>>> sum(len(C) for C in W.conjugacy_classes()) == W.cardinality()
True
```

conjugacy_classes_representatives()

Return the shortest representatives of the conjugacy classes of `self`.

EXAMPLES:

```
sage: W = ReflectionGroup((1,1,3))
sage: [w.reduced_word() for w in W.conjugacy_classes_representatives()]
[[], [1], [1, 2]]

sage: W = ReflectionGroup((1,1,4))
sage: [w.reduced_word() for w in W.conjugacy_classes_representatives()]
[[], [1], [1, 3], [1, 2], [1, 3, 2]]

sage: W = ReflectionGroup((3,1,2))
sage: [w.reduced_word() for w in W.conjugacy_classes_representatives()]
```

(continues on next page)

(continued from previous page)

```
[[], [1], [1, 1], [2, 1, 2, 1], [2, 1, 2, 1, 1],
 [2, 1, 1, 2, 1, 1], [2], [1, 2], [1, 1, 2]]

sage: W = ReflectionGroup(23)
sage: [w.reduced_word() for w in W.conjugacy_classes_representatives()]
    [[],
     [1],
     [1, 2],
     [1, 3],
     [2, 3],
     [1, 2, 3],
     [1, 2, 1, 2],
     [1, 2, 1, 2, 3],
     [1, 2, 1, 2, 3, 2, 1, 2, 3],
     [1, 2, 1, 2, 1, 3, 2, 1, 2, 1, 3, 2, 1, 2, 3]]
```

```
>>> from sage.all import *
>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(3)))
>>> [w.reduced_word() for w in W.conjugacy_classes_representatives()]
[[], [1], [1, 2]]

>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(4)))
>>> [w.reduced_word() for w in W.conjugacy_classes_representatives()]
[[], [1], [1, 3], [1, 2], [1, 3, 2]]

>>> W = ReflectionGroup((Integer(3),Integer(1),Integer(2)))
>>> [w.reduced_word() for w in W.conjugacy_classes_representatives()]
[[], [1], [1, 1], [2, 1, 2, 1], [2, 1, 2, 1, 1],
 [2, 1, 1, 2, 1, 1], [2], [1, 2], [1, 1, 2]]

>>> W = ReflectionGroup(Integer(23))
>>> [w.reduced_word() for w in W.conjugacy_classes_representatives()]
    [[],
     [1],
     [1, 2],
     [1, 3],
     [2, 3],
     [1, 2, 3],
     [1, 2, 1, 2],
     [1, 2, 1, 2, 3],
     [1, 2, 1, 2, 3, 2, 1, 2, 3],
     [1, 2, 1, 2, 1, 3, 2, 1, 2, 1, 3, 2, 1, 2, 3]]
```

coxeter_number(*chi=None*)

Return the Coxeter number associated to the irreducible character chi of the reflection group `self`.

The *Coxeter number* of a complex reflection group W is the trace in a character χ of $\sum_t (Id - t)$, where t runs over all reflections. The result is always an integer.

When χ is the reflection representation, the Coxeter number is equal to $\frac{N+N^*}{n}$ where N is the number of reflections, N^* is the number of reflection hyperplanes, and n is the rank of W. If W is further well-generated, the Coxeter number is equal to the highest degree d_n and to the order of a Coxeter element c of W.

EXAMPLES:

```
sage: W = ReflectionGroup(["H",4])
sage: W.coxeter_number()
30
sage: all(W.coxeter_number(chi).is_integer()
....:     for chi in W.irreducible_characters())
True
sage: W = ReflectionGroup(14)
sage: W.coxeter_number()
24
```

```
>>> from sage.all import *
>>> W = ReflectionGroup(["H",Integer(4)])
>>> W.coxeter_number()
30
>>> all(W.coxeter_number(chi).is_integer()
...     for chi in W.irreducible_characters())
True
>>> W = ReflectionGroup(Integer(14))
>>> W.coxeter_number()
24
```

degrees()

Return the degrees of `self` ordered within each irreducible component of `self`.

EXAMPLES:

```
sage: W = ReflectionGroup((1,1,4))
sage: W.degrees()
(2, 3, 4)

sage: W = ReflectionGroup((2,1,4))
sage: W.degrees()
(2, 4, 6, 8)

sage: W = ReflectionGroup((4,1,4))
sage: W.degrees()
(4, 8, 12, 16)

sage: W = ReflectionGroup((4,2,4))
sage: W.degrees()
(4, 8, 8, 12)

sage: W = ReflectionGroup((4,4,4))
sage: W.degrees()
(4, 4, 8, 12)
```

```
>>> from sage.all import *
>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(4)))
>>> W.degrees()
(2, 3, 4)

>>> W = ReflectionGroup((Integer(2),Integer(1),Integer(4)))
>>> W.degrees()
```

(continues on next page)

(continued from previous page)

```
(2, 4, 6, 8)

>>> W = ReflectionGroup((Integer(4),Integer(1),Integer(4)))
>>> W.degrees()
(4, 8, 12, 16)

>>> W = ReflectionGroup((Integer(4),Integer(2),Integer(4)))
>>> W.degrees()
(4, 8, 8, 12)

>>> W = ReflectionGroup((Integer(4),Integer(4),Integer(4)))
>>> W.degrees()
(4, 4, 8, 12)
```

Examples of reducible types:

```
sage: W = ReflectionGroup((1,1,4), (3,1,2)); W
Reducible complex reflection group of rank 5 and type A3 x G(3,1,2)
sage: W.degrees()
(2, 3, 4, 3, 6)

sage: W = ReflectionGroup((1,1,4), (6,1,12), 23)
sage: W.degrees()
(2, 3, 4, 6, 12, 18, 24, 30, 36, 42, 48, 54, 60, 66, 72, 2, 6, 10)
```

```
>>> from sage.all import *
>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(4)), (Integer(3),
↪Integer(1),Integer(2))); W
Reducible complex reflection group of rank 5 and type A3 x G(3,1,2)
>>> W.degrees()
(2, 3, 4, 3, 6)

>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(4)), (Integer(6),
↪Integer(1),Integer(12)), Integer(23))
>>> W.degrees()
(2, 3, 4, 6, 12, 18, 24, 30, 36, 42, 48, 54, 60, 66, 72, 2, 6, 10)
```

discriminant()

Return the discriminant of `self` in the polynomial ring on which the group acts.

This is the product

$$\prod_H \alpha_H^{e_H},$$

where α_H is the linear form of the hyperplane H and e_H is its stabilizer order.

EXAMPLES:

```
sage: W = ReflectionGroup(['A',2])
sage: W.discriminant()
x0^6 - 3*x0^5*x1 - 3/4*x0^4*x1^2 + 13/2*x0^3*x1^3
 - 3/4*x0^2*x1^4 - 3*x0*x1^5 + x1^6
```

(continues on next page)

(continued from previous page)

```
sage: W = ReflectionGroup(['B',2])
sage: W.discriminant()
x0^6*x1^2 - 6*x0^5*x1^3 + 13*x0^4*x1^4 - 12*x0^3*x1^5 + 4*x0^2*x1^6
```

```
>>> from sage.all import *
>>> W = ReflectionGroup(['A',Integer(2)])
>>> W.discriminant()
x0^6 - 3*x0^5*x1 - 3/4*x0^4*x1^2 + 13/2*x0^3*x1^3
 - 3/4*x0^2*x1^4 - 3*x0*x1^5 + x1^6

>>> W = ReflectionGroup(['B',Integer(2)])
>>> W.discriminant()
x0^6*x1^2 - 6*x0^5*x1^3 + 13*x0^4*x1^4 - 12*x0^3*x1^5 + 4*x0^2*x1^6
```

discriminant_in_invariant_ring(*invariants=None*)

Return the discriminant of `self` in the invariant ring.

This is the function f in the invariants such that $f(F_1(x), \ldots, F_n(x))$ is the discriminant.

EXAMPLES:

```
sage: W = ReflectionGroup(['A',3])
sage: W.discriminant_in_invariant_ring()
6*t0^3*t1^2 - 18*t0^4*t2 + 9*t1^4 - 36*t0*t1^2*t2 + 24*t0^2*t2^2 - 8*t2^3

sage: W = ReflectionGroup(['B',3])
sage: W.discriminant_in_invariant_ring()
-t0^2*t1^2*t2 + 16*t0^3*t2^2 + 2*t1^3*t2 - 36*t0*t1*t2^2 + 108*t2^3

sage: W = ReflectionGroup(['H',3])
sage: W.discriminant_in_invariant_ring()     # long time

```

distinguished_reflection(*i*)

Return the `i`-th distinguished reflection of `self`.

These are the reflections in `self` acting on the complement of the fixed hyperplane H as $\exp(2\pi i/n)$, where n is the order of the reflection subgroup fixing H.

EXAMPLES:

```
sage: W = ReflectionGroup((1,1,3))
sage: W.distinguished_reflection(1)
(1,4)(2,3)(5,6)
sage: W.distinguished_reflection(2)
(1,3)(2,5)(4,6)
sage: W.distinguished_reflection(3)
(1,5)(2,4)(3,6)
```

(continues on next page)

(continued from previous page)

```
sage: W = ReflectionGroup((3,1,1),hyperplane_index_set=['a'])
sage: W.distinguished_reflection('a')
(1,2,3)

sage: W = ReflectionGroup((1,1,3),(3,1,2))
sage: for i in range(W.number_of_reflection_hyperplanes()):
....:     W.distinguished_reflection(i+1)
(1,6)(2,5)(7,8)
(1,5)(2,7)(6,8)
(3,9,15)(4,10,16)(12,17,23)(14,18,24)(20,25,29)(21,22,26)(27,28,30)

→28)
```

distinguished_reflections()

Return a finite family containing the distinguished reflections of `self` indexed by *hyperplane_index_set()*.

These are the reflections in `self` acting on the complement of the fixed hyperplane H as $\exp(2\pi i/n)$, where n is the order of the reflection subgroup fixing H.

EXAMPLES:

```
sage: W = ReflectionGroup((1,1,3))
sage: W.distinguished_reflections()
Finite family {1: (1,4)(2,3)(5,6), 2: (1,3)(2,5)(4,6), 3: (1,5)(2,4)(3,6)}

sage: W = ReflectionGroup((1,1,3),hyperplane_index_set=['a','b','c'])
sage: W.distinguished_reflections()
Finite family {'a': (1,4)(2,3)(5,6), 'b': (1,3)(2,5)(4,6), 'c': (1,5)(2,4)(3,
→6)}

sage: W = ReflectionGroup((3,1,1))
sage: W.distinguished_reflections()
Finite family {1: (1,2,3)}

sage: W = ReflectionGroup((1,1,3),(3,1,2))
sage: W.distinguished_reflections()
Finite family {1: (1,6)(2,5)(7,8), 2: (1,5)(2,7)(6,8),
 3: (3,9,15)(4,10,16)(12,17,23)(14,18,24)(20,25,29)(21,22,26)(27,28,30),
 4: (3,11)(4,12)(9,13)(10,14)(15,19)(16,20)(17,21)(18,22)(23,27)(24,28)(25,
→26)(29,30),
 5: (1,7)(2,6)(5,8),
 6: (3,19)(4,25)(9,11)(10,17)(12,28)(13,15)(14,30)(16,18)(20,27)(21,29)(22,
→23)(24,26),
 7: (4,21,27)(10,22,28)(11,13,19)(12,14,20)(16,26,30)(17,18,25)(23,24,29),
 8: (3,13)(4,24)(9,19)(10,29)(11,15)(12,26)(14,21)(16,23)(17,30)(18,27)(20,
→22)(25,28)}
```

```
>>> from sage.all import *
>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(3)))
>>> W.distinguished_reflections()
Finite family {1: (1,4)(2,3)(5,6), 2: (1,3)(2,5)(4,6), 3: (1,5)(2,4)(3,6)}

→set=['a','b','c'])
>>> W.distinguished_reflections()
Finite family {'a': (1,4)(2,3)(5,6), 'b': (1,3)(2,5)(4,6), 'c': (1,5)(2,4)(3,
→6)}

>>> W = ReflectionGroup((Integer(3),Integer(1),Integer(1)))
>>> W.distinguished_reflections()
Finite family {1: (1,2,3)}

>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(3)),(Integer(3),
→Integer(1),Integer(2)))
>>> W.distinguished_reflections()
Finite family {1: (1,6)(2,5)(7,8), 2: (1,5)(2,7)(6,8),
 3: (3,9,15)(4,10,16)(12,17,23)(14,18,24)(20,25,29)(21,22,26)(27,28,30),
 4: (3,11)(4,12)(9,13)(10,14)(15,19)(16,20)(17,21)(18,22)(23,27)(24,28)(25,
→26)(29,30),
 5: (1,7)(2,6)(5,8),
```

(continues on next page)

(continued from previous page)

```
 6: (3,19)(4,25)(9,11)(10,17)(12,28)(13,15)(14,30)(16,18)(20,27)(21,29)(22,
↪23)(24,26),
 7: (4,21,27)(10,22,28)(11,13,19)(12,14,20)(16,26,30)(17,18,25)(23,24,29),
 8: (3,13)(4,24)(9,19)(10,29)(11,15)(12,26)(14,21)(16,23)(17,30)(18,27)(20,
↪22)(25,28)}
```

fake_degrees()

Return the list of the fake degrees associated to `self`.

The fake degrees are q-versions of the degree of the character. In particular, they sum to Hilbert series of the coinvariant algebra of `self`.

Note

The ordering follows the one in Chevie and is not compatible with the current implementation of `irredubile_characters()`.

EXAMPLES:

```
sage: W = ReflectionGroup(12)
sage: W.fake_degrees()
[1, q^12, q^11 + q, q^8 + q^4, q^7 + q^5, q^6 + q^4 + q^2,
 q^10 + q^8 + q^6, q^9 + q^7 + q^5 + q^3]

sage: W = ReflectionGroup(["H",4])
sage: W.cardinality()
14400
sage: sum(fdeg.subs(q=1)**2 for fdeg in W.fake_degrees())
14400
```

```
>>> from sage.all import *
>>> W = ReflectionGroup(Integer(12))
>>> W.fake_degrees()
[1, q^12, q^11 + q, q^8 + q^4, q^7 + q^5, q^6 + q^4 + q^2,
 q^10 + q^8 + q^6, q^9 + q^7 + q^5 + q^3]

>>> W = ReflectionGroup(["H",Integer(4)])
>>> W.cardinality()
14400
>>> sum(fdeg.subs(q=Integer(1))**Integer(2) for fdeg in W.fake_degrees())
14400
```

fundamental_invariants()

Return the fundamental invariants of `self`.

EXAMPLES:

```
sage: W = ReflectionGroup((1,1,3))
sage: W.fundamental_invariants()
(-2*x0^2 + 2*x0*x1 - 2*x1^2, 6*x0^2*x1 - 6*x0*x1^2)

sage: W = ReflectionGroup((3,1,2))
```

(continues on next page)

(continued from previous page)

```
sage: W.fundamental_invariants()
(x0^3 + x1^3, x0^3*x1^3)
```

```
>>> from sage.all import *
>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(3)))
>>> W.fundamental_invariants()
(-2*x0^2 + 2*x0*x1 - 2*x1^2, 6*x0^2*x1 - 6*x0*x1^2)

>>> W = ReflectionGroup((Integer(3),Integer(1),Integer(2)))
>>> W.fundamental_invariants()
(x0^3 + x1^3, x0^3*x1^3)
```

hyperplane_index_set()

Return the index set of the hyperplanes of `self`.

EXAMPLES:

```
sage: W = ReflectionGroup((1,1,4))
sage: W.hyperplane_index_set()
(1, 2, 3, 4, 5, 6)
sage: W = ReflectionGroup((1,1,4), hyperplane_index_set=[1,3,'asdf',7,9,11])
sage: W.hyperplane_index_set()
(1, 3, 'asdf', 7, 9, 11)
sage: W = ReflectionGroup((1,1,4),hyperplane_index_set=('a','b','c','d','e','f
→'))
sage: W.hyperplane_index_set()
('a', 'b', 'c', 'd', 'e', 'f')
```

```
>>> from sage.all import *
>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(4)))
>>> W.hyperplane_index_set()
(1, 2, 3, 4, 5, 6)
>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(4)), hyperplane_index_
→set=[Integer(1),Integer(3),'asdf',Integer(7),Integer(9),Integer(11)])
>>> W.hyperplane_index_set()
(1, 3, 'asdf', 7, 9, 11)
>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(4)),hyperplane_index_
→set=('a','b','c','d','e','f'))
>>> W.hyperplane_index_set()
('a', 'b', 'c', 'd', 'e', 'f')
```

independent_roots()

Return a collection of simple roots generating the underlying vector space of `self`.

For well-generated groups, these are all simple roots. Otherwise, a linearly independent subset of the simple roots is chosen.

EXAMPLES:

```
sage: W = ReflectionGroup((1,1,3))
sage: W.independent_roots()
Finite family {1: (1, 0), 2: (0, 1)}
```

(continues on next page)

(continued from previous page)

```
sage: W = ReflectionGroup((4,2,3))
sage: W.simple_roots()
Finite family {1: (1, 0, 0), 2: (-E(4), 1, 0), 3: (-1, 1, 0), 4: (0, -1, 1)}
sage: W.independent_roots()
Finite family {1: (1, 0, 0), 2: (-E(4), 1, 0), 4: (0, -1, 1)}
```

```
>>> from sage.all import *
>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(3)))
>>> W.independent_roots()
Finite family {1: (1, 0), 2: (0, 1)}

>>> W = ReflectionGroup((Integer(4),Integer(2),Integer(3)))
>>> W.simple_roots()
Finite family {1: (1, 0, 0), 2: (-E(4), 1, 0), 3: (-1, 1, 0), 4: (0, -1, 1)}
>>> W.independent_roots()
Finite family {1: (1, 0, 0), 2: (-E(4), 1, 0), 4: (0, -1, 1)}
```

index_set()

Return the index set of the simple reflections of `self`.

EXAMPLES:

```
sage: W = ReflectionGroup((1,1,4))
sage: W.index_set()
(1, 2, 3)
sage: W = ReflectionGroup((1,1,4), index_set=[1,3,'asdf'])
sage: W.index_set()
(1, 3, 'asdf')
sage: W = ReflectionGroup((1,1,4), index_set=('a', 'b', 'c'))
sage: W.index_set()
('a', 'b', 'c')
```

```
>>> from sage.all import *
>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(4)))
>>> W.index_set()
(1, 2, 3)
>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(4)), index_
↪set=[Integer(1),Integer(3),'asdf'])
>>> W.index_set()
(1, 3, 'asdf')
>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(4)), index_set=('a', 'b
↪', 'c'))
>>> W.index_set()
('a', 'b', 'c')
```

invariant_form(*brute_force=False*)

Return the form that is invariant under the action of `self`.

This is unique only up to a global scalar on the irreducible components.

INPUT:

- `brute_force` – if `True`, the computation is done by applying the Reynolds operator; this is, the invariant form of e_i and e_j is computed as the sum $\langle w(e_i), w(e_j)\rangle$, where $\langle\cdot,\cdot\rangle$ is the standard scalar product

EXAMPLES:

```
sage: W = ReflectionGroup(['A',3])
sage: F = W.invariant_form(); F
[   1 -1/2    0]
[-1/2    1 -1/2]
[   0 -1/2    1]
```

```
>>> from sage.all import *
>>> W = ReflectionGroup(['A',Integer(3)])
>>> F = W.invariant_form(); F
[   1 -1/2    0]
[-1/2    1 -1/2]
[   0 -1/2    1]
```

To check that this is indeed the invariant form, see:

```
sage: S = W.simple_reflections()
sage: all( F == S[i].matrix()*F*S[i].matrix().transpose() for i in W.index_
↪set() )
True

sage: W = ReflectionGroup(['B',3])
sage: F = W.invariant_form(); F
[ 1 -1  0]
[-1  2 -1]
[ 0 -1  2]
sage: w = W.an_element().to_matrix()
sage: w * F * w.transpose().conjugate() == F
True

sage: S = W.simple_reflections()
sage: all( F == S[i].matrix()*F*S[i].matrix().transpose() for i in W.index_
↪set() )
True

sage: W = ReflectionGroup((3,1,2))
sage: F = W.invariant_form(); F
[1 0]
[0 1]

sage: S = W.simple_reflections()
sage: all( F == S[i].matrix()*F*S[i].matrix().transpose().conjugate() for i␣
↪in W.index_set() )
True
```

```
>>> from sage.all import *
>>> S = W.simple_reflections()
>>> all( F == S[i].matrix()*F*S[i].matrix().transpose() for i in W.index_
↪set() )
True
```

(continues on next page)

(continued from previous page)

```
>>> W = ReflectionGroup(['B',Integer(3)])
>>> F = W.invariant_form(); F
[ 1 -1  0]
[-1  2 -1]
[ 0 -1  2]
>>> w = W.an_element().to_matrix()
>>> w * F * w.transpose().conjugate() == F
True

>>> S = W.simple_reflections()
>>> all( F == S[i].matrix()*F*S[i].matrix().transpose() for i in W.index_
↪set() )
True

>>> W = ReflectionGroup((Integer(3),Integer(1),Integer(2)))
>>> F = W.invariant_form(); F
[1 0]
[0 1]

>>> S = W.simple_reflections()
>>> all( F == S[i].matrix()*F*S[i].matrix().transpose().conjugate() for i in␣
↪W.index_set() )
True
```

It also worked for badly generated groups:

```
sage: W = ReflectionGroup(7)
sage: W.is_well_generated()
False

sage: F = W.invariant_form(); F
[1 0]
[0 1]
sage: S = W.simple_reflections()
sage: all( F == S[i].matrix()*F*S[i].matrix().transpose().conjugate() for i␣
↪in W.index_set() )
True
```

```
>>> from sage.all import *
>>> W = ReflectionGroup(Integer(7))
>>> W.is_well_generated()
False

>>> F = W.invariant_form(); F
[1 0]
[0 1]
>>> S = W.simple_reflections()
>>> all( F == S[i].matrix()*F*S[i].matrix().transpose().conjugate() for i in␣
↪W.index_set() )
True
```

And also for reducible types:

```
sage: W = ReflectionGroup(['B',3],(4,2,3),4,7); W
Reducible complex reflection group of rank 10 and type B3 x G(4,2,3) x ST4 x␣
↪ST7
sage: F = W.invariant_form(); S = W.simple_reflections()
sage: all( F == S[i].matrix()*F*S[i].matrix().transpose().conjugate() for i␣
↪in W.index_set() )
True
```

```
>>> from sage.all import *
>>> W = ReflectionGroup(['B',Integer(3)],(Integer(4),Integer(2),Integer(3)),
↪Integer(4),Integer(7)); W
Reducible complex reflection group of rank 10 and type B3 x G(4,2,3) x ST4 x␣
↪ST7
>>> F = W.invariant_form(); S = W.simple_reflections()
>>> all( F == S[i].matrix()*F*S[i].matrix().transpose().conjugate() for i in␣
↪W.index_set() )
True
```

invariant_form_standardization()

Return the transformation of the space that turns the invariant form of `self` into the standard scalar product.

Let I be the invariant form of a complex reflection group, and let A be the Hermitian matrix such that $A^2 = I$. The matrix A defines a change of basis such that the identity matrix is the invariant form. Indeed, we have

$$(A^{-1}xA)\mathcal{I}(A^{-1}yA)^* = A^{-1}xIy^*A^{-1} = A^{-1}IA^{-1} = \mathcal{I},$$

where $\mathcal{I}$ is the identity matrix.

EXAMPLES:

```
sage: W = ReflectionGroup((4,2,5))
sage: I = W.invariant_form()
sage: A = W.invariant_form_standardization()
sage: A^2 == I
True
```

```
>>> from sage.all import *
>>> W = ReflectionGroup((Integer(4),Integer(2),Integer(5)))
>>> I = W.invariant_form()
>>> A = W.invariant_form_standardization()
>>> A**Integer(2) == I
True
```

irreducible_components()

Return a list containing the irreducible components of `self` as finite reflection groups.

EXAMPLES:

```
sage: W = ReflectionGroup((1,1,3))
sage: W.irreducible_components()
[Irreducible real reflection group of rank 2 and type A2]

sage: W = ReflectionGroup((1,1,3),(2,1,3))
sage: W.irreducible_components()
```

(continues on next page)

(continued from previous page)

```
[Irreducible real reflection group of rank 2 and type A2,
Irreducible real reflection group of rank 3 and type B3]
```

```
>>> from sage.all import *
>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(3)))
>>> W.irreducible_components()
[Irreducible real reflection group of rank 2 and type A2]

>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(3)),(Integer(2),
↪Integer(1),Integer(3)))
>>> W.irreducible_components()
[Irreducible real reflection group of rank 2 and type A2,
Irreducible real reflection group of rank 3 and type B3]
```

is_crystallographic()

Return `True` if `self` is crystallographic.

This is, if the field of definition is the rational field.

Todo

Make this more robust and do not use the matrix representation of the simple reflections.

EXAMPLES:

```
sage: W = ReflectionGroup((1,1,3)); W
Irreducible real reflection group of rank 2 and type A2
sage: W.is_crystallographic()
True

sage: W = ReflectionGroup((2,1,3)); W
Irreducible real reflection group of rank 3 and type B3
sage: W.is_crystallographic()
True

sage: W = ReflectionGroup(23); W
Irreducible real reflection group of rank 3 and type H3
sage: W.is_crystallographic()
False

sage: W = ReflectionGroup((3,1,3)); W
Irreducible complex reflection group of rank 3 and type G(3,1,3)
sage: W.is_crystallographic()
False

sage: W = ReflectionGroup((4,2,2)); W
Irreducible complex reflection group of rank 2 and type G(4,2,2)
sage: W.is_crystallographic()
False
```

```
>>> from sage.all import *
>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(3))); W
Irreducible real reflection group of rank 2 and type A2
>>> W.is_crystallographic()
True

>>> W = ReflectionGroup((Integer(2),Integer(1),Integer(3))); W
Irreducible real reflection group of rank 3 and type B3
>>> W.is_crystallographic()
True

>>> W = ReflectionGroup(Integer(23)); W
Irreducible real reflection group of rank 3 and type H3
>>> W.is_crystallographic()
False

>>> W = ReflectionGroup((Integer(3),Integer(1),Integer(3))); W
Irreducible complex reflection group of rank 3 and type G(3,1,3)
>>> W.is_crystallographic()
False

>>> W = ReflectionGroup((Integer(4),Integer(2),Integer(2))); W
Irreducible complex reflection group of rank 2 and type G(4,2,2)
>>> W.is_crystallographic()
False
```

iteration_tracking_words()

Return an iterator going through all elements in `self` that tracks the reduced expressions.

This can be much slower than using the iteration as a permutation group with strong generating set.

EXAMPLES:

```
sage: W = ReflectionGroup((1,1,3))
sage: for w in W.iteration_tracking_words(): w
()
(1,4)(2,3)(5,6)
(1,3)(2,5)(4,6)
(1,6,2)(3,5,4)
(1,2,6)(3,4,5)
(1,5)(2,4)(3,6)
```

```
>>> from sage.all import *
>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(3)))
>>> for w in W.iteration_tracking_words(): w
()
(1,4)(2,3)(5,6)
(1,3)(2,5)(4,6)
(1,6,2)(3,5,4)
(1,2,6)(3,4,5)
(1,5)(2,4)(3,6)
```

jacobian_of_fundamental_invariants(*invs=None*)

Return the matrix $[\partial_{x_i} F_j]$, where `invs` are are any polynomials $F_1, \ldots, F_n$ in $x_1, \ldots, x_n$.

INPUT:

- `invs` – (default: the fundamental invariants) the polynomials $F_1, \ldots, F_n$

EXAMPLES:

```
sage: W = ReflectionGroup(['A',2])
sage: W.fundamental_invariants()
(-2*x0^2 + 2*x0*x1 - 2*x1^2, 6*x0^2*x1 - 6*x0*x1^2)

sage: W.jacobian_of_fundamental_invariants()
[     -4*x0 + 2*x1       2*x0 - 4*x1]
[12*x0*x1 - 6*x1^2 6*x0^2 - 12*x0*x1]
```

```
>>> from sage.all import *
>>> W = ReflectionGroup(['A',Integer(2)])
>>> W.fundamental_invariants()
(-2*x0^2 + 2*x0*x1 - 2*x1^2, 6*x0^2*x1 - 6*x0*x1^2)

>>> W.jacobian_of_fundamental_invariants()
[     -4*x0 + 2*x1       2*x0 - 4*x1]
[12*x0*x1 - 6*x1^2 6*x0^2 - 12*x0*x1]
```

number_of_irreducible_components()

Return the number of irreducible components of `self`.

EXAMPLES:

```
sage: W = ReflectionGroup((1,1,3))
sage: W.number_of_irreducible_components()
1

sage: W = ReflectionGroup((1,1,3),(2,1,3))
sage: W.number_of_irreducible_components()
2
```

```
>>> from sage.all import *
>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(3)))
>>> W.number_of_irreducible_components()
1

>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(3)),(Integer(2),
↪Integer(1),Integer(3)))
>>> W.number_of_irreducible_components()
2
```

primitive_vector_field(*invs=None*)

Return the primitive vector field of `self` is irreducible and well-generated.

The primitive vector field is given as the coefficients (being rational functions) in the basis $\partial_{x_1}, \ldots, \partial_{x_n}$.

This is the partial derivation along the unique invariant of degree given by the Coxeter number. It can be computed as the row of the inverse of the Jacobian given by the highest degree.

EXAMPLES:

```
sage: W = ReflectionGroup(['A',2])
sage: W.primitive_vector_field()
(3*x1/(6*x0^2 - 6*x0*x1 - 12*x1^2), 1/(6*x0^2 - 6*x0*x1 - 12*x1^2))
```

```
>>> from sage.all import *
>>> W = ReflectionGroup(['A',Integer(2)])
>>> W.primitive_vector_field()
(3*x1/(6*x0^2 - 6*x0*x1 - 12*x1^2), 1/(6*x0^2 - 6*x0*x1 - 12*x1^2))
```

rank()

Return the rank of `self`.

This is the dimension of the underlying vector space.

EXAMPLES:

```
sage: W = ReflectionGroup((1,1,3))
sage: W.rank()
2
sage: W = ReflectionGroup((2,1,3))
sage: W.rank()
3
sage: W = ReflectionGroup((4,1,3))
sage: W.rank()
3
sage: W = ReflectionGroup((4,2,3))
sage: W.rank()
3
```

```
>>> from sage.all import *
>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(3)))
>>> W.rank()
2
>>> W = ReflectionGroup((Integer(2),Integer(1),Integer(3)))
>>> W.rank()
3
>>> W = ReflectionGroup((Integer(4),Integer(1),Integer(3)))
>>> W.rank()
3
>>> W = ReflectionGroup((Integer(4),Integer(2),Integer(3)))
>>> W.rank()
3
```

reflection(*i*)

Return the `i`-th reflection of `self`.

EXAMPLES:

```
sage: W = ReflectionGroup((1,1,3))
sage: W.reflection(1)
(1,4)(2,3)(5,6)
sage: W.reflection(2)
(1,3)(2,5)(4,6)
sage: W.reflection(3)
```

(continues on next page)

(continued from previous page)

```
(1,5)(2,4)(3,6)

sage: W = ReflectionGroup((3,1,1),reflection_index_set=['a','b'])
sage: W.reflection('a')
(1,2,3)
sage: W.reflection('b')
(1,3,2)
```

```
>>> from sage.all import *
>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(3)))
>>> W.reflection(Integer(1))
(1,4)(2,3)(5,6)
>>> W.reflection(Integer(2))
(1,3)(2,5)(4,6)
>>> W.reflection(Integer(3))
(1,5)(2,4)(3,6)

>>> W = ReflectionGroup((Integer(3),Integer(1),Integer(1)),reflection_index_
↪set=['a','b'])
>>> W.reflection('a')
(1,2,3)
>>> W.reflection('b')
(1,3,2)
```

reflection_character()

Return the reflection characters of `self`.

EXAMPLES:

```
sage: W = ReflectionGroup((1,1,3))
sage: W.reflection_character()
[2, 0, -1]
```

```
>>> from sage.all import *
>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(3)))
>>> W.reflection_character()
[2, 0, -1]
```

reflection_eigenvalues(*w*, *is_class_representative=False*)

Return the reflection eigenvalue of `w` in `self`.

INPUT:

- `is_class_representative` – boolean (default: `True`) whether to compute instead on the conjugacy class representative

See also

reflection_eigenvalues_family()

EXAMPLES:

```
sage: W = ReflectionGroup((1,1,3))
sage: for w in W:
....:     print('%s %s'%(w.reduced_word(), W.reflection_eigenvalues(w)))
[] [0, 0]
[2] [1/2, 0]
[1] [1/2, 0]
[1, 2] [1/3, 2/3]
[2, 1] [1/3, 2/3]
[1, 2, 1] [1/2, 0]
```

```
>>> from sage.all import *
>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(3)))
>>> for w in W:
...     print('%s %s'%(w.reduced_word(), W.reflection_eigenvalues(w)))
[] [0, 0]
[2] [1/2, 0]
[1] [1/2, 0]
[1, 2] [1/3, 2/3]
[2, 1] [1/3, 2/3]
[1, 2, 1] [1/2, 0]
```

reflection_eigenvalues_family()

Return the reflection eigenvalues of `self` as a finite family indexed by the class representatives of `self`.

OUTPUT: list with entries k/n representing the eigenvalue ζ_n^k

EXAMPLES:

```
sage: W = ReflectionGroup((1,1,3))
sage: W.reflection_eigenvalues_family()
Finite family {(): [0, 0], (1,4)(2,3)(5,6): [1/2, 0], (1,6,2)(3,5,4): [1/3, 2/
↪3]}

sage: W = ReflectionGroup((3,1,2))
sage: reflection_eigenvalues = W.reflection_eigenvalues_family()
sage: for elt in sorted(reflection_eigenvalues.keys()):
....:     print('%s %s'%(elt, reflection_eigenvalues[elt]))
() [0, 0]
(1,3,9)(2,4,10)(6,11,17)(8,12,18)(14,19,23)(15,16,20)(21,22,24) [1/3, 0]

↪28,12) [3/10, 1/2, 7/10]
```

reflection_hyperplane(*i*, *as_linear_functional=False*, *with_order=False*)

Return the `i`-th reflection hyperplane of `self`.

The `i`-th reflection hyperplane corresponds to the `i` distinguished reflection.

INPUT:

- `i` – an index in the index set
- `as_linear_functionals` – boolean (default: `False`); whether to return the hyperplane or its linear functional in the basis dual to the given root basis

EXAMPLES:

```
sage: W = ReflectionGroup((2,1,2))
sage: W.reflection_hyperplane(3)
Vector space of degree 2 and dimension 1 over Rational Field
Basis matrix:
[1 0]
```

```
>>> from sage.all import *
>>> W = ReflectionGroup((Integer(2),Integer(1),Integer(2)))
>>> W.reflection_hyperplane(Integer(3))
Vector space of degree 2 and dimension 1 over Rational Field
Basis matrix:
[1 0]
```

One can ask for the result as a linear form:

```
sage: W.reflection_hyperplane(3, True)
(0, 1)
```

```
>>> from sage.all import *
>>> W.reflection_hyperplane(Integer(3), True)
(0, 1)
```

reflection_hyperplanes(*as_linear_functionals=False*, *with_order=False*)

Return the list of all reflection hyperplanes of `self`, either as a codimension 1 space, or as its linear functional.

INPUT:

- `as_linear_functionals` – boolean (default: `False`); whether to return the hyperplane or its linear functional in the basis dual to the given root basis

EXAMPLES:

```
sage: W = ReflectionGroup((1,1,3))
sage: for H in W.reflection_hyperplanes(): H
Vector space of degree 2 and dimension 1 over Rational Field
Basis matrix:
[1 2]
Vector space of degree 2 and dimension 1 over Rational Field
Basis matrix:
[  1 1/2]
Vector space of degree 2 and dimension 1 over Rational Field
Basis matrix:
[ 1 -1]

sage: for H in W.reflection_hyperplanes(as_linear_functionals=True): H
(1, -1/2)
(1, -2)
(1, 1)

sage: W = ReflectionGroup((2,1,2))
sage: for H in W.reflection_hyperplanes(): H
Vector space of degree 2 and dimension 1 over Rational Field
Basis matrix:
[1 1]
Vector space of degree 2 and dimension 1 over Rational Field
Basis matrix:
[  1 1/2]
Vector space of degree 2 and dimension 1 over Rational Field
Basis matrix:
[1 0]
Vector space of degree 2 and dimension 1 over Rational Field
Basis matrix:
[0 1]

sage: for H in W.reflection_hyperplanes(as_linear_functionals=True): H
(1, -1)
(1, -2)
(0, 1)
(1, 0)

sage: for H in W.reflection_hyperplanes(as_linear_functionals=True, with_
↪order=True): H
((1, -1), 2)
((1, -2), 2)
((0, 1), 2)
((1, 0), 2)
```

```
>>> from sage.all import *
>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(3)))
>>> for H in W.reflection_hyperplanes(): H
Vector space of degree 2 and dimension 1 over Rational Field
Basis matrix:
[1 2]
Vector space of degree 2 and dimension 1 over Rational Field
Basis matrix:
[  1 1/2]
Vector space of degree 2 and dimension 1 over Rational Field
Basis matrix:
[ 1 -1]

>>> for H in W.reflection_hyperplanes(as_linear_functionals=True): H
(1, -1/2)
(1, -2)
(1, 1)

>>> W = ReflectionGroup((Integer(2),Integer(1),Integer(2)))
>>> for H in W.reflection_hyperplanes(): H
Vector space of degree 2 and dimension 1 over Rational Field
Basis matrix:
[1 1]
Vector space of degree 2 and dimension 1 over Rational Field
Basis matrix:
[  1 1/2]
Vector space of degree 2 and dimension 1 over Rational Field
Basis matrix:
[1 0]
Vector space of degree 2 and dimension 1 over Rational Field
Basis matrix:
[0 1]

>>> for H in W.reflection_hyperplanes(as_linear_functionals=True): H
(1, -1)
(1, -2)
(0, 1)
(1, 0)

>>> for H in W.reflection_hyperplanes(as_linear_functionals=True, with_
→order=True): H
((1, -1), 2)
((1, -2), 2)
((0, 1), 2)
((1, 0), 2)
```

reflection_index_set()

Return the index set of the reflections of `self`.

EXAMPLES:

```
sage: W = ReflectionGroup((1,1,4))
```

(continues on next page)

(continued from previous page)

```
sage: W.reflection_index_set()
(1, 2, 3, 4, 5, 6)
sage: W = ReflectionGroup((1,1,4), reflection_index_set=[1,3,'asdf',7,9,11])
sage: W.reflection_index_set()
(1, 3, 'asdf', 7, 9, 11)
sage: W = ReflectionGroup((1,1,4), reflection_index_set=('a','b','c','d','e',
↪'f'))
sage: W.reflection_index_set()
('a', 'b', 'c', 'd', 'e', 'f')
```

```
>>> from sage.all import *
>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(4)))
>>> W.reflection_index_set()
(1, 2, 3, 4, 5, 6)
>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(4)), reflection_index_
↪set=[Integer(1),Integer(3),'asdf',Integer(7),Integer(9),Integer(11)])
>>> W.reflection_index_set()
(1, 3, 'asdf', 7, 9, 11)
>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(4)), reflection_index_
↪set=('a','b','c','d','e','f'))
>>> W.reflection_index_set()
('a', 'b', 'c', 'd', 'e', 'f')
```

reflections()

Return a finite family containing the reflections of `self`, indexed by `self.reflection_index_set()`.

EXAMPLES:

```
sage: W = ReflectionGroup((1,1,3))
sage: W.reflections()
Finite family {1: (1,4)(2,3)(5,6), 2: (1,3)(2,5)(4,6), 3: (1,5)(2,4)(3,6)}

sage: W = ReflectionGroup((1,1,3),reflection_index_set=['a','b','c'])
sage: W.reflections()
Finite family {'a': (1,4)(2,3)(5,6), 'b': (1,3)(2,5)(4,6), 'c': (1,5)(2,4)(3,
↪6)}

sage: W = ReflectionGroup((3,1,1))
sage: W.reflections()
Finite family {1: (1,2,3), 2: (1,3,2)}

sage: W = ReflectionGroup((1,1,3),(3,1,2))
sage: W.reflections()
Finite family {1: (1,6)(2,5)(7,8), 2: (1,5)(2,7)(6,8),
               3: (3,9,15)(4,10,16)(12,17,23)(14,18,24)(20,25,29)(21,22,
↪26)(27,28,30),
               4: (3,11)(4,12)(9,13)(10,14)(15,19)(16,20)(17,21)(18,22)(23,
↪27)(24,28)(25,26)(29,30),
               5: (1,7)(2,6)(5,8),
               6: (3,19)(4,25)(9,11)(10,17)(12,28)(13,15)(14,30)(16,18)(20,
↪27)(21,29)(22,23)(24,26),
               7: (4,21,27)(10,22,28)(11,13,19)(12,14,20)(16,26,30)(17,18,
```

(continues on next page)

(continued from previous page)

```
↪25)(23,24,29),
                 8: (3,13)(4,24)(9,19)(10,29)(11,15)(12,26)(14,21)(16,23)(17,
↪30)(18,27)(20,22)(25,28),
                 9: (3,15,9)(4,16,10)(12,23,17)(14,24,18)(20,29,25)(21,26,
↪22)(27,30,28),
                 10: (4,27,21)(10,28,22)(11,19,13)(12,20,14)(16,30,26)(17,25,
↪18)(23,29,24)}
```

```
>>> from sage.all import *
>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(3)))
>>> W.reflections()
Finite family {1: (1,4)(2,3)(5,6), 2: (1,3)(2,5)(4,6), 3: (1,5)(2,4)(3,6)}

>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(3)),reflection_index_
↪set=['a','b','c'])
>>> W.reflections()
Finite family {'a': (1,4)(2,3)(5,6), 'b': (1,3)(2,5)(4,6), 'c': (1,5)(2,4)(3,
↪6)}

>>> W = ReflectionGroup((Integer(3),Integer(1),Integer(1)))
>>> W.reflections()
Finite family {1: (1,2,3), 2: (1,3,2)}

>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(3)),(Integer(3),
↪Integer(1),Integer(2)))
>>> W.reflections()
Finite family {1: (1,6)(2,5)(7,8), 2: (1,5)(2,7)(6,8),
                 3: (3,9,15)(4,10,16)(12,17,23)(14,18,24)(20,25,29)(21,22,
↪26)(27,28,30),
                 4: (3,11)(4,12)(9,13)(10,14)(15,19)(16,20)(17,21)(18,22)(23,
↪27)(24,28)(25,26)(29,30),
                 5: (1,7)(2,6)(5,8),
                 6: (3,19)(4,25)(9,11)(10,17)(12,28)(13,15)(14,30)(16,18)(20,
↪27)(21,29)(22,23)(24,26),
                 7: (4,21,27)(10,22,28)(11,13,19)(12,14,20)(16,26,30)(17,18,
↪25)(23,24,29),
                 8: (3,13)(4,24)(9,19)(10,29)(11,15)(12,26)(14,21)(16,23)(17,
↪30)(18,27)(20,22)(25,28),
                 9: (3,15,9)(4,16,10)(12,23,17)(14,24,18)(20,29,25)(21,26,
↪22)(27,30,28),
                 10: (4,27,21)(10,28,22)(11,19,13)(12,20,14)(16,30,26)(17,25,
↪18)(23,29,24)}
```

roots()

Return all roots corresponding to all reflections of `self`.

EXAMPLES:

```
sage: W = ReflectionGroup((1,1,3))
sage: W.roots()
[(1, 0), (0, 1), (1, 1), (-1, 0), (0, -1), (-1, -1)]
```

(continues on next page)

(continued from previous page)

```
sage: W = ReflectionGroup((3,1,2))
sage: W.roots()
[(1, 0), (-1, 1), (E(3), 0), (-E(3), 1), (0, 1), (1, -1),
 (0, E(3)), (1, -E(3)), (E(3)^2, 0), (-E(3)^2, 1),
 (E(3), -1), (E(3), -E(3)), (0, E(3)^2), (1, -E(3)^2),
 (-1, E(3)), (-E(3), E(3)), (E(3)^2, -1), (E(3)^2, -E(3)),
 (E(3), -E(3)^2), (-E(3)^2, E(3)), (-1, E(3)^2),
 (-E(3), E(3)^2), (E(3)^2, -E(3)^2), (-E(3)^2, E(3)^2)]

sage: W = ReflectionGroup((4,2,2))
sage: W.roots()
[(1, 0), (-E(4), 1), (-1, 1), (-1, 0), (E(4), 1), (1, 1),
 (0, -E(4)), (E(4), -1), (E(4), E(4)), (0, E(4)),
 (E(4), -E(4)), (0, 1), (1, -E(4)), (1, -1), (0, -1),
 (1, E(4)), (-E(4), 0), (-1, E(4)), (E(4), 0), (-E(4), E(4)),
 (-E(4), -1), (-E(4), -E(4)), (-1, -E(4)), (-1, -1)]

sage: W = ReflectionGroup((1,1,4), (3,1,2))
sage: W.roots()
[(1, 0, 0, 0, 0), (0, 1, 0, 0, 0), (0, 0, 1, 0, 0),

 (0, 0, 0, -E(3), E(3)^2), (0, 0, 0, E(3)^2, -E(3)^2),
 (0, 0, 0, -E(3)^2, E(3)^2)]
```

series()

Return the series of the classification type to which `self` belongs.

For real reflection groups, these are the Cartan-Killing classification types "A","B","C","D","E","F","G","H","I", and for complx non-real reflection groups these are the Shephard-Todd classification type "ST".

EXAMPLES:

```
sage: ReflectionGroup((1,1,3)).series()
['A']
sage: ReflectionGroup((3,1,3)).series()
['ST']
```

```
>>> from sage.all import *
>>> ReflectionGroup((Integer(1),Integer(1),Integer(3))).series()
['A']
>>> ReflectionGroup((Integer(3),Integer(1),Integer(3))).series()
['ST']
```

set_reflection_representation(*refl_repr=None*)

Set the reflection representation of `self`.

INPUT:

- `refl_repr` – dictionary representing the matrices of the generators of `self` with keys given by the index set, or `None` to reset to the default reflection representation

EXAMPLES:

```
sage: W = ReflectionGroup((1,1,3))
sage: for w in W: w.to_matrix(); print("-----")
```

>>> W.set_reflection_representation()
```

simple_coroot(*i*)

Return the simple root with index `i`.

EXAMPLES:

```
sage: W = ReflectionGroup(['A',3])
sage: W.simple_coroot(1)
(2, -1, 0)
```

```
>>> from sage.all import *
>>> W = ReflectionGroup(['A',Integer(3)])
>>> W.simple_coroot(Integer(1))
(2, -1, 0)
```

simple_coroots()

Return the simple coroots of `self`.

These are the coroots corresponding to the simple reflections.

EXAMPLES:

```
sage: W = ReflectionGroup((1,1,3))
sage: W.simple_coroots()
Finite family {1: (2, -1), 2: (-1, 2)}

sage: W = ReflectionGroup((1,1,4), (2,1,2))
sage: W.simple_coroots()
Finite family {1: (2, -1, 0, 0, 0), 2: (-1, 2, -1, 0, 0), 3: (0, -1, 2, 0, 0),
↪ 4: (0, 0, 0, 2, -2), 5: (0, 0, 0, -1, 2)}

sage: W = ReflectionGroup((3,1,2))
sage: W.simple_coroots()
Finite family {1: (-2*E(3) - E(3)^2, 0), 2: (-1, 1)}

sage: W = ReflectionGroup((1,1,4), (3,1,2))
sage: W.simple_coroots()
Finite family {1: (2, -1, 0, 0, 0), 2: (-1, 2, -1, 0, 0), 3: (0, -1, 2, 0, 0),
↪ 4: (0, 0, 0, -2*E(3) - E(3)^2, 0), 5: (0, 0, 0, -1, 1)}
```

```
>>> from sage.all import *
>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(3)))
>>> W.simple_coroots()
Finite family {1: (2, -1), 2: (-1, 2)}

>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(4)), (Integer(2),
↪Integer(1),Integer(2)))
>>> W.simple_coroots()
Finite family {1: (2, -1, 0, 0, 0), 2: (-1, 2, -1, 0, 0), 3: (0, -1, 2, 0, 0),
↪ 4: (0, 0, 0, 2, -2), 5: (0, 0, 0, -1, 2)}

>>> W = ReflectionGroup((Integer(3),Integer(1),Integer(2)))
>>> W.simple_coroots()
Finite family {1: (-2*E(3) - E(3)^2, 0), 2: (-1, 1)}

>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(4)), (Integer(3),
↪Integer(1),Integer(2)))
>>> W.simple_coroots()
```

(continues on next page)

(continued from previous page)

```
Finite family {1: (2, -1, 0, 0, 0), 2: (-1, 2, -1, 0, 0), 3: (0, -1, 2, 0, 0),
↪ 4: (0, 0, 0, -2*E(3) - E(3)^2, 0), 5: (0, 0, 0, -1, 1)}
```

simple_reflection(*i*)

Return the `i`-th simple reflection of `self`.

EXAMPLES:

```
sage: W = ReflectionGroup((1,1,3))
sage: W.simple_reflection(1)
(1,4)(2,3)(5,6)
sage: W.simple_reflections()
Finite family {1: (1,4)(2,3)(5,6), 2: (1,3)(2,5)(4,6)}
```

```
>>> from sage.all import *
>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(3)))
>>> W.simple_reflection(Integer(1))
(1,4)(2,3)(5,6)
>>> W.simple_reflections()
Finite family {1: (1,4)(2,3)(5,6), 2: (1,3)(2,5)(4,6)}
```

simple_root(*i*)

Return the simple root with index `i`.

EXAMPLES:

```
sage: W = ReflectionGroup(['A',3])
sage: W.simple_root(1)
(1, 0, 0)
sage: W.simple_root(2)
(0, 1, 0)
sage: W.simple_root(3)
(0, 0, 1)
```

```
>>> from sage.all import *
>>> W = ReflectionGroup(['A',Integer(3)])
>>> W.simple_root(Integer(1))
(1, 0, 0)
>>> W.simple_root(Integer(2))
(0, 1, 0)
>>> W.simple_root(Integer(3))
(0, 0, 1)
```

simple_roots()

Return the simple roots of `self`.

These are the roots corresponding to the simple reflections.

EXAMPLES:

```
sage: W = ReflectionGroup((1,1,3))
sage: W.simple_roots()
Finite family {1: (1, 0), 2: (0, 1)}
```

(continues on next page)

(continued from previous page)

```
sage: W = ReflectionGroup((1,1,4), (2,1,2))
sage: W.simple_roots()
Finite family {1: (1, 0, 0, 0, 0), 2: (0, 1, 0, 0, 0), 3: (0, 0, 1, 0, 0), 4:␣
↪(0, 0, 0, 1, 0), 5: (0, 0, 0, 0, 1)}

sage: W = ReflectionGroup((3,1,2))
sage: W.simple_roots()
Finite family {1: (1, 0), 2: (-1, 1)}

sage: W = ReflectionGroup((1,1,4), (3,1,2))
sage: W.simple_roots()
Finite family {1: (1, 0, 0, 0, 0), 2: (0, 1, 0, 0, 0), 3: (0, 0, 1, 0, 0), 4:␣
↪(0, 0, 0, 1, 0), 5: (0, 0, 0, -1, 1)}
```

```
>>> from sage.all import *
>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(3)))
>>> W.simple_roots()
Finite family {1: (1, 0), 2: (0, 1)}

>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(4)), (Integer(2),
↪Integer(1),Integer(2)))
>>> W.simple_roots()
Finite family {1: (1, 0, 0, 0, 0), 2: (0, 1, 0, 0, 0), 3: (0, 0, 1, 0, 0), 4:␣
↪(0, 0, 0, 1, 0), 5: (0, 0, 0, 0, 1)}

>>> W = ReflectionGroup((Integer(3),Integer(1),Integer(2)))
>>> W.simple_roots()
Finite family {1: (1, 0), 2: (-1, 1)}

>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(4)), (Integer(3),
↪Integer(1),Integer(2)))
>>> W.simple_roots()
Finite family {1: (1, 0, 0, 0, 0), 2: (0, 1, 0, 0, 0), 3: (0, 0, 1, 0, 0), 4:␣
↪(0, 0, 0, 1, 0), 5: (0, 0, 0, -1, 1)}
```

class sage.combinat.root_system.reflection_group_complex.**IrreducibleComplexReflectionGroup**(*W_types*, *index_set=None*, *hyperplane_index_set=None*, *reflection_index_set=None*)

Bases: `ComplexReflectionGroup`

class Element

Bases: `Element`

is_coxeter_element(*which_primitive=1*, *is_class_representative=False*)

Return `True` if `self` is a Coxeter element.

This is, whether `self` has an eigenvalue that is a primitive h-th root of unity.

INPUT:

- `which_primitive` – (default: `1`) for which power of the first primitive `h`-th root of unity to look as a reflection eigenvalue for a regular element
- `is_class_representative` – boolean (default: `True`); whether to compute instead on the conjugacy class representative

See also

`coxeter_element()` `coxeter_elements()`

EXAMPLES:

```
sage: W = ReflectionGroup((1,1,3))
sage: for w in W:
....:     print('%s %s'%(w.reduced_word(), w.is_coxeter_element()))
[] False
[2] False
[1] False
[1, 2] True
[2, 1] True
[1, 2, 1] False
```

```
>>> from sage.all import *
>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(3)))
>>> for w in W:
...     print('%s %s'%(w.reduced_word(), w.is_coxeter_element()))
[] False
[2] False
[1] False
[1, 2] True
[2, 1] True
[1, 2, 1] False
```

is_h_regular(*is_class_representative=False*)

Return whether `self` is regular.

This is if `self` has an eigenvector with eigenvalue h and which does not lie in any reflection hyperplane. Here, h denotes the Coxeter number.

EXAMPLES:

```
sage: W = ReflectionGroup((1,1,3))
sage: for w in W:
....:     print('%s %s'%(w.reduced_word(), w.is_h_regular()))
[] False
[2] False
[1] False
[1, 2] True
[2, 1] True
[1, 2, 1] False
```

```
>>> from sage.all import *
>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(3)))
>>> for w in W:
...     print('%s %s'%(w.reduced_word(), w.is_h_regular()))
[] False
[2] False
[1] False
[1, 2] True
[2, 1] True
[1, 2, 1] False
```

is_regular(*h*, *is_class_representative=False*)

Return whether `self` is regular.

This is, if `self` has an eigenvector with eigenvalue of order `h` and which does not lie in any reflection hyperplane.

INPUT:

- `h` – the order of the eigenvalue
- `is_class_representative` – boolean (default: `True`); whether to compute instead on the conjugacy class representative

EXAMPLES:

```
sage: W = ReflectionGroup((1,1,3))
sage: h = W.coxeter_number()
sage: for w in W:
....:     print("{} {}".format(w.reduced_word(), w.is_regular(h)))
[] False
[2] False
[1] False
[1, 2] True
[2, 1] True
[1, 2, 1] False

sage: W = ReflectionGroup(23); h = W.coxeter_number()
sage: for w in W:
....:     if w.is_regular(h):
....:         w.reduced_word()
[1, 2, 3]
[2, 1, 3]
[1, 3, 2]
[3, 2, 1]
[2, 1, 2, 3, 2]
[2, 3, 2, 1, 2]
[1, 2, 1, 2, 3, 2, 1]
[1, 2, 3, 2, 1, 2, 1]
[1, 2, 1, 2, 3, 2, 1, 2, 3]
[2, 1, 2, 1, 3, 2, 1, 2, 3]
[2, 1, 2, 3, 2, 1, 2, 1, 3]
[1, 2, 3, 2, 1, 2, 1, 3, 2]
[3, 2, 1, 2, 1, 3, 2, 1, 2]
[1, 2, 1, 2, 1, 3, 2, 1, 2]
[2, 3, 2, 1, 2, 1, 3, 2, 1]
[2, 1, 2, 1, 3, 2, 1, 2, 1]
```

(continues on next page)

(continued from previous page)

[1, 2, 1, 2, 1, 3, 2, 1, 2]
[2, 3, 2, 1, 2, 1, 3, 2, 1]
[2, 1, 2, 1, 3, 2, 1, 2, 1]
[2, 3, 2, 1, 2, 1, 3, 2, 1, 2, 3]
[1, 3, 2, 1, 2, 1, 3, 2, 1, 2, 3]
[1, 2, 1, 2, 1, 3, 2, 1, 2, 1, 3]
[1, 2, 1, 2, 3, 2, 1, 2, 1, 3, 2]
[1, 2, 3, 2, 1, 2, 1, 3, 2, 1, 2]
[2, 1, 2, 3, 2, 1, 2, 1, 3, 2, 1]
[2, 1, 2, 3, 2, 1, 2, 1, 3, 2, 1, 2, 3]
[1, 2, 1, 3, 2, 1, 2, 1, 3, 2, 1, 2, 3]
```

Check that Issue #25478 is fixed:

```
sage: W = ReflectionGroup(["A",5])
sage: w = W.from_reduced_word([1,2,3,5])
sage: w.is_regular(4)
False
sage: W = ReflectionGroup(["A",3])
sage: len([w for w in W if w.is_regular(w.order())])
18
```

```
>>> from sage.all import *
>>> W = ReflectionGroup(["A",Integer(5)])
>>> w = W.from_reduced_word([Integer(1),Integer(2),Integer(3),Integer(5)])
>>> w.is_regular(Integer(4))
False
>>> W = ReflectionGroup(["A",Integer(3)])
>>> len([w for w in W if w.is_regular(w.order())])
18
```

sage.combinat.root_system.reflection_group_complex.**multi_partitions**(*n*, *S*, *i=None*)

Return all vectors as lists of the same length as S whose standard inner product with S equals n.

EXAMPLES:

```
sage: from sage.combinat.root_system.reflection_group_complex import multi_
↪partitions
sage: multi_partitions(10, [2,3,3,4])
[[5, 0, 0, 0],
 [3, 0, 0, 1],
 [2, 2, 0, 0],
 [2, 1, 1, 0],
 [2, 0, 2, 0],
 [1, 0, 0, 2],
 [0, 2, 0, 1],
 [0, 1, 1, 1],
 [0, 0, 2, 1]]
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.reflection_group_complex import multi_
↪partitions
>>> multi_partitions(Integer(10), [Integer(2),Integer(3),Integer(3),Integer(4)])
[[5, 0, 0, 0],
 [3, 0, 0, 1],
 [2, 2, 0, 0],
 [2, 1, 1, 0],
 [2, 0, 2, 0],
 [1, 0, 0, 2],
 [0, 2, 0, 1],
 [0, 1, 1, 1],
 [0, 0, 2, 1]]
```

sage.combinat.root_system.reflection_group_complex.**power**(*k*)

Return f^k and caching all intermediate results.

Speeds the computation if one has to compute f^k's for many values of k.

EXAMPLES:

```
sage: P.<x,y,z> = PolynomialRing(QQ)
sage: f = -2*x^2 + 2*x*y - 2*y^2 + 2*y*z - 2*z^2
sage: all( f^k == power(f,k) for k in range(20) )
True
```

```
>>> from sage.all import *
>>> P = PolynomialRing(QQ, names=('x', 'y', 'z',)); (x, y, z,) = P._first_ngens(3)
>>> f = -Integer(2)*x**Integer(2) + Integer(2)*x*y - Integer(2)*y**Integer(2) +␣
↪Integer(2)*y*z - Integer(2)*z**Integer(2)
>>> all( f**k == power(f,k) for k in range(Integer(20)) )
True
```

5.1.237 Finite real reflection groups

Let V be a finite-dimensional real vector space. A reflection of V is an operator $r \in \mathrm{GL}(V)$ that has order 2 and fixes pointwise a hyperplane in V. In the present implementation, finite real reflection groups are tied with a root system.

Finite real reflection groups with root systems have been classified according to finite Cartan-Killing types. For more definitions and classification types of finite complex reflection groups, see Wikipedia article Complex_reflection_group.

The point of entry to work with reflection groups is `ReflectionGroup()` which can be used with finite Cartan-Killing types:

```
sage: ReflectionGroup(['A',2])
Irreducible real reflection group of rank 2 and type A2
sage: ReflectionGroup(['F',4])
Irreducible real reflection group of rank 4 and type F4
sage: ReflectionGroup(['H',3])
Irreducible real reflection group of rank 3 and type H3
```

```
>>> from sage.all import *
>>> ReflectionGroup(['A',Integer(2)])
Irreducible real reflection group of rank 2 and type A2
>>> ReflectionGroup(['F',Integer(4)])
Irreducible real reflection group of rank 4 and type F4
>>> ReflectionGroup(['H',Integer(3)])
Irreducible real reflection group of rank 3 and type H3
```

ReflectionGroup()

class Element

Bases: RealReflectionGroupElement, *Element*

left_coset_representatives()

Return the left coset representatives of self.

See also

right_coset_representatives()

EXAMPLES:

```
sage: W = ReflectionGroup(['A',2])
sage: for w in W:
....:     lcr = w.left_coset_representatives()
....:     print("%s %s"%(w.reduced_word(),
....:                    [v.reduced_word() for v in lcr]))

[1, 2] [[]]
[2, 1] [[]]
[1, 2, 1] [[], [2], [1, 2]]
```

right_coset_representatives()

Return the right coset representatives of `self`.

EXAMPLES:

```
sage: W = ReflectionGroup(['A',2])
sage: for w in W:
....:     rcr = w.right_coset_representatives()
....:     print("%s %s"%(w.reduced_word(),
....:                    [v.reduced_word() for v in rcr]))
[] [[], [2], [1], [2, 1], [1, 2], [1, 2, 1]]
[2] [[], [2], [1]]
[1] [[], [1], [1, 2]]
[1, 2] [[]]
[2, 1] [[]]
[1, 2, 1] [[], [2], [2, 1]]
```

```
>>> from sage.all import *
>>> W = ReflectionGroup(['A',Integer(2)])
>>> for w in W:
...     rcr = w.right_coset_representatives()
...     print("%s %s"%(w.reduced_word(),
...                    [v.reduced_word() for v in rcr]))
[] [[], [2], [1], [2, 1], [1, 2], [1, 2, 1]]
[2] [[], [2], [1]]
[1] [[], [1], [1, 2]]
[1, 2] [[]]
[2, 1] [[]]
[1, 2, 1] [[], [2], [2, 1]]
```

almost_positive_roots()

Return the almost positive roots of `self`.

EXAMPLES:

```
sage: W = ReflectionGroup(['A',3], ['B',2])
sage: W.almost_positive_roots()
[(-1, 0, 0, 0, 0),
 (0, -1, 0, 0, 0),
 (0, 0, -1, 0, 0),

 (0, 0, 1),
```

(continues on next page)

(continued from previous page)

```
 (1, 1, 0),
 (0, 1, 1),
 (1, 1, 1)]
```

bipartite_index_set()

Return the bipartite index set of a real reflection group.

EXAMPLES:

```
sage: W = ReflectionGroup(["A",5])
sage: W.bipartite_index_set()
[[1, 3, 5], [2, 4]]

sage: W = ReflectionGroup(["A",5],index_set=['a','b','c','d','e'])
sage: W.bipartite_index_set()
[['a', 'c', 'e'], ['b', 'd']]
```

```
>>> from sage.all import *
>>> W = ReflectionGroup(["A",Integer(5)])
>>> W.bipartite_index_set()
[[1, 3, 5], [2, 4]]

>>> W = ReflectionGroup(["A",Integer(5)],index_set=['a','b','c','d','e'])
>>> W.bipartite_index_set()
[['a', 'c', 'e'], ['b', 'd']]
```

bruhat_cone(*x*, *y*, *side='upper'*, *backend='cdd'*)

Return the (upper or lower) Bruhat cone associated to the interval `[x,y]`.

To a cover relation $v \prec w$ in strong Bruhat order you can assign a positive root β given by the unique reflection s_β such that $s_\beta v = w$.

The upper Bruhat cone of the interval $[x, y]$ is the non-empty, polyhedral cone generated by the roots corresponding to $x \prec a$ for all atoms a in the interval. The lower Bruhat cone of the interval $[x, y]$ is the non-empty, polyhedral cone generated by the roots corresponding to $c \prec y$ for all coatoms c in the interval.

INPUT:

- `x` – an element in the group W
- `y` – an element in the group W
- `side` – (default: `'upper'`) must be one of the following:
  - `'upper'` – return the upper Bruhat cone of the interval [`x`, `y`]
  - `'lower'` – return the lower Bruhat cone of the interval [`x`, `y`]
- `backend` – string (default: `'cdd'`); the backend to use to create the polyhedron

EXAMPLES:

```
sage: W = ReflectionGroup(['A',2])
sage: x = W.from_reduced_word([1])
sage: y = W.w0
sage: W.bruhat_cone(x, y)
A 2-dimensional polyhedron in QQ^2 defined as the convex hull of 1 vertex and
```

(continues on next page)

(continued from previous page)

```
↪2 rays

sage: W = ReflectionGroup(['E',6])
sage: x = W.one()
sage: y = W.w0
sage: W.bruhat_cone(x, y, side='lower')
A 6-dimensional polyhedron in QQ^6 defined as the convex hull of 1 vertex and␣
↪6 rays
```

```
>>> from sage.all import *
>>> W = ReflectionGroup(['A',Integer(2)])
>>> x = W.from_reduced_word([Integer(1)])
>>> y = W.w0
>>> W.bruhat_cone(x, y)
A 2-dimensional polyhedron in QQ^2 defined as the convex hull of 1 vertex and␣
↪2 rays

>>> W = ReflectionGroup(['E',Integer(6)])
>>> x = W.one()
>>> y = W.w0
>>> W.bruhat_cone(x, y, side='lower')
A 6-dimensional polyhedron in QQ^6 defined as the convex hull of 1 vertex and␣
↪6 rays
```

REFERENCES:

- [Dy1994]
- [JS2021]

cartan_type()

Return the Cartan type of `self`.

EXAMPLES:

```
sage: W = ReflectionGroup(['A',3])
sage: W.cartan_type()
['A', 3]

sage: W = ReflectionGroup(['A',3], ['B',3])
sage: W.cartan_type()
A3xB3 relabelled by {1: 3, 2: 2, 3: 1}
```

```
>>> from sage.all import *
>>> W = ReflectionGroup(['A',Integer(3)])
>>> W.cartan_type()
['A', 3]

>>> W = ReflectionGroup(['A',Integer(3)], ['B',Integer(3)])
>>> W.cartan_type()
A3xB3 relabelled by {1: 3, 2: 2, 3: 1}
```

coxeter_diagram()

Return the Coxeter diagram associated to `self`.

EXAMPLES:

```
sage: G = ReflectionGroup(['B',3])
sage: G.coxeter_diagram().edges(labels=True, sort=True)
[(1, 2, 4), (2, 3, 3)]
```

```
>>> from sage.all import *
>>> G = ReflectionGroup(['B',Integer(3)])
>>> G.coxeter_diagram().edges(labels=True, sort=True)
[(1, 2, 4), (2, 3, 3)]
```

coxeter_matrix()

Return the Coxeter matrix associated to `self`.

EXAMPLES:

```
sage: G = ReflectionGroup(['A',3])
sage: G.coxeter_matrix()
[1 3 2]
[3 1 3]
[2 3 1]
```

```
>>> from sage.all import *
>>> G = ReflectionGroup(['A',Integer(3)])
>>> G.coxeter_matrix()
[1 3 2]
[3 1 3]
[2 3 1]
```

fundamental_weight(*i*)

Return the fundamental weight with index `i`.

EXAMPLES:

```
sage: W = ReflectionGroup(['A',3])
sage: [ W.fundamental_weight(i) for i in W.index_set() ]
[(3/4, 1/2, 1/4), (1/2, 1, 1/2), (1/4, 1/2, 3/4)]
```

```
>>> from sage.all import *
>>> W = ReflectionGroup(['A',Integer(3)])
>>> [ W.fundamental_weight(i) for i in W.index_set() ]
[(3/4, 1/2, 1/4), (1/2, 1, 1/2), (1/4, 1/2, 3/4)]
```

fundamental_weights()

Return the fundamental weights of `self` in terms of the simple roots.

The fundamental weights are defined by $s_j(\omega_i) = \omega_i - \delta_{i=j}\alpha_j$ for the simple reflection s_j with corresponding simple roots α_j.

In other words, the transpose Cartan matrix sends the weight basis to the root basis. Observe again that the action here is defined as a right action, see the example below.

EXAMPLES:

```
sage: W = ReflectionGroup(['A',3], ['B',2])
sage: W.fundamental_weights()
Finite family {1: (3/4, 1/2, 1/4, 0, 0), 2: (1/2, 1, 1/2, 0, 0), 3: (1/4, 1/2,
↪ 3/4, 0, 0), 4: (0, 0, 0, 1, 1/2), 5: (0, 0, 0, 1, 1)}

sage: W = ReflectionGroup(['A',3])
sage: W.fundamental_weights()
Finite family {1: (3/4, 1/2, 1/4), 2: (1/2, 1, 1/2), 3: (1/4, 1/2, 3/4)}

sage: W = ReflectionGroup(['A',3])
sage: S = W.simple_reflections()
sage: N = W.fundamental_weights()
sage: for i in W.index_set():
....:     for j in W.index_set():
....:         print("{} {} {} {}".format(i, j, N[i], N[i]*S[j].to_matrix()))
1 1 (3/4, 1/2, 1/4) (-1/4, 1/2, 1/4)
1 2 (3/4, 1/2, 1/4) (3/4, 1/2, 1/4)
1 3 (3/4, 1/2, 1/4) (3/4, 1/2, 1/4)
2 1 (1/2, 1, 1/2) (1/2, 1, 1/2)
2 2 (1/2, 1, 1/2) (1/2, 0, 1/2)
2 3 (1/2, 1, 1/2) (1/2, 1, 1/2)
3 1 (1/4, 1/2, 3/4) (1/4, 1/2, 3/4)
3 2 (1/4, 1/2, 3/4) (1/4, 1/2, 3/4)
3 3 (1/4, 1/2, 3/4) (1/4, 1/2, -1/4)
```

```
>>> from sage.all import *
>>> W = ReflectionGroup(['A',Integer(3)], ['B',Integer(2)])
>>> W.fundamental_weights()
Finite family {1: (3/4, 1/2, 1/4, 0, 0), 2: (1/2, 1, 1/2, 0, 0), 3: (1/4, 1/2,
↪ 3/4, 0, 0), 4: (0, 0, 0, 1, 1/2), 5: (0, 0, 0, 1, 1)}

>>> W = ReflectionGroup(['A',Integer(3)])
>>> W.fundamental_weights()
Finite family {1: (3/4, 1/2, 1/4), 2: (1/2, 1, 1/2), 3: (1/4, 1/2, 3/4)}

>>> W = ReflectionGroup(['A',Integer(3)])
>>> S = W.simple_reflections()
>>> N = W.fundamental_weights()
>>> for i in W.index_set():
...     for j in W.index_set():
...         print("{} {} {} {}".format(i, j, N[i], N[i]*S[j].to_matrix()))
1 1 (3/4, 1/2, 1/4) (-1/4, 1/2, 1/4)
1 2 (3/4, 1/2, 1/4) (3/4, 1/2, 1/4)
1 3 (3/4, 1/2, 1/4) (3/4, 1/2, 1/4)
2 1 (1/2, 1, 1/2) (1/2, 1, 1/2)
2 2 (1/2, 1, 1/2) (1/2, 0, 1/2)
2 3 (1/2, 1, 1/2) (1/2, 1, 1/2)
3 1 (1/4, 1/2, 3/4) (1/4, 1/2, 3/4)
3 2 (1/4, 1/2, 3/4) (1/4, 1/2, 3/4)
3 3 (1/4, 1/2, 3/4) (1/4, 1/2, -1/4)
```

iteration(*algorithm='breadth'*, *tracking_words=True*)

Return an iterator going through all elements in `self`.

INPUT:

- `algorithm` – (default: `'breadth'`) must be one of the following:
  - `'breadth'` – iterate over in a linear extension of the weak order
  - `'depth'` – iterate by a depth-first-search
  - `'parabolic'` – iterate by using parabolic subgroups
- `tracking_words` – boolean (default: `True`); whether or not to keep track of the reduced words and store them in `_reduced_word`

Note

The fastest iteration is the parabolic iteration and the depth first algorithm without tracking words is second. In particular, `'depth'` is ~1.5x faster than `'breadth'`.

Note

The `'parabolic'` iteration does not track words and requires keeping the subgroup corresponding to $I \setminus \{i\}$ in memory (for each i individually).

EXAMPLES:

```
sage: W = ReflectionGroup(["B",2])

sage: for w in W.iteration("breadth",True):
....:     print("%s %s"%(w, w._reduced_word))
() []
(1,3)(2,6)(5,7) [1]
(1,5)(2,4)(6,8) [0]
(1,7,5,3)(2,4,6,8) [0, 1]
(1,3,5,7)(2,8,6,4) [1, 0]
(2,8)(3,7)(4,6) [1, 0, 1]
(1,7)(3,5)(4,8) [0, 1, 0]
(1,5)(2,6)(3,7)(4,8) [0, 1, 0, 1]

sage: for w in W.iteration("depth", False): w
()
(1,3)(2,6)(5,7)
(1,5)(2,4)(6,8)
(1,3,5,7)(2,8,6,4)
(1,7)(3,5)(4,8)
(1,7,5,3)(2,4,6,8)
(2,8)(3,7)(4,6)
(1,5)(2,6)(3,7)(4,8)
```

```
>>> from sage.all import *
>>> W = ReflectionGroup(["B",Integer(2)])

>>> for w in W.iteration("breadth",True):
...     print("%s %s"%(w, w._reduced_word))
```

(continues on next page)

(continued from previous page)

```
() []
(1,3)(2,6)(5,7) [1]
(1,5)(2,4)(6,8) [0]
(1,7,5,3)(2,4,6,8) [0, 1]
(1,3,5,7)(2,8,6,4) [1, 0]
(2,8)(3,7)(4,6) [1, 0, 1]
(1,7)(3,5)(4,8) [0, 1, 0]
(1,5)(2,6)(3,7)(4,8) [0, 1, 0, 1]

>>> for w in W.iteration("depth", False): w
()
(1,3)(2,6)(5,7)
(1,5)(2,4)(6,8)
(1,3,5,7)(2,8,6,4)
(1,7)(3,5)(4,8)
(1,7,5,3)(2,4,6,8)
(2,8)(3,7)(4,6)
(1,5)(2,6)(3,7)(4,8)
```

positive_roots()

Return the positive roots of `self`.

EXAMPLES:

```
sage: W = ReflectionGroup(['A',3], ['B',2])
sage: W.positive_roots()
[(1, 0, 0, 0, 0),
 (0, 1, 0, 0, 0),
 (0, 0, 1, 0, 0),
 (0, 0, 0, 1, 0),
 (0, 0, 0, 0, 1),
 (1, 1, 0, 0, 0),
 (0, 1, 1, 0, 0),
 (0, 0, 0, 1, 1),
 (1, 1, 1, 0, 0),
 (0, 0, 0, 2, 1)]

sage: W = ReflectionGroup(['A',3])
sage: W.positive_roots()
[(1, 0, 0), (0, 1, 0), (0, 0, 1), (1, 1, 0), (0, 1, 1), (1, 1, 1)]
```

```
>>> from sage.all import *
>>> W = ReflectionGroup(['A',Integer(3)], ['B',Integer(2)])
>>> W.positive_roots()
[(1, 0, 0, 0, 0),
 (0, 1, 0, 0, 0),
 (0, 0, 1, 0, 0),
 (0, 0, 0, 1, 0),
 (0, 0, 0, 0, 1),
 (1, 1, 0, 0, 0),
 (0, 1, 1, 0, 0),
 (0, 0, 0, 1, 1),
```

(continues on next page)

(continued from previous page)

```
 (1, 1, 1, 0, 0),
 (0, 0, 0, 2, 1)]

>>> W = ReflectionGroup(['A',Integer(3)])
>>> W.positive_roots()
[(1, 0, 0), (0, 1, 0), (0, 0, 1), (1, 1, 0), (0, 1, 1), (1, 1, 1)]
```

reflection_to_positive_root(*r*)

Return the positive root orthogonal to the given reflection.

EXAMPLES:

```
sage: W = ReflectionGroup(['A',2])
sage: for r in W.reflections():
....:     print(W.reflection_to_positive_root(r))
(1, 0)
(0, 1)
(1, 1)
```

```
>>> from sage.all import *
>>> W = ReflectionGroup(['A',Integer(2)])
>>> for r in W.reflections():
...     print(W.reflection_to_positive_root(r))
(1, 0)
(0, 1)
(1, 1)
```

right_coset_representatives(*J*)

Return the right coset representatives of `self` for the parabolic subgroup generated by the simple reflections in `J`.

EXAMPLES:

```
sage: W = ReflectionGroup(["A",3])
sage: for J in Subsets([1,2,3]): W.right_coset_representatives(J)
[(), (2,5)(3,9)(4,6)(8,11)(10,12), (1,4)(2,8)(3,5)(7,10)(9,11),
 (1,7)(2,4)(5,6)(8,10)(11,12), (1,2,10)(3,6,5)(4,7,8)(9,12,11),
 (1,4,6)(2,3,11)(5,8,9)(7,10,12), (1,6,4)(2,11,3)(5,9,8)(7,12,10),
 (1,7)(2,6)(3,9)(4,5)(8,12)(10,11),

 (1,12,3,2)(4,11,10,5)(6,9,8,7)]
[()]
```

root_to_reflection(*root*)

Return the reflection along the given `root`.

EXAMPLES:

```
sage: W = ReflectionGroup(['A',2])
sage: for beta in W.roots(): W.root_to_reflection(beta)
(1,4)(2,3)(5,6)
(1,3)(2,5)(4,6)
(1,5)(2,4)(3,6)
(1,4)(2,3)(5,6)
(1,3)(2,5)(4,6)
(1,5)(2,4)(3,6)
```

```
>>> from sage.all import *
>>> W = ReflectionGroup(['A',Integer(2)])
>>> for beta in W.roots(): W.root_to_reflection(beta)
(1,4)(2,3)(5,6)
(1,3)(2,5)(4,6)
(1,5)(2,4)(3,6)
(1,4)(2,3)(5,6)
(1,3)(2,5)(4,6)
(1,5)(2,4)(3,6)
```

simple_root_index(*i*)

Return the index of the simple root α_i.

This is the position of α_i in the list of simple roots.

EXAMPLES:

```
sage: W = ReflectionGroup(['A',3])
sage: [W.simple_root_index(i) for i in W.index_set()]
[0, 1, 2]
```

```
>>> from sage.all import *
>>> W = ReflectionGroup(['A',Integer(3)])
>>> [W.simple_root_index(i) for i in W.index_set()]
[0, 1, 2]
```

sage.combinat.root_system.reflection_group_real.**ReflectionGroup**(**args*, ***kwds*)

Construct a finite (complex or real) reflection group as a Sage permutation group by fetching the permutation representation of the generators from chevie's database.

INPUT:

Can be one or multiple of the following:

- a triple (r, p, n) with p divides r, which denotes the group $G(r, p, n)$
- an integer between 4 and 37, which denotes an exceptional irreducible complex reflection group
- a finite Cartan-Killing type

EXAMPLES:

Finite reflection groups can be constructed from

Cartan-Killing classification types:

```
sage: W = ReflectionGroup(['A',3]); W
 Irreducible real reflection group of rank 3 and type A3

sage: W = ReflectionGroup(['H',4]); W
 Irreducible real reflection group of rank 4 and type H4

sage: W = ReflectionGroup(['I',5]); W
 Irreducible real reflection group of rank 2 and type I2(5)
```

```
>>> from sage.all import *
>>> W = ReflectionGroup(['A',Integer(3)]); W
 Irreducible real reflection group of rank 3 and type A3

>>> W = ReflectionGroup(['H',Integer(4)]); W
 Irreducible real reflection group of rank 4 and type H4

>>> W = ReflectionGroup(['I',Integer(5)]); W
 Irreducible real reflection group of rank 2 and type I2(5)
```

the complex infinite family $G(r, p, n)$ with p divides r:

```
sage: W = ReflectionGroup((1,1,4)); W
Irreducible real reflection group of rank 3 and type A3

sage: W = ReflectionGroup((2,1,3)); W
Irreducible real reflection group of rank 3 and type B3
```

```
>>> from sage.all import *
>>> W = ReflectionGroup((Integer(1),Integer(1),Integer(4))); W
Irreducible real reflection group of rank 3 and type A3

>>> W = ReflectionGroup((Integer(2),Integer(1),Integer(3))); W
Irreducible real reflection group of rank 3 and type B3
```

Chevalley-Shepard-Todd exceptional classification types:

```
sage: W = ReflectionGroup(23); W
Irreducible real reflection group of rank 3 and type H3
```

```
>>> from sage.all import *
>>> W = ReflectionGroup(Integer(23)); W
Irreducible real reflection group of rank 3 and type H3
```

Cartan types and matrices:

```
sage: ReflectionGroup(CartanType(['A',2]))
Irreducible real reflection group of rank 2 and type A2

sage: ReflectionGroup(CartanType((['A',2],['A',2])))
Reducible real reflection group of rank 4 and type A2 x A2

sage: C = CartanMatrix(['A',2])
sage: ReflectionGroup(C)
Irreducible real reflection group of rank 2 and type A2
```

```
>>> from sage.all import *
>>> ReflectionGroup(CartanType(['A',Integer(2)]))
Irreducible real reflection group of rank 2 and type A2

>>> ReflectionGroup(CartanType((['A',Integer(2)],['A',Integer(2)])))
Reducible real reflection group of rank 4 and type A2 x A2

>>> C = CartanMatrix(['A',Integer(2)])
>>> ReflectionGroup(C)
Irreducible real reflection group of rank 2 and type A2
```

multiples of the above:

```
sage: W = ReflectionGroup(['A',2],['B',2]); W
Reducible real reflection group of rank 4 and type A2 x B2

sage: W = ReflectionGroup(['A',2],4); W
Reducible complex reflection group of rank 4 and type A2 x ST4

sage: W = ReflectionGroup((4,2,2),4); W
Reducible complex reflection group of rank 4 and type G(4,2,2) x ST4
```

```
>>> from sage.all import *
>>> W = ReflectionGroup(['A',Integer(2)],['B',Integer(2)]); W
Reducible real reflection group of rank 4 and type A2 x B2

>>> W = ReflectionGroup(['A',Integer(2)],Integer(4)); W
Reducible complex reflection group of rank 4 and type A2 x ST4

>>> W = ReflectionGroup((Integer(4),Integer(2),Integer(2)),Integer(4)); W
Reducible complex reflection group of rank 4 and type G(4,2,2) x ST4
```

sage.combinat.root_system.reflection_group_real.**is_chevie_available**()

Test whether the GAP3 Chevie package is available.

EXAMPLES:

```
sage: # needs sage.groups
sage: from sage.combinat.root_system.reflection_group_real import is_chevie_
↪available
sage: is_chevie_available() # random
False
sage: is_chevie_available() in [True, False]
True
```

```
>>> from sage.all import *
>>> # needs sage.groups
>>> from sage.combinat.root_system.reflection_group_real import is_chevie_
↪available
>>> is_chevie_available() # random
False
>>> is_chevie_available() in [True, False]
True
```

5.1.238 Group algebras of root lattice realizations

class sage.combinat.root_system.root_lattice_realization_algebras.**Algebras**(*category*, **args*)

Bases: AlgebrasCategory

The category of group algebras of root lattice realizations.

This includes typically weight rings (group algebras of weight lattices).

class ElementMethods

Bases: object

acted_upon(*w*)

Implement the action of w on self.

INPUT:

- w – an element of the Weyl group acting on the underlying weight lattice realization

EXAMPLES:

```
sage: L = RootSystem(["A",3]).ambient_space()
sage: W = L.weyl_group()                                                    #␣
↪needs sage.libs.gap
sage: M = L.algebra(QQ['q','t'])
sage: m = M.an_element(); m  # TODO: investigate why we don't get␣
↪something more interesting
B[(2, 2, 3, 0)]
sage: m = (m+1)^2; m
B[(0, 0, 0, 0)] + 2*B[(2, 2, 3, 0)] + B[(4, 4, 6, 0)]
sage: w = W.an_element(); w.reduced_word()                                  #␣
↪needs sage.libs.gap
[1, 2, 3]
sage: m.acted_upon(w)                                                       #␣
↪needs sage.libs.gap
B[(0, 0, 0, 0)] + 2*B[(0, 2, 2, 3)] + B[(0, 4, 4, 6)]
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(3)]).ambient_space()
>>> W = L.weyl_group()                                                  #␣
↪needs sage.libs.gap
>>> M = L.algebra(QQ['q','t'])
>>> m = M.an_element(); m  # TODO: investigate why we don't get something␣
↪more interesting
B[(2, 2, 3, 0)]
>>> m = (m+Integer(1))**Integer(2); m
B[(0, 0, 0, 0)] + 2*B[(2, 2, 3, 0)] + B[(4, 4, 6, 0)]
>>> w = W.an_element(); w.reduced_word()                                #␣
↪needs sage.libs.gap
[1, 2, 3]
>>> m.acted_upon(w)                                                     #␣
↪needs sage.libs.gap
B[(0, 0, 0, 0)] + 2*B[(0, 2, 2, 3)] + B[(0, 4, 4, 6)]
```

expand(*alphabet*)

Expand `self` into variables in the `alphabet`.

INPUT:

- `alphabet` – a non empty list/tuple of (invertible) variables in a ring to expand in

EXAMPLES:

```
sage: L = RootSystem(["A",2]).ambient_lattice()
sage: KL = L.algebra(QQ)
sage: p = KL.an_element() + KL.sum_of_monomials(L.some_elements()); p
B[(1, 0, 0)] + B[(1, -1, 0)] + B[(1, 1, 0)] + 2*B[(2, 2, 3)] + B[(0, 1, -
↪1)]
sage: F = LaurentPolynomialRing(QQ, 'x,y,z')
sage: p.expand(F.gens())
2*x^2*y^2*z^3 + x*y + x + y*z^-1 + x*y^-1
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(2)]).ambient_lattice()
>>> KL = L.algebra(QQ)
>>> p = KL.an_element() + KL.sum_of_monomials(L.some_elements()); p
B[(1, 0, 0)] + B[(1, -1, 0)] + B[(1, 1, 0)] + 2*B[(2, 2, 3)] + B[(0, 1, -
↪1)]
>>> F = LaurentPolynomialRing(QQ, 'x,y,z')
>>> p.expand(F.gens())
2*x^2*y^2*z^3 + x*y + x + y*z^-1 + x*y^-1
```

class ParentMethods

Bases: `object`

T0_check_on_basis(*q1*, *q2*, *convention='antidominant'*)

Return the $T_0^\vee$ operator acting on the basis.

This implements the formula for $T_{0'}$ in Section 6.12 of [Haiman06].

REFERENCES:

> **Warning**
>
> The current implementation probably returns just nonsense, if the convention is not "dominant".

EXAMPLES:

```
sage: K = QQ['q1,q2'].fraction_field()
sage: q1,q2 = K.gens()

sage: L = RootSystem(["A",1,1]).ambient_space()
sage: L0 = L.classical()
sage: KL = L.algebra(K)
sage: some_weights = L.fundamental_weights()                           #␣
↪needs sage.graphs
sage: f = KL.T0_check_on_basis(q1,q2, convention='dominant')           #␣
↪needs sage.graphs
sage: f(L0.zero())                                                     #␣
↪needs sage.graphs
(q1+q2)*B[(0, 0)] + q1*B[(1, -1)]

sage: L = RootSystem(["A",3,1]).ambient_space()
sage: L0 = L.classical()
sage: KL = L.algebra(K)
sage: some_weights = L0.fundamental_weights()
sage: f = KL.T0_check_on_basis(q1,q2, convention='dominant')           #␣
↪needs sage.graphs
sage: f(L0.zero())        # not checked                                #␣
↪needs sage.graphs
(q1+q2)*B[(0, 0, 0, 0)] + q1^3/q2^2*B[(1, 0, 0, -1)]
```

```
>>> from sage.all import *
>>> K = QQ['q1,q2'].fraction_field()
>>> q1,q2 = K.gens()

>>> L = RootSystem(["A",Integer(1),Integer(1)]).ambient_space()
>>> L0 = L.classical()
>>> KL = L.algebra(K)
>>> some_weights = L.fundamental_weights()                             #␣
↪needs sage.graphs
>>> f = KL.T0_check_on_basis(q1,q2, convention='dominant')             #␣
↪needs sage.graphs
>>> f(L0.zero())                                                       #␣
↪needs sage.graphs
(q1+q2)*B[(0, 0)] + q1*B[(1, -1)]

>>> L = RootSystem(["A",Integer(3),Integer(1)]).ambient_space()
>>> L0 = L.classical()
>>> KL = L.algebra(K)
>>> some_weights = L0.fundamental_weights()
>>> f = KL.T0_check_on_basis(q1,q2, convention='dominant')             #␣
↪needs sage.graphs
>>> f(L0.zero())        # not checked                                  #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.graphs
(q1+q2)*B[(0, 0, 0, 0)] + q1^3/q2^2*B[(1, 0, 0, -1)]
```

The following results have not been checked:

```
sage: for x in some_weights:                                                    #␣
↪needs sage.graphs
....:     print("{} : {}".format(x, f(x)))
(1, 0, 0, 0) : q1*B[(1, 0, 0, 0)]
(1, 1, 0, 0) : q1*B[(1, 1, 0, 0)]
(1, 1, 1, 0) : q1*B[(1, 1, 1, 0)]
```

