Given four SDS with parameters $4-\{n; n_1, n_2, n_3, n_4; \lambda\}$ with $n_1 + n_2 + n_3 + n_4 = n + \lambda$ we can construct four (-1,+1) sequences $a_i = (a_{i,0}, ..., a_{i,n-1})$ where $a_{i,j} = -1$ iff $j \in S_i$. These will be the fist rows of four circulant matrices A_1, A_2, A_3, A_4 which, when plugged into the Goethals-Seidel array, create an Hadamard matrix of order $4n$ (see [Djo1994b]).

The supplementary difference sets are taken from *sage.combinat.designs.difference_family.supplementary_difference_set()*.

INPUT:

- `n` – integer; the order of the matrix to be constructed
- `check` – boolean (default: `True`); if `True`, check that the matrix is a Hadamard before returning
- `existence` – boolean (default: `False`); if `True`, only check if the matrix exists

OUTPUT:

If `existence=False`, returns the Hadamard matrix of order n. It raises an error if no data is available to construct the matrix of the given order, or if n is not a multiple of 4. If `existence=True`, returns a boolean representing whether the matrix can be constructed or not.

EXAMPLES:

By default The function returns the Hadamard matrix

```
sage: from sage.combinat.matrices.hadamard_matrix import hadamard_matrix_from_sds
sage: hadamard_matrix_from_sds(148)
148 x 148 dense matrix over Integer Ring...
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.hadamard_matrix import hadamard_matrix_from_sds
>>> hadamard_matrix_from_sds(Integer(148))
148 x 148 dense matrix over Integer Ring...
```

If `existence` is set to True, the function returns a boolean

```
sage: hadamard_matrix_from_sds(764, existence=True)
True
```

```
>>> from sage.all import *
>>> hadamard_matrix_from_sds(Integer(764), existence=True)
True
```

sage.combinat.matrices.hadamard_matrix.**hadamard_matrix_from_symmetric_conference_matrix**(*n*, *existence=False*, *check=True*)

Construct a Hadamard matrix of order n from a symmetric conference matrix of order $n/2$.

The construction is described in Theorem 4.3.24 of [IS2006]. The symmetric conference matrices are obtained from *sage.combinat.matrices.hadamard_matrix.symmetric_conference_matrix()*.

INPUT:

- `n` – integer; the order of the matrix to be constructed
- `existence` – boolean (default: `False`); if `True`, only check if the matrix exists
- `check` – boolean (default: `True`); if `True`, check that the matrix is a Hadamard before returning

OUTPUT:

If `existence=False`, returns the Hadamard matrix of order n. It raises an error if no data is available to construct the matrix of the given order, or if n does not satisfies the constraints. If `existence=True`, returns a boolean representing whether the matrix can be constructed or not.

EXAMPLES:

By default the function returns the Hadamard matrix

```
sage: from sage.combinat.matrices.hadamard_matrix import hadamard_matrix_from_
↪symmetric_conference_matrix
sage: hadamard_matrix_from_symmetric_conference_matrix(20)
20 x 20 dense matrix over Integer Ring...
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.hadamard_matrix import hadamard_matrix_from_
↪symmetric_conference_matrix
>>> hadamard_matrix_from_symmetric_conference_matrix(Integer(20))
20 x 20 dense matrix over Integer Ring...
```

If `existence` is set to True, the function returns True if the matrix exists, False if the conference matrix does not exist, and Unknown if the conference matrix cannot be constructed yet

```
sage: hadamard_matrix_from_symmetric_conference_matrix(12, existence=True)
True
sage: hadamard_matrix_from_symmetric_conference_matrix(4*787, existence=True)
True
```

```
>>> from sage.all import *
>>> hadamard_matrix_from_symmetric_conference_matrix(Integer(12), existence=True)
True
>>> hadamard_matrix_from_symmetric_conference_matrix(Integer(4)*Integer(787),␣
↪existence=True)
True
```

`sage.combinat.matrices.hadamard_matrix.`**`hadamard_matrix_miyamoto_construction`**`(`*n*, *existence=False*, *check=True*`)`

Construct Hadamard matrix using the Miyamoto construction.

If $q = n/4$ is a prime power, and there exists a Hadamard matrix of order $q - 1$, then a Hadamard matrix of order n can be constructed (see [Miy1991]).

INPUT:

- `n` – integer; the order of the matrix to be constructed
- `check` – boolean (default: `True`); if `True`, check that the matrix is a Hadamard before returning
- `existence` – boolean (default: `False`); if `True`, only check if the matrix exists

OUTPUT:

If `existence=False`, returns the Hadamard matrix of order n. It raises an error if no data is available to construct the matrix of the given order, or if n does not satisfies the constraints. If `existence=True`, returns a boolean representing whether the matrix can be constructed or not.

EXAMPLES:

By default the function returns the Hadamard matrix

```
sage: from sage.combinat.matrices.hadamard_matrix import hadamard_matrix_miyamoto_
↪construction
sage: hadamard_matrix_miyamoto_construction(20)
20 x 20 dense matrix over Integer Ring...
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.hadamard_matrix import hadamard_matrix_miyamoto_
↪construction
>>> hadamard_matrix_miyamoto_construction(Integer(20))
20 x 20 dense matrix over Integer Ring...
```

If `existence` is set to True, the function returns a boolean

```
sage: hadamard_matrix_miyamoto_construction(36, existence=True)
True
```

```
>>> from sage.all import *
>>> hadamard_matrix_miyamoto_construction(Integer(36), existence=True)
True
```

`sage.combinat.matrices.hadamard_matrix.`**`hadamard_matrix_paleyI`**(*n*, *normalize=True*)

Implement the Paley type I construction.

The Paley type I case corresponds to the case $p = n - 1 \cong 3 \mod 4$ for a prime power p (see [Hora]).

INPUT:

- `n` – the matrix size
- `normalize` – boolean (default: `True`); whether to normalize the result

EXAMPLES:

We note that this method by default returns a normalised Hadamard matrix

```
sage: from sage.combinat.matrices.hadamard_matrix import hadamard_matrix_paleyI
sage: hadamard_matrix_paleyI(4)
[ 1  1  1  1]
[ 1 -1  1 -1]
[ 1 -1 -1  1]
[ 1  1 -1 -1]
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.hadamard_matrix import hadamard_matrix_paleyI
>>> hadamard_matrix_paleyI(Integer(4))
[ 1  1  1  1]
[ 1 -1  1 -1]
[ 1 -1 -1  1]
[ 1  1 -1 -1]
```

Otherwise, it returns a skew Hadamard matrix H, i.e. $H = S + I$, with $S = -S^\top$

```
sage: M = hadamard_matrix_paleyI(4, normalize=False); M
[ 1  1  1  1]
[-1  1  1 -1]
[-1 -1  1  1]
[-1  1 -1  1]
sage: S = M - identity_matrix(4); -S == S.T
True
```

```
>>> from sage.all import *
>>> M = hadamard_matrix_paleyI(Integer(4), normalize=False); M
[ 1  1  1  1]
[-1  1  1 -1]
[-1 -1  1  1]
[-1  1 -1  1]
>>> S = M - identity_matrix(Integer(4)); -S == S.T
True
```

sage.combinat.matrices.hadamard_matrix.**hadamard_matrix_paleyII**(*n*)

Implement the Paley type II construction.

The Paley type II case corresponds to the case $p = n/2 - 1 \cong 1 \mod 4$ for a prime power p (see [Hora]).

EXAMPLES:

```
sage: sage.combinat.matrices.hadamard_matrix.hadamard_matrix_paleyII(12).det()
2985984
sage: 12^6
2985984
```

```
>>> from sage.all import *
>>> sage.combinat.matrices.hadamard_matrix.hadamard_matrix_paleyII(Integer(12)).
↪det()
2985984
>>> Integer(12)**Integer(6)
2985984
```

We note that the method returns a normalised Hadamard matrix

```
sage: sage.combinat.matrices.hadamard_matrix.hadamard_matrix_paleyII(12)
[ 1  1| 1  1| 1  1| 1  1| 1  1| 1  1]
[ 1 -1|-1  1|-1  1|-1  1|-1  1|-1  1]
[-----+-----+-----+-----+-----+-----]
[ 1 -1| 1 -1| 1  1|-1 -1|-1 -1| 1  1]
```

(continues on next page)

(continued from previous page)

```
[ 1  1|-1 -1| 1 -1|-1  1|-1  1| 1 -1]
[-----+-----+-----+-----+-----+-----]
[ 1 -1| 1  1| 1 -1| 1  1|-1 -1|-1 -1]
[ 1  1| 1 -1|-1 -1| 1 -1|-1  1|-1  1]
[-----+-----+-----+-----+-----+-----]
[ 1 -1|-1 -1| 1  1| 1 -1| 1  1|-1 -1]
[ 1  1|-1  1| 1 -1|-1 -1| 1 -1|-1  1]

[-----+-----+-----+-----+-----+-----]
[ 1 -1| 1  1|-1 -1|-1 -1| 1  1| 1 -1]
[ 1  1| 1 -1|-1  1|-1  1| 1 -1|-1 -1]
```

`sage.combinat.matrices.hadamard_matrix.`**`hadamard_matrix_spence_construction`**`(`*n*, *existence=False*, *check=True*`)`

Create a Hadamard matrix of order n using the Spence construction.

This construction (detailed in [Spe1975]), uses supplementary difference sets implemented in *`sage.combinat.designs.difference_family.supplementary_difference_set_from_rel_diff_set()`* to create the desired matrix.

INPUT:

- `n` – integer; the order of the matrix to be constructed
- `existence` – boolean (default: `False`); if `True`, only check if the matrix exists
- `check` – boolean (default: `True`); if `True`, check that the matrix is a Hadamard matrix before returning

OUTPUT:

If `existence=True`, returns a boolean representing whether the Hadamard matrix can be constructed. Otherwise, returns the Hadamard matrix, or raises an error if it cannot be constructed.

EXAMPLES:

```
sage: from sage.combinat.matrices.hadamard_matrix import hadamard_matrix_spence_
↪construction
sage: hadamard_matrix_spence_construction(36)
36 x 36 dense matrix over Integer Ring...
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.hadamard_matrix import hadamard_matrix_spence_
↪construction
>>> hadamard_matrix_spence_construction(Integer(36))
36 x 36 dense matrix over Integer Ring...
```

If `existence` is `True`, the function returns a boolean

```
sage: hadamard_matrix_spence_construction(52, existence=True)
True
```

```
>>> from sage.all import *
>>> hadamard_matrix_spence_construction(Integer(52), existence=True)
True
```

`sage.combinat.matrices.hadamard_matrix.`**`hadamard_matrix_turyn_type`**(*a*, *b*, *c*, *d*, *e1*, *e2*, *e3*, *e4*, *check=True*)

Construction of Turyn type Hadamard matrix.

Given $n \times n$ circulant matrices A, B, C, D with 1,-1 entries, satisfying $AA^\top + BB^\top + CC^\top + DD^\top = 4nI$, and a set of Baumert-Hall units of order $4t$, one can construct a Hadamard matrix of order $4tn$ as detailed by Turyn in [Tur1974].

INPUT:

- `a` – 1,-1 list; the 1st row of A
- `b` – 1,-1 list; the 1st row of B
- `d` – 1,-1 list; the 1st row of C
- `c` – 1,-1 list; the 1st row of D
- `e1` – matrix; the first Baumert-Hall unit
- `e2` – matrix; the second Baumert-Hall unit
- `e3` – matrix; the third Baumert-Hall unit
- `e4` – matrix; the fourth Baumert-Hall unit
- `check` – boolean (default: `True`); whether to check that the output is a Hadamard matrix before returning it

EXAMPLES:

```
sage: from sage.combinat.matrices.hadamard_matrix import hadamard_matrix_turyn_
↪type, _get_baumert_hall_units
sage: A, B, C, D = _get_baumert_hall_units(28)
sage: hadamard_matrix_turyn_type([1], [1], [1], [1], A, B, C, D)
28 x 28 dense matrix over Integer Ring...
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.hadamard_matrix import hadamard_matrix_turyn_type,
↪ _get_baumert_hall_units
>>> A, B, C, D = _get_baumert_hall_units(Integer(28))
>>> hadamard_matrix_turyn_type([Integer(1)], [Integer(1)], [Integer(1)],
↪[Integer(1)], A, B, C, D)
28 x 28 dense matrix over Integer Ring...
```

sage.combinat.matrices.hadamard_matrix.**hadamard_matrix_williamson_type**(*a*, *b*, *c*, *d*, *check=True*)

Construction of Williamson type Hadamard matrix.

Given $n \times n$ circulant matrices A, B, C, D with 1,-1 entries, and satisfying $AA^\top + BB^\top + CC^\top + DD^\top = 4nI$, one can construct a Hadamard matrix of order $4n$, cf. [Ha83].

INPUT:

- a – (1,-1) list; the 1st row of A
- b – (1,-1) list; the 1st row of B
- d – (1,-1) list; the 1st row of C
- c – (1,-1) list; the 1st row of D
- check – boolean (default: True); whether to check that the output is a Hadamard matrix before returning it

EXAMPLES:

```
sage: from sage.combinat.matrices.hadamard_matrix import hadamard_matrix_
↪williamson_type
sage: a = [ 1,  1, 1]
sage: b = [ 1, -1, -1]
sage: c = [ 1, -1, -1]
sage: d = [ 1, -1, -1]
sage: M = hadamard_matrix_williamson_type(a,b,c,d,check=True)
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.hadamard_matrix import hadamard_matrix_williamson_
↪type
>>> a = [ Integer(1),  Integer(1), Integer(1)]
>>> b = [ Integer(1), -Integer(1), -Integer(1)]
>>> c = [ Integer(1), -Integer(1), -Integer(1)]
>>> d = [ Integer(1), -Integer(1), -Integer(1)]
>>> M = hadamard_matrix_williamson_type(a,b,c,d,check=True)
```

sage.combinat.matrices.hadamard_matrix.**hadamard_matrix_www**(*url_file*, *comments=False*)

Pull file from Sloane's database and return the corresponding Hadamard matrix as a Sage matrix.

You must input a filename of the form "had.n.xxx.txt" as described on the webpage http://neilsloane.com/hadamard/, where "xxx" could be empty or a number of some characters.

If comments=True then the "Automorphism…" line of the had.n.xxx.txt file is printed if it exists. Otherwise nothing is done.

EXAMPLES:

```
sage: hadamard_matrix_www("had.4.txt")      # optional - internet
[ 1  1  1  1]
[ 1 -1  1 -1]
[ 1  1 -1 -1]
[ 1 -1 -1  1]
sage: hadamard_matrix_www("had.16.2.txt",comments=True)   # optional - internet
Automorphism group has order = 49152 = 2^14 * 3
[ 1  1  1  1  1  1  1  1  1  1  1  1  1  1  1  1]
[ 1 -1  1 -1  1 -1  1 -1  1 -1  1 -1  1 -1  1 -1]
[ 1  1 -1 -1  1  1 -1 -1  1  1 -1 -1  1  1 -1 -1]
[ 1 -1 -1  1  1 -1 -1  1  1 -1 -1  1  1 -1 -1  1]
[ 1  1  1  1 -1 -1 -1 -1  1  1  1  1 -1 -1 -1 -1]
[ 1 -1  1 -1 -1  1 -1  1  1 -1  1 -1 -1  1 -1  1]
[ 1  1 -1 -1 -1 -1  1  1  1  1 -1 -1 -1 -1  1  1]
[ 1 -1 -1  1 -1  1  1 -1  1 -1 -1  1 -1  1  1 -1]
[ 1  1  1  1  1  1  1  1 -1 -1 -1 -1 -1 -1 -1 -1]
[ 1  1  1  1 -1 -1 -1 -1 -1 -1 -1 -1  1  1  1  1]
[ 1  1 -1 -1  1 -1  1 -1 -1 -1  1  1 -1  1 -1  1]
[ 1  1 -1 -1 -1  1 -1  1 -1 -1  1  1  1 -1  1 -1]
[ 1 -1  1 -1  1 -1 -1  1 -1  1 -1  1 -1  1  1 -1]
[ 1 -1  1 -1 -1  1  1 -1 -1  1 -1  1  1 -1 -1  1]
[ 1 -1 -1  1  1  1 -1 -1 -1  1  1 -1 -1 -1  1  1]
[ 1 -1 -1  1 -1 -1  1  1 -1  1  1 -1  1  1 -1 -1]
```

```
>>> from sage.all import *
>>> hadamard_matrix_www("had.4.txt")      # optional - internet
[ 1  1  1  1]
[ 1 -1  1 -1]
[ 1  1 -1 -1]
[ 1 -1 -1  1]
>>> hadamard_matrix_www("had.16.2.txt",comments=True)   # optional - internet
Automorphism group has order = 49152 = 2^14 * 3
[ 1  1  1  1  1  1  1  1  1  1  1  1  1  1  1  1]

[ 1 -1  1 -1 -1  1  1 -1 -1  1 -1  1  1 -1 -1  1]
[ 1 -1 -1  1  1  1 -1 -1 -1  1  1 -1 -1 -1  1  1]
[ 1 -1 -1  1 -1 -1  1  1 -1  1  1 -1  1  1 -1 -1]
```

sage.combinat.matrices.hadamard_matrix.**is_hadamard_matrix**(*M*, *normalized=False*, *skew=False*, *verbose=False*)

Test if `M` is a Hadamard matrix.

INPUT:

- `M` – a matrix
- `normalized` – boolean (default: `False`); whether to test if `M` is a normalized Hadamard matrix, i.e. has its first row/column filled with +1
- `skew` – boolean (default: `False`); whether to test if `M` is a skew Hadamard matrix, i.e. $M = S + I$ for $-S = S^\top$, and I the identity matrix
- `verbose` – boolean (default: `False`); whether to be verbose when the matrix is not Hadamard

EXAMPLES:

```
sage: from sage.combinat.matrices.hadamard_matrix import is_hadamard_matrix
sage: h = matrix.hadamard(12)
sage: is_hadamard_matrix(h)
True
sage: from sage.combinat.matrices.hadamard_matrix import skew_hadamard_matrix
sage: h = skew_hadamard_matrix(12)
sage: is_hadamard_matrix(h, skew=True)
True
sage: h = matrix.hadamard(12)
sage: h[0,0] = 2
sage: is_hadamard_matrix(h,verbose=True)
The matrix does not only contain +1 and -1 entries, e.g. 2
False
sage: h = matrix.hadamard(12)
sage: for i in range(12):
....:     h[i,2] = -h[i,2]
sage: is_hadamard_matrix(h,verbose=True,normalized=True)
The matrix is not normalized
False
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.hadamard_matrix import is_hadamard_matrix
>>> h = matrix.hadamard(Integer(12))
>>> is_hadamard_matrix(h)
True
>>> from sage.combinat.matrices.hadamard_matrix import skew_hadamard_matrix
>>> h = skew_hadamard_matrix(Integer(12))
>>> is_hadamard_matrix(h, skew=True)
True
>>> h = matrix.hadamard(Integer(12))
>>> h[Integer(0),Integer(0)] = Integer(2)
>>> is_hadamard_matrix(h,verbose=True)
The matrix does not only contain +1 and -1 entries, e.g. 2
False
>>> h = matrix.hadamard(Integer(12))
>>> for i in range(Integer(12)):
...     h[i,Integer(2)] = -h[i,Integer(2)]
>>> is_hadamard_matrix(h,verbose=True,normalized=True)
The matrix is not normalized
False
```

`sage.combinat.matrices.hadamard_matrix.`**`is_skew_hadamard_matrix`**(*M*, *normalized=False*, *verbose=False*)

Test if M is a skew Hadamard matrix.

this is a wrapper around the function *is_hadamard_matrix()*

INPUT:

- M – a matrix
- normalized – boolean (default: False); whether to test if M is a skew-normalized Hadamard matrix, i.e. has its first row filled with +1
- verbose – boolean (default: False); whether to be verbose when the matrix is not skew Hadamard

EXAMPLES:

```
sage: from sage.combinat.matrices.hadamard_matrix import is_skew_hadamard_matrix,␣
↪skew_hadamard_matrix
sage: h = matrix.hadamard(12)
sage: is_skew_hadamard_matrix(h, verbose=True)
The matrix is not skew
False
sage: h = skew_hadamard_matrix(12)
sage: is_skew_hadamard_matrix(h)
True
sage: from sage.combinat.matrices.hadamard_matrix import normalise_hadamard
sage: h = normalise_hadamard(skew_hadamard_matrix(12), skew=True)
sage: is_skew_hadamard_matrix(h, verbose=True, normalized=True)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.hadamard_matrix import is_skew_hadamard_matrix,␣
↪skew_hadamard_matrix
>>> h = matrix.hadamard(Integer(12))
>>> is_skew_hadamard_matrix(h, verbose=True)
The matrix is not skew
False
>>> h = skew_hadamard_matrix(Integer(12))
>>> is_skew_hadamard_matrix(h)
True
>>> from sage.combinat.matrices.hadamard_matrix import normalise_hadamard
>>> h = normalise_hadamard(skew_hadamard_matrix(Integer(12)), skew=True)
>>> is_skew_hadamard_matrix(h, verbose=True, normalized=True)
True
```

sage.combinat.matrices.hadamard_matrix.**normalise_hadamard**(*H*, *skew=False*)

Return the normalised Hadamard matrix corresponding to H.

The normalised Hadamard matrix corresponding to a Hadamard matrix H is a matrix whose every entry in the first row and column is +1.

If skew is True, the matrix returned will be skew-normal: a skew Hadamard matrix with first row of all $+1$.

EXAMPLES:

```
sage: from sage.combinat.matrices.hadamard_matrix import normalise_hadamard, is_
↪hadamard_matrix, skew_hadamard_matrix
sage: H = normalise_hadamard(hadamard_matrix(4))
```

(continues on next page)

(continued from previous page)

```
sage: H == hadamard_matrix(4)
True
sage: H = normalise_hadamard(skew_hadamard_matrix(20, skew_normalize=False),␣
↪skew=True)
sage: is_hadamard_matrix(H, skew=True, normalized=True)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.hadamard_matrix import normalise_hadamard, is_
↪hadamard_matrix, skew_hadamard_matrix
>>> H = normalise_hadamard(hadamard_matrix(Integer(4)))
>>> H == hadamard_matrix(Integer(4))
True
>>> H = normalise_hadamard(skew_hadamard_matrix(Integer(20), skew_
↪normalize=False), skew=True)
>>> is_hadamard_matrix(H, skew=True, normalized=True)
True
```

If `skew` is `True` but the Hadamard matrix is not skew, the matrix returned will not be normalized:

```
sage: H = normalise_hadamard(hadamard_matrix(92), skew=True)
sage: is_hadamard_matrix(H, normalized=True)
False
```

```
>>> from sage.all import *
>>> H = normalise_hadamard(hadamard_matrix(Integer(92)), skew=True)
>>> is_hadamard_matrix(H, normalized=True)
False
```

sage.combinat.matrices.hadamard_matrix.**regular_symmetric_hadamard_matrix_with_constant_diagonal**(*n*, *e*, *existence=*

Return a Regular Symmetric Hadamard Matrix with Constant Diagonal.

A Hadamard matrix is said to be *regular* if its rows all sum to the same value.

For $\epsilon \in \{-1,+1\}$, we say that M is a $(n,\epsilon)-RSHCD$ if M is a regular symmetric Hadamard matrix with constant diagonal $\delta \in \{-1,+1\}$ and row sums all equal to $\delta\epsilon\sqrt(n)$. For more information, see [HX2010] or 10.5.1 in [BH2012]. For the case $n = 324$, see `RSHCD_324()` and [CP2016].

INPUT:

- `n` – integer; side of the matrix
- `e` – -1 or $+1$; the value of ϵ

EXAMPLES:

```
sage: from sage.combinat.matrices.hadamard_matrix import regular_symmetric_
↪hadamard_matrix_with_constant_diagonal
sage: regular_symmetric_hadamard_matrix_with_constant_diagonal(4,1)
[ 1  1  1 -1]
```

(continues on next page)

(continued from previous page)

```
[ 1  1 -1  1]
[ 1 -1  1  1]
[-1  1  1  1]
sage: regular_symmetric_hadamard_matrix_with_constant_diagonal(4,-1)
[ 1 -1 -1 -1]
[-1  1 -1 -1]
[-1 -1  1 -1]
[-1 -1 -1  1]
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.hadamard_matrix import regular_symmetric_hadamard_
↪matrix_with_constant_diagonal
>>> regular_symmetric_hadamard_matrix_with_constant_diagonal(Integer(4),
↪Integer(1))
[ 1  1  1 -1]
[ 1  1 -1  1]
[ 1 -1  1  1]
[-1  1  1  1]
>>> regular_symmetric_hadamard_matrix_with_constant_diagonal(Integer(4),-
↪Integer(1))
[ 1 -1 -1 -1]
[-1  1 -1 -1]
[-1 -1  1 -1]
[-1 -1 -1  1]
```

Other hardcoded values:

```
sage: for n,e in [(36,1),(36,-1),(100,1),(100,-1),(196, 1)]:  # long time
....:     print(repr(regular_symmetric_hadamard_matrix_with_constant_diagonal(n,
↪e)))
36 x 36 dense matrix over Integer Ring
36 x 36 dense matrix over Integer Ring
100 x 100 dense matrix over Integer Ring
100 x 100 dense matrix over Integer Ring
196 x 196 dense matrix over Integer Ring

sage: for n,e in [(324,1),(324,-1)]: # not tested - long time, tested in RSHCD_324
....:     print(repr(regular_symmetric_hadamard_matrix_with_constant_diagonal(n,
↪e)))
324 x 324 dense matrix over Integer Ring
324 x 324 dense matrix over Integer Ring
```

```
>>> from sage.all import *
>>> for n,e in [(Integer(36),Integer(1)),(Integer(36),-Integer(1)),(Integer(100),
↪Integer(1)),(Integer(100),-Integer(1)),(Integer(196), Integer(1))]:  # long time
...     print(repr(regular_symmetric_hadamard_matrix_with_constant_diagonal(n,e)))
36 x 36 dense matrix over Integer Ring
36 x 36 dense matrix over Integer Ring
100 x 100 dense matrix over Integer Ring
100 x 100 dense matrix over Integer Ring
196 x 196 dense matrix over Integer Ring
```

(continues on next page)

(continued from previous page)

```
>>> for n,e in [(Integer(324),Integer(1)),(Integer(324),-Integer(1))]: # not␣
↪tested - long time, tested in RSHCD_324
...     print(repr(regular_symmetric_hadamard_matrix_with_constant_diagonal(n,e)))
324 x 324 dense matrix over Integer Ring
324 x 324 dense matrix over Integer Ring
```

From two close prime powers:

```
sage: regular_symmetric_hadamard_matrix_with_constant_diagonal(64,-1)
64 x 64 dense matrix over Integer Ring (use the '.str()' method to see the␣
↪entries)
```

```
>>> from sage.all import *
>>> regular_symmetric_hadamard_matrix_with_constant_diagonal(Integer(64),-
↪Integer(1))
64 x 64 dense matrix over Integer Ring (use the '.str()' method to see the␣
↪entries)
```

From a prime power and a conference matrix:

```
sage: regular_symmetric_hadamard_matrix_with_constant_diagonal(676,1)  # long time
676 x 676 dense matrix over Integer Ring (use the '.str()' method to see the␣
↪entries)
```

```
>>> from sage.all import *
>>> regular_symmetric_hadamard_matrix_with_constant_diagonal(Integer(676),
↪Integer(1))  # long time
676 x 676 dense matrix over Integer Ring (use the '.str()' method to see the␣
↪entries)
```

Recursive construction:

```
sage: regular_symmetric_hadamard_matrix_with_constant_diagonal(144,-1)
144 x 144 dense matrix over Integer Ring (use the '.str()' method to see the␣
↪entries)
```

```
>>> from sage.all import *
>>> regular_symmetric_hadamard_matrix_with_constant_diagonal(Integer(144),-
↪Integer(1))
144 x 144 dense matrix over Integer Ring (use the '.str()' method to see the␣
↪entries)
```

REFERENCE:

- [BH2012]
- [HX2010]

sage.combinat.matrices.hadamard_matrix.**rshcd_from_close_prime_powers**(*n*)

Return a $(n^2, 1)$-RSHCD when $n-1$ and $n+1$ are odd prime powers and $n = 0 \pmod 4$.

The construction implemented here appears in Theorem 4.3 from [GS1970].

Note that the authors of [SWW1972] claim in Corollary 5.12 (page 342) to have proved the same result without the $n = 0 \pmod 4$ restriction with a *very* similar construction. So far, however, I (Nathann Cohen) have not been able to make it work.

INPUT:

- `n` – integer congruent to $0 \pmod 4$

```

REFERENCE:

- [SWW1972]

sage.combinat.matrices.hadamard_matrix.**rshcd_from_prime_power_and_conference_matrix**(*n*)

Return a $((n-1)^2, 1)$-RSHCD if n is prime power, and symmetric $(n-1)$-conference matrix exists.

The construction implemented here is Theorem 16 (and Corollary 17) from [WW1972].

In [SWW1972] this construction (Theorem 5.15 and Corollary 5.16) is reproduced with a typo. Note that [WW1972] refers to [Sz1969] for the construction, provided by *szekeres_difference_set_pair()*, of complementary difference sets, and the latter has a typo.

From a *symmetric_conference_matrix()*, we only need the Seidel adjacency matrix of the underlying strongly regular conference (i.e. Paley type) graph, which we construct directly.

INPUT:

- n – integer

See also

regular_symmetric_hadamard_matrix_with_constant_diagonal()

EXAMPLES:

A 36x36 example

```
sage: from sage.combinat.matrices.hadamard_matrix import rshcd_from_prime_power_
↪and_conference_matrix
sage: from sage.combinat.matrices.hadamard_matrix import is_hadamard_matrix
sage: H = rshcd_from_prime_power_and_conference_matrix(7); H
36 x 36 dense matrix over Integer Ring (use the '.str()' method to see the␣
↪entries)
sage: H == H.T and is_hadamard_matrix(H) and H.diagonal() == [1]*36 and␣
↪list(sum(H)) == [6]*36
True
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.hadamard_matrix import rshcd_from_prime_power_and_
↪conference_matrix
>>> from sage.combinat.matrices.hadamard_matrix import is_hadamard_matrix
>>> H = rshcd_from_prime_power_and_conference_matrix(Integer(7)); H
36 x 36 dense matrix over Integer Ring (use the '.str()' method to see the␣
↪entries)
>>> H == H.T and is_hadamard_matrix(H) and H.diagonal() ==␣
↪[Integer(1)]*Integer(36) and list(sum(H)) == [Integer(6)]*Integer(36)
True
```

Bigger examples, only provided by this construction

```
sage: H = rshcd_from_prime_power_and_conference_matrix(27)  # long time
sage: H == H.T and is_hadamard_matrix(H)                    # long time
True
sage: H.diagonal() == [1]*676 and list(sum(H)) == [26]*676  # long time
True
```

```
>>> from sage.all import *
>>> H = rshcd_from_prime_power_and_conference_matrix(Integer(27))   # long time
>>> H == H.T and is_hadamard_matrix(H)                     # long time
True
>>> H.diagonal() == [Integer(1)]*Integer(676) and list(sum(H)) ==␣
↪[Integer(26)]*Integer(676)   # long time
True
```

In this example the conference matrix is not Paley, as 45 is not a prime power

```
sage: H = rshcd_from_prime_power_and_conference_matrix(47)  # not tested (long␣
↪time)
```

```
>>> from sage.all import *
>>> H = rshcd_from_prime_power_and_conference_matrix(Integer(47))   # not tested␣
↪(long time)
```

REFERENCE:

- [WW1972]

sage.combinat.matrices.hadamard_matrix.**skew_hadamard_matrix**(*n*, *existence=False*, *skew_normalize=True*, *check=True*, *construction_name=False*)

Try to construct a skew Hadamard matrix.

A Hadamard matrix H is called skew if $H = S - I$, for I the identity matrix and $-S = S^\top$. Currently all orders ≤ 1200 for which a construction is known are implemented. For $n > 1200$, only some orders are available.

INPUT:

- `n` – integer; dimension of the matrix
- `existence` – boolean (default: `False`); whether to build the matrix or merely query if a construction is available in Sage. When set to `True`, the function returns:
  - `True` – meaning that Sage knows how to build the matrix
  - `Unknown` – meaning that Sage does not know how to build the matrix, but that the design may exist (see `sage.misc.unknown`).
  - `False` – meaning that the matrix does not exist
- `skew_normalize` – boolean (default: `True`); whether to make the 1st row all-one, and adjust the 1st column accordingly
- `check` – boolean (default: `True`); whether to check that output is correct before returning it. As this is expected to be useless, you may want to disable it whenever you want speed.
- `construction_name` – boolean (default: `False`); if it is `True`, `existence` is `True`, and a matrix exists, output the construction name. It has no effect if `existence` is set to `False`.

EXAMPLES:

```
sage: from sage.combinat.matrices.hadamard_matrix import skew_hadamard_matrix
sage: skew_hadamard_matrix(12).det()
2985984
sage: 12^6
2985984
```

- [Ha83]

sage.combinat.matrices.hadamard_matrix.**skew_hadamard_matrix_from_complementary_difference_sets**(*n*, *existence=False*, *check=True*)

Construct a skew Hadamard matrix of order $n = 4(m + 1)$ from complementary difference sets.

If A, B are complementary difference sets over a group of order $2m + 1$, then they can be used to construct a skew Hadamard matrix, as described in [BS1969].

The complementary difference sets are constructed using the function *sage.combinat.designs.difference_family.complementary_difference_sets()*.

INPUT:

- `n` – positive integer; the order of the matrix to be constructed
- `existence` – boolean (default: `False`); if `True`, only return whether the skew Hadamard matrix can be constructed
- `check` – boolean (default: `True`); if `True`, check that the result is a skew Hadamard matrix before returning it

OUTPUT:

If `existence=False`, returns the skew Hadamard matrix of order n. It raises an error if n does not satisfy the required conditions. If `existence=True`, returns a boolean representing whether the matrix can be constructed or not.

EXAMPLES:

```
sage: from sage.combinat.matrices.hadamard_matrix import skew_hadamard_matrix_
↪from_complementary_difference_sets
sage: skew_hadamard_matrix_from_complementary_difference_sets(20)
20 x 20 dense matrix over Integer Ring...
sage: skew_hadamard_matrix_from_complementary_difference_sets(52, existence=True)
True
```

```

20 x 20 dense matrix over Integer Ring...
>>> skew_hadamard_matrix_from_complementary_difference_sets(Integer(52),␣
↪existence=True)
True
```

sage.combinat.matrices.hadamard_matrix.**skew_hadamard_matrix_from_good_matrices**(*a*, *b*, *c*, *d*, *check=True*)

Construct skew Hadamard matrix from good matrices.

Given good matrices A, B, C, D (A circulant, B, C, D back-circulant) they can be used to construct a skew Hadamard matrix using the following block matrix (as described in [Sze1988]):

$$\begin{pmatrix} A & B & C & D \\ -B & A & D & -C \\ -C & -D & A & B \\ -D & C & -B & A \end{pmatrix}$$

INPUT:

- a – (1,-1) list; the 1st row of A
- b – (1,-1) list; the 1st row of B
- d – (1,-1) list; the 1st row of C
- c – (1,-1) list; the 1st row of D
- check – boolean (default: True); if True, check that the matrix is a skew Hadamard matrix before returning it

EXAMPLES:

```
sage: from sage.combinat.matrices.hadamard_matrix import skew_hadamard_matrix_
↪from_good_matrices
sage: a, b, c, d = ([1, 1, 1, -1, -1], [1, -1, 1, 1, -1], [1, -1, -1, -1, -1], [1,
↪ -1, -1, -1, -1])
sage: skew_hadamard_matrix_from_good_matrices(a, b, c, d)
20 x 20 dense matrix over Integer Ring...
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.hadamard_matrix import skew_hadamard_matrix_from_
↪good_matrices
>>> a, b, c, d = ([Integer(1), Integer(1), Integer(1), -Integer(1), -Integer(1)],␣
↪[Integer(1), -Integer(1), Integer(1), Integer(1), -Integer(1)], [Integer(1), -
↪Integer(1), -Integer(1), -Integer(1), -Integer(1)], [Integer(1), -Integer(1), -
```

(continues on next page)

(continued from previous page)

```
↪Integer(1), -Integer(1), -Integer(1)])
>>> skew_hadamard_matrix_from_good_matrices(a, b, c, d)
20 x 20 dense matrix over Integer Ring...
```

sage.combinat.matrices.hadamard_matrix.**skew_hadamard_matrix_from_good_matrices_smallcases**(*n*, *existence=False*, *check=True*)

Construct skew Hadamard matrices from good matrices for some small values of $n = 4m$, with m odd.

The function stores good matrices of odd orders ≤ 31, taken from [Sze1988]. These are used to create skew Hadamard matrices of order $4m$, $1 \leq m \leq 31$ (m odd), using the function *skew_hadamard_matrix_from_good_matrices()*.

ALGORITHM:

Given four sequences (stored in `E_sequences`) of length m, they can be used to construct four $E-sequences$ of length $n = 2m + 1$, as follows:

$$\begin{aligned}
a &= 1, a_0, a_1, ..., a_m, -a_m, -a_{m-1}, ..., -a_0 \\
b &= 1, b_0, b_1, ..., b_m, b_m, b_{m-1}, ..., b_0 \\
c &= 1, c_0, c_1, ..., c_m, c_m, c_{m-1}, ..., c_0 \\
d &= 1, d_0, d_1, ..., d_m, d_m, d_{m-1}, ..., d_0
\end{aligned}$$

These E-sequences will be the first rows of the four good matrices needed to construct a skew Hadamard matrix of order $4n$.

INPUT:

- `n` – integer; the order of the skew Hadamard matrix to be constructed
- `existence` – boolean (default: `False`); if `True`, only return whether the Hadamard matrix can be constructed
- `check` – boolean (default: `True`); if `True`, check that the matrix is a Hadamard matrix before returning it

OUTPUT:

If `existence=False`, returns the skew Hadamard matrix of order n. It raises an error if no data is available to construct the matrix of the given order. If `existence=True`, returns a boolean representing whether the matrix can be constructed or not.

EXAMPLES:

```
sage: from sage.combinat.matrices.hadamard_matrix import skew_hadamard_matrix_
↪from_good_matrices_smallcases
sage: skew_hadamard_matrix_from_good_matrices_smallcases(20)
20 x 20 dense matrix over Integer Ring...
sage: skew_hadamard_matrix_from_good_matrices_smallcases(20, existence=True)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.hadamard_matrix import skew_hadamard_matrix_from_
↪good_matrices_smallcases
>>> skew_hadamard_matrix_from_good_matrices_smallcases(Integer(20))
```

(continues on next page)

(continued from previous page)

```

↪existence=True)
True
```

sage.combinat.matrices.hadamard_matrix.**skew_hadamard_matrix_from_orthogonal_design**(*n*, *existence=False*, *check=True*)

Construct skew Hadamard matrices of order $mn(n-1)$ if suitable orthogonal designs exist.

In [Seb1978] is proved that if amicable Hadamard matrices of order n and an orthogonal design of type $(1, m, mn-m-1)$ in order mn exist, then a skew Hadamard matrix of order $mn(n-1)$ can be constructed. The paper uses amicable orthogonal designs instead of amicable Hadamard matrices, but the two are equivalent (see [Seb2017]).

Amicable Hadamard matrices are constructed using `amicable_hadamard_matrices()`, and the orthogonal designs are constructed using the Goethals-Seidel array, with data taken from [Seb2017].

INPUT:

- `n` – positive integer; the order of the matrix to be constructed
- `existence` – boolean (default: `False`); if `True`, only return whether the skew Hadamard matrix can be constructed
- `check` – boolean (default: `True`); if `True`, check that the result is a skew Hadamard matrix before returning it

OUTPUT:

If `existence=False`, returns the skew Hadamard matrix of order n. It raises an error if a construction for order n is not yet implemented, or if n does not satisfy the constraint. If `existence=True`, returns a boolean representing whether the matrix can be constructed or not.

EXAMPLES:

```
sage: from sage.combinat.matrices.hadamard_matrix import skew_hadamard_matrix_
↪from_orthogonal_design
sage: skew_hadamard_matrix_from_orthogonal_design(756)
756 x 756 dense matrix over Integer Ring...
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.hadamard_matrix import skew_hadamard_matrix_from_
↪orthogonal_design
>>> skew_hadamard_matrix_from_orthogonal_design(Integer(756))
756 x 756 dense matrix over Integer Ring...
```

If `existence` is True, the function returns a boolean:

```
sage: skew_hadamard_matrix_from_orthogonal_design(200, existence=True)
False
```

```
>>> from sage.all import *
>>> skew_hadamard_matrix_from_orthogonal_design(Integer(200), existence=True)
False
```

sage.combinat.matrices.hadamard_matrix.**skew_hadamard_matrix_spence_1975**(*n*, *existence=False*, *check=True*)

Construct a skew Hadamard matrix of order $n = 4(1 + q + q^2)$ using the Spence construction.

If $n = 4(1 + q + q^2)$ where q is a prime power such that either $1 + q + q^2$ is a prime congruent to $3, 5, 7$ mod 8 or $3 + 2q + 2q^2$ is a prime power, then a skew Hadamard matrix of order n can be constructed using the Goethals Seidel array. The four matrices A, B, C, D plugged into the GS-array are created using complementary difference sets of order $1 + q + q^2$ (which exist if q satisfies the conditions above), and a cyclic planar difference set with parameters $(1 + q^2 + q^4, 1 + q^2, 1)$. These are constructed by the functions `sage.combinat.designs.difference_family.complementary_difference_sets()` and `sage.combinat.designs.difference_family.difference_family()`.

For more details, see [Spe1975b].

INPUT:

- `n` – positive integer; the order of the matrix to be constructed
- `existence` – boolean (default: `False`); if `True`, only return whether the Hadamard matrix can be constructed
- `check` – boolean (default: `True`); check that the result is a skew Hadamard matrix before returning it

OUTPUT:

If `existence=False`, returns the skew Hadamard matrix of order n. It raises an error if n does not satisfy the required conditions. If `existence=True`, returns a boolean representing whether the matrix can be constructed or not.

EXAMPLES:

```
sage: from sage.combinat.matrices.hadamard_matrix import skew_hadamard_matrix_
↪spence_1975
sage: skew_hadamard_matrix_spence_1975(52)
52 x 52 dense matrix over Integer Ring...
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.hadamard_matrix import skew_hadamard_matrix_
↪spence_1975
>>> skew_hadamard_matrix_spence_1975(Integer(52))
52 x 52 dense matrix over Integer Ring...
```

If `existence` is True, the function returns a boolean:

```
sage: skew_hadamard_matrix_spence_1975(52, existence=True)
True
```

```
>>> from sage.all import *
>>> skew_hadamard_matrix_spence_1975(Integer(52), existence=True)
True
```

sage.combinat.matrices.hadamard_matrix.**skew_hadamard_matrix_spence_construction**(*n*, *check=True*)

Construct skew Hadamard matrix of order n using Spence construction.

This function will construct skew Hadamard matrix of order $n = 2(q + 1)$ where q is a prime power with $q = 5$ (mod 8). The construction is taken from [Spe1977], and the relative difference sets are constructed using `sage.combinat.designs.difference_family.relative_difference_set_from_homomorphism()`.

INPUT:

- `n` – positive integer
- `check` – boolean (default: `True`); if `True`, check that the resulting matrix is Hadamard before returning it

OUTPUT:

If `n` satisfies the requirements described above, the function returns a $n \times n$ Hadamard matrix. Otherwise, an exception is raised.

EXAMPLES:

```
sage: from sage.combinat.matrices.hadamard_matrix import skew_hadamard_matrix_
↪spence_construction
sage: skew_hadamard_matrix_spence_construction(28)
28 x 28 dense matrix over Integer Ring...
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.hadamard_matrix import skew_hadamard_matrix_
↪spence_construction
>>> skew_hadamard_matrix_spence_construction(Integer(28))
28 x 28 dense matrix over Integer Ring...
```

`sage.combinat.matrices.hadamard_matrix.`**`skew_hadamard_matrix_whiteman_construction`**(*n*, *existence=False*, *check=True*)

Construct a skew Hadamard matrix of order $n = 2(q + 1)$ where $q = p^t$ is a prime power with $p \cong 5 \mod 8$ and $t \cong 2 \mod 4$.

Assuming n satisfies the conditions above, it is possible to construct two supplementary difference sets A, B (see [Whi1971]), and these can be used to construct a skew Hadamard matrix, as described in [BS1969].

INPUT:

- `n` – positive integer; the order of the matrix to be constructed
- `existence` – boolean (default: `False`); if `True`, only return whether the Hadamard matrix can be constructed
- `check` – boolean (default: `True`); if `True`, check that the result is a skew Hadamard matrix before returning it

OUTPUT:

If `existence=False`, returns the skew Hadamard matrix of order n. It raises an error if n does not satisfy the required conditions. If `existence=True`, returns a boolean representing whether the matrix can be constructed or not.

EXAMPLES:

```
sage: from sage.combinat.matrices.hadamard_matrix import skew_hadamard_matrix_
↪whiteman_construction
sage: skew_hadamard_matrix_whiteman_construction(52)
52 x 52 dense matrix over Integer Ring...
sage: skew_hadamard_matrix_whiteman_construction(52, existence=True)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.hadamard_matrix import skew_hadamard_matrix_
↪whiteman_construction
>>> skew_hadamard_matrix_whiteman_construction(Integer(52))
52 x 52 dense matrix over Integer Ring...
>>> skew_hadamard_matrix_whiteman_construction(Integer(52), existence=True)
True
```

Note

A more general version of this construction is *skew_hadamard_matrix_from_complementary_difference_sets()*.

sage.combinat.matrices.hadamard_matrix.**symmetric_conference_matrix**(*n*, *check=True*, *existence=False*)

Try to construct a symmetric conference matrix.

A conference matrix is an $n \times n$ matrix C with 0s on the main diagonal and 1s and -1s elsewhere, satisfying $CC^\top = (n-1)I$. If $C = C^\top$ then $n \cong 2 \mod 4$ and C is Seidel adjacency matrix of a graph, whose descendent graphs are strongly regular graphs with parameters $(n-1, (n-2)/2, (n-6)/4, (n-2)/4)$, see Sec.10.4 of [BH2012]. Thus we build C from the Seidel adjacency matrix of the latter by adding row and column of 1s.

INPUT:

- n – integer; dimension of the matrix
- check – boolean (default: True); whether to check that output is correct before returning it. As this is expected to be useless, you may want to disable it whenever you want speed.
- existence – boolean (default: False); if true, only check that such a matrix exists.

EXAMPLES:

```
sage: from sage.combinat.matrices.hadamard_matrix import symmetric_conference_
↪matrix
sage: C = symmetric_conference_matrix(10); C
[ 0  1  1  1  1  1  1  1  1  1]
[ 1  0 -1 -1  1 -1  1  1  1 -1]
[ 1 -1  0 -1  1  1 -1 -1  1  1]
[ 1 -1 -1  0 -1  1  1  1 -1  1]
[ 1  1  1 -1  0 -1 -1  1 -1  1]
[ 1 -1  1  1 -1  0 -1  1  1 -1]
[ 1  1 -1  1 -1 -1  0 -1  1  1]
[ 1  1 -1  1  1  1 -1  0 -1 -1]
[ 1  1  1 -1 -1  1  1 -1  0 -1]
[ 1 -1  1  1  1 -1  1 -1 -1  0]
sage: C^2 == 9*identity_matrix(10) and C == C.T
True
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.hadamard_matrix import symmetric_conference_matrix
>>> C = symmetric_conference_matrix(Integer(10)); C
[ 0  1  1  1  1  1  1  1  1  1]
[ 1  0 -1 -1  1 -1  1  1  1 -1]
```

(continues on next page)

(continued from previous page)

```
[ 1 -1  0 -1  1  1 -1 -1  1  1]
[ 1 -1 -1  0 -1  1  1  1 -1  1]
[ 1  1  1 -1  0 -1 -1  1 -1  1]
[ 1 -1  1  1 -1  0 -1  1  1 -1]
[ 1  1 -1  1 -1 -1  0 -1  1  1]
[ 1  1 -1  1  1  1 -1  0 -1 -1]
[ 1  1  1 -1 -1  1  1 -1  0 -1]
[ 1 -1  1  1  1 -1  1 -1 -1  0]
>>> C**Integer(2) == Integer(9)*identity_matrix(Integer(10)) and C == C.T
True
```

sage.combinat.matrices.hadamard_matrix.**symmetric_conference_matrix_paley**(*n*)

Construct a symmetric conference matrix of order n.

A conference matrix is an $n \times n$ matrix C with 0s on the main diagonal and 1s and -1s elsewhere, satisfying $CC^\top = (n-1)I$. This construction assumes that $q = n - 1$ is a prime power, with $q \cong 1 \mod 4$. See [Hora] or [Lon2013].

These matrices are used in *hadamard_matrix_paleyII()*.

INPUT:

- n – integer; the order of the symmetric conference matrix to construct

EXAMPLES:

```
sage: from sage.combinat.matrices.hadamard_matrix import symmetric_conference_
↪matrix_paley
sage: symmetric_conference_matrix_paley(6)
[ 0  1  1  1  1  1]
[ 1  0  1 -1 -1  1]
[ 1  1  0  1 -1 -1]
[ 1 -1  1  0  1 -1]
[ 1 -1 -1  1  0  1]
[ 1  1 -1 -1  1  0]
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.hadamard_matrix import symmetric_conference_
↪matrix_paley
>>> symmetric_conference_matrix_paley(Integer(6))
[ 0  1  1  1  1  1]
[ 1  0  1 -1 -1  1]
[ 1  1  0  1 -1 -1]
[ 1 -1  1  0  1 -1]
[ 1 -1 -1  1  0  1]
[ 1  1 -1 -1  1  0]
```

sage.combinat.matrices.hadamard_matrix.**szekeres_difference_set_pair**(*m*, *check=True*)

Construct Szekeres $(2m + 1, m, 1)$-cyclic difference family.

Let $4m+3$ be a prime power. Theorem 3 in [Sz1969] contains a construction of a pair of *complementary difference sets* A, B in the subgroup G of the quadratic residues in F^*_{4m+3}. Namely $|A| = |B| = m$, $a \in A$ whenever $a - 1 \in G$, $b \in B$ whenever $b + 1 \in G$. See also Theorem 2.6 in [SWW1972] (there the formula for B is correct, as opposed to (4.2) in [Sz1969], where the sign before 1 is wrong.

In modern terminology, for $m > 1$ the sets A and B form a `difference family` with parameters $(2m+1, m, 1)$. I.e. each non-identity $g \in G$ can be expressed uniquely as xy^{-1} for $x, y \in A$ or $x, y \in B$. Other, specific to this construction, properties of A and B are: for a in A one has a^{-1} not in A, whereas for b in B one has b^{-1} in B.

INPUT:

- `m` – integer; dimension of the matrix
- `check` – boolean (default: `True`); whether to check A and B for correctness

EXAMPLES:

```
sage: from sage.combinat.matrices.hadamard_matrix import szekeres_difference_set_
↪pair
sage: G,A,B=szekeres_difference_set_pair(6)
sage: G,A,B=szekeres_difference_set_pair(7)
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.hadamard_matrix import szekeres_difference_set_
↪pair
>>> G,A,B=szekeres_difference_set_pair(Integer(6))
>>> G,A,B=szekeres_difference_set_pair(Integer(7))
```

REFERENCE:

- [Sz1969]

`sage.combinat.matrices.hadamard_matrix.`**`turyn_type_hadamard_matrix_smallcases`**`(`*n*, *existence=False*, *check=True*`)`

Construct a Hadamard matrix of order n from available 4-symbol δ codes and Williamson quadruples.

The function looks for Baumert-Hall units and Williamson type matrices from `four_symbol_delta_code_smallcases()` and `williamson_type_quadruples_smallcases()` and use them to construct a Hadamard matrix with the Turyn construction defined in `hadamard_matrix_turyn_type()`.

INPUT:

- `n` – integer; the order of the matrix to be constructed
- `existence` – boolean (default: `False`); if `True`, only check if the matrix exists
- `check` – boolean (default: `True`); if `True`, check that the matrix is a Hadamard matrix before returning

EXAMPLES:

```
sage: from sage.combinat.matrices.hadamard_matrix import turyn_type_hadamard_
↪matrix_smallcases
sage: turyn_type_hadamard_matrix_smallcases(28, existence=True)

28 x 28 dense matrix over Integer Ring...
```

sage.combinat.matrices.hadamard_matrix.**typeI_matrix_difference_set**(G, A)

(1,-1)-incidence type I matrix of a difference set A in G.

Let A be a difference set in a group G of order n. Return $n \times n$ matrix M with $M_{ij} = 1$ if $A_i A_j^{-1} \in A$, and $M_{ij} = -1$ otherwise.

EXAMPLES:

```
sage: from sage.combinat.matrices.hadamard_matrix import szekeres_difference_set_
↪pair
sage: from sage.combinat.matrices.hadamard_matrix import typeI_matrix_difference_
↪set
sage: G,A,B=szekeres_difference_set_pair(2)
sage: typeI_matrix_difference_set(G,A)
[-1  1 -1 -1  1]
[-1 -1 -1  1  1]
[ 1  1 -1 -1 -1]
[ 1 -1  1 -1 -1]
[-1 -1  1  1 -1]
```

```
>>> from sage.all import *

↪pair
>>> from sage.combinat.matrices.hadamard_matrix import typeI_matrix_difference_set
>>> G,A,B=szekeres_difference_set_pair(Integer(2))
>>> typeI_matrix_difference_set(G,A)
[-1  1 -1 -1  1]
[-1 -1 -1  1  1]
[ 1  1 -1 -1 -1]
[ 1 -1  1 -1 -1]
[-1 -1  1  1 -1]
```

sage.combinat.matrices.hadamard_matrix.**williamson_goethals_seidel_skew_hadamard_matrix**(*a*, *b*, *c*, *d*, *check=True*)

Williamson-Goethals-Seidel construction of a skew Hadamard matrix.

Given $n \times n$ (anti)circulant matrices A, B, C, D with 1,-1 entries, and satisfying $A + A^\top = 2I$, $AA^\top + BB^\top + CC^\top + DD^\top = 4nI$, one can construct a skew Hadamard matrix of order $4n$, cf. [GS70s].

INPUT:

- `a` – 1,-1 list; the 1st row of A
- `b` – 1,-1 list; the 1st row of B
- `d` – 1,-1 list; the 1st row of C
- `c` – 1,-1 list; the 1st row of D
- `check` – boolean (default: `True`); if `True`, check that the resulting matrix is skew Hadamard before returning it

EXAMPLES:

```
sage: from sage.combinat.matrices.hadamard_matrix import williamson_goethals_
↪seidel_skew_hadamard_matrix as WGS
sage: a = [ 1,  1, 1, -1,  1, -1,  1, -1, -1]
sage: b = [ 1, -1, 1,  1, -1, -1,  1,  1, -1]
sage: c = [-1, -1]+[1]*6+[-1]
sage: d = [ 1,  1, 1, -1,  1,  1, -1,  1,  1]
sage: M = WGS(a,b,c,d,check=True)
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.hadamard_matrix import williamson_goethals_seidel_
↪skew_hadamard_matrix as WGS
>>> a = [ Integer(1),  Integer(1), Integer(1), -Integer(1),  Integer(1), -
↪Integer(1),  Integer(1), -Integer(1), -Integer(1)]
>>> b = [ Integer(1), -Integer(1), Integer(1),  Integer(1), -Integer(1), -
↪Integer(1),  Integer(1),  Integer(1), -Integer(1)]
>>> c = [-Integer(1), -Integer(1)]+[Integer(1)]*Integer(6)+[-Integer(1)]
>>> d = [ Integer(1),  Integer(1), Integer(1), -Integer(1),  Integer(1), 
↪Integer(1), -Integer(1),  Integer(1),  Integer(1)]
>>> M = WGS(a,b,c,d,check=True)
```

sage.combinat.matrices.hadamard_matrix.**williamson_hadamard_matrix_smallcases**(*n*, *existence=False*, *check=True*)

Construct Williamson type Hadamard matrices for some small values of n.

This function uses the data contained in `sage.combinat.matrices.hadamard_matrix.williamson_type_quadruples_smallcases()` to create Hadamard matrices of the Williamson type, using the construction from `sage.combinat.matrices.hadamard_matrix.hadamard_matrix_williamson_type()`.

INPUT:

- `n` – integer; the order of the matrix
- `existence` – boolean (dafault: `False`); if `True`, only check that we can do the construction
- `check` – boolean (default: `True`); if `True` check the result

sage.combinat.matrices.hadamard_matrix.**williamson_type_quadruples_smallcases**(*n*, *existence=False*)

Quadruples of matrices that can be used to construct Williamson type Hadamard matrices.

This function contains for some values of n, four $n \times n$ matrices used in the Williamson construction of Hadamard matrices. Namely, the function returns the first row of 4 $n \times n$ circulant matrices with the properties described in `sage.combinat.matrices.hadamard_matrix.hadamard_matrix_williamson_type()`. The matrices for $n = 3, 5, ..., 29, 37, 43$ are given in [Ha83]. The matrices for $n = 31, 33, 39, 41, 45, 49, 51, 55, 57, 61, 63$ are given in [Lon2013].

INPUT:

- n – integer; the order of the matrices to be returned
- existence – boolean (dafault: False); if True, only check that we have the quadruple

OUTPUT:

If existence is false, returns a tuple containing four vectors, each being the first line of one of the four matrices. It raises an error if no such matrices are available. If existence is true, returns a boolean representing whether the matrices are available or not.

EXAMPLES:

```
sage: from sage.combinat.matrices.hadamard_matrix import williamson_type_
↪quadruples_smallcases

5.1.138 Latin Squares

A *latin square* of order n is an $n \times n$ array such that each symbol $s \in \{0, 1, \dots, n-1\}$ appears precisely once in each row, and precisely once in each column. A *partial latin square* of order n is an $n \times n$ array such that each symbol $s \in \{0, 1, \dots, n-1\}$ appears at most once in each row, and at most once in each column. Empty cells are denoted by -1. A latin square L is a *completion* of a partial latin square P if $P \subseteq L$. If P completes to just L then P *has unique completion*.

A *latin bitrade* (T_1, T_2) is a pair of partial latin squares such that:

1. $\{(i, j) \mid (i, j, k) \in T_1 \text{ for some symbol } k\} = \{(i, j) \mid (i, j, k') \in T_2 \text{ for some symbol } k'\}$;
2. for each $(i, j, k) \in T_1$ and $(i, j, k') \in T_2$, $k \neq k'$;
3. the symbols appearing in row i of T_1 are the same as those of row i of T_2; the symbols appearing in column j of T_1 are the same as those of column j of T_2.

Intuitively speaking, a bitrade gives the difference between two latin squares, so if (T_1, T_2) is a bitrade for the pair of latin squares (L_1, L_2), then $L1 = (L2 \setminus T_1) \cup T_2$ and $L2 = (L1 \setminus T_2) \cup T_1$.

This file contains

1. LatinSquare class definition;
2. some named latin squares (back circulant, forward circulant, abelian 2-group);
3. methods `is_partial_latin_square()` and `is_latin_square()` to test if a `LatinSquare` object satisfies the definition of a latin square or partial latin square, respectively;
4. tests for completion and unique completion (these use the C++ implementation of Knuth's dancing links algorithm to solve the problem as a instance of $0-1$ matrix exact cover);
5. functions for calculating the τ_i representation of a bitrade and the genus of the associated hypermap embedding;
6. Markov chain of Jacobson and Matthews (1996) for generating latin squares uniformly at random (provides a generator interface);
7. a few examples of τ_i representations of bitrades constructed from the action of a group on itself by right multiplication, functions for converting to a pair of `LatinSquare` objects.

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: B = back_circulant(5)
sage: B
[0 1 2 3 4]
[1 2 3 4 0]
[2 3 4 0 1]
[3 4 0 1 2]
[4 0 1 2 3]
sage: B.is_latin_square()
True
sage: B[0, 1] = 0
sage: B.is_latin_square()
False

sage: (a, b, c, G) = alternating_group_bitrade_generators(1)
sage: (T1, T2) = bitrade_from_group(a, b, c, G)
sage: T1
[ 0 -1  3  1]
[-1  1  0  2]
[ 1  3  2 -1]
[ 2  0 -1  3]
sage: T2
[ 1 -1  0  3]
[-1  0  2  1]
[ 2  1  3 -1]
[ 0  3 -1  2]
sage: T1.nr_filled_cells()
12
sage: genus(T1, T2)
1
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
```

(continues on next page)

(continued from previous page)

```
>>> B = back_circulant(Integer(5))
>>> B
[0 1 2 3 4]
[1 2 3 4 0]
[2 3 4 0 1]
[3 4 0 1 2]
[4 0 1 2 3]
>>> B.is_latin_square()
True
>>> B[Integer(0), Integer(1)] = Integer(0)
>>> B.is_latin_square()
False

>>> (a, b, c, G) = alternating_group_bitrade_generators(Integer(1))
>>> (T1, T2) = bitrade_from_group(a, b, c, G)
>>> T1
[ 0 -1  3  1]
[-1  1  0  2]
[ 1  3  2 -1]
[ 2  0 -1  3]
>>> T2
[ 1 -1  0  3]
[-1  0  2  1]
[ 2  1  3 -1]
[ 0  3 -1  2]
>>> T1.nr_filled_cells()
12
>>> genus(T1, T2)
1
```

Todo

1. Latin squares with symbols from a ring instead of the integers $\{0, 1, \ldots, n-1\}$.
2. Isotopism testing of latin squares and bitrades via graph isomorphism (nauty?).
3. Combinatorial constructions for bitrades.

AUTHORS:

- Carlo Hamalainen (2008-03-23): initial version

class sage.combinat.matrices.latin.**LatinSquare**(**args*)

Bases: object

Latin squares.

This class implements a latin square of order n with rows and columns indexed by the set 0, 1, …, n-1 and symbols from the same set. The underlying latin square is a matrix(ZZ, n, n). If L is a latin square, then the cell at row r, column c is empty if and only if L[r, c] < 0. In this way we allow partial latin squares and can speak of completions to latin squares, etc.

There are two ways to declare a latin square:

Empty latin square of order n:

```
sage: n = 3
sage: L = LatinSquare(n)
sage: L
[-1 -1 -1]
[-1 -1 -1]
[-1 -1 -1]
```

```
>>> from sage.all import *
>>> n = Integer(3)
>>> L = LatinSquare(n)
>>> L
[-1 -1 -1]
[-1 -1 -1]
[-1 -1 -1]
```

Latin square from a matrix:

```
sage: M = matrix(ZZ, [[0, 1], [2, 3]])
sage: LatinSquare(M)
[0 1]
[2 3]
```

```
>>> from sage.all import *
>>> M = matrix(ZZ, [[Integer(0), Integer(1)], [Integer(2), Integer(3)]])
>>> LatinSquare(M)
[0 1]
[2 3]
```

actual_row_col_sym_sizes()

Bitrades sometimes end up in partial latin squares with unused rows, columns, or symbols. This function works out the actual number of used rows, columns, and symbols.

> **Warning**
>
> We assume that the unused rows/columns occur in the lower right of self, and that the used symbols are in the range {0, 1, …, m} (no holes in that list).

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: B = back_circulant(3)
sage: B[0,2] = B[1,2] = B[2,2] = -1
sage: B[0,0] = B[2,1] = -1
sage: B
[-1  1 -1]
[ 1  2 -1]
[ 2 -1 -1]
sage: B.actual_row_col_sym_sizes()
(3, 2, 2)
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> B = back_circulant(Integer(3))
>>> B[Integer(0),Integer(2)] = B[Integer(1),Integer(2)] = B[Integer(2),
↪Integer(2)] = -Integer(1)
>>> B[Integer(0),Integer(0)] = B[Integer(2),Integer(1)] = -Integer(1)
>>> B
[-1  1 -1]
[ 1  2 -1]
[ 2 -1 -1]
>>> B.actual_row_col_sym_sizes()
(3, 2, 2)
```

apply_isotopism(*row_perm*, *col_perm*, *sym_perm*)

An isotopism is a permutation of the rows, columns, and symbols of a partial latin square `self`. Use isotopism() to convert a tuple (indexed from 0) to a Permutation object.

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: B = back_circulant(5)
sage: B
[0 1 2 3 4]
[1 2 3 4 0]
[2 3 4 0 1]
[3 4 0 1 2]
[4 0 1 2 3]
sage: alpha = isotopism((0,1,2,3,4))
sage: beta  = isotopism((1,0,2,3,4))
sage: gamma = isotopism((2,1,0,3,4))
sage: B.apply_isotopism(alpha, beta, gamma)
[3 4 2 0 1]
[0 2 3 1 4]
[1 3 0 4 2]
[4 0 1 2 3]
[2 1 4 3 0]
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> B = back_circulant(Integer(5))
>>> B
[0 1 2 3 4]
[1 2 3 4 0]
[2 3 4 0 1]
[3 4 0 1 2]
[4 0 1 2 3]
>>> alpha = isotopism((Integer(0),Integer(1),Integer(2),Integer(3),
↪Integer(4)))
>>> beta  = isotopism((Integer(1),Integer(0),Integer(2),Integer(3),
↪Integer(4)))
>>> gamma = isotopism((Integer(2),Integer(1),Integer(0),Integer(3),
↪Integer(4)))
>>> B.apply_isotopism(alpha, beta, gamma)
```

(continues on next page)

(continued from previous page)

```
[3 4 2 0 1]
[0 2 3 1 4]
[1 3 0 4 2]
[4 0 1 2 3]
[2 1 4 3 0]
```

clear_cells()

Mark every cell in `self` as being empty.

EXAMPLES:

```
sage: A = LatinSquare(matrix(ZZ, [[0, 1], [2, 3]]))
sage: A.clear_cells()
sage: A
[-1 -1]
[-1 -1]
```

```
>>> from sage.all import *
>>> A = LatinSquare(matrix(ZZ, [[Integer(0), Integer(1)], [Integer(2),␣
↪Integer(3)]]))
>>> A.clear_cells()
>>> A
[-1 -1]
[-1 -1]
```

column(x)

Return column x of the latin square.

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: back_circulant(3).column(0)
(0, 1, 2)
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> back_circulant(Integer(3)).column(Integer(0))
(0, 1, 2)
```

contained_in(Q)

Return `True` if `self` is a subset of Q.

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: P = elementary_abelian_2group(2)
sage: P[0, 0] = -1
sage: P.contained_in(elementary_abelian_2group(2))
True
sage: back_circulant(4).contained_in(elementary_abelian_2group(2))
False
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> P = elementary_abelian_2group(Integer(2))
>>> P[Integer(0), Integer(0)] = -Integer(1)
>>> P.contained_in(elementary_abelian_2group(Integer(2)))
True
>>> back_circulant(Integer(4)).contained_in(elementary_abelian_
↪2group(Integer(2)))
False
```

disjoint_mate_dlxcpp_rows_and_map(*allow_subtrade*)

Internal function for find_disjoint_mates.

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: B = back_circulant(4)
sage: B.disjoint_mate_dlxcpp_rows_and_map(allow_subtrade = True)
([[0, 16, 32],

```

dlxcpp_has_unique_completion()

Check if the partial latin square `self` of order n can be embedded in precisely one latin square of order n.

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: back_circulant(2).dlxcpp_has_unique_completion()
True
sage: P = LatinSquare(2)
sage: P.dlxcpp_has_unique_completion()
False
sage: P[0, 0] = 0
sage: P.dlxcpp_has_unique_completion()
True
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> back_circulant(Integer(2)).dlxcpp_has_unique_completion()
True
>>> P = LatinSquare(Integer(2))
>>> P.dlxcpp_has_unique_completion()
False
>>> P[Integer(0), Integer(0)] = Integer(0)
>>> P.dlxcpp_has_unique_completion()
True
```

dumps()

Since the latin square class does not hold any other private variables we just call dumps on self.square:

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: back_circulant(2) == loads(dumps(back_circulant(2)))
True
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> back_circulant(Integer(2)) == loads(dumps(back_circulant(Integer(2))))
True
```

filled_cells_map()

Number the filled cells of `self` with integers from $\{1, 2, 3, \ldots\}$.

INPUT:

- `self` – partial latin square `self` (empty cells have negative values)

OUTPUT:

A dictionary `cells_map` where `cells_map[(i,j)] = m` means that `(i,j)` is the `m`-th filled cell in `P`, while `cells_map[m] = (i,j)`.

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: (a, b, c, G) = alternating_group_bitrade_generators(1)
sage: (T1, T2) = bitrade_from_group(a, b, c, G)
sage: D = T1.filled_cells_map()
sage: {i: v for i,v in D.items() if i in ZZ}
{1: (0, 0),
 2: (0, 2),
 3: (0, 3),
 4: (1, 1),
 5: (1, 2),
 6: (1, 3),
 7: (2, 0),
 8: (2, 1),
 9: (2, 2),
 10: (3, 0),
 11: (3, 1),
 12: (3, 3)}
sage: {i: v for i,v in D.items() if i not in ZZ}
{(0, 0): 1,
 (0, 2): 2,
 (0, 3): 3,
 (1, 1): 4,
 (1, 2): 5,
 (1, 3): 6,
 (2, 0): 7,
 (2, 1): 8,
 (2, 2): 9,
 (3, 0): 10,
 (3, 1): 11,
 (3, 3): 12}
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> (a, b, c, G) = alternating_group_bitrade_generators(Integer(1))
>>> (T1, T2) = bitrade_from_group(a, b, c, G)
>>> D = T1.filled_cells_map()
```

(continues on next page)

(continued from previous page)

```
>>> {i: v for i,v in D.items() if i in ZZ}
{1: (0, 0),
 2: (0, 2),
 3: (0, 3),
 4: (1, 1),
 5: (1, 2),
 6: (1, 3),
 7: (2, 0),
 8: (2, 1),
 9: (2, 2),
 10: (3, 0),
 11: (3, 1),
 12: (3, 3)}
>>> {i: v for i,v in D.items() if i not in ZZ}
{(0, 0): 1,
 (0, 2): 2,
 (0, 3): 3,
 (1, 1): 4,
 (1, 2): 5,
 (1, 3): 6,
 (2, 0): 7,
 (2, 1): 8,
 (2, 2): 9,
 (3, 0): 10,
 (3, 1): 11,
 (3, 3): 12}
```

find_disjoint_mates(*nr_to_find=None*, *allow_subtrade=False*)

> **Warning**
>
> If allow_subtrade is `True` then we may return a partial latin square that is *not* disjoint to `self`. In that case, use bitrade(P, Q) to get an actual bitrade.

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: B = back_circulant(4)
sage: g = B.find_disjoint_mates(allow_subtrade = True)
sage: B1 = next(g)
sage: B0, B1 = bitrade(B, B1)
sage: assert is_bitrade(B0, B1)
sage: print(B0)
[-1  1  2 -1]
[-1  2 -1  0]
[-1 -1 -1 -1]
[-1  0  1  2]
sage: print(B1)
[-1  2  1 -1]
[-1  0 -1  2]
[-1 -1 -1 -1]
```

(continues on next page)

(continued from previous page)

```
[-1  1  2  0]
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> B = back_circulant(Integer(4))
>>> g = B.find_disjoint_mates(allow_subtrade = True)
>>> B1 = next(g)
>>> B0, B1 = bitrade(B, B1)
>>> assert is_bitrade(B0, B1)
>>> print(B0)
[-1  1  2 -1]
[-1  2 -1  0]
[-1 -1 -1 -1]
[-1  0  1  2]
>>> print(B1)
[-1  2  1 -1]
[-1  0 -1  2]
[-1 -1 -1 -1]
[-1  1  2  0]
```

gcs()

A greedy critical set of a latin square `self` is found by successively removing elements in a row-wise (bottom-up) manner, checking for unique completion at each step.

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: A = elementary_abelian_2group(3)
sage: G = A.gcs()
sage: A
[0 1 2 3 4 5 6 7]
[1 0 3 2 5 4 7 6]
[2 3 0 1 6 7 4 5]
[3 2 1 0 7 6 5 4]
[4 5 6 7 0 1 2 3]
[5 4 7 6 1 0 3 2]
[6 7 4 5 2 3 0 1]
[7 6 5 4 3 2 1 0]
sage: G
[ 0  1  2  3  4  5  6 -1]
[ 1  0  3  2  5  4 -1 -1]
[ 2  3  0  1  6 -1  4 -1]
[ 3  2  1  0 -1 -1 -1 -1]
[ 4  5  6 -1  0  1  2 -1]
[ 5  4 -1 -1  1  0 -1 -1]
[ 6 -1  4 -1  2 -1  0 -1]
[-1 -1 -1 -1 -1 -1 -1 -1]
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> A = elementary_abelian_2group(Integer(3))
>>> G = A.gcs()
```

(continues on next page)

(continued from previous page)

```
>>> A
[0 1 2 3 4 5 6 7]
[1 0 3 2 5 4 7 6]
[2 3 0 1 6 7 4 5]
[3 2 1 0 7 6 5 4]
[4 5 6 7 0 1 2 3]
[5 4 7 6 1 0 3 2]
[6 7 4 5 2 3 0 1]
[7 6 5 4 3 2 1 0]
>>> G
[ 0  1  2  3  4  5  6 -1]
[ 1  0  3  2  5  4 -1 -1]
[ 2  3  0  1  6 -1  4 -1]
[ 3  2  1  0 -1 -1 -1 -1]
[ 4  5  6 -1  0  1  2 -1]
[ 5  4 -1 -1  1  0 -1 -1]
[ 6 -1  4 -1  2 -1  0 -1]
[-1 -1 -1 -1 -1 -1 -1 -1]
```

is_completable()

Return `True` if the partial latin square can be completed to a latin square.

EXAMPLES:

The following partial latin square has no completion because there is nowhere that we can place the symbol 0 in the third row:

```
sage: B = LatinSquare(3)
```

```
>>> from sage.all import *
>>> B = LatinSquare(Integer(3))
```

```
sage: B[0, 0] = 0
sage: B[1, 1] = 0
sage: B[2, 2] = 1
```

```
>>> from sage.all import *
>>> B[Integer(0), Integer(0)] = Integer(0)
>>> B[Integer(1), Integer(1)] = Integer(0)
>>> B[Integer(2), Integer(2)] = Integer(1)
```

```
sage: B
[ 0 -1 -1]
[-1  0 -1]
[-1 -1  1]
```

```
>>> from sage.all import *
>>> B
[ 0 -1 -1]
[-1  0 -1]
[-1 -1  1]
```

```
sage: B.is_completable()
False
```

```
>>> from sage.all import *
>>> B.is_completable()
False
```

```
sage: B[2, 2] = 0
sage: B.is_completable()
True
```

```
>>> from sage.all import *
>>> B[Integer(2), Integer(2)] = Integer(0)
>>> B.is_completable()
True
```

is_empty_column(*c*)

Check if column c of the partial latin square `self` is empty.

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: L = back_circulant(4)
sage: L.is_empty_column(0)
False
sage: L[0,0] = L[1,0] = L[2,0] = L[3,0] = -1
sage: L.is_empty_column(0)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> L = back_circulant(Integer(4))
>>> L.is_empty_column(Integer(0))
False
>>> L[Integer(0),Integer(0)] = L[Integer(1),Integer(0)] = L[Integer(2),
↪Integer(0)] = L[Integer(3),Integer(0)] = -Integer(1)
>>> L.is_empty_column(Integer(0))
True
```

is_empty_row(*r*)

Check if row r of the partial latin square `self` is empty.

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: L = back_circulant(4)
sage: L.is_empty_row(0)
False
sage: L[0,0] = L[0,1] = L[0,2] = L[0,3] = -1
sage: L.is_empty_row(0)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> L = back_circulant(Integer(4))
>>> L.is_empty_row(Integer(0))
False
>>> L[Integer(0),Integer(0)] = L[Integer(0),Integer(1)] = L[Integer(0),
↪Integer(2)] = L[Integer(0),Integer(3)] = -Integer(1)
>>> L.is_empty_row(Integer(0))
True
```

is_latin_square()

self is a latin square if it is an n by n matrix, and each symbol in [0, 1, …, n-1] appears exactly once in each row, and exactly once in each column.

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: elementary_abelian_2group(4).is_latin_square()
True
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> elementary_abelian_2group(Integer(4)).is_latin_square()
True
```

```
sage: forward_circulant(7).is_latin_square()
True
```

```
>>> from sage.all import *
>>> forward_circulant(Integer(7)).is_latin_square()
True
```

is_partial_latin_square()

self is a partial latin square if it is an n by n matrix, and each symbol in [0, 1, …, n-1] appears at most once in each row, and at most once in each column.

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: LatinSquare(4).is_partial_latin_square()
True
sage: back_circulant(3).gcs().is_partial_latin_square()
True
sage: back_circulant(6).is_partial_latin_square()
True
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> LatinSquare(Integer(4)).is_partial_latin_square()
True
>>> back_circulant(Integer(3)).gcs().is_partial_latin_square()
True
```

(continues on next page)

(continued from previous page)

```
>>> back_circulant(Integer(6)).is_partial_latin_square()
True
```

is_uniquely_completable()

Return `True` if the partial latin square `self` has exactly one completion to a latin square. This is just a wrapper for the current best-known algorithm, Dancing Links by Knuth. See dancing_links.spyx

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: back_circulant(4).gcs().is_uniquely_completable()
True
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> back_circulant(Integer(4)).gcs().is_uniquely_completable()
True
```

```
sage: G = elementary_abelian_2group(3).gcs()
sage: G.is_uniquely_completable()
True
```

```
>>> from sage.all import *
>>> G = elementary_abelian_2group(Integer(3)).gcs()
>>> G.is_uniquely_completable()
True
```

```
sage: G[0, 0] = -1
sage: G.is_uniquely_completable()
False
```

```
>>> from sage.all import *
>>> G[Integer(0), Integer(0)] = -Integer(1)
>>> G.is_uniquely_completable()
False
```

latex()

Return LaTeX code for the latin square.

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: print(back_circulant(3).latex())
\begin{array}{|c|c|c|}\hline 0 & 1 & 2\\\hline 1 & 2 & 0\\\hline 2 & 0 & 1\\
↪hline\end{array}
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> print(back_circulant(Integer(3)).latex())
\begin{array}{|c|c|c|}\hline 0 & 1 & 2\\\hline 1 & 2 & 0\\\hline 2 & 0 & 1\\
↪hline\end{array}
```

list()

Convert the latin square into a list, in a row-wise manner.

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: back_circulant(3).list()
[0, 1, 2, 1, 2, 0, 2, 0, 1]
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> back_circulant(Integer(3)).list()
[0, 1, 2, 1, 2, 0, 2, 0, 1]
```

ncols()

Number of columns in the latin square.

EXAMPLES:

```
sage: LatinSquare(3).ncols()
3
```

```
>>> from sage.all import *
>>> LatinSquare(Integer(3)).ncols()
3
```

nr_distinct_symbols()

Return the number of distinct symbols in the partial latin square `self`.

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: back_circulant(5).nr_distinct_symbols()
5
sage: L = LatinSquare(10)
sage: L.nr_distinct_symbols()
0
sage: L[0, 0] = 0
sage: L[0, 1] = 1
sage: L.nr_distinct_symbols()
2
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> back_circulant(Integer(5)).nr_distinct_symbols()
5
>>> L = LatinSquare(Integer(10))
>>> L.nr_distinct_symbols()
0
>>> L[Integer(0), Integer(0)] = Integer(0)
>>> L[Integer(0), Integer(1)] = Integer(1)
>>> L.nr_distinct_symbols()
2
```

nr_filled_cells()

Return the number of filled cells (i.e. cells with a positive value) in the partial latin square `self`.

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: LatinSquare(matrix([[0, -1], [-1, 0]])).nr_filled_cells()
2
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> LatinSquare(matrix([[Integer(0), -Integer(1)], [-Integer(1),
→Integer(0)]])).nr_filled_cells()
2
```

nrows()

Number of rows in the latin square.

EXAMPLES:

```
sage: LatinSquare(3).nrows()
3
```

```
>>> from sage.all import *
>>> LatinSquare(Integer(3)).nrows()
3
```

permissable_values(*r*, *c*)

Find all values that do not appear in row r and column c of the latin square `self`. If `self[r, c]` is filled then we return the empty list.

INPUT:

- `self` – LatinSquare
- `r` – integer; row of the latin square
- `c` – integer; column of the latin square

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: L = back_circulant(5)
sage: L[0, 0] = -1
sage: L.permissable_values(0, 0)
[0]
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> L = back_circulant(Integer(5))
>>> L[Integer(0), Integer(0)] = -Integer(1)
>>> L.permissable_values(Integer(0), Integer(0))
[0]
```

random_empty_cell()

Find an empty cell of self, uniformly at random.

INPUT:

- `self` – LatinSquare

OUTPUT:

- `[r, c]` – cell such that `self[r, c]` is empty, or returns `None` if `self` is a (full) latin square

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: P = back_circulant(2)
sage: P[1,1] = -1
sage: P.random_empty_cell()
[1, 1]
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> P = back_circulant(Integer(2))
>>> P[Integer(1),Integer(1)] = -Integer(1)
>>> P.random_empty_cell()
[1, 1]
```

row(*x*)

Return row x of the latin square.

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: back_circulant(3).row(0)
(0, 1, 2)
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> back_circulant(Integer(3)).row(Integer(0))
(0, 1, 2)
```

set_immutable()

A latin square is immutable if the underlying matrix is immutable.

EXAMPLES:

```
sage: L = LatinSquare(matrix(ZZ, [[0, 1], [2, 3]]))
sage: L.set_immutable()
sage: {L : 0}    # this would fail without set_immutable()
{[0 1]
[2 3]: 0}
```

```
>>> from sage.all import *
>>> L = LatinSquare(matrix(ZZ, [[Integer(0), Integer(1)], [Integer(2),
→Integer(3)]]))
>>> L.set_immutable()
>>> {L : Integer(0)}    # this would fail without set_immutable()
{[0 1]
[2 3]: 0}
```

top_left_empty_cell()

Return the least `[r, c]` such that `self[r, c]` is an empty cell. If all cells are filled then we return `None`.

INPUT:

- `self` – LatinSquare

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: B = back_circulant(5)
sage: B[3, 4] = -1
sage: B.top_left_empty_cell()
[3, 4]
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> B = back_circulant(Integer(5))
>>> B[Integer(3), Integer(4)] = -Integer(1)
>>> B.top_left_empty_cell()
[3, 4]
```

vals_in_col(*c*)

Return a dictionary with key e if and only if column c of `self` has the symbol e.

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: B = back_circulant(3)
sage: B[0, 0] = -1
sage: back_circulant(3).vals_in_col(0)
{0: True, 1: True, 2: True}
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> B = back_circulant(Integer(3))
>>> B[Integer(0), Integer(0)] = -Integer(1)
>>> back_circulant(Integer(3)).vals_in_col(Integer(0))
{0: True, 1: True, 2: True}
```

vals_in_row(*r*)

Return a dictionary with key e if and only if row r of `self` has the symbol e.

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: B = back_circulant(3)
sage: B[0, 0] = -1
sage: back_circulant(3).vals_in_row(0)
{0: True, 1: True, 2: True}
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> B = back_circulant(Integer(3))
>>> B[Integer(0), Integer(0)] = -Integer(1)
```

(continues on next page)

(continued from previous page)

```
>>> back_circulant(Integer(3)).vals_in_row(Integer(0))
{0: True, 1: True, 2: True}
```

sage.combinat.matrices.latin.**LatinSquare_generator**(*L_start*, *check_assertions=False*)

Generator for a sequence of uniformly distributed latin squares, given L_start as the initial latin square.

This code implements the Markov chain algorithm of Jacobson and Matthews (1996), see below for the BibTex entry. This generator will never throw the `StopIteration` exception, so it provides an infinite sequence of latin squares.

EXAMPLES:

Use the back circulant latin square of order 4 as the initial square and print the next two latin squares given by the Markov chain:

```
sage: from sage.combinat.matrices.latin import *
sage: g = LatinSquare_generator(back_circulant(4))
sage: next(g).is_latin_square()
True
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> g = LatinSquare_generator(back_circulant(Integer(4)))
>>> next(g).is_latin_square()
True
```

REFERENCES:

sage.combinat.matrices.latin.**alternating_group_bitrade_generators**(*m*)

Construct generators a, b, c for the alternating group on 3m+1 points, such that a*b*c = 1.

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: a, b, c, G = alternating_group_bitrade_generators(1)
sage: (a, b, c, G)
((1,2,3), (1,4,2), (2,4,3), Permutation Group with generators [(1,2,3), (1,4,2)])
sage: a*b*c
()
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> a, b, c, G = alternating_group_bitrade_generators(Integer(1))
>>> (a, b, c, G)
((1,2,3), (1,4,2), (2,4,3), Permutation Group with generators [(1,2,3), (1,4,2)])
>>> a*b*c
()
```

```
sage: (T1, T2) = bitrade_from_group(a, b, c, G)
sage: T1
[ 0 -1  3  1]
[-1  1  0  2]
[ 1  3  2 -1]
[ 2  0 -1  3]
```

(continues on next page)

(continued from previous page)

```
sage: T2
[ 1 -1  0  3]
[-1  0  2  1]
[ 2  1  3 -1]
[ 0  3 -1  2]
```

```
>>> from sage.all import *
>>> (T1, T2) = bitrade_from_group(a, b, c, G)
>>> T1
[ 0 -1  3  1]
[-1  1  0  2]
[ 1  3  2 -1]
[ 2  0 -1  3]
>>> T2
[ 1 -1  0  3]
[-1  0  2  1]
[ 2  1  3 -1]
[ 0  3 -1  2]
```

sage.combinat.matrices.latin.**back_circulant**(*n*)

The back-circulant latin square of order n is the Cayley table for (Z_n, +), the integers under addition modulo n.

INPUT:

- n – integer; order of the latin square

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: back_circulant(5)
[0 1 2 3 4]
[1 2 3 4 0]
[2 3 4 0 1]
[3 4 0 1 2]
[4 0 1 2 3]
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> back_circulant(Integer(5))
[0 1 2 3 4]
[1 2 3 4 0]
[2 3 4 0 1]
[3 4 0 1 2]
[4 0 1 2 3]
```

sage.combinat.matrices.latin.**beta1**(*rce*, *T1*, *T2*)

Find the unique (x, c, e) in T2 such that (r, c, e) is in T1.

INPUT:

- rce – tuple (or list) (r, c, e) in T1
- T1, T2 – latin bitrade

OUTPUT: (x, c, e) in T2

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: T1 = back_circulant(5)
sage: x = isotopism( (0,1,2,3,4) )
sage: y = isotopism(5) # identity
sage: z = isotopism(5) # identity
sage: T2 = T1.apply_isotopism(x, y, z)
sage: is_bitrade(T1, T2)
True
sage: beta1([0, 0, 0], T1, T2)
(1, 0, 0)
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> T1 = back_circulant(Integer(5))
>>> x = isotopism( (Integer(0),Integer(1),Integer(2),Integer(3),Integer(4)) )
>>> y = isotopism(Integer(5)) # identity
>>> z = isotopism(Integer(5)) # identity
>>> T2 = T1.apply_isotopism(x, y, z)
>>> is_bitrade(T1, T2)
True
>>> beta1([Integer(0), Integer(0), Integer(0)], T1, T2)
(1, 0, 0)
```

sage.combinat.matrices.latin.**beta2**(*rce*, *T1*, *T2*)

Find the unique (r, x, e) in T2 such that (r, c, e) is in T1.

INPUT:

- `rce` – tuple (or list) (r, c, e) in T1
- `T1`, `T2` – latin bitrade

OUTPUT: (r, x, e) in T2

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: T1 = back_circulant(5)
sage: x = isotopism( (0,1,2,3,4) )
sage: y = isotopism(5) # identity
sage: z = isotopism(5) # identity
sage: T2 = T1.apply_isotopism(x, y, z)
sage: is_bitrade(T1, T2)
True
sage: beta2([0, 0, 0], T1, T2)
(0, 1, 0)
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> T1 = back_circulant(Integer(5))
>>> x = isotopism( (Integer(0),Integer(1),Integer(2),Integer(3),Integer(4)) )
>>> y = isotopism(Integer(5)) # identity
>>> z = isotopism(Integer(5)) # identity
```

(continues on next page)

(continued from previous page)

```
>>> T2 = T1.apply_isotopism(x, y, z)
>>> is_bitrade(T1, T2)
True
>>> beta2([Integer(0), Integer(0), Integer(0)], T1, T2)
(0, 1, 0)
```

sage.combinat.matrices.latin.**beta3**(*rce*, *T1*, *T2*)

Find the unique (r, c, x) in T2 such that (r, c, e) is in T1.

INPUT:

- `rce` – tuple (or list) (r, c, e) in T1
- `T1, T2` – latin bitrade

OUTPUT: (r, c, x) in T2.

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: T1 = back_circulant(5)
sage: x = isotopism( (0,1,2,3,4) )
sage: y = isotopism(5) # identity
sage: z = isotopism(5) # identity
sage: T2 = T1.apply_isotopism(x, y, z)
sage: is_bitrade(T1, T2)
True
sage: beta3([0, 0, 0], T1, T2)
(0, 0, 4)
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> T1 = back_circulant(Integer(5))
>>> x = isotopism( (Integer(0),Integer(1),Integer(2),Integer(3),Integer(4)) )
>>> y = isotopism(Integer(5)) # identity
>>> z = isotopism(Integer(5)) # identity
>>> T2 = T1.apply_isotopism(x, y, z)
>>> is_bitrade(T1, T2)
True
>>> beta3([Integer(0), Integer(0), Integer(0)], T1, T2)
(0, 0, 4)
```

sage.combinat.matrices.latin.**bitrade**(*T1*, *T2*)

Form the bitrade (Q1, Q2) from (T1, T2) by setting empty the cells (r, c) such that T1[r, c] == T2[r, c].

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: B1 = back_circulant(5)
sage: alpha = isotopism((0,1,2,3,4))
sage: beta  = isotopism((1,0,2,3,4))
sage: gamma = isotopism((2,1,0,3,4))
sage: B2 = B1.apply_isotopism(alpha, beta, gamma)
sage: T1, T2 = bitrade(B1, B2)
sage: T1
```

(continues on next page)

(continued from previous page)

```
[ 0  1 -1  3  4]
[ 1 -1 -1  4  0]
[ 2 -1  4  0  1]
[ 3  4  0  1  2]
[ 4  0  1  2  3]
sage: T2
[ 3  4 -1  0  1]
[ 0 -1 -1  1  4]
[ 1 -1  0  4  2]
[ 4  0  1  2  3]
[ 2  1  4  3  0]
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> B1 = back_circulant(Integer(5))
>>> alpha = isotopism((Integer(0),Integer(1),Integer(2),Integer(3),Integer(4)))
>>> beta  = isotopism((Integer(1),Integer(0),Integer(2),Integer(3),Integer(4)))
>>> gamma = isotopism((Integer(2),Integer(1),Integer(0),Integer(3),Integer(4)))
>>> B2 = B1.apply_isotopism(alpha, beta, gamma)
>>> T1, T2 = bitrade(B1, B2)
>>> T1
[ 0  1 -1  3  4]
[ 1 -1 -1  4  0]
[ 2 -1  4  0  1]
[ 3  4  0  1  2]
[ 4  0  1  2  3]
>>> T2
[ 3  4 -1  0  1]
[ 0 -1 -1  1  4]
[ 1 -1  0  4  2]
[ 4  0  1  2  3]
[ 2  1  4  3  0]
```

sage.combinat.matrices.latin.**bitrade_from_group**(*a*, *b*, *c*, *G*)

Given group elements a, b, c in G such that abc = 1 and the subgroups a, b, c intersect (pairwise) only in the identity, construct a bitrade (T1, T2) where rows, columns, and symbols correspond to cosets of a, b, and c, respectively.

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: a, b, c, G = alternating_group_bitrade_generators(1)
sage: (T1, T2) = bitrade_from_group(a, b, c, G)
sage: T1
[ 0 -1  3  1]
[-1  1  0  2]
[ 1  3  2 -1]
[ 2  0 -1  3]
sage: T2
[ 1 -1  0  3]
[-1  0  2  1]
[ 2  1  3 -1]
[ 0  3 -1  2]
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> a, b, c, G = alternating_group_bitrade_generators(Integer(1))
>>> (T1, T2) = bitrade_from_group(a, b, c, G)
>>> T1
[ 0 -1  3  1]
[-1  1  0  2]
[ 1  3  2 -1]
[ 2  0 -1  3]
>>> T2
[ 1 -1  0  3]
[-1  0  2  1]
[ 2  1  3 -1]
[ 0  3 -1  2]
```

sage.combinat.matrices.latin.**cells_map_as_square**(*cells_map*, *n*)

Return a LatinSquare with cells numbered from 1, 2, … to given the dictionary cells_map.

Note

The value n should be the maximum of the number of rows and columns of the original partial latin square

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: (a, b, c, G) = alternating_group_bitrade_generators(1)
sage: (T1, T2) = bitrade_from_group(a, b, c, G)
sage: T1
[ 0 -1  3  1]
[-1  1  0  2]
[ 1  3  2 -1]
[ 2  0 -1  3]
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> (a, b, c, G) = alternating_group_bitrade_generators(Integer(1))
>>> (T1, T2) = bitrade_from_group(a, b, c, G)
>>> T1
[ 0 -1  3  1]
[-1  1  0  2]
[ 1  3  2 -1]
[ 2  0 -1  3]
```

There are 12 filled cells in T:

```
sage: cells_map_as_square(T1.filled_cells_map(), max(T1.nrows(), T1.ncols()))
[ 1 -1  2  3]
[-1  4  5  6]
[ 7  8  9 -1]
[10 11 -1 12]
```

```
>>> from sage.all import *
>>> cells_map_as_square(T1.filled_cells_map(), max(T1.nrows(), T1.ncols()))
[ 1 -1  2  3]
[-1  4  5  6]
[ 7  8  9 -1]
[10 11 -1 12]
```

sage.combinat.matrices.latin.**check_bitrade_generators**(*a*, *b*, *c*)

Three group elements a, b, c will generate a bitrade if a*b*c = 1 and the subgroups a, b, c intersect (pairwise) in just the identity.

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: a, b, c, G = p3_group_bitrade_generators(3)
sage: check_bitrade_generators(a, b, c)
True
sage: check_bitrade_generators(a, b, libgap(gap('()')))
False
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> a, b, c, G = p3_group_bitrade_generators(Integer(3))
>>> check_bitrade_generators(a, b, c)
True
>>> check_bitrade_generators(a, b, libgap(gap('()')))
False
```

sage.combinat.matrices.latin.**coin**()

Simulate a fair coin (returns `True` or `False`) using ZZ.random_element(2).

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import coin
sage: x = coin()
sage: x == 0 or x == 1
True
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import coin
>>> x = coin()
>>> x == Integer(0) or x == Integer(1)
True
```

sage.combinat.matrices.latin.**column_containing_sym**(*L*, *r*, *x*)

Given an improper latin square L with L[r, c1] = L[r, c2] = x, return c1 or c2 with equal probability. This is an internal function and should only be used in LatinSquare_generator().

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: L = matrix([(1, 0, 2, 3), (0, 2, 3, 0), (2, 3, 0, 1), (3, 0, 1, 2)])
sage: L
```

(continues on next page)

(continued from previous page)

```
[1 0 2 3]
[0 2 3 0]
[2 3 0 1]
[3 0 1 2]
sage: c = column_containing_sym(L, 1, 0)
sage: c == 0 or c == 3
True
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> L = matrix([(Integer(1), Integer(0), Integer(2), Integer(3)), (Integer(0),␣
↪Integer(2), Integer(3), Integer(0)), (Integer(2), Integer(3), Integer(0),␣
↪Integer(1)), (Integer(3), Integer(0), Integer(1), Integer(2))])
>>> L
[1 0 2 3]
[0 2 3 0]
[2 3 0 1]
[3 0 1 2]
>>> c = column_containing_sym(L, Integer(1), Integer(0))
>>> c == Integer(0) or c == Integer(3)
True
```

sage.combinat.matrices.latin.**direct_product**(*L1*, *L2*, *L3*, *L4*)

The 'direct product' of four latin squares L1, L2, L3, L4 of order n is the latin square of order 2n consisting of

```
-----------
| L1 | L2 |
-----------
| L3 | L4 |
-----------
```

where the subsquares L2 and L3 have entries offset by n.

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: direct_product(back_circulant(4), back_circulant(4), elementary_abelian_
↪2group(2), elementary_abelian_2group(2))
[0 1 2 3 4 5 6 7]
[1 2 3 0 5 6 7 4]
[2 3 0 1 6 7 4 5]
[3 0 1 2 7 4 5 6]
[4 5 6 7 0 1 2 3]
[5 4 7 6 1 0 3 2]
[6 7 4 5 2 3 0 1]
[7 6 5 4 3 2 1 0]
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> direct_product(back_circulant(Integer(4)), back_circulant(Integer(4)),␣
↪elementary_abelian_2group(Integer(2)), elementary_abelian_2group(Integer(2)))
[0 1 2 3 4 5 6 7]
```

(continues on next page)

(continued from previous page)

```
[1 2 3 0 5 6 7 4]
[2 3 0 1 6 7 4 5]
[3 0 1 2 7 4 5 6]
[4 5 6 7 0 1 2 3]
[5 4 7 6 1 0 3 2]
[6 7 4 5 2 3 0 1]
[7 6 5 4 3 2 1 0]
```

sage.combinat.matrices.latin.**dlxcpp_find_completions**(*P*, *nr_to_find=None*)

Return a list of all latin squares L of the same order as P such that P is contained in L. The optional parameter nr_to_find limits the number of latin squares that are found.

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: dlxcpp_find_completions(LatinSquare(2))
[[0 1]
[1 0], [1 0]
[0 1]]
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> dlxcpp_find_completions(LatinSquare(Integer(2)))
[[0 1]
[1 0], [1 0]
[0 1]]
```

```
sage: dlxcpp_find_completions(LatinSquare(2), 1)
[[0 1]
[1 0]]
```

```
>>> from sage.all import *
>>> dlxcpp_find_completions(LatinSquare(Integer(2)), Integer(1))
[[0 1]
[1 0]]
```

sage.combinat.matrices.latin.**dlxcpp_rows_and_map**(*P*)

Internal function for `dlxcpp_find_completions`. Given a partial latin square P we construct a list of rows of a 0-1 matrix M such that an exact cover of M corresponds to a completion of P to a latin square.

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: dlxcpp_rows_and_map(LatinSquare(2))
([[0, 4, 8],
  [1, 5, 8],
  [2, 4, 9],
  [3, 5, 9],
  [0, 6, 10],
  [1, 7, 10],
  [2, 6, 11],
  [3, 7, 11]],
```

(continues on next page)

(continued from previous page)

```
 {(0, 4, 8): (0, 0, 0),
  (0, 6, 10): (1, 0, 0),
  (1, 5, 8): (0, 0, 1),
  (1, 7, 10): (1, 0, 1),
  (2, 4, 9): (0, 1, 0),
  (2, 6, 11): (1, 1, 0),
  (3, 5, 9): (0, 1, 1),
  (3, 7, 11): (1, 1, 1)})
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> dlxcpp_rows_and_map(LatinSquare(Integer(2)))
([[0, 4, 8],
  [1, 5, 8],
  [2, 4, 9],
  [3, 5, 9],
  [0, 6, 10],
  [1, 7, 10],
  [2, 6, 11],
  [3, 7, 11]],
 {(0, 4, 8): (0, 0, 0),
  (0, 6, 10): (1, 0, 0),
  (1, 5, 8): (0, 0, 1),
  (1, 7, 10): (1, 0, 1),
  (2, 4, 9): (0, 1, 0),
  (2, 6, 11): (1, 1, 0),
  (3, 5, 9): (0, 1, 1),
  (3, 7, 11): (1, 1, 1)})
```

sage.combinat.matrices.latin.**elementary_abelian_2group**(*s*)

Return the latin square based on the Cayley table for the elementary abelian 2-group of order 2s.

INPUT:

- `s` – integer; order of the latin square will be 2s

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: elementary_abelian_2group(3)
[0 1 2 3 4 5 6 7]
[1 0 3 2 5 4 7 6]
[2 3 0 1 6 7 4 5]
[3 2 1 0 7 6 5 4]
[4 5 6 7 0 1 2 3]
[5 4 7 6 1 0 3 2]
[6 7 4 5 2 3 0 1]
[7 6 5 4 3 2 1 0]
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> elementary_abelian_2group(Integer(3))
[0 1 2 3 4 5 6 7]
```

(continues on next page)

(continued from previous page)

```
[1 0 3 2 5 4 7 6]
[2 3 0 1 6 7 4 5]
[3 2 1 0 7 6 5 4]
[4 5 6 7 0 1 2 3]
[5 4 7 6 1 0 3 2]
[6 7 4 5 2 3 0 1]
[7 6 5 4 3 2 1 0]
```

sage.combinat.matrices.latin.**forward_circulant**(*n*)

The forward-circulant latin square of order n is the Cayley table for the operation r + c = (n-c+r) mod n.

INPUT:

- n – integer; order of the latin square

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: forward_circulant(5)
[0 4 3 2 1]
[1 0 4 3 2]
[2 1 0 4 3]
[3 2 1 0 4]
[4 3 2 1 0]
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> forward_circulant(Integer(5))
[0 4 3 2 1]
[1 0 4 3 2]
[2 1 0 4 3]
[3 2 1 0 4]
[4 3 2 1 0]
```

sage.combinat.matrices.latin.**genus**(*T1*, *T2*)

Return the genus of hypermap embedding associated with the bitrade (T1, T2).

Informally, we compute the [tau_1, tau_2, tau_3] permutation representation of the bitrade. Each cycle of tau_1, tau_2, and tau_3 gives a rotation scheme for a black, white, and star vertex (respectively). The genus then comes from Euler's formula.

For more details see Carlo Hamalainen: *Partitioning 3-homogeneous latin bitrades*. To appear in Geometriae Dedicata, available at arXiv 0710.0938

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: (a, b, c, G) = alternating_group_bitrade_generators(1)
sage: (T1, T2) = bitrade_from_group(a, b, c, G)
sage: genus(T1, T2)
1
sage: (a, b, c, G) = pq_group_bitrade_generators(3, 7)
sage: (T1, T2) = bitrade_from_group(a, b, c, G)
sage: genus(T1, T2)
3
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> (a, b, c, G) = alternating_group_bitrade_generators(Integer(1))
>>> (T1, T2) = bitrade_from_group(a, b, c, G)
>>> genus(T1, T2)
1
>>> (a, b, c, G) = pq_group_bitrade_generators(Integer(3), Integer(7))
>>> (T1, T2) = bitrade_from_group(a, b, c, G)
>>> genus(T1, T2)
3
```

sage.combinat.matrices.latin.**group_to_LatinSquare**(*G*)

Construct a latin square on the symbols [0, 1, …, n-1] for a group with an n by n Cayley table.

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import group_to_LatinSquare

sage: group_to_LatinSquare(DihedralGroup(2))
[0 1 2 3]
[1 0 3 2]
[2 3 0 1]
[3 2 1 0]
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import group_to_LatinSquare

>>> group_to_LatinSquare(DihedralGroup(Integer(2)))
[0 1 2 3]
[1 0 3 2]
[2 3 0 1]
[3 2 1 0]
```

```
sage: G = libgap.Group(PermutationGroupElement((1,2,3)))
sage: group_to_LatinSquare(G)
[0 1 2]
[1 2 0]
[2 0 1]
```

```
>>> from sage.all import *
>>> G = libgap.Group(PermutationGroupElement((Integer(1),Integer(2),Integer(3))))
>>> group_to_LatinSquare(G)
[0 1 2]
[1 2 0]
[2 0 1]
```

sage.combinat.matrices.latin.**is_bitrade**(*T1*, *T2*)

Combinatorially, a pair (T1, T2) of partial latin squares is a bitrade if they are disjoint, have the same shape, and have row and column balance. For definitions of each of these terms see the relevant function in this file.

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: T1 = back_circulant(5)
sage: x = isotopism( (0,1,2,3,4) )
sage: y = isotopism(5) # identity
sage: z = isotopism(5) # identity
sage: T2 = T1.apply_isotopism(x, y, z)
sage: is_bitrade(T1, T2)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> T1 = back_circulant(Integer(5))
>>> x = isotopism( (Integer(0),Integer(1),Integer(2),Integer(3),Integer(4)) )
>>> y = isotopism(Integer(5)) # identity
>>> z = isotopism(Integer(5)) # identity
>>> T2 = T1.apply_isotopism(x, y, z)
>>> is_bitrade(T1, T2)
True
```

sage.combinat.matrices.latin.**is_disjoint**(*T1*, *T2*)

The partial latin squares T1 and T2 are disjoint if T1[r, c] != T2[r, c] or T1[r, c] == T2[r, c] == -1 for each cell [r, c].

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import is_disjoint, back_circulant,␣
↪isotopism
sage: is_disjoint(back_circulant(2), back_circulant(2))
False
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import is_disjoint, back_circulant,␣
↪isotopism
>>> is_disjoint(back_circulant(Integer(2)), back_circulant(Integer(2)))
False
```

```
sage: T1 = back_circulant(5)
sage: x = isotopism( (0,1,2,3,4) )
sage: y = isotopism(5) # identity
sage: z = isotopism(5) # identity
sage: T2 = T1.apply_isotopism(x, y, z)
sage: is_disjoint(T1, T2)
True
```

```
>>> from sage.all import *
>>> T1 = back_circulant(Integer(5))
>>> x = isotopism( (Integer(0),Integer(1),Integer(2),Integer(3),Integer(4)) )
>>> y = isotopism(Integer(5)) # identity
>>> z = isotopism(Integer(5)) # identity
>>> T2 = T1.apply_isotopism(x, y, z)
>>> is_disjoint(T1, T2)
True
```

sage.combinat.matrices.latin.**is_primary_bitrade**(*a*, *b*, *c*, *G*)

A bitrade generated from elements a, b, c is primary if a, b, c = G.

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: (a, b, c, G) = p3_group_bitrade_generators(5)
sage: is_primary_bitrade(a, b, c, G)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> (a, b, c, G) = p3_group_bitrade_generators(Integer(5))
>>> is_primary_bitrade(a, b, c, G)
True
```

sage.combinat.matrices.latin.**is_row_and_col_balanced**(*T1*, *T2*)

Partial latin squares T1 and T2 are balanced if the symbols appearing in row r of T1 are the same as the symbols appearing in row r of T2, for each r, and if the same condition holds on columns.

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: T1 = matrix([[0,1,-1,-1], [-1,-1,-1,-1], [-1,-1,-1,-1], [-1,-1,-1,-1]])
sage: T2 = matrix([[0,1,-1,-1], [-1,-1,-1,-1], [-1,-1,-1,-1], [-1,-1,-1,-1]])
sage: is_row_and_col_balanced(T1, T2)
True
sage: T2 = matrix([[0,3,-1,-1], [-1,-1,-1,-1], [-1,-1,-1,-1], [-1,-1,-1,-1]])
sage: is_row_and_col_balanced(T1, T2)
False
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> T1 = matrix([[Integer(0),Integer(1),-Integer(1),-Integer(1)], [-Integer(1),-
↪Integer(1),-Integer(1),-Integer(1)], [-Integer(1),-Integer(1),-Integer(1),-
↪Integer(1)], [-Integer(1),-Integer(1),-Integer(1),-Integer(1)]])
>>> T2 = matrix([[Integer(0),Integer(1),-Integer(1),-Integer(1)], [-Integer(1),-
↪Integer(1),-Integer(1),-Integer(1)], [-Integer(1),-Integer(1),-Integer(1),-
↪Integer(1)], [-Integer(1),-Integer(1),-Integer(1),-Integer(1)]])
>>> is_row_and_col_balanced(T1, T2)
True
>>> T2 = matrix([[Integer(0),Integer(3),-Integer(1),-Integer(1)], [-Integer(1),-
↪Integer(1),-Integer(1),-Integer(1)], [-Integer(1),-Integer(1),-Integer(1),-
↪Integer(1)], [-Integer(1),-Integer(1),-Integer(1),-Integer(1)]])
>>> is_row_and_col_balanced(T1, T2)
False
```

sage.combinat.matrices.latin.**is_same_shape**(*T1*, *T2*)

Two partial latin squares T1, T2 have the same shape if T1[r, c] = 0 if and only if T2[r, c] = 0.

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: is_same_shape(elementary_abelian_2group(2), back_circulant(4))
```

(continues on next page)

(continued from previous page)

```
True
sage: is_same_shape(LatinSquare(5), LatinSquare(5))
True
sage: is_same_shape(forward_circulant(5), LatinSquare(5))
False
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> is_same_shape(elementary_abelian_2group(Integer(2)), back_
↪circulant(Integer(4)))
True
>>> is_same_shape(LatinSquare(Integer(5)), LatinSquare(Integer(5)))
True
>>> is_same_shape(forward_circulant(Integer(5)), LatinSquare(Integer(5)))
False
```

sage.combinat.matrices.latin.**isotopism**(*p*)

Return a Permutation object that represents an isotopism (for rows, columns or symbols of a partial latin square).

Technically, all this function does is take as input a representation of a permutation of $0, ..., n-1$ and return a `Permutation` object defined on $1, ..., n$.

For a definition of isotopism, see the wikipedia section on isotopism.

INPUT:

According to the type of input (see examples below):

- an integer n – the function returns the identity on $1, ..., n$
- a string representing a permutation in disjoint cycles notation, e.g. $(0, 1, 2)(3, 4, 5)$ – the corresponding permutation is returned, shifted by 1 to act on $1, ..., n$
- list/tuple of tuples – assumes disjoint cycle notation, see previous entry
- a list of integers – the function adds 1 to each member of the list, and returns the corresponding permutation
- a `PermutationGroupElement` `p` – returns a permutation describing `p` **without** any shift

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: isotopism(5) # identity on 5 points
[1, 2, 3, 4, 5]
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> isotopism(Integer(5)) # identity on 5 points
[1, 2, 3, 4, 5]
```

```
sage: G = PermutationGroup(['(1,2,3)(4,5)'])
sage: g = G.gen(0)
sage: isotopism(g)
[2, 3, 1, 5, 4]
```

```
>>> from sage.all import *
>>> G = PermutationGroup(['(1,2,3)(4,5)'])
>>> g = G.gen(Integer(0))
>>> isotopism(g)
[2, 3, 1, 5, 4]
```

```
sage: isotopism([0,3,2,1]) # 0 goes to 0, 1 goes to 3, etc.
[1, 4, 3, 2]
```

```
>>> from sage.all import *
>>> isotopism([Integer(0),Integer(3),Integer(2),Integer(1)]) # 0 goes to 0, 1␣
↪goes to 3, etc.
[1, 4, 3, 2]
```

```
sage: isotopism( (0,1,2) ) # single cycle, presented as a tuple
[2, 3, 1]
```

```
>>> from sage.all import *
>>> isotopism( (Integer(0),Integer(1),Integer(2)) ) # single cycle, presented as␣
↪a tuple
[2, 3, 1]
```

```
sage: x = isotopism( ((0,1,2), (3,4)) ) # tuple of cycles
sage: x
[2, 3, 1, 5, 4]
sage: x.to_cycles()
[(1, 2, 3), (4, 5)]
```

```
>>> from sage.all import *
>>> x = isotopism( ((Integer(0),Integer(1),Integer(2)), (Integer(3),Integer(4)))␣
↪) # tuple of cycles
>>> x
[2, 3, 1, 5, 4]
>>> x.to_cycles()
[(1, 2, 3), (4, 5)]
```

sage.combinat.matrices.latin.**next_conjugate**(*L*)

Permute L[r, c] = e to the conjugate L[c, e] = r.

We assume that L is an n by n matrix and has values in the range 0, 1, …, n-1.

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: L = back_circulant(6)
sage: L
[0 1 2 3 4 5]
[1 2 3 4 5 0]
[2 3 4 5 0 1]
[3 4 5 0 1 2]
[4 5 0 1 2 3]
[5 0 1 2 3 4]
```

(continues on next page)

(continued from previous page)

```
sage: next_conjugate(L)
[0 1 2 3 4 5]
[5 0 1 2 3 4]
[4 5 0 1 2 3]
[3 4 5 0 1 2]
[2 3 4 5 0 1]
[1 2 3 4 5 0]
sage: L == next_conjugate(next_conjugate(next_conjugate(L)))
True
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> L = back_circulant(Integer(6))
>>> L
[0 1 2 3 4 5]
[1 2 3 4 5 0]
[2 3 4 5 0 1]
[3 4 5 0 1 2]
[4 5 0 1 2 3]
[5 0 1 2 3 4]
>>> next_conjugate(L)
[0 1 2 3 4 5]
[5 0 1 2 3 4]
[4 5 0 1 2 3]
[3 4 5 0 1 2]
[2 3 4 5 0 1]
[1 2 3 4 5 0]
>>> L == next_conjugate(next_conjugate(next_conjugate(L)))
True
```

sage.combinat.matrices.latin.**p3_group_bitrade_generators**(*p*)

Generators for a group of order p3 where p is a prime.

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: p3_group_bitrade_generators(3)   # random output
((2,6,7)(3,8,9),
 (1,2,3)(4,7,8)(5,6,9),
 (1,9,2)(3,7,4)(5,8,6),
 Permutation Group with generators [(2,6,7)(3,8,9), (1,2,3)(4,7,8)(5,6,9)])
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> p3_group_bitrade_generators(Integer(3))   # random output
((2,6,7)(3,8,9),
 (1,2,3)(4,7,8)(5,6,9),
 (1,9,2)(3,7,4)(5,8,6),
 Permutation Group with generators [(2,6,7)(3,8,9), (1,2,3)(4,7,8)(5,6,9)])
```

sage.combinat.matrices.latin.**pq_group_bitrade_generators**(*p*, *q*)

Generators for a group of order pq where p and q are primes such that (q % p) == 1.

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: pq_group_bitrade_generators(3,7)
((2,3,5)(4,7,6), (1,2,3,4,5,6,7), (1,4,2)(3,5,6), Permutation Group with␣
→generators [(2,3,5)(4,7,6), (1,2,3,4,5,6,7)])
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> pq_group_bitrade_generators(Integer(3),Integer(7))
((2,3,5)(4,7,6), (1,2,3,4,5,6,7), (1,4,2)(3,5,6), Permutation Group with␣
→generators [(2,3,5)(4,7,6), (1,2,3,4,5,6,7)])
```

`sage.combinat.matrices.latin.`**`row_containing_sym`**`(`*L, c, x*`)`

Given an improper latin square L with L[r1, c] = L[r2, c] = x, return r1 or r2 with equal probability. This is an internal function and should only be used in LatinSquare_generator().

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: L = matrix([(0, 1, 0, 3), (3, 0, 2, 1), (1, 0, 3, 2), (2, 3, 1, 0)])
sage: L
[0 1 0 3]
[3 0 2 1]
[1 0 3 2]
[2 3 1 0]
sage: c = row_containing_sym(L, 1, 0)
sage: c == 1 or c == 2
True
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> L = matrix([(Integer(0), Integer(1), Integer(0), Integer(3)), (Integer(3),␣
→Integer(0), Integer(2), Integer(1)), (Integer(1), Integer(0), Integer(3),␣
→Integer(2)), (Integer(2), Integer(3), Integer(1), Integer(0))])
>>> L
[0 1 0 3]
[3 0 2 1]
[1 0 3 2]
[2 3 1 0]
>>> c = row_containing_sym(L, Integer(1), Integer(0))
>>> c == Integer(1) or c == Integer(2)
True
```

`sage.combinat.matrices.latin.`**`tau1`**`(`*T1, T2, cells_map*`)`

The definition of τ_1 is

$$\tau_1 : T1 \to T1$$
$$\tau_1 = \beta_2^{-1}\beta_3$$

where the composition is left to right and $\beta_i : T2 \to T1$ changes just the i-th coordinate of a triple.

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: T1 = back_circulant(5)
sage: x = isotopism( (0,1,2,3,4) )
sage: y = isotopism(5) # identity
sage: z = isotopism(5) # identity
sage: T2 = T1.apply_isotopism(x, y, z)
sage: is_bitrade(T1, T2)
True
sage: (cells_map, t1, t2, t3) = tau123(T1, T2)
sage: t1 = tau1(T1, T2, cells_map)
sage: t1
[2, 3, 4, 5, 1, 7, 8, 9, 10, 6, 12, 13, 14, 15, 11, 17, 18, 19, 20, 16, 22, 23,␣
↪24, 25, 21]
sage: t1.to_cycles()
[(1, 2, 3, 4, 5), (6, 7, 8, 9, 10), (11, 12, 13, 14, 15), (16, 17, 18, 19, 20),␣
↪(21, 22, 23, 24, 25)]
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> T1 = back_circulant(Integer(5))
>>> x = isotopism( (Integer(0),Integer(1),Integer(2),Integer(3),Integer(4)) )
>>> y = isotopism(Integer(5)) # identity
>>> z = isotopism(Integer(5)) # identity
>>> T2 = T1.apply_isotopism(x, y, z)
>>> is_bitrade(T1, T2)
True
>>> (cells_map, t1, t2, t3) = tau123(T1, T2)
>>> t1 = tau1(T1, T2, cells_map)
>>> t1
[2, 3, 4, 5, 1, 7, 8, 9, 10, 6, 12, 13, 14, 15, 11, 17, 18, 19, 20, 16, 22, 23,␣
↪24, 25, 21]
>>> t1.to_cycles()
[(1, 2, 3, 4, 5), (6, 7, 8, 9, 10), (11, 12, 13, 14, 15), (16, 17, 18, 19, 20),␣
↪(21, 22, 23, 24, 25)]
```

sage.combinat.matrices.latin.**tau123**(*T1*, *T2*)

Compute the tau_i representation for a bitrade (T1, T2).

See the functions tau1, tau2, and tau3 for the mathematical definitions.

OUTPUT:

- (cells_map, t1, t2, t3)

where cells_map is a map to/from the filled cells of T1, and t1, t2, t3 are the tau1, tau2, tau3 permutations.

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: (a, b, c, G) = pq_group_bitrade_generators(3, 7)
sage: (T1, T2) = bitrade_from_group(a, b, c, G)
sage: T1
[ 0  1  3 -1 -1 -1 -1]
[ 1  2  4 -1 -1 -1 -1]
[ 2  3  5 -1 -1 -1 -1]
```

↪19, 17)]
```

The product t1*t2*t3 is the identity, i.e. it fixes every point:

```
sage: len((t1*t2*t3).fixed_points()) == T1.nr_filled_cells()
True
```

```
>>> from sage.all import *
>>> len((t1*t2*t3).fixed_points()) == T1.nr_filled_cells()
True
```

sage.combinat.matrices.latin.**tau2**(*T1*, *T2*, *cells_map*)

The definition of τ_2 is

$$\tau_2 : T1 \rightarrow T1$$
$$\tau_2 = \beta_3^{-1}\beta_1$$

where the composition is left to right and $\beta_i : T2 \rightarrow T1$ changes just the i-th coordinate of a triple.

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: T1 = back_circulant(5)
sage: x = isotopism( (0,1,2,3,4) )
sage: y = isotopism(5) # identity
sage: z = isotopism(5) # identity
sage: T2 = T1.apply_isotopism(x, y, z)
sage: is_bitrade(T1, T2)

sage: (cells_map, t1, t2, t3) = tau123(T1, T2)
sage: t2 = tau2(T1, T2, cells_map)
sage: t2
[21, 22, 23, 24, 25, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17,␣
↪18, 19, 20]
sage: t2.to_cycles()
[(1, 21, 16, 11, 6), (2, 22, 17, 12, 7), (3, 23, 18, 13, 8), (4, 24, 19, 14, 9),␣
↪(5, 25, 20, 15, 10)]
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> T1 = back_circulant(Integer(5))
>>> x = isotopism( (Integer(0),Integer(1),Integer(2),Integer(3),Integer(4)) )
>>> y = isotopism(Integer(5)) # identity
>>> z = isotopism(Integer(5)) # identity
>>> T2 = T1.apply_isotopism(x, y, z)
>>> is_bitrade(T1, T2)
True
>>> (cells_map, t1, t2, t3) = tau123(T1, T2)
>>> t2 = tau2(T1, T2, cells_map)
>>> t2
[21, 22, 23, 24, 25, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17,
↪18, 19, 20]
>>> t2.to_cycles()
[(1, 21, 16, 11, 6), (2, 22, 17, 12, 7), (3, 23, 18, 13, 8), (4, 24, 19, 14, 9),
↪(5, 25, 20, 15, 10)]
```

sage.combinat.matrices.latin.**tau3**(*T1*, *T2*, *cells_map*)

The definition of τ_3 is

$$\tau_3 : T1 \rightarrow T1$$
$$\tau_3 = \beta_1^{-1}\beta_2$$

where the composition is left to right and $\beta_i : T2 \rightarrow T1$ changes just the i-th coordinate of a triple.

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: T1 = back_circulant(5)
sage: x = isotopism( (0,1,2,3,4) )
sage: y = isotopism(5) # identity
sage: z = isotopism(5) # identity
sage: T2 = T1.apply_isotopism(x, y, z)
sage: is_bitrade(T1, T2)

[(1, 10, 14, 18, 22), (2, 6, 15, 19, 23), (3, 7, 11, 20, 24), (4, 8, 12, 16, 25),␣
↪(5, 9, 13, 17, 21)]
```

sage.combinat.matrices.latin.**tau_to_bitrade**(*t1*, *t2*, *t3*)

Given permutations t1, t2, t3 that represent a latin bitrade, convert them to an explicit latin bitrade (T1, T2). The result is unique up to isotopism.

EXAMPLES:

```
sage: from sage.combinat.matrices.latin import *
sage: T1 = back_circulant(5)
sage: x = isotopism( (0,1,2,3,4) )
sage: y = isotopism(5) # identity
sage: z = isotopism(5) # identity
sage: T2 = T1.apply_isotopism(x, y, z)
sage: _, t1, t2, t3 = tau123(T1, T2)
sage: U1, U2 = tau_to_bitrade(t1, t2, t3)
sage: assert is_bitrade(U1, U2)
sage: U1
[0 1 2 3 4]
[1 2 3 4 0]
[2 3 4 0 1]
[3 4 0 1 2]
[4 0 1 2 3]
sage: U2
[4 0 1 2 3]
[0 1 2 3 4]
[1 2 3 4 0]
[2 3 4 0 1]
[3 4 0 1 2]
```

```
>>> from sage.all import *
>>> from sage.combinat.matrices.latin import *
>>> T1 = back_circulant(Integer(5))
>>> x = isotopism( (Integer(0),Integer(1),Integer(2),Integer(3),Integer(4)) )
>>> y = isotopism(Integer(5)) # identity
>>> z = isotopism(Integer(5)) # identity
>>> T2 = T1.apply_isotopism(x, y, z)
>>> _, t1, t2, t3 = tau123(T1, T2)
>>> U1, U2 = tau_to_bitrade(t1, t2, t3)
>>> assert is_bitrade(U1, U2)
>>> U1
[0 1 2 3 4]
[1 2 3 4 0]
[2 3 4 0 1]
```

(continues on next page)

(continued from previous page)

```
[3 4 0 1 2]
[4 0 1 2 3]
>>> U2
[4 0 1 2 3]
[0 1 2 3 4]
[1 2 3 4 0]
[2 3 4 0 1]
[3 4 0 1 2]
```

5.1.139 Miscellaneous

class sage.combinat.misc.**DoublyLinkedList**(*l*)

Bases: object

A doubly linked list class that provides constant time hiding and unhiding of entries.

Note that this list's indexing is 1-based.

EXAMPLES:

```
sage: dll = sage.combinat.misc.DoublyLinkedList([1,2,3]); dll
Doubly linked list of [1, 2, 3]: [1, 2, 3]
sage: dll.hide(1); dll
Doubly linked list of [1, 2, 3]: [2, 3]
sage: dll.unhide(1); dll
Doubly linked list of [1, 2, 3]: [1, 2, 3]
sage: dll.hide(2); dll
Doubly linked list of [1, 2, 3]: [1, 3]
sage: dll.unhide(2); dll
Doubly linked list of [1, 2, 3]: [1, 2, 3]
```

```
>>> from sage.all import *
>>> dll = sage.combinat.misc.DoublyLinkedList([Integer(1),Integer(2),Integer(3)]);
↪ dll
Doubly linked list of [1, 2, 3]: [1, 2, 3]
>>> dll.hide(Integer(1)); dll
Doubly linked list of [1, 2, 3]: [2, 3]
>>> dll.unhide(Integer(1)); dll
Doubly linked list of [1, 2, 3]: [1, 2, 3]
>>> dll.hide(Integer(2)); dll
Doubly linked list of [1, 2, 3]: [1, 3]
>>> dll.unhide(Integer(2)); dll
Doubly linked list of [1, 2, 3]: [1, 2, 3]
```

head()

hide(*i*)

next(*j*)

prev(*j*)

unhide(*i*)

class sage.combinat.misc.**IterableFunctionCall**(*f*, **args*, ***kwargs*)

Bases: object

This class wraps functions with a yield statement (generators) by an object that can be iterated over. For example,

EXAMPLES:

```
sage: def f(): yield 'a'; yield 'b'
```

```
>>> from sage.all import *
>>> def f(): yield 'a'; yield 'b'
```

This does not work:

```
sage: for z in f: print(z)
Traceback (most recent call last):
...
TypeError: 'function' object is not iterable
```

```
>>> from sage.all import *
>>> for z in f: print(z)
Traceback (most recent call last):
...
TypeError: 'function' object is not iterable
```

Use IterableFunctionCall if you want something like the above to work:

```
sage: from sage.combinat.misc import IterableFunctionCall
sage: g = IterableFunctionCall(f)
sage: for z in g: print(z)
a
b
```

```
>>> from sage.all import *
>>> from sage.combinat.misc import IterableFunctionCall
>>> g = IterableFunctionCall(f)
>>> for z in g: print(z)
a
b
```

If your function takes arguments, just put them after the function name. You needn't enclose them in a tuple or anything, just put them there:

```
sage: def f(n, m): yield 'a' * n; yield 'b' * m; yield 'foo'
sage: g = IterableFunctionCall(f, 2, 3)
sage: for z in g: print(z)
aa
bbb
foo
```

```
>>> from sage.all import *
>>> def f(n, m): yield 'a' * n; yield 'b' * m; yield 'foo'
>>> g = IterableFunctionCall(f, Integer(2), Integer(3))
>>> for z in g: print(z)
```

(continues on next page)

(continued from previous page)

```
aa
bbb
foo
```

sage.combinat.misc.**check_integer_list_constraints**(*l*, ***kwargs*)

EXAMPLES:

```
sage: from sage.combinat.misc import check_integer_list_constraints
sage: cilc = check_integer_list_constraints
sage: l = [[2,1,3],[1,2],[3,3],[4,1,1]]
sage: cilc(l, min_part=2)
[[3, 3]]
sage: cilc(l, max_part=2)
[[1, 2]]
sage: cilc(l, length=2)
[[1, 2], [3, 3]]
sage: cilc(l, max_length=2)
[[1, 2], [3, 3]]
sage: cilc(l, min_length=3)
[[2, 1, 3], [4, 1, 1]]
sage: cilc(l, max_slope=0)
[[3, 3], [4, 1, 1]]
sage: cilc(l, min_slope=1)
[[1, 2]]
sage: cilc(l, outer=[2,2])
[[1, 2]]
sage: cilc(l, inner=[2,2])
[[3, 3]]
```

```
>>> from sage.all import *
>>> from sage.combinat.misc import check_integer_list_constraints
>>> cilc = check_integer_list_constraints
>>> l = [[Integer(2),Integer(1),Integer(3)],[Integer(1),Integer(2)],[Integer(3),
↪Integer(3)],[Integer(4),Integer(1),Integer(1)]]
>>> cilc(l, min_part=Integer(2))
[[3, 3]]
>>> cilc(l, max_part=Integer(2))
[[1, 2]]
>>> cilc(l, length=Integer(2))
[[1, 2], [3, 3]]
>>> cilc(l, max_length=Integer(2))
[[1, 2], [3, 3]]
>>> cilc(l, min_length=Integer(3))
[[2, 1, 3], [4, 1, 1]]
>>> cilc(l, max_slope=Integer(0))
[[3, 3], [4, 1, 1]]
>>> cilc(l, min_slope=Integer(1))
[[1, 2]]
>>> cilc(l, outer=[Integer(2),Integer(2)])
[[1, 2]]
>>> cilc(l, inner=[Integer(2),Integer(2)])
[[3, 3]]
```

```
sage: cilc([1,2,3], length=3, singleton=True)
[1, 2, 3]
sage: cilc([1,2,3], length=2, singleton=True) is None
True
```

```
>>> from sage.all import *
>>> cilc([Integer(1),Integer(2),Integer(3)], length=Integer(3), singleton=True)
[1, 2, 3]
>>> cilc([Integer(1),Integer(2),Integer(3)], length=Integer(2), singleton=True)␣
↪is None
True
```

sage.combinat.misc.**umbral_operation**(*poly*)

Return the umbral operation $\downarrow$ applied to poly.

The umbral operation replaces each instance of $x_i^{a_i}$ with $x_i * (x_i - 1) * \cdots * (x_i - a_i + 1)$.

EXAMPLES:

```
sage: P = PolynomialRing(QQ, 2, 'x')
sage: x = P.gens()
sage: from sage.combinat.misc import umbral_operation
sage: umbral_operation(x[0]^3) == x[0]*(x[0]-1)*(x[0]-2)
True
sage: umbral_operation(x[0]*x[1])
x0*x1
sage: umbral_operation(x[0]+x[1])
x0 + x1
sage: umbral_operation(x[0]^2*x[1]^2) == x[0]*(x[0]-1)*x[1]*(x[1]-1)
True
```

```
>>> from sage.all import *
>>> P = PolynomialRing(QQ, Integer(2), 'x')
>>> x = P.gens()
>>> from sage.combinat.misc import umbral_operation
>>> umbral_operation(x[Integer(0)]**Integer(3)) == x[Integer(0)]*(x[Integer(0)]-
↪Integer(1))*(x[Integer(0)]-Integer(2))
True
>>> umbral_operation(x[Integer(0)]*x[Integer(1)])
x0*x1
>>> umbral_operation(x[Integer(0)]+x[Integer(1)])
x0 + x1
>>> umbral_operation(x[Integer(0)]**Integer(2)*x[Integer(1)]**Integer(2)) ==␣
↪x[Integer(0)]*(x[Integer(0)]-Integer(1))*x[Integer(1)]*(x[Integer(1)]-
↪Integer(1))
True
```

5.1.140 Ordered Multiset Partitions into Sets and the Minimaj Crystal

This module provides element and parent classes for ordered multiset partitions. It also implements the minimaj crystal of Benkart et al. [BCHOPSY2017]. (See *MinimajCrystal*.)

AUTHORS:

- Aaron Lauve (2018): initial implementation. First draft of minimaj crystal code provided by Anne Schilling.

REFERENCES:

- [BCHOPSY2017]
- [HRW2015]
- [HRS2016]
- [LM2018]

EXAMPLES:

An ordered multiset partition into sets of the multiset $\{\{1, 3, 3, 5\}\}$:

```
sage: OrderedMultisetPartitionIntoSets([[5, 3], [1, 3]])
[{3,5}, {1,3}]
```

```
>>> from sage.all import *
>>> OrderedMultisetPartitionIntoSets([[Integer(5), Integer(3)], [Integer(1),␣
↪Integer(3)]])
[{3,5}, {1,3}]
```

Ordered multiset partitions into sets of the multiset $\{\{1, 3, 3\}\}$:

```
sage: OrderedMultisetPartitionsIntoSets([1,1,3]).list()
[[{1}, {1}, {3}], [{1}, {1,3}], [{1}, {3}, {1}], [{1,3}, {1}], [{3}, {1}, {1}]]
```

```
>>> from sage.all import *
>>> OrderedMultisetPartitionsIntoSets([Integer(1),Integer(1),Integer(3)]).list()
[[{1}, {1}, {3}], [{1}, {1,3}], [{1}, {3}, {1}], [{1,3}, {1}], [{3}, {1}, {1}]]
```

Ordered multiset partitions into sets of the integer 4:

```
sage: OrderedMultisetPartitionsIntoSets(4).list()
[[{4}], [{1,3}], [{3}, {1}], [{1,2}, {1}], [{2}, {2}], [{2}, {1}, {1}],
 [{1}, {3}], [{1}, {1,2}], [{1}, {2}, {1}], [{1}, {1}, {2}], [{1}, {1}, {1}, {1}]]
```

```
>>> from sage.all import *
>>> OrderedMultisetPartitionsIntoSets(Integer(4)).list()
[[{4}], [{1,3}], [{3}, {1}], [{1,2}, {1}], [{2}, {2}], [{2}, {1}, {1}],
 [{1}, {3}], [{1}, {1,2}], [{1}, {2}, {1}], [{1}, {1}, {2}], [{1}, {1}, {1}, {1}]]
```

Ordered multiset partitions into sets on the alphabet $\{1, 4\}$ of order 3:

```
sage: OrderedMultisetPartitionsIntoSets([1,4], 3).list()
[[{1,4}, {1}], [{1,4}, {4}], [{1}, {1,4}], [{4}, {1,4}], [{1}, {1}, {1}],
 [{1}, {1}, {4}], [{1}, {4}, {1}], [{1}, {4}, {4}], [{4}, {1}, {1}],
 [{4}, {1}, {4}], [{4}, {4}, {1}], [{4}, {4}, {4}]]
```

```
>>> from sage.all import *
>>> OrderedMultisetPartitionsIntoSets([Integer(1),Integer(4)], Integer(3)).list()
[[{1,4}, {1}], [{1,4}, {4}], [{1}, {1,4}], [{4}, {1,4}], [{1}, {1}, {1}],
 [{1}, {1}, {4}], [{1}, {4}, {1}], [{1}, {4}, {4}], [{4}, {1}, {1}],
 [{4}, {1}, {4}], [{4}, {4}, {1}], [{4}, {4}, {4}]]
```

Crystal of ordered multiset partitions into sets on the alphabet $\{1, 2, 3\}$ with 4 letters divided into 2 blocks:

```
sage: crystals.Minimaj(3, 4, 2).list()                                        #␣
↪needs sage.modules
[((2, 3, 1), (1,)), ((2, 3), (1, 2)), ((2, 3), (1, 3)), ((2, 1), (1, 2)),
 ((3, 1), (1, 2)), ((3, 1, 2), (2,)), ((3, 1), (1, 3)), ((3, 1), (2, 3)),
 ((3, 2), (2, 3)), ((2, 1), (1, 3)), ((2,), (1, 2, 3)), ((3,), (1, 2, 3)),
 ((1,), (1, 2, 3)), ((1, 2), (2, 3)), ((1, 2, 3), (3,))]
```

```
>>> from sage.all import *
>>> crystals.Minimaj(Integer(3), Integer(4), Integer(2)).list()               ␣
↪                      # needs sage.modules
[((2, 3, 1), (1,)), ((2, 3), (1, 2)), ((2, 3), (1, 3)), ((2, 1), (1, 2)),
 ((3, 1), (1, 2)), ((3, 1, 2), (2,)), ((3, 1), (1, 3)), ((3, 1), (2, 3)),
 ((3, 2), (2, 3)), ((2, 1), (1, 3)), ((2,), (1, 2, 3)), ((3,), (1, 2, 3)),
 ((1,), (1, 2, 3)), ((1, 2), (2, 3)), ((1, 2, 3), (3,))]
```

class sage.combinat.multiset_partition_into_sets_ordered.**MinimajCrystal**(*n*, *ell*, *k*)

Bases: UniqueRepresentation, Parent

Crystal of ordered multiset partitions into sets with ell letters from alphabet $\{1, 2, \ldots, n\}$ divided into k blocks.

Elements are represented in the minimaj ordering of blocks as in Benkart et al. [BCHOPSY2017].

Note

Elements are not stored internally as ordered multiset partitions into sets, but as certain (pairs of) words stemming from the minimaj bijection ϕ of [BCHOPSY2017]. See *sage.combinat.multiset_partition_into_sets_ordered.MinimajCrystal.Element* for further details.

AUTHORS:

- Anne Schilling (2018): initial draft
- Aaron Lauve (2018): changed to use `Letters` crystal for elements

EXAMPLES:

```
sage: list(crystals.Minimaj(2,3,2))                                           #␣
↪needs sage.modules
[((2, 1), (1,)), ((2,), (1, 2)), ((1,), (1, 2)), ((1, 2), (2,))]

sage: b = crystals.Minimaj(3, 5, 2).an_element(); b                           #␣
↪needs sage.modules
((2, 3, 1), (1, 2))
sage: b.f(2)                                                                  #␣
↪needs sage.modules
((2, 3, 1), (1, 3))
sage: b.e(2)                                                                  #␣
↪needs sage.modules
```

```
>>> from sage.all import *
>>> list(crystals.Minimaj(Integer(2),Integer(3),Integer(2)))                  ␣
↪                      # needs sage.modules
```

(continues on next page)

(continued from previous page)

```
[((2, 1), (1,)), ((2,), (1, 2)), ((1,), (1, 2)), ((1, 2), (2,))]

>>> b = crystals.Minimaj(Integer(3), Integer(5), Integer(2)).an_element(); b
↪                        # needs sage.modules
((2, 3, 1), (1, 2))
>>> b.f(Integer(2))
↪     # needs sage.modules
((2, 3, 1), (1, 3))
>>> b.e(Integer(2))
↪     # needs sage.modules
```

class Element

Bases: `ElementWrapper`

An element of a Minimaj crystal.

> **Note**
>
> Minimaj elements b are stored internally as pairs `(w, breaks)`, where:
>
> - `w` – a word of length `self.parent().ell` over the letters 1 up to `self.parent().n`;
> - `breaks` is a list of de-concatenation points to turn `w` into a list of row words of (skew-)tableaux that represent b under the minimaj bijection ϕ of [BCHOPSY2017].
>
> The pair `(w, breaks)` may be recovered via `b.value`.

e(*i*)

Return e_i on `self`.

EXAMPLES:

```
sage: B = crystals.Minimaj(4,3,2)                                         #
↪needs sage.modules
sage: b = B([[2,3], [3]]); b                                              #
↪needs sage.modules
((2, 3), (3,))
sage: [b.e(i) for i in range(1,4)]                                        #
↪needs sage.modules
[((1, 3), (3,)), ((2,), (2, 3)), None]
```

```
>>> from sage.all import *
>>> B = crystals.Minimaj(Integer(4),Integer(3),Integer(2))
↪                        # needs sage.modules
>>> b = B([[Integer(2),Integer(3)], [Integer(3)]]); b
↪                        # needs sage.modules
((2, 3), (3,))
>>> [b.e(i) for i in range(Integer(1),Integer(4))]
↪                   # needs sage.modules
[((1, 3), (3,)), ((2,), (2, 3)), None]
```

f(*i*)

Return f_i on `self`.

EXAMPLES:

```
sage: B = crystals.Minimaj(4,3,2)                                          #␣
↪needs sage.modules
sage: b = B([[2,3], [3]]); b                                               #␣
↪needs sage.modules
((2, 3), (3,))
sage: [b.f(i) for i in range(1,4)]                                         #␣
↪needs sage.modules
[None, None, ((2, 3), (4,))]
```

```
>>> from sage.all import *
>>> B = crystals.Minimaj(Integer(4),Integer(3),Integer(2))                  ␣
↪                        # needs sage.modules
>>> b = B([[Integer(2),Integer(3)], [Integer(3)]]); b                       ␣
↪                        # needs sage.modules
((2, 3), (3,))
>>> [b.f(i) for i in range(Integer(1),Integer(4))]                          ␣
↪              # needs sage.modules
[None, None, ((2, 3), (4,))]
```

to_tableaux_words()

Return the image of the ordered multiset partition into sets `self` under the minimaj bijection ϕ of [BCHOPSY2017].

EXAMPLES:

```
sage: # needs sage.modules
sage: B = crystals.Minimaj(4,5,3)
sage: b = B.an_element(); b
((2, 3, 1), (1,), (1,))
sage: b.to_tableaux_words()
[[1], [3], [2, 1, 1]]
sage: b = B([[1,3,4], [3], [3]]); b
((4, 1, 3), (3,), (3,))
sage: b.to_tableaux_words()
[[3, 1], [], [4, 3, 3]]
```

```
>>> from sage.all import *
>>> # needs sage.modules
>>> B = crystals.Minimaj(Integer(4),Integer(5),Integer(3))
>>> b = B.an_element(); b
((2, 3, 1), (1,), (1,))
>>> b.to_tableaux_words()
[[1], [3], [2, 1, 1]]
>>> b = B([[Integer(1),Integer(3),Integer(4)], [Integer(3)],␣
↪[Integer(3)]]); b
((4, 1, 3), (3,), (3,))
>>> b.to_tableaux_words()
[[3, 1], [], [4, 3, 3]]
```

from_tableau(*t*)

Return the bijection ϕ^{-1} of [BCHOPSY2017] applied to `t`.

INPUT:

- `t` – a sequence of column tableaux and a ribbon tableau

EXAMPLES:

```
sage: # needs sage.modules
sage: B = crystals.Minimaj(3,6,3)
sage: b = B.an_element(); b
((3, 1, 2), (2, 1), (1,))
sage: t = b.to_tableaux_words(); t
[[1], [2, 1], [], [3, 2, 1]]
sage: B.from_tableau(t)
((3, 1, 2), (2, 1), (1,))
sage: B.from_tableau(t) == b
True
```

```
>>> from sage.all import *
>>> # needs sage.modules
>>> B = crystals.Minimaj(Integer(3),Integer(6),Integer(3))
>>> b = B.an_element(); b
((3, 1, 2), (2, 1), (1,))
>>> t = b.to_tableaux_words(); t
[[1], [2, 1], [], [3, 2, 1]]
>>> B.from_tableau(t)
((3, 1, 2), (2, 1), (1,))
>>> B.from_tableau(t) == b
True
```

val(*q='q'*)

Return the Val polynomial corresponding to `self`.

EXAMPLES:

Verifying Example 4.5 from [BCHOPSY2017]:

```
sage: B = crystals.Minimaj(3, 4, 2)  # for `Val_{4,1}^{(3)}`                   #␣
↪needs sage.modules
sage: B.val()                                                                   #␣
↪needs sage.modules
(q^2+q+1)*s[2, 1, 1] + q*s[2, 2]
```

```
>>> from sage.all import *
>>> B = crystals.Minimaj(Integer(3), Integer(4), Integer(2))  # for `Val_{4,1}
↪^{(3)}`                    # needs sage.modules
>>> B.val()                                                                   #␣
↪needs sage.modules
(q^2+q+1)*s[2, 1, 1] + q*s[2, 2]
```

class sage.combinat.multiset_partition_into_sets_ordered.**OrderedMultisetPartitionIntoSets**(*parent*, *data*)

Bases: `ClonableArray`

Ordered Multiset Partition into sets.

An *ordered multiset partition into sets* c of a multiset X is a list $[c_1, \ldots, c_r]$ of nonempty subsets of X (note: not sub-multisets), called the *blocks* of c, whose multi-union is X.

EXAMPLES:

The simplest way to create an ordered multiset partition into sets is by specifying its blocks as a list or tuple:

```
sage: OrderedMultisetPartitionIntoSets([[3],[2,1]])
[{3}, {1,2}]
sage: OrderedMultisetPartitionIntoSets(((3,), (1,2)))
[{3}, {1,2}]
sage: OrderedMultisetPartitionIntoSets([set([i]) for i in range(2,5)])
[{2}, {3}, {4}]
```

```
>>> from sage.all import *
>>> OrderedMultisetPartitionIntoSets([[Integer(3)],[Integer(2),Integer(1)]])
[{3}, {1,2}]
>>> OrderedMultisetPartitionIntoSets(((Integer(3),), (Integer(1),Integer(2))))
[{3}, {1,2}]
>>> OrderedMultisetPartitionIntoSets([set([i]) for i in range(Integer(2),
↪Integer(5))])
[{2}, {3}, {4}]
```

REFERENCES:

- [HRW2015]
- [HRS2016]
- [LM2018]

check()

Check that we are a valid ordered multiset partition into sets.

EXAMPLES:

```
sage: c = OrderedMultisetPartitionsIntoSets(4)([[1], [1,2]])
sage: c.check()

sage: OMPs = OrderedMultisetPartitionsIntoSets()
sage: c = OMPs([[1], [1], ['a']])
sage: c.check()
```

```
>>> from sage.all import *
>>> c = OrderedMultisetPartitionsIntoSets(Integer(4))([[Integer(1)],
↪[Integer(1),Integer(2)]])
>>> c.check()

>>> OMPs = OrderedMultisetPartitionsIntoSets()
>>> c = OMPs([[Integer(1)], [Integer(1)], ['a']])
>>> c.check()
```

deconcatenate(*k=2*)

Return the list of k-deconcatenations of `self`.

A k-tuple $(C_1, \ldots, C_k)$ of ordered multiset partitions into sets represents a k-deconcatenation of an ordered multiset partition into sets C if $C_1 + \cdots + C_k = C$.

Note

This is not to be confused with `self.split_blocks()`, which splits each block of `self` before making k-tuples of ordered multiset partitions into sets.

EXAMPLES:

```
sage: OrderedMultisetPartitionIntoSets([[7,1],[3,4,5]]).deconcatenate()
[([{1,7}, {3,4,5}], []), ([{1,7}], [{3,4,5}]), ([], [{1,7}, {3,4,5}])]
sage: OrderedMultisetPartitionIntoSets([['b','c'],['a']]).deconcatenate()
[([{'b','c'}, {'a'}], []), ([{'b','c'}], [{'a'}]), ([], [{'b','c'}, {'a'}])]
sage: OrderedMultisetPartitionIntoSets([['a','b','c']]).deconcatenate(3)
[([{'a','b','c'}], [], []),
 ([], [{'a','b','c'}], []),
 ([], [], [{'a','b','c'}])]
```

```
>>> from sage.all import *
>>> OrderedMultisetPartitionIntoSets([[Integer(7),Integer(1)],[Integer(3),
↪Integer(4),Integer(5)]]).deconcatenate()
[([{1,7}, {3,4,5}], []), ([{1,7}], [{3,4,5}]), ([], [{1,7}, {3,4,5}])]
>>> OrderedMultisetPartitionIntoSets([['b','c'],['a']]).deconcatenate()
[([{'b','c'}, {'a'}], []), ([{'b','c'}], [{'a'}]), ([], [{'b','c'}, {'a'}])]
>>> OrderedMultisetPartitionIntoSets([['a','b','c']]).
↪deconcatenate(Integer(3))
[([{'a','b','c'}], [], []),
 ([], [{'a','b','c'}], []),
 ([], [], [{'a','b','c'}])]
```

fatten(*grouping*)

Return the ordered multiset partition into sets fatter than `self`, obtained by grouping together consecutive parts according to `grouping` (whenever this does not violate the strictness condition).

INPUT:

- `grouping` – a composition (or list) whose sum is the length of `self`

EXAMPLES:

Let us start with the composition:

```
sage: C = OrderedMultisetPartitionIntoSets([[4,1,5], [2], [7,1]]); C
[{1,4,5}, {2}, {1,7}]
```

```
>>> from sage.all import *
>>> C = OrderedMultisetPartitionIntoSets([[Integer(4),Integer(1),Integer(5)],␣
↪[Integer(2)], [Integer(7),Integer(1)]]); C
[{1,4,5}, {2}, {1,7}]
```

With `grouping` equal to $(1,1,1)$, C is left unchanged:

```
sage: C.fatten([1,1,1])
[{1,4,5}, {2}, {1,7}]
```

```
>>> from sage.all import *
>>> C.fatten([Integer(1),Integer(1),Integer(1)])
[{1,4,5}, {2}, {1,7}]
```

With grouping equal to $(2, 1)$ or $(1, 2)$, a union of consecutive parts is achieved:

```
sage: C.fatten([2,1])
[{1,2,4,5}, {1,7}]
sage: C.fatten([1,2])
[{1,4,5}, {1,2,7}]
```

```
>>> from sage.all import *
>>> C.fatten([Integer(2),Integer(1)])
[{1,2,4,5}, {1,7}]
>>> C.fatten([Integer(1),Integer(2)])
[{1,4,5}, {1,2,7}]
```

However, the grouping (3) will throw an error, as 1 cannot appear twice in any block of C:

```
sage: C.fatten(Composition([3]))
Traceback (most recent call last):
...
ValueError: [{1,4,5,2,1,7}] is not a valid ordered multiset partition into
↪sets
```

```
>>> from sage.all import *
>>> C.fatten(Composition([Integer(3)]))
Traceback (most recent call last):
...
ValueError: [{1,4,5,2,1,7}] is not a valid ordered multiset partition into
↪sets
```

fatter()

Return the set of ordered multiset partitions into sets which are fatter than self.

An ordered multiset partition into sets A is fatter than another B if, reading left-to-right, every block of A is the union of some consecutive blocks of B.

EXAMPLES:

```
sage: C = OrderedMultisetPartitionIntoSets([{1,4,5}, {2}, {1,7}]).fatter()
sage: len(C)
3
sage: sorted(C)
[[{1,4,5}, {2}, {1,7}], [{1,4,5}, {1,2,7}], [{1,2,4,5}, {1,7}]]
sage: sorted(OrderedMultisetPartitionIntoSets([['a','b'],['c'],['a']]).
↪fatter())
[[{'a','b'}, {'c'}, {'a'}], [{'a','b'}, {'a','c'}], [{'a','b','c'}, {'a'}]]
```

```
>>> from sage.all import *
>>> C = OrderedMultisetPartitionIntoSets([{Integer(1),Integer(4),Integer(5)},
↪{Integer(2)}, {Integer(1),Integer(7)}]).fatter()
>>> len(C)
```

(continues on next page)

(continued from previous page)

```
3
>>> sorted(C)
[[{1,4,5}, {2}, {1,7}], [{1,4,5}, {1,2,7}], [{1,2,4,5}, {1,7}]]
>>> sorted(OrderedMultisetPartitionIntoSets([['a','b'],['c'],['a']]).fatter())
[[{'a','b'}, {'c'}, {'a'}], [{'a','b'}, {'a','c'}], [{'a','b','c'}, {'a'}]]
```

Some extreme cases:

```
sage: list(OrderedMultisetPartitionIntoSets([['a','b','c']]).fatter())
[[{'a','b','c'}]]
sage: list(OrderedMultisetPartitionIntoSets([]).fatter())
[[]]
sage: A = OrderedMultisetPartitionIntoSets([[1], [2], [3], [4]])
sage: B = OrderedMultisetPartitionIntoSets([[1,2,3,4]])
sage: A.fatter().issubset(B.finer())
True
```

```
>>> from sage.all import *
>>> list(OrderedMultisetPartitionIntoSets([['a','b','c']]).fatter())
[[{'a','b','c'}]]
>>> list(OrderedMultisetPartitionIntoSets([]).fatter())
[[]]
>>> A = OrderedMultisetPartitionIntoSets([[Integer(1)], [Integer(2)],␣
↪[Integer(3)], [Integer(4)]])
>>> B = OrderedMultisetPartitionIntoSets([[Integer(1),Integer(2),Integer(3),
↪Integer(4)]])
>>> A.fatter().issubset(B.finer())
True
```

finer(*strong=False*)

Return the set of ordered multiset partitions into sets that are finer than `self`.

An ordered multiset partition into sets A is finer than another B if, reading left-to-right, every block of B is the union of some consecutive blocks of A.

If optional argument `strong` is set to `True`, then return only those A whose blocks are deconcatenations of blocks of B. (Here, we view blocks of B as sorted lists instead of sets.)

EXAMPLES:

```
sage: C = OrderedMultisetPartitionIntoSets([[3,2]]).finer()
sage: len(C)
3
sage: sorted(C, key=str)
[[{2,3}], [{2}, {3}], [{3}, {2}]]
sage: OrderedMultisetPartitionIntoSets([]).finer()
{[]}
sage: O = OrderedMultisetPartitionsIntoSets([1, 1, 'a', 'b'])
sage: o = O([{1}, {'a', 'b'}, {1}])
sage: sorted(o.finer(), key=str)
[[{1}, {'a','b'}, {1}], [{1}, {'a'}, {'b'}, {1}], [{1}, {'b'}, {'a'}, {1}]]
sage: o.finer() & o.fatter() == set([o])
True
```

```
>>> from sage.all import *
>>> C = OrderedMultisetPartitionIntoSets([[Integer(3),Integer(2)]]).finer()
>>> len(C)
3
>>> sorted(C, key=str)
[[{2,3}], [{2}, {3}], [{3}, {2}]]
>>> OrderedMultisetPartitionIntoSets([]).finer()
{[]}
>>> O = OrderedMultisetPartitionsIntoSets([Integer(1), Integer(1), 'a', 'b'])
>>> o = O([{Integer(1)}, {'a', 'b'}, {Integer(1)}])
>>> sorted(o.finer(), key=str)
[[{1}, {'a','b'}, {1}], [{1}, {'a'}, {'b'}, {1}], [{1}, {'b'}, {'a'}, {1}]]
>>> o.finer() & o.fatter() == set([o])
True
```

is_finer(*co*)

Return `True` if the ordered multiset partition into sets `self` is finer than the composition `co`; otherwise, return `False`.

EXAMPLES:

```
sage: OrderedMultisetPartitionIntoSets([[4],[1],[2]]).is_finer([[1,4],[2]])
True
sage: OrderedMultisetPartitionIntoSets([[1],[4],[2]]).is_finer([[1,4],[2]])
True
sage: OrderedMultisetPartitionIntoSets([[1,4],[1],[1]]).is_finer([[1,4],[2]])
False
```

```
>>> from sage.all import *
>>> OrderedMultisetPartitionIntoSets([[Integer(4)],[Integer(1)],
↪[Integer(2)]]).is_finer([[Integer(1),Integer(4)],[Integer(2)]])
True
>>> OrderedMultisetPartitionIntoSets([[Integer(1)],[Integer(4)],
↪[Integer(2)]]).is_finer([[Integer(1),Integer(4)],[Integer(2)]])
True
>>> OrderedMultisetPartitionIntoSets([[Integer(1),Integer(4)],[Integer(1)],
↪[Integer(1)]]).is_finer([[Integer(1),Integer(4)],[Integer(2)]])
False
```

length()

Return the number of blocks of `self`.

EXAMPLES:

```
sage: OrderedMultisetPartitionIntoSets([[7,1],[3]]).length()
2
```

```
>>> from sage.all import *
>>> OrderedMultisetPartitionIntoSets([[Integer(7),Integer(1)],[Integer(3)]]).
↪length()
2
```

letters()

Return the set of distinct elements occurring within the blocks of `self`.

EXAMPLES:

```
sage: C = OrderedMultisetPartitionIntoSets([[3, 4, 1], [2], [1, 2, 3, 7]]); C
[{1,3,4}, {2}, {1,2,3,7}]
sage: C.letters()
frozenset({1, 2, 3, 4, 7})
```

```
>>> from sage.all import *
>>> C = OrderedMultisetPartitionIntoSets([[Integer(3), Integer(4),␣
→Integer(1)], [Integer(2)], [Integer(1), Integer(2), Integer(3),␣
→Integer(7)]]); C
[{1,3,4}, {2}, {1,2,3,7}]
>>> C.letters()
frozenset({1, 2, 3, 4, 7})
```

major_index()

Return the major index of `self`.

The major index is a statistic on ordered multiset partitions into sets, which we define here via an example.

1. Sort each block in the list `self` in descending order to create a word w, keeping track of the original separation into blocks:

```
in:  [{3,4,5}, {2,3,4}, {1}, {4,5}]
out: [ 5,4,3 /  4,3,2 /  1 /  5,4 ]
```

2. Create a sequence $v = (v_0, v_1, v_2, \ldots)$ of length `self.order()+1`, built recursively by:

   1. $v_0 = 0$
   2. $v_j = v_{j-1} + \delta(j)$, where $\delta(j) = 1$ if j is the index of an end of a block, and zero otherwise.

