sage: RowStandardTableau([[2,3],[1]]).residue_sequence(3,(0,1)).row_standard_tableaux().quantum_characteristic()
3
sage: StandardTableau([[1,2],[3]]).residue_sequence(3,(0,1)).row_standard_tableaux().quantum_characteristic()
3
sage: RowStandardTableauTuple(([4],[[2,3],[1]])).residue_sequence(3,(0,1)).row_standard_tableaux().quantum_characteristic()
3
sage: StandardTableauTuple(([4],[[1,3],[2]])).residue_sequence(3,(0,1)).row_standard_tableaux().quantum_characteristic()
3
```

residue_sequence()

Return the residue sequence of self.

EXAMPLES:

```
sage: RowStandardTableau([[2,3],[1]]).residue_sequence(3,(0,1)).row_standard_tableaux().residue_sequence()
3-residue sequence (2,0,1) with multicharge (0,1)
sage: StandardTableau([[1,2],[3]]).residue_sequence(3,(0,1)).row_standard_tableaux().residue_sequence()
3-residue sequence (0,1,2) with multicharge (0,1)
sage: RowStandardTableauTuple(([4],[[2,3],[1]])).residue_sequence(3,(0,1)).row_standard_tableaux().residue_sequence()
3-residue sequence (0,1,2,0) with multicharge (0,1)
sage: StandardTableauTuple(([4],[[1,3],[2]])).residue_sequence(3,(0,1)).row_standard_tableaux().residue_sequence()
3-residue sequence (1,0,2,0) with multicharge (0,1)
```
```python
>>> from sage.all import *

>>> RowStandardTableau([[Integer(2),Integer(3)], [Integer(1)]]).residue_sequence(Integer(3), (Integer(0), Integer(1))).row_standard_tableaux().residue_sequence()
3-residue sequence (2,0,1) with multicharge (0,1)

>>> StandardTableau([[Integer(1),Integer(2)], [Integer(3)]]).residue_sequence(Integer(3), (Integer(0), Integer(1))).row_standard_tableaux().residue_sequence()
3-residue sequence (0,1,2) with multicharge (0,1)

>>> RowStandardTableauTuple([[Integer(1)],[[Integer(2),Integer(3)], [Integer(1)]]]).residue_sequence(Integer(3), (Integer(0), Integer(1))).row_standard_tableaux().residue_sequence()
3-residue sequence (0,1,2,0) with multicharge (0,1)

>>> StandardTableauTuple([[Integer(4)], [[Integer(1),Integer(3)], [Integer(2)]]]).residue_sequence(Integer(3), (Integer(0), Integer(1))).row_standard_tableaux().residue_sequence()
3-residue sequence (1,0,2,0) with multicharge (0,1)
```

```
size()

Return the size of self.

EXAMPLES:

sage: RowStandardTableau([[2,3],[1]]).residue_sequence(3,(0,1)).row_standard_tableaux().size()
3
sage: StandardTableau([[1,2],[3]]).residue_sequence(3,(0,1)).row_standard_tableaux().size()
3
sage: RowStandardTableauTuple([[4],[[2,3],[1]]]).residue_sequence(3,(0,1)).row_standard_tableaux().size()
4
sage: StandardTableauTuple([[4],[[1,3],[2]]]).residue_sequence(3,(0,1)).row_standard_tableaux().size()
4
```

```
>>> from sage.all import *

>>> RowStandardTableau([[Integer(2),Integer(3)], [Integer(1)]]).residue_sequence(Integer(3), (Integer(0), Integer(1))).row_standard_tableaux().size()
3

>>> StandardTableau([[Integer(1),Integer(2)], [Integer(3)]]).residue_sequence(Integer(3), (Integer(0), Integer(1))).row_standard_tableaux().size()
3

>>> RowStandardTableauTuple([[Integer(4)],[[Integer(2),Integer(3)], [Integer(1)]]]).residue_sequence(Integer(3), (Integer(0), Integer(1))).row_standard_tableaux().size()
4

>>> StandardTableauTuple([[Integer(4)],[[Integer(1),Integer(3)], [Integer(2)]]]).residue_sequence(Integer(3), (Integer(0), Integer(1))).row_standard_tableaux().size()
4
```

```python
class sage.combinat.tableau_tuple.RowStandardTableauTuples_residue_shape(residue, shape)

Bases: RowStandardTableauTuples_residue

All row standard tableau tuples with a fixed residue and shape.
```
INPUT:

- **shape** – the shape of the partitions or partition tuples
- **residue** – the residue sequence of the label

EXAMPLES:

```python
sage: res = RowStandardTableauTuple([[3, 6], [1]], [[5, 7], [4], [2]]).residue_sequence(3, (0, 0))
sage: tabs = res.row_standard_tableaux([[2, 1], [2, 1, 1]]); tabs
Row standard (2,1|2,1^2)-tableaux with 3-residue sequence (2,1,0,2,0,1,1) and multicharge (0,0)
sage: tabs.shape()
([2, 1], [2, 1, 1])
sage: tabs.level()
2
```

```python
>>> from sage.all import *

>>> res = RowStandardTableauTuple([[Integer(3), Integer(6)], [Integer(1)]],
                                  [[Integer(5), Integer(7)], [Integer(4)], [Integer(2)]]).residue_sequence(Integer(3), (Integer(0), Integer(0)))

>>> tabs = res.row_standard_tableaux([[Integer(2), Integer(1)], [Integer(2), Integer(1), Integer(1)]]); tabs
Row standard (2,1|2,1^2)-tableaux with 3-residue sequence (2,1,0,2,0,1,1) and multicharge (0,0)

>>> tabs.shape()
([2, 1], [2, 1, 1])

>>> tabs.level()
2
```

```python
class sage.combinat.tableau_tuple.RowStandardTableauTuples_shape(shape)

Bases: RowStandardTableauTuples

Class of all RowStandardTableauTuples of a fixed shape.

an_element()

Return a particular element of self.

EXAMPLES:

```python
sage: RowStandardTableauTuples([[2], [2, 1]]).an_element() # needs sage.graphs
([[4, 5]], [[1, 3], [2]])
sage: RowStandardTableauTuples([[10], [], []]).an_element() # needs sage.graphs
```
```
cardinality()

Return the number of row standard tableau tuples of with the same shape as the partition tuple self.

This is just the index of the corresponding Young subgroup in the full symmetric group.

EXAMPLES:

```python
sage: RowStandardTableauTuples([[3,2,1],[1]]).cardinality()
sage: RowStandardTableauTuples([[1],[1],[1]]).cardinality()
sage: RowStandardTableauTuples([[2,1],[1],[1]]).cardinality()
```

```python
>>> from sage.all import *
>>> RowStandardTableauTuples([[Integer(3),Integer(2),Integer(1)],[1]]).cardinality()
60
>>> RowStandardTableauTuples([[Integer(1)],[Integer(1)],[Integer(1)]]).cardinality()
6
```
class sage.combinat.tableau_tuple.StandardTableauTuple (parent, t, check=True)

Bases: RowStandardTableauTuple

A class to model a standard tableau of shape a partition tuple. This is a tuple of standard tableau with entries 1, 2, ..., n, where n is the size of the underlying partition tuple, such that the entries increase along rows and down columns in each component of the tuple.

sage: s = StandardTableauTuple([[1,2,3],[4,5]])
sage: t = StandardTableauTuple([[1,2],[3,5],[4]])
sage: s.dominates(t) True
sage: t.dominates(s) False
sage: StandardTableauTuple([[1,2,3],[4,5]]) in RowStandardTableauTuples() True

The tableaux appearing in a StandardTableauTuple are both row and column strict, but individually they are not standard tableaux because the entries in any single component of a StandardTableauTuple will typically not be in bijection with {1, 2, ..., n}.

INPUT:

• t – a tableau, a list of (standard) tableau or an equivalent list

OUTPUT:

• A StandardTableauTuple object constructed from t.

Note: Sage uses the English convention for (tuples of) partitions and tableaux: the longer rows are displayed on top. As with PartitionTuple, in sage the cells, or nodes, of partition tuples are 0-based. For example, the (lexicographically) first cell in any non-empty partition tuple is [0, 0, 0]. Further, the coordinates [k, r, c] in a TableauTuple refer to the component, row and column indices, respectively.

EXAMPLES:

sage: t = TableauTuple([[1,3,4],[7,9]], [[2,8,11],[6]], [[5,10]])
sage: t
([[1, 3, 4], [7, 9]], [[2, 8, 11], [6]], [[5, 10]])
sage: t[0][0][0] 1
sage: t[1][1][0] 6
sage: t[2][0][0] 5
sage: t[2][0][1] 10
sage: t = StandardTableauTuple([[4,5],[7]], [[1,2,3],[6,8]], [[9]]); t
([[4, 5], [7]], [[1, 2, 3], [6, 8]], [[9]])
sage: t.pp()
4 5 1 2 3 9
7 6 8
sage: t.shape() ([2, 1], [3, 2], [1])
sage: t[0].pp() # pretty printing
4 5
7
sage: t.is_standard() True
sage: t[0].is_standard() False
sage: StandardTableauTuple([[],[],[]]) # An empty tableau tuple
([[], [], []])
```python
>>> from sage.all import *

>>> t = TableauTuple([ [[Integer(1),Integer(3),Integer(4)], [Integer(7), Integer(9)]], [[Integer(2),Integer(8),Integer(11)], [Integer(6)]], [[Integer(5), Integer(10)]]
]

>>> t
([ [1, 3, 4], [7, 9] ], [ [2, 8, 11], [6] ], [ [5, 10] ])

>>> t[Integer(0)][Integer(0)][Integer(0)]
1

>>> t[Integer(1)][Integer(1)][Integer(0)]
6

>>> t[Integer(2)][Integer(0)][Integer(0)]
5

>>> t[Integer(2)][Integer(0)][Integer(1)]
10

>>> t = StandardTableauTuple([ [[Integer(4),Integer(5)], [Integer(7)]], [[Integer(1),Integer(2),Integer(3)], [Integer(6),Integer(8)]], [[Integer(9)]]
])

>>> t
([ [4, 5], [7] ], [ [1, 2, 3], [6, 8] ], [ [9] ])

>>> t.pp()
4 5
7 6 8

>>> t.shape()
([2, 1], [3, 2], [1])

>>> t[Integer(0)].pp()  # pretty printing
4 5
7

>>> t.is_standard()
True

>>> t[Integer(0)].is_standard()
False

>>> StandardTableauTuple([[],[],[]])  # An empty tableau tuple
([], [], [])
```

When using code that will generate a lot of tableaux, it is slightly more efficient to construct a `StandardTableauTuple` from the appropriate parent object:

```python
sage: STT = StandardTableauTuples()
sage: STT([[Integer(4),Integer(5)], [Integer(7)]], [[Integer(1),Integer(2),Integer(3)], [Integer(6),Integer(8)]], [[Integer(9)]])
([ [4, 5], [7] ], [ [1, 2, 3], [6, 8] ], [ [9] ])
```

```python
>>> from sage.all import *

>>> STT = StandardTableauTuples()

>>> STT([[Integer(4),Integer(5)], [Integer(7)]], [[Integer(1),Integer(2),Integer(3)], [Integer(6),Integer(8)]], [[Integer(9)]])
([ [4, 5], [7] ], [ [1, 2, 3], [6, 8] ], [ [9] ])
```

See also:

- `Tableau`
- `Tableaux`
- `TableauTuples`
- `TableauTuple`
- `StandardTableauTuples`
`dominates(t)`

Return `True` if the tableau (tuple) `self` dominates the tableau `t`. The two tableaux do not need to be of the same shape.

**EXAMPLES:**

```python
sage: s = StandardTableauTuple([[1,2,3],[4,5]])
sage: t = StandardTableauTuple([[1,2],[3,5],[4]])
sage: s.dominates(t)
True
sage: t.dominates(s)
False
```

`restrict(m=None)`

Return the restriction of the standard tableau `self` to `m`, which defaults to one less than the current `size()`.

**EXAMPLES:**

```python
>>> from sage.all import *

>>> StandardTableauTuple([[Integer(5)],[[Integer(1),Integer(2)],[Integer(3), Integer(4)]]]).restrict(Integer(6))
([[[5]], [[1, 2], [3, 4]]])
```

(continues on next page)
Where possible the restricted tableau belongs to the same category as the tableau \texttt{self}:

\begin{verbatim}
sage: TableauTuple([[5],[1,2],[3,4]]).restrict(3).category()
Category of elements of Tableau tuples
sage: StandardTableauTuple([[5],[1,2],[3,4]]).restrict(3).category()
Category of elements of Standard tableau tuples
sage: StandardTableauTuples().[[5],[1,2],[3,4]]).restrict(3).category()
Category of elements of Standard tableau tuples
sage: StandardTableauTuples(level=2).[[5],[1,2],[3,4]]).restrict(3).category()
Category of elements of Standard tableau tuples of level 2
\end{verbatim}

\texttt{to\_chain()}\texttt{\textend{verbatim}}

Return the chain of partitions corresponding to the standard tableau tuple \texttt{self}.

\textbf{EXAMPLES:}

\begin{verbatim}
sage: StandardTableauTuple([[5],[1,2],[3,4]]).to_chain()
[(\[
], [\]
),
(\[
], [1]
),
(\[
], [2]
),
(\[
], [2, 1]
),
(\[
], [2, 2]
),
(1, [2, 2])
\end{verbatim}

\begin{verbatim}
>>> from sage.all import *

>>> StandardTableauTuple([[Integer(5)],[[Integer(1),Integer(2)],
Integer(3),
Integer(4)]]).to_chain()
[(\[
], [\]
),
(\[
], [1]
),
(\[
], [2]
),
(\[
], [2, 1]
),
(\[
], [2, 2]
),
(1, [2, 2])
\end{verbatim}
class sage.combinat.tableau_tuple.StandardTableauTuples

Bases: RowStandardTableauTuples

A factory class for the various classes of tuples of standard tableau.

INPUT:

There are three optional arguments:

• level – the level() of the tuples of tableaux
• size – the size() of the tuples of tableaux
• shape – a list or a partition tuple specifying the shape() of the standard tableau tuples

It is not necessary to use the keywords. If they are not used then the first integer argument specifies the level() and the second the size() of the tableau tuples.

OUTPUT:

The appropriate subclass of StandardTableauTuples.

A tuple of standard tableau is a tableau whose entries are positive integers which increase from left to right along the rows, and from top to bottom down the columns, in each component. The entries do NOT need to increase from left to right along the components.

Note: Sage uses the English convention for (tuples of) partitions and tableaux: the longer rows are displayed on top. As with PartitionTuple, in sage the cells, or nodes, of partition tuples are 0-based. For example, the (lexicographically) first cell in any non-empty partition tuple is [0, 0, 0].

EXAMPLES:

sage: tabs=StandardTableauTuples([[3],[2,2]]); tabs
Standard tableau tuples of shape ([3], [2, 2])
sage: tabs.cardinality()
70
sage: tabs[10:16]

(([1, 2, 3], [4, 6], [5, 7]),
 ([1, 2, 4], [3, 6], [5, 7]),
 ([1, 3, 4], [2, 6], [5, 7]),
 ([2, 3, 4], [1, 6], [5, 7]),
 ([1, 2, 5], [3, 6], [4, 7]),
 ([1, 3, 5], [2, 6], [4, 7]))

sage: tabs=StandardTableauTuples(level=3); tabs
Standard tableau tuples of level 3
sage: tabs[100]

# needs sage.libs.flint
([1, 2, 3], [4], [5])

sage: StandardTableauTuples()[0]

# needs sage.libs.flint
()
```python
>>> from sage.all import *
>>> tabs=StandardTableauTuples([[Integer(3)],[Integer(2),Integer(2)]]); tabs
Standard tableau tuples of shape ([3], [2, 2])
>>> tabs.cardinality()
70
>>> tabs[Integer(10):Integer(16)]
[([[1, 2, 3]], [[4, 6], [5, 7]]),
 ([[1, 2, 4]], [[3, 6], [5, 7]]),
 ([[1, 3, 4]], [[2, 6], [5, 7]]),
 ([[2, 3, 4]], [[1, 6], [5, 7]]),
 ([[1, 2, 5]], [[3, 6], [4, 7]]),
 ([[1, 3, 5]], [[2, 6], [4, 7]]))

>>> tabs=StandardTableauTuples(level=Integer(3)); tabs
Standard tableau tuples of level 3

See also:

- TableauTuples
- Tableau
- StandardTableau
- StandardTableauTuples

Element

alias of StandardTableauTuple

level_one_parent_class

alias of StandardTableaux_all

shape()

Return the shape of the set of StandardTableauTuples, or None if it is not defined.

EXAMPLES:

```
sage: tabs=StandardTableauTuples(shape=[[5,2],[3,2],[1,1,1],[3]]); tabs
Standard tableau tuples of shape ([5, 2], [3, 2], [1, 1, 1], [3])
sage: tabs.shape()
([5, 2], [3, 2], [1, 1, 1], [3])
sage: StandardTableauTuples().shape() is None
True
```
```
class sage.combinat.tableau_tuple.StandardTableauTuples_all

Bases: StandardTableauTuples, DisjointUnionEnumeratedSets

Default class of all StandardTableauTuples with an arbitrary level() and size().

class sage.combinat.tableau_tuple.StandardTableauTuples_level(level)

Bases: StandardTableauTuples, DisjointUnionEnumeratedSets

Class of all StandardTableauTuples with a fixed level and arbitrary size.

an_element()

Return a particular element of the class.

EXAMPLES:

```python
sage: StandardTableauTuples(size=2).an_element()
([[1]], [[2]], [], [])
sage: StandardTableauTuples(size=4).an_element()
([[1]], [[2, 3], [], []])
```

```python
>>> from sage.all import *

>>> StandardTableauTuples(size=Integer(2)).an_element()
([[1]], [[2]], [], [])

>>> StandardTableauTuples(size=Integer(4)).an_element()
([[1]], [[2, 3], [], []])
```

class sage.combinat.tableau_tuple.StandardTableauTuples_level_size(level, size)

Bases: StandardTableauTuples, DisjointUnionEnumeratedSets

Class of all StandardTableauTuples with a fixed level and a fixed size.

an_element()

Return a particular element of the class.

EXAMPLES:

```python
sage: StandardTableauTuples(5, size=2).an_element()  # needs sage.libs.flint
([], [], [], [], [[1], [2]])
sage: StandardTableauTuples(2, size=4).an_element()  # needs sage.libs.flint
([[1]], [[2], [3], [4]])
```

```python
>>> from sage.all import *

>>> StandardTableauTuples(Integer(5), size=Integer(2)).an_element()  # needs sage.libs.flint
([], [], [], [], [[1], [2]])

>>> StandardTableauTuples(Integer(2), size=Integer(4)).an_element()  # needs sage.libs.flint
([[1]], [[2], [3], [4]])
```

cardinality()

Return the number of elements in this set of tableaux.

EXAMPLES:
Combinatorics, Release 10.4

```python
sage: StandardTableauTuples(3,2).cardinality()  # needs sage.libs.flint
12
sage: StandardTableauTuples(4,6).cardinality()  # needs sage.libs.flint
31936
```

```python
>>> from sage.all import *
>>> StandardTableauTuples(Integer(3),Integer(2)).cardinality()  # needs sage.libs.flint
12
>>> StandardTableauTuples(Integer(4),Integer(6)).cardinality()  # needs sage.libs.flint
31936
```

```python
class sage.combinat.tableau_tuple.StandardTableauTuples_shape(shape)

Bases: StandardTableauTuples

Class of all StandardTableauTuples of a fixed shape.

an_element()  
Return a particular element of the class.

EXAMPLES:

```python
sage: StandardTableauTuples([[2],[2,1]]).an_element()
([[2, 4]], [[1, 3], [5]])
sage: StandardTableauTuples([[10],[],[]]).an_element()
([[1, 2, 3, 4, 5, 6, 7, 8, 9, 10]], [], [])
```

```python
>>> from sage.all import *
>>> StandardTableauTuples([[Integer(2)], [Integer(2), Integer(1)]]).an_element()
([[2, 4]], [[1, 3], [5]])
>>> StandardTableauTuples([[Integer(10)], [], []]).an_element()
([[1, 2, 3, 4, 5, 6, 7, 8, 9, 10]], [], [])
```

cardinality()  
Return the number of standard Young tableau tuples of with the same shape as the partition tuple self.

Let \( \mu = (\mu(1), \ldots, \mu(l)) \) be the shape of the tableaux in self and let \( m_k = |\mu(k)| \), for \( 1 \leq k \leq l \). Multiplying by a (unique) coset representative of the Young subgroup \( S_{m_1} \times \cdots \times S_{m_l} \) inside the symmetric group \( S_n \), we can assume that \( t \) is standard and the numbers 1, 2, ..., \( n \) are entered in order from to right along the components of the tableau. Therefore, there are

\[
\binom{n}{m_1, \ldots, m_l} \prod_{k=1}^{l} |\text{Std}(\mu(k))|
\]

standard tableau tuples of this shape, where \( |\text{Std}(\mu(k))| \) is the number of standard tableau of shape \( \mu(k) \), for \( 1 \leq k \leq l \). This is given by the hook length formula.

EXAMPLES:

```python
sage: StandardTableauTuples([[3,2,1],[]]).cardinality()
16
sage: StandardTableauTuples([[1],[1],[1]]).cardinality()
6
```

(continues on next page)
sage: StandardTableauTuples([[2,1],[1],[1]]).cardinality()
40

sage: StandardTableauTuples([[3,2,1],[3,2]]).cardinality()
36960

>>> from sage.all import *

>>> StandardTableauTuples([[Integer(3),Integer(2),Integer(1)],[Integer(1)]]).cardinality()
16

>>> StandardTableauTuples([[Integer(1)], [Integer(1)], [Integer(1)]]).cardinality()
6

>>> StandardTableauTuples([[Integer(2),Integer(1)], [Integer(1)], [Integer(1)]]).cardinality()
40

>>> StandardTableauTuples([[Integer(3),Integer(2),Integer(1)],[Integer(3),Integer(2)]]).cardinality()
36960

last()

Return the last standard tableau tuple in self, with respect to the order that they are generated by the iterator.

This is just the standard tableau tuple with the numbers 1, 2, ..., n, where n is size(), entered in order down the columns form right to left along the components.

EXAMPLES:

sage: StandardTableauTuples([[2],[2,2]]).last().pp()
\[
\begin{array}{c}
5 & 6 & 1 & 3 \\

& 2 & 4
\end{array}
\]

random_element()

Return a random standard tableau in self.

We do this by randomly selecting addable nodes to place 1, 2, ..., n. Of course we could do this recursively, but it is more efficient to keep track of the (changing) list of addable nodes as we go.

EXAMPLES:

sage: StandardTableauTuples([[2],[2,1]]).random_element()  # random
([[[1, 2]], [[3, 4], [5]]])

>>> from sage.all import *

>>> StandardTableauTuples([[Integer(2)],[Integer(2),Integer(1)]]).random_element()  # random
([[[1, 2]], [[3, 4], [5]]])

class sage.combinat.tableau_tuple.StandardTableauTuples_size(size)

Bases: StandardTableauTuples, DisjointUnionEnumeratedSets

Class of all StandardTableauTuples with an arbitrary level and a fixed size.
The `an_element()` function returns a particular element of the class.

**Examples:**

```python
sage: StandardTableauTuples(size=2).an_element()
([[1]], [[2]], [], [])

sage: StandardTableauTuples(size=4).an_element()
([[1]], [[2, 3, 4]], [], [])
```

```python
>>> from sage.all import *

>>> StandardTableauTuples(size=Integer(2)).an_element()
([[1]], [[2]], [], [])

>>> StandardTableauTuples(size=Integer(4)).an_element()
([[1]], [[2, 3, 4]], [], [])
```

### Class `sage.combinat.tableau_tuple.StandardTableaux_residue(residue)`

**Bases:** `StandardTableauTuples`

Class of all standard tableau tuples with a fixed residue sequence. Implicitly, this also specifies the quantum characteristic, multicharge and hence the level and size of the tableaux.

**Note:** This class is not intended to be called directly, but rather, it is accessed through the standard tableaux.

**Examples:**

```python
sage: StandardTableau([[1,2,3],[4,5]]).residue_sequence(2).standard_tableaux()
Standard tableaux with 2-residue sequence (0,1,0,1,0) and multicharge (0)

sage: StandardTableau([[1,2,3],[4,5]]).residue_sequence(3).standard_tableaux()
Standard tableaux with 3-residue sequence (0,1,2,2,0) and multicharge (0)

sage: StandardTableauTuple([[5,6],[7]], [[1,2,3],[4]]).residue_sequence(2,(0,0)).standard_tableaux()
Standard tableaux with 2-residue sequence (0,1,0,1,0,1,1) and multicharge (0,0)

sage: StandardTableauTuple([[5,6],[7]], [[1,2,3],[4]]).residue_sequence(3,(0,1)).standard_tableaux()
Standard tableaux with 3-residue sequence (1,2,0,0,0,1,2) and multicharge (0,1)
```

```python
>>> from sage.all import *

>>> StandardTableau([[Integer(1),Integer(2),Integer(3)],[Integer(4),Integer(5)]]).residue_sequence(Integer(2)).standard_tableaux()
Standard tableaux with 2-residue sequence (0,1,0,1,0) and multicharge (0)

>>> StandardTableau([[Integer(1),Integer(2),Integer(3)],[Integer(4),Integer(5)]]).residue_sequence(Integer(3)).standard_tableaux()
Standard tableaux with 3-residue sequence (0,1,2,2,0) and multicharge (0)

>>> StandardTableauTuple([[Integer(5),Integer(6)],[Integer(7)]], [[Integer(1), Integer(2),Integer(3)],[Integer(4)]]).residue_sequence(Integer(2),(Integer(0), Integer(0))).standard_tableaux()
Standard tableaux with 2-residue sequence (0,1,0,1,0,1,1) and multicharge (0,0)

>>> StandardTableauTuple([[Integer(5),Integer(6)],[Integer(7)]], [[Integer(1), Integer(2),Integer(3)],[Integer(4)]]).residue_sequence(Integer(3),(Integer(0), Integer(1))).standard_tableaux()
Standard tableaux with 3-residue sequence (1,2,0,0,0,1,2) and multicharge (0,1)
```

### Class `sage.combinat.tableau_tuple.StandardTableaux_residue_shape(residue, shape)`

**Bases:** `StandardTableaux_residue`

5534

Chapter 5. Comprehensive Module List
All standard tableau tuples with a fixed residue and shape.

INPUT:

- shape – the shape of the partitions or partition tuples
- residue – the residue sequence of the label

EXAMPLES:

```
sage: res = StandardTableauTuple([[1,3],[6]], [[2,7],[4],[5]]).residue_sequence(3,(0,0))
sage: tabs = res.standard_tableaux([[2,1],[2,1,1]]); tabs
Standard (2,1|2,1^2)-tableaux with 3-residue sequence (0,0,1,2,1,2,1) and multicharge (0,0)

```
class sage.combinat.tableau_tuple.TableauTuple(parent, t, check=True)

Bases: CombinatorialElement

A class to model a tuple of tableaux.

INPUT:

• t – a list or tuple of Tableau, a list or tuple of lists of lists

OUTPUT:

• The Tableau tuple object constructed from t.

A TableauTuple is a tuple of tableaux of shape a PartitionTuple. These combinatorial objects are useful in several areas of algebraic combinatorics. In particular, they are important in:

• the representation theory of the complex reflection groups of type $G(l, 1, n)$ and the representation theory of the associated (degenerate and non-degenerate) Hecke algebras. See, for example, [DJM1998]

• the crystal theory of (quantum) affine special linear groups and its integral highest weight modules and their canonical bases. See, for example, [BK2009].

These apparently different and unrelated contexts are, in fact, intimately related as in characteristic zero the cyclotomic Hecke algebras categorify the canonical bases of the integral highest weight modules of the quantum affine special linear groups.

The level() of a tableau tuple is the length of the tuples. This corresponds to the level of the corresponding highest weight module.

In sage a TableauTuple looks and behaves like a real tuple of (level 1) Tableaux. Many of the operations which are defined on Tableau extend to TableauTuples. Tableau tuples of level 1 are just ordinary Tableau.

In sage, the entries of Tableaux can be very general, including arbitrarily nested lists, so some lists can be interpreted either as a tuple of tableaux or simply as tableaux. If it is possible to interpret the input to TableauTuple as a tuple of tableaux then TableauTuple returns the corresponding tuple. Given a 1-tuple of tableaux the tableau itself is returned.

EXAMPLES:

```
sage: t = TableauTuple([ [[6,9,10],[11]], [[1,2,3],[4,5]], [[7],[8]] ]); t
([[6, 9, 10], [11]], [[1, 2, 3], [4, 5]], [[7], [8]])
sage: t.level() 3
sage: t.size() 11
sage: t.shape() ([3, 1], [3, 2], [1, 1])
sage: t.is_standard() True
sage: t.pp() # pretty printing
  6  9  10  1  2  3  7
11  4  5  8
sage: t.category() Category of elements of Tableau tuples
sage: t.parent()
```

(continues on next page)
Tableau tuples

```python
s = TableauTuple([ [['a', 'c', 'b'], ['d', 'e']], [[[2, 1]]]]); s
([[a', 'c', 'b'], ['d', 'e']], [[[2, 1]]])
sage: s.shape()
([[3, 2], [1]])
sage: s.size()
6

sage: TableauTuple([], [], [])  # The empty 3-tuple of tableaux
([], [], []

sage: TableauTuple([[1, 2, 3], [4, 5]])
[[1, 2, 3], [4, 5]]
sage: TableauTuple([[1, 2, 3], [4, 5]]) == Tableau([[1, 2, 3], [4, 5]])
True

>>> from sage.all import *

>>> t = TableauTuple([ [[Integer(6), Integer(9), Integer(10)], [Integer(11)]], ...
    [[Integer(1), Integer(2), Integer(3)], [Integer(4), Integer(5)], ...
    [[Integer(7)], [Integer(8)]]]); t
([[6, 9, 10], [11]], [[1, 2, 3], [4, 5]], [[7], [8]])
>>> t.level()

IndexError: (2, 1, 2) is not an addable cell of the tableau

**cells_containing(m)**

Return the list of cells in which the letter \( m \) appears in the tableau self.

The list is ordered with cells appearing from left to right.

**EXAMPLES:**

```
sage: t = TableauTuple([[4,5],[[1,1,2,4],[2,4,4],[4],[1,3,4],[3,4]]])
sage: t.cells_containing(4)
[(0, 0, 0),
 (1, 2, 0),
 (1, 1, 1),
 (1, 1, 2),
 (1, 0, 3),
 (2, 1, 1),
 (2, 0, 2)]
sage: t.cells_containing(6)
[]
```

```python
>>> from sage.all import *
>>> t = TableauTuple([[Integer(4),Integer(5)],[[Integer(1),Integer(1),
  =Integer(2),Integer(4)],[Integer(2),Integer(4),Integer(4)],[Integer(4)],[
  =[[Integer(1),Integer(3),Integer(4)],[Integer(3),Integer(4)]]])
>>> t.cells_containing(Integer(4))
[(0, 0, 0),
 (1, 2, 0),
 (1, 1, 1),
```
charge()
Return the charge of the reading word of self.
See charge() for more information.

EXAMPLES:

```
sage: TableauTuple([[4,5],[1,2,4],[2,4,4],[4],[1,3,4],[3,4]]).charge()
4
```

cocharge()
Return the cocharge of the reading word of self.
See cocharge() for more information.

EXAMPLES:

```
sage: TableauTuple([[4,5],[1,2,4],[2,4,4],[4],[1,3,4],[3,4]]).cocharge()
4
```

column_stabilizer()
Return the PermutationGroup corresponding to self. That is, return subgroup of the symmetric group of degree size() which is the column stabilizer of self.

EXAMPLES:

```
sage: # needs sage.groups
t = TableauTuple([[1,2,3],[4,5],[6,7],[8],[9]])
sage: cs = t.column_stabilizer()
sage: cs.order()
8
```

```sage: PermutationGroupElement(((1,3,2),(4,5))) in cs
False
sage: PermutationGroupElement(((1,4))) in cs
True
```
>>> from sage.all import *
>>> # needs sage.groups
>>> t = TableauTuple([[Integer(1), Integer(2), Integer(3)], [Integer(4), Integer(5)]], [[Integer(6), Integer(7)]], [[Integer(8), Integer(9)]])
>>> cs = t.column_stabilizer()
>>> cs.order()
8
>>> PermutationGroupElement(((Integer(1), Integer(3), Integer(2)), (Integer(4), Integer(5)))) in cs
False
>>> PermutationGroupElement(((Integer(1), Integer(4))))) in cs
True

components()

Return a list of the components of tableau tuple self.

The components are the individual Tableau which are contained in the tuple self.

For compatibility with TableauTuples of level() 1, components() should be used to iterate over
the components of TableauTuples.

EXAMPLES:

```python
sage: for t in TableauTuple([[[1,2,3],[4,5]]]).components(): t.pp()
  1 2 3
  4 5
sage: for t in TableauTuple([[[1,2,3],[4,5]], [[6,7],[8,9]]]).components():
  t.pp()
  1 2 3
  4 5
  6 7
  8 9
```

conjugate()

Return the conjugate of the tableau tuple self.

The conjugate tableau tuple $T'$ is the TableauTuple obtained from $T$ by reversing the order of the components and conjugating each component - that is, swapping the rows and columns of the all of Tableau in $T$ (see sage.combinat.tableau.Tableau.conjugate()).

EXAMPLES:

```python
sage: TableauTuple([[[1,2],[3,4]], [[5,6,7],[8]], [[9,10],[11],[12]]]).
  conjugate()
  ([[9, 11, 12], [10]], [[5, 8], [6, 7]], [[1, 3], [2, 4]])
```
content \( (k, \text{multicharge}) \)

Return the content \( k \) in \( \text{self} \).

The content of \( k \) in a standard tableau. That is, if \( k \) appears in row \( r \) and column \( c \) of the tableau, then we return \( c - r + a_k \), where the multicharge is \((a_1, a_2, \ldots, a_l)\) and \( l \) is the level of the tableau.

The multicharge determines the dominant weight

\[
\Lambda = \sum_{i=1}^{l} \Lambda a_i
\]

of the affine special linear group. In the combinatorics, the multicharge simply offsets the contents in each component so that the cell \((k, r, c)\) has content \( a_k + c - r \).

INPUT:

- \( k \) – an integer in \( \{1, 2, \ldots, n\} \)
- \( \text{multicharge} \) – a sequence of integers of length \( l \)

Here \( l \) is the \text{level()} \) and \( n \) is the \text{size()} \) of \( \text{self} \).

EXAMPLES:

```python
sage: StandardTableauTuple([[5]], [[1,2],[3,4]]).content(3,[0,0])
-1
sage: StandardTableauTuple([[5]], [[1,2],[3,4]]).content(3,[0,1])
0
sage: StandardTableauTuple([[5]], [[1,2],[3,4]]).content(3,[0,2])
1
sage: StandardTableauTuple([[5]], [[1,2],[3,4]]).content(6,[0,2])
Traceback (most recent call last):
... 
ValueError: 6 must be contained in the tableaux
```

entries()

Return a sorted list of all entries of \( \text{self} \), in the order obtained by reading across the rows.
EXAMPLES:

```python
sage: TableauTuple([[1,2],[3,4]], [[5,6,7],[8]], [[9,10],[11],[12]]).entries()
[1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12]
sage: TableauTuple([[1,2],[3,4]], [[9,10],[11],[12]], [[5,6,7],[8]]).entries()
[1, 2, 3, 4, 9, 10, 11, 12, 5, 6, 7, 8]
```

```python
def entry(l, r, c)
    return the entry of the cell (l, r, c) in self.
    A cell is a tuple (l, r, c) of coordinates, where l is the component index, r is the row index, and c is the column index.
    EXAMPLES:
    sage: t = TableauTuple([[1,2],[3,4]], [[5,6,7],[8]], [[9,10],[11],[12]])
    sage: t.entry(1, 0, 0)
    5
    sage: t.entry(1, 1, 1)
    Traceback (most recent call last):
    ... IndexError: tuple index out of range
```

```python
>>> from sage.all import *

>>> TableauTuple([[Integer(1),Integer(2)], [Integer(3),Integer(4)]],
               [[Integer(5),Integer(6),Integer(7)], [Integer(8)]],
               [[Integer(9),Integer(10)], [Integer(11)], [Integer(12)]]).entries()
[1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12]
```

```python
>>> TableauTuple([[Integer(1),Integer(2)], [Integer(3),Integer(4)]],
               [[Integer(9),Integer(10)], [Integer(11)], [Integer(12)]],[[Integer(5),
               Integer(6),Integer(7)], [Integer(8)]]).entries()
[1, 2, 3, 4, 9, 10, 11, 12, 5, 6, 7, 8]
```

```python
>>> from sage.all import *

>>> TableauTuple([[Integer(1),Integer(2)], [Integer(3),Integer(4)]],
               [[Integer(5),Integer(6),Integer(7)], [Integer(8)]],
               [[Integer(9),Integer(10)], [Integer(11)], [Integer(12)]]).entries()
[1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 5, 6, 7, 8]
```

```python
>>> from sage.all import *

>>> TableauTuple([[Integer(1),Integer(2)], [Integer(3),Integer(4)]],
               [[Integer(5),Integer(6),Integer(7)], [Integer(8)]],
               [[Integer(9),Integer(10)], [Integer(11)], [Integer(12)]]).entries()
[1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 5, 6, 7, 8]
```

```python
first_column_descent()
    return the first cell of self is not column standard.
    Cells are ordered left to right along the rows and then top to bottom. That is, return the cell (k, r, c) with (k, r, c) minimal such that the entry in position (k, r, c) is bigger than the entry in position (k, r, c + 1). If there is no such cell then None is returned - in this case the tableau is column strict.
    OUTPUT:
    The cell corresponding to the first column descent or None if the tableau is column strict.
    EXAMPLES:
```
**first_row_descent()**

Return the first cell of self that is not row standard.

Cells are ordered left to right along the rows and then top to bottom. That is, the cell minimal \((k, r, c)\) such that the entry in position \((k, r, c)\) is bigger than the entry in position \((k, r, c + 1)\). If there is no such cell then None is returned - in this case the tableau is row strict.

**OUTPUT:**

The cell corresponding to the first row descent or None if the tableau is row strict.

**EXAMPLES:**

```
sage: TableauTuple([[5,6,7],[1,2]], [[1,3,2],[4]]).first_row_descent() (1, 0, 1)
sage: TableauTuple([[1,2,3],[4]], [[6,7,8],[1,2,3]], [[1,11]]).first_row_descent() is None True
```

**is_column_strict()**

Return True if the tableau self is column strict and False otherwise.

A tableau tuple is column strict if the entries in each column of each component are in increasing order, when read from top to bottom.

**EXAMPLES:**

```
sage: TableauTuple([[5,7],[8]], [[1,3], [2,4]], [[6]]).is_column_strict() True
sage: TableauTuple([[1,2], [2,4]], [[4,5,6],[7,8]]).is_column_strict() True
sage: TableauTuple([[1],[2,3],[2,4]]).is_column_strict() False
```

(continues on next page)

```python
sage: TableauTuple([[1,],[2,],[4,5]]).is_column_strict()
True
sage: TableauTuple([[1,2],[6,7],[4,8],[6,9],[1]]).is_column_strict()
True

>>> from sage.all import *
>>> TableauTuple([[Integer(5),Integer(7)],[Integer(8)],[Integer(1),Integer(3), [Integer(2), Integer(4), [Integer(6)]].is_column_strict()
True
>>> TableauTuple([[Integer(1), Integer(2)], [Integer(2), Integer(4)]],
[Integer(4),Integer(5),Integer(6),[Integer(7),Integer(8)]].is_column_strict()
True
>>> TableauTuple([[Integer(1)], [Integer(2), Integer(3)], [Integer(2),
Integer(4)]].is_column_strict()
False
>>> TableauTuple([[Integer(1)], [Integer(2), Integer(2), [Integer(4),Integer(5)].is_column_strict()
True
>>> TableauTuple([[Integer(1), Integer(2)], [Integer(6),Integer(7)],
[Integer(4),Integer(8), [Integer(6), Integer(9)],[1]].is_column_strict()
True
```

`is_row_strict()`

Return `True` if the tableau `self` is row strict and `False` otherwise. A tableau tuple is *row strict* if the entries in each row of each component are in increasing order, when read from left to right.

EXAMPLES:

```python
sage: TableauTuple([[5,7],[8],[1,3],[2,4],[6]]).is_row_strict()
True
sage: TableauTuple([[1,2],[2,4],[4,5,6],[7,8]]).is_row_strict()
True
sage: TableauTuple([[1],[2,3],[2,4]]).is_row_strict()
True
sage: TableauTuple([[1],[2],[4,5]]).is_row_strict()
False
sage: TableauTuple([[1,2],[6,7],[4,8],[6,9],[1]]).is_row_strict()
True
```

```python
>>> from sage.all import *
>>> TableauTuple([[Integer(5),Integer(7)],[Integer(8)],[Integer(1),Integer(3), [Integer(2), Integer(4), [Integer(6)]].is_row_strict()
True
>>> TableauTuple([[Integer(1), Integer(2)], [Integer(2), Integer(4)]],
[Integer(4),Integer(5),Integer(6),[Integer(7),Integer(8)]].is_row_strict()
True
>>> TableauTuple([[Integer(1)], [Integer(2), Integer(3)], [Integer(2),
Integer(4)]].is_row_strict()
True
>>> TableauTuple([[Integer(1)], [Integer(2), Integer(2), [Integer(4),Integer(5)].is_row_strict()
False
```

(continues on next page)
is_standard()  

Return True if the tableau self is a standard tableau and False otherwise.

A tableau tuple is standard if it is row standard, column standard and the entries in the tableaux are 1, 2, ..., n, where n is the size() of the underlying partition tuple of self.

EXAMPLES:

sage: TableauTuple([[[5,7],[8]],[[1, 3],[2, 4]],[[6]]]).is_standard()  
True  

sage: TableauTuple([[[1, 2],[2, 4]],[[4,5,6],[7,8]]]).is_standard()  
False  

sage: TableauTuple([[[1]],[[2, 3],[2, 4]]]).is_standard()  
False  

sage: TableauTuple([[[1],[2, 2],[4,5]]]).is_row_strict()  
False  

sage: TableauTuple([[[Integer(5),Integer(7)],[Integer(8)],[[Integer(4),Integer(8)],[[Integer(6), Integer(9)]]],[]]).is_standard()  
False  

>>> from sage.all import *  

>>> TableauTuple([[[Integer(5),Integer(8)],[[Integer(6), Integer(9)]]],[]]).is_standard()  
False  

level()  

Return the level of the tableau self.

This is just the number of components in the tableau tuple self.

EXAMPLES:

sage: TableauTuple([[[7,8,9]],[[1,2,3],[4,5]],[[6]]]).level()  
3  

>>> from sage.all import *  

>>> TableauTuple([[[Integer(7),Integer(8),Integer(9)],[[Integer(6), Integer(9)]]],[[Integer(1),  
Integer(2),Integer(3)],[Integer(4),Integer(5)],[Integer(6)]]]).level()  
3  

PP()  

Pretty printing for the tableau tuple self.
EXAMPLES:

```python
sage: TableauTuple([ [[1,2,3],[4,5]], [[1,2,3],[4,5]] ]).pp()
   1 2 3 1 2 3
   4 5 4 5
sage: TableauTuple([ [[1,2],[3],[4]],[],[[6,7,8],[10,11],[12],[13]] ]).pp()
   1 2 - 6 7 8
   3 10 11
   4 12
   13
sage: t = TableauTuple([ [[1,2,3],[4,5],[6],[9]], [[1,2,3],[4,5,8]], [[11,12,13],[14]] ])
```

```python
sage: t.pp()
   1 2 3 1 2 3 11 12 13
   4 5 4 5 8 14
   6
   9
```

```python
sage: TableauTuples.options(convention="french")
```

```python
sage: t.pp()
   9
   6
   4 5 4 5 8 14
   1 2 3 1 2 3 11 12 13
```

```python
sage: TableauTuples.options._reset()
```

```python
>>> from sage.all import *
>>> TableauTuple([ [Integer(1),Integer(2),Integer(3)], [Integer(4),
    Integer(5)], [Integer(1),Integer(2),Integer(3)],[Integer(4),Integer(5)]...]).pp()
   1 2 3 1 2 3
   4 5 4 5
```

```python
>>> TableauTuple([ [Integer(1),Integer(2)], [Integer(3)], [Integer(4)],[],
    [Integer(5),Integer(7),Integer(8)],[Integer(10),Integer(11)],[Integer(12)],
    [Integer(13)]]).pp()
   1 2 - 6 7 8
   3 10 11
   4 12
   13
```

```python
>>> t = TableauTuple([ [[Integer(1),Integer(2),Integer(3)], [Integer(4),
    Integer(5)], [Integer(6)],[Integer(9)],[Integer(11),Integer(12),Integer(13)],[Integer(14)] ])
```

```python
>>> t.pp()
   1 2 3 1 2 3 11 12 13
   4 5 4 5 8 14
   6
   9
```

```python
>>> TableauTuples.options(convention="french")
```

```python
>>> t.pp()
   9
   6
   4 5 4 5 8 14
   1 2 3 1 2 3 11 12 13
```

```python
>>> TableauTuples.options._reset()
```

reduced_column_word()  
Return the lexicographically minimal reduced expression for the permutation that maps the initial_column_tableau() to self.
This reduced expression is a minimal length coset representative for the corresponding Young subgroup. In one line notation, the permutation is obtained by concatenating the rows of the tableau from top to bottom in each component, and then left to right along the components.

**EXAMPLES:**

```python
sage: StandardTableauTuple([[[7,9],[8]], [[1,4,6],[2,5],[3]]]).reduced_column_word()
[]
sage: StandardTableauTuple([[[7,9],[8]], [[1,3,6],[2,5],[4]]]).reduced_column_word()
[3]
sage: StandardTableauTuple([[[6,9],[8]], [[1,3,7],[2,5],[4]]]).reduced_column_word()
[3, 6]
sage: StandardTableauTuple([[[6,8],[9]], [[1,3,7],[2,5],[4]]]).reduced_column_word()
[3, 6, 8]
sage: StandardTableauTuple([[[5,8],[9]], [[1,3,7],[2,6],[4]]]).reduced_column_word()
[3, 6, 5, 8]
```

```python
>>> from sage.all import *

>>> StandardTableauTuple([[[Integer(7),Integer(9)], [Integer(8)]], [[Integer(1), Integer(4), Integer(6)], [Integer(2), Integer(5), [Integer(3)]]]]).reduced_column_word()
[]

>>> StandardTableauTuple([[[Integer(7),Integer(9)], [Integer(8)]], [[Integer(1), Integer(3), Integer(6)], [Integer(2), Integer(5), [Integer(4)]]]]).reduced_column_word()
[3]

>>> StandardTableauTuple([[[Integer(6),Integer(9)], [Integer(8)]], [[Integer(1), Integer(3), Integer(7)], [Integer(2), Integer(5), [Integer(4)]]]]).reduced_column_word()
[3, 6]

>>> StandardTableauTuple([[[Integer(6),Integer(8)], [Integer(9)]], [[Integer(1), Integer(3), Integer(7)], [Integer(2), Integer(6), [Integer(4)]]]]).reduced_column_word()
[3, 6, 8]

>>> StandardTableauTuple([[[Integer(5),Integer(8)], [Integer(9)]], [[Integer(1), Integer(3), Integer(7)], [Integer(2), Integer(6), [Integer(4)]]]]).reduced_column_word()
[3, 6, 5, 8]
```

**reduced_row_word()**

Return the lexicographically minimal reduced expression for the permutation that maps the `initial_tableau()` to `self`.

This reduced expression is a minimal length coset representative for the corresponding Young subgroup. In one line notation, the permutation is obtained by concatenating the rows of the tableau from top to bottom in each component, and then left to right along the components.

**EXAMPLES:**

```python
sage: StandardTableauTuple([[[1,2],[3]], [[4,5,6],[7,8],[9]]]).reduced_row_word()
[]
sage: StandardTableauTuple([[[1,2],[3]], [[4,5,6],[7,9],[8]]]).reduced_row_word()
(continues on next page)```
residue \( (k, e, \text{multicharge}) \)

Return the residue of the integer \( k \) in the tableau \( \text{self} \).

The residue of \( k \) is \( c - r + a_k \) in \( \mathbb{Z}/e\mathbb{Z} \), where \( k \) appears in row \( r \) and column \( c \) of the tableau and the multicharge is \( (a_1, a_2, \ldots, a_l) \).

The multicharge determines the dominant weight

\[
\sum_{i=1}^{l} \Lambda_{a_i}
\]

for the affine special linear group. In the combinatorics, it simply offsets the contents in each component so that the cell \((k, 0, 0)\) has content \( a_k \).

**INPUT:**

- \( k \) – an integer in \( \{1, 2, \ldots, n\} \)
• $e$ – an integer in $\{0, 2, 3, 4, 5, \ldots\}$
• multicharge – a list of integers of length $l$

Here $l$ is the level() and $n$ is the size() of self.

**OUTPUT:**

The residue of $k$ in a standard tableau. That is,

**EXAMPLES:**

```python
sage: StandardTableauTuple([[5]], [[1, 2], [3, 4]]).residue(1, 3, [0, 0])
0
sage: StandardTableauTuple([[5]], [[1, 2], [3, 4]]).residue(1, 3, [0, 1])
1
sage: StandardTableauTuple([[5]], [[1, 2], [3, 4]]).residue(1, 3, [0, 2])
2
sage: StandardTableauTuple([[5]], [[1, 2], [3, 4]]).residue(6, 3, [0, 2])
Traceback (most recent call last):
... ValueError: 6 must be contained in the tableaux
```

```python
>>> from sage.all import *

>>> StandardTableauTuple([[Integer(5)]], [[Integer(1), Integer(2)], [Integer(3), Integer(4)]]).residue(Integer(1), Integer(3), [Integer(0), Integer(0)])
0
>>> StandardTableauTuple([[Integer(5)]], [[Integer(1), Integer(2)], [Integer(3), Integer(4)]]).residue(Integer(1), Integer(3), [Integer(0), Integer(1)])
1
>>> StandardTableauTuple([[Integer(5)]], [[Integer(1), Integer(2)], [Integer(3), Integer(4)]]).residue(Integer(1), Integer(3), [Integer(0), Integer(2)])
2
>>> StandardTableauTuple([[Integer(5)]], [[Integer(1), Integer(2)], [Integer(3), Integer(4)]]).residue(Integer(6), Integer(3), [Integer(0), Integer(2)])
Traceback (most recent call last):
... ValueError: 6 must be contained in the tableaux
```

**restrict ($m=\text{None}$)**

Return the restriction of the standard tableau self to $m$.

The restriction is the subtableau of self whose entries are less than or equal to $m$.

By default, $m$ is one less than the current size.

**EXAMPLES:**

```python
sage: TableauTuple([[5]], [[1, 2], [3, 4]]).restrict()([], [[1, 2], [3, 4]])
sage: TableauTuple([[5]], [[1, 2], [3, 4]]).restrict(6)([[5]], [[1, 2], [3, 4]])
sage: TableauTuple([[5]], [[1, 2], [3, 4]]).restrict(5)([[5]], [[1, 2], [3, 4]])
sage: TableauTuple([[5]], [[1, 2], [3, 4]]).restrict(4)([[1, 2], [3, 4]])
sage: TableauTuple([[5]], [[1, 2], [3, 4]]).restrict(3)([[1, 2], [3]])
sage: TableauTuple([[5]], [[1, 2], [3, 4]]).restrict(2)([[1, 2]])
```

(continues on next page)
Combinatorics, Release 10.4

(continued from previous page)

```python
sage: TableauTuple([[[5]], [[1,2],[3,4]]]).restrict(1)
([], [[1]])
sage: TableauTuple([[[5]], [[1,2],[3,4]]]).restrict(0)
([], [])
```

```python
>>> from sage.all import *
```

```python
>>> TableauTuple([[[Integer(5)],[Integer(1),Integer(2)],[Integer(3),
                                       Integer(4)]]]).restrict()  
([], [[1, 2], [3, 4]])
>>> TableauTuple([[[Integer(5)],[Integer(1),Integer(2)],[Integer(3),
                                       Integer(4)]]]).restrict(Integer(6))  
([[[5]], [[1, 2], [3, 4]]])
>>> TableauTuple([[[Integer(5)],[Integer(1),Integer(2)],[Integer(3),
                                       Integer(4)]]]).restrict(Integer(5))  
([[[5]], [[1, 2], [3, 4]]])
>>> TableauTuple([[[Integer(5)],[Integer(1),Integer(2)],[Integer(3),
                                       Integer(4)]]]).restrict(Integer(4))  
([[[5]], [[1, 2], [3, 4]]])
>>> TableauTuple([[[Integer(5)],[Integer(1),Integer(2)],[Integer(3),
                                       Integer(4)]]]).restrict(Integer(3))  
([[[5]], [[1, 2], [3, 4]]])
>>> TableauTuple([[[Integer(5)],[Integer(1),Integer(2)],[Integer(3),
                                       Integer(4)]]]).restrict(Integer(2))  
([[[5]], [[1, 2]]])
>>> TableauTuple([[[Integer(5)],[Integer(1),Integer(2)],[Integer(3),
                                       Integer(4)]]]).restrict(Integer(1))  
([[[5]], [[1]]])
>>> TableauTuple([[[Integer(5)],[Integer(1),Integer(2)],[Integer(3),
                                       Integer(4)]]]).restrict(Integer(0))  
([[], []])
```

Where possible the restricted tableau belongs to the same category as the original tableaux:

```python
sage: TableauTuple([[[5]], [[1,2],[3,4]]]).restrict(3).category()  
Category of elements of Tableau tuples
sage: TableauTuple([[[5]], [[1,2],[3,4]]]).restrict(3).category()  
Category of elements of Tableau tuples
sage: TableauTuples(level=Integer(2))([[[5]], [[1,2],[3,4]]]).restrict(3).category()  
Category of elements of Tableau tuples of level 2
```
shape() 

Return the PartitionTuple which is the shape of the tableau tuple self.

EXAMPLES:

```sage
TableauTuple([[7, 8, 9]], [[1, 2, 3], [4, 5], [6]]).shape()
```

```sage
[(3), [], [3, 2, 1]]
```

size() 

Return the size of the tableau tuple self.

This is just the number of boxes, or the size, of the underlying PartitionTuple.

EXAMPLES:

```sage
TableauTuple([[7, 8, 9]], [[1, 2, 3], [4, 5], [6]]).size()
```

```sage
9
```

symmetric_group_action_on_entries(w) 

Return the action of a permutation w on self.
Consider a standard tableau tuple \( T = (t^{(1)}, t^{(2)}, \ldots, t^{(l)}) \) of size \( n \), then the action of \( w \in S_n \) is defined by permuting the entries of \( T \) (recall they are 1, 2, \ldots, \( n \)). In particular, suppose the entry at cell \((k, i, j)\) is \( a \), then the entry becomes \( w(a) \). In general, the resulting tableau tuple \( wT \) may not be standard.

**INPUT:**

- \( w \) – a permutation

**EXAMPLES:**

```sage
sage: TableauTuple([[1,2],[4]],[[3,5]]).symmetric_group_action_on_entries(Permutation(((4,5))))
([[1, 2], [5]], [[3, 4]])
sage: TableauTuple([[1,2],[4]],[[3,5]]).symmetric_group_action_on_entries(Permutation(((1,2))))
([[2, 1], [4]], [[3, 5]])
```

**to_list()**

Return the list representation of the tableaux tuple \( self \).

**EXAMPLES:**

```sage
sage: TableauTuple([[[1,2,3],[4,5]], [[6,7],[8,9]]]).to_list()
[[[1, 2, 3], [4, 5]], [[6, 7], [8, 9]]]
```

**to_permutation()**

Return a permutation with the entries in the tableau tuple \( self \).

The permutation is obtained from \( self \) by reading the entries of the tableau tuple in order from left to right along the rows, and then top to bottom, in each component and then left to right along the components.

**EXAMPLES:**

```sage
sage: TableauTuple([[1,2],[3,4]],[[5,6,7],[8],[9,10],[11],[12]]).to_permutation()
[12, 11, 9, 10, 8, 5, 6, 7, 3, 4, 1, 2]
```

---

5.1. Comprehensive Module List

Combinatorics, Release 10.4
to_word()

Return a word obtained from a row reading of the tableau tuple self.

EXAMPLES:

```python
sage: TableauTuple([[1,2],[3,4]], [[5,6,7],[8]], [[9,10],[11],[12]]).to_word_by_row()
word: 12,11,9,10,8,5,6,7,3,4,1,2
```

```python
>>> from sage.all import *

>>> TableauTuple([[Integer(1),Integer(2)], [Integer(3),Integer(4)]],
               [[Integer(5),Integer(6),Integer(7)], [Integer(8)]],
               [[Integer(9),Integer(10)],
               [Integer(11)],[Integer(12)])].to_word_by_row()
word: 12,11,9,10,8,5,6,7,3,4,1,2
```

to_word_by_column()

Return the word obtained from a column reading of the tableau tuple self.

EXAMPLES:

```python
sage: TableauTuple([[1,2],[3,4]], [[5,6,7],[8]], [[9,10],[11],[12]]).to_word_by_column()
word: 12,11,9,10,8,5,6,7,3,1,4,2
```

```python
>>> from sage.all import *

>>> TableauTuple([[Integer(1),Integer(2)], [Integer(3),Integer(4)]],
               [[Integer(5),Integer(6),Integer(7)], [Integer(8)]],
               [[Integer(9),Integer(10)],
               [Integer(11)],[Integer(12)])].to_word_by_column()
word: 12,11,9,10,8,5,6,7,3,1,4,2
```

to_word_by_row()

Return a word obtained from a row reading of the tableau tuple self.

EXAMPLES:

```python
sage: TableauTuple([[1,2],[3,4]], [[5,6,7],[8]], [[9,10],[11],[12]]).to_word_by_row()
word: 12,11,9,10,8,5,6,7,3,4,1,2
```

```python
>>> from sage.all import *

>>> TableauTuple([[Integer(1),Integer(2)], [Integer(3),Integer(4)]],
               [[Integer(5),Integer(6),Integer(7)], [Integer(8)]],
               [[Integer(9),Integer(10)],
               [Integer(11)],[Integer(12)])].to_word_by_row()
word: 12,11,9,10,8,5,6,7,3,4,1,2
```

up\(^{(n=\text{None})}\)

An iterator for all the TableauTuple that can be obtained from self by adding a cell with the label \(n\). If \(n\) is not specified then a cell with label \(n\) will be added to the tableau tuple, where \(n-1\) is the size of the tableau tuple before any cells are added.

EXAMPLES:

```python
sage: list(TableauTuple([[1,2],[3]]).up())
[([[1, 2, 4]], [[3]]),
 (([[1, 2], [4]], [[3]]),
 (([[1, 2]], [[3, 4]]),
 (([[1, 2]], [[3], [4]]))]
```
```python
>>> from sage.all import *
>>> list(TableauTuple([[Integer(1),Integer(2)]],[[Integer(3)]]).up())

([[1, 2, 4]], [[3]]),
([[1, 2], [4]], [[3]]),
([[1, 2]], [[3, 4]]),
([[1, 2]], [[3], [4]])
```

class sage.combinat.tableau_tuple.TableauTuples

Bases: UniqueRepresentation, Parent

A factory class for the various classes of tableau tuples.

INPUT:

There are three optional arguments:

- **shape** – determines a PartitionTuple which gives the shape of the TableauTuples
- **level** – the level of the tableau tuples (positive integer)
- **size** – the size of the tableau tuples (non-negative integer)

It is not necessary to use the keywords. If they are not specified then the first integer argument specifies the level and the second the size of the tableaux.

OUTPUT:

- The corresponding class of tableau tuples.

The entries of a tableau can be any sage object. Because of this, no enumeration of the set of TableauTuples is possible.

EXAMPLES:

```python
sage: T3 = TableauTuples(3); T3
Tableau tuples of level 3
sage: [['a', 'b']] in TableauTuples()
True
sage: [['a', 'b']] in TableauTuples(level=3)
False
sage: t = TableauTuples(level=3)([[],[[1,1,1]],[]]); t
([[], [[1, 1, 1]], []])
sage: t in T3
True
sage: t in TableauTuples()
True
sage: t in TableauTuples(size=3)
True
sage: t in TableauTuples(size=4)
False
sage: t in StandardTableauTuples()
False
sage: t.parent()
Tableau tuples of level 3
sage: t.category()
Category of elements of Tableau tuples of level 3
```

```python
>>> from sage.all import *
>>> T3 = TableauTuples(Integer(3)); T3
Tableau tuples of level 3
```

(continues on next page)
Combinatorics, Release 10.4

(continued from previous page)

```python
>>> [['a', 'b']] in TableauTuples()
True
>>> [['a', 'b']] in TableauTuples(level=Integer(3))
False
>>> t = TableauTuples(level=Integer(3))([[], [[Integer(1), Integer(1), Integer(1)]]],
   \texttt{t}([[1, 1, 1]], [], []))
>>> t in T3
True
>>> t in TableauTuples()
True
>>> t in TableauTuples(size=Integer(3))
True
>>> t in TableauTuples(size=Integer(4))
False
>>> t in StandardTableauTuples()
False
>>> t.parent()
Tableau tuples of level 3
>>> t.category()
Category of elements of Tableau tuples of level 3
```

See also:

- `Tableau`
- `StandardTableau`
- `StandardTableauTuples`

**Element**

alias of `TableauTuple`

**level()**

Return the level of a tableau tuple in self, or `None` if different tableau tuples in self can have different sizes. The level of a tableau tuple is just the level of the underlying `PartitionTuple`.

Examples:

```python
sage: TableauTuples().level() is None
True
sage: TableauTuples(7).level()
7
```

```python
>>> from sage.all import *
>>> TableauTuples().level() is None
True
>>> TableauTuples(Integer(7)).level()
7
```

**level_one_parent_class**

alias of `Tableaux_all`

**list()**

If the set of tableau tuples `self` is finite then this function returns the list of these tableau tuples. If the class is infinite an error is returned.
EXAMPLES:

```
sage: StandardTableauTuples([[2,1],[2]]).list()
[([[[1, 2], [3]], [[4, 5]]],
  ([[1, 3], [2]], [[4, 5]]),
  ([[1, 2], [4]], [[3, 5]]),
  ([[1, 3], [4]], [[2, 5]]),
  ([[2, 3], [4]], [[1, 5]]),
  ([[1, 4], [2]], [[3, 5]]),
  ([[1, 4], [3]], [[2, 5]]),
  ([[2, 4], [3]], [[1, 5]]),
  ([[1, 2], [5]], [[3, 4]]),
  ([[1, 3], [5]], [[2, 4]]),
  ([[2, 3], [5]], [[1, 4]]),
  ([[1, 4], [5]], [[2, 3]]),
  ([[2, 4], [5]], [[1, 3]]),
  ([[3, 4], [5]], [[1, 2]]))
```

```
>>> from sage.all import *

```

```
>>> StandardTableauTuples([[Integer(2),Integer(1)],[Integer(2)]]).list()
[([[[1, 2], [3]], [[4, 5]]],
  ([[1, 3], [2]], [[4, 5]]),
  ([[1, 2], [4]], [[3, 5]]),
  ([[1, 3], [4]], [[2, 5]]),
  ([[2, 3], [4]], [[1, 5]]),
  ([[1, 4], [2]], [[3, 5]]),
  ([[1, 4], [3]], [[2, 5]]),
  ([[2, 4], [3]], [[1, 5]]),
  ([[1, 2], [5]], [[3, 4]]),
  ([[1, 3], [5]], [[2, 4]]),
  ([[2, 3], [5]], [[1, 4]]),
  ([[1, 4], [5]], [[2, 3]]),
  ([[2, 4], [5]], [[1, 3]]),
  ([[3, 4], [5]], [[1, 2]]))
```

options = Current options for Tableaux - ascii_art: repr - convention: English - display: list - latex: diagram

```
sage: TableauTuples(size=14).size()
14
```
```python
>>> from sage.all import *
>>> TableauTuples(size=Integer(14)).size()
14
```

class sage.combinat.tableau_tuple.TableauTuples_all

Bases: TableauTuples

The parent class of all TableauTuples, with arbitrary level and size.

an_element()

Return a particular element of the class.

EXAMPLES:

```python
sage: TableauTuples().an_element()
([[]], [[], []])
```

```python
>>> from sage.all import *
>>> TableauTuples().an_element()
([[]], [[], []])
```

class sage.combinat.tableau_tuple.TableauTuples_level(level)

Bases: TableauTuples

Class of all TableauTuples with a fixed level and arbitrary size.

an_element()

Return a particular element of the class.

EXAMPLES:

```python
sage: TableauTuples(3).an_element()
([], [], [])
sage: TableauTuples(5).an_element()
([], [], [], [], [])
sage: T = TableauTuples(0)
Traceback (most recent call last):
...
ValueError: the level must be a positive integer
```

```python
>>> from sage.all import *
>>> TableauTuples(Integer(3)).an_element()
([], [], [])
>>> TableauTuples(Integer(5)).an_element()
([], [], [], [], [])
>>> T = TableauTuples(Integer(0))
Traceback (most recent call last):
...
ValueError: the level must be a positive integer
```

class sage.combinat.tableau_tuple.TableauTuples_level_size(level, size)

Bases: TableauTuples

Class of all TableauTuples with a fixed level and a fixed size.

an_element()

Return a particular element of the class.

EXAMPLES:
Combinatorics, Release 10.4

class sage.combinat.tableau_tuple.TableauTuples_size(size)
    Bases: TableauTuples
    Class of all TableauTuples with arbitrary level and fixed size.
    an_element()
        Return a particular element of the class.
        EXAMPLES:

        sage: TableauTuples(size=3).an_element()
        ([], [[1, 2, 3]], [])
        sage: TableauTuples(size=0).an_element()
        ([], [], [])

        >>> from sage.all import *
        >>> TableauTuples(size=Integer(3)).an_element()
        ([], [[1, 2, 3]], [])
        >>> TableauTuples(size=Integer(0)).an_element()
        ([], [], [])

5.1.348 Generalized Tamari lattices

These lattices depend on three parameters $a$, $b$, and $m$, where $a$ and $b$ are positive integers and $m$ is a nonnegative integer. The elements are Dyck paths in the $(a \times b)$-rectangle. The order relation depends on $m$.

To use the provided functionality, you should import Generalized Tamari lattices by typing:

sage: from sage.combinat.tamari_lattices import GeneralizedTamariLattice

>>> from sage.all import *
>>> from sage.combinat.tamari_lattices import GeneralizedTamariLattice

Then,

sage: GeneralizedTamariLattice(3,2)
Finite lattice containing 2 elements
sage: GeneralizedTamariLattice(4,3)
Finite lattice containing 5 elements
The classical Tamari lattices are special cases of this construction and are also available directly using the catalogue of posets, as follows:

```
sage: posets.TamariLattice(3)
Finite lattice containing 5 elements
```

See also:

For more detailed information see `TamariLattice()`, `GeneralizedTamariLattice()`. 

```
sage.combinat.tamari_lattices.DexterSemilattice(n)
Return the \(n\)-th Dexter meet-semilattice.
```

**INPUT:**

- \(n\) – a nonnegative integer (the index)

**OUTPUT:**

a finite meet-semilattice

The elements of the semilattice are Dyck paths in the \((n + 1 \times n)\)-rectangle.

**EXAMPLES:**

```
sage: posets.DexterSemilattice(3)
Finite meet-semilattice containing 5 elements
```

```
sage: P = posets.DexterSemilattice(4); P
Finite meet-semilattice containing 14 elements
```

```
sage: len(P.maximal_chains())
15
```

```
sage: len(P.maximal_elements())
4
```

```
sage: P.chain_polynomial()
q^5 + 19*q^4 + 47*q^3 + 42*q^2 + 14*q + 1
```

```
sage: posets.DexterSemilattice(Integer(3))
```

```
Finite meet-semilattice containing 5 elements
```

```
sage: P = posets.DexterSemilattice(Integer(4)); P
Finite meet-semilattice containing 14 elements
```

```
>>> len(P.maximal_chains())
15
```

```
>>> len(P.maximal_elements())
4
```

```
>>> P.chain_polynomial()
q^5 + 19*q^4 + 47*q^3 + 42*q^2 + 14*q + 1
```
Combinatorics, Release 10.4

REFERENCES:

• [Cha18]

 sage.combinat.tamari_lattices.GeneralizedTamariLattice(a, b, m=1)

Return the \((a,b)\)-Tamari lattice of parameter \(m\).

INPUT:

• \(a\) and \(b\) – integers with \(a \geq b\)
• \(m\) – a nonnegative rational number such that \(a \geq bm\)

OUTPUT:

• a finite lattice (special case of the alt \(\nu\)-Tamari lattices in [CC2023])

The elements of the lattice are Dyck paths in the \((a \times b)\)-rectangle.

The parameter \(m\) (slope) is used only to define the covering relations. When the slope \(m\) is 0, two paths are comparable if and only if one is always above the other.

The usual Tamari lattice of index \(b\) is the special case \(a = b + 1\) and \(m = 1\).

Other special cases give the \(m\)-Tamari lattices studied in [BMFPR2011], or the rational Tamari lattices when \(a\) and \(b\) are coprime and \(m = a/b\) (see [PRV2017]).

EXAMPLES:

 sage: from sage.combinat.tamari_lattices import GeneralizedTamariLattice
 sage: GeneralizedTamariLattice(3,2)
 Finite lattice containing 2 elements
 sage: GeneralizedTamariLattice(4,3)
 Finite lattice containing 5 elements
 sage: GeneralizedTamariLattice(7,5,2)
 Traceback (most recent call last):
 ... ValueError: the condition a>=b*m does not hold
 sage: P = GeneralizedTamariLattice(5,3); P
 Finite lattice containing 7 elements
 sage: P = GeneralizedTamariLattice(5, 3, m=5/3); P
 Finite lattice containing 7 elements

>>> from sage.all import *
>>> from sage.combinat.tamari_lattices import GeneralizedTamariLattice
>>> GeneralizedTamariLattice(Integer(3),Integer(2))
Finite lattice containing 2 elements
>>> GeneralizedTamariLattice(Integer(4),Integer(3))
Finite lattice containing 5 elements
>>> GeneralizedTamariLattice(Integer(7),Integer(5),Integer(2))
Traceback (most recent call last):
... ValueError: the condition a>=b*m does not hold
>>> P = GeneralizedTamariLattice(Integer(5),Integer(3)); P
Finite lattice containing 7 elements
>>> P = GeneralizedTamariLattice(Integer(5), Integer(3), m=Integer(5)/Integer(3));
 → P
Finite lattice containing 7 elements

REFERENCES:

• [BMFPR2011]
sage.combinat.tamari_lattices.TamariLattice \( (n, m=1) \)

Return the \( n \)-th Tamari lattice.

Using the slope parameter \( m \), one can also get the \( m \)-Tamari lattices.

**INPUT:**
- \( n \) – a nonnegative integer (the index)
- \( m \) – an optional nonnegative integer (the slope, default to 1)

**OUTPUT:**
- a finite lattice

In the usual case, the elements of the lattice are **Dyck paths** in the \((n + 1 \times n)\)-rectangle. For a general slope \( m \), the elements are Dyck paths in the \((mn + 1 \times n)\)-rectangle.

See **Tamari lattice** for mathematical background.

**EXAMPLES:**

```
sage: posets.TamariLattice(3)
Finite lattice containing 5 elements
sage: posets.TamariLattice(3, 2)
Finite lattice containing 12 elements
```

```python
>>> from sage.all import *
>>> posets.TamariLattice(Integer(3))
Finite lattice containing 5 elements
>>> posets.TamariLattice(Integer(3), Integer(2))
Finite lattice containing 12 elements
```

**REFERENCES:**
- [BMFPR2011]

sage.combinat.tamari_lattices.paths_in_triangle \((i, j, a, b)\)

Return all Dyck paths from \((0, 0)\) to \((i, j)\) in the \((a \times b)\)-rectangle.

This means that at each step of the path, one has \( ay \geq bx \).

A path is represented by a sequence of 0 and 1, where 0 is an horizontal step \((1, 0)\) and 1 is a vertical step \((0, 1)\).

**INPUT:**
- \( a \) and \( b \) – integers with \( a \geq b \)
- \( i \) and \( j \) – nonnegative integers with \( 1 \geq \frac{j}{b} \geq \frac{i}{a} \geq 0 \)

**OUTPUT:**
- a list of paths

**EXAMPLES:**
sage: from sage.combinat.tamari_lattices import paths_in_triangle
sage: paths_in_triangle(2,2,2)
[(1, 0, 1, 0), (1, 1, 0, 0)]
sage: paths_in_triangle(2,3,4)
[(1, 0, 1, 0, 1), (1, 1, 0, 0, 1), (1, 0, 1, 1, 0),
(1, 1, 0, 1, 0), (1, 1, 1, 0, 0)]
sage: paths_in_triangle(2,1,4,4)
Traceback (most recent call last):
...
ValueError: the endpoint is not valid
sage: paths_in_triangle(3,2,5,3)
[(1, 0, 1, 0, 0), (1, 1, 0, 0, 0)]

sage.combinat.tamari_lattices.swap(p, i, m=1)
Perform a covering move in the \((a, b)\)-Tamari lattice of slope parameter \(m\).
The letter at position \(i\) in \(p\) must be a 0, followed by at least one 1.

**INPUT:**

- \(p\) – a Dyck path in the \((a \times b)\)-rectangle
- \(i\) – an integer between 0 and \(a + b - 1\)

**OUTPUT:**

- a Dyck path in the \((a \times b)\)-rectangle

**EXAMPLES:**

sage: from sage.combinat.tamari_lattices import swap
sage: swap((1,0,1,0,0),1)
(1, 1, 0, 0, 0)
sage: swap((1,0,1,0,0,1),1)
(1, 1, 0, 0, 0)
sage: swap((1,0,1,0,0,0,0,0,0),3)
(1, 1, 0, 0, 0, 0, 0)

(continues on next page)
sage.combinat.tamari_lattices.swap_dexter(p, i)

Perform covering moves in the \((a, b)\)-Dexter posets.

The letter at position \(i\) in \(p\) must be a 0, followed by at least one 1.

**INPUT:**

- \(p\) – a Dyck path in the \((a \times b)\)-rectangle
- \(i\) – an integer between 0 and \(a + b - 1\)

**OUTPUT:**

- a list of Dyck paths in the \((a \times b)\)-rectangle

**EXAMPLES:**

```python
sage: from sage.combinat.tamari_lattices import swap_dexter
sage: swap_dexter((1,0,1,0,0),1)
[(1, 1, 0, 0, 0)]
```

5.1.349 Tiling Solver

Tiling a \(n\)-dimensional polyomino with \(n\)-dimensional polyominoes.

This module defines two classes:

- `sage.combinat.tiling.Polymino` class, to represent polyominoes in arbitrary dimension. The goal of this class is to return all the rotated, reflected and/or translated copies of a polyomino that are contained in a certain box.

- `sage.combinat.tiling.TilingSolver` class, to solve the problem of tiling a \(n\)-dimensional polyomino with a set of \(n\)-dimensional polyominoes. One can specify if rotations and reflections are allowed or not and if
Combinatorics, Release 10.4

This class can be reused or not. This class convert the tiling data into rows of a matrix that are passed to the DLX solver. It also allows to compute the number of solutions.

This uses dancing links code which is in Sage. Dancing links were originally introduced by Donald Knuth in 2000 [Knuth1]. Knuth used dancing links to solve tilings of a region by 2d pentaminoes. Here we extend the method to any dimension.

In particular, the `sage.games.quantumino` module is based on the Tiling Solver and allows to solve the 3d Quantumino puzzle.

AUTHOR:

- Sébastien Labbé, June 2011, initial version
- Sébastien Labbé, July 2015, count solutions up to rotations
- Sébastien Labbé, April 2017, tiling a polyomino, not only a rectangular box

EXAMPLES:

**2d Easy Example**

Here is a 2d example. Let us try to fill the $3 \times 2$ rectangle with a $1 \times 2$ rectangle and a $2 \times 2$ square. Obviously, there are two solutions:

```python
sage: from sage.combinat.tiling import TilingSolver, Polyomino
sage: p = Polyomino([(0,0), (0,1)])
sage: q = Polyomino([(0,0), (0,1), (1,0), (1,1)])
sage: T = TilingSolver([p,q], box=[3,2])
sage: it = T.solve()
sage: next(it)
[Polyomino: [(0, 0), (0, 1), (1, 0), (1, 1)], Color: gray, Polyomino: [(2, 0), (2, 1)], Color: gray]
sage: next(it)
[Polyomino: [(1, 0), (1, 1), (2, 0), (2, 1)], Color: gray, Polyomino: [(0, 0), (0, 1)], Color: gray]
sage: next(it)
Traceback (most recent call last):
  ... StopIteration
sage: T.number_of_solutions()
2
```

```python
>>> from sage.all import *
>>> from sage.combinat.tiling import TilingSolver, Polyomino
>>> p = Polyomino([(Integer(0),Integer(0)), (Integer(0),Integer(1))])
>>> q = Polyomino([(Integer(0),Integer(0)), (Integer(0),Integer(1)), (Integer(1),Integer(0)), (Integer(1),Integer(1))])
>>> T = TilingSolver([p,q], box=[Integer(3),Integer(2)])
>>> it = T.solve()
>>> next(it)
[Polyomino: [(0, 0), (0, 1), (1, 0), (1, 1)], Color: gray, Polyomino: [(2, 0), (2, 1)], Color: gray]
>>> next(it)
[Polyomino: [(1, 0), (1, 1), (2, 0), (2, 1)], Color: gray, Polyomino: [(0, 0), (0, 1)], Color: gray]
>>> next(it)
Traceback (most recent call last):
  ... StopIteration
(continues on next page)
```
Scott's pentamino problem

As mentioned in the introduction of [Knuth1], Scott's pentamino problem consists in tiling a chessboard leaving the center four squares vacant with the 12 distinct pentaminoes.

The 12 pentaminoes:

```python
sage: from sage.combinat.tiling import Polyomino
sage: I = Polyomino([(0,0),(1,0),(2,0),(3,0),(4,0)], color='brown')
sage: N = Polyomino([(1,0),(1,1),(1,2),(0,2),(0,3)], color='yellow')
sage: L = Polyomino([(0,0),(1,0),(0,1),(0,2),(0,3)], color='magenta')
sage: U = Polyomino([(0,0),(1,0),(0,1),(0,2),(1,2)], color='violet')
sage: X = Polyomino([(1,0),(0,1),(1,1),(1,2),(2,1)], color='pink')
sage: W = Polyomino([(2,0),(2,1),(1,1),(1,2),(0,2)], color='green')
sage: P = Polyomino([(1,0),(2,0),(0,1),(1,1),(2,1)], color='orange')
sage: F = Polyomino([(1,0),(1,1),(0,1),(2,1),(2,2)], color='gray')
sage: Z = Polyomino([(0,0),(1,0),(1,1),(1,2),(2,2)], color='yellow')
sage: T = Polyomino([(0,0),(0,1),(1,1),(2,1),(0,2)], color='red')
sage: Y = Polyomino([(0,0),(1,0),(2,0),(3,0),(2,1)], color='green')
sage: V = Polyomino([(0,0),(0,1),(0,2),(1,0),(2,0)], color='blue')
```

A 8 × 8 chessboard leaving the center four squares vacant:
This problem is represented by a matrix made of 1568 rows and 72 columns. It has 65 different solutions up to isometries:

```
sage: from sage.combinat.tiling import TilingSolver
sage: len(T.rows())         # long time
1568
sage: T.number_of_solutions()  # long time
520
sage: 520 / 8
65
```

Showing one solution:

```
sage: solution = next(T.solve())        # long time
sage: G = sum([piece.show2d() for piece in solution], Graphics())        # long time,
               # needs sage.plot
sage: G.show(aspect_ratio=1, axes=False)        # long time, # needs sage.plot
```

(continues on next page)
Here is an easy one dimensional example where we try to tile a stick of length 6 with three sticks of length 1, 2 and 3. There are six solutions:

```python
sage: p = Polyomino([[0]])

sage: q = Polyomino([[0], [1]])

sage: r = Polyomino([[0], [1], [2]])

sage: T = TilingSolver([p, q, r], box=[6])

sage: len(T.rows())
15

sage: it = T.solve()

sage: next(it)
[Polyomino: [(0)], Color: gray, Polyomino: [(1), (2)], Color: gray, Polyomino: [(3), (4), (5)], Color: gray]

sage: next(it)
[Polyomino: [(0)], Color: gray, Polyomino: [(1), (2), (3)], Color: gray, Polyomino: [(4), (5)], Color: gray]

sage: T.number_of_solutions()
6
```
2d Puzzle allowing reflections

The following is a puzzle owned by Florent Hivert:

```python
sage: from sage.combinat.tiling import Polyomino, TilingSolver
sage: L = []
sage: L.append(Polyomino([(0,0),(0,1),(0,2),(0,3),(1,0),(1,1),(1,2),(1,3)], 'yellow'))
sage: L.append(Polyomino([(0,0),(0,1),(0,2),(0,3),(1,0),(1,1),(1,2)], 'black'))
sage: L.append(Polyomino([(0,0),(0,1),(0,2),(0,3),(1,0),(1,1),(1,3)], 'gray'))
sage: L.append(Polyomino([(0,0),(0,1),(0,2),(0,3),(1,0),(1,1)], 'cyan'))
sage: L.append(Polyomino([(0,0),(0,1),(0,2),(0,3),(1,0),(1,3)], 'red'))
sage: L.append(Polyomino([(0,0),(0,1),(0,2),(0,3),(1,1),(1,2)], 'blue'))
sage: L.append(Polyomino([(0,0),(0,1),(0,2),(0,3),(1,1),(1,3)], 'green'))
sage: L.append(Polyomino([(1,1),(0,2),(0,3),(1,0),(1,1),(1,3)], 'magenta'))
sage: L.append(Polyomino([(1,1),(0,2),(0,3),(1,0),(1,1),(1,2)], 'orange'))
```

By default, rotations are allowed and reflections are not. In this case, there are no solution for tiling a $8 \times 8$ rectangular box:

```python
sage: T = TilingSolver(L, box=(8,8))
sage: T.number_of_solutions()
# long time (2.5s)
0
```
If reflections are allowed, there are solutions. Solve the puzzle and show one solution:

```python
sage: T = TilingSolver(L, box=(8,8), reflection=True)
```
```python
sage: solution = next(T.solve())
```
```python
sage: G = sum([piece.show2d() for piece in solution], Graphics())
```

Compute the number of solutions:

```python
sage: T.number_of_solutions()
```

Create an animation of all the solutions:

```python
sage: a = T.animate()
```

3d Puzzle

The same thing done in 3d without allowing reflections this time:
sage: L.append(Polyomino([(0,0,0),(0,1,0),(0,2,0),(0,3,0),(1,1,0),(1,2,0)]))

sage: L.append(Polyomino([(0,0,0),(0,1,0),(0,2,0),(0,3,0),(1,1,0),(1,3,0)]))

sage: L.append(Polyomino([(0,1,0),(0,2,0),(0,3,0),(1,0,0),(1,1,0),(1,2,0)]))

sage: L.append(Polyomino([(0,1,0),(0,2,0),(0,3,0),(1,0,0),(1,1,0),(1,2,0)]))

>>> from sage.all import *

>>> from sage.combinat.tiling import Polyomino, TilingSolver

>>>

L = []

>>> L.append(Polyomino([(Integer(0),Integer(0),Integer(0)),(Integer(0),Integer(1),Integer(0)),(Integer(0),Integer(2),Integer(0)),(Integer(0),Integer(3),Integer(0)),(Integer(1),Integer(0),Integer(0)),(Integer(1),Integer(1),Integer(0)),(Integer(1),Integer(2),Integer(0)),(Integer(1),Integer(3),Integer(0))]))

>>> L.append(Polyomino([(Integer(0),Integer(0),Integer(0)),(Integer(0),Integer(1),Integer(0)),(Integer(0),Integer(2),Integer(0)),(Integer(0),Integer(3),Integer(0)),(Integer(1),Integer(0),Integer(0)),(Integer(1),Integer(1),Integer(0)),(Integer(1),Integer(2),Integer(0))]))

>>> L.append(Polyomino([(Integer(0),Integer(0),Integer(0)),(Integer(0),Integer(1),Integer(0)),(Integer(0),Integer(2),Integer(0)),(Integer(0),Integer(3),Integer(0)),(Integer(1),Integer(0),Integer(0)),(Integer(1),Integer(1),Integer(0)),(Integer(1),Integer(2),Integer(0))]))

>>> L.append(Polyomino([(Integer(0),Integer(0),Integer(0)),(Integer(0),Integer(1),Integer(0)),(Integer(0),Integer(2),Integer(0)),(Integer(0),Integer(3),Integer(0)),(Integer(1),Integer(0),Integer(0)),(Integer(1),Integer(1),Integer(0)),(Integer(1),Integer(2),Integer(0))]))

>>> L.append(Polyomino([(Integer(0),Integer(0),Integer(0)),(Integer(0),Integer(1),Integer(0)),(Integer(0),Integer(2),Integer(0)),(Integer(0),Integer(3),Integer(0)),(Integer(1),Integer(0),Integer(0)),(Integer(1),Integer(1),Integer(0)),(Integer(1),Integer(2),Integer(0))]))

>>> from sage.all import *

>>> T = TilingSolver(L, box=(Integer(8),Integer(8),Integer(1)))

>>> solution = next(T.solve())

# long time (8s)

>>> G = sum([p.show3d(size=RealNumber(0.85)) for p in solution], Graphics())

# long time (<1s), needs sage.plot

>>> G.show(aspect_ratio=1, viewer='tachyon')

# long time (2s), needs sage.plot

5.1. Comprehensive Module List
Let us compute the number of solutions:

\[
sage: T.number_of_solutions()
328
\]

\[
>>> from sage.all import *
\]

\[
>>> T.number_of_solutions()
328
\]

**Donald Knuth example: the Y pentamino**

Donald Knuth [Knuth1] considered the problem of packing 45 Y pentaminoes into a 15 × 15 square:

\[
sage: from sage.combinat.tiling import Polyomino, TilingSolver
sage: y = Polyomino([(0,0), (1,0), (2,0), (3,0), (2,1)])
sage: T = TilingSolver([y], box=(5,10), reusable=True, reflection=True)
sage: T.number_of_solutions()
10
sage: solution = next(T.solve())
\]

\[
sage: G = sum([p.show2d() for p in solution], Graphics())
\]

\[
\]

\[
\]

\[
\]

\[
\]

\[
\]

\[
\]

\[
\]

\[
\]

\[
\]

\[
\]

\[
\]

Up to the symmetries of the square, there are 212 distinct solutions:
Combinatorics, Release 10.4

sage: 1696 // 8
212

>>> from sage.all import *
>>> Integer(1696) // Integer(8)
212

Animation of Donald Knuth’s dancing links

Animation of the solutions:

sage: from sage.combinat.tiling import Polyomino, TilingSolver
sage: Y = Polyomino([(0,0),(1,0),(2,0),(3,0),(2,1)], color='yellow')
sage: T = TilingSolver([Y], box=(15,15), reusable=True, reflection=True)

Animation with 40 frames

>>> from sage.all import *
>>> from sage.combinat.tiling import Polyomino, TilingSolver
>>> Y = Polyomino([(Integer(0),Integer(0)),(Integer(1), Integer(0)),(Integer(2), Integer(0)),(Integer(3), Integer(0)),(Integer(2), Integer(1))], color='yellow')
>>> T = TilingSolver([Y], box=(Integer(15),Integer(15)), reusable=True, reflection=True)

Animation with 40 frames

Incremental animation of the solutions (one piece is removed/added at a time):

sage: a = T.animate('incremental', stop=40); a
Animation with 40 frames
sage: a.show(delay=50, iterations=1)
Animation with 40 frames

5d Easy Example

Here is a 5d example. Let us try to fill the $2 \times 2 \times 2 \times 2 \times 2$ rectangle with reusable $1 \times 1 \times 1 \times 1 \times 1$ rectangles. Obviously, there is one solution:

sage: from sage.combinat.tiling import Polyomino, TilingSolver
sage: p = Polyomino([(0,0,0,0,0)])

(continues on next page)
sage: T.number_of_solutions()  # long time (fast)
1

>>> from sage.all import *
>>> from sage.combinat.tiling import Polyomino, TilingSolver
>>> p = Polyomino(((Integer(0),Integer(0),Integer(0),Integer(0),Integer(0))])
>>> T = TilingSolver([p], box=(Integer(2),Integer(2),Integer(2),Integer(2),
˓→Integer(2)), reusable=True)
>>> rows = T.rows()  # long time (3s)
>>> rows  # long time (fast)
[[0], [1], [2], [3], [4], [5], [6], [7], [8], [9], [10], [11], [12],
[13], [14], [15], [16], [17], [18], [19], [20], [21], [22], [23], [24],
[25], [26], [27], [28], [29], [30], [31]]
>>> T.number_of_solutions()  # long time (fast)
1

REFERENCES:

class sage.combinat.tiling.Polyomino(coords, color='gray', dimension=None)

Bases: sage.object

A polyomino in Z^d.

The polyomino is the union of the unit square (or cube, or n-cube) centered at those coordinates. Such an object should be connected, but the code does not make this assumption.

INPUT:

• coords – iterable of integer coordinates in Z^d
• color – string (default: 'gray'), color for display
• dimension – integer (default: None), dimension of the space, if None, it is guessed from the coords if coords is non empty

EXAMPLES:

sage: from sage.combinat.tiling import Polyomino
sage: Polyomino(((0,0,0), (0,1,0), (1,1,0), (1,1,1)), color='blue')
Polyomino: [(0, 0, 0), (0, 1, 0), (1, 1, 0), (1, 1, 1)], Color: blue

>>> from sage.all import *
>>> from sage.combinat.tiling import Polyomino
>>> Polyomino(((Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(1),
˓→Integer(0)), (Integer(1),Integer(1),Integer(0)), (Integer(1),Integer(1),
˓→Integer(1))), color='blue')
Polyomino: [{0, 0, 0), (0, 1, 0), (1, 1, 0), (1, 1, 1)], Color: blue

boundary()

Return the boundary of a 2d polyomino.

INPUT:

• self – a 2d polyomino

OUTPUT:
• list of edges (an edge is a pair of adjacent 2d coordinates)

EXAMPLES:

```python
sage: from sage.combinat.tiling import Polyomino
sage: p = Polyomino(((0,0), (1,0), (0,1), (1,1)))
sage: sorted(p.boundary())
[((-0.5, -0.5), (-0.5, 0.5)), ((-0.5, -0.5), (0.5, -0.5)),
 ((-0.5, 0.5), (-0.5, 1.5)), ((-0.5, 0.5), (0.5, 1.5)),
 ((0.5, -0.5), (1.5, -0.5)), ((0.5, 1.5), (1.5, 1.5)),
 ((1.5, -0.5), (1.5, 0.5)), ((1.5, 0.5), (1.5, 1.5))]
sage: len(_)
8
sage: p = Polyomino(((5,5),))
sage: sorted(p.boundary())
[((4.5, 4.5), (4.5, 5.5)), ((4.5, 4.5), (5.5, 4.5)),
 ((4.5, 5.5), (5.5, 5.5)), ((5.5, 4.5), (5.5, 5.5))]
```

```python
>>> from sage.all import *
>>> from sage.combinat.tiling import Polyomino
>>> p = Polyomino(((Integer(0),Integer(0)), (Integer(1),Integer(0)),...
            (Integer(0),Integer(1)), (Integer(1),Integer(1))))
>>> sorted(p.boundary())
[((-0.5, -0.5), (-0.5, 0.5)), ((-0.5, -0.5), (0.5, -0.5)),
 ((-0.5, 0.5), (-0.5, 1.5)), ((-0.5, 0.5), (0.5, 1.5)),
 ((0.5, -0.5), (1.5, -0.5)), ((0.5, 1.5), (1.5, 1.5)),
 ((1.5, -0.5), (1.5, 0.5)), ((1.5, 0.5), (1.5, 1.5))]
>>> len(_)
8
>>> p = Polyomino(((Integer(5),Integer(5)),))
>>> sorted(p.boundary())
[((4.5, 4.5), (4.5, 5.5)), ((4.5, 4.5), (5.5, 4.5)),
 ((4.5, 5.5), (5.5, 5.5)), ((5.5, 4.5), (5.5, 5.5))]
```

`bounding_box()`

EXAMPLES:

```python
sage: from sage.combinat.tiling import Polyomino
sage: p = Polyomino(((0,0,0),(1,0,0),(1,1,0),(1,1,1),(1,2,0)], color='deppink')
sage: p.bounding_box()
[[0, 0, 0], [1, 2, 1]]
```

```python
>>> from sage.all import *
>>> from sage.combinat.tiling import Polyomino
>>> p = Polyomino(((Integer(0),Integer(0),Integer(0)),(Integer(1),Integer(0),...
            (Integer(0)),(Integer(1),Integer(1),Integer(0)),(Integer(1),Integer(1),
            (Integer(1)),(Integer(1),Integer(2),Integer(0))], color='deppink')
>>> p.bounding_box()
[[0, 0, 0], [1, 2, 1]]
```

`canonical()`

Return the translated copy of self having minimal and nonnegative coordinates

EXAMPLES:
sage: from sage.combinat.tiling import Polyomino
sage: p = Polyomino([(0,0,0), (1,0,0), (1,1,0), (1,1,1), (1,2,0)], color='deeppink')
sage: p
Polyomino: [(0, 0, 0), (1, 0, 0), (1, 1, 0), (1, 1, 1), (1, 2, 0)], Color: →deeppink
sage: p.canonical()
Polyomino: [(0, 0, 0), (1, 0, 0), (1, 1, 0), (1, 1, 1), (1, 2, 0)], Color: →deeppink

```python
>>> from sage.all import *
>>> from sage.combinat.tiling import Polyomino
>>>
p = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(1),Integer(0),
    →Integer(0)), (Integer(1),Integer(1),Integer(0)), (Integer(1),Integer(1),
    →Integer(1)), (Integer(1),Integer(2),Integer(0))], color='deeppink')
>>>
p
Polyomino: [(0, 0, 0), (1, 0, 0), (1, 1, 0), (1, 1, 1), (1, 2, 0)], Color: →deeppink
```  
canonical_isometric_copies (orientation_preserving=True, mod_box_isometries=False)

Return the list of image of self under isometries of the n-cube where the coordinates are all nonnegative and minimal.

INPUT:

- orientation_preserving – bool (default: True); if True, the group of isometries of the n-cube is restricted to those that preserve the orientation, i.e. of determinant 1.
- mod_box_isometries – bool (default: False), whether to quotient the group of isometries of the n-cube by the subgroup of isometries of the $a_1 \times a_2 \cdots \times a_n$ rectangular box where are the $a_i$ are assumed to be distinct.

OUTPUT:

set of Polyomino

EXAMPLES:

```python
sage: from sage.combinat.tiling import Polyomino
sage: p = Polyomino([(0,0,0), (0,1,0), (1,1,0), (1,1,1)], color='blue')
```

```python
sage: s = p.canonical_isometric_copies()
sage: len(s)
12
```  
```python
>>> from sage.all import *
>>> from sage.combinat.tiling import Polyomino
```  
```python
>>> p = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(1),
    →Integer(0)), (Integer(1),Integer(1),Integer(0)), (Integer(1),Integer(1),
    →Integer(1)), (Integer(1),Integer(2),Integer(0))], color='blue')
```  
```python
>>> s = p.canonical_isometric_copies()
```  
```python
>>> len(s)
12
```  
With the non orientation-preserving:
Combinatorics, Release 10.4

```
sage: s = p.canonical_isometric_copies(orientation_preserving=False)
sage: len(s)
24

>>> from sage.all import *
>>> s = p.canonical_isometric_copies(orientation_preserving=False)
>>> len(s)
24

Modulo rotation by angle 180 degrees:

sage: s = p.canonical_isometric_copies(mod_box_isometries=True)
sage: len(s)
3

>>> from sage.all import *
>>> s = p.canonical_isometric_copies(mod_box_isometries=True)
>>> len(s)
3

center()

Return the center of the polyomino.

EXAMPLES:

sage: from sage.combinat.tiling import Polyomino
sage: p = Polyomino([(0,0,0),(0,0,1)])
sage: p.center()
(0, 0, 1/2)

>>> from sage.all import *
>>> from sage.combinat.tiling import Polyomino
>>>
p = Polyomino([(Integer(0),Integer(0),Integer(0)),(Integer(0),Integer(0),
˓→Integer(1))])
>>> p.center()
(0, 0, 1/2)

In 3d:

sage: p = Polyomino([(0,0,0),(1,0,0),(1,1,0),(1,1,1),(1,2,0)], color='deeppink'
˓→')
sage: p.center()
(4/5, 4/5, 1/5)

>>> from sage.all import *
>>> from sage.combinat.tiling import Polyomino
>>> p = Polyomino([(Integer(0),Integer(0),Integer(0)),(Integer(1),Integer(0),
˓→Integer(0)),(Integer(1),Integer(1),Integer(0)),(Integer(1),Integer(1),
˓→Integer(1)),(Integer(1),Integer(2),Integer(0))], color='deeppink')
>>> p.center()
(4/5, 4/5, 1/5)

In 2d:

sage: p = Polyomino([(0,0),(1,0),(1,1),(1,2)])
sage: p.center()
(3/4, 3/4)
```
```python
>>> from sage.all import *
p = Polyomino([(Integer(0), Integer(0)), (Integer(1), Integer(0)), (Integer(1), Integer(1)), (Integer(1), Integer(2))])
p.center()
(3/4, 3/4)
```

**color** *(color=None)*

Return or change the color of the polyomino.

**INPUT:**

- color – string, RGB tuple or None (default: None), if None, it returns the current color

**EXAMPLES:**

```
sage: from sage.combinat.tiling import Polyomino
sage: p = Polyomino([(0,0,0), (0,1,0), (1,1,0), (1,1,1)], color='blue')
sage: p.color()
'blue'
```

```
sage: from sage.all import *
sage: from sage.combinat.tiling import Polyomino
>>> p = Polyomino([(Integer(0), Integer(0), Integer(0)), (Integer(0), Integer(1), Integer(0)), (Integer(1), Integer(1), Integer(0)), (Integer(1), Integer(1), Integer(1))], color='red')
```

```
sage: p = Polyomino([(Integer(0), Integer(0), Integer(0)), (Integer(0), Integer(1), Integer(0)), (Integer(1), Integer(1), Integer(0)), (Integer(1), Integer(1), Integer(1))], color='red')
```

**frozenset()**

Return the elements of \( Z^d \) in the polyomino as a frozenset.

**EXAMPLES:**

```
sage: from sage.combinat.tiling import Polyomino
sage: p = Polyomino([(0,0,0), (0,1,0), (1,1,0), (1,1,1)], color='red')
sage: p.frozenset()
frozenset((0, 0, 0), (0, 1, 0), (1, 1, 0), (1, 1, 1))
```

**intersection (other)**

Return the intersection of self and other.