```
>>> from sage.all import *
>>> for x in some_weights:                                                    #␣
↪needs sage.graphs
...     print("{} : {}".format(x, f(x)))
(1, 0, 0, 0) : q1*B[(1, 0, 0, 0)]
(1, 1, 0, 0) : q1*B[(1, 1, 0, 0)]
(1, 1, 1, 0) : q1*B[(1, 1, 1, 0)]
```

Some examples for type $B_2^{(1)}$ dual:

```
sage: L = RootSystem("B2~*").ambient_space()
sage: L0 = L.classical()
sage: e = L.basis()
sage: K = QQ['q,u'].fraction_field()
sage: q,u = K.gens()
sage: q1 = u
sage: q2 = -1/u
sage: KL = L.algebra(K)
sage: KL0 = KL.classical()
sage: f = KL.T0_check_on_basis(q1,q2, convention='dominant')                   #␣
↪needs sage.graphs
sage: T = KL.twisted_demazure_lusztig_operators(q1,q2, convention=
↪'dominant')
```

```
>>> from sage.all import *
>>> L = RootSystem("B2~*").ambient_space()
>>> L0 = L.classical()
>>> e = L.basis()
>>> K = QQ['q,u'].fraction_field()
>>> q,u = K.gens()
>>> q1 = u
>>> q2 = -Integer(1)/u
>>> KL = L.algebra(K)
>>> KL0 = KL.classical()
>>> f = KL.T0_check_on_basis(q1,q2, convention='dominant')                   #␣
↪needs sage.graphs
>>> T = KL.twisted_demazure_lusztig_operators(q1,q2, convention='dominant
↪')
```

Direct calculation:

```
sage: T.Tw(0)(KL0.monomial(L0([0,0])))                                          #␣
↪needs sage.graphs
((u^2-1)/u)*B[(0, 0)] + u^3*B[(1, 1)]
sage: KL.T0_check_on_basis(q1,q2, convention='dominant')(L0([0,0]))            #␣
↪needs sage.graphs
((u^2-1)/u)*B[(0, 0)] + u^3*B[(1, 1)]
```

```
>>> from sage.all import *
>>> T.Tw(Integer(0))(KL0.monomial(L0([Integer(0),Integer(0)])))                ␣
↪                        # needs sage.graphs
((u^2-1)/u)*B[(0, 0)] + u^3*B[(1, 1)]
>>> KL.T0_check_on_basis(q1,q2, convention='dominant')(L0([Integer(0),
↪Integer(0)]))      # needs sage.graphs
((u^2-1)/u)*B[(0, 0)] + u^3*B[(1, 1)]
```

Step by step calculation, comparing by hand with Mark Shimozono:

```
sage: res = T.Tw(2)(KL0.monomial(L0([0,0]))); res
u*B[(0, 0)]
sage: res = res * KL0.monomial(L0([-1,1])); res
u*B[(-1, 1)]
sage: res = T.Tw_inverse(1)(res); res
(u^2-1)*B[(0, 0)] + u^2*B[(1, -1)]
sage: res = T.Tw_inverse(2)(res); res
((u^2-1)/u)*B[(0, 0)] + u^3*B[(1, 1)]
```

```
>>> from sage.all import *
>>> res = T.Tw(Integer(2))(KL0.monomial(L0([Integer(0),Integer(0)]))); res
u*B[(0, 0)]
>>> res = res * KL0.monomial(L0([-Integer(1),Integer(1)])); res
u*B[(-1, 1)]
>>> res = T.Tw_inverse(Integer(1))(res); res
(u^2-1)*B[(0, 0)] + u^2*B[(1, -1)]
>>> res = T.Tw_inverse(Integer(2))(res); res
((u^2-1)/u)*B[(0, 0)] + u^3*B[(1, 1)]
```

cartan_type()

Return the Cartan type of `self`.

EXAMPLES:

```
sage: A = RootSystem(["A",2,1]).ambient_space().algebra(QQ)
sage: A.cartan_type()
['A', 2, 1]
sage: A = RootSystem(["B",2]).weight_space().algebra(QQ)
sage: A.cartan_type()
['B', 2]
```

```
>>> from sage.all import *
>>> A = RootSystem(["A",Integer(2),Integer(1)]).ambient_space().
↪algebra(QQ)
>>> A.cartan_type()
```

(continues on next page)

(continued from previous page)

```
['A', 2, 1]
>>> A = RootSystem(["B",Integer(2)]).weight_space().algebra(QQ)
>>> A.cartan_type()
['B', 2]
```

classical()

Return the group algebra of the corresponding classical lattice.

EXAMPLES:

```
sage: KL = RootSystem(["A",2,1]).ambient_space().algebra(QQ)
sage: KL.classical()
Algebra of the Ambient space of the Root system of type ['A', 2] over
↪Rational Field
```

```
>>> from sage.all import *
>>> KL = RootSystem(["A",Integer(2),Integer(1)]).ambient_space().
↪algebra(QQ)
>>> KL.classical()
Algebra of the Ambient space of the Root system of type ['A', 2] over
↪Rational Field
```

demazure_lusztig_operator_on_basis(*weight*, *i*, *q1*, *q2*, *convention='antidominant'*)

Return the result of applying the i-th Demazure-Lusztig operator on `weight`.

INPUT:

- `weight` – an element λ of the weight lattice
- `i` – an element of the index set
- `q1`, `q2` – two elements of the ground ring
- `convention` – `'antidominant'`, `'bar'`, or `'dominant'` (default: `'antidominant'`)

See *demazure_lusztig_operators()* for the details.

EXAMPLES:

```
sage: L = RootSystem(["A",1]).ambient_space()
sage: K = QQ['q1,q2']
sage: q1, q2 = K.gens()
sage: KL = L.algebra(K)
sage: KL.demazure_lusztig_operator_on_basis(L((2,2)), 1, q1, q2)
q1*B[(2, 2)]
sage: KL.demazure_lusztig_operator_on_basis(L((3,0)), 1, q1, q2)
(q1+q2)*B[(1, 2)] + (q1+q2)*B[(2, 1)] + (q1+q2)*B[(3, 0)] + q1*B[(0, 3)]
sage: KL.demazure_lusztig_operator_on_basis(L((0,3)), 1, q1, q2)
-(q1+q2)*B[(1, 2)] - (q1+q2)*B[(2, 1)] - q2*B[(3, 0)]
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(1)]).ambient_space()
>>> K = QQ['q1,q2']
>>> q1, q2 = K.gens()
>>> KL = L.algebra(K)
>>> KL.demazure_lusztig_operator_on_basis(L((Integer(2),Integer(2))),
↪Integer(1), q1, q2)
q1*B[(2, 2)]
```

(continues on next page)

(continued from previous page)

```
>>> KL.demazure_lusztig_operator_on_basis(L((Integer(3),Integer(0))),␣
↪Integer(1), q1, q2)
(q1+q2)*B[(1, 2)] + (q1+q2)*B[(2, 1)] + (q1+q2)*B[(3, 0)] + q1*B[(0, 3)]
>>> KL.demazure_lusztig_operator_on_basis(L((Integer(0),Integer(3))),␣
↪Integer(1), q1, q2)
-(q1+q2)*B[(1, 2)] - (q1+q2)*B[(2, 1)] - q2*B[(3, 0)]
```

At $q_1 = 1$ and $q_2 = 0$ we recover the action of the isobaric divided differences π_i:

```
sage: KL.demazure_lusztig_operator_on_basis(L((2,2)), 1, 1, 0)
B[(2, 2)]
sage: KL.demazure_lusztig_operator_on_basis(L((3,0)), 1, 1, 0)
B[(1, 2)] + B[(2, 1)] + B[(3, 0)] + B[(0, 3)]
sage: KL.demazure_lusztig_operator_on_basis(L((0,3)), 1, 1, 0)
-B[(1, 2)] - B[(2, 1)]
```

```
>>> from sage.all import *
>>> KL.demazure_lusztig_operator_on_basis(L((Integer(2),Integer(2))),␣
↪Integer(1), Integer(1), Integer(0))
B[(2, 2)]
>>> KL.demazure_lusztig_operator_on_basis(L((Integer(3),Integer(0))),␣
↪Integer(1), Integer(1), Integer(0))
B[(1, 2)] + B[(2, 1)] + B[(3, 0)] + B[(0, 3)]
>>> KL.demazure_lusztig_operator_on_basis(L((Integer(0),Integer(3))),␣
↪Integer(1), Integer(1), Integer(0))
-B[(1, 2)] - B[(2, 1)]
```

Or $1 - \pi_i$ for `bar=True`:

```
sage: KL.demazure_lusztig_operator_on_basis(L((2,2)), 1, 1, 0, convention=
↪'bar')
0
sage: KL.demazure_lusztig_operator_on_basis(L((3,0)), 1, 1, 0, convention=
↪'bar')
-B[(1, 2)] - B[(2, 1)] - B[(0, 3)]
sage: KL.demazure_lusztig_operator_on_basis(L((0,3)), 1, 1, 0, convention=
↪'bar')
B[(1, 2)] + B[(2, 1)] + B[(0, 3)]
```

```
>>> from sage.all import *
>>> KL.demazure_lusztig_operator_on_basis(L((Integer(2),Integer(2))),␣
↪Integer(1), Integer(1), Integer(0), convention='bar')
0
>>> KL.demazure_lusztig_operator_on_basis(L((Integer(3),Integer(0))),␣
↪Integer(1), Integer(1), Integer(0), convention='bar')
-B[(1, 2)] - B[(2, 1)] - B[(0, 3)]
>>> KL.demazure_lusztig_operator_on_basis(L((Integer(0),Integer(3))),␣
↪Integer(1), Integer(1), Integer(0), convention='bar')
B[(1, 2)] + B[(2, 1)] + B[(0, 3)]
```

At $q_1 = 1$ and $q_2 = -1$ we recover the action of the simple reflection s_i:

```
sage: KL.demazure_lusztig_operator_on_basis(L((2,2)), 1, 1, -1)
B[(2, 2)]
sage: KL.demazure_lusztig_operator_on_basis(L((3,0)), 1, 1, -1)
B[(0, 3)]
sage: KL.demazure_lusztig_operator_on_basis(L((0,3)), 1, 1, -1)
B[(3, 0)]
```

```
>>> from sage.all import *
>>> KL.demazure_lusztig_operator_on_basis(L((Integer(2),Integer(2))),␣
↪Integer(1), Integer(1), -Integer(1))
B[(2, 2)]
>>> KL.demazure_lusztig_operator_on_basis(L((Integer(3),Integer(0))),␣
↪Integer(1), Integer(1), -Integer(1))
B[(0, 3)]
>>> KL.demazure_lusztig_operator_on_basis(L((Integer(0),Integer(3))),␣
↪Integer(1), Integer(1), -Integer(1))
B[(3, 0)]
```

demazure_lusztig_operator_on_classical_on_basis(*weight*, *i*, *q*, *q1*, *q2*, *convention='antidominant'*)

Return the result of applying the i-th Demazure-Lusztig operator on the classical weight `weight` embedded at level 0.

INPUT:

- `weight` – a classical weight λ
- `i` – an element of the index set
- `q1`, `q2` – two elements of the ground ring
- `convention` – `'antidominant'`, `'bar'`, or `'dominant'` (default: `'antidominant'`)

See *demazure_lusztig_operators()* for the details.

Todo

- Optimize the code to only do the embedding/projection for T_0
- Add an option to specify at which level one wants to work. Currently this is level 0.

EXAMPLES:

```
sage: L = RootSystem(["A",1,1]).ambient_space()
sage: L0 = L.classical()
sage: K = QQ['q,q1,q2']
sage: q, q1, q2 = K.gens()
sage: KL = L.algebra(K)
sage: KL0 = L0.algebra(K)
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(1),Integer(1)]).ambient_space()
>>> L0 = L.classical()
>>> K = QQ['q,q1,q2']
>>> q, q1, q2 = K.gens()
>>> KL = L.algebra(K)
>>> KL0 = L0.algebra(K)
```

These operators coincide with the usual Demazure-Lusztig operators:

```
sage: KL.demazure_lusztig_operator_on_classical_on_basis(L0((2,2)),      #␣
↪needs sage.graphs
....:                                                    1, q, q1, q2)
q1*B[(2, 2)]
sage: KL0.demazure_lusztig_operator_on_basis(L0((2,2)), 1, q1, q2)
q1*B[(2, 2)]

sage: KL.demazure_lusztig_operator_on_classical_on_basis(L0((3,0)),      #␣
↪needs sage.graphs
....:                                                    1, q, q1, q2)
(q1+q2)*B[(1, 2)] + (q1+q2)*B[(2, 1)] + (q1+q2)*B[(3, 0)] + q1*B[(0, 3)]
sage: KL0.demazure_lusztig_operator_on_basis(L0((3,0)), 1, q1, q2)
(q1+q2)*B[(1, 2)] + (q1+q2)*B[(2, 1)] + (q1+q2)*B[(3, 0)] + q1*B[(0, 3)]
```

```
>>> from sage.all import *
>>> KL.demazure_lusztig_operator_on_classical_on_basis(L0((Integer(2),
↪Integer(2))),      # needs sage.graphs
...                                                    Integer(1), q, q1,␣
↪q2)
q1*B[(2, 2)]
>>> KL0.demazure_lusztig_operator_on_basis(L0((Integer(2),Integer(2))),␣
↪Integer(1), q1, q2)
q1*B[(2, 2)]

>>> KL.demazure_lusztig_operator_on_classical_on_basis(L0((Integer(3),
↪Integer(0))),      # needs sage.graphs
...                                                    Integer(1), q, q1,␣
↪q2)
(q1+q2)*B[(1, 2)] + (q1+q2)*B[(2, 1)] + (q1+q2)*B[(3, 0)] + q1*B[(0, 3)]
>>> KL0.demazure_lusztig_operator_on_basis(L0((Integer(3),Integer(0))),␣
↪Integer(1), q1, q2)
(q1+q2)*B[(1, 2)] + (q1+q2)*B[(2, 1)] + (q1+q2)*B[(3, 0)] + q1*B[(0, 3)]
```

except that we now have an action of T_0, which introduces some q s:

```
sage: KL.demazure_lusztig_operator_on_classical_on_basis(L0((2,2)),      #␣
↪needs sage.graphs
....:                                                    0, q, q1, q2)
q1*B[(2, 2)]
sage: KL.demazure_lusztig_operator_on_classical_on_basis(L0((3,0)),      #␣
↪needs sage.graphs
....:                                                    0, q, q1, q2)
-(q^2*q1+q^2*q2)*B[(1, 2)] - (q*q1+q*q2)*B[(2, 1)] - q^3*q2*B[(0, 3)]
```

```
>>> from sage.all import *
>>> KL.demazure_lusztig_operator_on_classical_on_basis(L0((Integer(2),
↪Integer(2))),      # needs sage.graphs
...                                                    Integer(0), q, q1,␣
↪q2)
q1*B[(2, 2)]
>>> KL.demazure_lusztig_operator_on_classical_on_basis(L0((Integer(3),
```

(continues on next page)

(continued from previous page)

```
↪Integer(0))),      # needs sage.graphs
...                                                    Integer(0), q, q1,␣
↪q2)
-(q^2*q1+q^2*q2)*B[(1, 2)] - (q*q1+q*q2)*B[(2, 1)] - q^3*q2*B[(0, 3)]
```

demazure_lusztig_operators(*q1*, *q2*, *convention='antidominant'*)

Return the Demazure-Lusztig operators acting on `self`.

INPUT:

- `q1`, `q2` – two elements of the ground ring
- `convention` – "antidominant", "bar", or "dominant" (default: `'antidominant'`)

If R is the parent weight ring, the Demazure-Lusztig operator T_i is the linear map $R \to R$ obtained by interpolating between the isobaric divided difference operator π_i (see `isobaric_divided_difference_on_basis()`) and the simple reflection s_i.

$$(q_1 + q_2)\pi_i - q_2 s_i$$

The Demazure-Lusztig operators give the usual representation of the operator T_i of the (affine) Hecke algebra with eigenvalues q_1 and q_2 associated to the Weyl group.

Several variants are available to match with various conventions used in the literature:

- "bar" replaces π_i in the formula above by $\overline{\pi}_i = (1 - \pi_i)$.
- "dominant" conjugates the operator by $x^\lambda \mapsto x^-\lambda$.

The names dominant and antidominant for the conventions were chosen with regards to the nonsymmetric Macdonald polynomials. The Y operators for the Macdonald polynomials in the "dominant" convention satisfy $Y_\lambda = T_{t_\lambda}$ for λ dominant. This is also the convention used in [Haiman06]. For the "antidominant" convention, $Y_\lambda = T_{t_\lambda}$ with λ antidominant.

EXAMPLES:

```
sage: L = RootSystem(["A",1]).ambient_space()
sage: K = QQ['q1,q2'].fraction_field()
sage: q1, q2 = K.gens()
sage: KL = L.algebra(K)
sage: T = KL.demazure_lusztig_operators(q1, q2)
sage: Tbar = KL.demazure_lusztig_operators(q1, q2, convention='bar')
sage: Tdominant = KL.demazure_lusztig_operators(q1, q2,
....:                                           convention='dominant')
sage: x = KL.monomial(L((3,0)))
sage: T[1](x)
(q1+q2)*B[(1, 2)] + (q1+q2)*B[(2, 1)] + (q1+q2)*B[(3, 0)] + q1*B[(0, 3)]
sage: Tbar[1](x)
-(q1+q2)*B[(1, 2)] - (q1+q2)*B[(2, 1)] - (q1+2*q2)*B[(0, 3)]
sage: Tbar[1](x) + T[1](x)
(q1+q2)*B[(3, 0)] - 2*q2*B[(0, 3)]
```

(continues on next page)

(continued from previous page)

```
sage: Tdominant[1](x)
-(q1+q2)*B[(1, 2)] - (q1+q2)*B[(2, 1)] - q2*B[(0, 3)]

sage: Tdominant.Tw_inverse(1)(KL.monomial(-L.simple_root(1)))
-((q1+q2)/(q1*q2))*B[(0, 0)] - 1/q2*B[(1, -1)]
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(1)]).ambient_space()
>>> K = QQ['q1,q2'].fraction_field()
>>> q1, q2 = K.gens()
>>> KL = L.algebra(K)
>>> T = KL.demazure_lusztig_operators(q1, q2)
>>> Tbar = KL.demazure_lusztig_operators(q1, q2, convention='bar')
>>> Tdominant = KL.demazure_lusztig_operators(q1, q2,
...                                           convention='dominant')
>>> x = KL.monomial(L((Integer(3),Integer(0))))
>>> T[Integer(1)](x)
(q1+q2)*B[(1, 2)] + (q1+q2)*B[(2, 1)] + (q1+q2)*B[(3, 0)] + q1*B[(0, 3)]
>>> Tbar[Integer(1)](x)
-(q1+q2)*B[(1, 2)] - (q1+q2)*B[(2, 1)] - (q1+2*q2)*B[(0, 3)]
>>> Tbar[Integer(1)](x) + T[Integer(1)](x)
(q1+q2)*B[(3, 0)] - 2*q2*B[(0, 3)]
>>> Tdominant[Integer(1)](x)
-(q1+q2)*B[(1, 2)] - (q1+q2)*B[(2, 1)] - q2*B[(0, 3)]

>>> Tdominant.Tw_inverse(Integer(1))(KL.monomial(-L.simple_
↪root(Integer(1))))
-((q1+q2)/(q1*q2))*B[(0, 0)] - 1/q2*B[(1, -1)]
```

We repeat similar computation in the affine setting:

```
sage: L = RootSystem(["A",2,1]).ambient_space()
sage: K = QQ['q1,q2'].fraction_field()
sage: q1, q2 = K.gens()
sage: KL = L.algebra(K)
sage: T = KL.demazure_lusztig_operators(q1, q2)
sage: Tbar = KL.demazure_lusztig_operators(q1, q2, convention='bar')
sage: Tdominant = KL.demazure_lusztig_operators(q1, q2,
....:                                           convention='dominant')
sage: e = L.basis()
sage: x = KL.monomial(3*e[0])
sage: T[1](x)
(q1+q2)*B[e[0] + 2*e[1]] + (q1+q2)*B[2*e[0] + e[1]]
 + (q1+q2)*B[3*e[0]] + q1*B[3*e[1]]
sage: Tbar[1](x)
-(q1+q2)*B[e[0] + 2*e[1]] - (q1+q2)*B[2*e[0] + e[1]] - (q1+2*q2)*B[3*e[1]]
sage: Tbar[1](x) + T[1](x)
(q1+q2)*B[3*e[0]] - 2*q2*B[3*e[1]]
sage: Tdominant[1](x)
-(q1+q2)*B[e[0] + 2*e[1]] - (q1+q2)*B[2*e[0] + e[1]] - q2*B[3*e[1]]
sage: Tdominant.Tw_inverse(1)(KL.monomial(-L.simple_root(1)))
-((q1+q2)/(q1*q2))*B[0] - 1/q2*B[e[0] - e[1]]
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(2),Integer(1)]).ambient_space()
>>> K = QQ['q1,q2'].fraction_field()
>>> q1, q2 = K.gens()
>>> KL = L.algebra(K)
>>> T = KL.demazure_lusztig_operators(q1, q2)
>>> Tbar = KL.demazure_lusztig_operators(q1, q2, convention='bar')
>>> Tdominant = KL.demazure_lusztig_operators(q1, q2,
...                                           convention='dominant')
>>> e = L.basis()
>>> x = KL.monomial(Integer(3)*e[Integer(0)])
>>> T[Integer(1)](x)
(q1+q2)*B[e[0] + 2*e[1]] + (q1+q2)*B[2*e[0] + e[1]]
 + (q1+q2)*B[3*e[0]] + q1*B[3*e[1]]
>>> Tbar[Integer(1)](x)
-(q1+q2)*B[e[0] + 2*e[1]] - (q1+q2)*B[2*e[0] + e[1]] - (q1+2*q2)*B[3*e[1]]
>>> Tbar[Integer(1)](x) + T[Integer(1)](x)
(q1+q2)*B[3*e[0]] - 2*q2*B[3*e[1]]
>>> Tdominant[Integer(1)](x)
-(q1+q2)*B[e[0] + 2*e[1]] - (q1+q2)*B[2*e[0] + e[1]] - q2*B[3*e[1]]
>>> Tdominant.Tw_inverse(Integer(1))(KL.monomial(-L.simple_
↪root(Integer(1))))
-((q1+q2)/(q1*q2))*B[0] - 1/q2*B[e[0] - e[1]]
```

One can obtain iterated operators by passing a reduced word or an element of the Weyl group:

```
sage: T[1,2](x)
(q1^2+2*q1*q2+q2^2)*B[e[0] + e[1] + e[2]] +
(q1^2+2*q1*q2+q2^2)*B[e[0] + 2*e[1]] +
(q1^2+q1*q2)*B[e[0] + 2*e[2]] + (q1^2+2*q1*q2+q2^2)*B[2*e[0] + e[1]] +
(q1^2+q1*q2)*B[2*e[0] + e[2]] + (q1^2+q1*q2)*B[3*e[0]] +
(q1^2+q1*q2)*B[e[1] + 2*e[2]] + (q1^2+q1*q2)*B[2*e[1] + e[2]] +
(q1^2+q1*q2)*B[3*e[1]] + q1^2*B[3*e[2]]
```

```
>>> from sage.all import *
>>> T[Integer(1),Integer(2)](x)
(q1^2+2*q1*q2+q2^2)*B[e[0] + e[1] + e[2]] +
(q1^2+2*q1*q2+q2^2)*B[e[0] + 2*e[1]] +
(q1^2+q1*q2)*B[e[0] + 2*e[2]] + (q1^2+2*q1*q2+q2^2)*B[2*e[0] + e[1]] +
(q1^2+q1*q2)*B[2*e[0] + e[2]] + (q1^2+q1*q2)*B[3*e[0]] +
(q1^2+q1*q2)*B[e[1] + 2*e[2]] + (q1^2+q1*q2)*B[2*e[1] + e[2]] +
(q1^2+q1*q2)*B[3*e[1]] + q1^2*B[3*e[2]]
```

and use that to check, for example, the braid relations:

```
sage: T[1,2,1](x) - T[2,1,2](x)
0
```

```
>>> from sage.all import *
>>> T[Integer(1),Integer(2),Integer(1)](x) - T[Integer(2),Integer(1),
↪Integer(2)](x)
0
```

The operators satisfy the relations of the affine Hecke algebra with parameters q_1, q_2:

```
sage: T._test_relations()
sage: Tdominant._test_relations()
sage: Tbar._test_relations() #-q2,q1+2*q2   # todo: not implemented: set␣
↪the appropriate eigenvalues!
```

```
>>> from sage.all import *
>>> T._test_relations()
>>> Tdominant._test_relations()
>>> Tbar._test_relations() #-q2,q1+2*q2   # todo: not implemented: set␣
↪the appropriate eigenvalues!
```

And the $\bar{T}$ are basically the inverses of the T s:

```
sage: Tinv = KL.demazure_lusztig_operators(2/q1 + 1/q2, -1/q1,
....:                                       convention='bar')
sage: [Tinv[1](T[1](x)) - x for x in KL.some_elements()]                #␣
↪needs sage.graphs
[0, 0, 0, 0, 0, 0, 0]
```

```
>>> from sage.all import *
>>> Tinv = KL.demazure_lusztig_operators(Integer(2)/q1 + Integer(1)/q2, -
↪Integer(1)/q1,
...                                       convention='bar')
>>> [Tinv[Integer(1)](T[Integer(1)](x)) - x for x in KL.some_elements()] ␣
↪              # needs sage.graphs
[0, 0, 0, 0, 0, 0, 0]
```

We check that $\Lambda_1 - \Lambda_0$ is an eigenvector for the Y s in affine type:

```
sage: K = QQ['q,q1,q2'].fraction_field()
sage: q,q1,q2 = K.gens()
sage: L = RootSystem(["A",2,1]).ambient_space()
sage: L0 = L.classical()
sage: Lambda = L.fundamental_weights()                                   #␣
↪needs sage.graphs
sage: alphacheck = L0.simple_coroots()
sage: KL = L.algebra(K)
sage: T = KL.demazure_lusztig_operators(q1, q2, convention='dominant')
sage: Y = T.Y()
sage: alphacheck = Y.keys().alpha()  # alpha of coroot lattice is␣
↪alphacheck
sage: alphacheck
Finite family {0: alphacheck[0], 1: alphacheck[1], 2: alphacheck[2]}
sage: x = KL.monomial(Lambda[1] - Lambda[0]); x                          #␣
↪needs sage.graphs
B[e[0]]
```

```
>>> from sage.all import *
>>> K = QQ['q,q1,q2'].fraction_field()
>>> q,q1,q2 = K.gens()
>>> L = RootSystem(["A",Integer(2),Integer(1)]).ambient_space()
```

(continues on next page)

(continued from previous page)

```
>>> L0 = L.classical()
>>> Lambda = L.fundamental_weights()                                    #␣
↪needs sage.graphs
>>> alphacheck = L0.simple_coroots()
>>> KL = L.algebra(K)
>>> T = KL.demazure_lusztig_operators(q1, q2, convention='dominant')
>>> Y = T.Y()
>>> alphacheck = Y.keys().alpha()  # alpha of coroot lattice is alphacheck
>>> alphacheck
Finite family {0: alphacheck[0], 1: alphacheck[1], 2: alphacheck[2]}
>>> x = KL.monomial(Lambda[Integer(1)] - Lambda[Integer(0)]); x         ␣
↪              # needs sage.graphs
B[e[0]]
```

In fact it is not exactly an eigenvector, but the extra 'delta` term is to be interpreted as a q parameter:

```
sage: # needs sage.graphs
sage: Y[alphacheck[0]](KL.one())
q2^2/q1^2*B[0]
sage: Y[alphacheck[1]](x)
-(q2^2/(-q1^2))*B[e[0] - e['delta']]
sage: Y[alphacheck[2]](x)
(q1/(-q2))*B[e[0]]
sage: KL.q_project(Y[alphacheck[1]](x),q)
-(q2^2/(-q*q1^2))*B[(1, 0, 0)]

sage: # needs sage.graphs
sage: KL.q_project(x, q)
B[(1, 0, 0)]
sage: KL.q_project(Y[alphacheck[0]](x),q)
-q*q1/q2*B[(1, 0, 0)]
sage: KL.q_project(Y[alphacheck[1]](x),q)
-(q2^2/(-q*q1^2))*B[(1, 0, 0)]
sage: KL.q_project(Y[alphacheck[2]](x),q)
(q1/(-q2))*B[(1, 0, 0)]
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> Y[alphacheck[Integer(0)]](KL.one())
q2^2/q1^2*B[0]
>>> Y[alphacheck[Integer(1)]](x)
-(q2^2/(-q1^2))*B[e[0] - e['delta']]
>>> Y[alphacheck[Integer(2)]](x)
(q1/(-q2))*B[e[0]]
>>> KL.q_project(Y[alphacheck[Integer(1)]](x),q)
-(q2^2/(-q*q1^2))*B[(1, 0, 0)]

>>> # needs sage.graphs
>>> KL.q_project(x, q)
B[(1, 0, 0)]
>>> KL.q_project(Y[alphacheck[Integer(0)]](x),q)
-q*q1/q2*B[(1, 0, 0)]
```

(continues on next page)

(continued from previous page)

```
>>> KL.q_project(Y[alphacheck[Integer(1)]](x),q)
-(q2^2/(-q*q1^2))*B[(1, 0, 0)]
>>> KL.q_project(Y[alphacheck[Integer(2)]](x),q)
(q1/(-q2))*B[(1, 0, 0)]
```

We now check systematically that the Demazure-Lusztig operators satisfy the relations of the Iwahori-Hecke algebra:

```
sage: K = QQ['q1,q2']
sage: q1, q2 = K.gens()
sage: for cartan_type in CartanType.samples(crystallographic=True):   #␣
↪long time (12s)
....:     L = RootSystem(cartan_type).root_lattice()
....:     KL = L.algebra(K)
....:     T = KL.demazure_lusztig_operators(q1,q2)
....:     T._test_relations()

sage: for cartan_type in CartanType.samples(crystallographic=True):   #␣
↪long time (12s)
....:     L = RootSystem(cartan_type).weight_lattice()
....:     KL = L.algebra(K)
....:     T = KL.demazure_lusztig_operators(q1,q2)
....:     T._test_relations()
```

```
>>> from sage.all import *
>>> K = QQ['q1,q2']
>>> q1, q2 = K.gens()
>>> for cartan_type in CartanType.samples(crystallographic=True):   # long␣
↪time (12s)
...     L = RootSystem(cartan_type).root_lattice()
...     KL = L.algebra(K)
...     T = KL.demazure_lusztig_operators(q1,q2)
...     T._test_relations()

>>> for cartan_type in CartanType.samples(crystallographic=True):   # long␣
↪time (12s)
...     L = RootSystem(cartan_type).weight_lattice()
...     KL = L.algebra(K)
...     T = KL.demazure_lusztig_operators(q1,q2)
...     T._test_relations()
```

Recall that the Demazure-Lusztig operators are only defined when all monomials belong to the weight lattice. Thus, in the group algebra of the ambient space, we need to specify explicitly the elements on which to run the tests:

```
sage: for cartan_type in CartanType.samples(crystallographic=True):   #␣
↪long time (12s)
....:     L = RootSystem(cartan_type).ambient_space()
....:     KL = L.algebra(K)
....:     weight_lattice = RootSystem(cartan_type).weight_
↪lattice(extended=L.is_extended())
....:     elements = [ KL.monomial(L(weight)) for weight in weight_lattice.
```

(continues on next page)

(continued from previous page)

```
↪some_elements() ]
....:     T = KL.demazure_lusztig_operators(q1,q2)
....:     T._test_relations(elements=elements)
```

```
>>> from sage.all import *
>>> for cartan_type in CartanType.samples(crystallographic=True):  # long␣
↪time (12s)
...     L = RootSystem(cartan_type).ambient_space()
...     KL = L.algebra(K)
...     weight_lattice = RootSystem(cartan_type).weight_lattice(extended=L.
↪is_extended())
...     elements = [ KL.monomial(L(weight)) for weight in weight_lattice.
↪some_elements() ]
...     T = KL.demazure_lusztig_operators(q1,q2)
...     T._test_relations(elements=elements)
```

demazure_lusztig_operators_on_classical(*q*, *q1*, *q2*, *convention='antidominant'*)

Return the Demazure-Lusztig operators acting at level 1 on `self.classical()`.

INPUT:

- `q`, `q1`, `q2` – three elements of the ground ring
- `convention` – `'antidominant'`, `'bar'`, or `'dominant'` (default: `'antidominant'`)

Let KL be the group algebra of an affine weight lattice realization L. The Demazure-Lusztig operators for KL act on the group algebra of the corresponding classical weight lattice by embedding it at level 1, and projecting back.

See also

- *demazure_lusztig_operators()*.
- *demazure_lusztig_operator_on_classical_on_basis()*.
- *q_project()*

EXAMPLES:

```
sage: L = RootSystem(["A",1,1]).ambient_space()
sage: K = QQ['q,q1,q2'].fraction_field()
sage: q, q1, q2 = K.gens()
sage: KL = L.algebra(K)
sage: KL0 = KL.classical()
sage: L0 = KL0.basis().keys()
sage: T = KL.demazure_lusztig_operators_on_classical(q, q1, q2)          #␣
↪needs sage.graphs

sage: x = KL0.monomial(L0((3,0))); x
B[(3, 0)]
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(1),Integer(1)]).ambient_space()
>>> K = QQ['q,q1,q2'].fraction_field()
>>> q, q1, q2 = K.gens()
```

(continues on next page)

(continued from previous page)

```
>>> KL = L.algebra(K)
>>> KL0 = KL.classical()
>>> L0 = KL0.basis().keys()
>>> T = KL.demazure_lusztig_operators_on_classical(q, q1, q2)          #␣
↪needs sage.graphs

>>> x = KL0.monomial(L0((Integer(3),Integer(0)))); x
B[(3, 0)]
```

For $T_1, \ldots$ we recover the usual Demazure-Lusztig operators:

```
sage: T[1](x)                                                           #␣
↪needs sage.graphs
(q1+q2)*B[(1, 2)] + (q1+q2)*B[(2, 1)] + (q1+q2)*B[(3, 0)] + q1*B[(0, 3)]
```

```
>>> from sage.all import *
>>> T[Integer(1)](x)                                                    ␣
↪     # needs sage.graphs
(q1+q2)*B[(1, 2)] + (q1+q2)*B[(2, 1)] + (q1+q2)*B[(3, 0)] + q1*B[(0, 3)]
```

For T_0, we can note that, in the projection, δ is mapped to q:

```
sage: T[0](x)                                                           #␣
↪needs sage.graphs
-(q^2*q1+q^2*q2)*B[(1, 2)] - (q*q1+q*q2)*B[(2, 1)] - q^3*q2*B[(0, 3)]
```

```
>>> from sage.all import *
>>> T[Integer(0)](x)                                                    ␣
↪     # needs sage.graphs
-(q^2*q1+q^2*q2)*B[(1, 2)] - (q*q1+q*q2)*B[(2, 1)] - q^3*q2*B[(0, 3)]
```

Note that there is no translation part, and in particular 1 is an eigenvector for all T_i's:

```
sage: # needs sage.graphs
sage: T[0](KL0.one())
q1*B[(0, 0)]
sage: T[1](KL0.one())
q1*B[(0, 0)]
sage: Y = T.Y()
sage: alphacheck = Y.keys().simple_roots()
sage: Y[alphacheck[0]](KL0.one())
-q2/(q*q1)*B[(0, 0)]
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> T[Integer(0)](KL0.one())
q1*B[(0, 0)]
>>> T[Integer(1)](KL0.one())
q1*B[(0, 0)]
>>> Y = T.Y()
>>> alphacheck = Y.keys().simple_roots()
```

(continues on next page)

(continued from previous page)

```
>>> Y[alphacheck[Integer(0)]](KL0.one())
-q2/(q*q1)*B[(0, 0)]
```

Matching with Ion Bogdan's hand calculations from 3/15/2013:

```
sage: L = RootSystem(["A",1,1]).weight_space(extended=True)
sage: K = QQ['q,u'].fraction_field()
sage: q, u = K.gens()
sage: KL = L.algebra(K)
sage: KL0 = KL.classical()
sage: L0 = KL0.basis().keys()
sage: omega = L0.fundamental_weights()

sage: # needs sage.graphs
sage: T = KL.demazure_lusztig_operators_on_classical(q, u, -1/u,
....:                                                  convention='dominant
↪')
sage: Y = T.Y()
sage: alphacheck = Y.keys().simple_roots()
sage: Ydelta = Y[Y.keys().null_root()]
sage: Ydelta.word, Ydelta.signs, Ydelta.scalar
((), (), 1/q)
sage: Y1 = Y[alphacheck[1]]
sage: Y1.word, Y1.signs, Y1.scalar  # This is T_0 T_1 (T_1 acts first,␣
↪then T_0); Ion gets T_1 T_0
((1, 0), (1, 1), 1)
sage: Y0 = Y[alphacheck[0]]
sage: Y0.word, Y0.signs, Y0.scalar  # This is 1/q T_1^-1 T_0^-1
((0, 1), (-1, -1), 1/q)
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(1),Integer(1)]).weight_
↪space(extended=True)
>>> K = QQ['q,u'].fraction_field()
>>> q, u = K.gens()
>>> KL = L.algebra(K)
>>> KL0 = KL.classical()
>>> L0 = KL0.basis().keys()
>>> omega = L0.fundamental_weights()

>>> # needs sage.graphs
>>> T = KL.demazure_lusztig_operators_on_classical(q, u, -Integer(1)/u,
...                                                  convention='dominant')
>>> Y = T.Y()
>>> alphacheck = Y.keys().simple_roots()
>>> Ydelta = Y[Y.keys().null_root()]
>>> Ydelta.word, Ydelta.signs, Ydelta.scalar
((), (), 1/q)
>>> Y1 = Y[alphacheck[Integer(1)]]
>>> Y1.word, Y1.signs, Y1.scalar  # This is T_0 T_1 (T_1 acts first, then␣
↪T_0); Ion gets T_1 T_0
((1, 0), (1, 1), 1)
```

(continues on next page)

(continued from previous page)

```
>>> Y0 = Y[alphacheck[Integer(0)]]
>>> Y0.word, Y0.signs, Y0.scalar  # This is 1/q T_1^-1 T_0^-1
((0, 1), (-1, -1), 1/q)
```

Note that the following computations use the “dominant” convention:

```
sage: # needs sage.graphs
sage: T0 = T.Tw(0)
sage: T0(KL0.monomial(omega[1]))
q*u*B[-Lambda[1]] + ((u^2-1)/u)*B[Lambda[1]]
sage: T0(KL0.monomial(2*omega[1]))
((q*u^2-q)/u)*B[0] + q^2*u*B[-2*Lambda[1]] + ((u^2-1)/u)*B[2*Lambda[1]]
sage: T0(KL0.monomial(-omega[1]))
1/(q*u)*B[Lambda[1]]
sage: T0(KL0.monomial(-2*omega[1]))
-((u^2-1)/(q*u))*B[0] + 1/(q^2*u)*B[2*Lambda[1]]
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> T0 = T.Tw(Integer(0))
>>> T0(KL0.monomial(omega[Integer(1)]))
q*u*B[-Lambda[1]] + ((u^2-1)/u)*B[Lambda[1]]
>>> T0(KL0.monomial(Integer(2)*omega[Integer(1)]))
((q*u^2-q)/u)*B[0] + q^2*u*B[-2*Lambda[1]] + ((u^2-1)/u)*B[2*Lambda[1]]
>>> T0(KL0.monomial(-omega[Integer(1)]))
1/(q*u)*B[Lambda[1]]
>>> T0(KL0.monomial(-Integer(2)*omega[Integer(1)]))
-((u^2-1)/(q*u))*B[0] + 1/(q^2*u)*B[2*Lambda[1]]
```

demazure_operators()

Return the Demazure operators acting on `self`.

The i-th Demazure operator is defined by:

$$\pi_i = \frac{1 - e^{-\alpha_i}s_i}{1 - e^{-\alpha_i}}$$

It acts on e^λ, for λ a weight, by:

$$\pi_i e^\lambda = \frac{e^\lambda - e^{-\alpha_i + s_i\lambda}}{1 - e^{-\alpha_i}}$$

This matches with Lascoux’ definition [Lascoux2003] of π_i, and with the i-th Demazure operator of [Kumar1987], which also works for general Kac-Moody types.

REFERENCES:

EXAMPLES:

We compute some Schur functions, as images of dominant monomials under the action of the maximal isobaric divided difference Δ_{w_0}:

```
sage: L = RootSystem(["A",2]).ambient_lattice()
sage: KL = L.algebra(QQ)
sage: w0 = tuple(L.weyl_group().long_element().reduced_word())             #
```

(continues on next page)

(continued from previous page)

```
↪needs sage.libs.gap
sage: pi = KL.demazure_operators()
sage: pi0 = pi[w0]                                                             #␣
↪needs sage.libs.gap
sage: pi0(KL.monomial(L((2,1))))                                               #␣
↪needs sage.libs.gap
2*B[(1, 1, 1)] + B[(1, 2, 0)] + B[(1, 0, 2)] + B[(2, 1, 0)]
 + B[(2, 0, 1)] + B[(0, 1, 2)] + B[(0, 2, 1)]
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(2)]).ambient_lattice()
>>> KL = L.algebra(QQ)
>>> w0 = tuple(L.weyl_group().long_element().reduced_word())                 #␣
↪needs sage.libs.gap
>>> pi = KL.demazure_operators()
>>> pi0 = pi[w0]                                                             #␣
↪needs sage.libs.gap
>>> pi0(KL.monomial(L((Integer(2),Integer(1)))))                              ␣
↪              # needs sage.libs.gap
2*B[(1, 1, 1)] + B[(1, 2, 0)] + B[(1, 0, 2)] + B[(2, 1, 0)]
 + B[(2, 0, 1)] + B[(0, 1, 2)] + B[(0, 2, 1)]
```

Let us make the result into an actual polynomial:

```
sage: P = QQ['x,y,z']
sage: pi0(KL.monomial(L((2,1)))).expand(P.gens())                              #␣
↪needs sage.libs.gap
x^2*y + x*y^2 + x^2*z + 2*x*y*z + y^2*z + x*z^2 + y*z^2
```

```
>>> from sage.all import *
>>> P = QQ['x,y,z']
>>> pi0(KL.monomial(L((Integer(2),Integer(1))))).expand(P.gens())             ␣
↪              # needs sage.libs.gap
x^2*y + x*y^2 + x^2*z + 2*x*y*z + y^2*z + x*z^2 + y*z^2
```

This is indeed a Schur function:

```
sage: s = SymmetricFunctions(QQ).s()                                           #␣
↪needs sage.combinat
sage: s[2,1].expand(3, P.variable_names())                                     #␣
↪needs sage.combinat
x^2*y + x*y^2 + x^2*z + 2*x*y*z + y^2*z + x*z^2 + y*z^2
```

```
>>> from sage.all import *
>>> s = SymmetricFunctions(QQ).s()                                           #␣
↪needs sage.combinat
>>> s[Integer(2),Integer(1)].expand(Integer(3), P.variable_names())           ␣
↪                       # needs sage.combinat
x^2*y + x*y^2 + x^2*z + 2*x*y*z + y^2*z + x*z^2 + y*z^2
```

Let us check this systematically on Schur functions of degree 6:

```
sage: for p in Partitions(6, max_length=3).list():                          #␣
↪needs sage.combinat sage.libs.gap
....:     assert (s.monomial(p).expand(3, P.variable_names())
....:              == pi0(KL.monomial(L(tuple(p)))).expand(P.gens()))
```

```
>>> from sage.all import *
>>> for p in Partitions(Integer(6), max_length=Integer(3)).list():              ␣
↪             # needs sage.combinat sage.libs.gap
...     assert (s.monomial(p).expand(Integer(3), P.variable_names())
...              == pi0(KL.monomial(L(tuple(p)))).expand(P.gens()))
```

We check systematically that these operators satisfy the Iwahori-Hecke algebra relations:

```
sage: for cartan_type in CartanType.samples(crystallographic=True):  #␣
↪long time (12s)
....:     L = RootSystem(cartan_type).weight_lattice()
....:     KL = L.algebra(QQ)
....:     T = KL.demazure_operators()
....:     T._test_relations()

sage: L = RootSystem(['A',1,1]).weight_lattice()
sage: KL = L.algebra(QQ)
sage: T = KL.demazure_operators()
sage: T._test_relations()
```

```
>>> from sage.all import *
>>> for cartan_type in CartanType.samples(crystallographic=True):  # long␣
↪time (12s)
...     L = RootSystem(cartan_type).weight_lattice()
...     KL = L.algebra(QQ)
...     T = KL.demazure_operators()
...     T._test_relations()

>>> L = RootSystem(['A',Integer(1),Integer(1)]).weight_lattice()
>>> KL = L.algebra(QQ)
>>> T = KL.demazure_operators()
>>> T._test_relations()
```

Warning

The Demazure operators are only defined if all the elements in the support have integral scalar products with the coroots (basically, they are in the weight lattice). Otherwise an error is raised:

```
sage: L = RootSystem(CartanType(["G",2]).dual()).ambient_space()
sage: KL = L.algebra(QQ)
sage: pi = KL.demazure_operators()
sage: pi[1](KL.monomial(L([0,0,1])))
Traceback (most recent call last):
...
ValueError: the weight does not have an integral scalar product with␣
↪the coroot
```

```
>>> from sage.all import *
>>> L = RootSystem(CartanType(["G",Integer(2)]).dual()).ambient_space()
>>> KL = L.algebra(QQ)
>>> pi = KL.demazure_operators()
>>> pi[Integer(1)](KL.monomial(L([Integer(0),Integer(0),Integer(1)])))
Traceback (most recent call last):
...
ValueError: the weight does not have an integral scalar product with␣
↪the coroot
```

divided_difference_on_basis(*weight*, *i*)

Return the result of applying the i-th divided difference on `weight`.

INPUT:

- `weight` – a weight
- `i` – an element of the index set

Todo

type free definition (Viviane's definition uses that we are in the ambient space)

EXAMPLES:

```
sage: L = RootSystem(["A",1]).ambient_space()
sage: KL = L.algebra(QQ)
sage: KL.divided_difference_on_basis(L((2,2)), 1) # todo: not implemented
0
sage: KL.divided_difference_on_basis(L((3,0)), 1) # todo: not implemented
B[(2, 0)] + B[(1, 1)] + B[(0, 2)]
sage: KL.divided_difference_on_basis(L((0,3)), 1) # todo: not implemented
-B[(2, 0)] - B[(1, 1)] - B[(0, 2)]
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(1)]).ambient_space()
>>> KL = L.algebra(QQ)
>>> KL.divided_difference_on_basis(L((Integer(2),Integer(2))),␣
↪Integer(1)) # todo: not implemented
0
>>> KL.divided_difference_on_basis(L((Integer(3),Integer(0))),␣
↪Integer(1)) # todo: not implemented
B[(2, 0)] + B[(1, 1)] + B[(0, 2)]
>>> KL.divided_difference_on_basis(L((Integer(0),Integer(3))),␣
↪Integer(1)) # todo: not implemented
-B[(2, 0)] - B[(1, 1)] - B[(0, 2)]
```

In type A and in the ambient lattice, we recover the usual action of divided differences polynomials:

```
sage: x,y = QQ['x,y'].gens()
sage: d = lambda p: (p - p(y,x)) / (x-y)
sage: d(x^2*y^2)
0
```

(continues on next page)

(continued from previous page)

```
sage: d(x^3)
x^2 + x*y + y^2
sage: d(y^3)
-x^2 - x*y - y^2
```

```
>>> from sage.all import *
>>> x,y = QQ['x,y'].gens()
>>> d = lambda p: (p - p(y,x)) / (x-y)
>>> d(x**Integer(2)*y**Integer(2))
0
>>> d(x**Integer(3))
x^2 + x*y + y^2
>>> d(y**Integer(3))
-x^2 - x*y - y^2
```

from_polynomial(*p*)

Construct an element of `self` from a polynomial p.

INPUT:

- `p` – a polynomial

EXAMPLES:

```
sage: L = RootSystem(["A",2]).ambient_lattice()
sage: KL = L.algebra(QQ)
sage: x,y,z = QQ['x,y,z'].gens()
sage: KL.from_polynomial(x)
B[(1, 0, 0)]
sage: KL.from_polynomial(x^2*y + 2*y - z)
B[(2, 1, 0)] + 2*B[(0, 1, 0)] - B[(0, 0, 1)]
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(2)]).ambient_lattice()
>>> KL = L.algebra(QQ)
>>> x,y,z = QQ['x,y,z'].gens()
>>> KL.from_polynomial(x)
B[(1, 0, 0)]
>>> KL.from_polynomial(x**Integer(2)*y + Integer(2)*y - z)
B[(2, 1, 0)] + 2*B[(0, 1, 0)] - B[(0, 0, 1)]
```

Todo

make this work for Laurent polynomials too

isobaric_divided_difference_on_basis(*weight*, *i*)

Return the result of applying the i-th isobaric divided difference on `weight`.

INPUT:

- `weight` – a weight
- `i` – an element of the index set

See also:

demazure_operators()

EXAMPLES:

```
sage: L = RootSystem(["A",1]).ambient_space()
sage: KL = L.algebra(QQ)
sage: KL.isobaric_divided_difference_on_basis(L((2,2)), 1)
B[(2, 2)]
sage: KL.isobaric_divided_difference_on_basis(L((3,0)), 1)
B[(1, 2)] + B[(2, 1)] + B[(3, 0)] + B[(0, 3)]
sage: KL.isobaric_divided_difference_on_basis(L((0,3)), 1)
-B[(1, 2)] - B[(2, 1)]
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(1)]).ambient_space()
>>> KL = L.algebra(QQ)
>>> KL.isobaric_divided_difference_on_basis(L((Integer(2),Integer(2))),␣
↪Integer(1))
B[(2, 2)]
>>> KL.isobaric_divided_difference_on_basis(L((Integer(3),Integer(0))),␣
↪Integer(1))
B[(1, 2)] + B[(2, 1)] + B[(3, 0)] + B[(0, 3)]
>>> KL.isobaric_divided_difference_on_basis(L((Integer(0),Integer(3))),␣
↪Integer(1))
-B[(1, 2)] - B[(2, 1)]
```

In type A and in the ambient lattice, we recover the usual action of divided differences on polynomials:

```
sage: x,y = QQ['x,y'].gens()
sage: d = lambda p: (x*p - (x*p)(y,x)) / (x-y)
sage: d(x^2*y^2)
x^2*y^2
sage: d(x^3)
x^3 + x^2*y + x*y^2 + y^3
sage: d(y^3)
-x^2*y - x*y^2
```

```
>>> from sage.all import *
>>> x,y = QQ['x,y'].gens()
>>> d = lambda p: (x*p - (x*p)(y,x)) / (x-y)
>>> d(x**Integer(2)*y**Integer(2))
x^2*y^2
>>> d(x**Integer(3))
x^3 + x^2*y + x*y^2 + y^3
>>> d(y**Integer(3))
-x^2*y - x*y^2
```

REFERENCES:

q_project(x, q)

Implement the q-projection morphism from `self` to the group algebra of the classical space.

INPUT:

- `x` – an element of the group algebra of `self`
- `q` – an element of the ground ring

This is an algebra morphism mapping δ to q and X^b to its classical counterpart for the other elements b of the basis of the realization.

EXAMPLES:

```
sage: K = QQ['q'].fraction_field()
sage: q = K.gen()
sage: KL = RootSystem(["A",2,1]).ambient_space().algebra(K)
sage: L = KL.basis().keys()
sage: e = L.basis()
sage: x = (KL.an_element()
....:       + KL.monomial(4*e[1] + 3*e[2]
....:                     + e['deltacheck'] - 2*e['delta'])); x
B[2*e[0] + 2*e[1] + 3*e[2]]
 + B[4*e[1] + 3*e[2] - 2*e['delta'] + e['deltacheck']]
sage: KL.q_project(x, q)
B[(2, 2, 3)] + 1/q^2*B[(0, 4, 3)]

sage: KL = RootSystem(["BC",3,2]).ambient_space().algebra(K)
sage: L = KL.basis().keys()
sage: e = L.basis()
sage: x = (KL.an_element()
....:       + KL.monomial(4*e[1] + 3*e[2]
....:                     + e['deltacheck'] - 2*e['delta'])); x
B[2*e[0] + 2*e[1] + 3*e[2]]
 + B[4*e[1] + 3*e[2] - 2*e['delta'] + e['deltacheck']]
sage: KL.q_project(x, q)
B[(2, 2, 3)] + 1/q^2*B[(0, 4, 3)]
```

```
>>> from sage.all import *
>>> K = QQ['q'].fraction_field()
>>> q = K.gen()
>>> KL = RootSystem(["A",Integer(2),Integer(1)]).ambient_space().
↪algebra(K)
>>> L = KL.basis().keys()
>>> e = L.basis()
>>> x = (KL.an_element()
...       + KL.monomial(Integer(4)*e[Integer(1)] +␣
↪Integer(3)*e[Integer(2)]
...                     + e['deltacheck'] - Integer(2)*e['delta'])); x
B[2*e[0] + 2*e[1] + 3*e[2]]
 + B[4*e[1] + 3*e[2] - 2*e['delta'] + e['deltacheck']]
>>> KL.q_project(x, q)

>>> KL = RootSystem(["BC",Integer(3),Integer(2)]).ambient_space().
↪algebra(K)
>>> L = KL.basis().keys()
>>> e = L.basis()
>>> x = (KL.an_element()
...       + KL.monomial(Integer(4)*e[Integer(1)] +␣
```

(continues on next page)

(continued from previous page)

```
↪Integer(3)*e[Integer(2)]
...                          + e['deltacheck'] - Integer(2)*e['delta'])); x
B[2*e[0] + 2*e[1] + 3*e[2]]
 + B[4*e[1] + 3*e[2] - 2*e['delta'] + e['deltacheck']]
>>> KL.q_project(x, q)
B[(2, 2, 3)] + 1/q^2*B[(0, 4, 3)]
```

Warning

Recall that the null root, usually denoted δ, is in fact `a[0]\delta` in Sage's notation, in order to avoid half integer coefficients (this only makes a difference in type BC). Similarly, what's usually denoted q is in fact `q^a[0]` in Sage's notations, to avoid manipulating square roots:

```
sage: KL.q_project(KL.monomial(L.null_root()),q)                           #␣
↪needs sage.graphs
q^2*B[(0, 0, 0)]
```

```
>>> from sage.all import *
>>> KL.q_project(KL.monomial(L.null_root()),q)                           #␣
↪needs sage.graphs
q^2*B[(0, 0, 0)]
```

q_project_on_basis(l, q)

Return the monomial $c * cl(l)$ in the group algebra of the classical lattice.

INPUT:

- `l` – an element of the root lattice realization
- `q` – an element of the ground ring

Here, $cl(l)$ is the projection of l in the classical lattice, and c is the coefficient of l in δ.

See also

q_project_on_basis()

EXAMPLES:

```
sage: K = QQ['q'].fraction_field()
sage: q = K.gen()
sage: KL = RootSystem(["A",2,1]).ambient_space().algebra(K)
sage: L = KL.basis().keys()
sage: e = L.basis()
sage: KL.q_project_on_basis(4*e[1] + 3*e[2]
....:                          + e['deltacheck'] - 2*e['delta'], q)
1/q^2*B[(0, 4, 3)]
```

```
>>> from sage.all import *
>>> K = QQ['q'].fraction_field()
>>> q = K.gen()
>>> KL = RootSystem(["A",Integer(2),Integer(1)]).ambient_space().
↪algebra(K)
```

(continues on next page)

(continued from previous page)

```
>>> L = KL.basis().keys()
>>> e = L.basis()
>>> KL.q_project_on_basis(Integer(4)*e[Integer(1)] +␣
↪Integer(3)*e[Integer(2)]
...                          + e['deltacheck'] - Integer(2)*e['delta'], q)
1/q^2*B[(0, 4, 3)]
```

some_elements()

Return some elements of the algebra self.

EXAMPLES:

```
sage: A = RootSystem(["A",2,1]).ambient_space().algebra(QQ)
sage: A.some_elements()
[B[2*e[0] + 2*e[1] + 3*e[2]]...]
sage: A.some_elements()                                                 #␣
↪needs sage.graphs
[B[2*e[0] + 2*e[1] + 3*e[2]],
 B[-e[0] + e[2] + e['delta']],
 B[e[0] - e[1]],
 B[e[1] - e[2]],
 B[e['deltacheck']],
 B[e[0] + e['deltacheck']],
 B[e[0] + e[1] + e['deltacheck']]]

sage: A = RootSystem(["B",2]).weight_space().algebra(QQ)
sage: A.some_elements()
[B[2*Lambda[1] + 2*Lambda[2]], ... B[Lambda[1]], B[Lambda[2]]]
sage: A.some_elements()                                                 #␣
↪needs sage.graphs
[B[2*Lambda[1] + 2*Lambda[2]],
 B[2*Lambda[1] - 2*Lambda[2]],
 B[-Lambda[1] + 2*Lambda[2]],
 B[Lambda[1]],
 B[Lambda[2]]]
```

```
>>> from sage.all import *
>>> A = RootSystem(["A",Integer(2),Integer(1)]).ambient_space().
↪algebra(QQ)
>>> A.some_elements()
[B[2*e[0] + 2*e[1] + 3*e[2]]...]
>>> A.some_elements()                                                 #␣
↪needs sage.graphs
[B[2*e[0] + 2*e[1] + 3*e[2]],
 B[-e[0] + e[2] + e['delta']],
 B[e[0] - e[1]],
 B[e[1] - e[2]],
 B[e['deltacheck']],
 B[e[0] + e['deltacheck']],
 B[e[0] + e[1] + e['deltacheck']]]

>>> A = RootSystem(["B",Integer(2)]).weight_space().algebra(QQ)
```

(continues on next page)

(continued from previous page)

 B[2*Lambda[1] - 2*Lambda[2]],
 B[-Lambda[1] + 2*Lambda[2]],
 B[Lambda[1]],
 B[Lambda[2]]]
```

twisted_demazure_lusztig_operator_on_basis(*weight*, *i*, *q1*, *q2*, *convention='antidominant'*)

Return the twisted Demazure-Lusztig operator acting on the basis.

INPUT:

- `weight` – an element λ of the weight lattice
- `i` – an element of the index set
- `q1`, `q2` – two elements of the ground ring
- `convention` – `'antidominant'`, `'bar'`, or `'dominant'` (default: `'antidominant'`)

 + ((q1^2+2*q1*q2+q2^2)/q1)*B[(2, 1, 2, 0)]
 + ((q1*q2+q2^2)/q1)*B[(2, 1, 0, 2)]
 + ((q1^2+2*q1*q2+q2^2)/q1)*B[(2, 2, 1, 0)]
 + ((q1*q2+q2^2)/q1)*B[(2, 2, 0, 1)]
```

twisted_demazure_lusztig_operators(*q1*, *q2*, *convention='antidominant'*)

Return the twisted Demazure-Lusztig operators acting on `self`.

INPUT:

- `q1`, `q2` – two elements of the ground ring
- `convention` – `'antidominant'`, `'bar'`, or `'dominant'` (default: `'antidominant'`)

Warning

- the code is currently only tested for $q_1 q_2 = -1$
- only the `'dominant'` convention is functional for $i = 0$

For $T_1, \ldots, T_n$, these operators are the usual Demazure-Lusztig operators. On the other hand, the operator T_0 is twisted:

```
sage: L = RootSystem(["A",3,1]).ambient_space()
sage: e = L.basis()
sage: K = QQ['q1,q2'].fraction_field()
sage: q1, q2 = K.gens()
sage: KL = L.algebra(K)
sage: T = KL.twisted_demazure_lusztig_operators(q1, q2, convention=
↪'dominant')
sage: T._test_relations()
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(3),Integer(1)]).ambient_space()
>>> e = L.basis()
>>> K = QQ['q1,q2'].fraction_field()
>>> q1, q2 = K.gens()
>>> KL = L.algebra(K)
>>> T = KL.twisted_demazure_lusztig_operators(q1, q2, convention='dominant
↪')
>>> T._test_relations()
```

Todo

Choose a good set of Cartan Type to run on. Rank >4 is too big. But C_1 and B_1 are boring.

We now check systematically that those operators satisfy the relations of the Iwahori-Hecke algebra:

```
sage: K = QQ['q1,q2'].fraction_field()
sage: q1, q2 = K.gens()
sage: for cartan_type in CartanType.samples(affine=True,␣
↪crystallographic=True):  # long time (12s)
....:     if cartan_type.rank() > 4: continue
....:     if cartan_type.type() == 'BC': continue
....:     KL = RootSystem(cartan_type).weight_lattice().algebra(K)
....:     T = KL.twisted_demazure_lusztig_operators(q1, q2, convention=
↪'dominant')
....:     T._test_relations()
```

```
>>> from sage.all import *
>>> K = QQ['q1,q2'].fraction_field()
>>> q1, q2 = K.gens()
>>> for cartan_type in CartanType.samples(affine=True,␣
↪crystallographic=True):  # long time (12s)
...     if cartan_type.rank() > Integer(4): continue
...     if cartan_type.type() == 'BC': continue
...     KL = RootSystem(cartan_type).weight_lattice().algebra(K)
...     T = KL.twisted_demazure_lusztig_operators(q1, q2, convention=
↪'dominant')
...     T._test_relations()
```

Todo

Investigate why $T_0^\vee$ currently does not satisfy the quadratic relation in type BC. This should hopefully be fixed when $T_0^\vee$ will have a more uniform implementation:

```
sage: cartan_type = CartanType(["BC",1,2])
sage: KL = RootSystem(cartan_type).weight_lattice().algebra(K)
sage: T = KL.twisted_demazure_lusztig_operators(q1,q2, convention=
↪'dominant')
sage: T._test_relations()                                          #␣
↪needs sage.graphs
Traceback (most recent call last):
... tester.assertTrue(Ti(Ti(x,i,-q2),i,-q1).is_zero()) ...
AssertionError: False is not true
```

```
>>> from sage.all import *
>>> cartan_type = CartanType(["BC",Integer(1),Integer(2)])
>>> KL = RootSystem(cartan_type).weight_lattice().algebra(K)
>>> T = KL.twisted_demazure_lusztig_operators(q1,q2, convention=
↪'dominant')
>>> T._test_relations()                                           #␣
↪needs sage.graphs
Traceback (most recent call last):
... tester.assertTrue(Ti(Ti(x,i,-q2),i,-q1).is_zero()) ...
AssertionError: False is not true
```

Comparison with T0:

```
sage: L = RootSystem(["A",2,1]).ambient_space()
sage: e = L.basis()
sage: K = QQ['t,q'].fraction_field()
sage: t,q = K.gens()
sage: q1 = t
sage: q2 = -1
sage: KL = L.algebra(K)
sage: L0 = L.classical()
sage: T = KL.demazure_lusztig_operators(q1,q2, convention='dominant')
sage: def T0(*l0): return KL.q_project(T[0].on_basis()(L.embed_at_
↪level(L0(l0), 1)), q)
sage: T0_check_on_basis = KL.T0_check_on_basis(q1, q2,                #␣
↪needs sage.graphs
....:                                          convention='dominant')
sage: def T0c(*l0): return T0_check_on_basis(L0(l0))

sage: T0(0,0,1)                                   # not double checked    #␣
↪needs sage.graphs
-((t-1)/q)*B[(1, 0, 0)] + 1/q^2*B[(2, 0, -1)]
sage: T0c(0,0,1)                                                      #␣
↪needs sage.graphs
(t^2-t)*B[(1, 0, 0)] + (t^2-t)*B[(1, 1, -1)] + t^2*B[(2, 0, -1)] + (t-
↪1)*B[(0, 0, 1)]
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(2),Integer(1)]).ambient_space()
>>> e = L.basis()
>>> K = QQ['t,q'].fraction_field()
>>> t,q = K.gens()
>>> q1 = t
>>> q2 = -Integer(1)
>>> KL = L.algebra(K)
>>> L0 = L.classical()
>>> T = KL.demazure_lusztig_operators(q1,q2, convention='dominant')
>>> def T0(*l0): return KL.q_project(T[Integer(0)].on_basis()(L.embed_at_
↪level(L0(l0), Integer(1))), q)
>>> T0_check_on_basis = KL.T0_check_on_basis(q1, q2,                  #␣
↪needs sage.graphs
...                                          convention='dominant')
```

(continues on next page)

(continued from previous page)

```
>>> def T0c(*l0): return T0_check_on_basis(L0(l0))

>>> T0(Integer(0),Integer(0),Integer(1))
↪# not double checked     # needs sage.graphs
-((t-1)/q)*B[(1, 0, 0)] + 1/q^2*B[(2, 0, -1)]
>>> T0c(Integer(0),Integer(0),Integer(1))                                                ␣
↪                              # needs sage.graphs
(t^2-t)*B[(1, 0, 0)] + (t^2-t)*B[(1, 1, -1)] + t^2*B[(2, 0, -1)] + (t-
↪1)*B[(0, 0, 1)]
```

5.1.239 Root lattice realizations

class sage.combinat.root_system.root_lattice_realizations.**RootLatticeRealizations**(*base*, *name=None*)

Bases: `Category_over_base_ring`

The category of root lattice realizations over a given base ring.

A *root lattice realization* L over a base ring R is a free module (or vector space if R is a field) endowed with an embedding of the root lattice of some root system.

Typical root lattice realizations over $\mathbf{Z}$ include the root lattice, weight lattice, and ambient lattice. Typical root lattice realizations over $\mathbf{Q}$ include the root space, weight space, and ambient space.

To describe the embedding, a root lattice realization must implement a method `simple_root()` returning for each i in the index set the image of the simple root α_i under the embedding.

A root lattice realization must further implement a method on elements `scalar()`, computing the scalar product with elements of the coroot lattice or coroot space.

Using those, this category provides tools for reflections, roots, the Weyl group and its action, …

- *WeightSpace*
- *AmbientSpace*

EXAMPLES:

Here, we consider the root system of type A_7, and embed the root lattice element $x = \alpha_2 + 2\alpha_6$ in several root lattice realizations:

```
sage: R = RootSystem(["A",7])
sage: alpha = R.root_lattice().simple_roots()
sage: x = alpha[2] + 2 * alpha[5]

sage: L = R.root_space()
sage: L(x)
```

(continues on next page)

(continued from previous page)

```
alpha[2] + 2*alpha[5]

sage: L = R.weight_lattice()
sage: L(x)                                                                    #␣
↪needs sage.graphs
-Lambda[1] + 2*Lambda[2] - Lambda[3] - 2*Lambda[4] + 4*Lambda[5] - 2*Lambda[6]

sage: L = R.ambient_space()
sage: L(x)
(0, 1, -1, 0, 2, -2, 0, 0)
```

```
>>> from sage.all import *
>>> R = RootSystem(["A",Integer(7)])
>>> alpha = R.root_lattice().simple_roots()
>>> x = alpha[Integer(2)] + Integer(2) * alpha[Integer(5)]

>>> L = R.root_space()
>>> L(x)
alpha[2] + 2*alpha[5]

>>> L = R.weight_lattice()
>>> L(x)                                                                    #␣
↪needs sage.graphs
-Lambda[1] + 2*Lambda[2] - Lambda[3] - 2*Lambda[4] + 4*Lambda[5] - 2*Lambda[6]

>>> L = R.ambient_space()
>>> L(x)
(0, 1, -1, 0, 2, -2, 0, 0)
```

We embed the root space element $x = \alpha_2 + 1/2\alpha_6$ in several root lattice realizations:

```
sage: alpha = R.root_space().simple_roots()
sage: x = alpha[2] + 1/2 * alpha[5]

sage: L = R.weight_space()
sage: L(x)                                                                    #␣
↪needs sage.graphs
-Lambda[1] + 2*Lambda[2] - Lambda[3] - 1/2*Lambda[4] + Lambda[5] - 1/2*Lambda[6]

sage: L = R.ambient_space()
sage: L(x)
(0, 1, -1, 0, 1/2, -1/2, 0, 0)
```

```
>>> from sage.all import *
>>> alpha = R.root_space().simple_roots()
>>> x = alpha[Integer(2)] + Integer(1)/Integer(2) * alpha[Integer(5)]

>>> L = R.weight_space()
>>> L(x)                                                                    #␣
↪needs sage.graphs
-Lambda[1] + 2*Lambda[2] - Lambda[3] - 1/2*Lambda[4] + Lambda[5] - 1/2*Lambda[6]
```

(continues on next page)

(continued from previous page)

```
>>> L = R.ambient_space()
>>> L(x)
(0, 1, -1, 0, 1/2, -1/2, 0, 0)
```

Of course, one can't embed the root space in the weight lattice:

```
sage: L = R.weight_lattice()
sage: L(x)
Traceback (most recent call last):
...
TypeError: do not know how to make x (= alpha[2] + 1/2*alpha[5])
an element of self (=Weight lattice of the Root system of type ['A', 7])
```

```
>>> from sage.all import *
>>> L = R.weight_lattice()
>>> L(x)
Traceback (most recent call last):
...
TypeError: do not know how to make x (= alpha[2] + 1/2*alpha[5])
an element of self (=Weight lattice of the Root system of type ['A', 7])
```

If K_1 is a subring of K_2, then one could in theory have an embedding from the root space over K_1 to any root lattice realization over K_2; this is not implemented:

```
sage: K1 = QQ
sage: K2 = QQ['q']
sage: L = R.weight_space(K2)

sage: alpha = R.root_space(K2).simple_roots()
sage: L(alpha[1])                                                    #␣
↪needs sage.graphs
2*Lambda[1] - Lambda[2]

sage: alpha = R.root_space(K1).simple_roots()
sage: L(alpha[1])
Traceback (most recent call last):
...
TypeError: do not know how to make x (= alpha[1]) an element of self
(=Weight space over the Univariate Polynomial Ring in q
over Rational Field of the Root system of type ['A', 7])
```

```
>>> from sage.all import *
>>> K1 = QQ
>>> K2 = QQ['q']
>>> L = R.weight_space(K2)

>>> alpha = R.root_space(K2).simple_roots()
>>> L(alpha[Integer(1)])                                             ␣
↪     # needs sage.graphs
2*Lambda[1] - Lambda[2]

>>> alpha = R.root_space(K1).simple_roots()
```

(continues on next page)

(continued from previous page)

```
>>> L(alpha[Integer(1)])
Traceback (most recent call last):
...
TypeError: do not know how to make x (= alpha[1]) an element of self
(=Weight space over the Univariate Polynomial Ring in q
over Rational Field of the Root system of type ['A', 7])
```

By a slight abuse, the embedding of the root lattice is not actually required to be faithful. Typically for an affine root system, the null root of the root lattice is killed in the non extended weight lattice:

```
sage: R = RootSystem(["A", 3, 1])
sage: delta = R.root_lattice().null_root()                                    #␣
↪needs sage.graphs
sage: L = R.weight_lattice()
sage: L(delta)                                                                #␣
↪needs sage.graphs
0
```

```
>>> from sage.all import *
>>> R = RootSystem(["A", Integer(3), Integer(1)])
>>> delta = R.root_lattice().null_root()                                    #␣
↪needs sage.graphs
>>> L = R.weight_lattice()
>>> L(delta)                                                                #␣
↪needs sage.graphs
0
```

Algebras

alias of *Algebras*

class ElementMethods

Bases: `object`

affine_orbit()

The orbit of `self` under the dot or affine action of the Weyl group.

EXAMPLES:

```
sage: L = RootSystem(['A', 2]).ambient_lattice()
sage: sorted(L.rho().dot_orbit())                   # the output order␣
↪is not specified                # needs sage.graphs
[(-2, 1, 4), (-2, 3, 2), (2, -1, 2),
 (2, 1, 0), (0, -1, 4), (0, 3, 0)]

sage: L = RootSystem(['B',2]).weight_lattice()
sage: sorted(L.fundamental_weights()[1].dot_orbit())    # the output order␣
↪is not specified                # needs sage.graphs
[-4*Lambda[1], -4*Lambda[1] + 4*Lambda[2],
 -3*Lambda[1] - 2*Lambda[2], -3*Lambda[1] + 4*Lambda[2],
 Lambda[1], Lambda[1] - 6*Lambda[2],
 2*Lambda[1] - 6*Lambda[2], 2*Lambda[1] - 2*Lambda[2]]
```

```
>>> from sage.all import *
>>> L = RootSystem(['A', Integer(2)]).ambient_lattice()
>>> sorted(L.rho().dot_orbit())                          # the output order␣
↪is not specified                # needs sage.graphs
[(-2, 1, 4), (-2, 3, 2), (2, -1, 2),
 (2, 1, 0), (0, -1, 4), (0, 3, 0)]

>>> L = RootSystem(['B',Integer(2)]).weight_lattice()
>>> sorted(L.fundamental_weights()[Integer(1)].dot_orbit())    # the␣
↪output order is not specified             # needs sage.graphs
[-4*Lambda[1], -4*Lambda[1] + 4*Lambda[2],
 -3*Lambda[1] - 2*Lambda[2], -3*Lambda[1] + 4*Lambda[2],
 Lambda[1], Lambda[1] - 6*Lambda[2],
 2*Lambda[1] - 6*Lambda[2], 2*Lambda[1] - 2*Lambda[2]]
```

We compare the dot action orbit to the regular orbit:

```
sage: # needs sage.graphs
sage: L = RootSystem(['A', 3]).weight_lattice()
sage: len(L.rho().dot_orbit())
24
sage: len((-L.rho()).dot_orbit())
1
sage: La = L.fundamental_weights()
sage: len(La[1].dot_orbit())
24
sage: len(La[1].orbit())
4
sage: len((-L.rho() + La[1]).dot_orbit())
4
sage: len(La[2].dot_orbit())
24
sage: len(La[2].orbit())
6
sage: len((-L.rho() + La[2]).dot_orbit())
6
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> L = RootSystem(['A', Integer(3)]).weight_lattice()
>>> len(L.rho().dot_orbit())
24
>>> len((-L.rho()).dot_orbit())
1
>>> La = L.fundamental_weights()
>>> len(La[Integer(1)].dot_orbit())
24
>>> len(La[Integer(1)].orbit())
4
>>> len((-L.rho() + La[Integer(1)]).dot_orbit())
4
>>> len(La[Integer(2)].dot_orbit())
24
```

(continues on next page)

(continued from previous page)

```
>>> len(La[Integer(2)].orbit())
6
>>> len((-L.rho() + La[Integer(2)]).dot_orbit())
6
```

associated_coroot()

Return the coroot associated to this root.

EXAMPLES:

```
sage: alpha = RootSystem(["A", 3]).root_space().simple_roots()
sage: alpha[1].associated_coroot()                                          #␣
↪needs sage.graphs
alphacheck[1]
```

```
>>> from sage.all import *
>>> alpha = RootSystem(["A", Integer(3)]).root_space().simple_roots()
>>> alpha[Integer(1)].associated_coroot()                                  ␣
↪     # needs sage.graphs
alphacheck[1]
```

associated_reflection()

Given a positive root `self`, return a reduced word for the reflection orthogonal to `self`.

Since the answer is cached, it is a tuple instead of a list.

EXAMPLES:

```
sage: C3_rl = RootSystem(['C',3]).root_lattice()                           #␣
↪needs sage.graphs
sage: C3_rl.simple_root(3).weyl_action([1,2]).associated_reflection()     #␣
↪needs sage.graphs
(1, 2, 3, 2, 1)
sage: C3_rl.simple_root(2).associated_reflection()                         #␣
↪needs sage.graphs
(2,)
```

```
>>> from sage.all import *
>>> C3_rl = RootSystem(['C',Integer(3)]).root_lattice()                    ␣
↪     # needs sage.graphs
>>> C3_rl.simple_root(Integer(3)).weyl_action([Integer(1),Integer(2)]).
↪associated_reflection()    # needs sage.graphs
(1, 2, 3, 2, 1)
>>> C3_rl.simple_root(Integer(2)).associated_reflection()                  ␣
↪     # needs sage.graphs
(2,)
```

descents(*index_set=None*, *positive=False*)

Return the descents of pt.

EXAMPLES:

```
sage: space=RootSystem(['A',5]).weight_space()
sage: alpha = space.simple_roots()                                      #␣
↪needs sage.graphs
sage: (alpha[1]+alpha[2]+alpha[4]).descents()                          #␣
↪needs sage.graphs
[3, 5]
```

```
>>> from sage.all import *
>>> space=RootSystem(['A',Integer(5)]).weight_space()
>>> alpha = space.simple_roots()                                     #␣
↪needs sage.graphs
>>> (alpha[Integer(1)]+alpha[Integer(2)]+alpha[Integer(4)]).descents()   ␣
↪                          # needs sage.graphs
[3, 5]
```

dot_action(*w*, *inverse=False*)

Act on `self` by `w` using the dot or affine action.

Let w be an element of the Weyl group. The *dot action* or *affine action* is given by:

$$w \bullet \lambda = w(\lambda + \rho) - \rho,$$

where ρ is the sum of the fundamental weights.

INPUT:

- `w` – an element of a Coxeter or Weyl group of the same Cartan type, or a tuple or a list (such as a reduced word) of elements from the index set
- `inverse` – boolean (default: `False`); whether to act by the inverse element

EXAMPLES:

```
sage: P = RootSystem(['B',3]).weight_lattice()
sage: La = P.fundamental_weights()
sage: mu = La[1] + 2*La[2] - 3*La[3]
sage: mu.dot_action([1])                                                #␣
↪needs sage.graphs
-3*Lambda[1] + 4*Lambda[2] - 3*Lambda[3]
sage: mu.dot_action([3])                                                #␣
↪needs sage.graphs
Lambda[1] + Lambda[3]
sage: mu.dot_action([1,2,3])                                            #␣
↪needs sage.graphs
-4*Lambda[1] + Lambda[2] + 3*Lambda[3]
```

```
>>> from sage.all import *
>>> P = RootSystem(['B',Integer(3)]).weight_lattice()
>>> La = P.fundamental_weights()
>>> mu = La[Integer(1)] + Integer(2)*La[Integer(2)] -␣
↪Integer(3)*La[Integer(3)]
>>> mu.dot_action([Integer(1)])                                          ␣
↪      # needs sage.graphs
-3*Lambda[1] + 4*Lambda[2] - 3*Lambda[3]
>>> mu.dot_action([Integer(3)])                                          ␣
↪      # needs sage.graphs
```

(continues on next page)

(continued from previous page)

```
Lambda[1] + Lambda[3]
>>> mu.dot_action([Integer(1),Integer(2),Integer(3)])                          ␣
↪                       # needs sage.graphs
-4*Lambda[1] + Lambda[2] + 3*Lambda[3]
```

We check that the origin of this action is at $-\rho$:

```
sage: all((-P.rho()).dot_action([i]) == -P.rho()                            #␣
↪needs sage.graphs
....:     for i in P.index_set())
True
```

```
>>> from sage.all import *
>>> all((-P.rho()).dot_action([i]) == -P.rho()                            #␣
↪needs sage.graphs
...     for i in P.index_set())
True
```

- Wikipedia article Affine_action

dot_orbit()

The orbit of `self` under the dot or affine action of the Weyl group.

EXAMPLES:

```
sage: L = RootSystem(['A', 2]).ambient_lattice()
sage: sorted(L.rho().dot_orbit())                        # the output order␣
↪is not specified              # needs sage.graphs
[(-2, 1, 4), (-2, 3, 2), (2, -1, 2),
 (2, 1, 0), (0, -1, 4), (0, 3, 0)]

sage: L = RootSystem(['B',2]).weight_lattice()
sage: sorted(L.fundamental_weights()[1].dot_orbit())    # the output order␣
↪is not specified              # needs sage.graphs
[-4*Lambda[1], -4*Lambda[1] + 4*Lambda[2],
 -3*Lambda[1] - 2*Lambda[2], -3*Lambda[1] + 4*Lambda[2],
 Lambda[1], Lambda[1] - 6*Lambda[2],
 2*Lambda[1] - 6*Lambda[2], 2*Lambda[1] - 2*Lambda[2]]
```

```
>>> from sage.all import *
>>> L = RootSystem(['A', Integer(2)]).ambient_lattice()
>>> sorted(L.rho().dot_orbit())                        # the output order␣
↪is not specified              # needs sage.graphs
[(-2, 1, 4), (-2, 3, 2), (2, -1, 2),
 (2, 1, 0), (0, -1, 4), (0, 3, 0)]

>>> L = RootSystem(['B',Integer(2)]).weight_lattice()
>>> sorted(L.fundamental_weights()[Integer(1)].dot_orbit())    # the␣
↪output order is not specified              # needs sage.graphs
[-4*Lambda[1], -4*Lambda[1] + 4*Lambda[2],
 -3*Lambda[1] - 2*Lambda[2], -3*Lambda[1] + 4*Lambda[2],
```

(continues on next page)

(continued from previous page)

```
Lambda[1], Lambda[1] - 6*Lambda[2],
2*Lambda[1] - 6*Lambda[2], 2*Lambda[1] - 2*Lambda[2]]
```

We compare the dot action orbit to the regular orbit:

```
sage: # needs sage.graphs
sage: L = RootSystem(['A', 3]).weight_lattice()
sage: len(L.rho().dot_orbit())
24
sage: len((-L.rho()).dot_orbit())
1
sage: La = L.fundamental_weights()
sage: len(La[1].dot_orbit())
24
sage: len(La[1].orbit())
4
sage: len((-L.rho() + La[1]).dot_orbit())
4
sage: len(La[2].dot_orbit())
24
sage: len(La[2].orbit())
6
sage: len((-L.rho() + La[2]).dot_orbit())
6
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> L = RootSystem(['A', Integer(3)]).weight_lattice()
>>> len(L.rho().dot_orbit())
24
>>> len((-L.rho()).dot_orbit())
1
>>> La = L.fundamental_weights()
>>> len(La[Integer(1)].dot_orbit())
24
>>> len(La[Integer(1)].orbit())
4
>>> len((-L.rho() + La[Integer(1)]).dot_orbit())
4
>>> len(La[Integer(2)].dot_orbit())
24
>>> len(La[Integer(2)].orbit())
6
>>> len((-L.rho() + La[Integer(2)]).dot_orbit())
6
```

extraspecial_pair()

Return the extraspecial pair of `self` under the ordering defined by *positive_roots_by_height()*.

The *extraspecial pair* of a positive root γ with some total ordering $<$ of the root lattice that respects height is the pair of positive roots (α, β) such that $\gamma = \alpha + \beta$ and α is as small as possible.

EXAMPLES:

```
sage: Q = RootSystem(['G', 2]).root_lattice()
sage: Q.highest_root().extraspecial_pair()                                  #␣
↪needs sage.graphs
(alpha[2], 3*alpha[1] + alpha[2])
```

```
>>> from sage.all import *
>>> Q = RootSystem(['G', Integer(2)]).root_lattice()
>>> Q.highest_root().extraspecial_pair()                                    #␣
↪needs sage.graphs
(alpha[2], 3*alpha[1] + alpha[2])
```

first_descent(*index_set=None*, *positive=False*)

Return the first descent of pt.

One can use the `index_set` option to restrict to the parabolic subgroup indexed by `index_set`.

EXAMPLES:

```
sage: # needs sage.graphs
sage: space = RootSystem(['A',5]).weight_space()
sage: alpha = space.simple_roots()
sage: (alpha[1]+alpha[2]+alpha[4]).first_descent()
3
sage: (alpha[1]+alpha[2]+alpha[4]).first_descent([1,2,5])
5
sage: (alpha[1]+alpha[2]+alpha[4]).first_descent([1,2,5,3,4])
5
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> space = RootSystem(['A',Integer(5)]).weight_space()
>>> alpha = space.simple_roots()
>>> (alpha[Integer(1)]+alpha[Integer(2)]+alpha[Integer(4)]).first_
↪descent()
3
>>> (alpha[Integer(1)]+alpha[Integer(2)]+alpha[Integer(4)]).first_
↪descent([Integer(1),Integer(2),Integer(5)])
5
>>> (alpha[Integer(1)]+alpha[Integer(2)]+alpha[Integer(4)]).first_
↪descent([Integer(1),Integer(2),Integer(5),Integer(3),Integer(4)])
5
```

greater()

Return the elements in the orbit of `self` which are greater than `self` in the weak order.

EXAMPLES:

```
sage: L = RootSystem(['A',3]).ambient_lattice()
sage: e = L.basis()
sage: e[2].greater()
[(0, 0, 1, 0), (0, 0, 0, 1)]
sage: len(L.rho().greater())
24
sage: len((-L.rho()).greater())
```

(continues on next page)

(continued from previous page)

```
1
sage: sorted([len(x.greater()) for x in L.rho().orbit()])
[1, 2, 2, 2, 3, 3, 3, 3, 4, 4, 4, 5, 5, 6, 6, 6, 8, 8, 8, 8, 12, 12, 12,␣
↪24]
```

```
>>> from sage.all import *
>>> L = RootSystem(['A',Integer(3)]).ambient_lattice()
>>> e = L.basis()
>>> e[Integer(2)].greater()
[(0, 0, 1, 0), (0, 0, 0, 1)]
>>> len(L.rho().greater())
24
>>> len((-L.rho()).greater())
1
>>> sorted([len(x.greater()) for x in L.rho().orbit()])
[1, 2, 2, 2, 3, 3, 3, 3, 4, 4, 4, 5, 5, 6, 6, 6, 8, 8, 8, 8, 12, 12, 12,␣
↪24]
```

has_descent(*i*, *positive=False*)

Test if `self` has a descent at position i, that is, if `self` is on the strict negative side of the i-th simple reflection hyperplane.

If positive is `True`, tests if it is on the strict positive side instead.

EXAMPLES:

```
sage: # needs sage.graphs
sage: space = RootSystem(['A',5]).weight_space()
sage: alpha = RootSystem(['A',5]).weight_space().simple_roots()
sage: [alpha[i].has_descent(1) for i in space.index_set()]
[False, True, False, False, False]
sage: [(-alpha[i]).has_descent(1) for i in space.index_set()]
[True, False, False, False, False]
sage: [alpha[i].has_descent(1, True) for i in space.index_set()]
[True, False, False, False, False]
sage: [(-alpha[i]).has_descent(1, True) for i in space.index_set()]
[False, True, False, False, False]
sage: (alpha[1]+alpha[2]+alpha[4]).has_descent(3)
True
sage: (alpha[1]+alpha[2]+alpha[4]).has_descent(1)
False
sage: (alpha[1]+alpha[2]+alpha[4]).has_descent(1, True)
True
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> space = RootSystem(['A',Integer(5)]).weight_space()
>>> alpha = RootSystem(['A',Integer(5)]).weight_space().simple_roots()
>>> [alpha[i].has_descent(Integer(1)) for i in space.index_set()]
[False, True, False, False, False]
>>> [(-alpha[i]).has_descent(Integer(1)) for i in space.index_set()]
[True, False, False, False, False]
```

(continues on next page)

(continued from previous page)

```
>>> [alpha[i].has_descent(Integer(1), True) for i in space.index_set()]
[True, False, False, False, False]
>>> [(-alpha[i]).has_descent(Integer(1), True) for i in space.index_set()]
[False, True, False, False, False]
>>> (alpha[Integer(1)]+alpha[Integer(2)]+alpha[Integer(4)]).has_
↪descent(Integer(3))
True
>>> (alpha[Integer(1)]+alpha[Integer(2)]+alpha[Integer(4)]).has_
↪descent(Integer(1))
False
>>> (alpha[Integer(1)]+alpha[Integer(2)]+alpha[Integer(4)]).has_
↪descent(Integer(1), True)
True
```

height()

Return the height of `self`.

The height of a root $\alpha = \sum_i a_i \alpha_i$ is defined to be $h(\alpha) := \sum_i a_i$.

EXAMPLES:

```
sage: Q = RootSystem(['G', 2]).root_lattice()
sage: Q.highest_root().height()                                          #␣
↪needs sage.graphs
5
```

```
>>> from sage.all import *
>>> Q = RootSystem(['G', Integer(2)]).root_lattice()
>>> Q.highest_root().height()                                          #␣
↪needs sage.graphs
5
```

is_dominant(*index_set=None*, *positive=True*)

Return whether `self` is dominant.

This is done with respect to the sub–root system indicated by the subset of Dynkin nodes `index_set`. If `index_set` is `None`, then the entire Dynkin node set is used. If positive is `False`, then the dominance condition is replaced by antidominance.

EXAMPLES:

```
sage: L = RootSystem(['A',2]).ambient_lattice()
sage: Lambda = L.fundamental_weights()
sage: [x.is_dominant() for x in Lambda]
[True, True]
sage: [x.is_dominant(positive=False) for x in Lambda]
[False, False]
sage: (Lambda[1]-Lambda[2]).is_dominant()
False
sage: (-Lambda[1]+Lambda[2]).is_dominant()
False
sage: (Lambda[1]-Lambda[2]).is_dominant([1])
True
sage: (Lambda[1]-Lambda[2]).is_dominant([2])
```

(continues on next page)

(continued from previous page)

```
False
sage: [x.is_dominant() for x in L.roots()]
[False, True, False, False, False, False]
sage: [x.is_dominant(positive=False) for x in L.roots()]
[False, False, False, False, True, False]
```

```
>>> from sage.all import *
>>> L = RootSystem(['A',Integer(2)]).ambient_lattice()
>>> Lambda = L.fundamental_weights()
>>> [x.is_dominant() for x in Lambda]
[True, True]
>>> [x.is_dominant(positive=False) for x in Lambda]
[False, False]
>>> (Lambda[Integer(1)]-Lambda[Integer(2)]).is_dominant()
False
>>> (-Lambda[Integer(1)]+Lambda[Integer(2)]).is_dominant()
False
>>> (Lambda[Integer(1)]-Lambda[Integer(2)]).is_dominant([Integer(1)])
True
>>> (Lambda[Integer(1)]-Lambda[Integer(2)]).is_dominant([Integer(2)])
False
>>> [x.is_dominant() for x in L.roots()]
[False, True, False, False, False, False]
>>> [x.is_dominant(positive=False) for x in L.roots()]
[False, False, False, False, True, False]
```

is_dominant_weight()

Test whether `self` is a dominant element of the weight lattice.

EXAMPLES:

```
sage: L = RootSystem(['A',2]).ambient_lattice()
sage: Lambda = L.fundamental_weights()
sage: [x.is_dominant() for x in Lambda]
[True, True]
sage: (3*Lambda[1]+Lambda[2]).is_dominant()
True
sage: (Lambda[1]-Lambda[2]).is_dominant()
False
sage: (-Lambda[1]+Lambda[2]).is_dominant()
False
```

```
>>> from sage.all import *
>>> L = RootSystem(['A',Integer(2)]).ambient_lattice()
>>> Lambda = L.fundamental_weights()
>>> [x.is_dominant() for x in Lambda]
[True, True]
>>> (Integer(3)*Lambda[Integer(1)]+Lambda[Integer(2)]).is_dominant()
True
>>> (Lambda[Integer(1)]-Lambda[Integer(2)]).is_dominant()
False
>>> (-Lambda[Integer(1)]+Lambda[Integer(2)]).is_dominant()
```

(continues on next page)

(continued from previous page)

```
False
```

Tests that the scalar products with the coroots are all nonnegative integers. For example, if x is the sum of a dominant element of the weight lattice plus some other element orthogonal to all coroots, then the implementation correctly reports x to be a dominant weight:

```
sage: x = Lambda[1] + L([-1,-1,-1])
sage: x.is_dominant_weight()
True
```

```
>>> from sage.all import *
>>> x = Lambda[Integer(1)] + L([-Integer(1),-Integer(1),-Integer(1)])
>>> x.is_dominant_weight()
True
```

is_imaginary_root()

Return `True` if `self` is an imaginary root.

A root α is imaginary if it is not W-conjugate to a simple root where W is the corresponding Weyl group.

EXAMPLES:

```
sage: Q = RootSystem(['B',2,1]).root_lattice()
sage: alpha = Q.simple_roots()
sage: alpha[0].is_imaginary_root()                                          #␣
↪needs sage.graphs
False
sage: elt = alpha[0] + alpha[1] + 2*alpha[2]
sage: elt.is_imaginary_root()                                               #␣
↪needs sage.graphs
True
```

```
>>> from sage.all import *
>>> Q = RootSystem(['B',Integer(2),Integer(1)]).root_lattice()
>>> alpha = Q.simple_roots()
>>> alpha[Integer(0)].is_imaginary_root()                                    ␣
↪     # needs sage.graphs
False
>>> elt = alpha[Integer(0)] + alpha[Integer(1)] +␣
↪Integer(2)*alpha[Integer(2)]
>>> elt.is_imaginary_root()                                                #␣
↪needs sage.graphs
True
```

is_long_root()

Return `True` if `self` is a long (real) root.

EXAMPLES:

```
sage: Q = RootSystem(['B',2,1]).root_lattice()
sage: alpha = Q.simple_roots()
sage: alpha[0].is_long_root()                                               #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.graphs
True
sage: alpha[1].is_long_root()                                             #␣
↪needs sage.graphs
True
sage: alpha[2].is_long_root()                                             #␣
↪needs sage.graphs
False
```

```
>>> from sage.all import *
>>> Q = RootSystem(['B',Integer(2),Integer(1)]).root_lattice()
>>> alpha = Q.simple_roots()
>>> alpha[Integer(0)].is_long_root()                                      ␣
↪      # needs sage.graphs
True
>>> alpha[Integer(1)].is_long_root()                                      ␣
↪      # needs sage.graphs
True
>>> alpha[Integer(2)].is_long_root()                                      ␣
↪      # needs sage.graphs
False
```

is_parabolic_root(*index_set*)

Return whether `root` is in the parabolic subsystem with Dynkin nodes `index_set`.

This assumes that `self` is a root.

INPUT:

- `index_set` – the Dynkin node set of the parabolic subsystem

Todo

This implementation is only valid in the root or weight lattice

EXAMPLES:

```
sage: alpha = RootSystem(['A',3]).root_lattice().from_vector(vector([1,1,
↪0]))
sage: alpha.is_parabolic_root([1,3])
False
sage: alpha.is_parabolic_root([1,2])
True
sage: alpha.is_parabolic_root([2])
False
```

```
>>> from sage.all import *
>>> alpha = RootSystem(['A',Integer(3)]).root_lattice().from_
↪vector(vector([Integer(1),Integer(1),Integer(0)]))
>>> alpha.is_parabolic_root([Integer(1),Integer(3)])
False
>>> alpha.is_parabolic_root([Integer(1),Integer(2)])
True
```

(continues on next page)

(continued from previous page)

```
>>> alpha.is_parabolic_root([Integer(2)])
False
```

is_real_root()

Return `True` if `self` is a real root.

A root α is real if it is W-conjugate to a simple root where W is the corresponding Weyl group.

EXAMPLES:

```
sage: Q = RootSystem(['B',2,1]).root_lattice()
sage: alpha = Q.simple_roots()
sage: alpha[0].is_real_root()                                          #␣
↪needs sage.graphs
True
sage: elt = alpha[0] + alpha[1] + 2*alpha[2]
sage: elt.is_real_root()                                               #␣
↪needs sage.graphs
False
```

```
>>> from sage.all import *
>>> Q = RootSystem(['B',Integer(2),Integer(1)]).root_lattice()
>>> alpha = Q.simple_roots()
>>> alpha[Integer(0)].is_real_root()                                   ␣
↪     # needs sage.graphs
True
>>> elt = alpha[Integer(0)] + alpha[Integer(1)] +␣
↪Integer(2)*alpha[Integer(2)]
>>> elt.is_real_root()                                               #␣
↪needs sage.graphs
False
```

is_short_root()

Return `True` if `self` is a short (real) root.

Returns `False` unless the parent is an irreducible root system of finite type having two root lengths and `self` is of the shorter length. There is no check of whether `self` is actually a root.

EXAMPLES:

```
sage: # needs sage.graphs
sage: Q = RootSystem(['C',2]).root_lattice()
sage: al = Q.simple_root(1).weyl_action([1,2]); al
alpha[1] + alpha[2]
sage: al.is_short_root()
True
sage: bt = Q.simple_root(2).weyl_action([2,1,2]); bt
-2*alpha[1] - alpha[2]
sage: bt.is_short_root()
False
sage: RootSystem(['A',2]).root_lattice().simple_root(1).is_short_root()
False
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> Q = RootSystem(['C',Integer(2)]).root_lattice()
>>> al = Q.simple_root(Integer(1)).weyl_action([Integer(1),Integer(2)]);␣
↪al
alpha[1] + alpha[2]
>>> al.is_short_root()
True
>>> bt = Q.simple_root(Integer(2)).weyl_action([Integer(2),Integer(1),
↪Integer(2)]); bt
-2*alpha[1] - alpha[2]
>>> bt.is_short_root()
False
>>> RootSystem(['A',Integer(2)]).root_lattice().simple_root(Integer(1)).
↪is_short_root()
False
```

An example in affine type:

```
sage: # needs sage.graphs
sage: Q = RootSystem(['B',2,1]).root_lattice()
sage: alpha = Q.simple_roots()
sage: alpha[0].is_short_root()
False
sage: alpha[1].is_short_root()
False
sage: alpha[2].is_short_root()
True
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> Q = RootSystem(['B',Integer(2),Integer(1)]).root_lattice()
>>> alpha = Q.simple_roots()
>>> alpha[Integer(0)].is_short_root()
False
>>> alpha[Integer(1)].is_short_root()
False
>>> alpha[Integer(2)].is_short_root()
True
```

is_verma_dominant(*positive=True*)

Return if `self` is Verma dominant.

A weight λ is *Verma dominant* if

$$\langle \lambda + \rho, \alpha^\vee \rangle \notin \mathbf{Z}_{<0}$$

for all positive roots α. Note that begin Verma dominant does *not* imply that $\langle \lambda + \rho, \alpha^\vee \rangle \geq 0$ for any positive root α. This is used to determine if a Verma module is simple or projective.

INPUT:

- `positive` – boolean (default: `True`); if `False`, then this checks if the weight is Verma anti-dominant, where $\mathbf{Z}_{<0}$ is replaced with $\mathbf{Z}_{>0}$ in the definition.

EXAMPLES:

```
sage: P = RootSystem(['A', 3]).weight_space()
sage: La = P.fundamental_weights()
sage: alphacheck = P.coroot_lattice().positive_roots()
sage: rho = P.rho()
sage: (La[1] + 2*La[2]).is_verma_dominant()
True
sage: la = La[1] - 3/2*La[3] - rho
sage: la.is_verma_dominant()
True
sage: la.is_verma_dominant(positive=False)
False
sage: [(la+rho).scalar(coroot) for coroot in alphacheck]
[1, 0, -3/2, 1, -3/2, -1/2]
sage: mu = 1/2*La[1] - 3/2*La[3] - rho
sage: mu.is_verma_dominant()
False
sage: mu.is_verma_dominant(positive=False)
True
sage: [(mu+rho).scalar(coroot) for coroot in alphacheck]
[1/2, 0, -3/2, 1/2, -3/2, -1]
```

```
>>> from sage.all import *
>>> P = RootSystem(['A', Integer(3)]).weight_space()
>>> La = P.fundamental_weights()
>>> alphacheck = P.coroot_lattice().positive_roots()
>>> rho = P.rho()
>>> (La[Integer(1)] + Integer(2)*La[Integer(2)]).is_verma_dominant()
True
>>> la = La[Integer(1)] - Integer(3)/Integer(2)*La[Integer(3)] - rho
>>> la.is_verma_dominant()
True
>>> la.is_verma_dominant(positive=False)
False
>>> [(la+rho).scalar(coroot) for coroot in alphacheck]
[1, 0, -3/2, 1, -3/2, -1/2]
>>> mu = Integer(1)/Integer(2)*La[Integer(1)] - Integer(3)/
↪Integer(2)*La[Integer(3)] - rho
>>> mu.is_verma_dominant()
False
>>> mu.is_verma_dominant(positive=False)
True
>>> [(mu+rho).scalar(coroot) for coroot in alphacheck]
[1/2, 0, -3/2, 1/2, -3/2, -1]
```

level()

EXAMPLES:

```
sage: L = RootSystem(['A',2,1]).weight_lattice()
sage: L.rho().level()                                                   #␣
↪needs sage.graphs
3
```

```
>>> from sage.all import *
>>> L = RootSystem(['A',Integer(2),Integer(1)]).weight_lattice()
>>> L.rho().level()                                                         #␣
↪needs sage.graphs
3
```

norm_squared()

Return the norm squared of `self` with respect to the symmetric form.

EXAMPLES:

```
sage: # needs sage.graphs
sage: Q = RootSystem(['B',2,1]).root_lattice()
sage: alpha = Q.simple_roots()
sage: alpha[1].norm_squared()
4
sage: alpha[2].norm_squared()
2
sage: elt = alpha[0] - 3*alpha[1] + alpha[2]
sage: elt.norm_squared()
50
sage: elt = alpha[0] + alpha[1] + 2*alpha[2]
sage: elt.norm_squared()
0

sage: Q = RootSystem(CartanType(['A',4,2]).dual()).root_lattice()
sage: Qc = RootSystem(['A',4,2]).coroot_lattice()
sage: alpha = Q.simple_roots()
sage: alphac = Qc.simple_roots()
sage: elt = alpha[0] + 2*alpha[1] + 2*alpha[2]
sage: eltc = alphac[0] + 2*alphac[1] + 2*alphac[2]
sage: elt.norm_squared()                                                    #␣
↪needs sage.graphs
0
sage: eltc.norm_squared()                                                   #␣
↪needs sage.graphs
0
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> Q = RootSystem(['B',Integer(2),Integer(1)]).root_lattice()
>>> alpha = Q.simple_roots()
>>> alpha[Integer(1)].norm_squared()
4
>>> alpha[Integer(2)].norm_squared()
2
>>> elt = alpha[Integer(0)] - Integer(3)*alpha[Integer(1)] +␣
↪alpha[Integer(2)]
>>> elt.norm_squared()
50
>>> elt = alpha[Integer(0)] + alpha[Integer(1)] +␣
↪Integer(2)*alpha[Integer(2)]
>>> elt.norm_squared()
```

(continues on next page)

(continued from previous page)

```
0

>>> Q = RootSystem(CartanType(['A',Integer(4),Integer(2)]).dual()).root_
↪lattice()
>>> Qc = RootSystem(['A',Integer(4),Integer(2)]).coroot_lattice()
>>> alpha = Q.simple_roots()
>>> alphac = Qc.simple_roots()
>>> elt = alpha[Integer(0)] + Integer(2)*alpha[Integer(1)] +␣
↪Integer(2)*alpha[Integer(2)]
>>> eltc = alphac[Integer(0)] + Integer(2)*alphac[Integer(1)] +␣
↪Integer(2)*alphac[Integer(2)]
>>> elt.norm_squared()                                                  #␣
↪needs sage.graphs
0
>>> eltc.norm_squared()                                                 #␣
↪needs sage.graphs
0
```

orbit()

The orbit of `self` under the action of the Weyl group.

EXAMPLES:

ρ is a regular element whose orbit is in bijection with the Weyl group. In particular, it has 6 elements for the symmetric group S_3:

```
sage: L = RootSystem(["A", 2]).ambient_lattice()
sage: sorted(L.rho().orbit())               # the output order is not␣
↪specified
[(1, 2, 0), (1, 0, 2), (2, 1, 0),
 (2, 0, 1), (0, 1, 2), (0, 2, 1)]

sage: L = RootSystem(["A", 3]).weight_lattice()
sage: len(L.rho().orbit())                                                #␣
↪needs sage.graphs
24
sage: len(L.fundamental_weights()[1].orbit())                             #␣
↪needs sage.graphs
4
sage: len(L.fundamental_weights()[2].orbit())                             #␣
↪needs sage.graphs
6
```

```
>>> from sage.all import *
>>> L = RootSystem(["A", Integer(2)]).ambient_lattice()
>>> sorted(L.rho().orbit())               # the output order is not␣
↪specified
[(1, 2, 0), (1, 0, 2), (2, 1, 0),
 (2, 0, 1), (0, 1, 2), (0, 2, 1)]

>>> L = RootSystem(["A", Integer(3)]).weight_lattice()
>>> len(L.rho().orbit())                                                #␣
↪needs sage.graphs
```

(continues on next page)

(continued from previous page)

```
24
>>> len(L.fundamental_weights()[Integer(1)].orbit())                    ␣
↪     # needs sage.graphs
4
>>> len(L.fundamental_weights()[Integer(2)].orbit())                    ␣
↪     # needs sage.graphs
6
```

pred(*index_set=None*)

Return the immediate predecessors of `self` for the weak order.

INPUT:

- `index_set` – a subset (as a list or iterable) of the nodes of the Dynkin diagram; (default: `None` for all of them)

If `index_set` is specified, the successors for the corresponding parabolic subsystem are returned.

EXAMPLES:

```
sage: L = RootSystem(['A',3]).weight_lattice()
sage: Lambda = L.fundamental_weights()
sage: Lambda[1].pred()
[]
sage: L.rho().pred()
[]
sage: (-L.rho()).pred()                                                 #␣
↪needs sage.graphs
[Lambda[1] - 2*Lambda[2] - Lambda[3],
 -2*Lambda[1] + Lambda[2] - 2*Lambda[3],
 -Lambda[1] - 2*Lambda[2] + Lambda[3]]
sage: (-L.rho()).pred(index_set=[1])                                    #␣
↪needs sage.graphs
[Lambda[1] - 2*Lambda[2] - Lambda[3]]
```

```
>>> from sage.all import *
>>> L = RootSystem(['A',Integer(3)]).weight_lattice()
>>> Lambda = L.fundamental_weights()
>>> Lambda[Integer(1)].pred()
[]
>>> L.rho().pred()
[]
>>> (-L.rho()).pred()                                                 #␣
↪needs sage.graphs
[Lambda[1] - 2*Lambda[2] - Lambda[3],
 -2*Lambda[1] + Lambda[2] - 2*Lambda[3],
 -Lambda[1] - 2*Lambda[2] + Lambda[3]]
>>> (-L.rho()).pred(index_set=[Integer(1)])                             ␣
↪     # needs sage.graphs
[Lambda[1] - 2*Lambda[2] - Lambda[3]]
```

reduced_word(*index_set=None*, *positive=True*)

Return a reduced word for the inverse of the shortest Weyl group element that sends the vector `self` into the dominant chamber.

With the `index_set` optional parameter, this is done with respect to the corresponding parabolic subgroup.

If `positive` is False, use the antidominant chamber instead.

EXAMPLES:

```
sage: space = RootSystem(['A',5]).weight_space()
sage: alpha = RootSystem(['A',5]).weight_space().simple_roots()          #␣
↪needs sage.graphs
sage: alpha[1].reduced_word()                                            #␣
↪needs sage.graphs
[2, 3, 4, 5]
sage: alpha[1].reduced_word([1,2])                                       #␣
↪needs sage.graphs
[2]
```

```
>>> from sage.all import *
>>> space = RootSystem(['A',Integer(5)]).weight_space()
>>> alpha = RootSystem(['A',Integer(5)]).weight_space().simple_roots()     ␣
↪     # needs sage.graphs
>>> alpha[Integer(1)].reduced_word()                                      ␣
↪     # needs sage.graphs
[2, 3, 4, 5]
>>> alpha[Integer(1)].reduced_word([Integer(1),Integer(2)])               ␣
↪                         # needs sage.graphs
[2]
```

reflection(*root*, *use_coroot=False*)

Reflect `self` across the hyperplane orthogonal to `root`.

If `use_coroot` is `True`, `root` is interpreted as a coroot.

EXAMPLES:

```
sage: R = RootSystem(['C',4])
sage: weight_lattice = R.weight_lattice()
sage: mu = weight_lattice.from_vector(vector([0,0,1,2]))
sage: coroot_lattice = R.coroot_lattice()
sage: alphavee = coroot_lattice.from_vector(vector([0,0,1,1]))
sage: mu.reflection(alphavee, use_coroot=True)                           #␣
↪needs sage.graphs
6*Lambda[2] - 5*Lambda[3] + 2*Lambda[4]
sage: root_lattice = R.root_lattice()
sage: beta = root_lattice.from_vector(vector([0,1,1,0]))
sage: mu.reflection(beta)                                                #␣
↪needs sage.graphs
Lambda[1] - Lambda[2] + 3*Lambda[4]
```

```
>>> from sage.all import *
>>> R = RootSystem(['C',Integer(4)])
>>> weight_lattice = R.weight_lattice()
>>> mu = weight_lattice.from_vector(vector([Integer(0),Integer(0),
↪Integer(1),Integer(2)]))
>>> coroot_lattice = R.coroot_lattice()
```

(continues on next page)

(continued from previous page)

```
>>> alphavee = coroot_lattice.from_vector(vector([Integer(0),Integer(0),
↪Integer(1),Integer(1)]))
>>> mu.reflection(alphavee, use_coroot=True)                            #␣
↪needs sage.graphs
6*Lambda[2] - 5*Lambda[3] + 2*Lambda[4]
>>> root_lattice = R.root_lattice()
>>> beta = root_lattice.from_vector(vector([Integer(0),Integer(1),
↪Integer(1),Integer(0)]))
>>> mu.reflection(beta)                                                 #␣
↪needs sage.graphs
Lambda[1] - Lambda[2] + 3*Lambda[4]
```

scalar(*lambdacheck*)

Implement the natural pairing with the coroot lattice.

INPUT:

- `self` – an element of a root lattice realization
- `lambdacheck` – an element of the coroot lattice or coroot space

OUTPUT: the scalar product of `self` and `lambdacheck`

EXAMPLES:

```
sage: L = RootSystem(['A',4]).root_lattice()
sage: alpha      = L.simple_roots()
sage: alphacheck = L.simple_coroots()
sage: alpha[1].scalar(alphacheck[1])                                     #␣
↪needs sage.graphs
2
sage: alpha[1].scalar(alphacheck[2])                                     #␣
↪needs sage.graphs
-1
sage: matrix([ [ alpha[i].scalar(alphacheck[j])                          #␣
↪needs sage.graphs
....:           for i in L.index_set() ]
....:         for j in L.index_set() ])
[ 2 -1  0  0]
[-1  2 -1  0]
[ 0 -1  2 -1]
[ 0  0 -1  2]
```

```
>>> from sage.all import *
>>> L = RootSystem(['A',Integer(4)]).root_lattice()
>>> alpha      = L.simple_roots()
>>> alphacheck = L.simple_coroots()
>>> alpha[Integer(1)].scalar(alphacheck[Integer(1)])                      ␣
↪               # needs sage.graphs
2
>>> alpha[Integer(1)].scalar(alphacheck[Integer(2)])                      ␣
↪               # needs sage.graphs
-1
>>> matrix([ [ alpha[i].scalar(alphacheck[j])                           #␣
↪needs sage.graphs
...           for i in L.index_set() ]
```

(continues on next page)

(continued from previous page)

```
...             for j in L.index_set() ])
[ 2 -1  0  0]
[-1  2 -1  0]
[ 0 -1  2 -1]
[ 0  0 -1  2]
```

simple_reflection(*i*)

Return the image of `self` by the i-th simple reflection.

EXAMPLES:

```
sage: alpha = RootSystem(["A", 3]).root_lattice().alpha()
sage: alpha[1].simple_reflection(2)                                    #␣
↪needs sage.graphs
alpha[1] + alpha[2]

sage: Q = RootSystem(['A', 3, 1]).weight_lattice(extended=True)
sage: Lambda = Q.fundamental_weights()
sage: L = Lambda[0] + Q.null_root()                                    #␣
↪needs sage.graphs
sage: L.simple_reflection(0)                                           #␣
↪needs sage.graphs
-Lambda[0] + Lambda[1] + Lambda[3]
```

```
>>> from sage.all import *
>>> alpha = RootSystem(["A", Integer(3)]).root_lattice().alpha()
>>> alpha[Integer(1)].simple_reflection(Integer(2))                    ␣
↪               # needs sage.graphs
alpha[1] + alpha[2]

>>> Q = RootSystem(['A', Integer(3), Integer(1)]).weight_
↪lattice(extended=True)
>>> Lambda = Q.fundamental_weights()
>>> L = Lambda[Integer(0)] + Q.null_root()                             ␣
↪      # needs sage.graphs
>>> L.simple_reflection(Integer(0))                                    ␣
↪      # needs sage.graphs
-Lambda[0] + Lambda[1] + Lambda[3]
```

simple_reflections()

The images of `self` by all the simple reflections.

EXAMPLES:

```
sage: alpha = RootSystem(["A", 3]).root_lattice().alpha()
sage: alpha[1].simple_reflections()                                    #␣
↪needs sage.graphs
[-alpha[1], alpha[1] + alpha[2], alpha[1]]
```

```
>>> from sage.all import *
>>> alpha = RootSystem(["A", Integer(3)]).root_lattice().alpha()
>>> alpha[Integer(1)].simple_reflections()                             ␣
```

(continues on next page)

(continued from previous page)

```
↪     # needs sage.graphs
[-alpha[1], alpha[1] + alpha[2], alpha[1]]
```

smaller()

Return the elements in the orbit of `self` which are smaller than `self` in the weak order.

EXAMPLES:

```
sage: L = RootSystem(['A',3]).ambient_lattice()
sage: e = L.basis()
sage: e[2].smaller()
[(0, 0, 1, 0), (0, 1, 0, 0), (1, 0, 0, 0)]
sage: len(L.rho().smaller())
1
sage: len((-L.rho()).smaller())
24
sage: sorted([len(x.smaller()) for x in L.rho().orbit()])
[1, 2, 2, 2, 3, 3, 3, 3, 4, 4, 4, 5, 5, 6, 6, 6, 8, 8, 8, 8, 12, 12, 12,␣
↪24]
```

```
>>> from sage.all import *
>>> L = RootSystem(['A',Integer(3)]).ambient_lattice()
>>> e = L.basis()
>>> e[Integer(2)].smaller()
[(0, 0, 1, 0), (0, 1, 0, 0), (1, 0, 0, 0)]
>>> len(L.rho().smaller())
1
>>> len((-L.rho()).smaller())
24
>>> sorted([len(x.smaller()) for x in L.rho().orbit()])
[1, 2, 2, 2, 3, 3, 3, 3, 4, 4, 4, 5, 5, 6, 6, 6, 8, 8, 8, 8, 12, 12, 12,␣
↪24]
```

succ(*index_set=None*)

Return the immediate successors of `self` for the weak order.

INPUT:

- `index_set` – a subset (as a list or iterable) of the nodes of the Dynkin diagram; (default: `None` for all of them)

If `index_set` is specified, the successors for the corresponding parabolic subsystem are returned.

EXAMPLES:

```
sage: # needs sage.graphs
sage: L = RootSystem(['A',3]).weight_lattice()
sage: Lambda = L.fundamental_weights()
sage: Lambda[1].succ()
[-Lambda[1] + Lambda[2]]
sage: L.rho().succ()
[-Lambda[1] + 2*Lambda[2] + Lambda[3],
 2*Lambda[1] - Lambda[2] + 2*Lambda[3],
 Lambda[1] + 2*Lambda[2] - Lambda[3]]
sage: (-L.rho()).succ()
```

(continues on next page)

(continued from previous page)

```
[]
sage: L.rho().succ(index_set=[1])
[-Lambda[1] + 2*Lambda[2] + Lambda[3]]
sage: L.rho().succ(index_set=[2])
[2*Lambda[1] - Lambda[2] + 2*Lambda[3]]
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> L = RootSystem(['A',Integer(3)]).weight_lattice()
>>> Lambda = L.fundamental_weights()
>>> Lambda[Integer(1)].succ()
[-Lambda[1] + Lambda[2]]
>>> L.rho().succ()
[-Lambda[1] + 2*Lambda[2] + Lambda[3],
 2*Lambda[1] - Lambda[2] + 2*Lambda[3],
 Lambda[1] + 2*Lambda[2] - Lambda[3]]
>>> (-L.rho()).succ()
[]
>>> L.rho().succ(index_set=[Integer(1)])
[-Lambda[1] + 2*Lambda[2] + Lambda[3]]
>>> L.rho().succ(index_set=[Integer(2)])
[2*Lambda[1] - Lambda[2] + 2*Lambda[3]]
```

symmetric_form(*alpha*)

Return the symmetric form of `self` with `alpha`.

Consider the simple roots α_i and let $(b_{ij})_{ij}$ denote the symmetrized Cartan matrix $(a_{ij})_{ij}$, we have

$$(\alpha_i|\alpha_j) = b_{ij}$$

and extended bilinearly. See Chapter 6 in Kac, Infinite Dimensional Lie Algebras for more details.

EXAMPLES:

```
sage: # needs sage.graphs
sage: Q = RootSystem(['B',2,1]).root_lattice()
sage: alpha = Q.simple_roots()
sage: alpha[1].symmetric_form(alpha[0])
0
sage: alpha[1].symmetric_form(alpha[1])
4
sage: elt = alpha[0] - 3*alpha[1] + alpha[2]
sage: elt.symmetric_form(alpha[1])
-14
sage: elt.symmetric_form(alpha[0]+2*alpha[2])
14

sage: Q = RootSystem(CartanType(['A',4,2]).dual()).root_lattice()
sage: Qc = RootSystem(['A',4,2]).coroot_lattice()
sage: alpha = Q.simple_roots()
sage: alphac = Qc.simple_roots()
sage: elt = alpha[0] + 2*alpha[1] + 2*alpha[2]
sage: eltc = alphac[0] + 2*alphac[1] + 2*alphac[2]
```

(continues on next page)

(continued from previous page)

```
sage: elt.symmetric_form(alpha[1])                                        #␣
↪needs sage.graphs
0
sage: eltc.symmetric_form(alphac[1])                                      #␣
↪needs sage.graphs
0
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> Q = RootSystem(['B',Integer(2),Integer(1)]).root_lattice()
>>> alpha = Q.simple_roots()
>>> alpha[Integer(1)].symmetric_form(alpha[Integer(0)])
0
>>> alpha[Integer(1)].symmetric_form(alpha[Integer(1)])
4
>>> elt = alpha[Integer(0)] - Integer(3)*alpha[Integer(1)] +␣
↪alpha[Integer(2)]
>>> elt.symmetric_form(alpha[Integer(1)])
-14
>>> elt.symmetric_form(alpha[Integer(0)]+Integer(2)*alpha[Integer(2)])
14

>>> Q = RootSystem(CartanType(['A',Integer(4),Integer(2)]).dual()).root_
↪lattice()
>>> Qc = RootSystem(['A',Integer(4),Integer(2)]).coroot_lattice()
>>> alpha = Q.simple_roots()
>>> alphac = Qc.simple_roots()
>>> elt = alpha[Integer(0)] + Integer(2)*alpha[Integer(1)] +␣
↪Integer(2)*alpha[Integer(2)]
>>> eltc = alphac[Integer(0)] + Integer(2)*alphac[Integer(1)] +␣
↪Integer(2)*alphac[Integer(2)]
>>> elt.symmetric_form(alpha[Integer(1)])                                  ␣
↪     # needs sage.graphs
0
>>> eltc.symmetric_form(alphac[Integer(1)])                                ␣
↪     # needs sage.graphs
0
```

to_ambient()

Map `self` to the ambient space.

EXAMPLES:

```
sage: B4_rs = CartanType(['B',4]).root_system()
sage: alpha = B4_rs.root_lattice().an_element(); alpha
2*alpha[1] + 2*alpha[2] + 3*alpha[3]
sage: alpha.to_ambient()
(2, 0, 1, -3)
sage: mu = B4_rs.weight_lattice().an_element(); mu
2*Lambda[1] + 2*Lambda[2] + 3*Lambda[3]
sage: mu.to_ambient()
(7, 5, 3, 0)
```

(continues on next page)

(continued from previous page)

```
sage: v = B4_rs.ambient_space().an_element(); v
(2, 2, 3, 0)
sage: v.to_ambient()
(2, 2, 3, 0)
sage: alphavee = B4_rs.coroot_lattice().an_element(); alphavee
2*alphacheck[1] + 2*alphacheck[2] + 3*alphacheck[3]
sage: alphavee.to_ambient()
(2, 0, 1, -3)
```

```
>>> from sage.all import *
>>> B4_rs = CartanType(['B',Integer(4)]).root_system()
>>> alpha = B4_rs.root_lattice().an_element(); alpha
2*alpha[1] + 2*alpha[2] + 3*alpha[3]
>>> alpha.to_ambient()
(2, 0, 1, -3)
>>> mu = B4_rs.weight_lattice().an_element(); mu
2*Lambda[1] + 2*Lambda[2] + 3*Lambda[3]
>>> mu.to_ambient()
(7, 5, 3, 0)
>>> v = B4_rs.ambient_space().an_element(); v
(2, 2, 3, 0)
>>> v.to_ambient()
(2, 2, 3, 0)
>>> alphavee = B4_rs.coroot_lattice().an_element(); alphavee
2*alphacheck[1] + 2*alphacheck[2] + 3*alphacheck[3]
>>> alphavee.to_ambient()
(2, 0, 1, -3)
```

to_classical()

Map `self` to the classical lattice/space.

Only makes sense for affine type.

EXAMPLES:

```
sage: R = CartanType(['A',3,1]).root_system()
sage: alpha = R.root_lattice().an_element(); alpha
2*alpha[0] + 2*alpha[1] + 3*alpha[2]
sage: alb = alpha.to_classical(); alb                                  #␣
↪needs sage.graphs
alpha[2] - 2*alpha[3]
sage: alb.parent()                                                     #␣
↪needs sage.graphs
Root lattice of the Root system of type ['A', 3]
sage: v = R.ambient_space().an_element(); v
2*e[0] + 2*e[1] + 3*e[2]
sage: v.to_classical()                                                 #␣
↪needs sage.graphs
(2, 2, 3, 0)
```

```
>>> from sage.all import *
>>> R = CartanType(['A',Integer(3),Integer(1)]).root_system()
```

(continues on next page)

(continued from previous page)

```
>>> alpha = R.root_lattice().an_element(); alpha
2*alpha[0] + 2*alpha[1] + 3*alpha[2]
>>> alb = alpha.to_classical(); alb                                   #␣
↪needs sage.graphs
alpha[2] - 2*alpha[3]
>>> alb.parent()                                                      #␣
↪needs sage.graphs
Root lattice of the Root system of type ['A', 3]
>>> v = R.ambient_space().an_element(); v
2*e[0] + 2*e[1] + 3*e[2]
>>> v.to_classical()                                                  #␣
↪needs sage.graphs
(2, 2, 3, 0)
```

to_dominant_chamber(*index_set=None*, *positive=True*, *reduced_word=False*)

Return the unique dominant element in the Weyl group orbit of the vector `self`.

If `positive` is `False`, returns the antidominant orbit element.

With the `index_set` optional parameter, this is done with respect to the corresponding parabolic subgroup.

If `reduced_word` is `True`, returns the 2-tuple (`weight`, `direction`) where `weight` is the (anti)dominant orbit element and `direction` is a reduced word for the Weyl group element sending `weight` to `self`.

Warning

In infinite type, an orbit may not contain a dominant element. In this case the function may go into an infinite loop.

For affine root systems, errors are generated if the orbit does not contain the requested kind of representative. If the input vector is of positive (resp. negative) level, then there is a dominant (resp. antidominant) element in its orbit but not an antidominant (resp. dominant) one. If the vector is of level zero, then there are neither dominant nor antidominant orbit representatives, except for multiples of the null root, which are themselves both dominant and antidominant orbit representatives.

EXAMPLES:

```
sage: # needs sage.graphs
sage: space = RootSystem(['A',5]).weight_space()
sage: alpha = RootSystem(['A',5]).weight_space().simple_roots()
sage: alpha[1].to_dominant_chamber()
Lambda[1] + Lambda[5]
sage: alpha[1].to_dominant_chamber([1,2])
Lambda[1] + Lambda[2] - Lambda[3]
sage: wl = RootSystem(['A',2,1]).weight_lattice(extended=True)
sage: mu = wl.from_vector(vector([1,-3,0]))
sage: mu.to_dominant_chamber(positive=False, reduced_word=True)
(-Lambda[1] - Lambda[2] - delta, [0, 2])

sage: # needs sage.graphs
sage: R = RootSystem(['A',1,1])
```

(continues on next page)

(continued from previous page)

```
sage: rl = R.root_lattice()
sage: nu = rl.zero()
sage: nu.to_dominant_chamber()

ValueError: alpha[1] is not in the orbit of the negative of the␣
↪fundamental chamber
```

to_dual_type_cospace()

Map `self` to the dual type cospace.

For example, if `self` is in the root lattice of type $['B', 2]$, send it to the coroot lattice of type $['C', 2]$.

EXAMPLES:

```
sage: v = CartanType(['C',3]).root_system().weight_lattice().an_element();
↪ v
2*Lambda[1] + 2*Lambda[2] + 3*Lambda[3]
sage: w = v.to_dual_type_cospace(); w
2*Lambdacheck[1] + 2*Lambdacheck[2] + 3*Lambdacheck[3]
sage: w.parent()
Coweight lattice of the Root system of type ['B', 3]
```

```
>>> from sage.all import *
>>> v = CartanType(['C',Integer(3)]).root_system().weight_lattice().an_
↪element(); v
2*Lambda[1] + 2*Lambda[2] + 3*Lambda[3]
>>> w = v.to_dual_type_cospace(); w
2*Lambdacheck[1] + 2*Lambdacheck[2] + 3*Lambdacheck[3]
>>> w.parent()
Coweight lattice of the Root system of type ['B', 3]
```

to_simple_root(*reduced_word=False*)

Return (the index of) a simple root in the orbit of the positive root `self`.

INPUT:

- `self` – a positive root
- `reduced_word` – boolean (default: `False`)

OUTPUT:

- The index i of a simple root α_i. If `reduced_word` is `True`, this returns instead a pair `(i, word)`, where word is a sequence of reflections mapping α_i up the root poset to `self`.

EXAMPLES:

```
sage: L = RootSystem(["A",3]).root_lattice()
sage: positive_roots = L.positive_roots()
sage: for alpha in sorted(positive_roots):                              #␣
↪needs sage.graphs
....:     print("{} {}".format(alpha, alpha.to_simple_root()))
alpha[1] 1
alpha[1] + alpha[2] 2
alpha[1] + alpha[2] + alpha[3] 3
alpha[2] 2
alpha[2] + alpha[3] 3
alpha[3] 3
sage: for alpha in sorted(positive_roots):                              #␣
↪needs sage.graphs
....:     print("{} {}".format(alpha, alpha.to_simple_root(reduced_
↪word=True)))
alpha[1] (1, ())
alpha[1] + alpha[2] (2, (1,))
alpha[1] + alpha[2] + alpha[3] (3, (1, 2))
alpha[2] (2, ())
alpha[2] + alpha[3] (3, (2,))
alpha[3] (3, ())
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(3)]).root_lattice()
>>> positive_roots = L.positive_roots()
>>> for alpha in sorted(positive_roots):                                    #␣
↪needs sage.graphs
...     print("{} {}".format(alpha, alpha.to_simple_root()))
alpha[1] 1
alpha[1] + alpha[2] 2
alpha[1] + alpha[2] + alpha[3] 3
alpha[2] 2
alpha[2] + alpha[3] 3
alpha[3] 3
>>> for alpha in sorted(positive_roots):                                    #␣
↪needs sage.graphs
...     print("{} {}".format(alpha, alpha.to_simple_root(reduced_
↪word=True)))
alpha[1] (1, ())
alpha[1] + alpha[2] (2, (1,))
alpha[1] + alpha[2] + alpha[3] (3, (1, 2))
alpha[2] (2, ())
alpha[2] + alpha[3] (3, (2,))
alpha[3] (3, ())
```

ALGORITHM:

This method walks from `self` down to the antidominant chamber by applying successively the simple reflection given by the first descent. Since `self` is a positive root, each step goes down the root poset, and one must eventually cross a simple root α_i.

See also

- *first_descent()*
- *to_dominant_chamber()*

Warning

The behavior is not specified if the input is not a positive root. For a finite root system, this is currently caught (albeit with a not perfect message):

```
sage: alpha = L.simple_roots()                                             #␣
↪needs sage.graphs
sage: (2*alpha[1]).to_simple_root()                                        #␣
↪needs sage.graphs
Traceback (most recent call last):
...
ValueError: -2*alpha[1] - 2*alpha[2] - 2*alpha[3] is not a positive root
```

```
>>> from sage.all import *
>>> alpha = L.simple_roots()                                             #␣
↪needs sage.graphs
>>> (Integer(2)*alpha[Integer(1)]).to_simple_root()                              ␣
↪             # needs sage.graphs
Traceback (most recent call last):
...
ValueError: -2*alpha[1] - 2*alpha[2] - 2*alpha[3] is not a positive root
```

For an infinite root system, this method may run into an infinite recursion if the input is not a positive root.

translation(x)

Return x translated by t, that is, $x + level(x)t$.

INPUT:

- `self` – an element t at level 0
- `x` – an element of the same space

EXAMPLES:

```
sage: L = RootSystem(['A',2,1]).weight_lattice()
sage: alpha = L.simple_roots()                                          #␣
↪needs sage.graphs
sage: Lambda = L.fundamental_weights()                                  #␣
↪needs sage.graphs
sage: t = alpha[2]                                                      #␣
↪needs sage.graphs
```

```
>>> from sage.all import *
>>> L = RootSystem(['A',Integer(2),Integer(1)]).weight_lattice()
>>> alpha = L.simple_roots()                                          #␣
↪needs sage.graphs
>>> Lambda = L.fundamental_weights()                                  #␣
↪needs sage.graphs
>>> t = alpha[Integer(2)]                                             ␣
↪      # needs sage.graphs
```

Let us look at the translation of an element of level 1:

```
sage: Lambda[1].level()                                                 #␣
↪needs sage.graphs
1
sage: t.translation(Lambda[1])                                          #␣
↪needs sage.graphs
-Lambda[0] + 2*Lambda[2]
sage: Lambda[1] + t                                                     #␣
↪needs sage.graphs
-Lambda[0] + 2*Lambda[2]
```

```
>>> from sage.all import *
>>> Lambda[Integer(1)].level()                                          ␣
↪      # needs sage.graphs
1
>>> t.translation(Lambda[Integer(1)])                                   ␣
↪      # needs sage.graphs
-Lambda[0] + 2*Lambda[2]
>>> Lambda[Integer(1)] + t                                              ␣
↪      # needs sage.graphs
-Lambda[0] + 2*Lambda[2]
```

and of an element of level 0:

```
sage: alpha[1].level()                                                  #␣
↪needs sage.graphs
0
sage: t.translation(alpha [1])                                          #␣
↪needs sage.graphs
-Lambda[0] + 2*Lambda[1] - Lambda[2]
sage: alpha[1] + 0*t                                                    #␣
↪needs sage.graphs
-Lambda[0] + 2*Lambda[1] - Lambda[2]
```

```
>>> from sage.all import *
>>> alpha[Integer(1)].level()                                           ␣
↪     # needs sage.graphs
0
>>> t.translation(alpha [Integer(1)])                                   ␣
↪     # needs sage.graphs
-Lambda[0] + 2*Lambda[1] - Lambda[2]
>>> alpha[Integer(1)] + Integer(0)*t                                    ␣
↪              # needs sage.graphs
-Lambda[0] + 2*Lambda[1] - Lambda[2]
```

The arguments are given in this seemingly unnatural order to make it easy to construct the translation function:

```
sage: f = t.translation                                                 #␣
↪needs sage.graphs
sage: f(Lambda[1])                                                      #␣
↪needs sage.graphs
-Lambda[0] + 2*Lambda[2]
```

```
>>> from sage.all import *
>>> f = t.translation                                                 #␣
↪needs sage.graphs
>>> f(Lambda[Integer(1)])                                               ␣
↪     # needs sage.graphs
-Lambda[0] + 2*Lambda[2]
```

weyl_action(*element*, *inverse=False*)

Act on `self` by an element of the Coxeter or Weyl group.

INPUT:

- `element` – an element of a Coxeter or Weyl group of the same Cartan type, or a tuple or a list (such as a reduced word) of elements from the index set
- `inverse` – boolean (default: `False`); whether to act by the inverse element

EXAMPLES:

```
sage: wl = RootSystem(['A',3]).weight_lattice()
sage: mu = wl.from_vector(vector([1,0,-2]))
sage: mu
Lambda[1] - 2*Lambda[3]
sage: mudom, rw = mu.to_dominant_chamber(positive=False,                #␣
↪needs sage.graphs
....:                                        reduced_word=True)
```

(continues on next page)

(continued from previous page)

```
sage: mudom, rw                                                          #␣
↪needs sage.graphs
(-Lambda[2] - Lambda[3], [1, 2])
```

```
>>> from sage.all import *
>>> wl = RootSystem(['A',Integer(3)]).weight_lattice()
>>> mu = wl.from_vector(vector([Integer(1),Integer(0),-Integer(2)]))
>>> mu
Lambda[1] - 2*Lambda[3]
>>> mudom, rw = mu.to_dominant_chamber(positive=False,                 #␣
↪needs sage.graphs
...                                    reduced_word=True)
>>> mudom, rw                                                          #␣
↪needs sage.graphs
(-Lambda[2] - Lambda[3], [1, 2])
```

Acting by a (reduced) word:

```
sage: mudom.weyl_action(rw)                                              #␣
↪needs sage.graphs
Lambda[1] - 2*Lambda[3]
sage: mu.weyl_action(rw, inverse=True)                                   #␣
↪needs sage.graphs
-Lambda[2] - Lambda[3]
```

```
>>> from sage.all import *
>>> mudom.weyl_action(rw)                                              #␣
↪needs sage.graphs
Lambda[1] - 2*Lambda[3]
>>> mu.weyl_action(rw, inverse=True)                                   #␣
↪needs sage.graphs
-Lambda[2] - Lambda[3]
```

Acting by an element of the Coxeter or Weyl group on a vector in its own lattice of definition (implemented by matrix multiplication on a vector):

```
sage: w = wl.weyl_group().from_reduced_word([1, 2])                      #␣
↪needs sage.graphs sage.libs.gap
sage: mudom.weyl_action(w)                                               #␣
↪needs sage.graphs sage.libs.gap
Lambda[1] - 2*Lambda[3]
```

```
>>> from sage.all import *
>>> w = wl.weyl_group().from_reduced_word([Integer(1), Integer(2)])     ␣
↪              # needs sage.graphs sage.libs.gap
>>> mudom.weyl_action(w)                                               #␣
↪needs sage.graphs sage.libs.gap
Lambda[1] - 2*Lambda[3]
```

Acting by an element of an isomorphic Coxeter or Weyl group (implemented by the action of a corresponding reduced word):

```
sage: # needs sage.libs.gap
sage: W = WeylGroup(['A',3], prefix='s')
sage: w = W.from_reduced_word([1, 2])
sage: wl.weyl_group() == W
False
sage: mudom.weyl_action(w)                                              #␣
↪needs sage.graphs
Lambda[1] - 2*Lambda[3]
```

```
>>> from sage.all import *
>>> # needs sage.libs.gap
>>> W = WeylGroup(['A',Integer(3)], prefix='s')
>>> w = W.from_reduced_word([Integer(1), Integer(2)])
>>> wl.weyl_group() == W
False
>>> mudom.weyl_action(w)                                                #␣
↪needs sage.graphs
Lambda[1] - 2*Lambda[3]
```

weyl_stabilizer(*index_set=None*)

Return the subset of Dynkin nodes whose reflections fix `self`.

If `index_set` is not `None`, only consider nodes in this set. Note that if `self` is dominant or antidominant, then its stabilizer is the parabolic subgroup defined by the returned node set.

EXAMPLES:

```
sage: wl = RootSystem(['A',2,1]).weight_lattice(extended=True)
sage: al = wl.null_root()                                               #␣
↪needs sage.graphs
sage: al.weyl_stabilizer()                                              #␣
↪needs sage.graphs
[0, 1, 2]
sage: wl = RootSystem(['A',4]).weight_lattice()
sage: mu = wl.from_vector(vector([1,1,0,0]))
sage: mu.weyl_stabilizer()
[3, 4]
sage: mu.weyl_stabilizer(index_set = [1,2,3])
[3]
```

```
>>> from sage.all import *
>>> wl = RootSystem(['A',Integer(2),Integer(1)]).weight_
↪lattice(extended=True)
>>> al = wl.null_root()                                                 #␣
↪needs sage.graphs
>>> al.weyl_stabilizer()                                                #␣
↪needs sage.graphs
[0, 1, 2]
>>> wl = RootSystem(['A',Integer(4)]).weight_lattice()
>>> mu = wl.from_vector(vector([Integer(1),Integer(1),Integer(0),
↪Integer(0)]))
>>> mu.weyl_stabilizer()
[3, 4]
```

(continues on next page)

(continued from previous page)

```
>>> mu.weyl_stabilizer(index_set = [Integer(1),Integer(2),Integer(3)])
[3]
```

class ParentMethods

Bases: `object`

a_long_simple_root()

Return a long simple root, corresponding to the highest outgoing edge in the Dynkin diagram.

Warning

This may be broken in affine type $A_{2n}^{(2)}$

Is it meaningful/broken for non irreducible?

Todo

implement CartanType.nodes_by_length as in MuPAD-Combinat (using CartanType.symmetrizer), and use it here.

almost_positive_roots()

Return the almost positive roots of `self`.

These are the positive roots together with the simple negative roots.

See also

`almost_positive_root_decomposition()`, *`tau_plus_minus()`*

EXAMPLES:

```
sage: L = RootSystem(['A',2]).root_lattice()
sage: L.almost_positive_roots()                                         #␣
↪needs sage.graphs
[-alpha[1], alpha[1], alpha[1] + alpha[2], -alpha[2], alpha[2]]
```

```
>>> from sage.all import *
>>> L = RootSystem(['A',Integer(2)]).root_lattice()
>>> L.almost_positive_roots()                                         #␣
↪needs sage.graphs
[-alpha[1], alpha[1], alpha[1] + alpha[2], -alpha[2], alpha[2]]
```

almost_positive_roots_decomposition()

Return the decomposition of the almost positive roots of `self`.

This is the list of the orbits of the almost positive roots under the action of the dihedral group generated by the operators τ_+ and τ_-.

See also

- *almost_positive_roots()*
- *tau_plus_minus()*

EXAMPLES:

```
sage: RootSystem(['A',2]).root_lattice().almost_positive_roots_
↪decomposition()      # needs sage.graphs sage.libs.gap
[[-alpha[1], alpha[1], alpha[1] + alpha[2], alpha[2], -alpha[2]]]

sage: RootSystem(['B',2]).root_lattice().almost_positive_roots_
↪decomposition()      # needs sage.graphs sage.libs.gap
[[-alpha[1], alpha[1], alpha[1] + 2*alpha[2]],
 [-alpha[2], alpha[2], alpha[1] + alpha[2]]]

sage: RootSystem(['D',4]).root_lattice().almost_positive_roots_
↪decomposition()      # needs sage.graphs sage.libs.gap
[[-alpha[1], alpha[1], alpha[1] + alpha[2], alpha[2] + alpha[3] +␣
↪alpha[4]],
 [-alpha[2], alpha[2], alpha[1] + alpha[2] + alpha[3] + alpha[4],
     alpha[1] + 2*alpha[2] + alpha[3] + alpha[4]],
 [-alpha[3], alpha[3], alpha[2] + alpha[3], alpha[1] + alpha[2] +␣
↪alpha[4]],
 [-alpha[4], alpha[4], alpha[2] + alpha[4], alpha[1] + alpha[2] +␣
↪alpha[3]]]
```

```
>>> from sage.all import *
>>> RootSystem(['A',Integer(2)]).root_lattice().almost_positive_roots_
↪decomposition()      # needs sage.graphs sage.libs.gap
[[-alpha[1], alpha[1], alpha[1] + alpha[2], alpha[2], -alpha[2]]]

>>> RootSystem(['B',Integer(2)]).root_lattice().almost_positive_roots_
↪decomposition()      # needs sage.graphs sage.libs.gap
[[-alpha[1], alpha[1], alpha[1] + 2*alpha[2]],
 [-alpha[2], alpha[2], alpha[1] + alpha[2]]]

>>> RootSystem(['D',Integer(4)]).root_lattice().almost_positive_roots_
↪decomposition()      # needs sage.graphs sage.libs.gap
[[-alpha[1], alpha[1], alpha[1] + alpha[2], alpha[2] + alpha[3] +␣
↪alpha[4]],
 [-alpha[2], alpha[2], alpha[1] + alpha[2] + alpha[3] + alpha[4],
     alpha[1] + 2*alpha[2] + alpha[3] + alpha[4]],
 [-alpha[3], alpha[3], alpha[2] + alpha[3], alpha[1] + alpha[2] +␣
↪alpha[4]],
 [-alpha[4], alpha[4], alpha[2] + alpha[4], alpha[1] + alpha[2] +␣
↪alpha[3]]]
```

alpha()

Return the family $(\alpha_i)_{i \in I}$ of the simple roots, with the extra feature that, for simple irreducible root systems, α_0 yields the opposite of the highest root.

EXAMPLES:

```
sage: alpha = RootSystem(["A",2]).root_lattice().alpha()
sage: alpha[1]
alpha[1]
sage: alpha[0]                                                              #␣
↪needs sage.graphs
-alpha[1] - alpha[2]
```

```
>>> from sage.all import *
>>> alpha = RootSystem(["A",Integer(2)]).root_lattice().alpha()
>>> alpha[Integer(1)]
alpha[1]
>>> alpha[Integer(0)]                                                        ␣
↪     # needs sage.graphs
-alpha[1] - alpha[2]
```

alphacheck()

Return the family $(\alpha_i^\vee)_{i\in I}$ of the simple coroots, with the extra feature that, for simple irreducible root systems, $\alpha_0^\vee$ yields the coroot associated to the opposite of the highest root (caveat: for non-simply-laced root systems, this is not the opposite of the highest coroot!).

EXAMPLES:

```
sage: alphacheck = RootSystem(["A",2]).ambient_space().alphacheck()
sage: alphacheck
Finite family {1: (1, -1, 0), 2: (0, 1, -1)}
```

```
>>> from sage.all import *
>>> alphacheck = RootSystem(["A",Integer(2)]).ambient_space().alphacheck()
>>> alphacheck
Finite family {1: (1, -1, 0), 2: (0, 1, -1)}
```

Here is now $\alpha_0^\vee$:

(-1, 0, 1)

Todo

add a non simply laced example

Finally, here is an affine example:

```
sage: RootSystem(["A",2,1]).weight_space().alphacheck()
Finite family {0: alphacheck[0], 1: alphacheck[1], 2: alphacheck[2]}

sage: RootSystem(["A",3]).ambient_space().alphacheck()
Finite family {1: (1, -1, 0, 0), 2: (0, 1, -1, 0), 3: (0, 0, 1, -1)}
```

```
>>> from sage.all import *
>>> RootSystem(["A",Integer(2),Integer(1)]).weight_space().alphacheck()
Finite family {0: alphacheck[0], 1: alphacheck[1], 2: alphacheck[2]}
```

(continues on next page)

(continued from previous page)

```
>>> RootSystem(["A",Integer(3)]).ambient_space().alphacheck()
Finite family {1: (1, -1, 0, 0), 2: (0, 1, -1, 0), 3: (0, 0, 1, -1)}
```

basic_imaginary_roots()

Return the basic imaginary roots of `self`.

The basic imaginary roots δ are the set of imaginary roots in $-C^\vee$ where C is the dominant chamber (i.e., $\langle \beta, \alpha_i^\vee \rangle \leq 0$ for all $i \in I$). All imaginary roots are W-conjugate to a simple imaginary root.

EXAMPLES:

```
sage: RootSystem(['A', 2]).root_lattice().basic_imaginary_roots()
()
sage: Q = RootSystem(['A', 2, 1]).root_lattice()
sage: Q.basic_imaginary_roots()                                        #␣
↪needs sage.graphs
(alpha[0] + alpha[1] + alpha[2],)
sage: delta = Q.basic_imaginary_roots()[0]                             #␣
↪needs sage.graphs
sage: all(delta.scalar(Q.simple_coroot(i)) <= 0                        #␣
↪needs sage.graphs
....:     for i in Q.index_set())
True
```

```
>>> from sage.all import *
>>> RootSystem(['A', Integer(2)]).root_lattice().basic_imaginary_roots()
()
>>> Q = RootSystem(['A', Integer(2), Integer(1)]).root_lattice()
>>> Q.basic_imaginary_roots()                                        #␣
↪needs sage.graphs
(alpha[0] + alpha[1] + alpha[2],)
>>> delta = Q.basic_imaginary_roots()[Integer(0)]                       ␣
↪     # needs sage.graphs
>>> all(delta.scalar(Q.simple_coroot(i)) <= Integer(0)                  ␣
↪     # needs sage.graphs
...     for i in Q.index_set())
True
```

cartan_type()

EXAMPLES:

```
sage: r = RootSystem(['A',4]).root_space()
sage: r.cartan_type()
['A', 4]
```

```
>>> from sage.all import *
>>> r = RootSystem(['A',Integer(4)]).root_space()
>>> r.cartan_type()
['A', 4]
```

classical()

Return the corresponding root/weight/ambient lattice/space.

EXAMPLES:

```
sage: RootSystem(["A",4,1]).root_lattice().classical()
Root lattice of the Root system of type ['A', 4]
sage: RootSystem(["A",4,1]).weight_lattice().classical()
Weight lattice of the Root system of type ['A', 4]
sage: RootSystem(["A",4,1]).ambient_space().classical()
Ambient space of the Root system of type ['A', 4]
```

```
>>> from sage.all import *
>>> RootSystem(["A",Integer(4),Integer(1)]).root_lattice().classical()
Root lattice of the Root system of type ['A', 4]
>>> RootSystem(["A",Integer(4),Integer(1)]).weight_lattice().classical()
Weight lattice of the Root system of type ['A', 4]
>>> RootSystem(["A",Integer(4),Integer(1)]).ambient_space().classical()
Ambient space of the Root system of type ['A', 4]
```

cohighest_root()

Return the associated coroot of the highest root.

> **Note**
>
> this is usually not the highest coroot.

EXAMPLES:

```
sage: RootSystem(['A', 3]).ambient_space().cohighest_root()
(1, 0, 0, -1)
```

```
>>> from sage.all import *
>>> RootSystem(['A', Integer(3)]).ambient_space().cohighest_root()
(1, 0, 0, -1)
```

coroot_lattice()

Return the coroot lattice.

EXAMPLES:

```
sage: RootSystem(['A',2]).root_lattice().coroot_lattice()
Coroot lattice of the Root system of type ['A', 2]
```

```
>>> from sage.all import *
>>> RootSystem(['A',Integer(2)]).root_lattice().coroot_lattice()
Coroot lattice of the Root system of type ['A', 2]
```

coroot_space(*base_ring=Rational Field*)

Return the coroot space over `base_ring`.

INPUT:

- `base_ring` – a ring (default: $\mathbf{Q}$)

EXAMPLES:

```
sage: RootSystem(['A',2]).root_lattice().coroot_space()
Coroot space over the Rational Field of the Root system of type ['A', 2]
```

(continues on next page)

(continued from previous page)

```
sage: RootSystem(['A',2]).root_lattice().coroot_space(QQ['q'])
Coroot space over the Univariate Polynomial Ring in q over Rational Field
 of the Root system of type ['A', 2]
```

```
>>> from sage.all import *
>>> RootSystem(['A',Integer(2)]).root_lattice().coroot_space()
Coroot space over the Rational Field of the Root system of type ['A', 2]

>>> RootSystem(['A',Integer(2)]).root_lattice().coroot_space(QQ['q'])
Coroot space over the Univariate Polynomial Ring in q over Rational Field
 of the Root system of type ['A', 2]
```

dual_type_cospace()

Return the cospace of dual type.

For example, if invoked on the root lattice of type $['B', 2]$, returns the coroot lattice of type $['C', 2]$.

> **Warning**
>
> Not implemented for ambient spaces.

EXAMPLES:

```
sage: CartanType(['B',2]).root_system().root_lattice().dual_type_cospace()
Coroot lattice of the Root system of type ['C', 2]
sage: CartanType(['F',4]).root_system().coweight_lattice().dual_type_
↪cospace()
Weight lattice of the Root system of type ['F', 4]
 relabelled by {1: 4, 2: 3, 3: 2, 4: 1}
```

```
>>> from sage.all import *
>>> CartanType(['B',Integer(2)]).root_system().root_lattice().dual_type_
↪cospace()
Coroot lattice of the Root system of type ['C', 2]
>>> CartanType(['F',Integer(4)]).root_system().coweight_lattice().dual_
↪type_cospace()
Weight lattice of the Root system of type ['F', 4]
 relabelled by {1: 4, 2: 3, 3: 2, 4: 1}
```

dynkin_diagram()

EXAMPLES:

```
sage: r = RootSystem(['A',4]).root_space()
sage: r.dynkin_diagram()                                                #␣
↪needs sage.graphs
O---O---O---O
1   2   3   4
A4
```

```
>>> from sage.all import *
>>> r = RootSystem(['A',Integer(4)]).root_space()
>>> r.dynkin_diagram()                                                  #␣
↪needs sage.graphs
O---O---O---O
1   2   3   4
A4
```

fundamental_weights_from_simple_roots()

Return the fundamental weights.

This is computed from the simple roots by using the inverse of the Cartan matrix. This method is therefore only valid for finite types and if this realization of the root lattice is large enough to contain them.

EXAMPLES:

In the root space, we retrieve the inverse of the Cartan matrix:

```
sage: L = RootSystem(["B",3]).root_space()
sage: L.fundamental_weights_from_simple_roots()                           #␣
↪needs sage.graphs
Finite family {1:     alpha[1] +   alpha[2] +     alpha[3],
               2:     alpha[1] + 2*alpha[2] +   2*alpha[3],
               3: 1/2*alpha[1] +   alpha[2] + 3/2*alpha[3]}
sage: ~L.cartan_type().cartan_matrix()                                    #␣
↪needs sage.graphs
[  1   1 1/2]
[  1   2   1]
[  1   2 3/2]
```

```
>>> from sage.all import *
>>> L = RootSystem(["B",Integer(3)]).root_space()
>>> L.fundamental_weights_from_simple_roots()                           #␣
↪needs sage.graphs
Finite family {1:     alpha[1] +   alpha[2] +     alpha[3],
               2:     alpha[1] + 2*alpha[2] +   2*alpha[3],
               3: 1/2*alpha[1] +   alpha[2] + 3/2*alpha[3]}
>>> ~L.cartan_type().cartan_matrix()                                    #␣
↪needs sage.graphs
[  1   1 1/2]
[  1   2   1]
[  1   2 3/2]
```

In the weight lattice and the ambient space, we retrieve the fundamental weights:

```
sage: L = RootSystem(["B",3]).weight_lattice()
sage: L.fundamental_weights_from_simple_roots()                           #␣
↪needs sage.graphs
Finite family {1: Lambda[1], 2: Lambda[2], 3: Lambda[3]}

sage: L = RootSystem(["B",3]).ambient_space()
sage: L.fundamental_weights()
Finite family {1: (1, 0, 0), 2: (1, 1, 0), 3: (1/2, 1/2, 1/2)}
```

(continues on next page)

(continued from previous page)

```
sage: L.fundamental_weights_from_simple_roots()                              #␣
↪needs sage.graphs
Finite family {1: (1, 0, 0), 2: (1, 1, 0), 3: (1/2, 1/2, 1/2)}
```

```
>>> from sage.all import *
>>> L = RootSystem(["B",Integer(3)]).weight_lattice()
>>> L.fundamental_weights_from_simple_roots()                              #␣
↪needs sage.graphs
Finite family {1: Lambda[1], 2: Lambda[2], 3: Lambda[3]}

>>> L = RootSystem(["B",Integer(3)]).ambient_space()
>>> L.fundamental_weights()
Finite family {1: (1, 0, 0), 2: (1, 1, 0), 3: (1/2, 1/2, 1/2)}
>>> L.fundamental_weights_from_simple_roots()                              #␣
↪needs sage.graphs
Finite family {1: (1, 0, 0), 2: (1, 1, 0), 3: (1/2, 1/2, 1/2)}
```

However the fundamental weights do not belong to the root lattice:

```
sage: L = RootSystem(["B",3]).root_lattice()
sage: L.fundamental_weights_from_simple_roots()                              #␣
↪needs sage.graphs
Traceback (most recent call last):
...
ValueError: The fundamental weights do not live in this realization
of the root lattice
```

```
>>> from sage.all import *
>>> L = RootSystem(["B",Integer(3)]).root_lattice()
>>> L.fundamental_weights_from_simple_roots()                              #␣
↪needs sage.graphs
Traceback (most recent call last):
...
ValueError: The fundamental weights do not live in this realization
of the root lattice
```

Beware of the usual GL_n vs SL_n catch in type A:

```
sage: L = RootSystem(["A",3]).ambient_space()
sage: L.fundamental_weights()
Finite family {1: (1, 0, 0, 0), 2: (1, 1, 0, 0), 3: (1, 1, 1, 0)}
sage: L.fundamental_weights_from_simple_roots()                              #␣
↪needs sage.graphs
Finite family {1: (3/4, -1/4, -1/4, -1/4),
               2: (1/2, 1/2, -1/2, -1/2),
               3: (1/4, 1/4, 1/4, -3/4)}

sage: L = RootSystem(["A",3]).ambient_lattice()
sage: L.fundamental_weights_from_simple_roots()                              #␣
↪needs sage.graphs
Traceback (most recent call last):
...
```

(continues on next page)

(continued from previous page)

```
ValueError: The fundamental weights do not live in this realization
of the root lattice
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(3)]).ambient_space()
>>> L.fundamental_weights()
Finite family {1: (1, 0, 0, 0), 2: (1, 1, 0, 0), 3: (1, 1, 1, 0)}
>>> L.fundamental_weights_from_simple_roots()                          #␣
↪needs sage.graphs
Finite family {1: (3/4, -1/4, -1/4, -1/4),
               2: (1/2, 1/2, -1/2, -1/2),
               3: (1/4, 1/4, 1/4, -3/4)}

>>> L = RootSystem(["A",Integer(3)]).ambient_lattice()
>>> L.fundamental_weights_from_simple_roots()                          #␣
↪needs sage.graphs
Traceback (most recent call last):
...
ValueError: The fundamental weights do not live in this realization
of the root lattice
```

generalized_nonnesting_partition_lattice(*m*, *facade=False*)

Return the lattice of m-nonnesting partitions.

This has been defined by Athanasiadis, see chapter 5 of [Arm06].

INPUT:

- m – integer

See also

nonnesting_partition_lattice()

EXAMPLES:

```
sage: R = RootSystem(['A', 2])
sage: RS = R.root_lattice()
sage: P = RS.generalized_nonnesting_partition_lattice(2); P              #␣
↪needs sage.graphs
Finite lattice containing 12 elements
sage: P.coxeter_transformation()**20 == 1                               #␣
↪needs sage.graphs sage.libs.flint
True
```

```
>>> from sage.all import *
>>> R = RootSystem(['A', Integer(2)])
>>> RS = R.root_lattice()
>>> P = RS.generalized_nonnesting_partition_lattice(Integer(2)); P      ␣
↪     # needs sage.graphs
Finite lattice containing 12 elements
>>> P.coxeter_transformation()**Integer(20) == Integer(1)               ␣
↪              # needs sage.graphs sage.libs.flint
```

(continues on next page)

(continued from previous page)

```
True
```

highest_root()

Return the highest root (for an irreducible finite root system).

EXAMPLES:

```
sage: RootSystem(['A',4]).ambient_space().highest_root()
(1, 0, 0, 0, -1)

sage: RootSystem(['E',6]).weight_space().highest_root()                    #␣
↪needs sage.graphs
Lambda[2]
```

```
>>> from sage.all import *
>>> RootSystem(['A',Integer(4)]).ambient_space().highest_root()
(1, 0, 0, 0, -1)

>>> RootSystem(['E',Integer(6)]).weight_space().highest_root()              ␣
↪     # needs sage.graphs
Lambda[2]
```

index_set()

EXAMPLES:

```
sage: r = RootSystem(['A',4]).root_space()
sage: r.index_set()
(1, 2, 3, 4)
```

```
>>> from sage.all import *
>>> r = RootSystem(['A',Integer(4)]).root_space()
>>> r.index_set()
(1, 2, 3, 4)
```

long_roots()

Return a list of the long roots of `self`.

EXAMPLES:

```
sage: L = RootSystem(['B',3]).root_lattice()
sage: sorted(L.long_roots())                                                #␣
↪needs sage.graphs
[-alpha[1], -alpha[1] - 2*alpha[2] - 2*alpha[3],
 -alpha[1] - alpha[2], -alpha[1] - alpha[2] - 2*alpha[3],
 alpha[1], alpha[1] + alpha[2],
 alpha[1] + alpha[2] + 2*alpha[3],
 alpha[1] + 2*alpha[2] + 2*alpha[3], -alpha[2],
 -alpha[2] - 2*alpha[3], alpha[2], alpha[2] + 2*alpha[3]]
```

```
>>> from sage.all import *
>>> L = RootSystem(['B',Integer(3)]).root_lattice()
>>> sorted(L.long_roots())                                                #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.graphs
[-alpha[1], -alpha[1] - 2*alpha[2] - 2*alpha[3],
 -alpha[1] - alpha[2], -alpha[1] - alpha[2] - 2*alpha[3],
 alpha[1], alpha[1] + alpha[2],
 alpha[1] + alpha[2] + 2*alpha[3],
 alpha[1] + 2*alpha[2] + 2*alpha[3], -alpha[2],
 -alpha[2] - 2*alpha[3], alpha[2], alpha[2] + 2*alpha[3]]
```

negative_roots()

Return the negative roots of `self`.

EXAMPLES:

```
sage: L = RootSystem(['A', 2]).weight_lattice()
sage: sorted(L.negative_roots())                                          #␣
↪needs sage.graphs
[-2*Lambda[1] + Lambda[2], -Lambda[1] - Lambda[2], Lambda[1] -␣
↪2*Lambda[2]]
```

```
>>> from sage.all import *
>>> L = RootSystem(['A', Integer(2)]).weight_lattice()
>>> sorted(L.negative_roots())                                            #␣
↪needs sage.graphs
[-2*Lambda[1] + Lambda[2], -Lambda[1] - Lambda[2], Lambda[1] -␣
↪2*Lambda[2]]
```

Algorithm: negate the positive roots

nonnesting_partition_lattice(*facade=False*)

Return the lattice of nonnesting partitions.

This is the lattice of order ideals of the root poset.

This has been defined by Postnikov, see Remark 2 in [Reiner97].

See also

generalized_nonnesting_partition_lattice(), *root_poset()*

EXAMPLES:

```
sage: R = RootSystem(['A', 3])
sage: RS = R.root_lattice()
sage: P = RS.nonnesting_partition_lattice(); P                            #␣
↪needs sage.graphs
Finite lattice containing 14 elements
sage: P.coxeter_transformation()**10 == 1                                 #␣
↪needs sage.graphs sage.libs.flint
True

sage: # needs sage.graphs
sage: R = RootSystem(['B', 3])
sage: RS = R.root_lattice()
```

(continues on next page)

(continued from previous page)

```
sage: P = RS.nonnesting_partition_lattice(); P
Finite lattice containing 20 elements
sage: P.coxeter_transformation()**7 == 1                                    #␣
↪needs sage.libs.flint
True
```

```
>>> from sage.all import *
>>> R = RootSystem(['A', Integer(3)])
>>> RS = R.root_lattice()
>>> P = RS.nonnesting_partition_lattice(); P                              #␣
↪needs sage.graphs
Finite lattice containing 14 elements
>>> P.coxeter_transformation()**Integer(10) == Integer(1)                     ␣
↪              # needs sage.graphs sage.libs.flint
True

>>> # needs sage.graphs
>>> R = RootSystem(['B', Integer(3)])
>>> RS = R.root_lattice()
>>> P = RS.nonnesting_partition_lattice(); P
Finite lattice containing 20 elements
>>> P.coxeter_transformation()**Integer(7) == Integer(1)                      ␣
↪              # needs sage.libs.flint
True
```

REFERENCES:

nonparabolic_positive_root_sum(*index_set=None*)

Return the sum of positive roots not in a parabolic subsystem.

The conventions for `index_set` are as in *nonparabolic_positive_roots()*.

EXAMPLES:

```
sage: Q = RootSystem(['A',3]).root_lattice()
sage: Q.nonparabolic_positive_root_sum((1,2))                                #␣
↪needs sage.graphs
alpha[1] + 2*alpha[2] + 3*alpha[3]
sage: Q.nonparabolic_positive_root_sum()                                     #␣
↪needs sage.graphs
0
sage: Q.nonparabolic_positive_root_sum(())                                   #␣
↪needs sage.graphs
3*alpha[1] + 4*alpha[2] + 3*alpha[3]
```

```
>>> from sage.all import *
>>> Q = RootSystem(['A',Integer(3)]).root_lattice()
>>> Q.nonparabolic_positive_root_sum((Integer(1),Integer(2)))                 ␣
↪              # needs sage.graphs
alpha[1] + 2*alpha[2] + 3*alpha[3]
>>> Q.nonparabolic_positive_root_sum()                                      #␣
↪needs sage.graphs
0
```

(continues on next page)

(continued from previous page)

```
>>> Q.nonparabolic_positive_root_sum(())                                  #␣
↪needs sage.graphs
3*alpha[1] + 4*alpha[2] + 3*alpha[3]
```

nonparabolic_positive_roots(*index_set=None*)

Return the positive roots of `self` that are not in the parabolic subsystem indicated by `index_set`.

If `index_set` is `None`, as in *positive_roots()* it is assumed to be the entire Dynkin node set. Then the parabolic subsystem consists of all positive roots and the empty list is returned.

EXAMPLES:

```
sage: L = RootSystem(['A',3]).root_lattice()
sage: L.nonparabolic_positive_roots()                                      #␣
↪needs sage.graphs
[]
sage: sorted(L.nonparabolic_positive_roots((1,2)))                         #␣
↪needs sage.graphs
[alpha[1] + alpha[2] + alpha[3], alpha[2] + alpha[3], alpha[3]]
sage: sorted(L.nonparabolic_positive_roots(()))                            #␣
↪needs sage.graphs
[alpha[1], alpha[1] + alpha[2], alpha[1] + alpha[2] + alpha[3],
 alpha[2], alpha[2] + alpha[3], alpha[3]]
```

```
>>> from sage.all import *
>>> L = RootSystem(['A',Integer(3)]).root_lattice()
>>> L.nonparabolic_positive_roots()                                       #␣
↪needs sage.graphs
[]
>>> sorted(L.nonparabolic_positive_roots((Integer(1),Integer(2))))        ␣
↪              # needs sage.graphs
[alpha[1] + alpha[2] + alpha[3], alpha[2] + alpha[3], alpha[3]]
>>> sorted(L.nonparabolic_positive_roots(()))                             #␣
↪needs sage.graphs
[alpha[1], alpha[1] + alpha[2], alpha[1] + alpha[2] + alpha[3],
 alpha[2], alpha[2] + alpha[3], alpha[3]]
```

null_coroot()

Return the null coroot of `self`.

The null coroot is the smallest non trivial positive coroot which is orthogonal to all simple roots. It exists for any affine root system.

EXAMPLES:

```
sage: RootSystem(['C',2,1]).root_lattice().null_coroot()                   #␣
↪needs sage.graphs
alphacheck[0] + alphacheck[1] + alphacheck[2]
sage: RootSystem(['D',4,1]).root_lattice().null_coroot()                   #␣
↪needs sage.graphs
alphacheck[0] + alphacheck[1] + 2*alphacheck[2]
 + alphacheck[3] + alphacheck[4]
sage: RootSystem(['F',4,1]).root_lattice().null_coroot()                   #␣
↪needs sage.graphs
```

(continues on next page)

(continued from previous page)

```
alphacheck[0] + 2*alphacheck[1] + 3*alphacheck[2]
 + 2*alphacheck[3] + alphacheck[4]
```

```
>>> from sage.all import *
>>> RootSystem(['C',Integer(2),Integer(1)]).root_lattice().null_coroot()
↪                # needs sage.graphs
alphacheck[0] + alphacheck[1] + alphacheck[2]
>>> RootSystem(['D',Integer(4),Integer(1)]).root_lattice().null_coroot()
↪                # needs sage.graphs
alphacheck[0] + alphacheck[1] + 2*alphacheck[2]
 + alphacheck[3] + alphacheck[4]
>>> RootSystem(['F',Integer(4),Integer(1)]).root_lattice().null_coroot()
↪                # needs sage.graphs
alphacheck[0] + 2*alphacheck[1] + 3*alphacheck[2]
 + 2*alphacheck[3] + alphacheck[4]
```

null_root()

Return the null root of `self`.

The null root is the smallest non trivial positive root which is orthogonal to all simple coroots. It exists for any affine root system.

EXAMPLES:

```
sage: RootSystem(['C',2,1]).root_lattice().null_root()                    #
↪needs sage.graphs
alpha[0] + 2*alpha[1] + alpha[2]
sage: RootSystem(['D',4,1]).root_lattice().null_root()                    #
↪needs sage.graphs
alpha[0] + alpha[1] + 2*alpha[2] + alpha[3] + alpha[4]
sage: RootSystem(['F',4,1]).root_lattice().null_root()                    #
↪needs sage.graphs
alpha[0] + 2*alpha[1] + 3*alpha[2] + 4*alpha[3] + 2*alpha[4]
```

```
>>> from sage.all import *
>>> RootSystem(['C',Integer(2),Integer(1)]).root_lattice().null_root()
↪                # needs sage.graphs
alpha[0] + 2*alpha[1] + alpha[2]
>>> RootSystem(['D',Integer(4),Integer(1)]).root_lattice().null_root()
↪                # needs sage.graphs
alpha[0] + alpha[1] + 2*alpha[2] + alpha[3] + alpha[4]
>>> RootSystem(['F',Integer(4),Integer(1)]).root_lattice().null_root()
↪                # needs sage.graphs
alpha[0] + 2*alpha[1] + 3*alpha[2] + 4*alpha[3] + 2*alpha[4]
```

plot(*roots='simple'*, *coroots=False*, *reflection_hyperplanes='simple'*, *fundamental_weights=None*, *fundamental_chamber=None*, *alcoves=None*, *alcove_labels=False*, *alcove_walk=None*, ***options*)

Return a picture of this root lattice realization.

INPUT:

- `roots` – which roots to display, if any Can be one of the following:
  - `'simple'` – the simple roots (the default)
  - `'classical'` – not yet implemented

  - 'all' – only works in the finite case
  - A list or tuple of roots
  - False
- coroots – which coroots to display, if any Can be one of the following:
  - 'simple' – the simple coroots (the default)
  - 'classical' – not yet implemented
  - 'all' – only works in the finite case
  - A list or tuple of coroots
  - False
- fundamental_weights – boolean or None (default: None) whether to display the fundamental weights. If None, the fundamental weights are drawn if available.
- reflection_hyperplanes – which reflection hyperplanes to display, if any. Can be one of the following:
  - 'simple' – the simple roots
  - 'classical' – not yet implemented
  - 'all' – only works in the finite case
  - A list or tuple of roots
  - False (the default)
- fundamental_chamber – whether and how to draw the fundamental chamber. Can be one of the following:
  - A boolean – Set to True to draw the fundamental chamber
  - 'classical' – draw the classical fundamental chamber
  - None – (the default) The fundamental chamber is drawn except in the root lattice where this is not yet implemented. For affine types the classical fundamental chamber is drawn instead.
- alcoves – one of the following (default: True):
  - A boolean – whether to display the alcoves
  - A list of alcoves – The alcoves to be drawn. Each alcove is specified by the coordinates of its center in the root lattice (affine type only). Otherwise the alcoves that intersect the bounding box are drawn.
- alcove_labels – one of the following (default: False):
  - A boolean – whether to display the elements of the Weyl group indexing the alcoves. This currently requires to also set the alcoves option.
  - A number l – the label is drawn at level l (affine type only), which only makes sense if affine is False.
- bounding_box – a rational number or a list of pairs thereof (default: 3)

  Specifies a bounding box, in the coordinate system for this plot, in which to plot alcoves and other infinite objects. If the bounding box is a number a, then the bounding box is of the form $[-a, a]$ in all directions. Beware that there can be some border effects and the returned graphic is not necessarily strictly contained in the bounding box.
- alcove_walk – an alcove walk or None (default: None)

  The alcove walk is described by a list (or iterable) of vertices of the Dynkin diagram which specifies which wall is crossed at each step, starting from the fundamental alcove.
- projection – one of the following (default: True):
  - True – the default projection for the root lattice realization is used.
  - False – no projection is used.
  - barycentric – a barycentric projection is used.
  - A function – If a function is specified, it should implement a linear (or affine) map taking as input an element of this root lattice realization and returning its desired coordinates in the plot, as a vector with rational coordinates.
- color – a function mapping vertices of the Dynkin diagram to colors (default: 'black' for 0, 'blue' for 1, 'red' for 2, 'green' for 3)

  This is used to set the color for the simple roots, fundamental weights, reflection hyperplanes, alcove

facets, etc. If the color is None, the object is not drawn.
- labels – boolean (default: True) whether to display labels on the simple roots, fundamental weights, etc.

EXAMPLES:

```
sage: L = RootSystem(["A",2,1]).ambient_space().plot()   # long time,␣
↪needs sage.plot sage.symbolic
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(2),Integer(1)]).ambient_space().plot()   #␣
↪long time, needs sage.plot sage.symbolic
```

- *plot_crystal()*

plot_alcove_walk(*word*, *start=None*, *foldings=None*, *color='orange'*, ***options*)

Plot an alcove walk.

INPUT:
- word – list of elements of the index set
- foldings – list of booleans or None (default: None)
- start – an element of this space (default: None for ρ)
- **options – plotting options

See also

- *plot()* for a description of the plotting options
- *Tutorial: visualizing root systems* for a tutorial on root system plotting

EXAMPLES:

An alcove walk of type $A_2^{(1)}$:

```
sage: L = RootSystem(["A",2,1]).ambient_space()
sage: w1 = [0,2,1,2,0,2,1,0,2,1,2,1,2,0,2,0,1,2,0]
sage: p = L.plot_alcoves(bounding_box=5)         # long time (5s)         #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.plot sage.symbolic
sage: p += L.plot_alcove_walk(w1)       # long time                          #␣
↪needs sage.plot sage.symbolic
sage: p                             # long time                              #␣
↪needs sage.plot sage.symbolic
Graphics object consisting of 375 graphics primitives
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(2),Integer(1)]).ambient_space()
>>> w1 = [Integer(0),Integer(2),Integer(1),Integer(2),Integer(0),
↪Integer(2),Integer(1),Integer(0),Integer(2),Integer(1),Integer(2),
↪Integer(1),Integer(2),Integer(0),Integer(2),Integer(0),Integer(1),
↪Integer(2),Integer(0)]
>>> p = L.plot_alcoves(bounding_box=Integer(5))        # long time (5s)  ␣
↪     # needs sage.plot sage.symbolic
>>> p += L.plot_alcove_walk(w1)       # long time                          #␣
↪needs sage.plot sage.symbolic
>>> p                             # long time                              #␣
↪needs sage.plot sage.symbolic
Graphics object consisting of 375 graphics primitives
```

The same plot with another alcove walk:

```
sage: w2 = [2,1,2,0,2,0,2,1,2,0,1,2,1,2,1,0,1,2,0,2,0,1,2,0,2]
sage: p += L.plot_alcove_walk(w2, color='orange')       # long time,␣
↪needs sage.plot sage.symbolic
```

```
>>> from sage.all import *
>>> w2 = [Integer(2),Integer(1),Integer(2),Integer(0),Integer(2),
↪Integer(0),Integer(2),Integer(1),Integer(2),Integer(0),Integer(1),
↪Integer(2),Integer(1),Integer(2),Integer(1),Integer(0),Integer(1),
↪Integer(2),Integer(0),Integer(2),Integer(0),Integer(1),Integer(2),
↪Integer(0),Integer(2)]
>>> p += L.plot_alcove_walk(w2, color='orange')       # long time, needs␣
↪sage.plot sage.symbolic
```

And another with some foldings:

```
sage: pic = L.plot_alcoves(bounding_box=3)            # long time,␣
↪needs sage.plot sage.symbolic
sage: pic += L.plot_alcove_walk([0,1,2,0,2,0,1,2,0,1],  # long time (3s),␣
↪needs sage.plot sage.symbolic
....:                           foldings=[False, False, True, False, False,
....:                                     False, True, False, True, False],
....:                           color='green'); pic
Graphics object consisting of 155 graphics primitives
```

```
>>> from sage.all import *
>>> pic = L.plot_alcoves(bounding_box=Integer(3))            # long␣
↪time, needs sage.plot sage.symbolic
>>> pic += L.plot_alcove_walk([Integer(0),Integer(1),Integer(2),
↪Integer(0),Integer(2),Integer(0),Integer(1),Integer(2),Integer(0),
```

(continues on next page)

(continued from previous page)

```
↪Integer(1)],  # long time (3s), needs sage.plot sage.symbolic
...                         foldings=[False, False, True, False, False,
...                                   False, True, False, True, False],
...                         color='green'); pic
Graphics object consisting of 155 graphics primitives
```

plot_alcoves(*alcoves=True*, *alcove_labels=False*, *wireframe=False*, ***options*)

Plot the alcoves and optionally their labels.

INPUT:

- `alcoves` – list of alcoves or `True` (default: `True`)
- `alcove_labels` – boolean or a number specifying at which level to put the label (default: `False`)
- `**options` – plotting options

See also

- *plot()* for a description of the plotting options
- *Tutorial: visualizing root systems* for a tutorial on root system plotting, and in particular how the alcoves can be specified.

EXAMPLES:

2D plots:

```
sage: RootSystem(["B",2,1]).ambient_space().plot_alcoves()      # long␣
↪time (3s), needs sage.plot sage.symbolic
Graphics object consisting of 228 graphics primitives
```

```
>>> from sage.all import *
>>> RootSystem(["B",Integer(2),Integer(1)]).ambient_space().plot_
↪alcoves()      # long time (3s), needs sage.plot sage.symbolic
Graphics object consisting of 228 graphics primitives
```

3D plots:

```
sage: RootSystem(["A",2,1]).weight_space() .plot_alcoves(affine=False)  #␣
↪long time (3s), needs sage.plot sage.symbolic
Graphics3d Object
sage: RootSystem(["G",2,1]).ambient_space().plot_alcoves(affine=False,␣
↪level=1)  # long time (3s), needs sage.plot sage.symbolic
Graphics3d Object
```

```
>>> from sage.all import *
>>> RootSystem(["A",Integer(2),Integer(1)]).weight_space() .plot_
↪alcoves(affine=False)  # long time (3s), needs sage.plot sage.symbolic
Graphics3d Object
>>> RootSystem(["G",Integer(2),Integer(1)]).ambient_space().plot_
↪alcoves(affine=False, level=Integer(1))  # long time (3s), needs sage.
↪plot sage.symbolic
Graphics3d Object
```

Here we plot a single alcove:

```
sage: L = RootSystem(["A",3,1]).ambient_space()
sage: W = L.weyl_group()                                                   #␣
↪needs sage.libs.gap
sage: L.plot(alcoves=[W.one()], reflection_hyperplanes=False, bounding_
↪box=2)       # needs sage.libs.gap sage.plot sage.symbolic
Graphics3d Object
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(3),Integer(1)]).ambient_space()
>>> W = L.weyl_group()                                                  #␣
↪needs sage.libs.gap
>>> L.plot(alcoves=[W.one()], reflection_hyperplanes=False, bounding_
↪box=Integer(2))       # needs sage.libs.gap sage.plot sage.symbolic
Graphics3d Object
```

plot_bounding_box(***options*)

Plot the bounding box.

INPUT:

- `**options` – plotting options

This is mostly for testing purposes.

See also

- `plot()` for a description of the plotting options
- *Tutorial: visualizing root systems* for a tutorial on root system plotting

EXAMPLES:

```
sage: L = RootSystem(["A",2,1]).ambient_space()
sage: L.plot_bounding_box()                                                #␣
↪needs sage.plot sage.symbolic
Graphics object consisting of 1 graphics primitive
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(2),Integer(1)]).ambient_space()
>>> L.plot_bounding_box()                                               #␣
↪needs sage.plot sage.symbolic
Graphics object consisting of 1 graphics primitive
```

plot_coroots(*collection='simple'*, ***options*)

Plot the (simple/classical) coroots of this root lattice.

INPUT:

- `collection` – which coroots to display Can be one of the following:
  - `'simple'` (the default)
  - `'classical'`
  - `'all'`
- `**options` – plotting options

See also

- `plot()` for a description of the plotting options
- *Tutorial: visualizing root systems* for a tutorial on root system plotting

EXAMPLES:

```
sage: RootSystem(["B",3]).ambient_space().plot_coroots()                    #␣
↪needs sage.plot sage.symbolic
Graphics3d Object
```

```
>>> from sage.all import *
>>> RootSystem(["B",Integer(3)]).ambient_space().plot_coroots()              ␣
↪     # needs sage.plot sage.symbolic
Graphics3d Object
```

plot_crystal(*crystal*, *plot_labels=True*, *label_color='black'*, *edge_labels=False*, *circle_size=0.06*, *circle_thickness=1.6*, ***options*)

Plot a finite crystal.

INPUT:

- `crystal` – the finite crystal to plot
- `plot_labels` – boolean (default: `True`); can be one of the following:
  - `True` – use the latex labels
  - `'circles'` – use circles for multiplicity up to 4; if the multiplicity is larger, then it uses the multiplicity
  - `'multiplicities'` – use the multiplicities
- `label_color` – (default: `'black'`) the color of the labels
- `edge_labels` – boolean (default: `False`); if `True`, then draw in the edge label
- `circle_size` – (default: 0.06) the size of the circles
- `circle_thickness` – (default: 1.6) the thinkness of the extra rings of circles
- `**options` – plotting options

See also

- `plot()` for a description of the plotting options
- *Tutorial: visualizing root systems* for a tutorial on root system plotting

EXAMPLES:

```
sage: # needs sage.combinat sage.plot sage.symbolic
sage: L = RootSystem(['A',2]).ambient_space()
sage: C = crystals.Tableaux(['A',2], shape=[2,1])
sage: L.plot_crystal(C, plot_labels='multiplicities')
Graphics object consisting of 15 graphics primitives
sage: C = crystals.Tableaux(['A',2], shape=[8,4])
sage: p = L.plot_crystal(C, plot_labels='circles')
sage: p.show(figsize=15)
```

```
>>> from sage.all import *
>>> # needs sage.combinat sage.plot sage.symbolic
>>> L = RootSystem(['A',Integer(2)]).ambient_space()
>>> C = crystals.Tableaux(['A',Integer(2)], shape=[Integer(2),Integer(1)])
>>> L.plot_crystal(C, plot_labels='multiplicities')
Graphics object consisting of 15 graphics primitives
>>> C = crystals.Tableaux(['A',Integer(2)], shape=[Integer(8),Integer(4)])
>>> p = L.plot_crystal(C, plot_labels='circles')
>>> p.show(figsize=Integer(15))
```

A 3-dimensional example:

```
sage: L = RootSystem(['B',3]).ambient_space()
sage: C = crystals.Tableaux(['B',3], shape=[2,1])                        #␣
↪needs sage.combinat
sage: L.plot_crystal(C, plot_labels='circles',  # long time              #␣
↪needs sage.combinat sage.plot sage.symbolic
....:                edge_labels=True)
Graphics3d Object
```