```
in:    [ 5,4,3 /  4,3,2 /  1 /  5,4]
out: (0, 0,0,1,   1,1,2,   3,   3,4)
```

3. Compute $\sum_j v_j$, restricted to descent positions in w, i.e., sum over those j with $w_j > w_{j+1}$:

```
in:  w:   [5, 4, 3, 4, 3, 2, 1, 5, 4]
     v: (0 0, 0, 1, 1, 1, 2, 3, 3, 4)
maj :=     0 +0    +1 +1 +2    +3     = 7
```

REFERENCES:

- [HRW2015]

EXAMPLES:

```
sage: C = OrderedMultisetPartitionIntoSets([{1,5,7}, {2,4}, {5,6}, {4,6,8},
→{1,3}, {1,2,3}])
sage: C.major_index()
27
sage: C = OrderedMultisetPartitionIntoSets([{3,4,5}, {2,3,4}, {1}, {4,5}])
sage: C.major_index()
7
```

```
>>> from sage.all import *
>>> C = OrderedMultisetPartitionIntoSets([{Integer(1),Integer(5),Integer(7)},
↪{Integer(2),Integer(4)}, {Integer(5),Integer(6)}, {Integer(4),Integer(6),
↪Integer(8)}, {Integer(1),Integer(3)}, {Integer(1),Integer(2),Integer(3)}])
>>> C.major_index()
27
>>> C = OrderedMultisetPartitionIntoSets([{Integer(3),Integer(4),Integer(5)},
↪{Integer(2),Integer(3),Integer(4)}, {Integer(1)}, {Integer(4),Integer(5)}])
>>> C.major_index()
7
```

max_letter()

Return the maximum letter appearing in `self.letters()` of `self`.

EXAMPLES:

```
sage: C = OrderedMultisetPartitionIntoSets([[3, 4, 1], [2], [1, 2, 3, 7]])
sage: C.max_letter()
7
sage: D = OrderedMultisetPartitionIntoSets([['a','b','c'],['a','b'],['a'],['b
↪','c','f'],['c','d']])
sage: D.max_letter()
'f'
sage: C = OrderedMultisetPartitionIntoSets([])
sage: C.max_letter()
```

```
>>> from sage.all import *
>>> C = OrderedMultisetPartitionIntoSets([[Integer(3), Integer(4),␣
↪Integer(1)], [Integer(2)], [Integer(1), Integer(2), Integer(3),␣
↪Integer(7)]])
>>> C.max_letter()
7
>>> D = OrderedMultisetPartitionIntoSets([['a','b','c'],['a','b'],['a'],['b',
↪'c','f'],['c','d']])
>>> D.max_letter()
'f'
>>> C = OrderedMultisetPartitionIntoSets([])
>>> C.max_letter()
```

minimaj()

Return the minimaj statistic on ordered multiset partitions into sets.

We define *minimaj* via an example:

1. Sort the block in `self` as prescribed by `self.minimaj_word()`, keeping track of the original separation into blocks:

```
in:   [{1,5,7}, {2,4}, {5,6}, {4,6,8}, {1,3}, {1,2,3}]
out:  ( 5,7,1 /  2,4 /  5,6 /  4,6,8 /  3,1 /  1,2,3 )
```

2. Record the indices where descents in this word occur:

```
word:       (5, 7, 1 / 2, 4 / 5, 6 / 4, 6, 8 / 3, 1 / 1, 2, 3)
indices:     1  2  3   4  5   6  7   8  9 10   11 12  13 14 15
```

(continues on next page)

(continued from previous page)

```
descents:  {    2,                 7,        10, 11              }
```

3. Compute the sum of the descents:

```
minimaj = 2 + 7 + 10 + 11 = 30
```

REFERENCES:

- [HRW2015]

EXAMPLES:

```
sage: C = OrderedMultisetPartitionIntoSets([{1,5,7}, {2,4}, {5,6}, {4,6,8},
↪{1,3}, {1,2,3}])
sage: C, C.minimaj_word()
([{1,5,7}, {2,4}, {5,6}, {4,6,8}, {1,3}, {1,2,3}],
 (5, 7, 1, 2, 4, 5, 6, 4, 6, 8, 3, 1, 1, 2, 3))
sage: C.minimaj()
30
sage: C = OrderedMultisetPartitionIntoSets([{2,4}, {1,2,3}, {1,6,8}, {2,3}])
sage: C, C.minimaj_word()
([{2,4}, {1,2,3}, {1,6,8}, {2,3}], (2, 4, 1, 2, 3, 6, 8, 1, 2, 3))
sage: C.minimaj()
9
sage: OrderedMultisetPartitionIntoSets([]).minimaj()
0
sage: C = OrderedMultisetPartitionIntoSets([['b','d'],['a','b','c'],['b']])
sage: C, C.minimaj_word()
([{'b','d'}, {'a','b','c'}, {'b'}], ('d', 'b', 'c', 'a', 'b', 'b'))
sage: C.minimaj()
4
```

```
>>> from sage.all import *
>>> C = OrderedMultisetPartitionIntoSets([{Integer(1),Integer(5),Integer(7)},
↪{Integer(2),Integer(4)}, {Integer(5),Integer(6)}, {Integer(4),Integer(6),
↪Integer(8)}, {Integer(1),Integer(3)}, {Integer(1),Integer(2),Integer(3)}])
>>> C, C.minimaj_word()
([{1,5,7}, {2,4}, {5,6}, {4,6,8}, {1,3}, {1,2,3}],
 (5, 7, 1, 2, 4, 5, 6, 4, 6, 8, 3, 1, 1, 2, 3))
>>> C.minimaj()
30
>>> C = OrderedMultisetPartitionIntoSets([{Integer(2),Integer(4)},
↪{Integer(1),Integer(2),Integer(3)}, {Integer(1),Integer(6),Integer(8)},
↪{Integer(2),Integer(3)}])
>>> C, C.minimaj_word()
([{2,4}, {1,2,3}, {1,6,8}, {2,3}], (2, 4, 1, 2, 3, 6, 8, 1, 2, 3))
>>> C.minimaj()
9
>>> OrderedMultisetPartitionIntoSets([]).minimaj()
0
>>> C = OrderedMultisetPartitionIntoSets([['b','d'],['a','b','c'],['b']])
>>> C, C.minimaj_word()
([{'b','d'}, {'a','b','c'}, {'b'}], ('d', 'b', 'c', 'a', 'b', 'b'))
```

(continues on next page)

(continued from previous page)

```
>>> C.minimaj()
4
```

minimaj_blocks()

Return the minimaj ordering on blocks of `self`.

We define the ordering via the example below.

Sort the blocks $[B_1, ..., B_k]$ of `self` from right to left via:

1. Sort the last block B_k in increasing order, call it the word W_k
2. If blocks $B_{i+1}, \ldots, B_k$ have been converted to words $W_{i+1}, \ldots, W_k$, use the letters in B_i to make the unique word W_i that has a factorization $W_i = (u, v)$ satisfying:
   - letters of u and v appear in increasing order, with v possibly empty;
   - letters in vu appear in increasing order;
   - `v[-1]` is the largest letter $a \in B_i$ satisfying `a <= W_{i+1}[0]`.

EXAMPLES:

```
sage: OrderedMultisetPartitionIntoSets([[1,5,7], [2,4], [5,6], [4,6,8], [1,3],
↪ [1,2,3]])
[{1,5,7}, {2,4}, {5,6}, {4,6,8}, {1,3}, {1,2,3}]
sage: _.minimaj_blocks()
((5, 7, 1), (2, 4), (5, 6), (4, 6, 8), (3, 1), (1, 2, 3))
sage: OrderedMultisetPartitionIntoSets([]).minimaj_blocks()
()
```

```
>>> from sage.all import *
>>> OrderedMultisetPartitionIntoSets([[Integer(1),Integer(5),Integer(7)],
↪[Integer(2),Integer(4)], [Integer(5),Integer(6)], [Integer(4),Integer(6),
↪Integer(8)], [Integer(1),Integer(3)], [Integer(1),Integer(2),Integer(3)]])
[{1,5,7}, {2,4}, {5,6}, {4,6,8}, {1,3}, {1,2,3}]
>>> _.minimaj_blocks()
((5, 7, 1), (2, 4), (5, 6), (4, 6, 8), (3, 1), (1, 2, 3))
>>> OrderedMultisetPartitionIntoSets([]).minimaj_blocks()
()
```

minimaj_word()

Return an ordering of `self._multiset` derived from the minimaj ordering on blocks of `self`.

See also

OrderedMultisetPartitionIntoSets.minimaj_blocks().

EXAMPLES:

```
sage: C = OrderedMultisetPartitionIntoSets([[2,1], [1,2,3], [1,2], [3], [1]]);
↪ C
[{1,2}, {1,2,3}, {1,2}, {3}, {1}]
sage: C.minimaj_blocks()
((1, 2), (2, 3, 1), (1, 2), (3,), (1,))
```

(continues on next page)

(continued from previous page)

```
sage: C.minimaj_word()
(1, 2, 2, 3, 1, 1, 2, 3, 1)
```

```
>>> from sage.all import *
>>> C = OrderedMultisetPartitionIntoSets([[Integer(2),Integer(1)],
↪[Integer(1),Integer(2),Integer(3)], [Integer(1),Integer(2)], [Integer(3)],
↪[Integer(1)]]); C
[{1,2}, {1,2,3}, {1,2}, {3}, {1}]
>>> C.minimaj_blocks()
((1, 2), (2, 3, 1), (1, 2), (3,), (1,))
>>> C.minimaj_word()
(1, 2, 2, 3, 1, 1, 2, 3, 1)
```

multiset(*as_dict=False*)

Return the multiset corresponding to `self`.

INPUT:

- `as_dict` – boolean (default: `False`); whether to return the multiset as a tuple of a dict of multiplicities

EXAMPLES:

```
sage: C = OrderedMultisetPartitionIntoSets([[3, 4, 1], [2], [1, 2, 3, 7]]); C
[{1,3,4}, {2}, {1,2,3,7}]
sage: C.multiset()
(1, 1, 2, 2, 3, 3, 4, 7)
sage: C.multiset(as_dict=True)
{1: 2, 2: 2, 3: 2, 4: 1, 7: 1}
sage: OrderedMultisetPartitionIntoSets([]).multiset() == ()
True
```

```
>>> from sage.all import *
>>> C = OrderedMultisetPartitionIntoSets([[Integer(3), Integer(4),
↪Integer(1)], [Integer(2)], [Integer(1), Integer(2), Integer(3),
↪Integer(7)]]); C
[{1,3,4}, {2}, {1,2,3,7}]
>>> C.multiset()
(1, 1, 2, 2, 3, 3, 4, 7)
>>> C.multiset(as_dict=True)
{1: 2, 2: 2, 3: 2, 4: 1, 7: 1}
>>> OrderedMultisetPartitionIntoSets([]).multiset() == ()
True
```

order()

Return the total number of elements in all blocks of `self`.

EXAMPLES:

```
sage: C = OrderedMultisetPartitionIntoSets([[3, 4, 1], [2], [1, 2, 3, 7]]); C
[{1,3,4}, {2}, {1,2,3,7}]
sage: C.order()
8
sage: C.order() == sum(C.weight().values())
```

(continues on next page)

(continued from previous page)

```
True
sage: C.order() == sum(k for k in C.shape_from_cardinality())
True
sage: OrderedMultisetPartitionIntoSets([[7,1],[3]]).order()
3
```

```
>>> from sage.all import *
>>> C = OrderedMultisetPartitionIntoSets([[Integer(3), Integer(4),
↪Integer(1)], [Integer(2)], [Integer(1), Integer(2), Integer(3),
↪Integer(7)]]); C
[{1,3,4}, {2}, {1,2,3,7}]
>>> C.order()
8
>>> C.order() == sum(C.weight().values())
True
>>> C.order() == sum(k for k in C.shape_from_cardinality())
True
>>> OrderedMultisetPartitionIntoSets([[Integer(7),Integer(1)],[Integer(3)]]).
↪order()
3
```

reversal()

Return the reverse ordered multiset partition into sets of `self`.

Given an ordered multiset partition into sets $(B_1, B_2, \ldots, B_k)$, its reversal is defined to be the ordered multiset partition into sets $(B_k, \ldots, B_2, B_1)$.

EXAMPLES:

```
sage: C = OrderedMultisetPartitionIntoSets([[1], [1, 3], [2, 3, 4]]); C
[{1}, {1,3}, {2,3,4}]
sage: C.reversal()
[{2,3,4}, {1,3}, {1}]
```

```
>>> from sage.all import *
>>> C = OrderedMultisetPartitionIntoSets([[Integer(1)], [Integer(1),
↪Integer(3)], [Integer(2), Integer(3), Integer(4)]]); C
[{1}, {1,3}, {2,3,4}]
>>> C.reversal()
[{2,3,4}, {1,3}, {1}]
```

shape_from_cardinality()

Return a composition that records the cardinality of each block of `self`.

EXAMPLES:

```
sage: C = OrderedMultisetPartitionIntoSets([[3, 4, 1], [2], [1, 2, 3, 7]]); C
[{1,3,4}, {2}, {1,2,3,7}]
sage: C.shape_from_cardinality()
[3, 1, 4]
sage: OrderedMultisetPartitionIntoSets([]).shape_from_cardinality() ==
↪Composition([])
True
```

```
>>> from sage.all import *
>>> C = OrderedMultisetPartitionIntoSets([[Integer(3), Integer(4),␣
↪Integer(1)], [Integer(2)], [Integer(1), Integer(2), Integer(3),␣
↪Integer(7)]]); C
[{1,3,4}, {2}, {1,2,3,7}]
>>> C.shape_from_cardinality()
[3, 1, 4]
>>> OrderedMultisetPartitionIntoSets([]).shape_from_cardinality() ==␣
↪Composition([])
True
```

shape_from_size()

Return a composition that records the sum of entries of each block of `self`.

EXAMPLES:

```
sage: C = OrderedMultisetPartitionIntoSets([[3, 4, 1], [2], [1, 2, 3, 7]]); C
[{1,3,4}, {2}, {1,2,3,7}]
sage: C.shape_from_size()
[8, 2, 13]
```

```
>>> from sage.all import *
>>> C = OrderedMultisetPartitionIntoSets([[Integer(3), Integer(4),␣
↪Integer(1)], [Integer(2)], [Integer(1), Integer(2), Integer(3),␣
↪Integer(7)]]); C
[{1,3,4}, {2}, {1,2,3,7}]
>>> C.shape_from_size()
[8, 2, 13]
```

shuffle_product(*other*, *overlap=False*)

Return the shuffles (with multiplicity) of blocks of `self` with blocks of `other`.

In case optional argument `overlap` is `True`, instead return the allowable overlapping shuffles. An overlapping shuffle C is allowable if, whenever one of its blocks c comes from the union $c = a \cup b$ of a block of `self` and a block of `other`, then this union is disjoint.

See also

Composition.shuffle_product()

EXAMPLES:

```
sage: A = OrderedMultisetPartitionIntoSets([[2,1,3], [1,2]]); A
[{1,2,3}, {1,2}]
sage: B = OrderedMultisetPartitionIntoSets([[3,4]]); B
[{3,4}]
sage: C = OrderedMultisetPartitionIntoSets([[4,5]]); C
[{4,5}]
sage: list(A.shuffle_product(B))
[[{1,2,3}, {1,2}, {3,4}], [{3,4}, {1,2,3}, {1,2}], [{1,2,3}, {3,4}, {1,2}]]
sage: list(A.shuffle_product(B, overlap=True))
[[{1,2,3}, {1,2}, {3,4}], [{1,2,3}, {3,4}, {1,2}],
```

(continues on next page)

(continued from previous page)

```
 [{3,4}, {1,2,3}, {1,2}], [{1,2,3}, {1,2,3,4}]]
sage: list(A.shuffle_product(C, overlap=True))
[[{1,2,3}, {1,2}, {4,5}], [{1,2,3}, {4,5}, {1,2}], [{4,5}, {1,2,3}, {1,2}],
 [{1,2,3,4,5}, {1,2}], [{1,2,3}, {1,2,4,5}]]
```

```
>>> from sage.all import *
>>> A = OrderedMultisetPartitionIntoSets([[Integer(2),Integer(1),Integer(3)],␣
→[Integer(1),Integer(2)]]); A
[{1,2,3}, {1,2}]
>>> B = OrderedMultisetPartitionIntoSets([[Integer(3),Integer(4)]]); B
[{3,4}]
>>> C = OrderedMultisetPartitionIntoSets([[Integer(4),Integer(5)]]); C
[{4,5}]
>>> list(A.shuffle_product(B))
[[{1,2,3}, {1,2}, {3,4}], [{3,4}, {1,2,3}, {1,2}], [{1,2,3}, {3,4}, {1,2}]]
>>> list(A.shuffle_product(B, overlap=True))
[[{1,2,3}, {1,2}, {3,4}], [{1,2,3}, {3,4}, {1,2}],
 [{3,4}, {1,2,3}, {1,2}], [{1,2,3}, {1,2,3,4}]]
>>> list(A.shuffle_product(C, overlap=True))
[[{1,2,3}, {1,2}, {4,5}], [{1,2,3}, {4,5}, {1,2}], [{4,5}, {1,2,3}, {1,2}],
 [{1,2,3,4,5}, {1,2}], [{1,2,3}, {1,2,4,5}]]
```

size()

Return the size of `self` (that is, the sum of all integers in all blocks) if `self` is a list of subsets of positive integers.

Else, return `None`.

EXAMPLES:

```
sage: C = OrderedMultisetPartitionIntoSets([[3, 4, 1], [2], [1, 2, 3, 7]]); C
[{1,3,4}, {2}, {1,2,3,7}]
sage: C.size()
23
sage: C.size() == sum(k for k in C.shape_from_size())
True
sage: OrderedMultisetPartitionIntoSets([[7,1],[3]]).size()
11
```

```
>>> from sage.all import *
>>> C = OrderedMultisetPartitionIntoSets([[Integer(3), Integer(4),␣
→Integer(1)], [Integer(2)], [Integer(1), Integer(2), Integer(3),␣
→Integer(7)]]); C
[{1,3,4}, {2}, {1,2,3,7}]
>>> C.size()
23
>>> C.size() == sum(k for k in C.shape_from_size())
True
>>> OrderedMultisetPartitionIntoSets([[Integer(7),Integer(1)],[Integer(3)]]).
→size()
11
```

split_blocks(*k=2*)

Return a dictionary representing the k-splittings of `self`.

A k-tuple $(A^1, \ldots, A^k)$ of ordered multiset partitions into sets represents a k-splitting of an ordered multiset partition into sets $A = [b_1, \ldots, b_r]$ if one can express each block b_i as an (ordered) disjoint union of sets $b_i = b_i^1 \sqcup \cdots \sqcup b_i^k$ (some possibly empty) so that each A^j is the ordered multiset partition into sets corresponding to the list $[b_1^j, b_2^j, \ldots, b_r^j]$, excising empty sets appearing therein.

This operation represents the coproduct in Hopf algebra of ordered multiset partitions into sets in its natural basis [LM2018].

EXAMPLES:

```
sage: sorted(OrderedMultisetPartitionIntoSets([[1,2],[3,4]]).split_blocks(),␣
↪key=str)
[([], [{1,2}, {3,4}]),
 ([{1,2}, {3,4}], []),
 ([{1,2}, {3}], [{4}]),
 ([{1,2}, {4}], [{3}]),
 ([{1,2}], [{3,4}]),
 ([{1}, {3,4}], [{2}]),
 ([{1}, {3}], [{2}, {4}]),
 ([{1}, {4}], [{2}, {3}]),
 ([{1}], [{2}, {3,4}]),
 ([{2}, {3,4}], [{1}]),
 ([{2}, {3}], [{1}, {4}]),
 ([{2}, {4}], [{1}, {3}]),
 ([{2}], [{1}, {3,4}]),
 ([{3,4}], [{1,2}]),
 ([{3}], [{1,2}, {4}]),
 ([{4}], [{1,2}, {3}])]
sage: sorted(OrderedMultisetPartitionIntoSets([[1,2]]).split_blocks(3),␣
↪key=str)
[([], [], [{1,2}]), ([], [{1,2}], []), ([], [{1}], [{2}]),
 ([], [{2}], [{1}]), ([{1,2}], [], []), ([{1}], [], [{2}]),
 ([{1}], [{2}], []), ([{2}], [], [{1}]), ([{2}], [{1}], [])]
sage: OrderedMultisetPartitionIntoSets([[4],[4]]).split_blocks()
{([], [{4}, {4}]): 1, ([{4}], [{4}]): 2, ([{4}, {4}], []): 1}
```

```
>>> from sage.all import *
>>> sorted(OrderedMultisetPartitionIntoSets([[Integer(1),Integer(2)],
↪[Integer(3),Integer(4)]]).split_blocks(), key=str)
[([], [{1,2}, {3,4}]),
 ([{1,2}, {3,4}], []),
 ([{1,2}, {3}], [{4}]),
 ([{1,2}, {4}], [{3}]),
 ([{1,2}], [{3,4}]),
 ([{1}, {3,4}], [{2}]),
 ([{1}, {3}], [{2}, {4}]),
 ([{1}, {4}], [{2}, {3}]),
 ([{1}], [{2}, {3,4}]),
 ([{2}, {3,4}], [{1}]),
 ([{2}, {3}], [{1}, {4}]),
 ([{2}, {4}], [{1}, {3}]),
 ([{2}], [{1}, {3,4}]),
```

(continues on next page)

(continued from previous page)

```
 ([{3,4}], [{1,2}]),
 ([{3}], [{1,2}, {4}]),
 ([{4}], [{1,2}, {3}])]
>>> sorted(OrderedMultisetPartitionIntoSets([[Integer(1),Integer(2)]]).split_
↪blocks(Integer(3)), key=str)
[([], [], [{1,2}]), ([], [{1,2}], []), ([], [{1}], [{2}]),
 ([], [{2}], [{1}]), ([{1,2}], [], []), ([{1}], [], [{2}]),
 ([{1}], [{2}], []), ([{2}], [], [{1}]), ([{2}], [{1}], [])]
>>> OrderedMultisetPartitionIntoSets([[Integer(4)],[Integer(4)]]).split_
↪blocks()
{([], [{4}, {4}]): 1, ([{4}], [{4}]): 2, ([{4}, {4}], []): 1}
```

to_tableaux_words()

Return a sequence of lists corresponding to row words of (skew-)tableaux.

OUTPUT:

The minimaj bijection ϕ of [BCHOPSY2017] applied to `self`.

Todo

Implement option for mapping to sequence of (skew-)tableaux?

EXAMPLES:

```
sage: co = ((1,2,4),(4,5),(3,),(4,6,1),(2,3,1),(1,),(2,5))
sage: OrderedMultisetPartitionIntoSets(co).to_tableaux_words()
[[5, 1], [3, 1], [6], [5, 4, 2], [1, 4, 3, 4, 2, 1, 2]]
```

```
>>> from sage.all import *
>>> co = ((Integer(1),Integer(2),Integer(4)),(Integer(4),Integer(5)),
↪(Integer(3),),(Integer(4),Integer(6),Integer(1)),(Integer(2),Integer(3),
↪Integer(1)),(Integer(1),),(Integer(2),Integer(5)))
>>> OrderedMultisetPartitionIntoSets(co).to_tableaux_words()
[[5, 1], [3, 1], [6], [5, 4, 2], [1, 4, 3, 4, 2, 1, 2]]
```

weight(*as_weak_comp=False*)

Return a dictionary, with keys being the letters in `self.letters()` and values being their (positive) frequency.

Alternatively, if `as_weak_comp` is `True`, count the number of instances n_i for each distinct positive integer i across all blocks of `self`. Return as a list $[n_1, n_2, n_3, ..., n_k]$, where k is the max letter appearing in `self.letters()`.

EXAMPLES:

```
sage: c = OrderedMultisetPartitionIntoSets([[6,1],[1,3],[1,3,6]])
sage: c.weight()
{1: 3, 3: 2, 6: 2}
sage: c.weight(as_weak_comp=True)
[3, 0, 2, 0, 0, 2]
```

```
>>> from sage.all import *
>>> c = OrderedMultisetPartitionIntoSets([[Integer(6),Integer(1)],[Integer(1),
↪Integer(3)],[Integer(1),Integer(3),Integer(6)]])
>>> c.weight()
{1: 3, 3: 2, 6: 2}
>>> c.weight(as_weak_comp=True)
[3, 0, 2, 0, 0, 2]
```

class sage.combinat.multiset_partition_into_sets_ordered.**OrderedMultisetPartitionsIntoSets**(*is_finite=None*, ***constraints*)

Bases: UniqueRepresentation, Parent

Ordered Multiset Partitions into Sets.

An *ordered multiset partition into sets* c of a multiset X is a list of nonempty subsets (not multisets), called the *blocks* of c, whose multi-union is X.

The number of blocks of c is called its *length*. The *order* of c is the cardinality of the multiset X. If, additionally, X is a multiset of positive integers, then the *size* of c is the sum of all elements of X.

The user may wish to focus on ordered multiset partitions into sets of a given size, or over a given alphabet. Hence, this class allows a variety of arguments as input.

INPUT:

Expects one or two arguments, with different behaviors resulting:

- One Argument:
  - X – a dictionary or list or tuple (representing a multiset for c), or an integer (representing the size of c)
- Two Arguments:
  - A – list (representing allowable letters within blocks of c), or a positive integer (representing the maximal allowable letter)
  - n – a nonnegative integer (the total number of letters within c)

Optional keyword arguments are as follows: (See corresponding methods in see *OrderedMultisetPartitionIntoSets* for more details.)

- `weight=X` (list or dictionary X) specifies the multiset for c
- `size=n` (integer n) specifies the size of c
- `alphabet=A` (iterable A) specifies allowable elements for the blocks of c
- `length=k` (integer k) specifies the number of blocks in the partition
- `min_length=k` (integer k) specifies minimum number of blocks in the partition
- `max_length=k` (integer k) specifies maximum number of blocks in the partition
- `order=n` (integer n) specifies the cardinality of the multiset that c partitions
- `min_order=n` (integer n) specifies minimum number of elements in the partition
- `max_order=n` (integer n) specifies maximum number of elements in the partition

EXAMPLES:

Passing one argument to *OrderedMultisetPartitionsIntoSets*:

There are 5 ordered multiset partitions into sets of the multiset $\{\{1, 1, 4\}\}$:

```
sage: OrderedMultisetPartitionsIntoSets([1,1,4]).cardinality()
5
```

```
>>> from sage.all import *
>>> OrderedMultisetPartitionsIntoSets([Integer(1),Integer(1),Integer(4)]).
↪cardinality()
5
```

Here is the list of them:

```
sage: OrderedMultisetPartitionsIntoSets([1,1,4]).list()
[[{1}, {1}, {4}], [{1}, {1,4}], [{1}, {4}, {1}], [{1,4}, {1}], [{4}, {1}, {1}]]
```

```
>>> from sage.all import *
>>> OrderedMultisetPartitionsIntoSets([Integer(1),Integer(1),Integer(4)]).list()
[[{1}, {1}, {4}], [{1}, {1,4}], [{1}, {4}, {1}], [{1,4}, {1}], [{4}, {1}, {1}]]
```

By chance, there are also 5 ordered multiset partitions into sets of the integer 3:

```
sage: OrderedMultisetPartitionsIntoSets(3).cardinality()
5
```

```
>>> from sage.all import *
>>> OrderedMultisetPartitionsIntoSets(Integer(3)).cardinality()
5
```

Here is the list of them:

```
sage: OrderedMultisetPartitionsIntoSets(3).list()
[[{3}], [{1,2}], [{2}, {1}], [{1}, {2}], [{1}, {1}, {1}]]
```

```
>>> from sage.all import *
>>> OrderedMultisetPartitionsIntoSets(Integer(3)).list()
[[{3}], [{1,2}], [{2}, {1}], [{1}, {2}], [{1}, {1}, {1}]]
```

Passing two arguments to *OrderedMultisetPartitionsIntoSets*:

There are also 5 ordered multiset partitions into sets of order 2 over the alphabet $\{1, 4\}$:

```
sage: OrderedMultisetPartitionsIntoSets([1, 4], 2)
Ordered Multiset Partitions into Sets of order 2 over alphabet {1, 4}
sage: OrderedMultisetPartitionsIntoSets([1, 4], 2).cardinality()
5
```

```
>>> from sage.all import *
>>> OrderedMultisetPartitionsIntoSets([Integer(1), Integer(4)], Integer(2))
Ordered Multiset Partitions into Sets of order 2 over alphabet {1, 4}
>>> OrderedMultisetPartitionsIntoSets([Integer(1), Integer(4)], Integer(2)).
↪cardinality()
5
```

Here is the list of them:

```
sage: OrderedMultisetPartitionsIntoSets([1, 4], 2).list()
[[{1,4}], [{1}, {1}], [{1}, {4}], [{4}, {1}], [{4}, {4}]]
```

```
>>> from sage.all import *
>>> OrderedMultisetPartitionsIntoSets([Integer(1), Integer(4)], Integer(2)).list()
[[{1,4}], [{1}, {1}], [{1}, {4}], [{4}, {1}], [{4}, {4}]]
```

If no arguments are passed to `OrderedMultisetPartitionsIntoSets`, then the code returns all ordered multiset partitions into sets:

```
sage: OrderedMultisetPartitionsIntoSets()
Ordered Multiset Partitions into Sets
sage: [] in OrderedMultisetPartitionsIntoSets()
True
sage: [[2,3], [1]] in OrderedMultisetPartitionsIntoSets()
True
sage: [['a','b'], ['a']] in OrderedMultisetPartitionsIntoSets()
True
sage: [[-2,3], [3]] in OrderedMultisetPartitionsIntoSets()
True
sage: [[2], [3,3]] in OrderedMultisetPartitionsIntoSets()
False
```

```
>>> from sage.all import *
>>> OrderedMultisetPartitionsIntoSets()
Ordered Multiset Partitions into Sets
>>> [] in OrderedMultisetPartitionsIntoSets()
True
>>> [[Integer(2),Integer(3)], [Integer(1)]] in OrderedMultisetPartitionsIntoSets()
True
>>> [['a','b'], ['a']] in OrderedMultisetPartitionsIntoSets()
True
>>> [[-Integer(2),Integer(3)], [Integer(3)]] in␣
↪OrderedMultisetPartitionsIntoSets()
True
>>> [[Integer(2)], [Integer(3),Integer(3)]] in OrderedMultisetPartitionsIntoSets()
False
```

The following examples show how to test whether or not an object is an ordered multiset partition into sets:

```
sage: [[3,2],[2]] in OrderedMultisetPartitionsIntoSets()
True
sage: [[3,2],[2]] in OrderedMultisetPartitionsIntoSets(7)
True
sage: [[3,2],[2]] in OrderedMultisetPartitionsIntoSets([2,2,3])
True
sage: [[3,2],[2]] in OrderedMultisetPartitionsIntoSets(5)
False
```

```
>>> from sage.all import *
>>> [[Integer(3),Integer(2)],[Integer(2)]] in OrderedMultisetPartitionsIntoSets()
True
```

(continues on next page)

(continued from previous page)

```
>>> [[Integer(3),Integer(2)],[Integer(2)]] in␣
↪OrderedMultisetPartitionsIntoSets(Integer(7))
True
>>> [[Integer(3),Integer(2)],[Integer(2)]] in␣
↪OrderedMultisetPartitionsIntoSets([Integer(2),Integer(2),Integer(3)])
True
>>> [[Integer(3),Integer(2)],[Integer(2)]] in␣
↪OrderedMultisetPartitionsIntoSets(Integer(5))
False
```

Optional keyword arguments

Passing keyword arguments that are incompatible with required requirements results in an error; otherwise, the collection of ordered multiset partitions into sets is restricted accordingly:

The `weight` *keyword:*

This is used to specify which multiset X is to be considered, if this multiset was not passed as one of the required arguments for *OrderedMultisetPartitionsIntoSets*. In principle, it is a dictionary, but weak compositions are also allowed. For example, the ordered multiset partitions into sets of integer 4 are listed by weight below:

```
sage: OrderedMultisetPartitionsIntoSets(4, weight=[0,0,0,1])
Ordered Multiset Partitions into Sets of integer 4 with constraint: weight={4: 1}
sage: OrderedMultisetPartitionsIntoSets(4, weight=[0,0,0,1]).list()
[[{4}]]
sage: OrderedMultisetPartitionsIntoSets(4, weight=[1,0,1]).list()
[[{1}, {3}], [{1,3}], [{3}, {1}]]
sage: OrderedMultisetPartitionsIntoSets(4, weight=[0,2]).list()
[[{2}, {2}]]
sage: OrderedMultisetPartitionsIntoSets(4, weight=[0,1,1]).list()
[]
sage: OrderedMultisetPartitionsIntoSets(4, weight=[2,1]).list()
[[{1}, {1}, {2}], [{1}, {1,2}], [{1}, {2}, {1}], [{1,2}, {1}], [{2}, {1}, {1}]]
sage: O1 = OrderedMultisetPartitionsIntoSets(weight=[2,0,1])
sage: O2 = OrderedMultisetPartitionsIntoSets(weight={1:2, 3:1})
sage: O1 == O2
True
sage: OrderedMultisetPartitionsIntoSets(4, weight=[4]).list()
[[{1}, {1}, {1}, {1}]]
```

```
>>> from sage.all import *
>>> OrderedMultisetPartitionsIntoSets(Integer(4), weight=[Integer(0),Integer(0),
↪Integer(0),Integer(1)])
Ordered Multiset Partitions into Sets of integer 4 with constraint: weight={4: 1}
>>> OrderedMultisetPartitionsIntoSets(Integer(4), weight=[Integer(0),Integer(0),
↪Integer(0),Integer(1)]).list()
[[{4}]]
>>> OrderedMultisetPartitionsIntoSets(Integer(4), weight=[Integer(1),Integer(0),
↪Integer(1)]).list()
[[{1}, {3}], [{1,3}], [{3}, {1}]]
>>> OrderedMultisetPartitionsIntoSets(Integer(4), weight=[Integer(0),Integer(2)]).
↪list()
[[{2}, {2}]]
```

(continues on next page)

(continued from previous page)

```
>>> OrderedMultisetPartitionsIntoSets(Integer(4), weight=[Integer(0),Integer(1),
↪Integer(1)]).list()
[]
>>> OrderedMultisetPartitionsIntoSets(Integer(4), weight=[Integer(2),Integer(1)]).
↪list()
[[{1}, {1}, {2}], [{1}, {1,2}], [{1}, {2}, {1}], [{1,2}, {1}], [{2}, {1}, {1}]]
>>> O1 = OrderedMultisetPartitionsIntoSets(weight=[Integer(2),Integer(0),
↪Integer(1)])
>>> O2 = OrderedMultisetPartitionsIntoSets(weight={Integer(1):Integer(2),␣
↪Integer(3):Integer(1)})
>>> O1 == O2
True
>>> OrderedMultisetPartitionsIntoSets(Integer(4), weight=[Integer(4)]).list()
[[{1}, {1}, {1}, {1}]]
```

The `size` *keyword:*

This is used to constrain the sum of entries across all blocks of the ordered multiset partition into sets. (This size is not pre-determined when alphabet A and order d are passed as required arguments.) For example, the ordered multiset partitions into sets of order 3 over the alphabet $[1, 2, 4]$ that have size equal to 5 are as follows:

```
sage: OMPs = OrderedMultisetPartitionsIntoSets
sage: OMPs([1,2,4], 3, size=5).list()
[[{1,2}, {2}], [{2}, {1,2}], [{2}, {2}, {1}],
 [{2}, {1}, {2}], [{1}, {2}, {2}]]
```

```
>>> from sage.all import *
>>> OMPs = OrderedMultisetPartitionsIntoSets
>>> OMPs([Integer(1),Integer(2),Integer(4)], Integer(3), size=Integer(5)).list()
[[{1,2}, {2}], [{2}, {1,2}], [{2}, {2}, {1}],
 [{2}, {1}, {2}], [{1}, {2}, {2}]]
```

The `alphabet` *option:*

This is used to constrain which integers appear across all blocks of the ordered multiset partition into sets. For example, the ordered multiset partitions into sets of integer 4 are listed for different choices of alphabet below. Note that `alphabet` is allowed to be an integer or an iterable:

```
sage: OMPs = OrderedMultisetPartitionsIntoSets
sage: OMPs(4, alphabet=3).list()
[[{1,3}], [{3}, {1}],
 [{1,2}, {1}], [{2}, {2}],
 [{2}, {1}, {1}], [{1}, {3}],
 [{1}, {1,2}], [{1}, {2}, {1}],
 [{1}, {1}, {2}], [{1}, {1}, {1}, {1}]]
sage: OMPs(4, alphabet=3) == OMPs(4, alphabet=[1,2,3])
True
sage: OMPs(4, alphabet=[3]).list()
[]
sage: OMPs(4, alphabet=[1,3]).list()
[[{1,3}], [{3}, {1}], [{1}, {3}], [{1}, {1}, {1}, {1}]]
sage: OMPs(4, alphabet=[2]).list()
[[{2}, {2}]]
```

(continues on next page)

(continued from previous page)

```
sage: OMPs(4, alphabet=[1,2]).list()
[[{1,2}, {1}], [{2}, {2}], [{2}, {1}, {1}], [{1}, {1,2}],
 [{1}, {2}, {1}], [{1}, {1}, {2}], [{1}, {1}, {1}, {1}]]
sage: OMPs(4, alphabet=4).list() == OMPs(4).list()
True
```

```
>>> from sage.all import *
>>> OMPs = OrderedMultisetPartitionsIntoSets
>>> OMPs(Integer(4), alphabet=Integer(3)).list()
[[{1,3}], [{3}, {1}],
 [{1,2}, {1}], [{2}, {2}],
 [{2}, {1}, {1}], [{1}, {3}],
 [{1}, {1,2}], [{1}, {2}, {1}],
 [{1}, {1}, {2}], [{1}, {1}, {1}, {1}]]
>>> OMPs(Integer(4), alphabet=Integer(3)) == OMPs(Integer(4),␣
↪alphabet=[Integer(1),Integer(2),Integer(3)])
True
>>> OMPs(Integer(4), alphabet=[Integer(3)]).list()
[]
>>> OMPs(Integer(4), alphabet=[Integer(1),Integer(3)]).list()
[[{1,3}], [{3}, {1}], [{1}, {3}], [{1}, {1}, {1}, {1}]]
>>> OMPs(Integer(4), alphabet=[Integer(2)]).list()
[[{2}, {2}]]
>>> OMPs(Integer(4), alphabet=[Integer(1),Integer(2)]).list()
[[{1,2}, {1}], [{2}, {2}], [{2}, {1}, {1}], [{1}, {1,2}],
 [{1}, {2}, {1}], [{1}, {1}, {2}], [{1}, {1}, {1}, {1}]]
>>> OMPs(Integer(4), alphabet=Integer(4)).list() == OMPs(Integer(4)).list()
True
```

The `length`, `min_length`, *and* `max_length` *options:*

These are used to constrain the number of blocks within the ordered multiset partitions into sets. For example, the ordered multiset partitions into sets of integer 4 of length exactly 2, at least 2, and at most 2 are given by:

```
sage: OrderedMultisetPartitionsIntoSets(4, length=2).list()
[[{3}, {1}], [{1,2}, {1}], [{2}, {2}], [{1}, {3}], [{1}, {1,2}]]
sage: OrderedMultisetPartitionsIntoSets(4, min_length=3).list()
[[{2}, {1}, {1}], [{1}, {2}, {1}], [{1}, {1}, {2}], [{1}, {1}, {1}, {1}]]
sage: OrderedMultisetPartitionsIntoSets(4, max_length=2).list()
[[{4}], [{1,3}], [{3}, {1}], [{1,2}, {1}], [{2}, {2}], [{1}, {3}],
 [{1}, {1,2}]]
```

```
>>> from sage.all import *
>>> OrderedMultisetPartitionsIntoSets(Integer(4), length=Integer(2)).list()
[[{3}, {1}], [{1,2}, {1}], [{2}, {2}], [{1}, {3}], [{1}, {1,2}]]
>>> OrderedMultisetPartitionsIntoSets(Integer(4), min_length=Integer(3)).list()
[[{2}, {1}, {1}], [{1}, {2}, {1}], [{1}, {1}, {2}], [{1}, {1}, {1}, {1}]]
>>> OrderedMultisetPartitionsIntoSets(Integer(4), max_length=Integer(2)).list()
[[{4}], [{1,3}], [{3}, {1}], [{1,2}, {1}], [{2}, {2}], [{1}, {3}],
 [{1}, {1,2}]]
```

The `order`, `min_order`, *and* `max_order` *options:*

These are used to constrain the number of elements across all blocks of the ordered multiset partitions into sets. For example, the ordered multiset partitions into sets of integer 4 are listed by order below:

```
sage: OrderedMultisetPartitionsIntoSets(4, order=1).list()
[[{4}]]
sage: OrderedMultisetPartitionsIntoSets(4, order=2).list()
[[{1,3}], [{3}, {1}], [{2}, {2}], [{1}, {3}]]
sage: OrderedMultisetPartitionsIntoSets(4, order=3).list()
[[{1,2}, {1}], [{2}, {1}, {1}], [{1}, {1,2}], [{1}, {2}, {1}], [{1}, {1}, {2}]]
sage: OrderedMultisetPartitionsIntoSets(4, order=4).list()
[[{1}, {1}, {1}, {1}]]
```

```
>>> from sage.all import *
>>> OrderedMultisetPartitionsIntoSets(Integer(4), order=Integer(1)).list()
[[{4}]]
>>> OrderedMultisetPartitionsIntoSets(Integer(4), order=Integer(2)).list()
[[{1,3}], [{3}, {1}], [{2}, {2}], [{1}, {3}]]
>>> OrderedMultisetPartitionsIntoSets(Integer(4), order=Integer(3)).list()
[[{1,2}, {1}], [{2}, {1}, {1}], [{1}, {1,2}], [{1}, {2}, {1}], [{1}, {1}, {2}]]
>>> OrderedMultisetPartitionsIntoSets(Integer(4), order=Integer(4)).list()
[[{1}, {1}, {1}, {1}]]
```

Also, here is a use of `max_order`, giving the ordered multiset partitions into sets of integer 4 with order 1 or 2:

```
sage: OrderedMultisetPartitionsIntoSets(4, max_order=2).list()
[[{4}], [{1,3}], [{3}, {1}], [{2}, {2}], [{1}, {3}]]
```

```
>>> from sage.all import *
>>> OrderedMultisetPartitionsIntoSets(Integer(4), max_order=Integer(2)).list()
[[{4}], [{1,3}], [{3}, {1}], [{2}, {2}], [{1}, {3}]]
```

Element

alias of *OrderedMultisetPartitionIntoSets*

subset (*size*)

Return a subset of all ordered multiset partitions into sets.

INPUT:

- `size` – integer representing a slice of all ordered multiset partitions into sets

The slice alluded to above is taken with respect to length, or to order, or to size, depending on the constraints of `self`.

EXAMPLES:

```
sage: C = OrderedMultisetPartitionsIntoSets(weight={2:2, 3:1, 5:1})
sage: C.subset(3)
Ordered Multiset Partitions into Sets of multiset {{2, 2, 3, 5}} with␣
↪constraint: length=3
sage: C = OrderedMultisetPartitionsIntoSets(weight={2:2, 3:1, 5:1}, min_
↪length=2)
sage: C.subset(3)
Ordered Multiset Partitions into Sets of multiset {{2, 2, 3, 5}} with␣
↪constraint: length=3
```

(continues on next page)

(continued from previous page)

```
sage: C = OrderedMultisetPartitionsIntoSets(alphabet=[2,3,5])
sage: C.subset(3)
Ordered Multiset Partitions into Sets of order 3 over alphabet {2, 3, 5}
sage: C = OrderedMultisetPartitionsIntoSets(order=5)
sage: C.subset(3)
Ordered Multiset Partitions into Sets of integer 3 with constraint: order=5
sage: C = OrderedMultisetPartitionsIntoSets(alphabet=[2,3,5], order=5,␣
↪length=3)
sage: C.subset(3)
Ordered Multiset Partitions into Sets of order 3 over alphabet {2, 3, 5} with␣
↪constraint: length=3
sage: C = OrderedMultisetPartitionsIntoSets()
sage: C.subset(3)
Ordered Multiset Partitions into Sets of integer 3
sage: C.subset(3) == OrderedMultisetPartitionsIntoSets(3)
True
```

```
>>> from sage.all import *
>>> C = OrderedMultisetPartitionsIntoSets(weight={Integer(2):Integer(2),␣
↪Integer(3):Integer(1), Integer(5):Integer(1)})
>>> C.subset(Integer(3))
Ordered Multiset Partitions into Sets of multiset {{2, 2, 3, 5}} with␣
↪constraint: length=3
>>> C = OrderedMultisetPartitionsIntoSets(weight={Integer(2):Integer(2),␣
↪Integer(3):Integer(1), Integer(5):Integer(1)}, min_length=Integer(2))
>>> C.subset(Integer(3))
Ordered Multiset Partitions into Sets of multiset {{2, 2, 3, 5}} with␣
↪constraint: length=3
>>> C = OrderedMultisetPartitionsIntoSets(alphabet=[Integer(2),Integer(3),
↪Integer(5)])
>>> C.subset(Integer(3))
Ordered Multiset Partitions into Sets of order 3 over alphabet {2, 3, 5}
>>> C = OrderedMultisetPartitionsIntoSets(order=Integer(5))
>>> C.subset(Integer(3))
Ordered Multiset Partitions into Sets of integer 3 with constraint: order=5
>>> C = OrderedMultisetPartitionsIntoSets(alphabet=[Integer(2),Integer(3),
↪Integer(5)], order=Integer(5), length=Integer(3))
>>> C.subset(Integer(3))
Ordered Multiset Partitions into Sets of order 3 over alphabet {2, 3, 5} with␣
↪constraint: length=3
>>> C = OrderedMultisetPartitionsIntoSets()
>>> C.subset(Integer(3))
Ordered Multiset Partitions into Sets of integer 3
>>> C.subset(Integer(3)) == OrderedMultisetPartitionsIntoSets(Integer(3))
True
```

class sage.combinat.multiset_partition_into_sets_ordered.**OrderedMultisetPartitionsIntoSets_X**(X)

Bases: *OrderedMultisetPartitionsIntoSets*

Class of ordered multiset partitions into sets of a fixed multiset X.

cardinality()

Return the number of ordered partitions of multiset X.

random_element()

Return a random element of `self`.

This method does not return elements of `self` with uniform probability, but it does cover all elements. The scheme is as follows:

- produce a random permutation `p` of the multiset;
- create blocks of an OMP `fat` by breaking `p` after non-ascents;
- take a random element of `fat.finer()`.

EXAMPLES:

```
sage: OrderedMultisetPartitionsIntoSets([1,1,3]).random_element()   # random
[{1}, {1,3}]
sage: OrderedMultisetPartitionsIntoSets([1,1,3]).random_element()   # random
[{3}, {1}, {1}]

sage: OMP = OrderedMultisetPartitionsIntoSets([1,1,3,3])
sage: d = {}
sage: for _ in range(1000):
....:     x = OMP.random_element()
....:     d[x] = d.get(x, 0) + 1
sage: d.values()   # random
[102, 25, 76, 24, 66, 88, 327, 27, 83, 83, 239, 72, 88]
```

```
>>> from sage.all import *
>>> OrderedMultisetPartitionsIntoSets([Integer(1),Integer(1),Integer(3)]).
↪random_element()   # random
[{1}, {1,3}]
>>> OrderedMultisetPartitionsIntoSets([Integer(1),Integer(1),Integer(3)]).
↪random_element()   # random
[{3}, {1}, {1}]

>>> OMP = OrderedMultisetPartitionsIntoSets([Integer(1),Integer(1),Integer(3),
↪Integer(3)])
>>> d = {}
>>> for _ in range(Integer(1000)):
...     x = OMP.random_element()
...     d[x] = d.get(x, Integer(0)) + Integer(1)
>>> d.values()   # random
[102, 25, 76, 24, 66, 88, 327, 27, 83, 83, 239, 72, 88]
```

class sage.combinat.multiset_partition_into_sets_ordered.**OrderedMultisetPartitionsIntoSets_X_constrai**

Bases: *OrderedMultisetPartitionsIntoSets*

Class of ordered multiset partitions into sets of a fixed multiset X satisfying constraints.

class sage.combinat.multiset_partition_into_sets_ordered.**OrderedMultisetPartitionsIntoSets_all_constr**

Bases: *OrderedMultisetPartitionsIntoSets*

All ordered multiset partitions into sets (with or without constraints).

EXAMPLES:

```
sage: C = OrderedMultisetPartitionsIntoSets(); C
Ordered Multiset Partitions into Sets
sage: [[1],[1,'a']] in C
True

sage: OrderedMultisetPartitionsIntoSets(weight=[2,0,1], length=2)
Ordered Multiset Partitions into Sets of multiset {{1, 1, 3}} with constraint:␣
↪length=2
```

```
>>> from sage.all import *
>>> C = OrderedMultisetPartitionsIntoSets(); C
Ordered Multiset Partitions into Sets
>>> [[Integer(1)],[Integer(1),'a']] in C
True

>>> OrderedMultisetPartitionsIntoSets(weight=[Integer(2),Integer(0),Integer(1)],␣
↪length=Integer(2))
Ordered Multiset Partitions into Sets of multiset {{1, 1, 3}} with constraint:␣
↪length=2
```

class sage.combinat.multiset_partition_into_sets_ordered.**OrderedMultisetPartitionsIntoSets_alph_d**(A, d)

Bases: *OrderedMultisetPartitionsIntoSets*

Class of ordered multiset partitions into sets of specified order d over a fixed alphabet A.

cardinality()

Return the number of ordered partitions of order `self._order` on alphabet `self._alphabet`.

random_element()

Return a random element of `self`.

This method does not return elements of `self` with uniform probability, but it does cover all elements. The scheme is as follows:

- produce a random composition C;
- choose random subsets of `self._alphabet` of size c for each c in C.

EXAMPLES:

```
sage: OrderedMultisetPartitionsIntoSets([1,4], 3).random_element()   # random
[{4}, {1,4}]
sage: OrderedMultisetPartitionsIntoSets([1,3], 4).random_element()   # random
[{1,3}, {1}, {3}]

sage: OMP = OrderedMultisetPartitionsIntoSets([2,3,4], 2)
sage: d = {}
sage: for _ in range(1200):
....:     x = OMP.random_element()
....:     d[x] = d.get(x, 0) + 1
sage: d.values()  # random
[192, 68, 73, 61, 69, 60, 77, 204, 210, 66, 53, 67]
```

```
>>> from sage.all import *
>>> OrderedMultisetPartitionsIntoSets([Integer(1),Integer(4)], Integer(3)).
↪random_element()  # random
[{4}, {1,4}]
>>> OrderedMultisetPartitionsIntoSets([Integer(1),Integer(3)], Integer(4)).
↪random_element()  # random
[{1,3}, {1}, {3}]

>>> OMP = OrderedMultisetPartitionsIntoSets([Integer(2),Integer(3),
↪Integer(4)], Integer(2))
>>> d = {}
>>> for _ in range(Integer(1200)):
...     x = OMP.random_element()
...     d[x] = d.get(x, Integer(0)) + Integer(1)
>>> d.values()  # random
[192, 68, 73, 61, 69, 60, 77, 204, 210, 66, 53, 67]
```

class sage.combinat.multiset_partition_into_sets_ordered.**OrderedMultisetPartitionsIntoSets_alph_d_con**

Bases: *OrderedMultisetPartitionsIntoSets*

Class of ordered multiset partitions into sets of specified order d over a fixed alphabet A satisfying constraints.

class sage.combinat.multiset_partition_into_sets_ordered.**OrderedMultisetPartitionsIntoSets_n**(*n*)

Bases: *OrderedMultisetPartitionsIntoSets*

Ordered multiset partitions into sets of a fixed integer n.

cardinality()

Return the number of elements in `self`.

random_element()

Return a random element of `self`.

This method does not return elements of `self` with uniform probability, but it does cover all elements. The scheme is as follows:

- produce a random composition C;
- choose a random partition of c into distinct parts for each c in C.

EXAMPLES:

```
sage: OrderedMultisetPartitionsIntoSets(5).random_element()  # random
[{1,2}, {1}, {1}]
sage: OrderedMultisetPartitionsIntoSets(5).random_element()  # random
[{2}, {1,2}]

sage: OMP = OrderedMultisetPartitionsIntoSets(5)
sage: d = {}
sage: for _ in range(1100):
....:     x = OMP.random_element()
....:     d[x] = d.get(x, 0) + 1
sage: d.values()  # random
[72, 73, 162, 78, 135, 75, 109, 65, 135, 134, 62]
```

```
>>> from sage.all import *
>>> OrderedMultisetPartitionsIntoSets(Integer(5)).random_element()   # random
[{1,2}, {1}, {1}]
>>> OrderedMultisetPartitionsIntoSets(Integer(5)).random_element()   # random
[{2}, {1,2}]

>>> OMP = OrderedMultisetPartitionsIntoSets(Integer(5))
>>> d = {}
>>> for _ in range(Integer(1100)):
...     x = OMP.random_element()
...     d[x] = d.get(x, Integer(0)) + Integer(1)
>>> d.values()  # random
[72, 73, 162, 78, 135, 75, 109, 65, 135, 134, 62]
```

class sage.combinat.multiset_partition_into_sets_ordered.**OrderedMultisetPartitionsIntoSets_n_constra**

Bases: *OrderedMultisetPartitionsIntoSets*

Class of ordered multiset partitions into sets of a fixed integer n satisfying constraints.

5.1.142 Common combinatorial tools

REFERENCES:

sage.combinat.ncsf_qsym.combinatorics.**coeff_dab**(I, J)

Return the number of standard composition tableaux of shape I with descent composition J.

INPUT:

- I, J – compositions

OUTPUT: integer

EXAMPLES:

```
sage: from sage.combinat.ncsf_qsym.combinatorics import coeff_dab
sage: coeff_dab(Composition([2,1]),Composition([2,1]))
1
sage: coeff_dab(Composition([1,1,2]),Composition([1,2,1]))
0
```

```
>>> from sage.all import *
>>> from sage.combinat.ncsf_qsym.combinatorics import coeff_dab
>>> coeff_dab(Composition([Integer(2),Integer(1)]),Composition([Integer(2),
↪Integer(1)]))
1
```

(continues on next page)

(continued from previous page)

```
>>> coeff_dab(Composition([Integer(1),Integer(1),Integer(2)]),
↪Composition([Integer(1),Integer(2),Integer(1)]))
0
```

sage.combinat.ncsf_qsym.combinatorics.**coeff_ell**(J, I)

Return the coefficient $\ell_{J,I}$ as defined in [NCSF].

INPUT:

- `J` – a composition
- `I` – a composition refining `J`

OUTPUT: integer

EXAMPLES:

```
sage: from sage.combinat.ncsf_qsym.combinatorics import coeff_ell
sage: coeff_ell(Composition([1,1,1]), Composition([2,1]))
2
sage: coeff_ell(Composition([2,1]), Composition([3]))
2
```

```
>>> from sage.all import *
>>> from sage.combinat.ncsf_qsym.combinatorics import coeff_ell
>>> coeff_ell(Composition([Integer(1),Integer(1),Integer(1)]),␣
↪Composition([Integer(2),Integer(1)]))
2
>>> coeff_ell(Composition([Integer(2),Integer(1)]), Composition([Integer(3)]))
2
```

sage.combinat.ncsf_qsym.combinatorics.**coeff_lp**(J, I)

Return the coefficient $lp_{J,I}$ as defined in [NCSF].

INPUT:

- `J` – a composition
- `I` – a composition refining `J`

OUTPUT: integer

EXAMPLES:

```
sage: from sage.combinat.ncsf_qsym.combinatorics import coeff_lp
sage: coeff_lp(Composition([1,1,1]), Composition([2,1]))
1
sage: coeff_lp(Composition([2,1]), Composition([3]))
1
```

```
>>> from sage.all import *
>>> from sage.combinat.ncsf_qsym.combinatorics import coeff_lp
>>> coeff_lp(Composition([Integer(1),Integer(1),Integer(1)]),␣
↪Composition([Integer(2),Integer(1)]))
1
>>> coeff_lp(Composition([Integer(2),Integer(1)]), Composition([Integer(3)]))
1
```

sage.combinat.ncsf_qsym.combinatorics.**coeff_pi**(*J*, *I*)

Return the coefficient $\pi_{J,I}$ as defined in [NCSF].

INPUT:

- `J` – a composition
- `I` – a composition refining `J`

OUTPUT: integer

EXAMPLES:

```
sage: from sage.combinat.ncsf_qsym.combinatorics import coeff_pi
sage: coeff_pi(Composition([1,1,1]), Composition([2,1]))
2
sage: coeff_pi(Composition([2,1]), Composition([3]))
6
```

```
>>> from sage.all import *
>>> from sage.combinat.ncsf_qsym.combinatorics import coeff_pi
>>> coeff_pi(Composition([Integer(1),Integer(1),Integer(1)]),␣
↪Composition([Integer(2),Integer(1)]))
2
>>> coeff_pi(Composition([Integer(2),Integer(1)]), Composition([Integer(3)]))
6
```

sage.combinat.ncsf_qsym.combinatorics.**coeff_sp**(*J*, *I*)

Return the coefficient $sp_{J,I}$ as defined in [NCSF].

INPUT:

- `J` – a composition
- `I` – a composition refining `J`

OUTPUT: integer

EXAMPLES:

```
sage: from sage.combinat.ncsf_qsym.combinatorics import coeff_sp
sage: coeff_sp(Composition([1,1,1]), Composition([2,1]))
2
sage: coeff_sp(Composition([2,1]), Composition([3]))
4
```

```
>>> from sage.all import *
>>> from sage.combinat.ncsf_qsym.combinatorics import coeff_sp
>>> coeff_sp(Composition([Integer(1),Integer(1),Integer(1)]),␣
↪Composition([Integer(2),Integer(1)]))
2
>>> coeff_sp(Composition([Integer(2),Integer(1)]), Composition([Integer(3)]))
4
```

sage.combinat.ncsf_qsym.combinatorics.**compositions_order**(*n*)

Return the compositions of n ordered as defined in [QSCHUR].

Let $S(\gamma)$ return the composition γ after sorting. For compositions α and β, we order $\alpha \rhd \beta$ if

1) $S(\alpha) > S(\beta)$ lexicographically, or
2) $S(\alpha) = S(\beta)$ and $\alpha > \beta$ lexicographically.

INPUT:

- n – positive integer

OUTPUT: list of the compositions of n sorted into decreasing order by $\rhd$

EXAMPLES:

```
sage: from sage.combinat.ncsf_qsym.combinatorics import compositions_order
sage: compositions_order(3)
[[3], [2, 1], [1, 2], [1, 1, 1]]
sage: compositions_order(4)
[[4], [3, 1], [1, 3], [2, 2], [2, 1, 1], [1, 2, 1], [1, 1, 2], [1, 1, 1, 1]]
```

```
>>> from sage.all import *
>>> from sage.combinat.ncsf_qsym.combinatorics import compositions_order
>>> compositions_order(Integer(3))
[[3], [2, 1], [1, 2], [1, 1, 1]]
>>> compositions_order(Integer(4))
[[4], [3, 1], [1, 3], [2, 2], [2, 1, 1], [1, 2, 1], [1, 1, 2], [1, 1, 1, 1]]
```

sage.combinat.ncsf_qsym.combinatorics.**m_to_s_stat**(*R*, *I*, *K*)

Return the coefficient of the complete non-commutative symmetric function S^K in the expansion of the monomial non-commutative symmetric function M^I with respect to the complete basis over the ring R. This is the coefficient in formula (36) of Tevlin's paper [Tev2007].

INPUT:

- R – a ring; supposed to be a **Q**-algebra
- I, K – compositions

OUTPUT:

- The coefficient of S^K in the expansion of M^I in the complete basis of the non-commutative symmetric functions over R.

EXAMPLES:

```
sage: from sage.combinat.ncsf_qsym.combinatorics import m_to_s_stat
sage: m_to_s_stat(QQ, Composition([2,1]), Composition([1,1,1]))
-1
sage: m_to_s_stat(QQ, Composition([3]), Composition([1,2]))
-2
sage: m_to_s_stat(QQ, Composition([2,1,2]), Composition([2,1,2]))
8/3
```

```
>>> from sage.all import *
>>> from sage.combinat.ncsf_qsym.combinatorics import m_to_s_stat
>>> m_to_s_stat(QQ, Composition([Integer(2),Integer(1)]), Composition([Integer(1),
↪Integer(1),Integer(1)]))
-1
>>> m_to_s_stat(QQ, Composition([Integer(3)]), Composition([Integer(1),
↪Integer(2)]))
```

(continues on next page)

(continued from previous page)

```
-2
>>> m_to_s_stat(QQ, Composition([Integer(2),Integer(1),Integer(2)]),␣
↪Composition([Integer(2),Integer(1),Integer(2)]))
8/3
```

sage.combinat.ncsf_qsym.combinatorics.**number_of_SSRCT**(*shape_comp*)

The number of semi-standard reverse composition tableaux.

The dual quasisymmetric-Schur functions satisfy a left Pieri rule where $S_n dQS_\gamma$ is a sum over dual quasisymmetric-Schur functions indexed by compositions which contain the composition γ. The definition of an SSRCT comes from this rule. The number of SSRCT of content β and shape α is equal to the number of SSRCT of content $(\beta_2, \ldots, \beta_\ell)$ and shape γ where dQS_α appears in the expansion of $S_{\beta_1} dQS_\gamma$.

In sage the recording tableau for these objects are called `CompositionTableaux`.

INPUT:

- `content_comp`, `shape_comp` – compositions

OUTPUT: integer

EXAMPLES:

```
sage: from sage.combinat.ncsf_qsym.combinatorics import number_of_SSRCT
sage: number_of_SSRCT(Composition([3,1]), Composition([1,3]))
0
sage: number_of_SSRCT(Composition([1,2,1]), Composition([1,3]))
1
sage: number_of_SSRCT(Composition([1,1,2,2]), Composition([3,3]))
2
sage: all(CompositionTableaux(be).cardinality()
....:     == sum(number_of_SSRCT(al,be)*binomial(4,len(al))
....:            for al in Compositions(4))
....:     for be in Compositions(4))
True
```

```
>>> from sage.all import *
>>> from sage.combinat.ncsf_qsym.combinatorics import number_of_SSRCT
>>> number_of_SSRCT(Composition([Integer(3),Integer(1)]), Composition([Integer(1),
↪Integer(3)]))
0
>>> number_of_SSRCT(Composition([Integer(1),Integer(2),Integer(1)]),␣
↪Composition([Integer(1),Integer(3)]))
1
>>> number_of_SSRCT(Composition([Integer(1),Integer(1),Integer(2),Integer(2)]),␣
↪Composition([Integer(3),Integer(3)]))
2
>>> all(CompositionTableaux(be).cardinality()
...     == sum(number_of_SSRCT(al,be)*binomial(Integer(4),len(al))
...            for al in Compositions(Integer(4)))
...     for be in Compositions(Integer(4)))
True
```

sage.combinat.ncsf_qsym.combinatorics.**number_of_fCT**(*shape_comp*)

Return the number of Immaculate tableaux of shape `shape_comp` and content `content_comp`.

See [BBSSZ2012], Definition 3.9, for the notion of an immaculate tableau.

INPUT:

- `content_comp`, `shape_comp` – compositions

OUTPUT: integer

EXAMPLES:

```
sage: from sage.combinat.ncsf_qsym.combinatorics import number_of_fCT
sage: number_of_fCT(Composition([3,1]), Composition([1,3]))
0
sage: number_of_fCT(Composition([1,2,1]), Composition([1,3]))
1
sage: number_of_fCT(Composition([1,1,3,1]), Composition([2,1,3]))
2
```

```
>>> from sage.all import *
>>> from sage.combinat.ncsf_qsym.combinatorics import number_of_fCT
>>> number_of_fCT(Composition([Integer(3),Integer(1)]), Composition([Integer(1),
↪Integer(3)]))
0
>>> number_of_fCT(Composition([Integer(1),Integer(2),Integer(1)]),␣
↪Composition([Integer(1),Integer(3)]))
1
>>> number_of_fCT(Composition([Integer(1),Integer(1),Integer(3),Integer(1)]),␣
↪Composition([Integer(2),Integer(1),Integer(3)]))
2
```

5.1.143 Generic code for bases

This is a collection of code that is shared by bases of noncommutative symmetric functions and quasisymmetric functions.

AUTHORS:

- Jason Bandlow
- Franco Saliola
- Chris Berg

class `sage.combinat.ncsf_qsym.generic_basis_code.`**`AlgebraMorphism`**(*domain*, *on_generators*, *position=0*, *codomain=None*, *category=None*, *anti=False*)

Bases: `ModuleMorphismByLinearity`

A class for algebra morphism defined on a free algebra from the image of the generators

class `sage.combinat.ncsf_qsym.generic_basis_code.`**`BasesOfQSymOrNCSF`**(*parent_with_realization*)

Bases: `Category_realization_of_parent`

class ElementMethods

Bases: `object`

`degree()`

The maximum of the degrees of the homogeneous summands.

See also

`homogeneous_degree()`

EXAMPLES:

```
sage: S = NonCommutativeSymmetricFunctions(QQ).S()
sage: (x, y) = (S[2], S[3])
sage: x.degree()
2
sage: (x^3 + 4*y^2).degree()
6
sage: ((1 + x)^3).degree()
6
```

```
>>> from sage.all import *
>>> S = NonCommutativeSymmetricFunctions(QQ).S()
>>> (x, y) = (S[Integer(2)], S[Integer(3)])
>>> x.degree()
2
>>> (x**Integer(3) + Integer(4)*y**Integer(2)).degree()
6
>>> ((Integer(1) + x)**Integer(3)).degree()
6
```

```
sage: F = QuasiSymmetricFunctions(QQ).F()
sage: (x, y) = (F[2], F[3])
sage: x.degree()
2
sage: (x^3 + 4*y^2).degree()
6
sage: ((1 + x)^3).degree()
6
```

```
>>> from sage.all import *
>>> F = QuasiSymmetricFunctions(QQ).F()
>>> (x, y) = (F[Integer(2)], F[Integer(3)])
>>> x.degree()
2
>>> (x**Integer(3) + Integer(4)*y**Integer(2)).degree()
6
>>> ((Integer(1) + x)**Integer(3)).degree()
6
```

degree_negation()

Return the image of `self` under the degree negation automorphism of the parent of `self`.

The degree negation is the automorphism which scales every homogeneous element of degree k by $(-1)^k$ (for all k).

Calling `degree_negation(self)` is equivalent to calling `self.parent().degree_negation(self)`.

EXAMPLES:

```
sage: NSym = NonCommutativeSymmetricFunctions(ZZ)
sage: S = NSym.S()
sage: f = 2*S[2,1] + 4*S[1,1] - 5*S[1,2] - 3*S[[]]
sage: f.degree_negation()
-3*S[] + 4*S[1, 1] + 5*S[1, 2] - 2*S[2, 1]

sage: QSym = QuasiSymmetricFunctions(QQ)
sage: dI = QSym.dualImmaculate()
sage: f = -3*dI[2,1] + 4*dI[2] + 2*dI[1]
sage: f.degree_negation()
-2*dI[1] + 4*dI[2] + 3*dI[2, 1]
```

```
>>> from sage.all import *
>>> NSym = NonCommutativeSymmetricFunctions(ZZ)
>>> S = NSym.S()
>>> f = Integer(2)*S[Integer(2),Integer(1)] + Integer(4)*S[Integer(1),
↪Integer(1)] - Integer(5)*S[Integer(1),Integer(2)] - Integer(3)*S[[]]
>>> f.degree_negation()
-3*S[] + 4*S[1, 1] + 5*S[1, 2] - 2*S[2, 1]

>>> QSym = QuasiSymmetricFunctions(QQ)
>>> dI = QSym.dualImmaculate()
>>> f = -Integer(3)*dI[Integer(2),Integer(1)] + Integer(4)*dI[Integer(2)]␣
↪+ Integer(2)*dI[Integer(1)]
>>> f.degree_negation()
-2*dI[1] + 4*dI[2] + 3*dI[2, 1]
```

Todo

Generalize this to all graded vector spaces?

duality_pairing(*y*)

The duality pairing between elements of $NSym$ and elements of $QSym$.

The complete basis is dual to the monomial basis with respect to this pairing.

INPUT:

- `y` – an element of the dual Hopf algebra of `self`

OUTPUT: the result of pairing `self` with `y`

EXAMPLES:

```
sage: R = NonCommutativeSymmetricFunctions(QQ).Ribbon()
sage: F = QuasiSymmetricFunctions(QQ).Fundamental()
sage: R[1,1,2].duality_pairing(F[1,1,2])
1
sage: R[1,2,1].duality_pairing(F[1,1,2])
0
```

```
>>> from sage.all import *
>>> R = NonCommutativeSymmetricFunctions(QQ).Ribbon()
>>> F = QuasiSymmetricFunctions(QQ).Fundamental()
```

(continues on next page)

(continued from previous page)

```
>>> R[Integer(1),Integer(1),Integer(2)].duality_pairing(F[Integer(1),
↪Integer(1),Integer(2)])
1
>>> R[Integer(1),Integer(2),Integer(1)].duality_pairing(F[Integer(1),
↪Integer(1),Integer(2)])
0
```

```
sage: L = NonCommutativeSymmetricFunctions(QQ).Elementary()
sage: F = QuasiSymmetricFunctions(QQ).Fundamental()
sage: L[1,2].duality_pairing(F[1,2])
0
sage: L[1,1,1].duality_pairing(F[1,2])
1
```

```
>>> from sage.all import *
>>> L = NonCommutativeSymmetricFunctions(QQ).Elementary()
>>> F = QuasiSymmetricFunctions(QQ).Fundamental()
>>> L[Integer(1),Integer(2)].duality_pairing(F[Integer(1),Integer(2)])
0
>>> L[Integer(1),Integer(1),Integer(1)].duality_pairing(F[Integer(1),
↪Integer(2)])
1
```

skew_by(*y*, *side='left'*)

The operation which is dual to multiplication by `y`, where `y` is an element of the dual space of `self`.

This is calculated through the coproduct of `self` and the expansion of `y` in the dual basis.

INPUT:

- `y` – an element of the dual Hopf algebra of `self`
- `side` – (default: `'left'`) either `'left'` or `'right'`

OUTPUT: the result of skewing `self` by `y`, on the side `side`

EXAMPLES:

Skewing an element of NCSF by an element of QSym:

```
sage: R = NonCommutativeSymmetricFunctions(QQ).ribbon()
sage: F = QuasiSymmetricFunctions(QQ).Fundamental()
sage: R([2,2,2]).skew_by(F[1,1])
R[1, 1, 2] + R[1, 2, 1] + R[1, 3] + R[2, 1, 1] + 2*R[2, 2] + R[3, 1] +
↪R[4]
sage: R([2,2,2]).skew_by(F[2])
R[1, 1, 2] + R[1, 2, 1] + R[1, 3] + R[2, 1, 1] + 3*R[2, 2] + R[3, 1] +
↪R[4]
```

```
>>> from sage.all import *
>>> R = NonCommutativeSymmetricFunctions(QQ).ribbon()
>>> F = QuasiSymmetricFunctions(QQ).Fundamental()
>>> R([Integer(2),Integer(2),Integer(2)]).skew_by(F[Integer(1),
↪Integer(1)])
R[1, 1, 2] + R[1, 2, 1] + R[1, 3] + R[2, 1, 1] + 2*R[2, 2] + R[3, 1] +
↪R[4]
```

(continues on next page)

(continued from previous page)

```
>>> R([Integer(2),Integer(2),Integer(2)]).skew_by(F[Integer(2)])
R[1, 1, 2] + R[1, 2, 1] + R[1, 3] + R[2, 1, 1] + 3*R[2, 2] + R[3, 1] +␣
↪R[4]
```

Skewing an element of QSym by an element of NCSF:

```
sage: S = NonCommutativeSymmetricFunctions(QQ).S()
sage: R = NonCommutativeSymmetricFunctions(QQ).R()
sage: F = QuasiSymmetricFunctions(QQ).F()
sage: F[3,2].skew_by(R[1,1])
0
sage: F[3,2].skew_by(R[1,1], side='right')
0
sage: F[3,2].skew_by(S[1,1,1], side='right')
F[2]
sage: F[3,2].skew_by(S[1,2], side='right')
F[2]
sage: F[3,2].skew_by(S[2,1], side='right')
0
sage: F[3,2].skew_by(S[1,1,1])
F[2]
sage: F[3,2].skew_by(S[1,1])
F[1, 2]
sage: F[3,2].skew_by(S[1])
F[2, 2]
```

```
>>> from sage.all import *
>>> S = NonCommutativeSymmetricFunctions(QQ).S()
>>> R = NonCommutativeSymmetricFunctions(QQ).R()
>>> F = QuasiSymmetricFunctions(QQ).F()
>>> F[Integer(3),Integer(2)].skew_by(R[Integer(1),Integer(1)])
0
>>> F[Integer(3),Integer(2)].skew_by(R[Integer(1),Integer(1)], side='right
↪')
0
>>> F[Integer(3),Integer(2)].skew_by(S[Integer(1),Integer(1),Integer(1)],␣
↪side='right')
F[2]
>>> F[Integer(3),Integer(2)].skew_by(S[Integer(1),Integer(2)], side='right
↪')
F[2]
>>> F[Integer(3),Integer(2)].skew_by(S[Integer(2),Integer(1)], side='right
↪')
0
>>> F[Integer(3),Integer(2)].skew_by(S[Integer(1),Integer(1),Integer(1)])
F[2]
>>> F[Integer(3),Integer(2)].skew_by(S[Integer(1),Integer(1)])
F[1, 2]
>>> F[Integer(3),Integer(2)].skew_by(S[Integer(1)])
F[2, 2]
```

```
sage: S = NonCommutativeSymmetricFunctions(QQ).S()
sage: R = NonCommutativeSymmetricFunctions(QQ).R()
sage: M = QuasiSymmetricFunctions(QQ).M()
sage: M[3,2].skew_by(S[2])
0
sage: M[3,2].skew_by(S[2], side='right')
M[3]
sage: M[3,2].skew_by(S[3])
M[2]
sage: M[3,2].skew_by(S[3], side='right')
0
```

```
>>> from sage.all import *
>>> S = NonCommutativeSymmetricFunctions(QQ).S()
>>> R = NonCommutativeSymmetricFunctions(QQ).R()
>>> M = QuasiSymmetricFunctions(QQ).M()
>>> M[Integer(3),Integer(2)].skew_by(S[Integer(2)])
0
>>> M[Integer(3),Integer(2)].skew_by(S[Integer(2)], side='right')
M[3]
>>> M[Integer(3),Integer(2)].skew_by(S[Integer(3)])
M[2]
>>> M[Integer(3),Integer(2)].skew_by(S[Integer(3)], side='right')
0
```

class ParentMethods

Bases: `object`

alternating_sum_of_compositions(*n*)

Alternating sum over compositions of `n`.

Note that this differs from the method *alternating_sum_of_finer_compositions()* because the coefficient of the composition 1^n is positive. This method is used in the expansion of the elementary generators into the complete generators and vice versa.

INPUT:

- `n` – positive integer

OUTPUT:

- The expansion of the complete generator indexed by `n` into the elementary basis.

EXAMPLES:

```
sage: L = NonCommutativeSymmetricFunctions(QQ).L()
sage: L.alternating_sum_of_compositions(0)
L[]
sage: L.alternating_sum_of_compositions(1)
L[1]
sage: L.alternating_sum_of_compositions(2)
L[1, 1] - L[2]
sage: L.alternating_sum_of_compositions(3)
L[1, 1, 1] - L[1, 2] - L[2, 1] + L[3]
sage: S = NonCommutativeSymmetricFunctions(QQ).S()
sage: S.alternating_sum_of_compositions(3)
S[1, 1, 1] - S[1, 2] - S[2, 1] + S[3]
```

```
>>> from sage.all import *
>>> L = NonCommutativeSymmetricFunctions(QQ).L()
>>> L.alternating_sum_of_compositions(Integer(0))
L[]
>>> L.alternating_sum_of_compositions(Integer(1))
L[1]
>>> L.alternating_sum_of_compositions(Integer(2))
L[1, 1] - L[2]
>>> L.alternating_sum_of_compositions(Integer(3))
L[1, 1, 1] - L[1, 2] - L[2, 1] + L[3]
>>> S = NonCommutativeSymmetricFunctions(QQ).S()
>>> S.alternating_sum_of_compositions(Integer(3))
S[1, 1, 1] - S[1, 2] - S[2, 1] + S[3]
```

alternating_sum_of_fatter_compositions(*composition*)

Return the alternating sum of fatter compositions in a basis of the non-commutative symmetric functions.

INPUT:

- `composition` – a composition

OUTPUT:

- The alternating sum of the compositions fatter than `composition`, in the basis `self`. The alternation is upon the length of the compositions, and is normalized so that `composition` has coefficient 1.

EXAMPLES:

```
sage: NCSF=NonCommutativeSymmetricFunctions(QQ)
sage: elementary = NCSF.elementary()
sage: elementary.alternating_sum_of_fatter_compositions(Composition([2,2,
→1]))
L[2, 2, 1] - L[2, 3] - L[4, 1] + L[5]
sage: elementary.alternating_sum_of_fatter_compositions(Composition([1,
→2]))
L[1, 2] - L[3]
```

```
>>> from sage.all import *
>>> NCSF=NonCommutativeSymmetricFunctions(QQ)
>>> elementary = NCSF.elementary()
>>> elementary.alternating_sum_of_fatter_
→compositions(Composition([Integer(2),Integer(2),Integer(1)]))
L[2, 2, 1] - L[2, 3] - L[4, 1] + L[5]
>>> elementary.alternating_sum_of_fatter_
→compositions(Composition([Integer(1),Integer(2)]))
L[1, 2] - L[3]
```

alternating_sum_of_finer_compositions(*composition*, *conjugate=False*)

Return the alternating sum of finer compositions in a basis of the non-commutative symmetric functions.

INPUT:

- `composition` – a composition
- `conjugate` – boolean (default: `False`)

OUTPUT:

- The alternating sum of the compositions finer than `composition`, in the basis `self`. The alternation is upon the length of the compositions, and is normalized so that `composition` has coefficient 1. If the variable `conjugate` is set to `True`, then the conjugate of `composition` is used instead of composition.

EXAMPLES:

```
sage: NCSF = NonCommutativeSymmetricFunctions(QQ)
sage: elementary = NCSF.elementary()
sage: elementary.alternating_sum_of_finer_compositions(Composition([2,2,
↪1]))
L[1, 1, 1, 1, 1] - L[1, 1, 2, 1] - L[2, 1, 1, 1] + L[2, 2, 1]
sage: elementary.alternating_sum_of_finer_compositions(Composition([1,2]))
-L[1, 1, 1] + L[1, 2]
```

```
>>> from sage.all import *
>>> NCSF = NonCommutativeSymmetricFunctions(QQ)
>>> elementary = NCSF.elementary()
>>> elementary.alternating_sum_of_finer_
↪compositions(Composition([Integer(2),Integer(2),Integer(1)]))
L[1, 1, 1, 1, 1] - L[1, 1, 2, 1] - L[2, 1, 1, 1] + L[2, 2, 1]
>>> elementary.alternating_sum_of_finer_
↪compositions(Composition([Integer(1),Integer(2)]))
-L[1, 1, 1] + L[1, 2]
```

counit_on_basis(*I*)

The counit is defined by sending all elements of positive degree to zero.

EXAMPLES:

```
sage: S = NonCommutativeSymmetricFunctions(QQ).S()
sage: S.counit_on_basis([1,3])
0
sage: M = QuasiSymmetricFunctions(QQ).M()
sage: M.counit_on_basis([1,3])
0
```

```
>>> from sage.all import *
>>> S = NonCommutativeSymmetricFunctions(QQ).S()
>>> S.counit_on_basis([Integer(1),Integer(3)])
0
>>> M = QuasiSymmetricFunctions(QQ).M()
>>> M.counit_on_basis([Integer(1),Integer(3)])
0
```

degree_negation(*element*)

Return the image of `element` under the degree negation automorphism of `self`.

The degree negation is the automorphism which scales every homogeneous element of degree k by $(-1)^k$ (for all k).

INPUT:

- `element` – element of `self`

EXAMPLES:

```
sage: NSym = NonCommutativeSymmetricFunctions(ZZ)
sage: S = NSym.S()
sage: f = 2*S[2,1] + 4*S[1,1] - 5*S[1,2] - 3*S[[]]
```

(continues on next page)

(continued from previous page)

```
sage: S.degree_negation(f)
-3*S[] + 4*S[1, 1] + 5*S[1, 2] - 2*S[2, 1]

sage: QSym = QuasiSymmetricFunctions(QQ)
sage: dI = QSym.dualImmaculate()
sage: f = -3*dI[2,1] + 4*dI[2] + 2*dI[1]
sage: dI.degree_negation(f)
-2*dI[1] + 4*dI[2] + 3*dI[2, 1]
```

```
>>> from sage.all import *
>>> NSym = NonCommutativeSymmetricFunctions(ZZ)
>>> S = NSym.S()
>>> f = Integer(2)*S[Integer(2),Integer(1)] + Integer(4)*S[Integer(1),
↪Integer(1)] - Integer(5)*S[Integer(1),Integer(2)] - Integer(3)*S[[]]
>>> S.degree_negation(f)
-3*S[] + 4*S[1, 1] + 5*S[1, 2] - 2*S[2, 1]

>>> QSym = QuasiSymmetricFunctions(QQ)
>>> dI = QSym.dualImmaculate()
>>> f = -Integer(3)*dI[Integer(2),Integer(1)] + Integer(4)*dI[Integer(2)]␣
↪+ Integer(2)*dI[Integer(1)]
>>> dI.degree_negation(f)
-2*dI[1] + 4*dI[2] + 3*dI[2, 1]
```

Todo

Generalize this to all graded vector spaces?

degree_on_basis(*I*)

Return the degree of the basis element indexed by I.

INPUT:

- `I` – a composition

OUTPUT:

- The degree of the non-commutative symmetric function basis element of `self` indexed by `I`. By definition, this is the size of the composition `I`.

EXAMPLES:

```
sage: R = NonCommutativeSymmetricFunctions(QQ).ribbon()
sage: R.degree_on_basis(Composition([2,3]))
5
sage: M = QuasiSymmetricFunctions(QQ).Monomial()
sage: M.degree_on_basis(Composition([3,2]))
5
sage: M.degree_on_basis(Composition([]))
0
```

```
>>> from sage.all import *
>>> R = NonCommutativeSymmetricFunctions(QQ).ribbon()
>>> R.degree_on_basis(Composition([Integer(2),Integer(3)]))
```

(continues on next page)

(continued from previous page)

```
5
>>> M = QuasiSymmetricFunctions(QQ).Monomial()
>>> M.degree_on_basis(Composition([Integer(3),Integer(2)]))
5
>>> M.degree_on_basis(Composition([]))
0
```

duality_pairing(*x*, *y*)

The duality pairing between elements of $NSym$ and elements of $QSym$.

This is a default implementation that uses `self.realizations_of().a_realization()` and its dual basis.

INPUT:

- `x` – an element of `self`
- `y` – an element in the dual basis of `self`

OUTPUT:

- The result of pairing the function `x` from `self` with the function `y` from the dual basis of `self`

EXAMPLES:

```
sage: R = NonCommutativeSymmetricFunctions(QQ).Ribbon()
sage: F = QuasiSymmetricFunctions(QQ).Fundamental()
sage: R.duality_pairing(R[1,1,2], F[1,1,2])
1
sage: R.duality_pairing(R[1,2,1], F[1,1,2])
0
sage: F.duality_pairing(F[1,2,1], R[1,1,2])
0
```

```
>>> from sage.all import *
>>> R = NonCommutativeSymmetricFunctions(QQ).Ribbon()
>>> F = QuasiSymmetricFunctions(QQ).Fundamental()
>>> R.duality_pairing(R[Integer(1),Integer(1),Integer(2)], F[Integer(1),
↪Integer(1),Integer(2)])
1
>>> R.duality_pairing(R[Integer(1),Integer(2),Integer(1)], F[Integer(1),
↪Integer(1),Integer(2)])
0
>>> F.duality_pairing(F[Integer(1),Integer(2),Integer(1)], R[Integer(1),
↪Integer(1),Integer(2)])
0
```

```
sage: S = NonCommutativeSymmetricFunctions(QQ).Complete()
sage: M = QuasiSymmetricFunctions(QQ).Monomial()
sage: S.duality_pairing(S[1,1,2], M[1,1,2])
1
sage: S.duality_pairing(S[1,2,1], M[1,1,2])
0
sage: M.duality_pairing(M[1,1,2], S[1,1,2])
1
sage: M.duality_pairing(M[1,2,1], S[1,1,2])
0
```

```
>>> from sage.all import *
>>> S = NonCommutativeSymmetricFunctions(QQ).Complete()
>>> M = QuasiSymmetricFunctions(QQ).Monomial()
>>> S.duality_pairing(S[Integer(1),Integer(1),Integer(2)], M[Integer(1),
↪Integer(1),Integer(2)])
1
>>> S.duality_pairing(S[Integer(1),Integer(2),Integer(1)], M[Integer(1),
↪Integer(1),Integer(2)])
0
>>> M.duality_pairing(M[Integer(1),Integer(1),Integer(2)], S[Integer(1),
↪Integer(1),Integer(2)])
1
>>> M.duality_pairing(M[Integer(1),Integer(2),Integer(1)], S[Integer(1),
↪Integer(1),Integer(2)])
0
```

```
sage: S = NonCommutativeSymmetricFunctions(QQ).Complete()
sage: F = QuasiSymmetricFunctions(QQ).Fundamental()
sage: S.duality_pairing(S[1,2], F[1,1,1])
0
sage: S.duality_pairing(S[1,1,1,1], F[4])
1
```

```
>>> from sage.all import *
>>> S = NonCommutativeSymmetricFunctions(QQ).Complete()
>>> F = QuasiSymmetricFunctions(QQ).Fundamental()
>>> S.duality_pairing(S[Integer(1),Integer(2)], F[Integer(1),Integer(1),
↪Integer(1)])
0
>>> S.duality_pairing(S[Integer(1),Integer(1),Integer(1),Integer(1)],␣
↪F[Integer(4)])
1
```

duality_pairing_by_coercion(x, y)

The duality pairing between elements of NSym and elements of QSym.

This is a default implementation that uses `self.realizations_of().a_realization()` and its dual basis.

INPUT:

- `x` – an element of `self`
- `y` – an element in the dual basis of `self`

OUTPUT:

- The result of pairing the function `x` from `self` with the function `y` from the dual basis of `self`

EXAMPLES:

```
sage: L = NonCommutativeSymmetricFunctions(QQ).Elementary()
sage: F = QuasiSymmetricFunctions(QQ).Fundamental()
sage: L.duality_pairing_by_coercion(L[1,2], F[1,2])
0
sage: F.duality_pairing_by_coercion(F[1,2], L[1,2])
0
sage: L.duality_pairing_by_coercion(L[1,1,1], F[1,2])
```

(continues on next page)

(continued from previous page)

```
1
sage: F.duality_pairing_by_coercion(F[1,2], L[1,1,1])
1
```

```
>>> from sage.all import *
>>> L = NonCommutativeSymmetricFunctions(QQ).Elementary()
>>> F = QuasiSymmetricFunctions(QQ).Fundamental()
>>> L.duality_pairing_by_coercion(L[Integer(1),Integer(2)], F[Integer(1),
↪Integer(2)])
0
>>> F.duality_pairing_by_coercion(F[Integer(1),Integer(2)], L[Integer(1),
↪Integer(2)])
0
>>> L.duality_pairing_by_coercion(L[Integer(1),Integer(1),Integer(1)],
↪F[Integer(1),Integer(2)])
1
>>> F.duality_pairing_by_coercion(F[Integer(1),Integer(2)], L[Integer(1),
↪Integer(1),Integer(1)])
1
```

duality_pairing_matrix(*basis*, *degree*)

The matrix of scalar products between elements of NSym and elements of QSym.

INPUT:

- `basis` – a basis of the dual Hopf algebra
- `degree` – nonnegative integer

OUTPUT:

- The matrix of scalar products between the basis `self` and the basis `basis` in the dual Hopf algebra in degree `degree`.

EXAMPLES:

The ribbon basis of NCSF is dual to the fundamental basis of QSym:

```
sage: R = NonCommutativeSymmetricFunctions(QQ).ribbon()
sage: F = QuasiSymmetricFunctions(QQ).Fundamental()
sage: R.duality_pairing_matrix(F, 3)
[1 0 0 0]
[0 1 0 0]
[0 0 1 0]
[0 0 0 1]
sage: F.duality_pairing_matrix(R, 3)
[1 0 0 0]
[0 1 0 0]
[0 0 1 0]
[0 0 0 1]
```

```
>>> from sage.all import *
>>> R = NonCommutativeSymmetricFunctions(QQ).ribbon()
>>> F = QuasiSymmetricFunctions(QQ).Fundamental()
>>> R.duality_pairing_matrix(F, Integer(3))
[1 0 0 0]
[0 1 0 0]
```

(continues on next page)

(continued from previous page)

```
[0 0 1 0]
[0 0 0 1]
>>> F.duality_pairing_matrix(R, Integer(3))
[1 0 0 0]
[0 1 0 0]
[0 0 1 0]
[0 0 0 1]
```

The complete basis of NCSF is dual to the monomial basis of QSym:

```
sage: S = NonCommutativeSymmetricFunctions(QQ).complete()
sage: M = QuasiSymmetricFunctions(QQ).Monomial()
sage: S.duality_pairing_matrix(M, 3)
[1 0 0 0]
[0 1 0 0]
[0 0 1 0]
[0 0 0 1]
sage: M.duality_pairing_matrix(S, 3)
[1 0 0 0]
[0 1 0 0]
[0 0 1 0]
[0 0 0 1]
```

```
>>> from sage.all import *
>>> S = NonCommutativeSymmetricFunctions(QQ).complete()
>>> M = QuasiSymmetricFunctions(QQ).Monomial()
>>> S.duality_pairing_matrix(M, Integer(3))
[1 0 0 0]
[0 1 0 0]
[0 0 1 0]
[0 0 0 1]
>>> M.duality_pairing_matrix(S, Integer(3))
[1 0 0 0]
[0 1 0 0]
[0 0 1 0]
[0 0 0 1]
```

The matrix between the ribbon basis of NCSF and the monomial basis of QSym:

```
sage: R = NonCommutativeSymmetricFunctions(QQ).ribbon()
sage: M = QuasiSymmetricFunctions(QQ).Monomial()
sage: R.duality_pairing_matrix(M, 3)
[ 1 -1 -1  1]
[ 0  1  0 -1]
[ 0  0  1 -1]
[ 0  0  0  1]
sage: M.duality_pairing_matrix(R, 3)
[ 1  0  0  0]
[-1  1  0  0]
[-1  0  1  0]
[ 1 -1 -1  1]
```

```
>>> from sage.all import *
>>> R = NonCommutativeSymmetricFunctions(QQ).ribbon()
>>> M = QuasiSymmetricFunctions(QQ).Monomial()
>>> R.duality_pairing_matrix(M, Integer(3))
[ 1 -1 -1  1]
[ 0  1  0 -1]
[ 0  0  1 -1]
[ 0  0  0  1]
>>> M.duality_pairing_matrix(R, Integer(3))
[ 1  0  0  0]
[-1  1  0  0]
[-1  0  1  0]
[ 1 -1 -1  1]
```

The matrix between the complete basis of NCSF and the fundamental basis of QSym:

```
sage: S = NonCommutativeSymmetricFunctions(QQ).complete()
sage: F = QuasiSymmetricFunctions(QQ).Fundamental()
sage: S.duality_pairing_matrix(F, 3)
[1 1 1 1]
[0 1 0 1]
[0 0 1 1]
[0 0 0 1]
```

```
>>> from sage.all import *
>>> S = NonCommutativeSymmetricFunctions(QQ).complete()
>>> F = QuasiSymmetricFunctions(QQ).Fundamental()
>>> S.duality_pairing_matrix(F, Integer(3))
[1 1 1 1]
[0 1 0 1]
[0 0 1 1]
[0 0 0 1]
```

A base case test:

```
sage: R.duality_pairing_matrix(M,0)
[1]
```

```
>>> from sage.all import *
>>> R.duality_pairing_matrix(M,Integer(0))
[1]
```

one_basis()

Return the empty composition.

OUTPUT: the empty composition

EXAMPLES:

```
sage: L = NonCommutativeSymmetricFunctions(QQ).L()
sage: parent(L)
<class 'sage.combinat.ncsf_qsym.ncsf.NonCommutativeSymmetricFunctions.
↪Elementary_with_category'>
```

(continues on next page)

(continued from previous page)

```
sage: parent(L).one_basis()
[]
```

```
>>> from sage.all import *
>>> L = NonCommutativeSymmetricFunctions(QQ).L()
>>> parent(L)
<class 'sage.combinat.ncsf_qsym.ncsf.NonCommutativeSymmetricFunctions.
↪Elementary_with_category'>
>>> parent(L).one_basis()
[]
```

skew(*x*, *y*, *side='left'*)

Return a function x in self skewed by a function y in the Hopf dual of self.

INPUT:

- x – a non-commutative or quasi-symmetric function; it is an element of self
- y – a quasi-symmetric or non-commutative symmetric function; it is an element of the dual algebra of self
- side – (default: 'left') either 'left' or 'right'

OUTPUT:

- The result of skewing the element x by the Hopf algebra element y (either from the left or from the right, as determined by side), written in the basis self.

EXAMPLES:

```
sage: S = NonCommutativeSymmetricFunctions(QQ).complete()
sage: F = QuasiSymmetricFunctions(QQ).Fundamental()
sage: S.skew(S[2,2,2], F[1,1])
S[1, 1, 2] + S[1, 2, 1] + S[2, 1, 1]
sage: S.skew(S[2,2,2], F[2])
S[1, 1, 2] + S[1, 2, 1] + S[2, 1, 1] + 3*S[2, 2]
```

```
>>> from sage.all import *
>>> S = NonCommutativeSymmetricFunctions(QQ).complete()
>>> F = QuasiSymmetricFunctions(QQ).Fundamental()
>>> S.skew(S[Integer(2),Integer(2),Integer(2)], F[Integer(1),Integer(1)])
S[1, 1, 2] + S[1, 2, 1] + S[2, 1, 1]
>>> S.skew(S[Integer(2),Integer(2),Integer(2)], F[Integer(2)])
S[1, 1, 2] + S[1, 2, 1] + S[2, 1, 1] + 3*S[2, 2]
```

```
sage: R = NonCommutativeSymmetricFunctions(QQ).ribbon()
sage: F = QuasiSymmetricFunctions(QQ).Fundamental()
sage: R.skew(R[2,2,2], F[1,1])
R[1, 1, 2] + R[1, 2, 1] + R[1, 3] + R[2, 1, 1] + 2*R[2, 2] + R[3, 1] +␣
↪R[4]
sage: R.skew(R[2,2,2], F[2])
R[1, 1, 2] + R[1, 2, 1] + R[1, 3] + R[2, 1, 1] + 3*R[2, 2] + R[3, 1] +␣
↪R[4]
```

```
>>> from sage.all import *
>>> R = NonCommutativeSymmetricFunctions(QQ).ribbon()
>>> F = QuasiSymmetricFunctions(QQ).Fundamental()
```

(continues on next page)

(continued from previous page)

```
>>> R.skew(R[Integer(2),Integer(2),Integer(2)], F[Integer(1),Integer(1)])
R[1, 1, 2] + R[1, 2, 1] + R[1, 3] + R[2, 1, 1] + 2*R[2, 2] + R[3, 1] +␣
↪R[4]
>>> R.skew(R[Integer(2),Integer(2),Integer(2)], F[Integer(2)])

>>> R = NonCommutativeSymmetricFunctions(QQ).R()
>>> M = QuasiSymmetricFunctions(QQ).M()
>>> M.skew(M[Integer(3),Integer(2)], S[Integer(2)])
0
>>> M.skew(M[Integer(3),Integer(2)], S[Integer(2)], side='right')
M[3]
>>> M.skew(M[Integer(3),Integer(2)], S[Integer(3)])
M[2]
>>> M.skew(M[Integer(3),Integer(2)], S[Integer(3)], side='right')
0
```

sum_of_fatter_compositions(*composition*)

Return the sum of all fatter compositions.

INPUT:

- `composition` – a composition

OUTPUT:

- the sum of all basis elements which are indexed by compositions fatter (coarser?) than `composition`.

EXAMPLES:

```
sage: L = NonCommutativeSymmetricFunctions(QQ).L()
sage: L.sum_of_fatter_compositions(Composition([2,1]))
L[2, 1] + L[3]
sage: R = NonCommutativeSymmetricFunctions(QQ).R()
sage: R.sum_of_fatter_compositions(Composition([1,3]))
R[1, 3] + R[4]
```

```
>>> from sage.all import *
>>> L = NonCommutativeSymmetricFunctions(QQ).L()
>>> L.sum_of_fatter_compositions(Composition([Integer(2),Integer(1)]))
```

(continues on next page)

(continued from previous page)

```
L[2, 1] + L[3]
>>> R = NonCommutativeSymmetricFunctions(QQ).R()
>>> R.sum_of_fatter_compositions(Composition([Integer(1),Integer(3)]))
R[1, 3] + R[4]
```

sum_of_finer_compositions(*composition*)

Return the sum of all finer compositions.

INPUT:

- `composition` – a composition

OUTPUT:

- The sum of all basis `self` elements which are indexed by compositions finer than `composition`.

EXAMPLES:

```
sage: L = NonCommutativeSymmetricFunctions(QQ).L()
sage: L.sum_of_finer_compositions(Composition([2,1]))
L[1, 1, 1] + L[2, 1]
sage: R = NonCommutativeSymmetricFunctions(QQ).R()
sage: R.sum_of_finer_compositions(Composition([1,3]))
R[1, 1, 1, 1] + R[1, 1, 2] + R[1, 2, 1] + R[1, 3]
```

```
>>> from sage.all import *
>>> L = NonCommutativeSymmetricFunctions(QQ).L()
>>> L.sum_of_finer_compositions(Composition([Integer(2),Integer(1)]))
L[1, 1, 1] + L[2, 1]
>>> R = NonCommutativeSymmetricFunctions(QQ).R()
>>> R.sum_of_finer_compositions(Composition([Integer(1),Integer(3)]))
R[1, 1, 1, 1] + R[1, 1, 2] + R[1, 2, 1] + R[1, 3]
```

sum_of_partition_rearrangements(*par*)

Return the sum of all basis elements indexed by compositions which can be sorted to obtain a given partition.

INPUT:

- `par` – a partition

OUTPUT:

- The sum of all `self` basis elements indexed by compositions which are permutations of `par` (without multiplicity).

EXAMPLES:

```
sage: NCSF=NonCommutativeSymmetricFunctions(QQ)
sage: elementary = NCSF.elementary()
sage: elementary.sum_of_partition_rearrangements(Partition([2,2,1]))
L[1, 2, 2] + L[2, 1, 2] + L[2, 2, 1]
sage: elementary.sum_of_partition_rearrangements(Partition([3,2,1]))
L[1, 2, 3] + L[1, 3, 2] + L[2, 1, 3] + L[2, 3, 1] + L[3, 1, 2] + L[3, 2,
↪1]
sage: elementary.sum_of_partition_rearrangements(Partition([]))
L[]
```

```
>>> from sage.all import *
>>> NCSF=NonCommutativeSymmetricFunctions(QQ)
```

(continues on next page)

(continued from previous page)

```
>>> elementary = NCSF.elementary()
>>> elementary.sum_of_partition_rearrangements(Partition([Integer(2),
↪Integer(2),Integer(1)]))
L[1, 2, 2] + L[2, 1, 2] + L[2, 2, 1]
>>> elementary.sum_of_partition_rearrangements(Partition([Integer(3),
↪Integer(2),Integer(1)]))
L[1, 2, 3] + L[1, 3, 2] + L[2, 1, 3] + L[2, 3, 1] + L[3, 1, 2] + L[3, 2,␣
↪1]
>>> elementary.sum_of_partition_rearrangements(Partition([]))
L[]
```

super_categories()

class sage.combinat.ncsf_qsym.generic_basis_code.**GradedModulesWithInternalProduct**(*base*, *name=None*)

Bases: `Category_over_base_ring`

Construct the class of modules with internal product. This is used to give an internal product structure to the non-commutative symmetric functions.

EXAMPLES:

```
sage: from sage.combinat.ncsf_qsym.generic_basis_code import␣
↪GradedModulesWithInternalProduct
sage: N = NonCommutativeSymmetricFunctions(QQ)
sage: R = N.ribbon()
sage: R in GradedModulesWithInternalProduct(QQ)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.ncsf_qsym.generic_basis_code import␣
↪GradedModulesWithInternalProduct
>>> N = NonCommutativeSymmetricFunctions(QQ)
>>> R = N.ribbon()
>>> R in GradedModulesWithInternalProduct(QQ)
True
```

class ElementMethods

Bases: `object`

internal_product(*other*)

Return the internal product of two non-commutative symmetric functions.

The internal product on the algebra of non-commutative symmetric functions is adjoint to the internal coproduct on the algebra of quasisymmetric functions with respect to the duality pairing between these two algebras. This means, explicitly, that any two non-commutative symmetric functions f and g and any quasi-symmetric function h satisfy

$$\langle f * g, h \rangle = \sum_i \langle f, h'_i \rangle \langle g, h''_i \rangle ,$$

where we write $\Delta^\times(h)$ as $\sum_i h'_i \otimes h''_i$. Here, $f * g$ denotes the internal product of the non-commutative symmetric functions f and g.

If f and g are two homogeneous elements of $NSym$ having distinct degrees, then the internal product $f * g$ is zero.

Explicit formulas can be given for internal products of elements of the complete and the Psi bases. First, the formula for the Complete basis ([NCSF1] Proposition 5.1): If I and J are two compositions of lengths p and q, respectively, then the corresponding Complete homogeneous non-commutative symmetric functions S^I and S^J have internal product

$$S^I * S^J = \sum S^{\mathrm{comp}\, M},$$

where the sum ranges over all $p \times q$-matrices $M \in \mathbf{N}^{p \times q}$ (with nonnegative integers as entries) whose row sum vector is I (that is, the sum of the entries of the r-th row is the r-th part of I for all r) and whose column sum vector is J (that is, the sum of all entries of the s-th row is the s-th part of J for all s). Here, for any $M \in \mathbf{N}^{p \times q}$, we denote by $\mathrm{comp}\, M$ the composition obtained by reading the entries of the matrix M in the usual order (row by row, proceeding left to right in each row, traversing the rows from top to bottom).

The formula on the Psi basis ([NCSF2] Lemma 3.10) is more complicated. Let I and J be two compositions of lengths p and q, respectively, having the same size $|I| = |J|$. We denote by Ψ^K the element of the Psi basis corresponding to any composition K.

- If $p > q$, then $\Psi^I * \Psi^J$ is plainly 0.
- Assume that $p = q$. Let $\widetilde{\delta}_{I,J}$ denote the integer 1 if the compositions I and J are permutations of each other, and the integer 0 otherwise. For every positive integer i, let m_i denote the number of parts of I equal to i. Then, $\Psi^I * \Psi^J$ equals $\widetilde{\delta}_{I,J} \prod_{i>0} i^{m_i} m_i! \Psi^I$.
- Now assume that $p < q$. Write the composition I as $I = (i_1, i_2, \ldots, i_p)$. For every nonempty composition $K = (k_1, k_2, \ldots, k_s)$, denote by Γ_K the non-commutative symmetric function $k_1[\ldots[[\Psi_{k_1}, \Psi_{k_2}], \Psi_{k_3}], \ldots \Psi_{k_s}]$. For any subset A of $\{1, 2, \ldots, q\}$, let J_A be the composition obtained from J by removing the r-th parts for all $r \notin A$ (while keeping the r-th parts for all $r \in A$ in order). Then, $\Psi^I * \Psi^J$ equals the sum of $\Gamma_{J_{K_1}} \Gamma_{J_{K_2}} \cdots \Gamma_{J_{K_p}}$ over all ordered set partitions $(K_1, K_2, \ldots, K_p)$ of $\{1, 2, \ldots, q\}$ into p parts such that each $1 \leq k \leq p$ satisfies $|J_{K_k}| = i_k$. (See `OrderedSetPartition()` for the meaning of "ordered set partition".)

Aliases for `internal_product()` are `itensor()` and `kronecker_product()`.

INPUT:

- `other` – another non-commutative symmetric function

OUTPUT:

- The result of taking the internal product of `self` with `other`.

EXAMPLES:

```
sage: N = NonCommutativeSymmetricFunctions(QQ)
sage: S = N.complete()
sage: x = S.an_element(); x
2*S[] + 2*S[1] + 3*S[1, 1]
sage: x.internal_product(S[2])
3*S[1, 1]
sage: x.internal_product(S[1])
2*S[1]
sage: S[1,2].internal_product(S[1,2])
S[1, 1, 1] + S[1, 2]
```

```
>>> from sage.all import *
>>> N = NonCommutativeSymmetricFunctions(QQ)
>>> S = N.complete()
>>> x = S.an_element(); x
2*S[] + 2*S[1] + 3*S[1, 1]
>>> x.internal_product(S[Integer(2)])
3*S[1, 1]
```

(continues on next page)

(continued from previous page)

```
>>> x.internal_product(S[Integer(1)])
2*S[1]
>>> S[Integer(1),Integer(2)].internal_product(S[Integer(1),Integer(2)])
S[1, 1, 1] + S[1, 2]
```

Let us check the duality between the inner product and the inner coproduct in degree 4:

```
sage: M = QuasiSymmetricFunctions(FiniteField(29)).M()
sage: S = NonCommutativeSymmetricFunctions(FiniteField(29)).S()
sage: def tensor_incopr(f, g, h):  # computes \sum_i \left< f, h'_i \
↪right> \left< g, h''_i \right>
....:     result = h.base_ring().zero()
....:     h_parent = h.parent()
....:     for partition_pair, coeff in h.internal_coproduct().monomial_
↪coefficients().items():
....:         result += coeff * f.duality_pairing(h_parent[partition_
↪pair[0]]) * g.duality_pairing(h_parent[partition_pair[1]])
....:     return result
sage: def testall(n):
....:     return all( all( all( tensor_incopr(S[u], S[v], M[w]) == (S[u].
↪itensor(S[v])).duality_pairing(M[w])
....:                               for w in Compositions(n) )
....:                          for v in Compositions(n) )
....:                     for u in Compositions(n) )
sage: testall(2)
True
sage: testall(3)  # long time
True
sage: testall(4)  # not tested, too long
True
```

```
>>> from sage.all import *
>>> M = QuasiSymmetricFunctions(FiniteField(Integer(29))).M()
>>> S = NonCommutativeSymmetricFunctions(FiniteField(Integer(29))).S()
>>> def tensor_incopr(f, g, h):  # computes \sum_i \left< f, h'_i \right>␣
↪\left< g, h''_i \right>
...     result = h.base_ring().zero()
...     h_parent = h.parent()
...     for partition_pair, coeff in h.internal_coproduct().monomial_
↪coefficients().items():
...         result += coeff * f.duality_pairing(h_parent[partition_
↪pair[Integer(0)]]) * g.duality_pairing(h_parent[partition_
↪pair[Integer(1)]])
...     return result
>>> def testall(n):
...     return all( all( all( tensor_incopr(S[u], S[v], M[w]) == (S[u].
↪itensor(S[v])).duality_pairing(M[w])
...                               for w in Compositions(n) )
...                          for v in Compositions(n) )
...                     for u in Compositions(n) )
>>> testall(Integer(2))
True
```

(continues on next page)

(continued from previous page)

```
>>> testall(Integer(3))  # long time
True
>>> testall(Integer(4))  # not tested, too long
True
```

The internal product on the algebra of non-commutative symmetric functions commutes with the canonical commutative projection on the symmetric functions:

```
sage: S = NonCommutativeSymmetricFunctions(ZZ).S()
sage: e = SymmetricFunctions(ZZ).e()
sage: def int_pr_of_S_in_e(I, J):
....:     return (S[I].internal_product(S[J])).to_symmetric_function()
sage: all( all( int_pr_of_S_in_e(I, J)
....:           == S[I].to_symmetric_function().internal_product(S[J].to_
↪symmetric_function())
....:           for I in Compositions(3) )
....:      for J in Compositions(3) )
True
```

```
>>> from sage.all import *
>>> S = NonCommutativeSymmetricFunctions(ZZ).S()
>>> e = SymmetricFunctions(ZZ).e()
>>> def int_pr_of_S_in_e(I, J):
...     return (S[I].internal_product(S[J])).to_symmetric_function()
>>> all( all( int_pr_of_S_in_e(I, J)
...           == S[I].to_symmetric_function().internal_product(S[J].to_
↪symmetric_function())
...           for I in Compositions(Integer(3)) )
...      for J in Compositions(Integer(3)) )
True
```

itensor(*other*)

Return the internal product of two non-commutative symmetric functions.

The internal product on the algebra of non-commutative symmetric functions is adjoint to the internal coproduct on the algebra of quasisymmetric functions with respect to the duality pairing between these two algebras. This means, explicitly, that any two non-commutative symmetric functions f and g and any quasi-symmetric function h satisfy

$$\langle f * g, h \rangle = \sum_i \langle f, h'_i \rangle \langle g, h''_i \rangle ,$$

where we write $\Delta^{\times}(h)$ as $\sum_i h'_i \otimes h''_i$. Here, $f * g$ denotes the internal product of the non-commutative symmetric functions f and g.

If f and g are two homogeneous elements of $NSym$ having distinct degrees, then the internal product $f * g$ is zero.

Explicit formulas can be given for internal products of elements of the complete and the Psi bases. First, the formula for the Complete basis ([NCSF1] Proposition 5.1): If I and J are two compositions of lengths p and q, respectively, then the corresponding Complete homogeneous non-commutative symmetric functions S^I and S^J have internal product

$$S^I * S^J = \sum S^{\mathrm{comp}\, M},$$

where the sum ranges over all $p \times q$-matrices $M \in \mathbf{N}^{p\times q}$ (with nonnegative integers as entries) whose row sum vector is I (that is, the sum of the entries of the r-th row is the r-th part of I for all r) and whose column sum vector is J (that is, the sum of all entries of the s-th row is the s-th part of J for all s). Here, for any $M \in \mathbf{N}^{p\times q}$, we denote by comp M the composition obtained by reading the entries of the matrix M in the usual order (row by row, proceeding left to right in each row, traversing the rows from top to bottom).

The formula on the Psi basis ([NCSF2] Lemma 3.10) is more complicated. Let I and J be two compositions of lengths p and q, respectively, having the same size $|I| = |J|$. We denote by Ψ^K the element of the Psi basis corresponding to any composition K.

- If $p > q$, then $\Psi^I * \Psi^J$ is plainly 0.
- Assume that $p = q$. Let $\widetilde{\delta}_{I,J}$ denote the integer 1 if the compositions I and J are permutations of each other, and the integer 0 otherwise. For every positive integer i, let m_i denote the number of parts of I equal to i. Then, $\Psi^I * \Psi^J$ equals $\widetilde{\delta}_{I,J} \prod_{i>0} i^{m_i} m_i! \Psi^I$.
- Now assume that $p < q$. Write the composition I as $I = (i_1, i_2, \ldots, i_p)$. For every nonempty composition $K = (k_1, k_2, \ldots, k_s)$, denote by Γ_K the non-commutative symmetric function $k_1[\ldots[[\Psi_{k_1}, \Psi_{k_2}], \Psi_{k_3}], \ldots \Psi_{k_s}]$. For any subset A of $\{1, 2, \ldots, q\}$, let J_A be the composition obtained from J by removing the r-th parts for all $r \notin A$ (while keeping the r-th parts for all $r \in A$ in order). Then, $\Psi^I * \Psi^J$ equals the sum of $\Gamma_{J_{K_1}} \Gamma_{J_{K_2}} \cdots \Gamma_{J_{K_p}}$ over all ordered set partitions $(K_1, K_2, \ldots, K_p)$ of $\{1, 2, \ldots, q\}$ into p parts such that each $1 \leq k \leq p$ satisfies $|J_{K_k}| = i_k$. (See `OrderedSetPartition()` for the meaning of "ordered set partition".)

Aliases for `internal_product()` are `itensor()` and `kronecker_product()`.

INPUT:

- `other` – another non-commutative symmetric function

OUTPUT:

- The result of taking the internal product of `self` with `other`.

EXAMPLES:

```
sage: N = NonCommutativeSymmetricFunctions(QQ)
sage: S = N.complete()
sage: x = S.an_element(); x
2*S[] + 2*S[1] + 3*S[1, 1]
sage: x.internal_product(S[2])
3*S[1, 1]
sage: x.internal_product(S[1])
2*S[1]
sage: S[1,2].internal_product(S[1,2])
S[1, 1, 1] + S[1, 2]
```

```
>>> from sage.all import *
>>> N = NonCommutativeSymmetricFunctions(QQ)
>>> S = N.complete()
>>> x = S.an_element(); x
2*S[] + 2*S[1] + 3*S[1, 1]
>>> x.internal_product(S[Integer(2)])
3*S[1, 1]
>>> x.internal_product(S[Integer(1)])
2*S[1]
>>> S[Integer(1),Integer(2)].internal_product(S[Integer(1),Integer(2)])
S[1, 1, 1] + S[1, 2]
```

Let us check the duality between the inner product and the inner coproduct in degree 4:

```
sage: M = QuasiSymmetricFunctions(FiniteField(29)).M()
sage: S = NonCommutativeSymmetricFunctions(FiniteField(29)).S()
sage: def tensor_incopr(f, g, h):  # computes \sum_i \left< f, h'_i \
↪right> \left< g, h''_i \right>
....:     result = h.base_ring().zero()
....:     h_parent = h.parent()
....:     for partition_pair, coeff in h.internal_coproduct().monomial_
↪coefficients().items():
....:         result += coeff * f.duality_pairing(h_parent[partition_
↪pair[0]]) * g.duality_pairing(h_parent[partition_pair[1]])
....:     return result
sage: def testall(n):
....:     return all( all( all( tensor_incopr(S[u], S[v], M[w]) == (S[u].
↪itensor(S[v])).duality_pairing(M[w])
....:                               for w in Compositions(n) )
....:                         for v in Compositions(n) )
....:                   for u in Compositions(n) )
sage: testall(2)
True
sage: testall(3)  # long time
True
sage: testall(4)  # not tested, too long
True
```

```
>>> from sage.all import *
>>> M = QuasiSymmetricFunctions(FiniteField(Integer(29))).M()
>>> S = NonCommutativeSymmetricFunctions(FiniteField(Integer(29))).S()
>>> def tensor_incopr(f, g, h):  # computes \sum_i \left< f, h'_i \right>␣
↪\left< g, h''_i \right>
...     result = h.base_ring().zero()
...     h_parent = h.parent()
...     for partition_pair, coeff in h.internal_coproduct().monomial_
↪coefficients().items():
...         result += coeff * f.duality_pairing(h_parent[partition_
↪pair[Integer(0)]]) * g.duality_pairing(h_parent[partition_
↪pair[Integer(1)]])
...     return result
>>> def testall(n):
...     return all( all( all( tensor_incopr(S[u], S[v], M[w]) == (S[u].
↪itensor(S[v])).duality_pairing(M[w])
...                               for w in Compositions(n) )
...                         for v in Compositions(n) )
...                   for u in Compositions(n) )
>>> testall(Integer(2))
True
>>> testall(Integer(3))  # long time
True
>>> testall(Integer(4))  # not tested, too long
True
```

The internal product on the algebra of non-commutative symmetric functions commutes with the canonical commutative projection on the symmetric functions:

```
sage: S = NonCommutativeSymmetricFunctions(ZZ).S()
sage: e = SymmetricFunctions(ZZ).e()
sage: def int_pr_of_S_in_e(I, J):
....:     return (S[I].internal_product(S[J])).to_symmetric_function()
sage: all( all( int_pr_of_S_in_e(I, J)
....:             == S[I].to_symmetric_function().internal_product(S[J].to_
↪symmetric_function())
....:             for I in Compositions(3) )
....:       for J in Compositions(3) )
True
```

```
>>> from sage.all import *
>>> S = NonCommutativeSymmetricFunctions(ZZ).S()
>>> e = SymmetricFunctions(ZZ).e()
>>> def int_pr_of_S_in_e(I, J):
...     return (S[I].internal_product(S[J])).to_symmetric_function()
>>> all( all( int_pr_of_S_in_e(I, J)
...             == S[I].to_symmetric_function().internal_product(S[J].to_
↪symmetric_function())
...             for I in Compositions(Integer(3)) )
...       for J in Compositions(Integer(3)) )
True
```

kronecker_product(*other*)

Return the internal product of two non-commutative symmetric functions.

The internal product on the algebra of non-commutative symmetric functions is adjoint to the internal coproduct on the algebra of quasisymmetric functions with respect to the duality pairing between these two algebras. This means, explicitly, that any two non-commutative symmetric functions f and g and any quasi-symmetric function h satisfy

$$\langle f * g, h \rangle = \sum_i \langle f, h_i' \rangle \langle g, h_i'' \rangle,$$

where we write $\Delta^{\times}(h)$ as $\sum_i h_i' \otimes h_i''$. Here, $f * g$ denotes the internal product of the non-commutative symmetric functions f and g.

If f and g are two homogeneous elements of $NSym$ having distinct degrees, then the internal product $f * g$ is zero.

Explicit formulas can be given for internal products of elements of the complete and the Psi bases. First, the formula for the Complete basis ([NCSF1] Proposition 5.1): If I and J are two compositions of lengths p and q, respectively, then the corresponding Complete homogeneous non-commutative symmetric functions S^I and S^J have internal product

$$S^I * S^J = \sum S^{\operatorname{comp} M},$$

where the sum ranges over all $p \times q$-matrices $M \in \mathbf{N}^{p \times q}$ (with nonnegative integers as entries) whose row sum vector is I (that is, the sum of the entries of the r-th row is the r-th part of I for all r) and whose column sum vector is J (that is, the sum of all entries of the s-th row is the s-th part of J for all s). Here, for any $M \in \mathbf{N}^{p \times q}$, we denote by $\operatorname{comp} M$ the composition obtained by reading the entries of the matrix M in the usual order (row by row, proceeding left to right in each row, traversing the rows from top to bottom).

The formula on the Psi basis ([NCSF2] Lemma 3.10) is more complicated. Let I and J be two compositions of lengths p and q, respectively, having the same size $|I| = |J|$. We denote by Ψ^K the element of the Psi basis corresponding to any composition K.

- If $p > q$, then $\Psi^I * \Psi^J$ is plainly 0.
- Assume that $p = q$. Let $\widetilde{\delta}_{I,J}$ denote the integer 1 if the compositions I and J are permutations of each other, and the integer 0 otherwise. For every positive integer i, let m_i denote the number of parts of I equal to i. Then, $\Psi^I * \Psi^J$ equals $\widetilde{\delta}_{I,J} \prod_{i>0} i^{m_i} m_i! \Psi^I$.
- Now assume that $p < q$. Write the composition I as $I = (i_1, i_2, \ldots, i_p)$. For every nonempty composition $K = (k_1, k_2, \ldots, k_s)$, denote by Γ_K the non-commutative symmetric function $k_1[\ldots[[\Psi_{k_1}, \Psi_{k_2}], \Psi_{k_3}], \ldots \Psi_{k_s}]$. For any subset A of $\{1, 2, \ldots, q\}$, let J_A be the composition obtained from J by removing the r-th parts for all $r \notin A$ (while keeping the r-th parts for all $r \in A$ in order). Then, $\Psi^I * \Psi^J$ equals the sum of $\Gamma_{J_{K_1}} \Gamma_{J_{K_2}} \cdots \Gamma_{J_{K_p}}$ over all ordered set partitions $(K_1, K_2, \ldots, K_p)$ of $\{1, 2, \ldots, q\}$ into p parts such that each $1 \leq k \leq p$ satisfies $|J_{K_k}| = i_k$. (See `OrderedSetPartition()` for the meaning of "ordered set partition".)

Aliases for `internal_product()` are `itensor()` and `kronecker_product()`.

INPUT:

- `other` – another non-commutative symmetric function

OUTPUT:

- The result of taking the internal product of `self` with `other`.

EXAMPLES:

```
sage: N = NonCommutativeSymmetricFunctions(QQ)
sage: S = N.complete()
sage: x = S.an_element(); x
2*S[] + 2*S[1] + 3*S[1, 1]
sage: x.internal_product(S[2])
3*S[1, 1]
sage: x.internal_product(S[1])
2*S[1]
sage: S[1,2].internal_product(S[1,2])
S[1, 1, 1] + S[1, 2]
```

```
>>> from sage.all import *
>>> N = NonCommutativeSymmetricFunctions(QQ)
>>> S = N.complete()
>>> x = S.an_element(); x
2*S[] + 2*S[1] + 3*S[1, 1]
>>> x.internal_product(S[Integer(2)])
3*S[1, 1]
>>> x.internal_product(S[Integer(1)])
2*S[1]
>>> S[Integer(1),Integer(2)].internal_product(S[Integer(1),Integer(2)])
S[1, 1, 1] + S[1, 2]
```

Let us check the duality between the inner product and the inner coproduct in degree 4:

```
sage: M = QuasiSymmetricFunctions(FiniteField(29)).M()
sage: S = NonCommutativeSymmetricFunctions(FiniteField(29)).S()
sage: def tensor_incopr(f, g, h):   # computes \sum_i \left< f, h'_i \
↪right> \left< g, h''_i \right>
....:     result = h.base_ring().zero()
....:     h_parent = h.parent()
....:     for partition_pair, coeff in h.internal_coproduct().monomial_
↪coefficients().items():
....:         result += coeff * f.duality_pairing(h_parent[partition_
↪pair[0]]) * g.duality_pairing(h_parent[partition_pair[1]])
```

(continues on next page)

(continued from previous page)

```
....:     return result
sage: def testall(n):
....:     return all( all( all( tensor_incopr(S[u], S[v], M[w]) == (S[u].
↪itensor(S[v])).duality_pairing(M[w])
....:                             for w in Compositions(n) )
....:                       for v in Compositions(n) )
....:                 for u in Compositions(n) )
sage: testall(2)
True
sage: testall(3)  # long time
True
sage: testall(4)  # not tested, too long
True
```

```
>>> from sage.all import *

↪symmetric_function())
...           for I in Compositions(Integer(3)) )
...      for J in Compositions(Integer(3)) )
True
```

class ParentMethods

Bases: `object`

internal_product()

The bilinear product inherited from the isomorphism with the descent algebra.

This is constructed by extending the method *internal_product_on_basis()* bilinearly, if available, or using the method *internal_product_by_coercion()*.

OUTPUT:

- The internal product map of the algebra the non-commutative symmetric functions.

EXAMPLES:

```
sage: N = NonCommutativeSymmetricFunctions(QQ)
sage: S = N.complete()
sage: S.internal_product
Generic endomorphism of Non-Commutative Symmetric Functions over the␣
↪Rational Field in the Complete basis
sage: S.internal_product(S[2,2], S[1,2,1])
2*S[1, 1, 1, 1] + S[1, 1, 2] + S[2, 1, 1]
sage: S.internal_product(S[2,2], S[1,2])
0
```

```
>>> from sage.all import *
>>> N = NonCommutativeSymmetricFunctions(QQ)
>>> S = N.complete()
>>> S.internal_product
Generic endomorphism of Non-Commutative Symmetric Functions over the␣
↪Rational Field in the Complete basis
>>> S.internal_product(S[Integer(2),Integer(2)], S[Integer(1),Integer(2),
↪Integer(1)])
2*S[1, 1, 1, 1] + S[1, 1, 2] + S[2, 1, 1]
>>> S.internal_product(S[Integer(2),Integer(2)], S[Integer(1),Integer(2)])
0
```

```
sage: N = NonCommutativeSymmetricFunctions(QQ)

↪R[Integer(1),Integer(1)])
R[2]
>>> R.internal_product(R[Integer(2),Integer(2)], R[Integer(1),Integer(2)])
0
```

internal_product_on_basis(*I*, *J*)

The internal product of the two basis elements indexed by `I` and `J` (optional)

INPUT:

- `I`, `J` – compositions indexing two elements of the basis of self

Returns the internal product of the corresponding basis elements. If this method is implemented, the internal product is defined from it by linearity.

EXAMPLES:

```
sage: N = NonCommutativeSymmetricFunctions(QQ)
sage: S = N.complete()
sage: S.internal_product_on_basis([2,2], [1,2,1])
2*S[1, 1, 1, 1] + S[1, 1, 2] + S[2, 1, 1]
sage: S.internal_product_on_basis([2,2], [2,1])
0
```

```
>>> from sage.all import *
>>> N = NonCommutativeSymmetricFunctions(QQ)
>>> S = N.complete()
>>> S.internal_product_on_basis([Integer(2),Integer(2)], [Integer(1),
↪Integer(2),Integer(1)])
2*S[1, 1, 1, 1] + S[1, 1, 2] + S[2, 1, 1]
>>> S.internal_product_on_basis([Integer(2),Integer(2)], [Integer(2),
↪Integer(1)])
0
```

itensor()

The bilinear product inherited from the isomorphism with the descent algebra.

This is constructed by extending the method *internal_product_on_basis()* bilinearly, if available, or using the method *internal_product_by_coercion()*.

OUTPUT:

- The internal product map of the algebra the non-commutative symmetric functions.

EXAMPLES:

```
sage: N = NonCommutativeSymmetricFunctions(QQ)
sage: S = N.complete()
sage: S.internal_product
Generic endomorphism of Non-Commutative Symmetric Functions over the␣
↪Rational Field in the Complete basis
sage: S.internal_product(S[2,2], S[1,2,1])
2*S[1, 1, 1, 1] + S[1, 1, 2] + S[2, 1, 1]
sage: S.internal_product(S[2,2], S[1,2])
0
```

```

↪R[Integer(1),Integer(1)])
R[2]
>>> R.internal_product(R[Integer(2),Integer(2)], R[Integer(1),Integer(2)])
0
```

class Realizations(*category*, **args*)

Bases: `RealizationsCategory`

class ParentMethods

Bases: `object`

internal_product_by_coercion(*left*, *right*)

Internal product of `left` and `right`.

This is a default implementation that computes the internal product in the realization specified by `self.realization_of().a_realization()`.

INPUT:

- `left` – an element of the non-commutative symmetric functions
- `right` – an element of the non-commutative symmetric functions

OUTPUT: the internal product of `left` and `right`

EXAMPLES:

```
sage: S = NonCommutativeSymmetricFunctions(QQ).S()
sage: S.internal_product_by_coercion(S[2,1], S[3])
S[2, 1]
sage: S.internal_product_by_coercion(S[2,1], S[4])
0
```

```
>>> from sage.all import *
>>> S = NonCommutativeSymmetricFunctions(QQ).S()
>>> S.internal_product_by_coercion(S[Integer(2),Integer(1)],␣
↪S[Integer(3)])
S[2, 1]
>>> S.internal_product_by_coercion(S[Integer(2),Integer(1)],␣
↪S[Integer(4)])
0
```

super_categories()

EXAMPLES:

```
sage: from sage.combinat.ncsf_qsym.generic_basis_code import␣
↪GradedModulesWithInternalProduct
sage: GradedModulesWithInternalProduct(ZZ).super_categories()
[Category of graded modules over Integer Ring]
```

5.1.144 Non-Commutative Symmetric Functions

class sage.combinat.ncsf_qsym.ncsf.**NonCommutativeSymmetricFunctions**(R)

Bases: `UniqueRepresentation`, `Parent`

The abstract algebra of non-commutative symmetric functions.

We construct the abstract algebra of non-commutative symmetric functions over the rational numbers:

```
sage: NCSF = NonCommutativeSymmetricFunctions(QQ)
sage: NCSF
Non-Commutative Symmetric Functions over the Rational Field
sage: S = NCSF.complete()
sage: R = NCSF.ribbon()
sage: S[2,1]*R[1,2]
S[2, 1, 1, 2] - S[2, 1, 3]
```

```
>>> from sage.all import *
>>> NCSF = NonCommutativeSymmetricFunctions(QQ)
>>> NCSF
Non-Commutative Symmetric Functions over the Rational Field
>>> S = NCSF.complete()
>>> R = NCSF.ribbon()
>>> S[Integer(2),Integer(1)]*R[Integer(1),Integer(2)]
S[2, 1, 1, 2] - S[2, 1, 3]
```

NCSF is the unique free (non-commutative!) graded connected algebra with one generator in each degree:

```
sage: NCSF.category()
Join of Category of Hopf algebras over Rational Field
    and Category of graded algebras over Rational Field
    and Category of monoids with realizations
    and Category of graded coalgebras over Rational Field
    and Category of coalgebras over Rational Field with realizations
    and Category of cocommutative coalgebras over Rational Field

sage: [S[i].degree() for i in range(10)]
[0, 1, 2, 3, 4, 5, 6, 7, 8, 9]
```

```
>>> from sage.all import *
>>> NCSF.category()
Join of Category of Hopf algebras over Rational Field
    and Category of graded algebras over Rational Field
    and Category of monoids with realizations
    and Category of graded coalgebras over Rational Field
    and Category of coalgebras over Rational Field with realizations
    and Category of cocommutative coalgebras over Rational Field

>>> [S[i].degree() for i in range(Integer(10))]
[0, 1, 2, 3, 4, 5, 6, 7, 8, 9]
```

We use the Sage standard renaming idiom to get shorter outputs:

```
sage: NCSF.rename('NCSF')
sage: NCSF
NCSF
```

```
>>> from sage.all import *
>>> NCSF.rename('NCSF')
>>> NCSF
NCSF
```

NCSF has many representations as a concrete algebra. Each of them has a distinguished basis, and its elements are expanded in this basis. Here is the Ψ (`Psi`) representation:

```
sage: Psi = NCSF.Psi()
sage: Psi
NCSF in the Psi basis
```

```
>>> from sage.all import *
>>> Psi = NCSF.Psi()
>>> Psi
NCSF in the Psi basis
```

Elements of `Psi` are linear combinations of basis elements indexed by compositions:

```
sage: Psi.an_element()
2*Psi[] + 2*Psi[1] + 3*Psi[1, 1]
```

```
>>> from sage.all import *
>>> Psi.an_element()
2*Psi[] + 2*Psi[1] + 3*Psi[1, 1]
```

The basis itself is accessible through:

```
sage: Psi.basis()
Lazy family (Term map from Compositions of nonnegative integers...
sage: Psi.basis().keys()
Compositions of nonnegative integers
```

```
>>> from sage.all import *
>>> Psi.basis()
Lazy family (Term map from Compositions of nonnegative integers...
>>> Psi.basis().keys()
Compositions of nonnegative integers
```

To construct an element one can therefore do:

```
sage: Psi.basis()[Composition([2,1,3])]
Psi[2, 1, 3]
```

```
>>> from sage.all import *
>>> Psi.basis()[Composition([Integer(2),Integer(1),Integer(3)])]
Psi[2, 1, 3]
```

As this is rather cumbersome, the following abuses of notation are allowed:

```
sage: Psi[Composition([2, 1, 3])]
Psi[2, 1, 3]
sage: Psi[[2, 1, 3]]
Psi[2, 1, 3]
sage: Psi[2, 1, 3]
Psi[2, 1, 3]
```

```
>>> from sage.all import *
>>> Psi[Composition([Integer(2), Integer(1), Integer(3)])]
Psi[2, 1, 3]
>>> Psi[[Integer(2), Integer(1), Integer(3)]]
Psi[2, 1, 3]
>>> Psi[Integer(2), Integer(1), Integer(3)]
Psi[2, 1, 3]
```

or even:

```
sage: Psi[(i for i in [2, 1, 3])]
Psi[2, 1, 3]
```

```
>>> from sage.all import *
>>> Psi[(i for i in [Integer(2), Integer(1), Integer(3)])]
Psi[2, 1, 3]
```

Unfortunately, due to a limitation in Python syntax, one cannot use:

```
sage: Psi[]       # not implemented
```

```
>>> from sage.all import *
>>> Psi[]       # not implemented
```

Instead, you can use:

```
sage: Psi[[]]
Psi[]
```

```
>>> from sage.all import *
>>> Psi[[]]
Psi[]
```

Now, we can construct linear combinations of basis elements:

```
sage: Psi[2,1,3] + 2 * (Psi[4] + Psi[2,1])
2*Psi[2, 1] + Psi[2, 1, 3] + 2*Psi[4]
```

```
>>> from sage.all import *
>>> Psi[Integer(2),Integer(1),Integer(3)] + Integer(2) * (Psi[Integer(4)] +␣
↪Psi[Integer(2),Integer(1)])
2*Psi[2, 1] + Psi[2, 1, 3] + 2*Psi[4]
```

Algebra structure

To start with, `Psi` is a graded algebra, the grading being induced by the size of compositions. The one is the basis element indexed by the empty composition:

```
sage: Psi.one()
Psi[]
sage: S.one()
S[]
sage: R.one()
R[]
```

```
>>> from sage.all import *
>>> Psi.one()
Psi[]
>>> S.one()
S[]
```

(continues on next page)

(continued from previous page)

```
>>> R.one()
R[]
```

As we have seen above, the `Psi` basis is multiplicative; that is multiplication is induced by linearity from the concatenation of compositions:

```
sage: Psi[1,3] * Psi[2,1]
Psi[1, 3, 2, 1]
sage: (Psi.one() + 2 * Psi[1,3]) * Psi[2, 4]
2*Psi[1, 3, 2, 4] + Psi[2, 4]
```

```
>>> from sage.all import *
>>> Psi[Integer(1),Integer(3)] * Psi[Integer(2),Integer(1)]
Psi[1, 3, 2, 1]
>>> (Psi.one() + Integer(2) * Psi[Integer(1),Integer(3)]) * Psi[Integer(2),
↪Integer(4)]
2*Psi[1, 3, 2, 4] + Psi[2, 4]
```

Hopf algebra structure

`Psi` is further endowed with a coalgebra structure. The coproduct is an algebra morphism, and therefore determined by its values on the generators; those are primitive:

```
sage: Psi[1].coproduct()
Psi[] # Psi[1] + Psi[1] # Psi[]
sage: Psi[2].coproduct()
Psi[] # Psi[2] + Psi[2] # Psi[]
```

```
>>> from sage.all import *
>>> Psi[Integer(1)].coproduct()
Psi[] # Psi[1] + Psi[1] # Psi[]
>>> Psi[Integer(2)].coproduct()
Psi[] # Psi[2] + Psi[2] # Psi[]
```

The coproduct, being cocommutative on the generators, is cocommutative everywhere:

```
sage: Psi[1,2].coproduct()
Psi[] # Psi[1, 2] + Psi[1] # Psi[2] + Psi[1, 2] # Psi[] + Psi[2] # Psi[1]
```

```
>>> from sage.all import *
>>> Psi[Integer(1),Integer(2)].coproduct()
Psi[] # Psi[1, 2] + Psi[1] # Psi[2] + Psi[1, 2] # Psi[] + Psi[2] # Psi[1]
```

The algebra and coalgebra structures on `Psi` combine to form a bialgebra structure, which cooperates with the grading to form a connected graded bialgebra. Thus, as any connected graded bialgebra, `Psi` is a Hopf algebra. Over `QQ` (or any other **Q**-algebra), this Hopf algebra `Psi` is isomorphic to the universal enveloping algebra of its space of primitive elements. Here, the primitives form a countably generated free Lie algebra, so `Psi` is isomorphic to the tensor algebra on a countably infinite dimensional vector space.

The antipode is an anti-algebra morphism; in the `Psi` basis, it sends the generators to their opposites and changes their sign if they are of odd degree:

```
sage: Psi[3].antipode()
-Psi[3]
sage: Psi[1,3,2].antipode()
-Psi[2, 3, 1]
sage: Psi[1,3,2].coproduct().apply_multilinear_morphism(lambda be,ga:␣
↪Psi(be)*Psi(ga).antipode())
0
```

```
>>> from sage.all import *
>>> Psi[Integer(3)].antipode()
-Psi[3]
>>> Psi[Integer(1),Integer(3),Integer(2)].antipode()
-Psi[2, 3, 1]
>>> Psi[Integer(1),Integer(3),Integer(2)].coproduct().apply_multilinear_
↪morphism(lambda be,ga: Psi(be)*Psi(ga).antipode())
0
```

The counit is defined by sending all elements of positive degree to zero:

```
sage: S[3].degree(), S[3,1,2].degree(), S.one().degree()
(3, 6, 0)
sage: S[3].counit()
0
sage: S[3,1,2].counit()
0
sage: S.one().counit()
1
sage: (S[3] - 2*S[3,1,2] + 7).counit()
7
sage: (R[3] - 2*R[3,1,2] + 7).counit()
7
```

```
>>> from sage.all import *
>>> S[Integer(3)].degree(), S[Integer(3),Integer(1),Integer(2)].degree(), S.one().
↪degree()
(3, 6, 0)
>>> S[Integer(3)].counit()
0
>>> S[Integer(3),Integer(1),Integer(2)].counit()
0
>>> S.one().counit()
1
>>> (S[Integer(3)] - Integer(2)*S[Integer(3),Integer(1),Integer(2)] + Integer(7)).
↪counit()
7
>>> (R[Integer(3)] - Integer(2)*R[Integer(3),Integer(1),Integer(2)] + Integer(7)).
↪counit()
7
```

It is possible to change the prefix used to display the basis elements using the method `print_options()`. Say that for instance one wanted to display the *`Complete`* basis as having a prefix `H` instead of the default `S`:

```
sage: H = NCSF.complete()
sage: H.an_element()
2*S[] + 2*S[1] + 3*S[1, 1]
sage: H.print_options(prefix='H')
sage: H.an_element()
2*H[] + 2*H[1] + 3*H[1, 1]
sage: H.print_options(prefix='S') #restore to 'S'
```

```
>>> from sage.all import *
>>> H = NCSF.complete()
>>> H.an_element()
2*S[] + 2*S[1] + 3*S[1, 1]
>>> H.print_options(prefix='H')
>>> H.an_element()
2*H[] + 2*H[1] + 3*H[1, 1]
>>> H.print_options(prefix='S') #restore to 'S'
```

Concrete representations

NCSF admits the concrete realizations defined in [NCSF1]:

```
sage: Phi        = NCSF.Phi()
sage: Psi        = NCSF.Psi()
sage: ribbon     = NCSF.ribbon()
sage: complete   = NCSF.complete()
sage: elementary = NCSF.elementary()
```

```
>>> from sage.all import *
>>> Phi        = NCSF.Phi()
>>> Psi        = NCSF.Psi()
>>> ribbon     = NCSF.ribbon()
>>> complete   = NCSF.complete()
>>> elementary = NCSF.elementary()
```

To change from one basis to another, one simply does:

```
sage: Phi(Psi[1])
Phi[1]
sage: Phi(Psi[3])
-1/4*Phi[1, 2] + 1/4*Phi[2, 1] + Phi[3]
```

```
>>> from sage.all import *
>>> Phi(Psi[Integer(1)])
Phi[1]
>>> Phi(Psi[Integer(3)])
-1/4*Phi[1, 2] + 1/4*Phi[2, 1] + Phi[3]
```

In general, one can mix up different bases in computations:

```
sage: Phi[1] * Psi[1]
Phi[1, 1]
```

```
>>> from sage.all import *
>>> Phi[Integer(1)] * Psi[Integer(1)]
Phi[1, 1]
```

Some of the changes of basis are easy to guess:

```
sage: ribbon(complete[1,3,2])
R[1, 3, 2] + R[1, 5] + R[4, 2] + R[6]
```

```
>>> from sage.all import *
>>> ribbon(complete[Integer(1),Integer(3),Integer(2)])
R[1, 3, 2] + R[1, 5] + R[4, 2] + R[6]
```

This is the sum of all fatter compositions. Using the usual Möbius function for the boolean lattice, the inverse change of basis is given by the alternating sum of all fatter compositions:

```
sage: complete(ribbon[1,3,2])
S[1, 3, 2] - S[1, 5] - S[4, 2] + S[6]
```

```
>>> from sage.all import *
>>> complete(ribbon[Integer(1),Integer(3),Integer(2)])
S[1, 3, 2] - S[1, 5] - S[4, 2] + S[6]
```

The analogue of the elementary basis is the sum over all finer compositions than the 'complement' of the composition in the ribbon basis:

```
sage: Composition([1,3,2]).complement()
[2, 1, 2, 1]
sage: ribbon(elementary([1,3,2]))
R[1, 1, 1, 1, 1, 1] + R[1, 1, 1, 2, 1] + R[2, 1, 1, 1, 1] + R[2, 1, 2, 1]
```

```
>>> from sage.all import *
>>> Composition([Integer(1),Integer(3),Integer(2)]).complement()
[2, 1, 2, 1]
>>> ribbon(elementary([Integer(1),Integer(3),Integer(2)]))
R[1, 1, 1, 1, 1, 1] + R[1, 1, 1, 2, 1] + R[2, 1, 1, 1, 1] + R[2, 1, 2, 1]
```

By Möbius inversion on the composition poset, the ribbon basis element corresponding to a composition I is then the alternating sum over all compositions fatter than the complement composition of I in the elementary basis:

```
sage: elementary(ribbon[2,1,2,1])
L[1, 3, 2] - L[1, 5] - L[4, 2] + L[6]
```

```
>>> from sage.all import *
>>> elementary(ribbon[Integer(2),Integer(1),Integer(2),Integer(1)])
L[1, 3, 2] - L[1, 5] - L[4, 2] + L[6]
```

The Φ (`Phi`) and Ψ bases are computed by changing to and from the `Complete` basis. The expansion of Ψ basis is given in Proposition 4.5 of [NCSF1] by the formulae

$$S^I = \sum_{J \geq I} \frac{1}{\pi_u(J,I)} \Psi^J$$

and

$$\Psi^I = \sum_{J \geq I} (-1)^{\ell(J)-\ell(I)} lp(J, I) S^J$$

where the coefficients $\pi_u(J, I)$ and $lp(J, I)$ are coefficients in the methods `coeff_pi()` and `coeff_lp()` respectively. For example:

```
sage: Psi(complete[3])
1/6*Psi[1, 1, 1] + 1/3*Psi[1, 2] + 1/6*Psi[2, 1] + 1/3*Psi[3]
sage: complete(Psi[3])
S[1, 1, 1] - 2*S[1, 2] - S[2, 1] + 3*S[3]
```

```
>>> from sage.all import *
>>> Psi(complete[Integer(3)])
1/6*Psi[1, 1, 1] + 1/3*Psi[1, 2] + 1/6*Psi[2, 1] + 1/3*Psi[3]
>>> complete(Psi[Integer(3)])
S[1, 1, 1] - 2*S[1, 2] - S[2, 1] + 3*S[3]
```

The `Phi` basis is another analogue of the power sum basis from the algebra of symmetric functions and the expansion in the Complete basis is given in Proposition 4.9 of [NCSF1] by the formulae

$$S^I = \sum_{J \geq I} \frac{1}{sp(J, I)} \Phi^J$$

and

$$\Phi^I = \sum_{J \geq I} (-1)^{\ell(J)-\ell(I)} \frac{\prod_i I_i}{\ell(J, I)} S^J$$

where the coefficients $sp(J, I)$ and $\ell(J, I)$ are coefficients in the methods `coeff_sp()` and `coeff_ell()` respectively. For example:

```
sage: Phi(complete[3])
1/6*Phi[1, 1, 1] + 1/4*Phi[1, 2] + 1/4*Phi[2, 1] + 1/3*Phi[3]
sage: complete(Phi[3])
S[1, 1, 1] - 3/2*S[1, 2] - 3/2*S[2, 1] + 3*S[3]
```

```
>>> from sage.all import *
>>> Phi(complete[Integer(3)])
1/6*Phi[1, 1, 1] + 1/4*Phi[1, 2] + 1/4*Phi[2, 1] + 1/3*Phi[3]
>>> complete(Phi[Integer(3)])
S[1, 1, 1] - 3/2*S[1, 2] - 3/2*S[2, 1] + 3*S[3]
```

Here is how to fetch the conversion morphisms:

```
sage: f = complete.coerce_map_from(elementary); f
Generic morphism:
  From: NCSF in the Elementary basis
  To:   NCSF in the Complete basis
sage: g = elementary.coerce_map_from(complete); g
Generic morphism:
  From: NCSF in the Complete basis
  To:   NCSF in the Elementary basis
```

(continues on next page)

(continued from previous page)

```
sage: f.category()
Category of homsets of unital magmas and right modules over Rational Field and
  left modules over Rational Field
sage: f(elementary[1,2,2])
S[1, 1, 1, 1, 1] - S[1, 1, 1, 2] - S[1, 2, 1, 1] + S[1, 2, 2]
sage: g(complete[1,2,2])
L[1, 1, 1, 1, 1] - L[1, 1, 1, 2] - L[1, 2, 1, 1] + L[1, 2, 2]
sage: h = f*g; h
Composite map:
  From: NCSF in the Complete basis
  To:   NCSF in the Complete basis
  Defn:   Generic morphism:
          From: NCSF in the Complete basis
          To:   NCSF in the Elementary basis
        then
          Generic morphism:
          From: NCSF in the Elementary basis
          To:   NCSF in the Complete basis
sage: h(complete[1,3,2])
S[1, 3, 2]
```

```
>>> from sage.all import *
>>> f = complete.coerce_map_from(elementary); f
Generic morphism:
  From: NCSF in the Elementary basis
  To:   NCSF in the Complete basis
>>> g = elementary.coerce_map_from(complete); g
Generic morphism:
  From: NCSF in the Complete basis
  To:   NCSF in the Elementary basis
>>> f.category()
Category of homsets of unital magmas and right modules over Rational Field and
  left modules over Rational Field
>>> f(elementary[Integer(1),Integer(2),Integer(2)])
S[1, 1, 1, 1, 1] - S[1, 1, 1, 2] - S[1, 2, 1, 1] + S[1, 2, 2]
>>> g(complete[Integer(1),Integer(2),Integer(2)])
L[1, 1, 1, 1, 1] - L[1, 1, 1, 2] - L[1, 2, 1, 1] + L[1, 2, 2]
>>> h = f*g; h
Composite map:
  From: NCSF in the Complete basis
  To:   NCSF in the Complete basis
  Defn:   Generic morphism:
          From: NCSF in the Complete basis
          To:   NCSF in the Elementary basis
        then
          Generic morphism:
          From: NCSF in the Elementary basis
          To:   NCSF in the Complete basis
>>> h(complete[Integer(1),Integer(3),Integer(2)])
S[1, 3, 2]
```

Additional concrete representations

NCSF has some additional bases which appear in the literature:

```
sage: Monomial                  = NCSF.Monomial()
sage: Immaculate                = NCSF.Immaculate()
sage: dualQuasisymmetric_Schur = NCSF.dualQuasisymmetric_Schur()
```

```
>>> from sage.all import *
>>> Monomial                  = NCSF.Monomial()
>>> Immaculate                = NCSF.Immaculate()
>>> dualQuasisymmetric_Schur = NCSF.dualQuasisymmetric_Schur()
```

The *Monomial* basis was introduced in [Tev2007] and the *Immaculate* basis was introduced in [BBSSZ2012]. The *Quasisymmetric_Schur* were defined in [QSCHUR] and the dual basis is implemented here as *dualQuasisymmetric_Schur*. Refer to the documentation for the use and definition of these bases.

Todo

- implement fundamental, forgotten, and simple (coming from the simple modules of HS_n) bases.

We revert back to the original name from our custom short name NCSF:

```
sage: NCSF
NCSF
sage: NCSF.rename()
sage: NCSF
Non-Commutative Symmetric Functions over the Rational Field
```

```
>>> from sage.all import *
>>> NCSF
NCSF
>>> NCSF.rename()
>>> NCSF
Non-Commutative Symmetric Functions over the Rational Field
```

class Bases(*parent_with_realization*)

Bases: `Category_realization_of_parent`

Category of bases of non-commutative symmetric functions.

EXAMPLES:

```
sage: N = NonCommutativeSymmetricFunctions(QQ)
sage: N.Bases()
Category of bases of Non-Commutative Symmetric Functions over the Rational␣
↪Field
sage: R = N.Ribbon()
sage: R in N.Bases()
True
```

```
>>> from sage.all import *
>>> N = NonCommutativeSymmetricFunctions(QQ)
```

(continues on next page)

(continued from previous page)

```
>>> N.Bases()
Category of bases of Non-Commutative Symmetric Functions over the Rational␣
↪Field
>>> R = N.Ribbon()
>>> R in N.Bases()
True
```

class ElementMethods

Bases: `object`

bernstein_creation_operator(*n*)

Return the image of `self` under the n-th Bernstein creation operator.

Let n be an integer. The n-th Bernstein creation operator $\mathbb{B}_n$ is defined as the endomorphism of the space $NSym$ of noncommutative symmetric functions which sends every f to

$$\sum_{i \geq 0} (-1)^i H_{n+i} F_{1^i}^{\perp},$$

where usual notations are in place (the letter H stands for the complete basis of $NSym$, the letter F stands for the fundamental basis of the algebra $QSym$ of quasisymmetric functions, and $F_{1^i}^{\perp}$ means skewing (`skew_by()`) by F_{1^i}). Notice that F_{1^i} is nothing other than the elementary symmetric function e_i.

This has been introduced in [BBSSZ2012], section 3.1, in analogy to the Bernstein creation operators on the symmetric functions (`bernstein_creation_operator()`), and studied further in [BBSSZ2012], mainly in the context of immaculate functions (`Immaculate`). In fact, if $(\alpha_1, \alpha_2, \ldots, \alpha_m)$ is an m-tuple of integers, then

$$\mathbb{B}_n I_{(\alpha_1, \alpha_2, \ldots, \alpha_m)} = I_{(n, \alpha_1, \alpha_2, \ldots, \alpha_m)},$$

where $I_{(\alpha_1, \alpha_2, \ldots, \alpha_m)}$ is the immaculate function associated to the m-tuple $(\alpha_1, \alpha_2, \ldots, \alpha_m)$ (see `immaculate_function()`).

EXAMPLES:

We get the immaculate functions by repeated application of Bernstein creation operators:

```
sage: NSym = NonCommutativeSymmetricFunctions(ZZ)
sage: I = NSym.I()
sage: S = NSym.S()
sage: def immaculate_by_bernstein(xs):
....:     # immaculate function corresponding to integer
....:     # tuple ``xs``, computed by iterated application
....:     # of Bernstein creation operators.
....:     res = S.one()
....:     for i in reversed(xs):
....:         res = res.bernstein_creation_operator(i)
....:     return res
sage: import itertools
sage: all( immaculate_by_bernstein(p) == I.immaculate_function(p)
....:      for p in itertools.product(range(-1, 3), repeat=3))
True
```

```
>>> from sage.all import *
>>> NSym = NonCommutativeSymmetricFunctions(ZZ)
>>> I = NSym.I()
>>> S = NSym.S()
>>> def immaculate_by_bernstein(xs):
...     # immaculate function corresponding to integer
...     # tuple ``xs``, computed by iterated application
...     # of Bernstein creation operators.
...     res = S.one()
...     for i in reversed(xs):
...         res = res.bernstein_creation_operator(i)
...     return res
>>> import itertools
>>> all( immaculate_by_bernstein(p) == I.immaculate_function(p)
...      for p in itertools.product(range(-Integer(1), Integer(3)),
↪repeat=Integer(3)))
True
```

Some examples:

```
sage: S[3,2].bernstein_creation_operator(-2)
S[2, 1]
sage: S[3,2].bernstein_creation_operator(-1)
S[1, 2, 1] - S[2, 2] - S[3, 1]
sage: S[3,2].bernstein_creation_operator(0)

S[2, 3, 2] - S[3, 2, 2] - S[3, 3, 1] + S[4, 2, 1]
```

chi()

Return the commutative image of a non-commutative symmetric function.

OUTPUT: the commutative image of `self`; this will be a symmetric function

EXAMPLES:

```
sage: N = NonCommutativeSymmetricFunctions(QQ)
sage: R = N.ribbon()
sage: x = R.an_element(); x
2*R[] + 2*R[1] + 3*R[1, 1]
```

(continues on next page)

(continued from previous page)

```
sage: x.to_symmetric_function()
2*s[] + 2*s[1] + 3*s[1, 1]
sage: y = N.Phi()[1,3]
sage: y.to_symmetric_function()
h[1, 1, 1, 1] - 3*h[2, 1, 1] + 3*h[3, 1]
```

```
>>> from sage.all import *
>>> N = NonCommutativeSymmetricFunctions(QQ)
>>> R = N.ribbon()
>>> x = R.an_element(); x
2*R[] + 2*R[1] + 3*R[1, 1]
>>> x.to_symmetric_function()
2*s[] + 2*s[1] + 3*s[1, 1]
>>> y = N.Phi()[Integer(1),Integer(3)]
>>> y.to_symmetric_function()
h[1, 1, 1, 1] - 3*h[2, 1, 1] + 3*h[3, 1]
```

expand(*n*, *alphabet='x'*)

Expand the noncommutative symmetric function into an element of a free algebra in n indeterminates of an alphabet, which by default is `'x'`.

INPUT:

- `n` – nonnegative integer; the number of variables in the expansion
- `alphabet` – (default: `'x'`) the alphabet in which `self` is to be expanded

OUTPUT: an expansion of `self` into the n variables specified by `alphabet`

EXAMPLES:

```
sage: NSym = NonCommutativeSymmetricFunctions(QQ)
sage: S = NSym.S()
sage: S[3].expand(3)
x0^3 + x0^2*x1 + x0^2*x2 + x0*x1^2 + x0*x1*x2
 + x0*x2^2 + x1^3 + x1^2*x2 + x1*x2^2 + x2^3
sage: L = NSym.L()
sage: L[3].expand(3)
x2*x1*x0
sage: L[2].expand(3)
x1*x0 + x2*x0 + x2*x1
sage: L[3].expand(4)
x2*x1*x0 + x3*x1*x0 + x3*x2*x0 + x3*x2*x1
sage: Psi = NSym.Psi()
sage: Psi[2, 1].expand(3)
x0^3 + x0^2*x1 + x0^2*x2 + x0*x1*x0 + x0*x1^2 + x0*x1*x2
 + x0*x2*x0 + x0*x2*x1 + x0*x2^2 - x1*x0^2 - x1*x0*x1
 - x1*x0*x2 + x1^2*x0 + x1^3 + x1^2*x2 + x1*x2*x0
 + x1*x2*x1 + x1*x2^2 - x2*x0^2 - x2*x0*x1 - x2*x0*x2
 - x2*x1*x0 - x2*x1^2 - x2*x1*x2 + x2^2*x0 + x2^2*x1 + x2^3
```

```
>>> from sage.all import *
>>> NSym = NonCommutativeSymmetricFunctions(QQ)
>>> S = NSym.S()
>>> S[Integer(3)].expand(Integer(3))
```

(continues on next page)

(continued from previous page)

```
x0^3 + x0^2*x1 + x0^2*x2 + x0*x1^2 + x0*x1*x2
 + x0*x2^2 + x1^3 + x1^2*x2 + x1*x2^2 + x2^3
>>> L = NSym.L()
>>> L[Integer(3)].expand(Integer(3))
x2*x1*x0
>>> L[Integer(2)].expand(Integer(3))
x1*x0 + x2*x0 + x2*x1
>>> L[Integer(3)].expand(Integer(4))
x2*x1*x0 + x3*x1*x0 + x3*x2*x0 + x3*x2*x1
>>> Psi = NSym.Psi()
>>> Psi[Integer(2), Integer(1)].expand(Integer(3))
x0^3 + x0^2*x1 + x0^2*x2 + x0*x1*x0 + x0*x1^2 + x0*x1*x2
 + x0*x2*x0 + x0*x2*x1 + x0*x2^2 - x1*x0^2 - x1*x0*x1
 - x1*x0*x2 + x1^2*x0 + x1^3 + x1^2*x2 + x1*x2*x0
 + x1*x2*x1 + x1*x2^2 - x2*x0^2 - x2*x0*x1 - x2*x0*x2
 - x2*x1*x0 - x2*x1^2 - x2*x1*x2 + x2^2*x0 + x2^2*x1 + x2^3
```

One can use a different set of variables by adding an optional argument `alphabet=...`:

```
sage: L[3].expand(4, alphabet='y')
y2*y1*y0 + y3*y1*y0 + y3*y2*y0 + y3*y2*y1
```

```
>>> from sage.all import *
>>> L[Integer(3)].expand(Integer(4), alphabet='y')
y2*y1*y0 + y3*y1*y0 + y3*y2*y0 + y3*y2*y1
```

Todo

So far this is only implemented on the elementary basis, and everything else goes through coercion. Maybe it is worth shortcutting some of the other bases?

left_padded_kronecker_product(*x*)

Return the left-padded Kronecker product of `self` and `x` in the basis of `self`.

The left-padded Kronecker product is a bilinear map mapping two non-commutative symmetric functions to another, not necessarily preserving degree. It can be defined as follows: Let $*$ denote the internal product (`internal_product()`) on the space of non-commutative symmetric functions. For any composition I, let S^I denote the complete homogeneous symmetric function indexed by I. For any compositions α, β, γ, let $g^{\gamma}_{\alpha,\beta}$ denote the coefficient of S^{γ} in the internal product $S^{\alpha} * S^{\beta}$. For every composition $I = (i_1, i_2, \ldots, i_k)$ and every integer $n > |I|$, define the *`n`-completion of `I`* to be the composition $(n - |I|, i_1, i_2, \ldots, i_k)$; this n-completion is denoted by $I[n]$. Then, for any compositions α and β and every integer $n > |\alpha| + |\beta|$, we can write the internal product $S^{\alpha[n]} * S^{\beta[n]}$ in the form

$$S^{\alpha[n]} * S^{\beta[n]} = \sum_{\gamma} g^{\gamma[n]}_{\alpha[n],\beta[n]} S^{\gamma[n]}$$

with γ ranging over all compositions. The coefficients $g^{\gamma[n]}_{\alpha[n],\beta[n]}$ are independent on n. These coefficients $g^{\gamma[n]}_{\alpha[n],\beta[n]}$ are denoted by $\widetilde{g}^{\gamma}_{\alpha,\beta}$, and the non-commutative symmetric function

$$\sum_{\gamma} \widetilde{g}^{\gamma}_{\alpha,\beta} S^{\gamma}$$

is said to be the *left-padded Kronecker product* of S^{α} and S^{β}. By bilinearity, this extends to a definition of a left-padded Kronecker product of any two non-commutative symmetric functions.

The left-padded Kronecker product on the non-commutative symmetric functions lifts the left-padded Kronecker product on the symmetric functions. More precisely: Let π denote the canonical projection (`to_symmetric_function()`) from the non-commutative symmetric functions to the symmetric functions. Then, any two non-commutative symmetric functions f and g satisfy

$$\pi(f\overline{*}g) = \pi(f)\overline{*}\pi(g),$$

where the $\overline{*}$ on the left-hand side denotes the left-padded Kronecker product on the non-commutative symmetric functions, and the $\overline{*}$ on the right-hand side denotes the left-padded Kronecker product on the symmetric functions.

INPUT:

- `x` – element of the ring of non-commutative symmetric functions over the same base ring as `self`

OUTPUT:

- the left-padded Kronecker product of `self` with `x` (an element of the ring of non-commutative symmetric functions in the same basis as `self`)

AUTHORS:

- Darij Grinberg (15 Mar 2014)

EXAMPLES:

```
sage: NSym = NonCommutativeSymmetricFunctions(QQ)
sage: S = NSym.S()
sage: S[2,1].left_padded_kronecker_product(S[3])
S[1, 1, 1, 1] + S[1, 2, 1] + S[2, 1] + S[2, 1, 1, 1] + S[2, 2, 1] +␣

S[1, 2] + S[2, 1, 1] + S[3, 2]
```

Taking the left-padded Kronecker product with $1 = S$ is the identity map on the ring of non-commutative symmetric functions:

```
sage: all( S[Composition([])].left_padded_kronecker_product(S[lam])
....:      == S[lam].left_padded_kronecker_product(S[Composition([])])
....:      == S[lam] for i in range(4)
....:      for lam in Compositions(i) )
True
```

```
>>> from sage.all import *
>>> all( S[Composition([])].left_padded_kronecker_product(S[lam])
...      == S[lam].left_padded_kronecker_product(S[Composition([])])
...      == S[lam] for i in range(Integer(4))
...      for lam in Compositions(i) )
True
```

Here is a rule for the left-padded Kronecker product of S_1 (this is the same as $S^{(1)}$) with any complete homogeneous function: Let I be a composition. Then, the left-padded Kronecker product of S_1 and S^I is $\sum_K a_K S^K$, where the sum runs over all compositions K, and the coefficient a_K is defined as the number of ways to obtain K from I by one of the following two operations:

- Insert a 1 at the end of I.
- Subtract 1 from one of the entries of I (and remove the entry if it thus becomes 0), and insert a 1 at the end of I.

We check this for compositions of size ≤ 4:

```
sage: def mults1(I):
....:     # Left left-padded Kronecker multiplication by S[1].
....:     res = S[I[:] + [1]]
....:     for k in range(len(I)):
....:         I2 = I[:]
....:         if I2[k] == 1:
....:             I2 = I2[:k] + I2[k+1:]
....:         else:
....:             I2[k] -= 1
....:         res += S[I2 + [1]]
....:     return res
sage: all( mults1(I) == S[1].left_padded_kronecker_product(S[I])
....:      for i in range(5) for I in Compositions(i) )
True
```

```
>>> from sage.all import *
>>> def mults1(I):
...     # Left left-padded Kronecker multiplication by S[1].
...     res = S[I[:] + [Integer(1)]]
...     for k in range(len(I)):
...         I2 = I[:]
```

(continues on next page)

(continued from previous page)

```
...             if I2[k] == Integer(1):
...                 I2 = I2[:k] + I2[k+Integer(1):]
...             else:
...                 I2[k] -= Integer(1)
...             res += S[I2 + [Integer(1)]]
...         return res
>>> all( mults1(I) == S[Integer(1)].left_padded_kronecker_product(S[I])
...          for i in range(Integer(5)) for I in Compositions(i) )
True
```

A similar rule can be made for the left-padded Kronecker product of any complete homogeneous function with S_1: Let I be a composition. Then, the left-padded Kronecker product of S^I and S_1 is $\sum_K b_K S^K$, where the sum runs over all compositions K, and the coefficient b_K is defined as the number of ways to obtain K from I by one of the following two operations:

- Insert a 1 at the front of I.
- Subtract 1 from one of the entries of I (and remove the entry if it thus becomes 0), and insert a 1 right after this entry.

We check this for compositions of size ≤ 4:

```
sage: def mults2(I):
....:     # Left left-padded Kronecker multiplication by S[1].
....:     res = S[[1] + I[:]]
....:     for k in range(len(I)):
....:         I2 = I[:]
....:         i2k = I2[k]
....:         if i2k != 1:
....:             I2 = I2[:k] + [i2k-1, 1] + I2[k+1:]
....:         res += S[I2]
....:     return res
sage: all( mults2(I) == S[I].left_padded_kronecker_product(S[1])
....:      for i in range(5) for I in Compositions(i) )
True
```

```
>>> from sage.all import *
>>> def mults2(I):
...     # Left left-padded Kronecker multiplication by S[1].
...     res = S[[Integer(1)] + I[:]]
...     for k in range(len(I)):
...         I2 = I[:]
...         i2k = I2[k]
...         if i2k != Integer(1):
...             I2 = I2[:k] + [i2k-Integer(1), Integer(1)] +␣
↪I2[k+Integer(1):]
...         res += S[I2]
...     return res
>>> all( mults2(I) == S[I].left_padded_kronecker_product(S[Integer(1)])
...          for i in range(Integer(5)) for I in Compositions(i) )
True
```

Checking the $\pi(f \overline{*} g) = \pi(f) \overline{*} \pi(g)$ equality:

```
sage: NSym = NonCommutativeSymmetricFunctions(ZZ)
```

(continues on next page)

(continued from previous page)

```
sage: R = NSym.R()
sage: def testpi(n):
....:     for I in Compositions(n):
....:         for J in Compositions(n):
....:             a = R[I].to_symmetric_function()
....:             b = R[J].to_symmetric_function()
....:             x = a.left_padded_kronecker_product(b)
....:             y = R[I].left_padded_kronecker_product(R[J])
....:             y = y.to_symmetric_function()
....:             if x != y:
....:                 return False
....:     return True
sage: testpi(3)
True
```

```
>>> from sage.all import *
>>> NSym = NonCommutativeSymmetricFunctions(ZZ)
>>> R = NSym.R()
>>> def testpi(n):
...     for I in Compositions(n):
...         for J in Compositions(n):
...             a = R[I].to_symmetric_function()
...             b = R[J].to_symmetric_function()
...             x = a.left_padded_kronecker_product(b)
...             y = R[I].left_padded_kronecker_product(R[J])
...             y = y.to_symmetric_function()
...             if x != y:
...                 return False
...     return True
>>> testpi(Integer(3))
True
```

omega_involution()

Return the image of the noncommutative symmetric function `self` under the omega involution.

The omega involution is defined as the algebra antihomomorphism $NCSF \to NCSF$ which, for every positive integer n, sends the n-th complete non-commutative symmetric function S_n to the n-th elementary non-commutative symmetric function Λ_n. This omega involution is denoted by ω. It can be shown that every composition I satisfies

$$\omega(S^I) = \Lambda^{I^r}, \quad \omega(\Lambda^I) = S^{I^r}, \quad \omega(R_I) = R_{I^t}, \quad \omega(\Phi^I) = (-1)^{|I|-\ell(I)}\Phi^{I^r}, \omega(\Psi^I) = (-1)^{|I|-\ell(I)}\Psi^{I^r},$$

where I^r denotes the reversed composition of I, and I^t denotes the conjugate composition of I, and $\ell(I)$ denotes the length of the composition I, and standard notations for classical bases of $NCSF$ are being used (S for the complete basis, Λ for the elementary basis, R for the ribbon basis, Φ for that of the power-sums of the second kind, and Ψ for that of the power-sums of the first kind). More generally, if f is a homogeneous element of $NCSF$ of degree n, then

$$\omega(f) = (-1)^n S(f),$$

where S denotes the antipode of $NCSF$.

The omega involution ω is an involution and a coalgebra automorphism of $NCSF$. It is an automorphism of the graded vector space $NCSF$. If π denotes the projection from $NCSF$ to the ring of symmetric functions (`to_symmetric_function()`), then $\pi(\omega(f)) = \omega(\pi(f))$ for every $f \in NCSF$, where the ω on the right hand side denotes the omega automorphism of Sym.

The omega involution on $NCSF$ is adjoint to the omega involution on $QSym$ by the standard adjunction between $NCSF$ and $QSym$.

The omega involution has been denoted by ω in [LMvW13], section 3.6. See [NCSF1], section 3.1 for the properties of this map.

See also:

`omega involution of QSym`, `psi involution of NCSF`, `star involution of NCSF`.

EXAMPLES:

```
sage: NSym = NonCommutativeSymmetricFunctions(ZZ)
sage: S = NSym.S()
sage: L = NSym.L()
sage: L(S[3,2].omega_involution())
L[2, 3]
sage: L(S[6,3].omega_involution())
L[3, 6]
sage: L(S[1,3].omega_involution())
L[3, 1]
sage: L((S[9,1] - S[8,2] + 2*S[6,4] - 3*S[3] + 4*S[[]]).omega_
↪involution()) # long time
4*L[] + L[1, 9] - L[2, 8] - 3*L[3] + 2*L[4, 6]
sage: L((S[3,3] - 2*S[2]).omega_involution())
-2*L[2] + L[3, 3]
sage: L(S([4,2]).omega_involution())
L[2, 4]
sage: R = NSym.R()
sage: R([4,2]).omega_involution()
R[1, 2, 1, 1, 1]
sage: R.zero().omega_involution()
0
sage: NSym = NonCommutativeSymmetricFunctions(QQ)
sage: Phi = NSym.Phi()
sage: Phi([2,1]).omega_involution()
-Phi[1, 2]
sage: Psi = NSym.Psi()
sage: Psi([2,1]).omega_involution()
-Psi[1, 2]
sage: Psi([3,1]).omega_involution()
Psi[1, 3]
```

```
>>> from sage.all import *
>>> NSym = NonCommutativeSymmetricFunctions(ZZ)
>>> S = NSym.S()
>>> L = NSym.L()
>>> L(S[Integer(3),Integer(2)].omega_involution())
L[2, 3]
```

(continues on next page)

(continued from previous page)

```
>>> L(S[Integer(6),Integer(3)].omega_involution())
L[3, 6]
>>> L(S[Integer(1),Integer(3)].omega_involution())
L[3, 1]
>>> L((S[Integer(9),Integer(1)] - S[Integer(8),Integer(2)] +␣
↪Integer(2)*S[Integer(6),Integer(4)] - Integer(3)*S[Integer(3)] +␣
↪Integer(4)*S[[]]).omega_involution()) # long time
4*L[] + L[1, 9] - L[2, 8] - 3*L[3] + 2*L[4, 6]
>>> L((S[Integer(3),Integer(3)] - Integer(2)*S[Integer(2)]).omega_
↪involution())
-2*L[2] + L[3, 3]
>>> L(S([Integer(4),Integer(2)]).omega_involution())
L[2, 4]
>>> R = NSym.R()
>>> R([Integer(4),Integer(2)]).omega_involution()
R[1, 2, 1, 1, 1]
>>> R.zero().omega_involution()
0
>>> NSym = NonCommutativeSymmetricFunctions(QQ)
>>> Phi = NSym.Phi()
>>> Phi([Integer(2),Integer(1)]).omega_involution()
-Phi[1, 2]
>>> Psi = NSym.Psi()
>>> Psi([Integer(2),Integer(1)]).omega_involution()
-Psi[1, 2]
>>> Psi([Integer(3),Integer(1)]).omega_involution()
Psi[1, 3]
```

Testing the $\pi(\omega(f)) = \omega(\pi(f))$ relation noticed above:

```
sage: NSym = NonCommutativeSymmetricFunctions(QQ)
sage: R = NSym.R()
sage: all( R(I).omega_involution().to_symmetric_function()
....:      == R(I).to_symmetric_function().omega_involution()
....:      for I in Compositions(4) )
True
```

```
>>> from sage.all import *
>>> NSym = NonCommutativeSymmetricFunctions(QQ)
>>> R = NSym.R()
>>> all( R(I).omega_involution().to_symmetric_function()
...      == R(I).to_symmetric_function().omega_involution()
...      for I in Compositions(Integer(4)) )
True
```

The omega involution on $QSym$ is adjoint to the omega involution on $NSym$ with respect to the duality pairing:

```
sage: QSym = QuasiSymmetricFunctions(QQ)
sage: M = QSym.M()
sage: NSym = NonCommutativeSymmetricFunctions(QQ)
sage: S = NSym.S()
```

(continues on next page)

True
```

psi_involution()

Return the image of the noncommutative symmetric function `self` under the involution ψ.

The involution ψ is defined as the linear map $NCSF \to NCSF$ which, for every composition I, sends the complete noncommutative symmetric function S^I to the elementary noncommutative symmetric function Λ^I. It can be shown that every composition I satisfies

$$\psi(R_I) = R_{I^c}, \quad \psi(S^I) = \Lambda^I, \quad \psi(\Lambda^I) = S^I, \quad \psi(\Phi^I) = (-1)^{|I|-\ell(I)}\Phi^I$$

where I^c denotes the complement of the composition I, and $\ell(I)$ denotes the length of I, and where standard notations for classical bases of $NCSF$ are being used (S for the complete basis, Λ for the elementary basis, Φ for the basis of the power sums of the second kind, and R for the ribbon basis). The map ψ is an involution and a graded Hopf algebra automorphism of $NCSF$. If π denotes the projection from $NCSF$ to the ring of symmetric functions (*to_symmetric_function()*), then $\pi(\psi(f)) = \omega(\pi(f))$ for every $f \in NCSF$, where the ω on the right hand side denotes the omega automorphism of Sym.

The involution ψ of $NCSF$ is adjoint to the involution ψ of $QSym$ by the standard adjunction between $NCSF$ and $QSym$.

The involution ψ has been denoted by ψ in [LMvW13], section 3.6.

sage: R([2,1,1]).psi_involution()
R[1, 3]
sage: S = NSym.S()
sage: S([2,1]).psi_involution()
S[1, 1, 1] - S[2, 1]
sage: S.zero().psi_involution()
0
sage: NSym = NonCommutativeSymmetricFunctions(QQ)
sage: Phi = NSym.Phi()
sage: Phi([2,1]).psi_involution()
-Phi[2, 1]
sage: Phi([3,1]).psi_involution()
Phi[3, 1]
```

```
>>> from sage.all import *
>>> NSym = NonCommutativeSymmetricFunctions(ZZ)
>>> R = NSym.R()
>>> R[Integer(3),Integer(2)].psi_involution()
R[1, 1, 2, 1]
>>> R[Integer(6),Integer(3)].psi_involution()
R[1, 1, 1, 1, 1, 2, 1, 1]
>>> (R[Integer(9),Integer(1)] - R[Integer(8),Integer(2)] +␣
↪Integer(2)*R[Integer(2),Integer(4)] - Integer(3)*R[Integer(3)] +␣
↪Integer(4)*R[[]]).psi_involution()
4*R[] - 3*R[1, 1, 1] + R[1, 1, 1, 1, 1, 1, 1, 1, 2] - R[1, 1, 1, 1, 1,␣
↪1, 1, 2, 1] + 2*R[1, 2, 1, 1, 1]
>>> (R[Integer(3),Integer(3)] - Integer(2)*R[Integer(2)]).psi_
↪involution()
-2*R[1, 1] + R[1, 1, 2, 1, 1]
>>> R([Integer(2),Integer(1),Integer(1)]).psi_involution()
R[1, 3]
>>> S = NSym.S()
>>> S([Integer(2),Integer(1)]).psi_involution()
S[1, 1, 1] - S[2, 1]
>>> S.zero().psi_involution()
0
>>> NSym = NonCommutativeSymmetricFunctions(QQ)
>>> Phi = NSym.Phi()
>>> Phi([Integer(2),Integer(1)]).psi_involution()
-Phi[2, 1]
>>> Phi([Integer(3),Integer(1)]).psi_involution()
Phi[3, 1]
```

The Psi basis doesn't behave as nicely:

```
sage: Psi = NSym.Psi()
sage: Psi([2,1]).psi_involution()
-Psi[2, 1]
sage: Psi([3,1]).psi_involution()
```

(continues on next page)

(continued from previous page)

```
1/2*Psi[1, 2, 1] - 1/2*Psi[2, 1, 1] + Psi[3, 1]
```

```
>>> from sage.all import *
>>> Psi = NSym.Psi()
>>> Psi([Integer(2),Integer(1)]).psi_involution()
-Psi[2, 1]
>>> Psi([Integer(3),Integer(1)]).psi_involution()
1/2*Psi[1, 2, 1] - 1/2*Psi[2, 1, 1] + Psi[3, 1]
```

The involution ψ commutes with the antipode:

```
sage: all( R(I).psi_involution().antipode()
....:      == R(I).antipode().psi_involution()
....:      for I in Compositions(4) )
True
```

```
>>> from sage.all import *
>>> all( R(I).psi_involution().antipode()
...      == R(I).antipode().psi_involution()
...      for I in Compositions(Integer(4)) )
True
```

Testing the $\pi(\psi(f)) = \omega(\pi(f))$ relation noticed above:

```
sage: NSym = NonCommutativeSymmetricFunctions(QQ)
sage: R = NSym.R()
sage: all( R(I).psi_involution().to_symmetric_function()
....:      == R(I).to_symmetric_function().omega()
....:      for I in Compositions(4) )
True
```

```
>>> from sage.all import *
>>> NSym = NonCommutativeSymmetricFunctions(QQ)
>>> R = NSym.R()
>>> all( R(I).psi_involution().to_symmetric_function()
...      == R(I).to_symmetric_function().omega()
...      for I in Compositions(Integer(4)) )
True
```

The involution ψ of $QSym$ is adjoint to the involution ψ of $NSym$ with respect to the duality pairing:

```
sage: QSym = QuasiSymmetricFunctions(QQ)
sage: M = QSym.M()
sage: NSym = NonCommutativeSymmetricFunctions(QQ)
sage: S = NSym.S()
sage: all( all( M(I).psi_involution().duality_pairing(S(J))
....:           == M(I).duality_pairing(S(J).psi_involution())
....:           for I in Compositions(2) )
....:      for J in Compositions(3) )
True
```

```
>>> from sage.all import *
>>> QSym = QuasiSymmetricFunctions(QQ)
>>> M = QSym.M()
>>> NSym = NonCommutativeSymmetricFunctions(QQ)
>>> S = NSym.S()
>>> all( all( M(I).psi_involution().duality_pairing(S(J))
...           == M(I).duality_pairing(S(J).psi_involution())
...           for I in Compositions(Integer(2)) )
...       for J in Compositions(Integer(3)) )
True
```

star_involution()

Return the image of the noncommutative symmetric function `self` under the star involution.

The star involution is defined as the algebra antihomomorphism $NCSF \to NCSF$ which, for every positive integer n, sends the n-th complete non-commutative symmetric function S_n to S_n. Denoting by f^* the image of an element $f \in NCSF$ under this star involution, it can be shown that every composition I satisfies

$$(S^I)^* = S^{I^r}, \quad (\Lambda^I)^* = \Lambda^{I^r}, \quad R_I^* = R_{I^r}, \quad (\Phi^I)^* = \Phi^{I^r},$$

where I^r denotes the reversed composition of I, and standard notations for classical bases of $NCSF$ are being used (S for the complete basis, Λ for the elementary basis, R for the ribbon basis, and Φ for that of the power-sums of the second kind). The star involution is an involution and a coalgebra automorphism of $NCSF$. It is an automorphism of the graded vector space $NCSF$. Under the canonical isomorphism between the n-th graded component of $NCSF$ and the descent algebra of the symmetric group S_n (see `to_descent_algebra()`), the star involution (restricted to the n-th graded component) corresponds to the automorphism of the descent algebra given by $x \mapsto \omega_n x \omega_n$, where ω_n is the permutation $(n, n-1, \ldots, 1) \in S_n$ (written here in one-line notation). If π denotes the projection from $NCSF$ to the ring of symmetric functions (`to_symmetric_function()`), then $\pi(f^*) = \pi(f)$ for every $f \in NCSF$.

The star involution on $NCSF$ is adjoint to the star involution on $QSym$ by the standard adjunction between $NCSF$ and $QSym$.

The star involution has been denoted by ρ in [LMvW13], section 3.6. See [NCSF2], section 2.3 for the properties of this map.

>>> R.zero().star_involution()
0
>>> NSym = NonCommutativeSymmetricFunctions(QQ)
>>> Phi = NSym.Phi()
>>> Phi([Integer(2),Integer(1)]).star_involution()
Phi[1, 2]
```

The Psi basis doesn't behave as nicely:

```
sage: Psi = NSym.Psi()
sage: Psi([2,1]).star_involution()
Psi[1, 2]
sage: Psi([3,1]).star_involution()
1/2*Psi[1, 1, 2] - 1/2*Psi[1, 2, 1] + Psi[1, 3]
```

```
>>> from sage.all import *
>>> Psi = NSym.Psi()
>>> Psi([Integer(2),Integer(1)]).star_involution()
Psi[1, 2]
>>> Psi([Integer(3),Integer(1)]).star_involution()
1/2*Psi[1, 1, 2] - 1/2*Psi[1, 2, 1] + Psi[1, 3]
```

The star involution commutes with the antipode:

```
sage: all( R(I).star_involution().antipode()
....:      == R(I).antipode().star_involution()
....:      for I in Compositions(4) )
True
```

```
>>> from sage.all import *
>>> all( R(I).star_involution().antipode()
...      == R(I).antipode().star_involution()
...      for I in Compositions(Integer(4)) )
True
```

Checking the relation with the descent algebra described above:

```
sage: def descent_test(n):
....:     DA = DescentAlgebra(QQ, n)
....:     NSym = NonCommutativeSymmetricFunctions(QQ)
....:     S = NSym.S()
....:     DAD = DA.D()
....:     w_n = DAD(set(range(1, n)))
....:     for I in Compositions(n):
....:         if not (S[I].star_involution()
....:                 == w_n * S[I].to_descent_algebra(n) * w_n):
....:             return False
....:         return True
sage: all( descent_test(i) for i in range(4) )
True
sage: all( descent_test(i) for i in range(6) ) # long time
True
```

```
>>> from sage.all import *
>>> def descent_test(n):
...     DA = DescentAlgebra(QQ, n)
...     NSym = NonCommutativeSymmetricFunctions(QQ)
...     S = NSym.S()
...     DAD = DA.D()
...     w_n = DAD(set(range(Integer(1), n)))
...     for I in Compositions(n):
...         if not (S[I].star_involution()
...                 == w_n * S[I].to_descent_algebra(n) * w_n):
...             return False
...         return True
>>> all( descent_test(i) for i in range(Integer(4)) )
True
>>> all( descent_test(i) for i in range(Integer(6)) ) # long time
True
```

Testing the $\pi(f^*) = \pi(f)$ relation noticed above:

```
sage: NSym = NonCommutativeSymmetricFunctions(QQ)
sage: R = NSym.R()
sage: all( R(I).star_involution().to_symmetric_function()
```

(continues on next page)

(continued from previous page)

```
....:       == R(I).to_symmetric_function()
....:       for I in Compositions(4) )
True
```

```
>>> from sage.all import *
>>> NSym = NonCommutativeSymmetricFunctions(QQ)
>>> R = NSym.R()
>>> all( R(I).star_involution().to_symmetric_function()
...       == R(I).to_symmetric_function()
...       for I in Compositions(Integer(4)) )
True
```

The star involution on $QSym$ is adjoint to the star involution on $NSym$ with respect to the duality pairing:

```
sage: QSym = QuasiSymmetricFunctions(QQ)
sage: M = QSym.M()
sage: NSym = NonCommutativeSymmetricFunctions(QQ)
sage: S = NSym.S()
sage: all( all( M(I).star_involution().duality_pairing(S(J))
....:             == M(I).duality_pairing(S(J).star_involution())
....:             for I in Compositions(2) )
....:       for J in Compositions(3) )
True
```

```
>>> from sage.all import *
>>> QSym = QuasiSymmetricFunctions(QQ)
>>> M = QSym.M()
>>> NSym = NonCommutativeSymmetricFunctions(QQ)
>>> S = NSym.S()
>>> all( all( M(I).star_involution().duality_pairing(S(J))
...             == M(I).duality_pairing(S(J).star_involution())
...             for I in Compositions(Integer(2)) )
...       for J in Compositions(Integer(3)) )
True
```

to_descent_algebra(*n=None*)

Return the image of the `n`-th degree homogeneous component of `self` in the descent algebra of S_n over the same base ring as `self`.

This is based upon the canonical isomorphism from the n-th degree homogeneous component of the algebra of noncommutative symmetric functions to the descent algebra of S_n. This isomorphism maps the inner product of noncommutative symmetric functions either to the product in the descent algebra of S_n or to its opposite (depending on how the latter is defined).

If `n` is not specified, it will be taken to be the highest homogeneous component of `self`.

OUTPUT:

- The image of the `n`-th homogeneous component of `self` under the isomorphism into the descent algebra of S_n over the same base ring as `self`.

EXAMPLES:

```
sage: S = NonCommutativeSymmetricFunctions(ZZ).S()
sage: S[2,1].to_descent_algebra(3)
B[2, 1]
sage: (S[1,2,1] - 3 * S[1,1,2]).to_descent_algebra(4)
-3*B[1, 1, 2] + B[1, 2, 1]
sage: S[2,1].to_descent_algebra(2)
0
sage: S[2,1].to_descent_algebra()
B[2, 1]
sage: S.zero().to_descent_algebra().parent()
Descent algebra of 0 over Integer Ring in the subset basis
sage: (S[1,2,1] - 3 * S[1,1,2]).to_descent_algebra(1)
0
```

```
>>> from sage.all import *
>>> S = NonCommutativeSymmetricFunctions(ZZ).S()
>>> S[Integer(2),Integer(1)].to_descent_algebra(Integer(3))
B[2, 1]
>>> (S[Integer(1),Integer(2),Integer(1)] - Integer(3) * S[Integer(1),
↪Integer(1),Integer(2)]).to_descent_algebra(Integer(4))
-3*B[1, 1, 2] + B[1, 2, 1]
>>> S[Integer(2),Integer(1)].to_descent_algebra(Integer(2))
0
>>> S[Integer(2),Integer(1)].to_descent_algebra()
B[2, 1]
>>> S.zero().to_descent_algebra().parent()
Descent algebra of 0 over Integer Ring in the subset basis
>>> (S[Integer(1),Integer(2),Integer(1)] - Integer(3) * S[Integer(1),
↪Integer(1),Integer(2)]).to_descent_algebra(Integer(1))
0
```

to_fqsym()

Return the image of the non-commutative symmetric function `self` under the morphism $\iota : NSym \to FQSym$.

This morphism is the injective algebra homomorphism $NSym \to FQSym$ that sends each Complete generator S_n to $F_{[1,2,\ldots,n]}$. It is the inclusion map, if we regard both $NSym$ and $FQSym$ as rings of noncommutative power series.

See also

FreeQuasisymmetricFunctions for a definition of $FQSym$.

EXAMPLES:

```
sage: N = NonCommutativeSymmetricFunctions(QQ)
sage: R = N.ribbon()
sage: x = 2*R[[]] + 2*R[1] + 3*R[2]
sage: x.to_fqsym()
2*F[] + 2*F[1] + 3*F[1, 2]
sage: R[2,1].to_fqsym()
F[1, 3, 2] + F[3, 1, 2]
```

(continues on next page)

(continued from previous page)

```
sage: x = R.an_element(); x
2*R[] + 2*R[1] + 3*R[1, 1]
sage: x.to_fqsym()
2*F[] + 2*F[1] + 3*F[2, 1]

sage: y = N.Phi()[1,2]
sage: y.to_fqsym()
F[1, 2, 3] - F[1, 3, 2] + F[2, 1, 3] + F[2, 3, 1]
 - F[3, 1, 2] - F[3, 2, 1]

sage: S = NonCommutativeSymmetricFunctions(QQ).S()
sage: S[2].to_fqsym()
F[1, 2]
sage: S[1,2].to_fqsym()
F[1, 2, 3] + F[2, 1, 3] + F[2, 3, 1]
sage: S[2,1].to_fqsym()
F[1, 2, 3] + F[1, 3, 2] + F[3, 1, 2]
sage: S[1,2,1].to_fqsym()
F[1, 2, 3, 4] + F[1, 2, 4, 3] + F[1, 4, 2, 3]
 + F[2, 1, 3, 4] + F[2, 1, 4, 3] + F[2, 3, 1, 4]
 + F[2, 3, 4, 1] + F[2, 4, 1, 3] + F[2, 4, 3, 1]
 + F[4, 1, 2, 3] + F[4, 2, 1, 3] + F[4, 2, 3, 1]
```

```
>>> from sage.all import *
>>> N = NonCommutativeSymmetricFunctions(QQ)
>>> R = N.ribbon()
>>> x = Integer(2)*R[[]] + Integer(2)*R[Integer(1)] +␣
↪Integer(3)*R[Integer(2)]
>>> x.to_fqsym()
2*F[] + 2*F[1] + 3*F[1, 2]
>>> R[Integer(2),Integer(1)].to_fqsym()
F[1, 3, 2] + F[3, 1, 2]
>>> x = R.an_element(); x
2*R[] + 2*R[1] + 3*R[1, 1]
>>> x.to_fqsym()
2*F[] + 2*F[1] + 3*F[2, 1]

>>> y = N.Phi()[Integer(1),Integer(2)]
>>> y.to_fqsym()
F[1, 2, 3] - F[1, 3, 2] + F[2, 1, 3] + F[2, 3, 1]
 - F[3, 1, 2] - F[3, 2, 1]

>>> S = NonCommutativeSymmetricFunctions(QQ).S()
>>> S[Integer(2)].to_fqsym()
F[1, 2]
>>> S[Integer(1),Integer(2)].to_fqsym()
F[1, 2, 3] + F[2, 1, 3] + F[2, 3, 1]
>>> S[Integer(2),Integer(1)].to_fqsym()
F[1, 2, 3] + F[1, 3, 2] + F[3, 1, 2]
>>> S[Integer(1),Integer(2),Integer(1)].to_fqsym()
F[1, 2, 3, 4] + F[1, 2, 4, 3] + F[1, 4, 2, 3]
 + F[2, 1, 3, 4] + F[2, 1, 4, 3] + F[2, 3, 1, 4]
```

(continues on next page)

(continued from previous page)

```
 + F[2, 3, 4, 1] + F[2, 4, 1, 3] + F[2, 4, 3, 1]
 + F[4, 1, 2, 3] + F[4, 2, 1, 3] + F[4, 2, 3, 1]
```

to_fsym()

Return the image of `self` under the natural map to $FSym$.

There is an injective Hopf algebra morphism from $NSym$ to $FSym$ (see *FreeSymmetricFunctions*), which maps the ribbon R_α indexed by a composition α to the sum of all tableaux whose descent composition is α. If we regard $NSym$ as a Hopf subalgebra of $FQSym$ via the morphism $\iota : NSym \to FQSym$ (implemented as *to_fqsym()*), then this injective morphism is just the inclusion map.

EXAMPLES:

```
sage: N = NonCommutativeSymmetricFunctions(QQ)
sage: R = N.ribbon()
sage: x = 2*R[[]] + 2*R[1] + 3*R[2]
sage: x.to_fsym()
2*G[] + 2*G[1] + 3*G[12]
sage: R[2,1].to_fsym()
G[12|3]
sage: R[1,2].to_fsym()
G[13|2]
sage: R[2,1,2].to_fsym()
G[12|35|4] + G[125|3|4]
sage: x = R.an_element(); x
2*R[] + 2*R[1] + 3*R[1, 1]
sage: x.to_fsym()
2*G[] + 2*G[1] + 3*G[1|2]

sage: y = N.Phi()[1,2]
sage: y.to_fsym()
-G[1|2|3] - G[12|3] + G[123] + G[13|2]

sage: S = NonCommutativeSymmetricFunctions(QQ).S()
sage: S[2].to_fsym()
G[12]
sage: S[2,1].to_fsym()

G[12|3] + G[123]
```

to_ncsym()

Return the image of `self` under the injective algebra homomorphism $\kappa : NSym \to NCSym$ that fixes the symmetric functions.

As usual, $NCSym$ denotes the ring of symmetric functions in non-commuting variables. Let S_n denote a generator of the complete basis. The algebra homomorphism $\kappa : NSym \to NCSym$ is defined by

$$S_n \mapsto \sum_{A \vdash [n]} \frac{\lambda(A)!\lambda(A)^!}{n!} \mathbf{m}_A.$$

It has the property that the canonical maps $\chi : NCSym \to Sym$ and $\rho : NSym \to Sym$ satisfy $\chi \circ \kappa = \rho$.

Note

A remark in [BRRZ08] makes it clear that the embedding of $NSym$ into $NCSym$ that preserves the projection into the symmetric functions is not unique. While this seems to be a natural embedding, any free set of algebraic generators of $NSym$ can be sent to a set of free elements in $NCSym$ to form another embedding.

See also

NonCommutativeSymmetricFunctions for a definition of $NCSym$.