**INPUT:**

- other – a polyomino

**OUTPUT:**

polyomino

**EXAMPLES:**
sage: from sage.combinat.tiling import Polyomino
sage: a = Polyomino([(0,0)])
sage: b = Polyomino([(0,0), (0,1), (1,1), (2,1)])
sage: a.intersection(b)
Polyomino: [(0, 0)], Color: gray
sage: a.intersection(b+(1,1))
Polyomino: [], Color: gray

>>> from sage.all import *
>>> from sage.combinat.tiling import Polyomino
>>>
>>> a = Polyomino([(Integer(0),Integer(0))])
>>> b = Polyomino([(Integer(0),Integer(0)), (Integer(0),Integer(1)), (Integer(1),Integer(1)), (Integer(2),Integer(1))])
>>> a.intersection(b)
Polyomino: [(0, 0)], Color: gray
>>> a.intersection(b+(Integer(1),Integer(1)))
Polyomino: [], Color: gray

isometric_copies (box, orientation_preserving=True, mod_box_isometries=False)

Return the translated and isometric images of self that lies in the box.

INPUT:

- box – Polyomino or tuple of integers (size of a box)
- orientation_preserving – bool (default: True): If True, the group of isometries of the \( n \)-cube is restricted to those that preserve the orientation, i.e. of determinant 1.
- mod_box_isometries – bool (default: False), whether to quotient the group of isometries of the \( n \)-cube by the subgroup of isometries of the \( a_1 \times a_2 \cdots \times a_n \) rectangular box where are the \( a_i \) are assumed to be distinct.

EXAMPLES:

sage: from sage.combinat.tiling import Polyomino
sage: p = Polyomino([(0,0,0),(1,0,0),(1,1,0),(1,1,1),(1,2,0)], color='deeppink')

sage: L = list(p.isometric_copies(box=(5,8,2)))

sage: len(L)
360

>>> from sage.all import *
>>> from sage.combinat.tiling import Polyomino
>>>
>>> p = Polyomino([(Integer(0),Integer(0),Integer(0)),(Integer(1),Integer(0),Integer(0)),(Integer(1),Integer(1),Integer(0)),(Integer(1),Integer(1),Integer(1)),(Integer(1),Integer(2),Integer(0))], color='deeppink')

>>> L = list(p.isometric_copies(box=(Integer(5),Integer(8),Integer(2))))

>>> len(L)
360

sage: p = Polyomino([(0,0,0),(1,0,0),(1,1,0),(1,1,1),(1,2,0),(1,2,1)], color='orange')

sage: L = list(p.isometric_copies(box=(5,8,2)))

sage: len(L)
180

sage: L = list(p.isometric_copies((5,8,2), False))

sage: len(L)
360

(continues on next page)
sage: L = list(p.isometric_copies((5,8,2), mod_box_isometries=True))
sage: len(L)
45

>>> from sage.all import *

>>> p = Polyomino(((Integer(0),Integer(0),Integer(0)),(Integer(1),Integer(0),
    →Integer(0)),(Integer(1),Integer(1),Integer(0)),(Integer(1),Integer(2),
    →Integer(0)),(Integer(1),Integer(2),Integer(1))], color='orange')

>>> L = list(p.isometric_copies(box=(Integer(5),Integer(8),Integer(2))))

>>> len(L)
180

>>> L = list(p.isometric_copies((Integer(5),Integer(8),Integer(2)), False))

>>> len(L)
360

>>> L = list(p.isometric_copies((Integer(5),Integer(8),Integer(2)), mod_box_isometries=True))

>>> len(L)
45

sage: p = Polyomino([(0,0), (1,0), (0,1)])
sage: b = Polyomino([(0,0), (1,0), (2,0), (0,1), (1,1), (0,2)])
sage: sorted(p.isometric_copies(b), key=lambda p: p.sorted_list())
[Polyomino: [(0, 0), (0, 1), (1, 0)], Color: gray,
 Polyomino: [(0, 0), (0, 1), (1, 1)], Color: gray,
 Polyomino: [(0, 0), (1, 0), (1, 1)], Color: gray,
 Polyomino: [(0, 1), (0, 2), (1, 1)], Color: gray,
 Polyomino: [(0, 1), (1, 0), (1, 1)], Color: gray,
 Polyomino: [(1, 0), (1, 1), (2, 0)], Color: gray]

>>> from sage.all import *

>>> p = Polyomino(((Integer(0),Integer(0),Integer(0)),(Integer(1),Integer(0),
    →Integer(0)),(Integer(1),Integer(1),Integer(0)),(Integer(1),Integer(2),
    →Integer(0)),(Integer(1),Integer(2),Integer(1))])

>>> b = Polyomino(((Integer(0),Integer(0),Integer(0)), (Integer(1),Integer(0),
    →(Integer(2)),(Integer(0)), (Integer(0),Integer(1)), (Integer(1),Integer(1)),
    →(Integer(0)),(Integer(2))])

>>> sorted(p.isometric_copies(b), key=lambda p: p.sorted_list())
[Polyomino: [(0, 0), (0, 1), (1, 0)], Color: gray,
 Polyomino: [(0, 0), (0, 1), (1, 1)], Color: gray,
 Polyomino: [(0, 0), (1, 0), (1, 1)], Color: gray,
 Polyomino: [(0, 1), (0, 2), (1, 1)], Color: gray,
 Polyomino: [(0, 1), (1, 0), (1, 1)], Color: gray,
 Polyomino: [(1, 0), (1, 1), (2, 0)], Color: gray]

isometric_copies_intersection (box, orientation_preserving=True)

Return the set of non empty intersections of isometric images of self with a polyomino.

INPUT:

- box – Polyomino or tuple of integers (size of a box)
- orientation_preserving – bool (default: True); if True, the group of isometries of the $n$-cube is restricted to those that preserve the orientation, i.e. of determinant 1.

EXAMPLES:

sage: from sage.combinat.tiling import Polyomino
sage: p = Polyomino(((0,0),(1,0)), color='deeppink')
Combinatorics, Release 10.4

sage: sorted(sorted(a.frozenset()) for a in p.isometric_copies_˓→intersection(box=(2,3)))
[[[0, 0]],
 [[0, 0], (0, 1)],
 [[0, 0], (1, 0)],
 [[0, 1]],
 [[0, 1], (0, 2)],
 [[0, 1], (1, 1)],
 [[0, 2]],
 [[0, 2], (1, 2)],
 [[1, 0]],
 [[1, 0], (1, 1)],
 [[1, 1]],
 [[1, 1], (1, 2)],
 [[1, 2]]]

neighbor_edges()
Return an iterator over the pairs of neighbor coordinates inside of the polyomino.

Two points $P$ and $Q$ in the polyomino are neighbor if $P - Q$ has one coordinate equal to $+1$ or $-1$ and zero everywhere else.

EXAMPLES:

sage: from sage.combinat.tiling import Polyomino
sage: p = Polyomino([(0,0,0),(0,0,1)])

sage: [sorted(edge) for edge in p.neighbor_edges()]

[[[0, 0], (0, 0, 1)]]

In 3d:
sage: p = Polyomino(((0,0,0),(1,0,0),(1,1,0),(1,1,1),(1,2,0)], color='deeppink')

sage: L = sorted(sorted(edge) for edge in p.neighbor_edges())

sage: for a in L: a
[(0, 0, 0), (1, 0, 0)]
[(1, 0, 0), (1, 1, 0)]
[(1, 1, 0), (1, 1, 1)]
[(1, 1, 0), (1, 2, 0)]

>>> from sage.all import *

>>> p = Polyomino([Integer(0),Integer(0),Integer(0),Integer(1),Integer(1),Integer(1),Integer(1),Integer(2),Integer(0)], color='deeppink')

>>> L = sorted(sorted(edge) for edge in p.neighbor_edges())

>>> for a in L: a
[(0, 0, 0), (1, 0, 0)]
[(1, 0, 0), (1, 1, 0)]
[(1, 1, 0), (1, 1, 1)]
[(1, 1, 0), (1, 2, 0)]

In 2d:

sage: p = Polyomino([(0,0),(1,0),(1,1),(1,2)])

sage: L = sorted(sorted(edge) for edge in p.neighbor_edges())

sage: for a in L: a
[(0, 0), (1, 0)]
[(1, 0), (1, 1)]
[(1, 1), (1, 2)]

>>> from sage.all import *

>>> p = Polyomino([(Integer(0),Integer(0)),(Integer(1),Integer(0)),(Integer(1),Integer(1)),(Integer(1),Integer(1)),(Integer(1),Integer(2))])

>>> L = sorted(sorted(edge) for edge in p.neighbor_edges())

>>> for a in L: a
[(0, 0), (1, 0)]
[(1, 0), (1, 1)]
[(1, 1), (1, 2)]

**self_surrounding** (radius, remove_incomplete_copies=True, ncpus=None)

Return a list of isometric copies of self surrounding it with an annulus of given radius.

**INPUT:**

- **self** – a polyomino of dimension 2
- **radius** – integer
- **remove_incomplete_copies** – bool (default: True), whether to keep only complete copies of self in the output
- **ncpus** – integer (default: None), maximal number of subprocesses to use at the same time. If None, it detects the number of effective CPUs in the system using `sage.parallel.ncpus.ncpus()`.
  If ncpus=1, the first solution is searched serially.

**OUTPUT:**

list of polyominoes

**EXAMPLES:**
sage: from sage.combinat.tiling import Polyomino
sage: H = Polyomino((-1, 1), (-1, 4), (-1, 7), (0, 0), (0, 1), (0, 2),
                  (0, 3), (0, 4), (0, 5), (0, 6), (0, 7), (0, 8), (1, 1), (1, 2),
                  (1, 3), (1, 4), (1, 5), (1, 6), (1, 7), (1, 8), (2, 0), (2, 2),
                  (2, 3), (2, 5), (2, 6), (2, 8))

sage: solution = H.self_surrounding(8)

sage: G = sum([p.show2d() for p in solution], Graphics())

>>> from sage.all import *
>>> from sage.combinat.tiling import Polyomino

>>> H = Polyomino([(-Integer(1), Integer(1)), (-Integer(1), Integer(4)),
                  (-Integer(1), Integer(7)), (Integer(0), Integer(0)), (Integer(0),
                  Integer(1)), (Integer(0), Integer(2)), (Integer(0),
                  Integer(3)), (Integer(0), Integer(4)), (Integer(0),
                  Integer(5)), (Integer(0), Integer(6)), (Integer(0), Integer(7)),
                  (Integer(0), Integer(8)), (Integer(1), Integer(1)), (Integer(1),
                  Integer(2)), (Integer(1), Integer(3)), (Integer(1), Integer(4)),
                  (Integer(1), Integer(5)), (Integer(1), Integer(6)), (Integer(1),
                  Integer(7)), (Integer(1), Integer(8)), (Integer(2), Integer(0)),
                  (Integer(2), Integer(2)), (Integer(2), Integer(3)), (Integer(2),
                  Integer(5)), (Integer(2), Integer(6)), (Integer(2), Integer(8))])

>>> solution = H.self_surrounding(Integer(8))

>>> G = sum([p.show2d() for p in solution], Graphics())

sage: solution = H.self_surrounding(8, remove_incomplete_copies=False)

sage: G = sum([p.show2d() for p in solution], Graphics())

>>> from sage.all import *

>>> solution = H.self_surrounding(Integer(8), remove_incomplete_copies=False)

>>> G = sum([p.show2d() for p in solution], Graphics())

show2d(size=0.7, color='black', thickness=1)

Return a 2d Graphic object representing the polyomino.

INPUT:

- self — a polyomino of dimension 2
- size — number (default: 0.7), the size of each square.
- color — color (default: 'black'), color of the boundary line.
- thickness — number (default: 1), how thick the boundary line is.

EXAMPLES:
Combinatorics, Release 10.4

```python
>>> from sage.all import *
>>> from sage.combinat.tiling import Polyomino
>>> p = Polyomino([(Integer(0),Integer(0)), (Integer(1),Integer(0)),
                  (Integer(1),Integer(1)), (Integer(1),Integer(2))], color='deeppink')
>>> p.show2d()  # long time (0.5s)  # needs sage.plot
Graphics object consisting of 17 graphics primitives
```

**show3d**(size=1)

Return a 3d Graphic object representing the polyomino.

**INPUT:**

- `self` – a polyomino of dimension 3
- `size` – number (default: 1), the size of each $1 \times 1 \times 1$ cube. This does a homothety with respect to the center of the polyomino.

**EXAMPLES:**

```python
sage: from sage.combinat.tiling import Polyomino
sage: p = Polyomino([(0,0,0), (0,1,0), (1,1,0), (1,1,1)], color='blue')
sage: p.show3d()  # long time (2s)  # needs sage.plot
Graphics3d Object
```

**sorted_list()**

Return the color of the polyomino.

**EXAMPLES:**

```python
sage: from sage.combinat.tiling import Polyomino
sage: p = Polyomino([(0,0,0), (0,1,0), (1,1,0), (1,1,1)], color='blue')
sage: p.sorted_list()
[(0, 0, 0), (0, 1, 0), (1, 1, 0), (1, 1, 1)]
```

**translated_copies**(box)

Return an iterator over the translated images of `self` inside a polyomino.

**INPUT:**

- `box` – Polyomino or tuple of integers (size of a box)
OUTPUT:

iterator of 3d polyominoes

EXAMPLES:

```
sage: from sage.combinat.tiling import Polyomino
sage: p = Polyomino([(0,0,0),(1,0,0),(1,1,0),(1,1,1),(1,2,0)], color='deeppink')

sage: for t in p.translated_copies(box=(5,8,2)): t

Polyomino: [(0, 0, 0), (1, 0, 0), (1, 1, 0), (1, 1, 1), (1, 2, 0)], Color: → deeppink
Polyomino: [(0, 1, 0), (1, 1, 0), (1, 2, 0), (1, 2, 1), (1, 3, 0)], Color: → deeppink
Polyomino: [(0, 2, 0), (1, 2, 0), (1, 3, 0), (1, 3, 1), (1, 4, 0)], Color: → deeppink
Polyomino: [(0, 3, 0), (1, 3, 0), (1, 4, 0), (1, 4, 1), (1, 5, 0)], Color: → deeppink
Polyomino: [(0, 4, 0), (1, 4, 0), (1, 5, 0), (1, 5, 1), (1, 6, 0)], Color: → deeppink
Polyomino: [(0, 5, 0), (1, 5, 0), (1, 6, 0), (1, 6, 1), (1, 7, 0)], Color: → deeppink
Polyomino: [(1, 0, 0), (2, 0, 0), (2, 1, 0), (2, 1, 1), (2, 2, 0)], Color: → deeppink
Polyomino: [(1, 1, 0), (2, 1, 0), (2, 2, 0), (2, 2, 1), (2, 3, 0)], Color: → deeppink
Polyomino: [(1, 2, 0), (2, 2, 0), (2, 3, 0), (2, 3, 1), (2, 4, 0)], Color: → deeppink
Polyomino: [(1, 3, 0), (2, 3, 0), (2, 4, 0), (2, 4, 1), (2, 5, 0)], Color: → deeppink
Polyomino: [(1, 4, 0), (2, 4, 0), (2, 5, 0), (2, 5, 1), (2, 6, 0)], Color: → deeppink
Polyomino: [(1, 5, 0), (2, 5, 0), (2, 6, 0), (2, 6, 1), (2, 7, 0)], Color: → deeppink

Polyomino: [(0, 2, 0), (1, 2, 0), (1, 3, 0), (1, 3, 1), (1, 4, 0)], Color: -> deeppink
Polyomino: [(0, 3, 0), (1, 3, 0), (1, 4, 0), (1, 4, 1), (1, 5, 0)], Color: -> deeppink
Polyomino: [(0, 4, 0), (1, 4, 0), (1, 5, 0), (1, 5, 1), (1, 6, 0)], Color: -> deeppink
Polyomino: [(0, 5, 0), (1, 5, 0), (1, 6, 0), (1, 6, 1), (1, 7, 0)], Color: -> deeppink
Polyomino: [(1, 0, 0), (2, 0, 0), (2, 1, 0), (2, 1, 1), (2, 2, 0)], Color: -> deeppink
Polyomino: [(1, 1, 0), (2, 1, 0), (2, 2, 0), (2, 2, 1), (2, 3, 0)], Color: -> deeppink
Polyomino: [(1, 2, 0), (2, 2, 0), (2, 3, 0), (2, 3, 1), (2, 4, 0)], Color: -> deeppink
Polyomino: [(1, 3, 0), (2, 3, 0), (2, 4, 0), (2, 4, 1), (2, 5, 0)], Color: -> deeppink
Polyomino: [(1, 4, 0), (2, 4, 0), (2, 5, 0), (2, 5, 1), (2, 6, 0)], Color: -> deeppink
Polyomino: [(1, 5, 0), (2, 5, 0), (2, 6, 0), (2, 6, 1), (2, 7, 0)], Color: -> deeppink
Polyomino: [(2, 0, 0), (3, 0, 0), (3, 1, 0), (3, 1, 1), (3, 2, 0)], Color: -> deeppink
Polyomino: [(2, 1, 0), (3, 1, 0), (3, 2, 0), (3, 2, 1), (3, 3, 0)], Color: -> deeppink
Polyomino: [(2, 2, 0), (3, 2, 0), (3, 3, 0), (3, 3, 1), (3, 4, 0)], Color: -> deeppink
Polyomino: [(2, 3, 0), (3, 3, 0), (3, 4, 0), (3, 4, 1), (3, 5, 0)], Color: -> deeppink
Polyomino: [(2, 4, 0), (3, 4, 0), (3, 5, 0), (3, 5, 1), (3, 6, 0)], Color: -> deeppink
Polyomino: [(2, 5, 0), (3, 5, 0), (3, 6, 0), (3, 6, 1), (3, 7, 0)], Color: -> deeppink
Polyomino: [(3, 0, 0), (4, 0, 0), (4, 1, 0), (4, 1, 1), (4, 2, 0)], Color: -> deeppink
Polyomino: [(3, 1, 0), (4, 1, 0), (4, 2, 0), (4, 2, 1), (4, 3, 0)], Color: -> deeppink
Polyomino: [(3, 2, 0), (4, 2, 0), (4, 3, 0), (4, 3, 1), (4, 4, 0)], Color: -> deeppink
Polyomino: [(3, 3, 0), (4, 3, 0), (4, 4, 0), (4, 4, 1), (4, 5, 0)], Color: -> deeppink
Polyomino: [(3, 4, 0), (4, 4, 0), (4, 5, 0), (4, 5, 1), (4, 6, 0)], Color: -> deeppink
Polyomino: [(3, 5, 0), (4, 5, 0), (4, 6, 0), (4, 6, 1), (4, 7, 0)], Color: -> deeppink

This method is independent of the translation of the polyomino:
```
sage: q = Polyomino([(0,0,0), (1,0,0)])
sage: list(q.translated_copies((2,2,1)))
[Polyomino: [(0,0,0), (1,0,0)], Color: gray, Polyomino: [(0,1,0), (1,1,0)], Color: gray]
sage: q = Polyomino([(34,7,-9), (35,7,-9)])
sage: list(q.translated_copies((2,2,1)))
[Polyomino: [(0,0,0), (1,0,0)], Color: gray, Polyomino: [(0,1,0), (1,1,0)], Color: gray]
```

```
>>> from sage.all import *
>>> q = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(1),Integer(0),Integer(0))])
```

```
>>> list(q.translated_copies((Integer(2),Integer(2),Integer(1))))
[Polyomino: [(0,0,0), (1,0,0)], Color: gray, Polyomino: [(0,1,0), (1,1,0)], Color: gray]
>>> q = Polyomino([(Integer(34),Integer(7),-Integer(9)), (Integer(35),-Integer(9))])
```

```
>>> list(q.translated_copies((Integer(2),Integer(2),Integer(1))))
[Polyomino: [(0,0,0), (1,0,0)], Color: gray, Polyomino: [(0,1,0), (1,1,0)], Color: gray]
```

Inside smaller boxes:

```
sage: list(p.translated_copies(box=(2,2,3)))
[]
```

```
sage: list(p.translated_copies(box=(2,3,2)))
[Polyomino: [(0,0,0), (1,0,0), (1,1,0), (1,1,1), (1,2,0)], Color: deppink]
```

```
sage: list(p.translated_copies(box=(3,2,2)))
[]
```

```
sage: list(p.translated_copies(box=(1,1,1)))
[]
```

```
>>> from sage.all import *
>>> list(p.translated_copies(box=(Integer(2),Integer(2),Integer(3))))
[]
>>> list(p.translated_copies(box=(Integer(2),Integer(3),Integer(2))))
[Polyomino: [(0,0,0), (1,0,0), (1,1,0), (1,1,1), (1,2,0)], Color: deppink]
```

```
>>> list(p.translated_copies(box=(Integer(3),Integer(2),Integer(2))))
[]
>>> list(p.translated_copies(box=(Integer(1),Integer(1),Integer(1))))
[]
```

Using a Polyomino as input:

```
sage: b = Polyomino([(0,0), (0,1), (0,2), (1,0), (1,1), (1,2)])
sage: p = Polyomino([0,0])
sage: list(p.translated_copies(b))
```

```
[Polyomino: [(0,0)], Color: gray, Polyomino: [(0,1)], Color: gray, Polyomino: [(0,2)], Color: gray, Polyomino: [(1,0)], Color: gray, Polyomino: [(1,1)], Color: gray, Polyomino: [(1,2)], Color: gray]
```
```
5.1. Comprehensive Module List

Combinatorics, Release 10.4

```
translated_copies_intersection(box)

Return the set of non empty intersections of translated images of self with a polyomino.

INPUT:

- box – Polyomino or tuple of integers (size of a box)

OUTPUT:

set of 3d polyominoes

EXAMPLES:

```python
sage: from sage.combinat.tiling import Polyomino
sage: p = Polyomino([(0,0),(1,0)], color='deeppink')
sage: sorted(sorted(a.frozenset())
....: for a in p.translated_copies_intersection(box=(2,3)))
[[[0, 0]],
 [[0, 0], (1, 0)],
 [[0, 1]],
 [[0, 1], (1, 1)],
 [[0, 2]],
 [[0, 2], (1, 2)],
 [(1, 0)],
 [(1, 1)],
 [(1, 2)]
```
Using a Polyomino as input:

```python
sage: b = Polyomino(((0,0), (0,1), (0,2), (1,0), (2,0)))

sage: p = Polyomino(((0,0), (1,0)))

sage: sorted(sorted(a.frozenset())
... for a in p.translated_copies_intersection(b))
[[(0, 0)], [(0, 0), (1, 0)], [(0, 1)], [(0, 2)], [(1, 0), (2, 0)], [(2, 0)]]
```

```python
sage: from sage.all import *

sage: b = Polyomino((Integer(0), Integer(0)), (Integer(0), Integer(1)),
    ... (Integer(0), Integer(2)), (Integer(1), Integer(0)), (Integer(2), Integer(0)))

sage: p = Polyomino((Integer(0), Integer(0)), (Integer(1), Integer(0)))

sage: sorted(sorted(a.frozenset())
... for a in p.translated_copies_intersection(b))
[[(0, 0)], [(0, 0), (1, 0)], [(0, 1)], [(0, 2)], [(1, 0), (2, 0)], [(2, 0)]]
```

### class sage.combinat.tiling.TilingSolver

Bases: `SageObject`

Tiling solver

Solve the problem of tiling a polyomino with a certain number of polyominoes.

**INPUT:**

- `pieces` — iterable of Polyominoes
- `box` — Polyomino or tuple of integers (size of a box)
- `rotation` — bool (default: True), whether to allow rotations
- `reflection` — bool (default: False), whether to allow reflections
- `reusable` — bool (default: False), whether to allow the pieces to be reused
- `outside` — bool (default: False), whether to allow pieces to partially go outside of the box (all non-empty intersection of the pieces with the box are considered)

**EXAMPLES:**

By default, rotations are allowed and reflections are not allowed:
sage: from sage.combinat.tiling import TilingSolver, Polyomino
sage: p = Polyomino([(0,0,0)])
sage: q = Polyomino([(0,0,0), (0,0,1)])
sage: r = Polyomino([(0,0,0), (0,0,1), (0,0,2)])
sage: T = TilingSolver([p,q,r], box=(1,1,6))
sage: T
Tiling solver of 3 pieces into a box of size 6
Rotation allowed: True
Reflection allowed: False
Reusing pieces allowed: False

>>> from sage.all import *
>>> from sage.combinat.tiling import TilingSolver, Polyomino
>>>
p = Polyomino(((Integer(0),Integer(0),Integer(0)))))
>>> q = Polyomino(((Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0),
Integer(1))))
>>> r = Polyomino(((Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0),
Integer(1)), (Integer(0),Integer(0),Integer(2))))
>>> T = TilingSolver([p,q,r], box=(Integer(1),Integer(1),Integer(6)))
>>> T
Tiling solver of 3 pieces into a box of size 6
Rotation allowed: True
Reflection allowed: False
Reusing pieces allowed: False

Solutions are given by an iterator:

sage: it = T.solve()
sage: for p in next(it): p
Polyomino: [(0, 0, 0)], Color: gray
Polyomino: [(0, 0, 1), (0, 0, 2)], Color: gray
Polyomino: [(0, 0, 3), (0, 0, 4), (0, 0, 5)], Color: gray

>>> from sage.all import *
>>> it = T.solve()
>>> for p in next(it): p
Polyomino: [(0, 0, 0)], Color: gray
Polyomino: [(0, 0, 1), (0, 0, 2), (0, 0, 3)], Color: gray
Polyomino: [(0, 0, 4), (0, 0, 5)], Color: gray

Another solution:

sage: for p in next(it): p
Polyomino: [(0, 0, 0)], Color: gray
Polyomino: [(0, 0, 1), (0, 0, 2), (0, 0, 3)], Color: gray
Polyomino: [(0, 0, 4), (0, 0, 5)], Color: gray

>>> from sage.all import *
>>> for p in next(it): p
Polyomino: [(0, 0, 0)], Color: gray
Polyomino: [(0, 0, 1), (0, 0, 2), (0, 0, 3)], Color: gray
Polyomino: [(0, 0, 4), (0, 0, 5)], Color: gray

Tiling of a polyomino by polyominoes:
sage: b = Polyomino([(0,0), (1,0), (1,1), (2,1), (2,2), (0,3), (1,3)])
sage: p = Polyomino([(0,0), (1,0)])
sage: T = TilingSolver([p], box=b, reusable=True)
sage: T.number_of_solutions()
2

from sage.all import *

>>> b = Polyomino([(Integer(0),Integer(0)), (Integer(1),Integer(0)), (Integer(1),
˓→Integer(1)), (Integer(2),Integer(1)), (Integer(1),Integer(2)), (Integer(2),
˓→Integer(2)), (Integer(0),Integer(3)), (Integer(1),Integer(3))])
>>> p = Polyomino([(Integer(0),Integer(0)), (Integer(1),Integer(0))])
>>> T = TilingSolver([p], box=b, reusable=True)
>>> T.number_of_solutions()
2

animate (partial=None, stop=None, size=0.75, axes=False)
Return an animation of evolving solutions.

INPUT:

• partial – string (default: None), whether to include partial (incomplete) solutions. It can be one of
  the following:
  – None – include only complete solutions
  – 'common_prefix' – common prefix between two consecutive solutions
  – 'incremental' – one piece change at a time
• stop – integer (default: None), number of frames
• size – number (default: 0.75), the size of each 1 \times 1 square. This does a homothety with
  respect to the center of each polyomino.
• axes – bool (default: False), whether the x and y axes are shown.

EXAMPLES:

sage: from sage.combinat.tiling import Polyomino, TilingSolver
sage: y = Polyomino([(0,0),(1,0),(2,0),(3,0),(2,1)], color='cyan')

sage: T = TilingSolver([y], box=(5,10), reusable=True, reflection=True)

# needs sage.plot
sage: a = T.animate()  # long time, optional - imagemagick,
˓→needs sage.plot

Animation with 10 frames

from sage.all import *

from sage.combinat.tiling import Polyomino, TilingSolver

>>> y = Polyomino([(Integer(0),Integer(0)), (Integer(1),Integer(0)), (Integer(2),Integer(0)), (Integer(3),Integer(0)), (Integer(2),Integer(1))], color='cyan')

>>> T = TilingSolver([y], box=(Integer(5),Integer(10)), reusable=True, reflection=True)

# needs sage.plot
>>> a = T.animate()  # long time, optional - imagemagick, needs
˓→sage.plot

Animation with 10 frames
Include partial solutions (common prefix between two consecutive solutions):

```sage
# long time, optional - imagemagick,
from sage.all import *
a = T.animate('common_prefix')
```

Incremental solutions (one piece removed or added at a time):

```sage
# long time (2s), optional - imagemagick,
a = T.animate('incremental')
```
coord_to_int_dict()

Return a dictionary mapping coordinates to integers.

OUTPUT:

dict

EXAMPLES:

```python
sage: from sage.combinat.tiling import TilingSolver, Polyomino
sage: p = Polyomino([(0,0,0)])
```

```python
t = Polyomino([(0,0,0), (0,0,1)])
```

```python
r = Polyomino([(0,0,0), (0,0,1), (0,0,2)])
```

```python
S = TilingSolver([p,q,r], box=(1,1,6))
```

```python
A = S.coord_to_int_dict()
```

```python
sorted(A.items())
```

```python
[((0, 0, 0), 3), ((0, 0, 1), 4), ((0, 0, 2), 5),
 ((0, 0, 3), 6), ((0, 0, 4), 7), ((0, 0, 5), 8)]
```

```python
>>> from sage.all import *
>>> from sage.combinat.tiling import TilingSolver, Polyomino
>>> p = Polyomino([(Integer(0),Integer(0),Integer(0))])
```

```python
t = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0),Integer(1))])
```

```python
r = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0),Integer(1)), (Integer(0),Integer(0),Integer(2))])
```

```python
S = TilingSolver([p,q,r], box=(Integer(1),Integer(1),Integer(6)))
```

```python
A = S.coord_to_int_dict()
```

```python
sorted(A.items())
```

```python
[((0, 0, 0), 3), ((0, 0, 1), 4), ((0, 0, 2), 5),
 ((0, 0, 3), 6), ((0, 0, 4), 7), ((0, 0, 5), 8)]
```

Reusable pieces:

```python
sage: p = Polyomino([(0,0), (0,1)])
```

```python
t = Polyomino([(0,0), (0,1), (1,0), (1,1)])
```

```python
S = TilingSolver([p,q], box=[3,2], reusable=True)
```

```python
B = S.coord_to_int_dict()
```

```python
sorted(B.items())
```

```python
[((0, 0), 0), ((0, 1), 1), ((1, 0), 2), ((1, 1), 3),
 ((2, 0), 4), ((2, 1), 5)]
```

```python
>>> from sage.all import *
>>> from sage.combinat.tiling import TilingSolver, Polyomino
>>> p = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0),Integer(1))])
```

```python
t = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0),Integer(1)), (Integer(1),Integer(0))])
```

```python
r = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0),Integer(1)), (Integer(1),Integer(0)), (Integer(1),Integer(1))])
```

```python
S = TilingSolver([p,q,r], box=[Integer(1),Integer(1),Integer(6)], reusable=True)
```

```python
B = S.coord_to_int_dict()
```

```python
sorted(B.items())
```

```python
[((0, 0, 0), 3), ((0, 0, 1), 4), ((0, 0, 2), 5),
 ((0, 0, 3), 6), ((0, 0, 4), 7), ((0, 0, 5), 8)]
```
dlx_solver()

Return the sage DLX solver of that tiling problem.

OUTPUT:

DLX Solver

EXAMPLES:

.. code-block:: python

    sage: from sage.combinat.tiling import TilingSolver, Polyomino
    sage: p = Polyomino([(0,0,0)])
    sage: q = Polyomino([(0,0,0), (0,0,1)])
    sage: r = Polyomino([(0,0,0), (0,0,1), (0,0,2)])
    sage: T = TilingSolver([p,q,r], box=(1,1,6))
    sage: T.dlx_solver()
    Dancing links solver for 9 columns and 15 rows

int_to_coord_dict()

Return a dictionary mapping integers to coordinates.

EXAMPLES:

.. code-block:: python

    sage: from sage.combinat.tiling import TilingSolver, Polyomino
    sage: p = Polyomino([(0,0,0)])
    sage: q = Polyomino([(0,0,0), (0,0,1)])
    sage: r = Polyomino([(0,0,0), (0,0,1), (0,0,2)])
    sage: T = TilingSolver([p,q,r], box=(1,1,6))
    sage: B = T.int_to_coord_dict()
    sage: sorted(B.items())
    [(3, (0, 0, 0)), (4, (0, 0, 1)), (5, (0, 0, 2)),
     (6, (0, 0, 3)), (7, (0, 0, 4)), (8, (0, 0, 5))]

Reusable pieces:
```python
sage: from sage.combinat.tiling import Polyomino, TilingSolver
sage: p = Polyomino([(0,0), (0,1)])
sage: q = Polyomino([(0,0), (0,1), (1,0), (1,1)])

sage: T = TilingSolver([p,q], box=[3,2], reusable=True)

sage: B = T.int_to_coord_dict()

sage: sorted(B.items())
[(0, (0, 0)), (1, (0, 1)), (2, (1, 0)), (3, (1, 1)), (4, (2, 0)), (5, (2, 1))]

sage: from sage.all import *

sage: from sage.combinat.tiling import Polyomino, TilingSolver

sage: p = Polyomino([(Integer(0),Integer(0)), (Integer(0),Integer(1))])

sage: q = Polyomino([(Integer(0),Integer(0)), (Integer(0),Integer(1)), (Integer(1),Integer(0)), (Integer(1),Integer(1))])

sage: T = TilingSolver([p,q], box=[Integer(3),Integer(2)], reusable=True)

sage: B = T.int_to_coord_dict()

sage: sorted(B.items())
[(0, (0, 0)), (1, (0, 1)), (2, (1, 0)), (3, (1, 1)), (4, (2, 0)), (5, (2, 1))]
```

```python
is_suitable()

Return whether the volume of the box is equal to sum of the volume of the polyominoes and the number of rows sent to the DLX solver is larger than zero.

If these conditions are not verified, then the problem is not suitable in the sense that there are no solution.

EXAMPLES:

```python
sage: from sage.combinat.tiling import TilingSolver, Polyomino

sage: p = Polyomino([(0,0,0)])

sage: q = Polyomino([(0,0,0), (0,0,1)])

sage: r = Polyomino([(0,0,0), (0,0,1), (0,0,2)])

sage: T = TilingSolver([p,q,r], box=(1,1,6))

sage: T.is_suitable()
True

sage: T = TilingSolver([p,q,r], box=(1,1,7))

sage: T.is_suitable()
False
```
```
```
```
```
```python
nrows_per_piece()

Return the number of rows necessary by each piece.

OUTPUT:

```
```
```
```
```
```
list

EXAMPLES:

```python
sage: from sage.games.quantumino import QuantuminoSolver
sage: q = QuantuminoSolver(0)
sage: T = q.tiling_solver()
>>> T.nrows_per_piece() # long time (10s)
[360, 360, 360, 360, 360, 180, 180, 672, 672, 360, 360, 180, 180, 360, 360, ...
   -180]
```

```python
>>> from sage.all import *
>>> from sage.games.quantumino import QuantuminoSolver
>>> q = QuantuminoSolver(Integer(0))
>>> T = q.tiling_solver()
>>> T.nrows_per_piece() # long time (10s)
[360, 360, 360, 360, 360, 180, 180, 672, 672, 360, 360, 180, 180, 360, 360, ...
   -180]
```

`number_of_solutions()`

Return the number of distinct solutions.

**OUTPUT:**

integer

**EXAMPLES:**

```python
sage: from sage.combinat.tiling import TilingSolver, Polyomino
sage: p = Polyomino([(0,0)])
sage: q = Polyomino([(0,0), (0,1)])
sage: r = Polyomino([(0,0), (0,1), (0,2)])
sage: T = TilingSolver([p,q,r], box=(1,6))
>>> T.number_of_solutions()
6
```

```python
>>> from sage.all import *
>>> from sage.combinat.tiling import TilingSolver, Polyomino
>>> p = Polyomino([(Integer(0),Integer(0))])
>>> q = Polyomino([(Integer(0),Integer(0)), (Integer(0),Integer(1))])
>>> r = Polyomino([(Integer(0),Integer(0)), (Integer(0),Integer(1)), ...
   - (Integer(0),Integer(2))])
>>> T = TilingSolver([p,q,r], box=(Integer(1),Integer(6)))
>>> T.number_of_solutions()
6
```

```python
sage: T = TilingSolver([p,q,r], box=(1,7))
sage: T.number_of_solutions()
0
```

```python
>>> from sage.all import *
>>> T = TilingSolver([p,q,r], box=(Integer(1),Integer(7)))
>>> T.number_of_solutions()
0
```

`pieces()`

Return the list of pieces.
OUTPUT:

list of 3d polyominoes

EXAMPLES:

```python
sage: from sage.combinat.tiling import TilingSolver, Polyomino
sage: p = Polyomino([(0,0,0)])
```

```python
sage: q = Polyomino([(0,0,0), (0,0,1)])
```

```python
sage: r = Polyomino([(0,0,0), (0,0,1), (0,0,2)])
```

```python
sage: T = TilingSolver([p,q,r], box=(1,1,6))
```

```python
sage: for p in T._pieces: p
Polyomino: [(0, 0, 0)], Color: gray
Polyomino: [(0, 0, 0), (0, 0, 1)], Color: gray
Polyomino: [(0, 0, 0), (0, 0, 1), (0, 0, 2)], Color: gray
```

```python
>>> from sage.all import *
```

```python
>>> from sage.combinat.tiling import TilingSolver, Polyomino
```

```python
>>> a = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0),Integer(1)), (Integer(1),Integer(0),Integer(0))], color=blue)
```

```python
>>> b = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(1),Integer(0),Integer(0)), (Integer(0),Integer(1),Integer(0))], color=red)
```

```python
>>> T = TilingSolver([a,b], box=(Integer(2),Integer(1),Integer(3)))
```

```python
>>> for p in T._pieces: p
Polyomino: [(0, 0, 0)], Color: gray
Polyomino: [(0, 0, 0), (0, 0, 1)], Color: gray
Polyomino: [(0, 0, 0), (0, 0, 1), (0, 0, 2)], Color: gray
```

`row_to_polyomino(row_number)`

Return a polyomino associated to a row.

INPUT:
- row_number -- integer, the $i$-th row

OUTPUT:
polyomino

EXAMPLES:

```python
sage: from sage.combinat.tiling import TilingSolver, Polyomino
sage: a = Polyomino([(0,0,0), (0,0,1), (1,0,0)], color='blue')
```

```python
sage: b = Polyomino([(0,0,0), (1,0,0), (0,1,0)], color='red')
```

```python
sage: T = TilingSolver([a,b], box=(2,1,3))
```

```python
sage: len(T.rows())
16
```

```python
>>> from sage.all import *
```

```python
>>> from sage.combinat.tiling import TilingSolver, Polyomino
```

```python
>>> a = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0),Integer(1)), (Integer(1),Integer(0),Integer(0))], color='blue')
```

```python
>>> b = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(1),Integer(0),Integer(0)), (Integer(0),Integer(1),Integer(0))], color='red')
```

```python
>>> T = TilingSolver([a,b], box=(Integer(2),Integer(1),Integer(3)))
```

```python
>>> len(T.rows())
16
```
rows()

Creation of the rows

EXAMPLES:

```
sage: from sage.combinat.tiling import TilingSolver, Polyomino
sage: p = Polyomino([(0,0,0)])
```
```
sage: q = Polyomino([(0,0,0), (0,0,1)])
```
```
sage: r = Polyomino([(0,0,0), (0,0,1), (0,0,2)])
```
```
sage: T = TilingSolver([p,q,r], box=(1,1,6))
```
```
sage: rows = T.rows()
```
```
sage: for row in rows: row
[0, 3]
[0, 4]
[0, 5]
[0, 6]
[0, 7]
[0, 8]
[1, 3, 4]
[1, 4, 5]
[1, 5, 6]
[1, 6, 7]
[1, 7, 8]
[2, 3, 4, 5]
[2, 4, 5, 6]
[2, 5, 6, 7]
[2, 6, 7, 8]
```
```
rows_for_piece \( (i, \text{mod\_box\_isometries}=False) \)

Return the rows for the \( i \)-th piece.

**INPUT:**

- \( i \) – integer, the \( i \)-th piece
- \( \text{mod\_box\_isometries} \) – bool (default: False), whether to consider only rows for positions up to the action of the quotient the group of isometries of the \( n \)-cube by the subgroup of isometries of the \( a_1 \times a_2 \cdots \times a_n \) rectangular box where the \( a_i \) are assumed to be distinct.

**EXAMPLES:**

```python
sage: from sage.combinat.tiling import TilingSolver, Polyomino
sage: p = Polyomino([(0,0,0)])
sage: q = Polyomino([(0,0,0), (0,0,1)])
sage: r = Polyomino([(0,0,0), (0,0,1), (0,0,2)])
sage: T = TilingSolver([p,q,r], box=(1,1,6))
sage: T.rows_for_piece(0)
[[0, 3], [0, 4], [0, 5], [0, 6], [0, 7], [0, 8]]
sage: T.rows_for_piece(1)
[[1, 3, 4], [1, 4, 5], [1, 5, 6], [1, 6, 7], [1, 7, 8]]
sage: T.rows_for_piece(2)
[[2, 3, 4, 5], [2, 4, 5, 6], [2, 5, 6, 7], [2, 6, 7, 8]]
```

Less rows when using \( \text{mod\_box\_isometries}=True \):

```python
sage: a = Polyomino([(0,0,0), (0,0,1), (1,0,0)])
sage: b = Polyomino([(0,0,0), (1,0,0), (0,1,0)])
sage: T = TilingSolver([a,b], box=(2,1,3))
```

(continues on next page)
sage: T.rows_for_piece(0)
[[0, 2, 3, 5],
 [0, 3, 4, 6],
 [0, 2, 3, 6],
 [0, 3, 4, 7],
 [0, 3, 6, 7],
 [0, 3, 5, 6],
 [0, 4, 6, 7]]

sage: T.rows_for_piece(0, mod_box_isometries=True)
[[0, 2, 3, 5], [0, 3, 4, 6]]

sage: T.rows_for_piece(1, mod_box_isometries=True)
[[1, 2, 3, 5], [1, 3, 4, 6]]

>>> from sage.all import *

>>> a = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0),
   → Integer(1)), (Integer(1),Integer(0),Integer(0))])

>>> b = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(1),Integer(0),
   → Integer(0)), (Integer(0),Integer(1),Integer(0))])

>>> T = TilingSolver([a,b], box=(Integer(2),Integer(1),Integer(3)))

>>> T.solve(partial=None)

Return an iterator of list of polyominoes that are an exact cover of the box.

INPUT:

• partial -- string (default: None), whether to include partial (incomplete) solutions. It can be one of the following:
  – None – include only complete solution
  – 'common_prefix' – common prefix between two consecutive solutions
  – 'incremental' – one piece change at a time

OUTPUT:

iterator of list of polyominoes

EXAMPLES:

sage: from sage.combinat.tiling import TilingSolver, Polyomino

sage: p = Polyomino([(0,0,0)])

sage: q = Polyomino([(0,0,0), (0,0,1)])

sage: r = Polyomino([(0,0,0), (0,0,1), (0,0,2)])

sage: T = TilingSolver([p,q,r], box=(1,1,6))
sage: it = T.solve()
sage: for p in next(it): p
Polyomino: [(0, 0, 0)], Color: gray
Polyomino: [(0, 0, 1), (0, 0, 2)], Color: gray
Polyomino: [(0, 0, 3), (0, 0, 4), (0, 0, 5)], Color: gray

sage: for p in next(it): p
Polyomino: [(0, 0, 0)], Color: gray
Polyomino: [(0, 0, 1), (0, 0, 2), (0, 0, 3)], Color: gray
Polyomino: [(0, 0, 4), (0, 0, 5)], Color: gray

sage: for p in next(it): p
Polyomino: [(0, 0, 0), (0, 0, 1)], Color: gray
Polyomino: [(0, 0, 2), (0, 0, 3), (0, 0, 4)], Color: gray
Polyomino: [(0, 0, 5)], Color: gray

Including the partial solutions:

sage: it = T.solve(partial='common_prefix')
sage: for p in next(it): p
Polyomino: [(0, 0, 0)], Color: gray
Polyomino: [(0, 0, 1), (0, 0, 2)], Color: gray
Polyomino: [(0, 0, 3), (0, 0, 4), (0, 0, 5)], Color: gray

sage: for p in next(it): p
Polyomino: [(0, 0, 0)], Color: gray
Polyomino: [(0, 0, 1), (0, 0, 2), (0, 0, 3)], Color: gray
Polyomino: [(0, 0, 4), (0, 0, 5)], Color: gray

sage: for p in next(it): p
Polyomino: [(0, 0, 0), (0, 0, 1)], Color: gray
Polyomino: [(0, 0, 2), (0, 0, 3), (0, 0, 4)], Color: gray
Polyomino: [(0, 0, 5)], Color: gray

>>> from sage.all import *
>>> from sage.combinat.tiling import TilingSolver, Polyomino

>>> p = Polyomino([(Integer(0),Integer(0),Integer(0))])
>>> q = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0),-Integer(1))])
>>> r = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0),-Integer(1)), (Integer(0),Integer(0),Integer(2))])
>>> T = TilingSolver([p,q,r], box=(Integer(1),Integer(1),Integer(6)))
>>> it = T.solve()

>>> for p in next(it): p
Polyomino: [(0, 0, 0)], Color: gray
Polyomino: [(0, 0, 1), (0, 0, 2)], Color: gray
Polyomino: [(0, 0, 3), (0, 0, 4), (0, 0, 5)], Color: gray

>>> for p in next(it): p
Polyomino: [(0, 0, 0)], Color: gray
Polyomino: [(0, 0, 1), (0, 0, 2), (0, 0, 3)], Color: gray
Polyomino: [(0, 0, 4), (0, 0, 5)], Color: gray

>>> for p in next(it): p
Polyomino: [(0, 0, 0), (0, 0, 1)], Color: gray
Polyomino: [(0, 0, 2), (0, 0, 3), (0, 0, 4)], Color: gray
Polyomino: [(0, 0, 5)], Color: gray
from sage.all import *

it = T.solve(partial='common_prefix')
for p in next(it):
    Polyomino: [(0, 0, 0)], Color: gray
    Polyomino: [(0, 0, 1), (0, 0, 2)], Color: gray
    Polyomino: [(0, 0, 3), (0, 0, 4), (0, 0, 5)], Color: gray

for p in next(it):
    Polyomino: [(0, 0, 0)], Color: gray

for p in next(it):
    Polyomino: [(0, 0, 0)], Color: gray

for p in next(it):
    Polyomino: [(0, 0, 0)], Color: gray
    Polyomino: [(0, 0, 1), (0, 0, 2), (0, 0, 3)], Color: gray
    Polyomino: [(0, 0, 4), (0, 0, 5)], Color: gray

for p in next(it):
    Polyomino: [(0, 0, 0), (0, 0, 1)], Color: gray
    Polyomino: [(0, 0, 2), (0, 0, 3), (0, 0, 4)], Color: gray
    Polyomino: [(0, 0, 5)], Color: gray

Colors are preserved when the polyomino can be reused:

```
sage: p = Polyomino([(0,0,0)], color='yellow')
sage: q = Polyomino([(0,0,0), (0,0,1)], color='yellow')
sage: r = Polyomino([(0,0,0), (0,0,1), (0,0,2)], color='yellow')
sage: T = TilingSolver([p,q,r], box=(1,1,6), reusable=True)
sage: it = T.solve()
sage: for p in next(it):
    Polyomino: [(0, 0, 0)], Color: yellow
    Polyomino: [(0, 0, 1)], Color: yellow
    Polyomino: [(0, 0, 2)], Color: yellow
    Polyomino: [(0, 0, 3)], Color: yellow
    Polyomino: [(0, 0, 4)], Color: yellow
    Polyomino: [(0, 0, 5)], Color: yellow
```

```
>>> from sage.all import *
>>> p = Polyomino([(Integer(0),Integer(0),Integer(0))], color='yellow')
>>> q = Polyomino([(Integer(0),Integer(0),Integer(1))], color='yellow')
>>> r = Polyomino([(Integer(0),Integer(0),Integer(1)), (Integer(0),Integer(0),Integer(2))], color='yellow')
>>> T = TilingSolver([p,q,r], box=(Integer(1),Integer(1),Integer(6)), reusable=True)
>>> it = T.solve()
>>> for p in next(it):
    Polyomino: [(0, 0, 0)], Color: yellow
    Polyomino: [(0, 0, 1)], Color: yellow
    Polyomino: [(0, 0, 2)], Color: yellow
    Polyomino: [(0, 0, 3)], Color: yellow
    Polyomino: [(0, 0, 4)], Color: yellow
    Polyomino: [(0, 0, 5)], Color: yellow
```

```
>>> from sage.all import *
>>> p = Polyomino([(Integer(0),Integer(0),Integer(0))], color='yellow')
>>> q = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0),Integer(1))], color='yellow')
>>> r = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0),Integer(1)), (Integer(0),Integer(0),Integer(2))], color='yellow')
>>> T = TilingSolver([p,q,r], box=(Integer(1),Integer(1),Integer(6)), reusable=True)
>>> it = T.solve()
>>> for p in next(it):
    Polyomino: [(0, 0, 0)], Color: yellow
    Polyomino: [(0, 0, 1)], Color: yellow
    Polyomino: [(0, 0, 2)], Color: yellow
    Polyomino: [(0, 0, 3)], Color: yellow
    Polyomino: [(0, 0, 4)], Color: yellow
    Polyomino: [(0, 0, 5)], Color: yellow
```

```
```

space()

Return an iterator over all the non negative integer coordinates contained in the space to tile.

EXAMPLES:

```
sage: from sage.combinat.tiling import TilingSolver, Polyomino
sage: p = Polyomino([(0,0,0)])
```
sage: q = Polyomino([(0,0,0), (0,0,1)])
sage: r = Polyomino([(0,0,0), (0,0,1), (0,0,2)])
sage: T = TilingSolver([p,q,r], box=(1,1,6))
sage: list(T.space())
[(0, 0, 0), (0, 0, 1), (0, 0, 2), (0, 0, 3), (0, 0, 4), (0, 0, 5)]

### starting_rows()

Return the starting rows for each piece.

**EXAMPLES:**

```python
sage: from sage.combinat.tiling import TilingSolver, Polyomino
sage: p = Polyomino([(0,0,0)])
sage: q = Polyomino([(0,0,0), (0,0,1)])
sage: r = Polyomino([(0,0,0), (0,0,1), (0,0,2)])
sage: T = TilingSolver([p,q,r], box=(1,1,6))
sage: T.starting_rows()
[0, 6, 11, 15]
```

```python
>>> from sage.all import *
>>> from sage.combinat.tiling import TilingSolver, Polyomino
>>> p = Polyomino([(Integer(0),Integer(0),Integer(0))])
>>> q = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0), Integer(1))])
>>> r = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0), Integer(1)), (Integer(0),Integer(0),Integer(2))])
>>> T = TilingSolver([p,q,r], box=(Integer(1),Integer(1),Integer(6)))
>>> T.starting_rows()
[0, 6, 11, 15]
```

`sage.combinat.tiling.ncube_isometry_group` *(n, orientation_preserving=True)*

Return the isometry group of the \(n\)-cube as a list of matrices.

**INPUT:**

- \(n\) – positive integer, dimension of the space
- `orientation_preserving` – bool (default: True), whether the orientation is preserved

**OUTPUT:**

list of matrices

**EXAMPLES:**

```python
sage: from sage.combinat.tiling import ncube_isometry_group
sage: ncube_isometry_group(2)
```

(continues on next page)
The Combinatorics, Release 10.4

sage.combinat.tiling.ncube_isometry_group_cosets (orientation_preserving=True)

Return the quotient of the isometry group of the $n$-cube by the isometry group of the rectangular parallelepiped.

**INPUT:**
- $n$ – positive integer, dimension of the space
- orientation_preserving – bool (default: True), whether the orientation is preserved

**OUTPUT:**
list of cosets, each coset being a sorted list of matrices

**EXAMPLES:**

```python
sage: from sage.combinat.tiling import ncube_isometry_group_cosets
sage: sorted(ncube_isometry_group_cosets(2))
[[[-1 0] [1 0]
  [0 -1] [0 1]]
, [[0 -1] [0 1]
  [1 0] [-1 0]]
]
```

```python
sage: sorted(ncube_isometry_group_cosets(2, False))
[[[-1 0] [-1 0] [1 0] [1 0]
  [0 -1] [0 1] [0 -1] [0 1]]
, [[0 -1] [0 -1] [0 1] [0 1]
  [-1 0] [1 0] [-1 0] [1 0]]
]
```

```python
>>> from sage.all import *
>>> from sage.combinat.tiling import ncube_isometry_group_cosets
>>> sorted(ncube_isometry_group_cosets(Integer(2)))
[[[-1 0] [1 0]
  [0 -1] [0 1]]
, [[0 -1] [0 1]
  [1 0] [-1 0]]
]
>>> sorted(ncube_isometry_group_cosets(Integer(2), False))

]]

```
5.1.350 Transitive ideal closure tool

`sage.combinat.tools.transitive_ideal(f, x)`

Return a list of all elements reachable from `x` in the abstract reduction system whose reduction relation is given by
the function `f`.

In more elementary terms:

If `S` is a set, and `f` is a function sending every element of `S` to a list of elements of `S`, then we can define a digraph
on the vertex set `S` by drawing an edge from `s` to `t` for every `s ∈ S` and every `t ∈ f(s)`.

If `x ∈ S`, then an element `y ∈ S` is said to be reachable from `x` if there is a path `x → y` in this graph.

Given `f` and `x`, this method computes the list of all elements of `S` reachable from `x`.

Note that if there are infinitely many such elements, then this method will never halt.

For more powerful versions, see `sage.combinat.backtrack`

**EXAMPLES:**

```python
sage: f = lambda x: [x-1] if x > 0 else []
sage: sage.combinat.tools.transitive_ideal(f, 10)
[0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10]
```

```python
>>> from sage.all import *
>>> f = lambda x: [x-Integer(1)] if x > Integer(0) else []
>>> sage.combinat.tools.transitive_ideal(f, Integer(10))
[0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10]
```

5.1.351 Combinatorial triangles for posets and fans

This provides several classes and methods to convert between them. Elements of the classes are polynomials in two
variables `x` and `y`, possibly with other parameters. The conversion methods amount to specific invertible rational
change-of-variables involving `x` and `y`.

These polynomial are called triangles because their supports, the sets of exponents where their coefficients can be non-zero,
have a triangular shape.

The M-triangle class is motivated by the generating series of Möbius numbers for graded posets. A typical example is:

```python
sage: W = SymmetricGroup(4)
# needs sage.groups
sage: posets.NoncrossingPartitions(W).M_triangle()
# needs sage.graphs sage.groups
M: x^3*y^3 - 6*x^2*y^3 + 6*x^2*y^2 + 10*x*y^3 - 16*x*y^2
- 5*y^3 + 6*x*y + 10*y^2 - 6*y + 1
sage: unicode_art(_)
# needs sage.graphs sage.groups sage.modules
```

| -5 10 -6 1 |
| 10 -16 6 0 |
| -6 6 0 0 |
| 1 0 0 0 |
The F-triangle class is motivated by the generating series of pure simplicial complexes endowed with a distinguished facet. One can also think about complete fans endowed with a distinguished maximal cone. A typical example is:

```python
sage: C = ClusterComplex(['A',3])
sage: f = C.greedy_facet()
sage: C.F_triangle(f)
F: 5*x^3 + 5*x^2*y + 3*x*y^2 + y^3 + 10*x^2 + 8*x*y + 3*y^2 + 6*x + 3*y + 1
sage: unicode_art(_)
\[
\begin{pmatrix}
1 & 0 & 0 & 0 \\
3 & 3 & 0 & 0 \\
3 & 8 & 5 & 0 \\
1 & 6 & 10 & 5
\end{pmatrix}
\]
```

The H-triangles are related to the F-triangles by a relationship similar to the classical link between the f-vector and the h-vector of a simplicial complex.

The Gamma-triangles are related to the H-triangles by an analog of the relationship between gamma-vectors and h-vectors of flag simplicial complexes.

```python
class sage.combinat.triangles_FHM.F_triangle(poly, variables=None)
Bases: Triangle

Class for the F-triangles.

h()

Return the associated H-triangle.

EXAMPLES:

```
sage: ft = F_triangle(1+x+y)
sage: ft.h()
H: x*y + 1

>>> from sage.all import *
>>> from sage.combinat.triangles_FHM import F_triangle
>>> x, y = polygens(ZZ,'x,y')
>>> ft = F_triangle(Integer(1)+x+y)
>>> ft.h()
H: x*y + 1

m()

Return the associated M-triangle.

**EXAMPLES:**

sage: from sage.combinat.triangles_FHM import H_triangle
sage: x, y = polygens(ZZ,'x,y')

sage: H_triangle(1+x*y).f()
F: x + y + 1
sage: _.m()
M: x*y - y + 1

sage: H_triangle(x^2*y^2 + 2*x*y + x + 1).f()
F: 2*x^2 + 2*x*y + y^2 + 3*x + 2*y + 1
sage: _.m()
M: x^2*y^2 - 3*x*y^2 + 3*x*y + 2*y^2 - 3*y + 1

vector()

Return the f-vector as a polynomial in one variable.

This is obtained by letting \( y = x \).

**EXAMPLES:**

sage: from sage.combinat.triangles_FHM import F_triangle
sage: x, y = polygen(ZZ,'x,y')
sage: ft = 2*x^2 + 2*x*y + y^2 + 3*x + 2*y + 1
sage: F_triangle(ft).vector()
5*x^2 + 5*x + 1
```python
>>> from sage.all import *
>>> from sage.combinat.triangles_FHM import F_triangle
>>> x, y = polygen(ZZ,'x,y')
>>> ft = Integer(2)*x**Integer(2) + Integer(2)*x*y + y**Integer(2) +
    Integer(3)*x + Integer(2)*y + Integer(1)
>>> F_triangle(ft).vector()
5*x^2 + 5*x + 1
```

class sage.combinat.triangles_FHM.Gamma_triangle(poly, variables=None)

Bases: Triangle

Class for the Gamma-triangles.

h()

Return the associated H-triangle.

The transition between Gamma-triangles and H-triangles is defined by

\[ H(x, y) = (1 + x)^d \sum_{0 \leq i, 0 \leq j \leq d-2i} \gamma_{i,j} \left( \frac{x}{(1+x)^2} \right)^i \left( \frac{1+xy}{1+x} \right)^j \]

EXAMPLES:

```python
sage: from sage.combinat.triangles_FHM import Gamma_triangle
sage: x, y = polygen(ZZ,'x,y')
\sage: g = y**2 + x
\sage: Gamma_triangle(g).h()
H: x^2*y^2 + 2*x*y + x + 1
\sage: a, b = polygen(ZZ, 'a, b')
\sage: x, y = polygens(a.parent(),'x,y')
\sage: g = Gamma_triangle(y**3+a*x*y+b*x,(x,y))
\sage: hh = g.h()
\sage: hh.gamma() == g
True
```

vector()

Return the gamma-vector as a polynomial in one variable.

This is obtained by letting \( y = 1 \).

EXAMPLES:
```python
sage: from sage.combinat.triangles_FHM import Gamma_triangle
sage: x, y = polygen(ZZ,'x,y')
sage: gt = y**2 + x
sage: Gamma_triangle(gt).vector()
x + 1
```

```python
>>> from sage.all import *
>>> from sage.combinat.triangles_FHM import Gamma_triangle
>>> x, y = polygen(ZZ,'x,y')
>>> gt = y**Integer(2) + x
>>> Gamma_triangle(gt).vector()
x + 1
```

```python
class sage.combinat.triangles_FHM.H_triangle(poly, variables=None)
Bases: Triangle

Class for the H-triangles.

f()

Return the associated F-triangle.

EXAMPLES:

```python
sage: from sage.combinat.triangles_FHM import H_triangle
sage: x, y = polygens(ZZ,'x,y')

sage: H_triangle(1+x*y).f()
F: x + y + 1
sage: H_triangle(x**2*y**2 + 2*x*y + x + Integer(1)).f()
F: 2*x^2 + 2*x*y + y^2 + 3*x + 2*y + 1
sage: flo = H_triangle(Integer(1)+4*x+2*x**2+x*y*(4+8*x)+x**2*y**2*(6+4*x)+4*(x*y)**3+(x*y)**4).f(); flo
F: 7*x^4 + 12*x^3*y + 10*x^2*y^2 + 4*x*y^3 + y^4 + 20*x^3 + 28*x^2*y + 16*x*y^2 + 4*y^3 + 20*x^2 + 20*x*y + 6*y^2 + 8*x + 4*y + 1
sage: flo(-1-x,-1-y) == flo
True
```

```python
>>> from sage.all import *
>>> from sage.combinat.triangles_FHM import H_triangle

>>> H_triangle(Integer(1)+x*y).f()
F: x + y + 1
```

```python
>>> H_triangle(x**Integer(2)*y**Integer(2) + Integer(2)*x*y + x + Integer(1)).f()
F: 2*x^2 + 2*x*y + y^2 + 3*x + 2*y + 1
```

```python
>>> flo = H_triangle(Integer(1)+Integer(4)*x+Integer(2)*x**Integer(2)+x*y*(Integer(4)+Integer(8)*x)+x**2*y**2*(Integer(6)+Integer(4)*x)+Integer(4)*(x*y)**3+(x*y)**4).f(); flo
F: 7*x^4 + 12*x^3*y + 10*x^2*y^2 + 4*x*y^3 + y^4 + 20*x^3 + 28*x^2*y + 16*x*y^2 + 4*y^3 + 20*x^2 + 20*x*y + 6*y^2 + 8*x + 4*y + 1
>>> flo(-Integer(1)-x,-Integer(1)-y) == flo
True
```

```python
gamma()

Return the associated Gamma-triangle.
```
In some cases, this is a more condensed way to encode the same amount of information.

EXAMPLES:

```
sage: from sage.combinat.triangles_FHM import H_triangle
sage: x, y = polygen(ZZ, 'x, y')
sage: ht = x**2*y**2 + 2*x*y + x + 1
sage: H_triangle(ht).gamma()
Γ: y^2 + x

sage: W = SymmetricGroup(5) # needs sage.groups
  → needs sage.graphs sage.groups
sage: P = posets.NoncrossingPartitions(W) # needs sage.graphs sage.groups
sage: P.M_triangle().h().gamma()
Γ: y^4 + 3*x*y^2 + 2*x^2 + 2*x*y + x
```

Return the associated M-triangle.

EXAMPLES:

```
sage: from sage.combinat.triangles_FHM import H_triangle
sage: h = polygen(ZZ, 'h')
sage: x, y = polygens(h.parent(), 'x, y')
sage: ht = H_triangle(x**2*y**2 + 2*x*y + 2*x*h - 4*x + 1, variables=[x,y])
sage: ht.m()
M: x^2*y^2 + (-2*h + 2)*x*y^2 + (2*h - 2)*x*y + (2*h - 3)*y^2 + (-2*h + 2)*y + 1
```

Return the transposed H-triangle.
OUTPUT:

another H-triangle

This operation is an involution. When seen as a matrix, it performs a symmetry with respect to the northwest-southeast diagonal.

EXAMPLES:

```
sage: from sage.combinat.triangles_FHM import H_triangle
sage: x, y = polygens(ZZ, 'x, y')
sage: H_triangle(1+x*y).transpose()  
H: x*y + 1
sage: H_triangle(x^2*y^2 + 2*x*y + x + 1).transpose()  
H: x^2*y^2 + x^2*y + 2*x*y + 1
```

```
>>> from sage.all import *
>>> from sage.combinat.triangles_FHM import H_triangle
>>> x, y = polygens(ZZ, 'x, y')
>>> H_triangle(Integer(1)+x*y).transpose()  
H: x*y + 1
>>> H_triangle(x**Integer(2)*y**Integer(2) + Integer(2)*x*y + x + Integer(1)).transpose()  
H: x^2*y^2 + x^2*y + 2*x*y + 1
```

```
vector()  
Return the h-vector as a polynomial in one variable.
This is obtained by letting $y = 1$.

EXAMPLES:

```
sage: from sage.combinat.triangles_FHM import H_triangle
sage: x, y = polygen(ZZ, x, y)
sage: ht = x**2*y**2 + 2*x*y + x + 1
sage: H_triangle(ht).vector()  
x^2 + 3*x + 1
```

```
>>> from sage.all import *
>>> from sage.combinat.triangles_FHM import H_triangle
>>> x, y = polygen(ZZ, x, y)
>>> ht = x**Integer(2)*y**Integer(2) + Integer(2)*x*y + x + Integer(1)
>>> H_triangle(ht).vector()  
x^2 + 3*x + 1
```

```
class sage.combinat.triangles_FHM.M_triangle(poly, variables=None)

Bases: Triangle

Class for the M-triangles.
This is motivated by generating series of Möbius numbers of graded posets.

EXAMPLES:

```
sage: x, y = polygens(ZZ, 'x, y')
sage: P = Poset({2: [1]})  
# needs sage.graphs  
sage: P.M_triangle()  
M: x*y - y + 1
```
```
```
\begin{verbatim}
>>> from sage.all import *
>>> x, y = polygens(ZZ, 'x,y')
>>> P = Poset({Integer(2): [Integer(1)]})
    # needs sage.graphs
>>> P.M_triangle()
    # needs sage.graphs
M: x*y - y + 1
\end{verbatim}

dual()

Return the dual M-triangle.

This is the M-triangle of the dual poset, hence an involution.

When seen as a matrix, this performs a symmetry with respect to the northwest-southeast diagonal.

EXAMPLES:

\begin{verbatim}
sage: from sage.combinat.triangles_FHM import M_triangle
sage: x, y = polygens(ZZ, 'x,y')
sage: mt = M_triangle(x*y - y + 1)
sage: mt.dual() == mt
True
\end{verbatim}

f()

Return the associated F-triangle.

EXAMPLES:

\begin{verbatim}
sage: from sage.combinat.triangles_FHM import M_triangle
sage: x, y = polygens(ZZ, 'x,y')
sage: M_triangle(1-y+x*y).f()
F: x + y + 1
\end{verbatim}

h()

Return the associated H-triangle.

EXAMPLES:

\begin{verbatim}
sage: from sage.combinat.triangles_FHM import M_triangle
sage: x, y = polygens(ZZ, 'x,y')
sage: M_triangle(1-y+x*y).h()
H: x*y + 1
\end{verbatim}
transmute()

Return the image of self by an involution.

OUTPUT:

another M-triangle

The involution is defined by converting to an H-triangle, transposing the matrix, and then converting back to
an M-triangle.

EXAMPLES:

```python
sage: from sage.combinat.triangles_FHM import M_triangle
sage: x, y = polygens(ZZ, 'x,y')
```

(continues on next page)
sage: unicode_art(ht)  # needs sage.modules
\[
\begin{pmatrix}
0 & 2 \\
1 & 4 \\
\end{pmatrix}
\]

```python
>>> from sage.all import *
>>> from sage.combinat.triangles_FHM import Triangle
>>> x, y = polygens(ZZ, 'x,y')
>>> ht = Triangle(Integer(1)+Integer(4)*x+Integer(2)*x*y)
>>> unicode_art(ht)  # needs sage.modules
\[
\begin{pmatrix}
0 & 2 \\
1 & 4 \\
\end{pmatrix}
\]
```

matrix()

Return the associated matrix for display.

**EXAMPLES:**

```python
sage: from sage.combinat.triangles_FHM import H_triangle
sage: x, y = polygens(ZZ, 'x,y')
sage: h = H_triangle(1+2*x*y)
sage: h.matrix()  # needs sage.modules
\[
\begin{pmatrix}
0 & 2 \\
1 & 0 \\
\end{pmatrix}
\]
```

polynomial()

Return the triangle as a bare polynomial.

**EXAMPLES:**

```python
sage: from sage.combinat.triangles_FHM import H_triangle
sage: x, y = polygens(ZZ, 'x,y')
sage: h = H_triangle(1+2*x*y)
sage: h.polynomial()
2*x*y + 1
```

```python
>>> from sage.all import *
>>> from sage.combinat.triangles_FHM import H_triangle
>>> x, y = polygens(ZZ, 'x,y')
>>> h = H_triangle(Integer(1)+Integer(2)*x*y)
>>> h.polynomial()
2*x*y + 1
```

truncate \(d\)

Return the truncated triangle.
INPUT:

- $d$ – integer

As a polynomial, this means that all monomials with a power of either $x$ or $y$ greater than or equal to $d$ are dismissed.

EXAMPLES:

```python
sage: from sage.combinat.triangles_FHM import H_triangle
sage: x, y = polygens(ZZ, 'x','y')
>>> h = H_triangle(1+2*x*y)
>>> h.truncate(2)
H: 2*x*y + 1
```

5.1.352 Tuples

class sage.combinat.tuple.Tuples($S$, $k$)

Bases: Parent, UniqueRepresentation

Return the enumerated set of ordered tuples of $S$ of length $k$.

An ordered tuple of length $k$ of set is an ordered selection with repetition and is represented by a list of length $k$ containing elements of set.

EXAMPLES:

```python
sage: S = [1,2]
sage: Tuples(S,3).list()
[(1, 1, 1), (2, 1, 1), (1, 2, 1), (2, 2, 1), (1, 1, 2),
 (2, 1, 2), (1, 2, 2), (2, 2, 2)]
```
(continued from previous page)

\[(s', i'), (t', i'), (e', i'), (i', i'), (n', i'),
(s', n'), (t', n'), (e', n'), (i', n'), (n', n')\]

```python
sage: K.<a> = GF(4, 'a')
# needs sage.rings.finite_rings
mset = sorted((x for x in K if x != 0), key=str)
# needs sage.rings.finite_rings
Tuples(mset, 2).list()
# needs sage.rings.finite_rings
[(1, 1), (a, 1), (a + 1, 1),
(1, a), (a, a), (a + 1, a),
(1, a + 1), (a, a + 1), (a + 1, a + 1)]
```

```python
>>> from sage.all import *
>>> K = GF(Integer(4), 'a', names=('a',)); (a,) = K._first_ngens(1)
# needs sage.rings.finite_rings
mset = sorted((x for x in K if x != Integer(0)), key=str)
# needs sage.rings.finite_rings
Tuples(mset, Integer(2)).list()
# needs sage.rings.finite_rings
[(1, 1), (a, 1), (a + 1, 1),
(1, a), (a, a), (a + 1, a),
(1, a + 1), (a, a + 1), (a + 1, a + 1)]
```

cardinality()

EXAMPLES:

```python
sage: S = [1,2,3,4,5]
sage: Tuples(S,2).cardinality()
25
sage: S = [1,1,2,3,4,5]
sage: Tuples(S,2).cardinality()
25
```

```python
>>> from sage.all import *
>>> S = [Integer(1),Integer(2),Integer(3),Integer(4),Integer(5)]
>>> Tuples(S,Integer(2)).cardinality()
25
>>> S = [Integer(1),Integer(1),Integer(2),Integer(3),Integer(4),Integer(5)]
>>> Tuples(S,Integer(2)).cardinality()
25
```

sage.combinat.tuple.Tuples_sk

alias of :class:`Tuples`

class sage.combinat.tuple.UnorderedTuples($S, k$)

**Bases:** :class:`Parent`, :class:`UniqueRepresentation`

Return the enumerated set of unordered tuples of $S$ of length $k$.

An unordered tuple of length $k$ of set is an unordered selection with repetitions of set and is represented by a sorted list of length $k$ containing elements from set.

EXAMPLES:
Sage: S = [1,2]
Sage: UnorderedTuples(S,3).list()
[(1, 1, 1), (1, 1, 2), (1, 2, 2), (2, 2, 2)]
Sage: UnorderedTuples(['a','b','c'],2).list()
['(a', 'a'), ('a', 'b'), ('a', 'c'), ('b', 'b'), ('b', 'c'), ('c', 'c')]

>>> from sage.all import *
>>> S = [Integer(1),Integer(2)]
>>> UnorderedTuples(S,Integer(3)).list()
[(1, 1, 1), (1, 1, 2), (1, 2, 2), (2, 2, 2)]
>>> UnorderedTuples(['a','b','c'],Integer(2)).list()
['(a', 'a'), ('a', 'b'), ('a', 'c'), ('b', 'b'), ('b', 'c'), ('c', 'c')]

cardinality()

EXAMPLES:

Sage: S = [1,2,3,4,5]
Sage: UnorderedTuples(S,2).cardinality()
15

>>> from sage.all import *
>>> S = [Integer(1),Integer(2),Integer(3),Integer(4),Integer(5)]
>>> UnorderedTuples(S,Integer(2)).cardinality()
15

sage.combinat.tuple.UnorderedTuples_sk
alias of UnorderedTuples

5.1.353 Introduction to combinatorics in Sage

This thematic tutorial is a translation by Hugh Thomas of the combinatorics chapter written by Nicolas M. Thiéry in the book “CalculMathématiqueavecSage” [CMS2012]. It covers mainly the treatment in _Sage_ of the following combinatorial problems: enumeration (how many elements are there in a set $S$?), listing (generate all the elements of $S$, or iterate through them), and random selection (choosing an element at random from a set $S$ according to a given distribution, for example the uniform distribution). These questions arise naturally in the calculation of probabilities (what is the probability in poker of obtaining a straight or a four-of-a-kind of aces?), in statistical physics, and also in computer algebra (the number of elements in a finite field), or in the analysis of algorithms. Combinatorics covers a much wider domain (partial orders, representation theory, …) for which we only give a few pointers towards the possibilities offered by _Sage_.

**Todo:** Add link to some thematic tutorial on graphs

A characteristic of computational combinatorics is the profusion of types of objects and sets that one wants to manipulate. It would be impossible to describe them all or, a fortiori, to implement them all. After some _Initial examples_, this chapter illustrates the underlying method: supplying the basic building blocks to describe common combinatorial sets _Common enumerated sets_, tools for combining them to construct new examples _Constructions_, and generic algorithms for solving uniformly a large class of problems _Generic algorithms_.

This is a domain in which _Sage_ has much more extensive capabilities than most computer algebra systems, and it is rapidly expanding; at the same time, it is still quite new, and has many unnecessary limitations and incoherences.
Initial examples

Poker and probability

We begin by solving a classic problem: enumerating certain combinations of cards in the game of poker, in order to deduce their probability.

A card in a poker deck is characterized by a suit (hearts, diamonds, spades, or clubs) and a value (2, 3, ..., 10, jack, queen, king, ace). The game is played with a full deck, which consists of the Cartesian product of the set of suits and the set of values:

\[
\text{Cards} = \text{Suits} \times \text{Values} = \{(s, v) \mid s \in \text{Suits} \text{ and } v \in \text{Values}\}.
\]

We construct these examples in Sage:

```python
sage: Suits = Set(['Hearts', 'Diamonds', 'Spades', 'Clubs'])
sage: Values = Set([2, 3, 4, 5, 6, 7, 8, 9, 10, 'Jack', 'Queen', 'King', 'Ace'])
sage: Cards = cartesian_product([Values, Suits])
```

There are 4 suits and 13 possible values, and therefore \(4 \times 13 = 52\) cards in the poker deck:

```python
sage: Suits.cardinality()
4
sage: Values.cardinality()
13
sage: Cards.cardinality()
52
```

Draw a card at random:

```python
sage: Cards.random_element()  # random
(6, 'Clubs')
```

Now we can define a set of cards:
This problem should eventually disappear: it is planned to change the implementation of Cartesian products so that their elements are immutable by default.

Returning to our main topic, we will be considering a simplified version of poker, in which each player directly draws five cards, which form his hand. The cards are all distinct and the order in which they are drawn is irrelevant; a hand is therefore a subset of size 5 of the set of cards. To draw a hand at random, we first construct the set of all possible hands, and then we ask for a randomly chosen element:

```
sage: Hands = Subsets(Cards, 5)
sage: Hands.random_element() # random
{(4, 'Hearts'), (9, 'Diamonds'), (8, 'Spades'), (9, 'Clubs'), (7, 'Hearts')}
```

The total number of hands is given by the number of subsets of size 5 of a set of size 52, which is given by the binomial coefficient \( \binom{52}{5} \):

```
sage: binomial(52,5)
2598960
```

One can also ignore the method of calculation, and simply ask for the size of the set of hands:

```
sage: Hands.cardinality()
2598960
```

The strength of a poker hand depends on the particular combination of cards present. One such combination is the flush; this is a hand all of whose cards have the same suit. (In principle, straight flushes should be excluded; this will be the goal of an exercise given below.) Such a hand is therefore characterized by the choice of five values from among the thirteen possibilities, and the choice of one of four suits. We will construct the set of all flushes, so as to determine how many there are:

```
sage: Flushes = cartesian_product([Subsets(Values, 5), Suits])
sage: Flushes.cardinality()
5148
```
The probability of obtaining a flush when drawing a hand at random is therefore:

```
sage: Flashes.cardinality() / Hands.cardinality()
33/16660
```

or about two in a thousand:

```
sage: 1000.0 * Flashes.cardinality() / Hands.cardinality()
1.98079231692677
```

We will now attempt a little numerical simulation. The following function tests whether a given hand is a flush or not:

```
sage: def is_flush(hand):
    ....:     return len(set(suit for (val, suit) in hand)) == 1
```

We now draw 10000 hands at random, and count the number of flushes obtained (this takes about 10 seconds):

```
sage: n = 10000
sage: nflush = 0
sage: for i in range(n): # long time
    ....:     hand = Hands.random_element()
    ....:     if is_flush(hand):
    ....:         nflush += 1
sage: n, nflush # random
(10000, 18)
```

```python
>>> n = Integer(10000)
>>> nflush = Integer(0)
>>> for i in range(n): # long time
...     hand = Hands.random_element()
...     if is_flush(hand):
...         nflush += Integer(1)
>>> n, nflush # random
(10000, 18)
```
**Exercises**

A hand containing four cards of the same value is called a *four of a kind*. Construct the set of four of a kind hands (Hint: use *Arrangements* to choose a pair of distinct values at random, then choose a suit for the first value). Calculate the number of four of a kind hand, list them, and then determine the probability of obtaining a four of a kind when drawing a hand at random.

A hand all of whose cards have the same suit, and whose values are consecutive, is called a *straight flush* rather than a *flush*. Count the number of straight flushes, and then deduce the correct probability of obtaining a flush when drawing a hand at random.

Calculate the probability of each of the poker hands (see Wikipedia article *Poker hands*), and compare them with the results of simulations.

**Enumeration of trees using generating functions**

In this section, we discuss the example of complete binary trees, and illustrate in this context many techniques of enumeration in which formal power series play a natural role. These techniques are quite general, and can be applied whenever the combinatorial objects in question admit a recursive definition (grammar) (see *Species, decomposable combinatorial classes* for an automated treatment). The goal is not a formal presentation of these methods; the calculations are rigorous, but most of the justifications will be skipped.

A *complete binary tree* is either a leaf L, or a node to which two complete binary trees are attached (see *Figure: The five complete binary trees with four leaves*).

**Fig. 1:** Figure: The five complete binary trees with four leaves

**Exercise: enumeration of binary trees**

Find by hand all the complete binary trees with \( n = 1, 2, 3, 4, 5 \) leaves (see *Exercise: complete binary tree iterator* to find them using *Sage*).

Our goal is to determine the number \( c_n \) of complete binary trees with \( n \) leaves (in this section, except when explicitly stated otherwise, “trees” always means complete binary trees). This is a typical situation in which one is not only interested in a single set, but in a family of sets, typically parameterized by \( n \in \mathbb{N} \).

According to the solution of *Exercise: enumeration of binary trees*, the first terms are given by \( c_1, \ldots, c_5 = 1, 1, 2, 5, 14 \). The simple fact of knowing these few numbers is already very valuable. In fact, this permits research in a gold mine of information: the *Online Encyclopedia of Integer Sequences*, commonly called “Sloane”, the name of its principal author, which contains more than 190000 sequences of integers:

```
sage: oeis([1,1,2,5,14])                      # optional -- internet
0: A000108: Catalan numbers: ...
1: ...
2: ...
```
The result suggests that the trees are counted by one of the most famous sequences, the Catalan numbers. Looking through the references supplied by the Encyclopedia, we see that this is really the case: the few numbers above form a digital fingerprint of our objects, which enable us to find, in a few seconds, a precise result from within an abundant literature.

Our next goal is to recover this result using Sage. Let $C_n$ be the set of trees with $n$ leaves, so that $c_n = |C_n|$; by convention, we will define $C_0 = \emptyset$ and $c_0 = 0$. The set of all trees is then the disjoint union of the sets $C_n$:

$$C = \bigsqcup_{n \in \mathbb{N}} C_n.$$ 

Having named the set $C$ of all trees, we can translate the recursive definition of trees into a set-theoretic equation:

$$C \approx \{L\} \cup C \times C.$$ 

In words: a tree $t$ (which is by definition in $C$) is either a leaf (so in $\{L\}$) or a node to which two trees $t_1$ and $t_2$ have been attached, and which we can therefore identify with the pair $(t_1, t_2)$ (in the Cartesian product $C \times C$).

The founding idea of algebraic combinatorics, introduced by Euler in a letter to Goldbach of 1751 to treat a similar problem, is to manipulate all the numbers $c_n$ simultaneously, by encoding them as coefficients in a formal power series, called the generating function of the $c_n$’s:

$$C(z) = \sum_{n \in \mathbb{N}} c_n z^n,$$

where $z$ is a formal variable (which means that we do not have to worry about questions of convergence). The beauty of this idea is that set-theoretic operations ($A \cup B$, $A \times B$) translate naturally into algebraic operations on the corresponding series ($A(z) + B(z)$, $A(z) \cdot B(z)$), in such a way that the set-theoretic equation satisfied by $C$ can be translated directly into an algebraic equation satisfied by $C(z)$:

$$C(z) = z + C(z) \cdot C(z).$$

Now we can solve this equation with Sage. In order to do so, we introduce two variables, $C$ and $z$, and we define the equation:

```sage
sage: C, z = var('C,z')

sage: sys = [ C == z + C*C ]

sage: from sage.all import *
```

There are two solutions, which happen to have closed forms:
```python
sage: sol = solve(sys, C, solution_dict=True); sol
[\{C: -1/2*sqrt(-4*z + 1) + 1/2\}, \{C: 1/2*sqrt(-4*z + 1) + 1/2\}]
```

The second solution is clearly aberrant, while the first one gives the expected coefficients. Therefore, we set:

```python
sage: C = s0
```

We can now calculate the next terms:

```python
sage: C.series(z, 11)
```

or calculate, more or less instantaneously, the 100-th coefficient:
It is unfortunate to have to recalculate everything if at some point we wanted the 101-st coefficient. Lazy power series (see sage.rings.lazy_series_ring) come into their own here, in that one can define them from a system of equations without solving it, and, in particular, without needing a closed form for the answer. We begin by defining the ring of lazy power series:

\[
\text{sage: } L.<z> = \text{LazyPowerSeriesRing}(\mathbb{Q})
\]

Then we create a “free” power series, which we name, and which we then define by a recursive equation:

\[
\text{sage: } C = L.\text{undefined}(\text{valuation}=1)
\]

\[
\text{sage: } C.\text{define}(z + C \times C)
\]

At any point, one can ask for any coefficient without having to redefine \(C\):

\[
\text{sage: } C.\text{coefficient}(100)
\]

\[
\text{sage: } C.\text{coefficient}(200)
\]

We now return to the closed form of \(C(z)\):

\[
\text{sage: } z = \text{var}('z')
\]

\[
\text{sage: } C = s0; C
\]

\[
-\frac{1}{2}\sqrt{-4z + 1} + \frac{1}{2}
\]
The \( n\)-th coefficient in the Taylor series for \( C(z) \) being given by \( \frac{1}{n!} C(z)^{(n)}(0) \), we look at the successive derivatives \( C(z)^{(n)}(z) \):

```
>>> from sage.all import *
>>> z = var('z')  # needs sage.symbolic
>>> C = s0; C  # needs sage.symbolic
-1/2*sqrt(-4*z + 1) + 1/2
```

Taking successive quotients:

```
>>> from sage.all import *
>>> [ (d(n+Integer(1)) / d(n)) for n in range(Integer(1),Integer(17)) ]  # needs sage.symbolic
[2, 6, 10, 14, 18, 22, 26, 30, 34, 38, 42, 46, 50, 54, 58, 62]
```

we observe that \( d_n \) satisfies the recurrence relation \( d_{n+1} = (4n - 2)d_n \), from which we deduce that \( c_n \) satisfies the recurrence relation \( c_{n+1} = \binom{4n-2}{n+1} c_n \). Simplifying, we find that \( c_n \) is the \((n-1)\)-th Catalan number:

\[
c_n = \text{Catalan}(n-1) = \frac{1}{n} \binom{2(n-1)}{n-1}.
\]

We check this:
Combinatorics, Release 10.4

```sage
sage: n = var('n')
# needs sage.symbolic
sage: c = 1/n*binomial(2*(n-1),n-1)
# needs sage.symbolic
sage: [c.subs(n=k) for k in range(1, 11)]
# needs sage.symbolic
[1, 1, 2, 5, 14, 42, 132, 429, 1430, 4862]
sage: [catalan_number(k-1) for k in range(1, 11)]
[1, 1, 2, 5, 14, 42, 132, 429, 1430, 4862]
```

We can now calculate coefficients much further; here we calculate \(c_{100000}\) which has more than 60000 digits:

```sage
sage: cc = c(n=100000)
# needs sage.symbolic
```  

This takes a couple of seconds:

```sage
sage: %time cc = c(100000)  # not tested  # needs sage.symbolic
CPU times: user 2.34 s, sys: 0.00 s, total: 2.34 s
Wall time: 2.34 s
sage: ZZ(cc).ndigits()
# needs sage.symbolic
60198
```  

The methods which we have used generalize to all recursively defined objects: the system of set-theoretic equations can be translated into a system of equations on the generating function, which enables the recursive calculation of its coefficients. If the set-theoretic equations are simple enough (for example, if they only involve Cartesian products and disjoint unions), the equation for \(C(z)\) is algebraic. This equation has, in general, no closed-form solution. However, using confinement, one can deduce a linear differential equation which \(C(z)\) satisfies. This differential equation, in turn, can be translated into a recurrence relation of fixed length on its coefficients \(c_n\). In this case, the series is called \(D\)-finite. After the initial calculation of this recurrence relation, the calculation of coefficients is very fast. All these steps are purely algorithmic,
and it is planned to port into Sage the implementations which exist in Maple (the gfun and combstruct packages) or MuPAD-Combinat (the decomposableObjects library).

For the moment, we illustrate this general procedure in the case of complete binary trees. The generating function $C(z)$ is a solution to an algebraic equation $P(z, C(z)) = 0$, where $P = P(x, y)$ is a polynomial with coefficients in $Q$. In the present case, $P = y^2 - y + x$. We formally differentiate this equation with respect to $z$:

\[
\frac{dC(z)}{dz} \frac{\partial P}{\partial y}(z, C(z)) + \frac{\partial P}{\partial x}(z, C(z)) = 0
\]

or, in a more readable format,

\[
\frac{dC(z)}{dz} \frac{\partial P}{\partial y}(z, C(z)) + \frac{\partial P}{\partial x}(z, C(z)) = 0
\]

From this we deduce:

\[
\frac{dC(z)}{dz} = -\frac{\partial P}{\partial y}(z, C(z)).
\]

In the case of complete binary trees, this gives:

\[
P = y^2 - y + x
\]

Recall that $P(z, C(z)) = 0$. Thus, we can calculate this fraction mod $P$ and, in this way, express the derivative of $C(z)$ as a polynomial in $C(z)$ with coefficients in $Q(z)$. In order to achieve this, we construct the quotient ring $R = Q(x)[y]/(P)$:
Combinatorics, Release 10.4

\begin{verbatim}
sage: Qx = QQ['x'].fraction_field()
sage: Qxy = Qx['y']
sage: R = Qxy.quo(P); R
Univariate Quotient Polynomial Ring in ybar
over Fraction Field of Univariate Polynomial Ring in x
over Rational Field with modulus y^2 - y + x

>>> from sage.all import *
>>> Qx = QQ['x'].fraction_field()
>>> Qxy = Qx['y']
>>> R = Qxy.quo(P); R
Univariate Quotient Polynomial Ring in ybar
over Fraction Field of Univariate Polynomial Ring in x
over Rational Field with modulus y^2 - y + x

Note: ybar is the name of the variable \( y \) in the quotient ring.

Todo: add link to some tutorial on quotient rings

We continue the calculation of this fraction in \( R \):

\begin{verbatim}
sage: fraction = - R(Px) / R(Py); fraction

(1/2/(x - 1/4))*ybar - 1/4/(x - 1/4)

>>> from sage.all import *
>>> fraction = - R(Px) / R(Py); fraction

(1/2/(x - 1/4))*ybar - 1/4/(x - 1/4)

Note: The following variant does not work yet:

\begin{verbatim}
sage: fraction = R( - Px / Py ); fraction

Traceback (most recent call last):
...
TypeError: denominator must be a unit

>>> from sage.all import *
>>> fraction = R( - Px / Py ); fraction

Traceback (most recent call last):
...
TypeError: denominator must be a unit
\end{verbatim}

We lift the result to \( \mathbb{Q}[x][y] \) and then substitute \( z \) and \( C(z) \) to obtain an expression for \( \frac{d}{dz} C(z) \):

\begin{verbatim}
sage: fraction = fraction.lift(); fraction

(1/2/(x - 1/4))*y - 1/4/(x - 1/4)
sage: fraction(x=z, y=C)

2*C(z)/(4*z - 1) - 1/(4*z - 1)
\end{verbatim}
\end{verbatim}

5630 Chapter 5. Comprehensive Module List
or, more legibly,
\[
\frac{\partial C(z)}{\partial z} = \frac{1}{1-4z} - \frac{2}{1-4z} C(z).
\]

In this simple case, we can directly deduce from this expression a linear differential equation with coefficients in \( \mathbb{Q}[z] \):

It is trivial to verify this equation on the closed form:
(4*z - 1)/sqrt(-4*z + 1) + sqrt(-4*z + 1) == 0

>>> bool(equadiff.substitute_function(Cf, s0.function(z)))

needs sage.symbolic
True

In the general case, one continues to calculate successive derivatives of \( C(z) \). These derivatives are confined in the quotient ring \( \mathbb{Q}[z][C]/(P) \) which is of finite dimension \( \deg P \) over \( \mathbb{Q}(z) \). Therefore, one will eventually find a linear relation among the first \( \deg P \) derivatives of \( C(z) \). Putting it over a single denominator, we obtain a linear differential equation of degree \( \leq \deg P \) with coefficients in \( \mathbb{Q}[z] \). By extracting the coefficient of \( z^n \) in the differential equation, we obtain the desired recurrence relation on the coefficients; in this case we recover the relation we had already found, based on the closed form:

\[
c_{n+1} = \frac{(4n - 2)}{n + 1} c_n
\]

After fixing the correct initial conditions, it becomes possible to calculate the coefficients of \( C(z) \) recursively:

sage: def C(n):
    return 1 if n <= 1 else (4*n-6)/n * C(n-1)
sage: [ C(i) for i in range(10) ]
[1, 1, 1, 2, 5, 14, 42, 132, 429, 1430]

If \( n \) is too large for the explicit calculation of \( c_n \), a sequence asymptotically equivalent to the sequence of coefficients \( c_n \) may be sought. Here again, there are generic techniques. The central tool is complex analysis, specifically, the study of the generating function around its singularities. In the present instance, the singularity is at \( z_0 = 1/4 \) and one would obtain \( c_n \sim \frac{4^n}{n^{3/2}} \sqrt{\pi} \).

Summary

We see here a general phenomenon of computer algebra: the best data structure to describe a complicated mathematical object (a real number, a sequence, a formal power series, a function, a set) is often an equation defining the object (or a system of equations, typically with some initial conditions). Attempting to find a closed-form solution to this equation is not necessarily of interest: on the one hand, such a closed form rarely exists (e.g., the problem of solving a polynomial by radicals), and on the other hand, the equation, in itself, contains all the necessary information to calculate algorithmically the properties of the object under consideration (e.g., a numerical approximation, the initial terms or elements, an asymptotic equivalent), or to calculate with the object itself (e.g., performing arithmetic on power series). Therefore, instead of solving the equation, we look for the equation describing the object which is best suited to the problem we want to solve.

As we saw in our example, confinement (for example, in a finite dimensional vector space) is a fundamental tool for studying such equations. This notion of confinement is widely applicable in elimination techniques (linear algebra, Gröbner bases, and their algebro-differential generalizations). The same tool is central in algorithms for automatic summation and automatic verification of identities (Gosper’s algorithm, Zeilberger’s algorithm, and their generalizations; see also Exercise: alternating sign matrices).

Todo: add link to some tutorial on summation

All these techniques and their many generalizations are at the heart of very active topics of research: automatic combinatorics and analytic combinatorics, with major applications in the analysis of algorithms. It is likely, and desirable, that they will be progressively implemented in Sage.
Common enumerated sets

First example: the subsets of a set

Fix a set $E$ of size $n$ and consider the subsets of $E$ of size $k$. We know that these subsets are counted by the binomial coefficients $\binom{n}{k}$. We can therefore calculate the number of subsets of size $k = 2$ of $E = \{1, 2, 3, 4\}$ with the function binomial:

```
sage: binomial(4, 2)
6
```

Alternatively, we can construct the set $\mathcal{P}_2(E)$ of all the subsets of size 2 of $E$, then ask its cardinality:

```
sage: S = Subsets([1,2,3,4], 2)
sage: S.cardinality()
6
```

Once $S$ has been constructed, we can also obtain the list of its elements:

```
sage: S.list()
[(1, 2), (1, 3), (1, 4), (2, 3), (2, 4), (3, 4)]
```

or select an element at random:

```
sage: S.random_element()  # random
{1, 4}
```

More precisely, the object $S$ models the set $\mathcal{P}_2(E)$ equipped with a fixed order (here, lexicographic order). It is therefore possible to ask for its 5-th element, keeping in mind that, as with Python lists, the first element is numbered zero:

```
sage: S.unrank(4)
{2, 4}
```

As a shortcut, in this setting, one can also use the notation:
Combinatorics, Release 10.4

sage: S[4]
{2, 4}

>>> from sage.all import *

>>> S[Integer(4)]
{2, 4}

but this should be used with care because some sets have a natural indexing other than by \((0, 1, \ldots)\).

Conversely, one can calculate the position of an object in this order:

sage: s = S([2,4]); s
{2, 4}
sage: S.rank(s)
4

sage: s = S([Integer(2),Integer(4)]); s
{2, 4}

>>> S.rank(s)
4

Note that \(S\) is not the list of its elements. One can, for example, model the set \(\mathcal{P}(\mathcal{P}(\mathcal{P}(E)))\) and calculate its cardinality \(2^{2^2}\):

sage: E = Set([1,2,3,4])
sage: S = Subsets(Subsets(Subsets(E))); S
Subsets of Subsets of Subsets of {1, 2, 3, 4}
sage: n = S.cardinality(); n
2003529930468464979072351560255750447825475569751419265016973...

>>> from sage.all import *

>>> E = Set([Integer(1),Integer(2),Integer(3),Integer(4)])

>>> S = Subsets(Subsets(Subsets(E))); S
Subsets of Subsets of Subsets of {1, 2, 3, 4}

>>> n = S.cardinality(); n
2003529930468464979072351560255750447825475569751419265016973...

which is roughly \(2 \cdot 10^{19728}\):

sage: n.ndigits()
19729

>>> from sage.all import *

>>> n.ndigits()
19729

or ask for its 237102124-th element:

sage: S.unrank(237102123) # random print output
{{1, 2, 4}, {1, 4}, {1, 3, 4}, {1, 2, 4}, {1, 2, 4}, {4}, {2, 3}, {1, 3}, {2},
   {1, 3}, {2, 4}, {1, 2, 4}, {}}, {3, 4}}

>>> from sage.all import *

>>> S.unrank(Integer(237102123)) # random print output

(continues on next page)
It would be physically impossible to construct explicitly all the elements of $S$, as there are many more of them than there are particles in the universe (estimated at $10^{82}$).

Remark: it would be natural in Python to use `len(S)` to ask for the cardinality of $S$. This is not possible because Python requires that the result of `len` be an integer of type `int`; this could cause overflows, and would not permit the return of `{Infinity}` for infinite sets:

```sage
sage: len(S)
Traceback (most recent call last):
...  OverflowError: cannot fit 'int' into an index-sized integer
```

```python
>>> from sage.all import *

>>> len(S)
Traceback (most recent call last):
...  OverflowError: cannot fit 'int' into an index-sized integer
```

**Partitions of integers**

We now consider another classic problem: given a positive integer $n$, in how many ways can it be written in the form of a sum $n = i_1 + i_2 + \cdots + i_\ell$, where $i_1, \ldots, i_\ell$ are positive integers? There are two cases to distinguish:

- the order of the elements in the sum is not important, in which case we call $(i_1, \ldots, i_\ell)$ a partition of $n$;
- the order of the elements in the sum is important, in which case we call $(i_1, \ldots, i_\ell)$ a composition of $n$.

We will begin with the partitions of $n = 5$; as before, we begin by constructing the set of these partitions:

```python
sage: P5 = Partitions(5); P5
Partitions of the integer 5
```

```python
>>> from sage.all import *

>>> P5 = Partitions(Integer(5)); P5
Partitions of the integer 5
```

then we ask for its cardinality:

```python
sage: P5.cardinality()
7
```

```python
>>> from sage.all import *

>>> P5.cardinality()
7
```

We look at these 7 partitions; the order being irrelevant, the entries are ordered, by convention, in decreasing order.