```
>>> from sage.all import *
>>> L = RootSystem(['B',Integer(3)]).ambient_space()
>>> C = crystals.Tableaux(['B',Integer(3)], shape=[Integer(2),
↪Integer(1)])                               # needs sage.combinat
>>> L.plot_crystal(C, plot_labels='circles',  # long time              #␣
↪needs sage.combinat sage.plot sage.symbolic
...                edge_labels=True)
Graphics3d Object
```

plot_fundamental_chamber(*style='normal'*, ***options*)

Plot the (classical) fundamental chamber.

INPUT:

- `style` – `'normal'` or `'classical'` (default: `'normal'`)
- `**options` – plotting options

See also

- *plot()* for a description of the plotting options
- *Tutorial: visualizing root systems* for a tutorial on root system plotting

EXAMPLES:

2D plots:

```
sage: RootSystem(["B",2]).ambient_space().plot_fundamental_chamber()     #␣
↪needs sage.plot
Graphics object consisting of 1 graphics primitive
sage: RootSystem(["B",2,1]).ambient_space().plot_fundamental_chamber()   #␣
↪needs sage.plot
Graphics object consisting of 1 graphics primitive
sage: RootSystem(["B",2,1]).ambient_space().plot_fundamental_chamber(
```

(continues on next page)

(continued from previous page)

```
↪"classical")    # needs sage.plot
Graphics object consisting of 1 graphics primitive
```

```
>>> from sage.all import *
>>> RootSystem(["B",Integer(2)]).ambient_space().plot_fundamental_
↪chamber()     # needs sage.plot
Graphics object consisting of 1 graphics primitive
>>> RootSystem(["B",Integer(2),Integer(1)]).ambient_space().plot_
↪fundamental_chamber()   # needs sage.plot
Graphics object consisting of 1 graphics primitive
>>> RootSystem(["B",Integer(2),Integer(1)]).ambient_space().plot_
↪fundamental_chamber("classical")    # needs sage.plot
Graphics object consisting of 1 graphics primitive
```

3D plots:

```
sage: RootSystem(["A",3,1]).weight_space() .plot_fundamental_chamber()   #␣
↪needs sage.plot
Graphics3d Object
sage: RootSystem(["B",3,1]).ambient_space().plot_fundamental_chamber()   #␣
↪needs sage.plot
Graphics3d Object
```

```
>>> from sage.all import *
>>> RootSystem(["A",Integer(3),Integer(1)]).weight_space() .plot_
↪fundamental_chamber()   # needs sage.plot
Graphics3d Object
>>> RootSystem(["B",Integer(3),Integer(1)]).ambient_space().plot_
↪fundamental_chamber()   # needs sage.plot
Graphics3d Object
```

This feature is currently not available in the root lattice/space:

```
sage: list(RootSystem(["A",2]).root_lattice().plot_fundamental_chamber())␣
↪          # needs sage.plot
Traceback (most recent call last):
...
TypeError: classical fundamental chamber not yet available in the root␣
↪lattice
```

```
>>> from sage.all import *
>>> list(RootSystem(["A",Integer(2)]).root_lattice().plot_fundamental_
↪chamber())           # needs sage.plot
Traceback (most recent call last):
...
TypeError: classical fundamental chamber not yet available in the root␣
↪lattice
```

plot_fundamental_weights(***options*)

Plot the fundamental weights of this root lattice.

INPUT:

- `**options` – plotting options

See also

- `plot()` for a description of the plotting options
- *Tutorial: visualizing root systems* for a tutorial on root system plotting

EXAMPLES:

```
sage: RootSystem(["B",3]).ambient_space().plot_fundamental_weights()     #␣
↪needs sage.plot
Graphics3d Object
```

```
>>> from sage.all import *
>>> RootSystem(["B",Integer(3)]).ambient_space().plot_fundamental_
↪weights()     # needs sage.plot
Graphics3d Object
```

plot_hedron(***options*)

Plot the polyhedron whose vertices are given by the orbit of ρ.

In type A, this is the usual permutohedron.

See also

- `plot()` for a description of the plotting options
- *Tutorial: visualizing root systems* for a tutorial on root system plotting

EXAMPLES:

```
sage: # needs sage.plot sage.symbolic
sage: RootSystem(["A",2]).ambient_space().plot_hedron()
Graphics object consisting of 8 graphics primitives
sage: RootSystem(["A",3]).ambient_space().plot_hedron()
Graphics3d Object
sage: RootSystem(["B",3]).ambient_space().plot_hedron()
Graphics3d Object
sage: RootSystem(["C",3]).ambient_space().plot_hedron()
Graphics3d Object
sage: RootSystem(["D",3]).ambient_space().plot_hedron()
Graphics3d Object
```

```
>>> from sage.all import *
>>> # needs sage.plot sage.symbolic
>>> RootSystem(["A",Integer(2)]).ambient_space().plot_hedron()
Graphics object consisting of 8 graphics primitives
>>> RootSystem(["A",Integer(3)]).ambient_space().plot_hedron()
Graphics3d Object
>>> RootSystem(["B",Integer(3)]).ambient_space().plot_hedron()
Graphics3d Object
>>> RootSystem(["C",Integer(3)]).ambient_space().plot_hedron()
```

(continues on next page)

(continued from previous page)

```
Graphics3d Object
>>> RootSystem(["D",Integer(3)]).ambient_space().plot_hedron()
Graphics3d Object
```

Surprise: polyhedra of large dimension know how to project themselves nicely:

```
sage: RootSystem(["F",4]).ambient_space().plot_hedron()        # long␣
↪time, needs sage.plot sage.symbolic
Graphics3d Object
```

```
>>> from sage.all import *
>>> RootSystem(["F",Integer(4)]).ambient_space().plot_hedron()        #␣
↪long time, needs sage.plot sage.symbolic
Graphics3d Object
```

plot_ls_paths(*paths*, *plot_labels=None*, *colored_labels=True*, ***options*)

Plot LS paths.

INPUT:

- `paths` – a finite crystal or list of LS paths
- `plot_labels` – (default: `None`) the distance to plot the LS labels from the endpoint of the path; set to `None` to not display the labels
- `colored_labels` – boolean (default: `True`); if `True`, then color the labels the same color as the LS path
- `**options` – plotting options

See also

- `plot()` for a description of the plotting options
- *Tutorial: visualizing root systems* for a tutorial on root system plotting

EXAMPLES:

```
sage: B = crystals.LSPaths(['A',2], [1,1])                               #␣
↪needs sage.combinat
sage: L = RootSystem(['A',2]).ambient_space()
sage: L.plot_fundamental_weights() + L.plot_ls_paths(B)                  #␣
↪needs sage.combinat sage.plot sage.symbolic
Graphics object consisting of 14 graphics primitives
```

```
>>> from sage.all import *
>>> B = crystals.LSPaths(['A',Integer(2)], [Integer(1),Integer(1)])       ␣
↪                       # needs sage.combinat
>>> L = RootSystem(['A',Integer(2)]).ambient_space()
>>> L.plot_fundamental_weights() + L.plot_ls_paths(B)                  #␣
↪needs sage.combinat sage.plot sage.symbolic
Graphics object consisting of 14 graphics primitives
```

This also works in 3 dimensions:

```
sage: B = crystals.LSPaths(['B',3], [2,0,0])                                 #␣
↪needs sage.combinat
sage: L = RootSystem(['B',3]).ambient_space()
sage: L.plot_ls_paths(B)                                                     #␣
↪needs sage.combinat sage.plot sage.symbolic
Graphics3d Object
```

```
>>> from sage.all import *
>>> B = crystals.LSPaths(['B',Integer(3)], [Integer(2),Integer(0),
↪Integer(0)])                            # needs sage.combinat
>>> L = RootSystem(['B',Integer(3)]).ambient_space()
>>> L.plot_ls_paths(B)                                                      #␣
↪needs sage.combinat sage.plot sage.symbolic
Graphics3d Object
```

plot_mv_polytope(*mv_polytope*, *mark_endpoints=True*, *circle_size=0.06*, *circle_thickness=1.6*, *wireframe='blue'*, *fill='green'*, *alpha=1*, ***options*)

Plot an MV polytope.

INPUT:

- `mv_polytope` – an MV polytope
- `mark_endpoints` – boolean (default: `True`); mark the endpoints of the MV polytope
- `circle_size` – (default: 0.06) the size of the circles
- `circle_thickness` – (default: 1.6) the thinkness of the extra rings of circles
- `wireframe` – (default: `'blue'`) color to draw the wireframe of the polytope with
- `fill` – (default: `'green'`) color to fill the polytope with
- `alpha` – (default: 1) the alpha value (opacity) of the fill
- `**options` – plotting options

See also

- *plot()* for a description of the plotting options
- *Tutorial: visualizing root systems* for a tutorial on root system plotting

EXAMPLES:

```
sage: B = crystals.infinity.MVPolytopes(['C',2])                             #␣
↪needs sage.combinat
sage: L = RootSystem(['C',2]).ambient_space()
sage: p = B.highest_weight_vector().f_string([1,2,1,2])                      #␣
↪needs sage.combinat
sage: L.plot_fundamental_weights() + L.plot_mv_polytope(p)                   #␣
↪needs sage.combinat sage.geometry.polyhedron sage.plot sage.symbolic
Graphics object consisting of 14 graphics primitives
```

```
>>> from sage.all import *
>>> B = crystals.infinity.MVPolytopes(['C',Integer(2)])                      ␣
↪     # needs sage.combinat
>>> L = RootSystem(['C',Integer(2)]).ambient_space()
>>> p = B.highest_weight_vector().f_string([Integer(1),Integer(2),
↪Integer(1),Integer(2)])                 # needs sage.combinat
```

(continues on next page)

(continued from previous page)

```
>>> L.plot_fundamental_weights() + L.plot_mv_polytope(p)              #␣
↪needs sage.combinat sage.geometry.polyhedron sage.plot sage.symbolic
Graphics object consisting of 14 graphics primitives
```

This also works in 3 dimensions:

```
sage: B = crystals.infinity.MVPolytopes(['A',3])                       #␣
↪needs sage.combinat
sage: L = RootSystem(['A',3]).ambient_space()
sage: p = B.highest_weight_vector().f_string([2,1,3,2])                #␣
↪needs sage.combinat
sage: L.plot_mv_polytope(p)                                            #␣
↪needs sage.combinat sage.geometry.polyhedron sage.plot sage.symbolic
Graphics3d Object
```

```
>>> from sage.all import *
>>> B = crystals.infinity.MVPolytopes(['A',Integer(3)])                 ␣
↪     # needs sage.combinat
>>> L = RootSystem(['A',Integer(3)]).ambient_space()
>>> p = B.highest_weight_vector().f_string([Integer(2),Integer(1),
↪Integer(3),Integer(2)])                  # needs sage.combinat
>>> L.plot_mv_polytope(p)                                              #␣
↪needs sage.combinat sage.geometry.polyhedron sage.plot sage.symbolic
Graphics3d Object
```

plot_parse_options(***args*)

Return an option object to be used for root system plotting.

EXAMPLES:

```
sage: L = RootSystem(["A",2,1]).ambient_space()
sage: options = L.plot_parse_options(); options                        #␣
↪needs sage.symbolic
<sage.combinat.root_system.plot.PlotOptions object at ...>
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(2),Integer(1)]).ambient_space()
>>> options = L.plot_parse_options(); options                          #␣
↪needs sage.symbolic
<sage.combinat.root_system.plot.PlotOptions object at ...>
```

See also

- `plot()` for a description of the plotting options
- *Tutorial: visualizing root systems* for a tutorial on root system plotting

plot_reflection_hyperplanes(*collection='simple'*, ***options*)

Plot the simple reflection hyperplanes.

INPUT:

- `collection` – which reflection hyperplanes to display Can be one of the following:

  - 'simple' (the default)
  - 'classical'
  - 'all'
- `**options` – plotting options

See also

- `plot()` for a description of the plotting options
- *Tutorial: visualizing root systems* for a tutorial on root system plotting

EXAMPLES:

```
sage: # needs sage.plot sage.symbolic
sage: RootSystem(["A",2,1]).ambient_space().plot_reflection_hyperplanes()
Graphics object consisting of 6 graphics primitives
sage: RootSystem(["G",2,1]).ambient_space().plot_reflection_hyperplanes()
Graphics object consisting of 6 graphics primitives
sage: RootSystem(["A",3]).weight_space().plot_reflection_hyperplanes()
Graphics3d Object
sage: RootSystem(["B",3]).ambient_space().plot_reflection_hyperplanes()
Graphics3d Object
sage: RootSystem(["A",3,1]).weight_space().plot_reflection_hyperplanes()
Graphics3d Object
sage: RootSystem(["B",3,1]).ambient_space().plot_reflection_hyperplanes()
Graphics3d Object
sage: RootSystem(["A",2,1]).weight_space().plot_reflection_
↪hyperplanes(affine=False, level=1)
Graphics3d Object
sage: RootSystem(["A",2]).root_lattice().plot_reflection_hyperplanes()
Graphics object consisting of 4 graphics primitives
```

```
>>> from sage.all import *
>>> # needs sage.plot sage.symbolic
>>> RootSystem(["A",Integer(2),Integer(1)]).ambient_space().plot_
↪reflection_hyperplanes()
Graphics object consisting of 6 graphics primitives
>>> RootSystem(["G",Integer(2),Integer(1)]).ambient_space().plot_
↪reflection_hyperplanes()
Graphics object consisting of 6 graphics primitives
>>> RootSystem(["A",Integer(3)]).weight_space().plot_reflection_
↪hyperplanes()
Graphics3d Object
>>> RootSystem(["B",Integer(3)]).ambient_space().plot_reflection_
↪hyperplanes()
Graphics3d Object
>>> RootSystem(["A",Integer(3),Integer(1)]).weight_space().plot_
↪reflection_hyperplanes()
Graphics3d Object
>>> RootSystem(["B",Integer(3),Integer(1)]).ambient_space().plot_
↪reflection_hyperplanes()
Graphics3d Object
>>> RootSystem(["A",Integer(2),Integer(1)]).weight_space().plot_
```

(continues on next page)

(continued from previous page)

```
↪reflection_hyperplanes(affine=False, level=Integer(1))
Graphics3d Object
>>> RootSystem(["A",Integer(2)]).root_lattice().plot_reflection_
↪hyperplanes()
Graphics object consisting of 4 graphics primitives
```

Todo

Provide an option for transparency?

plot_roots(*collection='simple'*, ***options*)

Plot the (simple/classical) roots of this root lattice.

INPUT:

- `collection` – which roots to display can be one of the following:
  - `'simple'` (the default)
  - `'classical'`
  - `'all'`
- `**options` – plotting options

See also

- *plot()* for a description of the plotting options
- *Tutorial: visualizing root systems* for a tutorial on root system plotting

EXAMPLES:

```
sage: RootSystem(["B",3]).ambient_space().plot_roots()                      #␣
↪needs sage.plot
Graphics3d Object
sage: RootSystem(["B",3]).ambient_space().plot_roots("all")                 #␣
↪needs sage.plot
Graphics3d Object
```

```
>>> from sage.all import *
>>> RootSystem(["B",Integer(3)]).ambient_space().plot_roots()              ␣
↪      # needs sage.plot
Graphics3d Object
>>> RootSystem(["B",Integer(3)]).ambient_space().plot_roots("all")         ␣
↪      # needs sage.plot
Graphics3d Object
```

positive_imaginary_roots()

Return the positive imaginary roots of `self`.

EXAMPLES:

```
sage: L = RootSystem(['A',3]).root_lattice()
sage: L.positive_imaginary_roots()
()
```

(continues on next page)

(continued from previous page)

```
sage: L = RootSystem(['A',3,1]).root_lattice()
sage: PIR = L.positive_imaginary_roots(); PIR                               #␣
↪needs sage.graphs
Positive imaginary roots of type ['A', 3, 1]
sage: [PIR.unrank(i) for i in range(5)]                                     #␣
↪needs sage.graphs
[alpha[0] + alpha[1] + alpha[2] + alpha[3],
 2*alpha[0] + 2*alpha[1] + 2*alpha[2] + 2*alpha[3],
 3*alpha[0] + 3*alpha[1] + 3*alpha[2] + 3*alpha[3],
 4*alpha[0] + 4*alpha[1] + 4*alpha[2] + 4*alpha[3],
 5*alpha[0] + 5*alpha[1] + 5*alpha[2] + 5*alpha[3]]
```

```
>>> from sage.all import *
>>> L = RootSystem(['A',Integer(3)]).root_lattice()
>>> L.positive_imaginary_roots()
()

>>> L = RootSystem(['A',Integer(3),Integer(1)]).root_lattice()
>>> PIR = L.positive_imaginary_roots(); PIR                               #␣
↪needs sage.graphs
Positive imaginary roots of type ['A', 3, 1]
>>> [PIR.unrank(i) for i in range(Integer(5))]                              ␣
↪       # needs sage.graphs
[alpha[0] + alpha[1] + alpha[2] + alpha[3],
 2*alpha[0] + 2*alpha[1] + 2*alpha[2] + 2*alpha[3],
 3*alpha[0] + 3*alpha[1] + 3*alpha[2] + 3*alpha[3],
 4*alpha[0] + 4*alpha[1] + 4*alpha[2] + 4*alpha[3],
 5*alpha[0] + 5*alpha[1] + 5*alpha[2] + 5*alpha[3]]
```

positive_real_roots()

Return the positive real roots of `self`.

EXAMPLES:

```
sage: L = RootSystem(['A',3]).root_lattice()
sage: sorted(L.positive_real_roots())                                       #␣
↪needs sage.graphs
[alpha[1], alpha[1] + alpha[2], alpha[1] + alpha[2] + alpha[3],
 alpha[2], alpha[2] + alpha[3], alpha[3]]

sage: L = RootSystem(['A',3,1]).root_lattice()
sage: PRR = L.positive_real_roots(); PRR                                    #␣
↪needs sage.graphs
Positive real roots of type ['A', 3, 1]
sage: [PRR.unrank(i) for i in range(10)]                                    #␣
↪needs sage.graphs
[alpha[1],
 alpha[2],
 alpha[3],
 alpha[1] + alpha[2],
 alpha[2] + alpha[3],
```

(continues on next page)

(continued from previous page)

```
 alpha[1] + alpha[2] + alpha[3],
 alpha[0] + 2*alpha[1] + alpha[2] + alpha[3],
 alpha[0] + alpha[1] + 2*alpha[2] + alpha[3],
 alpha[0] + alpha[1] + alpha[2] + 2*alpha[3],
 alpha[0] + 2*alpha[1] + 2*alpha[2] + alpha[3]]

sage: Q = RootSystem(['A',4,2]).root_lattice()
sage: PR = Q.positive_roots()                                               #␣
↪needs sage.graphs
sage: [PR.unrank(i) for i in range(5)]                                      #␣
↪needs sage.graphs
[alpha[1],
 alpha[2],
 alpha[1] + alpha[2],
 2*alpha[1] + alpha[2],
 alpha[0] + alpha[1] + alpha[2]]

sage: Q = RootSystem(['D',3,2]).root_lattice()
sage: PR = Q.positive_roots()                                               #␣
↪needs sage.graphs
sage: [PR.unrank(i) for i in range(5)]                                      #␣
↪needs sage.graphs
[alpha[1],
 alpha[2],
 alpha[1] + 2*alpha[2],
 alpha[1] + alpha[2],
 alpha[0] + alpha[1] + 2*alpha[2]]
```

```
>>> from sage.all import *
>>> L = RootSystem(['A',Integer(3)]).root_lattice()

 alpha[2],
 alpha[1] + 2*alpha[2],
 alpha[1] + alpha[2],
 alpha[0] + alpha[1] + 2*alpha[2]]
```

positive_roots(*index_set=None*)

Return the positive roots of `self`.

If `index_set` is not `None`, returns the positive roots of the parabolic subsystem with simple roots in `index_set`.

Algorithm for finite type: generate them from the simple roots by applying successive reflections toward the positive chamber.

EXAMPLES:

```
sage: L = RootSystem(['A',3]).root_lattice()
sage: sorted(L.positive_roots())                                         #␣
↪needs sage.graphs
[alpha[1], alpha[1] + alpha[2],
 alpha[1] + alpha[2] + alpha[3], alpha[2],
 alpha[2] + alpha[3], alpha[3]]
sage: sorted(L.positive_roots((1,2)))                                    #␣
↪needs sage.graphs
[alpha[1], alpha[1] + alpha[2], alpha[2]]
sage: sorted(L.positive_roots(()))                                       #␣
↪needs sage.graphs
[]

sage: L = RootSystem(['A',3,1]).root_lattice()
sage: PR = L.positive_roots(); PR                                        #␣
↪needs sage.graphs
Disjoint union of Family (Positive real roots of type ['A', 3, 1],
    Positive imaginary roots of type ['A', 3, 1])
sage: [PR.unrank(i) for i in range(10)]                                  #␣
↪needs sage.graphs
```

(continues on next page)

(continued from previous page)

 alpha[0] + 2*alpha[1] + 2*alpha[2] + alpha[3]]
```

positive_roots_by_height(*increasing=True*)

Return a list of positive roots in increasing order by height.

If `increasing` is False, returns them in decreasing order.

> **Warning**
>
> Raise an error if the Cartan type is not finite.

EXAMPLES:

```
sage: L = RootSystem(['C',2]).root_lattice()
sage: L.positive_roots_by_height()                                         #␣
↪needs sage.graphs
[alpha[2], alpha[1], alpha[1] + alpha[2], 2*alpha[1] + alpha[2]]
sage: L.positive_roots_by_height(increasing=False)                         #␣
↪needs sage.graphs
[2*alpha[1] + alpha[2], alpha[1] + alpha[2], alpha[2], alpha[1]]

sage: L = RootSystem(['A',2,1]).root_lattice()
sage: L.positive_roots_by_height()                                         #␣
↪needs sage.graphs
Traceback (most recent call last):
...
NotImplementedError: Only implemented for finite Cartan type
```

```
>>> from sage.all import *
>>> L = RootSystem(['C',Integer(2)]).root_lattice()

NotImplementedError: Only implemented for finite Cartan type
```

positive_roots_nonparabolic(*index_set=None*)

Return the set of positive roots outside the parabolic subsystem with Dynkin node set `index_set`.

INPUT:

- `index_set` – (default: `None`) the Dynkin node set of the parabolic subsystem. It should be a tuple. The default value implies the entire Dynkin node set

EXAMPLES:

```
sage: # needs sage.graphs
sage: lattice = RootSystem(['A',3]).root_lattice()
sage: sorted(lattice.positive_roots_nonparabolic((1,3)), key=str)
[alpha[1] + alpha[2], alpha[1] + alpha[2] + alpha[3],
 alpha[2], alpha[2] + alpha[3]]
sage: sorted(lattice.positive_roots_nonparabolic((2,3)), key=str)
[alpha[1], alpha[1] + alpha[2], alpha[1] + alpha[2] + alpha[3]]
sage: lattice.positive_roots_nonparabolic()
[]
sage: lattice.positive_roots_nonparabolic((1,2,3))
[]
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> lattice = RootSystem(['A',Integer(3)]).root_lattice()
>>> sorted(lattice.positive_roots_nonparabolic((Integer(1),Integer(3))),␣
↪key=str)
[alpha[1] + alpha[2], alpha[1] + alpha[2] + alpha[3],
 alpha[2], alpha[2] + alpha[3]]
>>> sorted(lattice.positive_roots_nonparabolic((Integer(2),Integer(3))),␣
↪key=str)
[alpha[1], alpha[1] + alpha[2], alpha[1] + alpha[2] + alpha[3]]
>>> lattice.positive_roots_nonparabolic()
[]
>>> lattice.positive_roots_nonparabolic((Integer(1),Integer(2),
↪Integer(3)))
[]
```

Warning

This returns an error if the Cartan type is not finite.

positive_roots_nonparabolic_sum(*index_set=None*)

Return the sum of positive roots outside the parabolic subsystem with Dynkin node set `index_set`.

INPUT:

- `index_set` – (default: `None`) the Dynkin node set of the parabolic subsystem. It should be a tuple. The default value implies the entire Dynkin node set

EXAMPLES:

```
sage: # needs sage.graphs
sage: lattice = RootSystem(['A',3]).root_lattice()
sage: lattice.positive_roots_nonparabolic_sum((1,3))
2*alpha[1] + 4*alpha[2] + 2*alpha[3]
sage: lattice.positive_roots_nonparabolic_sum((2,3))
3*alpha[1] + 2*alpha[2] + alpha[3]
sage: lattice.positive_roots_nonparabolic_sum(())
3*alpha[1] + 4*alpha[2] + 3*alpha[3]
sage: lattice.positive_roots_nonparabolic_sum()
0
sage: lattice.positive_roots_nonparabolic_sum((1,2,3))
0
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> lattice = RootSystem(['A',Integer(3)]).root_lattice()
>>> lattice.positive_roots_nonparabolic_sum((Integer(1),Integer(3)))
2*alpha[1] + 4*alpha[2] + 2*alpha[3]
>>> lattice.positive_roots_nonparabolic_sum((Integer(2),Integer(3)))
3*alpha[1] + 2*alpha[2] + alpha[3]
>>> lattice.positive_roots_nonparabolic_sum(())
3*alpha[1] + 4*alpha[2] + 3*alpha[3]
>>> lattice.positive_roots_nonparabolic_sum()
```

(continues on next page)

(continued from previous page)

```
0
>>> lattice.positive_roots_nonparabolic_sum((Integer(1),Integer(2),
↪Integer(3)))
0
```

> **Warning**
>
> This returns an error if the Cartan type is not finite.

positive_roots_parabolic(*index_set=None*)

Return the set of positive roots for the parabolic subsystem with Dynkin node set `index_set`.

INPUT:

- `index_set` – (default: `None`) the Dynkin node set of the parabolic subsystem. It should be a tuple. The default value implies the entire Dynkin node set

EXAMPLES:

```
sage: lattice =  RootSystem(['A',3]).root_lattice()
sage: sorted(lattice.positive_roots_parabolic((1,3)), key=str)            #␣
↪needs sage.graphs
[alpha[1], alpha[3]]
sage: sorted(lattice.positive_roots_parabolic((2,3)), key=str)            #␣
↪needs sage.graphs
[alpha[2], alpha[2] + alpha[3], alpha[3]]
sage: sorted(lattice.positive_roots_parabolic(), key=str)                 #␣
↪needs sage.graphs
[alpha[1], alpha[1] + alpha[2], alpha[1] + alpha[2] + alpha[3],
 alpha[2], alpha[2] + alpha[3], alpha[3]]
```

```
>>> from sage.all import *
>>> lattice =  RootSystem(['A',Integer(3)]).root_lattice()
>>> sorted(lattice.positive_roots_parabolic((Integer(1),Integer(3))),␣
↪key=str)           # needs sage.graphs
[alpha[1], alpha[3]]
>>> sorted(lattice.positive_roots_parabolic((Integer(2),Integer(3))),␣
↪key=str)           # needs sage.graphs
[alpha[2], alpha[2] + alpha[3], alpha[3]]
>>> sorted(lattice.positive_roots_parabolic(), key=str)                 #␣
↪needs sage.graphs
[alpha[1], alpha[1] + alpha[2], alpha[1] + alpha[2] + alpha[3],
 alpha[2], alpha[2] + alpha[3], alpha[3]]
```

> **Warning**
>
> This returns an error if the Cartan type is not finite.

projection(*root*, *coroot=None*, *to_negative=True*)

Return the projection along the `root`, and across the hyperplane defined by `coroot`, as a function π from `self` to `self`.

π is a half-linear map which stabilizes the negative half space and acts by reflection on the positive half space.

If `to_negative` is `False`, then project onto the positive half space instead.

EXAMPLES:

```
sage: # needs sage.graphs
sage: space = RootSystem(['A',2]).weight_lattice()
sage: x = space.simple_roots()[1]
sage: y = space.simple_coroots()[1]
sage: pi = space.projection(x,y)
sage: x
2*Lambda[1] - Lambda[2]
sage: pi(x)
-2*Lambda[1] + Lambda[2]
sage: pi(-x)
-2*Lambda[1] + Lambda[2]
sage: pi = space.projection(x,y,False)
sage: pi(-x)
2*Lambda[1] - Lambda[2]
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> space = RootSystem(['A',Integer(2)]).weight_lattice()
>>> x = space.simple_roots()[Integer(1)]
>>> y = space.simple_coroots()[Integer(1)]
>>> pi = space.projection(x,y)
>>> x
2*Lambda[1] - Lambda[2]
>>> pi(x)
-2*Lambda[1] + Lambda[2]
>>> pi(-x)
-2*Lambda[1] + Lambda[2]
>>> pi = space.projection(x,y,False)
>>> pi(-x)
2*Lambda[1] - Lambda[2]
```

reflection(*root*, *coroot=None*)

Return the reflection along the `root`, and across the hyperplane defined by `coroot`, as a function from `self` to `self`.

EXAMPLES:

```
sage: # needs sage.graphs
sage: space = RootSystem(['A',2]).weight_lattice()
sage: x = space.simple_roots()[1]
sage: y = space.simple_coroots()[1]
sage: s = space.reflection(x,y)
sage: x
2*Lambda[1] - Lambda[2]
sage: s(x)
-2*Lambda[1] + Lambda[2]
sage: s(-x)
2*Lambda[1] - Lambda[2]
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> space = RootSystem(['A',Integer(2)]).weight_lattice()
>>> x = space.simple_roots()[Integer(1)]
>>> y = space.simple_coroots()[Integer(1)]
>>> s = space.reflection(x,y)
>>> x
2*Lambda[1] - Lambda[2]
>>> s(x)
-2*Lambda[1] + Lambda[2]
>>> s(-x)
2*Lambda[1] - Lambda[2]
```

root_poset(*restricted=False*, *facade=False*)

Return the (restricted) root poset associated to `self`.

The elements are given by the positive roots (resp. non-simple, positive roots), and $\alpha \leq \beta$ iff $\beta - \alpha$ is a nonnegative linear combination of simple roots.

INPUT:

- `restricted` – boolean (default: `False`); if `True`, only non-simple roots are considered.
- `facade` – boolean (default: `False`); passes facade option to the poset generator

EXAMPLES:

```
sage: # needs sage.graphs
sage: Phi = RootSystem(['A',1]).root_poset(); Phi
Finite poset containing 1 elements
sage: Phi.cover_relations()
[]
sage: Phi = RootSystem(['A',2]).root_poset(); Phi
Finite poset containing 3 elements
sage: sorted(Phi.cover_relations(), key=str)
[[alpha[1], alpha[1] + alpha[2]], [alpha[2], alpha[1] + alpha[2]]]
sage: Phi = RootSystem(['A',3]).root_poset(restricted=True); Phi
Finite poset containing 3 elements
sage: sorted(Phi.cover_relations(), key=str)
[[alpha[1] + alpha[2], alpha[1] + alpha[2] + alpha[3]],
 [alpha[2] + alpha[3], alpha[1] + alpha[2] + alpha[3]]]
sage: Phi = RootSystem(['B',2]).root_poset(); Phi
Finite poset containing 4 elements
sage: sorted(Phi.cover_relations(), key=str)
[[alpha[1] + alpha[2], alpha[1] + 2*alpha[2]],
 [alpha[1], alpha[1] + alpha[2]],
 [alpha[2], alpha[1] + alpha[2]]]
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> Phi = RootSystem(['A',Integer(1)]).root_poset(); Phi
Finite poset containing 1 elements
>>> Phi.cover_relations()
[]
>>> Phi = RootSystem(['A',Integer(2)]).root_poset(); Phi
Finite poset containing 3 elements
```

(continues on next page)

(continued from previous page)

```
>>> sorted(Phi.cover_relations(), key=str)
[[alpha[1], alpha[1] + alpha[2]], [alpha[2], alpha[1] + alpha[2]]]
>>> Phi = RootSystem(['A',Integer(3)]).root_poset(restricted=True); Phi
Finite poset containing 3 elements
>>> sorted(Phi.cover_relations(), key=str)
[[alpha[1] + alpha[2], alpha[1] + alpha[2] + alpha[3]],
 [alpha[2] + alpha[3], alpha[1] + alpha[2] + alpha[3]]]
>>> Phi = RootSystem(['B',Integer(2)]).root_poset(); Phi
Finite poset containing 4 elements
>>> sorted(Phi.cover_relations(), key=str)
[[alpha[1] + alpha[2], alpha[1] + 2*alpha[2]],
 [alpha[1], alpha[1] + alpha[2]],
 [alpha[2], alpha[1] + alpha[2]]]
```

roots()

Return the roots of `self`.

EXAMPLES:

```
sage: RootSystem(['A',2]).ambient_lattice().roots()
[(1, -1, 0), (1, 0, -1), (0, 1, -1), (-1, 1, 0), (-1, 0, 1), (0, -1, 1)]
```

```
>>> from sage.all import *
>>> RootSystem(['A',Integer(2)]).ambient_lattice().roots()
[(1, -1, 0), (1, 0, -1), (0, 1, -1), (-1, 1, 0), (-1, 0, 1), (0, -1, 1)]
```

This matches with Wikipedia article Root_systems:

['G', 2]  12  12
```

Todo

The result should be an enumerated set, and handle infinite root systems.

s()

Return the family $(s_i)_{i\in I}$ of the simple reflections of this root system.

EXAMPLES:

```
sage: r = RootSystem(["A", 2]).root_lattice()
sage: s = r.simple_reflections()
sage: s[1]( r.simple_root(1) )                                          #␣
↪needs sage.graphs
-alpha[1]
```

```
>>> from sage.all import *
>>> r = RootSystem(["A", Integer(2)]).root_lattice()
>>> s = r.simple_reflections()
>>> s[Integer(1)]( r.simple_root(Integer(1)) )                          ␣
↪              # needs sage.graphs
-alpha[1]
```

short_roots()

Return a list of the short roots of `self`.

EXAMPLES:

```
sage: L = RootSystem(['B',3]).root_lattice()
sage: sorted(L.short_roots())                                           #␣
↪needs sage.graphs
[-alpha[1] - alpha[2] - alpha[3],
 alpha[1] + alpha[2] + alpha[3],
 -alpha[2] - alpha[3],
```

(continues on next page)

(continued from previous page)

```
 alpha[2] + alpha[3],
 -alpha[3],
 alpha[3]]
```

```
>>> from sage.all import *
>>> L = RootSystem(['B',Integer(3)]).root_lattice()
>>> sorted(L.short_roots())                                              #␣
↪needs sage.graphs
[-alpha[1] - alpha[2] - alpha[3],
 alpha[1] + alpha[2] + alpha[3],
 -alpha[2] - alpha[3],
 alpha[2] + alpha[3],
 -alpha[3],
 alpha[3]]
```

simple_coroot(*i*)

Return the i-th simple coroot.

EXAMPLES:

```
sage: RootSystem(['A',2]).root_lattice().simple_coroot(1)
alphacheck[1]
```

```
>>> from sage.all import *
>>> RootSystem(['A',Integer(2)]).root_lattice().simple_coroot(Integer(1))
alphacheck[1]
```

simple_coroots()

Return the family $(\alpha_i^\vee)_{i\in I}$ of the simple coroots.

EXAMPLES:

```
sage: alphacheck = RootSystem(['A',3]).root_lattice().simple_coroots()
sage: [alphacheck[i] for i in [1, 2, 3]]
[alphacheck[1], alphacheck[2], alphacheck[3]]
```

```
>>> from sage.all import *
>>> alphacheck = RootSystem(['A',Integer(3)]).root_lattice().simple_
↪coroots()
>>> [alphacheck[i] for i in [Integer(1), Integer(2), Integer(3)]]
[alphacheck[1], alphacheck[2], alphacheck[3]]
```

simple_projection(*i*, *to_negative=True*)

Return the projection along the i-th simple root, and across the hyperplane define by the i-th simple coroot, as a function from `self` to `self`.

INPUT:

- `i` – an element of the index set of `self`

EXAMPLES:

```
sage: # needs sage.graphs
sage: space = RootSystem(['A',2]).weight_lattice()
```

(continues on next page)

(continued from previous page)

```
sage: x = space.simple_roots()[1]
sage: pi = space.simple_projection(1)
sage: x
2*Lambda[1] - Lambda[2]
sage: pi(x)
-2*Lambda[1] + Lambda[2]
sage: pi(-x)
-2*Lambda[1] + Lambda[2]
sage: pi = space.simple_projection(1,False)
sage: pi(-x)
2*Lambda[1] - Lambda[2]
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> space = RootSystem(['A',Integer(2)]).weight_lattice()
>>> x = space.simple_roots()[Integer(1)]
>>> pi = space.simple_projection(Integer(1))
>>> x
2*Lambda[1] - Lambda[2]
>>> pi(x)
-2*Lambda[1] + Lambda[2]
>>> pi(-x)
-2*Lambda[1] + Lambda[2]
>>> pi = space.simple_projection(Integer(1),False)
>>> pi(-x)
2*Lambda[1] - Lambda[2]
```

simple_projections(*to_negative=True*)

Return the family $(s_i)_{i\in I}$ of the simple projections of this root system.

EXAMPLES:

```
sage: space = RootSystem(['A',2]).weight_lattice()
sage: pi = space.simple_projections()                                    #␣
↪needs sage.graphs
sage: x = space.simple_roots()                                           #␣
↪needs sage.graphs
sage: pi[1](x[2])                                                        #␣
↪needs sage.graphs
-Lambda[1] + 2*Lambda[2]
```

```
>>> from sage.all import *
>>> space = RootSystem(['A',Integer(2)]).weight_lattice()
>>> pi = space.simple_projections()                                    #␣
↪needs sage.graphs
>>> x = space.simple_roots()                                           #␣
↪needs sage.graphs
>>> pi[Integer(1)](x[Integer(2)])                                       ␣
↪              # needs sage.graphs
-Lambda[1] + 2*Lambda[2]
```

simple_reflection(*i*)

Return the i-th simple reflection, as a function from `self` to `self`.

INPUT:

- `i` – an element of the index set of `self`

EXAMPLES:

```
sage: space = RootSystem(['A',2]).ambient_lattice()
sage: s = space.simple_reflection(1)
sage: x = space.simple_roots()[1]; x
(1, -1, 0)
sage: s(x)
(-1, 1, 0)
```

```
>>> from sage.all import *
>>> space = RootSystem(['A',Integer(2)]).ambient_lattice()
>>> s = space.simple_reflection(Integer(1))
>>> x = space.simple_roots()[Integer(1)]; x
(1, -1, 0)
>>> s(x)
(-1, 1, 0)
```

simple_reflections()

Return the family $(s_i)_{i\in I}$ of the simple reflections of this root system.

EXAMPLES:

```
sage: r = RootSystem(["A", 2]).root_lattice()
sage: s = r.simple_reflections()
sage: s[1]( r.simple_root(1) )                                              #␣
↪needs sage.graphs
-alpha[1]
```

```
>>> from sage.all import *
>>> r = RootSystem(["A", Integer(2)]).root_lattice()
>>> s = r.simple_reflections()
>>> s[Integer(1)]( r.simple_root(Integer(1)) )                              ␣
↪              # needs sage.graphs
-alpha[1]
```

simple_root(i)

Return the i-th simple root.

This should be overridden by any subclass, and typically implemented as a cached method for efficiency.

EXAMPLES:

```
sage: r = RootSystem(["A",3]).root_lattice()
sage: r.simple_root(1)
alpha[1]
```

```
>>> from sage.all import *
>>> r = RootSystem(["A",Integer(3)]).root_lattice()
>>> r.simple_root(Integer(1))
alpha[1]
```

simple_roots()

Return the family $(\alpha_i)_{i\in I}$ of the simple roots.

EXAMPLES:

```
sage: alpha = RootSystem(["A",3]).root_lattice().simple_roots()
sage: [alpha[i] for i in [1,2,3]]
[alpha[1], alpha[2], alpha[3]]
```

```
>>> from sage.all import *
>>> alpha = RootSystem(["A",Integer(3)]).root_lattice().simple_roots()
>>> [alpha[i] for i in [Integer(1),Integer(2),Integer(3)]]
[alpha[1], alpha[2], alpha[3]]
```

simple_roots_tilde()

Return the family $(\tilde{\alpha}_i)_{i\in I}$ of the simple roots.

INPUT:

- self – an affine root lattice realization

The $\tilde{\alpha}_i$ give the embedding of the root lattice of the other affinization of the same classical root lattice into this root lattice (space?).

This uses the fact that $\alpha_i = \tilde{\alpha}_i$ for i not a special node, and that

$$\delta = \sum a_i\alpha_i = \sum b_i\tilde{\alpha}_i$$

EXAMPLES:

In simply laced cases, this is boring:

```
sage: RootSystem(["A",3, 1]).root_lattice().simple_roots_tilde()          #␣
↪needs sage.graphs
Finite family {0: alpha[0], 1: alpha[1], 2: alpha[2], 3: alpha[3]}
```

```
>>> from sage.all import *
>>> RootSystem(["A",Integer(3), Integer(1)]).root_lattice().simple_roots_
↪tilde()         # needs sage.graphs
Finite family {0: alpha[0], 1: alpha[1], 2: alpha[2], 3: alpha[3]}
```

This was checked by hand:

```
sage: RootSystem(["C",2,1]).coroot_lattice().simple_roots_tilde()         #␣
↪needs sage.graphs
Finite family {0: alphacheck[0] - alphacheck[2],
               1: alphacheck[1],
               2: alphacheck[2]}
sage: RootSystem(["B",2,1]).coroot_lattice().simple_roots_tilde()         #␣
↪needs sage.graphs
Finite family {0: alphacheck[0] - alphacheck[1],
               1: alphacheck[1],
               2: alphacheck[2]}
```

```
>>> from sage.all import *
>>> RootSystem(["C",Integer(2),Integer(1)]).coroot_lattice().simple_roots_
↪tilde()        # needs sage.graphs
Finite family {0: alphacheck[0] - alphacheck[2],
               1: alphacheck[1],
```

(continues on next page)

(continued from previous page)

```
                 2: alphacheck[2]}
>>> RootSystem(["B",Integer(2),Integer(1)]).coroot_lattice().simple_roots_
↪tilde()        # needs sage.graphs
Finite family {0: alphacheck[0] - alphacheck[1],
               1: alphacheck[1],
               2: alphacheck[2]}
```

What about type BC?

some_elements()

Return some elements of this root lattice realization.

EXAMPLES:

```
sage: L = RootSystem(["A",2]).weight_lattice()
sage: L.some_elements()                                                  #␣
↪needs sage.graphs
[2*Lambda[1] + 2*Lambda[2], 2*Lambda[1] - Lambda[2],
 -Lambda[1] + 2*Lambda[2], Lambda[1], Lambda[2]]
sage: L = RootSystem(["A",2]).root_lattice()
sage: L.some_elements()
[2*alpha[1] + 2*alpha[2], alpha[1], alpha[2]]
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(2)]).weight_lattice()
>>> L.some_elements()                                                  #␣
↪needs sage.graphs
[2*Lambda[1] + 2*Lambda[2], 2*Lambda[1] - Lambda[2],
 -Lambda[1] + 2*Lambda[2], Lambda[1], Lambda[2]]
>>> L = RootSystem(["A",Integer(2)]).root_lattice()
>>> L.some_elements()
[2*alpha[1] + 2*alpha[2], alpha[1], alpha[2]]
```

tau_epsilon_operator_on_almost_positive_roots(J)

The τ_ϵ operator on almost positive roots.

Given a subset J of non adjacent vertices of the Dynkin diagram, this constructs the operator on the almost positive roots which fixes the negative simple roots α_i for i not in J, and acts otherwise by:

$$\tau_+(\beta) = (\prod_{i \in J} s_i)(\beta)$$

See Equation (1.2) of [CFZ2002].

EXAMPLES:

```
sage: L = RootSystem(['A',4]).root_lattice()
sage: tau = L.tau_epsilon_operator_on_almost_positive_roots([1,3])      #␣
↪needs sage.libs.gap
sage: alpha = L.simple_roots()                                           #␣
↪needs sage.graphs
```

```
>>> from sage.all import *
>>> L = RootSystem(['A',Integer(4)]).root_lattice()
```

(continues on next page)

(continued from previous page)

```
>>> tau = L.tau_epsilon_operator_on_almost_positive_roots([Integer(1),
↪Integer(3)])       # needs sage.libs.gap
>>> alpha = L.simple_roots()                                           #␣
↪needs sage.graphs
```

The action on a negative simple root not in J:

```
sage: tau(-alpha[2])                                                   #␣
↪needs sage.graphs sage.libs.gap
-alpha[2]
```

```
>>> from sage.all import *
>>> tau(-alpha[Integer(2)])                                            ␣
↪       # needs sage.graphs sage.libs.gap
-alpha[2]
```

The action on a negative simple root in J:

```
sage: tau(-alpha[1])                                                   #␣
↪needs sage.graphs sage.libs.gap
alpha[1]
```

```
>>> from sage.all import *
>>> tau(-alpha[Integer(1)])                                            ␣
↪       # needs sage.graphs sage.libs.gap
alpha[1]
```

The action on all almost positive roots:

```
sage: for root in L.almost_positive_roots():                           #␣
↪needs sage.graphs sage.libs.gap
....:     print('tau({:<41}) = {}'.format(str(root), tau(root)))
tau(-alpha[1]                                ) = alpha[1]
tau(alpha[1]                                 ) = -alpha[1]
tau(alpha[1] + alpha[2]                      ) = alpha[2] + alpha[3]
tau(alpha[1] + alpha[2] + alpha[3]           ) = alpha[2]
tau(alpha[1] + alpha[2] + alpha[3] + alpha[4]) = alpha[2] + alpha[3] +␣
↪alpha[4]
tau(-alpha[2]                                ) = -alpha[2]
tau(alpha[2]                                 ) = alpha[1] + alpha[2] +␣
↪alpha[3]
tau(alpha[2] + alpha[3]                      ) = alpha[1] + alpha[2]
tau(alpha[2] + alpha[3] + alpha[4]           ) = alpha[1] + alpha[2] +␣
↪alpha[3] + alpha[4]
tau(-alpha[3]                                ) = alpha[3]
tau(alpha[3]                                 ) = -alpha[3]
tau(alpha[3] + alpha[4]                      ) = alpha[4]
tau(-alpha[4]                                ) = -alpha[4]
tau(alpha[4]                                 ) = alpha[3] + alpha[4]
```

```
>>> from sage.all import *
>>> for root in L.almost_positive_roots():                             #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.graphs sage.libs.gap
...     print('tau({:<41}) = {}'.format(str(root), tau(root)))
tau(-alpha[1]                                 ) = alpha[1]
tau(alpha[1]                                  ) = -alpha[1]
tau(alpha[1] + alpha[2]                       ) = alpha[2] + alpha[3]
tau(alpha[1] + alpha[2] + alpha[3]            ) = alpha[2]
tau(alpha[1] + alpha[2] + alpha[3] + alpha[4]) = alpha[2] + alpha[3] +␣
↪alpha[4]
tau(-alpha[2]                                 ) = -alpha[2]
tau(alpha[2]                                  ) = alpha[1] + alpha[2] +␣
↪alpha[3]
tau(alpha[2] + alpha[3]                       ) = alpha[1] + alpha[2]
tau(alpha[2] + alpha[3] + alpha[4]            ) = alpha[1] + alpha[2] +␣
↪alpha[3] + alpha[4]
tau(-alpha[3]                                 ) = alpha[3]
tau(alpha[3]                                  ) = -alpha[3]
tau(alpha[3] + alpha[4]                       ) = alpha[4]
tau(-alpha[4]                                 ) = -alpha[4]
tau(alpha[4]                                  ) = alpha[3] + alpha[4]
```

This method works on any root lattice realization:

```
sage: L = RootSystem(['B',3]).ambient_space()
sage: tau = L.tau_epsilon_operator_on_almost_positive_roots([1,3])      #␣
↪needs sage.libs.gap
sage: for root in L.almost_positive_roots():                            #␣
↪needs sage.graphs sage.libs.gap
....:     print('tau({:<41}) = {}'.format(str(root), tau(root)))
tau((-1, 1, 0)                                ) = (1, -1, 0)
tau((1, 0, 0)                                 ) = (0, 1, 0)
tau((1, -1, 0)                                ) = (-1, 1, 0)
tau((1, 1, 0)                                 ) = (1, 1, 0)
tau((1, 0, -1)                                ) = (0, 1, 1)
tau((1, 0, 1)                                 ) = (0, 1, -1)

```

See also

tau_plus_minus()

tau_plus_minus()

Return the τ^+ and τ^- piecewise linear operators on `self`.

Those operators are induced by the bipartition $\{L, R\}$ of the simple roots of `self`, and stabilize the almost positive roots. Namely, τ_+ fixes the negative simple roots α_i for i in R, and acts otherwise by:

$$\tau_+(\beta) = (\prod_{i \in L} s_i)(\beta)$$

τ_- acts analogously, with L and R interchanged.

Those operators are used to construct the associahedron, a polytopal realization of the cluster complex (see `Associahedron`).

See also

tau_epsilon_operator_on_almost_positive_roots()

EXAMPLES:

We explore the example of [CFZ2002] Eq.(1.3):

```
sage: S = RootSystem(['A',2]).root_lattice()
sage: taup, taum = S.tau_plus_minus()                                     #␣
↪needs sage.graphs sage.libs.gap
sage: for beta in S.almost_positive_roots():                              #␣
↪needs sage.graphs sage.libs.gap
....:     print("{} , {} , {}".format(beta, taup(beta), taum(beta)))
-alpha[1] , alpha[1] , -alpha[1]
alpha[1] , -alpha[1] , alpha[1] + alpha[2]
alpha[1] + alpha[2] , alpha[2] , alpha[1]
-alpha[2] , -alpha[2] , alpha[2]
alpha[2] , alpha[1] + alpha[2] , -alpha[2]
```

```
>>> from sage.all import *
>>> S = RootSystem(['A',Integer(2)]).root_lattice()
>>> taup, taum = S.tau_plus_minus()                                     #␣
↪needs sage.graphs sage.libs.gap
>>> for beta in S.almost_positive_roots():                              #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.graphs sage.libs.gap
...     print("{} , {} , {}".format(beta, taup(beta), taum(beta)))
-alpha[1] , alpha[1] , -alpha[1]
alpha[1] , -alpha[1] , alpha[1] + alpha[2]
alpha[1] + alpha[2] , alpha[2] , alpha[1]
-alpha[2] , -alpha[2] , alpha[2]
alpha[2] , alpha[1] + alpha[2] , -alpha[2]
```

to_ambient_space_morphism()

Return the morphism to the ambient space.

EXAMPLES:

```
sage: B2rs = CartanType(['B',2]).root_system()
sage: B2rs.root_lattice().to_ambient_space_morphism()
Generic morphism:
  From: Root lattice of the Root system of type ['B', 2]
  To:   Ambient space of the Root system of type ['B', 2]
sage: B2rs.coroot_lattice().to_ambient_space_morphism()
Generic morphism:
  From: Coroot lattice of the Root system of type ['B', 2]
  To:   Ambient space of the Root system of type ['B', 2]
sage: B2rs.weight_lattice().to_ambient_space_morphism()
Generic morphism:
  From: Weight lattice of the Root system of type ['B', 2]
  To:   Ambient space of the Root system of type ['B', 2]
```

```
>>> from sage.all import *
>>> B2rs = CartanType(['B',Integer(2)]).root_system()
>>> B2rs.root_lattice().to_ambient_space_morphism()
Generic morphism:
  From: Root lattice of the Root system of type ['B', 2]
  To:   Ambient space of the Root system of type ['B', 2]
>>> B2rs.coroot_lattice().to_ambient_space_morphism()
Generic morphism:
  From: Coroot lattice of the Root system of type ['B', 2]
  To:   Ambient space of the Root system of type ['B', 2]
>>> B2rs.weight_lattice().to_ambient_space_morphism()
Generic morphism:
  From: Weight lattice of the Root system of type ['B', 2]
  To:   Ambient space of the Root system of type ['B', 2]
```

weyl_group(*prefix=None*)

Return the Weyl group associated to `self`.

EXAMPLES:

```
sage: RootSystem(['F',4]).ambient_space().weyl_group()                  #␣
↪needs sage.libs.gap
Weyl Group of type ['F', 4] (as a matrix group acting on the ambient␣
↪space)
sage: RootSystem(['F',4]).root_space().weyl_group()                     #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.libs.gap
Weyl Group of type ['F', 4] (as a matrix group acting on the root space)
```

```
>>> from sage.all import *
>>> RootSystem(['F',Integer(4)]).ambient_space().weyl_group()                  ␣
↪     # needs sage.libs.gap
Weyl Group of type ['F', 4] (as a matrix group acting on the ambient␣
↪space)
>>> RootSystem(['F',Integer(4)]).root_space().weyl_group()                     ␣
↪     # needs sage.libs.gap
Weyl Group of type ['F', 4] (as a matrix group acting on the root space)
```

super_categories()

EXAMPLES:

```
sage: from sage.combinat.root_system.root_lattice_realizations import␣
↪RootLatticeRealizations
sage: RootLatticeRealizations(QQ).super_categories()
[Category of vector spaces with basis over Rational Field]
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.root_lattice_realizations import␣
↪RootLatticeRealizations
>>> RootLatticeRealizations(QQ).super_categories()
[Category of vector spaces with basis over Rational Field]
```

5.1.240 Root lattices and root spaces

class sage.combinat.root_system.root_space.**RootSpace**(*root_system*, *base_ring*)

Bases: `CombinatorialFreeModule`

The root space of a root system over a given base ring.

INPUT:

- `root_system` – a root system
- `base_ring` – a ring R

The *root space* (or lattice if `base_ring` is $\mathbf{Z}$) of a root system is the formal free module $\bigoplus_i R\alpha_i$ generated by the simple roots $(\alpha_i)_{i\in I}$ of the root system.

This class is also used for coroot spaces (or lattices).

See also

- `RootSystem()`
- `RootSystem.root_lattice()` and `RootSystem.root_space()`
- `RootLatticeRealizations()`

Todo: standardize the variable used for the root space in the examples (P?)

Element

alias of *RootSpaceElement*

simple_root()

Return the basis element indexed by `i`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: F = CombinatorialFreeModule(QQ, ['a', 'b', 'c'])
sage: F.monomial('a')
B['a']
```

```
>>> from sage.all import *
>>> F = CombinatorialFreeModule(QQ, ['a', 'b', 'c'])
>>> F.monomial('a')
B['a']
```

`F.monomial` is in fact (almost) a map:

```
sage: F.monomial
Term map from {'a', 'b', 'c'} to Free module generated by {'a', 'b', 'c'}␣
↪over Rational Field
```

```
>>> from sage.all import *
>>> F.monomial
Term map from {'a', 'b', 'c'} to Free module generated by {'a', 'b', 'c'}␣
↪over Rational Field
```

to_ambient_space_morphism()

The morphism from `self` to its associated ambient space.

EXAMPLES:

```
sage: CartanType(['A',2]).root_system().root_lattice().to_ambient_space_
↪morphism()
Generic morphism:
From: Root lattice of the Root system of type ['A', 2]
To:   Ambient space of the Root system of type ['A', 2]
```

```
>>> from sage.all import *
>>> CartanType(['A',Integer(2)]).root_system().root_lattice().to_ambient_
↪space_morphism()
Generic morphism:
From: Root lattice of the Root system of type ['A', 2]
To:   Ambient space of the Root system of type ['A', 2]
```

to_coroot_space_morphism()

Return the `nu` map to the coroot space over the same base ring, using the symmetrizer of the Cartan matrix.

It does not map the root lattice to the coroot lattice, but has the property that any root is mapped to some scalar multiple of its associated coroot.

EXAMPLES:

```
sage: R = RootSystem(['A',3]).root_space()
sage: alpha = R.simple_roots()
sage: f = R.to_coroot_space_morphism()                                          #␣
↪needs sage.graphs
sage: f(alpha[1])                                                               #␣
↪needs sage.graphs
alphacheck[1]
sage: f(alpha[1] + alpha[2])                                                    #␣
↪needs sage.graphs
alphacheck[1] + alphacheck[2]

sage: R = RootSystem(['A',3]).root_lattice()
sage: alpha = R.simple_roots()
sage: f = R.to_coroot_space_morphism()                                          #␣
↪needs sage.graphs
sage: f(alpha[1])                                                               #␣
↪needs sage.graphs
alphacheck[1]
sage: f(alpha[1] + alpha[2])                                                    #␣
↪needs sage.graphs
alphacheck[1] + alphacheck[2]

sage: S = RootSystem(['G',2]).root_space()
sage: alpha = S.simple_roots()
sage: f = S.to_coroot_space_morphism()                                          #␣
↪needs sage.graphs
sage: f(alpha[1])                                                               #␣
↪needs sage.graphs
alphacheck[1]
sage: f(alpha[1] + alpha[2])                                                    #␣
↪needs sage.graphs
alphacheck[1] + 3*alphacheck[2]
```

```
>>> from sage.all import *
>>> R = RootSystem(['A',Integer(3)]).root_space()
>>> alpha = R.simple_roots()
>>> f = R.to_coroot_space_morphism()                                          #␣
↪needs sage.graphs
>>> f(alpha[Integer(1)])                                                        ␣
↪     # needs sage.graphs
alphacheck[1]
>>> f(alpha[Integer(1)] + alpha[Integer(2)])                                    ␣
↪                # needs sage.graphs
alphacheck[1] + alphacheck[2]

>>> R = RootSystem(['A',Integer(3)]).root_lattice()
>>> alpha = R.simple_roots()
>>> f = R.to_coroot_space_morphism()                                          #␣
↪needs sage.graphs
>>> f(alpha[Integer(1)])                                                        ␣
↪     # needs sage.graphs
alphacheck[1]
```

(continues on next page)

(continued from previous page)

```
>>> f(alpha[Integer(1)] + alpha[Integer(2)])
↪                # needs sage.graphs
alphacheck[1] + alphacheck[2]

>>> S = RootSystem(['G',Integer(2)]).root_space()
>>> alpha = S.simple_roots()
>>> f = S.to_coroot_space_morphism()                                    #␣
↪needs sage.graphs
>>> f(alpha[Integer(1)])
↪      # needs sage.graphs
alphacheck[1]
>>> f(alpha[Integer(1)] + alpha[Integer(2)])
↪                # needs sage.graphs
alphacheck[1] + 3*alphacheck[2]
```

class sage.combinat.root_system.root_space.**RootSpaceElement**

Bases: IndexedFreeModuleElement

associated_coroot()

Return the coroot associated to this root.

OUTPUT:

An element of the coroot space over the same base ring; in particular the result is in the coroot lattice whenever `self` is in the root lattice.

EXAMPLES:

```
sage: L = RootSystem(["B", 3]).root_space()
sage: alpha = L.simple_roots()
sage: alpha[1].associated_coroot()                                      #␣
↪needs sage.graphs
alphacheck[1]
sage: alpha[1].associated_coroot().parent()                             #␣
↪needs sage.graphs
Coroot space over the Rational Field of the Root system of type ['B', 3]

sage: L.highest_root()                                                  #␣
↪needs sage.graphs
alpha[1] + 2*alpha[2] + 2*alpha[3]
sage: L.highest_root().associated_coroot()                              #␣
↪needs sage.graphs
alphacheck[1] + 2*alphacheck[2] + alphacheck[3]

sage: alpha = RootSystem(["B", 3]).root_lattice().simple_roots()
sage: alpha[1].associated_coroot()                                      #␣
↪needs sage.graphs
alphacheck[1]
sage: alpha[1].associated_coroot().parent()                             #␣
↪needs sage.graphs
Coroot lattice of the Root system of type ['B', 3]
```

```
>>> from sage.all import *
>>> L = RootSystem(["B", Integer(3)]).root_space()
```

(continues on next page)

(continued from previous page)

```
>>> alpha = L.simple_roots()
>>> alpha[Integer(1)].associated_coroot()                                      ␣
↪     # needs sage.graphs
alphacheck[1]
>>> alpha[Integer(1)].associated_coroot().parent()                             ␣
↪     # needs sage.graphs
Coroot space over the Rational Field of the Root system of type ['B', 3]

>>> L.highest_root()                                                          #␣
↪needs sage.graphs
alpha[1] + 2*alpha[2] + 2*alpha[3]
>>> L.highest_root().associated_coroot()                                      #␣
↪needs sage.graphs
alphacheck[1] + 2*alphacheck[2] + alphacheck[3]

>>> alpha = RootSystem(["B", Integer(3)]).root_lattice().simple_roots()
>>> alpha[Integer(1)].associated_coroot()                                      ␣
↪     # needs sage.graphs
alphacheck[1]
>>> alpha[Integer(1)].associated_coroot().parent()                             ␣
↪     # needs sage.graphs
Coroot lattice of the Root system of type ['B', 3]
```

is_positive_root()

Check whether an element in the root space lies in the nonnegative cone spanned by the simple roots.

EXAMPLES:

```
sage: R = RootSystem(['A',3,1]).root_space()
sage: B = R.basis()
sage: w = B[0] + B[3]
sage: w.is_positive_root()
True
sage: w = B[1] - B[2]
sage: w.is_positive_root()
False
```

```
>>> from sage.all import *
>>> R = RootSystem(['A',Integer(3),Integer(1)]).root_space()
>>> B = R.basis()
>>> w = B[Integer(0)] + B[Integer(3)]
>>> w.is_positive_root()
True
>>> w = B[Integer(1)] - B[Integer(2)]
>>> w.is_positive_root()
False
```

max_coroot_le()

Return the highest positive coroot whose associated root is less than or equal to `self`.

INPUT:

- `self` – an element of the nonnegative integer span of simple roots

Returns None for the zero element.

Really `self` is an element of a coroot lattice and this method returns the highest root whose associated coroot is <= `self`.

> **Warning**
>
> This implementation only handles finite Cartan types

EXAMPLES:

```
sage: # needs sage.graphs
sage: root_lattice = RootSystem(['C',2]).root_lattice()
sage: root_lattice.from_vector(vector([1,1])).max_coroot_le()
alphacheck[1] + 2*alphacheck[2]
sage: root_lattice.from_vector(vector([2,1])).max_coroot_le()
alphacheck[1] + 2*alphacheck[2]
sage: root_lattice = RootSystem(['B',2]).root_lattice()
sage: root_lattice.from_vector(vector([1,1])).max_coroot_le()
2*alphacheck[1] + alphacheck[2]
sage: root_lattice.from_vector(vector([1,2])).max_coroot_le()
2*alphacheck[1] + alphacheck[2]

sage: root_lattice.zero().max_coroot_le() is None                          #␣

max_quantum_element()

Return a reduced word for the longest element of the Weyl group whose shortest path in the quantum Bruhat graph to the identity has sum of quantum coroots at most `self`.

INPUT:

- `self` – an element of the nonnegative integer span of simple roots

Really `self` is an element of a coroot lattice.

> **Warning**
>
> This implementation only handles finite Cartan types

EXAMPLES:

```
sage: # needs sage.graphs sage.libs.gap
sage: Qvee = RootSystem(['C',2]).coroot_lattice()
sage: Qvee.from_vector(vector([1,2])).max_quantum_element()
[2, 1, 2, 1]
sage: Qvee.from_vector(vector([1,1])).max_quantum_element()
[1, 2, 1]
sage: Qvee.from_vector(vector([0,2])).max_quantum_element()
[2]
```

```
>>> from sage.all import *
>>> # needs sage.graphs sage.libs.gap
>>> Qvee = RootSystem(['C',Integer(2)]).coroot_lattice()
>>> Qvee.from_vector(vector([Integer(1),Integer(2)])).max_quantum_element()
[2, 1, 2, 1]
>>> Qvee.from_vector(vector([Integer(1),Integer(1)])).max_quantum_element()
[1, 2, 1]
>>> Qvee.from_vector(vector([Integer(0),Integer(2)])).max_quantum_element()
[2]
```

quantum_root()

Check whether `self` is a quantum root.

INPUT:

- `self` – an element of the nonnegative integer span of simple roots

A root α is a quantum root if $\ell(s_\alpha) = \langle 2\rho, \alpha^\vee \rangle - 1$ where ℓ is the length function, s_α is the reflection across the hyperplane orthogonal to α, and 2ρ is the sum of positive roots.

Warning

This implementation only handles finite Cartan types and assumes that `self` is a root.

Todo

Rename to is_quantum_root

EXAMPLES:

```
sage: Q = RootSystem(['C',2]).root_lattice()
sage: positive_roots = Q.positive_roots()
sage: for x in sorted(positive_roots):                                          #␣
↪needs sage.graphs
....:     print("{} {}".format(x, x.quantum_root()))
alpha[1] True
alpha[1] + alpha[2] False
2*alpha[1] + alpha[2] True
alpha[2] True
```

```
>>> from sage.all import *
>>> Q = RootSystem(['C',Integer(2)]).root_lattice()
>>> positive_roots = Q.positive_roots()
>>> for x in sorted(positive_roots):                                            #␣
↪needs sage.graphs
...     print("{} {}".format(x, x.quantum_root()))
alpha[1] True
alpha[1] + alpha[2] False
2*alpha[1] + alpha[2] True
alpha[2] True
```

scalar(*lambdacheck*)

The scalar product between the root lattice and the coroot lattice.

EXAMPLES:

```
sage: L = RootSystem(['B',4]).root_lattice()
sage: alpha      = L.simple_roots()
sage: alphacheck = L.simple_coroots()
sage: alpha[1].scalar(alphacheck[1])                                            #␣
↪needs sage.graphs
2
sage: alpha[1].scalar(alphacheck[2])                                            #␣
↪needs sage.graphs
-1
```

```
>>> from sage.all import *
>>> L = RootSystem(['B',Integer(4)]).root_lattice()
>>> alpha      = L.simple_roots()
>>> alphacheck = L.simple_coroots()
>>> alpha[Integer(1)].scalar(alphacheck[Integer(1)])                         ␣
↪               # needs sage.graphs
2
>>> alpha[Integer(1)].scalar(alphacheck[Integer(2)])                         ␣
↪               # needs sage.graphs
-1
```

The scalar products between the roots and coroots are given by the Cartan matrix:

```
sage: matrix([ [ alpha[i].scalar(alphacheck[j])                              #␣
↪needs sage.graphs
....:              for i in L.index_set() ]
....:            for j in L.index_set() ])
[ 2 -1  0  0]
[-1  2 -1  0]
[ 0 -1  2 -1]
[ 0  0 -2  2]

sage: L.cartan_type().cartan_matrix()                                        #␣
↪needs sage.graphs
[ 2 -1  0  0]
[-1  2 -1  0]
[ 0 -1  2 -1]
[ 0  0 -2  2]
```

```
>>> from sage.all import *
>>> matrix([ [ alpha[i].scalar(alphacheck[j])                              #␣
↪needs sage.graphs
...              for i in L.index_set() ]
...            for j in L.index_set() ])
[ 2 -1  0  0]
[-1  2 -1  0]
[ 0 -1  2 -1]
[ 0  0 -2  2]

>>> L.cartan_type().cartan_matrix()                                        #␣
↪needs sage.graphs
[ 2 -1  0  0]
[-1  2 -1  0]
[ 0 -1  2 -1]
[ 0  0 -2  2]
```

to_ambient()

Map `self` to the ambient space.

EXAMPLES:

```
sage: alpha = CartanType(['B',2]).root_system().root_lattice().an_element();␣
↪alpha
```

(continues on next page)

(continued from previous page)

```
2*alpha[1] + 2*alpha[2]
sage: alpha.to_ambient()
(2, 0)
sage: alphavee = CartanType(['B',2]).root_system().coroot_lattice().an_
↪element(); alphavee
2*alphacheck[1] + 2*alphacheck[2]
sage: alphavee.to_ambient()
(2, 2)
```

```
>>> from sage.all import *
>>> alpha = CartanType(['B',Integer(2)]).root_system().root_lattice().an_
↪element(); alpha
2*alpha[1] + 2*alpha[2]
>>> alpha.to_ambient()
(2, 0)
>>> alphavee = CartanType(['B',Integer(2)]).root_system().coroot_lattice().an_
↪element(); alphavee
2*alphacheck[1] + 2*alphacheck[2]
>>> alphavee.to_ambient()
(2, 2)
```

5.1.241 Root systems

See *Root Systems* for an overview.

class sage.combinat.root_system.root_system.**RootSystem**(*cartan_type*, *as_dual_of=None*)

Bases: UniqueRepresentation, SageObject

A class for root systems.

EXAMPLES:

We construct the root system for type B_3:

```
sage: R = RootSystem(['B',3]); R
Root system of type ['B', 3]
```

```
>>> from sage.all import *
>>> R = RootSystem(['B',Integer(3)]); R
Root system of type ['B', 3]
```

R models the root system abstractly. It comes equipped with various realizations of the root and weight lattices, where all computations take place. Let us play first with the root lattice:

```
sage: space = R.root_lattice(); space
Root lattice of the Root system of type ['B', 3]
```

```
>>> from sage.all import *
>>> space = R.root_lattice(); space
Root lattice of the Root system of type ['B', 3]
```

This is the free $\mathbf{Z}$-module $\bigoplus_i \mathbf{Z}.\alpha_i$ spanned by the simple roots:

```
sage: space.base_ring()
Integer Ring
sage: list(space.basis())
[alpha[1], alpha[2], alpha[3]]
```

```
>>> from sage.all import *
>>> space.base_ring()
Integer Ring
>>> list(space.basis())
[alpha[1], alpha[2], alpha[3]]
```

Let us do some computations with the simple roots:

```
sage: alpha = space.simple_roots()
sage: alpha[1] + alpha[2]
alpha[1] + alpha[2]
```

```
>>> from sage.all import *
>>> alpha = space.simple_roots()
>>> alpha[Integer(1)] + alpha[Integer(2)]
alpha[1] + alpha[2]
```

There is a canonical pairing between the root lattice and the coroot lattice:

```
sage: R.coroot_lattice()
Coroot lattice of the Root system of type ['B', 3]
```

```
>>> from sage.all import *
>>> R.coroot_lattice()
Coroot lattice of the Root system of type ['B', 3]
```

We construct the simple coroots, and do some computations (see comments about duality below for some caveat):

```
sage: alphacheck = space.simple_coroots()
sage: list(alphacheck)
[alphacheck[1], alphacheck[2], alphacheck[3]]
```

```
>>> from sage.all import *
>>> alphacheck = space.simple_coroots()
>>> list(alphacheck)
[alphacheck[1], alphacheck[2], alphacheck[3]]
```

We can carry over the same computations in any of the other realizations of the root lattice, like the root space $\bigoplus_i \mathbf{Q}.\alpha_i$, the weight lattice $\bigoplus_i \mathbf{Z}.\Lambda_i$, the weight space $\bigoplus_i \mathbf{Q}.\Lambda_i$. For example:

```
sage: space = R.weight_space(); space
Weight space over the Rational Field of the Root system of type ['B', 3]
```

```
>>> from sage.all import *
>>> space = R.weight_space(); space
Weight space over the Rational Field of the Root system of type ['B', 3]
```

```
sage: space.base_ring()
Rational Field
sage: list(space.basis())
[Lambda[1], Lambda[2], Lambda[3]]
```

```
>>> from sage.all import *
>>> space.base_ring()
Rational Field
>>> list(space.basis())
[Lambda[1], Lambda[2], Lambda[3]]
```

```
sage: alpha = space.simple_roots()                                          #␣
↪needs sage.graphs
sage: alpha[1] + alpha[2]                                                   #␣
↪needs sage.graphs
Lambda[1] + Lambda[2] - 2*Lambda[3]
```

```
>>> from sage.all import *
>>> alpha = space.simple_roots()                                          #␣
↪needs sage.graphs
>>> alpha[Integer(1)] + alpha[Integer(2)]                                   ␣
↪                # needs sage.graphs
Lambda[1] + Lambda[2] - 2*Lambda[3]
```

The fundamental weights are the dual basis of the coroots:

```
sage: Lambda = space.fundamental_weights()
sage: Lambda[1]
Lambda[1]
```

```
>>> from sage.all import *
>>> Lambda = space.fundamental_weights()
>>> Lambda[Integer(1)]
Lambda[1]
```

```
sage: alphacheck = space.simple_coroots()                                   #␣
↪needs sage.graphs
sage: list(alphacheck)                                                      #␣
↪needs sage.graphs
[alphacheck[1], alphacheck[2], alphacheck[3]]
```

```
>>> from sage.all import *
>>> alphacheck = space.simple_coroots()                                   #␣
↪needs sage.graphs
>>> list(alphacheck)                                                      #␣
↪needs sage.graphs
[alphacheck[1], alphacheck[2], alphacheck[3]]
```

```
sage: [Lambda[i].scalar(alphacheck[1]) for i in space.index_set()]
[1, 0, 0]
sage: [Lambda[i].scalar(alphacheck[2]) for i in space.index_set()]
```

(continues on next page)

(continued from previous page)

```
[0, 1, 0]
sage: [Lambda[i].scalar(alphacheck[3]) for i in space.index_set()]
[0, 0, 1]
```

```
>>> from sage.all import *
>>> [Lambda[i].scalar(alphacheck[Integer(1)]) for i in space.index_set()]
[1, 0, 0]
>>> [Lambda[i].scalar(alphacheck[Integer(2)]) for i in space.index_set()]
[0, 1, 0]
>>> [Lambda[i].scalar(alphacheck[Integer(3)]) for i in space.index_set()]
[0, 0, 1]
```

Let us use the simple reflections. In the weight space, they work as in the *number game*: firing the node i on an element x adds c times the simple root α_i, where c is the coefficient of i in x:

```
sage: # needs sage.graphs
sage: Lambda[1].simple_reflection(1)
-Lambda[1] + Lambda[2]
sage: Lambda[2].simple_reflection(1)
Lambda[2]
sage: Lambda[3].simple_reflection(1)
Lambda[3]
sage: (-2*Lambda[1] + Lambda[2] + Lambda[3]).simple_reflection(1)
2*Lambda[1] - Lambda[2] + Lambda[3]
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> Lambda[Integer(1)].simple_reflection(Integer(1))
-Lambda[1] + Lambda[2]
>>> Lambda[Integer(2)].simple_reflection(Integer(1))
Lambda[2]
>>> Lambda[Integer(3)].simple_reflection(Integer(1))
Lambda[3]
>>> (-Integer(2)*Lambda[Integer(1)] + Lambda[Integer(2)] + Lambda[Integer(3)]).
↪simple_reflection(Integer(1))
2*Lambda[1] - Lambda[2] + Lambda[3]
```

It can be convenient to manipulate the simple reflections themselves:

```
sage: # needs sage.graphs
sage: s = space.simple_reflections()
sage: s[1](Lambda[1])
-Lambda[1] + Lambda[2]
sage: s[1](Lambda[2])
Lambda[2]
sage: s[1](Lambda[3])
Lambda[3]
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> s = space.simple_reflections()
>>> s[Integer(1)](Lambda[Integer(1)])
```

(continues on next page)

(continued from previous page)

```
-Lambda[1] + Lambda[2]
>>> s[Integer(1)](Lambda[Integer(2)])
Lambda[2]
>>> s[Integer(1)](Lambda[Integer(3)])
Lambda[3]
```

Ambient spaces

The root system may also come equipped with an ambient space. This is a **Q**-module, endowed with its canonical Euclidean scalar product, which admits simultaneous embeddings of the (extended) weight and the (extended) coweight lattice, and therefore the root and the coroot lattice. This is implemented on a type by type basis for the finite crystallographic root systems following Bourbaki's conventions and is extended to the affine cases. Coefficients permitting, this is also available as an ambient lattice.

See also:

ambient_space() and *ambient_lattice()* for details

In finite type A, we recover the natural representation of the symmetric group as group of permutation matrices:

```
sage: RootSystem(["A",2]).ambient_space().weyl_group().simple_reflections()      #␣
↪needs sage.libs.gap sage.libs.pari
Finite family {1: [0 1 0]
                  [1 0 0]
                  [0 0 1],
               2: [1 0 0]
                  [0 0 1]
                  [0 1 0]}
```

```
>>> from sage.all import *
>>> RootSystem(["A",Integer(2)]).ambient_space().weyl_group().simple_
↪reflections()      # needs sage.libs.gap sage.libs.pari
Finite family {1: [0 1 0]
                  [1 0 0]
                  [0 0 1],
               2: [1 0 0]
                  [0 0 1]
                  [0 1 0]}
```

In type B, C, and D, we recover the natural representation of the Weyl group as groups of signed permutation matrices:

```
sage: RootSystem(["B",3]).ambient_space().weyl_group().simple_reflections()      #␣
↪needs sage.libs.gap sage.libs.pari
Finite family {1: [0 1 0]
                  [1 0 0]
                  [0 0 1],
               2: [1 0 0]
                  [0 0 1]
                  [0 1 0],
               3: [ 1  0  0]
```

(continues on next page)

(continued from previous page)

```
                  [ 0  1  0]
                  [ 0  0 -1]}
```

```
>>> from sage.all import *
>>> RootSystem(["B",Integer(3)]).ambient_space().weyl_group().simple_
↪reflections()      # needs sage.libs.gap sage.libs.pari
Finite family {1: [0 1 0]
                  [1 0 0]
                  [0 0 1],
               2: [1 0 0]
                  [0 0 1]
                  [0 1 0],
               3: [ 1  0  0]
                  [ 0  1  0]
                  [ 0  0 -1]}
```

In (untwisted) affine types A, …, D, one can recover from the ambient space the affine permutation representation, in window notation. Let us consider the ambient space for affine type A:

```
sage: L = RootSystem(["A",2,1]).ambient_space(); L
Ambient space of the Root system of type ['A', 2, 1]
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(2),Integer(1)]).ambient_space(); L
Ambient space of the Root system of type ['A', 2, 1]
```

Define the "identity" by an appropriate vector at level -3:

```
sage: e = L.basis(); Lambda = L.fundamental_weights()                          #␣
↪needs sage.graphs
sage: id = e[0] + 2*e[1] + 3*e[2]  - 3*Lambda[0]                               #␣
↪needs sage.graphs
```

```
>>> from sage.all import *
>>> e = L.basis(); Lambda = L.fundamental_weights()                          #␣
↪needs sage.graphs
>>> id = e[Integer(0)] + Integer(2)*e[Integer(1)] + Integer(3)*e[Integer(2)]  -␣
↪Integer(3)*Lambda[Integer(0)]                                 # needs sage.graphs
```

The corresponding permutation is obtained by projecting it onto the classical ambient space:

```
sage: L.classical()
Ambient space of the Root system of type ['A', 2]
sage: L.classical()(id)                                                        #␣
↪needs sage.graphs
(1, 2, 3)
```

```
>>> from sage.all import *
>>> L.classical()
Ambient space of the Root system of type ['A', 2]
>>> L.classical()(id)                                                        #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.graphs
(1, 2, 3)
```

Here is the orbit of the identity under the action of the finite group:

```
sage: # needs sage.graphs sage.libs.gap sage.libs.pari
sage: W = L.weyl_group()
sage: S3 = [ w.action(id) for w in W.classical() ]
sage: [L.classical()(x) for x in S3]
[(1, 2, 3), (3, 1, 2), (2, 3, 1), (2, 1, 3), (1, 3, 2), (3, 2, 1)]
```

```
>>> from sage.all import *
>>> # needs sage.graphs sage.libs.gap sage.libs.pari
>>> W = L.weyl_group()
>>> S3 = [ w.action(id) for w in W.classical() ]
>>> [L.classical()(x) for x in S3]
[(1, 2, 3), (3, 1, 2), (2, 3, 1), (2, 1, 3), (1, 3, 2), (3, 2, 1)]
```

And the action of s_0 on these yields:

```
sage: # needs sage.graphs sage.libs.gap sage.libs.pari
sage: s = W.simple_reflections()
sage: [L.classical()(s[0].action(x)) for x in S3]
[(0, 2, 4), (-1, 1, 6), (-2, 3, 5), (0, 1, 5), (-1, 3, 4), (-2, 2, 6)]
```

```
>>> from sage.all import *
>>> # needs sage.graphs sage.libs.gap sage.libs.pari
>>> s = W.simple_reflections()
>>> [L.classical()(s[Integer(0)].action(x)) for x in S3]
[(0, 2, 4), (-1, 1, 6), (-2, 3, 5), (0, 1, 5), (-1, 3, 4), (-2, 2, 6)]
```

We can also plot various components of the ambient spaces:

```
sage: L = RootSystem(['A',2]).ambient_space()
sage: L.plot()                                                              #␣
↪needs sage.plot sage.symbolic
Graphics object consisting of 13 graphics primitives
```

```
>>> from sage.all import *
>>> L = RootSystem(['A',Integer(2)]).ambient_space()
>>> L.plot()                                                              #␣
↪needs sage.plot sage.symbolic
Graphics object consisting of 13 graphics primitives
```

For more on plotting, see *Tutorial: visualizing root systems*.

Dual root systems

The root system is aware of its dual root system:

```
sage: R.dual
Dual of root system of type ['B', 3]
```

```
>>> from sage.all import *
>>> R.dual
Dual of root system of type ['B', 3]
```

R.dual is really the root system of type C_3:

```
sage: R.dual.cartan_type()
['C', 3]
```

```
>>> from sage.all import *
>>> R.dual.cartan_type()
['C', 3]
```

And the coroot lattice that we have been manipulating before is really implemented as the root lattice of the dual root system:

```
sage: R.dual.root_lattice()
Coroot lattice of the Root system of type ['B', 3]
```

```
>>> from sage.all import *
>>> R.dual.root_lattice()
Coroot lattice of the Root system of type ['B', 3]
```

In particular, the coroots for the root lattice are in fact the roots of the coroot lattice:

```
sage: list(R.root_lattice().simple_coroots())
[alphacheck[1], alphacheck[2], alphacheck[3]]
sage: list(R.coroot_lattice().simple_roots())
[alphacheck[1], alphacheck[2], alphacheck[3]]
sage: list(R.dual.root_lattice().simple_roots())
[alphacheck[1], alphacheck[2], alphacheck[3]]
```

```
>>> from sage.all import *
>>> list(R.root_lattice().simple_coroots())
[alphacheck[1], alphacheck[2], alphacheck[3]]
>>> list(R.coroot_lattice().simple_roots())
[alphacheck[1], alphacheck[2], alphacheck[3]]
>>> list(R.dual.root_lattice().simple_roots())
[alphacheck[1], alphacheck[2], alphacheck[3]]
```

The coweight lattice and space are defined similarly. Note that, to limit confusion, all the output have been tweaked appropriately.

- *RootSpace*
- *WeightSpace*
- AmbientSpace
- *RootLatticeRealizations*

- *WeightLatticeRealizations*

ambient_lattice()

Return the ambient lattice for this root_system.

This is the ambient space, over **Z**.

See also

- *ambient_space()*
- *root_lattice()*
- *weight_lattice()*

EXAMPLES:

```
sage: RootSystem(['A',4]).ambient_lattice()
Ambient lattice of the Root system of type ['A', 4]
sage: RootSystem(['A',4,1]).ambient_lattice()
Ambient lattice of the Root system of type ['A', 4, 1]
```

```
>>> from sage.all import *
>>> RootSystem(['A',Integer(4)]).ambient_lattice()
Ambient lattice of the Root system of type ['A', 4]
>>> RootSystem(['A',Integer(4),Integer(1)]).ambient_lattice()
Ambient lattice of the Root system of type ['A', 4, 1]
```

Except in type A, only an ambient space can be realized:

```
sage: RootSystem(['B',4]).ambient_lattice()
sage: RootSystem(['C',4]).ambient_lattice()
sage: RootSystem(['D',4]).ambient_lattice()
sage: RootSystem(['E',6]).ambient_lattice()
sage: RootSystem(['F',4]).ambient_lattice()
sage: RootSystem(['G',2]).ambient_lattice()
```

```
>>> from sage.all import *
>>> RootSystem(['B',Integer(4)]).ambient_lattice()
>>> RootSystem(['C',Integer(4)]).ambient_lattice()
>>> RootSystem(['D',Integer(4)]).ambient_lattice()
>>> RootSystem(['E',Integer(6)]).ambient_lattice()
>>> RootSystem(['F',Integer(4)]).ambient_lattice()
>>> RootSystem(['G',Integer(2)]).ambient_lattice()
```

ambient_space(*base_ring=Rational Field*)

Return the usual ambient space for this root_system.

INPUT:

- `base_ring` – a base ring (default: **Q**)

This is a `base_ring`-module, endowed with its canonical Euclidean scalar product, which admits simultaneous embeddings into the weight and the coweight lattice, and therefore the root and the coroot lattice, and preserves scalar products between elements of the coroot lattice and elements of the root or weight lattice (and dually).

There is no mechanical way to define the ambient space just from the Cartan matrix. Instead it is constructed from hard coded type by type data, according to the usual Bourbaki conventions. Such data is provided for all the finite (crystallographic) types. From this data, ambient spaces can be built as well for dual types, reducible types and affine types. When no data is available, or if the base ring is not large enough, None is returned.

Warning

for affine types

See also

- The section on ambient spaces in *RootSystem*
- *ambient_lattice()*
- *AmbientSpace*
- AmbientSpace
- *root_space()*
- weight:space()

EXAMPLES:

```
sage: RootSystem(['A',4]).ambient_space()
Ambient space of the Root system of type ['A', 4]
```

```
>>> from sage.all import *
>>> RootSystem(['A',Integer(4)]).ambient_space()
Ambient space of the Root system of type ['A', 4]
```

```
sage: RootSystem(['B',4]).ambient_space()
Ambient space of the Root system of type ['B', 4]
```

```
>>> from sage.all import *
>>> RootSystem(['B',Integer(4)]).ambient_space()
Ambient space of the Root system of type ['B', 4]
```

```
sage: RootSystem(['C',4]).ambient_space()
Ambient space of the Root system of type ['C', 4]
```

```
>>> from sage.all import *
>>> RootSystem(['C',Integer(4)]).ambient_space()
Ambient space of the Root system of type ['C', 4]
```

```
sage: RootSystem(['D',4]).ambient_space()
Ambient space of the Root system of type ['D', 4]
```

```
>>> from sage.all import *
>>> RootSystem(['D',Integer(4)]).ambient_space()
Ambient space of the Root system of type ['D', 4]
```

```
sage: RootSystem(['E',6]).ambient_space()
Ambient space of the Root system of type ['E', 6]
```

```
>>> from sage.all import *
>>> RootSystem(['E',Integer(6)]).ambient_space()
Ambient space of the Root system of type ['E', 6]
```

```
sage: RootSystem(['F',4]).ambient_space()
Ambient space of the Root system of type ['F', 4]
```

```
>>> from sage.all import *
>>> RootSystem(['F',Integer(4)]).ambient_space()
Ambient space of the Root system of type ['F', 4]
```

```
sage: RootSystem(['G',2]).ambient_space()
Ambient space of the Root system of type ['G', 2]
```

```
>>> from sage.all import *
>>> RootSystem(['G',Integer(2)]).ambient_space()
Ambient space of the Root system of type ['G', 2]
```

An alternative base ring can be provided as an option:

```
sage: e = RootSystem(['B',3]).ambient_space(RR)
sage: TestSuite(e).run()                                                    #␣
↪needs sage.graphs
```

```
>>> from sage.all import *
>>> e = RootSystem(['B',Integer(3)]).ambient_space(RR)
>>> TestSuite(e).run()                                                    #␣
↪needs sage.graphs
```

It should contain the smallest ring over which the ambient space can be defined (**Z** in type A or **Q** otherwise). Otherwise None is returned:

```
sage: RootSystem(['B',2]).ambient_space(ZZ)
```

```
>>> from sage.all import *
>>> RootSystem(['B',Integer(2)]).ambient_space(ZZ)
```

The base ring should also be totally ordered. In practice, only **Z** and **Q** are really supported at this point, but you are welcome to experiment:

```
sage: e = RootSystem(['G',2]).ambient_space(RR)
sage: TestSuite(e).run()                                                    #␣
↪needs sage.graphs
Failure in _test_root_lattice_realization:
```

(continues on next page)

(continued from previous page)

```
Traceback (most recent call last):
...
AssertionError: 2.00000000000000 != 2.00000000000000
------------------------------------------------------------
The following tests failed: _test_root_lattice_realization
```

```
>>> from sage.all import *
>>> e = RootSystem(['G',Integer(2)]).ambient_space(RR)
>>> TestSuite(e).run()                                                      #␣
↪needs sage.graphs
Failure in _test_root_lattice_realization:
Traceback (most recent call last):
...
AssertionError: 2.00000000000000 != 2.00000000000000
------------------------------------------------------------
The following tests failed: _test_root_lattice_realization
```

cartan_matrix()

EXAMPLES:

```
sage: RootSystem(['A',3]).cartan_matrix()                                     #␣
↪needs sage.graphs
[ 2 -1  0]
[-1  2 -1]
[ 0 -1  2]
```

```
>>> from sage.all import *
>>> RootSystem(['A',Integer(3)]).cartan_matrix()                              ␣
↪      # needs sage.graphs
[ 2 -1  0]
[-1  2 -1]
[ 0 -1  2]
```

cartan_type()

Return the Cartan type of the root system.

EXAMPLES:

```
sage: R = RootSystem(['A',3])
sage: R.cartan_type()
['A', 3]
```

```
>>> from sage.all import *
>>> R = RootSystem(['A',Integer(3)])
>>> R.cartan_type()
['A', 3]
```

coambient_space(*base_ring=Rational Field*)

Return the coambient space for this root system.

This is the ambient space of the dual root system.

See also

- *ambient_space()*

EXAMPLES:

```
sage: L = RootSystem(["B",2]).ambient_space(); L
Ambient space of the Root system of type ['B', 2]
sage: coL = RootSystem(["B",2]).coambient_space(); coL
Coambient space of the Root system of type ['B', 2]
```

```
>>> from sage.all import *
>>> L = RootSystem(["B",Integer(2)]).ambient_space(); L
Ambient space of the Root system of type ['B', 2]
>>> coL = RootSystem(["B",Integer(2)]).coambient_space(); coL
Coambient space of the Root system of type ['B', 2]
```

The roots and coroots are interchanged:

```
sage: coL.simple_roots()
Finite family {1: (1, -1), 2: (0, 2)}
sage: L.simple_coroots()
Finite family {1: (1, -1), 2: (0, 2)}

sage: coL.simple_coroots()
Finite family {1: (1, -1), 2: (0, 1)}
sage: L.simple_roots()
Finite family {1: (1, -1), 2: (0, 1)}
```

```
>>> from sage.all import *
>>> coL.simple_roots()
Finite family {1: (1, -1), 2: (0, 2)}
>>> L.simple_coroots()
Finite family {1: (1, -1), 2: (0, 2)}

>>> coL.simple_coroots()
Finite family {1: (1, -1), 2: (0, 1)}
>>> L.simple_roots()
Finite family {1: (1, -1), 2: (0, 1)}
```

coroot_lattice()

Return the coroot lattice associated to `self`.

EXAMPLES:

```
sage: RootSystem(['A',3]).coroot_lattice()
Coroot lattice of the Root system of type ['A', 3]
```

```
>>> from sage.all import *
>>> RootSystem(['A',Integer(3)]).coroot_lattice()
Coroot lattice of the Root system of type ['A', 3]
```

coroot_space(*base_ring=Rational Field*)

Return the coroot space associated to `self`.

EXAMPLES:

```
sage: RootSystem(['A',3]).coroot_space()
Coroot space over the Rational Field of the Root system of type ['A', 3]
```

```
>>> from sage.all import *
>>> RootSystem(['A',Integer(3)]).coroot_space()
Coroot space over the Rational Field of the Root system of type ['A', 3]
```

coweight_lattice(*extended=False*)

Return the coweight lattice associated to `self`.

This is the weight lattice of the dual root system.

See also

- *coweight_space()*
- *weight_space()*, *weight_lattice()*
- `WeightSpace`

EXAMPLES:

```
sage: RootSystem(['A',3]).coweight_lattice()
Coweight lattice of the Root system of type ['A', 3]

sage: RootSystem(['A',3,1]).coweight_lattice(extended=True)
Extended coweight lattice of the Root system of type ['A', 3, 1]
```

```
>>> from sage.all import *
>>> RootSystem(['A',Integer(3)]).coweight_lattice()
Coweight lattice of the Root system of type ['A', 3]

>>> RootSystem(['A',Integer(3),Integer(1)]).coweight_lattice(extended=True)
Extended coweight lattice of the Root system of type ['A', 3, 1]
```

coweight_space(*base_ring=Rational Field*, *extended=False*)

Return the coweight space associated to `self`.

This is the weight space of the dual root system.

See also

- *coweight_lattice()*
- *weight_space()*, *weight_lattice()*
- `WeightSpace`

EXAMPLES:

```
sage: RootSystem(['A',3]).coweight_space()
Coweight space over the Rational Field of the Root system of type ['A', 3]

sage: RootSystem(['A',3,1]).coweight_space(extended=True)
Extended coweight space over the Rational Field
 of the Root system of type ['A', 3, 1]
```

```
>>> from sage.all import *
>>> RootSystem(['A',Integer(3)]).coweight_space()
Coweight space over the Rational Field of the Root system of type ['A', 3]

>>> RootSystem(['A',Integer(3),Integer(1)]).coweight_space(extended=True)
Extended coweight space over the Rational Field
 of the Root system of type ['A', 3, 1]
```

coxeter_number()

Return the Coxeter number of an irreducible finite root system.

See also

coxeter_number().

EXAMPLES:

```
sage: rt = RootSystem(['C', 5])
sage: rt.coxeter_number()
10
```

```
>>> from sage.all import *
>>> rt = RootSystem(['C', Integer(5)])
>>> rt.coxeter_number()
10
```

dual_coxeter_number()

Return the dual Coxeter number of a irreducible finite root system.

The dual Coxeter number is equal to 1 plus the sum of the coefficients of simple roots in the highest short root of the dual root system.

See also

dual_coxeter_number()

EXAMPLES:

```
sage: rt = RootSystem(['C', 5])
sage: rt.dual_coxeter_number()
6
```

```
>>> from sage.all import *
>>> rt = RootSystem(['C', Integer(5)])
```

(continues on next page)

(continued from previous page)

```
>>> rt.dual_coxeter_number()
6
```

The dual Coxeter number is not the same concept as the Coxeter number of the dual root system:

```
sage: rt.dual
Dual of root system of type ['C', 5]
sage: rt.dual.coxeter_number()
10
```

```
>>> from sage.all import *
>>> rt.dual
Dual of root system of type ['C', 5]
>>> rt.dual.coxeter_number()
10
```

dynkin_diagram()

Return the Dynkin diagram of the root system.

EXAMPLES:

```
sage: R = RootSystem(['A',3])
sage: R.dynkin_diagram()                                                    #␣
↪needs sage.graphs
O---O---O
1   2   3
A3
```

```
>>> from sage.all import *
>>> R = RootSystem(['A',Integer(3)])
>>> R.dynkin_diagram()                                                  #␣
↪needs sage.graphs
O---O---O
1   2   3
A3
```

index_set()

EXAMPLES:

```
sage: RootSystem(['A',3]).index_set()
(1, 2, 3)
```

```
>>> from sage.all import *
>>> RootSystem(['A',Integer(3)]).index_set()
(1, 2, 3)
```

is_finite()

Return `True` if `self` is a finite root system.

EXAMPLES:

```
sage: RootSystem(["A",3]).is_finite()
True
sage: RootSystem(["A",3,1]).is_finite()
False
```

```
>>> from sage.all import *
>>> RootSystem(["A",Integer(3)]).is_finite()
True
>>> RootSystem(["A",Integer(3),Integer(1)]).is_finite()
False
```

is_irreducible()

Return `True` if `self` is an irreducible root system.

EXAMPLES:

```
sage: RootSystem(['A', 3]).is_irreducible()
True
sage: RootSystem("A2xB2").is_irreducible()
False
```

```
>>> from sage.all import *
>>> RootSystem(['A', Integer(3)]).is_irreducible()
True
>>> RootSystem("A2xB2").is_irreducible()
False
```

root_lattice()

Return the root lattice associated to `self`.

EXAMPLES:

```
sage: RootSystem(['A',3]).root_lattice()
Root lattice of the Root system of type ['A', 3]
```

```
>>> from sage.all import *
>>> RootSystem(['A',Integer(3)]).root_lattice()
Root lattice of the Root system of type ['A', 3]
```

root_poset(*restricted=False*, *facade=False*)

Return the (restricted) root poset associated to `self`.

The elements are given by the positive roots (resp. non-simple, positive roots), and $\alpha \leq \beta$ iff $\beta - \alpha$ is a nonnegative linear combination of simple roots.

INPUT:

- `restricted` – boolean (default: `False`); if `True`, only non-simple roots are considered
- `facade` – boolean (default: `False`); passes facade option to the poset generator

EXAMPLES:

```
sage: Phi = RootSystem(['A',2]).root_poset(); Phi                          #␣
↪needs sage.graphs
```

(continues on next page)

(continued from previous page)

```
Finite poset containing 3 elements
sage: sorted(Phi.cover_relations(), key=str)                               #␣
↪needs sage.graphs
[[alpha[1], alpha[1] + alpha[2]], [alpha[2], alpha[1] + alpha[2]]]

sage: Phi = RootSystem(['A',3]).root_poset(restricted=True); Phi           #␣
↪needs sage.graphs
Finite poset containing 3 elements
sage: sorted(Phi.cover_relations(), key=str)                               #␣
↪needs sage.graphs
[[alpha[1] + alpha[2], alpha[1] + alpha[2] + alpha[3]],
 [alpha[2] + alpha[3], alpha[1] + alpha[2] + alpha[3]]]

sage: Phi = RootSystem(['B',2]).root_poset(); Phi                          #␣
↪needs sage.graphs
Finite poset containing 4 elements
sage: Phi.cover_relations()                                                #␣
↪needs sage.graphs
[[alpha[2], alpha[1] + alpha[2]], [alpha[1], alpha[1] + alpha[2]],
 [alpha[1] + alpha[2], alpha[1] + 2*alpha[2]]]
```

```
>>> from sage.all import *
>>> Phi = RootSystem(['A',Integer(2)]).root_poset(); Phi                  ␣
↪     # needs sage.graphs
Finite poset containing 3 elements
>>> sorted(Phi.cover_relations(), key=str)                               #␣
↪needs sage.graphs
[[alpha[1], alpha[1] + alpha[2]], [alpha[2], alpha[1] + alpha[2]]]

>>> Phi = RootSystem(['A',Integer(3)]).root_poset(restricted=True); Phi   ␣
↪     # needs sage.graphs
Finite poset containing 3 elements
>>> sorted(Phi.cover_relations(), key=str)                               #␣
↪needs sage.graphs
[[alpha[1] + alpha[2], alpha[1] + alpha[2] + alpha[3]],
 [alpha[2] + alpha[3], alpha[1] + alpha[2] + alpha[3]]]

>>> Phi = RootSystem(['B',Integer(2)]).root_poset(); Phi                  ␣
↪     # needs sage.graphs
Finite poset containing 4 elements
>>> Phi.cover_relations()                                                #␣
↪needs sage.graphs
[[alpha[2], alpha[1] + alpha[2]], [alpha[1], alpha[1] + alpha[2]],
 [alpha[1] + alpha[2], alpha[1] + 2*alpha[2]]]
```

root_space(*base_ring=Rational Field*)

Return the root space associated to `self`.

EXAMPLES:

```
sage: RootSystem(['A',3]).root_space()
Root space over the Rational Field of the Root system of type ['A', 3]
```

```
>>> from sage.all import *
>>> RootSystem(['A',Integer(3)]).root_space()
Root space over the Rational Field of the Root system of type ['A', 3]
```

weight_lattice(*extended=False*)

Return the weight lattice associated to `self`.

> **See also**
>
> - *weight_space()*
> - *coweight_space()*, *coweight_lattice()*
> - WeightSpace

EXAMPLES:

```
sage: RootSystem(['A',3]).weight_lattice()
Weight lattice of the Root system of type ['A', 3]

sage: RootSystem(['A',3,1]).weight_space(extended=True)
Extended weight space over the Rational Field
 of the Root system of type ['A', 3, 1]
```

```
>>> from sage.all import *
>>> RootSystem(['A',Integer(3)]).weight_lattice()
Weight lattice of the Root system of type ['A', 3]

>>> RootSystem(['A',Integer(3),Integer(1)]).weight_space(extended=True)
Extended weight space over the Rational Field
 of the Root system of type ['A', 3, 1]
```

weight_space(*base_ring=Rational Field*, *extended=False*)

Return the weight space associated to `self`.

> **See also**
>
> - *weight_lattice()*
> - *coweight_space()*, *coweight_lattice()*
> - WeightSpace

EXAMPLES:

```
sage: RootSystem(['A',3]).weight_space()
Weight space over the Rational Field of the Root system of type ['A', 3]

sage: RootSystem(['A',3,1]).weight_space(extended=True)
Extended weight space over the Rational Field
 of the Root system of type ['A', 3, 1]
```

```
>>> from sage.all import *
>>> RootSystem(['A',Integer(3)]).weight_space()
Weight space over the Rational Field of the Root system of type ['A', 3]

>>> RootSystem(['A',Integer(3),Integer(1)]).weight_space(extended=True)
Extended weight space over the Rational Field
 of the Root system of type ['A', 3, 1]
```

sage.combinat.root_system.root_system.**WeylDim**(*ct*, *coeffs*)

The Weyl Dimension Formula.

INPUT:

- ct – a Cartan type
- coeffs – list of nonnegative integers

The length of the list must equal the rank type[1]. A dominant weight hwv is constructed by summing the fundamental weights with coefficients from this list. The dimension of the irreducible representation of the semisimple complex Lie algebra with highest weight vector hwv is returned.

EXAMPLES:

For $SO(7)$, the Cartan type is B_3, so:

```
sage: WeylDim(['B',3],[1,0,0])  # standard representation of SO(7)
7
sage: WeylDim(['B',3],[0,1,0])  # exterior square
21
sage: WeylDim(['B',3],[0,0,1])  # spin representation of spin(7)
8
sage: WeylDim(['B',3],[1,0,1])  # sum of the first and third fundamental weights
48
sage: [WeylDim(['F',4],x) for x in ([1,0,0,0],[0,1,0,0],[0,0,1,0],[0,0,0,1])]
[52, 1274, 273, 26]
sage: [WeylDim(['E', 6], x)
....:  for x in ([0, 0, 0, 0, 0, 0], [0, 1, 0, 0, 0, 0], [0, 0, 0, 0, 0, 1],
....:            [0, 0, 0, 0, 0, 2], [0, 0, 0, 0, 1, 0], [0, 0, 1, 0, 0, 0],
....:            [1, 0, 0, 0, 0, 0], [1, 0, 0, 0, 0, 1], [2, 0, 0, 0, 0, 0])]
[1, 78, 27, 351, 351, 351, 27, 650, 351]
```

```
>>> from sage.all import *
>>> WeylDim(['B',Integer(3)],[Integer(1),Integer(0),Integer(0)])  # standard␣
↪representation of SO(7)
7
>>> WeylDim(['B',Integer(3)],[Integer(0),Integer(1),Integer(0)])  # exterior␣
↪square
21
>>> WeylDim(['B',Integer(3)],[Integer(0),Integer(0),Integer(1)])  # spin␣
↪representation of spin(7)
8
>>> WeylDim(['B',Integer(3)],[Integer(1),Integer(0),Integer(1)])  # sum of the␣
↪first and third fundamental weights
48
>>> [WeylDim(['F',Integer(4)],x) for x in ([Integer(1),Integer(0),Integer(0),
```

(continues on next page)

5.1.242 Root system data for super type A

class sage.combinat.root_system.type_super_A.**AmbientSpace**(*root_system*, *base_ring*, *index_set=None*)

Bases: *AmbientSpace*

The ambient space for (super) type $A(m|n)$.

EXAMPLES:

```
sage: R = RootSystem(['A', [2,1]])
sage: AL = R.ambient_space(); AL
Ambient space of the Root system of type ['A', [2, 1]]
sage: AL.basis()
Finite family {-3: (1, 0, 0, 0, 0),
 -2: (0, 1, 0, 0, 0),
 -1: (0, 0, 1, 0, 0),
 1: (0, 0, 0, 1, 0),
 2: (0, 0, 0, 0, 1)}
```

```
>>> from sage.all import *
>>> R = RootSystem(['A', [Integer(2),Integer(1)]])
>>> AL = R.ambient_space(); AL
Ambient space of the Root system of type ['A', [2, 1]]
>>> AL.basis()
Finite family {-3: (1, 0, 0, 0, 0),
 -2: (0, 1, 0, 0, 0),
 -1: (0, 0, 1, 0, 0),
 1: (0, 0, 0, 1, 0),
 2: (0, 0, 0, 0, 1)}
```

class Element

Bases: *AmbientSpaceElement*

associated_coroot()

Return the coroot associated to `self`.

EXAMPLES:

```
sage: L = RootSystem(['A', [3,2]]).ambient_space()
sage: al = L.simple_roots()
sage: al[-1].associated_coroot()
(0, 0, 1, -1, 0, 0, 0)
sage: al[0].associated_coroot()
(0, 0, 0, 1, -1, 0, 0)
sage: al[1].associated_coroot()
(0, 0, 0, 0, -1, 1, 0)

sage: a = al[-1] + al[0] + al[1]; a
(0, 0, 1, 0, 0, -1, 0)
sage: a.associated_coroot()
(0, 0, 1, 0, -2, 1, 0)
sage: h = L.simple_coroots()
sage: h[-1] + h[0] + h[1]
(0, 0, 1, 0, -2, 1, 0)

sage: (al[-1] + al[0] + al[2]).associated_coroot()
(0, 0, 1, 0, -1, -1, 1)
```

```
>>> from sage.all import *
>>> L = RootSystem(['A', [Integer(3),Integer(2)]]).ambient_space()
>>> al = L.simple_roots()
>>> al[-Integer(1)].associated_coroot()
(0, 0, 1, -1, 0, 0, 0)
>>> al[Integer(0)].associated_coroot()
(0, 0, 0, 1, -1, 0, 0)
>>> al[Integer(1)].associated_coroot()
(0, 0, 0, 0, -1, 1, 0)

>>> a = al[-Integer(1)] + al[Integer(0)] + al[Integer(1)]; a
(0, 0, 1, 0, 0, -1, 0)
>>> a.associated_coroot()
(0, 0, 1, 0, -2, 1, 0)
>>> h = L.simple_coroots()
>>> h[-Integer(1)] + h[Integer(0)] + h[Integer(1)]
(0, 0, 1, 0, -2, 1, 0)

>>> (al[-Integer(1)] + al[Integer(0)] + al[Integer(2)]).associated_
↪coroot()
(0, 0, 1, 0, -1, -1, 1)
```

dot_product(*lambdacheck*)

The scalar product with elements of the coroot lattice embedded in the ambient space.

EXAMPLES:

```
sage: L = RootSystem(['A', [2,1]]).ambient_space()
sage: a = L.simple_roots()
```

(continues on next page)

(continued from previous page)

```
sage: matrix([[a[i].inner_product(a[j]) for j in L.index_set()] for i in␣
↪L.index_set()])
[ 2 -1  0  0]
[-1  2 -1  0]
[ 0 -1  0  1]
[ 0  0  1 -2]
```

```
>>> from sage.all import *
>>> L = RootSystem(['A', [Integer(2),Integer(1)]]).ambient_space()
>>> a = L.simple_roots()
>>> matrix([[a[i].inner_product(a[j]) for j in L.index_set()] for i in L.
↪index_set()])
[ 2 -1  0  0]
[-1  2 -1  0]
[ 0 -1  0  1]
[ 0  0  1 -2]
```

has_descent(*i*, *positive=False*)

Test if `self` has a descent at position i, that is if `self` is on the strict negative side of the i-th simple reflection hyperplane.

If `positive` is `True`, tests if it is on the strict positive side instead.

EXAMPLES:

```
sage: L = RootSystem(['A', [2,1]]).ambient_space()
sage: al = L.simple_roots()
sage: [al[i].has_descent(1) for i in L.index_set()]
[False, False, True, False]
sage: [(-al[i]).has_descent(1) for i in L.index_set()]
[False, False, False, True]
sage: [al[i].has_descent(1, True) for i in L.index_set()]
[False, False, False, True]
sage: [(-al[i]).has_descent(1, True) for i in L.index_set()]
[False, False, True, False]
sage: (al[-2] + al[0] + al[1]).has_descent(-1)
True
sage: (al[-2] + al[0] + al[1]).has_descent(1)
False
sage: (al[-2] + al[0] + al[1]).has_descent(1, positive=True)
True
sage: all(all(not la.has_descent(i) for i in L.index_set())
....:     for la in L.fundamental_weights())
True
```

```
>>> from sage.all import *
>>> L = RootSystem(['A', [Integer(2),Integer(1)]]).ambient_space()
>>> al = L.simple_roots()
>>> [al[i].has_descent(Integer(1)) for i in L.index_set()]
[False, False, True, False]
>>> [(-al[i]).has_descent(Integer(1)) for i in L.index_set()]
[False, False, False, True]
```

(continues on next page)

(continued from previous page)

```
>>> [al[i].has_descent(Integer(1), True) for i in L.index_set()]
[False, False, False, True]
>>> [(-al[i]).has_descent(Integer(1), True) for i in L.index_set()]
[False, False, True, False]
>>> (al[-Integer(2)] + al[Integer(0)] + al[Integer(1)]).has_descent(-
↪Integer(1))
True
>>> (al[-Integer(2)] + al[Integer(0)] + al[Integer(1)]).has_
↪descent(Integer(1))
False
>>> (al[-Integer(2)] + al[Integer(0)] + al[Integer(1)]).has_
↪descent(Integer(1), positive=True)
True
>>> all(all(not la.has_descent(i) for i in L.index_set())
...     for la in L.fundamental_weights())
True
```

inner_product(*lambdacheck*)

The scalar product with elements of the coroot lattice embedded in the ambient space.

EXAMPLES:

```
sage: L = RootSystem(['A', [2,1]]).ambient_space()
sage: a = L.simple_roots()
sage: matrix([[a[i].inner_product(a[j]) for j in L.index_set()] for i in␣
↪L.index_set()])
[ 2 -1  0  0]
[-1  2 -1  0]
[ 0 -1  0  1]
[ 0  0  1 -2]
```

```
>>> from sage.all import *
>>> L = RootSystem(['A', [Integer(2),Integer(1)]]).ambient_space()
>>> a = L.simple_roots()
>>> matrix([[a[i].inner_product(a[j]) for j in L.index_set()] for i in L.
↪index_set()])
[ 2 -1  0  0]
[-1  2 -1  0]
[ 0 -1  0  1]
[ 0  0  1 -2]
```

is_dominant_weight()

Test whether `self` is a dominant element of the weight lattice.

EXAMPLES:

```
sage: L = RootSystem(['A',2]).ambient_lattice()
sage: Lambda = L.fundamental_weights()
sage: [x.is_dominant() for x in Lambda]
[True, True]
sage: (3*Lambda[1]+Lambda[2]).is_dominant()
True
sage: (Lambda[1]-Lambda[2]).is_dominant()
```

(continues on next page)

(continued from previous page)

```
False
sage: (-Lambda[1]+Lambda[2]).is_dominant()
False
```

```
>>> from sage.all import *
>>> L = RootSystem(['A',Integer(2)]).ambient_lattice()
>>> Lambda = L.fundamental_weights()
>>> [x.is_dominant() for x in Lambda]
[True, True]
>>> (Integer(3)*Lambda[Integer(1)]+Lambda[Integer(2)]).is_dominant()
True
>>> (Lambda[Integer(1)]-Lambda[Integer(2)]).is_dominant()
False
>>> (-Lambda[Integer(1)]+Lambda[Integer(2)]).is_dominant()
False
```

Tests that the scalar products with the coroots are all nonnegative integers. For example, if x is the sum of a dominant element of the weight lattice plus some other element orthogonal to all coroots, then the implementation correctly reports x to be a dominant weight:

```
sage: x = Lambda[1] + L([-1,-1,-1])
sage: x.is_dominant_weight()
True
```

```
>>> from sage.all import *
>>> x = Lambda[Integer(1)] + L([-Integer(1),-Integer(1),-Integer(1)])
>>> x.is_dominant_weight()
True
```

scalar(*lambdacheck*)

The scalar product with elements of the coroot lattice embedded in the ambient space.

EXAMPLES:

```
sage: L = RootSystem(['A', [2,1]]).ambient_space()
sage: a = L.simple_roots()
sage: matrix([[a[i].inner_product(a[j]) for j in L.index_set()] for i in␣
↪L.index_set()])
[ 2 -1  0  0]
[-1  2 -1  0]
[ 0 -1  0  1]
[ 0  0  1 -2]
```

```
>>> from sage.all import *
>>> L = RootSystem(['A', [Integer(2),Integer(1)]]).ambient_space()
>>> a = L.simple_roots()
>>> matrix([[a[i].inner_product(a[j]) for j in L.index_set()] for i in L.
↪index_set()])
[ 2 -1  0  0]
[-1  2 -1  0]
[ 0 -1  0  1]
[ 0  0  1 -2]
```

dimension()

Return the dimension of this ambient space.

EXAMPLES:

```
sage: e = RootSystem(['A', [4,2]]).ambient_space()
sage: e.dimension()
8
```

```
>>> from sage.all import *
>>> e = RootSystem(['A', [Integer(4),Integer(2)]]).ambient_space()
>>> e.dimension()
8
```

fundamental_weight(i)

Return the fundamental weight Λ_i of `self`.

EXAMPLES:

```
sage: L = RootSystem(['A', [3,2]]).ambient_space()
sage: L.fundamental_weight(-1)
(1, 1, 1, 0, 0, 0, 0)
sage: L.fundamental_weight(0)
(1, 1, 1, 1, 0, 0, 0)
sage: L.fundamental_weight(2)
(1, 1, 1, 1, -1, -1, -2)
sage: list(L.fundamental_weights())
[(1, 0, 0, 0, 0, 0, 0),
 (1, 1, 0, 0, 0, 0, 0),
 (1, 1, 1, 0, 0, 0, 0),
 (1, 1, 1, 1, 0, 0, 0),
 (1, 1, 1, 1, -1, -2, -2),
 (1, 1, 1, 1, -1, -1, -2)]
```

```
>>> from sage.all import *
>>> L = RootSystem(['A', [Integer(3),Integer(2)]]).ambient_space()
>>> L.fundamental_weight(-Integer(1))
(1, 1, 1, 0, 0, 0, 0)
>>> L.fundamental_weight(Integer(0))
(1, 1, 1, 1, 0, 0, 0)
>>> L.fundamental_weight(Integer(2))
(1, 1, 1, 1, -1, -1, -2)
>>> list(L.fundamental_weights())
[(1, 0, 0, 0, 0, 0, 0),
 (1, 1, 0, 0, 0, 0, 0),
 (1, 1, 1, 0, 0, 0, 0),
 (1, 1, 1, 1, 0, 0, 0),
 (1, 1, 1, 1, -1, -2, -2),
 (1, 1, 1, 1, -1, -1, -2)]
```

```
sage: L = RootSystem(['A', [2,3]]).ambient_space()
sage: La = L.fundamental_weights()
sage: al = L.simple_roots()
```

(continues on next page)

(continued from previous page)

```
sage: I = L.index_set()
sage: matrix([[al[i].scalar(La[j]) for i in I] for j in I])
[ 1  0  0  0  0  0]
[ 0  1  0  0  0  0]
[ 0  0  1  0  0  0]
[ 0  0  0 -1  0  0]
[ 0  0  0  0 -1  0]
[ 0  0  0  0  0 -1]
```

```
>>> from sage.all import *
>>> L = RootSystem(['A', [Integer(2),Integer(3)]]).ambient_space()
>>> La = L.fundamental_weights()
>>> al = L.simple_roots()
>>> I = L.index_set()
>>> matrix([[al[i].scalar(La[j]) for i in I] for j in I])
[ 1  0  0  0  0  0]
[ 0  1  0  0  0  0]
[ 0  0  1  0  0  0]
[ 0  0  0 -1  0  0]
[ 0  0  0  0 -1  0]
[ 0  0  0  0  0 -1]
```

highest_root()

Return the highest root of `self`.

EXAMPLES:

```
sage: e = RootSystem(['A', [4,2]]).ambient_lattice()
sage: e.highest_root()
(1, 0, 0, 0, 0, 0, 0, -1)
```

```
>>> from sage.all import *
>>> e = RootSystem(['A', [Integer(4),Integer(2)]]).ambient_lattice()
>>> e.highest_root()
(1, 0, 0, 0, 0, 0, 0, -1)
```

negative_even_roots()

Return the negative even roots of `self`.

EXAMPLES:

```
sage: e = RootSystem(['A', [2,1]]).ambient_lattice()
sage: e.negative_even_roots()
[(0, -1, 1, 0, 0), (-1, 0, 1, 0, 0),
 (-1, 1, 0, 0, 0), (0, 0, 0, -1, 1)]
```

```
>>> from sage.all import *
>>> e = RootSystem(['A', [Integer(2),Integer(1)]]).ambient_lattice()
>>> e.negative_even_roots()
[(0, -1, 1, 0, 0), (-1, 0, 1, 0, 0),
 (-1, 1, 0, 0, 0), (0, 0, 0, -1, 1)]
```

negative_odd_roots()

Return the negative odd roots of `self`.

EXAMPLES:

```
sage: e = RootSystem(['A', [2,1]]).ambient_lattice()
sage: e.negative_odd_roots()
[(0, 0, -1, 1, 0),
 (0, 0, -1, 0, 1),
 (0, -1, 0, 1, 0),
 (0, -1, 0, 0, 1),
 (-1, 0, 0, 1, 0),
 (-1, 0, 0, 0, 1)]
```

```
>>> from sage.all import *
>>> e = RootSystem(['A', [Integer(2),Integer(1)]]).ambient_lattice()
>>> e.negative_odd_roots()
[(0, 0, -1, 1, 0),
 (0, 0, -1, 0, 1),
 (0, -1, 0, 1, 0),
 (0, -1, 0, 0, 1),
 (-1, 0, 0, 1, 0),
 (-1, 0, 0, 0, 1)]
```

negative_roots()

Return the negative roots of `self`.

EXAMPLES:

```
sage: e = RootSystem(['A', [2,1]]).ambient_lattice()
sage: e.negative_roots()
[(0, -1, 1, 0, 0),
 (-1, 0, 1, 0, 0),
 (-1, 1, 0, 0, 0),
 (0, 0, 0, -1, 1),
 (0, 0, -1, 1, 0),
 (0, 0, -1, 0, 1),
 (0, -1, 0, 1, 0),
 (0, -1, 0, 0, 1),
 (-1, 0, 0, 1, 0),
 (-1, 0, 0, 0, 1)]
```

```
>>> from sage.all import *
>>> e = RootSystem(['A', [Integer(2),Integer(1)]]).ambient_lattice()
>>> e.negative_roots()
[(0, -1, 1, 0, 0),
 (-1, 0, 1, 0, 0),
 (-1, 1, 0, 0, 0),
 (0, 0, 0, -1, 1),
 (0, 0, -1, 1, 0),
 (0, 0, -1, 0, 1),
 (0, -1, 0, 1, 0),
 (0, -1, 0, 0, 1),
```

(continues on next page)

(continued from previous page)

```
 (-1, 0, 0, 1, 0),
 (-1, 0, 0, 0, 1)]
```

positive_even_roots()

Return the positive even roots of `self`.

EXAMPLES:

```
sage: e = RootSystem(['A', [2,1]]).ambient_lattice()
sage: e.positive_even_roots()
[(0, 1, -1, 0, 0), (1, 0, -1, 0, 0),
 (1, -1, 0, 0, 0), (0, 0, 0, 1, -1)]
```

```
>>> from sage.all import *
>>> e = RootSystem(['A', [Integer(2),Integer(1)]]).ambient_lattice()
>>> e.positive_even_roots()
[(0, 1, -1, 0, 0), (1, 0, -1, 0, 0),
 (1, -1, 0, 0, 0), (0, 0, 0, 1, -1)]
```

positive_odd_roots()

Return the positive odd roots of `self`.

EXAMPLES:

```
sage: e = RootSystem(['A', [2,1]]).ambient_lattice()
sage: e.positive_odd_roots()
[(0, 0, 1, -1, 0),
 (0, 0, 1, 0, -1),
 (0, 1, 0, -1, 0),
 (0, 1, 0, 0, -1),
 (1, 0, 0, -1, 0),
 (1, 0, 0, 0, -1)]
```

```
>>> from sage.all import *
>>> e = RootSystem(['A', [Integer(2),Integer(1)]]).ambient_lattice()
>>> e.positive_odd_roots()
[(0, 0, 1, -1, 0),
 (0, 0, 1, 0, -1),
 (0, 1, 0, -1, 0),
 (0, 1, 0, 0, -1),
 (1, 0, 0, -1, 0),
 (1, 0, 0, 0, -1)]
```

positive_roots()

Return the positive roots of `self`.

EXAMPLES:

```
sage: e = RootSystem(['A', [2,1]]).ambient_lattice()
sage: e.positive_roots()
[(0, 1, -1, 0, 0),
 (1, 0, -1, 0, 0),
 (1, -1, 0, 0, 0),
```

(continues on next page)

(continued from previous page)

```
 (0, 0, 0, 1, -1),
 (0, 0, 1, -1, 0),
 (0, 0, 1, 0, -1),
 (0, 1, 0, -1, 0),
 (0, 1, 0, 0, -1),
 (1, 0, 0, -1, 0),
 (1, 0, 0, 0, -1)]
```

```
>>> from sage.all import *
>>> e = RootSystem(['A', [Integer(2),Integer(1)]]).ambient_lattice()
>>> e.positive_roots()
[(0, 1, -1, 0, 0),
 (1, 0, -1, 0, 0),
 (1, -1, 0, 0, 0),
 (0, 0, 0, 1, -1),
 (0, 0, 1, -1, 0),
 (0, 0, 1, 0, -1),
 (0, 1, 0, -1, 0),
 (0, 1, 0, 0, -1),
 (1, 0, 0, -1, 0),
 (1, 0, 0, 0, -1)]
```

simple_coroot(i)

Return the simple coroot h_i of `self`.

EXAMPLES:

```
sage: L = RootSystem(['A', [3,2]]).ambient_space()
sage: L.simple_coroot(-2)
(0, 1, -1, 0, 0, 0, 0)
sage: L.simple_coroot(0)
(0, 0, 0, 1, -1, 0, 0)
sage: L.simple_coroot(2)
(0, 0, 0, 0, 0, -1, 1)
sage: list(L.simple_coroots())
[(1, -1, 0, 0, 0, 0, 0),
 (0, 1, -1, 0, 0, 0, 0),
 (0, 0, 1, -1, 0, 0, 0),
 (0, 0, 0, 1, -1, 0, 0),
 (0, 0, 0, 0, -1, 1, 0),
 (0, 0, 0, 0, 0, -1, 1)]
```

```
>>> from sage.all import *
>>> L = RootSystem(['A', [Integer(3),Integer(2)]]).ambient_space()
>>> L.simple_coroot(-Integer(2))
(0, 1, -1, 0, 0, 0, 0)
>>> L.simple_coroot(Integer(0))
(0, 0, 0, 1, -1, 0, 0)
>>> L.simple_coroot(Integer(2))
(0, 0, 0, 0, 0, -1, 1)
>>> list(L.simple_coroots())
[(1, -1, 0, 0, 0, 0, 0),
```

(continues on next page)

(continued from previous page)

```
 (0, 1, -1, 0, 0, 0, 0),
 (0, 0, 1, -1, 0, 0, 0),
 (0, 0, 0, 1, -1, 0, 0),
 (0, 0, 0, 0, -1, 1, 0),
 (0, 0, 0, 0, 0, -1, 1)]
```

simple_root(*i*)

Return the i-th simple root of `self`.

EXAMPLES:

```
sage: e = RootSystem(['A', [2,1]]).ambient_lattice()
sage: list(e.simple_roots())
[(1, -1, 0, 0, 0), (0, 1, -1, 0, 0),
 (0, 0, 1, -1, 0), (0, 0, 0, 1, -1)]
```

```
>>> from sage.all import *
>>> e = RootSystem(['A', [Integer(2),Integer(1)]]).ambient_lattice()
>>> list(e.simple_roots())
[(1, -1, 0, 0, 0), (0, 1, -1, 0, 0),
 (0, 0, 1, -1, 0), (0, 0, 0, 1, -1)]
```

classmethod smallest_base_ring(*cartan_type=None*)

Return the smallest base ring the ambient space can be defined upon.

See also

smallest_base_ring()

EXAMPLES:

```
sage: e = RootSystem(['A', [3,1]]).ambient_space()
sage: e.smallest_base_ring()
Integer Ring
```

```
>>> from sage.all import *
>>> e = RootSystem(['A', [Integer(3),Integer(1)]]).ambient_space()
>>> e.smallest_base_ring()
Integer Ring
```

class sage.combinat.root_system.type_super_A.**CartanType**(*m*, *n*)

Bases: *SuperCartanType_standard*

Cartan Type $A(m|n)$.

See also

`CartanType()`

AmbientSpace

alias of *AmbientSpace*

ascii_art(*label=None*, *node=None*)

Return an ascii art representation of the Dynkin diagram.

EXAMPLES:

```
sage: t = CartanType(['A', [3,2]])
sage: print(t.ascii_art())
O---O---O---X---O---O
-3  -2  -1  0   1   2
sage: t = CartanType(['A', [3,7]])
sage: print(t.ascii_art())
O---O---O---X---O---O---O---O---O---O---O
-3  -2  -1  0   1   2   3   4   5   6   7

sage: t = CartanType(['A', [0,7]])
sage: print(t.ascii_art())
X---O---O---O---O---O---O---O
0   1   2   3   4   5   6   7
sage: t = CartanType(['A', [0,0]])
sage: print(t.ascii_art())
X
0
sage: t = CartanType(['A', [5,0]])
sage: print(t.ascii_art())
O---O---O---O---O---X
-5  -4  -3  -2  -1  0
```

```
>>> from sage.all import *
>>> t = CartanType(['A', [Integer(3),Integer(2)]])
>>> print(t.ascii_art())
O---O---O---X---O---O
-3  -2  -1  0   1   2
>>> t = CartanType(['A', [Integer(3),Integer(7)]])
>>> print(t.ascii_art())
O---O---O---X---O---O---O---O---O---O---O
-3  -2  -1  0   1   2   3   4   5   6   7

>>> t = CartanType(['A', [Integer(0),Integer(7)]])
>>> print(t.ascii_art())
X---O---O---O---O---O---O---O
0   1   2   3   4   5   6   7
>>> t = CartanType(['A', [Integer(0),Integer(0)]])
>>> print(t.ascii_art())
X
0
>>> t = CartanType(['A', [Integer(5),Integer(0)]])
>>> print(t.ascii_art())
O---O---O---O---O---X
-5  -4  -3  -2  -1  0
```

cartan_matrix()

Return the Cartan matrix associated to `self`.

EXAMPLES:

```
sage: ct = CartanType(['A', [2,3]])
sage: ct.cartan_matrix()                                                    #␣
↪needs sage.graphs
[ 2 -1  0  0  0  0]
[-1  2 -1  0  0  0]
[ 0 -1  0  1  0  0]
[ 0  0 -1  2 -1  0]
[ 0  0  0 -1  2 -1]
[ 0  0  0  0 -1  2]
```

```
>>> from sage.all import *
>>> ct = CartanType(['A', [Integer(2),Integer(3)]])
>>> ct.cartan_matrix()                                                    #␣
↪needs sage.graphs
[ 2 -1  0  0  0  0]
[-1  2 -1  0  0  0]
[ 0 -1  0  1  0  0]
[ 0  0 -1  2 -1  0]
[ 0  0  0 -1  2 -1]
[ 0  0  0  0 -1  2]
```

dual()

Return dual of `self`.

EXAMPLES:

```
sage: CartanType(['A', [2,3]]).dual()
['A', [2, 3]]
```

```
>>> from sage.all import *
>>> CartanType(['A', [Integer(2),Integer(3)]]).dual()
['A', [2, 3]]
```

dynkin_diagram()

Return the Dynkin diagram of super type A.

EXAMPLES:

```
sage: a = CartanType(['A', [4,2]]).dynkin_diagram(); a                     #␣
↪needs sage.graphs
O---O---O---O---X---O---O
-4  -3  -2  -1  0   1   2
A4|2
sage: a.edges(sort=True)                                                  #␣
↪needs sage.graphs
[(-4, -3, 1), (-3, -4, 1), (-3, -2, 1), (-2, -3, 1),
 (-2, -1, 1), (-1, -2, 1), (-1, 0, 1), (0, -1, 1),
 (0, 1, 1), (1, 0, -1), (1, 2, 1), (2, 1, 1)]
```

```
>>> from sage.all import *
>>> a = CartanType(['A', [Integer(4),Integer(2)]]).dynkin_diagram(); a     ␣
↪               # needs sage.graphs
O---O---O---O---X---O---O
```

(continues on next page)

(continued from previous page)

```
-4  -3  -2  -1  0   1   2
A4|2
>>> a.edges(sort=True)                                                  #␣
↪needs sage.graphs
[(-4, -3, 1), (-3, -4, 1), (-3, -2, 1), (-2, -3, 1),
 (-2, -1, 1), (-1, -2, 1), (-1, 0, 1), (0, -1, 1),
 (0, 1, 1), (1, 0, -1), (1, 2, 1), (2, 1, 1)]
```

index_set()

Return the index set of `self`.

EXAMPLES:

```
sage: CartanType(['A', [2,3]]).index_set()
(-2, -1, 0, 1, 2, 3)
```

```
>>> from sage.all import *
>>> CartanType(['A', [Integer(2),Integer(3)]]).index_set()
(-2, -1, 0, 1, 2, 3)
```

is_affine()

Return whether `self` is affine or not.

EXAMPLES:

```
sage: CartanType(['A', [2,3]]).is_affine()
False
```

```
>>> from sage.all import *
>>> CartanType(['A', [Integer(2),Integer(3)]]).is_affine()
False
```

is_finite()

Return whether `self` is finite or not.

EXAMPLES:

```
sage: CartanType(['A', [2,3]]).is_finite()
True
```

```
>>> from sage.all import *
>>> CartanType(['A', [Integer(2),Integer(3)]]).is_finite()
True
```

is_irreducible()

Return whether `self` is irreducible, which is `True`.

EXAMPLES:

```
sage: CartanType(['A', [3,4]]).is_irreducible()
True
```

```
>>> from sage.all import *
>>> CartanType(['A', [Integer(3),Integer(4)]]).is_irreducible()
True
```

relabel(*relabelling*)

Return a relabelled copy of this Cartan type.

INPUT:

- `relabelling` – a function (or a list or dictionary)

OUTPUT:

an isomorphic Cartan type obtained by relabelling the nodes of the Dynkin diagram. Namely, the node with label `i` is relabelled `f(i)` (or, by `f[i]` if `f` is a list or dictionary).

EXAMPLES:

```
sage: ct = CartanType(['A', [1,2]])
sage: ct.dynkin_diagram()                                                    #␣
↪needs sage.graphs
O---X---O---O
-1   0   1   2
A1|2
sage: f = {1:2, 2:1, 0:0, -1:-1}
sage: ct.relabel(f)
['A', [1, 2]] relabelled by {-1: -1, 0: 0, 1: 2, 2: 1}
sage: ct.relabel(f).dynkin_diagram()                                         #␣
↪needs sage.graphs
O---X---O---O
-1   0   2   1
A1|2 relabelled by {-1: -1, 0: 0, 1: 2, 2: 1}
```

```
>>> from sage.all import *
>>> ct = CartanType(['A', [Integer(1),Integer(2)]])
>>> ct.dynkin_diagram()                                                    #␣
↪needs sage.graphs
O---X---O---O
-1   0   1   2
A1|2
>>> f = {Integer(1):Integer(2), Integer(2):Integer(1), Integer(0):Integer(0),␣
↪-Integer(1):-Integer(1)}
>>> ct.relabel(f)
['A', [1, 2]] relabelled by {-1: -1, 0: 0, 1: 2, 2: 1}
>>> ct.relabel(f).dynkin_diagram()                                         #␣
↪needs sage.graphs
O---X---O---O
-1   0   2   1
A1|2 relabelled by {-1: -1, 0: 0, 1: 2, 2: 1}
```

root_system()

Return root system of `self`.

EXAMPLES:

```
sage: CartanType(['A', [2,3]]).root_system()
Root system of type ['A', [2, 3]]
```

```
>>> from sage.all import *
>>> CartanType(['A', [Integer(2),Integer(3)]]).root_system()
Root system of type ['A', [2, 3]]
```

symmetrizer()

Return symmetrizing matrix for `self`.

EXAMPLES:

```
sage: CartanType(['A', [2,3]]).symmetrizer()
Finite family {-2: 1, -1: 1, 0: 1, 1: -1, 2: -1, 3: -1}
```

```
>>> from sage.all import *
>>> CartanType(['A', [Integer(2),Integer(3)]]).symmetrizer()
Finite family {-2: 1, -1: 1, 0: 1, 1: -1, 2: -1, 3: -1}
```

type()

Return type of `self`.

EXAMPLES:

```
sage: CartanType(['A', [2,3]]).type()
'A'
```

```
>>> from sage.all import *
>>> CartanType(['A', [Integer(2),Integer(3)]]).type()
'A'
```

5.1.243 Root system data for type A

class sage.combinat.root_system.type_A.**AmbientSpace**(*root_system*, *base_ring*, *index_set=None*)

Bases: *AmbientSpace*

EXAMPLES:

```
sage: R = RootSystem(["A",3])
sage: e = R.ambient_space(); e
Ambient space of the Root system of type ['A', 3]
sage: TestSuite(e).run()                                                    #␣
↪needs sage.graphs
```

```
>>> from sage.all import *
>>> R = RootSystem(["A",Integer(3)])
>>> e = R.ambient_space(); e
Ambient space of the Root system of type ['A', 3]
>>> TestSuite(e).run()                                                      #␣
↪needs sage.graphs
```

By default, this ambient space uses the barycentric projection for plotting:

```
sage: # needs sage.symbolic
sage: L = RootSystem(["A",2]).ambient_space()
sage: e = L.basis()
sage: L._plot_projection(e[0])
(1/2, 989/1142)
sage: L._plot_projection(e[1])
(-1, 0)
sage: L._plot_projection(e[2])
(1/2, -989/1142)
sage: L = RootSystem(["A",3]).ambient_space()
sage: l = L.an_element(); l
(2, 2, 3, 0)
sage: L._plot_projection(l)
(0, -1121/1189, 7/3)
```

```
>>> from sage.all import *
>>> # needs sage.symbolic
>>> L = RootSystem(["A",Integer(2)]).ambient_space()
>>> e = L.basis()
>>> L._plot_projection(e[Integer(0)])
(1/2, 989/1142)
>>> L._plot_projection(e[Integer(1)])
(-1, 0)
>>> L._plot_projection(e[Integer(2)])
(1/2, -989/1142)
>>> L = RootSystem(["A",Integer(3)]).ambient_space()
>>> l = L.an_element(); l
(2, 2, 3, 0)
>>> L._plot_projection(l)
(0, -1121/1189, 7/3)
```

See also

- `sage.combinat.root_system.root_lattice_realizations.RootLatticeRealizations.ParentMethods._plot_projection()`

det(*k=1*)

Return the vector (1, … ,1) which in the ['A',r] weight lattice, interpreted as a weight of GL(r+1,CC) is the determinant. If the optional parameter k is given, returns (k, … ,k), the k-th power of the determinant.

EXAMPLES:

```
sage: e = RootSystem(['A',3]).ambient_space()
sage: e.det(1/2)
(1/2, 1/2, 1/2, 1/2)
```

```
>>> from sage.all import *
>>> e = RootSystem(['A',Integer(3)]).ambient_space()
>>> e.det(Integer(1)/Integer(2))
(1/2, 1/2, 1/2, 1/2)
```

dimension()

EXAMPLES:

```
sage: e = RootSystem(["A",3]).ambient_space()
sage: e.dimension()
4
```

```
>>> from sage.all import *
>>> e = RootSystem(["A",Integer(3)]).ambient_space()
>>> e.dimension()
4
```

fundamental_weight(*i*)

EXAMPLES:

```
sage: e = RootSystem(['A',3]).ambient_lattice()
sage: e.fundamental_weights()
Finite family {1: (1, 0, 0, 0), 2: (1, 1, 0, 0), 3: (1, 1, 1, 0)}
```

```
>>> from sage.all import *
>>> e = RootSystem(['A',Integer(3)]).ambient_lattice()
>>> e.fundamental_weights()
Finite family {1: (1, 0, 0, 0), 2: (1, 1, 0, 0), 3: (1, 1, 1, 0)}
```

highest_root()

EXAMPLES:

```
sage: e = RootSystem(['A',3]).ambient_lattice()
sage: e.highest_root()
(1, 0, 0, -1)
```

```
>>> from sage.all import *
>>> e = RootSystem(['A',Integer(3)]).ambient_lattice()
>>> e.highest_root()
(1, 0, 0, -1)
```

negative_roots()

EXAMPLES:

```
sage: e = RootSystem(['A',3]).ambient_lattice()
sage: e.negative_roots()
[(-1, 1, 0, 0),
 (-1, 0, 1, 0),
 (-1, 0, 0, 1),
 (0, -1, 1, 0),
 (0, -1, 0, 1),
 (0, 0, -1, 1)]
```

```
>>> from sage.all import *
>>> e = RootSystem(['A',Integer(3)]).ambient_lattice()
>>> e.negative_roots()
[(-1, 1, 0, 0),
```

(continues on next page)

(continued from previous page)

```
 (-1, 0, 1, 0),
 (-1, 0, 0, 1),
 (0, -1, 1, 0),
 (0, -1, 0, 1),
 (0, 0, -1, 1)]
```

positive_roots()

EXAMPLES:

```
sage: e = RootSystem(['A',3]).ambient_lattice()
sage: e.positive_roots()
[(1, -1, 0, 0),
 (1, 0, -1, 0),
 (0, 1, -1, 0),
 (1, 0, 0, -1),
 (0, 1, 0, -1),
 (0, 0, 1, -1)]
```

```
>>> from sage.all import *
>>> e = RootSystem(['A',Integer(3)]).ambient_lattice()
>>> e.positive_roots()
[(1, -1, 0, 0),
 (1, 0, -1, 0),
 (0, 1, -1, 0),
 (1, 0, 0, -1),
 (0, 1, 0, -1),
 (0, 0, 1, -1)]
```

root(i, j)

Note that indexing starts at 0.

EXAMPLES:

```
sage: e = RootSystem(['A',3]).ambient_lattice()
sage: e.root(0,1)
(1, -1, 0, 0)
```

```
>>> from sage.all import *
>>> e = RootSystem(['A',Integer(3)]).ambient_lattice()
>>> e.root(Integer(0),Integer(1))
(1, -1, 0, 0)
```

simple_root(i)

EXAMPLES:

```
sage: e = RootSystem(['A',3]).ambient_lattice()
sage: e.simple_roots()
Finite family {1: (1, -1, 0, 0), 2: (0, 1, -1, 0), 3: (0, 0, 1, -1)}
```

```
>>> from sage.all import *
>>> e = RootSystem(['A',Integer(3)]).ambient_lattice()
```

(continues on next page)

(continued from previous page)

```
>>> e.simple_roots()
Finite family {1: (1, -1, 0, 0), 2: (0, 1, -1, 0), 3: (0, 0, 1, -1)}
```

classmethod smallest_base_ring(*cartan_type=None*)

Return the smallest base ring the ambient space can be defined upon.

See also:

smallest_base_ring()

EXAMPLES:

```
sage: e = RootSystem(["A",3]).ambient_space()
sage: e.smallest_base_ring()
Integer Ring
```

```
>>> from sage.all import *
>>> e = RootSystem(["A",Integer(3)]).ambient_space()
>>> e.smallest_base_ring()
Integer Ring
```

class sage.combinat.root_system.type_A.**CartanType**(*n*)

Bases: *CartanType_standard_finite*, *CartanType_simply_laced*, *CartanType_simple*

Cartan Type A_n.

See also:

CartanType()

AmbientSpace

alias of *AmbientSpace*

PieriFactors

alias of *PieriFactors_type_A*

ascii_art(*label=None, node=None*)

Return an ascii art representation of the Dynkin diagram.

EXAMPLES:

```
sage: print(CartanType(['A',0]).ascii_art())
sage: print(CartanType(['A',1]).ascii_art())
O
1
sage: print(CartanType(['A',3]).ascii_art())
O---O---O
1   2   3
sage: print(CartanType(['A',12]).ascii_art())
O---O---O---O---O---O---O---O---O---O---O---O
1   2   3   4   5   6   7   8   9   10  11  12
```

(continues on next page)

(continued from previous page)

```
sage: print(CartanType(['A',5]).ascii_art(label = lambda x: x+2))
O---O---O---O---O
3   4   5   6   7
sage: print(CartanType(['A',5]).ascii_art(label = lambda x: x-2))
O---O---O---O---O
-1  0   1   2   3
```

```
>>> from sage.all import *
>>> print(CartanType(['A',Integer(0)]).ascii_art())
>>> print(CartanType(['A',Integer(1)]).ascii_art())
O
1
>>> print(CartanType(['A',Integer(3)]).ascii_art())
O---O---O
1   2   3
>>> print(CartanType(['A',Integer(12)]).ascii_art())
O---O---O---O---O---O---O---O---O---O---O---O
1   2   3   4   5   6   7   8   9   10  11  12
>>> print(CartanType(['A',Integer(5)]).ascii_art(label = lambda x:␣
↪x+Integer(2)))
O---O---O---O---O
3   4   5   6   7
>>> print(CartanType(['A',Integer(5)]).ascii_art(label = lambda x: x-
↪Integer(2)))
O---O---O---O---O
-1  0   1   2   3
```

coxeter_number()

Return the Coxeter number associated with `self`.

EXAMPLES:

```
sage: CartanType(['A',4]).coxeter_number()
5
```

```
>>> from sage.all import *
>>> CartanType(['A',Integer(4)]).coxeter_number()
5
```

dual_coxeter_number()

Return the dual Coxeter number associated with `self`.

EXAMPLES:

```
sage: CartanType(['A',4]).dual_coxeter_number()
5
```

```
>>> from sage.all import *
>>> CartanType(['A',Integer(4)]).dual_coxeter_number()
5
```

dynkin_diagram()

Return the Dynkin diagram of type A.

EXAMPLES:

```
sage: a = CartanType(['A',3]).dynkin_diagram(); a                              #␣
↪needs sage.graphs
O---O---O
1   2   3
A3
sage: a.edges(sort=True)                                                       #␣
↪needs sage.graphs
[(1, 2, 1), (2, 1, 1), (2, 3, 1), (3, 2, 1)]
```

```
>>> from sage.all import *
>>> a = CartanType(['A',Integer(3)]).dynkin_diagram(); a                        ␣
↪      # needs sage.graphs
O---O---O
1   2   3
A3
>>> a.edges(sort=True)                                                        #␣
↪needs sage.graphs
[(1, 2, 1), (2, 1, 1), (2, 3, 1), (3, 2, 1)]
```

5.1.244 Root system data for (untwisted) type A affine

class sage.combinat.root_system.type_A_affine.**CartanType**(*n*)

Bases: *CartanType_standard_untwisted_affine*

EXAMPLES:

```
sage: ct = CartanType(['A',4,1])
sage: ct
['A', 4, 1]
sage: ct._repr_(compact = True)
'A4~'

sage: ct.is_irreducible()
True
sage: ct.is_finite()
False
sage: ct.is_affine()
True
sage: ct.is_untwisted_affine()
True
sage: ct.is_crystallographic()
True
sage: ct.is_simply_laced()
True
sage: ct.classical()
['A', 4]
sage: ct.dual()
['A', 4, 1]

sage: ct = CartanType(['A', 1, 1])
sage: ct.is_simply_laced()
```

(continues on next page)

(continued from previous page)

```
False
sage: ct.dual()
['A', 1, 1]
```

```
>>> from sage.all import *
>>> ct = CartanType(['A',Integer(4),Integer(1)])
>>> ct
['A', 4, 1]
>>> ct._repr_(compact = True)
'A4~'

>>> ct.is_irreducible()
True
>>> ct.is_finite()
False
>>> ct.is_affine()
True
>>> ct.is_untwisted_affine()
True
>>> ct.is_crystallographic()
True
>>> ct.is_simply_laced()
True
>>> ct.classical()
['A', 4]
>>> ct.dual()
['A', 4, 1]

>>> ct = CartanType(['A', Integer(1), Integer(1)])
>>> ct.is_simply_laced()
False
>>> ct.dual()
['A', 1, 1]
```

PieriFactors

alias of *PieriFactors_type_A_affine*

ascii_art(*label=None*, *node=None*)

Return an ascii art representation of the extended Dynkin diagram.

EXAMPLES:

```
sage: print(CartanType(['A',3,1]).ascii_art())
0
O-------+
|       |
|       |
O---O---O
1   2   3

sage: print(CartanType(['A',5,1]).ascii_art(label = lambda x: x+2))
2
```

(continues on next page)

(continued from previous page)

```
O--------------+
|              |
|              |
O---O---O---O---O
3   4   5   6   7

sage: print(CartanType(['A',1,1]).ascii_art())
O<=>O
0   1

sage: print(CartanType(['A',1,1]).ascii_art(label = lambda x: x+2))
O<=>O
2   3
```

```
>>> from sage.all import *
>>> print(CartanType(['A',Integer(3),Integer(1)]).ascii_art())
0
O-------+
|       |
|       |
O---O---O
1   2   3

>>> print(CartanType(['A',Integer(5),Integer(1)]).ascii_art(label = lambda x:␣
→x+Integer(2)))
2
O--------------+
|              |
|              |
O---O---O---O---O
3   4   5   6   7

>>> print(CartanType(['A',Integer(1),Integer(1)]).ascii_art())
O<=>O
0   1

>>> print(CartanType(['A',Integer(1),Integer(1)]).ascii_art(label = lambda x:␣
→x+Integer(2)))
O<=>O
2   3
```

dual()

Type A_1^1 is self dual despite not being simply laced.

EXAMPLES:

```
sage: CartanType(['A',1,1]).dual()
['A', 1, 1]
```

```
>>> from sage.all import *
>>> CartanType(['A',Integer(1),Integer(1)]).dual()
['A', 1, 1]
```

dynkin_diagram()

Return the extended Dynkin diagram for affine type A.

EXAMPLES:

```
sage: a = CartanType(['A',3,1]).dynkin_diagram(); a                          #␣
↪needs sage.graphs
 0
 O-------+
 |       |
 |       |
 O---O---O
 1   2   3
 A3~
sage: a.edges(sort=True)                                                     #␣
↪needs sage.graphs
[(0, 1, 1),
 (0, 3, 1),
 (1, 0, 1),
 (1, 2, 1),
 (2, 1, 1),
 (2, 3, 1),
 (3, 0, 1),
 (3, 2, 1)]

sage: a = DynkinDiagram(['A',1,1]); a                                        #␣
↪needs sage.graphs
O<=>O
0   1
A1~
sage: a.edges(sort=True)                                                     #␣
↪needs sage.graphs
[(0, 1, 2), (1, 0, 2)]
```

```
>>> from sage.all import *
>>> a = CartanType(['A',Integer(3),Integer(1)]).dynkin_diagram(); a          ␣
↪                # needs sage.graphs
 0
 O-------+
 |       |
 |       |
 O---O---O
 1   2   3
 A3~
>>> a.edges(sort=True)                                                     #␣
↪needs sage.graphs
[(0, 1, 1),
 (0, 3, 1),
 (1, 0, 1),
 (1, 2, 1),
 (2, 1, 1),
 (2, 3, 1),
 (3, 0, 1),
```

(continues on next page)

(continued from previous page)

```
 (3, 2, 1)]

>>> a = DynkinDiagram(['A',Integer(1),Integer(1)]); a                    ␣
↪                # needs sage.graphs
O<=>O
0   1
A1~
>>> a.edges(sort=True)                                                  #␣
↪needs sage.graphs
[(0, 1, 2), (1, 0, 2)]
```

5.1.245 Root system data for type A infinity

class sage.combinat.root_system.type_A_infinity.**CartanType**(*index_set*)

Bases: *CartanType_standard*, *CartanType_simple*

The Cartan type A_∞.

We use NN and ZZ to explicitly differentiate between the $A_{+\infty}$ and A_∞ root systems, respectively. While oo is the same as +Infinity in Sage, it is used as an alias for ZZ.

ascii_art(*label=None*, *node=None*)

Return an ascii art representation of the extended Dynkin diagram.

EXAMPLES:

```
sage: print(CartanType(['A', ZZ]).ascii_art())
..---O---O---O---O---O---O---O---..
    -3  -2  -1   0   1   2   3
sage: print(CartanType(['A', NN]).ascii_art())
O---O---O---O---O---O---O---..
0   1   2   3   4   5   6
```

```
>>> from sage.all import *
>>> print(CartanType(['A', ZZ]).ascii_art())
..---O---O---O---O---O---O---O---..
    -3  -2  -1   0   1   2   3
>>> print(CartanType(['A', NN]).ascii_art())
O---O---O---O---O---O---O---..
0   1   2   3   4   5   6
```

dual()

Simply laced Cartan types are self-dual, so return self.

EXAMPLES:

```
sage: CartanType(["A", NN]).dual()
['A', NN]
sage: CartanType(["A", ZZ]).dual()
['A', ZZ]
```

```
>>> from sage.all import *
>>> CartanType(["A", NN]).dual()
```

(continues on next page)

(continued from previous page)

```
['A', NN]
>>> CartanType(["A", ZZ]).dual()
['A', ZZ]
```

index_set()

Return the index set for the Cartan type `self`.

The index set for all standard finite Cartan types is of the form $\{1, \ldots, n\}$. (See `type_I` for a slight abuse of this).

EXAMPLES:

```
sage: CartanType(['A', NN]).index_set()
Non negative integer semiring
sage: CartanType(['A', ZZ]).index_set()
Integer Ring
```

```
>>> from sage.all import *
>>> CartanType(['A', NN]).index_set()
Non negative integer semiring
>>> CartanType(['A', ZZ]).index_set()
Integer Ring
```

is_affine()

Return `False` because `self` is not (untwisted) affine.

EXAMPLES:

```
sage: CartanType(['A', NN]).is_affine()
False
sage: CartanType(['A', ZZ]).is_affine()
False
```

```
>>> from sage.all import *
>>> CartanType(['A', NN]).is_affine()
False
>>> CartanType(['A', ZZ]).is_affine()
False
```

is_crystallographic()

Return `False` because `self` is not crystallographic.

EXAMPLES:

```
sage: CartanType(['A', NN]).is_crystallographic()
True
sage: CartanType(['A', ZZ]).is_crystallographic()
True
```

```
>>> from sage.all import *
>>> CartanType(['A', NN]).is_crystallographic()
True
>>> CartanType(['A', ZZ]).is_crystallographic()
True
```

is_finite()

Return True because self is not finite.

EXAMPLES:

```
sage: CartanType(['A', NN]).is_finite()
False
sage: CartanType(['A', ZZ]).is_finite()
False
```

```
>>> from sage.all import *
>>> CartanType(['A', NN]).is_finite()
False
>>> CartanType(['A', ZZ]).is_finite()
False
```

is_simply_laced()

Return True because self is simply laced.

EXAMPLES:

```
sage: CartanType(['A', NN]).is_simply_laced()
True
sage: CartanType(['A', ZZ]).is_simply_laced()
True
```

```
>>> from sage.all import *
>>> CartanType(['A', NN]).is_simply_laced()
True
>>> CartanType(['A', ZZ]).is_simply_laced()
True
```

is_untwisted_affine()

Return False because self is not (untwisted) affine.

EXAMPLES:

```
sage: CartanType(['A', NN]).is_untwisted_affine()
False
sage: CartanType(['A', ZZ]).is_untwisted_affine()
False
```

```
>>> from sage.all import *
>>> CartanType(['A', NN]).is_untwisted_affine()
False
>>> CartanType(['A', ZZ]).is_untwisted_affine()
False
```

rank()

Return the rank of self which for type X_n is n.

EXAMPLES:

```
sage: CartanType(['A', NN]).rank()
+Infinity
sage: CartanType(['A', ZZ]).rank()
+Infinity
```

```
>>> from sage.all import *
>>> CartanType(['A', NN]).rank()
+Infinity
>>> CartanType(['A', ZZ]).rank()
+Infinity
```

As this example shows, the rank is slightly ambiguous because the root systems of type $['A', NN]$ and type $['A', ZZ]$ have the same rank. Instead, it is better ot use `index_set()` to differentiate between these two root systems.

type()

Return the type of `self`.

EXAMPLES:

```
sage: CartanType(['A', NN]).type()
'A'
sage: CartanType(['A', ZZ]).type()
'A'
```

```
>>> from sage.all import *
>>> CartanType(['A', NN]).type()
'A'
>>> CartanType(['A', ZZ]).type()
'A'
```

5.1.246 Root system data for type B

class sage.combinat.root_system.type_B.**AmbientSpace**(*root_system*, *base_ring*, *index_set=None*)

Bases: `AmbientSpace`

dimension()

EXAMPLES:

```
sage: e = RootSystem(['B',3]).ambient_space()
sage: e.dimension()
3
```

```
>>> from sage.all import *
>>> e = RootSystem(['B',Integer(3)]).ambient_space()
>>> e.dimension()
3
```

fundamental_weight(*i*)

EXAMPLES:

```
sage: RootSystem(['B',3]).ambient_space().fundamental_weights()
Finite family {1: (1, 0, 0), 2: (1, 1, 0), 3: (1/2, 1/2, 1/2)}
```

```
>>> from sage.all import *
>>> RootSystem(['B',Integer(3)]).ambient_space().fundamental_weights()
Finite family {1: (1, 0, 0), 2: (1, 1, 0), 3: (1/2, 1/2, 1/2)}
```

negative_roots()

EXAMPLES:

```
sage: RootSystem(['B',3]).ambient_space().negative_roots()
[(-1, 1, 0),
 (-1, -1, 0),
 (-1, 0, 1),
 (-1, 0, -1),
 (0, -1, 1),
 (0, -1, -1),
 (-1, 0, 0),
 (0, -1, 0),
 (0, 0, -1)]
```

```
>>> from sage.all import *
>>> RootSystem(['B',Integer(3)]).ambient_space().negative_roots()
[(-1, 1, 0),
 (-1, -1, 0),
 (-1, 0, 1),
 (-1, 0, -1),
 (0, -1, 1),
 (0, -1, -1),
 (-1, 0, 0),
 (0, -1, 0),
 (0, 0, -1)]
```

positive_roots()

EXAMPLES:

```
sage: RootSystem(['B',3]).ambient_space().positive_roots()
[(1, -1, 0),
 (1, 1, 0),
 (1, 0, -1),
 (1, 0, 1),
 (0, 1, -1),
 (0, 1, 1),
 (1, 0, 0),
 (0, 1, 0),
 (0, 0, 1)]
```

```
>>> from sage.all import *
>>> RootSystem(['B',Integer(3)]).ambient_space().positive_roots()
[(1, -1, 0),
 (1, 1, 0),
 (1, 0, -1),
 (1, 0, 1),
 (0, 1, -1),
 (0, 1, 1),
```

(continues on next page)

(continued from previous page)

```
(1, 0, 0),
(0, 1, 0),
(0, 0, 1)]
```

root (i, j)

Note that indexing starts at 0.

EXAMPLES:

```
sage: e = RootSystem(['B',3]).ambient_space()
sage: e.root(0,1)
(1, -1, 0)
```

```
>>> from sage.all import *
>>> e = RootSystem(['B',Integer(3)]).ambient_space()
>>> e.root(Integer(0),Integer(1))
(1, -1, 0)
```

simple_root (i)

EXAMPLES:

```
sage: e = RootSystem(['B',4]).ambient_space()
sage: e.simple_roots()
Finite family {1: (1, -1, 0, 0), 2: (0, 1, -1, 0), 3: (0, 0, 1, -1), 4: (0, 0,
↪ 0, 1)}
sage: e.positive_roots()
[(1, -1, 0, 0),
(1, 1, 0, 0),
(1, 0, -1, 0),
(1, 0, 1, 0),
(1, 0, 0, -1),
(1, 0, 0, 1),
(0, 1, -1, 0),
(0, 1, 1, 0),
(0, 1, 0, -1),
(0, 1, 0, 1),
(0, 0, 1, -1),
(0, 0, 1, 1),
(1, 0, 0, 0),
(0, 1, 0, 0),
(0, 0, 1, 0),
(0, 0, 0, 1)]
sage: e.fundamental_weights()
Finite family {1: (1, 0, 0, 0), 2: (1, 1, 0, 0), 3: (1, 1, 1, 0), 4: (1/2, 1/
↪2, 1/2, 1/2)}
```

```
>>> from sage.all import *
>>> e = RootSystem(['B',Integer(4)]).ambient_space()
>>> e.simple_roots()
Finite family {1: (1, -1, 0, 0), 2: (0, 1, -1, 0), 3: (0, 0, 1, -1), 4: (0, 0,
↪ 0, 1)}
>>> e.positive_roots()
```

(continues on next page)

(continued from previous page)

```
[(1, -1, 0, 0),
(1, 1, 0, 0),
(1, 0, -1, 0),
(1, 0, 1, 0),
(1, 0, 0, -1),
(1, 0, 0, 1),
(0, 1, -1, 0),
(0, 1, 1, 0),
(0, 1, 0, -1),
(0, 1, 0, 1),
(0, 0, 1, -1),
(0, 0, 1, 1),
(1, 0, 0, 0),
(0, 1, 0, 0),
(0, 0, 1, 0),
(0, 0, 0, 1)]
>>> e.fundamental_weights()
Finite family {1: (1, 0, 0, 0), 2: (1, 1, 0, 0), 3: (1, 1, 1, 0), 4: (1/2, 1/
↪2, 1/2, 1/2)}
```

class sage.combinat.root_system.type_B.**CartanType**(*n*)

Bases: *CartanType_standard_finite*, *CartanType_simple*, *CartanType_crystallographic*

EXAMPLES:

```
sage: ct = CartanType(['B',4])
sage: ct
['B', 4]
sage: ct._repr_(compact = True)
'B4'

sage: ct.is_irreducible()
True
sage: ct.is_finite()
True
sage: ct.is_affine()
False
sage: ct.is_crystallographic()
True
sage: ct.is_simply_laced()
False
sage: ct.affine()
['B', 4, 1]
sage: ct.dual()
['C', 4]

sage: ct = CartanType(['B',1])
sage: ct.is_simply_laced()
True
sage: ct.affine()
['B', 1, 1]
```

```
>>> from sage.all import *
>>> ct = CartanType(['B',Integer(4)])
>>> ct
['B', 4]
>>> ct._repr_(compact = True)
'B4'

>>> ct.is_irreducible()
True
>>> ct.is_finite()
True
>>> ct.is_affine()
False
>>> ct.is_crystallographic()
True
>>> ct.is_simply_laced()
False
>>> ct.affine()
['B', 4, 1]
>>> ct.dual()
['C', 4]

>>> ct = CartanType(['B',Integer(1)])
>>> ct.is_simply_laced()
True
>>> ct.affine()
['B', 1, 1]
```

AmbientSpace

alias of *AmbientSpace*

PieriFactors

alias of *PieriFactors_type_B*

ascii_art(*label=None*, *node=None*)

Return an ascii art representation of the Dynkin diagram.

EXAMPLES:

```
sage: print(CartanType(['B',1]).ascii_art())
O
1
sage: print(CartanType(['B',2]).ascii_art())
O=>=O
1   2
sage: print(CartanType(['B',5]).ascii_art(label = lambda x: x+2))
O---O---O---O=>=O
3   4   5   6   7
```

```
>>> from sage.all import *
>>> print(CartanType(['B',Integer(1)]).ascii_art())
O
1
```

(continues on next page)

(continued from previous page)

```
>>> print(CartanType(['B',Integer(2)]).ascii_art())
O=>=O
1   2
>>> print(CartanType(['B',Integer(5)]).ascii_art(label = lambda x:␣
↪x+Integer(2)))
O---O---O---O=>=O
3   4   5   6   7
```

coxeter_number()

Return the Coxeter number associated with `self`.

EXAMPLES:

```
sage: CartanType(['B',4]).coxeter_number()
8
```

```
>>> from sage.all import *
>>> CartanType(['B',Integer(4)]).coxeter_number()
8
```

dual()

Types B and C are in duality:

EXAMPLES:

```
sage: CartanType(["C", 3]).dual()
['B', 3]
```

```
>>> from sage.all import *
>>> CartanType(["C", Integer(3)]).dual()
['B', 3]
```

dual_coxeter_number()

Return the dual Coxeter number associated with `self`.

EXAMPLES:

```
sage: CartanType(['B',4]).dual_coxeter_number()
7
```

```
>>> from sage.all import *
>>> CartanType(['B',Integer(4)]).dual_coxeter_number()
7
```

dynkin_diagram()

Return a Dynkin diagram for type B.

EXAMPLES:

```
sage: b = CartanType(['B',3]).dynkin_diagram(); b                    #␣
↪needs sage.graphs
O---O=>=O
1   2   3
```

(continues on next page)

(continued from previous page)

```
B3
sage: b.edges(sort=True)                                                    #␣
↪needs sage.graphs
[(1, 2, 1), (2, 1, 1), (2, 3, 2), (3, 2, 1)]

sage: b = CartanType(['B',1]).dynkin_diagram(); b                           #␣
↪needs sage.graphs
O
1
B1
sage: b.edges(sort=True)                                                    #␣
↪needs sage.graphs
[]
```

```
>>> from sage.all import *
>>> b = CartanType(['B',Integer(3)]).dynkin_diagram(); b                      ␣
↪    # needs sage.graphs
O---O=>=O
1   2   3
B3
>>> b.edges(sort=True)                                                     #␣
↪needs sage.graphs
[(1, 2, 1), (2, 1, 1), (2, 3, 2), (3, 2, 1)]

>>> b = CartanType(['B',Integer(1)]).dynkin_diagram(); b                      ␣
↪    # needs sage.graphs
O
1
B1
>>> b.edges(sort=True)                                                     #␣
↪needs sage.graphs
[]
```

5.1.247 Root system data for type BC affine

class sage.combinat.root_system.type_BC_affine.**CartanType**(*n*)

Bases: *CartanType_standard_affine*

EXAMPLES:

```
sage: ct = CartanType(['BC',4,2])
sage: ct
['BC', 4, 2]
sage: ct._repr_(compact=True)
'BC4~'
sage: ct.dynkin_diagram()                                                  #␣
↪needs sage.graphs
O=<=O---O---O=<=O

0   1
BC1~
```

ascii_art(*label=None*, *node=None*)

Return a ascii art representation of the extended Dynkin diagram.

EXAMPLES:

```
sage: print(CartanType(['BC',2,2]).ascii_art())
O=<=O=<=O
0   1   2
sage: print(CartanType(['BC',3,2]).ascii_art())
O=<=O---O=<=O
0   1   2   3
sage: print(CartanType(['BC',5,2]).ascii_art(label = lambda x: x+2))
O=<=O---O---O---O=<=O
2   3   4   5   6   7

sage: print(CartanType(['BC',1,2]).ascii_art(label = lambda x: x+2))
  4
O=<=O
2   3
```

```
>>> from sage.all import *
>>> print(CartanType(['BC',Integer(2),Integer(2)]).ascii_art())
O=<=O=<=O
```

(continues on next page)

(continued from previous page)

```
0   1   2
>>> print(CartanType(['BC',Integer(3),Integer(2)]).ascii_art())
O=<=O---O=<=O
0   1   2   3
>>> print(CartanType(['BC',Integer(5),Integer(2)]).ascii_art(label = lambda␣
↪x: x+Integer(2)))
O=<=O---O---O---O=<=O
2   3   4   5   6   7

>>> print(CartanType(['BC',Integer(1),Integer(2)]).ascii_art(label = lambda␣
↪x: x+Integer(2)))
  4
O=<=O
2   3
```

basic_untwisted()

Return the basic untwisted Cartan type associated with this affine Cartan type.

Given an affine type $X_n^{(r)}$, the basic untwisted type is X_n. In other words, it is the classical Cartan type that is twisted to obtain `self`.

EXAMPLES:

```
sage: CartanType(['A', 2, 2]).basic_untwisted()
['A', 2]
sage: CartanType(['A', 4, 2]).basic_untwisted()
['A', 4]
sage: CartanType(['BC', 4, 2]).basic_untwisted()
['A', 8]
```

```
>>> from sage.all import *
>>> CartanType(['A', Integer(2), Integer(2)]).basic_untwisted()
['A', 2]
>>> CartanType(['A', Integer(4), Integer(2)]).basic_untwisted()
['A', 4]
>>> CartanType(['BC', Integer(4), Integer(2)]).basic_untwisted()
['A', 8]
```

classical()

Return the classical Cartan type associated with `self`.

sage: CartanType([“BC”, 3, 2]).classical() [‘C’, 3]

dynkin_diagram()

Return the extended Dynkin diagram for affine type BC.

EXAMPLES:

```
sage: c = CartanType(['BC',3,2]).dynkin_diagram(); c                    #␣
↪needs sage.graphs
O=<=O---O=<=O
0   1   2   3
BC3~
sage: c.edges(sort=True)                                                #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.graphs
[(0, 1, 1), (1, 0, 2), (1, 2, 1), (2, 1, 1), (2, 3, 1), (3, 2, 2)]

sage: c = CartanType(["A", 6, 2]).dynkin_diagram()  # should be the same as␣
↪above; did fail at some point!  # needs sage.graphs
sage: c                                                                   #␣
↪needs sage.graphs
O=<=O---O=<=O
0   1   2   3
BC3~
sage: c.edges(sort=True)                                                  #␣
↪needs sage.graphs
[(0, 1, 1), (1, 0, 2), (1, 2, 1), (2, 1, 1), (2, 3, 1), (3, 2, 2)]

sage: c = CartanType(['BC',2,2]).dynkin_diagram(); c                      #␣
↪needs sage.graphs
O=<=O=<=O
0   1   2
BC2~
sage: c.edges(sort=True)                                                  #␣
↪needs sage.graphs
[(0, 1, 1), (1, 0, 2), (1, 2, 1), (2, 1, 2)]

sage: c = CartanType(['BC',1,2]).dynkin_diagram(); c                      #␣
↪needs sage.graphs
  4
O=<=O
0   1
BC1~
sage: c.edges(sort=True)                                                  #␣
↪needs sage.graphs
[(0, 1, 1), (1, 0, 4)]
```

```
>>> from sage.all import *
>>> c = CartanType(['BC',Integer(3),Integer(2)]).dynkin_diagram(); c      ␣

  4
O=<=O
0   1
BC1~
>>> c.edges(sort=True)                                                  #
↪needs sage.graphs
[(0, 1, 1), (1, 0, 4)]
```

5.1.248 Root system data for (untwisted) type B affine

class sage.combinat.root_system.type_B_affine.**CartanType**(*n*)

Bases: *CartanType_standard_untwisted_affine*

EXAMPLES:

```
sage: ct = CartanType(['B',4,1])
sage: ct
['B', 4, 1]
sage: ct._repr_(compact = True)
'B4~'

sage: ct.is_irreducible()
True
sage: ct.is_finite()
False
sage: ct.is_affine()
True
sage: ct.is_untwisted_affine()
True
sage: ct.is_crystallographic()
True
sage: ct.is_simply_laced()
False
sage: ct.classical()
['B', 4]
sage: ct.dual()
['B', 4, 1]^*
sage: ct.dual().is_untwisted_affine()
False
```

```
>>> from sage.all import *
>>> ct = CartanType(['B',Integer(4),Integer(1)])
>>> ct
['B', 4, 1]
>>> ct._repr_(compact = True)
'B4~'

>>> ct.is_irreducible()
True
>>> ct.is_finite()
False
>>> ct.is_affine()
True
>>> ct.is_untwisted_affine()
True
>>> ct.is_crystallographic()
True
>>> ct.is_simply_laced()
False
>>> ct.classical()
['B', 4]
>>> ct.dual()
['B', 4, 1]^*
>>> ct.dual().is_untwisted_affine()
False
```

PieriFactors

alias of *PieriFactors_type_B_affine*

ascii_art(*label=None*, *node=None*)

Return an ascii art representation of the extended Dynkin diagram.

EXAMPLES:

```
sage: print(CartanType(['B',3,1]).ascii_art())
    O 0
    |
    |
O---O=>=O
1   2   3

sage: print(CartanType(['B',5,1]).ascii_art(label = lambda x: x+2))
    O 2
    |
    |
O---O---O---O=>=O
3   4   5   6   7

sage: print(CartanType(['B',2,1]).ascii_art(label = lambda x: x+2))
O=>=O=<=O
2   4   3
sage: print(CartanType(['B',1,1]).ascii_art(label = lambda x: x+2))
O<=>O
2   3
```

```
>>> from sage.all import *
>>> print(CartanType(['B',Integer(3),Integer(1)]).ascii_art())
    O 0
    |
    |
O---O=>=O
1   2   3

>>> print(CartanType(['B',Integer(5),Integer(1)]).ascii_art(label = lambda x:␣
↪x+Integer(2)))
    O 2
    |
    |
O---O---O---O=>=O
3   4   5   6   7

>>> print(CartanType(['B',Integer(2),Integer(1)]).ascii_art(label = lambda x:␣
↪x+Integer(2)))
O=>=O=<=O
2   4   3
>>> print(CartanType(['B',Integer(1),Integer(1)]).ascii_art(label = lambda x:␣
↪x+Integer(2)))
O<=>O
2   3
```

dynkin_diagram()

Return the extended Dynkin diagram for affine type B.

EXAMPLES:

```
sage: # needs sage.graphs
sage: b = CartanType(['B',3,1]).dynkin_diagram(); b
    O 0
    |
    |
O---O=>=O
1   2   3
B3~
sage: b.edges(sort=True)
[(0, 2, 1), (1, 2, 1), (2, 0, 1), (2, 1, 1), (2, 3, 2), (3, 2, 1)]
sage: b = CartanType(['B',2,1]).dynkin_diagram(); b
O=>=O=<=O
0   2   1
B2~
sage: b.edges(sort=True)
[(0, 2, 2), (1, 2, 2), (2, 0, 1), (2, 1, 1)]
sage: b = CartanType(['B',1,1]).dynkin_diagram(); b
O<=>O
0   1
B1~
sage: b.edges(sort=True)
[(0, 1, 2), (1, 0, 2)]
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> b = CartanType(['B',Integer(3),Integer(1)]).dynkin_diagram(); b
    O 0
    |
    |
O---O=>=O
1   2   3
B3~
>>> b.edges(sort=True)
[(0, 2, 1), (1, 2, 1), (2, 0, 1), (2, 1, 1), (2, 3, 2), (3, 2, 1)]
>>> b = CartanType(['B',Integer(2),Integer(1)]).dynkin_diagram(); b
O=>=O=<=O
0   2   1
B2~
>>> b.edges(sort=True)
[(0, 2, 2), (1, 2, 2), (2, 0, 1), (2, 1, 1)]
>>> b = CartanType(['B',Integer(1),Integer(1)]).dynkin_diagram(); b
O<=>O
0   1
B1~
>>> b.edges(sort=True)
[(0, 1, 2), (1, 0, 2)]
```

5.1.249 Root system data for type C

class sage.combinat.root_system.type_C.**AmbientSpace**(*root_system*, *base_ring*, *index_set=None*)

Bases: *AmbientSpace*

EXAMPLES:

```
sage: e = RootSystem(['C',2]).ambient_space(); e
Ambient space of the Root system of type ['C', 2]
```

```
>>> from sage.all import *
>>> e = RootSystem(['C',Integer(2)]).ambient_space(); e
Ambient space of the Root system of type ['C', 2]
```

One cannot construct the ambient lattice because the fundamental coweights have rational coefficients:

```
sage: e.smallest_base_ring()
Rational Field

sage: RootSystem(['B',2]).ambient_space().fundamental_weights()
Finite family {1: (1, 0), 2: (1/2, 1/2)}
```

```
>>> from sage.all import *
>>> e.smallest_base_ring()
Rational Field

>>> RootSystem(['B',Integer(2)]).ambient_space().fundamental_weights()
Finite family {1: (1, 0), 2: (1/2, 1/2)}
```

dimension()

EXAMPLES:

```
sage: e = RootSystem(['C',3]).ambient_space()
sage: e.dimension()
3
```

```
>>> from sage.all import *
>>> e = RootSystem(['C',Integer(3)]).ambient_space()
>>> e.dimension()
3
```

fundamental_weight(*i*)

EXAMPLES:

```
sage: RootSystem(['C',3]).ambient_space().fundamental_weights()
Finite family {1: (1, 0, 0), 2: (1, 1, 0), 3: (1, 1, 1)}
```

```
>>> from sage.all import *
>>> RootSystem(['C',Integer(3)]).ambient_space().fundamental_weights()
Finite family {1: (1, 0, 0), 2: (1, 1, 0), 3: (1, 1, 1)}
```

negative_roots()

EXAMPLES:

```
sage: RootSystem(['C',3]).ambient_space().negative_roots()
[(-1, 1, 0),
 (-1, 0, 1),
 (0, -1, 1),
 (-1, -1, 0),
 (-1, 0, -1),
 (0, -1, -1),
 (-2, 0, 0),
 (0, -2, 0),
 (0, 0, -2)]
```

```
>>> from sage.all import *
>>> RootSystem(['C',Integer(3)]).ambient_space().negative_roots()
[(-1, 1, 0),
 (-1, 0, 1),
 (0, -1, 1),
 (-1, -1, 0),
 (-1, 0, -1),
 (0, -1, -1),
 (-2, 0, 0),
 (0, -2, 0),
 (0, 0, -2)]
```

positive_roots()

EXAMPLES:

```
sage: RootSystem(['C',3]).ambient_space().positive_roots()
[(1, 1, 0),
 (1, 0, 1),
 (0, 1, 1),
 (1, -1, 0),
 (1, 0, -1),
 (0, 1, -1),
 (2, 0, 0),
 (0, 2, 0),
 (0, 0, 2)]
```

```
>>> from sage.all import *
>>> RootSystem(['C',Integer(3)]).ambient_space().positive_roots()
[(1, 1, 0),
 (1, 0, 1),
 (0, 1, 1),
 (1, -1, 0),
 (1, 0, -1),
 (0, 1, -1),
 (2, 0, 0),
 (0, 2, 0),
 (0, 0, 2)]
```

root (*i*, *j*, *p1*, *p2*)

Note that indexing starts at 0.

EXAMPLES:

```
sage: e = RootSystem(['C',3]).ambient_space()
sage: e.root(0, 1, 1, 1)
(-1, -1, 0)
```

```
>>> from sage.all import *
>>> e = RootSystem(['C',Integer(3)]).ambient_space()
>>> e.root(Integer(0), Integer(1), Integer(1), Integer(1))
(-1, -1, 0)
```

simple_root (*i*)

EXAMPLES:

```
sage: RootSystem(['C',3]).ambient_space().simple_roots()
Finite family {1: (1, -1, 0), 2: (0, 1, -1), 3: (0, 0, 2)}
```

```
>>> from sage.all import *
>>> RootSystem(['C',Integer(3)]).ambient_space().simple_roots()
Finite family {1: (1, -1, 0), 2: (0, 1, -1), 3: (0, 0, 2)}
```

class sage.combinat.root_system.type_C.**CartanType** (*n*)

Bases: *CartanType_standard_finite*, *CartanType_simple*, *CartanType_crystallographic*

EXAMPLES:

```
sage: ct = CartanType(['C',4])
sage: ct
['C', 4]
sage: ct._repr_(compact = True)
'C4'

sage: ct.is_irreducible()
True
sage: ct.is_finite()
True
sage: ct.is_crystallographic()
True
sage: ct.is_simply_laced()
False
sage: ct.affine()
['C', 4, 1]
sage: ct.dual()
['B', 4]

sage: ct = CartanType(['C',1])
sage: ct.is_simply_laced()
True
sage: ct.affine()
['C', 1, 1]
```

```
>>> from sage.all import *
>>> ct = CartanType(['C',Integer(4)])
>>> ct
['C', 4]
>>> ct._repr_(compact = True)
'C4'

>>> ct.is_irreducible()
True
>>> ct.is_finite()
True
>>> ct.is_crystallographic()
True
>>> ct.is_simply_laced()
False
>>> ct.affine()
['C', 4, 1]
>>> ct.dual()
['B', 4]

>>> ct = CartanType(['C',Integer(1)])
>>> ct.is_simply_laced()
True
>>> ct.affine()
['C', 1, 1]
```

AmbientSpace

alias of *AmbientSpace*

ascii_art(*label=None*, *node=None*)

Return a ascii art representation of the extended Dynkin diagram.

EXAMPLES:

```
sage: print(CartanType(['C',1]).ascii_art())
O
1
sage: print(CartanType(['C',2]).ascii_art())
O=<=O
1   2
sage: print(CartanType(['C',3]).ascii_art())
O---O=<=O
1   2   3
sage: print(CartanType(['C',5]).ascii_art(label = lambda x: x+2))
O---O---O---O=<=O
3   4   5   6   7
```

```
>>> from sage.all import *
>>> print(CartanType(['C',Integer(1)]).ascii_art())
O
1
>>> print(CartanType(['C',Integer(2)]).ascii_art())
O=<=O
1   2
>>> print(CartanType(['C',Integer(3)]).ascii_art())
O---O=<=O
1   2   3
>>> print(CartanType(['C',Integer(5)]).ascii_art(label = lambda x:␣
↪x+Integer(2)))
O---O---O---O=<=O
3   4   5   6   7
```

coxeter_number()

Return the Coxeter number associated with `self`.

EXAMPLES:

```
sage: CartanType(['C',4]).coxeter_number()
8
```

```
>>> from sage.all import *
>>> CartanType(['C',Integer(4)]).coxeter_number()
8
```

dual()

Types B and C are in duality:

EXAMPLES:

```
sage: CartanType(["C", 3]).dual()
['B', 3]
```

```
>>> from sage.all import *
>>> CartanType(["C", Integer(3)]).dual()
['B', 3]
```

dual_coxeter_number()

Return the dual Coxeter number associated with `self`.

EXAMPLES:

```
sage: CartanType(['C',4]).dual_coxeter_number()
5
```

```
>>> from sage.all import *
>>> CartanType(['C',Integer(4)]).dual_coxeter_number()
5
```

dynkin_diagram()

Return a Dynkin diagram for type C.

EXAMPLES:

```
sage: c = CartanType(['C',3]).dynkin_diagram(); c                          #␣
↪needs sage.graphs
O---O=<=O
1   2   3
C3
sage: c.edges(sort=True)                                                    #␣
↪needs sage.graphs
[(1, 2, 1), (2, 1, 1), (2, 3, 1), (3, 2, 2)]

 sage: b = CartanType(['C',1]).dynkin_diagram(); b                          #␣
↪needs sage.graphs
 O
 1
 C1
 sage: b.edges(sort=True)                                                   #␣
↪needs sage.graphs
 []
```

```
>>> from sage.all import *
>>> c = CartanType(['C',Integer(3)]).dynkin_diagram(); c                    ␣
↪     # needs sage.graphs
O---O=<=O
1   2   3
C3
>>> c.edges(sort=True)                                                    #␣
↪needs sage.graphs
[(1, 2, 1), (2, 1, 1), (2, 3, 1), (3, 2, 2)]

>>> b = CartanType(['C',Integer(1)]).dynkin_diagram(); b                    ␣
↪    # needs sage.graphs
 O
 1
```

(continues on next page)

(continued from previous page)