EXAMPLES:

```
sage: N = NonCommutativeSymmetricFunctions(QQ)
sage: S = N.complete()
sage: S[2].to_ncsym()
1/2*m{{1}, {2}} + m{{1, 2}}
sage: S[1,2,1].to_ncsym()
1/2*m{{1}, {2}, {3}, {4}} + 1/2*m{{1}, {2}, {3, 4}} + m{{1}, {2, 3},
↪{4}}
 + m{{1}, {2, 3, 4}} + 1/2*m{{1}, {2, 4}, {3}} + 1/2*m{{1, 2}, {3}, {4}
```

```

to_symmetric_function()

Return the commutative image of a non-commutative symmetric function.

OUTPUT: the commutative image of `self`; this will be a symmetric function

EXAMPLES:

```
sage: N = NonCommutativeSymmetricFunctions(QQ)
sage: R = N.ribbon()
sage: x = R.an_element(); x
2*R[] + 2*R[1] + 3*R[1, 1]
sage: x.to_symmetric_function()
2*s[] + 2*s[1] + 3*s[1, 1]
sage: y = N.Phi()[1,3]
sage: y.to_symmetric_function()
h[1, 1, 1, 1] - 3*h[2, 1, 1] + 3*h[3, 1]
```

```
>>> from sage.all import *
>>> N = NonCommutativeSymmetricFunctions(QQ)
>>> R = N.ribbon()
>>> x = R.an_element(); x
2*R[] + 2*R[1] + 3*R[1, 1]
>>> x.to_symmetric_function()
2*s[] + 2*s[1] + 3*s[1, 1]
>>> y = N.Phi()[Integer(1),Integer(3)]
>>> y.to_symmetric_function()
h[1, 1, 1, 1] - 3*h[2, 1, 1] + 3*h[3, 1]
```

to_symmetric_group_algebra()

Return the image of a non-commutative symmetric function into the symmetric group algebra where the ribbon basis element indexed by a composition is associated with the sum of all permutations which have descent set equal to said composition. In compliance with the anti- isomorphism between the descent algebra and the non-commutative symmetric functions, we index descent positions by the reversed composition.

OUTPUT:

- The image of `self` under the embedding of the n-th degree homogeneous component of the non-commutative symmetric functions in the symmetric group algebra of S_n. This can behave unexpectedly when `self` is not homogeneous.

EXAMPLES:

```
sage: R = NonCommutativeSymmetricFunctions(QQ).R()
sage: R[2,1].to_symmetric_group_algebra()
[1, 3, 2] + [2, 3, 1]
sage: R([]).to_symmetric_group_algebra()
[]
```

```
>>> from sage.all import *
>>> R = NonCommutativeSymmetricFunctions(QQ).R()
>>> R[Integer(2),Integer(1)].to_symmetric_group_algebra()
[1, 3, 2] + [2, 3, 1]
>>> R([]).to_symmetric_group_algebra()
[]
```

verschiebung(n)

Return the image of the noncommutative symmetric function `self` under the n-th Verschiebung operator.

The n-th Verschiebung operator $\mathbf{V}_n$ is defined to be the map from the $\mathbf{k}$-algebra of noncommutative symmetric functions to itself that sends the complete function S^I indexed by a composition $I = (i_1, i_2, \ldots, i_k)$ to $S^{(i_1/n, i_2/n, \ldots, i_k/n)}$ if all of the numbers $i_1, i_2, \ldots, i_k$ are divisible by n, and to 0 otherwise. This operator $\mathbf{V}_n$ is a Hopf algebra endomorphism. For every positive integer r with $n \mid r$, it satisfies

$$\mathbf{V}_n(S_r) = S_{r/n}, \quad \mathbf{V}_n(\Lambda_r) = (-1)^{r-r/n}\Lambda_{r/n}, \quad \mathbf{V}_n(\Psi_r) = n\Psi_{r/n}, \quad \mathbf{V}_n(\Phi_r) = n\Phi_{r/n}$$

(where S_r denotes the r-th complete non-commutative symmetric function, Λ_r denotes the r-th elementary non-commutative symmetric function, Ψ_r denotes the r-th power-sum non-commutative symmetric function of the first kind, and Φ_r denotes the r-th power-sum non-commutative symmetric function of the second kind). For every positive integer r with $n \nmid r$, it satisfes

$$\mathbf{V}_n(S_r) = \mathbf{V}_n(\Lambda_r) = \mathbf{V}_n(\Psi_r) = \mathbf{V}_n(\Phi_r) = 0.$$

The n-th Verschiebung operator is also called the n-th Verschiebung endomorphism.

It is a lift of the n-th Verschiebung operator on the ring of symmetric functions (*verschiebung()*) to the ring of noncommutative symmetric functions.

The action of the n-th Verschiebung operator can also be described on the ribbon Schur functions. Namely, every composition I of size $n\ell$ satisfies

$$\mathbf{V}_n(R_I) = (-1)^{\ell(I)-\ell(J)} \cdot R_{J/n},$$

where J denotes the meet of the compositions I and $(\underbrace{n, n, \ldots, n}_{|I|/n \text{ times}})$, where $\ell(I)$ is the length of I, and where J/n denotes the composition obtained by dividing every entry of J by n. For a composition I of size not divisible by n, we have $\mathbf{V}_n(R_I) = 0$.

See also

adams_operator method of QSym, *verschiebung method of Sym*

INPUT:

- n – positive integer

OUTPUT:

The result of applying the n-th Verschiebung operator (on the ring of noncommutative symmetric functions) to self.

EXAMPLES:

```
sage: NSym = NonCommutativeSymmetricFunctions(ZZ)
sage: S = NSym.S()
sage: S[3,2].verschiebung(2)
0
sage: S[6,4].verschiebung(2)
S[3, 2]
sage: (S[9,1] - S[8,2] + 2*S[6,4] - 3*S[3] + 4*S[[]]).verschiebung(2)
4*S[] + 2*S[3, 2] - S[4, 1]
sage: (S[3,3] - 2*S[2]).verschiebung(3)
S[1, 1]
sage: S([4,2]).verschiebung(1)
S[4, 2]
sage: R = NSym.R()
sage: R([4,2]).verschiebung(2)
R[2, 1]
```

```
>>> from sage.all import *
>>> NSym = NonCommutativeSymmetricFunctions(ZZ)
>>> S = NSym.S()
>>> S[Integer(3),Integer(2)].verschiebung(Integer(2))
0
>>> S[Integer(6),Integer(4)].verschiebung(Integer(2))
S[3, 2]
>>> (S[Integer(9),Integer(1)] - S[Integer(8),Integer(2)] +␣
↪Integer(2)*S[Integer(6),Integer(4)] - Integer(3)*S[Integer(3)] +␣
↪Integer(4)*S[[]]).verschiebung(Integer(2))
4*S[] + 2*S[3, 2] - S[4, 1]
>>> (S[Integer(3),Integer(3)] - Integer(2)*S[Integer(2)]).
↪verschiebung(Integer(3))
S[1, 1]
>>> S([Integer(4),Integer(2)]).verschiebung(Integer(1))
S[4, 2]
>>> R = NSym.R()
>>> R([Integer(4),Integer(2)]).verschiebung(Integer(2))
R[2, 1]
```

Being Hopf algebra endomorphisms, the Verschiebung operators commute with the antipode:

```
sage: all( R(I).verschiebung(2).antipode()
....:      == R(I).antipode().verschiebung(2)
....:      for I in Compositions(4) )
True
```

```
>>> from sage.all import *
>>> all( R(I).verschiebung(Integer(2)).antipode()
```

(continues on next page)

(continued from previous page)

```
...        == R(I).antipode().verschiebung(Integer(2))
...        for I in Compositions(Integer(4)) )
True
```

They lift the Verschiebung operators of the ring of symmetric functions:

```
sage: all( S(I).verschiebung(2).to_symmetric_function()
....:       == S(I).to_symmetric_function().verschiebung(2)
....:       for I in Compositions(4) )
True
```

```
>>> from sage.all import *
>>> all( S(I).verschiebung(Integer(2)).to_symmetric_function()
...        == S(I).to_symmetric_function().verschiebung(Integer(2))
...        for I in Compositions(Integer(4)) )
True
```

The Frobenius operators on $QSym$ are adjoint to the Verschiebung operators on $NSym$ with respect to the duality pairing:

```
sage: QSym = QuasiSymmetricFunctions(ZZ)
sage: M = QSym.M()
sage: all( all( M(I).adams_operator(3).duality_pairing(S(J))
....:             == M(I).duality_pairing(S(J).verschiebung(3))
....:             for I in Compositions(2) )
....:       for J in Compositions(3) )
True
```

```
>>> from sage.all import *
>>> QSym = QuasiSymmetricFunctions(ZZ)
>>> M = QSym.M()
>>> all( all( M(I).adams_operator(Integer(3)).duality_pairing(S(J))
...             == M(I).duality_pairing(S(J).verschiebung(Integer(3)))
...             for I in Compositions(Integer(2)) )
...        for J in Compositions(Integer(3)) )
True
```

class ParentMethods

Bases: `object`

immaculate_function(*xs*)

Return the immaculate function corresponding to the integer vector `xs`, written in the basis `self`.

If α is any integer vector – i.e., an element of $\mathbf{Z}^m$ for some $m \in \mathbf{N}$ –, the *immaculate function corresponding to* α is a non-commutative symmetric function denoted by $\mathfrak{S}_\alpha$. One way to define this function is by setting

$$\mathfrak{S}_\alpha = \sum_{\sigma \in S_m} (-1)^\sigma S_{\alpha_1+\sigma(1)-1} S_{\alpha_2+\sigma(2)-2} \cdots S_{\alpha_m+\sigma(m)-m},$$

where α is written in the form $(\alpha_1, \alpha_2, \ldots, \alpha_m)$, and where S stands for the complete basis (`Complete`).

The immaculate function $\mathfrak{S}_\alpha$ first appeared in [BBSSZ2012] (where it was defined differently, but the definition we gave above appeared as Theorem 3.27).

The immaculate functions $\mathfrak{S}_\alpha$ for α running over all compositions (i.e., finite sequences of positive integers) form a basis of $NCSF$. This is the *immaculate basis* (`Immaculate`).

INPUT:

- `xs` – list (or tuple or any iterable – possibly a composition) of integers

OUTPUT:

The immaculate function $\mathfrak{S}_{xs}$ written in the basis `self`.

EXAMPLES:

Let us first check that, for `xs` a composition, we get the same as the result of `self.realization_of().I()[xs]`:

```
sage: def test_comp(xs):
....:     NSym = NonCommutativeSymmetricFunctions(QQ)
....:     I = NSym.I()
....:     return I[xs] == I.immaculate_function(xs)
sage: def test_allcomp(n):
....:     return all( test_comp(c) for c in Compositions(n) )
sage: test_allcomp(1)
True
sage: test_allcomp(2)
True
sage: test_allcomp(3)
True
```

```
>>> from sage.all import *
>>> def test_comp(xs):
...     NSym = NonCommutativeSymmetricFunctions(QQ)
...     I = NSym.I()
...     return I[xs] == I.immaculate_function(xs)
>>> def test_allcomp(n):
...     return all( test_comp(c) for c in Compositions(n) )
>>> test_allcomp(Integer(1))
True
>>> test_allcomp(Integer(2))
True
>>> test_allcomp(Integer(3))
True
```

Now some examples of non-composition immaculate functions:

```
sage: NSym = NonCommutativeSymmetricFunctions(QQ)
sage: I = NSym.I()
sage: I.immaculate_function([0, 1])
0
sage: I.immaculate_function([0, 2])
-I[1, 1]
sage: I.immaculate_function([-1, 1])
-I[]
sage: I.immaculate_function([2, -1])
0
sage: I.immaculate_function([2, 0])
I[2]
```

(continues on next page)

(continued from previous page)

```
sage: I.immaculate_function([2, 0, 1])
0
sage: I.immaculate_function([1, 0, 2])
-I[1, 1, 1]
sage: I.immaculate_function([2, 0, 2])
-I[2, 1, 1]
sage: I.immaculate_function([0, 2, 0, 2])
I[1, 1, 1, 1] + I[1, 2, 1]
sage: I.immaculate_function([2, 0, 2, 0, 2])
I[2, 1, 1, 1, 1] + I[2, 1, 2, 1]
```

```
>>> from sage.all import *
>>> NSym = NonCommutativeSymmetricFunctions(QQ)
>>> I = NSym.I()
>>> I.immaculate_function([Integer(0), Integer(1)])
0
>>> I.immaculate_function([Integer(0), Integer(2)])
-I[1, 1]
>>> I.immaculate_function([-Integer(1), Integer(1)])
-I[]
>>> I.immaculate_function([Integer(2), -Integer(1)])
0
>>> I.immaculate_function([Integer(2), Integer(0)])
I[2]
>>> I.immaculate_function([Integer(2), Integer(0), Integer(1)])
0
>>> I.immaculate_function([Integer(1), Integer(0), Integer(2)])
-I[1, 1, 1]
>>> I.immaculate_function([Integer(2), Integer(0), Integer(2)])
-I[2, 1, 1]
>>> I.immaculate_function([Integer(0), Integer(2), Integer(0),␣
↪Integer(2)])
I[1, 1, 1, 1] + I[1, 2, 1]
>>> I.immaculate_function([Integer(2), Integer(0), Integer(2),␣
↪Integer(0), Integer(2)])
I[2, 1, 1, 1, 1] + I[2, 1, 2, 1]
```

to_symmetric_function()

Morphism to the algebra of symmetric functions.

This is constructed by extending the computation on the basis or by coercion to the complete basis.

OUTPUT:

- The module morphism from the basis `self` to the symmetric functions which corresponds to taking a commutative image.

EXAMPLES:

```
sage: N = NonCommutativeSymmetricFunctions(QQ)
sage: R = N.ribbon()
sage: x = R.an_element(); x
2*R[] + 2*R[1] + 3*R[1, 1]
sage: R.to_symmetric_function(x)
2*s[] + 2*s[1] + 3*s[1, 1]
```

(continues on next page)

(continued from previous page)

```
sage: nM = N.Monomial()
sage: nM.to_symmetric_function(nM[3,1])
h[1, 1, 1, 1] - 7/2*h[2, 1, 1] + h[2, 2] + 7/2*h[3, 1] - 2*h[4]
```

```
>>> from sage.all import *
>>> N = NonCommutativeSymmetricFunctions(QQ)
>>> R = N.ribbon()
>>> x = R.an_element(); x
2*R[] + 2*R[1] + 3*R[1, 1]
>>> R.to_symmetric_function(x)
2*s[] + 2*s[1] + 3*s[1, 1]
>>> nM = N.Monomial()
>>> nM.to_symmetric_function(nM[Integer(3),Integer(1)])
h[1, 1, 1, 1] - 7/2*h[2, 1, 1] + h[2, 2] + 7/2*h[3, 1] - 2*h[4]
```

to_symmetric_function_on_basis(*I*)

The image of the basis element indexed by `I` under the map to the symmetric functions.

This default implementation does a change of basis and computes the image in the complete basis.

INPUT:

- `I` – a composition

OUTPUT:

- The image of the non-commutative basis element of `self` indexed by the composition `I` under the map from non-commutative symmetric functions to the symmetric functions. This will be a symmetric function.

EXAMPLES:

```
sage: N = NonCommutativeSymmetricFunctions(QQ)
sage: I = N.Immaculate()
sage: I.to_symmetric_function(I[1,3])
-h[2, 2] + h[3, 1]
sage: I.to_symmetric_function(I[1,2])
0
sage: Phi = N.Phi()
sage: Phi.to_symmetric_function_on_basis([3,1,2])==Phi.to_symmetric_
↪function(Phi[3,1,2])
True
sage: Phi.to_symmetric_function_on_basis([])
h[]
```

```
>>> from sage.all import *
>>> N = NonCommutativeSymmetricFunctions(QQ)
>>> I = N.Immaculate()
>>> I.to_symmetric_function(I[Integer(1),Integer(3)])
-h[2, 2] + h[3, 1]
>>> I.to_symmetric_function(I[Integer(1),Integer(2)])
0
>>> Phi = N.Phi()
>>> Phi.to_symmetric_function_on_basis([Integer(3),Integer(1),
↪Integer(2)])==Phi.to_symmetric_function(Phi[Integer(3),Integer(1),
↪Integer(2)])
```

(continues on next page)

(continued from previous page)

```
True
>>> Phi.to_symmetric_function_on_basis([])
h[]
```

super_categories()

Return the super categories of the category of bases of the non-commutative symmetric functions.

OUTPUT: list

class Complete(*NCSF*)

Bases: *CombinatorialFreeModule*, BindableClass

The Hopf algebra of non-commutative symmetric functions in the Complete basis.

The Complete basis is defined in Definition 3.4 of [NCSF1], where it is denoted by $(S^I)_I$. It is a multiplicative basis, and is connected to the elementary generators Λ_i of the ring of non-commutative symmetric functions by the following relation: Define a non-commutative symmetric function S_n for every nonnegative integer n by the power series identity

$$\sum_{k\geq 0} t^k S_k = \left(\sum_{k\geq 0} (-t)^k \Lambda_k \right)^{-1},$$

with Λ_0 denoting 1. For every composition $(i_1, i_2, \ldots, i_k)$, we have $S^{(i_1,i_2,\ldots,i_k)} = S_{i_1} S_{i_2} \cdots S_{i_k}$.

EXAMPLES:

```
sage: NCSF = NonCommutativeSymmetricFunctions(QQ)
sage: S = NCSF.Complete(); S
Non-Commutative Symmetric Functions over the Rational Field in the Complete␣
↪basis
sage: S.an_element()
2*S[] + 2*S[1] + 3*S[1, 1]
```

```

class Element

Bases: `IndexedFreeModuleElement`

An element in the Complete basis.

psi_involution()

Return the image of the noncommutative symmetric function `self` under the involution ψ.

The involution ψ is defined as the linear map $NCSF \to NCSF$ which, for every composition I, sends the complete noncommutative symmetric function S^I to the elementary noncommutative symmetric function Λ^I. It can be shown that every composition I satisfies

$$\psi(R_I) = R_{I^c}, \quad \psi(S^I) = \Lambda^I, \quad \psi(\Lambda^I) = S^I, \quad \psi(\Phi^I) = (-1)^{|I|-\ell(I)}\Phi^I$$

where I^c denotes the complement of the composition I, and $\ell(I)$ denotes the length of I, and where standard notations for classical bases of $NCSF$ are being used (S for the complete basis, Λ for the elementary basis, Φ for the basis of the power sums of the second kind, and R for the ribbon basis). The map ψ is an involution and a graded Hopf algebra automorphism of $NCSF$. If π denotes the projection from $NCSF$ to the ring of symmetric functions (`to_symmetric_function()`), then $\pi(\psi(f)) = \omega(\pi(f))$ for every $f \in NCSF$, where the ω on the right hand side denotes the omega automorphism of Sym.

The involution ψ of $NCSF$ is adjoint to the involution ψ of $QSym$ by the standard adjunction between $NCSF$ and $QSym$.

The involution ψ has been denoted by ψ in [LMvW13], section 3.6.

See also

psi involution of NCSF, *psi involution of QSym*, *star involution of NCSF*.

EXAMPLES:

```
sage: NSym = NonCommutativeSymmetricFunctions(ZZ)
sage: S = NSym.S()
sage: L = NSym.L()
sage: S[3,1].psi_involution()
S[1, 1, 1, 1] - S[1, 2, 1] - S[2, 1, 1] + S[3, 1]
sage: L(S[3,1].psi_involution())
L[3, 1]
sage: S[[]].psi_involution()
S[]
sage: S[1,1].psi_involution()
S[1, 1]
sage: (S[2,1] - 2*S[2]).psi_involution()
-2*S[1, 1] + S[1, 1, 1] + 2*S[2] - S[2, 1]
```

```
>>> from sage.all import *
>>> NSym = NonCommutativeSymmetricFunctions(ZZ)
>>> S = NSym.S()
>>> L = NSym.L()
>>> S[Integer(3),Integer(1)].psi_involution()
S[1, 1, 1, 1] - S[1, 2, 1] - S[2, 1, 1] + S[3, 1]
>>> L(S[Integer(3),Integer(1)].psi_involution())
L[3, 1]
>>> S[[]].psi_involution()
S[]
>>> S[Integer(1),Integer(1)].psi_involution()
S[1, 1]
>>> (S[Integer(2),Integer(1)] - Integer(2)*S[Integer(2)]).psi_
↪involution()
-2*S[1, 1] + S[1, 1, 1] + 2*S[2] - S[2, 1]
```

The implementation at hand is tailored to the complete basis. It is equivalent to the generic implementation via the ribbon basis:

```
sage: R = NSym.R()
sage: all( R(S[I].psi_involution()) == R(S[I]).psi_involution()
....:      for I in Compositions(4) )
True
```

```
>>> from sage.all import *
>>> R = NSym.R()
>>> all( R(S[I].psi_involution()) == R(S[I]).psi_involution()
...      for I in Compositions(Integer(4)) )
True
```

dual()

Return the dual basis to the complete basis of non-commutative symmetric functions. This is the Monomial basis of quasi-symmetric functions.

OUTPUT: the Monomial basis of quasi-symmetric functions

EXAMPLES:

```
sage: S = NonCommutativeSymmetricFunctions(QQ).S()
sage: S.dual()
Quasisymmetric functions over the Rational Field in the Monomial basis
```

```
>>> from sage.all import *
>>> S = NonCommutativeSymmetricFunctions(QQ).S()
>>> S.dual()
Quasisymmetric functions over the Rational Field in the Monomial basis
```

internal_product_on_basis(I, J)

The internal product of two non-commutative symmetric complete functions.

See *internal_product()* for a thorough documentation of this operation.

INPUT:

- I, J – compositions

OUTPUT:

- The internal product of the complete non-commutative symmetric function basis elements indexed by `I` and `J`, expressed in the complete basis.

EXAMPLES:

```
sage: N = NonCommutativeSymmetricFunctions(QQ)
sage: S = N.complete()
sage: S.internal_product_on_basis([2,2],[1,2,1])
2*S[1, 1, 1, 1] + S[1, 1, 2] + S[2, 1, 1]
sage: S.internal_product_on_basis([2,2],[1,2])
0
```

```
>>> from sage.all import *
>>> N = NonCommutativeSymmetricFunctions(QQ)
>>> S = N.complete()
>>> S.internal_product_on_basis([Integer(2),Integer(2)],[Integer(1),
→Integer(2),Integer(1)])
2*S[1, 1, 1, 1] + S[1, 1, 2] + S[2, 1, 1]
>>> S.internal_product_on_basis([Integer(2),Integer(2)],[Integer(1),
→Integer(2)])
0
```

to_symmetric_function()

Morphism to the algebra of symmetric functions.

This is constructed by extending the computation on the complete basis.

OUTPUT:

- The module morphism from the basis `self` to the symmetric functions which corresponds to taking a commutative image.

EXAMPLES:

```
sage: N = NonCommutativeSymmetricFunctions(QQ)
sage: S = N.complete()
sage: S.to_symmetric_function(S[3,1,2])
h[3, 2, 1]
sage: S.to_symmetric_function(S[[]])
h[]
```

```
>>> from sage.all import *
>>> N = NonCommutativeSymmetricFunctions(QQ)
>>> S = N.complete()
>>> S.to_symmetric_function(S[Integer(3),Integer(1),Integer(2)])
h[3, 2, 1]
>>> S.to_symmetric_function(S[[]])
h[]
```

to_symmetric_function_on_basis(*I*)

The commutative image of a complete element.

The commutative image of a basis element is obtained by sorting the indexing composition of the basis element and the output is in the complete basis of the symmetric functions.

INPUT:

- `I` – a composition

OUTPUT:

- The commutative image of the complete basis element indexed by `I`. The result is the complete symmetric function indexed by the partition obtained by sorting `I`.

EXAMPLES:

```
sage: S = NonCommutativeSymmetricFunctions(QQ).complete()
sage: S.to_symmetric_function_on_basis([2,1,3])
h[3, 2, 1]
sage: S.to_symmetric_function_on_basis([])
h[]
```

```
>>> from sage.all import *
>>> S = NonCommutativeSymmetricFunctions(QQ).complete()
>>> S.to_symmetric_function_on_basis([Integer(2),Integer(1),Integer(3)])
h[3, 2, 1]
>>> S.to_symmetric_function_on_basis([])
h[]
```

class Elementary(*NCSF*)

Bases: *CombinatorialFreeModule*, BindableClass

The Hopf algebra of non-commutative symmetric functions in the Elementary basis.

The Elementary basis is defined in Definition 3.4 of [NCSF1], where it is denoted by $(\Lambda^I)_I$. It is a multiplicative basis, and is obtained from the elementary generators Λ_i of the ring of non-commutative symmetric functions through the formula $\Lambda^{(i_1,i_2,\ldots,i_k)} = \Lambda_{i_1}\Lambda_{i_2}\cdots\Lambda_{i_k}$ for every composition $(i_1, i_2, \ldots, i_k)$.

EXAMPLES:

```
sage: NCSF = NonCommutativeSymmetricFunctions(QQ)
sage: L = NCSF.Elementary(); L
Non-Commutative Symmetric Functions over the Rational Field in the Elementary␣
↪basis
sage: L.an_element()
2*L[] + 2*L[1] + 3*L[1, 1]
```

```
>>> from sage.all import *
>>> NCSF = NonCommutativeSymmetricFunctions(QQ)
>>> L = NCSF.Elementary(); L
Non-Commutative Symmetric Functions over the Rational Field in the Elementary␣
↪basis
>>> L.an_element()
2*L[] + 2*L[1] + 3*L[1, 1]
```

The following are aliases for this basis:

```
sage: NCSF.elementary()
Non-Commutative Symmetric Functions over the Rational Field in the Elementary␣
↪basis
sage: NCSF.L()
Non-Commutative Symmetric Functions over the Rational Field in the Elementary␣
↪basis
```

```
>>> from sage.all import *
>>> NCSF.elementary()
```

(continues on next page)

(continued from previous page)

```

↪basis
>>> NCSF.L()
Non-Commutative Symmetric Functions over the Rational Field in the Elementary
↪basis
```

class Element

Bases: `IndexedFreeModuleElement`

psi_involution()

Return the image of the noncommutative symmetric function `self` under the involution ψ.

The involution ψ is defined as the linear map $NCSF \to NCSF$ which, for every composition I, sends the complete noncommutative symmetric function S^I to the elementary noncommutative symmetric function Λ^I. It can be shown that every composition I satisfies

$$\psi(R_I) = R_{I^c}, \quad \psi(S^I) = \Lambda^I, \quad \psi(\Lambda^I) = S^I, \quad \psi(\Phi^I) = (-1)^{|I|-\ell(I)}\Phi^I$$

where I^c denotes the complement of the composition I, and $\ell(I)$ denotes the length of I, and where standard notations for classical bases of $NCSF$ are being used (S for the complete basis, Λ for the elementary basis, Φ for the basis of the power sums of the second kind, and R for the ribbon basis). The map ψ is an involution and a graded Hopf algebra automorphism of $NCSF$. If π denotes the projection from $NCSF$ to the ring of symmetric functions (`to_symmetric_function()`), then $\pi(\psi(f)) = \omega(\pi(f))$ for every $f \in NCSF$, where the ω on the right hand side denotes the omega automorphism of Sym.

The involution ψ of $NCSF$ is adjoint to the involution ψ of $QSym$ by the standard adjunction between $NCSF$ and $QSym$.

The involution ψ has been denoted by ψ in [LMvW13], section 3.6.

See also

psi involution of NCSF, *psi involution of QSym*, *star involution of NCSF*.

EXAMPLES:

```
sage: NSym = NonCommutativeSymmetricFunctions(QQ)
sage: S = NSym.S()
sage: L = NSym.L()
sage: L[3,1].psi_involution()
L[1, 1, 1, 1] - L[1, 2, 1] - L[2, 1, 1] + L[3, 1]
sage: S(L[3,1].psi_involution())
S[3, 1]
sage: L[[]].psi_involution()
L[]
sage: L[1,1].psi_involution()
L[1, 1]
sage: (L[2,1] - 2*L[2]).psi_involution()
-2*L[1, 1] + L[1, 1, 1] + 2*L[2] - L[2, 1]
```

```
>>> from sage.all import *
>>> NSym = NonCommutativeSymmetricFunctions(QQ)
```

(continues on next page)

(continued from previous page)

```
>>> S = NSym.S()
>>> L = NSym.L()
>>> L[Integer(3),Integer(1)].psi_involution()
L[1, 1, 1, 1] - L[1, 2, 1] - L[2, 1, 1] + L[3, 1]
>>> S(L[Integer(3),Integer(1)].psi_involution())
S[3, 1]
>>> L[[]].psi_involution()
L[]
>>> L[Integer(1),Integer(1)].psi_involution()
L[1, 1]
>>> (L[Integer(2),Integer(1)] - Integer(2)*L[Integer(2)]).psi_
↪involution()
-2*L[1, 1] + L[1, 1, 1] + 2*L[2] - L[2, 1]
```

The implementation at hand is tailored to the elementary basis. It is equivalent to the generic implementation via the ribbon basis:

```
sage: R = NSym.R()
sage: all( R(L[I].psi_involution()) == R(L[I]).psi_involution()
....:      for I in Compositions(3) )
True
sage: all( R(L[I].psi_involution()) == R(L[I]).psi_involution()
....:      for I in Compositions(4) )
True
```

```
>>> from sage.all import *
>>> R = NSym.R()
>>> all( R(L[I].psi_involution()) == R(L[I]).psi_involution()
...      for I in Compositions(Integer(3)) )
True
>>> all( R(L[I].psi_involution()) == R(L[I]).psi_involution()
...      for I in Compositions(Integer(4)) )
True
```

star_involution()

Return the image of the noncommutative symmetric function `self` under the star involution.

The star involution is defined as the algebra antihomomorphism $NCSF \to NCSF$ which, for every positive integer n, sends the n-th complete non-commutative symmetric function S_n to S_n. Denoting by f^* the image of an element $f \in NCSF$ under this star involution, it can be shown that every composition I satisfies

$$(S^I)^* = S^{I^r}, \quad (\Lambda^I)^* = \Lambda^{I^r}, \quad R_I^* = R_{I^r}, \quad (\Phi^I)^* = \Phi^{I^r},$$

where I^r denotes the reversed composition of I, and standard notations for classical bases of $NCSF$ are being used (S for the complete basis, Λ for the elementary basis, R for the ribbon basis, and Φ for that of the power-sums of the second kind). The star involution is an involution and a coalgebra automorphism of $NCSF$. It is an automorphism of the graded vector space $NCSF$. Under the canonical isomorphism between the n-th graded component of $NCSF$ and the descent algebra of the symmetric group S_n (see *to_descent_algebra()*), the star involution (restricted to the n-th graded component) corresponds to the automorphism of the descent algebra given by $x \mapsto \omega_n x \omega_n$, where ω_n is the permutation $(n, n-1, \ldots, 1) \in S_n$ (written here in one-line notation). If π denotes the projection from $NCSF$ to the ring of symmetric functions (*to_symmetric_function()*), then $\pi(f^*) = \pi(f)$ for every $f \in NCSF$.

The star involution on $NCSF$ is adjoint to the star involution on $QSym$ by the standard adjunction between $NCSF$ and $QSym$.

The star involution has been denoted by ρ in [LMvW13], section 3.6. See [NCSF2], section 2.3 for the properties of this map.

EXAMPLES:

```
sage: NSym = NonCommutativeSymmetricFunctions(ZZ)
sage: L = NSym.L()
sage: L[3,3,2,3].star_involution()
L[3, 2, 3, 3]
sage: L[6,3,3].star_involution()
L[3, 3, 6]
sage: (L[1,9,1] - L[8,2] + 2*L[6,4] - 3*L[3] + 4*L[[]]).star_
↪involution()
4*L[] + L[1, 9, 1] - L[2, 8] - 3*L[3] + 2*L[4, 6]
sage: (L[3,3] - 2*L[2]).star_involution()
-2*L[2] + L[3, 3]
sage: L([4,1]).star_involution()
L[1, 4]
```

```
>>> from sage.all import *
>>> NSym = NonCommutativeSymmetricFunctions(ZZ)
>>> L = NSym.L()
>>> L[Integer(3),Integer(3),Integer(2),Integer(3)].star_involution()
L[3, 2, 3, 3]
>>> L[Integer(6),Integer(3),Integer(3)].star_involution()
L[3, 3, 6]
>>> (L[Integer(1),Integer(9),Integer(1)] - L[Integer(8),Integer(2)] +␣
↪Integer(2)*L[Integer(6),Integer(4)] - Integer(3)*L[Integer(3)] +␣
↪Integer(4)*L[[]]).star_involution()
4*L[] + L[1, 9, 1] - L[2, 8] - 3*L[3] + 2*L[4, 6]
>>> (L[Integer(3),Integer(3)] - Integer(2)*L[Integer(2)]).star_
↪involution()
-2*L[2] + L[3, 3]
>>> L([Integer(4),Integer(1)]).star_involution()
L[1, 4]
```

The implementation at hand is tailored to the elementary basis. It is equivalent to the generic implementation via the complete basis:

```
sage: S = NSym.S()
sage: all( S(L[I].star_involution()) == S(L[I]).star_involution()
....:      for I in Compositions(4) )
True
```

```
>>> from sage.all import *
>>> S = NSym.S()
```

(continues on next page)

(continued from previous page)

```
>>> all( S(L[I].star_involution()) == S(L[I]).star_involution()
...      for I in Compositions(Integer(4)) )
True
```

verschiebung(n)

Return the image of the noncommutative symmetric function `self` under the n-th Verschiebung operator.

The n-th Verschiebung operator $\mathbf{V}_n$ is defined to be the map from the $\mathbf{k}$-algebra of noncommutative symmetric functions to itself that sends the complete function S^I indexed by a composition $I = (i_1, i_2, \ldots, i_k)$ to $S^{(i_1/n, i_2/n, \ldots, i_k/n)}$ if all of the numbers $i_1, i_2, \ldots, i_k$ are divisible by n, and to 0 otherwise. This operator $\mathbf{V}_n$ is a Hopf algebra endomorphism. For every positive integer r with $n \mid r$, it satisfies

$$\mathbf{V}_n(S_r) = S_{r/n}, \quad \mathbf{V}_n(\Lambda_r) = (-1)^{r-r/n}\Lambda_{r/n}, \quad \mathbf{V}_n(\Psi_r) = n\Psi_{r/n}, \quad \mathbf{V}_n(\Phi_r) = n\Phi_{r/n}$$

(where S_r denotes the r-th complete non-commutative symmetric function, Λ_r denotes the r-th elementary non-commutative symmetric function, Ψ_r denotes the r-th power-sum non-commutative symmetric function of the first kind, and Φ_r denotes the r-th power-sum non-commutative symmetric function of the second kind). For every positive integer r with $n \nmid r$, it satisfes

$$\mathbf{V}_n(S_r) = \mathbf{V}_n(\Lambda_r) = \mathbf{V}_n(\Psi_r) = \mathbf{V}_n(\Phi_r) = 0.$$

The n-th Verschiebung operator is also called the n-th Verschiebung endomorphism.

It is a lift of the n-th Verschiebung operator on the ring of symmetric functions (*verschiebung()*) to the ring of noncommutative symmetric functions.

The action of the n-th Verschiebung operator can also be described on the ribbon Schur functions. Namely, every composition I of size $n\ell$ satisfies

$$\mathbf{V}_n(R_I) = (-1)^{\ell(I)-\ell(J)} \cdot R_{J/n},$$

where J denotes the meet of the compositions I and $\underbrace{(n, n, \ldots, n)}_{|I|/n \text{ times}}$, where $\ell(I)$ is the length of I, and where J/n denotes the composition obtained by dividing every entry of J by n. For a composition I of size not divisible by n, we have $\mathbf{V}_n(R_I) = 0$.

See also:

verschiebung method of NCSF, *adams_operator method of QSym*, *verschiebung method of Sym*

INPUT:

- `n` – positive integer

OUTPUT:

The result of applying the n-th Verschiebung operator (on the ring of noncommutative symmetric functions) to `self`.

EXAMPLES:

```
sage: NSym = NonCommutativeSymmetricFunctions(ZZ)
sage: L = NSym.L()

```

I

alias of *Immaculate*

class Immaculate(*NCSF*)

Bases: *CombinatorialFreeModule*, BindableClass

The immaculate basis of the non-commutative symmetric functions.

The immaculate basis first appears in Berg, Bergeron, Saliola, Serrano and Zabrocki's [BBSSZ2012]. It can be described as the family $(\mathfrak{S}_\alpha)$, where α runs over all compositions, and $\mathfrak{S}_\alpha$ denotes the immaculate function corresponding to α (see *immaculate_function()*).

If α is a composition $(\alpha_1, \alpha_2, \ldots, \alpha_m)$, then

$$\mathfrak{S}_\alpha = \sum_{\sigma \in S_m} (-1)^\sigma S_{\alpha_1+\sigma(1)-1} S_{\alpha_2+\sigma(2)-2} \cdots S_{\alpha_m+\sigma(m)-m}.$$

Warning

This *basis* contains only the immaculate functions indexed by compositions (i.e., finite sequences of positive integers). To obtain the remaining immaculate functions (sensu lato), use the *immaculate_function()* method. Calling the immaculate *basis* with a list which is not a composition will currently return garbage!

EXAMPLES:

```
sage: NCSF = NonCommutativeSymmetricFunctions(QQ)
sage: I = NCSF.I()
sage: I([1,3,2])*I([1])
I[1, 3, 2, 1] + I[1, 3, 3] + I[1, 4, 2] + I[2, 3, 2]
sage: I([1])*I([1,3,2])
I[1, 1, 3, 2] - I[2, 2, 1, 2] - I[2, 2, 2, 1] - I[2, 2, 3] - I[3, 2, 2]
sage: I([1,3])*I([1,1])
I[1, 3, 1, 1] + I[1, 4, 1] + I[2, 3, 1] + I[2, 4]
sage: I([3,1])*I([2,1])
I[3, 1, 2, 1] + I[3, 2, 1, 1] + I[3, 2, 2] + I[3, 3, 1] + I[4, 1, 1, 1] + I[4,
↪ 1, 2] + 2*I[4, 2, 1] + I[4, 3] + I[5, 1, 1] + I[5, 2]
sage: R = NCSF.ribbon()
sage: I(R[1,3,1])
I[1, 3, 1] + I[2, 2, 1] + I[2, 3] + I[3, 1, 1] + I[3, 2]
sage: R(I(R([2,1,3])))
R[2, 1, 3]
```

```
>>> from sage.all import *
>>> NCSF = NonCommutativeSymmetricFunctions(QQ)

↪ 1, 2] + 2*I[4, 2, 1] + I[4, 3] + I[5, 1, 1] + I[5, 2]
>>> R = NCSF.ribbon()
>>> I(R[Integer(1),Integer(3),Integer(1)])
I[1, 3, 1] + I[2, 2, 1] + I[2, 3] + I[3, 1, 1] + I[3, 2]
>>> R(I(R([Integer(2),Integer(1),Integer(3)])))
R[2, 1, 3]
```

class Element

Bases: `IndexedFreeModuleElement`

An element in the Immaculate basis.

bernstein_creation_operator(*n*)

Return the image of `self` under the n-th Bernstein creation operator.

Let n be an integer. The n-th Bernstein creation operator $\mathbb{B}_n$ is defined as the endomorphism of the space $NSym$ of noncommutative symmetric functions given by

$$\mathbb{B}_n I_{(\alpha_1,\alpha_2,\ldots,\alpha_m)} = I_{(n,\alpha_1,\alpha_2,\ldots,\alpha_m)},$$

where $I_{(\alpha_1,\alpha_2,\ldots,\alpha_m)}$ is the immaculate function associated to the m-tuple $(\alpha_1, \alpha_2, \ldots, \alpha_m) \in \mathbf{Z}^m$.

This has been introduced in [BBSSZ2012], section 3.1, in analogy to the Bernstein creation operators on the symmetric functions.

For more information on the n-th Bernstein creation operator, see *bernstein_creation_operator()*.

EXAMPLES:

```
sage: NSym = NonCommutativeSymmetricFunctions(QQ)
sage: I = NSym.I()
sage: b = I[1,3,2,1]
sage: b.bernstein_creation_operator(3)
I[3, 1, 3, 2, 1]
sage: b.bernstein_creation_operator(5)
I[5, 1, 3, 2, 1]
sage: elt = b + 3*I[4,1,2]
sage: elt.bernstein_creation_operator(1)
I[1, 1, 3, 2, 1] + 3*I[1, 4, 1, 2]
```

```
>>> from sage.all import *
>>> NSym = NonCommutativeSymmetricFunctions(QQ)
>>> I = NSym.I()
```

(continues on next page)

(continued from previous page)

```
>>> b = I[Integer(1),Integer(3),Integer(2),Integer(1)]
>>> b.bernstein_creation_operator(Integer(3))
I[3, 1, 3, 2, 1]
>>> b.bernstein_creation_operator(Integer(5))
I[5, 1, 3, 2, 1]
>>> elt = b + Integer(3)*I[Integer(4),Integer(1),Integer(2)]
>>> elt.bernstein_creation_operator(Integer(1))
I[1, 1, 3, 2, 1] + 3*I[1, 4, 1, 2]
```

We check that this agrees with the definition on the Complete basis:

```
sage: S = NSym.S()
sage: S(elt).bernstein_creation_operator(1) == S(elt.bernstein_
↪creation_operator(1))
True
```

```
>>> from sage.all import *
>>> S = NSym.S()
>>> S(elt).bernstein_creation_operator(Integer(1)) == S(elt.bernstein_
↪creation_operator(Integer(1)))
True
```

Check on nonpositive values of n:

```
sage: I[2,2,2].bernstein_creation_operator(-1)
I[1, 1, 1, 2] + I[1, 1, 2, 1] + I[1, 2, 1, 1] - I[1, 2, 2]
sage: I[2,3,2].bernstein_creation_operator(0)
-I[1, 1, 3, 2] - I[1, 2, 2, 2] - I[1, 2, 3, 1] + I[2, 3, 2]
```

```
>>> from sage.all import *
>>> I[Integer(2),Integer(2),Integer(2)].bernstein_creation_operator(-
↪Integer(1))
I[1, 1, 1, 2] + I[1, 1, 2, 1] + I[1, 2, 1, 1] - I[1, 2, 2]
>>> I[Integer(2),Integer(3),Integer(2)].bernstein_creation_
↪operator(Integer(0))
-I[1, 1, 3, 2] - I[1, 2, 2, 2] - I[1, 2, 3, 1] + I[2, 3, 2]
```

dual()

Return the dual basis to the Immaculate basis of NCSF.

The basis returned is the dualImmaculate basis of QSym.

OUTPUT: the dualImmaculate basis of the quasi-symmetric functions

EXAMPLES:

```
sage: I = NonCommutativeSymmetricFunctions(QQ).Immaculate()
sage: I.dual()
Quasisymmetric functions over the Rational Field in the dualImmaculate
basis
```

```
>>> from sage.all import *
>>> I = NonCommutativeSymmetricFunctions(QQ).Immaculate()
```

(continues on next page)

(continued from previous page)

```
>>> I.dual()
Quasisymmetric functions over the Rational Field in the dualImmaculate
basis
```

L

alias of *Elementary*

class Monomial(*NCSF*)

Bases: *CombinatorialFreeModule*, BindableClass

The monomial basis defined in Tevlin's paper [Tev2007].

The monomial basis is well-defined only when the base ring is a **Q**-algebra. It is the basis denoted by $(M^I)_I$ in [Tev2007].

class MultiplicativeBases(*parent_with_realization*)

Bases: Category_realization_of_parent

Category of multiplicative bases of non-commutative symmetric functions.

EXAMPLES:

```
sage: N = NonCommutativeSymmetricFunctions(QQ)
sage: N.MultiplicativeBases()
Category of multiplicative bases of Non-Commutative Symmetric Functions over␣
↪the Rational Field
```

```
>>> from sage.all import *
>>> N = NonCommutativeSymmetricFunctions(QQ)
>>> N.MultiplicativeBases()
Category of multiplicative bases of Non-Commutative Symmetric Functions over␣
↪the Rational Field
```

The complete basis is a multiplicative basis, but the ribbon basis is not:

```
sage: N.Complete() in N.MultiplicativeBases()
True
sage: N.Ribbon() in N.MultiplicativeBases()
False
```

```
>>> from sage.all import *
>>> N.Complete() in N.MultiplicativeBases()
True
>>> N.Ribbon() in N.MultiplicativeBases()
False
```

class ParentMethods

Bases: object

algebra_generators()

Return the algebra generators of a given multiplicative basis of non-commutative symmetric functions.

OUTPUT: the family of generators of the multiplicative basis `self`

EXAMPLES:

```
sage: Psi = NonCommutativeSymmetricFunctions(QQ).Psi()
sage: f = Psi.algebra_generators()
sage: f
Lazy family (<lambda>(i))_{i in Positive integers}
sage: f[1], f[2], f[3]
(Psi[1], Psi[2], Psi[3])
```

```
>>> from sage.all import *
>>> Psi = NonCommutativeSymmetricFunctions(QQ).Psi()
>>> f = Psi.algebra_generators()
>>> f
Lazy family (<lambda>(i))_{i in Positive integers}
>>> f[Integer(1)], f[Integer(2)], f[Integer(3)]
(Psi[1], Psi[2], Psi[3])
```

algebra_morphism(*on_generators*, ***keywords*)

Given a map defined on the generators of the multiplicative basis `self`, return the algebra morphism that extends this map to the whole algebra of non-commutative symmetric functions.

INPUT:

- `on_generators` – a function defined on the index set of the generators (that is, on the positive integers)
- `anti` – boolean (default: `False`)
- `category` – a category (default: `None`)

OUTPUT:

- The algebra morphism of `self` which is defined by `on_generators` in the basis `self`. When `anti` is set to `True`, an algebra anti-morphism is computed instead of an algebra morphism.

EXAMPLES:

```
sage: NCSF = NonCommutativeSymmetricFunctions(QQ)
sage: Psi = NCSF.Psi()
sage: double = lambda i: Psi[i,i]
sage: f = Psi.algebra_morphism(double, codomain = Psi)
sage: f
Generic endomorphism of Non-Commutative Symmetric Functions over the
↪Rational Field in the Psi basis
sage: f(2*Psi[[]] + 3 * Psi[1,3,2] + Psi[2,4] )
2*Psi[] + 3*Psi[1, 1, 3, 3, 2, 2] + Psi[2, 2, 4, 4]
sage: f.category()
Category of endsets of unital magmas and right modules over Rational
↪Field and left modules over Rational Field
```

```
>>> from sage.all import *
>>> NCSF = NonCommutativeSymmetricFunctions(QQ)
>>> Psi = NCSF.Psi()
>>> double = lambda i: Psi[i,i]
>>> f = Psi.algebra_morphism(double, codomain = Psi)
>>> f
Generic endomorphism of Non-Commutative Symmetric Functions over the
↪Rational Field in the Psi basis
>>> f(Integer(2)*Psi[[]] + Integer(3) * Psi[Integer(1),Integer(3),
↪Integer(2)] + Psi[Integer(2),Integer(4)] )
2*Psi[] + 3*Psi[1, 1, 3, 3, 2, 2] + Psi[2, 2, 4, 4]
```

(continues on next page)

(continued from previous page)

```
>>> f.category()
Category of endsets of unital magmas and right modules over Rational␣
↪Field and left modules over Rational Field
```

When extra properties about the morphism are known, one can specify the category of which it is a morphism:

```
sage: negate = lambda i: -Psi[i]
sage: f = Psi.algebra_morphism(negate, codomain = Psi, category =␣
↪GradedHopfAlgebrasWithBasis(QQ))
sage: f
Generic endomorphism of Non-Commutative Symmetric Functions over the␣
↪Rational Field in the Psi basis
sage: f(2*Psi[[]] + 3 * Psi[1,3,2] + Psi[2,4] )
2*Psi[] - 3*Psi[1, 3, 2] + Psi[2, 4]
sage: f.category()
Category of endsets of Hopf algebras over Rational Field and graded␣
↪modules over Rational Field
```

```
>>> from sage.all import *
>>> negate = lambda i: -Psi[i]
>>> f = Psi.algebra_morphism(negate, codomain = Psi, category =␣
↪GradedHopfAlgebrasWithBasis(QQ))
>>> f
Generic endomorphism of Non-Commutative Symmetric Functions over the␣
↪Rational Field in the Psi basis
>>> f(Integer(2)*Psi[[]] + Integer(3) * Psi[Integer(1),Integer(3),
↪Integer(2)] + Psi[Integer(2),Integer(4)] )
2*Psi[] - 3*Psi[1, 3, 2] + Psi[2, 4]
>>> f.category()
Category of endsets of Hopf algebras over Rational Field and graded␣
↪modules over Rational Field
```

If `anti` is true, this returns an anti-algebra morphism:

```
sage: f = Psi.algebra_morphism(double, codomain = Psi, anti=True)
sage: f
Generic endomorphism of Non-Commutative Symmetric Functions over the␣
↪Rational Field in the Psi basis
sage: f(2*Psi[[]] + 3 * Psi[1,3,2] + Psi[2,4] )
2*Psi[] + 3*Psi[2, 2, 3, 3, 1, 1] + Psi[4, 4, 2, 2]
sage: f.category()
Category of endsets of modules with basis over Rational Field
```

```
>>> from sage.all import *
>>> f = Psi.algebra_morphism(double, codomain = Psi, anti=True)
>>> f
Generic endomorphism of Non-Commutative Symmetric Functions over the␣
↪Rational Field in the Psi basis
>>> f(Integer(2)*Psi[[]] + Integer(3) * Psi[Integer(1),Integer(3),
↪Integer(2)] + Psi[Integer(2),Integer(4)] )
2*Psi[] + 3*Psi[2, 2, 3, 3, 1, 1] + Psi[4, 4, 2, 2]
```

(continues on next page)

(continued from previous page)

```
>>> f.category()
Category of endsets of modules with basis over Rational Field
```

antipode()

Return the antipode morphism on the basis `self`.

The antipode of $NSym$ is closely related to the omega involution; see `omega_involution()` for the latter.

OUTPUT:

- The antipode module map from non-commutative symmetric functions on basis `self`.

EXAMPLES:

```
sage: S = NonCommutativeSymmetricFunctions(QQ).S()
sage: S.antipode
Generic endomorphism of Non-Commutative Symmetric Functions over the␣
→Rational Field in the Complete basis
```

```
>>> from sage.all import *
>>> S = NonCommutativeSymmetricFunctions(QQ).S()
>>> S.antipode
Generic endomorphism of Non-Commutative Symmetric Functions over the␣
→Rational Field in the Complete basis
```

coproduct()

Return the coproduct morphism in the basis `self`.

OUTPUT:

- The coproduct module map from non-commutative symmetric functions on basis `self`.

EXAMPLES:

```
sage: S = NonCommutativeSymmetricFunctions(QQ).S()
sage: S.coproduct
Generic morphism:
  From: Non-Commutative Symmetric Functions over the Rational Field in␣
→the Complete basis
  To:   Non-Commutative Symmetric Functions over the Rational Field in␣
→the Complete basis # Non-Commutative Symmetric Functions over the␣
→Rational Field in the Complete basis
```

```
>>> from sage.all import *
>>> S = NonCommutativeSymmetricFunctions(QQ).S()
>>> S.coproduct
Generic morphism:
  From: Non-Commutative Symmetric Functions over the Rational Field in␣
→the Complete basis
  To:   Non-Commutative Symmetric Functions over the Rational Field in␣
→the Complete basis # Non-Commutative Symmetric Functions over the␣
→Rational Field in the Complete basis
```

product_on_basis(*composition1*, *composition2*)

Return the product of two basis elements from the multiplicative basis. Multiplication is just concatenation on compositions.

INPUT:

- `composition1`, `composition2` – integer compositions

OUTPUT:

- The product of the two non-commutative symmetric functions indexed by `composition1` and `composition2` in the multiplicative basis `self`. This will be again a non-commutative symmetric function.

EXAMPLES:

```
sage: Psi = NonCommutativeSymmetricFunctions(QQ).Psi()
sage: Psi[3,1,2] * Psi[4,2] == Psi[3,1,2,4,2]
True
sage: S = NonCommutativeSymmetricFunctions(QQ).S()
sage: S.product_on_basis(Composition([2,1]), Composition([1,2]))
S[2, 1, 1, 2]
```

```
>>> from sage.all import *
>>> Psi = NonCommutativeSymmetricFunctions(QQ).Psi()
>>> Psi[Integer(3),Integer(1),Integer(2)] * Psi[Integer(4),Integer(2)]␣
↪== Psi[Integer(3),Integer(1),Integer(2),Integer(4),Integer(2)]
True
>>> S = NonCommutativeSymmetricFunctions(QQ).S()
>>> S.product_on_basis(Composition([Integer(2),Integer(1)]),␣
↪Composition([Integer(1),Integer(2)]))
S[2, 1, 1, 2]
```

to_symmetric_function()

Morphism to the algebra of symmetric functions.

This is constructed by extending the algebra morphism by the image of the generators.

OUTPUT:

- The module morphism from the basis `self` to the symmetric functions which corresponds to taking a commutative image.

EXAMPLES:

```
sage: N = NonCommutativeSymmetricFunctions(QQ)
sage: S = N.complete()
sage: S.to_symmetric_function(S[1,3])
h[3, 1]
sage: Phi = N.Phi()
sage: Phi.to_symmetric_function(Phi[1,3])
h[1, 1, 1, 1] - 3*h[2, 1, 1] + 3*h[3, 1]
sage: Psi = N.Psi()
sage: Psi.to_symmetric_function(Psi[1,3])
h[1, 1, 1, 1] - 3*h[2, 1, 1] + 3*h[3, 1]
```

```
>>> from sage.all import *
>>> N = NonCommutativeSymmetricFunctions(QQ)
>>> S = N.complete()
>>> S.to_symmetric_function(S[Integer(1),Integer(3)])
h[3, 1]
>>> Phi = N.Phi()
>>> Phi.to_symmetric_function(Phi[Integer(1),Integer(3)])
h[1, 1, 1, 1] - 3*h[2, 1, 1] + 3*h[3, 1]
```

(continues on next page)

(continued from previous page)

```
>>> Psi = N.Psi()
>>> Psi.to_symmetric_function(Psi[Integer(1),Integer(3)])
h[1, 1, 1, 1] - 3*h[2, 1, 1] + 3*h[3, 1]
```

to_symmetric_function_on_generators(*i*)

Morphism of the generators to symmetric functions.

This is constructed by coercion to the complete basis and applying the morphism.

OUTPUT:

- The module morphism from the basis `self` to the symmetric functions which corresponds to taking a commutative image.

EXAMPLES:

```
sage: N = NonCommutativeSymmetricFunctions(QQ)
sage: Phi = N.Phi()
sage: Phi.to_symmetric_function_on_generators(3)
h[1, 1, 1] - 3*h[2, 1] + 3*h[3]
sage: Phi.to_symmetric_function_on_generators(0)
h[]
sage: Psi = N.Psi()
sage: Psi.to_symmetric_function_on_generators(3)
h[1, 1, 1] - 3*h[2, 1] + 3*h[3]
sage: L = N.elementary()
sage: L.to_symmetric_function_on_generators(3)
h[1, 1, 1] - 2*h[2, 1] + h[3]
```

```
>>> from sage.all import *
>>> N = NonCommutativeSymmetricFunctions(QQ)
>>> Phi = N.Phi()
>>> Phi.to_symmetric_function_on_generators(Integer(3))
h[1, 1, 1] - 3*h[2, 1] + 3*h[3]
>>> Phi.to_symmetric_function_on_generators(Integer(0))
h[]
>>> Psi = N.Psi()
>>> Psi.to_symmetric_function_on_generators(Integer(3))
h[1, 1, 1] - 3*h[2, 1] + 3*h[3]
>>> L = N.elementary()
>>> L.to_symmetric_function_on_generators(Integer(3))
h[1, 1, 1] - 2*h[2, 1] + h[3]
```

super_categories()

Return the super categories of the category of multiplicative bases of the non-commutative symmetric functions.

OUTPUT: list

class MultiplicativeBasesOnGroupLikeElements(*parent_with_realization*)

Bases: `Category_realization_of_parent`

Category of multiplicative bases on grouplike elements of non-commutative symmetric functions.

Here, a "multiplicative basis on grouplike elements" means a multiplicative basis whose generators

$(f_1, f_2, f_3, \ldots)$ satisfy

$$\Delta(f_i) = \sum_{j=0}^{i} f_j \otimes f_{i-j}$$

with $f_0 = 1$. (In other words, the generators are to form a divided power sequence in the sense of a coalgebra.) This does not mean that the generators are grouplike, but means that the element $1 + f_1 + f_2 + f_3 + \cdots$ in the completion of the ring of non-commutative symmetric functions with respect to the grading is grouplike.

EXAMPLES:

```
sage: N = NonCommutativeSymmetricFunctions(QQ)
sage: N.MultiplicativeBasesOnGroupLikeElements()
Category of multiplicative bases on group like elements of Non-Commutative␣
↪Symmetric Functions over the Rational Field
```

```
>>> from sage.all import *
>>> N = NonCommutativeSymmetricFunctions(QQ)
>>> N.MultiplicativeBasesOnGroupLikeElements()
Category of multiplicative bases on group like elements of Non-Commutative␣
↪Symmetric Functions over the Rational Field
```

The complete basis is a multiplicative basis, but the ribbon basis is not:

```
sage: N.Complete() in N.MultiplicativeBasesOnGroupLikeElements()
True
sage: N.Ribbon() in N.MultiplicativeBasesOnGroupLikeElements()
False
```

```
>>> from sage.all import *
>>> N.Complete() in N.MultiplicativeBasesOnGroupLikeElements()
True
>>> N.Ribbon() in N.MultiplicativeBasesOnGroupLikeElements()
False
```

class ParentMethods

Bases: `object`

antipode_on_basis(*composition*)

Return the application of the antipode to a basis element.

INPUT:

- `composition` – a composition

OUTPUT:

- The image of the basis element indexed by `composition` under the antipode map.

EXAMPLES:

```
sage: S = NonCommutativeSymmetricFunctions(QQ).complete()
sage: S.antipode_on_basis(Composition([2,1]))
-S[1, 1, 1] + S[1, 2]
sage: S[1].antipode() # indirect doctest
-S[1]
sage: S[2].antipode() # indirect doctest
S[1, 1] - S[2]
```

(continues on next page)

(continued from previous page)

```
sage: S[3].antipode() # indirect doctest
-S[1, 1, 1] + S[1, 2] + S[2, 1] - S[3]
sage: S[2,3].coproduct().apply_multilinear_morphism(lambda be,ga:␣
↪S(be)*S(ga).antipode())
0
sage: S[2,3].coproduct().apply_multilinear_morphism(lambda be,ga:␣
↪S(be).antipode()*S(ga))
0
```

```
>>> from sage.all import *
>>> S = NonCommutativeSymmetricFunctions(QQ).complete()
>>> S.antipode_on_basis(Composition([Integer(2),Integer(1)]))
-S[1, 1, 1] + S[1, 2]
>>> S[Integer(1)].antipode() # indirect doctest
-S[1]
>>> S[Integer(2)].antipode() # indirect doctest
S[1, 1] - S[2]
>>> S[Integer(3)].antipode() # indirect doctest
-S[1, 1, 1] + S[1, 2] + S[2, 1] - S[3]
>>> S[Integer(2),Integer(3)].coproduct().apply_multilinear_
↪morphism(lambda be,ga: S(be)*S(ga).antipode())
0
>>> S[Integer(2),Integer(3)].coproduct().apply_multilinear_
↪morphism(lambda be,ga: S(be).antipode()*S(ga))
0
```

coproduct_on_generators(*i*)

Return the image of the i-th generator of the algebra under the coproduct.

INPUT:

- `i` – positive integer

OUTPUT: the result of applying the coproduct to the i-th generator of `self`

EXAMPLES:

```
sage: S = NonCommutativeSymmetricFunctions(QQ).complete()
sage: S.coproduct_on_generators(3)
S[] # S[3] + S[1] # S[2] + S[2] # S[1] + S[3] # S[]
```

```
>>> from sage.all import *
>>> S = NonCommutativeSymmetricFunctions(QQ).complete()
>>> S.coproduct_on_generators(Integer(3))
S[] # S[3] + S[1] # S[2] + S[2] # S[1] + S[3] # S[]
```

super_categories()

Return the super categories of the category of multiplicative bases of group-like elements of the non-commutative symmetric functions.

OUTPUT: list

class MultiplicativeBasesOnPrimitiveElements(*parent_with_realization*)

Bases: `Category_realization_of_parent`

Category of multiplicative bases of the non-commutative symmetric functions whose generators are primitive elements.

An element x of a bialgebra is *primitive* if $\Delta(x) = x \otimes 1 + 1 \otimes x$, where Δ is the coproduct of the bialgebra.

Given a multiplicative basis and knowing the coproducts and antipodes of its generators, one can compute the coproduct and the antipode of any element, since they are respectively algebra morphisms and anti-morphisms. See `antipode_on_generators()` and `coproduct_on_generators()`.

Todo

this could be generalized to any free algebra.

EXAMPLES:

```
sage: N = NonCommutativeSymmetricFunctions(QQ)
sage: N.MultiplicativeBasesOnPrimitiveElements()
Category of multiplicative bases on primitive elements of Non-Commutative␣
↪Symmetric Functions over the Rational Field
```

```
>>> from sage.all import *
>>> N = NonCommutativeSymmetricFunctions(QQ)
>>> N.MultiplicativeBasesOnPrimitiveElements()
Category of multiplicative bases on primitive elements of Non-Commutative␣
↪Symmetric Functions over the Rational Field
```

The Phi and Psi bases are multiplicative bases whose generators are primitive elements, but the complete and ribbon bases are not:

```
sage: N.Phi() in N.MultiplicativeBasesOnPrimitiveElements()
True
sage: N.Psi() in N.MultiplicativeBasesOnPrimitiveElements()
True
sage: N.Complete() in N.MultiplicativeBasesOnPrimitiveElements()
False
sage: N.Ribbon() in N.MultiplicativeBasesOnPrimitiveElements()
False
```

```
>>> from sage.all import *
>>> N.Phi() in N.MultiplicativeBasesOnPrimitiveElements()
True
>>> N.Psi() in N.MultiplicativeBasesOnPrimitiveElements()
True
>>> N.Complete() in N.MultiplicativeBasesOnPrimitiveElements()
False
>>> N.Ribbon() in N.MultiplicativeBasesOnPrimitiveElements()
False
```

class ParentMethods

Bases: `object`

antipode_on_generators(*i*)

Return the image of a generator of a primitive basis of the non-commutative symmetric functions under the antipode map.

INPUT:

- `i` – positive integer

OUTPUT:

The image of the i-th generator of the multiplicative basis `self` under the antipode of the algebra of non-commutative symmetric functions.

EXAMPLES:

```
sage: Psi=NonCommutativeSymmetricFunctions(QQ).Psi()
sage: Psi.antipode_on_generators(2)
-Psi[2]
```

```
>>> from sage.all import *
>>> Psi=NonCommutativeSymmetricFunctions(QQ).Psi()
>>> Psi.antipode_on_generators(Integer(2))
-Psi[2]
```

coproduct_on_generators(*i*)

Return the image of the i-th generator of the multiplicative basis `self` under the coproduct.

INPUT:

- `i` – positive integer

OUTPUT: the result of applying the coproduct to the i-th generator of `self`

EXAMPLES:

```
sage: Psi = NonCommutativeSymmetricFunctions(QQ).Psi()
sage: Psi.coproduct_on_generators(3)
Psi[] # Psi[3] + Psi[3] # Psi[]
```

```
>>> from sage.all import *
>>> Psi = NonCommutativeSymmetricFunctions(QQ).Psi()
>>> Psi.coproduct_on_generators(Integer(3))
Psi[] # Psi[3] + Psi[3] # Psi[]
```

super_categories()

Return the super categories of the category of multiplicative bases of primitive elements of the non-commutative symmetric functions.

OUTPUT: list

class Phi(*NCSF*)

Bases: *CombinatorialFreeModule*, `BindableClass`

The Hopf algebra of non-commutative symmetric functions in the Phi basis.

The Phi basis is defined in Definition 3.4 of [NCSF1], where it is denoted by $(\Phi^I)_I$. It is a multiplicative basis, and is connected to the elementary generators Λ_i of the ring of non-commutative symmetric functions by the following relation: Define a non-commutative symmetric function Φ_n for every positive integer n by the power series identity

$$\sum_{k\geq 1} t^k \frac{1}{k} \Phi_k = -\log\left(\sum_{k\geq 0} (-t)^k \Lambda_k\right),$$

with Λ_0 denoting 1. For every composition $(i_1, i_2, \ldots, i_k)$, we have $\Phi^{(i_1,i_2,\ldots,i_k)} = \Phi_{i_1}\Phi_{i_2}\cdots\Phi_{i_k}$.

The Φ-basis is well-defined only when the base ring is a $\mathbf{Q}$-algebra. The elements of the Φ-basis are known as the "power-sum non-commutative symmetric functions of the second kind".

The generators Φ_n are related to the (first) Eulerian idempotents in the descent algebras of the symmetric groups (see [NCSF1], 5.4 for details).

EXAMPLES:

```
sage: NCSF = NonCommutativeSymmetricFunctions(QQ)
sage: Phi = NCSF.Phi(); Phi
Non-Commutative Symmetric Functions over the Rational Field in the Phi basis
sage: Phi.an_element()
2*Phi[] + 2*Phi[1] + 3*Phi[1, 1]
```

```
>>> from sage.all import *
>>> NCSF = NonCommutativeSymmetricFunctions(QQ)
>>> Phi = NCSF.Phi(); Phi
Non-Commutative Symmetric Functions over the Rational Field in the Phi basis
>>> Phi.an_element()
2*Phi[] + 2*Phi[1] + 3*Phi[1, 1]
```

class Element

Bases: `IndexedFreeModuleElement`

psi_involution()

Return the image of the noncommutative symmetric function `self` under the involution ψ.

The involution ψ is defined as the linear map $NCSF \to NCSF$ which, for every composition I, sends the complete noncommutative symmetric function S^I to the elementary noncommutative symmetric function Λ^I. It can be shown that every composition I satisfies

$$\psi(R_I) = R_{I^c}, \quad \psi(S^I) = \Lambda^I, \quad \psi(\Lambda^I) = S^I, \quad \psi(\Phi^I) = (-1)^{|I|-\ell(I)}\Phi^I$$

where I^c denotes the complement of the composition I, and $\ell(I)$ denotes the length of I, and where standard notations for classical bases of $NCSF$ are being used (S for the complete basis, Λ for the elementary basis, Φ for the basis of the power sums of the second kind, and R for the ribbon basis). The map ψ is an involution and a graded Hopf algebra automorphism of $NCSF$. If π denotes the projection from $NCSF$ to the ring of symmetric functions (`to_symmetric_function()`), then $\pi(\psi(f)) = \omega(\pi(f))$ for every $f \in NCSF$, where the ω on the right hand side denotes the omega automorphism of Sym.

The involution ψ of $NCSF$ is adjoint to the involution ψ of $QSym$ by the standard adjunction between $NCSF$ and $QSym$.

The involution ψ has been denoted by ψ in [LMvW13], section 3.6.

psi involution of NCSF, *psi involution of QSym*, *star involution of NCSF*.

EXAMPLES:

```
sage: NSym = NonCommutativeSymmetricFunctions(QQ)
sage: Phi = NSym.Phi()
sage: Phi[3,2].psi_involution()
```

(continues on next page)

(continued from previous page)

```
-Phi[3, 2]
sage: Phi[2,2].psi_involution()
Phi[2, 2]
sage: Phi[[]].psi_involution()
Phi[]
sage: (Phi[2,1] - 2*Phi[2]).psi_involution()
2*Phi[2] - Phi[2, 1]
sage: Phi(0).psi_involution()
0
```

```
>>> from sage.all import *
>>> NSym = NonCommutativeSymmetricFunctions(QQ)
>>> Phi = NSym.Phi()
>>> Phi[Integer(3),Integer(2)].psi_involution()
-Phi[3, 2]
>>> Phi[Integer(2),Integer(2)].psi_involution()
Phi[2, 2]
>>> Phi[[]].psi_involution()
Phi[]
>>> (Phi[Integer(2),Integer(1)] - Integer(2)*Phi[Integer(2)]).psi_
↪involution()
2*Phi[2] - Phi[2, 1]
>>> Phi(Integer(0)).psi_involution()
0
```

The implementation at hand is tailored to the Phi basis. It is equivalent to the generic implementation via the ribbon basis:

```
sage: R = NSym.R()
sage: all( R(Phi[I].psi_involution()) == R(Phi[I]).psi_involution()
....:      for I in Compositions(4) )
True
```

```
>>> from sage.all import *
>>> R = NSym.R()
>>> all( R(Phi[I].psi_involution()) == R(Phi[I]).psi_involution()
...      for I in Compositions(Integer(4)) )
True
```

star_involution()

Return the image of the noncommutative symmetric function `self` under the star involution.

The star involution is defined as the algebra antihomomorphism $NCSF \to NCSF$ which, for every positive integer n, sends the n-th complete non-commutative symmetric function S_n to S_n. Denoting by f^* the image of an element $f \in NCSF$ under this star involution, it can be shown that every composition I satisfies

$$(S^I)^* = S^{I^r}, \quad (\Lambda^I)^* = \Lambda^{I^r}, \quad R_I^* = R_{I^r}, \quad (\Phi^I)^* = \Phi^{I^r},$$

where I^r denotes the reversed composition of I, and standard notations for classical bases of $NCSF$ are being used (S for the complete basis, Λ for the elementary basis, R for the ribbon basis, and Φ for that of the power-sums of the second kind). The star involution is an involution and a coalgebra automorphism of $NCSF$. It is an automorphism of the graded vector space $NCSF$. Under the canonical isomorphism between the n-th graded component of $NCSF$ and the descent algebra of the symmetric group S_n (see `to_descent_algebra()`), the star involution (restricted to the n-th graded component) corresponds to the automorphism of the descent algebra given by $x \mapsto \omega_n x \omega_n$, where ω_n is the permutation $(n, n-1, \ldots, 1) \in S_n$ (written here in one-line notation). If π denotes the projection from $NCSF$ to the ring of symmetric functions (`to_symmetric_function()`), then $\pi(f^*) = \pi(f)$ for every $f \in NCSF$.

The star involution on $NCSF$ is adjoint to the star involution on $QSym$ by the standard adjunction between $NCSF$ and $QSym$.

The star involution has been denoted by ρ in [LMvW13], section 3.6. See [NCSF2], section 2.3 for the properties of this map.

See also:

`star involution of NCSF`, `psi involution of NCSF`, `star involution of QSym`.

EXAMPLES:

```
sage: NSym = NonCommutativeSymmetricFunctions(QQ)
sage: Phi = NSym.Phi()
sage: Phi[3,1,1,4].star_involution()
Phi[4, 1, 1, 3]
sage: Phi[4,2,1].star_involution()
Phi[1, 2, 4]
sage: (Phi[1,4] - Phi[2,3] + 2*Phi[5,4] - 3*Phi[3] + 4*Phi[[]]).star_
↪involution()
4*Phi[] - 3*Phi[3] - Phi[3, 2] + Phi[4, 1] + 2*Phi[4, 5]
sage: (Phi[3,3] + 3*Phi[1]).star_involution()
3*Phi[1] + Phi[3, 3]
sage: Phi([2,1]).star_involution()
Phi[1, 2]
```

```
>>> from sage.all import *
>>> NSym = NonCommutativeSymmetricFunctions(QQ)
>>> Phi = NSym.Phi()
>>> Phi[Integer(3),Integer(1),Integer(1),Integer(4)].star_involution()
Phi[4, 1, 1, 3]
>>> Phi[Integer(4),Integer(2),Integer(1)].star_involution()
Phi[1, 2, 4]
>>> (Phi[Integer(1),Integer(4)] - Phi[Integer(2),Integer(3)] +␣
↪Integer(2)*Phi[Integer(5),Integer(4)] - Integer(3)*Phi[Integer(3)] +␣
↪Integer(4)*Phi[[]]).star_involution()
4*Phi[] - 3*Phi[3] - Phi[3, 2] + Phi[4, 1] + 2*Phi[4, 5]
>>> (Phi[Integer(3),Integer(3)] + Integer(3)*Phi[Integer(1)]).star_
↪involution()
3*Phi[1] + Phi[3, 3]
>>> Phi([Integer(2),Integer(1)]).star_involution()
Phi[1, 2]
```

The implementation at hand is tailored to the Phi basis. It is equivalent to the generic implementation via the complete basis:

```
sage: S = NSym.S()
sage: all( S(Phi[I].star_involution()) == S(Phi[I]).star_involution()
....:      for I in Compositions(4) )
True
```

```
>>> from sage.all import *
>>> S = NSym.S()
>>> all( S(Phi[I].star_involution()) == S(Phi[I]).star_involution()
...      for I in Compositions(Integer(4)) )
True
```

verschiebung(*n*)

Return the image of the noncommutative symmetric function `self` under the n-th Verschiebung operator.

The n-th Verschiebung operator $\mathbf{V}_n$ is defined to be the map from the **k**-algebra of noncommutative symmetric functions to itself that sends the complete function S^I indexed by a composition $I = (i_1, i_2, \ldots, i_k)$ to $S^{(i_1/n, i_2/n, \ldots, i_k/n)}$ if all of the numbers $i_1, i_2, \ldots, i_k$ are divisible by n, and to 0 otherwise. This operator $\mathbf{V}_n$ is a Hopf algebra endomorphism. For every positive integer r with $n \mid r$, it satisfies

$$\mathbf{V}_n(S_r) = S_{r/n}, \quad \mathbf{V}_n(\Lambda_r) = (-1)^{r-r/n}\Lambda_{r/n}, \quad \mathbf{V}_n(\Psi_r) = n\Psi_{r/n}, \quad \mathbf{V}_n(\Phi_r) = n\Phi_{r/n}$$

(where S_r denotes the r-th complete non-commutative symmetric function, Λ_r denotes the r-th elementary non-commutative symmetric function, Ψ_r denotes the r-th power-sum non-commutative symmetric function of the first kind, and Φ_r denotes the r-th power-sum non-commutative symmetric function of the second kind). For every positive integer r with $n \nmid r$, it satisfes

$$\mathbf{V}_n(S_r) = \mathbf{V}_n(\Lambda_r) = \mathbf{V}_n(\Psi_r) = \mathbf{V}_n(\Phi_r) = 0.$$

The n-th Verschiebung operator is also called the n-th Verschiebung endomorphism.

It is a lift of the n-th Verschiebung operator on the ring of symmetric functions (*verschiebung()*) to the ring of noncommutative symmetric functions.

The action of the n-th Verschiebung operator can also be described on the ribbon Schur functions. Namely, every composition I of size $n\ell$ satisfies

$$\mathbf{V}_n(R_I) = (-1)^{\ell(I)-\ell(J)} \cdot R_{J/n},$$

where J denotes the meet of the compositions I and $(\underbrace{n, n, \ldots, n}_{|I|/n \text{ times}})$, where $\ell(I)$ is the length of I, and where J/n denotes the composition obtained by dividing every entry of J by n. For a composition I of size not divisible by n, we have $\mathbf{V}_n(R_I) = 0$.

```

class Psi(*NCSF*)

Bases: *CombinatorialFreeModule*, BindableClass

The Hopf algebra of non-commutative symmetric functions in the Psi basis.

The Psi basis is defined in Definition 3.4 of [NCSF1], where it is denoted by $(\Psi^I)_I$. It is a multiplicative basis, and is connected to the elementary generators Λ_i of the ring of non-commutative symmetric functions by the following relation: Define a non-commutative symmetric function Ψ_n for every positive integer n by the power series identity

$$\frac{d}{dt}\sigma(t) = \sigma(t) \cdot \left(\sum_{k \geq 1} t^{k-1} \Psi_k \right),$$

where

$$\sigma(t) = \left(\sum_{k \geq 0} (-t)^k \Lambda_k \right)^{-1}$$

and where Λ_0 denotes 1. For every composition $(i_1, i_2, \ldots, i_k)$, we have $\Psi^{(i_1,i_2,\ldots,i_k)} = \Psi_{i_1}\Psi_{i_2}\cdots\Psi_{i_k}$.

The Ψ-basis is a basis only when the base ring is a **Q**-algebra (although the Ψ^I can be defined over any base ring). The elements of the Ψ-basis are known as the "power-sum non-commutative symmetric functions of the first kind". The generators Ψ_n correspond to the Dynkin (quasi-)idempotents in the descent algebras of the symmetric groups (see [NCSF1], 5.2 for details).

Another (equivalent) definition of Ψ_n is

$$\Psi_n = \sum_{i=0}^{n-1} (-1)^i R_{1^i,n-i},$$

where R denotes the ribbon basis of $NCSF$, and where 1^i stands for i repetitions of the integer 1.

EXAMPLES:

```
sage: NCSF = NonCommutativeSymmetricFunctions(QQ)
sage: Psi = NCSF.Psi(); Psi
Non-Commutative Symmetric Functions over the Rational Field in the Psi basis
sage: Psi.an_element()
2*Psi[] + 2*Psi[1] + 3*Psi[1, 1]
```

```
>>> from sage.all import *
>>> NCSF = NonCommutativeSymmetricFunctions(QQ)
>>> Psi = NCSF.Psi(); Psi
Non-Commutative Symmetric Functions over the Rational Field in the Psi basis
>>> Psi.an_element()
2*Psi[] + 2*Psi[1] + 3*Psi[1, 1]
```

Checking the equivalent definition of Ψ_n:

```
sage: def test_psi(n):
....:     NCSF = NonCommutativeSymmetricFunctions(ZZ)
....:     R = NCSF.R()
....:     Psi = NCSF.Psi()
....:     a = R.sum([(-1) ** i * R[[1]*i + [n-i]]
....:                for i in range(n)])
....:     return a == R(Psi[n])
sage: test_psi(2)
True
sage: test_psi(3)
True
sage: test_psi(4)
True
```

```
>>> from sage.all import *
>>> def test_psi(n):
...     NCSF = NonCommutativeSymmetricFunctions(ZZ)
...     R = NCSF.R()
...     Psi = NCSF.Psi()
...     a = R.sum([(-Integer(1)) ** i * R[[Integer(1)]*i + [n-i]]
...                for i in range(n)])
...     return a == R(Psi[n])
>>> test_psi(Integer(2))
True
>>> test_psi(Integer(3))
True
>>> test_psi(Integer(4))
True
```

class Element

Bases: `IndexedFreeModuleElement`

verschiebung(*n*)

Return the image of the noncommutative symmetric function `self` under the n-th Verschiebung operator.

The n-th Verschiebung operator $\mathbf{V}_n$ is defined to be the map from the $\mathbf{k}$-algebra of noncommutative symmetric functions to itself that sends the complete function S^I indexed by a composition $I = (i_1, i_2, \ldots, i_k)$ to $S^{(i_1/n, i_2/n, \ldots, i_k/n)}$ if all of the numbers $i_1, i_2, \ldots, i_k$ are divisible by n, and to 0 otherwise. This operator $\mathbf{V}_n$ is a Hopf algebra endomorphism. For every positive integer r with $n \mid r$, it satisfies

$$\mathbf{V}_n(S_r) = S_{r/n}, \quad \mathbf{V}_n(\Lambda_r) = (-1)^{r-r/n}\Lambda_{r/n}, \quad \mathbf{V}_n(\Psi_r) = n\Psi_{r/n}, \quad \mathbf{V}_n(\Phi_r) = n\Phi_{r/n}$$

(where S_r denotes the r-th complete non-commutative symmetric function, Λ_r denotes the r-th elementary non-commutative symmetric function, Ψ_r denotes the r-th power-sum non-commutative symmetric function of the first kind, and Φ_r denotes the r-th power-sum non-commutative symmetric function of the second kind). For every positive integer r with $n \nmid r$, it satisfes

$$\mathbf{V}_n(S_r) = \mathbf{V}_n(\Lambda_r) = \mathbf{V}_n(\Psi_r) = \mathbf{V}_n(\Phi_r) = 0.$$

The n-th Verschiebung operator is also called the n-th Verschiebung endomorphism.

It is a lift of the n-th Verschiebung operator on the ring of symmetric functions (*verschiebung()*) to the ring of noncommutative symmetric functions.

The action of the n-th Verschiebung operator can also be described on the ribbon Schur functions. Namely, every composition I of size $n\ell$ satisfies

$$\mathbf{V}_n(R_I) = (-1)^{\ell(I)-\ell(J)} \cdot R_{J/n},$$

where J denotes the meet of the compositions I and $(\underbrace{n, n, \ldots, n}_{|I|/n \text{ times}})$, where $\ell(I)$ is the length of I, and where J/n denotes the composition obtained by dividing every entry of J by n. For a composition I of size not divisible by n, we have $\mathbf{V}_n(R_I) = 0$.

internal_product_on_basis_by_bracketing(I, J)

The internal product of two elements of the Psi basis.

See *internal_product()* for a thorough documentation of this operation.

This is an implementation using [NCSF2] Lemma 3.10. It is fast when the length of I is small, but can get very slow otherwise. Therefore it is not being used by default for internally multiplying Psi functions.

INPUT:

- I, J – compositions

OUTPUT:

- The internal product of the elements of the Psi basis of $NSym$ indexed by I and J, expressed in the Psi basis.

AUTHORS:

- Travis Scrimshaw, 29 Mar 2014

EXAMPLES:

```
sage: N = NonCommutativeSymmetricFunctions(QQ)
sage: Psi = N.Psi()
sage: Psi.internal_product_on_basis_by_bracketing([2,2],[1,2,1])
0
sage: Psi.internal_product_on_basis_by_bracketing([1,2,1],[2,1,1])
4*Psi[1, 2, 1]

```

R

alias of *Ribbon*

class Ribbon(*NCSF*)

Bases: `CombinatorialFreeModule`, `BindableClass`

The Hopf algebra of non-commutative symmetric functions in the Ribbon basis.

The Ribbon basis is defined in Definition 3.12 of [NCSF1], where it is denoted by $(R_I)_I$. It is connected to the complete basis of the ring of non-commutative symmetric functions by the following relation: For every composition I, we have

$$R_I = \sum_J (-1)^{\ell(I)-\ell(J)} S^J,$$

where the sum is over all compositions J which are coarser than I and $\ell(I)$ denotes the length of I. (See the proof of Proposition 4.13 in [NCSF1].)

The elements of the Ribbon basis are commonly referred to as the ribbon Schur functions.

EXAMPLES:

```
sage: NCSF = NonCommutativeSymmetricFunctions(QQ)
sage: R = NCSF.Ribbon(); R
Non-Commutative Symmetric Functions over the Rational Field in the Ribbon␣
↪basis
sage: R.an_element()
2*R[] + 2*R[1] + 3*R[1, 1]
```

```
>>> from sage.all import *
>>> NCSF = NonCommutativeSymmetricFunctions(QQ)
>>> R = NCSF.Ribbon(); R
Non-Commutative Symmetric Functions over the Rational Field in the Ribbon␣
↪basis
>>> R.an_element()
2*R[] + 2*R[1] + 3*R[1, 1]
```

The following are aliases for this basis:

```
sage: NCSF.ribbon()
Non-Commutative Symmetric Functions over the Rational Field in the Ribbon␣
↪basis
sage: NCSF.R()
Non-Commutative Symmetric Functions over the Rational Field in the Ribbon␣
↪basis
```

```
>>> from sage.all import *
>>> NCSF.ribbon()
Non-Commutative Symmetric Functions over the Rational Field in the Ribbon␣
↪basis
>>> NCSF.R()
Non-Commutative Symmetric Functions over the Rational Field in the Ribbon␣
↪basis
```

class Element

Bases: `IndexedFreeModuleElement`

star_involution()

Return the image of the noncommutative symmetric function `self` under the star involution.

The star involution is defined as the algebra antihomomorphism $NCSF \to NCSF$ which, for every positive integer n, sends the n-th complete non-commutative symmetric function S_n to S_n. Denoting by f^* the image of an element $f \in NCSF$ under this star involution, it can be shown that every composition I satisfies

$$(S^I)^* = S^{I^r}, \quad (\Lambda^I)^* = \Lambda^{I^r}, \quad R_I^* = R_{I^r}, \quad (\Phi^I)^* = \Phi^{I^r},$$

where I^r denotes the reversed composition of I, and standard notations for classical bases of $NCSF$ are being used (S for the complete basis, Λ for the elementary basis, R for the ribbon basis, and Φ for that of the power-sums of the second kind). The star involution is an involution and a coalgebra automorphism of $NCSF$. It is an automorphism of the graded vector space $NCSF$. Under the canonical isomorphism between the n-th graded component of $NCSF$ and the descent algebra of the symmetric group S_n (see `to_descent_algebra()`), the star involution (restricted to the n-th graded component) corresponds to the automorphism of the descent algebra given by $x \mapsto \omega_n x \omega_n$, where ω_n is the permutation $(n, n-1, \ldots, 1) \in S_n$ (written here in one-line notation). If π denotes the projection from $NCSF$ to the ring of symmetric functions (`to_symmetric_function()`), then $\pi(f^*) = \pi(f)$ for every $f \in NCSF$.

The star involution on $NCSF$ is adjoint to the star involution on $QSym$ by the standard adjunction between $NCSF$ and $QSym$.

The star involution has been denoted by ρ in [LMvW13], section 3.6. See [NCSF2], section 2.3 for the properties of this map.

See also

`star involution of NCSF`, `star involution of QSym`, `psi involution of NCSF`.

EXAMPLES:

```
sage: NSym = NonCommutativeSymmetricFunctions(ZZ)
sage: R = NSym.R()
sage: R[3,1,4,2].star_involution()
R[2, 4, 1, 3]
sage: R[4,1,2].star_involution()
R[2, 1, 4]
sage: (R[1] - R[2] + 2*R[5,4] - 3*R[3] + 4*R[[]]).star_involution()
4*R[] + R[1] - R[2] - 3*R[3] + 2*R[4, 5]
sage: (R[3,3] - 21*R[1]).star_involution()
-21*R[1] + R[3, 3]
sage: R([14,1]).star_involution()
R[1, 14]
```

```
>>> from sage.all import *
>>> NSym = NonCommutativeSymmetricFunctions(ZZ)
>>> R = NSym.R()
>>> R[Integer(3),Integer(1),Integer(4),Integer(2)].star_involution()
R[2, 4, 1, 3]
>>> R[Integer(4),Integer(1),Integer(2)].star_involution()
R[2, 1, 4]
>>> (R[Integer(1)] - R[Integer(2)] + Integer(2)*R[Integer(5),
↪Integer(4)] - Integer(3)*R[Integer(3)] + Integer(4)*R[[]]).star_
↪involution()
4*R[] + R[1] - R[2] - 3*R[3] + 2*R[4, 5]
```

(continues on next page)

(continued from previous page)

```
>>> (R[Integer(3),Integer(3)] - Integer(21)*R[Integer(1)]).star_
↪involution()
-21*R[1] + R[3, 3]
>>> R([Integer(14),Integer(1)]).star_involution()
R[1, 14]
```

The implementation at hand is tailored to the ribbon basis. It is equivalent to the generic implementation via the complete basis:

```
sage: S = NSym.S()
sage: all( S(R[I].star_involution()) == S(R[I]).star_involution()
....:      for I in Compositions(4) )
True
```

```
>>> from sage.all import *
>>> S = NSym.S()
>>> all( S(R[I].star_involution()) == S(R[I]).star_involution()
...      for I in Compositions(Integer(4)) )
True
```

verschiebung(n)

Return the image of the noncommutative symmetric function `self` under the n-th Verschiebung operator.

The n-th Verschiebung operator $\mathbf{V}_n$ is defined to be the map from the **k**-algebra of noncommutative symmetric functions to itself that sends the complete function S^I indexed by a composition $I = (i_1, i_2, \ldots, i_k)$ to $S^{(i_1/n, i_2/n, \ldots, i_k/n)}$ if all of the numbers $i_1, i_2, \ldots, i_k$ are divisible by n, and to 0 otherwise. This operator $\mathbf{V}_n$ is a Hopf algebra endomorphism. For every positive integer r with $n \mid r$, it satisfies

$$\mathbf{V}_n(S_r) = S_{r/n}, \quad \mathbf{V}_n(\Lambda_r) = (-1)^{r-r/n}\Lambda_{r/n}, \quad \mathbf{V}_n(\Psi_r) = n\Psi_{r/n}, \quad \mathbf{V}_n(\Phi_r) = n\Phi_{r/n}$$

(where S_r denotes the r-th complete non-commutative symmetric function, Λ_r denotes the r-th elementary non-commutative symmetric function, Ψ_r denotes the r-th power-sum non-commutative symmetric function of the first kind, and Φ_r denotes the r-th power-sum non-commutative symmetric function of the second kind). For every positive integer r with $n \nmid r$, it satisfes

$$\mathbf{V}_n(S_r) = \mathbf{V}_n(\Lambda_r) = \mathbf{V}_n(\Psi_r) = \mathbf{V}_n(\Phi_r) = 0.$$

The n-th Verschiebung operator is also called the n-th Verschiebung endomorphism.

It is a lift of the n-th Verschiebung operator on the ring of symmetric functions (`verschiebung()`) to the ring of noncommutative symmetric functions.

The action of the n-th Verschiebung operator can also be described on the ribbon Schur functions. Namely, every composition I of size $n\ell$ satisfies

$$\mathbf{V}_n(R_I) = (-1)^{\ell(I)-\ell(J)} \cdot R_{J/n},$$

where J denotes the meet of the compositions I and $(\underbrace{n, n, \ldots, n}_{|I|/n \text{ times}})$, where $\ell(I)$ is the length of I, and where J/n denotes the composition obtained by dividing every entry of J by n. For a composition I of size not divisible by n, we have $\mathbf{V}_n(R_I) = 0$.

verschiebung method of NCSF, *adams_operator method of QSym*, *verschiebung method of Sym*

INPUT:

- n – positive integer

OUTPUT:

The result of applying the n-th Verschiebung operator (on the ring of noncommutative symmetric functions) to self.

EXAMPLES:

```
sage: NSym = NonCommutativeSymmetricFunctions(ZZ)
sage: R = NSym.R()
sage: R([4,2]).verschiebung(2)
R[2, 1]
sage: R([2,1]).verschiebung(3)
-R[1]
sage: R([3]).verschiebung(2)
0
sage: R([]).verschiebung(2)
R[]
sage: R([5, 1]).verschiebung(3)
-R[2]
sage: R([5, 1]).verschiebung(6)
-R[1]
sage: R([5, 1]).verschiebung(2)
-R[3]
sage: R([1, 2, 3, 1]).verschiebung(7)
-R[1]
sage: R([1, 2, 3, 1]).verschiebung(5)
0
sage: (R[1] - R[2] + 2*R[3]).verschiebung(1)
R[1] - R[2] + 2*R[3]
```

```
>>> from sage.all import *
>>> NSym = NonCommutativeSymmetricFunctions(ZZ)
>>> R = NSym.R()
>>> R([Integer(4),Integer(2)]).verschiebung(Integer(2))
R[2, 1]
>>> R([Integer(2),Integer(1)]).verschiebung(Integer(3))
-R[1]
>>> R([Integer(3)]).verschiebung(Integer(2))
0
>>> R([]).verschiebung(Integer(2))
R[]
>>> R([Integer(5), Integer(1)]).verschiebung(Integer(3))
-R[2]
>>> R([Integer(5), Integer(1)]).verschiebung(Integer(6))
-R[1]
>>> R([Integer(5), Integer(1)]).verschiebung(Integer(2))
```

(continues on next page)

(continued from previous page)

```
-R[3]
>>> R([Integer(1), Integer(2), Integer(3), Integer(1)]).
↪verschiebung(Integer(7))
-R[1]
>>> R([Integer(1), Integer(2), Integer(3), Integer(1)]).
↪verschiebung(Integer(5))
0
>>> (R[Integer(1)] - R[Integer(2)] + Integer(2)*R[Integer(3)]).
↪verschiebung(Integer(1))
R[1] - R[2] + 2*R[3]
```

antipode_on_basis(*composition*)

Return the application of the antipode to a basis element of the ribbon basis `self`.

INPUT:

- `composition` – a composition

OUTPUT:

- The image of the basis element indexed by `composition` under the antipode map.

EXAMPLES:

```
sage: R = NonCommutativeSymmetricFunctions(QQ).ribbon()
sage: R.antipode_on_basis(Composition([2,1]))
-R[2, 1]
sage: R[3,1].antipode() # indirect doctest
R[2, 1, 1]
sage: R[[]].antipode() # indirect doctest
R[]
```

```
>>> from sage.all import *
>>> R = NonCommutativeSymmetricFunctions(QQ).ribbon()
>>> R.antipode_on_basis(Composition([Integer(2),Integer(1)]))
-R[2, 1]
>>> R[Integer(3),Integer(1)].antipode() # indirect doctest
R[2, 1, 1]
>>> R[[]].antipode() # indirect doctest
R[]
```

We check that the implementation of the antipode at hand does not contradict the generic one:

```
sage: S = NonCommutativeSymmetricFunctions(QQ).S()
sage: all( S(R[I].antipode()) == S(R[I]).antipode()
....:      for I in Compositions(4) )
True
```

```
>>> from sage.all import *
>>> S = NonCommutativeSymmetricFunctions(QQ).S()
>>> all( S(R[I].antipode()) == S(R[I]).antipode()
...      for I in Compositions(Integer(4)) )
True
```

dual()

Return the dual basis to the ribbon basis of the non-commutative symmetric functions. This is the Fundamental basis of the quasi-symmetric functions.

OUTPUT: the fundamental basis of the quasi-symmetric functions

EXAMPLES:

```
sage: R = NonCommutativeSymmetricFunctions(QQ).ribbon()
sage: R.dual()
Quasisymmetric functions over the Rational Field in the Fundamental basis
```

```
>>> from sage.all import *
>>> R = NonCommutativeSymmetricFunctions(QQ).ribbon()
>>> R.dual()
Quasisymmetric functions over the Rational Field in the Fundamental basis
```

product_on_basis(*I*, *J*)

Return the product of two ribbon basis elements of the non-commutative symmetric functions.

INPUT:

- I, J – compositions

OUTPUT: the product of the ribbon functions indexed by I and J

EXAMPLES:

```
sage: R = NonCommutativeSymmetricFunctions(QQ).ribbon()
sage: R[1,2,1] * R[3,1]
R[1, 2, 1, 3, 1] + R[1, 2, 4, 1]
sage: ( R[1,2] + R[3] ) * ( R[3,1] + R[1,2,1] )
R[1, 2, 1, 2, 1] + R[1, 2, 3, 1] + R[1, 3, 2, 1] + R[1, 5, 1] + R[3, 1, 2,
↪ 1] + R[3, 3, 1] + R[4, 2, 1] + R[6, 1]
```

```
>>> from sage.all import *
>>> R = NonCommutativeSymmetricFunctions(QQ).ribbon()
>>> R[Integer(1),Integer(2),Integer(1)] * R[Integer(3),Integer(1)]
R[1, 2, 1, 3, 1] + R[1, 2, 4, 1]
>>> ( R[Integer(1),Integer(2)] + R[Integer(3)] ) * ( R[Integer(3),
↪Integer(1)] + R[Integer(1),Integer(2),Integer(1)] )
R[1, 2, 1, 2, 1] + R[1, 2, 3, 1] + R[1, 3, 2, 1] + R[1, 5, 1] + R[3, 1, 2,
↪ 1] + R[3, 3, 1] + R[4, 2, 1] + R[6, 1]
```

to_symmetric_function_on_basis(*I*)

Return the commutative image of a ribbon basis element of the non-commutative symmetric functions.

INPUT:

- I – a composition

OUTPUT:

- The commutative image of the ribbon basis element indexed by I. This will be expressed as a symmetric function in the Schur basis.

EXAMPLES:

```
sage: R = NonCommutativeSymmetricFunctions(QQ).R()
sage: R.to_symmetric_function_on_basis(Composition([3,1,1]))
s[3, 1, 1]
sage: R.to_symmetric_function_on_basis(Composition([4,2,1]))
s[4, 2, 1] + s[5, 1, 1] + s[5, 2]
sage: R.to_symmetric_function_on_basis(Composition([]))
s[]
```

```
>>> from sage.all import *
>>> R = NonCommutativeSymmetricFunctions(QQ).R()
>>> R.to_symmetric_function_on_basis(Composition([Integer(3),Integer(1),
↪Integer(1)]))
s[3, 1, 1]
>>> R.to_symmetric_function_on_basis(Composition([Integer(4),Integer(2),
↪Integer(1)]))
s[4, 2, 1] + s[5, 1, 1] + s[5, 2]
>>> R.to_symmetric_function_on_basis(Composition([]))
s[]
```

S

alias of *Complete*

ZL

alias of *Zassenhaus_left*

ZR

alias of *Zassenhaus_right*

class Zassenhaus_left(*NCSF*)

Bases: *CombinatorialFreeModule*, BindableClass

The Hopf algebra of non-commutative symmetric functions in the left Zassenhaus basis.

This basis is the left-version of the basis defined in Section 2.5.1 of [HLNT09]. It is multiplicative, with Z_n defined as the element of $NCSF_n$ satisfying the equation

$$\sigma_1 = \cdots exp(Z_n) \cdots exp(Z_2) exp(Z_1),$$

where

$$\sigma_1 = \sum_{n \geq 0} S_n.$$

It can be recursively computed by the formula

$$S_n = \sum_{\lambda \vdash n} \frac{1}{m_1(\lambda)! m_2(\lambda)! m_3(\lambda)! \cdots} Z_{\lambda_1} Z_{\lambda_2} Z_{\lambda_3} \cdots$$

for all $n \geq 0$.

class Zassenhaus_right(*NCSF*)

Bases: *CombinatorialFreeModule*, BindableClass

The Hopf algebra of non-commutative symmetric functions in the right Zassenhaus basis.

This basis is defined in Section 2.5.1 of [HLNT09]. It is multiplicative, with Z_n defined as the element of $NCSF_n$ satisfying the equation

$$\sigma_1 = exp(Z_1) exp(Z_2) exp(Z_3) \cdots exp(Z_n) \cdots$$

where

$$\sigma_1 = \sum_{n \geq 0} S_n.$$

It can be recursively computed by the formula

$$S_n = \sum_{\lambda \vdash n} \frac{1}{m_1(\lambda)!m_2(\lambda)!m_3(\lambda)!\cdots} \cdots Z_{\lambda_3} Z_{\lambda_2} Z_{\lambda_1}$$

for all $n \geq 0$.

Note that there is a variant (called the "noncommutative power sum symmetric functions of the third kind") in Definition 5.26 of [NCSF2] that satisfies:

$$\sigma_1 = exp(Z_1)exp(Z_2/2)exp(Z_3/3)\cdots exp(Z_n/n)\cdots.$$

a_realization()

Give a realization of the algebra of non-commutative symmetric functions. This particular realization is the complete basis of non-commutative symmetric functions.

OUTPUT:

- The realization of the non-commutative symmetric functions in the complete basis.

EXAMPLES:

```
sage: NonCommutativeSymmetricFunctions(ZZ).a_realization()
Non-Commutative Symmetric Functions over the Integer Ring in the Complete␣
↪basis
```

```
>>> from sage.all import *
>>> NonCommutativeSymmetricFunctions(ZZ).a_realization()
Non-Commutative Symmetric Functions over the Integer Ring in the Complete␣
↪basis
```

complete

alias of *Complete*

dQS

alias of *dualQuasisymmetric_Schur*

dYQS

alias of *dualYoungQuasisymmetric_Schur*

dual()

Return the dual to the non-commutative symmetric functions.

OUTPUT:

- The dual of the non-commutative symmetric functions over a ring. This is the algebra of quasi-symmetric functions over the ring.

EXAMPLES:

```
sage: NCSF = NonCommutativeSymmetricFunctions(QQ)
sage: NCSF.dual()
Quasisymmetric functions over the Rational Field
```

```
>>> from sage.all import *
>>> NCSF = NonCommutativeSymmetricFunctions(QQ)
>>> NCSF.dual()
Quasisymmetric functions over the Rational Field
```

class dualQuasisymmetric_Schur(*NCSF*)

Bases: *CombinatorialFreeModule*, BindableClass

The basis of NCSF dual to the Quasisymmetric-Schur basis of QSym.

The *Quasisymmetric_Schur* functions are defined in [QSCHUR] (see also Definition 5.1.1 of [LMvW13]). The dual basis in the algebra of non-commutative symmetric functions is defined by the following formula:

$$R_\alpha = \sum_T dQS_{shape(T)},$$

where the sum is over all standard composition tableaux with descent composition equal to α. The *Quasisymmetric_Schur* basis QS_α has the property that

$$s_\lambda = \sum_{sort(\alpha)=\lambda} QS_\alpha.$$

As a consequence the commutative image of a dual Quasisymmetric-Schur element in the algebra of symmetric functions (the map defined in the method *to_symmetric_function()*) is equal to the Schur function indexed by the decreasing sort of the indexing composition.

See also

CompositionTableaux, *CompositionTableau*.

EXAMPLES:

```
sage: NCSF = NonCommutativeSymmetricFunctions(QQ)
sage: dQS = NCSF.dQS()
sage: dQS([1,3,2])*dQS([1])
dQS[1, 2, 4] + dQS[1, 3, 2, 1] + dQS[1, 3, 3] + dQS[3, 2, 2]
sage: dQS([1])*dQS([1,3,2])
dQS[1, 1, 3, 2] + dQS[1, 3, 3] + dQS[1, 4, 2] + dQS[2, 3, 2]
sage: dQS([1,3])*dQS([1,1])
dQS[1, 3, 1, 1] + dQS[1, 4, 1] + dQS[3, 2, 1] + dQS[4, 2]

>>> S(dQS[Integer(1),Integer(3),Integer(1)])
S[1, 3, 1] - S[3, 2] - S[4, 1] + S[5]
>>> s = SymmetricFunctions(QQ).s()
>>> s(S(dQS([Integer(2),Integer(1),Integer(3)])).to_symmetric_function())
s[3, 2, 1]
```

dual()

The dual basis to the dual Quasisymmetric-Schur basis of NCSF.

The basis returned is the *Quasisymmetric_Schur* basis of QSym.

OUTPUT: the Quasisymmetric-Schur basis of the quasi-symmetric functions

EXAMPLES:

```
sage: dQS=NonCommutativeSymmetricFunctions(QQ).dualQuasisymmetric_Schur()
sage: dQS.dual()
Quasisymmetric functions over the Rational Field in the Quasisymmetric
Schur basis
sage: dQS.duality_pairing_matrix(dQS.dual(),3)
[1 0 0 0]
[0 1 0 0]
[0 0 1 0]
[0 0 0 1]
```

```
>>> from sage.all import *
>>> dQS=NonCommutativeSymmetricFunctions(QQ).dualQuasisymmetric_Schur()
>>> dQS.dual()
Quasisymmetric functions over the Rational Field in the Quasisymmetric
Schur basis

[0 0 0 1]
```

to_symmetric_function_on_basis(*I*)

The commutative image of a dual quasi-symmetric Schur element.

The commutative image of a basis element is obtained by sorting the indexing composition of the basis element.

INPUT:

- I – a composition

OUTPUT:

- The commutative image of the dual quasi-Schur basis element indexed by I. The result is the Schur symmetric function indexed by the partition obtained by sorting I.

EXAMPLES:

```
sage: dQS=NonCommutativeSymmetricFunctions(QQ).dQS()
sage: dQS.to_symmetric_function_on_basis([2,1,3])
s[3, 2, 1]
sage: dQS.to_symmetric_function_on_basis([])
s[]
```

```
>>> from sage.all import *
>>> dQS=NonCommutativeSymmetricFunctions(QQ).dQS()
>>> dQS.to_symmetric_function_on_basis([Integer(2),Integer(1),Integer(3)])
s[3, 2, 1]
>>> dQS.to_symmetric_function_on_basis([])
s[]
```

class dualYoungQuasisymmetric_Schur(*NCSF*)

Bases: *CombinatorialFreeModule*, BindableClass

The basis of NCSF dual to the Young Quasisymmetric-Schur basis of QSym.

The YoungQuasisymmetric_Schur functions are given in Definition 5.2.1 of [LMvW13]. The dual basis in the algebra of non-commutative symmetric functions are related by an involution reversing the indexing composition of the complete expansion of a quasi-Schur basis element. This basis has many of the same properties as the Quasisymmetric Schur basis and is related to that basis by an algebraic transformation.

EXAMPLES:

```
sage: NCSF = NonCommutativeSymmetricFunctions(QQ)
sage: dYQS = NCSF.dYQS()
sage: dYQS([1,3,2])*dYQS([1])
dYQS[1, 3, 2, 1] + dYQS[1, 3, 3] + dYQS[1, 4, 2] + dYQS[2, 3, 2]
sage: dYQS([1])*dYQS([1,3,2])
dYQS[1, 1, 3, 2] + dYQS[2, 3, 2] + dYQS[3, 3, 1] + dYQS[4, 1, 2]
sage: dYQS([1,3])*dYQS([1,1])
dYQS[1, 3, 1, 1] + dYQS[1, 4, 1] + dYQS[2, 3, 1] + dYQS[2, 4]
sage: dYQS([3,1])*dYQS([2,1])
dYQS[3, 1, 2, 1] + dYQS[3, 2, 2] + dYQS[3, 3, 1] + dYQS[4, 1, 1, 1]
 + dYQS[4, 1, 2] + dYQS[4, 2, 1] + dYQS[4, 3] + dYQS[5, 1, 1]
 + dYQS[5, 2]
sage: dYQS([1,1]).coproduct()
```

(continues on next page)

(continued from previous page)

```
dYQS[] # dYQS[1, 1] + dYQS[1] # dYQS[1] + dYQS[1, 1] # dYQS[]
sage: dYQS([3,3]).coproduct().monomial_coefficients()[(Composition([1,2]),
↪Composition([2,1]))]
1
sage: S = NCSF.complete()
sage: dYQS(S[1,3,1])
dYQS[1, 3, 1] + dYQS[1, 4] + dYQS[2, 3] + dYQS[4, 1] + dYQS[5]
sage: S(dYQS[1,3,1])
S[1, 3, 1] - S[1, 4] - S[2, 3] + S[5]
sage: s = SymmetricFunctions(QQ).s()
sage: s(S(dYQS([2,1,3])).to_symmetric_function())
s[3, 2, 1]
```

```
>>> from sage.all import *
>>> NCSF = NonCommutativeSymmetricFunctions(QQ)

s[3, 2, 1]
```

dual()

The dual basis to the dual Quasisymmetric-Schur basis of NCSF.

The basis returned is the *Quasisymmetric_Schur* basis of QSym.

OUTPUT: the Young Quasisymmetric-Schur basis of quasi-symmetric functions

EXAMPLES:

```
sage: dYQS=NonCommutativeSymmetricFunctions(QQ).dualYoungQuasisymmetric_
↪Schur()
sage: dYQS.dual()
```

(continues on next page)

(continued from previous page)

```
Quasisymmetric functions over the Rational Field in the Young
Quasisymmetric Schur basis
sage: dYQS.duality_pairing_matrix(dYQS.dual(),3)
[1 0 0 0]
[0 1 0 0]
[0 0 1 0]
[0 0 0 1]
```

```
>>> from sage.all import *
>>> dYQS=NonCommutativeSymmetricFunctions(QQ).dualYoungQuasisymmetric_
↪Schur()
>>> dYQS.dual()
Quasisymmetric functions over the Rational Field in the Young
Quasisymmetric Schur basis
>>> dYQS.duality_pairing_matrix(dYQS.dual(),Integer(3))
[1 0 0 0]
[0 1 0 0]
[0 0 1 0]
[0 0 0 1]
```

to_symmetric_function_on_basis(*I*)

The commutative image of a dual Young quasi-symmetric Schur element.

The commutative image of a basis element is obtained by sorting the indexing composition of the basis element.

INPUT:

- `I` – a composition

OUTPUT:

- The commutative image of the dual Young quasi-Schur basis element indexed by `I`. The result is the Schur symmetric function indexed by the partition obtained by sorting `I`.

EXAMPLES:

```
sage: dYQS=NonCommutativeSymmetricFunctions(QQ).dYQS()
sage: dYQS.to_symmetric_function_on_basis([2,1,3])
s[3, 2, 1]
sage: dYQS.to_symmetric_function_on_basis([])
s[]
```

```
>>> from sage.all import *
>>> dYQS=NonCommutativeSymmetricFunctions(QQ).dYQS()
>>> dYQS.to_symmetric_function_on_basis([Integer(2),Integer(1),
↪Integer(3)])
s[3, 2, 1]
>>> dYQS.to_symmetric_function_on_basis([])
s[]
```

class sage.combinat.ncsf_qsym.qsym.**QuasiSymmetricFunctions**(R)

Bases: UniqueRepresentation, Parent

The Hopf algebra of quasisymmetric functions.

Let R be a commutative ring with unity. The R-algebra of quasi-symmetric functions may be realized as an R-subalgebra of the ring of power series in countably many variables $R[[x_1, x_2, x_3, \ldots]]$. It consists of those formal power series p which are degree-bounded (i. e., the degrees of all monomials occurring with nonzero coefficient in p are bounded from above, although the bound can depend on p) and satisfy the following condition: For every tuple $(a_1, a_2, \ldots, a_m)$ of positive integers, the coefficient of the monomial $x_{i_1}^{a_1} x_{i_2}^{a_2} \cdots x_{i_m}^{a_m}$ in p is the same for all strictly increasing sequences $(i_1 < i_2 < \cdots < i_m)$ of positive integers. (In other words, the coefficient of a monomial in p depends only on the sequence of nonzero exponents in the monomial. If "sequence" were to be replaced by "multiset" here, we would obtain the definition of a symmetric function.)

The R-algebra of quasi-symmetric functions is commonly called QSym_R or occasionally just QSym (when R is clear from the context or **Z** or **Q**). It is graded by the total degree of the power series. Its homogeneous elements of degree k form a free R-submodule of rank equal to the number of compositions of k (that is, 2^{k-1} if $k \geq 1$, else 1).

The two classical bases of QSym, the monomial basis $(M_I)_I$ and the fundamental basis $(F_I)_I$, are indexed by compositions $I = (I_1, I_2, \cdots, I_\ell)$ and defined by the formulas:

$$M_I = \sum_{1 \leq i_1 < i_2 < \cdots < i_\ell} x_{i_1}^{I_1} x_{i_2}^{I_2} \cdots x_{i_\ell}^{I_\ell}$$

and

$$F_I = \sum_{(j_1, j_2, \ldots, j_n)} x_{j_1} x_{j_2} \cdots x_{j_n}$$

where in the second equation the sum runs over all weakly increasing n-tuples $(j_1, j_2, \ldots, j_n)$ of positive integers (where n is the size of I) which increase strictly from j_r to j_{r+1} if r is a descent of the composition I.

These bases are related by the formula

$F_I = \sum_{J \leq I} M_J$

where the inequality $J \leq I$ indicates that J is finer than I.

The R-algebra of quasi-symmetric functions is a Hopf algebra, with the coproduct satisfying

$$\Delta M_I = \sum_{k=0}^{\ell} M_{(I_1,I_2,\cdots,I_k)} \otimes M_{(I_{k+1},I_{k+2},\cdots,I_\ell)}$$

for every composition $I = (I_1, I_2, \cdots, I_\ell)$.

It is possible to define an R-algebra of quasi-symmetric functions in a finite number of variables as well (but it is not a bialgebra). These quasi-symmetric functions are actual polynomials then, not just power series.

Chapter 5 of [GriRei18] and Section 11 of [HazWitt1] are devoted to quasi-symmetric functions, as are Malvenuto's thesis [Mal1993] and part of Chapter 7 of [Sta-EC2].

The implementation of the quasi-symmetric function Hopf algebra

We realize the R-algebra of quasi-symmetric functions in Sage as a graded Hopf algebra with basis elements indexed by compositions:

```
sage: QSym = QuasiSymmetricFunctions(QQ)
sage: QSym.category()
Join of Category of Hopf algebras over Rational Field
    and Category of graded algebras over Rational Field
    and Category of commutative algebras over Rational Field
    and Category of monoids with realizations
    and Category of graded coalgebras over Rational Field
    and Category of coalgebras over Rational Field with realizations
```

```
>>> from sage.all import *
>>> QSym = QuasiSymmetricFunctions(QQ)
>>> QSym.category()
Join of Category of Hopf algebras over Rational Field
    and Category of graded algebras over Rational Field
    and Category of commutative algebras over Rational Field
    and Category of monoids with realizations
    and Category of graded coalgebras over Rational Field
    and Category of coalgebras over Rational Field with realizations
```

The most standard two bases for this R-algebra are the monomial and fundamental bases, and are accessible by the `M()` and `F()` methods:

```
sage: M = QSym.M()
sage: F = QSym.F()
sage: M(F[2,1,2])
M[1, 1, 1, 1, 1] + M[1, 1, 1, 2] + M[2, 1, 1, 1] + M[2, 1, 2]
sage: F(M[2,1,2])
F[1, 1, 1, 1, 1] - F[1, 1, 1, 2] - F[2, 1, 1, 1] + F[2, 1, 2]
```

```
>>> from sage.all import *
>>> M = QSym.M()
>>> F = QSym.F()
>>> M(F[Integer(2),Integer(1),Integer(2)])
M[1, 1, 1, 1, 1] + M[1, 1, 1, 2] + M[2, 1, 1, 1] + M[2, 1, 2]
>>> F(M[Integer(2),Integer(1),Integer(2)])
F[1, 1, 1, 1, 1] - F[1, 1, 1, 2] - F[2, 1, 1, 1] + F[2, 1, 2]
```

The product on this space is commutative and is inherited from the product on the realization within the ring of power series:

```
sage: M[3]*M[1,1] == M[1,1]*M[3]
True
sage: M[3]*M[1,1]
M[1, 1, 3] + M[1, 3, 1] + M[1, 4] + M[3, 1, 1] + M[4, 1]
sage: F[3]*F[1,1]
F[1, 1, 3] + F[1, 2, 2] + F[1, 3, 1] + F[1, 4] + F[2, 1, 2]
 + F[2, 2, 1] + F[2, 3] + F[3, 1, 1] + F[3, 2] + F[4, 1]
sage: M[3]*F[2]
M[1, 1, 3] + M[1, 3, 1] + M[1, 4] + M[2, 3] + M[3, 1, 1] + M[3, 2]
 + M[4, 1] + M[5]
sage: F[2]*M[3]
F[1, 1, 1, 2] - F[1, 2, 2] + F[2, 1, 1, 1] - F[2, 1, 2] - F[2, 2, 1]
 + F[5]
```

```
>>> from sage.all import *
>>> M[Integer(3)]*M[Integer(1),Integer(1)] == M[Integer(1),
↪Integer(1)]*M[Integer(3)]
True
>>> M[Integer(3)]*M[Integer(1),Integer(1)]
M[1, 1, 3] + M[1, 3, 1] + M[1, 4] + M[3, 1, 1] + M[4, 1]
>>> F[Integer(3)]*F[Integer(1),Integer(1)]
F[1, 1, 3] + F[1, 2, 2] + F[1, 3, 1] + F[1, 4] + F[2, 1, 2]
 + F[2, 2, 1] + F[2, 3] + F[3, 1, 1] + F[3, 2] + F[4, 1]
>>> M[Integer(3)]*F[Integer(2)]
M[1, 1, 3] + M[1, 3, 1] + M[1, 4] + M[2, 3] + M[3, 1, 1] + M[3, 2]
 + M[4, 1] + M[5]
>>> F[Integer(2)]*M[Integer(3)]
F[1, 1, 1, 2] - F[1, 2, 2] + F[2, 1, 1, 1] - F[2, 1, 2] - F[2, 2, 1]
 + F[5]
```

There is a coproduct on QSym as well, which in the Monomial basis acts by cutting the composition into a left half and a right half. The coproduct is not co-commutative:

```
sage: M[1,3,1].coproduct()
M[] # M[1, 3, 1] + M[1] # M[3, 1] + M[1, 3] # M[1] + M[1, 3, 1] # M[]
sage: F[1,3,1].coproduct()
F[] # F[1, 3, 1] + F[1] # F[3, 1] + F[1, 1] # F[2, 1]
 + F[1, 2] # F[1, 1] + F[1, 3] # F[1] + F[1, 3, 1] # F[]
```

```
>>> from sage.all import *
>>> M[Integer(1),Integer(3),Integer(1)].coproduct()
M[] # M[1, 3, 1] + M[1] # M[3, 1] + M[1, 3] # M[1] + M[1, 3, 1] # M[]
>>> F[Integer(1),Integer(3),Integer(1)].coproduct()
F[] # F[1, 3, 1] + F[1] # F[3, 1] + F[1, 1] # F[2, 1]
 + F[1, 2] # F[1, 1] + F[1, 3] # F[1] + F[1, 3, 1] # F[]
```

The duality pairing with non-commutative symmetric functions

These two operations endow the quasi-symmetric functions QSym with the structure of a Hopf algebra. It is the graded dual Hopf algebra of the non-commutative symmetric functions $NCSF$. Under this duality, the Monomial basis of QSym is dual to the Complete basis of $NCSF$, and the Fundamental basis of QSym is dual to the Ribbon basis of $NCSF$ (see [MR]).

```
sage: S = M.dual(); S

[ 1  0  0  0  0  0  0  0]
[-1  1  0  0  0  0  0  0]
[-1  0  1  0  0  0  0  0]
[ 1 -1 -1  1  0  0  0  0]
[-1  0  0  0  1  0  0  0]
[ 1 -1  0  0 -1  1  0  0]
[ 1  0 -1  0 -1  0  1  0]
[-1  1  1 -1  1 -1 -1  1]
```

Let H and G be elements of QSym, and h an element of $NCSF$. Then, if we represent the duality pairing with the mathematical notation $[\cdot,\cdot]$,

$$[HG, h] = [H \otimes G, \Delta(h)] .$$

For example, the coefficient of `M[2,1,4,1]` in `M[1,3]*M[2,1,1]` may be computed with the duality pairing:

```
sage: I, J = Composition([1,3]), Composition([2,1,1])
sage: (M[I]*M[J]).duality_pairing(S[2,1,4,1])
1
```

```
>>> from sage.all import *
```

(continues on next page)

(continued from previous page)

```
>>> I, J = Composition([Integer(1),Integer(3)]), Composition([Integer(2),
↪Integer(1),Integer(1)])
>>> (M[I]*M[J]).duality_pairing(S[Integer(2),Integer(1),Integer(4),Integer(1)])
1
```

And the coefficient of `S[1,3] # S[2,1,1]` in `S[2,1,4,1].coproduct()` is equal to this result:

```
sage: S[2,1,4,1].coproduct()
S[] # S[2, 1, 4, 1] + ... + S[1, 3] # S[2, 1, 1] + ... + S[4, 1] # S[2, 1]
```

```
>>> from sage.all import *
>>> S[Integer(2),Integer(1),Integer(4),Integer(1)].coproduct()
S[] # S[2, 1, 4, 1] + ... + S[1, 3] # S[2, 1, 1] + ... + S[4, 1] # S[2, 1]
```

The duality pairing on the tensor space is another way of getting this coefficient, but currently the method `duality_pairing` is not defined on the tensor squared space. However, we can extend this functionality by applying a linear morphism to the terms in the coproduct, as follows:

```
sage: X = S[2,1,4,1].coproduct()
sage: def linear_morphism(x, y):
....:   return x.duality_pairing(M[1,3]) * y.duality_pairing(M[2,1,1])
sage: X.apply_multilinear_morphism(linear_morphism, codomain=ZZ)
1
```

```
>>> from sage.all import *
>>> X = S[Integer(2),Integer(1),Integer(4),Integer(1)].coproduct()
>>> def linear_morphism(x, y):
...   return x.duality_pairing(M[Integer(1),Integer(3)]) * y.duality_
↪pairing(M[Integer(2),Integer(1),Integer(1)])
>>> X.apply_multilinear_morphism(linear_morphism, codomain=ZZ)
1
```

Similarly, if H is an element of QSym and g and h are elements of $NCSF$, then

$$[H, gh] = [\Delta(H), g \otimes h].$$

For example, the coefficient of `R[2,3,1]` in `R[2,1]*R[2,1]` is computed with the duality pairing by the following command:

```
sage: (R[2,1]*R[2,1]).duality_pairing(F[2,3,1])
1
sage: R[2,1]*R[2,1]
R[2, 1, 2, 1] + R[2, 3, 1]
```

```
>>> from sage.all import *
>>> (R[Integer(2),Integer(1)]*R[Integer(2),Integer(1)]).duality_
↪pairing(F[Integer(2),Integer(3),Integer(1)])
1
>>> R[Integer(2),Integer(1)]*R[Integer(2),Integer(1)]
R[2, 1, 2, 1] + R[2, 3, 1]
```

This coefficient should then be equal to the coefficient of `F[2,1] # F[2,1]` in `F[2,3,1].coproduct()`:

```
sage: F[2,3,1].coproduct()
F[] # F[2, 3, 1] + ... + F[2, 1] # F[2, 1]  + ... + F[2, 3, 1] # F[]
```

```
>>> from sage.all import *
>>> F[Integer(2),Integer(3),Integer(1)].coproduct()
F[] # F[2, 3, 1] + ... + F[2, 1] # F[2, 1]  + ... + F[2, 3, 1] # F[]
```

This can also be computed by the duality pairing on the tensor space, as above:

```
sage: X = F[2,3,1].coproduct()
sage: def linear_morphism(x, y):
....:   return x.duality_pairing(R[2,1]) * y.duality_pairing(R[2,1])
sage: X.apply_multilinear_morphism(linear_morphism, codomain=ZZ)
1
```

```
>>> from sage.all import *
>>> X = F[Integer(2),Integer(3),Integer(1)].coproduct()
>>> def linear_morphism(x, y):
...   return x.duality_pairing(R[Integer(2),Integer(1)]) * y.duality_
↪pairing(R[Integer(2),Integer(1)])
>>> X.apply_multilinear_morphism(linear_morphism, codomain=ZZ)
1
```

The operation dual to multiplication by a non-commutative symmetric function

Let $g \in NCSF$ and consider the linear endomorphism of $NCSF$ defined by left (respectively, right) multiplication by g. Since there is a duality between QSym and $NCSF$, this linear transformation induces an operator $g^{\perp}$ on QSym satisfying

$$[g^{\perp}(H), h] = [H, gh].$$

for any non-commutative symmetric function h.

This is implemented by the method *skew_by()*. Explicitly, if `H` is a quasi-symmetric function and `g` a non-commutative symmetric function, then `H.skew_by(g)` and `H.skew_by(g, side='right')` are expressions that satisfy, for any non-commutative symmetric function `h`, the following equalities:

```
H.skew_by(g).duality_pairing(h) == H.duality_pairing(g*h)
H.skew_by(g, side='right').duality_pairing(h) == H.duality_pairing(h*g)
```

For example, `M[J].skew_by(S[I])` is 0 unless the composition `J` begins with `I` and `M(J).skew_by(S(I), side='right')` is 0 unless the composition `J` ends with `I`. For example:

```
sage: M[3,2,2].skew_by(S[3])
M[2, 2]
sage: M[3,2,2].skew_by(S[2])
0
sage: M[3,2,2].coproduct().apply_multilinear_morphism( lambda x,y: x.duality_
↪pairing(S[3])*y )
M[2, 2]
sage: M[3,2,2].skew_by(S[3], side='right')
0
sage: M[3,2,2].skew_by(S[2], side='right')
M[3, 2]
```

```
>>> from sage.all import *
>>> M[Integer(3),Integer(2),Integer(2)].skew_by(S[Integer(3)])
M[2, 2]
>>> M[Integer(3),Integer(2),Integer(2)].skew_by(S[Integer(2)])
0
>>> M[Integer(3),Integer(2),Integer(2)].coproduct().apply_multilinear_morphism(
↪lambda x,y: x.duality_pairing(S[Integer(3)])*y )
M[2, 2]
>>> M[Integer(3),Integer(2),Integer(2)].skew_by(S[Integer(3)], side='right')
0
>>> M[Integer(3),Integer(2),Integer(2)].skew_by(S[Integer(2)], side='right')
M[3, 2]
```

The counit

The counit is defined by sending all elements of positive degree to zero:

```
sage: M[3].degree(), M[3,1,2].degree(), M.one().degree()
(3, 6, 0)
sage: M[3].counit()
0
sage: M[3,1,2].counit()
0
sage: M.one().counit()
1
sage: (M[3] - 2*M[3,1,2] + 7).counit()
7
sage: (F[3] - 2*F[3,1,2] + 7).counit()
7
```

```
>>> from sage.all import *
>>> M[Integer(3)].degree(), M[Integer(3),Integer(1),Integer(2)].degree(), M.one().
↪degree()
(3, 6, 0)
>>> M[Integer(3)].counit()
0
>>> M[Integer(3),Integer(1),Integer(2)].counit()
0
>>> M.one().counit()
1
>>> (M[Integer(3)] - Integer(2)*M[Integer(3),Integer(1),Integer(2)] + Integer(7)).
↪counit()
7
>>> (F[Integer(3)] - Integer(2)*F[Integer(3),Integer(1),Integer(2)] + Integer(7)).
↪counit()
7
```

The antipode

The antipode sends the Fundamental basis element indexed by the composition I to $(-1)^{|I|}$ times the Fundamental basis element indexed by the conjugate composition to I (where $|I|$ stands for the size of I, that is, the sum of all entries of I).

```
sage: F[3,2,2].antipode()
-F[1, 2, 2, 1, 1]
sage: Composition([3,2,2]).conjugate()
[1, 2, 2, 1, 1]
```

```
>>> from sage.all import *
>>> F[Integer(3),Integer(2),Integer(2)].antipode()
-F[1, 2, 2, 1, 1]
>>> Composition([Integer(3),Integer(2),Integer(2)]).conjugate()
[1, 2, 2, 1, 1]
```

The antipodes of the Monomial quasisymmetric functions can also be computed easily: Every composition I satisfies

$$\omega(M_I) = (-1)^{\ell(I)} \sum M_J,$$

where the sum ranges over all compositions J of $|I|$ which are coarser than the reversed composition I^r of I. Here, $\ell(I)$ denotes the length of the composition I (that is, the number of its parts).

```
sage: M[3,2,1].antipode()
-M[1, 2, 3] - M[1, 5] - M[3, 3] - M[6]
sage: M[3,2,2].antipode()
-M[2, 2, 3] - M[2, 5] - M[4, 3] - M[7]
```

```
>>> from sage.all import *
>>> M[Integer(3),Integer(2),Integer(1)].antipode()
-M[1, 2, 3] - M[1, 5] - M[3, 3] - M[6]
>>> M[Integer(3),Integer(2),Integer(2)].antipode()
-M[2, 2, 3] - M[2, 5] - M[4, 3] - M[7]
```

We demonstrate here the defining relation of the antipode:

```
sage: X = F[3,2,2].coproduct()
sage: X.apply_multilinear_morphism(lambda x,y: x*y.antipode())
0
sage: X.apply_multilinear_morphism(lambda x,y: x.antipode()*y)
0
```

```
>>> from sage.all import *
>>> X = F[Integer(3),Integer(2),Integer(2)].coproduct()
>>> X.apply_multilinear_morphism(lambda x,y: x*y.antipode())
0
>>> X.apply_multilinear_morphism(lambda x,y: x.antipode()*y)
0
```

The relation with symmetric functions

The quasi-symmetric functions are a ring which contain the symmetric functions as a subring. The Monomial quasi-symmetric functions are related to the monomial symmetric functions by

$$m_\lambda = \sum_{\mathrm{sort}(I)=\lambda} M_I$$

(where $\mathrm{sort}(I)$ denotes the result of sorting the entries of I in decreasing order).

There are methods to test if an expression in the quasi-symmetric functions is a symmetric function and, if it is, send it to an expression in the symmetric functions:

```
sage: f = M[1,1,2] + M[1,2,1]
sage: f.is_symmetric()
False
sage: g = M[3,1] + M[1,3]
sage: g.is_symmetric()
True
sage: g.to_symmetric_function()
m[3, 1]
```

```
>>> from sage.all import *
>>> f = M[Integer(1),Integer(1),Integer(2)] + M[Integer(1),Integer(2),Integer(1)]
>>> f.is_symmetric()
False
>>> g = M[Integer(3),Integer(1)] + M[Integer(1),Integer(3)]
>>> g.is_symmetric()
True
>>> g.to_symmetric_function()
m[3, 1]
```

The expansion of the Schur function in terms of the Fundamental quasi-symmetric functions is due to [Ges]. There is one term in the expansion for each standard tableau of shape equal to the partition indexing the Schur function.

```
sage: f = F[3,2] + F[2,2,1] + F[2,3] + F[1,3,1] + F[1,2,2]
sage: f.is_symmetric()
True
sage: f.to_symmetric_function()
5*m[1, 1, 1, 1, 1] + 3*m[2, 1, 1, 1] + 2*m[2, 2, 1] + m[3, 1, 1] + m[3, 2]
sage: s = SymmetricFunctions(QQ).s()
sage: s(f.to_symmetric_function())
s[3, 2]
```

```
>>> from sage.all import *
>>> f = F[Integer(3),Integer(2)] + F[Integer(2),Integer(2),Integer(1)] +␣
↪F[Integer(2),Integer(3)] + F[Integer(1),Integer(3),Integer(1)] + F[Integer(1),
↪Integer(2),Integer(2)]
>>> f.is_symmetric()
True
>>> f.to_symmetric_function()
5*m[1, 1, 1, 1, 1] + 3*m[2, 1, 1, 1] + 2*m[2, 2, 1] + m[3, 1, 1] + m[3, 2]
>>> s = SymmetricFunctions(QQ).s()
>>> s(f.to_symmetric_function())
s[3, 2]
```

It is also possible to convert a symmetric function to a quasi-symmetric function:

```
sage: m = SymmetricFunctions(QQ).m()
sage: M( m[3,1,1] )
M[1, 1, 3] + M[1, 3, 1] + M[3, 1, 1]
sage: F( s[2,2,1] )
F[1, 1, 2, 1] + F[1, 2, 1, 1] + F[1, 2, 2] + F[2, 1, 2] + F[2, 2, 1]
```

```
>>> from sage.all import *
>>> m = SymmetricFunctions(QQ).m()
>>> M( m[Integer(3),Integer(1),Integer(1)] )
M[1, 1, 3] + M[1, 3, 1] + M[3, 1, 1]
>>> F( s[Integer(2),Integer(2),Integer(1)] )
F[1, 1, 2, 1] + F[1, 2, 1, 1] + F[1, 2, 2] + F[2, 1, 2] + F[2, 2, 1]
```

It is possible to experiment with the quasi-symmetric function expansion of other bases, but it is important that the base ring be the same for both algebras.

```
sage: R = QQ['t']
sage: Qp = SymmetricFunctions(R).hall_littlewood().Qp()
sage: QSymt = QuasiSymmetricFunctions(R)
sage: Ft = QSymt.F()
sage: Ft( Qp[2,2] )
F[1, 2, 1] + t*F[1, 3] + (t+1)*F[2, 2] + t*F[3, 1] + t^2*F[4]
```

```
>>> from sage.all import *
>>> R = QQ['t']
>>> Qp = SymmetricFunctions(R).hall_littlewood().Qp()
>>> QSymt = QuasiSymmetricFunctions(R)
>>> Ft = QSymt.F()
>>> Ft( Qp[Integer(2),Integer(2)] )
F[1, 2, 1] + t*F[1, 3] + (t+1)*F[2, 2] + t*F[3, 1] + t^2*F[4]
```

```
sage: K = QQ['q','t'].fraction_field()
sage: Ht = SymmetricFunctions(K).macdonald().Ht()
sage: Fqt = QuasiSymmetricFunctions(Ht.base_ring()).F()
sage: Fqt(Ht[2,1])
q*t*F[1, 1, 1] + (q+t)*F[1, 2] + (q+t)*F[2, 1] + F[3]
```

```
>>> from sage.all import *
>>> K = QQ['q','t'].fraction_field()
>>> Ht = SymmetricFunctions(K).macdonald().Ht()
>>> Fqt = QuasiSymmetricFunctions(Ht.base_ring()).F()
>>> Fqt(Ht[Integer(2),Integer(1)])
q*t*F[1, 1, 1] + (q+t)*F[1, 2] + (q+t)*F[2, 1] + F[3]
```

The following will raise an error because the base ring of `F` is not equal to the base ring of `Ht`:

```
sage: F(Ht[2,1])
Traceback (most recent call last):
...
TypeError: do not know how to make x (= McdHt[2, 1]) an element of self␣
↪(=Quasisymmetric functions over the Rational Field in the Fundamental basis)
```

```
>>> from sage.all import *
>>> F(Ht[Integer(2),Integer(1)])
Traceback (most recent call last):
...
TypeError: do not know how to make x (= McdHt[2, 1]) an element of self␣
↪(=Quasisymmetric functions over the Rational Field in the Fundamental basis)
```

The map to the ring of polynomials

The quasi-symmetric functions can be seen as an inverse limit of a subring of a polynomial ring as the number of variables increases. Indeed, there exists a projection from the quasi-symmetric functions onto the polynomial ring $R[x_1, x_2, \ldots, x_n]$. This projection is defined by sending the variables $x_{n+1}, x_{n+2}, \cdots$ to 0, while the remaining n variables remain fixed. Note that this projection sends M_I to 0 if the length of the composition I is higher than n.

```
sage: M[1,3,1].expand(4)
x0*x1^3*x2 + x0*x1^3*x3 + x0*x2^3*x3 + x1*x2^3*x3
sage: F[1,3,1].expand(4)
x0*x1^3*x2 + x0*x1^3*x3 + x0*x1^2*x2*x3 + x0*x1*x2^2*x3 + x0*x2^3*x3 + x1*x2^3*x3
sage: M[1,3,1].expand(2)
0
```

```
>>> from sage.all import *
>>> M[Integer(1),Integer(3),Integer(1)].expand(Integer(4))
x0*x1^3*x2 + x0*x1^3*x3 + x0*x2^3*x3 + x1*x2^3*x3
>>> F[Integer(1),Integer(3),Integer(1)].expand(Integer(4))
x0*x1^3*x2 + x0*x1^3*x3 + x0*x1^2*x2*x3 + x0*x1*x2^2*x3 + x0*x2^3*x3 + x1*x2^3*x3
>>> M[Integer(1),Integer(3),Integer(1)].expand(Integer(2))
0
```

class Bases(*parent_with_realization*)

Bases: `Category_realization_of_parent`

Category of bases of quasi-symmetric functions.

EXAMPLES:

```
sage: QSym = QuasiSymmetricFunctions(QQ)
sage: QSym.Bases()
Category of bases of Quasisymmetric functions over the Rational Field
```

```
>>> from sage.all import *
>>> QSym = QuasiSymmetricFunctions(QQ)
>>> QSym.Bases()
Category of bases of Quasisymmetric functions over the Rational Field
```

class ElementMethods

Bases: `object`

Methods common to all elements of `QuasiSymmetricFunctions`.

adams_operator(*n*)

Return the image of the quasi-symmetric function `self` under the n-th Adams operator.

The n-th Adams operator $\mathbf{f}_n$ is defined to be the map from the R-algebra of quasi-symmetric functions to itself that sends every symmetric function $P(x_1, x_2, x_3, \ldots)$ to $P(x_1^n, x_2^n, x_3^n, \ldots)$. This operator $\mathbf{f}_n$ is a Hopf algebra endomorphism, and satisfies

$$f_n M_{(i_1, i_2, i_3, \ldots)} = M_{(ni_1, ni_2, ni_3, \ldots)}$$

for every composition $(i_1, i_2, i_3, \ldots)$ (where M means the monomial basis).

The n-th Adams operator is also called the n-th Frobenius endomorphism. It is not related to the Frobenius map which connects the ring of symmetric functions with the representation theory of the symmetric group.

The n-th Adams operator is the n-th Adams operator of the Λ-ring of quasi-symmetric functions over the integers.

The restriction of the n-th Adams operator to the subring formed by all symmetric functions is, not unexpectedly, the n-th Adams operator of the ring of symmetric functions.

See also

Symmetric functions plethysm

INPUT:

- `n` – positive integer

OUTPUT:

The result of applying the n-th Adams operator (on the ring of quasi-symmetric functions) to `self`.

EXAMPLES:

```
sage: QSym = QuasiSymmetricFunctions(ZZ)
sage: M = QSym.M()
sage: F = QSym.F()
sage: M[3,2].adams_operator(2)
M[6, 4]
sage: (M[2,1] - 2*M[3]).adams_operator(4)
M[8, 4] - 2*M[12]
sage: M([]).adams_operator(3)
M[]
sage: F[1,1].adams_operator(2)
F[1, 1, 1, 1] - F[1, 1, 2] - F[2, 1, 1] + F[2, 2]
```

```
>>> from sage.all import *
>>> QSym = QuasiSymmetricFunctions(ZZ)
>>> M = QSym.M()
>>> F = QSym.F()
>>> M[Integer(3),Integer(2)].adams_operator(Integer(2))
M[6, 4]
>>> (M[Integer(2),Integer(1)] - Integer(2)*M[Integer(3)]).adams_
↪operator(Integer(4))
M[8, 4] - 2*M[12]
>>> M([]).adams_operator(Integer(3))
M[]
>>> F[Integer(1),Integer(1)].adams_operator(Integer(2))
F[1, 1, 1, 1] - F[1, 1, 2] - F[2, 1, 1] + F[2, 2]
```

The Adams endomorphisms are multiplicative:

```
sage: all( all( M(I).adams_operator(3) * M(J).adams_operator(3)
....:           == (M(I) * M(J)).adams_operator(3)
....:           for I in Compositions(3) )
....:      for J in Compositions(2) )
True
```

```
>>> from sage.all import *
>>> all( all( M(I).adams_operator(Integer(3)) * M(J).adams_
```

(continues on next page)

(continued from previous page)

```
↪operator(Integer(3))
...              == (M(I) * M(J)).adams_operator(Integer(3))
...              for I in Compositions(Integer(3)) )
...         for J in Compositions(Integer(2)) )
True
```

Being Hopf algebra endomorphisms, the Adams operators commute with the antipode:

```
sage: all( M(I).adams_operator(4).antipode()
....:      == M(I).antipode().adams_operator(4)
....:      for I in Compositions(3) )
True
```

```
>>> from sage.all import *
>>> all( M(I).adams_operator(Integer(4)).antipode()
...      == M(I).antipode().adams_operator(Integer(4))
...      for I in Compositions(Integer(3)) )
True
```

The restriction of the Adams operators to the subring of symmetric functions are the Adams operators of the latter:

```
sage: e = SymmetricFunctions(ZZ).e()
sage: all( M(e(lam)).adams_operator(3)
....:      == M(e(lam).adams_operator(3))
....:      for lam in Partitions(3) )
True
```

```
>>> from sage.all import *
>>> e = SymmetricFunctions(ZZ).e()
>>> all( M(e(lam)).adams_operator(Integer(3))
...      == M(e(lam).adams_operator(Integer(3)))
...      for lam in Partitions(Integer(3)) )
True
```

dendriform_leq(*other*)

Return the result of applying the dendriform smaller-or-equal operation to the two quasi-symmetric functions `self` and `other`.

The dendriform smaller-or-equal operation is a binary operation, denoted by $\preceq$ and written infix, on the ring of quasi-symmetric functions. It can be defined as a restriction of a binary operation (denoted by $\preceq$ and written infix as well) on the ring of formal power series $R[[x_1, x_2, x_3, \ldots]]$, which is defined as follows: If m and n are two monomials in $x_1, x_2, x_3, \ldots$, then we let $m \preceq n$ be the product mn if the smallest positive integer i for which x_i occurs in m is smaller or equal to the smallest positive integer j for which x_j occurs in n (this is understood to be false when $m = 1$ and $n \neq 1$, and true when $n = 1$), and we let $m \preceq n$ be 0 otherwise. Having thus defined $\preceq$ on monomials, we extend $\preceq$ to a binary operation on $R[[x_1, x_2, x_3, \ldots]]$ by requiring it to be continuous (in both inputs) and R-bilinear. It is easily seen that $QSym \preceq QSym \subseteq QSym$, so that $\preceq$ restricts to a binary operation on $QSym$.

This operation $\preceq$ is related to the dendriform smaller relation $\prec$ (`dendriform_less()`). Namely, if we define a binary operation $\succ$ on $QSym$ by $a \succ b = b \prec a$, then $(QSym, \preceq, \succ)$ is a dendriform R-algebra. Thus, any $a, b \in QSym$ satisfy $a \preceq b = ab - b \prec a$.

See also

dendriform_less()

INPUT:

- `other` – a quasi-symmetric function over the same base ring as `self`

OUTPUT:

The quasi-symmetric function `self` $\preceq$ `other`, written in the basis of `self`.

EXAMPLES:

```
sage: QSym = QuasiSymmetricFunctions(QQ)
sage: M = QSym.M()
sage: M[2, 1].dendriform_leq(M[1, 2])
2*M[2, 1, 1, 2] + M[2, 1, 2, 1] + M[2, 1, 3] + M[2, 2, 2]
 + M[3, 1, 2] + M[3, 2, 1] + M[3, 3]
sage: F = QSym.F()
sage: F[2, 1].dendriform_leq(F[1, 2])
F[2, 1, 1, 2] + F[2, 1, 2, 1] + F[2, 1, 3] + F[2, 2, 1, 1]
 + 2*F[2, 2, 2] + F[2, 3, 1] + F[3, 1, 2] + F[3, 2, 1] + F[3, 3]
```

```
>>> from sage.all import *
>>> QSym = QuasiSymmetricFunctions(QQ)
>>> M = QSym.M()
>>> M[Integer(2), Integer(1)].dendriform_leq(M[Integer(1), Integer(2)])
2*M[2, 1, 1, 2] + M[2, 1, 2, 1] + M[2, 1, 3] + M[2, 2, 2]
 + M[3, 1, 2] + M[3, 2, 1] + M[3, 3]
>>> F = QSym.F()
>>> F[Integer(2), Integer(1)].dendriform_leq(F[Integer(1), Integer(2)])
F[2, 1, 1, 2] + F[2, 1, 2, 1] + F[2, 1, 3] + F[2, 2, 1, 1]
 + 2*F[2, 2, 2] + F[2, 3, 1] + F[3, 1, 2] + F[3, 2, 1] + F[3, 3]
```

dendriform_less(*other*)

Return the result of applying the dendriform smaller operation to the two quasi-symmetric functions `self` and `other`.

The dendriform smaller operation is a binary operation, denoted by $\prec$ and written infix, on the ring of quasi-symmetric functions. It can be defined as a restriction of a binary operation (denoted by $\prec$ and written infix as well) on the ring of formal power series $R[[x_1, x_2, x_3, \ldots]]$, which is defined as follows: If m and n are two monomials in $x_1, x_2, x_3, \ldots$, then we let $m \prec n$ be the product mn if the smallest positive integer i for which x_i occurs in m is smaller than the smallest positive integer j for which x_j occurs in n (this is understood to be false when $m = 1$, and true when $m \neq 1$ and $n = 1$), and we let $m \prec n$ be 0 otherwise. Having thus defined $\prec$ on monomials, we extend $\prec$ to a binary operation on $R[[x_1, x_2, x_3, \ldots]]$ by requiring it to be continuous (in both inputs) and R-bilinear. It is easily seen that $QSym \prec QSym \subseteq QSym$, so that $\prec$ restricts to a binary operation on $QSym$.

See also

dendriform_leq()

INPUT:

- `other` – a quasi-symmetric function over the same base ring as `self`

OUTPUT:

The quasi-symmetric function `self` $\prec$ `other`, written in the basis of `self`.

EXAMPLES:

```
sage: QSym = QuasiSymmetricFunctions(QQ)
sage: M = QSym.M()
sage: M[2, 1].dendriform_less(M[1, 2])
2*M[2, 1, 1, 2] + M[2, 1, 2, 1] + M[2, 1, 3] + M[2, 2, 2]
sage: F = QSym.F()
sage: F[2, 1].dendriform_less(F[1, 2])
F[1, 1, 2, 1, 1] + F[1, 1, 2, 2] + F[1, 1, 3, 1]
 + F[1, 2, 1, 2] + F[1, 2, 2, 1] + F[1, 2, 3]
 + F[2, 1, 1, 2] + F[2, 1, 2, 1] + F[2, 1, 3] + F[2, 2, 2]
```

```
>>> from sage.all import *
>>> QSym = QuasiSymmetricFunctions(QQ)
>>> M = QSym.M()
>>> M[Integer(2), Integer(1)].dendriform_less(M[Integer(1),␣
↪Integer(2)])
2*M[2, 1, 1, 2] + M[2, 1, 2, 1] + M[2, 1, 3] + M[2, 2, 2]
>>> F = QSym.F()
>>> F[Integer(2), Integer(1)].dendriform_less(F[Integer(1),␣
↪Integer(2)])
F[1, 1, 2, 1, 1] + F[1, 1, 2, 2] + F[1, 1, 3, 1]
 + F[1, 2, 1, 2] + F[1, 2, 2, 1] + F[1, 2, 3]
 + F[2, 1, 1, 2] + F[2, 1, 2, 1] + F[2, 1, 3] + F[2, 2, 2]
```

The operation $\prec$ can be used to recursively construct the dual immaculate basis: For every positive integer m and every composition I, the dual immaculate function $\mathrm{dI}_{[m,I]}$ of the composition $[m, I]$ (this composition is I with m prepended to it) is $F_{[m]} \prec \mathrm{dI}_I$.

```
sage: dI = QSym.dI()
sage: dI(F[2]).dendriform_less(dI[1, 2])
dI[2, 1, 2]
```

```
>>> from sage.all import *
>>> dI = QSym.dI()
>>> dI(F[Integer(2)]).dendriform_less(dI[Integer(1), Integer(2)])
dI[2, 1, 2]
```

We check with the identity element:

```
sage: M.one().dendriform_less(M[1,2])
0
sage: M[1,2].dendriform_less(M.one())
M[1, 2]
```

```
>>> from sage.all import *
>>> M.one().dendriform_less(M[Integer(1),Integer(2)])
0
>>> M[Integer(1),Integer(2)].dendriform_less(M.one())
M[1, 2]
```

The operation $\prec$ is not symmetric, nor if $a \prec b \neq 0$, then $b \prec a = 0$ (as it would be for a single monomial):

```
sage: M[1,2,1].dendriform_less(M[1,2])
M[1, 1, 2, 1, 2] + 2*M[1, 1, 2, 2, 1] + M[1, 1, 2, 3]
 + M[1, 1, 4, 1] + 2*M[1, 2, 1, 1, 2] + M[1, 2, 1, 2, 1]
 + M[1, 2, 1, 3] + M[1, 2, 2, 2] + M[1, 3, 1, 2]
 + M[1, 3, 2, 1] + M[1, 3, 3]
sage: M[1,2].dendriform_less(M[1,2,1])
M[1, 1, 2, 1, 2] + 2*M[1, 1, 2, 2, 1] + M[1, 1, 2, 3]
 + M[1, 1, 4, 1] + M[1, 2, 1, 2, 1] + M[1, 3, 2, 1]
```

```
>>> from sage.all import *
>>> M[Integer(1),Integer(2),Integer(1)].dendriform_less(M[Integer(1),
→Integer(2)])
M[1, 1, 2, 1, 2] + 2*M[1, 1, 2, 2, 1] + M[1, 1, 2, 3]
 + M[1, 1, 4, 1] + 2*M[1, 2, 1, 1, 2] + M[1, 2, 1, 2, 1]
 + M[1, 2, 1, 3] + M[1, 2, 2, 2] + M[1, 3, 1, 2]
 + M[1, 3, 2, 1] + M[1, 3, 3]
>>> M[Integer(1),Integer(2)].dendriform_less(M[Integer(1),Integer(2),
→Integer(1)])
M[1, 1, 2, 1, 2] + 2*M[1, 1, 2, 2, 1] + M[1, 1, 2, 3]
 + M[1, 1, 4, 1] + M[1, 2, 1, 2, 1] + M[1, 3, 2, 1]
```

expand(*n*, *alphabet='x'*)

Expand the quasi-symmetric function into `n` variables in an alphabet, which by default is `'x'`.

INPUT:

- `n` – nonnegative integer; the number of variables in the expansion
- `alphabet` – (default: `'x'`) the alphabet in which `self` is to be expanded

OUTPUT: an expansion of `self` into the `n` variables specified by `alphabet`

EXAMPLES:

```
sage: F = QuasiSymmetricFunctions(QQ).Fundamental()
sage: F[3].expand(3)
x0^3 + x0^2*x1 + x0*x1^2 + x1^3 + x0^2*x2 + x0*x1*x2 + x1^2*x2 + x0*x2^
→2 + x1*x2^2 + x2^3
sage: F[2,1].expand(3)
x0^2*x1 + x0^2*x2 + x0*x1*x2 + x1^2*x2
```

```
>>> from sage.all import *
>>> F = QuasiSymmetricFunctions(QQ).Fundamental()
>>> F[Integer(3)].expand(Integer(3))
x0^3 + x0^2*x1 + x0*x1^2 + x1^3 + x0^2*x2 + x0*x1*x2 + x1^2*x2 + x0*x2^
→2 + x1*x2^2 + x2^3
>>> F[Integer(2),Integer(1)].expand(Integer(3))
x0^2*x1 + x0^2*x2 + x0*x1*x2 + x1^2*x2
```

One can use a different set of variable by adding an optional argument `alphabet=...`

```
sage: F = QuasiSymmetricFunctions(QQ).Fundamental()
sage: F[3].expand(2,alphabet='y')
y0^3 + y0^2*y1 + y0*y1^2 + y1^3
```

```
>>> from sage.all import *
>>> F = QuasiSymmetricFunctions(QQ).Fundamental()
>>> F[Integer(3)].expand(Integer(2),alphabet='y')
y0^3 + y0^2*y1 + y0*y1^2 + y1^3
```

frobenius(**args*, ***kwds*)

Deprecated: Use `adams_operator()` instead. See Issue #36396 for details.

internal_coproduct()

Return the inner coproduct of `self` in the basis of `self`.

The inner coproduct (also known as the Kronecker coproduct, or as the second comultiplication on the R-algebra of quasi-symmetric functions) is an R-algebra homomorphism $\Delta^\times$ from the R-algebra of quasi-symmetric functions to the tensor square (over R) of quasi-symmetric functions. It can be defined in the following two ways:

1. If I is a composition, then a $(0, I)$-matrix will mean a matrix whose entries are nonnegative integers such that no row and no column of this matrix is zero, and such that if all the nonzero entries of the matrix are read (row by row, starting at the topmost row, reading every row from left to right), then the reading word obtained is I. If A is a $(0, I)$-matrix, then row(A) will denote the vector of row sums of A (regarded as a composition), and column(A) will denote the vector of column sums of A (regarded as a composition).

   For every composition I, the internal coproduct $\Delta^\times(M_I)$ of the I-th monomial quasisymmetric function M_I is the sum

   $$\sum_{A \text{ is a } (0,I)\text{-matrix}} M_{\text{row}(A)} \otimes M_{\text{column}(A)}.$$

   See Section 11.39 of [HazWitt1].
2. For every permutation w, let $C(w)$ denote the descent composition of w. Then, for any composition I of size n, the internal coproduct $\Delta^\times(F_I)$ of the I-th fundamental quasisymmetric function F_I is the sum

   $$\sum_{\substack{\sigma\in S_n,\\ \tau\in S_n,\\ \tau\sigma=\pi}} F_{C(\sigma)} \otimes F_{C(\tau)},$$

   where π is any permutation in S_n having descent composition I and where permutations act from the left and multiply accordingly, so $\tau\sigma$ means first applying σ and then τ. See Theorem 4.23 in [Mal1993], but beware of the notations which are apparently different from those in [HazWitt1].

The restriction of the internal coproduct to the R-algebra of symmetric functions is the well-known internal coproduct on the symmetric functions.

The method `kronecker_coproduct()` is a synonym of this one.

EXAMPLES:

Let us compute the internal coproduct of M_{21} (which is short for $M_{[2,1]}$). The $(0, [2, 1])$-matrices are

$$\begin{bmatrix}2 & 1\end{bmatrix}, \begin{bmatrix}2\\1\end{bmatrix}, \begin{bmatrix}2 & 0\\0 & 1\end{bmatrix}, \text{ and } \begin{bmatrix}0 & 2\\1 & 0\end{bmatrix}$$

so

$$\Delta^\times(M_{21}) = M_3 \otimes M_{21} + M_{21} \otimes M_3 + M_{21} \otimes M_{21} + M_{21} \otimes M_{12}.$$

This is confirmed by the following Sage computation (incidentally demonstrating the non-cocommutativity of the internal coproduct):

```
sage: M = QuasiSymmetricFunctions(ZZ).M()
sage: a = M([2,1])
sage: a.internal_coproduct()
M[2, 1] # M[1, 2] + M[2, 1] # M[2, 1] + M[2, 1] # M[3] + M[3] # M[2, 1]
```

```
>>> from sage.all import *
>>> M = QuasiSymmetricFunctions(ZZ).M()
>>> a = M([Integer(2),Integer(1)])
>>> a.internal_coproduct()
M[2, 1] # M[1, 2] + M[2, 1] # M[2, 1] + M[2, 1] # M[3] + M[3] # M[2, 1]
```

Further examples:

```
sage: all( M([i]).internal_coproduct() == tensor([M([i]), M([i])])
....:      for i in range(1, 4) )
True

sage: M([1, 2]).internal_coproduct()
M[1, 2] # M[1, 2] + M[1, 2] # M[2, 1] + M[1, 2] # M[3] + M[3] # M[1, 2]
```

```
>>> from sage.all import *
>>> all( M([i]).internal_coproduct() == tensor([M([i]), M([i])])
...      for i in range(Integer(1), Integer(4)) )
True

>>> M([Integer(1), Integer(2)]).internal_coproduct()
M[1, 2] # M[1, 2] + M[1, 2] # M[2, 1] + M[1, 2] # M[3] + M[3] # M[1, 2]
```

The definition of $\Delta^{\times}(M_I)$ in terms of $(0, I)$-matrices is not suitable for computation in cases where the length of I is large, but we can use it as a doctest. Here is a naive implementation:

```
sage: def naive_internal_coproduct_on_M(I):
....:     # INPUT: composition I
....:     #        (not quasi-symmetric function)
....:     # OUTPUT: interior coproduct of M_I
....:     M = QuasiSymmetricFunctions(ZZ).M()
....:     M2 = M.tensor(M)
....:     res = M2.zero()
....:     l = len(I)
....:     n = I.size()
....:     for S in Subsets(range(l**2), l):
....:         M_list = sorted(S)
....:         row_M = [sum([I[M_list.index(l * i + j)]
....:                       for j in range(l) if
....:                       l * i + j in S])
....:                  for i in range(l)]
....:         col_M = [sum([I[M_list.index(l * i + j)]
....:                       for i in range(l) if
....:                       l * i + j in S])
....:                  for j in range(l)]
....:         if 0 in row_M:
....:             first_zero = row_M.index(0)
....:             row_M = row_M[:first_zero]
```

(continues on next page)

(continued from previous page)

```
....:             if sum(row_M) != n:
....:                 continue
....:         if 0 in col_M:
....:             first_zero = col_M.index(0)
....:             col_M = col_M[:first_zero]
....:             if sum(col_M) != n:
....:                 continue
....:         res += tensor([M(Compositions(n)(row_M)),
....:                        M(Compositions(n)(col_M))])
....:     return res
sage: all( naive_internal_coproduct_on_M(I)
....:      == M(I).internal_coproduct()
....:      for I in Compositions(3) )
True
```

```
>>> from sage.all import *
>>> def naive_internal_coproduct_on_M(I):
...     # INPUT: composition I
...     #        (not quasi-symmetric function)
...     # OUTPUT: interior coproduct of M_I
...     M = QuasiSymmetricFunctions(ZZ).M()
...     M2 = M.tensor(M)
...     res = M2.zero()
...     l = len(I)
...     n = I.size()
...     for S in Subsets(range(l**Integer(2)), l):
...         M_list = sorted(S)
...         row_M = [sum([I[M_list.index(l * i + j)]
...                       for j in range(l) if
...                       l * i + j in S])
...                  for i in range(l)]
...         col_M = [sum([I[M_list.index(l * i + j)]
...                       for i in range(l) if
...                       l * i + j in S])
...                  for j in range(l)]
...         if Integer(0) in row_M:
...             first_zero = row_M.index(Integer(0))
...             row_M = row_M[:first_zero]
...             if sum(row_M) != n:
...                 continue
...         if Integer(0) in col_M:
...             first_zero = col_M.index(Integer(0))
...             col_M = col_M[:first_zero]
...             if sum(col_M) != n:
...                 continue
...         res += tensor([M(Compositions(n)(row_M)),
...                        M(Compositions(n)(col_M))])
...     return res
>>> all( naive_internal_coproduct_on_M(I)
...      == M(I).internal_coproduct()
...      for I in Compositions(Integer(3)) )
True
```

Todo

Implement this directly on the monomial basis maybe? The $(0, I)$-matrices are a pain to generate from their definition, but maybe there is a good algorithm. If so, the above "further examples" should be moved to the M-method.

is_symmetric()

Return `True` if `self` is an element of the symmetric functions.

This is being tested by looking at the expansion in the Monomial basis and checking if the coefficients are the same if the indexing compositions are permutations of each other.

OUTPUT:

- `True` if `self` is symmetric. `False` if `self` is not symmetric.

EXAMPLES:

```
sage: QSym = QuasiSymmetricFunctions(QQ)
sage: F = QSym.Fundamental()
sage: (F[3,2] + F[2,3]).is_symmetric()
False
sage: (F[1, 1, 1, 2] + F[1, 1, 3] + F[1, 3, 1] + F[2, 1, 1, 1] + F[3,
↪1, 1]).is_symmetric()
True
sage: F([]).is_symmetric()
True
```

```
>>> from sage.all import *
>>> QSym = QuasiSymmetricFunctions(QQ)
>>> F = QSym.Fundamental()
>>> (F[Integer(3),Integer(2)] + F[Integer(2),Integer(3)]).is_
↪symmetric()
False
>>> (F[Integer(1), Integer(1), Integer(1), Integer(2)] + F[Integer(1),
↪Integer(1), Integer(3)] + F[Integer(1), Integer(3), Integer(1)] +
↪F[Integer(2), Integer(1), Integer(1), Integer(1)] + F[Integer(3),
↪Integer(1), Integer(1)]).is_symmetric()
True
>>> F([]).is_symmetric()
True
```

kronecker_coproduct()

Return the inner coproduct of `self` in the basis of `self`.

The inner coproduct (also known as the Kronecker coproduct, or as the second comultiplication on the R-algebra of quasi-symmetric functions) is an R-algebra homomorphism $\Delta^{\times}$ from the R-algebra of quasi-symmetric functions to the tensor square (over R) of quasi-symmetric functions. It can be defined in the following two ways:

1. If I is a composition, then a $(0, I)$-matrix will mean a matrix whose entries are nonnegative integers such that no row and no column of this matrix is zero, and such that if all the nonzero entries of the matrix are read (row by row, starting at the topmost row, reading every row from left to right), then the reading word obtained is I. If A is a $(0, I)$-matrix, then row(A) will denote the vector of row sums of A (regarded as a composition), and column(A) will denote the vector of column sums of A (regarded as a composition).

For every composition I, the internal coproduct $\Delta^\times(M_I)$ of the I-th monomial quasisymmetric function M_I is the sum

$$\sum_{A \text{ is a } (0,I)\text{-matrix}} M_{\text{row}(A)} \otimes M_{\text{column}(A)}.$$

See Section 11.39 of [HazWitt1].

2. For every permutation w, let $C(w)$ denote the descent composition of w. Then, for any composition I of size n, the internal coproduct $\Delta^\times(F_I)$ of the I-th fundamental quasisymmetric function F_I is the sum

$$\sum_{\substack{\sigma\in S_n,\\ \tau\in S_n,\\ \tau\sigma=\pi}} F_{C(\sigma)} \otimes F_{C(\tau)},$$

where π is any permutation in S_n having descent composition I and where permutations act from the left and multiply accordingly, so $\tau\sigma$ means first applying σ and then τ. See Theorem 4.23 in [Mal1993], but beware of the notations which are apparently different from those in [HazWitt1].

The restriction of the internal coproduct to the R-algebra of symmetric functions is the well-known internal coproduct on the symmetric functions.

The method `kronecker_coproduct()` is a synonym of this one.

EXAMPLES:

Let us compute the internal coproduct of M_{21} (which is short for $M_{[2,1]}$). The $(0,[2,1])$-matrices are

$$\begin{bmatrix}2 & 1\end{bmatrix}, \begin{bmatrix}2\\1\end{bmatrix}, \begin{bmatrix}2 & 0\\0 & 1\end{bmatrix}, \text{ and } \begin{bmatrix}0 & 2\\1 & 0\end{bmatrix}$$

so

$$\Delta^\times(M_{21}) = M_3 \otimes M_{21} + M_{21} \otimes M_3 + M_{21} \otimes M_{21} + M_{21} \otimes M_{12}.$$

This is confirmed by the following Sage computation (incidentally demonstrating the non-cocommutativity of the internal coproduct):

```
sage: M = QuasiSymmetricFunctions(ZZ).M()
sage: a = M([2,1])
sage: a.internal_coproduct()
M[2, 1] # M[1, 2] + M[2, 1] # M[2, 1] + M[2, 1] # M[3] + M[3] # M[2, 1]
```

```
>>> from sage.all import *
>>> M = QuasiSymmetricFunctions(ZZ).M()
>>> a = M([Integer(2),Integer(1)])
>>> a.internal_coproduct()
M[2, 1] # M[1, 2] + M[2, 1] # M[2, 1] + M[2, 1] # M[3] + M[3] # M[2, 1]
```

Further examples:

```
sage: all( M([i]).internal_coproduct() == tensor([M([i]), M([i])])
....:      for i in range(1, 4) )
True

sage: M([1, 2]).internal_coproduct()
M[1, 2] # M[1, 2] + M[1, 2] # M[2, 1] + M[1, 2] # M[3] + M[3] # M[1, 2]
```

```
>>> from sage.all import *
>>> all( M([i]).internal_coproduct() == tensor([M([i]), M([i])])
...      for i in range(Integer(1), Integer(4)) )
True

>>> M([Integer(1), Integer(2)]).internal_coproduct()
M[1, 2] # M[1, 2] + M[1, 2] # M[2, 1] + M[1, 2] # M[3] + M[3] # M[1, 2]
```

The definition of $\Delta^{\times}(M_I)$ in terms of $(0, I)$-matrices is not suitable for computation in cases where the length of I is large, but we can use it as a doctest. Here is a naive implementation:

```
sage: def naive_internal_coproduct_on_M(I):
....:     # INPUT: composition I
....:     #        (not quasi-symmetric function)
....:     # OUTPUT: interior coproduct of M_I
....:     M = QuasiSymmetricFunctions(ZZ).M()
....:     M2 = M.tensor(M)
....:     res = M2.zero()
....:     l = len(I)
....:     n = I.size()
....:     for S in Subsets(range(l**2), l):
....:         M_list = sorted(S)
....:         row_M = [sum([I[M_list.index(l * i + j)]
....:                       for j in range(l) if
....:                       l * i + j in S])
....:                  for i in range(l)]
....:         col_M = [sum([I[M_list.index(l * i + j)]
....:                       for i in range(l) if
....:                       l * i + j in S])
....:                  for j in range(l)]
....:         if 0 in row_M:
....:             first_zero = row_M.index(0)
....:             row_M = row_M[:first_zero]
....:             if sum(row_M) != n:
....:                 continue
....:         if 0 in col_M:
....:             first_zero = col_M.index(0)
....:             col_M = col_M[:first_zero]
....:             if sum(col_M) != n:
....:                 continue
....:         res += tensor([M(Compositions(n)(row_M)),
....:                        M(Compositions(n)(col_M))])
....:     return res
sage: all( naive_internal_coproduct_on_M(I)
....:      == M(I).internal_coproduct()
....:      for I in Compositions(3) )
True
```

```
>>> from sage.all import *
>>> def naive_internal_coproduct_on_M(I):
...     # INPUT: composition I
...     #        (not quasi-symmetric function)
...     # OUTPUT: interior coproduct of M_I
```

(continues on next page)

(continued from previous page)

```
...     M = QuasiSymmetricFunctions(ZZ).M()
...     M2 = M.tensor(M)
...     res = M2.zero()
...     l = len(I)
...     n = I.size()
...     for S in Subsets(range(l**Integer(2)), l):
...         M_list = sorted(S)
...         row_M = [sum([I[M_list.index(l * i + j)]
...                       for j in range(l) if
...                       l * i + j in S])
...                  for i in range(l)]
...         col_M = [sum([I[M_list.index(l * i + j)]
...                       for i in range(l) if
...                       l * i + j in S])
...                  for j in range(l)]
...         if Integer(0) in row_M:
...             first_zero = row_M.index(Integer(0))
...             row_M = row_M[:first_zero]
...             if sum(row_M) != n:
...                 continue
...         if Integer(0) in col_M:
...             first_zero = col_M.index(Integer(0))
...             col_M = col_M[:first_zero]
...             if sum(col_M) != n:
...                 continue
...         res += tensor([M(Compositions(n)(row_M)),
...                        M(Compositions(n)(col_M))])
...     return res
>>> all( naive_internal_coproduct_on_M(I)
...      == M(I).internal_coproduct()
...      for I in Compositions(Integer(3)) )
True
```

Todo

Implement this directly on the monomial basis maybe? The $(0, I)$-matrices are a pain to generate from their definition, but maybe there is a good algorithm. If so, the above "further examples" should be moved to the M-method.

omega_involution()

Return the image of the quasisymmetric function `self` under the omega involution.

The omega involution is defined as the linear map $QSym \to QSym$ which, for every composition I, sends the fundamental quasisymmetric function F_I to F_{I^t}, where I^t denotes the conjugate (`conjugate()`) of the composition I. This map is commonly denoted by ω. It is an algebra homomorphism and a coalgebra antihomomorphism; it also is an involution and an automorphism of the graded vector space $QSym$. Also, every composition I satisfies

$$\omega(M_I) = (-1)^{|I|-\ell(I)} \sum M_J,$$

where the sum ranges over all compositions J of $|I|$ which are coarser than the reversed composition I^r of I. Here, $\ell(I)$ denotes the length of the composition I (that is, the number of parts of I).

If f is a homogeneous element of $NCSF$ of degree n, then

$$\omega(f) = (-1)^n S(f),$$

where S denotes the antipode of $QSym$.

The restriction of ω to the ring of symmetric functions (which is a subring of $QSym$) is precisely the omega involution (`omega()`) of said ring.

The omega involution on $QSym$ is adjoint to the omega involution on $NCSF$ by the standard adjunction between $NCSF$ and $QSym$.

The omega involution has been denoted by ω in [LMvW13], section 3.6.

See also:

`omega involution on NCSF`, `psi involution on QSym`, `star involution on QSym`.

EXAMPLES:

```
sage: QSym = QuasiSymmetricFunctions(ZZ)
sage: F = QSym.F()
sage: F[3,2].omega_involution()
F[1, 2, 1, 1]
sage: F[6,3].omega_involution()
F[1, 1, 2, 1, 1, 1, 1, 1]
sage: (F[9,1] - F[8,2] + 2*F[2,4] - 3*F[3] + 4*F[[]]).omega_
↪involution()
4*F[] - 3*F[1, 1, 1] + 2*F[1, 1, 1, 2, 1] - F[1, 2, 1, 1, 1, 1, 1, 1,␣
↪1] + F[2, 1, 1, 1, 1, 1, 1, 1, 1]
sage: (F[3,3] - 2*F[2]).omega_involution()
-2*F[1, 1] + F[1, 1, 2, 1, 1]
sage: F([2,1,1]).omega_involution()
F[3, 1]
sage: M = QSym.M()
sage: M([2,1]).omega_involution()
-M[1, 2] - M[3]
sage: M.zero().omega_involution()
0
```

```
>>> from sage.all import *
>>> QSym = QuasiSymmetricFunctions(ZZ)
>>> F = QSym.F()
>>> F[Integer(3),Integer(2)].omega_involution()
F[1, 2, 1, 1]
>>> F[Integer(6),Integer(3)].omega_involution()
F[1, 1, 2, 1, 1, 1, 1, 1]
>>> (F[Integer(9),Integer(1)] - F[Integer(8),Integer(2)] +␣
↪Integer(2)*F[Integer(2),Integer(4)] - Integer(3)*F[Integer(3)] +␣
↪Integer(4)*F[[]]).omega_involution()
4*F[] - 3*F[1, 1, 1] + 2*F[1, 1, 1, 2, 1] - F[1, 2, 1, 1, 1, 1, 1, 1,␣
↪1] + F[2, 1, 1, 1, 1, 1, 1, 1, 1]
>>> (F[Integer(3),Integer(3)] - Integer(2)*F[Integer(2)]).omega_
```

(continues on next page)

(continued from previous page)

```
↪involution()
-2*F[1, 1] + F[1, 1, 2, 1, 1]
>>> F([Integer(2),Integer(1),Integer(1)]).omega_involution()
F[3, 1]
>>> M = QSym.M()

-M[1, 2] - M[3]
>>> M.zero().omega_involution()
0
```

Testing the fact that the restriction of ω to Sym is the omega automorphism of Sym:

```
sage: Sym = SymmetricFunctions(ZZ)
sage: e = Sym.e()
sage: all( F(e[lam]).omega_involution() == F(e[lam].omega())
....:      for lam in Partitions(4) )
True
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(ZZ)
>>> e = Sym.e()
>>> all( F(e[lam]).omega_involution() == F(e[lam].omega())
...      for lam in Partitions(Integer(4)) )
True
```

psi_involution()

Return the image of the quasisymmetric function `self` under the involution ψ.

The involution ψ is defined as the linear map $QSym \to QSym$ which, for every composition I, sends the fundamental quasisymmetric function F_I to F_{I^c}, where I^c denotes the complement of the composition I. The map ψ is an involution and a graded Hopf algebra automorphism of $QSym$. Its restriction to the ring of symmetric functions coincides with the omega automorphism of the latter ring.

The involution ψ of $QSym$ is adjoint to the involution ψ of $NCSF$ by the standard adjunction between $NCSF$ and $QSym$.

The involution ψ has been denoted by ψ in [LMvW13], section 3.6.

See also

psi involution on NCSF, *star involution on QSym*.

EXAMPLES:

```
sage: QSym = QuasiSymmetricFunctions(ZZ)
sage: F = QSym.F()
sage: F[3,2].psi_involution()
F[1, 1, 2, 1]
sage: F[6,3].psi_involution()
F[1, 1, 1, 1, 1, 2, 1, 1]
sage: (F[9,1] - F[8,2] + 2*F[2,4] - 3*F[3] + 4*F[[]]).psi_involution()
```

(continues on next page)

(continued from previous page)

```
4*F[] - 3*F[1, 1, 1] + F[1, 1, 1, 1, 1, 1, 1, 1, 2] - F[1, 1, 1, 1, 1,␣
↪1, 1, 2, 1] + 2*F[1, 2, 1, 1, 1]
sage: (F[3,3] - 2*F[2]).psi_involution()
-2*F[1, 1] + F[1, 1, 2, 1, 1]
sage: F([2,1,1]).psi_involution()
F[1, 3]
sage: M = QSym.M()
sage: M([2,1]).psi_involution()
-M[2, 1] - M[3]
sage: M.zero().psi_involution()
0
```

```
>>> from sage.all import *
>>> QSym = QuasiSymmetricFunctions(ZZ)
>>> F = QSym.F()
>>> F[Integer(3),Integer(2)].psi_involution()
F[1, 1, 2, 1]
>>> F[Integer(6),Integer(3)].psi_involution()
F[1, 1, 1, 1, 1, 2, 1, 1]
>>> (F[Integer(9),Integer(1)] - F[Integer(8),Integer(2)] +␣
↪Integer(2)*F[Integer(2),Integer(4)] - Integer(3)*F[Integer(3)] +␣
↪Integer(4)*F[[]]).psi_involution()
4*F[] - 3*F[1, 1, 1] + F[1, 1, 1, 1, 1, 1, 1, 1, 2] - F[1, 1, 1, 1, 1,␣
↪1, 1, 2, 1] + 2*F[1, 2, 1, 1, 1]
>>> (F[Integer(3),Integer(3)] - Integer(2)*F[Integer(2)]).psi_
↪involution()
-2*F[1, 1] + F[1, 1, 2, 1, 1]
>>> F([Integer(2),Integer(1),Integer(1)]).psi_involution()
F[1, 3]
>>> M = QSym.M()
>>> M([Integer(2),Integer(1)]).psi_involution()
-M[2, 1] - M[3]
>>> M.zero().psi_involution()
0
```

The involution ψ commutes with the antipode:

```
sage: all( F(I).psi_involution().antipode()
....:      == F(I).antipode().psi_involution()
....:      for I in Compositions(4) )
True
```

```
>>> from sage.all import *
>>> all( F(I).psi_involution().antipode()
...      == F(I).antipode().psi_involution()
...      for I in Compositions(Integer(4)) )
True
```

Testing the fact that the restriction of ψ to Sym is the omega automorphism of Sym:

```
sage: Sym = SymmetricFunctions(ZZ)
sage: e = Sym.e()
```

(continues on next page)

(continued from previous page)

```
sage: all( F(e[lam]).psi_involution() == F(e[lam].omega())
....:      for lam in Partitions(4) )
True
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(ZZ)
>>> e = Sym.e()
>>> all( F(e[lam]).psi_involution() == F(e[lam].omega())
...      for lam in Partitions(Integer(4)) )
True
```

star_involution()

Return the image of the quasisymmetric function `self` under the star involution.

The star involution is defined as the linear map $QSym \to QSym$ which, for every composition I, sends the monomial quasisymmetric function M_I to M_{I^r}. Here, if I is a composition, we denote by I^r the reversed composition of I. Denoting by f^* the image of an element $f \in QSym$ under the star involution, it can be shown that every composition I satisfies

$$(M_I)^* = M_{I^r}, \quad (F_I)^* = F_{I^r},$$

where F_I denotes the fundamental quasisymmetric function corresponding to the composition I. The star involution is an involution, an algebra automorphism and a coalgebra anti-automorphism of $QSym$. It also is an automorphism of the graded vector space $QSym$, and is the identity on the subspace Sym of $QSym$. It is adjoint to the star involution on $NCSF$ by the standard adjunction between $NCSF$ and $QSym$.

The star involution has been denoted by ρ in [LMvW13], section 3.6.

See also

star involution on NCSF.

EXAMPLES:

```
sage: QSym = QuasiSymmetricFunctions(ZZ)
sage: M = QSym.M()
sage: M[3,2].star_involution()
M[2, 3]
sage: M[6,3].star_involution()
M[3, 6]
sage: (M[9,1] - M[6,2] + 2*M[6,4] - 3*M[3] + 4*M[[]]).star_involution()
4*M[] + M[1, 9] - M[2, 6] - 3*M[3] + 2*M[4, 6]
sage: (M[3,3] - 2*M[2]).star_involution()
-2*M[2] + M[3, 3]
sage: M([4,2]).star_involution()
M[2, 4]
sage: dI = QSym.dI()
sage: dI([1,2]).star_involution()
-dI[1, 2] + dI[2, 1]
sage: dI.zero().star_involution()
0
```

```
>>> from sage.all import *
>>> QSym = QuasiSymmetricFunctions(ZZ)
>>> M = QSym.M()
>>> M[Integer(3),Integer(2)].star_involution()
M[2, 3]
>>> M[Integer(6),Integer(3)].star_involution()
M[3, 6]
>>> (M[Integer(9),Integer(1)] - M[Integer(6),Integer(2)] +␣
↪Integer(2)*M[Integer(6),Integer(4)] - Integer(3)*M[Integer(3)] +␣
↪Integer(4)*M[[]]).star_involution()
4*M[] + M[1, 9] - M[2, 6] - 3*M[3] + 2*M[4, 6]
>>> (M[Integer(3),Integer(3)] - Integer(2)*M[Integer(2)]).star_
↪involution()
-2*M[2] + M[3, 3]
>>> M([Integer(4),Integer(2)]).star_involution()
M[2, 4]
>>> dI = QSym.dI()
>>> dI([Integer(1),Integer(2)]).star_involution()
-dI[1, 2] + dI[2, 1]
>>> dI.zero().star_involution()
0
```

The star involution commutes with the antipode:

```
sage: all( M(I).star_involution().antipode()
....:      == M(I).antipode().star_involution()
....:      for I in Compositions(4) )
True
```

```
>>> from sage.all import *
>>> all( M(I).star_involution().antipode()
...      == M(I).antipode().star_involution()
...      for I in Compositions(Integer(4)) )
True
```

The star involution is the identity on Sym:

```
sage: Sym = SymmetricFunctions(ZZ)
sage: e = Sym.e()
sage: all( M(e(lam)).star_involution() == M(e(lam))
....:      for lam in Partitions(4) )
True
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(ZZ)
>>> e = Sym.e()
>>> all( M(e(lam)).star_involution() == M(e(lam))
...      for lam in Partitions(Integer(4)) )
True
```

to_symmetric_function()

Convert a quasi-symmetric function to a symmetric function.

OUTPUT:

- If `self` is a symmetric function, then return the expansion in the monomial basis. Otherwise raise an error.

EXAMPLES:

```
sage: QSym = QuasiSymmetricFunctions(QQ)
sage: F = QSym.Fundamental()
sage: (F[3,2] + F[2,3]).to_symmetric_function()
Traceback (most recent call last):
...
ValueError: F[2, 3] + F[3, 2] is not a symmetric function
sage: m = SymmetricFunctions(QQ).m()
sage: s = SymmetricFunctions(QQ).s()
sage: F(s[3,1,1]).to_symmetric_function()
6*m[1, 1, 1, 1, 1] + 3*m[2, 1, 1, 1] + m[2, 2, 1] + m[3, 1, 1]
sage: m(s[3,1,1])
6*m[1, 1, 1, 1, 1] + 3*m[2, 1, 1, 1] + m[2, 2, 1] + m[3, 1, 1]
```

```
>>> from sage.all import *
>>> QSym = QuasiSymmetricFunctions(QQ)
>>> F = QSym.Fundamental()
>>> (F[Integer(3),Integer(2)] + F[Integer(2),Integer(3)]).to_symmetric_
→function()
Traceback (most recent call last):
...
ValueError: F[2, 3] + F[3, 2] is not a symmetric function
>>> m = SymmetricFunctions(QQ).m()
>>> s = SymmetricFunctions(QQ).s()
>>> F(s[Integer(3),Integer(1),Integer(1)]).to_symmetric_function()
6*m[1, 1, 1, 1, 1] + 3*m[2, 1, 1, 1] + m[2, 2, 1] + m[3, 1, 1]
>>> m(s[Integer(3),Integer(1),Integer(1)])
6*m[1, 1, 1, 1, 1] + 3*m[2, 1, 1, 1] + m[2, 2, 1] + m[3, 1, 1]
```

class ParentMethods

Bases: `object`

Methods common to all bases of `QuasiSymmetricFunctions`.

Eulerian(*n*, *j*, *k=None*)

Return the Eulerian (quasi)symmetric function $Q_{n,j}$ in terms of `self`.

INPUT:

- `n` – the value n or a partition
- `j` – the number of excedances
- `k` – (optional) if specified, determines the number of fixed points of the permutation

EXAMPLES:

```
sage: QSym = QuasiSymmetricFunctions(QQ)
sage: M = QSym.M()
sage: M.Eulerian(3, 1)
4*M[1, 1, 1] + 3*M[1, 2] + 3*M[2, 1] + 2*M[3]
sage: M.Eulerian(4, 1, 2)
6*M[1, 1, 1, 1] + 4*M[1, 1, 2] + 4*M[1, 2, 1]
 + 2*M[1, 3] + 4*M[2, 1, 1] + 3*M[2, 2] + 2*M[3, 1] + M[4]
sage: QS = QSym.QS()
```

(continues on next page)

(continued from previous page)

```
sage: QS.Eulerian(4, 2)
2*QS[1, 3] + QS[2, 2] + 2*QS[3, 1] + 3*QS[4]
sage: QS.Eulerian([2, 2, 1], 2)
QS[1, 2, 2] + QS[1, 4] + QS[2, 1, 2] + QS[2, 2, 1]
 + QS[2, 3] + QS[3, 2] + QS[4, 1] + QS[5]
sage: dI = QSym.dI()
sage: dI.Eulerian(5, 2)
-dI[1, 3, 1] - 5*dI[1, 4] + dI[2, 2, 1] + dI[3, 1, 1]
 + 5*dI[3, 2] + 6*dI[4, 1] + 6*dI[5]
```

```
>>> from sage.all import *
>>> QSym = QuasiSymmetricFunctions(QQ)
>>> M = QSym.M()
>>> M.Eulerian(Integer(3), Integer(1))
4*M[1, 1, 1] + 3*M[1, 2] + 3*M[2, 1] + 2*M[3]
>>> M.Eulerian(Integer(4), Integer(1), Integer(2))
6*M[1, 1, 1, 1] + 4*M[1, 1, 2] + 4*M[1, 2, 1]
 + 2*M[1, 3] + 4*M[2, 1, 1] + 3*M[2, 2] + 2*M[3, 1] + M[4]
>>> QS = QSym.QS()
>>> QS.Eulerian(Integer(4), Integer(2))
2*QS[1, 3] + QS[2, 2] + 2*QS[3, 1] + 3*QS[4]
>>> QS.Eulerian([Integer(2), Integer(2), Integer(1)], Integer(2))
QS[1, 2, 2] + QS[1, 4] + QS[2, 1, 2] + QS[2, 2, 1]
 + QS[2, 3] + QS[3, 2] + QS[4, 1] + QS[5]
>>> dI = QSym.dI()
>>> dI.Eulerian(Integer(5), Integer(2))
-dI[1, 3, 1] - 5*dI[1, 4] + dI[2, 2, 1] + dI[3, 1, 1]
 + 5*dI[3, 2] + 6*dI[4, 1] + 6*dI[5]
```

from_polynomial(*f*, *check=True*)

The quasi-symmetric function expanded in this basis corresponding to the quasi-symmetric polynomial `f`.

This is a default implementation that computes the expansion in the Monomial basis and converts to this basis.

INPUT:

- `f` – a polynomial in finitely many variables over the same base ring as `self`. It is assumed that this polynomial is quasi-symmetric.
- `check` – boolean (default: `True`); checks whether the polynomial is indeed quasi-symmetric

OUTPUT: quasi-symmetric function

EXAMPLES:

```
sage: M = QuasiSymmetricFunctions(QQ).Monomial()
sage: F = QuasiSymmetricFunctions(QQ).Fundamental()
sage: P = PolynomialRing(QQ, 'x', 3)
sage: x = P.gens()
sage: f = x[0] + x[1] + x[2]
sage: M.from_polynomial(f)
M[1]
sage: F.from_polynomial(f)
F[1]
```

(continues on next page)

(continued from previous page)

```
sage: f = x[0]**2+x[1]**2+x[2]**2
sage: M.from_polynomial(f)
M[2]
sage: F.from_polynomial(f)
-F[1, 1] + F[2]
```

```
>>> from sage.all import *
>>> M = QuasiSymmetricFunctions(QQ).Monomial()
>>> F = QuasiSymmetricFunctions(QQ).Fundamental()
>>> P = PolynomialRing(QQ, 'x', Integer(3))
>>> x = P.gens()
>>> f = x[Integer(0)] + x[Integer(1)] + x[Integer(2)]
>>> M.from_polynomial(f)
M[1]
>>> F.from_polynomial(f)
F[1]
>>> f = x[Integer(0)]**Integer(2)+x[Integer(1)]**Integer(2)+x[Integer(2
↪)]**Integer(2)
>>> M.from_polynomial(f)
M[2]
>>> F.from_polynomial(f)
-F[1, 1] + F[2]
```

If the polynomial is not quasi-symmetric, an error is raised:

```
sage: f = x[0]^2+x[1]
sage: M.from_polynomial(f)
Traceback (most recent call last):
...
ValueError: x0^2 + x1 is not a quasi-symmetric polynomial
sage: F.from_polynomial(f)
Traceback (most recent call last):
...
ValueError: x0^2 + x1 is not a quasi-symmetric polynomial
```

```
>>> from sage.all import *
>>> f = x[Integer(0)]**Integer(2)+x[Integer(1)]
>>> M.from_polynomial(f)
Traceback (most recent call last):
...
ValueError: x0^2 + x1 is not a quasi-symmetric polynomial
>>> F.from_polynomial(f)
Traceback (most recent call last):
...
ValueError: x0^2 + x1 is not a quasi-symmetric polynomial
```

super_categories()

Return the super categories of bases of the Quasi-symmetric functions.

OUTPUT: list of categories

E

alias of *Essential*

class Essential(*QSym*)

Bases: `CombinatorialFreeModule`, `BindableClass`

The Hopf algebra of quasi-symmetric functions in the Essential basis.

The Essential quasi-symmetric functions are defined by

$$E_I = \sum_{J \geq I} M_J = \sum_{i_1 \leq \cdots \leq i_k} x_{i_1}^{I_1} \cdots x_{i_k}^{I_k},$$

where $I = (I_1, \ldots, I_k)$.

Note: Our convention of $\leq$ and $\geq$ of compositions is opposite that of [Hoff2015].

EXAMPLES:

```
sage: QSym = QuasiSymmetricFunctions(QQ)
sage: E = QSym.E()
sage: M = QSym.M()
sage: E(M[2,2])
E[2, 2] - E[4]
sage: s = SymmetricFunctions(QQ).s()
sage: E(s[3,2])
5*E[1, 1, 1, 1, 1] - 2*E[1, 1, 1, 2] - 2*E[1, 1, 2, 1]
 - 2*E[1, 2, 1, 1] + E[1, 2, 2] - 2*E[2, 1, 1, 1]
 + E[2, 1, 2] + E[2, 2, 1]
sage: (1 + E[1])^3
E[] + 3*E[1] + 6*E[1, 1] + 6*E[1, 1, 1] - 3*E[1, 2]
 - 3*E[2] - 3*E[2, 1] + E[3]
sage: E[1,2,1].coproduct()
E[] # E[1, 2, 1] + E[1] # E[2, 1] + E[1, 2] # E[1] + E[1, 2, 1] # E[]
```

```
>>> from sage.all import *
>>> QSym = QuasiSymmetricFunctions(QQ)
>>> E = QSym.E()
>>> M = QSym.M()
>>> E(M[Integer(2),Integer(2)])
E[2, 2] - E[4]
>>> s = SymmetricFunctions(QQ).s()
>>> E(s[Integer(3),Integer(2)])
5*E[1, 1, 1, 1, 1] - 2*E[1, 1, 1, 2] - 2*E[1, 1, 2, 1]
 - 2*E[1, 2, 1, 1] + E[1, 2, 2] - 2*E[2, 1, 1, 1]
 + E[2, 1, 2] + E[2, 2, 1]
>>> (Integer(1) + E[Integer(1)])**Integer(3)
E[] + 3*E[1] + 6*E[1, 1] + 6*E[1, 1, 1] - 3*E[1, 2]
 - 3*E[2] - 3*E[2, 1] + E[3]
>>> E[Integer(1),Integer(2),Integer(1)].coproduct()
E[] # E[1, 2, 1] + E[1] # E[2, 1] + E[1, 2] # E[1] + E[1, 2, 1] # E[]
```

The following is an alias for this basis:

```
sage: QSym.Essential()
Quasisymmetric functions over the Rational Field in the Essential basis
```

```
>>> from sage.all import *
>>> QSym.Essential()
Quasisymmetric functions over the Rational Field in the Essential basis
```

antipode_on_basis(*compo*)

Return the result of the antipode applied to a quasi-symmetric Essential basis element.

INPUT:

- `compo` – composition

OUTPUT:

- The result of the antipode applied to the composition `compo`, expressed in the Essential basis.

EXAMPLES:

```
sage: E = QuasiSymmetricFunctions(QQ).E()
sage: E.antipode_on_basis(Composition([2,1]))
E[1, 2] - E[3]
sage: E.antipode_on_basis(Composition([]))
E[]
```

```
>>> from sage.all import *
>>> E = QuasiSymmetricFunctions(QQ).E()
>>> E.antipode_on_basis(Composition([Integer(2),Integer(1)]))
E[1, 2] - E[3]
>>> E.antipode_on_basis(Composition([]))
E[]
```

coproduct_on_basis(*compo*)

Return the coproduct of a Essential basis element.

Combinatorial rule: deconcatenation.

INPUT:

- `compo` – composition

OUTPUT:

- The coproduct applied to the Essential quasi-symmetric function indexed by `compo`, expressed in the Essential basis.

EXAMPLES:

```
sage: E = QuasiSymmetricFunctions(QQ).Essential()
sage: E[4,2,3].coproduct()
E[] # E[4, 2, 3] + E[4] # E[2, 3] + E[4, 2] # E[3] + E[4, 2, 3] # E[]
sage: E.coproduct_on_basis(Composition([]))
E[] # E[]
```

```
>>> from sage.all import *
>>> E = QuasiSymmetricFunctions(QQ).Essential()
>>> E[Integer(4),Integer(2),Integer(3)].coproduct()
E[] # E[4, 2, 3] + E[4] # E[2, 3] + E[4, 2] # E[3] + E[4, 2, 3] # E[]
>>> E.coproduct_on_basis(Composition([]))
E[] # E[]
```

product_on_basis(*I*, *J*)

The product on Essential basis elements.

The product of the basis elements indexed by two compositions I and J is the sum of the basis elements indexed by compositions K in the stuffle product (also called the overlapping shuffle product) of I and J with a coefficient of $(-1)^{\ell(I)+\ell(J)-\ell(K)}$, where $\ell(C)$ is the length of the composition C.

INPUT:

- `I`, `J` – compositions

OUTPUT:

- The product of the Essential quasi-symmetric functions indexed by `I` and `J`, expressed in the Essential basis.

EXAMPLES:

```
sage: E = QuasiSymmetricFunctions(QQ).E()
sage: c1 = Composition([2])
sage: c2 = Composition([1,3])
sage: E.product_on_basis(c1, c2)
E[1, 2, 3] + E[1, 3, 2] - E[1, 5] + E[2, 1, 3] - E[3, 3]
sage: E.product_on_basis(c1, Composition([]))
E[2]
sage: E.product_on_basis(c1, Composition([3]))
E[2, 3] + E[3, 2] - E[5]
```

```
>>> from sage.all import *
>>> E = QuasiSymmetricFunctions(QQ).E()
>>> c1 = Composition([Integer(2)])
>>> c2 = Composition([Integer(1),Integer(3)])
>>> E.product_on_basis(c1, c2)
E[1, 2, 3] + E[1, 3, 2] - E[1, 5] + E[2, 1, 3] - E[3, 3]
>>> E.product_on_basis(c1, Composition([]))

```

F

alias of `Fundamental`

class Fundamental(*QSym*)

Bases: `CombinatorialFreeModule`, `BindableClass`

The Hopf algebra of quasi-symmetric functions in the Fundamental basis.

EXAMPLES:

```
sage: QSym = QuasiSymmetricFunctions(QQ)
sage: F = QSym.F()
sage: M = QSym.M()
sage: F(M[2,2])
F[1, 1, 1, 1] - F[1, 1, 2] - F[2, 1, 1] + F[2, 2]
sage: s = SymmetricFunctions(QQ).s()
sage: F(s[3,2])
F[1, 2, 2] + F[1, 3, 1] + F[2, 2, 1] + F[2, 3] + F[3, 2]
sage: (1+F[1])^3
F[] + 3*F[1] + 3*F[1, 1] + F[1, 1, 1] + 2*F[1, 2] + 3*F[2] + 2*F[2, 1] + F[3]
```

(continues on next page)

(continued from previous page)

```
sage: F[1,2,1].coproduct()
F[] # F[1, 2, 1] + F[1] # F[2, 1] + F[1, 1] # F[1, 1] + F[1, 2] # F[1] + F[1,
→2, 1] # F[]
```

```
>>> from sage.all import *
>>> QSym = QuasiSymmetricFunctions(QQ)
>>> F = QSym.F()
>>> M = QSym.M()
>>> F(M[Integer(2),Integer(2)])
F[1, 1, 1, 1] - F[1, 1, 2] - F[2, 1, 1] + F[2, 2]
>>> s = SymmetricFunctions(QQ).s()
>>> F(s[Integer(3),Integer(2)])
F[1, 2, 2] + F[1, 3, 1] + F[2, 2, 1] + F[2, 3] + F[3, 2]
>>> (Integer(1)+F[Integer(1)])**Integer(3)
F[] + 3*F[1] + 3*F[1, 1] + F[1, 1, 1] + 2*F[1, 2] + 3*F[2] + 2*F[2, 1] + F[3]
>>> F[Integer(1),Integer(2),Integer(1)].coproduct()
F[] # F[1, 2, 1] + F[1] # F[2, 1] + F[1, 1] # F[1, 1] + F[1, 2] # F[1] + F[1,
→2, 1] # F[]
```

The following is an alias for this basis:

```
sage: QSym.Fundamental()
Quasisymmetric functions over the Rational Field in the Fundamental basis
```

```
>>> from sage.all import *
>>> QSym.Fundamental()
Quasisymmetric functions over the Rational Field in the Fundamental basis
```

class Element

Bases: `IndexedFreeModuleElement`

internal_coproduct()

Return the inner coproduct of `self` in the Fundamental basis.

The inner coproduct (also known as the Kronecker coproduct, or as the second comultiplication on the R-algebra of quasi-symmetric functions) is an R-algebra homomorphism $\Delta^\times$ from the R-algebra of quasi-symmetric functions to the tensor square (over R) of quasi-symmetric functions. It can be defined in the following two ways:

1. If I is a composition, then a $(0, I)$-matrix will mean a matrix whose entries are nonnegative integers such that no row and no column of this matrix is zero, and such that if all the nonzero entries of the matrix are read (row by row, starting at the topmost row, reading every row from left to right), then the reading word obtained is I. If A is a $(0, I)$-matrix, then $\mathrm{row}(A)$ will denote the vector of row sums of A (regarded as a composition), and $\mathrm{column}(A)$ will denote the vector of column sums of A (regarded as a composition).

   For every composition I, the internal coproduct $\Delta^\times(M_I)$ of the I-th monomial quasisymmetric function M_I is the sum

$$\sum_{A \text{ is a } (0,I)\text{-matrix}} M_{\mathrm{row}(A)} \otimes M_{\mathrm{column}(A)}.$$

   See Section 11.39 of [HazWitt1].

2. For every permutation w, let $C(w)$ denote the descent composition of w. Then, for any composition I of size n, the internal coproduct $\Delta^\times(F_I)$ of the I-th fundamental quasisymmetric function

F_I is the sum

$$\sum_{\substack{\sigma \in S_n, \\ \tau \in S_n, \\ \tau\sigma = \pi}} F_{C(\sigma)} \otimes F_{C(\tau)},$$

where π is any permutation in S_n having descent composition I and where permutations act from the left and multiply accordingly, so $\tau\sigma$ means first applying σ and then τ. See Theorem 4.23 in [Mal1993], but beware of the notations which are apparently different from those in [HazWitt1].

The restriction of the internal coproduct to the R-algebra of symmetric functions is the well-known internal coproduct on the symmetric functions.

The method `kronecker_coproduct()` is a synonym of this one.

EXAMPLES:

Let us compute the internal coproduct of M_{21} (which is short for $M_{[2,1]}$). The $(0, [2, 1])$-matrices are

$$\begin{bmatrix} 2 & 1 \end{bmatrix}, \begin{bmatrix} 2 \\ 1 \end{bmatrix}, \begin{bmatrix} 2 & 0 \\ 0 & 1 \end{bmatrix}, \text{ and } \begin{bmatrix} 0 & 2 \\ 1 & 0 \end{bmatrix}$$

so

$$\Delta^{\times}(M_{21}) = M_3 \otimes M_{21} + M_{21} \otimes M_3 + M_{21} \otimes M_{21} + M_{21} \otimes M_{12}.$$

This is confirmed by the following Sage computation (incidentally demonstrating the non-cocommutativity of the internal coproduct):

```
sage: M = QuasiSymmetricFunctions(ZZ).M()
sage: a = M([2,1])
sage: a.internal_coproduct()
M[2, 1] # M[1, 2] + M[2, 1] # M[2, 1] + M[2, 1] # M[3] + M[3] # M[2, 1]
```

```
>>> from sage.all import *
>>> M = QuasiSymmetricFunctions(ZZ).M()
>>> a = M([Integer(2),Integer(1)])
>>> a.internal_coproduct()
M[2, 1] # M[1, 2] + M[2, 1] # M[2, 1] + M[2, 1] # M[3] + M[3] # M[2, 1]
```

Some examples on the Fundamental basis:

```
sage: F = QuasiSymmetricFunctions(ZZ).F()
sage: F([1,1]).internal_coproduct()
F[1, 1] # F[2] + F[2] # F[1, 1]
sage: F([2]).internal_coproduct()
F[1, 1] # F[1, 1] + F[2] # F[2]
sage: F([3]).internal_coproduct()
F[1, 1, 1] # F[1, 1, 1] + F[1, 2] # F[1, 2] + F[1, 2] # F[2, 1]
 + F[2, 1] # F[1, 2] + F[2, 1] # F[2, 1] + F[3] # F[3]
sage: F([1,2]).internal_coproduct()
F[1, 1, 1] # F[1, 2] + F[1, 2] # F[2, 1] + F[1, 2] # F[3]
 + F[2, 1] # F[1, 1, 1] + F[2, 1] # F[2, 1] + F[3] # F[1, 2]
```

```
>>> from sage.all import *
>>> F = QuasiSymmetricFunctions(ZZ).F()
```

(continues on next page)

(continued from previous page)

```
>>> F([Integer(1),Integer(1)]).internal_coproduct()
F[1, 1] # F[2] + F[2] # F[1, 1]
>>> F([Integer(2)]).internal_coproduct()
F[1, 1] # F[1, 1] + F[2] # F[2]
>>> F([Integer(3)]).internal_coproduct()
F[1, 1, 1] # F[1, 1, 1] + F[1, 2] # F[1, 2] + F[1, 2] # F[2, 1]
 + F[2, 1] # F[1, 2] + F[2, 1] # F[2, 1] + F[3] # F[3]
>>> F([Integer(1),Integer(2)]).internal_coproduct()
F[1, 1, 1] # F[1, 2] + F[1, 2] # F[2, 1] + F[1, 2] # F[3]
 + F[2, 1] # F[1, 1, 1] + F[2, 1] # F[2, 1] + F[3] # F[1, 2]
```

kronecker_coproduct()

Return the inner coproduct of `self` in the Fundamental basis.

The inner coproduct (also known as the Kronecker coproduct, or as the second comultiplication on the R-algebra of quasi-symmetric functions) is an R-algebra homomorphism $\Delta^{\times}$ from the R-algebra of quasi-symmetric functions to the tensor square (over R) of quasi-symmetric functions. It can be defined in the following two ways:

1. If I is a composition, then a $(0, I)$-matrix will mean a matrix whose entries are nonnegative integers such that no row and no column of this matrix is zero, and such that if all the nonzero entries of the matrix are read (row by row, starting at the topmost row, reading every row from left to right), then the reading word obtained is I. If A is a $(0, I)$-matrix, then row(A) will denote the vector of row sums of A (regarded as a composition), and column(A) will denote the vector of column sums of A (regarded as a composition).

   For every composition I, the internal coproduct $\Delta^{\times}(M_I)$ of the I-th monomial quasisymmetric function M_I is the sum

   $$\sum_{A \text{ is a } (0,I)\text{-matrix}} M_{\text{row}(A)} \otimes M_{\text{column}(A)}.$$

   See Section 11.39 of [HazWitt1].

2. For every permutation w, let $C(w)$ denote the descent composition of w. Then, for any composition I of size n, the internal coproduct $\Delta^{\times}(F_I)$ of the I-th fundamental quasisymmetric function F_I is the sum

   $$\sum_{\substack{\sigma \in S_n, \\ \tau \in S_n, \\ \tau\sigma = \pi}} F_{C(\sigma)} \otimes F_{C(\tau)},$$

   where π is any permutation in S_n having descent composition I and where permutations act from the left and multiply accordingly, so $\tau\sigma$ means first applying σ and then τ. See Theorem 4.23 in [Mal1993], but beware of the notations which are apparently different from those in [HazWitt1].

The restriction of the internal coproduct to the R-algebra of symmetric functions is the well-known internal coproduct on the symmetric functions.

The method `kronecker_coproduct()` is a synonym of this one.

EXAMPLES:

Let us compute the internal coproduct of M_{21} (which is short for $M_{[2,1]}$). The $(0, [2, 1])$-matrices are

$$\begin{bmatrix} 2 & 1 \end{bmatrix}, \begin{bmatrix} 2 \\ 1 \end{bmatrix}, \begin{bmatrix} 2 & 0 \\ 0 & 1 \end{bmatrix}, \text{ and } \begin{bmatrix} 0 & 2 \\ 1 & 0 \end{bmatrix}$$

so

$$\Delta^{\times}(M_{21}) = M_3 \otimes M_{21} + M_{21} \otimes M_3 + M_{21} \otimes M_{21} + M_{21} \otimes M_{12}.$$

This is confirmed by the following Sage computation (incidentally demonstrating the non-cocommutativity of the internal coproduct):

```
sage: M = QuasiSymmetricFunctions(ZZ).M()
sage: a = M([2,1])
sage: a.internal_coproduct()
M[2, 1] # M[1, 2] + M[2, 1] # M[2, 1] + M[2, 1] # M[3] + M[3] # M[2, 1]
```

```
>>> from sage.all import *
>>> M = QuasiSymmetricFunctions(ZZ).M()
>>> a = M([Integer(2),Integer(1)])
>>> a.internal_coproduct()
M[2, 1] # M[1, 2] + M[2, 1] # M[2, 1] + M[2, 1] # M[3] + M[3] # M[2, 1]
```

Some examples on the Fundamental basis:

```
sage: F = QuasiSymmetricFunctions(ZZ).F()
sage: F([1,1]).internal_coproduct()
F[1, 1] # F[2] + F[2] # F[1, 1]
sage: F([2]).internal_coproduct()
F[1, 1] # F[1, 1] + F[2] # F[2]
sage: F([3]).internal_coproduct()
F[1, 1, 1] # F[1, 1, 1] + F[1, 2] # F[1, 2] + F[1, 2] # F[2, 1]
 + F[2, 1] # F[1, 2] + F[2, 1] # F[2, 1] + F[3] # F[3]
sage: F([1,2]).internal_coproduct()
F[1, 1, 1] # F[1, 2] + F[1, 2] # F[2, 1] + F[1, 2] # F[3]
 + F[2, 1] # F[1, 1, 1] + F[2, 1] # F[2, 1] + F[3] # F[1, 2]
```

```
>>> from sage.all import *
>>> F = QuasiSymmetricFunctions(ZZ).F()
>>> F([Integer(1),Integer(1)]).internal_coproduct()
F[1, 1] # F[2] + F[2] # F[1, 1]
>>> F([Integer(2)]).internal_coproduct()
F[1, 1] # F[1, 1] + F[2] # F[2]
>>> F([Integer(3)]).internal_coproduct()
F[1, 1, 1] # F[1, 1, 1] + F[1, 2] # F[1, 2] + F[1, 2] # F[2, 1]
 + F[2, 1] # F[1, 2] + F[2, 1] # F[2, 1] + F[3] # F[3]
>>> F([Integer(1),Integer(2)]).internal_coproduct()
F[1, 1, 1] # F[1, 2] + F[1, 2] # F[2, 1] + F[1, 2] # F[3]
 + F[2, 1] # F[1, 1, 1] + F[2, 1] # F[2, 1] + F[3] # F[1, 2]
```

star_involution()

Return the image of the quasisymmetric function `self` under the star involution.

The star involution is defined as the linear map $QSym \to QSym$ which, for every composition I, sends the monomial quasisymmetric function M_I to M_{I^r}. Here, if I is a composition, we denote by I^r the reversed composition of I. Denoting by f^* the image of an element $f \in QSym$ under the star involution, it can be shown that every composition I satisfies

$$(M_I)^* = M_{I^r}, \quad (F_I)^* = F_{I^r},$$

where F_I denotes the fundamental quasisymmetric function corresponding to the composition I. The star involution is an involution, an algebra automorphism and a coalgebra anti-automorphism of $QSym$. It also is an automorphism of the graded vector space $QSym$, and is the identity on the subspace Sym of $QSym$. It is adjoint to the star involution on $NCSF$ by the standard adjunction between $NCSF$ and $QSym$.

The star involution has been denoted by ρ in [LMvW13], section 3.6.

See also:

star involution on QSym, *star involution on NCSF*.

EXAMPLES:

```
sage: QSym = QuasiSymmetricFunctions(ZZ)
sage: F = QSym.F()
sage: F[3,1].star_involution()
F[1, 3]
sage: F[5,3].star_involution()
F[3, 5]
sage: (F[9,1] - F[6,2] + 2*F[6,4] - 3*F[3] + 4*F[[]]).star_involution()
4*F[] + F[1, 9] - F[2, 6] - 3*F[3] + 2*F[4, 6]
sage: (F[3,3] - 2*F[2]).star_involution()
-2*F[2] + F[3, 3]
sage: F([4,2]).star_involution()
F[2, 4]
sage: dI = QSym.dI()
sage: dI([1,2]).star_involution()
-dI[1, 2] + dI[2, 1]
sage: dI.zero().star_involution()
0
```

```
>>> from sage.all import *
>>> QSym = QuasiSymmetricFunctions(ZZ)
>>> F = QSym.F()
>>> F[Integer(3),Integer(1)].star_involution()
F[1, 3]
>>> F[Integer(5),Integer(3)].star_involution()
F[3, 5]
>>> (F[Integer(9),Integer(1)] - F[Integer(6),Integer(2)] +␣
↪Integer(2)*F[Integer(6),Integer(4)] - Integer(3)*F[Integer(3)] +␣
↪Integer(4)*F[[]]).star_involution()
4*F[] + F[1, 9] - F[2, 6] - 3*F[3] + 2*F[4, 6]
>>> (F[Integer(3),Integer(3)] - Integer(2)*F[Integer(2)]).star_
↪involution()
-2*F[2] + F[3, 3]
>>> F([Integer(4),Integer(2)]).star_involution()
F[2, 4]
>>> dI = QSym.dI()
>>> dI([Integer(1),Integer(2)]).star_involution()
-dI[1, 2] + dI[2, 1]
>>> dI.zero().star_involution()
0
```

Eulerian(*n*, *j*, *k=None*)

Return the Eulerian (quasi)symmetric function $Q_{n,j}$ (with n either an integer or a partition) defined in

[SW2010] in terms of the fundamental quasisymmetric functions. Or, if the optional argument `k` is specified, return the function $Q_{n,j,k}$ defined ibidem.

If n and j are nonnegative integers, then the Eulerian quasisymmetric function $Q_{n,j}$ is defined as

$$Q_{n,j} := \sum_{\sigma} F_{\mathrm{Dex}(\sigma)},$$

where we sum over all permutations $\sigma \in S_n$ such that the number of excedances of σ is j, and where $\mathrm{Dex}(\sigma)$ is a composition of n defined as follows: Let S be the set of all $i \in \{1, 2, \ldots, n-1\}$ such that either $\sigma_i > \sigma_{i+1} > i+1$ or $i \geq \sigma_i > \sigma_{i+1}$ or $\sigma_{i+1} > i+1 > \sigma_i$. Then, $\mathrm{Dex}(\sigma)$ is set to be the composition of n whose descent set is S.

Here, an excedance of a permutation $\sigma \in S_n$ means an element $i \in \{1, 2, \ldots, n-1\}$ satisfying $\sigma_i > i$.

Similarly we can define a quasisymmetric function $Q_{\lambda,j}$ for every partition λ and every nonnegative integer j. This differs from $Q_{n,j}$ only in that the sum is restricted to all permutations $\sigma \in S_n$ whose cycle type is λ (where $n = |\lambda|$, and where we still require the number of excedances to be j). The method at hand allows computing these functions by passing λ as the `n` parameter.

Analogously we can define a quasisymmetric function $Q_{n,j,k}$ for any nonnegative integers n, j and k by restricting the sum to all permutations $\sigma \in S_n$ that have exactly k fixed points (and j excedances). This can be obtained by specifying the optional `k` argument in this method.

All three versions of Eulerian quasisymmetric functions ($Q_{n,j}$, $Q_{\lambda,j}$ and $Q_{n,j,k}$) are actually symmetric functions. See `Eulerian()`.

INPUT:

- `n` – the nonnegative integer n or a partition
- `j` – the number of excedances
- `k` – (optional) if specified, determines the number of fixed points of the permutations which are being summed over

EXAMPLES:

```
sage: F = QuasiSymmetricFunctions(QQ).F()
sage: F.Eulerian(3, 1)
F[1, 2] + F[2, 1] + 2*F[3]
sage: F.Eulerian(4, 2)
F[1, 2, 1] + 2*F[1, 3] + 3*F[2, 2] + 2*F[3, 1] + 3*F[4]
sage: F.Eulerian(5, 2)
F[1, 1, 2, 1] + F[1, 1, 3] + F[1, 2, 1, 1] + 7*F[1, 2, 2] + 6*F[1, 3, 1]
↪+ 6*F[1, 4] + 2*F[2, 1, 2] + 7*F[2, 2, 1] + 11*F[2, 3] + F[3, 1, 1] +

>>> F.Eulerian(Integer(1), Integer(1))
0
```

antipode_on_basis(*compo*)

Return the antipode to a Fundamental quasi-symmetric basis element.

INPUT:

- `compo` – composition

OUTPUT:

- The result of the antipode applied to the quasi-symmetric Fundamental basis element indexed by `compo`.

EXAMPLES:

```
sage: F = QuasiSymmetricFunctions(QQ).F()
sage: F.antipode_on_basis(Composition([2,1]))
-F[2, 1]
```

```
>>> from sage.all import *
>>> F = QuasiSymmetricFunctions(QQ).F()
>>> F.antipode_on_basis(Composition([Integer(2),Integer(1)]))
```

(continues on next page)

(continued from previous page)

```
-F[2, 1]
```

coproduct_on_basis(*compo*)

Return the coproduct to a Fundamental quasi-symmetric basis element.

Combinatorial rule: quasi-deconcatenation.

INPUT:

- compo – composition

OUTPUT:

- The application of the coproduct to the Fundamental quasi-symmetric function indexed by the composition compo.

EXAMPLES:

```
sage: F = QuasiSymmetricFunctions(QQ).Fundamental()
sage: F[4].coproduct()
F[] # F[4] + F[1] # F[3] + F[2] # F[2] + F[3] # F[1] + F[4] # F[]
sage: F[2,1,3].coproduct()
F[] # F[2, 1, 3] + F[1] # F[1, 1, 3] + F[2] # F[1, 3] + F[2, 1] # F[3] +
↪F[2, 1, 1] # F[2] + F[2, 1, 2] # F[1] + F[2, 1, 3] # F[]
```

```
>>> from sage.all import *
>>> F = QuasiSymmetricFunctions(QQ).Fundamental()
>>> F[Integer(4)].coproduct()
F[] # F[4] + F[1] # F[3] + F[2] # F[2] + F[3] # F[1] + F[4] # F[]
>>> F[Integer(2),Integer(1),Integer(3)].coproduct()
F[] # F[2, 1, 3] + F[1] # F[1, 1, 3] + F[2] # F[1, 3] + F[2, 1] # F[3] +
↪F[2, 1, 1] # F[2] + F[2, 1, 2] # F[1] + F[2, 1, 3] # F[]
```

dual()

Return the dual basis to the Fundamental basis. This is the ribbon basis of the non-commutative symmetric functions.

OUTPUT: the ribbon basis of the non-commutative symmetric functions

EXAMPLES:

```
sage: F = QuasiSymmetricFunctions(QQ).F()
sage: F.dual()
Non-Commutative Symmetric Functions over the Rational Field in the Ribbon
↪basis
```

```
>>> from sage.all import *
>>> F = QuasiSymmetricFunctions(QQ).F()
>>> F.dual()
Non-Commutative Symmetric Functions over the Rational Field in the Ribbon
↪basis
```

class HazewinkelLambda(*QSym*)

Bases: *CombinatorialFreeModule*, BindableClass

The Hazewinkel lambda basis of the quasi-symmetric functions.

This basis goes back to [Haz2004], albeit it is indexed in a different way here. It is a multiplicative basis in a weak sense of this word (the product of any two basis elements is a basis element, but of course not the one obtained by concatenating the indexing compositions).

In [Haz2004], Hazewinkel showed that the **k**-algebra QSym is a polynomial algebra. (The proof is correct but rests upon an unproven claim that the lexicographically largest term of the n-th shuffle power of a Lyndon word is the n-fold concatenation of this Lyndon word with itself, occurring $n!$ times in that shuffle power. But this can be deduced from Section 2 of [Rad1979]. See also Chapter 6 of [GriRei18], specifically Theorem 6.5.13, for a complete proof.) More precisely, he showed that QSym is generated, as a free commutative **k**-algebra, by the elements $\lambda^n(M_I)$, where n ranges over the positive integers, and I ranges over all compositions which are Lyndon words and whose entries have gcd 1. Here, λ^n denotes the n-th lambda operation as explained in `lambda_of_monomial()`.

Thus, products of these generators form a **k**-module basis of QSym. We index this basis by compositions here. More precisely, we define the Hazewinkel lambda basis $(\mathrm{HWL}_I)_I$ (with I ranging over all compositions) as follows:

Let I be a composition. Let $I = I_1 I_2 \ldots I_k$ be the Chen-Fox-Lyndon factorization of I (see `lyndon_factorization()`). For every $j \in \{1, 2, \ldots, k\}$, let g_j be the gcd of the entries of the Lyndon word I_j, and let J_j be the result of dividing the entries of I_j by this gcd. Then, HWL_I is defined to be $\prod_{j=1}^{k} \lambda^{g_j}(M_{J_j})$.

Todo

The conversion from the M basis to the HWL basis is currently implemented in the naive way (inverting the base-change matrix in the other direction). This matrix is not triangular (not even after any permutations of the bases), and there could very well be a faster method (the one given by Hazewinkel?).

EXAMPLES:

```
sage: QSym = QuasiSymmetricFunctions(ZZ)
sage: HWL = QSym.HazewinkelLambda()
sage: M = QSym.M()
sage: M(HWL([2]))
M[1, 1]
sage: M(HWL([1,1]))
2*M[1, 1] + M[2]
sage: M(HWL([1,2]))
M[1, 2]
sage: M(HWL([2,1]))
3*M[1, 1, 1] + M[1, 2] + M[2, 1]
sage: M(HWL(Composition([])))
M[]
sage: HWL(M([1,1]))
HWL[2]
sage: HWL(M(Composition([2])))
HWL[1, 1] - 2*HWL[2]
sage: HWL(M([1]))
HWL[1]
```

```
>>> from sage.all import *
>>> QSym = QuasiSymmetricFunctions(ZZ)
>>> HWL = QSym.HazewinkelLambda()
>>> M = QSym.M()
>>> M(HWL([Integer(2)]))
M[1, 1]
```

(continues on next page)

(continued from previous page)

```
>>> M(HWL([Integer(1),Integer(1)]))
2*M[1, 1] + M[2]
>>> M(HWL([Integer(1),Integer(2)]))
M[1, 2]
>>> M(HWL([Integer(2),Integer(1)]))
3*M[1, 1, 1] + M[1, 2] + M[2, 1]
>>> M(HWL(Composition([])))
M[]
>>> HWL(M([Integer(1),Integer(1)]))
HWL[2]
>>> HWL(M(Composition([Integer(2)])))
HWL[1, 1] - 2*HWL[2]
>>> HWL(M([Integer(1)]))
HWL[1]
```

product_on_basis(I, J)

The product on Hazewinkel Lambda basis elements.

The product of the basis elements indexed by two compositions I and J is the basis element obtained by concatenating the Lyndon factorizations of the words I and J, then reordering the Lyndon factors in nonincreasing order, and finally concatenating them in this order (giving a new composition).

INPUT:

- `I`, `J` – compositions

OUTPUT:

- The product of the Hazewinkel Lambda quasi-symmetric functions indexed by `I` and `J`, expressed in the Hazewinkel Lambda basis.

EXAMPLES:

```
sage: HWL = QuasiSymmetricFunctions(QQ).HazewinkelLambda()
sage: c1 = Composition([1, 2, 1])
sage: c2 = Composition([2, 1, 3, 2])
sage: HWL.product_on_basis(c1, c2)
HWL[2, 1, 3, 2, 1, 2, 1]
sage: HWL.product_on_basis(c1, Composition([]))
HWL[1, 2, 1]
sage: HWL.product_on_basis(Composition([]), Composition([]))
HWL[]
```

```
>>> from sage.all import *
>>> HWL = QuasiSymmetricFunctions(QQ).HazewinkelLambda()
>>> c1 = Composition([Integer(1), Integer(2), Integer(1)])
>>> c2 = Composition([Integer(2), Integer(1), Integer(3), Integer(2)])
>>> HWL.product_on_basis(c1, c2)
HWL[2, 1, 3, 2, 1, 2, 1]
>>> HWL.product_on_basis(c1, Composition([]))
HWL[1, 2, 1]
>>> HWL.product_on_basis(Composition([]), Composition([]))
HWL[]
```

M

alias of `Monomial`

class Monomial(*QSym*)

Bases: *CombinatorialFreeModule*, BindableClass

The Hopf algebra of quasi-symmetric function in the Monomial basis.

EXAMPLES:

```
sage: QSym = QuasiSymmetricFunctions(QQ)
sage: M = QSym.M()
sage: F = QSym.F()
sage: M(F[2,2])
M[1, 1, 1, 1] + M[1, 1, 2] + M[2, 1, 1] + M[2, 2]
sage: m = SymmetricFunctions(QQ).m()
sage: M(m[3,1,1])
M[1, 1, 3] + M[1, 3, 1] + M[3, 1, 1]
sage: (1+M[1])^3
M[] + 3*M[1] + 6*M[1, 1] + 6*M[1, 1, 1] + 3*M[1, 2] + 3*M[2] + 3*M[2, 1] +
→M[3]
sage: M[1,2,1].coproduct()
M[] # M[1, 2, 1] + M[1] # M[2, 1] + M[1, 2] # M[1] + M[1, 2, 1] # M[]
```

```
>>> from sage.all import *
>>> QSym = QuasiSymmetricFunctions(QQ)
>>> M = QSym.M()
>>> F = QSym.F()
>>> M(F[Integer(2),Integer(2)])
M[1, 1, 1, 1] + M[1, 1, 2] + M[2, 1, 1] + M[2, 2]
>>> m = SymmetricFunctions(QQ).m()
>>> M(m[Integer(3),Integer(1),Integer(1)])
M[1, 1, 3] + M[1, 3, 1] + M[3, 1, 1]
>>> (Integer(1)+M[Integer(1)])**Integer(3)
M[] + 3*M[1] + 6*M[1, 1] + 6*M[1, 1, 1] + 3*M[1, 2] + 3*M[2] + 3*M[2, 1] +
→M[3]
>>> M[Integer(1),Integer(2),Integer(1)].coproduct()
M[] # M[1, 2, 1] + M[1] # M[2, 1] + M[1, 2] # M[1] + M[1, 2, 1] # M[]
```

The following is an alias for this basis:

```
sage: QSym.Monomial()
Quasisymmetric functions over the Rational Field in the Monomial basis
```

```
>>> from sage.all import *
>>> QSym.Monomial()
Quasisymmetric functions over the Rational Field in the Monomial basis
```

class Element

Bases: IndexedFreeModuleElement

Element methods of the `Monomial` basis of `QuasiSymmetricFunctions`.

expand(*n*, *alphabet='x'*)

Expand the quasi-symmetric function written in the monomial basis in n variables.

INPUT:

- `n` – integer
- `alphabet` – string (default: `'x'`)

OUTPUT: the quasi-symmetric function `self` expressed in the n variables described by `alphabet`

Todo

accept an *alphabet* as input

EXAMPLES:

```
sage: M = QuasiSymmetricFunctions(QQ).Monomial()
sage: M[4,2].expand(3)
x0^4*x1^2 + x0^4*x2^2 + x1^4*x2^2
```

```
>>> from sage.all import *
>>> M = QuasiSymmetricFunctions(QQ).Monomial()
>>> M[Integer(4),Integer(2)].expand(Integer(3))
x0^4*x1^2 + x0^4*x2^2 + x1^4*x2^2
```

One can use a different set of variables by using the optional argument `alphabet`:

```
sage: M = QuasiSymmetricFunctions(QQ).Monomial()
sage: M[2,1,1].expand(4,alphabet='y')
y0^2*y1*y2 + y0^2*y1*y3 + y0^2*y2*y3 + y1^2*y2*y3
```

```
>>> from sage.all import *
>>> M = QuasiSymmetricFunctions(QQ).Monomial()
>>> M[Integer(2),Integer(1),Integer(1)].expand(Integer(4),alphabet='y')
y0^2*y1*y2 + y0^2*y1*y3 + y0^2*y2*y3 + y1^2*y2*y3
```

is_symmetric()

Determine if a quasi-symmetric function, written in the Monomial basis, is symmetric.

This is being tested by looking at the expansion in the Monomial basis and checking if the coefficients are the same if the indexing compositions are permutations of each other.

OUTPUT:

- `True` if `self` is an element of the symmetric functions and `False` otherwise.

EXAMPLES:

```
sage: QSym = QuasiSymmetricFunctions(QQ)
sage: M = QSym.Monomial()
sage: (M[3,2] + M[2,3] + M[4,1]).is_symmetric()
False
sage: (M[3,2] + M[2,3]).is_symmetric()
True
sage: (M[1,2,1] + M[1,1,2]).is_symmetric()
False
sage: (M[1,2,1] + M[1,1,2] + M[2,1,1]).is_symmetric()
True
```

```
>>> from sage.all import *
>>> QSym = QuasiSymmetricFunctions(QQ)
>>> M = QSym.Monomial()
>>> (M[Integer(3),Integer(2)] + M[Integer(2),Integer(3)] +
```

(continues on next page)

(continued from previous page)

```
↪M[Integer(4),Integer(1)]).is_symmetric()
False
>>> (M[Integer(3),Integer(2)] + M[Integer(2),Integer(3)]).is_
↪symmetric()
True
>>> (M[Integer(1),Integer(2),Integer(1)] + M[Integer(1),Integer(1),
↪Integer(2)]).is_symmetric()
False
>>> (M[Integer(1),Integer(2),Integer(1)] + M[Integer(1),Integer(1),
↪Integer(2)] + M[Integer(2),Integer(1),Integer(1)]).is_symmetric()
True
```

psi_involution()

Return the image of the quasisymmetric function `self` under the involution ψ.

The involution ψ is defined as the linear map $QSym \to QSym$ which, for every composition I, sends the fundamental quasisymmetric function F_I to F_{I^c}, where I^c denotes the complement of the composition I. The map ψ is an involution and a graded Hopf algebra automorphism of $QSym$. Its restriction to the ring of symmetric functions coincides with the omega automorphism of the latter ring.

The involution ψ of $QSym$ is adjoint to the involution ψ of $NCSF$ by the standard adjunction between $NCSF$ and $QSym$.

The involution ψ has been denoted by ψ in [LMvW13], section 3.6.

See also

psi involution on QSym, *psi involution on NCSF*, *star involution on QSym*.

EXAMPLES:

```
sage: QSym = QuasiSymmetricFunctions(ZZ)
sage: M = QSym.M()
sage: M[3,2].psi_involution()
-M[3, 2] - M[5]
sage: M[3,1].psi_involution()
M[3, 1] + M[4]
sage: M[3,1,1].psi_involution()
M[3, 1, 1] + M[3, 2] + M[4, 1] + M[5]
sage: M[1,1,1].psi_involution()
M[1, 1, 1] + M[1, 2] + M[2, 1] + M[3]
sage: M[[]].psi_involution()
M[]
sage: M(0).psi_involution()
0
sage: (2*M[[]] - M[3,1] + 4*M[2]).psi_involution()
2*M[] - 4*M[2] - M[3, 1] - M[4]
```

```
>>> from sage.all import *
>>> QSym = QuasiSymmetricFunctions(ZZ)
>>> M = QSym.M()
```

(continues on next page)

(continued from previous page)

```
>>> M[Integer(3),Integer(2)].psi_involution()
-M[3, 2] - M[5]
>>> M[Integer(3),Integer(1)].psi_involution()
M[3, 1] + M[4]
>>> M[Integer(3),Integer(1),Integer(1)].psi_involution()
M[3, 1, 1] + M[3, 2] + M[4, 1] + M[5]
>>> M[Integer(1),Integer(1),Integer(1)].psi_involution()
M[1, 1, 1] + M[1, 2] + M[2, 1] + M[3]
>>> M[[]].psi_involution()
M[]
>>> M(Integer(0)).psi_involution()
0
>>> (Integer(2)*M[[]] - M[Integer(3),Integer(1)] +␣
↪Integer(4)*M[Integer(2)]).psi_involution()
2*M[] - 4*M[2] - M[3, 1] - M[4]
```

This particular implementation is tailored to the monomial basis. It is semantically equivalent to the generic implementation it overshadows:

```
sage: F = QSym.F()
sage: all( F(M[I].psi_involution()) == F(M[I]).psi_involution()
....:      for I in Compositions(3) )
True

sage: F = QSym.F()
sage: all( F(M[I].psi_involution()) == F(M[I]).psi_involution()
....:      for I in Compositions(4) )
True
```

```
>>> from sage.all import *
>>> F = QSym.F()
>>> all( F(M[I].psi_involution()) == F(M[I]).psi_involution()
...      for I in Compositions(Integer(3)) )
True

>>> F = QSym.F()
>>> all( F(M[I].psi_involution()) == F(M[I]).psi_involution()
...      for I in Compositions(Integer(4)) )
True
```

to_symmetric_function()

Take a quasi-symmetric function, expressed in the monomial basis, and return its symmetric realization, when possible, expressed in the monomial basis of symmetric functions.

OUTPUT:

- If `self` is a symmetric function, then the expansion in the monomial basis of the symmetric functions is returned. Otherwise an error is raised.

EXAMPLES:

```
sage: QSym = QuasiSymmetricFunctions(QQ)
sage: M = QSym.Monomial()
sage: (M[3,2] + M[2,3] + M[4,1]).to_symmetric_function()
```

(continues on next page)

(continued from previous page)

```

↪symmetric_function()-m[Integer(2),Integer(1)]*m[Integer(2),
↪Integer(1)]
0
```

antipode_on_basis(*compo*)

Return the result of the antipode applied to a quasi-symmetric Monomial basis element.

INPUT:

- `compo` – composition

OUTPUT:

- The result of the antipode applied to the composition `compo`, expressed in the Monomial basis.

EXAMPLES:

```
sage: M = QuasiSymmetricFunctions(QQ).M()
sage: M.antipode_on_basis(Composition([2,1]))
M[1, 2] + M[3]
sage: M.antipode_on_basis(Composition([]))
M[]
```

```
>>> from sage.all import *
>>> M = QuasiSymmetricFunctions(QQ).M()
>>> M.antipode_on_basis(Composition([Integer(2),Integer(1)]))
M[1, 2] + M[3]
>>> M.antipode_on_basis(Composition([]))
M[]
```

coproduct_on_basis(*compo*)

Return the coproduct of a Monomial basis element.

Combinatorial rule: deconcatenation.

INPUT:

- compo – composition

OUTPUT:

- The coproduct applied to the Monomial quasi-symmetric function indexed by compo, expressed in the Monomial basis.

EXAMPLES:

```
sage: M = QuasiSymmetricFunctions(QQ).Monomial()
sage: M[4,2,3].coproduct()
M[] # M[4, 2, 3] + M[4] # M[2, 3] + M[4, 2] # M[3] + M[4, 2, 3] # M[]
sage: M.coproduct_on_basis(Composition([]))
M[] # M[]
```

```
>>> from sage.all import *
>>> M = QuasiSymmetricFunctions(QQ).Monomial()
>>> M[Integer(4),Integer(2),Integer(3)].coproduct()
M[] # M[4, 2, 3] + M[4] # M[2, 3] + M[4, 2] # M[3] + M[4, 2, 3] # M[]
>>> M.coproduct_on_basis(Composition([]))
M[] # M[]
```

dual()

Return the dual basis to the Monomial basis. This is the complete basis of the non-commutative symmetric functions.

OUTPUT: the complete basis of the non-commutative symmetric functions

EXAMPLES:

```
sage: M = QuasiSymmetricFunctions(QQ).M()
sage: M.dual()
Non-Commutative Symmetric Functions over the Rational Field in the␣
↪Complete basis
```

```
>>> from sage.all import *
>>> M = QuasiSymmetricFunctions(QQ).M()
>>> M.dual()
Non-Commutative Symmetric Functions over the Rational Field in the␣
↪Complete basis
```

lambda_of_monomial(I, n)

Return the image of the monomial quasi-symmetric function M_I under the lambda-map λ^n, expanded in the monomial basis.

The ring of quasi-symmetric functions over the integers, $\mathrm{QSym}_{\mathbf{Z}}$ (and more generally, the ring of quasi-symmetric functions over any binomial ring) becomes a λ-ring (with the λ-structure inherited from the ring of formal power series, so that $\lambda^i(x_j)$ is x_j if $i = 1$ and 0 if $i > 1$).

The Adams operations of this λ-ring are the Adams endomorphisms $\mathbf{f}_n$ (see *adams_operator()* for their definition). Using these endomorphisms, the λ-operations can be explicitly computed via the formula

$$\exp\left(-\sum_{n=1}^{\infty}\frac{1}{n}\mathbf{f}_n(x)t^n\right)=\sum_{j=0}^{\infty}(-1)^j\lambda^j(x)t^j$$

in the ring of formal power series in a variable t over the ring of quasi-symmetric functions. In particular, every composition $I=(I_1,I_2,\cdots,I_\ell)$ satisfies

$$\exp\left(-\sum_{n=1}^{\infty}\frac{1}{n}M_{(nI_1,nI_2,\cdots,nI_\ell)}t^n\right)=\sum_{j=0}^{\infty}(-1)^j\lambda^j(M_I)t^j$$

(corrected version of Remark 2.4 in [Haz2004]).

The quasi-symmetric functions $\lambda^i(M_I)$ with n ranging over the positive integers and I ranging over the reduced Lyndon compositions (i. e., compositions which are Lyndon words and have the gcd of their entries equal to 1) form a set of free polynomial generators for QSym. See [GriRei18], Chapter 6, for the proof, and [Haz2004] for a major part of it.

INPUT:

- `I` – composition
- `n` – nonnegative integer

OUTPUT:

The quasi-symmetric function $\lambda^n(M_I)$, expanded in the monomial basis over the ground ring of `self`.

EXAMPLES:

```
sage: M = QuasiSymmetricFunctions(CyclotomicField()).Monomial()
sage: M.lambda_of_monomial([1, 2], 2)
2*M[1, 1, 2, 2] + M[1, 1, 4] + M[1, 2, 1, 2] + M[1, 3, 2] + M[2, 2, 2]
sage: M.lambda_of_monomial([1, 1], 2)
3*M[1, 1, 1, 1] + M[1, 1, 2] + M[1, 2, 1] + M[2, 1, 1]
sage: M = QuasiSymmetricFunctions(Integers(19)).Monomial()
sage: M.lambda_of_monomial([1, 2], 3)
6*M[1, 1, 1, 2, 2, 2] + 3*M[1, 1, 1, 2, 4] + 3*M[1, 1, 1, 4, 2]
+ M[1, 1, 1, 6] + 4*M[1, 1, 2, 1, 2, 2] + 2*M[1, 1, 2, 1, 4]
+ 2*M[1, 1, 2, 2, 1, 2] + 2*M[1, 1, 2, 3, 2] + 4*M[1, 1, 3, 2, 2]
+ 2*M[1, 1, 3, 4] + M[1, 1, 4, 1, 2] + M[1, 1, 5, 2]
+ 2*M[1, 2, 1, 1, 2, 2] + M[1, 2, 1, 1, 4] + M[1, 2, 1, 2, 1, 2]
+ M[1, 2, 1, 3, 2] + 4*M[1, 2, 2, 2, 2] + M[1, 2, 2, 4] + M[1, 2, 4, 2]
+ 2*M[1, 3, 1, 2, 2] + M[1, 3, 1, 4] + M[1, 3, 2, 1, 2] + M[1, 3, 3, 2]
+ M[1, 4, 2, 2] + 3*M[2, 1, 2, 2, 2] + M[2, 1, 2, 4] + M[2, 1, 4, 2]
+ 2*M[2, 2, 1, 2, 2] + M[2, 2, 1, 4] + M[2, 2, 2, 1, 2] + M[2, 2, 3, 2]
+ 2*M[2, 3, 2, 2] + M[2, 3, 4] + M[3, 2, 2, 2]
```

```
>>> from sage.all import *
>>> M = QuasiSymmetricFunctions(CyclotomicField()).Monomial()
>>> M.lambda_of_monomial([Integer(1), Integer(2)], Integer(2))
2*M[1, 1, 2, 2] + M[1, 1, 4] + M[1, 2, 1, 2] + M[1, 3, 2] + M[2, 2, 2]
>>> M.lambda_of_monomial([Integer(1), Integer(1)], Integer(2))
3*M[1, 1, 1, 1] + M[1, 1, 2] + M[1, 2, 1] + M[2, 1, 1]
>>> M = QuasiSymmetricFunctions(Integers(Integer(19))).Monomial()
>>> M.lambda_of_monomial([Integer(1), Integer(2)], Integer(3))
6*M[1, 1, 1, 2, 2, 2] + 3*M[1, 1, 1, 2, 4] + 3*M[1, 1, 1, 4, 2]
+ M[1, 1, 1, 6] + 4*M[1, 1, 2, 1, 2, 2] + 2*M[1, 1, 2, 1, 4]
```

(continues on next page)

(continued from previous page)

```
+ 2*M[1, 1, 2, 2, 1, 2] + 2*M[1, 1, 2, 3, 2] + 4*M[1, 1, 3, 2, 2]
+ 2*M[1, 1, 3, 4] + M[1, 1, 4, 1, 2] + M[1, 1, 5, 2]
+ 2*M[1, 2, 1, 1, 2, 2] + M[1, 2, 1, 1, 4] + M[1, 2, 1, 2, 1, 2]
+ M[1, 2, 1, 3, 2] + 4*M[1, 2, 2, 2, 2] + M[1, 2, 2, 4] + M[1, 2, 4, 2]
+ 2*M[1, 3, 1, 2, 2] + M[1, 3, 1, 4] + M[1, 3, 2, 1, 2] + M[1, 3, 3, 2]
+ M[1, 4, 2, 2] + 3*M[2, 1, 2, 2, 2] + M[2, 1, 2, 4] + M[2, 1, 4, 2]
+ 2*M[2, 2, 1, 2, 2] + M[2, 2, 1, 4] + M[2, 2, 2, 1, 2] + M[2, 2, 3, 2]
+ 2*M[2, 3, 2, 2] + M[2, 3, 4] + M[3, 2, 2, 2]
```

The map λ^0 sends everything to 1:

```
sage: M = QuasiSymmetricFunctions(ZZ).Monomial()
sage: all( M.lambda_of_monomial(I, 0) == M.one()
....:      for I in Compositions(3) )
True
```

```
>>> from sage.all import *
>>> M = QuasiSymmetricFunctions(ZZ).Monomial()
>>> all( M.lambda_of_monomial(I, Integer(0)) == M.one()
...      for I in Compositions(Integer(3)) )
True
```

The map λ^1 is the identity map:

```
sage: M = QuasiSymmetricFunctions(QQ).Monomial()
sage: all( M.lambda_of_monomial(I, 1) == M(I)
....:      for I in Compositions(3) )
True
sage: M = QuasiSymmetricFunctions(Integers(5)).Monomial()
sage: all( M.lambda_of_monomial(I, 1) == M(I)
....:      for I in Compositions(3) )
True
sage: M = QuasiSymmetricFunctions(ZZ).Monomial()
sage: all( M.lambda_of_monomial(I, 1) == M(I)
....:      for I in Compositions(3) )
True
```

```
>>> from sage.all import *
>>> M = QuasiSymmetricFunctions(QQ).Monomial()
>>> all( M.lambda_of_monomial(I, Integer(1)) == M(I)
...      for I in Compositions(Integer(3)) )
True
>>> M = QuasiSymmetricFunctions(Integers(Integer(5))).Monomial()
>>> all( M.lambda_of_monomial(I, Integer(1)) == M(I)
...      for I in Compositions(Integer(3)) )
True
>>> M = QuasiSymmetricFunctions(ZZ).Monomial()
>>> all( M.lambda_of_monomial(I, Integer(1)) == M(I)
...      for I in Compositions(Integer(3)) )
True
```

product_on_basis (I, J)

The product on Monomial basis elements.

The product of the basis elements indexed by two compositions I and J is the sum of the basis elements indexed by compositions in the stuffle product (also called the overlapping shuffle product) of I and J.

INPUT:

- `I`, `J` – compositions

OUTPUT:

- The product of the Monomial quasi-symmetric functions indexed by `I` and `J`, expressed in the Monomial basis.

EXAMPLES:

```
sage: M = QuasiSymmetricFunctions(QQ).Monomial()
sage: c1 = Composition([2])
sage: c2 = Composition([1,3])
sage: M.product_on_basis(c1, c2)
M[1, 2, 3] + M[1, 3, 2] + M[1, 5] + M[2, 1, 3] + M[3, 3]
sage: M.product_on_basis(c1, Composition([]))
M[2]
```

```
>>> from sage.all import *
>>> M = QuasiSymmetricFunctions(QQ).Monomial()
>>> c1 = Composition([Integer(2)])
>>> c2 = Composition([Integer(1),Integer(3)])
>>> M.product_on_basis(c1, c2)
M[1, 2, 3] + M[1, 3, 2] + M[1, 5] + M[2, 1, 3] + M[3, 3]
>>> M.product_on_basis(c1, Composition([]))
M[2]
```

QS

alias of *Quasisymmetric_Schur*

class Quasisymmetric_Schur(*QSym*)

Bases: *CombinatorialFreeModule*, `BindableClass`

The Hopf algebra of quasi-symmetric function in the Quasisymmetric Schur basis.

The basis of Quasisymmetric Schur functions is defined in [QSCHUR] and in Definition 5.1.1 of [LMvW13]. Don't mistake them for the completely unrelated quasi-Schur functions of [NCSF1]!

EXAMPLES:

```
sage: QSym = QuasiSymmetricFunctions(QQ)
sage: QS = QSym.QS()
sage: F = QSym.F()
sage: M = QSym.M()
sage: F(QS[1,2])
F[1, 2]
sage: M(QS[1,2])
M[1, 1, 1] + M[1, 2]
sage: s = SymmetricFunctions(QQ).s()
sage: QS(s[2,1,1])
QS[1, 1, 2] + QS[1, 2, 1] + QS[2, 1, 1]
```

```
>>> from sage.all import *
>>> QSym = QuasiSymmetricFunctions(QQ)
>>> QS = QSym.QS()
```

(continues on next page)

(continued from previous page)

```
>>> F = QSym.F()
>>> M = QSym.M()
>>> F(QS[Integer(1),Integer(2)])
F[1, 2]
>>> M(QS[Integer(1),Integer(2)])
M[1, 1, 1] + M[1, 2]
>>> s = SymmetricFunctions(QQ).s()
>>> QS(s[Integer(2),Integer(1),Integer(1)])
QS[1, 1, 2] + QS[1, 2, 1] + QS[2, 1, 1]
```

dual()

The dual basis to the Quasisymmetric Schur basis.

The dual basis to the Quasisymmetric Schur basis is implemented as dual.

OUTPUT:

- the dual Quasisymmetric Schur basis of the non-commutative symmetric functions

EXAMPLES:

```
sage: QS = QuasiSymmetricFunctions(QQ).Quasisymmetric_Schur()
sage: QS.dual()
Non-Commutative Symmetric Functions over the Rational Field
 in the dual Quasisymmetric-Schur basis
```

```
>>> from sage.all import *
>>> QS = QuasiSymmetricFunctions(QQ).Quasisymmetric_Schur()
>>> QS.dual()
Non-Commutative Symmetric Functions over the Rational Field
 in the dual Quasisymmetric-Schur basis
```

YQS

alias of *Young_Quasisymmetric_Schur*

class Young_Quasisymmetric_Schur(*QSym*)

Bases: *CombinatorialFreeModule*, BindableClass

The Hopf algebra of quasi-symmetric functions in the Young Quasisymmetric Schur basis.

The basis of Young Quasisymmetric Schur functions is from Definition 5.2.1 of [LMvW13].

This basis is related to the Quasisymmetric Schur basis `QS` by `QS(alpha.reversed()) == YQS(alpha).star_involution()`.

EXAMPLES:

```
sage: QSym = QuasiSymmetricFunctions(QQ)
sage: YQS = QSym.YQS()
sage: F = QSym.F()
sage: QS = QSym.QS()
sage: F(YQS[1,2])
F[1, 2]
sage: all(QS(al.reversed())==YQS(al).star_involution() for al in
↪Compositions(5))
True
sage: s = SymmetricFunctions(QQ).s()
```

(continues on next page)

(continued from previous page)

```
sage: YQS(s[2,1,1])
YQS[1, 1, 2] + YQS[1, 2, 1] + YQS[2, 1, 1]
```

```
>>> from sage.all import *
>>> QSym = QuasiSymmetricFunctions(QQ)
>>> YQS = QSym.YQS()
>>> F = QSym.F()
>>> QS = QSym.QS()
>>> F(YQS[Integer(1),Integer(2)])
F[1, 2]
>>> all(QS(al.reversed())==YQS(al).star_involution() for al in␣
↪Compositions(Integer(5)))
True
>>> s = SymmetricFunctions(QQ).s()
>>> YQS(s[Integer(2),Integer(1),Integer(1)])
YQS[1, 1, 2] + YQS[1, 2, 1] + YQS[2, 1, 1]
```

a_realization()

Return the realization of the Monomial basis of the ring of quasi-symmetric functions.

OUTPUT: the Monomial basis of quasi-symmetric functions

EXAMPLES:

```
sage: QuasiSymmetricFunctions(QQ).a_realization()
Quasisymmetric functions over the Rational Field in the Monomial basis
```

```
>>> from sage.all import *
>>> QuasiSymmetricFunctions(QQ).a_realization()
Quasisymmetric functions over the Rational Field in the Monomial basis
```

dI

alias of *dualImmaculate*

dual()

Return the dual Hopf algebra of the quasi-symmetric functions, which is the non-commutative symmetric functions.

OUTPUT: the non-commutative symmetric functions

EXAMPLES:

```
sage: QSym = QuasiSymmetricFunctions(QQ)
sage: QSym.dual()
Non-Commutative Symmetric Functions over the Rational Field
```

```
>>> from sage.all import *
>>> QSym = QuasiSymmetricFunctions(QQ)
>>> QSym.dual()
Non-Commutative Symmetric Functions over the Rational Field
```

class dualImmaculate(*QSym*)

Bases: *CombinatorialFreeModule*, BindableClass

The dual immaculate basis of the quasi-symmetric functions.

This basis first appears in [BBSSZ2012].

EXAMPLES:

```
sage: QSym = QuasiSymmetricFunctions(QQ)
sage: dI = QSym.dI()
sage: dI([1,3,2])*dI([1])  # long time (6s on sage.math, 2013)
dI[1, 1, 3, 2] + dI[2, 3, 2]
sage: dI([1,3])*dI([1,1])
dI[1, 1, 1, 3] + dI[1, 1, 4] + dI[1, 2, 3] - dI[1, 3, 2] - dI[1, 4, 1] - dI[1,
→ 5] + dI[2, 3, 1] + dI[2, 4]
sage: dI([3,1])*dI([2,1])  # long time (7s on sage.math, 2013)
dI[1, 1, 5] - dI[1, 4, 1, 1] - dI[1, 4, 2] - 2*dI[1, 5, 1] - dI[1, 6] - dI[2,␣
→4, 1] - dI[2, 5] - dI[3, 1, 3] + dI[3, 2, 1, 1] + dI[3, 2, 2] + dI[3, 3, 1]␣
→+ dI[4, 1, 1, 1] + 2*dI[4, 2, 1] + dI[4, 3] + dI[5, 1, 1] + dI[5, 2]
sage: F = QSym.F()
sage: dI(F[1,3,1])
-dI[1, 1, 1, 2] + dI[1, 1, 2, 1] - dI[1, 2, 2] + dI[1, 3, 1]
sage: F(dI(F([2,1,3])))
F[2, 1, 3]
```

```
>>> from sage.all import *
>>> QSym = QuasiSymmetricFunctions(QQ)
>>> dI = QSym.dI()
>>> dI([Integer(1),Integer(3),Integer(2)])*dI([Integer(1)])  # long time (6s␣
→on sage.math, 2013)
dI[1, 1, 3, 2] + dI[2, 3, 2]
>>> dI([Integer(1),Integer(3)])*dI([Integer(1),Integer(1)])
dI[1, 1, 1, 3] + dI[1, 1, 4] + dI[1, 2, 3] - dI[1, 3, 2] - dI[1, 4, 1] - dI[1,
→ 5] + dI[2, 3, 1] + dI[2, 4]
>>> dI([Integer(3),Integer(1)])*dI([Integer(2),Integer(1)])  # long time (7s␣
→on sage.math, 2013)
dI[1, 1, 5] - dI[1, 4, 1, 1] - dI[1, 4, 2] - 2*dI[1, 5, 1] - dI[1, 6] - dI[2,␣
→4, 1] - dI[2, 5] - dI[3, 1, 3] + dI[3, 2, 1, 1] + dI[3, 2, 2] + dI[3, 3, 1]␣
→+ dI[4, 1, 1, 1] + 2*dI[4, 2, 1] + dI[4, 3] + dI[5, 1, 1] + dI[5, 2]
>>> F = QSym.F()
>>> dI(F[Integer(1),Integer(3),Integer(1)])
-dI[1, 1, 1, 2] + dI[1, 1, 2, 1] - dI[1, 2, 2] + dI[1, 3, 1]
>>> F(dI(F([Integer(2),Integer(1),Integer(3)])))
F[2, 1, 3]
```

from_polynomial(*f*, *check=True*)

Return the quasi-symmetric function in the Monomial basis corresponding to the quasi-symmetric polynomial `f`.

INPUT:

- `f` – a polynomial in finitely many variables over the same base ring as `self`. It is assumed that this polynomial is quasi-symmetric.
- `check` – boolean (default: `True`); checks whether the polynomial is indeed quasi-symmetric

OUTPUT: quasi-symmetric function in the Monomial basis

EXAMPLES:

```
sage: P = PolynomialRing(QQ, 'x', 3)
sage: x = P.gens()
sage: f = x[0] + x[1] + x[2]
sage: QSym = QuasiSymmetricFunctions(QQ)
sage: QSym.from_polynomial(f)
M[1]
```

```
>>> from sage.all import *
>>> P = PolynomialRing(QQ, 'x', Integer(3))
>>> x = P.gens()
>>> f = x[Integer(0)] + x[Integer(1)] + x[Integer(2)]
>>> QSym = QuasiSymmetricFunctions(QQ)
>>> QSym.from_polynomial(f)
M[1]
```

Beware of setting `check=False`:

```
sage: f = x[0] + 2*x[1] + x[2]
sage: QSym.from_polynomial(f, check=True)
Traceback (most recent call last):
...
ValueError: x0 + 2*x1 + x2 is not a quasi-symmetric polynomial
sage: QSym.from_polynomial(f, check=False)
M[1]
```

```
>>> from sage.all import *
>>> f = x[Integer(0)] + Integer(2)*x[Integer(1)] + x[Integer(2)]
>>> QSym.from_polynomial(f, check=True)
Traceback (most recent call last):
...
ValueError: x0 + 2*x1 + x2 is not a quasi-symmetric polynomial
>>> QSym.from_polynomial(f, check=False)
M[1]
```

To expand the quasi-symmetric function in a basis other than the Monomial basis, the following shorthands are provided:

```
sage: M = QSym.Monomial()
sage: f = x[0]**2+x[1]**2+x[2]**2
sage: g = M.from_polynomial(f); g
M[2]
sage: F = QSym.Fundamental()
sage: F(g)
-F[1, 1] + F[2]
sage: F.from_polynomial(f)
-F[1, 1] + F[2]
```

```
>>> from sage.all import *
>>> M = QSym.Monomial()
>>> f =␣
↪x[Integer(0)]**Integer(2)+x[Integer(1)]**Integer(2)+x[Integer(2)]**Integer(2)
>>> g = M.from_polynomial(f); g
```

(continues on next page)

(continued from previous page)

```
M[2]
>>> F = QSym.Fundamental()
>>> F(g)
-F[1, 1] + F[2]
>>> F.from_polynomial(f)
-F[1, 1] + F[2]
```

class phi(*QSym*)

Bases: `CombinatorialFreeModule`, `BindableClass`

The Hopf algebra of quasi-symmetric functions in the ϕ basis.

The ϕ basis is defined as a rescaled Hopf dual of the Φ basis of the non-commutative symmetric functions (see Section 3.1 of [BDHMN2017]), where the pairing is

$$(\phi_I, \Phi_J) = z_I \delta_{I,J},$$

where $z_I = 1^{m_1} m_1! 2^{m_2} m_2! \cdots$ with m_i being the multiplicity of i in the composition I. Therefore, we call these the *quasi-symmetric power sums of the second kind*.

Using the duality, we can directly define the ϕ basis by

$$\phi_I = \sum_{J \succ I} z_I / sp_{I,J} M_J,$$

where $sp_{I,J}$ is as defined in [NCSF].

The ϕ-basis is well-defined only when the base ring is a **Q**-algebra.

EXAMPLES:

```
sage: QSym = QuasiSymmetricFunctions(QQ)
sage: phi = QSym.phi(); phi
Quasisymmetric functions over the Rational Field in the phi basis
sage: phi.an_element()
2*phi[] + 2*phi[1] + 3*phi[1, 1]
sage: p = SymmetricFunctions(QQ).p()
sage: phi(p[2,2,1])
phi[1, 2, 2] + phi[2, 1, 2] + phi[2, 2, 1]
sage: all(sum(phi(list(al)) for al in Permutations(la))==phi(p(la)) for la in␣
↪Partitions(6))
True
sage: p = SymmetricFunctions(QQ).p()
sage: phi(p[3,2,2])
phi[2, 2, 3] + phi[2, 3, 2] + phi[3, 2, 2]
```

```
>>> from sage.all import *
>>> QSym = QuasiSymmetricFunctions(QQ)
>>> phi = QSym.phi(); phi
Quasisymmetric functions over the Rational Field in the phi basis
>>> phi.an_element()
2*phi[] + 2*phi[1] + 3*phi[1, 1]
>>> p = SymmetricFunctions(QQ).p()
>>> phi(p[Integer(2),Integer(2),Integer(1)])
phi[1, 2, 2] + phi[2, 1, 2] + phi[2, 2, 1]
```

(continues on next page)

(continued from previous page)

```
>>> all(sum(phi(list(al)) for al in Permutations(la))==phi(p(la)) for la in␣
↪Partitions(Integer(6)))
True
>>> p = SymmetricFunctions(QQ).p()
>>> phi(p[Integer(3),Integer(2),Integer(2)])
phi[2, 2, 3] + phi[2, 3, 2] + phi[3, 2, 2]
```

Checking the equivalent definition of ϕ_n:

```
sage: def test_phi(n):
....:     phi = QuasiSymmetricFunctions(QQ).phi()
....:     Phi = NonCommutativeSymmetricFunctions(QQ).Phi()
....:     M = matrix([[phi[I].duality_pairing(Phi[J])
....:                  for I in Compositions(n)]
....:                 for J in Compositions(n)])
....:     def z(J): return J.to_partition().centralizer_size()
....:     return M == matrix.diagonal([z(I) for I in Compositions(n)])
sage: all(test_phi(k) for k in range(1,5))
True
```

```
>>> from sage.all import *
>>> def test_phi(n):
...     phi = QuasiSymmetricFunctions(QQ).phi()
...     Phi = NonCommutativeSymmetricFunctions(QQ).Phi()
...     M = matrix([[phi[I].duality_pairing(Phi[J])
...                  for I in Compositions(n)]
...                 for J in Compositions(n)])
...     def z(J): return J.to_partition().centralizer_size()
...     return M == matrix.diagonal([z(I) for I in Compositions(n)])
>>> all(test_phi(k) for k in range(Integer(1),Integer(5)))
True
```

class psi(*QSym*)

Bases: `CombinatorialFreeModule`, `BindableClass`

The Hopf algebra of quasi-symmetric functions in the ψ basis.

The ψ basis is defined as a rescaled Hopf dual of the Ψ basis of the non-commutative symmetric functions (see Section 3.1 of [BDHMN2017]), where the pairing is

$$(\psi_I, \Psi_J) = z_I \delta_{I,J},$$

where $z_I = 1^{m_1} m_1! 2^{m_2} m_2! \cdots$ with m_i being the multiplicity of i in the composition I. Therefore, we call these the *quasi-symmetric power sums of the first kind*.

Using the duality, we can directly define the ψ basis by

$$\psi_I = \sum_{J \succ I} z_I / \pi_{I,J} M_J,$$

where $\pi_{I,J}$ is as defined in [NCSF].

The ψ-basis is well-defined only when the base ring is a $\mathbf{Q}$-algebra.

EXAMPLES:

```
sage: QSym = QuasiSymmetricFunctions(QQ)
sage: psi = QSym.psi(); psi
Quasisymmetric functions over the Rational Field in the psi basis
sage: psi.an_element()
2*psi[] + 2*psi[1] + 3*psi[1, 1]
sage: p = SymmetricFunctions(QQ).p()
sage: psi(p[2,2,1])
psi[1, 2, 2] + psi[2, 1, 2] + psi[2, 2, 1]
sage: all(sum(psi(list(al)) for al in Permutations(la))==psi(p(la)) for la in␣
↪Partitions(6))
True
sage: p = SymmetricFunctions(QQ).p()
sage: psi(p[3,2,2])
psi[2, 2, 3] + psi[2, 3, 2] + psi[3, 2, 2]
```

```
>>> from sage.all import *
>>> QSym = QuasiSymmetricFunctions(QQ)
>>> psi = QSym.psi(); psi
Quasisymmetric functions over the Rational Field in the psi basis
>>> psi.an_element()
2*psi[] + 2*psi[1] + 3*psi[1, 1]
>>> p = SymmetricFunctions(QQ).p()
>>> psi(p[Integer(2),Integer(2),Integer(1)])
psi[1, 2, 2] + psi[2, 1, 2] + psi[2, 2, 1]
>>> all(sum(psi(list(al)) for al in Permutations(la))==psi(p(la)) for la in␣
↪Partitions(Integer(6)))
True
>>> p = SymmetricFunctions(QQ).p()
>>> psi(p[Integer(3),Integer(2),Integer(2)])
psi[2, 2, 3] + psi[2, 3, 2] + psi[3, 2, 2]
```

Checking the equivalent definition of ψ_n:

```
sage: def test_psi(n):
....:     psi = QuasiSymmetricFunctions(QQ).psi()
....:     Psi = NonCommutativeSymmetricFunctions(QQ).Psi()
....:     M = matrix([[psi[I].duality_pairing(Psi[J])
....:                  for I in Compositions(n)]
....:                 for J in Compositions(n)])
....:     def z(J): return J.to_partition().centralizer_size()
....:     return M == matrix.diagonal([z(I) for I in Compositions(n)])
sage: all(test_psi(k) for k in range(1,5))
True
```

```
>>> from sage.all import *
>>> def test_psi(n):
...     psi = QuasiSymmetricFunctions(QQ).psi()
...     Psi = NonCommutativeSymmetricFunctions(QQ).Psi()
...     M = matrix([[psi[I].duality_pairing(Psi[J])
...                  for I in Compositions(n)]
...                 for J in Compositions(n)])
...     def z(J): return J.to_partition().centralizer_size()
```

(continues on next page)

(continued from previous page)

```
...     return M == matrix.diagonal([z(I) for I in Compositions(n)])
>>> all(test_psi(k) for k in range(Integer(1),Integer(5)))
True
```

5.1.146 Introduction to Quasisymmetric Functions

In this document we briefly explain the quasisymmetric function bases and related functionality in Sage. We assume the reader is familiar with the package `SymmetricFunctions`.

Quasisymmetric functions, denoted $QSym$, form a subring of the power series ring in countably many variables. $QSym$ contains the symmetric functions. These functions first arose in the theory of P-partitions. The initial ideas in this field are attributed to MacMahon, Knuth, Kreweras, Glânffrwd Thomas, Stanley. In 1984, Gessel formalized the study of quasisymmetric functions and introduced the basis of fundamental quasisymmetric functions [Ges]. In 1995, Gelfand, Krob, Lascoux, Leclerc, Retakh, and Thibon showed that the ring of quasisymmetric functions is Hopf dual to the non-commutative symmetric functions [NCSF]. Many results have built on these.

One advantage of working in $QSym$ is that many interesting families of symmetric functions have explicit expansions in fundamental quasisymmetric functions such as Schur functions [Ges], Macdonald polynomials [HHL05], and plethysm of Schur functions [LW12].

For more background see Wikipedia article Quasisymmetric_function.

To begin, initialize the ring. Below we chose to use the rational numbers $\mathbf{Q}$. Other options include the integers $\mathbf{Z}$ and $\mathbf{C}$:

```
sage: QSym = QuasiSymmetricFunctions(QQ)
sage: QSym
Quasisymmetric functions over the Rational Field

sage: QSym = QuasiSymmetricFunctions(CC); QSym
Quasisymmetric functions over the Complex Field with 53 bits of precision

sage: QSym = QuasiSymmetricFunctions(ZZ); QSym
Quasisymmetric functions over the Integer Ring
```

```
>>> from sage.all import *
>>> QSym = QuasiSymmetricFunctions(QQ)
>>> QSym
Quasisymmetric functions over the Rational Field

>>> QSym = QuasiSymmetricFunctions(CC); QSym
Quasisymmetric functions over the Complex Field with 53 bits of precision

>>> QSym = QuasiSymmetricFunctions(ZZ); QSym
Quasisymmetric functions over the Integer Ring
```

All bases of $QSym$ are indexed by compositions e.g. $[3, 1, 1, 4]$. The convention is to use capital letters for bases of $QSym$ and lowercase letters for bases of the symmetric functions Sym. Next set up names for the known bases by running `inject_shorthands()`. As with symmetric functions, you do not need to run this command and you could assign these bases other names.

```
sage: QSym = QuasiSymmetricFunctions(QQ)
sage: QSym.inject_shorthands()
Defining M as shorthand for Quasisymmetric functions over the Rational Field in the
↪Monomial basis
```

(continues on next page)

(continued from previous page)

```
Defining F as shorthand for Quasisymmetric functions over the Rational Field in the␣
↪Fundamental basis
Defining E as shorthand for Quasisymmetric functions over the Rational Field in the␣
↪Essential basis
Defining dI as shorthand for Quasisymmetric functions over the Rational Field in the␣
↪dualImmaculate basis
Defining QS as shorthand for Quasisymmetric functions over the Rational Field in the␣
↪Quasisymmetric Schur basis
Defining YQS as shorthand for Quasisymmetric functions over the Rational Field in the␣
↪Young Quasisymmetric Schur basis
Defining phi as shorthand for Quasisymmetric functions over the Rational Field in the␣
↪phi basis
Defining psi as shorthand for Quasisymmetric functions over the Rational Field in the␣
↪psi basis
```

```
>>> from sage.all import *
>>> QSym = QuasiSymmetricFunctions(QQ)
>>> QSym.inject_shorthands()
Defining M as shorthand for Quasisymmetric functions over the Rational Field in the␣
↪Monomial basis
Defining F as shorthand for Quasisymmetric functions over the Rational Field in the␣
↪Fundamental basis
Defining E as shorthand for Quasisymmetric functions over the Rational Field in the␣
↪Essential basis
Defining dI as shorthand for Quasisymmetric functions over the Rational Field in the␣
↪dualImmaculate basis
Defining QS as shorthand for Quasisymmetric functions over the Rational Field in the␣
↪Quasisymmetric Schur basis
Defining YQS as shorthand for Quasisymmetric functions over the Rational Field in the␣
↪Young Quasisymmetric Schur basis
Defining phi as shorthand for Quasisymmetric functions over the Rational Field in the␣
↪phi basis
Defining psi as shorthand for Quasisymmetric functions over the Rational Field in the␣
↪psi basis
```

Now one can start constructing quasisymmetric functions.

Note

It is best to use variables other than `M` and `F`.

```
sage: x = M[2,1] + M[1,2]
sage: x
M[1, 2] + M[2, 1]

sage: y = 3*M[1,2] + M[3]^2; y
3*M[1, 2] + 2*M[3, 3] + M[6]

sage: F[3,1,3] + 7*F[2,1]
7*F[2, 1] + F[3, 1, 3]
```

(continues on next page)

(continued from previous page)

```
sage: 3*F[2,1,2] + F[3]^2
F[1, 2, 2, 1] + F[1, 2, 3] + 2*F[1, 3, 2] + F[1, 4, 1] + F[1, 5] + 3*F[2, 1, 2]
 + 2*F[2, 2, 2] + 2*F[2, 3, 1] + 2*F[2, 4] + F[3, 2, 1] + 3*F[3, 3] + 2*F[4, 2] + F[5,
↪ 1] + F[6]
```

```
>>> from sage.all import *
>>> x = M[Integer(2),Integer(1)] + M[Integer(1),Integer(2)]
>>> x
M[1, 2] + M[2, 1]

>>> y = Integer(3)*M[Integer(1),Integer(2)] + M[Integer(3)]**Integer(2); y
3*M[1, 2] + 2*M[3, 3] + M[6]

>>> F[Integer(3),Integer(1),Integer(3)] + Integer(7)*F[Integer(2),Integer(1)]
7*F[2, 1] + F[3, 1, 3]

>>> Integer(3)*F[Integer(2),Integer(1),Integer(2)] + F[Integer(3)]**Integer(2)
F[1, 2, 2, 1] + F[1, 2, 3] + 2*F[1, 3, 2] + F[1, 4, 1] + F[1, 5] + 3*F[2, 1, 2]
 + 2*F[2, 2, 2] + 2*F[2, 3, 1] + 2*F[2, 4] + F[3, 2, 1] + 3*F[3, 3] + 2*F[4, 2] + F[5,
↪ 1] + F[6]
```

To convert from one basis to another is easy:

```
sage: z = M[1,2,1]
sage: z
M[1, 2, 1]

sage: F(z)
-F[1, 1, 1, 1] + F[1, 2, 1]

sage: M(F(z))
M[1, 2, 1]
```

```
>>> from sage.all import *
>>> z = M[Integer(1),Integer(2),Integer(1)]
>>> z
M[1, 2, 1]

>>> F(z)
-F[1, 1, 1, 1] + F[1, 2, 1]

>>> M(F(z))
M[1, 2, 1]
```

To expand in variables, one can specify a finite size alphabet $x_1, x_2, \ldots, x_m$:

```
sage: y = M[1,2,1]
sage: y.expand(4)
x0*x1^2*x2 + x0*x1^2*x3 + x0*x2^2*x3 + x1*x2^2*x3
```

```
>>> from sage.all import *
>>> y = M[Integer(1),Integer(2),Integer(1)]
```

(continues on next page)

(continued from previous page)

```
>>> y.expand(Integer(4))
x0*x1^2*x2 + x0*x1^2*x3 + x0*x2^2*x3 + x1*x2^2*x3
```

The usual methods on free modules are available such as coefficients, degrees, and the support:

```
sage: z = 3*M[1,2]+M[3]^2; z
3*M[1, 2] + 2*M[3, 3] + M[6]

sage: z.coefficient([1,2])
3

sage: z.degree()
6

sage: sorted(z.coefficients())
[1, 2, 3]

sage: sorted(z.monomials(), key=lambda x: tuple(x.support()))
[M[1, 2], M[3, 3], M[6]]

sage: z.monomial_coefficients()
{[1, 2]: 3, [3, 3]: 2, [6]: 1}
```

```
>>> from sage.all import *
>>> z = Integer(3)*M[Integer(1),Integer(2)]+M[Integer(3)]**Integer(2); z
3*M[1, 2] + 2*M[3, 3] + M[6]

>>> z.coefficient([Integer(1),Integer(2)])
3

>>> z.degree()
6

>>> sorted(z.coefficients())
[1, 2, 3]

>>> sorted(z.monomials(), key=lambda x: tuple(x.support()))
[M[1, 2], M[3, 3], M[6]]

>>> z.monomial_coefficients()
{[1, 2]: 3, [3, 3]: 2, [6]: 1}
```

As with the symmetric functions package, the quasisymmetric function `1` has several instantiations. However, the most obvious way to write `1` leads to an error (this is due to the semantics of python):

```
sage: M[[]]
M[]
sage: M.one()
M[]
sage: M(1)
M[]
sage: M[[]] == 1
```

(continues on next page)

(continued from previous page)

```
True
sage: M[]
Traceback (most recent call last):
...
SyntaxError: invalid ...
```

```
>>> from sage.all import *
>>> M[[]]
M[]
>>> M.one()
M[]
>>> M(Integer(1))
M[]
>>> M[[]] == Integer(1)
True
>>> M[]
Traceback (most recent call last):
...
SyntaxError: invalid ...
```

Working with symmetric functions

The quasisymmetric functions are a ring which contains the symmetric functions as a subring. The Monomial quasisymmetric functions are related to the monomial symmetric functions by $m_\lambda = \sum_{\mathrm{sort}(c)=\lambda} M_c$, where $\mathrm{sort}(c)$ means the partition obtained by sorting the composition c:

```
sage: SymmetricFunctions(QQ).inject_shorthands()
Defining e as shorthand for Symmetric Functions over Rational Field in the elementary␣
↪basis
Defining f as shorthand for Symmetric Functions over Rational Field in the forgotten␣
↪basis
Defining h as shorthand for Symmetric Functions over Rational Field in the␣
↪homogeneous basis
Defining m as shorthand for Symmetric Functions over Rational Field in the monomial␣
↪basis
Defining p as shorthand for Symmetric Functions over Rational Field in the powersum␣
↪basis
Defining s as shorthand for Symmetric Functions over Rational Field in the Schur basis

sage: m[2,1]
m[2, 1]
sage: M(m[2,1])
M[1, 2] + M[2, 1]
sage: M(s[2,1])
2*M[1, 1, 1] + M[1, 2] + M[2, 1]
```

```
>>> from sage.all import *
>>> SymmetricFunctions(QQ).inject_shorthands()
Defining e as shorthand for Symmetric Functions over Rational Field in the elementary␣
↪basis
Defining f as shorthand for Symmetric Functions over Rational Field in the forgotten␣
```

(continues on next page)

(continued from previous page)

```
↪basis
Defining h as shorthand for Symmetric Functions over Rational Field in the␣
↪homogeneous basis
Defining m as shorthand for Symmetric Functions over Rational Field in the monomial␣
↪basis
Defining p as shorthand for Symmetric Functions over Rational Field in the powersum␣
↪basis
Defining s as shorthand for Symmetric Functions over Rational Field in the Schur basis

>>> m[Integer(2),Integer(1)]
m[2, 1]
>>> M(m[Integer(2),Integer(1)])
M[1, 2] + M[2, 1]
>>> M(s[Integer(2),Integer(1)])
2*M[1, 1, 1] + M[1, 2] + M[2, 1]
```

There are methods to test if an expression f in the quasisymmetric functions is a symmetric function:

```
sage: f = M[1,1,2] + M[1,2,1]
sage: f.is_symmetric()
False
sage: f = M[3,1] + M[1,3]
sage: f.is_symmetric()
True
```

```
>>> from sage.all import *
>>> f = M[Integer(1),Integer(1),Integer(2)] + M[Integer(1),Integer(2),Integer(1)]
>>> f.is_symmetric()
False
>>> f = M[Integer(3),Integer(1)] + M[Integer(1),Integer(3)]
>>> f.is_symmetric()
True
```

If f is symmetric, there are methods to convert f to an expression in the symmetric functions:

```
sage: f.to_symmetric_function()
m[3, 1]
```

```
>>> from sage.all import *
>>> f.to_symmetric_function()
m[3, 1]
```

The expansion of the Schur function in terms of the Fundamental quasisymmetric functions is due to [Ges]. There is one term in the expansion for each standard tableau of shape equal to the partition indexing the Schur function.

```
sage: f = F[3,2] + F[2,2,1] + F[2,3] + F[1,3,1] + F[1,2,2]
sage: f.is_symmetric()
True
sage: f.to_symmetric_function()
5*m[1, 1, 1, 1, 1] + 3*m[2, 1, 1, 1] + 2*m[2, 2, 1] + m[3, 1, 1] + m[3, 2]
sage: s(f.to_symmetric_function())
s[3, 2]
```

```
>>> from sage.all import *
>>> f = F[Integer(3),Integer(2)] + F[Integer(2),Integer(2),Integer(1)] + F[Integer(2),
↪Integer(3)] + F[Integer(1),Integer(3),Integer(1)] + F[Integer(1),Integer(2),
↪Integer(2)]
>>> f.is_symmetric()
True
>>> f.to_symmetric_function()
5*m[1, 1, 1, 1, 1] + 3*m[2, 1, 1, 1] + 2*m[2, 2, 1] + m[3, 1, 1] + m[3, 2]
>>> s(f.to_symmetric_function())
s[3, 2]
```

It is also possible to convert any symmetric function to the quasisymmetric function expansion in any known basis. The converse is not true:

```
sage: M( m[3,1,1] )
M[1, 1, 3] + M[1, 3, 1] + M[3, 1, 1]
sage: F( s[2,2,1] )
F[1, 1, 2, 1] + F[1, 2, 1, 1] + F[1, 2, 2] + F[2, 1, 2] + F[2, 2, 1]

sage: s(M[2,1])
Traceback (most recent call last):
...
TypeError: do not know how to make x (= M[2, 1]) an element of self
```

```
>>> from sage.all import *
>>> M( m[Integer(3),Integer(1),Integer(1)] )
M[1, 1, 3] + M[1, 3, 1] + M[3, 1, 1]
>>> F( s[Integer(2),Integer(2),Integer(1)] )
F[1, 1, 2, 1] + F[1, 2, 1, 1] + F[1, 2, 2] + F[2, 1, 2] + F[2, 2, 1]

>>> s(M[Integer(2),Integer(1)])
Traceback (most recent call last):
...
TypeError: do not know how to make x (= M[2, 1]) an element of self
```

It is possible to experiment with the quasisymmetric function expansion of other bases, but it is important that the base ring be the same for both algebras.

```
sage: R = QQ['t']
sage: Qp = SymmetricFunctions(R).hall_littlewood().Qp()
sage: QSymt = QuasiSymmetricFunctions(R)
sage: Ft = QSymt.F()
sage: Ft( Qp[2,2] )
F[1, 2, 1] + t*F[1, 3] + (t+1)*F[2, 2] + t*F[3, 1] + t^2*F[4]
```

```
>>> from sage.all import *
>>> R = QQ['t']
>>> Qp = SymmetricFunctions(R).hall_littlewood().Qp()
>>> QSymt = QuasiSymmetricFunctions(R)
>>> Ft = QSymt.F()
>>> Ft( Qp[Integer(2),Integer(2)] )
F[1, 2, 1] + t*F[1, 3] + (t+1)*F[2, 2] + t*F[3, 1] + t^2*F[4]
```

```
sage: K = QQ['q','t'].fraction_field()
sage: Ht = SymmetricFunctions(K).macdonald().Ht()
sage: Fqt = QuasiSymmetricFunctions(Ht.base_ring()).F()
sage: Fqt(Ht[2,1])
q*t*F[1, 1, 1] + (q+t)*F[1, 2] + (q+t)*F[2, 1] + F[3]
```

```
>>> from sage.all import *
>>> K = QQ['q','t'].fraction_field()
>>> Ht = SymmetricFunctions(K).macdonald().Ht()
>>> Fqt = QuasiSymmetricFunctions(Ht.base_ring()).F()
>>> Fqt(Ht[Integer(2),Integer(1)])
q*t*F[1, 1, 1] + (q+t)*F[1, 2] + (q+t)*F[2, 1] + F[3]
```

The following will raise an error because the base ring of `F` is not equal to the base ring of `Ht`:

```
sage: F(Ht[2,1])
Traceback (most recent call last):
...
TypeError: do not know how to make x (= McdHt[2, 1]) an element of self␣
↪(=Quasisymmetric functions over the Rational Field in the Fundamental basis)
```

```
>>> from sage.all import *
>>> F(Ht[Integer(2),Integer(1)])
Traceback (most recent call last):
...
TypeError: do not know how to make x (= McdHt[2, 1]) an element of self␣
↪(=Quasisymmetric functions over the Rational Field in the Fundamental basis)
```

QSym is a Hopf algebra

The product on $QSym$ is commutative and is inherited from the product by the realization within the polynomial ring:

```
sage: M[3]*M[1,1] == M[1,1]*M[3]
True
sage: M[3]*M[1,1]
M[1, 1, 3] + M[1, 3, 1] + M[1, 4] + M[3, 1, 1] + M[4, 1]
sage: F[3]*F[1,1]
F[1, 1, 3] + F[1, 2, 2] + F[1, 3, 1] + F[1, 4] + F[2, 1, 2] + F[2, 2, 1] + F[2, 3] +␣
↪F[3, 1, 1] + F[3, 2] + F[4, 1]
sage: M[3]*F[2]
M[1, 1, 3] + M[1, 3, 1] + M[1, 4] + M[2, 3] + M[3, 1, 1] + M[3, 2] + M[4, 1] + M[5]
sage: F[2]*M[3]
F[1, 1, 1, 2] - F[1, 2, 2] + F[2, 1, 1, 1] - F[2, 1, 2] - F[2, 2, 1] + F[5]
```

```
>>> from sage.all import *
>>> M[Integer(3)]*M[Integer(1),Integer(1)] == M[Integer(1),Integer(1)]*M[Integer(3)]
True
>>> M[Integer(3)]*M[Integer(1),Integer(1)]
M[1, 1, 3] + M[1, 3, 1] + M[1, 4] + M[3, 1, 1] + M[4, 1]
>>> F[Integer(3)]*F[Integer(1),Integer(1)]
F[1, 1, 3] + F[1, 2, 2] + F[1, 3, 1] + F[1, 4] + F[2, 1, 2] + F[2, 2, 1] + F[2, 3] +␣
↪F[3, 1, 1] + F[3, 2] + F[4, 1]
```

(continues on next page)

(continued from previous page)

```
>>> M[Integer(3)]*F[Integer(2)]
M[1, 1, 3] + M[1, 3, 1] + M[1, 4] + M[2, 3] + M[3, 1, 1] + M[3, 2] + M[4, 1] + M[5]
>>> F[Integer(2)]*M[Integer(3)]
F[1, 1, 1, 2] - F[1, 2, 2] + F[2, 1, 1, 1] - F[2, 1, 2] - F[2, 2, 1] + F[5]
```

There is a coproduct on this ring as well, which in the Monomial basis acts by cutting the composition into a left half and a right half. The co-product is non-co-commutative:

```
sage: M[1,3,1].coproduct()
M[] # M[1, 3, 1] + M[1] # M[3, 1] + M[1, 3] # M[1] + M[1, 3, 1] # M[]
sage: F[1,3,1].coproduct()
F[] # F[1, 3, 1] + F[1] # F[3, 1] + F[1, 1] # F[2, 1] + F[1, 2] # F[1, 1] + F[1, 3] #
↪F[1] + F[1, 3, 1] # F[]
```

```
>>> from sage.all import *
>>> M[Integer(1),Integer(3),Integer(1)].coproduct()
M[] # M[1, 3, 1] + M[1] # M[3, 1] + M[1, 3] # M[1] + M[1, 3, 1] # M[]
>>> F[Integer(1),Integer(3),Integer(1)].coproduct()
F[] # F[1, 3, 1] + F[1] # F[3, 1] + F[1, 1] # F[2, 1] + F[1, 2] # F[1, 1] + F[1, 3] #
↪F[1] + F[1, 3, 1] # F[]
```

The Duality Pairing with Non-Commutative Symmetric Functions

These two operations endow $QSym$ with the structure of a Hopf algebra. It is the dual Hopf algebra of the non-commutative symmetric functions $NCSF$. Under this duality, the Monomial basis of $QSym$ is dual to the Complete basis of $NCSF$, and the Fundamental basis of $QSym$ is dual to the Ribbon basis of $NCSF$ (see [MR]):

```
sage: S = M.dual(); S
Non-Commutative Symmetric Functions over the Rational Field in the Complete basis
sage: M[1,3,1].duality_pairing( S[1,3,1] )
1
sage: M.duality_pairing_matrix( S, degree=4 )

[ 1  -1   0   0  -1   1   0   0]
[ 1   0  -1   0  -1   0   1   0]
[-1   1   1  -1   1  -1  -1   1]
```

Let H and G be elements of $QSym$ and h an element of $NCSF$. Then if we represent the duality pairing with the mathematical notation $[\cdot,\cdot]$, we have:

$$[H\cdot G, h] = [H\otimes G, \Delta(h)].$$

For example, the coefficient of `M[2,1,4,1]` in `M[1,3]*M[2,1,1]` may be computed with the duality pairing:

```
sage: I, J = Composition([1,3]), Composition([2,1,1])
sage: (M[I]*M[J]).duality_pairing(S[2,1,4,1])
1
```

```
>>> from sage.all import *
>>> I, J = Composition([Integer(1),Integer(3)]), Composition([Integer(2),Integer(1),
↪Integer(1)])
>>> (M[I]*M[J]).duality_pairing(S[Integer(2),Integer(1),Integer(4),Integer(1)])
1
```

And the coefficient of `S[1,3] # S[2,1,1]` in `S[2,1,4,1].coproduct()` is equal to this result:

```
sage: S[2,1,4,1].coproduct()
S[] # S[2, 1, 4, 1] + ... + S[1, 3] # S[2, 1, 1] + ... + S[4, 1] # S[2, 1]
```

```
>>> from sage.all import *
>>> S[Integer(2),Integer(1),Integer(4),Integer(1)].coproduct()
S[] # S[2, 1, 4, 1] + ... + S[1, 3] # S[2, 1, 1] + ... + S[4, 1] # S[2, 1]
```

The duality pairing on the tensor space is another way of getting this coefficient, but currently the method *duality_pairing()* is not defined on the tensor squared space. However, we can extend this functionality by applying a linear morphism to the terms in the coproduct, as follows:

```
sage: X = S[2,1,4,1].coproduct()
sage: def linear_morphism(x, y):
....:     return x.duality_pairing(M[1,3]) * y.duality_pairing(M[2,1,1])
sage: X.apply_multilinear_morphism(linear_morphism, codomain=ZZ)
1
```

```
>>> from sage.all import *
>>> X = S[Integer(2),Integer(1),Integer(4),Integer(1)].coproduct()
>>> def linear_morphism(x, y):
...     return x.duality_pairing(M[Integer(1),Integer(3)]) * y.duality_
↪pairing(M[Integer(2),Integer(1),Integer(1)])
```

(continues on next page)

(continued from previous page)

```
>>> X.apply_multilinear_morphism(linear_morphism, codomain=ZZ)
1
```

Similarly, if H is an element of $QSym$ and g and h are elements of $NCSF$, then

$$[H, g \cdot h] = [\Delta(H), g \otimes h].$$

For example, the coefficient of `R[2,3,1]` in `R[2,1]*R[2,1]` is computed with the duality pairing by the following command:

```
sage: (R[2,1]*R[2,1]).duality_pairing(F[2,3,1])
1
sage: R[2,1]*R[2,1]
R[2, 1, 2, 1] + R[2, 3, 1]
```

```
>>> from sage.all import *
>>> (R[Integer(2),Integer(1)]*R[Integer(2),Integer(1)]).duality_pairing(F[Integer(2),
↪Integer(3),Integer(1)])
1
>>> R[Integer(2),Integer(1)]*R[Integer(2),Integer(1)]
R[2, 1, 2, 1] + R[2, 3, 1]
```

This coefficient should then be equal to the coefficient of `F[2,1] # F[2,1]` in `F[2,3,1].coproduct()`:

```
sage: F[2,3,1].coproduct()
F[] # F[2, 3, 1] + ... + F[2, 1] # F[2, 1]  + ... + F[2, 3, 1] # F[]
```

```
>>> from sage.all import *
>>> F[Integer(2),Integer(3),Integer(1)].coproduct()
F[] # F[2, 3, 1] + ... + F[2, 1] # F[2, 1]  + ... + F[2, 3, 1] # F[]
```

This can also be computed by the duality pairing on the tensor space, as above:

```
sage: X = F[2,3,1].coproduct()
sage: def linear_morphism(x, y):
....:     return x.duality_pairing(R[2,1]) * y.duality_pairing(R[2,1])
sage: X.apply_multilinear_morphism(linear_morphism, codomain=ZZ)
1
```

```
>>> from sage.all import *
>>> X = F[Integer(2),Integer(3),Integer(1)].coproduct()
>>> def linear_morphism(x, y):
...     return x.duality_pairing(R[Integer(2),Integer(1)]) * y.duality_
↪pairing(R[Integer(2),Integer(1)])
>>> X.apply_multilinear_morphism(linear_morphism, codomain=ZZ)
1
```

The Operation Adjoint to Multiplication by a Non-Commutative Symmetric Function

Let $g \in NCSF$ and consider the linear endomorphism of $NCSF$ defined by left (respectively, right) multiplication by g. Since there is a duality between $QSym$ and $NCSF$, this linear transformation induces an operator $g^{\perp}$ on $QSym$ satisfying

$$[g^{\perp}(H), h] = [H, g \cdot h].$$

for any non-commutative symmetric function h.

This is implemented by the method `skew_by()`. Explicitly, if `H` is a quasisymmetric function and `g` a non-commutative symmetric function, then `H.skew_by(g)` and `H.skew_by(g, side='right')` are expressions that satisfy, for any non-commutative symmetric function `h`, the following identities:

```
H.skew_by(g).duality_pairing(h) == H.duality_pairing(g*h)
H.skew_by(g, side='right').duality_pairing(h) == H.duality_pairing(h*g)
```

For example, `M[J].skew_by(S[I])` is 0 unless the composition J begins with I and `M(J).skew_by(S(I), side='right')` is 0 unless the composition J ends with I:

```
sage: M[3,2,2].skew_by(S[3])
M[2, 2]
sage: M[3,2,2].skew_by(S[2])
0
sage: M[3,2,2].coproduct().apply_multilinear_morphism( lambda x,y: x.duality_
↪pairing(S[3])*y )
M[2, 2]
sage: M[3,2,2].skew_by(S[3], side='right')
0
sage: M[3,2,2].skew_by(S[2], side='right')
M[3, 2]
```

```
>>> from sage.all import *
>>> M[Integer(3),Integer(2),Integer(2)].skew_by(S[Integer(3)])
M[2, 2]
>>> M[Integer(3),Integer(2),Integer(2)].skew_by(S[Integer(2)])
0
>>> M[Integer(3),Integer(2),Integer(2)].coproduct().apply_multilinear_morphism(␣
↪lambda x,y: x.duality_pairing(S[Integer(3)])*y )
M[2, 2]
>>> M[Integer(3),Integer(2),Integer(2)].skew_by(S[Integer(3)], side='right')
0
>>> M[Integer(3),Integer(2),Integer(2)].skew_by(S[Integer(2)], side='right')
M[3, 2]
```

The antipode

The antipode sends the Fundamental basis element indexed by the composition I to -1 to the size of I times the Fundamental basis element indexed by the conjugate composition to I:

```
sage: F[3,2,2].antipode()
-F[1, 2, 2, 1, 1]
sage: Composition([3,2,2]).conjugate()
[1, 2, 2, 1, 1]
sage: M[3,2,2].antipode()
-M[2, 2, 3] - M[2, 5] - M[4, 3] - M[7]
```

```
>>> from sage.all import *
>>> F[Integer(3),Integer(2),Integer(2)].antipode()
-F[1, 2, 2, 1, 1]
>>> Composition([Integer(3),Integer(2),Integer(2)]).conjugate()
```

(continues on next page)

(continued from previous page)

```
[1, 2, 2, 1, 1]
>>> M[Integer(3),Integer(2),Integer(2)].antipode()
-M[2, 2, 3] - M[2, 5] - M[4, 3] - M[7]
```

We demonstrate here the defining relation of the antipode:

```
sage: X = F[3,2,2].coproduct()
sage: X.apply_multilinear_morphism(lambda x,y: x*y.antipode())
0
sage: X.apply_multilinear_morphism(lambda x,y: x.antipode()*y)
0
```

```
>>> from sage.all import *
>>> X = F[Integer(3),Integer(2),Integer(2)].coproduct()
>>> X.apply_multilinear_morphism(lambda x,y: x*y.antipode())
0
>>> X.apply_multilinear_morphism(lambda x,y: x.antipode()*y)
0
```

5.1.148 Bases for $NCSym$

AUTHORS:

- Travis Scrimshaw (08-04-2013): Initial version

class sage.combinat.ncsym.bases.**MultiplicativeNCSymBases**(*parent_with_realization*)

Bases: Category_realization_of_parent

Category of multiplicative bases of symmetric functions in non-commuting variables.

A multiplicative basis is one for which $\mathbf{b}_A \mathbf{b}_B = \mathbf{b}_{A|B}$ where $A|B$ is the pipe() operation on set partitions.

EXAMPLES:

```
sage: from sage.combinat.ncsym.bases import MultiplicativeNCSymBases
sage: NCSym = SymmetricFunctionsNonCommutingVariables(QQ)
sage: MultiplicativeNCSymBases(NCSym)
Category of multiplicative bases of symmetric functions in non-commuting␣
↪variables over the Rational Field
```

```
>>> from sage.all import *
>>> from sage.combinat.ncsym.bases import MultiplicativeNCSymBases
>>> NCSym = SymmetricFunctionsNonCommutingVariables(QQ)

class ElementMethods

Bases: `object`

class ParentMethods

Bases: `object`

product_on_basis(A, B)

The product on basis elements.

The product on a multiplicative basis is given by $\mathbf{b}_A \cdot \mathbf{b}_B = \mathbf{b}_{A|B}$.

The bases $\{\mathbf{e}, \mathbf{h}, \mathbf{x}, \mathbf{cp}, \mathbf{p}, \mathbf{chi}, \mathbf{rho}\}$ are all multiplicative.

INPUT:

- `A`, `B` – set partitions

OUTPUT: an element in the basis `self`

EXAMPLES:

```
sage: e = SymmetricFunctionsNonCommutingVariables(QQ).e()
sage: h = SymmetricFunctionsNonCommutingVariables(QQ).h()
sage: x = SymmetricFunctionsNonCommutingVariables(QQ).x()
sage: cp = SymmetricFunctionsNonCommutingVariables(QQ).cp()
sage: p = SymmetricFunctionsNonCommutingVariables(QQ).p()
sage: chi = SymmetricFunctionsNonCommutingVariables(QQ).chi()
sage: rho = SymmetricFunctionsNonCommutingVariables(QQ).rho()
sage: A = SetPartition([[1], [2, 3]])
sage: B = SetPartition([[1], [3], [2,4]])
sage: e.product_on_basis(A, B)
e{{1}, {2, 3}, {4}, {5, 7}, {6}}
sage: h.product_on_basis(A, B)
h{{1}, {2, 3}, {4}, {5, 7}, {6}}
sage: x.product_on_basis(A, B)
x{{1}, {2, 3}, {4}, {5, 7}, {6}}
sage: cp.product_on_basis(A, B)
cp{{1}, {2, 3}, {4}, {5, 7}, {6}}
sage: p.product_on_basis(A, B)
p{{1}, {2, 3}, {4}, {5, 7}, {6}}
sage: chi.product_on_basis(A, B)
chi{{1}, {2, 3}, {4}, {5, 7}, {6}}
sage: rho.product_on_basis(A, B)
rho{{1}, {2, 3}, {4}, {5, 7}, {6}}
sage: e.product_on_basis(A,B)==e(h(e(A))*h(e(B)))
True
sage: h.product_on_basis(A,B)==h(x(h(A))*x(h(B)))
True
sage: x.product_on_basis(A,B)==x(h(x(A))*h(x(B)))
True
sage: cp.product_on_basis(A,B)==cp(p(cp(A))*p(cp(B)))
True
sage: p.product_on_basis(A,B)==p(e(p(A))*e(p(B)))
True
```

```

True
>>> cp.product_on_basis(A,B)==cp(p(cp(A))*p(cp(B)))
True
>>> p.product_on_basis(A,B)==p(e(p(A))*e(p(B)))
True
```

super_categories()

Return the super categories of bases of the Hopf dual of the symmetric functions in non-commuting variables.

OUTPUT: list of categories

class sage.combinat.ncsym.bases.**NCSymBases**(*parent_with_realization*)

Bases: Category_realization_of_parent

Category of bases of symmetric functions in non-commuting variables.

EXAMPLES:

```
sage: from sage.combinat.ncsym.bases import NCSymBases
sage: NCSym = SymmetricFunctionsNonCommutingVariables(QQ)
sage: NCSymBases(NCSym)
Category of bases of symmetric functions in non-commuting variables over the␣
↪Rational Field
```

```
>>> from sage.all import *
>>> from sage.combinat.ncsym.bases import NCSymBases
>>> NCSym = SymmetricFunctionsNonCommutingVariables(QQ)
>>> NCSymBases(NCSym)
Category of bases of symmetric functions in non-commuting variables over the␣
↪Rational Field
```

class ElementMethods

Bases: `object`

expand(*n*, *alphabet='x'*)

Expand the symmetric function into `n` non-commuting variables in an alphabet, which by default is `'x'`.

This computation is completed by coercing the element `self` into the monomial basis and computing the expansion in the `alphabet` there.

INPUT:

- `n` – the number of variables in the expansion
- `alphabet` – (default: `'x'`) the alphabet in which `self` is to be expanded

OUTPUT:

- an expansion of `self` into the `n` non-commuting variables specified by `alphabet`

EXAMPLES:

```
sage: h = SymmetricFunctionsNonCommutingVariables(QQ).h()
sage: h[[1,3],[2]].expand(3)
2*x0^3 + x0^2*x1 + x0^2*x2 + 2*x0*x1*x0 + x0*x1^2 + x0*x1*x2 + 2*x0*x2*x0
 + x0*x2*x1 + x0*x2^2 + x1*x0^2 + 2*x1*x0*x1 + x1*x0*x2 + x1^2*x0 + 2*x1^3
 + x1^2*x2 + x1*x2*x0 + 2*x1*x2*x1 + x1*x2^2 + x2*x0^2 + x2*x0*x1 +␣
↪2*x2*x0*x2
 + x2*x1*x0 + x2*x1^2 + 2*x2*x1*x2 + x2^2*x0 + x2^2*x1 + 2*x2^3
sage: x = SymmetricFunctionsNonCommutingVariables(QQ).x()
sage: x[[1,3],[2]].expand(3)
-x0^2*x1 - x0^2*x2 - x0*x1^2 - x0*x1*x2 - x0*x2*x1 - x0*x2^2 - x1*x0^2
 - x1*x0*x2 - x1^2*x0 - x1^2*x2 - x1*x2*x0 - x1*x2^2 - x2*x0^2 - x2*x0*x1
 - x2*x1*x0 - x2*x1^2 - x2^2*x0 - x2^2*x1
```

```
>>> from sage.all import *
>>> h = SymmetricFunctionsNonCommutingVariables(QQ).h()
>>> h[[Integer(1),Integer(3)],[Integer(2)]].expand(Integer(3))
2*x0^3 + x0^2*x1 + x0^2*x2 + 2*x0*x1*x0 + x0*x1^2 + x0*x1*x2 + 2*x0*x2*x0
 + x0*x2*x1 + x0*x2^2 + x1*x0^2 + 2*x1*x0*x1 + x1*x0*x2 + x1^2*x0 + 2*x1^3
 + x1^2*x2 + x1*x2*x0 + 2*x1*x2*x1 + x1*x2^2 + x2*x0^2 + x2*x0*x1 +␣
↪2*x2*x0*x2
 + x2*x1*x0 + x2*x1^2 + 2*x2*x1*x2 + x2^2*x0 + x2^2*x1 + 2*x2^3
>>> x = SymmetricFunctionsNonCommutingVariables(QQ).x()
>>> x[[Integer(1),Integer(3)],[Integer(2)]].expand(Integer(3))
-x0^2*x1 - x0^2*x2 - x0*x1^2 - x0*x1*x2 - x0*x2*x1 - x0*x2^2 - x1*x0^2
 - x1*x0*x2 - x1^2*x0 - x1^2*x2 - x1*x2*x0 - x1*x2^2 - x2*x0^2 - x2*x0*x1
 - x2*x1*x0 - x2*x1^2 - x2^2*x0 - x2^2*x1
```

internal_coproduct()

Return the internal coproduct of `self`.

The internal coproduct is defined on the power sum basis as

$$\mathbf{p}_A \mapsto \mathbf{p}_A \otimes \mathbf{p}_A$$

and the map is extended linearly.

OUTPUT: an element of the tensor square of the basis of `self`

EXAMPLES:

```
sage: x = SymmetricFunctionsNonCommutingVariables(QQ).x()
sage: x[[1,3],[2]].internal_coproduct()
x{{1}, {2}, {3}} # x{{1, 3}, {2}} + x{{1, 3}, {2}} # x{{1}, {2}, {3}}
 + x{{1, 3}, {2}} # x{{1, 3}, {2}}
```

```
>>> from sage.all import *
>>> x = SymmetricFunctionsNonCommutingVariables(QQ).x()
>>> x[[Integer(1),Integer(3)],[Integer(2)]].internal_coproduct()
x{{1}, {2}, {3}} # x{{1, 3}, {2}} + x{{1, 3}, {2}} # x{{1}, {2}, {3}}
 + x{{1, 3}, {2}} # x{{1, 3}, {2}}
```

omega()

Return the involution ω applied to `self`.

The involution ω is defined by

$$\mathbf{e}_A \mapsto \mathbf{h}_A$$

and the result is extended linearly.

OUTPUT: an element in the same basis as `self`

EXAMPLES:

```
sage: NCSym = SymmetricFunctionsNonCommutingVariables(QQ)
sage: m = NCSym.m()
sage: m[[1,3],[2]].omega()
-2*m{{1, 2, 3}} - m{{1, 3}, {2}}
sage: p = NCSym.p()
sage: p[[1,3],[2]].omega()
-p{{1, 3}, {2}}
sage: cp = NCSym.cp()
sage: cp[[1,3],[2]].omega()
-2*cp{{1, 2, 3}} - cp{{1, 3}, {2}}
sage: x = NCSym.x()
sage: x[[1,3],[2]].omega()
-2*x{{1}, {2}, {3}} - x{{1, 3}, {2}}
```

```
>>> from sage.all import *
>>> NCSym = SymmetricFunctionsNonCommutingVariables(QQ)
>>> m = NCSym.m()
>>> m[[Integer(1),Integer(3)],[Integer(2)]].omega()
-2*m{{1, 2, 3}} - m{{1, 3}, {2}}
>>> p = NCSym.p()
>>> p[[Integer(1),Integer(3)],[Integer(2)]].omega()
-p{{1, 3}, {2}}
```

(continues on next page)

(continued from previous page)

```
>>> cp = NCSym.cp()
>>> cp[[Integer(1),Integer(3)],[Integer(2)]].omega()
-2*cp{{1, 2, 3}} - cp{{1, 3}, {2}}
>>> x = NCSym.x()
>>> x[[Integer(1),Integer(3)],[Integer(2)]].omega()
-2*x{{1}, {2}, {3}} - x{{1, 3}, {2}}
```

to_symmetric_function()

Compute the projection of an element of symmetric function in non-commuting variables to the symmetric functions.

The projection of a monomial symmetric function in non-commuting variables indexed by the set partition A is defined as

$$\mathbf{m}_A \mapsto m_{\lambda(A)} \prod_i n_i(\lambda(A))!$$

where $\lambda(A)$ is the partition associated with A by taking the sizes of the parts and $n_i(\mu)$ is the multiplicity of i in μ. For other bases this map is extended linearly.

OUTPUT: an element of the symmetric functions in the monomial basis

EXAMPLES:

```
sage: NCSym = SymmetricFunctionsNonCommutingVariables(QQ)
sage: e = NCSym.e()
sage: h = NCSym.h()
sage: p = NCSym.p()
sage: cp = NCSym.cp()
sage: x = NCSym.x()
sage: cp[[1,3],[2]].to_symmetric_function()
m[2, 1]
sage: x[[1,3],[2]].to_symmetric_function()
-6*m[1, 1, 1] - 2*m[2, 1]
sage: e[[1,3],[2]].to_symmetric_function()
2*e[2, 1]
sage: h[[1,3],[2]].to_symmetric_function()
2*h[2, 1]
sage: p[[1,3],[2]].to_symmetric_function()
p[2, 1]
```

```
>>> from sage.all import *
>>> NCSym = SymmetricFunctionsNonCommutingVariables(QQ)
>>> e = NCSym.e()
>>> h = NCSym.h()
>>> p = NCSym.p()
>>> cp = NCSym.cp()
>>> x = NCSym.x()
>>> cp[[Integer(1),Integer(3)],[Integer(2)]].to_symmetric_function()
m[2, 1]
>>> x[[Integer(1),Integer(3)],[Integer(2)]].to_symmetric_function()
-6*m[1, 1, 1] - 2*m[2, 1]
>>> e[[Integer(1),Integer(3)],[Integer(2)]].to_symmetric_function()
2*e[2, 1]
```

(continues on next page)

(continued from previous page)

```
>>> h[[Integer(1),Integer(3)],[Integer(2)]].to_symmetric_function()
2*h[2, 1]
>>> p[[Integer(1),Integer(3)],[Integer(2)]].to_symmetric_function()
p[2, 1]
```

to_wqsym()

Return the image of `self` under the canonical inclusion map $NCSym \to WQSym$.

The canonical inclusion map $NCSym \to WQSym$ is an injective homomorphism of algebras. It sends a basis element $\mathbf{m}_A$ of $NCSym$ to the sum of basis elements $\mathbf{M}_P$ of $WQSym$, where P ranges over all ordered set partitions that become A when the ordering is forgotten. This map is denoted by θ in [BZ05] (17).

See also:

WordQuasiSymmetricFunctions for a definition of $WQSym$.

EXAMPLES:

```
sage: NCSym = SymmetricFunctionsNonCommutingVariables(QQ)
sage: e = NCSym.e()
sage: h = NCSym.h()
sage: p = NCSym.p()
sage: cp = NCSym.cp()
sage: x = NCSym.x()
sage: m = NCSym.m()
sage: m[[1,3],[2]].to_wqsym()
M[{1, 3}, {2}] + M[{2}, {1, 3}]
sage: x[[1,3],[2]].to_wqsym()
-M[{1}, {2}, {3}] - M[{1}, {2, 3}] - M[{1}, {3}, {2}]
 - M[{1, 2}, {3}] - M[{2}, {1}, {3}] - M[{2}, {3}, {1}]
 - M[{2, 3}, {1}] - M[{3}, {1}, {2}] - M[{3}, {1, 2}]
 - M[{3}, {2}, {1}]
sage: (4*p[[1,3],[2]]-p[[1]]).to_wqsym()
-M[{1}] + 4*M[{1, 2, 3}] + 4*M[{1, 3}, {2}] + 4*M[{2}, {1, 3}]
```

```
>>> from sage.all import *
>>> NCSym = SymmetricFunctionsNonCommutingVariables(QQ)
>>> e = NCSym.e()
>>> h = NCSym.h()
>>> p = NCSym.p()
>>> cp = NCSym.cp()
>>> x = NCSym.x()
>>> m = NCSym.m()
>>> m[[Integer(1),Integer(3)],[Integer(2)]].to_wqsym()
M[{1, 3}, {2}] + M[{2}, {1, 3}]
>>> x[[Integer(1),Integer(3)],[Integer(2)]].to_wqsym()
-M[{1}, {2}, {3}] - M[{1}, {2, 3}] - M[{1}, {3}, {2}]
 - M[{1, 2}, {3}] - M[{2}, {1}, {3}] - M[{2}, {3}, {1}]
 - M[{2, 3}, {1}] - M[{3}, {1}, {2}] - M[{3}, {1, 2}]
 - M[{3}, {2}, {1}]
```

(continues on next page)

(continued from previous page)

```
>>> (Integer(4)*p[[Integer(1),Integer(3)],[Integer(2)]]-p[[Integer(1)]]).
↪to_wqsym()
-M[{1}] + 4*M[{1, 2, 3}] + 4*M[{1, 3}, {2}] + 4*M[{2}, {1, 3}]
```

class ParentMethods

Bases: `object`

from_symmetric_function(*f*)

Return the image of the symmetric function `f` in `self`.

This is performed by converting to the monomial basis and extending the method `sum_of_partitions()` linearly. This is a linear map from the symmetric functions to the symmetric functions in non-commuting variables that does not preserve the product or coproduct structure of the Hopf algebra.

See also:

`to_symmetric_function()`

INPUT:

- `f` – a symmetric function

OUTPUT: an element of `self`

EXAMPLES:

```
sage: NCSym = SymmetricFunctionsNonCommutingVariables(QQ)
sage: Sym = SymmetricFunctions(QQ)
sage: e = NCSym.e()
sage: elem = Sym.e()
sage: elt = e.from_symmetric_function(elem[2,1,1]); elt
1/12*e{{1}, {2}, {3, 4}} + 1/12*e{{1}, {2, 3}, {4}} + 1/12*e{{1}, {2, 4},
↪{3}}
 + 1/12*e{{1, 2}, {3}, {4}} + 1/12*e{{1, 3}, {2}, {4}} + 1/12*e{{1, 4},
↪{2}, {3}}
sage: elem(elt.to_symmetric_function())
e[2, 1, 1]
sage: e.from_symmetric_function(elem[4])
1/24*e{{1, 2, 3, 4}}
sage: p = NCSym.p()
sage: pow = Sym.p()
sage: elt = p.from_symmetric_function(pow[2,1,1]); elt
1/6*p{{1}, {2}, {3, 4}} + 1/6*p{{1}, {2, 3}, {4}} + 1/6*p{{1}, {2, 4}, {3}
↪}
 + 1/6*p{{1, 2}, {3}, {4}} + 1/6*p{{1, 3}, {2}, {4}} + 1/6*p{{1, 4}, {2},
↪{3}}
sage: pow(elt.to_symmetric_function())
p[2, 1, 1]
sage: p.from_symmetric_function(pow[4])

```

internal_coproduct()

Compute the internal coproduct of `self`.

If *internal_coproduct_on_basis()* is available, construct the internal coproduct morphism from `self` to `self` $\otimes$ `self` by extending it by linearity. Otherwise, this uses *internal_coprod-*

uct_by_coercion(), if available.

OUTPUT: an element of the tensor squared of `self`

EXAMPLES:

```
sage: cp = SymmetricFunctionsNonCommutingVariables(QQ).cp()
sage: cp.internal_coproduct(cp[[1,3],[2]] - 2*cp[[1]])
-2*cp{{1}} # cp{{1}} + cp{{1, 2, 3}} # cp{{1, 3}, {2}} + cp{{1, 3}, {2}}
↪# cp{{1, 2, 3}}
 + cp{{1, 3}, {2}} # cp{{1, 3}, {2}}
```

```
>>> from sage.all import *
>>> cp = SymmetricFunctionsNonCommutingVariables(QQ).cp()
>>> cp.internal_coproduct(cp[[Integer(1),Integer(3)],[Integer(2)]] -␣
↪Integer(2)*cp[[Integer(1)]])
-2*cp{{1}} # cp{{1}} + cp{{1, 2, 3}} # cp{{1, 3}, {2}} + cp{{1, 3}, {2}}
↪# cp{{1, 2, 3}}
 + cp{{1, 3}, {2}} # cp{{1, 3}, {2}}
```

internal_coproduct_by_coercion(*x*)

Return the internal coproduct by coercing the element to the powersum basis.

INPUT:

- `x` – an element of `self`

OUTPUT: an element of the tensor squared of `self`

EXAMPLES:

```
sage: h = SymmetricFunctionsNonCommutingVariables(QQ).h()
sage: h[[1,3],[2]].internal_coproduct() # indirect doctest
2*h{{1}, {2}, {3}} # h{{1}, {2}, {3}} - h{{1}, {2}, {3}} # h{{1, 3}, {2}}
 - h{{1, 3}, {2}} # h{{1}, {2}, {3}} + h{{1, 3}, {2}} # h{{1, 3}, {2}}
```

```
>>> from sage.all import *
>>> h = SymmetricFunctionsNonCommutingVariables(QQ).h()
>>> h[[Integer(1),Integer(3)],[Integer(2)]].internal_coproduct() #␣
↪indirect doctest
2*h{{1}, {2}, {3}} # h{{1}, {2}, {3}} - h{{1}, {2}, {3}} # h{{1, 3}, {2}}
 - h{{1, 3}, {2}} # h{{1}, {2}, {3}} + h{{1, 3}, {2}} # h{{1, 3}, {2}}
```

internal_coproduct_on_basis(*i*)

The internal coproduct of the algebra on the basis (optional).

INPUT:

- `i` – the indices of an element of the basis of `self`

OUTPUT: an element of the tensor squared of `self`

EXAMPLES:

```
sage: m = SymmetricFunctionsNonCommutingVariables(QQ).m()
sage: m.internal_coproduct_on_basis(SetPartition([[1,2]]))
m{{1, 2}} # m{{1, 2}}
```

```
>>> from sage.all import *
>>> m = SymmetricFunctionsNonCommutingVariables(QQ).m()
>>> m.internal_coproduct_on_basis(SetPartition([[Integer(1),Integer(2)]]))
m{{1, 2}} # m{{1, 2}}
```

primitive(*A*, *i=1*)

Return the primitive associated to `A` in `self`.

See also

primitive()

INPUT:

- `A` – set partition
- `i` – positive integer

OUTPUT: an element of `self`

EXAMPLES:

```
sage: e = SymmetricFunctionsNonCommutingVariables(QQ).e()
sage: elt = e.primitive(SetPartition([[1,3],[2]])); elt
e{{1, 2}, {3}} - e{{1, 3}, {2}}
sage: elt.coproduct()
e{} # e{{1, 2}, {3}} - e{} # e{{1, 3}, {2}} + e{{1, 2}, {3}} # e{} - e{{1,
↪ 3}, {2}} # e{}
```

```
>>> from sage.all import *
>>> e = SymmetricFunctionsNonCommutingVariables(QQ).e()
>>> elt = e.primitive(SetPartition([[Integer(1),Integer(3)],
↪[Integer(2)]])); elt
e{{1, 2}, {3}} - e{{1, 3}, {2}}
>>> elt.coproduct()
e{} # e{{1, 2}, {3}} - e{} # e{{1, 3}, {2}} + e{{1, 2}, {3}} # e{} - e{{1,
↪ 3}, {2}} # e{}
```

super_categories()

Return the super categories of bases of the Hopf dual of the symmetric functions in non-commuting variables.

OUTPUT: list of categories

class sage.combinat.ncsym.bases.**NCSymBasis_abstract**(*R*, *basis_keys=None*, *element_class=None*, *category=None*, *prefix=None*, *names=None*, ***kwds*)

Bases: *CombinatorialFreeModule*, `BindableClass`

Abstract base class for a basis of $NCSym$ or its dual.

class sage.combinat.ncsym.bases.**NCSymDualBases**(*parent_with_realization*)

Bases: `Category_realization_of_parent`

Category of bases of dual symmetric functions in non-commuting variables.

EXAMPLES:

```
sage: from sage.combinat.ncsym.bases import NCSymDualBases
sage: DNCSym = SymmetricFunctionsNonCommutingVariables(QQ).dual()
sage: NCSymDualBases(DNCSym)
Category of bases of dual symmetric functions in non-commuting variables over the␣
↪Rational Field
```

```
>>> from sage.all import *
>>> from sage.combinat.ncsym.bases import NCSymDualBases
>>> DNCSym = SymmetricFunctionsNonCommutingVariables(QQ).dual()
>>> NCSymDualBases(DNCSym)
Category of bases of dual symmetric functions in non-commuting variables over the␣
↪Rational Field
```

super_categories()

Return the super categories of bases of the Hopf dual of the symmetric functions in non-commuting variables.

OUTPUT: list of categories

class sage.combinat.ncsym.bases.**NCSymOrNCSymDualBases**(*parent_with_realization*)

Bases: Category_realization_of_parent

Base category for the category of bases of symmetric functions in non-commuting variables or its Hopf dual for the common code.

class ElementMethods

Bases: object

duality_pairing(*other*)

Compute the pairing between self and an element other of the dual.

EXAMPLES:

```
sage: NCSym = SymmetricFunctionsNonCommutingVariables(QQ)
sage: m = NCSym.m()
sage: w = m.dual_basis()
sage: elt = m[[1,3],[2]] - 3*m[[1,2],[3]]
sage: elt.duality_pairing(w[[1,3],[2]])
1
sage: elt.duality_pairing(w[[1,2],[3]])
-3
sage: elt.duality_pairing(w[[1,2]])
0
sage: e = NCSym.e()
sage: w[[1,3],[2]].duality_pairing(e[[1,3],[2]])
0
```

```
>>> from sage.all import *
>>> NCSym = SymmetricFunctionsNonCommutingVariables(QQ)
>>> m = NCSym.m()
>>> w = m.dual_basis()
>>> elt = m[[Integer(1),Integer(3)],[Integer(2)]] -␣
↪Integer(3)*m[[Integer(1),Integer(2)],[Integer(3)]]
>>> elt.duality_pairing(w[[Integer(1),Integer(3)],[Integer(2)]])
1
```

(continues on next page)

(continued from previous page)

```
>>> elt.duality_pairing(w[[Integer(1),Integer(2)],[Integer(3)]])
-3
>>> elt.duality_pairing(w[[Integer(1),Integer(2)]])
0
>>> e = NCSym.e()
>>> w[[Integer(1),Integer(3)],[Integer(2)]].duality_pairing(e[[Integer(1),
↪Integer(3)],[Integer(2)]])
0
```

class ParentMethods

Bases: `object`

counit_on_basis(*A*)

The counit is defined by sending all elements of positive degree to zero.

INPUT:

- `A` – set partition

OUTPUT: either the 0 or the 1 of the base ring of `self`

EXAMPLES:

```
sage: m = SymmetricFunctionsNonCommutingVariables(QQ).m()
sage: m.counit_on_basis(SetPartition([[1,3], [2]]))
0
sage: m.counit_on_basis(SetPartition([]))
1
sage: w = SymmetricFunctionsNonCommutingVariables(QQ).dual().w()
sage: w.counit_on_basis(SetPartition([[1,3], [2]]))
0
sage: w.counit_on_basis(SetPartition([]))
1
```

```
>>> from sage.all import *
>>> m = SymmetricFunctionsNonCommutingVariables(QQ).m()
>>> m.counit_on_basis(SetPartition([[Integer(1),Integer(3)],␣
↪[Integer(2)]]))
0
>>> m.counit_on_basis(SetPartition([]))
1
>>> w = SymmetricFunctionsNonCommutingVariables(QQ).dual().w()
>>> w.counit_on_basis(SetPartition([[Integer(1),Integer(3)],␣
↪[Integer(2)]]))
0
>>> w.counit_on_basis(SetPartition([]))
1
```

duality_pairing(*x*, *y*)

Compute the pairing between an element of `self` and an element of the dual.

Carry out this computation by converting `x` to the **m** basis and `y` to the **w** basis.

INPUT:

- `x` – an element of symmetric functions in non-commuting variables
- `y` – an element of the dual of symmetric functions in non-commuting variables

OUTPUT: an element of the base ring of `self`

EXAMPLES:

```
sage: NCSym = SymmetricFunctionsNonCommutingVariables(QQ)
sage: h = NCSym.h()
sage: w = NCSym.m().dual_basis()
sage: matrix([[h(A).duality_pairing(w(B)) for A in SetPartitions(3)] for␣
↪B in SetPartitions(3)])
[6 2 2 2 1]
[2 2 1 1 1]
[2 1 2 1 1]
[2 1 1 2 1]
[1 1 1 1 1]
sage: (h[[1,2],[3]] + 3*h[[1,3],[2]]).duality_pairing(2*w[[1,3],[2]] +␣
↪w[[1,2,3]] + 2*w[[1,2],[3]])
32
```

```
>>> from sage.all import *
>>> NCSym = SymmetricFunctionsNonCommutingVariables(QQ)
>>> h = NCSym.h()
>>> w = NCSym.m().dual_basis()
>>> matrix([[h(A).duality_pairing(w(B)) for A in␣
↪SetPartitions(Integer(3))] for B in SetPartitions(Integer(3))])
[6 2 2 2 1]
[2 2 1 1 1]
[2 1 2 1 1]
[2 1 1 2 1]
[1 1 1 1 1]
>>> (h[[Integer(1),Integer(2)],[Integer(3)]] + Integer(3)*h[[Integer(1),
↪Integer(3)],[Integer(2)]]).duality_pairing(Integer(2)*w[[Integer(1),
↪Integer(3)],[Integer(2)]] + w[[Integer(1),Integer(2),Integer(3)]] +␣
↪Integer(2)*w[[Integer(1),Integer(2)],[Integer(3)]])
32
```

duality_pairing_matrix(*basis*, *degree*)

The matrix of scalar products between elements of $NCSym$ and elements of $NCSym^*$.

INPUT:

- `basis` – a basis of the dual Hopf algebra
- `degree` – nonnegative integer

OUTPUT:

The matrix of scalar products between the basis `self` and the basis `basis` in the dual Hopf algebra of degree `degree`.

EXAMPLES:

The matrix between the **m** basis and the **w** basis:

```
sage: NCSym = SymmetricFunctionsNonCommutingVariables(QQ)
sage: m = NCSym.m()
sage: w = NCSym.dual().w()
sage: m.duality_pairing_matrix(w, 3)
[1 0 0 0 0]
[0 1 0 0 0]
```

(continues on next page)

(continued from previous page)

```
[0 0 1 0 0]
[0 0 0 1 0]
[0 0 0 0 1]
```

```
>>> from sage.all import *
>>> NCSym = SymmetricFunctionsNonCommutingVariables(QQ)
>>> m = NCSym.m()
>>> w = NCSym.dual().w()
>>> m.duality_pairing_matrix(w, Integer(3))
[1 0 0 0 0]
[0 1 0 0 0]
[0 0 1 0 0]
[0 0 0 1 0]
[0 0 0 0 1]
```

Similarly for some of the other basis of $NCSym$ and the **w** basis:

```
sage: e = NCSym.e()
sage: e.duality_pairing_matrix(w, 3)
[0 0 0 0 1]
[0 0 1 1 1]
[0 1 0 1 1]
[0 1 1 0 1]
[1 1 1 1 1]
sage: p = NCSym.p()
sage: p.duality_pairing_matrix(w, 3)
[1 0 0 0 0]
[1 1 0 0 0]
[1 0 1 0 0]
[1 0 0 1 0]
[1 1 1 1 1]
sage: cp = NCSym.cp()
sage: cp.duality_pairing_matrix(w, 3)
[1 0 0 0 0]
[1 1 0 0 0]
[0 0 1 0 0]
[1 0 0 1 0]
[1 1 1 1 1]
sage: x = NCSym.x()
sage: w.duality_pairing_matrix(x, 3)
[ 0  0  0  0  1]
[ 1  0 -1 -1  1]
[ 1 -1  0 -1  1]
[ 1 -1 -1  0  1]
[ 2 -1 -1 -1  1]
```

```
>>> from sage.all import *
>>> e = NCSym.e()
>>> e.duality_pairing_matrix(w, Integer(3))
[0 0 0 0 1]
[0 0 1 1 1]
[0 1 0 1 1]
```

(continues on next page)

(continued from previous page)

```
[0 1 1 0 1]
[1 1 1 1 1]
>>> p = NCSym.p()
>>> p.duality_pairing_matrix(w, Integer(3))
[1 0 0 0 0]
[1 1 0 0 0]
[1 0 1 0 0]
[1 0 0 1 0]
[1 1 1 1 1]
>>> cp = NCSym.cp()
>>> cp.duality_pairing_matrix(w, Integer(3))
[1 0 0 0 0]
[1 1 0 0 0]
[0 0 1 0 0]
[1 0 0 1 0]
[1 1 1 1 1]
>>> x = NCSym.x()
>>> w.duality_pairing_matrix(x, Integer(3))
[ 0  0  0  0  1]
[ 1  0 -1 -1  1]
[ 1 -1  0 -1  1]
[ 1 -1 -1  0  1]
[ 2 -1 -1 -1  1]
```

A base case test:

```
sage: m.duality_pairing_matrix(w, 0)
[1]
```

```
>>> from sage.all import *
>>> m.duality_pairing_matrix(w, Integer(0))
[1]
```

one_basis()

Return the index of the basis element containing 1.

OUTPUT: the empty set partition

EXAMPLES:

```
sage: m = SymmetricFunctionsNonCommutingVariables(QQ).m()
sage: m.one_basis()
{}
sage: w = SymmetricFunctionsNonCommutingVariables(QQ).dual().w()
sage: w.one_basis()
{}
```

```
>>> from sage.all import *
>>> m = SymmetricFunctionsNonCommutingVariables(QQ).m()
>>> m.one_basis()
{}
>>> w = SymmetricFunctionsNonCommutingVariables(QQ).dual().w()
```

(continues on next page)

(continued from previous page)

```
>>> w.one_basis()
{}
```

super_categories()

Return the super categories of bases of (the Hopf dual of) the symmetric functions in non-commuting variables.

OUTPUT: list of categories

5.1.149 Dual Symmetric Functions in Non-Commuting Variables

AUTHORS:

- Travis Scrimshaw (08-04-2013): Initial version

class sage.combinat.ncsym.dual.**SymmetricFunctionsNonCommutingVariablesDual**(*R*)

Bases: UniqueRepresentation, Parent

The Hopf dual to the symmetric functions in non-commuting variables.

See Section 2.3 of [BZ05] for a study.

a_realization()

Return the realization of the **w** basis of self.

EXAMPLES:

```
sage: SymmetricFunctionsNonCommutingVariables(QQ).dual().a_realization()
Dual symmetric functions in non-commuting variables over the Rational Field␣
↪in the w basis
```

```
>>> from sage.all import *
>>> SymmetricFunctionsNonCommutingVariables(QQ).dual().a_realization()
Dual symmetric functions in non-commuting variables over the Rational Field␣
↪in the w basis
```

dual()

Return the dual Hopf algebra of the dual symmetric functions in non-commuting variables.

EXAMPLES:

```
sage: NCSymD = SymmetricFunctionsNonCommutingVariables(QQ).dual()
sage: NCSymD.dual()
Symmetric functions in non-commuting variables over the Rational Field
```

```
>>> from sage.all import *
>>> NCSymD = SymmetricFunctionsNonCommutingVariables(QQ).dual()
>>> NCSymD.dual()
Symmetric functions in non-commuting variables over the Rational Field
```

class w(*NCSymD*)

Bases: *NCSymBasis_abstract*

The dual Hopf algebra of symmetric functions in non-commuting variables in the **w** basis.

EXAMPLES:

```
sage: NCSymD = SymmetricFunctionsNonCommutingVariables(QQ).dual()
sage: w = NCSymD.w()
```

```
>>> from sage.all import *
>>> NCSymD = SymmetricFunctionsNonCommutingVariables(QQ).dual()
>>> w = NCSymD.w()
```

We have the embedding χ^* of Sym into $NCSym^*$ available as a coercion:

```
sage: h = SymmetricFunctions(QQ).h()
sage: w(h[2,1])
w{{1}, {2, 3}} + w{{1, 2}, {3}} + w{{1, 3}, {2}}
```

```
>>> from sage.all import *
>>> h = SymmetricFunctions(QQ).h()
>>> w(h[Integer(2),Integer(1)])
w{{1}, {2, 3}} + w{{1, 2}, {3}} + w{{1, 3}, {2}}
```

Similarly we can pull back when we are in the image of χ^*:

```
sage: elt = 3*(w[[1],[2,3]] + w[[1,2],[3]] + w[[1,3],[2]])
sage: h(elt)
3*h[2, 1]
```

```
>>> from sage.all import *
>>> elt = Integer(3)*(w[[Integer(1)],[Integer(2),Integer(3)]] + w[[Integer(1),
↪Integer(2)],[Integer(3)]] + w[[Integer(1),Integer(3)],[Integer(2)]])
>>> h(elt)
3*h[2, 1]
```

class Element

Bases: `IndexedFreeModuleElement`

An element in the **w** basis.

expand(*n*, *letter='x'*)

Expand `self` written in the **w** basis in n^2 commuting variables which satisfy the relation $x_{ij}x_{ik} = 0$ for all i, j, and k.

The expansion of an element of the **w** basis is given by equations (26) and (55) in [HNT06].

INPUT:
- `n` – integer
- `letter` – string (default: `'x'`)

OUTPUT:
- The symmetric function of `self` expressed in the `n*n` non-commuting variables described by `letter`.

REFERENCES:

EXAMPLES:

```
sage: w = SymmetricFunctionsNonCommutingVariables(QQ).dual().w()
sage: w[[1,3],[2]].expand(4)
x02*x11*x20 + x03*x11*x30 + x03*x22*x30 + x13*x22*x31
```

```
>>> from sage.all import *
>>> w = SymmetricFunctionsNonCommutingVariables(QQ).dual().w()
>>> w[[Integer(1),Integer(3)],[Integer(2)]].expand(Integer(4))
x02*x11*x20 + x03*x11*x30 + x03*x22*x30 + x13*x22*x31
```

One can use a different set of variable by using the optional argument `letter`:

```
sage: w[[1,3],[2]].expand(3, letter='y')
y02*y11*y20
```

```
>>> from sage.all import *
>>> w[[Integer(1),Integer(3)],[Integer(2)]].expand(Integer(3), letter=
↪'y')
y02*y11*y20
```

is_symmetric()

Determine if a $NCSym^*$ function, expressed in the **w** basis, is symmetric.

A function f in the **w** basis is a symmetric function if it is in the image of χ^*. That is to say we have

$$f = \sum_{\lambda} c_{\lambda} \prod_i m_i(\lambda)! \sum_{\lambda(A)=\lambda} \mathbf{w}_A$$

where the second sum is over all set partitions A whose shape $\lambda(A)$ is equal to λ and $m_i(\mu)$ is the multiplicity of i in the partition μ.

OUTPUT:

- `True` if $\lambda(A) = \lambda(B)$ implies the coefficients of $\mathbf{w}_A$ and $\mathbf{w}_B$ are equal, `False` otherwise

EXAMPLES:

```
sage: w = SymmetricFunctionsNonCommutingVariables(QQ).dual().w()
sage: elt = w.sum_of_partitions([2,1,1])
sage: elt.is_symmetric()
True
sage: elt -= 3*w.sum_of_partitions([1,1])
sage: elt.is_symmetric()
True
sage: w = SymmetricFunctionsNonCommutingVariables(ZZ).dual().w()
sage: elt = w.sum_of_partitions([2,1,1]) / 2
sage: elt.is_symmetric()
False
sage: elt = w[[1,3],[2]]
sage: elt.is_symmetric()
False
sage: elt = w[[1],[2,3]] + w[[1,2],[3]] + 2*w[[1,3],[2]]
sage: elt.is_symmetric()
False
```

```
>>> from sage.all import *
>>> w = SymmetricFunctionsNonCommutingVariables(QQ).dual().w()
>>> elt = w.sum_of_partitions([Integer(2),Integer(1),Integer(1)])
>>> elt.is_symmetric()
True
>>> elt -= Integer(3)*w.sum_of_partitions([Integer(1),Integer(1)])
```

(continues on next page)

(continued from previous page)

```
>>> elt.is_symmetric()
True
>>> w = SymmetricFunctionsNonCommutingVariables(ZZ).dual().w()
>>> elt = w.sum_of_partitions([Integer(2),Integer(1),Integer(1)]) /
↪Integer(2)
>>> elt.is_symmetric()
False
>>> elt = w[[Integer(1),Integer(3)],[Integer(2)]]
>>> elt.is_symmetric()
False
>>> elt = w[[Integer(1)],[Integer(2),Integer(3)]] + w[[Integer(1),
↪Integer(2)],[Integer(3)]] + Integer(2)*w[[Integer(1),Integer(3)],
↪[Integer(2)]]
>>> elt.is_symmetric()
False
```

to_symmetric_function()

Take a function in the **w** basis, and return its symmetric realization, when possible, expressed in the homogeneous basis of symmetric functions.

OUTPUT:

- If `self` is a symmetric function, then the expansion in the homogeneous basis of the symmetric functions is returned. Otherwise an error is raised.

EXAMPLES:

```
sage: w = SymmetricFunctionsNonCommutingVariables(QQ).dual().w()
sage: elt = w[[1],[2,3]] + w[[1,2],[3]] + w[[1,3],[2]]
sage: elt.to_symmetric_function()
h[2, 1]
sage: elt = w.sum_of_partitions([2,1,1]) / 2
sage: elt.to_symmetric_function()
1/2*h[2, 1, 1]
```

```
>>> from sage.all import *
>>> w = SymmetricFunctionsNonCommutingVariables(QQ).dual().w()
>>> elt = w[[Integer(1)],[Integer(2),Integer(3)]] + w[[Integer(1),
↪Integer(2)],[Integer(3)]] + w[[Integer(1),Integer(3)],[Integer(2)]]
>>> elt.to_symmetric_function()
h[2, 1]
>>> elt = w.sum_of_partitions([Integer(2),Integer(1),Integer(1)]) /
↪Integer(2)
>>> elt.to_symmetric_function()
1/2*h[2, 1, 1]
```

antipode_on_basis(*A*)

Return the antipode applied to the basis element indexed by `A`.

INPUT:

- `A` – set partition

OUTPUT: an element in the basis `self`

EXAMPLES:

```
sage: w = SymmetricFunctionsNonCommutingVariables(QQ).dual().w()
sage: w.antipode_on_basis(SetPartition([[1],[2,3]]))
-3*w{{1}, {2}, {3}} + w{{1, 2}, {3}} + w{{1, 3}, {2}}
sage: F = w[[1,3],[5],[2,4]].coproduct()
sage: F.apply_multilinear_morphism(lambda x,y: x.antipode()*y)
0
```

```
>>> from sage.all import *
>>> w = SymmetricFunctionsNonCommutingVariables(QQ).dual().w()
>>> w.antipode_on_basis(SetPartition([[Integer(1)],[Integer(2),
↪Integer(3)]]))
-3*w{{1}, {2}, {3}} + w{{1, 2}, {3}} + w{{1, 3}, {2}}
>>> F = w[[Integer(1),Integer(3)],[Integer(5)],[Integer(2),Integer(4)]].
↪coproduct()
>>> F.apply_multilinear_morphism(lambda x,y: x.antipode()*y)
0
```

coproduct_on_basis(A)

Return the coproduct of a **w** basis element.

The coproduct on the basis element $\mathbf{w}_A$ is the sum over tensor product terms $\mathbf{w}_B \otimes \mathbf{w}_C$ where B is the restriction of A to $\{1, 2, \ldots, k\}$ and C is the restriction of A to $\{k + 1, k + 2, \ldots, n\}$.

INPUT:

- `A` – set partition

OUTPUT:

- The coproduct applied to the **w** dual symmetric function in non-commuting variables indexed by `A` expressed in the **w** basis.

EXAMPLES:

```
sage: w = SymmetricFunctionsNonCommutingVariables(QQ).dual().w()
sage: w[[1], [2,3]].coproduct()
w{} # w{{1}, {2, 3}} + w{{1}} # w{{1, 2}}
 + w{{1}, {2}} # w{{1}} + w{{1}, {2, 3}} # w{}
sage: w.coproduct_on_basis(SetPartition([]))
w{} # w{}
```

```
>>> from sage.all import *
>>> w = SymmetricFunctionsNonCommutingVariables(QQ).dual().w()
>>> w[[Integer(1)], [Integer(2),Integer(3)]].coproduct()
w{} # w{{1}, {2, 3}} + w{{1}} # w{{1, 2}}
 + w{{1}, {2}} # w{{1}} + w{{1}, {2, 3}} # w{}
>>> w.coproduct_on_basis(SetPartition([]))
w{} # w{}
```

dual_basis()

Return the dual basis to the **w** basis.

The dual basis to the **w** basis is the monomial basis of the symmetric functions in non-commuting variables.

OUTPUT: the monomial basis of the symmetric functions in non-commuting variables

EXAMPLES:

```
sage: w = SymmetricFunctionsNonCommutingVariables(QQ).dual().w()
sage: w.dual_basis()
Symmetric functions in non-commuting variables over the Rational Field in␣
↪the monomial basis
```

```
>>> from sage.all import *
>>> w = SymmetricFunctionsNonCommutingVariables(QQ).dual().w()
>>> w.dual_basis()
Symmetric functions in non-commuting variables over the Rational Field in␣
↪the monomial basis
```

duality_pairing(*x*, *y*)

Compute the pairing between an element of `self` and an element of the dual.

INPUT:

- `x` – an element of the dual of symmetric functions in non-commuting variables
- `y` – an element of the symmetric functions in non-commuting variables

OUTPUT: an element of the base ring of `self`

EXAMPLES:

```
sage: DNCSym = SymmetricFunctionsNonCommutingVariablesDual(QQ)
sage: w = DNCSym.w()
sage: m = w.dual_basis()
sage: matrix([[w(A).duality_pairing(m(B)) for A in SetPartitions(3)] for␣
↪B in SetPartitions(3)])
[1 0 0 0 0]
[0 1 0 0 0]
[0 0 1 0 0]
[0 0 0 1 0]
[0 0 0 0 1]
sage: (w[[1,2],[3]] + 3*w[[1,3],[2]]).duality_pairing(2*m[[1,3],[2]] +␣
↪m[[1,2,3]] + 2*m[[1,2],[3]])
8
sage: h = SymmetricFunctionsNonCommutingVariables(QQ).h()
sage: matrix([[w(A).duality_pairing(h(B)) for A in SetPartitions(3)] for␣
↪B in SetPartitions(3)])
[6 2 2 2 1]
[2 2 1 1 1]
[2 1 2 1 1]
[2 1 1 2 1]
[1 1 1 1 1]
sage: (2*w[[1,3],[2]] + w[[1,2,3]] + 2*w[[1,2],[3]]).duality_pairing(h[[1,
↪2],[3]] + 3*h[[1,3],[2]])
32
```

```
>>> from sage.all import *
>>> DNCSym = SymmetricFunctionsNonCommutingVariablesDual(QQ)
>>> w = DNCSym.w()
>>> m = w.dual_basis()
>>> matrix([[w(A).duality_pairing(m(B)) for A in␣
↪SetPartitions(Integer(3))] for B in SetPartitions(Integer(3))])
[1 0 0 0 0]
```

(continues on next page)

↪Integer(2),Integer(3)]] + Integer(2)*w[[Integer(1),Integer(2)],
↪[Integer(3)]]).duality_pairing(h[[Integer(1),Integer(2)],[Integer(3)]]␣
↪+ Integer(3)*h[[Integer(1),Integer(3)],[Integer(2)]])
32
```

product_on_basis(A, B)

The product on **w** basis elements.

The product on the **w** is the dual to the coproduct on the **m** basis. On the basis **w** it is defined as

$$\mathbf{w}_A \mathbf{w}_B = \sum_{S \subseteq [n]} \mathbf{w}_{A\uparrow_S \cup B\uparrow_{S^c}}$$

where the sum is over all possible subsets S of $[n]$ such that $|S| = |A|$ with a term indexed the union of $A \uparrow_S$ and $B \uparrow_{S^c}$. The notation $A \uparrow_S$ represents the unique set partition of the set S such that the standardization is A. This product is commutative.

INPUT:

- A, B – set partitions

OUTPUT: an element of the **w** basis

EXAMPLES:

```
sage: w = SymmetricFunctionsNonCommutingVariables(QQ).dual().w()
sage: A = SetPartition([[1], [2,3]])
sage: B = SetPartition([[1, 2, 3]])
sage: w.product_on_basis(A, B)
w{{1}, {2, 3}, {4, 5, 6}} + w{{1}, {2, 3, 4}, {5, 6}}
 + w{{1}, {2, 3, 5}, {4, 6}} + w{{1}, {2, 3, 6}, {4, 5}}
 + w{{1}, {2, 4}, {3, 5, 6}} + w{{1}, {2, 4, 5}, {3, 6}}
 + w{{1}, {2, 4, 6}, {3, 5}} + w{{1}, {2, 5}, {3, 4, 6}}
 + w{{1}, {2, 5, 6}, {3, 4}} + w{{1}, {2, 6}, {3, 4, 5}}
 + w{{1, 2, 3}, {4}, {5, 6}} + w{{1, 2, 4}, {3}, {5, 6}}
 + w{{1, 2, 5}, {3}, {4, 6}} + w{{1, 2, 6}, {3}, {4, 5}}
 + w{{1, 3, 4}, {2}, {5, 6}} + w{{1, 3, 5}, {2}, {4, 6}}
 + w{{1, 3, 6}, {2}, {4, 5}} + w{{1, 4, 5}, {2}, {3, 6}}
```

(continues on next page)

(continued from previous page)

```
 + w{{1, 4, 6}, {2}, {3, 5}} + w{{1, 5, 6}, {2}, {3, 4}}
sage: B = SetPartition([[1], [2]])
sage: w.product_on_basis(A, B)
3*w{{1}, {2}, {3}, {4, 5}} + 2*w{{1}, {2}, {3, 4}, {5}}
 + 2*w{{1}, {2}, {3, 5}, {4}} + w{{1}, {2, 3}, {4}, {5}}
 + w{{1}, {2, 4}, {3}, {5}} + w{{1}, {2, 5}, {3}, {4}}
sage: w.product_on_basis(A, SetPartition([]))
w{{1}, {2, 3}}
```

```
>>> from sage.all import *
>>> w = SymmetricFunctionsNonCommutingVariables(QQ).dual().w()
>>> A = SetPartition([[Integer(1)], [Integer(2),Integer(3)]])
>>> B = SetPartition([[Integer(1), Integer(2), Integer(3)]])
>>> w.product_on_basis(A, B)
w{{1}, {2, 3}, {4, 5, 6}} + w{{1}, {2, 3, 4}, {5, 6}}
 + w{{1}, {2, 3, 5}, {4, 6}} + w{{1}, {2, 3, 6}, {4, 5}}
 + w{{1}, {2, 4}, {3, 5, 6}} + w{{1}, {2, 4, 5}, {3, 6}}
 + w{{1}, {2, 4, 6}, {3, 5}} + w{{1}, {2, 5}, {3, 4, 6}}
 + w{{1}, {2, 5, 6}, {3, 4}} + w{{1}, {2, 6}, {3, 4, 5}}
 + w{{1, 2, 3}, {4}, {5, 6}} + w{{1, 2, 4}, {3}, {5, 6}}
 + w{{1, 2, 5}, {3}, {4, 6}} + w{{1, 2, 6}, {3}, {4, 5}}
 + w{{1, 3, 4}, {2}, {5, 6}} + w{{1, 3, 5}, {2}, {4, 6}}
 + w{{1, 3, 6}, {2}, {4, 5}} + w{{1, 4, 5}, {2}, {3, 6}}
 + w{{1, 4, 6}, {2}, {3, 5}} + w{{1, 5, 6}, {2}, {3, 4}}
>>> B = SetPartition([[Integer(1)], [Integer(2)]])
>>> w.product_on_basis(A, B)
3*w{{1}, {2}, {3}, {4, 5}} + 2*w{{1}, {2}, {3, 4}, {5}}
 + 2*w{{1}, {2}, {3, 5}, {4}} + w{{1}, {2, 3}, {4}, {5}}
 + w{{1}, {2, 4}, {3}, {5}} + w{{1}, {2, 5}, {3}, {4}}
>>> w.product_on_basis(A, SetPartition([]))
w{{1}, {2, 3}}
```

sum_of_partitions(*la*)

Return the sum over all sets partitions whose shape is `la`, scaled by $\prod_i m_i!$ where m_i is the multiplicity of i in `la`.

INPUT:

- `la` – integer partition

OUTPUT: an element of `self`

EXAMPLES:

```
sage: w = SymmetricFunctionsNonCommutingVariables(QQ).dual().w()
sage: w.sum_of_partitions([2,1,1])
2*w{{1}, {2}, {3, 4}} + 2*w{{1}, {2, 3}, {4}} + 2*w{{1}, {2, 4}, {3}}
 + 2*w{{1, 2}, {3}, {4}} + 2*w{{1, 3}, {2}, {4}} + 2*w{{1, 4}, {2}, {3}}
```

```
>>> from sage.all import *
>>> w = SymmetricFunctionsNonCommutingVariables(QQ).dual().w()
>>> w.sum_of_partitions([Integer(2),Integer(1),Integer(1)])
2*w{{1}, {2}, {3, 4}} + 2*w{{1}, {2, 3}, {4}} + 2*w{{1}, {2, 4}, {3}}
 + 2*w{{1, 2}, {3}, {4}} + 2*w{{1, 3}, {2}, {4}} + 2*w{{1, 4}, {2}, {3}}
```

to_symmetric_function()

The preimage of χ^* in the $\mathbf{w}$ basis.

EXAMPLES:

```
sage: w = SymmetricFunctionsNonCommutingVariables(QQ).dual().w()
sage: w.to_symmetric_function
Generic morphism:
  From: Dual symmetric functions in non-commuting variables over the␣
↪Rational Field in the w basis
  To:   Symmetric Functions over Rational Field in the homogeneous basis
```

```
>>> from sage.all import *
>>> w = SymmetricFunctionsNonCommutingVariables(QQ).dual().w()
>>> w.to_symmetric_function
Generic morphism:
  From: Dual symmetric functions in non-commuting variables over the␣
↪Rational Field in the w basis
  To:   Symmetric Functions over Rational Field in the homogeneous basis
```

5.1.150 Symmetric Functions in Non-Commuting Variables

AUTHORS:

- Travis Scrimshaw (08-04-2013): Initial version

class sage.combinat.ncsym.ncsym.**SymmetricFunctionsNonCommutingVariables**(R)

Bases: UniqueRepresentation, Parent

Symmetric functions in non-commutative variables.

The ring of symmetric functions in non-commutative variables, which is not to be confused with the *non-commutative symmetric functions*, is the ring of all bounded-degree noncommutative power series in countably many indeterminates (i.e., elements in $R\langle\langle x_1, x_2, x_3, \ldots\rangle\rangle$ of bounded degree) which are invariant with respect to the action of the symmetric group S_∞ on the indices of the indeterminates. It can be regarded as a direct limit over all $n \to \infty$ of rings of S_n-invariant polynomials in n non-commuting variables (that is, S_n-invariant elements of $R\langle x_1, x_2, \ldots, x_n\rangle$).

This ring is implemented as a Hopf algebra whose basis elements are indexed by set partitions.

Let $A = \{A_1, A_2, \ldots, A_r\}$ be a set partition of the integers $[k] := \{1, 2, \ldots, k\}$. This partition A determines an equivalence relation $\sim_A$ on $[k]$, which has $c \sim_A d$ if and only if c and d are in the same part A_j of A. The monomial basis element $\mathbf{m}_A$ indexed by A is the sum of monomials $x_{i_1} x_{i_2} \cdots x_{i_k}$ such that $i_c = i_d$ if and only if $c \sim_A d$.

The k-th graded component of the ring of symmetric functions in non-commutative variables has its dimension equal to the number of set partitions of $[k]$. (If we work, instead, with finitely many – say, n – variables, then its dimension is equal to the number of set partitions of $[k]$ where the number of parts is at most n.)

Note

All set partitions are considered standard (i.e., set partitions of $[n]$ for some n) unless otherwise stated.

REFERENCES:

EXAMPLES:

We begin by first creating the ring of $NCSym$ and the bases that are analogues of the usual symmetric functions:

```
sage: NCSym = SymmetricFunctionsNonCommutingVariables(QQ)
sage: m = NCSym.m()
sage: e = NCSym.e()
sage: h = NCSym.h()
sage: p = NCSym.p()
sage: m
Symmetric functions in non-commuting variables over the Rational Field in the␣
↪monomial basis
```

```
>>> from sage.all import *
>>> NCSym = SymmetricFunctionsNonCommutingVariables(QQ)
>>> m = NCSym.m()
>>> e = NCSym.e()
>>> h = NCSym.h()
>>> p = NCSym.p()
>>> m
Symmetric functions in non-commuting variables over the Rational Field in the␣
↪monomial basis
```

The basis is indexed by set partitions, so we create a few elements and convert them between these bases:

```
sage: elt = m(SetPartition([[1,3],[2]])) - 2*m(SetPartition([[1],[2]])); elt
-2*m{{1}, {2}} + m{{1, 3}, {2}}
sage: e(elt)
1/2*e{{1}, {2, 3}} - 2*e{{1, 2}} + 1/2*e{{1, 2}, {3}} - 1/2*e{{1, 2, 3}} - 1/2*e{
↪{1, 3}, {2}}
sage: h(elt)
-4*h{{1}, {2}} - 2*h{{1}, {2}, {3}} + 1/2*h{{1}, {2, 3}} + 2*h{{1, 2}}
 + 1/2*h{{1, 2}, {3}} - 1/2*h{{1, 2, 3}} + 3/2*h{{1, 3}, {2}}
sage: p(elt)
-2*p{{1}, {2}} + 2*p{{1, 2}} - p{{1, 2, 3}} + p{{1, 3}, {2}}
sage: m(p(elt))
-2*m{{1}, {2}} + m{{1, 3}, {2}}

sage: elt = p(SetPartition([[1,3],[2]])) - 4*p(SetPartition([[1],[2]])) + 2; elt
2*p{} - 4*p{{1}, {2}} + p{{1, 3}, {2}}
sage: e(elt)
2*e{} - 4*e{{1}, {2}} + e{{1}, {2}, {3}} - e{{1, 3}, {2}}
sage: m(elt)
2*m{} - 4*m{{1}, {2}} - 4*m{{1, 2}} + m{{1, 2, 3}} + m{{1, 3}, {2}}
sage: h(elt)
2*h{} - 4*h{{1}, {2}} - h{{1}, {2}, {3}} + h{{1, 3}, {2}}
sage: p(m(elt))
2*p{} - 4*p{{1}, {2}} + p{{1, 3}, {2}}
```

```
>>> from sage.all import *
>>> elt = m(SetPartition([[Integer(1),Integer(3)],[Integer(2)]])) -␣
↪Integer(2)*m(SetPartition([[Integer(1)],[Integer(2)]])); elt
-2*m{{1}, {2}} + m{{1, 3}, {2}}
>>> e(elt)
1/2*e{{1}, {2, 3}} - 2*e{{1, 2}} + 1/2*e{{1, 2}, {3}} - 1/2*e{{1, 2, 3}} - 1/2*e{
```

(continues on next page)

(continued from previous page)

```
↪{1, 3}, {2}}
>>> h(elt)
-4*h{{1}, {2}} - 2*h{{1}, {2}, {3}} + 1/2*h{{1}, {2, 3}} + 2*h{{1, 2}}
 + 1/2*h{{1, 2}, {3}} - 1/2*h{{1, 2, 3}} + 3/2*h{{1, 3}, {2}}
>>> p(elt)
-2*p{{1}, {2}} + 2*p{{1, 2}} - p{{1, 2, 3}} + p{{1, 3}, {2}}
>>> m(p(elt))
-2*m{{1}, {2}} + m{{1, 3}, {2}}

>>> elt = p(SetPartition([[Integer(1),Integer(3)],[Integer(2)]])) -␣
↪Integer(4)*p(SetPartition([[Integer(1)],[Integer(2)]])) + Integer(2); elt
2*p{} - 4*p{{1}, {2}} + p{{1, 3}, {2}}
>>> e(elt)
2*e{} - 4*e{{1}, {2}} + e{{1}, {2}, {3}} - e{{1, 3}, {2}}
>>> m(elt)
2*m{} - 4*m{{1}, {2}} - 4*m{{1, 2}} + m{{1, 2, 3}} + m{{1, 3}, {2}}
>>> h(elt)
2*h{} - 4*h{{1}, {2}} - h{{1}, {2}, {3}} + h{{1, 3}, {2}}
>>> p(m(elt))
2*p{} - 4*p{{1}, {2}} + p{{1, 3}, {2}}
```

There is also a shorthand for creating elements. We note that we must use `p[[]]` to create the empty set partition due to python's syntax.

```
sage: eltm = m[[1,3],[2]] - 3*m[[1],[2]]; eltm
-3*m{{1}, {2}} + m{{1, 3}, {2}}
sage: elte = e[[1,3],[2]]; elte
e{{1, 3}, {2}}
sage: elth = h[[1,3],[2,4]]; elth
h{{1, 3}, {2, 4}}
sage: eltp = p[[1,3],[2,4]] + 2*p[[1]] - 4*p[[]]; eltp
-4*p{} + 2*p{{1}} + p{{1, 3}, {2, 4}}
```

```
>>> from sage.all import *
>>> eltm = m[[Integer(1),Integer(3)],[Integer(2)]] - Integer(3)*m[[Integer(1)],
↪[Integer(2)]]; eltm
-3*m{{1}, {2}} + m{{1, 3}, {2}}
>>> elte = e[[Integer(1),Integer(3)],[Integer(2)]]; elte
e{{1, 3}, {2}}
>>> elth = h[[Integer(1),Integer(3)],[Integer(2),Integer(4)]]; elth
h{{1, 3}, {2, 4}}
>>> eltp = p[[Integer(1),Integer(3)],[Integer(2),Integer(4)]] +␣
↪Integer(2)*p[[Integer(1)]] - Integer(4)*p[[]]; eltp
-4*p{} + 2*p{{1}} + p{{1, 3}, {2, 4}}
```

There is also a natural projection to the usual symmetric functions by letting the variables commute. This projection map preserves the product and coproduct structure. We check that Theorem 2.1 of [RS06] holds:

```
sage: Sym = SymmetricFunctions(QQ)
sage: Sm = Sym.m()
sage: Se = Sym.e()
sage: Sh = Sym.h()
```

(continues on next page)

(continued from previous page)

```
sage: Sp = Sym.p()
sage: eltm.to_symmetric_function()
-6*m[1, 1] + m[2, 1]
sage: Sm(p(eltm).to_symmetric_function())
-6*m[1, 1] + m[2, 1]
sage: elte.to_symmetric_function()
2*e[2, 1]
sage: Se(h(elte).to_symmetric_function())
2*e[2, 1]
sage: elth.to_symmetric_function()
4*h[2, 2]
sage: Sh(m(elth).to_symmetric_function())
4*h[2, 2]
sage: eltp.to_symmetric_function()
-4*p[] + 2*p[1] + p[2, 2]
sage: Sp(e(eltp).to_symmetric_function())
-4*p[] + 2*p[1] + p[2, 2]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> Sm = Sym.m()
>>> Se = Sym.e()
>>> Sh = Sym.h()
>>> Sp = Sym.p()
>>> eltm.to_symmetric_function()
-6*m[1, 1] + m[2, 1]
>>> Sm(p(eltm).to_symmetric_function())
-6*m[1, 1] + m[2, 1]
>>> elte.to_symmetric_function()
2*e[2, 1]
>>> Se(h(elte).to_symmetric_function())
2*e[2, 1]
>>> elth.to_symmetric_function()
4*h[2, 2]
>>> Sh(m(elth).to_symmetric_function())
4*h[2, 2]
>>> eltp.to_symmetric_function()
-4*p[] + 2*p[1] + p[2, 2]
>>> Sp(e(eltp).to_symmetric_function())
-4*p[] + 2*p[1] + p[2, 2]
```

a_realization()

Return the realization of the powersum basis of `self`.

OUTPUT: the powersum basis of symmetric functions in non-commuting variables

EXAMPLES:

```
sage: SymmetricFunctionsNonCommutingVariables(QQ).a_realization()
Symmetric functions in non-commuting variables over the Rational Field in the
↪powersum basis
```

```
>>> from sage.all import *
>>> SymmetricFunctionsNonCommutingVariables(QQ).a_realization()
Symmetric functions in non-commuting variables over the Rational Field in the␣
↪powersum basis
```

chi

alias of *supercharacter*

class coarse_powersum(*NCSym*)

Bases: *NCSymBasis_abstract*

The Hopf algebra of symmetric functions in non-commuting variables in the **cp** basis.

This basis was defined in [BZ05] as

$$\mathbf{cp}_A = \sum_{A \leq_* B} \mathbf{m}_B,$$

where we sum over all strict coarsenings of the set partition A. An alternative description of this basis was given in [BT13] as

$$\mathbf{cp}_A = \sum_{A \subseteq B} \mathbf{m}_B,$$

where we sum over all set partitions whose arcs are a subset of the arcs of the set partition A.

Note

In [BZ05], this basis was denoted by **q**. In [BT13], this basis was called the powersum basis and denoted by p. However it is a coarser basis than the usual powersum basis in the sense that it does not yield the usual powersum basis of the symmetric function under the natural map of letting the variables commute.

EXAMPLES:

```
sage: NCSym = SymmetricFunctionsNonCommutingVariables(QQ)
sage: cp = NCSym.cp()
sage: cp[[1,3],[2,4]]*cp[[1,2,3]]
cp{{1, 3}, {2, 4}, {5, 6, 7}}
sage: cp[[1,2],[3]].internal_coproduct()
cp{{1, 2}, {3}} # cp{{1, 2}, {3}}
sage: ps = SymmetricFunctions(NCSym.base_ring()).p()
sage: ps(cp[[1,3],[2]].to_symmetric_function())
p[2, 1] - p[3]
sage: ps(cp[[1,2],[3]].to_symmetric_function())
p[2, 1]
```

```
>>> from sage.all import *
>>> NCSym = SymmetricFunctionsNonCommutingVariables(QQ)
>>> cp = NCSym.cp()
>>> cp[[Integer(1),Integer(3)],[Integer(2),Integer(4)]]*cp[[Integer(1),
↪Integer(2),Integer(3)]]
cp{{1, 3}, {2, 4}, {5, 6, 7}}
>>> cp[[Integer(1),Integer(2)],[Integer(3)]].internal_coproduct()
cp{{1, 2}, {3}} # cp{{1, 2}, {3}}
```

(continues on next page)

(continued from previous page)

```
>>> ps = SymmetricFunctions(NCSym.base_ring()).p()
>>> ps(cp[[Integer(1),Integer(3)],[Integer(2)]].to_symmetric_function())
p[2, 1] - p[3]
>>> ps(cp[[Integer(1),Integer(2)],[Integer(3)]].to_symmetric_function())
p[2, 1]
```

cp

alias of *coarse_powersum*

class deformed_coarse_powersum(*NCSym*, *q=2*)

Bases: *NCSymBasis_abstract*

The Hopf algebra of symmetric functions in non-commuting variables in the ρ basis.

This basis was defined in [BT13] as a q-deformation of the **cp** basis:

$$\rho_A = \sum_{A \subseteq B} \frac{1}{q^{\mathrm{nst}_{B-A}^{A}}} \mathbf{m}_B,$$

where we sum over all set partitions whose arcs are a subset of the arcs of the set partition A.

INPUT:

- q – (default: 2) the parameter q

EXAMPLES:

```
sage: R = QQ['q'].fraction_field()
sage: q = R.gen()
sage: NCSym = SymmetricFunctionsNonCommutingVariables(R)
sage: rho = NCSym.rho(q)
```

```
>>> from sage.all import *
>>> R = QQ['q'].fraction_field()
>>> q = R.gen()
>>> NCSym = SymmetricFunctionsNonCommutingVariables(R)
>>> rho = NCSym.rho(q)
```

We construct Example 3.1 in [BT13]:

```
sage: rnode = lambda A: sorted([a[1] for a in A.arcs()], reverse=True)
sage: dimv = lambda A: sorted([a[1]-a[0] for a in A.arcs()], reverse=True)
sage: lst = list(SetPartitions(4))
sage: S = sorted(lst, key=lambda A: (dimv(A), rnode(A)))
sage: m = NCSym.m()
sage: matrix([[m(rho[A])[B] for B in S] for A in S])
[  1   1   1   1   1   1   1   1   1   1   1   1   1   1   1]
[  0   1   0   0   1   1   0   1   0   0   1   0   0   0   0]
[  0   0   1   0   1   0   1   1   0   0   0   0   0   0   1]
[  0   0   0   1   0   1   1   1   0   0   0   1   0   0   0]
[  0   0   0   0   1   0   0   1   0   0   0   0   0   0   0]
[  0   0   0   0   0   1   0   1   0   0   0   0   0   0   0]
[  0   0   0   0   0   0   1   1   0   0   0   0   0   0   0]
[  0   0   0   0   0   0   0   1   0   0   0   0   0   0   0]
[  0   0   0   0   0   0   0   0   1   0   0   1   1   0   0]
```

(continues on next page)

(continued from previous page)

[  0   0   0   0   0   0   0   0   0   0   0   0   0   0   1]
```

q()

Return the deformation parameter q of `self`.