```python
sage: P5.list()
[[5], [4, 1], [3, 2], [3, 1, 1], [2, 2, 1], [2, 1, 1, 1], [1, 1, 1, 1, 1]]
```
The calculation of the number of partitions uses the Rademacher formula (Wikipedia article Partition_(number_theory)), implemented in C and highly optimized, which makes it very fast:

Partitions of integers are combinatorial objects naturally equipped with many operations. They are therefore returned as objects that are richer than simple lists:

For example, they can be represented graphically by a Ferrers diagram:

We leave it to the user to explore by introspection the available operations.

Note that we can also construct a partition directly by:

or:
sage: P7([4, 2, 1])
[4, 2, 1]

>>> from sage.all import *

>>> P7([Integer(4), Integer(2), Integer(1)])
[4, 2, 1]

If one wants to restrict the possible values of the parts $i_1, \ldots, i_\ell$ of the partition as, for example, when giving change, one can use `WeightedIntegerVectors`. For example, the following calculation:

sage: WeightedIntegerVectors(8, [2, 3, 5]).list()
[[0, 1, 1], [1, 2, 0], [4, 0, 0]]

>>> from sage.all import *

>>> WeightedIntegerVectors(Integer(8), [Integer(2), Integer(3), Integer(5)]).list()
[[0, 1, 1], [1, 2, 0], [4, 0, 0]]

shows that to make 8 dollars using 2, 3, and 5 dollar bills, one can use a 3 and a 5 dollar bill, or a 2 and two 3 dollar bills, or four 2 dollar bills.

Compositions of integers are manipulated the same way:

sage: C5 = Compositions(5); C5
Compositions of 5
sage: C5.cardinality()
16
sage: C5.list()
[[1, 1, 1, 1, 1], [1, 1, 1, 2], [1, 1, 2, 1], [1, 1, 3], 
[1, 2, 1, 1], [1, 2, 2], [1, 3, 1], [1, 4], [2, 1, 1, 1], 
[2, 1, 2], [2, 2, 1], [2, 3], [3, 1, 1], [3, 2], [4, 1], [5]]

>>> from sage.all import *

>>> C5 = Compositions(Integer(5)); C5
Compositions of 5
>>> C5.cardinality()
16
>>> C5.list()
[[1, 1, 1, 1, 1], [1, 1, 1, 2], [1, 1, 2, 1], [1, 1, 3], 
[1, 2, 1, 1], [1, 2, 2], [1, 3, 1], [1, 4], [2, 1, 1, 1], 
[2, 1, 2], [2, 2, 1], [2, 3], [3, 1, 1], [3, 2], [4, 1], [5]]

The number 16 above seems significant and suggests the existence of a formula. We look at the number of compositions of $n$ ranging from 0 to 9:

sage: [Compositions(n).cardinality() for n in range(10)]
[1, 1, 2, 4, 8, 16, 32, 64, 128, 256]

>>> from sage.all import *

>>> [Compositions(n).cardinality() for n in range(Integer(10))]
[1, 1, 2, 4, 8, 16, 32, 64, 128, 256]

Similarly, if we consider the number of compositions of 5 by length, we find a line of Pascal’s triangle:

sage: x = var('x')
#_needs_sage.symbolic
sage: sum(x^len(c) for c in C5) #_
The above example uses a functionality which we have not seen yet: \( C5 \) being iterable, it can be used like a list in a `for` loop or a comprehension (Set comprehension and iterators).

Prove the formulas suggested by the above examples for the number of compositions of \( n \) and the number of compositions of \( n \) of length \( k \); investigate by introspection whether Sage uses these formulas for calculating cardinalities.

### Some other finite enumerated sets

Essentially, the principle is the same for all the finite sets with which one wants to do combinatorics in Sage; begin by constructing an object which models this set, and then supply appropriate methods, following a uniform interface¹. We now give a few more typical examples.

#### Intervals of integers:

```python
>>> from sage.all import *
>>> x = var('x')

# needs sage.symbolic
x^5 + 4*x^4 + 6*x^3 + 4*x^2 + x

# needs sage.symbolic
>>> sum(x**len(c) for c in C5)

# needs sage.symbolic
x^5 + 4*x^4 + 6*x^3 + 4*x^2 + x
```

sage: C = IntegerRange(3, 21, 2); C
\{3, 5, ..., 19\}

sage: C.cardinality()
9

sage: C.list()
[3, 5, 7, 9, 11, 13, 15, 17, 19]

```python
>>> from sage.all import *
>>> C = IntegerRange(3, 21, 2); C
\{3, 5, ..., 19\}

>>> C.cardinality()
9

>>> C.list()
[3, 5, 7, 9, 11, 13, 15, 17, 19]
```

#### Permutations:

```python
sage: C = Permutations(4); C
Standard permutations of 4

sage: C.cardinality()
24

sage: C.list()
[[1, 2, 3, 4], [1, 2, 4, 3], [1, 3, 2, 4], [1, 3, 4, 2],
 [1, 4, 2, 3], [1, 4, 3, 2], [2, 1, 3, 4], [2, 1, 4, 3],
 [2, 3, 1, 4], [2, 3, 4, 1], [2, 4, 1, 3], [2, 4, 3, 1],
 [3, 1, 2, 4], [3, 1, 4, 2], [3, 2, 1, 4], [3, 2, 4, 1],
 [3, 4, 1, 2], [3, 4, 2, 1], [4, 1, 2, 3], [4, 1, 3, 2],
 [4, 2, 1, 3], [4, 2, 3, 1], [4, 3, 1, 2], [4, 3, 2, 1]]
```

¹ Or at least that should be the case; there are still many corners to clean up.
```python
>>> from sage.all import *

>>> C = Permutations(Integer(4)); C
Standard permutations of 4

>>> C.cardinality()
24

>>> C.list()
[[1, 2, 3, 4], [1, 2, 4, 3], [1, 3, 2, 4], [1, 3, 4, 2],
 [1, 4, 2, 3], [1, 4, 3, 2], [2, 1, 3, 4], [2, 1, 4, 3],
 [2, 3, 1, 4], [2, 3, 4, 1], [2, 4, 1, 3], [2, 4, 3, 1],
 [3, 1, 2, 4], [3, 1, 4, 2], [3, 2, 1, 4], [3, 2, 4, 1],
 [3, 4, 1, 2], [3, 4, 2, 1], [4, 1, 2, 3], [4, 1, 3, 2],
 [4, 2, 1, 3], [4, 2, 3, 1], [4, 3, 1, 2], [4, 3, 2, 1]]

Set partitions:

sage: C = SetPartitions(['a', 'b', 'c'])
sage: C # random print output
Set partitions of {'a', 'c', 'b'}
sage: C.cardinality()
5

sage: C.list()
[[{'a'}, {'b', 'c'}],
 [{'a', 'b'}, {'c'}],
 [{'a', 'c'}, {'b'}],
 [{'a'}, {'b', 'c'}],
 [{'a'}, {'b'}, {'c'}]]

>>> from sage.all import *

>>> C = SetPartitions(['a', 'b', 'c'])

>>> C # random print output
Set partitions of {'a', 'c', 'b'}

>>> C.cardinality()
5

>>> C.list()
[[{'a'}, {'b', 'c'}],
 [{'a', 'b'}, {'c'}],
 [{'a', 'c'}, {'b'}],
 [{'a'}, {'b', 'c'}],
 [{'a'}, {'b'}, {'c'}]]

Partial orders on a set of 8 elements, up to isomorphism:

sage: C = Posets(8); C
Posets containing 8 elements

sage: C.cardinality()
16999

>>> from sage.all import *

>>> C = Posets(Integer(8)); C
Posets containing 8 elements

>>> C.cardinality()
16999

sage: C.unrank(20).plot()
Graphics object consisting of 20 graphics primitives
```

5.1. Comprehensive Module List 5639
One can iterate through all graphs up to isomorphism. For example, there are 34 simple graphs with 5 vertices:

```sage
sage: len(list(graphs(5)))
34
```

Here are those with at most 4 edges:

```sage
sage: up_to_four_edges = list(graphs(5, lambda G: G.size() <= 4))
sage: pretty_print(*up_to_four_edges)
```
However, the set $C$ of these graphs is not yet available in Sage; as a result, the following commands are not yet implemented:

```
sage: # not implemented
sage: C = Graphs(5)
sage: C.cardinality()
34
sage: Graphs(19).cardinality()
24637809253125004524383007491432768
sage: Graphs(19).random_element()
```
Graph on 19 vertices

```python
>>> from sage.all import *

# not implemented

>>> C = Graphs(Integer(5))
>>> C.cardinality()
34

>>> Graphs(Integer(19)).cardinality()
24637809253125004524383007491432768

>>> Graphs(Integer(19)).random_element()
Graph on 19 vertices
```

What we have seen so far also applies, in principle, to finite algebraic structures like the dihedral groups:

```python
sage: G = DihedralGroup(4); G
Dihedral group of order 8 as a permutation group

sage: G.cardinality()
8

sage: G.list()
[(), (1,3)(2,4), (1,4,3,2), (1,2,3,4), (2,4), (1,3), (1,4)(2,3), (1,2)(3,4)]

>>> from sage.all import *

>>> G = DihedralGroup(Integer(4)); G
Dihedral group of order 8 as a permutation group

>>> G.cardinality()
8

>>> G.list()
[(), (1,3)(2,4), (1,4,3,2), (1,2,3,4), (2,4), (1,3), (1,4)(2,3), (1,2)(3,4)]
```

or the algebra of $2 \times 2$ matrices over the finite field $\mathbb{Z}/2\mathbb{Z}$:

```python
sage: C = MatrixSpace(GF(2), 2)

sage: C.list()
[[(0, 0), (1, 0), (0, 1), (0, 0), (1, 1), (1, 0), (0, 1), (0, 1), (0, 0), (1, 1), (1, 1), (1, 0)], [(0, 1), (1, 1), (0, 1), (0, 1), (1, 1), (1, 1), (1, 1)]

sage: C.cardinality()
16

>>> from sage.all import *

>>> C = MatrixSpace(GF(Integer(2)), Integer(2)) # needs sage.modules sage.rings.finite_rings

>>> C.list() # needs sage.modules sage.rings.finite_rings
[[(0, 0), (1, 0), (0, 1), (0, 0), (1, 1), (1, 0), (0, 1), (0, 1), (0, 0), (1, 1), (1, 1), (1, 0)], [(0, 1), (1, 1), (0, 1), (0, 1), (1, 1), (1, 1), (1, 1)]

(continues on next page)
Combinatorics, Release 10.4

(continued from previous page)

>>> C.cardinality()
˓→ needs sage.modules sage.rings.finite_rings

5.1. Comprehensive Module List

Exercise

List all the monomials of degree 5 in three variables (see IntegerVectors). Manipulate the ordered set partitions OrderedSetPartitions and standard tableaux (StandardTableaux).

Exercise

List the alternating sign matrices of size 3, 4, and 5 (AlternatingSignMatrices), and try to guess the definition. The discovery and proof of the formula for the enumeration of these matrices (see the method cardinality), motivated by calculations of determinants in physics, is quite a story. In particular, the first proof, given by Zeilberger in 1992 was automatically produced by a computer program. It was 84 pages long, and required nearly a hundred people to verify it.

Exercise

Calculate by hand the number of vectors in \((\mathbb{Z}/2\mathbb{Z})^5\), and the number of matrices in \(GL_3(\mathbb{Z}/2\mathbb{Z})\) (that is to say, the number of invertible \(3 \times 3\) matrices with coefficients in \(\mathbb{Z}/2\mathbb{Z}\)). Verify your answer with Sage. Generalize to \(GL_n(\mathbb{Z}/q\mathbb{Z})\).

Set comprehension and iterators

We will now show some of the possibilities offered by Python for constructing (and iterating through) sets, with a notation that is flexible and close to usual mathematical usage, and in particular the benefits this yields in combinatorics.

We begin by constructing the finite set \(\{i^2 \mid i \in \{1, 3, 7\}\}:

sage: [ i^2 for i in [1, 3, 7] ]
[1, 9, 49]

>>> from sage.all import *

>>> [ i**Integer(2) for i in [Integer(1), Integer(3), Integer(7)] ]
[1, 9, 49]

and then the same set, but with \(i\) running from 1 to 9:

sage: [ i^2 for i in range(1,10) ]
[1, 4, 9, 16, 25, 36, 49, 64, 81]

>>> from sage.all import *

>>> [ i**Integer(2) for i in range(Integer(1),Integer(10)) ]
[1, 4, 9, 16, 25, 36, 49, 64, 81]
A construction of this form in Python is called *set comprehension*. A clause can be added to keep only those elements with \( i \) prime:

```python
sage: [ i^2 for i in range(1,10) if is_prime(i) ]
[4, 9, 25, 49]
```

```python
>>> from sage.all import *
>>> [ i**Integer(2) for i in range(Integer(1),Integer(10)) if is_prime(i) ]
[4, 9, 25, 49]
```

Combining more than one set comprehension, it is possible to construct the set \( \{(i,j) \mid 1 \leq j < i < 5\} \):

```python
sage: [(i,j) for i in range(1,6) for j in range(1,i) ]
[(2, 1), (3, 1), (3, 2), (4, 1), (4, 2), (4, 3),
 (5, 1), (5, 2), (5, 3), (5, 4)]
```

```python
>>> from sage.all import *
>>> [(i,j) for i in range(Integer(1),Integer(6)) for j in range(Integer(1),i) ]
[(2, 1), (3, 1), (3, 2), (4, 1), (4, 2), (4, 3),
 (5, 1), (5, 2), (5, 3), (5, 4)]
```

or to produce Pascal's triangle:

```python
sage: [[[binomial(n,i) for i in range(n+1)] for n in range(10)]]
[[[1],
  [1, 1],
  [1, 2, 1],
  [1, 3, 3, 1],
  [1, 4, 6, 4, 1],
  [1, 5, 10, 10, 5, 1],
  [1, 6, 15, 20, 15, 6, 1],
  [1, 7, 21, 35, 35, 21, 7, 1],
  [1, 8, 28, 56, 70, 56, 28, 8, 1],
  [1, 9, 36, 84, 126, 126, 84, 36, 9, 1]]
```

```python
>>> from sage.all import *
>>> [[[binomial(n,i) for i in range(n+Integer(1))]] for n in range(Integer(10))]
[[[1],
  [1, 1],
  [1, 2, 1],
  [1, 3, 3, 1],
  [1, 4, 6, 4, 1],
  [1, 5, 10, 10, 5, 1],
  [1, 6, 15, 20, 15, 6, 1],
  [1, 7, 21, 35, 35, 21, 7, 1],
  [1, 8, 28, 56, 70, 56, 28, 8, 1],
  [1, 9, 36, 84, 126, 126, 84, 36, 9, 1]]
```

The execution of a set comprehension is accomplished in two steps; first an *iterator* is constructed, and then a list is filled with the elements successively produced by the iterator. Technically, an *iterator* is an object with a method `next` which returns a new value each time it is called, until it is exhausted. For example, the following iterator `it`:

```python
sage: it = (binomial(3, i) for i in range(4))
```

```python
>>> from sage.all import *
>>> it = (binomial(Integer(3), i) for i in range(Integer(4)))
```
returns successively the binomial coefficients \( \binom{3}{i} \) with \( i = 0, 1, 2, 3 \):

```python
sage: next(it)
1
sage: next(it)
3
sage: next(it)
3
sage: next(it)
1
```

When the iterator is finally exhausted, an exception is raised:

```python
sage: next(it)
Traceback (most recent call last):
  ...StopIteration
```

More generally, an iterable is a Python object \( L \) (a list, a set, \(...\) over whose elements it is possible to iterate. Technically, the iterator is constructed by `iter(L)`. In practice, the commands `iter` and `next` are used very rarely, since `for` loops and list comprehensions provide a much pleasanter syntax:

```python
sage: for s in Subsets(3):
    print(s)
{ }
{1}
{2}
{3}
{1, 2}
{1, 3}
{2, 3}
{1, 2, 3}
```

(continues on next page)
What is the point of an iterator? Consider the following example:

```python
sage: sum( [ binomial(8, i) for i in range(9) ] )
256
```

When it is executed, a list of 9 elements is constructed, and then it is passed as an argument to `sum` to add them up. If, on the other hand, the iterator is passed directly to `sum` (note the absence of square brackets):

```python
sage: sum( binomial(8, i) for i in range(9) )
256
```

the function `sum` receives the iterator directly, and can short-circuit the construction of the intermediate list. If there are a large number of elements, this avoids allocating a large quantity of memory to fill a list which will be immediately destroyed.

Most functions that take a list of elements as input will also accept an iterator (or an iterable) instead. To begin with, one can obtain the list (or the tuple) of elements of an iterator as follows:

```python
sage: list(binomial(8, i) for i in range(9))
[1, 8, 28, 56, 70, 56, 28, 8, 1]
sage: tuple(binomial(8, i) for i in range(9))
(1, 8, 28, 56, 70, 56, 28, 8, 1)
```

We now consider the functions `all` and `any` which denote respectively the $n$-ary and and or:

```python
sage: all([True, True, True, True])
True
sage: all([True, False, True, True])
False
```
sage: any([False, False, False, False])
False
sage: any([False, False, True, False])
True

>>> from sage.all import *
>>> all([True, True, True, True])
True

The following example verifies that all primes from 3 to 99 are odd:

sage: all( is_odd(p) for p in range(3,100) if is_prime(p) )
True

A Mersenne prime is a prime of the form $2^p - 1$. We verify that, for $p < 1000$, if $2^p - 1$ is prime, then $p$ is also prime:

sage: def mersenne(p):
    return 2^p -1
sage: 
[True, True, True, True, True, True, True, True, True, True, True, True, True, True]

Is the converse true?

Exercise

Try the two following commands and explain the considerable difference in the length of the calculations:

sage: def mersenne(p):
    return Integer(2)**p -Integer(1)

>>> from sage.all import *

[True, True, True, True, True, True, True, True, True, True, True, True, True, True]
We now try to find the smallest counter-example. In order to do this, we use the Sage function `exists`:

```python
sage: exists( (p for p in range(1000) if is_prime(p)),
....: lambda p: not is_prime(mersenne(p)) )
(True, 11)
```

Alternatively, we could construct an iterator on the counter-examples:

```python
sage: counter_examples = (p for p in range(1000)
....: if is_prime(p) and not is_prime(mersenne(p)))
sage: next(counter_examples)
11
sage: next(counter_examples)
23
```

Exercise

What do the following commands do?

```python
sage: cubes = [t**3 for t in range(-999,1000)]
sage: exists(([x,y] for x in cubes for y in cubes),
....: lambda x_y: x_y[0] + x_y[1] == 218)
(True, (-125, 343))
sage: exists(((x,y) for x in cubes for y in cubes),
....: lambda x_y: x_y[Integer(0)] + x_y[Integer(1)] == Integer(218))
(True, (-125, 343))
```

```python
sage: from sage.all import *
sage: cubes = [t**Integer(3) for t in range(-Integer(999),Integer(1000))] 
>>> exists(([x,y] for x in cubes for y in cubes),
... lambda x_y: x_y[Integer(0)] + x_y[Integer(1)] == Integer(218))
(True, (-125, 343))
```
Which of the last two is more economical in terms of time? In terms of memory? By how much?

Exercise

Try each of the following commands, and explain its result. If possible, hide the result first and try to guess it before launching the command.

Todo: hide the results by default

Warning: it will be necessary to interrupt the execution of some of the commands

Operations on iterators

Python provides numerous tools for manipulating iterators; most of them are in the `itertools` library, which can be imported by:

```
sage: import itertools
```

```python
>>> from sage.all import *
>>> import itertools
```

We will demonstrate some applications, taking as a starting point the permutations of 3:

```
sage: list(Permutations(3))
[[1, 2, 3], [1, 3, 2], [2, 1, 3],
 [2, 3, 1], [3, 1, 2], [3, 2, 1]]
```

```
>>> from sage.all import *
>>>
>>> list(Permutations(Integer(3)))
[[1, 2, 3], [1, 3, 2], [2, 1, 3],
 [2, 3, 1], [3, 1, 2], [3, 2, 1]]
```

We can list the elements of a set by numbering them:

```
sage: list(enumerate(Permutations(3)))
[(0, [1, 2, 3]), (1, [1, 3, 2]), (2, [2, 1, 3]),
 (3, [2, 3, 1]), (4, [3, 1, 2]), (5, [3, 2, 1])]
```

```
>>> from sage.all import *
>>>
>>> list(enumerate(Permutations(Integer(3))))
[(0, [1, 2, 3]), (1, [1, 3, 2]), (2, [2, 1, 3]),
 (3, [2, 3, 1]), (4, [3, 1, 2]), (5, [3, 2, 1])]
```

or select only the elements in positions 2, 3, and 4 (analogue of `l[1:4]`):

```
sage: import itertools
sage: list(itertools.islice(Permutations(3), int(1), int(4)))
[[1, 3, 2], [2, 1, 3], [2, 3, 1]]
```

```
>>> from sage.all import *
>>> import itertools
>>>
>>> list(itertools.islice(Permutations(Integer(3)), int(Integer(1)), int(Integer(4))))
[[1, 3, 2], [2, 1, 3], [2, 3, 1]]
```

To apply a function to all the elements, one can do:

```
sage: [z.cycle_type() for z in Permutations(3)]
[[1, 1, 1], [2, 1], [2, 1], [3], [3], [2, 1]]
```

```
>>> from sage.all import *
>>> import itertools
>>>
>>> [z.cycle_type() for z in Permutations(Integer(3))]  # int(Integer(4)))
[[1, 1, 1], [2, 1], [2, 1], [3], [3], [2, 1]]
```

and similarly to select the elements satisfying a certain condition:

```
sage: [z for z in Permutations(3) if z.has_pattern([1,2])]
[[1, 2, 3], [1, 3, 2], [2, 1, 3], [2, 3, 1], [3, 1, 2]]
```

```
Implementation of new iterators

It is easy to construct new iterators, using the keyword `yield` instead of `return` in a function:

```python
sage: def f(n):
    ... for i in range(n):
    ...    yield i
```

After the `yield`, execution is not halted, but only suspended, ready to be continued from the same point. The result of the function is therefore an iterator over the successive values returned by `yield`:

```python
sage: g = f(4)
sage: next(g)
0
sage: next(g)
1
sage: next(g)
2
sage: next(g)
3
```

The function could be used as follows:
This model of computation, called *continuation*, is very useful in combinatorics, especially when combined with recursion. Here is how to generate all words of a given length on a given alphabet:

```
sage: def words(alphabet, l):
    ....: if l == 0:
    ....:     yield []
    ....: else:
    ....:     for word in words(alphabet, l-1):
    ....:         for l in alphabet:
    ....:             yield word + [l]

sage: words(['a', 'b'], 3)
[['a', 'a', 'a'], ['a', 'a', 'b'], ['a', 'b', 'a'], ['a', 'b', 'b'],
 ['b', 'a', 'a'], ['b', 'a', 'b'], ['b', 'b', 'a'], ['b', 'b', 'b']]
```

These words can then be counted by:

```
sage: sum(1 for w in words(['a', 'b', 'c', 'd'], 10))
1048576
```

Counting the words one by one is clearly not an efficient method in this case, since the formula $n^l$ is also available; note, though, that this is not the stupidest possible approach - it does, at least, avoid constructing the entire list in memory.

We now consider Dyck words, which are well-parenthesized words in the letters "(" and ")". The function below generates all the Dyck words of a given length (where the length is the number of pairs of parentheses), using the recursive definition which says that a Dyck word is either empty or of the form $(w_1)w_2$ where $w_1$ and $w_2$ are Dyck words:

```
sage: def dyck_words(l):
    ....:     if l==0:
    ....:         yield ''
    ....:     else:
    ....:         for k in range(l):
```

(continues on next page)
Combinatorics, Release 10.4

(continued from previous page)

```python
....:     for w1 in dyck_words(k):
....:         for w2 in dyck_words(l-k-1):
....:             yield '(' + w1 + ')' + w2
```

```python
>>> from sage.all import *
>>> def dyck_words(l):
...     if l==Integer(0):
...         yield ''
...     else:
...         for k in range(l):
...             for w1 in dyck_words(k):
...                 for w2 in dyck_words(l-k-Integer(1)):
...                     yield '(' + w1 + ')' + w2
```

Here are all the Dyck words of length 4:

```python
sage: list(dyck_words(4))
['()()(()), ()(())(), ()(()()), ()((())), (())()(), (())(()), (()())(), ((()))(), (()()()), (()(())), ((())()), ((()())), (((())))']
```

Counting them, we recover a well-known sequence:

```python
sage: [ sum(1 for w in dyck_words(l)) for l in range(10) ]
[1, 1, 2, 5, 14, 42, 132, 429, 1430, 4862]
```

Exercise: complete binary tree iterator

Construct an iterator on the set $C_n$ of complete binary trees with $n$ leaves (see *Enumeration of trees using generating functions*).

Hint: Sage 4.8.2 does not yet have a native data structure to represent complete binary trees. One simple way to represent them is to define a formal variable Leaf for the leaves and a formal 2-ary function Node:

```python
var('Leaf')
# needs sage.symbolic
Leaf
sage: function('Node', nargs=2)
# needs sage.symbolic
Node
```

```python
>>> from sage.all import *
>>> var('Leaf')
# needs sage.symbolic
Leaf
>>> function('Node', nargs=Integer(2))
# needs sage.symbolic
Node
```
The second tree in *Figure: The five complete binary trees with four leaves* can be represented by the expression:

```
sage: tr = Node(Node(Leaf, Node(Leaf, Leaf)), Leaf)  # needs sage.symbolic
```

```
>>> from sage.all import *

```
We now construct the union of two existing disjoint sets:

```python
sage: C = DisjointUnionEnumeratedSets(
    ....:    [ Compositions(4), Permutations(3) ]
)
sage: C
Disjoint union of Family (Compositions of 4,
Standard permutations of 3)
sage: C.cardinality()
14
sage: C.list()
[[1, 1, 1, 1], [1, 1, 2], [1, 2, 1], [1, 3], [2, 1, 1], [2, 2],
 [3, 1], [4], [1, 2, 3], [1, 3, 2], [2, 1, 3], [2, 3, 1],
 [3, 1, 2], [3, 2, 1]]
```

It is also possible to take the union of more than two disjoint sets, or even an infinite number of them. We will now construct the set of all permutations, viewed as the union of the sets $P_n$ of permutations of size $n$. We begin by constructing the infinite family $F = (P_n)_{n \in \mathbb{N}}$:

```python
sage: F = Family(NonNegativeIntegers(), Permutations); F
Lazy family (<class sage.combinat.permutation.Permutations>(i))_{i in Non negative␣→integers}
sage: F.keys()
Non negative integers
sage: F[1000]
Standard permutations of 1000
```

Now we can construct the disjoint union $\bigcup_{n \in \mathbb{N}} P_n$:

```python
sage: U = DisjointUnionEnumeratedSets(F); U
Disjoint union of
Lazy family (<class 'sage.combinat.permutation.Permutations'>)(i)_{i in Non negative␣→integers}
```

(continues on next page)
Disjoint union of
Lazy family (<class 'sage.combinat.permutation.Permutations'>,(i))_{i in Non negative…\rightarrow integers}

It is an infinite set:

```sage
sage: U.cardinality()
+Infinity
```

```python
>>> from sage.all import *

>>> U.cardinality()
+Infinity
```

which doesn’t prohibit iteration through its elements, though it will be necessary to interrupt it at some point:

```sage
sage: for p in U:         # not tested
....:     print(p)
[]
[1]
[1, 2]
[2, 1]
[1, 2, 3]
[1, 3, 2]
[2, 1, 3]
[2, 3, 1]
[3, 1, 2]
...
```

```python
>>> from sage.all import *

>>> for p in U:         # not tested
...
...     print(p)
[]
[1]
[1, 2]
[2, 1]
[1, 2, 3]
[1, 3, 2]
[2, 1, 3]
[2, 3, 1]
[3, 1, 2]
...
```

Note: the above set could also have been constructed directly with:

```sage
sage: U = Permutations(); U
Standard permutations
```

```python
>>> from sage.all import *

>>> U = Permutations(); U
Standard permutations
```
Summary

Sage provides a library of common enumerated sets, which can be combined by standard constructions, giving a toolbox that is flexible (but which could still be expanded). It is also possible to add new building blocks to Sage with a few lines (see the code in FiniteEnumeratedSets().example()). This is made possible by the uniformity of the interfaces and the fact that Sage is based on an object-oriented language. Also, very large or even infinite sets can be manipulated thanks to lazy evaluation strategies (iterators, etc.).

There is no magic to any of this: under the hood, Sage applies the usual rules (for example, that the cardinality of $E \times E$ is $|E|^2$); the added value comes from the capacity to manipulate complicated constructions. The situation is comparable to Sage's implementation of differential calculus: Sage applies the usual rules for differentiation of functions and their compositions, where the added value comes from the possibility of manipulating complicated formulas. In this sense, Sage implements a calculus of finite enumerated sets.

Generic algorithms

Lexicographic generation of lists of integers

Among the classic enumerated sets, especially in algebraic combinatorics, a certain number are composed of lists of integers of fixed sum, such as partitions, compositions, or integer vectors. These examples can also have supplementary constraints added to them. Here are some examples. We start with the integer vectors with sum 10 and length 3, with parts bounded below by 2, 4 and 2 respectively:

```
sage: IntegerVectors(10, 3, min_part=2, max_part=5, 
...: inner=[2, 4, 2]).list()
[[4, 4, 2], [3, 5, 2], [3, 4, 3], [2, 5, 3], [2, 4, 4]]
```

The compositions of 5 with each part at most 3, and with length 2 or 3:

```
sage: Compositions(5, max_part=3, 
...: min_length=2, max_length=3).list()
[[3, 2], [3, 1, 1], [2, 3], [2, 2, 1], [2, 1, 2], [1, 3, 1], 
[1, 2, 2], [1, 1, 3]]
```

The strictly decreasing partitions of 5:

```
sage: Partitions(5, max_slope=-1).list()
[[5], [4, 1], [3, 2]]
```

5.1. Comprehensive Module List
These sets share the same underlying algorithmic structure, implemented in the more general (and slightly more cumbersome) class `IntegerListsLex`. This class models sets of vectors \((\ell_0, \ldots, \ell_k)\) of non-negative integers, with constraints on the sum and the length, and bounds on the parts and on the consecutive differences between the parts. Here are some more examples:

```python
sage: IntegerListsLex(10, length=3,
...:     min_part=2, max_part=5,
...:     floor=[2, 4, 2]).list()
[[4, 4, 2], [3, 5, 2], [3, 4, 3], [2, 5, 3], [2, 4, 4]]

sage: IntegerListsLex(5, min_part=1, max_part=3,
...:     min_length=2, max_length=3).list()
[[3, 2], [3, 1, 1], [2, 3], [2, 2, 1], [2, 1, 2],
 [1, 3, 1], [1, 2, 2], [1, 1, 3]]

sage: IntegerListsLex(5, min_part=1, max_slope=-1).list()
[[5], [4, 1], [3, 2]]

sage: list(Compositions(5, max_length=2))
[[5], [4, 1], [3, 2], [2, 3], [1, 4]]

sage: list(IntegerListsLex(5, max_length=2, min_part=1))
[[5], [4, 1], [3, 2], [2, 3], [1, 4]]
```

The point of the model of `IntegerListsLex` is in the compromise between generality and efficiency. The main algorithm permits iteration through the elements of such a set \(S\) in reverse lexicographic order with a good complexity in most practical use cases. Roughly speaking, the time needed to iterate through all the elements of \(S\) is proportional to the number of elements, where the proportion factor is controlled by the length \(l\) of the longest element of \(S\). In addition, the memory usage is also controlled by \(l\), which is to say negligible in practice.

This algorithm is based on a very general principle for traversing a decision tree, called branch and bound: at the top level, we run through all the possible choices for \(\ell_0\); for each of these choices, we run through all the possible choices for \(\ell_1\), and so on. Mathematically speaking, we have put the structure of a prefix tree on the elements of \(S\): a node of the tree at depth \(k\) corresponds to a prefix \(\ell_0, \ldots, \ell_k\) of one (or more) elements of \(S\) (see Figure: The prefix tree of the partitions of \(S\)).

The usual problem with this type of approach is to avoid bad decisions which lead to leaving the prefix tree and exploring dead branches; this is particularly problematic because the growth of the number of elements is usually exponential in the
depth. It turns out that the constraints listed above are simple enough to be able to reasonably predict when a sequence \( \ell_0, \ldots, \ell_k \) is a prefix of some element \( S \). Hence, most dead branches can be pruned.

### Integer points in polytopes

Although the algorithm for iteration in \texttt{IntegerListsLex} is efficient, its counting algorithm is naive: it just iterates over all the elements.

There is an alternative approach to treating this problem: modelling the desired lists of integers as the set of integer points of a polytope, that is to say, the set of solutions with integer coordinates of a system of linear inequalities. This is a very general context in which there exist advanced counting algorithms (e.g. Barvinok), which are implemented in libraries like \texttt{LattE}. Iteration does not pose a hard problem in principle. However, there are two limitations that justify the existence of \texttt{IntegerListsLex}. The first is theoretical: lattice points in a polytope only allow modelling of problems of a fixed dimension (length). The second is practical: at the moment only the library \texttt{PALP} has a \texttt{Sage} interface, and though it offers multiple capabilities for the study of polytopes, in the present application it only produces a list of lattice points, without providing either an iterator or non-naive counting:

```python
sage: A = random_matrix(ZZ, 6, 3, x=7)
sage: L = LatticePolytope(A.rows())
sage: L.points()  # random
M(4, 1, 0),
M(0, 3, 5),
M(2, 2, 3),
M(6, 1, 3),
M(1, 3, 6),
M(6, 2, 3),
M(3, 2, 4),
M(3, 2, 3),
```

(continues on next page)
This polytope can be visualized in 3D with `L.plot3d()` (see Figure: The polytope $L$ and its integer points, in cross-eyed stereographic perspective.).

Fig. 3: Figure: The polytope $L$ and its integer points, in cross-eyed stereographic perspective.
Species, decomposable combinatorial classes

In *Enumeration of trees using generating functions*, we showed how to use the recursive definition of binary trees to count them efficiently using generating functions. The techniques we used there are very general, and apply whenever the sets involved can be defined recursively (depending on who you ask, such a set is called a *decomposable combinatorial class* or, roughly speaking, a *combinatorial species*). This includes all the types of trees, but also permutations, compositions, functional graphs, etc.

Here, we illustrate just a few examples using the *Sage* library on combinatorial species:

```python
sage: from sage.combinat.species.library import *
sage: o = var('o')
```

We begin by redefining the complete binary trees; to do so, we stipulate the recurrence relation directly on the sets:

```python
sage: BT = CombinatorialSpecies(min=1)
sage: Leaf = Singleton Species()
sage: BT.define( Leaf + (BT*BT) )
```

Now we can construct the set of trees with five nodes, list them, count them…:

```python
sage: BT5 = BT.isotypes([o]*5)
```

```python
sage: BT5.cardinality()    # needs sage.symbolic
14
```

```python
sage: BT5.list()           # needs sage.symbolic
[o*(o*(o*(o*o))), o*(o*((o*o)*o)), o*((o*o)*(o*o)), o*((o*(o*o))*o), o*(((o*o)*o)*o),
 (o*o)*(o*(o*o)), (o*o)*((o*o)*o), (o*(o*o))*(o*o), ((o*o)*o)*(o*o),
 ((o*(o*o))*o)*o, (((o*o)*o)*o)*o]
```

```python
>>> from sage.all import *
```

```python
>>> BT5 = BT.isotypes([o]*Integer(5))   # needs sage.symbolic
```

```python
>>> BT5.cardinality()    # needs sage.symbolic
14
```

```python
>>> BT5.list()           # needs sage.symbolic
[o*(o*(o*(o*o))), o*(o*((o*o)*o)), o*((o*o)*(o*o)), o*((o*(o*o))*o), o*(((o*o)*o)*o),
 (o*o)*(o*(o*o)), (o*o)*((o*o)*o), (o*(o*o))*(o*o), ((o*o)*o)*(o*o),
 ((o*(o*o))*o)*o, (((o*o)*o)*o)*o]
```

(continues on next page)
The trees are constructed using a generic recursive structure; the display is therefore not wonderful. To do better, it would be necessary to provide Sage with a more specialized data structure with the desired display capabilities.

We recover the generating function for the Catalan numbers:

\[
\begin{align*}
&((o^*(o^*(o^o)))^o, (o^*(o^o)^*(o^o))^o, ((o^o)^*(o^o))o^o, \\
&((o^o)^*(o^o))o^o, (((o^o)^o)^o)^o)
\end{align*}
\]

which is returned in the form of a lazy power series:

\[
\begin{align*}
&\text{sage: } g = BT.isotype_generating_series(); g \\
&z + z^2 + 2z^3 + 5z^4 + 14z^5 + 42z^6 + 132z^7 + O(z^8)
\end{align*}
\]

We finish with the Fibonacci words, which are binary words without two consecutive “1”s. They admit a natural recursive definition:

\[
\begin{align*}
&\text{sage: } Eps = \text{EmptySetSpecies()} \\
&\text{sage: } Z0 = \text{SingletonSpecies()} \\
&\text{sage: } Z1 = Eps*SingletonSpecies() \\
&\text{sage: } FW = \text{CombinatorialSpecies()} \\
&\text{sage: } FW.define(Eps + Z0*FW + Z1*Eps + Z1*Z0*FW)
\end{align*}
\]

The Fibonacci sequence is easily recognized here, hence the name:

\[
\begin{align*}
&\text{sage: } L = FW.isotype_generating_series()[:15]; L \\
&[1, 2, 3, 5, 8, 13, 21, 34, 55, 89, 144, 233, 377, 610, 987]
\end{align*}
\]
This is an immediate consequence of the recurrence relation. One can also generate immediately all the Fibonacci words of a given length, with the same limitations resulting from the generic display.

```
>>> from sage.all import *
>>> oeis(L) # optional -- internet
0: A000045: Fibonacci numbers: F(n) = F(n-1) + F(n-2) with F(0) = 0 and F(1) = 1.
1: ...
2: ...
```

Graphs up to isomorphism

We saw in Some other finite enumerated sets that Sage could generate graphs and partial orders up to isomorphism. We will now describe the underlying algorithm, which is the same in both cases, and covers a substantially wider class of problems.

We begin by recalling some notions. A graph \( G = (V, E) \) is a set \( V \) of vertices and a set \( E \) of edges connecting these vertices; an edge is described by a pair \( \{u, v\} \) of distinct vertices of \( V \). Such a graph is called labelled; its vertices are typically numbered by considering \( V = \{1, 2, 3, 4, 5\} \).

In many problems, the labels on the vertices play no role. Typically a chemist wants to study all the possible molecules with a given composition, for example the alkanes with \( n = 8 \) atoms of carbon and \( 2n + 2 = 18 \) atoms of hydrogen. He therefore wants to find all the graphs consisting of 8 vertices with 4 neighbours, and 18 vertices with a single neighbour. The different carbon atoms, however, are all considered to be identical, and the same for the hydrogen atoms. The problem of our chemist is not imaginary; this type of application is actually at the origin of an important part of the research in graph theory on isomorphism problems.

Working by hand on a small graph it is possible, as in the example of Some other finite enumerated sets, to make a drawing, erase the labels, and “forget” the geometrical information about the location of the vertices in the plane. However, to represent a graph in a computer program, it is necessary to introduce labels on the vertices so as to be able to describe how the edges connect them together. To compensate for the extra information which we have introduced, we then say that two labelled graphs \( g_1 \) and \( g_2 \) are isomorphic if there is a bijection from the vertices of \( g_1 \) to those of \( g_2 \), which maps bijectively the edges of \( g_1 \) to those of \( g_2 \); an unlabelled graph is then an equivalence class of labelled graphs.

In general, testing if two labelled graphs are isomorphic is expensive. However, the number of graphs, even unlabelled, grows very rapidly. Nonetheless, it is possible to list unlabelled graphs very efficiently considering their number. For example, the program Nauty can list the 12005168 simple graphs with 10 vertices in 20 seconds.

As in Lexicographic generation of lists of integers, the general principle of the algorithm is to organize the objects to be enumerated into a tree that one traverses.
For this, in each equivalence class of labelled graphs (that is to say, for each unlabelled graph) one fixes a convenient canonical representative. The following are the fundamental operations:

- Testing whether a labelled graph is canonical
- Calculating the canonical representative of a labelled graph

These unavoidable operations remain expensive; one therefore tries to minimize the number of calls to them.

The canonical representatives are chosen in such a way that, for each canonical labelled graph \( G \), there is a canonical choice of an edge whose removal produces a canonical graph again, which is called the father of \( G \). This property implies that it is possible to organize the set of canonical representatives as a tree: at the root, the graph with no edges; below it, its unique child, the graph with one edge; then the graphs with two edges, and so on. The set of children of a graph \( G \) can be constructed by augmentation, adding an edge in all the possible ways to \( G \), and then selecting, from among those graphs, the ones that are still canonical\(^{2}\). Recursively, one obtains all the canonical graphs.

In what sense is this algorithm generic? Consider for example planar graphs (graphs which can be drawn in the plane without edges crossing): by removing an edge from a planar graph, one obtains another planar graph; so planar graphs form a subtree of the previous tree. To generate them, exactly the same algorithm can be used, selecting only the children which are planar:

```python
sage: [len(list(graphs(n, property=lambda G: G.is_planar())))
  for n in range(7)]
[1, 1, 2, 4, 11, 33, 142]
```

In a similar fashion, one can generate any family of graphs closed under deletion of an edge, and in particular any family characterized by a forbidden subgraph. This includes for example forests (graphs without cycles), bipartite graphs (graphs without odd cycles), etc. This can be applied to generate:

- partial orders, via the bijection with Hasse diagrams which are oriented graphs without cycles and without edges implied by the transitivity of the order relation;
- lattices (not implemented in Sage), via the bijection with the meet semi-lattice obtained by deleting the maximal vertex; in this case an augmentation by vertices rather than by edges is used.

5.1.354 Vector Partitions

AUTHORS:

- Amritanshu Prasad (2013): Initial version
- Shriya M (2022): Added new parameters such as distinct.parts and is_repeatable

sage.combinat.vector_partition.IntegerVectorsIterator(vect, min=None)

Return an iterator over the list of integer vectors which are componentwise less than or equal to vect, and lexicographically greater than or equal to min.

INPUT:

\(^{2}\) In practice, an efficient implementation would exploit the symmetries of \( G \), i.e., its automorphism group, to reduce the number of children to explore, and to reduce the cost of each test of canonicity.
Fig. 4: Figure: The generation tree of simple graphs with 4 vertices.
Combinatorics, Release 10.4

- **vect** – A list of non-negative integers
- **min** – A list of non-negative integers dominated elementwise by **vect**

**OUTPUT:**

A list in lexicographic order of all integer vectors (as lists) which are dominated elementwise by **vect** and are greater than or equal to **min** in lexicographic order.

**EXAMPLES:**

```python
sage: from sage.combinat.vector_partition import IntegerVectorsIterator
sage: list(IntegerVectorsIterator([1, 1]))
[[0, 0], [0, 1], [1, 0], [1, 1]]

sage: list(IntegerVectorsIterator([1, 1], min = [1, 0]))
[[1, 0], [1, 1]]
```

```python
>>> from sage.all import *
>>> from sage.combinat.vector_partition import IntegerVectorsIterator

>>> list(IntegerVectorsIterator([Integer(1), Integer(1)]))
[[0, 0], [0, 1], [1, 0], [1, 1]]

>>> list(IntegerVectorsIterator([Integer(1), Integer(1)], min = [Integer(1), Integer(0)]))
[[1, 0], [1, 1]]
```

class **sage.combinat.vector_partition.VectorPartition** *(parent, vecpar)*

**Bases:** **CombinatorialElement**

A vector partition is a multiset of integer vectors.

**partition_at_vertex(i)**

Return the partition obtained by sorting the i-th elements of the vectors in the vector partition.

**EXAMPLES:**

```python
sage: V = VectorPartition([[1, 2, 1], [2, 4, 1]])
sage: V.partition_at_vertex(1)
[4, 2]
```

```python
>>> from sage.all import *

>>> V = VectorPartition([[Integer(1), Integer(2), Integer(1)], [Integer(2), Integer(4), Integer(1)]])

>>> V.partition_at_vertex(Integer(1))
[4, 2]
```

**sum()**

Return the sum vector as a list.

**EXAMPLES:**

```python
sage: V = VectorPartition([[3, 2, 1], [2, 2, 1]])
sage: V.sum()
[5, 4, 2]
```

```python
>>> from sage.all import *

>>> V = VectorPartition([[Integer(3), Integer(2), Integer(1)], [Integer(2), Integer(4), Integer(1)]]

>>> V.sum()
[5, 4, 2]
```
class sage.combinat.vector_partition.VectorPartitions (vec, min=None, parts=None, distinct=False, is_repeatable=None)

Bases: UniqueRepresentation, Parent

Class of all vector partitions of vec with all parts greater than or equal to min in lexicographic order, with parts from parts.

A vector partition of vec is a list of vectors with non-negative integer entries whose sum is vec.

INPUT:

- vec – Integer vector
- min – Integer vector dominated elementwise by vec
- parts – Finite list of possible parts
- distinct – Boolean, set to True if only vector partitions with distinct parts are enumerated
- is_repeatable – Boolean function on parts which gives True in parts that can be repeated

EXAMPLES:

If min is not specified, then the class of all vector partitions of vec is created:

```python
sage: VP = VectorPartitions([2, 2])
sage: for vecpar in VP:
    ....:     print(vecpar)
[[0, 1], [0, 1], [1, 0], [1, 0]]
[[0, 1], [0, 1], [2, 0]]
[[0, 1], [1, 0], [1, 1]]
[[0, 1], [2, 1]]
[[0, 2], [1, 0], [1, 0]]
[[0, 2], [2, 0]]
[[1, 0], [1, 2]]
[[1, 1], [1, 1]]
[[2, 2]]
```

```python
>>> from sage.all import *
>>> VP = VectorPartitions([Integer(2), Integer(2)])
>>> for vecpar in VP:
    ...     print(vecpar)
[[0, 1], [0, 1], [1, 0], [1, 0]]
[[0, 1], [0, 1], [2, 0]]
[[0, 1], [1, 0], [1, 1]]
[[0, 1], [2, 1]]
[[0, 2], [1, 0], [1, 0]]
[[0, 2], [2, 0]]
[[1, 0], [1, 2]]
[[1, 1], [1, 1]]
[[2, 2]]
```

If distinct is set to be True, then distinct part partitions are created:
sage: VP = VectorPartitions([2, 2], distinct = True)
sage: list(VP)
[[[0, 1], [1, 0], [1, 1]],
[[0, 1], [2, 1]],
[[0, 2], [2, 0]],
[[1, 0], [1, 2]],
[[2, 2]]]

>>> from sage.all import *

>>> VP = VectorPartitions([Integer(2), Integer(2)], distinct = True)

If \texttt{min} is specified, then the class consists of only those vector partitions whose parts are all greater than or equal to \texttt{min} in lexicographic order:

sage: VP = VectorPartitions([2, 2], min = [1, 0])
sage: for vecpar in VP:
....:     print(vecpar)
[[1, 0], [1, 2]]
[[1, 1], [1, 1]]
[[2, 2]]

sage: VP = VectorPartitions([2, 2], min = [1, 0], distinct = True)

If \texttt{parts} is specified, then the class consists only of those vector partitions whose parts are from \texttt{parts}:

sage: Vec_Par = VectorPartitions([2, 2], parts=[[0, 1], [1, 0], [1, 1]])
sage: list(Vec_Par)

(continues on next page)
If \texttt{is\_repeatable} is specified, then the parts which satisfy the boolean function \texttt{is\_repeatable} are allowed to be repeated:

\begin{verbatim}
sage: Vector_Partitions = VectorPartitions([2,2], parts=[0,1],[1,0],[1,1], is_repeatable=lambda vec: sum(vec)%2!=0)
sage: list(Vector_Partitions)
[[[0, 1], [0, 1], [1, 0], [1, 0]], [[0, 1], [1, 0], [1, 1]]]
\end{verbatim}

\begin{verbatim}
>>> from sage.all import *
>>> from sage.combinat.vector_partition import find_min

sage.combinat.vector_partition.find_min(vec)
Return a string of 0's with one 1 at the location where the list \texttt{vec} has its last entry which is not equal to 0.

INPUT:

• vec – A list of integers

OUTPUT:

A list of the same length with 0's everywhere, except for a 1 at the last position where \texttt{vec} has an entry not equal to 0.

EXAMPLES:

\begin{verbatim}
sage: from sage.combinat.vector_partition import find_min
sage: find_min([2, 1])
[0, 1]
sage: find_min([2, 1, 0])
[0, 1, 0]
\end{verbatim}
\end{verbatim}
5.1.355 Abstract word (finite or infinite)

This module gathers functions that works for both finite and infinite words.

AUTHORS:
- Sébastien Labbé
- Franco Saliola

EXAMPLES:

```python
sage: a = 0.618
sage: g = words.CodingOfRotationWord(alpha=a, beta=1-a, x=a)
sage: f = words.FibonacciWord()
sage: p = f.longest_common_prefix(g, length='finite')
sage: p
word: 0100101001001010010100100101001001010010...
sage: p.length()
231
```

```python
>>> from sage.all import *
>>> a = RealNumber('0.618')
>>> g = words.CodingOfRotationWord(alpha=a, beta=Integer(1)-a, x=a)
>>> f = words.FibonacciWord()
>>> p = f.longest_common_prefix(g, length='finite')
>>> p
word: 0100101001001010010100100101001001010010...
>>> p.length()
231
```

class sage.combinat.words.abstract_word.Word_class
Bases: SageObject

`apply_morphism(morphism)`

Returns the word obtained by applying the morphism to self.

INPUT:
- `morphism` – Can be an instance of WordMorphism, or anything that can be used to construct one.

EXAMPLES:

```python
sage: w = Word("ab")
sage: d = {'a':'ab', 'b':'ba'}
sage: w.apply_morphism(d)
word: abba
```

```python
>>> from sage.all import *
>>> w = Word("ab")
>>> d = {'a':'ab', 'b':'ba'}
>>> w.apply_morphism(d)
word: abba
```
sage: w = Word('ababa')
sage: d = dict(a='ab', b='ba')
sage: d
{'a': 'ab', 'b': 'ba'}
sage: w.apply_morphism(d)
word: abbaabbaab

>>> from sage.all import *
>>> w = Word('ababa')
>>> d = dict(a='ab', b='ba')
>>> d
{'a': 'ab', 'b': 'ba'}
>>> w.apply_morphism(d)
word: abbaabbaab

For infinite words:

sage: t = words.ThueMorseWord([0,1]); t
word: 0100100100100101100101100110100110010110...
sage: t.apply_morphism({0:8,1:9})
word: 898989898989898989898989898989898989898...

>>> from sage.all import *
>>> t = words.ThueMorseWord([Integer(0),Integer(1)]); t
word: 0100100100100101100101100110100110010110...
>>> t.apply_morphism({Integer(0):Integer(8),Integer(1):Integer(9)})
word: 898989898989898989898989898989898989898...

**complete_return_words_iterator**(fact)

Returns an iterator over all the complete return words of fact in self (without unicity).

A complete return words $u$ of a factor $v$ is a factor starting by the given factor $v$ and ending just after the next occurrence of this factor $v$. See for instance [1].

**INPUT:**

- **fact** – a non empty finite word

**OUTPUT:**

iterator

**EXAMPLES:**

sage: TM = words.ThueMorseWord()
sage: fact = Word([0,1,0,1])
sage: it = TM.complete_return_words_iterator(fact)
sage: next(it)
word: 01101001100101101
sage: next(it)
word: 01101001011001101
sage: next(it)
word: 011010011001011001101
sage: next(it)
word: 0110100101101
sage: next(it)
word: 01101001100101101
sage: next(it)
word: 01101001011001101
sage: next(it)
word: 01101001100101101
sage: next(it)
word: 01101001011001101
```python
>>> from sage.all import *
>>> TM = words.ThueMorseWord()
>>> fact = Word([Integer(0), Integer(1), Integer(1), Integer(0), Integer(1)])
>>> it = TM.complete_return_words_iterator(fact)
>>> next(it)
word: 01101001100101101
>>> next(it)
word: 01101001011001101
>>> next(it)
word: 011010011001011001101
>>> next(it)
word: 0110100101101
>>> next(it)
word: 01101001100101101
>>> next(it)
word: 01101001011001101
```

REFERENCES:

**delta()**

Returns the image of self under the delta morphism.

This is the word composed of the length of consecutive runs of the same letter in a given word.

**OUTPUT:**

Word over integers

**EXAMPLES:**

For finite words:

```python
sage: W = Words('0123456789')
sage: W('22112122').delta()
word: 22112
sage: W('555008').delta()
word: 321
sage: W('').delta()
word:
sage: Word('aabbabaa').delta()
word: 22112
```

For infinite words:

```python
>>> from sage.all import *
>>> W = Words('0123456789')
>>> W('22112122').delta()
word: 22112
>>> W('555008').delta()
word: 321
>>> W('').delta()
word:
>>> Word('aabbabaa').delta()
word: 22112
```
```python
sage: t = words.ThueMorseWord()
sage: t.delta()
word: 1211222112112112221122211222112112112221...
```

```python
>>> from sage.all import *
>> t = words.ThueMorseWord()
>> t.delta()
word: 1211222112112112221122211222112112112221...
```

**factor_occurrences_iterator** *(fact)*

Returns an iterator over all occurrences (including overlapping ones) of fact in self in their order of appearance.

**INPUT:**

- *fact* – a non empty finite word

**OUTPUT:**

iterator

**EXAMPLES:**

```python
sage: TM = words.ThueMorseWord()
sage: fact = Word([0,1,1,0,1])
sage: it = TM.factor_occurrences_iterator(fact)
sage: next(it)
0
sage: next(it)
12
sage: next(it)
24
```

```python
>>> from sage.all import *
>>> TM = words.ThueMorseWord()
>>> fact = Word([Integer(0),Integer(1),Integer(1),Integer(0),Integer(1)])
>>> it = TM.factor_occurrences_iterator(fact)
>>> next(it)
0
>>> next(it)
12
>>> next(it)
24
```

```python
sage: u = Word('121')
sage: w = Word('121213211213')
sage: list(w.factor_occurrences_iterator(u))
[0, 2, 8]
```

```python
>>> from sage.all import *
>>> u = Word('121')
>>> w = Word('121213211213')
>>> list(w.factor_occurrences_iterator(u))
[0, 2, 8]
```

**finite_differences** *(mod=None)*

Return the word obtained by the differences of consecutive letters of self.

**INPUT:**

• self – A word over the integers.
• mod – (default: None) It can be one of the following:
  – None or 0: result is over the integers
  – integer: result is over the integers modulo mod.

EXAMPLES:

```python
sage: w = Word([x^2 for x in range(10)])
sage: w.finite_differences()
word: 1,3,5,7,9,11,13,15,17
sage: w.finite_differences(mod=4)
word: 131313131
sage: w.finite_differences(mod=0)
word: 1,3,5,7,9,11,13,15,17
```

```python
>>> from sage.all import *

w = Word([x**Integer(2) for x in range(Integer(10))])
>>> w.finite_differences()
word: 1,3,5,7,9,11,13,15,17
>>> w.finite_differences(mod=Integer(4))
word: 131313131
>>> w.finite_differences(mod=Integer(0))
word: 1,3,5,7,9,11,13,15,17
```

first_occurrence(other, start=0)
Return the position of the first occurrence of other in self.
If other is not a factor of self, it returns None or loops forever when self is an infinite word.

INPUT:
• other – a finite word
• start – integer (default: 0), where the search starts

OUTPUT:
integer or None

EXAMPLES:

```python
sage: w = Word('01234567890123456789')
sage: w.first_occurrence(Word('3456'))
3
sage: w.first_occurrence(Word('3456'), start=7)
13
```

```python
>>> from sage.all import *

w = Word('01234567890123456789')
>>> w.first_occurrence(Word('3456'))
3
>>> w.first_occurrence(Word('3456'), start=Integer(7))
13
```

When the factor is not present, None is returned:
```python
sage: w.first_occurrence(Word('3456'), start=17)  is None
True
sage: w.first_occurrence(Word('3333'))  is None
True

>>> from sage.all import *

w.first_occurrence(Word('3456'), start=Integer(17))  is None
True
w.first_occurrence(Word('3333'))  is None
True

Also works for searching a finite word in an infinite word:

sage: w = Word('0123456789')^oo
sage: w.first_occurrence(Word('3456'))
3
sage: w.first_occurrence(Word('3456'), start=1000)
1003

>>> from sage.all import *

w.first_occurrence(Word('3456'))
3
w.first_occurrence(Word('3456'), start=Integer(1000))
1003

But it will loop for ever if the factor is not found:

sage: w.first_occurrence(Word('3333'))  # not tested -- infinite loop

>>> from sage.all import *

w.first_occurrence(Word('3333'))  # not tested -- infinite loop

The empty word occurs in a word:

sage: Word('123').first_occurrence(Word(''), 0)
0
sage: Word('').first_occurrence(Word(''), 0)
0

>>> from sage.all import *

Word('123').first_occurrence(Word(''), Integer(0))
0
Word('').first_occurrence(Word(''), Integer(0))
0

is_empty()
Returns True if the length of self is zero, and False otherwise.

EXAMPLES:

sage: it = iter([])
sage: Word(it).is_empty()
True
sage: it = iter([1,2,3])
sage: Word(it).is_empty()
```

(continues on next page)
False
sage: from itertools import count
sage: Word(count()).is_empty()
False

>>> from sage.all import *

>>> it = iter([])

>>> Word(it).is_empty()
True

>>> it = iter([Integer(1),Integer(2),Integer(3)])

>>> Word(it).is_empty()
False

>>> from itertools import count

>>> Word(count()).is_empty()
False

is_finite()

Returns whether this word is known to be finite.

**Warning:** A word defined by an iterator such that its end has never been reached will returns False.

EXAMPLES:

sage: Word([]).is_finite()
True
sage: Word('a').is_finite()
True
sage: TM = words.ThueMorseWord()
sage: TM.is_finite()
False

>>> from sage.all import *

>>> Word([]).is_finite()
True

>>> Word('a').is_finite()
True

>>> TM = words.ThueMorseWord()

>>> TM.is_finite()
False

sage: w = Word(iter('a'*100))
sage: w.is_finite()
False

>>> from sage.all import *

>>> w = Word(iter('a'*Integer(100)))

>>> w.is_finite()
False

iterated_right_palindromic_closure *(f=None, algorithm='recursive')*

Returns the iterated (f-)palindromic closure of self.

INPUT:
• \( f \) – involution (default: None) on the alphabet of self. It must be callable on letters as well as words (e.g. WordMorphism).

• \texttt{algorithm} – string (default: 'recursive') specifying which algorithm to be used when computing the iterated palindromic closure. It must be one of the two following values:
  
  – 'definition' – computed using the definition
  
  – 'recursive' – computation based on an efficient formula that recursively computes the iterated right palindromic closure without having to recompute the longest \( f \)-palindromic suffix at each iteration [2].

OUTPUT:

word – the iterated (\( f \))-palindromic closure of self

EXAMPLES:

\begin{verbatim}
sage: Word('123').iterated_right_palindromic_closure()
word: 1213121

>>> from sage.all import *

>>> w = Word('abc')
w.iterated_right_palindromic_closure()
word: abacaba

>>> w = Word('aaa')
w.iterated_right_palindromic_closure()
word: aaa

>>> w = Word('abbab')
w.iterated_right_palindromic_closure()
word: ababaababaababa

A right \( f \)-palindromic closure:

sage: f = WordMorphism('a->b,b->a')
sage: w = Word('abbab')
w.iterated_right_palindromic_closure(f=f)
word: ababaababaababaabbaaabaabab
>>> from sage.all import *
>>> f = WordMorphism('a->b,b->a')
>>> w = Word('abbab')
>>> witerated_right_palindromic_closure(f=f)
word: ababaababaababaababaababaababaababaababaabab

An infinite word:

sage: t = words.ThueMorseWord('ab')
sage: titerated_right_palindromic_closure()
word: ababaababaababaababaababaababaababaababaabab...

sage: t = words.ThueMorseWord('ab')
sage: t.iterated_right_palindromic_closure()
word: ababaababaababaababaababaababaababaababaabab...

There are two implementations computing the iterated right $f$-palindromic closure, the latter being much more efficient:

sage: w = Word('abaab')
sage: u = w.iterated_right_palindromic_closure(algorithm='definition')
sage: v = w.iterated_right_palindromic_closure(algorithm='recursive')
sage: u == v
True
sage: w = words.RandomWord(8)
>>> u = w.iterated_right_palindromic_closure(algorithm='definition')
>>> v = w.iterated_right_palindromic_closure(algorithm='recursive')
>>> u == v
True

REFERENCES:

length()

Returns the length of self.
**lex_greater** *(other)*
Returns True if self is lexicographically greater than other.

**EXAMPLES:**

```
sage: w = Word([1,2,3])
sage: u = Word([1,3,2])
sage: v = Word([3,2,1])
sage: w.lex_greater(u) False
sage: v.lex_greater(w) True
sage: a = Word("abba")
sage: b = Word("abbb")
sage: a.lex_greater(b) False
sage: b.lex_greater(a) True
```

```
>>> from sage.all import *
>>> w = Word([Integer(1),Integer(2),Integer(3)])
>>> u = Word([Integer(1),Integer(3),Integer(2)])
>>> v = Word([Integer(3),Integer(2),Integer(1)])
>>> w.lex_greater(u) False
>>> v.lex_greater(w) True
```

For infinite words:

```
sage: t = words.ThueMorseWord()
sage: t[:10].lex_greater(t) False
sage: t.lex_greater(t[:10]) True
```

```
>>> from sage.all import *
>>> t = words.ThueMorseWord()
>>> t[:Integer(10)].lex_greater(t) False
>>> t.lex_greater(t[:Integer(10)]) True
```

**lex_less** *(other)*
Returns True if self is lexicographically less than other.

**EXAMPLES:**

```
sage: w = Word([1,2,3])
sage: u = Word([1,3,2])
sage: v = Word([3,2,1])
```

(continues on next page)
For infinite words:

```python
sage: t = words.ThueMorseWord()
sage: t.lex_less(t[:10])
False
sage: t[:10].lex_less(t)
True
```

```python
>> import *  
>> t = words.ThueMorseWord()  
>> t.lex_less(t[:Integer(10)])
False  
>> t[:Integer(10)].lex_less(t)
True
```

`longest_common_prefix(other, length='unknown')`

Returns the longest common prefix of self and other.

**INPUT:**

- `other` – word
- `length` – string (default: 'unknown') the length type of the resulting word if known. It may be one of the following:
  - 'unknown'
  - 'finite'
  - 'infinite'

**EXAMPLES:**
Combinatorics, Release 10.4

sage: f = lambda n : add(Integer(n).digits(2)) % 2
sage: t = Word(f)
sage: u = t[:10]
sage: t.longest_common_prefix(u)
word: 0110100110

The longest common prefix of two equal infinite words:

sage: t1 = Word(f)
sage: t2 = Word(f)
sage: t1.longest_common_prefix(t2)
word: 0110100110010110100101100110100110010110...

Useful to study the approximation of an infinite word:

sage: a = 0.618
sage: g = words.CodingOfRotationWord(alpha=a, beta=1-a, x=a)
sage: f = words.FibonacciWord()
sage: p = f.longest_common_prefix(g, length='finite')
sage: p.length()
231

longest_periodic_prefix(period=1)
Returns the longest prefix of self having the given period.

INPUT:

• period – positive integer (default: 1)

OUTPUT:

word

EXAMPLES:
Combinatorics, Release 10.4

```
sage: Word([]).longest_periodic_prefix()
word: 
sage: Word([1]).longest_periodic_prefix()
word: 1
sage: Word([1,2]).longest_periodic_prefix()
word: 1
sage: Word([1,1,2]).longest_periodic_prefix()
word: 11
sage: Word([1,2,1,2,1,3]).longest_periodic_prefix(2)
word: 12121
sage: type(_)
<class 'sage.combinat.words.word.FiniteWord_iter_with_caching'>
sage: Word(lambda n:0).longest_periodic_prefix()
word: 0000000000000000000000000000000000000000...
```

```
>>> from sage.all import *
>>> Word([]).longest_periodic_prefix()
word: 
>>> Word([Integer(1)]).longest_periodic_prefix()
word: 1
>>> Word([Integer(1),Integer(2)]).longest_periodic_prefix()
word: 1
>>> Word([Integer(1),Integer(1),Integer(2)]).longest_periodic_prefix()
word: 11
>>> Word([Integer(1),Integer(2),Integer(1),Integer(2),Integer(1),Integer(3)]).longest_periodic_prefix(Integer(2))
word: 12121
>>> type(_)
<class 'sage.combinat.words.word.FiniteWord_iter_with_caching'>
>>> Word(lambda n:Integer(0)).longest_periodic_prefix()
word: 0000000000000000000000000000000000000000...
```

`palindrome_prefixes_iterator(max_length=None)`

Returns an iterator over the palindrome prefixes of self.

**INPUT:**

- `max_length` – non negative integer or None (optional, default: None) the maximum length of the prefixes

**OUTPUT:**

iterator

**EXAMPLES:**

```
sage: w = Word('abaaba')
sage: for pp in w.palindrome_prefixes_iterator(): pp
word: a
word: aba
word: abaaba
```

```
sage: for pp in w.palindrome_prefixes_iterator(max_length=4): pp
word: a
word: aba
```
You can iterate over the palindrome prefixes of an infinite word:

```
>>> from sage.all import *
>>> f = words.FibonacciWord()
>>> for pp in f.palindrome_prefixes_iterator(max_length=Integer(20)): pp
word: 0
word: 010
word: 010010
word: 01001010010
word: 0100101001001010010
```

**parent()**

Returns the parent of self.

**partial_sums**(start, mod=None)

Returns the word defined by the partial sums of its prefixes.

**INPUT:**

- self – A word over the integers.
- start – integer, the first letter of the resulting word.
- mod – (default: None) It can be one of the following:
  - None or 0: result is over the integers
  - integer: result is over the integers modulo mod.

**EXAMPLES:**

```
sage: w = Word(range(10))
sage: w.partial_sums(0)
word: 0,0,1,3,6,10,15,21,28,36,45
sage: w.partial_sums(1)
word: 1,1,2,4,7,11,16,22,29,37,46
```
```python
>>> from sage.all import *

w = Word(range(Integer(10)))
w.partial_sums(Integer(0))
word: 0,0,1,3,6,10,15,21,28,36,45

w.partial_sums(Integer(1))
word: 1,1,2,4,7,11,16,22,29,37,46
```

```python
sage: w = Word([1,2,3,1,2,3,2,2,2,2])
sage: w.partial_sums(0, mod=None)
word: 0,1,3,6,7,9,12,14,16,18,20
sage: w.partial_sums(0, mod=0)
word: 0,1,3,6,7,9,12,14,16,18,20
sage: w.partial_sums(0, mod=8)
word: 01367146024
sage: w.partial_sums(0, mod=4)
word: 01323102020
sage: w.partial_sums(0, mod=2)
word: 01101100000
sage: w.partial_sums(0, mod=1)
word: 00000000000
```

```python
>>> from sage.all import *

w = Word([Integer(1),Integer(2),Integer(3),Integer(1),Integer(2),
Integer(3),Integer(2),Integer(2),Integer(2),Integer(2)])

w.partial_sums(Integer(0), mod=None)
word: 0,1,3,6,7,9,12,14,16,18,20

w.partial_sums(Integer(0), mod=Integer(0))
word: 0,1,3,6,7,9,12,14,16,18,20

w.partial_sums(Integer(0), mod=Integer(8))
word: 01367146024

w.partial_sums(Integer(0), mod=Integer(4))
word: 01323102020

w.partial_sums(Integer(0), mod=Integer(2))
word: 01101100000

w.partial_sums(Integer(0), mod=Integer(1))
word: 00000000000
```

**prefixes_iterator** (*max_length=None*)

Returns an iterator over the prefixes of self.

**INPUT:**

- *max_length* – non negative integer or None (optional, default: None) the maximum length of the prefixes

**OUTPUT:**

- iterator

**EXAMPLES:**

```python
sage: w = Word('abaaba')
sage: for p in w.prefixes_iterator(): p
word:
word: a
word: ab
word: aba
word: abaa
```

(continues on next page)
You can iterate over the prefixes of an infinite word:

```plaintext
code: >>> from sage.all import *
code: >>> w = Word('abaaba')
code: >>> for p in w.prefixes_iterator(): p
word: a
word: ab
word: aba
word: abaa
word: abaab
word: abaaba
```

```plaintext
code: >>> for p in w.prefixes_iterator(max_length=Integer(3)): p
word: a
word: ab
word: aba
```

```
return_words_iterator(fact)

Returns an iterator over all the return words of fact in self (without unicity).

INPUT:

- fact – a non empty finite word
```
OUTPUT:

iterator

EXAMPLES:

```
sage: w = Word('baccabccbacbca')
sage: b = Word('b')
sage: list(w.return_words_iterator(b))
[word: bacca, word: bcc, word: bac]
```

```python
>>> from sage.all import *

w = Word('baccabccbacbca')
b = Word('b')
list(w.return_words_iterator(b))
[word: bacca, word: bcc, word: bac]
```

```
sage: TM = words.ThueMorseWord()
sage: fact = Word([0,1,1,0,1])
sage: it = TM.return_words_iterator(fact)
sage: next(it)
word: 011010011001
sage: next(it)
word: 011010010110
sage: next(it)
word: 0110100110010110
sage: next(it)
word: 01101001
sage: next(it)
word: 011010011001
sage: next(it)
word: 011010010110
```

```python
>>> from sage.all import *

TM = words.ThueMorseWord()
fact = Word([Integer(0),Integer(1),Integer(1),Integer(0),Integer(1)])
it = TM.return_words_iterator(fact)
next(it)
word: 011010011001
next(it)
word: 011010010110
next(it)
word: 0110100110010110
next(it)
word: 01101001
next(it)
word: 011010011001
next(it)
word: 011010010110
```

```
string_rep()
```

Returns the (truncated) raw sequence of letters as a string.

EXAMPLES:

```
sage: Word('abbabaab').string_rep()
'abbabaab'
sage: Word([0, 1, 0, 0, 1]).string_rep()
```

(continues on next page)
sum_digits (base=2, mod=None)

Return the sequence of the sum modulo mod of the digits written in base base of self.

INPUT:

• self – word over natural numbers
• base – integer (default: 2), greater or equal to 2
• mod – modulo (default: None), can take the following values:
  – integer – the modulo
  – None – the value base is considered for the modulo.

EXAMPLES:

The Thue-Morse word:

```python
sage: from itertools import count
sage: Word(count()).sum_digits()
word: 0110100110010110100101100110100110010110...
```

Sum of digits modulo 2 of the prime numbers written in base 2:

```python
sage: Word(primes(1000)).sum_digits()  # needs sage.libs.pari
word: 10011101001110111010110011010011001101110...  
```

```python
>>> from sage.all import *
>>> from itertools import count
>>> from sage.all import *
>>> from itertools import count
>>> from sage.all import *
>>> from itertools import count
```

(continues from previous page)
Sum of digits modulo 3 of the prime numbers written in base 3:

```
sage: Word(primes(1000)).sum_digits(base=3)  # needs sage.libs.pari
word: 21000020022122121210222122122111022...
```

Sum of digits modulo 2 of the prime numbers written in base 3:

```
sage: Word(primes(1000)).sum_digits(base=3, mod=2)  # needs sage.libs.pari
word: 0111111111111111111111111111111111111111...
```

Sum of digits modulo 7 of the prime numbers written in base 10:

```
sage: Word(primes(1000)).sum_digits(base=10, mod=7)  # needs sage.libs.pari
word: 235024135435041006132432241353546006304...
```

Negative entries:

```
sage: w = Word([-1,0,1,2,3,4,5])
sage: w.sum_digits()
Traceback (most recent call last):
  ... NotImplementedError: nth digit of Thue-Morse word is not implemented for negative value of n
```

(continues on next page)
to_integer_word()

Returns a word over the integers whose letters are those output by self._to_integer_iterator()

EXAMPLES:

```
sage: from itertools import count
sage: w = Word(count()); w
word: 0,1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,17,18,19,20,21,22,23,24,25,26,
     →27,28,29,30,31,32,33,34,35,36,37,38,39,...
sage: w.to_integer_word()
word: 0,1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,17,18,19,20,21,22,23,24,25,26,
     →27,28,29,30,31,32,33,34,35,36,37,38,39,...
sage: w = Word(iter("abbacabba"), length="finite"); w
word: abbacabba
sage: w.to_integer_word()
word: 011020110
sage: w = Word(iter("abbacabba"), length="unknown"); w
word: abbacabba
sage: w.to_integer_word()
word: 011020110
```

5.1.356 Combinatorics on words

Main modules and their methods:

- Abstract word (finite or infinite)
- Finite word
- Infinite word
- Alphabet
- Set of words
- **Word paths**
- **Word morphisms/substitutions**
- **Shuffle product of words**
- **Suffix Tries and Suffix Trees**

Main classes and functions meant to be used by the user:

A list of common words can be accessed through `words.<tab>` and are listed in the `words catalog`.

**Internal representation of words:**

- **Word classes**
- **Fast word datatype using an array of unsigned char**
- **Datatypes for finite words**
- **Datatypes for words defined by iterators and callables**

**Options:**

- **User-customizable options for words**

See `WordOptions()`.

### 5.1.357 Alphabet

**AUTHORS:**

- Franco Saliola (2008-12-17): merged into sage
- Vincent Delecroix and Stepan Starosta (2012): remove classes for alphabet and use other Sage classes otherwise (TotallyOrderedFiniteSet, FiniteEnumeratedSet, …). More shortcut to standard alphabets.

**EXAMPLES:**

```python
sage: build_alphabet("ab")
{'a', 'b'}
sage: build_alphabet([0,1,2])
{0, 1, 2}
sage: build_alphabet(name="PP")
Positive integers
sage: build_alphabet(name="NN")
Non negative integers
sage: build_alphabet(name="lower")
{'a', 'b', 'c', 'd', 'e', 'f', 'g', 'h', 'i', 'j', 'k', 'l', 'm', 'n', 'o', 'p', 'q',
 'r', 's', 't', 'u', 'v', 'w', 'x', 'y', 'z'}
```

```python
>>> from sage.all import *
>>> build_alphabet("ab")
{'a', 'b'}
```

(continues on next page)
Non negative integers

```python
build_alphabet(name="lower")
{'a', 'b', 'c', 'd', 'e', 'f', 'g', 'h', 'i', 'j', 'k', 'l', 'm', 'n', 'o', 'p', 'q', 'r', 's', 't', 'u', 'v', 'w', 'x', 'y', 'z'}
```

sage.combinat.words.alphabet.Alphabet (data=None, names=None, name=None)

Return an object representing an ordered alphabet.

**INPUT:**

- `data` – the letters of the alphabet; it can be:
  - a list/tuple/iterable of letters; the iterable may be infinite
  - an integer $n$ to represent \{1, \ldots, n\}, or infinity to represent $\mathbb{N}$

- `names` – (optional) a list for the letters (i.e. variable names) or a string for prefix for all letters; if given a list, it must have the same cardinality as the set represented by `data`

- `name` – (optional) if given, then return a named set and can be equal to: 'lower', 'upper', 'space', 'underscore', 'punctuation', 'printable', 'binary', 'octal', 'decimal', 'hexadecimal', 'radix64'.

You can use many of them at once, separated by spaces: 'lower punctuation' represents the union of the two alphabets 'lower' and 'punctuation'.

Alternatively, `name` can be set to "positive integers" (or "PP") or "natural numbers" (or "NN").

`name` cannot be combined with `data`.

**EXAMPLES:**

If the argument is a Set, it just returns it:

```python
sage: build_alphabet(ZZ) is ZZ
True
sage: F = FiniteEnumeratedSet(abc)
sage: build_alphabet(F) is F
True
```

```python
>>> from sage.all import *
```
Combinatorics, Release 10.4

{0, 1, 2}

>>> F = build_alphabet('abc'); F
{'a', 'b', 'c'}

>>> print(type(F).__name__)
TotallyOrderedFiniteSet_with_category

If an integer and a set is given, then it constructs a TotallyOrderedFiniteSet:

sage: build_alphabet(3, ['a','b','c'])
{'a', 'b', 'c'}

>>> from sage.all import *

>>> build_alphabet(Integer(3), ['a','b','c'])
{'a', 'b', 'c'}

If an integer and a string is given, then it considers that string as a prefix:

sage: build_alphabet(3, 'x')
{'x0', 'x1', 'x2'}

>>> from sage.all import *

>>> build_alphabet(Integer(3), 'x')
{'x0', 'x1', 'x2'}

If no data is provided, name may be a string which describe an alphabet. The available names decompose into two families. The first one are 'positive integers', 'PP', 'natural numbers' or 'NN' which refer to standard set of numbers:

sage: build_alphabet(name="positive integers")
Positive integers

sage: build_alphabet(name="PP")
Positive integers

sage: build_alphabet(name="natural numbers")
Non negative integers

sage: build_alphabet(name="NN")
Non negative integers

>>> from sage.all import *

>>> build_alphabet(name="positive integers")
Positive integers

>>> build_alphabet(name="PP")
Positive integers

>>> build_alphabet(name="natural numbers")
Non negative integers

>>> build_alphabet(name="NN")
Non negative integers

The other families for the option name are among 'lower', 'upper', 'space', 'underscore', 'punctuation', 'printable', 'binary', 'octal', 'decimal', 'hexadecimal', 'radix64' which refer to standard set of characters. These names may be combined by separating them by a space:

sage: build_alphabet(name="lower")
{'a', 'b', 'c', 'd', 'e', 'f', 'g', 'h', 'i', 'j', 'k', 'l', 'm', 'n', 'o', 'p', 'q', 'r', 's', 't', 'u', 'v', 'w', 'x', 'y', 'z'}

sage: build_alphabet(name="hexadecimal")
{'0', '1', '2', '3', '4', '5', '6', '7', '8', '9', 'a', 'b', 'c', 'd', 'e', 'f'}

(continues on next page)
build_alphabet(name="decimal punctuation")
{0, 1, 2, 3, 4, 5, 6, 7, 8, 9, ', ', ';', ':', '?'}

>>> from sage.all import *
>>>
build_alphabet(name="lower")
{'a', 'b', 'c', 'd', 'e', 'f', 'g', 'h', 'i', 'j', 'k', 'l', 'm', 'n', 'o', 'p',
'q', 'r', 's', 't', 'u', 'v', 'w', 'x', 'y', 'z'}

build_alphabet(name="hexadecimal")
{'0', '1', '2', '3', '4', '5', '6', '7', '8', '9', 'a', 'b', 'c', 'd', 'e', 'f'}

build_alphabet(name="decimal punctuation")
{0, 1, 2, 3, 4, 5, 6, 7, 8, 9, ', ', ';', ':', '?'}

In the case the alphabet is built from a list or a tuple, the order on the alphabet is given by the elements themselves:

sage: A = build_alphabet([0,2,1])
sage: A(0) < A(2)
True
sage: A(2) < A(1)
False

>>> from sage.all import *
>>>
A = build_alphabet([Integer(0),Integer(2),Integer(1)])
>>>
A(Integer(0)) < A(Integer(2))
True
>>>
A(Integer(2)) < A(Integer(1))
False

If a different order is needed, you may use TotallyOrderedFiniteSet and set the option facade to False. That way, the comparison fits the order of the input:

sage: A = TotallyOrderedFiniteSet([4,2,6,1], facade=False)
sage: A(4) < A(2)
True
sage: A(1) < A(6)
False

>>> from sage.all import *
>>>
A = TotallyOrderedFiniteSet([Integer(4),Integer(2),Integer(6),Integer(1)],
facade=False)
>>>
A(Integer(4)) < A(Integer(2))
True
>>>
A(Integer(1)) < A(Integer(6))
False

Be careful, the element of the set in the last example are no more integers and do not compare equal with integers:

sage: type(A.an_element())
<class 'sage.sets.totally_ordered_finite_set.TotallyOrderedFiniteSet_with_
    category.element_class'>
sage: A(1) == 1
False
sage: 1 == A(1)
False
We give an example of an infinite alphabet indexed by the positive integers and the prime numbers:

```python
sage: build_alphabet(oo, 'x')
Lazy family (x(i))_{i in Non negative integers}
```

```python
sage: build_alphabet(Primes(), 'y')
Lazy family (y(i))_{i in Set of all prime numbers: 2, 3, 5, 7, ...}
```

\[ \text{sage.combinat.words.alphabet.} \text{\texttt{build\_alphabet}}(\texttt{data}=\texttt{None}, \texttt{names}=\texttt{None}, \texttt{name}=\texttt{None}) \]

Return an object representing an ordered alphabet.

INPUT:

- **data** – the letters of the alphabet; it can be:
  - a list/tuple/iterable of letters; the iterable may be infinite
  - an integer \( n \) to represent \{1, \ldots, n\}, or infinity to represent \( \mathbb{N} \)

- **names** – (optional) a list for the letters (i.e. variable names) or a string for prefix for all letters; if given a list, it must have the same cardinality as the set represented by `data`

- **name** – (optional) if given, then return a named set and can be equal to: 'lower', 'upper', 'space', 'underscore', 'punctuation', 'printable', 'binary', 'octal', 'decimal', 'hexadecimal', 'radix64'.

You can use many of them at once, separated by spaces: 'lower punctuation' represents the union of the two alphabets 'lower' and 'punctuation'.

Alternatively, name can be set to "positive integers" (or "PP") or "natural numbers" (or "NN").

name cannot be combined with data.

EXAMPLES:

If the argument is a Set, it just returns it:

```python
sage: build_alphabet(ZZ) is ZZ
True
```

```python
sage: F = FiniteEnumeratedSet('abc')
sage: build_alphabet(F) is F
True
```
Combinatorics, Release 10.4

```python
>>> from sage.all import *
>>> build_alphabet(ZZ) is ZZ
True
>>> F = FiniteEnumeratedSet('abc')
>>> build_alphabet(F) is F
True
```

If a list, tuple or string is provided, then it builds a proper Sage class (TotallyOrderedFiniteSet):

```python
sage: build_alphabet([0,1,2])
{0, 1, 2}
sage: F = build_alphabet('abc'); F
('a', 'b', 'c')
sage: print(type(F).__name__)
TotallyOrderedFiniteSet_with_category
```

```python
>>> from sage.all import *

>>> build_alphabet([Integer(0),Integer(1),Integer(2)])
{0, 1, 2}
>>> F = build_alphabet('abc'); F
('a', 'b', 'c')
>>> print(type(F).__name__)
TotallyOrderedFiniteSet_with_category
```

If an integer and a set is given, then it constructs a TotallyOrderedFiniteSet:

```python
sage: build_alphabet(3, [a,b,c])
('a', 'b', 'c')
```

```python
>>> from sage.all import *

>>> build_alphabet(Integer(3), [a,b,c])
{'a', 'b', 'c'}
```

If an integer and a string is given, then it considers that string as a prefix:

```python
sage: build_alphabet(3, 'x')
{'x0', 'x1', 'x2'}
```

```python
>>> from sage.all import *

>>> build_alphabet(Integer(3), 'x')
{'x0', 'x1', 'x2'}
```

If no data is provided, name may be a string which describe an alphabet. The available names decompose into two families. The first one are 'positive integers', 'PP', 'natural numbers' or 'NN' which refer to standard set of numbers:

```python
sage: build_alphabet(name="positive integers")
Positive integers
sage: build_alphabet(name="PP")
Positive integers
sage: build_alphabet(name="natural numbers")
Non negative integers
sage: build_alphabet(name="NN")
Non negative integers
```

```python
>>> from sage.all import *

>>> build_alphabet(name="positive integers")
```

(continues on next page)

5.1. Comprehensive Module List
Positive integers
>>> build_alphabet(name="PP")
Positive integers
>>> build_alphabet(name="natural numbers")
Non negative integers
>>> build_alphabet(name="NN")
Non negative integers

The other families for the option name are among ‘lower’, ‘upper’, ‘space’, ‘underscore’, ‘punctuation’, ‘printable’, ‘binary’, ‘octal’, ‘decimal’, ‘hexadecimal’, ‘radix64’ which refer to standard set of characters. These names may be combined by separating them by a space:

```
sage: build_alphabet(name="lower")
{a, b, c, d, e, f, g, h, i, j, k, l, m, n, o, p,
    q, r, s, t, u, v, w, x, y, z}
```

```
sage: build_alphabet(name="hexadecimal")
{0, 1, 2, 3, 4, 5, 6, 7, 8, 9, a, b, c, d, e, f}
```

```
sage: build_alphabet(name="decimal punctuation")
{0, 1, 2, 3, 4, 5, 6, 7, 8, 9, , ,, ., ;, :, !,
    ?}
```

In the case the alphabet is built from a list or a tuple, the order on the alphabet is given by the elements themselves:

```
sage: A = build_alphabet([0,2,1])
sage: A(0) < A(2)
True
sage: A(2) < A(1)
False
```

```
>>> from sage.all import *
```

```
>>> A = build_alphabet([Integer(0),Integer(2),Integer(1)])
```

```
>>> A(Integer(0)) < A(Integer(2))
True
>>> A(Integer(2)) < A(Integer(1))
False
```

If a different order is needed, you may use `TotallyOrderedFiniteSet` and set the option facade to False. That way, the comparison fits the order of the input:

```
sage: A = TotallyOrderedFiniteSet([4,2,6,1], facade=False)
sage: A(4) < A(2)
True
sage: A(1) < A(6)
False
```
Be careful, the element of the set in the last example are no more integers and do not compare equal with integers:

```python
sage: type(A.an_element())
<class 'sage.sets.totally_ordered_finite_set.TotallyOrderedFiniteSet_with_category.element_class'>
sage: A(1) == 1
False
sage: 1 == A(1)
False
```

We give an example of an infinite alphabet indexed by the positive integers and the prime numbers:

```python
sage: build_alphabet(oo, 'x')
Lazy family (x(i))_{i in Non negative integers}
sage: build_alphabet(Primes(), 'y')
Lazy family (y(i))_{i in Set of all prime numbers: 2, 3, 5, 7, ...}
```

5.1.358 Finite word

AUTHORS:

- Arnaud Bergeron
- Amy Glen
- Sébastien Labbé
- Franco Saliola
- Julien Leroy (March 2010): reduced_rauzy_graph

EXAMPLES:
Creation of a finite word

Finite words from Python strings, lists and tuples:

```python
sage: Word("abbaab")
word: abbaab
sage: Word([0, 1, 1, 0, 1, 0, 0, 1])
word: 01101001
sage: Word( ('a', 0, 5, 7, 'b', 9, 8) )
word: a057b98
```

```python
>>> from sage.all import *
>>> Word("abbaab")
word: abbaab
>>> Word([Integer(0), Integer(1), Integer(1), Integer(0), Integer(1), Integer(0),
    Integer(0), Integer(1)])
word: 01101001
>>> Word( ('a', Integer(0), Integer(5), Integer(7), 'b', Integer(9), Integer(8)) )
word: a057b98
```

Finite words from functions:

```python
sage: f = lambda n : n%3
sage: Word(f, length=13)
word: 0120120120120
```

```python
>>> from sage.all import *
>>> from sage.all import *
>>> f = lambda n : n%Integer(3)
>>> Word(f, length=Integer(13))
word: 0120120120120
```

Finite words from iterators:

```python
sage: from itertools import count
sage: Word(count(), length=10)
word: 0123456789
```

```python
>>> from sage.all import *
>>> from itertools import count
>>> Word(count(), length=Integer(10))
word: 0123456789
```

```python
sage: Word( iter(abbccdef) )
word: abbccdef
```

```python
>>> from sage.all import *
>>> Word( iter(abbccdef) )
word: abbccdef
```

Finite words from words via concatenation:

```python
sage: u = Word("abccabba")
sage: v = Word([0, 4, 8, 8, 3])
sage: u * v
word: abccabba04883
sage: v * u
```

(continues on next page)
<table>
<thead>
<tr>
<th>Word: 04883abcccabba</th>
</tr>
</thead>
<tbody>
<tr>
<td>sage: u + v</td>
</tr>
<tr>
<td>Word: abcccabba04883</td>
</tr>
<tr>
<td>sage: u^3 * v^(8/5)</td>
</tr>
<tr>
<td>Word: abcccabbaabcccabbaabcccabba04883048</td>
</tr>
</tbody>
</table>

```python
>>> from sage.all import *
>>> u = Word("abcccabba")
>>> v = Word([Integer(0), Integer(4), Integer(8), Integer(8), Integer(3)])
>>> u * v
word: abcccabba04883
>>> v * u
word: 04883abcccabba
>>> u + v
word: abcccabba04883
>>> u**Integer(3) * v**(Integer(8)/Integer(5))
word: abcccabbaabcccabbaabcccabba04883048
```

**Finite words from infinite words:**

```python
sage: vv = v^Infinity
sage: vv[10000:10015]
word: 048830488304883
```

**Finite words in a specific combinatorial class:**

```python
sage: W = Words("ab")
sage: W
Finite and infinite words over {'a', 'b'}
sage: W("abbabaab")
word: abbabaab
sage: W(["a","b","b","a","b","a","a","b"])
word: abbabaab
sage: W( iter('ababab') )
word: ababab
```

**Finite word as the image under a morphism:**

```python
sage: m = WordMorphism({0:[4,4,5,0], 5:[0,5,5], 4:[4,0,0,0]})
sage: m(0)  
```
Note: The following two finite words have the same string representation:

```
sage: w = Word('010120')
sage: z = Word([0, 1, 0, 1, 2, 0])
sage: w
word: 010120
sage: z
word: 010120
```

but are not equal:

```
sage: w == z
False
```

Indeed, w and z are defined on different alphabets:

```
sage: w[2] '0'
sage: z[2] 0
```

(continues on next page)
Functions and algorithms

There are more than 100 functions defined on a finite word. Here are some of them:

```python
sage: w = Word('abaabbbba'); w
word: abaabbbba
sage: w.is_palindrome()
False
sage: w.is_lyndon()
False
sage: w.number_of_factors()
28
sage: w.critical_exponent()
3
```

```python
>>> from sage.all import *
>>> w = Word('abaabbbba'); w
word: abaabbbba
>>> w.is_palindrome()
False
>>> w.is_lyndon()
False
>>> w.number_of_factors()
28
>>> w.critical_exponent()
3
```

```python
sage: print(w.lyndon_factorization())
(ab, aabbb, a)
sage: print(w.crochemore_factorization())
(a, b, a, ab, bb, a)
```

```python
>>> from sage.all import *
>>> print(w.lyndon_factorization())
(ab, aabbb, a)
>>> print(w.crochemore_factorization())
(a, b, a, ab, bb, a)
```

```python
sage: st = w.suffix_tree()
sage: st
Implicit Suffix Tree of the word: abaabbbba
sage: st.show(word_labels=True)  # needs sage.plot
```

```python
>>> from sage.all import *
>>> st = w.suffix_tree()
>>> st
Implicit Suffix Tree of the word: abaabbbba
>>> st.show(word_labels=True)  # needs sage.plot
```
sage: T = words.FibonacciWord('ab')
word: abaababa

sage: T.longest_common_prefix(Word('abaababbbbb'))
word: abaababa

As matrix and many other sage objects, words have a parent:

sage: u = Word('xyxyxyxyy')
sage: u.parent()
Finite words over Set of Python objects of class 'object'

sage: v = Word('xyxyxyxyy', alphabet='xy')
sage: v.parent()
Finite words over {'x', 'y'}

Factors and Rauzy Graphs

Enumeration of factors, the successive values returned by next(it) can appear in a different order depending on hardware. Therefore we mark the three first results of the test random. The important test is that the iteration stops properly on the fourth call:

sage: w = Word([4,5,6])**7
sage: it = w.factor_iterator(4)
sage: next(it) # random
word: 6456
sage: next(it) # random
word: 5645
sage: next(it) # random
word: 4564
sage: next(it)
Traceback (most recent call last):
...
StopIteration

(continues on next page)
The set of factors:

```
sage: sorted(w.factor_set(3))
[word: 456, word: 564, word: 645]
sage: sorted(w.factor_set(4))
[word: 4564, word: 5645, word: 6456]
sage: w.factor_set().cardinality()
61
```

Rauzy graphs:

```
sage: f = words.FibonacciWord()[:30]
sage: f.rauzy_graph(4) # needs sage.graphs
Looped digraph on 5 vertices
sage: f.reduced_rauzy_graph(4) # needs sage.graphs
Looped multi-digraph on 2 vertices
```

Left-special and bispecial factors:

```
sage: f.number_of_left_special_factors(7)
1
sage: f.bispecial_factors()
[word: , word: 0, word: 010, word: 010010, word: 01001010010]
```

```
>>> from sage.all import *
```
class sage.combinat.words.finite_word.CallableFromListOfWords(words)
    Bases: tuple
    
    A class to create a callable from a list of words. The concatenation of a list of words is obtained by creating a word
    from this callable.

class sage.combinat.words.finite_word.Factorization(iterable=(), /)
    Bases: list
    
    A list subclass having a nicer representation for factorization of words.

class sage.combinat.words.finite_word.FiniteWord_class
    Bases: Word_class

    BWT()
    
    Return the Burrows-Wheeler Transform (BWT) of self.
    
    The Burrows-Wheeler transform of a finite word $w$ is obtained from $w$ by first listing the conjugates of $w$ in
    lexicographic order and then concatenating the final letters of the conjugates in this order. See [BW1994].

    EXAMPLES:

    sage: Word('abaccaaba').BWT()
    word: cbaabaaca
    sage: Word('abaab').BWT()
    word: bbaaa
    sage: Word('bbabbaca').BWT()
    word: cbbbaaa
    sage: Word('aabaab').BWT()
    word: bbaaaa
    sage: Word('').BWT()
    word: 
    sage: Word('a').BWT()
    word: a

    >>> from sage.all import *
    >>> Word('abaccaaba').BWT()
    word: cbaabaaca
    >>> Word('abaab').BWT()
    word: bbaaa
    >>> Word('bbabbaca').BWT()
    word: cbbbaaa
    >>> Word('aabaab').BWT()
    word: bbaaaa
    >>> Word('').BWT()
    word:
    >>> Word('a').BWT()
    word: a

    LZ_decomposition()
    
    Return the Crochemore factorization of self as an ordered list of factors.
    
    The Crochemore factorization or the Lempel-Ziv decomposition of a finite word $w$ is the unique factorization:
    $(x_1, x_2, \ldots, x_n)$ of $w$ with each $x_i$ satisfying either: C1. $x_i$ is a letter that does not appear in $u = x_1 \ldots x_{i-1}$;
    C2. $x_i$ is the longest prefix of $v = x_i \ldots x_n$ that also has an occurrence beginning within $u = x_1 \ldots x_{i-1}$.
    See [Cro1983].

    EXAMPLES:
```sage
x = Word('abababb')
x.crochemore_factorization()
(a, b, abab, b)
```

```sage
x.crochemore_factorization() == x
```

```sage
y = Word('abaababacabba')
y.crochemore_factorization()
(a, b, a, aba, ba, c, ab, ba)
```

```sage
y.crochemore_factorization() == y
```

```sage
x = Word([0,1,0,1,0,1,1])
x.crochemore_factorization()
(0, 1, 0101, 1)
x.crochemore_factorization() == x
```

```sage
from sage.all import *
```

```sage
x = Word('abababb')
x.crochemore_factorization()
(a, b, abab, b)
x.crochemore_factorization() == x
```

```sage
y = Word('abaababacabba')
y.crochemore_factorization()
(a, b, a, aba, ba, c, ab, ba)
y.crochemore_factorization() == y
```

```sage
x = Word([0,1,0,1,0,1,1])
x.crochemore_factorization()
(0, 1, 0101, 1)
x.crochemore_factorization() == x
```

```sage
w = words.FibonacciWord()[:100]
[w.abelian_complexity(i) for i in range(20)]
```

```sage
from sage.all import *
```

```sage
w = words.FibonacciWord()[:Integer(100)]
[w.abelian_complexity(i) for i in range(Integer(20))]
```

```sage
w = words.ThueMorseWord()[:100]
[w.abelian_complexity(i) for i in range(20)]
```

```sage
from sage.all import *
```

```sage
w = words.ThueMorseWord()[:Integer(100)]
[w.abelian_complexity(i) for i in range(Integer(20))]
```

**abelian_complexity(n)**

Return the number of abelian vectors of factors of length n of self.

**EXAMPLES:**

```sage
w = words.FibonacciWord()[:100]
[w.abelian_complexity(i) for i in range(20)]
```

```sage
from sage.all import *
```

```sage
w = words.FibonacciWord()[:Integer(100)]
[w.abelian_complexity(i) for i in range(Integer(20))]
```

```sage
w = words.ThueMorseWord()[:100]
[w.abelian_complexity(i) for i in range(20)]
```

```sage
from sage.all import *
```

```sage
w = words.ThueMorseWord()[:Integer(100)]
[w.abelian_complexity(i) for i in range(Integer(20))]
```
**abelian_vector()**

Return the abelian vector of `self` counting the occurrences of each letter.

The vector is defined w.r.t. the order of the alphabet of the parent. See also `evaluation_dict()`.

**INPUT:**

- `self` – word having a parent on a finite alphabet

**OUTPUT:**

a list

**EXAMPLES:**

```python
sage: W = Words('ab')
sage: W('aaabbbbb').abelian_vector()
[3, 5]
sage: W('a').abelian_vector()
[1, 0]
sage: W().abelian_vector()
[0, 0]
```

The result depends on the alphabet of the parent:

```python
sage: W = Words('abc')
sage: W('aabaa').abelian_vector()
[4, 1, 0]
```

**abelian_vectors(n)**

Return the abelian vectors of factors of length `n` of `self`.

The vectors are defined w.r.t. the order of the alphabet of the parent.

**OUTPUT:**

a set of tuples

**EXAMPLES:**

```python
sage: W = Words([0, 1, 2])
sage: w = W([0, 1, 1, 0, 1, 2, 0, 2, 0, 2])
sage: w.abelian_vectors(3)
tuple((1, 0, 2), (1, 1, 1), (1, 2, 0), (2, 0, 1))
sage: w[:5].abelian_vectors(3)
tuple((1, 2, 0))
```
apply_permutation_to_letters (permutation)

Return the word obtained by applying the permutation permutation of the alphabet of self to each letter of self.

EXAMPLES:
apply_permutation_to_positions (permutation)

Return the word obtained by permuting the positions of the letters in self according to the permutation.

EXAMPLES:

```python
sage: w = Words('abcd')('abcd')
sage: w.apply_permutation_to_positions([2, 1, 4, 3])
word: badc
sage: u = Words('dabc')('abcd')
sage: u.apply_permutation_to_positions([2, 1, 4, 3])
word: dcba
sage: w.apply_permutation_to_positions(Permutation([2, 1, 4, 3]))
word: badc
sage: w.apply_permutation_to_positions(PermutationGroupElement([2, 1, 4, 3]))  #→ needs sage.groups
word: badc
```

```python
>>> from sage.all import *
>>> w = Words('abcd')('abcd')
>>> w.apply_permutation_to_positions([Integer(2), Integer(1), Integer(4), Integer(3)])
word: badc
>>> u = Words('dabc')('abcd')
>>> u.apply_permutation_to_positions([Integer(2), Integer(1), Integer(4), Integer(3)])
word: dcba
>>> w.apply_permutation_to_positions(Permutation([Integer(2), Integer(1), Integer(4), Integer(3)])) #→ needs sage.groups
word: badc
>>> Word([1, 2, 3, 4]).apply_permutation_to_positions([3, 4, 2, 1])
word: 3421
```

(continues on next page)
balance()

Return the balance of self.

The balance of a word is the smallest number \( q \) such that self is \( q \)-balanced [FV2002].

A finite or infinite word \( w \) is said to be \( q \)-balanced if for any two factors \( u, v \) of \( w \) of the same length, the difference between the number of \( x \)'s in each of \( u \) and \( v \) is at most \( q \) for all letters \( x \) in the alphabet of \( w \). A 1-balanced word is simply said to be balanced. See Chapter 2 of [Lot2002].

OUTPUT:

integer

EXAMPLES:

sage: Word('1111111').balance()
 0
sage: Word('001010101011').balance()
 2
sage: Word('0101010101').balance()
 1

>>> from sage.all import *

>>> Word('1111111').balance()
 0
>>> Word('001010101011').balance()
 2
>>> Word('0101010101').balance()
 1

sage: w = Word('11112222')
sage: w.is_balanced(2)
False
sage: w.is_balanced(3)
False
sage: w.is_balanced(4)
True
sage: w.is_balanced(5)
True
sage: w.balance()
4

>>> from sage.all import *

>>> w = Word('11112222')
>>> w.is_balanced(Integer(2))
False
>>> w.is_balanced(Integer(3))
False
\begin{verbatim}
>>> w.is_balanced(Integer(4))
True
>>> w.is_balanced(Integer(5))
True
>>> w.balance()
4
\end{verbatim}

\textbf{bispecial\_factors}(n=None)

Return the bispecial factors (of length \(n\)).

A factor \(u\) of a word \(w\) is \textit{bispecial} if it is right special and left special.

\textbf{INPUT:}

\begin{itemize}
  \item \(n\) – integer (default: None). If None, it returns all bispecial factors.
\end{itemize}

\textbf{OUTPUT:}

a list of words

\textbf{EXAMPLES:}

\begin{verbatim}
sage: w = words.FibonacciWord()[:30]
sage: w.bispecial_factors()
[word: , word: 0, word: 010, word: 010010, word: 01001010010]

>>> from sage.all import *

>>> w = words.FibonacciWord()[:Integer(30)]
>>> w.bispecial_factors()
[word: , word: 0, word: 010, word: 010010, word: 01001010010]

sage: w = words.ThueMorseWord()[:30]
sage: for i in range(10):
....:     print("{} ".format(i, sorted(w.bispecial_factors(i)))))
0 [word: ]
1 [word: 0, word: 1]
2 [word: 01, word: 10]
3 [word: 010, word: 101]
4 [word: 0110, word: 1001]
5 []
6 [word: 011001, word: 100110]
7 []
8 [word: 10010110]
9 []

>>> from sage.all import *

>>> w = words.ThueMorseWord()[:Integer(30)]
>>> for i in range(Integer(10)):
...     print("{} ".format(i, sorted(w.bispecial_factors(i)))))
0 [word: ]
1 [word: 0, word: 1]
2 [word: 01, word: 10]
3 [word: 010, word: 101]
4 [word: 0110, word: 1001]
5 []
6 [word: 011001, word: 100110]
7 []
\end{verbatim}
bispecial_factors_iterator \((n=\text{None})\)

Return an iterator over the bispecial factors (of length \(n\)).

A factor \(u\) of a word \(w\) is bispecial if it is right special and left special.

INPUT:

- \(n\) – integer (default: None). If None, it returns an iterator over all bispecial factors.

EXAMPLES:

```python
sage: w = words.ThueMorseWord()[:30]
sage: for i in range(10):
    ...:     for u in sorted(w.bispecial_factors_iterator(i)):
    ...:         print("{} {}\n").format(i,u))
0
1 0
1 1
2 01
2 10
3 010
3 101
4 0110
4 1001
6 011001
6 100110
8 10010110
```

```python
>>> from sage.all import *
>>> w = words.ThueMorseWord()[:Integer(30)]
>>> for i in range(Integer(10)):
...     for u in sorted(w.bispecial_factors_iterator(i)):
...         print("{} {}\n").format(i,u))
0
1 0
1 1
2 01
2 10
3 010
3 101
4 0110
4 1001
6 011001
6 100110
8 10010110
```

```python
sage: key = lambda u : (len(u), u)
sage: for u in sorted(w.bispecial_factors_iterator(), key=key):
    word:
        word: 0
        word: 1
        word: 01
        word: 10
        word: 010
```

(continues on next page)
word: 101
dword: 0110
dword: 1001
dword: 011001
dword: 100110
dword: 10010110

>>> from sage.all import *

>>> def key(u):
    return (len(u), u)

>>> for u in sorted(word.bispecial_factors_iterator(), key=key):
    print(u)

word: 0
word: 1
word: 01
word: 10
word: 010
word: 101
word: 0110
word: 1001
word: 011001
word: 100110
word: 10010110

border()

Return the longest word that is both a proper prefix and a proper suffix of self.

EXAMPLES:

sage: word.border()
sage: Word('121212').border()
word: 1212
sage: Word('12321').border()
word: 1
sage: Word().border() is None
True

charge(check=True)

Return the charge of self. This is defined as follows.

If \( w \) is a permutation of length \( n \), (in other words, the evaluation of \( w \) is \( (1, 1, \ldots, 1) \)), the statistic charge(\( w \)) is given by \( \sum_{i=1}^{n} c_i(w) \) where \( c_1(w) = 0 \) and \( c_i(w) \) is defined recursively by setting \( p_i \) equal to 1 if \( i \) appears to the right of \( i + 1 \) in \( w \) and 0 otherwise. Then we set \( c_i(w) = c_{i-1}(w) + p_i \).

EXAMPLES:

sage: word.charge()
3
sage: Word([3, 5, 1, 4, 2]).charge() == 0 + 1 + 1 + 2 + 2
True
If \( w \) is not a permutation, but the evaluation of \( w \) is a partition, the charge of \( w \) is defined to be the sum of its charge subwords (each of which will be a permutation). The first charge subword is found by starting at the end of \( w \) and moving left until the first 1 is found. This is marked, and we continue to move to the left until the first 2 is found, wrapping around from the beginning of the word back to the end, if necessary. We mark this 2, and continue on until we have marked the largest letter in \( w \). The marked letters, with relative order preserved, form the first charge subword of \( w \). This subword is removed, and the next charge subword is found in the same manner from the remaining letters. In the following example, \( w_1, w_2, w_3 \) are the charge subwords of \( w \).

EXAMPLES:

```python
sage: w = Word([5, 2, 3, 4, 4, 1, 1, 1, 2, 2, 3])
sage: w1 = Word([5, 2, 4, 1, 3])
sage: w2 = Word([3, 4, 1, 2])
sage: w3 = Word([1, 2])
sage: w.charge() == w1.charge() + w2.charge() + w3.charge()
True
```

Finally, if \( w \) does not have partition content, we apply the Lascoux-Schützenberger standardization operators \( s_i \) in such a manner as to obtain a word with partition content. (The word we obtain is independent of the choice of operators.) The charge is then defined to be the charge of this word:

```python
sage: w = Word([3, 3, 2, 1, 1]).charge()
sage: w = Word([1, 2, 3, 1, 2]).charge()
```

Note that this differs from the definition of charge given in Macdonald’s book. The difference amounts to a choice of reading a word from left-to-right or right-to-left. The choice in Sage was made to agree with the definition of a reading word of a tableau in Sage, and seems to be the more common convention in the literature.

See [Mac1995], [LLM2003], and [LLT].
cocharge()

Return the cocharge of self. For a word \( w \), this can be defined as \( n_{ev} - ch(w) \), where \( ch(w) \) is the charge of \( w \) and \( ev \) is the evaluation of \( w \), and \( n_{ev} = \sum_{i<j} \min(ev_i, ev_j) \).

EXAMPLES:

```
sage: Word([1,2,3]).cocharge()
0
sage: Word([3,2,1]).cocharge()
3
sage: Word([1,1,2]).cocharge()
0
sage: Word([2,1,2]).cocharge()
1
```

coerce (other)

Try to return a pair of words with a common parent; raise an exception if this is not possible.

This function begins by checking if both words have the same parent. If this is the case, then no work is done and both words are returned as-is.

Otherwise it will attempt to convert \( \text{other} \) to the domain of \( \text{self} \). If that fails, it will attempt to convert \( \text{self} \) to the domain of \( \text{other} \). If both attempts fail, it raises a TypeError to signal failure.

EXAMPLES:

```
sage: W1 = Words('abc'); W2 = Words('ab')
sage: w1 = W1('abc'); w2 = W2('abba'); w3 = W1('baab')
sage: w1.parent() is w2.parent()
False
sage: a, b = w1.coerce(w2)
sage: a.parent() is b.parent()
True
sage: w1.parent() is w2.parent()
False
```

colored_vector (x=0, y=0, width='default', height=1, cmap='hsv', thickness=1, label=None)
Return a vector (Graphics object) illustrating self. Each letter is represented by a coloured rectangle.

If the parent of self is a class of words over a finite alphabet, then each letter in the alphabet is assigned a unique colour, and this colour will be the same every time this method is called. This is especially useful when plotting and comparing words defined on the same alphabet.

If the alphabet is infinite, then the letters appearing in the word are used as the alphabet.

INPUT:

- x – (default: 0) bottom left x-coordinate of the vector
- y – (default: 0) bottom left y-coordinate of the vector
- width – (default: 'default') width of the vector. By default, the width is the length of self.
- height – (default: 1) height of the vector
- thickness – (default: 1) thickness of the contour
- cmap – (default: 'hsv') color map; for available color map names type: import matplotlib.cm; list(matplotlib.cm.datad)
- label – string (default: None) a label to add on the colored vector

OUTPUT:

Graphics

EXAMPLES:

```python
sage: # needs sage.plot
graphics = Word(range(20)).colored_vector()
Graphics object consisting of 21 graphics primitives
sage: Word(range(100)).colored_vector(0,0,10,1)
Graphics object consisting of 101 graphics primitives
sage: Words(range(100))(range(10)).colored_vector()
Graphics object consisting of 11 graphics primitives
sage: w = Word('abbabaab')
sage: w.colored_vector()
Graphics object consisting of 9 graphics primitives
sage: w.colored_vector(cmap='autumn')
Graphics object consisting of 9 graphics primitives
>>> from sage.all import *
>>>
```
When two words are defined under the same parent, same letters are mapped to same colors:

```
sage: W = Words(range(20))
sage: w = W(range(20))
sage: y = W(range(10,20))
sage: y.colored_vector(y=1, x=10) + w.colored_vector() # needs sage.plot
Graphics object consisting of 32 graphics primitives
```

```
>>> from sage.all import *
>>> W = Words(range(Integer(20)))
>>> w = W(range(Integer(20)))
>>> y = W(range(Integer(10),Integer(20)))
>>> y.colored_vector(y=Integer(1), x=Integer(10)) + w.colored_vector() # needs sage.plot
Graphics object consisting of 32 graphics primitives
```

**commutes_with**(other)

Return `True` if `self` commutes with `other`, and `False` otherwise.

**EXAMPLES:**

```
sage: Word('12').commutes_with(Word('12'))
True
sage: Word('12').commutes_with(Word('11'))
False
sage: Word().commutes_with(Word('21'))
True
```

```
>>> from sage.all import *
>>> Word('12').commutes_with(Word('12'))
True
>>> Word('12').commutes_with(Word('11'))
False
>>> Word().commutes_with(Word('21'))
True
```

**complete_return_words**(fact)

Return the set of complete return words of `fact` in `self`.

This is the set of all factors starting by the given factor and ending just after the next occurrence of this factor. See for instance [JV2000].

**INPUT:**

- `fact` – a non-empty finite word

**OUTPUT:**

a Python set of finite words

**EXAMPLES:**
concatenate(\texttt{other})

Return the concatenation of \texttt{self} and \texttt{other}.

\textbf{INPUT:}

- \texttt{other} – a word over the same alphabet as \texttt{self}

\textbf{EXAMPLES:}

Concatenation may be made using + or * operations:

```python
sage: w = Word('abadafd')
sage: y = Word([5,3,5,8,7])
sage: w * y
word: abadafd53587
sage: w + y
word: abadafd53587
sage: w.concatenate(y)
word: abadafd53587
```

Both words must be defined over the same alphabet:

```python
sage: z = Word('12223', alphabet = '123')
sage: z + y
Traceback (most recent call last):
  ...
ValueError: 5 not in alphabet
```

(continues on next page)
Eventually, it should work:

```python
sage: z = Word('12223', alphabet = '123')
sage: z + y  #todo: not implemented
word: 1222353587
```

```
>>> from sage.all import *

sage: z = Word('12223', alphabet = '123')
>>> z + y  #todo: not implemented
word: 1222353587
```

**conjugate** *(pos)*

Return the conjugate at *pos* of *self*.

*pos* can be any integer, the distance used is the modulo by the length of *self*.

**EXAMPLES:**

```python
sage: Word('12112').conjugate(1)
word: 21121
sage: Word().conjugate(2)
word:
sage: Word('12112').conjugate(8)
word: 12121
sage: Word('12112').conjugate(-1)
word: 21211
```

```
>>> from sage.all import *

sage: Word('12112').conjugate(Integer(1))
word: 21121
>>>
```

**conjugate_position** *(other)*

Return the position where *self* is conjugate with *other*. Return *None* if there is no such position.

**EXAMPLES:**

```python
sage: Word('12113').conjugate_position(Word('31211'))
1
sage: Word('12131').conjugate_position(Word('12113')) is None
True
sage: Word().conjugate_position(Word('123')) is None
True
```

```
>>> from sage.all import *

>>>
```
conjugates()  
Return the list of unique conjugates of self.

EXAMPLES:

```python
sage: Word(range(6)).conjugates()
[word: 012345,  
 word: 123450,  
 word: 234501,  
 word: 345012,  
 word: 450123,  
 word: 501234]

sage: Word('cbbca').conjugates()
[word: cbbca, word: bbcac, word: bcacb, word: cacbb, word: acbbc]
```

The result contains each conjugate only once:

```python
sage: Word('abcabc').conjugates()
[word: abcabc, word: bcabca, word: cabcab]
```

conjugates_iterator()  
Return an iterator over the conjugates of self.

EXAMPLES:

```python
sage: it = Word(range(4)).conjugates_iterator()
sage: for w in it: w
word: 0123
word: 1230
word: 2301
word: 3012
```
content \((n=None)\)

Return content of \(self\).

INPUT:

- \(n\) – (optional) an integer specifying the maximal letter in the alphabet

OUTPUT:

- a list where the \(i\)-th entry indicates the multiplicity of the \(i\)-th letter in the alphabet in \(self\)

EXAMPLES:

```
sage: w = Word([1,2,4,3,2,2,2])
sage: w.content()
[1, 4, 1, 1]
sage: w = Word([3,1])
sage: w.content()
[1, 1]
sage: w.content(n=3)
[1, 0, 1]
sage: w = Word([2,4],alphabet=[1,2,3,4])
sage: w.content(n=3)
[0, 1, 0]
sage: w.content()
[0, 1, 0, 1]
```

count \((letter)\)

Return the number of occurrences of \(letter\) in \(self\).

INPUT:

- \(letter\) – a letter

OUTPUT:

- integer
EXAMPLES:

```python
sage: w = Word('abbabaab')
sage: w.number_of_letter_occurrences('a')
4
sage: w.number_of_letter_occurrences('ab')
0
```

>>> from sage.all import *
>>> w = Word('abbabaab')
>>> w.number_of_letter_occurrences('a')
4
>>> w.number_of_letter_occurrences('ab')
0

This method is equivalent to `list(w).count(letter)` and `tuple(w).count(letter)`, thus `count` is an alias for the method `number_of_letter_occurrences`:

```python
sage: list(w).count('a')
4
sage: w.count('a')
4
```

```python
>>> from sage.all import *
>>> list(w).count('a')
4
>>> w.count('a')
4
```

But notice that if `s` and `w` are strings, `Word(s).count(w)` counts the number occurrences of `w` as a letter in `Word(s)` which is not the same as `s.count(w)` which counts the number of occurrences of the string `w` inside `s`:

```python
sage: s = 'abbabaab'
sage: s.count('ab')
3
sage: Word(s).count('ab')
0
```

```python
>>> from sage.all import *
>>> s = 'abbabaab'
>>> s.count('ab')
3
>>> Word(s).count('ab')
0
```

See also:

`sage.combinat.words.finite_word.FiniteWord_class.number_of_factor_occurrences()`

critical_exponent()

Return the critical exponent of `self`.

The critical exponent of a word is the supremum of the order of all its (finite) factors. See [Dej1972].

Note: The implementation here uses the suffix tree to enumerate all the factors. It should be improved
(especially when the critical exponent is larger than 2).

EXAMPLES:

```python
sage: Word('aaba').critical_exponent()
2
sage: Word('aabaa').critical_exponent()
2
sage: Word('aababa').critical_exponent()
7/3
sage: Word('ab').critical_exponent()
1
sage: Word('aba').critical_exponent()
3/2
sage: words.ThueMorseWord()[:20].critical_exponent()
2
```

For the Fibonacci word, the critical exponent is known to be \((5 + \sqrt{5})/2\). With a prefix of length 500, we obtain a lower bound:

```python
sage: words.FibonacciWord()[:500].critical_exponent()
320/89
```

It is an error to compute the critical exponent of the empty word:

```python
sage: Word('').critical_exponent()
Traceback (most recent call last):
...
ValueError: no critical exponent for empty word
```

```
crochemore_factorization()
```

Return the Crochemore factorization of self as an ordered list of factors.
The Crochemore factorization or the Lempel-Ziv decomposition of a finite word \( w \) is the unique factorization:
\[(x_1, x_2, \ldots, x_n)\] of \( w \) with each \( x_i \) satisfying either: C1. \( x_i \) is a letter that does not appear in \( u = x_1 \ldots x_{i-1} \); C2. \( x_i \) is the longest prefix of \( v = x_i \ldots x_n \) that also has an occurrence beginning within \( u = x_1 \ldots x_{i-1} \).

See [Cro1983].

EXAMPLES:

```python
sage: x = Word('abababb')
sage: x.crochemore_factorization()
(a, b, abab, b)
sage: mul(x.crochemore_factorization()) == x
True
sage: y = Word('abaabacabba')
sage: y.crochemore_factorization()
(a, b, a, aba, ba, c, ab, ba)
sage: mul(y.crochemore_factorization()) == y
True
sage: x = Word([0,1,0,1,0,1,1])
sage: x.crochemore_factorization()
(0, 1, 0101, 1)
sage: mul(x.crochemore_factorization()) == x
True
```

```python
>>> from sage.all import *

>>> x = Word('abababb')
>>> x.crochemore_factorization()
(a, b, abab, b)
>>> mul(x.crochemore_factorization()) == x
True
>>> y = Word('abaabacabba')
>>> y.crochemore_factorization()
(a, b, a, aba, ba, c, ab, ba)
>>> mul(y.crochemore_factorization()) == y
True
>>> x = Word([Integer(0),Integer(1),Integer(0),Integer(1),Integer(0),
Integer(1),Integer(1)])
>>> x.crochemore_factorization()
(0, 1, 0101, 1)
>>> mul(x.crochemore_factorization()) == x
True
```

defect (f=None)

Return the defect of self.

The defect of a finite word \( w \) is given by the difference between the maximum number of possible palindromic factors in a word of length \(|w|\) and the actual number of palindromic factors contained in \( w \). It is well known that the maximum number of palindromic factors in \( w \) is \(|w| + 1\) (see [DJP2001]).

An optional involution on letters \( f \) can be given. In that case, the \( f \)-palindromic defect (or pseudopalindromic defect, or theta-palindromic defect) of \( w \) is returned. It is a generalization of defect to \( f \)-palindromes. More precisely, the defect is \( D(w) = |w| + 1 - g_f(w) - |PAL_f(w)| \), where \( PAL_f(w) \) denotes the set of \( f \)-palindromic factors of \( w \) (including the empty word) and \( g_f(w) \) is the number of pairs \( \{a, f(a)\} \) such that \( a \) is a letter, \( a \) is not equal to \( f(a) \), and \( a \) or \( f(a) \) occurs in \( w \). In the case of usual palindromes (i.e., for \( f \) not given or equal to the identity), \( g_f(w) = 0 \) for all \( w \). See [BHNR2004] for usual palindromes and [Star2011] for \( f \)-palindromes.

INPUT:

- \( f \) – involution (default: None) on the alphabet of self. It must be callable on letters as well as words
(e.g. WordMorphism). The default value corresponds to usual palindromes, i.e., $f$ equal to the identity.

**OUTPUT:**

an integer – If $f$ is None, the palindromic defect of self; otherwise, the $f$-palindromic defect of self.

**EXAMPLES:**

```
sage: Word('ara').defect()
0
sage: Word('abcacba').defect()
1
```
For generalized defect with an involution different from the identity, there is always a letter which is not a palindrome! This is the reason for the modification of the definition:

```python
sage: f = WordMorphism('a->b,b->a')
sage: Word('a').defect(f) 0
game: Word('ab').defect(f) 0
game: Word('aa').defect(f) 1
game: Word('abbaabbaababba').defect(f) 3

>>> from sage.all import *
>>> f = WordMorphism('a->b,b->a')
>>> Word('a').defect(f) 0
game: Word('ab').defect(f) 0
game: Word('aa').defect(f) 1
>>> Word('abbaabbaababba').defect(f) 3

sage: f = WordMorphism('a->b,b->a,c->c')
sage: Word('abc').defect(f) 0
game: Word('abc').defect(f) 2

>>> from sage.all import *
>>> f = WordMorphism('a->b,b->a,c->c')
>>> Word('abc').defect(f) 0
>>> Word('abc').defect(f) 2
```

Other examples:
sage: Word('000000000000').defect()
sage: Word('011010011001').defect()
sage: Word('0101001010001').defect()
sage: Word().defect()
sage: Word('abbabaabbaababba').defect()

>> from sage.all import *
>> Word('000000000000').defect()
>> Word('011010011001').defect()
>> Word('0101001010001').defect()
>> Word().defect()
>> Word('abbabaabbaababba').defect()

deg_inv_lex_less (other, weights=None)

Return True if the word self is degree inverse lexicographically less than other.

EXAMPLES:

sage: Word([1,2,4]).deg_inv_lex_less(Word([1,3,2]))
False
sage: Word([3,2,1]).deg_inv_lex_less(Word([1,2,3]))

>>> from sage.all import *
>>> Word([Integer(1),Integer(2),Integer(4)]).deg_inv_lex_less(Word([Integer(1),Integer(3),Integer(2)]))
False
>>> Word([Integer(3),Integer(2),Integer(1)]).deg_inv_lex_less(Word([Integer(1),Integer(2),Integer(3)]))
True

deg_lex_less (other, weights=None)

Return True if self is degree lexicographically less than other, and False otherwise. The weight of each letter in the ordered alphabet is given by weights, which defaults to [1, 2, 3, ...].

EXAMPLES:

sage: Word([1,2,3]).deg_lex_less(Word([1,3,2]))
True
sage: Word([3,2,1]).deg_lex_less(Word([1,2,3]))

sage: W = Words(range(5))
sage: W([1,2,4]).deg_lex_less(W([1,3,2]))
False
sage: Word("abba").deg_lex_less(Word("abbb"), dict(a=1,b=2))
True

(continues on next page)
Combinatorics, Release 10.4

(continued from previous page)

```python
sage: Word("abba").deg_lex_less(Word("baba"), dict(a=1, b=2))
True
sage: Word("abba").deg_lex_less(Word("aaba"), dict(a=1, b=2))
False
sage: Word("abba").deg_lex_less(Word("aaba"), dict(a=1, b=0))
True
```

```python
>>> from sage.all import *
```

```python
>>> Word([Integer(1), Integer(2), Integer(3)]).deg_lex_less(Word([Integer(1),
    Integer(3), Integer(2)]))
True
>>> Word([Integer(3), Integer(2), Integer(1)]).deg_lex_less(Word([Integer(1),
    Integer(2), Integer(3)]))
False
>>> W = Words(range(Integer(5)))
>>> W([Integer(1), Integer(2), Integer(4)]).deg_lex_less(W([Integer(1),
    Integer(3), Integer(2)]))
False
>>> Word("abba").deg_lex_less(Word("abbb"), dict(a=Integer(1), b=Integer(2)))
True
>>> Word("abba").deg_lex_less(Word("baba"), dict(a=Integer(1), b=Integer(2)))
True
>>> Word("abba").deg_lex_less(Word("aaba"), dict(a=Integer(1), b=Integer(2)))
False
>>> Word("abba").deg_lex_less(Word("aaba"), dict(a=Integer(1), b=Integer(0)))
True
```

**deg_rev_lex_less**(other, weights=None)

Return True if self is degree reverse lexicographically less than other.

**EXAMPLES:**

```python
sage: Word([3, 2, 1]).deg_rev_lex_less(Word([1, 2, 3]))
False
sage: Word([1, 2, 4]).deg_rev_lex_less(Word([1, 3, 2]))
False
sage: Word([1, 2, 3]).deg_rev_lex_less(Word([1, 2, 4]))
True
```

```python
>>> from sage.all import *
```

```python
>>> Word([Integer(3), Integer(2), Integer(1)]).deg_rev_lex_less(Word([Integer(1),
    Integer(3), Integer(2)]))
False
>>> Word([Integer(1), Integer(2), Integer(4)]).deg_rev_lex_less(Word([Integer(1),
    Integer(3), Integer(2)]))
False
>>> Word([Integer(1), Integer(2), Integer(3)]).deg_rev_lex_less(Word([Integer(1),
    Integer(2), Integer(4)]))
True
```

**degree**(weights=None)

Return the weighted degree of self, where the weighted degree of each letter in the ordered alphabet is given by weights, which defaults to [1, 2, 3, ...].

**INPUT:**

- weights – a list or a tuple, or a dictionary keyed by the letters occurring in self.
delta()

Return the image of self under the delta morphism.

The delta morphism, also known as the run-length encoding, is the word composed of the length of consecutive runs of the same letter in a given word.

EXAMPLES:
### delta_derivate($W=None$)

Return the derivative under delta for self.

**EXAMPLES:**

```python
sage: W = Words('12')
sage: W('12211').delta_derivate()  # word: 22
sage: W('1').delta_derivate( Words([1]) )  # word: 1
sage: W('2112').delta_derivate()  # word: 2
sage: W('2211').delta_derivate()  # word: 22
sage: W('112').delta_derivate()  # word: 2
sage: W('11222').delta_derivate( Words([1, 2, 3]) )  # word: 3
```

```python
>>> from sage.all import *
>>> W = Words('12')
>>> W('12211').delta_derivate()  # word: 22
>>> W('1').delta_derivate( Words([Integer(1)]) )  # word: 1
>>> W('2112').delta_derivate()  # word: 2
>>> W('2211').delta_derivate()  # word: 22
>>> W('112').delta_derivate()  # word: 2
>>> W('11222').delta_derivate( Words([Integer(1), Integer(2), Integer(3)]) )  # word: 3
```

### delta_derivate_left($W=None$)

Return the derivative under delta for self.

**EXAMPLES:**

```python
>>> from sage.all import *
>>> W = Words('12')
>>> W('12211').delta_derivate()  # word: 22
>>> W('1').delta_derivate( Words([Integer(1)]) )  # word: 1
>>> W('2112').delta_derivate()  # word: 2
>>> W('2211').delta_derivate()  # word: 22
>>> W('112').delta_derivate()  # word: 2
>>> W('11222').delta_derivate( Words([Integer(1), Integer(2), Integer(3)]) )  # word: 3
```
Combinatorics, Release 10.4

```python
sage: W = Words('12')
sage: W('12211').delta_derivate_left()
word: 22
sage: W('1').delta_derivate_left(Words([1]))
word: 1
sage: W('2112').delta_derivate_left()
word: 21
sage: W('2211').delta_derivate_left()
word: 22
sage: W('112').delta_derivate_left()
word: 21
sage: W('11222').delta_derivate_left(Words([1, 2, 3]))
word: 3
```

```python
>>> from sage.all import *
>>> W = Words('12')
>>> W('12211').delta_derivate_left()
word: 22
>>> W('1').delta_derivate_left(Words([Integer(1)]))
word: 1
>>> W('2112').delta_derivate_left()
word: 21
>>> W('2211').delta_derivate_left()
word: 22
>>> W('112').delta_derivate_left()
word: 21
>>> W('11222').delta_derivate_left(Words([Integer(1), Integer(2), Integer(3)]))
word: 3
```

**delta_derivative_right** *(W=None)*

Return the right derivative under delta for self.

EXAMPLES:

```python
sage: W = Words('12')
sage: W('12211').delta_derivate_right()
word: 122
sage: W('1').delta_derivate_right(Words([1]))
word: 1
sage: W('2112').delta_derivate_right()
word: 12
sage: W('2211').delta_derivate_right()
word: 22
sage: W('112').delta_derivate_right()
word: 2
sage: W('11222').delta_derivate_right(Words([1, 2, 3]))
word: 23
```

```python
>>> from sage.all import *
>>> W = Words('12')
>>> W('12211').delta_derivate_right()
word: 122
>>> W('1').delta_derivate_right(Words([Integer(1)]))
word: 1
>>> W('2112').delta_derivate_right()
word: 12
```

(continues on next page)
Combinatorics, Release 10.4

Continued from previous page

```python
>>> W('2211').delta_derivate_right()
word: 22
>>> W('112').delta_derivate_right()
word: 2
>>> W('11222').delta_derivate_right(Words([Integer(1), Integer(2), Integer(3)]))
word: 23
```

delta_inv (W=None, s=None)

Lift self via the delta operator to obtain a word containing the letters in alphabet (default is [0, 1]). The letters used in the construction start with s (default is alphabet[0]) and cycle through alphabet.

**INPUT:**

- alphabet – an iterable
- s – an object in the iterable

**EXAMPLES:**

```python
sage: W = Words([1, 2])
sage: W([2, 2, 1, 1]).delta_inv()
word: 112212
sage: W([1, 1, 1, 1]).delta_inv(Words(123))
word: 1231
sage: W([2, 2, 1, 1, 2]).delta_inv(s=Integer(2))
word: 22112122
```

```python
>>> from sage.all import *
```

```python
>>> W = Words([Integer(1), Integer(2)])
```

```python
>>> W([Integer(2), Integer(1), Integer(1), Integer(1)]).delta_inv()
word: 112212
>>> W([Integer(1), Integer(1), Integer(1), Integer(1)]).delta_inv(Words('123'))
word: 1231
>>> W([Integer(2), Integer(1), Integer(1), Integer(1), Integer(2)]).delta_inv(s=Integer(2))
word: 22112122
```

evaluation()

Return the abelian vector of self counting the occurrences of each letter.

The vector is defined w.r.t. the order of the alphabet of the parent. See also `evaluation_dict()`.

**INPUT:**

- self – word having a parent on a finite alphabet

**OUTPUT:**

a list

**EXAMPLES:**

```python
sage: W = Words('ab')
sage: W('aaabbbbb').abelian_vector()
[3, 5]
sage: W('a').abelian_vector()
[1, 0]
```
The result depends on the alphabet of the parent:

```python
sage: W = Words('abc')
sage: W('aabaa').abelian_vector()
[4, 1, 0]
```

**evaluation_dict()**

Return a dictionary keyed by the letters occurring in `self` with values the number of occurrences of the letter.

**EXAMPLES:**

```python
sage: Word([2,1,4,2,3,4,2]).evaluation_dict()
{1: 1, 2: 3, 3: 1, 4: 2}
sage: Word('badbcdb').evaluation_dict()
{a: 1, b: 3, c: 1, d: 2}
sage: Word().evaluation_dict()
{}
```

```python
>>> from sage.all import *

>>> f = Word('1213121').evaluation_dict() # keys appear in random order
{'1': 4, '2': 2, '3': 1}
```

**evaluation_partition()**

Return the evaluation of the word `w` as a partition.

**EXAMPLES:**
evaluation_sparse()  
Return a list representing the evaluation of self. The entries of the list are two-element lists \([a, n]\), where \(a\) is a letter occurring in self and \(n\) is the number of occurrences of \(a\) in self.

EXAMPLES:

```python
sage: sorted(Word([4,4,2,5,2,1,4,1]).evaluation_sparse())
[(1, 2), (2, 2), (4, 3), (5, 1)]
sage: sorted(Word("abcaccab").evaluation_sparse())
[(\text{a}, 3), (\text{b}, 2), (\text{c}, 3)]
```

exponent()  
Return the exponent of self.

OUTPUT:

integer – the exponent  

EXAMPLES:

```python
sage: Word('1231').exponent()
1
sage: Word('121212').exponent()
3
sage: Word().exponent()
0
```

factor_complexity\((n)\)

Return the number of distinct factors of length \(n\) of self.

INPUT:
• \( n \) – the length of the factors.

**EXAMPLES:**

```python
sage: w = words.FibonacciWord()[:100]
sage: [w.factor_complexity(i) for i in range(20)]
[1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20]
```

```python
>>> from sage.all import *

>>> w = words.FibonacciWord()[:Integer(100)]

>>> [w.factor_complexity(i) for i in range(Integer(20))]
[1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20]
```

```python
sage: w = words.ThueMorseWord()[:1000]
sage: [w.factor_complexity(i) for i in range(20)]
[1, 2, 4, 6, 10, 12, 16, 20, 22, 24, 28, 32, 36, 40, 42, 44, 46, 52, 56]
```

```python
>>> from sage.all import *

>>> w = words.ThueMorseWord()[:Integer(1000)]

>>> [w.factor_complexity(i) for i in range(Integer(20))]
[1, 2, 4, 6, 10, 12, 16, 20, 22, 24, 28, 32, 36, 40, 42, 44, 46, 52, 56]
```

**factor_iterator**\( (n=None) \)

Generate distinct factors of \( \text{self} \).

**INPUT:**

• \( n \) – an integer, or None.

**OUTPUT:**

If \( n \) is an integer, returns an iterator over all distinct factors of length \( n \). If \( n \) is None, returns an iterator generating all distinct factors.

**EXAMPLES:**

```python
sage: w = Word('1213121')
sage: sorted( w.factor_iterator(0) )
[word: ]
sage: sorted( w.factor_iterator(10) )
[]
sage: sorted( w.factor_iterator(1) )
[word: 1, word: 2, word: 3]
sage: sorted( w.factor_iterator(4) )
[word: 1213, word: 1312, word: 2131, word: 3121]
sage: sorted( w.factor_iterator() )
[word: , word: 1, word: 12, word: 121, word: 1213, word: 12131, word: 121312, word: 1213121, word: 13, word: 131, word: 1312, word: 13121, word: 2, word: 213, word: 2131, word: 21312, word: 213121, word: 3, word: 31, word: 312, word: 3121]
```

```python
>>> from sage.all import *

>>> w = Word('1213121')

>>> sorted( w.factor_iterator(Integer(0)) )
[word: ]

>>> sorted( w.factor_iterator(Integer(10)) )
[]

>>> sorted( w.factor_iterator(Integer(1)) )
```

(continues on next page)
```python
sage: u = Word([1, 2, 1, 2, 3])
sage: sorted( u.factor_iterator(0) )
[[]]
sage: sorted( u.factor_iterator(10) )
[]
sage: sorted( u.factor_iterator(1) )
[word: 1, word: 2, word: 3]
sage: sorted( u.factor_iterator(5) )
[word: 12123]
sage: sorted( u.factor_iterator() )
[word: , word: 1, word: 12, word: 121, word: 1212, word: 12123, word: 123,
→word: 2, word: 21, word: 212, word: 2123, word: 23, word: 3]
```

```python
sage:xxx = Word("xxx")
sage: sorted( xxx.factor_iterator(0) )
[[]]
sage: sorted( xxx.factor_iterator(4) )
[]
sage: sorted( xxx.factor_iterator(2) )
[word: xx]
sage: sorted( xxx.factor_iterator() )
[word: , word: x, word: xx, word: xxx]
```

```python
>>> from sage.all import *
```

```python
>>> u = Word([Integer(1), Integer(2), Integer(1), Integer(2), Integer(3)])
```

```python
>>> sorted( u.factor_iterator(Integer(0)) )
[[]]
```

```python
>>> sorted( u.factor_iterator(Integer(10)) )
[]
```

```python
>>> sorted( u.factor_iterator(Integer(1)) )
[word: 1, word: 2, word: 3]
```

```python
>>> sorted( u.factor_iterator(Integer(5)) )
[word: 12123]
```

```python
>>> sorted( u.factor_iterator() )
[word: , word: 1, word: 12, word: 121, word: 1212, word: 12123, word: 123,
→word: 2, word: 21, word: 212, word: 2123, word: 23, word: 3]
```

```python
>>> from sage.all import *
```

```python
>>> xxx = Word("xxx")
```

```python
>>> sorted( xxx.factor_iterator(Integer(0)) )
[[]]
```

```python
>>> sorted( xxx.factor_iterator(Integer(4)) )
[]
```

```python
>>> sorted( xxx.factor_iterator(Integer(2)) )
[word: xx]
```

```python
>>> sorted( xxx.factor_iterator() )
```

(continues on next page)
factor_occurrences_in\((\text{other})\)

Return an iterator over all occurrences (including overlapping ones) of self in other in their order of appearance.

**Warning:** This method is deprecated since 2020 and will be removed in a later version of SageMath. Use factor_occurrences_iterator() instead.

**EXAMPLES:**

```python
>>> from sage.all import *
>>> e = Word()
>>> sorted( e.factor_iterator(0) )
[word: ]
>>> sorted( e.factor_iterator(17) )
[]
>>> sorted( e.factor_iterator() )
[word: ]
```

```python
from sage.all import *

u = Word('121')
w = Word('121213211213')
list(u.factor_occurrences_in(w))
doctest:warning
...

DeprecationWarning: f.factor_occurrences_in(w) is deprecated.
Use w.factor_occurrences_iterator(f) instead.
See https://github.com/sagemath/sage/issues/30187 for details.
[0, 2, 8]
```

factor_set\((n=\text{None},\; \text{algorithm}=\text{'suffix tree'})\)

Return the set of factors (of length n) of self.

**INPUT:**

---

5738 Chapter 5. Comprehensive Module List
• $n$ – an integer or None (default: None).

• `algorithm` – string (default: 'suffix tree'), takes the following values:
  - 'suffix tree' – construct and use the suffix tree of the word
  - 'naive' – algorithm uses a sliding window

OUTPUT:

If $n$ is an integer, returns the set of all distinct factors of length $n$. If $n$ is None, returns the set of all distinct factors.

EXAMPLES:

```python
sage: w = Word('121')
sage: sorted(w.factor_set())
[word: , word: 1, word: 12, word: 121, word: 2, word: 21]
sage: sorted(w.factor_set(algorithm='naive'))
[word: , word: 1, word: 12, word: 121, word: 2, word: 21]
```

```python
>>> from sage.all import *

w = Word('1213121')
>>> for i in range(w.length()): sorted(w.factor_set(i))
[word: , word: 1, word: 2, word: 3]
[word: 12, word: 13, word: 21, word: 31]
[word: 121, word: 131, word: 213, word: 312]
[word: 1213, word: 1312, word: 2131, word: 3121]
[word: 12131, word: 13121, word: 21312]
[word: 121312, word: 213121]
```

```python
sage: w = Word([1,2,1,2,3])
sage: s = w.factor_set()
sage: sorted(s)
[word: , word: 1, word: 12, word: 121, word: 1212, word: 12123, word: 123, word: 2, word: 21, word: 212, word: 2123, word: 23, word: 3]
```

```python
>>> from sage.all import *

w = Word([Integer(1),Integer(2),Integer(1),Integer(2),Integer(3)])
```

(continues on next page)
sorted(s)
[word: , word: 1, word: 12, word: 121, word: 1212, word: 12123, word: 123, word: 2, word: 21, word: 212, word: 2123, word: 23, word: 3]

find(sub, start=0, end=None)

Return the index of the first occurrence of sub in self, such that sub is contained within self[start:end]. Return -1 on failure.

INPUT:

- sub – string, list, tuple or word to search for.
- start – non-negative integer (default: 0) specifying the position from which to start the search.
- end – non-negative integer (default: None) specifying the position at which the search must stop. If None, then the search is performed up to the end of the string.

OUTPUT:

a non-negative integer or -1

EXAMPLES:

sage: w = Word([0,1,0,0,1])
sage: w.find(Word([1,0]))
1

>>> from sage.all import *

>>> w.find(Word([Integer(1),Integer(0)]))
1

The sub argument can also be a tuple or a list:

sage: w.find([1,0])
1

sage: w.find((1,0))
1

>>> from sage.all import *

>>> w.find([Integer(1),Integer(0)])
1
>>> w.find((Integer(1),Integer(0)))
1

Examples using start and end:

sage: w.find(Word([0,1]), start=1)
3
sage: w.find(Word([0,1]), start=1, end=5)
3
sage: w.find(Word([0,1]), start=1, end=4) == -1
True
sage: w.find(Word([1,1])) == -1
True
sage: w.find("aa")
-1
Instances of \texttt{Word.str} handle string inputs as well:

\begin{verbatim}
sage: w = Word('abac')
sage: w.find('a')
0
sage: w.find('ba')
1
\end{verbatim}

\section*{first\_pos\_in\ (other)}

Return the position of the first occurrence of \texttt{self} in \texttt{other}, or \texttt{None} if \texttt{self} is not a factor of \texttt{other}.

\begin{verbatim}
Warning: This method is deprecated since 2020 and will be removed in a later version of SageMath. Use \texttt{first\_occurrence()} instead.
\end{verbatim}

\section*{EXAMPLES:}

\begin{verbatim}
sage: Word('12').first_pos_in(Word('131231'))
doctest:warning
...
DeprecationWarning: f.first_pos_in(w) is deprecated. Use w.first_occurrence(f) instead.
See https://github.com/sagemath/sage/issues/30187 for details.
2
sage: Word('32').first_pos_in(Word('131231'))
False
\end{verbatim}

(continues on next page)
\textbf{foata\_bijection()}

Return word self under the Foata bijection.

The Foata bijection $\phi$ is a bijection on the set of words of given content (by a slight generalization of Section 2 in [FS1978]). It can be defined by induction on the size of the word: Given a word $w_1w_2 \cdots w_n$, start with $\phi(w_1) = w_1$. At the $i$-th step, if $\phi(w_1w_2 \cdots w_i) = v_1v_2 \cdots v_i$, we define $\phi(w_1w_2 \cdots w_iw_{i+1})$ by placing $w_{i+1}$ on the end of the word $v_1v_2 \cdots v_i$ and breaking the word up into blocks as follows. If $w_{i+1} \geq v_i$, place a vertical line to the right of each $v_k$ for which $w_{i+1} \geq v_k$. Otherwise, if $w_{i+1} < v_i$, place a vertical line to the right of each $v_k$ for which $w_{i+1} < v_k$. In either case, place a vertical line at the start of the word as well. Now, within each block between vertical lines, cyclically shift the entries one place to the right.

For instance, to compute $\phi([4, 1, 5, 4, 2, 2, 3])$, the sequence of words is
\begin{itemize}
  \item 4,
  \item $|4| \to 41$,
  \item $|4|1\to 415$,
  \item $|415|4 \to 5414$,
  \item $|5414|2 \to 54412$,
  \item $|5441|2|2 \to 154422$,
  \item $|15442|2|3 \to 1254423$.
\end{itemize}
So $\phi([4, 1, 5, 4, 2, 2, 3]) = [1, 2, 5, 4, 4, 2, 3]$.

See also:

\textit{Foata bijection on Permutations.}

\textbf{EXAMPLES:}

\begin{verbatim}
sage: w = Word([2,2,1,1,1])
sage: w.foata_bijection()
word: 112221

sage: w = Word([2,2,2,2,1,1,1])
sage: w.foata_bijection()
word: 2122212211

sage: w = Word([4,1,5,4,2,2,3])
sage: w.foata_bijection()
word: 1254423

sage: from sage.all import *

>>> w = Word([Integer(2),Integer(2),Integer(2),Integer(1),Integer(1),
Integer(1)])
>>> w.foata_bijection()
word: 112221

>>> w = Word([Integer(2),Integer(2),Integer(1),Integer(2),Integer(2),
Integer(1),Integer(1),Integer(2),Integer(1)])
>>> w.foata_bijection()
word: 2122212211

>>> w = Word([Integer(4),Integer(2),Integer(1),Integer(5),Integer(4),Integer(2),
Integer(3)])

(continues on next page)
\end{verbatim}
good_suffix_table()

Return a table of the maximum skip you can do in order not to miss a possible occurrence of self in a word.

This is a part of the Boyer-Moore algorithm to find factors. See [BM1977].

EXAMPLES:

```python
sage: Word('121321').good_suffix_table()
[5, 5, 5, 5, 3, 3, 1]
sage: Word('12412').good_suffix_table()
[3, 3, 3, 3, 3, 1]
```

has_period(p)

Return True if self has the period p, False otherwise.

**Note:** By convention, integers greater than the length of self are periods of self.

**INPUT:**

• p – an integer to check if it is a period of self.

**EXAMPLES:**

```python
sage: w = Word('ababa')
sage: w.has_period(2)
True
sage: w.has_period(3)
False
sage: w.has_period(4)
True
sage: w.has_period(-1)
False
sage: w.has_period(5)
True
sage: w.has_period(6)
True
```

```python
>>> from sage.all import *
>>> w = Word('ababa')
>>> w.has_period(Integer(2))
True
>>> w.has_period(Integer(3))
False
>>> w.has_period(Integer(4))
True
>>> w.has_period(-Integer(1))
False
```
False
>>> w.has_period(Integer(5))
True
>>> w.has_period(Integer(6))
True

**has_prefix** *(other)*

Test whether `self` has `other` as a prefix.

**INPUT:**

- `other` – a word, or data describing a word

**OUTPUT:**

boolean

**EXAMPLES:**

```python
sage: w = Word("abbabaabababa")
sage: u = Word("abbab")
sage: w.has_prefix(u)
True
sage: u.has_prefix(w)
False
sage: u.has_prefix("abbab")
True
```

```python
>>> from sage.all import *
```

```python
>>> w = Word("abbabaabababa")
>>> u = Word("abbab")
>>> w.has_prefix(u)
True
>>> u.has_prefix(w)
False
>>> u.has_prefix("abbab")
True
```

```python
sage: w = Word([0,1,1,0,1,0,0,1,0,1,0,1,0])
sage: u = Word([0,1,1,0,1])
sage: w.has_prefix(u)
True
sage: u.has_prefix(w)
False
sage: u.has_prefix([0,1,1,0,1])
True
```

```python
>>> from sage.all import *
```

```python
>>> w = Word([Integer(0),Integer(1),Integer(1),Integer(0),Integer(0),Integer(1),
Integer(1),Integer(0),Integer(0),Integer(1),Integer(0),Integer(0)])
>>> u = Word([Integer(0),Integer(1),Integer(1),Integer(0),Integer(0),Integer(1),Integer(1),Integer(0),Integer(0),Integer(1),Integer(0),Integer(0)])
>>> w.has_prefix(u)
True
>>> u.has_prefix(w)
False
```

(continues on next page)
has_suffix(other)

Test whether self has other as a suffix.

Note: Some word datatype classes, like WordDatatype_str, override this method.

INPUT:

- other – a word, or data describing a word

OUTPUT:

boolean

EXAMPLES:

```
sage: w = Word("abbabaabababa")
sage: u = Word("ababa")
sage: w.has_suffix(u)
True
```

```
sage: u.has_suffix(w)
False
```

```
sage: u.has_suffix("ababa")
True
```

```
>>> from sage.all import *
```

```
>>> w = Word("abbabaabababa")
>>> u = Word("ababa")
>>> w.has_suffix(u)
True
```

```
>>> u.has_suffix(w)
False
```

```
>>> u.has_suffix("ababa")
True
```

```
sage: w = Word([0,1,1,0,1,0,0,1,0,1,0,1,0])
sage: u = Word([0,1,0,1,0])
sage: w.has_suffix(u)
True
```

```
sage: u.has_suffix(w)
False
```

```
sage: u.has_suffix([0,1,0,1,0])
True
```

```
>>> from sage.all import *
```

```
>>> w = Word([Integer(0),Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
→Integer(0),Integer(0),Integer(1),Integer(0),Integer(1),Integer(0),
→Integer(1),Integer(0)])
>>> u = Word([Integer(0),Integer(1),Integer(0),Integer(1),Integer(0),Integer(0),
→Integer(1),Integer(0)])
>>> w.has_suffix(u)
True
```

```
>>> u.has_suffix(w)
False
```

(continues on next page)
>>> u.has_suffix([Integer(0), Integer(1), Integer(0), Integer(1), Integer(0)])
True

implicit_suffix_tree()

Return the implicit suffix tree of self.

The suffix tree of a word \( w \) is a compactification of the suffix trie for \( w \). The compactification removes all nodes that have exactly one incoming edge and exactly one outgoing edge. It consists of two components: a tree and a word. Thus, instead of labelling the edges by factors of \( w \), we can label them by indices of the occurrence of the factors in \( w \).

Type \texttt{sage.combinat.words.suffix_trees.ImplicitSuffixTree?} for more information.

EXAMPLES:

```python
sage: w = Word("cacao")
sage: w.implicit_suffix_tree()
Implicit Suffix Tree of the word: cacao
```
combinatorics, release 10.4

sage: Word([1,2,3,2,2,1]).inversions()
[[1, 5], [2, 3], [2, 4], [2, 5], [3, 5], [4, 5]]
sage: Words([3,2,1])([1,2,3,2,2,1]).inversions()
[[0, 1], [0, 2], [0, 3], [0, 4], [1, 2]]
sage: Word('abbaba').inversions()
[[1, 3], [1, 5], [2, 3], [2, 5], [4, 5]]
sage: Words('ba')('abbaba').inversions()
[[0, 1], [0, 2], [0, 4], [3, 4]]

>>> from sage.all import *
>>> Word([Integer(1),Integer(2),Integer(3),Integer(2),Integer(2),Integer(1)]).→
inversions()
[[1, 5], [2, 3], [2, 4], [2, 5], [3, 5], [4, 5]]
>>> Words([Integer(3),Integer(2),Integer(1)])([Integer(1),Integer(2),
→Integer(3),Integer(2),Integer(2),Integer(1)]).inversions()
[[0, 1], [0, 2], [0, 3], [0, 4], [1, 2]]
>>> Word('abbaba').inversions()
[[1, 3], [1, 5], [2, 3], [2, 5], [4, 5]]
>>> Words('ba')('abbaba').inversions()
[[0, 1], [0, 2], [0, 4], [3, 4]]

is_balanced(q=1)
Return True if self is q-balanced, and False otherwise.
A finite or infinite word w is said to be q-balanced if for any two factors u, v of w of the same length, the difference between the number of x’s in each of u and v is at most q for all letters x in the alphabet of w. A 1-balanced word is simply said to be balanced. See for instance [CFZ2000] and Chapter 2 of [Lot2002].

INPUT:
• q – integer (default: 1), the balance level

OUTPUT:
boolean – the result

EXAMPLES:

sage: Word('1213121').is_balanced()
True
sage: Word('1122').is_balanced()
False
sage: Word('121333121').is_balanced()
False
sage: Word('121333121').is_balanced(2)
False
sage: Word('121333121').is_balanced(3)
True
sage: Word('121122121').is_balanced()
False
sage: Word('121122121').is_balanced(2)
True

>>> from sage.all import *
>>> Word('1213121').is_balanced()
True
>>> Word('1122').is_balanced()
False

(continues on next page)
is_balanced()
False

is_balanced(Integer(2))
False

is_balanced(Integer(3))
True

is_balanced()
False

is_balanced(Integer(2))
True

is_cadence(seq)

Return True if seq is a cadence of self, and False otherwise.

A cadence is an increasing sequence of indexes that all map to the same letter.

EXAMPLES:

sage: Word('121132123').is_cadence([0, 2, 6])
True

sage: Word('121132123').is_cadence([0, 1, 2])
False

sage: Word('121132123').is_cadence([])
True

>>> from sage.all import *

>>> Word('121132123').is_cadence([Integer(0), Integer(2), Integer(6)])
True

>>> Word('121132123').is_cadence([Integer(0), Integer(1), Integer(2)])
False

>>> Word('121132123').is_cadence([])
True

is_christoffel()

Return True if self is a Christoffel word, and False otherwise.

The Christoffel word of slope \(p/q\) is obtained from the Cayley graph of \(\mathbb{Z}/(p + q)\mathbb{Z}\) with generator \(q\) as follows. If \(u \rightarrow v\) is an edge in the Cayley graph, then, \(v = u + p \mod p + q\). Let \(a, b\) be the alphabet of \(w\). Label the edge \(u \rightarrow v\) by \(a\) if \(u < v\) and \(b\) otherwise. The Christoffel word is the word obtained by reading the edge labels along the cycle beginning from 0.

Equivalently, \(w\) is a Christoffel word iff \(w\) is a symmetric non-empty word and \(w[1 : n − 1]\) is a palindrome.

See for instance [Ber2007] and [BLRS2009].

INPUT:

• self – word

OUTPUT:

boolean – True if self is a Christoffel word, False otherwise.

EXAMPLES:

sage: Word('00100101').is_christoffel()
True

sage: Word('aab').is_christoffel()
True
Combinatorics, Release 10.4

from sage.all import *

w = Word((ellipsis_range(Integer(0),Ellipsis,Integer(20))))

z = Word((ellipsis_range(Integer(7),Ellipsis,Integer(20))) + (ellipsis_range(Integer(0),Ellipsis,Integer(6))))

w
word: 0,1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,17,18,19,20

z
word: 7,8,9,10,11,12,13,14,15,16,17,18,19,20,0,1,2,3,4,5,6

w.is_conjugate_with(z)
True

z.is_conjugate_with(w)
True

u = Word([4]*21)

u.is_conjugate_with(w)
False

u.is_conjugate_with(z)
False
Both words must be finite:

```python
sage: w = Word(iter([2]*100), length='unknown')
sage: z = Word([2]*100)
sage: z.is_conjugate_with(w)  # TODO: Not implemented for word of unknown length
True
sage: wf = Word(iter([2]*100), length='finite')
sage: z.is_conjugate_with(wf)
True
```
is_cube_free()

Return True if self does not contain cubes, and False otherwise.

EXAMPLES:

```python
>>> Word('012012').is_cube()
False
```

```python
>>> from sage.all import *
>>> Word('012012').is_cube()
False
```

is_empty()

Return True if the length of self is zero, and False otherwise.

EXAMPLES:

```python
>>> Word([]).is_empty()
True
```

```python
>>> from sage.all import *
>>> Word([]).is_empty()
True
```

is_factor(other)

Return True if self is a factor of other, and False otherwise.

A finite word $u \in A^*$ is a factor of a finite word $v \in A^*$ if there exists $p, s \in A^*$ such that $v = pus$.

EXAMPLES:

```python
sage: u = Word('2113')
sage: w = Word('123121332131233121132123')
sage: u.is_factor(w)
True
```

```python
sage: u = Word('321')
sage: w = Word('1231241231312312312')
sage: u.is_factor(w)
False
```
```python
>>> from sage.all import *
>>> u = Word('2113')
>>> w = Word('123121332131233121132123')
>>> u.is_factor(w)
True
>>> u = Word('321')
>>> w = Word('1231241231312312312')
>>> u.is_factor(w)
False

The empty word is factor of another word:

sage: Word().is_factor(Word())
True
sage: Word().is_factor(Word('a'))
True
sage: Word().is_factor(Word([1,2,3]))
True
sage: Word().is_factor(Word(lambda n:n, length=5))
True
```

**is_finite**

Return True.

**EXAMPLES:**

```python
>>> from sage.all import *
>>> Word().is_finite()
True
>>> Word('a').is_finite()
True
```

**is_full** *(f=None)*

Return True if self has defect 0, and False otherwise.

A word is full (or rich) if its defect is zero (see [BHNR2004]).

If f is given, then the f-palindromic defect is used (see [PeSt2011]).

**INPUT:**

- f – involution (default: None) on the alphabet of self. It must be callable on letters as well as words (e.g. WordMorphism).
OUTPUT:

boolean – If \( f \) is \texttt{None}, whether \texttt{self} is full; otherwise, whether \texttt{self} is full of \( f \)-palindromes.

EXAMPLES:

```python
sage: words.ThueMorseWord()[:100].is_full()
False
sage: words.FibonacciWord()[:100].is_full()
True
sage: Word('000000000000000').is_full()
True
sage: Word('011010011001').is_full()
False
sage: Word('2194').is_full()
True
sage: Word().is_full()
True

>>> from sage.all import *

>>> words.ThueMorseWord()[:Integer(100)].is_full()
False
>>> words.FibonacciWord()[:Integer(100)].is_full()
True
>>> Word('000000000000000').is_full()
True
>>> Word('011010011001').is_full()
False
>>> Word('2194').is_full()
True
>>> Word().is_full()
True

sage: f = WordMorphism('a->b,b->a')
sage: Word().is_full(f)
True
sage: w = Word('ab')
sage: w.is_full()
True
sage: w.is_full(f)
True

>>> from sage.all import *

>>> f = WordMorphism('a->b,b->a')

>>> Word().is_full(f)
True
>>> w = Word('ab')
>>> w.is_full()
True
>>> w.is_full(f)
True

sage: f = WordMorphism('a->b,b->a')
sage: Word('abab').is_full(f)
True
sage: Word('abba').is_full(f)
False
```
A simple example of an infinite word full of f-palindromes:

```python
sage: p = WordMorphism({0: 'abc', 1: 'ab'})
sage: f = WordMorphism({a->b, b->a, c->c})
sage: p(words.FibonacciWord()[:50]).is_full(f)
True
sage: p(words.FibonacciWord()[:150]).is_full(f)
True
>>> from sage.all import *
```
is_palindrome $f=\text{None}$

Return True if self is a palindrome (or a $f$-palindrome), and False otherwise.

Let $f : \Sigma \rightarrow \Sigma$ be an involution that extends to a morphism on $\Sigma^*$. We say that $w \in \Sigma^*$ is a $f$-$\text{palindrome}$ if $w = f(\bar{w})$ [Lab2008]. Also called $f$-$\text{pseudo-palindrome}$ [AZZ2005].

INPUT:

- $f$ – involution (default: None) on the alphabet of self. It must be callable on letters as well as words (e.g. WordMorphism). The default value corresponds to usual palindromes, i.e., $f$ equal to the identity.

EXAMPLES:

\begin{verbatim}
sage: Word('esope reste ici et se repose').is_palindrome()
False
sage: Word('esoperesteicietserepose').is_palindrome()
True
sage: Word('I saw I was I').is_palindrome()
True
sage: Word('abcbba').is_palindrome()
True
sage: Word('abcdba').is_palindrome()
False
\end{verbatim}
Some \( f \)-palindromes:

```python
sage: f = WordMorphism('a\rightarrow b, b\rightarrow a')
sage: Word('aababb').is_palindrome(f)
True
```

```python
>>> from sage.all import *

sage: f = WordMorphism('a\rightarrow b, b\rightarrow a')
>>> Word('aababb').is_palindrome(f)
True
```

```python
sage: f = WordMorphism('a\rightarrow b, b\rightarrow a, c\rightarrow c')
sage: Word('abacbacbab').is_palindrome(f)
True
```

```python
>>> from sage.all import *

sage: f = WordMorphism('a\rightarrow b, b\rightarrow a, c\rightarrow c')
>>> Word('abacbacbab').is_palindrome(f)
True
```

```python
sage: f = WordMorphism('{{a': 'b', 'b': 'a'}}

sage: Word('aababb').is_palindrome(f)
True
```

```python
>>> from sage.all import *

sage: f = WordMorphism('{{a': 'b', 'b': 'a'}}

>>> Word('aababb').is_palindrome(f)
True
```

```python
sage: f = WordMorphism({0:[1], 1:[0]})
sage: w = words.ThueMorseWord()[:8]; w
word: 01101001
sage: w.is_palindrome(f)
True
```

```python
>>> from sage.all import *

sage: f = WordMorphism({Integer(0):[Integer(1)], Integer(1):[Integer(0)]})

>>> w = words.ThueMorseWord()[:Integer(8)]; w
word: 01101001

>>> w.is_palindrome(f)
True
```

The word must be in the domain of the involution:

```python
sage: f = WordMorphism('a\rightarrow a')
sage: Word('aababb').is_palindrome(f)
Traceback (most recent call last):
```

(continues on next page)
KeyError: 'b'

```python
>>> from sage.all import *

>>> f = WordMorphism('a->a')

>>> Word('aababb').is_palindrome(f)
Traceback (most recent call last):
...
KeyError: 'b'
```

### is_prefix(other)

Return `True` if `self` is a prefix of `other`, and `False` otherwise.

**EXAMPLES:**

```python
sage: w = Word('0123456789')
sage: y = Word('012345')
sage: y.is_prefix(w)
True
sage: w.is_prefix(y)
False
sage: w.is_prefix(Word())
False
sage: Word().is_prefix(w)
True
sage: Word().is_prefix(Word())
True
```

```python
>>> from sage.all import *

>>> w = Word('0123456789')

>>> y = Word('012345')

>>> y.is_prefix(w)
True

>>> w.is_prefix(y)
False

>>> w.is_prefix(Word())
False

>>> Word().is_prefix(w)
True

>>> Word().is_prefix(Word())
True
```

### is_primitive()

Return `True` if `self` is primitive, and `False` otherwise.

A finite word `w` is *primitive* if it is not a positive integer power of a shorter word.

**EXAMPLES:**

```python
sage: Word('1231').is_primitive()
True
sage: Word('111').is_primitive()
False

>>> from sage.all import *

>>> Word('1231').is_primitive()
```

(continues on next page)
>> True
>> Word('111').is_primitive()
>>> False

**is_proper_prefix**(other)

Return True if self is a proper prefix of other, and False otherwise.

**EXAMPLES:**

```python
sage: Word('12').is_proper_prefix(Word('123'))
True
sage: Word('12').is_proper_prefix(Word('12'))
False
sage: Word().is_proper_prefix(Word('123'))
True
sage: Word('123').is_proper_prefix(Word('12'))
False
sage: Word().is_proper_prefix(Word())
False
```

```python
from sage.all import *
```

```python
>>> Word('12').is_proper_prefix(Word('123'))
True
>>> Word('12').is_proper_prefix(Word('12'))
False
>>> Word().is_proper_prefix(Word('123'))
True
>>> Word('123').is_proper_prefix(Word('12'))
False
>>> Word().is_proper_prefix(Word())
False
```

**is_proper_suffix**(other)

Return True if self is a proper suffix of other, and False otherwise.

**EXAMPLES:**

```python
sage: Word('23').is_proper_suffix(Word('123'))
True
sage: Word('12').is_proper_suffix(Word('12'))
False
sage: Word().is_proper_suffix(Word('123'))
True
sage: Word('123').is_proper_suffix(Word('12'))
False
sage: Word().is_proper_suffix(Word())
False
```

```python
from sage.all import *
```

```python
>>> from sage.all import *
```

```python
>>> Word('23').is_proper_suffix(Word('123'))
True
>>> Word('12').is_proper_suffix(Word('12'))
False
>>> Word().is_proper_suffix(Word('123'))
True
>>> Word('123').is_proper_suffix(Word('12'))
False
>>> Word().is_proper_suffix(Word())
False
```
is_quasiperiodic()
Return True if self is quasiperiodic, and False otherwise.

A finite or infinite word \( w \) is quasiperiodic if it can be constructed by concatenations and superpositions of one of its proper factors \( u \), which is called a quasiperiod of \( w \). See for instance [AE1993], [Mar2004], and [GLR2008].

EXAMPLES:

```python
sage: Word('abaababaabaababaaba').is_quasiperiodic()
True
sage: Word('abacaba').is_quasiperiodic()
False
sage: Word('a').is_quasiperiodic()
False
sage: Word().is_quasiperiodic()
False
sage: Word('abaaba').is_quasiperiodic()
True
```

```python
>>> from sage.all import *
>>> Word('abaababaabaababaaba').is_quasiperiodic()
True
>>> Word('abacaba').is_quasiperiodic()
False
>>> Word('a').is_quasiperiodic()
False
>>> Word().is_quasiperiodic()
False
>>> Word('abaaba').is_quasiperiodic()
True
```

is_rich(\( f=\)None)
Return True if self has defect 0, and False otherwise.

A word is full (or rich) if its defect is zero (see [BHNR2004]).

If \( f \) is given, then the \( f \)-palindromic defect is used (see [PeSt2011]).

INPUT:

- \( f \) – involution (default: None) on the alphabet of self. It must be callable on letters as well as words (e.g. WordMorphism).

OUTPUT:

boolean – If \( f \) is None, whether self is full; otherwise, whether self is full of \( f \)-palindromes.

EXAMPLES:

```python
sage: words.ThueMorseWord()[:100].is_full()
False
sage: words.FibonacciWord()[:100].is_full()
True
sage: Word('000000000000000').is_full()
True
sage: Word('011010011001').is_full()
False
sage: Word('2194').is_full()
True
```

(continues on next page)
Combinatorics, Release 10.4

sage: Word().is_full()
True

>>> from sage.all import *

>>> words.ThueMorseWord()[:Integer(100)].is_full()
False

>>> words.FibonacciWord()[:Integer(100)].is_full()
True

>>> Word('000000000000000').is_full()
True

>>> Word('011010011001').is_full()
False

>>> Word('2194').is_full()
True

>>> Word().is_full()
True

sage: f = WordMorphism('a->b,b->a')

sage: Word().is_full(f)
True

sage: w = Word('ab')

sage: w.is_full()
True

sage: w.is_full(f)
True

>>> from sage.all import *

>>> f = WordMorphism('a->b,b->a')

>>> Word().is_full(f)
True

>>> w = Word('ab')

>>> w.is_full()
True

>>> w.is_full(f)
True

sage: f = WordMorphism('a->b,b->a')

sage: f = WordMorphism('a->b,b->a')

sage: Word(abab).is_full(f)
True

sage: Word(abba).is_full(f)
False

>>> from sage.all import *

>>> f = WordMorphism('a->b,b->a')

>>> Word(abab).is_full(f)
True

>>> Word(abba).is_full(f)
False

A simple example of an infinite word full of f-palindromes:

sage: p = WordMorphism({0:'abc',1:'ab'})

sage: f = WordMorphism('a->b,b->a,c->c')

sage: p(words.FibonacciWord()[:50]).is_full(f)
True
Combinatorics, Release 10.4

```
>>> from sage.all import *
>>> p = WordMorphism({Integer(0):'abc',Integer(1):'ab'})
>>> f = WordMorphism('a->b,b->a,c->c')
>>> p(words.FibonacciWord()[:Integer(50)]).is_full(f)
True
>>> p(words.FibonacciWord()[:Integer(150)]).is_full(f)
True
```

**is_smooth_prefix()**

Return `True` if `self` is the prefix of a smooth word, and `False` otherwise.

Let \( A_k = \{1, \ldots, k\}, k \geq 2 \). An infinite word \( w \) in \( A_k^\omega \) is said to be smooth if and only if for all positive integers \( m \), \( \Delta^m(w) \) is in \( A_k^\omega \), where \( \Delta(w) \) is the word obtained from \( w \) by composing the length of consecutive runs of the same letter in \( w \). See for instance [BL2003] and [BDLV2006].

**INPUT:**

- `self` – must be a word over the integers to get something other than `False`

**OUTPUT:**

boolean – whether `self` is a smooth prefix or not

**EXAMPLES:**

```
sage: W = Words([1, 2])
sage: W([1, 1, 2, 2, 1, 2, 1, 1]).is_smooth_prefix()
True
sage: W([1, 2, 1, 2, 1, 2]).is_smooth_prefix()
False
```

```
>>> from sage.all import *

>>> W = Words([Integer(1), Integer(2)])
>>> W([Integer(1), Integer(1), Integer(2), Integer(2), Integer(1), Integer(2),
    → Integer(1), Integer(1)]).is_smooth_prefix()
True
>>> W([Integer(1), Integer(2), Integer(1), Integer(2), Integer(1),
    → Integer(2)]).is_smooth_prefix()
False
```

**is_square()**

Return `True` if `self` is a square, and `False` otherwise.

**EXAMPLES:**

```
sage: Word([1,0,0,1]).is_square()
False
sage: Word('1212').is_square()
True
sage: Word('1213').is_square()
False
sage: Word('12123').is_square()
False
sage: Word().is_square()
True
```
>>> from sage.all import *
>>> Word([Integer(1),Integer(0),Integer(0),Integer(1)]).is_square()
False
>>> Word('1212').is_square()
True
>>> Word('1213').is_square()
False
>>> Word('12123').is_square()
False
>>> Word().is_square()
True

is_square_free()

Return True if self does not contain squares, and False otherwise.

EXAMPLES:

sage: Word('12312').is_square_free()
True
sage: Word('31212').is_square_free()
False
sage: Word().is_square_free()
True

is_sturmian_factor()

Tell whether self is a factor of a Sturmian word.

The finite word self must be defined on a two-letter alphabet.

Equivalently, tells whether self is balanced. The advantage over the is_balanced method is that this one runs in linear time whereas is_balanced runs in quadratic time.

OUTPUT:

boolean – the result

EXAMPLES:

sage: w = Word('0111011101101101101',alphabet='01')
sage: w.is_sturmian_factor()
True

(continues on next page)
True

sage: words.CharacteristicSturmianWord(random())[:100].is_sturmian_factor()  
    # needs sage.rings.real_mpfr
True

>>> from sage.all import *

>>> words.LowerMechanicalWord(random(),alphabet='01')[:Integer(100)].is_sturmian_factor()
True

>>> words.CharacteristicSturmianWord(random())[:Integer(100)].is_sturmian_factor()  
    # needs sage.rings.real_mpfr
True

sage: w = Word('aabb',alphabet='ab')
sage: w.is_sturmian_factor()
False

    sage: s1 = WordMorphism('a->ab,b->b')
sage: s2 = WordMorphism('a->ba,b->b')
sage: s3 = WordMorphism('a->a,b->ba')
sage: s4 = WordMorphism('a->a,b->ab')
sage: W = Words('ab')
sage: w = W('ab')
    sage: for i in range(8): w = choice([s1,s2,s3,s4])(w)
    sage: w.is_sturmian_factor()
True

>>> from sage.all import *

>>> w = Word('aabb',alphabet='ab')

>>> w.is_sturmian_factor()
False

>>> s1 = WordMorphism('a->ab,b->b')
>>> s2 = WordMorphism('a->ba,b->b')
>>> s3 = WordMorphism('a->a,b->ba')
>>> s4 = WordMorphism('a->a,b->ab')
>>> W = Words('ab')
>>> w = W('ab')
    >>> for i in range(Integer(8)): w = choice([s1,s2,s3,s4])(w)
    >>> w.is_sturmian_factor()
True

Famous words:

sage: words.FibonacciWord()[:100].is_sturmian_factor()
True

sage: words.ThueMorseWord()[:1000].is_sturmian_factor()
False

sage: words.KolakoskiWord()[:1000].is_sturmian_factor()
False

>>> from sage.all import *

>>> words.FibonacciWord()[:Integer(100)].is_sturmian_factor()
True

>>> words.ThueMorseWord()[:Integer(1000)].is_sturmian_factor()
False

(continues on next page)
False

```python
>>> words.KolakoskiWord()[:Integer(1000)].is_sturmian_factor()
False
```

See [Arn2002], [Ser1985], and [SU2009].

AUTHOR:
- Thierry Monteil

### is_subword_of (other)

Return True if self is a subword of other, and False otherwise.

A finite word $u$ is a subword of a finite word $v$ if $u$ is a subsequence of $v$. See Chapter 6 on Subwords in [Lot1997].

Some references define subword as a consecutive subsequence. Use `is_factor()` if this is what you need.

**INPUT:**
- other – a finite word

**EXAMPLES:**

```python
sage: Word('bb').is_subword_of(Word('ababa'))
True
sage: Word('bbb').is_subword_of(Word('ababa'))
False
```

```python
>>> from sage.all import *
```

```python
>>> Word('bb').is_subword_of(Word('ababa'))
True
>>> Word('bbb').is_subword_of(Word('ababa'))
False
```

```python
sage: Word().is_subword_of(Word('123'))
True
sage: Word('123').is_subword_of(Word('3211333213233321'))
True
sage: Word('321').is_subword_of(Word('1112221212212311222332'))
False
```

```python
>>> from sage.all import *
```

```python
>>> Word().is_subword_of(Word('123'))
True
>>> Word('123').is_subword_of(Word('3211333213233321'))
True
>>> Word('321').is_subword_of(Word('1112221212212311222332'))
False
```

**See also:**
- `longest_common_subword()`
- `number_of_subword_occurrences()`
- `is_factor()`

### is_suffix (other)

Return True if self is a suffix of other, and False otherwise.

**EXAMPLES:**
Combinatorics, Release 10.4

```python
sage: w = Word('0123456789')
sage: y = Word('56789')
sage: y.is_suffix(w)
True
sage: w.is_suffix(y)
False
sage: Word('579').is_suffix(w)
False
sage: Word().is_suffix(y)
True
sage: w.is_suffix(Word())
False
sage: Word().is_suffix(Word())
True
```

```python
>>> from sage.all import *

>>> w = Word('0123456789')
>>> y = Word('56789')
>>> y.is_suffix(w)
True
>>> w.is_suffix(y)
False
>>> Word('579').is_suffix(w)
False
>>> Word().is_suffix(y)
True
>>> w.is_suffix(Word())
False
>>> Word().is_suffix(Word())
True
```

**is_symmetric**(f=None)

Return True if self is symmetric (or f-symmetric), and False otherwise.

A word is symmetric (resp. f-symmetric) if it is the product of two palindromes (resp. f-palindromes). See [BHNR2004] and [DeLuca2006].

INPUT:

- f – involution (default: None) on the alphabet of self. It must be callable on letters as well as words (e.g. WordMorphism).

EXAMPLES:

```python
sage: Word('abbabab').is_symmetric()
True
sage: Word('ababa').is_symmetric()
True
sage: Word('aababaabba').is_symmetric()
False
sage: Word('aabbbbaabba').is_symmetric()
False
sage: f = WordMorphism('a->b,b->a')
sage: Word('aabbbbaabba').is_symmetric(f)
True
```

```python
>>> from sage.all import *

>>> Word('abbabab').is_symmetric()
```

(continues on next page)
True
>>> Word('ababa').is_symmetric()
True
>>> Word('aababaabba').is_symmetric()
False
>>> Word('aabbbaababba').is_symmetric()
False
>>> f = WordMorphism('a->b,b->a')
>>> Word('aabbbaababba').is_symmetric(f)
True

is_tangent()

Tell whether self is a tangent word.

The finite word self must be defined on a two-letter alphabet.

A binary word is said to be tangent if it can appear in infinitely many cutting sequences of a smooth curve, where each cutting sequence is observed on a progressively smaller grid.

This class of words strictly contains the class of 1-balanced words, and is strictly contained in the class of 2-balanced words.

This method runs in linear time.

OUTPUT:

boolean – the result

EXAMPLES:

```python
sage: w = Word('01110110110111011101',alphabet='01')
sage: w.is_tangent()
True
```

```python
>>> from sage.all import *

>>> w = Word('01110110110111011101',alphabet='01')
>>> w.is_tangent()
True
```

Some tangent words may not be balanced:

```python
sage: Word('aabb',alphabet='ab').is_balanced()
False
sage: Word('aabb',alphabet='ab').is_tangent()
True
```

```python
>>> from sage.all import *

>>> Word('aabb',alphabet='ab').is_balanced()
False
>>> Word('aabb',alphabet='ab').is_tangent()
True
```

Some 2-balanced words may not be tangent:

```python
sage: Word('aaabb',alphabet='ab').is_tangent()
False
sage: Word('aaabb',alphabet='ab').is_balanced(2)
True
```
Famous words:

```python
>>> from sage.all import *

>>> Word('aaabb',alphabet='ab').is_tangent()
False

>>> Word('aaabb',alphabet='ab').is_balanced(Integer(2))
True

sage: words.FibonacciWord()[:100].is_tangent()
True
sage: words.ThueMorseWord()[:1000].is_tangent()
True
sage: words.KolakoskiWord()[:1000].is_tangent()
False
```

See [Mon2010].

AUTHOR:

- Thierry Monteil

### is_yamanouchi 

Return whether self is Yamanouchi.

A word \( w \) is Yamanouchi if, when read from right to left, it always has weakly more \( i \)'s than \( i+1 \)'s for all \( i \) that appear in \( w \).

INPUT:

- \( n \) – (optional) an integer specifying the maximal letter in the alphabet

EXAMPLES:

```python
sage: w = Word([1,2,4,3,2,2,2])
sage: w.is_yamanouchi()
False
sage: w = Word([2,3,4,3,1,2,1,1,2,1])
sage: w.is_yamanouchi()
True
sage: w = Word([3,1])
sage: w.is_yamanouchi(n=3)
False
sage: w.is_yamanouchi()
True
sage: w = Word([3,1],alphabet=[1,2,3])
sage: w.is_yamanouchi()
False
sage: w = Word([2,1,1,2])
sage: w.is_yamanouchi()
False
```
>>> from sage.all import *
>>> w = Word([Integer(1), Integer(2), Integer(4), Integer(3), Integer(2),
→ Integer(2), Integer(2)])
>>> w.is_yamanouchi()
False
>>> w = Word([Integer(2), Integer(3), Integer(4), Integer(3), Integer(1),
→ Integer(2), Integer(1), Integer(1), Integer(2), Integer(1)])
>>> w.is_yamanouchi()
True
>>> w = Word([Integer(3), Integer(1)])
>>> w.is_yamanouchi(n=Integer(3))
False
>>> w.is_yamanouchi()
True
>>> w = Word([Integer(3), Integer(1)], alphabet=[Integer(1), Integer(2),
→ Integer(3)])
>>> w.is_yamanouchi()
False
>>> w = Word([Integer(2), Integer(1), Integer(1), Integer(2)])
>>> w.is_yamanouchi()
False

iterated_left_palindromic_closure \(f=None\)

Return the iterated left \(f\)-palindromic closure of \(self\).

INPUT:

- \(f\) – involution (default: None) on the alphabet of \(self\). It must be callable on letters as well as words (e.g. WordMorphism).

OUTPUT:

word – the left iterated \(f\)-palindromic closure of \(self\).

EXAMPLES:

```
sage: Word('123').iterated_left_palindromic_closure()
word: 3231323
sage: f = WordMorphism('a->b,b->a')
sage: Word('ab').iterated_left_palindromic_closure(f=f)
word: abbaab
```

lacunas \(f=None\)

Return the list of all the lacunas of \(self\).

A lacuna is a position in a word where the longest \(f\)-palindromic suffix is not unioccurrent (see [BMBL2008]).
INPUT:

- $f$ – involution (default: None) on the alphabet of self. It must be callable on letters as well as words (e.g. WordMorphism). The default value corresponds to usual palindromes, i.e., $f$ equal to the identity.

OUTPUT:

a list – list of all the lacunas of self

EXAMPLES:

```
sage: w = Word([0,1,1,2,3,4,5,1,13,3])
sage: w.lacunas()  # 7, 9
sage: words.ThueMorseWord()[:100].lacunas()  # 8, 9, 24, 25, 32, 33, 34, 35, 36, 37, 38, 39, 96, 97, 98, 99
sage: f = WordMorphism({0:[1], 1:[0]})
sage: words.ThueMorseWord()[:50].lacunas(f)  # 0, 2, 4, 12, 16, 17, 18, 19, 48, 49
```

```
>>> from sage.all import *

>>> w = Word([Integer(0),Integer(1),Integer(1),Integer(2),Integer(3),
            Integer(4),Integer(5),Integer(1),Integer(13),Integer(3)])

>>> w.lacunas()  # 7, 9

>>> words.ThueMorseWord()[:Integer(100)].lacunas()  # 8, 9, 24, 25, 32, 33, 34, 35, 36, 37, 38, 39, 96, 97, 98, 99

>>> f = WordMorphism({Integer(0):[Integer(1)], Integer(1):[Integer(0)]})

>>> words.ThueMorseWord()[:Integer(50)].lacunas(f)  # 0, 2, 4, 12, 16, 17, 18, 19, 48, 49
```

```
last_position_dict()
Return a dictionary that contains the last position of each letter in self.

EXAMPLES:

```
sage: Word('1231232').last_position_dict()
{'1': 3, '2': 6, '3': 5}
```

```
>>> from sage.all import *

>>> Word('1231232').last_position_dict()
{'1': 3, '2': 6, '3': 5}
```

```
left_special_factors (n=None)
Return the left special factors (of length n).

A factor $u$ of a word $w$ is left special if there are two distinct letters $a$ and $b$ such that $au$ and $bu$ are factors of $w$.

INPUT:

- $n$ – integer (default: None). If None, it returns all left special factors.

OUTPUT:

a list of words

EXAMPLES:
sage: alpha, beta, x = 0.54, 0.294, 0.1415
sage: w = words.CodingOfRotationWord(alpha, beta, x)[:40]
sage: for i in range(5):
    ...:     print("{} {}":format(i, sorted(w.left_special_factors(i))))
0 [word: ]
1 [word: 0]
2 [word: 00, word: 01]
3 [word: 000, word: 010]
4 [word: 0000, word: 0101]

left_special_factors_iterator(n=None)
Return an iterator over the left special factors (of length n).

A factor $u$ of a word $w$ is left special if there are two distinct letters $a$ and $b$ such that $au$ and $bu$ are factors of $w$.

INPUT:
- $n$ – integer (default: None). If None, it returns an iterator over all left special factors.

EXAMPLES:

sage: alpha, beta, x = 0.54, 0.294, 0.1415
sage: w = words.CodingOfRotationWord(alpha, beta, x)[:40]
sage: sorted(w.left_special_factors_iterator(3))
[word: 000, word: 010]
sage: sorted(w.left_special_factors_iterator(4))
[word: 0000, word: 0101]
sage: sorted(w.left_special_factors_iterator(5))
[word: 00000, word: 01010]

length()
Return the length of self.
**length_border()**

Return the length of the border of `self`.

The *border* of a word is the longest word that is both a proper prefix and a proper suffix of `self`.

**EXAMPLES:**

```python
sage: Word('121').length_border()
1
sage: Word('1').length_border()
0
sage: Word('1212').length_border()
2
sage: Word('111').length_border()
2
sage: Word('').length_border() is None
True
```

```python
>>> from sage.all import *
>>> Word('121').length_border()
1
>>> Word('1').length_border()
0
>>> Word('1212').length_border()
2
>>> Word('111').length_border()
2
>>> Word('').length_border() is None
True
```

**length_maximal_palindrome** *(j, m=None, f=None)*

Return the length of the longest palindrome centered at position `j`.

**INPUT:**

- `j` – rational, position of the symmetry axis of the palindrome. Must return an integer when doubled. It is an integer when the center of the palindrome is a letter.
- `m` – integer (default: `None`), minimal length of palindrome, if known. The parity of `m` can’t be the same as the parity of `2j`.
- `f` – involution (default: `None`), on the alphabet. It must be callable on letters as well as words (e.g. `WordMorphism`).

**OUTPUT:**

length of the longest `f`-palindrome centered at position `j`

**EXAMPLES:**

```python
sage: Word('01001010').length_maximal_palindrome(3/2)
0
sage: Word('01101001').length_maximal_palindrome(3/2)
4
sage: Word('01010').length_maximal_palindrome(j=3, f='0->1,1->0')
0
sage: Word('01010').length_maximal_palindrome(j=2.5, f='0->1,1->0')
4
sage: Word('0222220').length_maximal_palindrome(3, f='0->1,1->0,2->2')
5
```
```python
>>> from sage.all import *

>>> Word('01001010').length_maximal_palindrome(Integer(3)/Integer(2))
0
>>> Word('01101001').length_maximal_palindrome(Integer(3)/Integer(2))
4
>>> Word('01010').length_maximal_palindrome(j=Integer(3), f='0->1,1->0')
0
>>> Word('01010').length_maximal_palindrome(j=RealNumber('2.5'), f='0->1,1->0')
4
>>> Word('0222220').length_maximal_palindrome(Integer(3), f='0->1,1->0,2->2')
5

sage: w = Word('abcdcbaxyzyx')
sage: w.length_maximal_palindrome(3)
7
sage: w.length_maximal_palindrome(3, 3)
7
sage: w.length_maximal_palindrome(3.5)
0
sage: w.length_maximal_palindrome(9.5)
6
sage: w.length_maximal_palindrome(9.5, 2)
6

>>> from sage.all import *

>>> w = Word('abcdcbaxyzyx')

>>> w.length_maximal_palindrome(Integer(3))
7
>>> w.length_maximal_palindrome(Integer(3), Integer(3))
7
>>> w.length_maximal_palindrome(RealNumber('3.5'))
0
>>> w.length_maximal_palindrome(RealNumber('9.5'))
6
>>> w.length_maximal_palindrome(RealNumber('9.5'), Integer(2))
6
```

---

`lengths_maximal_palindromes (f=None)`

Return the length of maximal palindromes centered at each position.

**INPUT:**

- `f` – involution (default: `None`) on the alphabet of `self`. It must be callable on letters as well as words (e.g. `WordMorphism`).

**OUTPUT:**

a list – The length of the maximal palindrome (or $f$-palindrome) with a given symmetry axis (letter or space between two letters).

**EXAMPLES:**

```python
sage: Word('01101001').lengths_maximal_palindromes()
[0, 1, 0, 1, 4, 1, 0, 3, 0, 3, 0, 1, 4, 1, 0, 1, 0]
sage: Word('00000').lengths_maximal_palindromes()
[0, 1, 2, 3, 4, 5, 4, 3, 2, 1, 0]
sage: Word('0').lengths_maximal_palindromes()
(continues on next page)```
[0, 1, 0]
sage: Word('').lengths_maximal_palindromes()
[0]
sage: Word().lengths_maximal_palindromes()
[0]
sage: f = WordMorphism({'a':'b', 'b':'a'})
sage: Word('abbabaab').lengths_maximal_palindromes(f)
[0, 0, 2, 0, 0, 0, 2, 0, 8, 0, 2, 0, 0, 0, 2, 0, 0]

lengths_unioccurrent_lps (f=None)

Return the list of the lengths of the unioccurrent longest (f)-palindromic suffixes (lps) for each non-empty prefix of self. No unioccurrent lps are indicated by None.

It corresponds to the function $H_w$ defined in [BMBL2008] and [BMBFLR2008].

INPUT:

• f – involution (default: None) on the alphabet of self. It must be callable on letters as well as words (e.g. WordMorphism). The default value corresponds to usual palindromes, i.e., f equal to the identity.

OUTPUT:

a list – list of the length of the unioccurrent longest palindromic suffix (lps) for each non-empty prefix of self. No unioccurrent lps are indicated by None.

EXAMPLES:

sage: w = Word([0, 1, 1, 2, 3, 4, 5, 5, 13, 3])
sage: w.lengths_unioccurrent_lps()
[1, 1, 2, 1, 1, 1, 1, None, 1, None]
sage: f = words.FibonacciWord()[:20]
sage: f.lengths_unioccurrent_lps() == f.lps_lengths()[1:]
True
sage: t = words.ThueMorseWord()
sage: t[20].lengths_unioccurrent_lps()
[1, 1, 2, 4, 3, 2, 4, None, None, 6, 8, 10, 12, 14, 16, 6, 8, 10, 12]
sage: f = WordMorphism({1:[0], 0:[1]})
sage: t[:15].lengths_unioccurrent_lps(f)
[None, 2, None, 2, None, 4, 6, 8, 4, 6, 4, 6, None, 4, 6]
\begin{verbatim}
>>> Integer(4), Integer(5), Integer(1), Integer(13), Integer(3))
[1, 1, 2, 1, 1, 1, None, 1, None]
>>>
>>> f = words.FibonacciWord()[:Integer(20)]
>>> f.lengths_unioccurrent_lps() == f.lps_lengths()[Integer(1):]
True
>>> t = words.ThueMorseWord()
>>> t[:Integer(20)].lengths_unioccurrent_lps()
[1, 1, 2, 4, 3, 3, 2, 4, None, None, 6, 8, 10, 12, 14, 16, 6, 8, 10, 12]
>>>
>>> f = WordMorphism({Integer(1):[Integer(0)], Integer(0):[Integer(1)]})
>>> t[:Integer(15)].lengths_unioccurrent_lps(f)
[None, 2, None, 2, None, 4, 6, 8, 4, 6, 4, 6, None, 4, 6]
\end{verbatim}

\textbf{letters()}

Return the list of letters that appear in this word, listed in the order of first appearance.

\textbf{EXAMPLES:}

\begin{verbatim}
 sage: Word([0,1,1,0,1,0,0,1]).letters()
 [0, 1]
 sage: Word("cacao").letters()
 ['c', 'a', 'o']
\end{verbatim}

\begin{verbatim}
>>> from sage.all import *
>>>
>>> Word([Integer(0), Integer(1), Integer(1), Integer(0), Integer(1), Integer(0),
 Integer(0), Integer(1)]).letters()
[0, 1]
>>> Word("cacao").letters()
['c', 'a', 'o']
\end{verbatim}

\textbf{longest_backward_extension}(x, y)

Compute the length of the longest factor of \texttt{self} that ends at \texttt{x} and that matches a factor that ends at \texttt{y}.

\textbf{INPUT:}

- \texttt{x, y} – positions in \texttt{self}

\textbf{EXAMPLES:}

\begin{verbatim}
 sage: w = Word('0011001')
 sage: w.longest_backward_extension(6, 2)
 3
 sage: w.longest_backward_extension(1, 4)
 1
 sage: w.longest_backward_extension(1, 3)
 0
\end{verbatim}

\begin{verbatim}
>>> from sage.all import *
>>>
>>> w = Word('0011001')
>>> w.longest_backward_extension(Integer(6), Integer(2))
3
>>> w.longest_backward_extension(Integer(1), Integer(4))
1
>>> w.longest_backward_extension(Integer(1), Integer(3))
0
\end{verbatim}

The method also accepts negative positions indicating the distance from the end of the word (in order to be
consist with how negative indices work with lists). For instance, for a word of length 7, using positions 6 and −5 is the same as using positions 6 and 2:

```
sage: w.longest_backward_extension(6, -5)
3
sage: w.longest_backward_extension(-6, 4)
1
```

```
>>> from sage.all import *
>>> w.longest_backward_extension(Integer(6), -Integer(5))
3
>>> w.longest_backward_extension(-Integer(6), Integer(4))
1
```

**longest_common_subword** *(other)*

Return a longest subword of self and other.

A subword of a word is a subset of the word’s letters, read in the order in which they appear in the word.

For more information, see Wikipedia article Longest_common_subsequence_problem.

**INPUT:**

- other – a word

**ALGORITHM:**

For any indices $i, j$, we compute the longest common subword $lcs[i, j]$ of $self[:i]$ and $other[:j]$. This can be easily obtained as the longest of

- $lcs[i-1, j]$
- $lcs[i, j-1]$
- $lcs[i-1, j-1] + self[i]$ if $self[i]==other[j]$

**EXAMPLES:**

```
sage: v1 = Word("abc")
sage: v2 = Word("ace")
sage: v1.longest_common_subword(v2)
word: ac
```

```
sage: w1 = Word("1010101010101010101010101010101010101010")
sage: w2 = Word("0011001100110011001100110011001100110011")
sage: w1.longest_common_subword(w2)
word: 00110011001100110011010101010
```

```
>>> from sage.all import *
>>> v1 = Word("abc")
>>> v2 = Word("ace")
>>> v1.longest_common_subword(v2)
word: ac
```

```python
>>> w1 = Word("1010101010101010101010101010101010101010")
>>> w2 = Word("0011001100110011001100110011001100110011")
>>> w1.longest_common_subword(w2)
word: 00110011001100110011010101010
```

See also:

- is_subword_of()
longest_common_suffix(other)

Return the longest common suffix of self and other.

EXAMPLES:

```
sage: w = Word('112345678')
sage: u = Word('1115678')
sage: w.longest_common_suffix(u)  # word: 5678
sage: u.longest_common_suffix(u)  # word: 1115678
sage: u.longest_common_suffix(w)  # word: 5678
sage: w.longest_common_suffix(w)  # word: 112345678
sage: y = Word('549332345')
sage: w.longest_common_suffix(y)  # word:
```

longest_forward_extension(x, y)

Compute the length of the longest factor of self that starts at x and that matches a factor that starts at y.

INPUT:

- x, y – positions in self

EXAMPLES:

```
sage: w = Word('0011001')
sage: w.longest_forward_extension(0, 4)  # 3
sage: w.longest_forward_extension(0, 2)  # 0
```

```
>>> from sage.all import *
>>> w = Word('0011001')
>>> w.longest_forward_extension(Integer(0), Integer(4))  # 3
>>> w.longest_forward_extension(Integer(0), Integer(2))  # 0
```

The method also accepts negative positions indicating the distance from the end of the word (in order to be consistent with how negative indices work with lists). For instance, for a word of length 7, using positions −3 and 2 is the same as using positions 4 and 2:
\texttt{sage}: \texttt{w.longest_forward_extension(1, -2)}
\>
\texttt{2}
\texttt{sage}: \texttt{w.longest_forward_extension(4, -3)}
\>
\texttt{3}

```python
>>> \texttt{from sage.all import *}

\texttt{w.longest_forward_extension(Integer(1), -Integer(2))}
\>
\texttt{2}
\texttt{w.longest_forward_extension(Integer(4), -Integer(3))}
\>
\texttt{3}
```

\texttt{lps} \texttt{(f=\texttt{None}, l=\texttt{None})}

Return the longest palindromic (or \texttt{f}-palindromic) suffix of \texttt{self}.

INPUT:

- \texttt{f} – involution (default: \texttt{None}) on the alphabet of \texttt{self}. It must be callable on letters as well as words (e.g. WordMorphism).

- \texttt{l} – integer (default: \texttt{None}) the length of the longest palindrome suffix of `\texttt{self[\:-1]}`, if known.

OUTPUT:

word – If \texttt{f} is \texttt{None}, the longest palindromic suffix of \texttt{self}; otherwise, the longest \texttt{f}-palindromic suffix of \texttt{self}.