```
C1
>>> b.edges(sort=True)                                                    #␣
↪needs sage.graphs
[]
```

5.1.250 Root system data for (untwisted) type C affine

class sage.combinat.root_system.type_C_affine.**CartanType**(*n*)

Bases: *CartanType_standard_untwisted_affine*

EXAMPLES:

```
sage: ct = CartanType(['C',4,1])
sage: ct
['C', 4, 1]
sage: ct._repr_(compact = True)
'C4~'

sage: ct.is_irreducible()
True
sage: ct.is_finite()
False
sage: ct.is_affine()
True
sage: ct.is_untwisted_affine()
True
sage: ct.is_crystallographic()
True
sage: ct.is_simply_laced()
False
sage: ct.classical()
['C', 4]
sage: ct.dual()
['C', 4, 1]^*
sage: ct.dual().is_untwisted_affine()
False
```

```
>>> from sage.all import *
>>> ct = CartanType(['C',Integer(4),Integer(1)])
>>> ct
['C', 4, 1]
>>> ct._repr_(compact = True)
'C4~'

>>> ct.is_irreducible()
True
>>> ct.is_finite()
False
>>> ct.is_affine()
True
>>> ct.is_untwisted_affine()
True
```

(continues on next page)

(continued from previous page)

```
>>> ct.is_crystallographic()
True
>>> ct.is_simply_laced()
False
>>> ct.classical()
['C', 4]
>>> ct.dual()
['C', 4, 1]^*
>>> ct.dual().is_untwisted_affine()
False
```

PieriFactors

alias of *PieriFactors_type_C_affine*

ascii_art (*label=None*, *node=None*)

Return a ascii art representation of the extended Dynkin diagram.

EXAMPLES:

```
sage: print(CartanType(['C',5,1]).ascii_art(label = lambda x: x+2))
O=>=O---O---O---O=<=O
2   3   4   5   6   7

sage: print(CartanType(['C',3,1]).ascii_art())
O=>=O---O=<=O
0   1   2   3

sage: print(CartanType(['C',2,1]).ascii_art())
O=>=O=<=O
0   1   2

sage: print(CartanType(['C',1,1]).ascii_art())
O<=>O
0   1
```

```
>>> from sage.all import *
>>> print(CartanType(['C',Integer(5),Integer(1)]).ascii_art(label = lambda x:␣
↪x+Integer(2)))
O=>=O---O---O---O=<=O
2   3   4   5   6   7

>>> print(CartanType(['C',Integer(3),Integer(1)]).ascii_art())
O=>=O---O=<=O
0   1   2   3

>>> print(CartanType(['C',Integer(2),Integer(1)]).ascii_art())
O=>=O=<=O
0   1   2

>>> print(CartanType(['C',Integer(1),Integer(1)]).ascii_art())
O<=>O
0   1
```

dynkin_diagram()

Return the extended Dynkin diagram for affine type C.

EXAMPLES:

```
sage: c = CartanType(['C',3,1]).dynkin_diagram(); c                          #␣
↪needs sage.graphs
O=>=O---O=<=O
0   1   2   3
C3~
sage: c.edges(sort=True)                                                     #␣
↪needs sage.graphs
[(0, 1, 2), (1, 0, 1), (1, 2, 1), (2, 1, 1), (2, 3, 1), (3, 2, 2)]
```

```
>>> from sage.all import *
>>> c = CartanType(['C',Integer(3),Integer(1)]).dynkin_diagram(); c             ␣
↪              # needs sage.graphs
O=>=O---O=<=O
0   1   2   3
C3~
>>> c.edges(sort=True)                                                     #␣
↪needs sage.graphs
[(0, 1, 2), (1, 0, 1), (1, 2, 1), (2, 1, 1), (2, 3, 1), (3, 2, 2)]
```

5.1.251 Root system data for type D

class sage.combinat.root_system.type_D.**AmbientSpace**(*root_system*, *base_ring*, *index_set=None*)

Bases: *AmbientSpace*

dimension()

EXAMPLES:

```
sage: e = RootSystem(['D',3]).ambient_space()
sage: e.dimension()
3
```

```
>>> from sage.all import *
>>> e = RootSystem(['D',Integer(3)]).ambient_space()
>>> e.dimension()
3
```

fundamental_weight(*i*)

EXAMPLES:

```
sage: RootSystem(['D',4]).ambient_space().fundamental_weights()
Finite family {1: (1, 0, 0, 0), 2: (1, 1, 0, 0), 3: (1/2, 1/2, 1/2, -1/2), 4:␣
↪(1/2, 1/2, 1/2, 1/2)}
```

```
>>> from sage.all import *
>>> RootSystem(['D',Integer(4)]).ambient_space().fundamental_weights()
Finite family {1: (1, 0, 0, 0), 2: (1, 1, 0, 0), 3: (1/2, 1/2, 1/2, -1/2), 4:␣
↪(1/2, 1/2, 1/2, 1/2)}
```

negative_roots()

EXAMPLES:

```
sage: RootSystem(['D',4]).ambient_space().negative_roots()
[(-1, 1, 0, 0),
 (-1, 0, 1, 0),
 (0, -1, 1, 0),
 (-1, 0, 0, 1),
 (0, -1, 0, 1),
 (0, 0, -1, 1),
 (-1, -1, 0, 0),
 (-1, 0, -1, 0),
 (0, -1, -1, 0),
 (-1, 0, 0, -1),
 (0, -1, 0, -1),
 (0, 0, -1, -1)]
```

```
>>> from sage.all import *
>>> RootSystem(['D',Integer(4)]).ambient_space().negative_roots()
[(-1, 1, 0, 0),
 (-1, 0, 1, 0),
 (0, -1, 1, 0),
 (-1, 0, 0, 1),
 (0, -1, 0, 1),
 (0, 0, -1, 1),
 (-1, -1, 0, 0),
 (-1, 0, -1, 0),
 (0, -1, -1, 0),
 (-1, 0, 0, -1),
 (0, -1, 0, -1),
 (0, 0, -1, -1)]
```

positive_roots()

EXAMPLES:

```
sage: RootSystem(['D',4]).ambient_space().positive_roots()
[(1, 1, 0, 0),
 (1, 0, 1, 0),
 (0, 1, 1, 0),
 (1, 0, 0, 1),
 (0, 1, 0, 1),
 (0, 0, 1, 1),
 (1, -1, 0, 0),
 (1, 0, -1, 0),
 (0, 1, -1, 0),
 (1, 0, 0, -1),
 (0, 1, 0, -1),
 (0, 0, 1, -1)]
```

```
>>> from sage.all import *
>>> RootSystem(['D',Integer(4)]).ambient_space().positive_roots()
[(1, 1, 0, 0),
 (1, 0, 1, 0),
```

(continues on next page)

(continued from previous page)

```
 (0, 1, 1, 0),
 (1, 0, 0, 1),
 (0, 1, 0, 1),
 (0, 0, 1, 1),
 (1, -1, 0, 0),
 (1, 0, -1, 0),
 (0, 1, -1, 0),
 (1, 0, 0, -1),
 (0, 1, 0, -1),
 (0, 0, 1, -1)]
```

root (*i*, *j*, *p1*, *p2*)

Note that indexing starts at 0.

EXAMPLES:

```
sage: e = RootSystem(['D',3]).ambient_space()
sage: e.root(0, 1, 1, 1)
(-1, -1, 0)
sage: e.root(0, 0, 1, 1)
(-1, 0, 0)
```

```
>>> from sage.all import *
>>> e = RootSystem(['D',Integer(3)]).ambient_space()
>>> e.root(Integer(0), Integer(1), Integer(1), Integer(1))
(-1, -1, 0)
>>> e.root(Integer(0), Integer(0), Integer(1), Integer(1))
(-1, 0, 0)
```

simple_root (*i*)

EXAMPLES:

```
sage: RootSystem(['D',4]).ambient_space().simple_roots()
Finite family {1: (1, -1, 0, 0), 2: (0, 1, -1, 0), 3: (0, 0, 1, -1), 4: (0, 0,
↪ 1, 1)}
```

```
>>> from sage.all import *
>>> RootSystem(['D',Integer(4)]).ambient_space().simple_roots()
Finite family {1: (1, -1, 0, 0), 2: (0, 1, -1, 0), 3: (0, 0, 1, -1), 4: (0, 0,
↪ 1, 1)}
```

class sage.combinat.root_system.type_D.**CartanType** (*n*)

Bases: *CartanType_standard_finite*, *CartanType_simply_laced*

EXAMPLES:

```
sage: ct = CartanType(['D',4])
sage: ct
['D', 4]
sage: ct._repr_(compact = True)
'D4'
```

(continues on next page)

(continued from previous page)

```
sage: ct.is_irreducible()
True
sage: ct.is_finite()
True
sage: ct.is_crystallographic()
True
sage: ct.is_simply_laced()
True
sage: ct.dual()
['D', 4]
sage: ct.affine()
['D', 4, 1]

sage: ct = CartanType(['D',2])
sage: ct.is_irreducible()
False
sage: ct.dual()
['D', 2]
sage: ct.affine()
Traceback (most recent call last):
...
ValueError: ['D', 2, 1] is not a valid Cartan type
```

```
>>> from sage.all import *
>>> ct = CartanType(['D',Integer(4)])
>>> ct
['D', 4]
>>> ct._repr_(compact = True)
'D4'

>>> ct.is_irreducible()
True
>>> ct.is_finite()
True
>>> ct.is_crystallographic()
True
>>> ct.is_simply_laced()
True
>>> ct.dual()
['D', 4]
>>> ct.affine()
['D', 4, 1]

>>> ct = CartanType(['D',Integer(2)])
>>> ct.is_irreducible()
False
>>> ct.dual()
['D', 2]
>>> ct.affine()
Traceback (most recent call last):
...
ValueError: ['D', 2, 1] is not a valid Cartan type
```

AmbientSpace

alias of *AmbientSpace*

ascii_art(*label=None*, *node=None*)

Return a ascii art representation of the extended Dynkin diagram.

EXAMPLES:

```
sage: print(CartanType(['D',3]).ascii_art())
O 3
|
|
O---O
1   2
sage: print(CartanType(['D',4]).ascii_art())
    O 4
    |
    |
O---O---O
1   2   3
sage: print(CartanType(['D',4]).ascii_art(label = lambda x: x+2))
    O 6
    |
    |
O---O---O
3   4   5
sage: print(CartanType(['D',6]).ascii_art(label = lambda x: x+2))
            O 8
            |
            |
O---O---O---O---O
3   4   5   6   7
```

```
>>> from sage.all import *
>>> print(CartanType(['D',Integer(3)]).ascii_art())
O 3
|
|
O---O
1   2
>>> print(CartanType(['D',Integer(4)]).ascii_art())
    O 4
    |
    |
O---O---O
1   2   3
>>> print(CartanType(['D',Integer(4)]).ascii_art(label = lambda x:␣
↪x+Integer(2)))
    O 6
    |
    |
O---O---O
3   4   5
>>> print(CartanType(['D',Integer(6)]).ascii_art(label = lambda x:␣
```

(continues on next page)

(continued from previous page)

```
↪x+Integer(2)))
            O 8
            |
            |
O---O---O---O---O
3   4   5   6   7
```

coxeter_number()

Return the Coxeter number associated with `self`.

EXAMPLES:

```
sage: CartanType(['D',4]).coxeter_number()
6
```

```
>>> from sage.all import *
>>> CartanType(['D',Integer(4)]).coxeter_number()
6
```

dual_coxeter_number()

Return the dual Coxeter number associated with `self`.

EXAMPLES:

```
sage: CartanType(['D',4]).dual_coxeter_number()
6
```

```
>>> from sage.all import *
>>> CartanType(['D',Integer(4)]).dual_coxeter_number()
6
```

dynkin_diagram()

Return a Dynkin diagram for type D.

EXAMPLES:

```
sage: d = CartanType(['D',5]).dynkin_diagram(); d                          #␣
↪needs sage.graphs
        O 5
        |
        |
O---O---O---O
1   2   3   4
D5
sage: d.edges(sort=True)                                                    #␣
↪needs sage.graphs
[(1, 2, 1), (2, 1, 1), (2, 3, 1), (3, 2, 1),
 (3, 4, 1), (3, 5, 1), (4, 3, 1), (5, 3, 1)]

sage: d = CartanType(['D',4]).dynkin_diagram(); d                          #␣
↪needs sage.graphs
    O 4
    |
```

(continues on next page)

(continued from previous page)

```
    |
O---O---O
1   2   3
D4
sage: d.edges(sort=True)                                                    #␣
↪needs sage.graphs
[(1, 2, 1), (2, 1, 1), (2, 3, 1), (2, 4, 1), (3, 2, 1), (4, 2, 1)]

↪     # needs sage.graphs
O   O
1   2
D2
>>> d.edges(sort=True)                                                    #␣
↪needs sage.graphs
[]
```

is_atomic()

Implement `CartanType_abstract.is_atomic()`.

D_2 is atomic, like all D_n, despite being non irreducible.

EXAMPLES:

```
sage: CartanType(["D",2]).is_atomic()
True
sage: CartanType(["D",2]).is_irreducible()
False
```

```
>>> from sage.all import *
>>> CartanType(["D",Integer(2)]).is_atomic()
True
>>> CartanType(["D",Integer(2)]).is_irreducible()
False
```

5.1.252 Root system data for (untwisted) type D affine

class sage.combinat.root_system.type_D_affine.**CartanType**(*n*)

Bases: *CartanType_standard_untwisted_affine*, *CartanType_simply_laced*

EXAMPLES:

```
sage: ct = CartanType(['D',4,1])
sage: ct
```

(continues on next page)

(continued from previous page)

```
['D', 4, 1]
sage: ct._repr_(compact = True)
'D4~'

sage: ct.is_irreducible()
True
sage: ct.is_finite()
False
sage: ct.is_affine()
True
sage: ct.is_untwisted_affine()
True
sage: ct.is_crystallographic()
True
sage: ct.is_simply_laced()
True
sage: ct.classical()
['D', 4]
sage: ct.dual()
['D', 4, 1]
```

```
>>> from sage.all import *
>>> ct = CartanType(['D',Integer(4),Integer(1)])
>>> ct
['D', 4, 1]
>>> ct._repr_(compact = True)
'D4~'

>>> ct.is_irreducible()
True
>>> ct.is_finite()
False
>>> ct.is_affine()
True
>>> ct.is_untwisted_affine()
True
>>> ct.is_crystallographic()
True
>>> ct.is_simply_laced()
True
>>> ct.classical()
['D', 4]
>>> ct.dual()
['D', 4, 1]
```

PieriFactors

alias of `PieriFactors_type_D_affine`

ascii_art(*label=None*, *node=None*)

Return an ascii art representation of the extended Dynkin diagram.

dynkin_diagram()

Return the extended Dynkin diagram for affine type D.

EXAMPLES:

```
sage: d = CartanType(['D', 6, 1]).dynkin_diagram(); d
↪# needs sage.graphs
   0 O       O 6
     |       |
     |       |
 O---O---O---O---O
 1   2   3   4   5
 D6~
sage: d.edges(sort=True)
↪# needs sage.graphs
[(0, 2, 1), (1, 2, 1), (2, 0, 1), (2, 1, 1), (2, 3, 1),
 (3, 2, 1), (3, 4, 1), (4, 3, 1), (4, 5, 1), (4, 6, 1), (5, 4, 1), (6, 4, 1)]

sage: d = CartanType(['D', 4, 1]).dynkin_diagram(); d
↪# needs sage.graphs
    O 4
    |
    |
O---O---O
1   |2  3
    |
    O 0
D4~
sage: d.edges(sort=True)
↪# needs sage.graphs
[(0, 2, 1),

```

5.1.253 Root system data for type E

class sage.combinat.root_system.type_E.**AmbientSpace**(*root_system*, *baseRing*)

Bases: *AmbientSpace*

The lattice behind E6, E7, or E8. The computations are based on Bourbaki, Groupes et Algèbres de Lie, Ch. 4,5,6 (planche V-VII).

dimension()

EXAMPLES:

```
sage: e = RootSystem(['E',6]).ambient_space()
sage: e.dimension()
8
```

```
>>> from sage.all import *
>>> e = RootSystem(['E',Integer(6)]).ambient_space()
>>> e.dimension()
8
```

fundamental_weights()

EXAMPLES:

```
sage: e = RootSystem(['E',6]).ambient_space()
sage: e.fundamental_weights()
Finite family {1: (0, 0, 0, 0, 0, -2/3, -2/3, 2/3), 2: (1/2, 1/2, 1/2, 1/2, 1/
↪2, -1/2, -1/2, 1/2), 3: (-1/2, 1/2, 1/2, 1/2, 1/2, -5/6, -5/6, 5/6), 4: (0,␣
↪0, 1, 1, 1, -1, -1, 1), 5: (0, 0, 0, 1, 1, -2/3, -2/3, 2/3), 6: (0, 0, 0, 0,
↪ 1, -1/3, -1/3, 1/3)}
```

```
>>> from sage.all import *
>>> e = RootSystem(['E',Integer(6)]).ambient_space()
>>> e.fundamental_weights()
Finite family {1: (0, 0, 0, 0, 0, -2/3, -2/3, 2/3), 2: (1/2, 1/2, 1/2, 1/2, 1/
↪2, -1/2, -1/2, 1/2), 3: (-1/2, 1/2, 1/2, 1/2, 1/2, -5/6, -5/6, 5/6), 4: (0,␣
↪0, 1, 1, 1, -1, -1, 1), 5: (0, 0, 0, 1, 1, -2/3, -2/3, 2/3), 6: (0, 0, 0, 0,
↪ 1, -1/3, -1/3, 1/3)}
```

negative_roots()

The negative roots.

EXAMPLES:

```
sage: e = RootSystem(['E',6]).ambient_space()
sage: e.negative_roots()
[(-1, -1, 0, 0, 0, 0, 0, 0),
 (-1, 0, -1, 0, 0, 0, 0, 0),
 (-1, 0, 0, -1, 0, 0, 0, 0),
 (-1, 0, 0, 0, -1, 0, 0, 0),
 (0, -1, -1, 0, 0, 0, 0, 0),
 (0, -1, 0, -1, 0, 0, 0, 0),
 (0, -1, 0, 0, -1, 0, 0, 0),
 (0, 0, -1, -1, 0, 0, 0, 0),
 (0, 0, -1, 0, -1, 0, 0, 0),
 (0, 0, 0, -1, -1, 0, 0, 0),
 (1, -1, 0, 0, 0, 0, 0, 0),
 (1, 0, -1, 0, 0, 0, 0, 0),
 (1, 0, 0, -1, 0, 0, 0, 0),
 (1, 0, 0, 0, -1, 0, 0, 0),
 (0, 1, -1, 0, 0, 0, 0, 0),
```

```

positive_roots()

These are the roots positive w.r.t. to lexicographic ordering of the basis elements (e1<…<e4).

EXAMPLES:

```
sage: e = RootSystem(['E',6]).ambient_space()
sage: e.positive_roots()
[(1, 1, 0, 0, 0, 0, 0, 0),
 (1, 0, 1, 0, 0, 0, 0, 0),
 (1, 0, 0, 1, 0, 0, 0, 0),
 (1, 0, 0, 0, 1, 0, 0, 0),
 (0, 1, 1, 0, 0, 0, 0, 0),
 (0, 1, 0, 1, 0, 0, 0, 0),
 (0, 1, 0, 0, 1, 0, 0, 0),
 (0, 0, 1, 1, 0, 0, 0, 0),
 (0, 0, 1, 0, 1, 0, 0, 0),
 (0, 0, 0, 1, 1, 0, 0, 0),
 (-1, 1, 0, 0, 0, 0, 0, 0),
 (-1, 0, 1, 0, 0, 0, 0, 0),
 (-1, 0, 0, 1, 0, 0, 0, 0),
 (-1, 0, 0, 0, 1, 0, 0, 0),
 (0, -1, 1, 0, 0, 0, 0, 0),
 (0, -1, 0, 1, 0, 0, 0, 0),
 (0, -1, 0, 0, 1, 0, 0, 0),
 (0, 0, -1, 1, 0, 0, 0, 0),
 (0, 0, -1, 0, 1, 0, 0, 0),
 (0, 0, 0, -1, 1, 0, 0, 0),
 (1/2, 1/2, 1/2, 1/2, 1/2, -1/2, -1/2, 1/2),
 (1/2, 1/2, 1/2, -1/2, -1/2, -1/2, -1/2, 1/2),
 (1/2, 1/2, -1/2, 1/2, -1/2, -1/2, -1/2, 1/2),
 (1/2, 1/2, -1/2, -1/2, 1/2, -1/2, -1/2, 1/2),

>>> e.rho()
(0, 1, 2, 3, 4, 5, 6, 23)
```

root (*i1*, *i2=None*, *i3=None*, *i4=None*, *i5=None*, *i6=None*, *i7=None*, *i8=None*, *p1=0*, *p2=0*, *p3=0*, *p4=0*, *p5=0*, *p6=0*, *p7=0*, *p8=0*)

Compute an element of the underlying lattice, using the specified elements of the standard basis, with signs dictated by the corresponding 'pi' arguments. We rely on the caller to provide the correct arguments. This is typically used to generate roots, although the generated elements need not be roots themselves. We assume that if one of the indices is not given, the rest are not as well. This should work for E6, E7, E8.

EXAMPLES:

```
sage: e = RootSystem(['E',6]).ambient_space()
sage: [ e.root(i, j, p3=1) for i in range(e.n) for j in range(i+1, e.n) ]
[(1, 1, 0, 0, 0, 0, 0, 0),
 (1, 0, 1, 0, 0, 0, 0, 0),
 (1, 0, 0, 1, 0, 0, 0, 0),
 (1, 0, 0, 0, 1, 0, 0, 0),
 (1, 0, 0, 0, 0, 1, 0, 0),
```

simple_root(*i*)

There are computed as what Bourbaki calls the Base:
a1 = e2-e3, a2 = e3-e4, a3 = e4, a4 = 1/2*(e1-e2-e3-e4)

EXAMPLES:

```
sage: LE6 = RootSystem(['E',6]).ambient_space()
sage: LE6.simple_roots()
Finite family {1: (1/2, -1/2, -1/2, -1/2, -1/2, -1/2, -1/2, 1/2), 2: (1, 1, 0,
↪ 0, 0, 0, 0, 0), 3: (-1, 1, 0, 0, 0, 0, 0, 0), 4: (0, -1, 1, 0, 0, 0, 0, 0),
↪ 5: (0, 0, -1, 1, 0, 0, 0, 0), 6: (0, 0, 0, -1, 1, 0, 0, 0)}
```

```
>>> from sage.all import *
>>> LE6 = RootSystem(['E',Integer(6)]).ambient_space()
>>> LE6.simple_roots()
Finite family {1: (1/2, -1/2, -1/2, -1/2, -1/2, -1/2, -1/2, 1/2), 2: (1, 1, 0,
↪ 0, 0, 0, 0, 0), 3: (-1, 1, 0, 0, 0, 0, 0, 0), 4: (0, -1, 1, 0, 0, 0, 0, 0),
↪ 5: (0, 0, -1, 1, 0, 0, 0, 0), 6: (0, 0, 0, -1, 1, 0, 0, 0)}
```

class sage.combinat.root_system.type_E.**CartanType**(*n*)

Bases: *CartanType_standard_finite*, *CartanType_simple*, *CartanType_simply_laced*

EXAMPLES:

```
sage: ct = CartanType(['E',6])
sage: ct
['E', 6]
sage: ct._repr_(compact = True)
'E6'
sage: ct.is_irreducible()
True
sage: ct.is_finite()
True
sage: ct.is_affine()
False
sage: ct.is_crystallographic()
True
sage: ct.is_simply_laced()
True
sage: ct.affine()
['E', 6, 1]
sage: ct.dual()
['E', 6]
```

```
>>> from sage.all import *
>>> ct = CartanType(['E',Integer(6)])
>>> ct
```

(continues on next page)

(continued from previous page)

```
['E', 6]
>>> ct._repr_(compact = True)
'E6'
>>> ct.is_irreducible()
True
>>> ct.is_finite()
True
>>> ct.is_affine()
False
>>> ct.is_crystallographic()
True
>>> ct.is_simply_laced()
True
>>> ct.affine()
['E', 6, 1]
>>> ct.dual()
['E', 6]
```

AmbientSpace

alias of *AmbientSpace*

ascii_art(*label=None*, *node=None*)

Return a ascii art representation of the extended Dynkin diagram.

EXAMPLES:

```
sage: print(CartanType(['E',6]).ascii_art(label = lambda x: x+2))
        O 4
        |
        |
O---O---O---O---O
3   5   6   7   8
sage: print(CartanType(['E',7]).ascii_art(label = lambda x: x+2))
        O 4
        |
        |
O---O---O---O---O---O
3   5   6   7   8   9
sage: print(CartanType(['E',8]).ascii_art(label = lambda x: x+1))
        O 3
        |
        |
O---O---O---O---O---O---O
2   4   5   6   7   8   9
```

```
>>> from sage.all import *
>>> print(CartanType(['E',Integer(6)]).ascii_art(label = lambda x:␣
↪x+Integer(2)))
        O 4
        |
        |
O---O---O---O---O
```

(continues on next page)

(continued from previous page)

```
3   5   6   7   8
>>> print(CartanType(['E',Integer(7)]).ascii_art(label = lambda x:␣
↪x+Integer(2)))
        O 4
        |
        |
O---O---O---O---O---O
3   5   6   7   8   9
>>> print(CartanType(['E',Integer(8)]).ascii_art(label = lambda x:␣
↪x+Integer(1)))
        O 3
        |
        |
O---O---O---O---O---O---O
2   4   5   6   7   8   9
```

coxeter_number()

Return the Coxeter number associated with `self`.

EXAMPLES:

```
sage: CartanType(['E',6]).coxeter_number()
12
sage: CartanType(['E',7]).coxeter_number()
18
sage: CartanType(['E',8]).coxeter_number()
30
```

```
>>> from sage.all import *
>>> CartanType(['E',Integer(6)]).coxeter_number()
12
>>> CartanType(['E',Integer(7)]).coxeter_number()
18
>>> CartanType(['E',Integer(8)]).coxeter_number()
30
```

dual_coxeter_number()

Return the dual Coxeter number associated with `self`.

EXAMPLES:

```
sage: CartanType(['E',6]).dual_coxeter_number()
12
sage: CartanType(['E',7]).dual_coxeter_number()
18
sage: CartanType(['E',8]).dual_coxeter_number()
30
```

```
>>> from sage.all import *
>>> CartanType(['E',Integer(6)]).dual_coxeter_number()
12
>>> CartanType(['E',Integer(7)]).dual_coxeter_number()
```

(continues on next page)

(continued from previous page)

```
18
>>> CartanType(['E',Integer(8)]).dual_coxeter_number()
30
```

dynkin_diagram()

Return a Dynkin diagram for type E.

EXAMPLES:

```
sage: # needs sage.graphs
sage: e = CartanType(['E',6]).dynkin_diagram(); e
        O 2
        |
        |
O---O---O---O---O
1   3   4   5   6
E6
sage: e.edges(sort=True)
[(1, 3, 1), (2, 4, 1), (3, 1, 1), (3, 4, 1), (4, 2, 1),
 (4, 3, 1), (4, 5, 1), (5, 4, 1), (5, 6, 1), (6, 5, 1)]
sage: e = CartanType(['E',7]).dynkin_diagram(); e
        O 2
        |
        |
O---O---O---O---O---O
1   3   4   5   6   7
E7
sage: e.edges(sort=True)
[(1, 3, 1), (2, 4, 1), (3, 1, 1), (3, 4, 1), (4, 2, 1),
 (4, 3, 1), (4, 5, 1), (5, 4, 1), (5, 6, 1), (6, 5, 1),
 (6, 7, 1), (7, 6, 1)]
sage: e = CartanType(['E',8]).dynkin_diagram(); e
        O 2
        |
        |
O---O---O---O---O---O---O
1   3   4   5   6   7   8
E8
sage: e.edges(sort=True)
[(1, 3, 1), (2, 4, 1), (3, 1, 1), (3, 4, 1), (4, 2, 1),
 (4, 3, 1), (4, 5, 1), (5, 4, 1), (5, 6, 1), (6, 5, 1),
 (6, 7, 1), (7, 6, 1), (7, 8, 1), (8, 7, 1)]
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> e = CartanType(['E',Integer(6)]).dynkin_diagram(); e
        O 2
        |
        |
O---O---O---O---O
1   3   4   5   6
E6
```

(continues on next page)

(continued from previous page)

```
>>> e.edges(sort=True)
[(1, 3, 1), (2, 4, 1), (3, 1, 1), (3, 4, 1), (4, 2, 1),
 (4, 3, 1), (4, 5, 1), (5, 4, 1), (5, 6, 1), (6, 5, 1)]
>>> e = CartanType(['E',Integer(7)]).dynkin_diagram(); e
        O 2
        |
        |
O---O---O---O---O---O
1   3   4   5   6   7
E7
>>> e.edges(sort=True)
[(1, 3, 1), (2, 4, 1), (3, 1, 1), (3, 4, 1), (4, 2, 1),
 (4, 3, 1), (4, 5, 1), (5, 4, 1), (5, 6, 1), (6, 5, 1),
 (6, 7, 1), (7, 6, 1)]
>>> e = CartanType(['E',Integer(8)]).dynkin_diagram(); e
        O 2
        |
        |
O---O---O---O---O---O---O
1   3   4   5   6   7   8
E8
>>> e.edges(sort=True)
[(1, 3, 1), (2, 4, 1), (3, 1, 1), (3, 4, 1), (4, 2, 1),
 (4, 3, 1), (4, 5, 1), (5, 4, 1), (5, 6, 1), (6, 5, 1),
 (6, 7, 1), (7, 6, 1), (7, 8, 1), (8, 7, 1)]
```

5.1.254 Root system data for (untwisted) type E affine

class sage.combinat.root_system.type_E_affine.**CartanType**(*n*)

Bases: *CartanType_standard_untwisted_affine*, *CartanType_simply_laced*

EXAMPLES:

```
sage: ct = CartanType(['E',6,1])
sage: ct
['E', 6, 1]
sage: ct._repr_(compact = True)
'E6~'

sage: ct.is_irreducible()
True
sage: ct.is_finite()
False
sage: ct.is_affine()
True
sage: ct.is_untwisted_affine()
True
sage: ct.is_crystallographic()
True
sage: ct.is_simply_laced()
True
sage: ct.classical()
```

(continues on next page)

(continued from previous page)

```
['E', 6]
sage: ct.dual()
['E', 6, 1]
```

```
>>> from sage.all import *
>>> ct = CartanType(['E',Integer(6),Integer(1)])
>>> ct
['E', 6, 1]
>>> ct._repr_(compact = True)
'E6~'

>>> ct.is_irreducible()
True
>>> ct.is_finite()
False
>>> ct.is_affine()
True
>>> ct.is_untwisted_affine()
True
>>> ct.is_crystallographic()
True
>>> ct.is_simply_laced()
True
>>> ct.classical()
['E', 6]
>>> ct.dual()
['E', 6, 1]
```

ascii_art(*label=None*, *node=None*)

Return an ascii art representation of the extended Dynkin diagram.

EXAMPLES:

```
sage: print(CartanType(['E',6,1]).ascii_art(label = lambda x: x+2))
        O 2
        |
        |
        O 4
        |
        |
O---O---O---O---O
3   5   6   7   8
sage: print(CartanType(['E',7,1]).ascii_art(label = lambda x: x+2))
            O 4
            |
            |
O---O---O---O---O---O---O
2   3   5   6   7   8   9
sage: print(CartanType(['E',8,1]).ascii_art(label = lambda x: x-3))
        O -1
        |
        |
```

(continues on next page)

(continued from previous page)

```
O---O---O---O---O---O---O---O
-2  0   1   2   3   4   5   -3
```

```
>>> from sage.all import *
>>> print(CartanType(['E',Integer(6),Integer(1)]).ascii_art(label = lambda x:␣
↪x+Integer(2)))
        O 2
        |
        |
        O 4
        |
        |
O---O---O---O---O
3   5   6   7   8
>>> print(CartanType(['E',Integer(7),Integer(1)]).ascii_art(label = lambda x:␣
↪x+Integer(2)))
            O 4
            |
            |
O---O---O---O---O---O---O
2   3   5   6   7   8   9
>>> print(CartanType(['E',Integer(8),Integer(1)]).ascii_art(label = lambda x:␣
↪x-Integer(3)))
        O -1
        |
        |
O---O---O---O---O---O---O---O
-2  0   1   2   3   4   5   -3
```

dynkin_diagram()

Return the extended Dynkin diagram for affine type E.

EXAMPLES:

```
sage: e = CartanType(['E', 6, 1]).dynkin_diagram(); e                    #␣
↪needs sage.graphs
        O 0
        |
        |
        O 2
        |
        |
O---O---O---O---O
1   3   4   5   6
E6~
sage: e.edges(sort=True)                                                 #␣
↪needs sage.graphs
[(0, 2, 1),
 (1, 3, 1),
 (2, 0, 1),
 (2, 4, 1),
 (3, 1, 1),
```

(continues on next page)

(continued from previous page)

```
 (3, 4, 1),
 (4, 2, 1),
 (4, 3, 1),
 (4, 5, 1),
 (5, 4, 1),
 (5, 6, 1),
 (6, 5, 1)]

sage: # needs sage.graphs
sage: e = CartanType(['E', 7, 1]).dynkin_diagram(); e
            O 2
            |
            |

```

5.1.255 Root system data for type F

class sage.combinat.root_system.type_F.**AmbientSpace**(*root_system*, *base_ring*)

Bases: *AmbientSpace*

The lattice behind F_4. The computations are based on Bourbaki, Groupes et Algèbres de Lie, Ch. 4,5,6 (planche VIII).

dimension()

Return the dimension of self.

EXAMPLES:

```
sage: e = RootSystem(['F',4]).ambient_space()
sage: e.dimension()
4
```

```
>>> from sage.all import *
>>> e = RootSystem(['F',Integer(4)]).ambient_space()
>>> e.dimension()
4
```

fundamental_weights()

Return the fundamental weights of `self`.

EXAMPLES:

```
sage: e =  RootSystem(['F',4]).ambient_space()
sage: e.fundamental_weights()
Finite family {1: (1, 1, 0, 0), 2: (2, 1, 1, 0), 3: (3/2, 1/2, 1/2, 1/2), 4:␣
↪(1, 0, 0, 0)}
```

```
>>> from sage.all import *
>>> e =  RootSystem(['F',Integer(4)]).ambient_space()
>>> e.fundamental_weights()
Finite family {1: (1, 1, 0, 0), 2: (2, 1, 1, 0), 3: (3/2, 1/2, 1/2, 1/2), 4:␣
↪(1, 0, 0, 0)}
```

negative_roots()

Return the negative roots.

EXAMPLES:

```
sage: e = RootSystem(['F',4]).ambient_space()
sage: e.negative_roots()
[(-1, 0, 0, 0),
(0, -1, 0, 0),
(0, 0, -1, 0),
(0, 0, 0, -1),
(-1, -1, 0, 0),
(-1, 0, -1, 0),
(-1, 0, 0, -1),
(0, -1, -1, 0),
(0, -1, 0, -1),
(0, 0, -1, -1),
(-1, 1, 0, 0),
(-1, 0, 1, 0),
(-1, 0, 0, 1),
(0, -1, 1, 0),
(0, -1, 0, 1),
(0, 0, -1, 1),
(-1/2, -1/2, -1/2, -1/2),
(-1/2, -1/2, -1/2, 1/2),
(-1/2, -1/2, 1/2, -1/2),
(-1/2, -1/2, 1/2, 1/2),
(-1/2, 1/2, -1/2, -1/2),
(-1/2, 1/2, -1/2, 1/2),
(-1/2, 1/2, 1/2, -1/2),
(-1/2, 1/2, 1/2, 1/2)]
```

```
>>> from sage.all import *
>>> e = RootSystem(['F',Integer(4)]).ambient_space()
>>> e.negative_roots()
[(-1, 0, 0, 0),
(0, -1, 0, 0),
(0, 0, -1, 0),
```

(continues on next page)

(continued from previous page)

```
(0, 0, 0, -1),
(-1, -1, 0, 0),
(-1, 0, -1, 0),
(-1, 0, 0, -1),
(0, -1, -1, 0),
(0, -1, 0, -1),
(0, 0, -1, -1),
(-1, 1, 0, 0),
(-1, 0, 1, 0),
(-1, 0, 0, 1),
(0, -1, 1, 0),
(0, -1, 0, 1),
(0, 0, -1, 1),
(-1/2, -1/2, -1/2, -1/2),
(-1/2, -1/2, -1/2, 1/2),
(-1/2, -1/2, 1/2, -1/2),
(-1/2, -1/2, 1/2, 1/2),
(-1/2, 1/2, -1/2, -1/2),
(-1/2, 1/2, -1/2, 1/2),
(-1/2, 1/2, 1/2, -1/2),
(-1/2, 1/2, 1/2, 1/2)]
```

positive_roots()

Return the positive roots.

These are the roots which are positive with respect to the lexicographic ordering of the basis elements ($\epsilon_1 < \epsilon_2 < \epsilon_3 < \epsilon_4$).

EXAMPLES:

```
sage: e = RootSystem(['F',4]).ambient_space()
sage: e.positive_roots()
[(1, 0, 0, 0),
(0, 1, 0, 0),
(0, 0, 1, 0),
(0, 0, 0, 1),
(1, 1, 0, 0),
(1, 0, 1, 0),
(1, 0, 0, 1),
(0, 1, 1, 0),
(0, 1, 0, 1),
(0, 0, 1, 1),
(1, -1, 0, 0),
(1, 0, -1, 0),
(1, 0, 0, -1),
(0, 1, -1, 0),
(0, 1, 0, -1),
(0, 0, 1, -1),
(1/2, 1/2, 1/2, 1/2),
(1/2, 1/2, 1/2, -1/2),
(1/2, 1/2, -1/2, 1/2),
(1/2, 1/2, -1/2, -1/2),
(1/2, -1/2, 1/2, 1/2),
```

(continues on next page)

(continued from previous page)

```
(1/2, -1/2, 1/2, -1/2),
(1/2, -1/2, -1/2, 1/2),
(1/2, -1/2, -1/2, -1/2)]
sage: e.rho()
(11/2, 5/2, 3/2, 1/2)
```

```
>>> from sage.all import *
>>> e = RootSystem(['F',Integer(4)]).ambient_space()
>>> e.positive_roots()
[(1, 0, 0, 0),

(11/2, 5/2, 3/2, 1/2)
```

root(*i*, *j=None*, *k=None*, *l=None*, *p1=0*, *p2=0*, *p3=0*, *p4=0*)

Compute a root from base elements of the underlying lattice. The arguments specify the basis elements and the signs. Sadly, the base elements are indexed zero-based. We assume that if one of the indices is not given, the rest are not as well.

EXAMPLES:

```
sage: e = RootSystem(['F',4]).ambient_space()
sage: [ e.root(i,j,p2=1) for i in range(e.n) for j in range(i+1,e.n) ]
[(1, -1, 0, 0), (1, 0, -1, 0), (1, 0, 0, -1), (0, 1, -1, 0), (0, 1, 0, -1),
↪(0, 0, 1, -1)]
```

```
>>> from sage.all import *
>>> e = RootSystem(['F',Integer(4)]).ambient_space()
>>> [ e.root(i,j,p2=Integer(1)) for i in range(e.n) for j in
↪range(i+Integer(1),e.n) ]
```

(continues on next page)

(continued from previous page)

```
[(1, -1, 0, 0), (1, 0, -1, 0), (1, 0, 0, -1), (0, 1, -1, 0), (0, 1, 0, -1),␣
↪(0, 0, 1, -1)]
```

simple_root (i)

Return the i-th simple root.

It is computed according to what Bourbaki calls the Base:

$$\alpha_1 = \epsilon_2 - \epsilon_3, \alpha_2 = \epsilon_3 - \epsilon_4, \alpha_3 = \epsilon_4, \alpha_4 = \frac{1}{2}\left(\epsilon_1 - \epsilon_2 - \epsilon_3 - \epsilon_4\right).$$

EXAMPLES:

```
sage: e = RootSystem(['F',4]).ambient_space()
sage: e.simple_roots()
Finite family {1: (0, 1, -1, 0), 2: (0, 0, 1, -1), 3: (0, 0, 0, 1), 4: (1/2, -
↪1/2, -1/2, -1/2)}
```

```
>>> from sage.all import *
>>> e = RootSystem(['F',Integer(4)]).ambient_space()
>>> e.simple_roots()
Finite family {1: (0, 1, -1, 0), 2: (0, 0, 1, -1), 3: (0, 0, 0, 1), 4: (1/2, -
↪1/2, -1/2, -1/2)}
```

class sage.combinat.root_system.type_F.**CartanType**

Bases: *CartanType_standard_finite*, *CartanType_simple*, *CartanType_crystallographic*

EXAMPLES:

```
sage: ct = CartanType(['F',4])
sage: ct
['F', 4]
sage: ct._repr_(compact = True)
'F4'

sage: ct.is_irreducible()
True
sage: ct.is_finite()
True
sage: ct.is_crystallographic()
True
sage: ct.is_simply_laced()
False
sage: ct.dual()
['F', 4] relabelled by {1: 4, 2: 3, 3: 2, 4: 1}
sage: ct.affine()
['F', 4, 1]
```

```
>>> from sage.all import *
>>> ct = CartanType(['F',Integer(4)])
>>> ct
['F', 4]
>>> ct._repr_(compact = True)
```

(continues on next page)

(continued from previous page)

```
'F4'

>>> ct.is_irreducible()
True
>>> ct.is_finite()
True
>>> ct.is_crystallographic()
True
>>> ct.is_simply_laced()
False
>>> ct.dual()
['F', 4] relabelled by {1: 4, 2: 3, 3: 2, 4: 1}
>>> ct.affine()
['F', 4, 1]
```

AmbientSpace

alias of *AmbientSpace*

ascii_art(*label=None*, *node=None*)

Return an ascii art representation of the extended Dynkin diagram.

EXAMPLES:

```
sage: print(CartanType(['F',4]).ascii_art(label = lambda x: x+2))
O---O=>=O---O
3   4   5   6
sage: print(CartanType(['F',4]).ascii_art(label = lambda x: x-2))
O---O=>=O---O
-1  0   1   2
```

```
>>> from sage.all import *
>>> print(CartanType(['F',Integer(4)]).ascii_art(label = lambda x:␣
↪x+Integer(2)))
O---O=>=O---O
3   4   5   6
>>> print(CartanType(['F',Integer(4)]).ascii_art(label = lambda x: x-
↪Integer(2)))
O---O=>=O---O
-1  0   1   2
```

coxeter_number()

Return the Coxeter number associated with `self`.

EXAMPLES:

```
sage: CartanType(['F',4]).coxeter_number()
12
```

```
>>> from sage.all import *
>>> CartanType(['F',Integer(4)]).coxeter_number()
12
```

dual()

Return the dual Cartan type.

This uses that F_4 is self-dual up to relabelling.

EXAMPLES:

```
sage: F4 = CartanType(['F',4])
sage: F4.dual()
['F', 4] relabelled by {1: 4, 2: 3, 3: 2, 4: 1}

sage: F4.dynkin_diagram()                                            #␣
↪needs sage.graphs
O---O=>=O---O
1   2   3   4
F4
sage: F4.dual().dynkin_diagram()                                     #␣
↪needs sage.graphs
O---O=>=O---O
4   3   2   1
F4 relabelled by {1: 4, 2: 3, 3: 2, 4: 1}
```

```
>>> from sage.all import *
>>> F4 = CartanType(['F',Integer(4)])
>>> F4.dual()
['F', 4] relabelled by {1: 4, 2: 3, 3: 2, 4: 1}

>>> F4.dynkin_diagram()                                              #␣
↪needs sage.graphs
O---O=>=O---O
1   2   3   4
F4
>>> F4.dual().dynkin_diagram()                                       #␣
↪needs sage.graphs
O---O=>=O---O
4   3   2   1
F4 relabelled by {1: 4, 2: 3, 3: 2, 4: 1}
```

dual_coxeter_number()

Return the dual Coxeter number associated with `self`.

EXAMPLES:

```
sage: CartanType(['F',4]).dual_coxeter_number()
9
```

```
>>> from sage.all import *
>>> CartanType(['F',Integer(4)]).dual_coxeter_number()
9
```

dynkin_diagram()

Return a Dynkin diagram for type F.

EXAMPLES:

```
sage: f = CartanType(['F',4]).dynkin_diagram(); f                          #␣
↪needs sage.graphs
O---O=>=O---O
1   2   3   4
F4
sage: f.edges(sort=True)                                                   #␣
↪needs sage.graphs
[(1, 2, 1), (2, 1, 1), (2, 3, 2), (3, 2, 1), (3, 4, 1), (4, 3, 1)]
```

```
>>> from sage.all import *
>>> f = CartanType(['F',Integer(4)]).dynkin_diagram(); f                    ␣
↪     # needs sage.graphs
O---O=>=O---O
1   2   3   4
F4
>>> f.edges(sort=True)                                                    #␣
↪needs sage.graphs
[(1, 2, 1), (2, 1, 1), (2, 3, 2), (3, 2, 1), (3, 4, 1), (4, 3, 1)]
```

5.1.256 Root system data for (untwisted) type F affine

class sage.combinat.root_system.type_F_affine.**CartanType**

Bases: *CartanType_standard_untwisted_affine*

EXAMPLES:

```
sage: ct = CartanType(['F',4,1])
sage: ct
['F', 4, 1]
sage: ct._repr_(compact = True)
'F4~'

sage: ct.is_irreducible()
True
sage: ct.is_finite()
False
sage: ct.is_affine()
True
sage: ct.is_untwisted_affine()
True
sage: ct.is_crystallographic()
True
sage: ct.is_simply_laced()
False
sage: ct.classical()
['F', 4]
sage: ct.dual()
['F', 4, 1]^*
sage: ct.dual().is_untwisted_affine()
False
```

```
>>> from sage.all import *
>>> ct = CartanType(['F',Integer(4),Integer(1)])
>>> ct
['F', 4, 1]
>>> ct._repr_(compact = True)
'F4~'

>>> ct.is_irreducible()
True
>>> ct.is_finite()
False
>>> ct.is_affine()
True
>>> ct.is_untwisted_affine()
True
>>> ct.is_crystallographic()
True
>>> ct.is_simply_laced()
False
>>> ct.classical()
['F', 4]
>>> ct.dual()
['F', 4, 1]^*
>>> ct.dual().is_untwisted_affine()
False
```

ascii_art(*label=None*, *node=None*)

Return a ascii art representation of the extended Dynkin diagram.

EXAMPLES:

```
sage: print(CartanType(['F',4,1]).ascii_art(label = lambda x: x+2))
O---O---O=>=O---O
2   3   4   5   6
```

```
>>> from sage.all import *
>>> print(CartanType(['F',Integer(4),Integer(1)]).ascii_art(label = lambda x:␣
→x+Integer(2)))
O---O---O=>=O---O
2   3   4   5   6
```

dynkin_diagram()

Return the extended Dynkin diagram for affine type F.

EXAMPLES:

```
sage: f = CartanType(['F', 4, 1]).dynkin_diagram(); f                  #␣
→needs sage.graphs
O---O---O=>=O---O
0   1   2   3   4
F4~
sage: f.edges(sort=True)                                                #␣
→needs sage.graphs
```

(continues on next page)

(continued from previous page)

```
[(0, 1, 1), (1, 0, 1), (1, 2, 1), (2, 1, 1),
 (2, 3, 2), (3, 2, 1), (3, 4, 1), (4, 3, 1)]
```

```
>>> from sage.all import *
>>> f = CartanType(['F', Integer(4), Integer(1)]).dynkin_diagram(); f      ␣
↪              # needs sage.graphs
O---O---O=>=O---O
0   1   2   3   4
F4~
>>> f.edges(sort=True)                                                    #␣
↪needs sage.graphs
[(0, 1, 1), (1, 0, 1), (1, 2, 1), (2, 1, 1),
 (2, 3, 2), (3, 2, 1), (3, 4, 1), (4, 3, 1)]
```

5.1.257 Root system data for type G

class sage.combinat.root_system.type_G.**AmbientSpace**(*root_system*, *base_ring*, *index_set=None*)

Bases: *AmbientSpace*

EXAMPLES:

```
sage: e = RootSystem(['G',2]).ambient_space(); e
Ambient space of the Root system of type ['G', 2]
```

```
>>> from sage.all import *
>>> e = RootSystem(['G',Integer(2)]).ambient_space(); e
Ambient space of the Root system of type ['G', 2]
```

One can not construct the ambient lattice because the simple coroots have rational coefficients:

```
sage: e.simple_coroots()
Finite family {1: (0, 1, -1), 2: (1/3, -2/3, 1/3)}
sage: e.smallest_base_ring()
Rational Field
```

```
>>> from sage.all import *
>>> e.simple_coroots()
Finite family {1: (0, 1, -1), 2: (1/3, -2/3, 1/3)}
>>> e.smallest_base_ring()
Rational Field
```

By default, this ambient space uses the barycentric projection for plotting:

```
sage: # needs sage.symbolic
sage: L = RootSystem(["G",2]).ambient_space()
sage: e = L.basis()
sage: L._plot_projection(e[0])
(1/2, 989/1142)
sage: L._plot_projection(e[1])
(-1, 0)
sage: L._plot_projection(e[2])
```

(continues on next page)

(continued from previous page)

```
(1/2, -989/1142)
sage: L = RootSystem(["A",3]).ambient_space()
sage: l = L.an_element(); l
(2, 2, 3, 0)
sage: L._plot_projection(l)
(0, -1121/1189, 7/3)
```

```
>>> from sage.all import *
>>> # needs sage.symbolic
>>> L = RootSystem(["G",Integer(2)]).ambient_space()
>>> e = L.basis()
>>> L._plot_projection(e[Integer(0)])
(1/2, 989/1142)
>>> L._plot_projection(e[Integer(1)])
(-1, 0)
>>> L._plot_projection(e[Integer(2)])
(1/2, -989/1142)
>>> L = RootSystem(["A",Integer(3)]).ambient_space()
>>> l = L.an_element(); l
(2, 2, 3, 0)
>>> L._plot_projection(l)
(0, -1121/1189, 7/3)
```

See also

- `sage.combinat.root_system.root_lattice_realizations.RootLatticeRealizations.ParentMethods._plot_projection()`

dimension()

EXAMPLES:

```
sage: e = RootSystem(['G',2]).ambient_space()
sage: e.dimension()
3
```

```
>>> from sage.all import *
>>> e = RootSystem(['G',Integer(2)]).ambient_space()
>>> e.dimension()
3
```

fundamental_weights()

EXAMPLES:

```
sage: CartanType(['G',2]).root_system().ambient_space().fundamental_weights()
Finite family {1: (1, 0, -1), 2: (2, -1, -1)}
```

```
>>> from sage.all import *
>>> CartanType(['G',Integer(2)]).root_system().ambient_space().fundamental_
↪weights()
Finite family {1: (1, 0, -1), 2: (2, -1, -1)}
```

negative_roots()

EXAMPLES:

```
sage: CartanType(['G',2]).root_system().ambient_space().negative_roots()
[(0, -1, 1), (-1, 2, -1), (-1, 1, 0), (-1, 0, 1), (-1, -1, 2), (-2, 1, 1)]
```

```
>>> from sage.all import *
>>> CartanType(['G',Integer(2)]).root_system().ambient_space().negative_
→roots()
[(0, -1, 1), (-1, 2, -1), (-1, 1, 0), (-1, 0, 1), (-1, -1, 2), (-2, 1, 1)]
```

positive_roots()

EXAMPLES:

```
sage: CartanType(['G',2]).root_system().ambient_space().positive_roots()
[(0, 1, -1), (1, -2, 1), (1, -1, 0), (1, 0, -1), (1, 1, -2), (2, -1, -1)]
```

```
>>> from sage.all import *
>>> CartanType(['G',Integer(2)]).root_system().ambient_space().positive_
→roots()
[(0, 1, -1), (1, -2, 1), (1, -1, 0), (1, 0, -1), (1, 1, -2), (2, -1, -1)]
```

simple_root(*i*)

EXAMPLES:

```
sage: CartanType(['G',2]).root_system().ambient_space().simple_roots()
Finite family {1: (0, 1, -1), 2: (1, -2, 1)}
```

```
>>> from sage.all import *
>>> CartanType(['G',Integer(2)]).root_system().ambient_space().simple_roots()
Finite family {1: (0, 1, -1), 2: (1, -2, 1)}
```

class sage.combinat.root_system.type_G.**CartanType**

Bases: *CartanType_standard_finite*, *CartanType_simple*, *CartanType_crystallographic*

EXAMPLES:

```
sage: ct = CartanType(['G',2])
sage: ct
['G', 2]
sage: ct._repr_(compact = True)
'G2'

sage: ct.is_irreducible()
True
sage: ct.is_finite()
True
sage: ct.is_crystallographic()
True
sage: ct.is_simply_laced()
False
sage: ct.dual()
['G', 2] relabelled by {1: 2, 2: 1}
```

(continues on next page)

(continued from previous page)

```
sage: ct.affine()
['G', 2, 1]
```

```
>>> from sage.all import *
>>> ct = CartanType(['G',Integer(2)])
>>> ct
['G', 2]
>>> ct._repr_(compact = True)
'G2'

>>> ct.is_irreducible()
True
>>> ct.is_finite()
True
>>> ct.is_crystallographic()
True
>>> ct.is_simply_laced()
False
>>> ct.dual()
['G', 2] relabelled by {1: 2, 2: 1}
>>> ct.affine()
['G', 2, 1]
```

AmbientSpace

alias of *AmbientSpace*

ascii_art (*label=None*, *node=None*)

Return an ascii art representation of the Dynkin diagram.

EXAMPLES:

```
sage: print(CartanType(['G',2]).ascii_art(label=lambda x: x+2))
  3
O=<=O
3   4
```

```
>>> from sage.all import *
>>> print(CartanType(['G',Integer(2)]).ascii_art(label=lambda x:␣
↪x+Integer(2)))
  3
O=<=O
3   4
```

coxeter_number ()

Return the Coxeter number associated with `self`.

EXAMPLES:

```
sage: CartanType(['G',2]).coxeter_number()
6
```

```
>>> from sage.all import *
>>> CartanType(['G',Integer(2)]).coxeter_number()
6
```

dual()

Return the dual Cartan type.

This uses that G_2 is self-dual up to relabelling.

EXAMPLES:

```
sage: G2 = CartanType(['G',2])
sage: G2.dual()
['G', 2] relabelled by {1: 2, 2: 1}

sage: G2.dynkin_diagram()                                                    #␣
↪needs sage.graphs
  3
O=<=O
1   2
G2
sage: G2.dual().dynkin_diagram()                                             #␣
↪needs sage.graphs
  3
O=<=O
2   1
G2 relabelled by {1: 2, 2: 1}
```

```
>>> from sage.all import *
>>> G2 = CartanType(['G',Integer(2)])
>>> G2.dual()
['G', 2] relabelled by {1: 2, 2: 1}

>>> G2.dynkin_diagram()                                                    #␣
↪needs sage.graphs
  3
O=<=O
1   2
G2
>>> G2.dual().dynkin_diagram()                                             #␣
↪needs sage.graphs
  3
O=<=O
2   1
G2 relabelled by {1: 2, 2: 1}
```

dual_coxeter_number()

Return the dual Coxeter number associated with `self`.

EXAMPLES:

```
sage: CartanType(['G',2]).dual_coxeter_number()
4
```

```
>>> from sage.all import *
>>> CartanType(['G',Integer(2)]).dual_coxeter_number()
4
```

dynkin_diagram()

Return a Dynkin diagram for type G.

EXAMPLES:

```
sage: g = CartanType(['G',2]).dynkin_diagram(); g                        #␣
↪needs sage.graphs
  3
O=<=O
1   2
G2
sage: g.edges(sort=True)                                                 #␣
↪needs sage.graphs
[(1, 2, 1), (2, 1, 3)]
```

```
>>> from sage.all import *
>>> g = CartanType(['G',Integer(2)]).dynkin_diagram(); g                 ␣
↪       # needs sage.graphs
  3
O=<=O
1   2
G2
>>> g.edges(sort=True)                                                 #␣
↪needs sage.graphs
[(1, 2, 1), (2, 1, 3)]
```

5.1.258 Root system data for (untwisted) type G affine

class sage.combinat.root_system.type_G_affine.**CartanType**

Bases: *CartanType_standard_untwisted_affine*

EXAMPLES:

```
sage: ct = CartanType(['G',2,1])
sage: ct
['G', 2, 1]
sage: ct._repr_(compact = True)
'G2~'

sage: ct.is_irreducible()
True
sage: ct.is_finite()
False
sage: ct.is_affine()
True
sage: ct.is_untwisted_affine()
True
sage: ct.is_crystallographic()
True
```

(continues on next page)

(continued from previous page)

```
sage: ct.is_simply_laced()
False
sage: ct.classical()
['G', 2]
sage: ct.dual()
['G', 2, 1]^*
sage: ct.dual().is_untwisted_affine()
False
```

```
>>> from sage.all import *
>>> ct = CartanType(['G',Integer(2),Integer(1)])
>>> ct
['G', 2, 1]
>>> ct._repr_(compact = True)
'G2~'

>>> ct.is_irreducible()
True
>>> ct.is_finite()
False
>>> ct.is_affine()
True
>>> ct.is_untwisted_affine()
True
>>> ct.is_crystallographic()
True
>>> ct.is_simply_laced()
False
>>> ct.classical()
['G', 2]
>>> ct.dual()
['G', 2, 1]^*
>>> ct.dual().is_untwisted_affine()
False
```

ascii_art(*label=None*, *node=None*)

Return an ascii art representation of the Dynkin diagram.

EXAMPLES:

```
sage: print(CartanType(['G',2,1]).ascii_art(label = lambda x: x+2))
  3
O=<=O---O
3   4   2
```

```
>>> from sage.all import *
>>> print(CartanType(['G',Integer(2),Integer(1)]).ascii_art(label = lambda x:␣
↪x+Integer(2)))
  3
O=<=O---O
3   4   2
```

dynkin_diagram()

Return the extended Dynkin diagram for type G.

EXAMPLES:

```
sage: g = CartanType(['G',2,1]).dynkin_diagram(); g                     #␣
↪needs sage.graphs
  3
O=<=O---O
1   2   0
G2~
sage: g.edges(sort=True)                                                #␣
↪needs sage.graphs
[(0, 2, 1), (1, 2, 1), (2, 0, 1), (2, 1, 3)]
```

```
>>> from sage.all import *
>>> g = CartanType(['G',Integer(2),Integer(1)]).dynkin_diagram(); g    ␣
↪              # needs sage.graphs
  3
O=<=O---O
1   2   0
G2~
>>> g.edges(sort=True)                                                 #␣
↪needs sage.graphs
[(0, 2, 1), (1, 2, 1), (2, 0, 1), (2, 1, 3)]
```

5.1.259 Root system data for type H

class sage.combinat.root_system.type_H.**CartanType**(*n*)

Bases: *CartanType_standard_finite*, *CartanType_simple*

EXAMPLES:

```
sage: ct = CartanType(['H',3])
sage: ct
['H', 3]
sage: ct._repr_(compact = True)
'H3'
sage: ct.rank()
3

sage: ct.is_irreducible()
True
sage: ct.is_finite()
True
sage: ct.is_affine()
False
sage: ct.is_crystallographic()
False
sage: ct.is_simply_laced()
False
```

```
>>> from sage.all import *
>>> ct = CartanType(['H',Integer(3)])
>>> ct
['H', 3]
>>> ct._repr_(compact = True)
'H3'
>>> ct.rank()
3

>>> ct.is_irreducible()
True
>>> ct.is_finite()
True
>>> ct.is_affine()
False
>>> ct.is_crystallographic()
False
>>> ct.is_simply_laced()
False
```

coxeter_diagram()

Return a Coxeter diagram for type H.

EXAMPLES:

```
sage: ct = CartanType(['H',3])
sage: ct.coxeter_diagram()                                              #␣
↪needs sage.graphs
Graph on 3 vertices
sage: ct.coxeter_diagram().edges(sort=True)                            #␣
↪needs sage.graphs
[(1, 2, 3), (2, 3, 5)]
sage: ct.coxeter_matrix()                                               #␣
↪needs sage.graphs
[1 3 2]
[3 1 5]
[2 5 1]

sage: ct = CartanType(['H',4])
sage: ct.coxeter_diagram()                                              #␣
↪needs sage.graphs
Graph on 4 vertices
sage: ct.coxeter_diagram().edges(sort=True)                            #␣
↪needs sage.graphs
[(1, 2, 3), (2, 3, 3), (3, 4, 5)]
sage: ct.coxeter_matrix()                                               #␣
↪needs sage.graphs
[1 3 2 2]
[3 1 3 2]
[2 3 1 5]
[2 2 5 1]
```

```
>>> from sage.all import *
>>> ct = CartanType(['H',Integer(3)])
>>> ct.coxeter_diagram()                                                    #␣
↪needs sage.graphs
Graph on 3 vertices
>>> ct.coxeter_diagram().edges(sort=True)                                   #␣
↪needs sage.graphs
[(1, 2, 3), (2, 3, 5)]
>>> ct.coxeter_matrix()                                                     #␣
↪needs sage.graphs
[1 3 2]
[3 1 5]
[2 5 1]

>>> ct = CartanType(['H',Integer(4)])
>>> ct.coxeter_diagram()                                                    #␣
↪needs sage.graphs
Graph on 4 vertices
>>> ct.coxeter_diagram().edges(sort=True)                                   #␣
↪needs sage.graphs
[(1, 2, 3), (2, 3, 3), (3, 4, 5)]
>>> ct.coxeter_matrix()                                                     #␣
↪needs sage.graphs
[1 3 2 2]
[3 1 3 2]
[2 3 1 5]
[2 2 5 1]
```

coxeter_number()

Return the Coxeter number associated with `self`.

EXAMPLES:

```
sage: CartanType(['H',3]).coxeter_number()
10
sage: CartanType(['H',4]).coxeter_number()
30
```

```
>>> from sage.all import *
>>> CartanType(['H',Integer(3)]).coxeter_number()
10
>>> CartanType(['H',Integer(4)]).coxeter_number()
30
```

5.1.260 Root system data for type I

class sage.combinat.root_system.type_I.**CartanType**(*n*)

Bases: *CartanType_standard_finite*, *CartanType_simple*

EXAMPLES:

```
sage: ct = CartanType(['I',5])
sage: ct
```

(continues on next page)

(continued from previous page)

```
['I', 5]
sage: ct._repr_(compact = True)
'I5'
sage: ct.rank()
2
sage: ct.index_set()
(1, 2)

sage: ct.is_irreducible()
True
sage: ct.is_finite()
True
sage: ct.is_affine()
False
sage: ct.is_crystallographic()
False
sage: ct.is_simply_laced()
False
```

```
>>> from sage.all import *
>>> ct = CartanType(['I',Integer(5)])
>>> ct
['I', 5]
>>> ct._repr_(compact = True)
'I5'
>>> ct.rank()
2
>>> ct.index_set()
(1, 2)

>>> ct.is_irreducible()
True
>>> ct.is_finite()
True
>>> ct.is_affine()
False
>>> ct.is_crystallographic()
False
>>> ct.is_simply_laced()
False
```

coxeter_diagram()

Return the Coxeter matrix for this type.

EXAMPLES:

```
sage: ct = CartanType(['I', 4])
sage: ct.coxeter_diagram()                                              #␣
↪needs sage.graphs
Graph on 2 vertices
sage: ct.coxeter_diagram().edges(sort=True)                             #␣
↪needs sage.graphs
```

(continues on next page)

(continued from previous page)

```
[(1, 2, 4)]
sage: ct.coxeter_matrix()                                                    #␣
↪needs sage.graphs
[1 4]
[4 1]
```

```
>>> from sage.all import *
>>> ct = CartanType(['I', Integer(4)])
>>> ct.coxeter_diagram()                                                     #␣
↪needs sage.graphs
Graph on 2 vertices
>>> ct.coxeter_diagram().edges(sort=True)                                    #␣
↪needs sage.graphs
[(1, 2, 4)]
>>> ct.coxeter_matrix()                                                      #␣
↪needs sage.graphs
[1 4]
[4 1]
```

coxeter_number()

Return the Coxeter number associated with `self`.

EXAMPLES:

```
sage: CartanType(['I',3]).coxeter_number()
3
sage: CartanType(['I',12]).coxeter_number()
12
```

```
>>> from sage.all import *
>>> CartanType(['I',Integer(3)]).coxeter_number()
3
>>> CartanType(['I',Integer(12)]).coxeter_number()
12
```

index_set()

Type $I_2(p)$ is indexed by $\{1, 2\}$.

EXAMPLES:

```
sage: CartanType(['I', 5]).index_set()
(1, 2)
```

```
>>> from sage.all import *
>>> CartanType(['I', Integer(5)]).index_set()
(1, 2)
```

rank()

Type $I_2(p)$ is of rank 2.

EXAMPLES:

```
sage: CartanType(['I', 5]).rank()
2
```

```
>>> from sage.all import *
>>> CartanType(['I', Integer(5)]).rank()
2
```

5.1.261 Root system data for type Q

class sage.combinat.root_system.type_Q.**CartanType**(*m*)

Bases: *CartanType_standard_finite*

Cartan Type Q_n.

See also

CartanType()

dual()

Return dual of self.

EXAMPLES:

```
sage: Q = CartanType(['Q',3])
sage: Q.dual()
['Q', 3]
```

```
>>> from sage.all import *
>>> Q = CartanType(['Q',Integer(3)])
>>> Q.dual()
['Q', 3]
```

index_set()

Return the index set for Cartan type Q.

The index set for type Q is of the form $\{-n, \ldots, -1, 1, \ldots, n\}$.

EXAMPLES:

```
sage: CartanType(['Q', 3]).index_set()
(1, 2, -2, -1)
```

```
>>> from sage.all import *
>>> CartanType(['Q', Integer(3)]).index_set()
(1, 2, -2, -1)
```

is_irreducible()

Return whether this Cartan type is irreducible.

EXAMPLES:

```
sage: Q = CartanType(['Q',3])
sage: Q.is_irreducible()
True
```

```
>>> from sage.all import *
>>> Q = CartanType(['Q',Integer(3)])
>>> Q.is_irreducible()
True
```

is_simply_laced()

Return whether this Cartan type is simply-laced.

EXAMPLES:

```
sage: Q = CartanType(['Q',3])
sage: Q.is_simply_laced()
True
```

```
>>> from sage.all import *
>>> Q = CartanType(['Q',Integer(3)])
>>> Q.is_simply_laced()
True
```

root_system()

Return the root system of `self`.

EXAMPLES:

```
sage: Q = CartanType(['Q',3])
sage: Q.root_system()
Root system of type ['A', 2]
```

```
>>> from sage.all import *
>>> Q = CartanType(['Q',Integer(3)])
>>> Q.root_system()
Root system of type ['A', 2]
```

5.1.262 Root system data for affine Cartan types

class sage.combinat.root_system.type_affine.**AmbientSpace**(*root_system*, *base_ring*)

Bases: *CombinatorialFreeModule*

Ambient space for affine types.

This is constructed from the data in the corresponding classical ambient space. Namely, this space is obtained by adding two elements δ and $\delta^\vee$ to the basis of the classical ambient space, and by endowing it with the canonical scalar product.

The coefficient of an element in $\delta^\vee$, thus its scalar product with $\delta^\vee$ gives its level, and dually for the colevel. The canonical projection onto the classical ambient space (by killing δ and $\delta^\vee$) maps the simple roots (except α_0) onto the corresponding classical simple roots, and similarly for the coroots, fundamental weights, … Altogether, this uniquely determines the embedding of the root, coroot, weight, and coweight lattices. See *simple_root()* and *fundamental_weight()* for the details.

⚠ **Warning**

In type BC, the null root is in fact:

```
sage: R = RootSystem(["BC",3,2]).ambient_space()
sage: R.null_root()                                                    #␣
↪needs sage.graphs
2*e['delta']
```

```
>>> from sage.all import *
>>> R = RootSystem(["BC",Integer(3),Integer(2)]).ambient_space()
>>> R.null_root()                                                    #␣
↪needs sage.graphs
2*e['delta']
```

⚠ **Warning**

In the literature one often considers a larger affine ambient space obtained from the classical ambient space by adding four dimensions, namely for the fundamental weight Λ_0 the fundamental coweight $\Lambda_0^\vee$, the null root δ, and the null coroot c (aka central element). In this larger ambient space, the scalar product is degenerate: $\langle\delta, \delta\rangle = 0$ and similarly for the null coroot.

In the current implementation, Λ_0 and the null coroot are identified:

```
sage: L = RootSystem(["A",3,1]).ambient_space()
sage: Lambda = L.fundamental_weights()                                 #␣
↪needs sage.graphs
sage: Lambda[0]                                                        #␣
↪needs sage.graphs
e['deltacheck']
sage: L.null_coroot()                                                  #␣
↪needs sage.graphs
e['deltacheck']
```

```
>>> from sage.all import *
>>> L = RootSystem(["A",Integer(3),Integer(1)]).ambient_space()
>>> Lambda = L.fundamental_weights()                                 #␣
↪needs sage.graphs
>>> Lambda[Integer(0)]                                                  ␣
↪    # needs sage.graphs
e['deltacheck']
>>> L.null_coroot()                                                  #␣
↪needs sage.graphs
e['deltacheck']
```

Therefore the scalar product of the null coroot with itself differs from the larger ambient space:

```
sage: L.null_coroot().scalar(L.null_coroot())                          #␣
↪needs sage.graphs
1
```

```
>>> from sage.all import *
>>> L.null_coroot().scalar(L.null_coroot())                          #␣
↪needs sage.graphs
1
```

In general, scalar products between two elements that do not live on "opposite sides" won't necessarily match.

EXAMPLES:

```
sage: R = RootSystem(["A",3,1])
sage: e = R.ambient_space(); e
Ambient space of the Root system of type ['A', 3, 1]
sage: TestSuite(e).run()
```

```
>>> from sage.all import *
>>> R = RootSystem(["A",Integer(3),Integer(1)])
>>> e = R.ambient_space(); e
Ambient space of the Root system of type ['A', 3, 1]
>>> TestSuite(e).run()
```

Systematic checks on all affine types:

```
sage: for ct in CartanType.samples(affine=True, crystallographic=True):
....:     if ct.classical().root_system().ambient_space() is not None:
....:         print(ct)
....:         L = ct.root_system().ambient_space()
....:         assert L
....:         TestSuite(L).run()
['A', 1, 1]
['A', 5, 1]
['B', 1, 1]
['B', 5, 1]
['C', 1, 1]
['C', 5, 1]
['D', 3, 1]
['D', 5, 1]
['E', 6, 1]
['E', 7, 1]
['E', 8, 1]
['F', 4, 1]
['G', 2, 1]
['BC', 1, 2]
['BC', 5, 2]
['B', 5, 1]^*
['C', 4, 1]^*
['F', 4, 1]^*
['G', 2, 1]^*
['BC', 1, 2]^*
['BC', 5, 2]^*
```

```
>>> from sage.all import *
>>> for ct in CartanType.samples(affine=True, crystallographic=True):
...     if ct.classical().root_system().ambient_space() is not None:
...         print(ct)
...         L = ct.root_system().ambient_space()
...         assert L
...         TestSuite(L).run()
```

(continues on next page)

(continued from previous page)

```
['A', 1, 1]
['A', 5, 1]
['B', 1, 1]
['B', 5, 1]
['C', 1, 1]
['C', 5, 1]
['D', 3, 1]
['D', 5, 1]
['E', 6, 1]
['E', 7, 1]
['E', 8, 1]
['F', 4, 1]
['G', 2, 1]
['BC', 1, 2]
['BC', 5, 2]
['B', 5, 1]^*
['C', 4, 1]^*
['F', 4, 1]^*
['G', 2, 1]^*
['BC', 1, 2]^*
['BC', 5, 2]^*
```

class Element

Bases: `IndexedFreeModuleElement`

associated_coroot()

Return the coroot associated to `self`.

INPUT:

- `self` – a root

EXAMPLES:

```
sage: # needs sage.graphs
sage: alpha = RootSystem(['C',2,1]).ambient_space().simple_roots()
sage: alpha
Finite family {0: -2*e[0] + e['delta'], 1: e[0] - e[1], 2: 2*e[1]}
sage: alpha[0].associated_coroot()
-e[0] + e['deltacheck']
sage: alpha[1].associated_coroot()
e[0] - e[1]
sage: alpha[2].associated_coroot()
e[1]
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> alpha = RootSystem(['C',Integer(2),Integer(1)]).ambient_space().
↪simple_roots()
>>> alpha
Finite family {0: -2*e[0] + e['delta'], 1: e[0] - e[1], 2: 2*e[1]}
>>> alpha[Integer(0)].associated_coroot()
-e[0] + e['deltacheck']
>>> alpha[Integer(1)].associated_coroot()
```

(continues on next page)

(continued from previous page)

```
e[0] - e[1]
>>> alpha[Integer(2)].associated_coroot()
e[1]
```

inner_product(*other*)

Implement the canonical inner product of `self` with `other`.

EXAMPLES:

```
sage: e = RootSystem(['B',3,1]).ambient_space()
sage: B = e.basis()
sage: matrix([[x.inner_product(y) for x in B] for y in B])
[1 0 0 0 0]
[0 1 0 0 0]
[0 0 1 0 0]
[0 0 0 1 0]
[0 0 0 0 1]
sage: x = e.an_element(); x
2*e[0] + 2*e[1] + 3*e[2]
sage: x.inner_product(x)
17
```

```
>>> from sage.all import *
>>> e = RootSystem(['B',Integer(3),Integer(1)]).ambient_space()
>>> B = e.basis()
>>> matrix([[x.inner_product(y) for x in B] for y in B])
[1 0 0 0 0]
[0 1 0 0 0]
[0 0 1 0 0]
[0 0 0 1 0]
[0 0 0 0 1]
>>> x = e.an_element(); x
2*e[0] + 2*e[1] + 3*e[2]
>>> x.inner_product(x)
17
```

`scalar()` is an alias for this method:

```
sage: x.scalar(x)
17
```

```
>>> from sage.all import *
>>> x.scalar(x)
17
```

Todo

Lift to CombinatorialFreeModule.Element as canonical_inner_product

scalar(*other*)

Implement the canonical inner product of `self` with `other`.

EXAMPLES:

```
sage: e = RootSystem(['B',3,1]).ambient_space()
sage: B = e.basis()
sage: matrix([[x.inner_product(y) for x in B] for y in B])
[1 0 0 0 0]
[0 1 0 0 0]
[0 0 1 0 0]
[0 0 0 1 0]
[0 0 0 0 1]
sage: x = e.an_element(); x
2*e[0] + 2*e[1] + 3*e[2]
sage: x.inner_product(x)
17
```

```
>>> from sage.all import *
>>> e = RootSystem(['B',Integer(3),Integer(1)]).ambient_space()
>>> B = e.basis()
>>> matrix([[x.inner_product(y) for x in B] for y in B])
[1 0 0 0 0]
[0 1 0 0 0]
[0 0 1 0 0]
[0 0 0 1 0]
[0 0 0 0 1]
>>> x = e.an_element(); x
2*e[0] + 2*e[1] + 3*e[2]
>>> x.inner_product(x)
17
```

`scalar()` is an alias for this method:

```
sage: x.scalar(x)
17
```

```
>>> from sage.all import *
>>> x.scalar(x)
17
```

Todo

Lift to CombinatorialFreeModule.Element as canonical_inner_product

coroot_lattice()

EXAMPLES:

```
sage: RootSystem(["A",3,1]).ambient_lattice().coroot_lattice()
Ambient lattice of the Root system of type ['A', 3, 1]
```

```
>>> from sage.all import *
>>> RootSystem(["A",Integer(3),Integer(1)]).ambient_lattice().coroot_lattice()
Ambient lattice of the Root system of type ['A', 3, 1]
```

Todo

Factor out this code with the classical ambient space.

fundamental_weight(*i*)

Return the fundamental weight Λ_i in this ambient space.

It is constructed by taking the corresponding fundamental weight of the classical ambient space (or 0 for Λ_0) and raising it to the appropriate level by adding a suitable multiple of $\delta^\vee$.

EXAMPLES:

```
sage: RootSystem(['A',3,1]).ambient_space().fundamental_weight(2)              #␣
↪needs sage.graphs
e[0] + e[1] + e['deltacheck']
sage: RootSystem(['A',3,1]).ambient_space().fundamental_weights()              #␣
↪needs sage.graphs
Finite family {0: e['deltacheck'],
               1: e[0] + e['deltacheck'],
               2: e[0] + e[1] + e['deltacheck'],
               3: e[0] + e[1] + e[2] + e['deltacheck']}
sage: RootSystem(['A',3]).ambient_space().fundamental_weights()
Finite family {1: (1, 0, 0, 0), 2: (1, 1, 0, 0), 3: (1, 1, 1, 0)}
sage: A31wl = RootSystem(['A',3,1]).weight_lattice()
sage: A31wl.fundamental_weights().map(attrcall("level"))                        #␣
↪needs sage.graphs
Finite family {0: 1, 1: 1, 2: 1, 3: 1}

sage: RootSystem(['B',3,1]).ambient_space().fundamental_weights()              #␣
↪needs sage.graphs
Finite family {0: e['deltacheck'],

↪needs sage.graphs
Finite family {0: 1, 1: 1, 2: 2, 3: 1}
```

In type BC dual, the coefficient of 'delta^vee' is the level divided by 2 to take into account that the null coroot is $2\delta^\vee$:

```
sage: R = CartanType(['BC',3,2]).dual().root_system()
sage: R.ambient_space().fundamental_weights()                                 #␣
↪needs sage.graphs
Finite family {0: e['deltacheck'],
               1: e[0] + e['deltacheck'],
               2: e[0] + e[1] + e['deltacheck'],
               3: 1/2*e[0] + 1/2*e[1] + 1/2*e[2] + 1/2*e['deltacheck']}
sage: R.weight_lattice().fundamental_weights().map(attrcall("level"))         #␣
↪needs sage.graphs
Finite family {0: 2, 1: 2, 2: 2, 3: 1}
sage: R.ambient_space().null_coroot()                                         #␣
↪needs sage.graphs
2*e['deltacheck']
```

```
>>> from sage.all import *
>>> R = CartanType(['BC',Integer(3),Integer(2)]).dual().root_system()
>>> R.ambient_space().fundamental_weights()                                 #␣
↪needs sage.graphs
Finite family {0: e['deltacheck'],
               1: e[0] + e['deltacheck'],
               2: e[0] + e[1] + e['deltacheck'],
               3: 1/2*e[0] + 1/2*e[1] + 1/2*e[2] + 1/2*e['deltacheck']}
>>> R.weight_lattice().fundamental_weights().map(attrcall("level"))         #␣
↪needs sage.graphs
Finite family {0: 2, 1: 2, 2: 2, 3: 1}
>>> R.ambient_space().null_coroot()                                         #␣
↪needs sage.graphs
2*e['deltacheck']
```

By a slight naming abuse this function also accepts "delta" as input so that it can be used to implement the embedding from the extended weight lattice:

```
sage: RootSystem(['A',3,1]).ambient_space().fundamental_weight("delta")
e['delta']
```

```
>>> from sage.all import *
>>> RootSystem(['A',Integer(3),Integer(1)]).ambient_space().fundamental_
↪weight("delta")
e['delta']
```

is_extended()

Return whether this is a realization of the extended weight lattice: yes!

See also

- *sage.combinat.root_system.weight_space.WeightSpace*
- *sage.combinat.root_system.weight_lattice_realizations.WeightLatticeRealizations.ParentMethods.is_extended()*

EXAMPLES:

```
sage: RootSystem(['A',3,1]).ambient_space().is_extended()
True
```

```
>>> from sage.all import *
>>> RootSystem(['A',Integer(3),Integer(1)]).ambient_space().is_extended()
True
```

simple_coroot(i)

Return the i-th simple coroot $\alpha_i^\vee$ of this affine ambient space.

EXAMPLES:

```
sage: RootSystem(["A",3,1]).ambient_space().simple_coroot(1)
e[0] - e[1]
```

```
>>> from sage.all import *
>>> RootSystem(["A",Integer(3),Integer(1)]).ambient_space().simple_
↪coroot(Integer(1))
e[0] - e[1]
```

It is built as the coroot associated to the simple root α_i:

```
sage: RootSystem(["B",3,1]).ambient_space().simple_roots()                  #␣
↪needs sage.graphs
Finite family {0: -e[0] - e[1] + e['delta'], 1: e[0] - e[1],
               2: e[1] - e[2], 3: e[2]}
sage: RootSystem(["B",3,1]).ambient_space().simple_coroots()                #␣
↪needs sage.graphs
Finite family {0: -e[0] - e[1] + e['deltacheck'], 1: e[0] - e[1],
               2: e[1] - e[2], 3: 2*e[2]}
```

```
>>> from sage.all import *
>>> RootSystem(["B",Integer(3),Integer(1)]).ambient_space().simple_roots()      ␣
↪               # needs sage.graphs
Finite family {0: -e[0] - e[1] + e['delta'], 1: e[0] - e[1],
               2: e[1] - e[2], 3: e[2]}
>>> RootSystem(["B",Integer(3),Integer(1)]).ambient_space().simple_coroots()  ␣
↪               # needs sage.graphs
Finite family {0: -e[0] - e[1] + e['deltacheck'], 1: e[0] - e[1],
               2: e[1] - e[2], 3: 2*e[2]}
```

Todo

Factor out this code with the classical ambient space.

simple_root(*i*)

Return the i-th simple root of this affine ambient space.

EXAMPLES:

It is built straightforwardly from the corresponding simple root α_i in the classical ambient space:

```
sage: RootSystem(["A",3,1]).ambient_space().simple_root(1)
e[0] - e[1]
```

```
>>> from sage.all import *
>>> RootSystem(["A",Integer(3),Integer(1)]).ambient_space().simple_
↪root(Integer(1))
e[0] - e[1]
```

For the special node (typically $i = 0$), α_0 is built from the other simple roots using the column annihilator of the Cartan matrix and adding δ, where δ is the null root:

```
sage: RootSystem(["A",3]).ambient_space().simple_roots()
Finite family {1: (1, -1, 0, 0), 2: (0, 1, -1, 0), 3: (0, 0, 1, -1)}
sage: RootSystem(["A",3,1]).ambient_space().simple_roots()                  #␣
↪needs sage.graphs
Finite family {0: -e[0] + e[3] + e['delta'], 1: e[0] - e[1],
               2: e[1] - e[2], 3: e[2] - e[3]}
```

```
>>> from sage.all import *
>>> RootSystem(["A",Integer(3)]).ambient_space().simple_roots()
Finite family {1: (1, -1, 0, 0), 2: (0, 1, -1, 0), 3: (0, 0, 1, -1)}
>>> RootSystem(["A",Integer(3),Integer(1)]).ambient_space().simple_roots()      ␣
↪               # needs sage.graphs
Finite family {0: -e[0] + e[3] + e['delta'], 1: e[0] - e[1],
               2: e[1] - e[2], 3: e[2] - e[3]}
```

Here is a twisted affine example:

```
sage: B31v = RootSystem(CartanType(["B",3,1]).dual())
sage: B31v.ambient_space().simple_roots()                                   #␣
↪needs sage.graphs
```

(continues on next page)

(continued from previous page)

```
Finite family {0: -e[0] - e[1] + e['delta'], 1: e[0] - e[1],
               2: e[1] - e[2], 3: 2*e[2]}
```

```
>>> from sage.all import *
>>> B31v = RootSystem(CartanType(["B",Integer(3),Integer(1)]).dual())
>>> B31v.ambient_space().simple_roots()                                     #␣
↪needs sage.graphs
Finite family {0: -e[0] - e[1] + e['delta'], 1: e[0] - e[1],
               2: e[1] - e[2], 3: 2*e[2]}
```

In fact δ is really $1/a_0$ times the null root (see the discussion in `WeightSpace`) but this only makes a difference in type BC:

```
sage: L = RootSystem(CartanType(["BC",3,2])).ambient_space()
sage: L.simple_roots()                                                      #␣
↪needs sage.graphs
Finite family {0: -e[0] + e['delta'], 1: e[0] - e[1],
               2: e[1] - e[2], 3: 2*e[2]}
sage: L.null_root()                                                         #␣
↪needs sage.graphs
2*e['delta']
```

```
>>> from sage.all import *
>>> L = RootSystem(CartanType(["BC",Integer(3),Integer(2)])).ambient_space()
>>> L.simple_roots()                                                        #␣
↪needs sage.graphs
Finite family {0: -e[0] + e['delta'], 1: e[0] - e[1],
               2: e[1] - e[2], 3: 2*e[2]}
>>> L.null_root()                                                           #␣
↪needs sage.graphs
2*e['delta']
```

Note

An alternative would have been to use the default implementation of the simple roots as linear combinations of the fundamental weights. However, as in type A_n it is preferable to take a slight variant to avoid rational coefficient (the usual GL_n vs SL_n issue).

See also

- `simple_root()`
- `WeightSpace`
- `CartanType.col_annihilator()`
- `null_root()`

classmethod smallest_base_ring(*cartan_type*)

Return the smallest base ring the ambient space can be defined on.

This is the smallest base ring for the associated classical ambient space.

See also

smallest_base_ring()

EXAMPLES:

```
sage: cartan_type = CartanType(["A",3,1])
sage: cartan_type.AmbientSpace.smallest_base_ring(cartan_type)
Integer Ring
sage: cartan_type = CartanType(["B",3,1])
sage: cartan_type.AmbientSpace.smallest_base_ring(cartan_type)
Rational Field
```

```
>>> from sage.all import *
>>> cartan_type = CartanType(["A",Integer(3),Integer(1)])
>>> cartan_type.AmbientSpace.smallest_base_ring(cartan_type)
Integer Ring
>>> cartan_type = CartanType(["B",Integer(3),Integer(1)])
>>> cartan_type.AmbientSpace.smallest_base_ring(cartan_type)
Rational Field
```

5.1.263 Root system data for dual Cartan types

class sage.combinat.root_system.type_dual.**AmbientSpace**(*root_system*, *base_ring*, *index_set=None*)

Bases: *AmbientSpace*

Ambient space for a dual finite Cartan type.

It is constructed in the canonical way from the ambient space of the original Cartan type by switching the roles of simple roots, fundamental weights, etc.

Note

Recall that, for any finite Cartan type, and in particular the a simply laced one, the dual Cartan type is constructed as another preexisting Cartan type. Furthermore the ambient space for an affine type is constructed from the ambient space for its classical type. Thus this code is not actually currently used.

It is kept for cross-checking and for reference in case it could become useful, e.g., for dual of general Kac-Moody types.

For the doctests, we need to explicitly create a dual type. Subsequently, since reconstruction of the dual of type F_4 is the relabelled Cartan type, pickling fails on the `TestSuite` run.

EXAMPLES:

```
sage: ct = sage.combinat.root_system.type_dual.CartanType(CartanType(['F',4]))
sage: L = ct.root_system().ambient_space(); L
Ambient space of the Root system of type ['F', 4]^*
sage: TestSuite(L).run(skip=["_test_elements","_test_pickling"])            #␣
↪needs sage.graphs
```

```
>>> from sage.all import *
>>> ct = sage.combinat.root_system.type_dual.CartanType(CartanType(['F',
↪Integer(4)]))
>>> L = ct.root_system().ambient_space(); L
Ambient space of the Root system of type ['F', 4]^*
>>> TestSuite(L).run(skip=["_test_elements","_test_pickling"])          #␣
↪needs sage.graphs
```

dimension()

Return the dimension of this ambient space.

See also

sage.combinat.root_system.ambient_space.AmbientSpace.dimension()

EXAMPLES:

```
sage: ct = sage.combinat.root_system.type_dual.CartanType(CartanType(['F',4]))
sage: L = ct.root_system().ambient_space()
sage: L.dimension()
4
```

```
>>> from sage.all import *
>>> ct = sage.combinat.root_system.type_dual.CartanType(CartanType(['F',
↪Integer(4)]))
>>> L = ct.root_system().ambient_space()
>>> L.dimension()
4
```

fundamental_weights()

Return the fundamental weights.

They are computed from the simple roots by inverting the Cartan matrix. This is acceptable since this is only about ambient spaces for finite Cartan types. Also, we do not have to worry about the usual GL_n vs SL_n catch because type A is self dual.

An alternative would have been to start from the fundamental coweights in the dual ambient space, but those are not yet implemented.

EXAMPLES:

```
sage: ct = sage.combinat.root_system.type_dual.CartanType(CartanType(['F',4]))
sage: L = ct.root_system().ambient_space()
sage: L.fundamental_weights()                                            #␣
↪needs sage.graphs
Finite family {1: (1, 1, 0, 0), 2: (2, 1, 1, 0), 3: (3, 1, 1, 1), 4: (2, 0, 0,
↪ 0)}
```

```
>>> from sage.all import *
>>> ct = sage.combinat.root_system.type_dual.CartanType(CartanType(['F',
↪Integer(4)]))
>>> L = ct.root_system().ambient_space()
>>> L.fundamental_weights()                                              #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.graphs
Finite family {1: (1, 1, 0, 0), 2: (2, 1, 1, 0), 3: (3, 1, 1, 1), 4: (2, 0, 0,
↪ 0)}
```

Note that this ambient space is isomorphic, but not equal, to that obtained by constructing F_4 dual by relabelling:

```
sage: ct = CartanType(['F',4]).dual(); ct
['F', 4] relabelled by {1: 4, 2: 3, 3: 2, 4: 1}
sage: ct.root_system().ambient_space().fundamental_weights()
Finite family {1: (1, 0, 0, 0), 2: (3/2, 1/2, 1/2, 1/2), 3: (2, 1, 1, 0), 4:␣
↪(1, 1, 0, 0)}
```

```
>>> from sage.all import *
>>> ct = CartanType(['F',Integer(4)]).dual(); ct
['F', 4] relabelled by {1: 4, 2: 3, 3: 2, 4: 1}
>>> ct.root_system().ambient_space().fundamental_weights()
Finite family {1: (1, 0, 0, 0), 2: (3/2, 1/2, 1/2, 1/2), 3: (2, 1, 1, 0), 4:␣
↪(1, 1, 0, 0)}
```

simple_root(*i*)

Return the i-th simple root.