EXAMPLES:

```
sage: NCSym = SymmetricFunctionsNonCommutingVariables(QQ)
sage: rho = NCSym.rho(5)
sage: rho.q()
5

sage: R = QQ['q'].fraction_field()
sage: q = R.gen()
sage: NCSym = SymmetricFunctionsNonCommutingVariables(R)
sage: rho = NCSym.rho(q)
sage: rho.q() == q
True
```

```
>>> from sage.all import *
>>> NCSym = SymmetricFunctionsNonCommutingVariables(QQ)
>>> rho = NCSym.rho(Integer(5))
>>> rho.q()
```

(continues on next page)

(continued from previous page)

```
5

>>> R = QQ['q'].fraction_field()
>>> q = R.gen()
>>> NCSym = SymmetricFunctionsNonCommutingVariables(R)
>>> rho = NCSym.rho(q)
>>> rho.q() == q
True
```

dual()

Return the dual Hopf algebra of the symmetric functions in non-commuting variables.

EXAMPLES:

```
sage: SymmetricFunctionsNonCommutingVariables(QQ).dual()
Dual symmetric functions in non-commuting variables over the Rational Field
```

```
>>> from sage.all import *
>>> SymmetricFunctionsNonCommutingVariables(QQ).dual()
Dual symmetric functions in non-commuting variables over the Rational Field
```

e

alias of *elementary*

class elementary(*NCSym*)

Bases: *NCSymBasis_abstract*

The Hopf algebra of symmetric functions in non-commuting variables in the elementary basis.

EXAMPLES:

```
sage: NCSym = SymmetricFunctionsNonCommutingVariables(QQ)
sage: e = NCSym.e()
```

```
>>> from sage.all import *
>>> NCSym = SymmetricFunctionsNonCommutingVariables(QQ)
>>> e = NCSym.e()
```

class Element

Bases: `IndexedFreeModuleElement`

An element in the elementary basis of $NCSym$.

omega()

Return the involution ω applied to `self`.

The involution ω on $NCSym$ is defined by $\omega(\mathbf{e}_A) = \mathbf{h}_A$.

OUTPUT: an element in the basis `self`

EXAMPLES:

```
sage: NCSym = SymmetricFunctionsNonCommutingVariables(QQ)
sage: e = NCSym.e()
sage: h = NCSym.h()
```

(continues on next page)

(continued from previous page)

```
sage: elt = e[[1,3],[2]].omega(); elt
2*e{{1}, {2}, {3}} - e{{1, 3}, {2}}
sage: elt.omega()
e{{1, 3}, {2}}
sage: h(elt)
h{{1, 3}, {2}}
```

```
>>> from sage.all import *
>>> NCSym = SymmetricFunctionsNonCommutingVariables(QQ)
>>> e = NCSym.e()
>>> h = NCSym.h()
>>> elt = e[[Integer(1),Integer(3)],[Integer(2)]].omega(); elt
2*e{{1}, {2}, {3}} - e{{1, 3}, {2}}
>>> elt.omega()
e{{1, 3}, {2}}
>>> h(elt)
h{{1, 3}, {2}}
```

to_symmetric_function()

The projection of `self` to the symmetric functions.

Take a symmetric function in non-commuting variables expressed in the **e** basis, and return the projection of expressed in the elementary basis of symmetric functions.

The map $\chi: NCSym \to Sym$ is given by

$$\mathbf{e}_A \mapsto e_{\lambda(A)} \prod_i \lambda(A)_i!$$

where $\lambda(A)$ is the partition associated with A by taking the sizes of the parts.

OUTPUT: an element of the symmetric functions in the elementary basis

EXAMPLES:

```
sage: e = SymmetricFunctionsNonCommutingVariables(QQ).e()
sage: e[[1,3],[2]].to_symmetric_function()
2*e[2, 1]
sage: e[[1],[3],[2]].to_symmetric_function()
e[1, 1, 1]
```

```
>>> from sage.all import *
>>> e = SymmetricFunctionsNonCommutingVariables(QQ).e()
>>> e[[Integer(1),Integer(3)],[Integer(2)]].to_symmetric_function()
2*e[2, 1]
>>> e[[Integer(1)],[Integer(3)],[Integer(2)]].to_symmetric_function()
e[1, 1, 1]
```

h

alias of *homogeneous*

class homogeneous(*NCSym*)

Bases: *NCSymBasis_abstract*

The Hopf algebra of symmetric functions in non-commuting variables in the homogeneous basis.

EXAMPLES:

```
sage: NCSym = SymmetricFunctionsNonCommutingVariables(QQ)
sage: h = NCSym.h()
sage: h[[1,3],[2,4]]*h[[1,2,3]]
h{{1, 3}, {2, 4}, {5, 6, 7}}
sage: h[[1,2]].coproduct()
h{} # h{{1, 2}} + 2*h{{1}} # h{{1}} + h{{1, 2}} # h{}
```

```
>>> from sage.all import *
>>> NCSym = SymmetricFunctionsNonCommutingVariables(QQ)
>>> h = NCSym.h()
>>> h[[Integer(1),Integer(3)],[Integer(2),Integer(4)]]*h[[Integer(1),
↪Integer(2),Integer(3)]]
h{{1, 3}, {2, 4}, {5, 6, 7}}
>>> h[[Integer(1),Integer(2)]].coproduct()
h{} # h{{1, 2}} + 2*h{{1}} # h{{1}} + h{{1, 2}} # h{}
```

class Element

Bases: `IndexedFreeModuleElement`

An element in the homogeneous basis of $NCSym$.

omega()

Return the involution ω applied to `self`.

The involution ω on $NCSym$ is defined by $\omega(\mathbf{h}_A) = \mathbf{e}_A$.

OUTPUT: an element in the basis `self`

EXAMPLES:

```
sage: NCSym = SymmetricFunctionsNonCommutingVariables(QQ)
sage: h = NCSym.h()
sage: e = NCSym.e()
sage: elt = h[[1,3],[2]].omega(); elt
2*h{{1}, {2}, {3}} - h{{1, 3}, {2}}
sage: elt.omega()
h{{1, 3}, {2}}
sage: e(elt)
e{{1, 3}, {2}}
```

```
>>> from sage.all import *
>>> NCSym = SymmetricFunctionsNonCommutingVariables(QQ)
>>> h = NCSym.h()
>>> e = NCSym.e()
>>> elt = h[[Integer(1),Integer(3)],[Integer(2)]].omega(); elt
2*h{{1}, {2}, {3}} - h{{1, 3}, {2}}
>>> elt.omega()
h{{1, 3}, {2}}
>>> e(elt)
e{{1, 3}, {2}}
```

to_symmetric_function()

The projection of `self` to the symmetric functions.

Take a symmetric function in non-commuting variables expressed in the **h** basis, and return the projection of expressed in the complete basis of symmetric functions.

The map $\chi: NCSym \to Sym$ is given by

$$\mathbf{h}_A \mapsto h_{\lambda(A)} \prod_i \lambda(A)_i!$$

where $\lambda(A)$ is the partition associated with A by taking the sizes of the parts.

OUTPUT: an element of the symmetric functions in the complete basis

EXAMPLES:

```
sage: h = SymmetricFunctionsNonCommutingVariables(QQ).h()
sage: h[[1,3],[2]].to_symmetric_function()
2*h[2, 1]
sage: h[[1],[3],[2]].to_symmetric_function()
h[1, 1, 1]
```

```
>>> from sage.all import *
>>> h = SymmetricFunctionsNonCommutingVariables(QQ).h()
>>> h[[Integer(1),Integer(3)],[Integer(2)]].to_symmetric_function()
2*h[2, 1]
>>> h[[Integer(1)],[Integer(3)],[Integer(2)]].to_symmetric_function()
h[1, 1, 1]
```

m

alias of *monomial*

class monomial(*NCSym*)

Bases: *NCSymBasis_abstract*

The Hopf algebra of symmetric functions in non-commuting variables in the monomial basis.

EXAMPLES:

```
sage: NCSym = SymmetricFunctionsNonCommutingVariables(QQ)
sage: m = NCSym.m()
sage: m[[1,3],[2]]*m[[1,2]]
m{{1, 3}, {2}, {4, 5}} + m{{1, 3}, {2, 4, 5}} + m{{1, 3, 4, 5}, {2}}
sage: m[[1,3],[2]].coproduct()
m{} # m{{1, 3}, {2}} + m{{1}} # m{{1, 2}} + m{{1, 2}} # m{{1}} + m{{1,
 3}, {2}} # m{}
```

```
>>> from sage.all import *
>>> NCSym = SymmetricFunctionsNonCommutingVariables(QQ)
>>> m = NCSym.m()
>>> m[[Integer(1),Integer(3)],[Integer(2)]]*m[[Integer(1),Integer(2)]]
m{{1, 3}, {2}, {4, 5}} + m{{1, 3}, {2, 4, 5}} + m{{1, 3, 4, 5}, {2}}
>>> m[[Integer(1),Integer(3)],[Integer(2)]].coproduct()
m{} # m{{1, 3}, {2}} + m{{1}} # m{{1, 2}} + m{{1, 2}} # m{{1}} + m{{1,
 3}, {2}} # m{}
```

class Element

Bases: `IndexedFreeModuleElement`

An element in the monomial basis of $NCSym$.

expand(*n*, *alphabet='x'*)

Expand `self` written in the monomial basis in n non-commuting variables.

INPUT:

- `n` – integer
- `alphabet` – string (default: `'x'`)

OUTPUT:

- The symmetric function of `self` expressed in the `n` non-commuting variables described by `alphabet`.

EXAMPLES:

```
sage: m = SymmetricFunctionsNonCommutingVariables(QQ).monomial()
sage: m[[1,3],[2]].expand(4)
x0*x1*x0 + x0*x2*x0 + x0*x3*x0 + x1*x0*x1 + x1*x2*x1 + x1*x3*x1
 + x2*x0*x2 + x2*x1*x2 + x2*x3*x2 + x3*x0*x3 + x3*x1*x3 + x3*x2*x3
```

```
>>> from sage.all import *
>>> m = SymmetricFunctionsNonCommutingVariables(QQ).monomial()
>>> m[[Integer(1),Integer(3)],[Integer(2)]].expand(Integer(4))
x0*x1*x0 + x0*x2*x0 + x0*x3*x0 + x1*x0*x1 + x1*x2*x1 + x1*x3*x1
 + x2*x0*x2 + x2*x1*x2 + x2*x3*x2 + x3*x0*x3 + x3*x1*x3 + x3*x2*x3
```

One can use a different set of variables by using the optional argument `alphabet`:

```
sage: m[[1],[2,3]].expand(3,alphabet='y')
y0*y1^2 + y0*y2^2 + y1*y0^2 + y1*y2^2 + y2*y0^2 + y2*y1^2
```

```
>>> from sage.all import *
>>> m[[Integer(1)],[Integer(2),Integer(3)]].expand(Integer(3),alphabet=
↪'y')
y0*y1^2 + y0*y2^2 + y1*y0^2 + y1*y2^2 + y2*y0^2 + y2*y1^2
```

to_symmetric_function()

The projection of `self` to the symmetric functions.

Take a symmetric function in non-commuting variables expressed in the **m** basis, and return the projection of expressed in the monomial basis of symmetric functions.

The map $\chi \colon NCSym \to Sym$ is defined by

$$\mathbf{m}_A \mapsto m_{\lambda(A)} \prod_i n_i(\lambda(A))!$$

where $\lambda(A)$ is the partition associated with A by taking the sizes of the parts and $n_i(\mu)$ is the multiplicity of i in μ.

OUTPUT: an element of the symmetric functions in the monomial basis

EXAMPLES:

```
sage: m = SymmetricFunctionsNonCommutingVariables(QQ).monomial()
sage: m[[1,3],[2]].to_symmetric_function()
m[2, 1]
sage: m[[1],[3],[2]].to_symmetric_function()
6*m[1, 1, 1]
```

```
>>> from sage.all import *
>>> m = SymmetricFunctionsNonCommutingVariables(QQ).monomial()
>>> m[[Integer(1),Integer(3)],[Integer(2)]].to_symmetric_function()
m[2, 1]
>>> m[[Integer(1)],[Integer(3)],[Integer(2)]].to_symmetric_function()
6*m[1, 1, 1]
```

coproduct_on_basis(*A*)

Return the coproduct of a monomial basis element.

INPUT:

- `A` – set partition

OUTPUT:

- The coproduct applied to the monomial symmetric function in non-commuting variables indexed by `A` expressed in the monomial basis.

EXAMPLES:

```
sage: m = SymmetricFunctionsNonCommutingVariables(QQ).monomial()
sage: m[[1, 3], [2]].coproduct()
m{} # m{{1, 3}, {2}} + m{{1}} # m{{1, 2}} + m{{1, 2}} # m{{1}} + m{{1, 3},
→ {2}} # m{}
sage: m.coproduct_on_basis(SetPartition([]))
m{} # m{}
sage: m.coproduct_on_basis(SetPartition([[1,2,3]]))
m{} # m{{1, 2, 3}} + m{{1, 2, 3}} # m{}
sage: m[[1,5],[2,4],[3,7],[6]].coproduct()
m{} # m{{1, 5}, {2, 4}, {3, 7}, {6}} + m{{1}} # m{{1, 5}, {2, 4}, {3, 6}}
 + 2*m{{1, 2}} # m{{1, 3}, {2, 5}, {4}} + m{{1, 2}} # m{{1, 4}, {2, 3},
→{5}}
 + 2*m{{1, 2}, {3}} # m{{1, 3}, {2, 4}} + m{{1, 3}, {2}} # m{{1, 4}, {2,␣
→3}}
 + 2*m{{1, 3}, {2, 4}} # m{{1, 2}, {3}} + 2*m{{1, 3}, {2, 5}, {4}} # m{{1,
→ 2}}
 + m{{1, 4}, {2, 3}} # m{{1, 3}, {2}} + m{{1, 4}, {2, 3}, {5}} # m{{1, 2}}
 + m{{1, 5}, {2, 4}, {3, 6}} # m{{1}} + m{{1, 5}, {2, 4}, {3, 7}, {6}} # m
→{}
```

```
>>> from sage.all import *
>>> m = SymmetricFunctionsNonCommutingVariables(QQ).monomial()
>>> m[[Integer(1), Integer(3)], [Integer(2)]].coproduct()
m{} # m{{1, 3}, {2}} + m{{1}} # m{{1, 2}} + m{{1, 2}} # m{{1}} + m{{1, 3},
→ {2}} # m{}
>>> m.coproduct_on_basis(SetPartition([]))
m{} # m{}
>>> m.coproduct_on_basis(SetPartition([[Integer(1),Integer(2),
→Integer(3)]]))
m{} # m{{1, 2, 3}} + m{{1, 2, 3}} # m{}
>>> m[[Integer(1),Integer(5)],[Integer(2),Integer(4)],[Integer(3),
→Integer(7)],[Integer(6)]].coproduct()
m{} # m{{1, 5}, {2, 4}, {3, 7}, {6}} + m{{1}} # m{{1, 5}, {2, 4}, {3, 6}}
 + 2*m{{1, 2}} # m{{1, 3}, {2, 5}, {4}} + m{{1, 2}} # m{{1, 4}, {2, 3},
→{5}}
 + 2*m{{1, 2}, {3}} # m{{1, 3}, {2, 4}} + m{{1, 3}, {2}} # m{{1, 4}, {2,␣
```

(continues on next page)

(continued from previous page)

```
↪3}}
 + 2*m{{1, 3}, {2, 4}} # m{{1, 2}, {3}} + 2*m{{1, 3}, {2, 5}, {4}} # m{{1,
↪ 2}}
 + m{{1, 4}, {2, 3}} # m{{1, 3}, {2}} + m{{1, 4}, {2, 3}, {5}} # m{{1, 2}}
 + m{{1, 5}, {2, 4}, {3, 6}} # m{{1}} + m{{1, 5}, {2, 4}, {3, 7}, {6}} # m
↪{}
```

dual_basis()

Return the dual basis to the monomial basis.

OUTPUT: the **w** basis of the dual Hopf algebra

EXAMPLES:

```
sage: m = SymmetricFunctionsNonCommutingVariables(QQ).m()
sage: m.dual_basis()
Dual symmetric functions in non-commuting variables over the Rational␣
↪Field in the w basis
```

```
>>> from sage.all import *
>>> m = SymmetricFunctionsNonCommutingVariables(QQ).m()
>>> m.dual_basis()
Dual symmetric functions in non-commuting variables over the Rational␣
↪Field in the w basis
```

duality_pairing(*x*, *y*)

Compute the pairing between an element of `self` and an element of the dual.

INPUT:

- `x` – an element of symmetric functions in non-commuting variables
- `y` – an element of the dual of symmetric functions in non-commuting variables

OUTPUT: an element of the base ring of `self`

EXAMPLES:

```
sage: NCSym = SymmetricFunctionsNonCommutingVariables(QQ)
sage: m = NCSym.m()
sage: w = m.dual_basis()
sage: matrix([[m(A).duality_pairing(w(B)) for A in SetPartitions(3)] for␣
↪B in SetPartitions(3)])
[1 0 0 0 0]
[0 1 0 0 0]
[0 0 1 0 0]
[0 0 0 1 0]
[0 0 0 0 1]
sage: (m[[1,2],[3]] + 3*m[[1,3],[2]]).duality_pairing(2*w[[1,3],[2]] +␣
↪w[[1,2,3]] + 2*w[[1,2],[3]])
8
```

```
>>> from sage.all import *
>>> NCSym = SymmetricFunctionsNonCommutingVariables(QQ)
>>> m = NCSym.m()
>>> w = m.dual_basis()

```

from_symmetric_function(*f*)

Return the image of the symmetric function `f` in `self`.

This is performed by converting to the monomial basis and extending the method *sum_of_partitions()* linearly. This is a linear map from the symmetric functions to the symmetric functions in non-commuting variables that does not preserve the product or coproduct structure of the Hopf algebra.

See also

to_symmetric_function()

INPUT:

- `f` – an element of the symmetric functions

OUTPUT: an element of the **m** basis

EXAMPLES:

```
sage: m = SymmetricFunctionsNonCommutingVariables(QQ).m()
sage: mon = SymmetricFunctions(QQ).m()
sage: elt = m.from_symmetric_function(mon[2,1,1]); elt
1/12*m{{1}, {2}, {3, 4}} + 1/12*m{{1}, {2, 3}, {4}} + 1/12*m{{1}, {2, 4},
↪{3}}
 + 1/12*m{{1, 2}, {3}, {4}} + 1/12*m{{1, 3}, {2}, {4}} + 1/12*m{{1, 4},
↪{2}, {3}}
sage: elt.to_symmetric_function()
m[2, 1, 1]
sage: e = SymmetricFunctionsNonCommutingVariables(QQ).e()
sage: elm = SymmetricFunctions(QQ).e()
sage: e(m.from_symmetric_function(elm[4]))
1/24*e{{1, 2, 3, 4}}
sage: h = SymmetricFunctionsNonCommutingVariables(QQ).h()
sage: hom = SymmetricFunctions(QQ).h()
sage: h(m.from_symmetric_function(hom[4]))
1/24*h{{1, 2, 3, 4}}
sage: p = SymmetricFunctionsNonCommutingVariables(QQ).p()
sage: pow = SymmetricFunctions(QQ).p()
sage: p(m.from_symmetric_function(pow[4]))
p{{1, 2, 3, 4}}
sage: p(m.from_symmetric_function(pow[2,1]))
```

(continues on next page)

(continued from previous page)

```
1/3*p{{1}, {2, 3}} + 1/3*p{{1, 2}, {3}} + 1/3*p{{1, 3}, {2}}
sage: p([[1,2]])*p([[1]])
p{{1, 2}, {3}}
```

```
>>> from sage.all import *
>>> m = SymmetricFunctionsNonCommutingVariables(QQ).m()
>>> mon = SymmetricFunctions(QQ).m()
>>> elt = m.from_symmetric_function(mon[Integer(2),Integer(1),
↪Integer(1)]); elt
1/12*m{{1}, {2}, {3, 4}} + 1/12*m{{1}, {2, 3}, {4}} + 1/12*m{{1}, {2, 4},
↪{3}}
 + 1/12*m{{1, 2}, {3}, {4}} + 1/12*m{{1, 3}, {2}, {4}} + 1/12*m{{1, 4},
↪{2}, {3}}
>>> elt.to_symmetric_function()
m[2, 1, 1]
>>> e = SymmetricFunctionsNonCommutingVariables(QQ).e()
>>> elm = SymmetricFunctions(QQ).e()
>>> e(m.from_symmetric_function(elm[Integer(4)]))
1/24*e{{1, 2, 3, 4}}
>>> h = SymmetricFunctionsNonCommutingVariables(QQ).h()
>>> hom = SymmetricFunctions(QQ).h()
>>> h(m.from_symmetric_function(hom[Integer(4)]))
1/24*h{{1, 2, 3, 4}}
>>> p = SymmetricFunctionsNonCommutingVariables(QQ).p()
>>> pow = SymmetricFunctions(QQ).p()
>>> p(m.from_symmetric_function(pow[Integer(4)]))
p{{1, 2, 3, 4}}
>>> p(m.from_symmetric_function(pow[Integer(2),Integer(1)]))
1/3*p{{1}, {2, 3}} + 1/3*p{{1, 2}, {3}} + 1/3*p{{1, 3}, {2}}
>>> p([[Integer(1),Integer(2)]])*p([[Integer(1)]])
p{{1, 2}, {3}}
```

Check that $\chi \circ \tilde{\chi}$ is the identity on Sym:

```
sage: all(m.from_symmetric_function(pow(la)).to_symmetric_function() ==␣
↪pow(la)
....:     for la in Partitions(4))
True
```

```
>>> from sage.all import *
>>> all(m.from_symmetric_function(pow(la)).to_symmetric_function() ==␣
↪pow(la)
...     for la in Partitions(Integer(4)))
True
```

internal_coproduct_on_basis(*A*)

Return the internal coproduct of a monomial basis element.

The internal coproduct is defined by

$$\Delta^{\odot}(\mathbf{m}_A) = \sum_{B \wedge C = A} \mathbf{m}_B \otimes \mathbf{m}_C$$

where we sum over all pairs of set partitions B and C whose infimum is A.

INPUT:

- A – set partition

OUTPUT: an element of the tensor square of the **m** basis

EXAMPLES:

```
sage: m = SymmetricFunctionsNonCommutingVariables(QQ).monomial()
sage: m.internal_coproduct_on_basis(SetPartition([[1,3],[2]]))
m{{1, 2, 3}} # m{{1, 3}, {2}} + m{{1, 3}, {2}} # m{{1, 2, 3}} + m{{1, 3},
↪{2}} # m{{1, 3}, {2}}
```

```
>>> from sage.all import *
>>> m = SymmetricFunctionsNonCommutingVariables(QQ).monomial()
>>> m.internal_coproduct_on_basis(SetPartition([[Integer(1),Integer(3)],
↪[Integer(2)]]))
m{{1, 2, 3}} # m{{1, 3}, {2}} + m{{1, 3}, {2}} # m{{1, 2, 3}} + m{{1, 3},
↪{2}} # m{{1, 3}, {2}}
```

product_on_basis(*A*, *B*)

The product on monomial basis elements.

The product of the basis elements indexed by two set partitions A and B is the sum of the basis elements indexed by set partitions C such that $C \wedge ([n]|[k]) = A|B$ where $n = |A|$ and $k = |B|$. Here $A \wedge B$ is the infimum of A and B and $A|B$ is the *SetPartition.pipe()* operation. Equivalently we can describe all C as matchings between the parts of A and B where if $a \in A$ is matched with $b \in B$, we take $a \cup b$ instead of a and b in C.

INPUT:

- A, B – set partitions

OUTPUT: an element of the **m** basis

EXAMPLES:

```
sage: m = SymmetricFunctionsNonCommutingVariables(QQ).monomial()
sage: A = SetPartition([[1], [2,3]])
sage: B = SetPartition([[1], [3], [2,4]])
sage: m.product_on_basis(A, B)
m{{1}, {2, 3}, {4}, {5, 7}, {6}} + m{{1}, {2, 3, 4}, {5, 7}, {6}}
 + m{{1}, {2, 3, 5, 7}, {4}, {6}} + m{{1}, {2, 3, 6}, {4}, {5, 7}}
 + m{{1, 4}, {2, 3}, {5, 7}, {6}} + m{{1, 4}, {2, 3, 5, 7}, {6}}
 + m{{1, 4}, {2, 3, 6}, {5, 7}} + m{{1, 5, 7}, {2, 3}, {4}, {6}}
 + m{{1, 5, 7}, {2, 3, 4}, {6}} + m{{1, 5, 7}, {2, 3, 6}, {4}}
 + m{{1, 6}, {2, 3}, {4}, {5, 7}} + m{{1, 6}, {2, 3, 4}, {5, 7}}
 + m{{1, 6}, {2, 3, 5, 7}, {4}}
sage: B = SetPartition([[1], [2]])
sage: m.product_on_basis(A, B)
m{{1}, {2, 3}, {4}, {5}} + m{{1}, {2, 3, 4}, {5}}
 + m{{1}, {2, 3, 5}, {4}} + m{{1, 4}, {2, 3}, {5}} + m{{1, 4}, {2, 3, 5}}
 + m{{1, 5}, {2, 3}, {4}} + m{{1, 5}, {2, 3, 4}}
sage: m.product_on_basis(A, SetPartition([]))
m{{1}, {2, 3}}
```

```
>>> from sage.all import *
>>> m = SymmetricFunctionsNonCommutingVariables(QQ).monomial()
>>> A = SetPartition([[Integer(1)], [Integer(2),Integer(3)]])
```

(continues on next page)

(continued from previous page)

```
>>> B = SetPartition([[Integer(1)], [Integer(3)], [Integer(2),
↪Integer(4)]])
>>> m.product_on_basis(A, B)
m{{1}, {2, 3}, {4}, {5, 7}, {6}} + m{{1}, {2, 3, 4}, {5, 7}, {6}}
 + m{{1}, {2, 3, 5, 7}, {4}, {6}} + m{{1}, {2, 3, 6}, {4}, {5, 7}}
 + m{{1, 4}, {2, 3}, {5, 7}, {6}} + m{{1, 4}, {2, 3, 5, 7}, {6}}
 + m{{1, 4}, {2, 3, 6}, {5, 7}} + m{{1, 5, 7}, {2, 3}, {4}, {6}}
 + m{{1, 5, 7}, {2, 3, 4}, {6}} + m{{1, 5, 7}, {2, 3, 6}, {4}}
 + m{{1, 6}, {2, 3}, {4}, {5, 7}} + m{{1, 6}, {2, 3, 4}, {5, 7}}
 + m{{1, 6}, {2, 3, 5, 7}, {4}}
>>> B = SetPartition([[Integer(1)], [Integer(2)]])
>>> m.product_on_basis(A, B)
m{{1}, {2, 3}, {4}, {5}} + m{{1}, {2, 3, 4}, {5}}
 + m{{1}, {2, 3, 5}, {4}} + m{{1, 4}, {2, 3}, {5}} + m{{1, 4}, {2, 3, 5}}
 + m{{1, 5}, {2, 3}, {4}} + m{{1, 5}, {2, 3, 4}}
>>> m.product_on_basis(A, SetPartition([]))
m{{1}, {2, 3}}
```

sum_of_partitions(*la*)

Return the sum over all set partitions whose shape is `la` with a fixed coefficient C defined below.

Fix a partition λ, we define $\lambda! := \prod_i \lambda_i!$ and $\lambda^! := \prod_i m_i!$. Recall that $|\lambda| = \sum_i \lambda_i$ and m_i is the number of parts of length i of λ. Thus we defined the coefficient as

$$C := \frac{\lambda! \lambda^!}{|\lambda|!}.$$

Hence we can define a lift $\widetilde{\chi}$ from Sym to $NCSym$ by

$$m_\lambda \mapsto C \sum_A \mathbf{m}_A$$

where the sum is over all set partitions whose shape is λ.

INPUT:

- `la` – integer partition

OUTPUT: an element of the **m** basis

EXAMPLES:

```
sage: m = SymmetricFunctionsNonCommutingVariables(QQ).m()
sage: m.sum_of_partitions(Partition([2,1,1]))
1/12*m{{1}, {2}, {3, 4}} + 1/12*m{{1}, {2, 3}, {4}} + 1/12*m{{1}, {2, 4},
↪{3}}
 + 1/12*m{{1, 2}, {3}, {4}} + 1/12*m{{1, 3}, {2}, {4}} + 1/12*m{{1, 4},
↪{2}, {3}}
```

```
>>> from sage.all import *
>>> m = SymmetricFunctionsNonCommutingVariables(QQ).m()
>>> m.sum_of_partitions(Partition([Integer(2),Integer(1),Integer(1)]))
1/12*m{{1}, {2}, {3, 4}} + 1/12*m{{1}, {2, 3}, {4}} + 1/12*m{{1}, {2, 4},
↪{3}}
 + 1/12*m{{1, 2}, {3}, {4}} + 1/12*m{{1, 3}, {2}, {4}} + 1/12*m{{1, 4},
↪{2}, {3}}
```

p

alias of `powersum`

class powersum(*NCSym*)

Bases: `NCSymBasis_abstract`

The Hopf algebra of symmetric functions in non-commuting variables in the powersum basis.

The powersum basis is given by

$$\mathbf{p}_A = \sum_{A \leq B} \mathbf{m}_B,$$

where we sum over all coarsenings of the set partition A. If we allow our variables to commute, then $\mathbf{p}_A$ goes to the usual powersum symmetric function p_λ whose (integer) partition λ is the shape of A.

EXAMPLES:

```
sage: NCSym = SymmetricFunctionsNonCommutingVariables(QQ)
sage: p = NCSym.p()

sage: x = p.an_element()**2; x
4*p{} + 8*p{{1}} + 4*p{{1}, {2}} + 6*p{{1}, {2, 3}}
 + 12*p{{1, 2}} + 6*p{{1, 2}, {3}} + 9*p{{1, 2}, {3, 4}}
sage: x.to_symmetric_function()
4*p[] + 8*p[1] + 4*p[1, 1] + 12*p[2] + 12*p[2, 1] + 9*p[2, 2]
```

```
>>> from sage.all import *
>>> NCSym = SymmetricFunctionsNonCommutingVariables(QQ)
>>> p = NCSym.p()

>>> x = p.an_element()**Integer(2); x
4*p{} + 8*p{{1}} + 4*p{{1}, {2}} + 6*p{{1}, {2, 3}}
 + 12*p{{1, 2}} + 6*p{{1, 2}, {3}} + 9*p{{1, 2}, {3, 4}}
>>> x.to_symmetric_function()
4*p[] + 8*p[1] + 4*p[1, 1] + 12*p[2] + 12*p[2, 1] + 9*p[2, 2]
```

class Element

Bases: `IndexedFreeModuleElement`

An element in the powersum basis of $NCSym$.

to_symmetric_function()

The projection of `self` to the symmetric functions.

Take a symmetric function in non-commuting variables expressed in the **p** basis, and return the projection of expressed in the powersum basis of symmetric functions.

The map $\chi \colon NCSym \to Sym$ is given by

$$\mathbf{p}_A \mapsto p_{\lambda(A)}$$

where $\lambda(A)$ is the partition associated with A by taking the sizes of the parts.

OUTPUT: an element of symmetric functions in the power sum basis

EXAMPLES:

```
sage: p = SymmetricFunctionsNonCommutingVariables(QQ).p()
sage: p[[1,3],[2]].to_symmetric_function()
p[2, 1]
sage: p[[1],[3],[2]].to_symmetric_function()
p[1, 1, 1]
```

```
>>> from sage.all import *
>>> p = SymmetricFunctionsNonCommutingVariables(QQ).p()
>>> p[[Integer(1),Integer(3)],[Integer(2)]].to_symmetric_function()
p[2, 1]
>>> p[[Integer(1)],[Integer(3)],[Integer(2)]].to_symmetric_function()
p[1, 1, 1]
```

antipode_on_basis(A)

Return the result of the antipode applied to a powersum basis element.

Let A be a set partition. The antipode given in [LM2011] is

$$S(\mathbf{p}_A) = \sum_{\gamma} (-1)^{\ell(\gamma)} \mathbf{p}_{\gamma[A]}$$

where we sum over all ordered set partitions (i.e. set compositions) of $[\ell(A)]$ and

$$\gamma[A] = A^{\downarrow}_{\gamma_1} | \cdots | A^{\downarrow}_{\gamma_{\ell(A)}}$$

is the action of γ on A defined in *SetPartition.ordered_set_partition_action()*.

INPUT:

- `A` – set partition

OUTPUT: an element in the basis `self`

EXAMPLES:

```
sage: p = SymmetricFunctionsNonCommutingVariables(QQ).powersum()
sage: p.antipode_on_basis(SetPartition([[1], [2,3]]))
p{{1, 2}, {3}}
sage: p.antipode_on_basis(SetPartition([]))
p{}
sage: F = p[[1,3],[5],[2,4]].coproduct()
sage: F.apply_multilinear_morphism(lambda x,y: x.antipode()*y)
0
```

```
>>> from sage.all import *
>>> p = SymmetricFunctionsNonCommutingVariables(QQ).powersum()
>>> p.antipode_on_basis(SetPartition([[Integer(1)], [Integer(2),
↪Integer(3)]]))
p{{1, 2}, {3}}
>>> p.antipode_on_basis(SetPartition([]))
p{}
>>> F = p[[Integer(1),Integer(3)],[Integer(5)],[Integer(2),Integer(4)]].
↪coproduct()
>>> F.apply_multilinear_morphism(lambda x,y: x.antipode()*y)
0
```

coproduct_on_basis(*A*)

Return the coproduct of a monomial basis element.

INPUT:

- A – set partition

OUTPUT:

- The coproduct applied to the monomial symmetric function in non-commuting variables indexed by A expressed in the monomial basis.

EXAMPLES:

```
sage: p = SymmetricFunctionsNonCommutingVariables(QQ).powersum()
sage: p[[1, 3], [2]].coproduct()
p{} # p{{1, 3}, {2}} + p{{1}} # p{{1, 2}} + p{{1, 2}} # p{{1}} + p{{1, 3},
↪ {2}} # p{}
sage: p.coproduct_on_basis(SetPartition([[1]]))
p{} # p{{1}} + p{{1}} # p{}
sage: p.coproduct_on_basis(SetPartition([]))
p{} # p{}
```

```
>>> from sage.all import *
>>> p = SymmetricFunctionsNonCommutingVariables(QQ).powersum()
>>> p[[Integer(1), Integer(3)], [Integer(2)]].coproduct()
p{} # p{{1, 3}, {2}} + p{{1}} # p{{1, 2}} + p{{1, 2}} # p{{1}} + p{{1, 3},
↪ {2}} # p{}
>>> p.coproduct_on_basis(SetPartition([[Integer(1)]]))
p{} # p{{1}} + p{{1}} # p{}
>>> p.coproduct_on_basis(SetPartition([]))
p{} # p{}
```

internal_coproduct_on_basis(*A*)

Return the internal coproduct of a powersum basis element.

The internal coproduct is defined by

$$\Delta^{\odot}(\mathbf{p}_A) = \mathbf{p}_A \otimes \mathbf{p}_A$$

INPUT:

- A – set partition

OUTPUT: an element of the tensor square of self

EXAMPLES:

```
sage: p = SymmetricFunctionsNonCommutingVariables(QQ).powersum()
sage: p.internal_coproduct_on_basis(SetPartition([[1,3],[2]]))
p{{1, 3}, {2}} # p{{1, 3}, {2}}
```

```
>>> from sage.all import *
>>> p = SymmetricFunctionsNonCommutingVariables(QQ).powersum()
>>> p.internal_coproduct_on_basis(SetPartition([[Integer(1),Integer(3)],
↪[Integer(2)]]))
p{{1, 3}, {2}} # p{{1, 3}, {2}}
```

primitive(*A*, *i=1*)

Return the primitive associated to A in self.

Fix some $i \in S$. Let A be an atomic set partition of S, then the primitive $p(A)$ given in [LM2011] is

$$p(A) = \sum_{\gamma} (-1)^{\ell(\gamma)-1} \mathbf{p}_{\gamma[A]}$$

where we sum over all ordered set partitions of $[\ell(A)]$ such that $i \in \gamma_1$ and $\gamma[A]$ is the action of γ on A defined in `SetPartition.ordered_set_partition_action()`. If A is not atomic, then $p(A) = 0$.

See also:

`SetPartition.is_atomic()`

INPUT:

- `A` – set partition
- `i` – (default: 1) index in the base set for `A` specifying which set of primitives this belongs to

OUTPUT: an element in the basis `self`

EXAMPLES:

```
sage: p = SymmetricFunctionsNonCommutingVariables(QQ).powersum()
sage: elt = p.primitive(SetPartition([[1,3], [2]])); elt
-p{{1, 2}, {3}} + p{{1, 3}, {2}}
sage: elt.coproduct()
-p{} # p{{1, 2}, {3}} + p{} # p{{1, 3}, {2}} - p{{1, 2}, {3}} # p{} + p{
↪{1, 3}, {2}} # p{}
sage: p.primitive(SetPartition([[1], [2,3]]))
0
sage: p.primitive(SetPartition([]))
p{}
```

```
>>> from sage.all import *
>>> p = SymmetricFunctionsNonCommutingVariables(QQ).powersum()
>>> elt = p.primitive(SetPartition([[Integer(1),Integer(3)],
↪[Integer(2)]])); elt
-p{{1, 2}, {3}} + p{{1, 3}, {2}}
>>> elt.coproduct()
-p{} # p{{1, 2}, {3}} + p{} # p{{1, 3}, {2}} - p{{1, 2}, {3}} # p{} + p{
↪{1, 3}, {2}} # p{}
>>> p.primitive(SetPartition([[Integer(1)], [Integer(2),Integer(3)]]))
0
>>> p.primitive(SetPartition([]))
p{}
```

rho

alias of `deformed_coarse_powersum`

class supercharacter(*NCSym*, *q=2*)

Bases: `NCSymBasis_abstract`

The Hopf algebra of symmetric functions in non-commuting variables in the supercharacter χ basis.

This basis was defined in [BT13] as a q-deformation of the supercharacter basis.

$$\chi_A = \sum_B \chi_A(B) \mathbf{m}_B,$$

where we sum over all set partitions A and $\chi_A(B)$ is the evaluation of the supercharacter χ_A on the superclass μ_B.

Note: The supercharacters considered in [BT13] are coarser than those considered by Aguiar et. al.

INPUT:

- q – (default: 2) the parameter q

EXAMPLES:

```
sage: R = QQ['q'].fraction_field()
sage: q = R.gen()
sage: NCSym = SymmetricFunctionsNonCommutingVariables(R)
sage: chi = NCSym.chi(q)
sage: chi[[1,3],[2]]*chi[[1,2]]
chi{{1, 3}, {2}, {4, 5}}
sage: chi[[1,3],[2]].coproduct()
chi{} # chi{{1, 3}, {2}} + (2*q-2)*chi{{1}} # chi{{1}, {2}} +
 (3*q-2)*chi{{1}} # chi{{1, 2}} + (2*q-2)*chi{{1}, {2}} # chi{{1}} +
 (3*q-2)*chi{{1, 2}} # chi{{1}} + chi{{1, 3}, {2}} # chi{}
sage: chi2 = NCSym.chi()
sage: chi(chi2[[1,2],[3]])
((-q+2)/q)*chi{{1}, {2}, {3}} + 2/q*chi{{1, 2}, {3}}
sage: chi2
Symmetric functions in non-commuting variables over the Fraction Field
 of Univariate Polynomial Ring in q over Rational Field in the
 supercharacter basis with parameter q=2
```

```
>>> from sage.all import *
>>> R = QQ['q'].fraction_field()
>>> q = R.gen()
>>> NCSym = SymmetricFunctionsNonCommutingVariables(R)
>>> chi = NCSym.chi(q)
>>> chi[[Integer(1),Integer(3)],[Integer(2)]]*chi[[Integer(1),Integer(2)]]
chi{{1, 3}, {2}, {4, 5}}
>>> chi[[Integer(1),Integer(3)],[Integer(2)]].coproduct()
chi{} # chi{{1, 3}, {2}} + (2*q-2)*chi{{1}} # chi{{1}, {2}} +
 (3*q-2)*chi{{1}} # chi{{1, 2}} + (2*q-2)*chi{{1}, {2}} # chi{{1}} +
 (3*q-2)*chi{{1, 2}} # chi{{1}} + chi{{1, 3}, {2}} # chi{}
>>> chi2 = NCSym.chi()
>>> chi(chi2[[Integer(1),Integer(2)],[Integer(3)]])
((-q+2)/q)*chi{{1}, {2}, {3}} + 2/q*chi{{1, 2}, {3}}
>>> chi2
Symmetric functions in non-commuting variables over the Fraction Field
 of Univariate Polynomial Ring in q over Rational Field in the
 supercharacter basis with parameter q=2
```

q()

Return the deformation parameter q of self.

EXAMPLES:

```
sage: NCSym = SymmetricFunctionsNonCommutingVariables(QQ)
sage: chi = NCSym.chi(5)
sage: chi.q()
5

sage: R = QQ['q'].fraction_field()
sage: q = R.gen()
sage: NCSym = SymmetricFunctionsNonCommutingVariables(R)
sage: chi = NCSym.chi(q)
sage: chi.q() == q
True
```

```
>>> from sage.all import *
>>> NCSym = SymmetricFunctionsNonCommutingVariables(QQ)
>>> chi = NCSym.chi(Integer(5))
>>> chi.q()
5

>>> R = QQ['q'].fraction_field()
>>> q = R.gen()
>>> NCSym = SymmetricFunctionsNonCommutingVariables(R)
>>> chi = NCSym.chi(q)
>>> chi.q() == q
True
```

x

alias of *x_basis*

class x_basis(*NCSym*)

Bases: *NCSymBasis_abstract*

The Hopf algebra of symmetric functions in non-commuting variables in the **x** basis.

This basis is defined in [BHRZ06] by the formula:

$$\mathbf{x}_A = \sum_{B \leq A} \mu(B, A)\mathbf{p}_B$$

and has the following properties:

$$\mathbf{x}_A\mathbf{x}_B = \mathbf{x}_{A|B}, \qquad \Delta^{\odot}(\mathbf{x}_C) = \sum_{A \vee B = C} \mathbf{x}_A \otimes \mathbf{x}_B.$$

EXAMPLES:

```
sage: NCSym = SymmetricFunctionsNonCommutingVariables(QQ)
sage: x = NCSym.x()
sage: x[[1,3],[2,4]]*x[[1,2,3]]
x{{1, 3}, {2, 4}, {5, 6, 7}}
sage: x[[1,2],[3]].internal_coproduct()
x{{1}, {2}, {3}} # x{{1, 2}, {3}} + x{{1, 2}, {3}} # x{{1}, {2}, {3}} +
 x{{1, 2}, {3}} # x{{1, 2}, {3}}
```

```
>>> from sage.all import *
>>> NCSym = SymmetricFunctionsNonCommutingVariables(QQ)
>>> x = NCSym.x()
>>> x[[Integer(1),Integer(3)],[Integer(2),Integer(4)]]*x[[Integer(1),
↪Integer(2),Integer(3)]]
x{{1, 3}, {2, 4}, {5, 6, 7}}
>>> x[[Integer(1),Integer(2)],[Integer(3)]].internal_coproduct()
x{{1}, {2}, {3}} # x{{1, 2}, {3}} + x{{1, 2}, {3}} # x{{1}, {2}, {3}} +
 x{{1, 2}, {3}} # x{{1, 2}, {3}}
```

sage.combinat.ncsym.ncsym.**matchings**(A, B)

Iterate through all matchings of the sets A and B.

EXAMPLES:

```
sage: from sage.combinat.ncsym.ncsym import matchings
sage: list(matchings([1, 2, 3], [-1, -2]))
[[[1], [2], [3], [-1], [-2]],
 [[1], [2], [3, -1], [-2]],
 [[1], [2], [3, -2], [-1]],
 [[1], [2, -1], [3], [-2]],
 [[1], [2, -1], [3, -2]],
 [[1], [2, -2], [3], [-1]],
 [[1], [2, -2], [3, -1]],
 [[1, -1], [2], [3], [-2]],
 [[1, -1], [2], [3, -2]],
 [[1, -1], [2, -2], [3]],
 [[1, -2], [2], [3], [-1]],
 [[1, -2], [2], [3, -1]],
 [[1, -2], [2, -1], [3]]]
```

```
>>> from sage.all import *
>>> from sage.combinat.ncsym.ncsym import matchings
>>> list(matchings([Integer(1), Integer(2), Integer(3)], [-Integer(1), -
↪Integer(2)]))
[[[1], [2], [3], [-1], [-2]],
 [[1], [2], [3, -1], [-2]],
 [[1], [2], [3, -2], [-1]],
 [[1], [2, -1], [3], [-2]],
 [[1], [2, -1], [3, -2]],
 [[1], [2, -2], [3], [-1]],
 [[1], [2, -2], [3, -1]],
 [[1, -1], [2], [3], [-2]],
 [[1, -1], [2], [3, -2]],
 [[1, -1], [2, -2], [3]],
 [[1, -2], [2], [3], [-1]],
 [[1, -2], [2], [3, -1]],
 [[1, -2], [2, -1], [3]]]
```

sage.combinat.ncsym.ncsym.**nesting**(*la*, *nu*)

Return the nesting number of `la` inside of `nu`.

If we consider a set partition A as a set of arcs $i - j$ where i and j are in the same part of A. Define

$$\mathrm{nst}_{\lambda}^{\nu} = \#\{i < j < k < l \mid i - l \in \nu, j - k \in \lambda\},$$

and this corresponds to the number of arcs of λ strictly contained inside of ν.

EXAMPLES:

```
sage: from sage.combinat.ncsym.ncsym import nesting
sage: nu = SetPartition([[1,4], [2], [3]])
sage: mu = SetPartition([[1,4], [2,3]])
sage: nesting(set(mu).difference(nu), nu)
1

sage: A = SetPartition([[1], [2,5], [3,4]])
sage: B = SetPartition([[1,3,4], [2,5]])
sage: nesting(A, B)
1
sage: nesting(B, A)
1
```

```
>>> from sage.all import *
>>> from sage.combinat.ncsym.ncsym import nesting
>>> nu = SetPartition([[Integer(1),Integer(4)], [Integer(2)], [Integer(3)]])
>>> mu = SetPartition([[Integer(1),Integer(4)], [Integer(2),Integer(3)]])
>>> nesting(set(mu).difference(nu), nu)
1

>>> A = SetPartition([[Integer(1)], [Integer(2),Integer(5)], [Integer(3),
↪Integer(4)]])
>>> B = SetPartition([[Integer(1),Integer(3),Integer(4)], [Integer(2),
↪Integer(5)]])
>>> nesting(A, B)
1
>>> nesting(B, A)
1
```

```
sage: lst = list(SetPartitions(4))
sage: d = {}
sage: for i, nu in enumerate(lst):
....:     for mu in nu.coarsenings():
....:         if set(nu.arcs()).issubset(mu.arcs()):
....:             d[i, lst.index(mu)] = nesting(set(mu).difference(nu), nu)
sage: matrix(d)
[0 0 0 0 0 0 0 0 0 0 0 0 0 0 0]
[0 0 0 0 0 0 0 0 0 0 0 0 0 0 0]

5.1.151 Necklaces

The algorithm used in this file comes from

- Sawada, Joe. *A fast algorithm to generate necklaces with fixed content*, Theoretical Computer Science archive Volume 301, Issue 1-3 (May 2003) doi:10.1016/S0304-3975(03)00049-5

`sage.combinat.necklace.`**`Necklaces`**`(`*content*`)`

Return the set of necklaces with evaluation `content`.

A necklace is a list of integers that such that the list is the smallest lexicographic representative of all the cyclic shifts of the list.

See also

LyndonWords

INPUT:

- `content` – list or tuple of nonnegative integers

EXAMPLES:

```
sage: Necklaces([2,1,1])
Necklaces with evaluation [2, 1, 1]
sage: Necklaces([2,1,1]).cardinality()
3
sage: Necklaces([2,1,1]).first()
[1, 1, 2, 3]
sage: Necklaces([2,1,1]).last()
[1, 2, 1, 3]
sage: Necklaces([2,1,1]).list()
[[1, 1, 2, 3], [1, 1, 3, 2], [1, 2, 1, 3]]
sage: Necklaces([0,2,1,1]).list()
[[2, 2, 3, 4], [2, 2, 4, 3], [2, 3, 2, 4]]
sage: Necklaces([2,0,1,1]).list()
[[1, 1, 3, 4], [1, 1, 4, 3], [1, 3, 1, 4]]
```

```
>>> from sage.all import *
>>> Necklaces([Integer(2),Integer(1),Integer(1)])
Necklaces with evaluation [2, 1, 1]
>>> Necklaces([Integer(2),Integer(1),Integer(1)]).cardinality()
3
>>> Necklaces([Integer(2),Integer(1),Integer(1)]).first()
[1, 1, 2, 3]
>>> Necklaces([Integer(2),Integer(1),Integer(1)]).last()
[1, 2, 1, 3]
>>> Necklaces([Integer(2),Integer(1),Integer(1)]).list()
[[1, 1, 2, 3], [1, 1, 3, 2], [1, 2, 1, 3]]
>>> Necklaces([Integer(0),Integer(2),Integer(1),Integer(1)]).list()
[[2, 2, 3, 4], [2, 2, 4, 3], [2, 3, 2, 4]]
>>> Necklaces([Integer(2),Integer(0),Integer(1),Integer(1)]).list()
[[1, 1, 3, 4], [1, 1, 4, 3], [1, 3, 1, 4]]
```

class sage.combinat.necklace.**Necklaces_evaluation**(*content*)

Bases: UniqueRepresentation, Parent

Necklaces with a fixed evaluation (content).

INPUT:

- `content` – list or tuple of nonnegative integers

cardinality()

Return the number of integer necklaces with the evaluation `content`.

The formula for the number of necklaces of content α a composition of n is:

$$\sum_{d|gcd(\alpha)} \phi(d) \binom{n/d}{\alpha_1/d, \ldots, \alpha_\ell/d},$$

where $\phi(d)$ is the Euler ϕ function.

EXAMPLES:

```
sage: Necklaces([]).cardinality()
0
sage: Necklaces([2,2]).cardinality()
```

(continues on next page)

(continued from previous page)

```
2
sage: Necklaces([2,3,2]).cardinality()
30
sage: Necklaces([0,3,2]).cardinality()
2
```

```
>>> from sage.all import *
>>> Necklaces([]).cardinality()
0
>>> Necklaces([Integer(2),Integer(2)]).cardinality()
2
>>> Necklaces([Integer(2),Integer(3),Integer(2)]).cardinality()
30
>>> Necklaces([Integer(0),Integer(3),Integer(2)]).cardinality()
2
```

Check to make sure that the count matches up with the number of necklace words generated.

```
sage: comps = [[],[2,2],[3,2,7],[4,2],[0,4,2],[2,0,4]] + Compositions(4).
↪list()
sage: ns = [Necklaces(comp) for comp in comps]
sage: all(n.cardinality() == len(n.list()) for n in ns)                    #␣
↪needs sage.libs.pari
True
```

```
>>> from sage.all import *
>>> comps = [[],[Integer(2),Integer(2)],[Integer(3),Integer(2),Integer(7)],
↪[Integer(4),Integer(2)],[Integer(0),Integer(4),Integer(2)],[Integer(2),
↪Integer(0),Integer(4)]] + Compositions(Integer(4)).list()
>>> ns = [Necklaces(comp) for comp in comps]
>>> all(n.cardinality() == len(n.list()) for n in ns)                    #␣
↪needs sage.libs.pari
True
```

content()

Return the content (or evaluation) of the necklaces.

EXAMPLES:

```
sage: N = Necklaces([2,2,2])
sage: N.content()
[2, 2, 2]
```

```
>>> from sage.all import *
>>> N = Necklaces([Integer(2),Integer(2),Integer(2)])
>>> N.content()
[2, 2, 2]
```

5.1.152 Non-Decreasing Parking Functions

A *non-decreasing parking function* of size n is a non-decreasing function f from $\{1, \ldots, n\}$ to itself such that for all i, one has $f(i) \leq i$.

The number of non-decreasing parking functions of size n is the n-th `Catalan number`.

The set of non-decreasing parking functions of size n is in bijection with the set of `Dyck words` of size n.

AUTHORS:

- Florent Hivert (2009-04)
- Christian Stump (2012-11) added pretty printing

class sage.combinat.non_decreasing_parking_function.**NonDecreasingParkingFunction**(*lst*)

Bases: `Element`

A *non decreasing parking function* of size n is a non-decreasing function f from $\{1, \ldots, n\}$ to itself such that for all i, one has $f(i) \leq i$.

EXAMPLES:

```
sage: NonDecreasingParkingFunction([])
[]
sage: NonDecreasingParkingFunction([1])
[1]
sage: NonDecreasingParkingFunction([2])
Traceback (most recent call last):
...
ValueError: [2] is not a non-decreasing parking function
sage: NonDecreasingParkingFunction([1,2])
[1, 2]
sage: NonDecreasingParkingFunction([1,1,2])
[1, 1, 2]
sage: NonDecreasingParkingFunction([1,1,4])
Traceback (most recent call last):
...
ValueError: [1, 1, 4] is not a non-decreasing parking function
```

```
>>> from sage.all import *
>>> NonDecreasingParkingFunction([])
[]
>>> NonDecreasingParkingFunction([Integer(1)])
[1]
>>> NonDecreasingParkingFunction([Integer(2)])
Traceback (most recent call last):
...
ValueError: [2] is not a non-decreasing parking function
>>> NonDecreasingParkingFunction([Integer(1),Integer(2)])
[1, 2]
>>> NonDecreasingParkingFunction([Integer(1),Integer(1),Integer(2)])
[1, 1, 2]
>>> NonDecreasingParkingFunction([Integer(1),Integer(1),Integer(4)])
Traceback (most recent call last):
...
ValueError: [1, 1, 4] is not a non-decreasing parking function
```

classmethod from_dyck_word(*dw*)

Bijection from `Dyck words`. It is the inverse of the bijection `to_dyck_word()`. You can find there the mathematical definition.

EXAMPLES:

```
sage: NonDecreasingParkingFunction.from_dyck_word([])
[]
sage: NonDecreasingParkingFunction.from_dyck_word([1,0])
[1]
sage: NonDecreasingParkingFunction.from_dyck_word([1,1,0,0])
[1, 1]
sage: NonDecreasingParkingFunction.from_dyck_word([1,0,1,0])
[1, 2]
sage: NonDecreasingParkingFunction.from_dyck_word([1,0,1,1,0,1,0,0,1,0])
[1, 2, 2, 3, 5]
```

```
>>> from sage.all import *
>>> NonDecreasingParkingFunction.from_dyck_word([])
[]
>>> NonDecreasingParkingFunction.from_dyck_word([Integer(1),Integer(0)])
[1]
>>> NonDecreasingParkingFunction.from_dyck_word([Integer(1),Integer(1),
↪Integer(0),Integer(0)])
[1, 1]
>>> NonDecreasingParkingFunction.from_dyck_word([Integer(1),Integer(0),
↪Integer(1),Integer(0)])
[1, 2]
>>> NonDecreasingParkingFunction.from_dyck_word([Integer(1),Integer(0),
↪Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),Integer(0),
↪Integer(1),Integer(0)])
[1, 2, 2, 3, 5]
```

grade()

Return the length of `self`.

EXAMPLES:

```
sage: ndpf = NonDecreasingParkingFunctions(5)
sage: len(ndpf.random_element())
5
```

```
>>> from sage.all import *
>>> ndpf = NonDecreasingParkingFunctions(Integer(5))
>>> len(ndpf.random_element())
5
```

to_dyck_word()

Implement the bijection to `Dyck words`, which is defined as follows. Take a non decreasing parking function, say [1,1,2,4,5,5], and draw its graph:

```
         ___
        |  . 5
       _|  . 5
```

(continues on next page)

(continued from previous page)

```
  ___|  . . 4
 _|  . . . . 2
|  . . . . . 1
|  . . . . . 1
```

The corresponding Dyck word [1,1,0,1,0,0,1,0,1,1,0,0] is then read off from the sequence of horizontal and vertical steps. The converse bijection is `from_dyck_word()`.

EXAMPLES:

```
sage: NonDecreasingParkingFunction([1,1,2,4,5,5]).to_dyck_word()
[1, 1, 0, 1, 0, 0, 1, 0, 1, 1, 0, 0]
sage: NonDecreasingParkingFunction([]).to_dyck_word()
[]
sage: NonDecreasingParkingFunction([1,1,1]).to_dyck_word()
[1, 1, 1, 0, 0, 0]
sage: NonDecreasingParkingFunction([1,2,3]).to_dyck_word()
[1, 0, 1, 0, 1, 0]
sage: NonDecreasingParkingFunction([1,1,3,3,4,6,6]).to_dyck_word()
[1, 1, 0, 0, 1, 1, 0, 1, 0, 0, 1, 1, 0, 0]
```

```
>>> from sage.all import *
>>> NonDecreasingParkingFunction([Integer(1),Integer(1),Integer(2),Integer(4),
↪Integer(5),Integer(5)]).to_dyck_word()
[1, 1, 0, 1, 0, 0, 1, 0, 1, 1, 0, 0]
>>> NonDecreasingParkingFunction([]).to_dyck_word()
[]
>>> NonDecreasingParkingFunction([Integer(1),Integer(1),Integer(1)]).to_dyck_
↪word()
[1, 1, 1, 0, 0, 0]
>>> NonDecreasingParkingFunction([Integer(1),Integer(2),Integer(3)]).to_dyck_
↪word()
[1, 0, 1, 0, 1, 0]
>>> NonDecreasingParkingFunction([Integer(1),Integer(1),Integer(3),Integer(3),
↪Integer(4),Integer(6),Integer(6)]).to_dyck_word()
[1, 1, 0, 0, 1, 1, 0, 1, 0, 0, 1, 1, 0, 0]
```

`sage.combinat.non_decreasing_parking_function.`**`NonDecreasingParkingFunctions`**`(`*n=None*`)`

Return the set of Non-Decreasing Parking Functions.

A *non-decreasing parking function* of size n is a non-decreasing function f from $\{1, \dots, n\}$ to itself such that for all i, one has $f(i) \leq i$.

EXAMPLES:

Here are all the-non decreasing parking functions of size 5:

```
sage: NonDecreasingParkingFunctions(3).list()
[[1, 1, 1], [1, 1, 2], [1, 1, 3], [1, 2, 2], [1, 2, 3]]
```

```
>>> from sage.all import *
>>> NonDecreasingParkingFunctions(Integer(3)).list()
[[1, 1, 1], [1, 1, 2], [1, 1, 3], [1, 2, 2], [1, 2, 3]]
```

If no size is specified, then NonDecreasingParkingFunctions returns the set of all non-decreasing parking functions.

```
sage: PF = NonDecreasingParkingFunctions(); PF
Non-decreasing parking functions
sage: [] in PF
True
sage: [1] in PF
True
sage: [2] in PF
False
sage: [1,1,3] in PF
True
sage: [1,1,4] in PF
False
```

```
>>> from sage.all import *
>>> PF = NonDecreasingParkingFunctions(); PF
Non-decreasing parking functions
>>> [] in PF
True
>>> [Integer(1)] in PF
True
>>> [Integer(2)] in PF
False
>>> [Integer(1),Integer(1),Integer(3)] in PF
True
>>> [Integer(1),Integer(1),Integer(4)] in PF
False
```

If the size n is specified, then NonDecreasingParkingFunctions returns the set of all non-decreasing parking functions of size n.

```
sage: PF = NonDecreasingParkingFunctions(0)
sage: PF.list()
[[]]
sage: PF = NonDecreasingParkingFunctions(1)
sage: PF.list()
[[1]]
sage: PF = NonDecreasingParkingFunctions(3)
sage: PF.list()
[[1, 1, 1], [1, 1, 2], [1, 1, 3], [1, 2, 2], [1, 2, 3]]

sage: PF3 = NonDecreasingParkingFunctions(3); PF3
Non-decreasing parking functions of size 3
sage: [] in PF3
False
sage: [1] in PF3
False
sage: [1,1,3] in PF3
True
sage: [1,1,4] in PF3
False
```

```
>>> from sage.all import *
>>> PF = NonDecreasingParkingFunctions(Integer(0))
>>> PF.list()
[[]]
>>> PF = NonDecreasingParkingFunctions(Integer(1))
>>> PF.list()
[[1]]
>>> PF = NonDecreasingParkingFunctions(Integer(3))
>>> PF.list()
[[1, 1, 1], [1, 1, 2], [1, 1, 3], [1, 2, 2], [1, 2, 3]]

>>> PF3 = NonDecreasingParkingFunctions(Integer(3)); PF3
Non-decreasing parking functions of size 3
>>> [] in PF3
False
>>> [Integer(1)] in PF3
False
>>> [Integer(1),Integer(1),Integer(3)] in PF3
True
>>> [Integer(1),Integer(1),Integer(4)] in PF3
False
```

class sage.combinat.non_decreasing_parking_function.**NonDecreasingParkingFunctions_all**

Bases: UniqueRepresentation, Parent

graded_component(*n*)

Return the graded component.

EXAMPLES:

```
sage: P = NonDecreasingParkingFunctions()
sage: P.graded_component(4) == NonDecreasingParkingFunctions(4)
True
```

```
>>> from sage.all import *
>>> P = NonDecreasingParkingFunctions()
>>> P.graded_component(Integer(4)) ==␣
↪NonDecreasingParkingFunctions(Integer(4))
True
```

class sage.combinat.non_decreasing_parking_function.**NonDecreasingParkingFunctions_n**(*n*)

Bases: UniqueRepresentation, Parent

The combinatorial class of non-decreasing parking functions of size n.

A *non-decreasing parking function* of size n is a non-decreasing function f from $\{1, \dots, n\}$ to itself such that for all i, one has $f(i) \leq i$.

The number of non-decreasing parking functions of size n is the n-th Catalan number.

EXAMPLES:

```
sage: PF = NonDecreasingParkingFunctions(3)
sage: PF.list()
[[1, 1, 1], [1, 1, 2], [1, 1, 3], [1, 2, 2], [1, 2, 3]]
```

(continues on next page)

(continued from previous page)

```
sage: PF = NonDecreasingParkingFunctions(4)
sage: PF.list()
[[1, 1, 1, 1], [1, 1, 1, 2], [1, 1, 1, 3], [1, 1, 1, 4], [1, 1, 2, 2], [1, 1, 2,␣
↪3], [1, 1, 2, 4], [1, 1, 3, 3], [1, 1, 3, 4], [1, 2, 2, 2], [1, 2, 2, 3], [1, 2,
↪ 2, 4], [1, 2, 3, 3], [1, 2, 3, 4]]
sage: [ NonDecreasingParkingFunctions(i).cardinality() for i in range(10)]
[1, 1, 2, 5, 14, 42, 132, 429, 1430, 4862]
```

```
>>> from sage.all import *
>>> PF = NonDecreasingParkingFunctions(Integer(3))
>>> PF.list()
[[1, 1, 1], [1, 1, 2], [1, 1, 3], [1, 2, 2], [1, 2, 3]]
>>> PF = NonDecreasingParkingFunctions(Integer(4))
>>> PF.list()
[[1, 1, 1, 1], [1, 1, 1, 2], [1, 1, 1, 3], [1, 1, 1, 4], [1, 1, 2, 2], [1, 1, 2,␣
↪3], [1, 1, 2, 4], [1, 1, 3, 3], [1, 1, 3, 4], [1, 2, 2, 2], [1, 2, 2, 3], [1, 2,
↪ 2, 4], [1, 2, 3, 3], [1, 2, 3, 4]]
>>> [ NonDecreasingParkingFunctions(i).cardinality() for i in range(Integer(10))]
[1, 1, 2, 5, 14, 42, 132, 429, 1430, 4862]
```

Warning

The precise order in which the parking function are generated or listed is not fixed, and may change in the future.

AUTHORS:

- Florent Hivert

Element

alias of *NonDecreasingParkingFunction*

cardinality()

Return the number of non-decreasing parking functions of size n.

This number is the n-th *Catalan number*.

EXAMPLES:

```
sage: PF = NonDecreasingParkingFunctions(0)
sage: PF.cardinality()
1
sage: PF = NonDecreasingParkingFunctions(1)
sage: PF.cardinality()
1
sage: PF = NonDecreasingParkingFunctions(3)
sage: PF.cardinality()
5
sage: PF = NonDecreasingParkingFunctions(5)
sage: PF.cardinality()
42
```

```
>>> from sage.all import *
>>> PF = NonDecreasingParkingFunctions(Integer(0))
>>> PF.cardinality()
1
>>> PF = NonDecreasingParkingFunctions(Integer(1))
>>> PF.cardinality()
1
>>> PF = NonDecreasingParkingFunctions(Integer(3))
>>> PF.cardinality()
5
>>> PF = NonDecreasingParkingFunctions(Integer(5))
>>> PF.cardinality()
42
```

one()

Return the unit of this monoid.

This is the non-decreasing parking function [1, 2, …, n].

EXAMPLES:

```
sage: ndpf = NonDecreasingParkingFunctions(5)
sage: x = ndpf.random_element(); x  # random
sage: e = ndpf.one()
sage: x == e*x == x*e
True
```

```
>>> from sage.all import *
>>> ndpf = NonDecreasingParkingFunctions(Integer(5))
>>> x = ndpf.random_element(); x  # random
>>> e = ndpf.one()
>>> x == e*x == x*e
True
```

random_element()

Return a random parking function of the given size.

EXAMPLES:

```
sage: ndpf = NonDecreasingParkingFunctions(5)
sage: x = ndpf.random_element(); x  # random
[1, 2, 2, 4, 5]
sage: x in ndpf
True
```

```
>>> from sage.all import *
>>> ndpf = NonDecreasingParkingFunctions(Integer(5))
>>> x = ndpf.random_element(); x  # random
[1, 2, 2, 4, 5]
>>> x in ndpf
True
```

sage.combinat.non_decreasing_parking_function.**is_a**(*x*, *n=None*)

Check whether a list is a non-decreasing parking function.

If a size n is specified, checks if a list is a non-decreasing parking function of size n.

5.1.153 ν-Dyck Words

A class of the ν-Dyck word, see [PRV2017] for details.

AUTHORS:

- Aram Dermenjian (2020-09-26)

This file is based off the class `DyckWords` written by Mike Hansen, Dan Drake, Florent Hivert, Christian Stump, Mike Zabrocki, Jean–Baptiste Priez and Travis Scrimshaw

class `sage.combinat.nu_dyck_word.`**`NuDyckWord`**(*parent*, *dw*, *latex_options=None*)

Bases: `CombinatorialElement`

A ν-Dyck word.

Given a lattice path ν in the $\mathbf{Z}^2$ grid starting at the origin $(0,0)$ consisting of North $N = (0,1)$ and East $E = (1,0)$ steps, a ν-Dyck path is a lattice path in the $\mathbf{Z}^2$ grid starting at the origin $(0,0)$ and ending at the same coordinate as ν such that it is weakly above ν. A ν-Dyck word is the representation of a ν-Dyck path where a North step is represented by a 1 and an East step is represented by a 0.

INPUT:

- `k1` – a path for the ν-Dyck word
- `k2` – a path for ν

EXAMPLES:

```
sage: dw = NuDyckWord([1,0,1,0],[1,0,0,1]); dw
[1, 0, 1, 0]
sage: print(dw)
NENE
sage: dw.height()
2

sage: dw = NuDyckWord('1010',[1,0,0,1]); dw
[1, 0, 1, 0]

sage: dw = NuDyckWord('NENE',[1,0,0,1]); dw
[1, 0, 1, 0]

sage: NuDyckWord([1,0,1,0],[1,0,0,1]).pretty_print()
   __
 _|x
| . .

sage: from sage.combinat.nu_dyck_word import update_ndw_symbols
sage: update_ndw_symbols(0,1)
sage: dw = NuDyckWord('0101001','0110010'); dw
[0, 1, 0, 1, 0, 0, 1]
sage: dw.pp()
     __
    |x
   _| .
 _|x  .
```

(continues on next page)

(continued from previous page)

```
| . . .
sage: update_ndw_symbols(1,0)
```

```
>>> from sage.all import *
>>> dw = NuDyckWord([Integer(1),Integer(0),Integer(1),Integer(0)],[Integer(1),
↪Integer(0),Integer(0),Integer(1)]); dw
[1, 0, 1, 0]
>>> print(dw)
NENE
>>> dw.height()
2

>>> dw = NuDyckWord('1010',[Integer(1),Integer(0),Integer(0),Integer(1)]); dw
[1, 0, 1, 0]

>>> dw = NuDyckWord('NENE',[Integer(1),Integer(0),Integer(0),Integer(1)]); dw
[1, 0, 1, 0]

>>> NuDyckWord([Integer(1),Integer(0),Integer(1),Integer(0)],[Integer(1),
↪Integer(0),Integer(0),Integer(1)]).pretty_print()
   __
 _|x
| . .

>>> from sage.combinat.nu_dyck_word import update_ndw_symbols
>>> update_ndw_symbols(Integer(0),Integer(1))
>>> dw = NuDyckWord('0101001','0110010'); dw
[0, 1, 0, 1, 0, 0, 1]
>>> dw.pp()
     __
    |x
   _| .
 _|x  .
| . . .
>>> update_ndw_symbols(Integer(1),Integer(0))
```

can_mutate(i)

Return True/False based off if mutable at height i.

Can only mutate if an east step is followed by a north step at height i.

OUTPUT: whether we can mutate at height of i

EXAMPLES:

```
sage: NDW = NuDyckWord('10010100','00000111')
sage: NDW.can_mutate(1)
False
sage: NDW.can_mutate(3)
5
```

```
>>> from sage.all import *
>>> NDW = NuDyckWord('10010100','00000111')
```

(continues on next page)

(continued from previous page)

```
>>> NDW.can_mutate(Integer(1))
False
>>> NDW.can_mutate(Integer(3))
5
```

height()

Return the height of `self`.

The height is the number of `north` steps.

EXAMPLES:

```
sage: NuDyckWord('1101110011010010001101111000110000',
....: '1010101010101010101010101010101010').height()
17
```

```
>>> from sage.all import *
>>> NuDyckWord('1101110011010010001101111000110000',
... '1010101010101010101010101010101010').height()
17
```

heights()

Return the heights of each point on `self`.

We view the Dyck word as a Dyck path from $(0, 0)$ to (x, y) in the first quadrant by letting `1`'s represent steps in the direction $(0, 1)$ and `0`'s represent steps in the direction $(1, 0)$.

The heights is the sequence of the y-coordinates of all $x + y$ lattice points along the path.

EXAMPLES:

```
sage: NuDyckWord('010','010').heights()
[0, 0, 1, 1]
sage: NuDyckWord('110100','101010').heights()
[0, 1, 2, 2, 3, 3, 3]
```

```
>>> from sage.all import *
>>> NuDyckWord('010','010').heights()
[0, 0, 1, 1]
>>> NuDyckWord('110100','101010').heights()
[0, 1, 2, 2, 3, 3, 3]
```

horizontal_distance()

Return a list of how far each point is from ν.

EXAMPLES:

```
sage: NDW = NuDyckWord('10010100','00000111')
sage: NDW.horizontal_distance()
[5, 5, 4, 3, 3, 2, 2, 1, 0]
sage: NDW = NuDyckWord('10010100','00001011')
sage: NDW.horizontal_distance()
[4, 5, 4, 3, 3, 2, 2, 1, 0]
sage: NDW = NuDyckWord('10011001000','00100101001')
```

(continues on next page)

(continued from previous page)

```
sage: NDW.horizontal_distance()
[2, 4, 3, 2, 3, 5, 4, 3, 3, 2, 1, 0]
```

```
>>> from sage.all import *
>>> NDW = NuDyckWord('10010100','00000111')
>>> NDW.horizontal_distance()
[5, 5, 4, 3, 3, 2, 2, 1, 0]
>>> NDW = NuDyckWord('10010100','00001011')
>>> NDW.horizontal_distance()
[4, 5, 4, 3, 3, 2, 2, 1, 0]
>>> NDW = NuDyckWord('10011001000','00100101001')
>>> NDW.horizontal_distance()
[2, 4, 3, 2, 3, 5, 4, 3, 3, 2, 1, 0]
```

latex_options()

Return the latex options for use in the `_latex_` function as a dictionary.

The default values are set using the options.

- `color` – (default: black) the line color
- `line width` – (default: 2*``tikz_scale``) value representing the line width
- `nu_options` – (default: `'rounded corners=1, color=red, line width=1'`) string to indicate what the tikz options should be for path of ν
- `points_color` – (default: `'black'`) str to indicate color points should be drawn with
- `show_grid` – boolean (default: `True`); value to indicate if grid should be shown
- `show_nu` – boolean (default: `True`); value to indicate if ν should be shown
- `show_points` – boolean (default: `False`); value to indicate if points should be shown on path
- `tikz_scale` – (default: 1) scale for use with the tikz package

EXAMPLES:

```
sage: NDW = NuDyckWord('010','010')
sage: NDW.latex_options()
{'color': black,
 'line width': 2,
 'nu_options': rounded corners=1, color=red, line width=1,
 'points_color': black,
 'show_grid': True,
 'show_nu': True,
 'show_points': False,
 'tikz_scale': 1}
```

```
>>> from sage.all import *
>>> NDW = NuDyckWord('010','010')
>>> NDW.latex_options()
{'color': black,
 'line width': 2,
 'nu_options': rounded corners=1, color=red, line width=1,
 'points_color': black,
```

(continues on next page)

(continued from previous page)

```
'show_grid': True,
'show_nu': True,
'show_points': False,
'tikz_scale': 1}
```

Todo

This should probably be merged into NuDyckWord.options.

length()

Return the length of `self`.

The length is the total number of steps.

EXAMPLES:

```
sage: NDW = NuDyckWord('10011001000','00100101001')
sage: NDW.length()
11
```

```
>>> from sage.all import *
>>> NDW = NuDyckWord('10011001000','00100101001')
>>> NDW.length()
11
```

mutate(i)

Return a new ν-Dyck Word if possible.

If at height i we have an east step E meeting a north step N then we calculate all horizontal distances from this point until we find the first point that has the same horizontal distance to ν. We let

- d is everything up until EN (not including EN)
- f be everything between N and the point with the same horizontal distance (including N)
- g is everything after f

See also

can_mutate()

EXAMPLES:

```
sage: NDW = NuDyckWord('10010100','00000111')
sage: NDW.mutate(1)
sage: NDW.mutate(3)
[1, 0, 0, 1, 1, 0, 0, 0]
```

```
>>> from sage.all import *
>>> NDW = NuDyckWord('10010100','00000111')
>>> NDW.mutate(Integer(1))
```

(continues on next page)

(continued from previous page)

```
>>> NDW.mutate(Integer(3))
[1, 0, 0, 1, 1, 0, 0, 0]
```

path()

Return the underlying path object.

EXAMPLES:

```
sage: NDW = NuDyckWord('10011001000','00100101001')
sage: NDW.path()
Path: 10011001000
```

```
>>> from sage.all import *
>>> NDW = NuDyckWord('10011001000','00100101001')
>>> NDW.path()
Path: 10011001000
```

plot(***kwds*)

Plot a ν-Dyck word as a continuous path.

EXAMPLES:

```
sage: NDW = NuDyckWord('010','010')
sage: NDW.plot()                                                    #␣
↪needs sage.plot
Graphics object consisting of 1 graphics primitive
```

```
>>> from sage.all import *
>>> NDW = NuDyckWord('010','010')
>>> NDW.plot()                                                    #␣
↪needs sage.plot
Graphics object consisting of 1 graphics primitive
```

points()

Return an iterator for the points on the ν-Dyck path.

EXAMPLES:

```
sage: list(NuDyckWord('110111001101001000110111100011000',
....: '101010101010101010101010101010101')._path.points())

pp (*style=None*, *labelling=None*)

Display a NuDyckWord as a lattice path in the $\mathbf{Z}^2$ grid.

If the `style` is "N-E", then a cell below the diagonal is indicated by a period, whereas a cell below the path but above the diagonal is indicated by an x. If a list of labels is included, they are displayed along the vertical edges of the Dyck path.

INPUT:

- `style` – (default: `None`) can either be:
  - `None` to use the option default
  - "N-E" to show `self` as a path of north and east steps, or
- `labelling` – (if style is "N-E") a list of labels assigned to the up steps in `self`
- `underpath` – (if style is "N-E", default: `True`) if `True`, an `x` to show the boxes between ν and the ν-Dyck Path

EXAMPLES:

```
sage: for ND in NuDyckWords('101010'): ND.pretty_print()

set_latex_options(*D*)

Set the latex options for use in the `_latex_` function.

The default values are set in the `__init__` function.

- `color` – (default: black) the line color
- `line width` – (default: $2\times$ `tikz_scale`) value representing the line width
- `nu_options` – (default: `'rounded corners=1, color=red, line width=1'`) string to indicate what the tikz options should be for path of ν
- `points_color` – (default: `'black'`) str to indicate color points should be drawn with
- `show_grid` – boolean (default: `True`); value to indicate if grid should be shown
- `show_nu` – boolean (default: `True`); value to indicate if ν should be shown
- `show_points` – boolean (default: `False`); value to indicate if points should be shown on path
- `tikz_scale` – (default: 1) scale for use with the tikz package

INPUT:

- `D` – dictionary with a list of latex parameters to change

EXAMPLES:

```
sage: NDW = NuDyckWord('010','010')
sage: NDW.set_latex_options({"tikz_scale":2})
sage: NDW.set_latex_options({"color":"blue", "show_points":True})
```

```
>>> from sage.all import *
>>> NDW = NuDyckWord('010','010')
>>> NDW.set_latex_options({"tikz_scale":Integer(2)})
>>> NDW.set_latex_options({"color":"blue", "show_points":True})
```

Todo

This should probably be merged into NuDyckWord.options.

width()

Return the width of `self`.

The width is the number of `east` steps.

EXAMPLES:

```
sage: NuDyckWord('110111001101001000110111100011000',
....: '101010101010101010101010101010101').width()
16
```

```
>>> from sage.all import *
>>> NuDyckWord('110111001101001000110111100011000',
... '101010101010101010101010101010101').width()
16
```

widths()

Return the widths of each point on `self`.

We view the Dyck word as a Dyck path from $(0,0)$ to (x,y) in the first quadrant by letting `1`'s represent steps in the direction $(0,1)$ and `0`'s represent steps in the direction $(1,0)$.

The widths is the sequence of the x-coordinates of all $x+y$ lattice points along the path.

EXAMPLES:

```
sage: NuDyckWord('010','010').widths()
[0, 1, 1, 2]
sage: NuDyckWord('110100','101010').widths()
[0, 0, 0, 1, 1, 2, 3]
```

```
>>> from sage.all import *
>>> NuDyckWord('010','010').widths()
[0, 1, 1, 2]
>>> NuDyckWord('110100','101010').widths()
[0, 0, 0, 1, 1, 2, 3]
```

class sage.combinat.nu_dyck_word.**NuDyckWords**(*nu=()*)

Bases: `Parent`

ν-Dyck words.

Given a lattice path ν in the $\mathbf{Z}^2$ grid starting at the origin $(0,0)$ consisting of North $N=(0,1)$ and East $E=(1,0)$ steps, a ν-Dyck path is a lattice path in the`ZZ^2` grid starting at the origin $(0,0)$ and ending at the same coordinate as ν such that it is weakly above ν. A ν-Dyck word is the representation of a ν-Dyck path where a North step is represented by a 1 and an East step is represented by a 0.

INPUT:

- `nu` – the base lattice path

EXAMPLES:

```
sage: NDW = NuDyckWords('1010'); NDW
[1, 0, 1, 0] Dyck words
sage: [1,0,1,0] in NDW
True
```

(continues on next page)

(continued from previous page)

```
sage: [1,1,0,0] in NDW
True
sage: [1,0,0,1] in NDW
False
sage: [0,1,0,1] in NDW
False
sage: NDW.cardinality()
2
```

```
>>> from sage.all import *
>>> NDW = NuDyckWords('1010'); NDW
[1, 0, 1, 0] Dyck words
>>> [Integer(1),Integer(0),Integer(1),Integer(0)] in NDW
True
>>> [Integer(1),Integer(1),Integer(0),Integer(0)] in NDW
True
>>> [Integer(1),Integer(0),Integer(0),Integer(1)] in NDW
False
>>> [Integer(0),Integer(1),Integer(0),Integer(1)] in NDW
False
>>> NDW.cardinality()
2
```

Element

alias of *NuDyckWord*

cardinality()

Return the number of ν-Dyck words.

EXAMPLES:

```
sage: NDW = NuDyckWords('101010'); NDW.cardinality()
5
sage: NDW = NuDyckWords('1010010'); NDW.cardinality()
7
sage: NDW = NuDyckWords('100100100'); NDW.cardinality()
12
```

```
>>> from sage.all import *
>>> NDW = NuDyckWords('101010'); NDW.cardinality()
5
>>> NDW = NuDyckWords('1010010'); NDW.cardinality()
7
>>> NDW = NuDyckWords('100100100'); NDW.cardinality()
12
```

options = Current options for NuDyckWords - ascii_art: pretty_output - diagram_style: grid - display: list - latex_color: black - latex_line_width_scalar: 2 - latex_nu_options: rounded corners=1, color=red, line width=1 - latex_points_color: black - latex_show_grid: True - latex_show_nu: True - latex_show_points: False - latex_tikz_scale: 1

sage.combinat.nu_dyck_word.**path_weakly_above_other**(*path*, *other*)

Test if `path` is weakly above `other`.

A path P is wealy above another path Q if P and Q are the same length and if any prefix of length n of Q contains more North steps than the prefix of length n of P.

INPUT:

- `path` – the path to verify is weakly above the other path
- `other` – the other path to verify is weakly below the path

OUTPUT: boolean

EXAMPLES:

```
sage: from sage.combinat.nu_dyck_word import path_weakly_above_other
sage: path_weakly_above_other('1001','0110')
False
sage: path_weakly_above_other('1001','0101')
True
sage: path_weakly_above_other('1111','0101')
False
sage: path_weakly_above_other('111100','0101')
False
```

```
>>> from sage.all import *
>>> from sage.combinat.nu_dyck_word import path_weakly_above_other
>>> path_weakly_above_other('1001','0110')
False
>>> path_weakly_above_other('1001','0101')
True
>>> path_weakly_above_other('1111','0101')
False
>>> path_weakly_above_other('111100','0101')
False
```

sage.combinat.nu_dyck_word.**replace_dyck_char**(*x*)

A map sending an opening character (`'1'`, `'N'`, and `'('`) to `ndw_open_symbol`, a closing character (`'0'`, `'E'`, and `')'`) to `ndw_close_symbol`, and raising an error on any input other than one of the opening or closing characters.

This is the inverse map of `replace_dyck_symbol()`.

INPUT:

- `x` – string; a `'1'`, `'0'`, `'N'`, `'E'`, `'('` or `')'`

OUTPUT:

- If `x` is an opening character, replace `x` with the constant `ndw_open_symbol`.
- If `x` is a closing character, replace `x` with the constant `ndw_close_symbol`.
- Raise a `ValueError` if `x` is neither an opening nor a closing character.

See also

`replace_dyck_symbol()`

EXAMPLES:

```
sage: from sage.combinat.nu_dyck_word import replace_dyck_char
sage: replace_dyck_char('(')
1
sage: replace_dyck_char(')')
0
sage: replace_dyck_char(1)
Traceback (most recent call last):
...
ValueError
```

```
>>> from sage.all import *
>>> from sage.combinat.nu_dyck_word import replace_dyck_char
>>> replace_dyck_char('(')
1
>>> replace_dyck_char(')')
0
>>> replace_dyck_char(Integer(1))
Traceback (most recent call last):
...
ValueError
```

sage.combinat.nu_dyck_word.**replace_dyck_symbol**(*x*, *open_char='N'*, *close_char='E'*)

A map sending `ndw_open_symbol` to `open_char` and `ndw_close_symbol` to `close_char`, and raising an error on any input other than `ndw_open_symbol` and `ndw_close_symbol`. The values of the constants `ndw_open_symbol` and `ndw_close_symbol` are subject to change.

This is the inverse map of *replace_dyck_char()*.

INPUT:

- `x` – either `ndw_open_symbol` or `ndw_close_symbol`
- `open_char` – string (optional) default `'N'`
- `close_char` – string (optional) default `'E'`

OUTPUT: if `x` is `ndw_open_symbol`, replace `x` with `open_char`

- If `x` is `ndw_close_symbol`, replace `x` with `close_char`.
- If `x` is neither `ndw_open_symbol` nor `ndw_close_symbol`, a `ValueError` is raised.

See also

replace_dyck_char()

EXAMPLES:

```
sage: from sage.combinat.nu_dyck_word import replace_dyck_symbol
sage: replace_dyck_symbol(1)
'N'
sage: replace_dyck_symbol(0)
'E'
sage: replace_dyck_symbol(3)
```

(continues on next page)

(continued from previous page)

```
Traceback (most recent call last):
...
ValueError
```

```
>>> from sage.all import *
>>> from sage.combinat.nu_dyck_word import replace_dyck_symbol
>>> replace_dyck_symbol(Integer(1))
'N'
>>> replace_dyck_symbol(Integer(0))
'E'
>>> replace_dyck_symbol(Integer(3))
Traceback (most recent call last):
...
ValueError
```

sage.combinat.nu_dyck_word.**to_word_path**(*word*)

Convert input into a word path over an appropriate alphabet.

Helper function.

INPUT:

- `word` – word to convert to wordpath

OUTPUT: a `FiniteWordPath_north_east` object

EXAMPLES:

```
sage: from sage.combinat.nu_dyck_word import to_word_path
sage: wp = to_word_path('NEENENEN'); wp
Path: 10010101
sage: from sage.combinat.words.paths import FiniteWordPath_north_east
sage: isinstance(wp,FiniteWordPath_north_east)
True
sage: to_word_path('1001')
Path: 1001
sage: to_word_path([0,1,0,0,1,0])
Path: 010010
```

```
>>> from sage.all import *
>>> from sage.combinat.nu_dyck_word import to_word_path
>>> wp = to_word_path('NEENENEN'); wp
Path: 10010101
>>> from sage.combinat.words.paths import FiniteWordPath_north_east
>>> isinstance(wp,FiniteWordPath_north_east)
True
>>> to_word_path('1001')
Path: 1001
>>> to_word_path([Integer(0),Integer(1),Integer(0),Integer(0),Integer(1),
↪Integer(0)])
Path: 010010
```

sage.combinat.nu_dyck_word.**update_ndw_symbols**(*os*, *cs*)

A way to alter the open and close symbols from sage.

INPUT:

- `os` – the open symbol
- `cs` – the close symbol

EXAMPLES:

```
sage: from sage.combinat.nu_dyck_word import update_ndw_symbols
sage: update_ndw_symbols(0,1)
sage: dw = NuDyckWord('0101001','0110010'); dw
[0, 1, 0, 1, 0, 0, 1]

sage: dw = NuDyckWord('1010110','1001101'); dw
Traceback (most recent call last):
...
ValueError: invalid nu-Dyck word
sage: update_ndw_symbols(1,0)
```

```
>>> from sage.all import *
>>> from sage.combinat.nu_dyck_word import update_ndw_symbols
>>> update_ndw_symbols(Integer(0),Integer(1))
>>> dw = NuDyckWord('0101001','0110010'); dw
[0, 1, 0, 1, 0, 0, 1]

>>> dw = NuDyckWord('1010110','1001101'); dw
Traceback (most recent call last):
...
ValueError: invalid nu-Dyck word
>>> update_ndw_symbols(Integer(1),Integer(0))
```

5.1.154 ν-Tamari lattice

A class of the ν-Tamari lattice, and (δ, ν)-Tamari lattice (or alt ν-Tamari lattices), see [PRV2017] and [CC2023] for details.

These lattices depend on a parameter ν where ν is a path of North and East steps. The alt ν-Tamari lattice depends on an additional parameter δ, which is an increment vector with respect to ν.

The elements are *nu-Dyck paths* which are weakly above ν.

To use the provided functionality, you should import ν-Tamari lattices by typing:

```
sage: from sage.combinat.nu_tamari_lattice import NuTamariLattice, AltNuTamariLattice
```

```
>>> from sage.all import *
>>> from sage.combinat.nu_tamari_lattice import NuTamariLattice, AltNuTamariLattice
```

Then,

```
sage: NuTamariLattice([1,1,1,0,0,1,1,0])
Finite lattice containing 6 elements
sage: NuTamariLattice([0,0,0,1,1,0,0,1])
Finite lattice containing 40 elements
sage: AltNuTamariLattice([0,0,0,1,1,0,0,1])
Finite lattice containing 40 elements
```

(continues on next page)

(continued from previous page)

```
sage: AltNuTamariLattice([0,0,0,1,1,0,0,1], [0,1,0])
Finite lattice containing 40 elements
```

```
>>> from sage.all import *
>>> NuTamariLattice([Integer(1),Integer(1),Integer(1),Integer(0),Integer(0),
↪Integer(1),Integer(1),Integer(0)])
Finite lattice containing 6 elements
>>> NuTamariLattice([Integer(0),Integer(0),Integer(0),Integer(1),Integer(1),
↪Integer(0),Integer(0),Integer(1)])
Finite lattice containing 40 elements
>>> AltNuTamariLattice([Integer(0),Integer(0),Integer(0),Integer(1),Integer(1),
↪Integer(0),Integer(0),Integer(1)])
Finite lattice containing 40 elements
>>> AltNuTamariLattice([Integer(0),Integer(0),Integer(0),Integer(1),Integer(1),
↪Integer(0),Integer(0),Integer(1)], [Integer(0),Integer(1),Integer(0)])
Finite lattice containing 40 elements
```

The classical **Tamari lattices** and the **Generalized Tamari lattices** are special cases of this construction and are also available with this poset:

```
sage: NuTamariLattice([1,0,1,0,1,0])
Finite lattice containing 5 elements

sage: NuTamariLattice([1,0,0,1,0,0,1,0,0])
Finite lattice containing 12 elements
```

```
>>> from sage.all import *
>>> NuTamariLattice([Integer(1),Integer(0),Integer(1),Integer(0),Integer(1),
↪Integer(0)])
Finite lattice containing 5 elements

>>> NuTamariLattice([Integer(1),Integer(0),Integer(0),Integer(1),Integer(0),
↪Integer(0),Integer(1),Integer(0),Integer(0)])
Finite lattice containing 12 elements
```

See also

For more detailed information see `NuTamariLattice()` and `AltNuTamariLattice()`. For more information on the standard Tamari lattice see `sage.combinat.tamari_lattices.TamariLattice()`, `sage.combinat.tamari_lattices.GeneralizedTamariLattice()`

AUTHORS:

- Aram Dermenjian (2020-09-26): initial version
- Clément Chenevière (2024-02-01): added the alt ν-Tamari lattices

`sage.combinat.nu_tamari_lattice.`**`AltNuTamariLattice`**`(`*nu*, *delta=None*`)`

Return the (δ, ν)-Tamari lattice (or alt ν-Tamari lattice).

For more information, see [CC2023].

The path ν is a path of North steps (represented as 1 s) and East steps (represented as 0 s).

The vector $\delta = (\delta_1, \ldots, \delta_n)$ is an increment vector with respect to the path ν, that is to say $\delta_i \leq \nu_i$, where ν_i is the number of 0 s following the i-th 1 of ν. If not provided, δ is set by default to produce the classical ν-Tamari lattice.

INPUT:

- ν – list of 0s and 1s or a string of 0s and 1s
- δ – list of nonnegative integers

OUTPUT: a finite lattice

EXAMPLES:

```
sage: from sage.combinat.nu_tamari_lattice import AltNuTamariLattice,␣
↪NuTamariLattice
sage: AltNuTamariLattice('01001', [0, 0])
Finite lattice containing 7 elements
sage: AltNuTamariLattice('01001', [1, 0])
Finite lattice containing 7 elements
sage: AltNuTamariLattice('01001') == AltNuTamariLattice('01001', [2, 0])
True
sage: nu = '00100100101'; P = AltNuTamariLattice(nu); Q = NuTamariLattice(nu); P␣
↪== Q
True
```

```
>>> from sage.all import *
>>> from sage.combinat.nu_tamari_lattice import AltNuTamariLattice,␣
↪NuTamariLattice
>>> AltNuTamariLattice('01001', [Integer(0), Integer(0)])
Finite lattice containing 7 elements
>>> AltNuTamariLattice('01001', [Integer(1), Integer(0)])
Finite lattice containing 7 elements
>>> AltNuTamariLattice('01001') == AltNuTamariLattice('01001', [Integer(2),␣
↪Integer(0)])
True
>>> nu = '00100100101'; P = AltNuTamariLattice(nu); Q = NuTamariLattice(nu); P ==␣
↪Q
True
```

REFERENCES:

- [PRV2017]
- [CC2023]

`sage.combinat.nu_tamari_lattice.`**`NuTamariLattice`**`(`*nu*`)`

Return the ν-Tamari lattice.

INPUT:

- ν – list of 0s and 1s or a string of 0s and 1s

OUTPUT: a finite lattice

The elements of the lattice are `nu-Dyck paths` weakly above ν.

The usual Tamari lattice is the special case where $\nu = (NE)^h$ where h is the height.

Other special cases give the m-Tamari lattices studied in [BMFPR].

EXAMPLES:

```
sage: from sage.combinat.nu_tamari_lattice import NuTamariLattice
sage: NuTamariLattice([1,0,1,0,0,1,0])
Finite lattice containing 7 elements
sage: NuTamariLattice([1,0,1,0,1,0])
Finite lattice containing 5 elements
sage: NuTamariLattice([1,0,1,0,1,0,1,0])
Finite lattice containing 14 elements
sage: NuTamariLattice([1,0,1,0,1,0,0,0,1])
Finite lattice containing 24 elements
```

```
>>> from sage.all import *
>>> from sage.combinat.nu_tamari_lattice import NuTamariLattice
>>> NuTamariLattice([Integer(1),Integer(0),Integer(1),Integer(0),Integer(0),
↪Integer(1),Integer(0)])
Finite lattice containing 7 elements
>>> NuTamariLattice([Integer(1),Integer(0),Integer(1),Integer(0),Integer(1),
↪Integer(0)])
Finite lattice containing 5 elements
>>> NuTamariLattice([Integer(1),Integer(0),Integer(1),Integer(0),Integer(1),
↪Integer(0),Integer(1),Integer(0)])
Finite lattice containing 14 elements
>>> NuTamariLattice([Integer(1),Integer(0),Integer(1),Integer(0),Integer(1),
↪Integer(0),Integer(0),Integer(0),Integer(1)])
Finite lattice containing 24 elements
```

sage.combinat.nu_tamari_lattice.**delta_swap**(*p*, *k*, *delta*)

Perform a covering move in the (δ, ν)-Tamari lattice (or alt ν-Tamari lattice, see [CC2023]).

The letter at position k is a North step of the ν-Dyck word p, and must be preceded by an East step.

The vector $\delta = (\delta_1, \ldots, \delta_n)$ is an increment vector with respect to the path ν, that is to say $\delta_i \leq \nu_i$, where ν_i is the number of East steps following the i-th North step of ν.

INPUT:

- `p` – a ν-Dyck word
- `k` – integer between 0 and `p.length()-1`
- `delta` – list of nonnegative integers of length `p.height()`

OUTPUT: a ν-Dyck word

EXAMPLES:

```
sage: from sage.combinat.nu_tamari_lattice import delta_swap
sage: delta_swap(NuDyckWord('0101', '0101'), 3, delta = [1, 0])
[0, 1, 1, 0]
sage: delta_swap(NuDyckWord('1001110100', '0100010111'), 3, [3, 1, 0, 0, 0])
[1, 0, 1, 1, 1, 0, 0, 1, 0, 0]
sage: delta_swap(NuDyckWord('10100101000', '01001000110'), 2, [2, 3, 0, 1])
[1, 1, 0, 0, 1, 0, 0, 1, 0, 0, 0]
sage: delta_swap(NuDyckWord('10100101000', '01001000110'), 2, [1, 1, 0, 0])
[1, 1, 0, 0, 0, 1, 0, 1, 0, 0, 0]
```

```
>>> from sage.all import *
>>> from sage.combinat.nu_tamari_lattice import delta_swap
>>> delta_swap(NuDyckWord('0101', '0101'), Integer(3), delta = [Integer(1),
↪Integer(0)])
[0, 1, 1, 0]
>>> delta_swap(NuDyckWord('1001110100', '0100010111'), Integer(3), [Integer(3),
↪Integer(1), Integer(0), Integer(0), Integer(0)])
[1, 0, 1, 1, 1, 0, 0, 1, 0, 0]
>>> delta_swap(NuDyckWord('10100101000', '01001000110'), Integer(2), [Integer(2),
↪Integer(3), Integer(0), Integer(1)])
[1, 1, 0, 0, 1, 0, 0, 1, 0, 0, 0]
>>> delta_swap(NuDyckWord('10100101000', '01001000110'), Integer(2), [Integer(1),
↪Integer(1), Integer(0), Integer(0)])
[1, 1, 0, 0, 0, 1, 0, 1, 0, 0, 0]
```

5.1.155 Ordered Rooted Trees

AUTHORS:

- Florent Hivert (2010-2011): initial revision
- Frédéric Chapoton (2010): contributed some methods

class sage.combinat.ordered_tree.**LabelledOrderedTree**(*parent*, *children*, *label=None*, *check=True*)

Bases: *AbstractLabelledClonableTree*, *OrderedTree*

Labelled ordered trees.

A labelled ordered tree is an ordered tree with a label attached at each node.

INPUT:

- `children` – list or tuple or more generally any iterable of trees or object convertible to trees
- `label` – any Sage object (default: `None`)

EXAMPLES:

```
sage: x = LabelledOrderedTree([], label = 3); x
3[]
sage: LabelledOrderedTree([x, x, x], label = 2)
2[3[], 3[], 3[]]
sage: LabelledOrderedTree((x, x, x), label = 2)
2[3[], 3[], 3[]]
sage: LabelledOrderedTree([[],[[], []]], label = 3)
3[None[], None[None[], None[]]]
```

```
>>> from sage.all import *
>>> x = LabelledOrderedTree([], label = Integer(3)); x
3[]
>>> LabelledOrderedTree([x, x, x], label = Integer(2))
2[3[], 3[], 3[]]
>>> LabelledOrderedTree((x, x, x), label = Integer(2))
2[3[], 3[], 3[]]
>>> LabelledOrderedTree([[],[[], []]], label = Integer(3))
3[None[], None[None[], None[]]]
```

left_right_symmetry()

Return the symmetric tree of `self`.

The symmetric tree $s(T)$ of a labelled ordered tree T is defined as follows: If T is a labelled ordered tree with children $C_1, C_2, \ldots, C_k$ (listed from left to right), then the symmetric tree $s(T)$ of T is a labelled ordered tree with children $s(C_k), s(C_{k-1}), \ldots, s(C_1)$ (from left to right), and with the same root label as T.

Note

If you have a subclass of *LabelledOrderedTree()* which also inherits from another subclass of *OrderedTree()* which does not come with a labelling, then (depending on the method resolution order) it might happen that this method gets overridden by an implementation from that other subclass, and thus forgets about the labels. In this case you need to manually override this method on your subclass.

EXAMPLES:

```
sage: L2 = LabelledOrderedTree([], label=2)
sage: L3 = LabelledOrderedTree([], label=3)
sage: T23 = LabelledOrderedTree([L2, L3], label=4)
sage: T23.left_right_symmetry()
4[3[], 2[]]
sage: T223 = LabelledOrderedTree([L2, T23], label=17)
sage: T223.left_right_symmetry()
17[4[3[], 2[]], 2[]]
sage: T223.left_right_symmetry().left_right_symmetry() == T223
True
```

```
>>> from sage.all import *
>>> L2 = LabelledOrderedTree([], label=Integer(2))
>>> L3 = LabelledOrderedTree([], label=Integer(3))
>>> T23 = LabelledOrderedTree([L2, L3], label=Integer(4))
>>> T23.left_right_symmetry()
4[3[], 2[]]
>>> T223 = LabelledOrderedTree([L2, T23], label=Integer(17))
>>> T223.left_right_symmetry()
17[4[3[], 2[]], 2[]]
>>> T223.left_right_symmetry().left_right_symmetry() == T223
True
```

sort_key()

Return a tuple of nonnegative integers encoding the labelled tree `self`.

The first entry of the tuple is a pair consisting of the number of children of the root and the label of the root. Then the rest of the tuple is the concatenation of the tuples associated to these children (we view the children of a tree as trees themselves) from left to right.

This tuple characterizes the labelled tree uniquely, and can be used to sort the labelled ordered trees provided that the labels belong to a type which is totally ordered.

Warning

This method overrides *OrderedTree.sort_key()* and returns a result different from what the latter would return, as it wants to encode the whole labelled tree including its labelling rather than just the unlabelled tree. Therefore, be careful with using this method on subclasses of `LabelledOrderedTree`; under some circumstances they could inherit it from another superclass instead of from `OrderedTree`, which would cause the method to forget the labelling. See the docstring of `OrderedTree.sort_key()`.

EXAMPLES:

```
sage: L2 = LabelledOrderedTree([], label=2)
sage: L3 = LabelledOrderedTree([], label=3)
sage: T23 = LabelledOrderedTree([L2, L3], label=4)
sage: T23.sort_key()
((2, 4), (0, 2), (0, 3))
sage: T32 = LabelledOrderedTree([L3, L2], label=5)
sage: T32.sort_key()
((2, 5), (0, 3), (0, 2))
sage: T23322 = LabelledOrderedTree([T23, T32, L2], label=14)
sage: T23322.sort_key()
((3, 14), (2, 4), (0, 2), (0, 3), (2, 5), (0, 3), (0, 2), (0, 2))
```

```
>>> from sage.all import *
>>> L2 = LabelledOrderedTree([], label=Integer(2))
>>> L3 = LabelledOrderedTree([], label=Integer(3))
>>> T23 = LabelledOrderedTree([L2, L3], label=Integer(4))
>>> T23.sort_key()
((2, 4), (0, 2), (0, 3))
>>> T32 = LabelledOrderedTree([L3, L2], label=Integer(5))
>>> T32.sort_key()
((2, 5), (0, 3), (0, 2))
>>> T23322 = LabelledOrderedTree([T23, T32, L2], label=Integer(14))
>>> T23322.sort_key()
((3, 14), (2, 4), (0, 2), (0, 3), (2, 5), (0, 3), (0, 2), (0, 2))
```

class `sage.combinat.ordered_tree.`**`LabelledOrderedTrees`**(*category=None*)

Bases: `UniqueRepresentation`, `Parent`

This is a parent stub to serve as a factory class for trees with various label constraints.

EXAMPLES:

```
sage: LOT = LabelledOrderedTrees(); LOT
Labelled ordered trees
sage: x = LOT([], label = 3); x
3[]
sage: x.parent() is LOT
True
sage: y = LOT([x, x, x], label = 2); y
2[3[], 3[], 3[]]
sage: y.parent() is LOT
True
```

```
>>> from sage.all import *
>>> LOT = LabelledOrderedTrees(); LOT
Labelled ordered trees
>>> x = LOT([], label = Integer(3)); x
```

(continues on next page)

(continued from previous page)

```
3[]
>>> x.parent() is LOT
True
>>> y = LOT([x, x, x], label = Integer(2)); y
2[3[], 3[], 3[]]
>>> y.parent() is LOT
True
```

Element

alias of *LabelledOrderedTree*

cardinality()

Return the cardinality of `self`.

EXAMPLES:

```
sage: LabelledOrderedTrees().cardinality()
+Infinity
```

```
>>> from sage.all import *
>>> LabelledOrderedTrees().cardinality()
+Infinity
```

labelled_trees()

Return the set of labelled trees associated to `self`.

This is precisely `self`, because `self` already is the set of labelled ordered trees.

EXAMPLES:

```
sage: LabelledOrderedTrees().labelled_trees()
Labelled ordered trees
sage: LOT = LabelledOrderedTrees()
sage: x = LOT([], label = 3)
sage: y = LOT([x, x, x], label = 2)
sage: y.canonical_labelling()
1[2[], 3[], 4[]]
```

```
>>> from sage.all import *
>>> LabelledOrderedTrees().labelled_trees()
Labelled ordered trees
>>> LOT = LabelledOrderedTrees()
>>> x = LOT([], label = Integer(3))
>>> y = LOT([x, x, x], label = Integer(2))
>>> y.canonical_labelling()
1[2[], 3[], 4[]]
```

unlabelled_trees()

Return the set of unlabelled trees associated to `self`.

This is the set of ordered trees, since `self` is the set of labelled ordered trees.

EXAMPLES:

```
sage: LabelledOrderedTrees().unlabelled_trees()
Ordered trees
```

```
>>> from sage.all import *
>>> LabelledOrderedTrees().unlabelled_trees()
Ordered trees
```

class sage.combinat.ordered_tree.**OrderedTree**(*parent=None*, *children=None*, *check=True*)

Bases: *AbstractClonableTree*, ClonableList

The class of (ordered rooted) trees.

An ordered tree is constructed from a node, called the root, on which one has grafted a possibly empty list of trees. There is a total order on the children of a node which is given by the order of the elements in the list. Note that there is no empty ordered tree (so the smallest ordered tree consists of just one node).

INPUT:

One can create a tree from any list (or more generally iterable) of trees or objects convertible to a tree. Alternatively a string is also accepted. The syntax is the same as for printing: children are grouped by square brackets.

EXAMPLES:

```
sage: x = OrderedTree([])
sage: x1 = OrderedTree([x,x])
sage: x2 = OrderedTree([[],[]])
sage: x1 == x2
True
sage: tt1 = OrderedTree([x,x1,x2])
sage: tt2 = OrderedTree([[], [[], []], x2])
sage: tt1 == tt2
True

sage: OrderedTree([]) == OrderedTree()
True
```

```
>>> from sage.all import *
>>> x = OrderedTree([])
>>> x1 = OrderedTree([x,x])
>>> x2 = OrderedTree([[],[]])
>>> x1 == x2
True
>>> tt1 = OrderedTree([x,x1,x2])
>>> tt2 = OrderedTree([[], [[], []], x2])
>>> tt1 == tt2
True

>>> OrderedTree([]) == OrderedTree()
True
```

is_empty()

Return if `self` is the empty tree.

For ordered trees, this always returns `False`.

Note: this is different from `bool(t)` which returns whether `t` has some child or not.

EXAMPLES:

```
sage: t = OrderedTrees(4)([[],[[]]])
sage: t.is_empty()
False
sage: bool(t)
True
```

```
>>> from sage.all import *
>>> t = OrderedTrees(Integer(4))([[],[[]]])
>>> t.is_empty()
False
>>> bool(t)
True
```

left_right_symmetry()

Return the symmetric tree of `self`.

The symmetric tree $s(T)$ of an ordered tree T is defined as follows: If T is an ordered tree with children $C_1, C_2, \ldots, C_k$ (listed from left to right), then the symmetric tree $s(T)$ of T is the ordered tree with children $s(C_k), s(C_{k-1}), \ldots, s(C_1)$ (from left to right).

EXAMPLES:

```
sage: T = OrderedTree([[],[[]]])
sage: T.left_right_symmetry()
[[[]], []]
sage: T = OrderedTree([[], [[], []], [[], [[]]]])
sage: T.left_right_symmetry()
[[[[]], []], [[], []], []]
```

```
>>> from sage.all import *
>>> T = OrderedTree([[],[[]]])
>>> T.left_right_symmetry()
[[[]], []]
>>> T = OrderedTree([[], [[], []], [[], [[]]]])
>>> T.left_right_symmetry()
[[[[]], []], [[], []], []]
```

normalize(*inplace=False*)

Return the normalized tree of `self`.

INPUT:

- `inplace` – boolean (default: `False`); if `True`, then `self` is modified and nothing returned. Otherwise the normalized tree is returned.

The normalization of an ordered tree t is an ordered tree s which has the property that t and s are isomorphic as *unordered* rooted trees, and that if two ordered trees t and t' are isomorphic as *unordered* rooted trees, then the normalizations of t and t' are identical. In other words, normalization is a map from the set of ordered trees to itself which picks a representative from every equivalence class with respect to the relation of "being isomorphic as unordered trees", and maps every ordered tree to the representative chosen from its class.

This map proceeds recursively by first normalizing every subtree, and then sorting the subtrees according to the value of the `sort_key()` method.

Consider the quotient map π that sends a planar rooted tree to the associated unordered rooted tree. Normalization is the composite $s \circ \pi$, where s is a section of π.

EXAMPLES:

```
sage: OT = OrderedTree
sage: ta = OT([[],[[]]])
sage: tb = OT([[[]],[]])
sage: ta.normalize() == tb.normalize()
True
sage: ta == tb
False
```

```
>>> from sage.all import *
>>> OT = OrderedTree
>>> ta = OT([[],[[]]])
>>> tb = OT([[[]],[]])
>>> ta.normalize() == tb.normalize()
True
>>> ta == tb
False
```

An example with inplace normalization:

```
sage: OT = OrderedTree
sage: ta = OT([[],[[]]])
sage: tb = OT([[[]],[]])
sage: ta.normalize(inplace=True); ta
[[], [[]]]
sage: tb.normalize(inplace=True); tb
[[], [[]]]
```

```
>>> from sage.all import *
>>> OT = OrderedTree
>>> ta = OT([[],[[]]])
>>> tb = OT([[[]],[]])
>>> ta.normalize(inplace=True); ta
[[], [[]]]
>>> tb.normalize(inplace=True); tb
[[], [[]]]
```

plot()

Plot the tree `self`.

> **Warning**
>
> For a labelled tree, this will fail unless all labels are distinct. For unlabelled trees, some arbitrary labels are chosen. Use `_latex_()`, `view`, `_ascii_art_()` or `pretty_print` for more faithful representations

of the data of the tree.

EXAMPLES:

```
sage: p = OrderedTree([[[]],[],[]])
sage: ascii_art(p)
  _o__
 / / /
o o o
|
o
sage: p.plot()                                                          #␣
↪needs sage.plot
Graphics object consisting of 10 graphics primitives
```

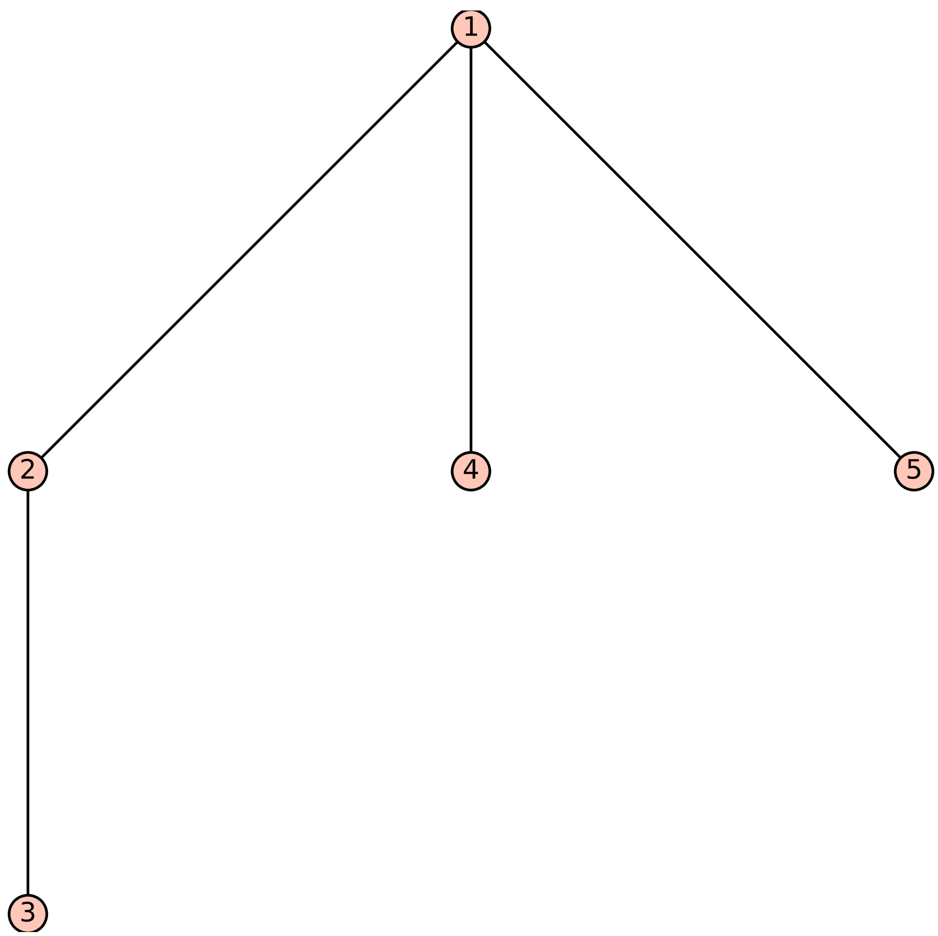
```
>>> from sage.all import *
>>> p = OrderedTree([[[]],[],[]])
>>> ascii_art(p)
  _o__
 / / /
o o o
|
o
>>> p.plot()                                                        #␣
↪needs sage.plot
Graphics object consisting of 10 graphics primitives
```

Now a labelled example:

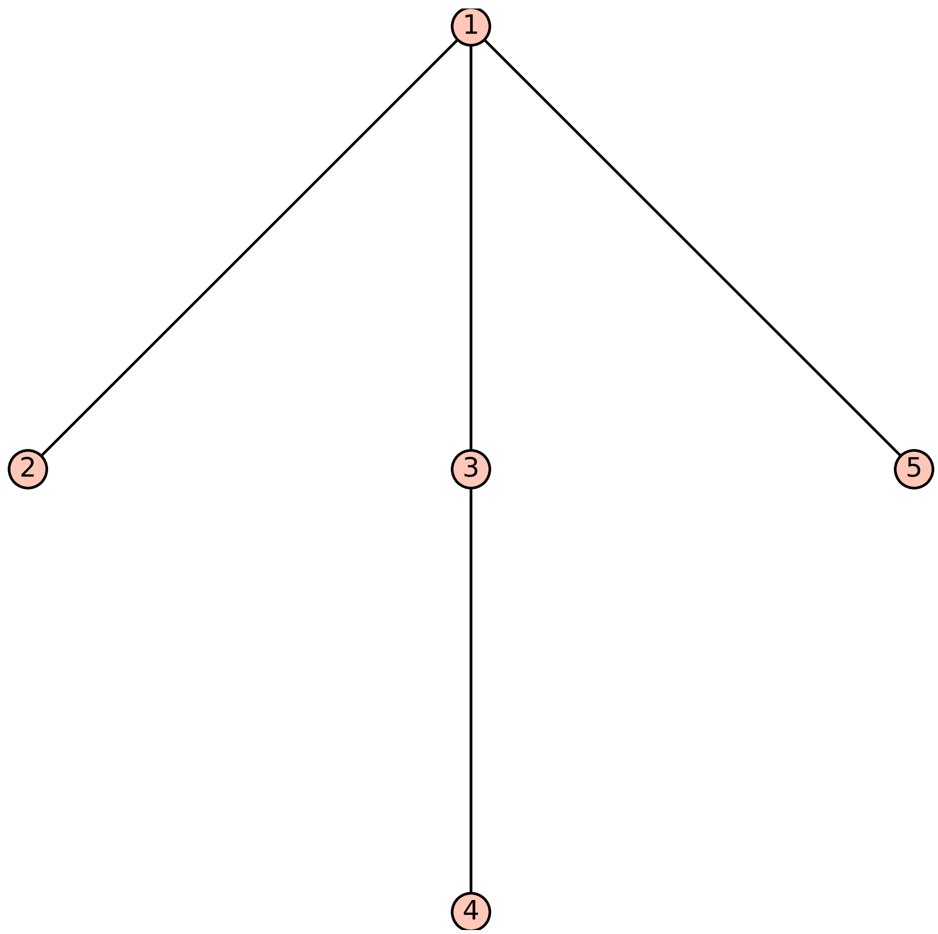
```
sage: g = OrderedTree([[],[[]],[]]).canonical_labelling()
sage: ascii_art(g)
  _1__
 / / /
2 3 5
  |
  4
sage: g.plot()                                                          #␣
↪needs sage.plot
Graphics object consisting of 10 graphics primitives
```

```
>>> from sage.all import *
>>> g = OrderedTree([[],[[]],[]]).canonical_labelling()
>>> ascii_art(g)
  _1__
 / / /
2 3 5
  |
  4
>>> g.plot()                                                        #␣
↪needs sage.plot
Graphics object consisting of 10 graphics primitives
```

sort_key()



1
2
4
5
3



1
2
3
5
4

Return a tuple of nonnegative integers encoding the ordered tree `self`.

The first entry of the tuple is the number of children of the root. Then the rest of the tuple is the concatenation of the tuples associated to these children (we view the children of a tree as trees themselves) from left to right.

This tuple characterizes the tree uniquely, and can be used to sort the ordered trees.

Note: By default, this method does not encode any extra structure that `self` might have – e.g., if you were to define a class `EdgeColoredOrderedTree` which implements edge-colored trees and which inherits from `OrderedTree`, then the `sort_key()` method it would inherit would forget about the colors of the edges (and thus would not characterize edge-colored trees uniquely). If you want to preserve extra data, you need to override this method or use a new method. For instance, on the `LabelledOrderedTree` subclass, this method is overridden by a slightly different method, which encodes not only the numbers of children of the nodes of `self`, but also their labels. Be careful with using overridden methods, however: If you have (say) a class `BalancedTree` which inherits from `OrderedTree` and which encodes balanced trees, and if you have another class `BalancedLabelledOrderedTree` which inherits both from `BalancedOrderedTree` and from `LabelledOrderedTree`, then (depending on the MRO) the default `sort_key()` method on `BalancedLabelledOrderedTree` (unless manually overridden) will be taken either from `BalancedTree` or from `LabelledOrderedTree`, and in the former case will ignore the labelling!

EXAMPLES:

```
sage: RT = OrderedTree
sage: RT([[],[[]]]).sort_key()
(2, 0, 1, 0)
sage: RT([[[]],[]]).sort_key()
(2, 1, 0, 0)
```

```
>>> from sage.all import *
>>> RT = OrderedTree
>>> RT([[],[[]]]).sort_key()
(2, 0, 1, 0)
>>> RT([[[]],[]]).sort_key()
(2, 1, 0, 0)
```

to_binary_tree_left_branch()

Return a binary tree of size $n - 1$ (where n is the size of t, and where t is `self`) obtained from t by the following recursive rule:

- if x is the left brother of y in t, then x becomes the left child of y;
- if x is the last child of y in t, then x becomes the right child of y,

and removing the root of t.

EXAMPLES:

```
sage: T = OrderedTree([[],[]])
sage: T.to_binary_tree_left_branch()
[[., .], .]
sage: T = OrderedTree([[], [[], []], [[], [[]]]])
```

(continues on next page)

(continued from previous page)

```
sage: T.to_binary_tree_left_branch()
[[[., .], [[., .], .]], [[., .], [., .]]]
```

```
>>> from sage.all import *
>>> T = OrderedTree([[],[]])
>>> T.to_binary_tree_left_branch()
[[., .], .]
>>> T = OrderedTree([[], [[], []], [[], [[]]]])
>>> T.to_binary_tree_left_branch()
[[[., .], [[., .], .]], [[., .], [., .]]]
```

to_binary_tree_right_branch()

Return a binary tree of size $n - 1$ (where n is the size of t, and where t is `self`) obtained from t by the following recursive rule:

- if x is the right brother of y in t, then`x` becomes the right child of y;
- if x is the first child of y in t, then x becomes the left child of y,

and removing the root of t.

EXAMPLES:

```
sage: T = OrderedTree([[],[]])
sage: T.to_binary_tree_right_branch()
[., [., .]]
sage: T = OrderedTree([[], [[], []], [[], [[]]]])
sage: T.to_binary_tree_right_branch()
[., [[., [., .]], [[., [[., .], .]], .]]]
```

```
>>> from sage.all import *
>>> T = OrderedTree([[],[]])
>>> T.to_binary_tree_right_branch()
[., [., .]]
>>> T = OrderedTree([[], [[], []], [[], [[]]]])
>>> T.to_binary_tree_right_branch()
[., [[., [., .]], [[., [[., .], .]], .]]]
```

to_dyck_word()

Return the Dyck path corresponding to `self` where the maximal height of the Dyck path is the depth of `self` .

EXAMPLES:

```
sage: T = OrderedTree([[],[]])
sage: T.to_dyck_word()                                                  #␣
↪needs sage.combinat
[1, 0, 1, 0]
sage: T = OrderedTree([[],[[]]])
sage: T.to_dyck_word()                                                  #␣
↪needs sage.combinat
[1, 0, 1, 1, 0, 0]
sage: T = OrderedTree([[], [[], []], [[], [[]]]])
sage: T.to_dyck_word()                                                  #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.combinat
[1, 0, 1, 1, 0, 1, 0, 0, 1, 1, 0, 1, 1, 0, 0, 0]
```

```
>>> from sage.all import *
>>> T = OrderedTree([[],[]])
>>> T.to_dyck_word()                                                    #␣
↪needs sage.combinat
[1, 0, 1, 0]
>>> T = OrderedTree([[],[[]]])
>>> T.to_dyck_word()                                                    #␣
↪needs sage.combinat
[1, 0, 1, 1, 0, 0]
>>> T = OrderedTree([[], [[], []], [[], [[]]]])
>>> T.to_dyck_word()                                                    #␣
↪needs sage.combinat
[1, 0, 1, 1, 0, 1, 0, 0, 1, 1, 0, 1, 1, 0, 0, 0]
```

to_parallelogram_polyomino(*bijection=None*)

Return a polyomino parallelogram.

INPUT:

- `bijection` – (default: `'Boussicault-Socci'`) is the name of the bijection to use. Possible values are `'Boussicault-Socci'`, `'via dyck and Delest-Viennot'`.

EXAMPLES:

```
sage: # needs sage.combinat sage.modules
sage: T = OrderedTree([[[], [[], [[]]]], [], [[[],[]]], [], []])
sage: T.to_parallelogram_polyomino(bijection='Boussicault-Socci')
[[0, 0, 0, 1, 1, 0, 1, 1, 1, 1, 0, 1, 1, 1],
 [1, 1, 1, 1, 1, 0, 0, 1, 1, 0, 1, 1, 0, 0]]
sage: T = OrderedTree( [] )
sage: T.to_parallelogram_polyomino()
[[1], [1]]
sage: T = OrderedTree( [[]] )
sage: T.to_parallelogram_polyomino()
[[0, 1], [1, 0]]
sage: T = OrderedTree( [[],[]] )
sage: T.to_parallelogram_polyomino()
[[0, 1, 1], [1, 1, 0]]
sage: T = OrderedTree( [[[]]] )
sage: T.to_parallelogram_polyomino()
[[0, 0, 1], [1, 0, 0]]
```

```
>>> from sage.all import *
>>> # needs sage.combinat sage.modules
>>> T = OrderedTree([[[], [[], [[]]]], [], [[[],[]]], [], []])
>>> T.to_parallelogram_polyomino(bijection='Boussicault-Socci')
[[0, 0, 0, 1, 1, 0, 1, 1, 1, 1, 0, 1, 1, 1],
 [1, 1, 1, 1, 1, 0, 0, 1, 1, 0, 1, 1, 0, 0]]
>>> T = OrderedTree( [] )
>>> T.to_parallelogram_polyomino()
```

(continues on next page)

(continued from previous page)

```
[[1], [1]]
>>> T = OrderedTree( [[]] )
>>> T.to_parallelogram_polyomino()
[[0, 1], [1, 0]]
>>> T = OrderedTree( [[],[]] )
>>> T.to_parallelogram_polyomino()
[[0, 1, 1], [1, 1, 0]]
>>> T = OrderedTree( [[[]]] )
>>> T.to_parallelogram_polyomino()
[[0, 0, 1], [1, 0, 0]]
```

to_poset (*root_to_leaf=False*)

Return the poset obtained by interpreting the tree as a Hasse diagram. The default orientation is from leaves to root but you can pass `root_to_leaf=True` to obtain the inverse orientation.

INPUT:

- `root_to_leaf` – boolean (default: `False`); `True` if the poset orientation should be from root to leaves

EXAMPLES:

```
sage: t = OrderedTree([])
sage: t.to_poset()
Finite poset containing 1 elements
sage: p = OrderedTree([[[]],[],[]]).to_poset()
sage: p.height(), p.width()                                            #␣
↪needs networkx
(3, 3)
```

```
>>> from sage.all import *
>>> t = OrderedTree([])
>>> t.to_poset()
Finite poset containing 1 elements
>>> p = OrderedTree([[[]],[],[]]).to_poset()
>>> p.height(), p.width()                                            #␣
↪needs networkx
(3, 3)
```

If the tree is labelled, we use its labelling to label the poset. Otherwise, we use the poset canonical labelling:

```
sage: t = OrderedTree([[[]],[],[]]).canonical_labelling().to_poset()
sage: t.height(), t.width()                                            #␣
↪needs networkx
(3, 3)
```

```
>>> from sage.all import *
>>> t = OrderedTree([[[]],[],[]]).canonical_labelling().to_poset()
>>> t.height(), t.width()                                            #␣
↪needs networkx
(3, 3)
```

to_undirected_graph ()

Return the undirected graph obtained from the tree nodes and edges.

The graph is endowed with an embedding, so that it will be displayed correctly.

EXAMPLES:

```
sage: t = OrderedTree([])
sage: t.to_undirected_graph()
Graph on 1 vertex
sage: t = OrderedTree([[[]],[],[]])
sage: t.to_undirected_graph()
Graph on 5 vertices
```

```
>>> from sage.all import *
>>> t = OrderedTree([])
>>> t.to_undirected_graph()
Graph on 1 vertex
>>> t = OrderedTree([[[]],[],[]])
>>> t.to_undirected_graph()
Graph on 5 vertices
```

If the tree is labelled, we use its labelling to label the graph. This will fail if the labels are not all distinct. Otherwise, we use the graph canonical labelling which means that two different trees can have the same graph.

EXAMPLES:

```
sage: t = OrderedTree([[[]],[],[]])
sage: t.canonical_labelling().to_undirected_graph()
Graph on 5 vertices
```

```
>>> from sage.all import *
>>> t = OrderedTree([[[]],[],[]])
>>> t.canonical_labelling().to_undirected_graph()
Graph on 5 vertices
```

class sage.combinat.ordered_tree.**OrderedTrees**

Bases: `UniqueRepresentation`, `Parent`

Factory for ordered trees.

INPUT:

- `size` – integer (optional)

OUTPUT:

- the set of all ordered trees (of the given `size` if specified)

EXAMPLES:

```
sage: OrderedTrees()
Ordered trees

sage: OrderedTrees(2)
Ordered trees of size 2
```

```
>>> from sage.all import *
>>> OrderedTrees()
Ordered trees
```

(continues on next page)

(continued from previous page)

```
>>> OrderedTrees(Integer(2))
Ordered trees of size 2
```

Note: this is a factory class whose constructor returns instances of subclasses.

Note: the fact that OrderedTrees is a class instead of a simple callable is an implementation detail. It could be changed in the future and one should not rely on it.

leaf()

Return a leaf tree with `self` as parent.

EXAMPLES:

```
sage: OrderedTrees().leaf()
[]
```

```
>>> from sage.all import *
>>> OrderedTrees().leaf()
[]
```

class sage.combinat.ordered_tree.**OrderedTrees_all**

Bases: `DisjointUnionEnumeratedSets`, *OrderedTrees*

The set of all ordered trees.

EXAMPLES:

```
sage: OT = OrderedTrees(); OT
Ordered trees
sage: OT.cardinality()
+Infinity
```

```
>>> from sage.all import *
>>> OT = OrderedTrees(); OT
Ordered trees
>>> OT.cardinality()
+Infinity
```

Element

alias of *OrderedTree*

labelled_trees()

Return the set of labelled trees associated to `self`.

EXAMPLES:

```
sage: OrderedTrees().labelled_trees()
Labelled ordered trees
```

```
>>> from sage.all import *
>>> OrderedTrees().labelled_trees()
Labelled ordered trees
```

unlabelled_trees()

Return the set of unlabelled trees associated to `self`.

EXAMPLES:

```
sage: OrderedTrees().unlabelled_trees()
Ordered trees
```

```
>>> from sage.all import *
>>> OrderedTrees().unlabelled_trees()
Ordered trees
```

class sage.combinat.ordered_tree.**OrderedTrees_size**(*size*)

Bases: *OrderedTrees*

The enumerated sets of binary trees of a given size.

EXAMPLES:

```
sage: S = OrderedTrees(3); S
Ordered trees of size 3
sage: S.cardinality()
2
sage: S.list()
[[[], []], [[[]]]]
```

```
>>> from sage.all import *
>>> S = OrderedTrees(Integer(3)); S
Ordered trees of size 3
>>> S.cardinality()
2
>>> S.list()
[[[], []], [[[]]]]
```

cardinality()

The cardinality of `self`.

This is a Catalan number.

element_class()

The class of the element of `self`.

EXAMPLES:

```
sage: from sage.combinat.ordered_tree import OrderedTrees_size, OrderedTrees_
↪all
sage: S = OrderedTrees_size(3)
```

(continues on next page)

(continued from previous page)

```
sage: S.element_class is OrderedTrees().element_class
True
sage: S.first().__class__ == OrderedTrees_all().first().__class__
True
```

```
>>> from sage.all import *
>>> from sage.combinat.ordered_tree import OrderedTrees_size, OrderedTrees_all
>>> S = OrderedTrees_size(Integer(3))
>>> S.element_class is OrderedTrees().element_class
True
>>> S.first().__class__ == OrderedTrees_all().first().__class__
True
```

random_element()

Return a random `OrderedTree` with uniform probability.

This method generates a random `DyckWord` and then uses a bijection between Dyck words and ordered trees.

EXAMPLES:

```
sage: OrderedTrees(5).random_element()  # random                          #␣
↪needs sage.combinat
[[[], []], []]
sage: OrderedTrees(0).random_element()
Traceback (most recent call last):
...
EmptySetError: there are no ordered trees of size 0
sage: OrderedTrees(1).random_element()                                      #␣
↪needs sage.combinat
[]
```

```
>>> from sage.all import *
>>> OrderedTrees(Integer(5)).random_element()  # random                      ␣
↪     # needs sage.combinat
[[[], []], []]
>>> OrderedTrees(Integer(0)).random_element()
Traceback (most recent call last):
...
EmptySetError: there are no ordered trees of size 0
>>> OrderedTrees(Integer(1)).random_element()                                ␣
↪     # needs sage.combinat
[]
```

5.1.156 Output functions

These are the output functions for latexing and ascii/unicode art versions of partitions and tableaux.

AUTHORS:

- Mike Hansen (?): initial version
- Andrew Mathas (2013-02-14): Added support for displaying conventions and lines, and tableaux of skew partition, composition, and skew/composition/partition/tableaux tuple shape.
- Travis Scrimshaw (2020-08): Added support for ascii/unicode art

sage.combinat.output.**ascii_art_table**(*data*, *use_unicode=False*, *convention='English'*)

Return an ascii art table of `data`.

EXAMPLES:

```
sage: from sage.combinat.output import ascii_art_table

sage: data = [[None, None, 1], [2, 2], [3,4,5], [None, None, 10], [], [6]]
sage: print(ascii_art_table(data))
        +----+
        | 1  |
+---+---+----+
| 2 | 2 |
+---+---+----+
| 3 | 4 | 5  |
+---+---+----+
        | 10 |
        +----+

+---+
| 6 |
+---+
sage: print(ascii_art_table(data, use_unicode=True))
        ┌────┐
        │ 1  │

    │ 2 │
    └───┘
```

`sage.combinat.output.`**`ascii_art_table_russian`**(*data*, *use_unicode=False*, *compact=False*)

Return an ascii art table of `data` for the russian convention.

EXAMPLES:

```
sage: from sage.combinat.output import ascii_art_table_russian
```

(continues on next page)

(continued from previous page)

```
sage: data = [[None, None, 1], [2, 2], [3,4,5], [None, None, 10], [], [6]]
sage: print(ascii_art_table_russian(data))

```

sage.combinat.output.**box_exists**(*tab*, *i*, *j*)

Return `True` if `tab[i][j]` exists and is not `None`; in particular this allows for $tab[i][j]$ to be `''` or `0`.

INPUT:

- `tab` – list of lists
- `i` – first coordinate
- `j` – second coordinate

sage.combinat.output.**tex_from_array**(*array*, *with_lines=True*)

Return a latex string for a two dimensional array of partition, composition or skew composition shape.

INPUT:

- `array` – list of list
- `with_lines` – boolean (default: `True`); whether to draw a line to separate the entries in the array

Empty rows are allowed; however, such rows should be given as `[None]` rather than `[]`.

The array is drawn using either the English or French convention following `Tableaux.options()`.

`sage.combinat.output.`**`tex_from_array_tuple`**`(`*a_tuple*, *with_lines=True*`)`

Return a latex string for a tuple of two dimensional array of partition, composition or skew composition shape.

INPUT:

- `a_tuple` – tuple of lists of lists
- `with_lines` – boolean (default: `True`); whether to draw lines to separate the entries in the components of `a_tuple`

See also

`tex_from_array()` for the description of each array

EXAMPLES:

```
sage: from sage.combinat.output import tex_from_array_tuple
sage: print(tex_from_array_tuple([[[1,2,3],[4,5]],[],[[None,6,7],[None,8],[9]]]))

sage.combinat.output.**tex_from_skew_array**(*array*, *with_lines=False*, *align='b'*)

This function creates latex code for a "skew composition" `array`. That is, for a two dimensional array in which each row can begin with an arbitrary number `None`'s and the remaining entries could, in principle, be anything but probably should be strings or integers of similar width. A row consisting completely of `None`'s is allowed.

INPUT:

- `array` – the array
- `with_lines` – (default: `False`) if `True` lines are drawn, if `False` they are not
- `align` – (default: `'b'`) determine the alignment on the latex array environments

EXAMPLES:

```
sage: array=[[None, 2,3,4],[None,None],[5,6,7,8]]
sage: print(sage.combinat.output.tex_from_skew_array(array))
\raisebox{-.6ex}{$\begin{array}[b]{*{4}c}\\
&\lr{2}&\lr{3}&\lr{4}\\
&\\
\lr{5}&\lr{6}&\lr{7}&\lr{8}\\
\end{array}$}
```

```
>>> from sage.all import *
>>> array=[[None, Integer(2),Integer(3),Integer(4)],[None,None],[Integer(5),
↪Integer(6),Integer(7),Integer(8)]]
>>> print(sage.combinat.output.tex_from_skew_array(array))
\raisebox{-.6ex}{$\begin{array}[b]{*{4}c}\\
&\lr{2}&\lr{3}&\lr{4}\\
&\\
\lr{5}&\lr{6}&\lr{7}&\lr{8}\\
\end{array}$}
```

5.1.157 Parallelogram Polyominoes

The goal of this module is to give some tools to manipulate the parallelogram polyominoes.

class sage.combinat.parallelogram_polyomino.**LocalOptions**(*name=''*, ***options*)

Bases: object

This class allow to add local options to an object. LocalOptions is like a dictionary, it has keys and values that represent options and the values associated to the option. This is useful to decorate an object with some optional informations.

LocalOptions should be used as follow.

INPUT:

- name – the name of the LocalOptions
- <options>=dict(...) – dictionary specifying an option

The options are specified by keyword arguments with their values being a dictionary which describes the option. The allowed/expected keys in the dictionary are:

- checker – a function for checking whether a particular value for the option is valid
- default – the default value of the option
- values – dictionary of the legal values for this option (this automatically defines the corresponding checker); this dictionary gives the possible options, as keys, together with a brief description of them

```
sage: from sage.combinat.parallelogram_polyomino import LocalOptions
sage: o = LocalOptions(
....:     'Name Example',
....:     delim=dict(
....:         default='b',
....:         values={'b':'the option b', 'p':'the option p'}
....:     )
....: )
sage: class Ex:
....:     options=o
....:     def _repr_b(self): return "b"
....:     def _repr_p(self): return "p"
....:     def __repr__(self): return self.options._dispatch(
....:         self, '_repr_','delim'
....:     )
sage: e = Ex(); e
b
sage: e.options(delim='p'); e
p
```

```
>>> from sage.all import *
>>> from sage.combinat.parallelogram_polyomino import LocalOptions
>>> o = LocalOptions(
...     'Name Example',
...     delim=dict(
...         default='b',
...         values={'b':'the option b', 'p':'the option p'}
```

(continues on next page)

(continued from previous page)

```
...     )
... )
>>> class Ex:
...     options=o
...     def _repr_b(self): return "b"
...     def _repr_p(self): return "p"
...     def __repr__(self): return self.options._dispatch(
...         self, '_repr_','delim'
...     )
>>> e = Ex(); e
b
>>> e.options(delim='p'); e
p
```

This class is temporary, in the future, this class should be integrated in sage.structure.global_options.py. We should split global_option in two classes LocalOptions and GlobalOptions.

keys()

Return the list of the options in `self`.

EXAMPLES:

```
sage: from sage.combinat.parallelogram_polyomino import (
....:     LocalOptions
....: )
sage: o = LocalOptions(
....:     "Name Example",
....:     tikz_options=dict(
....:         default='toto',
....:         values=dict(
....:             toto='name',
....:             x="3"
....:         )
....:     ),
....:     display=dict(
....:         default='list',
....:         values=dict(
....:             list="list representation",
....:             diagram="diagram representation"
....:         )
....:     )
....: )
sage: keys=o.keys()
sage: keys.sort()
sage: keys
['display', 'tikz_options']
```

```
>>> from sage.all import *
>>> from sage.combinat.parallelogram_polyomino import (
...     LocalOptions
... )
>>> o = LocalOptions(
...     "Name Example",
```

(continues on next page)

(continued from previous page)

```
...     tikz_options=dict(
...         default='toto',
...         values=dict(
...             toto='name',
...             x="3"
...         )
...     ),
...     display=dict(
...         default='list',
...         values=dict(
...             list="list representation",
...             diagram="diagram representation"
...         )
...     )
... )
>>> keys=o.keys()
>>> keys.sort()
>>> keys
['display', 'tikz_options']
```

class sage.combinat.parallelogram_polyomino.**ParallelogramPolyomino**(*parent*, *value*, *check=True*)

Bases: ClonableList

Parallelogram Polyominoes.

A parallelogram polyomino is a finite connected union of cells whose boundary can be decomposed in two paths, the upper and the lower paths, which are comprised of north and east unit steps and meet only at their starting and final points.

Parallelogram Polyominoes can be defined with those two paths.

EXAMPLES:

```
sage: pp = ParallelogramPolyomino([[0, 1], [1, 0]])
sage: pp
[[0, 1], [1, 0]]
```

```
>>> from sage.all import *
>>> pp = ParallelogramPolyomino([[Integer(0), Integer(1)], [Integer(1),␣
↪Integer(0)]])
>>> pp
[[0, 1], [1, 0]]
```

area()

Return the area of the parallelogram polyomino. The area of a parallelogram polyomino is the number of cells of the parallelogram polyomino.

EXAMPLES:

```
sage: pp = ParallelogramPolyomino(
....:     [
....:         [0, 0, 1, 0, 1, 1, 1, 0, 0, 1, 1],
....:         [1, 1, 0, 1, 0, 1, 1, 0, 1, 0, 0]
```

(continues on next page)

(continued from previous page)

```
....:     ]
....: )
sage: pp.area()
13

sage: pp = ParallelogramPolyomino([[0, 1], [1, 0]])
sage: pp.area()
1

sage: pp = ParallelogramPolyomino([[1], [1]])
sage: pp.area()
0
```

```
>>> from sage.all import *
>>> pp = ParallelogramPolyomino(
...     [
...         [Integer(0), Integer(0), Integer(1), Integer(0), Integer(1),␣
↪Integer(1), Integer(1), Integer(0), Integer(0), Integer(1), Integer(1)],
...         [Integer(1), Integer(1), Integer(0), Integer(1), Integer(0),␣
↪Integer(1), Integer(1), Integer(0), Integer(1), Integer(0), Integer(0)]
...     ]
... )
>>> pp.area()
13

>>> pp = ParallelogramPolyomino([[Integer(0), Integer(1)], [Integer(1),␣
↪Integer(0)]])
>>> pp.area()
1

>>> pp = ParallelogramPolyomino([[Integer(1)], [Integer(1)]])
>>> pp.area()
0
```

bounce(*direction=1*)

Return the bounce of the parallelogram polyomino.

Let `p` be the bounce path of the parallelogram polyomino (`bounce_path()`). The bounce is defined by:

```
sum([(1+ floor(i/2))*p[i] for i in range(len(p))])
```

INPUT:

- `direction` – the initial direction of the bounce path (see `bounce_path()` for the definition)

EXAMPLES:

```
sage: PP = ParallelogramPolyomino(
....:     [[0, 0, 1, 0, 1, 1], [1, 1, 0, 0, 1, 0]]
....: )
sage: PP.bounce(direction=1)
6
sage: PP.bounce(direction=0)
7
```

(continues on next page)

(continued from previous page)

```
sage: PP = ParallelogramPolyomino(
....:     [
....:         [0, 0, 1, 1, 1, 0, 0, 1, 1],
....:         [1, 1, 1, 0, 1, 1, 0, 0, 0]
....:     ]
....: )
sage: PP.bounce(direction=1)
12
sage: PP.bounce(direction=0)
10

sage: PP = ParallelogramPolyomino([[0, 1], [1, 0]])
sage: PP.bounce(direction=1)
1
sage: PP.bounce(direction=0)
1

sage: PP = ParallelogramPolyomino([[1], [1]])
sage: PP.bounce(direction=1)
0
sage: PP.bounce(direction=0)
0
```

```
>>> from sage.all import *
>>> PP = ParallelogramPolyomino(
...     [[Integer(0), Integer(0), Integer(1), Integer(0), Integer(1),␣
↪Integer(1)], [Integer(1), Integer(1), Integer(0), Integer(0), Integer(1),␣
↪Integer(0)]]
... )
>>> PP.bounce(direction=Integer(1))
6
>>> PP.bounce(direction=Integer(0))
7

>>> PP = ParallelogramPolyomino(
...     [
...         [Integer(0), Integer(0), Integer(1), Integer(1), Integer(1),␣
↪Integer(0), Integer(0), Integer(1), Integer(1)],
...         [Integer(1), Integer(1), Integer(1), Integer(0), Integer(1),␣
↪Integer(1), Integer(0), Integer(0), Integer(0)]
...     ]
... )
>>> PP.bounce(direction=Integer(1))
12
>>> PP.bounce(direction=Integer(0))
10

>>> PP = ParallelogramPolyomino([[Integer(0), Integer(1)], [Integer(1),␣
↪Integer(0)]])
>>> PP.bounce(direction=Integer(1))
1
```

(continues on next page)

(continued from previous page)

```
>>> PP.bounce(direction=Integer(0))
1

>>> PP = ParallelogramPolyomino([[Integer(1)], [Integer(1)]])
>>> PP.bounce(direction=Integer(1))
0
>>> PP.bounce(direction=Integer(0))
0
```

bounce_path(*direction=1*)

Return the bounce path of the parallelogram polyomino.

The bounce path is a path with two steps (1, 0) and (0, 1).

If 'direction' is 1 (resp. 0), the bounce path is the path starting at position (h=1, w=0) (resp. (h=0, w=1)) with initial direction, the vector (0, 1) (resp. (1, 0)), and turning each time the path crosses the perimeter of the parallelogram polyomino.

The path is coded by a list of integers. Each integer represents the size of the path between two turnings.

You can visualize the two bounce paths by using the following commands.

INPUT:

- `direction` – the initial direction of the bounce path (see above for the definition)

EXAMPLES:

```
sage: PP = ParallelogramPolyomino(
....:     [[0, 0, 1, 0, 1, 1], [1, 1, 0, 0, 1, 0]]
....: )
sage: PP.bounce_path(direction=1)
[2, 2, 1]
sage: PP.bounce_path(direction=0)
[2, 1, 1, 1]

sage: PP = ParallelogramPolyomino(
....:     [
....:         [0, 0, 1, 1, 1, 0, 0, 1, 1],
....:         [1, 1, 1, 0, 1, 1, 0, 0, 0]
....:     ]
....: )
sage: PP.bounce_path(direction=1)
[3, 1, 2, 2]
sage: PP.bounce_path(direction=0)
[2, 4, 2]

sage: PP = ParallelogramPolyomino(
....:     [[0, 0, 1, 0, 1, 1], [1, 1, 0, 0, 1, 0]]
....: )
sage: PP.set_options(
....:     drawing_components=dict(
....:         diagram = True
....:         , bounce_0 = True
....:         , bounce_1 = True
```

(continues on next page)

(continued from previous page)

```
....:     )
....: )
sage: view(PP) # not tested

sage: PP = ParallelogramPolyomino([[0, 1], [1, 0]])
sage: PP.bounce_path(direction=1)
[1]
sage: PP.bounce_path(direction=0)
[1]

sage: PP = ParallelogramPolyomino([[1], [1]])
sage: PP.bounce_path(direction=1)
[]
sage: PP.bounce_path(direction=0)
[]
```

```
>>> from sage.all import *

>>> PP.bounce_path(direction=Integer(0))
[1]

>>> PP = ParallelogramPolyomino([[Integer(1)], [Integer(1)]])
>>> PP.bounce_path(direction=Integer(1))
[]
>>> PP.bounce_path(direction=Integer(0))
[]
```

box_is_node(*pos*)

Return True if the box contains a node in the context of the Aval-Boussicault bijection between parallelogram polyomino and binary tree.

A box is a node if there is no cell on the top of the box in the same column or on the left of the box.in the same row.

INPUT:

- pos – the [x,y] coordinate of the box

OUTPUT: boolean

EXAMPLES:

```
sage: pp = ParallelogramPolyomino(
....:     [[0, 0, 1, 0, 0, 0, 1, 1], [1, 1, 0, 1, 0, 0, 0, 0]]
....: )
sage: pp.set_options(display='drawing')
sage: pp
[1 1 0]
[1 1 1]
[0 1 1]
[0 1 1]
[0 1 1]
sage: pp.box_is_node([2,1])
True
sage: pp.box_is_node([2,0])
False
sage: pp.box_is_node([1,1])
False
```

```
>>> from sage.all import *
>>> pp = ParallelogramPolyomino(
...     [[Integer(0), Integer(0), Integer(1), Integer(0), Integer(0),␣
↪Integer(0), Integer(1), Integer(1)], [Integer(1), Integer(1), Integer(0),␣
↪Integer(1), Integer(0), Integer(0), Integer(0), Integer(0)]]
... )
>>> pp.set_options(display='drawing')
```

(continues on next page)

(continued from previous page)

```
>>> pp
[1 1 0]
[1 1 1]
[0 1 1]
[0 1 1]
[0 1 1]
>>> pp.box_is_node([Integer(2),Integer(1)])
True
>>> pp.box_is_node([Integer(2),Integer(0)])
False
>>> pp.box_is_node([Integer(1),Integer(1)])
False
```

box_is_root(*box*)

Return `True` if the box contains the root of the tree : it is the top-left box of the parallelogram polyomino.

INPUT:

- `box` – the x,y coordinate of the cell

EXAMPLES:

```
sage: pp = ParallelogramPolyomino(
....:     [[0, 0, 1, 0, 0, 0, 1, 1], [1, 1, 0, 1, 0, 0, 0, 0]]
....: )
sage: pp.box_is_root([0, 0])
True
sage: pp.box_is_root([0, 1])
False
```

```
>>> from sage.all import *
>>> pp = ParallelogramPolyomino(
...     [[Integer(0), Integer(0), Integer(1), Integer(0), Integer(0),␣
↪Integer(0), Integer(1), Integer(1)], [Integer(1), Integer(1), Integer(0),␣
↪Integer(1), Integer(0), Integer(0), Integer(0), Integer(0)]]
... )
>>> pp.box_is_root([Integer(0), Integer(0)])
True
>>> pp.box_is_root([Integer(0), Integer(1)])
False
```

cell_is_inside(*w*, *h*)

Determine whether the cell at a given position is inside the parallelogram polyomino.

INPUT:

- `w` – the x coordinate of the box position
- `h` – the y coordinate of the box position

OUTPUT:

Return 0 if there is no cell at the given position, return 1 if there is a cell.

EXAMPLES:

```
sage: pp = ParallelogramPolyomino(
....:     [
....:         [0, 1, 0, 0, 1, 1, 0, 1, 1, 1],
....:         [1, 1, 1, 0, 1, 0, 0, 1, 1, 0]
....:     ]
....: )
sage: pp.cell_is_inside(0, 0)
1
sage: pp.cell_is_inside(1, 0)
1
sage: pp.cell_is_inside(0, 1)
0
sage: pp.cell_is_inside(3, 0)
0
sage: pp.cell_is_inside(pp.width()-1,pp.height()-1)

0
>>> pp.cell_is_inside(pp.width()-Integer(1),pp.height())
0
```

check()

This method raises an error if the internal data of the class does not represent a parallelogram polyomino.

EXAMPLES:

```
sage: pp = ParallelogramPolyomino(
....:     [
....:         [0, 0, 0, 1, 0, 1, 0, 1, 1],
```

degree_convexity()

Return the degree convexity of a parallelogram polyomino.

A convex polyomino is said to be k-convex if every pair of its cells can be connected by a monotone path (path with south and east steps) with at most k changes of direction. The degree of convexity of a convex polyomino P is the smallest integer k such that P is k-convex.

If the parallelogram polyomino is empty, the function return -1.

EXAMPLES:

```
sage: pp = ParallelogramPolyomino(
....:     [
....:         [0, 0, 0, 1, 0, 1, 0, 1, 1],
....:         [1, 0, 1, 1, 0, 0, 1, 0, 0]
....:     ]
....: )
sage: pp.degree_convexity()
3

sage: pp = ParallelogramPolyomino([[0, 1], [1, 0]])
sage: pp.degree_convexity()
0

sage: pp = ParallelogramPolyomino([[1], [1]])
sage: pp.degree_convexity()
-1
```

```
>>> from sage.all import *
>>> pp = ParallelogramPolyomino(
...     [
...         [Integer(0), Integer(0), Integer(0), Integer(1), Integer(0),␣
↪Integer(1), Integer(0), Integer(1), Integer(1)],
...         [Integer(1), Integer(0), Integer(1), Integer(1), Integer(0),␣
↪Integer(0), Integer(1), Integer(0), Integer(0)]
...     ]
... )
>>> pp.degree_convexity()
3

>>> pp = ParallelogramPolyomino([[Integer(0), Integer(1)], [Integer(1),␣
↪Integer(0)]])
>>> pp.degree_convexity()
0

>>> pp = ParallelogramPolyomino([[Integer(1)], [Integer(1)]])
>>> pp.degree_convexity()
-1
```

static **from_dyck_word**(*dyck*, *bijection=None*)

Convert a Dyck word to parallelogram polyomino.

INPUT:

- `dyck` – a Dyck word
- `bijection` – string or `None` (default: `None`); the bijection to use. See `to_dyck_word()` for more details.

OUTPUT: a parallelogram polyomino

EXAMPLES:

```
sage: dyck = DyckWord([1, 1, 0, 1, 1, 0, 1, 0, 0, 0])
sage: ParallelogramPolyomino.from_dyck_word(dyck)
[[0, 1, 0, 0, 1, 1], [1, 1, 1, 0, 0, 0]]
sage: ParallelogramPolyomino.from_dyck_word(dyck, bijection='Delest-Viennot')
[[0, 1, 0, 0, 1, 1], [1, 1, 1, 0, 0, 0]]
sage: ParallelogramPolyomino.from_dyck_word(dyck, bijection='Delest-Viennot-
↪beta')
[[0, 0, 1, 0, 1, 1], [1, 1, 1, 0, 0, 0]]
```

```
>>> from sage.all import *
>>> dyck = DyckWord([Integer(1), Integer(1), Integer(0), Integer(1),␣
↪Integer(1), Integer(0), Integer(1), Integer(0), Integer(0), Integer(0)])
>>> ParallelogramPolyomino.from_dyck_word(dyck)
[[0, 1, 0, 0, 1, 1], [1, 1, 1, 0, 0, 0]]
>>> ParallelogramPolyomino.from_dyck_word(dyck, bijection='Delest-Viennot')
[[0, 1, 0, 0, 1, 1], [1, 1, 1, 0, 0, 0]]
>>> ParallelogramPolyomino.from_dyck_word(dyck, bijection='Delest-Viennot-beta
↪')
[[0, 0, 1, 0, 1, 1], [1, 1, 1, 0, 0, 0]]
```

geometry()

Return a pair [h, w] containing the height and the width of the parallelogram polyomino.

EXAMPLES:

```
sage: pp = ParallelogramPolyomino(
....:     [[0, 1, 1, 1, 1], [1, 1, 1, 1, 0]]
....: )
sage: pp.geometry()
[1, 4]

sage: pp = ParallelogramPolyomino([[0, 1], [1, 0]])
sage: pp.geometry()
[1, 1]

sage: pp = ParallelogramPolyomino([[1], [1]])
sage: pp.geometry()
[0, 1]
```

```
>>> from sage.all import *
>>> pp = ParallelogramPolyomino(
...     [[Integer(0), Integer(1), Integer(1), Integer(1), Integer(1)],␣
↪[Integer(1), Integer(1), Integer(1), Integer(1), Integer(0)]]
... )
```

(continues on next page)

(continued from previous page)

```
>>> pp.geometry()
[1, 4]

>>> pp = ParallelogramPolyomino([[Integer(0), Integer(1)], [Integer(1),␣
↪Integer(0)]])
>>> pp.geometry()
[1, 1]

>>> pp = ParallelogramPolyomino([[Integer(1)], [Integer(1)]])
>>> pp.geometry()
[0, 1]
```

get_BS_nodes()

Return the list of cells containing node of the left and right planar tree in the Boussicault-Socci bijection.

EXAMPLES:

```
sage: pp = ParallelogramPolyomino(
....:     [[0, 0, 1, 0, 0, 0, 1, 1], [1, 1, 0, 1, 0, 0, 0, 0]]
....: )
sage: pp.set_options(display='drawing')
sage: pp
[1 1 0]
[1 1 1]
[0 1 1]
[0 1 1]
[0 1 1]
sage: sorted(pp.get_BS_nodes())
[[0, 1], [1, 0], [1, 2], [2, 1], [3, 1], [4, 1]]
```

```
>>> from sage.all import *
>>> pp = ParallelogramPolyomino(
...     [[Integer(0), Integer(0), Integer(1), Integer(0), Integer(0),␣
↪Integer(0), Integer(1), Integer(1)], [Integer(1), Integer(1), Integer(0),␣
↪Integer(1), Integer(0), Integer(0), Integer(0), Integer(0)]]
... )
>>> pp.set_options(display='drawing')
>>> pp
[1 1 0]
[1 1 1]
[0 1 1]
[0 1 1]
[0 1 1]
>>> sorted(pp.get_BS_nodes())
[[0, 1], [1, 0], [1, 2], [2, 1], [3, 1], [4, 1]]
```

You can draw the point inside the parallelogram polyomino by typing (the left nodes are in blue, and the right node are in red)

```
sage: pp.set_options(drawing_components=dict(tree=True))
sage: view(pp) # not tested
```

```
>>> from sage.all import *
>>> pp.set_options(drawing_components=dict(tree=True))
>>> view(pp) # not tested
```

get_array()

Return an array of 0s and 1s such that the 1s represent the boxes of the parallelogram polyomino.

EXAMPLES:

```
sage: pp = ParallelogramPolyomino(
....:     [
....:         [0, 0, 0, 0, 1, 0, 1, 0, 1],
....:         [1, 0, 0, 0, 1, 1, 0, 0, 0]
....:     ]
....: )
sage: matrix(pp.get_array())
[1 0 0]
[1 0 0]
[1 0 0]
[1 1 1]
[0 1 1]
[0 0 1]

sage: pp = ParallelogramPolyomino([[0, 1], [1, 0]])
sage: pp.get_array()
[[1]]

sage: pp = ParallelogramPolyomino([[1], [1]])
sage: pp.get_array()
[]
```

```
>>> from sage.all import *
>>> pp = ParallelogramPolyomino(
...     [
...         [Integer(0), Integer(0), Integer(0), Integer(0), Integer(1),␣
↪Integer(0), Integer(1), Integer(0), Integer(1)],
...         [Integer(1), Integer(0), Integer(0), Integer(0), Integer(1),␣
↪Integer(1), Integer(0), Integer(0), Integer(0)]
...     ]
... )
>>> matrix(pp.get_array())
[1 0 0]
[1 0 0]
[1 0 0]
[1 1 1]
[0 1 1]
[0 0 1]

>>> pp = ParallelogramPolyomino([[Integer(0), Integer(1)], [Integer(1),␣
↪Integer(0)]])
>>> pp.get_array()
[[1]]
```

(continues on next page)

(continued from previous page)

```
>>> pp = ParallelogramPolyomino([[Integer(1)], [Integer(1)]])
>>> pp.get_array()
[]
```

get_left_BS_nodes()

Return the list of cells containing node of the left planar tree in the Boussicault-Socci bijection between parallelogram polyominoes and pair of ordered trees.

OUTPUT: list of [row,column] position of cells

EXAMPLES:

```
sage: pp = ParallelogramPolyomino(
....:     [[0, 0, 1, 0, 0, 0, 1, 1], [1, 1, 0, 1, 0, 0, 0, 0]]
....: )
sage: pp.set_options(display='drawing')
sage: pp
[1 1 0]
[1 1 1]
[0 1 1]
[0 1 1]
[0 1 1]
sage: sorted(pp.get_left_BS_nodes())
[[0, 1], [2, 1], [3, 1], [4, 1]]

sage: pp = ParallelogramPolyomino(
....:     [[0, 0, 1, 0, 0, 0, 1, 1], [1, 0, 1, 1, 0, 0, 0, 0]]
....: )
sage: pp.set_options(display='drawing')
sage: pp
[1 0 0]
[1 1 1]
[0 1 1]
[0 1 1]
[0 1 1]
sage: sorted(pp.get_left_BS_nodes())
[]
```

```
>>> from sage.all import *
>>> pp = ParallelogramPolyomino(
...     [[Integer(0), Integer(0), Integer(1), Integer(0), Integer(0),␣
↪Integer(0), Integer(1), Integer(1)], [Integer(1), Integer(1), Integer(0),␣
↪Integer(1), Integer(0), Integer(0), Integer(0), Integer(0)]]
... )
>>> pp.set_options(display='drawing')
>>> pp
[1 1 0]
[1 1 1]
[0 1 1]
[0 1 1]
[0 1 1]
>>> sorted(pp.get_left_BS_nodes())
[[0, 1], [2, 1], [3, 1], [4, 1]]
```

(continues on next page)

(continued from previous page)

```
>>> pp = ParallelogramPolyomino(
...     [[Integer(0), Integer(0), Integer(1), Integer(0), Integer(0),␣
↪Integer(0), Integer(1), Integer(1)], [Integer(1), Integer(0), Integer(1),␣
↪Integer(1), Integer(0), Integer(0), Integer(0), Integer(0)]]
... )
>>> pp.set_options(display='drawing')
>>> pp
[1 0 0]
[1 1 1]
[0 1 1]
[0 1 1]
[0 1 1]
>>> sorted(pp.get_left_BS_nodes())
[]
```

You can draw the point inside the parallelogram polyomino by typing (the left nodes are in blue, and the right node are in red)

```
sage: pp.set_options(drawing_components=dict(tree=True))
sage: view(pp) # not tested
```

```
>>> from sage.all import *
>>> pp.set_options(drawing_components=dict(tree=True))
>>> view(pp) # not tested
```

get_node_position_from_box(*box_position*, *direction*, *nb_crossed_nodes=None*)

This function starts from a cell inside a parallelogram polyomino and a direction.

If `direction` is equal to 0, the function selects the column associated with the y-coordinate of `box_position` and then returns the topmost cell of the column that is on the top of `box_position` (the cell of `box_position` is included).

If `direction` is equal to 1, the function selects the row associated with the x-coordinate of `box_position` and then returns the leftmost cell of the row that is on the left of `box_position`. (the cell of `box_position` is included).

This function updates the entry of `nb_crossed_nodes`. The function increases the entry of `nb_crossed_nodes` by the number of boxes that is a node (see `box_is_node`) located on the top if `direction` is 0 (resp. on the left if `direction` is 1) of `box_position` (cell at `box_position` is excluded).

INPUT:

- `box_position` – the position of the starting cell
- `direction` – the direction (0 or 1)
- `nb_crossed_nodes` – `[0]` (default) a list containing just one integer

OUTPUT: a [row,column] position of the cell

EXAMPLES:

```
sage: pp = ParallelogramPolyomino(
....:     [[0, 0, 1, 0, 0, 0, 1, 1], [1, 0, 1, 1, 0, 0, 0, 0]]
....: )
```

(continues on next page)

(continued from previous page)

```
sage: matrix(pp.get_array())
[1 0 0]
[1 1 1]

[3, 1]
>>> l
[0]
```

get_options()

Return all the options of the object.

EXAMPLES:

```
sage: pp = ParallelogramPolyomino([[0, 1], [1, 0]])
sage: pp.get_options()
Current options for ParallelogramPolyominoes_size
  - display:            'list'
  - drawing_components: {'bounce_0': False,
 'bounce_1': False,
 'bounce_values': False,
 'diagram': True,
 'tree': False}
  - latex:              'drawing'
  - tikz_options:       {'color_bounce_0': 'red',
 'color_bounce_1': 'blue',
 'color_line': 'black',
 'color_point': 'black',
 'line_size': 1,
 'mirror': None,
 'point_size': 3.5,
 'rotation': 0,
 'scale': 1,
 'translation': [0, 0]}
```

```
>>> from sage.all import *
>>> pp = ParallelogramPolyomino([[Integer(0), Integer(1)], [Integer(1),␣
↪Integer(0)]])
>>> pp.get_options()
Current options for ParallelogramPolyominoes_size
  - display:            'list'
  - drawing_components: {'bounce_0': False,
 'bounce_1': False,
 'bounce_values': False,
 'diagram': True,
 'tree': False}
  - latex:              'drawing'
  - tikz_options:       {'color_bounce_0': 'red',
 'color_bounce_1': 'blue',
 'color_line': 'black',
 'color_point': 'black',
 'line_size': 1,
 'mirror': None,
 'point_size': 3.5,
 'rotation': 0,
 'scale': 1,
 'translation': [0, 0]}
```

get_right_BS_nodes()

Return the list of cells containing node of the right planar tree in the Boussicault-Socci bijection between parallelogram polyominoes and pair of ordered trees.

EXAMPLES:

```
sage: pp = ParallelogramPolyomino(
....:     [[0, 0, 1, 0, 0, 0, 1, 1], [1, 1, 0, 1, 0, 0, 0, 0]]
....: )
sage: pp.set_options(display='drawing')
sage: pp
[1 1 0]
[1 1 1]
[0 1 1]
[0 1 1]
[0 1 1]
sage: sorted(pp.get_right_BS_nodes())
[[1, 0], [1, 2]]

sage: pp = ParallelogramPolyomino(
....:     [[0, 0, 1, 0, 0, 0, 1, 1], [1, 0, 1, 1, 0, 0, 0, 0]]
....: )
sage: pp.set_options(display='drawing')
sage: pp
[1 0 0]
[1 1 1]
[0 1 1]
[0 1 1]
[0 1 1]
sage: sorted(pp.get_right_BS_nodes())
```

(continues on next page)

(continued from previous page)

```
[[1, 0], [1, 1], [1, 2], [2, 1], [3, 1], [4, 1]]
```

```
>>> from sage.all import *
>>> pp = ParallelogramPolyomino(
...     [[Integer(0), Integer(0), Integer(1), Integer(0), Integer(0),␣
↪Integer(0), Integer(1), Integer(1)], [Integer(1), Integer(1), Integer(0),␣
↪Integer(1), Integer(0), Integer(0), Integer(0), Integer(0)]]
... )
>>> pp.set_options(display='drawing')
>>> pp
[1 1 0]
[1 1 1]
[0 1 1]
[0 1 1]
[0 1 1]
>>> sorted(pp.get_right_BS_nodes())
[[1, 0], [1, 2]]

>>> pp = ParallelogramPolyomino(
...     [[Integer(0), Integer(0), Integer(1), Integer(0), Integer(0),␣
↪Integer(0), Integer(1), Integer(1)], [Integer(1), Integer(0), Integer(1),␣
↪Integer(1), Integer(0), Integer(0), Integer(0), Integer(0)]]
... )
>>> pp.set_options(display='drawing')
>>> pp
[1 0 0]
[1 1 1]
[0 1 1]
[0 1 1]
[0 1 1]
>>> sorted(pp.get_right_BS_nodes())
[[1, 0], [1, 1], [1, 2], [2, 1], [3, 1], [4, 1]]
```

You can draw the point inside the parallelogram polyomino by typing, (the left nodes are in blue, and the right node are in red)

```
sage: pp.set_options(drawing_components=dict(tree=True))
sage: view(pp) # not tested
```

```
>>> from sage.all import *
>>> pp.set_options(drawing_components=dict(tree=True))
>>> view(pp) # not tested
```

get_tikz_options()

Return all the tikz options permitting to draw the parallelogram polyomino.

See `LocalOption` to have more informations about the modification of those options.

EXAMPLES:

```
sage: pp = ParallelogramPolyomino([[0, 1], [1, 0]])
sage: pp.get_tikz_options()
{'color_bounce_0': 'red',
```

(continues on next page)

(continued from previous page)

```
 'color_bounce_1': 'blue',
 'color_line': 'black',
 'color_point': 'black',
 'line_size': 1,
 'mirror': None,
 'point_size': 3.5,
 'rotation': 0,
 'scale': 1,
 'translation': [0, 0]}
```

```
>>> from sage.all import *
>>> pp = ParallelogramPolyomino([[Integer(0), Integer(1)], [Integer(1),␣
↪Integer(0)]])
>>> pp.get_tikz_options()
{'color_bounce_0': 'red',
 'color_bounce_1': 'blue',
 'color_line': 'black',
 'color_point': 'black',
 'line_size': 1,
 'mirror': None,
 'point_size': 3.5,
 'rotation': 0,
 'scale': 1,
 'translation': [0, 0]}
```

height()

Return the height of the parallelogram polyomino.

EXAMPLES:

```
sage: pp = ParallelogramPolyomino(
....:     [
....:         [0, 1, 0, 0, 1, 1, 0, 1, 1, 1],
....:         [1, 1, 1, 0, 1, 0, 0, 1, 1, 0]
....:     ]
....: )
sage: pp.height()
4

sage: pp = ParallelogramPolyomino([[0, 1], [1, 0]])
sage: pp.height()
1

sage: pp = ParallelogramPolyomino([[1], [1]])
sage: pp.height()
0
```

```
>>> from sage.all import *
>>> pp = ParallelogramPolyomino(
...     [
...         [Integer(0), Integer(1), Integer(0), Integer(0), Integer(1),␣
↪Integer(1), Integer(0), Integer(1), Integer(1), Integer(1)],
```

(continues on next page)

(continued from previous page)

```
...         [Integer(1), Integer(1), Integer(1), Integer(0), Integer(1),␣
↪Integer(0), Integer(0), Integer(1), Integer(1), Integer(0)]
...     ]
... )
>>> pp.height()
4

>>> pp = ParallelogramPolyomino([[Integer(0), Integer(1)], [Integer(1),␣
↪Integer(0)]])
>>> pp.height()
1

>>> pp = ParallelogramPolyomino([[Integer(1)], [Integer(1)]])
>>> pp.height()
0
```

heights()

Return a list of heights of the parallelogram polyomino.

Namely, the parallelogram polyomino is split column by column and the method returns the list containing the sizes of the columns.

EXAMPLES:

```
sage: pp = ParallelogramPolyomino(
....:     [
....:         [0, 0, 0, 1, 0, 1, 0, 1, 1],
....:         [1, 0, 1, 1, 0, 0, 1, 0, 0]
....:     ]
....: )
sage: pp.heights()
[3, 3, 4, 2]

sage: pp = ParallelogramPolyomino([[0, 1], [1, 0]])
sage: pp.heights()
[1]

sage: pp = ParallelogramPolyomino([[1], [1]])
sage: pp.heights()
[0]
```

```
>>> from sage.all import *
>>> pp = ParallelogramPolyomino(
...     [
...         [Integer(0), Integer(0), Integer(0), Integer(1), Integer(0),␣
↪Integer(1), Integer(0), Integer(1), Integer(1)],
...         [Integer(1), Integer(0), Integer(1), Integer(1), Integer(0),␣
↪Integer(0), Integer(1), Integer(0), Integer(0)]
...     ]
... )
>>> pp.heights()
[3, 3, 4, 2]
```

(continues on next page)

(continued from previous page)

```
>>> pp = ParallelogramPolyomino([[Integer(0), Integer(1)], [Integer(1),␣
↪Integer(0)]])
>>> pp.heights()
[1]

>>> pp = ParallelogramPolyomino([[Integer(1)], [Integer(1)]])
>>> pp.heights()
[0]
```

is_flat()

Return whether the two bounce paths join together in the rightmost cell of the bottom row of P.

EXAMPLES:

```
sage: pp = ParallelogramPolyomino(
....:     [
....:         [0, 0, 0, 1, 0, 1, 0, 1, 1],
....:         [1, 0, 1, 1, 0, 0, 1, 0, 0]
....:     ]
....: )
sage: pp.is_flat()
False

sage: pp = ParallelogramPolyomino([[0, 1], [1, 0]])
sage: pp.is_flat()
True

sage: pp = ParallelogramPolyomino([[1], [1]])
sage: pp.is_flat()
True
```

```
>>> from sage.all import *
>>> pp = ParallelogramPolyomino(
...     [
...         [Integer(0), Integer(0), Integer(0), Integer(1), Integer(0),␣
↪Integer(1), Integer(0), Integer(1), Integer(1)],
...         [Integer(1), Integer(0), Integer(1), Integer(1), Integer(0),␣
↪Integer(0), Integer(1), Integer(0), Integer(0)]
...     ]
... )
>>> pp.is_flat()
False

>>> pp = ParallelogramPolyomino([[Integer(0), Integer(1)], [Integer(1),␣
↪Integer(0)]])
>>> pp.is_flat()
True

>>> pp = ParallelogramPolyomino([[Integer(1)], [Integer(1)]])
>>> pp.is_flat()
True
```

is_k_directed(k)

Return whether the Polyomino Parallelogram is k-directed.

A convex polyomino is said to be k-convex if every pair of its cells can be connected by a monotone path (path with south and east steps) with at most k changes of direction.

The degree of convexity of a convex polyomino P is the smallest integer k such that P is k-convex.

INPUT:

- `k` – nonnegative integer

EXAMPLES:

```
sage: pp = ParallelogramPolyomino(
....:     [
....:         [0, 0, 0, 1, 0, 1, 0, 1, 1],
....:         [1, 0, 1, 1, 0, 0, 1, 0, 0]
....:     ]
....: )
sage: pp.is_k_directed(3)
True
sage: pp.is_k_directed(4)
True
sage: pp.is_k_directed(5)
True
sage: pp.is_k_directed(0)
False
sage: pp.is_k_directed(1)
False
sage: pp.is_k_directed(2)
False

sage: pp = ParallelogramPolyomino([[0, 1], [1, 0]])
sage: pp.is_k_directed(0)
True
sage: pp.is_k_directed(1)
True

sage: pp = ParallelogramPolyomino([[1], [1]])
sage: pp.is_k_directed(0)
True
sage: pp.is_k_directed(1)
True
```

```
>>> from sage.all import *
>>> pp = ParallelogramPolyomino(
...     [
...         [Integer(0), Integer(0), Integer(0), Integer(1), Integer(0),
↪Integer(1), Integer(0), Integer(1), Integer(1)],
...         [Integer(1), Integer(0), Integer(1), Integer(1), Integer(0),
↪Integer(0), Integer(1), Integer(0), Integer(0)]
...     ]
... )
>>> pp.is_k_directed(Integer(3))
True
```

(continues on next page)

(continued from previous page)

```
>>> pp.is_k_directed(Integer(4))
True
>>> pp.is_k_directed(Integer(5))
True
>>> pp.is_k_directed(Integer(0))
False
>>> pp.is_k_directed(Integer(1))
False
>>> pp.is_k_directed(Integer(2))
False

>>> pp = ParallelogramPolyomino([[Integer(0), Integer(1)], [Integer(1),␣
↪Integer(0)]])
>>> pp.is_k_directed(Integer(0))
True
>>> pp.is_k_directed(Integer(1))
True

>>> pp = ParallelogramPolyomino([[Integer(1)], [Integer(1)]])
>>> pp.is_k_directed(Integer(0))
True
>>> pp.is_k_directed(Integer(1))
True
```

lower_heights()

Return the list of heights associated to each vertical step of the parallelogram polyomino's lower path.