EXAMPLES:

```python
\texttt{sage}: \texttt{Word('0111').lps()}
\>
\texttt{word: 111}
\texttt{sage}: \texttt{Word('011101').lps()}
\>
\texttt{word: 101}
\texttt{sage}: \texttt{Word('6667').lps()}
\>
\texttt{word: 7}
\texttt{sage}: \texttt{Word('abbabaab').lps()}
\>
\texttt{word: baab}
\texttt{sage}: \texttt{Word().lps()}
\>
\texttt{word: \texttt{sage}: \texttt{f = WordMorphism('a\rightarrow b, b\rightarrow a')}
\texttt{sage}: \texttt{w.lps(l=3)}
\>
\texttt{word: 12321}
\texttt{sage}: \texttt{Y().lps(l=2)}
\>
\texttt{word: 1001}
\texttt{sage}: \texttt{w.lps(l=\texttt{None})}
\>
\texttt{1001}
\texttt{sage}: \texttt{Y().lps(l=2)}
\>
\texttt{Traceback (most recent call last):
...

word: ab
word: ba
word: ab
word: bbaba
word: bbabaab

lps_lengths (f=None)
Return the length of the longest palindromic suffix of each prefix.

INPUT:
• f – involution (default: None) on the alphabet of self. It must be callable on letters as well as words (e.g. WordMorphism).

OUTPUT:
a list – The length of the longest palindromic (or f-palindromic) suffix of each prefix of self.

EXAMPLES:
sage: Word('01101001').lps_lengths()
[0, 1, 1, 2, 4, 3, 3, 2, 4]
sage: Word('00000').lps_lengths()
[0, 1, 2, 3, 4, 5]
sage: Word('0').lps_lengths()
[0, 1]
sage: Word('').lps_lengths()
[0]
sage: f = WordMorphism('a->b,b->a')
sage: Word('abbabaab').lps_lengths(f)
[0, 0, 2, 0, 2, 2, 4, 6, 8]

>>> from sage.all import *
>>> Word('01101001').lps_lengths()
[0, 1, 1, 2, 4, 3, 3, 2, 4]
>>> Word('00000').lps_lengths()
\documentclass{article}

\lstset{style=mystyle}

\begin{document}

Combinatorics, Release 10.4

(continued from previous page)

\begin{verbatim}
[0, 1, 2, 3, 4, 5]
>>> Word('0').lps_lengths()
[0, 1]
>>> Word('').lps_lengths()
[0]
>>> Word().lps_lengths()
[0]
>>> f = WordMorphism('a->b,b->a')
>>> Word('abbabaab').lps_lengths(f)
[0, 0, 2, 0, 2, 2, 4, 6, 8]
\end{verbatim}

\textbf{lyndon_factorization()}

Return the Lyndon factorization of self.

The \textit{Lyndon factorization} of a finite word \(w\) is the unique factorization of \(w\) as a non-increasing product of Lyndon words, i.e., \(w = l_1 \cdots l_n\) where each \(l_i\) is a Lyndon word and \(l_1 \geq \cdots \geq l_n\). See for instance [Duv1983].

\textbf{OUTPUT:}

the list \([l_1,\ldots,l_n]\) of factors obtained

\textbf{EXAMPLES:}

\begin{verbatim}
sage: Word('010010010001000').lyndon_factorization()
(01, 001, 001, 0001, 0, 0, 0)
sage: Words('10')('010010010001000').lyndon_factorization()
(0, 10010010001000)
sage: Word('abbababbaababba').lyndon_factorization()
(abb, ababb, aababb, a)
sage: Words('ba')('abbababbaababba').lyndon_factorization()
(a, bbababbaab, bba)
sage: Word([Integer(1),Integer(2),Integer(1),Integer(3),Integer(1),Integer(2),Integer(1)]).lyndon_factorization()
(1213, 12, 1)
\end{verbatim}

\begin{verbatim}
>>> from sage.all import *
>>> Word('010010010001000').lyndon_factorization()
(01, 001, 001, 0001, 0, 0, 0)
>>> Words('10')('010010010001000').lyndon_factorization()
(0, 10010010001000)
>>> Word('abbababbaababba').lyndon_factorization()
(abb, ababb, aababb, a)
>>> Words('ba')('abbababbaababba').lyndon_factorization()
(a, bbababbaab, bba)
>>> Word([Integer(1),Integer(2),Integer(1),Integer(3),Integer(1),Integer(2),Integer(1)]).lyndon_factorization()
(1213, 12, 1)
\end{verbatim}

\textbf{major_index (final_descent=False)}

Return the major index of self.

The major index of a word \(w\) is the sum of the descents of \(w\).

With the \texttt{final_descent} option, the last position of a non-empty word is also considered as a descent.

See also:

major index on Permutations.

\end{document}
EXAMPLES:

```python
sage: w = Word([2,1,3,3,2])
sage: w.major_index()
5
sage: w = Word([2,1,3,3,2])
sage: w.major_index(final_descent=True)
10
```

```python
>>> from sage.all import *
>>> w = Word([Integer(2),Integer(1),Integer(3),Integer(3),Integer(2)])
>>> w.major_index()
5
>>> w = Word([Integer(2),Integer(1),Integer(3),Integer(3),Integer(2)])
>>> w.major_index(final_descent=True)
10
```

`minimal_conjugate()`
Return the lexicographically minimal conjugate of this word (see Wikipedia article Lexicographically_minimal_string_rotation).

EXAMPLES:

```python
sage: Word('213').minimal_conjugate()
word: 132
sage: Word('11').minimal_conjugate()
word: 11
sage: Word('12112').minimal_conjugate()
word: 11212
sage: Word('211').minimal_conjugate()
word: 112
sage: Word('211211211').minimal_conjugate()
word: 112112112
```

```python
>>> from sage.all import *
>>> Word('213').minimal_conjugate()
word: 132
>>> Word('11').minimal_conjugate()
word: 11
>>> Word('12112').minimal_conjugate()
word: 11212
>>> Word('211').minimal_conjugate()
word: 112
>>> Word('211211211').minimal_conjugate()
word: 112112112
```

`minimal_period()`
Return the period of self.

Let $A$ be an alphabet. An integer $p \geq 1$ is a period of a word $w = a_1a_2\cdots a_n$ where $a_i \in A$ if $a_i = a_{i+p}$ for $i = 1, \ldots, n - p$. The smallest period of $w$ is called the period of $w$. See Chapter 1 of [Lot2002].

EXAMPLES:

```python
sage: Word('aba').minimal_period()
2
sage: Word('abab').minimal_period()
```

(continues on next page)
```python
>>> from sage.all import *
>>> Word('aba').minimal_period()
2
>>> Word('abab').minimal_period()
2
>>> Word('ababa').minimal_period()
2
>>> Word('ababab').minimal_period()
2
>>> Word('aaaaaa').minimal_period()
1
>>> Word('a').minimal_period()
1
>>> Word().minimal_period()
1

>>> from sage.all import *  
>>> Word('ababa').minimal_period()  
2
>>> Word('ababaa').minimal_period()  
5
>>> Word('ababac').minimal_period()  
6
>>> Word('aaaaaa').minimal_period()  
1
>>> Word('a').minimal_period()  
1
>>> Word().minimal_period()  
1
```

**nb_factor_occurrences_in**(other)

Return the number of times self appears as a factor in other.

**Warning:** This method is deprecated since 2020 and will be removed in a later version of SageMath. Use `number_of_factor_occurrences()` instead.

**Examples:**

```python
sage: Word('123').nb_factor_occurrences_in(Word('112332312313112332121123'))
doctest:warning
...
DeprecationWarning: f.nb_factor_occurrences_in(w) is deprecated. Use w.number_of_factor_occurrences(f) instead.
See https://github.com/sagemath/sage/issues/30187 for details.
4
```

```python
>>> from sage.all import *
>>> Word('123').nb_factor_occurrences_in(Word('112332312313112332121123'))
doctest:warning
...
```
An error is raised for the empty word:

```
sage: Word().nb_factor_occurrences_in(Word('123'))
Traceback (most recent call last):
... NotImplementedError: The factor must be non empty
```

```
>>> from sage.all import *

>>> Word().nb_factor_occurrences_in(Word('123'))
Traceback (most recent call last):
... NotImplementedError: The factor must be non empty
```

```
5.1. Comprehensive Module List
```

```python

```
doctest:warning
...
DeprecationWarning: f.nb_subword_occurrences_in(w) is deprecated.
Use w.number_of_subword_occurrences(f) instead.
See https://github.com/sagemath/sage/issues/30187 for details.

>>> u = Word([Integer(0),Integer(1),Integer(0),Integer(1),Integer(1),
             Integer(0)])
>>> u.nb_subword_occurrences_in(tm[:Integer(100)])
20370432

Note: This code, based on [MSSY2001], actually compute the number of occurrences of all prefixes of self as subwords in all prefixes of other. In particular, its complexity is bounded by \( \text{len}(\text{self}) \times \text{len}(\text{other}) \).

**number_of_factor_occurrences** *(other)*

Return the number of times other appears as a factor in self.

**INPUT:**

- other – a non empty word

**EXAMPLES:**

```python
sage: w = Word('1123323123112332121123')
sage: w.number_of_factor_occurrences(Word('123'))
4
sage: w = Word('112332312311233221123')
sage: w.number_of_factor_occurrences(Word('321'))
0
```

```python
>>> from sage.all import *

>>> w = Word('1123323123112332121123')

>>> w.number_of_factor_occurrences(Word('123'))
4

>>> w.number_of_factor_occurrences(Word('321'))
0
```

```python
sage: Word().number_of_factor_occurrences(Word('123'))
0
```

```python
>>> from sage.all import *

>>> Word().number_of_factor_occurrences(Word('123'))
0
```

An error is raised for the empty word:

```python
sage: Word('123').number_of_factor_occurrences(Word())
Traceback (most recent call last):
...
NotImplementedError: The factor must be non empty
```
number_of_factors \( (n=None, \text{algorithm}='\text{suffix tree}') \)

Count the number of distinct factors of self.

INPUT:

- \( n \) – an integer, or None.
- \( \text{algorithm} \) – string (default: 'suffix tree'), takes the following values:
  - 'suffix tree' – construct and use the suffix tree of the word
  - 'naive' – algorithm uses a sliding window

OUTPUT:

If \( n \) is an integer, returns the number of distinct factors of length \( n \). If \( n \) is None, returns the total number of distinct factors.

EXAMPLES:

```python
sage: w = Word([1,2,1,2,3])
sage: w.number_of_factors()
13
sage: [w.number_of_factors(i) for i in range(6)]
[1, 3, 3, 3, 2, 1]

>>> from sage.all import *
>>> w = Word([Integer(1),Integer(2),Integer(1),Integer(2),Integer(3)])
>>> w.number_of_factors()
13
>>> [w.number_of_factors(i) for i in range(Integer(6))]
[1, 3, 3, 3, 2, 1]

sage: w = words.ThueMorseWord()[:100]
sage: [w.number_of_factors(i) for i in range(10)]
[1, 2, 4, 6, 10, 12, 16, 20, 22, 24]

>>> from sage.all import *
>>> w = words.ThueMorseWord()[:Integer(100)]
>>> [w.number_of_factors(i) for i in range(Integer(10))]
[1, 2, 4, 6, 10, 12, 16, 20, 22, 24]

sage: Word('1213121').number_of_factors()
22
sage: Word('1213121').number_of_factors(1)
3

>>> from sage.all import *
>>> Word('1213121').number_of_factors()
22
>>> Word('1213121').number_of_factors(Integer(1))
```
sage: Word('a'*100).number_of_factors()
101
sage: Word('a'*100).number_of_factors(77)
1

>>> from sage.all import *
>>> Word('a'*Integer(100)).number_of_factors()
101
>>> Word('a'*Integer(100)).number_of_factors(Integer(77))
1

sage: Word().number_of_factors()
1
sage: Word().number_of_factors(17)
0

>>> from sage.all import *
>>> Word().number_of_factors()
1
>>> Word().number_of_factors(Integer(17))
0

sage: blueberry = Word("blueberry")
sage: blueberry.number_of_factors()
43
sage: [blueberry.number_of_factors(i) for i in range(10)]
[1, 6, 8, 7, 6, 5, 4, 3, 2, 1]

>>> from sage.all import *
>>> blueberry = Word("blueberry")
>>> blueberry.number_of_factors()
43
>>> [blueberry.number_of_factors(i) for i in range(Integer(10))]
[1, 6, 8, 7, 6, 5, 4, 3, 2, 1]

def number_of_inversions()
    Return the number of inversions in self.

    An inversion of a word \( w = w_1 \ldots w_n \) is a pair of indices \((i, j)\) with \( i < j \) and \( w_i > w_j \).

    See also:
    number of inversions on Permutations.

    EXAMPLES:

    sage: w = Word([2,1,3,3,2])
sage: w.number_of_inversions()
3

>>> from sage.all import *
>>> w = Word([Integer(2),Integer(1),Integer(3),Integer(3),Integer(2)])
>>> w.number_of_inversions()
3

def number_of_left_special_factors(n)
    Return the number of left special factors of length \( n \).
A factor \( u \) of a word \( w \) is left special if there are two distinct letters \( a \) and \( b \) such that \( au \) and \( bu \) are factors of \( w \).

**INPUT:**

- \( n \) – integer

**OUTPUT:**

a non-negative integer

**EXAMPLES:**

```python
sage: w = words.FibonacciWord()[:100]
sage: [w.number_of_left_special_factors(i) for i in range(10)]
[1, 1, 1, 1, 1, 1, 1, 1, 1, 1]

>>> from sage.all import *
>>> w = words.FibonacciWord()[:Integer(100)]
>>> [w.number_of_left_special_factors(i) for i in range(Integer(10))]
[1, 1, 1, 1, 1, 1, 1, 1, 1, 1]
```

```
sage: w = words.ThueMorseWord()[:100]
sage: [w.number_of_left_special_factors(i) for i in range(10)]
[1, 2, 2, 4, 2, 4, 4, 2, 2, 4]

>>> from sage.all import *
>>> w = words.ThueMorseWord()[:Integer(100)]
>>> [w.number_of_left_special_factors(i) for i in range(Integer(10))]
[1, 2, 2, 4, 2, 4, 4, 2, 2, 4]
```

### number_of_letter_occurrences (letter)

Return the number of occurrences of \( letter \) in \( self \).

**INPUT:**

- \( letter \) – a letter

**OUTPUT:**

- integer

**EXAMPLES:**

```python
sage: w = Word('abbabaab')
sage: w.number_of_letter_occurrences('a')
4
sage: w.number_of_letter_occurrences('ab')
0

>>> from sage.all import *
>>> w = Word('abbabaab')
>>> w.number_of_letter_occurrences('a')
4
>>> w.number_of_letter_occurrences('ab')
0
```

This method is equivalent to `list(w).count(letter)` and `tuple(w).count(letter)`, thus `count` is an alias for the method `number_of_letter_occurrences`:
sage: list(w).count('a')
4
sage: w.count('a')
4

>>> from sage.all import *
>>> list(w).count('a')
4
>>> w.count('a')
4

But notice that if \( s \) and \( w \) are strings, \( \text{Word}(s).\text{count}(w) \) counts the number occurrences of \( w \) as a letter in \( \text{Word}(s) \) which is not the same as \( s.\text{count}(w) \) which counts the number of occurrences of the string \( w \) inside \( s \):

sage: s = 'abbabaab'
sage: s.count('ab')
3
sage: Word(s).count('ab')
0

>>> from sage.all import *
>>> s = 'abbabaab'
>>> s.count('ab')
3
>>> Word(s).count('ab')
0

See also:

\texttt{sage.combinat.words.finite_word.FiniteWord_class.\text{number_of_factor_occurrences}()}

\texttt{number_of_right_special_factors}(n)

Return the number of right special factors of length \( n \).

A factor \( u \) of a word \( w \) is right special if there are two distinct letters \( a \) and \( b \) such that \( ua \) and \( ub \) are factors of \( w \).

INPUT:

\begin{itemize}
\item \( n \) – integer
\end{itemize}

OUTPUT:

a non-negative integer

EXAMPLES:

sage: w = words.FibonacciWord()[:100]
sage: [w.number_of_right_special_factors(i) for i in range(10)]
[1, 1, 1, 1, 1, 1, 1, 1, 1, 1]

>>> from sage.all import *
>>> w = words.FibonacciWord()[:\text{Integer}(100)]
[1, 1, 1, 1, 1, 1, 1, 1, 1, 1]
sage: w = words.ThueMorseWord()[:100]
sage: [w.number_of_right_special_factors(i) for i in range(10)]
[1, 2, 2, 4, 2, 4, 4, 2, 2, 4]

>>> from sage.all import *
>>> w = words.ThueMorseWord()[:Integer(100)]
>>> [w.number_of_right_special_factors(i) for i in range(Integer(10))]
[1, 2, 2, 4, 2, 4, 4, 2, 2, 4]

number_of_subword_occurrences(other)

Return the number of times other appears in self as a subword.
This corresponds to the notion of binomialcoefficient of two finite words whose properties are presented in the chapter of Lothaire’s book written by Sakarovitch and Simon [Lot1997].

INPUT:
• other – finite word

EXAMPLES:

sage: tm = words.ThueMorseWord()
sage: u = Word([0,1,0,1])
sage: tm[:1000].number_of_subword_occurrences(u)
2604124996

sage: u = Word([0,1,0,1,1,0])
sage: tm[:100].number_of_subword_occurrences(u)
20370432

Note: This code, based on [MSSY2001], actually compute the number of occurrences of all prefixes of self as subwords in all prefixes of other. In particular, its complexity is bounded by len(self) * len(other).

order()

Return the order of self.
Let \( p(w) \) be the period of a word \( w \). The positive rational number \( |w|/p(w) \) is the order of \( w \). See Chapter 8 of [Lot2002].

OUTPUT:
• rational – the order

EXAMPLES:
**overlap_partition** (other, delay=0, p=None, involution=None)

Return the partition of the alphabet induced by the overlap of `self` and `other` with the given delay.

The partition of the alphabet is given by the equivalence relation obtained from the symmetric, reflexive and transitive closure of the set of pairs of letters $R_{u,v,d} = \{(u_k, v_{k-d}) : 0 \leq k < n, 0 \leq k - d < m\}$ where $u = u_0u_1 \cdots u_{n-1}$, $v = v_0v_1 \cdots v_{m-1}$ are two words on the alphabet $A$ and $d$ is an integer.

The equivalence relation defined by $R$ is inspired from [Lab2008].

**INPUT:**

- `other` – word on the same alphabet as `self`
- `delay` – integer (default: 0)
- `p` – disjoint sets data structure (default: None), a partition of the alphabet into disjoint sets to start with. If None, each letter start in distinct equivalence classes.
- `involution` – callable (default: None), an involution on the alphabet. If `involution` is not None, the relation $R_{u,v,d} \cup R_{\text{involution}(u),\text{involution}(v),d}$ is considered.

**OUTPUT:**

a disjoint set data structure

**EXAMPLES:**

```python
sage: W = Words(list('abc012345'))
sage: u = W('abc')
sage: v = W('01234')
sage: u.overlap_partition(v)
{{'0', 'a'}, {'1', 'b'}, {'2', 'c'}, {'3'}, {'4'}, {'5'}}
sage: u.overlap_partition(v, 2)
{{'0', 'c'}, {'1'}, {'2'}, {'3'}, {'4'}, {'5'}, {'a'}, {'b'}}
sage: u.overlap_partition(v, -1)
{{'0'}, {'1', 'a'}, {'2', 'b'}, {'3', 'c'}, {'4'}, {'5'}}
```
You can re-use the same disjoint set and do more than one overlap:

```python
sage: p = u.overlap_partition(v, 2)
sage: p
{{0, 'c'}, {1}, {2}, {3}, {4}, {5}, {'a'}, {'b'}}
sage: u.overlap_partition(v, 1, p)
{{0, 1, 'b', 'c'}, {2}, {3}, {4}, {5}, {'a'}}
```

The function `overlap_partition` can be used to study equations on words. For example, if a word $w$ overlaps itself with delay $d$, then $d$ is a period of $w$:

```python
sage: W = Words(range(20))
sage: w = W(range(14)); w
word: 0,1,2,3,4,5,6,7,8,9,10,11,12,13
sage: d = 5
sage: p = w.overlap_partition(w, d)
sage: m = WordMorphism(p.element_to_root_dict())
sage: w2 = m(w); w2
word: 56789567895678
sage: w2.minimal_period() == d
True
```

If a word is equal to its reversal, then it is a palindrome:

```python
sage: W = Words(range(20))
sage: w = W(range(17)); w
(continues on next page)```
Combinatorics, Release 10.4

If the reversal of a word \( w \) is factor of its square \( w^2 \), then \( w \) is symmetric, i.e. the product of two palindromes:

```
sage: W = Words(range(10))
sage: w = W(range(10)); w
word: 0123456789
sage: p = (w*w).overlap_partition(w.reversal(), 4)
sage: m = WordMorphism(p.element_to_root_dict())
sage: w2 = m(w); w2
word: 0110456654
sage: w2.is_symmetric()
True
```

If the image of the reversal of a word \( w \) under an involution \( f \) is factor of its square \( w^2 \), then \( w \) is \( f \)-symmetric:

```
sage: W = Words([-11,-9,..,11])
sage: w = W([1,3,..,11])
sage: w
word: 1,3,5,7,9,11
sage: inv = lambda x:-x
sage: f = WordMorphism(dict( (a, inv(a)) for a in W.alphabet()))
sage: p = (w*w).overlap_partition(f(w).reversal(), 2, involution=f)
sage: m = WordMorphism(p.element_to_root_dict())
```

(continues on next page)
palindrome_prefixes()

Return a list of all palindrome prefixes of self.

OUTPUT:

a list – A list of all palindrome prefixes of self.

EXAMPLES:

sage: w = Word('abaaba')
sage: w.palindrome_prefixes()  
[word: , word: a, word: aba, word: abaaba]  
sage: w = Word('abbbbbbbbb')
sage: w.palindrome_prefixes()  
[word: , word: a]

palindromes(\texttt{f=None})

Return the set of all palindromic (or f-palindromic) factors of self.

INPUT:

- \texttt{f} – involution (default: \texttt{None}) on the alphabet of self. It must be callable on letters as well as words (e.g. WordMorphism).

OUTPUT:

a set – If \texttt{f} is \texttt{None}, the set of all palindromic factors of self; otherwise, the set of all f-palindromic factors of self.

EXAMPLES:
palindromic_closure (side='right', f=None)

Return the shortest palindrome having self as a prefix (or as a suffix if side is 'left').

See [DeLuca2006].

INPUT:

- side - 'right' or 'left' (default: 'right') the direction of the closure
- f – involution (default: None) on the alphabet of self. It must be callable on letters as well as words (e.g. WordMorphism).

OUTPUT:

a word – If f is None, the right palindromic closure of self; otherwise, the right f-palindromic closure of self. If side is 'left', the left palindromic closure.

EXAMPLES:

sage: Word('1233').palindromic_closure()
word: 123321
sage: Word('12332').palindromic_closure()
word: 123321
sage: Word('0110343').palindromic_closure()
word: 01103430110
sage: Word('0110343').palindromic_closure(side='left')
word: 3430110343
sage: Word('01105678').palindromic_closure(side='left')

(continues on next page)
```python
word: 876501105678
sage: w = Word('abbaba')
sage: w.palindromic_closure()
word: abbababba

>>> from sage.all import *
>>> Word('1233').palindromic_closure()
word: 123321
>>> Word('12332').palindromic_closure()
word: 123321
>>> Word('0110343').palindromic_closure()
word: 01103430110
>>> Word('0110343').palindromic_closure(side='left')
word: 3430110343
>>> Word('01105678').palindromic_closure(side='left')
word: 876501105678
>>> w = Word('abbaba')
>>> w.palindromic_closure()
word: abbababba

sage: f = WordMorphism('a->b,b->a')
sage: w.palindromic_closure(f=f)
word: abbabaab
sage: w.palindromic_closure(f=f, side='left')
word: babaabbaba

from sage.all import *
>>> f = WordMorphism('a->b,b->a')
>>> w.palindromic_closure(f=f)
word: abbabaab
>>> w.palindromic_closure(f=f, side='left')
word: babaabbaba
```

**palindromic_complexity**

Return the number of distinct palindromic factors of length \( n \) of \self.

**INPUT:**

- \( n \) – the length of the factors.

**EXAMPLES:**

```python
sage: w = words.FibonacciWord()[:100]
sage: [w.palindromic_complexity(i) for i in range(20)]
[1, 2, 1, 2, 1, 2, 1, 2, 1, 2, 1, 2, 1, 2, 1, 2, 1, 2, 1, 2]

from sage.all import *
>>> w = words.FibonacciWord()[:Integer(100)]
>>> [w.palindromic_complexity(i) for i in range(Integer(20))]
[1, 2, 1, 2, 1, 2, 1, 2, 1, 2, 1, 2, 1, 2, 1, 2, 1, 2, 1, 2]

sage: w = words.ThueMorseWord()[:1000]
sage: [w.palindromic_complexity(i) for i in range(20)]
[1, 2, 2, 2, 2, 0, 4, 0, 4, 0, 4, 0, 4, 0, 4, 0, 2, 0, 2, 0, 4, 0]
```
```python
>>> from sage.all import *
>>> w = words.ThueMorseWord()[:Integer(1000)]

>>> [w.palindromic_complexity(i) for i in range(Integer(20))]
[1, 2, 2, 2, 0, 4, 0, 4, 0, 4, 0, 2, 0, 2, 0, 4, 0, 2, 0, 4]
```

**palindromic_lacunas_study (f=None)**

Return interesting statistics about longest (f-)palindromic suffixes and lacunas of `self` (see [BMBL2008] and [BMBFLR2008]).

Note that a word \( w \) has at most \(|w| + 1 \) different palindromic factors (see [DJP2001]). For \( f \)-palindromes (or pseudopalindromes or theta-palindromes), the maximum number of \( f \)-palindromic factors is \(|w| + 1 - g_f(w)\)
where \( g_f(w) \) is the number of pairs \( \{a, f(a)\} \) such that \( a \) is a letter, \( a \) is not equal to \( f(a) \), and \( a \) or \( f(a) \) occurs in \( w \), see [Star2011].

**INPUT:**

- \( f \) – involution (default: `None`) on the alphabet of `self`. It must be callable on letters as well as words (e.g. `WordMorphism`). The default value corresponds to usual palindromes, i.e., \( f \) equal to the identity.

**OUTPUT:**

- `list` – list of the length of the longest palindromic suffix (lps) for each non-empty prefix of `self`
- `list` – list of all the lacunas, i.e. positions where there is no unioccurent lps
- `set` – set of palindromic factors of `self`

**EXAMPLES:**

```python
sage: a, b, c = Word('abbabaabbaab').palindromic_lacunas_study()
sage: a
[1, 1, 2, 4, 3, 2, 4, 2, 4, 6, 8]
sage: b
[8, 9]
sage: c
# random order
set([word: , word: b, word: bab, word: abba, word: bb, word: aa, word:...
    baabbaab, word: baab, word: aba, word: aabbaa, word: a])
```

```python
>>> from sage.all import *

>>> a, b, c = Word('abbabaabbaab').palindromic_lacunas_study()

>>> a
[1, 1, 2, 4, 3, 2, 4, 2, 4, 6, 8]

>>> b
[8, 9]

>>> c
# random order
set([word: , word: b, word: bab, word: abba, word: bb, word: aa, word:...
    aabbaa, word: a])

```

```python
sage: f = WordMorphism('a->b,b->a')
sage: a, b, c = Word('abbabaab').palindromic_lacunas_study(f=f)
sage: a
[0, 2, 0, 2, 4, 6, 8]

sage: b
[0, 2, 4]

sage: c
# random order
set([word: , word: ba, word: baba, word: ab, word: bbaba, word: aabbaab])
sage: c == set([Word(), Word('ba'), Word('baba'), Word('ab'), Word('bbaba'), Word('aabbaa'),...
    Word('abbabaab'))]
True
```
```python
>>> from sage.all import *

>>> f = WordMorphism('a->b, b->a')

>>> a, b, c = Word('ababaab').palindromic_lacunas_study(f=f)

>>> a
[0, 2, 0, 2, 2, 4, 6, 8]

>>> b
[0, 2, 4]

>>> c  # random order
set([word: a, word: ba, word: baba, word: ab, word: bbabaa, word: ababaab])

>>> c == set([Word(), Word('ba'), Word('baba'), Word('ab'), Word('bbabaa'), ...
Word('ababaab'))
True
```

**periods** *(divide_length=False)*

Return a list containing the periods of self between 1 and \(n - 1\), where \(n\) is the length of self.

**INPUT:**

  - divide_length – boolean (default: False). When set to True, then only periods that divide the length of self are considered.

**OUTPUT:**

a list of positive integers

**EXAMPLES:**

```
sage: w = Word('ababab')
sage: w.periods()
[2, 4]
sage: w.periods(divide_length=True)
[2]
sage: w = Word('ababa')
sage: w.periods()
[2, 4]
sage: w.periods(divide_length=True)
[]
```

**phi**

Apply the phi function to self and return the result. This is the word obtained by taking the first letter of the words obtained by iterating delta on self.

**OUTPUT:**

a word – the result of the phi function

**EXAMPLES:**
phi_inv\(_(W=None)\)

Apply the inverse of the \(\phi\) function to \(\text{self}\).

INPUT:

- \(\text{self}\) – a word over the integers
- \(W\) – a parent object of words defined over integers

OUTPUT:

a word – the inverse of the \(\phi\) function

EXAMPLES:

```python
sage: W = Words([1, 2])
sage: W([2, 2, 1, 1, 2, 1, 2, 1, 2, 1]) .phi_inv()
word: 22112122
```
sage: W([2, 2, 2]).phi_inv(Words([2, 3]))
word: 2233

>>> from sage.all import *
>>> W = Words([Integer(1), Integer(2)])
>>> W([Integer(2), Integer(2), Integer(2), Integer(2), Integer(1),... → Integer(2)]).phi_inv()
word: 22112122
>>> W([Integer(2), Integer(2), Integer(2)]).phi_inv(Words([Integer(2),... → Integer(3)]))
word: 2233

prefix_function_table()

Return a vector containing the length of the proper prefix-suffixes for all the non-empty prefixes of self.

EXAMPLES:

sage: Word('121321').prefix_function_table()
[0, 0, 1, 0, 0, 1]
sage: Word('1241245').prefix_function_table()
[0, 0, 0, 1, 2, 3, 0]
sage: Word().prefix_function_table()
[]

>>> from sage.all import *

>>> Word('121321').prefix_function_table()
[0, 0, 1, 0, 0, 1]
>>> Word('1241245').prefix_function_table()
[0, 0, 0, 1, 2, 3, 0]
>>> Word().prefix_function_table()
[]

primitive()

Return the primitive of self.

EXAMPLES:

sage: Word('12312').primitive()
word: 12312
sage: Word('121212').primitive()
word: 12

>>> from sage.all import *

>>> Word('12312').primitive()
word: 12312
>>> Word('121212').primitive()
word: 12

primitive_length()

Return the length of the primitive of self.

EXAMPLES:

sage: Word('1231').primitive_length()
4
sage: Word('121212').primitive_length()
2

```python
>>> from sage.all import *
>>> Word('1231').primitive_length()
4
>>> Word('121212').primitive_length()
2
```

**quasiperiods()**

Return the quasiperiods of `self` as a list ordered from shortest to longest.

Let \( w \) be a finite or infinite word. A *quasiperiod* of \( w \) is a proper factor \( u \) of \( w \) such that the occurrences of \( u \) in \( w \) entirely cover \( w \), i.e., every position of \( w \) falls within some occurrence of \( u \) in \( w \). See for instance [AE1993], [Mar2004], and [GLR2008].

**EXAMPLES:**

```python
sage: Word('abaababaabaababaaba').quasiperiods()
[word: aba, word: abaaba, word: abaababaaba]
sage: Word('abaaba').quasiperiods()
[word: aba]
sage: Word('abacaba').quasiperiods()
[]
```

```python
>>> from sage.all import *
```  

```python
>>> Word('abaababaabaababaaba').quasiperiods()
[word: aba, word: abaaba, word: abaababaaba]
```  

```python
>>> Word('abaaba').quasiperiods()
[word: aba]
```  

```python
>>> Word('abacaba').quasiperiods()
[]
```

**rauzy_graph(n)**

Return the Rauzy graph of the factors of length \( n \) of `self`.

The vertices are the factors of length \( n \) and there is an edge from \( u \) to \( v \) if \( ua = bv \) is a factor of length \( n + 1 \) for some letters \( a \) and \( b \).

**INPUT:**

- \( n \) – integer

**EXAMPLES:**

```python
sage: w = Word(range(10)); w
word: 0123456789
sage: g = w.rauzy_graph(3); g
Looped digraph on 8 vertices

sage: g.vertices(sort=True)
[012, 123, 234, 345, 456, 567, 678, 789]
```

```python
(continues on next page)
```
sage: WordOptions(identifier='word: ')

>>> from sage.all import *
>>> w = Word(range(Integer(10))); w
tword: 0123456789

>>> g = w.rauzy_graph(Integer(3)); g

Looped digraph on 8 vertices
>>> WordOptions(identifier='')

>>> g.vertices(sort=True)

[012, 123, 234, 345, 456, 567, 678, 789]

>>> g.edges(sort=True)

[(012, 123, 3), (123, 234, 4), (234, 345, 5), (345, 456, 6), (456, 567, 7), (567, 678, 8), (678, 789, 9)]

>>> from sage.all import *

>>> w = Word('1111111')

>>> g = w.rauzy_graph(Integer(3))

[(word: 111, word: 111, word: 1)]

>>> from sage.all import *

>>> w = Word('1111111')

>>> g = w.rauzy_graph(Integer(3))

[(word: 111, word: 111, word: 1)]

5.1. Comprehensive Module List
sage: w = Word('111')
sage: for i in range(5): w.rauzy_graph(i)  # needs sage.graphs
Looped multi-digraph on 1 vertex
Looped digraph on 1 vertex
Looped digraph on 1 vertex
Looped digraph on 1 vertex
Looped digraph on 0 vertices

Multi-edges are allowed for the empty word:

sage: W = Words('abcde')
sage: w = W('abc')
sage: w.rauzy_graph(0)  # needs sage.graphs
Looped multi-digraph on 1 vertex
sage: _.edges(sort=True)  # needs sage.graphs
[(word: , word: , word: a), (word: , word: , word: b), (word: , word: , word: c)]

reduced_rauzy_graph(n)
Return the reduced Rauzy graph of order n of self.

INPUT:

• n – a non-negative integer. Every vertex of a reduced Rauzy graph of order n is a factor of length n of self.

OUTPUT:

a looped multi-digraph

DEFINITION:

For infinite periodic words (resp. for finite words of type $u^ju[0 : j]$), the reduced Rauzy graph of order $n$
(resp. for $n$ smaller or equal to $(i - 1)|u| + j$) is the directed graph whose unique vertex is the prefix $p$ of length $n$ of $\text{self}$ and which has an only edge which is a loop on $p$ labelled by $w[n + 1 : |w|]p$ where $w$ is the unique return word to $p$.

In other cases, it is the directed graph defined as followed. Let $G_n$ be the Rauzy graph of order $n$ of $\text{self}$. The vertices are the vertices of $G_n$ that are either special or not prolongable to the right or to the left. For each couple $(u, v)$ of such vertices and each directed path in $G_n$ from $u$ to $v$ that contains no other vertices that are special, there is an edge from $u$ to $v$ in the reduced Rauzy graph of order $n$ whose label is the label of the path in $G_n$.

**Note:** In the case of infinite recurrent non-periodic words, this definition corresponds to the following one that can be found in [BDLGZ2009] and [BPS2008] where a simple path is a path that begins with a special factor, ends with a special factor and contains no other vertices that are special:

The reduced Rauzy graph of factors of length $n$ is obtained from $G_n$ by replacing each simple path $P = v_1v_2...v_\ell$ with an edge $v_1v_\ell$ whose label is the concatenation of the labels of the edges of $P$.

**EXAMPLES:**

```sage
sage: w = Word(range(10)); w
word: 0123456789
sage: g = w.reduced_rauzy_graph(3); g
Looped multi-digraph on 2 vertices
sage: g.vertices(sort=True)
[word: 012, word: 789]
sage: g.edges(sort=True)
[(word: 012, word: 789, word: 3456789)]
```

```sage
>>> from sage.all import *
>>> w = Word(range(Integer(10))); w
word: 0123456789
>>> g = w.reduced_rauzy_graph(Integer(3)); g
Looped multi-digraph on 2 vertices
>>> g.vertices(sort=True)
[word: 012, word: 789]
>>> g.edges(sort=True)
[(word: 012, word: 789, word: 3456789)]
```

For the Fibonacci word:

```sage
sage: f = words.FibonacciWord()[100]
sage: g = f.reduced_rauzy_graph(8); g
Looped multi-digraph on 2 vertices
sage: g.vertices(sort=True)
[word: 01001010, word: 01010010]
sage: g.edges(sort=True)
([(word: 01001010, word: 01010010, word: 010),
```
For periodic words:

```
sage: from itertools import cycle
sage: w = Word(cycle('abcd'))[:100]
sage: g = w.reduced_rauzy_graph(3)
# needs sage.graphs
sage: g.edges(sort=True)
# needs sage.graphs
[(word: abc, word: abc, word: dabc)]
```

```
sage: w = Word('111')
sage: for i in range(5): w.reduced_rauzy_graph(i)
# needs sage.graphs
Looped digraph on 1 vertex
Looped digraph on 1 vertex
Looped digraph on 1 vertex
Looped multi-digraph on 1 vertex
Looped multi-digraph on 0 vertices
```

For ultimately periodic words:
sage: sigma = WordMorphism('a->abcd,b->cd,c->cd,d->cd')  
sage: w = sigma.fixed_point('a')[:100]; w  
word: abcdcdcdcdcdcdcdcdcdcdcdcdcdcdcdcdcdcdcd...  
sage: g = w.reduced_rauzy_graph(5)  
(word: abcdc, word: cdcdd)  
[(word: abcdcd, word: cdcdc, word: dc), (word: cdcdc, word: cdcdc, word: dc)]

>>> from sage.all import *  
>>> sigma = WordMorphism('a->abcd,b->cd,c->cd,d->cd')  
>>> w = sigma.fixed_point('a')[:Integer(100)]; w  
word: abcdcdcdcdcdcdcdcdcdcdcdcdcdcdcdcdcdcdcd...  
>>> g = w.reduced_rauzy_graph(Integer(5))  
[word: abcdc, word: cdcdd]  
[(word: abcdcd, word: cdcdc, word: dc), (word: cdcdc, word: cdcdc, word: dc)]

AUTHOR:
Julien Leroy (March 2010): initial version

return_words (fact)
Return the set of return words of fact in self.
This is the set of all factors starting by the given factor and ending just before the next occurrence of this
factor. See [Dur1998] and [HZ1999].

INPUT:
• fact – a non-empty finite word

OUTPUT:
a Python set of finite words

EXAMPLES:
sage: Word('21331233213231').return_words(Word('2'))
{word: 213, word: 21331, word: 233}
sage: Word().return_words(Word('213'))
set()  
sage: Word('12121212').return_words(Word('1212'))
{word: 12}

>>> from sage.all import *  
>>> Word('21331233213231').return_words(Word('2'))
{word: 213, word: 21331, word: 233}
>>> Word().return_words(Word('213'))
set()  
(continues on next page)
>>> Word('121212').return_words(Word('1212'))
{'word': 12}

sage: TM = words.ThueMorseWord()[:1000]
sage: sorted(TM.return_words(Word([0])))
[word: 0, word: 01, word: 011]

>>> from sage.all import *

>>> TM = words.ThueMorseWord()[:Integer(1000)]
>>> sorted(TM.return_words(Word([Integer(0)])))
[word: 0, word: 01, word: 011]

return_words_derivate(fact)
Return the word generated by mapping a letter to each occurrence of the return words for the given factor dropping any dangling prefix and suffix. See for instance [Dur1998].

EXAMPLES:

sage: Word('1213221312313122').return_words_derivate(Word('1'))
word: 123242

>>> from sage.all import *

>>> Word('1213221312313122').return_words_derivate(Word('1'))
word: 123242

rev_lex_less(other)
Return True if the word self is reverse lexicographically less than other.

EXAMPLES:

sage: Word([1,2,4]).rev_lex_less(Word([1,3,2]))
True
sage: Word([3,2,1]).rev_lex_less(Word([1,2,3]))
False

>>> from sage.all import *

>>> Word([Integer(1),Integer(2),Integer(4)]).rev_lex_less(Word([Integer(1),
Integer(3),Integer(2)]))
True
>>> Word([Integer(3),Integer(2),Integer(1)]).rev_lex_less(Word([Integer(1),
Integer(2),Integer(3)]))
False

transform
Return the reversal of self.

EXAMPLES:

sage: Word('124563').reversal()
word: 365421

>>> from sage.all import *

>>> Word('124563').reversal()
word: 365421
rfind(sub, start=0, end=None)

Return the index of the last occurrence of sub in self, such that sub is contained within self[start:end]. Return -1 on failure.

INPUT:

• sub – string, list, tuple or word to search for.
• start – non-negative integer (default: 0) specifying the position at which the search must stop.
• end – non-negative integer (default: None) specifying the position from which to start the search. If None, then the search is performed up to the end of the string.

OUTPUT:

a non-negative integer or -1

EXAMPLES:

sage: w = Word([0,1,0,0,1])
sage: w.rfind(Word([0,1]))
3

>>> from sage.all import *
>>> w = Word([Integer(0),Integer(1),Integer(0),Integer(0),Integer(1)])
>>> w.rfind(Word([Integer(0),Integer(1)]))
3

The sub parameter can also be a list or a tuple:

sage: w.rfind([0,1])
3
sage: w.rfind((0,1))
3

>>> from sage.all import *
>>> w.rfind([Integer(0),Integer(1)])
3
>>> w.rfind((Integer(0),Integer(1)))
3

Examples using the argument start and end:

sage: w.rfind(Word([0,1]), end=4)
0
sage: w.rfind(Word([0,1]), end=5)
3
sage: w.rfind(Word([0,0]), start=2, end=5)
2
sage: w.rfind(Word([0,0]), start=3, end=5)
-1

>>> from sage.all import *
>>> w.rfind(Word([Integer(0),Integer(1)]), end=Integer(4))
0
>>> w.rfind(Word([Integer(0),Integer(1)]), end=Integer(5))
3
>>> w.rfind(Word([Integer(0),Integer(0)]), start=Integer(2), end=Integer(5))
2

(continues on next page)
Instances of \texttt{Word\_str} handle string inputs as well:

\begin{verbatim}
>>> w = Word('abac')
>>> w.rfind('a')
2
>>> w.rfind(Word('a'))
2
>>> w.rfind([0,1])
-1
\end{verbatim}

\texttt{right\_special\_factors}(n=None)\texttt{right\_special\_factors}(n=None)

Return the right special factors (of length \(n\)).

A factor \(u\) of a word \(w\) is right special if there are two distinct letters \(a\) and \(b\) such that \(ua\) and \(ub\) are factors of \(w\).

INPUT:

\begin{itemize}
\item \texttt{n} – integer (default: None). If None, it returns all right special factors.
\end{itemize}

OUTPUT:

a list of words

EXAMPLES:

\begin{verbatim}
>>> w = words.ThueMorseWord()[:30]
for i in range(5):
    ...:     print("{} {}").format(i, sorted(w.right_special_factors(i)))
0 [word: ]
1 [word: 0, word: 1]
2 [word: 01, word: 10]
3 [word: 001, word: 010, word: 101, word: 110]
4 [word: 0110, word: 1001]
\end{verbatim}

\begin{verbatim}
>>> from sage.all import *
>>> w = words.ThueMorseWord()[:Integer(30)]
>>> for i in range(Integer(5)):
...     print("{} {}").format(i, sorted(w.right_special_factors(i)))
0 [word: ]
1 [word: 0, word: 1]
2 [word: 01, word: 10]
3 [word: 001, word: 010, word: 101, word: 110]
4 [word: 0110, word: 1001]
\end{verbatim}
**right_special_factors_iterator** *(n=None)*

Return an iterator over the right special factors (of length n).

A factor \( u \) of a word \( w \) is right special if there are two distinct letters \( a \) and \( b \) such that \( ua \) and \( ub \) are factors of \( w \).

**INPUT:**

- \( n \) – integer (default: None). If None, it returns an iterator over all right special factors.

**EXAMPLES:**

```python
sage: alpha, beta, x = 0.61, 0.54, 0.3
sage: w = words.CodingOfRotationWord(alpha, beta, x)[:40]
sage: sorted(w.right_special_factors_iterator(3))
[word: 010, word: 101]
sage: sorted(w.right_special_factors_iterator(4))
[word: 0101, word: 1010]
sage: sorted(w.right_special_factors_iterator(5))
[word: 00101, word: 11010]
```

```python
>>> from sage.all import *
>>> alpha, beta, x = RealNumber('0.61'), RealNumber('0.54'), RealNumber('0.3')
>>> w = words.CodingOfRotationWord(alpha, beta, x)[:Integer(40)]
>>> sorted(w.right_special_factors_iterator(Integer(3)))
[word: 010, word: 101]
>>> sorted(w.right_special_factors_iterator(Integer(4)))
[word: 0101, word: 1010]
>>> sorted(w.right_special_factors_iterator(Integer(5)))
[word: 00101, word: 11010]
```

**robinson_schensted**

Return the semistandard tableau and standard tableau pair obtained by running the Robinson-Schensted algorithm on `self`.

This can also be done by running `RSK()` on `self`.

**EXAMPLES:**

```python
sage: Word([1,1,3,1,2,3,1]).robinson_schensted()
[[[1, 1, 1, 1, 3], [2], [3]], [[1, 2, 3, 5, 6], [4], [7]]]
```

```python
>>> from sage.all import *
>>> Word([Integer(1),Integer(1),Integer(3),Integer(1),Integer(2),Integer(3),
       Integer(1)]).robinson_schensted()
[[[1, 1, 1, 1, 3], [2], [3]], [[1, 2, 3, 5, 6], [4], [7]]]
```

**schuetzenberger_involution** *(n=None)*

Return the Schützenberger involution of the word `self`, which is obtained by reverting the word and then complementing all letters within the underlying ordered alphabet. If \( n \) is specified, the underlying alphabet is assumed to be \([1, 2, \ldots, n]\). If no alphabet is specified, \( n \) is the maximal letter appearing in `self`.

**INPUT:**

- `self` – a word
- `n` – an integer specifying the maximal letter in the alphabet (optional)

**OUTPUT:**

- a word, the Schützenberger involution of `self`
EXAMPLES:

```
sage: w = Word([9,7,4,1,6,2,3])
sage: v = w.schuetzenberger_involution(); v
word: 7849631
sage: v.parent()
Finite words over Set of Python objects of class 'object'

sage: w = Word([1,2,3],alphabet=[1,2,3,4,5])
sage: v = w.schuetzenberger_involution();v
word: 345
sage: v.parent()
Finite words over {1, 2, 3, 4, 5}

sage: w = Word([1,2,3])
sage: v = w.schuetzenberger_involution(n=5);v
word: 345
sage: v.parent()
Finite words over Set of Python objects of class 'object'

sage: w = Word([11,32,69,2,53,1,2,3,18,41])
sage: w.schuetzenberger_involution()
word: 29,52,67,68,69,17,68,1,38,59

sage: w = Word([],alphabet=[1,2,3,4,5])
sage: w.schuetzenberger_involution()
word:

>>> from sage.all import *
>>> w = Word([Integer(9),Integer(7),Integer(4),Integer(1),Integer(6),
→Integer(2),Integer(3)])
>>> v = w.schuetzenberger_involution(); v
word: 7849631
>>> v.parent()
Finite words over Set of Python objects of class 'object'

>>> w = Word([Integer(1),Integer(2),Integer(3)],alphabet=[Integer(1),
→Integer(2),Integer(3),Integer(4),Integer(5)])
>>> v = w.schuetzenberger_involution();v
word: 345
>>> v.parent()
Finite words over {1, 2, 3, 4, 5}

>>> w = Word([Integer(1),Integer(2),Integer(3)])
>>> v = w.schuetzenberger_involution(n=Integer(5));v
word: 345
>>> v.parent()
Finite words over Set of Python objects of class 'object'

>>> w = Word([Integer(11),Integer(32),Integer(69),Integer(2),Integer(53),
→Integer(1),Integer(2),Integer(3),Integer(18),Integer(41)])
>>> w.schuetzenberger_involution()
word: 29,52,67,68,69,17,68,1,38,59
```

(continues on next page)
Combinatorics, Release 10.4

>>> w = Word([], alphabet=[Integer(1), Integer(2), Integer(3), Integer(4), Integer(5)])
>>> w.schuetzenberger_involution()
word:

>>> w = Word([])
>>> w.schuetzenberger_involution()
word:

**shifted_shuffle** *(other, shift=None)*

Return the combinatorial class representing the shifted shuffle product between words `self` and `other`. This is the same as the shuffle product of `self` with the word obtained from `other` by incrementing its values (i.e. its letters) by the given `shift`.

**INPUT:**

- `other` – finite word over the integers
- `shift` – integer or None (default: None) added to each letter of `other`. When `shift` is None, it is replaced by `self.length()`

**OUTPUT:**

combinatorial class of shifted shuffle products of `self` and `other`

**EXAMPLES:**

```sage
sage: w = Word([0,1,1])
sage: sp = w.shifted_shuffle(w); sp
Shuffle product of word: 011 and word: 344
sage: sp = w.shifted_shuffle(w, 2); sp
Shuffle product of word: 011 and word: 233
sage: sp.cardinality()
20
sage: WordOptions(identifier='')
sage: sp.list()
[011233, 012133, 012313, 012331, 021133, 021313, 021331, 023113, 023131, 023311, 201133, 201313, 201331, 203113, 203131, 203311, 230113, 230131, 230311, 233011]
sage: WordOptions(identifier='word: ')
sage: y = Word('aba')
sage: y.shifted_shuffle(w,2)
Traceback (most recent call last):
... ValueError: for shifted shuffle, words must only contain integers as letters
```

```sage
>> from sage.all import *

>>> w = Word([Integer(0), Integer(1), Integer(1)])
>>> sp = w.shifted_shuffle(w); sp
Shuffle product of word: 011 and word: 344
```

(continues on next page)
shuffle (other, overlap=0)

Return the combinatorial class representing the shuffle product between words self and other. This consists of all words of length self.length()+other.length() that have both self and other as subwords.

If overlap is non-zero, then the combinatorial class representing the shuffle product with overlaps is returned. The calculation of the shift in each overlap is done relative to the order of the alphabet. For example, a shifted by a is b in the alphabet [a, b, c] and 0 shifted by 1 in [0, 1, 2, 3] is 2.

INPUT:

• other – finite word
• overlap – (default: 0) integer or True

OUTPUT:

combinatorial class of shuffle product of self and other

EXAMPLES:

sage: ab = Word("ab")
sage: cd = Word("cd")
sage: sp = ab.shuffle(cd); sp
Shuffle product of word: ab and word: cd
sage: sp.cardinality()
6
sage: sp.list()
[word: abcd, word: acbd, word: acdb, word: cabd, word: cadb, word: cdab]
sage: w = Word([0,1])
sage: u = Word([2,3])
sage: w.shuffle(u)
Shuffle product of word: 01 and word: 01
sage: u.shuffle(u)
Shuffle product of word: 23 and word: 23
sage: w.shuffle(u)
Shuffle product of word: 01 and word: 23
sage: u.shuffle(u)
Shuffle product of word: 23 and word: 23
sage: sp2 = w.shuffle(u,2); sp2
Overlapping shuffle product of word: 01 and word: 23 with 2 overlaps
sage: list(sp2)
[word: 24]
Combinatorics, Release 10.4

(continued from previous page)

```
[w: abcd, w: acbd, w: acdb, w: cabd, w: cadb, w: cdab]
>>> w = Word([Integer(0),Integer(1)])
>>> u = Word([Integer(2),Integer(3)])
>>> w.shuffle(w)
Shuffle product of word: 01 and word: 01
>>> u.shuffle(u)
Shuffle product of word: 23 and word: 23
>>> w.shuffle(u)
Shuffle product of word: 01 and word: 23
>>> sp2 = w.shuffle(u,Integer(2)); sp2
Overlapping shuffle product of word: 01 and word: 23 with 2 overlaps
>>> list(sp2)
[word: 24]
```

`squares()`

Returns a set of all distinct squares of self.

EXAMPLES:

```
sage: sorted(Word('cacao').squares())
[word: , word: caca]
sage: sorted(Word('1111').squares())
[word: , word: 11, word: 1111]
sage: w = Word('00110011010')
sage: sorted(w.squares())
[word: , word: 00, word: 00110011, word: 01100110, word: 1010, word: 11]
```

```from sage.all import *
>>> sorted(Word('cacao').squares())
[word: , word: caca]
``` 

```from sage.all import *
>>> sorted(Word('1111').squares())
[word: , word: 11, word: 1111]
>>> w = Word('00110011010')
>>> sorted(w.squares())
[word: , word: 00, word: 00110011, word: 01100110, word: 1010, word: 11]
```

`standard_factorization()`

Return the standard factorization of self.

The standard factorization of a word \( w \) of length greater than 1 is the factorization \( w = uv \) where \( v \) is the longest proper suffix of \( w \) that is a Lyndon word.

Note that if \( w \) is a Lyndon word of length greater than 1 with standard factorization \( w = uv \), then \( u \) and \( v \) are also Lyndon words and \( u < v \).

See for instance [CFL1958], [Duv1983] and [Lot2002].

INPUT:

- `self` -- finite word of length greater than 1

OUTPUT:

2-tuple \((u, v)\)

EXAMPLES:
Combinatorics, Release 10.4

sage: Words('01')('0010110011').standard_factorization()
(word: 001011, word: 0011)
sage: Words('123')('1223312').standard_factorization()
(word: 12233, word: 12)
sage: Word([3,2,1]).standard_factorization()
(word: 32, word: 1)

>>> from sage.all import *

>>> Words('01')('0010110011').standard_factorization()
(word: 001011, word: 0011)

>>> Words('123')('1223312').standard_factorization()
(word: 12233, word: 12)

>>> Word([Integer(3),Integer(2),Integer(1)]).standard_factorization()
(word: 32, word: 1)

standard_permutation()

Return the standard permutation of the word self on the ordered alphabet. It is defined as the permutation with exactly the same inversions as self. Equivalently, it is the permutation of minimal length whose inverse sorts self.

EXAMPLES:

sage: w = Word('0010110011',alphabet='01')
sage: w.standard_factorization()
(word: 001011, word: 0011)
sage: w = Word('0010110011',alphabet='10')
sage: w.standard_factorization()
(word: 001011001, word: 1)
sage: w = Word('1223312',alphabet='123')
sage: w.standard_factorization()
(word: 12233, word: 12)

>>> from sage.all import *

>>> w = Word('0010110011',alphabet='01')

>>> w.standard_permutation()
[1, 3, 6, 4, 5, 2]

>>> v = Word(p.inverse().action(w)); v
word: 112223

>>> [q for q in Permutations(w.length())
.....: if q.length() <= p.length() and
.....: q.inverse().action(w) == list(v)]
[[1, 3, 6, 4, 5, 2]]
Combinatorics, Release 10.4

(continued from previous page)

\[
\begin{align*}
\text{word: } & 123221 \\
\text{p = w.standard_permutation(); p} & \text{[1, 3, 6, 4, 5, 2]} \\
\text{v = Word(p.inverse().action(w)); v} & \text{word: 112223} \\
\text{[q for q in Permutations(w.length())} & \text{]} \\
& \text{... if q.length() <= p.length() and} \\
& \text{... q.inverse().action(w) == list(v)]} \\
\text{[[1, 3, 6, 4, 5, 2]]}
\end{align*}
\]

sage: w = Words([1,2,3])([1,2,3,2,2,1,2,1]); w
word: 12322121
sage: p = w.standard_permutation(); p
[1, 4, 8, 5, 6, 2, 7, 3]

>> from sage.all import *

>> w = Words([[Integer(1),Integer(2),Integer(3)]])([Integer(1),Integer(2),
\rightarrow Integer(3),Integer(2),Integer(2),Integer(1),Integer(2),Integer(1)]); w
word: 12322121
>> p = w.standard_permutation(); p
[1, 4, 8, 5, 6, 2, 7, 3]
>> Word(p.inverse().action(w))
word: 11122223

sage: w = Words([3,2,1])([1,2,3,2,2,1,2,1]); w
word: 12322121
sage: p = w.standard_permutation(); p
[6, 2, 1, 3, 4, 7, 5, 8]

>> from sage.all import *

>> w = Words('ab')('abbaba'); w
word: ababa
sage: p = w.standard_permutation(); p
[1, 4, 5, 2, 6, 3]

>> from sage.all import *

>> w = Words('ab')('abbaba'); w
word: ababa
>> p = w.standard_permutation(); p

(continues on next page)
sturmian_desubstitute_as_possible()
Sturmian-desubstitute the word self as much as possible.

The finite word self must be defined on a two-letter alphabet or use at most two letters.

It can be Sturmian desubstituted if one letter appears isolated: the Sturmian desubstitution consists in removing one letter per run of the non-isolated letter. The accelerated Sturmian desubstitution consists in removing a run equal to the length of the shortest inner run from any run of the non-isolated letter (including possible leading and trailing runs even if they have shorter length). The (accelerated) Sturmian desubstitution is done as much as possible. A word is a factor of a Sturmian word if, and only if, the result is the empty word.

OUTPUT:
a finite word defined on a two-letter alphabet

EXAMPLES:

sage: u = Word('101111011101110111',alphabet='01') ; u
word: 101111011101110111
sage: v = u.sturmian_desubstitute_as_possible() ; v
word: 01100101
sage: v == v.sturmian_desubstitute_as_possible()
True
sage: Word('azaazaazzaazzaazzaaz', alphabet='az').sturmian_desubstitute_as_possible()
word:
subword_complementaries (other)

Return the possible complementaries other minus self if self is a subword of other (empty list otherwise). The complementary is made of all the letters that are in other once we removed the letters of self. There can be more than one.

To check whether self is a subword of other (without knowing its complementaries), use self. is_subword_of(other), and to count the number of occurrences of self in other, use other. number_of_subword_occurrences(self).

INPUT:

- other – finite word

OUTPUT:

- list of all the complementary subwords of self in other.

EXAMPLES:

```python
sage: Word('tamtam').subword_complementaries(Word('ta'))
[]

sage: Word('mtam').subword_complementaries(Word('tamtam'))
[word: tam]

sage: Word('ta').subword_complementaries(Word('tamtam'))
[word: mtam, word: amtm, word: tamm]

sage: Word('a').subword_complementaries(Word('a'))
[word: ]
```

```python
>>> from sage.all import *

>>> Word('tamtam').subword_complementaries(Word('ta'))
[]

>>> Word('mtam').subword_complementaries(Word('tamtam'))
[word: tam]

>>> Word('ta').subword_complementaries(Word('tamtam'))
[word: mtam, word: amtm, word: tamm]

>>> Word('a').subword_complementaries(Word('a'))
[word: ]
```

suffix_tree()

Alias for implicit_suffix_tree().

EXAMPLES:

```python
sage: Word('abbabaab').suffix_tree()
 Implicit Suffix Tree of the word: abbabaab
```
from sage.all import *

Word('abbabaab').suffix_tree()

Implicit Suffix Tree of the word: abbabaab

suffix_trie()

Return the suffix trie of self.

The suffix trie of a finite word $w$ is a data structure representing the factors of $w$. It is a tree whose edges are labelled with letters of $w$, and whose leaves correspond to suffixes of $w$.

Type sage.combinat.words.suffix_trees.SuffixTrie? for more information.

EXAMPLES:

sage: w = Word("cacao")
sage: w.suffix_trie()
Suffix Trie of the word: cacao

sage: w = Word([0,1,0,1,1])
sage: w.suffix_trie()
Suffix Trie of the word: 01011

sage: w = Word([Integer(0),Integer(1),Integer(0),Integer(1),Integer(1)])
sage: w.suffix_trie()
Suffix Trie of the word: 01011

swap(i, j=None)

Return the word $w$ with entries at positions $i$ and $j$ swapped. By default, $j = i+1$.

EXAMPLES:

sage: Word([1,2,3]).swap(0,2)
word: 321
sage: Word([1,2,3]).swap(1)
word: 132
sage: Word("abba").swap(1,-1)
word: aabb

>>> from sage.all import *

>>> Word([Integer(1),Integer(2),Integer(3)]).swap(Integer(0),Integer(2))
word: 321

>>> Word([Integer(1),Integer(2),Integer(3)]).swap(Integer(1))
word: 132

>>> Word("abba").swap(Integer(1),-Integer(1))
word: aabb

swap_decrease(i)

Return the word with positions $i$ and $i+1$ exchanged if $self[i] < self[i+1]$. Otherwise, it returns self.

EXAMPLES:
sage: w = Word([1,3,2])
sage: w.swap_decrease(0)
word: 312
sage: w.swap_decrease(1)
word: 132
sage: w.swap_decrease(1) is w
True
sage: Words("ab")("abba").swap_decrease(0)
word: baba
sage: Words("ba")("abba").swap_decrease(0)
word: abba

```python
>>> from sage.all import *
>>> w = Word([Integer(1),Integer(3),Integer(2)])
>>> w.swap_decrease(Integer(0))
word: 312
>>> w.swap_decrease(Integer(1))
word: 132
>>> w.swap_decrease(Integer(1)) is w
True
>>> Words("ab")("abba").swap_decrease(Integer(0))
word: baba
>>> Words("ba")("abba").swap_decrease(Integer(0))
word: abba
```

swap_increase(i)
Return the word with positions i and i+1 exchanged if self[i] > self[i+1]. Otherwise, it returns self.

EXAMPLES:

```python
sage: w = Word([1,3,2])
sage: w.swap_increase(1)
word: 123
sage: w.swap_increase(0)
word: 132
sage: w.swap_increase(0) is w
True
sage: Words("ab")("abba").swap_increase(0)
word: abba
sage: Words("ba")("abba").swap_increase(0)
word: baba

```
Return a list of integers from $[0, 1, \ldots, \text{self.length()-1}]$ in the same relative order as the letters in \texttt{self} in the parent.

**EXAMPLES:**

```python
sage: from itertools import count
sage: w = Word('abbabaab')
sage: w.to_integer_list()
[0, 1, 1, 0, 1, 0, 0, 1]
sage: w = Word(iter("cacao"), length="finite")
sage: w.to_integer_list()
[1, 0, 1, 0, 2]
sage: w = Words([Integer(3),Integer(2),Integer(1)])([Integer(2),Integer(3),
    Integer(1)])
sage: w.to_integer_list()
[1, 0, 0, 2]
```

```
>>> from sage.all import *
>>> from itertools import count

>>> w = Word('abbabaab')

>>> w.to_integer_word()
word: 01101001

>>> w = Word(iter("cacao"), length="finite")

>>> w.to_integer_word()
word: 10102

>>> w = Words([Integer(3),Integer(2),Integer(1)])([Integer(2),Integer(3),
    Integer(1)])

>>> w.to_integer_word()
word: 1002
```

\texttt{to_integer_word()} 
Return a word over the alphabet $[0, 1, \ldots, \text{self.length()-1}]$ whose letters are in the same relative order as the letters of \texttt{self} in the parent.

**EXAMPLES:**

```python
sage: from itertools import count
sage: w = Word('abbabaab')
sage: w.to_integer_word()
word: 01101001

sage: w = Word(iter("cacao"), length="finite")
sage: w.to_integer_word()
word: 10102

sage: w = Words([3,2,1])([2,3,3,1])
sage: w.to_integer_word()
word: 1002
```
to_monoid_element()

Return self as an element of the free monoid with the same alphabet as self.

EXAMPLES:

```python
sage: w = Word('aabb')
sage: w.to_monoid_element()
a^2*b^2
sage: W = Words('abc')
sage: w = W(w)
sage: w.to_monoid_element()
a^2*b^2
```

to_ordered_set_partition()

Return the ordered set partition corresponding to self.

If \( w \) is a finite word of length \( n \), then the corresponding ordered set partition is an ordered set partition \( (P_1, P_2, \ldots, P_k) \) of \( \{1, 2, \ldots, n\} \), where each block \( P_i \) is the set of positions at which the \( i \)-th smallest letter occurring in \( w \) occurs in \( w \).

EXAMPLES:

```python
sage: w = Word('ababaab')
sage: w.to_ordered_set_partition()=[[1, 4, 6, 7], [2, 3, 5, 8]]
sage: W = Word([-10, 3, -10, 2]).to_ordered_set_partition()=[[1, 3], [4], [2]]
sage: W = Word([]).to_ordered_set_partition()[]
sage: Word('aaaaa').to_ordered_set_partition()=[[1, 2, 3, 4, 5]]
```

```python
>>> from sage.all import *

>>> w = Word('ababaab')
>>> w.to_ordered_set_partition()=[[1, 4, 6, 7], [2, 3, 5, 8]]
>>> W = Word([-Integer(10), Integer(3), -Integer(10), Integer(2)]).to_ordered_set_partition()=[[1, 3], [4], [2]]
>>> W = Word([]).to_ordered_set_partition()[]
>>> Word('aaaaa').to_ordered_set_partition()=[[1, 2, 3, 4, 5]]
```
**topological_entropy** \((n)\)

Return the topological entropy for the factors of length \(n\).

The topological entropy of a sequence \(u\) is defined as the exponential growth rate of the complexity of \(u\) as the length increases: 
\[
H_{\text{top}}(u) = \lim_{n \to \infty} \frac{\log(p_u(n))}{n}
\]
where \(d\) denotes the cardinality of the alphabet and \(p_u(n)\) is the complexity function, i.e. the number of factors of length \(n\) in the sequence \(u\) [Fog2002].

**INPUT:**

- **self** – a word defined over a finite alphabet
- **n** – positive integer

**OUTPUT:**

real number (a symbolic expression)

**EXAMPLES:**

```python
sage: W = Words([0, 1])
sage: w = W([0, 1, 0, 0, 0, 1, 1, 0, 0, 1, 0, 1])
sage: t = w.topological_entropy(3); t  # needs sage.symbolic
1/3*log(7)/log(2)
sage: n(t)  # needs sage.symbolic
0.935784974019201

sage: W = Words([Integer(0), Integer(1)])
sage: w = W([Integer(0), Integer(1), Integer(0), Integer(0), Integer(1), Integer(1), Integer(0), Integer(1), Integer(0), Integer(1)])
sage: t = w.topological_entropy(Integer(3)); t  # needs sage.symbolic
1/3*log(7)/log(2)
sage: n(t)  # needs sage.symbolic
0.935784974019201
```

```python
>>> from sage.all import *

>>> W = Words([Integer(0), Integer(1)])
>>> w = W([Integer(0), Integer(1), Integer(0), Integer(0), Integer(1), Integer(1), Integer(0), Integer(1), Integer(0), Integer(1)])

>>> t = w.topological_entropy(Integer(3)); t  # needs sage.symbolic
1/3*log(7)/log(2)

>>> n(t)  # needs sage.symbolic
0.935784974019201
```

```python
sage: w = words.ThueMorseWord()[:100]
sage: topo = w.topological_entropy
sage: for i in range(0, 41, 5):  # needs sage.symbolic
    ....:     print("{} {}\n0 1.0000
5 0.71699
10 0.48074
15 0.36396
20 0.28774
25 0.23628
30 0.20075
35 0.17270
40 0.14827
```

```python
>>> from sage.all import *

>>> w = words.ThueMorseWord()[:Integer(100)]
>>> topo = w.topological_entropy
>>> for i in range(Integer(0), Integer(41), Integer(5)):  ...
```

(continues on next page)
If no alphabet is specified, an error is raised:

```
sage: w = Word(range(20))
sage: w.topological_entropy(3)
Traceback (most recent call last):
...  
TypeError: The word must be defined over a finite alphabet
```

The following is ok:

```
sage: W = Words(range(20))
sage: w = W(range(20))
sage: w.topological_entropy(3)  # needs sage.symbolic
1/3*log(18)/log(20)
```

```
>>> from sage.all import *
>>> W = Words(range(Integer(20)))
>>> w = W(range(Integer(20)))
>>> w.topological_entropy(Integer(3))  # needs sage.symbolic
1/3*log(18)/log(20)
```

`sage.combinat.words.finite_word.evaluation_dict(w)`

Return a dictionary keyed by the letters occurring in \( w \) with values the number of occurrences of the letter.

**INPUT:**

- \( w \) — a word

`sage.combinat.words.finite_word.word_to_ordered_set_partition(w)`

Return the ordered set partition corresponding to a finite word \( w \).

If \( w \) is a finite word of length \( n \), then the corresponding ordered set partition is an ordered set partition \((P_1, P_2, \ldots, P_k)\) of \( \{1, 2, \ldots, n\} \), where each block \( P_i \) is the set of positions at which the \( i \)-th smallest letter occurring in \( w \) occurs in \( w \). (Positions are 1-based.)

This is the same functionality that `to_ordered_set_partition()` provides, but without the wrapping: The
input $w$ can be given as a list or tuple, not necessarily as a word; and the output is returned as a list of lists (which are the blocks of the ordered set partition in increasing order), not as an ordered set partition.

EXÁMPLES:

```python
sage: from sage.combinat.words.finite_word import word_to_ordered_set_partition
sage: word_to_ordered_set_partition([3, 6, 3, 1])
[[4], [1, 3], [2]]
sage: word_to_ordered_set_partition((1, 3, 3, 7))
[[1], [2, 3], [4]]
sage: word_to_ordered_set_partition("noob")
[[4], [1], [2, 3]]
sage: word_to_ordered_set_partition(Word("hell"))
[[2], [1], [3, 4]]
sage: word_to_ordered_set_partition([1])
[[1]]
sage: word_to_ordered_set_partition([])
[]
```

5.1.359 Infinite word

AUTHORS:

• Sebastien Labbe

• Franco Saliola

EXAMPLES:

Creation of an infinite word

Periodic infinite words:

```python
sage: v = Word([0, 4, 8, 8, 3])
sage: vv = v^Infinity
sage: vv
word: 0488304883048830488304883048830488304883...
```
Infinite words from a function \( f : \mathbb{N} \to A \) over an alphabet \( A \):

```
sage: Word(lambda n: n%3)
word: 0120120120120120120120120120120120120120...
```

```
sage: def t(n):
....:     return add(Integer(n).digits(base=2)) % 2
sage: Word(t, alphabet=[0, 1])
word: 0110100110100110011010011001101011...
```

or as a one-liner:

```
sage: Word(lambda n : add(Integer(n).digits(base=2)) % 2, alphabet=[0, 1])
word: 0110100110100110011010011001101011...
```

Infinite words from iterators:

```
sage: from itertools import count, repeat
sage: Word( repeat(4) )
word: 444444444444444444444444444444444...
```

```
sage: Word( count() )
word: 0,1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,17,18,19,20,21,22,23,24,25,26,27,28,29,30,31,32,33,34,35,36,37,38,39,...
```

```
sage: from itertools import count, repeat
sage: Word( repeat(Integer(4)) )
word: 444444444444444444444444444444444...
```

```
sage: Word( count() )
word: 0,1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,17,18,19,20,21,22,23,24,25,26,27,28,29,30,31,32,33,34,35,36,37,38,39,...
```

Infinite words from morphism

For example, let \( A = \{a, b\} \) and \( \mu : A^* \to A^* \) be the morphism defined by \( a \mapsto ab, b \mapsto ba \):
Combinatorics, Release 10.4

sage: mu = WordMorphism( a->ab,b->ba ); mu
WordMorphism: a->ab, b->ba
sage: mu.fixed_point( a )
word: abbabaabbaababbabaababbaabbabaabbaababba...
>>> from sage.all import *
>>> mu = WordMorphism( a->ab,b->ba ); mu
WordMorphism: a->ab, b->ba
>>> mu.fixed_point( a )
word: abbabaabbaababbabaababbaabbabaabbaababba...

Infinite words in a specific combinatorial class:
sage: W = InfiniteWords("ab"); W
Infinite words over { a , b }
sage: f = lambda n : a if n % 2 == 1 else b
sage: W(f)
word: babababababababababababababababababababa...
>>> from sage.all import *
>>> W = InfiniteWords("ab"); W
Infinite words over { a , b }
>>> f = lambda n : a if n % Integer(2) == Integer(1) else
>>> W(f)
word: babababababababababababababababababababa...

b

class sage.combinat.words.infinite_word.InfiniteWord_class
Bases: Word_class
length()
Returns the length of self.
EXAMPLES:
sage: f = lambda n : n % 6
sage: w = Word(f); w
word: 0123450123450123450123450123450123450123...
sage: w.length()
+Infinity
>>> from sage.all import *
>>> f = lambda n : n % Integer(6)
>>> w = Word(f); w
word: 0123450123450123450123450123450123450123...
>>> w.length()
+Infinity

5826

Chapter 5. Comprehensive Module List


5.1.360 Lyndon words

`sage.combinat.words.lyndon_word.LyndonWord(data, check=True)`

Construction of a Lyndon word.

**INPUT:**
- data – list
- check – bool (default: True) if True, check that the input data represents a Lyndon word.

**OUTPUT:**
A Lyndon word.

**EXAMPLES:**

```python
sage: LyndonWord([1,2,2])
word: 122
sage: LyndonWord([1,2,3])
word: 123
sage: LyndonWord([2,1,2,3])
Traceback (most recent call last):
...
ValueError: not a Lyndon word
```

If `check` is `False`, then no verification is done:

```python
sage: LyndonWord([2,1,2,3], check=False)
word: 2123
```

`sage.combinat.words.lyndon_word.LyndonWords(e=None, k=None)`

Return the combinatorial class of Lyndon words.

A Lyndon word \( w \) is a word that is lexicographically less than all of its rotations. Equivalently, whenever \( w \) is split into two non-empty substrings, \( w \) is lexicographically less than the right substring.

See Wikipedia article Lyndon_word

**INPUT:**
- no input at all
  - or
  - \( e \) – integer, size of alphabet
k – integer, length of the words

or

• e – a composition

OUTPUT:

A combinatorial class of Lyndon words.

EXAMPLES:

```python
sage: LyndonWords()
Lyndon words

>>> from sage.all import *
>>> LyndonWords()
Lyndon words

If e is an integer, then e specifies the length of the alphabet; k must also be specified in this case:

```python
sage: LW = LyndonWords(3, 4); LW
Lyndon words from an alphabet of size 3 of length 4
sage: LW.first()
word: 1112
sage: LW.last()
word: 2333
sage: LW.random_element()  # random
word: 1232
sage: LW.cardinality()  #...
18

>>> from sage.all import *
>>> LyndonWords(Integer(3), Integer(4)); LW
Lyndon words from an alphabet of size 3 of length 4
>>> LW.first()
word: 1112
>>> LW.last()
word: 2333
>>> LW.random_element()  # random
word: 1232
>>> LW.cardinality()  #...
18

If e is a (weak) composition, then it returns the class of Lyndon words that have evaluation e:

```python
sage: LyndonWords([2, 0, 1]).list()
[word: 113]
sage: LyndonWords([2, 0, 1, 0, 1]).list()
[word: 1135, word: 1153, word: 1315]
sage: LyndonWords([2, 1, 1]).list()
[word: 1123, word: 1132, word: 1213]

>>> from sage.all import *
>>> LyndonWords([Integer(2), Integer(0), Integer(1)]).list()
```

(continues on next page)
class sage.combinat.words.lyndon_word.LyndonWords_class(alphabet=None)
    Bases: UniqueRepresentation, Parent
    
    The set of all Lyndon words.

class sage.combinat.words.lyndon_word.LyndonWords_evaluation(e)
    Bases: UniqueRepresentation, Parent
    
    The set of Lyndon words on a fixed multiset of letters.
    EXAMPLES:

    sage: L = LyndonWords([1,2,1])
    sage: L
    Lyndon words with evaluation [1, 2, 1]
    sage: L.list()
    [word: 1223, word: 1232, word: 1322]

    >>> from sage.all import *
    >>> L = LyndonWords([Integer(1),Integer(2),Integer(1)])
    >>> L
    Lyndon words with evaluation [1, 2, 1]
    >>> L.list()
    [word: 1223, word: 1232, word: 1322]

    cardinality()
    
    Return the number of Lyndon words with the evaluation e.
    EXAMPLES:

    sage: LyndonWords([]).cardinality()
    0
    sage: LyndonWords([2,2]).cardinality() # needs sage.libs.pari
    1
    sage: LyndonWords([2,3,2]).cardinality() # needs sage.libs.pari
    30

    >>> from sage.all import *
    >>> LyndonWords([]).cardinality()
    0
    >>> LyndonWords([Integer(2),Integer(2)]).cardinality() # needs sage.libs.pari
    1
    >>> LyndonWords([Integer(2),Integer(3),Integer(2)]).cardinality() # needs sage.libs.pari
    30

    Check to make sure that the count matches up with the number of Lyndon words generated:
```python
sage: comps = [[],[2,2],[3,2,7],[4,2]] + Compositions(4).list()

sage: lws = [LyndonWords(comp) for comp in comps]

sage: all(lw.cardinality() == len(lw.list()) for lw in lws)  # needs sage.libs.pari
True
```

```python
>>> from sage.all import *

>>> comps = [[],[Integer(2),Integer(2)], [Integer(3),Integer(2),Integer(7)],
   [Integer(4),Integer(2)] ] + Compositions(Integer(4)).list()

>>> lws = [LyndonWords(comp) for comp in comps]

>>> all(lw.cardinality() == len(lw.list()) for lw in lws)  # needs sage.libs.pari
True
```

class sage.combinat.words.lyndon_word.LyndonWords_nk(n, k)

Bases: UniqueRepresentation, Parent

Lyndon words of fixed length $k$ over the alphabet \{1, 2, \ldots, n\}.

INPUT:

- $n$ – the size of the alphabet
- $k$ – the length of the words

EXAMPLES:

```python
sage: L = LyndonWords(3, 4)
sage: L.list()
[word: 1112,
 word: 1113,
 word: 1122,
 word: 1123,
... word: 1333,
 word: 2223,
 word: 2233,
 word: 2333]
```

```python
>>> from sage.all import *

>>> L = LyndonWords(Integer(3), Integer(4))

>>> L.list()
[word: 1112,
 word: 1113,
 word: 1122,
 word: 1123,
... word: 1333,
 word: 2223,
 word: 2233,
 word: 2333]
```

cardinality()

sage.combinat.words.lyndon_word.StandardBracketedLyndonWords(n, k)

Return the combinatorial class of standard bracketed Lyndon words from \{1, \ldots, n\} of length $k$.

These are in one to one correspondence with the Lyndon words and form a basis for the subspace of degree $k$ of the free Lie algebra of rank $n$.  

Chapter 5. Comprehensive Module List
EXAMPLES:

```python
sage: SBLW33 = StandardBracketedLyndonWords(3,3); SBLW33
Standard bracketed Lyndon words from an alphabet of size 3 of length 3
sage: SBLW33.first()
[1, [1, 2]]
sage: SBLW33.last()
[[2, 3], 3]
sage: SBLW33.cardinality()
8
sage: SBLW33.random_element() in SBLW33
True
```

```python
>>> from sage.all import *
>>> SBLW33 = StandardBracketedLyndonWords(Integer(3),Integer(3)); SBLW33
Standard bracketed Lyndon words from an alphabet of size 3 of length 3
>>> SBLW33.first()
[1, [1, 2]]
>>> SBLW33.last()
[[2, 3], 3]
>>> SBLW33.cardinality()
8
>>> SBLW33.random_element() in SBLW33
True
```

class sage.combinat.words.lyndon_word.StandardBracketedLyndonWords_nk(n, k)

Bases: UniqueRepresentation, Parent
cardinality()

EXAMPLES:

```python
sage: StandardBracketedLyndonWords(3, 3).cardinality()
8
sage: StandardBracketedLyndonWords(3, 4).cardinality()
18
```

```python
>>> from sage.all import *
>>> StandardBracketedLyndonWords(Integer(3), Integer(3)).cardinality()
8
>>> StandardBracketedLyndonWords(Integer(3), Integer(4)).cardinality()
18
```

sage.combinat.words.lyndon_word.standard_bracketing(lw)

Return the standard bracketing of a Lyndon word lw.

EXAMPLES:

```python
sage: import sage.combinat.words.lyndon_word as lyndon_word
sage: [lyndon_word.standard_bracketing(u) for u in LyndonWords(3,3)]
[[[1, [1, 2]],
  [1, [1, 3]],
  [[1, 2], 2]],
 [1, [2, 3]],
 [[1, 3], 2],
 [[1, 3], 3],
 [[2, [2, 3]],
  [[2, 3], 3]]
```
```python
>>> from sage.all import *
>>> import sage.combinat.words.lyndon_word as lyndon_word

>>> [lyndon_word.standard_bracketing(u) for u in LyndonWords(Integer(3), Integer(3))]
[[1, [1, 2]],
 [1, [1, 3]],
 [[1, 2], 2],
 [1, [2, 3]],
 [[1, 3], 2],
 [[1, 3], 3],
 [2, [2, 3]],
 [[2, 3], 3]]
```

```python
sage.combinat.words.lyndon_word.standard_unbracketing(sblw)
```

Return flattened sblw if it is a standard bracketing of a Lyndon word, otherwise raise an error.

EXAMPLES:

```python
sage: from sage.combinat.words.lyndon_word import standard_unbracketing
sage: standard_unbracketing([1, [2, 3]])
word: 123
sage: standard_unbracketing([[1, 2], 3])
Traceback (most recent call last):
  ...
ValueError: not a standard bracketing of a Lyndon word
```

```python
>>> from sage.all import *
>>> from sage.combinat.words.lyndon_word import standard_unbracketing

>>> standard_unbracketing([Integer(1), [Integer(2), Integer(3)]])
word: 123
>>> standard_unbracketing([[Integer(1), Integer(2)], Integer(3)])
Traceback (most recent call last):
  ...
ValueError: not a standard bracketing of a Lyndon word
```

### 5.1.361 Word morphisms/substitutions

This module implements morphisms over finite and infinite words.

**AUTHORS:**

- Sébastien Labbé (2007-06-01): initial version
- Sébastien Labbé (2008-07-01): merged into sage-words
- Sébastien Labbé (2008-12-17): merged into sage
- Sébastien Labbé (2009-02-03): words next generation
- Stepan Starosta (2012-11-09): growing letters

**EXAMPLES:**

Creation of a morphism from a dictionary or a string:

```python
sage: n = WordMorphism({0:[0,2,2,1],1:[0,2],2:[2,2,1]})
```
```python
>>> from sage.all import *
>>> n = WordMorphism({Integer(0): [Integer(0), Integer(2), Integer(2), Integer(1)],
                  Integer(1): [Integer(0), Integer(2)],
                  Integer(2): [Integer(2), Integer(2), Integer(1)]})
```

```python
sage: m = WordMorphism('x->xyxsxss, s->xyss, y->ys')
```

```python
>>> from sage.all import *
>>> m = WordMorphism('x->xyxsxss, s->xyss, y->ys')
```

```python
sage: n
WordMorphism: 0->0221, 1->02, 2->221
sage: m
WordMorphism: s->xyss, x->xyxsxss, y->ys
```

```python
>>> from sage.all import *
>>> m = WordMorphism('x->xyxsxss, s->xyss, y->ys')
```

```python
The codomain may be specified:
```
```python
sage: WordMorphism({0:[0,2,2,1],1:[0,2],2:[2,2,1]}, codomain=Words([0,1,2,3,4]))
WordMorphism: 0->0221, 1->02, 2->221
```

```python
>>> from sage.all import *
>>> WordMorphism({Integer(0): [Integer(0), Integer(2), Integer(2), Integer(1)],
                  Integer(1): [Integer(0), Integer(2)],
                  Integer(2): [Integer(2), Integer(2), Integer(1)]},
                  codomain=Words([Integer(0), Integer(1), Integer(2), Integer(3), Integer(4)]))
WordMorphism: 0->0221, 1->02, 2->221
```

```python
Power of a morphism:
```
```python
sage: n^2
WordMorphism: 0->022122122102, 1->0221221, 2->22122102
```

```python
>>> from sage.all import *
>>> n**Integer(2)
>>> n**Integer(2)
```

```python
Image under a morphism:
```
```python
sage: m('y')
word: ys
sage: m('xxyxy')
word: xyxsxssxyxsxssxyxsxssxyxsxssxyxsxssxyss
```

```python
>>> from sage.all import *
>>> m('y')
>>> m('xxyxy')
```

```python
Iterated image under a morphism:
```
```python
5.1. Comprehensive Module List 5833
```
Combinatorics, Release 10.4

```python
sage: m('y', 3)
word: ysxyssxyxsxsxsxxssxyss
```

```python
globals() = \*

m('y', Integer(3))
word: ysxyssxyxsxsxsxxssxyss
```

See more examples in the documentation of the call method (m.__call__).

Infinite fixed point of morphism:

```python
sage: fix = m.fixed_point('x')
sage: fix
word: xyxsxssysxyxsxssxyxsxssxyssxyssxys ...
sage: fix.length()
+Infinity
```

```python
from sage.all import *

fix = m.fixed_point('x')

fix
word: xyxsxssysxyxsxssxyxsxssxyxsxssxyssxys ...

fix.length()
+Infinity
```

Incidences matrix:

```python
sage: matrix(m)  # needs sage.modules
[2 3 1]
[1 3 0]
[1 1 1]
```

```python
from sage.all import *

matrix(m)  # needs sage.modules
[2 3 1]
[1 3 0]
[1 1 1]
```

Many other functionalities…:

```python
sage: m.is_identity()
False
sage: m.is_endomorphism()
True
```

```python
from sage.all import *

m.is_identity()
False

m.is_endomorphism()
True
```

```python
class sage.combinat.words.morphism.PeriodicPointIterator(m, cycle)
    Bases: object

    (Lazy) constructor of the periodic points of a word morphism.
```
This class is mainly used in `WordMorphism.periodic_point` and `WordMorphism.periodic_points`.

EXAMPLES:

```python
sage: from sage.combinat.words.morphism import PeriodicPointIterator
sage: s = WordMorphism('a->bacca,b->cba,c->aab')
sage: p = PeriodicPointIterator(s, ['a','b','c'])
sage: p._cache[0]
lazy list ['a', 'a', 'b', '...]
sage: p._cache[1]
lazy list ['b', 'a', 'c', '...]
sage: p._cache[2]
lazy list ['c', 'b', 'a', '...]
```

```python
>>> from sage.all import *
>>> from sage.combinat.words.morphism import PeriodicPointIterator
>>> s = WordMorphism('a->bacca,b->cba,c->aab')
>>> p = PeriodicPointIterator(s, ['a','b','c'])
>>> p._cache[Integer(0)]
lazy list ['a', 'a', 'b', '...]
>>> p._cache[Integer(1)]
lazy list ['b', 'a', 'c', '...]
>>> p._cache[Integer(2)]
lazy list ['c', 'b', 'a', '...]
```

```python
def get_iterator(i):
    Internal method.

    EXAMPLES:

```python
sage: from sage.combinat.words.morphism import PeriodicPointIterator
sage: s = WordMorphism('a->bacca,b->cba,c->aab')
sage: p = PeriodicPointIterator(s, ['a','b','c'])
sage: p.get_iterator(0)
<generator object ...get_iterator at ...>
```

```python
>>> from sage.all import *
>>> from sage.combinat.words.morphism import PeriodicPointIterator
>>> s = WordMorphism('a->bacca,b->cba,c->aab')
>>> p = PeriodicPointIterator(s, ['a','b','c'])
>>> p.get_iterator(Integer(0))
<generator object ...get_iterator at ...>
```

```python
class sage.combinat.words.morphism.WordMorphism(data=None, domain=None, codomain=None)

Bases: SageObject

WordMorphism class

INPUT:

- `data` – dict or str or an instance of `WordMorphism`, the map giving the image of letters
- `domain` – (optional: None) set of words over a given alphabet. If None, the domain alphabet is computed from data and is sorted.
- `codomain` – (optional: None) set of words over a given alphabet. If None, the codomain alphabet is computed from data and is sorted.
```
**Note:** When the domain or the codomain are not explicitly given, it is expected that the letters are comparable because the alphabets of the domain and of the codomain are sorted.

### EXAMPLES:

From a dictionary:

```python
sage: n = WordMorphism({0:[0,2,2,1], 1:[0,2], 2:[2,2,1]})
sage: n
WordMorphism: 0->0221, 1->02, 2->221
```

```python
>>> from sage.all import *

>>> n = WordMorphism({Integer(0):[Integer(0),Integer(2),Integer(2),Integer(1)],
                   1:[Integer(0),Integer(2)],
                   2:[Integer(2),Integer(2),Integer(1)]})

>>> n
WordMorphism: 0->0221, 1->02, 2->221
```

From a string with `->` as separation:

```python
sage: m = WordMorphism('x->xyxsxss, s->xyss, y->ys')
sage: m
WordMorphism: s->xyss, x->xyxsxss, y->ys
```

```python
>>> from sage.all import *

>>> m = WordMorphism('x->xyxsxss, s->xyss, y->ys')

>>> m
WordMorphism: s->xyss, x->xyxsxss, y->ys
```

Specifying the domain and codomain:

```python
sage: W = FiniteWords([0,1,2])
sage: d = {0:[0,1], 1:[0,1,0], 2:[0]}
sage: m = WordMorphism(d, domain=W, codomain=W)
sage: m([0]).parent()
Finite words over (0, 1, 2)
```

```python
>>> from sage.all import *

>>> W = FiniteWords([Integer(0),Integer(1),Integer(2)])

>>> d = {Integer(0):[Integer(0),Integer(1)],
       1:[Integer(0),Integer(1),
          Integer(0)],
       2:[Integer(0)]}

>>> m = WordMorphism(d, domain=W, codomain=W)

>>> m([Integer(0)]).parent()
Finite words over (0, 1, 2)
```

When the alphabet is non-sortable, the domain and/or codomain must be explicitly given:
\begin{verbatim}
sage: W = FiniteWords(['a','6'])
sage: d = {'a': ['a', '6', 'a'], '6': [6, 6, 'a']}
sage: WordMorphism(d, domain=W, codomain=W)
WordMorphism: 6->666a, a->a6a
>>> from sage.all import *
>>> W = FiniteWords(['a',Integer(6)])
>>> d = {'a': ['a',Integer(6), 'a'], Integer(6):[Integer(6),Integer(6),Integer(6), 'a '→']}
>>> WordMorphism(d, domain=W, codomain=W)
WordMorphism: 6->666a, a->a6a
\end{verbatim}

\textbf{abelian_rotation_subspace()}

Return the subspace on which the incidence matrix of \texttt{self} acts by roots of unity.

\textbf{EXAMPLES:}

\begin{verbatim}
sage: # needs sage.modules
d = WordMorphism('0->1,1->0').abelian_rotation_subspace()
Vector space of degree 2 and dimension 2 over Rational Field
Basis matrix:
[1 0]
[0 1]
sage: WordMorphism('0->01,1->10').abelian_rotation_subspace()
Vector space of degree 2 and dimension 0 over Rational Field
Basis matrix:
[]
sage: WordMorphism('0->01,1->1').abelian_rotation_subspace()
Vector space of degree 2 and dimension 1 over Rational Field
Basis matrix:
[0 1]
sage: WordMorphism('1->122,2->211').abelian_rotation_subspace()
Vector space of degree 2 and dimension 1 over Rational Field
Basis matrix:
[ 1 -1]
sage: WordMorphism('0->1,1->102,2->3,3->4,4->2').abelian_rotation_subspace()
Vector space of degree 5 and dimension 3 over Rational Field
Basis matrix:
[0 0 1 0 0]
[0 0 0 1 0]
[0 0 0 0 1]
\end{verbatim}

(continues on next page)
WordMorphism(1->122,2->211).abelian_rotation_subspace()
Vector space of degree 2 and dimension 1 over Rational Field
Basis matrix:
[ 1 -1]

WordMorphism(0->1,1->102,2->3,3->4,4->2).abelian_rotation_subspace()
Vector space of degree 5 and dimension 3 over Rational Field
Basis matrix:
[0 0 1 0]
[0 0 0 1]

The domain needs to be equal to the codomain:

```python
def abelian_rotation_subspace(self):
    domain = self.codomain()
    codomain = self.domain()
    if domain != codomain:
        raise ValueError("domain and codomain must be equal")
    else:
        # remaining code...
```

**codomain()**

Return the codomain of self.

**EXAMPLES:**

```python
sage: m = WordMorphism('a->abcde')
sage: m.codomain()
Finite words over {a, b, c, d, e}
```

**conjugate**(pos)

Return the morphism where the image of the letter by self is conjugated of parameter pos.

**INPUT:**

- pos – integer

**EXAMPLES:**

```python
sage: m = WordMorphism('a->abcde')
sage: m.conjugate(0) == m
True
sage: m.conjugate(1)
WordMorphism: a->bcdea
```
Combinatorics, Release 10.4

sage: m.conjugate(3)
WordMorphism: a->deabc
sage: W = WordMorphism('').conjugate(4)
WordMorphism:
sage: m = WordMorphism('a->abcde,b->xyz')
sage: m.conjugate(2)
WordMorphism: a->cdeab, b->zxy

>>> from sage.all import *

>>> m = WordMorphism('a->abcde')

>>> m.conjugate(Integer(0)) == m
True

>>> m.conjugate(Integer(1))
WordMorphism: a->bcdea

>>> m.conjugate(Integer(3))
WordMorphism: a->deabc

>>> W = WordMorphism('').conjugate(Integer(4))

>>> m = WordMorphism('a->abcde,b->xyz')

>>> m.conjugate(Integer(2))
WordMorphism: a->cdeab, b->zxy

\textbf{domain()}

Return domain of self.

\textbf{Examples:}

\begin{verbatim}
sage: W = WordMorphism('a->ab,b->a').domain()
Finite words over {'a', 'b'}
sage: W = WordMorphism('b->ba,a->ab').domain()
Finite words over {'a', 'b'}
sage: W = WordMorphism('6->ab,y->5,0->asd').domain()
Finite words over {'0', '6', 'y'}
\end{verbatim}

\begin{verbatim}
>>> from sage.all import *

>>> W = WordMorphism('a->ab,b->a').domain()
Finite words over {'a', 'b'}

>>> W = WordMorphism('b->ba,a->ab').domain()
Finite words over {'a', 'b'}

>>> W = WordMorphism('6->ab,y->5,0->asd').domain()
Finite words over {'0', '6', 'y'}
\end{verbatim}

\textbf{dual_map ($k=1$)}

Return the dual map $E_k^*$ of self (see [1]).

\textbf{Note:} It is actually implemented only for $k=1$.

\textbf{Input:}

- self - unimodular endomorphism defined on integers $1, 2, \ldots, d$
- k - integer (default: $1$)

\textbf{Output:}

an instance of $E1Star$ - the dual map

5.1. Comprehensive Module List 5839
EXAMPLES:

```python
sage: sigma = WordMorphism({1: [2], 2: [3], 3: [1,2]})
sage: sigma.dual_map()
```

```
-> needs sage.modules
E_1^*(1->2, 2->3, 3->12)
```

```python
>>> from sage.all import *

>>> sigma = WordMorphism({Integer(1): [Integer(2)], Integer(2): [Integer(3)],...
˓→Integer(3): [Integer(1),Integer(2)]})

>>> sigma.dual_map()
```

```
-> needs sage.modules
E_1^*(1->2, 2->3, 3->12)
```

```python
sage: sigma.dual_map(k=2)
Traceback (most recent call last):
...
NotImplementedError: the dual map E_k^* is implemented only for k = 1 (not 2)
```

```python
>>> from sage.all import *

>>> sigma = WordMorphism(a->ab,b->ba)

>>> n = WordMorphism({0:1,1:0,a:5})

>>> m.extend_by(n)
```

```
WordMorphism: 0->1, 1->0, a->ab, b->ba
```

```python
>>> m.extend_by(m)
```

```
WordMorphism: a->ab, b->ba
```

REFERENCES:

`extend_by` (other)

Return self extended by other.

Let \( \varphi_1 : A^* \to B^* \) and \( \varphi_2 : C^* \to D^* \) be two morphisms. A morphism \( \mu : (A \cup C)^* \to (B \cup D)^* \) corresponds to \( \varphi_1 \) extended by \( \varphi_2 \) if \( \mu(a) = \varphi_1(a) \) if \( a \in A \) and \( \mu(a) = \varphi_2(a) \) otherwise.

INPUT:

• other – a WordMorphism.

OUTPUT:

WordMorphism

EXAMPLES:

```python
sage: m = WordMorphism('a->ab,b->ba')
sage: n = WordMorphism({'0':'1','1':'0','a':'5'})
sage: m.extend_by(n)
```

```
WordMorphism: 0->1, 1->0, a->ab, b->ba
```

```python
>>> m.extend_by(m)
```

```
WordMorphism: a->ab, b->ba
```

```python
>>> m = WordMorphism('a->ab,b->ba')

>>> n = WordMorphism({'0':'1','1':'0','a':'5'})

>>> m.extend_by(n)
```

(continues on next page)
**fixed_point** *(letter)*

Return the fixed point of *self* beginning by the given *letter*.

A fixed point of morphism *φ* is a word *w* such that *φ*(*w*) = *w*.

**INPUT:**

- *self* – an endomorphism (or more generally a self-composable morphism), must be prolongable on *letter*
- *letter* – in the domain of *self*, the first letter of the fixed point.

**OUTPUT:**

- *word* – the fixed point of *self* beginning with *letter*.

**EXAMPLES:**

```sage
def W = FiniteWords('abc')
```

1. Infinite fixed point:

```sage
W = FiniteWords('abc')
>>> from sage.all import *
>>> W = FiniteWords('abc')
```

2. Infinite fixed point of an erasing morphism:

```sage
>>> W = FiniteWords('abc')
```

3. Finite fixed point:

```sage
>>> W = FiniteWords('abc')
```
5. Fixed point of a power of a morphism:

```python
sage: m = WordMorphism('a->ba,b->ab')
sage: (m^2).fixed_point(letter='a')
word: abbbbabaabbbaababbaababbaababbaabbbbabaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabbaababbaabbbbababaabic
```

```python
>>> from sage.all import *
```
**fixed_points()**

Return the list of all fixed points of self.

**EXAMPLES:**

```python
sage: f = WordMorphism('a->ab,b->ba')
sage: for w in f.fixed_points(): print(w)
  abbabaabbaaabbaabbaaabbabaababbaababbaababbaababaababbaababba...  
  baababbaabbaaabbaabbaaabbabaababbaababbaababbaababaababbaababbaababaab...  

sage: f = WordMorphism('a->ab,b->c,c->a')
sage: for w in f.fixed_points(): print(w)
  abcabbccabcabccbcabccabcabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabc...  

sage: f = WordMorphism('a->ab,b->cab,c->bcc')
sage: for w in f.fixed_points(): print(w)
  abcabbccabcabccbcabccbcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabcabccabc...  
```

This shows that issue **Issue #13668** has been resolved:

```python
sage: d = {1:[1,2],2:[2,3],3:[4,5],4:[6],5:[7],6:[8],7:[9,10],9:[10],10:[1]}
sage: s = WordMorphism(d)
sage: s7 = s^7
sage: s7.fixed_points()
[word: 12232342..., word: 2,3,4,5,6,7,8...]
sage: s7r = s7.reversal()
sage: s7r.periodic_point(2)
word: 2,1,1,10,9,8,7,6,5,4,3,2,1,10,9,8,7,6,5,4,3,2,10,9,8,7,6,5,4,3,2,9,8,7,...
  \rightarrow 6,5,4,3,2,8,...
```

```python
>>> from sage.all import *
>>> d = {Integer(1):[Integer(1),Integer(2)],Integer(2):[Integer(2),
  \rightarrow Integer(3)],Integer(3):[Integer(4)],Integer(4):[Integer(5)],
  \rightarrow Integer(5):[Integer(6)],Integer(6):[Integer(7)],Integer(7):[Integer(8)],
  \rightarrow Integer(8):[Integer(9)],Integer(9):[Integer(10)],Integer(10):[Integer(1)]}
>>> s = WordMorphism(d)
>>> s7 = s**Integer(7)
>>> s7.fixed_points()
[word: 12232342..., word: 2,3,4,5,6,7,8...]
>>> s7r = s7.reversal()
>>> s7r.periodic_point(Integer(2))
word: 2,1,1,10,9,8,7,6,5,4,3,2,1,10,9,8,7,6,5,4,3,2,10,9,8,7,6,5,4,3,2,9,8,7,...
  \rightarrow 6,5,4,3,2,8,...
```
This shows that issue Issue #13668 has been resolved:

```python
sage: s = "1->321331332133133,2->133321331332133133,3->2133133133321331332133133"
sage: s = WordMorphism(s)
sage: (s^2).fixed_points()
[]
```

```python
from sage.all import *
```

```python
s = "1->321331332133133,2->133321331332133133,3->2133133133321331332133133"
```

```python
s = WordMorphism(s)
``` 

```python
(s**Integer(2)).fixed_points()
[]
```

```python
growing_letters()
```

Return the list of growing letters.

See `is_growing()` for more information.

EXAMPLES:

```python
sage: WordMorphism('0->01,1->10').growing_letters()
['0', '1']
sage: WordMorphism('0->01,1->1').growing_letters()
['0']
sage: WordMorphism('0->01,1->0,2->1', codomain=Words('012')).growing_letters()
['0', '1', '2']
sage: WordMorphism('a->b,b->a').growing_letters()
[]
sage: WordMorphism('a->b,b->c,c->d,d->c', codomain=Words('abcd')).growing_letters()
[]
```

```python
>>> from sage.all import *
```

```python
>>> WordMorphism('0->01,1->10').growing_letters()
['0', '1']
```

```python
>>> WordMorphism('0->01,1->1').growing_letters()
['0']
```

```python
>>> WordMorphism('0->01,1->0,2->1', codomain=Words('012')).growing_letters()
['0', '1', '2']
```

```python
>>> WordMorphism('a->b,b->a').growing_letters()
[]
```

>>> WordMorphism('a->b,b->c,c->d,d->c', codomain=Words('abcd')).growing_letters()
[]
```

```python
has_conjugate_in_classP (f=None)
```

Return `True` if `self` has a conjugate in class `f-P`.

**DEFINITION**: Let $A$ be an alphabet. We say that a primitive substitution $S$ is in the class $P$ if there exists a palindrome $p$ and for each $b \in A$ a palindrome $q_b$ such that $S(b) = pq_b$ for all $b \in A$. [1]

Let $f$ be an involution on $A$. We say that a morphism $\varphi$ is in class $f-P$ if there exists an $f$-palindrome $p$ and for each $\alpha \in A$ there exists an $f$-palindrome $q_\alpha$ such that $\varphi(\alpha) = p q_\alpha$. [2]

**INPUT:**
• \( f \) – involution (default: None) on the alphabet of \( \text{self} \). It must be callable on letters as well as words (e.g. WordMorphism).

REFERENCES:

EXAMPLES:

```python
sage: fibo = WordMorphism('a->ab,b->a')
sage: fibo.has_conjugate_in_classP()
True
sage: (fibo^2).is_in_classP()
False
sage: (fibo^2).has_conjugate_in_classP()
True
```

```python
>>> from sage.all import *

>>> m = WordMorphism('a->abcde,b->xyz')

>>> m.has_left_conjugate()
False
```

```python
>>> WordMorphism('b->xyz').has_left_conjugate()
True
```

```python
>>> m = WordMorphism('a->abbab,b->abb')

>>> m.has_left_conjugate()
True
```

```python
>>> WordMorphism('a->abbab,b->abb,c->').has_left_conjugate()
True
```

\( \text{has_left_conjugate()} \)

Return True if all the non empty images of \( \text{self} \) begins with the same letter.

EXAMPLES:

```python
sage: m = WordMorphism('a->abcde,b->xyz')

sage: m.has_left_conjugate()
False
```

```python
>>> from sage.all import *

>>> m = WordMorphism('a->abcde,b->xyz')

>>> m.has_left_conjugate()
False
```

(continues on next page)
True
>>> WordMorphism('a->abbab,b->abb').has_left_conjugate()
True
>>> WordMorphism('a->abbab,b->abb,c->').has_left_conjugate()
True

**has_right_conjugate()**

Return True if all the non empty images of self ends with the same letter.

**EXAMPLES:**

```
sage: m = WordMorphism('a->abcde,b->xyz')
sage: m.has_right_conjugate()
False
sage: WordMorphism('b->xyz').has_right_conjugate()
True
sage: WordMorphism('').has_right_conjugate()
True
sage: WordMorphism('a->,b->xyz').has_right_conjugate()
True
sage: WordMorphism('a->abbab,b->abb').has_right_conjugate()
True
sage: WordMorphism('a->abbab,b->abb,c->').has_right_conjugate()
True
```

```python
>>> from sage.all import *

m = WordMorphism('a->abcde,b->xyz')
m.has_right_conjugate()
False
>>> WordMorphism('b->xyz').has_right_conjugate()
True
>>> WordMorphism('').has_right_conjugate()
True
>>> WordMorphism('a->,b->xyz').has_right_conjugate()
True
>>> WordMorphism('a->abbab,b->abb').has_right_conjugate()
True
>>> WordMorphism('a->abbab,b->abb,c->').has_right_conjugate()
True
```

**image(letter)**

Return the image of a letter.

**INPUT:**

- letter – a letter in the domain alphabet

**OUTPUT:**

word

**Note:** The letter is assumed to be in the domain alphabet (no check done). Hence, this method is faster than the **__call__** method suitable for words input.