It is constructed by looking up the corresponding simple coroot in the ambient space for the dual Cartan type.

EXAMPLES:

```
sage: ct = sage.combinat.root_system.type_dual.CartanType(CartanType(['F',4]))
sage: ct.root_system().ambient_space().simple_root(1)
(0, 1, -1, 0)

sage: ct.root_system().ambient_space().simple_roots()
Finite family {1: (0, 1, -1, 0), 2: (0, 0, 1, -1), 3: (0, 0, 0, 2), 4: (1, -1,
↪ -1, -1)}

sage: ct.dual().root_system().ambient_space().simple_coroots()
Finite family {1: (0, 1, -1, 0), 2: (0, 0, 1, -1), 3: (0, 0, 0, 2), 4: (1, -1,
↪ -1, -1)}
```

```
>>> from sage.all import *
>>> ct = sage.combinat.root_system.type_dual.CartanType(CartanType(['F',
↪Integer(4)]))
>>> ct.root_system().ambient_space().simple_root(Integer(1))
(0, 1, -1, 0)

>>> ct.root_system().ambient_space().simple_roots()
Finite family {1: (0, 1, -1, 0), 2: (0, 0, 1, -1), 3: (0, 0, 0, 2), 4: (1, -1,
↪ -1, -1)}

>>> ct.dual().root_system().ambient_space().simple_coroots()
Finite family {1: (0, 1, -1, 0), 2: (0, 0, 1, -1), 3: (0, 0, 0, 2), 4: (1, -1,
↪ -1, -1)}
```

Note that this ambient space is isomorphic, but not equal, to that obtained by constructing F_4 dual by relabelling:

```
sage: ct = CartanType(['F',4]).dual(); ct
['F', 4] relabelled by {1: 4, 2: 3, 3: 2, 4: 1}
sage: ct.root_system().ambient_space().simple_roots()
Finite family {1: (1/2, -1/2, -1/2, -1/2), 2: (0, 0, 0, 1), 3: (0, 0, 1, -1),␣
↪4: (0, 1, -1, 0)}
```

```
>>> from sage.all import *
>>> ct = CartanType(['F',Integer(4)]).dual(); ct
['F', 4] relabelled by {1: 4, 2: 3, 3: 2, 4: 1}
>>> ct.root_system().ambient_space().simple_roots()
Finite family {1: (1/2, -1/2, -1/2, -1/2), 2: (0, 0, 0, 1), 3: (0, 0, 1, -1),␣
↪4: (0, 1, -1, 0)}
```

class sage.combinat.root_system.type_dual.**CartanType**(*type*)

Bases: *CartanType_decorator*, *CartanType_crystallographic*

A class for dual Cartan types.

The dual of a (crystallographic) Cartan type is a Cartan type with the same index set, but all arrows reversed in the Dynkin diagram (otherwise said, the Cartan matrix is transposed). It shares a lot of properties in common with its dual. In particular, the Weyl group is isomorphic to that of the dual as a Coxeter group.

EXAMPLES:

For all finite Cartan types, and in particular the simply laced ones, the dual Cartan type is given by another preexisting Cartan type:

```
sage: CartanType(['A',4]).dual()
['A', 4]
sage: CartanType(['B',4]).dual()
['C', 4]
sage: CartanType(['C',4]).dual()
['B', 4]
sage: CartanType(['F',4]).dual()
['F', 4] relabelled by {1: 4, 2: 3, 3: 2, 4: 1}
```

```
>>> from sage.all import *
>>> CartanType(['A',Integer(4)]).dual()
['A', 4]
>>> CartanType(['B',Integer(4)]).dual()
['C', 4]
>>> CartanType(['C',Integer(4)]).dual()
['B', 4]
>>> CartanType(['F',Integer(4)]).dual()
['F', 4] relabelled by {1: 4, 2: 3, 3: 2, 4: 1}
```

So to exercise this class we consider some non simply laced affine Cartan types and also create explicitly F_4^* as a dual cartan type:

```
sage: from sage.combinat.root_system.type_dual import CartanType as CartanTypeDual
sage: F4d = CartanTypeDual(CartanType(['F',4])); F4d
['F', 4]^*
```

(continues on next page)

(continued from previous page)

```
sage: G21d = CartanType(['G',2,1]).dual(); G21d
['G', 2, 1]^*
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.type_dual import CartanType as CartanTypeDual
>>> F4d = CartanTypeDual(CartanType(['F',Integer(4)])); F4d
['F', 4]^*
>>> G21d = CartanType(['G',Integer(2),Integer(1)]).dual(); G21d
['G', 2, 1]^*
```

They share many properties with their original Cartan types:

```
sage: F4d.is_irreducible()
True
sage: F4d.is_crystallographic()
True
sage: F4d.is_simply_laced()
False
sage: F4d.is_finite()
True
sage: G21d.is_finite()
False
sage: F4d.is_affine()
False
sage: G21d.is_affine()
True
```

```
>>> from sage.all import *
>>> F4d.is_irreducible()
True
>>> F4d.is_crystallographic()
True
>>> F4d.is_simply_laced()
False
>>> F4d.is_finite()
True
>>> G21d.is_finite()
False
>>> F4d.is_affine()
False
>>> G21d.is_affine()
True
```

Note

F4d is pickled by construction as F4.dual() hence the above failure.

ascii_art(*label=None*, *node=None*)

Return an ascii art representation of this Cartan type.

(by hacking the ascii art representation of the dual Cartan type)

EXAMPLES:

```
sage: print(CartanType(["B", 3, 1]).dual().ascii_art())
    O 0
    |
    |
O---O=<=O
1   2   3
sage: print(CartanType(["C", 4, 1]).dual().ascii_art())
O=<=O---O---O=>=O
0   1   2   3   4
sage: print(CartanType(["G", 2, 1]).dual().ascii_art())
  3
O=>=O---O
1   2   0
sage: print(CartanType(["F", 4, 1]).dual().ascii_art())
O---O---O=<=O---O
0   1   2   3   4
sage: print(CartanType(["BC", 4, 2]).dual().ascii_art())
O=>=O---O---O=>=O
0   1   2   3   4
```

```
>>> from sage.all import *
>>> print(CartanType(["B", Integer(3), Integer(1)]).dual().ascii_art())
    O 0
    |
    |
O---O=<=O
1   2   3
>>> print(CartanType(["C", Integer(4), Integer(1)]).dual().ascii_art())
O=<=O---O---O=>=O
0   1   2   3   4
>>> print(CartanType(["G", Integer(2), Integer(1)]).dual().ascii_art())
  3
O=>=O---O
1   2   0
>>> print(CartanType(["F", Integer(4), Integer(1)]).dual().ascii_art())
O---O---O=<=O---O
0   1   2   3   4
>>> print(CartanType(["BC", Integer(4), Integer(2)]).dual().ascii_art())
O=>=O---O---O=>=O
0   1   2   3   4
```

dual()

EXAMPLES:

```
sage: ct = CartanType(['F', 4, 1]).dual()
sage: ct.dual()
['F', 4, 1]
```

```
>>> from sage.all import *
>>> ct = CartanType(['F', Integer(4), Integer(1)]).dual()
>>> ct.dual()
```

(continues on next page)

(continued from previous page)

```
['F', 4, 1]
```

dynkin_diagram()

EXAMPLES:

```
sage: ct = CartanType(['F', 4, 1]).dual()
sage: ct.dynkin_diagram()                                                    #␣
↪needs sage.graphs
O---O---O=<=O---O
0   1   2   3   4
F4~*
```

```
>>> from sage.all import *
>>> ct = CartanType(['F', Integer(4), Integer(1)]).dual()
>>> ct.dynkin_diagram()                                                    #␣
↪needs sage.graphs
O---O---O=<=O---O
0   1   2   3   4
F4~*
```

class sage.combinat.root_system.type_dual.**CartanType_affine**(*type*)

Bases: *CartanType*, *CartanType_affine*

basic_untwisted()

Return the basic untwisted Cartan type associated with this affine Cartan type.

Given an affine type $X_n^{(r)}$, the basic untwisted type is X_n. In other words, it is the classical Cartan type that is twisted to obtain `self`.

EXAMPLES:

```
sage: CartanType(['A', 7, 2]).basic_untwisted()
['A', 7]
sage: CartanType(['E', 6, 2]).basic_untwisted()
['E', 6]
sage: CartanType(['D', 4, 3]).basic_untwisted()
['D', 4]
```

```
>>> from sage.all import *
>>> CartanType(['A', Integer(7), Integer(2)]).basic_untwisted()
['A', 7]
>>> CartanType(['E', Integer(6), Integer(2)]).basic_untwisted()
['E', 6]
>>> CartanType(['D', Integer(4), Integer(3)]).basic_untwisted()
['D', 4]
```

classical()

Return the classical Cartan type associated with `self` (which should be affine).

EXAMPLES:

```
sage: CartanType(['A',3,1]).dual().classical()
['A', 3]
```

(continues on next page)

(continued from previous page)

```
sage: CartanType(['B',3,1]).dual().classical()
['C', 3]
sage: CartanType(['F',4,1]).dual().classical()
['F', 4] relabelled by {1: 4, 2: 3, 3: 2, 4: 1}
sage: CartanType(['BC',4,2]).dual().classical()
['B', 4]
```

```
>>> from sage.all import *
>>> CartanType(['A',Integer(3),Integer(1)]).dual().classical()
['A', 3]
>>> CartanType(['B',Integer(3),Integer(1)]).dual().classical()
['C', 3]
>>> CartanType(['F',Integer(4),Integer(1)]).dual().classical()
['F', 4] relabelled by {1: 4, 2: 3, 3: 2, 4: 1}
>>> CartanType(['BC',Integer(4),Integer(2)]).dual().classical()
['B', 4]
```

special_node()

Implement *CartanType_affine.special_node()*.

The special node of the dual of an affine type T is the special node of T.

EXAMPLES:

```
sage: CartanType(['A',3,1]).dual().special_node()
0
sage: CartanType(['B',3,1]).dual().special_node()
0
sage: CartanType(['F',4,1]).dual().special_node()
0
sage: CartanType(['BC',4,2]).dual().special_node()
0
```

```
>>> from sage.all import *
>>> CartanType(['A',Integer(3),Integer(1)]).dual().special_node()
0
>>> CartanType(['B',Integer(3),Integer(1)]).dual().special_node()
0
>>> CartanType(['F',Integer(4),Integer(1)]).dual().special_node()
0
>>> CartanType(['BC',Integer(4),Integer(2)]).dual().special_node()
0
```

`sage.combinat.root_system.extended_affine_weyl_group.`**`ExtendedAffineWeylGroup`**`(`*cartan_type*, *general_linear=None*, ***print_options*`)`

The extended affine Weyl group.

INPUT:

- `cartan_type` – an affine or finite Cartan type (a finite Cartan type is an abbreviation for its untwisted affinization)
- `general_linear` – (default: `None`) if `True` and `cartan_type` indicates untwisted type A, returns the universal central extension
- `print_options` – special instructions for printing elements (see below)

Mnemonics

- "P" – subgroup of translations
- "Pv" – subgroup of translations in a dual form
- "W0" – classical Weyl group
- "W" – affine Weyl group
- "F" – fundamental group of length zero elements

There are currently six realizations: "PW0", "W0P, "WF", "FW", "PvW0", and "W0Pv".

"PW0" means the semidirect product of "P" with "W0" acting from the right. "W0P" is similar but with "W0" acting from the left. "WF" is the semidirect product of "W" with "F" acting from the right, etc.

Recognized arguments for `print_options` are:

- `print_tuple` – boolean (default: `False`); if `True`, elements are printed (a, b), otherwise as $a * b$
- `affine` – prefix for simple reflections in the affine Weyl group
- `classical` – prefix for simple reflections in the classical Weyl group
- `translation` – prefix for the translation elements
- `fundamental` – prefix for the elements of the fundamental group

These options are not mutable.

The *extended affine Weyl group* was introduced in the following references.

REFERENCES:

- [Ka1990]

Notation

- R – an irreducible affine root system
- I – set of nodes of the Dynkin diagram of R
- R_0 – the classical subsystem of R
- I_0 – set of nodes of the Dynkin diagram of R_0
- E – extended affine Weyl group of type R
- W – affine Weyl group of type R
- W_0 – finite (classical) Weyl group (of type R_0)
- M – translation lattice for W
- L – translation lattice for E
- F – fundamental subgroup of E (the length zero elements)
- P – finite weight lattice
- Q – finite root lattice
- $P^\vee$ – finite coweight lattice
- $Q^\vee$ – finite coroot lattice

Translation lattices

The styles "PW0" and "W0P" use the following lattices:

- Untwisted affine: $L = P^\vee$, $M = Q^\vee$
- Dual of untwisted affine: $L = P$, $M = Q$
- BC_n ($A_{2n}^{(2)}$): $L = M = P$
- Dual of BC_n ($A_{2n}^{(2)\dagger}$): $L = M = P^\vee$

The styles "PvW0" and "W0Pv" use the following lattices:

- Untwisted affine: The weight lattice of the dual finite Cartan type.
- Dual untwisted affine: The same as for "PW0" and "W0P".

For mixed affine type ($A_{2n}^{(2)}$, aka $\tilde{BC}_n$, and their affine duals) the styles "PvW0" and "W0Pv" are not implemented.

Finite and affine Weyl groups W_0 and W

The finite Weyl group W_0 is generated by the simple reflections s_i for $i \in I_0$ where s_i is the reflection across a suitable hyperplane H_i through the origin in the real span V of the lattice M.

R specifies another (affine) hyperplane H_0. The affine Weyl group W is generated by W_0 and the reflection S_0 across H_0.

Extended affine Weyl group E

The complement in V of the set H of hyperplanes obtained from the H_i by the action of W, has connected components called alcoves. W acts freely and transitively on the set of alcoves. After the choice of a certain alcove (the fundamental alcove), there is an induced bijection from W to the set of alcoves under which the identity in W maps to the fundamental alcove.

Then L is the largest sublattice of V, whose translations stabilize the set of alcoves.

There are isomorphisms

$$W \cong M \rtimes W_0 \cong W_0 \ltimes M$$
$$E \cong L \rtimes W_0 \cong W_0 \ltimes L$$

Fundamental group of affine Dynkin automorphisms

Since L acts on the set of alcoves, the group $F = L/M$ may be viewed as a subgroup of the symmetries of the fundamental alcove or equivalently the symmetries of the affine Dynkin diagram. F acts on the set of alcoves and hence on W. Conjugation by an element of F acts on W by permuting the indices of simple reflections.

There are isomorphisms

$$E \cong F \ltimes W \cong W \rtimes F$$

An affine Dynkin node is *special* if it is conjugate to the zero node under some affine Dynkin automorphism.

There is a bijection $i \mapsto \pi_i$ from the set of special nodes to the group F, where π_i is the unique element of F that sends 0 to i. When $L = P$ (resp. $L = P^\vee$) the element π_i is induced (under the isomorphism $F \cong L/M$) by addition of the coset of the i-th fundamental weight (resp. coweight).

The length function of the Coxeter group W may be extended to E by $\ell(w\pi) = \ell(w)$ where $w \in W$ and $\pi \in F$. This is the number of hyperplanes in H separating the fundamental alcove from its image by $w\pi$ (or equivalently w).

It is known that if G is the compact Lie group of adjoint type with root system R_0 then F is isomorphic to the fundamental group of G, or to the center of its simply-connected covering group. That is why we call F the *fundamental group*.

In the future we may want to build an element of the group from an appropriate linear map f on some of the root lattice realizations for this Cartan type: W.from_endomorphism(f).

EXAMPLES:

```

```

When the realizations are constructed from each other as above, there are built-in coercions between them.

```
sage: F = E.fundamental_group()
sage: x = WF.from_reduced_word([0,1,2]) * WF(F(2)); x
S0*S1*S2 * pi[2]
sage: FW(x)
pi[2] * S1*S2*S0
sage: W0P(x)
s1*s2*s1 * t[-2*Lambdacheck[1] - Lambdacheck[2]]
sage: PW0(x)
t[Lambdacheck[1] + 2*Lambdacheck[2]] * s1*s2*s1
sage: PvW0(x)
t[Lambda[1] + 2*Lambda[2]] * s1*s2*s1
```

```
>>> from sage.all import *
>>> F = E.fundamental_group()
>>> x = WF.from_reduced_word([Integer(0),Integer(1),Integer(2)]) *␣
↪WF(F(Integer(2))); x
S0*S1*S2 * pi[2]
>>> FW(x)
pi[2] * S1*S2*S0
>>> W0P(x)
s1*s2*s1 * t[-2*Lambdacheck[1] - Lambdacheck[2]]
>>> PW0(x)
t[Lambdacheck[1] + 2*Lambdacheck[2]] * s1*s2*s1
>>> PvW0(x)
t[Lambda[1] + 2*Lambda[2]] * s1*s2*s1
```

The translation lattice and its distinguished basis are obtained from `E`:

```
sage: L = E.lattice(); L
Coweight lattice of the Root system of type ['A', 2]
sage: b = E.lattice_basis(); b
Finite family {1: Lambdacheck[1], 2: Lambdacheck[2]}
```

```
>>> from sage.all import *
>>> L = E.lattice(); L
Coweight lattice of the Root system of type ['A', 2]
```

(continues on next page)

(continued from previous page)

```
>>> b = E.lattice_basis(); b
Finite family {1: Lambdacheck[1], 2: Lambdacheck[2]}
```

Translation lattice elements can be coerced into any realization:

```
sage: PW0(b[1]-b[2])
t[Lambdacheck[1] - Lambdacheck[2]]
sage: FW(b[1]-b[2])
pi[2] * S0*S1
```

```
>>> from sage.all import *
>>> PW0(b[Integer(1)]-b[Integer(2)])
t[Lambdacheck[1] - Lambdacheck[2]]
>>> FW(b[Integer(1)]-b[Integer(2)])
pi[2] * S0*S1
```

The dual form of the translation lattice and its basis are similarly obtained:

```
sage: Lv = E.dual_lattice(); Lv
Weight lattice of the Root system of type ['A', 2]
sage: bv = E.dual_lattice_basis(); bv
Finite family {1: Lambda[1], 2: Lambda[2]}
sage: FW(bv[1]-bv[2])
pi[2] * S0*S1
```

```
>>> from sage.all import *
>>> Lv = E.dual_lattice(); Lv
Weight lattice of the Root system of type ['A', 2]
>>> bv = E.dual_lattice_basis(); bv
Finite family {1: Lambda[1], 2: Lambda[2]}
>>> FW(bv[Integer(1)]-bv[Integer(2)])
pi[2] * S0*S1
```

The abstract fundamental group is accessed from `E`:

```
sage: F = E.fundamental_group(); F
Fundamental group of type ['A', 2, 1]
```

```
>>> from sage.all import *
>>> F = E.fundamental_group(); F
Fundamental group of type ['A', 2, 1]
```

Its elements are indexed by the set of special nodes of the affine Dynkin diagram:

```
sage: E.cartan_type().special_nodes()
(0, 1, 2)
sage: F.special_nodes()
(0, 1, 2)
sage: [F(i) for i in F.special_nodes()]
[pi[0], pi[1], pi[2]]
```

```
>>> from sage.all import *
>>> E.cartan_type().special_nodes()
(0, 1, 2)
>>> F.special_nodes()
(0, 1, 2)
>>> [F(i) for i in F.special_nodes()]
[pi[0], pi[1], pi[2]]
```

There is a coercion from the fundamental group into each realization:

```
sage: F(2)
pi[2]
sage: WF(F(2))
pi[2]
sage: W0P(F(2))
s2*s1 * t[-Lambdacheck[1]]
sage: W0Pv(F(2))
s2*s1 * t[-Lambda[1]]
```

```
>>> from sage.all import *
>>> F(Integer(2))
pi[2]
>>> WF(F(Integer(2)))
pi[2]
>>> W0P(F(Integer(2)))
s2*s1 * t[-Lambdacheck[1]]
>>> W0Pv(F(Integer(2)))
s2*s1 * t[-Lambda[1]]
```

Using E one may access the classical and affine Weyl groups and their morphisms into each realization:

```
sage: W0 = E.classical_weyl(); W0
Weyl Group of type ['A', 2] (as a matrix group acting on the coweight lattice)
sage: v = W0.from_reduced_word([1,2,1]); v
s1*s2*s1
sage: PW0(v)
s1*s2*s1
sage: WF(v)
S1*S2*S1
sage: W = E.affine_weyl(); W
Weyl Group of type ['A', 2, 1] (as a matrix group acting on the root lattice)
sage: w = W.from_reduced_word([2,1,0]); w
S2*S1*S0
sage: WF(w)
S2*S1*S0
sage: PW0(w)
t[Lambdacheck[1] - 2*Lambdacheck[2]] * s1
```

```
>>> from sage.all import *
>>> W0 = E.classical_weyl(); W0
Weyl Group of type ['A', 2] (as a matrix group acting on the coweight lattice)
>>> v = W0.from_reduced_word([Integer(1),Integer(2),Integer(1)]); v
s1*s2*s1
```

(continues on next page)

(continued from previous page)

```
>>> PW0(v)
s1*s2*s1
>>> WF(v)
S1*S2*S1
>>> W = E.affine_weyl(); W
Weyl Group of type ['A', 2, 1] (as a matrix group acting on the root lattice)
>>> w = W.from_reduced_word([Integer(2),Integer(1),Integer(0)]); w
S2*S1*S0
>>> WF(w)
S2*S1*S0
>>> PW0(w)
t[Lambdacheck[1] - 2*Lambdacheck[2]] * s1
```

Note that for untwisted affine type, the dual form of the classical Weyl group is isomorphic to the usual one, but acts on a different lattice and is therefore different to sage:

```
sage: W0v = E.dual_classical_weyl(); W0v
Weyl Group of type ['A', 2] (as a matrix group acting on the weight lattice)
sage: v = W0v.from_reduced_word([1,2])
sage: x = PvW0(v); x
s1*s2
sage: y = PW0(v); y
s1*s2
sage: x.parent() == y.parent()
False
```

```
>>> from sage.all import *
>>> W0v = E.dual_classical_weyl(); W0v
Weyl Group of type ['A', 2] (as a matrix group acting on the weight lattice)
>>> v = W0v.from_reduced_word([Integer(1),Integer(2)])
>>> x = PvW0(v); x
s1*s2
>>> y = PW0(v); y
s1*s2
>>> x.parent() == y.parent()
False
```

However, because there is a coercion from `PvW0` to `PW0`, the elements `x` and `y` compare as equal:

```
sage: x == y
True
```

```
>>> from sage.all import *
>>> x == y
True
```

An element can be created directly from a reduced word:

```
sage: PW0.from_reduced_word([2,1,0])
t[Lambdacheck[1] - 2*Lambdacheck[2]] * s1
```

```
>>> from sage.all import *
>>> PW0.from_reduced_word([Integer(2),Integer(1),Integer(0)])
t[Lambdacheck[1] - 2*Lambdacheck[2]] * s1
```

Here is a demonstration of the printing options:

```
sage: E = ExtendedAffineWeylGroup(["A",2,1], affine='sx', classical='Sx',
....:                               translation='x', fundamental='pix')
sage: PW0 = E.PW0()
sage: y = PW0(E.lattice_basis()[1]); y
x[Lambdacheck[1]]
sage: FW = E.FW()
sage: FW(y)
pix[1] * sx2*sx1
sage: PW0.an_element()
x[2*Lambdacheck[1] + 2*Lambdacheck[2]] * Sx1*Sx2
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(["A",Integer(2),Integer(1)], affine='sx',␣
↪classical='Sx',
...                               translation='x', fundamental='pix')
>>> PW0 = E.PW0()
>>> y = PW0(E.lattice_basis()[Integer(1)]); y
x[Lambdacheck[1]]
>>> FW = E.FW()
>>> FW(y)
pix[1] * sx2*sx1
>>> PW0.an_element()
x[2*Lambdacheck[1] + 2*Lambdacheck[2]] * Sx1*Sx2
```

Todo

- Implement a “slow” action of E on any affine root or weight lattice realization.
- Implement the level m actions of E and W on the lattices of finite type.
- Implement the relevant methods from the usual affine Weyl group
- Implementation by matrices: style “M”.
- Use case: implement the Hecke algebra on top of this

The semidirect product construction in sage currently only admits multiplicative groups. Therefore for the styles involving “P” and “Pv”, one must convert the additive group of translations L into a multiplicative group by applying the `sage.groups.group_exp.GroupExp` functor.

The general linear case

The general linear group is not semisimple. Sage can build its extended affine Weyl group:

```
sage: E = ExtendedAffineWeylGroup(['A',2,1], general_linear=True); E
Extended affine Weyl group of GL(3)
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)], general_linear=True);
↪ E
Extended affine Weyl group of GL(3)
```

If the Cartan type is `['A', n-1, 1]` and the parameter `general_linear` is not True, the extended affine Weyl group that is built will be for SL_n, not GL_n. But if `general_linear` is True, let W_a and W_e be the affine and extended affine Weyl groups. We make the following nonstandard definition: the extended affine Weyl group $W_e(GL_n)$ is defined by

$$W_e(GL_n) = P(GL_n) \rtimes W$$

where W is the finite Weyl group (the symmetric group S_n) and $P(GL_n)$ is the weight lattice of GL_n, which is usually identified with the lattice $\mathbf{Z}^n$ of n-tuples of integers:

```
sage: PW0 = E.PW0(); PW0
Extended affine Weyl group of GL(3) realized by Semidirect product of
 Multiplicative form of Ambient space of the Root system of type ['A', 2] acted␣
↪upon
  by Weyl Group of type ['A', 2] (as a matrix group acting on the ambient space)
sage: PW0.an_element()
t[(2, 2, 3)] * s1*s2
```

```
>>> from sage.all import *
>>> PW0 = E.PW0(); PW0
Extended affine Weyl group of GL(3) realized by Semidirect product of
 Multiplicative form of Ambient space of the Root system of type ['A', 2] acted␣
↪upon
  by Weyl Group of type ['A', 2] (as a matrix group acting on the ambient space)
>>> PW0.an_element()
t[(2, 2, 3)] * s1*s2
```

There is an isomorphism

$$W_e(GL_n) = \mathbf{Z} \ltimes W_a$$

where the group of integers $\mathbf{Z}$ (with generator π) acts on W_a by

$$\pi\, s_i\, \pi^{-1} = s_{i+1}$$

and the indices of the simple reflections are taken modulo n:

```
sage: FW = E.FW(); FW
Extended affine Weyl group of GL(3) realized by
 Semidirect product of Fundamental group of GL(3) acting on
  Weyl Group of type ['A', 2, 1] (as a matrix group acting on the root lattice)
sage: FW.an_element()
pi[5] * S0*S1*S2
```

```
>>> from sage.all import *
>>> FW = E.FW(); FW
Extended affine Weyl group of GL(3) realized by
 Semidirect product of Fundamental group of GL(3) acting on
```

(continues on next page)

(continued from previous page)

```
Weyl Group of type ['A', 2, 1] (as a matrix group acting on the root lattice)
>>> FW.an_element()
pi[5] * S0*S1*S2
```

We regard **Z** as the fundamental group of affine type GL_n:

```
sage: F = E.fundamental_group(); F
Fundamental group of GL(3)
sage: F.special_nodes()
Integer Ring

sage: x = FW.from_fundamental(F(10)); x
pi[10]
sage: x*x
pi[20]
sage: E.PvW0()(x*x)
t[(7, 7, 6)] * s2*s1
```

```
>>> from sage.all import *
>>> F = E.fundamental_group(); F
Fundamental group of GL(3)
>>> F.special_nodes()
Integer Ring

>>> x = FW.from_fundamental(F(Integer(10))); x
pi[10]
>>> x*x
pi[20]
>>> E.PvW0()(x*x)
t[(7, 7, 6)] * s2*s1
```

class sage.combinat.root_system.extended_affine_weyl_group.**ExtendedAffineWeylGroup_Class**(*cartan_type*, *general_linear*, ***print_options*)

Bases: UniqueRepresentation, Parent

The parent-with-realization class of an extended affine Weyl group.

class ExtendedAffineWeylGroupFW(E)

Bases: GroupSemidirectProduct, BindableClass

Extended affine Weyl group, realized as the semidirect product of the affine Weyl group by the fundamental group.

INPUT:

- E – a parent with realization in *ExtendedAffineWeylGroup_Class*

EXAMPLES:

```
sage: ExtendedAffineWeylGroup(['A',2,1]).FW()
Extended affine Weyl group of type ['A', 2, 1] realized by Semidirect product␣
↪of
 Fundamental group of type ['A', 2, 1] acting on Weyl Group of type ['A', 2,␣
↪1]
 (as a matrix group acting on the root lattice)
```

```
>>> from sage.all import *
>>> ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]).FW()
Extended affine Weyl group of type ['A', 2, 1] realized by Semidirect product␣
↪of
 Fundamental group of type ['A', 2, 1] acting on Weyl Group of type ['A', 2,␣
↪1]
 (as a matrix group acting on the root lattice)
```

Element

alias of *ExtendedAffineWeylGroupFWElement*

from_affine_weyl(*w*)

Return the image of w under the map of the affine Weyl group into the right (affine Weyl group) factor in the "FW" style.

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',2,1], print_tuple=True)
sage: E.FW().from_affine_weyl(E.affine_weyl().from_reduced_word([0,2,1]))
(pi[0], S0*S2*S1)
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)], print_
↪tuple=True)
>>> E.FW().from_affine_weyl(E.affine_weyl().from_reduced_word([Integer(0),
↪Integer(2),Integer(1)]))
(pi[0], S0*S2*S1)
```

from_fundamental(*f*)

Return the image of the fundamental group element f into `self`.

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',2,1], print_tuple=True)
sage: E.FW().from_fundamental(E.fundamental_group()(2))
(pi[2], 1)
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)], print_
↪tuple=True)
>>> E.FW().from_fundamental(E.fundamental_group()(Integer(2)))
(pi[2], 1)
```

simple_reflections()

Return the family of simple reflections of `self`.

EXAMPLES:

```
sage: ExtendedAffineWeylGroup(['A',2,1],print_tuple=True).FW().simple_
↪reflections()
Finite family {0: (pi[0], S0), 1: (pi[0], S1), 2: (pi[0], S2)}
```

```
>>> from sage.all import *
>>> ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)],print_tuple=True).
↪FW().simple_reflections()
Finite family {0: (pi[0], S0), 1: (pi[0], S1), 2: (pi[0], S2)}
```

class ExtendedAffineWeylGroupFWElement

Bases: `GroupSemidirectProductElement`

The element class for the "FW" realization.

action_on_affine_roots(*beta*)

Act by `self` on the affine root lattice element `beta`.

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',2,1], affine='s')
sage: x = E.FW().an_element(); x
pi[2] * s0*s1*s2
sage: v = RootSystem(['A',2,1]).root_lattice().an_element(); v
2*alpha[0] + 2*alpha[1] + 3*alpha[2]
sage: x.action_on_affine_roots(v)
alpha[0] + alpha[1]
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)], affine='s')
>>> x = E.FW().an_element(); x
pi[2] * s0*s1*s2
>>> v = RootSystem(['A',Integer(2),Integer(1)]).root_lattice().an_
↪element(); v
2*alpha[0] + 2*alpha[1] + 3*alpha[2]
>>> x.action_on_affine_roots(v)
alpha[0] + alpha[1]
```

has_descent(*i*, *side='right'*, *positive=False*)

Return whether `self` has descent at i.

INPUT:

- `i` – an affine Dynkin index

OPTIONAL:

- `side` – `'left'` or `'right'` (default: `'right'`)
- `positive` – boolean (default: `False`)

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',2,1])
sage: x = E.FW().an_element(); x
pi[2] * S0*S1*S2
sage: [(i, x.has_descent(i)) for i in E.cartan_type().index_set()]
[(0, False), (1, False), (2, True)]
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)])
>>> x = E.FW().an_element(); x
pi[2] * S0*S1*S2
>>> [(i, x.has_descent(i)) for i in E.cartan_type().index_set()]
[(0, False), (1, False), (2, True)]
```

to_affine_weyl_right()

Project `self` to the right (affine Weyl group) factor in the "FW" style.

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',2,1])
sage: x = E.FW().from_translation(E.lattice_basis()[1]); x
pi[1] * S2*S1
sage: x.to_affine_weyl_right()
S2*S1
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)])
>>> x = E.FW().from_translation(E.lattice_basis()[Integer(1)]); x
pi[1] * S2*S1
>>> x.to_affine_weyl_right()
S2*S1
```

to_fundamental_group()

Return the projection of `self` to the fundamental group in the "FW" style.

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',2,1])
sage: x = E.FW().from_translation(E.lattice_basis()[2]); x
pi[2] * S1*S2
sage: x.to_fundamental_group()
pi[2]
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)])
>>> x = E.FW().from_translation(E.lattice_basis()[Integer(2)]); x
pi[2] * S1*S2
>>> x.to_fundamental_group()
pi[2]
```

class ExtendedAffineWeylGroupPW0(*E*)

Bases: `GroupSemidirectProduct`, `BindableClass`

Extended affine Weyl group, realized as the semidirect product of the translation lattice by the finite Weyl group.

INPUT:

- `E` – a parent with realization in *ExtendedAffineWeylGroup_Class*

EXAMPLES:

```
sage: ExtendedAffineWeylGroup(['A',2,1]).PW0()
Extended affine Weyl group of type ['A', 2, 1] realized by Semidirect product␣
↪of
 Multiplicative form of Coweight lattice of the Root system of type ['A', 2]
  acted upon by Weyl Group of type ['A', 2]
   (as a matrix group acting on the coweight lattice)
```

```
>>> from sage.all import *
>>> ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]).PW0()
Extended affine Weyl group of type ['A', 2, 1] realized by Semidirect product␣
↪of
 Multiplicative form of Coweight lattice of the Root system of type ['A', 2]
  acted upon by Weyl Group of type ['A', 2]
   (as a matrix group acting on the coweight lattice)
```

Element

alias of *ExtendedAffineWeylGroupPW0Element*

S0()

Return the affine simple reflection.

EXAMPLES:

```
sage: ExtendedAffineWeylGroup(['B',2]).PW0().S0()
t[Lambdacheck[2]] * s2*s1*s2
```

```
>>> from sage.all import *
>>> ExtendedAffineWeylGroup(['B',Integer(2)]).PW0().S0()
t[Lambdacheck[2]] * s2*s1*s2
```

from_classical_weyl(*w*)

Return the image of w under the homomorphism of the classical Weyl group into `self`.

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup("A3",print_tuple=True)
sage: E.PW0().from_classical_weyl(E.classical_weyl().from_reduced_word([1,
↪2]))
(t[0], s1*s2)
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup("A3",print_tuple=True)
>>> E.PW0().from_classical_weyl(E.classical_weyl().from_reduced_
↪word([Integer(1),Integer(2)]))
(t[0], s1*s2)
```

from_translation(*la*)

Map the translation lattice element `la` into `self`.

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',2,1], translation='tau',
....:                             print_tuple=True)
```

(continues on next page)

(continued from previous page)

```
sage: la = E.lattice().an_element(); la
2*Lambdacheck[1] + 2*Lambdacheck[2]
sage: E.PW0().from_translation(la)
(tau[2*Lambdacheck[1] + 2*Lambdacheck[2]], 1)
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)], translation=
↪'tau',
...                             print_tuple=True)
>>> la = E.lattice().an_element(); la
2*Lambdacheck[1] + 2*Lambdacheck[2]
>>> E.PW0().from_translation(la)
(tau[2*Lambdacheck[1] + 2*Lambdacheck[2]], 1)
```

simple_reflection(*i*)

Return the i-th simple reflection in `self`.

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup("G2")
sage: [(i, E.PW0().simple_reflection(i)) for i in E.cartan_type().index_
↪set()]
[(0, t[Lambdacheck[2]] * s2*s1*s2*s1*s2), (1, s1), (2, s2)]
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup("G2")
>>> [(i, E.PW0().simple_reflection(i)) for i in E.cartan_type().index_
↪set()]
[(0, t[Lambdacheck[2]] * s2*s1*s2*s1*s2), (1, s1), (2, s2)]
```

simple_reflections()

Return a family for the simple reflections of `self`.

EXAMPLES:

```
sage: ExtendedAffineWeylGroup("A3").PW0().simple_reflections()
Finite family {0: t[Lambdacheck[1] + Lambdacheck[3]] * s1*s2*s3*s2*s1,
               1: s1, 2: s2, 3: s3}
```

```
>>> from sage.all import *
>>> ExtendedAffineWeylGroup("A3").PW0().simple_reflections()
Finite family {0: t[Lambdacheck[1] + Lambdacheck[3]] * s1*s2*s3*s2*s1,
               1: s1, 2: s2, 3: s3}
```

class ExtendedAffineWeylGroupPW0Element

Bases: `GroupSemidirectProductElement`

The element class for the "PW0" realization.

action(*la*)

Return the action of `self` on an element `la` of the translation lattice.

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',2,1]); PW0 = E.PW0()
sage: x = PW0.an_element(); x
t[2*Lambdacheck[1] + 2*Lambdacheck[2]] * s1*s2
sage: la = E.lattice().an_element(); la
2*Lambdacheck[1] + 2*Lambdacheck[2]
sage: x.action(la)
-2*Lambdacheck[1] + 4*Lambdacheck[2]
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]); PW0 = E.
→PW0()
>>> x = PW0.an_element(); x
t[2*Lambdacheck[1] + 2*Lambdacheck[2]] * s1*s2
>>> la = E.lattice().an_element(); la
2*Lambdacheck[1] + 2*Lambdacheck[2]
>>> x.action(la)
-2*Lambdacheck[1] + 4*Lambdacheck[2]
```

has_descent (*i*, *side='right'*, *positive=False*)

Return whether `self` has i as a descent.

INPUT:

- `i` – an affine Dynkin node

OPTIONAL:

- `side` – `'left'` or `'right'` (default: `'right'`)
- `positive` – boolean (default: `False`)

EXAMPLES:

```
sage: w = ExtendedAffineWeylGroup(['A',4,2]).PW0().from_reduced_word([0,
→1]); w
t[Lambda[1]] * s1*s2
sage: w.has_descent(0, side='left')
True
```

```
>>> from sage.all import *
>>> w = ExtendedAffineWeylGroup(['A',Integer(4),Integer(2)]).PW0().from_
→reduced_word([Integer(0),Integer(1)]); w
t[Lambda[1]] * s1*s2
>>> w.has_descent(Integer(0), side='left')
True
```

to_classical_weyl ()

Return the image of `self` under the homomorphism that projects to the classical Weyl group factor after rewriting it in either style "PW0" or "W0P".

EXAMPLES:

```
sage: s = ExtendedAffineWeylGroup(['A',2,1]).PW0().S0(); s
t[Lambdacheck[1] + Lambdacheck[2]] * s1*s2*s1
sage: s.to_classical_weyl()
s1*s2*s1
```

```
>>> from sage.all import *
>>> s = ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]).PW0().S0(); s
t[Lambdacheck[1] + Lambdacheck[2]] * s1*s2*s1
>>> s.to_classical_weyl()
s1*s2*s1
```

to_translation_left()

The image of `self` under the map that projects to the translation lattice factor after factoring it to the left as in style "PW0".

EXAMPLES:

```
sage: s = ExtendedAffineWeylGroup(['A',2,1]).PW0().S0(); s
t[Lambdacheck[1] + Lambdacheck[2]] * s1*s2*s1
sage: s.to_translation_left()
Lambdacheck[1] + Lambdacheck[2]
```

```
>>> from sage.all import *
>>> s = ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]).PW0().S0(); s
t[Lambdacheck[1] + Lambdacheck[2]] * s1*s2*s1
>>> s.to_translation_left()
Lambdacheck[1] + Lambdacheck[2]
```

class ExtendedAffineWeylGroupPvW0(E)

Bases: `GroupSemidirectProduct`, `BindableClass`

Extended affine Weyl group, realized as the semidirect product of the dual form of the translation lattice by the finite Weyl group.

INPUT:

- `E` – a parent with realization in *ExtendedAffineWeylGroup_Class*

EXAMPLES:

```
sage: ExtendedAffineWeylGroup(['A',2,1]).PvW0()
Extended affine Weyl group of type ['A', 2, 1] realized by Semidirect product␣
↪of
 Multiplicative form of Weight lattice of the Root system of type ['A', 2]␣
↪acted
  upon by Weyl Group of type ['A', 2] (as a matrix group acting on the weight␣
↪lattice)
```

```
>>> from sage.all import *
>>> ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]).PvW0()
Extended affine Weyl group of type ['A', 2, 1] realized by Semidirect product␣
↪of
 Multiplicative form of Weight lattice of the Root system of type ['A', 2]␣
↪acted
  upon by Weyl Group of type ['A', 2] (as a matrix group acting on the weight␣
↪lattice)
```

Element

alias of *ExtendedAffineWeylGroupPvW0Element*

from_dual_classical_weyl(*w*)

Return the image of w under the homomorphism of the dual form of the classical Weyl group into `self`.

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',3,1], print_tuple=True)
sage: E.PvW0().from_dual_classical_weyl(
....:     E.dual_classical_weyl().from_reduced_word([1,2]))
(t[0], s1*s2)
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(3),Integer(1)], print_
↪tuple=True)
>>> E.PvW0().from_dual_classical_weyl(
...     E.dual_classical_weyl().from_reduced_word([Integer(1),
↪Integer(2)]))
(t[0], s1*s2)
```

from_dual_translation(*la*)

Map the dual translation lattice element `la` into `self`.

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',2,1], translation='tau',
....:                             print_tuple=True)
sage: la = E.dual_lattice().an_element(); la
2*Lambda[1] + 2*Lambda[2]
sage: E.PvW0().from_dual_translation(la)
(tau[2*Lambda[1] + 2*Lambda[2]], 1)
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)], translation=
↪'tau',
...                             print_tuple=True)
>>> la = E.dual_lattice().an_element(); la
2*Lambda[1] + 2*Lambda[2]
>>> E.PvW0().from_dual_translation(la)
(tau[2*Lambda[1] + 2*Lambda[2]], 1)
```

simple_reflections()

Return a family for the simple reflections of `self`.

EXAMPLES:

```
sage: ExtendedAffineWeylGroup(['A',3,1]).PvW0().simple_reflections()
Finite family {0: t[Lambda[1] + Lambda[3]] * s1*s2*s3*s2*s1,
               1: s1, 2: s2, 3: s3}
```

```
>>> from sage.all import *
>>> ExtendedAffineWeylGroup(['A',Integer(3),Integer(1)]).PvW0().simple_
↪reflections()
Finite family {0: t[Lambda[1] + Lambda[3]] * s1*s2*s3*s2*s1,
               1: s1, 2: s2, 3: s3}
```

class ExtendedAffineWeylGroupPvW0Element

Bases: `GroupSemidirectProductElement`

The element class for the "PvW0" realization.

dual_action(*la*)

Return the action of `self` on an element `la` of the dual version of the translation lattice.

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',2,1])
sage: x = E.PvW0().an_element(); x
t[2*Lambda[1] + 2*Lambda[2]] * s1*s2
sage: la = E.dual_lattice().an_element(); la
2*Lambda[1] + 2*Lambda[2]
sage: x.dual_action(la)
-2*Lambda[1] + 4*Lambda[2]
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)])
>>> x = E.PvW0().an_element(); x
t[2*Lambda[1] + 2*Lambda[2]] * s1*s2
>>> la = E.dual_lattice().an_element(); la
2*Lambda[1] + 2*Lambda[2]
>>> x.dual_action(la)
-2*Lambda[1] + 4*Lambda[2]
```

has_descent(*i*, *side='right'*, *positive=False*)

Return whether `self` has i as a descent.

INPUT:

- `i` – an affine Dynkin index

OPTIONAL:

- `side` – `'left'` or `'right'` (default: `'right'`)
- `positive` – boolean (default: `False`)

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',4,2])
sage: w = E.PvW0().from_reduced_word([0,1]); w
t[Lambda[1]] * s1*s2
sage: [(i, w.has_descent(i, side='left')) for i in E.cartan_type().index_
↪set()]
[(0, True), (1, False), (2, False)]
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(4),Integer(2)])
>>> w = E.PvW0().from_reduced_word([Integer(0),Integer(1)]); w
t[Lambda[1]] * s1*s2
>>> [(i, w.has_descent(i, side='left')) for i in E.cartan_type().index_
↪set()]
[(0, True), (1, False), (2, False)]
```

to_dual_classical_weyl()

Return the image of `self` under the homomorphism that projects to the dual classical Weyl group factor after rewriting it in either style "PvW0" or "W0Pv".

EXAMPLES:

```
sage: s = ExtendedAffineWeylGroup(['A',2,1]).PvW0().simple_reflection(0);␣
↪s
t[Lambda[1] + Lambda[2]] * s1*s2*s1
sage: s.to_dual_classical_weyl()
s1*s2*s1
```

```
>>> from sage.all import *
>>> s = ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]).PvW0().
↪simple_reflection(Integer(0)); s
t[Lambda[1] + Lambda[2]] * s1*s2*s1
>>> s.to_dual_classical_weyl()
s1*s2*s1
```

to_dual_translation_left()

The image of `self` under the map that projects to the dual translation lattice factor after factoring it to the left as in style "PvW0".

EXAMPLES:

```
sage: s = ExtendedAffineWeylGroup(['A',2,1]).PvW0().simple_reflection(0);␣
↪s
t[Lambda[1] + Lambda[2]] * s1*s2*s1
sage: s.to_dual_translation_left()
Lambda[1] + Lambda[2]
```

```
>>> from sage.all import *
>>> s = ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]).PvW0().
↪simple_reflection(Integer(0)); s
t[Lambda[1] + Lambda[2]] * s1*s2*s1
>>> s.to_dual_translation_left()
Lambda[1] + Lambda[2]
```

class ExtendedAffineWeylGroupW0P(E)

Bases: `GroupSemidirectProduct`, `BindableClass`

Extended affine Weyl group, realized as the semidirect product of the finite Weyl group by the translation lattice.

INPUT:

- `E` – a parent with realization in *ExtendedAffineWeylGroup_Class*

EXAMPLES:

```
sage: ExtendedAffineWeylGroup(['A',2,1]).W0P()
Extended affine Weyl group of type ['A', 2, 1] realized by Semidirect product␣
↪of
 Weyl Group of type ['A', 2] (as a matrix group acting on the coweight␣
↪lattice)
 acting on Multiplicative form of Coweight lattice of the Root system of type␣
↪['A', 2]
```

```
>>> from sage.all import *
>>> ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]).W0P()
Extended affine Weyl group of type ['A', 2, 1] realized by Semidirect product␣
↪of
 Weyl Group of type ['A', 2] (as a matrix group acting on the coweight␣
↪lattice)
 acting on Multiplicative form of Coweight lattice of the Root system of type␣
↪['A', 2]
```

Element

alias of *ExtendedAffineWeylGroupW0PElement*

S0()

Return the zero-th simple reflection in style "W0P".

EXAMPLES:

```
sage: ExtendedAffineWeylGroup(["A",3,1]).W0P().S0()
s1*s2*s3*s2*s1 * t[-Lambdacheck[1] - Lambdacheck[3]]
```

```
>>> from sage.all import *
>>> ExtendedAffineWeylGroup(["A",Integer(3),Integer(1)]).W0P().S0()
s1*s2*s3*s2*s1 * t[-Lambdacheck[1] - Lambdacheck[3]]
```

from_classical_weyl(*w*)

Return the image of the classical Weyl group element w in `self`.

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',2,1],print_tuple=True)
sage: E.W0P().from_classical_weyl(E.classical_weyl().from_reduced_word([2,
↪1]))
(s2*s1, t[0])
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)],print_
↪tuple=True)
>>> E.W0P().from_classical_weyl(E.classical_weyl().from_reduced_
↪word([Integer(2),Integer(1)]))
(s2*s1, t[0])
```

from_translation(*la*)

Return the image of the lattice element `la` in `self`.

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',2,1],print_tuple=True)
sage: E.W0P().from_translation(E.lattice().an_element())
(1, t[2*Lambdacheck[1] + 2*Lambdacheck[2]])
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)],print_
↪tuple=True)
```

(continues on next page)

(continued from previous page)

```
>>> E.W0P().from_translation(E.lattice().an_element())
(1, t[2*Lambdacheck[1] + 2*Lambdacheck[2]])
```

simple_reflection(*i*)

Return the i-th simple reflection in `self`.

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',3,1]); W0P = E.W0P()
sage: [(i, W0P.simple_reflection(i)) for i in E.cartan_type().index_set()]
[(0, s1*s2*s3*s2*s1 * t[-Lambdacheck[1] - Lambdacheck[3]]),
 (1, s1), (2, s2), (3, s3)]
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(3),Integer(1)]); W0P = E.
↪W0P()
>>> [(i, W0P.simple_reflection(i)) for i in E.cartan_type().index_set()]
[(0, s1*s2*s3*s2*s1 * t[-Lambdacheck[1] - Lambdacheck[3]]),
 (1, s1), (2, s2), (3, s3)]
```

simple_reflections()

Return the family of simple reflections.

EXAMPLES:

```
sage: ExtendedAffineWeylGroup(["A",3,1]).W0P().simple_reflections()
Finite family {0: s1*s2*s3*s2*s1 * t[-Lambdacheck[1] - Lambdacheck[3]],
               1: s1, 2: s2, 3: s3}
```

```
>>> from sage.all import *
>>> ExtendedAffineWeylGroup(["A",Integer(3),Integer(1)]).W0P().simple_
↪reflections()
Finite family {0: s1*s2*s3*s2*s1 * t[-Lambdacheck[1] - Lambdacheck[3]],
               1: s1, 2: s2, 3: s3}
```

class ExtendedAffineWeylGroupW0PElement

Bases: `GroupSemidirectProductElement`

The element class for the W0P realization.

has_descent(*i*, *side='right'*, *positive=False*)

Return whether `self` has i as a descent.

INPUT:

- `i` – an index

OPTIONAL:

- `side` – `'left'` or `'right'` (default: `'right'`)
- `positive` – boolean (default: `False`)

EXAMPLES:

```
sage: W0P = ExtendedAffineWeylGroup(['A',4,2]).W0P()
sage: w = W0P.from_reduced_word([0,1]); w
s1*s2 * t[Lambda[1] - Lambda[2]]
```

(continues on next page)

(continued from previous page)

```
sage: w.has_descent(0, side='left')
True
```

```
>>> from sage.all import *
>>> W0P = ExtendedAffineWeylGroup(['A',Integer(4),Integer(2)]).W0P()
>>> w = W0P.from_reduced_word([Integer(0),Integer(1)]); w
s1*s2 * t[Lambda[1] - Lambda[2]]
>>> w.has_descent(Integer(0), side='left')
True
```

to_classical_weyl()

Project self into the classical Weyl group.

EXAMPLES:

```
sage: x = ExtendedAffineWeylGroup(['A',2,1]).W0P().simple_reflection(0); x
s1*s2*s1 * t[-Lambdacheck[1] - Lambdacheck[2]]
sage: x.to_classical_weyl()
s1*s2*s1
```

```
>>> from sage.all import *
>>> x = ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]).W0P().simple_
↪reflection(Integer(0)); x
s1*s2*s1 * t[-Lambdacheck[1] - Lambdacheck[2]]
>>> x.to_classical_weyl()
s1*s2*s1
```

to_translation_right()

Project onto the right (translation) factor in the "W0P" style.

EXAMPLES:

```
sage: x = ExtendedAffineWeylGroup(['A',2,1]).W0P().simple_reflection(0); x
s1*s2*s1 * t[-Lambdacheck[1] - Lambdacheck[2]]
sage: x.to_translation_right()
-Lambdacheck[1] - Lambdacheck[2]
```

```
>>> from sage.all import *
>>> x = ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]).W0P().simple_
↪reflection(Integer(0)); x
s1*s2*s1 * t[-Lambdacheck[1] - Lambdacheck[2]]
>>> x.to_translation_right()
-Lambdacheck[1] - Lambdacheck[2]
```

class ExtendedAffineWeylGroupW0Pv(E)

Bases: GroupSemidirectProduct, BindableClass

Extended affine Weyl group, realized as the semidirect product of the finite Weyl group, acting on the dual form of the translation lattice.

INPUT:

- E – a parent with realization in *ExtendedAffineWeylGroup_Class*

EXAMPLES:

```
sage: ExtendedAffineWeylGroup(['A',2,1]).W0Pv()
Extended affine Weyl group of type ['A', 2, 1] realized by Semidirect product␣
↪of
 Weyl Group of type ['A', 2] (as a matrix group acting on the weight lattice)
 acting on Multiplicative form of Weight lattice of the Root system of type [
↪'A', 2]
```

```
>>> from sage.all import *
>>> ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]).W0Pv()
Extended affine Weyl group of type ['A', 2, 1] realized by Semidirect product␣
↪of
 Weyl Group of type ['A', 2] (as a matrix group acting on the weight lattice)
 acting on Multiplicative form of Weight lattice of the Root system of type [
↪'A', 2]
```

Element

alias of *ExtendedAffineWeylGroupW0PvElement*

from_dual_classical_weyl(*w*)

Return the image of w under the homomorphism of the dual form of the classical Weyl group into `self`.

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',3,1],print_tuple=True)
sage: E.W0Pv().from_dual_classical_weyl(E.dual_classical_weyl().from_
↪reduced_word([1,2]))
(s1*s2, t[0])
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(3),Integer(1)],print_
↪tuple=True)
>>> E.W0Pv().from_dual_classical_weyl(E.dual_classical_weyl().from_
↪reduced_word([Integer(1),Integer(2)]))
(s1*s2, t[0])
```

from_dual_translation(*la*)

Map the dual translation lattice element `la` into `self`.

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',2,1], translation='tau',
....:                             print_tuple=True)
sage: la = E.dual_lattice().an_element(); la
2*Lambda[1] + 2*Lambda[2]
sage: E.W0Pv().from_dual_translation(la)
(1, tau[2*Lambda[1] + 2*Lambda[2]])
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)], translation=
↪'tau',
...                             print_tuple=True)
>>> la = E.dual_lattice().an_element(); la
2*Lambda[1] + 2*Lambda[2]
```

(continues on next page)

(continued from previous page)

```
>>> E.W0Pv().from_dual_translation(la)
(1, tau[2*Lambda[1] + 2*Lambda[2]])
```

simple_reflections()

Return a family for the simple reflections of `self`.

EXAMPLES:

```
sage: ExtendedAffineWeylGroup(['A',3,1]).W0Pv().simple_reflections()
Finite family {0: s1*s2*s3*s2*s1 * t[-Lambda[1] - Lambda[3]],
               1: s1, 2: s2, 3: s3}
```

```
>>> from sage.all import *
>>> ExtendedAffineWeylGroup(['A',Integer(3),Integer(1)]).W0Pv().simple_
↪reflections()
Finite family {0: s1*s2*s3*s2*s1 * t[-Lambda[1] - Lambda[3]],
               1: s1, 2: s2, 3: s3}
```

class ExtendedAffineWeylGroupW0PvElement

Bases: `GroupSemidirectProductElement`

The element class for the "W0Pv" realization.

dual_action(*la*)

Return the action of `self` on an element `la` of the dual version of the translation lattice.

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',2,1])
sage: x = E.W0Pv().an_element(); x
s1*s2 * t[2*Lambda[1] + 2*Lambda[2]]
sage: la = E.dual_lattice().an_element(); la
2*Lambda[1] + 2*Lambda[2]
sage: x.dual_action(la)
-8*Lambda[1] + 4*Lambda[2]
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)])
>>> x = E.W0Pv().an_element(); x
s1*s2 * t[2*Lambda[1] + 2*Lambda[2]]
>>> la = E.dual_lattice().an_element(); la
2*Lambda[1] + 2*Lambda[2]
>>> x.dual_action(la)
-8*Lambda[1] + 4*Lambda[2]
```

has_descent(*i*, *side='right'*, *positive=False*)

Return whether `self` has i as a descent.

INPUT:

- `i` – an affine Dynkin index

OPTIONAL:

- `side` – `'left'` or `'right'` (default: `'right'`)
- `positive` – boolean (default: `False`)

EXAMPLES:

```
sage: w = ExtendedAffineWeylGroup(['A',4,2]).W0Pv().from_reduced_word([0,
↪1]); w
s1*s2 * t[Lambda[1] - Lambda[2]]
sage: w.has_descent(0, side='left')
True
```

```
>>> from sage.all import *
>>> w = ExtendedAffineWeylGroup(['A',Integer(4),Integer(2)]).W0Pv().from_
↪reduced_word([Integer(0),Integer(1)]); w
s1*s2 * t[Lambda[1] - Lambda[2]]
>>> w.has_descent(Integer(0), side='left')
True
```

to_dual_classical_weyl()

Return the image of `self` under the homomorphism that projects to the dual classical Weyl group factor after rewriting it in either style "PvW0" or "W0Pv".

EXAMPLES:

```
sage: s = ExtendedAffineWeylGroup(['A',2,1]).W0Pv().simple_reflection(0);
↪s
s1*s2*s1 * t[-Lambda[1] - Lambda[2]]
sage: s.to_dual_classical_weyl()
s1*s2*s1
```

```
>>> from sage.all import *
>>> s = ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]).W0Pv().
↪simple_reflection(Integer(0)); s
s1*s2*s1 * t[-Lambda[1] - Lambda[2]]
>>> s.to_dual_classical_weyl()
s1*s2*s1
```

to_dual_translation_right()

The image of `self` under the map that projects to the dual translation lattice factor after factoring it to the right as in style "W0Pv".

EXAMPLES:

```
sage: s = ExtendedAffineWeylGroup(['A',2,1]).W0Pv().simple_reflection(0);
↪s
s1*s2*s1 * t[-Lambda[1] - Lambda[2]]
sage: s.to_dual_translation_right()
-Lambda[1] - Lambda[2]
```

```
>>> from sage.all import *
>>> s = ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]).W0Pv().
↪simple_reflection(Integer(0)); s
s1*s2*s1 * t[-Lambda[1] - Lambda[2]]
>>> s.to_dual_translation_right()
-Lambda[1] - Lambda[2]
```

class ExtendedAffineWeylGroupWF(E)

Bases: `GroupSemidirectProduct`, `BindableClass`

Extended affine Weyl group, realized as the semidirect product of the affine Weyl group by the fundamental group.

INPUT:

- E – a parent with realization in *ExtendedAffineWeylGroup_Class*

EXAMPLES:

```
sage: ExtendedAffineWeylGroup(['A',2,1]).WF()
Extended affine Weyl group of type ['A', 2, 1] realized by Semidirect product␣
↪of
 Weyl Group of type ['A', 2, 1] (as a matrix group acting on the root lattice)
  acted upon by Fundamental group of type ['A', 2, 1]
```

```
>>> from sage.all import *
>>> ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]).WF()
Extended affine Weyl group of type ['A', 2, 1] realized by Semidirect product␣
↪of
 Weyl Group of type ['A', 2, 1] (as a matrix group acting on the root lattice)
  acted upon by Fundamental group of type ['A', 2, 1]
```

Element

alias of *ExtendedAffineWeylGroupWFElement*

from_affine_weyl(w)

Return the image of the affine Weyl group element w in `self`.

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['C',2,1], print_tuple=True)
sage: E.WF().from_affine_weyl(E.affine_weyl().from_reduced_word([1,2,1,
↪0]))
(S1*S2*S1*S0, pi[0])
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['C',Integer(2),Integer(1)], print_
↪tuple=True)
>>> E.WF().from_affine_weyl(E.affine_weyl().from_reduced_word([Integer(1),
↪Integer(2),Integer(1),Integer(0)]))
(S1*S2*S1*S0, pi[0])
```

from_fundamental(f)

Return the image of f under the homomorphism from the fundamental group into the right (fundamental group) factor in "WF" style.

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['E',6,1], print_tuple=True); WF = E.
↪WF()
sage: F = E.fundamental_group()
sage: [(x, WF.from_fundamental(x)) for x in F]
[(pi[0], (1, pi[0])), (pi[1], (1, pi[1])), (pi[6], (1, pi[6]))]
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['E',Integer(6),Integer(1)], print_
↪tuple=True); WF = E.WF()
>>> F = E.fundamental_group()
>>> [(x, WF.from_fundamental(x)) for x in F]
[(pi[0], (1, pi[0])), (pi[1], (1, pi[1])), (pi[6], (1, pi[6]))]
```

simple_reflections()

Return the family of simple reflections.

EXAMPLES:

```
sage: ExtendedAffineWeylGroup(["A",3,1], affine='r').WF().simple_
↪reflections()
Finite family {0: r0, 1: r1, 2: r2, 3: r3}
```

```
>>> from sage.all import *
>>> ExtendedAffineWeylGroup(["A",Integer(3),Integer(1)], affine='r').WF().
↪simple_reflections()
Finite family {0: r0, 1: r1, 2: r2, 3: r3}
```

class ExtendedAffineWeylGroupWFElement

Bases: `GroupSemidirectProductElement`

Element class for the "WF" realization.

bruhat_le(x)

Return whether `self` is less than or equal to x in the Bruhat order.

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',2,1], affine='s',
....:                             print_tuple=True); WF = E.WF()
sage: r = E.affine_weyl().from_reduced_word
sage: v = r([1,0])
sage: w = r([1,2,0])
sage: v.bruhat_le(w)
True
sage: vv = WF.from_affine_weyl(v); vv
(s1*s0, pi[0])
sage: ww = WF.from_affine_weyl(w); ww
(s1*s2*s0, pi[0])
sage: vv.bruhat_le(ww)
True
sage: f = E.fundamental_group()(2); f
pi[2]
sage: ff = WF.from_fundamental(f); ff
(1, pi[2])
sage: vv.bruhat_le(ww*ff)
False
sage: (vv*ff).bruhat_le(ww*ff)
True
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)], affine='s',
...                             print_tuple=True); WF = E.WF()
>>> r = E.affine_weyl().from_reduced_word
>>> v = r([Integer(1),Integer(0)])
>>> w = r([Integer(1),Integer(2),Integer(0)])
>>> v.bruhat_le(w)
True
>>> vv = WF.from_affine_weyl(v); vv
(s1*s0, pi[0])
>>> ww = WF.from_affine_weyl(w); ww
(s1*s2*s0, pi[0])
>>> vv.bruhat_le(ww)
True
>>> f = E.fundamental_group()(Integer(2)); f
pi[2]
>>> ff = WF.from_fundamental(f); ff
(1, pi[2])
>>> vv.bruhat_le(ww*ff)
False
>>> (vv*ff).bruhat_le(ww*ff)
True
```

has_descent(*i*, *side='right'*, *positive=False*)

Return whether `self` has i as a descent.

INPUT:

- `i` – an affine Dynkin index

OPTIONAL:

- `side` – `'left'` or `'right'` (default: `'right'`)
- `positive` – boolean (default: `False`)

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',2,1])
sage: x = E.WF().an_element(); x
S0*S1*S2 * pi[2]
sage: [(i, x.has_descent(i)) for i in E.cartan_type().index_set()]
[(0, True), (1, False), (2, False)]
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)])
>>> x = E.WF().an_element(); x
S0*S1*S2 * pi[2]
>>> [(i, x.has_descent(i)) for i in E.cartan_type().index_set()]
[(0, True), (1, False), (2, False)]
```

to_affine_weyl_left()

Project `self` to the left (affine Weyl group) factor in the “WF” style.

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',2,1])
sage: x = E.WF().from_translation(E.lattice_basis()[1]); x
```

(continues on next page)

(continued from previous page)

```
S0*S2 * pi[1]
sage: x.to_affine_weyl_left()
S0*S2
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)])
>>> x = E.WF().from_translation(E.lattice_basis()[Integer(1)]); x
S0*S2 * pi[1]
>>> x.to_affine_weyl_left()
S0*S2
```

to_fundamental_group()

Project `self` to the right (fundamental group) factor in the "WF" style.

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',2,1])
sage: x = E.WF().from_translation(E.lattice_basis()[1]); x
S0*S2 * pi[1]
sage: x.to_fundamental_group()
pi[1]
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)])
>>> x = E.WF().from_translation(E.lattice_basis()[Integer(1)]); x
S0*S2 * pi[1]
>>> x.to_fundamental_group()
pi[1]
```

FW()

Realizes `self` in "FW"-style.

EXAMPLES:

```
sage: ExtendedAffineWeylGroup(['A',2,1]).FW()
Extended affine Weyl group of type ['A', 2, 1] realized by Semidirect product␣
↪of
 Fundamental group of type ['A', 2, 1] acting on
  Weyl Group of type ['A', 2, 1] (as a matrix group acting on the root␣
↪lattice)
```

```
>>> from sage.all import *
>>> ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]).FW()
Extended affine Weyl group of type ['A', 2, 1] realized by Semidirect product␣
↪of
 Fundamental group of type ['A', 2, 1] acting on
  Weyl Group of type ['A', 2, 1] (as a matrix group acting on the root␣
↪lattice)
```

PW0()

Realizes `self` in "PW0"-style.

EXAMPLES:

```
sage: ExtendedAffineWeylGroup(['A',2,1]).PW0()
Extended affine Weyl group of type ['A', 2, 1] realized by
 Semidirect product of Multiplicative form of
  Coweight lattice of the Root system of type ['A', 2] acted upon by
   Weyl Group of type ['A', 2] (as a matrix group acting on the coweight␣
↪lattice)
```

```
>>> from sage.all import *
>>> ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]).PW0()
Extended affine Weyl group of type ['A', 2, 1] realized by
 Semidirect product of Multiplicative form of
  Coweight lattice of the Root system of type ['A', 2] acted upon by
   Weyl Group of type ['A', 2] (as a matrix group acting on the coweight␣
↪lattice)
```

PW0_to_WF_func(*x*)

Implement coercion from style "PW0" to "WF".

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(["A", 2, 1])
sage: x = E.PW0().an_element(); x
t[2*Lambdacheck[1] + 2*Lambdacheck[2]] * s1*s2
sage: E.PW0_to_WF_func(x)
S0*S1*S2*S0*S1*S0
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(["A", Integer(2), Integer(1)])
>>> x = E.PW0().an_element(); x
t[2*Lambdacheck[1] + 2*Lambdacheck[2]] * s1*s2
>>> E.PW0_to_WF_func(x)
S0*S1*S2*S0*S1*S0
```

Warning

This function cannot use coercion, because it is used to define the coercion maps.

PvW0()

Realizes `self` in "PvW0"-style.

EXAMPLES:

```
sage: ExtendedAffineWeylGroup(['A',2,1]).PvW0()
Extended affine Weyl group of type ['A', 2, 1] realized by Semidirect product␣
↪of
 Multiplicative form of Weight lattice of the Root system of type ['A', 2]
 acted upon by Weyl Group of type ['A', 2] (as a matrix group acting on the␣
↪weight lattice)
```

```
>>> from sage.all import *
>>> ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]).PvW0()
```

(continues on next page)

(continued from previous page)

```
Extended affine Weyl group of type ['A', 2, 1] realized by Semidirect product␣
↪of
 Multiplicative form of Weight lattice of the Root system of type ['A', 2]
 acted upon by Weyl Group of type ['A', 2] (as a matrix group acting on the␣
↪weight lattice)
```

class Realizations(*parent_with_realization*)

Bases: `Category_realization_of_parent`

The category of the realizations of an extended affine Weyl group

class ElementMethods

Bases: `object`

action(*la*)

Action of `self` on a lattice element `la`.

INPUT:

- `self` – an element of the extended affine Weyl group
- `la` – an element of the translation lattice of the extended affine Weyl group, the lattice denoted by the mnemonic "P" in the documentation for `ExtendedAffineWeylGroup()`.

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',2,1], affine='s')
sage: x = E.FW().an_element(); x
pi[2] * s0*s1*s2
sage: la = E.lattice().an_element(); la
2*Lambdacheck[1] + 2*Lambdacheck[2]
sage: x.action(la)
5*Lambdacheck[1] - 3*Lambdacheck[2]
sage: E = ExtendedAffineWeylGroup(['C',2,1], affine='s')
sage: x = E.PW0().from_translation(E.lattice_basis()[1])
sage: x.action(E.lattice_basis()[2])
Lambdacheck[1] + Lambdacheck[2]
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)], affine='s
↪')
>>> x = E.FW().an_element(); x
pi[2] * s0*s1*s2
>>> la = E.lattice().an_element(); la
2*Lambdacheck[1] + 2*Lambdacheck[2]
>>> x.action(la)
5*Lambdacheck[1] - 3*Lambdacheck[2]
>>> E = ExtendedAffineWeylGroup(['C',Integer(2),Integer(1)], affine='s
↪')
>>> x = E.PW0().from_translation(E.lattice_basis()[Integer(1)])
>>> x.action(E.lattice_basis()[Integer(2)])
Lambdacheck[1] + Lambdacheck[2]
```

Warning

Must be implemented by style "PW0".

action_on_affine_roots(*beta*)

Act by `self` on the affine root lattice element `beta`.

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',2,1])
sage: beta = E.cartan_type().root_system().root_lattice().an_element();
↪ beta
2*alpha[0] + 2*alpha[1] + 3*alpha[2]
sage: x = E.FW().an_element(); x
pi[2] * S0*S1*S2
sage: x.action_on_affine_roots(beta)
alpha[0] + alpha[1]
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)])
>>> beta = E.cartan_type().root_system().root_lattice().an_element();
↪beta
2*alpha[0] + 2*alpha[1] + 3*alpha[2]
>>> x = E.FW().an_element(); x
pi[2] * S0*S1*S2
>>> x.action_on_affine_roots(beta)
alpha[0] + alpha[1]
```

Warning

Must be implemented by style "FW".

alcove_walk_signs()

Return a signed alcove walk for `self`.

INPUT:

- An element `self` of the extended affine Weyl group.

OUTPUT:

- A 3-tuple (g, `rw`, `signs`).

ALGORITHM:

The element `self` can be uniquely written `self` = $g * w$ where g has length zero and w is an element of the nonextended affine Weyl group. Let w have reduced word `rw`. Starting with g and applying simple reflections from `rw`, one obtains a sequence of extended affine Weyl group elements (that is, alcoves) and simple roots. The signs give the sequence of sides on which the alcoves lie, relative to the face indicated by the simple roots.

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',3,1]); FW=E.FW()
sage: w = FW.from_reduced_word([0,2,1,3,0])*FW.from_fundamental(1); w
pi[1] * S3*S1*S2*S0*S3
sage: w.alcove_walk_signs()
(pi[1], [3, 1, 2, 0, 3], [-1, 1, -1, -1, 1])
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(3),Integer(1)]); FW=E.FW()
>>> w = FW.from_reduced_word([Integer(0),Integer(2),Integer(1),
↪Integer(3),Integer(0)])*FW.from_fundamental(Integer(1)); w
pi[1] * S3*S1*S2*S0*S3
>>> w.alcove_walk_signs()
(pi[1], [3, 1, 2, 0, 3], [-1, 1, -1, -1, 1])
```

apply_simple_projection (*i*, *side='right'*, *length_increasing=True*)

Return the product of `self` by the simple reflection s_i if that product is of greater length than `self` and otherwise return `self`.

INPUT:

- `self` – an element of the extended affine Weyl group
- `i` – a Dynkin node (index of a simple reflection s_i)
- `side` – `'right'` or `'left'` (default: `'right'`) according to which side of `self` the reflection s_i should be multiplied
- `length_increasing` – boolean (default: `True`); if `False`, do the above with the word "greater" replaced by "less"

EXAMPLES:

```
sage: x = ExtendedAffineWeylGroup(['A',3,1]).WF().an_element(); x
S0*S1*S2*S3 * pi[3]
sage: x.apply_simple_projection(1)
S0*S1*S2*S3*S0 * pi[3]
sage: x.apply_simple_projection(1, length_increasing=False)
S0*S1*S2*S3 * pi[3]
```

```
>>> from sage.all import *
>>> x = ExtendedAffineWeylGroup(['A',Integer(3),Integer(1)]).WF().an_
↪element(); x
S0*S1*S2*S3 * pi[3]
>>> x.apply_simple_projection(Integer(1))
S0*S1*S2*S3*S0 * pi[3]
>>> x.apply_simple_projection(Integer(1), length_increasing=False)
S0*S1*S2*S3 * pi[3]
```

apply_simple_reflection (*i*, *side='right'*)

Apply the i-th simple reflection to `self`.

EXAMPLES:

```
sage: x = ExtendedAffineWeylGroup(['A',3,1]).WF().an_element(); x
S0*S1*S2*S3 * pi[3]
sage: x.apply_simple_reflection(1)
S0*S1*S2*S3*S0 * pi[3]
sage: x.apply_simple_reflection(0, side='left')
S1*S2*S3 * pi[3]
```

```
>>> from sage.all import *
>>> x = ExtendedAffineWeylGroup(['A',Integer(3),Integer(1)]).WF().an_
↪element(); x
S0*S1*S2*S3 * pi[3]
```

(continues on next page)

(continued from previous page)

```
>>> x.apply_simple_reflection(Integer(1))
S0*S1*S2*S3*S0 * pi[3]
>>> x.apply_simple_reflection(Integer(0), side='left')
S1*S2*S3 * pi[3]
```

bruhat_le(x)

Return whether `self` <= x in Bruhat order.

INPUT:

- `self` – an element of the extended affine Weyl group
- `x` – another element with the same parent as `self`

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',2,1], print_tuple=True); WF = E.
↪WF()
sage: W = E.affine_weyl()
sage: v = W.from_reduced_word([2,1,0])
sage: w = W.from_reduced_word([2,0,1,0])
sage: v.bruhat_le(w)
True
sage: vx = WF.from_affine_weyl(v); vx
(S2*S1*S0, pi[0])
sage: wx = WF.from_affine_weyl(w); wx
(S2*S0*S1*S0, pi[0])
sage: vx.bruhat_le(wx)
True
sage: F = E.fundamental_group()
sage: f = WF.from_fundamental(F(2))
sage: vx.bruhat_le(wx*f)
False
sage: (vx*f).bruhat_le(wx*f)
True
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)], print_
↪tuple=True); WF = E.WF()
>>> W = E.affine_weyl()
>>> v = W.from_reduced_word([Integer(2),Integer(1),Integer(0)])
>>> w = W.from_reduced_word([Integer(2),Integer(0),Integer(1),
↪Integer(0)])
>>> v.bruhat_le(w)
True
>>> vx = WF.from_affine_weyl(v); vx
(S2*S1*S0, pi[0])
>>> wx = WF.from_affine_weyl(w); wx
(S2*S0*S1*S0, pi[0])
>>> vx.bruhat_le(wx)
True
>>> F = E.fundamental_group()
>>> f = WF.from_fundamental(F(Integer(2)))
>>> vx.bruhat_le(wx*f)
False
```

(continues on next page)

(continued from previous page)

```
>>> (vx*f).bruhat_le(wx*f)
True
```

> **Warning**
>
> Must be implemented by "WF".

coset_representative(*index_set*, *side='right'*)

Return the minimum length representative in the coset of `self` with respect to the subgroup generated by the reflections given by `index_set`.

INPUT:

- `self` – an element of the extended affine Weyl group
- `index_set` – a subset of the set of Dynkin nodes
- `side` – `'right'` or `'left'` (default: `'right'`) the side on which the subgroup acts

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',3,1]); WF = E.WF()
sage: b = E.lattice_basis()
sage: I0 = E.cartan_type().classical().index_set()
sage: [WF.from_translation(x).coset_representative(index_set=I0) for x␣
↪in b]
[pi[1], pi[2], pi[3]]
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(3),Integer(1)]); WF = E.
↪WF()
>>> b = E.lattice_basis()
>>> I0 = E.cartan_type().classical().index_set()
>>> [WF.from_translation(x).coset_representative(index_set=I0) for x␣
↪in b]
[pi[1], pi[2], pi[3]]
```

dual_action(*la*)

Action of `self` on a dual lattice element `la`.

INPUT:

- `self` – an element of the extended affine Weyl group
- `la` – an element of the dual translation lattice of the extended affine Weyl group, the lattice denoted by the mnemonic "Pv" in the documentation for `ExtendedAffineWeylGroup()`.

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',2,1], affine='s')
sage: x = E.FW().an_element(); x
pi[2] * s0*s1*s2
sage: la = E.dual_lattice().an_element(); la
2*Lambda[1] + 2*Lambda[2]
sage: x.dual_action(la)
5*Lambda[1] - 3*Lambda[2]
sage: E = ExtendedAffineWeylGroup(['C',2,1], affine='s')
sage: x = E.PvW0().from_dual_translation(E.dual_lattice_basis()[1])
```

(continues on next page)

(continued from previous page)

```
sage: x.dual_action(E.dual_lattice_basis()[2])
Lambda[1] + Lambda[2]
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)], affine='s
↪')
>>> x = E.FW().an_element(); x
pi[2] * s0*s1*s2
>>> la = E.dual_lattice().an_element(); la
2*Lambda[1] + 2*Lambda[2]
>>> x.dual_action(la)
5*Lambda[1] - 3*Lambda[2]
>>> E = ExtendedAffineWeylGroup(['C',Integer(2),Integer(1)], affine='s
↪')
>>> x = E.PvW0().from_dual_translation(E.dual_lattice_
↪basis()[Integer(1)])
>>> x.dual_action(E.dual_lattice_basis()[Integer(2)])
Lambda[1] + Lambda[2]
```

> **Warning**
>
> Must be implemented by style “PvW0”.

face_data(*i*)

Return a description of one of the bounding hyperplanes of the alcove of an extended affine Weyl group element.

INPUT:

- `self` – an element of the extended affine Weyl group
- `i` – an affine Dynkin node

OUTPUT:

- A 2-tuple (m, β) defined as follows.

ALGORITHM:

Each element of the extended affine Weyl group corresponds to an alcove, and each alcove has a face for each affine Dynkin node. Given the data of `self` and i, let the extended affine Weyl group element `self` act on the affine simple root α_i, yielding a real affine root, which can be expressed uniquely as

$$``self`` \cdot \alpha_i = m\delta + \beta$$

where m is an integer (the height of the i-th bounding hyperplane of the alcove of `self`) and β is a classical root (the normal vector for the hyperplane which points towards the alcove).

EXAMPLES:

```
sage: x = ExtendedAffineWeylGroup(['A',2,1]).PW0().an_element(); x
t[2*Lambdacheck[1] + 2*Lambdacheck[2]] * s1*s2
sage: x.face_data(0)
(-1, alpha[1])
```

```
>>> from sage.all import *
>>> x = ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]).PW0().an_
↪element(); x
t[2*Lambdacheck[1] + 2*Lambdacheck[2]] * s1*s2
>>> x.face_data(Integer(0))
(-1, alpha[1])
```

first_descent (*side='right'*, *positive=False*, *index_set=None*)

Return the first descent of `self`.

INPUT:

- `side` – `'left'` or `'right'` (default: `'right'`)
- `positive` – boolean (default: `False`)
- `index_set` – an optional subset of Dynkin nodes

If `index_set` is not `None`, then the descent must be in the `index_set`.

EXAMPLES:

```
sage: x = ExtendedAffineWeylGroup(['A',3,1]).WF().an_element(); x
S0*S1*S2*S3 * pi[3]
sage: x.first_descent()
0
sage: x.first_descent(side='left')
0
sage: x.first_descent(positive=True)
1
sage: x.first_descent(side='left',positive=True)
1
```

```
>>> from sage.all import *
>>> x = ExtendedAffineWeylGroup(['A',Integer(3),Integer(1)]).WF().an_
↪element(); x
S0*S1*S2*S3 * pi[3]
>>> x.first_descent()
0
>>> x.first_descent(side='left')
0
>>> x.first_descent(positive=True)
1
>>> x.first_descent(side='left',positive=True)
1
```

has_descent (*i*, *side='right'*, *positive=False*)

Return whether `self` * s_i < `self` where s_i is the i-th simple reflection in the realized group.

INPUT:

- `i` – an affine Dynkin index

OPTIONAL:

- `side` – `'right'` or `'left'` (default: `'right'`)
- `positive` – boolean (default: `False`)

If `side='left'`, then the reflection acts on the left. If `positive=True`, then the inequality is reversed.

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',3,1]); WF = E.WF()
sage: F = E.fundamental_group()
sage: x = WF.an_element(); x
S0*S1*S2*S3 * pi[3]
sage: I = E.cartan_type().index_set()
sage: [(i, x.has_descent(i)) for i in I]
[(0, True), (1, False), (2, False), (3, False)]
sage: [(i, x.has_descent(i,side='left')) for i in I]
[(0, True), (1, False), (2, False), (3, False)]
sage: [(i, x.has_descent(i,positive=True)) for i in I]
[(0, False), (1, True), (2, True), (3, True)]
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(3),Integer(1)]); WF = E.
↪WF()
>>> F = E.fundamental_group()
>>> x = WF.an_element(); x
S0*S1*S2*S3 * pi[3]
>>> I = E.cartan_type().index_set()
>>> [(i, x.has_descent(i)) for i in I]
[(0, True), (1, False), (2, False), (3, False)]
>>> [(i, x.has_descent(i,side='left')) for i in I]
[(0, True), (1, False), (2, False), (3, False)]
>>> [(i, x.has_descent(i,positive=True)) for i in I]
[(0, False), (1, True), (2, True), (3, True)]
```

Warning

This method is abstract because it is used in the recursive coercions between "PW0" and "WF" and other methods use this coercion.

is_affine_grassmannian()

Return whether self is affine Grassmannian.

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',2,1]); PW0 = E.PW0()
sage: F = E.fundamental_group()
sage: [(x,PW0.from_fundamental(x).is_affine_grassmannian()) for x in F]
[(pi[0], True), (pi[1], True), (pi[2], True)]
sage: b = E.lattice_basis()
sage: [(-x,PW0.from_translation(-x).is_affine_grassmannian()) for x in␣
↪b]
[(-Lambdacheck[1], True), (-Lambdacheck[2], True)]
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]); PW0 = E.
↪PW0()
>>> F = E.fundamental_group()
>>> [(x,PW0.from_fundamental(x).is_affine_grassmannian()) for x in F]
[(pi[0], True), (pi[1], True), (pi[2], True)]
```

(continues on next page)

(continued from previous page)

```
>>> b = E.lattice_basis()
>>> [(-x,PW0.from_translation(-x).is_affine_grassmannian()) for x in b]
[(-Lambdacheck[1], True), (-Lambdacheck[2], True)]
```

is_grassmannian(*index_set*, *side='right'*)

Return whether `self` is of minimum length in its coset with respect to the subgroup generated by the reflections of `index_set`.

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',3,1]); PW0 = E.PW0()
sage: x = PW0.from_translation(E.lattice_basis()[1]); x
t[Lambdacheck[1]]
sage: I = E.cartan_type().index_set()
sage: [(i, x.is_grassmannian(index_set=[i])) for i in I]
[(0, True), (1, False), (2, True), (3, True)]
sage: [(i, x.is_grassmannian(index_set=[i], side='left')) for i in I]
[(0, False), (1, True), (2, True), (3, True)]
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(3),Integer(1)]); PW0 = E.
↪PW0()
>>> x = PW0.from_translation(E.lattice_basis()[Integer(1)]); x
t[Lambdacheck[1]]
>>> I = E.cartan_type().index_set()
>>> [(i, x.is_grassmannian(index_set=[i])) for i in I]
[(0, True), (1, False), (2, True), (3, True)]
>>> [(i, x.is_grassmannian(index_set=[i], side='left')) for i in I]
[(0, False), (1, True), (2, True), (3, True)]
```

is_translation()

Return whether `self` is a translation element or not.

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',2,1]); FW = E.FW()
sage: F = E.fundamental_group()
sage: FW.from_affine_weyl(E.affine_weyl().from_reduced_word([1,2,1,
↪0])).is_translation()
True
sage: FW.from_translation(E.lattice_basis()[1]).is_translation()
True
sage: FW.simple_reflection(0).is_translation()
False
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]); FW = E.
↪FW()
>>> F = E.fundamental_group()
>>> FW.from_affine_weyl(E.affine_weyl().from_reduced_word([Integer(1),
↪Integer(2),Integer(1),Integer(0)])).is_translation()
True
```

(continues on next page)

(continued from previous page)

```
>>> FW.from_translation(E.lattice_basis()[Integer(1)]).is_translation()
True
>>> FW.simple_reflection(Integer(0)).is_translation()
False
```

length()

Return the length of `self` in the Coxeter group sense.

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',3,1]); PW0 = E.PW0()
sage: I0 = E.cartan_type().classical().index_set()
sage: [PW0.from_translation(E.lattice_basis()[i]).length() for i in I0]
[3, 4, 3]
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(3),Integer(1)]); PW0 = E.
↪PW0()
>>> I0 = E.cartan_type().classical().index_set()
>>> [PW0.from_translation(E.lattice_basis()[i]).length() for i in I0]
[3, 4, 3]
```

to_affine_grassmannian()

Return the unique affine Grassmannian element in the same coset of `self` with respect to the finite Weyl group acting on the right.

EXAMPLES:

```
sage: elts = ExtendedAffineWeylGroup(['A',2,1]).PW0().some_elements()
sage: [(x, x.to_affine_grassmannian()) for x in elts]
[(t[2*Lambdacheck[1] + 2*Lambdacheck[2]] * s1*s2,
  t[2*Lambdacheck[1] + 2*Lambdacheck[2]] * s1*s2*s1)]
```

```
>>> from sage.all import *
>>> elts = ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]).PW0().
↪some_elements()
>>> [(x, x.to_affine_grassmannian()) for x in elts]
[(t[2*Lambdacheck[1] + 2*Lambdacheck[2]] * s1*s2,
  t[2*Lambdacheck[1] + 2*Lambdacheck[2]] * s1*s2*s1)]
```

to_affine_weyl_left()

Return the projection of `self` to the affine Weyl group on the left, after factorizing using the style "WF".

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',3,1]); PW0 = E.PW0()
sage: b = E.lattice_basis()
sage: [(x, PW0.from_translation(x).to_affine_weyl_left()) for x in b]
[(Lambdacheck[1], S0*S3*S2),
 (Lambdacheck[2], S0*S3*S1*S0),
 (Lambdacheck[3], S0*S1*S2)]
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(3),Integer(1)]); PW0 = E.
↪PW0()
>>> b = E.lattice_basis()
>>> [(x, PW0.from_translation(x).to_affine_weyl_left()) for x in b]
[(Lambdacheck[1], S0*S3*S2),
 (Lambdacheck[2], S0*S3*S1*S0),
 (Lambdacheck[3], S0*S1*S2)]
```

Warning: Must be implemented in style “WF”.

to_affine_weyl_right()

Return the projection of `self` to the affine Weyl group on the right, after factorizing using the style “FW”.

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',3,1]); PW0 = E.PW0()
sage: b = E.lattice_basis()
sage: [(x, PW0.from_translation(x).to_affine_weyl_right()) for x in b]
[(Lambdacheck[1], S3*S2*S1),
 (Lambdacheck[2], S2*S3*S1*S2),
 (Lambdacheck[3], S1*S2*S3)]
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(3),Integer(1)]); PW0 = E.
↪PW0()
>>> b = E.lattice_basis()
>>> [(x, PW0.from_translation(x).to_affine_weyl_right()) for x in b]
[(Lambdacheck[1], S3*S2*S1),
 (Lambdacheck[2], S2*S3*S1*S2),
 (Lambdacheck[3], S1*S2*S3)]
```

Warning: Must be implemented in style “FW”.

to_classical_weyl()

Return the image of `self` under the homomorphism to the classical Weyl group.

EXAMPLES:

```
sage: ExtendedAffineWeylGroup(['A',3,1]).WF().simple_reflection(0).to_
↪classical_weyl()
s1*s2*s3*s2*s1
```

```
>>> from sage.all import *
>>> ExtendedAffineWeylGroup(['A',Integer(3),Integer(1)]).WF().simple_
```

(continues on next page)

(continued from previous page)

```
→reflection(Integer(0)).to_classical_weyl()
s1*s2*s3*s2*s1
```

Warning: Must be implemented in style "PW0".

to_dual_classical_weyl()

Return the image of `self` under the homomorphism to the dual form of the classical Weyl group.

EXAMPLES:

```
sage: x = ExtendedAffineWeylGroup(['A',3,1]).WF().simple_reflection(0).
→to_dual_classical_weyl(); x
s1*s2*s3*s2*s1
sage: x.parent()
Weyl Group of type ['A', 3] (as a matrix group acting on the weight␣
→lattice)
```

```
>>> from sage.all import *
>>> x = ExtendedAffineWeylGroup(['A',Integer(3),Integer(1)]).WF().
→simple_reflection(Integer(0)).to_dual_classical_weyl(); x
s1*s2*s3*s2*s1
>>> x.parent()
Weyl Group of type ['A', 3] (as a matrix group acting on the weight␣
→lattice)
```

Warning: Must be implemented in style "PvW0".

to_dual_translation_left()

Return the projection of `self` to the dual translation lattice after factorizing it to the left using the style "PvW0".

EXAMPLES:

```
sage: ExtendedAffineWeylGroup(['A',3,1]).PvW0().simple_reflection(0).
→to_dual_translation_left()
Lambda[1] + Lambda[3]
```

```
>>> from sage.all import *
>>> ExtendedAffineWeylGroup(['A',Integer(3),Integer(1)]).PvW0().simple_
→reflection(Integer(0)).to_dual_translation_left()
Lambda[1] + Lambda[3]
```

Warning:

Must be implemented in style "PvW0".

to_dual_translation_right()

Return the projection of `self` to the dual translation lattice after factorizing it to the right using the style "W0Pv".