OUTPUT: list of integers

EXAMPLES:

```
sage: ParallelogramPolyomino([[0, 1], [1, 0]]).lower_heights()
[1]
sage: ParallelogramPolyomino(
....:     [[0, 0, 1, 1, 0, 1, 1, 1], [1, 0, 1, 1, 0, 1, 1, 0]]
....: ).lower_heights()
[2, 2, 3, 3, 3]
```

```
>>> from sage.all import *
>>> ParallelogramPolyomino([[Integer(0), Integer(1)], [Integer(1),␣
↪Integer(0)]]).lower_heights()
[1]
>>> ParallelogramPolyomino(
...     [[Integer(0), Integer(0), Integer(1), Integer(1), Integer(0),␣
↪Integer(1), Integer(1), Integer(1)], [Integer(1), Integer(0), Integer(1),␣
↪Integer(1), Integer(0), Integer(1), Integer(1), Integer(0)]]
... ).lower_heights()
[2, 2, 3, 3, 3]
```

lower_path()

Get the lower path of the parallelogram polyomino.

EXAMPLES:

```
sage: lower_path = [0, 0, 1, 0, 1, 1]
sage: upper_path = [1, 1, 0, 1, 0, 0]
sage: pp = ParallelogramPolyomino([lower_path, upper_path])
sage: pp.lower_path()
[0, 0, 1, 0, 1, 1]
```

```
>>> from sage.all import *
>>> lower_path = [Integer(0), Integer(0), Integer(1), Integer(0), Integer(1),␣
↪Integer(1)]
>>> upper_path = [Integer(1), Integer(1), Integer(0), Integer(1), Integer(0),␣
↪Integer(0)]
>>> pp = ParallelogramPolyomino([lower_path, upper_path])
>>> pp.lower_path()
[0, 0, 1, 0, 1, 1]
```

lower_widths()

Return the list of widths associated to each horizontal step of the parallelogram polyomino's lower path.

OUTPUT: list of integers

EXAMPLES:

```
sage: ParallelogramPolyomino([[0, 1], [1, 0]]).lower_widths()
[0]
sage: ParallelogramPolyomino(
....:     [[0, 0, 1, 1, 0, 1, 1, 1], [1, 0, 1, 1, 0, 1, 1, 0]]
....: ).lower_widths()
[0, 0, 2]
```

```
>>> from sage.all import *
>>> ParallelogramPolyomino([[Integer(0), Integer(1)], [Integer(1),␣
↪Integer(0)]]).lower_widths()
[0]
>>> ParallelogramPolyomino(
...     [[Integer(0), Integer(0), Integer(1), Integer(1), Integer(0),␣
↪Integer(1), Integer(1), Integer(1)], [Integer(1), Integer(0), Integer(1),␣
↪Integer(1), Integer(0), Integer(1), Integer(1), Integer(0)]]
... ).lower_widths()
[0, 0, 2]
```

plot()

Return a plot of `self`.

EXAMPLES:

```
sage: pp = ParallelogramPolyomino([[0,1],[1,0]])
sage: pp.plot()                                                         #␣
↪needs sage.plot
Graphics object consisting of 4 graphics primitives
sage: pp.set_options(
....:     drawing_components=dict(
....:         diagram=True,
....:         bounce_0=True,
....:         bounce_1=True,
```

(continues on next page)

(continued from previous page)

```
....:         bounce_values=0,
....:     )
....: )
sage: pp.plot()                                                          #␣
↪needs sage.plot
Graphics object consisting of 7 graphics primitives
```

```
>>> from sage.all import *
>>> pp = ParallelogramPolyomino([[Integer(0),Integer(1)],[Integer(1),
↪Integer(0)]])
>>> pp.plot()                                                          #␣
↪needs sage.plot
Graphics object consisting of 4 graphics primitives
>>> pp.set_options(
...     drawing_components=dict(
...         diagram=True,
...         bounce_0=True,
...         bounce_1=True,
...         bounce_values=Integer(0),
...     )
... )
>>> pp.plot()                                                          #␣
↪needs sage.plot
Graphics object consisting of 7 graphics primitives
```

reflect()

Return the parallelogram polyomino obtained by switching rows and columns.

EXAMPLES:

```
sage: pp = ParallelogramPolyomino([[0,0,0,0,1,1,0,1,0,1], [1,0,1,0,0,1,1,0,0,
↪0]])
sage: pp.heights(), pp.upper_heights()
([4, 3, 2, 3], [0, 1, 3, 3])
sage: pp = pp.reflect()
sage: pp.widths(), pp.lower_widths()
([4, 3, 2, 3], [0, 1, 3, 3])

sage: pp = ParallelogramPolyomino([[0,0,0,1,1], [1,0,0,1,0]])
sage: ascii_art(pp)
*
*
**
sage: ascii_art(pp.reflect())
***
  *
```

```
>>> from sage.all import *
>>> pp = ParallelogramPolyomino([[Integer(0),Integer(0),Integer(0),Integer(0),
↪Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),Integer(1)],␣
↪[Integer(1),Integer(0),Integer(1),Integer(0),Integer(0),Integer(1),
↪Integer(1),Integer(0),Integer(0),Integer(0)]])
```

(continues on next page)

(continued from previous page)

```
>>> pp.heights(), pp.upper_heights()
([4, 3, 2, 3], [0, 1, 3, 3])
>>> pp = pp.reflect()
>>> pp.widths(), pp.lower_widths()
([4, 3, 2, 3], [0, 1, 3, 3])

>>> pp = ParallelogramPolyomino([[Integer(0),Integer(0),Integer(0),Integer(1),
↪Integer(1)], [Integer(1),Integer(0),Integer(0),Integer(1),Integer(0)]])
>>> ascii_art(pp)
*
*
**
>>> ascii_art(pp.reflect())
***
  *
```

rotate()

Return the parallelogram polyomino obtained by rotation of 180 degrees.

EXAMPLES:

```
sage: pp = ParallelogramPolyomino([[0,0,0,1,1], [1,0,0,1,0]])
sage: ascii_art(pp)
*
*
**
sage: ascii_art(pp.rotate())
**
 *
 *
```

```
>>> from sage.all import *
>>> pp = ParallelogramPolyomino([[Integer(0),Integer(0),Integer(0),Integer(1),
↪Integer(1)], [Integer(1),Integer(0),Integer(0),Integer(1),Integer(0)]])
>>> ascii_art(pp)
*
*
**
>>> ascii_art(pp.rotate())
**
 *
 *
```

set_options(**get_value*, ***set_value*)

Set new options to the object. See `LocalOptions` for more info.

EXAMPLES:

```
sage: pp = ParallelogramPolyomino(
....:     [
....:         [0, 0, 0, 0, 1, 0, 1, 0, 1],
....:         [1, 0, 0, 0, 1, 1, 0, 0, 0]
....:     ]
```

(continues on next page)

(continued from previous page)

```
....: )
sage: pp
[[0, 0, 0, 0, 1, 0, 1, 0, 1], [1, 0, 0, 0, 1, 1, 0, 0, 0]]
sage: pp.set_options(display='drawing')
sage: pp
[1 0 0]
[1 0 0]
[1 0 0]
[1 1 1]
[0 1 1]
[0 0 1]

sage: pp = ParallelogramPolyomino([[0, 1], [1, 0]])
sage: view(PP) # not tested
sage: pp.set_options(
....:     drawing_components=dict(
....:         diagram = True,
....:         bounce_0 = True,
....:         bounce_1 = True,
....:     )
....: )
sage: view(PP) # not tested
```

```
>>> from sage.all import *
>>> pp = ParallelogramPolyomino(
...     [
...         [Integer(0), Integer(0), Integer(0), Integer(0), Integer(1),␣
↪Integer(0), Integer(1), Integer(0), Integer(1)],
...         [Integer(1), Integer(0), Integer(0), Integer(0), Integer(1),␣
↪Integer(1), Integer(0), Integer(0), Integer(0)]
...     ]
... )
>>> pp
[[0, 0, 0, 0, 1, 0, 1, 0, 1], [1, 0, 0, 0, 1, 1, 0, 0, 0]]
>>> pp.set_options(display='drawing')
>>> pp
[1 0 0]
[1 0 0]
[1 0 0]
[1 1 1]
[0 1 1]
[0 0 1]

>>> pp = ParallelogramPolyomino([[Integer(0), Integer(1)], [Integer(1),␣
↪Integer(0)]])
>>> view(PP) # not tested
>>> pp.set_options(
...     drawing_components=dict(
...         diagram = True,
...         bounce_0 = True,
...         bounce_1 = True,
...     )
```

(continues on next page)

(continued from previous page)

```
... )
>>> view(PP) # not tested
```

size()

Return the size of the parallelogram polyomino.

The size of a parallelogram polyomino is its half-perimeter.

EXAMPLES:

```
sage: pp = ParallelogramPolyomino(
....:     [[0, 0, 0, 0, 1, 0, 1, 1], [1, 0, 0, 0, 1, 1, 0, 0]]
....: )
sage: pp.size()
8

sage: pp = ParallelogramPolyomino([[0, 1], [1, 0]])
sage: pp.size()
2

sage: pp = ParallelogramPolyomino([[1], [1]])
sage: pp.size()
1
```

```
>>> from sage.all import *
>>> pp = ParallelogramPolyomino(
...     [[Integer(0), Integer(0), Integer(0), Integer(0), Integer(1),␣
↪Integer(0), Integer(1), Integer(1)], [Integer(1), Integer(0), Integer(0),␣
↪Integer(0), Integer(1), Integer(1), Integer(0), Integer(0)]]
... )
>>> pp.size()
8

>>> pp = ParallelogramPolyomino([[Integer(0), Integer(1)], [Integer(1),␣
↪Integer(0)]])
>>> pp.size()
2

>>> pp = ParallelogramPolyomino([[Integer(1)], [Integer(1)]])
>>> pp.size()
1
```

to_binary_tree(*bijection=None*)

Convert to a binary tree.

INPUT:

- `bijection` – string or `None` (default: `None`); the name of bijection to use for the conversion. The possible values are `None` or `'Aval-Boussicault'`. The `None` value is equivalent to `'Aval-Boussicault'`.

EXAMPLES:

```
sage: pp = ParallelogramPolyomino(
....:     [
....:         [0, 0, 1, 0, 1, 0, 1, 0, 1, 1],
....:         [1, 1, 0, 1, 1, 0, 0, 0, 1, 0]
....:     ]
....: )
sage: pp.to_binary_tree()
[[., [[., .], [[., [., .]], .]]], [[., .], .]]

sage: pp = ParallelogramPolyomino([[0, 1], [1, 0]])
sage: pp.to_binary_tree()
[., .]

sage: pp = ParallelogramPolyomino([[1], [1]])
sage: pp.to_binary_tree()
.
```

```
>>> from sage.all import *
>>> pp = ParallelogramPolyomino(
...     [
...         [Integer(0), Integer(0), Integer(1), Integer(0), Integer(1),
↪Integer(0), Integer(1), Integer(0), Integer(1), Integer(1)],
...         [Integer(1), Integer(1), Integer(0), Integer(1), Integer(1),
↪Integer(0), Integer(0), Integer(0), Integer(1), Integer(0)]
...     ]
... )
>>> pp.to_binary_tree()
[[., [[., .], [[., [., .]], .]]], [[., .], .]]

>>> pp = ParallelogramPolyomino([[Integer(0), Integer(1)], [Integer(1),
↪Integer(0)]])
>>> pp.to_binary_tree()
[., .]

>>> pp = ParallelogramPolyomino([[Integer(1)], [Integer(1)]])
>>> pp.to_binary_tree()
.
```

to_dyck_word(*bijection=None*)

Convert to a Dyck word.

INPUT:

- `bijection` – string or `None` (default: `None`); the name of the bijection. If it is set to `None` then the `'Delest-Viennot'` bijection is used. Expected values are `None`, `'Delest-Viennot'`, or `'Delest-Viennot-beta'`.

OUTPUT: a Dyck word

EXAMPLES:

```
sage: pp = ParallelogramPolyomino([[0, 1, 0, 0, 1, 1], [1, 1, 1, 0, 0, 0]])
sage: pp.to_dyck_word()
[1, 1, 0, 1, 1, 0, 1, 0, 0, 0]
```

(continues on next page)

(continued from previous page)

```
sage: pp.to_dyck_word(bijection='Delest-Viennot')
[1, 1, 0, 1, 1, 0, 1, 0, 0, 0]

sage: pp.to_dyck_word(bijection='Delest-Viennot-beta')
[1, 0, 1, 1, 1, 0, 1, 0, 0, 0]
```

```
>>> from sage.all import *
>>> pp = ParallelogramPolyomino([[Integer(0), Integer(1), Integer(0),␣
→Integer(0), Integer(1), Integer(1)], [Integer(1), Integer(1), Integer(1),␣
→Integer(0), Integer(0), Integer(0)]])
>>> pp.to_dyck_word()
[1, 1, 0, 1, 1, 0, 1, 0, 0, 0]
>>> pp.to_dyck_word(bijection='Delest-Viennot')
[1, 1, 0, 1, 1, 0, 1, 0, 0, 0]

>>> pp.to_dyck_word(bijection='Delest-Viennot-beta')
[1, 0, 1, 1, 1, 0, 1, 0, 0, 0]
```

to_ordered_tree(*bijection=None*)

Return an ordered tree from the parallelogram polyomino.

Different bijections can be specified.

The bijection 'via dyck and Delest-Viennot' is the composition of `_to_dyck_delest_viennot()` and the classical bijection between dyck paths and ordered trees.

The bijection between Dyck Word and ordered trees is described in [DerZak1980] (See page 12 and 13 and Figure 3.1).

The bijection 'Boussicault-Socci' is described in [BRS2015].

INPUT:

- `bijection` – string or `None` (default: `None`); the name of bijection to use for the conversion. The possible value are `None`, `'Boussicault-Socci'` or `'via dyck and Delest-Viennot'`. The `None` value is equivalent to the `'Boussicault-Socci'` value.

EXAMPLES:

```
sage: pp = ParallelogramPolyomino(
....:     [
....:         [0, 0, 1, 0, 1, 0, 1, 0, 1, 1],
....:         [1, 1, 0, 1, 1, 0, 0, 0, 1, 0]
....:     ]
....: )
sage: pp.to_ordered_tree()
[[[[[]], [[[]]]]], [[]]]

sage: pp = ParallelogramPolyomino([[0, 1], [1, 0]])
sage: pp.to_ordered_tree()
[[]]

sage: pp = ParallelogramPolyomino([[1], [1]])
sage: pp.to_ordered_tree()
[]
```

(continues on next page)

(continued from previous page)

```
sage: pp = ParallelogramPolyomino(
....:     [

[[[[]], [[[]], []]], [[]]]
```

to_tikz()

Return the tikz code of the parallelogram polyomino.

This code is the code present inside a tikz latex environment.

We can modify the output with the options.

EXAMPLES:

```
sage: pp = ParallelogramPolyomino(
....:     [[0,0,0,1,1,0,1,0,0,1,1,1],[1,1,1,0,0,1,1,0,0,1,0,0]]
```

(continues on next page)

(continued from previous page)

```
....: )
sage: print(pp.to_tikz())

  \draw[color=black, line width=1] (0.000000, 6.000000) --
(0.000000, 3.000000);

  \filldraw[color=black] (0.500000, 5.500000) circle (3.5pt);
```

upper_heights()

Return the list of heights associated to each vertical step of the parallelogram polyomino's upper path.

OUTPUT: list of integers

EXAMPLES:

```
sage: ParallelogramPolyomino([[0, 1], [1, 0]]).upper_heights()
[0]
sage: ParallelogramPolyomino(
....:     [[0, 0, 1, 1, 0, 1, 1, 1], [1, 0, 1, 1, 0, 1, 1, 0]]
....: ).upper_heights()
[0, 1, 1, 2, 2]
```

```
>>> from sage.all import *
>>> ParallelogramPolyomino([[Integer(0), Integer(1)], [Integer(1),␣
↪Integer(0)]]).upper_heights()
[0]
>>> ParallelogramPolyomino(
...     [[Integer(0), Integer(0), Integer(1), Integer(1), Integer(0),␣
↪Integer(1), Integer(1), Integer(1)], [Integer(1), Integer(0), Integer(1),␣
↪Integer(1), Integer(0), Integer(1), Integer(1), Integer(0)]]
... ).upper_heights()
[0, 1, 1, 2, 2]
```

upper_path()

Get the upper path of the parallelogram polyomino.

EXAMPLES:

```
sage: lower_path = [0, 0, 1, 0, 1, 1]
sage: upper_path = [1, 1, 0, 1, 0, 0]
sage: pp = ParallelogramPolyomino([lower_path, upper_path])
sage: pp.upper_path()
[1, 1, 0, 1, 0, 0]
```

```
>>> from sage.all import *
>>> lower_path = [Integer(0), Integer(0), Integer(1), Integer(0), Integer(1),␣
↪Integer(1)]
>>> upper_path = [Integer(1), Integer(1), Integer(0), Integer(1), Integer(0),␣
↪Integer(0)]
>>> pp = ParallelogramPolyomino([lower_path, upper_path])
>>> pp.upper_path()
[1, 1, 0, 1, 0, 0]
```

upper_widths()

Return the list of widths associated to each horizontal step of the parallelogram polyomino's upper path.

OUTPUT: list of integers

EXAMPLES:

```
sage: ParallelogramPolyomino([[0, 1], [1, 0]]).upper_widths()
[1]
sage: ParallelogramPolyomino(
....:     [[0, 0, 1, 1, 0, 1, 1, 1], [1, 0, 1, 1, 0, 1, 1, 0]]
....: ).upper_widths()
[1, 3, 5]
```

```
>>> from sage.all import *
>>> ParallelogramPolyomino([[Integer(0), Integer(1)], [Integer(1),␣
↪Integer(0)]]).upper_widths()
[1]
>>> ParallelogramPolyomino(
...     [[Integer(0), Integer(0), Integer(1), Integer(1), Integer(0),␣
↪Integer(1), Integer(1), Integer(1)], [Integer(1), Integer(0), Integer(1),␣
↪Integer(1), Integer(0), Integer(1), Integer(1), Integer(0)]]
... ).upper_widths()
[1, 3, 5]
```

width()

Return the width of the parallelogram polyomino.

EXAMPLES:

```
sage: pp = ParallelogramPolyomino(
....:     [
....:         [0, 1, 0, 0, 1, 1, 0, 1, 1, 1],
....:         [1, 1, 1, 0, 1, 0, 0, 1, 1, 0]
....:     ]
....: )
sage: pp.width()
6

sage: pp = ParallelogramPolyomino([[0, 1], [1, 0]])
sage: pp.width()
1

sage: pp = ParallelogramPolyomino([[1], [1]])
sage: pp.width()
1
```

```
>>> from sage.all import *
>>> pp = ParallelogramPolyomino(
...     [
...         [Integer(0), Integer(1), Integer(0), Integer(0), Integer(1),␣
↪Integer(1), Integer(0), Integer(1), Integer(1), Integer(1)],
...         [Integer(1), Integer(1), Integer(1), Integer(0), Integer(1),␣
↪Integer(0), Integer(0), Integer(1), Integer(1), Integer(0)]
...     ]
... )
>>> pp.width()
6

>>> pp = ParallelogramPolyomino([[Integer(0), Integer(1)], [Integer(1),␣
↪Integer(0)]])
>>> pp.width()
1

>>> pp = ParallelogramPolyomino([[Integer(1)], [Integer(1)]])
>>> pp.width()
1
```

widths()

Return a list of the widths of the parallelogram polyomino.

Namely, the parallelogram polyomino is split row by row and the method returns the list containing the sizes of the rows.

EXAMPLES:

```
sage: pp = ParallelogramPolyomino(
....:     [
....:         [0, 0, 0, 1, 0, 1, 0, 1, 1],
....:         [1, 0, 1, 1, 0, 0, 1, 0, 0]
....:     ]
....: )
sage: pp.widths()
[1, 3, 3, 3, 2]

sage: pp = ParallelogramPolyomino([[0, 1], [1, 0]])
sage: pp.widths()
[1]

sage: pp = ParallelogramPolyomino([[1], [1]])
sage: pp.widths()
[]
```

```
>>> from sage.all import *
>>> pp = ParallelogramPolyomino(
...     [
...         [Integer(0), Integer(0), Integer(0), Integer(1), Integer(0),␣
↪Integer(1), Integer(0), Integer(1), Integer(1)],
...         [Integer(1), Integer(0), Integer(1), Integer(1), Integer(0),␣
↪Integer(0), Integer(1), Integer(0), Integer(0)]
...     ]
... )
>>> pp.widths()
[1, 3, 3, 3, 2]

>>> pp = ParallelogramPolyomino([[Integer(0), Integer(1)], [Integer(1),␣
↪Integer(0)]])
>>> pp.widths()
[1]

>>> pp = ParallelogramPolyomino([[Integer(1)], [Integer(1)]])
>>> pp.widths()
[]
```

sage.combinat.parallelogram_polyomino.**ParallelogramPolyominoes**(*size=None*, *policy=None*)

Return a family of parallelogram polyominoes enumerated with the parameter constraints.

INPUT:

- **size – integer (default: None); the size of the parallelogram** polyominoes contained in the family. If set to None, the family returned contains all the parallelogram polyominoes.

EXAMPLES:

```
sage: PPS = ParallelogramPolyominoes(size=4)
sage: PPS
Parallelogram polyominoes of size 4
sage: sorted(PPS)
[[[0, 0, 0, 1], [1, 0, 0, 0]],
 [[0, 0, 1, 1], [1, 0, 1, 0]],
 [[0, 0, 1, 1], [1, 1, 0, 0]],
 [[0, 1, 0, 1], [1, 1, 0, 0]],
 [[0, 1, 1, 1], [1, 1, 1, 0]]]

sage: PPS = ParallelogramPolyominoes()
sage: PPS
Parallelogram polyominoes
sage: PPS.cardinality()
+Infinity

sage: PPS = ParallelogramPolyominoes(size=None)
sage: PPS
Parallelogram polyominoes
sage: PPS.cardinality()
+Infinity
```

```
>>> from sage.all import *
>>> PPS = ParallelogramPolyominoes(size=Integer(4))
>>> PPS
Parallelogram polyominoes of size 4
>>> sorted(PPS)
[[[0, 0, 0, 1], [1, 0, 0, 0]],
 [[0, 0, 1, 1], [1, 0, 1, 0]],
 [[0, 0, 1, 1], [1, 1, 0, 0]],
 [[0, 1, 0, 1], [1, 1, 0, 0]],
 [[0, 1, 1, 1], [1, 1, 1, 0]]]

>>> PPS = ParallelogramPolyominoes()
>>> PPS
Parallelogram polyominoes
>>> PPS.cardinality()
+Infinity

>>> PPS = ParallelogramPolyominoes(size=None)
>>> PPS
Parallelogram polyominoes
>>> PPS.cardinality()
+Infinity
```

class sage.combinat.parallelogram_polyomino.**ParallelogramPolyominoesFactory**

Bases: `SetFactory`

The parallelogram polyominoes factory.

EXAMPLES:

```
sage: PPS = ParallelogramPolyominoes(size=4)
```

(continues on next page)

(continued from previous page)

```
sage: PPS
Parallelogram polyominoes of size 4

sage: sorted(PPS)
[[[0, 0, 0, 1], [1, 0, 0, 0]],
 [[0, 0, 1, 1], [1, 0, 1, 0]],
 [[0, 0, 1, 1], [1, 1, 0, 0]],
 [[0, 1, 0, 1], [1, 1, 0, 0]],
 [[0, 1, 1, 1], [1, 1, 1, 0]]]

sage: PPS = ParallelogramPolyominoes()
sage: PPS
Parallelogram polyominoes
sage: PPS.cardinality()
+Infinity
```

```
>>> from sage.all import *
>>> PPS = ParallelogramPolyominoes(size=Integer(4))
>>> PPS
Parallelogram polyominoes of size 4

>>> sorted(PPS)
[[[0, 0, 0, 1], [1, 0, 0, 0]],
 [[0, 0, 1, 1], [1, 0, 1, 0]],
 [[0, 0, 1, 1], [1, 1, 0, 0]],
 [[0, 1, 0, 1], [1, 1, 0, 0]],
 [[0, 1, 1, 1], [1, 1, 1, 0]]]

>>> PPS = ParallelogramPolyominoes()
>>> PPS
Parallelogram polyominoes
>>> PPS.cardinality()
+Infinity
```

sage.combinat.parallelogram_polyomino.**ParallelogramPolyominoesOptions = Current options for ParallelogramPolyominoes_size - display: 'list' - drawing_components: {'bounce_0': False, 'bounce_1': False, 'bounce_values': False, 'diagram': True, 'tree': False} - latex: 'drawing' - tikz_options: {'color_bounce_0': 'red', 'color_bounce_1': 'blue', 'color_line': 'black', 'color_point': 'black', 'line_size': 1, 'mirror': None, 'point_size': 3.5, 'rotation': 0, 'scale': 1, 'translation': [0, 0]}**

This global option contains all the data needed by the Parallelogram classes to draw, display in ASCII, compile in latex a parallelogram polyomino.

The available options are:

- tikz_options : this option configurate all the information useful to generate TIKZ code. For example, color, line size, etc …
- drawing_components : this option is used to explain to the system which component of the drawing you want to draw. For example, you can ask to draw some elements of the following list: - the diagram, - the tree inside the parallelogram polyomino, - the bounce paths inside the parallelogram polyomino, - the value of the bounce on each square of a bounce path.
- display : this option is used to configurate the ASCII display. The available options are: - list : (this is the

default value) is used to represent PP as a list containing the upper and lower path. - drawing : this value is used to explain we want to display an array with the PP drawn inside (with connected 1).

- latex : Same as display. The default is "drawing".

See `ParallelogramPolyomino.get_options()` for more details and for an user use of options.

EXAMPLES:

```
sage: from sage.combinat.parallelogram_polyomino import (
....:     ParallelogramPolyominoesOptions
....: )
sage: opt = ParallelogramPolyominoesOptions['tikz_options']
sage: opt
{'color_bounce_0': 'red',
 'color_bounce_1': 'blue',
 'color_line': 'black',
 'color_point': 'black',
 'line_size': 1,
 'mirror': None,
 'point_size': 3.5,
 'rotation': 0,
 'scale': 1,
 'translation': [0, 0]}
```

```
>>> from sage.all import *
>>> from sage.combinat.parallelogram_polyomino import (
...     ParallelogramPolyominoesOptions
... )
>>> opt = ParallelogramPolyominoesOptions['tikz_options']
>>> opt
{'color_bounce_0': 'red',
 'color_bounce_1': 'blue',
 'color_line': 'black',
 'color_point': 'black',
 'line_size': 1,
 'mirror': None,
 'point_size': 3.5,
 'rotation': 0,
 'scale': 1,
 'translation': [0, 0]}
```

class sage.combinat.parallelogram_polyomino.**ParallelogramPolyominoes_all**(*policy*)

Bases: `ParentWithSetFactory`, `DisjointUnionEnumeratedSets`

This class enumerates all the parallelogram polyominoes.

EXAMPLES:

```
sage: PPS = ParallelogramPolyominoes()
sage: PPS
Parallelogram polyominoes
```

```
>>> from sage.all import *
>>> PPS = ParallelogramPolyominoes()
```

(continues on next page)

(continued from previous page)

```
>>> PPS
Parallelogram polyominoes
```

check_element (*el*, *check*)

Check is a given element *el* is in the set of parallelogram polyominoes.

EXAMPLES:

```
sage: PPS = ParallelogramPolyominoes()
sage: ParallelogramPolyomino(                          # indirect doctest
....:     [[0, 1, 1], [1, 1, 0]]
....: ) in PPS
True
```

```
>>> from sage.all import *
>>> PPS = ParallelogramPolyominoes()
>>> ParallelogramPolyomino(                          # indirect doctest
...     [[Integer(0), Integer(1), Integer(1)], [Integer(1), Integer(1),␣
↪Integer(0)]]
... ) in PPS
True
```

get_options ()

Return all the options associated with the set of parallelogram polyominoes.

EXAMPLES:

```
sage: PPS = ParallelogramPolyominoes()
sage: options = PPS.get_options()
sage: options
Current options for ParallelogramPolyominoes_size
  - display:            'list'
...
```

```
>>> from sage.all import *
>>> PPS = ParallelogramPolyominoes()
>>> options = PPS.get_options()
>>> options
Current options for ParallelogramPolyominoes_size
  - display:            'list'
...
```

options = Current options for ParallelogramPolyominoes_size - display: 'list' - drawing_components: {'bounce_0': False, 'bounce_1': False, 'bounce_values': False, 'diagram': True, 'tree': False} - latex: 'drawing' - tikz_options: {'color_bounce_0': 'red', 'color_bounce_1': 'blue', 'color_line': 'black', 'color_point': 'black', 'line_size': 1, 'mirror': None, 'point_size': 3.5, 'rotation': 0, 'scale': 1, 'translation': [0, 0]}

The options for ParallelogramPolyominoes.

set_options (**get_value*, ***set_value*)

Set new options to the object.

EXAMPLES:

```
sage: PPS = ParallelogramPolyominoes()
sage: PPS.set_options(
....:     drawing_components=dict(
....:         diagram = True,
....:         bounce_0 = True,
....:         bounce_1 = True,
....:     )
....: )
sage: pp = next(iter(PPS))
sage: view(pp) # not tested
```

```
>>> from sage.all import *
>>> PPS = ParallelogramPolyominoes()
>>> PPS.set_options(
...     drawing_components=dict(
...         diagram = True,
...         bounce_0 = True,
...         bounce_1 = True,
...     )
... )
>>> pp = next(iter(PPS))
>>> view(pp) # not tested
```

class sage.combinat.parallelogram_polyomino.**ParallelogramPolyominoes_size**(*size*, *policy*)

Bases: ParentWithSetFactory, UniqueRepresentation

The parallelogram polyominoes of size n.

EXAMPLES:

```
sage: PPS = ParallelogramPolyominoes(4)
sage: PPS
Parallelogram polyominoes of size 4
sage: sorted(PPS)
[[[0, 0, 0, 1], [1, 0, 0, 0]],
 [[0, 0, 1, 1], [1, 0, 1, 0]],
 [[0, 0, 1, 1], [1, 1, 0, 0]],
 [[0, 1, 0, 1], [1, 1, 0, 0]],
 [[0, 1, 1, 1], [1, 1, 1, 0]]]
```

```
>>> from sage.all import *
>>> PPS = ParallelogramPolyominoes(Integer(4))
>>> PPS
Parallelogram polyominoes of size 4
>>> sorted(PPS)
[[[0, 0, 0, 1], [1, 0, 0, 0]],
 [[0, 0, 1, 1], [1, 0, 1, 0]],
 [[0, 0, 1, 1], [1, 1, 0, 0]],
 [[0, 1, 0, 1], [1, 1, 0, 0]],
 [[0, 1, 1, 1], [1, 1, 1, 0]]]
```

an_element()

Return an element of a parallelogram polyomino of a given size.

EXAMPLES:

```
sage: PPS = ParallelogramPolyominoes(4)
sage: PPS.an_element() in PPS
True
```

```
>>> from sage.all import *
>>> PPS = ParallelogramPolyominoes(Integer(4))
>>> PPS.an_element() in PPS
True
```

cardinality()

Return the number of parallelogram polyominoes.

The number of parallelogram polyominoes of size n is given by the Catalan number c_{n-1}.

EXAMPLES:

```
sage: ParallelogramPolyominoes(1).cardinality()
1
sage: ParallelogramPolyominoes(2).cardinality()
1
sage: ParallelogramPolyominoes(3).cardinality()
2
sage: ParallelogramPolyominoes(4).cardinality()
5

sage: all(
....:     ParallelogramPolyominoes(i).cardinality()
....:     == len(list(ParallelogramPolyominoes(i)))
....:     for i in range(1,7)
....: )
True
```

```
>>> from sage.all import *
>>> ParallelogramPolyominoes(Integer(1)).cardinality()
1
>>> ParallelogramPolyominoes(Integer(2)).cardinality()
1
>>> ParallelogramPolyominoes(Integer(3)).cardinality()
2
>>> ParallelogramPolyominoes(Integer(4)).cardinality()
5

>>> all(
...     ParallelogramPolyominoes(i).cardinality()
...     == len(list(ParallelogramPolyominoes(i)))
...     for i in range(Integer(1),Integer(7))
... )
True
```

check_element(*el*, *check*)

Check is a given element *el* is in the set of parallelogram polyominoes of a fixed size.

EXAMPLES:

```
sage: PPS = ParallelogramPolyominoes(3)
sage: ParallelogramPolyomino(                        # indirect doctest
....:     [[0, 1, 1], [1, 1, 0]]
....: ) in PPS
True
```

```
>>> from sage.all import *
>>> PPS = ParallelogramPolyominoes(Integer(3))
>>> ParallelogramPolyomino(                        # indirect doctest
...     [[Integer(0), Integer(1), Integer(1)], [Integer(1), Integer(1),␣
↪Integer(0)]]
... ) in PPS
True
```

get_options()

Return all the options associated with all the elements of the set of parallelogram polyominoes with a fixed size.

EXAMPLES:

```
sage: pps = ParallelogramPolyominoes(5)
sage: pps.get_options()
Current options for ParallelogramPolyominoes_size
  - display:            'list'
...
```

```
>>> from sage.all import *
>>> pps = ParallelogramPolyominoes(Integer(5))
>>> pps.get_options()
Current options for ParallelogramPolyominoes_size
  - display:            'list'
...
```

options = Current options for ParallelogramPolyominoes_size - display: 'list' - drawing_components: {'bounce_0': False, 'bounce_1': False, 'bounce_values': False, 'diagram': True, 'tree': False} - latex: 'drawing' - tikz_options: {'color_bounce_0': 'red', 'color_bounce_1': 'blue', 'color_line': 'black', 'color_point': 'black', 'line_size': 1, 'mirror': None, 'point_size': 3.5, 'rotation': 0, 'scale': 1, 'translation': [0, 0]}

The options for ParallelogramPolyominoes.

set_options(**get_value*, ***set_value*)

Set new options to the object.

EXAMPLES:

```
sage: PPS = ParallelogramPolyominoes(3)
sage: PPS.set_options(
....:     drawing_components=dict(
....:         diagram = True,
....:         bounce_0 = True,
....:         bounce_1 = True,
....:     )
```

(continues on next page)

(continued from previous page)

```
....: )
sage: pp = PPS[0]
sage: view(pp) # not tested
```

```
>>> from sage.all import *
>>> PPS = ParallelogramPolyominoes(Integer(3))
>>> PPS.set_options(
...     drawing_components=dict(
...         diagram = True,
...         bounce_0 = True,
...         bounce_1 = True,
...     )
... )
>>> pp = PPS[Integer(0)]
>>> view(pp) # not tested
```

size()

Return the size of the parallelogram polyominoes generated by this parent.

EXAMPLES:

```
sage: ParallelogramPolyominoes(0).size()
0
sage: ParallelogramPolyominoes(1).size()
1
sage: ParallelogramPolyominoes(5).size()
5
```

```
>>> from sage.all import *
>>> ParallelogramPolyominoes(Integer(0)).size()
0
>>> ParallelogramPolyominoes(Integer(1)).size()
1
>>> ParallelogramPolyominoes(Integer(5)).size()
5
```

sage.combinat.parallelogram_polyomino.**default_tikz_options = {'color_bounce_0': 'red', 'color_bounce_1': 'blue', 'color_line': 'black', 'color_point': 'black', 'line_size': 1, 'mirror': None, 'point_size': 3.5, 'rotation': 0, 'scale': 1, 'translation': [0, 0]}**

This is the default TIKZ options.

This option is used to configurate element of a drawing to allow TIKZ code generation.

5.1.158 Parking Functions

INFORMALLY (reference [Beck]):

Imagine a one-way cul-de-sac with n parking spots. We will give the first parking spot the number 1, the next one number 2, etc., down to the last one, number n. Initially they are all free, but there are n cars approaching the street, and they would all like to park there. To make life interesting, every car has a parking preference, and we record the preferences in a sequence; For example, if $n = 3$, the sequence $(2, 1, 1)$ means that the first car would like to park at spot number 2, the second car prefers parking spot number 1, and the last car would also like to part at number 1. The street is very narrow, so there is no way to back up. Now each car enters the street and approaches its preferred parking spot; if it is free, it parks there, and if not, it moves down the street to the first available spot. We call a sequence a parking function (of length n) if all cars end up finding a parking spot. For example, the sequence $(2, 1, 1)$ is a parking sequence (of length 3), whereas the sequence $(2, 3, 2)$ is not.

FORMALLY:

A parking function of size n is a sequence $(a_1, \ldots, a_n)$ of positive integers such that if $b_1 \leq b_2 \leq \cdots \leq b_n$ is the increasing rearrangement of $a_1, \ldots, a_n$, then $b_i \leq i$.

A parking function of size n is a pair (L, D) of two sequences L and D where L is a permutation and D is an area sequence of a Dyck path of size n such that $D[i] \geq 0$, $D[i+1] \leq D[i]+1$ and if $D[i+1] = D[i]+1$ then $L[i+1] > L[i]$.

The number of parking functions of size n is equal to the number of rooted forests on n vertices and is equal to $(n+1)^{n-1}$.

`sage.combinat.parking_functions.`**`PF`**

alias of `ParkingFunction`

class `sage.combinat.parking_functions.`**`ParkingFunction`**(*parent*, *lst*)

Bases: `ClonableArray`

A Parking Function.

A *parking function* of size n is a sequence $(a_1, \ldots, a_n)$ of positive integers such that if $b_1 \leq b_2 \leq \cdots \leq b_n$ is the increasing rearrangement of $a_1, \ldots, a_n$, then $b_i \leq i$.

A *parking function* of size n is a pair (L, D) of two sequences L and D where L is a permutation and D is an area sequence of a Dyck Path of size n such that $D[i] \geq 0$, $D[i+1] \leq D[i]+1$ and if $D[i+1] = D[i]+1$ then $L[i+1] > L[i]$.

The number of parking functions of size n is equal to the number of rooted forests on n vertices and is equal to $(n+1)^{n-1}$.

INPUT:

- `pf` – (default: `None`) a list whose increasing rearrangement satisfies $b_i \leq i$
- `labelling` – (default: `None`) a labelling of the Dyck path
- `area_sequence` – (default: `None`) an area sequence of a Dyck path
- `labelled_dyck_word` – (default: `None`) a Dyck word with 1s replaced by labelling

OUTPUT: a parking function

EXAMPLES:

```
sage: ParkingFunction([])
[]
sage: ParkingFunction([1])
[1]
sage: ParkingFunction([2])
Traceback (most recent call last):
...
ValueError: [2] is not a parking function
```

(continues on next page)

(continued from previous page)

```
sage: ParkingFunction([1,2])
[1, 2]
sage: ParkingFunction([1,1,2])
[1, 1, 2]
sage: ParkingFunction([1,4,1])
Traceback (most recent call last):
...
ValueError: [1, 4, 1] is not a parking function
sage: ParkingFunction(labelling=[3,1,2], area_sequence=[0,0,1])
[2, 2, 1]
sage: ParkingFunction([2,2,1]).to_labelled_dyck_word()
[3, 0, 1, 2, 0, 0]
sage: ParkingFunction(labelled_dyck_word=[3,0,1,2,0,0])
[2, 2, 1]
sage: ParkingFunction(labelling=[3,1,2], area_sequence=[0,1,1])
Traceback (most recent call last):
...
ValueError: [3, 1, 2] is not a valid labeling of area sequence [0, 1, 1]
```

```
>>> from sage.all import *
>>> ParkingFunction([])
[]
>>> ParkingFunction([Integer(1)])
[1]
>>> ParkingFunction([Integer(2)])
Traceback (most recent call last):
...
ValueError: [2] is not a parking function
>>> ParkingFunction([Integer(1),Integer(2)])
[1, 2]
>>> ParkingFunction([Integer(1),Integer(1),Integer(2)])
[1, 1, 2]
>>> ParkingFunction([Integer(1),Integer(4),Integer(1)])
Traceback (most recent call last):
...
ValueError: [1, 4, 1] is not a parking function
>>> ParkingFunction(labelling=[Integer(3),Integer(1),Integer(2)], area_
↪sequence=[Integer(0),Integer(0),Integer(1)])
[2, 2, 1]
>>> ParkingFunction([Integer(2),Integer(2),Integer(1)]).to_labelled_dyck_word()
[3, 0, 1, 2, 0, 0]
>>> ParkingFunction(labelled_dyck_word=[Integer(3),Integer(0),Integer(1),
↪Integer(2),Integer(0),Integer(0)])
[2, 2, 1]
>>> ParkingFunction(labelling=[Integer(3),Integer(1),Integer(2)], area_
↪sequence=[Integer(0),Integer(1),Integer(1)])
Traceback (most recent call last):
...
ValueError: [3, 1, 2] is not a valid labeling of area sequence [0, 1, 1]
```

area()

Return the area of the labelled Dyck path corresponding to the parking function.

OUTPUT:

- the sum of squares under and over the main diagonal the Dyck Path, corresponding to the parking function

EXAMPLES:

```
sage: PF = ParkingFunction([6, 1, 5, 2, 2, 1, 5])
sage: PF.area()
6
```

```
>>> from sage.all import *
>>> PF = ParkingFunction([Integer(6), Integer(1), Integer(5), Integer(2),␣
↪Integer(2), Integer(1), Integer(5)])
>>> PF.area()
6
```

```
sage: ParkingFunction([3,1,1,4]).area()
1
sage: ParkingFunction([4,1,1,1]).area()
3
sage: ParkingFunction([2,1,4,1]).area()
2
```

```
>>> from sage.all import *
>>> ParkingFunction([Integer(3),Integer(1),Integer(1),Integer(4)]).area()
1
>>> ParkingFunction([Integer(4),Integer(1),Integer(1),Integer(1)]).area()
3
>>> ParkingFunction([Integer(2),Integer(1),Integer(4),Integer(1)]).area()
2
```

cars_permutation()

Return the sequence of cars that take parking spots 1 through n and corresponding to the parking function.

For example, `cars_permutation(PF) = [2, 4, 5, 6, 3, 1, 7]` means that car 2 takes spots 1, car 4 takes spot 2, …, car 1 takes spot 6 and car 7 takes spot 7.

OUTPUT:

- the permutation of cars corresponding to the parking function and which is the same size as parking function

EXAMPLES:

```
sage: PF = ParkingFunction([6, 1, 5, 2, 2, 1, 5])
sage: PF.cars_permutation()
[2, 4, 5, 6, 3, 1, 7]
```

```
>>> from sage.all import *
>>> PF = ParkingFunction([Integer(6), Integer(1), Integer(5), Integer(2),␣
↪Integer(2), Integer(1), Integer(5)])
>>> PF.cars_permutation()
[2, 4, 5, 6, 3, 1, 7]
```

```
sage: ParkingFunction([3,1,1,4]).cars_permutation()
[2, 3, 1, 4]
sage: ParkingFunction([4,1,1,1]).cars_permutation()
[2, 3, 4, 1]
sage: ParkingFunction([2,1,4,1]).cars_permutation()
[2, 1, 4, 3]
```

```
>>> from sage.all import *
>>> ParkingFunction([Integer(3),Integer(1),Integer(1),Integer(4)]).cars_
↪permutation()
[2, 3, 1, 4]
>>> ParkingFunction([Integer(4),Integer(1),Integer(1),Integer(1)]).cars_
↪permutation()
[2, 3, 4, 1]
>>> ParkingFunction([Integer(2),Integer(1),Integer(4),Integer(1)]).cars_
↪permutation()
[2, 1, 4, 3]
```

characteristic_quasisymmetric_function(*q=None*, *R=Fraction Field of Multivariate Polynomial Ring in q, t over Rational Field*)

Return the characteristic quasisymmetric function of `self`.

The characteristic function of the Parking Function is the sum over all permutation labellings of the Dyck path $q^{dinv(PF)} F_{ides(PF)}$ where $ides(PF)$ (`ides_composition()`) is the descent composition of diagonal reading word of the parking function.

INPUT:

- `q` – (default: `q = R('q')`) a parameter for the generating function power
- `R` – (default: `R = QQ['q','t'].fraction_field()`) the base ring to do the calculations over

OUTPUT: an element of the quasisymmetric functions over the ring `R`

EXAMPLES:

```
sage: # needs sage.modules
sage: R = QQ['q','t'].fraction_field()
sage: (q,t) = R.gens()
sage: cqf = sum(t**PF.area() * PF.characteristic_quasisymmetric_function()
....:           for PF in ParkingFunctions(3)); cqf
(q^3+q^2*t+q*t^2+t^3+q*t)*F[1, 1, 1] + (q^2+q*t+t^2+q+t)*F[1, 2]
 + (q^2+q*t+t^2+q+t)*F[2, 1] + F[3]
sage: s = SymmetricFunctions(R).s()
sage: s(cqf.to_symmetric_function())
(q^3+q^2*t+q*t^2+t^3+q*t)*s[1, 1, 1] + (q^2+q*t+t^2+q+t)*s[2, 1] + s[3]
sage: s(cqf.to_symmetric_function()).nabla(power=-1)
s[1, 1, 1]
```

```
>>> from sage.all import *
>>> # needs sage.modules
>>> R = QQ['q','t'].fraction_field()
>>> (q,t) = R.gens()
>>> cqf = sum(t**PF.area() * PF.characteristic_quasisymmetric_function()
...           for PF in ParkingFunctions(Integer(3))); cqf
```

(continues on next page)

(continued from previous page)

```
(q^3+q^2*t+q*t^2+t^3+q*t)*F[1, 1, 1] + (q^2+q*t+t^2+q+t)*F[1, 2]
 + (q^2+q*t+t^2+q+t)*F[2, 1] + F[3]
>>> s = SymmetricFunctions(R).s()
>>> s(cqf.to_symmetric_function())
(q^3+q^2*t+q*t^2+t^3+q*t)*s[1, 1, 1] + (q^2+q*t+t^2+q+t)*s[2, 1] + s[3]
>>> s(cqf.to_symmetric_function()).nabla(power=-Integer(1))
s[1, 1, 1]
```

```
sage: p = ParkingFunction([3, 1, 2])
sage: p.characteristic_quasisymmetric_function()                          #␣
↪needs sage.modules
q*F[2, 1]
sage: pf = ParkingFunction([1,2,7,2,1,2,3,2,1])
sage: pf.characteristic_quasisymmetric_function()                         #␣
↪needs sage.modules
q^2*F[1, 1, 1, 2, 1, 3]
```

```
>>> from sage.all import *
>>> p = ParkingFunction([Integer(3), Integer(1), Integer(2)])
>>> p.characteristic_quasisymmetric_function()                          #␣
↪needs sage.modules
q*F[2, 1]
>>> pf = ParkingFunction([Integer(1),Integer(2),Integer(7),Integer(2),
↪Integer(1),Integer(2),Integer(3),Integer(2),Integer(1)])
>>> pf.characteristic_quasisymmetric_function()                         #␣
↪needs sage.modules
q^2*F[1, 1, 1, 2, 1, 3]
```

check()

Check that `self` is a valid parking function.

EXAMPLES:

```
sage: PF = ParkingFunction([1, 1, 2, 2, 5, 6])
sage: PF.check()
```

```
>>> from sage.all import *
>>> PF = ParkingFunction([Integer(1), Integer(1), Integer(2), Integer(2),␣
↪Integer(5), Integer(6)])
>>> PF.check()
```

diagonal_composition()

Return the composition of the labelled Dyck path corresponding to the parking function.

For example, `touch_composition(PF) = [4, 3]` means that the first touch is four diagonal units from the starting point, and the second is three units further (see [GXZ] p. 2).

OUTPUT:

- the length between the corresponding touch points which of the labelled Dyck path that corresponds to the parking function

EXAMPLES:

```
sage: PF = ParkingFunction([6, 1, 5, 2, 2, 1, 5])
sage: PF.touch_composition()
[4, 3]
```

```
>>> from sage.all import *
>>> PF = ParkingFunction([Integer(6), Integer(1), Integer(5), Integer(2),␣
↪Integer(2), Integer(1), Integer(5)])
>>> PF.touch_composition()
[4, 3]
```

```
sage: ParkingFunction([3,1,1,4]).touch_composition()
[2, 1, 1]
sage: ParkingFunction([4,1,1,1]).touch_composition()
[3, 1]
sage: ParkingFunction([2,1,4,1]).touch_composition()
[3, 1]
```

```
>>> from sage.all import *
>>> ParkingFunction([Integer(3),Integer(1),Integer(1),Integer(4)]).touch_
↪composition()
[2, 1, 1]
>>> ParkingFunction([Integer(4),Integer(1),Integer(1),Integer(1)]).touch_
↪composition()
[3, 1]
>>> ParkingFunction([Integer(2),Integer(1),Integer(4),Integer(1)]).touch_
↪composition()
[3, 1]
```

diagonal_reading_word()

Return a diagonal word of the labelled Dyck path corresponding to parking function (see [Hag08] p. 75).

OUTPUT:

- returns a word, read diagonally from NE to SW of the pretty print of the labelled Dyck path that corresponds to `self` and the same size as `self`

EXAMPLES:

```
sage: PF = ParkingFunction([6, 1, 5, 2, 2, 1, 5])
sage: PF.diagonal_reading_word()
[5, 1, 7, 4, 6, 3, 2]
```

```
>>> from sage.all import *
>>> PF = ParkingFunction([Integer(6), Integer(1), Integer(5), Integer(2),␣
↪Integer(2), Integer(1), Integer(5)])
>>> PF.diagonal_reading_word()
[5, 1, 7, 4, 6, 3, 2]
```

```
sage: ParkingFunction([1, 1, 1]).diagonal_reading_word()
[3, 2, 1]
sage: ParkingFunction([1, 2, 3]).diagonal_reading_word()
[3, 2, 1]
```

(continues on next page)

(continued from previous page)

```
sage: ParkingFunction([1, 1, 3, 4]).diagonal_reading_word()
[2, 4, 3, 1]
```

```
>>> from sage.all import *

```

```
sage: ParkingFunction([1, 1, 1]).diagonal_word()
[3, 2, 1]
sage: ParkingFunction([1, 2, 3]).diagonal_word()
[3, 2, 1]
sage: ParkingFunction([1, 4, 3, 1]).diagonal_word()
[4, 2, 3, 1]
```

```
>>> from sage.all import *
>>> ParkingFunction([Integer(1), Integer(1), Integer(1)]).diagonal_word()
[3, 2, 1]
>>> ParkingFunction([Integer(1), Integer(2), Integer(3)]).diagonal_word()
[3, 2, 1]
>>> ParkingFunction([Integer(1), Integer(4), Integer(3), Integer(1)]).
↪diagonal_word()
[4, 2, 3, 1]
```

diagonal_word()

Return a diagonal word of the labelled Dyck path corresponding to parking function (see [Hag08] p. 75).

OUTPUT:

- returns a word, read diagonally from NE to SW of the pretty print of the labelled Dyck path that corresponds to `self` and the same size as `self`

EXAMPLES:

```
sage: PF = ParkingFunction([6, 1, 5, 2, 2, 1, 5])
sage: PF.diagonal_reading_word()
[5, 1, 7, 4, 6, 3, 2]
```

```
>>> from sage.all import *
>>> PF = ParkingFunction([Integer(6), Integer(1), Integer(5), Integer(2),␣
↪Integer(2), Integer(1), Integer(5)])
>>> PF.diagonal_reading_word()
[5, 1, 7, 4, 6, 3, 2]
```

```
sage: ParkingFunction([1, 1, 1]).diagonal_reading_word()
[3, 2, 1]
```

(continues on next page)

(continued from previous page)

```
sage: ParkingFunction([1, 2, 3]).diagonal_reading_word()
[3, 2, 1]
sage: ParkingFunction([1, 1, 3, 4]).diagonal_reading_word()
[2, 4, 3, 1]
```

```
>>> from sage.all import *
>>> ParkingFunction([Integer(1), Integer(1), Integer(1)]).diagonal_reading_
↪word()
[3, 2, 1]
>>> ParkingFunction([Integer(1), Integer(2), Integer(3)]).diagonal_reading_
↪word()
[3, 2, 1]
>>> ParkingFunction([Integer(1), Integer(1), Integer(3), Integer(4)]).
↪diagonal_reading_word()
[2, 4, 3, 1]
```

```
sage: ParkingFunction([1, 1, 1]).diagonal_word()
[3, 2, 1]
sage: ParkingFunction([1, 2, 3]).diagonal_word()
[3, 2, 1]
sage: ParkingFunction([1, 4, 3, 1]).diagonal_word()
[4, 2, 3, 1]
```

```
>>> from sage.all import *
>>> ParkingFunction([Integer(1), Integer(1), Integer(1)]).diagonal_word()
[3, 2, 1]
>>> ParkingFunction([Integer(1), Integer(2), Integer(3)]).diagonal_word()
[3, 2, 1]
>>> ParkingFunction([Integer(1), Integer(4), Integer(3), Integer(1)]).
↪diagonal_word()
[4, 2, 3, 1]
```

dinv()

Return the number of inversions of a labelled Dyck path corresponding to the parking function (see [Hag08] p. 74).

Same as the cardinality of *dinversion_pairs()*.

OUTPUT: the number of dinversion pairs

EXAMPLES:

```
sage: PF = ParkingFunction([6, 1, 5, 2, 2, 1, 5])
sage: PF.dinv()
6
```

```
>>> from sage.all import *
>>> PF = ParkingFunction([Integer(6), Integer(1), Integer(5), Integer(2),␣
↪Integer(2), Integer(1), Integer(5)])
>>> PF.dinv()
6
```

```
sage: ParkingFunction([3,1,1,4]).dinv()
3
sage: ParkingFunction([4,1,1,1]).dinv()
1
sage: ParkingFunction([2,1,4,1]).dinv()
2
```

```
>>> from sage.all import *
>>> ParkingFunction([Integer(3),Integer(1),Integer(1),Integer(4)]).dinv()
3
>>> ParkingFunction([Integer(4),Integer(1),Integer(1),Integer(1)]).dinv()
1
>>> ParkingFunction([Integer(2),Integer(1),Integer(4),Integer(1)]).dinv()
2
```

dinversion_pairs()

Return the descent inversion pairs of a labelled Dyck path corresponding to the parking function.

OUTPUT: the primary and secondary diversion pairs

EXAMPLES:

```
sage: PF = ParkingFunction([6, 1, 5, 2, 2, 1, 5])
sage: PF.dinversion_pairs()
[(0, 4), (1, 5), (2, 5), (1, 4), (2, 4), (3, 6)]
```

```
>>> from sage.all import *
>>> PF = ParkingFunction([Integer(6), Integer(1), Integer(5), Integer(2),␣
↪Integer(2), Integer(1), Integer(5)])
>>> PF.dinversion_pairs()
[(0, 4), (1, 5), (2, 5), (1, 4), (2, 4), (3, 6)]
```

```
sage: ParkingFunction([3,1,1,4]).dinversion_pairs()
[(0, 3), (2, 3), (1, 2)]
sage: ParkingFunction([4,1,1,1]).dinversion_pairs()
[(1, 3)]
sage: ParkingFunction([2,1,4,1]).dinversion_pairs()
[(0, 3), (1, 3)]
```

```
>>> from sage.all import *
>>> ParkingFunction([Integer(3),Integer(1),Integer(1),Integer(4)]).dinversion_
↪pairs()
[(0, 3), (2, 3), (1, 2)]
>>> ParkingFunction([Integer(4),Integer(1),Integer(1),Integer(1)]).dinversion_
↪pairs()
[(1, 3)]
>>> ParkingFunction([Integer(2),Integer(1),Integer(4),Integer(1)]).dinversion_
↪pairs()
[(0, 3), (1, 3)]
```

grade()

Return the length of the parking function.

EXAMPLES:

```
sage: PF = ParkingFunction([1, 1, 2, 2, 5, 6])
sage: PF.grade()
6
```

```
>>> from sage.all import *
>>> PF = ParkingFunction([Integer(1), Integer(1), Integer(2), Integer(2),␣
↪Integer(5), Integer(6)])
>>> PF.grade()
6
```

ides()

Return the *descents()* sequence of the inverse of the *diagonal_reading_word()* of self.

> **Warning**
>
> Here we use the standard convention that descent labels start at 1. This behaviour has been changed in Issue #20555.

For example, ides(PF) = [2, 3, 4, 6] means that descents are at the 2nd, 3rd, 4th and 6th positions in the inverse of the *diagonal_reading_word()* of the parking function (see [GXZ] p. 2).

OUTPUT:

- the descents sequence of the inverse of the *diagonal_reading_word()* of the parking function

EXAMPLES:

```
sage: PF = ParkingFunction([6, 1, 5, 2, 2, 1, 5])
sage: PF.ides()
[2, 3, 4, 6]
```

```
>>> from sage.all import *
>>> PF = ParkingFunction([Integer(6), Integer(1), Integer(5), Integer(2),␣
↪Integer(2), Integer(1), Integer(5)])
>>> PF.ides()
[2, 3, 4, 6]
```

```
sage: ParkingFunction([3,1,1,4]).ides()
[2]
sage: ParkingFunction([4,1,1,1]).ides()
[2, 3]
sage: ParkingFunction([4,3,1,1]).ides()
[3]
```

```
>>> from sage.all import *
>>> ParkingFunction([Integer(3),Integer(1),Integer(1),Integer(4)]).ides()
[2]
>>> ParkingFunction([Integer(4),Integer(1),Integer(1),Integer(1)]).ides()
[2, 3]
>>> ParkingFunction([Integer(4),Integer(3),Integer(1),Integer(1)]).ides()
[3]
```

ides_composition()

Return the *descents_composition()* of the inverse of the *diagonal_reading_word()* of corresponding parking function.

For example, `ides_composition(PF) = [4, 2, 1]` means that the descents of the inverse of the permutation *diagonal_reading_word()* of the parking function with word `PF` are at the 4th and 6th positions.

OUTPUT:

- the descents composition of the inverse of the *diagonal_reading_word()* of the parking function

EXAMPLES:

```
sage: PF = ParkingFunction([6, 1, 5, 2, 2, 1, 5])
sage: PF.ides_composition()
[2, 1, 1, 2, 1]
```

```
>>> from sage.all import *
>>> PF = ParkingFunction([Integer(6), Integer(1), Integer(5), Integer(2),␣
↪Integer(2), Integer(1), Integer(5)])
>>> PF.ides_composition()
[2, 1, 1, 2, 1]
```

```
sage: ParkingFunction([3,1,1,4]).ides_composition()
[2, 2]
sage: ParkingFunction([4,1,1,1]).ides_composition()
[2, 1, 1]
sage: ParkingFunction([4,3,1,1]).ides_composition()
[3, 1]
```

```
>>> from sage.all import *
>>> ParkingFunction([Integer(3),Integer(1),Integer(1),Integer(4)]).ides_
↪composition()
[2, 2]
>>> ParkingFunction([Integer(4),Integer(1),Integer(1),Integer(1)]).ides_
↪composition()
[2, 1, 1]
>>> ParkingFunction([Integer(4),Integer(3),Integer(1),Integer(1)]).ides_
↪composition()
[3, 1]
```

jump()

Return the sum of the differences between the parked and preferred parking spots.

See [Shin] p. 18.

OUTPUT:

- the sum of the differences between the parked and preferred parking spots

EXAMPLES:

```
sage: PF = ParkingFunction([6, 1, 5, 2, 2, 1, 5])
sage: PF.jump()
6
```

```
>>> from sage.all import *
>>> PF = ParkingFunction([Integer(6), Integer(1), Integer(5), Integer(2),␣
↪Integer(2), Integer(1), Integer(5)])
>>> PF.jump()
6
```

```
sage: ParkingFunction([3,1,1,4]).jump()
1
sage: ParkingFunction([4,1,1,1]).jump()
3
sage: ParkingFunction([2,1,4,1]).jump()
2
```

```
>>> from sage.all import *
>>> ParkingFunction([Integer(3),Integer(1),Integer(1),Integer(4)]).jump()
1
>>> ParkingFunction([Integer(4),Integer(1),Integer(1),Integer(1)]).jump()
3
>>> ParkingFunction([Integer(2),Integer(1),Integer(4),Integer(1)]).jump()
2
```

jump_list()

Return the displacements of cars that corresponds to the parking function.

For example, `jump_list(PF) = [0, 0, 0, 0, 1, 3, 2]` means that car 1 through 4 parked in their preferred spots, car 5 had to park one spot farther (jumped or was displaced by one spot), car 6 had to jump 3 spots, and car 7 had to jump two spots.

OUTPUT:

- the displacements sequence of parked cars which corresponds to the parking function and which is the same size as parking function

EXAMPLES:

```
sage: PF = ParkingFunction([6, 1, 5, 2, 2, 1, 5])
sage: PF.jump_list()
[0, 0, 0, 0, 1, 3, 2]
```

```
>>> from sage.all import *
>>> PF = ParkingFunction([Integer(6), Integer(1), Integer(5), Integer(2),␣
↪Integer(2), Integer(1), Integer(5)])
>>> PF.jump_list()
[0, 0, 0, 0, 1, 3, 2]
```

```
sage: ParkingFunction([3,1,1,4]).jump_list()
[0, 0, 1, 0]
sage: ParkingFunction([4,1,1,1]).jump_list()
[0, 0, 1, 2]
sage: ParkingFunction([2,1,4,1]).jump_list()
[0, 0, 0, 2]
```

```
>>> from sage.all import *
>>> ParkingFunction([Integer(3),Integer(1),Integer(1),Integer(4)]).jump_list()
[0, 0, 1, 0]
>>> ParkingFunction([Integer(4),Integer(1),Integer(1),Integer(1)]).jump_list()
[0, 0, 1, 2]
>>> ParkingFunction([Integer(2),Integer(1),Integer(4),Integer(1)]).jump_list()
[0, 0, 0, 2]
```

luck()

Return the number of cars that parked in their preferred parking spots (see [Shin] p. 33).

OUTPUT: the number of cars that parked in their preferred parking spots

EXAMPLES:

```
sage: PF = ParkingFunction([6, 1, 5, 2, 2, 1, 5])
sage: PF.luck()
4
```

```
>>> from sage.all import *
>>> PF = ParkingFunction([Integer(6), Integer(1), Integer(5), Integer(2),␣
↪Integer(2), Integer(1), Integer(5)])
>>> PF.luck()
4
```

```
sage: ParkingFunction([3,1,1,4]).luck()
3
sage: ParkingFunction([4,1,1,1]).luck()
2
sage: ParkingFunction([2,1,4,1]).luck()
3
```

```
>>> from sage.all import *
>>> ParkingFunction([Integer(3),Integer(1),Integer(1),Integer(4)]).luck()
3
>>> ParkingFunction([Integer(4),Integer(1),Integer(1),Integer(1)]).luck()
2
>>> ParkingFunction([Integer(2),Integer(1),Integer(4),Integer(1)]).luck()
3
```

lucky_cars()

Return the cars that can park in their preferred spots. For example, `lucky_cars(PF) = [1, 2, 7]` means that cars 1, 2 and 7 parked in their preferred spots and all the other cars did not.

OUTPUT: the cars that can park in their preferred spots

EXAMPLES:

```
sage: PF = ParkingFunction([6, 1, 5, 2, 2, 1, 5])
sage: PF.lucky_cars()
[1, 2, 3, 4]
```

```
>>> from sage.all import *
>>> PF = ParkingFunction([Integer(6), Integer(1), Integer(5), Integer(2),␣
↪Integer(2), Integer(1), Integer(5)])
>>> PF.lucky_cars()
[1, 2, 3, 4]
```

```
sage: ParkingFunction([3,1,1,4]).lucky_cars()
[1, 2, 4]
sage: ParkingFunction([4,1,1,1]).lucky_cars()
[1, 2]
sage: ParkingFunction([2,1,4,1]).lucky_cars()
[1, 2, 3]
```

```
>>> from sage.all import *
>>> ParkingFunction([Integer(3),Integer(1),Integer(1),Integer(4)]).lucky_
↪cars()
[1, 2, 4]
>>> ParkingFunction([Integer(4),Integer(1),Integer(1),Integer(1)]).lucky_
↪cars()
[1, 2]
>>> ParkingFunction([Integer(2),Integer(1),Integer(4),Integer(1)]).lucky_
↪cars()
[1, 2, 3]
```

parking_permutation()

Return the sequence of parking spots that are taken by cars 1 through n and corresponding to the parking function.

For example, `parking_permutation(PF) = [6, 1, 5, 2, 3, 4, 7]` means that spot 6 is taken by car 1, spot 1 by car 2, spot 5 by car 3, spot 2 is taken by car 4, spot 3 is taken by car 5, spot 4 is taken by car 6 and spot 7 is taken by car 7.

OUTPUT:

- the permutation of parking spots that corresponds to the parking function and which is the same size as parking function

EXAMPLES:

```
sage: PF = ParkingFunction([6, 1, 5, 2, 2, 1, 5])
sage: PF.parking_permutation()
[6, 1, 5, 2, 3, 4, 7]
```

```
>>> from sage.all import *
>>> PF = ParkingFunction([Integer(6), Integer(1), Integer(5), Integer(2),␣
↪Integer(2), Integer(1), Integer(5)])
>>> PF.parking_permutation()
[6, 1, 5, 2, 3, 4, 7]
```

```
sage: ParkingFunction([3,1,1,4]).parking_permutation()
[3, 1, 2, 4]
sage: ParkingFunction([4,1,1,1]).parking_permutation()
[4, 1, 2, 3]
```

(continues on next page)

(continued from previous page)

```
sage: ParkingFunction([2,1,4,1]).parking_permutation()
[2, 1, 4, 3]
```

```
>>> from sage.all import *
>>> ParkingFunction([Integer(3),Integer(1),Integer(1),Integer(4)]).parking_
↪permutation()
[3, 1, 2, 4]
>>> ParkingFunction([Integer(4),Integer(1),Integer(1),Integer(1)]).parking_
↪permutation()
[4, 1, 2, 3]
>>> ParkingFunction([Integer(2),Integer(1),Integer(4),Integer(1)]).parking_
↪permutation()
[2, 1, 4, 3]
```

pretty_print(*underpath=True*)

Displays a parking function as a lattice path consisting of a Dyck path and a labelling with the labels displayed along the edges of the Dyck path.

INPUT:

- `underpath` – if the length of the parking function is less than or equal to 9 then display the labels under the path if `underpath` is `True` otherwise display them to the right of the path (default: `True`)

EXAMPLES:

```
sage: PF = ParkingFunction([6, 1, 5, 2, 2, 1, 5])
sage: PF.pretty_print()
           ___
         _|1x
        |7x   .
  ______|3 . .
 |5x x   . . .
_|4x   . . . .
|6x   . . . . .
|2 . . . . . .

sage: PF = ParkingFunction([6, 1, 5, 2, 2, 1, 5])
sage: PF.pretty_print(underpath = false)
           ___
         _| x   1
        | x   . 7
  ______|   . . 3
 | x x   . . . 5
_| x   . . . . 4
| x   . . . . . 6
|   . . . . . . 2
```

```
>>> from sage.all import *
>>> PF = ParkingFunction([Integer(6), Integer(1), Integer(5), Integer(2),␣
↪Integer(2), Integer(1), Integer(5)])
>>> PF.pretty_print()
           ___
         _|1x
```

(continues on next page)

(continued from previous page)

```
        |7x  .
   _____|3 . .
  |5x x  . . .
 _|4x  . . . .
|6x  . . . . .
|2 . . . . . .

>>> PF = ParkingFunction([Integer(6), Integer(1), Integer(5), Integer(2),
↪Integer(2), Integer(1), Integer(5)])
>>> PF.pretty_print(underpath = false)
           ___
         _| x  1
        | x  . 7
   _____|  . . 3
  | x x  . . . 5
 _| x  . . . . 4
| x  . . . . . 6
|  . . . . . . 2
```

```
sage: ParkingFunction([3, 1, 1, 4]).pretty_print()
       _
     _|4
 ___|1 .
|3x  . .
|2 . . .

sage: ParkingFunction([1,1,1]).pretty_print()
 _____
|3x x
|2x  .
|1 . .

sage: ParkingFunction([4,1,1,1]).pretty_print()
       _
 _____|1
|4x x  .
|3x  . .
|2 . . .

sage: ParkingFunction([2,1,4,1]).pretty_print()
       _
   ___|3
 _|1x  .
|4x  . .
|2 . . .

sage: ParkingFunction([2,1,4,1]).pretty_print(underpath = false)
       _
   ___|  3
 _| x  . 1
| x  . . 4
|  . . . 2
```

(continues on next page)

(continued from previous page)

```
sage: pf = ParkingFunction([1,2,3,7,3,2,1,2,3,2,1])
sage: pf.pretty_print()
             _________
     _______| x x x x   4
    | x x x x x x x  .  9
    | x x x x x x  . .  5
   _| x x x x x  . . .  3

```

primary_dinversion_pairs()

Return the primary descent inversion pairs of a labelled Dyck path corresponding to the parking function.

OUTPUT:

The pairs (i, j) such that $i < j$, and i-th area = j-th area, and i-th label < j-th label

EXAMPLES:

```
sage: PF = ParkingFunction([6, 1, 5, 2, 2, 1, 5])
sage: PF.primary_dinversion_pairs()
[(0, 4), (1, 5), (2, 5)]
```

```
>>> from sage.all import *
>>> PF = ParkingFunction([Integer(6), Integer(1), Integer(5), Integer(2),␣
↪Integer(2), Integer(1), Integer(5)])
>>> PF.primary_dinversion_pairs()
[(0, 4), (1, 5), (2, 5)]
```

```
sage: ParkingFunction([3,1,1,4]).primary_dinversion_pairs()
[(0, 3), (2, 3)]
sage: ParkingFunction([4,1,1,1]).primary_dinversion_pairs()
[]
sage: ParkingFunction([2,1,4,1]).primary_dinversion_pairs()
[(0, 3)]
```

```
>>> from sage.all import *
>>> ParkingFunction([Integer(3),Integer(1),Integer(1),Integer(4)]).primary_
↪dinversion_pairs()
[(0, 3), (2, 3)]
>>> ParkingFunction([Integer(4),Integer(1),Integer(1),Integer(1)]).primary_
↪dinversion_pairs()
[]
```

(continues on next page)

(continued from previous page)

```
>>> ParkingFunction([Integer(2),Integer(1),Integer(4),Integer(1)]).primary_
↪dinversion_pairs()
[(0, 3)]
```

secondary_dinversion_pairs()

Return the secondary descent inversion pairs of a labelled Dyck path corresponding to the parking function.

OUTPUT:

The pairs (i, j) such that $i < j$, and i-th area = j-th area +1, and i-th label > j-th label

EXAMPLES:

```
sage: PF = ParkingFunction([6, 1, 5, 2, 2, 1, 5])
sage: PF.secondary_dinversion_pairs()
[(1, 4), (2, 4), (3, 6)]
```

```
>>> from sage.all import *
>>> PF = ParkingFunction([Integer(6), Integer(1), Integer(5), Integer(2),␣
↪Integer(2), Integer(1), Integer(5)])
>>> PF.secondary_dinversion_pairs()
[(1, 4), (2, 4), (3, 6)]
```

```
sage: ParkingFunction([3,1,1,4]).secondary_dinversion_pairs()
[(1, 2)]
sage: ParkingFunction([4,1,1,1]).secondary_dinversion_pairs()
[(1, 3)]
sage: ParkingFunction([2,1,4,1]).secondary_dinversion_pairs()
[(1, 3)]
```

```
>>> from sage.all import *
>>> ParkingFunction([Integer(3),Integer(1),Integer(1),Integer(4)]).secondary_
↪dinversion_pairs()
[(1, 2)]
>>> ParkingFunction([Integer(4),Integer(1),Integer(1),Integer(1)]).secondary_
↪dinversion_pairs()
[(1, 3)]
>>> ParkingFunction([Integer(2),Integer(1),Integer(4),Integer(1)]).secondary_
↪dinversion_pairs()
[(1, 3)]
```

to_NonDecreasingParkingFunction()

Return the non-decreasing parking function which underlies the parking function.

OUTPUT: a sorted parking function

See also

NonDecreasingParkingFunction()

EXAMPLES:

```
sage: PF = ParkingFunction([6, 1, 5, 2, 2, 1, 5])
sage: PF.to_NonDecreasingParkingFunction()
[1, 1, 2, 2, 5, 5, 6]
```

```
>>> from sage.all import *
>>> PF = ParkingFunction([Integer(6), Integer(1), Integer(5), Integer(2),␣
↪Integer(2), Integer(1), Integer(5)])
>>> PF.to_NonDecreasingParkingFunction()
[1, 1, 2, 2, 5, 5, 6]
```

```
sage: ParkingFunction([3,1,1,4]).to_NonDecreasingParkingFunction()
[1, 1, 3, 4]
sage: ParkingFunction([4,1,1,1]).to_NonDecreasingParkingFunction()
[1, 1, 1, 4]
sage: ParkingFunction([2,1,4,1]).to_NonDecreasingParkingFunction()
[1, 1, 2, 4]
sage: ParkingFunction([4,1,2,1]).to_NonDecreasingParkingFunction()
[1, 1, 2, 4]
```

```
>>> from sage.all import *
>>> ParkingFunction([Integer(3),Integer(1),Integer(1),Integer(4)]).to_
↪NonDecreasingParkingFunction()
[1, 1, 3, 4]
>>> ParkingFunction([Integer(4),Integer(1),Integer(1),Integer(1)]).to_
↪NonDecreasingParkingFunction()
[1, 1, 1, 4]
>>> ParkingFunction([Integer(2),Integer(1),Integer(4),Integer(1)]).to_
↪NonDecreasingParkingFunction()
[1, 1, 2, 4]
>>> ParkingFunction([Integer(4),Integer(1),Integer(2),Integer(1)]).to_
↪NonDecreasingParkingFunction()
[1, 1, 2, 4]
```

to_area_sequence()

Return the area sequence of the support Dyck path of the parking function.

OUTPUT: the area sequence of the Dyck path

EXAMPLES:

```
sage: PF = ParkingFunction([6, 1, 5, 2, 2, 1, 5])
sage: PF.to_area_sequence()
[0, 1, 1, 2, 0, 1, 1]
```

```
>>> from sage.all import *
>>> PF = ParkingFunction([Integer(6), Integer(1), Integer(5), Integer(2),␣
↪Integer(2), Integer(1), Integer(5)])
>>> PF.to_area_sequence()
[0, 1, 1, 2, 0, 1, 1]
```

```
sage: ParkingFunction([3,1,1,4]).to_area_sequence()
[0, 1, 0, 0]
```

(continues on next page)

(continued from previous page)

```
sage: ParkingFunction([4,1,1,1]).to_area_sequence()
[0, 1, 2, 0]
sage: ParkingFunction([2,1,4,1]).to_area_sequence()
[0, 1, 1, 0]
```

```
>>> from sage.all import *
>>> ParkingFunction([Integer(3),Integer(1),Integer(1),Integer(4)]).to_area_
↪sequence()
[0, 1, 0, 0]
>>> ParkingFunction([Integer(4),Integer(1),Integer(1),Integer(1)]).to_area_
↪sequence()
[0, 1, 2, 0]
>>> ParkingFunction([Integer(2),Integer(1),Integer(4),Integer(1)]).to_area_
↪sequence()
[0, 1, 1, 0]
```

to_dyck_word()

Return the support Dyck word of the parking function.

OUTPUT: the Dyck word of the corresponding parking function

See also

DyckWord()

EXAMPLES:

```
sage: PF = ParkingFunction([6, 1, 5, 2, 2, 1, 5])
sage: PF.to_dyck_word()
[1, 1, 0, 1, 1, 0, 0, 0, 1, 1, 0, 1, 0, 0]
```

```
>>> from sage.all import *
>>> PF = ParkingFunction([Integer(6), Integer(1), Integer(5), Integer(2),␣
↪Integer(2), Integer(1), Integer(5)])
>>> PF.to_dyck_word()
[1, 1, 0, 1, 1, 0, 0, 0, 1, 1, 0, 1, 0, 0]
```

```
sage: ParkingFunction([3,1,1,4]).to_dyck_word()
[1, 1, 0, 0, 1, 0, 1, 0]
sage: ParkingFunction([4,1,1,1]).to_dyck_word()
[1, 1, 1, 0, 0, 0, 1, 0]
sage: ParkingFunction([2,1,4,1]).to_dyck_word()
[1, 1, 0, 1, 0, 0, 1, 0]
```

```
>>> from sage.all import *
>>> ParkingFunction([Integer(3),Integer(1),Integer(1),Integer(4)]).to_dyck_
↪word()
[1, 1, 0, 0, 1, 0, 1, 0]
>>> ParkingFunction([Integer(4),Integer(1),Integer(1),Integer(1)]).to_dyck_
↪word()
```

(continues on next page)

(continued from previous page)

```
[1, 1, 1, 0, 0, 0, 1, 0]
>>> ParkingFunction([Integer(2),Integer(1),Integer(4),Integer(1)]).to_dyck_
↪word()
[1, 1, 0, 1, 0, 0, 1, 0]
```

to_labelled_dyck_word()

Return the labelled Dyck word corresponding to the parking function.

This is a representation of the parking function as a list where the entries of 1 in the Dyck word are replaced with the corresponding label.

OUTPUT:

- the labelled Dyck word of the corresponding parking function which is twice the size of parking function word

EXAMPLES:

```
sage: PF = ParkingFunction([6, 1, 5, 2, 2, 1, 5])
sage: PF.to_labelled_dyck_word()
[2, 6, 0, 4, 5, 0, 0, 0, 3, 7, 0, 1, 0, 0]
```

```
>>> from sage.all import *
>>> PF = ParkingFunction([Integer(6), Integer(1), Integer(5), Integer(2),␣
↪Integer(2), Integer(1), Integer(5)])
>>> PF.to_labelled_dyck_word()
[2, 6, 0, 4, 5, 0, 0, 0, 3, 7, 0, 1, 0, 0]
```

```
sage: ParkingFunction([3,1,1,4]).to_labelled_dyck_word()
[2, 3, 0, 0, 1, 0, 4, 0]
sage: ParkingFunction([4,1,1,1]).to_labelled_dyck_word()
[2, 3, 4, 0, 0, 0, 1, 0]
sage: ParkingFunction([2,1,4,1]).to_labelled_dyck_word()
[2, 4, 0, 1, 0, 0, 3, 0]
```

```
>>> from sage.all import *
>>> ParkingFunction([Integer(3),Integer(1),Integer(1),Integer(4)]).to_
↪labelled_dyck_word()
[2, 3, 0, 0, 1, 0, 4, 0]
>>> ParkingFunction([Integer(4),Integer(1),Integer(1),Integer(1)]).to_
↪labelled_dyck_word()
[2, 3, 4, 0, 0, 0, 1, 0]
>>> ParkingFunction([Integer(2),Integer(1),Integer(4),Integer(1)]).to_
↪labelled_dyck_word()
[2, 4, 0, 1, 0, 0, 3, 0]
```

to_labelling_area_sequence_pair()

Return a pair consisting of a labelling and an area sequence of a Dyck path which corresponds to the given parking function.

OUTPUT:

- returns a pair `(L, D)` where `L` is a labelling and `D` is the area sequence of the underlying Dyck path

EXAMPLES:

```
sage: PF = ParkingFunction([6, 1, 5, 2, 2, 1, 5])
sage: PF.to_labelling_area_sequence_pair()
([2, 6, 4, 5, 3, 7, 1], [0, 1, 1, 2, 0, 1, 1])
```

```
>>> from sage.all import *
>>> PF = ParkingFunction([Integer(6), Integer(1), Integer(5), Integer(2),␣
↪Integer(2), Integer(1), Integer(5)])
>>> PF.to_labelling_area_sequence_pair()
([2, 6, 4, 5, 3, 7, 1], [0, 1, 1, 2, 0, 1, 1])
```

```
sage: ParkingFunction([1, 1, 1]).to_labelling_area_sequence_pair()
([1, 2, 3], [0, 1, 2])
sage: ParkingFunction([1, 2, 3]).to_labelling_area_sequence_pair()
([1, 2, 3], [0, 0, 0])
sage: ParkingFunction([1, 1, 2]).to_labelling_area_sequence_pair()
([1, 2, 3], [0, 1, 1])
sage: ParkingFunction([1, 1, 3, 1]).to_labelling_area_sequence_pair()
([1, 2, 4, 3], [0, 1, 2, 1])
```

```
>>> from sage.all import *
>>> ParkingFunction([Integer(1), Integer(1), Integer(1)]).to_labelling_area_
↪sequence_pair()
([1, 2, 3], [0, 1, 2])
>>> ParkingFunction([Integer(1), Integer(2), Integer(3)]).to_labelling_area_
↪sequence_pair()
([1, 2, 3], [0, 0, 0])
>>> ParkingFunction([Integer(1), Integer(1), Integer(2)]).to_labelling_area_
↪sequence_pair()
([1, 2, 3], [0, 1, 1])
>>> ParkingFunction([Integer(1), Integer(1), Integer(3), Integer(1)]).to_
↪labelling_area_sequence_pair()
([1, 2, 4, 3], [0, 1, 2, 1])
```

to_labelling_dyck_word_pair()

Return the pair `(L, D)` where `L` is a labelling and `D` is the Dyck word of the parking function.

OUTPUT:

- the pair `(L, D)`, where `L` is the labelling and `D` is the Dyck word of the parking function

See also

DyckWord()

EXAMPLES:

```
sage: PF = ParkingFunction([6, 1, 5, 2, 2, 1, 5])
sage: PF.to_labelling_dyck_word_pair()
([2, 6, 4, 5, 3, 7, 1], [1, 1, 0, 1, 1, 0, 0, 0, 1, 1, 0, 1, 0, 0])
```

```
>>> from sage.all import *
>>> PF = ParkingFunction([Integer(6), Integer(1), Integer(5), Integer(2),␣
```

(continues on next page)

(continued from previous page)

```
↪Integer(2), Integer(1), Integer(5)])
>>> PF.to_labelling_dyck_word_pair()
([2, 6, 4, 5, 3, 7, 1], [1, 1, 0, 1, 1, 0, 0, 0, 1, 1, 0, 1, 0, 0])
```

```
sage: ParkingFunction([3,1,1,4]).to_labelling_dyck_word_pair()
([2, 3, 1, 4], [1, 1, 0, 0, 1, 0, 1, 0])
sage: ParkingFunction([4,1,1,1]).to_labelling_dyck_word_pair()
([2, 3, 4, 1], [1, 1, 1, 0, 0, 0, 1, 0])
sage: ParkingFunction([2,1,4,1]).to_labelling_dyck_word_pair()
([2, 4, 1, 3], [1, 1, 0, 1, 0, 0, 1, 0])
```

```
>>> from sage.all import *
>>> ParkingFunction([Integer(3),Integer(1),Integer(1),Integer(4)]).to_
↪labelling_dyck_word_pair()
([2, 3, 1, 4], [1, 1, 0, 0, 1, 0, 1, 0])
>>> ParkingFunction([Integer(4),Integer(1),Integer(1),Integer(1)]).to_
↪labelling_dyck_word_pair()
([2, 3, 4, 1], [1, 1, 1, 0, 0, 0, 1, 0])
>>> ParkingFunction([Integer(2),Integer(1),Integer(4),Integer(1)]).to_
↪labelling_dyck_word_pair()
([2, 4, 1, 3], [1, 1, 0, 1, 0, 0, 1, 0])
```

to_labelling_permutation()

Return the labelling of the support Dyck path of the parking function.

OUTPUT: the labelling of the Dyck path

EXAMPLES:

```
sage: PF = ParkingFunction([6, 1, 5, 2, 2, 1, 5])
sage: PF.to_labelling_permutation()
[2, 6, 4, 5, 3, 7, 1]
```

```
>>> from sage.all import *
>>> PF = ParkingFunction([Integer(6), Integer(1), Integer(5), Integer(2),␣
↪Integer(2), Integer(1), Integer(5)])
>>> PF.to_labelling_permutation()
[2, 6, 4, 5, 3, 7, 1]
```

```
sage: ParkingFunction([3,1,1,4]).to_labelling_permutation()
[2, 3, 1, 4]
sage: ParkingFunction([4,1,1,1]).to_labelling_permutation()
[2, 3, 4, 1]
sage: ParkingFunction([2,1,4,1]).to_labelling_permutation()
[2, 4, 1, 3]
```

```
>>> from sage.all import *
>>> ParkingFunction([Integer(3),Integer(1),Integer(1),Integer(4)]).to_
↪labelling_permutation()
[2, 3, 1, 4]
>>> ParkingFunction([Integer(4),Integer(1),Integer(1),Integer(1)]).to_
↪labelling_permutation()
```

(continues on next page)

(continued from previous page)

```
[2, 3, 4, 1]
>>> ParkingFunction([Integer(2),Integer(1),Integer(4),Integer(1)]).to_
↪labelling_permutation()
[2, 4, 1, 3]
```

touch_composition()

Return the composition of the labelled Dyck path corresponding to the parking function.

For example, `touch_composition(PF) = [4, 3]` means that the first touch is four diagonal units from the starting point, and the second is three units further (see [GXZ] p. 2).

OUTPUT:

- the length between the corresponding touch points which of the labelled Dyck path that corresponds to the parking function

EXAMPLES:

```
sage: PF = ParkingFunction([6, 1, 5, 2, 2, 1, 5])
sage: PF.touch_composition()
[4, 3]
```

```
>>> from sage.all import *
>>> PF = ParkingFunction([Integer(6), Integer(1), Integer(5), Integer(2),␣
↪Integer(2), Integer(1), Integer(5)])
>>> PF.touch_composition()
[4, 3]
```

```
sage: ParkingFunction([3,1,1,4]).touch_composition()
[2, 1, 1]
sage: ParkingFunction([4,1,1,1]).touch_composition()
[3, 1]
sage: ParkingFunction([2,1,4,1]).touch_composition()
[3, 1]
```

```
>>> from sage.all import *
>>> ParkingFunction([Integer(3),Integer(1),Integer(1),Integer(4)]).touch_
↪composition()
[2, 1, 1]
>>> ParkingFunction([Integer(4),Integer(1),Integer(1),Integer(1)]).touch_
↪composition()
[3, 1]
>>> ParkingFunction([Integer(2),Integer(1),Integer(4),Integer(1)]).touch_
↪composition()
[3, 1]
```

touch_points()

Return the sequence of touch points which corresponds to the labelled Dyck path after initial step.

For example, `touch_points(PF) = [4, 7]` means that after the initial step, the path touches the main diagonal at points $(4, 4)$ and $(7, 7)$.

OUTPUT:

- the sequence of touch points after the initial step of the labelled Dyck path that corresponds to the parking function

EXAMPLES:

```
sage: PF = ParkingFunction([6, 1, 5, 2, 2, 1, 5])
sage: PF.touch_points()
[4, 7]
```

```
>>> from sage.all import *
>>> PF = ParkingFunction([Integer(6), Integer(1), Integer(5), Integer(2),␣
↪Integer(2), Integer(1), Integer(5)])
>>> PF.touch_points()
[4, 7]
```

```
sage: ParkingFunction([3,1,1,4]).touch_points()
[2, 3, 4]
sage: ParkingFunction([4,1,1,1]).touch_points()
[3, 4]
sage: ParkingFunction([2,1,4,1]).touch_points()
[3, 4]
```

```
>>> from sage.all import *
>>> ParkingFunction([Integer(3),Integer(1),Integer(1),Integer(4)]).touch_
↪points()
[2, 3, 4]
>>> ParkingFunction([Integer(4),Integer(1),Integer(1),Integer(1)]).touch_
↪points()
[3, 4]
>>> ParkingFunction([Integer(2),Integer(1),Integer(4),Integer(1)]).touch_
↪points()
[3, 4]
```

class sage.combinat.parking_functions.**ParkingFunctions**

Bases: UniqueRepresentation, Parent

Return the combinatorial class of Parking Functions.

A *parking function* of size n is a sequence $(a_1, \ldots, a_n)$ of positive integers such that if $b_1 \leq b_2 \leq \cdots \leq b_n$ is the increasing rearrangement of $a_1, \ldots, a_n$, then $b_i \leq i$.

A *parking function* of size n is a pair (L, D) of two sequences L and D where L is a permutation and D is an area sequence of a Dyck Path of size n such that $D[i] \geq 0$, $D[i+1] \leq D[i] + 1$ and if $D[i+1] = D[i] + 1$ then $L[i+1] > L[i]$.

The number of parking functions of size n is equal to the number of rooted forests on n vertices and is equal to $(n+1)^{n-1}$.

EXAMPLES:

Here are all parking functions of size 3:

```
sage: from sage.combinat.parking_functions import ParkingFunctions
sage: ParkingFunctions(3).list()
[[1, 1, 1], [1, 1, 2], [1, 2, 1], [2, 1, 1], [1, 1, 3], [1, 3, 1],
```

(continues on next page)

(continued from previous page)

```
 [3, 1, 1], [1, 2, 2], [2, 1, 2], [2, 2, 1], [1, 2, 3], [1, 3, 2],
 [2, 1, 3], [2, 3, 1], [3, 1, 2], [3, 2, 1]]
```

```
>>> from sage.all import *
>>> from sage.combinat.parking_functions import ParkingFunctions
>>> ParkingFunctions(Integer(3)).list()
[[1, 1, 1], [1, 1, 2], [1, 2, 1], [2, 1, 1], [1, 1, 3], [1, 3, 1],
 [3, 1, 1], [1, 2, 2], [2, 1, 2], [2, 2, 1], [1, 2, 3], [1, 3, 2],
 [2, 1, 3], [2, 3, 1], [3, 1, 2], [3, 2, 1]]
```

If no size is specified, then ParkingFunctions returns the combinatorial class of all parking functions.

```
sage: PF = ParkingFunctions(); PF
Parking functions
sage: [] in PF
True
sage: [1] in PF
True
sage: [2] in PF
False
sage: [1,3,1] in PF
True
sage: [1,4,1] in PF
False
```

```
>>> from sage.all import *
>>> PF = ParkingFunctions(); PF
Parking functions
>>> [] in PF
True
>>> [Integer(1)] in PF
True
>>> [Integer(2)] in PF
False
>>> [Integer(1),Integer(3),Integer(1)] in PF
True
>>> [Integer(1),Integer(4),Integer(1)] in PF
False
```

If the size n is specified, then ParkingFunctions returns the combinatorial class of all parking functions of size n.

```
sage: PF = ParkingFunctions(0)
sage: PF.list()
[[]]
sage: PF = ParkingFunctions(1)
sage: PF.list()
[[1]]
sage: PF = ParkingFunctions(3)
sage: PF.list()
[[1, 1, 1], [1, 1, 2], [1, 2, 1], [2, 1, 1], [1, 1, 3],
 [1, 3, 1], [3, 1, 1], [1, 2, 2], [2, 1, 2], [2, 2, 1],
 [1, 2, 3], [1, 3, 2], [2, 1, 3], [2, 3, 1], [3, 1, 2], [3, 2, 1]]
```

```
>>> from sage.all import *
>>> PF = ParkingFunctions(Integer(0))
>>> PF.list()
[[]]
>>> PF = ParkingFunctions(Integer(1))
>>> PF.list()
[[1]]

```

class sage.combinat.parking_functions.**ParkingFunctions_all**

Bases: *ParkingFunctions*

Element

alias of *ParkingFunction*

graded_component(*n*)

Return the graded component.

EXAMPLES:

```
sage: PF = ParkingFunctions()
sage: PF.graded_component(4) == ParkingFunctions(4)
True
sage: it = iter(ParkingFunctions()) # indirect doctest
sage: [next(it) for i in range(8)]
[[], [1], [1, 1], [1, 2], [2, 1], [1, 1, 1], [1, 1, 2], [1, 2, 1]]
```

```
>>> from sage.all import *
>>> PF = ParkingFunctions()
>>> PF.graded_component(Integer(4)) == ParkingFunctions(Integer(4))
True
>>> it = iter(ParkingFunctions()) # indirect doctest
>>> [next(it) for i in range(Integer(8))]
[[], [1], [1, 1], [1, 2], [2, 1], [1, 1, 1], [1, 1, 2], [1, 2, 1]]
```

class sage.combinat.parking_functions.**ParkingFunctions_n**(*n*)

Bases: *ParkingFunctions*

The combinatorial class of parking functions of size n.

A *parking function* of size n is a sequence $(a_1, \ldots, a_n)$ of positive integers such that if $b_1 \leq b_2 \leq \cdots \leq b_n$ is the increasing rearrangement of $a_1, \ldots, a_n$, then $b_i \leq i$.

A *parking function* of size n is a pair (L, D) of two sequences L and D where L is a permutation and D is an area sequence of a Dyck Path of size n such that $D[i] \geq 0$, $D[i+1] \leq D[i]+1$ and if $D[i+1] = D[i]+1$ then $L[i+1] > L[i]$.

The number of parking functions of size n is equal to the number of rooted forests on n vertices and is equal to $(n+1)^{n-1}$.

EXAMPLES:

```
sage: PF = ParkingFunctions(3)
sage: PF.list()
[[1, 1, 1], [1, 1, 2], [1, 2, 1], [2, 1, 1], [1, 1, 3],
[1, 3, 1], [3, 1, 1], [1, 2, 2], [2, 1, 2], [2, 2, 1],
[1, 2, 3], [1, 3, 2], [2, 1, 3], [2, 3, 1], [3, 1, 2], [3, 2, 1]]

sage: [ParkingFunctions(i).cardinality() for i in range(6)]
[1, 1, 3, 16, 125, 1296]
```

```
>>> from sage.all import *
>>> PF = ParkingFunctions(Integer(3))
>>> PF.list()
[[1, 1, 1], [1, 1, 2], [1, 2, 1], [2, 1, 1], [1, 1, 3],
[1, 3, 1], [3, 1, 1], [1, 2, 2], [2, 1, 2], [2, 2, 1],
[1, 2, 3], [1, 3, 2], [2, 1, 3], [2, 3, 1], [3, 1, 2], [3, 2, 1]]

>>> [ParkingFunctions(i).cardinality() for i in range(Integer(6))]
[1, 1, 3, 16, 125, 1296]
```

Warning

The precise order in which the parking function are generated or listed is not fixed, and may change in the future.

Element

alias of *ParkingFunction*

cardinality()

Return the number of parking functions of size `n`.

The cardinality is equal to $(n+1)^{n-1}$.

EXAMPLES:

```
sage: [ParkingFunctions(i).cardinality() for i in range(6)]
[1, 1, 3, 16, 125, 1296]
```

```
>>> from sage.all import *
>>> [ParkingFunctions(i).cardinality() for i in range(Integer(6))]
[1, 1, 3, 16, 125, 1296]
```

random_element()

Return a random parking function of size n.

The algorithm uses a circular parking space with $n+1$ spots. Then all n cars can park and there remains one empty spot. Spots are then renumbered so that the empty spot is 0.

The probability distribution is uniform on the set of $(n+1)^{n-1}$ parking functions of size n.

EXAMPLES:

```
sage: pf = ParkingFunctions(8)
sage: a = pf.random_element(); a  # random
[5, 7, 2, 4, 2, 5, 1, 3]
sage: a in pf
True
```

```
>>> from sage.all import *
>>> pf = ParkingFunctions(Integer(8))
>>> a = pf.random_element(); a  # random
[5, 7, 2, 4, 2, 5, 1, 3]
>>> a in pf
True
```

sage.combinat.parking_functions.**from_labelled_dyck_word**(*LDW*)

Return the parking function corresponding to the labelled Dyck word.

INPUT:

- `LDW` – labelled Dyck word

OUTPUT:

- the parking function corresponding to the labelled Dyck word that is half the size of `LDW`

EXAMPLES:

```
sage: from sage.combinat.parking_functions import from_labelled_dyck_word
sage: LDW = [2, 6, 0, 4, 5, 0, 0, 0, 3, 7, 0, 1, 0, 0]
sage: from_labelled_dyck_word(LDW)
[6, 1, 5, 2, 2, 1, 5]
```

```
>>> from sage.all import *
>>> from sage.combinat.parking_functions import from_labelled_dyck_word
>>> LDW = [Integer(2), Integer(6), Integer(0), Integer(4), Integer(5), Integer(0),
→ Integer(0), Integer(0), Integer(3), Integer(7), Integer(0), Integer(1),␣
→Integer(0), Integer(0)]
```

(continues on next page)

(continued from previous page)

```
>>> from_labelled_dyck_word(LDW)
[6, 1, 5, 2, 2, 1, 5]
```

```
sage: from_labelled_dyck_word([2, 3, 0, 0, 1, 0, 4, 0])
[3, 1, 1, 4]
sage: from_labelled_dyck_word([2, 3, 4, 0, 0, 0, 1, 0])
[4, 1, 1, 1]
sage: from_labelled_dyck_word([2, 4, 0, 1, 0, 0, 3, 0])
[2, 1, 4, 1]
```

```
>>> from sage.all import *
>>> from_labelled_dyck_word([Integer(2), Integer(3), Integer(0), Integer(0),␣
↪Integer(1), Integer(0), Integer(4), Integer(0)])
[3, 1, 1, 4]
>>> from_labelled_dyck_word([Integer(2), Integer(3), Integer(4), Integer(0),␣
↪Integer(0), Integer(0), Integer(1), Integer(0)])
[4, 1, 1, 1]
>>> from_labelled_dyck_word([Integer(2), Integer(4), Integer(0), Integer(1),␣
↪Integer(0), Integer(0), Integer(3), Integer(0)])
[2, 1, 4, 1]
```

sage.combinat.parking_functions.**from_labelling_and_area_sequence**(L, D)

Return the parking function corresponding to the labelling area sequence pair.

INPUT:

- `L` – a labelling permutation
- `D` – an area sequence for a Dyck word

OUTPUT:

- the parking function corresponding the labelling permutation `L` and `D` an area sequence of the corresponding Dyck path

EXAMPLES:

```
sage: from sage.combinat.parking_functions import from_labelling_and_area_sequence
sage: from_labelling_and_area_sequence([2, 6, 4, 5, 3, 7, 1], [0, 1, 1, 2, 0, 1,␣
↪1])
[6, 1, 5, 2, 2, 1, 5]
```

```
>>> from sage.all import *
>>> from sage.combinat.parking_functions import from_labelling_and_area_sequence
>>> from_labelling_and_area_sequence([Integer(2), Integer(6), Integer(4),␣
↪Integer(5), Integer(3), Integer(7), Integer(1)], [Integer(0), Integer(1),␣
↪Integer(1), Integer(2), Integer(0), Integer(1), Integer(1)])
[6, 1, 5, 2, 2, 1, 5]
```

```
sage: from_labelling_and_area_sequence([1, 2, 3], [0, 1, 2])
[1, 1, 1]
sage: from_labelling_and_area_sequence([1, 2, 3], [0, 0, 0])
[1, 2, 3]
sage: from_labelling_and_area_sequence([1, 2, 3], [0, 1, 1])
```

(continues on next page)

(continued from previous page)

```
[1, 1, 2]
sage: from_labelling_and_area_sequence([1, 2, 4, 3], [0, 1, 2, 1])
[1, 1, 3, 1]
```

```
>>> from sage.all import *
>>> from_labelling_and_area_sequence([Integer(1), Integer(2), Integer(3)],
↪[Integer(0), Integer(1), Integer(2)])
[1, 1, 1]
>>> from_labelling_and_area_sequence([Integer(1), Integer(2), Integer(3)],
↪[Integer(0), Integer(0), Integer(0)])
[1, 2, 3]
>>> from_labelling_and_area_sequence([Integer(1), Integer(2), Integer(3)],
↪[Integer(0), Integer(1), Integer(1)])
[1, 1, 2]
>>> from_labelling_and_area_sequence([Integer(1), Integer(2), Integer(4),
↪Integer(3)], [Integer(0), Integer(1), Integer(2), Integer(1)])
[1, 1, 3, 1]
```

`sage.combinat.parking_functions.`**`is_a`**(*x*, *n=None*)

Check whether a list is a parking function.

If a size n is specified, checks if a list is a parking function of size n.

5.1.159 Catalog of Path Tableaux

The `path_tableaux` object may be used to access examples of various path tableau objects currently implemented in Sage. Using tab-completion on this object is an easy way to discover and quickly create the path tableaux that are available (as listed here).

Let `<tab>` indicate pressing the `Tab` key. So begin by typing `path_tableaux.<tab>` to the see the currently implemented path tableaux.

5.1.160 Dyck Paths

This is an implementation of the abstract base class *`sage.combinat.path_tableaux.path_tableau.PathTableau`*. This is the simplest implementation of a path tableau and is included to provide a convenient test case and for pedagogical purposes.

In this implementation we have sequences of nonnegative integers. These are required to be the heights Dyck words (except that we do not require the sequence to start or end at height zero). These are in bijection with skew standard tableaux with at most two rows. Sequences which start and end at height zero are in bijection with noncrossing perfect matchings.

AUTHORS:

- Bruce Westbury (2018): initial version

class sage.combinat.path_tableaux.dyck_path.**DyckPath**(*parent*, *ot*, *check=True*)

Bases: *PathTableau*

An instance is the sequence of nonnegative integers given by the heights of a Dyck word.

INPUT:

- a sequence of nonnegative integers
- a two row standard skew tableau
- a Dyck word
- a noncrossing perfect matching

EXAMPLES:

```
sage: path_tableaux.DyckPath([0,1,2,1,0])
[0, 1, 2, 1, 0]

sage: w = DyckWord([1,1,0,0])
sage: path_tableaux.DyckPath(w)
[0, 1, 2, 1, 0]

sage: p = PerfectMatching([(1,2), (3,4)])
sage: path_tableaux.DyckPath(p)
[0, 1, 0, 1, 0]

sage: t = Tableau([[1,2,4],[3,5,6]])
sage: path_tableaux.DyckPath(t)
[0, 1, 2, 1, 2, 1, 0]

sage: st = SkewTableau([[None, 1,4],[2,3]])
sage: path_tableaux.DyckPath(st)
[1, 2, 1, 0, 1]
```

```
>>> from sage.all import *
>>> path_tableaux.DyckPath([Integer(0),Integer(1),Integer(2),Integer(1),
↪Integer(0)])
[0, 1, 2, 1, 0]

>>> w = DyckWord([Integer(1),Integer(1),Integer(0),Integer(0)])
>>> path_tableaux.DyckPath(w)
[0, 1, 2, 1, 0]

>>> p = PerfectMatching([(Integer(1),Integer(2)), (Integer(3),Integer(4))])
>>> path_tableaux.DyckPath(p)
[0, 1, 0, 1, 0]

>>> t = Tableau([[Integer(1),Integer(2),Integer(4)],[Integer(3),Integer(5),
↪Integer(6)]])
>>> path_tableaux.DyckPath(t)
[0, 1, 2, 1, 2, 1, 0]

>>> st = SkewTableau([[None, Integer(1),Integer(4)],[Integer(2),Integer(3)]])
```

(continues on next page)

(continued from previous page)

```
>>> path_tableaux.DyckPath(st)
[1, 2, 1, 0, 1]
```

Here we illustrate the slogan that promotion = rotation:

```
sage: t = path_tableaux.DyckPath([0,1,2,3,2,1,0])
sage: t.to_perfect_matching()
[(0, 5), (1, 4), (2, 3)]

sage: t = t.promotion()
sage: t.to_perfect_matching()
[(0, 3), (1, 2), (4, 5)]

sage: t = t.promotion()
sage: t.to_perfect_matching()
[(0, 1), (2, 5), (3, 4)]

sage: t = t.promotion()
sage: t.to_perfect_matching()
[(0, 5), (1, 4), (2, 3)]
```

```
>>> from sage.all import *
>>> t = path_tableaux.DyckPath([Integer(0),Integer(1),Integer(2),Integer(3),
↪Integer(2),Integer(1),Integer(0)])
>>> t.to_perfect_matching()
[(0, 5), (1, 4), (2, 3)]

>>> t = t.promotion()
>>> t.to_perfect_matching()
[(0, 3), (1, 2), (4, 5)]

>>> t = t.promotion()
>>> t.to_perfect_matching()
[(0, 1), (2, 5), (3, 4)]

>>> t = t.promotion()
>>> t.to_perfect_matching()
[(0, 5), (1, 4), (2, 3)]
```

check()

Check that `self` is a valid path.

EXAMPLES:

```
sage: path_tableaux.DyckPath([0,1,0,-1,0]) # indirect doctest
Traceback (most recent call last):
...
ValueError: [0, 1, 0, -1, 0] has a negative entry

sage: path_tableaux.DyckPath([0,1,3,1,0]) # indirect doctest
Traceback (most recent call last):
...
ValueError: [0, 1, 3, 1, 0] is not a Dyck path
```

```
>>> from sage.all import *
>>> path_tableaux.DyckPath([Integer(0),Integer(1),Integer(0),-Integer(1),
↪Integer(0)]) # indirect doctest
Traceback (most recent call last):
...
ValueError: [0, 1, 0, -1, 0] has a negative entry

>>> path_tableaux.DyckPath([Integer(0),Integer(1),Integer(3),Integer(1),
↪Integer(0)]) # indirect doctest
Traceback (most recent call last):
...
ValueError: [0, 1, 3, 1, 0] is not a Dyck path
```

descents()

Return the descent set of `self`.

EXAMPLES:

```
sage: path_tableaux.DyckPath([0,1,2,1,2,1,0,1,0]).descents()
{3, 6}
```

```
>>> from sage.all import *
>>> path_tableaux.DyckPath([Integer(0),Integer(1),Integer(2),Integer(1),
↪Integer(2),Integer(1),Integer(0),Integer(1),Integer(0)]).descents()
{3, 6}
```

is_skew()

Return `True` if `self` is skew and `False` if not.

EXAMPLES:

```
sage: path_tableaux.DyckPath([0,1,2,1]).is_skew()
False

sage: path_tableaux.DyckPath([1,0,1,2,1]).is_skew()
True
```

```
>>> from sage.all import *
>>> path_tableaux.DyckPath([Integer(0),Integer(1),Integer(2),Integer(1)]).is_
↪skew()
False

>>> path_tableaux.DyckPath([Integer(1),Integer(0),Integer(1),Integer(2),
↪Integer(1)]).is_skew()
True
```

local_rule(i)

This has input a list of objects. This method first takes the list of objects of length three consisting of the $(i-1)$-st, i-th and $(i+1)$-term and applies the rule. It then replaces the i-th object by the object returned by the rule.

EXAMPLES:

```
sage: t = path_tableaux.DyckPath([0,1,2,3,2,1,0])
sage: t.local_rule(3)
[0, 1, 2, 1, 2, 1, 0]
```

```
>>> from sage.all import *
>>> t = path_tableaux.DyckPath([Integer(0),Integer(1),Integer(2),Integer(3),
↪Integer(2),Integer(1),Integer(0)])
>>> t.local_rule(Integer(3))
[0, 1, 2, 1, 2, 1, 0]
```

to_DyckWord()

Convert `self` to a Dyck word.

EXAMPLES:

```
sage: c = path_tableaux.DyckPath([0,1,2,1,0])
sage: c.to_DyckWord()
[1, 1, 0, 0]
```

```
>>> from sage.all import *
>>> c = path_tableaux.DyckPath([Integer(0),Integer(1),Integer(2),Integer(1),
↪Integer(0)])
>>> c.to_DyckWord()
[1, 1, 0, 0]
```

to_perfect_matching()

Return the perfect matching associated to `self`.

EXAMPLES:

```
sage: path_tableaux.DyckPath([0,1,2,1,2,1,0,1,0]).to_perfect_matching()
[(0, 5), (1, 2), (3, 4), (6, 7)]
```

```
>>> from sage.all import *
>>> path_tableaux.DyckPath([Integer(0),Integer(1),Integer(2),Integer(1),
↪Integer(2),Integer(1),Integer(0),Integer(1),Integer(0)]).to_perfect_
↪matching()
[(0, 5), (1, 2), (3, 4), (6, 7)]
```

to_tableau()

Return the skew tableau associated to `self`.

EXAMPLES:

```
sage: T = path_tableaux.DyckPath([0,1,2,3,2,3])
sage: T.to_tableau()
[[1, 2, 3, 5], [4]]

sage: U = path_tableaux.DyckPath([2,3,2,3])
sage: U.to_tableau()
[[None, None, 1, 3], [2]]
```

```
>>> from sage.all import *
>>> T = path_tableaux.DyckPath([Integer(0),Integer(1),Integer(2),Integer(3),
↪Integer(2),Integer(3)])
>>> T.to_tableau()
[[1, 2, 3, 5], [4]]

>>> U = path_tableaux.DyckPath([Integer(2),Integer(3),Integer(2),Integer(3)])
>>> U.to_tableau()
[[None, None, 1, 3], [2]]
```

to_word()

Return the word in the alphabet $\{0, 1\}$ associated to `self`.

EXAMPLES:

```
sage: path_tableaux.DyckPath([1,0,1,2,1]).to_word()
[0, 1, 1, 0]
```

```
>>> from sage.all import *
>>> path_tableaux.DyckPath([Integer(1),Integer(0),Integer(1),Integer(2),
↪Integer(1)]).to_word()
[0, 1, 1, 0]
```

class sage.combinat.path_tableaux.dyck_path.**DyckPaths**

Bases: *PathTableaux*

The parent class for DyckPath.

Element

alias of *DyckPath*

5.1.161 Frieze Patterns

This implements the original frieze patterns due to Conway and Coxeter. Such a frieze pattern is considered as a sequence of nonnegative integers following [CoCo1] and [CoCo2] using *sage.combinat.path_tableaux.path_tableau*.

AUTHORS:

- Bruce Westbury (2019): initial version

class sage.combinat.path_tableaux.frieze.**FriezePattern**

Bases: *PathTableau*

A frieze pattern.

We encode a frieze pattern as a sequence in a fixed ground field.

INPUT:

- `fp` – a sequence of elements of `field`
- `field` – (default: `QQ`) the ground field

EXAMPLES:

```
sage: t = path_tableaux.FriezePattern([1,2,1,2,3,1])
sage: path_tableaux.CylindricalDiagram(t)
[0, 1, 2, 1, 2, 3, 1, 0]
```

(continues on next page)

(continued from previous page)

```
[ , 0, 1, 1, 3, 5, 2, 1, 0]

↪ 3*sqrt2,        1,        0]
>>> TestSuite(t).run()
```

change_ring(R)

Return `self` as a frieze pattern with coefficients in `R`.

This assumes that there is a canonical coerce map from the base ring of `self` to `R`.

EXAMPLES:

```
sage: fp = path_tableaux.FriezePattern([1,2,7,5,3,7,4,1])
```

(continues on next page)

(continued from previous page)

```
sage: fp.change_ring(RealField())                                           #␣
↪needs sage.rings.real_mpfr
[0.000000000000000, 1.00000000000000, ...
 4.00000000000000, 1.00000000000000, 0.000000000000000]
sage: fp.change_ring(GF(7))
Traceback (most recent call last):
...
TypeError: no base extension defined
```

```
>>> from sage.all import *
>>> fp = path_tableaux.FriezePattern([Integer(1),Integer(2),Integer(7),
↪Integer(5),Integer(3),Integer(7),Integer(4),Integer(1)])
>>> fp.change_ring(RealField())                                             #␣
↪needs sage.rings.real_mpfr
[0.000000000000000, 1.00000000000000, ...
 4.00000000000000, 1.00000000000000, 0.000000000000000]
>>> fp.change_ring(GF(Integer(7)))
Traceback (most recent call last):
...
TypeError: no base extension defined
```

check()

Check that `self` is a valid frieze pattern.

is_integral()

Return `True` if all entries of the frieze pattern are positive integers.

EXAMPLES:

```
sage: path_tableaux.FriezePattern([1,2,7,5,3,7,4,1]).is_integral()
True

sage: path_tableaux.FriezePattern([1,3,4,5,1]).is_integral()
False
```

```
>>> from sage.all import *
>>> path_tableaux.FriezePattern([Integer(1),Integer(2),Integer(7),Integer(5),
↪Integer(3),Integer(7),Integer(4),Integer(1)]).is_integral()
True

>>> path_tableaux.FriezePattern([Integer(1),Integer(3),Integer(4),Integer(5),
↪Integer(1)]).is_integral()
False
```

is_positive()

Return `True` if all elements of `self` are positive.

This implies that all entries of `CylindricalDiagram(self)` are positive.

> **Warning**
>
> There are orders on all fields. These may not be ordered fields as they may not be compatible with the

field operations. This method is intended to be used with ordered fields only.

EXAMPLES:

```
sage: path_tableaux.FriezePattern([1,2,7,5,3,7,4,1]).is_positive()
True

sage: path_tableaux.FriezePattern([1,-3,4,5,1]).is_positive()
False

sage: x = polygen(ZZ, 'x')
sage: K.<sqrt3> = NumberField(x^2 - 3)                                    #␣
↪needs sage.rings.number_field
sage: path_tableaux.FriezePattern([1,sqrt3,1], K).is_positive()           #␣
↪needs sage.rings.number_field
True
```

```
>>> from sage.all import *
>>> path_tableaux.FriezePattern([Integer(1),Integer(2),Integer(7),Integer(5),
↪Integer(3),Integer(7),Integer(4),Integer(1)]).is_positive()
True

>>> path_tableaux.FriezePattern([Integer(1),-Integer(3),Integer(4),Integer(5),
↪Integer(1)]).is_positive()
False

>>> x = polygen(ZZ, 'x')
>>> K = NumberField(x**Integer(2) - Integer(3), names=('sqrt3',)); (sqrt3,) =␣
↪K._first_ngens(1)# needs sage.rings.number_field
>>> path_tableaux.FriezePattern([Integer(1),sqrt3,Integer(1)], K).is_
↪positive()             # needs sage.rings.number_field
True
```

is_skew()

Return `True` if `self` is skew and `False` if not.

EXAMPLES:

```
sage: path_tableaux.FriezePattern([1,2,1,2,3,1]).is_skew()
False

sage: path_tableaux.FriezePattern([2,2,1,2,3,1]).is_skew()
True
```

```
>>> from sage.all import *
>>> path_tableaux.FriezePattern([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(3),Integer(1)]).is_skew()
False

>>> path_tableaux.FriezePattern([Integer(2),Integer(2),Integer(1),Integer(2),
↪Integer(3),Integer(1)]).is_skew()
True
```

local_rule(*i*)

Return the i-th local rule on `self`.

This interprets `self` as a list of objects. This method first takes the list of objects of length three consisting of the $(i-1)$-st, i-th and $(i+1)$-term and applies the rule. It then replaces the i-th object by the object returned by the rule.

EXAMPLES:

```
sage: t = path_tableaux.FriezePattern([1,2,1,2,3,1])
sage: t.local_rule(3)
[1, 2, 5, 2, 3, 1]

sage: t = path_tableaux.FriezePattern([1,2,1,2,3,1])
sage: t.local_rule(0)
Traceback (most recent call last):
...
ValueError: 0 is not a valid integer
```

```
>>> from sage.all import *
>>> t = path_tableaux.FriezePattern([Integer(1),Integer(2),Integer(1),
↪Integer(2),Integer(3),Integer(1)])
>>> t.local_rule(Integer(3))
[1, 2, 5, 2, 3, 1]

>>> t = path_tableaux.FriezePattern([Integer(1),Integer(2),Integer(1),
↪Integer(2),Integer(3),Integer(1)])
>>> t.local_rule(Integer(0))
Traceback (most recent call last):
...
ValueError: 0 is not a valid integer
```

plot(*model='UHP'*)

Plot the frieze as an ideal hyperbolic polygon.

This is only defined up to isometry of the hyperbolic plane.

We are identifying the boundary of the hyperbolic plane with the real projective line.

The option `model` must be one of

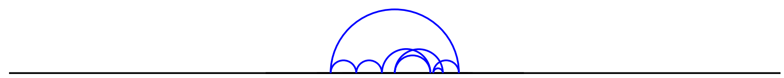
- `'UHP'` – (default) for the upper half plane model
- `'PD'` – for the Poincare disk model
- `'KM'` – for the Klein model

The hyperboloid model is not an option as this does not implement boundary points.

EXAMPLES:

```
sage: # needs sage.plot sage.symbolic
sage: t = path_tableaux.FriezePattern([1,2,7,5,3,7,4,1])
sage: t.plot()
Graphics object consisting of 18 graphics primitives
sage: t.plot(model='UHP')
Graphics object consisting of 18 graphics primitives
sage: t.plot(model='PD')
```

(continues on next page)



(continued from previous page)

```
Traceback (most recent call last):
...
TypeError: '>' not supported between instances of 'NotANumber' and 'Pi'
sage: t.plot(model='KM')
Graphics object consisting of 18 graphics primitives
```

```
>>> from sage.all import *
>>> # needs sage.plot sage.symbolic
>>> t = path_tableaux.FriezePattern([Integer(1),Integer(2),Integer(7),
↪Integer(5),Integer(3),Integer(7),Integer(4),Integer(1)])
>>> t.plot()
Graphics object consisting of 18 graphics primitives
>>> t.plot(model='UHP')
Graphics object consisting of 18 graphics primitives
>>> t.plot(model='PD')
Traceback (most recent call last):
...
TypeError: '>' not supported between instances of 'NotANumber' and 'Pi'
>>> t.plot(model='KM')
Graphics object consisting of 18 graphics primitives
```

triangulation()

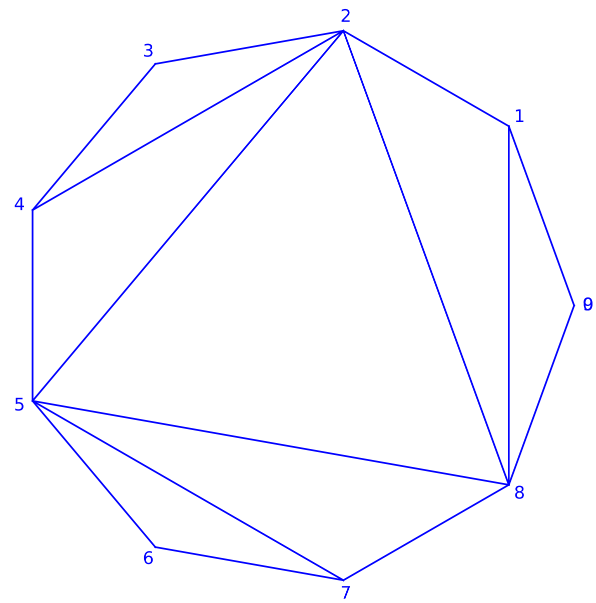
Plot a regular polygon with some diagonals.

If `self` is positive and integral then this will be a triangulation.

EXAMPLES:

```
sage: path_tableaux.FriezePattern([1,2,7,5,3,7,4,1]).triangulation()          #␣
↪needs sage.plot sage.symbolic
Graphics object consisting of 25 graphics primitives
```

(continues on next page)



(continued from previous page)

```
sage: path_tableaux.FriezePattern([1,2,1/7,5,3]).triangulation()          #␣
↪needs sage.plot sage.symbolic
Graphics object consisting of 12 graphics primitives

sage: x = polygen(ZZ, 'x')
sage: K.<sqrt2> = NumberField(x^2 - 2)                                     #␣
↪needs sage.rings.number_field
sage: path_tableaux.FriezePattern([1,sqrt2,1,sqrt2,3,2*sqrt2,5,3*sqrt2,1],   #␣
↪needs sage.plot sage.rings.number_field sage.symbolic
....:                             field=K).triangulation()
Graphics object consisting of 24 graphics primitives
```

```
>>> from sage.all import *
>>> path_tableaux.FriezePattern([Integer(1),Integer(2),Integer(7),Integer(5),
↪Integer(3),Integer(7),Integer(4),Integer(1)]).triangulation()        #␣
↪needs sage.plot sage.symbolic
Graphics object consisting of 25 graphics primitives

>>> path_tableaux.FriezePattern([Integer(1),Integer(2),Integer(1)/Integer(7),
↪Integer(5),Integer(3)]).triangulation()            # needs sage.plot sage.
↪symbolic
Graphics object consisting of 12 graphics primitives

>>> x = polygen(ZZ, 'x')
>>> K = NumberField(x**Integer(2) - Integer(2), names=('sqrt2',)); (sqrt2,) =␣
↪K._first_ngens(1)# needs sage.rings.number_field
>>> path_tableaux.FriezePattern([Integer(1),sqrt2,Integer(1),sqrt2,Integer(3),
↪Integer(2)*sqrt2,Integer(5),Integer(3)*sqrt2,Integer(1)],   # needs sage.
↪plot sage.rings.number_field sage.symbolic
```

(continues on next page)

(continued from previous page)

```
...                             field=K).triangulation()
Graphics object consisting of 24 graphics primitives
```

width()

Return the width of `self`.

If the first and last terms of `self` are 1 then this is the length of `self` plus two and otherwise is undefined.

EXAMPLES:

```
sage: path_tableaux.FriezePattern([1,2,1,2,3,1]).width()
8

sage: path_tableaux.FriezePattern([1,2,1,2,3,4]).width() is None
True
```

```
>>> from sage.all import *
>>> path_tableaux.FriezePattern([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(3),Integer(1)]).width()
8

>>> path_tableaux.FriezePattern([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(3),Integer(4)]).width() is None
True
```

class sage.combinat.path_tableaux.frieze.**FriezePatterns**(*field*)

Bases: *PathTableaux*

The set of all frieze patterns.

EXAMPLES:

```
sage: P = path_tableaux.FriezePatterns(QQ)
sage: fp = P((1, 1, 1))
sage: fp
[1]
sage: path_tableaux.CylindricalDiagram(fp)
[1, 1, 1]
[ , 1, 2, 1]
[ ,  , 1, 1, 1]
```

```
>>> from sage.all import *
>>> P = path_tableaux.FriezePatterns(QQ)
>>> fp = P((Integer(1), Integer(1), Integer(1)))
>>> fp
[1]
>>> path_tableaux.CylindricalDiagram(fp)
[1, 1, 1]
[ , 1, 2, 1]
[ ,  , 1, 1, 1]
```

Element

alias of *FriezePattern*

5.1.162 Path Tableaux

This is an abstract base class for using local rules to construct rectification and the action of the cactus group [Wes2017].

This is a construction of the Henriques-Kamnitzer construction of the action of the cactus group on tensor powers of a crystal. This is also a generalisation of the Fomin growth rules, which are a version of the operations on standard tableaux which were previously constructed using jeu de taquin.

The basic operations are rectification, evacuation and promotion. Rectification of standard skew tableaux agrees with the rectification by jeu de taquin as does evacuation. Promotion agrees with promotion by jeu de taquin on rectangular tableaux but in general they are different.

class sage.combinat.path_tableaux.path_tableau.**CylindricalDiagram**(T)

Bases: SageObject

Cylindrical growth diagrams.

EXAMPLES:

```
sage: t = path_tableaux.DyckPath([0,1,2,3,2,1,0])
sage: path_tableaux.CylindricalDiagram(t)
[0, 1, 2, 3, 2, 1, 0]
[ , 0, 1, 2, 1, 0, 1, 0]
[ ,  , 0, 1, 0, 1, 2, 1, 0]
[ ,  ,  , 0, 1, 2, 3, 2, 1, 0]
[ ,  ,  ,  , 0, 1, 2, 1, 0, 1, 0]
[ ,  ,  ,  ,  , 0, 1, 0, 1, 2, 1, 0]
[ ,  ,  ,  ,  ,  , 0, 1, 2, 3, 2, 1, 0]
```

```
>>> from sage.all import *
>>> t = path_tableaux.DyckPath([Integer(0),Integer(1),Integer(2),Integer(3),
↪Integer(2),Integer(1),Integer(0)])
>>> path_tableaux.CylindricalDiagram(t)
[0, 1, 2, 3, 2, 1, 0]
[ , 0, 1, 2, 1, 0, 1, 0]
[ ,  , 0, 1, 0, 1, 2, 1, 0]
[ ,  ,  , 0, 1, 2, 3, 2, 1, 0]
[ ,  ,  ,  , 0, 1, 2, 1, 0, 1, 0]
[ ,  ,  ,  ,  , 0, 1, 0, 1, 2, 1, 0]
[ ,  ,  ,  ,  ,  , 0, 1, 2, 3, 2, 1, 0]
```

pp()

A pretty print utility method.

EXAMPLES:

```
sage: t = path_tableaux.DyckPath([0,1,2,3,2,1,0])
sage: path_tableaux.CylindricalDiagram(t).pp()
0 1 2 3 2 1 0
  0 1 2 1 0 1 0
```

(continues on next page)

(continued from previous page)

```
    0 1 0 1 2 1 0
      0 1 2 3 2 1 0
        0 1 2 1 0 1 0
          0 1 0 1 2 1 0
            0 1 2 3 2 1 0

sage: t = path_tableaux.FriezePattern([1,3,4,5,1])
sage: path_tableaux.CylindricalDiagram(t).pp()
  0   1   3   4   5   1   0
      0   1 5/3 7/3 2/3   1   0
          0   1   2   1   3   1   0
              0   1   1   4 5/3   1   0
                  0   1   5 7/3   2   1   0
                      0   1 2/3   1   1   1   0
                          0   1   3   4   5   1   0
```

```
>>> from sage.all import *
>>> t = path_tableaux.DyckPath([Integer(0),Integer(1),Integer(2),Integer(3),
↪Integer(2),Integer(1),Integer(0)])
>>> path_tableaux.CylindricalDiagram(t).pp()
0 1 2 3 2 1 0
  0 1 2 1 0 1 0
    0 1 0 1 2 1 0
      0 1 2 3 2 1 0
        0 1 2 1 0 1 0
          0 1 0 1 2 1 0
            0 1 2 3 2 1 0

>>> t = path_tableaux.FriezePattern([Integer(1),Integer(3),Integer(4),
↪Integer(5),Integer(1)])
>>> path_tableaux.CylindricalDiagram(t).pp()
  0   1   3   4   5   1   0
      0   1 5/3 7/3 2/3   1   0
          0   1   2   1   3   1   0
              0   1   1   4 5/3   1   0
                  0   1   5 7/3   2   1   0
                      0   1 2/3   1   1   1   0
                          0   1   3   4   5   1   0
```

class sage.combinat.path_tableaux.path_tableau.**PathTableau**

Bases: ClonableArray

This is the abstract base class for a path tableau.

cactus(*i*, *j*)

Return the action of the generator $s_{i,j}$ of the cactus group on self.

INPUT:

- i – positive integer
- j – positive integer weakly greater than i

EXAMPLES:

```
sage: t = path_tableaux.DyckPath([0,1,2,3,2,1,0])
sage: t.cactus(1,5)
[0, 1, 0, 1, 2, 1, 0]

sage: t.cactus(1,6)
[0, 1, 2, 1, 0, 1, 0]

sage: t.cactus(1,7) == t.evacuation()
True
sage: t.cactus(1,7).cactus(1,6) == t.promotion()
True
```

```
>>> from sage.all import *
>>> t = path_tableaux.DyckPath([Integer(0),Integer(1),Integer(2),Integer(3),
↪Integer(2),Integer(1),Integer(0)])
>>> t.cactus(Integer(1),Integer(5))
[0, 1, 0, 1, 2, 1, 0]

>>> t.cactus(Integer(1),Integer(6))
[0, 1, 2, 1, 0, 1, 0]

>>> t.cactus(Integer(1),Integer(7)) == t.evacuation()
True
>>> t.cactus(Integer(1),Integer(7)).cactus(Integer(1),Integer(6)) == t.
↪promotion()
True
```

commutor(*other*, *verbose=False*)

Return the commutor of `self` with `other`.

If `verbose=True` then the function will print the rectangle.

EXAMPLES:

```
sage: t1 = path_tableaux.DyckPath([0,1,2,3,2,1,0])
sage: t2 = path_tableaux.DyckPath([0,1,2,1,0])
sage: t1.commutor(t2)
([0, 1, 2, 1, 0], [0, 1, 2, 3, 2, 1, 0])
sage: t1.commutor(t2,verbose=True)
[0, 1, 2, 1, 0]
[1, 2, 3, 2, 1]
[2, 3, 4, 3, 2]
[3, 4, 5, 4, 3]
[2, 3, 4, 3, 2]
[1, 2, 3, 2, 1]
[0, 1, 2, 1, 0]
([0, 1, 2, 1, 0], [0, 1, 2, 3, 2, 1, 0])
```

```
>>> from sage.all import *
>>> t1 = path_tableaux.DyckPath([Integer(0),Integer(1),Integer(2),Integer(3),
↪Integer(2),Integer(1),Integer(0)])
>>> t2 = path_tableaux.DyckPath([Integer(0),Integer(1),Integer(2),Integer(1),
↪Integer(0)])
```

(continues on next page)

(continued from previous page)

```
>>> t1.commutor(t2)
([0, 1, 2, 1, 0], [0, 1, 2, 3, 2, 1, 0])
>>> t1.commutor(t2,verbose=True)
[0, 1, 2, 1, 0]
[1, 2, 3, 2, 1]
[2, 3, 4, 3, 2]
[3, 4, 5, 4, 3]
[2, 3, 4, 3, 2]
[1, 2, 3, 2, 1]
[0, 1, 2, 1, 0]
([0, 1, 2, 1, 0], [0, 1, 2, 3, 2, 1, 0])
```

dual_equivalence_graph()

Return the graph with vertices the orbit of `self` and edges given by the action of the cactus group generators.

In most implementations the generators $s_{i,i+1}$ will act as the identity operators. The usual dual equivalence graphs are given by replacing the label $i, i+2$ by i and removing edges with other labels.

EXAMPLES:

```
sage: s = path_tableaux.DyckPath([0,1,2,3,2,3,2,1,0])
sage: s.dual_equivalence_graph().adjacency_matrix()                          #␣
↪needs sage.graphs sage.modules
[0 1 1 1 0 1 0 1 1 0 0 0 0 0]
[1 0 1 1 1 1 1 0 1 0 0 1 1 0]
[1 1 0 1 1 1 0 1 0 1 1 1 0 0]
[1 1 1 0 1 0 1 1 1 1 0 1 1 0]

 ([0, 1, 0, 1, 2, 1, 0], [0, 1, 2, 1, 2, 1, 0], '1,4'),
 ([0, 1, 0, 1, 2, 1, 0], [0, 1, 2, 3, 2, 1, 0], '2,7'),
 ([0, 1, 2, 1, 0, 1, 0], [0, 1, 2, 1, 2, 1, 0], '4,7'),
 ([0, 1, 2, 1, 0, 1, 0], [0, 1, 2, 3, 2, 1, 0], '3,7'),
 ([0, 1, 2, 1, 2, 1, 0], [0, 1, 2, 3, 2, 1, 0], '3,6')]
```

evacuation()

Return the evacuation operator applied to `self`.

EXAMPLES:

```
sage: t = path_tableaux.DyckPath([0,1,2,3,2,1,0])
sage: t.evacuation()
[0, 1, 2, 3, 2, 1, 0]
```

```
>>> from sage.all import *
>>> t = path_tableaux.DyckPath([Integer(0),Integer(1),Integer(2),Integer(3),
↪Integer(2),Integer(1),Integer(0)])
>>> t.evacuation()
[0, 1, 2, 3, 2, 1, 0]
```

final_shape()

Return the final shape of `self`.

EXAMPLES:

```
sage: t = path_tableaux.DyckPath([0,1,2,3,2,1,0])
sage: t.final_shape()
0
```

```
>>> from sage.all import *
>>> t = path_tableaux.DyckPath([Integer(0),Integer(1),Integer(2),Integer(3),
↪Integer(2),Integer(1),Integer(0)])
>>> t.final_shape()
0
```

initial_shape()

Return the initial shape of `self`.

EXAMPLES:

```
sage: t = path_tableaux.DyckPath([0,1,2,3,2,1,0])
sage: t.initial_shape()
0
```

```
>>> from sage.all import *
>>> t = path_tableaux.DyckPath([Integer(0),Integer(1),Integer(2),Integer(3),
↪Integer(2),Integer(1),Integer(0)])
>>> t.initial_shape()
0
```

local_rule(*i*)

This is the abstract local rule defined in any coboundary category.

This has input a list of objects. This method first takes the list of objects of length three consisting of the $(i-1)$-st, i-th and $(i+1)$-term and applies the rule. It then replaces the i-th object by the object returned by the rule.

EXAMPLES:

```
sage: t = path_tableaux.DyckPath([0,1,2,3,2,1,0])
sage: t.local_rule(3)
[0, 1, 2, 1, 2, 1, 0]
```

```
>>> from sage.all import *
>>> t = path_tableaux.DyckPath([Integer(0),Integer(1),Integer(2),Integer(3),
↪Integer(2),Integer(1),Integer(0)])
>>> t.local_rule(Integer(3))
[0, 1, 2, 1, 2, 1, 0]
```

orbit()

Return the orbit of `self` under the action of the cactus group.

EXAMPLES:

```
sage: t = path_tableaux.DyckPath([0,1,2,3,2,1,0])
sage: t.orbit()
{[0, 1, 0, 1, 0, 1, 0],
 [0, 1, 0, 1, 2, 1, 0],
 [0, 1, 2, 1, 0, 1, 0],
 [0, 1, 2, 1, 2, 1, 0],
 [0, 1, 2, 3, 2, 1, 0]}
```

```
>>> from sage.all import *
>>> t = path_tableaux.DyckPath([Integer(0),Integer(1),Integer(2),Integer(3),
↪Integer(2),Integer(1),Integer(0)])
>>> t.orbit()
{[0, 1, 0, 1, 0, 1, 0],
 [0, 1, 0, 1, 2, 1, 0],
 [0, 1, 2, 1, 0, 1, 0],
 [0, 1, 2, 1, 2, 1, 0],
 [0, 1, 2, 3, 2, 1, 0]}
```

promotion()

Return the promotion operator applied to `self`.

EXAMPLES:

```
sage: t = path_tableaux.DyckPath([0,1,2,3,2,1,0])
sage: t.promotion()
[0, 1, 2, 1, 0, 1, 0]
```

```
>>> from sage.all import *
>>> t = path_tableaux.DyckPath([Integer(0),Integer(1),Integer(2),Integer(3),
↪Integer(2),Integer(1),Integer(0)])
>>> t.promotion()
[0, 1, 2, 1, 0, 1, 0]
```

size()

Return the size or length of `self`.

EXAMPLES:

```
sage: t = path_tableaux.DyckPath([0,1,2,3,2,1,0])
sage: t.size()
7
```

```
>>> from sage.all import *
>>> t = path_tableaux.DyckPath([Integer(0),Integer(1),Integer(2),Integer(3),
↪Integer(2),Integer(1),Integer(0)])
>>> t.size()
7
```

class sage.combinat.path_tableaux.path_tableau.**PathTableaux**

Bases: `UniqueRepresentation`, `Parent`

The abstract parent class for PathTableau.

5.1.163 Semistandard Tableaux

This is an implementation of the abstract base class *sage.combinat.path_tableaux.path_tableau.PathTableau*.

This implementation is for semistandard tableaux, represented as a chain of partitions (essentially, the Gelfand-Tsetlin pattern). This generalises the jeu de taquin operations of rectification, promotion, evacuation from standard tableaux to semistandard tableaux. The local rule is the Bender-Knuth involution.

EXAMPLES:

```
sage: pt = path_tableaux.SemistandardPathTableau([[], [3], [3,2], [3,3,1],
....:                                            [3,3,2,1], [4,3,3,1,0]])
sage: pt.promotion()
[(), (2,), (3, 1), (3, 2, 1), (4, 3, 1, 0), (4, 3, 3, 1, 0)]
sage: pt.evacuation()
[(), (2,), (4, 0), (4, 2, 0), (4, 3, 1, 0), (4, 3, 3, 1, 0)]

sage: pt = path_tableaux.SemistandardPathTableau([[], [3], [3,2], [3,3,1],
....:                                            [3,3,2,1], [9/2,3,3,1,0]])
sage: pt.promotion()
[(), (2,), (3, 1), (3, 2, 1), (9/2, 3, 1, 0), (9/2, 3, 3, 1, 0)]
sage: pt.evacuation()
[(), (5/2,), (9/2, 0), (9/2, 2, 0), (9/2, 3, 1, 0), (9/2, 3, 3, 1, 0)]

sage: pt = path_tableaux.SemistandardPathTableau([[], [3], [4,2], [5,4,1]])
sage: path_tableaux.CylindricalDiagram(pt)
[       (),      (3,),    (4, 2), (5, 4, 1)]
[         ,        (),      (3,),    (5, 2), (5, 4, 1)]
[         ,          ,        (),      (4,),    (4, 3), (5, 4, 1)]
[         ,          ,          ,        (),      (3,),    (5, 1), (5, 4, 1)]

sage: pt2 = path_tableaux.SemistandardPathTableau([[3,2], [3,3,1],
....:                                             [3,3,2,1], [4,3,3,1,0]])
sage: pt1 = path_tableaux.SemistandardPathTableau([[], [3], [3,2]])
sage: pt1.commutor(pt2)
([(), (2,), (2, 2), (4, 2, 0)], [(4, 2, 0), (4, 3, 2, 0), (4, 3, 3, 1, 0)])
sage: pt1.commutor(pt2,verbose=True)
[(3, 2), (3, 3, 1), (3, 3, 2, 1), (4, 3, 3, 1, 0)]
[(3,), (3, 2), (3, 2, 2), (4, 3, 2, 0)]
[(), (2,), (2, 2), (4, 2, 0)]
([(), (2,), (2, 2), (4, 2, 0)], [(4, 2, 0), (4, 3, 2, 0), (4, 3, 3, 1, 0)])

sage: st = SkewTableau([[None, None, None, 4, 4, 5, 6, 7], [None, 2, 4, 6, 7, 7, 7],
....:                   [None, 4, 5, 8, 8, 9], [None, 6, 7, 10], [None, 8, 8, 11],
....:                   [None], [4]])
sage: pt = path_tableaux.SemistandardPathTableau(st)
sage: bk = [SkewTableau(st.bender_knuth_involution(i+1)) for i in range(10)]
sage: lr = [pt.local_rule(i+1) for i in range(10)]
sage: [r.to_tableau() for r in lr] == bk
True
```

```
>>> from sage.all import *
>>> pt = path_tableaux.SemistandardPathTableau([[], [Integer(3)], [Integer(3),
↪Integer(2)], [Integer(3),Integer(3),Integer(1)],
...                                            [Integer(3),Integer(3),Integer(2),
↪Integer(1)], [Integer(4),Integer(3),Integer(3),Integer(1),Integer(0)]])
>>> pt.promotion()
[(), (2,), (3, 1), (3, 2, 1), (4, 3, 1, 0), (4, 3, 3, 1, 0)]
>>> pt.evacuation()
[(), (2,), (4, 0), (4, 2, 0), (4, 3, 1, 0), (4, 3, 3, 1, 0)]
```

(continues on next page)

(continued from previous page)

True
```

AUTHORS:

- Bruce Westbury (2020): initial version

class sage.combinat.path_tableaux.semistandard.**SemistandardPathTableau**(*parent*, *st*, *check=True*)

Bases: *PathTableau*

An instance is a sequence of lists. Usually the entries will be nonnegative integers in which case this is the chain of partitions of a (skew) semistandard tableau. In general the entries are elements of an ordered abelian group; each list is weakly decreasing and successive lists are interleaved.

INPUT:

Can be any of the following

- a sequence of partitions
- a sequence of lists/tuples
- a semistandard tableau
- a semistandard skew tableau
- a Gelfand-Tsetlin pattern

EXAMPLES:

```
sage: path_tableaux.SemistandardPathTableau([[], [2], [2,1]])
[(), (2,), (2, 1)]

sage: gt = GelfandTsetlinPattern([[2,1], [2]])
sage: path_tableaux.SemistandardPathTableau(gt)
[(), (2,), (2, 1)]

sage: st = SemistandardTableau([[1,1], [2]])
sage: path_tableaux.SemistandardPathTableau(st)
[(), (2,), (2, 1)]

sage: st = SkewTableau([[1,1], [2]])
sage: path_tableaux.SemistandardPathTableau(st)
[(), (2,), (2, 1)]

sage: st = SkewTableau([[None,1,1], [2]])
sage: path_tableaux.SemistandardPathTableau(st)
[(1,), (3, 0), (3, 1, 0)]

sage: path_tableaux.SemistandardPathTableau([[], [5/2], [7/2,2]])
[(), (5/2,), (7/2, 2)]

sage: path_tableaux.SemistandardPathTableau([[], [2.5], [3.5,2]])
[(), (2.50000000000000,), (3.50000000000000, 2)]
```

```
>>> from sage.all import *
>>> path_tableaux.SemistandardPathTableau([[], [Integer(2)], [Integer(2),
↪Integer(1)]])
[(), (2,), (2, 1)]

>>> gt = GelfandTsetlinPattern([[Integer(2),Integer(1)], [Integer(2)]])
>>> path_tableaux.SemistandardPathTableau(gt)
[(), (2,), (2, 1)]

>>> st = SemistandardTableau([[Integer(1),Integer(1)], [Integer(2)]])
>>> path_tableaux.SemistandardPathTableau(st)
[(), (2,), (2, 1)]
```

(continues on next page)

(continued from previous page)

```
>>> st = SkewTableau([[Integer(1),Integer(1)], [Integer(2)]])
>>> path_tableaux.SemistandardPathTableau(st)
[(), (2,), (2, 1)]

>>> st = SkewTableau([[None,Integer(1),Integer(1)], [Integer(2)]])
>>> path_tableaux.SemistandardPathTableau(st)
[(1,), (3, 0), (3, 1, 0)]

>>> path_tableaux.SemistandardPathTableau([[], [Integer(5)/Integer(2)],␣
↪[Integer(7)/Integer(2),Integer(2)]])
[(), (5/2,), (7/2, 2)]

>>> path_tableaux.SemistandardPathTableau([[], [RealNumber('2.5')], [RealNumber(
↪'3.5'),Integer(2)]])
[(), (2.50000000000000,), (3.50000000000000, 2)]
```

check()

Check that `self` is a valid path.

EXAMPLES:

```
sage: path_tableaux.SemistandardPathTableau([[], [3], [2,2]])        #␣
↪indirect doctest
Traceback (most recent call last):
...
ValueError: [(), (3,), (2, 2)] does not satisfy
the required inequalities in row 1

sage: path_tableaux.SemistandardPathTableau([[], [3/2], [2,5/2]])    #␣
↪indirect doctest
Traceback (most recent call last):
...
ValueError: [(), (3/2,), (2, 5/2)] does not satisfy
the required inequalities in row 1
```

```
>>> from sage.all import *
>>> path_tableaux.SemistandardPathTableau([[], [Integer(3)], [Integer(2),
↪Integer(2)]])        # indirect doctest
Traceback (most recent call last):
...
ValueError: [(), (3,), (2, 2)] does not satisfy
the required inequalities in row 1

>>> path_tableaux.SemistandardPathTableau([[], [Integer(3)/Integer(2)],␣
↪[Integer(2),Integer(5)/Integer(2)]])    # indirect doctest
Traceback (most recent call last):
...
ValueError: [(), (3/2,), (2, 5/2)] does not satisfy
the required inequalities in row 1
```

is_integral()

Return `True` if all entries are nonnegative integers.

EXAMPLES:

```
sage: path_tableaux.SemistandardPathTableau([[], [3], [3,2]]).is_integral()
True
sage: path_tableaux.SemistandardPathTableau([[], [5/2], [7/2,2]]).is_
→integral()
False
sage: path_tableaux.SemistandardPathTableau([[], [3], [3,-2]]).is_integral()
False
```

```
>>> from sage.all import *
>>> path_tableaux.SemistandardPathTableau([[], [Integer(3)], [Integer(3),
→Integer(2)]]).is_integral()
True
>>> path_tableaux.SemistandardPathTableau([[], [Integer(5)/Integer(2)],␣
→[Integer(7)/Integer(2),Integer(2)]]).is_integral()
False
>>> path_tableaux.SemistandardPathTableau([[], [Integer(3)], [Integer(3),-
→Integer(2)]]).is_integral()
False
```

is_skew()

Return `True` if `self` is skew.

EXAMPLES:

```
sage: path_tableaux.SemistandardPathTableau([[], [2]]).is_skew()
False
sage: path_tableaux.SemistandardPathTableau([[2,1]]).is_skew()
True
```

```
>>> from sage.all import *
>>> path_tableaux.SemistandardPathTableau([[], [Integer(2)]]).is_skew()
False
>>> path_tableaux.SemistandardPathTableau([[Integer(2),Integer(1)]]).is_skew()
True
```

local_rule(*i*)

This is the Bender-Knuth involution.

This is implemented by toggling the entries of the i-th list. The allowed range for `i` is `0 < i < len(self)-1` so any row except the first and last can be changed.

EXAMPLES:

```
sage: pt = path_tableaux.SemistandardPathTableau([[], [3], [3,2],
....:                                              [3,3,1], [3,3,2,1]])
sage: pt.local_rule(1)
[(), (2,), (3, 2), (3, 3, 1), (3, 3, 2, 1)]
sage: pt.local_rule(2)
[(), (3,), (3, 2), (3, 3, 1), (3, 3, 2, 1)]
sage: pt.local_rule(3)
[(), (3,), (3, 2), (3, 2, 2), (3, 3, 2, 1)]
```

```
>>> from sage.all import *
>>> pt = path_tableaux.SemistandardPathTableau([[], [Integer(3)], [Integer(3),
↪Integer(2)],
...                                             [Integer(3),Integer(3),
↪Integer(1)], [Integer(3),Integer(3),Integer(2),Integer(1)]])
>>> pt.local_rule(Integer(1))
[(), (2,), (3, 2), (3, 3, 1), (3, 3, 2, 1)]
>>> pt.local_rule(Integer(2))
[(), (3,), (3, 2), (3, 3, 1), (3, 3, 2, 1)]
>>> pt.local_rule(Integer(3))
[(), (3,), (3, 2), (3, 2, 2), (3, 3, 2, 1)]
```

rectify(*inner=None*, *verbose=False*)

Rectify `self`.

This gives the usual rectification of a skew standard tableau and gives a generalisation to skew semistandard tableaux. The usual construction uses jeu de taquin but here we use the Bender-Knuth involutions.

EXAMPLES:

```
sage: st = SkewTableau([[None, None, None, 4], [None, None, 1, 6],
....:                    [None, None, 5], [2, 3]])
sage: path_tableaux.SemistandardPathTableau(st).rectify()
[(), (1,), (1, 1), (2, 1, 0), (3, 1, 0, 0), (3, 2, 0, 0, 0), (4, 2, 0, 0, 0,␣
↪0)]
sage: path_tableaux.SemistandardPathTableau(st).rectify(verbose=True)
[[(3, 2, 2), (3, 3, 2, 0), (3, 3, 2, 1, 0), (3, 3, 2, 2, 0, 0),
  (4, 3, 2, 2, 0, 0, 0), (4, 3, 3, 2, 0, 0, 0, 0), (4, 4, 3, 2, 0, 0, 0, 0,␣
↪0)],
 [(3, 2), (3, 3, 0), (3, 3, 1, 0), (3, 3, 2, 0, 0), (4, 3, 2, 0, 0, 0),
  (4, 3, 3, 0, 0, 0, 0), (4, 4, 3, 0, 0, 0, 0, 0)],
 [(3,), (3, 1), (3, 1, 1), (3, 2, 1, 0), (4, 2, 1, 0, 0), (4, 3, 1, 0, 0, 0),
  (4, 4, 1, 0, 0, 0, 0)],
 [(), (1,), (1, 1), (2, 1, 0), (3, 1, 0, 0), (3, 2, 0, 0, 0), (4, 2, 0, 0, 0,␣
↪0)]]
```

```
>>> from sage.all import *
>>> st = SkewTableau([[None, None, None, Integer(4)], [None, None, Integer(1),
↪ Integer(6)],
...                   [None, None, Integer(5)], [Integer(2), Integer(3)]])
>>> path_tableaux.SemistandardPathTableau(st).rectify()
[(), (1,), (1, 1), (2, 1, 0), (3, 1, 0, 0), (3, 2, 0, 0, 0), (4, 2, 0, 0, 0,␣
↪0)]
>>> path_tableaux.SemistandardPathTableau(st).rectify(verbose=True)
[[(3, 2, 2), (3, 3, 2, 0), (3, 3, 2, 1, 0), (3, 3, 2, 2, 0, 0),
  (4, 3, 2, 2, 0, 0, 0), (4, 3, 3, 2, 0, 0, 0, 0), (4, 4, 3, 2, 0, 0, 0, 0,␣
↪0)],
 [(3, 2), (3, 3, 0), (3, 3, 1, 0), (3, 3, 2, 0, 0), (4, 3, 2, 0, 0, 0),
  (4, 3, 3, 0, 0, 0, 0), (4, 4, 3, 0, 0, 0, 0, 0)],
 [(3,), (3, 1), (3, 1, 1), (3, 2, 1, 0), (4, 2, 1, 0, 0), (4, 3, 1, 0, 0, 0),
  (4, 4, 1, 0, 0, 0, 0)],
 [(), (1,), (1, 1), (2, 1, 0), (3, 1, 0, 0), (3, 2, 0, 0, 0), (4, 2, 0, 0, 0,␣
↪0)]]
```

size()

Return the size or length of `self`.

EXAMPLES:

```
sage: path_tableaux.SemistandardPathTableau([[], [3], [3,2], [3,3,1], [3,3,2,
↪1]]).size()
5
```

```
>>> from sage.all import *
>>> path_tableaux.SemistandardPathTableau([[], [Integer(3)], [Integer(3),
↪Integer(2)], [Integer(3),Integer(3),Integer(1)], [Integer(3),Integer(3),
↪Integer(2),Integer(1)]]).size()
5
```

to_pattern()

Convert `self` to a Gelfand-Tsetlin pattern.

EXAMPLES:

```
sage: pt = path_tableaux.SemistandardPathTableau([[], [3], [3,2], [3,3,1],
....:                                              [3,3,2,1], [4,3,3,1]])
sage: pt.to_pattern()
[[4, 3, 3, 1, 0], [3, 3, 2, 1], [3, 3, 1], [3, 2], [3]]
```

```
>>> from sage.all import *
>>> pt = path_tableaux.SemistandardPathTableau([[], [Integer(3)], [Integer(3),
↪Integer(2)], [Integer(3),Integer(3),Integer(1)],
...                                              [Integer(3),Integer(3),
↪Integer(2),Integer(1)], [Integer(4),Integer(3),Integer(3),Integer(1)]])
>>> pt.to_pattern()
[[4, 3, 3, 1, 0], [3, 3, 2, 1], [3, 3, 1], [3, 2], [3]]
```

to_tableau()

Convert `self` to a *SemistandardTableau*.

The `SemistandardSkewTableau` is not implemented so this returns a *SkewTableau*

EXAMPLES:

```
sage: pt = path_tableaux.SemistandardPathTableau([[], [3], [3,2], [3,3,1],
....:                                              [3,3,2,1], [4,3,3,1,0]])
sage: pt.to_tableau()
[[1, 1, 1, 5], [2, 2, 3], [3, 4, 5], [4]]
```

```
>>> from sage.all import *
>>> pt = path_tableaux.SemistandardPathTableau([[], [Integer(3)], [Integer(3),
↪Integer(2)], [Integer(3),Integer(3),Integer(1)],
...                                              [Integer(3),Integer(3),
↪Integer(2),Integer(1)], [Integer(4),Integer(3),Integer(3),Integer(1),
↪Integer(0)]])
>>> pt.to_tableau()
[[1, 1, 1, 5], [2, 2, 3], [3, 4, 5], [4]]
```

class sage.combinat.path_tableaux.semistandard.**SemistandardPathTableaux**

Bases: *PathTableaux*

The parent class for *SemistandardPathTableau*.

Element

alias of *SemistandardPathTableau*

5.1.164 Plane Partitions

AUTHORS:

- Jang Soo Kim (2016): Initial implementation
- Jessica Striker (2016): Added additional methods
- Kevin Dilks (2021): Added symmetry classes

class sage.combinat.plane_partition.**PlanePartition**(*parent*, *pp*, *check=True*)

Bases: ClonableArray

A plane partition.

A *plane partition* is a stack of cubes in the positive orthant.

INPUT:

- PP – list of lists which represents a tableau
- box_size – (optional) a list [A, B, C] of 3 positive integers, where A, B, C are the lengths of the box in the x-axis, y-axis, z-axis, respectively; if this is not given, it is determined by the smallest box bounding PP

OUTPUT: the plane partition whose tableau representation is PP

EXAMPLES:

```
sage: PP = PlanePartition([[4,3,3,1],[2,1,1],[1,1]])
sage: PP
Plane partition [[4, 3, 3, 1], [2, 1, 1], [1, 1]]
```

```
>>> from sage.all import *
>>> PP = PlanePartition([[Integer(4),Integer(3),Integer(3),Integer(1)],
↪[Integer(2),Integer(1),Integer(1)],[Integer(1),Integer(1)]])
>>> PP
Plane partition [[4, 3, 3, 1], [2, 1, 1], [1, 1]]
```

bounding_box()

Return the smallest box (a, b, c) that self is contained in.

EXAMPLES:

```
sage: PP = PlanePartition([[5,2,1,1], [2,2], [2]])
sage: PP.bounding_box()
(3, 4, 5)
```

```
>>> from sage.all import *
>>> PP = PlanePartition([[Integer(5),Integer(2),Integer(1),Integer(1)],␣
↪[Integer(2),Integer(2)], [Integer(2)]])
>>> PP.bounding_box()
(3, 4, 5)
```

cells()

Return the list of cells inside `self`.

Each cell is a tuple.

EXAMPLES:

```
sage: PP = PlanePartition([[3,1],[2]])
sage: PP.cells()
[(0, 0, 0), (0, 0, 1), (0, 0, 2), (0, 1, 0), (1, 0, 0), (1, 0, 1)]
```

```
>>> from sage.all import *
>>> PP = PlanePartition([[Integer(3),Integer(1)],[Integer(2)]])
>>> PP.cells()
[(0, 0, 0), (0, 0, 1), (0, 0, 2), (0, 1, 0), (1, 0, 0), (1, 0, 1)]
```

check()

Check to see that `self` is a valid plane partition.

EXAMPLES:

```
sage: a = PlanePartition([[4,3,3,1],[2,1,1],[1,1]])
sage: a.check()
sage: b = PlanePartition([[1,2],[1]])
Traceback (most recent call last):
...
ValueError: not weakly decreasing along rows
sage: c = PlanePartition([[1,1],[2]])
Traceback (most recent call last):
...
ValueError: not weakly decreasing along columns
sage: d = PlanePartition([[2,-1],[-2]])
Traceback (most recent call last):
...
ValueError: entries not all nonnegative
sage: e = PlanePartition([[3/2,1],[.5]])
Traceback (most recent call last):
...
ValueError: entries not all integers
```

```
>>> from sage.all import *
>>> a = PlanePartition([[Integer(4),Integer(3),Integer(3),Integer(1)],
↪[Integer(2),Integer(1),Integer(1)],[Integer(1),Integer(1)]])
>>> a.check()
>>> b = PlanePartition([[Integer(1),Integer(2)],[Integer(1)]])
Traceback (most recent call last):
...
ValueError: not weakly decreasing along rows
>>> c = PlanePartition([[Integer(1),Integer(1)],[Integer(2)]])
Traceback (most recent call last):
...
ValueError: not weakly decreasing along columns
>>> d = PlanePartition([[Integer(2),-Integer(1)],[-Integer(2)]])
Traceback (most recent call last):
```

(continues on next page)

(continued from previous page)

```
...
ValueError: entries not all nonnegative
>>> e = PlanePartition([[Integer(3)/Integer(2),Integer(1)],[RealNumber('.5
↪')]])
Traceback (most recent call last):
...
ValueError: entries not all integers
```

complement(*tableau_only=False*)

Return the complement of `self`.

If the parent of `self` consists only of partitions inside a given box, then the complement is taken in this box. Otherwise, the complement is taken in the smallest box containing the plane partition. The empty plane partition with no box specified is its own complement.

If `tableau_only` is set to `True`, then only the tableau consisting of the projection of boxes size onto the xy-plane is returned instead of a `PlanePartition`. This output will not have empty trailing rows or trailing zeros removed.

EXAMPLES:

```
sage: PP = PlanePartition([[4,3,3,1],[2,1,1],[1,1]])
sage: PP.complement()
Plane partition [[4, 4, 3, 3], [4, 3, 3, 2], [3, 1, 1]]
sage: PP.complement(True)
[[4, 4, 3, 3], [4, 3, 3, 2], [3, 1, 1, 0]]
```

```
>>> from sage.all import *
>>> PP = PlanePartition([[Integer(4),Integer(3),Integer(3),Integer(1)],
↪[Integer(2),Integer(1),Integer(1)],[Integer(1),Integer(1)]])
>>> PP.complement()
Plane partition [[4, 4, 3, 3], [4, 3, 3, 2], [3, 1, 1]]
>>> PP.complement(True)
[[4, 4, 3, 3], [4, 3, 3, 2], [3, 1, 1, 0]]
```

contains(*PP*)

Return `True` if `PP` is a plane partition that fits inside `self`.

Specifically, `self` contains `PP` if, for all i, j, the height of `PP` at ij is less than or equal to the height of `self` at ij.

EXAMPLES:

```
sage: P1 = PlanePartition([[5,4,3], [3,2,2], [1]])
sage: P2 = PlanePartition([[3,2], [1,1], [0,0], [0,0]])
sage: P3 = PlanePartition([[5,5,5], [2,1,0]])
sage: P1.contains(P2)
True
sage: P2.contains(P1)
False
sage: P1.contains(P3)
False
sage: P3.contains(P2)
True
```

```
>>> from sage.all import *
>>> P1 = PlanePartition([[Integer(5),Integer(4),Integer(3)], [Integer(3),
↪Integer(2),Integer(2)], [Integer(1)]])
>>> P2 = PlanePartition([[Integer(3),Integer(2)], [Integer(1),Integer(1)],␣
↪[Integer(0),Integer(0)], [Integer(0),Integer(0)]])
>>> P3 = PlanePartition([[Integer(5),Integer(5),Integer(5)], [Integer(2),
↪Integer(1),Integer(0)]])
>>> P1.contains(P2)
True
>>> P2.contains(P1)
False
>>> P1.contains(P3)
False
>>> P3.contains(P2)
True
```

cyclically_rotate(*preserve_parent=False*)

Return the cyclic rotation of `self`.

By default, if the parent of `self` consists of plane partitions inside an $a \times b \times c$ box, the result will have a parent consisting of partitions inside a $c \times a \times b$ box, unless the optional parameter `preserve_parent` is set to `True`. Enabling this setting may give an element that is **not** an element of its parent.

EXAMPLES:

```
sage: PlanePartition([[3,2,1],[2,2],[2]]).cyclically_rotate()
Plane partition [[3, 3, 1], [2, 2], [1]]
sage: PP = PlanePartition([[4,1],[1],[1]])
sage: PP.cyclically_rotate()
Plane partition [[3, 1, 1, 1], [1]]
sage: PP == PP.cyclically_rotate().cyclically_rotate().cyclically_rotate()
True

sage: # needs sage.graphs sage.modules
sage: PP = PlanePartitions([4,3,2]).random_element()
sage: PP.cyclically_rotate().parent()
Plane partitions inside a 2 x 4 x 3 box
sage: PP = PlanePartitions([3,4,2])([[2,2,2,2],[2,2,2,2],[2,2,2,2]])
sage: PP_rotated = PP.cyclically_rotate(preserve_parent=True)
sage: PP_rotated in PP_rotated.parent()
False
```

```
>>> from sage.all import *
>>> PlanePartition([[Integer(3),Integer(2),Integer(1)],[Integer(2),
↪Integer(2)],[Integer(2)]]).cyclically_rotate()
Plane partition [[3, 3, 1], [2, 2], [1]]
>>> PP = PlanePartition([[Integer(4),Integer(1)],[Integer(1)],[Integer(1)]])
>>> PP.cyclically_rotate()
Plane partition [[3, 1, 1, 1], [1]]
>>> PP == PP.cyclically_rotate().cyclically_rotate().cyclically_rotate()
True

>>> # needs sage.graphs sage.modules
```

(continues on next page)

(continued from previous page)

```
>>> PP = PlanePartitions([Integer(4),Integer(3),Integer(2)]).random_element()
>>> PP.cyclically_rotate().parent()
Plane partitions inside a 2 x 4 x 3 box
>>> PP = PlanePartitions([Integer(3),Integer(4),Integer(2)])([[Integer(2),
↪Integer(2),Integer(2),Integer(2)],[Integer(2),Integer(2),Integer(2),
↪Integer(2)],[Integer(2),Integer(2),Integer(2),Integer(2)]])
>>> PP_rotated = PP.cyclically_rotate(preserve_parent=True)
>>> PP_rotated in PP_rotated.parent()
False
```

is_CSPP()

Return whether `self` is a cyclically symmetric plane partition.

A plane partition is cyclically symmetric if its x, y, and z tableaux are all equal.

EXAMPLES:

```
sage: PP = PlanePartition([[4,3,3,1],[2,1,1],[1,1]])
sage: PP.is_CSPP()
False
sage: PP = PlanePartition([[3,2,2],[3,1,0],[1,1,0]])
sage: PP.is_CSPP()
True
```

```
>>> from sage.all import *
>>> PP = PlanePartition([[Integer(4),Integer(3),Integer(3),Integer(1)],
↪[Integer(2),Integer(1),Integer(1)],[Integer(1),Integer(1)]])
>>> PP.is_CSPP()
False
>>> PP = PlanePartition([[Integer(3),Integer(2),Integer(2)],[Integer(3),
↪Integer(1),Integer(0)],[Integer(1),Integer(1),Integer(0)]])
>>> PP.is_CSPP()
True
```

is_CSSCPP()

Return whether `self` is a cyclically symmetric and self-complementary plane partition.

EXAMPLES:

```
sage: PP = PlanePartition([[4,3,3,1],[2,1,1],[1,1]])
sage: PP.is_CSSCPP()
False
sage: PP = PlanePartition([[4,4,4,1],[3,3,2,1],[3,2,1,1],[3,0,0,0]])
sage: PP.is_CSSCPP()
True
```

```
>>> from sage.all import *
>>> PP = PlanePartition([[Integer(4),Integer(3),Integer(3),Integer(1)],
↪[Integer(2),Integer(1),Integer(1)],[Integer(1),Integer(1)]])
>>> PP.is_CSSCPP()
False
>>> PP = PlanePartition([[Integer(4),Integer(4),Integer(4),Integer(1)],
↪[Integer(3),Integer(3),Integer(2),Integer(1)],[Integer(3),Integer(2),
```

(continues on next page)

(continued from previous page)

```
↪Integer(1),Integer(1)],[Integer(3),Integer(0),Integer(0),Integer(0)]])
>>> PP.is_CSSCPP()
True
```

is_CSTCPP()

Return whether self is a cyclically symmetric and transpose-complementary plane partition.

EXAMPLES:

```
sage: PP = PlanePartition([[4,3,3,1],[2,1,1],[1,1]])
sage: PP.is_CSTCPP()
False
sage: PP = PlanePartition([[4,4,3,2],[4,3,2,1],[3,2,1,0],[2,1,0,0]])
sage: PP.is_CSTCPP()
True
```

```
>>> from sage.all import *
>>> PP = PlanePartition([[Integer(4),Integer(3),Integer(3),Integer(1)],
↪[Integer(2),Integer(1),Integer(1)],[Integer(1),Integer(1)]])
>>> PP.is_CSTCPP()
False
>>> PP = PlanePartition([[Integer(4),Integer(4),Integer(3),Integer(2)],
↪[Integer(4),Integer(3),Integer(2),Integer(1)],[Integer(3),Integer(2),
↪Integer(1),Integer(0)],[Integer(2),Integer(1),Integer(0),Integer(0)]])
>>> PP.is_CSTCPP()
True
```

is_SCPP()

Return whether self is a self-complementary plane partition.

Note that the complement of a plane partition (and thus the property of being self-complementary) is dependent on the choice of a box that it is contained in. If no parent/bounding box is specified, the box is taken to be the smallest box that contains the plane partition.

EXAMPLES:

```
sage: PP = PlanePartition([[4,3,3,1],[2,1,1],[1,1]])
sage: PP.is_SCPP()
False
sage: PP = PlanePartition([[4,4,4,4],[4,4,2,0],[4,2,0,0],[0,0,0,0]])
sage: PP.is_SCPP()
False
sage: PP = PlanePartitions([4,4,4])([[4,4,4,4],[4,4,2,0],[4,2,0,0],[0,0,0,0]])
sage: PP.is_SCPP()
True
```

```
>>> from sage.all import *
>>> PP = PlanePartition([[Integer(4),Integer(3),Integer(3),Integer(1)],
↪[Integer(2),Integer(1),Integer(1)],[Integer(1),Integer(1)]])
>>> PP.is_SCPP()
False
>>> PP = PlanePartition([[Integer(4),Integer(4),Integer(4),Integer(4)],
↪[Integer(4),Integer(4),Integer(2),Integer(0)],[Integer(4),Integer(2),
```

(continues on next page)

(continued from previous page)

```
↪Integer(0),Integer(0)],[Integer(0),Integer(0),Integer(0),Integer(0)]])
>>> PP.is_SCPP()
False
>>> PP = PlanePartitions([Integer(4),Integer(4),Integer(4)])([[Integer(4),
↪Integer(4),Integer(4),Integer(4)],[Integer(4),Integer(4),Integer(2),
↪Integer(0)],[Integer(4),Integer(2),Integer(0),Integer(0)],[Integer(0),
↪Integer(0),Integer(0),Integer(0)]])
>>> PP.is_SCPP()
True
```

is_SPP()

Return whether `self` is a symmetric plane partition.

A plane partition is symmetric if the corresponding tableau is symmetric about the diagonal.

EXAMPLES:

```
sage: PP = PlanePartition([[4,3,3,1],[2,1,1],[1,1]])
sage: PP.is_SPP()
False
sage: PP = PlanePartition([[3,3,2],[3,3,2],[2,2,2]])
sage: PP.is_SPP()
True
sage: PP = PlanePartition([[3,2,1],[2,0,0]])
sage: PP.is_SPP()
False
sage: PP = PlanePartition([[3,2,0],[2,0,0]])
sage: PP.is_SPP()
True
sage: PP = PlanePartition([[3,2],[2,0],[1,0]])
sage: PP.is_SPP()
False
sage: PP = PlanePartition([[3,2],[2,0],[0,0]])
sage: PP.is_SPP()
True
```

```
>>> from sage.all import *
>>> PP = PlanePartition([[Integer(4),Integer(3),Integer(3),Integer(1)],
↪[Integer(2),Integer(1),Integer(1)],[Integer(1),Integer(1)]])
>>> PP.is_SPP()
False
>>> PP = PlanePartition([[Integer(3),Integer(3),Integer(2)],[Integer(3),
↪Integer(3),Integer(2)],[Integer(2),Integer(2),Integer(2)]])
>>> PP.is_SPP()
True
>>> PP = PlanePartition([[Integer(3),Integer(2),Integer(1)],[Integer(2),
↪Integer(0),Integer(0)]])
>>> PP.is_SPP()
False
>>> PP = PlanePartition([[Integer(3),Integer(2),Integer(0)],[Integer(2),
↪Integer(0),Integer(0)]])
>>> PP.is_SPP()
True
```

(continues on next page)

(continued from previous page)

```
>>> PP = PlanePartition([[Integer(3),Integer(2)],[Integer(2),Integer(0)],
↪[Integer(1),Integer(0)]])
>>> PP.is_SPP()
False
>>> PP = PlanePartition([[Integer(3),Integer(2)],[Integer(2),Integer(0)],
↪[Integer(0),Integer(0)]])
>>> PP.is_SPP()
True
```

is_SSCPP()

Return whether `self` is a symmetric, self-complementary plane partition.

EXAMPLES:

```
sage: PP = PlanePartition([[4,3,3,1],[2,1,1],[1,1]])
sage: PP.is_SSCPP()
False
sage: PP = PlanePartition([[4,3,3,2],[3,2,2,1],[3,2,2,1],[2,1,1,0]])
sage: PP.is_SSCPP()
True
sage: PP = PlanePartition([[2,1],[1,0]])
sage: PP.is_SSCPP()
True
sage: PP = PlanePartition([[4,3,2],[3,2,1],[2,1,0]])
sage: PP.is_SSCPP()
True
sage: PP = PlanePartition([[4,2,2,2],[2,2,2,2],[2,2,2,2],[2,2,2,0]])
sage: PP.is_SSCPP()
True
```

```
>>> from sage.all import *
>>> PP = PlanePartition([[Integer(4),Integer(3),Integer(3),Integer(1)],
↪[Integer(2),Integer(1),Integer(1)],[Integer(1),Integer(1)]])
>>> PP.is_SSCPP()
False
>>> PP = PlanePartition([[Integer(4),Integer(3),Integer(3),Integer(2)],
↪[Integer(3),Integer(2),Integer(2),Integer(1)],[Integer(3),Integer(2),
↪Integer(2),Integer(1)],[Integer(2),Integer(1),Integer(1),Integer(0)]])
>>> PP.is_SSCPP()
True
>>> PP = PlanePartition([[Integer(2),Integer(1)],[Integer(1),Integer(0)]])
>>> PP.is_SSCPP()
True
>>> PP = PlanePartition([[Integer(4),Integer(3),Integer(2)],[Integer(3),
↪Integer(2),Integer(1)],[Integer(2),Integer(1),Integer(0)]])
>>> PP.is_SSCPP()
True
>>> PP = PlanePartition([[Integer(4),Integer(2),Integer(2),Integer(2)],
↪[Integer(2),Integer(2),Integer(2),Integer(2)],[Integer(2),Integer(2),
↪Integer(2),Integer(2)],[Integer(2),Integer(2),Integer(2),Integer(0)]])
>>> PP.is_SSCPP()
True
```

is_TCPP()

Return whether `self` is a transpose-complementary plane partition.

EXAMPLES:

```
sage: PP = PlanePartition([[4,3,3,1],[2,1,1],[1,1]])
sage: PP.is_TCPP()
False
sage: PP = PlanePartition([[4,4,3,2],[4,4,2,1],[4,2,0,0],[2,0,0,0]])
sage: PP.is_TCPP()
True
```

```
>>> from sage.all import *
>>> PP = PlanePartition([[Integer(4),Integer(3),Integer(3),Integer(1)],
↪[Integer(2),Integer(1),Integer(1)],[Integer(1),Integer(1)]])
>>> PP.is_TCPP()
False
>>> PP = PlanePartition([[Integer(4),Integer(4),Integer(3),Integer(2)],
↪[Integer(4),Integer(4),Integer(2),Integer(1)],[Integer(4),Integer(2),
↪Integer(0),Integer(0)],[Integer(2),Integer(0),Integer(0),Integer(0)]])
>>> PP.is_TCPP()
True
```

is_TSPP()

Return whether `self` is a totally symmetric plane partition.

A plane partition is totally symmetric if it is both symmetric and cyclically symmetric.

EXAMPLES:

```
sage: PP = PlanePartition([[4,3,3,1],[2,1,1],[1,1]])
sage: PP.is_TSPP()
False
sage: PP = PlanePartition([[3,3,3],[3,3,2],[3,2,1]])
sage: PP.is_TSPP()
True
```

```
>>> from sage.all import *
>>> PP = PlanePartition([[Integer(4),Integer(3),Integer(3),Integer(1)],
↪[Integer(2),Integer(1),Integer(1)],[Integer(1),Integer(1)]])
>>> PP.is_TSPP()
False
>>> PP = PlanePartition([[Integer(3),Integer(3),Integer(3)],[Integer(3),
↪Integer(3),Integer(2)],[Integer(3),Integer(2),Integer(1)]])
>>> PP.is_TSPP()
True
```

is_TSSCPP()

Return whether `self` is a totally symmetric self-complementary plane partition.

EXAMPLES:

```
sage: PP = PlanePartition([[4,3,3,1],[2,1,1],[1,1]])
sage: PP.is_TSSCPP()
False
```

(continues on next page)

(continued from previous page)

```
sage: PP = PlanePartition([[4,4,3,2],[4,3,2,1],[3,2,1,0],[2,1,0,0]])
sage: PP.is_TSSCPP()
True
```

```
>>> from sage.all import *
>>> PP = PlanePartition([[Integer(4),Integer(3),Integer(3),Integer(1)],
↪[Integer(2),Integer(1),Integer(1)],[Integer(1),Integer(1)]])
>>> PP.is_TSSCPP()
False
>>> PP = PlanePartition([[Integer(4),Integer(4),Integer(3),Integer(2)],
↪[Integer(4),Integer(3),Integer(2),Integer(1)],[Integer(3),Integer(2),
↪Integer(1),Integer(0)],[Integer(2),Integer(1),Integer(0),Integer(0)]])
>>> PP.is_TSSCPP()
True
```

maximal_boxes()

Return the coordinates of the maximal boxes of `self`.

The maximal boxes of a plane partitions are the boxes that can be removed from a plane partition and still yield a valid plane partition.

EXAMPLES:

```
sage: sorted(PlanePartition([[3,2,1],[2,2],[2]]).maximal_boxes())
[[0, 0, 2], [0, 2, 0], [1, 1, 1], [2, 0, 1]]
sage: sorted(PlanePartition([[2,1],[1],[1]]).maximal_boxes())
[[0, 0, 1], [0, 1, 0], [2, 0, 0]]
```

```
>>> from sage.all import *
>>> sorted(PlanePartition([[Integer(3),Integer(2),Integer(1)],[Integer(2),
↪Integer(2)],[Integer(2)]]).maximal_boxes())
[[0, 0, 2], [0, 2, 0], [1, 1, 1], [2, 0, 1]]
>>> sorted(PlanePartition([[Integer(2),Integer(1)],[Integer(1)],
↪[Integer(1)]]).maximal_boxes())
[[0, 0, 1], [0, 1, 0], [2, 0, 0]]
```

number_of_boxes()

Return the number of boxes in the plane partition.

EXAMPLES:

```
sage: PP = PlanePartition([[3,1],[2]])
sage: PP.number_of_boxes()
6
```

```
>>> from sage.all import *
>>> PP = PlanePartition([[Integer(3),Integer(1)],[Integer(2)]])
>>> PP.number_of_boxes()
6
```

plot(*show_box=False*, *colors=None*)

Return a plot of `self`.

INPUT:

- `show_box` – boolean (default: `False`); if `True`, also shows the visible tiles on the xy-, yz-, zx-planes
- `colors` – (default: `["white", "lightgray", "darkgray"]`) list `[A, B, C]` of 3 strings representing colors

EXAMPLES:

```
sage: PP = PlanePartition([[4,3,3,1],[2,1,1],[1,1]])
sage: PP.plot()                                                              #␣
↪needs sage.plot
Graphics object consisting of 27 graphics primitives
```

```
>>> from sage.all import *
>>> PP = PlanePartition([[Integer(4),Integer(3),Integer(3),Integer(1)],
↪[Integer(2),Integer(1),Integer(1)],[Integer(1),Integer(1)]])
>>> PP.plot()                                                              #␣
↪needs sage.plot
Graphics object consisting of 27 graphics primitives
```

plot3d(*colors=None*)

Return a 3D-plot of `self`.

INPUT:

- `colors` – (default: `["white", "lightgray", "darkgray"]`) list `[A, B, C]` of 3 strings representing colors

EXAMPLES:

```
sage: PP = PlanePartition([[4,3,3,1],[2,1,1],[1,1]])
sage: PP.plot3d()                                                            #␣
↪needs sage.plot
Graphics3d Object
```

```
>>> from sage.all import *
>>> PP = PlanePartition([[Integer(4),Integer(3),Integer(3),Integer(1)],
↪[Integer(2),Integer(1),Integer(1)],[Integer(1),Integer(1)]])
>>> PP.plot3d()                                                            #␣
↪needs sage.plot
Graphics3d Object
```

pp(*show_box=False*)

Return a pretty print of the plane partition.

INPUT:

- `show_box` – boolean (default: `False`); if `True`, also shows the visible tiles on the xy-, yz-, zx-planes

OUTPUT: a pretty print of the plane partition

EXAMPLES:

```
sage: PlanePartition([[4,3,3,1],[2,1,1],[1,1]]).pp()
        __
       /\_\
    __/\/_/

```

to_order_ideal()

Return the order ideal corresponding to `self`.

> **Todo**
>
> As many families of symmetric plane partitions are in bijection with order ideals in an associated poset, this function could feasibly have options to send symmetric plane partitions to the associated order ideal in that poset, instead.

EXAMPLES:

```
sage: PlanePartition([[3,2,1],[2,2],[2]]).to_order_ideal()                    #␣
↪needs sage.graphs sage.modules
[(0, 0, 0), (0, 0, 1), (0, 0, 2), (0, 1, 0), (0, 1, 1), (0, 2, 0),
 (1, 0, 0), (1, 0, 1), (1, 1, 0), (1, 1, 1), (2, 0, 0), (2, 0, 1)]
sage: PlanePartition([[2,1],[1],[1]]).to_order_ideal()                        #␣
↪needs sage.graphs sage.modules
[(0, 0, 0), (0, 0, 1), (0, 1, 0), (1, 0, 0), (2, 0, 0)]
```

```
>>> from sage.all import *
>>> PlanePartition([[Integer(3),Integer(2),Integer(1)],[Integer(2),
↪Integer(2)],[Integer(2)]]).to_order_ideal()                        # needs sage.
↪graphs sage.modules
[(0, 0, 0), (0, 0, 1), (0, 0, 2), (0, 1, 0), (0, 1, 1), (0, 2, 0),
 (1, 0, 0), (1, 0, 1), (1, 1, 0), (1, 1, 1), (2, 0, 0), (2, 0, 1)]
>>> PlanePartition([[Integer(2),Integer(1)],[Integer(1)],[Integer(1)]]).to_
↪order_ideal()                          # needs sage.graphs sage.modules
[(0, 0, 0), (0, 0, 1), (0, 1, 0), (1, 0, 0), (2, 0, 0)]
```

to_tableau()

Return the tableau class of `self`.

EXAMPLES:

```
sage: PP = PlanePartition([[4,3,3,1],[2,1,1],[1,1]])
sage: PP.to_tableau()
[[4, 3, 3, 1], [2, 1, 1], [1, 1]]
```

```
>>> from sage.all import *
>>> PP = PlanePartition([[Integer(4),Integer(3),Integer(3),Integer(1)],
↪[Integer(2),Integer(1),Integer(1)],[Integer(1),Integer(1)]])
>>> PP.to_tableau()
[[4, 3, 3, 1], [2, 1, 1], [1, 1]]
```

transpose(*tableau_only=False*)

Return the transpose of `self`.

If `tableau_only` is set to `True`, then only the tableau consisting of the projection of boxes size onto the xy-plane is returned instead of a `PlanePartition`. This will not necessarily have trailing rows or trailing zeros removed.

EXAMPLES:

```
sage: PP = PlanePartition([[4,3,3,1],[2,1,1],[1,1]])
sage: PP.transpose()
Plane partition [[4, 2, 1], [3, 1, 1], [3, 1], [1]]
sage: PP.transpose(True)
[[4, 2, 1], [3, 1, 1], [3, 1, 0], [1, 0, 0]]

sage: PPP = PlanePartitions([1, 2, 3])
sage: PP = PPP([[1, 1]])
sage: PT = PP.transpose(); PT
Plane partition [[1], [1]]
sage: PT.parent()
Plane partitions inside a 2 x 1 x 3 box
```

```
>>> from sage.all import *
>>> PP = PlanePartition([[Integer(4),Integer(3),Integer(3),Integer(1)],
↪[Integer(2),Integer(1),Integer(1)],[Integer(1),Integer(1)]])
>>> PP.transpose()
Plane partition [[4, 2, 1], [3, 1, 1], [3, 1], [1]]
>>> PP.transpose(True)
[[4, 2, 1], [3, 1, 1], [3, 1, 0], [1, 0, 0]]

>>> PPP = PlanePartitions([Integer(1), Integer(2), Integer(3)])
>>> PP = PPP([[Integer(1), Integer(1)]])
>>> PT = PP.transpose(); PT
Plane partition [[1], [1]]
>>> PT.parent()
Plane partitions inside a 2 x 1 x 3 box
```

x_tableau(*tableau=True*)

Return the projection of `self` in the x direction.

If `tableau` is set to `False`, then only the list of lists consisting of the projection of boxes size onto the yz-plane is returned instead of a `Tableau` object. This output will not have empty trailing rows or trailing zeros removed.

EXAMPLES:

```
sage: PP = PlanePartition([[4,3,3,1],[2,1,1],[1,1]])
sage: PP.x_tableau()
[[3, 2, 1, 1], [3, 1, 1, 0], [2, 1, 1, 0], [1, 0, 0, 0]]
```

```
>>> from sage.all import *
>>> PP = PlanePartition([[Integer(4),Integer(3),Integer(3),Integer(1)],
↪[Integer(2),Integer(1),Integer(1)],[Integer(1),Integer(1)]])
>>> PP.x_tableau()
[[3, 2, 1, 1], [3, 1, 1, 0], [2, 1, 1, 0], [1, 0, 0, 0]]
```

y_tableau(*tableau=True*)

Return the projection of `self` in the y direction.

If `tableau` is set to `False`, then only the list of lists consisting of the projection of boxes size onto the xz-plane is returned instead of a `Tableau` object. This output will not have empty trailing rows or trailing zeros removed.

EXAMPLES:

```
sage: PP = PlanePartition([[4,3,3,1],[2,1,1],[1,1]])
sage: PP.y_tableau()
[[4, 3, 2], [3, 1, 0], [3, 0, 0], [1, 0, 0]]
```

```
>>> from sage.all import *
>>> PP = PlanePartition([[Integer(4),Integer(3),Integer(3),Integer(1)],
↪[Integer(2),Integer(1),Integer(1)],[Integer(1),Integer(1)]])
>>> PP.y_tableau()
[[4, 3, 2], [3, 1, 0], [3, 0, 0], [1, 0, 0]]
```

z_tableau(*tableau=True*)

Return the projection of `self` in the z direction.

If `tableau` is set to `False`, then only the list of lists consisting of the projection of boxes size onto the xy-plane is returned instead of a *Tableau* object. This output will not have empty trailing rows or trailing zeros removed.

EXAMPLES:

```
sage: PP = PlanePartition([[4,3,3,1],[2,1,1],[1,1]])
sage: PP.z_tableau()
[[4, 3, 3, 1], [2, 1, 1, 0], [1, 1, 0, 0]]
```

```
>>> from sage.all import *
>>> PP = PlanePartition([[Integer(4),Integer(3),Integer(3),Integer(1)],
↪[Integer(2),Integer(1),Integer(1)],[Integer(1),Integer(1)]])
>>> PP.z_tableau()
[[4, 3, 3, 1], [2, 1, 1, 0], [1, 1, 0, 0]]
```

class `sage.combinat.plane_partition.`**`PlanePartitions`**(*box_size=None*, *symmetry=None*, *category=None*)

Bases: `UniqueRepresentation`, `Parent`

Plane partitions.

`PlanePartitions()` returns the class of all plane partitions.

`PlanePartitions(n)` return the class of all plane partitions with precisely n boxes.

`PlanePartitions([a, b, c])` returns the class of plane partitions that fit inside an $a \times b \times c$ box.

`PlanePartitions([a, b, c])` has the optional keyword `symmetry`, which restricts the plane partitions inside a box of the specified size satisfying certain symmetry conditions.

- `symmetry='SPP'` gives the class of symmetric plane partitions. which is all plane partitions fixed under reflection across the diagonal. Requires that $a = b$.
- `symmetry='CSPP'` gives the class of cyclic plane partitions, which is all plane partitions fixed under cyclic rotation of coordinates. Requires that $a = b = c$.
- `symmetry='TSPP'` gives the class of totally symmetric plane partitions, which is all plane partitions fixed under any interchanging of coordinates. Requires that $a = b = c$.
- `symmetry='SCPP'` gives the class of self-complementary plane partitions. which is all plane partitions that are equal to their own complement in the specified box. Requires at least one of a, b, c be even.
- `symmetry='TCPP'` gives the class of transpose complement plane partitions, which is all plane partitions whose complement in the box of the specified size is equal to their transpose. Requires $a = b$ and at least one of a, b, c be even.
- `symmetry='SSCPP'` gives the class of symmetric self-complementary plane partitions, which is all plane partitions that are both symmetric and self-complementary. Requires $a = b$ and at least one of a, b, c be even.
- `symmetry='CSTCPP'` gives the class of cyclically symmetric transpose complement plane partitions, which is all plane partitions that are both symmetric and equal to the transpose of their complement. Requires $a = b = c$.
- `symmetry='CSSCPP'` gives the class of cyclically symmetric self-complementary plane partitions, which is all plane partitions that are both cyclically symmetric and self-complementary. Requires $a = b = c$ and all a, b, c be even.

- `symmetry='TSSCPP'` gives the class of totally symmetric self-complementary plane partitions, which is all plane partitions that are totally symmetric and also self-complementary. Requires $a = b = c$ and all a, b, c be even.

EXAMPLES:

If no arguments are passed, then the class of all plane partitions is returned:

```
sage: PlanePartitions()
Plane partitions
sage: [[2,1],[1]] in PlanePartitions()
True
```

```
>>> from sage.all import *
>>> PlanePartitions()
Plane partitions
>>> [[Integer(2),Integer(1)],[Integer(1)]] in PlanePartitions()
True
```

If an integer n is passed, then the class of plane partitions of n is returned:

```
sage: PlanePartitions(3)
Plane partitions of size 3
sage: PlanePartitions(3).list()
[Plane partition [[3]],
 Plane partition [[2, 1]],
 Plane partition [[1, 1, 1]],
 Plane partition [[2], [1]],
 Plane partition [[1, 1], [1]],
 Plane partition [[1], [1], [1]]]
```

```
>>> from sage.all import *
>>> PlanePartitions(Integer(3))
Plane partitions of size 3
>>> PlanePartitions(Integer(3)).list()
[Plane partition [[3]],
 Plane partition [[2, 1]],
 Plane partition [[1, 1, 1]],
 Plane partition [[2], [1]],
 Plane partition [[1, 1], [1]],
 Plane partition [[1], [1], [1]]]
```

If a three-element tuple or list $[a, b, c]$ is passed, then the class of all plane partitions that fit inside and $a \times b \times c$ box is returned:

```
sage: PlanePartitions([2,2,2])
Plane partitions inside a 2 x 2 x 2 box
sage: [[2,1],[1]] in PlanePartitions([2,2,2])
True
```

```
>>> from sage.all import *
>>> PlanePartitions([Integer(2),Integer(2),Integer(2)])
Plane partitions inside a 2 x 2 x 2 box
>>> [[Integer(2),Integer(1)],[Integer(1)]] in PlanePartitions([Integer(2),
```

(continues on next page)

(continued from previous page)

```
↪Integer(2),Integer(2)])
True
```

If an additional keyword `symmetry` is pass along with a three-element tuple or list $[a, b, c]$, then the class of all plane partitions that fit inside an $a \times b \times c$ box with the specified symmetry is returned:

```
sage: PlanePartitions([2,2,2], symmetry='CSPP')
Cyclically symmetric plane partitions inside a 2 x 2 x 2 box
sage: [[2,1],[1]] in PlanePartitions([2,2,2], symmetry='CSPP')
True
```

```
>>> from sage.all import *
>>> PlanePartitions([Integer(2),Integer(2),Integer(2)], symmetry='CSPP')
Cyclically symmetric plane partitions inside a 2 x 2 x 2 box
>>> [[Integer(2),Integer(1)],[Integer(1)]] in PlanePartitions([Integer(2),
↪Integer(2),Integer(2)], symmetry='CSPP')
True
```

Element

alias of *PlanePartition*

box()

Return the size of the box of the plane partition of `self` is contained in.

EXAMPLES:

```
sage: P = PlanePartitions([4,3,5])
sage: P.box()
(4, 3, 5)
```

(continues on next page)

(continued from previous page)

```
sage: PP = PlanePartitions()
sage: PP.box() is None
True
```

```
>>> from sage.all import *
>>> P = PlanePartitions([Integer(4),Integer(3),Integer(5)])
>>> P.box()
(4, 3, 5)

>>> PP = PlanePartitions()
>>> PP.box() is None
True
```

symmetry()

Return the symmetry class of `self`.

EXAMPLES:

```
sage: PP = PlanePartitions([3,3,2], symmetry='SPP')
sage: PP.symmetry()
'SPP'
sage: PP = PlanePartitions()
sage: PP.symmetry() is None
True
```

```
>>> from sage.all import *
>>> PP = PlanePartitions([Integer(3),Integer(3),Integer(2)], symmetry='SPP')
>>> PP.symmetry()
'SPP'
>>> PP = PlanePartitions()
>>> PP.symmetry() is None
True
```

class sage.combinat.plane_partition.**PlanePartitions_CSPP**(*box_size*)

Bases: *PlanePartitions*

Plane partitions that fit inside a box of a specified size that are cyclically symmetric.

cardinality()

Return the cardinality of `self`.

The number of cyclically symmetric plane partitions inside an $a \times a \times a$ box is equal to

$$\left(\prod_{i=1}^{a} \frac{3i-1}{3i-2}\right)\left(\prod_{1\leq i<j\leq a} \frac{i+j+a-1}{2i+j-1}\right).$$

EXAMPLES:

```
sage: P = PlanePartitions([4,4,4], symmetry='CSPP')
sage: P.cardinality()
132
```

```
>>> from sage.all import *
>>> P = PlanePartitions([Integer(4),Integer(4),Integer(4)], symmetry='CSPP')
>>> P.cardinality()
132
```

from_antichain(*acl*)

Return the cyclically symmetric plane partition corresponding to an antichain in the poset given in *to_poset()*.

EXAMPLES:

```
sage: PP = PlanePartitions([3,3,3], symmetry='CSPP')
sage: A = [(0, 2, 2), (1, 1, 1)]
sage: PP.from_antichain(A)
Plane partition [[3, 3, 3], [3, 2, 1], [3, 1, 1]]
```

```
>>> from sage.all import *
>>> PP = PlanePartitions([Integer(3),Integer(3),Integer(3)], symmetry='CSPP')
>>> A = [(Integer(0), Integer(2), Integer(2)), (Integer(1), Integer(1),␣
↪Integer(1))]
>>> PP.from_antichain(A)
Plane partition [[3, 3, 3], [3, 2, 1], [3, 1, 1]]
```

from_order_ideal(*I*)

Return the cylically symmetric plane partition corresponding to an order ideal in the poset given in *to_poset()*.

EXAMPLES:

```
sage: PP = PlanePartitions([3,3,3], symmetry='CSPP')
sage: I = [(0, 0, 0), (0, 0, 1), (0, 0, 2), (0, 1, 1), (0, 1, 2),
....:      (1, 0, 2), (0, 2, 2), (1, 1, 1), (1, 1, 2), (1, 2, 2)]
sage: PP.from_order_ideal(I)                                             #␣
↪needs sage.graphs
Plane partition [[3, 3, 3], [3, 3, 3], [3, 3, 2]]
```

```
>>> from sage.all import *
>>> PP = PlanePartitions([Integer(3),Integer(3),Integer(3)], symmetry='CSPP')
>>> I = [(Integer(0), Integer(0), Integer(0)), (Integer(0), Integer(0),␣
↪Integer(1)), (Integer(0), Integer(0), Integer(2)), (Integer(0), Integer(1),␣
↪Integer(1)), (Integer(0), Integer(1), Integer(2)),
...      (Integer(1), Integer(0), Integer(2)), (Integer(0), Integer(2),␣
↪Integer(2)), (Integer(1), Integer(1), Integer(1)), (Integer(1), Integer(1),␣
↪Integer(2)), (Integer(1), Integer(2), Integer(2))]
>>> PP.from_order_ideal(I)                                             #␣
↪needs sage.graphs
Plane partition [[3, 3, 3], [3, 3, 3], [3, 3, 2]]
```

random_element()

Return a uniformly random element of `self`.

ALGORITHM:

This uses the *random_order_ideal()* method and the natural bijection between cyclically symmetric plane partitions and order ideals in an associated poset.

EXAMPLES:

```
sage: PP = PlanePartitions([3,3,3], symmetry='CSPP')
sage: PP.random_element()   # random                                        #␣
↪needs sage.graphs
Plane partition [[3, 2, 2], [3, 1], [1, 1]]
```

```
>>> from sage.all import *
>>> PP = PlanePartitions([Integer(3),Integer(3),Integer(3)], symmetry='CSPP')
>>> PP.random_element()   # random                                        #␣
↪needs sage.graphs
Plane partition [[3, 2, 2], [3, 1], [1, 1]]
```

to_poset()

Return a partially ordered set whose order ideals are in bijection with cyclically symmetric plane partitions.

EXAMPLES:

```
sage: PP = PlanePartitions([3,3,3], symmetry='CSPP')
sage: PP.to_poset()                                                         #␣
↪needs sage.graphs
Finite poset containing 11 elements
sage: PP.to_poset().order_ideals_lattice().cardinality() == PP.cardinality() ␣
↪          # needs sage.graphs
True
```

```
>>> from sage.all import *
>>> PP = PlanePartitions([Integer(3),Integer(3),Integer(3)], symmetry='CSPP')
>>> PP.to_poset()                                                         #␣
↪needs sage.graphs
Finite poset containing 11 elements
>>> PP.to_poset().order_ideals_lattice().cardinality() == PP.cardinality()   ␣
↪          # needs sage.graphs
True
```

class sage.combinat.plane_partition.**PlanePartitions_CSSCPP**(*box_size*)

Bases: *PlanePartitions*

Plane partitions that fit inside a box of a specified size that are cyclically symmetric self-complementary.

cardinality()

Return the cardinality of `self`.

The number of cyclically symmetric self-complementary plane partitions inside a $2a \times 2a \times 2a$ box is equal to

$$\left(\prod_{i=0}^{a-1} \frac{(3i+1)!}{(a+i)!}\right)^2.$$

EXAMPLES:

```
sage: P = PlanePartitions([6,6,6], symmetry='CSSCPP')
sage: P.cardinality()
49
```

```
>>> from sage.all import *
>>> P = PlanePartitions([Integer(6),Integer(6),Integer(6)], symmetry='CSSCPP')
>>> P.cardinality()
49
```

class sage.combinat.plane_partition.**PlanePartitions_CSTCPP**(*box_size*)

Bases: *PlanePartitions*

Plane partitions that fit inside a box of a specified size that are cyclically symmetric and transpose-complement.

cardinality()

Return the cardinality of self.

The number of cyclically symmetric transpose complement plane partitions inside a $2a \times 2a \times 2a$ box is equal to

$$\prod_{i=0}^{a-1} \frac{(3i+1)(6i)!(2i)!}{(4i+1)!(4i)!}.$$

EXAMPLES:

```
sage: P = PlanePartitions([6,6,6], symmetry='CSTCPP')
sage: P.cardinality()
11
```

```
>>> from sage.all import *
>>> P = PlanePartitions([Integer(6),Integer(6),Integer(6)], symmetry='CSTCPP')
>>> P.cardinality()
11
```

class sage.combinat.plane_partition.**PlanePartitions_SCPP**(*box_size*)

Bases: *PlanePartitions*

Plane partitions that fit inside a box of a specified size that are self-complementary.

cardinality()

Return the cardinality of self.

The number of self complementary plane partitions inside a $2a \times 2b \times 2c$ box is equal to

$$\left(\prod_{i=1}^{r}\prod_{j=1}^{b} \frac{i+j+c-1}{i+j-1}\right)^2.$$

The number of self complementary plane partitions inside an $(2a+1) \times 2b \times 2c$ box is equal to

$$\left(\prod_{i=1}^{a}\prod_{j=1}^{b} \frac{i+j+c-1}{i+j-1}\right)\left(\prod_{i=1}^{a+1}\prod_{j=1}^{b} \frac{i+j+c-1}{i+j-1}\right).$$

The number of self complementary plane partitions inside an $(2a+1) \times (2b+1) \times 2c$ box is equal to

$$\left(\prod_{i=1}^{a+1}\prod_{j=1}^{b} \frac{i+j+c-1}{i+j-1}\right)\left(\prod_{i=1}^{a}\prod_{j=1}^{b+1} \frac{i+j+c-1}{i+j-1}\right).$$

EXAMPLES:

```
sage: P = PlanePartitions([4,4,4], symmetry='SCPP')
sage: P.cardinality()
400

sage: P = PlanePartitions([5,4,4], symmetry='SCPP')
sage: P.cardinality()
1000
sage: P = PlanePartitions([4,5,4], symmetry='SCPP')
sage: P.cardinality()
1000
sage: P = PlanePartitions([4,4,5], symmetry='SCPP')
sage: P.cardinality()
1000

sage: P = PlanePartitions([5,5,4], symmetry='SCPP')
sage: P.cardinality()
2500
sage: P = PlanePartitions([5,4,5], symmetry='SCPP')
sage: P.cardinality()
2500
sage: P = PlanePartitions([4,5,5], symmetry='SCPP')
sage: P.cardinality()
2500
```

```
>>> from sage.all import *
>>> P = PlanePartitions([Integer(4),Integer(4),Integer(4)], symmetry='SCPP')
>>> P.cardinality()
400

>>> P = PlanePartitions([Integer(5),Integer(4),Integer(4)], symmetry='SCPP')
>>> P.cardinality()
1000
>>> P = PlanePartitions([Integer(4),Integer(5),Integer(4)], symmetry='SCPP')
>>> P.cardinality()
1000
>>> P = PlanePartitions([Integer(4),Integer(4),Integer(5)], symmetry='SCPP')
>>> P.cardinality()
1000

>>> P = PlanePartitions([Integer(5),Integer(5),Integer(4)], symmetry='SCPP')
>>> P.cardinality()
2500
>>> P = PlanePartitions([Integer(5),Integer(4),Integer(5)], symmetry='SCPP')
>>> P.cardinality()
2500
>>> P = PlanePartitions([Integer(4),Integer(5),Integer(5)], symmetry='SCPP')
>>> P.cardinality()
2500
```

class sage.combinat.plane_partition.**PlanePartitions_SPP**(*box_size*)

Bases: *PlanePartitions*

Plane partitions that fit inside a box of a specified size that are symmetric.

cardinality()

Return the cardinality of `self`.

The number of symmetric plane partitions inside an $a \times a \times b$ box is equal to

$$\left(\prod_{i=1}^{a} \frac{2i+b-1}{2i-1}\right)\left(\prod_{1\leq i<j\leq a} \frac{i+j+b-1}{i+j-1}\right).$$

EXAMPLES:

```
sage: P = PlanePartitions([3,3,2], symmetry='SPP')
sage: P.cardinality()
35
```

```
>>> from sage.all import *
>>> P = PlanePartitions([Integer(3),Integer(3),Integer(2)], symmetry='SPP')
>>> P.cardinality()
35
```

from_antichain(A)

Return the symmetric plane partition corresponding to an antichain in the poset given in `to_poset()`.

EXAMPLES:

```
sage: PP = PlanePartitions([3,3,2], symmetry='SPP')
sage: A = [(2, 2, 0), (1, 0, 1), (1, 1, 0)]
sage: PP.from_antichain(A)
Plane partition [[2, 2, 1], [2, 1, 1], [1, 1, 1]]
```

```
>>> from sage.all import *
>>> PP = PlanePartitions([Integer(3),Integer(3),Integer(2)], symmetry='SPP')
>>> A = [(Integer(2), Integer(2), Integer(0)), (Integer(1), Integer(0),␣
↪Integer(1)), (Integer(1), Integer(1), Integer(0))]
>>> PP.from_antichain(A)
Plane partition [[2, 2, 1], [2, 1, 1], [1, 1, 1]]
```

from_order_ideal(I)

Return the symmetric plane partition corresponding to an order ideal in the poset given in `to_poset()`.

EXAMPLES:

```
sage: PP = PlanePartitions([3,3,2], symmetry='SPP')
sage: I = [(0, 0, 0), (1, 0, 0), (1, 1, 0), (2, 0, 0)]
sage: PP.from_order_ideal(I)                                            #␣
↪needs sage.graphs
Plane partition [[1, 1, 1], [1, 1], [1]]
```

```
>>> from sage.all import *
>>> PP = PlanePartitions([Integer(3),Integer(3),Integer(2)], symmetry='SPP')
>>> I = [(Integer(0), Integer(0), Integer(0)), (Integer(1), Integer(0),␣
↪Integer(0)), (Integer(1), Integer(1), Integer(0)), (Integer(2), Integer(0),␣
↪Integer(0))]
>>> PP.from_order_ideal(I)                                              #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.graphs
Plane partition [[1, 1, 1], [1, 1], [1]]
```

random_element()

Return a uniformly random element of `self`.

ALGORITHM:

This uses the *random_order_ideal()* method and the natural bijection between symmetric plane partitions and order ideals in an associated poset.

EXAMPLES:

```
sage: PP = PlanePartitions([3,3,2], symmetry='SPP')
sage: PP.random_element()  # random                                        #␣
↪needs sage.graphs
Plane partition [[2, 2, 2], [2, 2], [2]]
```

```
>>> from sage.all import *
>>> PP = PlanePartitions([Integer(3),Integer(3),Integer(2)], symmetry='SPP')
>>> PP.random_element()  # random                                        #␣
↪needs sage.graphs
Plane partition [[2, 2, 2], [2, 2], [2]]
```

to_poset()

Return a poset whose order ideals are in bijection with symmetric plane partitions.

EXAMPLES:

```
sage: PP = PlanePartitions([3,3,2], symmetry='SPP')
sage: PP.to_poset()                                                        #␣
↪needs sage.graphs
Finite poset containing 12 elements
sage: PP.to_poset().order_ideals_lattice().cardinality() == PP.cardinality() ␣
↪           # needs sage.graphs sage.modules sage.rings.finite_rings
True
```

```
>>> from sage.all import *
>>> PP = PlanePartitions([Integer(3),Integer(3),Integer(2)], symmetry='SPP')
>>> PP.to_poset()                                                        #␣
↪needs sage.graphs
Finite poset containing 12 elements
>>> PP.to_poset().order_ideals_lattice().cardinality() == PP.cardinality()   ␣
↪         # needs sage.graphs sage.modules sage.rings.finite_rings
True
```

class sage.combinat.plane_partition.**PlanePartitions_SSCPP**(*box_size*)

Bases: *PlanePartitions*

Plane partitions that fit inside a box of a specified size that are symmetric self-complementary.

cardinality()

Return the cardinality of `self`.

The number of symmetric self-complementary plane partitions inside a $2a \times 2a \times 2b$ box is equal to

$$\prod_{i=1}^{a}\prod_{j=1}^{a}\frac{i+j+b-1}{i+j-1}.$$

The number of symmetric self-complementary plane partitions inside a $(2a+1)\times(2a+1)\times 2b$ box is equal to

$$\prod_{i=1}^{a}\prod_{j=1}^{a+1}\frac{i+j+b-1}{i+j-1}.$$

EXAMPLES:

```
sage: P = PlanePartitions([4,4,2], symmetry='SSCPP')
sage: P.cardinality()
6
sage: Q = PlanePartitions([3,3,2], symmetry='SSCPP')
sage: Q.cardinality()
3
```

```
>>> from sage.all import *
>>> P = PlanePartitions([Integer(4),Integer(4),Integer(2)], symmetry='SSCPP')
>>> P.cardinality()
6
>>> Q = PlanePartitions([Integer(3),Integer(3),Integer(2)], symmetry='SSCPP')
>>> Q.cardinality()
3
```

class sage.combinat.plane_partition.**PlanePartitions_TCPP**(*box_size*)

Bases: *PlanePartitions*

Plane partitions that fit inside a box of a specified size that are transpose-complement.

cardinality()

Return the cardinality of `self`.

The number of transpose complement plane partitions inside an $a \times a \times 2b$ box is equal to

$$\binom{b+1-1}{a-1}\prod_{1\leq i,j\leq a-2}\frac{i+j+2b-1}{i+j-1}.$$

EXAMPLES:

```
sage: P = PlanePartitions([3,3,2], symmetry='TCPP')
sage: P.cardinality()
5
```

```
>>> from sage.all import *
>>> P = PlanePartitions([Integer(3),Integer(3),Integer(2)], symmetry='TCPP')
>>> P.cardinality()
5
```

class sage.combinat.plane_partition.**PlanePartitions_TSPP**(*box_size*)

Bases: *PlanePartitions*

Plane partitions that fit inside a box of a specified size that are totally symmetric.

cardinality()

Return the cardinality of `self`.

The number of totally symmetric plane partitions inside an $a \times a \times a$ box is equal to

$$\prod_{1 \leq i \leq j \leq a} \frac{i+j+a-1}{i+2j-2}.$$

EXAMPLES:

```
sage: P = PlanePartitions([4,4,4], symmetry='TSPP')
sage: P.cardinality()
66
```

```
>>> from sage.all import *
>>> P = PlanePartitions([Integer(4),Integer(4),Integer(4)], symmetry='TSPP')
>>> P.cardinality()
66
```

from_antichain(*acl*)

Return the totally symmetric plane partition corresponding to an antichain in the poset given in `to_poset()`.

EXAMPLES:

```
sage: PP = PlanePartitions([3,3,3], symmetry='TSPP')
sage: A = [(0, 0, 2), (0, 1, 1)]
sage: PP.from_antichain(A)
Plane partition [[3, 2, 1], [2, 1], [1]]
```

```
>>> from sage.all import *
>>> PP = PlanePartitions([Integer(3),Integer(3),Integer(3)], symmetry='TSPP')
>>> A = [(Integer(0), Integer(0), Integer(2)), (Integer(0), Integer(1),␣
↪Integer(1))]
>>> PP.from_antichain(A)
Plane partition [[3, 2, 1], [2, 1], [1]]
```

from_order_ideal(*I*)

Return the totally symmetric plane partition corresponding to an order ideal in the poset given in `to_poset()`.

EXAMPLES:

```
sage: PP = PlanePartitions([3,3,3], symmetry='TSPP')
sage: I = [(0, 0, 0), (0, 0, 1), (0, 0, 2), (0, 1, 1)]
sage: PP.from_order_ideal(I)                                              #␣
↪needs sage.graphs
Plane partition [[3, 2, 1], [2, 1], [1]]
```

```
>>> from sage.all import *
>>> PP = PlanePartitions([Integer(3),Integer(3),Integer(3)], symmetry='TSPP')
>>> I = [(Integer(0), Integer(0), Integer(0)), (Integer(0), Integer(0),␣
↪Integer(1)), (Integer(0), Integer(0), Integer(2)), (Integer(0), Integer(1),␣
↪Integer(1))]
>>> PP.from_order_ideal(I)                                                #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.graphs
Plane partition [[3, 2, 1], [2, 1], [1]]
```

to_poset()

Return a poset whose order ideals are in bijection with totally symmetric plane partitions.

EXAMPLES:

```
sage: PP = PlanePartitions([3,3,3], symmetry='TSPP')
sage: PP.to_poset()                                                    #␣
↪needs sage.graphs
Finite poset containing 10 elements
sage: (PP.to_poset().order_ideals_lattice().cardinality()              #␣
↪needs sage.graphs sage.modules sage.rings.finite_rings
....:     == PP.cardinality())
True
```

```
>>> from sage.all import *
>>> PP = PlanePartitions([Integer(3),Integer(3),Integer(3)], symmetry='TSPP')
>>> PP.to_poset()                                                   #␣
↪needs sage.graphs
Finite poset containing 10 elements
>>> (PP.to_poset().order_ideals_lattice().cardinality()             #␣
↪needs sage.graphs sage.modules sage.rings.finite_rings
...     == PP.cardinality())
True
```

class sage.combinat.plane_partition.**PlanePartitions_TSSCPP**(*box_size*)

Bases: *PlanePartitions*

Plane partitions that fit inside a box of a specified size that are totally symmetric self-complementary.

cardinality()

Return the cardinality of `self`.

The number of totally symmetric self-complementary plane partitions inside a $2a \times 2a \times 2a$ box is equal to

$$\prod_{i=0}^{a-1} \frac{(3i+1)!}{(a+i)!}.$$

EXAMPLES:

```
sage: P = PlanePartitions([6,6,6], symmetry='TSSCPP')
sage: P.cardinality()
7
```

```
>>> from sage.all import *
>>> P = PlanePartitions([Integer(6),Integer(6),Integer(6)], symmetry='TSSCPP')
>>> P.cardinality()
7
```

from_antichain(*acl*)

Return the totally symmetric self-complementary plane partition corresponding to an antichain in the poset given in *to_poset()*.

EXAMPLES:

```
sage: PP = PlanePartitions([6,6,6], symmetry='TSSCPP')
sage: A = [(0, 0, 1), (1, 1, 0)]
sage: PP.from_antichain(A)
Plane partition [[6, 6, 6, 5, 5, 3], [6, 5, 5, 4, 3, 1], [6, 5, 4, 3, 2, 1],
                 [5, 4, 3, 2, 1], [5, 3, 2, 1, 1], [3, 1, 1]]
```

```
>>> from sage.all import *
>>> PP = PlanePartitions([Integer(6),Integer(6),Integer(6)], symmetry='TSSCPP
↪')
>>> A = [(Integer(0), Integer(0), Integer(1)), (Integer(1), Integer(1),␣
↪Integer(0))]
>>> PP.from_antichain(A)
Plane partition [[6, 6, 6, 5, 5, 3], [6, 5, 5, 4, 3, 1], [6, 5, 4, 3, 2, 1],
                 [5, 4, 3, 2, 1], [5, 3, 2, 1, 1], [3, 1, 1]]
```

from_order_ideal(*I*)

Return the totally symmetric self-complementary plane partition corresponding to an order ideal in the poset given in `to_poset()`.

EXAMPLES:

```
sage: PP = PlanePartitions([6,6,6], symmetry='TSSCPP')                     #␣
↪needs sage.graphs
sage: I = [(0, 0, 0), (0, 1, 0), (1, 1, 0)]
sage: PP.from_order_ideal(I)                                               #␣
↪needs sage.graphs
Plane partition [[6, 6, 6, 5, 5, 3], [6, 5, 5, 3, 3, 1], [6, 5, 5, 3, 3, 1],
                 [5, 3, 3, 1, 1], [5, 3, 3, 1, 1], [3, 1, 1]]
```

```
>>> from sage.all import *
>>> PP = PlanePartitions([Integer(6),Integer(6),Integer(6)], symmetry='TSSCPP
↪')                          # needs sage.graphs
>>> I = [(Integer(0), Integer(0), Integer(0)), (Integer(0), Integer(1),␣
↪Integer(0)), (Integer(1), Integer(1), Integer(0))]
>>> PP.from_order_ideal(I)                                               #␣
↪needs sage.graphs
Plane partition [[6, 6, 6, 5, 5, 3], [6, 5, 5, 3, 3, 1], [6, 5, 5, 3, 3, 1],
                 [5, 3, 3, 1, 1], [5, 3, 3, 1, 1], [3, 1, 1]]
```

to_poset()

Return a poset whose order ideals are in bijection with totally symmetric self-complementary plane partitions.

EXAMPLES:

```
sage: PP = PlanePartitions([6,6,6], symmetry='TSSCPP')
sage: PP.to_poset()                                                        #␣
↪needs sage.graphs sage.modules
Finite poset containing 4 elements
sage: PP.to_poset().order_ideals_lattice().cardinality() == PP.cardinality() ␣
↪           # needs sage.graphs sage.modules
True
```

```
>>> from sage.all import *
>>> PP = PlanePartitions([Integer(6),Integer(6),Integer(6)], symmetry='TSSCPP
↪')
>>> PP.to_poset()                                                          #␣
↪needs sage.graphs sage.modules
Finite poset containing 4 elements
>>> PP.to_poset().order_ideals_lattice().cardinality() == PP.cardinality()   ␣
↪        # needs sage.graphs sage.modules
True
```

class sage.combinat.plane_partition.**PlanePartitions_all**

Bases: *PlanePartitions*, DisjointUnionEnumeratedSets

All plane partitions.

an_element()

Return a particular element of the class.

class sage.combinat.plane_partition.**PlanePartitions_box**(*box_size*)

Bases: *PlanePartitions*

All plane partitions that fit inside a box of a specified size.

By convention, a plane partition in an $a \times b \times c$ box will have at most a rows, of lengths at most b, with entries at most c.

cardinality()

Return the cardinality of self.

The number of plane partitions inside an $a \times b \times c$ box is equal to

$$\prod_{i=1}^{a} \prod_{j=1}^{b} \prod_{k=1}^{c} \frac{i+j+k-1}{i+j+k-2}.$$

EXAMPLES:

```
sage: P = PlanePartitions([4,3,5])
sage: P.cardinality()
116424
```

```
>>> from sage.all import *
>>> P = PlanePartitions([Integer(4),Integer(3),Integer(5)])
>>> P.cardinality()
116424
```

from_antichain(A)

Return the plane partition corresponding to an antichain in the poset given in *to_poset()*.

EXAMPLES:

```
sage: A = [(1,0,1), (0,1,1), (1,1,0)]
sage: PlanePartitions([2,2,2]).from_antichain(A)
Plane partition [[2, 2], [2, 1]]
```

```
>>> from sage.all import *
>>> A = [(Integer(1),Integer(0),Integer(1)), (Integer(0),Integer(1),
↪Integer(1)), (Integer(1),Integer(1),Integer(0))]
>>> PlanePartitions([Integer(2),Integer(2),Integer(2)]).from_antichain(A)
Plane partition [[2, 2], [2, 1]]
```

from_order_ideal(*I*)

Return the plane partition corresponding to an order ideal in the poset given in *to_poset()*.

EXAMPLES:

```
sage: I = [(1, 0, 0), (1, 0, 1), (1, 1, 0), (0, 1, 0),
....:      (0, 0, 0), (0, 0, 1), (0, 1, 1)]
sage: PlanePartitions([2,2,2]).from_order_ideal(I)                    #␣
↪needs sage.graphs sage.modules
Plane partition [[2, 2], [2, 1]]
```

```
>>> from sage.all import *
>>> I = [(Integer(1), Integer(0), Integer(0)), (Integer(1), Integer(0),␣
↪Integer(1)), (Integer(1), Integer(1), Integer(0)), (Integer(0), Integer(1),␣
↪Integer(0)),
...      (Integer(0), Integer(0), Integer(0)), (Integer(0), Integer(0),␣
↪Integer(1)), (Integer(0), Integer(1), Integer(1))]
>>> PlanePartitions([Integer(2),Integer(2),Integer(2)]).from_order_ideal(I)  ␣
↪                         # needs sage.graphs sage.modules
Plane partition [[2, 2], [2, 1]]
```

random_element()

Return a uniformly random plane partition inside a box.

ALGORITHM:

This uses the *random_order_ideal()* method and the natural bijection with plane partitions.

EXAMPLES:

```
sage: P = PlanePartitions([4,3,5])
sage: P.random_element()   # random                                   #␣
↪needs sage.graphs sage.modules
Plane partition [[4, 3, 3], [4], [2]]
```

```
>>> from sage.all import *
>>> P = PlanePartitions([Integer(4),Integer(3),Integer(5)])
>>> P.random_element()   # random                                   #␣
↪needs sage.graphs sage.modules
Plane partition [[4, 3, 3], [4], [2]]
```

to_poset()

Return the product of three chains poset, whose order ideals are naturally in bijection with plane partitions inside a box.

EXAMPLES:

```
sage: PlanePartitions([2,2,2]).to_poset()                                   #␣
↪needs sage.graphs sage.modules
Finite lattice containing 8 elements
```

```
>>> from sage.all import *
>>> PlanePartitions([Integer(2),Integer(2),Integer(2)]).to_poset()          ␣
↪                       # needs sage.graphs sage.modules
Finite lattice containing 8 elements
```

class sage.combinat.plane_partition.**PlanePartitions_n**(*n*)

Bases: *PlanePartitions*

Plane partitions with a fixed number of boxes.

cardinality()

Return the number of plane partitions with `n` boxes.

Calculated using the recurrence relation

$$PL(n) = \sum_{k=1}^{n} PL(n-k)\sigma_2(k),$$

where $\sigma_k(n)$ is the sum of the k-th powers of divisors of n.

EXAMPLES:

```
sage: P = PlanePartitions(17)
sage: P.cardinality()
18334
```

```
>>> from sage.all import *
>>> P = PlanePartitions(Integer(17))
>>> P.cardinality()
18334
```

5.1.165 Integer partitions

A partition p of a nonnegative integer n is a non-increasing list of positive integers (the *parts* of the partition) with total sum n.

A partition can be depicted by a diagram made of rows of cells, where the number of cells in the i-th row starting from the top is the i-th part of the partition.

The coordinate system related to a partition applies from the top to the bottom and from left to right. So, the corners of the partition $[5, 3, 1]$ are $[[0, 4], [1, 2], [2, 0]]$.

For display options, see *Partitions.options*.

Note

- Boxes is a synonym for cells. All methods will use 'cell' and 'cells' instead of 'box' and 'boxes'.
- Partitions are 0 based with coordinates in the form of (row-index, column-index).
- If given coordinates of the form `(r, c)`, then use Python's *-operator.

- Throughout this documentation, for a partition λ we will denote its conjugate partition by λ'. For more on conjugate partitions, see `Partition.conjugate()`.
- The comparisons on partitions use lexicographic order.

Note: We use the convention that lexicographic ordering is read from left-to-right. That is to say $[1, 3, 7]$ is smaller than $[2, 3, 4]$.

AUTHORS:

- Mike Hansen (2007): initial version
- Dan Drake (2009-03-28): deprecate RestrictedPartitions and implement Partitions_parts_in
- Travis Scrimshaw (2012-01-12): Implemented latex function to Partition_class
- Travis Scrimshaw (2012-05-09): Fixed Partitions(-1).list() infinite recursion loop by saying Partitions_n is the empty set.
- Travis Scrimshaw (2012-05-11): Fixed bug in inner where if the length was longer than the length of the inner partition, it would include 0's.
- Andrew Mathas (2012-06-01): Removed deprecated functions and added compatibility with the PartitionTuple classes. See Issue #13072
- Travis Scrimshaw (2012-10-12): Added options. Made `Partition_class` to the element `Partition`. `Partitions*` are now all in the category framework except `PartitionsRestricted` (which will eventually be removed). Cleaned up documentation.
- Matthew Lancellotti (2018-09-14): Added a bunch of "k" methods to Partition.

EXAMPLES:

There are 5 partitions of the integer 4:

```
sage: Partitions(4).cardinality()                                               #␣
↪needs sage.libs.flint
5
sage: Partitions(4).list()
[[4], [3, 1], [2, 2], [2, 1, 1], [1, 1, 1, 1]]
```

```
>>> from sage.all import *
>>> Partitions(Integer(4)).cardinality()                                        ␣
↪     # needs sage.libs.flint
5
>>> Partitions(Integer(4)).list()
[[4], [3, 1], [2, 2], [2, 1, 1], [1, 1, 1, 1]]
```

We can use the method `.first()` to get the 'first' partition of a number:

```
sage: Partitions(4).first()
[4]
```

```
>>> from sage.all import *
>>> Partitions(Integer(4)).first()
[4]
```

Using the method `.next(p)`, we can calculate the 'next' partition after p. When we are at the last partition, `None` will be returned:

```
sage: Partitions(4).next([4])
[3, 1]
sage: Partitions(4).next([1,1,1,1]) is None
True
```

```
>>> from sage.all import *
>>> Partitions(Integer(4)).next([Integer(4)])
[3, 1]
>>> Partitions(Integer(4)).next([Integer(1),Integer(1),Integer(1),Integer(1)]) is None
True
```

We can use `iter` to get an object which iterates over the partitions one by one to save memory. Note that when we do something like `for part in Partitions(4)` this iterator is used in the background:

```
sage: g = iter(Partitions(4))
sage: next(g)
[4]
sage: next(g)
[3, 1]
sage: next(g)
[2, 2]
sage: for p in Partitions(4): print(p)
[4]
[3, 1]
[2, 2]
[2, 1, 1]
[1, 1, 1, 1]
```

```
>>> from sage.all import *
>>> g = iter(Partitions(Integer(4)))
>>> next(g)
[4]
>>> next(g)
[3, 1]
>>> next(g)
[2, 2]
>>> for p in Partitions(Integer(4)): print(p)
[4]
[3, 1]
[2, 2]
[2, 1, 1]
[1, 1, 1, 1]
```

We can add constraints to the type of partitions we want. For example, to get all of the partitions of 4 of length 2, we'd do the following:

```
sage: Partitions(4, length=2).list()
[[3, 1], [2, 2]]
```

```
>>> from sage.all import *
>>> Partitions(Integer(4), length=Integer(2)).list()
[[3, 1], [2, 2]]
```

Here is the list of partitions of length at least 2 and the list of ones with length at most 2:

```
sage: Partitions(4, min_length=2).list()
[[3, 1], [2, 2], [2, 1, 1], [1, 1, 1, 1]]
sage: Partitions(4, max_length=2).list()
[[4], [3, 1], [2, 2]]
```

```
>>> from sage.all import *
>>> Partitions(Integer(4), min_length=Integer(2)).list()
[[3, 1], [2, 2], [2, 1, 1], [1, 1, 1, 1]]
>>> Partitions(Integer(4), max_length=Integer(2)).list()
[[4], [3, 1], [2, 2]]
```

The options `min_part` and `max_part` can be used to set constraints on the sizes of all parts. Using `max_part`, we can select partitions having only 'small' entries. The following is the list of the partitions of 4 with parts at most 2:

```
sage: Partitions(4, max_part=2).list()
[[2, 2], [2, 1, 1], [1, 1, 1, 1]]
```

```
>>> from sage.all import *
>>> Partitions(Integer(4), max_part=Integer(2)).list()
[[2, 2], [2, 1, 1], [1, 1, 1, 1]]
```

The `min_part` options is complementary to `max_part` and selects partitions having only 'large' parts. Here is the list of all partitions of 4 with each part at least 2:

```
sage: Partitions(4, min_part=2).list()
[[4], [2, 2]]
```

```
>>> from sage.all import *
>>> Partitions(Integer(4), min_part=Integer(2)).list()
[[4], [2, 2]]
```

The options `inner` and `outer` can be used to set part-by-part constraints. This is the list of partitions of 4 with `[3, 1, 1]` as an outer bound (that is, partitions of 4 contained in the partition `[3, 1, 1]`):

```
sage: Partitions(4, outer=[3,1,1]).list()
[[3, 1], [2, 1, 1]]
```

```
>>> from sage.all import *
>>> Partitions(Integer(4), outer=[Integer(3),Integer(1),Integer(1)]).list()
[[3, 1], [2, 1, 1]]
```

`outer` sets `max_length` to the length of its argument. Moreover, the parts of `outer` may be infinite to clear constraints on specific parts. Here is the list of the partitions of 4 of length at most 3 such that the second and third part are 1 when they exist:

```
sage: Partitions(4, outer=[oo,1,1]).list()
[[4], [3, 1], [2, 1, 1]]
```

```
>>> from sage.all import *
>>> Partitions(Integer(4), outer=[oo,Integer(1),Integer(1)]).list()
[[4], [3, 1], [2, 1, 1]]
```

Finally, here are the partitions of 4 with `[1,1,1]` as an inner bound (i. e., the partitions of 4 containing the partition `[1,1,1]`). Note that `inner` sets `min_length` to the length of its argument:

```
sage: Partitions(4, inner=[1,1,1]).list()
[[2, 1, 1], [1, 1, 1, 1]]
```

```
>>> from sage.all import *
>>> Partitions(Integer(4), inner=[Integer(1),Integer(1),Integer(1)]).list()
[[2, 1, 1], [1, 1, 1, 1]]
```

The options `min_slope` and `max_slope` can be used to set constraints on the slope, that is on the difference `p[i+1]-p[i]` of two consecutive parts. Here is the list of the strictly decreasing partitions of 4:

```
sage: Partitions(4, max_slope=-1).list()
[[4], [3, 1]]
```

```
>>> from sage.all import *
>>> Partitions(Integer(4), max_slope=-Integer(1)).list()
[[4], [3, 1]]
```

The constraints can be combined together in all reasonable ways. Here are all the partitions of 11 of length between 2 and 4 such that the difference between two consecutive parts is between -3 and -1:

```
sage: Partitions(11, min_slope=-3, max_slope=-1, min_length=2, max_length=4).list()
[[7, 4], [6, 5], [6, 4, 1], [6, 3, 2], [5, 4, 2], [5, 3, 2, 1]]
```

```
>>> from sage.all import *
>>> Partitions(Integer(11), min_slope=-Integer(3), max_slope=-Integer(1), min_
↪length=Integer(2), max_length=Integer(4)).list()
[[7, 4], [6, 5], [6, 4, 1], [6, 3, 2], [5, 4, 2], [5, 3, 2, 1]]
```

Partition objects can also be created individually with *Partition*:

```
sage: Partition([2,1])
[2, 1]
```

```
>>> from sage.all import *
>>> Partition([Integer(2),Integer(1)])
[2, 1]
```

Once we have a partition object, then there are a variety of methods that we can use. For example, we can get the conjugate of a partition. Geometrically, the conjugate of a partition is the reflection of that partition through its main diagonal. Of course, this operation is an involution:

```
sage: Partition([4,1]).conjugate()
[2, 1, 1, 1]
sage: Partition([4,1]).conjugate().conjugate()
[4, 1]
```

```
>>> from sage.all import *
>>> Partition([Integer(4),Integer(1)]).conjugate()
[2, 1, 1, 1]
>>> Partition([Integer(4),Integer(1)]).conjugate().conjugate()
[4, 1]
```

If we create a partition with extra zeros at the end, they will be dropped:

```
sage: Partition([4,1,0,0])
[4, 1]
sage: Partition([0])
[]
sage: Partition([0,0])
[]
```

```
>>> from sage.all import *
>>> Partition([Integer(4),Integer(1),Integer(0),Integer(0)])
[4, 1]
>>> Partition([Integer(0)])
[]
>>> Partition([Integer(0),Integer(0)])
[]
```

The idea of a partition being followed by infinitely many parts of size 0 is consistent with the `get_part` method:

```
sage: p = Partition([5, 2])
sage: p.get_part(0)
5
sage: p.get_part(10)
0
```

```
>>> from sage.all import *
>>> p = Partition([Integer(5), Integer(2)])
>>> p.get_part(Integer(0))
5
>>> p.get_part(Integer(10))
0
```

We can go back and forth between the standard and the exponential notations of a partition. The exponential notation can be padded with extra zeros:

```
sage: Partition([6,4,4,2,1]).to_exp()
[1, 1, 0, 2, 0, 1]
sage: Partition(exp=[1,1,0,2,0,1])
[6, 4, 4, 2, 1]
sage: Partition([6,4,4,2,1]).to_exp(5)
[1, 1, 0, 2, 0, 1]
```

(continues on next page)

(continued from previous page)

```
sage: Partition([6,4,4,2,1]).to_exp(7)
[1, 1, 0, 2, 0, 1, 0]
sage: Partition([6,4,4,2,1]).to_exp(10)
[1, 1, 0, 2, 0, 1, 0, 0, 0, 0]
```

```
>>> from sage.all import *
>>> Partition([Integer(6),Integer(4),Integer(4),Integer(2),Integer(1)]).to_exp()
[1, 1, 0, 2, 0, 1]
>>> Partition(exp=[Integer(1),Integer(1),Integer(0),Integer(2),Integer(0),Integer(1)])
[6, 4, 4, 2, 1]
>>> Partition([Integer(6),Integer(4),Integer(4),Integer(2),Integer(1)]).to_
↪exp(Integer(5))
[1, 1, 0, 2, 0, 1]
>>> Partition([Integer(6),Integer(4),Integer(4),Integer(2),Integer(1)]).to_
↪exp(Integer(7))
[1, 1, 0, 2, 0, 1, 0]
>>> Partition([Integer(6),Integer(4),Integer(4),Integer(2),Integer(1)]).to_
↪exp(Integer(10))
[1, 1, 0, 2, 0, 1, 0, 0, 0, 0]
```

We can get the (zero-based!) coordinates of the corners of a partition:

```
sage: Partition([4,3,1]).corners()
[(0, 3), (1, 2), (2, 0)]
```

```
>>> from sage.all import *
>>> Partition([Integer(4),Integer(3),Integer(1)]).corners()
[(0, 3), (1, 2), (2, 0)]
```

We can compute the core and quotient of a partition and build the partition back up from them:

```
sage: Partition([6,3,2,2]).core(3)
[2, 1, 1]
sage: Partition([7,7,5,3,3,3,1]).quotient(3)
([2], [1], [2, 2, 2])
sage: p = Partition([11,5,5,3,2,2,2])
sage: p.core(3)
[]
sage: p.quotient(3)
([2, 1], [4], [1, 1, 1])
sage: Partition(core=[],quotient=([2, 1], [4], [1, 1, 1]))
[11, 5, 5, 3, 2, 2, 2]
```

```
>>> from sage.all import *
>>> Partition([Integer(6),Integer(3),Integer(2),Integer(2)]).core(Integer(3))
[2, 1, 1]
>>> Partition([Integer(7),Integer(7),Integer(5),Integer(3),Integer(3),Integer(3),
↪Integer(1)]).quotient(Integer(3))
([2], [1], [2, 2, 2])
>>> p = Partition([Integer(11),Integer(5),Integer(5),Integer(3),Integer(2),Integer(2),
↪Integer(2)])
>>> p.core(Integer(3))
```

(continues on next page)

(continued from previous page)

```
[]
>>> p.quotient(Integer(3))
([2, 1], [4], [1, 1, 1])
>>> Partition(core=[],quotient=([Integer(2), Integer(1)], [Integer(4)], [Integer(1),␣
↪Integer(1), Integer(1)]))
[11, 5, 5, 3, 2, 2, 2]
```

We can compute the $0 - 1$ sequence and go back and forth:

```
sage: Partitions().from_zero_one([1, 1, 1, 1, 0, 1, 0])
[5, 4]
sage: all(Partitions().from_zero_one(mu.zero_one_sequence())
....:     == mu for n in range(5) for mu in Partitions(n))
True
```

```
>>> from sage.all import *
>>> Partitions().from_zero_one([Integer(1), Integer(1), Integer(1), Integer(1),␣
↪Integer(0), Integer(1), Integer(0)])
[5, 4]
>>> all(Partitions().from_zero_one(mu.zero_one_sequence())
...     == mu for n in range(Integer(5)) for mu in Partitions(n))
True
```

We can compute the Frobenius coordinates and go back and forth:

```
sage: Partition([7,3,1]).frobenius_coordinates()
([6, 1], [2, 0])
sage: Partition(frobenius_coordinates=([6,1],[2,0]))
[7, 3, 1]
sage: all(mu == Partition(frobenius_coordinates=mu.frobenius_coordinates())
....:     for n in range(12) for mu in Partitions(n))
True
```

```
>>> from sage.all import *
>>> Partition([Integer(7),Integer(3),Integer(1)]).frobenius_coordinates()
([6, 1], [2, 0])
>>> Partition(frobenius_coordinates=([Integer(6),Integer(1)],[Integer(2),Integer(0)]))
[7, 3, 1]
>>> all(mu == Partition(frobenius_coordinates=mu.frobenius_coordinates())
...     for n in range(Integer(12)) for mu in Partitions(n))
True
```

We use the lexicographic ordering:

```
sage: pl = Partition([4,1,1])
sage: ql = Partitions()([3,3])
sage: pl > ql
True
sage: PL = Partitions()
sage: pl = PL([4,1,1])
sage: ql = PL([3,3])
sage: pl > ql
```

(continues on next page)

(continued from previous page)

```
True
```

```
>>> from sage.all import *
>>> pl = Partition([Integer(4),Integer(1),Integer(1)])
>>> ql = Partitions()([Integer(3),Integer(3)])
>>> pl > ql
True
>>> PL = Partitions()
>>> pl = PL([Integer(4),Integer(1),Integer(1)])
>>> ql = PL([Integer(3),Integer(3)])
>>> pl > ql
True
```

class sage.combinat.partition.**OrderedPartitions**(*n*, *k*)

Bases: *Partitions*

The class of ordered partitions of n. If k is specified, then this contains only the ordered partitions of length k.

An *ordered partition* of a nonnegative integer n means a list of positive integers whose sum is n. This is the same as a composition of n.

> **Note**
>
> It is recommended that you use *Compositions()* instead as *OrderedPartitions()* wraps GAP.

EXAMPLES:

```
sage: OrderedPartitions(3)
Ordered partitions of 3
sage: OrderedPartitions(3).list()                                              #␣
↪needs sage.libs.gap
[[3], [2, 1], [1, 2], [1, 1, 1]]
sage: OrderedPartitions(3,2)
Ordered partitions of 3 of length 2
sage: OrderedPartitions(3,2).list()                                            #␣
↪needs sage.libs.gap
[[2, 1], [1, 2]]

sage: OrderedPartitions(10, k=2).list()                                        #␣
↪needs sage.libs.gap
[[9, 1], [8, 2], [7, 3], [6, 4], [5, 5], [4, 6], [3, 7], [2, 8], [1, 9]]
sage: OrderedPartitions(4).list()                                              #␣
↪needs sage.libs.gap
[[4], [3, 1], [2, 2], [2, 1, 1], [1, 3], [1, 2, 1], [1, 1, 2], [1, 1, 1, 1]]
```

```
>>> from sage.all import *
>>> OrderedPartitions(Integer(3))
Ordered partitions of 3
>>> OrderedPartitions(Integer(3)).list()                                       ␣
↪     # needs sage.libs.gap
[[3], [2, 1], [1, 2], [1, 1, 1]]
```

(continues on next page)

(continued from previous page)

```
>>> OrderedPartitions(Integer(3),Integer(2))
Ordered partitions of 3 of length 2
>>> OrderedPartitions(Integer(3),Integer(2)).list()                          ␣
↪              # needs sage.libs.gap
[[2, 1], [1, 2]]

>>> OrderedPartitions(Integer(10), k=Integer(2)).list()                      ␣
↪              # needs sage.libs.gap
[[9, 1], [8, 2], [7, 3], [6, 4], [5, 5], [4, 6], [3, 7], [2, 8], [1, 9]]
>>> OrderedPartitions(Integer(4)).list()                                     ␣
↪     # needs sage.libs.gap
[[4], [3, 1], [2, 2], [2, 1, 1], [1, 3], [1, 2, 1], [1, 1, 2], [1, 1, 1, 1]]
```

cardinality()

Return the cardinality of `self`.

EXAMPLES:

```
sage: # needs sage.libs.gap
sage: OrderedPartitions(3).cardinality()
4
sage: OrderedPartitions(3,2).cardinality()
2
sage: OrderedPartitions(10,2).cardinality()
9
sage: OrderedPartitions(15).cardinality()
16384
```

```
>>> from sage.all import *
>>> # needs sage.libs.gap
>>> OrderedPartitions(Integer(3)).cardinality()
4
>>> OrderedPartitions(Integer(3),Integer(2)).cardinality()
2
>>> OrderedPartitions(Integer(10),Integer(2)).cardinality()
9
>>> OrderedPartitions(Integer(15)).cardinality()
16384
```

list()

Return a list of partitions in `self`.

EXAMPLES:

```
sage: OrderedPartitions(3).list()                                            #␣
↪needs sage.libs.gap
[[3], [2, 1], [1, 2], [1, 1, 1]]
sage: OrderedPartitions(3,2).list()                                          #␣
↪needs sage.libs.gap
[[2, 1], [1, 2]]
```

```
>>> from sage.all import *
>>> OrderedPartitions(Integer(3)).list()                                     ␣
```

(continues on next page)

(continued from previous page)

```
↪     # needs sage.libs.gap
[[3], [2, 1], [1, 2], [1, 1, 1]]
>>> OrderedPartitions(Integer(3),Integer(2)).list()                                    ␣
↪              # needs sage.libs.gap
[[2, 1], [1, 2]]
```

class sage.combinat.partition.**Partition**(*parent*, *mu*)

Bases: `CombinatorialElement`

A partition p of a nonnegative integer n is a non-increasing list of positive integers (the *parts* of the partition) with total sum n.

A partition is often represented as a diagram consisting of **cells**, or **boxes**, placed in rows on top of each other such that the number of cells in the i-th row, reading from top to bottom, is the i-th part of the partition. The rows are left-justified (and become shorter and shorter the farther down one goes). This diagram is called the **Young diagram** of the partition, or more precisely its Young diagram in English notation. (French and Russian notations are variations on this representation.)

The coordinate system related to a partition applies from the top to the bottom and from left to right. So, the corners of the partition `[5, 3, 1]` are `[[0,4], [1,2], [2,0]]`.

For display options, see `Partitions.options()`.

Note

Partitions are 0 based with coordinates in the form of (row-index, column-index). For example consider the partition `mu=Partition([4,3,2,2])`, the first part is `mu[0]` (which is 4), the second is `mu[1]`, and so on, and the upper-left cell in English convention is `(0, 0)`.

A partition can be specified in one of the following ways:

- a list (the default)
- using exponential notation
- by Frobenius coordinates
- specifying its $0 - 1$ sequence
- specifying the core and the quotient

See the examples below.

EXAMPLES:

Creating partitions though parents:

```
sage: mu = Partitions(8)([3,2,1,1,1]); mu
[3, 2, 1, 1, 1]
sage: nu = Partition([3,2,1,1,1]); nu
[3, 2, 1, 1, 1]
sage: mu == nu
True
sage: mu is nu
False
sage: mu in Partitions()
True
```

(continues on next page)

(continued from previous page)

```
sage: mu.parent()
Partitions of the integer 8
sage: mu.size()
8
sage: mu.category()
Category of elements of Partitions of the integer 8
sage: nu.parent()
Partitions
sage: nu.category()
Category of elements of Partitions
sage: mu[0]
3
sage: mu[1]
2
sage: mu[2]
1
sage: mu.pp()
***
**
*
*
*
sage: mu.removable_cells()
[(0, 2), (1, 1), (4, 0)]
sage: mu.down_list()
[[2, 2, 1, 1, 1], [3, 1, 1, 1, 1], [3, 2, 1, 1]]
sage: mu.addable_cells()
[(0, 3), (1, 2), (2, 1), (5, 0)]
sage: mu.up_list()
[[4, 2, 1, 1, 1], [3, 3, 1, 1, 1], [3, 2, 2, 1, 1], [3, 2, 1, 1, 1, 1]]
sage: mu.conjugate()
[5, 2, 1]
sage: mu.dominates(nu)
True
sage: nu.dominates(mu)
True
```

```
>>> from sage.all import *
>>> mu = Partitions(Integer(8))([Integer(3),Integer(2),Integer(1),Integer(1),
↪Integer(1)]); mu
[3, 2, 1, 1, 1]
>>> nu = Partition([Integer(3),Integer(2),Integer(1),Integer(1),Integer(1)]); nu
[3, 2, 1, 1, 1]
>>> mu == nu
True
>>> mu is nu
False
>>> mu in Partitions()
True
>>> mu.parent()
Partitions of the integer 8
>>> mu.size()
```

(continues on next page)

(continued from previous page)

```
8
>>> mu.category()
Category of elements of Partitions of the integer 8
>>> nu.parent()
Partitions
>>> nu.category()
Category of elements of Partitions
>>> mu[Integer(0)]

>>> mu.pp()
***
**
*
*
*
>>> mu.removable_cells()
[(0, 2), (1, 1), (4, 0)]
>>> mu.down_list()
[[2, 2, 1, 1, 1], [3, 1, 1, 1, 1], [3, 2, 1, 1]]
>>> mu.addable_cells()
[(0, 3), (1, 2), (2, 1), (5, 0)]
>>> mu.up_list()
[[4, 2, 1, 1, 1], [3, 3, 1, 1, 1], [3, 2, 2, 1, 1], [3, 2, 1, 1, 1, 1]]
>>> mu.conjugate()
[5, 2, 1]
>>> mu.dominates(nu)
True
>>> nu.dominates(mu)
True
```

Creating partitions using `Partition`:

```
sage: Partition([3,2,1])
[3, 2, 1]
sage: Partition(exp=[2,1,1])
[3, 2, 1, 1]
sage: Partition(core=[2,1], quotient=[[2,1],[3],[1,1,1]])
[11, 5, 5, 3, 2, 2, 2]
sage: Partition(frobenius_coordinates=([3,2],[4,0]))
[4, 4, 1, 1, 1]
sage: Partitions().from_zero_one([1, 1, 1, 1, 0, 1, 0])
[5, 4]
sage: [2,1] in Partitions()
True
sage: [2,1,0] in Partitions()
True
sage: Partition([1,2,3])
Traceback (most recent call last):
```

(continues on next page)

(continued from previous page)

```
...
ValueError: [1, 2, 3] is not an element of Partitions
```

```
>>> from sage.all import *
>>> Partition([Integer(3),Integer(2),Integer(1)])
[3, 2, 1]
>>> Partition(exp=[Integer(2),Integer(1),Integer(1)])
[3, 2, 1, 1]
>>> Partition(core=[Integer(2),Integer(1)], quotient=[[Integer(2),Integer(1)],
↪[Integer(3)],[Integer(1),Integer(1),Integer(1)]])
[11, 5, 5, 3, 2, 2, 2]
>>> Partition(frobenius_coordinates=([Integer(3),Integer(2)],[Integer(4),
↪Integer(0)]))
[4, 4, 1, 1, 1]
>>> Partitions().from_zero_one([Integer(1), Integer(1), Integer(1), Integer(1),␣
↪Integer(0), Integer(1), Integer(0)])
[5, 4]
>>> [Integer(2),Integer(1)] in Partitions()
True
>>> [Integer(2),Integer(1),Integer(0)] in Partitions()
True
>>> Partition([Integer(1),Integer(2),Integer(3)])
Traceback (most recent call last):
...
ValueError: [1, 2, 3] is not an element of Partitions
```

Sage ignores trailing zeros at the end of partitions:

```
sage: Partition([3,2,1,0])
[3, 2, 1]
sage: Partitions()([3,2,1,0])
[3, 2, 1]
sage: Partitions(6)([3,2,1,0])
[3, 2, 1]
```

```
>>> from sage.all import *
>>> Partition([Integer(3),Integer(2),Integer(1),Integer(0)])
[3, 2, 1]
>>> Partitions()([Integer(3),Integer(2),Integer(1),Integer(0)])
[3, 2, 1]
>>> Partitions(Integer(6))([Integer(3),Integer(2),Integer(1),Integer(0)])
[3, 2, 1]
```

add_cell(*i*, *j=None*)

Return a partition corresponding to `self` with a cell added in row `i`. (This does not change `self`.)

EXAMPLES:

```
sage: Partition([3, 2, 1, 1]).add_cell(0)
[4, 2, 1, 1]
sage: cell = [4, 0]; Partition([3, 2, 1, 1]).add_cell(*cell)
[3, 2, 1, 1, 1]
```

```
>>> from sage.all import *
>>> Partition([Integer(3), Integer(2), Integer(1), Integer(1)]).add_
↪cell(Integer(0))
[4, 2, 1, 1]
>>> cell = [Integer(4), Integer(0)]; Partition([Integer(3), Integer(2),␣
↪Integer(1), Integer(1)]).add_cell(*cell)
[3, 2, 1, 1, 1]
```

add_horizontal_border_strip(*k*)

Return a list of all the partitions that can be obtained by adding a horizontal border strip of length `k` to `self`.

EXAMPLES:

```
sage: Partition([]).add_horizontal_border_strip(0)
[[]]
sage: Partition([3,2,1]).add_horizontal_border_strip(0)
[[3, 2, 1]]
sage: Partition([]).add_horizontal_border_strip(2)
[[2]]
sage: Partition([2,2]).add_horizontal_border_strip(2)
[[4, 2], [3, 2, 1], [2, 2, 2]]
sage: Partition([3,2,2]).add_horizontal_border_strip(2)
[[5, 2, 2], [4, 3, 2], [4, 2, 2, 1], [3, 3, 2, 1], [3, 2, 2, 2]]
```

```
>>> from sage.all import *
>>> Partition([]).add_horizontal_border_strip(Integer(0))
[[]]
>>> Partition([Integer(3),Integer(2),Integer(1)]).add_horizontal_border_
↪strip(Integer(0))
[[3, 2, 1]]
>>> Partition([]).add_horizontal_border_strip(Integer(2))
[[2]]
>>> Partition([Integer(2),Integer(2)]).add_horizontal_border_strip(Integer(2))
[[4, 2], [3, 2, 1], [2, 2, 2]]
>>> Partition([Integer(3),Integer(2),Integer(2)]).add_horizontal_border_
↪strip(Integer(2))
[[5, 2, 2], [4, 3, 2], [4, 2, 2, 1], [3, 3, 2, 1], [3, 2, 2, 2]]
```

add_vertical_border_strip(*k*)

Return a list of all the partitions that can be obtained by adding a vertical border strip of length `k` to `self`.

EXAMPLES:

```
sage: Partition([]).add_vertical_border_strip(0)
[[]]
sage: Partition([3,2,1]).add_vertical_border_strip(0)
[[3, 2, 1]]
sage: Partition([]).add_vertical_border_strip(2)
[[1, 1]]
sage: Partition([2,2]).add_vertical_border_strip(2)
[[3, 3], [3, 2, 1], [2, 2, 1, 1]]
sage: Partition([3,2,2]).add_vertical_border_strip(2)
[[4, 3, 2], [4, 2, 2, 1], [3, 3, 3], [3, 3, 2, 1], [3, 2, 2, 1, 1]]
```

```
>>> from sage.all import *
>>> Partition([]).add_vertical_border_strip(Integer(0))
[[]]
>>> Partition([Integer(3),Integer(2),Integer(1)]).add_vertical_border_
↪strip(Integer(0))
[[3, 2, 1]]
>>> Partition([]).add_vertical_border_strip(Integer(2))
[[1, 1]]
>>> Partition([Integer(2),Integer(2)]).add_vertical_border_strip(Integer(2))
[[3, 3], [3, 2, 1], [2, 2, 1, 1]]
>>> Partition([Integer(3),Integer(2),Integer(2)]).add_vertical_border_
↪strip(Integer(2))
[[4, 3, 2], [4, 2, 2, 1], [3, 3, 3], [3, 3, 2, 1], [3, 2, 2, 1, 1]]
```

addable_cells()

Return a list of the outside corners of the partition `self`.

An outside corner (also called a cocorner) of a partition λ is a cell on $\mathbf{Z}^2$ which does not belong to the Young diagram of λ but can be added to this Young diagram to still form a straight-shape Young diagram.

The entries of the list returned are pairs of the form (i, j), where i and j are the coordinates of the respective corner. The coordinates are counted from 0.

Note

These are called "outer corners" in [Sag2001].

EXAMPLES:

```
sage: Partition([2,2,1]).outside_corners()
[(0, 2), (2, 1), (3, 0)]
sage: Partition([2,2]).outside_corners()
[(0, 2), (2, 0)]
sage: Partition([6,3,3,1,1,1]).outside_corners()
[(0, 6), (1, 3), (3, 1), (6, 0)]
sage: Partition([]).outside_corners()
[(0, 0)]
```

```
>>> from sage.all import *
>>> Partition([Integer(2),Integer(2),Integer(1)]).outside_corners()
[(0, 2), (2, 1), (3, 0)]
>>> Partition([Integer(2),Integer(2)]).outside_corners()
[(0, 2), (2, 0)]
>>> Partition([Integer(6),Integer(3),Integer(3),Integer(1),Integer(1),
↪Integer(1)]).outside_corners()
[(0, 6), (1, 3), (3, 1), (6, 0)]
>>> Partition([]).outside_corners()
[(0, 0)]
```

addable_cells_residue(i, l)

Return a list of the outside corners of the partition `self` having `l`-residue `i`.

An outside corner (also called a cocorner) of a partition λ is a cell on $\mathbf{Z}^2$ which does not belong to the Young diagram of λ but can be added to this Young diagram to still form a straight-shape Young diagram. See `residue()` for the definition of the `l`-residue.

The entries of the list returned are pairs of the form (i, j), where i and j are the coordinates of the respective corner. The coordinates are counted from 0.

EXAMPLES:

```
sage: Partition([3,2,1]).outside_corners_residue(0, 3)
[(0, 3), (3, 0)]
sage: Partition([3,2,1]).outside_corners_residue(1, 3)
[(1, 2)]
sage: Partition([3,2,1]).outside_corners_residue(2, 3)
[(2, 1)]
```

```
>>> from sage.all import *
>>> Partition([Integer(3),Integer(2),Integer(1)]).outside_corners_
→residue(Integer(0), Integer(3))
[(0, 3), (3, 0)]
>>> Partition([Integer(3),Integer(2),Integer(1)]).outside_corners_
→residue(Integer(1), Integer(3))
[(1, 2)]
>>> Partition([Integer(3),Integer(2),Integer(1)]).outside_corners_
→residue(Integer(2), Integer(3))
[(2, 1)]
```

arm_cells(i, j)

Return the list of the cells of the arm of cell (i, j) in `self`.

The arm of cell $c = (i, j)$ is the boxes that appear to the right of c.

The cell coordinates are zero-based, i. e., the northwesternmost cell is $(0, 0)$.

INPUT:

- `i, j` – two integers

OUTPUT: list of pairs of integers

EXAMPLES:

```
sage: Partition([4,4,3,1]).arm_cells(1,1)
[(1, 2), (1, 3)]

sage: Partition([]).arm_cells(0,0)
Traceback (most recent call last):
...
ValueError: the cell is not in the diagram
```

```
>>> from sage.all import *
>>> Partition([Integer(4),Integer(4),Integer(3),Integer(1)]).arm_
→cells(Integer(1),Integer(1))
[(1, 2), (1, 3)]

>>> Partition([]).arm_cells(Integer(0),Integer(0))
Traceback (most recent call last):
```

(continues on next page)

(continued from previous page)

```
...
ValueError: the cell is not in the diagram
```

arm_length(*i*, *j*)

Return the length of the arm of cell (i, j) in `self`.

The arm of cell (i, j) is the cells that appear to the right of cell (i, j).

The cell coordinates are zero-based, i. e., the northwesternmost cell is $(0, 0)$.

INPUT:

- `i, j` – two integers

OUTPUT: integer or a `ValueError`

EXAMPLES:

```
sage: p = Partition([2,2,1])
sage: p.arm_length(0, 0)
1
sage: p.arm_length(0, 1)
0
sage: p.arm_length(2, 0)
0
sage: Partition([3,3]).arm_length(0, 0)
2
sage: Partition([3,3]).arm_length(*[0,0])
2
```

```
>>> from sage.all import *
>>> p = Partition([Integer(2),Integer(2),Integer(1)])
>>> p.arm_length(Integer(0), Integer(0))
1
>>> p.arm_length(Integer(0), Integer(1))
0
>>> p.arm_length(Integer(2), Integer(0))
0
>>> Partition([Integer(3),Integer(3)]).arm_length(Integer(0), Integer(0))
2
>>> Partition([Integer(3),Integer(3)]).arm_length(*[Integer(0),Integer(0)])
2
```

arm_lengths(*flat=False*)

Return a tableau of shape `self` where each cell is filled with its arm length.

The optional boolean parameter `flat` provides the option of returning a flat list.

EXAMPLES:

```
sage: Partition([2,2,1]).arm_lengths()
[[1, 0], [1, 0], [0]]
sage: Partition([2,2,1]).arm_lengths(flat=True)
[1, 0, 1, 0, 0]
sage: Partition([3,3]).arm_lengths()
[[2, 1, 0], [2, 1, 0]]
```

(continues on next page)

(continued from previous page)

```
sage: Partition([3,3]).arm_lengths(flat=True)
[2, 1, 0, 2, 1, 0]
```

```
>>> from sage.all import *
>>> Partition([Integer(2),Integer(2),Integer(1)]).arm_lengths()
[[1, 0], [1, 0], [0]]
>>> Partition([Integer(2),Integer(2),Integer(1)]).arm_lengths(flat=True)
[1, 0, 1, 0, 0]
>>> Partition([Integer(3),Integer(3)]).arm_lengths()
[[2, 1, 0], [2, 1, 0]]
>>> Partition([Integer(3),Integer(3)]).arm_lengths(flat=True)
[2, 1, 0, 2, 1, 0]
```

arms_legs_coeff (i, j)

This is a statistic on a cell $c = (i, j)$ in the diagram of partition p given by

$$\frac{1 - q^a \cdot t^{\ell+1}}{1 - q^{a+1} \cdot t^{\ell}}$$

where a is the arm length of c and ℓ is the leg length of c.

The coordinates `i` and `j` of the cell are understood to be 0-based, so that `(0, 0)` is the northwesternmost cell (in English notation).

EXAMPLES:

```
sage: Partition([3,2,1]).arms_legs_coeff(1,1)
(-t + 1)/(-q + 1)
sage: Partition([3,2,1]).arms_legs_coeff(0,0)
(-q^2*t^3 + 1)/(-q^3*t^2 + 1)
sage: Partition([3,2,1]).arms_legs_coeff(*[0,0])
(-q^2*t^3 + 1)/(-q^3*t^2 + 1)
```

```
>>> from sage.all import *
>>> Partition([Integer(3),Integer(2),Integer(1)]).arms_legs_coeff(Integer(1),
↪Integer(1))
(-t + 1)/(-q + 1)
>>> Partition([Integer(3),Integer(2),Integer(1)]).arms_legs_coeff(Integer(0),
↪Integer(0))
(-q^2*t^3 + 1)/(-q^3*t^2 + 1)
>>> Partition([Integer(3),Integer(2),Integer(1)]).arms_legs_
↪coeff(*[Integer(0),Integer(0)])
(-q^2*t^3 + 1)/(-q^3*t^2 + 1)
```

atom ()

Return a list of the standard tableaux of size `self.size()` whose atom is equal to `self`.

EXAMPLES:

```
sage: Partition([2,1]).atom()
[[[1, 2], [3]]]
sage: Partition([3,2,1]).atom()
[[[1, 2, 3, 6], [4, 5]], [[1, 2, 3], [4, 5], [6]]]
```

```
>>> from sage.all import *
>>> Partition([Integer(2),Integer(1)]).atom()
[[[1, 2], [3]]]
>>> Partition([Integer(3),Integer(2),Integer(1)]).atom()
[[[1, 2, 3, 6], [4, 5]], [[1, 2, 3], [4, 5], [6]]]
```

attacking_pairs()

Return a list of the attacking pairs of the Young diagram of `self`.

A pair of cells (c, d) of a Young diagram (in English notation) is said to be attacking if one of the following conditions holds:

1. c and d lie in the same row with c strictly to the west of d.
2. c is in the row immediately to the south of d, and c lies strictly east of d.

This particular method returns each pair (c, d) as a tuple, where each of c and d is given as a tuple (i, j) with i and j zero-based (so $i = 0$ means that the cell lies in the topmost row).

EXAMPLES:

```
sage: p = Partition([3, 2])
sage: p.attacking_pairs()
[((0, 0), (0, 1)),
 ((0, 0), (0, 2)),
 ((0, 1), (0, 2)),
 ((1, 0), (1, 1)),
 ((1, 1), (0, 0))]
sage: Partition([]).attacking_pairs()
[]
```

```
>>> from sage.all import *
>>> p = Partition([Integer(3), Integer(2)])
>>> p.attacking_pairs()
[((0, 0), (0, 1)),
 ((0, 0), (0, 2)),
 ((0, 1), (0, 2)),
 ((1, 0), (1, 1)),
 ((1, 1), (0, 0))]
>>> Partition([]).attacking_pairs()
[]
```

aut(*t=0*, *q=0*)

Return the size of the centralizer of any permutation of cycle type `self`.

If m_i is the multiplicity of i as a part of p, this is given by

$$\prod_i m_i! i^{m_i}.$$

Including the optional parameters t and q gives the q, t analog, which is the former product times

$$\prod_{i=1}^{\mathrm{length}(p)} \frac{1 - q^{p_i}}{1 - t^{p_i}}.$$

See Section 1.3, p. 24, in [Ke1991].

EXAMPLES:

```
sage: Partition([2,2,1]).centralizer_size()
8
sage: Partition([2,2,2]).centralizer_size()
48
sage: Partition([2,2,1]).centralizer_size(q=2, t=3)
9/16
sage: Partition([]).centralizer_size()
1
sage: Partition([]).centralizer_size(q=2, t=4)
1
```

```
>>> from sage.all import *
>>> Partition([Integer(2),Integer(2),Integer(1)]).centralizer_size()
8
>>> Partition([Integer(2),Integer(2),Integer(2)]).centralizer_size()
48
>>> Partition([Integer(2),Integer(2),Integer(1)]).centralizer_
↪size(q=Integer(2), t=Integer(3))
9/16
>>> Partition([]).centralizer_size()
1
>>> Partition([]).centralizer_size(q=Integer(2), t=Integer(4))
1
```

beta_numbers(*length=None*)

Return the set of beta numbers corresponding to `self`.

The optional argument `length` specifies the length of the beta set (which must be at least the length of `self`).

For more on beta numbers, see *frobenius_coordinates()*.

EXAMPLES:

```
sage: Partition([4,3,2]).beta_numbers()
[6, 4, 2]
sage: Partition([4,3,2]).beta_numbers(5)
[8, 6, 4, 1, 0]
sage: Partition([]).beta_numbers()
[]
sage: Partition([]).beta_numbers(3)
[2, 1, 0]
sage: Partition([6,4,1,1]).beta_numbers()
[9, 6, 2, 1]
sage: Partition([6,4,1,1]).beta_numbers(6)
[11, 8, 4, 3, 1, 0]
sage: Partition([1,1,1]).beta_numbers()
[3, 2, 1]
sage: Partition([1,1,1]).beta_numbers(4)
[4, 3, 2, 0]
```

```
>>> from sage.all import *
>>> Partition([Integer(4),Integer(3),Integer(2)]).beta_numbers()
[6, 4, 2]
>>> Partition([Integer(4),Integer(3),Integer(2)]).beta_numbers(Integer(5))
```

(continues on next page)

(continued from previous page)

```
[8, 6, 4, 1, 0]
>>> Partition([]).beta_numbers()
[]
>>> Partition([]).beta_numbers(Integer(3))
[2, 1, 0]
>>> Partition([Integer(6),Integer(4),Integer(1),Integer(1)]).beta_numbers()
[9, 6, 2, 1]
>>> Partition([Integer(6),Integer(4),Integer(1),Integer(1)]).beta_
→numbers(Integer(6))
[11, 8, 4, 3, 1, 0]
>>> Partition([Integer(1),Integer(1),Integer(1)]).beta_numbers()
[3, 2, 1]
>>> Partition([Integer(1),Integer(1),Integer(1)]).beta_numbers(Integer(4))
[4, 3, 2, 0]
```

block (*e*, *multicharge=(0,)*)

Return a dictionary β that determines the block associated to the partition `self` and the *quantum_characteristic()* `e`.

INPUT:

- `e` – the quantum characteristic
- `multicharge` – the multicharge (default: $(0,)$)

OUTPUT:

- A dictionary giving the multiplicities of the residues in the partition tuple `self`

In more detail, the value `beta[i]` is equal to the number of nodes of residue `i`. This corresponds to the positive root

$$\sum_{i\in I}\beta_i\alpha_i \in Q^+,$$

a element of the positive root lattice of the corresponding Kac-Moody algebra. See [DJM1998] and [BK2009] for more details.

This is a useful statistics because two Specht modules for a Hecke algebra of type A belong to the same block if and only if they correspond to same element β of the root lattice, given above.

We return a dictionary because when the quantum characteristic is 0, the Cartan type is A_∞, in which case the simple roots are indexed by the integers.

EXAMPLES:

```
sage: Partition([4,3,2]).block(0)
{-2: 1, -1: 2, 0: 2, 1: 2, 2: 1, 3: 1}
sage: Partition([4,3,2]).block(2)
{0: 4, 1: 5}
sage: Partition([4,3,2]).block(2, multicharge=(1,))
{0: 5, 1: 4}
sage: Partition([4,3,2]).block(3)
{0: 3, 1: 3, 2: 3}
sage: Partition([4,3,2]).block(4)
{0: 2, 1: 2, 2: 2, 3: 3}
```

```
>>> from sage.all import *
>>> Partition([Integer(4),Integer(3),Integer(2)]).block(Integer(0))
{-2: 1, -1: 2, 0: 2, 1: 2, 2: 1, 3: 1}
>>> Partition([Integer(4),Integer(3),Integer(2)]).block(Integer(2))
{0: 4, 1: 5}
>>> Partition([Integer(4),Integer(3),Integer(2)]).block(Integer(2),␣
↪multicharge=(Integer(1),))
{0: 5, 1: 4}
>>> Partition([Integer(4),Integer(3),Integer(2)]).block(Integer(3))
{0: 3, 1: 3, 2: 3}
>>> Partition([Integer(4),Integer(3),Integer(2)]).block(Integer(4))
{0: 2, 1: 2, 2: 2, 3: 3}
```

boundary()

Return the integer coordinates of points on the boundary of `self`.

For the following description, picture the Ferrer's diagram of `self` using the French convention. Recall that the French convention puts the longest row on the bottom and the shortest row on the top. In addition, interpret the Ferrer's diagram as 1 x 1 cells in the Euclidean plane. So if `self` was the partition [3, 1], the lower-left vertices of the 1 x 1 cells in the Ferrer's diagram would be (0, 0), (1, 0), (2, 0), and (0, 1).

The boundary of a partition is the set $\{\mathrm{NE}(d) \mid \forall d \text{ diagonal}\}$. That is, for every diagonal line $y = x + b$ where $b \in \mathbb{Z}$, we find the northeasternmost (NE) point on that diagonal which is also in the Ferrer's diagram.

The boundary will go from bottom-right to top-left.

EXAMPLES:

Consider the partition (1) depicted as a square on a cartesian plane with vertices (0, 0), (1, 0), (1, 1), and (0, 1). Three of those vertices in the appropriate order form the boundary:

```
sage: Partition([1]).boundary()
[(1, 0), (1, 1), (0, 1)]
```

```
>>> from sage.all import *
>>> Partition([Integer(1)]).boundary()
[(1, 0), (1, 1), (0, 1)]
```

The partition (3, 1) can be visualized as three squares on a cartesian plane. The coordinates of the appropriate vertices form the boundary:

```
sage: Partition([3, 1]).boundary()
[(3, 0), (3, 1), (2, 1), (1, 1), (1, 2), (0, 2)]
```

```
>>> from sage.all import *
>>> Partition([Integer(3), Integer(1)]).boundary()
[(3, 0), (3, 1), (2, 1), (1, 1), (1, 2), (0, 2)]
```

See also

k_rim(). You might have been looking for *k_boundary()* instead.

cell_poset(*orientation='SE'*)

Return the Young diagram of `self` as a poset. The optional keyword variable `orientation` determines the order relation of the poset.

The poset always uses the set of cells of the Young diagram of `self` as its ground set. The order relation of the poset depends on the `orientation` variable (which defaults to `'SE'`). Concretely, `orientation` has to be specified to one of the strings `'NW'`, `'NE'`, `'SW'`, and `'SE'`, standing for "northwest", "northeast", "southwest" and "southeast", respectively. If `orientation` is `'SE'`, then the order relation of the poset is such that a cell u is greater or equal to a cell v in the poset if and only if u lies weakly southeast of v (this means that u can be reached from v by a sequence of south and east steps; the sequence is allowed to consist of south steps only, or of east steps only, or even be empty). Similarly the order relation is defined for the other three orientations. The Young diagram is supposed to be drawn in English notation.

The elements of the poset are the cells of the Young diagram of `self`, written as tuples of zero-based coordinates (so that $(3, 7)$ stands for the 8-th cell of the 4-th row, etc.).

EXAMPLES:

```
sage: # needs sage.graphs
sage: p = Partition([3,3,1])
sage: Q = p.cell_poset(); Q
Finite poset containing 7 elements
sage: sorted(Q)
[(0, 0), (0, 1), (0, 2), (1, 0), (1, 1), (1, 2), (2, 0)]
sage: sorted(Q.maximal_elements())
[(1, 2), (2, 0)]
sage: Q.minimal_elements()
[(0, 0)]
sage: sorted(Q.upper_covers((1, 0)))
[(1, 1), (2, 0)]
sage: Q.upper_covers((1, 1))
[(1, 2)]

sage: # needs sage.graphs
sage: P = p.cell_poset(orientation="NW"); P
Finite poset containing 7 elements
sage: sorted(P)
[(0, 0), (0, 1), (0, 2), (1, 0), (1, 1), (1, 2), (2, 0)]
sage: sorted(P.minimal_elements())
[(1, 2), (2, 0)]
sage: P.maximal_elements()
[(0, 0)]
sage: P.upper_covers((2, 0))
[(1, 0)]
sage: sorted(P.upper_covers((1, 2)))
[(0, 2), (1, 1)]
sage: sorted(P.upper_covers((1, 1)))
[(0, 1), (1, 0)]
sage: sorted([len(P.upper_covers(v)) for v in P])
[0, 1, 1, 1, 1, 2, 2]

sage: # needs sage.graphs
sage: R = p.cell_poset(orientation="NE"); R
Finite poset containing 7 elements
sage: sorted(R)
```

(continues on next page)

(continued from previous page)

```
[(0, 0), (0, 1), (0, 2), (1, 0), (1, 1), (1, 2), (2, 0)]
sage: R.maximal_elements()
[(0, 2)]
sage: R.minimal_elements()
[(2, 0)]
sage: sorted([len(R.upper_covers(v)) for v in R])
[0, 1, 1, 1, 1, 2, 2]
sage: R.is_isomorphic(P)
False
sage: R.is_isomorphic(P.dual())
False
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> p = Partition([Integer(3),Integer(3),Integer(1)])
>>> Q = p.cell_poset(); Q
Finite poset containing 7 elements

>>> R.is_isomorphic(P)
False
>>> R.is_isomorphic(P.dual())
False
```

Linear extensions of `p.cell_poset()` are in 1-to-1 correspondence with standard Young tableaux of shape p:

```
sage: all( len(p.cell_poset().linear_extensions())                         #␣
↪needs sage.graphs
....:      == len(p.standard_tableaux())
....:      for n in range(8) for p in Partitions(n) )
True
```

```
>>> from sage.all import *
>>> all( len(p.cell_poset().linear_extensions())                         #␣
↪needs sage.graphs
...      == len(p.standard_tableaux())
...      for n in range(Integer(8)) for p in Partitions(n) )
True
```

This is not the case for northeast orientation:

```
sage: q = Partition([3, 1])
sage: q.cell_poset(orientation="NE").is_chain()                            #␣
↪needs sage.graphs
True
```

```
>>> from sage.all import *
>>> q = Partition([Integer(3), Integer(1)])
>>> q.cell_poset(orientation="NE").is_chain()                            #␣
↪needs sage.graphs
True
```

cells()

Return the coordinates of the cells of `self`.

EXAMPLES:

```
sage: Partition([2,2]).cells()
[(0, 0), (0, 1), (1, 0), (1, 1)]
sage: Partition([3,2]).cells()
[(0, 0), (0, 1), (0, 2), (1, 0), (1, 1)]
```

```
>>> from sage.all import *
>>> Partition([Integer(2),Integer(2)]).cells()
[(0, 0), (0, 1), (1, 0), (1, 1)]
```

(continues on next page)

(continued from previous page)

```
>>> Partition([Integer(3),Integer(2)]).cells()
[(0, 0), (0, 1), (0, 2), (1, 0), (1, 1)]
```

centralizer_size(*t=0*, *q=0*)

Return the size of the centralizer of any permutation of cycle type `self`.

If m_i is the multiplicity of i as a part of p, this is given by

$$\prod_i m_i! i^{m_i}.$$

Including the optional parameters t and q gives the q,t analog, which is the former product times

$$\prod_{i=1}^{\mathrm{length}(p)} \frac{1-q^{p_i}}{1-t^{p_i}}.$$

See Section 1.3, p. 24, in [Ke1991].

EXAMPLES:

```
sage: Partition([2,2,1]).centralizer_size()
8
sage: Partition([2,2,2]).centralizer_size()
48
sage: Partition([2,2,1]).centralizer_size(q=2, t=3)
9/16
sage: Partition([]).centralizer_size()
1
sage: Partition([]).centralizer_size(q=2, t=4)
1
```

```
>>> from sage.all import *
>>> Partition([Integer(2),Integer(2),Integer(1)]).centralizer_size()
8
>>> Partition([Integer(2),Integer(2),Integer(2)]).centralizer_size()
48
>>> Partition([Integer(2),Integer(2),Integer(1)]).centralizer_
↪size(q=Integer(2), t=Integer(3))
9/16
>>> Partition([]).centralizer_size()
1
>>> Partition([]).centralizer_size(q=Integer(2), t=Integer(4))
1
```

character_polynomial()

Return the character polynomial associated to the partition `self`.

The character polynomial q_μ associated to a partition μ is defined by

$$q_\mu(x_1, x_2, \ldots, x_k) = \downarrow \sum_{\alpha \vdash k} \frac{\chi^\mu_\alpha}{1^{a_1}2^{a_2}\cdots k^{a_k}a_1!a_2!\cdots a_k!} \prod_{i=1}^{k}(ix_i - 1)^{a_i}$$

where k is the size of μ, and a_i is the multiplicity of i in α.

It is computed in the following manner:

1. Expand the Schur function s_μ in the power-sum basis,
2. Replace each p_i with $ix_i - 1$,
3. Apply the umbral operator $\downarrow$ to the resulting polynomial.

EXAMPLES:

```
sage: Partition([1]).character_polynomial()                                    #␣
↪needs sage.modules
x - 1
sage: Partition([1,1]).character_polynomial()                                  #␣
↪needs sage.modules
1/2*x0^2 - 3/2*x0 - x1 + 1
sage: Partition([2,1]).character_polynomial()                                  #␣
↪needs sage.modules
1/3*x0^3 - 2*x0^2 + 8/3*x0 - x2
```

```
>>> from sage.all import *
>>> Partition([Integer(1)]).character_polynomial()                              ␣
↪     # needs sage.modules
x - 1
>>> Partition([Integer(1),Integer(1)]).character_polynomial()                   ␣
↪                # needs sage.modules
1/2*x0^2 - 3/2*x0 - x1 + 1
>>> Partition([Integer(2),Integer(1)]).character_polynomial()                   ␣
↪                # needs sage.modules
1/3*x0^3 - 2*x0^2 + 8/3*x0 - x2
```

components()

Return a list containing the shape of `self`.

This method exists only for compatibility with *PartitionTuples*.

EXAMPLES:

```
sage: Partition([3,2]).components()
[[3, 2]]
```

```
>>> from sage.all import *
>>> Partition([Integer(3),Integer(2)]).components()
[[3, 2]]
```

conjugacy_class_size()

Return the size of the conjugacy class of the symmetric group indexed by `self`.

EXAMPLES:

```
sage: Partition([2,2,2]).conjugacy_class_size()
15
sage: Partition([2,2,1]).conjugacy_class_size()
15
sage: Partition([2,1,1]).conjugacy_class_size()
6
```

```
>>> from sage.all import *
>>> Partition([Integer(2),Integer(2),Integer(2)]).conjugacy_class_size()
15
>>> Partition([Integer(2),Integer(2),Integer(1)]).conjugacy_class_size()
15
>>> Partition([Integer(2),Integer(1),Integer(1)]).conjugacy_class_size()
6
```

conjugate()

Return the conjugate partition of the partition `self`. This is also called the associated partition or the transpose in the literature.

EXAMPLES:

```
sage: Partition([2,2]).conjugate()
[2, 2]
sage: Partition([6,3,1]).conjugate()
[3, 2, 2, 1, 1, 1]
```

```
>>> from sage.all import *
>>> Partition([Integer(2),Integer(2)]).conjugate()
[2, 2]
>>> Partition([Integer(6),Integer(3),Integer(1)]).conjugate()
[3, 2, 2, 1, 1, 1]
```

The conjugate partition is obtained by transposing the Ferrers diagram of the partition (see *ferrers_diagram()*):

```
sage: print(Partition([6,3,1]).ferrers_diagram())
******
***
*
sage: print(Partition([6,3,1]).conjugate().ferrers_diagram())
***
**
**
*
*
*
```

```
>>> from sage.all import *
>>> print(Partition([Integer(6),Integer(3),Integer(1)]).ferrers_diagram())
******
***
*
>>> print(Partition([Integer(6),Integer(3),Integer(1)]).conjugate().ferrers_
↪diagram())
***
**
**
*
*
*
```

contains(*x*)

Return True if x is a partition whose Ferrers diagram is contained in the Ferrers diagram of self.

EXAMPLES:

```
sage: p = Partition([3,2,1])
sage: p.contains([2,1])
True
sage: all(p.contains(mu) for mu in Partitions(3))
True
sage: all(p.contains(mu) for mu in Partitions(4))
False
```

```
>>> from sage.all import *
>>> p = Partition([Integer(3),Integer(2),Integer(1)])
>>> p.contains([Integer(2),Integer(1)])
True
>>> all(p.contains(mu) for mu in Partitions(Integer(3)))
True
>>> all(p.contains(mu) for mu in Partitions(Integer(4)))
False
```

content(*r*, *c*, *multicharge=(0,)*)

Return the content of the cell at row r and column c.

The content of a cell is $c - r$.

For consistency with partition tuples there is also an optional multicharge argument which is an offset to the usual content. By setting the multicharge equal to the 0-element of the ring $\mathbf{Z}/e\mathbf{Z}$, the corresponding e-residue will be returned. This is the content modulo e.

The content (and residue) do not strictly depend on the partition, however, this method is included because it is often useful in the context of partitions.

EXAMPLES:

```
sage: Partition([2,1]).content(1,0)
-1
sage: p = Partition([3,2])
sage: sum([p.content(*c) for c in p.cells()])
2
```

```
>>> from sage.all import *
>>> Partition([Integer(2),Integer(1)]).content(Integer(1),Integer(0))
-1
>>> p = Partition([Integer(3),Integer(2)])
>>> sum([p.content(*c) for c in p.cells()])
2
```

and now we return the 3-residue of a cell:

```
sage: Partition([2,1]).content(1,0, multicharge=[IntegerModRing(3)(0)])
2
```

```
>>> from sage.all import *
>>> Partition([Integer(2),Integer(1)]).content(Integer(1),Integer(0),␣
↪multicharge=[IntegerModRing(Integer(3))(Integer(0))])
2
```

contents_tableau(*multicharge=(0,)*)

Return the tableau which has `(k,r,c)`-th cell equal to the content `multicharge[k] - r + c` of the cell.

EXAMPLES:

```
sage: Partition([2,1]).contents_tableau()
[[0, 1], [-1]]
sage: Partition([3,2,1,1]).contents_tableau().pp()
    0  1  2
   -1  0
   -2
   -3
sage: Partition([3,2,1,1]).contents_tableau([ IntegerModRing(3)(0)] ).pp()
    0  1  2
    2  0
    1
    0
```

```
>>> from sage.all import *
>>> Partition([Integer(2),Integer(1)]).contents_tableau()
[[0, 1], [-1]]
>>> Partition([Integer(3),Integer(2),Integer(1),Integer(1)]).contents_
↪tableau().pp()
    0  1  2
   -1  0
   -2
   -3
>>> Partition([Integer(3),Integer(2),Integer(1),Integer(1)]).contents_
↪tableau([ IntegerModRing(Integer(3))(Integer(0))] ).pp()
    0  1  2
    2  0
    1
    0
```

core(*length*)

Return the `length`-core of the partition – in the literature the core is commonly referred to as the k-core, p-core, r-core, … .

The r-core of a partition λ can be obtained by repeatedly removing rim hooks of size r from (the Young diagram of) λ until this is no longer possible. The remaining partition is the core.

EXAMPLES:

```
sage: Partition([6,3,2,2]).core(3)
[2, 1, 1]
sage: Partition([]).core(3)
[]
sage: Partition([8,7,7,4,1,1,1,1,1]).core(3)
[2, 1, 1]
```

```
>>> from sage.all import *
>>> Partition([Integer(6),Integer(3),Integer(2),Integer(2)]).core(Integer(3))
[2, 1, 1]
>>> Partition([]).core(Integer(3))
[]
>>> Partition([Integer(8),Integer(7),Integer(7),Integer(4),Integer(1),
↪Integer(1),Integer(1),Integer(1),Integer(1)]).core(Integer(3))
[2, 1, 1]
```

corners()

Return a list of the corners of the partition `self`.

A corner of a partition λ is a cell of the Young diagram of λ which can be removed from the Young diagram while still leaving a straight shape behind.

The entries of the list returned are pairs of the form (i, j), where i and j are the coordinates of the respective corner. The coordinates are counted from 0.

Note

This is referred to as an "inner corner" in [Sag2001].

EXAMPLES:

```
sage: Partition([3,2,1]).corners()
[(0, 2), (1, 1), (2, 0)]
sage: Partition([3,3,1]).corners()
[(1, 2), (2, 0)]
sage: Partition([]).corners()
[]
```

```
>>> from sage.all import *
>>> Partition([Integer(3),Integer(2),Integer(1)]).corners()
[(0, 2), (1, 1), (2, 0)]
>>> Partition([Integer(3),Integer(3),Integer(1)]).corners()
[(1, 2), (2, 0)]
>>> Partition([]).corners()
[]
```

corners_residue(i, l)

Return a list of the corners of the partition `self` having `l`-residue `i`.

A corner of a partition λ is a cell of the Young diagram of λ which can be removed from the Young diagram while still leaving a straight shape behind. See `residue()` for the definition of the `l`-residue.

The entries of the list returned are pairs of the form (i, j), where i and j are the coordinates of the respective corner. The coordinates are counted from 0.

EXAMPLES:

```
sage: Partition([3,2,1]).corners_residue(0, 3)
[(1, 1)]
sage: Partition([3,2,1]).corners_residue(1, 3)
[(2, 0)]
```

(continues on next page)

(continued from previous page)

```
sage: Partition([3,2,1]).corners_residue(2, 3)
[(0, 2)]
```

```
>>> from sage.all import *
>>> Partition([Integer(3),Integer(2),Integer(1)]).corners_residue(Integer(0),
↪Integer(3))
[(1, 1)]
>>> Partition([Integer(3),Integer(2),Integer(1)]).corners_residue(Integer(1),
↪Integer(3))
[(2, 0)]
>>> Partition([Integer(3),Integer(2),Integer(1)]).corners_residue(Integer(2),
↪Integer(3))
[(0, 2)]
```

crank()

Return the Dyson crank of `self`.

The Dyson crank of a partition λ is defined as follows: If λ contains at least one 1, then the crank is $\mu(\lambda) - \omega(\lambda)$, where $\omega(\lambda)$ is the number of $1`sin`\lambda$, and $\mu(\lambda)$ is the number of parts of λ larger than $\omega(\lambda)$. If λ contains no 1, then the crank is simply the largest part of λ.

REFERENCES:

- [AG1988]

EXAMPLES:

```
sage: Partition([]).crank()
0
sage: Partition([3,2,2]).crank()
3
sage: Partition([5,4,2,1,1]).crank()
0
sage: Partition([1,1,1]).crank()
-3
sage: Partition([6,4,4,3]).crank()
6
sage: Partition([6,3,3,1,1]).crank()
1
sage: Partition([6]).crank()
6

>>> Partition([Integer(2),Integer(1),Integer(1),Integer(1),Integer(1)]).
↪crank()
-4
>>> Partition([Integer(1),Integer(1),Integer(1),Integer(1),Integer(1),
↪Integer(1)]).crank()
-6
```

defect (*e*, *multicharge=(0,)*)

Return the e-defect or the e-weight of `self`.

The e-defect is the number of (connected) e-rim hooks that can be removed from the partition.

The defect of a partition is given by

$$\operatorname{defect}(\beta) = (\Lambda, \beta) - \tfrac{1}{2}(\beta, \beta),$$

where $\Lambda = \sum_r \Lambda_{\kappa_r}$ for the multicharge $(\kappa_1, \ldots, \kappa_\ell)$ and $\beta = \sum_{(r,c)} \alpha_{(c-r) \pmod e}$, with the sum being over the cells in the partition.

INPUT:

- `e` – the quantum characteristic
- `multicharge` – the multicharge (default: $(0,)$)

OUTPUT: nonnegative integer, which is the defect of the block containing the partition `self`

EXAMPLES:

```
sage: Partition([4,3,2]).defect(2)
3
sage: Partition([0]).defect(2)
0
sage: Partition([3]).defect(2)
1
sage: Partition([6]).defect(2)
3
sage: Partition([9]).defect(2)
4
sage: Partition([12]).defect(2)
6
sage: Partition([4,3,2]).defect(3)
3
sage: Partition([0]).defect(3)
0
sage: Partition([3]).defect(3)
1
sage: Partition([6]).defect(3)
2
sage: Partition([9]).defect(3)
3
sage: Partition([12]).defect(3)
4
```

```
>>> from sage.all import *
>>> Partition([Integer(4),Integer(3),Integer(2)]).defect(Integer(2))
3
>>> Partition([Integer(0)]).defect(Integer(2))
0
>>> Partition([Integer(3)]).defect(Integer(2))
1
>>> Partition([Integer(6)]).defect(Integer(2))
3
>>> Partition([Integer(9)]).defect(Integer(2))
4
>>> Partition([Integer(12)]).defect(Integer(2))
6
>>> Partition([Integer(4),Integer(3),Integer(2)]).defect(Integer(3))
```

(continues on next page)

(continued from previous page)

```
3
>>> Partition([Integer(0)]).defect(Integer(3))
0
>>> Partition([Integer(3)]).defect(Integer(3))
1
>>> Partition([Integer(6)]).defect(Integer(3))
2
>>> Partition([Integer(9)]).defect(Integer(3))
3
>>> Partition([Integer(12)]).defect(Integer(3))
4
```

degree(*e*)

Return the e-th degree of `self`.

The e-th degree of a partition λ is the sum of the e-th degrees of the standard tableaux of shape λ. The e-th degree is the exponent of $\Phi_e(q)$ in the Gram determinant of the Specht module for a semisimple Iwahori-Hecke algebra of type A with parameter q.

INPUT:

- `e` – an integer $e > 1$

OUTPUT: nonnegative integer

EXAMPLES:

```
sage: Partition([4,3]).degree(2)
28
sage: Partition([4,3]).degree(3)
15
sage: Partition([4,3]).degree(4)
8
sage: Partition([4,3]).degree(5)
13
sage: Partition([4,3]).degree(6)
0
sage: Partition([4,3]).degree(7)
0
```

```
>>> from sage.all import *
>>> Partition([Integer(4),Integer(3)]).degree(Integer(2))
28
>>> Partition([Integer(4),Integer(3)]).degree(Integer(3))
15
>>> Partition([Integer(4),Integer(3)]).degree(Integer(4))
8
>>> Partition([Integer(4),Integer(3)]).degree(Integer(5))
13
>>> Partition([Integer(4),Integer(3)]).degree(Integer(6))
0
>>> Partition([Integer(4),Integer(3)]).degree(Integer(7))
0
```

Therefore, the Gram determinant of $S(5,3)$ when the Hecke parameter q is "generic" is

$$q^N \Phi_2(q)^{28} \Phi_3(q)^{15} \Phi_4(q)^8 \Phi_5(q)^{13}$$

for some integer N. Compare with `prime_degree()`.

dimension(*smaller=None*, *k=1*)

Return the number of paths from the `smaller` partition to the partition `self`, where each step consists of adding a k-ribbon while keeping a partition.

Note that a 1-ribbon is just a single cell, so this counts paths in the Young graph when $k = 1$.

Note also that the default case ($k = 1$ and `smaller = []`) gives the dimension of the irreducible representation of the symmetric group corresponding to `self`.

INPUT:

- `smaller` – a partition (default: an empty list `[]`)
- `k` – positive integer (default: 1)

OUTPUT: the number of such paths

EXAMPLES:

Looks at the number of ways of getting from `[5,4]` to the empty partition, removing one cell at a time:

```
sage: mu = Partition([5,4])
sage: mu.dimension()
42
```

```
>>> from sage.all import *
>>> mu = Partition([Integer(5),Integer(4)])
>>> mu.dimension()
42
```

Same, but removing one 3-ribbon at a time. Note that the 3-core of `mu` is empty:

```
sage: mu.dimension(k=3)
3
```

```
>>> from sage.all import *
>>> mu.dimension(k=Integer(3))
3
```

The 2-core of `mu` is not the empty partition:

```
sage: mu.dimension(k=2)
0
```

```
>>> from sage.all import *
>>> mu.dimension(k=Integer(2))
0
```

Indeed, the 2-core of `mu` is `[1]`:

```
sage: mu.dimension(Partition([1]),k=2)
2
```

```
>>> from sage.all import *
>>> mu.dimension(Partition([Integer(1)]),k=Integer(2))
2
```

ALGORITHM:

Depending on the parameters given, different simplifications occur. When $k = 1$ and `smaller` is empty, this function uses the hook formula. When $k = 1$ and `smaller` is not empty, it uses a formula from [ORV].

When $k \neq 1$, we first check that both `self` and `smaller` have the same k-core, then use the k-quotients and the same algorithm on each of the k-quotients.

AUTHORS:

- Paul-Olivier Dehaye (2011-06-07)

dominated_partitions(*rows=None*)

Return a list of the partitions dominated by n. If `rows` is specified, then it only returns the ones whose number of rows is at most `rows`.

EXAMPLES:

```
sage: Partition([3,2,1]).dominated_partitions()
[[3, 2, 1], [3, 1, 1, 1], [2, 2, 2], [2, 2, 1, 1], [2, 1, 1, 1, 1], [1, 1, 1,␣
↪1, 1, 1]]
sage: Partition([3,2,1]).dominated_partitions(rows=3)
[[3, 2, 1], [2, 2, 2]]
```

```
>>> from sage.all import *
>>> Partition([Integer(3),Integer(2),Integer(1)]).dominated_partitions()
[[3, 2, 1], [3, 1, 1, 1], [2, 2, 2], [2, 2, 1, 1], [2, 1, 1, 1, 1], [1, 1, 1,␣
↪1, 1, 1]]
>>> Partition([Integer(3),Integer(2),Integer(1)]).dominated_
↪partitions(rows=Integer(3))
[[3, 2, 1], [2, 2, 2]]
```

dominates(*p2*)

Return `True` if `self` dominates the partition `p2`. Otherwise it returns `False`.

EXAMPLES:

```
sage: p = Partition([3,2])
sage: p.dominates([3,1])
True
sage: p.dominates([2,2])
True
sage: p.dominates([2,1,1])
True
sage: p.dominates([3,3])
False
sage: p.dominates([4])
False
sage: Partition([4]).dominates(p)
False
sage: Partition([]).dominates([1])
False
```

(continues on next page)

(continued from previous page)

```
sage: Partition([]).dominates([])
True
sage: Partition([1]).dominates([])
True
```

```
>>> from sage.all import *
>>> p = Partition([Integer(3),Integer(2)])
>>> p.dominates([Integer(3),Integer(1)])
True
>>> p.dominates([Integer(2),Integer(2)])
True
>>> p.dominates([Integer(2),Integer(1),Integer(1)])
True
>>> p.dominates([Integer(3),Integer(3)])
False
>>> p.dominates([Integer(4)])
False
>>> Partition([Integer(4)]).dominates(p)
False
>>> Partition([]).dominates([Integer(1)])
False
>>> Partition([]).dominates([])
True
>>> Partition([Integer(1)]).dominates([])
True
```

down()

Return a generator for partitions that can be obtained from `self` by removing a cell.

EXAMPLES:

```
sage: [p for p in Partition([2,1,1]).down()]
[[1, 1, 1], [2, 1]]
sage: [p for p in Partition([3,2]).down()]
[[2, 2], [3, 1]]
sage: [p for p in Partition([3,2,1]).down()]
[[2, 2, 1], [3, 1, 1], [3, 2]]
```

```
>>> from sage.all import *
>>> [p for p in Partition([Integer(2),Integer(1),Integer(1)]).down()]
[[1, 1, 1], [2, 1]]
>>> [p for p in Partition([Integer(3),Integer(2)]).down()]
[[2, 2], [3, 1]]
>>> [p for p in Partition([Integer(3),Integer(2),Integer(1)]).down()]
[[2, 2, 1], [3, 1, 1], [3, 2]]
```

down_list()

Return a list of the partitions that can be obtained from `self` by removing a cell.

EXAMPLES:

```
sage: Partition([2,1,1]).down_list()
[[1, 1, 1], [2, 1]]
```

(continues on next page)

(continued from previous page)

```
sage: Partition([3,2]).down_list()
[[2, 2], [3, 1]]
sage: Partition([3,2,1]).down_list()
[[2, 2, 1], [3, 1, 1], [3, 2]]
sage: Partition([]).down_list()  #checks :issue:`11435`
[]
```

```
>>> from sage.all import *
>>> Partition([Integer(2),Integer(1),Integer(1)]).down_list()
[[1, 1, 1], [2, 1]]
>>> Partition([Integer(3),Integer(2)]).down_list()
[[2, 2], [3, 1]]
>>> Partition([Integer(3),Integer(2),Integer(1)]).down_list()
[[2, 2, 1], [3, 1, 1], [3, 2]]
>>> Partition([]).down_list()  #checks :issue:`11435`
[]
```

dual_equivalence_graph(*directed=False*, *coloring=None*)

Return the dual equivalence graph of `self`.

Two permutations p and q in the symmetric group S_n differ by an *i-elementary dual equivalence (or dual Knuth) relation* (where i is an integer with $1 < i < n$) when the following two conditions are satisfied:

- In the one-line notation of the permutation p, the letter i does not appear between $i-1$ and $i+1$.
- The permutation q is obtained from p by switching two of the three letters $i-1, i, i+1$ (in its one-line notation) – namely, the leftmost and the rightmost one in order of their appearance in p.

Notice that this is equivalent to the statement that the permutations p^{-1} and q^{-1} differ by an elementary Knuth equivalence at positions $i-1, i, i+1$.

Two standard Young tableaux of shape λ differ by an i-elementary dual equivalence relation (of color i), if their reading words differ by an i-elementary dual equivalence relation.

The *dual equivalence graph* of the partition λ is the edge-colored graph whose vertices are the standard Young tableaux of shape λ, and whose edges colored by i are given by the i-elementary dual equivalences.

INPUT:

- `directed` – boolean (default: `False`); whether to have the dual equivalence graph be directed (where we have a directed edge $S \to T$ if i appears to the left of $i+1$ in the reading word of T; otherwise we have the directed edge $T \to S$)
- `coloring` – (optional) a function which sends each integer $i > 1$ to a color (as a string, e.g., `'red'` or `'black'`) to be used when visually representing the resulting graph using dot2tex; the default choice is `2 -> 'red', 3 -> 'blue', 4 -> 'green', 5 -> 'purple', 6 -> 'brown', 7 -> 'orange', 8 -> 'yellow', anything greater than 8 -> 'black'`.

 ([[1, 4, 5], [2], [3]], [[1, 3, 5], [2], [4]], 3)]
```

evaluation()

Return the evaluation of `self`.

The **commutative evaluation**, often shortened to **evaluation**, of a word (we think of a partition as a word in $\{1, 2, 3, \ldots\}$) is its image in the free commutative monoid. In other words, this counts how many occurrences there are of each letter.

This is also is known as **Parikh vector** and **abelianization** and has the same output as `to_exp()`.

EXAMPLES:

```
sage: Partition([4,3,1,1]).evaluation()
[2, 0, 1, 1]
```

```
>>> from sage.all import *
>>> Partition([Integer(4),Integer(3),Integer(1),Integer(1)]).evaluation()
[2, 0, 1, 1]
```

ferrers_diagram()

Return the Ferrers diagram of `self`.

EXAMPLES:

```
sage: mu = Partition([5,5,2,1])
sage: Partitions.options(diagram_str='*', convention='english')
sage: print(mu.ferrers_diagram())
*****
*****
**
*
sage: Partitions.options(diagram_str='█')
sage: print(mu.ferrers_diagram())
█████
█████
██
█
sage: Partitions.options.convention="french"
sage: print(mu.ferrers_diagram())
█
██
█████
█████
sage: print(Partition([]).ferrers_diagram())
-
sage: Partitions.options(diagram_str='-')
sage: print(Partition([]).ferrers_diagram())
(/)
sage: Partitions.options._reset()
```

```
>>> from sage.all import *
>>> mu = Partition([Integer(5),Integer(5),Integer(2),Integer(1)])
>>> Partitions.options(diagram_str='*', convention='english')
>>> print(mu.ferrers_diagram())
*****
*****
**
*
>>> Partitions.options(diagram_str='█')
>>> print(mu.ferrers_diagram())
█████
█████
██
█
>>> Partitions.options.convention="french"
>>> print(mu.ferrers_diagram())
█
██
█████
█████
>>> print(Partition([]).ferrers_diagram())
-
```

(continues on next page)

(continued from previous page)

```
>>> Partitions.options(diagram_str='-')
>>> print(Partition([]).ferrers_diagram())
(/)
>>> Partitions.options._reset()
```

frobenius_coordinates()

Return a pair of sequences of Frobenius coordinates aka beta numbers of the partition.

These are two strictly decreasing sequences of nonnegative integers of the same length.

EXAMPLES:

```
sage: Partition([]).frobenius_coordinates()
([], [])
sage: Partition([1]).frobenius_coordinates()
([0], [0])
sage: Partition([3,3,3]).frobenius_coordinates()
([2, 1, 0], [2, 1, 0])
sage: Partition([9,1,1,1,1,1,1]).frobenius_coordinates()
([8], [6])
```

```
>>> from sage.all import *
>>> Partition([]).frobenius_coordinates()
([], [])
>>> Partition([Integer(1)]).frobenius_coordinates()
([0], [0])
>>> Partition([Integer(3),Integer(3),Integer(3)]).frobenius_coordinates()
([2, 1, 0], [2, 1, 0])
>>> Partition([Integer(9),Integer(1),Integer(1),Integer(1),Integer(1),
↪Integer(1),Integer(1)]).frobenius_coordinates()
([8], [6])
```

frobenius_rank()

Return the Frobenius rank of the partition `self`.

The Frobenius rank of a partition $\lambda = (\lambda_1, \lambda_2, \lambda_3, \cdots)$ is defined to be the largest i such that $\lambda_i \geq i$. In other words, it is the number of cells on the main diagonal of λ. In yet other words, it is the size of the largest square fitting into the Young diagram of λ.

EXAMPLES:

```
sage: Partition([]).frobenius_rank()
0
sage: Partition([1]).frobenius_rank()
1
sage: Partition([3,3,3]).frobenius_rank()
3
sage: Partition([9,1,1,1,1,1]).frobenius_rank()
1
sage: Partition([2,1,1,1,1,1]).frobenius_rank()
1
sage: Partition([2,2,1,1,1,1]).frobenius_rank()
2
sage: Partition([3,2]).frobenius_rank()
```

(continues on next page)

(continued from previous page)

```
2
sage: Partition([3,2,2]).frobenius_rank()
2
sage: Partition([8,4,4,4,4]).frobenius_rank()
4
sage: Partition([8,4,1]).frobenius_rank()
2
sage: Partition([3,3,1]).frobenius_rank()
2
```

```
>>> from sage.all import *
>>> Partition([]).frobenius_rank()
0
>>> Partition([Integer(1)]).frobenius_rank()
1
>>> Partition([Integer(3),Integer(3),Integer(3)]).frobenius_rank()
3
>>> Partition([Integer(9),Integer(1),Integer(1),Integer(1),Integer(1),
↪Integer(1)]).frobenius_rank()
1
>>> Partition([Integer(2),Integer(1),Integer(1),Integer(1),Integer(1),
↪Integer(1)]).frobenius_rank()
1
>>> Partition([Integer(2),Integer(2),Integer(1),Integer(1),Integer(1),
↪Integer(1)]).frobenius_rank()
2
>>> Partition([Integer(3),Integer(2)]).frobenius_rank()
2
>>> Partition([Integer(3),Integer(2),Integer(2)]).frobenius_rank()
2
>>> Partition([Integer(8),Integer(4),Integer(4),Integer(4),Integer(4)]).
↪frobenius_rank()
4
>>> Partition([Integer(8),Integer(4),Integer(1)]).frobenius_rank()
2
>>> Partition([Integer(3),Integer(3),Integer(1)]).frobenius_rank()
2
```

from_kbounded_to_grassmannian(k)

Map a k-bounded partition to a Grassmannian element in the affine Weyl group of type $A_k^{(1)}$.

For details, see the documentation of the method *from_kbounded_to_reduced_word()* .

EXAMPLES:

```
sage: p = Partition([2,1,1])
sage: p.from_kbounded_to_grassmannian(2)                                    #␣
↪needs sage.modules
[-1  1  1]
[-2  2  1]
[-2  1  2]
sage: p = Partition([])
```

(continues on next page)

(continued from previous page)

```
sage: p.from_kbounded_to_grassmannian(2)                                    #␣
↪needs sage.modules
[1 0 0]
[0 1 0]
[0 0 1]
```

```
>>> from sage.all import *
>>> p = Partition([Integer(2),Integer(1),Integer(1)])
>>> p.from_kbounded_to_grassmannian(Integer(2))                            ␣
↪     # needs sage.modules
[-1  1  1]
[-2  2  1]
[-2  1  2]
>>> p = Partition([])
>>> p.from_kbounded_to_grassmannian(Integer(2))                            ␣
↪     # needs sage.modules
[1 0 0]
[0 1 0]
[0 0 1]
```

from_kbounded_to_reduced_word(k)

Map a k-bounded partition to a reduced word for an element in the affine permutation group.

This uses the fact that there is a bijection between k-bounded partitions and $(k+1)$-cores and an action of the affine nilCoxeter algebra of type $A_k^{(1)}$ on $(k+1)$-cores as described in [LM2006b].

EXAMPLES:

```
sage: p = Partition([2,1,1])
sage: p.from_kbounded_to_reduced_word(2)
[2, 1, 2, 0]
sage: p = Partition([3,1])
sage: p.from_kbounded_to_reduced_word(3)
[3, 2, 1, 0]
sage: p.from_kbounded_to_reduced_word(2)
Traceback (most recent call last):
...
ValueError: the partition must be 2-bounded
sage: p = Partition([])
sage: p.from_kbounded_to_reduced_word(2)
[]
```

```
>>> from sage.all import *
>>> p = Partition([Integer(2),Integer(1),Integer(1)])
>>> p.from_kbounded_to_reduced_word(Integer(2))
[2, 1, 2, 0]
>>> p = Partition([Integer(3),Integer(1)])
>>> p.from_kbounded_to_reduced_word(Integer(3))
[3, 2, 1, 0]
>>> p.from_kbounded_to_reduced_word(Integer(2))
Traceback (most recent call last):
...
```

(continues on next page)

(continued from previous page)

```
ValueError: the partition must be 2-bounded
>>> p = Partition([])
>>> p.from_kbounded_to_reduced_word(Integer(2))
[]
```

garnir_tableau(**cell*)

Return the Garnir tableau of shape `self` corresponding to the cell `cell`. If `cell` $= (a, c)$ then $(a + 1, c)$ must belong to the diagram of `self`.

The Garnir tableaux play an important role in integral and non-semisimple representation theory because they determine the "straightening" rules for the Specht modules over an arbitrary ring.

The Garnir tableaux are the "first" non-standard tableaux which arise when you act by simple transpositions. If (a, c) is a cell in the Young diagram of a partition, which is not at the bottom of its column, then the corresponding Garnir tableau has the integers $1, 2, \ldots, n$ entered in order from left to right along the rows of the diagram up to the cell $(a, c - 1)$, then along the cells $(a + 1, 1)$ to $(a + 1, c)$, then (a, c) until the end of row a and then continuing from left to right in the remaining positions. The examples below probably make this clearer!

Note: The function also sets `g._garnir_cell`, where `g` is the resulting Garnir tableau, equal to `cell` which is used by some other functions.

EXAMPLES:

```
sage: g = Partition([5,3,3,2]).garnir_tableau((0,2)); g.pp()
  1  2  6  7  8
  3  4  5
  9 10 11
 12 13
sage: g.is_row_strict(); g.is_column_strict()
True
False

sage: Partition([5,3,3,2]).garnir_tableau(0,2).pp()
  1  2  6  7  8
  3  4  5
  9 10 11
 12 13
sage: Partition([5,3,3,2]).garnir_tableau(2,1).pp()
  1  2  3  4  5
  6  7  8
  9 12 13
 10 11
sage: Partition([5,3,3,2]).garnir_tableau(2,2).pp()
Traceback (most recent call last):
...
ValueError: (row+1, col) must be inside the diagram
```

```
>>> from sage.all import *
>>> g = Partition([Integer(5),Integer(3),Integer(3),Integer(2)]).garnir_
```

(continues on next page)

(continued from previous page)

```
↪tableau((Integer(0),Integer(2))); g.pp()
  1  2  6  7  8
  3  4  5
  9 10 11
 12 13
>>> g.is_row_strict(); g.is_column_strict()
True
False

>>> Partition([Integer(5),Integer(3),Integer(3),Integer(2)]).garnir_
↪tableau(Integer(0),Integer(2)).pp()
  1  2  6  7  8
  3  4  5
  9 10 11
 12 13
>>> Partition([Integer(5),Integer(3),Integer(3),Integer(2)]).garnir_
↪tableau(Integer(2),Integer(1)).pp()
  1  2  3  4  5
  6  7  8
  9 12 13
 10 11
>>> Partition([Integer(5),Integer(3),Integer(3),Integer(2)]).garnir_
↪tableau(Integer(2),Integer(2)).pp()
Traceback (most recent call last):
...
ValueError: (row+1, col) must be inside the diagram
```

See also

- `top_garnir_tableau()`

garsia_procesi_module(*base_ring=None*)

Return the `Garsia-Procesi module` corresponding to `self`.

INPUT:

- `base_ring` – (default: $\mathbf{Q}$) the base ring

EXAMPLES:

```
sage: GP = Partition([3,2,1]).garsia_procesi_module(QQ); GP
Garsia-Procesi module of shape [3, 2, 1] over Rational Field
sage: GP.graded_frobenius_image()
q^4*s[3, 2, 1] + q^3*s[3, 3] + q^3*s[4, 1, 1] + (q^3+q^2)*s[4, 2]
 + (q^2+q)*s[5, 1] + s[6]

sage: Partition([3,2,1]).garsia_procesi_module(GF(3))
Garsia-Procesi module of shape [3, 2, 1] over Finite Field of size 3
```

```
>>> from sage.all import *
>>> GP = Partition([Integer(3),Integer(2),Integer(1)]).garsia_procesi_
```

(continues on next page)

(continued from previous page)

```
↪module(QQ); GP
Garsia-Procesi module of shape [3, 2, 1] over Rational Field
>>> GP.graded_frobenius_image()
q^4*s[3, 2, 1] + q^3*s[3, 3] + q^3*s[4, 1, 1] + (q^3+q^2)*s[4, 2]
 + (q^2+q)*s[5, 1] + s[6]

>>> Partition([Integer(3),Integer(2),Integer(1)]).garsia_procesi_
↪module(GF(Integer(3)))
Garsia-Procesi module of shape [3, 2, 1] over Finite Field of size 3
```

generalized_pochhammer_symbol(*a*, *alpha*)

Return the generalized Pochhammer symbol $(a)^{(\alpha)}_{self}$. This is the product over all cells (i, j) in `self` of $a - (i - 1)/\alpha + j - 1$.

EXAMPLES:

```
sage: Partition([2,2]).generalized_pochhammer_symbol(2,1)
12
```

```
>>> from sage.all import *
>>> Partition([Integer(2),Integer(2)]).generalized_pochhammer_
↪symbol(Integer(2),Integer(1))
12
```

get_part(*i*, *default=0*)

Return the i-th part of `self`, or `default` if it does not exist.

EXAMPLES:

```
sage: p = Partition([2,1])
sage: p.get_part(0), p.get_part(1), p.get_part(2)
(2, 1, 0)
sage: p.get_part(10,-1)
-1
sage: Partition([]).get_part(0)
0
```

```
>>> from sage.all import *
>>> p = Partition([Integer(2),Integer(1)])
>>> p.get_part(Integer(0)), p.get_part(Integer(1)), p.get_part(Integer(2))
(2, 1, 0)
>>> p.get_part(Integer(10),-Integer(1))
-1
>>> Partition([]).get_part(Integer(0))
0
```

glaisher_franklin(*s*)

Apply the Glaisher-Franklin bijection to `self`.

The Franklin-Glaisher bijection, with parameter s, returns a partition whose set of parts that are repeated at least s times equals the set of parts divisible by s in `self`, after dividing each part by s.

INPUT:

- s – positive integer

EXAMPLES:

```
sage: Partition([4, 3, 2, 2, 1]).glaisher_franklin(2)
[3, 2, 2, 1, 1, 1, 1, 1]
```

```
>>> from sage.all import *
>>> Partition([Integer(4), Integer(3), Integer(2), Integer(2), Integer(1)]).
→glaisher_franklin(Integer(2))
[3, 2, 2, 1, 1, 1, 1, 1]
```

glaisher_franklin_inverse(*s*)

Apply the inverse of the Glaisher-Franklin bijection to self.

The inverse of the Franklin-Glaisher bijection, with parameter s, returns a partition whose set of parts that are divisible by s, after dividing each by s, equals the equals the set of parts repeated at least s times in self.

INPUT:

- s – positive integer

EXAMPLES:

```
sage: Partition([4, 3, 2, 2, 1]).glaisher_franklin(2)
[3, 2, 2, 1, 1, 1, 1, 1]
sage: Partition([3, 2, 2, 1, 1, 1, 1, 1]).glaisher_franklin_inverse(2)
[4, 3, 2, 2, 1]
```

```
>>> from sage.all import *
>>> Partition([Integer(4), Integer(3), Integer(2), Integer(2), Integer(1)]).
→glaisher_franklin(Integer(2))
[3, 2, 2, 1, 1, 1, 1, 1]
>>> Partition([Integer(3), Integer(2), Integer(2), Integer(1), Integer(1),␣
→Integer(1), Integer(1), Integer(1)]).glaisher_franklin_inverse(Integer(2))
[4, 3, 2, 2, 1]
```

has_k_rectangle(*k*)

Return True if the Ferrer's diagram of self contains $k - i + 1$ rows (*or more*) of length i (*exactly*) for any i in $[1, k]$.

This is mainly a helper function for *is_k_reducible()* and *is_k_irreducible()*, the only difference between this function and *is_k_reducible()* being that this function allows any partition as input while *is_k_reducible()* requires the input to be k-bounded.

EXAMPLES:

The partition [1, 1, 1] has at least 2 rows of length 1:

```
sage: Partition([1, 1, 1]).has_k_rectangle(2)
True
```

```
>>> from sage.all import *
>>> Partition([Integer(1), Integer(1), Integer(1)]).has_k_
→rectangle(Integer(2))
True
```

The partition [1, 1, 1] does *not* have 4 rows of length 1, 3 rows of length 2, 2 rows of length 3, nor 1 row of length 4:

```
sage: Partition([1, 1, 1]).has_k_rectangle(4)
False
```

```
>>> from sage.all import *
>>> Partition([Integer(1), Integer(1), Integer(1)]).has_k_
↪rectangle(Integer(4))
False
```

See also:

is_k_irreducible(), *is_k_reducible()*, *has_rectangle()*

has_rectangle(*h*, *w*)

Return True if the Ferrer's diagram of self has h (*or more*) rows of length w (*exactly*).

INPUT:

- h – integer $h \geq 1$; the (*minimum*) height of the rectangle
- w – integer $w \geq 1$; the width of the rectangle

EXAMPLES:

```
sage: Partition([3, 3, 3, 3]).has_rectangle(2, 3)
True
sage: Partition([3, 3]).has_rectangle(2, 3)
True
sage: Partition([4, 3]).has_rectangle(2, 3)
False
sage: Partition([3]).has_rectangle(2, 3)
False
```

```
>>> from sage.all import *
>>> Partition([Integer(3), Integer(3), Integer(3), Integer(3)]).has_
↪rectangle(Integer(2), Integer(3))
True
>>> Partition([Integer(3), Integer(3)]).has_rectangle(Integer(2), Integer(3))
True
>>> Partition([Integer(4), Integer(3)]).has_rectangle(Integer(2), Integer(3))
False
>>> Partition([Integer(3)]).has_rectangle(Integer(2), Integer(3))
False
```

See also:

has_k_rectangle()

hook_length(*i*, *j*)

Return the length of the hook of cell (i, j) in self.

The (length of the) hook of cell (i, j) of a partition λ is

$$\lambda_i + \lambda'_j - i - j + 1$$

where λ' is the conjugate partition. In English convention, the hook length is the number of cells horizontally to the right and vertically below the cell (i, j) (including that cell).

EXAMPLES:

```
sage: p = Partition([2,2,1])
sage: p.hook_length(0, 0)
4
sage: p.hook_length(0, 1)
2
sage: p.hook_length(2, 0)
1
sage: Partition([3,3]).hook_length(0, 0)
4
sage: cell = [0,0]; Partition([3,3]).hook_length(*cell)
4
```

```
>>> from sage.all import *
>>> p = Partition([Integer(2),Integer(2),Integer(1)])
>>> p.hook_length(Integer(0), Integer(0))
4
>>> p.hook_length(Integer(0), Integer(1))
2
>>> p.hook_length(Integer(2), Integer(0))
1
>>> Partition([Integer(3),Integer(3)]).hook_length(Integer(0), Integer(0))
4
>>> cell = [Integer(0),Integer(0)]; Partition([Integer(3),Integer(3)]).hook_
↪length(*cell)
4
```

hook_lengths()

Return a tableau of shape `self` with the cells filled in with the hook lengths.

In each cell, put the sum of one plus the number of cells horizontally to the right and vertically below the cell (the hook length).

For example, consider the partition `[3,2,1]` of 6 with Ferrers diagram:

```
# # #
# #
#
```

When we fill in the cells with the hook lengths, we obtain:

```
5 3 1
3 1
1
```

EXAMPLES:

```
sage: Partition([2,2,1]).hook_lengths()
[[4, 2], [3, 1], [1]]
sage: Partition([3,3]).hook_lengths()
[[4, 3, 2], [3, 2, 1]]
sage: Partition([3,2,1]).hook_lengths()
[[5, 3, 1], [3, 1], [1]]
sage: Partition([2,2]).hook_lengths()
[[3, 2], [2, 1]]
sage: Partition([5]).hook_lengths()
[[5, 4, 3, 2, 1]]
```

```
>>> from sage.all import *
>>> Partition([Integer(2),Integer(2),Integer(1)]).hook_lengths()
[[4, 2], [3, 1], [1]]
>>> Partition([Integer(3),Integer(3)]).hook_lengths()
[[4, 3, 2], [3, 2, 1]]
>>> Partition([Integer(3),Integer(2),Integer(1)]).hook_lengths()
[[5, 3, 1], [3, 1], [1]]
>>> Partition([Integer(2),Integer(2)]).hook_lengths()
[[3, 2], [2, 1]]
>>> Partition([Integer(5)]).hook_lengths()
[[5, 4, 3, 2, 1]]
```

REFERENCES:

- http://mathworld.wolfram.com/HookLengthFormula.html

hook_polynomial (q, t)

Return the two-variable hook polynomial.

EXAMPLES:

```
sage: R.<q,t> = PolynomialRing(QQ)
sage: a = Partition([2,2]).hook_polynomial(q,t)
sage: a == (1 - t)*(1 - q*t)*(1 - t^2)*(1 - q*t^2)
True
sage: a = Partition([3,2,1]).hook_polynomial(q,t)
sage: a == (1 - t)^3*(1 - q*t^2)^2*(1 - q^2*t^3)
True
```

```
>>> from sage.all import *
>>> R = PolynomialRing(QQ, names=('q', 't',)); (q, t,) = R._first_ngens(2)
>>> a = Partition([Integer(2),Integer(2)]).hook_polynomial(q,t)
>>> a == (Integer(1) - t)*(Integer(1) - q*t)*(Integer(1) -
↪t**Integer(2))*(Integer(1) - q*t**Integer(2))
True
>>> a = Partition([Integer(3),Integer(2),Integer(1)]).hook_polynomial(q,t)
>>> a == (Integer(1) - t)**Integer(3)*(Integer(1) -
↪q*t**Integer(2))**Integer(2)*(Integer(1) - q**Integer(2)*t**Integer(3))
True
```

hook_product (a)

Return the Jack hook-product.

EXAMPLES:

```
sage: Partition([3,2,1]).hook_product(x)                                    #␣
↪needs sage.symbolic
(2*x + 3)*(x + 2)^2
sage: Partition([2,2]).hook_product(x)                                      #␣
↪needs sage.symbolic
2*(x + 2)*(x + 1)
```

```
>>> from sage.all import *
>>> Partition([Integer(3),Integer(2),Integer(1)]).hook_product(x)          ␣
↪                       # needs sage.symbolic
(2*x + 3)*(x + 2)^2
>>> Partition([Integer(2),Integer(2)]).hook_product(x)                     ␣
↪                  # needs sage.symbolic
2*(x + 2)*(x + 1)
```

hooks()

Return a sorted list of the hook lengths in `self`.

EXAMPLES:

```
sage: Partition([3,2,1]).hooks()
[5, 3, 3, 1, 1, 1]
```

```
>>> from sage.all import *
>>> Partition([Integer(3),Integer(2),Integer(1)]).hooks()
[5, 3, 3, 1, 1, 1]
```

horizontal_border_strip_cells(*k*)

Return a list of all the horizontal border strips of length `k` which can be added to `self`, where each horizontal border strip is a `generator` of cells.

EXAMPLES:

```
sage: list(Partition([]).horizontal_border_strip_cells(0))
[]
sage: list(Partition([3,2,1]).horizontal_border_strip_cells(0))
[]
sage: list(Partition([]).horizontal_border_strip_cells(2))
[[(0, 0), (0, 1)]]
sage: list(Partition([2,2]).horizontal_border_strip_cells(2))
[[(0, 2), (0, 3)], [(0, 2), (2, 0)], [(2, 0), (2, 1)]]
sage: list(Partition([3,2,2]).horizontal_border_strip_cells(2))
[[(0, 3), (0, 4)],
 [(0, 3), (1, 2)],
 [(0, 3), (3, 0)],
 [(1, 2), (3, 0)],
 [(3, 0), (3, 1)]]
```

```
>>> from sage.all import *
>>> list(Partition([]).horizontal_border_strip_cells(Integer(0)))
[]
>>> list(Partition([Integer(3),Integer(2),Integer(1)]).horizontal_border_
↪strip_cells(Integer(0)))
```

(continues on next page)

(continued from previous page)

```
[]
>>> list(Partition([]).horizontal_border_strip_cells(Integer(2)))
[[(0, 0), (0, 1)]]
>>> list(Partition([Integer(2),Integer(2)]).horizontal_border_strip_
↪cells(Integer(2)))
[[(0, 2), (0, 3)], [(0, 2), (2, 0)], [(2, 0), (2, 1)]]
>>> list(Partition([Integer(3),Integer(2),Integer(2)]).horizontal_border_
↪strip_cells(Integer(2)))
[[(0, 3), (0, 4)],
 [(0, 3), (1, 2)],
 [(0, 3), (3, 0)],
 [(1, 2), (3, 0)],
 [(3, 0), (3, 1)]]
```

initial_column_tableau()

Return the initial column tableau of shape `self`.

The initial column tableau of shape `self` is the standard tableau that has the numbers 1 to n, where n is the *size()* of `self`, entered in order from top to bottom and then left to right down the columns of `self`.

EXAMPLES:

```
sage: Partition([3,2]).initial_column_tableau()
[[1, 3, 5], [2, 4]]
```

```
>>> from sage.all import *
>>> Partition([Integer(3),Integer(2)]).initial_column_tableau()
[[1, 3, 5], [2, 4]]
```

initial_tableau()

Return the *standard tableau* which has the numbers $1, 2, \ldots, n$ where n is the *size()* of `self` entered in order from left to right along the rows of each component, where the components are ordered from left to right.

EXAMPLES:

```
sage: Partition([3,2,2]).initial_tableau()
[[1, 2, 3], [4, 5], [6, 7]]
```

```
>>> from sage.all import *
>>> Partition([Integer(3),Integer(2),Integer(2)]).initial_tableau()
[[1, 2, 3], [4, 5], [6, 7]]
```

inside_corners()

Return a list of the corners of the partition `self`.

A corner of a partition λ is a cell of the Young diagram of λ which can be removed from the Young diagram while still leaving a straight shape behind.

The entries of the list returned are pairs of the form (i, j), where i and j are the coordinates of the respective corner. The coordinates are counted from 0.

> **Note**
>
> This is referred to as an "inner corner" in [Sag2001].

EXAMPLES:

```
sage: Partition([3,2,1]).corners()
[(0, 2), (1, 1), (2, 0)]
sage: Partition([3,3,1]).corners()
[(1, 2), (2, 0)]
sage: Partition([]).corners()
[]
```

```
>>> from sage.all import *
>>> Partition([Integer(3),Integer(2),Integer(1)]).corners()
[(0, 2), (1, 1), (2, 0)]
>>> Partition([Integer(3),Integer(3),Integer(1)]).corners()
[(1, 2), (2, 0)]
>>> Partition([]).corners()
[]
```

inside_corners_residue(*i*, *l*)

Return a list of the corners of the partition `self` having `l`-residue `i`.

A corner of a partition λ is a cell of the Young diagram of λ which can be removed from the Young diagram while still leaving a straight shape behind. See *residue()* for the definition of the `l`-residue.

The entries of the list returned are pairs of the form (i, j), where i and j are the coordinates of the respective corner. The coordinates are counted from 0.

EXAMPLES:

```
sage: Partition([3,2,1]).corners_residue(0, 3)
[(1, 1)]
sage: Partition([3,2,1]).corners_residue(1, 3)
[(2, 0)]
sage: Partition([3,2,1]).corners_residue(2, 3)
[(0, 2)]
```

```
>>> from sage.all import *
>>> Partition([Integer(3),Integer(2),Integer(1)]).corners_residue(Integer(0),
→Integer(3))
[(1, 1)]
>>> Partition([Integer(3),Integer(2),Integer(1)]).corners_residue(Integer(1),
→Integer(3))
[(2, 0)]
>>> Partition([Integer(3),Integer(2),Integer(1)]).corners_residue(Integer(2),
→Integer(3))
[(0, 2)]
```

is_core(*k*)

Return `True` if the Partition `self` is a `k`-core.

A partition is said to be a *`k`-core* if it has no hooks of length k. Equivalently, a partition is said to be a k-core if it is its own k-core (where the latter is defined as in `core()`).

Visually, this can be checked by trying to remove border strips of size k from `self`. If this is not possible, then `self` is a k-core.

EXAMPLES:

In the partition (2, 1), a hook length of 2 does not occur, but a hook length of 3 does:

```
sage: p = Partition([2, 1])
sage: p.is_core(2)
True
sage: p.is_core(3)
False

sage: q = Partition([12, 8, 5, 5, 2, 2, 1])
sage: q.is_core(4)
False
sage: q.is_core(5)
True
sage: q.is_core(0)
True
```

```
>>> from sage.all import *
>>> p = Partition([Integer(2), Integer(1)])
>>> p.is_core(Integer(2))
True
>>> p.is_core(Integer(3))
False

>>> q = Partition([Integer(12), Integer(8), Integer(5), Integer(5),␣
→Integer(2), Integer(2), Integer(1)])
>>> q.is_core(Integer(4))
False
>>> q.is_core(Integer(5))
True
>>> q.is_core(Integer(0))
True
```

See also

`core()`, `Core`

is_empty()

Return `True` if `self` is the empty partition.

EXAMPLES:

```
sage: Partition([]).is_empty()
True
sage: Partition([2,1,1]).is_empty()
False
```

```
>>> from sage.all import *
>>> Partition([]).is_empty()
True
>>> Partition([Integer(2),Integer(1),Integer(1)]).is_empty()
False
```

is_k_bounded(*k*)

Return `True` if the partition `self` is bounded by `k`.

EXAMPLES:

```
sage: Partition([4, 3, 1]).is_k_bounded(4)
True
sage: Partition([4, 3, 1]).is_k_bounded(7)
True
sage: Partition([4, 3, 1]).is_k_bounded(3)
False
```

```
>>> from sage.all import *
>>> Partition([Integer(4), Integer(3), Integer(1)]).is_k_bounded(Integer(4))
True
>>> Partition([Integer(4), Integer(3), Integer(1)]).is_k_bounded(Integer(7))
True
>>> Partition([Integer(4), Integer(3), Integer(1)]).is_k_bounded(Integer(3))
False
```

is_k_irreducible(*k*)

Return `True` if the partition `self` is `k`-irreducible.

A k-bounded partition is k-*irreducible* if its Ferrer's diagram does *not* contain $k - i + 1$ rows (or more) of length i (exactly) for every $i \in [1, k]$.

(Also, a k-bounded partition is k-irreducible if and only if it is not k-reducible.)

EXAMPLES:

The partition [1, 1, 1] has at least 2 rows of length 1:

```
sage: Partition([1, 1, 1]).is_k_irreducible(2)
False
```

```
>>> from sage.all import *
>>> Partition([Integer(1), Integer(1), Integer(1)]).is_k_
↪irreducible(Integer(2))
False
```

The partition [1, 1, 1] does *not* have 4 rows of length 1, 3 rows of length 2, 2 rows of length 3, nor 1 row of length 4:

```
sage: Partition([1, 1, 1]).is_k_irreducible(4)
True
```

```
>>> from sage.all import *
>>> Partition([Integer(1), Integer(1), Integer(1)]).is_k_
```

(continues on next page)

(continued from previous page)

```
↪irreducible(Integer(4))
True
```

See also:

is_k_reducible(), *has_k_rectangle()*

is_k_reducible(*k*)

Return True if the partition self is k-reducible.

A k-bounded partition is *k-reducible* if its Ferrer's diagram contains $k - i + 1$ rows (or more) of length i (exactly) for some $i \in [1, k]$.

(Also, a k-bounded partition is k-reducible if and only if it is not k-irreducible.)

EXAMPLES:

The partition [1, 1, 1] has at least 2 rows of length 1:

```
sage: Partition([1, 1, 1]).is_k_reducible(2)
True
```

```
>>> from sage.all import *
>>> Partition([Integer(1), Integer(1), Integer(1)]).is_k_reducible(Integer(2))
True
```

The partition [1, 1, 1] does *not* have 4 rows of length 1, 3 rows of length 2, 2 rows of length 3, nor 1 row of length 4:

```
sage: Partition([1, 1, 1]).is_k_reducible(4)
False
```

```
>>> from sage.all import *
>>> Partition([Integer(1), Integer(1), Integer(1)]).is_k_reducible(Integer(4))
False
```

See also:

is_k_irreducible(), *has_k_rectangle()*

is_regular(*e*, *multicharge=(0,)*)

Return True is this is an e-regular partition.

A partition is e-regular if it does not have e equal nonzero parts.

EXAMPLES:

```
sage: Partition([4,3,3,3]).is_regular(2)
False
sage: Partition([4,3,3,3]).is_regular(3)
False
```

(continues on next page)

(continued from previous page)

```
sage: Partition([4,3,3,3]).is_regular(4)
True
```

```
>>> from sage.all import *
>>> Partition([Integer(4),Integer(3),Integer(3),Integer(3)]).is_
↪regular(Integer(2))
False
>>> Partition([Integer(4),Integer(3),Integer(3),Integer(3)]).is_
↪regular(Integer(3))
False
>>> Partition([Integer(4),Integer(3),Integer(3),Integer(3)]).is_
↪regular(Integer(4))
True
```

is_restricted(*e*, *multicharge=(0,)*)

Return `True` is this is an `e`-restricted partition.

An e-restricted partition is a partition such that the difference of consecutive parts is always strictly less than e, where partitions are considered to have an infinite number of 0 parts. I.e., the last part must be strictly less than e.

EXAMPLES:

```
sage: Partition([4,3,3,2]).is_restricted(2)
False
sage: Partition([4,3,3,2]).is_restricted(3)
True
sage: Partition([4,3,3,2]).is_restricted(4)
True
sage: Partition([4]).is_restricted(4)
False
```

```
>>> from sage.all import *
>>> Partition([Integer(4),Integer(3),Integer(3),Integer(2)]).is_
↪restricted(Integer(2))
False
>>> Partition([Integer(4),Integer(3),Integer(3),Integer(2)]).is_
↪restricted(Integer(3))
True
>>> Partition([Integer(4),Integer(3),Integer(3),Integer(2)]).is_
↪restricted(Integer(4))
True
>>> Partition([Integer(4)]).is_restricted(Integer(4))
False
```

is_symmetric()

Return `True` if the partition `self` equals its own transpose.

EXAMPLES:

```
sage: Partition([2, 1]).is_symmetric()
True
```

(continues on next page)

(continued from previous page)

```
sage: Partition([3, 1]).is_symmetric()
False
```

```
>>> from sage.all import *
>>> Partition([Integer(2), Integer(1)]).is_symmetric()
True
>>> Partition([Integer(3), Integer(1)]).is_symmetric()
False
```

jacobi_trudi()

Return the Jacobi-Trudi matrix of `self` thought of as a skew partition. See *SkewPartition.jacobi_trudi()*.

EXAMPLES:

```
sage: # needs sage.modules
sage: part = Partition([3,2,1])
sage: jt = part.jacobi_trudi(); jt
[h[3] h[1]    0]
[h[4] h[2]  h[]]
[h[5] h[3] h[1]]
sage: s = SymmetricFunctions(QQ).schur()
sage: h = SymmetricFunctions(QQ).homogeneous()
sage: h( s(part) )
h[3, 2, 1] - h[3, 3] - h[4, 1, 1] + h[5, 1]
sage: jt.det()
h[3, 2, 1] - h[3, 3] - h[4, 1, 1] + h[5, 1]
```

```
>>> from sage.all import *
>>> # needs sage.modules
>>> part = Partition([Integer(3),Integer(2),Integer(1)])
>>> jt = part.jacobi_trudi(); jt
[h[3] h[1]    0]
[h[4] h[2]  h[]]
[h[5] h[3] h[1]]
>>> s = SymmetricFunctions(QQ).schur()
>>> h = SymmetricFunctions(QQ).homogeneous()
>>> h( s(part) )
h[3, 2, 1] - h[3, 3] - h[4, 1, 1] + h[5, 1]
>>> jt.det()
h[3, 2, 1] - h[3, 3] - h[4, 1, 1] + h[5, 1]
```

k_atom(*k*)

Return a list of the standard tableaux of size `self.size()` whose `k`-atom is equal to `self`.

EXAMPLES:

```
sage: p = Partition([3,2,1])
sage: p.k_atom(1)
[]
sage: p.k_atom(3)
[[[1, 1, 1, 2, 3], [2]],
```

(continues on next page)

(continued from previous page)

```
 [[1, 1, 1, 3], [2, 2]],
 [[1, 1, 1, 2], [2], [3]],
 [[1, 1, 1], [2, 2], [3]]]
sage: Partition([3,2,1]).k_atom(4)
[[[1, 1, 1, 3], [2, 2]], [[1, 1, 1], [2, 2], [3]]]
```

```
>>> from sage.all import *
>>> p = Partition([Integer(3),Integer(2),Integer(1)])
>>> p.k_atom(Integer(1))
[]
>>> p.k_atom(Integer(3))
[[[1, 1, 1, 2, 3], [2]],
 [[1, 1, 1, 3], [2, 2]],
 [[1, 1, 1, 2], [2], [3]],
 [[1, 1, 1], [2, 2], [3]]]
>>> Partition([Integer(3),Integer(2),Integer(1)]).k_atom(Integer(4))
[[[1, 1, 1, 3], [2, 2]], [[1, 1, 1], [2, 2], [3]]]
```

k_boundary(*k*)

Return the skew partition formed by removing the cells of the k-interior, see *k_interior()*.

EXAMPLES:

```
sage: p = Partition([3,2,1])
sage: p.k_boundary(2)
[3, 2, 1] / [2, 1]
sage: p.k_boundary(3)
[3, 2, 1] / [1]

sage: p = Partition([12,8,5,5,2,2,1])
sage: p.k_boundary(4)
[12, 8, 5, 5, 2, 2, 1] / [8, 5, 2, 2]
```

```
>>> from sage.all import *
>>> p = Partition([Integer(3),Integer(2),Integer(1)])
>>> p.k_boundary(Integer(2))
[3, 2, 1] / [2, 1]
>>> p.k_boundary(Integer(3))
[3, 2, 1] / [1]

>>> p = Partition([Integer(12),Integer(8),Integer(5),Integer(5),Integer(2),
↪Integer(2),Integer(1)])
>>> p.k_boundary(Integer(4))
[12, 8, 5, 5, 2, 2, 1] / [8, 5, 2, 2]
```

k_column_lengths(*k*)

Return the k-column-shape of the partition self.

This is the 'column' analog of *k_row_lengths()*.

EXAMPLES:

```
sage: Partition([6, 1]).k_column_lengths(2)
[1, 0, 0, 0, 1, 1]

sage: Partition([4, 4, 4, 3, 2]).k_column_lengths(2)
[1, 1, 1, 2]
```

```
>>> from sage.all import *
>>> Partition([Integer(6), Integer(1)]).k_column_lengths(Integer(2))
[1, 0, 0, 0, 1, 1]

>>> Partition([Integer(4), Integer(4), Integer(4), Integer(3), Integer(2)]).k_
↪column_lengths(Integer(2))
[1, 1, 1, 2]
```

See also

k_row_lengths(), *k_boundary()*, *SkewPartition.row_lengths()*, *SkewPartition.column_lengths()*

k_conjugate(*k*)

Return the k-conjugate of self.

The k-conjugate is the partition that is given by the columns of the k-skew diagram of the partition.

We can also define the k-conjugate in the following way. Let P denote the bijection from $(k+1)$-cores to k-bounded partitions. The k-conjugate of a $(k+1)$-core λ is

$$\lambda^{(k)} = P^{-1}\left((P(\lambda))'\right).$$

EXAMPLES:

```
sage: p = Partition([4,3,2,2,1,1])
sage: p.k_conjugate(4)
[3, 2, 2, 1, 1, 1, 1, 1, 1]
```

```
>>> from sage.all import *
>>> p = Partition([Integer(4),Integer(3),Integer(2),Integer(2),Integer(1),
↪Integer(1)])
>>> p.k_conjugate(Integer(4))
[3, 2, 2, 1, 1, 1, 1, 1, 1]
```

k_interior(*k*)

Return the partition consisting of the cells of self whose hook lengths are greater than k.

EXAMPLES:

```
sage: p = Partition([3,2,1])
sage: p.hook_lengths()
[[5, 3, 1], [3, 1], [1]]
sage: p.k_interior(2)
[2, 1]
sage: p.k_interior(3)
```

(continues on next page)

(continued from previous page)

```
[1]

sage: p = Partition([])
sage: p.k_interior(3)
[]
```

```
>>> from sage.all import *
>>> p = Partition([Integer(3),Integer(2),Integer(1)])
>>> p.hook_lengths()
[[5, 3, 1], [3, 1], [1]]
>>> p.k_interior(Integer(2))
[2, 1]
>>> p.k_interior(Integer(3))
[1]

>>> p = Partition([])
>>> p.k_interior(Integer(3))
[]
```

k_irreducible(k)

Return the partition with all $r \times (k + 1 - r)$ rectangles removed.

If `self` is a k-bounded partition, then this method will return the partition where all rectangles of dimension $r \times (k + 1 - r)$ for $1 \leq r \leq k$ have been deleted.

If `self` is not a k-bounded partition then the method will raise an error.

INPUT:

- `k` – nonnegative integer

OUTPUT: a partition

EXAMPLES:

```
sage: Partition([3,2,2,1,1,1]).k_irreducible(4)
[3, 2, 2, 1, 1, 1]
sage: Partition([3,2,2,1,1,1]).k_irreducible(3)
[]
sage: Partition([3,3,3,2,2,2,2,2,1,1,1,1]).k_irreducible(3)
[2, 1]
```

```
>>> from sage.all import *
>>> Partition([Integer(3),Integer(2),Integer(2),Integer(1),Integer(1),
↪Integer(1)]).k_irreducible(Integer(4))
[3, 2, 2, 1, 1, 1]
>>> Partition([Integer(3),Integer(2),Integer(2),Integer(1),Integer(1),
↪Integer(1)]).k_irreducible(Integer(3))
[]
>>> Partition([Integer(3),Integer(3),Integer(3),Integer(2),Integer(2),
↪Integer(2),Integer(2),Integer(2),Integer(1),Integer(1),Integer(1),
↪Integer(1)]).k_irreducible(Integer(3))
[2, 1]
```

k_rim(*k*)

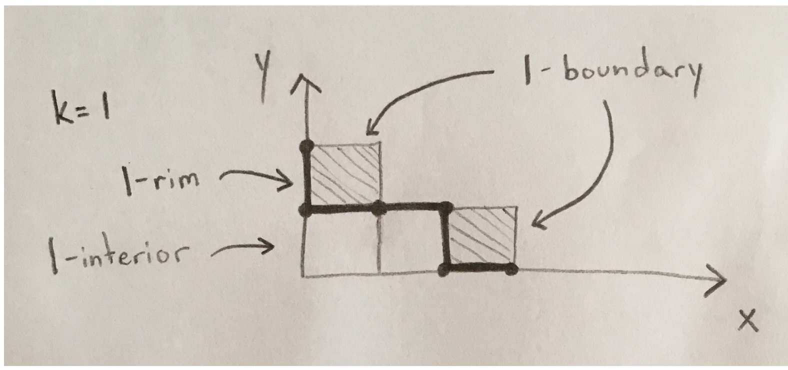
Return the k-rim of self as a list of integer coordinates.

The k-rim of a partition is the "line between" (or "intersection of") the k-boundary and the k-interior. (Section 2.3 of [HM2011])

It will be output as an ordered list of integer coordinates, where the origin is $(0, 0)$. It will start at the top-left of the k-rim (using French convention) and end at the bottom-right.

EXAMPLES:

Consider the partition (3, 1) split up into its 1-interior and 1-boundary:



The line shown in bold is the 1-rim, and that information is equivalent to the integer coordinates of the points that occur along that line:

```
sage: Partition([3, 1]).k_rim(1)
[(3, 0), (2, 0), (2, 1), (1, 1), (0, 1), (0, 2)]
```

```
>>> from sage.all import *
>>> Partition([Integer(3), Integer(1)]).k_rim(Integer(1))
[(3, 0), (2, 0), (2, 1), (1, 1), (0, 1), (0, 2)]
```

See also

k_interior(), *k_boundary()*, *boundary()*

k_row_lengths(*k*)

Return the k-row-shape of the partition self.

This is equivalent to taking the k-boundary of the partition and then returning the row-shape of that. We do *not* discard rows of length 0. (Section 2.2 of [LLMS2013])

EXAMPLES:

```
sage: Partition([6, 1]).k_row_lengths(2)
[2, 1]

sage: Partition([4, 4, 4, 3, 2]).k_row_lengths(2)
[0, 1, 1, 1, 2]
```

```
>>> from sage.all import *
>>> Partition([Integer(6), Integer(1)]).k_row_lengths(Integer(2))
```

(continues on next page)

(continued from previous page)

```
[2, 1]

>>> Partition([Integer(4), Integer(4), Integer(4), Integer(3), Integer(2)]).k_
→row_lengths(Integer(2))
[0, 1, 1, 1, 2]
```

See also

k_column_lengths(), *k_boundary()*, *SkewPartition.row_lengths()*, *SkewPartition.column_lengths()*

k_size(*k*)

Given a partition `self` and a `k`, return the size of the k-boundary.

This is the same as the length method *sage.combinat.core.Core.length()* of the *sage.combinat.core.Core* object, with the exception that here we don't require `self` to be a $k+1$-core.

EXAMPLES:

```
sage: Partition([2, 1, 1]).k_size(1)
2
sage: Partition([2, 1, 1]).k_size(2)
3
sage: Partition([2, 1, 1]).k_size(3)
3
sage: Partition([2, 1, 1]).k_size(4)
4
```

```
>>> from sage.all import *
>>> Partition([Integer(2), Integer(1), Integer(1)]).k_size(Integer(1))
2
>>> Partition([Integer(2), Integer(1), Integer(1)]).k_size(Integer(2))
3
>>> Partition([Integer(2), Integer(1), Integer(1)]).k_size(Integer(3))
3
>>> Partition([Integer(2), Integer(1), Integer(1)]).k_size(Integer(4))
4
```

See also

k_boundary(), *SkewPartition.size()*

k_skew(*k*)

Return the k-skew partition.

The k-skew diagram of a k-bounded partition is the skew diagram denoted $\lambda/^k$ satisfying the conditions:

1. row i of $\lambda/^k$ has length λ_i,
2. no cell in $\lambda/^k$ has hook-length exceeding k,
3. every square above the diagram of $\lambda/^k$ has hook length exceeding k.

REFERENCES:

- [LM2004]

EXAMPLES:

```
sage: p = Partition([4,3,2,2,1,1])
sage: p.k_skew(4)
[9, 5, 3, 2, 1, 1] / [5, 2, 1]
```

```
>>> from sage.all import *
>>> p = Partition([Integer(4),Integer(3),Integer(2),Integer(2),Integer(1),
↪Integer(1)])
>>> p.k_skew(Integer(4))
[9, 5, 3, 2, 1, 1] / [5, 2, 1]
```

k_split(*k*)

Return the k-split of self.

EXAMPLES:

```
sage: Partition([4,3,2,1]).k_split(3)
[]
sage: Partition([4,3,2,1]).k_split(4)
[[4], [3, 2], [1]]
sage: Partition([4,3,2,1]).k_split(5)
[[4, 3], [2, 1]]
sage: Partition([4,3,2,1]).k_split(6)
[[4, 3, 2], [1]]
sage: Partition([4,3,2,1]).k_split(7)
[[4, 3, 2, 1]]
sage: Partition([4,3,2,1]).k_split(8)
[[4, 3, 2, 1]]
```

```
>>> from sage.all import *
>>> Partition([Integer(4),Integer(3),Integer(2),Integer(1)]).k_
↪split(Integer(3))
[]
>>> Partition([Integer(4),Integer(3),Integer(2),Integer(1)]).k_
↪split(Integer(4))
[[4], [3, 2], [1]]
>>> Partition([Integer(4),Integer(3),Integer(2),Integer(1)]).k_
↪split(Integer(5))
[[4, 3], [2, 1]]
>>> Partition([Integer(4),Integer(3),Integer(2),Integer(1)]).k_
↪split(Integer(6))
[[4, 3, 2], [1]]
>>> Partition([Integer(4),Integer(3),Integer(2),Integer(1)]).k_
↪split(Integer(7))
[[4, 3, 2, 1]]
>>> Partition([Integer(4),Integer(3),Integer(2),Integer(1)]).k_
↪split(Integer(8))
[[4, 3, 2, 1]]
```

ladder_tableau(*e*, *ladder_lengths=False*)

Return the ladder tableau of shape `self`.

The e-*ladder tableau* is the standard Young tableau obtained by reading the *ladders*, the set of cells (i, j) that differ from $(i + e - 1, j - 1)$, of the partition λ from left-to-right.

INPUT:

- `e` – nonnegative integer; 0 is considered as ∞ (analogous to the characteristic of a ring)
- `ladder_sizes` – boolean (default: `False`); if `True`, also return the sizes of the ladders

See also

ladders()

EXAMPLES:

```
sage: la = Partition([6, 5, 3, 1])
sage: ascii_art(la.ladder_tableau(3))
  1  2  3  5  7 10
  4  6  8 11 13
  9 12 14
 15
sage: la.ladder_tableau(3, ladder_lengths=True)[1]
[1, 1, 2, 2, 3, 3, 3]

sage: ascii_art(la.ladder_tableau(0))
  1  2  3  4  5  6
  7  8  9 10 11
 12 13 14
 15
sage: all(ll == 1 for ll in la.ladder_tableau(0, ladder_lengths=True)[1])
True
```

```
>>> from sage.all import *
>>> la = Partition([Integer(6), Integer(5), Integer(3), Integer(1)])
>>> ascii_art(la.ladder_tableau(Integer(3)))
  1  2  3  5  7 10
  4  6  8 11 13
  9 12 14
 15
>>> la.ladder_tableau(Integer(3), ladder_lengths=True)[Integer(1)]
[1, 1, 2, 2, 3, 3, 3]

>>> ascii_art(la.ladder_tableau(Integer(0)))
  1  2  3  4  5  6
  7  8  9 10 11
 12 13 14
 15
>>> all(ll == Integer(1) for ll in la.ladder_tableau(Integer(0), ladder_
→lengths=True)[Integer(1)])
True
```

ladders(*e*)

Return a dictionary containing the ladders in the diagram of `self`.

For $e > 0$, a node (i, j) in a partition belongs to the l-th e-ladder if $l = (e - 1)r + c$.

INPUT:

- `e` – nonnegative integer; if `0`, then we set `e = self.size() + 1`

EXAMPLES:

```
sage: Partition([3, 2]).ladders(3)
{0: [(0, 0)], 1: [(0, 1)], 2: [(0, 2), (1, 0)], 3: [(1, 1)]}
```

```
>>> from sage.all import *
>>> Partition([Integer(3), Integer(2)]).ladders(Integer(3))
{0: [(0, 0)], 1: [(0, 1)], 2: [(0, 2), (1, 0)], 3: [(1, 1)]}
```

When `e` is `0`, the cells are in bijection with the ladders, but the index of the ladder depends on the size of the partition:

```
sage: Partition([3, 2]).ladders(0)
{0: [(0, 0)], 1: [(0, 1)], 2: [(0, 2)], 5: [(1, 0)], 6: [(1, 1)]}
sage: Partition([3, 2, 1]).ladders(0)
{0: [(0, 0)], 1: [(0, 1)], 2: [(0, 2)], 6: [(1, 0)], 7: [(1, 1)],
 12: [(2, 0)]}
sage: Partition([3, 1, 1]).ladders(0)
{0: [(0, 0)], 1: [(0, 1)], 2: [(0, 2)], 5: [(1, 0)], 10: [(2, 0)]}
sage: Partition([1, 1, 1]).ladders(0)
{0: [(0, 0)], 3: [(1, 0)], 6: [(2, 0)]}
```

```
>>> from sage.all import *
>>> Partition([Integer(3), Integer(2)]).ladders(Integer(0))
{0: [(0, 0)], 1: [(0, 1)], 2: [(0, 2)], 5: [(1, 0)], 6: [(1, 1)]}
>>> Partition([Integer(3), Integer(2), Integer(1)]).ladders(Integer(0))
{0: [(0, 0)], 1: [(0, 1)], 2: [(0, 2)], 6: [(1, 0)], 7: [(1, 1)],
 12: [(2, 0)]}
>>> Partition([Integer(3), Integer(1), Integer(1)]).ladders(Integer(0))
{0: [(0, 0)], 1: [(0, 1)], 2: [(0, 2)], 5: [(1, 0)], 10: [(2, 0)]}
>>> Partition([Integer(1), Integer(1), Integer(1)]).ladders(Integer(0))
{0: [(0, 0)], 3: [(1, 0)], 6: [(2, 0)]}
```

larger_lex(*rhs*)

Return `True` if `self` is larger than `rhs` in lexicographic order. Otherwise return `False`.

EXAMPLES:

```
sage: p = Partition([3,2])
sage: p.larger_lex([3,1])
True
sage: p.larger_lex([1,4])
True
sage: p.larger_lex([3,2,1])
False
sage: p.larger_lex([3])
```

(continues on next page)

(continued from previous page)

```
True
sage: p.larger_lex([5])
False
sage: p.larger_lex([3,1,1,1,1,1,1,1])
True
```

```
>>> from sage.all import *
>>> p = Partition([Integer(3),Integer(2)])
>>> p.larger_lex([Integer(3),Integer(1)])
True
>>> p.larger_lex([Integer(1),Integer(4)])
True
>>> p.larger_lex([Integer(3),Integer(2),Integer(1)])
False
>>> p.larger_lex([Integer(3)])
True
>>> p.larger_lex([Integer(5)])
False
>>> p.larger_lex([Integer(3),Integer(1),Integer(1),Integer(1),Integer(1),
↪Integer(1),Integer(1),Integer(1)])
True
```

leg_cells(i, j)

Return the list of the cells of the leg of cell (i, j) in `self`.

The leg of cell $c = (i, j)$ is defined to be the cells below c (in English convention).

The cell coordinates are zero-based, i. e., the northwesternmost cell is $(0, 0)$.

INPUT:

- `i`, `j` – two integers

OUTPUT: list of pairs of integers

EXAMPLES:

```
sage: Partition([4,4,3,1]).leg_cells(1,1)
[(2, 1)]
sage: Partition([4,4,3,1]).leg_cells(0,1)
[(1, 1), (2, 1)]

sage: Partition([]).leg_cells(0,0)
Traceback (most recent call last):
...
ValueError: the cell is not in the diagram
```

```
>>> from sage.all import *
>>> Partition([Integer(4),Integer(4),Integer(3),Integer(1)]).leg_
↪cells(Integer(1),Integer(1))
[(2, 1)]
>>> Partition([Integer(4),Integer(4),Integer(3),Integer(1)]).leg_
↪cells(Integer(0),Integer(1))
[(1, 1), (2, 1)]
```

(continues on next page)

(continued from previous page)

```
>>> Partition([]).leg_cells(Integer(0),Integer(0))
Traceback (most recent call last):
...
ValueError: the cell is not in the diagram
```

leg_length(*i*, *j*)

Return the length of the leg of cell (i, j) in `self`.

The leg of cell $c = (i, j)$ is defined to be the cells below c (in English convention).

The cell coordinates are zero-based, i. e., the northwesternmost cell is $(0, 0)$.

INPUT:

- `i, j` – two integers

OUTPUT: integer or a `ValueError`

EXAMPLES:

```
sage: p = Partition([2,2,1])
sage: p.leg_length(0, 0)
2
sage: p.leg_length(0,1)
1
sage: p.leg_length(2,0)
0
sage: Partition([3,3]).leg_length(0, 0)
1
sage: cell = [0,0]; Partition([3,3]).leg_length(*cell)
1
```

```
>>> from sage.all import *
>>> p = Partition([Integer(2),Integer(2),Integer(1)])
>>> p.leg_length(Integer(0), Integer(0))
2
>>> p.leg_length(Integer(0),Integer(1))
1
>>> p.leg_length(Integer(2),Integer(0))
0
>>> Partition([Integer(3),Integer(3)]).leg_length(Integer(0), Integer(0))
1
>>> cell = [Integer(0),Integer(0)]; Partition([Integer(3),Integer(3)]).leg_
↪length(*cell)
1
```

leg_lengths(*flat=False*)

Return a tableau of shape `self` with each cell filled in with its leg length. The optional boolean parameter `flat` provides the option of returning a flat list.

EXAMPLES:

```
sage: Partition([2,2,1]).leg_lengths()
[[2, 1], [1, 0], [0]]
```

(continues on next page)

(continued from previous page)

```
sage: Partition([2,2,1]).leg_lengths(flat=True)
[2, 1, 1, 0, 0]
sage: Partition([3,3]).leg_lengths()
[[1, 1, 1], [0, 0, 0]]
sage: Partition([3,3]).leg_lengths(flat=True)
[1, 1, 1, 0, 0, 0]
```

```
>>> from sage.all import *
>>> Partition([Integer(2),Integer(2),Integer(1)]).leg_lengths()
[[2, 1], [1, 0], [0]]
>>> Partition([Integer(2),Integer(2),Integer(1)]).leg_lengths(flat=True)
[2, 1, 1, 0, 0]
>>> Partition([Integer(3),Integer(3)]).leg_lengths()
[[1, 1, 1], [0, 0, 0]]
>>> Partition([Integer(3),Integer(3)]).leg_lengths(flat=True)
[1, 1, 1, 0, 0, 0]
```

length()

Return the number of parts in `self`.

EXAMPLES:

```
sage: Partition([3,2]).length()
2
sage: Partition([2,2,1]).length()
3
sage: Partition([]).length()
0
```

```
>>> from sage.all import *
>>> Partition([Integer(3),Integer(2)]).length()
2
>>> Partition([Integer(2),Integer(2),Integer(1)]).length()
3
>>> Partition([]).length()
0
```

level()

Return the level of `self`, which is always 1.

This method exists only for compatibility with *PartitionTuples*.

EXAMPLES:

```
sage: Partition([4,3,2]).level()
1
```

```
>>> from sage.all import *
>>> Partition([Integer(4),Integer(3),Integer(2)]).level()
1
```

lower_hook(i, j, *alpha*)

Return the lower hook length of the cell (i, j) in `self`. When `alpha = 1`, this is just the normal hook length.