**EXAMPLES:**
sage: m = WordMorphism('a->ab,b->ac,c->a')
sage: m.image('b')
word: ac

>>> from sage.all import *
>>> m = WordMorphism('a->ab,b->ac,c->a')
>>> m.image('b')
word: ac

sage: s = WordMorphism({('a', 1):[(a, 1), (a, 2)], ('a', 2):[(a, 1)]})
sage: s.image((a,1))
word: (a, 1), (a, 2)

>>> from sage.all import *
>>> s = WordMorphism({('a', Integer(1)):[(a, Integer(1)), (a, Integer(2))], ('a', Integer(2)):[(a, Integer(1))]}))
>>> s.image((a,Integer(1)))
word: (a, 1), (a, 2)

sage: s = WordMorphism({b:[1,2], a:(2,3,4), z:[9,8,7]})
sage: s.image(b)
word: 12
sage: s.image(a)
word: 234
sage: s.image(z)
word: 987

>>> from sage.all import *
>>> s = WordMorphism({b:[Integer(1),Integer(2)], a:{Integer(2),Integer(3), Integer(4)}, z:[Integer(9),Integer(8),Integer(7)]})
>>> s.image(b)
word: 12
>>> s.image(a)
word: 234
>>> s.image(z)
word: 987

images()

Return the list of all the images of the letters of the alphabet under self.

EXAMPLES:

sage: sorted(WordMorphism('a->ab,b->a').images())
[word: a, word: ab]
sage: sorted(WordMorphism('6->ab,y->5,0->asd').images())
[word: 5, word: ab, word: asd]

>>> from sage.all import *
>>> sorted(WordMorphism('a->ab,b->a').images())
[word: a, word: ab]
>>> sorted(WordMorphism('6->ab,y->5,0->asd').images())
[word: 5, word: ab, word: asd]

immortal_letters()

Return the list of immortal letters.
A letter \( a \) is \textit{immortal} for the morphism \( s \) if the length of the iterates of \(|s^n(a)|\) is larger than zero as \( n \) goes to infinity.

Requires this morphism to be self-composable.

EXAMPLES:

```python
sage: WordMorphism('a->a').immortal_letters()
['a']
sage: WordMorphism('a->b,b->a').immortal_letters()
['a', 'b']
sage: WordMorphism('a->abcd,b->cd,c->dd,d->').immortal_letters()
['a']
sage: WordMorphism('a->bc,b->cac,c->de,d->,e->').immortal_letters()
['a', 'b']
sage: WordMorphism('a->', domain=Words('a'), codomain=Words('a')).immortal_letters()
[]
sage: WordMorphism('a->').immortal_letters()
[]
```

```python
>>> from sage.all import *

>>> WordMorphism('a->a').immortal_letters()
['a']
>>> WordMorphism('a->b,b->a').immortal_letters()
['a', 'b']
>>> WordMorphism('a->abcd,b->cd,c->dd,d->').immortal_letters()
['a']
>>> WordMorphism('a->bc,b->cac,c->de,d->,e->').immortal_letters()
['a', 'b']
>>> WordMorphism('a->', domain=Words('a'), codomain=Words('a')).immortal_letters()
[]
>>> WordMorphism('a->').immortal_letters()
[]
```

\textbf{incidence_matrix()}

Return the incidence matrix of the morphism. The order of the rows and column are given by the order defined on the alphabet of the domain and the codomain.

The matrix returned is over the integers. If a different ring is desired, use either the \texttt{change\_ring} function or the \texttt{matrix} function.

EXAMPLES:

```python
sage: m = WordMorphism('a->abc,b->a,c->c')
sage: m.incidence_matrix()  # needs sage.modules
[1 1 0]
[1 0 0]
[1 0 1]
sage: m = WordMorphism('a->abc,b->a,c->c,d->abbccccabca,e->abc')
sage: m.incidence_matrix()  # needs sage.modules
[1 1 0 3 1]
[1 0 0 3 1]
[1 0 1 5 1]
```
```python
>>> from sage.all import *
>>> m = WordMorphism('a->abc,b->a,c->c')
>>> m.incidence_matrix()  #...
def needs_sage_modules
[1 1 0]
[1 0 0]
[1 0 1]
>>> m = WordMorphism('a->abc,b->a,c->c,d->abbccccabca,e->abc')
>>> m.incidence_matrix()  #...
def needs_sage_modules
[1 1 0 3 1]
[1 0 0 3 1]
[1 0 1 5 1]
```

**infinite_repetitions_primitive_roots** *(w=None, allow_growing=None)*

Return the set of primitive roots (up to conjugacy) of infinite repetitions from the language \(\{m^n(w)\}_{n \geq 0}\), where \(m\) is this morphism and \(w\) is a word inputted as a parameter.

Requires this morphism to be an endomorphism.

The word \(v^w\) is an infinite repetition (in other words, an infinite periodic factor) of a language, if \(v\) is a non-empty word and for each positive integer \(k\) the word \(v^k\) is a factor of some word from the language. It turns out that a language created by iterating a morphism has a finite number of primitive roots of infinite repetitions.

If \(v\) is a primitive root of an infinite repetition, then all its conjugations are also primitive roots of an infinite repetition. For simplicity’s sake this method returns only the lexicographically minimal one from each conjugacy class.

**INPUT:**

- \(w\) – finite iterable (default: `self.domain().alphabet()`). Represents a word used to start the language.
- `allow_growing` – boolean or `None` (default: `None`). If `False`, return only the primitive roots that contain no growing letters. If `True`, return only the primitive roots that contain at least one growing letter. If `None`, return both.

**ALGORITHM:**

The algorithm used is described in detail in [KS2015].

**EXAMPLES:**

```python
sage: m = WordMorphism('a->aba,b->aba,c->cd,d->e,e->d')
sage: inf_reps = m.infinite_repetitions_primitive_roots('ac')
sage: sorted(inf_reps)
[word: aab, word: de]
```

```python
>>> from sage.all import *
>>> m = WordMorphism('a->aba,b->aba,c->cd,d->e,e->d')
>>> inf_reps = m.infinite_repetitions_primitive_roots('ac')
>>> sorted(inf_reps)
[word: aab, word: de]
```

**allow_growing parameter:**

```python
sage: sorted(m.infinite_repetitionsPrimitive_roots('ac', True))
[word: aab]
```

(continues on next page)
Combinatorics, Release 10.4

sage: sorted(m.infinite_repetitions_primitive_roots('ac', False))
[word: de]

>>> from sage.all import *

>>> sorted(m.infinite_repetitions_primitive_roots('ac', True))
[word: aab]

>>> sorted(m.infinite_repetitions_primitive_roots('ac', False))
[word: de]

Incomplete check that these words are indeed the primitive roots of infinite repetitions:

sage: SL = m._language_naive(10, Word('ac'))
sage: all(x in SL for x in inf_reps)
True

sage: all(x^2 in SL for x in inf_reps)
True

sage: all(x^3 in SL for x in inf_reps)
True

>>> from sage.all import *

>>> SL = m._language_naive(Integer(10), Word('ac'))

>>> all(x in SL for x in inf_reps)
True

>>> all(x**Integer(2) in SL for x in inf_reps)
True

>>> all(x**Integer(3) in SL for x in inf_reps)
True

Large example:

sage: m = WordMorphism(a->1b5,b->fcg,c->dae,d->432,e->678,f->f,g->g,1->2,2->3,3->4,4->1,5->6,6->7,7->8,8->5)
sage: sorted(m.infinite_repetitions_primitive_roots('a'))
[word: 1432f2143f3214f4321f, word: 5678g8567g7856g6785g]

>>> from sage.all import *

>>> m = WordMorphism(a->1b5,b->fcg,c->dae,d->432,e->678,f->f,g->g,1->2,2->3,3->4,4->1,5->6,6->7,7->8,8->5)

>>> sorted(m.infinite_repetitions_primitive_roots('a'))
[word: 1432f2143f3214f4321f, word: 5678g8567g7856g6785g]

is_empty()

Return True if the cardinality of the domain is zero and False otherwise.

EXAMPLES:

sage: WordMorphism('').is_empty()
True

sage: WordMorphism('a->a').is_empty()
False

>>> from sage.all import *

>>> WordMorphism('').is_empty()
True

>>> WordMorphism('a->a').is_empty()
False
**is_endomorphism()**

Return whether `self` is an endomorphism, that is if the domain coincide with the codomain.

**EXAMPLES:**

```sage
sage: WordMorphism('a->ab,b->a').is_endomorphism()  # Continues next page
True
```

```sage
>>> from sage.all import *
>>> WordMorphism('a->ab,b->a').is_endomorphism()  # Continues next page
True
```

We check that Issue #8674 is fixed:

```sage
sage: P = WordPaths('abcd')  # Continues next page
← needs sage.modules
sage: m = WordMorphism('a->adab,b->ab,c->cbcd,d->cd',  # Continues next page
                        domain=P, codomain=P)
fung: m.is_endomorphism()  # Continues next page
True
```

**is_erasing()**

Return `True` if `self` is an erasing morphism, i.e. the image of a letter is the empty word.

**EXAMPLES:**

```sage
sage: WordMorphism('a->ab,b->a').is_erasing()  # Continues next page
False
```

```sage
>>> from sage.all import *
>>> WordMorphism('a->ab,b->a').is_erasing()  # Continues next page
False
```

(continues on next page)
Combinatorics, Release 10.4

False
```
sage: WordMorphism('6->ab,y->5,0->asd,7->').is_erasing()
True
sage: WordMorphism('').is_erasing()
False
```

```
>>> from sage.all import *

>>> WordMorphism('a->ab,b->a').is_erasing()
False
>>> WordMorphism('6->ab,y->5,0->asd').is_erasing()
False
>>> WordMorphism('6->ab,y->5,0->asd,7->').is_erasing()
True
>>> WordMorphism('').is_erasing()
False
```

**is_growing** *(letter=None)*

Return True if letter is a growing letter.

A letter $a$ is *growing* for the morphism $s$ if the length of the iterates of $|s^n(a)|$ tend to infinity as $n$ goes to infinity.

**INPUT:**

- letter – None or a letter in the domain of self

**Note:** If letter is None, this returns True if self is everywhere growing, i.e., all letters are growing letters (see [CassNic10]), and that self must be an endomorphism.

**EXAMPLES:**

```
sage: WordMorphism('0->01,1->1').is_growing('0')
True
sage: WordMorphism('0->01,1->1').is_growing('1')
False
sage: WordMorphism('0->01,1->10').is_growing()
True
sage: WordMorphism('0->1,1->2,2->01').is_growing()
True
sage: WordMorphism('0->01,1->1').is_growing()
False
```

```
>>> from sage.all import *

>>> WordMorphism('0->01,1->1').is_growing('0')
True
>>> WordMorphism('0->01,1->1').is_growing('1')
False
>>> WordMorphism('0->01,1->10').is_growing()
True
>>> WordMorphism('0->1,1->2,2->01').is_growing()
True
>>> WordMorphism('0->01,1->1').is_growing()
False
```

The domain needs to be equal to the codomain:
Combinatorics, Release 10.4

```python
sage: WordMorphism('0->01,1->0,2->1', codomain=Words('012')).is_growing()
True
```

```python
>>> from sage.all import *

>>> WordMorphism('0->01,1->0,2->1', codomain=Words('012')).is_growing()
True
```

Test of erasing morphisms:

```python
sage: WordMorphism('0->01,1->').is_growing('0')
False
sage: m = WordMorphism('a->bc,b->bcc,c->', codomain=Words('abc'))
sage: m.is_growing('a')
False
sage: m.is_growing('b')
False
sage: m.is_growing('c')
False
```

```python
>>> from sage.all import *

>>> WordMorphism('0->01,1->').is_growing('0')
False

>>> m = WordMorphism('a->bc,b->bcc,c->', codomain=Words('abc'))
>>> m.is_growing('a')
False
>>> m.is_growing('b')
False
>>> m.is_growing('c')
False
```

REFERENCES:

**is_identity()**

Return True if self is the identity morphism.

EXAMPLES:

```python
sage: m = WordMorphism('a->a,b->b,c->c,d->e')
sage: m.is_identity()
False
sage: WordMorphism('a->a,b->b,c->c').is_identity()
True
sage: WordMorphism('a->a,b->b,c->cb').is_identity()
False
sage: m = WordMorphism('a->a,b->b,c->cb')
sage: (m^2).is_identity()
False
sage: (m^3).is_identity()
True
sage: (m^4).is_identity()
False
sage: WordMorphism('').is_identity()
True
sage: WordMorphism({'0':[0], '1':[1]}).is_identity()
True
```
We check that Issue #8618 is fixed:

```python
sage: t = WordMorphism({'a1': ['a2'], 'a2': ['a1']})
sage: (t*t).is_identity()
True
```

**is_in_classP** *(f=None)*

Return `True` if `self` is in class `P` (or `f-P`).

**Definition**: Let `A` be an alphabet. We say that a primitive substitution `S` is in the class `P` if there exists a palindrome `p` and for each `b` in `A` a palindrome `q_b` such that `S(b) = pq_b` for all `b` in `A`. [1]

Let `f` be an involution on `A`. “We say that a morphism `φ` is in class `f-P` if there exists an `f`-palindrome `p` and for each `α` in `A` there exists an `f`-palindrome `q_α` such that `φ(α) = pq_α`. [2]

**input**:

- `f` – involution (default: None) on the alphabet of `self`. It must be callable on letters as well as words (e.g. `WordMorphism`).

**References**:

**Examples**:

```python
sage: WordMorphism('a->bbaba,b->bba').is_in_classP()
True
sage: tm = WordMorphism('a->ab,b->ba')
```
sage: tm.is_in_classP()
False
sage: f = WordMorphism('a->b,b->a')
sage: tm.is_in_classP(f=f)
True
sage: (tm^2).is_in_classP()
True
sage: (tm^2).is_in_classP(f=f)
False
sage: fibo = WordMorphism('a->ab,b->a')
sage: fibo.is_in_classP()
True
sage: fibo.is_in_classP(f=f)
False
sage: (fibo^2).is_in_classP()
False
sage: f = WordMorphism('a->b,b->a,c->c')
sage: WordMorphism('a->acbcc,b->acbab,c->acbba').is_in_classP(f)
True

is_injective()
Return whether this morphism is injective.

ALGORITHM:
Uses a version of Wikipedia article Sardinas–Patterson_algorithm. Time complexity is on average quadratic with regards to the size of the morphism.

EXAMPLES:
>>> from sage.all import *
>>> WordMorphism('a->0,b->10,c->110,d->111').is_injective()
True
>>> WordMorphism('a->00,b->01,c->012,d->20001').is_injective()
False

**is_involution()**

Return True if self is an involution, i.e. its square is the identity.

**INPUT:**

- self – an endomorphism

**EXAMPLES:**

```
sage: WordMorphism('a->b,b->a').is_involution()
True
sage: WordMorphism('a->b,b->ba').is_involution()
False
sage: WordMorphism({Integer(0):[Integer(1)],Integer(1):[Integer(0)]}).is_involution()
True
```

```
>>> from sage.all import *
>>> WordMorphism('a->b,b->a').is_involution()
True
>>> WordMorphism('a->b,b->ba').is_involution()
False
>>> WordMorphism({Integer(0):[Integer(1)],Integer(1):[Integer(0)]}).is_involution()
True
```

**is_primitive()**

Return True if self is primitive.

A morphism \( \varphi \) is **primitive** if there exists an positive integer \( k \) such that for all \( \alpha \in \Sigma \), \( \varphi^k(\alpha) \) contains all the letters of \( \Sigma \).

**INPUT:**

- self – an endomorphism

**ALGORITHM:**

Exercices 8.7.8, p.281 in [1]: (c) Let \( y(M) \) be the least integer \( e \) such that \( M^e \) has all positive entries. Prove that, for all primitive matrices \( M \), we have \( y(M) \leq (d-1)^2 + 1 \). (d) Prove that the bound \( y(M) \leq (d-1)^2 + 1 \) is best possible.

**EXAMPLES:**

```
sage: tm = WordMorphism('a->ab,b->ba')
sage: tm.is_primitive()
# needs sage.modules
True
sage: fibo = WordMorphism('a->ab,b->a')
sage: fibo.is_primitive()
# needs sage.modules
```

(continues on next page)
True
sage: m = WordMorphism('a->bb,b->aa')
sage: m.is_primitive() #...
→ needs sage.modules
False
sage: f = WordMorphism({0:[1],1:[0]})
sage: f.isPrimitive() #...
→ needs sage.modules
False
>>> from sage.all import *
>>> tm = WordMorphism('a->ab,b->ba')
>>> tm.isPrimitive() #...
→ needs sage.modules
True
>>> fibo = WordMorphism('a->ab,b->a')
fibo.isPrimitive() #...
→ needs sage.modules
True
>>> m = WordMorphism('a->bb,b->aa')
>>> m.isPrimitive() #...
→ needs sage.modules
False
>>> f = WordMorphism((Integer(0):[Integer(1)],Integer(1):[Integer(0)]))
>>> f.isPrimitive() #...
→ needs sage.modules
False

sage: s = WordMorphism('a->b,b->c,c->ab')
sage: s.isPrimitive() #...
→ needs sage.modules
True
sage: s = WordMorphism('a->b,b->c,c->d,d->e,e->f,f->g,g->h,h->ab')
sage: s.isPrimitive() #...
→ needs sage.modules
True

# REFERENCES:

**is_prolongable**(letter)

Return `True` if `self` is prolongable on `letter`.

A morphism $\varphi$ is prolongable on a letter $a$ if $a$ is a prefix of $\varphi(a)$. 5.1. Comprehensive Module List 5857
INPUT:
- self – its codomain must be an instance of Words
- letter – a letter in the domain alphabet

OUTPUT:
Boolean

EXAMPLES:

```python
sage: WordMorphism('a->ab,b->a').is_prolongable(letter='a')
True
sage: WordMorphism('a->ab,b->a').is_prolongable(letter='b')
False
sage: WordMorphism('a->ba,b->ab').is_prolongable(letter='b')
False
sage: (WordMorphism('a->ba,b->ab')^2).is_prolongable(letter='b')
True
sage: WordMorphism('a->ba,b->').is_prolongable(letter='b')
False
sage: WordMorphism('a->bb,b->aac').is_prolongable(letter='a')
False
```

We check that Issue #8595 is fixed:

```python
>>> from sage.all import *
>>> WordMorphism('a->ab,b->a').is_prolongable(letter='a')
True
>>> WordMorphism('a->ab,b->a').is_prolongable(letter='b')
False
>>> WordMorphism('a->ba,b->ab').is_prolongable(letter='b')
False
>>> (WordMorphism('a->ba,b->ab')**Integer(2)).is_prolongable(letter='b')
True
>>> WordMorphism('a->ba,b->').is_prolongable(letter='b')
False
>>> WordMorphism('a->bb,b->aac').is_prolongable(letter='a')
False
```

is_pushy (w=None)
Return whether the language \( \{m^n(w) \mid n \geq 0 \} \) is pushy, where \( m \) is this morphism and \( w \) is a word inputted as a parameter.

Requires this morphism to be an endomorphism.

A language created by iterating a morphism is pushy, if its words contain an infinite number of factors containing no growing letters. It turns out that this is equivalent to having at least one infinite repetition containing
no growing letters.

See \texttt{infinite_repetitions_primitive_roots()} and \texttt{is_growing()}.

INPUT:

- \( w \) – finite iterable (default: \texttt{self.domain().alphabet()}). Represents a word used to start the language.

EXAMPLES:

```python
sage: WordMorphism('a->abca,b->bc,c->').is_pushy()
False
sage: WordMorphism('a->abc,b->,c->bcb').is_pushy()
True
```

\texttt{is_repetitive(}w=None\texttt{)}

Return whether the language \( \{m^n(w)|n \geq 0\} \) is repetitive, where \( m \) is this morphism and \( w \) is a word inputted as a parameter.

Requires this morphism to be an endomorphism.

A language is repetitive, if for each positive integer \( k \) there exists a word \( u \) such that \( u^k \) is a factor of some word of the language.

It turns out that for languages created by iterating a morphism this is equivalent to having at least one infinite repetition (this property is also known as strong repetitiveness).

See \texttt{infinite_repetitions_primitive_roots()}.

INPUT:

- \( w \) – finite iterable (default: \texttt{self.domain().alphabet()}). Represents a word used to start the language.

EXAMPLES:

This method can be used to check whether a purely morpic word is not \( k \)-power free for all positive integers \( k \). For example, the language containing just the Thue-Morse word and its prefixes is not repetitive, since the Thue-Morse word is cube-free:

```python
sage: WordMorphism('a->ab,b->ba').is_repetitive('a')
False
```

Similarly, the Hanoi word is square-free:

```python
sage: WordMorphism('a->aC,A->ac,b->cB,B->cb,c->bA,C->ba').is_repetitive('a')
False
```
However, this method solves a more general problem, as it can be called on any morphism $m$ and with any word $w$:

```python
>>> from sage.all import *

>>> WordMorphism('a->aC,A->ac,b->cb,b->cb,c->bA,C->ba').is_repetitive('a')
False
```

```python
sage: WordMorphism('a->c,b->cda,c->a,d->abc').is_repetitive('bd')
True
```

```python
>>> from sage.all import *

>>> WordMorphism('a->c,b->cda,c->a,d->abc').is_repetitive('bd')
True
```

### is_self_composable()

Return whether the codomain of self is contained in the domain.

**EXAMPLES:**

```python
sage: f = WordMorphism('a->a,b->a')
sage: f.is_endomorphism()
False
```

```python
>>> from sage.all import *

>>> f = WordMorphism('a->a,b->a')
>>> f.is_endomorphism()
False
```

```python
>>> from sage.all import *

>>> f = WordMorphism('a->a,b->a')
>>> f.is_self_composable()
True
```

### is_unboundedly_repetitive($w=None$)

Return whether the language $\{m^n(w) | n \geq 0\}$ is unboundedly repetitive, where $m$ is this morphism and $w$ is a word inputted as a parameter.

Requires this morphism to be an endomorphism.

A language created by iterating a morphism is unboundedly repetitive, if it has at least one infinite repetition containing at least one growing letter.

See infinite_repetitions_primitive_roots() and is_growing().

**INPUT:**

- $w$ – finite iterable (default: self.domain().alphabet()). Represents a word used to start the language.

**EXAMPLES:**

```python
sage: WordMorphism('a->abca,b->bc,c->').is_unboundedly_repetitive()
True
```

```python
sage: WordMorphism('a->abca,b->bc,c->bcb').is_unboundedly_repetitive()
False
```

```python
>>> from sage.all import *

>>> WordMorphism('a->abca,b->bc,c->').is_unboundedly_repetitive()
(continues on next page)
```
is_uniform\( (k=\text{None}) \)

Return \( \text{True} \) if \( \text{self} \) is a \( k \)-uniform morphism.

Let \( k \) be a positive integer. A morphism \( \phi \) is called \( k \)-uniform if for every letter \( \alpha \), we have \( |\phi(\alpha)| = k \).

In other words, all images have length \( k \). A morphism is called uniform if it is \( k \)-uniform for some positive integer \( k \).

INPUT:

- \( k \) – a positive integer or \( \text{None} \). If set to a positive integer, then the function return \( \text{True} \) if \( \text{self} \) is \( k \)-uniform. If set to \( \text{None} \), then the function return \( \text{True} \) if \( \text{self} \) is uniform.

EXAMPLES:

```python
sage: phi = WordMorphism('a->ab,b->a')
sage: phi.is_uniform()
False
sage: phi.is_uniform(k=1)
False
sage: tau = WordMorphism('a->ab,b->ba')
sage: tau.is_uniform()
True
sage: tau.is_uniform(k=1)
False
sage: tau.is_uniform(k=2)
True
```

language\( (n, u=\text{None}) \)

Return the words of length \( n \) in the language generated by this substitution.

Given a non-erasing substitution \( s \) and a word \( u \) the DOL-language generated by \( s \) and \( u \) is the union of the factors of \( s^n(u) \) where \( n \) is a non-negative integer.

INPUT:

- \( n \) – non-negative integer; length of the words in the language
- \( u \) – a word or \( \text{None} \) (default: \( \text{None} \)); if set to \( \text{None} \) some letter of the alphabet is used

OUTPUT: a Python set

EXAMPLES:
The fibonacci morphism:

```
sage: s = WordMorphism({0: [0,1], 1: [0]})
sage: sorted(s.language(3))  # needs sage.modules
[0, 0, 1, 1, 1, 1]
sage: len(s.language(1000))  # needs sage.modules
1001
sage: all(len(s.language(n)) == n+1 for n in range(100))  # needs sage.modules
True
```

Agrowing butnon-primitiveexample. The DOL-languages generated by 0 and 2 are different:

```
sage: s = WordMorphism({0: [0,1], 1: [0], 2: [2,0,2]})
sage: u = s.fixed_point(0)
sage: A0 = u[:200].factor_set(5)  # needs sage.modules
sage: B0 = s.language(5, [0])  # needs sage.modules
set(A0) == B0  # needs sage.modules
True
sage: v = s.fixed_point(2)
sage: A2 = v[:200].factor_set(5)  # needs sage.modules
sage: B2 = s.language(5, [2])  # needs sage.modules
set(A2) == B2  # needs sage.modules
True
sage: len(A0), len(A2)  # needs sage.modules
(6, 20)
```
A0 = u[:Integer(200)].factor_set(Integer(5))  # needs sage.modules

B0 = s.language(Integer(5), [Integer(0)])  # needs sage.modules

set(A0) == B0  # needs sage.modules

v = s.fixed_point(Integer(2))

A2 = v[:Integer(200)].factor_set(Integer(5))  # needs sage.modules

B2 = s.language(Integer(5), [Integer(2)])  # needs sage.modules

set(A2) == B2  # needs sage.modules

len(A0), len(A2)  # needs sage.modules

(6, 20)

The Chacon transformation (non-primitive):

```python
s = WordMorphism({0: [0, 0, 1, 0], 1:[1]})
```

```text
>>> sorted(s.language(10))
[word: 0001000101,
word: 0001010010,
...]
```

```python
from sage.all import *
```

```python
s = WordMorphism({Integer(0): [Integer(0),Integer(0),Integer(1),
Integer(0)], Integer(1):[Integer(1)]})
```

```text
>>> sorted(s.language(Integer(10)))
[word: 0001000101,
word: 0001010010,
...]
```

### latex_layout (layout=None)

Get or set the actual latex layout (oneliner vs array).

**INPUT:**

- `layout` – string (default: None), can take one of the following values:
  - None – Returns the actual latex layout. By default, the layout is 'array'
  - 'oneliner' – Set the layout to 'oneliner'
  - 'array' – Set the layout to 'array'

**EXAMPLES:**
letter_growth_types()
Return the mortal, polynomial and exponential growing letters.

The growth of $|s^n(a)|$ as $n$ goes to $\infty$ is always of the form $\alpha^n n^\beta$ (where $\alpha$ is a Perron number and $\beta$ an integer).

Without doing any linear algebra three cases can be differentiated: mortal (ultimately empty or $\alpha = 0$); polynomial ($\alpha = 1$); exponential ($\alpha > 1$). This is what is done in this method.

It requires this morphism to be an endomorphism.

OUTPUT:
The output is a 3-tuple of lists (mortal, polynomial, exponential) where:

- **mortal**: list of mortal letters
- **polynomial**: a list of lists where polynomial[i] is the list of letters with growth $n^i$.
- **exponential**: list of at least exponentially growing letters

EXAMPLES:

```python
sage: s = WordMorphism('a->abc,b->bc,c->c')
sage: mortal, poly, expo = s.letter_growth_types()
sage: mortal
[]
sage: poly
[['c'], ['b'], ['a']]
sage: expo
[]
```

When three mortal letters (c, d, and e), and two letters (a, b) are not growing:
sage: s = WordMorphism('a->bc,b->cac,c->de,d->,e->')
sage: s^20
WordMorphism: a->cacde, b->debcde, c->, d->, e->
sage: mortal, poly, expo = s.letter_growth_types()
sage: mortal
['c', 'd', 'e']
sage: poly
[['a', 'b']]
sage: expo
[]

>>> from sage.all import *
>>> s = WordMorphism('a->bc,b->cac,c->de,d->,e->')
>>> s**Integer(20)
WordMorphism: a->cacde, b->debcde, c->, d->, e->
>>> mortal, poly, expo = s.letter_growth_types()
>>> mortal
['c', 'd', 'e']
>>> poly
[['a', 'b']]
>>> expo
[]

sage: s = WordMorphism('a->abcd,b->bc,c->c,d->a')
sage: mortal, poly, expo = s.letter_growth_types()
sage: mortal
[]
sage: poly
[['c'], ['b']]
sage: expo
['a', 'd']

list_of_conjugates()

Return the list of all the conjugate morphisms of self.

DEFINITION:

Recall from Lothaire [1] (Section 2.3.4) that $\varphi$ is right conjugate of $\varphi'$, noted $\varphi \triangleleft \varphi'$, if there exists $u \in \Sigma^*$ such that

$$\varphi(\alpha) u = u \varphi'(\alpha),$$

for all $\alpha \in \Sigma$, or equivalently that $\varphi(x) u = u \varphi'(x)$, for all words $x \in \Sigma^*$. Clearly, this relation is not symmetric so that we say that two morphisms $\varphi$ and $\varphi'$ are conjugate, noted $\varphi \bowtie \varphi'$, if $\varphi \triangleleft \varphi'$ or $\varphi' \triangleleft \varphi$. It is easy to see that conjugacy of morphisms is an equivalence relation.

REFERENCES:

EXAMPLES:

```
sage: m = WordMorphism('a->abbab,b->abb')
sage: m.list_of_conjugates()
[WordMorphism: a->babba, b->bab,
WordMorphism: a->abbab, b->abb,
WordMorphism: a->baba, b->bba,
WordMorphism: a->babab, b->bab,
WordMorphism: a->ababb, b->abb,
WordMorphism: a->babba, b->bba,
WordMorphism: a->abbab, b->bab]
sage: m = WordMorphism('a->aaa,b->aa')
sage: m.list_of_conjugates()
[WordMorphism: a->aaa, b->aa]
sage: m = WordMorphism('a->aba,b->aba')
sage: m.list_of_conjugates()
[WordMorphism: a->baa, b->baa,
WordMorphism: a->aab, b->aab,
WordMorphism: a->aba, b->aba]
sage: m = WordMorphism('a->abb,b->abbab,c->')
sage: m.list_of_conjugates()
[WordMorphism: a->bab, b->babba, c->,
WordMorphism: a->abb, b->abbab, c->,
WordMorphism: a->bba, b->bbaba, c->,
WordMorphism: a->bab, b->babab, c->,
WordMorphism: a->abb, b->ababb, c->,
WordMorphism: a->bba, b->babba, c->,
WordMorphism: a->bab, b->bbaba, c->]
```

```python
>>> from sage.all import *
>>> m = WordMorphism('a->abbab,b->abb')
>>> m.list_of_conjugates()
[WordMorphism: a->babba, b->bab,
WordMorphism: a->abbab, b->abb,
WordMorphism: a->baba, b->bba,
WordMorphism: a->babab, b->bab,
WordMorphism: a->ababb, b->abb,
WordMorphism: a->babba, b->bba,
WordMorphism: a->abbab, b->bab]
```
partition_of_domain_alphabet()

Return a partition of the domain alphabet.

Let \( \varphi : \Sigma^* \to \Sigma^* \) be an involution. There exists a triple of sets \((A, B, C)\) such that

- \( A \cup B \cup C = \Sigma \);
- \( A, B \) and \( C \) are mutually disjoint and
- \( \varphi(A) = B, \varphi(B) = A, \varphi(C) = C \).

These sets are not unique.

INPUT:
- \texttt{self} – An involution.

OUTPUT:
A tuple of three sets

EXAMPLES:

```
sage: m = WordMorphism('a->b,b->a')
sage: m.partition_of_domain_alphabet() # random ordering
(('a'), ('b'), ()
sage: m = WordMorphism('a->b,b->a,c->c')
sage: m.partition_of_domain_alphabet() # random ordering
(('a'), ('b'), ('c'))
sage: m = WordMorphism('a->a,b->b,c->c')
sage: m.partition_of_domain_alphabet() # random ordering
((), (), ('a', 'b', 'c'))
sage: m = WordMorphism('A->T,T->A,C->G,G->C')
sage: m.partition_of_domain_alphabet() # random ordering
(('A', 'C'), ('T', 'G'), ())
sage: I = WordMorphism({0:oo,oo:0,1:-1,-1:1,2:-2,-2:2,3:-3,-3:3})
sage: I.partition_of_domain_alphabet() # random ordering
((0, -1, -3, -2), {1, 2, 3, +Infinity}, ())
```

```python
t from sage.all import *
t m = WordMorphism('a->b,b->a')
t m.partition_of_domain_alphabet() # random ordering
(('a'), ('b'), ())
t m = WordMorphism('a->b,b->a,c->c')
t m.partition_of_domain_alphabet() # random ordering
(('a'), ('b'), ('c'))
t m = WordMorphism('a->a,b->b,c->c')
t m.partition_of_domain_alphabet() # random ordering
((), (), ('a', 'b', 'c'))
t m = WordMorphism('A->T,T->A,C->G,G->C')
t m.partition_of_domain_alphabet() # random ordering
(('A', 'C'), ('T', 'G'), ())
t I = WordMorphism({Integer(0):oo,oo:Integer(0),Integer(1):-Integer(1),-
-Integer(1):Integer(1),Integer(2):-Integer(2),-Integer(2):Integer(2),

```
Combinatorics, Release 10.4

Integer(3):-Integer(3),-Integer(3):Integer(3)})
>>> I.partition_of_domain_alphabet() # random ordering
({0, -1, -3, -2}, {1, 2, 3, +Infinity}, {})
˓→

periodic_point(letter)
Return the periodic point of self that starts with letter.
EXAMPLES:
sage: f = WordMorphism( a->bab,b->ab )
sage: f.periodic_point( a )
word: abbababbababbabababbababbabababbababbaba...
sage: f.fixed_point( a )
Traceback (most recent call last):
...
TypeError: self must be prolongable on a
>>> from sage.all import *
>>> f = WordMorphism( a->bab,b->ab )
>>> f.periodic_point( a )
word: abbababbababbabababbababbabababbababbaba...
>>> f.fixed_point( a )
Traceback (most recent call last):
...
TypeError: self must be prolongable on a

Make sure that Issue #31759 is fixed:
sage: WordMorphism( a->b,b->a ).periodic_point( a )
word: a
>>> from sage.all import *
>>> WordMorphism( a->b,b->a ).periodic_point( a )
word: a

periodic_points()
Return the periodic points of f as a list of tuples where each tuple is a periodic orbit of f.
EXAMPLES:
sage: f = WordMorphism( a->aba,b->baa )
sage: for p in f.periodic_points():
....:
print("{} , {}".format(len(p), p[0]))
1 , ababaaababaaabaabaababaaababaaabaabaabab...
1 , baaabaabaababaaabaababaaabaababaaababaaa...
sage: f = WordMorphism( a->bab,b->aa )
sage: for p in f.periodic_points():
....:
print("{} , {}".format(len(p), p[0]))
2 , aababaaaababaababbabaababaababbabaababaa...
sage: f.fixed_points()
[]
>>> from sage.all import *
>>> f = WordMorphism( a->aba,b->baa )
(continues on next page)

```

5.1. Comprehensive Module List

5869
Combinatorics, Release 10.4

```python
>>> from sage.all import *
>>> WordMorphism('a->a,b->bb').periodic_points()
[[word: bbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbb...]]
```

**pisot_eigenvector_left()**

Return the left eigenvector of the incidence matrix associated to the largest eigenvalue (in absolute value).

Unicity of the result is guaranteed when the multiplicity of the largest eigenvalue is one, for example when self is a Pisot irreducible substitution.

A substitution is Pisot irreducible if the characteristic polynomial of its incidence matrix is irreducible over \( \mathbb{Q} \) and has all roots, except one, of modulus strictly smaller than 1.

**INPUT:**

- `self` - a Pisot irreducible substitution.

**EXAMPLES:**

```python
sage: m = WordMorphism('a->aaaabc,b->aaabbc,c->aabc')
sage: matrix(m)  # needs sage.modules
[4 3 2]
[2 2 1]
[1 1 1]
sage: m.pisot_eigenvector_left()  # needs sage.modules sage.rings.number_field
(1, 0.8392867552141611?, 0.5436890126920763?)
```

```python
>>> from sage.all import *
>>> m = WordMorphism('a->aaaabc,b->aaabbc,c->aabc')
>>> matrix(m)  # needs sage.modules
[4 3 2]
[2 2 1]
[1 1 1]
>>> m.pisot_eigenvector_left()  # needs sage.modules sage.rings.number_field
(1, 0.8392867552141611?, 0.5436890126920763?)
```

**pisot_eigenvector_right()**

Return the right eigenvector of the incidence matrix associated to the largest eigenvalue (in absolute value).

Unicity of the result is guaranteed when the multiplicity of the largest eigenvalue is one, for example when self is a Pisot irreducible substitution.

A substitution is Pisot irreducible if the characteristic polynomial of its incidence matrix is irreducible over \( \mathbb{Q} \) and has all roots, except one, of modulus strictly smaller than 1.

**INPUT:**

- `self` - a Pisot irreducible substitution.

**EXAMPLES:**

```python
sage: m = WordMorphism('a->aaaabc,b->aaabbc,c->aabc')
sage: matrix(m)  # needs sage.modules
[4 3 2]
[2 2 1]
[1 1 1]
>>> m.pisot_eigenvector_right()  # needs sage.modules sage.rings.number_field
(1, 0.8392867552141611?, 0.5436890126920763?)
```
rauzy_fractal_plot(n=None, exchange=False, eig=None, translate=None, prec=53, colormap='hsv', opacity=None, plot_origin=None, plot_basis=False, point_size=None)

Return a plot of the Rauzy fractal associated with a substitution.

The substitution does not have to be irreducible. The usual definition of a Rauzy fractal requires that its
dominant eigenvalue is a Pisot number but the present method doesn’t require this, allowing to plot some
interesting pictures in the non-Pisot case (see the examples below).

For more details about the definition of the fractal and the projection which is used, see Section 3.1 of [1].

Plots with less than 100,000 points take a few seconds, and several millions of points can be plotted in
reasonable time.

Other ways to draw Rauzy fractals (and more generally projections of paths) can be found in Sage.
combinat.words.paths.FiniteWordPath_all.plot_projection() or in Sage.
combinat.e_one_star().

OUTPUT:
A Graphics object.

INPUT:

• n – integer (default: None) The number of points used to plot the fractal. Default values: 1000 for a
  1D fractal, 50000 for a 2D fractal, 10000 for a 3D fractal.

• exchange – boolean (default: False). Plot the Rauzy fractal with domain exchange.

• eig – a real element of QQbar of degree >= 2 (default: None). The eigenvalue used to plot the fractal.
  It must be an eigenvalue of self.incidence_matrix(). The one used by default is the maximal
  eigenvalue of self.incidence_matrix() (usually a Pisot number), but for substitutions with
  more than 3 letters other interesting choices are sometimes possible.

• translate – a list of vectors of RR^n size_alphabet, or a dictionary from the alphabet to lists of
  vectors (default: None). Plot translated copies of the fractal. This option allows to plot tilings easily.
  The projection used for these vectors is the same as the projection used for the canonical basis to plot
  the fractal. If the input is a list, all the pieces will be translated and plotted. If the input is a dictionary,
  each piece will be translated and plotted accordingly to the vectors associated with each letter in the
dictionary. Note: by default, the Rauzy fractal placed at the origin is not plotted with the translate
  option; the vector (0,0,...,0) has to be added manually.
• **prec** – integer (default: 53). The number of bits used in the floating point representations of the points of the fractal.

• **colormap** – color map or dictionary (default: 'hsv'). It can be one of the following:
  - string – a coloring map. For available coloring map names type: `sorted(colormaps)`
  - dict – a dictionary of the alphabet mapped to colors.

• **opacity** – a dictionary from the alphabet to the real interval [0, 1] (default: None). If none is specified, all letters are plotted with opacity 1.

• **plot_origin** – a couple (k, c) (default: None). If specified, mark the origin by a point of size k and color c.

• **plot_basis** – boolean (default: False). Plot the projection of the canonical basis with the fractal.

• **point_size** – float (default: None). The size of the points used to plot the fractal.

**EXAMPLES:**

1. The Rauzy fractal of the Tribonacci substitution:

```python
sage: s = WordMorphism('1->12,2->13,3->1')
sage: s.rauzy_fractal_plot()  # long time
    # needs sage.plot
Graphics object consisting of 3 graphics primitives
```

```python
>>> from sage.all import *
```

```python
sage: s = WordMorphism('1->12,2->13,3->1')
sage: s.rauzy_fractal_plot()  # long time
    # needs sage.plot
```

2. The “Hokkaido” fractal. We tweak the plot using the plotting options to get a nice reusable picture, in which we mark the origin by a black dot:

```python
sage: s = WordMorphism(a->ab,b->c,c->d,d->e,e->a)
sage: G = s.rauzy_fractal_plot(n=100000, point_size=3, plot_origin=(50,"black"))
sage: G.show(figsize=10, axes=false)  # not tested
```

```python
>>> from sage.all import *
```

```python
sage: s = WordMorphism(a->ab,b->c,c->d,d->e,e->a)
```

```python
sage: G = s.rauzy_fractal_plot(n=Integer(100000), point_size=Integer(3), plot_origin=(Integer(50),"black"))
```

```python
>>> G.show(figsize=Integer(10), axes=false)  # not tested
```

3. Another “Hokkaido” fractal and its domain exchange:

```python
sage: s = WordMorphism({1:[2], 2:[4,3], 3:[4], 4:[5,3], 5:[6], 6:[1]})
sage: s.rauzy_fractal_plot()  # not tested
```

```python
sage: s.rauzy_fractal_plot(exchange=True)  # not tested
```

```python
sage: s.rauzy_fractal_plot()  # not tested
```

sage: s.rauzy_fractal_plot(exchange=True)  # not tested
4. A three-dimensional Rauzy fractal:
```
>>> from sage.all import *
>>> s = WordMorphism({Integer(1):[Integer(2)], Integer(2):[Integer(4),
   Integer(3)], Integer(3):[Integer(4)], Integer(4):[Integer(5),
   Integer(3)], Integer(5):[Integer(6)], Integer(6):[Integer(1)]})
>>> s.rauzy_fractal_plot()  # not tested (> 1 second)
>>> s.rauzy_fractal_plot(exchange=True)  # not tested (> 1 second)
```

5. A one-dimensional Rauzy fractal (very scattered):
```
>>> from sage.all import *
>>> s = WordMorphism({Integer(1):[Integer(2)], Integer(2):[Integer(3),
   Integer(4), Integer(5), Integer(6), Integer(7)], Integer(3):[Integer(4)],
   Integer(4):[Integer(5)], Integer(5):[Integer(6)], Integer(6):[Integer(7)],
   Integer(7):[Integer(1)]})
>>> s.rauzy_fractal_plot()  # not tested (> 1 second)
```

6. A high resolution plot of a complicated fractal:
```
>>> from sage.all import *
>>> s = WordMorphism({Integer(1):[Integer(2)], Integer(2):[Integer(3),
   Integer(4), Integer(5), Integer(6), Integer(7), Integer(8)], Integer(3):[Integer(4)],
   Integer(4):[Integer(5)], Integer(5):[Integer(6)], Integer(6):[Integer(7)],
   Integer(7):[Integer(8)], Integer(8):[Integer(1)]})
>>> s.rauzy_fractal_plot(n=300000)  # not tested (> 1 second)
>>> s.show(axes=False, figsize=20)  # not tested (> 1 second)
```

7. A nice colorful animation of a domain exchange:
```
>>> from sage.all import *
>>> s = WordMorphism({Integer(1):[Integer(2)], Integer(2):[Integer(3),
   Integer(4), Integer(5), Integer(6), Integer(7), Integer(8)], Integer(3):[Integer(4)],
   Integer(4):[Integer(5)], Integer(5):[Integer(6)], Integer(6):[Integer(7)],
   Integer(7):[Integer(8)], Integer(8):[Integer(1)]})
>>> s.rauzy_fractal_plot(n=300000)  # not tested (> 1 second)
>>> s.show(axes=False, figsize=20)  # not tested (> 1 second)
>>> s.animate()  # not tested (> 1 second)
```
8. Plotting with only one color:

```
sage: s = WordMorphism('1->12,2->31,3->1')
sage: cm = {'1':'black', '2':'black', '3':'black'}
sage: s.rauzy_fractal_plot(colormap=cm)  # not tested (> 1 second)
```

9. Different fractals can be obtained by choosing another (non-Pisot) eigenvalue:

```
sage: s = WordMorphism('1->122->3,3->45,4->5,5->6,6->7,7->8,8->1')
esage: E = s.incidence_matrix().eigenvalues()  # needs sage.modules
sage: x = [x for x in E if -0.8 < x < -0.7][0]  # needs sage.modules
sage: s.rauzy_fractal_plot(eig=x)  # not tested (> 1 second)
sage: s.rauzy_fractal_plot()  # not tested (> 1 second)
```

10. A Pisot reducible substitution with seemingly overlapping tiles:

```
sage: s = WordMorphism({1:[1,2], 2:[2,3], 3:[4], 4:[5], 5:[6],
....: 6:[7], 7:[8], 8:[9], 9:[10], 10:[1]})
sage: s.rauzy_fractal_plot()  # not tested (> 1 second)
```

(continues on next page)
11. A non-Pisot reducible substitution with a strange Rauzy fractal:

```sage
s = WordMorphism({1:[3, 2], 2:[3, 3], 3:[4], 4:[1]})
s.rauzy_fractal_plot()  # not tested (> 1 second)
```

12. A substitution with overlapping tiles. We use the options colormap and opacity to study how the tiles overlap:

```sage
s = WordMorphism('1->213, 2->4, 3->5, 4->1, 5->21')
s.rauzy_fractal_plot()  # not tested (> 1 second)
s.rauzy_fractal_plot(colormap={1:red, 4:purple})  # not tested (> 1 second)
s.rauzy_fractal_plot(n=Integer(150000), opacity={1:0.1, 2:1, 3:0.1, 4:0.1, 5:0.1})  # not tested (> 1 second)
```

13. Funny experiments by playing with the precision of the float numbers used to plot the fractal:

```sage
s = WordMorphism('1->12, 2->13, 3->1')
s.rauzy_fractal_plot(prec=6)  # not tested
s.rauzy_fractal_plot(prec=9)  # not tested
s.rauzy_fractal_plot(prec=15)  # not tested
s.rauzy_fractal_plot(prec=19)  # not tested
s.rauzy_fractal_plot(prec=25)  # not tested
```
14. Using the `translate` option to plot periodic tilings:

```python
>>> from sage.all import *

>>> s = WordMorphism('1->12,2->13,3->1')

>>> s.rauzy_fractal_plot(prec=Integer(6))  # not tested
>>> s.rauzy_fractal_plot(prec=Integer(9))  # not tested
>>> s.rauzy_fractal_plot(prec=Integer(15))  # not tested
>>> s.rauzy_fractal_plot(prec=Integer(19))  # not tested
>>> s.rauzy_fractal_plot(prec=Integer(25))  # not tested
```

```python
sage: s = WordMorphism('1->12,2->13,3->1')  # substitution

sage: s.rauzy_fractal_plot(n=10000, translate=[(0,0,0),(-1,0,1),(0,-1,1),(1,-1,0),
(1,0,-1),(0,1,-1),(-1,1,0)])  # not tested (> 1 second)
```

```python
>>> from sage.all import *

>>> s = WordMorphism('1->12,2->13,3->1')

>>> s.rauzy_fractal_plot(n=Integer(10000), translate=[(Integer(0),Integer(0),Integer(0)),(-
Integer(1),Integer(0),Integer(1)),(Integer(0),-Integer(1),Integer(1)),
(Integer(1),-Integer(1),Integer(0)),(Integer(1),Integer(0),-Integer(1)),(Integer(0),Integer(1),-Integer(1)),(-Integer(1),Integer(1),
Integer(0))])  # not tested (> 1 second)
```

```python
sage: t = WordMorphism("a->ac,b->d,C->de,d->a,e->ab")  # substitution

sage: V = [vector((0,0,1,0,-1)), vector((0,0,1,-1,0))]  # needs sage.modules
sage: S = [i*V[0] + j*V[1] for i in [-1,0,1] for j in [-1,0,1]]  # needs sage.modules
sage: t.rauzy_fractal_plot(n=Integer(10000), translate=S, exchange=true)  # not tested (> 1 second)
```

```python
>>> from sage.all import *

>>> t = WordMorphism("a->ac,b->d,C->de,d->a,e->ab")  # substitution

>>> V = [vector((0,0,1,0,-1)), vector((0,0,1,-1,0)), vector((0,0,0,1,-1))]

>>> S = set(map(tuple, [i*V[0] + j*V[1] + k*V[2] for i in [-1,0,1] for j in [-1,0,1] for k in [-1,0,1]]))

>>> t.rauzy_fractal_plot(n=Integer(10000), translate=S, exchange=true)  # not tested (> 1 second)
```
15. Using the `translate` option to plot arbitrary tilings with the fractal pieces. This can be used for example to plot the self-replicating tiling of the Rauzy fractal:

```python
sage: s = WordMorphism({1:[1,2], 2:[3], 3:[4,3], 4:[5], 5:[6], 6:[1]})
sage: s.rauzy_fractal_plot()   # not tested (> 1 second)
sage: D = {1: [(0,0,0,0,0,0), (0,1,0,0,0,0)], 3: [(0,0,0,0,0,0), (0,1,0,0,0,0)], 6: [(0,0,0,0,0,0)]}
sage: s.rauzy_fractal_plot(n=30000, translate=D)  # not tested (> 1 second)
```

16. Plot the projection of the canonical basis with the fractal:

```python
>>> from sage.all import *

>>> s = WordMorphism({1:[2,1], 2:[3], 3:[6,4], 4:[5,1], 5:[6], 6:[7], 7:[8], 8:[9], 9:[1]})

>>> s.rauzy_fractal_plot(plot_basis=True)   # not tested (> 1 second)
```

REFERENCES:

AUTHOR:

Timo Jolivet (2012-06-16)

`rauzy_fractal_points (n=None, exchange=False, eig=None, translate=None, prec=53)`

Return a dictionary of list of points associated with the pieces of the Rauzy fractal of self.

INPUT:

See the method `rauzy_fractal_plot()` for a description of the options and more examples.
OUTPUT:

dictionary of list of points

EXAMPLES:
The Rauzy fractal of the Tribonacci substitution and the number of points in the piece of the fractal associated with '1', '2' and '3' are respectively:

```sage
s = WordMorphism('1->12,2->13,3->1')
sage: D = s.rauzy_fractal_points(n=100)  # needs sage.modules
sage: len(D['1'])  # needs sage.modules
54
sage: len(D['2'])  # needs sage.modules
30
sage: len(D['3'])  # needs sage.modules
16
```

AUTHOR:
Timo Jolivet (2012-06-16)

\texttt{rauzy_fractal_projection} (\texttt{eig=\texttt{None}, \texttt{prec=53})

Return a dictionary giving the projection of the canonical basis.

See the method \texttt{rauzy_fractal_plot()} for more details about the projection.

INPUT:

- \texttt{eig} – a real element of \texttt{QQbar} of degree \geq 2 (default: \texttt{None}). The eigenvalue used for the projection. It must be an eigenvalue of \texttt{self.incidence_matrix()}. The one used by default is the maximal eigenvalue of \texttt{self.incidence_matrix()} (usually a Pisot number), but for substitutions with more than 3 letters other interesting choices are sometimes possible.
- \texttt{prec} – integer (default: 53). The number of bits used in the floating point representations of the coordinates.

OUTPUT:

dictionary, letter \rightarrow vector, giving the projection

EXAMPLES:
The projection for the Rauzy fractal of the Tribonacci substitution is:
AUTHOR:

Timo Jolivet (2012-06-16)

**restrict_domain** *(alphabet)*  
Return a restriction of self to the given alphabet.

**INPUT:**
- alphabet – an iterable

**OUTPUT:**
WordMorphism

**EXAMPLES:**

```python
sage: m = WordMorphism('a->b,b->a')
sage: m.restrict_domain('a')
WordMorphism: a->b
sage: m.restrict_domain('a')
WordMorphism: a->b
```

The input alphabet must be iterable:

```python
sage: m.restrict_domain(66)
Traceback (most recent call last):
  ...
TypeError: 'sage.rings.integer.Integer' object is not iterable
```
reversal()  
Return the reversal of self.

EXAMPLES:

```python
sage: WordMorphism('6->ab,y->5,0->asd').reversal()
WordMorphism: 0->dsa, 6->ba, y->5
sage: WordMorphism('a->ab,b->a').reversal()
WordMorphism: a->ba, b->a
```

simplify_alphabet_size(Z=None)  
If this morphism is simplifiable, return morphisms $h$ and $k$ such that this morphism is simplifiable with respect to $h$ and $k$, otherwise raise ValueError.

This method is quite fast if this morphism is non-injective, but very slow if it is injective.

Let $f : X^* \to Y^*$ be a morphism. Then $f$ is simplifiable with respect to morphisms $h : X^* \to Z^*$ and $k : Z^* \to Y^*$, if $f = k \circ h$ and $|Z| < |X|$. If also $Y \subseteq X$, then the morphism $g : Z^* \to Z^* = h \circ k$ is a simplification of $f$ (with respect to $h$ and $k$).

Loosely speaking, a morphism is simplifiable if it contains “more letters than is needed”. Non-injectivity implies simplifiability. Simplification preserves some properties of the original morphism (e.g. repetitiveness).

For more information see Section 3 in [KO2000].

INPUT:

- Z – iterable (default: self.domain().alphabet()), whose elements are used as an alphabet for the simplification.

EXAMPLES:

Example of a simplifiable (non-injective) morphism:

```python
sage: f = WordMorphism('a->aca,b->badc,c->acab,d->adc')
sage: h, k = f.simplify_alphabet_size('xyz'); h, k
(WordMorphism: a->x, b->zy, c->xz, d->y, WordMorphism: x->aca, y->adc, z->b)
sage: k * h == f
True
sage: g = h * k; g
WordMorphism: x->xxzx, y->xyxz, z->zy
```

(continues on next page)
Example of a simplifiable (injective) morphism:

```sage
f = WordMorphism('a->abcc,b->abcd,c->abdc,d->abdd')
h, k = f.simplify_alphabet_size('xyz'); h, k
(WordMorphism: a->xyy, b->xyz, c->xzy, d->xzz, WordMorphism: x->ab, y->c, z->d)
k * h == f
True
g = h * k; g
WordMorphism: x->xyyxyz, y->xzy, z->xzz
```

Example of a non-simplifiable morphism:

```sage
f = WordMorphism('a->aa').simplify_alphabet_size()
Traceback (most recent call last):
... Value Error: self (a->aa) is not simplifiable
```

Example of an erasing morphism:

```sage
f = WordMorphism('a->abc,b->cc,c->')
h, k = f.simplify_alphabet_size(); h, k
(WordMorphism: a->a, b->b, c->, WordMorphism: a->abc, b->cc)
k * h == f
True
g = h * k; g
WordMorphism: a->ab, b->
```
Example of a morphism, that is not an endomorphism:

```python
sage: f = WordMorphism('a->xx,b->xy,c->yx,d->yy')
sage: h, k = f.simplify_alphabet_size(NN); h, k
(WordMorphism: a->00, b->01, c->10, d->11, WordMorphism: 0->x, 1->y)
sage: k * h == f
True
sage: len(k.domain().alphabet()) < len(f.domain().alphabet())
True
```

```python
>>> from sage.all import *
>>> f = WordMorphism('a->xx,b->xy,c->yx,d->yy')
>>> h, k = f.simplify_alphabet_size(NN); h, k
(WordMorphism: a->00, b->01, c->10, d->11, WordMorphism: 0->x, 1->y)
>>> k * h == f
True
>>> len(k.domain().alphabet()) < len(f.domain().alphabet())
True
```

**simplify_until_injective()**

Return a quadruplet \((g, h, k, i)\), where \(g\) is an injective simplification of this morphism with respect to \(h, k\) and \(i\).

Requires this morphism to be an endomorphism.

This method basically calls `simplify_alphabet_size()` until the returned simplification is injective. If this morphism is already injective, a quadruplet \((g, h, k, i)\) is still returned, where \(g\) is this morphism, \(h\) and \(k\) are the identity morphisms and \(i = 0\).

Let \(f : X^* \rightarrow Y^*\) be a morphism and \(Y \subseteq X\). Then \(g : Z^* \rightarrow Z^*\) is an injective simplification of \(f\) with respect to morphisms \(h : X^* \rightarrow Z^*\) and \(k : Z^* \rightarrow Y^*\) and a positive integer \(i\), if \(g\) is injective, \(|Z| < |X|\), \(g^i = h \circ k\) and \(f^i = k \circ h\).

For more information see Section 4 in [KO2000].

**EXAMPLES:**

```python
sage: f = WordMorphism('a->abc,b->a,c->bc')
sage: g, h, k, i = f.simplify_until_injective(); g, h, k, i
(WordMorphism: a->aa, WordMorphism: a->aa, b->a, c->a, WordMorphism: a->abc,␣
˓→2)
sage: g.is_injective()
True
sage: g**i == h * k
True
sage: f**i == k * h
True
```

```python
>>> from sage.all import *
>>> f = WordMorphism('a->abc,b->a,c->bc')
>>> g, h, k, i = f.simplify_until_injective(); g, h, k, i
(WordMorphism: a->aa, WordMorphism: a->aa, b->a, c->a, WordMorphism: a->abc,␣
˓→2)
>>> g.is_injective()
True
>>> g**i == h * k
True
>>> f**i == k * h
True
```
sage.combinat.words.morphism.get_cycles(f, domain)

Return the list of cycles of the function f contained in domain.

INPUT:

• f – function.

• domain – iterable, a subdomain of the domain of definition of f.

EXAMPLES:

```
sage: from sage.combinat.words.morphism import get_cycles
sage: get_cycles(lambda i: (i+1)%3, [0,1,2])
[(0, 1, 2)]
sage: get_cycles(lambda i: [0,0,0][i], [0,1,2])
[(0,)]
sage: get_cycles(lambda i: [1,1,1][i], [0,1,2])
[(1,)]
sage: get_cycles(lambda i: [2,3,0][i], [0,1,2])
[(0, 2)]
sage: d = {'a': 'a', 'b': 'b'}
sage: get_cycles(d.__getitem__, 'ba')
[('b',), ('a',)]
```

```
>>> from sage.all import *
>>> from sage.combinat.words.morphism import get_cycles
>>> get_cycles(lambda i: (i+Integer(1))%Integer(3), [Integer(0),Integer(1),
Integer(2)])
[(0, 1, 2)]
>>> get_cycles(lambda i: [Integer(0),Integer(0),Integer(0)][i], [Integer(0),
Integer(1),Integer(2)])
[(0,)]
>>> get_cycles(lambda i: [Integer(1),Integer(1),Integer(1)][i], [Integer(0),
Integer(1),Integer(2)])
[(1,)]
>>> get_cycles(lambda i: [Integer(2),Integer(3),Integer(0)][i], [Integer(0),
Integer(1),Integer(2)])
[(0, 2)]
>>> d = {'a': 'a', 'b': 'b'}
>>> get_cycles(d.__getitem__, 'ba')
[('b',), ('a',)]
```

5.1.362 Word paths

This module implements word paths, which is an application of Combinatorics on Words to Discrete Geometry. A word path is the representation of a word as a discrete path in a vector space using a one-to-one correspondence between the alphabet and a set of vectors called steps. Many problems surrounding 2d lattice polygons (such as questions of self-intersection, area, inertia moment, etc.) can be solved in linear time (linear in the length of the perimeter) using theory from Combinatorics on Words.

On the square grid, the encoding of a path using a four-letter alphabet (for East, North, West and South directions) is also known as the Freeman chain code [1,2] (see [3] for further reading).

AUTHORS:

• Arnaud Bergeron (2008) : Initial version, path on the square grid

• Sébastien Labbé (2009-01-14) : New classes and hierarchy, doc and functions.
EXAMPLES:

The combinatorial class of all paths defined over three given steps:

```python
sage: P = WordPaths('abc', steps=[(1,2), (-3,4), (0,-3)]); P
Word Paths over 3 steps
```

```python
>>> from sage.all import *

>>> P = WordPaths('abc', steps=[(Integer(1),Integer(2)), (-Integer(3),Integer(4)), (-Integer(0),-Integer(3))]); P
Word Paths over 3 steps
```

This defines a one-to-one correspondence between alphabet and steps:

```python
sage: d = P.letters_to_steps()
sage: sorted(d.items())
[('a', (1, 2)), ('b', (-3, 4)), ('c', (0, -3))]
```

Creation of a path from the combinatorial class P defined above:

```python
sage: p = P('abaccba'); p
Path: abaccba
```

```python
>>> from sage.all import *

>>> p = P('abaccba'); p
Path: abaccba
```

Many functions can be used on p: the coordinates of its trajectory, ask whether p is a closed path, plot it and many other:

```python
sage: list(p.points())
[(0, 0), (1, 2), (-2, 6), (-1, 8), (-1, 5), (-1, 2), (-4, 6), (-3, 8)]
sage: p.is_closed()
False
```

```python
>>> from sage.all import *

>>> list(p.points())
[(0, 0), (1, 2), (-2, 6), (-1, 8), (-1, 5), (-1, 2), (-4, 6), (-3, 8)]
```

```python
>>> p.is_closed()
False
```

```python
>>> p.plot()  # needs sage.plot
Graphics object consisting of 3 graphics primitives
```

```python
>>> from sage.all import *

>>> list(p.points())
[(0, 0), (1, 2), (-2, 6), (-1, 8), (-1, 5), (-1, 2), (-4, 6), (-3, 8)]
```

```python
>>> p.plot()  # needs sage.plot
Graphics object consisting of 3 graphics primitives
```

To obtain a list of all the available word path specific functions, use `help(p):`

```python
sage: help(p)
Help on FiniteWordPath_2d_str in module sage.combinat.words.paths object:
...
Methods inherited from FiniteWordPath_2d:
```

(continues on next page)
Methods inherited from FiniteWordPath_all:
...

```python
>>> from sage.all import *

>>> help(p)
Help on FiniteWordPath_2d_str in module sage.combinat.words.paths object:
...
Methods inherited from FiniteWordPath_2d:
...
Methods inherited from FiniteWordPath_all:
...
```

Since `p` is a finite word, many functions from the word library are available:

```python
sage: p.crochemore_factorization()
(a, b, a, c, c, ba)
sage: p.is_palindrome()
False
sage: p[:3]
Path: aba
sage: len(p)
7
```

```python
>>> from sage.all import *

>>> p.crochemore_factorization()
(a, b, a, c, c, ba)
>>> p.is_palindrome()
False
>>> p[:Integer(3)]
Path: aba
>>> len(p)
7
```

`P` also inherits many functions from `Words`:

```python
sage: P = WordPaths('rs', steps=[(1,2), (-1,4)]); P
Word Paths over 2 steps
sage: P.alphabet()
{'r', 's'}
sage: list(P.iterate_by_length(3))
[Path: rrr,
 Path: rrs,
 Path: rsr,
 Path: rss,
 Path: srr,
 Path: srs,
 Path: ssr,
 Path: sss]
```

```python
>>> from sage.all import *

>>> P = WordPaths('rs', steps=[(Integer(1),Integer(2)), (-Integer(1),Integer(4))]); P
Word Paths over 2 steps
>>> P.alphabet()
{'r', 's'}
```
When the number of given steps is half the size of alphabet, the opposite of vectors are used:

```python
sage: P = WordPaths('abcd', [(1,0), (0,1)])
sage: sorted(P.letters_to_steps().items())
[('a', (1, 0)), ('b', (0, 1)), ('c', (-1, 0)), ('d', (0, -1))]
```

Some built-in combinatorial classes of paths:

```python
sage: P = WordPaths('abAB', steps=square_grid); P
Word Paths on the square grid
```

```python
sage: D = WordPaths('()', steps=dyck); D
Finite Dyck paths
sage: d = D('()()()()()'); d
Path: ()()()()()
```

```python
sage: d.plot()  # needs sage.plot
Graphics object consisting of 3 graphics primitives
```

```python
sage: P = WordPaths('abcdef', steps=triangle_grid)
sage: p = P(babaddefadabdefaaddfaabacdefa)
sage: p.plot()  # needs sage.plot
Graphics object consisting of 3 graphics primitives
```
Vector steps may be in more than 2 dimensions:

```python
sage: d = [(1,0,0), (0,1,0), (0,0,1)]
sage: P = WordPaths(alphabet='abc', steps=d); P
Word Paths over 3 steps
sage: p = P('abcabcabcbaabacaabcaabcaabacacacacbcac')
sage: p.plot()  # needs sage.plot
Graphics3d Object
```

```python
sage: d = [(1,3,5,1), (-5,1,-6,0), (0,0,1,9), (4,2,-1,0)]
sage: P = WordPaths(alphabet='rstu', steps=d); P
Word Paths over 4 steps
sage: p = P('rtusuusususutursust'); p
Path: rtusuusususutursust
sage: p.end_point()
(5, 31, -26, 30)
```

```python
sage: CubePaths = WordPaths(abcABC, steps=cube_grid); CubePaths
Word Paths on the cube grid
sage: CubePaths('abcabaabcabAAAAA').plot()  # needs sage.plot
Graphics3d Object
```

```python
sage: CubePaths = WordPaths('abcABC', steps=cube_grid); CubePaths
Word Paths on the cube grid
```

(continues on next page)
The input data may be a str, a list, a tuple, a callable or a finite iterator:

```python
sage: P = WordPaths([0, 1, 2, 3])
sage: P([0,1,2,3,2,1,2,3,2])
Path: 012321232
Path: 012321232
sage: P((0,1,2,3,2,1,2,3,2))
Path: 012321232
Path: 012321232
sage: P(lambda n:n%4, length=10)
Path: 0123012301
sage: P(iter([0,3,2,1]), length='finite')
Path: 0321
```

- [5] Wikipedia article Dyck_word

class sage.combinat.words.paths.FiniteWordPath_2d

Bases: FiniteWordPath_all

animate()

Return an animation object illustrating the path growing step by step.

EXAMPLES:

```python
sage: P = WordPaths('abAB')
sage: p = P('aaababbb')
sage: a = p.animate(); print(a)  #...

Animation with 9 frames
sage: show(a)  # long time, optional - imagemagick,
```

(continues on next page)
The code block is a continuation from the previous page and includes various SageMath code snippets demonstrating the usage of the `WordPaths` class along with animation. Here is the continuation of the code block:

```python
>>> from sage.all import *
>>> P = WordPaths('abAB')
>>> p = P('aaababbb')
>>> a = p.animate(); print(a)  # needs sage.plot
Animation with 9 frames
```

```python
>>> show(a)  # long time, optional - imagemagick, needs sage.plot
```

```python
sage: P = WordPaths('abcdef', steps='triangle')
sage: p = P('abcdef')
sage: a = p.animate(); print(a)  # needs sage.plot
Animation with 8 frames
```

```python
sage: show(a)  # long time, optional - imagemagick, needs sage.plot
```

If the path is closed, the plain polygon is added at the end of the animation:

```python
sage: P = WordPaths('abAB')
sage: p = P('ababAbABABaB')
sage: a = p.animate(); print(a)  # needs sage.plot
Animation with 14 frames
```

```python
sage: show(a)  # long time, optional - imagemagick, needs sage.plot
```

Another example illustrating a Fibonacci tile:

```python
sage: w = words.fibonacci_tile(2)
sage: a = w.animate(); print(a)  # needs sage.plot
```

This concludes the code block and provides examples of using SageMath for creating animations and visualizations.
The first 4 Fibonacci tiles in an animation:

```
from sage.all import *

w = words.fibonacci_tile(Integer(2))
a = w.animate(); print(a)  # long time, optional - imagemagick

show(a)                      # long time, optional - imagemagick, needs
```

Note: If ImageMagick is not installed, you will get an error message like this:

```
convert: not found
```

Error: ImageMagick does not appear to be installed. Saving an animation to a GIF file or displaying an animation requires ImageMagick, so please install it and try again.

See www.imagemagick.org, for example.

```
area()
```

Return the area of a closed path.

INPUT:

• self – a closed path

EXAMPLES:

```
sage: P = WordPaths('abcd', steps=[(1,1),(-1,1),(-1,-1),(1,-1)])
sage: p = P('abcd')
```
height()

Return the height of self.

The height of a $2d$-path is merely the difference between the highest and the lowest $y$-coordinate of each points traced by it.

OUTPUT:

non negative real number

EXAMPLES:

```python
sage: Freeman = WordPaths('abAB')
sage: Freeman('aababaabbbAA').height()
5
```

The function is well-defined if self is not simple or close:

```python
sage: Freeman('aabAAB').height()
1
sage: Freeman('abbABA').height()
2
```

This works for any $2d$-paths:

```python
sage: Paths = WordPaths('ab', steps=[(1,0),(1,1)])
sage: p = Paths('abbaa')
sage: p.height()
2
sage: DyckPaths = WordPaths('ab', steps='dyck')
sage: p = DyckPaths('abaabb')
sage: p.height()
2
sage: w = WordPaths('abcABC', steps='triangle')('ababcaabBC')
sage: w.height()
2.59807621135332
```
\[\text{>> from sage.all import \*}\\
\text{>> Paths = WordPaths('ab', steps=[(Integer(1),Integer(0)),(Integer(1), Integer(1))])}\\
\text{>> p = Paths('abbba')}\\
\text{>> p.height() = 2}\\
\text{>> DyckPaths = WordPaths('ab', steps='dyck')}\\
\text{>> p = DyckPaths('abaabb')}\\
\text{>> p.height() = 2}\\
\text{>> w = WordPaths('abcABC', steps='triangle')('ababcabABC')}\\
\text{>> w.height() = 2.59807621135332}\\
\]

\[\text{height_vector()}\]
Return the height at each point.

**EXAMPLES:**

\[\text{sage: Paths = WordPaths('ab', steps=[(1,0),(0,1)])}\\
\text{sage: p = Paths(abbba)}\\
\text{sage: p.height_vector()} = [0, 0, 1, 2, 3, 3]\\
\]

\[\text{plot(pathoptions={\{'rgbcolor': 'red', \'thickness\': 3\}}, fill=True, filloptions={\{'rgbcolor': 'red', \'alpha\': 0.2\}}, startpoint=True, startoptions={\{'rgbcolor': 'red', \'pointsize\': 100\}}, endarrow=True, arrowoptions={\{'rgbcolor': 'red', \'arrowsize\': 20, \'width\': 3\}, gridlines=False, gridoptions={}})\]
Return a 2d Graphics illustrating the path.

**INPUT:**

- pathoptions – (dict, default: dict(rgbcolor='red',thickness=3)), options for the path drawing
- fill – (boolean, default: True), if fill is True and if the path is closed, the inside is colored
- filloptions – (dict, default:dict(rgbcolor='red',alpha=0.2)), options for the inside filling
- startpoint – (boolean, default: True), draw the start point?
- startoptions – (dict, default:dict(rgbcolor='red',pointsize=100)) options for the start point drawing
- endarrow – (boolean, default: True), draw an arrow end at the end?
- arrowoptions – (dict, default:dict(rgbcolor='red',arrowsize=20, width=3)) options for the end point arrow
- gridlines – (boolean, default: False), show gridlines?
- gridoptions – (dict, default: {}), options for the gridlines

**EXAMPLES:**
A non closed path on the square grid:
Combinatorics, Release 10.4

```python
sage: P = WordPaths('abAB')
sage: P('abababAABAB').plot()  # needs sage.plot
Graphics object consisting of 3 graphics primitives
```

A closed path on the square grid:

```python
>>> from sage.all import *
>>> P = WordPaths('abAB')
>>> P('abababAABAB').plot()  # needs sage.plot
Graphics object consisting of 4 graphics primitives
```

A Dyck path:

```python
sage: P = WordPaths('()', steps='dyck')
sage: P('()()()((()))').plot()  # needs sage.plot
Graphics object consisting of 3 graphics primitives
```

A path in the triangle grid:

```python
>>> from sage.all import *
>>> P = WordPaths('abcdef', steps='triangle_grid')
>>> P('abcdefabcdefab').plot()  # needs sage.plot
Graphics object consisting of 3 graphics primitives
```

A polygon of length 220 that tiles the plane in two ways:

```python
sage: P = WordPaths('abAB')
sage: P('aBababAbabaBABAbaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaB

5.1. Comprehensive Module List

5893
```python
>>> from sage.all import *
>>> P = WordPaths('abAB')
>>> P('aBababAbabaBabaBabaBabaBababAbabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBabaBana
```

With gridlines:

```python
>>> from sage.all import *
>>> P('ababababab').plot(gridlines=True)  # needs sage.plot
```

```
plot_directive_vector (options={'rgbcolor': 'blue'})
```

Return an arrow 2d graphics that goes from the start of the path to the end.

INPUT:

- options – dictionary, default: {'rgbcolor': 'blue'} graphic options for the arrow

If the start is the same as the end, a single point is returned.

EXAMPLES:

```python
>>> from sage.all import *
>>> P = WordPaths('abcd'); P
Word Paths on the square grid
>>> p = P('aaaccacacacacacacacccbbdd'); p
Path: aaaccacacacacacacacccbbdd
>>> R = p.plot() + p.plot_directive_vector()  # needs sage.plot
>>> R.axes(False)  # needs sage.plot
>>> R.set_aspect_ratio(1)  # needs sage.plot
>>> R.plot()  # needs sage.plot
```

```
width ()
```

Return the width of self.
The height of a $2d$-path is merely the difference between the rightmost and the leftmost $x$-coordinate of each point traced by it.

**OUTPUT:**

non negative real number

**EXAMPLES:**

```python
sage: Freeman = WordPaths('abAB')
sage: Freeman('aababaabbbAA').width()
5

>>> from sage.all import *

>>> Freeman = WordPaths('abAB')

>>> Freeman('aababaabbbAA').width()
5
```

The function is well-defined if self is not simple or close:

```python
sage: Freeman('aabAB').width()
2
sage: Freeman('abbABa').width()
1

>>> from sage.all import *

>>> Freeman('aabAB').width()
2

>>> Freeman('abbABa').width()
1
```

This works for any $2d$-paths:

```python
sage: Paths = WordPaths('ab', steps=[(1,0),(1,1)])
sage: p = Paths('abbab')
sage: p.width()
5
sage: DyckPaths = WordPaths('ab', steps='dyck')
sage: p = DyckPaths('abaabb')
sage: p.width()
6
sage: w = WordPaths('abcABC', steps='triangle')('ababcaaBC')
sage: w.width()
4.50000000000000

>>> from sage.all import *

>>> Paths = WordPaths('ab', steps=[(Integer(1),Integer(0)),(Integer(1), Integer(1))])

>>> p = Paths('abbab')

>>> p.width()
5

>>> DyckPaths = WordPaths('ab', steps='dyck')

>>> p = DyckPaths('abaabb')

>>> p.width()
6

>>> w = WordPaths('abcABC', steps='triangle')('ababcaaBC')

>>> w.width()
4.50000000000000
```

5.1. Comprehensive Module List 5895
width_vector()

Return the width at each point.

EXAMPLES:

```python
sage: Paths = WordPaths('ab', steps=[(1,0),(0,1)])
sage: p = Paths('abbaa')
sage: p.width_vector()
[0, 1, 1, 1, 1, 2]
```

```python
>>> from sage.all import *

>>> Paths = WordPaths('ab', steps=[(Integer(1),Integer(0)),(Integer(0),
˓→Integer(1))])
>>> p = Paths('abbaa')
>>> p.width_vector()
[0, 1, 1, 1, 1, 2]
```

xmax()

Return the maximum of the x-coordinates of the path.

EXAMPLES:

```python
sage: P = WordPaths('0123')
sage: p = P('0101013332')
sage: p.xmax()
3
```

```python
>>> from sage.all import *

>>> P = WordPaths('0123')

>>> p = P('0101013332')

>>> p.xmax()
3
```

This works for any 2d-paths:

```python
sage: Paths = WordPaths('ab', steps=[(1,-1),(-1,1)])
sage: p = Paths('ababa')
sage: p.xmax()
1
sage: DyckPaths = WordPaths('ab', steps='dyck')
sage: p = DyckPaths('abaabb')
sage: p.xmax()
6
sage: w = WordPaths('abcABC', steps='triangle')('ababcaabC')
sage: w.xmax()
4.50000000000000
```

```python
>>> from sage.all import *

>>> Paths = WordPaths('ab', steps=[(Integer(1),-Integer(1)),(-Integer(1),
˓→Integer(1))])

>>> p = Paths('ababa')

>>> p.xmax()
1

>>> DyckPaths = WordPaths('ab', steps='dyck')

>>> p = DyckPaths('abaabb')

>>> p.xmax()
6
```

(continues on next page)
w = WordPaths('abcABC', steps='triangle')('ababcaaBC')

>>> w.xmax()
4.50000000000000

\textbf{xmin()}

Return the minimum of the x-coordinates of the path.

\textbf{EXAMPLES:}

\begin{verbatim}
sage: P = WordPaths('0123')
sage: p = P('0101013332')
sage: p.xmin()
0

>>> from sage.all import *

>>> P = WordPaths('0123')

>>> p = P('0101013332')

>>> p.xmin()
0
\end{verbatim}

This works for any 2\(d\)-paths:

\begin{verbatim}
sage: Paths = WordPaths('ab', steps=[(1,0),(-1,1)])
sage: p = Paths('abba')
sage: p.xmin()
-2

sage: DyckPaths = WordPaths('ab', steps='dyck')

sage: p = DyckPaths('abaabb')

sage: p.xmin()
0

sage: w = WordPaths('abcABC', steps='triangle')('ababcaaBC')

sage: w.xmin()
0.000000000000000
\end{verbatim}

\textbf{ymax()}

Return the maximum of the y-coordinates of the path.

\textbf{EXAMPLES:}

\begin{verbatim}
sage: P = WordPaths('0123')

sage: p = P('0101013332')
\end{verbatim}
This works for any $2d$-paths:

```python
sage: Paths = WordPaths('ab', steps=[(1,-1),(-1,1)])
sage: p = Paths('ababa')
sage: p.ymax()
0
sage: DyckPaths = WordPaths('ab', steps='dyck')
sage: p = DyckPaths('abaabb')
sage: p.ymax()
2
sage: w = WordPaths('abcABC', steps='triangle')(ababcaaBC)
sage: w.ymax()
2.59807621135332
```

```
>>> from sage.all import *
>>> Paths = WordPaths('ab', steps=[(Integer(1),-Integer(1)),(-Integer(1),
˓→Integer(1))])
>>> p = Paths('ababa')
>>> p.ymax()
0
>>> DyckPaths = WordPaths('ab', steps='dyck')
>>> p = DyckPaths('abaabb')
>>> p.ymax()
2
>>> w = WordPaths('abcABC', steps='triangle')(ababcaaBC)
>>> w.ymax()
2.59807621135332
```

**ymin()**

Return the minimum of the y-coordinates of the path.

**EXAMPLES:**

```python
sage: P = WordPaths('0123')
```

```python
sage: p = P('0101013332')
```

```python
sage: p.ymin()
0
```

```python
>>> from sage.all import *
```

```python
>>> P = WordPaths('0123')
```

```python
>>> p = P('0101013332')
```

```python
>>> p.ymin()
0
```

This works for any $2d$-paths:
```python
sage: Paths = WordPaths('ab', steps=[(1,-1),(-1,1)])
sage: p = Paths('ababa')
sage: p.ymin()
-1
sage: DyckPaths = WordPaths('ab', steps='dyck')
sage: p = DyckPaths('abaabb')
sage: p.ymin()
0
sage: w = WordPaths('abcABC', steps='triangle')('ababcaaBC')
sage: w.ymin()
0.000000000000000
```

```python
>>> from sage.all import *

```

```python
class sage.combinat.words.paths.FiniteWordPath_2d_callable (parent, callable, length=None)

```

```python
plot (pathoptions={'rgbcolor': 'red', 'arrow_head': True, 'thickness': 3}, startpoint=True, startoptions={'rgbcolor': 'red', 'size': 10})
```

INPUT:
Combinatorics, Release 10.4

- **pathoptions** – (dict, default:dict(rgbcolor='red',arrow_head=True, thickness=3)), options for the path drawing
- **startpoint** – (boolean, default: True), draw the start point?
- **startoptions** – (dict, default:dict(rgbcolor='red',size=10)) options for the start point drawing

**EXAMPLES:**

```python
sage: d = ( vector((1,3,2)), vector((2,-4,5)) )
sage: P = WordPaths(alphabet='ab', steps=d); P
Word Paths over 2 steps
sage: p = P('ababab'); p
Path: ababab
sage: p.plot()
# needs sage.plot
```

```python
sage: P = WordPaths('abcABC', steps='cube_grid')
sage: p = P('abcabcAABBC')
sage: p.plot()
# needs sage.plot
```

```python
>>> from sage.all import *
>>> d = ( vector((Integer(1),Integer(3),Integer(2))), vector((Integer(2),-
... Integer(4),Integer(5))) )
>>> P = WordPaths(alphabet='ab', steps=d); P
Word Paths over 2 steps
>>> p = P('ababab'); p
Path: ababab
>>> p.plot()
# needs sage.plot
```

```python
>>> P = WordPaths('abcABC', steps='cube_grid')
>>> p = P('abcabcAABBC')
>>> p.plot()
# needs sage.plot
```

class sage.combinat.words.paths.FiniteWordPath_3d_callable (parent, callable, length=None)

**Bases:** WordDatatype_callable, FiniteWordPath_3d, FiniteWord_class

class sage.combinat.words.paths.FiniteWordPath_3d_callable_with_caching (parent, callable, length=None)

**Bases:** WordDatatype_callable_with_caching, FiniteWordPath_3d, FiniteWord_class

class sage.combinat.words.paths.FiniteWordPath_3d_iter (parent, iter, length=None)

**Bases:** WordDatatype_iter, FiniteWordPath_3d, FiniteWord_class

class sage.combinat.words.paths.FiniteWordPath_3d_iter_with_caching (parent, iter, length=None)

**Bases:** WordDatatype_iter_with_caching, FiniteWordPath_3d, FiniteWord_class
class sage.combinat.words.paths.FiniteWordPath_3d_list
    Bases: WordDatatype_list, FiniteWordPath_3d, FiniteWord_class

    Bases: WordDatatype_str, FiniteWordPath_3d, FiniteWord_class

class sage.combinat.words.paths.FiniteWordPath_3d_tuple
    Bases: WordDatatype_tuple, FiniteWordPath_3d, FiniteWord_class

class sage.combinat.words.paths.FiniteWordPath_all
    Bases: SageObject

    directive_vector()

    Return the directive vector of self.

    The directive vector is the vector starting at the start point and ending at the end point of the path self.

    EXAMPLES:

    sage: WordPaths('abcdef')('abababab').directive_vector()
    (6, 2*sqrt3)
    sage: WordPaths('abAB')('abababab').directive_vector()
    (4, 4)
    sage: P = WordPaths('abcABC', steps='cube_grid')
    sage: P('ababababCC').directive_vector()
    (4, 4, -2)
    sage: WordPaths('abcdef')('abcdef').directive_vector()
    (0, 0)
    sage: P = WordPaths('abc', steps=[(1,3,7,9),(-4,1,0,0),(0,32,1,8)])
    sage: P('abcabababacaacccbbcac').directive_vector()
    (-16, 254, 63, 128)

    >>> from sage.all import *
    >>> WordPaths('abcdef')('abababab').directive_vector()
    (6, 2*sqrt3)
    >>> WordPaths('abAB')('abababab').directive_vector()
    (4, 4)
    >>> P = WordPaths('abcABC', steps='cube_grid')
    >>> P('ababababCC').directive_vector()
    (4, 4, -2)
    >>> WordPaths('abcdef')('abcdef').directive_vector()
    (0, 0)
    >>> P = WordPaths('abc', steps=[(Integer(1),Integer(3),Integer(7),Integer(9)),
                                 (-Integer(4),Integer(1),Integer(0),Integer(0)),(Integer(0),Integer(32),
                                 Integer(1),Integer(8))])
    >>> P('abcabababacaacccbbcac').directive_vector()
    (-16, 254, 63, 128)

    end_point()

    Return the end point of the path.

    EXAMPLES:

    sage: WordPaths('abcdef')('abababab').end_point()
    (6, 2*sqrt3)
    sage: WordPaths('abAB')('abababab').end_point()
    (4, 4)
    sage: P = WordPaths('abcABC', steps='cube_grid')

    (continues on next page)
sage: P('ababababCC').end_point()
(4, 4, -2)
sage: WordPaths('abcdef')('abcdef').end_point()
(0, 0)

sage: P = WordPaths('abc', steps=[(1,3,7,9),(-4,1,0,0),(0,32,1,8)])
sage: P('abcabababacaacccbbcac').end_point()
(-16, 254, 63, 128)

>>> from sage.all import *

>>> WordPaths('abcdef')('abababab').end_point()
(6, 2*sqrt3)

>>> WordPaths('abAB')('bababab').end_point()
(4, 4)

>>> P = WordPaths('abcABC', steps='cube_grid')

>>> P('bababababCC').end_point()
(4, 4, -2)

>>> WordPaths('abcdef')('abcdef').end_point()
(0, 0)

>>> P = WordPaths('abc', steps=(Integer(1),Integer(3),Integer(7),Integer(9)),
                    (Integer(-4),Integer(1),Integer(0),Integer(0)),
                    (Integer(0),Integer(32),Integer(1),Integer(8)))

>>> P('abcabababacaacccbbcac').end_point()
(-16, 254, 63, 128)

is_closed()

Return True if the path is closed.

A path is closed if the origin and the end of the path are equal.

EXAMPLES:

sage: P = WordPaths('abcd', steps=[(1,0),(0,1),(-1,0),(0,-1)])
sage: P('abcd').is_closed()
True
sage: P('abc').is_closed()
False
sage: P('').is_closed()
True
sage: P('aacacc').is_closed()
True

>>> from sage.all import *

>>> P = WordPaths('abcd', steps=[(Integer(1),Integer(0)),(Integer(0),
                                (-Integer(1)),(Integer(1),Integer(0)),
                                (Integer(0),-Integer(1))])

>>> P('abcd').is_closed()
True

>>> P('abc').is_closed()
False

>>> P('').is_closed()
True

>>> P('aacacc').is_closed()
True

is_simple()

Return True if the path is simple.

A path is simple if all its points are distinct.
If the path is closed, the last point is not considered.

EXAMPLES:

```python
sage: P = WordPaths('abcdef', steps='triangle_grid'); P
Word Paths on the triangle grid
sage: P('abc').is_simple()
True
sage: P('abcde').is_simple()
True
sage: P('abcdef').is_simple()
True
sage: P('ad').is_simple()
True
sage: P('aabdee').is_simple()
False
```

```python
>>> from sage.all import *

>>> P = WordPaths('abcdef', steps='triangle_grid'); P
Word Paths on the triangle grid

>>> P('abc').is_simple()
True

>>> P('abcde').is_simple()
True

>>> P('abcdef').is_simple()
True

>>> P('ad').is_simple()
True

>>> P('aabdee').is_simple()
False
```

is_tangent()  
The is_tangent() method, which is implemented for words, has an extended meaning for word paths, which is not implemented yet.

AUTHOR:

- Thierry Monteil

plot_projection (v=None, letters=None, color=None, ring=None, size=12, kind='right')

Return an image of the projection of the successive points of the path into the space orthogonal to the given vector.

INPUT:

- self – a word path in a 3 or 4 dimension vector space
- v – vector (default: None) If None, the directive vector (i.e. the end point minus starting point) of the path is considered.
- letters – iterable (default: None) of the letters to be projected. If None, then all the letters are considered.
- color – dictionary (default: None) of the letters mapped to colors. If None, automatic colors are chosen.
- ring – ring (default: None) where to do the computations. If None, RealField(53) is used.
- size – number (default: 12) size of the points.
- kind – string (default: 'right') either 'right' or 'left'. The color of a letter is given to the projected prefix to the right or the left of the letter.
OUTPUT:
2d or 3d Graphic object.

EXAMPLES:
The Rauzy fractal:

```sage
s = WordMorphism('1->12,2->13,3->1')
sage: D = s.fixed_point('1')
sage: v = s.pisot_eigenvector_right()
sage: P = WordPaths('123',[(1,0,0),(0,1,0),(0,0,1)])
sage: w = P(D[:200])
sage: w.plot_projection(v)  # long time (2s)
Graphics object consisting of 200 graphics primitives
```

In this case, the abelianized vector doesn’t give a good projection:

```sage
w.plot_projection()  # long time (2s)
Graphics object consisting of 200 graphics primitives
```

You can project only the letters you want:

```sage
w.plot_projection(v, letters='12')  # long time (2s)
Graphics object consisting of 168 graphics primitives
```

You can increase or decrease the precision of the computations by changing the ring of the projection matrix:

```sage
w.plot_projection(v, ring=RealField(20))  # long time (2s)
Graphics object consisting of 200 graphics primitives
```

You can change the size of the points:

```sage
w.plot_projection(v, size=30)  # long time (2s)
Graphics object consisting of 200 graphics primitives
```
```python
>>> from sage.all import *

>>> w.plot_projection(v, size=Integer(30))  # long time (2s)
Graphics object consisting of 200 graphics primitives

You can assign the color of a letter to the projected prefix to the right or the left of the letter:

```python
sage: w.plot_projection(v, kind='left')  # long time (2s)
Graphics object consisting of 200 graphics primitives
```

To remove the axis, do like this:

```python
sage: r = w.plot_projection(v)  # needs sage.plot
sage: r.axes(False)  # needs sage.plot
sage: r  # long time (2s)  # needs sage.plot
Graphics object consisting of 200 graphics primitives
```

You can assign different colors to each letter:

```python
sage: color = {'1': 'purple', '2': (.2,.3,.4), '3': 'magenta'}
sage: w.plot_projection(v, color=color)  # long time (2s)  # needs sage.plot
Graphics object consisting of 200 graphics primitives
```

The 3d-Rauzy fractal:

```python
sage: s = WordMorphism('1->12,2->13,3->14,4->1')
sage: D = s.fixed_point('1')
sage: v = s.pisot_eigenvector_right()
sage: P = WordPaths('1234',[(1,0,0,0), (0,1,0,0), (0,0,1,0), (0,0,0,1)])
sage: w = P([1200])
sage: w.plot_projection(v)  # needs sage.plot
Graphics3d Object
```
Combinatorics, Release 10.4

```python
>>> from sage.all import *
>>> s = WordMorphism('1->12,2->13,3->14,4->1')
>>> D = s.fixed_point('1')
>>> v = s.pisot_eigenvector_right()
>>> P = WordPaths('1234', [(Integer(1), Integer(0), Integer(0), Integer(0)), (Integer(0), Integer(1), Integer(0), Integer(0)), (Integer(0), Integer(0), Integer(1), Integer(0)), (Integer(0), Integer(0), Integer(0), Integer(1))])
>>> w = P(D[:Integer(200)])
>>> w.plot_projection(v)  # needs sage.plot
Graphics3d Object
```

The dimension of the vector space of the parent must be 3 or 4:

```python
sage: P = WordPaths('ab', [(1, 0), (0, 1)])
sage: p = P('aababbab')
sage: p.plot_projection()  # needs sage.plot
Traceback (most recent call last):
  ...
TypeError: The dimension of the vector space (=2) must be 3 or 4
```

```python
>>> from sage.all import *
>>> P = WordPaths('ab', [(1, 0), (0, 1)])
>>> p = P('aababbab')
>>> p.plot_projection()  # needs sage.plot
Traceback (most recent call last):
  ...
TypeError: The dimension of the vector space (=2) must be 3 or 4
```

points (include_last=True)

Return an iterator yielding a list of points used to draw the path represented by this word.

INPUT:

- include_last – bool (default: True) whether to include the last point

EXAMPLES:

A simple closed square:

```python
sage: P = WordPaths('abAB')
sage: list(P('abAB').points(include_last=True))
[(0, 0), (1, 0), (1, 1), (0, 1), (0, 0)]
```

A simple closed square without the last point:

```python
sage: list(P('abAB').points(include_last=False))
[(0, 0), (1, 0), (1, 1), (0, 1)]
```
.. code-block:: python

>>> from sage.all import *
>>> list(P('abAB').points(include_last=False))
[(0, 0), (1, 0), (1, 1), (0, 1)]

sage: list(P('abaB').points())
[(0, 0), (1, 0), (1, 1), (2, 1), (2, 0)]

>>> from sage.all import *
>>> list(P('abaB').points())
[(0, 0), (1, 0), (1, 1), (2, 1), (2, 0)]

projected_path(v=None, ring=None)

Return the path projected into the space orthogonal to the given vector.

INPUT:

- **v** – vector (default: None) If None, the directive vector (i.e. the end point minus starting point) of the path is considered.
- **ring** – ring (default: None) where to do the computations. If None, RealField(53) is used.

OUTPUT:

word path

EXAMPLES:

The projected path of the tribonacci word:

.. code-block:: python

sage: s = WordMorphism('1->12,2->13,3->1')
sage: D = s.fixed_point('1')
sage: v = s.pisot_eigenvector_right()
sage: P = WordPaths('123',[(1,0,0),(0,1,0),(0,0,1)])
sage: w = P(D[:1000])
sage: p = w.projected_path(v)
sage: p
Path: 1213121121312121312112131213121121312121...

sage: p[:20].plot()  # needs sage.plot
Graphics object consisting of 3 graphics primitives

The ring argument allows to change the precision of the projected steps:
**Projected point iterator** (v=None, ring=None)

Return an iterator of the projection of the orbit points of the path into the space orthogonal to the given vector.

**INPUT:**

- **v** – vector (default: None) If None, the directive vector (i.e. the end point minus starting point) of the path is considered.
- **ring** – ring (default: None) where to do the computations. If None, RealField(53) is used.

**OUTPUT:**

iterator of points

**EXAMPLES:**

Projected points of the Rauzy fractal:

```
sage: s = WordMorphism('1->12,2->13,3->1')
sage: D = s.fixed_point('1')
sage: v = s.pisot_eigenvector_right()
sage: P = WordPaths('123',[i(1,0,0),(0,1,0),(0,0,1)])
sage: w = P[D[:200]]
sage: it = w.projected_point_iterator(v)
sage: for i in range(6): next(it)
(0.000000000000000, 0.000000000000000)
(-0.526233343362516, 0.000000000000000)
(0.220830337618112, -0.477656250512816)
(-0.305403005744404, -0.477656250512816)
(0.100767309386062, 0.400890564600664)
(-0.425466033976454, 0.400890564600664)
```

(continues on next page)
Projected points of a 2d path:

```python
sage: P = WordPaths('ab','ne')
sage: p = P('aabbabbab')
sage: it = p.projected_point_iterator(ring=RealField(20))

sage: for i in range(8): next(it)
(0.00000)
(0.78087)
(1.5617)
(0.93704)
(0.31235)
(1.0932)
(0.46852)
(-0.15617)
```

```python
>>> from sage.all import *
>>> P = WordPaths('ab','ne')
>>> p = P('aabbabbab')
>>> it = p.projected_point_iterator(ring=RealField(Integer(20)))
>>> for i in range(Integer(8)): next(it)
(0.00000)
(0.78087)
(1.5617)
(0.93704)
(0.31235)
(1.0932)
(0.46852)
(-0.15617)
```

**start_point()**

Return the starting point of self.

**OUTPUT:**

`vector`

**EXAMPLES:**

```python
sage: WordPaths('abcdef')('abcdef').start_point()
(0, 0)
sage: WordPaths('abcdef', steps='cube_grid')('abcdef').start_point()
(0, 0, 0)
sage: P = WordPaths('ab', steps=[(1,0,0,0),(0,1,0,0)]
```

```python
>>> from sage.all import *
>>> WordPaths('abcdef')('abcdef').start_point()
(0, 0)
>>> WordPaths('abcdef', steps='cube_grid')('abcdef').start_point()
(0, 0, 0)
>>> P = WordPaths('ab', steps=[(Integer(1),Integer(0),Integer(0),Integer(0)),
  (Integer(0),Integer(1),Integer(0),Integer(0))])
```

(continues on next page)
>>> P('abba').start_point()
(0, 0, 0, 0)

\texttt{tikz\_trajectory()}

Return the trajectory of self as a \texttt{tikz} string.

\textbf{EXAMPLES:}

\begin{verbatim}
sage: P = WordPaths('abcdef')
sage: p = P('abcde')
sage: p.tikz\_trajectory()
'(0.000, 0.000) -- (1.00, 0.000) -- (1.50, 0.866) -- (1.00, 1.73) -- (0.000,\ldots
\rightarrow 1.73) -- (-0.500, 0.866)'
\end{verbatim}

\begin{verbatim}
>>> from sage.all import *
>>> P = WordPaths('abcdef')
>>> p = P('abcde')
>>> p.tikz\_trajectory()
'(0.000, 0.000) -- (1.00, 0.000) -- (1.50, 0.866) -- (1.00, 1.73) -- (0.000,\ldots
\rightarrow 1.73) -- (-0.500, 0.866)'
\end{verbatim}

\textbf{class} \texttt{sage.combinat.words.paths.FiniteWordPath\_all\_callable}
\begin{verbatim}(parent, callable, length=None)\end{verbatim}

\textbf{Bases:} \texttt{WordDatatype\_callable, FiniteWordPath\_all, FiniteWord\_class}

Bases: WordDatatype_tuple, FiniteWordPath_dyck, FiniteWord_class
class sage.combinat.words.paths.FiniteWordPath_hexagonal_grid(parent, *args, **kwds)
Bases: FiniteWordPath_triangle_grid

INPUT:

- parent – a parent object inheriting from Words_all that has the alphabet attribute defined
- *args, **kwds – arguments accepted by AbstractWord

EXAMPLES:

sage: F = WordPaths('abcdef', steps='hexagon'); F
Word Paths on the hexagonal grid
sage: f = F('aaabbbccdef'); f
Path: aaabbbccdef

>>> from sage.all import *
>>> F = WordPaths('abcdef', steps='hexagon'); F
Word Paths on the hexagonal grid
>>> f = F('aaabbbccdef'); f
Path: aaabbbccdef

sage: f == loads(dumps(f))
True

>>> from sage.all import *
>>> f == loads(dumps(f))
True

class sage.combinat.words.paths.FiniteWordPath_hexagonal_grid_callable(parent, callable, length=None)

        (parent, iter, length=None)
    Bases: WordDatatype_iter, FiniteWordPath_north_east, FiniteWordClass

class sage.combinat.words.paths.FiniteWordPath_north_east_iter_with_caching
        (parent, iter, length=None)
    Bases: WordDatatype_iter_with_caching, FiniteWordPath_north_east, FiniteWordClass

class sage.combinat.words.paths.FiniteWordPath_north_east_list
    Bases: WordDatatype_list, FiniteWordPath_north_east, FiniteWordClass

class sage.combinat.words.paths.FiniteWordPath_north_east_str
    Bases: WordDatatype_str, FiniteWordPath_north_east, FiniteWordClass

class sage.combinat.words.paths.FiniteWordPath_north_east_tuple
    Bases: WordDatatype_tuple, FiniteWordPath_north_east, FiniteWordClass

class sage.combinat.words.paths.FiniteWordPath_square_grid
    Bases: FiniteWordPath_2d

area()
    Return the area of a closed path.

    INPUT:
    • self – a closed path

    EXAMPLES:

sage: P = WordPaths('abAB', steps='square_grid')
sage: P('abAB').area()
1
sage: P('aabbAABB').area()
4
sage: P('aabbABAB').area()
The area of the Fibonacci tiles:

```python
>>> from sage.all import *

>>> P = WordPaths('abAB', steps='square_grid')

>>> P('abAB').area()
1

>>> P('aabbAABB').area()
4

>>> P('aabbABAB').area()
3
```

```python
sage: [words.fibonacci_tile(i).area() for i in range(6)]
[1, 5, 29, 169, 985, 5741]

sage: [words.dual_fibonacci_tile(i).area() for i in range(6)]
[1, 5, 29, 169, 985, 5741]

sage: oeis(_) [0]  # optional -- internet
A001653: Numbers k such that 2*k^2 - 1 is a square.

sage: _.first_terms()  # optional -- internet
(1, 5, 29, 169, 985, 5741, 33461, 195025, 1136689, 6625109, 38613965, 225058681, 1311738121, 7645370045, 44560482149, 259717522849, 1513744654945, 8822750406821, 51422757785981, 299713796309065, 1746860020068409, 10181446324101389, 59341817924539925)
```

```python
>>> from sage.all import *

>>> [words.fibonacci_tile(i).area() for i in range(Integer(6))]
[1, 5, 29, 169, 985, 5741]

>>> [words.dual_fibonacci_tile(i).area() for i in range(Integer(6))]
[1, 5, 29, 169, 985, 5741]

>>> oeis(_) [Integer(0)]  # optional -- internet
A001653: Numbers k such that 2*k^2 - 1 is a square.