EXAMPLES:

```
sage: ExtendedAffineWeylGroup(['A',3,1]).PW0().simple_reflection(0).to_
↪dual_translation_right()
-Lambda[1] - Lambda[3]
```

```
>>> from sage.all import *
>>> ExtendedAffineWeylGroup(['A',Integer(3),Integer(1)]).PW0().simple_
↪reflection(Integer(0)).to_dual_translation_right()
-Lambda[1] - Lambda[3]
```

Warning

Must be implemented in style "W0Pv".

to_fundamental_group()

Return the image of `self` under the homomorphism to the fundamental group.

EXAMPLES:

```
sage: PW0 = ExtendedAffineWeylGroup(['A',3,1]).PW0()
sage: b = PW0.realization_of().lattice_basis()
sage: [(x, PW0.from_translation(x).to_fundamental_group()) for x in b]
[(Lambdacheck[1], pi[1]), (Lambdacheck[2], pi[2]), (Lambdacheck[3],␣
↪pi[3])]
```

```
>>> from sage.all import *
>>> PW0 = ExtendedAffineWeylGroup(['A',Integer(3),Integer(1)]).PW0()
>>> b = PW0.realization_of().lattice_basis()
>>> [(x, PW0.from_translation(x).to_fundamental_group()) for x in b]
[(Lambdacheck[1], pi[1]), (Lambdacheck[2], pi[2]), (Lambdacheck[3],␣
↪pi[3])]
```

Warning

Must be implemented in style "WF".

to_translation_left()

Return the projection of `self` to the translation lattice after factorizing it to the left using the style "PW0".

EXAMPLES:

```
sage: ExtendedAffineWeylGroup(['A',3,1]).PW0().simple_reflection(0).to_
↪translation_left()
Lambdacheck[1] + Lambdacheck[3]
```

```
>>> from sage.all import *
>>> ExtendedAffineWeylGroup(['A',Integer(3),Integer(1)]).PW0().simple_
↪reflection(Integer(0)).to_translation_left()
Lambdacheck[1] + Lambdacheck[3]
```

> **Warning**
>
> Must be implemented in style "PW0".

to_translation_right()

Return the projection of `self` to the translation lattice after factorizing it to the right using the style "W0P".

EXAMPLES:

```
sage: ExtendedAffineWeylGroup(['A',3,1]).PW0().simple_reflection(0).to_
↪translation_right()
-Lambdacheck[1] - Lambdacheck[3]
```

```
>>> from sage.all import *
>>> ExtendedAffineWeylGroup(['A',Integer(3),Integer(1)]).PW0().simple_
↪reflection(Integer(0)).to_translation_right()
-Lambdacheck[1] - Lambdacheck[3]
```

> **Warning**
>
> Must be implemented in style "W0P".

class ParentMethods

Bases: `object`

from_affine_weyl(w)

Return the image of w under the homomorphism from the affine Weyl group into `self`.

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',3,1]); PW0 = E.PW0()
sage: W = E.affine_weyl()
sage: w = W.from_reduced_word([2,1,3,0])
sage: x = PW0.from_affine_weyl(w); x
t[Lambdacheck[1] - 2*Lambdacheck[2] + Lambdacheck[3]] * s3*s1
sage: FW = E.FW()
sage: y = FW.from_affine_weyl(w); y
S2*S3*S1*S0
sage: FW(x) == y
True
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(3),Integer(1)]); PW0 = E.
↪PW0()
>>> W = E.affine_weyl()
>>> w = W.from_reduced_word([Integer(2),Integer(1),Integer(3),
↪Integer(0)])
>>> x = PW0.from_affine_weyl(w); x
t[Lambdacheck[1] - 2*Lambdacheck[2] + Lambdacheck[3]] * s3*s1
>>> FW = E.FW()
>>> y = FW.from_affine_weyl(w); y
S2*S3*S1*S0
>>> FW(x) == y
True
```

Warning

Must be implemented in style "WF" and "FW".

from_classical_weyl(*w*)

Return the image of w from the finite Weyl group into `self`.

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',3,1]); PW0=E.PW0()
sage: W0 = E.classical_weyl()
sage: w = W0.from_reduced_word([2,1,3])
sage: y = PW0.from_classical_weyl(w); y
s2*s3*s1
sage: y.parent() == PW0
True
sage: y.to_classical_weyl() == w
True
sage: W0P = E.W0P()
sage: z = W0P.from_classical_weyl(w); z
s2*s3*s1
sage: z.parent() == W0P
True
sage: W0P(y) == z
True
sage: FW = E.FW()
sage: x = FW.from_classical_weyl(w); x
S2*S3*S1
sage: x.parent() == FW
True
sage: FW(y) == x
True
sage: FW(z) == x
True
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(3),Integer(1)]); PW0=E.
```

(continues on next page)

(continued from previous page)

```
↪PW0()
>>> W0 = E.classical_weyl()
>>> w = W0.from_reduced_word([Integer(2),Integer(1),Integer(3)])
>>> y = PW0.from_classical_weyl(w); y
s2*s3*s1
>>> y.parent() == PW0
True
>>> y.to_classical_weyl() == w
True
>>> W0P = E.W0P()
>>> z = W0P.from_classical_weyl(w); z
s2*s3*s1
>>> z.parent() == W0P
True
>>> W0P(y) == z
True
>>> FW = E.FW()
>>> x = FW.from_classical_weyl(w); x
S2*S3*S1
>>> x.parent() == FW
True
>>> FW(y) == x
True
>>> FW(z) == x
True
```

> **Warning**
>
> Must be implemented in style "PW0" and "W0P".

from_dual_classical_weyl(*w*)

Return the image of w from the finite Weyl group of dual form into `self`.

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',3,1]); PvW0 = E.PvW0()
sage: W0v = E.dual_classical_weyl()
sage: w = W0v.from_reduced_word([2,1,3])
sage: y = PvW0.from_dual_classical_weyl(w); y
s2*s3*s1
sage: y.parent() == PvW0
True
sage: y.to_dual_classical_weyl() == w
True
sage: x = E.FW().from_dual_classical_weyl(w); x
S2*S3*S1
sage: PvW0(x) == y
True
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(3),Integer(1)]); PvW0 = E.
```

(continues on next page)

(continued from previous page)

```
↪PvW0()
>>> W0v = E.dual_classical_weyl()
>>> w = W0v.from_reduced_word([Integer(2),Integer(1),Integer(3)])
>>> y = PvW0.from_dual_classical_weyl(w); y
s2*s3*s1
>>> y.parent() == PvW0
True
>>> y.to_dual_classical_weyl() == w
True
>>> x = E.FW().from_dual_classical_weyl(w); x
S2*S3*S1
>>> PvW0(x) == y
True
```

Warning

Must be implemented in style "PvW0" and "W0Pv".

from_dual_translation(*la*)

Return the image of `la` under the homomorphism of the dual version of the translation lattice into `self`.

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',2,1]); PvW0 = E.PvW0()
sage: bv = E.dual_lattice_basis(); bv
Finite family {1: Lambda[1], 2: Lambda[2]}
sage: x = PvW0.from_dual_translation(2*bv[1] - bv[2]); x
t[2*Lambda[1] - Lambda[2]]
sage: FW = E.FW()
sage: y = FW.from_dual_translation(2*bv[1] - bv[2]); y
S0*S2*S0*S1
sage: FW(x) == y
True
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]); PvW0 = E.
↪PvW0()
>>> bv = E.dual_lattice_basis(); bv
Finite family {1: Lambda[1], 2: Lambda[2]}
>>> x = PvW0.from_dual_translation(Integer(2)*bv[Integer(1)] -␣
↪bv[Integer(2)]); x
t[2*Lambda[1] - Lambda[2]]
>>> FW = E.FW()
>>> y = FW.from_dual_translation(Integer(2)*bv[Integer(1)] -␣
↪bv[Integer(2)]); y
S0*S2*S0*S1
>>> FW(x) == y
True
```

from_fundamental(*x*)

Return the image of x under the homomorphism from the fundamental group into `self`.

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',3,1])
sage: PW0=E.PW0()
sage: F = E.fundamental_group()
sage: Is = F.special_nodes()
sage: [(i, PW0.from_fundamental(F(i))) for i in Is]
[(0, 1),
 (1, t[Lambdacheck[1]] * s1*s2*s3),
 (2, t[Lambdacheck[2]] * s2*s3*s1*s2),
 (3, t[Lambdacheck[3]] * s3*s2*s1)]
sage: [(i, E.W0P().from_fundamental((F(i)))) for i in Is]
[(0, 1),
 (1, s1*s2*s3 * t[-Lambdacheck[3]]),
 (2, s2*s3*s1*s2 * t[-Lambdacheck[2]]),
 (3, s3*s2*s1 * t[-Lambdacheck[1]])]
sage: [(i, E.WF().from_fundamental(F(i))) for i in Is]
[(0, 1), (1, pi[1]), (2, pi[2]), (3, pi[3])]
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(3),Integer(1)])
>>> PW0=E.PW0()
>>> F = E.fundamental_group()
>>> Is = F.special_nodes()
>>> [(i, PW0.from_fundamental(F(i))) for i in Is]
[(0, 1),
 (1, t[Lambdacheck[1]] * s1*s2*s3),
 (2, t[Lambdacheck[2]] * s2*s3*s1*s2),
 (3, t[Lambdacheck[3]] * s3*s2*s1)]
>>> [(i, E.W0P().from_fundamental((F(i)))) for i in Is]
[(0, 1),
 (1, s1*s2*s3 * t[-Lambdacheck[3]]),
 (2, s2*s3*s1*s2 * t[-Lambdacheck[2]]),
 (3, s3*s2*s1 * t[-Lambdacheck[1]])]
>>> [(i, E.WF().from_fundamental(F(i))) for i in Is]
[(0, 1), (1, pi[1]), (2, pi[2]), (3, pi[3])]
```

Warning

This method must be implemented by the "WF" and "FW" realizations.

from_reduced_word(*word*)

Convert an affine or finite reduced word into a group element.

EXAMPLES:

```
sage: ExtendedAffineWeylGroup(['A',2,1]).PW0().from_reduced_word([1,0,
↪1,2])
t[-Lambdacheck[1] + 2*Lambdacheck[2]]
```

```
>>> from sage.all import *
>>> ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]).PW0().from_
↪reduced_word([Integer(1),Integer(0),Integer(1),Integer(2)])
t[-Lambdacheck[1] + 2*Lambdacheck[2]]
```

from_translation(*la*)

Return the element of translation by `la` in `self`.

INPUT:

- `self` – a realization of the extended affine Weyl group
- `la` – an element of the translation lattice

In the notation of the documentation for *ExtendedAffineWeylGroup()*, `la` must be an element of "P".

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',2,1]); PW0 = E.PW0()
sage: b = E.lattice_basis(); b
Finite family {1: Lambdacheck[1], 2: Lambdacheck[2]}
sage: x = PW0.from_translation(2*b[1] - b[2]); x
t[2*Lambdacheck[1] - Lambdacheck[2]]
sage: FW = E.FW()
sage: y = FW.from_translation(2*b[1] - b[2]); y
S0*S2*S0*S1
sage: FW(x) == y
True
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]); PW0 = E.
↪PW0()
>>> b = E.lattice_basis(); b
Finite family {1: Lambdacheck[1], 2: Lambdacheck[2]}
>>> x = PW0.from_translation(Integer(2)*b[Integer(1)] - b[Integer(2)]);
↪ x
t[2*Lambdacheck[1] - Lambdacheck[2]]
>>> FW = E.FW()
>>> y = FW.from_translation(Integer(2)*b[Integer(1)] - b[Integer(2)]);␣
↪y
S0*S2*S0*S1
>>> FW(x) == y
True
```

Since the implementation as a semidirect product requires wrapping the lattice group to make it multiplicative, we cannot declare that this map is a morphism for sage `Groups()`.

> **Warning**
>
> This method must be implemented by the "PW0" and "W0P" realizations.

simple_reflection(*i*)

Return the i-th simple reflection in `self`.

INPUT:

- `self` – a realization of the extended affine Weyl group
- `i` – an affine Dynkin node

EXAMPLES:

```
sage: ExtendedAffineWeylGroup(['A',3,1]).PW0().simple_reflection(0)
t[Lambdacheck[1] + Lambdacheck[3]] * s1*s2*s3*s2*s1
sage: ExtendedAffineWeylGroup(['C',2,1]).WF().simple_reflection(0)
S0
sage: ExtendedAffineWeylGroup(['D',3,2]).PvW0().simple_reflection(1)
s1
```

```
>>> from sage.all import *
>>> ExtendedAffineWeylGroup(['A',Integer(3),Integer(1)]).PW0().simple_
→reflection(Integer(0))
t[Lambdacheck[1] + Lambdacheck[3]] * s1*s2*s3*s2*s1
>>> ExtendedAffineWeylGroup(['C',Integer(2),Integer(1)]).WF().simple_
→reflection(Integer(0))
S0
>>> ExtendedAffineWeylGroup(['D',Integer(3),Integer(2)]).PvW0().simple_
→reflection(Integer(1))
s1
```

simple_reflections()

Return a family from the set of affine Dynkin nodes to the simple reflections in the realization of the extended affine Weyl group.

EXAMPLES:

```
sage: ExtendedAffineWeylGroup(['A',3,1]).W0P().simple_reflections()
Finite family {0: s1*s2*s3*s2*s1 * t[-Lambdacheck[1] - Lambdacheck[3]],
               1: s1, 2: s2, 3: s3}
sage: ExtendedAffineWeylGroup(['A',3,1]).WF().simple_reflections()
Finite family {0: S0, 1: S1, 2: S2, 3: S3}
sage: ExtendedAffineWeylGroup(['A',3,1],
....:                         print_tuple=True).FW().simple_
→reflections()
Finite family {0: (pi[0], S0), 1: (pi[0], S1),
               2: (pi[0], S2), 3: (pi[0], S3)}
sage: ExtendedAffineWeylGroup(['A',3,1],
....:                         fundamental='f',
....:                         print_tuple=True).FW().simple_
→reflections()
Finite family {0: (f[0], S0), 1: (f[0], S1),
               2: (f[0], S2), 3: (f[0], S3)}
sage: ExtendedAffineWeylGroup(['A',3,1]).PvW0().simple_reflections()
Finite family {0: t[Lambda[1] + Lambda[3]] * s1*s2*s3*s2*s1,
               1: s1, 2: s2, 3: s3}
```

```
>>> from sage.all import *
>>> ExtendedAffineWeylGroup(['A',Integer(3),Integer(1)]).W0P().simple_
→reflections()
Finite family {0: s1*s2*s3*s2*s1 * t[-Lambdacheck[1] - Lambdacheck[3]],
               1: s1, 2: s2, 3: s3}
```

(continues on next page)

(continued from previous page)

```
>>> ExtendedAffineWeylGroup(['A',Integer(3),Integer(1)]).WF().simple_
↪reflections()
Finite family {0: S0, 1: S1, 2: S2, 3: S3}
>>> ExtendedAffineWeylGroup(['A',Integer(3),Integer(1)],
...                          print_tuple=True).FW().simple_reflections()
Finite family {0: (pi[0], S0), 1: (pi[0], S1),
               2: (pi[0], S2), 3: (pi[0], S3)}
>>> ExtendedAffineWeylGroup(['A',Integer(3),Integer(1)],
...                          fundamental='f',
...                          print_tuple=True).FW().simple_reflections()
Finite family {0: (f[0], S0), 1: (f[0], S1),
               2: (f[0], S2), 3: (f[0], S3)}
>>> ExtendedAffineWeylGroup(['A',Integer(3),Integer(1)]).PvW0().simple_
↪reflections()
Finite family {0: t[Lambda[1] + Lambda[3]] * s1*s2*s3*s2*s1,
               1: s1, 2: s2, 3: s3}
```

super_categories()

EXAMPLES:

```
sage: R = ExtendedAffineWeylGroup(['A',2,1]).Realizations(); R
Category of realizations of Extended affine Weyl group of type ['A', 2, 1]
sage: R.super_categories()
[Category of associative inverse realizations of unital magmas]
```

```
>>> from sage.all import *
>>> R = ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]).
↪Realizations(); R
Category of realizations of Extended affine Weyl group of type ['A', 2, 1]
>>> R.super_categories()
[Category of associative inverse realizations of unital magmas]
```

W0P()

Realizes `self` in "W0P"-style.

EXAMPLES:

```
sage: ExtendedAffineWeylGroup(['A',2,1]).W0P()
Extended affine Weyl group of type ['A', 2, 1] realized by Semidirect product␣
↪of
 Weyl Group of type ['A', 2] (as a matrix group acting on the coweight␣
↪lattice)
 acting on Multiplicative form of Coweight lattice of the Root system of type␣
↪['A', 2]
```

```
>>> from sage.all import *
>>> ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]).W0P()
Extended affine Weyl group of type ['A', 2, 1] realized by Semidirect product␣
↪of
 Weyl Group of type ['A', 2] (as a matrix group acting on the coweight␣
↪lattice)
```

(continues on next page)

(continued from previous page)

```
acting on Multiplicative form of Coweight lattice of the Root system of type␣
↪['A', 2]
```

W0Pv()

Realizes `self` in "W0Pv"-style.

EXAMPLES:

```
sage: ExtendedAffineWeylGroup(['A',2,1]).W0Pv()
Extended affine Weyl group of type ['A', 2, 1] realized by Semidirect product␣
↪of
 Weyl Group of type ['A', 2] (as a matrix group acting on the weight lattice)
  acting on Multiplicative form of Weight lattice of the Root system of type [
↪'A', 2]
```

```
>>> from sage.all import *
>>> ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]).W0Pv()
Extended affine Weyl group of type ['A', 2, 1] realized by Semidirect product␣
↪of
 Weyl Group of type ['A', 2] (as a matrix group acting on the weight lattice)
  acting on Multiplicative form of Weight lattice of the Root system of type [
↪'A', 2]
```

WF()

Realizes `self` in "WF"-style.

EXAMPLES:

```
sage: ExtendedAffineWeylGroup(['A',2,1]).WF()
Extended affine Weyl group of type ['A', 2, 1] realized by Semidirect product␣
↪of
 Weyl Group of type ['A', 2, 1] (as a matrix group acting on the root lattice)
 acted upon by Fundamental group of type ['A', 2, 1]
```

```
>>> from sage.all import *
>>> ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]).WF()
Extended affine Weyl group of type ['A', 2, 1] realized by Semidirect product␣
↪of
 Weyl Group of type ['A', 2, 1] (as a matrix group acting on the root lattice)
 acted upon by Fundamental group of type ['A', 2, 1]
```

WF_to_PW0_func(*x*)

Coercion from style "WF" to "PW0".

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(["A", 2, 1])
sage: x = E.WF().an_element(); x
S0*S1*S2 * pi[2]
sage: E.WF_to_PW0_func(x)
t[Lambdacheck[1] + 2*Lambdacheck[2]] * s1*s2*s1
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(["A", Integer(2), Integer(1)])
>>> x = E.WF().an_element(); x
S0*S1*S2 * pi[2]
>>> E.WF_to_PW0_func(x)
t[Lambdacheck[1] + 2*Lambdacheck[2]] * s1*s2*s1
```

Warning

Since this is used to define some coercion maps it cannot itself use coercion.

a_realization()

Return the default realization of an extended affine Weyl group.

EXAMPLES:

```
sage: ExtendedAffineWeylGroup(['A',2,1]).a_realization()
Extended affine Weyl group of type ['A', 2, 1] realized by Semidirect product␣
↪of
 Multiplicative form of Coweight lattice of the Root system of type ['A', 2]
 acted upon by Weyl Group of type ['A', 2] (as a matrix group acting on the␣
↪coweight lattice)
```

```
>>> from sage.all import *
>>> ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]).a_realization()
Extended affine Weyl group of type ['A', 2, 1] realized by Semidirect product␣
↪of
 Multiplicative form of Coweight lattice of the Root system of type ['A', 2]
 acted upon by Weyl Group of type ['A', 2] (as a matrix group acting on the␣
↪coweight lattice)
```

affine_weyl()

Return the affine Weyl group of `self`.

EXAMPLES:

```
sage: ExtendedAffineWeylGroup(['A',2,1]).affine_weyl()
Weyl Group of type ['A', 2, 1] (as a matrix group acting on the root lattice)
sage: ExtendedAffineWeylGroup(['A',5,2]).affine_weyl()
Weyl Group of type ['B', 3, 1]^* (as a matrix group acting on the root␣
↪lattice)
sage: ExtendedAffineWeylGroup(['A',4,2]).affine_weyl()
Weyl Group of type ['BC', 2, 2] (as a matrix group acting on the root lattice)
sage: ExtendedAffineWeylGroup(CartanType(['A',4,2]).dual()).affine_weyl()
Weyl Group of type ['BC', 2, 2]^* (as a matrix group acting on the root␣
↪lattice)
```

```
>>> from sage.all import *
>>> ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]).affine_weyl()
Weyl Group of type ['A', 2, 1] (as a matrix group acting on the root lattice)
>>> ExtendedAffineWeylGroup(['A',Integer(5),Integer(2)]).affine_weyl()
```

(continues on next page)

(continued from previous page)

```
Weyl Group of type ['B', 3, 1]^* (as a matrix group acting on the root␣
↪lattice)
>>> ExtendedAffineWeylGroup(['A',Integer(4),Integer(2)]).affine_weyl()
Weyl Group of type ['BC', 2, 2] (as a matrix group acting on the root lattice)
>>> ExtendedAffineWeylGroup(CartanType(['A',Integer(4),Integer(2)]).dual()).
↪affine_weyl()
Weyl Group of type ['BC', 2, 2]^* (as a matrix group acting on the root␣
↪lattice)
```

cartan_type()

The Cartan type of self.

EXAMPLES:

```
sage: ExtendedAffineWeylGroup(["D",3,2]).cartan_type()
['C', 2, 1]^*
```

```
>>> from sage.all import *
>>> ExtendedAffineWeylGroup(["D",Integer(3),Integer(2)]).cartan_type()
['C', 2, 1]^*
```

classical_weyl()

Return the classical Weyl group of self.

EXAMPLES:

```
sage: ExtendedAffineWeylGroup(['A',2,1]).classical_weyl()
Weyl Group of type ['A', 2] (as a matrix group acting on the coweight lattice)
sage: ExtendedAffineWeylGroup(['A',5,2]).classical_weyl()
Weyl Group of type ['C', 3] (as a matrix group acting on the weight lattice)
sage: ExtendedAffineWeylGroup(['A',4,2]).classical_weyl()
Weyl Group of type ['C', 2] (as a matrix group acting on the weight lattice)
sage: ExtendedAffineWeylGroup(CartanType(['A',4,2]).dual()).classical_weyl()
Weyl Group of type ['C', 2] (as a matrix group acting on the coweight lattice)
```

```
>>> from sage.all import *
>>> ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]).classical_weyl()
Weyl Group of type ['A', 2] (as a matrix group acting on the coweight lattice)
>>> ExtendedAffineWeylGroup(['A',Integer(5),Integer(2)]).classical_weyl()
Weyl Group of type ['C', 3] (as a matrix group acting on the weight lattice)
>>> ExtendedAffineWeylGroup(['A',Integer(4),Integer(2)]).classical_weyl()
Weyl Group of type ['C', 2] (as a matrix group acting on the weight lattice)
>>> ExtendedAffineWeylGroup(CartanType(['A',Integer(4),Integer(2)]).dual()).
↪classical_weyl()
Weyl Group of type ['C', 2] (as a matrix group acting on the coweight lattice)
```

classical_weyl_to_affine(*w*)

The image of w under the homomorphism from the classical Weyl group into the affine Weyl group.

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',2,1])
sage: W0 = E.classical_weyl()
```

(continues on next page)

(continued from previous page)

```
sage: w = W0.from_reduced_word([1,2]); w
s1*s2
sage: v = E.classical_weyl_to_affine(w); v
S1*S2
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)])
>>> W0 = E.classical_weyl()
>>> w = W0.from_reduced_word([Integer(1),Integer(2)]); w
s1*s2
>>> v = E.classical_weyl_to_affine(w); v
S1*S2
```

dual_classical_weyl()

Return the dual version of the classical Weyl group of `self`.

EXAMPLES:

```
sage: ExtendedAffineWeylGroup(['A',2,1]).dual_classical_weyl()
Weyl Group of type ['A', 2] (as a matrix group acting on the weight lattice)
sage: ExtendedAffineWeylGroup(['A',5,2]).dual_classical_weyl()
Weyl Group of type ['C', 3] (as a matrix group acting on the weight lattice)
```

```
>>> from sage.all import *
>>> ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]).dual_classical_weyl()
Weyl Group of type ['A', 2] (as a matrix group acting on the weight lattice)
>>> ExtendedAffineWeylGroup(['A',Integer(5),Integer(2)]).dual_classical_weyl()
Weyl Group of type ['C', 3] (as a matrix group acting on the weight lattice)
```

dual_classical_weyl_to_affine(w)

The image of w under the homomorphism from the dual version of the classical Weyl group into the affine Weyl group.

EXAMPLES:

```
sage: E = ExtendedAffineWeylGroup(['A',2,1])
sage: W0v = E.dual_classical_weyl()
sage: w = W0v.from_reduced_word([1,2]); w
s1*s2
sage: v = E.dual_classical_weyl_to_affine(w); v
S1*S2
```

```
>>> from sage.all import *
>>> E = ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)])
>>> W0v = E.dual_classical_weyl()
>>> w = W0v.from_reduced_word([Integer(1),Integer(2)]); w
s1*s2
>>> v = E.dual_classical_weyl_to_affine(w); v
S1*S2
```

dual_lattice()

Return the dual version of the translation lattice for `self`.

EXAMPLES:

```
sage: ExtendedAffineWeylGroup(['A',2,1]).dual_lattice()
Weight lattice of the Root system of type ['A', 2]
sage: ExtendedAffineWeylGroup(['A',5,2]).dual_lattice()
Weight lattice of the Root system of type ['C', 3]
```

```
>>> from sage.all import *
>>> ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]).dual_lattice()
Weight lattice of the Root system of type ['A', 2]
>>> ExtendedAffineWeylGroup(['A',Integer(5),Integer(2)]).dual_lattice()
Weight lattice of the Root system of type ['C', 3]
```

dual_lattice_basis()

Return the distinguished basis of the dual version of the translation lattice for `self`.

EXAMPLES:

```
sage: ExtendedAffineWeylGroup(['A',2,1]).dual_lattice_basis()
Finite family {1: Lambda[1], 2: Lambda[2]}
sage: ExtendedAffineWeylGroup(['A',5,2]).dual_lattice_basis()
Finite family {1: Lambda[1], 2: Lambda[2], 3: Lambda[3]}
```

```
>>> from sage.all import *
>>> ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]).dual_lattice_basis()
Finite family {1: Lambda[1], 2: Lambda[2]}
>>> ExtendedAffineWeylGroup(['A',Integer(5),Integer(2)]).dual_lattice_basis()
Finite family {1: Lambda[1], 2: Lambda[2], 3: Lambda[3]}
```

exp_dual_lattice()

Return the multiplicative version of the dual version of the translation lattice for `self`.

EXAMPLES:

```
sage: ExtendedAffineWeylGroup(['A',2,1]).exp_dual_lattice()
Multiplicative form of Weight lattice of the Root system of type ['A', 2]
```

```
>>> from sage.all import *
>>> ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]).exp_dual_lattice()
Multiplicative form of Weight lattice of the Root system of type ['A', 2]
```

exp_lattice()

Return the multiplicative version of the translation lattice for `self`.

EXAMPLES:

```
sage: ExtendedAffineWeylGroup(['A',2,1]).exp_lattice()
Multiplicative form of Coweight lattice of the Root system of type ['A', 2]
```

```
>>> from sage.all import *
>>> ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]).exp_lattice()
Multiplicative form of Coweight lattice of the Root system of type ['A', 2]
```

fundamental_group()

Return the abstract fundamental group.

EXAMPLES:

```
sage: F = ExtendedAffineWeylGroup(['D',5,1]).fundamental_group(); F
Fundamental group of type ['D', 5, 1]
sage: [a for a in F]
[pi[0], pi[1], pi[4], pi[5]]
```

```
>>> from sage.all import *
>>> F = ExtendedAffineWeylGroup(['D',Integer(5),Integer(1)]).fundamental_
↪group(); F
Fundamental group of type ['D', 5, 1]
>>> [a for a in F]
[pi[0], pi[1], pi[4], pi[5]]
```

group_generators()

Return a set of generators for the default realization of `self`.

EXAMPLES:

```
sage: ExtendedAffineWeylGroup(['A',2,1]).group_generators()
(t[Lambdacheck[1]], t[Lambdacheck[2]], s1, s2)
```

```
>>> from sage.all import *
>>> ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]).group_generators()
(t[Lambdacheck[1]], t[Lambdacheck[2]], s1, s2)
```

lattice()

Return the translation lattice for `self`.

EXAMPLES:

```
sage: ExtendedAffineWeylGroup(['A',2,1]).lattice()
Coweight lattice of the Root system of type ['A', 2]
sage: ExtendedAffineWeylGroup(['A',5,2]).lattice()
Weight lattice of the Root system of type ['C', 3]
sage: ExtendedAffineWeylGroup(['A',4,2]).lattice()
Weight lattice of the Root system of type ['C', 2]
sage: ExtendedAffineWeylGroup(CartanType(['A',4,2]).dual()).lattice()
Coweight lattice of the Root system of type ['B', 2]
sage: ExtendedAffineWeylGroup(CartanType(['A',2,1]),
....:                         general_linear=True).lattice()
Ambient space of the Root system of type ['A', 2]
```

```
>>> from sage.all import *
>>> ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]).lattice()
Coweight lattice of the Root system of type ['A', 2]
>>> ExtendedAffineWeylGroup(['A',Integer(5),Integer(2)]).lattice()
Weight lattice of the Root system of type ['C', 3]
>>> ExtendedAffineWeylGroup(['A',Integer(4),Integer(2)]).lattice()
Weight lattice of the Root system of type ['C', 2]
>>> ExtendedAffineWeylGroup(CartanType(['A',Integer(4),Integer(2)]).dual()).
```

(continues on next page)

(continued from previous page)

```
↪lattice()
Coweight lattice of the Root system of type ['B', 2]
>>> ExtendedAffineWeylGroup(CartanType(['A',Integer(2),Integer(1)]),
...                          general_linear=True).lattice()
Ambient space of the Root system of type ['A', 2]
```

lattice_basis()

Return the distinguished basis of the translation lattice for `self`.

EXAMPLES:

```
sage: ExtendedAffineWeylGroup(['A',2,1]).lattice_basis()
Finite family {1: Lambdacheck[1], 2: Lambdacheck[2]}
sage: ExtendedAffineWeylGroup(['A',5,2]).lattice_basis()
Finite family {1: Lambda[1], 2: Lambda[2], 3: Lambda[3]}
sage: ExtendedAffineWeylGroup(['A',4,2]).lattice_basis()
Finite family {1: Lambda[1], 2: Lambda[2]}
sage: ExtendedAffineWeylGroup(CartanType(['A',4,2]).dual()).lattice_basis()
Finite family {1: Lambdacheck[1], 2: Lambdacheck[2]}
```

```
>>> from sage.all import *
>>> ExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]).lattice_basis()
Finite family {1: Lambdacheck[1], 2: Lambdacheck[2]}
>>> ExtendedAffineWeylGroup(['A',Integer(5),Integer(2)]).lattice_basis()
Finite family {1: Lambda[1], 2: Lambda[2], 3: Lambda[3]}
>>> ExtendedAffineWeylGroup(['A',Integer(4),Integer(2)]).lattice_basis()
Finite family {1: Lambda[1], 2: Lambda[2]}
>>> ExtendedAffineWeylGroup(CartanType(['A',Integer(4),Integer(2)]).dual()).
↪lattice_basis()
Finite family {1: Lambdacheck[1], 2: Lambdacheck[2]}
```

5.1.265 Fundamental Group of an Extended Affine Weyl Group

AUTHORS:

- Mark Shimozono (2013) initial version

class sage.combinat.root_system.fundamental_group.**FundamentalGroupElement**(*parent*, *x*)

Bases: `MultiplicativeGroupElement`

This should not be called directly.

EXAMPLES:

```
sage: from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
sage: x = FundamentalGroupOfExtendedAffineWeylGroup(['A',4,1], prefix='f').an_
↪element()
sage: TestSuite(x).run()
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
```

(continues on next page)

(continued from previous page)

```
>>> x = FundamentalGroupOfExtendedAffineWeylGroup(['A',Integer(4),Integer(1)],␣
↪prefix='f').an_element()
>>> TestSuite(x).run()
```

act_on_affine_lattice(*wt*)

Act by `self` on the element `wt` of an affine root/weight lattice realization.

EXAMPLES:

```
sage: from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
sage: F = FundamentalGroupOfExtendedAffineWeylGroup(['A',3,1])
sage: wt = RootSystem(F.cartan_type()).weight_lattice().an_element(); wt
2*Lambda[0] + 2*Lambda[1] + 3*Lambda[2]
sage: F(3).act_on_affine_lattice(wt)
2*Lambda[0] + 3*Lambda[1] + 2*Lambda[3]
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
>>> F = FundamentalGroupOfExtendedAffineWeylGroup(['A',Integer(3),Integer(1)])
>>> wt = RootSystem(F.cartan_type()).weight_lattice().an_element(); wt
2*Lambda[0] + 2*Lambda[1] + 3*Lambda[2]
>>> F(Integer(3)).act_on_affine_lattice(wt)
2*Lambda[0] + 3*Lambda[1] + 2*Lambda[3]
```

Warning

Doesn't work on ambient spaces.

act_on_affine_weyl(*w*)

Act by `self` on the element w of the affine Weyl group.

EXAMPLES:

```
sage: from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
sage: F = FundamentalGroupOfExtendedAffineWeylGroup(['A',3,1])
sage: W = WeylGroup(F.cartan_type(),prefix='s')
sage: w = W.from_reduced_word([2,3,0])
sage: F(1).act_on_affine_weyl(w).reduced_word()
[3, 0, 1]
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
>>> F = FundamentalGroupOfExtendedAffineWeylGroup(['A',Integer(3),Integer(1)])
>>> W = WeylGroup(F.cartan_type(),prefix='s')
>>> w = W.from_reduced_word([Integer(2),Integer(3),Integer(0)])
>>> F(Integer(1)).act_on_affine_weyl(w).reduced_word()
[3, 0, 1]
```

value()

Return the special node which indexes the special automorphism `self`.

EXAMPLES:

```
sage: from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
sage: F = FundamentalGroupOfExtendedAffineWeylGroup(['A',4,1], prefix='f')
sage: F.special_nodes()
(0, 1, 2, 3, 4)
sage: x = F(4); x
f[4]
sage: x.value()
4
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
>>> F = FundamentalGroupOfExtendedAffineWeylGroup(['A',Integer(4),Integer(1)],
↪ prefix='f')
>>> F.special_nodes()
(0, 1, 2, 3, 4)
>>> x = F(Integer(4)); x
f[4]
>>> x.value()
4
```

class sage.combinat.root_system.fundamental_group.**FundamentalGroupGL**(*cartan_type*, *prefix='pi'*)

Bases: *FundamentalGroupOfExtendedAffineWeylGroup_Class*

Fundamental group of GL_n. It is just the integers with extra privileges.

Element

alias of *FundamentalGroupGLElement*

action(i)

The action of the i-th automorphism on the affine Dynkin node set.

EXAMPLES:

```
sage: from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
sage: F = FundamentalGroupOfExtendedAffineWeylGroup(['A',2,1], general_
↪linear=True)
sage: F.action(4)(2)
0
sage: F.action(-4)(2)
1
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
>>> F = FundamentalGroupOfExtendedAffineWeylGroup(['A',Integer(2),Integer(1)],
↪ general_linear=True)
>>> F.action(Integer(4))(Integer(2))
```

(continues on next page)

(continued from previous page)

```
0
>>> F.action(-Integer(4))(Integer(2))
1
```

an_element()

An element of `self`.

EXAMPLES:

```
sage: from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
sage: FundamentalGroupOfExtendedAffineWeylGroup(['A',2,1], general_
↪linear=True).an_element()
pi[5]
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
>>> FundamentalGroupOfExtendedAffineWeylGroup(['A',Integer(2),Integer(1)],␣
↪general_linear=True).an_element()
pi[5]
```

dual_node(i)

The node whose special automorphism is inverse to that of i.

EXAMPLES:

```
sage: from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
sage: F = FundamentalGroupOfExtendedAffineWeylGroup(['A',2,1], general_
↪linear=True)
sage: F.dual_node(2)
-2
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
>>> F = FundamentalGroupOfExtendedAffineWeylGroup(['A',Integer(2),Integer(1)],
↪ general_linear=True)
>>> F.dual_node(Integer(2))
-2
```

family()

The family associated with the set of special nodes.

EXAMPLES:

```
sage: from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
sage: fam = FundamentalGroupOfExtendedAffineWeylGroup(['A',2,1], general_
↪linear=True).family() # indirect doctest
sage: fam
Lazy family (<lambda>(i))_{i in Integer Ring}
```

(continues on next page)

(continued from previous page)

```
sage: fam[-3]
-3
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
>>> fam = FundamentalGroupOfExtendedAffineWeylGroup(['A',Integer(2),
↪Integer(1)], general_linear=True).family() # indirect doctest
>>> fam
Lazy family (<lambda>(i))_{i in Integer Ring}
>>> fam[-Integer(3)]
-3
```

group_generators()

Return group generators for `self`.

EXAMPLES:

```
sage: from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
sage: FundamentalGroupOfExtendedAffineWeylGroup(['A',2,1], general_
↪linear=True).group_generators()
(pi[1],)
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
>>> FundamentalGroupOfExtendedAffineWeylGroup(['A',Integer(2),Integer(1)],␣
↪general_linear=True).group_generators()
(pi[1],)
```

one()

Return the identity element of the fundamental group.

EXAMPLES:

```
sage: from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
sage: FundamentalGroupOfExtendedAffineWeylGroup(['A',2,1], general_
↪linear=True).one()
pi[0]
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
>>> FundamentalGroupOfExtendedAffineWeylGroup(['A',Integer(2),Integer(1)],␣
↪general_linear=True).one()
pi[0]
```

product(x, y)

Return the product of x and y.

EXAMPLES:

```
sage: from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
sage: F = FundamentalGroupOfExtendedAffineWeylGroup(['A',2,1], general_
↪linear=True)
sage: F.special_nodes()
Integer Ring
sage: F(2)*F(3)
pi[5]
sage: F(1)*F(3)^(-1)
pi[-2]
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
>>> F = FundamentalGroupOfExtendedAffineWeylGroup(['A',Integer(2),Integer(1)],
↪ general_linear=True)
>>> F.special_nodes()
Integer Ring
>>> F(Integer(2))*F(Integer(3))
pi[5]
>>> F(Integer(1))*F(Integer(3))**(-Integer(1))
pi[-2]
```

reduced_word(i)

A reduced word for the finite permutation part of the special automorphism indexed by i.

More precisely, return a reduced word for the finite Weyl group element u where i-th automorphism (expressed in the extended affine Weyl group) has the form tu where t is a translation element.

EXAMPLES:

```
sage: from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
sage: F = FundamentalGroupOfExtendedAffineWeylGroup(['A',2,1], general_
↪linear=True)
sage: F.reduced_word(10)
(1, 2)
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
>>> F = FundamentalGroupOfExtendedAffineWeylGroup(['A',Integer(2),Integer(1)],
↪ general_linear=True)
>>> F.reduced_word(Integer(10))
(1, 2)
```

some_elements()

Return some elements of `self`.

EXAMPLES:

```
sage: from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
sage: FundamentalGroupOfExtendedAffineWeylGroup(['A',2,1], general_
```

(continues on next page)

(continued from previous page)

```
↪linear=True).some_elements()
[pi[-2], pi[2], pi[5]]
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
>>> FundamentalGroupOfExtendedAffineWeylGroup(['A',Integer(2),Integer(1)],␣
↪general_linear=True).some_elements()
[pi[-2], pi[2], pi[5]]
```

class sage.combinat.root_system.fundamental_group.**FundamentalGroupGLElement**(*parent*, *x*)

Bases: *FundamentalGroupElement*

act_on_classical_ambient(*wt*)

Act by `self` on the classical ambient weight vector `wt`.

EXAMPLES:

```
sage: from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
sage: F = FundamentalGroupOfExtendedAffineWeylGroup(['A',2,1], general_
↪linear=True)
sage: f = F.an_element(); f
pi[5]
sage: la = F.cartan_type().classical().root_system().ambient_space().an_
↪element(); la
(2, 2, 3)
sage: f.act_on_classical_ambient(la)
(2, 3, 2)
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
>>> F = FundamentalGroupOfExtendedAffineWeylGroup(['A',Integer(2),Integer(1)],
↪ general_linear=True)
>>> f = F.an_element(); f
pi[5]
>>> la = F.cartan_type().classical().root_system().ambient_space().an_
↪element(); la
(2, 2, 3)
>>> f.act_on_classical_ambient(la)
(2, 3, 2)
```

sage.combinat.root_system.fundamental_group.**FundamentalGroupOfExtendedAffineWeylGroup**(*cartan_type*, *prefix='pi'*, *general_linear=None*)

Factory for the fundamental group of an extended affine Weyl group.

INPUT:

- `cartan_type` – a Cartan type that is either affine or finite, with the latter being a shorthand for the untwisted affinization
- `prefix` – (default: `'pi'`) string that labels the elements of the group
- `general_linear` – (default: `None`, meaning `False`) In untwisted type A, if `True`, use the universal central extension

Fundamental group

Associated to each affine Cartan type $\tilde{X}$ is an extended affine Weyl group E. Its subgroup of length-zero elements is called the fundamental group F. The group F can be identified with a subgroup of the group of automorphisms of the affine Dynkin diagram. As such, every element of F can be viewed as a permutation of the set I of affine Dynkin nodes.

Let $0 \in I$ be the distinguished affine node; it is the one whose removal produces the associated finite Cartan type (call it X). A node $i \in I$ is called *special* if some automorphism of the affine Dynkin diagram, sends 0 to i. The node 0 is always special due to the identity automorphism. There is a bijection of the set of special nodes with the fundamental group. We denote the image of i by π_i. The structure of F is determined as follows.

- $\tilde{X}$ is untwisted – F is isomorphic to $P^\vee/Q^\vee$ where $P^\vee$ and $Q^\vee$ are the coweight and coroot lattices of type X. The group $P^\vee/Q^\vee$ consists of the cosets $\omega_i^\vee + Q^\vee$ for special nodes i, where $\omega_0^\vee = 0$ by convention. In this case the special nodes i are the *cominuscule* nodes, the ones such that $\omega_i^\vee(\alpha_j)$ is 0 or 1 for all $j \in I_0 = I \setminus \{0\}$. For i special, addition by $\omega_i^\vee + Q^\vee$ permutes $P^\vee/Q^\vee$ and therefore permutes the set of special nodes. This permutation extends uniquely to an automorphism of the affine Dynkin diagram.
- $\tilde{X}$ is dual untwisted – (that is, the dual of $\tilde{X}$ is untwisted) F is isomorphic to P/Q where P and Q are the weight and root lattices of type X. The group P/Q consists of the cosets $\omega_i + Q$ for special nodes i, where $\omega_0 = 0$ by convention. In this case the special nodes i are the *minuscule* nodes, the ones such that $\alpha_j^\vee(\omega_i)$ is 0 or 1 for all $j \in I_0$. For i special, addition by $\omega_i + Q$ permutes P/Q and therefore permutes the set of special nodes. This permutation extends uniquely to an automorphism of the affine Dynkin diagram.
- $\tilde{X}$ is mixed – (that is, not of the above two types) F is the trivial group.

EXAMPLES:

```
sage: from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup

We also implement a fundamental group for GL_n. It is defined to be the group of integers, which is the covering group of the fundamental group Z/nZ for affine SL_n:

```
sage: F = FundamentalGroupOfExtendedAffineWeylGroup(['A',2,1], general_
↪linear=True); F
Fundamental group of GL(3)
sage: x = F.an_element(); x
pi[5]
sage: x*x
pi[10]
sage: x.inverse()
pi[-5]
sage: wt = F.cartan_type().classical().root_system().ambient_space().an_element();
↪ wt
(2, 2, 3)
sage: x.act_on_classical_ambient(wt)
(2, 3, 2)
sage: w = WeylGroup(F.cartan_type(),prefix='s').an_element(); w
s0*s1*s2
sage: x.act_on_affine_weyl(w)
s2*s0*s1
```

```
>>> from sage.all import *
>>> F = FundamentalGroupOfExtendedAffineWeylGroup(['A',Integer(2),Integer(1)],␣
↪general_linear=True); F
Fundamental group of GL(3)
>>> x = F.an_element(); x
pi[5]
>>> x*x
pi[10]
>>> x.inverse()
pi[-5]
>>> wt = F.cartan_type().classical().root_system().ambient_space().an_element();␣
```

s2*s0*s1
```

class sage.combinat.root_system.fundamental_group.**FundamentalGroupOfExtendedAffineWeylGroup_Class**(*car tan, pre fix, fi- nite*

Bases: `UniqueRepresentation`, `Parent`

The group of length zero elements in the extended affine Weyl group.

Element

alias of *FundamentalGroupElement*

action(*i*)

Return a function which permutes the affine Dynkin node set by the i-th special automorphism.

EXAMPLES:

```
sage: from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
sage: F = FundamentalGroupOfExtendedAffineWeylGroup(['A',2,1])
sage: [[(i, j, F.action(i)(j)) for j in F.index_set()] for i in F.special_
↪nodes()]
[[(0, 0, 0), (0, 1, 1), (0, 2, 2)], [(1, 0, 1), (1, 1, 2), (1, 2, 0)], [(2, 0,
↪ 2), (2, 1, 0), (2, 2, 1)]]
sage: G = FundamentalGroupOfExtendedAffineWeylGroup(['D',4,1])
sage: [[(i, j, G.action(i)(j)) for j in G.index_set()] for i in G.special_
↪nodes()]
[[(0, 0, 0), (0, 1, 1), (0, 2, 2), (0, 3, 3), (0, 4, 4)], [(1, 0, 1), (1, 1,␣
↪0), (1, 2, 2), (1, 3, 4), (1, 4, 3)], [(3, 0, 3), (3, 1, 4), (3, 2, 2), (3,␣
↪3, 0), (3, 4, 1)], [(4, 0, 4), (4, 1, 3), (4, 2, 2), (4, 3, 1), (4, 4, 0)]]
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
>>> F = FundamentalGroupOfExtendedAffineWeylGroup(['A',Integer(2),Integer(1)])
>>> [[(i, j, F.action(i)(j)) for j in F.index_set()] for i in F.special_
↪nodes()]
[[(0, 0, 0), (0, 1, 1), (0, 2, 2)], [(1, 0, 1), (1, 1, 2), (1, 2, 0)], [(2, 0,
↪ 2), (2, 1, 0), (2, 2, 1)]]
>>> G = FundamentalGroupOfExtendedAffineWeylGroup(['D',Integer(4),Integer(1)])
>>> [[(i, j, G.action(i)(j)) for j in G.index_set()] for i in G.special_
↪nodes()]
[[(0, 0, 0), (0, 1, 1), (0, 2, 2), (0, 3, 3), (0, 4, 4)], [(1, 0, 1), (1, 1,␣
```

(continues on next page)

(continued from previous page)

```
↪0), (1, 2, 2), (1, 3, 4), (1, 4, 3)], [(3, 0, 3), (3, 1, 4), (3, 2, 2), (3,␣
↪3, 0), (3, 4, 1)], [(4, 0, 4), (4, 1, 3), (4, 2, 2), (4, 3, 1), (4, 4, 0)]]
```

an_element()

Return an element of `self`.

EXAMPLES:

```
sage: from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
sage: FundamentalGroupOfExtendedAffineWeylGroup(['A',4,1],prefix='f').an_
↪element()
f[4]
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
>>> FundamentalGroupOfExtendedAffineWeylGroup(['A',Integer(4),Integer(1)],
↪prefix='f').an_element()
f[4]
```

cartan_type()

The Cartan type of `self`.

EXAMPLES:

```
sage: from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
sage: FundamentalGroupOfExtendedAffineWeylGroup(['A',3,1]).cartan_type()
['A', 3, 1]
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
>>> FundamentalGroupOfExtendedAffineWeylGroup(['A',Integer(3),Integer(1)]).
↪cartan_type()
['A', 3, 1]
```

dual_node(i)

Return the node that indexes the inverse of the i-th element.

EXAMPLES:

```
sage: from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
sage: F = FundamentalGroupOfExtendedAffineWeylGroup(['A',4,1])
sage: [(i, F.dual_node(i)) for i in F.special_nodes()]
[(0, 0), (1, 4), (2, 3), (3, 2), (4, 1)]
sage: G = FundamentalGroupOfExtendedAffineWeylGroup(['E',6,1])
sage: [(i, G.dual_node(i)) for i in G.special_nodes()]
[(0, 0), (1, 6), (6, 1)]
sage: H = FundamentalGroupOfExtendedAffineWeylGroup(['D',5,1])
```

(continues on next page)

(continued from previous page)

```
sage: [(i, H.dual_node(i)) for i in H.special_nodes()]
[(0, 0), (1, 1), (4, 5), (5, 4)]
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
>>> F = FundamentalGroupOfExtendedAffineWeylGroup(['A',Integer(4),Integer(1)])
>>> [(i, F.dual_node(i)) for i in F.special_nodes()]
[(0, 0), (1, 4), (2, 3), (3, 2), (4, 1)]
>>> G = FundamentalGroupOfExtendedAffineWeylGroup(['E',Integer(6),Integer(1)])
>>> [(i, G.dual_node(i)) for i in G.special_nodes()]
[(0, 0), (1, 6), (6, 1)]
>>> H = FundamentalGroupOfExtendedAffineWeylGroup(['D',Integer(5),Integer(1)])
>>> [(i, H.dual_node(i)) for i in H.special_nodes()]
[(0, 0), (1, 1), (4, 5), (5, 4)]
```

group_generators()

Return a tuple of generators of the fundamental group.

> **Warning**
>
> This returns the entire group, a necessary behavior because it is used in `__iter__()`.

EXAMPLES:

```
sage: from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
sage: FundamentalGroupOfExtendedAffineWeylGroup(['E',6,1],prefix='f').group_
↪generators()
Finite family {0: f[0], 1: f[1], 6: f[6]}
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
>>> FundamentalGroupOfExtendedAffineWeylGroup(['E',Integer(6),Integer(1)],
↪prefix='f').group_generators()
Finite family {0: f[0], 1: f[1], 6: f[6]}
```

index_set()

The node set of the affine Cartan type of `self`.

EXAMPLES:

```
sage: from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
sage: FundamentalGroupOfExtendedAffineWeylGroup(['A',2,1]).index_set()
(0, 1, 2)
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.fundamental_group import␣
```

(continues on next page)

(continued from previous page)

```
↪FundamentalGroupOfExtendedAffineWeylGroup
>>> FundamentalGroupOfExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]).
↪index_set()
(0, 1, 2)
```

one()

Return the identity element of the fundamental group.

EXAMPLES:

```
sage: from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
sage: F = FundamentalGroupOfExtendedAffineWeylGroup(['A',3,1])
sage: F.one()
pi[0]
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
>>> F = FundamentalGroupOfExtendedAffineWeylGroup(['A',Integer(3),Integer(1)])
>>> F.one()
pi[0]
```

product(x, y)

Return the product of x and y.

EXAMPLES:

```
sage: from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
sage: F = FundamentalGroupOfExtendedAffineWeylGroup(['A',3,1])
sage: F.special_nodes()
(0, 1, 2, 3)
sage: F(2)*F(3)
pi[1]
sage: F(1)*F(3)^(-1)
pi[2]
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
>>> F = FundamentalGroupOfExtendedAffineWeylGroup(['A',Integer(3),Integer(1)])
>>> F.special_nodes()
(0, 1, 2, 3)
>>> F(Integer(2))*F(Integer(3))
pi[1]
>>> F(Integer(1))*F(Integer(3))**(-Integer(1))
pi[2]
```

reduced_word(i)

Return a reduced word for the finite Weyl group element associated with the i-th special automorphism.

More precisely, for each special node i, `self.reduced_word(i)` is a reduced word for the element v in the finite Weyl group such that in the extended affine Weyl group, the i-th special automorphism is equal to tv where t is a translation element.

EXAMPLES:

```
sage: from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
sage: F = FundamentalGroupOfExtendedAffineWeylGroup(['A',3,1])
sage: [(i, F.reduced_word(i)) for i in F.special_nodes()]
[(0, ()), (1, (1, 2, 3)), (2, (2, 1, 3, 2)), (3, (3, 2, 1))]
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
>>> F = FundamentalGroupOfExtendedAffineWeylGroup(['A',Integer(3),Integer(1)])
>>> [(i, F.reduced_word(i)) for i in F.special_nodes()]
[(0, ()), (1, (1, 2, 3)), (2, (2, 1, 3, 2)), (3, (3, 2, 1))]
```

special_nodes()

Return the special nodes of `self`.

See `sage.combinat.root_system.cartan_type.special_nodes()`.

EXAMPLES:

```
sage: from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
sage: FundamentalGroupOfExtendedAffineWeylGroup(['D',4,1]).special_nodes()
(0, 1, 3, 4)
sage: FundamentalGroupOfExtendedAffineWeylGroup(['A',2,1]).special_nodes()
(0, 1, 2)
sage: FundamentalGroupOfExtendedAffineWeylGroup(['C',3,1]).special_nodes()
(0, 3)
sage: FundamentalGroupOfExtendedAffineWeylGroup(['D',4,2]).special_nodes()
(0, 3)
sage: FundamentalGroupOfExtendedAffineWeylGroup(['A',2,1], general_
↪linear=True).special_nodes()
Integer Ring
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.fundamental_group import␣
↪FundamentalGroupOfExtendedAffineWeylGroup
>>> FundamentalGroupOfExtendedAffineWeylGroup(['D',Integer(4),Integer(1)]).
↪special_nodes()
(0, 1, 3, 4)
>>> FundamentalGroupOfExtendedAffineWeylGroup(['A',Integer(2),Integer(1)]).
↪special_nodes()
(0, 1, 2)
>>> FundamentalGroupOfExtendedAffineWeylGroup(['C',Integer(3),Integer(1)]).
↪special_nodes()
(0, 3)
>>> FundamentalGroupOfExtendedAffineWeylGroup(['D',Integer(4),Integer(2)]).
↪special_nodes()
(0, 3)
```

(continues on next page)

(continued from previous page)

```
>>> FundamentalGroupOfExtendedAffineWeylGroup(['A',Integer(2),Integer(1)],␣
↪general_linear=True).special_nodes()
Integer Ring
```

5.1.266 Root system data for folded Cartan types

AUTHORS:

- Travis Scrimshaw (2013-01-12) - Initial version

class sage.combinat.root_system.type_folded.**CartanTypeFolded**(*cartan_type*, *folding_of*, *orbit*)

Bases: UniqueRepresentation, SageObject

A Cartan type realized from a (Dynkin) diagram folding.

Given a Cartan type X, we say $\hat{X}$ is a folded Cartan type of X if there exists a diagram folding of the Dynkin diagram of $\hat{X}$ onto X.

A folding of a simply-laced Dynkin diagram D with index set I is an automorphism σ of D where all nodes any orbit of σ are not connected. The resulting Dynkin diagram $\hat{D}$ is induced by I/σ where we identify edges in $\hat{D}$ which are not incident and add a k-edge if we identify k incident edges and the arrow is pointing towards the indicent note. We denote the index set of $\hat{D}$ by $\hat{I}$, and by abuse of notation, we denote the folding by σ.

We also have scaling factors γ_i for $i \in \hat{I}$ and defined as the unique numbers such that the map $\Lambda_j \mapsto \gamma_j \sum_{i\in\sigma^{-1}(j)} \Lambda_i$ is the smallest proper embedding of the weight lattice of X to $\hat{X}$.

If the Cartan type is simply laced, the default folding is the one induced from the identity map on D.

If X is affine type, the default embeddings we consider here are:

$$\begin{array}{rcl} C_n^{(1)}, A_{2n}^{(2)}, A_{2n}^{(2)\dagger}, D_{n+1}^{(2)} & \hookrightarrow & A_{2n-1}^{(1)}, \\ A_{2n-1}^{(2)}, B_n^{(1)} & \hookrightarrow & D_{n+1}^{(1)}, \\ E_6^{(2)}, F_4^{(1)} & \hookrightarrow & E_6^{(1)}, \\ D_4^{(3)}, G_2^{(1)} & \hookrightarrow & D_4^{(1)}, \end{array}$$

and were chosen based on virtual crystals. In particular, the diagram foldings extend to crystal morphisms and gives a realization of Kirillov-Reshetikhin crystals for non-simply-laced types as simply-laced types. See [OSShimo03] and [FOS2009] for more details. Here we can compute $\gamma_i = \max(c)/c_i$ where $(c_i)_i$ are the translation factors of the root system. In a more type-dependent way, we can define γ_i as follows:

1. There exists a unique arrow (multiple bond) in X.
   a. Suppose the arrow points towards 0. Then $\gamma_i = 1$ for all $i \in I$.
   b. Otherwise γ_i is the order of σ for all i in the connected component of 0 after removing the arrow, else $\gamma_i = 1$.
2. There is not a unique arrow. Thus $\hat{X} = A_{2n-1}^{(1)}$ and $\gamma_i = 1$ for all $1 \leq i \leq n-1$. If $i \in \{0, n\}$, then $\gamma_i = 2$ if the arrow incident to i points away and is 1 otherwise.

We note that γ_i only depends upon X.

If the Cartan type is finite, then we consider the classical foldings/embeddings induced by the above affine foldings/embeddings:

$$\begin{aligned} C_n &\hookrightarrow A_{2n-1}, \\ B_n &\hookrightarrow D_{n+1}, \\ F_4 &\hookrightarrow E_6, \\ G_2 &\hookrightarrow D_4. \end{aligned}$$

For more information on Cartan types, see *sage.combinat.root_system.cartan_type*.

Other foldings may be constructed by passing in an optional `folding_of` second argument. See below.

INPUT:

- `cartan_type` – the Cartan type X to create the folded type
- `folding_of` – the Cartan type $\hat{X}$ which X is a folding of
- `orbit` – the orbit of the Dynkin diagram automorphism σ given as a list of lists where the a-th list corresponds to the a-th entry in I or a dictionary with keys in I and values as lists

Note

If X is an affine type, we assume the special node is fixed under σ.

EXAMPLES:

```
sage: fct = CartanType(['C',4,1]).as_folding(); fct
['C', 4, 1] as a folding of ['A', 7, 1]
sage: fct.scaling_factors()                                                 #␣
↪needs sage.graphs
Finite family {0: 2, 1: 1, 2: 1, 3: 1, 4: 2}
sage: fct.folding_orbit()
Finite family {0: (0,), 1: (1, 7), 2: (2, 6), 3: (3, 5), 4: (4,)}
```

```
>>> from sage.all import *
>>> fct = CartanType(['C',Integer(4),Integer(1)]).as_folding(); fct
['C', 4, 1] as a folding of ['A', 7, 1]
>>> fct.scaling_factors()                                                 #␣
↪needs sage.graphs
Finite family {0: 2, 1: 1, 2: 1, 3: 1, 4: 2}
>>> fct.folding_orbit()
Finite family {0: (0,), 1: (1, 7), 2: (2, 6), 3: (3, 5), 4: (4,)}
```

A simply laced Cartan type can be considered as a virtual type of itself:

```
sage: fct = CartanType(['A',4,1]).as_folding(); fct
['A', 4, 1] as a folding of ['A', 4, 1]
sage: fct.scaling_factors()                                                 #␣
↪needs sage.graphs
Finite family {0: 1, 1: 1, 2: 1, 3: 1, 4: 1}
sage: fct.folding_orbit()
Finite family {0: (0,), 1: (1,), 2: (2,), 3: (3,), 4: (4,)}
```

```
>>> from sage.all import *
>>> fct = CartanType(['A',Integer(4),Integer(1)]).as_folding(); fct
['A', 4, 1] as a folding of ['A', 4, 1]
>>> fct.scaling_factors()                                                 #␣
↪needs sage.graphs
Finite family {0: 1, 1: 1, 2: 1, 3: 1, 4: 1}
>>> fct.folding_orbit()
Finite family {0: (0,), 1: (1,), 2: (2,), 3: (3,), 4: (4,)}
```

Finite types:

```
sage: fct = CartanType(['C',4]).as_folding(); fct
['C', 4] as a folding of ['A', 7]
sage: fct.scaling_factors()
Finite family {1: 1, 2: 1, 3: 1, 4: 2}
sage: fct.folding_orbit()
Finite family {1: (1, 7), 2: (2, 6), 3: (3, 5), 4: (4,)}

sage: fct = CartanType(['F',4]).dual().as_folding(); fct
['F', 4] relabelled by {1: 4, 2: 3, 3: 2, 4: 1} as a folding of ['E', 6]
sage: fct.scaling_factors()
Finite family {1: 1, 2: 1, 3: 2, 4: 2}
sage: fct.folding_orbit()
Finite family {1: (1, 6), 2: (3, 5), 3: (4,), 4: (2,)}
```

```
>>> from sage.all import *
>>> fct = CartanType(['C',Integer(4)]).as_folding(); fct
['C', 4] as a folding of ['A', 7]
>>> fct.scaling_factors()
Finite family {1: 1, 2: 1, 3: 1, 4: 2}
>>> fct.folding_orbit()
Finite family {1: (1, 7), 2: (2, 6), 3: (3, 5), 4: (4,)}

>>> fct = CartanType(['F',Integer(4)]).dual().as_folding(); fct
['F', 4] relabelled by {1: 4, 2: 3, 3: 2, 4: 1} as a folding of ['E', 6]
>>> fct.scaling_factors()
Finite family {1: 1, 2: 1, 3: 2, 4: 2}
>>> fct.folding_orbit()
Finite family {1: (1, 6), 2: (3, 5), 3: (4,), 4: (2,)}
```

REFERENCES:

- Wikipedia article Dynkin_diagram#Folding

cartan_type()

Return the Cartan type of `self`.

EXAMPLES:

```
sage: fct = CartanType(['C', 4, 1]).as_folding()
sage: fct.cartan_type()
['C', 4, 1]
```

```
>>> from sage.all import *
>>> fct = CartanType(['C', Integer(4), Integer(1)]).as_folding()
>>> fct.cartan_type()
['C', 4, 1]
```

folding_of()

Return the Cartan type of the virtual space.

EXAMPLES:

```
sage: fct = CartanType(['C', 4, 1]).as_folding()
sage: fct.folding_of()
['A', 7, 1]
```

```
>>> from sage.all import *
>>> fct = CartanType(['C', Integer(4), Integer(1)]).as_folding()
>>> fct.folding_of()
['A', 7, 1]
```

folding_orbit()

Return the orbits under the automorphism σ as a dictionary (of tuples).

EXAMPLES:

```
sage: fct = CartanType(['C', 4, 1]).as_folding()
sage: fct.folding_orbit()
Finite family {0: (0,), 1: (1, 7), 2: (2, 6), 3: (3, 5), 4: (4,)}
```

```
>>> from sage.all import *
>>> fct = CartanType(['C', Integer(4), Integer(1)]).as_folding()
>>> fct.folding_orbit()
Finite family {0: (0,), 1: (1, 7), 2: (2, 6), 3: (3, 5), 4: (4,)}
```

scaling_factors()

Return the scaling factors of `self`.

EXAMPLES:

```
sage: # needs sage.graphs
sage: fct = CartanType(['C', 4, 1]).as_folding()
sage: fct.scaling_factors()
Finite family {0: 2, 1: 1, 2: 1, 3: 1, 4: 2}
sage: fct = CartanType(['BC', 4, 2]).as_folding()
sage: fct.scaling_factors()
Finite family {0: 1, 1: 1, 2: 1, 3: 1, 4: 2}
sage: fct = CartanType(['BC', 4, 2]).dual().as_folding()
sage: fct.scaling_factors()
Finite family {0: 2, 1: 1, 2: 1, 3: 1, 4: 1}
sage: CartanType(['BC', 4, 2]).relabel({0:4, 1:3, 2:2, 3:1, 4:0}).as_
↪folding().scaling_factors()
Finite family {0: 2, 1: 1, 2: 1, 3: 1, 4: 1}
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> fct = CartanType(['C', Integer(4), Integer(1)]).as_folding()
>>> fct.scaling_factors()
Finite family {0: 2, 1: 1, 2: 1, 3: 1, 4: 2}
>>> fct = CartanType(['BC', Integer(4), Integer(2)]).as_folding()
>>> fct.scaling_factors()
Finite family {0: 1, 1: 1, 2: 1, 3: 1, 4: 2}
>>> fct = CartanType(['BC', Integer(4), Integer(2)]).dual().as_folding()
>>> fct.scaling_factors()
Finite family {0: 2, 1: 1, 2: 1, 3: 1, 4: 1}
```

(continues on next page)

(continued from previous page)

```
>>> CartanType(['BC', Integer(4), Integer(2)]).relabel({Integer(0):Integer(4),
↪ Integer(1):Integer(3), Integer(2):Integer(2), Integer(3):Integer(1),␣
↪Integer(4):Integer(0)}).as_folding().scaling_factors()
Finite family {0: 2, 1: 1, 2: 1, 3: 1, 4: 1}
```

5.1.267 Root system data for Cartan types with marked nodes

class sage.combinat.root_system.type_marked.**AmbientSpace**(*root_system*, *base_ring*, *index_set=None*)

Bases: *AmbientSpace*

Ambient space for a marked finite Cartan type.

It is constructed in the canonical way from the ambient space of the original Cartan type.

EXAMPLES:

```
sage: L = CartanType(["F",4]).marked_nodes([1,3]).root_system().ambient_space(); L
Ambient space of the Root system of type ['F', 4] with nodes (1, 3) marked
sage: TestSuite(L).run()                                                        #␣
↪needs sage.graphs
```

```
>>> from sage.all import *
>>> L = CartanType(["F",Integer(4)]).marked_nodes([Integer(1),Integer(3)]).root_
↪system().ambient_space(); L
Ambient space of the Root system of type ['F', 4] with nodes (1, 3) marked
>>> TestSuite(L).run()                                                        #␣
↪needs sage.graphs
```

dimension()

Return the dimension of this ambient space.

See also

sage.combinat.root_system.ambient_space.AmbientSpace.dimension()

EXAMPLES:

```
sage: L = CartanType(["F",4]).marked_nodes([1,3]).root_system().ambient_
↪space()
sage: L.dimension()
4
```

```
>>> from sage.all import *
>>> L = CartanType(["F",Integer(4)]).marked_nodes([Integer(1),Integer(3)]).
↪root_system().ambient_space()
>>> L.dimension()
4
```

fundamental_weight(*i*)

Return the i-th fundamental weight.

It is constructed by looking up the corresponding simple coroot in the ambient space for the original Cartan type.

EXAMPLES:

```
sage: L = CartanType(["F",4]).marked_nodes([1,3]).root_system().ambient_
→space()
sage: L.fundamental_weight(1)
(1, 1, 0, 0)
sage: L.fundamental_weights()
Finite family {1: (1, 1, 0, 0), 2: (2, 1, 1, 0),
               3: (3/2, 1/2, 1/2, 1/2), 4: (1, 0, 0, 0)}
```

```
>>> from sage.all import *
>>> L = CartanType(["F",Integer(4)]).marked_nodes([Integer(1),Integer(3)]).
→root_system().ambient_space()
>>> L.fundamental_weight(Integer(1))
(1, 1, 0, 0)
>>> L.fundamental_weights()
Finite family {1: (1, 1, 0, 0), 2: (2, 1, 1, 0),
               3: (3/2, 1/2, 1/2, 1/2), 4: (1, 0, 0, 0)}
```

simple_root(*i*)

Return the `i`-th simple root.

It is constructed by looking up the corresponding simple coroot in the ambient space for the original Cartan type.

EXAMPLES:

```
sage: L = CartanType(["F",4]).marked_nodes([1,3]).root_system().ambient_
→space()
sage: L.simple_root(1)
(0, 1, -1, 0)
sage: L.simple_roots()
Finite family {1: (0, 1, -1, 0), 2: (0, 0, 1, -1),
               3: (0, 0, 0, 1), 4: (1/2, -1/2, -1/2, -1/2)}
sage: L.simple_coroots()
Finite family {1: (0, 1, -1, 0), 2: (0, 0, 1, -1),
               3: (0, 0, 0, 2), 4: (1, -1, -1, -1)}
```

```
>>> from sage.all import *
>>> L = CartanType(["F",Integer(4)]).marked_nodes([Integer(1),Integer(3)]).
→root_system().ambient_space()
>>> L.simple_root(Integer(1))
(0, 1, -1, 0)
>>> L.simple_roots()
Finite family {1: (0, 1, -1, 0), 2: (0, 0, 1, -1),
               3: (0, 0, 0, 1), 4: (1/2, -1/2, -1/2, -1/2)}
>>> L.simple_coroots()
Finite family {1: (0, 1, -1, 0), 2: (0, 0, 1, -1),
               3: (0, 0, 0, 2), 4: (1, -1, -1, -1)}
```

class sage.combinat.root_system.type_marked.**CartanType**(*ct*, *marked_nodes*)

Bases: *CartanType_decorator*

A class for Cartan types with marked nodes.

INPUT:

- `ct` – a Cartan type
- `marked_nodes` – list of marked nodes

EXAMPLES:

We take the Cartan type B_4:

```
sage: T = CartanType(['B',4])
sage: T.dynkin_diagram()                                                    #␣
↪needs sage.graphs
O---O---O=>=O
1   2   3   4
B4
```

```
>>> from sage.all import *
>>> T = CartanType(['B',Integer(4)])
>>> T.dynkin_diagram()                                                    #␣
↪needs sage.graphs
O---O---O=>=O
1   2   3   4
B4
```

And mark some of its nodes:

```
sage: T = T.marked_nodes([2,3])
sage: T.dynkin_diagram()                                                    #␣
↪needs sage.graphs
O---X---X=>=O
1   2   3   4
B4 with nodes (2, 3) marked
```

```
>>> from sage.all import *
>>> T = T.marked_nodes([Integer(2),Integer(3)])
>>> T.dynkin_diagram()                                                    #␣
↪needs sage.graphs
O---X---X=>=O
1   2   3   4
B4 with nodes (2, 3) marked
```

Markings are not additive:

```
sage: T.marked_nodes([1,4]).dynkin_diagram()                                #␣
↪needs sage.graphs
X---O---O=>=X
1   2   3   4
B4 with nodes (1, 4) marked
```

```
>>> from sage.all import *
>>> T.marked_nodes([Integer(1),Integer(4)]).dynkin_diagram()                ␣
↪              # needs sage.graphs
X---O---O=>=X
1   2   3   4
B4 with nodes (1, 4) marked
```

And trivial relabelling are honoured nicely:

```
sage: T = T.marked_nodes([])
sage: T.dynkin_diagram()                                                   #␣
↪needs sage.graphs
O---O---O=>=O
1   2   3   4
B4
```

```
>>> from sage.all import *
>>> T = T.marked_nodes([])
>>> T.dynkin_diagram()                                                   #␣
↪needs sage.graphs
O---O---O=>=O
1   2   3   4
B4
```

ascii_art(*label=None*, *node=None*)

Return an ascii art representation of this Cartan type.

EXAMPLES:

```
sage: print(CartanType(["G", 2]).marked_nodes([2]).ascii_art())
  3
O=<=X
1   2
sage: print(CartanType(["B", 3, 1]).marked_nodes([0, 3]).ascii_art())
    X 0
    |
    |
O---O=>=X
1   2   3
sage: print(CartanType(["F", 4, 1]).marked_nodes([0, 2]).ascii_art())
X---O---X=>=O---O
0   1   2   3   4
```

```
>>> from sage.all import *
>>> print(CartanType(["G", Integer(2)]).marked_nodes([Integer(2)]).ascii_
↪art())
  3
O=<=X
1   2
>>> print(CartanType(["B", Integer(3), Integer(1)]).marked_nodes([Integer(0),␣
↪Integer(3)]).ascii_art())
    X 0
    |
    |
O---O=>=X
1   2   3
>>> print(CartanType(["F", Integer(4), Integer(1)]).marked_nodes([Integer(0),␣
↪Integer(2)]).ascii_art())
X---O---X=>=O---O
0   1   2   3   4
```

dual()

Implement *sage.combinat.root_system.cartan_type.CartanType_abstract.dual()*, using that taking the dual and marking nodes are commuting operations.

EXAMPLES:

```
sage: T = CartanType(["BC",3, 2])
sage: T.marked_nodes([1,3]).dual().dynkin_diagram()                          #␣
↪needs sage.graphs
O=>=X---O=>=X
0   1   2   3
BC3~* with nodes (1, 3) marked
sage: T.dual().marked_nodes([1,3]).dynkin_diagram()                          #␣
↪needs sage.graphs
O=>=X---O=>=X
0   1   2   3
BC3~* with nodes (1, 3) marked
```

```
>>> from sage.all import *
>>> T = CartanType(["BC",Integer(3), Integer(2)])
>>> T.marked_nodes([Integer(1),Integer(3)]).dual().dynkin_diagram()          ␣
↪                # needs sage.graphs
O=>=X---O=>=X
0   1   2   3
BC3~* with nodes (1, 3) marked
>>> T.dual().marked_nodes([Integer(1),Integer(3)]).dynkin_diagram()          ␣
↪                # needs sage.graphs
O=>=X---O=>=X
0   1   2   3
BC3~* with nodes (1, 3) marked
```

dynkin_diagram()

Return the Dynkin diagram for this Cartan type.

EXAMPLES:

```
sage: CartanType(["G", 2]).marked_nodes([2]).dynkin_diagram()                #␣
↪needs sage.graphs
  3
O=<=X
1   2
G2 with node 2 marked
```

```
>>> from sage.all import *
>>> CartanType(["G", Integer(2)]).marked_nodes([Integer(2)]).dynkin_diagram()␣
↪                # needs sage.graphs
  3
O=<=X
1   2
G2 with node 2 marked
```

marked_nodes(*marked_nodes*)

Return `self` with nodes `marked_nodes` marked.

EXAMPLES:

```
sage: ct = CartanType(['A',12])
sage: m = ct.marked_nodes([1,4,6,7,8,12]); m
['A', 12] with nodes (1, 4, 6, 7, 8, 12) marked
sage: m.marked_nodes([2])
['A', 12] with node 2 marked
sage: m.marked_nodes([]) is ct
True
```

```
>>> from sage.all import *
>>> ct = CartanType(['A',Integer(12)])
>>> m = ct.marked_nodes([Integer(1),Integer(4),Integer(6),Integer(7),
↪Integer(8),Integer(12)]); m
['A', 12] with nodes (1, 4, 6, 7, 8, 12) marked
>>> m.marked_nodes([Integer(2)])
['A', 12] with node 2 marked
>>> m.marked_nodes([]) is ct
True
```

relabel(*relabelling*)

Return the relabelling of `self`.

EXAMPLES:

```
sage: T = CartanType(["BC",3, 2])
sage: T.marked_nodes([1,3]).relabel(lambda x: x+2).dynkin_diagram()          #␣
↪needs sage.graphs
O=<=X---O=<=X
2   3   4   5
BC3~ relabelled by {0: 2, 1: 3, 2: 4, 3: 5} with nodes (3, 5) marked
sage: T.relabel(lambda x: x+2).marked_nodes([3,5]).dynkin_diagram()          #␣
↪needs sage.graphs
O=<=X---O=<=X
2   3   4   5
BC3~ relabelled by {0: 2, 1: 3, 2: 4, 3: 5} with nodes (3, 5) marked
```

```
>>> from sage.all import *
>>> T = CartanType(["BC",Integer(3), Integer(2)])
>>> T.marked_nodes([Integer(1),Integer(3)]).relabel(lambda x: x+Integer(2)).
↪dynkin_diagram()          # needs sage.graphs
O=<=X---O=<=X
2   3   4   5
BC3~ relabelled by {0: 2, 1: 3, 2: 4, 3: 5} with nodes (3, 5) marked
>>> T.relabel(lambda x: x+Integer(2)).marked_nodes([Integer(3),Integer(5)]).
↪dynkin_diagram()          # needs sage.graphs
O=<=X---O=<=X
2   3   4   5
BC3~ relabelled by {0: 2, 1: 3, 2: 4, 3: 5} with nodes (3, 5) marked
```

type()

Return the type of `self` or `None` if unknown.

EXAMPLES:

```
sage: ct = CartanType(['F', 4]).marked_nodes([1,3])
sage: ct.type()
'F'
```

```
>>> from sage.all import *
>>> ct = CartanType(['F', Integer(4)]).marked_nodes([Integer(1),Integer(3)])
>>> ct.type()
'F'
```

class sage.combinat.root_system.type_marked.**CartanType_affine**(*ct*, *marked_nodes*)

Bases: *CartanType*, *CartanType_affine*

basic_untwisted()

Return the basic untwisted Cartan type associated with this affine Cartan type.

Given an affine type $X_n^{(r)}$, the basic untwisted type is X_n. In other words, it is the classical Cartan type that is twisted to obtain self.

EXAMPLES:

```
sage: CartanType(['A', 7, 2]).marked_nodes([1,3]).basic_untwisted()
['A', 7] with nodes (1, 3) marked
sage: CartanType(['D', 4, 3]).marked_nodes([0,2]).basic_untwisted()
['D', 4] with node 2 marked
```

```
>>> from sage.all import *
>>> CartanType(['A', Integer(7), Integer(2)]).marked_nodes([Integer(1),
↪Integer(3)]).basic_untwisted()
['A', 7] with nodes (1, 3) marked
>>> CartanType(['D', Integer(4), Integer(3)]).marked_nodes([Integer(0),
↪Integer(2)]).basic_untwisted()
['D', 4] with node 2 marked
```

classical()

Return the classical Cartan type associated with self.

EXAMPLES:

```
sage: T = CartanType(['A',4,1]).marked_nodes([0,2,4])
sage: T.dynkin_diagram()                                                  #␣
↪needs sage.graphs
0
X-----------+
|           |
|           |
O---X---O---X
1   2   3   4
A4~ with nodes (0, 2, 4) marked

sage: T0 = T.classical(); T0
['A', 4] with nodes (2, 4) marked
sage: T0.dynkin_diagram()                                                 #␣
↪needs sage.graphs
O---X---O---X
```

(continues on next page)

(continued from previous page)

```
1   2   3   4
A4 with nodes (2, 4) marked
```

```
>>> from sage.all import *
>>> T = CartanType(['A',Integer(4),Integer(1)]).marked_nodes([Integer(0),
↪Integer(2),Integer(4)])
>>> T.dynkin_diagram()                                                   #␣
↪needs sage.graphs
0
X-----------+
|           |
|           |
O---X---O---X
1   2   3   4
A4~ with nodes (0, 2, 4) marked

>>> T0 = T.classical(); T0
['A', 4] with nodes (2, 4) marked
>>> T0.dynkin_diagram()                                                  #␣
↪needs sage.graphs
O---X---O---X
1   2   3   4
A4 with nodes (2, 4) marked
```

is_untwisted_affine()

Implement *CartanType_affine.is_untwisted_affine()*.

A marked Cartan type is untwisted affine if the original is.

EXAMPLES:

```
sage: CartanType(['B', 3, 1]).marked_nodes([1,3]).is_untwisted_affine()
True
```

```
>>> from sage.all import *
>>> CartanType(['B', Integer(3), Integer(1)]).marked_nodes([Integer(1),
↪Integer(3)]).is_untwisted_affine()
True
```

special_node()

Return the special node of the Cartan type.

See also

special_node()

It is the special node of the non-marked Cartan type..

EXAMPLES:

```
sage: CartanType(['B', 3, 1]).marked_nodes([1,3]).special_node()
0
```

```
>>> from sage.all import *
>>> CartanType(['B', Integer(3), Integer(1)]).marked_nodes([Integer(1),
↪Integer(3)]).special_node()
0
```

class sage.combinat.root_system.type_marked.**CartanType_finite**(*ct*, *marked_nodes*)

Bases: *CartanType*, *CartanType_finite*

AmbientSpace

alias of *AmbientSpace*

affine()

Return the affine Cartan type associated with `self`.

EXAMPLES:

```
sage: B4 = CartanType(['B',4]).marked_nodes([1,3])
sage: B4.dynkin_diagram()                                              #␣
↪needs sage.graphs
X---O---X=>=O
1   2   3   4
B4 with nodes (1, 3) marked
sage: B4.affine().dynkin_diagram()                                     #␣
↪needs sage.graphs
    O 0
    |
    |
X---O---X=>=O
1   2   3   4
B4~ with nodes (1, 3) marked
```

```
>>> from sage.all import *
>>> B4 = CartanType(['B',Integer(4)]).marked_nodes([Integer(1),Integer(3)])
>>> B4.dynkin_diagram()                                              #␣
↪needs sage.graphs
X---O---X=>=O
1   2   3   4
B4 with nodes (1, 3) marked
>>> B4.affine().dynkin_diagram()                                     #␣
↪needs sage.graphs
    O 0
    |
    |
X---O---X=>=O
1   2   3   4
B4~ with nodes (1, 3) marked
```

5.1.268 Root system data for reducible Cartan types

class sage.combinat.root_system.type_reducible.**AmbientSpace**(*root_system*, *base_ring*, *index_set=None*)

Bases: *AmbientSpace*

EXAMPLES:

```
sage: RootSystem("A2xB2").ambient_space()
Ambient space of the Root system of type A2xB2
```

```
>>> from sage.all import *
>>> RootSystem("A2xB2").ambient_space()
Ambient space of the Root system of type A2xB2
```

ambient_spaces()

Return a list of the irreducible Cartan types of which the given reducible Cartan type is a product.

EXAMPLES:

```
sage: RootSystem("A2xB2").ambient_space().ambient_spaces()
[Ambient space of the Root system of type ['A', 2],
 Ambient space of the Root system of type ['B', 2]]
```

```
>>> from sage.all import *
>>> RootSystem("A2xB2").ambient_space().ambient_spaces()
[Ambient space of the Root system of type ['A', 2],
 Ambient space of the Root system of type ['B', 2]]
```

cartan_type()

EXAMPLES:

```
sage: RootSystem("A2xB2").ambient_space().cartan_type()
A2xB2
```

```
>>> from sage.all import *
>>> RootSystem("A2xB2").ambient_space().cartan_type()
A2xB2
```

component_types()

EXAMPLES:

```
sage: RootSystem("A2xB2").ambient_space().component_types()
[['A', 2], ['B', 2]]
```

```
>>> from sage.all import *
>>> RootSystem("A2xB2").ambient_space().component_types()
[['A', 2], ['B', 2]]
```

dimension()

EXAMPLES:

```
sage: RootSystem("A2xB2").ambient_space().dimension()
5
```

```
>>> from sage.all import *
>>> RootSystem("A2xB2").ambient_space().dimension()
5
```

fundamental_weights()

EXAMPLES:

```
sage: RootSystem("A2xB2").ambient_space().fundamental_weights()
Finite family {1: (1, 0, 0, 0, 0), 2: (1, 1, 0, 0, 0), 3: (0, 0, 0, 1, 0), 4:␣
↪(0, 0, 0, 1/2, 1/2)}
```

```
>>> from sage.all import *
>>> RootSystem("A2xB2").ambient_space().fundamental_weights()
Finite family {1: (1, 0, 0, 0, 0), 2: (1, 1, 0, 0, 0), 3: (0, 0, 0, 1, 0), 4:␣
↪(0, 0, 0, 1/2, 1/2)}
```

inject_weights(i, v)

Produces the corresponding element of the lattice.

INPUT:

- `i` – integer in `range(self.components)`
- `v` – a vector in the i-th component weight lattice

EXAMPLES:

```
sage: V = RootSystem("A2xB2").ambient_space()
sage: [V.inject_weights(i,V.ambient_spaces()[i].fundamental_weights()[1]) for␣
↪i in range(2)]
[(1, 0, 0, 0, 0), (0, 0, 0, 1, 0)]
sage: [V.inject_weights(i,V.ambient_spaces()[i].fundamental_weights()[2]) for␣
↪i in range(2)]
[(1, 1, 0, 0, 0), (0, 0, 0, 1/2, 1/2)]
```

```
>>> from sage.all import *
>>> V = RootSystem("A2xB2").ambient_space()
>>> [V.inject_weights(i,V.ambient_spaces()[i].fundamental_
↪weights()[Integer(1)]) for i in range(Integer(2))]
[(1, 0, 0, 0, 0), (0, 0, 0, 1, 0)]
>>> [V.inject_weights(i,V.ambient_spaces()[i].fundamental_
↪weights()[Integer(2)]) for i in range(Integer(2))]
[(1, 1, 0, 0, 0), (0, 0, 0, 1/2, 1/2)]
```

negative_roots()

EXAMPLES:

```
sage: RootSystem("A1xA2").ambient_space().negative_roots()
[(-1, 1, 0, 0, 0), (0, 0, -1, 1, 0), (0, 0, -1, 0, 1), (0, 0, 0, -1, 1)]
```

```
>>> from sage.all import *
>>> RootSystem("A1xA2").ambient_space().negative_roots()
[(-1, 1, 0, 0, 0), (0, 0, -1, 1, 0), (0, 0, -1, 0, 1), (0, 0, 0, -1, 1)]
```

positive_roots()

EXAMPLES:

```
sage: RootSystem("A1xA2").ambient_space().positive_roots()
[(1, -1, 0, 0, 0), (0, 0, 1, -1, 0), (0, 0, 1, 0, -1), (0, 0, 0, 1, -1)]
```

```
>>> from sage.all import *
>>> RootSystem("A1xA2").ambient_space().positive_roots()
[(1, -1, 0, 0, 0), (0, 0, 1, -1, 0), (0, 0, 1, 0, -1), (0, 0, 0, 1, -1)]
```

simple_coroot(*i*)

EXAMPLES:

```
sage: A = RootSystem("A1xB2").ambient_space()
sage: A.simple_coroot(2)
(0, 0, 1, -1)
sage: A.simple_coroots()
Finite family {1: (1, -1, 0, 0), 2: (0, 0, 1, -1), 3: (0, 0, 0, 2)}
```

```
>>> from sage.all import *
>>> A = RootSystem("A1xB2").ambient_space()
>>> A.simple_coroot(Integer(2))
(0, 0, 1, -1)
>>> A.simple_coroots()
Finite family {1: (1, -1, 0, 0), 2: (0, 0, 1, -1), 3: (0, 0, 0, 2)}
```

simple_root(*i*)

EXAMPLES:

```
sage: A = RootSystem("A1xB2").ambient_space()
sage: A.simple_root(2)
(0, 0, 1, -1)
sage: A.simple_roots()
Finite family {1: (1, -1, 0, 0), 2: (0, 0, 1, -1), 3: (0, 0, 0, 1)}
```

```
>>> from sage.all import *
>>> A = RootSystem("A1xB2").ambient_space()
>>> A.simple_root(Integer(2))
(0, 0, 1, -1)
>>> A.simple_roots()
Finite family {1: (1, -1, 0, 0), 2: (0, 0, 1, -1), 3: (0, 0, 0, 1)}
```

class sage.combinat.root_system.type_reducible.**CartanType**(*types*)

Bases: `SageObject`, `CartanType_abstract`

A class for reducible Cartan types.

Reducible root systems are ones that can be factored as direct products. Strictly speaking type D_2 (corresponding to orthogonal groups of degree 4) is reducible since it is isomorphic to $A_1 \times A_1$. However type D_2 is not built using this class for our purposes.

INPUT:

- `types` – list of simple Cartan types

EXAMPLES:

```
sage: t1, t2 = [CartanType(x) for x in (['A',1], ['B',2])]
sage: CartanType([t1, t2])
A1xB2
sage: t = CartanType("A2xB2")
```

```
>>> from sage.all import *
>>> t1, t2 = [CartanType(x) for x in (['A',Integer(1)], ['B',Integer(2)])]
>>> CartanType([t1, t2])
A1xB2
>>> t = CartanType("A2xB2")
```

A reducible Cartan type is finite (resp. crystallographic, simply laced) if all its components are:

```
sage: t.is_finite()
True
sage: t.is_crystallographic()
True
sage: t.is_simply_laced()
False
```

```
>>> from sage.all import *
>>> t.is_finite()
True
>>> t.is_crystallographic()
True
>>> t.is_simply_laced()
False
```

This is implemented by inserting the appropriate abstract super classes (see `_add_abstract_superclass()`):

```
sage: t.__class__.mro()
[<class 'sage.combinat.root_system.type_reducible.CartanType_with_superclass'>,
↪<class 'sage.combinat.root_system.type_reducible.CartanType'>, <class 'sage.
↪structure.sage_object.SageObject'>, <class 'sage.combinat.root_system.cartan_
↪type.CartanType_finite'>, <class 'sage.combinat.root_system.cartan_type.
↪CartanType_crystallographic'>, <class 'sage.combinat.root_system.cartan_type.
↪CartanType_abstract'>, <class 'object'>]
```

```
>>> from sage.all import *
>>> t.__class__.mro()
[<class 'sage.combinat.root_system.type_reducible.CartanType_with_superclass'>,
↪<class 'sage.combinat.root_system.type_reducible.CartanType'>, <class 'sage.
↪structure.sage_object.SageObject'>, <class 'sage.combinat.root_system.cartan_
↪type.CartanType_finite'>, <class 'sage.combinat.root_system.cartan_type.
↪CartanType_crystallographic'>, <class 'sage.combinat.root_system.cartan_type.
↪CartanType_abstract'>, <class 'object'>]
```

The index set of the reducible Cartan type is obtained by relabelling successively the nodes of the Dynkin diagrams of the components by 1,2,…:

```
sage: t = CartanType(["A",4], ["BC",5,2], ["C",3])
sage: t.index_set()
(1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13)