>>> _.first_terms()  # optional -- internet
(1, 5, 29, 169, 985, 5741, 33461,
```

(continues on next page)
is_closed()

Return whether self represents a closed path.

EXAMPLES:

```
sage: P = WordPaths('abAB', steps='square_grid')
sage: P('aA').is_closed()
True
sage: P('abAB').is_closed()
True
sage: P('ababAABB').is_closed()
True
sage: P('aaabbbAABB').is_closed()
False
sage: P('ab').is_closed()
False
```

```
>>> from sage.all import *
>>> P = WordPaths('abAB', steps='square_grid')
>>> P('aA').is_closed()
True
>>> P('abAB').is_closed()
True
>>> P('ababAABB').is_closed()
True
>>> P('aaabbbAABB').is_closed()
False
>>> P('ab').is_closed()
False
```

is_simple()

Return whether the path is simple.

A path is simple if all its points are distinct.

If the path is closed, the last point is not considered.

**Note:** The linear algorithm described in the thesis of Xavier Provençal should be implemented here.
EXAMPLES:

```python
sage: P = WordPaths('abAB', steps='square_grid')
sage: P('abab').is_simple()
True
sage: P('abAB').is_simple()
True
sage: P('abA').is_simple()
True
sage: P('aabABB').is_simple()
False
sage: P().is_simple()
True
sage: P('A').is_simple()
True
sage: P('aA').is_simple()
True
sage: P(aaA).is_simple()
False
```

REFERENCES:

```python
>>> from sage.all import *
>>> P = WordPaths('abAB', steps='square_grid')
>>> P(abab).is_simple()
True
>>> P(abAB).is_simple()
True
>>> P(abA).is_simple()
True
>>> P(aabABB).is_simple()
False
>>> P().is_simple()
True
>>> P('A').is_simple()
True
>>> P('aA').is_simple()
True
>>> P(aaA).is_simple()
False
```

*tikz_trajectory*

Return the trajectory of `self` as a `tikz` string.

EXAMPLES:

```python
sage: f = words.fibonacci_tile(1)
sage: f.tikz_trajectory()
'(0, 0) -- (0, -1) -- (-1, -1) -- (-1, -2) -- (0, -2) -- (0, -3) -- (1, -3) --
   (1, -2) -- (2, -2) -- (2, -1) -- (1, -1) -- (1, 0) -- (0, 0)'
```

```python
>>> from sage.all import *
>>> f = words.fibonacci_tile(Integer(1))
>>> f.tikz_trajectory()
(continues on next page)
```
class sage.combinat.words.paths.FiniteWordPath_square_grid_callable (parent, callable, length=None)

Bases: WordDatatype_callable, FiniteWordPath_square_grid, FiniteWord_class

class sage.combinat.words.paths.FiniteWordPath_square_grid_callable_with_caching (parent, callable, length=None)

Bases: WordDatatype_callable_with_caching, FiniteWordPath_square_grid, FiniteWord_class

class sage.combinat.words.paths.FiniteWordPath_square_grid_iter (parent, iter, length=None)

Bases: WordDatatype_iter, FiniteWordPath_square_grid, FiniteWord_class

class sage.combinat.words.paths.FiniteWordPath_square_grid_iter_with_caching (parent, iter, length=None)

Bases: WordDatatype_iter_with_caching, FiniteWordPath_square_grid, FiniteWord_class

class sage.combinat.words.paths.FiniteWordPath_square_grid_list

Bases: WordDatatype_list, FiniteWordPath_square_grid, FiniteWord_class

class sage.combinat.words.paths.FiniteWordPath_square_grid_str

Bases: WordDatatype_str, FiniteWordPath_square_grid, FiniteWord_class

class sage.combinat.words.paths.FiniteWordPath_square_grid_tuple

Bases: WordDatatype_tuple, FiniteWordPath_square_grid, FiniteWord_class

class sage.combinat.words.paths.FiniteWordPath_triangle_grid

Bases: FiniteWordPath_2d

xmax ()

Return the maximum of the x-coordinates of the path.

EXAMPLES:

```python
sage: w = WordPaths('abcABC', steps='triangle')('ababcaaBC')
sage: w.xmax()
4.50000000000000
sage: w = WordPaths('abcABC', steps='triangle')('ABAcacababababcbcbAC')
sage: w.xmax()
5.10000000000000
```

```python
>>> from sage.all import *
>>> w = WordPaths('abcABC', steps='triangle')('ababcaaBC')
>>> w.xmax()
4.50000000000000
>>> w = WordPaths('abcABC', steps='triangle')('ABAcacababababcbcbAC')
```
w.xmax()
4.00000000000000

**xmin()**

Return the minimum of the x-coordinates of the path.

**EXAMPLES:**

```python
sage: w = WordPaths('abcABC', steps='triangle')('ababcaaBC')
sage: w.xmin()
0.000000000000000
```

```python
sage: w = WordPaths('abcABC', steps='triangle')('ABAacacabababcdbcbAC')
sage: w.xmin()
-3.00000000000000
```

```python
>>> from sage.all import *
```

```python
w = WordPaths('abcABC', steps='triangle')('ababcaaBC')

w.xmin()
```

```python
w = WordPaths('abcABC', steps='triangle')('ABAacacabababcdbcbAC')

w.xmin()
```

**ymax()**

Return the maximum of the y-coordinates of the path.

**EXAMPLES:**

```python
sage: w = WordPaths('abcABC', steps='triangle')('ababcaaBC')
sage: w.ymax()
2.59807621135332
```

```python
sage: w = WordPaths('abcABC', steps='triangle')('ABAacacabababcdbcbAC')
sage: w.ymax()
8.66025403784439
```

```python
>>> from sage.all import *
```

```python
w = WordPaths('abcABC', steps='triangle')('ababcaaBC')

w.ymax()
```

```python
w = WordPaths('abcABC', steps='triangle')('ABAacacabababcdbcbAC')

w.ymax()
```

**ymin()**

Return the minimum of the y-coordinates of the path.

**EXAMPLES:**

```python
sage: w = WordPaths('abcABC', steps='triangle')('ababcaaBC')
sage: w.ymin()
0.000000000000000
```

```python
sage: w = WordPaths('abcABC', steps='triangle')('ABAacacabababcdbcbAC')
sage: w.ymin()
-0.866025403784439
```

```python
>>> from sage.all import *
```

```python
w = WordPaths('abcABC', steps='triangle')('ababcaaBC')

w.ymin()
```

```python
w = WordPaths('abcABC', steps='triangle')('ABAacacabababcdbcbAC')

w.ymin()
```
from sage.all import *

w = WordPaths('abcABC', steps='triangle')('ababcaaBC')
w.ymin()  # 0.000000000000000

w = WordPaths('abcABC', steps='triangle')('ABAcacababababcacbAC')
w.ymin()  # -0.866025403784439

class sage.combinat.words.paths.FiniteWordPath_triangle_grid_callable (parent, callable, length=None):
    Bases: WordDatatype_callable, FiniteWordPath_triangle_grid, FiniteWord_class

class sage.combinat.words.paths.FiniteWordPath_triangle_grid_callable_with_caching (parent, callable, length=None):
    Bases: WordDatatype_callable_with_caching, FiniteWordPath_triangle_grid, FiniteWord_class

class sage.combinat.words.paths.FiniteWordPath_triangle_grid_iter (parent, iter, length=None):
    Bases: WordDatatype_iter, FiniteWordPath_triangle_grid, FiniteWord_class

class sage.combinat.words.paths.FiniteWordPath_triangle_grid_iter_with_caching (parent, iter, length=None):
    Bases: WordDatatype_iter_with_caching, FiniteWordPath_triangle_grid, FiniteWord_class

class sage.combinat.words.paths.FiniteWordPath_triangle_grid_list:
    Bases: WordDatatype_list, FiniteWordPath_triangle_grid, FiniteWord_class

class sage.combinat.words.paths.FiniteWordPath_triangle_grid_str:
    Bases: WordDatatype_str, FiniteWordPath_triangle_grid, FiniteWord_class

class sage.combinat.words.paths.FiniteWordPath_triangle_grid_tuple:
    Bases: WordDatatype_tuple, FiniteWordPath_triangle_grid, FiniteWord_class

Return the combinatorial class of paths of the given type of steps.

INPUT:

- alphabet – ordered alphabet
- steps – (default is None). It can be one of the following:
  - an iterable ordered container of as many vectors as there are letters in the alphabet. The vectors are associated to the letters according to their order in steps. The vectors can be a tuple or anything that can be passed to vector function.
  - an iterable ordered container of k vectors where k is half the size of alphabet. The vectors and their opposites are associated to the letters according to their order in steps (given vectors first, opposite vectors after).
  - None: In this case, the type of steps are guessed from the length of alphabet.
Combinatorics, Release 10.4

- ‘square_grid’ or ‘square’: (default when size of alphabet is 4) The order is: East, North, West, South.
- ‘triangle_grid’ or ‘triangle’:
- ‘hexagonal_grid’ or ‘hexagon’: (default when size of alphabet is 6)
- ‘cube_grid’ or ‘cube’:
- ‘north_east’, ‘ne’ or ‘NE’: (the default when size of alphabet is 2)
- ‘dyck’:

OUTPUT:
The combinatorial class of all paths of the given type.

EXAMPLES:
The steps can be given explicitly:

```python
sage: WordPaths('abc', steps=[(1,2), (-1,4), (0,-3)])
Word Paths over 3 steps
```

```python
>>> from sage.all import *

>>> WordPaths('abc', steps=[(Integer(1),Integer(2)), (-Integer(1),Integer(4)), (Integer(0),-Integer(3))])
Word Paths over 3 steps
```

Different type of input alphabet:

```python
sage: WordPaths(range(3), steps=[(1,2), (-1,4), (0,-3)])
Word Paths over 3 steps
```

```python
sage: WordPaths(['cric','crac','croc'], steps=[(1,2), (1,4), (0,3)])
Word Paths over 3 steps
```

```python
>>> from sage.all import *

>>> WordPaths(range(Integer(3)), steps=[(Integer(1),Integer(2)), (-Integer(1),Integer(4)), (Integer(0),-Integer(3))])
Word Paths over 3 steps
```

```python
>>> from sage.all import *

>>> WordPaths(['cric','crac','croc'], steps=[(Integer(1),Integer(2)), (Integer(1),Integer(4)), (Integer(0),Integer(3))])
Word Paths over 3 steps
```

Directions can be in three dimensions as well:

```python
sage: WordPaths('ab', steps=[(1,2,2),(-1,4,2)])
Word Paths over 2 steps
```

```python
>>> from sage.all import *

>>> WordPaths('ab', steps=[(Integer(1),Integer(2),Integer(2)),(-Integer(1),Integer(4),Integer(2))])
Word Paths over 2 steps
```

When the number of given steps is half the size of alphabet, the opposite of vectors are used:

```python
sage: P = WordPaths('abcd', [(1,0), (0,1)])
sage: P
Word Paths over 4 steps
```

```python
sage: sorted(P.letters_to_steps().items())
[['a', (1, 0)], ['b', (0, 1)], ['c', (-1, 0)], ['d', (0, -1)]]
```
```python
>>> from sage.all import *
>>> P = WordPaths('abcd', [(Integer(1),Integer(0)), (Integer(0),Integer(1))])
>>> P
Word Paths over 4 steps
>>> sorted(P.letters_to_steps().items())
[('a', (1, 0)), ('b', (0, 1)), ('c', (-1, 0)), ('d', (0, -1))]
```

When no steps are given, default classes are returned:

```
sage: WordPaths('ab')
Word Paths in North and East steps
sage: WordPaths(range(4))
Word Paths on the square grid
sage: WordPaths(range(6))
Word Paths on the hexagonal grid
```

There are many type of built-in steps...

On a two letters alphabet:

```
sage: WordPaths('ab', steps=north_east)
Word Paths in North and East steps
sage: WordPaths('()', steps=dyck)
Finite Dyck paths
```

On a four letters alphabet:

```
sage: WordPaths('ruld', steps=square_grid)
Word Paths on the square grid
```

On a six letters alphabet:

```
sage: WordPaths('abcdef', steps=hexagonal_grid)
Word Paths on the hexagonal grid
```
class sage.combinat.words.paths.WordPaths_all(alphabet, steps)

Bases: FiniteWords

The combinatorial class of all paths, i.e of all words over an alphabet where each letter is mapped to a step (a vector).

letters_to_steps()

Return the dictionary mapping letters to vectors (steps).

EXAMPLES:

```python
sage: d = WordPaths('ab').letters_to_steps()
sage: sorted(d.items())
[('a', (0, 1)), ('b', (1, 0))]

sage: d = WordPaths('abcd').letters_to_steps()
sage: sorted(d.items())
[('a', (1, 0)), ('b', (0, 1)), ('c', (-1, 0)), ('d', (0, -1))]

sage: d = WordPaths('abcdef').letters_to_steps()
sage: sorted(d.items())
[('a', (1, 0)), ('b', (1/2, 1/2*sqrt3)), ('c', (-1/2, 1/2*sqrt3)), ('d', (-1, 0)), ('e', (-1/2, -1/2*sqrt3)), ('f', (1/2, -1/2*sqrt3))]
```

vector_space()

Return the vector space over which the steps of the paths are defined.

EXAMPLES:

```python
sage: WordPaths('ab', steps='dyck').vector_space()
Ambient free module of rank 2 over the principal ideal domain Integer Ring
```
Combinatorics, Release 10.4

sage: WordPaths('ab', steps='north_east').vector_space()
Ambient free module of rank 2 over the principal ideal domain Integer Ring
sage: WordPaths('abcd', steps='square_grid').vector_space()
Ambient free module of rank 2 over the principal ideal domain Integer Ring
sage: WordPaths('abcdef', steps='hexagonal_grid').vector_space()
Vector space of dimension 2 over Number Field in sqrt3 with defining...
         → polynomial x^2 - 3 with sqrt3 = 1.732050807568878?
sage: WordPaths('abcdef', steps='cube_grid').vector_space()
Ambient free module of rank 3 over the principal ideal domain Integer Ring
sage: WordPaths('abcdef', steps='triangle_grid').vector_space()
Vector space of dimension 2 over Number Field in sqrt3 with defining...
         → polynomial x^2 - 3 with sqrt3 = 1.732050807568878?

>>> from sage.all import *

>>> WordPaths('ab', steps='dyck').vector_space()
Ambient free module of rank 2 over the principal ideal domain Integer Ring
>>> WordPaths('ab', steps='north_east').vector_space()
Ambient free module of rank 2 over the principal ideal domain Integer Ring
>>> WordPaths('abcd', steps='square_grid').vector_space()
Ambient free module of rank 2 over the principal ideal domain Integer Ring
>>> WordPaths('abcdef', steps='hexagonal_grid').vector_space()
Vector space of dimension 2 over Number Field in sqrt3 with defining...
         → polynomial x^2 - 3 with sqrt3 = 1.732050807568878?
>>> WordPaths('abcdef', steps='cube_grid').vector_space()
Ambient free module of rank 3 over the principal ideal domain Integer Ring
>>> WordPaths('abcdef', steps='triangle_grid').vector_space()
Vector space of dimension 2 over Number Field in sqrt3 with defining...
         → polynomial x^2 - 3 with sqrt3 = 1.732050807568878?

class sage.combinat.words.paths.WordPaths_cube_grid(alphabet)
    Bases: WordPaths_all

    The combinatorial class of all paths on the cube grid.

class sage.combinat.words.paths.WordPaths_dyck(alphabet)
    Bases: WordPaths_all

    The combinatorial class of all Dyck paths.

class sage.combinat.words.paths.WordPaths_hexagonal_grid(alphabet)
    Bases: WordPaths_triangle_grid

    The combinatorial class of all paths on the hexagonal grid.

class sage.combinat.words.paths.WordPaths_north_east(alphabet)
    Bases: WordPaths_all

    The combinatorial class of all paths using North and East directions.

class sage.combinat.words.paths.WordPaths_square_grid(alphabet)
    Bases: WordPaths_all

    The combinatorial class of all paths on the square grid.

class sage.combinat.words.paths.WordPaths_triangle_grid(alphabet)
    Bases: WordPaths_all

    The combinatorial class of all paths on the triangle grid.
5.1.363 Shuffle product of words

See also:
The module \texttt{sage.combinat.shuffle} contains a more general implementation of shuffle product.

\begin{verbatim}
class sage.combinat.words.shuffle_product.ShuffleProduct_shifted(w1, w2, check=True)
  Bases: ShuffleProduct_w1w2

Shifted shuffle product of \(w_1\) with \(w_2\).

This is the shuffle product of \(w_1\) with the word obtained by adding the length of \(w_1\) to every letter of \(w_2\).

Note that this class is meant to be used for words; it misbehaves when \(w_1\) is a permutation or composition.

INPUT:

\begin{itemize}
  \item \texttt{check} – boolean (default True) whether to check that all words in the shuffle product belong to the correct parent
\end{itemize}

EXAMPLES:
\end{verbatim}

\begin{verbatim}
sage: from sage.combinat.words.shuffle_product import ShuffleProduct_shifted
sage: w, u = Word([1,2]), Word([3,4])
sage: S = ShuffleProduct_shifted(w,u)
sage: S == loads(dumps(S))
True

>>> from sage.all import *
>>> from sage.combinat.words.shuffle_product import ShuffleProduct_shifted
>>> w, u = Word([Integer(1),Integer(2)]), Word([Integer(3),Integer(4)])
>>> S = ShuffleProduct_shifted(w,u)
>>> S == loads(dumps(S))
True
\end{verbatim}

\begin{verbatim}
class sage.combinat.words.shuffle_product.ShuffleProduct_w1w2(w1, w2, check=True)
  Bases: Parent, UniqueRepresentation

The shuffle product of the two words \(w_1\) and \(w_2\).

If \(u\) and \(v\) are two words, then the \textit{shuffle product} of \(u\) and \(v\) is a certain multiset of words defined as follows: Let \(a\) and \(b\) be the lengths of \(u\) and \(v\), respectively. For every \(a\)-element subset \(I\) of \(\{1,2,\cdots,a+b\}\), let \(w(I)\) be the length-\(a+b\) word such that:

\begin{itemize}
  \item for every \(1 \leq k \leq a\), the \(i_k\)-th letter of \(w(I)\) is the \(k\)-th letter of \(u\), where \(i_k\) is the \(k\)-th smallest element of \(I\);
  \item for every \(1 \leq l \leq b\), the \(j_l\)-th letter of \(w(I)\) is the \(l\)-th letter of \(v\), where \(j_l\) is the \(l\)-th smallest element of \(\{1,2,\cdots,a+b\}\setminus I\).
\end{itemize}

The shuffle product of \(u\) and \(v\) is then the multiset of all \(w(I)\) with \(I\) ranging over the \(a\)-element subsets of \(\{1,2,\cdots,a+b\}\).

INPUT:

\begin{itemize}
  \item \texttt{check} – boolean (default True) whether to check that all words in the shuffle product belong to the correct parent
\end{itemize}

EXAMPLES:
\end{verbatim}
```python
sage: from sage.combinat.words.shuffle_product import ShuffleProduct_w1w2
sage: W = Words([1,2,3,4])
sage: s = ShuffleProduct_w1w2(W([1,2]),W([3,4]))
sage: sorted(s)
[word: 1234, word: 1324, word: 1342, word: 3124,
 word: 3142, word: 3412]
sage: s == loads(dumps(s))
True
sage: TestSuite(s).run()
```

```python
sage: s = ShuffleProduct_w1w2(W([1,4,3]),W([2]))
sage: sorted(s)
[word: 1243, word: 1423, word: 1432, word: 2143]
sage: s = ShuffleProduct_w1w2(W([1,4,3]),W([]))
sage: sorted(s)
[word: 143]
```

```python
>>> from sage.all import *
>>> from sage.combinat.words.shuffle_product import ShuffleProduct_w1w2
>>> W = Words([Integer(1),Integer(2),Integer(3),Integer(4)])
>>> s = ShuffleProduct_w1w2(W([Integer(1),Integer(2)]),W([Integer(3),Integer(4)]))
>>> sorted(s)
[word: 1234, word: 1324, word: 1342, word: 3124,
 word: 3142, word: 3412]
>>> s == loads(dumps(s))
True
>>> TestSuite(s).run()
```

```python
>>> s = ShuffleProduct_w1w2(W([Integer(1),Integer(4),Integer(3)]),W([Integer(2)]))
>>> sorted(s)
[word: 1243, word: 1423, word: 1432, word: 2143]
>>> s = ShuffleProduct_w1w2(W([Integer(1),Integer(4),Integer(3)]),W([]))
>>> sorted(s)
[word: 143]
```

### cardinality()

Return the number of words in the shuffle product of \( w_1 \) and \( w_2 \).

This is understood as a multiset cardinality, not as a set cardinality; it does not count the distinct words only.

It is given by \( \binom{l_1+l_2}{l_1} \), where \( l_1 \) is the length of \( w_1 \) and where \( l_2 \) is the length of \( w_2 \).

**EXAMPLES:**

```python
sage: from sage.combinat.words.shuffle_product import ShuffleProduct_w1w2
sage: w, u = map(Words("abcd"), ["ab", "cd"])
sage: S = ShuffleProduct_w1w2(w,u)
sage: S.cardinality()
6
```

```python
sage: w, u = map(Words("ab"), ["ab", "ab"])
sage: S = ShuffleProduct_w1w2(w,u)
sage: S.cardinality()
6
```
Combinatorics, Release 10.4

```python
>>> from sage.all import *
>>> from sage.combinat.words.shuffle_product import ShuffleProduct_w1w2
>>> w, u = map(Words("abcd"), ["ab", "cd"])
>>> S = ShuffleProduct_w1w2(w, u)
>>> S.cardinality()
6

>>> w, u = map(Words("ab"), ["ab", "ab"])
>>> S = ShuffleProduct_w1w2(w, u)
>>> S.cardinality()
6
```
• output – (default: "pair") either "pair" or "word"

EXAMPLES:

```python
sage: from sage.combinat.words.suffix_trees import DecoratedSuffixTree
sage: w = Word('aabb')
sage: sorted(DecoratedSuffixTree(w).square_vocabulary())
[(0, 0), (0, 2), (2, 2)]
sage: w = Word('00110011010')
sage: sorted(DecoratedSuffixTree(w).square_vocabulary(output="word"))
[word: , word: 00, word: 00110011, word: 01100110, word: 1010, word: 11]
```

```python
>>> from sage.all import *
>>> from sage.combinat.words.suffix_trees import DecoratedSuffixTree

w = Word('aabb')

sorted(DecoratedSuffixTree(w).square_vocabulary())
[(0, 0), (0, 2), (2, 2)]

w = Word('00110011010')

sorted(DecoratedSuffixTree(w).square_vocabulary(output="word"))
[word: , word: 00, word: 00110011, word: 01100110, word: 1010, word: 11]
```

class sage.combinat.words.suffix_trees.ImplicitSuffixTree(word)

Bases: SageObject

Construct the implicit suffix tree of a word w.

The suffix tree of a word w is a compactification of the suffix trie for w. The compactification removes all nodes that have exactly one incoming edge and exactly one outgoing edge. It consists of two components: a tree and a word. Thus, instead of labelling the edges by factors of w, we can labelled them by indices of the occurrence of the factors in w.

The following is a straightforwad implementation of Ukkonen's on-line algorithm for constructing the implicit suffix tree [Ukko1995]. It constructs the suffix tree for w[:i] from that of w[:i-1].

GENERAL IDEA. The suffix tree of w[:i+1] can be obtained from that of w[:i] by visiting each node corresponding to a suffix of w[:i] and modifying the tree by applying one of two rules (either append a new node to the tree, or split an edge into two). The "active state" is the node where the algorithm begins and the "suffix link" carries us to the next node that needs to be dealt with.

TREE. The tree is modelled as an automaton, which is stored as a dictionary of dictionaries: it is keyed by the nodes of the tree, and the corresponding dictionary is keyed by pairs (i, j) of integers representing the word w[i-1:j]. This makes it faster to look up a particular transition beginning at a specific node.

STATES/NODES. The states will always be -1, 0, 1, ..., n. The state -1 is special and is only used for the purposes of the algorithm. All transitions map -1 to 0, so this information is not explicitly stored in the transition function.

EXPLICIT/IMPLICIT NODES. By definition, some of the nodes will not be states, but merely locations along an edge; these are called implicit nodes. A node r (implicit or explicit) is referenced as a pair (s,(k,p)) where s is an ancestor of r and w[k-1:p] is the word read by transitioning from s to r in the suffix trie. A reference pair is canonical if s is the closest ancestor of r.

SUFFIX LINK. The algorithm makes use of a map from (some) nodes to other nodes, called the suffix link. This is stored as a dictionary.

ACTIVE STATE. We store as ._active_state the active state of the tree, the state where the algorithm will begin when processing the next letter.

RUNNING TIME. The running time and storage space of the algorithm is linear in the length of the word w (whereas for a suffix tree it is quadratic).

REFERENCES:
EXAMPLES:

```python
sage: from sage.combinat.words.suffix_trees import ImplicitSuffixTree
sage: w = Words("aco")("cacao")
```

```
sage: t = ImplicitSuffixTree(w); t
Implicit Suffix Tree of the word: cacao
```

```python
sage: ababb = Words([0,1])([0,1,0,1,1])
```

```
sage: s = ImplicitSuffixTree(ababb); s
Implicit Suffix Tree of the word: 01011
```

```python
>>> from sage.all import *
```

```python
>>> from sage.combinat.words.suffix_trees import ImplicitSuffixTree
```

```
>>> w = Words("aco")("cacao")
```

```
>>> t = ImplicitSuffixTree(w); t
Implicit Suffix Tree of the word: cacao
```

```
>>> ababb = Words([Integer(0),Integer(1)])( [Integer(0),Integer(1),Integer(0), Integer(1),Integer(1)])
```

```
>>> s = ImplicitSuffixTree(ababb); s
Implicit Suffix Tree of the word: 01011
```

**LZ_decomposition()**

Return a list of index of the beginning of the block of the Lempel-Ziv decomposition of self.word

The Lempel-Ziv decomposition is the factorisation $u_1...u_k$ of a word $w = x_1...x_n$ such that $u_i$ is the longest prefix of $u_i...u_k$ that has an occurrence starting before $u_i$ or a letter if this prefix is empty.

OUTPUT:

Return a list $iB$ of index such that the blocks of the decomposition are self.word()[iB[k]:iB[k+1]]

EXAMPLES:

```python
sage: w = Word('abababb')
```

```
sage: T = w.suffix_tree()
```

```
sage: T.LZ_decomposition()
[0, 1, 2, 6, 7]
```

```python
sage: w = Word('abaababacabba')
```

```
sage: T = w.suffix_tree()
```

```
sage: T.LZ_decomposition()
[0, 1, 2, 3, 6, 8, 9, 11, 13]
```

```python
sage: w = Word([0, 0, 0, 1, 1, 0, 1])
```

```
sage: T = w.suffix_tree()
```

```
sage: T.LZ_decomposition()
[0, 1, 3, 4, 5, 7]
```

```python
sage: w = Word(0000100101)
```

```
sage: T = w.suffix_tree()
```

```
sage: T.LZ_decomposition()
[0, 1, 4, 5, 9, 10]
```

(continues on next page)
active_state()  
Return the active state of the suffix tree.

EXAMPLES:

```python
sage: from sage.combinat.words.suffix_trees import ImplicitSuffixTree
sage: W = Words([0,1,2])
sage: t = ImplicitSuffixTree(W([0,1,0,1,2]))
sage: t.active_state()
(0, (6, 6))
```

edge_iterator()  
Return an iterator over the edges of the suffix tree.

The edge from $u$ to $v$ labelled by $(i, j)$ is yielded as the tuple $(u, v, (i, j))$.

EXAMPLES:

```python
sage: from sage.all import *
sage: from sage.combinat.words.suffix_trees import ImplicitSuffixTree
sage: sorted( ImplicitSuffixTree(Word("aaaaa")).edge_iterator() )
[(0, 1, (0, None))]
sage: sorted( ImplicitSuffixTree(Word([0,1,0,1])).edge_iterator() )
[(0, 1, (0, None)), (0, 2, (1, None))]
sage: sorted( ImplicitSuffixTree(Word()).edge_iterator() )
[]
```

factor_iterator \( (n=None) \)

Generate distinct factors of self.

**INPUT:**

- \( n \) – an integer, or None.

**OUTPUT:**

- If \( n \) is an integer, returns an iterator over all distinct factors of length \( n \). If \( n \) is None, returns an iterator generating all distinct factors.

**EXAMPLES:**

```python
sage: from sage.combinat.words.suffix_trees import ImplicitSuffixTree
sage: sorted( ImplicitSuffixTree(Word("cacao")).factor_iterator() )
[word: , word: a, word: ac, word: aca, word: acao, word: ao, word: c, word: →ca, word: cac, word: caca, word: cacao, word: cao, word: o]
sage: sorted( ImplicitSuffixTree(Word("cacao")).factor_iterator(1) )
[word: a, word: c, word: o]
sage: sorted( ImplicitSuffixTree(Word("cacao")).factor_iterator(2) )
[word: ac, word: ao, word: ca]
sage: sorted( ImplicitSuffixTree(Word([0,0,0])).factor_iterator() )
[word: , word: 0, word: 00, word: 000]
sage: sorted( ImplicitSuffixTree(Word([0,0,0])).factor_iterator(2) )
[word: 00]
sage: sorted( ImplicitSuffixTree(Word([0,0,0])).factor_iterator(0) )
[word: ]
sage: sorted( ImplicitSuffixTree(Word()).factor_iterator() )
[word: ]
sage: sorted( ImplicitSuffixTree(Word()).factor_iterator(2) )
[]
```

```python
>>> from sage.all import *
>>> from sage.combinat.words.suffix_trees import ImplicitSuffixTree
>>> sorted( ImplicitSuffixTree(Word("cacao")).factor_iterator() )
[word: , word: a, word: ac, word: aca, word: acao, word: ao, word: c, word: →ca, word: cac, word: caca, word: cacao, word: cao, word: o]
>>> sorted( ImplicitSuffixTree(Word("cacao")).factor_iterator(Integer(1)) )
[word: a, word: c, word: o]
>>> sorted( ImplicitSuffixTree(Word("cacao")).factor_iterator(Integer(2)) )
[word: ac, word: ao, word: ca]
>>> sorted( ImplicitSuffixTree(Word([Integer(0),Integer(0),Integer(0)])).factor_iterator() )
[word: , word: 0, word: 00, word: 000]
>>> sorted( ImplicitSuffixTree(Word([Integer(0),Integer(0),Integer(0)])).factor_iterator(Integer(2)) )
[word: 00]
>>> sorted( ImplicitSuffixTree(Word([Integer(0),Integer(0),Integer(0)])).factor_iterator(Integer(0)) )
[word: ]
>>> sorted( ImplicitSuffixTree(Word()).factor_iterator() )
[word: ]
>>> sorted( ImplicitSuffixTree(Word()).factor_iterator(Integer(2)) )
[]
```

leftmost_covering_set()

Compute the leftmost covering set of square pairs in self.word(). Return a square as a pair \((i, l)\) designating factor self.word()[i:i+l].

5930 Chapter 5. Comprehensive Module List
A leftmost covering set is a set such that the leftmost occurrence \((j,l)\) of a square in \(\text{self.word()}\) is covered by a pair \((i,l)\) in the set for all types of squares. We say that \((j,l)\) is covered by \((i,l)\) if \((i,l) \text{ \(i+1,l\)}\), \ldots, \((j,l)\) are all squares.

The set is returned in the form of a list \(P\) such that \(P[i]\) contains all the lengths of squares starting at \(i\) in the set. The lists \(P[i]\) are sorted in decreasing order.

The algorithm used is described in [DS2004].

**EXAMPLES:**

```python
sage: w = Word('abaabaabbaabaaba')
sage: T = w.suffix_tree()
sage: T.leftmost_covering_set()
[[6], [6], [2], [], [], [], [], [6, 2], [], [], [], [], [], [], []]
sage: w = Word('abaca')
sage: T = w.suffix_tree()
sage: T.leftmost_covering_set()
[[], [], [], [], []]
sage: T = Word('aaaaa').suffix_tree()
sage: T.leftmost_covering_set()
[[4, 2], [], [], [], []]
```

**number_of_factors** \((n=None)\)

Count the number of distinct factors of \(\text{self.word()}\).

**INPUT:**

- \(n\) – an integer, or None.

**OUTPUT:**

- If \(n\) is an integer, returns the number of distinct factors of length \(n\). If \(n\) is None, returns the total number of distinct factors.

**EXAMPLES:**

```python
sage: from sage.combinat.words.suffix_trees import ImplicitSuffixTree
sage: t = ImplicitSuffixTree(Word([1,2,1,3,1,2,1]))
sage: t.number_of_factors()
22
sage: t.number_of_factors(1)
3
sage: t.number_of_factors(9)
0
sage: t.number_of_factors(0)
1
```
>>> from sage.all import *
>>> from sage.combinat.words.suffix_trees import ImplicitSuffixTree

>>> t = ImplicitSuffixTree(Word([Integer(1), Integer(2), Integer(1), Integer(3),
                             Integer(1), Integer(2), Integer(1)]))

>>> t.number_of_factors()
22
>>> t.number_of_factors(Integer(1))
3
>>> t.number_of_factors(Integer(9))
0
>>> t.number_of_factors(Integer(0))
1

sage: t = ImplicitSuffixTree(Word("cacao"))
sage: t.number_of_factors()
13
sage: list(map(t.number_of_factors, range(10)))
[1, 3, 3, 3, 2, 1, 0, 0, 0, 0]

>>> from sage.all import *
>>> t = ImplicitSuffixTree(Word("cacao"))
>>> t.number_of_factors()
13
>>> list(map(t.number_of_factors, range(Integer(10))))
[1, 3, 3, 3, 2, 1, 0, 0, 0, 0]

sage: t = ImplicitSuffixTree(Word("c"*1000))
sage: t.number_of_factors()
1001
sage: t.number_of_factors(17)
1
sage: t.number_of_factors(0)
1

>>> from sage.all import *
>>> t = ImplicitSuffixTree(Word("c"*Integer(1000)))
>>> t.number_of_factors()
1001
>>> t.number_of_factors(Integer(17))
1
>>> t.number_of_factors(Integer(0))
1

sage: ImplicitSuffixTree(Word()).number_of_factors()
1

>>> from sage.all import *
>>> ImplicitSuffixTree(Word()).number_of_factors()
1

sage: blueberry = ImplicitSuffixTree(Word("blueberry"))
sage: blueberry.number_of_factors()
43
sage: list(map(blueberry.number_of_factors, range(10)))
[1, 6, 8, 7, 6, 5, 4, 3, 2, 1]
```python
>>> from sage.all import *
>>> blueberry = ImplicitSuffixTree(Word("blueberry"))
>>> blueberry.number_of_factors()
43
>>> list(map(blueberry.number_of_factors, range(Integer(10))))
[1, 6, 8, 7, 6, 5, 4, 3, 2, 1]
```

```
plot (word_labels=False, layout='tree', tree_root=0, tree_orientation='up',
      vertex_colors=None, edge_labels=True, *args, **kwds)
```

Return a Graphics object corresponding to the transition graph of the suffix tree.

**INPUT:**

- `word_labels` – boolean (default: `False`) if `False`, labels the edges by pairs `(i, j)`; if `True`, labels the edges by `word[i:j]`.
- `layout` – (default: `tree`)
- `tree_root` – (default: 0)
- `tree_orientation` – (default: `'up'`)
- `vertex_colors` – (default: `None`)
- `edge_labels` – (default: `True`)

**EXAMPLES:**

```
sage: from sage.combinat.words.suffix_trees import ImplicitSuffixTree
sage: ImplicitSuffixTree(Word('cacao')).plot(word_labels=True)  # needs sage.graphs sage.plot
Graphics object consisting of 23 graphics primitives
```

```
sage: ImplicitSuffixTree(Word('cacao')).plot(word_labels=False)  # needs sage.graphs sage.plot
Graphics object consisting of 23 graphics primitives
```

```
process_letter (letter)
```

Modify the current implicit suffix tree producing the implicit suffix tree for `self.word() + letter`.

**EXAMPLES:**

```
sage: from sage.combinat.words.suffix_trees import ImplicitSuffixTree
sage: w = Words("aco")("cacao")
sage: t = ImplicitSuffixTree(w[:-1]); t
Implicit Suffix Tree of the word: caca
sage: t.process_letter(w[-1]); t
Implicit Suffix Tree of the word: cacao
```

(continues on next page)
```python
>>> w = Words("aco")("cacao")
>>> t = ImplicitSuffixTree(w[:-Integer(1)]); t
Implicit Suffix Tree of the word: caca
>>> t.process_letter(w[-Integer(1)]); t
Implicit Suffix Tree of the word: cacao
```

```python
sage: W = Words([0,1])
sage: s = ImplicitSuffixTree(W([0,1,0,1])); s
Implicit Suffix Tree of the word: 0101
sage: s.process_letter(W([1])[0]); s
Implicit Suffix Tree of the word: 01011
```

```python
>>> from sage.all import *
>>> W = Words([Integer(0),Integer(1)])
>>> s = ImplicitSuffixTree(W([Integer(0),Integer(1),Integer(0),Integer(1)])); s
Implicit Suffix Tree of the word: 0101
>>> s.process_letter(W([Integer(1)])[Integer(0)]); s
Implicit Suffix Tree of the word: 01011
```

```
show(word_labels=None, *args, **kwds)
Display the output of plot().
```

**INPUT:**

- **word_labels** — (default: None) if False, labels the edges by pairs $i,j$; if True, labels the edges by `word[i:j]`.

**EXAMPLES:**

```python
sage: from sage.combinat.words.suffix_trees import ImplicitSuffixTree
sage: w = Words("caeo")("cacao")
sage: t = ImplicitSuffixTree(w)
sage: t.show(word_labels=True)  # needs sage.plot
sage: t.show(word_labels=False)  # needs sage.plot
```

```python
>>> from sage.all import *
>>> from sage.combinat.words.suffix_trees import ImplicitSuffixTree
>>> w = Words("caeo")("cacao")
>>> t = ImplicitSuffixTree(w)
```

```python
states()
Return the states (explicit nodes) of the suffix tree.
```

**EXAMPLES:**

```python
sage: from sage.combinat.words.suffix_trees import ImplicitSuffixTree
sage: W = Words([0,1,2])
sage: t = ImplicitSuffixTree(W([0,1,0,1,2]))
sage: t.states()
[0, 1, 2, 3, 4, 5, 6, 7]
```
suffix_link(state)

Evaluate the suffix link map of the implicit suffix tree on state.

Note that the suffix link is not defined for all states.

The suffix link of a state $x'\text{ that corresponds to the suffix } x$ is defined to be -1 if $x'$ is the root (0) and $y'$ otherwise, where $y'$ is the state corresponding to the suffix $x[1:]$.

INPUT:

* state – a state

EXAMPLES:

```python
sage: from sage.combinat.words.suffix_trees import ImplicitSuffixTree
sage: W = Words([0,1,2])
```

```python
sage: t = ImplicitSuffixTree(W([0,1,0,1,2]))
```

```python
sage: t.suffix_link(3)
5
```

```python
sage: t.suffix_link(5)
0
```

```python
sage: t.suffix_link(0)
-1
```

```python
sage: t.suffix_link(-1)
Traceback (most recent call last):
...
TypeError: there is no suffix link from -1
```

suffix_walk(edge, l)

Return the state of “w” if the input state is “aw”.

If the input state (edge, l) is path labeled “aw” with “a” a letter, the output is the state which is path labeled “w”.

INPUT:
• edge – the edge containing the state
• l – the string-depth of the state on edge (l>0)

OUTPUT:
Return ("explicit", end_node) if the state of w is an explicit state and ("implicit", edge, d) is obtained by reading d letters on edge.

EXAMPLES:
sage: T = Word('00110111011').suffix_tree()
sage: T.suffix_walk((0, 5), 1)
('explicit', 0)
sage: T.suffix_walk((7, 3), 1)
('implicit', (9, 4), 1)

```python
to_digraph (word_labels=False)
```
Return a DiGraph object of the transition graph of the suffix tree.

INPUT:

• word_labels – boolean (default: False) if False, labels the edges by pairs (i, j); if True, labels the edges by word[i:j].

EXAMPLES:
sage: from sage.combinat.words.suffix_trees import ImplicitSuffixTree
sage: W = Words([0,1,2])
sage: t = ImplicitSuffixTree(W([0,1,0,1,2]))
sage: t.to_digraph()  # needs sage.graphs
Digraph on 8 vertices

```python
to_explicit_suffix_tree ()
```
Convert self to an explicit suffix tree.

It is obtained by processing an end of string letter as if it were a regular letter, except that no new leaf nodes are created (thus, the only thing that happens is that some implicit nodes become explicit).

EXAMPLES:
transition_function\((\text{word, node=}0)\)

Return the node obtained by starting from node and following the edges labelled by the letters of word.

OUTPUT:

("explicit", end_node) if we end at end_node, or ("implicit", edge, d) if we end d spots along an edge.

INPUT:

- word – a word
- node – (default: 0) starting node

EXAMPLES:
Combinatorics, Release 10.4

(continued from previous page)

\[
\begin{align*}
\text{>>> t.transition_function} & (W([\text{Integer(0)}, \text{Integer(1)}, \text{Integer(2)}]), \text{Integer(5)}) \\
& ('\text{explicit}', 4) \\
\text{>>> t.transition_function} & (W([\text{Integer(0)}, \text{Integer(1)}]), \text{Integer(5)}) \\
& ('\text{explicit}', 2) \\
\text{>>> t.transition_function} & (W([\text{Integer(0)}]), \text{Integer(5)}) \\
& ('\text{implicit}', (5, 2), 2)
\end{align*}
\]

**transition_function_dictionary()**

Return the transition function as a dictionary of dictionaries.

The format is consistent with the input format for DiGraph.

**EXAMPLES:**

```
sage: from sage.combinat.words.suffix_trees import ImplicitSuffixTree
sage: W = Words("aco")
sage: t = ImplicitSuffixTree(W("cac"))
sage: t.transition_function_dictionary()
{0: {1: (0, None), 2: (1, None)}}
```

```
>>> from sage.all import *
>>> from sage.combinat.words.suffix_trees import ImplicitSuffixTree
>>> W = Words("aco")
>>> t = ImplicitSuffixTree(W("cac"))
>>> t.transition_function_dictionary()
{0: {1: (0, None), 2: (1, None)}}
```

```
sage: W = Words([0, 1])
sage: t = ImplicitSuffixTree(W([0, 1, 0]))
sage: t.transition_function_dictionary()
{0: {1: (0, None), 2: (1, None)}}
```

```
>>> from sage.all import *
>>> W = Words([Integer(0), Integer(1)])
>>> t = ImplicitSuffixTree(W([Integer(0), Integer(1), Integer(0)]))
>>> t.transition_function_dictionary()
{0: {1: (0, None), 2: (1, None)}}
```

**trie_type_dict()**

Return a dictionary in a format compatible with that of the suffix trie transition function.

**EXAMPLES:**

```
sage: from sage.combinat.words.suffix_trees import ImplicitSuffixTree
from sage.combinat.words.suffix_trees import ImplicitSuffixTree,
˓→SuffixTrie
sage: W = Words("ab")
sage: t = ImplicitSuffixTree(W("aba"))
sage: d = t.trie_type_dict()
sage: len(d)
5
sage: d                            # random
{(4, word: b): 5, (0, word: a): 4, (0, word: b): 3, (5, word: a): 1, (3,
˓→word: a): 2}
```

```
>>> from sage.all import *
>>> from sage.combinat.words.suffix_trees import ImplicitSuffixTree,
˓→SuffixTrie
```
Combinatorics, Release 10.4

(continued from previous page)

```python
>>> W = Words("ab")
>>> t = ImplicitSuffixTree(W("aba"))
>>> d = t.trie_type_dict()
>>> len(d)
5
>>> d  # random
```

**uncompactify()**

Return the tree obtained from self by splitting edges so that they are labelled by exactly one letter.

The resulting tree is isomorphic to the suffix trie.

**EXAMPLES:**

```python
sage: from sage.combinat.words.suffix_trees import ImplicitSuffixTree,
     SuffixTrie
sage: abbab = Words("ab")("abbab")
sage: s = SuffixTrie(abbab)
sage: t = ImplicitSuffixTree(abbab)
sage: t.uncompactify().is_isomorphic(s.to_digraph())
True
```

**word()**

Return the word whose implicit suffix tree this is.

```python
class sage.combinat.words.suffix_trees.SuffixTrie(word)
Bases: sage.combinat.words.suffix_trees.SuffixTrie
```

Construct the suffix trie of the word w.

The suffix trie of a finite word w is a data structure representing the factors of w. It is a tree whose edges are labelled with letters of w, and whose leaves correspond to suffixes of w.

This is a straightforward implementation of Algorithm 1 from [Ukko1995]. It constructs the suffix trie of w[:i] from that of w[:i-1].

A suffix trie is modelled as a deterministic finite-state automaton together with the suffix_link map. The set of states corresponds to factors of the word (below we write x’ for the state corresponding to x); these are always 0, 1, ..., The state 0 is the initial state, and it corresponds to the empty word. For the purposes of the algorithm, there is also an auxiliary state -1. The transition function t is defined as:

\[ t(-1, a) = 0 \text{ for all letters } a; \text{ and} \\
   t(x', a) = y' \text{ for all } x', y' \in Q \text{ such that } y = x a, \]

5.1. Comprehensive Module List 5939
and the suffix link function is defined as:

```python
suffix_link(0) = -1;
suffix_link(x) = y', if x = ay for some letter a.
```

REFERENCES:

- [Ukko1995]

EXAMPLES:

```python
sage: from sage.combinat.words.suffix_trees import SuffixTrie
sage: w = Words("cao")("cacao")
sage: t = SuffixTrie(w); t
Suffix Trie of the word: cacao
```

```python
>>> from sage.all import *
>>> from sage.combinat.words.suffix_trees import SuffixTrie
>>> w = Words("cao")("cacao")
>>> t = SuffixTrie(w); t
Suffix Trie of the word: cacao
```

```python
sage: e = Words("ab")()
sage: t = SuffixTrie(e); t
Suffix Trie of the word:
```

```python
sage: t.process_letter("a"); t
Suffix Trie of the word: a
```

```python
sage: t.process_letter("b"); t
Suffix Trie of the word: ab
```

```python
sage: t.process_letter("a"); t
Suffix Trie of the word: aba
```

```python
>>> from sage.all import *
```

```python
>>> e = Words("ab")()
```

```python
>>> t = SuffixTrie(e); t
Suffix Trie of the word:
```

```python
>>> t.process_letter("a"); t
Suffix Trie of the word: a
```

```python
>>> t.process_letter("b"); t
Suffix Trie of the word: ab
```

```python
>>> t.process_letter("a"); t
Suffix Trie of the word: aba
```

```python
active_state()
```

Return the active state of the suffix trie.
This is the state corresponding to the word as a suffix of itself.

EXAMPLES:

```python
sage: from sage.combinat.words.suffix_trees import SuffixTrie
sage: w = Words("cao")("cacao")
sage: t = SuffixTrie(w)
sage: t.active_state()
```

8
from sage.all import *
from sage.combinat.words.suffix_trees import SuffixTrie

w = Words("cao")("cacao")
t = SuffixTrie(w)
t.active_state() 8

sage: u = Words([0,1])([0,1,1,0,1,0,0,1])
sage: s = SuffixTrie(u)
sage: s.active_state() 22

u = Words([Integer(0),Integer(1)])([Integer(0),Integer(1),Integer(1),
Integer(0),Integer(1),Integer(0),Integer(0),Integer(1)])
sage: s = SuffixTrie(u)
sage: s.active_state() 22

final_states()
Return the set of final states of the suffix trie.

These are the states corresponding to the suffixes of self.word(). They are obtained be repeatedly following the suffix link from the active state until we reach 0.

EXAMPLES:

sage: from sage.combinat.words.suffix_trees import SuffixTrie
sage: w = Words("cao")("cacao")
sage: t = SuffixTrie(w)
sage: t.final_states() == Set([8, 9, 10, 11, 12, 0])
True

has_suffix(word)
Return True if and only if word is a suffix of self.word().

EXAMPLES:

sage: from sage.combinat.words.suffix_trees import SuffixTrie
sage: w = Words("cao")("cacao")
sage: t = SuffixTrie(w)
[t.has_suffix(w[i:]) for i in range(len(w)+1)]
[True, True, True, True, True, True]

sage: t.has_suffix(w[:i]) for i in range(len(w)+1)]
[True, False, False, False, False, True]
node_to_word\( (\text{state}=0) \)

Return the word obtained by reading the edge labels from 0 to state.

INPUT:

- state – (default: 0) a state

EXAMPLES:

```python
sage: from sage.combinat.words.suffix_trees import SuffixTrie
sage: w = Words("abc")("abcba")
sage: t = SuffixTrie(w)
sage: t.node_to_word(10)
word: abcba
sage: t.node_to_word(7)
word: abcb
```

plot \( (\text{layout}=\text{tree}, \text{tree_root}=0, \text{tree_orientation}=\text{up}, \text{vertex_colors}=\text{None}, \text{edge_labels}=\text{True}, \*\text{args}, **\text{kwds}) \)

Return a Graphics object corresponding to the transition graph of the suffix trie.

EXAMPLES:

```python
sage: from sage.combinat.words.suffix_trees import SuffixTrie
sage: SuffixTrie(Word("cacao")).plot() # needs sage.plot
Graphics object consisting of 38 graphics primitives
```

process_letter \( \text{(letter)} \)

Modify self to produce the suffix trie for self.word() + letter.

**Note:** letter must occur within the alphabet of the word.

EXAMPLES:
```python
sage: from sage.combinat.words.suffix_trees import SuffixTrie
sage: w = Words("ab")("ababba")
sage: t = SuffixTrie(w); t
Suffix Trie of the word: ababba
sage: t.process_letter("a"); t
Suffix Trie of the word: ababbaa
```

```
>>> from sage.all import *
>>> from sage.combinat.words.suffix_trees import SuffixTrie
>>> w = Words("ab")("ababba")
>>> t = SuffixTrie(w); t
Suffix Trie of the word: ababba
>>> t.process_letter("a"); t
Suffix Trie of the word: ababbaa
```

```
show (*args, **kwds)
Display the output of plot().
EXAMPLES:
```
```
```
```
>>> from sage.all import *
>>> u = Words("aco")("cacao")
>>> s = SuffixTrie(u)
>>> s.states()
[0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11]

**suffix_link(state)**

Evaluate the suffix link map of the suffix trie on state.

Note that the suffix link map is not defined on -1.

**INPUT:**

- state – a state

**EXAMPLES:**

```
sage: from sage.combinat.words.suffix_trees import SuffixTrie
sage: w = Words("cao")("cacao")
sage: t = SuffixTrie(w)
sage: list(map(t.suffix_link, range(13)))
[-1, 0, 3, 0, 5, 1, 7, 2, 9, 10, 11, 12, 0]
sage: t.suffix_link(0)
-1
```

**to_digraph()**

Return a DiGraph object of the transition graph of the suffix trie.

**EXAMPLES:**

```
sage: from sage.combinat.words.suffix_trees import SuffixTrie
sage: w = Words("cao")("cac")
sage: t = SuffixTrie(w)
sage: d = t.to_digraph(); d
Digraph on 6 vertices
sage: d.adjacency_matrix()
[0 1 0 1 0 0]
[0 0 1 0 0 0]
[0 0 0 0 1 0]
[0 0 0 0 0 0]
[0 0 0 0 0 0]
```

(continues on next page)
transition_function (node, word)

Return the state reached by beginning at node and following the arrows in the transition graph labelled by the letters of word.

INPUT:

• node – a node
• word – a word

EXAMPLES:

```python
sage: from sage.combinat.words.suffix_trees import SuffixTrie
sage: w = Words([0,1])([0,1,0,1,1])
sage: t = SuffixTrie(w)
sage: all(t.transition_function(u, letter) == v
....: for (u, letter), v in t._transition_function.items())
True
```

word ()

Return the word whose suffix tree this is.

EXAMPLES:

```python
sage: from sage.combinat.words.suffix_trees import SuffixTrie
sage: w = Words("abc")("abcba")
sage: t = SuffixTrie(w)
sage: t.word()
word: abcba
sage: t.word() == w
True
```

5.1.365 Word classes

AUTHORS:

- Arnaud Bergeron
- Amy Glen
- Sébastien Labbé
- Franco Saliola

class sage.combinat.words.word.FiniteWord_callable (parent, callable, length=None)

Bases: WordDatatype_callable, FiniteWord_class

Finite word represented by a callable.

For such word \( w \), type \( w \) and hit Tab key to see the list of functions defined on \( w \).

EXAMPLES:

```python
sage: f = lambda n : 3 if n > 8 else 6
sage: w = Word(f, length=30, caching=False)
sage: w
word: 666666666333333333333333333333
sage: w.is_symmetric()
True
```

```python
>>> from sage.all import *

>>> f = lambda n : Integer(3) if n > Integer(8) else Integer(6)
>>> w = Word(f, length=Integer(30), caching=False)

>>> w

word: 666666666333333333333333333333

>>> w.is_symmetric()
True
```

class sage.combinat.words.word.FiniteWord_callable_with_caching (parent, callable, length=None)

Bases: WordDatatype_callable_with_caching, FiniteWord_class

Finite word represented by a callable (with caching).

For such word \( w \), type \( w \) and hit Tab key to see the list of functions defined on \( w \).

EXAMPLES:

```python
sage: f = lambda n : n % 3
sage: w = Word(f, length=32)
sage: w

word: 01201201201201201201201201201201

sage: w.border()

word: 01201201201201201201201201201
```

5946 Chapter 5. Comprehensive Module List
```python
>>> from sage.all import *
>>> f = lambda n : n % Integer(3)
>>> w = Word(f, length=Integer(32))

word: 01201201201201201201201201201201

w.border()

word: 01201201201201201201201201201201

class sage.combinat.words.word.FiniteWord_char
Bases: WordDatatype_char, FiniteWord_class

Finite word represented by an array unsigned char * (i.e. integers between 0 and 255).

For any word w, type w.<TAB> to see the functions that can be applied to w.

EXAMPLES:

sage: W = Words(range(20))
sage: w = W(list(range(1, 10)) * 2)
sage: type(w)
<class 'sage.combinat.words.word.FiniteWord_char'>
sage: w
word: 123456789123456789
sage: w.is_palindrome()
False
sage: (w*w[::-1]).is_palindrome()
True
sage: (w[:1]*w[::-1]).is_palindrome()
True
sage: w.is_lyndon()
False
sage: W(list(range(10)) + [10, 10]).is_lyndon()
True
sage: w.is_square_free()
False
sage: w[::-1].is_square_free()
True
sage: u = W([randint(0,10) for i in range(10)])
sage: (u*u).is_square()  # needs sage.graphs
True
sage: (u*u*u).is_cube()
True
sage: len(w.factor_set())
127
sage: w.rauzy_graph(5)  # needs sage.graphs
Looped digraph on 9 vertices
sage: u = W([1,2,3])
sage: w.first_occurrence(u)
0
sage: w.first_occurrence(u, start=1)
```

(continues on next page)
```python
>>> from sage.all import *

>>> W = Words(range(Integer(20))

>>> w = W(list(range(Integer(1), Integer(10))) * Integer(2))

>>> type(w)
<class 'sage.combinat.words.word.FiniteWord_char'>

>>> w
word: 123456789123456789

>>> w.is_palindrome()
False

>>> (w*w[::-Integer(1)]).is_palindrome()
True

>>> (w[::-Integer(1)]*w[::-Integer(1)]).is_palindrome()
True

>>> w.is_lyndon()
False

>>> W(list(range(Integer(10))) + [Integer(10), Integer(10)]).is_lyndon()
True

>>> w.is_square_free()
False

>>> w[::-Integer(1)].is_square_free()
True

>>> u = W([randint(Integer(0),Integer(10)) for i in range(Integer(10))])

>>> (u*u).is_square()
True

>>> (u*u*u).is_cube()
True

>>> len(w.factor_set())
127

>>> w.rauzy_graph(Integer(5))
Looped digraph on 9 vertices

>>> u = W([Integer(1),Integer(2),Integer(3)])

>>> w.first_occurrence(u)
0

>>> w.first_occurrence(u, start=Integer(1))
```

```
class sage.combinat.words.word.FiniteWord_iter (parent, iter, length=None)

Bases: WordDatatype_iter, FiniteWord_class

Finite word represented by an iterator.

For such word \( w \), type \( w \) and hit Tab key to see the list of functions defined on \( w \).

EXAMPLES:

sage: w = Word(iter(range(10)), caching=False)
```

(continues on next page)
Combinatorics, Release 10.4

(continued from previous page)

```python
word: 0123456789
sage: w.finite_differences()
word: 111111111

```  

```python
>>> from sage.all import *
>>> w = Word(iter(range(Integer(10))), caching=False)
>>> w
word: 0123456789
>>> w.finite_differences()
word: 111111111
```

**class** `sage.combinat.words.word.FiniteWord_iter_with_caching` *(parent, iter, length=None)*  

Bases: `WordDatatype_iter_with_caching`, `FiniteWord_class`

Finite word represented by an iterator (with caching).

For such word `w`, type `w.` and hit Tab key to see the list of functions defined on `w`.

**EXAMPLES:**

```python
sage: w = Word(iter('abcdef'))
sage: w.conjugate(2)
word: cdefab
```

```python
>>> from sage.all import *
>>> w = Word(iter('abcdef'))
>>> w.conjugate(Integer(2))
word: cdefab
```

**class** `sage.combinat.words.word.FiniteWord_list`

Bases: `WordDatatype_list`, `FiniteWord_class`

Finite word represented by a Python list.

For any word `w`, type `w.` and hit Tab key to see the list of functions defined on `w`.

**EXAMPLES:**

```python
sage: w = Word(range(10))
sage: w.iterated_right_palindromic_closure()
word: 0102010301020104010201030102010501020103...
```

```python
>>> from sage.all import *
>>> w = Word(range(Integer(10)))
>>> w.iterated_right_palindromic_closure()
word: 0102010301020104010201030102010501020103...
```

**class** `sage.combinat.words.word.FiniteWord_morphic` *(parent, morphism, letter, coding=None, length=+Infinity)*  

Bases: `WordDatatype_morphic`, `FiniteWord_class`

Finite morphic word.

For such word `w`, type `w.` and hit Tab key to see the list of functions defined on `w`.

**EXAMPLES:**

5.1. Comprehensive Module List 5949
sage: m = WordMorphism("a->ab,b->")
sage: w = m.fixed_point("a")
sage: w
word: ab

>>> from sage.all import *
>>> m = WordMorphism("a->ab,b->")
>>> w = m.fixed_point("a")
>>> w
word: ab

class sage.combinat.words.word.FiniteWord_str

Bases: WordDatatype_str, FiniteWord_class

Finite word represented by a Python str.

For such word \( w \), type \( w \) and hit Tab key to see the list of functions defined on \( w \).

EXAMPLES:

sage: w = Word('abcdef')
sage: w.is_square()
False

>>> from sage.all import *
>>> w = Word('abcdef')
>>> w.is_square()
False

class sage.combinat.words.word.FiniteWord_tuple

Bases: WordDatatype_tuple, FiniteWord_class

Finite word represented by a Python tuple.

For such word \( w \), type \( w \) and hit Tab key to see the list of functions defined on \( w \).

EXAMPLES:

sage: w = Word(())
sage: w.is_empty()
True

>>> from sage.all import *
>>> w = Word(())
>>> w.is_empty()
True

class sage.combinat.words.word.InfiniteWord_callable (parent, callable, length=None)

Bases: WordDatatype_callable, InfiniteWord_class

Infinite word represented by a callable.

For such word \( w \), type \( w \) and hit Tab key to see the list of functions defined on \( w \).

Infinite words behave like a Python list: they can be sliced using square brackets to define for example a prefix or a factor.

EXAMPLES:
sage: w = Word(lambda n:n, caching=False)
sage: w
word: 0,1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,17,18,19,20,21,22,23,24,25,26,27,
    →28,29,30,31,32,33,34,35,36,37,38,39,...
sage: w.iterated_right_palindromic_closure()
word: 0102010301020104010201030102010501020103...

>>> from sage.all import *
>>> w = Word(lambda n:n, caching=False)
>>> w
word: 0,1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,17,18,19,20,21,22,23,24,25,26,27,
    →28,29,30,31,32,33,34,35,36,37,38,39,...
>>> w.iterated_right_palindromic_closure()
word: 0102010301020104010201030102010501020103...

class sage.combinat.words.word.InfiniteWord_callable_with_caching (parent, callable, length=None)

Bases: WordDatatype_callable_with_caching, InfiniteWord_class

Infinite word represented by a callable (with caching).

For such word \( w \), type \( w \). and hit Tab key to see the list of functions defined on \( w \).

Infinite words behave like a Python list: they can be sliced using square brackets to define for example a prefix or a factor.

EXAMPLES:

sage: w = Word(lambda n:n)
sage: factor = w[4:13]
sage: factor
word: 4,5,6,7,8,9,10,11,12

>>> from sage.all import *
>>> w = Word(lambda n:n)
>>> factor = w[Integer(4):Integer(13)]
>>> factor
word: 4,5,6,7,8,9,10,11,12

class sage.combinat.words.word.InfiniteWord_iter (parent, iter, length=None)

Bases: WordDatatype_iter, InfiniteWord_class

Infinite word represented by an iterable.

For such word \( w \), type \( w \). and hit Tab key to see the list of functions defined on \( w \).

Infinite words behave like a Python list: they can be sliced using square brackets to define for example a prefix or a factor.

EXAMPLES:

sage: from itertools import chain, cycle
sage: w = Word(chain(letsgo, cycle(forever)), caching=False)
sage: w
word: letsgoeverforeverforeverforeverforeverforeverforeverforeverforeverforeverforeverforeverforeverforeverforever...

sage: prefix = w[:100]
sage: prefix
word: letsgoeverforeverforeverforeverforeverforeverforeverforeverforeverforeverforeverforeverforeverforeverforever...

(continues on next page)
sage: prefix.is_lyndon()  
False

>>> from sage.all import *  
>>> from itertools import chain, cycle  
>>> w = Word(chain('letsgo', cycle('forever')), caching=False)  
>>> w  
word: letsgoforeverforeverforeverforeverforever...

>>> prefix = w[:Integer(100)]  
>>> prefix  
word: letsgoforeverforeverforeverforeverforever...

>>> prefix.is_lyndon()  
False

class sage.combinat.words.word.InfiniteWord_iter_with_caching (parent, iter, length=None)  

Bases: WordDatatype_iter_with_caching, InfiniteWord_class

Infinite word represented by an iterable (with caching).

For such word \( w \), type \( w \) and hit Tab key to see the list of functions defined on \( w \).

Infinite words behave like a Python list: they can be sliced using square brackets to define for example a prefix or a factor.

EXAMPLES:

sage: from itertools import cycle  
sage: w = Word(cycle([9,8,4]))  
sage: w  
word: 9849849849849849849849849849849849849849...

sage: prefix = w[:23]  
sage: prefix  
word: 98498498498498498498498

sage: prefix.minimal_period()  
3

>>> from sage.all import *  
>>> from itertools import cycle  
>>> w = Word(cycle([Integer(9),Integer(8),Integer(4)]))  
>>> w  
word: 9849849849849849849849849849849849849849...

>>> prefix = w[:Integer(23)]  
>>> prefix  
word: 98498498498498498498498498498498498498498

>>> prefix.minimal_period()  
3

class sage.combinat.words.word.InfiniteWord_morphic (parent, morphism, letter, coding=None, length=+Infinity)  

Bases: WordDatatype_morphic, InfiniteWord_class

Morphic word of infinite length.

For such word \( w \), type \( w \) and hit Tab key to see the list of functions defined on \( w \).

Infinite words behave like a Python list: they can be sliced using square brackets to define for example a prefix or a factor.
EXAMPLES:

```python
sage: m = WordMorphism('a->ab,b->a')
sage: w = m.fixed_point('a')
sage: w
word: abaababaababaababaababaababaababaababaababaababaababa...  
```

```python
>>> from sage.all import *

>>> m = WordMorphism('a->ab,b->a')

>>> w = m.fixed_point('a')

>>> w
word: abaababaababaababaababaababaababaababaababaababaaba...  
```

```python
sage.combinat.words.word.Word(data=None, alphabet=None, length=None, datatype=None, 
caching=True, RSK_data=None)

Construct a word.

INPUT:

- **data** – (default: None) list, string, tuple, iterator, free monoid element, None (shorthand for []), or a callable defined on [0,1,...,length].
- **alphabet** – any argument accepted by Words
- **length** – (default: None) This is dependent on the type of data. It is ignored for words defined by lists, strings, tuples, etc., because they have a naturally defined length. For callables, this defines the domain of definition, which is assumed to be [0, 1, 2, ..., length-1]. For iterators: Infinity if you know the iterator will not terminate (default); "unknown" if you do not know whether the iterator terminates; "finite" if you know that the iterator terminates, but do not know the length.
- **datatype** – (default: None) None, "list", "str", "tuple", "iter", "callable". If None, then the function tries to guess this from the data.
- **caching** – (default: True) True or False. Whether to keep a cache of the letters computed by an iterator or callable.
- **RSK_data** – (Optional. Default: None) A semistandard and a standard Young tableau to run the inverse RSK bijection on.

**Note:** Be careful when defining words using callables and iterators. It appears that islice does not pickle correctly causing various errors when reloading. Also, most iterators do not support copying and should not support pickling by extension.

EXAMPLES:

Empty word:

```python
sage: Word() 
word: 
```

```python
>>> from sage.all import *

>>> Word() 
word: 
```

Word with string:

```python
sage: Word("ababaab")
word: ababaab
```
>>> from sage.all import *
>>> Word("abababaab")
word: abababaab

Word with string constructed from other types:

sage: Word([0,1,1,0,1,0,0,1], datatype="str")
word: 01101001
sage: Word((0,1,1,0,1,0,0,1), datatype="str")
word: 01101001

>>> from sage.all import *
>>> Word([Integer(0),Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
       Integer(0),Integer(1)], datatype="str")
word: 01101001
>>> Word((Integer(0),Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
       Integer(0),Integer(1)), datatype="str")
word: 01101001

Word with list:

sage: Word([0,1,1,0,1,0,0,1])
word: 01101001

>>> from sage.all import *
>>> Word([Integer(0),Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
       Integer(0),Integer(1)])
word: 01101001

Word with list constructed from other types:

sage: Word("01101001", datatype="list")
word: 01101001
sage: Word((0,1,1,0,1,0,0,1), datatype="list")
word: 01101001

>>> from sage.all import *
>>> Word("01101001", datatype="list")
word: 01101001
>>> Word((Integer(0),Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
       Integer(0),Integer(1)), datatype="list")
word: 01101001

Word with tuple:

sage: Word((0,1,1,0,1,0,0,1))
word: 01101001

>>> from sage.all import *
>>> Word((Integer(0),Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
       Integer(0),Integer(1)))
word: 01101001

Word with tuple constructed from other types:
Combinatorics, Release 10.4

```python
sage: Word([0,1,1,0,1,0,0,1], datatype="tuple")
word: 01101001
sage: Word("01101001", datatype="str")
word: 01101001

>>> from sage.all import *
>>> Word([Integer(0),Integer(1),Integer(1),Integer(0),Integer(1),Integer(0), Integer(0),Integer(1)], datatype="tuple")
word: 01101001
>>> Word("01101001", datatype="str")
word: 01101001

Word with iterator:

```python
sage: from itertools import count
sage: Word(count())
word: 0,1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,17,18,19,20,21,22,23,24,25,26,27,
    →28,29,30,31,32,33,34,35,36,37,38,39,...
sage: Word(iter("abbabaab")) # iterators default to infinite words
word: abbabaab
sage: Word(iter("abbabaab"), length="unknown")
word: abbabaab
sage: Word(iter("abbabaab"), length="finite")
word: abbabaab

>>> from sage.all import *
>>> from itertools import count
>>> Word(count())
word: 0,1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,17,18,19,20,21,22,23,24,25,26,27,
    →28,29,30,31,32,33,34,35,36,37,38,39,...
>>> Word(iter("abbabaab")) # iterators default to infinite words
word: abbabaab
>>> Word(iter("abbabaab"), length="unknown")
word: abbabaab
>>> Word(iter("abbabaab"), length="finite")
word: abbabaab

Word with function (a 'callable'):

```python
sage: f = lambda n : add(Integer(n).digits(2)) % 2
sage: Word(f)
word: 0110100110010110100101100110100110010110...

>>> from sage.all import *
>>> f = lambda n : add(Integer(n).digits(Integer(2))) % Integer(2)
>>> Word(f)
word: 0110100110010110100101100110100110010110...

Word over a string with a parent:

```python
sage: w = Word("abbabaab", alphabet="abc"); w
word: abbabaab
```

(continues on next page)
sage: w.parent()
Finite words over ('a', 'b', 'c')

>>> from sage.all import *
>>> w = Word("abbabaab", alphabet="abc"); w
word: abbabaab
>>> w.parent()
Finite words over ('a', 'b', 'c')

Word from a free monoid element:

sage: M.<x,y,z> = FreeMonoid(3)
sage: Word(x^3*y*x*z^2*x)
word: xxxyxzzx

The default parent is the combinatorial class of all words:

sage: w = Word("abbabaab"); w
word: abbabaab
sage: w.parent()
Finite words over Set of Python objects of class 'object'

We can also input a semistandard tableau and a standard tableau to obtain a word from the inverse RSK algorithm using the RSK_data option:

sage: p = Tableau([[1,2,2],[3]]); q = Tableau([[1,2,4],[3]])
sage: Word(RSK_data=[p, q])
word: 1322

sage.combinat.words.word.

class sage.combinat.words.word.

Word_iter (parent, iter, length=None)
Bases: WordDatatype_iter, Word_class

Word of unknown length (finite or infinite) represented by an iterable.

For such word \( w \), type \( w \) and hit Tab key to see the list of functions defined on \( w \).

Words behave like a Python list: they can be sliced using square brackets to define for example a prefix or a factor.

EXAMPLES:
class sage.combinat.words.word.Word_iter_with_caching (parent, iter, length=None)

Bases: WordDatatype_iter_with_caching, Word_class

Word of unknown length (finite or infinite) represented by an iterable (with caching).

For such word \(w\), type \(w.\) and hit Tab key to see the list of functions defined on \(w\).

Words behave like a Python list: they can be sliced using square brackets to define for example a prefix or a factor.

EXAMPLES:

```python
sage: w = Word(iter([1,2,3]*1000), length='unknown')
sage: w
word: 1231231231231231231231231231231231231231...
sage: w.finite_differences(mod=2)
word: 11011011011011011011011011011011011010110...
```

5.1.366 Fast word datatype using an array of unsigned char

class sage.combinat.words.word_char.WordDatatype_char

Bases: WordDatatype

A Fast class for words represented by an array unsigned char *.

Currently, only handles letters in [0,255].

```
5.1. Comprehensive Module List 5957
```
has_prefix(other)

Test whether other is a prefix of self.

INPUT:

• other – a word or a sequence (e.g. tuple, list)

EXAMPLES:

```python
>>> from sage.all import *
>>> W = Words([Integer(0), Integer(1), Integer(2)])
>>> W([Integer(0), Integer(2), Integer(1)]).concatenate([Integer(0), Integer(0), Integer(0)])
word: 021000

>>> W = Words([Integer(0), Integer(1), Integer(2)])
>>> w = W([Integer(0), Integer(1), Integer(1), Integer(0), Integer(1), Integer(2), Integer(0)])
>>> w.has_prefix([Integer(0), Integer(1), Integer(1)])
True
>>> w.has_prefix([Integer(0), Integer(1), Integer(2)])
False
>>> w.has_prefix(w)
True
>>> w.has_prefix(w[:-Integer(1)])
True
>>> w.has_prefix(w[Integer(1):])
False
```

is_empty()

Return whether the word is empty.

EXAMPLES:

```python
>>> from sage.all import *
>>> W = Words([Integer(0), Integer(1), Integer(2)])
>>> W([Integer(0), Integer(1), Integer(2), Integer(2)]).is_empty()
False
>>> W([]).is_empty()
True
```

(continues on next page)
Combinatorics, Release 10.4

False
>>> W([]).is_empty()
True

is\_square()
Return True if self is a square, and False otherwise.

EXAMPLES:
sage: w = Word([n % 4 for n in range(48)], alphabet=[0,1,2,3])
sage: w.is_square()
True

>>> from sage.all import *

>>> w = Word([n % Integer(4) for n in range(Integer(48))],
alphabet=[Integer(0),Integer(1),Integer(2),Integer(3)])
>>> w.is_square()
True

sage: w = Word([n % 4 for n in range(49)], alphabet=[0,1,2,3])
sage: w.is_square()
False
sage: (w*w).is_square()
True

length()
Return the length of the word as a Sage integer.

EXAMPLES:
sage: W = Words([0,1,2,3,4])
sage: w = W([0,1,2,0,3,2,1])
sage: w.length()
7
sage: type(w.length())
<class 'sage.rings.integer.Integer'>
sage: type(len(w))
<int>

>>> from sage.all import *

>>> W = Words([Integer(0),Integer(1),Integer(2),Integer(3),Integer(4)])
>>> w = W([Integer(0),Integer(1),Integer(2),Integer(0),Integer(3),Integer(2),
Integer(1)])
>>> w.length()
7
>>> type(w.length())
<class 'sage.rings.integer.Integer'>

(continues on next page)
**letters()**

Return the list of letters that appear in this word, listed in the order of first appearance.

**EXAMPLES:**

```python
sage: W = Words(5)
sage: W([1,3,1,2,2,3,1]).letters()
[1, 3, 2]
```

**longest_common_prefix(other)**

Return the longest common prefix of this word and `other`.

**EXAMPLES:**

```python
sage: W = Words([0,1,2])
sage: W([0,1,0,2]).longest_common_prefix([0,1])
word: 01
sage: u = W([0,1,0,0,1])
sage: v = W([0,1,0,2])
sage: u.longest_common_prefix(v)
word: 010
sage: v.longest_common_prefix(u)
word: 010
```

Using infinite words is also possible (and the return type is also a of the same type as `self`):

```python
sage: W([0,1,0,0]).longest_common_prefix(words.FibonacciWord())
word: 010
sage: type(_)
<class 'sage.combinat.words.word.FiniteWord_char'>
```
An example of an intensive usage:

```python
sage: W = Words([0,1])
sage: w = words.FibonacciWord()
sage: w = W(list(w[:5000]))
sage: L = [[len(w[n:].longest_common_prefix(w[n+fibonacci(i):])])
      #→ needs sage.libs.pari
      ....: for i in range(5,15)] for n in range(1,1000)]
sage: for n,l in enumerate(L):
      #→ needs sage.libs.pari
      ....: if l.count(0) > 4:
      ....:     print("{} {}"
375 [0, 13, 0, 34, 0, 89, 0, 233, 0, 233]
376 [0, 12, 0, 33, 0, 88, 0, 232, 0, 232]
608 [8, 0, 21, 0, 55, 0, 144, 0, 377, 0]
609 [7, 0, 20, 0, 54, 0, 143, 0, 376, 0]
985 [0, 13, 0, 34, 0, 89, 0, 233, 0, 610]
986 [0, 12, 0, 33, 0, 88, 0, 232, 0, 609]
```

```python
>>> from sage.all import *
```

```python
>>> W = Words([Integer(0),Integer(1)])
```

```python
>>> w = words.FibonacciWord()
```

```python
>>> w = W(list(w[:Integer(5000)]))
```

```python
>>> L = [[len(w[n:].longest_common_prefix(w[n+fibonacci(i):])])
      #→ needs sage.libs.pari
      ....: for i in range(Integer(5),Integer(15))] for n in range(Integer(1),
      #→ Integer(1000))]
```

```python
>>> for n,l in enumerate(L):
      #→ needs sage.libs.pari
      ....: if l.count(Integer(0)) > Integer(4):
      ....:     print("{} {}"
375 [0, 13, 0, 34, 0, 89, 0, 233, 0, 233]
376 [0, 12, 0, 33, 0, 88, 0, 232, 0, 232]
608 [8, 0, 21, 0, 55, 0, 144, 0, 377, 0]
609 [7, 0, 20, 0, 54, 0, 143, 0, 376, 0]
985 [0, 13, 0, 34, 0, 89, 0, 233, 0, 610]
986 [0, 12, 0, 33, 0, 88, 0, 232, 0, 609]
```

### longest_common_suffix(other)

Return the longest common suffix between this word and other.

**EXAMPLES:**

```python
sage: W = Words([0,1,2])
sage: W([0,1,0,2]).longest_common_suffix([2,0,2])
word: 02
sage: u = W([0,1,0,0,1])
sage: v = W([1,2,0,0,1])
sage: u.longest_common_suffix(v)
word: 001
sage: v.longest_common_suffix(u)
word: 001
```
>>> from sage.all import *
>>> W = Words([Integer(0), Integer(1), Integer(2)])
>>> W([Integer(0), Integer(1), Integer(0), Integer(2)]).longest_common_suffix([Integer(2), Integer(0), Integer(2)])
word: 02
>>> u = W([Integer(0), Integer(1), Integer(0), Integer(0), Integer(1)])
>>> v = W([Integer(1), Integer(2), Integer(0), Integer(0), Integer(1)])
>>> u.longest_common_suffix(v)
word: 001
>>> v.longest_common_suffix(u)
word: 001

This function exists only because it is not possible to use yield in the special method \_reversed\_.

EXAMPLES:

```
sage: W = Words([0,1,2])
sage: w = W([0,1,0,0,1,2])
```

```
list(reversed(w)) # indirect doctest
[2, 1, 0, 0, 1, 0]
```

```
>>> from sage.all import *
>>> W = Words([Integer(0), Integer(1), Integer(2)])
>>> w = W([Integer(0), Integer(1), Integer(0), Integer(0), Integer(1), Integer(2)])
```

```
list(reversed(w)) # indirect doctest
[2, 1, 0, 0, 1, 0]
```

5.1.367 Datatypes for finite words

```
class sage.combinat.words.word_datatypes.WordDatatype
   Bases: object
   The generic WordDatatype class.

   Any word datatype must contain two attributes (at least):
   
   • \_parent
   • \_hash

   They are automatically defined here and it's not necessary (and forbidden) to
define them anywhere else.
```

```
class sage.combinat.words.word_datatypes.WordDatatype_list
   Bases: WordDatatype
   Datatype class for words defined by lists.
```

```
length()
   Return the length of the word.
```

EXAMPLES:

```
sage: w = Word([0,1,1,0])
sage: w.length()
4
```

number_of_letter_occurrences(a)

Returns the number of occurrences of the letter a in the word self.

INPUT:
• a – a letter

OUTPUT:
• integer

EXAMPLES:

```python
sage: w = Word([0,1,1,0,1])
sage: w.number_of_letter_occurrences(0)
2
sage: w.number_of_letter_occurrences(1)
3
sage: w.number_of_letter_occurrences(2)
0
```

See also:

`sage.combinat.words.finite_word.FiniteWord_class.
number_of_factor_occurrences()`
EXAMPLES:

```
sage: w = Word("abbabaabababa")
sage: w.find("a")
0
sage: w.find("a", 4)
5
sage: w.find("a", 4, 5)
-1
```

```>>> from sage.all import *
>>> w = Word("abbabaabababa")
>>> w.find("a")
0
>>> w.find("a", Integer(4))
5
>>> w.find("a", Integer(4), Integer(5))
-1```

**has_prefix**(other)

Test whether `self` has `other` as a prefix.

INPUT:

- `other` – a word (an instance of `Word_class`) or a `str`.

OUTPUT:

- boolean

EXAMPLES:

```
sage: w = Word("abbabaabababa")
sage: u = Word("abbab")
sage: w.has_prefix(u)
True
sage: u.has_prefix(w)
False
sage: u.has_prefix("abbab")
True
```

```>>> from sage.all import *
>>> w = Word("abbabaabababa")
>>> u = Word("abbab")
>>> w.has_prefix(u)
True
>>> u.has_prefix(w)
False
>>> u.has_prefix("abbab")
True```

**has_suffix**(other)

Test whether `self` has `other` as a suffix.

INPUT:

- `other` – a word (an instance of `Word_class`) or a `str`.

OUTPUT:

- boolean
EXAMPLES:

```python
sage: w = Word("abbabaabababa")
sage: u = Word("ababa")
sage: w.has_suffix(u)
True
sage: u.has_suffix(w)
False
sage: u.has_suffix("ababa")
True
```

```python
>>> from sage.all import *
>>> w = Word("abbabaabababa")
>>> u = Word("ababa")
>>> w.has_suffix(u)
True
>>> u.has_suffix(w)
False
>>> u.has_suffix("ababa")
True
```

`is_prefix` *(other)*

Test whether *self* is a prefix of *other*.

**INPUT:**

- *other* — a word (an instance of `Word_class`) or a `str`.

**OUTPUT:**

- boolean

**EXAMPLES:**

```python
sage: w = Word("abbabaabababa")
sage: u = Word("abbab")
sage: w.is_prefix(u)
False
sage: u.is_prefix(w)
True
sage: u.is_prefix("abbabaabababa")
True
```

```python
>>> from sage.all import *
>>> w = Word("abbabaabababa")
>>> u = Word("abbab")
>>> w.is_prefix(u)
False
>>> u.is_prefix(w)
True
>>> u.is_prefix("abbabaabababa")
True
```

`is_suffix` *(other)*

Test whether *self* is a suffix of *other*.

**INPUT:**

- *other* — a word (an instance of `Word_class`) or a `str`.
OUTPUT:

• boolean

EXAMPLES:

```
sage: w = Word("abbabaabababa")
sage: u = Word("ababa")
sage: w.is_suffix(u)
False
sage: u.is_suffix(w)
True
sage: u.is_suffix("abbabaabababa")
True

>>> from sage.all import *

>>> w = Word("abbabaabababa")
>>> u = Word("ababa")
>>> w.is_suffix(u)
False
>>> u.is_suffix(w)
True
>>> u.is_suffix("abbabaabababa")
True
```

**length()**

Return the length of the word.

EXAMPLES:

```
sage: w = Word("abbabaabababa")
sage: w.length()
13

>>> from sage.all import *

>>> w = Word("abbabaabababa")
>>> w.length()
13
```

**number_of_letter_occurrences (letter)**

Count the number of occurrences of letter.

INPUT:

• letter – a letter

OUTPUT:

• integer

EXAMPLES:

```
sage: w = Word("abbabaabababa")
sage: w.number_of_letter_occurrences('a')
7
sage: w.number_of_letter_occurrences('b')
6
sage: w.number_of_letter_occurrences('c')
0
```
>>> from sage.all import *
>>> w = Word("ababaabababa")
>>> w.number_of_letter_occurrences('a')
7
>>> w.number_of_letter_occurrences('b')
6
>>> w.number_of_letter_occurrences('c')
0

sage: w.number_of_letter_occurrences('abb')
0

See also:
sage.combinat.words.finite_word.FiniteWord_class.
number_of_factor_occurrences()

partition(sep)

Search for the separator sep in S, and return the part before it, the separator itself, and the part after it. The concatenation of the terms in the list gives back the initial word.

See also the split method.

Note: This just wraps Python's builtin str::partition() for str.

INPUT:

• sep – string or word

EXAMPLES:

sage: w = Word("MyTailorIsPoor")
sage: w.partition("Tailor")
[word: My, word: Tailor, word: IsPoor]

>>> from sage.all import *
>>> w = Word("MyTailorIsPoor")
>>> w.partition("Tailor")
[word: My, word: Tailor, word: IsPoor]

sage: w = Word("3230301030323212323032321210121232121010")
sage: l = w.partition("323")
sage: print(l)
[word: , word: 323, word: 0301030323212323032321210121232121010]
sage: sum(l, Word()) == w
True

(continues on next page)
If the separator is not a string an error is raised:

```python
sage: w = Word("le papa du papa du papa etait un petit pioupiou")
sage: w.partition(Word(['p','a','p','a']))
Traceback (most recent call last):
  ... ValueError: the separator must be a string
```
Note: This just wraps Python’s built-in `str::split()` for `str`.

INPUT:

- `sep` – string or word (default: None)
- `maxsplit` – positive integer (default: None)

OUTPUT:

- a list of words

EXAMPLES:

You can split along white space to find words in a sentence:

```
sage: w = Word("My tailor is poor")
sage: w.split(" ")
[word: My, word: tailor, word: is, word: poor]
```

```
>>> from sage.all import *

>>> w = Word("My tailor is poor")

>>> w.split(" ")
[word: My, word: tailor, word: is, word: poor]
```

The python behavior is kept when no argument is given:

```
sage: w.split()
[word: My, word: tailor, word: is, word: poor]
```

```
>>> from sage.all import *

>>> w.split()
[word: My, word: tailor, word: is, word: poor]
```

You can split in two words letters to get the length of blocks in the other letter:

```
sage: w = Word("ababbabaaba")
sage: w.split('a')
[word: , word: b, word: bb, word: b, word: , word: b, word: ]
sage: w.split('b')
[word: a, word: a, word: , word: a, word: aa, word: a]
```

```
>>> from sage.all import *

>>> w = Word("ababbabaaba")

>>> w.split('a')
[word: , word: b, word: bb, word: b, word: , word: b, word: ]

>>> w.split('b')
[word: a, word: a, word: , word: a, word: aa, word: a]
```

You can split along words:

```
sage: w = Word("3230301030323212323032321")
sage: w.split("32")
[word: , word: 30301030, word: , word: 12, word: 30, word: , word: 1]
```

```
>>> from sage.all import *

>>> w = Word("3230301030323212323032321")

>>> w.split("32")
[word: , word: 30301030, word: , word: 12, word: 30, word: , word: 1]
```
```python
>>> from sage.all import *
>>> w = Word("3230301030323212323032321")
>>> w.split("32")
[word: , word: 30301030, word: , word: 12, word: 30, word: , word: 1]
```

If the separator is not a string a `ValueError` is raised:

```
sage: w = Word("le papa du papa du papa etait un petit pioupiou")
sage: w.split(Word(['p','a','p','a']))
Traceback (most recent call last):
... ValueError: the separator must be a string
```

```python
>>> from sage.all import *
>>> w = Word("le papa du papa du papa etait un petit pioupiou")
>>> w.split(Word(['p','a','p','a']))
Traceback (most recent call last):
... ValueError: the separator must be a string
```

class sage.combinat.words.word_datatypes.WordDatatype_tuple

Datatype class for words defined by tuples.

```
length()
```

Return the length of the word.

EXAMPLES:

```
sage: w = Word((0,1,1,0))
sage: w.length()
4
```

```
>>> from sage.all import *
>>> w = Word((Integer(0),Integer(1),Integer(1),Integer(0)))
>>> w.length()
4
```

5.1.368 Common words

AUTHORS:

- Franco Saliola (2008-12-17): merged into sage
- Sébastien Labbé (2008-12-17): merged into sage
- Arnaud Bergeron (2008-12-17): merged into sage
- Amy Glen (2008-12-17): merged into sage
- Sébastien Labbé (2009-12-19): Added S-adic words (Issue #7543)

USE:

To see a list of all word constructors, type `words`, and then press the Tab key. The documentation for each constructor includes information about each word, which provides a useful reference.

REFERENCES:
EXAMPLES:

```python
sage: t = words.ThueMorseWord(); t
word: 0110100110010110100101100110100110010110...
```

```python
>>> from sage.all import *

>>> t = words.ThueMorseWord(); t
word: 0110100110010110100101100110100110010110...
```

```python
class sage.combinat.words.word_generators.LowerChristoffelWord(p, q, alphabet=(0, 1), algorithm='cf')
```

Bases: `FiniteWord_list`

Returns the lower Christoffel word of slope \( \frac{p}{q} \), where \( p \) and \( q \) are relatively prime non-negative integers, over the given two-letter alphabet.

The Christoffel word of slope \( \frac{p}{q} \) is obtained from the Cayley graph of \( \mathbb{Z}/(p+q)\mathbb{Z} \) with generator \( q \) as follows. If \( u \to v \) is an edge in the Cayley graph, then \( v = u + p \mod p + q \). Label the edge \( u \to v \) by \( \text{alphabet}[1] \) if \( u < v \) and \( \text{alphabet}[0] \) otherwise. The Christoffel word is the word obtained by reading the edge labels along the cycle beginning from 0.

EXAMPLES:

```python
sage: words.LowerChristoffelWord(4,7)
word: 00100100101
```

```python
>>> from sage.all import *

>>> words.LowerChristoffelWord(Integer(4),Integer(7))
word: 00100100101
```

```python
sage: words.LowerChristoffelWord(4,7,alphabet='ab')
word: aabaabaabab
```

```python
>>> from sage.all import *

>>> words.LowerChristoffelWord(Integer(4),Integer(7),alphabet='ab')
word: aabaabaabab
```

```python
markoff_number()
```

Return the Markoff number associated to the Christoffel word \( \text{self} \).

The Markoff number of a Christoffel word \( w \) is \( \text{trace}(M(w))/3 \), where \( M(w) \) is the \( 2 \times 2 \) matrix obtained by applying the morphism: \( 0 \to \text{matrix}(2,[2,1,1,1]) \) \( 1 \to \text{matrix}(2,[5,2,2,1]) \)

EXAMPLES:

```python
sage: w0 = words.LowerChristoffelWord(4,7)
sage: w1, w2 = w0.standard_factorization()
sage: (m0,m1,m2) = (w.markoff_number() for w in (w0,w1,w2))
# Needs sage.modules
```

```python
sage: (m0,m1,m2)  # Needs sage.modules
(294685, 13, 7561)
sage: m0*m2 + m1**2 + m2**2 == 3*m0*m1*m2  # Needs sage.modules
True
```
```python
>>> from sage.all import *
>>> w0 = words.LowerChristoffelWord(Integer(4), Integer(7))
>>> w1, w2 = w0.standard_factorization()
>>> (m0, m1, m2) = (w.markoff_number() for w in (w0, w1, w2))          # needs sage.modules
>>> (m0, m1, m2)                                              # needs sage.modules
(294685, 13, 7561)
>>> m0**Integer(2) + m1**Integer(2) + m2**Integer(2) == Integer(3)*m0*m1*m2  # needs sage.modules
True
```

### standard_factorization()

Returns the standard factorization of the Christoffel word `self`.

The **standard factorization** of a Christoffel word `w` is the unique factorization of `w` into two Christoffel words.

**EXAMPLES:**

```python
sage: w = words.LowerChristoffelWord(5, 9)
sage: w
word: 00100100100101
sage: w1, w2 = w.standard_factorization()
sage: w1
word: 001
sage: w2
word: 00100100101

sage: w = words.LowerChristoffelWord(51, 37)
sage: w1, w2 = w.standard_factorization()
sage: w1
word: 0101011010101101011
sage: w2
word: 0101011010101101011010101101010110101101...
sage: w1 * w2 == w
True
```
class sage.combinat.words.word_generators.WordGenerator

Bases: object

Constructor of several famous words.

EXAMPLES:

```
sage: words.ThueMorseWord()

```

(continues on next page)
Note: To see a list of all word constructors, type `words` and then hit the Tab key. The documentation for each constructor includes information about each word, which provides a useful reference.

**BaumSweetWord()**

Returns the Baum-Sweet Word.

The Baum-Sweet Sequence is an infinite word over the alphabet \(\{0, 1\}\) defined by the following string substitution rules:

- \(00 \rightarrow 0000\)
- \(01 \rightarrow 1001\)
- \(10 \rightarrow 0100\)
- \(11 \rightarrow 1101\)

The substitution rule above can be considered as a morphism on the submonoid of \(\{0, 1\}\) generated by \(\{00, 01, 10, 11\}\) (which is a free monoid on these generators).

It is also defined as the concatenation of the terms from the Baum-Sweet Sequence:

\[
b_n = \begin{cases} 
0, & \text{if } n = 0 \\
1, & \text{if } m \text{ is even} \\
\frac{b_{m-1}}{2}, & \text{if } m \text{ is odd}
\end{cases}
\]

where \(n = m4^k\) and \(m\) is not divisible by 4 if \(m \neq 0\).

The individual terms of the Baum-Sweet Sequence are also given by:

\[
b_n = \begin{cases} 
1, & \text{if the binary representation of } n \text{ contains no block of consecutive 0's of odd length} \\
0, & \text{otherwise}
\end{cases}
\]

for \(n > 0\) with \(b_0 = 1\).

For more information see: [Wikipedia article Baum-Sweet sequence](https://en.wikipedia.org/wiki/Baum%E2%80%93Sweet_sequence).

**EXAMPLES:**

Baum-Sweet Word:

```python
sage: w = words.BaumSweetWord(); w
word: 1101100101001001100100000100100101001001...
```

```python
>>> from sage.all import *

>>> w = words.BaumSweetWord(); w
word: 1101100101001001100100000100100101001001...
```

Block Definition:
```
sage: w = words.BaumSweetWord()
sage: f = lambda n: 1 if all(len(x)%2==0 for x in bin(n)[2:].split('1')) else 0
sage: all(f(i) == w[i] for i in range(1,100))
True
```

>>> from sage.all import *

```sage
>>> w = words.BaumSweetWord()
>>> f = lambda n: 1 if all(len(x)%Integer(2)==0 for x in bin(n)[2:].split('1')) else 0
>>> all(f(i) == w[i] for i in range(Integer(1),Integer(100)))
True
```

CharacteristicSturmianWord\( (\text{slope}, \text{alphabet}=(0,1), \text{bits}=\text{None}) \)

Returns the characteristic Sturmian word (also called standard Sturmian word) of given slope.

Over a binary alphabet \(\{a,b\}\), the characteristic Sturmian word \(c_\alpha\) of irrational slope \(\alpha\) is the infinite word satisfying \(s_{0,0} = ac_\alpha\) and \(s'_{0,0} = bc_\alpha\), where \(s_{0,0}\) and \(s'_{0,0}\) are respectively the lower and upper mechanical words with slope \(\alpha\) and intercept 0. Equivalently, for irrational \(\alpha\), \(c_\alpha = s_{0,\alpha} = s'_{0,\alpha}\).

Let \(\alpha = [0,d_1 + 1,d_2,d_3,…]\) be the continued fraction expansion of \(\alpha\). It has been shown that the characteristic Sturmian word of slope \(\alpha\) is also the limit of the sequence: \(s_0 = b, s_1 = a, \ldots, s_{n+1} = s_{d_n}\) \(s_{n-1}\) for \(n > 0\).

See Section 2.1 of [Loth02] for more details.

INPUT:

- \text{slope} – the slope of the word. It can be one of the following:
  - real number in \([0,1]\)
  - iterable over the continued fraction expansion of a real number in \([0,1]\)
- \text{alphabet} – any container of length two that is suitable to build an instance of OrderedAlphabet (list, tuple, str, …)
- \text{bits} – integer (optional and considered only if \text{slope} is a real number) the number of bits to consider when computing the continued fraction.

OUTPUT:

word

ALGORITHM:

Let \([0,d_1 + 1,d_2,d_3,…]\) be the continued fraction expansion of \(\alpha\). Then, the characteristic Sturmian word of slope \(\alpha\) is the limit of the sequence: \(s_0 = b, s_1 = a \) and \(s_{n+1} = s_{d_n}\) \(s_{n-1}\) for \(n > 0\).

EXAMPLES:

From real slope:

```
sage: words.CharacteristicSturmianWord(1/golden_ratio^2) # needs sage.symbolic
word: 0100101001001010010100100101001001010010...
sage: words.CharacteristicSturmianWord(4/5) # needs sage.rings.real_mpfr
word: 11110
sage: words.CharacteristicSturmianWord(5/14) # needs sage.rings.real_mpfr
```

(continues on next page)
From an iterator of the continued fraction expansion of a real:

```python
sage: def cf():
    ...:    yield 0
    ...:    yield 2
    ...:    while True: yield 1
sage: F = words.CharacteristicSturmianWord(cf()); F
# needs sage.rings.real_mpfr
word: 0100101001001010010100100101001001010010...
```

```python
>>> from sage.all import *
>>> words.CharacteristicSturmianWord(Integer(1)/golden_ratio**Integer(2))
→ # needs sage.symbolic
word: 0000001000000100000010000001000000100000...
```

```python
>>> words.CharacteristicSturmianWord(Integer(4)/Integer(5))
→ # needs sage.rings.real_mpfr
word: 01001001001001
```

```python
>>> words.CharacteristicSturmianWord(Integer(5)/Integer(14))
→ # needs sage.rings.real_mpfr
word: 11110
```

The alphabet may be specified:

```python
sage: words.CharacteristicSturmianWord(cf(), 'rs')
# needs sage.rings.real_mpfr
word: rsrrsrrsrrsrrsrrsrrsrrsrrsrrsrrsrrsrrsrrsrrs...
```

```python
>>> from sage.all import *
>>> words.CharacteristicSturmianWord(cf(), 'rs')
# needs sage.rings.real_mpfr
word: rsrrsrrsrrsrrsrrsrrsrrsrrsrrsrrsrrsrrsrrsrrsrrs...
```
The characteristic sturmian word of slope $(\sqrt{3} - 1)/2$:

```
sage: words.CharacteristicSturmianWord((sqrt(3)-1)/2)  # needs sage.rings.real_mpfr
word: rsrrsrsrrsrrsrrsrrsrrsrrsrr...  
```

```
word: 0100100101001001001010010010010100100101...
```

```
>>> from sage.all import *
>>> words.CharacteristicSturmianWord((sqrt(Integer(3))-Integer(1))/Integer(2))  # needs sage.symbolic
word: 0100100101001001001010010010010100100101...
```

The same word defined from the continued fraction expansion of $(\sqrt{3} - 1)/2$:

```
sage: from itertools import cycle, chain
tsage: it = chain([0], cycle([2, 1]))
tsage: words.CharacteristicSturmianWord(it)
word: 0100100101001001001010010010010100100101...
```

```
>>> from itertools import cycle, chain
>>> it = chain([Integer(0)], cycle([Integer(2), Integer(1)]))
>>> words.CharacteristicSturmianWord(it)
word: 0100100101001001001010010010010100100101...
```

The first terms of the standard sequence of the characteristic sturmian word of slope $(\sqrt{3} - 1)/2$:

```
sage: words.CharacteristicSturmianWord([0,2])
word: 01
sage: words.CharacteristicSturmianWord([0,2,1])
word: 010
sage: words.CharacteristicSturmianWord([0,2,1,2])
word: 01001001
```

```
>>> from itertools import cycle, chain
>>> it = chain([Integer(0), Integer(2), Integer(1), Integer(2)])
>>> words.CharacteristicSturmianWord(it)
word: 0100100101001001001010010010010100100101...
```

(continues on next page)
ChristoffelWord
alias of LowerChristoffelWord

CodingOfRotationWord \((\alpha, \beta, x=0, \text{alphabet}=(0, 1))\)

Returns the infinite word obtained from the coding of rotation of parameters \((\alpha, \beta, x)\) over the given two-letter alphabet.

The *coding of rotation* corresponding to the parameters \((\alpha, \beta, x)\) is the symbolic sequence \(u = (u_n)_{n \geq 0}\) defined over the binary alphabet \(\{0, 1\}\) by \(u_n = 1\) if \(x + n\alpha \in [0, \beta]\) and \(u_n = 0\) otherwise. See [AC03].

**EXAMPLES:**

```
sage: alpha = 0.45
sage: beta = 0.48
sage: words.CodingOfRotationWord(0.45, 0.48)
word: 1101010101001010101011010101010010101010...
```

```
>>> from sage.all import *

alpha = RealNumber('0.45')

beta = RealNumber('0.48')

words.CodingOfRotationWord(RealNumber('0.45'), RealNumber('0.48'))
word: 1101010101001010101011010101010010101010...
```

```
sage: words.CodingOfRotationWord(0.45, 0.48, alphabet='xy')
word: yyxyxyxyxyxyxyxyxyxyxyxyxyxyxyxyxyxyxyxyxyxy...
```

```
>>> from sage.all import *

>>> words.CodingOfRotationWord(RealNumber('0.45'), RealNumber('0.48'), alphabet='xy')
word: yyxyxyxyxyxyxyxyxyxyxyxyxyxyxyxyxyxyxyxyxyxy...
```

FibonacciWord \((\text{alphabet}=(0, 1), \text{construction\_method}='\text{recursive}')\)

Returns the Fibonacci word on the given two-letter alphabet.

**INPUT:**

- \(\text{alphabet}\) – any container of length two that is suitable to build an instance of \(\text{OrderedAlphabet}\) (list, tuple, str, ...)
- \(\text{construction\_method}\) – can be any of the following: “recursive”, “fixed point”, “function” (see below for definitions).

Recursive construction: the Fibonacci word is the limit of the following sequence of words: \(S_0 = 0, S_1 = 01, S_n = S_{n-1}S_{n-2}\) for \(n \geq 2\).

Fixed point construction: the Fibonacci word is the fixed point of the morphism: \(0 \mapsto 01\) and \(1 \mapsto 0\). Hence, it can be constructed by the following read-write process:

1. beginning at the first letter of \(01\),
2. if the next letter is 0, append \(01\) to the word;
3. if the next letter is 1, append 1 to the word;
4. move to the next letter of the word.

Function: Over the alphabet \{1, 2\}, the \(n\)-th letter of the Fibonacci word is \(\lfloor (n + 2) \phi \rfloor - \lfloor (n + 1) \phi \rfloor\) where \(\phi = (1 + \sqrt{5})/2\) is the golden ratio.

EXAMPLES:

```sage
sage: w = words.FibonacciWord(construction_method="recursive"); w
word: 0100101001001010010100100101001001010010...

>>> from sage.all import *
>>> w = words.FibonacciWord(construction_method="recursive"); w
word: 0100101001001010010100100101001001010010...

sage: v = words.FibonacciWord(construction_method="recursive", alphabet='ab'); v
word: abaababaababaababaababaababaababaababaabaababaababaababaab...

>>> from sage.all import *
>>> v = words.FibonacciWord(construction_method="recursive", alphabet='ab'); v
word: abaababaababaababaababaababaababaababaababaababaababaababaab...

sage: u = words.FibonacciWord(construction_method="fixed point"); u
word: 0100101001001010010100100101001001010010...

>>> from sage.all import *
>>> u = words.FibonacciWord(construction_method="fixed point"); u
word: 0100101001001010010100100101001001010010...

sage: words.FibonacciWord(construction_method="fixed point", alphabet=[4, 1])
word: 414414414414414414414414414414414414414414...

>>> from sage.all import *
>>> words.FibonacciWord(construction_method="fixed point", alphabet=[Integer(4), Integer(1)])
word: 414414414414414414414414414414414414414414...

sage: words.FibonacciWord([0,1], 'function')
# needs sage.symbolic
word: 01001010010010100101001001010010010100100...

sage: words.FibonacciWord('ab', 'function')
# needs sage.symbolic
word: abaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaab...```

**FixedPointOfMorphism**(morphism, first_letter)

Returns the fixed point of the morphism beginning with first_letter.

A fixed point of a morphism \(\varphi\) is a word \(w\) such that \(\varphi(w) = w\).
INPUT:

- morphism – endomorphism prolongable on first_letter. It must be something that WordMorphism’s constructor understands (dict, str, ...).
- first_letter – the first letter of the fixed point

OUTPUT:

The fixed point of the morphism beginning with first_letter

EXAMPLES:

```python
sage: mu = {0:[0,1], 1:[1,0]}
sage: tm = words.FixedPointOfMorphism(mu,0); tm
word: 0110100110010110100101100110100110010110...

sage: TM = words.ThueMorseWord()
sage: tm[:1000] == TM[:1000]  # needs sage.modules
True

sage: mu = {0:[0,1], 1:[0]}

f = words.FixedPointOfMorphism(mu,0); f
word: 0100101001001010010100100101001001010010...

F = words.FibonacciWord(); F
word: 0100101001001010010100100101001001010010...

f[:1000] == F[:1000]  # needs sage.modules
True

>>> from sage.all import *

>>> mu = {Integer(0):[Integer(0),Integer(1)], Integer(1):[Integer(1),

...

>>> TM = words.ThueMorseWord()

>>> tm[:Integer(1000)] == TM[:Integer(1000)]  # needs sage.modules
True

>>> from sage.all import *

>>> mu = {Integer(0):[Integer(0),Integer(1)], Integer(1):[Integer(0)]}

>>> f = words.FixedPointOfMorphism(mu,0); f

word: 0100101001001010010100100101001001010010...

>>> F = words.FibonacciWord(); F

word: 0100101001001010010100100101001001010010...

>>> f[:Integer(1000)] == F[:Integer(1000)]  # needs sage.modules
True

>>> from sage.all import *

>>> fp = words.FixedPointOfMorphism('a->abc,b->c','a'); fp

word: abc

>>> from sage.all import *

>>> fp = words.FixedPointOfMorphism('a->abc,b->c','a'); fp

word: abc

KolakoskiWord(alphabet=(1, 2))
```
Returns the Kolakoski word over the given alphabet and starting with the first letter of the alphabet.

Let $A = \{a, b\}$ be an alphabet, where $a$ and $b$ are two distinct positive integers. The Kolakoski word $K_{a,b}$ over $A$ and starting with $a$ is the unique infinite word $w$ such that $w = \Delta(w)$, where $\Delta(w)$ is the word encoding the runs of $w$ (see $\texttt{delta()}$ method on words for more details).

Note that $K_{a,b} \neq K_{b,a}$. On the other hand, the words $K_{a,b}$ and $K_{b,a}$ are the unique two words over $A$ that are fixed by $\Delta$.

Also note that the Kolakoski word is also known as the Oldenburger word.

**INPUT:**

- alphabet – (default: (1,2)) an iterable of two positive integers

**OUTPUT:**

infinite word

**EXAMPLES:**

The usual Kolakoski word:

```sage
w = words.KolakoskiWord()
w
word: 12211221221122111212212211211221221221121122121121221121121221221221...
w.delta()
word: 12211221221122111212212211211221221221121122121121221121121221221221...
```

```python
from sage.all import *

w = words.KolakoskiWord()
w
word: 12211221221122111212212211211221221221121122121121221121121221221221...
w.delta()
word: 12211221221122111212212211211221221221121122121121221121121221221221...
```

The other Kolakoski word on the same alphabet:

```sage
w = words.KolakoskiWord(alphabet = (2,1))
w
word: 2211221112211211221211212211211212212211...
w.delta()
word: 2211221112211211221211212211211212212211...
```

```python
from sage.all import *

w = words.KolakoskiWord(alphabet = (2,1))
w
word: 2211221112211211221211212211211212212211...
w.delta()
word: 2211221112211211221211212211211212212211...
```

It is naturally generalized to any two integers alphabet:

```sage
w = words.KolakoskiWord(alphabet = (2,5))
w
word: 2255222225555522552225555552225555552...
w.delta()
word: 2255222225555522552225555552225555552...
```

```python
from sage.all import *

w = words.KolakoskiWord(alphabet = (2,5))
w
word: 2255222225555522552225555552225555552...
w.delta()
word: 2255222225555522552225555552225555552...
```
>> from sage.all import *
>>> w = words.KolakoskiWord(alphabet = (Integer(2),Integer(5)))
>>> w
word: 225522225555225225552222255552...
>>> w.delta()
word: 225522225555225225552255555222222555552...

REFERENCES:

LowerChristoffelWord
alias of LowerChristoffelWord

LowerMechanicalWord\((\alpha, \rho=0, \text{alphabet}=\text{None})\)

Returns the lower mechanical word with slope \(\alpha\) and intercept \(\rho\)

The lower mechanical word \(s_{\alpha,\rho}\) with slope \(\alpha\) and intercept \(\rho\) is defined by
\[
s_{\alpha,\rho}(n) = \lfloor \alpha (n + 1) + \rho \rfloor - \lfloor \alpha n + \rho \rfloor.
\]
[Loth02]

INPUT:

• \(\alpha\) – real number such that \(0 \leq \alpha \leq 1\)
• \(\rho\) – real number (default: 0)
• \(\text{alphabet}\) – iterable of two elements or \text{None} (default: \text{None})

OUTPUT:

infinite word

EXAMPLES:
infinite word

sage: words.LowerMechanicalWord(1/golden_ratio^2)  # needs sage.symbolic
word: 001001001001001001001001001001001001001001...
sage: words.LowerMechanicalWord(1/5)  # needs sage.symbolic
word: 000010000100001000010000100001000010000100...
sage: words.LowerMechanicalWord(1/pi)  # needs sage.symbolic
word: 00010010010010010010010001001001001001001...

>> from sage.all import *
>>> words.LowerMechanicalWord(Integer(1)/golden_ratio**Integer(2))  # needs sage.symbolic
word: 001001001001001001001001001001001001001001...
>>> words.LowerMechanicalWord(Integer(1)/Integer(5))  # needs sage.symbolic

>>> words.LowerMechanicalWord(Integer(1)/pi)  # needs sage.symbolic
word: 00010010010010010010010001001001001001001...

MinimalSmoothPrefix\((n)\)

This function finds and returns the minimal smooth prefix of length \(n\).

See [BMP2007] for a definition.

INPUT:

• \(n\) – the desired length of the prefix
OUTPUT:
word – the prefix

Note: Be patient, this function can take a really long time if asked for a large prefix.

EXAMPLES:

sage: words.MinimalSmoothPrefix(10)
word: 1212212112

>>> from sage.all import *
>>> words.MinimalSmoothPrefix(Integer(10))
word: 1212212112

PalindromicDefectWord(k=1, alphabet='ab')
Return the finite word $w = ab^k ab^{k-1} aab^{k-1} ab^k a$.
As described by Brlek, Hamel, Nivat and Reutenauer in [BHNR2004], this finite word $w$ is such that the
infinite periodic word $w^\omega$ has palindromic defect $k$.

INPUT:
• $k$ – positive integer (default: 1)
• alphabet – iterable (default: 'ab') of size two

OUTPUT:
finite word

EXAMPLES:

sage: words.PalindromicDefectWord(10)
word: abbbbbbbbbabbbbbbbbbabbbbbbbbbabbbbbbbbb...

>>> from sage.all import *
>>> words.PalindromicDefectWord(Integer(10))
word: abbbbbbbbbabbbbbbbbbabbbbbbbbbabbbbbbbbb...

sage: w = words.PalindromicDefectWord(3)
sage: w
word: abbbabbaabbbabba
sage: w.defect()
0
sage: (w^2).defect()
3
sage: (w^3).defect()
3

>>> from sage.all import *
>>> w = words.PalindromicDefectWord(Integer(3))
>>> w
word: abbbabbaabbbabba
>>> w.defect()
0
>>> (w*Integer(2)).defect()
On other alphabets:

```
sage: words.PalindromicDefectWord(3, alphabet='cd')
word: cdddcddccdddc
sage: words.PalindromicDefectWord(3, alphabet=['c', 3])
word: c333c33cc33c333c
```
StandardEpisturmianWord (directive_word)

Returns the standard episturmian word (or epistandard word) directed by directive_word. Over a 2-letter alphabet, this function gives characteristic Sturmian words.

An infinite word $w$ over a finite alphabet $A$ is said to be standard episturmian (or epistandard) iff there exists an infinite word $x_1 x_2 x_3 \cdots$ over $A$ (called the directive word of $w$) such that $w$ is the limit as $n$ goes to infinity of $Pal(x_1 \cdots x_n)$, where $Pal$ is the iterated palindromic closure function.

Note that an infinite word is episturmian if it has the same set of factors as some epistandard word.

See for instance [DJP2001], [JP2002], and [GJ2007].

INPUT:
- directive_word – an infinite word or a period of a periodic infinite word

EXAMPLES:

```python
sage: Fibonacci = words.StandardEpisturmianWord(Words('ab')('ab')); Fibonacci
word: abaababaababababaababababaababababaabababa.....
sage: Tribonacci = words.StandardEpisturmianWord(Words('abc')('abc'));
word: abacabacabacabacabacabacabacabacabacabacaba...
sage: S = words.StandardEpisturmianWord(Words('abcd')('aabcabada')); S
word: aabaabaabaabaabaabaabaabaabaabaabaabaabaaba...
sage: S = words.StandardEpisturmianWord(Fibonacci); S
word: aabaabaabaabaabaabaabaabaabaabaabaabaabaaba...
sage: S[Integer(25)]
word: aabaabaabaabaabaabaabaabaaba
```

```python
>>> from sage.all import *
>>> Fibonacci = words.StandardEpisturmianWord(Words('ab')('ab')); Fibonacci
word: abaababaababababaababababaababababaababababa.....
>>> Tribonacci = words.StandardEpisturmianWord(Words('abc')('abc'));
word: abacabacabacabacabacabacabacabacabacabacaba...
>>> S = words.StandardEpisturmianWord(Words('abcd')('aabcabada')); S
word: aabaabaabaabaabaabaabaabaabaabaabaabaabaaba...
>>> S = words.StandardEpisturmianWord(Fibonacci); S
word: aabaabaabaabaabaabaabaabaabaabaabaabaabaabaab...
>>> S[:Integer(25)]
word: aabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaabaa (continues on next page)
ThueMorseWord \((alphabet=(0, 1), base=2)\)

Returns the (Generalized) Thue-Morse word over the given alphabet.

There are several ways to define the Thue-Morse word \(t\). We use the following definition: \(t[n]\) is the sum modulo \(m\) of the digits in the given base expansion of \(n\).

See [BmBGL07], [Brlek89], and [MH38].

**INPUT:**

- `alphabet` – (default: \((0, 1)\)) any container that is suitable to build an instance of OrderedAlphabet (list, tuple, str, …)
- `base` – an integer (default: 2) greater or equal to 2

**EXAMPLES:**

Thue-Morse word:

```python
sage: t = words.ThueMorseWord(); t
word: 0110100110010110100101100110100110010110...
```

```python
>>> from sage.all import *
```

Thue-Morse word on other alphabets:

```python
sage: t = words.ThueMorseWord('ab'); t
word: abbaabbaabbaabbaabbaabbaabbaabbaabbaab...
```

```python
>>> from sage.all import *
```

Generalized Thue Morse word:

```python
sage: t = words.ThueMorseWord(['L1', 'L2'])
sage: t[:8]
word: L1,L2,L2,L1,L2,L1,L1,L2
```

```python
>>> from sage.all import *
```

```python
sage: t = words.ThueMorseWord(['L1', 'L2'])
>>> t[:Integer(8)]
word: L1,L2,L2,L1,L2,L1,L1,L2
```
sage: words.ThueMorseWord(alphabet=(0,1,2), base=2)
word: 01122012202001122020012001011212202001...
sage: t = words.ThueMorseWord(alphabet=(0,1,2), base=5); t
word: 0120112012201200120112012120122012001201...
sage: t[100:130].critical_exponent()
10/3

>>> from sage.all import *
>>> words.ThueMorseWord(alphabet=(Integer(0),Integer(1),Integer(2)),
˓→base=Integer(2))
word: 0112122012202001122020012001011212202001...
>>> t = words.ThueMorseWord(alphabet=(Integer(0),Integer(1),Integer(2)),
˓→base=Integer(5)); t
word: 0120112012201200120112012120122012001201...
>>> t[Integer(100):Integer(130)].critical_exponent()
10/3

REFERENCES:

UpperChristoffelWord \((p, q, \text{alphabet}=(0, 1))\)

Returns the upper Christoffel word of slope \(pq\), where \(p\) and \(q\) are relatively prime non-negative integers, over the given alphabet.

The upper Christoffel word of slope \(pq\) is equal to the reversal of the lower Christoffel word of slope \(pq\). Equivalently, if \(xuy\) is the lower Christoffel word of slope \(pq\), where \(x\) and \(y\) are letters, then \(yu\) is the upper Christoffel word of slope \(pq\) (because \(u\) is a palindrome).

INPUT:

* alphabet – any container of length two that is suitable to build an instance of OrderedAlphabet (list, tuple, str, ...)

EXAMPLES:

sage: words.UpperChristoffelWord(1,0)
word: 1

>>> from sage.all import *
>>> words.UpperChristoffelWord(Integer(1),Integer(0))
word: 1

sage: words.UpperChristoffelWord(0,1)
word: 0

>>> from sage.all import *
>>> words.UpperChristoffelWord(Integer(0),Integer(1))
word: 0

sage: words.UpperChristoffelWord(1,1)
word: 10

>>> from sage.all import *
>>> words.UpperChristoffelWord(Integer(1),Integer(1))
word: 10

5.1. Comprehensive Module List
**UpperMechanicalWord** *(alpha, rho=0, alphabet=None)*

Returns the upper mechanical word with slope $\alpha$ and intercept $\rho$.

The upper mechanical word $s'_{\alpha,\rho}$ with slope $\alpha$ and intercept $\rho$ is defined by $s'_{\alpha,\rho}(n) = \lceil \alpha(n+1) + \rho \rceil - \lceil \alpha n + \rho \rceil$. [Loth02]

**INPUT:**
- *alpha* – real number such that $0 \leq \alpha \leq 1$
- *rho* – real number (default: 0)
- *alphabet* – iterable of two elements or None (default: None)

**OUTPUT:**
infinite word

**EXAMPLES:**

```python
sage: words.UpperMechanicalWord(1/golden_ratio^2)  # needs sage.symbolic
word: 1010010100100101001010010010100100101001...
sage: words.UpperMechanicalWord(1/5)  # needs sage.symbolic
word: 1000010000100001000010000100001000010000...
sage: words.UpperMechanicalWord(1/pi)  # needs sage.symbolic
word: 1001001001001001001001000100100100100100...
```

**dual_fibonacci_tile** *(n)*

Returns the $n$-th dual Fibonacci Tile [BmBGL09].

**EXAMPLES:**

```python
sage: for i in range(4): words.dual_fibonacci_tile(i)  # needs sage.modules
Path: 3210
Path: 32123032301030121012
Path: 3212303230103230321232101232123032123210...
Path: 3212303230103230321232101232123032123210...
```
from sage.all import *

for i in range(Integer(4)): words.dual_fibonacci_tile(i)

fibonacci_tile(n)
Returns the \( n \)-th Fibonacci Tile [BmBGL09].

EXAMPLES:

s_adic(sequence, letters, morphisms=None)
Returns the \( s \)-adic infinite word obtained from a sequence of morphisms applied on a letter.

DEFINITION (from [Fogg]):
Let \( w \) be a infinite word over an alphabet \( A = A_0 \). A standard representation of \( w \) is obtained from a sequence of substitutions \( \sigma_k : A_{k+1} \rightarrow A_k \) and a sequence of letters \( a_k \in A_k \) such that:
\[
\lim_{k \to \infty} \sigma_0 \circ \sigma_1 \circ \cdots \circ \sigma_k(a_k).
\]

Given a set of substitutions \( S \), we say that the representation is \( S \)-adic standard if the substitutions are chosen in \( S \).

INPUT:
- sequence – An iterable sequence of indices or of morphisms. It may be finite or infinite. If sequence is infinite, the image of the \((i+1)\)-th letter under the \((i+1)\)-th morphism must start with the \(i\)-th letter.
- letters – A letter or a sequence of letters.
- morphisms – dict, list, callable or None (default: None) an object that maps indices to morphisms. If None, then sequence must consist of morphisms.

OUTPUT:
A word.

EXAMPLES:
Let us define three morphisms and compute the first nested successive prefixes of the \( s \)-adic word:
When the given sequence of morphism is finite, one may simply give the last letter, i.e. 'a', instead of giving all of them, i.e. 'eca':

```python
sage: words.s_adic([m1,m2,m3],'a')
word: ghhggh
sage: words.s_adic([m1,m2,m3],'b')
word: ghghhg
```

If the letters don’t satisfy the hypothesis of the algorithm (nested prefixes), an error is raised:

```python
sage: words.s_adic([m1,m2,m3],'ecb')
Traceback (most recent call last):
  ...  
ValueError: the hypothesis of the algorithm used is not satisfied; the image→of the 3-th letter (=b) under the 3-th morphism (=a->cd, b->dc) should→start with the 2-th letter (=c)
```

Let’s define the Thue-Morse morphism and the Fibonacci morphism which will be used below to illustrate more examples and let’s import the `repeat` tool from the `itertools`:

```python
>>> from sage.all import *
>>> m1 = WordMorphism('e->gh,f->hg')
>>> m2 = WordMorphism('c->ef,d->e')
>>> m3 = WordMorphism('a->cd,b->dc')
>>> words.s_adic([m1,m2,m3],'ecb')
Traceback (most recent call last):
  ...  
ValueError: the hypothesis of the algorithm used is not satisfied; the image→of the 3-th letter (=b) under the 3-th morphism (=a->cd, b->dc) should→start with the 2-th letter (=c)
```
Combinatorics, Release 10.4

```python
sage: tm = WordMorphism('a->ab,b->ba')
sage: fib = WordMorphism('a->ab,b->a')
sage: from itertools import repeat

Two trivial examples of infinite \( s \)-adic words:

```python
sage: words.s_adic(repeat(tm),repeat('a'))
word: abbabaabbaabbaabbaabbaababbaabbaababba...

```python
sage: words.s_adic(repeat(fib),repeat('a'))
word: abaababaababaababaababaababaababaababaababaababaababa...

A less trivial infinite \( s \)-adic word:

```python
sage: D = {4:tm, 5:fib}
sage: tmword = words.ThueMorseWord([4,5])
sage: it = (D[a] for a in tmword)
sage: words.s_adic(it, repeat('a'))
word: abbaababbaabbaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaababaabl...```
Combinatorics, Release 10.4

>>> from sage.all import *
>>> words.s_adic(tmword, repeat( a ), {Integer(0):tm,Integer(1):fib})
word: abbaababbaabbaabbaababbaababbaabbaababba...

because dict are more versatile for indices:
sage: tmwordTF = words.ThueMorseWord( TF )
sage: words.s_adic(tmwordTF, repeat( a ), { T :tm, F :fib})
word: abbaababbaabbaabbaababbaababbaabbaababba...
>>> from sage.all import *
>>> tmwordTF = words.ThueMorseWord( TF )
>>> words.s_adic(tmwordTF, repeat( a ), { T :tm, F :fib})
word: abbaababbaabbaabbaababbaababbaabbaababba...

or by a callable:
sage: f = lambda n: tm if n == 0 else fib
sage: words.s_adic(words.ThueMorseWord(), repeat( a ), f)
word: abbaababbaabbaabbaababbaababbaabbaababba...
>>> from sage.all import *
>>> f = lambda n: tm if n == Integer(0) else fib
>>> words.s_adic(words.ThueMorseWord(), repeat( a ), f)
word: abbaababbaabbaabbaababbaababbaabbaababba...

Random infinite 𝑠-adic words:
sage:
sage:
....:
sage:
word:
sage:
word:
sage:
word:

from sage.misc.prandom import randint
def it():
while True: yield randint(0,1)
words.s_adic(it(), repeat( a ), [tm,fib]) # random
abbaabababbaababbaabbaababbaabababbaabba...
words.s_adic(it(), repeat( a ), [tm,fib]) # random
abbaababbaabbaababbaababbaabbaababbaabba...
words.s_adic(it(), repeat( a ), [tm,fib]) # random
abaaababaabaabaaababaabaaababaaababaabaa...

>>> from sage.all import *
>>> from sage.misc.prandom import randint
>>> def it():
...
while True: yield randint(Integer(0),Integer(1))
>>> words.s_adic(it(), repeat( a ), [tm,fib]) # random
word: abbaabababbaababbaabbaababbaabababbaabba...
>>> words.s_adic(it(), repeat( a ), [tm,fib]) # random
word: abbaababbaabbaababbaababbaabbaababbaabba...
>>> words.s_adic(it(), repeat( a ), [tm,fib]) # random
word: abaaababaabaabaaababaabaaababaaababaabaa...

An example where the sequences cycle on two morphisms and two letters:
sage:
sage:
sage:
sage:
word:

G = WordMorphism( a->cd,b->dc )
H = WordMorphism( c->ab,d->ba )
from itertools import cycle
words.s_adic([G,H], ac )
cddc

Chapter 5. Comprehensive Module List


The morphism $\sigma : a \mapsto ba, b \mapsto b$ can't satisfy the hypothesis of the nested prefixes, but one may compute arbitrarily long finite words having the limit $\sigma^\omega(a)$:

```
sage: sigma = WordMorphism('a->ba,b->b')
sage: words.s_adic(repeat(sigma),repeat('a'))
Traceback (most recent call last):
...
ValueError: the hypothesis of the algorithm used is not satisfied; the image \rightarrow of the 2-th letter (=a) under the 2-th morphism (=a->ba, b->b) should start \rightarrow with the 1-th letter (=a)
sage: words.s_adic([sigma],'a')
word: ba
sage: words.s_adic([sigma,sigma],'a')
word: bba
sage: words.s_adic([sigma]*3,'a')
word: bbbba
sage: words.s_adic([sigma]*4,'a')
word: bbbbbba
sage: words.s_adic([sigma]*5,'a')
word: bbbbbbbba
sage: words.s_adic([sigma]*6,'a')
word: bbbbbbbbbba
```

(continues on next page)
The following examples illustrate an $S$-adic word defined over an infinite set $S$ of morphisms $x_h$:

```python
sage: x = lambda h:WordMorphism({1:[2], 2:[3]+[1]*(h+1), 3:[3]+[1]*h})
sage: for h in [0,1,2,3]:
    ....:    print("{} {}\n".format(h, x(h)))
0 1->2, 2->3
1 1->2, 2->31, 3->3
2 1->2, 2->311, 3->31
3 1->2, 2->3111, 3->311

sage: w = Word(lambda n : valuation(n+1, 2)); w
word: 0102010301020104010201030102010501020103...

sage: s = words.s_adic(w, repeat(3), x); s
word: 3232232232322322322323223223232232232232...

sage: prefixe = s[:10000]
sage: list(map(prefixe.number_of_factors, range(15)))
[1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15]
sage: [_[i+1] - _[i] for i in range(len(_)-1)]
[1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1]
```

AUTHORS:

- Sébastien Labbé (2009-12-18): initial version
5.1.369 Datatypes for words defined by iterators and callables

```python
class sage.combinat.words.word_infinite_datatypes.WordDatatype_callable(parent, callable, length=None):
    # Bases: WordDatatype
    Datatype for a word defined by a callable.

flush()
```

Empty the associated cache of letters.

**EXAMPLES:**

The first 40 (by default) values are always cached:

```
sage: w = words.ThueMorseWord()
sage: w._letter_cache
{0: 0, 1: 1, 2: 1, 3: 0, 4: 1, 5: 0, 6: 0, 7: 1, 8: 1, 9: 0, 10: 0, 11: 1, ...
    12: 0, 13: 1, 14: 1, 15: 0, 16: 1, 17: 0, 18: 0, 19: 1, 20: 0, ...
    23: 0, 24: 0, 25: 1, 26: 1, 27: 0, 28: 1, 29: 0, 30: 0, 31: 1, ...
    34: 0, 35: 1, 36: 0, 37: 1, 38: 1, 39: 0}
sage: w[100]
1
sage: w._letter_cache
{0: 0, 1: 1, 2: 1, 3: 0, 4: 1, 5: 0, 6: 0, 7: 1, 8: 1, 9: 0, 10: 0, 11: 1, ...
    12: 0, 13: 1, 14: 1, 15: 0, 16: 1, 17: 0, 18: 0, 19: 1, 20: 0, ...
    23: 0, 24: 0, 25: 1, 26: 1, 27: 0, 28: 1, 29: 0, 30: 0, 31: 1, ...
    34: 0, 35: 1, 36: 0, 37: 1, 38: 1, 39: 0, 100: 1}
sage: w.flush()
sage: w._letter_cache
{}
```

```python
global print
```

```python
>>> from sage.all import *
```

```
>>> w = words.ThueMorseWord()
```

```
>>> w._letter_cache
{0: 0, 1: 1, 2: 1, 3: 0, 4: 1, 5: 0, 6: 0, 7: 1, 8: 1, 9: 0, 10: 0, 11: 1, ...
    12: 0, 13: 1, 14: 1, 15: 0, 16: 1, 17: 0, 18: 0, 19: 1, 20: 0, ...
    23: 0, 24: 0, 25: 1, 26: 1, 27: 0, 28: 1, 29: 0, 30: 0, 31: 1, ...
    34: 0, 35: 1, 36: 0, 37: 1, 38: 1, 39: 0}
```

```
>>> w[Integer(100)]
1
```

```
>>> w._letter_cache
{0: 0, 1: 1, 2: 1, 3: 0, 4: 1, 5: 0, 6: 0, 7: 1, 8: 1, 9: 0, 10: 0, 11: 1, ...
    12: 0, 13: 1, 14: 1, 15: 0, 16: 1, 17: 0, 18: 0, 19: 1, 20: 0, ...
    23: 0, 24: 0, 25: 1, 26: 1, 27: 0, 28: 1, 29: 0, 30: 0, 31: 1, ...
    34: 0, 35: 1, 36: 0, 37: 1, 38: 1, 39: 0, 100: 1}
```

```
>>> w.flush()
```

```
>>> w._letter_cache
{}
```
Combinatorics, Release 10.4

class sage.combinat.words.word_infinite_datatypes.WordDatatype_iter(parent, iter,
length=None)
Bases: WordDatatype
INPUT:
• parent – a parent
• iter – an iterator
• length – (default: None) the length of the word
EXAMPLES:
sage:
word:
sage:
True
sage:
False
sage:
8
sage:
sage:
word:
sage:
True

w = Word(iter("abbabaab"), length="unknown", caching=False); w
abbabaab

w.length()

word: abbabaab
\end{verbatim}

\section*{5.1. Comprehensive Module List}

5997
>>> w.length()
8
>>> list(w)
['a', 'b', 'b', 'a', 'b', 'a', 'a', 'b']
>>> w.length()
8
>>> w = Word(iter("abbabaab"), length=Integer(8))
>>> w._len
8

flush()
Delete the cached values.

EXAMPLES:

```
sage: from itertools import count
sage: w = Word(count())
sage: w._last_index, len(w._list)
(39, 40)
sage: w[43]
43
sage: w._last_index, len(w._list)
(43, 44)
sage: w.flush()
sage: w._last_index, w._list
(-1, [])
```

```
>>> from sage.all import *
>>> from itertools import count
>>> w = Word(count())
>>> w._last_index, len(w._list)
(39, 40)
>>> w[Integer(43)]
43
>>> w._last_index, len(w._list)
(43, 44)
>>> w.flush()
>>> w._last_index, w._list
(-1, [])
```

5.1.370 User-customizable options for words

`sage.combinat.words.word_options.WordOptions(**kwargs)`

Sets the global options for elements of the word class. The defaults are for words to be displayed in list notation.

**INPUT:**

- `display` – 'string' (default), or 'list', words are displayed in string or list notation.
- `truncate` – boolean (default: True), whether to truncate the string output of long words (see `truncate_length` below).
- `truncate_length` – integer (default: 40), if the length of the word is greater than this integer, then the word is truncated.
- `letter_separator` – (string, default: ",") if the string representation of letters have length greater than 1, then the letters are separated by this string in the string representation of the word.
If no parameters are set, then the function returns a copy of the options dictionary.

EXAMPLES:

```python
sage: w = Word([2,1,3,12])
sage: u = Word("abba")
sage: WordOptions(display='list')
sage: w
word: [2, 1, 3, 12]
sage: u
word: ['a', 'b', 'b', 'a']
sage: WordOptions(display='string')
sage: w
word: 2,1,3,12
sage: u
word: abba
```

```python
>>> from sage.all import *
>>> w = Word([Integer(2),Integer(1),Integer(3),Integer(12)])
>>> u = Word("abba")
>>> WordOptions(display='list')
>>> w
word: [2, 1, 3, 12]
>>> u
word: ['a', 'b', 'b', 'a']
>>> WordOptions(display='string')
>>> w
word: 2,1,3,12
>>> u
word: abba
```

### 5.1.371 Set of words

To define a new class of words, please refer to the documentation file: sage/combinat/words/notes/word_inheritance_howto.rst

AUTHORS:

- Franco Saliola (2008-12-17): merged into sage
- Sebastien Labbe (2008-12-17): merged into sage
- Arnaud Bergeron (2008-12-17): merged into sage
- Vincent Delecroix (2015): classes simplifications (Issue #19619)

EXAMPLES:

```python
sage: Words()
Finite and infinite words over Set of Python objects of class 'object'
sage: Words(4)
Finite and infinite words over {1, 2, 3, 4}
sage: Words(4,5)
Words of length 5 over {1, 2, 3, 4}
sage: FiniteWords('ab')
Finite words over {'a', 'b'}
```

(continues on next page)
Combinatorics, Release 10.4

sage: InfiniteWords('natural numbers')
Infinite words over Non negative integers

>>> from sage.all import *
>>> Words()
Finite and infinite words over Set of Python objects of class 'object'
>>> Words(Integer(4))
Finite and infinite words over {1, 2, 3, 4}
>>> Words(Integer(4), Integer(5))
Words of length 5 over {1, 2, 3, 4}

>>> FiniteWords('ab')
Finite words over {'a', 'b'}
>>> InfiniteWords('natural numbers')
Infinite words over Non negative integers

class sage.combinat.words.words.AbstractLanguage(alphabet=None, category=None)
    Bases: Parent

Abstract base class

This is not to be used by any means. This class gather previous features of set of words (prior to Issue #19619). In the future that class might simply disappear or become a common base class for all languages. In the latter case, its name would possibly change to Language.

alphabet()

EXAMPLES:

sage: Words(NN).alphabet()
Non negative integer semiring
sage: InfiniteWords([1,2,3]).alphabet()
{1, 2, 3}
sage: InfiniteWords('ab').alphabet()
{'a', 'b'}

sage: FiniteWords([1,2,3]).alphabet()
{1, 2, 3}
sage: FiniteWords().alphabet()
Set of Python objects of class 'object'

>>> from sage.all import *
>>> Words(NN).alphabet()
Non negative integer semiring

>>> InfiniteWords([Integer(1), Integer(2), Integer(3)]).alphabet()
{1, 2, 3}

>>> InfiniteWords('ab').alphabet()
{'a', 'b'}

>>> FiniteWords([Integer(1), Integer(2), Integer(3)]).alphabet()
{1, 2, 3}

>>> FiniteWords().alphabet()
Set of Python objects of class 'object'

identity_morphism()

    Returns the identity morphism from self to itself.
Examples:

```python
sage: W = Words('ab')
sage: W.identity_morphism()
WordMorphism: a->a, b->b

>>> from sage.all import *
>>> W = Words('ab')
>>> W.identity_morphism()
WordMorphism: a->a, b->b

sage: W = Words(range(3))
sage: W.identity_morphism()
WordMorphism: 0->0, 1->1, 2->2

>>> from sage.all import *
>>> W = Words(range(Integer(3)))
>>> W.identity_morphism()
WordMorphism: 0->0, 1->1, 2->2
```

There is no support yet for infinite alphabet:

```python
sage: W = Words(alphabet=Alphabet(name='NN'))
sage: W
Finite and infinite words over Non negative integers
sage: W.identity_morphism()
Traceback (most recent call last):
  ...
NotImplementedError: size of alphabet must be finite

>>> from sage.all import *
>>> W = Words(alphabet=Alphabet(name='NN'))
>>> W
Finite and infinite words over Non negative integers
>>> W.identity_morphism()
Traceback (most recent call last):
  ...
NotImplementedError: size of alphabet must be finite
```

class sage.combinat.words.words.FiniteOrInfiniteWords(alphabet)

Bases: AbstractLanguage

INPUT:

• alphabet – the underlying alphabet
cardinality()  
Return the cardinality of this set of words.

Examples:

```python
sage: Words('abcd').cardinality()
+Infinity
sage: Words('a').cardinality()
+Infinity
sage: Words('').cardinality()
1
```
>>> from sage.all import *
>>> Words('abcd').cardinality()
+Infinity
>>> Words('a').cardinality()
+Infinity
>>> Words('').cardinality()
1

factors()
Return the set of finite words.

EXAMPLES:

sage: Words('ab').finite_words()
Finite words over {'a', 'b'}

finite_words()
Return the set of finite words.

EXAMPLES:

sage: Words('ab').finite_words()
Finite words over {'a', 'b'}

infinite_words()
Return the set of infinite words.

EXAMPLES:

sage: Words('ab').infinite_words()
Infinite words over {'a', 'b'}

iterate_by_length(length)
Return an iterator over the words of given length.

EXAMPLES:

sage: [w.string_rep() for w in Words('ab').iterate_by_length(3)]
['aaa', 'aab', 'aba', 'abb', 'baa', 'bab', 'bba', 'bbb']

>>> from sage.all import *
>>> [w.string_rep() for w in Words('ab').iterate_by_length(Integer(3))]  
['aaa', 'aab', 'aba', 'abb', 'baa', 'bab', 'bba', 'bbb']
**shift()**

Return the set of infinite words.

EXAMPLES:

```python
sage: Words('ab').infinite_words()
Infinite words over {'a', 'b'}
```

```python
>>> from sage.all import *

>>> Words('ab').infinite_words()
Infinite words over {'a', 'b'}
```

**class** `sage.combinat.words.words.FiniteWords(alphabet=None, category=None)`

The set of finite words over a fixed alphabet.

EXAMPLES:

```python
sage: W = FiniteWords('ab')
sage: W
Finite words over {'a', 'b'}
```

```python
>>> from sage.all import *

>>> W = FiniteWords('ab')

>>> W
Finite words over {'a', 'b'}
```

**cardinality()**

Return the cardinality of this set.

EXAMPLES:

```python
sage: FiniteWords('').cardinality()
1
```

```python
sage: FiniteWords('a').cardinality()
+Infinity
```

```python
>>> from sage.all import *

>>> FiniteWords('').cardinality()
1

>>> FiniteWords('a').cardinality()
+Infinity
```

**factors()**

Return itself.

EXAMPLES:

```python
sage: FiniteWords('ab').factors()
Finite words over {'a', 'b'}
```

```python
>>> from sage.all import *

>>> FiniteWords('ab').factors()
Finite words over {'a', 'b'}
```
iter_morphisms (arg=None, codomain=None, min_length=1)

Iterate over all morphisms with domain self and the given codomain.

INPUT:

- arg – (default: None) It can be one of the following:
  - None – then the method iterates through all morphisms.
  - tuple (a, b) of two integers – It specifies the range range(a, b) of values to consider for the sum of the length of the image of each letter in the alphabet.
  - list of nonnegative integers – The length of the list must be equal to the size of the alphabet, and the i-th integer of arg determines the length of the word mapped to by the i-th letter of the (ordered) alphabet.

- codomain – (default: None) a combinatorial class of words. By default, codomain is self.

- min_length – (default: 1) nonnegative integer. If arg is not specified, then iterate through all the morphisms where the length of the images of each letter in the alphabet is at least min_length. This is ignored if arg is a list.

OUTPUT:

iterator

EXAMPLES:

Iterator over all non-erasing morphisms:

```
sage: W = FiniteWords('ab')
sage: it = W.iter_morphisms()
sage: for _ in range(7): next(it)
WordMorphism: a->a, b->a
WordMorphism: a->a, b->b
WordMorphism: a->b, b->a
WordMorphism: a->b, b->b
WordMorphism: a->aa, b->a
WordMorphism: a->aa, b->b
WordMorphism: a->ab, b->a
```
Combinatorics, Release 10.4

WordMorphism: a->, b->a
WordMorphism: a->, b->b
WordMorphism: a->aa, b->
WordMorphism: a->ab, b->

```python
>>> from sage.all import *
>>> W = FiniteWords('ab')
>>> it = W.iter_morphisms(min_length=Integer(0))
>>> for _ in range(Integer(7)): next(it)
WordMorphism: a->, b->
WordMorphism: a->a, b->
WordMorphism: a->b, b->
WordMorphism: a->aa, b->
WordMorphism: a->ab, b->
```

Iterator over morphisms where the sum of the lengths of the images of the letters is in a specific range:

```python
sage: for m in W.iter_morphisms((0, 3), min_length=0): m
WordMorphism: a->aa, b->
WordMorphism: a->ab, b->
WordMorphism: a->ba, b->
WordMorphism: a->bb, b->
WordMorphism: a->a, b->a
WordMorphism: a->a, b->b
WordMorphism: a->b, b->a
WordMorphism: a->b, b->b
WordMorphism: a->a, b->
WordMorphism: a->b, b->
WordMorphism: a->, b->aa
WordMorphism: a->, b->ab
WordMorphism: a->, b->ba
WordMorphism: a->, b->bb
WordMorphism: a->, b->a
```

```python
>>> from sage.all import *
>>> for m in W.iter_morphisms((Integer(0), Integer(3)), min_length=Integer(0)): m
WordMorphism: a->aa, b->
WordMorphism: a->ab, b->
WordMorphism: a->ba, b->
WordMorphism: a->bb, b->
WordMorphism: a->a, b->a
WordMorphism: a->a, b->b
WordMorphism: a->b, b->a
WordMorphism: a->b, b->b
WordMorphism: a->a, b->
WordMorphism: a->b, b->
WordMorphism: a->, b->aa
WordMorphism: a->, b->ab
WordMorphism: a->, b->ba
WordMorphism: a->, b->bb
WordMorphism: a->, b->a
```

(continues on next page)
WordMorphism: a->, b->b
WordMorphism: a->, b->

```
sage: for m in W.iter_morphisms( (2, 4) ): m
WordMorphism: a->aa, b->a
WordMorphism: a->aa, b->b
WordMorphism: a->ab, b->a
WordMorphism: a->ab, b->b
WordMorphism: a->ba, b->a
WordMorphism: a->ba, b->b
WordMorphism: a->bb, b->a
WordMorphism: a->bb, b->b
WordMorphism: a->a, b->aa
WordMorphism: a->a, b->ab
WordMorphism: a->a, b->ba
WordMorphism: a->a, b->bb
WordMorphism: a->b, b->aa
WordMorphism: a->b, b->ab
WordMorphism: a->b, b->ba
WordMorphism: a->b, b->bb
WordMorphism: a->a, b->a
WordMorphism: a->a, b->b
WordMorphism: a->b, b->a
WordMorphism: a->b, b->b

>>> from sage.all import *
>>> for m in W.iter_morphisms( (Integer(2), Integer(4)) ): m
WordMorphism: a->aa, b->a
WordMorphism: a->aa, b->b
WordMorphism: a->ab, b->a
WordMorphism: a->ab, b->b
WordMorphism: a->ba, b->a
WordMorphism: a->ba, b->b
WordMorphism: a->bb, b->a
WordMorphism: a->bb, b->b
WordMorphism: a->a, b->aa
WordMorphism: a->a, b->ab
WordMorphism: a->a, b->ba
WordMorphism: a->a, b->bb
WordMorphism: a->b, b->aa
WordMorphism: a->b, b->ab
WordMorphism: a->b, b->ba
WordMorphism: a->b, b->bb
WordMorphism: a->a, b->a
WordMorphism: a->a, b->b
WordMorphism: a->b, b->a
WordMorphism: a->b, b->b
```

Iterator over morphisms with specific image lengths:

```
sage: for m in W.iter_morphisms([0, 0]): m
WordMorphism: a->, b->
sage: for m in W.iter_morphisms([0, 1]): m
WordMorphism: a->, b->a
WordMorphism: a->, b->b
sage: for m in W.iter_morphisms([2, 1]): m
```

(continues on next page)
WordMorphism: a→aa, b→a
WordMorphism: a→aa, b→b
WordMorphism: a→ab, b→a
WordMorphism: a→ab, b→b
WordMorphism: a→ba, b→a
WordMorphism: a→ba, b→b
WordMorphism: a→bb, b→a
WordMorphism: a→bb, b→b

```
sage: for m in W.iter_morphisms([2, 2]): m
WordMorphism: a→aa, b→aa
WordMorphism: a→aa, b→ab
WordMorphism: a→aa, b→ba
WordMorphism: a→aa, b→bb
WordMorphism: a→ab, b→aa
WordMorphism: a→ab, b→ab
WordMorphism: a→ab, b→ba
WordMorphism: a→ab, b→bb
WordMorphism: a→ba, b→aa
WordMorphism: a→ba, b→ab
WordMorphism: a→ba, b→ba
WordMorphism: a→ba, b→bb
WordMorphism: a→bb, b→aa
WordMorphism: a→bb, b→ab
WordMorphism: a→bb, b→ba
WordMorphism: a→bb, b→bb
```

```
>>> from sage.all import *
>>> for m in W.iter_morphisms([Integer(0), Integer(0)]): m
WordMorphism: a→, b→a

iterate_by_length(l=l)

Returns an iterator over all the words of self of length l.

INPUT:

- l – integer (default: 1), the length of the desired words

EXAMPLES:

```python
sage: W = FiniteWords(ab)
sage: list(W.iterate_by_length(1))
[word: a, word: b]
sage: list(W.iterate_by_length(2))
[word: aa, word: ab, word: ba, word: bb]
sage: list(W.iterate_by_length(3))
[word: aaa, word: aab, word: aba, word: abb, word: baa, word: bab, word: bba, word: bbb]
sage: list(W.iterate_by_length('a'))
```

Traceback (most recent call last):
```
TypeError: the parameter l (=a') must be an integer
```
random_element (length=None, *args, **kwds)

Returns a random finite word on the given alphabet.

INPUT:

- **length** – (optional) the length of the word. If not set, will use a uniformly random number between 0 and 10.
- all other argument are transmitted to the random generator of the alphabet

EXAMPLES:

```
sage: W = FiniteWords(5)
sage: W.random_element() # random
word: 5114325445423521544531411434451152142155...
sage: W = FiniteWords(ZZ)
sage: W.random_element() # random
word: 5,-1,-1,-1,0,0,0,0,-3,-11
sage: W.random_element(length=4, x=0, y=4) # random
word: 1003
```

shift()

Return the set of infinite words on the same alphabet.

EXAMPLES:

```
sage: FiniteWords('ab').shift()
Infinite words over {'a', 'b'}
```

```
sage: FiniteWords('ab').shift()
Infinite words over {'a', 'b'}
```

```
sage: W = FiniteWords(ab).shift()
Infinite words over {a, b}
```

```
from sage.all import *
>>> W = FiniteWords(ab).shift()
Infinite words over {a, b}
```
### cardinality()

Return the cardinality of this set

**EXAMPLES:**

```
sage: InfiniteWords('ab').cardinality()
+Infinity
sage: InfiniteWords('a').cardinality()
1
sage: InfiniteWords('').cardinality()
0
```

```
>>> from sage.all import *

>>> InfiniteWords('ab').cardinality()
+Infinity

>>> InfiniteWords('a').cardinality()
1

>>> InfiniteWords('').cardinality()
0
```

### factors()

Return the set of finite words on the same alphabet.

**EXAMPLES:**

```
sage: InfiniteWords('ab').factors()
Finite words over {'a', 'b'}
```

```
>>> from sage.all import *

>>> InfiniteWords('ab').factors()
Finite words over {'a', 'b'}
```

### random_element (*args, **kwds)

Return a random infinite word.

**EXAMPLES:**

```
sage: W = InfiniteWords('ab')
sage: W.random_element() # random
word: abbbabbaaabbbabbaaabbbabbbabbbabbbabbbabbb...
```

```
sage: W = InfiniteWords(ZZ)
sage: W.random_element(x=2,y=4) # random
word: 3333223322232233223322322222322323233233233...
```

```
>>> from sage.all import *

>>> W = InfiniteWords('ab')

>>> W.random_element() # random
word: abbbabbaaabbbabbaaabbbabbbabbbabbbabbbabbb...

>>> W = InfiniteWords(ZZ)

>>> W.random_element(x=Integer(2), y=Integer(4)) # random
word: 3333223322232233223322322222322323233233233...
```

### shift()

Return itself.

**EXAMPLES:**
sage: InfiniteWords('ab').shift()
Infinite words over {'a', 'b'}

>>> from sage.all import *
>>> InfiniteWords('ab').shift()
Infinite words over {'a', 'b'}

sage.combinat.words.words.Words(alphabet=None, length=None, finite=True, infinite=True)

Returns the combinatorial class of words of length k over an alphabet.

EXAMPLES:

sage: Words()
Finite and infinite words over Set of Python objects of class 'object'
sage: Words(length=7)
Words of length 7 over Set of Python objects of class 'object'
sage: Words(5)
Finite and infinite words over {1, 2, 3, 4, 5}
sage: Words(5, length=3)
Words of length 3 over {1, 2, 3, 4, 5}
sage: Words(5, infinite=False)
Finite words over {1, 2, 3, 4, 5}
sage: Words(5, infinite=False)
Infinite words over {1, 2, 3, 4, 5}
sage: Words('ab')
Finite and infinite words over {'a', 'b'}
sage: Words('ab', length=2)
Words of length 2 over {'a', 'b'}
sage: Words('ab', infinite=False)
Finite words over {'a', 'b'}

>>> from sage.all import *
>>> Words()
Finite and infinite words over Set of Python objects of class 'object'
>>> Words(length=Integer(7))
Words of length 7 over Set of Python objects of class 'object'
>>> Words(Integer(5))
Finite and infinite words over {1, 2, 3, 4, 5}
>>> Words(Integer(5), length=3)
Words of length 3 over {1, 2, 3, 4, 5}
>>> Words(Integer(5), infinite=False)
Finite words over {1, 2, 3, 4, 5}
>>> Words(Integer(5), infinite=False)
Infinite words over {1, 2, 3, 4, 5}

(continues on next page)
Infinite words over \{a, b\}

```python
>>> Words('positive integers', finite=False)
Infinite words over Positive integers
>>> Words('natural numbers')
Finite and infinite words over Non negative integers
```

class sage.combinat.words.words.Words_n(words, n)

Bases: Parent

The set of words of fixed length on a given alphabet.

alphabet()

Return the underlying alphabet.

EXAMPLES:

```python
sage: Words([0,1], 4).alphabet()
{0, 1}
```

```python
>>> from sage.all import *

>>> Words([Integer(0),Integer(1)], Integer(4)).alphabet()
{0, 1}
```

cardinality()

Returns the number of words of length \(n\) from alphabet.

EXAMPLES:

```python
sage: Words(['a','b','c'], 4).cardinality()
81
sage: Words(3, 4).cardinality()
81
sage: Words(0,0).cardinality()
1
sage: Words(5,0).cardinality()
1
sage: Words(['a','b','c'],0).cardinality()
1
sage: Words(0,1).cardinality()
0
sage: Words(5,1).cardinality()
5
sage: Words(['a','b','c'],1).cardinality()
3
sage: Words(7,13).cardinality()
96889010407
sage: Words(['a','b','c','d','e','f','g'],13).cardinality()
96889010407
```

```python
>>> from sage.all import *

>>> Words(['a','b','c'], Integer(4)).cardinality()
81
>>> Words(Integer(3), Integer(4)).cardinality()
81
>>> Words(Integer(0),Integer(0)).cardinality()
1
```
Combinatorics, Release 10.4

(continued from previous page)

>>> Words(Integer(5),Integer(0)).cardinality()
1
>>> Words(['a','b','c'],Integer(0)).cardinality()
1
>>> Words(Integer(0),Integer(1)).cardinality()
0
>>> Words(Integer(5),Integer(1)).cardinality()
5
>>> Words(['a','b','c'],Integer(1)).cardinality()
3
>>> Words(Integer(7),Integer(13)).cardinality()
96889010407
>>> Words(['a','b','c','d','e','f','g'],Integer(13)).cardinality()
96889010407

iterate_by_length (length)

All words in this class are of the same length, so use iterator instead.

list ()

Returns a list of all the words contained in self.

EXAMPLES:

sage: Words(0,0).list()
[ ]
sage: Words(5,0).list()
[ ]
sage: Words(['a','b','c'],0).list()
[ ]
sage: Words(5,1).list()
[1, 2, 3, 4, 5]
sage: Words(['a','b','c'],2).list()
[aa, ab, ac, ba, bb, bc, ca, cb, cc]

>>> from sage.all import *

>>> Words(Integer(0),Integer(0)).list()
[ ]
>>> Words(Integer(5),Integer(0)).list()
[ ]
>>> Words(['a','b','c'],Integer(0)).list()
[ ]
>>> Words(Integer(5),Integer(1)).list()
[1, 2, 3, 4, 5]
>>> Words(['a','b','c'],Integer(2)).list()
[aa, ab, ac, ba, bb, bc, ca, cb, cc]

random_element (*args, **kwds)

Return a random word in this set.

EXAMPLES:

sage: W = Words('ab', 4)
sage: W.random_element() # random
word: bbab

(continues on next page)
```python
sage: W.random_element() in W
True
sage: W = Words(ZZ, 5)
sage: W.random_element() # random
word: 1,2,2,-1,12
sage: W.random_element() in W
True

>>> from sage.all import *
>>> W = Words('ab', Integer(4))
>>> W.random_element() # random
word: bbab
>>> W.random_element() in W
True

>>> W = Words(ZZ, Integer(5))
>>> W.random_element() # random
word: 1,2,2,-1,12
>>> W.random_element() in W
True
```

### 5.1.372 Yang-Baxter Graphs

```python
class sage.combinat.yang_baxter_graph.SwapIncreasingOperator(i)
    Bases: SwapOperator
class sage.combinat.yang_baxter_graph.SwapOperator(i)
    Bases: SageObject
    The operator that swaps the items in positions $i$ and $i+1$. This method returns $i$.
    EXAMPLES:
```
```python
sage: from sage.combinat.yang_baxter_graph import SwapIncreasingOperator
sage: s3 = SwapIncreasingOperator(3)
sage: s3 == loads(dumps(s3))
True
```
```python
>>> from sage.all import *
>>> from sage.combinat.yang_baxter_graph import SwapOperator
>>> s3 = SwapOperator(Integer(3))
>>> s3 == loads(dumps(s3))
True
```
```python
position()
    self is the operator that swaps positions $i$ and $i+1$. This method returns $i$.
    EXAMPLES:
```
```python
sage: from sage.combinat.yang_baxter_graph import SwapOperator
sage: s3 = SwapOperator(3)
sage: s3.position()
3
```
sage.combinat.yang_baxter_graph.YangBaxterGraph (partition=None, root=None, operators=None)

Construct the Yang-Baxter graph from root by repeated application of operators, or the Yang-Baxter graph associated to partition.

INPUT:
The user needs to provide either partition or both root and operators, where

- partition – a partition of a positive integer
- root – the root vertex
- operator – a function that maps vertices \( u \) to a list of tuples of the form \((v, l)\) where \( v \) is a successor of \( u \) and \( l \) is the label of the edge from \( u \) to \( v \).

OUTPUT:

- Either:
  - YangBaxterGraph_partition – if partition is defined
  - YangBaxterGraph_generic – if partition is None

EXAMPLES:
The Yang-Baxter graph defined by a partition \([p_1, \ldots, p_k]\) is the labelled directed graph with vertex set obtained by bubble-sorting \((p_k - 1, p_k - 2, \ldots, 0, \ldots, p_1 - 1, p_1 - 2, \ldots, 0)\); there is an arrow from \( u \) to \( v \) labelled by \( i \) if \( v \) is obtained by swapping the \( i \)-th and \((i + 1)\)-th elements of \( u \). For example, if the partition is \([3, 1]\), then we begin with \((0, 2, 1, 0)\) and generate all tuples obtained from it by swapping two adjacent entries if they are increasing:

```python
sage: from sage.combinat.yang_baxter_graph import SwapIncreasingOperator
sage: bubbleswaps = [SwapIncreasingOperator(i) for i in range(3)]
```
The permutahedron can be realized as a Yang-Baxter graph:

```python
sage: from sage.combinat.yang_baxter_graph import SwapIncreasingOperator
sage: swappers = [SwapIncreasingOperator(i) for i in range(3)]
```

```python
sage: Y = YangBaxterGraph(root=(1,2,3,4), operators=swappers); Y
Yang-Baxter graph with root vertex (1, 2, 3, 4)
```

```
sage: Y.plot()
# needs sage.plot
```

```python
Graphics object consisting of 97 graphics primitives
```

The Cayley graph of a finite group can be realized as a Yang-Baxter graph:

```python
sage: # needs sage.groups
sage: def left_multiplication_by(g):
...:     return lambda h: h*g

sage: G = CyclicPermutationGroup(4)
sage: operators = [ left_multiplication_by(gen) for gen in G.gens() ]
```

```python
sage: Y = YangBaxterGraph(root=G.identity(), operators=operators); Y
Yang-Baxter graph with root vertex ()
```

```
sage: Y.plot(edge_labels=False)
# needs sage.plot
```

```python
Graphics object consisting of 96 graphics primitives
```

(continues on next page)
AUTHORS:

- Franco Saliola (2009-04-23)

class sage.combinat.yang_baxter_graph.YangBaxterGraph_generic(root, operators)
Bases: SageObject

A class to model the Yang-Baxter graph defined by root and operators.

INPUT:

- root – the root vertex of the graph
- operators – a list of callables that map vertices to (new) vertices.

Note: This is a lazy implementation: the digraph is only computed when it is needed.

EXAMPLES:

```python
sage: from sage.combinat.yang_baxter_graph import SwapIncreasingOperator
sage: ops = [SwapIncreasingOperator(i) for i in range(4)]

sage: Y = YangBaxterGraph(root=(1,0,2,1,0), operators=ops); Y
Yang-Baxter graph with root vertex (1, 0, 2, 1, 0)

sage: loads(dumps(Y)) == Y
True
```

AUTHORS:

- Franco Saliola (2009-04-23)

edges()

Return the (labelled) edges of self.

EXAMPLES:
sage: from sage.combinat.yang_baxter_graph import SwapIncreasingOperator
sage: ops = [SwapIncreasingOperator(i) for i in range(3)]

sage: Y = YangBaxterGraph(root=(0,2,1,0), operators=ops)
sage: Y.edges()
[((0, 2, 1, 0), (2, 0, 1, 0), Swap-if-increasing at position 0), ((2, 0, 1, 0), (2, 1, 0, 0), Swap-if-increasing at position 1)]

>>> from sage.all import *
>>> from sage.combinat.yang_baxter_graph import SwapIncreasingOperator
>>> ops = [SwapIncreasingOperator(i) for i in range(Integer(3))]

>>> Y = YangBaxterGraph(root=(Integer(0),Integer(2),Integer(1),Integer(0)), operators=ops)

>>> Y.edges()
[((0, 2, 1, 0), (2, 0, 1, 0), Swap-if-increasing at position 0), ((2, 0, 1, 0), (2, 1, 0, 0), Swap-if-increasing at position 1)]

plot(*args, **kwds)

Plot self as a digraph.

EXAMPLES:

sage: from sage.combinat.yang_baxter_graph import SwapIncreasingOperator
sage: ops = [SwapIncreasingOperator(i) for i in range(4)]

sage: Y = YangBaxterGraph(root=(1,0,2,1,0), operators=ops)

sage: Y.plot()    # needs sage.plot
Graphics object consisting of 16 graphics primitives

sage: Y.plot(edge_labels=False)    # needs sage.plot
Graphics object consisting of 11 graphics primitives

>>> from sage.all import *

>>> from sage.combinat.yang_baxter_graph import SwapIncreasingOperator

>>> ops = [SwapIncreasingOperator(i) for i in range(Integer(4))]

>>> Y = YangBaxterGraph(root=(Integer(1),Integer(0),Integer(2),Integer(1),Integer(0)), operators=ops)

>>> Y.plot()    # needs sage.plot
Graphics object consisting of 16 graphics primitives

>>> Y.plot(edge_labels=False)    # needs sage.plot
Graphics object consisting of 11 graphics primitives

relabel_edges(edge_dict, inplace=True)

Relabel the edges of self.

INPUT:

• edge_dict – a dictionary keyed by the (unlabelled) edges.

EXAMPLES:
relabel_vertices(v, relabel_operator, inplace=True)

Relabel the vertices \( u \) of \( self \) by the object obtained from \( u \) by applying the \( relabel_operator \) to \( v \) along a path from \( self.root() \) to \( u \).

Note that the \( self.root() \) is paired with \( v \).

INPUT:

- \( v \) – tuple, Permutation, …
- \( inplace \) – if True, modifies \( self \); otherwise returns a modified copy of \( self \).

EXAMPLES:

```python
from sage.combinat.yang_baxter_graph import SwapIncreasingOperator
sage: ops = [SwapIncreasingOperator(i) for i in range(3)]
sage: Y = YangBaxterGraph(root=(0,2,1,0), operators=ops)
sage: def relabel_op(op, u):
    ...:     i = op.position()
    ...:     return u[:i] + u[i:i+2][::-1] + u[i+2:]
```
sage: d = Y.relabel_vertices((1,2,3,4), relabel_op, inplace=False); d
Yang-Baxter graph with root vertex (1, 2, 3, 4)
sage: Y.vertices(sort=True)
[(0, 2, 1, 0), (2, 0, 1, 0), (2, 1, 0, 0)]
sage: e = Y.relabel_vertices((1,2,3,4), relabel_op); e
sage: Y.vertices(sort=True)
[(1, 2, 3, 4), (2, 1, 3, 4), (2, 3, 1, 4)]

>>> from sage.all import *
>>> from sage.combinat.yang_baxter_graph import SwapIncreasingOperator
>>>
ops = [SwapIncreasingOperator(i) for i in range(Integer(4))]

>>> Y = YangBaxterGraph(root=(Integer(0),Integer(2),Integer(1),Integer(0)),
operators=ops)

>>> def relabel_op(op, u):
...  i = op.position()
...  return u[:i] + u[i:i+Integer(2)][::-Integer(1)] + u[i+Integer(2):]

>>> d = Y.relabel_vertices((Integer(1),Integer(2),Integer(3),Integer(4)),
relabel_op, inplace=False); d
Yang-Baxter graph with root vertex (1, 2, 3, 4)

>>> Y.vertices(sort=True)
[(0, 2, 1, 0), (2, 0, 1, 0), (2, 1, 0, 0)]

>>> e = Y.relabel_vertices((Integer(1),Integer(2),Integer(3),Integer(4)),
relabel_op); e

>>> Y.vertices(sort=True)
[(1, 2, 3, 4), (2, 1, 3, 4), (2, 3, 1, 4)]

root()

Return the root vertex of self.

If self is the Yang-Baxter graph of the partition \([p_1, p_2, \ldots, p_k]\), then this is the vertex \((p_k - 1, p_k - 2, \ldots, 0, \ldots, p_1 - 1, p_1 - 2, \ldots, 0)\).

EXAMPLES:

sage: from sage.combinat.yang_baxter_graph import SwapIncreasingOperator
sage: ops = [SwapIncreasingOperator(i) for i in range(4)]

sage: Y = YangBaxterGraph(root=(1,0,2,1,0), operators=ops)
sage: Y.root()
(1, 0, 2, 1, 0)

sage: Y = YangBaxterGraph(root=(0,1,0,2,1,0), operators=ops)
sage: Y.root()
(0, 1, 0, 2, 1, 0)

sage: Y = YangBaxterGraph(root=(1,0,3,2,1,0), operators=ops)
sage: Y.root()
(1, 0, 3, 2, 1, 0)

sage: Y = YangBaxterGraph(partition=[3,2])
#_needs sage.combinat
sage: Y.root()
#_needs sage.combinat
(1, 0, 2, 1, 0)

>>> from sage.all import *
>>> from sage.combinat.yang_baxter_graph import SwapIncreasingOperator
>>> ops = [SwapIncreasingOperator(i) for i in range(Integer(4))]

>>> Y = YangBaxterGraph(root=(Integer(1),Integer(0),Integer(2),Integer(1), Integer(0)), operators=ops)
Combinatorics, Release 10.4

```
>>> Y.root()
(1, 0, 2, 1, 0)
>>> Y = YangBaxterGraph(root=(Integer(0),Integer(1),Integer(0),Integer(2),
               →Integer(1),Integer(0)), operators=ops)
>>> Y.root()
(0, 1, 0, 2, 1, 0)
>>> Y = YangBaxterGraph(root=(Integer(1),Integer(0),Integer(3),Integer(2),
               →Integer(1),Integer(0)), operators=ops)
>>> Y.root()
(1, 0, 3, 2, 1, 0)
>>> Y = YangBaxterGraph(partition=[Integer(3),Integer(2)])  # needs sage.combinat
  # needs sage.combinat
>>> Y.root()  # needs sage.combinat
(1, 0, 2, 1, 0)

successors(v)
Return the successors of the vertex v.

EXAMPLES:

```
sage: from sage.combinat.yang_baxter_graph import SwapIncreasingOperator
sage: ops = [SwapIncreasingOperator(i) for i in range(4)]
```

```
sage: Y = YangBaxterGraph(root=(1,0,2,1,0), operators=ops)
sage: Y.successors(Y.root())
[(1, 2, 0, 1, 0)]
```

```
sage: sorted(Y.successors((1, 2, 0, 1, 0)))
[(1, 2, 1, 0, 0), (2, 1, 0, 1, 0)]
```

```
>> from sage.all import *
>>> from sage.combinat.yang_baxter_graph import SwapIncreasingOperator
>> ops = [SwapIncreasingOperator(i) for i in range(Integer(4))]
>>> Y = YangBaxterGraph(root=(Integer(1),Integer(0),Integer(2),Integer(1),
               →Integer(0)), operators=ops)
>>> Y.successors(Y.root())
[(1, 2, 0, 1, 0)]
>>> sorted(Y.successors((Integer(1), Integer(2), Integer(0), Integer(1),
               →Integer(0))))
[(1, 2, 1, 0, 0), (2, 1, 0, 1, 0)]
```

vertex_relabelling_dict(v, relabel_operator)
Return a dictionary pairing vertices u of self with the object obtained from v by applying the relabel_operator along a path from the root to u.

Note that the root is paired with v.

INPUT:

• v – an object

• relabel_operator – function mapping a vertex and a label to the image of the vertex

OUTPUT:

• dictionary pairing vertices with the corresponding image of v

EXAMPLES:
sage: from sage.combinat.yang_baxter_graph import SwapIncreasingOperator
sage: ops = [SwapIncreasingOperator(i) for i in range(3)]

sage: Y = YangBaxterGraph(root=(0,2,1,0), operators=ops)
sage: def relabel_operator(op, u):
    ...:     i = op.position()
    ...:     return u[:i] + u[i:i+2][::-1] + u[i+2:]

sage: Y.vertex_relabelling_dict((1,2,3,4), relabel_operator)
{(0, 2, 1, 0): (1, 2, 3, 4),
 (2, 0, 1, 0): (2, 1, 3, 4),
 (2, 1, 0, 0): (2, 3, 1, 4)}

>>> from sage.all import *
>>> from sage.combinat.yang_baxter_graph import SwapIncreasingOperator
>>>
>>> ops = [SwapIncreasingOperator(i) for i in range(Integer(3))]
>>>
>>> Y = YangBaxterGraph(root=(Integer(0),Integer(2),Integer(1),Integer(0)),
                         operators=ops)

>>> def relabel_operator(op, u):
    ...:     i = op.position()
    ...:     return u[:i] + u[i:i+Integer(2)][::-Integer(1)] + u[i+Integer(2):]

>>> Y.vertex_relabelling_dict((Integer(1),Integer(2),Integer(3),Integer(4)),
                         relabel_operator)
{(0, 2, 1, 0): (1, 2, 3, 4),
 (2, 0, 1, 0): (2, 1, 3, 4),
 (2, 1, 0, 0): (2, 3, 1, 4)}

vertices (sort=False)

Return the vertices of self.

INPUT:

- sort - boolean (default False) whether to sort the vertices

EXAMPLES:

sage: from sage.combinat.yang_baxter_graph import SwapIncreasingOperator
sage: ops = [SwapIncreasingOperator(i) for i in range(3)]

sage: Y = YangBaxterGraph(root=(0,2,1,0), operators=ops)

sage: Y.vertices(sort=True)
[(0, 2, 1, 0), (2, 0, 1, 0), (2, 1, 0, 0)]

>>> from sage.all import *
>>> from sage.combinat.yang_baxter_graph import SwapIncreasingOperator
>>>

>>> ops = [SwapIncreasingOperator(i) for i in range(Integer(3))]

>>> Y = YangBaxterGraph(root=(Integer(0),Integer(2),Integer(1),Integer(0)),
                         operators=ops)

>>> Y.vertices(sort=True)
[(0, 2, 1, 0), (2, 0, 1, 0), (2, 1, 0, 0)]

class sage.combinat.yang_baxter_graph.YangBaxterGraph_partition (partition)

Bases: YangBaxterGraph_generic

A class to model the Yang-Baxter graph of a partition.

The Yang-Baxter graph defined by a partition \([p_1, \ldots, p_k]\) is the labelled directed graph with vertex set obtained by bubble-sorting \((p_k - 1, p_k - 2, \ldots, 0, \ldots, p_1 - 1, p_1 - 2, \ldots, 0)\); there is an arrow from \(u\) to \(v\) labelled by \(i\) if \(v\) is obtained by swapping the \(i\)-th and \((i+1)\)-th elements of \(u\).
Note: This is a lazy implementation: the digraph is only computed when it is needed.

EXAMPLES:

```python
sage: Y = YangBaxterGraph(partition=[3,2,1]); Y
# needs sage.combinat
Yang-Baxter graph of [3, 2, 1], with top vertex (0, 1, 0, 2, 1, 0)
sage: loads(dumps(Y)) == Y
# needs sage.combinat
True
```

```python
>>> from sage.all import *
>>> Y = YangBaxterGraph(partition=[Integer(3),Integer(2),Integer(1)]); Y
# needs sage.combinat
Yang-Baxter graph of [3, 2, 1], with top vertex (0, 1, 0, 2, 1, 0)
>>> loads(dumps(Y)) == Y  
# needs...
True
```

AUTHORS:

• Franco Saliola (2009-04-23)

relabel_vertices(v, inplace=\text{True})

Relabel the vertices of \texttt{self} with the object obtained from \texttt{v} by applying the transpositions corresponding to the edge labels along some path from the root to the vertex.

INPUT:

• \texttt{v} – tuple, Permutation, ...

• \texttt{inplace} – if True, modifies \texttt{self}; otherwise returns a modified copy of \texttt{self}.

EXAMPLES:

```python
sage: # needs sage.combinat
sage: Y = YangBaxterGraph(partition=[3,1]); Y
Yang-Baxter graph of [3, 1], with top vertex (0, 2, 1, 0)
sage: d = Y.relabel_vertices((1,2,3,4), inplace=False); d
Digraph on 3 vertices
sage: Y.vertices(sort=True)
[(0, 2, 1, 0), (2, 0, 1, 0), (2, 1, 0, 0)]
sage: e = Y.relabel_vertices((1,2,3,4)); e
sage: Y.vertices(sort=True)
[(1, 2, 3, 4), (2, 1, 3, 4), (2, 3, 1, 4)]
```

```python
>>> from sage.all import *
>>> # needs sage.combinat
>>> Y = YangBaxterGraph(partition=[Integer(3),Integer(1)]); Y
Yang-Baxter graph of [3, 1], with top vertex (0, 2, 1, 0)
>>> d = Y.relabel_vertices((Integer(1),Integer(2),Integer(3),Integer(4)), inplace=False); d
Digraph on 3 vertices
>>> Y.vertices(sort=True)
[(0, 2, 1, 0), (2, 0, 1, 0), (2, 1, 0, 0)]
>>> e = Y.relabel_vertices((Integer(1),Integer(2),Integer(3),Integer(4))); e
>>> Y.vertices(sort=True)
[(1, 2, 3, 4), (2, 1, 3, 4), (2, 3, 1, 4)]
```
**vertex_relabelling_dict** *(v)*

Return a dictionary pairing vertices *u* of *self* with the object obtained from *v* by applying transpositions corresponding to the edges labels along a path from the root to *u*.

Note that the root is paired with *v*.

**INPUT:**
- *v* – an object

**OUTPUT:**
- dictionary pairing vertices with the corresponding image of *v*

**EXAMPLES:**

```python
sage: Y = YangBaxterGraph(partition=[3,1])
    # needs sage.combinat
sage: Y.vertex_relabelling_dict((1,2,3,4))
    # needs sage.combinat
{(0, 2, 1, 0): (1, 2, 3, 4),
 (2, 0, 1, 0): (2, 1, 3, 4),
 (2, 1, 0, 0): (2, 3, 1, 4)}

sage: Y.vertex_relabelling_dict((4,3,2,1))
    # needs sage.combinat
{(0, 2, 1, 0): (4, 3, 2, 1),
 (2, 0, 1, 0): (3, 4, 2, 1),
 (2, 1, 0, 0): (3, 2, 4, 1)}
```

```python
from sage.all import *
Y = YangBaxterGraph(partition=[Integer(3),Integer(1)])
    # needs sage.combinat
Y.vertex_relabelling_dict((Integer(1),Integer(2),Integer(3),Integer(4)))
    # needs sage.combinat
{(0, 2, 1, 0): (1, 2, 3, 4),
 (2, 0, 1, 0): (2, 1, 3, 4),
 (2, 1, 0, 0): (2, 3, 1, 4)}
```

5.1. Comprehensive Module List 6025

### 5.1.373 C-Finite Sequences

C-finite infinite sequences satisfy homogeneous linear recurrences with constant coefficients:

\[ a_{n+d} = c_0a_n + c_1a_{n+1} + \cdots + c_{d-1}a_{n+d-1}, \quad d > 0. \]

CFiniteSequences are completely defined by their ordinary generating function (o.g.f., which is always a fraction of polynomials over \( \mathbb{Z} \) or \( \mathbb{Q} \)).

**EXAMPLES:**

```python
sage: fibo = CFiniteSequence(x/(1-x-x^2))  # the Fibonacci sequence
sage: fibo
C-finite sequence, generated by -x/(x^2 + x - 1)
sage: fibo.parent()
```

(continues on next page)
The ring of C-Finite sequences in $x$ over Rational Field

```sage
fibo.parent().category()
```

Category of commutative rings

```sage
C.<x> = CFiniteSequences(QQ)
fibo.parent() == C
```

True

```sage
C
```

The ring of C-Finite sequences in $x$ over Rational Field

```sage
C(x/(1-x-x^2))
```

C-finite sequence, generated by $-x/(x^2 + x - 1)$

```sage
C(x/(1-x-x^2)) == fibo
```

True

```sage
var('y')
y
```

```sage
CFiniteSequence(y/(1-y-y^2))
```

C-finite sequence, generated by $-y/(y^2 + y - 1)$

```sage
CFiniteSequence(y/(1-y-y^2)) == fibo
```

False

```>>> from sage.all import * >>> fibo = CFiniteSequence(x/(Integer(1)-x-x**Integer(2))) # the Fibonacci sequence >>> fibo
```

C-finite sequence, generated by $-x/(x^2 + x - 1)$

```>>> fibo.parent()
```

The ring of C-Finite sequences in $x$ over Rational Field

```>>> fibo.parent().category()
```

Category of commutative rings

```>>> C = CFiniteSequences(QQ, names=('x',)); (x,) = C._first_ngens(1) >>> fibo.parent() == C
```

True

```>>> C
```

The ring of C-Finite sequences in $x$ over Rational Field

```>>> C(x/(Integer(1)-x-x**Integer(2)))
```

C-finite sequence, generated by $-x/(x^2 + x - 1)$

```>>> C(x/(Integer(1)-x-x**Integer(2))) == fibo
```

True

```>>> var('y')
y
```

```>>> CFiniteSequence(y/(Integer(1)-y-y**Integer(2)))
```

C-finite sequence, generated by $-y/(y^2 + y - 1)$

```>>> CFiniteSequence(y/(Integer(1)-y-y**Integer(2))) == fibo
```

False

Finite subsets of the sequence are accessible via python slices:

```sage
fibo[137] # the 137th term of the Fibonacci sequence
```

19134702400093278081449423917

```sage
fibo[0:12]
```

[0, 1, 1, 2, 3, 5, 8, 13, 21, 34, 55, 89]

```sage
fibo[14:4:-2]
```

[377, 144, 55, 21, 8]
They can be created also from the coefficients and start values of a recurrence:

```python
sage: r = C.from_recurrence([1,1],[0,1])
sage: r == fibo
True
```

Given enough values, the o.g.f. of a C-finite sequence can be guessed:

```python
sage: r = C.guess([0,1,1,2,3,5,8])
sage: r == fibo
True
```

class *sage.rings.cfinite_sequence.CFiniteSequence*(*parent, ogf*)

Create a C-finite sequence given its ordinary generating function.

INPUT:

• *ogf* – a rational function, the ordinary generating function (can be an element from the symbolic ring, fraction field or polynomial ring)
OUTPUT:

A CFiniteSequence object

EXAMPLES:

```
sage: CFiniteSequence((2-x)/(1-x-x^2))  # the Lucas sequence
C-finite sequence, generated by (x - 2)/(x^2 + x - 1)
sage: CFiniteSequence(x/(1-x)^3)          # triangular numbers
C-finite sequence, generated by -x/(x^3 - 3*x^2 + 3*x - 1)
```

Polynomials are interpreted as finite sequences, or recurrences of degree 0:

```
sage: CFiniteSequence(x^2-4*x^5)
Finite sequence [1, 0, 0, -4], offset = 2
sage: CFiniteSequence(1)
Finite sequence [1], offset = 0
```

This implementation allows any polynomial fraction as o.g.f. by interpreting any power of $x$ dividing the o.g.f. numerator or denominator as a right or left shift of the sequence offset:

```
sage: CFiniteSequence(x^2+3/x)
Finite sequence [3, 0, 0, 1], offset = -1
sage: CFiniteSequence(1/x+4/x^3)
Finite sequence [4, 0, 1], offset = -3
sage: P = LaurentPolynomialRing(QQ.fraction_field(), 'X')
sage: X=P.gen()
sage: CFiniteSequence(1/(1-X))
C-finite sequence, generated by -1/(X - 1)
```

The o.g.f. is always normalized to get a denominator constant coefficient of +1:

```
sage: CFiniteSequence(1/(x-2))
C-finite sequence, generated by 1/(x - 2)
```
The given ogf is used to create an appropriate parent: it can be a symbolic expression, a polynomial, or a fraction field element as long as it can be coerced into a proper fraction field over the rationals:

```python
sage: var('x')
x
sage: f1 = CFiniteSequence((2-x)/(1-x-x^2))
sage: P.<x> = QQ[]
sage: f2 = CFiniteSequence((2-x)/(1-x-x^2))
sage: f1 == f2
True
sage: f1.parent()
The ring of C-Finite sequences in x over Rational Field
sage: f1.ogf().parent()
Fraction Field of Univariate Polynomial Ring in x over Rational Field
```

```
CFiniteSequence(log(x))
Traceback (most recent call last):
...TypeError: unable to convert log(x) to a rational
```

```
>>> from sage.all import *
>>> var('x')
x
>>> f1 = CFiniteSequence((Integer(2)-x)/(Integer(1)-x-x**Integer(2)))
>>> P = QQ['x']; (x,) = P._first_ngens(1)
>>> f2 = CFiniteSequence((Integer(2)-x)/(Integer(1)-x-x**Integer(2)))
>>> f1 == f2
True
>>> f1.parent()
The ring of C-Finite sequences in x over Rational Field
>>> f1.ogf().parent()
Fraction Field of Univariate Polynomial Ring in x over Rational Field
```

```
CFiniteSequence(log(x))
Traceback (most recent call last):
...TypeError: unable to convert log(x) to a rational
```

```
closed_form(n=n)
```

Return a symbolic expression in $n$, which equals the $n$-th term of the sequence.

It is a well-known property of C-finite sequences $a_n$ that they have a closed form of the type:

$$a_n = \sum_{i=1}^{d} c_i(n) \cdot r_i^n,$$

where $r_i$ are the roots of the characteristic equation and $c_i(n)$ is a polynomial (whose degree equals the multiplicity of $r_i$ minus one). This is a natural generalization of Binet’s formula for Fibonacci numbers. See, for instance, [KP2011, Theorem 4.1].

Note that if the o.g.f. has a polynomial part, that is, if the numerator degree is not strictly less than the denominator degree, then this closed form holds only when $n$ exceeds the degree of that polynomial part. In that case, the returned expression will differ from the sequence for small $n$.

EXAMPLES:
Binet's formula for the Fibonacci numbers:

```python
sage: CFiniteSequence(x/(1-x-x^2)).closed_form()
sqrt(1/5)*(1/2*sqrt(5) + 1/2)^n - sqrt(1/5)*(-1/2*sqrt(5) + 1/2)^n
sage: [__.subs(n=k).full_simplify() for k in range(6)]
[0, 1, 1, 2, 3, 5]
```

Examples with multiple roots:

```python
sage: CFiniteSequence(x*(x^2+4*x+1)/(1-x)^5).closed_form()
1/4*n^4 + 1/2*n^3 + 1/4*n^2
```

```python
sage: CFiniteSequence((1+2*x-x^2)/(1-x)^4/(1+x)^2).closed_form()
1/12*n^3 - 1/8*(-1)*n*(n + 1) + 3/4*n^2 + 43/24*n + 9/8
```

```python
sage: CFiniteSequence(1/(1-x)^3/(1-2*x)^4).closed_form()
4/3*(n^3 - 3n^2 + 20*n - 36)*2*n + 1/2*n^2 + 19/2*n + 49
```

```python
sage: CFiniteSequence((3*x^2+3*x+1)/(1-x-x^2)^2).closed_form()
1/5*(n - sqrt(1/5))*(1/2*sqrt(5) + 1/2)^n + 1/5*(n + sqrt(1/5))*(-1/2*sqrt(5) + 1/2)^n
```
Combinatorics, Release 10.4

```python
>>> from sage.all import *
>>> CFiniteSequence(x*(x**Integer(2)+Integer(4)*x+Integer(1))/(Integer(1)-
˓→x)**Integer(5)).closed_form()
1/4*n^4 + 1/2*n^3 + 1/4*n^2
>>> CFiniteSequence((Integer(1)+Integer(2)*x-x**Integer(2))/(Integer(1)-
˓→x)**Integer(4)/(Integer(1)+x)**Integer(2)).closed_form()
1/12*n^3 - 1/8*(-1)^n*(n + 1) + 3/4*n^2 + 43/24*n + 9/8
>>> CFiniteSequence(Integer(1)/(Integer(1)-x)**Integer(3)/(Integer(1)-
˓→Integer(2)*x)**Integer(4)).closed_form()
4/3*(n^3 - 3*n^2 + 20*n - 36)*2^n + 1/2*n^2 + 19/2*n + 49
>>> CFiniteSequence((x/(Integer(1)-x-x**Integer(2)))**Integer(2)).closed_˓→form()
1/5*(n - sqrt(1/5))*(1/2*sqrt(5) + 1/2)^n + 1/5*(n + sqrt(1/5))*(-1/2*sqrt(5)␣˓→+ 1/2)^n
```

**coefficients()**

Return the coefficients of the recurrence representation of the C-finite sequence.

**OUTPUT:**

- A list of values

**EXAMPLES:**

sage: C.<x> = CFiniteSequences(QQ)
sage: lucas = C((2-x)/(1-x-x^2))  # the Lucas sequence
dlucas = lucas.coefficients()
[1, 1]

```python
>>> from sage.all import *
>>> C = CFiniteSequences(QQ, names=('x',)); (x,) = C._first_ngens(1)
>>> lucas = C((Integer(2)-x)/(Integer(1)-x-x**Integer(2)))  # the Lucas_˓→sequence
>>> lucas.coefficients()
[1, 1]
```

**denominator()**

Return the numerator of the o.g.f of self.

**EXAMPLES:**

sage: f = CFiniteSequence((2-x)/(1-x-x^2)); f
C-finite sequence, generated by (x - 2)/(x^2 + x - 1)
sage: f.denominator()
x^2 + x - 1

```python
>>> from sage.all import *
>>> f = CFiniteSequence((Integer(2)-x)/(Integer(1)-x-x**Integer(2))); f
C-finite sequence, generated by (x - 2)/(x^2 + x - 1)
>>> f.denominator()
x^2 + x - 1
```

**numerator()**

Return the numerator of the o.g.f of self.

**EXAMPLES:**

sage: f = CFiniteSequence((2-x)/(1-x-x^2)); f
C-finite sequence, generated by (x - 2)/(x^2 + x - 1)
sage: f.numerator()
x^2 + x - 1
Combinatorics, Release 10.4

```python
sage: f = CFiniteSequence((2-x)/(1-x-x^2)); f
C-finite sequence, generated by (x - 2)/(x^2 + x - 1)
sage: f.numerator()
x - 2
```

```python
>>> from sage.all import *
>>> f = CFiniteSequence((Integer(2)-x)/(Integer(1)-x-x^Integer(2))); f
C-finite sequence, generated by (x - 2)/(x^2 + x - 1)
```  

```python
goog
ogf()
Return the ordinary generating function associated with the CFiniteSequence.
This is always a fraction of polynomials in the base ring.

EXAMPLES:
```  
```python
sage: C.<x> = CFiniteSequences(QQ)
sage: r = C.from_recurrence([2],[1])
sage: r.ogf()
-1/2/(x - 1/2)
sage: C(0).ogf()
0
```

```python
>>> from sage.all import *
```  

```python
C = CFiniteSequences(QQ, names=('x',)); (x,) = C._first_ngens(1)
>>> r = C.from_recurrence([Integer(2)],[Integer(1)])
```  

```python
recurrence_repr()
Return a string with the recurrence representation of the C-finite sequence.

OUTPUT:
A string

EXAMPLES:
```  
```python
sage: C.<x> = CFiniteSequences(QQ)
sage: C((2-x)/(1-x-x^2)).recurrence_repr()
'homogeneous linear recurrence with constant coefficients of degree 2: a(n+2)\rightarrow=a(n+1)+a(n), starting a(0...)=\[2, 1\]'
sage: C(x/(1-x)^3).recurrence_repr()
'homogeneous linear recurrence with constant coefficients of degree 3: a(n+3)\rightarrow=3*a(n+2)-3*a(n+1)+a(n), starting a(1...)=\[1, 3, 6\]
sage: C(1).recurrence_repr()
'Finite sequence [1], offset 0'
sage: r = C((-2*x^3 + x^2 - x + 1)/(2*x^2 - 3*x + 1))
sage: r.recurrence_repr()
'homogeneous linear recurrence with constant coefficients of degree 2: a(n+2)\rightarrow=3*a(n+1)-2*a(n), starting a(0...)=[1, 2, 5, 9]'
sage: r = CFiniteSequence(x^3/(1-x-x^2))
sage: r.recurrence_repr()
```

(continues on next page)
Combinatorics, Release 10.4

(continued from previous page)

'homogeneous linear recurrence with constant coefficients of degree 2: \( a(n+2) \rightarrow a(n+1) + a(n) \), starting \( a(3...) = [1, 1, 2, 3] \)'

```
>>> from sage.all import *

>>> C = CFiniteSequences(QQ, names=('x',)); (x,) = C._first_ngens(1)

>>> C((Integer(2)-x)/(Integer(1)-x-x**Integer(2))).recurrence_repr()
'homogeneous linear recurrence with constant coefficients of degree 2: \( a(n+2) \rightarrow a(n+1) + a(n) \), starting \( a(0...) = [2, 1] \)'

>>> C(x/(Integer(1)-x)**Integer(3)).recurrence_repr()
'homogeneous linear recurrence with constant coefficients of degree 3: \( a(n+3) \rightarrow 3a(n+2) - 3a(n+1) + a(n) \), starting \( a(1...) = [1, 3, 6] \)'

>>> C(Integer(1)).recurrence_repr()
'Finite sequence [1], offset 0'

>>> r = C((-Integer(2)*x**Integer(3) + x**Integer(2) - x + Integer(1)) /  
\( \rightarrow (Integer(2)^2 - Integer(3)*x + Integer(1)) \))

>>> r.recurrence_repr()
'homogeneous linear recurrence with constant coefficients of degree 2: \( a(n+2) \rightarrow 3a(n+1) - 2a(n) \), starting \( a(0...) = [1, 2, 5, 9] \)'

>>> r = CFiniteSequence(x**Integer(3)/(Integer(1)-x-x**Integer(2)))

>>> r.recurrence_repr()
'homogeneous linear recurrence with constant coefficients of degree 2: \( a(n+2) \rightarrow a(n+1) + a(n) \), starting \( a(3...) = [1, 1, 2, 3] \)'
```

**series** \((n)\)

Return the Laurent power series associated with the CFiniteSequence, with precision \(n\).

**INPUT:**

- \(n\) – a nonnegative integer

**EXAMPLES:**

```
sage: C.<x> = CFiniteSequences(QQ)
sage: r = C.from_recurrence([-1,2],[0,1])
sage: s = r.series(4); s
x + 2*x^2 + 3*x^3 + 4*x^4 + O(x^5)
sage: type(s)
<class 'sage.rings.laurent_series_ring_element.LaurentSeries'>
```

```
>>> from sage.all import *

>>> C = CFiniteSequences(QQ, names=('x',)); (x,) = C._first_ngens(1)

>>> r = C.from_recurrence([-Integer(1),Integer(2)], [Integer(0), Integer(1)])

>>> s = r.series(Integer(4)); s
x + 2*x^2 + 3*x^3 + 4*x^4 + O(x^5)

>>> type(s)
<class 'sage.rings.laurent_series_ring_element.LaurentSeries'>
```

**sage.rings.cfinite_sequence.CFiniteSequences** \((base\_ring, \ names=None, \ category=None)\)

Return the commutative ring of C-Finite sequences.

The ring is defined over a base ring \((\mathbb{Z} \text{ or } \mathbb{Q})\) and each element is represented by its ordinary generating function (ogf) which is a rational function over the base ring.

**INPUT:**

- \(base\_ring\) – the base ring to construct the fraction field representing the C-Finite sequences
- \(names\) – (optional) the list of variables.

5.1. Comprehensive Module List 6033
EXAMPLES:

```
sage: C.<x> = CFiniteSequences(QQ)
sage: C
The ring of C-Finite sequences in x over Rational Field
sage: C.an_element()
C-finite sequence, generated by (x - 2)/(x^2 + x - 1)
sage: C.category()
Category of commutative rings
sage: C.one()
Finite sequence [1], offset = 0
sage: C.zero()
Constant infinite sequence 0.
sage: C(x)
Finite sequence [1], offset = 1
sage: C(1/x)
Finite sequence [1], offset = -1
sage: C((-x + 2)/(-x^2 - x + 1))
C-finite sequence, generated by (x - 2)/(x^2 + x - 1)
```

```python
>>> from sage.all import *
>>>
C = CFiniteSequences(QQ, names=('x',)); (x,) = C._first_ngens(1)
>>> C
The ring of C-Finite sequences in x over Rational Field
>>> C.an_element()
C-finite sequence, generated by (x - 2)/(x^2 + x - 1)
>>> C.category()
Category of commutative rings
>>> C.one()
>>> C.zero()
>>> C(x)
>>> C(Integer(1)/x)
>>> C((-x + Integer(2))/(x**Integer(2) - x + Integer(1)))
```

```python
class sage.rings.cfinite_sequence.CFiniteSequences_generic(polynomial_ring, category)
    Bases: Parent, UniqueRepresentation

The class representing the ring of C-Finite Sequences

Element
    alias of CFiniteSequence

an_element()
    Return an element of C-Finite Sequences.

OUTPUT:
    The Lucas sequence.

EXAMPLES:

```
sage: C.<x> = CFiniteSequences(QQ)
sage: C.an_element()
C-finite sequence, generated by (x - 2)/(x^2 + x - 1)
```
from sage.all import *

C = CFiniteSequences(QQ, names=('x',)); (x,) = C._first_ngens(1)
C.an_element()

C-finite sequence, generated by \((x - 2)/(x^2 + x - 1)\)

fraction_field()

Return the fraction field used to represent the elements of self.

EXAMPLES:

```
sage: C.<x> = CFiniteSequences(QQ)
sage: C.fraction_field()
Fraction Field of Univariate Polynomial Ring in x over Rational Field
```

```
C = CFiniteSequences(QQ, names=('x',)); (x,) = C._first_ngens(1)
C.fraction_field()
Fraction Field of Univariate Polynomial Ring in x over Rational Field
```

from_recurrence(coefficients, values)

Create a C-finite sequence given the coefficients \(c\) and starting values \(a\) of a homogeneous linear recurrence.

\[
a_{n+d} = c_0a_n + c_1a_{n+1} + \cdots + c_{d-1}a_{n+d-1}, \quad d \geq 0.
\]

INPUT:

- coefficients – a list of rationals
- values – start values, a list of rationals

OUTPUT:

- A CFiniteSequence object

EXAMPLES:

```
sage: C.<x> = CFiniteSequences(QQ)
sage: C.from_recurrence([1,1],[0,1])  # Fibonacci numbers
C-finite sequence, generated by \(-x/(x^2 + x - 1)\)
sage: C.from_recurrence([-1,2],[0,1])  # natural numbers
C-finite sequence, generated by \(x/(x^2 - 2x + 1)\)
sage: r = C.from_recurrence([-1],[1])
sage: s = C.from_recurrence([-1],[1,-1])
sage: r == s
True
sage: r = C(x^3/(1-x-x^2))
sage: s = C.from_recurrence([1,1],[0,0,0,1,1])
sage: r == s
True
sage: C.from_recurrence(1,1)
Traceback (most recent call last):
  ... ValueError: Wrong type for recurrence coefficient list.
```

```
C-finite sequence, generated by \(-x/(x^2 + x - 1)\)

```python
>>> C.from_recurrence([-Integer(1),Integer(2)],[Integer(0),Integer(1)]) # C from recurrence
natural numbers
```

C-finite sequence, generated by \(x/(x^2 - 2x + 1)\)

```python
>>> r = C.from_recurrence([-Integer(1)],[Integer(1)])
>>> s = C.from_recurrence([-Integer(1)],[Integer(1),-Integer(1)])
>>> r == s
True
```

```python
>>> r = C(x**Integer(3)/(Integer(1)-x-x**Integer(2)))
>>> s = C.from_recurrence([Integer(1),Integer(1)],[Integer(0),Integer(0),
Integer(0),Integer(1),Integer(1)])
```

```python
>>> r == s
True
```

```python
>>> C.from_recurrence(Integer(1),Integer(1))
Traceback (most recent call last):
...
ValueError: Wrong type for recurrence coefficient list.
```

---

**gen**

(i=0)

Return the i-th generator of self.

**INPUT:**

- i – an integer (default:0)

**EXAMPLES:**

```python
sage: C.<x> = CFiniteSequences(QQ)
sage: C.gen()
x
sage: x == C.gen()
True
```

```python
>>> from sage.all import *
>>> C = CFiniteSequences(QQ, names=('x',)); (x,) = C._first_ngens(1)
>>> C.gen()
x
>>> x == C.gen()
True
```

**gens**

Return the generators of self.

**EXAMPLES:**

```python
sage: C.<x> = CFiniteSequences(QQ)
sage: C.gens()
(x,)
```

```python
>>> from sage.all import *
>>> C = CFiniteSequences(QQ, names=('x',)); (x,) = C._first_ngens(1)
>>> C.gens()
(x,)
```

**guess**

(sequence, algorithm='sage')

Return the minimal CFiniteSequence that generates the sequence.
Assume the first value has index 0.

INPUT:

- sequence – list of integers
- algorithm – string
  - ‘sage’ – the default is to use Sage’s matrix kernel function
  - ‘pari’ – use Pari’s implementation of LLL
  - ‘bm’ – use Sage’s Berlekamp-Massey algorithm

OUTPUT:

- a CFiniteSequence, or 0 if none could be found

With the default kernel method, trailing zeroes are chopped off before a guessing attempt. This may reduce the data below the accepted length of six values.

EXAMPLES:

```sage
sage: C.<x> = CFiniteSequences(QQ)
sage: C.guess([1,2,4,8,16,32])
C-finite sequence, generated by -1/2/(x - 1/2)
sage: r = C.guess([1,2,3,4,5])
Traceback (most recent call last):
...
ValueError: sequence too short for guessing
```

```python
>>> from sage.all import *

>>> C = CFiniteSequences(QQ, names=('x',)); (x,) = C._first_ngens(1)

>>> C.guess([Integer(1),Integer(2),Integer(4),Integer(8),Integer(16),
→Integer(32)])
C-finite sequence, generated by -1/2/(x - 1/2)
```

With Berlekamp-Massey, if an odd number of values is given, the last one is dropped. So with an odd number of values the result may not generate the last value:

```sage
sage: r = C.guess([1,2,4,8,9], algorithm='bm'); r
C-finite sequence, generated by -1/2/(x - 1/2)
```

```python
>>> r[0:5]
[1, 2, 4, 8, 16]
```

```python
>>> from sage.all import *

>>> r = C.guess([Integer(1),Integer(2),Integer(4),Integer(8),Integer(9)],
→algorithm='bm'); r
C-finite sequence, generated by -1/2/(x - 1/2)
```

```python
>>> r[Integer(0):Integer(5)]
[1, 2, 4, 8, 16]
```

ngens ()

Return the number of generators of self.

EXAMPLES:
```python
sage: from sage.rings.cfinite_sequence import CFiniteSequences
sage: C.<x> = CFiniteSequences(QQ)
sage: C.ngens()
1
```

```python
>>> from sage.all import *
>>> from sage.rings.cfinite_sequence import CFiniteSequences
>>> C = CFiniteSequences(QQ, names=('x',)); (x,) = C._first_ngens(1)
>>> C.ngens()
1
```

**polynomial_ring()**

Return the polynomial ring used to represent the elements of `self`.

**EXAMPLES:**

```python
sage: C.<x> = CFiniteSequences(QQ)
sage: C.polynomial_ring()
Univariate Polynomial Ring in x over Rational Field
```

```python
>>> from sage.all import *
>>> C = CFiniteSequences(QQ, names=('x',)); (x,) = C._first_ngens(1)
>>> C.polynomial_ring()
Univariate Polynomial Ring in x over Rational Field
```