The lower hook length of a cell (i, j) in a partition κ is defined by

$$h_*^\kappa(i,j) = \kappa_j' - i + 1 + \alpha(\kappa_i - j).$$

EXAMPLES:

```
sage: p = Partition([2,1])
sage: p.lower_hook(0,0,1)
3
sage: p.hook_length(0,0)
3
sage: [ p.lower_hook(i,j,x) for i,j in p.cells() ]                          #␣
↪needs sage.symbolic
[x + 2, 1, 1]
```

```
>>> from sage.all import *
>>> p = Partition([Integer(2),Integer(1)])
>>> p.lower_hook(Integer(0),Integer(0),Integer(1))
3
>>> p.hook_length(Integer(0),Integer(0))
3
>>> [ p.lower_hook(i,j,x) for i,j in p.cells() ]                        #␣
↪needs sage.symbolic
[x + 2, 1, 1]
```

lower_hook_lengths(*alpha*)

Return a tableau of shape `self` with the cells filled in with the lower hook lengths. When `alpha = 1`, these are just the normal hook lengths.

The lower hook length of a cell (i, j) in a partition κ is defined by

$$h_*^\kappa(i,j) = \kappa_j' - i + 1 + \alpha(\kappa_i - j).$$

EXAMPLES:

```
sage: Partition([3,2,1]).lower_hook_lengths(x)                              #␣
↪needs sage.symbolic
[[2*x + 3, x + 2, 1], [x + 2, 1], [1]]
sage: Partition([3,2,1]).lower_hook_lengths(1)
[[5, 3, 1], [3, 1], [1]]
sage: Partition([3,2,1]).hook_lengths()
[[5, 3, 1], [3, 1], [1]]
```

```
>>> from sage.all import *
>>> Partition([Integer(3),Integer(2),Integer(1)]).lower_hook_lengths(x)      ␣
↪                        # needs sage.symbolic
[[2*x + 3, x + 2, 1], [x + 2, 1], [1]]
>>> Partition([Integer(3),Integer(2),Integer(1)]).lower_hook_
↪lengths(Integer(1))
[[5, 3, 1], [3, 1], [1]]
>>> Partition([Integer(3),Integer(2),Integer(1)]).hook_lengths()
[[5, 3, 1], [3, 1], [1]]
```

next()

Return the partition that lexicographically follows `self`, of the same size. If `self` is the last partition, then return `False`.

EXAMPLES:

```
sage: next(Partition([4]))
[3, 1]
sage: next(Partition([1,1,1,1]))
False
```

```
>>> from sage.all import *
>>> next(Partition([Integer(4)]))
[3, 1]
>>> next(Partition([Integer(1),Integer(1),Integer(1),Integer(1)]))
False
```

next_within_bounds(*min=[]*, *max=None*, *partition_type=None*)

Get the next partition lexicographically that contains `min` and is contained in `max`.

INPUT:

- `min` – (default: `[]`, the empty partition) the 'minimum partition' that `next_within_bounds(self)` must contain
- `max` – (default: `None`) the 'maximum partition' that `next_within_bounds(self)` must be contained in; if set to `None`, then there is no restriction
- `partition_type` – (default: `None`) the type of partitions allowed; for example, 'strict' for strictly decreasing partitions, or `None` to allow any valid partition

EXAMPLES:

```
sage: m = [1, 1]
sage: M = [3, 2, 1]
sage: Partition([1, 1]).next_within_bounds(min=m, max=M)
[1, 1, 1]
sage: Partition([1, 1, 1]).next_within_bounds(min=m, max=M)
[2, 1]
sage: Partition([2, 1]).next_within_bounds(min=m, max=M)
[2, 1, 1]
sage: Partition([2, 1, 1]).next_within_bounds(min=m, max=M)
[2, 2]
sage: Partition([2, 2]).next_within_bounds(min=m, max=M)
[2, 2, 1]
sage: Partition([2, 2, 1]).next_within_bounds(min=m, max=M)
[3, 1]
sage: Partition([3, 1]).next_within_bounds(min=m, max=M)
[3, 1, 1]
sage: Partition([3, 1, 1]).next_within_bounds(min=m, max=M)
[3, 2]
sage: Partition([3, 2]).next_within_bounds(min=m, max=M)
[3, 2, 1]
sage: Partition([3, 2, 1]).next_within_bounds(min=m, max=M) == None
True
```

```
>>> from sage.all import *
>>> m = [Integer(1), Integer(1)]
>>> M = [Integer(3), Integer(2), Integer(1)]
>>> Partition([Integer(1), Integer(1)]).next_within_bounds(min=m, max=M)
[1, 1, 1]
>>> Partition([Integer(1), Integer(1), Integer(1)]).next_within_bounds(min=m,␣
↪max=M)
[2, 1]
>>> Partition([Integer(2), Integer(1)]).next_within_bounds(min=m, max=M)
[2, 1, 1]
>>> Partition([Integer(2), Integer(1), Integer(1)]).next_within_bounds(min=m,␣
↪max=M)
[2, 2]
>>> Partition([Integer(2), Integer(2)]).next_within_bounds(min=m, max=M)
[2, 2, 1]
>>> Partition([Integer(2), Integer(2), Integer(1)]).next_within_bounds(min=m,␣
↪max=M)
[3, 1]
>>> Partition([Integer(3), Integer(1)]).next_within_bounds(min=m, max=M)
[3, 1, 1]
>>> Partition([Integer(3), Integer(1), Integer(1)]).next_within_bounds(min=m,␣
↪max=M)
[3, 2]
>>> Partition([Integer(3), Integer(2)]).next_within_bounds(min=m, max=M)
[3, 2, 1]
>>> Partition([Integer(3), Integer(2), Integer(1)]).next_within_bounds(min=m,␣
↪max=M) == None
True
```

See also

next()

outer_rim()

Return the outer rim of `self`.

The outer rim of a partition λ is defined as the cells which do not belong to λ and which are adjacent to cells in λ.

EXAMPLES:

The outer rim of the partition $[4, 1]$ consists of the cells marked with `#` below:

```
****#
*####
##
```

```
sage: Partition([4,1]).outer_rim()
[(2, 0), (2, 1), (1, 1), (1, 2), (1, 3), (1, 4), (0, 4)]

sage: Partition([2,2,1]).outer_rim()
[(3, 0), (3, 1), (2, 1), (2, 2), (1, 2), (0, 2)]
sage: Partition([2,2]).outer_rim()
```

(continues on next page)

(continued from previous page)

```
[(2, 0), (2, 1), (2, 2), (1, 2), (0, 2)]
sage: Partition([6,3,3,1,1]).outer_rim()
[(5, 0), (5, 1), (4, 1), (3, 1), (3, 2), (3, 3), (2, 3), (1, 3), (1, 4), (1,␣
↪5), (1, 6), (0, 6)]
sage: Partition([]).outer_rim()
[(0, 0)]
```

```
>>> from sage.all import *
>>> Partition([Integer(4),Integer(1)]).outer_rim()
[(2, 0), (2, 1), (1, 1), (1, 2), (1, 3), (1, 4), (0, 4)]

>>> Partition([Integer(2),Integer(2),Integer(1)]).outer_rim()
[(3, 0), (3, 1), (2, 1), (2, 2), (1, 2), (0, 2)]
>>> Partition([Integer(2),Integer(2)]).outer_rim()
[(2, 0), (2, 1), (2, 2), (1, 2), (0, 2)]
>>> Partition([Integer(6),Integer(3),Integer(3),Integer(1),Integer(1)]).outer_
↪rim()
[(5, 0), (5, 1), (4, 1), (3, 1), (3, 2), (3, 3), (2, 3), (1, 3), (1, 4), (1,␣
↪5), (1, 6), (0, 6)]
>>> Partition([]).outer_rim()
[(0, 0)]
```

outline(*variable=None*)

Return the outline of the partition `self`.

This is a piecewise linear function, normalized so that the area under the partition `[1]` is 2.

INPUT:

- `variable` – a variable (default: `'x'` in the symbolic ring)

EXAMPLES:

```
sage: # needs sage.symbolic
sage: [Partition([5,4]).outline()(x=i) for i in range(-10, 11)]
[10, 9, 8, 7, 6, 5, 6, 5, 6, 5, 4, 3, 2, 3, 4, 5, 6, 7, 8, 9, 10]
sage: Partition([]).outline()
abs(x)
sage: Partition([1]).outline()
abs(x + 1) + abs(x - 1) - abs(x)
sage: y = SR.var("y")
sage: Partition([6,5,1]).outline(variable=y)
abs(y + 6) - abs(y + 5) + abs(y + 4) - abs(y + 3)
 + abs(y - 1) - abs(y - 2) + abs(y - 3)
```

```
>>> from sage.all import *
>>> # needs sage.symbolic
>>> [Partition([Integer(5),Integer(4)]).outline()(x=i) for i in range(-
↪Integer(10), Integer(11))]
[10, 9, 8, 7, 6, 5, 6, 5, 6, 5, 4, 3, 2, 3, 4, 5, 6, 7, 8, 9, 10]
>>> Partition([]).outline()
abs(x)
>>> Partition([Integer(1)]).outline()
```

(continues on next page)

(continued from previous page)

```
abs(x + 1) + abs(x - 1) - abs(x)
>>> y = SR.var("y")
>>> Partition([Integer(6),Integer(5),Integer(1)]).outline(variable=y)
abs(y + 6) - abs(y + 5) + abs(y + 4) - abs(y + 3)
 + abs(y - 1) - abs(y - 2) + abs(y - 3)
```

outside_corners()

Return a list of the outside corners of the partition `self`.

An outside corner (also called a cocorner) of a partition λ is a cell on $\mathbf{Z}^2$ which does not belong to the Young diagram of λ but can be added to this Young diagram to still form a straight-shape Young diagram.

The entries of the list returned are pairs of the form (i, j), where i and j are the coordinates of the respective corner. The coordinates are counted from 0.

Note

These are called "outer corners" in [Sag2001].

EXAMPLES:

```
sage: Partition([2,2,1]).outside_corners()
[(0, 2), (2, 1), (3, 0)]
sage: Partition([2,2]).outside_corners()
[(0, 2), (2, 0)]
sage: Partition([6,3,3,1,1,1]).outside_corners()
[(0, 6), (1, 3), (3, 1), (6, 0)]
sage: Partition([]).outside_corners()
[(0, 0)]
```

```
>>> from sage.all import *
>>> Partition([Integer(2),Integer(2),Integer(1)]).outside_corners()
[(0, 2), (2, 1), (3, 0)]
>>> Partition([Integer(2),Integer(2)]).outside_corners()
[(0, 2), (2, 0)]
>>> Partition([Integer(6),Integer(3),Integer(3),Integer(1),Integer(1),
↪Integer(1)]).outside_corners()
[(0, 6), (1, 3), (3, 1), (6, 0)]
>>> Partition([]).outside_corners()
[(0, 0)]
```

outside_corners_residue(i, l)

Return a list of the outside corners of the partition `self` having `l`-residue `i`.

An outside corner (also called a cocorner) of a partition λ is a cell on $\mathbf{Z}^2$ which does not belong to the Young diagram of λ but can be added to this Young diagram to still form a straight-shape Young diagram. See *residue()* for the definition of the `l`-residue.

The entries of the list returned are pairs of the form (i, j), where i and j are the coordinates of the respective corner. The coordinates are counted from 0.

EXAMPLES:

```
sage: Partition([3,2,1]).outside_corners_residue(0, 3)
[(0, 3), (3, 0)]
sage: Partition([3,2,1]).outside_corners_residue(1, 3)
[(1, 2)]
sage: Partition([3,2,1]).outside_corners_residue(2, 3)
[(2, 1)]
```

```
>>> from sage.all import *
>>> Partition([Integer(3),Integer(2),Integer(1)]).outside_corners_
↪residue(Integer(0), Integer(3))
[(0, 3), (3, 0)]
>>> Partition([Integer(3),Integer(2),Integer(1)]).outside_corners_
↪residue(Integer(1), Integer(3))
[(1, 2)]
>>> Partition([Integer(3),Integer(2),Integer(1)]).outside_corners_
↪residue(Integer(2), Integer(3))
[(2, 1)]
```

plancherel_measure()

Return the probability of `self` under the Plancherel probability measure on partitions of the same size.

This probability distribution comes from the uniform distribution on permutations via the Robinson-Schensted correspondence.

See Wikipedia article Plancherel_measure and *Partitions_n.random_element_plancherel()*.

EXAMPLES:

```
sage: Partition([]).plancherel_measure()
1
sage: Partition([1]).plancherel_measure()
1
sage: Partition([2]).plancherel_measure()
1/2
sage: [mu.plancherel_measure() for mu in Partitions(3)]
[1/6, 2/3, 1/6]
sage: Partition([5,4]).plancherel_measure()
7/1440
```

```
>>> from sage.all import *
>>> Partition([]).plancherel_measure()
1
>>> Partition([Integer(1)]).plancherel_measure()
1
>>> Partition([Integer(2)]).plancherel_measure()
1/2
>>> [mu.plancherel_measure() for mu in Partitions(Integer(3))]
[1/6, 2/3, 1/6]
>>> Partition([Integer(5),Integer(4)]).plancherel_measure()
7/1440
```

power(k)

Return the cycle type of the k-th power of any permutation with cycle type `self` (thus describes the powermap of symmetric groups).

Equivalent to GAP's `PowerPartition`.

EXAMPLES:

```
sage: p = Partition([5,3])
sage: p.power(1)
[5, 3]
sage: p.power(2)
[5, 3]
sage: p.power(3)
[5, 1, 1, 1]
sage: p.power(4)
[5, 3]
```

```
>>> from sage.all import *
>>> p = Partition([Integer(5),Integer(3)])
>>> p.power(Integer(1))
[5, 3]
>>> p.power(Integer(2))
[5, 3]
>>> p.power(Integer(3))
[5, 1, 1, 1]
>>> p.power(Integer(4))
[5, 3]
```

Now let us compare this to the power map on S_8:

```
sage: # needs sage.groups
sage: G = SymmetricGroup(8)
sage: g = G([(1,2,3,4,5),(6,7,8)]); g
(1,2,3,4,5)(6,7,8)
sage: g^2
(1,3,5,2,4)(6,8,7)
sage: g^3
(1,4,2,5,3)
sage: g^4
(1,5,4,3,2)(6,7,8)
```

```
>>> from sage.all import *
>>> # needs sage.groups
>>> G = SymmetricGroup(Integer(8))
>>> g = G([(Integer(1),Integer(2),Integer(3),Integer(4),Integer(5)),
↪(Integer(6),Integer(7),Integer(8))]); g
(1,2,3,4,5)(6,7,8)
>>> g**Integer(2)
(1,3,5,2,4)(6,8,7)
>>> g**Integer(3)
(1,4,2,5,3)
>>> g**Integer(4)
(1,5,4,3,2)(6,7,8)
```

```
sage: Partition([3,2,1]).power(3)
[2, 1, 1, 1]
```

```
>>> from sage.all import *
>>> Partition([Integer(3),Integer(2),Integer(1)]).power(Integer(3))
[2, 1, 1, 1, 1]
```

pp()

Print the Ferrers diagram.

See *ferrers_diagram()* for more on the Ferrers diagram.

EXAMPLES:

```
sage: Partition([5,5,2,1]).pp()
*****
*****
**
*
sage: Partitions.options.convention='French'
sage: Partition([5,5,2,1]).pp()
*
**
*****
*****
sage: Partitions.options._reset()
```

```
>>> from sage.all import *
>>> Partition([Integer(5),Integer(5),Integer(2),Integer(1)]).pp()
*****
*****
**
*
>>> Partitions.options.convention='French'
>>> Partition([Integer(5),Integer(5),Integer(2),Integer(1)]).pp()
*
**
*****
*****
>>> Partitions.options._reset()
```

prime_degree(*p*)

Return the prime degree for the prime integer``p`` for `self`.

INPUT:

- `p` – prime integer

OUTPUT: nonnegative integer

The degree of a partition λ is the sum of the e-*degree()* of the standard tableaux of shape λ, for e a power of the prime p. The prime degree gives the exponent of p in the Gram determinant of the integral Specht module of the symmetric group.

EXAMPLES:

```
sage: Partition([4,3]).prime_degree(2)
36
sage: Partition([4,3]).prime_degree(3)
```

(continues on next page)

(continued from previous page)

```
15
sage: Partition([4,3]).prime_degree(5)
13
sage: Partition([4,3]).prime_degree(7)
0
```

```
>>> from sage.all import *
>>> Partition([Integer(4),Integer(3)]).prime_degree(Integer(2))
36
>>> Partition([Integer(4),Integer(3)]).prime_degree(Integer(3))
15
>>> Partition([Integer(4),Integer(3)]).prime_degree(Integer(5))
13
>>> Partition([Integer(4),Integer(3)]).prime_degree(Integer(7))
0
```

Therefore, the Gram determinant of $S(5,3)$ when $q = 1$ is $2^{36}3^{15}5^{13}$. Compare with `degree()`.

quotient(*length*)

Return the quotient of the partition – in the literature the quotient is commonly referred to as the k-quotient, p-quotient, r-quotient, … .

The r-quotient of a partition λ is a list of r partitions (labelled from 0 to $r-1$), constructed in the following way. Label each cell in the Young diagram of λ with its content modulo r. Let R_i be the set of rows ending in a cell labelled i, and C_i be the set of columns ending in a cell labelled i. Then the j-th component of the quotient of λ is the partition defined by intersecting R_j with C_{j+1}. (See Theorem 2.7.37 in [JK1981].)

EXAMPLES:

```
sage: Partition([7,7,5,3,3,3,1]).quotient(3)
([2], [1], [2, 2, 2])
```

```
>>> from sage.all import *
>>> Partition([Integer(7),Integer(7),Integer(5),Integer(3),Integer(3),
↪Integer(3),Integer(1)]).quotient(Integer(3))
([2], [1], [2, 2, 2])
```

reading_tableau()

Return the RSK recording tableau of the reading word of the (standard) tableau T labeled down (in English convention) each column to the shape of `self`.

For an example of the tableau T, consider the partition $\lambda = (3,2,1)$, then we have:

```
1 4 6
2 5
3
```

For more, see `RSK()`.

EXAMPLES:

```
sage: Partition([3,2,1]).reading_tableau()
[[1, 3, 6], [2, 5], [4]]
```

```
>>> from sage.all import *
>>> Partition([Integer(3),Integer(2),Integer(1)]).reading_tableau()
[[1, 3, 6], [2, 5], [4]]
```

removable_cells()

Return a list of the corners of the partition `self`.

A corner of a partition λ is a cell of the Young diagram of λ which can be removed from the Young diagram while still leaving a straight shape behind.

The entries of the list returned are pairs of the form (i, j), where i and j are the coordinates of the respective corner. The coordinates are counted from 0.

> **Note**
>
> This is referred to as an "inner corner" in [Sag2001].

EXAMPLES:

```
sage: Partition([3,2,1]).corners()
[(0, 2), (1, 1), (2, 0)]
sage: Partition([3,3,1]).corners()
[(1, 2), (2, 0)]
sage: Partition([]).corners()
[]
```

```
>>> from sage.all import *
>>> Partition([Integer(3),Integer(2),Integer(1)]).corners()
[(0, 2), (1, 1), (2, 0)]
>>> Partition([Integer(3),Integer(3),Integer(1)]).corners()
[(1, 2), (2, 0)]
>>> Partition([]).corners()
[]
```

removable_cells_residue(i, l)

Return a list of the corners of the partition `self` having `l`-residue `i`.

A corner of a partition λ is a cell of the Young diagram of λ which can be removed from the Young diagram while still leaving a straight shape behind. See `residue()` for the definition of the `l`-residue.

The entries of the list returned are pairs of the form (i, j), where i and j are the coordinates of the respective corner. The coordinates are counted from 0.

EXAMPLES:

```
sage: Partition([3,2,1]).corners_residue(0, 3)
[(1, 1)]
sage: Partition([3,2,1]).corners_residue(1, 3)
[(2, 0)]
sage: Partition([3,2,1]).corners_residue(2, 3)
[(0, 2)]
```

```
>>> from sage.all import *
>>> Partition([Integer(3),Integer(2),Integer(1)]).corners_residue(Integer(0),␣
↪Integer(3))
[(1, 1)]
>>> Partition([Integer(3),Integer(2),Integer(1)]).corners_residue(Integer(1),␣
↪Integer(3))
[(2, 0)]
>>> Partition([Integer(3),Integer(2),Integer(1)]).corners_residue(Integer(2),␣
↪Integer(3))
[(0, 2)]
```

remove_cell(*i*, *j=None*)

Return the partition obtained by removing a cell at the end of row `i` of `self`.

EXAMPLES:

```
sage: Partition([2,2]).remove_cell(1)
[2, 1]
sage: Partition([2,2,1]).remove_cell(2)
[2, 2]
sage: #Partition([2,2]).remove_cell(0)
```

```
>>> from sage.all import *
>>> Partition([Integer(2),Integer(2)]).remove_cell(Integer(1))
[2, 1]
>>> Partition([Integer(2),Integer(2),Integer(1)]).remove_cell(Integer(2))
[2, 2]
>>> #Partition([2,2]).remove_cell(0)
```

```
sage: Partition([2,2]).remove_cell(1,1)
[2, 1]
sage: #Partition([2,2]).remove_cell(1,0)
```

```
>>> from sage.all import *
>>> Partition([Integer(2),Integer(2)]).remove_cell(Integer(1),Integer(1))
[2, 1]
>>> #Partition([2,2]).remove_cell(1,0)
```

remove_horizontal_border_strip(*k*)

Return the partitions obtained from `self` by removing an horizontal border strip of length `k`.

EXAMPLES:

```
sage: Partition([5,3,1]).remove_horizontal_border_strip(0).list()
[[5, 3, 1]]
sage: Partition([5,3,1]).remove_horizontal_border_strip(1).list()
[[5, 3], [5, 2, 1], [4, 3, 1]]
sage: Partition([5,3,1]).remove_horizontal_border_strip(2).list()
[[5, 2], [5, 1, 1], [4, 3], [4, 2, 1], [3, 3, 1]]
sage: Partition([5,3,1]).remove_horizontal_border_strip(3).list()
[[5, 1], [4, 2], [4, 1, 1], [3, 3], [3, 2, 1]]
sage: Partition([5,3,1]).remove_horizontal_border_strip(4).list()
[[4, 1], [3, 2], [3, 1, 1]]
```

(continues on next page)

(continued from previous page)

```
sage: Partition([5,3,1]).remove_horizontal_border_strip(5).list()
[[3, 1]]
sage: Partition([5,3,1]).remove_horizontal_border_strip(6).list()
[]
```

```
>>> from sage.all import *
>>> Partition([Integer(5),Integer(3),Integer(1)]).remove_horizontal_border_
↪strip(Integer(0)).list()
[[5, 3, 1]]
>>> Partition([Integer(5),Integer(3),Integer(1)]).remove_horizontal_border_
↪strip(Integer(1)).list()
[[5, 3], [5, 2, 1], [4, 3, 1]]
>>> Partition([Integer(5),Integer(3),Integer(1)]).remove_horizontal_border_
↪strip(Integer(2)).list()
[[5, 2], [5, 1, 1], [4, 3], [4, 2, 1], [3, 3, 1]]
>>> Partition([Integer(5),Integer(3),Integer(1)]).remove_horizontal_border_
↪strip(Integer(3)).list()
[[5, 1], [4, 2], [4, 1, 1], [3, 3], [3, 2, 1]]
>>> Partition([Integer(5),Integer(3),Integer(1)]).remove_horizontal_border_
↪strip(Integer(4)).list()
[[4, 1], [3, 2], [3, 1, 1]]
>>> Partition([Integer(5),Integer(3),Integer(1)]).remove_horizontal_border_
↪strip(Integer(5)).list()
[[3, 1]]
>>> Partition([Integer(5),Integer(3),Integer(1)]).remove_horizontal_border_
↪strip(Integer(6)).list()
[]
```

The result is returned as an instance of *Partitions_with_constraints*:

```
sage: Partition([5,3,1]).remove_horizontal_border_strip(5)
The subpartitions of [5, 3, 1] obtained by removing a horizontal border strip␣
↪of length 5
```

```
>>> from sage.all import *
>>> Partition([Integer(5),Integer(3),Integer(1)]).remove_horizontal_border_
↪strip(Integer(5))
The subpartitions of [5, 3, 1] obtained by removing a horizontal border strip␣
↪of length 5
```

residue(r, c, l)

Return the `l`-residue of the cell at row `r` and column `c`.

The ℓ-residue of a cell is $c - r$ modulo ℓ.

This does not strictly depend upon the partition, however, this method is included because it is often useful in the context of partitions.

EXAMPLES:

```
sage: Partition([2,1]).residue(1, 0, 3)
2
```

```
>>> from sage.all import *
>>> Partition([Integer(2),Integer(1)]).residue(Integer(1), Integer(0),␣
↪Integer(3))
2
```

rim()

Return the rim of `self`.

The rim of a partition λ is defined as the cells which belong to λ and which are adjacent to cells not in λ.

EXAMPLES:

The rim of the partition $[5, 5, 2, 1]$ consists of the cells marked with `#` below:

```
****#
*####
##
#

sage: Partition([5,5,2,1]).rim()
[(3, 0), (2, 0), (2, 1), (1, 1), (1, 2), (1, 3), (1, 4), (0, 4)]

sage: Partition([2,2,1]).rim()
[(2, 0), (1, 0), (1, 1), (0, 1)]
sage: Partition([2,2]).rim()
[(1, 0), (1, 1), (0, 1)]
sage: Partition([6,3,3,1,1]).rim()
[(4, 0), (3, 0), (2, 0), (2, 1), (2, 2), (1, 2), (0, 2), (0, 3), (0, 4), (0,␣
↪5)]
sage: Partition([]).rim()
[]
```

row_standard_tableaux()

Return the *row standard tableaux* of shape `self`.

EXAMPLES:

```
sage: Partition([3,2,2,1]).row_standard_tableaux()
Row standard tableaux of shape [3, 2, 2, 1]
```

```
>>> from sage.all import *
>>> Partition([Integer(3),Integer(2),Integer(2),Integer(1)]).row_standard_
↪tableaux()
Row standard tableaux of shape [3, 2, 2, 1]
```

sign()

Return the sign of any permutation with cycle type `self`.

This function corresponds to a homomorphism from the symmetric group S_n into the cyclic group of order 2, whose kernel is exactly the alternating group A_n. Partitions of sign 1 are called even partitions while partitions of sign -1 are called odd.

EXAMPLES:

```
sage: Partition([5,3]).sign()
1
sage: Partition([5,2]).sign()
-1
```

```
>>> from sage.all import *
>>> Partition([Integer(5),Integer(3)]).sign()
1
>>> Partition([Integer(5),Integer(2)]).sign()
-1
```

Zolotarev's lemma states that the Legendre symbol $\left(\frac{a}{p}\right)$ for an integer $a \pmod p$ (p a prime number), can be computed as sign(p_a), where sign denotes the sign of a permutation and p_a the permutation of the residue classes $\pmod p$ induced by modular multiplication by a, provided p does not divide a.

We verify this in some examples.

```
sage: F = GF(11)                                                    #␣
↪needs sage.rings.finite_rings
sage: a = F.multiplicative_generator();a                            #␣
↪needs sage.rings.finite_rings
2
sage: plist = [int(a*F(x)) for x in range(1,11)]; plist             #␣
↪needs sage.rings.finite_rings
[2, 4, 6, 8, 10, 1, 3, 5, 7, 9]
```

```
>>> from sage.all import *
>>> F = GF(Integer(11))                                              ␣
↪     # needs sage.rings.finite_rings
>>> a = F.multiplicative_generator();a                            #␣
↪needs sage.rings.finite_rings
2
>>> plist = [int(a*F(x)) for x in range(Integer(1),Integer(11))]; plist     ␣
↪              # needs sage.rings.finite_rings
[2, 4, 6, 8, 10, 1, 3, 5, 7, 9]
```

This corresponds to the permutation (1, 2, 4, 8, 5, 10, 9, 7, 3, 6) (acting the set $\{1, 2, ..., 10\}$) and to the partition [10].

```
sage: p = PermutationGroupElement('(1, 2, 4, 8, 5, 10, 9, 7, 3, 6)')   #␣
↪needs sage.groups
sage: p.sign()                                                      #␣
↪needs sage.groups
-1
sage: Partition([10]).sign()
-1
sage: kronecker_symbol(11,2)
-1
```

```
>>> from sage.all import *
>>> p = PermutationGroupElement('(1, 2, 4, 8, 5, 10, 9, 7, 3, 6)')   #␣
↪needs sage.groups
>>> p.sign()                                                      #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.groups
-1
>>> Partition([Integer(10)]).sign()
-1
>>> kronecker_symbol(Integer(11),Integer(2))
-1
```

Now replace 2 by 3:

```
sage: plist = [int(F(3*x)) for x in range(1,11)]; plist                     #␣
↪needs sage.rings.finite_rings
[3, 6, 9, 1, 4, 7, 10, 2, 5, 8]
sage: list(range(1, 11))
[1, 2, 3, 4, 5, 6, 7, 8, 9, 10]
sage: p = PermutationGroupElement('(3,4,8,7,9)')                             #␣
↪needs sage.groups
sage: p.sign()                                                               #␣
↪needs sage.groups
1
sage: kronecker_symbol(3,11)
1
sage: Partition([5,1,1,1,1,1]).sign()
1
```

```
>>> from sage.all import *
>>> plist = [int(F(Integer(3)*x)) for x in range(Integer(1),Integer(11))];␣
↪plist                      # needs sage.rings.finite_rings
[3, 6, 9, 1, 4, 7, 10, 2, 5, 8]
>>> list(range(Integer(1), Integer(11)))
[1, 2, 3, 4, 5, 6, 7, 8, 9, 10]
>>> p = PermutationGroupElement('(3,4,8,7,9)')                             #␣
↪needs sage.groups
>>> p.sign()                                                               #␣
↪needs sage.groups
1
>>> kronecker_symbol(Integer(3),Integer(11))
1
>>> Partition([Integer(5),Integer(1),Integer(1),Integer(1),Integer(1),
↪Integer(1)]).sign()
1
```

In both cases, Zolotarev holds.

REFERENCES:

- Wikipedia article Zolotarev%27s_lemma

simple_module_dimension(*base_ring=None*)

Return the dimension of the simple module corresponding to `self`.

When the base ring is a field of characteristic 0, this is equal to the dimension of the Specht module.

INPUT:

- `base_ring` – (default: $\mathbf{Q}$) the base ring

EXAMPLES:

```
sage: Partition([2,2,1]).simple_module_dimension()
5

4

sage: for la in Partitions(6, regular=3):
....:     print(la, la.specht_module_dimension(), la.simple_module_
↪dimension(GF(3)))
[6] 1 1
[5, 1] 5 4
[4, 2] 9 9
[4, 1, 1] 10 6
[3, 3] 5 1
[3, 2, 1] 16 4
[2, 2, 1, 1] 9 9
```

```
>>> from sage.all import *
>>> Partition([Integer(2),Integer(2),Integer(1)]).simple_module_dimension()
5
>>> Partition([Integer(2),Integer(2),Integer(1)]).specht_module_
↪dimension(GF(Integer(3)))                          # needs sage.rings.finite_
↪rings
5
>>> Partition([Integer(2),Integer(2),Integer(1)]).simple_module_
↪dimension(GF(Integer(3)))                          # needs sage.rings.finite_
↪rings
4

>>> for la in Partitions(Integer(6), regular=Integer(3)):
...     print(la, la.specht_module_dimension(), la.simple_module_
↪dimension(GF(Integer(3))))
[6] 1 1
[5, 1] 5 4
[4, 2] 9 9
[4, 1, 1] 10 6
[3, 3] 5 1
[3, 2, 1] 16 4
[2, 2, 1, 1] 9 9
```

size()

Return the size of `self`.

EXAMPLES:

```
sage: Partition([2,2]).size()
4
sage: Partition([3,2,1]).size()
6
```

```
>>> from sage.all import *
>>> Partition([Integer(2),Integer(2)]).size()
4
>>> Partition([Integer(3),Integer(2),Integer(1)]).size()
6
```

specht_module(*base_ring=None*)

Return the Specht module corresponding to `self`.

EXAMPLES:

```
sage: SM = Partition([2,2,1]).specht_module(QQ); SM                       #␣
↪needs sage.modules
Specht module of [2, 2, 1] over Rational Field
sage: SM.frobenius_image()                                                #␣
↪needs sage.modules
s[2, 2, 1]
```

```
>>> from sage.all import *
>>> SM = Partition([Integer(2),Integer(2),Integer(1)]).specht_module(QQ); SM ␣
↪                         # needs sage.modules
Specht module of [2, 2, 1] over Rational Field
>>> SM.frobenius_image()                                                 #␣
↪needs sage.modules
s[2, 2, 1]
```

specht_module_dimension(*base_ring=None*)

Return the dimension of the Specht module corresponding to `self`.

This is equal to the number of standard tableaux of shape `self` when over a field of characteristic 0.

INPUT:

- `base_ring` – (default: $\mathbf{Q}$) the base ring

EXAMPLES:

```
sage: Partition([2,2,1]).specht_module_dimension()
5
sage: Partition([2,2,1]).specht_module_dimension(GF(2))                   #␣
↪needs sage.rings.finite_rings
5
```

```
>>> from sage.all import *
>>> Partition([Integer(2),Integer(2),Integer(1)]).specht_module_dimension()
5
>>> Partition([Integer(2),Integer(2),Integer(1)]).specht_module_
↪dimension(GF(Integer(2)))                      # needs sage.rings.finite_
↪rings
5
```

standard_tableaux()

Return the *standard tableaux* of shape `self`.

EXAMPLES:

```
sage: Partition([3,2,2,1]).standard_tableaux()
Standard tableaux of shape [3, 2, 2, 1]
```

```
>>> from sage.all import *
>>> Partition([Integer(3),Integer(2),Integer(2),Integer(1)]).standard_
↪tableaux()
Standard tableaux of shape [3, 2, 2, 1]
```

stretch(*k*)

Return the partition obtained by multiplying each part with the given number.

EXAMPLES:

```
sage: p = Partition([4,2,2,1,1])
sage: p.stretch(3)
[12, 6, 6, 3, 3]
```

```
>>> from sage.all import *
>>> p = Partition([Integer(4),Integer(2),Integer(2),Integer(1),Integer(1)])
>>> p.stretch(Integer(3))
[12, 6, 6, 3, 3]
```

suter_diagonal_slide(*n*, *exp=1*)

Return the image of `self` in Y_n under Suter's diagonal slide σ_n, where the notations used are those defined in [Sut2002].

The set Y_n is defined as the set of all partitions λ such that the hook length of the $(0, 0)$-cell (i.e. the northwestern most cell in English notation) of λ is less than n, including the empty partition.

The map σ_n sends a partition (with nonzero entries) $(\lambda_1, \lambda_2, \ldots, \lambda_m) \in Y_n$ to the partition $(\lambda_2 + 1, \lambda_3 + 1, \ldots, \lambda_m + 1, \underbrace{1, 1, \ldots, 1}_{n-m-\lambda_1 \text{ ones}})$. In other words, it pads the partition with trailing zeroes until it has length $n - \lambda_1$, then removes its first part, and finally adds 1 to each part.

By Theorem 2.1 of [Sut2002], the dihedral group D_n with $2n$ elements acts on Y_n by letting the primitive rotation act as σ_n and the reflection act as conjugation of partitions (`conjugate()`). This action is faithful if $n \geq 3$.

INPUT:

- `n` – nonnegative integer
- `exp` – (default: 1) how many times σ_n should be applied

OUTPUT:

The result of applying Suter's diagonal slide σ_n to `self`, assuming that `self` lies in Y_n. If the optional argument `exp` is set, then the slide σ_n is applied not just once, but `exp` times (note that `exp` is allowed to be negative, since the slide has finite order).

EXAMPLES:

```
sage: Partition([5,4,1]).suter_diagonal_slide(8)
[5, 2]
sage: Partition([5,4,1]).suter_diagonal_slide(9)
[5, 2, 1]
sage: Partition([]).suter_diagonal_slide(7)
```

(continues on next page)

(continued from previous page)

```
[1, 1, 1, 1, 1, 1]
sage: Partition([]).suter_diagonal_slide(1)

...             .suter_diagonal_slide(Integer(9), exp=Integer(1))
...       for p in P7 )
True
```

Check of the assertion in [Sut2002] that $\sigma_n\big(\sigma_n(\lambda')'\big) = \lambda$:

```
sage: all( p.suter_diagonal_slide(8).conjugate()
....:       == p.conjugate().suter_diagonal_slide(8, exp=-1)
....:       for p in P7 )
True
```

```
>>> from sage.all import *
>>> all( p.suter_diagonal_slide(Integer(8)).conjugate()
...       == p.conjugate().suter_diagonal_slide(Integer(8), exp=-Integer(1))
...       for p in P7 )
True
```

Check of Claim 1 in [Sut2002]:

```
sage: P5 = Partitions(5)
sage: all( all( (p.suter_diagonal_slide(6) in q.suter_diagonal_slide(6).
↪down())
....:             or (q.suter_diagonal_slide(6) in p.suter_diagonal_slide(6).
↪down())
....:             for p in q.down() )
....:       for q in P5 )
True
```

```
>>> from sage.all import *
>>> P5 = Partitions(Integer(5))
>>> all( all( (p.suter_diagonal_slide(Integer(6)) in q.suter_diagonal_
↪slide(Integer(6)).down())
...             or (q.suter_diagonal_slide(Integer(6)) in p.suter_diagonal_
↪slide(Integer(6)).down())
...             for p in q.down() )
...       for q in P5 )
True
```

t_completion(*t*)

Return the t-completion of the partition self.

If $\lambda = (\lambda_1, \lambda_2, \lambda_3, \ldots)$ is a partition and t is an integer greater or equal to $|\lambda| + \lambda_1$, then the *t-completion of* λ is defined as the partition $(t - |\lambda|, \lambda_1, \lambda_2, \lambda_3, \ldots)$ of t. This partition is denoted by $\lambda[t]$ in [BOR2009], by $\lambda_{[t]}$ in [BdVO2012], and by $\lambda(t)$ in [CO2010].

EXAMPLES:

```
sage: Partition([]).t_completion(0)
[]
sage: Partition([]).t_completion(1)
[1]
sage: Partition([]).t_completion(2)
[2]
sage: Partition([]).t_completion(3)
[3]
sage: Partition([2, 1]).t_completion(5)
[2, 2, 1]
sage: Partition([2, 1]).t_completion(6)
[3, 2, 1]
sage: Partition([4, 2, 2, 1]).t_completion(13)
[4, 4, 2, 2, 1]
sage: Partition([4, 2, 2, 1]).t_completion(19)
[10, 4, 2, 2, 1]
sage: Partition([4, 2, 2, 1]).t_completion(10)
Traceback (most recent call last):
...
ValueError: 10-completion is not defined
sage: Partition([4, 2, 2, 1]).t_completion(5)
Traceback (most recent call last):
...
ValueError: 5-completion is not defined
```

```
>>> from sage.all import *
>>> Partition([]).t_completion(Integer(0))
[]
>>> Partition([]).t_completion(Integer(1))
[1]
>>> Partition([]).t_completion(Integer(2))
[2]
>>> Partition([]).t_completion(Integer(3))
[3]
>>> Partition([Integer(2), Integer(1)]).t_completion(Integer(5))
[2, 2, 1]
>>> Partition([Integer(2), Integer(1)]).t_completion(Integer(6))
[3, 2, 1]
>>> Partition([Integer(4), Integer(2), Integer(2), Integer(1)]).t_
↪completion(Integer(13))
[4, 4, 2, 2, 1]
>>> Partition([Integer(4), Integer(2), Integer(2), Integer(1)]).t_
↪completion(Integer(19))
[10, 4, 2, 2, 1]
>>> Partition([Integer(4), Integer(2), Integer(2), Integer(1)]).t_
↪completion(Integer(10))
Traceback (most recent call last):
...
ValueError: 10-completion is not defined
>>> Partition([Integer(4), Integer(2), Integer(2), Integer(1)]).t_
↪completion(Integer(5))
Traceback (most recent call last):
```

(continues on next page)

(continued from previous page)

```
...
ValueError: 5-completion is not defined
```

tabloid_module(*base_ring=None*)

Return the tabloid module corresponding to `self`.

EXAMPLES:

```
sage: TM = Partition([2,2,1]).tabloid_module(QQ); TM
Tabloid module of [2, 2, 1] over Rational Field
sage: TM.frobenius_image()
s[2, 2, 1] + s[3, 1, 1] + 2*s[3, 2] + 2*s[4, 1] + s[5]
```

```
>>> from sage.all import *
>>> TM = Partition([Integer(2),Integer(2),Integer(1)]).tabloid_module(QQ); TM
Tabloid module of [2, 2, 1] over Rational Field
>>> TM.frobenius_image()
s[2, 2, 1] + s[3, 1, 1] + 2*s[3, 2] + 2*s[4, 1] + s[5]
```

to_core(*k*)

Map the k-bounded partition `self` to its corresponding $k+1$-core.

See also `k_skew()`.

EXAMPLES:

```
sage: p = Partition([4,3,2,2,1,1])
sage: c = p.to_core(4); c
[9, 5, 3, 2, 1, 1]
sage: type(c)
<class 'sage.combinat.core.Cores_length_with_category.element_class'>
sage: c.to_bounded_partition() == p
True
```

```
>>> from sage.all import *
>>> p = Partition([Integer(4),Integer(3),Integer(2),Integer(2),Integer(1),
↪Integer(1)])
>>> c = p.to_core(Integer(4)); c
[9, 5, 3, 2, 1, 1]
>>> type(c)
<class 'sage.combinat.core.Cores_length_with_category.element_class'>
>>> c.to_bounded_partition() == p
True
```

to_dyck_word(*n=None*)

Return the `n`-Dyck word whose corresponding partition is `self` (or, if `n` is not specified, the n-Dyck word with smallest n to satisfy this property).

If w is an n-Dyck word (that is, a Dyck word with n open symbols and n close symbols), then the Dyck path corresponding to w can be regarded as a lattice path in the northeastern half of an $n \times n$-square. The region to the northeast of this Dyck path can be regarded as a partition. It is called the partition corresponding to the Dyck word w. (See `to_partition()`.)

For every partition λ and every nonnegative integer n, there exists at most one n-Dyck word w such that the partition corresponding to w is λ (in fact, such w exists if and only if $\lambda_i + i \leq n$ for every i, where λ is written in the form $(\lambda_1, \lambda_2, \ldots, \lambda_k)$ with $\lambda_k > 0$). This method computes this w for a given λ and n. If n is not specified, this method computes the w for the smallest possible n for which such an w exists. (The minimality of n means that the partition demarcated by the Dyck path touches the diagonal.)

EXAMPLES:

```
sage: Partition([2,2]).to_dyck_word()
[1, 1, 0, 0, 1, 1, 0, 0]
sage: Partition([2,2]).to_dyck_word(4)
[1, 1, 0, 0, 1, 1, 0, 0]
sage: Partition([2,2]).to_dyck_word(5)
[1, 1, 1, 0, 0, 1, 1, 0, 0, 0]
sage: Partition([6,3,1]).to_dyck_word()
[1, 1, 1, 1, 0, 1, 0, 0, 1, 0, 0, 0, 1, 0]
sage: Partition([]).to_dyck_word()
[]
sage: Partition([]).to_dyck_word(3)
[1, 1, 1, 0, 0, 0]
```

```
>>> from sage.all import *
>>> Partition([Integer(2),Integer(2)]).to_dyck_word()
[1, 1, 0, 0, 1, 1, 0, 0]
>>> Partition([Integer(2),Integer(2)]).to_dyck_word(Integer(4))
[1, 1, 0, 0, 1, 1, 0, 0]
>>> Partition([Integer(2),Integer(2)]).to_dyck_word(Integer(5))
[1, 1, 1, 0, 0, 1, 1, 0, 0, 0]
>>> Partition([Integer(6),Integer(3),Integer(1)]).to_dyck_word()
[1, 1, 1, 1, 0, 1, 0, 0, 1, 0, 0, 0, 1, 0]
>>> Partition([]).to_dyck_word()
[]
>>> Partition([]).to_dyck_word(Integer(3))
[1, 1, 1, 0, 0, 0]
```

The partition corresponding to `self.dyck_word()` is `self` indeed:

```
sage: all( p.to_dyck_word().to_partition() == p
....:      for p in Partitions(5) )
True
```

```
>>> from sage.all import *
>>> all( p.to_dyck_word().to_partition() == p
...      for p in Partitions(Integer(5)) )
True
```

to_exp(*k=0*)

Return a list of the multiplicities of the parts of a partition. Use the optional parameter `k` to get a return list of length at least `k`.

EXAMPLES:

```
sage: Partition([3,2,2,1]).to_exp()
[1, 2, 1]
sage: Partition([3,2,2,1]).to_exp(5)
[1, 2, 1, 0, 0]
```

```
>>> from sage.all import *
>>> Partition([Integer(3),Integer(2),Integer(2),Integer(1)]).to_exp()
[1, 2, 1]
>>> Partition([Integer(3),Integer(2),Integer(2),Integer(1)]).to_
↪exp(Integer(5))
[1, 2, 1, 0, 0]
```

to_exp_dict()

Return a dictionary containing the multiplicities of the parts of `self`.

EXAMPLES:

```
sage: p = Partition([4,2,2,1])
sage: d = p.to_exp_dict()
sage: d[4]
1
sage: d[2]
2
sage: d[1]
1
sage: 5 in d
False
```

```
>>> from sage.all import *
>>> p = Partition([Integer(4),Integer(2),Integer(2),Integer(1)])
>>> d = p.to_exp_dict()
>>> d[Integer(4)]
1
>>> d[Integer(2)]
2
>>> d[Integer(1)]
1
>>> Integer(5) in d
False
```

to_list()

Return `self` as a list.

EXAMPLES:

```
sage: p = Partition([2,1]).to_list(); p
[2, 1]
sage: type(p)
<class 'list'>
```

```
>>> from sage.all import *
>>> p = Partition([Integer(2),Integer(1)]).to_list(); p
[2, 1]
>>> type(p)
<class 'list'>
```

top_garnir_tableau(*e*, *cell*)

Return the most dominant *standard* tableau which dominates the corresponding Garnir tableau and has the same `e`-residue.

The Garnir tableau play an important role in integral and non-semisimple representation theory because they determine the "straightening" rules for the Specht modules. The *top Garnir tableaux* arise in the graded representation theory of the symmetric groups and higher level Hecke algebras. They were introduced in [KMR2012].

If the Garnir node is `cell=(r,c)` and m and M are the entries in the cells `(r,c)` and `(r+1,c)`, respectively, in the initial tableau then the top `e`-Garnir tableau is obtained by inserting the numbers $m, m+1, \ldots, M$ in order from left to right first in the cells in row `r+1` which are not in the `e`-Garnir belt, then in the cell in rows `r` and `r+1` which are in the Garnir belt and then, finally, in the remaining cells in row `r` which are not in the Garnir belt. All other entries in the tableau remain unchanged.

If `e = 0`, or if there are no `e`-bricks in either row `r` or `r+1`, then the top Garnir tableau is the corresponding Garnir tableau.

EXAMPLES:

```
sage: Partition([5,4,3,2]).top_garnir_tableau(2,(0,2)).pp()
   1  2  4  5  8
   3  6  7  9
  10 11 12
  13 14
sage: Partition([5,4,3,2]).top_garnir_tableau(3,(0,2)).pp()
   1  2  3  4  5
   6  7  8  9
  10 11 12
  13 14
sage: Partition([5,4,3,2]).top_garnir_tableau(4,(0,2)).pp()
   1  2  6  7  8
   3  4  5  9
  10 11 12
  13 14
sage: Partition([5,4,3,2]).top_garnir_tableau(0,(0,2)).pp()
   1  2  6  7  8
   3  4  5  9
  10 11 12
  13 14
```

```
>>> from sage.all import *
>>> Partition([Integer(5),Integer(4),Integer(3),Integer(2)]).top_garnir_
↪tableau(Integer(2),(Integer(0),Integer(2))).pp()
   1  2  4  5  8
   3  6  7  9
  10 11 12
  13 14
>>> Partition([Integer(5),Integer(4),Integer(3),Integer(2)]).top_garnir_
↪tableau(Integer(3),(Integer(0),Integer(2))).pp()
   1  2  3  4  5
   6  7  8  9
  10 11 12
  13 14
>>> Partition([Integer(5),Integer(4),Integer(3),Integer(2)]).top_garnir_
↪tableau(Integer(4),(Integer(0),Integer(2))).pp()
   1  2  6  7  8
   3  4  5  9
  10 11 12
```

(continues on next page)

(continued from previous page)

```
 13 14
>>> Partition([Integer(5),Integer(4),Integer(3),Integer(2)]).top_garnir_
↪tableau(Integer(0),(Integer(0),Integer(2))).pp()
  1  2  6  7  8
  3  4  5  9
 10 11 12
 13 14
```

REFERENCES:

- [KMR2012]

up()

Return a generator for partitions that can be obtained from `self` by adding a cell.

EXAMPLES:

```
sage: list(Partition([2,1,1]).up())
[[3, 1, 1], [2, 2, 1], [2, 1, 1, 1]]
sage: list(Partition([3,2]).up())
[[4, 2], [3, 3], [3, 2, 1]]
sage: [p for p in Partition([]).up()]
[[1]]
```

```
>>> from sage.all import *
>>> list(Partition([Integer(2),Integer(1),Integer(1)]).up())
[[3, 1, 1], [2, 2, 1], [2, 1, 1, 1]]
>>> list(Partition([Integer(3),Integer(2)]).up())
[[4, 2], [3, 3], [3, 2, 1]]
>>> [p for p in Partition([]).up()]
[[1]]
```

up_list()

Return a list of the partitions that can be formed from `self` by adding a cell.

EXAMPLES:

```
sage: Partition([2,1,1]).up_list()
[[3, 1, 1], [2, 2, 1], [2, 1, 1, 1]]
sage: Partition([3,2]).up_list()
[[4, 2], [3, 3], [3, 2, 1]]
sage: Partition([]).up_list()
[[1]]
```

```
>>> from sage.all import *
>>> Partition([Integer(2),Integer(1),Integer(1)]).up_list()
[[3, 1, 1], [2, 2, 1], [2, 1, 1, 1]]
>>> Partition([Integer(3),Integer(2)]).up_list()
[[4, 2], [3, 3], [3, 2, 1]]
>>> Partition([]).up_list()
[[1]]
```

upper_hook(*i*, *j*, *alpha*)

Return the upper hook length of the cell (i, j) in `self`. When `alpha = 1`, this is just the normal hook length.

The upper hook length of a cell (i, j) in a partition κ is defined by

$$h_\kappa^*(i, j) = \kappa_j' - i + \alpha(\kappa_i - j + 1).$$

EXAMPLES:

```
sage: p = Partition([2,1])
sage: p.upper_hook(0,0,1)
3
sage: p.hook_length(0,0)
3
sage: [ p.upper_hook(i,j,x) for i,j in p.cells() ]                          #␣
↪needs sage.symbolic
[2*x + 1, x, x]
```

```
>>> from sage.all import *
>>> p = Partition([Integer(2),Integer(1)])
>>> p.upper_hook(Integer(0),Integer(0),Integer(1))
3
>>> p.hook_length(Integer(0),Integer(0))
3
>>> [ p.upper_hook(i,j,x) for i,j in p.cells() ]                          #␣
↪needs sage.symbolic
[2*x + 1, x, x]
```

upper_hook_lengths(*alpha*)

Return a tableau of shape `self` with the cells filled in with the upper hook lengths. When `alpha = 1`, these are just the normal hook lengths.

The upper hook length of a cell (i, j) in a partition κ is defined by

$$h_\kappa^*(i, j) = \kappa_j' - i + \alpha(\kappa_i - j + 1).$$

EXAMPLES:

```
sage: Partition([3,2,1]).upper_hook_lengths(x)                               #␣
↪needs sage.symbolic
[[3*x + 2, 2*x + 1, x], [2*x + 1, x], [x]]
sage: Partition([3,2,1]).upper_hook_lengths(1)
[[5, 3, 1], [3, 1], [1]]
sage: Partition([3,2,1]).hook_lengths()
[[5, 3, 1], [3, 1], [1]]
```

```
>>> from sage.all import *
>>> Partition([Integer(3),Integer(2),Integer(1)]).upper_hook_lengths(x)      ␣
↪                       # needs sage.symbolic
[[3*x + 2, 2*x + 1, x], [2*x + 1, x], [x]]
>>> Partition([Integer(3),Integer(2),Integer(1)]).upper_hook_
↪lengths(Integer(1))
[[5, 3, 1], [3, 1], [1]]
>>> Partition([Integer(3),Integer(2),Integer(1)]).hook_lengths()
[[5, 3, 1], [3, 1], [1]]
```

vertical_border_strip_cells(*k*)

Return a list of all the vertical border strips of length k which can be added to self, where each horizontal border strip is a generator of cells.

EXAMPLES:

```
sage: list(Partition([]).vertical_border_strip_cells(0))
[]
sage: list(Partition([3,2,1]).vertical_border_strip_cells(0))
[]
sage: list(Partition([]).vertical_border_strip_cells(2))
[[(0, 0), (1, 0)]]
sage: list(Partition([2,2]).vertical_border_strip_cells(2))
[[(0, 2), (1, 2)],
 [(0, 2), (2, 0)],
 [(2, 0), (3, 0)]]
sage: list(Partition([3,2,2]).vertical_border_strip_cells(2))
[[(0, 3), (1, 2)],
 [(0, 3), (3, 0)],
 [(1, 2), (2, 2)],
 [(1, 2), (3, 0)],
 [(3, 0), (4, 0)]]
```

```
>>> from sage.all import *
>>> list(Partition([]).vertical_border_strip_cells(Integer(0)))
[]
>>> list(Partition([Integer(3),Integer(2),Integer(1)]).vertical_border_strip_
↪cells(Integer(0)))
[]
>>> list(Partition([]).vertical_border_strip_cells(Integer(2)))
[[(0, 0), (1, 0)]]
>>> list(Partition([Integer(2),Integer(2)]).vertical_border_strip_
↪cells(Integer(2)))
[[(0, 2), (1, 2)],
 [(0, 2), (2, 0)],
 [(2, 0), (3, 0)]]
>>> list(Partition([Integer(3),Integer(2),Integer(2)]).vertical_border_strip_
↪cells(Integer(2)))
[[(0, 3), (1, 2)],
 [(0, 3), (3, 0)],
 [(1, 2), (2, 2)],
 [(1, 2), (3, 0)],
 [(3, 0), (4, 0)]]
```

weighted_size()

Return the weighted size of self.

The weighted size of a partition λ is

$$\sum_i i \cdot \lambda_i,$$

where $\lambda = (\lambda_0, \lambda_1, \lambda_2, \cdots)$.

This also the sum of the leg length of every cell in λ, or

$$\sum_i \binom{\lambda'_i}{2}$$

where λ' is the conjugate partition of λ.

EXAMPLES:

```
sage: Partition([2,2]).weighted_size()
2
sage: Partition([3,3,3]).weighted_size()
9
sage: Partition([5,2]).weighted_size()
2
sage: Partition([]).weighted_size()
0
```

```
>>> from sage.all import *
>>> Partition([Integer(2),Integer(2)]).weighted_size()
2
>>> Partition([Integer(3),Integer(3),Integer(3)]).weighted_size()
9
>>> Partition([Integer(5),Integer(2)]).weighted_size()
2
>>> Partition([]).weighted_size()
0
```

young_subgroup()

Return the corresponding Young, or parabolic, subgroup of the symmetric group.

The Young subgroup of a partition $\lambda = (\lambda_1, \lambda_2, \ldots, \lambda_\ell)$ of n is the group:

$$S_{\lambda_1} \times S_{\lambda_2} \times \cdots \times S_{\lambda_\ell}$$

embedded into S_n in the standard way (i.e., the S_{λ_i} factor acts on the numbers from $\lambda_1 + \lambda_2 + \cdots + \lambda_{i-1} + 1$ to $\lambda_1 + \lambda_2 + \cdots + \lambda_i$).

EXAMPLES:

```
sage: Partition([4,2]).young_subgroup()                                    #␣
↪needs sage.groups
Permutation Group with generators [(), (5,6), (3,4), (2,3), (1,2)]
```

```
>>> from sage.all import *
>>> Partition([Integer(4),Integer(2)]).young_subgroup()                    ␣
↪               # needs sage.groups
Permutation Group with generators [(), (5,6), (3,4), (2,3), (1,2)]
```

young_subgroup_generators()

Return an indexing set for the generators of the corresponding Young subgroup. Here the generators correspond to the simple adjacent transpositions $s_i = (i\ i+1)$.

EXAMPLES:

```
sage: Partition([4,2]).young_subgroup_generators()
[1, 2, 3, 5]
sage: Partition([1,1,1]).young_subgroup_generators()
[]
sage: Partition([2,2]).young_subgroup_generators()
[1, 3]
```

```
>>> from sage.all import *
>>> Partition([Integer(4),Integer(2)]).young_subgroup_generators()
[1, 2, 3, 5]
>>> Partition([Integer(1),Integer(1),Integer(1)]).young_subgroup_generators()
[]
>>> Partition([Integer(2),Integer(2)]).young_subgroup_generators()
[1, 3]
```

See also

young_subgroup()

zero_one_sequence()

Compute the finite $0-1$ sequence of the partition.

The full $0-1$ sequence is the sequence (infinite in both directions) indicating the steps taken when following the outer rim of the diagram of the partition. We use the convention that in English convention, a 1 corresponds to an East step, and a 0 corresponds to a North step.

Note that every full $0-1$ sequence starts with infinitely many 0s and ends with infinitely many 1s.

One place where these arise is in the affine symmetric group where one takes an affine permutation w and every i such that $w(i) \leq 0$ corresponds to a 1 and $w(i) > 0$ corresponds to a 0. See pages 24-25 of [LLMSSZ2013] for connections to affine Grassmannian elements (note there they use the French convention for their partitions).

These are also known as **path sequences**, **Maya diagrams**, **plus-minus diagrams**, **Comet code** [Sta-EC2], among others.

OUTPUT:

The finite $0-1$ sequence is obtained from the full $0-1$ sequence by omitting all heading 0s and trailing 1s. The output sequence is finite, starts with a 1 and ends with a 0 (unless it is empty, for the empty partition). Its length is the sum of the first part of the partition with the length of the partition.

EXAMPLES:

```
sage: Partition([5,4]).zero_one_sequence()
[1, 1, 1, 1, 0, 1, 0]
sage: Partition([]).zero_one_sequence()
[]
sage: Partition([2]).zero_one_sequence()
[1, 1, 0]
```

```
>>> from sage.all import *
>>> Partition([Integer(5),Integer(4)]).zero_one_sequence()
[1, 1, 1, 1, 0, 1, 0]
```

(continues on next page)

(continued from previous page)

```
>>> Partition([]).zero_one_sequence()
[]
>>> Partition([Integer(2)]).zero_one_sequence()
[1, 1, 0]
```

class sage.combinat.partition.**Partitions**(*is_infinite=False*)

Bases: UniqueRepresentation, Parent

`Partitions(n, **kwargs)` returns the combinatorial class of integer partitions of n subject to the constraints given by the keywords.

Valid keywords are: `starting`, `ending`, `min_part`, `max_part`, `max_length`, `min_length`, `length`, `max_slope`, `min_slope`, `inner`, `outer`, `parts_in`, `regular`, and `restricted`. They have the following meanings:

- `starting=p` specifies that the partitions should all be less than or equal to p in lex order. This argument cannot be combined with any other (see Issue #15467).
- `ending=p` specifies that the partitions should all be greater than or equal to p in lex order. This argument cannot be combined with any other (see Issue #15467).
- `length=k` specifies that the partitions have exactly k parts.
- `min_length=k` specifies that the partitions have at least k parts.
- `min_part=k` specifies that all parts of the partitions are at least k.
- `inner=p` specifies that the partitions must contain the partition p.
- `outer=p` specifies that the partitions be contained inside the partition p.
- `min_slope=k` specifies that the partitions have slope at least k; the slope at position i is the difference between the $(i+1)$-th part and the i-th part.
- `parts_in=S` specifies that the partitions have parts in the set S, which can be any sequence of pairwise distinct positive integers. This argument cannot be combined with any other (see Issue #15467).
- `regular=ell` specifies that the partitions are ℓ-regular, and can only be combined with the `max_length` or `max_part`, but not both, keywords if n is not specified
- `restricted=ell` specifies that the partitions are ℓ-restricted, and cannot be combined with any other keywords

The `max_*` versions, along with `inner` and `ending`, work analogously.

Right now, the `parts_in`, `starting`, `ending`, `regular`, and `restricted` keyword arguments are mutually exclusive, both of each other and of other keyword arguments. If you specify, say, `parts_in`, all other keyword arguments will be ignored; `starting`, `ending`, `regular`, and `restricted` work the same way.

EXAMPLES:

If no arguments are passed, then the combinatorial class of all integer partitions is returned:

```
sage: Partitions()
Partitions
sage: [2,1] in Partitions()
True
```

```
>>> from sage.all import *
>>> Partitions()
```

(continues on next page)

(continued from previous page)

```
Partitions
>>> [Integer(2),Integer(1)] in Partitions()
True
```

If an integer n is passed, then the combinatorial class of integer partitions of n is returned:

```
sage: Partitions(3)
Partitions of the integer 3
sage: Partitions(3).list()
[[3], [2, 1], [1, 1, 1]]
```

```
>>> from sage.all import *
>>> Partitions(Integer(3))
Partitions of the integer 3
>>> Partitions(Integer(3)).list()
[[3], [2, 1], [1, 1, 1]]
```

If `starting=p` is passed, then the combinatorial class of partitions greater than or equal to p in lexicographic order is returned:

```
sage: Partitions(3, starting=[2,1])
Partitions of the integer 3 starting with [2, 1]
sage: Partitions(3, starting=[2,1]).list()
[[2, 1], [1, 1, 1]]
```

```
>>> from sage.all import *
>>> Partitions(Integer(3), starting=[Integer(2),Integer(1)])
Partitions of the integer 3 starting with [2, 1]
>>> Partitions(Integer(3), starting=[Integer(2),Integer(1)]).list()
[[2, 1], [1, 1, 1]]
```

If `ending=p` is passed, then the combinatorial class of partitions at most p in lexicographic order is returned:

```
sage: Partitions(3, ending=[2,1])
Partitions of the integer 3 ending with [2, 1]
sage: Partitions(3, ending=[2,1]).list()
[[3], [2, 1]]
```

```
>>> from sage.all import *
>>> Partitions(Integer(3), ending=[Integer(2),Integer(1)])
Partitions of the integer 3 ending with [2, 1]
>>> Partitions(Integer(3), ending=[Integer(2),Integer(1)]).list()
[[3], [2, 1]]
```

Using `max_slope=-1` yields partitions into distinct parts – each part differs from the next by at least 1. Use a different `max_slope` to get parts that differ by, say, 2:

```
sage: Partitions(7, max_slope=-1).list()
[[7], [6, 1], [5, 2], [4, 3], [4, 2, 1]]
sage: Partitions(15, max_slope=-1).cardinality()
27
```

```
>>> from sage.all import *
>>> Partitions(Integer(7), max_slope=-Integer(1)).list()
[[7], [6, 1], [5, 2], [4, 3], [4, 2, 1]]
>>> Partitions(Integer(15), max_slope=-Integer(1)).cardinality()
27
```

The number of partitions of n into odd parts equals the number of partitions into distinct parts. Let's test that for n from 10 to 20:

```
sage: def test(n):
....:     return (Partitions(n, max_slope=-1).cardinality()
....:             == Partitions(n, parts_in=[1,3..n]).cardinality())
sage: all(test(n) for n in [10..20])                                        #␣
↪needs sage.libs.gap
True
```

```
>>> from sage.all import *
>>> def test(n):
...     return (Partitions(n, max_slope=-Integer(1)).cardinality()
...             == Partitions(n, parts_in=(ellipsis_range(Integer(1),Integer(3),
↪Ellipsis,n))).cardinality())
>>> all(test(n) for n in (ellipsis_range(Integer(10),Ellipsis,Integer(20))))     ␣
↪                                   # needs sage.libs.gap
True
```

The number of partitions of n into distinct parts that differ by at least 2 equals the number of partitions into parts that equal 1 or 4 modulo 5; this is one of the Rogers-Ramanujan identities:

```
sage: def test(n):
....:     return (Partitions(n, max_slope=-2).cardinality()
....:             == Partitions(n, parts_in=([1,6..n] + [4,9..n])).cardinality())
sage: all(test(n) for n in [10..20])                                        #␣
↪needs sage.libs.gap
True
```

```
>>> from sage.all import *
>>> def test(n):
...     return (Partitions(n, max_slope=-Integer(2)).cardinality()
...             == Partitions(n, parts_in=((ellipsis_range(Integer(1),Integer(6),
↪Ellipsis,n)) + (ellipsis_range(Integer(4),Integer(9),Ellipsis,n)))).
↪cardinality())
>>> all(test(n) for n in (ellipsis_range(Integer(10),Ellipsis,Integer(20))))     ␣
↪                                   # needs sage.libs.gap
True
```

Here are some more examples illustrating `min_part`, `max_part`, and `length`:

```
sage: Partitions(5, min_part=2)
Partitions of 5 whose parts are at least 2
sage: Partitions(5, min_part=2).list()
[[5], [3, 2]]
```

```
>>> from sage.all import *
>>> Partitions(Integer(5), min_part=Integer(2))
Partitions of 5 whose parts are at least 2
>>> Partitions(Integer(5), min_part=Integer(2)).list()
[[5], [3, 2]]
```

```
sage: Partitions(3, max_length=2).list()
[[3], [2, 1]]
```

```
>>> from sage.all import *
>>> Partitions(Integer(3), max_length=Integer(2)).list()
[[3], [2, 1]]
```

```
sage: Partitions(10, min_part=2, length=3).list()
[[6, 2, 2], [5, 3, 2], [4, 4, 2], [4, 3, 3]]
```

```
>>> from sage.all import *
>>> Partitions(Integer(10), min_part=Integer(2), length=Integer(3)).list()
[[6, 2, 2], [5, 3, 2], [4, 4, 2], [4, 3, 3]]
```

Some examples using the `regular` keyword:

```
sage: Partitions(regular=4)
4-Regular Partitions
sage: Partitions(regular=4, max_length=3)
4-Regular Partitions with max length 3
sage: Partitions(regular=4, max_part=3)
4-Regular 3-Bounded Partitions
sage: Partitions(3, regular=4)
4-Regular Partitions of the integer 3
```

```
>>> from sage.all import *
>>> Partitions(regular=Integer(4))
4-Regular Partitions
>>> Partitions(regular=Integer(4), max_length=Integer(3))
4-Regular Partitions with max length 3
>>> Partitions(regular=Integer(4), max_part=Integer(3))
4-Regular 3-Bounded Partitions
>>> Partitions(Integer(3), regular=Integer(4))
4-Regular Partitions of the integer 3
```

Some examples using the `restricted` keyword:

```
sage: Partitions(restricted=4)
4-Restricted Partitions
sage: Partitions(3, restricted=4)
4-Restricted Partitions of the integer 3
```

```
>>> from sage.all import *
>>> Partitions(restricted=Integer(4))
4-Restricted Partitions
```

(continues on next page)

(continued from previous page)

```
>>> Partitions(Integer(3), restricted=Integer(4))
4-Restricted Partitions of the integer 3
```

Here are some further examples using various constraints:

```
sage: [x for x in Partitions(4)]
[[4], [3, 1], [2, 2], [2, 1, 1], [1, 1, 1, 1]]
sage: [x for x in Partitions(4, length=2)]
[[3, 1], [2, 2]]
sage: [x for x in Partitions(4, min_length=2)]
[[3, 1], [2, 2], [2, 1, 1], [1, 1, 1, 1]]
sage: [x for x in Partitions(4, max_length=2)]
[[4], [3, 1], [2, 2]]
sage: [x for x in Partitions(4, min_length=2, max_length=2)]
[[3, 1], [2, 2]]
sage: [x for x in Partitions(4, max_part=2)]
[[2, 2], [2, 1, 1], [1, 1, 1, 1]]
sage: [x for x in Partitions(4, min_part=2)]
[[4], [2, 2]]
sage: [x for x in Partitions(4, outer=[3,1,1])]
[[3, 1], [2, 1, 1]]
sage: [x for x in Partitions(4, outer=[infinity, 1, 1])]
[[4], [3, 1], [2, 1, 1]]
sage: [x for x in Partitions(4, inner=[1,1,1])]
[[2, 1, 1], [1, 1, 1, 1]]
sage: [x for x in Partitions(4, max_slope=-1)]
[[4], [3, 1]]
sage: [x for x in Partitions(4, min_slope=-1)]
[[4], [2, 2], [2, 1, 1], [1, 1, 1, 1]]
sage: [x for x in Partitions(11, max_slope=-1, min_slope=-3, min_length=2, max_
↪length=4)]
[[7, 4], [6, 5], [6, 4, 1], [6, 3, 2], [5, 4, 2], [5, 3, 2, 1]]
sage: [x for x in Partitions(11, max_slope=-1, min_slope=-3, min_length=2, max_
↪length=4, outer=[6,5,2])]
[[6, 5], [6, 4, 1], [6, 3, 2], [5, 4, 2]]
```

```
>>> from sage.all import *
>>> [x for x in Partitions(Integer(4))]
[[4], [3, 1], [2, 2], [2, 1, 1], [1, 1, 1, 1]]
>>> [x for x in Partitions(Integer(4), length=Integer(2))]
[[3, 1], [2, 2]]
>>> [x for x in Partitions(Integer(4), min_length=Integer(2))]
[[3, 1], [2, 2], [2, 1, 1], [1, 1, 1, 1]]
>>> [x for x in Partitions(Integer(4), max_length=Integer(2))]
[[4], [3, 1], [2, 2]]
>>> [x for x in Partitions(Integer(4), min_length=Integer(2), max_
↪length=Integer(2))]
[[3, 1], [2, 2]]
>>> [x for x in Partitions(Integer(4), max_part=Integer(2))]
[[2, 2], [2, 1, 1], [1, 1, 1, 1]]
>>> [x for x in Partitions(Integer(4), min_part=Integer(2))]
[[4], [2, 2]]
```

(continues on next page)

(continued from previous page)

```
>>> [x for x in Partitions(Integer(4), outer=[Integer(3),Integer(1),Integer(1)])]
[[3, 1], [2, 1, 1]]
>>> [x for x in Partitions(Integer(4), outer=[infinity, Integer(1), Integer(1)])]
[[4], [3, 1], [2, 1, 1]]
>>> [x for x in Partitions(Integer(4), inner=[Integer(1),Integer(1),Integer(1)])]
[[2, 1, 1], [1, 1, 1, 1]]
>>> [x for x in Partitions(Integer(4), max_slope=-Integer(1))]
[[4], [3, 1]]
>>> [x for x in Partitions(Integer(4), min_slope=-Integer(1))]
[[4], [2, 2], [2, 1, 1], [1, 1, 1, 1]]
>>> [x for x in Partitions(Integer(11), max_slope=-Integer(1), min_slope=-
↪Integer(3), min_length=Integer(2), max_length=Integer(4))]
[[7, 4], [6, 5], [6, 4, 1], [6, 3, 2], [5, 4, 2], [5, 3, 2, 1]]
>>> [x for x in Partitions(Integer(11), max_slope=-Integer(1), min_slope=-
↪Integer(3), min_length=Integer(2), max_length=Integer(4), outer=[Integer(6),
↪Integer(5),Integer(2)])]
[[6, 5], [6, 4, 1], [6, 3, 2], [5, 4, 2]]
```

Note that if you specify `min_part=0`, then it will treat the minimum part as being 1 (see Issue #13605):

```
sage: [x for x in Partitions(4, length=3, min_part=0)]
[[2, 1, 1]]
sage: [x for x in Partitions(4, min_length=3, min_part=0)]
[[2, 1, 1], [1, 1, 1, 1]]
```

```
>>> from sage.all import *
>>> [x for x in Partitions(Integer(4), length=Integer(3), min_part=Integer(0))]
[[2, 1, 1]]
>>> [x for x in Partitions(Integer(4), min_length=Integer(3), min_
↪part=Integer(0))]
[[2, 1, 1], [1, 1, 1, 1]]
```

Except for very special cases, counting is done by brute force iteration through all the partitions. However the iteration itself has a reasonable complexity (see *IntegerListsLex*), which allows for manipulating large partitions:

```
sage: Partitions(1000, max_length=1).list()
[[1000]]
```

```
>>> from sage.all import *
>>> Partitions(Integer(1000), max_length=Integer(1)).list()
[[1000]]
```

In particular, getting the first element is also constant time:

```
sage: Partitions(30, max_part=29).first()
[29, 1]
```

```
>>> from sage.all import *
>>> Partitions(Integer(30), max_part=Integer(29)).first()
[29, 1]
```

Element

alias of *Partition*

options = Current options for Partitions - convention: English - diagram_str: * - display: list - latex: young_diagram - latex_diagram_str: \ast

subset(**args*, ***kwargs*)

Return `self` if no arguments are given.

Otherwise, it raises a `ValueError`.

EXAMPLES:

```
sage: P = Partitions(5, starting=[3,1]); P
Partitions of the integer 5 starting with [3, 1]
sage: P.subset()
Partitions of the integer 5 starting with [3, 1]
sage: P.subset(ending=[3,1])
Traceback (most recent call last):
...
ValueError: invalid combination of arguments
```

```
>>> from sage.all import *
>>> P = Partitions(Integer(5), starting=[Integer(3),Integer(1)]); P
Partitions of the integer 5 starting with [3, 1]
>>> P.subset()
Partitions of the integer 5 starting with [3, 1]
>>> P.subset(ending=[Integer(3),Integer(1)])
Traceback (most recent call last):
...
ValueError: invalid combination of arguments
```

class sage.combinat.partition.**PartitionsGreatestEQ**(*n*, *k*)

Bases: `UniqueRepresentation`, *IntegerListsLex*

The class of all (unordered) "restricted" partitions of the integer n having all its greatest parts equal to the integer k.

EXAMPLES:

```
sage: PartitionsGreatestEQ(10, 2)
Partitions of 10 having greatest part equal to 2
sage: PartitionsGreatestEQ(10, 2).list()
[[2, 2, 2, 2, 2],
 [2, 2, 2, 2, 1, 1],
 [2, 2, 2, 1, 1, 1, 1],
 [2, 2, 1, 1, 1, 1, 1, 1],
 [2, 1, 1, 1, 1, 1, 1, 1, 1]]

sage: [4,3,2,1] in PartitionsGreatestEQ(10, 2)
False
sage: [2,2,2,2,2] in PartitionsGreatestEQ(10, 2)
True
```

```
>>> from sage.all import *
>>> PartitionsGreatestEQ(Integer(10), Integer(2))
Partitions of 10 having greatest part equal to 2
>>> PartitionsGreatestEQ(Integer(10), Integer(2)).list()
```

(continues on next page)

(continued from previous page)

```
[[2, 2, 2, 2, 2],
 [2, 2, 2, 2, 1, 1],
 [2, 2, 2, 1, 1, 1, 1],
 [2, 2, 1, 1, 1, 1, 1, 1],
 [2, 1, 1, 1, 1, 1, 1, 1, 1]]

>>> [Integer(4),Integer(3),Integer(2),Integer(1)] in␣
↪PartitionsGreatestEQ(Integer(10), Integer(2))
False
>>> [Integer(2),Integer(2),Integer(2),Integer(2),Integer(2)] in␣
↪PartitionsGreatestEQ(Integer(10), Integer(2))
True
```

The empty partition has no maximal part, but it is contained in the set of partitions with any specified maximal part:

```
sage: PartitionsGreatestEQ(0, 2).list()
[[]]
```

```
>>> from sage.all import *
>>> PartitionsGreatestEQ(Integer(0), Integer(2)).list()
[[]]
```

Element

alias of *Partition*

cardinality()

Return the cardinality of `self`.

EXAMPLES:

```
sage: PartitionsGreatestEQ(10, 2).cardinality()
5
```

```
>>> from sage.all import *
>>> PartitionsGreatestEQ(Integer(10), Integer(2)).cardinality()
5
```

options = Current options for Partitions - convention: English - diagram_str: * - display: list - latex: young_diagram - latex_diagram_str: \ast

class sage.combinat.partition.**PartitionsGreatestLE**(n, k)

Bases: `UniqueRepresentation`, *IntegerListsLex*

The class of all (unordered) "restricted" partitions of the integer n having parts less than or equal to the integer k.

EXAMPLES:

```
sage: PartitionsGreatestLE(10, 2)
Partitions of 10 having parts less than or equal to 2
sage: PartitionsGreatestLE(10, 2).list()
[[2, 2, 2, 2, 2],
 [2, 2, 2, 2, 1, 1],
```

(continues on next page)

(continued from previous page)

```
 [2, 2, 2, 1, 1, 1, 1],
 [2, 2, 1, 1, 1, 1, 1, 1],
 [2, 1, 1, 1, 1, 1, 1, 1, 1],
 [1, 1, 1, 1, 1, 1, 1, 1, 1, 1]]

sage: [4,3,2,1] in PartitionsGreatestLE(10, 2)
False
sage: [2,2,2,2,2] in PartitionsGreatestLE(10, 2)
True
sage: PartitionsGreatestLE(10, 2).first().parent()
Partitions...
```

```
>>> from sage.all import *
>>> PartitionsGreatestLE(Integer(10), Integer(2))
Partitions of 10 having parts less than or equal to 2
>>> PartitionsGreatestLE(Integer(10), Integer(2)).list()
[[2, 2, 2, 2, 2],
 [2, 2, 2, 2, 1, 1],
 [2, 2, 2, 1, 1, 1, 1],
 [2, 2, 1, 1, 1, 1, 1, 1],
 [2, 1, 1, 1, 1, 1, 1, 1, 1],
 [1, 1, 1, 1, 1, 1, 1, 1, 1, 1]]

>>> [Integer(4),Integer(3),Integer(2),Integer(1)] in␣
↪PartitionsGreatestLE(Integer(10), Integer(2))
False
>>> [Integer(2),Integer(2),Integer(2),Integer(2),Integer(2)] in␣
↪PartitionsGreatestLE(Integer(10), Integer(2))
True
>>> PartitionsGreatestLE(Integer(10), Integer(2)).first().parent()
Partitions...
```

Element

alias of *Partition*

cardinality()

Return the cardinality of `self`.

EXAMPLES:

```
sage: PartitionsGreatestLE(9, 5).cardinality()                            #␣
↪needs sage.libs.gap
23
```

```
>>> from sage.all import *
>>> PartitionsGreatestLE(Integer(9), Integer(5)).cardinality()              ␣
↪               # needs sage.libs.gap
23
```

options = Current options for Partitions - convention: English - diagram_str: * - display: list - latex: young_diagram - latex_diagram_str: \ast

class sage.combinat.partition.**PartitionsInBox**(*h*, *w*)

Bases: *Partitions*

All partitions which fit in an $h \times w$ box.

EXAMPLES:

```
sage: PartitionsInBox(2, 2)
Integer partitions which fit in a 2 x 2 box
sage: PartitionsInBox(2, 2).list()
[[], [1], [1, 1], [2], [2, 1], [2, 2]]

sage: Partitions(max_part=2, max_length=3)
Integer partitions which fit in a 3 x 2 box
```

```
>>> from sage.all import *
>>> PartitionsInBox(Integer(2), Integer(2))
Integer partitions which fit in a 2 x 2 box
>>> PartitionsInBox(Integer(2), Integer(2)).list()
[[], [1], [1, 1], [2], [2, 1], [2, 2]]

>>> Partitions(max_part=Integer(2), max_length=Integer(3))
Integer partitions which fit in a 3 x 2 box
```

cardinality()

Return the cardinality of `self`.

EXAMPLES:

```
sage: PartitionsInBox(2, 3).cardinality()
10
```

```
>>> from sage.all import *
>>> PartitionsInBox(Integer(2), Integer(3)).cardinality()
10
```

list()

Return a list of all the partitions inside a box of height h and width w.

EXAMPLES:

```
sage: PartitionsInBox(2,2).list()
[[], [1], [1, 1], [2], [2, 1], [2, 2]]
sage: PartitionsInBox(2,3).list()
[[], [1], [1, 1], [2], [2, 1], [2, 2], [3], [3, 1], [3, 2], [3, 3]]
```

```
>>> from sage.all import *
>>> PartitionsInBox(Integer(2),Integer(2)).list()
[[], [1], [1, 1], [2], [2, 1], [2, 2]]
>>> PartitionsInBox(Integer(2),Integer(3)).list()
[[], [1], [1, 1], [2], [2, 1], [2, 2], [3], [3, 1], [3, 2], [3, 3]]
```

class sage.combinat.partition.**Partitions_all**

Bases: *Partitions*

Class of all partitions.

from_beta_numbers(*beta*)

Return a partition corresponding to a sequence of beta numbers.

A sequence of beta numbers is a strictly increasing sequence $0 \leq b_1 < \cdots < b_k$ of nonnegative integers. The corresponding partition $\mu = (\mu_k, \ldots, \mu_1)$ is given by $\mu_i = [1, i) \setminus \{b_1, \ldots, b_i\}$. This gives a bijection from the set of partitions with at most k nonzero parts to the set of strictly increasing sequences of nonnegative integers of length k.

EXAMPLES:

```
sage: Partitions().from_beta_numbers([0,1,2,4,5,8])
[3, 1, 1]
sage: Partitions().from_beta_numbers([0,2,3,6])
[3, 1, 1]
```

```
>>> from sage.all import *
>>> Partitions().from_beta_numbers([Integer(0),Integer(1),Integer(2),
↪Integer(4),Integer(5),Integer(8)])
[3, 1, 1]
>>> Partitions().from_beta_numbers([Integer(0),Integer(2),Integer(3),
↪Integer(6)])
[3, 1, 1]
```

from_core_and_quotient(*core*, *quotient*)

Return a partition from its core and quotient.

Algorithm from mupad-combinat.

EXAMPLES:

```
sage: Partitions().from_core_and_quotient([2,1], [[2,1],[3],[1,1,1]])
[11, 5, 5, 3, 2, 2, 2]
```

```
>>> from sage.all import *
>>> Partitions().from_core_and_quotient([Integer(2),Integer(1)], [[Integer(2),
↪Integer(1)],[Integer(3)],[Integer(1),Integer(1),Integer(1)]])
[11, 5, 5, 3, 2, 2, 2]
```

from_exp(*exp*)

Return a partition from its list of multiplicities.

EXAMPLES:

```
sage: Partitions().from_exp([2,2,1])
[3, 2, 2, 1, 1]
```

```
>>> from sage.all import *
>>> Partitions().from_exp([Integer(2),Integer(2),Integer(1)])
[3, 2, 2, 1, 1]
```

from_frobenius_coordinates(*frobenius_coordinates*)

Return a partition from a pair of sequences of Frobenius coordinates.

EXAMPLES:

```
sage: Partitions().from_frobenius_coordinates(([],[]))
[]
sage: Partitions().from_frobenius_coordinates(([0],[0]))
[1]
sage: Partitions().from_frobenius_coordinates(([1],[1]))
[2, 1]
sage: Partitions().from_frobenius_coordinates(([6,3,2],[4,1,0]))
[7, 5, 5, 1, 1]
```

```
>>> from sage.all import *
>>> Partitions().from_frobenius_coordinates(([],[]))
[]
>>> Partitions().from_frobenius_coordinates(([Integer(0)],[Integer(0)]))
[1]
>>> Partitions().from_frobenius_coordinates(([Integer(1)],[Integer(1)]))
[2, 1]
>>> Partitions().from_frobenius_coordinates(([Integer(6),Integer(3),
→Integer(2)],[Integer(4),Integer(1),Integer(0)]))
[7, 5, 5, 1, 1]
```

from_zero_one(*seq*)

Return a partition from its $0-1$ sequence.

The full $0-1$ sequence is the sequence (infinite in both directions) indicating the steps taken when following the outer rim of the diagram of the partition. We use the convention that in English convention, a 1 corresponds to an East step, and a 0 corresponds to a North step.

Note that every full $0-1$ sequence starts with infinitely many 0s and ends with infinitely many 1s.

See also

Partition.zero_one_sequence()

INPUT:

The input should be a finite sequence of 0s and 1s. The heading 0s and trailing 1s will be discarded.

EXAMPLES:

```
sage: Partitions().from_zero_one([])
[]
sage: Partitions().from_zero_one([1,0])
[1]
sage: Partitions().from_zero_one([1, 1, 1, 1, 0, 1, 0])
[5, 4]
```

```
>>> from sage.all import *
>>> Partitions().from_zero_one([])
[]
>>> Partitions().from_zero_one([Integer(1),Integer(0)])
[1]
>>> Partitions().from_zero_one([Integer(1), Integer(1), Integer(1),
→Integer(1), Integer(0), Integer(1), Integer(0)])
[5, 4]
```

Heading 0s and trailing 1s are correctly handled:

```
sage: Partitions().from_zero_one([0,0,1,1,1,1,0,1,0,1,1,1])
[5, 4]
```

```
>>> from sage.all import *
>>> Partitions().from_zero_one([Integer(0),Integer(0),Integer(1),Integer(1),
↪Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),Integer(1),
↪Integer(1),Integer(1)])
[5, 4]
```

subset(*size=None*, ***kwargs*)

Return the subset of partitions of a given size and additional keyword arguments.

EXAMPLES:

```
sage: P = Partitions()
sage: P.subset(4)
Partitions of the integer 4
```

```
>>> from sage.all import *
>>> P = Partitions()
>>> P.subset(Integer(4))
Partitions of the integer 4
```

class sage.combinat.partition.**Partitions_all_bounded**(*k*)

Bases: *Partitions*

Partitions whose parts do not exceed a given bound.

class sage.combinat.partition.**Partitions_all_constrained**(***kwargs*)

Bases: *Partitions*

class sage.combinat.partition.**Partitions_constraints**(**args*, ***kwds*)

Bases: *IntegerListsLex*

For unpickling old constrained `Partitions_constraints` objects created with sage <= 3.4.1. See *Partitions*.

class sage.combinat.partition.**Partitions_ending**(*n*, *ending_partition*)

Bases: *Partitions*

All partitions with a given ending.

first()

Return the first partition in `self`.

EXAMPLES:

```
sage: Partitions(4, ending=[1,1,1,1]).first()
[4]
sage: Partitions(4, ending=[5]).first() is None
True
```

```
>>> from sage.all import *
>>> Partitions(Integer(4), ending=[Integer(1),Integer(1),Integer(1),
```

(continues on next page)

(continued from previous page)

```
↪Integer(1)]).first()
[4]
>>> Partitions(Integer(4), ending=[Integer(5)]).first() is None
True
```

next (*part*)

Return the next partition after `part` in `self`.

EXAMPLES::

sage: Partitions(4, ending=[1,1,1,1,1]).next(Partition([4])) [3, 1] sage: Partitions(4, ending=[3,2]).next(Partition([3,1])) is None True sage: Partitions(4, ending=[1,1,1,1]).next(Partition([4])) [3, 1] sage: Partitions(4, ending=[1,1,1,1]).next(Partition([1,1,1,1])) is None True sage: Partitions(4, ending=[3]).next(Partition([3,1])) is None True

class sage.combinat.partition.**Partitions_length_and_parts_constrained**(*n*, *min_length*, *max_length*, *min_part*, *max_part*)

Bases: *Partitions*

The class of all integer partitions having parts and length in a given range.

This class is strictly more general than *PartitionsGreatestLE*, except that we insist that the size of the partition is positive and that neither the constraints on the parts nor on the length are contradictory.

INPUT:

- `n` – the size of the partition, positive
- `min_length` – the lower bound on the number of parts, between 1 and `n`
- `max_length` – the upper bound on the number of parts, between `min_length` and `n`
- `min_part` – the bound on the smallest part, between 1 and `n`
- `max_part` – the bound on the largest part, between `min_part` and `n`

EXAMPLES:

```
sage: from sage.combinat.partition import Partitions_length_and_parts_constrained
sage: Partitions_length_and_parts_constrained(10, 1, 10, 2, 5)
Partitions of 10 whose parts are between 2 and 5
sage: list(Partitions_length_and_parts_constrained(9, 3, 4, 2, 4))
[[4, 3, 2], [3, 3, 3], [3, 2, 2, 2]]

sage: [4,3,2,1] in Partitions_length_and_parts_constrained(10, 1, 10, 2, 10)
False
sage: [2,2,2,2,2] in Partitions_length_and_parts_constrained(10, 1, 10, 2, 10)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.partition import Partitions_length_and_parts_constrained
>>> Partitions_length_and_parts_constrained(Integer(10), Integer(1), Integer(10),␣
↪Integer(2), Integer(5))
Partitions of 10 whose parts are between 2 and 5
>>> list(Partitions_length_and_parts_constrained(Integer(9), Integer(3),␣
↪Integer(4), Integer(2), Integer(4)))
[[4, 3, 2], [3, 3, 3], [3, 2, 2, 2]]
```

(continues on next page)

(continued from previous page)

```
>>> [Integer(4),Integer(3),Integer(2),Integer(1)] in Partitions_length_and_parts_
↪constrained(Integer(10), Integer(1), Integer(10), Integer(2), Integer(10))
False
>>> [Integer(2),Integer(2),Integer(2),Integer(2),Integer(2)] in Partitions_length_
↪and_parts_constrained(Integer(10), Integer(1), Integer(10), Integer(2),␣
↪Integer(10))
True
```

> **Warning**
>
> If `min_length` and `min_part` equal 1 and `max_length` and `max_part` equal `n`, this class contains the same partitions as *Partitions*, but is different from that class.

```
sage: Partitions_length_and_parts_constrained(9, 1, 9, 1, 9)
Partitions of 9
sage: Partitions_length_and_parts_constrained(9, 1, 9, 1, 9) == Partitions(9)
False
```

```
>>> from sage.all import *
>>> Partitions_length_and_parts_constrained(Integer(9), Integer(1), Integer(9),␣
↪Integer(1), Integer(9))
Partitions of 9
>>> Partitions_length_and_parts_constrained(Integer(9), Integer(1), Integer(9),␣
↪Integer(1), Integer(9)) == Partitions(Integer(9))
False
```

cardinality()

Return the cardinality of `self`.

EXAMPLES:

```
sage: from sage.combinat.partition import Partitions_length_and_parts_
↪constrained
sage: list(Partitions_length_and_parts_constrained(9, 1, 2, 3, 9))
[[9], [6, 3], [5, 4]]
sage: Partitions_length_and_parts_constrained(9, 1, 2, 3, 9).cardinality()
3
```

```
>>> from sage.all import *
>>> from sage.combinat.partition import Partitions_length_and_parts_
↪constrained
>>> list(Partitions_length_and_parts_constrained(Integer(9), Integer(1),␣
↪Integer(2), Integer(3), Integer(9)))
[[9], [6, 3], [5, 4]]
>>> Partitions_length_and_parts_constrained(Integer(9), Integer(1),␣
↪Integer(2), Integer(3), Integer(9)).cardinality()
3
```

class sage.combinat.partition.**Partitions_n**(*n*)

Bases: *Partitions*

Partitions of the integer n.

cardinality(*algorithm='flint'*)

Return the number of partitions of the specified size.

INPUT:

- `algorithm` – (default: `'flint'`)
  - `'flint'` – use FLINT (currently the fastest)
  - `'gap'` – use GAP (VERY *slow*)
  - `'pari'` – use PARI. Speed seems the same as GAP until n is in the thousands, in which case PARI is faster

It is possible to associate with every partition of the integer n a conjugacy class of permutations in the symmetric group on n points and vice versa. Therefore the number of partitions p_n is the number of conjugacy classes of the symmetric group on n points.

EXAMPLES:

```
sage: v = Partitions(5).list(); v
[[5], [4, 1], [3, 2], [3, 1, 1], [2, 2, 1], [2, 1, 1, 1], [1, 1, 1, 1, 1]]
sage: len(v)
7
sage: Partitions(5).cardinality(algorithm='gap')                          #␣
↪needs sage.libs.gap
7
```

```
>>> from sage.all import *
>>> v = Partitions(Integer(5)).list(); v
[[5], [4, 1], [3, 2], [3, 1, 1], [2, 2, 1], [2, 1, 1, 1], [1, 1, 1, 1, 1]]
>>> len(v)
7
>>> Partitions(Integer(5)).cardinality(algorithm='gap')                   ␣
↪     # needs sage.libs.gap
7
```

```
sage: # needs sage.libs.flint
sage: Partitions(3).cardinality()
3
sage: number_of_partitions(5, algorithm='flint')
7
sage: Partitions(10).cardinality()
42
sage: Partitions(40).cardinality()
37338
sage: Partitions(100).cardinality()
190569292
```

```
>>> from sage.all import *
>>> # needs sage.libs.flint
>>> Partitions(Integer(3)).cardinality()
3
>>> number_of_partitions(Integer(5), algorithm='flint')
```

(continues on next page)

(continued from previous page)

```
7
>>> Partitions(Integer(10)).cardinality()
42
>>> Partitions(Integer(40)).cardinality()
37338
>>> Partitions(Integer(100)).cardinality()
190569292
```

```
sage: # needs sage.libs.pari
sage: Partitions(3).cardinality(algorithm='pari')
3
sage: Partitions(5).cardinality(algorithm='pari')
7
sage: Partitions(10).cardinality(algorithm='pari')
42
```

```
>>> from sage.all import *
>>> # needs sage.libs.pari
>>> Partitions(Integer(3)).cardinality(algorithm='pari')
3
>>> Partitions(Integer(5)).cardinality(algorithm='pari')
7
>>> Partitions(Integer(10)).cardinality(algorithm='pari')
42
```

A generating function for p_n is given by the reciprocal of Euler's function:

$$\sum_{n=0}^{\infty} p_n x^n = \prod_{k=1}^{\infty} \frac{1}{1-x^k}.$$

We use Sage to verify that the first several coefficients do indeed agree:

```
sage: q = PowerSeriesRing(QQ, 'q', default_prec=9).gen()
sage: prod([(1-q^k)^(-1) for k in range(1,9)])  # partial product of
1 + q + 2*q^2 + 3*q^3 + 5*q^4 + 7*q^5 + 11*q^6 + 15*q^7 + 22*q^8 + O(q^9)
sage: [Partitions(k).cardinality() for k in range(2,10)]                    #␣
↪needs sage.libs.flint
[2, 3, 5, 7, 11, 15, 22, 30]
```

```
>>> from sage.all import *
>>> q = PowerSeriesRing(QQ, 'q', default_prec=Integer(9)).gen()
>>> prod([(Integer(1)-q**k)**(-Integer(1)) for k in range(Integer(1),
↪Integer(9))])  # partial product of
1 + q + 2*q^2 + 3*q^3 + 5*q^4 + 7*q^5 + 11*q^6 + 15*q^7 + 22*q^8 + O(q^9)
>>> [Partitions(k).cardinality() for k in range(Integer(2),Integer(10))]     ␣
↪              # needs sage.libs.flint
[2, 3, 5, 7, 11, 15, 22, 30]
```

Another consistency test for `n` up to 500:

```
sage: len([n for n in [1..500]                                              #␣
↪needs sage.libs.flint sage.libs.pari
```

(continues on next page)

(continued from previous page)

```
....:     if Partitions(n).cardinality() != Partitions(n).
↪cardinality(algorithm='pari')])
0
```

```
>>> from sage.all import *
>>> len([n for n in (ellipsis_range(Integer(1),Ellipsis,Integer(500)))     ␣
↪                                       # needs sage.libs.flint sage.libs.pari
...     if Partitions(n).cardinality() != Partitions(n).cardinality(algorithm=
↪'pari')])
0
```

For negative inputs, the result is zero (the algorithm is ignored):

```
sage: Partitions(-5).cardinality()
0
```

```
>>> from sage.all import *
>>> Partitions(-Integer(5)).cardinality()
0
```

REFERENCES:

- Wikipedia article Partition_(number_theory)

first()

Return the lexicographically first partition of a positive integer n. This is the partition `[n]`.

EXAMPLES:

```
sage: Partitions(4).first()
[4]
```

```
>>> from sage.all import *
>>> Partitions(Integer(4)).first()
[4]
```

last()

Return the lexicographically last partition of the positive integer n. This is the all-ones partition.

EXAMPLES:

```
sage: Partitions(4).last()
[1, 1, 1, 1]
```

```
>>> from sage.all import *
>>> Partitions(Integer(4)).last()
[1, 1, 1, 1]
```

next(p)

Return the lexicographically next partition after the partition `p`.

EXAMPLES:

```
sage: Partitions(4).next([4])
[3, 1]
sage: Partitions(4).next([1,1,1,1]) is None
True
```

```
>>> from sage.all import *
>>> Partitions(Integer(4)).next([Integer(4)])
[3, 1]
>>> Partitions(Integer(4)).next([Integer(1),Integer(1),Integer(1),
↪Integer(1)]) is None
True
```

prev (*p*)

Return the lexicographically previous partition before partition `p`.

EXAMPLES:

```
sage: Partitions(4).prev([3, 1])
[4]
sage: Partitions(4).prev([4]) is None
True
```

```
>>> from sage.all import *
>>> Partitions(Integer(4)).prev([Integer(3), Integer(1)])
[4]
>>> Partitions(Integer(4)).prev([Integer(4)]) is None
True
```

random_element (*measure='uniform'*)

Return a random partitions of n for the specified measure.

INPUT:

- `measure` – `'uniform'` or `'Plancherel'` (default: `'uniform'`)

See also

- *random_element_uniform()*
- *random_element_plancherel()*

EXAMPLES:

```
sage: Partitions(5).random_element()   # random                          #␣
↪needs sage.libs.flint
[2, 1, 1, 1]
sage: Partitions(5).random_element(measure='Plancherel')   # random      #␣
↪needs sage.libs.flint
[2, 1, 1, 1]
```

```
>>> from sage.all import *
>>> Partitions(Integer(5)).random_element()   # random                   ␣
```

(continues on next page)

(continued from previous page)

```
↪     # needs sage.libs.flint
[2, 1, 1, 1]
>>> Partitions(Integer(5)).random_element(measure='Plancherel')   # random    ␣
↪     # needs sage.libs.flint
[2, 1, 1, 1]
```

random_element_plancherel()

Return a random partition of n (for the Plancherel measure).

This probability distribution comes from the uniform distribution on permutations via the Robinson-Schensted correspondence.

See Wikipedia article Plancherel_measure and *Partition.plancherel_measure()*.

EXAMPLES:

```
sage: Partitions(5).random_element_plancherel()    # random
[2, 1, 1, 1]
sage: Partitions(20).random_element_plancherel()   # random
[9, 3, 3, 2, 2, 1]
```

```
>>> from sage.all import *
>>> Partitions(Integer(5)).random_element_plancherel()    # random
[2, 1, 1, 1]
>>> Partitions(Integer(20)).random_element_plancherel()   # random
[9, 3, 3, 2, 2, 1]
```

ALGORITHM:

- insert by Robinson-Schensted a uniform random permutations of n and returns the shape of the resulting tableau. The complexity is $O(n\ln(n))$ which is likely optimal. However, the implementation could be optimized.

AUTHOR:

- Florent Hivert (2009-11-23)

random_element_uniform()

Return a random partition of n with uniform probability.

EXAMPLES:

```
sage: Partitions(5).random_element_uniform()   # random                      #␣
↪needs sage.libs.flint
[2, 1, 1, 1]
sage: Partitions(20).random_element_uniform()   # random                     #␣
↪needs sage.libs.flint
[9, 3, 3, 2, 2, 1]
```

```
>>> from sage.all import *
>>> Partitions(Integer(5)).random_element_uniform()   # random                ␣
↪     # needs sage.libs.flint
[2, 1, 1, 1]
>>> Partitions(Integer(20)).random_element_uniform()   # random               ␣
↪     # needs sage.libs.flint
[9, 3, 3, 2, 2, 1]
```

ALGORITHM:

- It is a python Implementation of RANDPAR, see [NW1978]. The complexity is unknown, there may be better algorithms.

> **Todo**
>
> Check in Knuth AOCP4.

- There is also certainly a lot of room for optimizations, see comments in the code.

AUTHOR:

- Florent Hivert (2009-11-23)

subset(***kwargs*)

Return a subset of `self` with the additional optional arguments.

EXAMPLES:

```
sage: P = Partitions(5); P
Partitions of the integer 5
sage: P.subset(starting=[3,1])
Partitions of the integer 5 starting with [3, 1]
```

```
>>> from sage.all import *
>>> P = Partitions(Integer(5)); P
Partitions of the integer 5
>>> P.subset(starting=[Integer(3),Integer(1)])
Partitions of the integer 5 starting with [3, 1]
```

class sage.combinat.partition.**Partitions_nk**(*n*, *k*)

Bases: *Partitions*

Partitions of the integer n of length equal to k.

cardinality(*algorithm='hybrid'*)

Return the number of partitions of the specified size with the specified length.

INPUT:

- `algorithm` – (default: `'hybrid'`) the algorithm to compute the cardinality and can be one of the following:
  - `'hybrid'` – use a hybrid algorithm which uses heuristics to reduce the complexity
  - `'gap'` – use GAP

EXAMPLES:

```
sage: v = Partitions(5, length=2).list(); v
[[4, 1], [3, 2]]
sage: len(v)
2
sage: Partitions(5, length=2).cardinality()
2
```

```
>>> from sage.all import *
>>> v = Partitions(Integer(5), length=Integer(2)).list(); v
[[4, 1], [3, 2]]
>>> len(v)
2
>>> Partitions(Integer(5), length=Integer(2)).cardinality()
2
```

More generally, the number of partitions of n of length 2 is $\left\lfloor \frac{n}{2} \right\rfloor$:

```
sage: all( Partitions(n, length=2).cardinality()
....:      == n // 2 for n in range(10) )
True
```

```
>>> from sage.all import *
>>> all( Partitions(n, length=Integer(2)).cardinality()
...      == n // Integer(2) for n in range(Integer(10)) )
True
```

The number of partitions of n of length 1 is 1 for n positive:

```
sage: all( Partitions(n, length=1).cardinality() == 1
....:      for n in range(1, 10) )
True
```

```
>>> from sage.all import *
>>> all( Partitions(n, length=Integer(1)).cardinality() == Integer(1)
...      for n in range(Integer(1), Integer(10)) )
True
```

Further examples:

```
sage: # needs sage.libs.flint
sage: Partitions(5, length=3).cardinality()
2
sage: Partitions(6, length=3).cardinality()
3
sage: Partitions(8, length=4).cardinality()
5
sage: Partitions(8, length=5).cardinality()
3
sage: Partitions(15, length=6).cardinality()
26
sage: Partitions(0, length=0).cardinality()
1
sage: Partitions(0, length=1).cardinality()
0
sage: Partitions(1, length=0).cardinality()
0
sage: Partitions(1, length=4).cardinality()
0
```

```
>>> from sage.all import *
>>> # needs sage.libs.flint
>>> Partitions(Integer(5), length=Integer(3)).cardinality()
2
>>> Partitions(Integer(6), length=Integer(3)).cardinality()
3
>>> Partitions(Integer(8), length=Integer(4)).cardinality()
5
>>> Partitions(Integer(8), length=Integer(5)).cardinality()
3
>>> Partitions(Integer(15), length=Integer(6)).cardinality()
26
>>> Partitions(Integer(0), length=Integer(0)).cardinality()
1
>>> Partitions(Integer(0), length=Integer(1)).cardinality()
0
>>> Partitions(Integer(1), length=Integer(0)).cardinality()
0
>>> Partitions(Integer(1), length=Integer(4)).cardinality()
0
```

subset(***kwargs*)

Return a subset of `self` with the additional optional arguments.

EXAMPLES:

```
sage: P = Partitions(5, length=2); P
Partitions of the integer 5 of length 2
sage: P.subset(max_part=3)
Partitions of 5 having length 2 and whose parts are at most 3
```

```
>>> from sage.all import *
>>> P = Partitions(Integer(5), length=Integer(2)); P
Partitions of the integer 5 of length 2
>>> P.subset(max_part=Integer(3))
Partitions of 5 having length 2 and whose parts are at most 3
```

class sage.combinat.partition.**Partitions_parts_in**(*n*, *parts*)

Bases: `Partitions`

Partitions of n with parts in a given set S.

This is invoked indirectly when calling `Partitions(n, parts_in=parts)`, where `parts` is a list of pairwise distinct integers.

cardinality()

Return the number of partitions with parts in `self`. Wraps GAP's `NrRestrictedPartitions`.

EXAMPLES:

```
sage: Partitions(15, parts_in=[2,3,7]).cardinality()                    #␣
↪needs sage.libs.gap
5
```

```
>>> from sage.all import *
>>> Partitions(Integer(15), parts_in=[Integer(2),Integer(3),Integer(7)]).
↪cardinality()                          # needs sage.libs.gap
5
```

If you can use all parts 1 through n, we'd better get $p(n)$:

```
sage: (Partitions(20, parts_in=[1..20]).cardinality()                    #␣
↪needs sage.libs.gap
....:    == Partitions(20).cardinality())
True
```

```
>>> from sage.all import *
>>> (Partitions(Integer(20), parts_in=(ellipsis_range(Integer(1),Ellipsis,
↪Integer(20)))).cardinality()                         # needs sage.libs.gap
...    == Partitions(Integer(20)).cardinality())
True
```

first()

Return the lexicographically first partition of a positive integer n with the specified parts, or None if no such partition exists.

EXAMPLES:

```
sage: Partitions(9, parts_in=[3,4]).first()
[3, 3, 3]
sage: Partitions(6, parts_in=[1..6]).first()
[6]
sage: Partitions(30, parts_in=[4,7,8,10,11]).first()
[11, 11, 8]
```

```
>>> from sage.all import *
>>> Partitions(Integer(9), parts_in=[Integer(3),Integer(4)]).first()
[3, 3, 3]
>>> Partitions(Integer(6), parts_in=(ellipsis_range(Integer(1),Ellipsis,
↪Integer(6)))).first()
[6]
>>> Partitions(Integer(30), parts_in=[Integer(4),Integer(7),Integer(8),
↪Integer(10),Integer(11)]).first()
[11, 11, 8]
```

last()

Return the lexicographically last partition of the positive integer n with the specified parts, or None if no such partition exists.

EXAMPLES:

```
sage: Partitions(15, parts_in=[2,3]).last()
[3, 2, 2, 2, 2, 2, 2]
sage: Partitions(30, parts_in=[4,7,8,10,11]).last()
[7, 7, 4, 4, 4, 4]
sage: Partitions(10, parts_in=[3,6]).last() is None
True
```

(continues on next page)

(continued from previous page)

```
sage: Partitions(50, parts_in=[11,12,13]).last()
[13, 13, 12, 12]
sage: Partitions(30, parts_in=[4,7,8,10,11]).last()
[7, 7, 4, 4, 4, 4]
```

```
>>> from sage.all import *
>>> Partitions(Integer(15), parts_in=[Integer(2),Integer(3)]).last()
[3, 2, 2, 2, 2, 2, 2]
>>> Partitions(Integer(30), parts_in=[Integer(4),Integer(7),Integer(8),
↪Integer(10),Integer(11)]).last()
[7, 7, 4, 4, 4, 4]
>>> Partitions(Integer(10), parts_in=[Integer(3),Integer(6)]).last() is None
True
>>> Partitions(Integer(50), parts_in=[Integer(11),Integer(12),Integer(13)]).
↪last()
[13, 13, 12, 12]
>>> Partitions(Integer(30), parts_in=[Integer(4),Integer(7),Integer(8),
↪Integer(10),Integer(11)]).last()
[7, 7, 4, 4, 4, 4]
```

class sage.combinat.partition.**Partitions_starting**(*n*, *starting_partition*)

Bases: *Partitions*

All partitions with a given start.

first()

Return the first partition in self.

EXAMPLES:

```
sage: Partitions(3, starting=[2,1]).first()
[2, 1]
sage: Partitions(3, starting=[1,1,1]).first()
[1, 1, 1]
sage: Partitions(3, starting=[1,1]).first()
False
sage: Partitions(3, starting=[3,1]).first()
[3]
sage: Partitions(3, starting=[2,2]).first()
[2, 1]
```

```
>>> from sage.all import *
>>> Partitions(Integer(3), starting=[Integer(2),Integer(1)]).first()
[2, 1]
>>> Partitions(Integer(3), starting=[Integer(1),Integer(1),Integer(1)]).
↪first()
[1, 1, 1]
>>> Partitions(Integer(3), starting=[Integer(1),Integer(1)]).first()
False
>>> Partitions(Integer(3), starting=[Integer(3),Integer(1)]).first()
[3]
>>> Partitions(Integer(3), starting=[Integer(2),Integer(2)]).first()
[2, 1]
```

next (*part*)

Return the next partition after `part` in `self`.

EXAMPLES:

```
sage: Partitions(3, starting=[2,1]).next(Partition([2,1]))
[1, 1, 1]
```

```
>>> from sage.all import *
>>> Partitions(Integer(3), starting=[Integer(2),Integer(1)]).
↪next(Partition([Integer(2),Integer(1)]))
[1, 1, 1]
```

class sage.combinat.partition.**Partitions_with_constraints**(**args*, ***kwds*)

Bases: *IntegerListsLex*

Partitions which satisfy a set of constraints.

EXAMPLES:

```
sage: P = Partitions(6, inner=[1,1], max_slope=-1)
sage: list(P)
[[5, 1], [4, 2], [3, 2, 1]]
```

```
>>> from sage.all import *
>>> P = Partitions(Integer(6), inner=[Integer(1),Integer(1)], max_slope=-
↪Integer(1))
>>> list(P)
[[5, 1], [4, 2], [3, 2, 1]]
```

Element

alias of *Partition*

options = Current options for Partitions - convention: English - diagram_str: * - display: list - latex: young_diagram - latex_diagram_str: \ast

class sage.combinat.partition.**RegularPartitions**(*ell*, *is_infinite=False*)

Bases: *Partitions*

Base class for ℓ-regular partitions.

Let ℓ be a positive integer. A partition λ is *ℓ-regular* if $m_i < \ell$ for all i, where m_i is the multiplicity of i in λ.

> **Note**
>
> This is conjugate to the notion of *ℓ-restricted* partitions, where the difference between any two consecutive parts is $< \ell$.

INPUT:

- `ell` – the positive integer ℓ
- `is_infinite` – boolean; if the subset of ℓ-regular partitions is infinite

ell()

Return the value ℓ.

EXAMPLES:

```
sage: P = Partitions(regular=2)
sage: P.ell()
2
```

```
>>> from sage.all import *
>>> P = Partitions(regular=Integer(2))
>>> P.ell()
2
```

class sage.combinat.partition.**RegularPartitions_all**(*ell*)

Bases: *RegularPartitions*

The class of all ℓ-regular partitions.

INPUT:

- ell – the positive integer ℓ

See also

RegularPartitions

class sage.combinat.partition.**RegularPartitions_bounded**(*ell*, *k*)

Bases: *RegularPartitions*

The class of ℓ-regular k-bounded partitions.

INPUT:

- ell – the integer ℓ
- k – integer; the value k

See also

RegularPartitions

class sage.combinat.partition.**RegularPartitions_n**(*n*, *ell*)

Bases: *RegularPartitions*, *Partitions_n*

The class of ℓ-regular partitions of n.

INPUT:

- n – the integer n to partition
- ell – the integer ℓ

See also

RegularPartitions

cardinality()

Return the cardinality of `self`.

EXAMPLES:

```
sage: P = Partitions(5, regular=3)
sage: P.cardinality()                                                   #␣
↪needs sage.libs.flint
5
sage: P = Partitions(5, regular=6)
sage: P.cardinality()                                                   #␣
↪needs sage.libs.flint
7
sage: P.cardinality() == Partitions(5).cardinality()                   #␣
↪needs sage.libs.flint
True
```

```
>>> from sage.all import *
>>> P = Partitions(Integer(5), regular=Integer(3))
>>> P.cardinality()                                                   #␣
↪needs sage.libs.flint
5
>>> P = Partitions(Integer(5), regular=Integer(6))
>>> P.cardinality()                                                   #␣
↪needs sage.libs.flint
7
>>> P.cardinality() == Partitions(Integer(5)).cardinality()            ␣
↪       # needs sage.libs.flint
True
```

class `sage.combinat.partition.`**RegularPartitions_truncated**(*ell*, *max_len*)

Bases: *RegularPartitions*

The class of ℓ-regular partitions with max length k.

INPUT:

- `ell` – the integer ℓ
- `max_len` – integer; the maximum length

See also

RegularPartitions

max_length()

Return the maximum length of the partitions of `self`.

EXAMPLES:

```
sage: P = Partitions(regular=4, max_length=3)
sage: P.max_length()
3
```

```
>>> from sage.all import *
>>> P = Partitions(regular=Integer(4), max_length=Integer(3))
>>> P.max_length()
3
```

class sage.combinat.partition.**RestrictedPartitions_all**(*ell*)

Bases: *RestrictedPartitions_generic*

The class of all ℓ-restricted partitions.

INPUT:

- ell – the positive integer ℓ

See also

RestrictedPartitions_generic

class sage.combinat.partition.**RestrictedPartitions_generic**(*ell*, *is_infinite=False*)

Bases: *Partitions*

Base class for ℓ-restricted partitions.

Let ℓ be a positive integer. A partition λ is *ℓ-restricted* if $\lambda_i - \lambda_{i+1} < \ell$ for all i, including rows of length 0.

Note

This is conjugate to the notion of *ℓ-regular* partitions, where the multiplicity of any parts is at most ℓ.

INPUT:

- ell – the positive integer ℓ
- is_infinite – boolean; if the subset of ℓ-restricted partitions is infinite

ell()

Return the value ℓ.

EXAMPLES:

```
sage: P = Partitions(restricted=2)
sage: P.ell()
2
```

```
>>> from sage.all import *
>>> P = Partitions(restricted=Integer(2))
>>> P.ell()
2
```

class sage.combinat.partition.**RestrictedPartitions_n**(*n*, *ell*)

Bases: *RestrictedPartitions_generic*, *Partitions_n*

The class of ℓ-restricted partitions of n.

INPUT:

- n – the integer n to partition

- `ell` – the integer ℓ

See also

RestrictedPartitions_generic

cardinality()

Return the cardinality of `self`.

EXAMPLES:

```
sage: P = Partitions(5, restricted=3)
sage: P.cardinality()                                                    #␣
↪needs sage.libs.flint
5
sage: P = Partitions(5, restricted=6)
sage: P.cardinality()                                                    #␣
↪needs sage.libs.flint
7
sage: P.cardinality() == Partitions(5).cardinality()                     #␣
↪needs sage.libs.flint
True
```

```
>>> from sage.all import *
>>> P = Partitions(Integer(5), restricted=Integer(3))
>>> P.cardinality()                                                    #␣
↪needs sage.libs.flint
5
>>> P = Partitions(Integer(5), restricted=Integer(6))
>>> P.cardinality()                                                    #␣
↪needs sage.libs.flint
7
>>> P.cardinality() == Partitions(Integer(5)).cardinality()              ␣
↪      # needs sage.libs.flint
True
```

sage.combinat.partition.**number_of_partitions**(*n*, *algorithm='default'*)

Return the number of partitions of n with, optionally, at most k parts.

The options of *number_of_partitions()* are being deprecated Issue #13072 in favour of *Partitions_n.cardinality()* so that *number_of_partitions()* can become a stripped down version of the fastest algorithm available (currently this is using FLINT).

INPUT:

- `n` – integer
- **`algorithm` – (default: `'default'`)**
  [Will be deprecated except in Partition().cardinality()]
  - **`'default'` – if `k` is not `None`, then use Gap (very slow);**
    if `k` is `None`, use FLINT
  - `'flint'` – use FLINT

EXAMPLES:

```
sage: v = Partitions(5).list(); v
[[5], [4, 1], [3, 2], [3, 1, 1], [2, 2, 1], [2, 1, 1, 1], [1, 1, 1, 1, 1]]
sage: len(v)
7
```

```
>>> from sage.all import *
>>> v = Partitions(Integer(5)).list(); v
[[5], [4, 1], [3, 2], [3, 1, 1], [2, 2, 1], [2, 1, 1, 1], [1, 1, 1, 1, 1]]
>>> len(v)
7
```

The input must be a nonnegative integer or a `ValueError` is raised.

```
sage: number_of_partitions(-5)
Traceback (most recent call last):
...
ValueError: n (=-5) must be a nonnegative integer
```

```
>>> from sage.all import *
>>> number_of_partitions(-Integer(5))
Traceback (most recent call last):
...
ValueError: n (=-5) must be a nonnegative integer
```

↪108480158600569421098519
```

A generating function for the number of partitions p_n is given by the reciprocal of Euler's function:

$$\sum_{n=0}^{\infty} p_n x^n = \prod_{k=1}^{\infty} \left(\frac{1}{1-x^k} \right).$$

We use Sage to verify that the first several coefficients do instead agree:

```
sage: q = PowerSeriesRing(QQ, 'q', default_prec=9).gen()
sage: prod([(1-q^k)^(-1) for k in range(1,9)])  # partial product of
1 + q + 2*q^2 + 3*q^3 + 5*q^4 + 7*q^5 + 11*q^6 + 15*q^7 + 22*q^8 + O(q^9)
sage: [number_of_partitions(k) for k in range(2,10)]                          #␣
↪needs sage.libs.flint
[2, 3, 5, 7, 11, 15, 22, 30]
```

```
>>> from sage.all import *
>>> q = PowerSeriesRing(QQ, 'q', default_prec=Integer(9)).gen()
>>> prod([(Integer(1)-q**k)**(-Integer(1)) for k in range(Integer(1),
↪Integer(9))])  # partial product of
1 + q + 2*q^2 + 3*q^3 + 5*q^4 + 7*q^5 + 11*q^6 + 15*q^7 + 22*q^8 + O(q^9)
>>> [number_of_partitions(k) for k in range(Integer(2),Integer(10))]          ␣
↪              # needs sage.libs.flint
[2, 3, 5, 7, 11, 15, 22, 30]
```

sage.combinat.partition.**number_of_partitions_length**(*n*, *k*, *algorithm='hybrid'*)

Return the number of partitions of n with length k.

This is a wrapper for GAP's `NrPartitions` function.

EXAMPLES:

```
sage: # needs sage.libs.gap
sage: from sage.combinat.partition import number_of_partitions_length
sage: number_of_partitions_length(5, 2)
2
sage: number_of_partitions_length(10, 2)
5
sage: number_of_partitions_length(10, 4)
9
sage: number_of_partitions_length(10, 0)
0
sage: number_of_partitions_length(10, 1)
```

(continues on next page)

(continued from previous page)

```
1
sage: number_of_partitions_length(0, 0)
1
sage: number_of_partitions_length(0, 1)
0
```

```
>>> from sage.all import *
>>> # needs sage.libs.gap
>>> from sage.combinat.partition import number_of_partitions_length
>>> number_of_partitions_length(Integer(5), Integer(2))
2
>>> number_of_partitions_length(Integer(10), Integer(2))
5
>>> number_of_partitions_length(Integer(10), Integer(4))
9
>>> number_of_partitions_length(Integer(10), Integer(0))
0
>>> number_of_partitions_length(Integer(10), Integer(1))
1
>>> number_of_partitions_length(Integer(0), Integer(0))
1
>>> number_of_partitions_length(Integer(0), Integer(1))
0
```

sage.combinat.partition.**number_of_partitions_max_length_max_part**(k, b)

Return the number of partitions of n with at most k parts, all of which are at most b.

EXAMPLES:

This could also be computed using the q-binomial coefficient:

```
sage: from sage.combinat.partition import number_of_partitions_max_length_max_
↪part as f
sage: all(f(n, k, b) == q_binomial(k + b, b)[n] for n in range(5) for k in␣
↪range(n+1) for b in range(n+1))
True
```

```
>>> from sage.all import *
>>> from sage.combinat.partition import number_of_partitions_max_length_max_part␣
↪as f
>>> all(f(n, k, b) == q_binomial(k + b, b)[n] for n in range(Integer(5)) for k in␣
↪range(n+Integer(1)) for b in range(n+Integer(1)))
True
```

However, although the q-binomial coefficient is faster for individual invocations, it seems that the caching we use here is essential for some computations:

```
sage: def A(n):
....:     s1 = number_of_partitions(n)
....:     s2 = sum(Partitions(m, max_part=l, length=k).cardinality()
....:              * Partitions(n-m-l^2, min_length=k+2*l).cardinality()
....:              for l in range(1, (n+1).isqrt())
....:              for m in range((n-l^2-2*l)*l//(l+1)+1)
```

(continues on next page)

(continued from previous page)

```
....:                for k in range(ceil(m/l), min(m, n-m-l^2-2*l)+1))
....:      return s1 + s2

sage: A(100)
10934714090
```

```
>>> from sage.all import *
>>> def A(n):
...     s1 = number_of_partitions(n)
...     s2 = sum(Partitions(m, max_part=l, length=k).cardinality()
...                * Partitions(n-m-l**Integer(2), min_length=k+Integer(2)*l).
↪cardinality()
...                for l in range(Integer(1), (n+Integer(1)).isqrt())
...                for m in range((n-l**Integer(2)-Integer(2)*l)*l//
↪(l+Integer(1))+Integer(1))
...                for k in range(ceil(m/l), min(m, n-m-l**Integer(2)-
↪Integer(2)*l)+Integer(1)))
...     return s1 + s2

>>> A(Integer(100))
10934714090
```

>>> from sage.combinat.partition_algebra import *
>>> p = PartitionAlgebra_bk(QQ, Integer(3), Integer(1))
>>> p == loads(dumps(p))
True
```

class sage.combinat.partition_algebra.**PartitionAlgebra_generic**(*R*, *cclass*, *n*, *k*, *name=None*, *prefix=None*)

Bases: *CombinatorialFreeModule*

EXAMPLES:

```
sage: from sage.combinat.partition_algebra import *
sage: s = PartitionAlgebra_sk(QQ, 3, 1)
sage: TestSuite(s).run()
sage: s == loads(dumps(s))
True
```

```
>>> from sage.all import *
>>> from sage.combinat.partition_algebra import *
>>> s = PartitionAlgebra_sk(QQ, Integer(3), Integer(1))
>>> TestSuite(s).run()
>>> s == loads(dumps(s))
True
```

one_basis()

Return the basis index for the unit of the algebra.

EXAMPLES:

```
sage: from sage.combinat.partition_algebra import *
sage: s = PartitionAlgebra_sk(ZZ, 3, 1)
```

(continues on next page)

(continued from previous page)

```
sage: len(s.one().support())    # indirect doctest
1
```

```

>>> from sage.combinat.partition_algebra import *
>>> s = PartitionAlgebra_sk(ZZ, Integer(3), Integer(1))
>>> len(s.one().support())    # indirect doctest
1
```

product_on_basis(*left*, *right*)

EXAMPLES:

```
sage: from sage.combinat.partition_algebra import *
sage: s = PartitionAlgebra_sk(QQ, 3, 1)
sage: t12 = s(Set([Set([1,-2]),Set([2,-1]),Set([3,-3])]))
sage: t12^2 == s(1) #indirect doctest
True
```

```
>>> from sage.all import *
>>> from sage.combinat.partition_algebra import *
>>> s = PartitionAlgebra_sk(QQ, Integer(3), Integer(1))
>>> t12 = s(Set([Set([Integer(1),-Integer(2)]),Set([Integer(2),-Integer(1)]),
↪Set([Integer(3),-Integer(3)])]))
>>> t12**Integer(2) == s(Integer(1)) #indirect doctest
True
```

class sage.combinat.partition_algebra.**PartitionAlgebra_pk**(*R*, *k*, *n*, *name=None*)

Bases: *PartitionAlgebra_generic*

EXAMPLES:

```
sage: from sage.combinat.partition_algebra import *
sage: p = PartitionAlgebra_pk(QQ, 3, 1)
sage: p == loads(dumps(p))
True
```

```
>>> from sage.all import *
>>> from sage.combinat.partition_algebra import *
>>> p = PartitionAlgebra_pk(QQ, Integer(3), Integer(1))
>>> p == loads(dumps(p))
True
```

class sage.combinat.partition_algebra.**PartitionAlgebra_prk**(*R*, *k*, *n*, *name=None*)

Bases: *PartitionAlgebra_generic*

EXAMPLES:

```
sage: from sage.combinat.partition_algebra import *
sage: p = PartitionAlgebra_prk(QQ, 3, 1)
sage: p == loads(dumps(p))
True
```

```
>>> from sage.all import *
>>> from sage.combinat.partition_algebra import *
>>> p = PartitionAlgebra_prk(QQ, Integer(3), Integer(1))
>>> p == loads(dumps(p))
True
```

class sage.combinat.partition_algebra.**PartitionAlgebra_rk**(*R*, *k*, *n*, *name=None*)

Bases: *PartitionAlgebra_generic*

EXAMPLES:

```
sage: from sage.combinat.partition_algebra import *
sage: p = PartitionAlgebra_rk(QQ, 3, 1)
sage: p == loads(dumps(p))
True
```

```
>>> from sage.all import *
>>> from sage.combinat.partition_algebra import *
>>> p = PartitionAlgebra_rk(QQ, Integer(3), Integer(1))
>>> p == loads(dumps(p))
True
```

class sage.combinat.partition_algebra.**PartitionAlgebra_sk**(*R*, *k*, *n*, *name=None*)

Bases: *PartitionAlgebra_generic*

EXAMPLES:

```
sage: from sage.combinat.partition_algebra import *
sage: p = PartitionAlgebra_sk(QQ, 3, 1)
sage: p == loads(dumps(p))
True
```

```
>>> from sage.all import *
>>> from sage.combinat.partition_algebra import *
>>> p = PartitionAlgebra_sk(QQ, Integer(3), Integer(1))
>>> p == loads(dumps(p))
True
```

class sage.combinat.partition_algebra.**PartitionAlgebra_tk**(*R*, *k*, *n*, *name=None*)

Bases: *PartitionAlgebra_generic*

EXAMPLES:

```
sage: from sage.combinat.partition_algebra import *
sage: p = PartitionAlgebra_tk(QQ, 3, 1)
sage: p == loads(dumps(p))
True
```

```
>>> from sage.all import *
>>> from sage.combinat.partition_algebra import *
>>> p = PartitionAlgebra_tk(QQ, Integer(3), Integer(1))
>>> p == loads(dumps(p))
True
```

sage.combinat.partition_algebra.**SetPartitionsAk**(k)

Return the combinatorial class of set partitions of type A_k.

EXAMPLES:

```
sage: A3 = SetPartitionsAk(3); A3
Set partitions of {1, ..., 3, -1, ..., -3}

sage: A3.first() #random
{{1, 2, 3, -1, -3, -2}}
sage: A3.last() #random
{{-1}, {-2}, {3}, {1}, {-3}, {2}}
sage: A3.random_element()  #random
{{1, 3, -3, -1}, {2, -2}}

sage: A3.cardinality()
203

sage: A2p5 = SetPartitionsAk(2.5); A2p5
Set partitions of {1, ..., 3, -1, ..., -3} with 3 and -3 in the same block
sage: A2p5.cardinality()
52

sage: A2p5.first() #random
{{1, 2, 3, -1, -3, -2}}
sage: A2p5.last() #random
{{-1}, {-2}, {2}, {3, -3}, {1}}
sage: A2p5.random_element() #random
{{-1}, {-2}, {3, -3}, {1, 2}}
```

```
>>> from sage.all import *
>>> A3 = SetPartitionsAk(Integer(3)); A3
Set partitions of {1, ..., 3, -1, ..., -3}

>>> A3.first() #random
{{1, 2, 3, -1, -3, -2}}
>>> A3.last() #random
{{-1}, {-2}, {3}, {1}, {-3}, {2}}
>>> A3.random_element()  #random
{{1, 3, -3, -1}, {2, -2}}

>>> A3.cardinality()
203

>>> A2p5 = SetPartitionsAk(RealNumber('2.5')); A2p5
Set partitions of {1, ..., 3, -1, ..., -3} with 3 and -3 in the same block
>>> A2p5.cardinality()
52

>>> A2p5.first() #random
{{1, 2, 3, -1, -3, -2}}
>>> A2p5.last() #random
{{-1}, {-2}, {2}, {3, -3}, {1}}
```

(continues on next page)

(continued from previous page)

```
>>> A2p5.random_element() #random
{{-1}, {-2}, {3, -3}, {1, 2}}
```

class sage.combinat.partition_algebra.**SetPartitionsAk_k**(*k*)

Bases: *SetPartitions_set*

Element

alias of *SetPartitionsXkElement*

class sage.combinat.partition_algebra.**SetPartitionsAkhalf_k**(*k*)

Bases: *SetPartitions_set*

Element

alias of *SetPartitionsXkElement*

sage.combinat.partition_algebra.**SetPartitionsBk**(*k*)

Return the combinatorial class of set partitions of type B_k.

These are the set partitions where every block has size 2.

EXAMPLES:

```
sage: B3 = SetPartitionsBk(3); B3
Set partitions of {1, ..., 3, -1, ..., -3} with block size 2

sage: B3.first() #random
{{2, -2}, {1, -3}, {3, -1}}
sage: B3.last() #random
{{1, 2}, {3, -2}, {-3, -1}}
sage: B3.random_element() #random
{{2, -1}, {1, -3}, {3, -2}}

sage: B3.cardinality()
15

sage: B2p5 = SetPartitionsBk(2.5); B2p5
Set partitions of {1, ..., 3, -1, ..., -3} with 3 and -3 in the same block and
↪with block size 2

sage: B2p5.first() #random
{{2, -1}, {3, -3}, {1, -2}}
sage: B2p5.last() #random
{{1, 2}, {3, -3}, {-1, -2}}
sage: B2p5.random_element() #random
{{2, -2}, {3, -3}, {1, -1}}

sage: B2p5.cardinality()
3
```

```
>>> from sage.all import *
>>> B3 = SetPartitionsBk(Integer(3)); B3
Set partitions of {1, ..., 3, -1, ..., -3} with block size 2

>>> B3.first() #random
```

(continues on next page)

(continued from previous page)

```
{{2, -2}, {1, -3}, {3, -1}}
>>> B3.last() #random
{{1, 2}, {3, -2}, {-3, -1}}
>>> B3.random_element() #random
{{2, -1}, {1, -3}, {3, -2}}

>>> B3.cardinality()
15

>>> B2p5 = SetPartitionsBk(RealNumber('2.5')); B2p5
Set partitions of {1, ..., 3, -1, ..., -3} with 3 and -3 in the same block and
↪with block size 2

>>> B2p5.first() #random
{{2, -1}, {3, -3}, {1, -2}}
>>> B2p5.last() #random
{{1, 2}, {3, -3}, {-1, -2}}
>>> B2p5.random_element() #random
{{2, -2}, {3, -3}, {1, -1}}

>>> B2p5.cardinality()
3
```

class sage.combinat.partition_algebra.**SetPartitionsBk_k**(*k*)

Bases: *SetPartitionsAk_k*

cardinality()

Return the number of set partitions in B_k where k is an integer.

This is given by (2k)!! = (2k-1)*(2k-3)*…*5*3*1.

EXAMPLES:

```
sage: SetPartitionsBk(3).cardinality()
15
sage: SetPartitionsBk(2).cardinality()
3
sage: SetPartitionsBk(1).cardinality()
1
sage: SetPartitionsBk(4).cardinality()
105
sage: SetPartitionsBk(5).cardinality()
945
```

```
>>> from sage.all import *
>>> SetPartitionsBk(Integer(3)).cardinality()
15
>>> SetPartitionsBk(Integer(2)).cardinality()
3
>>> SetPartitionsBk(Integer(1)).cardinality()
1
>>> SetPartitionsBk(Integer(4)).cardinality()
105
```

(continues on next page)

(continued from previous page)

```
>>> SetPartitionsBk(Integer(5)).cardinality()
945
```

class sage.combinat.partition_algebra.**SetPartitionsBkhalf_k**(*k*)

Bases: *SetPartitionsAkhalf_k*

cardinality()

sage.combinat.partition_algebra.**SetPartitionsIk**(*k*)

Return the combinatorial class of set partitions of type I_k.

These are set partitions with a propagating number of less than k. Note that the identity set partition $\{\{1, -1\}, \ldots, \{k, -k\}\}$ is not in I_k.

EXAMPLES:

```
sage: I3 = SetPartitionsIk(3); I3
Set partitions of {1, ..., 3, -1, ..., -3} with propagating number < 3
sage: I3.cardinality()
197

sage: I3.first() #random
{{1, 2, 3, -1, -3, -2}}
sage: I3.last() #random
{{-1}, {-2}, {3}, {1}, {-3}, {2}}
sage: I3.random_element() #random
{{-1}, {-3, -2}, {2, 3}, {1}}

sage: I2p5 = SetPartitionsIk(2.5); I2p5
Set partitions of {1, ..., 3, -1, ..., -3} with 3 and -3 in the same block and propagating number < 3
sage: I2p5.cardinality()
50

sage: I2p5.first() #random
{{1, 2, 3, -1, -3, -2}}
sage: I2p5.last() #random
{{-1}, {-2}, {2}, {3, -3}, {1}}
sage: I2p5.random_element() #random
{{-1}, {-2}, {1, 3, -3}, {2}}
```

```
>>> from sage.all import *
>>> I3 = SetPartitionsIk(Integer(3)); I3
Set partitions of {1, ..., 3, -1, ..., -3} with propagating number < 3
>>> I3.cardinality()
197

>>> I3.first() #random
{{1, 2, 3, -1, -3, -2}}
>>> I3.last() #random
{{-1}, {-2}, {3}, {1}, {-3}, {2}}
>>> I3.random_element() #random
{{-1}, {-3, -2}, {2, 3}, {1}}
```

(continues on next page)

(continued from previous page)

```
>>> I2p5 = SetPartitionsIk(RealNumber('2.5')); I2p5
Set partitions of {1, ..., 3, -1, ..., -3} with 3 and -3 in the same block and
↪propagating number < 3
>>> I2p5.cardinality()
50

>>> I2p5.first() #random
{{1, 2, 3, -1, -3, -2}}
>>> I2p5.last() #random
{{-1}, {-2}, {2}, {3, -3}, {1}}
>>> I2p5.random_element() #random
{{-1}, {-2}, {1, 3, -3}, {2}}
```

class sage.combinat.partition_algebra.**SetPartitionsIk_k**(*k*)

Bases: *SetPartitionsAk_k*

cardinality()

class sage.combinat.partition_algebra.**SetPartitionsIkhalf_k**(*k*)

Bases: *SetPartitionsAkhalf_k*

cardinality()

sage.combinat.partition_algebra.**SetPartitionsPRk**(*k*)

Return the combinatorial class of set partitions of type PR_k.

EXAMPLES:

```
sage: SetPartitionsPRk(3)
Set partitions of {1, ..., 3, -1, ..., -3} with at most 1 positive
 and negative entry in each block and that are planar
```

```
>>> from sage.all import *
>>> SetPartitionsPRk(Integer(3))
Set partitions of {1, ..., 3, -1, ..., -3} with at most 1 positive
 and negative entry in each block and that are planar
```

class sage.combinat.partition_algebra.**SetPartitionsPRk_k**(*k*)

Bases: *SetPartitionsRk_k*

cardinality()

class sage.combinat.partition_algebra.**SetPartitionsPRkhalf_k**(*k*)

Bases: *SetPartitionsRkhalf_k*

cardinality()

sage.combinat.partition_algebra.**SetPartitionsPk**(*k*)

Return the combinatorial class of set partitions of type P_k.

These are the planar set partitions.

EXAMPLES:

```
sage: P3 = SetPartitionsPk(3); P3
Set partitions of {1, ..., 3, -1, ..., -3} that are planar
sage: P3.cardinality()
132

sage: P3.first() #random
{{1, 2, 3, -1, -3, -2}}
sage: P3.last() #random
{{-1}, {-2}, {3}, {1}, {-3}, {2}}
sage: P3.random_element() #random
{{1, 2, -1}, {-3}, {3, -2}}

sage: P2p5 = SetPartitionsPk(2.5); P2p5
Set partitions of {1, ..., 3, -1, ..., -3} with 3 and -3 in the same block and
↪that are planar
sage: P2p5.cardinality()
42

sage: P2p5.first() #random
{{1, 2, 3, -1, -3, -2}}
sage: P2p5.last() #random
{{-1}, {-2}, {2}, {3, -3}, {1}}
sage: P2p5.random_element() #random
{{1, 2, 3, -3}, {-1, -2}}
```

```
>>> from sage.all import *
>>> P3 = SetPartitionsPk(Integer(3)); P3
Set partitions of {1, ..., 3, -1, ..., -3} that are planar
>>> P3.cardinality()
132

>>> P3.first() #random
{{1, 2, 3, -1, -3, -2}}
>>> P3.last() #random
{{-1}, {-2}, {3}, {1}, {-3}, {2}}
>>> P3.random_element() #random
{{1, 2, -1}, {-3}, {3, -2}}

>>> P2p5 = SetPartitionsPk(RealNumber('2.5')); P2p5
Set partitions of {1, ..., 3, -1, ..., -3} with 3 and -3 in the same block and
↪that are planar
>>> P2p5.cardinality()
42

>>> P2p5.first() #random
{{1, 2, 3, -1, -3, -2}}
>>> P2p5.last() #random
{{-1}, {-2}, {2}, {3, -3}, {1}}
>>> P2p5.random_element() #random
{{1, 2, 3, -3}, {-1, -2}}
```

class sage.combinat.partition_algebra.**SetPartitionsPk_k**(k)

Bases: *SetPartitionsAk_k*

cardinality()

class sage.combinat.partition_algebra.**SetPartitionsPkhalf_k**(*k*)

Bases: *SetPartitionsAkhalf_k*

cardinality()

sage.combinat.partition_algebra.**SetPartitionsRk**(*k*)

Return the combinatorial class of set partitions of type R_k.

EXAMPLES:

```
sage: SetPartitionsRk(3)
Set partitions of {1, ..., 3, -1, ..., -3} with at most 1 positive
 and negative entry in each block
```

```
>>> from sage.all import *
>>> SetPartitionsRk(Integer(3))
Set partitions of {1, ..., 3, -1, ..., -3} with at most 1 positive
 and negative entry in each block
```

class sage.combinat.partition_algebra.**SetPartitionsRk_k**(*k*)

Bases: *SetPartitionsAk_k*

cardinality()

class sage.combinat.partition_algebra.**SetPartitionsRkhalf_k**(*k*)

Bases: *SetPartitionsAkhalf_k*

cardinality()

sage.combinat.partition_algebra.**SetPartitionsSk**(*k*)

Return the combinatorial class of set partitions of type S_k.

There is a bijection between these set partitions and the permutations of $1, \ldots, k$.

EXAMPLES:

```
sage: S3 = SetPartitionsSk(3); S3
Set partitions of {1, ..., 3, -1, ..., -3} with propagating number 3
sage: S3.cardinality()
6

sage: S3.list()  #random
[{{2, -2}, {3, -3}, {1, -1}},
 {{1, -1}, {2, -3}, {3, -2}},
 {{2, -1}, {3, -3}, {1, -2}},
 {{1, -2}, {2, -3}, {3, -1}},
 {{1, -3}, {2, -1}, {3, -2}},
 {{1, -3}, {2, -2}, {3, -1}}]
sage: S3.first() #random
{{2, -2}, {3, -3}, {1, -1}}
sage: S3.last() #random
{{1, -3}, {2, -2}, {3, -1}}
sage: S3.random_element() #random
{{1, -3}, {2, -1}, {3, -2}}
```

(continues on next page)

(continued from previous page)

```
sage: S3p5 = SetPartitionsSk(3.5); S3p5
Set partitions of {1, ..., 4, -1, ..., -4} with 4 and -4 in the same block and␣
↪propagating number 4
sage: S3p5.cardinality()
6

sage: S3p5.list() #random
[{{2, -2}, {3, -3}, {1, -1}, {4, -4}},
 {{2, -3}, {1, -1}, {4, -4}, {3, -2}},
 {{2, -1}, {3, -3}, {1, -2}, {4, -4}},
 {{2, -3}, {1, -2}, {4, -4}, {3, -1}},
 {{1, -3}, {2, -1}, {4, -4}, {3, -2}},
 {{1, -3}, {2, -2}, {4, -4}, {3, -1}}]
sage: S3p5.first() #random
{{2, -2}, {3, -3}, {1, -1}, {4, -4}}
sage: S3p5.last() #random
{{1, -3}, {2, -2}, {4, -4}, {3, -1}}
sage: S3p5.random_element() #random
{{1, -3}, {2, -2}, {4, -4}, {3, -1}}
```

```
>>> from sage.all import *
>>> S3 = SetPartitionsSk(Integer(3)); S3
Set partitions of {1, ..., 3, -1, ..., -3} with propagating number 3
>>> S3.cardinality()
6

>>> S3.list()  #random
[{{2, -2}, {3, -3}, {1, -1}},
 {{1, -1}, {2, -3}, {3, -2}},
 {{2, -1}, {3, -3}, {1, -2}},
 {{1, -2}, {2, -3}, {3, -1}},
 {{1, -3}, {2, -1}, {3, -2}},
 {{1, -3}, {2, -2}, {3, -1}}]
>>> S3.first() #random
{{2, -2}, {3, -3}, {1, -1}}
>>> S3.last() #random
{{1, -3}, {2, -2}, {3, -1}}
>>> S3.random_element() #random
{{1, -3}, {2, -1}, {3, -2}}

>>> S3p5 = SetPartitionsSk(RealNumber('3.5')); S3p5
Set partitions of {1, ..., 4, -1, ..., -4} with 4 and -4 in the same block and␣
↪propagating number 4
>>> S3p5.cardinality()
6

>>> S3p5.list() #random
[{{2, -2}, {3, -3}, {1, -1}, {4, -4}},
 {{2, -3}, {1, -1}, {4, -4}, {3, -2}},
 {{2, -1}, {3, -3}, {1, -2}, {4, -4}},
 {{2, -3}, {1, -2}, {4, -4}, {3, -1}},
```

(continues on next page)

(continued from previous page)

```
 {{1, -3}, {2, -1}, {4, -4}, {3, -2}},
 {{1, -3}, {2, -2}, {4, -4}, {3, -1}}]
>>> S3p5.first() #random
{{2, -2}, {3, -3}, {1, -1}, {4, -4}}
>>> S3p5.last() #random
{{1, -3}, {2, -2}, {4, -4}, {3, -1}}
>>> S3p5.random_element() #random
{{1, -3}, {2, -2}, {4, -4}, {3, -1}}
```

class sage.combinat.partition_algebra.**SetPartitionsSk_k**(*k*)

Bases: *SetPartitionsAk_k*

cardinality()

Return k!.

class sage.combinat.partition_algebra.**SetPartitionsSkhalf_k**(*k*)

Bases: *SetPartitionsAkhalf_k*

cardinality()

sage.combinat.partition_algebra.**SetPartitionsTk**(*k*)

Return the combinatorial class of set partitions of type T_k.

These are planar set partitions where every block is of size 2.

EXAMPLES:

```
sage: T3 = SetPartitionsTk(3); T3
Set partitions of {1, ..., 3, -1, ..., -3} with block size 2 and that are planar
sage: T3.cardinality()
5

sage: T3.first() #random
{{1, -3}, {2, 3}, {-1, -2}}
sage: T3.last() #random
{{1, 2}, {3, -1}, {-3, -2}}
sage: T3.random_element() #random
{{1, -3}, {2, 3}, {-1, -2}}

sage: T2p5 = SetPartitionsTk(2.5); T2p5
Set partitions of {1, ..., 3, -1, ..., -3} with 3 and -3 in the same block and␣
↪with block size 2 and that are planar
sage: T2p5.cardinality()
2

sage: T2p5.first() #random
{{2, -2}, {3, -3}, {1, -1}}
sage: T2p5.last() #random
{{1, 2}, {3, -3}, {-1, -2}}
```

```
>>> from sage.all import *
>>> T3 = SetPartitionsTk(Integer(3)); T3
Set partitions of {1, ..., 3, -1, ..., -3} with block size 2 and that are planar
>>> T3.cardinality()
```

(continues on next page)

(continued from previous page)

```
5

>>> T3.first() #random
{{1, -3}, {2, 3}, {-1, -2}}
>>> T3.last() #random
{{1, 2}, {3, -1}, {-3, -2}}
>>> T3.random_element() #random
{{1, -3}, {2, 3}, {-1, -2}}

>>> T2p5 = SetPartitionsTk(RealNumber('2.5')); T2p5
Set partitions of {1, ..., 3, -1, ..., -3} with 3 and -3 in the same block and␣
↪with block size 2 and that are planar
>>> T2p5.cardinality()
2

>>> T2p5.first() #random
{{2, -2}, {3, -3}, {1, -1}}
>>> T2p5.last() #random
{{1, 2}, {3, -3}, {-1, -2}}
```

class sage.combinat.partition_algebra.**SetPartitionsTk_k**(*k*)

Bases: *SetPartitionsBk_k*

cardinality()

class sage.combinat.partition_algebra.**SetPartitionsTkhalf_k**(*k*)

Bases: *SetPartitionsBkhalf_k*

cardinality()

class sage.combinat.partition_algebra.**SetPartitionsXkElement**(*parent*, *s*, *check=True*)

Bases: *SetPartition*

An element for the classes of `SetPartitionXk` where `X` is some letter.

check()

Check to make sure this is a set partition.

EXAMPLES:

```
sage: A2p5 = SetPartitionsAk(2.5)
sage: x = A2p5.first(); x
{{-3, -2, -1, 1, 2, 3}}
sage: x.check()
sage: y = A2p5.next(x); y
{{-3, 3}, {-2, -1, 1, 2}}
sage: y.check()
```

```
>>> from sage.all import *
>>> A2p5 = SetPartitionsAk(RealNumber('2.5'))
>>> x = A2p5.first(); x
{{-3, -2, -1, 1, 2, 3}}
>>> x.check()
>>> y = A2p5.next(x); y
```

(continues on next page)

(continued from previous page)

```
{{-3, 3}, {-2, -1, 1, 2}}
>>> y.check()
```

sage.combinat.partition_algebra.**identity**(*k*)

Return the identity set partition $1, -1, \ldots, k, -k$.

EXAMPLES:

```
sage: import sage.combinat.partition_algebra as pa
sage: pa.identity(2)
{{2, -2}, {1, -1}}
```

```
>>> from sage.all import *
>>> import sage.combinat.partition_algebra as pa
>>> pa.identity(Integer(2))
{{2, -2}, {1, -1}}
```

sage.combinat.partition_algebra.**is_planar**(*sp*)

Return True if the diagram corresponding to the set partition is planar; otherwise, it returns False.

EXAMPLES:

```
sage: import sage.combinat.partition_algebra as pa
sage: pa.is_planar( pa.to_set_partition([[1,-2],[2,-1]]))
False
sage: pa.is_planar( pa.to_set_partition([[1,-1],[2,-2]]))
True
```

```
>>> from sage.all import *
>>> import sage.combinat.partition_algebra as pa
>>> pa.is_planar( pa.to_set_partition([[Integer(1),-Integer(2)],[Integer(2),-
↪Integer(1)]]))
False
>>> pa.is_planar( pa.to_set_partition([[Integer(1),-Integer(1)],[Integer(2),-
↪Integer(2)]]))
True
```

sage.combinat.partition_algebra.**pair_to_graph**(*sp1*, *sp2*)

Return a graph consisting of the disjoint union of the graphs of set partitions sp1 and sp2 along with edges joining the bottom row (negative numbers) of sp1 to the top row (positive numbers) of sp2.

The vertices of the graph sp1 appear in the result as pairs (k, 1), whereas the vertices of the graph sp2 appear as pairs (k, 2).

EXAMPLES:

```
sage: import sage.combinat.partition_algebra as pa
sage: sp1 = pa.to_set_partition([[1,-2],[2,-1]])
sage: sp2 = pa.to_set_partition([[1,-2],[2,-1]])
sage: g = pa.pair_to_graph( sp1, sp2 ); g
Graph on 8 vertices
```

```
>>> from sage.all import *
>>> import sage.combinat.partition_algebra as pa
>>> sp1 = pa.to_set_partition([[Integer(1),-Integer(2)],[Integer(2),-Integer(1)]])
>>> sp2 = pa.to_set_partition([[Integer(1),-Integer(2)],[Integer(2),-Integer(1)]])
>>> g = pa.pair_to_graph( sp1, sp2 ); g
Graph on 8 vertices
```

```
sage: g.vertices(sort=False) #random
[(1, 2), (-1, 1), (-2, 2), (-1, 2), (-2, 1), (2, 1), (2, 2), (1, 1)]
sage: g.edges(sort=False) #random
[((1, 2), (-1, 1), None),
 ((1, 2), (-2, 2), None),
 ((-1, 1), (2, 1), None),
 ((-1, 2), (2, 2), None),
 ((-2, 1), (1, 1), None),
 ((-2, 1), (2, 2), None)]
```

```
>>> from sage.all import *
>>> g.vertices(sort=False) #random
[(1, 2), (-1, 1), (-2, 2), (-1, 2), (-2, 1), (2, 1), (2, 2), (1, 1)]
>>> g.edges(sort=False) #random
[((1, 2), (-1, 1), None),
 ((1, 2), (-2, 2), None),
 ((-1, 1), (2, 1), None),
 ((-1, 2), (2, 2), None),
 ((-2, 1), (1, 1), None),
 ((-2, 1), (2, 2), None)]
```

Another example which used to be wrong until Issue #15958:

```
sage: sp3 = pa.to_set_partition([[1, -1], [2], [-2]])
sage: sp4 = pa.to_set_partition([[1], [-1], [2], [-2]])
sage: g = pa.pair_to_graph( sp3, sp4 ); g
Graph on 8 vertices

sage: g.vertices(sort=True)
[(-2, 1), (-2, 2), (-1, 1), (-1, 2), (1, 1), (1, 2), (2, 1), (2, 2)]
sage: g.edges(sort=True)
[((-2, 1), (2, 2), None), ((-1, 1), (1, 1), None),
 ((-1, 1), (1, 2), None)]
```

```
>>> from sage.all import *
>>> sp3 = pa.to_set_partition([[Integer(1), -Integer(1)], [Integer(2)], [-
↪Integer(2)]])
>>> sp4 = pa.to_set_partition([[Integer(1)], [-Integer(1)], [Integer(2)], [-
↪Integer(2)]])
>>> g = pa.pair_to_graph( sp3, sp4 ); g
Graph on 8 vertices

>>> g.vertices(sort=True)
[(-2, 1), (-2, 2), (-1, 1), (-1, 2), (1, 1), (1, 2), (2, 1), (2, 2)]
>>> g.edges(sort=True)
```

(continues on next page)

(continued from previous page)

```
[((-2, 1), (2, 2), None), ((-1, 1), (1, 1), None),
 ((-1, 1), (1, 2), None)]
```

sage.combinat.partition_algebra.**propagating_number**(*sp*)

Return the propagating number of the set partition sp.

The propagating number is the number of blocks with both a positive and negative number.

EXAMPLES:

```
sage: import sage.combinat.partition_algebra as pa
sage: sp1 = pa.to_set_partition([[1,-2],[2,-1]])
sage: sp2 = pa.to_set_partition([[1,2],[-2,-1]])
sage: pa.propagating_number(sp1)
2
sage: pa.propagating_number(sp2)
0
```

```
>>> from sage.all import *
>>> import sage.combinat.partition_algebra as pa
>>> sp1 = pa.to_set_partition([[Integer(1),-Integer(2)],[Integer(2),-Integer(1)]])
>>> sp2 = pa.to_set_partition([[Integer(1),Integer(2)],[-Integer(2),-Integer(1)]])
>>> pa.propagating_number(sp1)
2
>>> pa.propagating_number(sp2)
0
```

sage.combinat.partition_algebra.**set_partition_composition**(*sp1*, *sp2*)

Return a tuple consisting of the composition of the set partitions sp1 and sp2 and the number of components removed from the middle rows of the graph.

EXAMPLES:

```
sage: import sage.combinat.partition_algebra as pa
sage: sp1 = pa.to_set_partition([[1,-2],[2,-1]])
sage: sp2 = pa.to_set_partition([[1,-2],[2,-1]])
sage: pa.set_partition_composition(sp1, sp2) == (pa.identity(2), 0)
True
```

```
>>> from sage.all import *
>>> import sage.combinat.partition_algebra as pa
>>> sp1 = pa.to_set_partition([[Integer(1),-Integer(2)],[Integer(2),-Integer(1)]])
>>> sp2 = pa.to_set_partition([[Integer(1),-Integer(2)],[Integer(2),-Integer(1)]])
>>> pa.set_partition_composition(sp1, sp2) == (pa.identity(Integer(2)),␣
↪Integer(0))
True
```

sage.combinat.partition_algebra.**to_graph**(*sp*)

Return a graph representing the set partition sp.

EXAMPLES:

```
sage: import sage.combinat.partition_algebra as pa
sage: g = pa.to_graph( pa.to_set_partition([[1,-2],[2,-1]])); g
Graph on 4 vertices

sage: g.vertices(sort=False) #random
[1, 2, -2, -1]
sage: g.edges(sort=False) #random
[(1, -2, None), (2, -1, None)]
```

```
>>> from sage.all import *
>>> import sage.combinat.partition_algebra as pa
>>> g = pa.to_graph( pa.to_set_partition([[Integer(1),-Integer(2)],[Integer(2),-
↪Integer(1)]])); g
Graph on 4 vertices

>>> g.vertices(sort=False) #random
[1, 2, -2, -1]
>>> g.edges(sort=False) #random
[(1, -2, None), (2, -1, None)]
```

sage.combinat.partition_algebra.**to_set_partition**(*l*, *k=None*)

Convert a list of a list of numbers to a set partitions.

Each list of numbers in the outer list specifies the numbers contained in one of the blocks in the set partition.

If k is specified, then the set partition will be a set partition of 1, …, k, -1, …, -k. Otherwise, k will default to the minimum number needed to contain all of the specified numbers.

EXAMPLES:

```
sage: import sage.combinat.partition_algebra as pa
sage: pa.to_set_partition([[1,-1],[2,-2]]) == pa.identity(2)
True
```

```
>>> from sage.all import *
>>> import sage.combinat.partition_algebra as pa
>>> pa.to_set_partition([[Integer(1),-Integer(1)],[Integer(2),-Integer(2)]]) ==␣
↪pa.identity(Integer(2))
True
```

5.1.167 Kleshchev partitions

A partition (tuple) μ is Kleshchev if it can be recursively obtained by adding a sequence of good nodes to the empty `PartitionTuple` of the same `level()` and *multicharge*. In this way, the set of Kleshchev multipartitions becomes a realization of a Kashiwara crystal `sage.combinat.crystals.crystals` for a irreducible integral highest weight representation of $U_q(\widehat{\mathfrak{sl}}_e)$.

The Kleshchev multipartitions first appeared in the work of Ariki and Mathas [AM2000] where it was shown that they index the irreducible representations of the cyclotomic Hecke algebras of type A [AK1994]. Soon afterwards Ariki [Ariki2001] showed that the set of Kleshchev multipartitions naturally label the irreducible representations of these algebras. As a far reaching generalization of these ideas the Ariki-Brundan-Kleshchev categorification theorem [Ariki1996] [BK2009] says that these algebras categorify the irreducible integral highest weight representations of the quantum group

$U_q(\widehat{\mathfrak{sl}}_e)$ of the affine special linear group. Under this categorification, q corresponds to the grading shift on the cyclotomic Hecke algebras, where the grading from the Brundan-Kleshchev graded isomorphism theorem to the *KLR algebras* of type A [BK2009].

The group algebras of the symmetric group in characteristic p are an important special case of the cyclotomic Hecke algebras of type A. In this case, depending on your prefer convention, the set of Kleshchev partitions is the set of *`p`-regular* or *`p`-restricted* `Partitions`. In this case, Kleshchev [Kle1995] proved that the *modular branching rules* were given by adding and removing *good nodes*; see `good_cells()`. Lascoux, Leclerc and Thibon [LLT1996] noticed that Kleshchev's branching rules coincided with Kashiwara's crystal operators for the fundamental representation of $L(\Lambda_0)$ of $U_q(\widehat{\mathfrak{sl}}_p)$ and their celebrated *LLT conjecture* said that decomposition matrices of the `sage.algebras.iwahori_hecke_algebra.IwahoriHeckeAlgebra` of the symmetric group should be computable using the canonical basis of $L(\Lambda_0)$. This was proved and generalised to all cyclotomic Hecke algebras of type A by Ariki [Ariki1996] and then further generalized to the graded setting by Brundan and Kleshchev [BK2009].

The main class for accessing Kleshchev partition (tuples) is `KleshchevPartitions`. Unfortunately, just as with the symmetric group, different authors use different conventions when defining Kleshchev partitions, which depends on whether you read components from left to right, or right to left, and whether you read the nodes in the partition in each component from top to bottom or bottom to top. The `KleshchevPartitions` class supports these four different conventions:

```
sage: KleshchevPartitions(2, [0,0], size=2, convention='left regular')[:]
[([1], [1]), ([2], [])]
sage: KleshchevPartitions(2, [0,0], size=2, convention='left restricted')[:]
[([1], [1]), ([], [1, 1])]
sage: KleshchevPartitions(2, [0,0], size=2, convention='right regular')[:]
[([1], [1]), ([], [2])]
sage: KleshchevPartitions(2, [0,0], size=2, convention='right restricted')[:]
[([1], [1]), ([1, 1], [])]
```

```
>>> from sage.all import *
>>> KleshchevPartitions(Integer(2), [Integer(0),Integer(0)], size=Integer(2),␣
↪convention='left regular')[:]
[([1], [1]), ([2], [])]
>>> KleshchevPartitions(Integer(2), [Integer(0),Integer(0)], size=Integer(2),␣
↪convention='left restricted')[:]
[([1], [1]), ([], [1, 1])]
>>> KleshchevPartitions(Integer(2), [Integer(0),Integer(0)], size=Integer(2),␣
↪convention='right regular')[:]
[([1], [1]), ([], [2])]
>>> KleshchevPartitions(Integer(2), [Integer(0),Integer(0)], size=Integer(2),␣
↪convention='right restricted')[:]
[([1], [1]), ([1, 1], [])]
```

By default, the `left restricted` convention is used. As a shorthand, `LG`, `LS`, `RG` and `RS`, respectively, can be used to specify the `convention` With the `left` convention the partition tuples should be ordered with the most dominant partitions in the partition tuple on the left and with the `right` convention the most dominant partition is on the right.

The `KleshchevPartitions` class can automatically convert between these four different conventions:

```
sage: KPlg = KleshchevPartitions(2, [0,0], size=2, convention='left regular')
sage: KPls = KleshchevPartitions(2, [0,0], size=2, convention='left restricted')
sage: [KPlg(mu) for mu in KPls] # indirect doc test
[([1], [1]), ([2], [])]
```

```
>>> from sage.all import *
>>> KPlg = KleshchevPartitions(Integer(2), [Integer(0),Integer(0)], size=Integer(2),␣
↪convention='left regular')
>>> KPls = KleshchevPartitions(Integer(2), [Integer(0),Integer(0)], size=Integer(2),␣
↪convention='left restricted')
>>> [KPlg(mu) for mu in KPls] # indirect doc test
[([1], [1]), ([2], [])]
```

AUTHORS:

- Andrew Mathas and Travis Scrimshaw (2018-05-1): Initial version

class sage.combinat.partition_kleshchev.**KleshchevCrystalMixin**

Bases: object

Mixin class for the crystal structure of a Kleshchev partition.

Epsilon()

Return ε of self.

EXAMPLES:

```
sage: C = crystals.KleshchevPartitions(3, [0,2], convention="left regular")
sage: x = C([[5,4,1],[3,2,1,1]])
sage: x.Epsilon()
3*Lambda[1]
```

```
>>> from sage.all import *
>>> C = crystals.KleshchevPartitions(Integer(3), [Integer(0),Integer(2)],␣
↪convention="left regular")
>>> x = C([[Integer(5),Integer(4),Integer(1)],[Integer(3),Integer(2),
↪Integer(1),Integer(1)]])
>>> x.Epsilon()
3*Lambda[1]
```

Phi()

Return ϕ of self.

EXAMPLES:

```
sage: C = crystals.KleshchevPartitions(3, [0,2], convention="left regular")
sage: x = C([[5,4,1],[3,2,1,1]])
sage: x.Phi()
3*Lambda[0] + 2*Lambda[1]
```

```
>>> from sage.all import *
>>> C = crystals.KleshchevPartitions(Integer(3), [Integer(0),Integer(2)],␣
↪convention="left regular")
>>> x = C([[Integer(5),Integer(4),Integer(1)],[Integer(3),Integer(2),
↪Integer(1),Integer(1)]])
>>> x.Phi()
3*Lambda[0] + 2*Lambda[1]
```

epsilon(i)

Return the Kashiwara crystal operator ε_i applied to self.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: C = crystals.KleshchevPartitions(3, [0,2], convention="left regular")
sage: x = C([[5,4,1],[3,2,1,1]])
sage: [x.epsilon(i) for i in C.index_set()]
[0, 3, 0]
```

```
>>> from sage.all import *
>>> C = crystals.KleshchevPartitions(Integer(3), [Integer(0),Integer(2)],␣
↪convention="left regular")
>>> x = C([[Integer(5),Integer(4),Integer(1)],[Integer(3),Integer(2),
↪Integer(1),Integer(1)]])
>>> [x.epsilon(i) for i in C.index_set()]
[0, 3, 0]
```

phi(*i*)

Return the Kashiwara crystal operator φ_i applied to `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: C = crystals.KleshchevPartitions(3, [0,2], convention="left regular")
sage: x = C([[5,4,1],[3,2,1,1]])
sage: [x.phi(i) for i in C.index_set()]
[3, 2, 0]
```

```
>>> from sage.all import *
>>> C = crystals.KleshchevPartitions(Integer(3), [Integer(0),Integer(2)],␣
↪convention="left regular")
>>> x = C([[Integer(5),Integer(4),Integer(1)],[Integer(3),Integer(2),
↪Integer(1),Integer(1)]])
>>> [x.phi(i) for i in C.index_set()]
[3, 2, 0]
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: C = crystals.KleshchevPartitions(3, [0,2], convention="left regular")
sage: x = C([[5,4,1], [3,2,1,1]])
sage: x.weight()
3*Lambda[0] - Lambda[1] - 5*delta
sage: x.Phi() - x.Epsilon()
3*Lambda[0] - Lambda[1]

sage: C = crystals.KleshchevPartitions(3, [0,2], convention="right regular")
sage: y = C([[5,1,1], [4,2,2,1,1]])
sage: y.weight()
```

(continues on next page)

(continued from previous page)

```
6*Lambda[0] - 4*Lambda[1] - 4*delta
sage: y.Phi() - y.Epsilon()
6*Lambda[0] - 4*Lambda[1]

sage: C = crystals.KleshchevPartitions(3, [0,2], convention="left regular")
sage: y = C([[5,1,1], [4,2,2,1,1]])
sage: y.weight()
6*Lambda[0] - 4*Lambda[1] - 4*delta
sage: y.Phi() - y.Epsilon()
6*Lambda[0] - 4*Lambda[1]
```

```
>>> from sage.all import *
>>> C = crystals.KleshchevPartitions(Integer(3), [Integer(0),Integer(2)],␣
↪convention="left regular")
>>> x = C([[Integer(5),Integer(4),Integer(1)], [Integer(3),Integer(2),
↪Integer(1),Integer(1)]])
>>> x.weight()
3*Lambda[0] - Lambda[1] - 5*delta
>>> x.Phi() - x.Epsilon()
3*Lambda[0] - Lambda[1]

>>> C = crystals.KleshchevPartitions(Integer(3), [Integer(0),Integer(2)],␣
↪convention="right regular")
>>> y = C([[Integer(5),Integer(1),Integer(1)], [Integer(4),Integer(2),
↪Integer(2),Integer(1),Integer(1)]])
>>> y.weight()

>>> y.Phi() - y.Epsilon()
6*Lambda[0] - 4*Lambda[1]

>>> C = crystals.KleshchevPartitions(Integer(3), [Integer(0),Integer(2)],␣
↪convention="left regular")
>>> y = C([[Integer(5),Integer(1),Integer(1)], [Integer(4),Integer(2),
↪Integer(2),Integer(1),Integer(1)]])
>>> y.weight()
6*Lambda[0] - 4*Lambda[1] - 4*delta
>>> y.Phi() - y.Epsilon()
6*Lambda[0] - 4*Lambda[1]
```

class sage.combinat.partition_kleshchev.**KleshchevPartition**(*parent*, *mu*)

Bases: *Partition*

Abstract base class for Kleshchev partitions. See *KleshchevPartitions*.

cogood_cells(*i=None*)

Return a list of the cells of `self` that are cogood.

The cogood i-cell is the 'last' conormal i-cell. As with the conormal cells we can choose to read either up or down the partition as specified by *convention()*.

INPUT:

- `i` – (optional) a residue

OUTPUT:

If no residue `i` is specified then a dictionary of cogood cells is returned, which gives the cogood cells for `0 <= i < e`.

EXAMPLES:

```
sage: KP = KleshchevPartitions(3, convention='regular')
sage: KP([5,4,4,3,2]).cogood_cells()
{0: (1, 4), 1: (4, 2)}
sage: KP([5,4,4,3,2]).cogood_cells(0)
(1, 4)
sage: KP([5,4,4,3,2]).cogood_cells(1)
(4, 2)
sage: KP = KleshchevPartitions(4, convention='restricted')
sage: KP([5,4,4,3,2]).cogood_cells()
{1: (0, 5), 2: (4, 2), 3: (1, 4)}
sage: KP([5,4,4,3,2]).cogood_cells(0)
sage: KP([5,4,4,3,2]).cogood_cells(2)
(4, 2)
```

```
>>> from sage.all import *
>>> KP = KleshchevPartitions(Integer(3), convention='regular')
>>> KP([Integer(5),Integer(4),Integer(4),Integer(3),Integer(2)]).cogood_
↪cells()
{0: (1, 4), 1: (4, 2)}
>>> KP([Integer(5),Integer(4),Integer(4),Integer(3),Integer(2)]).cogood_
↪cells(Integer(0))
(1, 4)
>>> KP([Integer(5),Integer(4),Integer(4),Integer(3),Integer(2)]).cogood_
↪cells(Integer(1))
(4, 2)
>>> KP = KleshchevPartitions(Integer(4), convention='restricted')
>>> KP([Integer(5),Integer(4),Integer(4),Integer(3),Integer(2)]).cogood_
↪cells()
{1: (0, 5), 2: (4, 2), 3: (1, 4)}
>>> KP([Integer(5),Integer(4),Integer(4),Integer(3),Integer(2)]).cogood_
↪cells(Integer(0))
>>> KP([Integer(5),Integer(4),Integer(4),Integer(3),Integer(2)]).cogood_
↪cells(Integer(2))
(4, 2)
```

conormal_cells(*i=None*)

Return a dictionary of the cells of `self` which are conormal.

Following [Kle1995], the *conormal* cells are computed by reading up (or down) the rows of the partition and marking all of the addable and removable cells of e-residue i and then recursively removing all adjacent pairs of removable and addable cells (in that order) from this list. The addable i-cells that remain at the end of the this process are the conormal i-cells.

When computing conormal cells you can either read the cells in order from top to bottom (this corresponds to labeling the simple modules of the symmetric group by regular partitions) or from bottom to top (corresponding to labeling the simples by restricted partitions). By default we read down the partition but this can be changed by setting `convention = 'RS'`.

INPUT:

- `i` – (optional) a residue

OUTPUT:

If no residue `i` is specified then a dictionary of conormal cells is returned, which gives the conormal cells for `0 <= i < e`.

EXAMPLES:

```
sage: KP = KleshchevPartitions(3, convention='regular')
sage: KP([5,4,4,3,2]).conormal_cells()
{0: [(1, 4)], 1: [(5, 0), (4, 2)]}
sage: KP([5,4,4,3,2]).conormal_cells(0)
[(1, 4)]
sage: KP([5,4,4,3,2]).conormal_cells(1)
[(5, 0), (4, 2)]
sage: KP = KleshchevPartitions(3, convention='restricted')
sage: KP([5,4,4,3,2]).conormal_cells()
{0: [(1, 4), (3, 3)], 2: [(0, 5)]}
```

```
>>> from sage.all import *
>>> KP = KleshchevPartitions(Integer(3), convention='regular')
>>> KP([Integer(5),Integer(4),Integer(4),Integer(3),Integer(2)]).conormal_
↪cells()
{0: [(1, 4)], 1: [(5, 0), (4, 2)]}
>>> KP([Integer(5),Integer(4),Integer(4),Integer(3),Integer(2)]).conormal_
↪cells(Integer(0))
[(1, 4)]
>>> KP([Integer(5),Integer(4),Integer(4),Integer(3),Integer(2)]).conormal_
↪cells(Integer(1))
[(5, 0), (4, 2)]
>>> KP = KleshchevPartitions(Integer(3), convention='restricted')
>>> KP([Integer(5),Integer(4),Integer(4),Integer(3),Integer(2)]).conormal_
↪cells()
{0: [(1, 4), (3, 3)], 2: [(0, 5)]}
```

good_cell_sequence()

Return a sequence of good nodes from the empty partition to `self`, or `None` if no such sequence exists.

EXAMPLES:

```
sage: KP = KleshchevPartitions(3, convention='regular')
sage: KP([5,4,4,3,2]).good_cell_sequence()
[(0, 0), (1, 0), (0, 1), (2, 0), (1, 1), (0, 2),
 (3, 0), (2, 1), (1, 2), (3, 1), (0, 3), (1, 3),
 (2, 2), (3, 2), (4, 0), (4, 1), (0, 4), (2, 3)]
sage: KP = KleshchevPartitions(3, convention='restricted')
sage: KP([5,4,4,3,2]).good_cell_sequence()
[(0, 0), (0, 1), (1, 0), (0, 2), (1, 1), (2, 0),
 (0, 3), (2, 1), (1, 2), (1, 3), (3, 0), (3, 1),
 (2, 2), (4, 0), (2, 3), (3, 2), (0, 4), (4, 1)]
```

```
>>> from sage.all import *
>>> KP = KleshchevPartitions(Integer(3), convention='regular')
>>> KP([Integer(5),Integer(4),Integer(4),Integer(3),Integer(2)]).good_cell_
↪sequence()
```

(continues on next page)

(continued from previous page)

```
[(0, 0), (1, 0), (0, 1), (2, 0), (1, 1), (0, 2),
 (3, 0), (2, 1), (1, 2), (3, 1), (0, 3), (1, 3),
 (2, 2), (3, 2), (4, 0), (4, 1), (0, 4), (2, 3)]
>>> KP = KleshchevPartitions(Integer(3), convention='restricted')
>>> KP([Integer(5),Integer(4),Integer(4),Integer(3),Integer(2)]).good_cell_
↪sequence()
[(0, 0), (0, 1), (1, 0), (0, 2), (1, 1), (2, 0),
 (0, 3), (2, 1), (1, 2), (1, 3), (3, 0), (3, 1),
 (2, 2), (4, 0), (2, 3), (3, 2), (0, 4), (4, 1)]
```

good_cells(*i=None*)

Return a list of the cells of `self` that are good.

The good i-cell is the 'first' normal i-cell. As with the normal cells we can choose to read either up or down the partition as specified by *convention()*.

INPUT:

- `i` – (optional) a residue

OUTPUT:

If no residue `i` is specified then a dictionary of good cells is returned, which gives the good cells for `0 <= i < e`.

EXAMPLES:

```
sage: KP3 = KleshchevPartitions(3, convention='regular')
sage: KP3([5,4,4,3,2]).good_cells()
{1: (2, 3)}
sage: KP3([5,4,4,3,2]).good_cells(1)
(2, 3)
sage: KP4 = KleshchevPartitions(4, convention='restricted')
sage: KP4([5,4,4,3,2]).good_cells()
{1: (2, 3)}
sage: KP4([5,4,4,3,2]).good_cells(0)
sage: KP4([5,4,4,3,2]).good_cells(1)
(2, 3)
```

```
>>> from sage.all import *
>>> KP3 = KleshchevPartitions(Integer(3), convention='regular')
>>> KP3([Integer(5),Integer(4),Integer(4),Integer(3),Integer(2)]).good_cells()
{1: (2, 3)}
>>> KP3([Integer(5),Integer(4),Integer(4),Integer(3),Integer(2)]).good_
↪cells(Integer(1))
(2, 3)
>>> KP4 = KleshchevPartitions(Integer(4), convention='restricted')
>>> KP4([Integer(5),Integer(4),Integer(4),Integer(3),Integer(2)]).good_cells()
{1: (2, 3)}
>>> KP4([Integer(5),Integer(4),Integer(4),Integer(3),Integer(2)]).good_
↪cells(Integer(0))
>>> KP4([Integer(5),Integer(4),Integer(4),Integer(3),Integer(2)]).good_
↪cells(Integer(1))
(2, 3)
```

good_residue_sequence()

Return a sequence of good nodes from the empty partition to `self`, or `None` if no such sequence exists.

EXAMPLES:

```
sage: KP = KleshchevPartitions(3, convention='regular')
sage: KP([5,4,4,3,2]).good_residue_sequence()
[0, 2, 1, 1, 0, 2, 0, 2, 1, 1, 0, 2, 0, 2, 2, 0, 1, 1]
sage: KP = KleshchevPartitions(3, convention='restricted')
sage: KP([5,4,4,3,2]).good_residue_sequence()
[0, 1, 2, 2, 0, 1, 0, 2, 1, 2, 0, 1, 0, 2, 1, 2, 1, 0]
```

```
>>> from sage.all import *
>>> KP = KleshchevPartitions(Integer(3), convention='regular')
>>> KP([Integer(5),Integer(4),Integer(4),Integer(3),Integer(2)]).good_residue_
↪sequence()
[0, 2, 1, 1, 0, 2, 0, 2, 1, 1, 0, 2, 0, 2, 2, 0, 1, 1]
>>> KP = KleshchevPartitions(Integer(3), convention='restricted')
>>> KP([Integer(5),Integer(4),Integer(4),Integer(3),Integer(2)]).good_residue_
↪sequence()
[0, 1, 2, 2, 0, 1, 0, 2, 1, 2, 0, 1, 0, 2, 1, 2, 1, 0]
```

is_regular()

Return `True` if `self` is a e-regular partition tuple.

A partition tuple is e-regular if we can get to the empty partition tuple by successively removing a sequence of good cells in the down direction. Equivalently, all partitions are 0-regular and if $e > 0$ then a partition is e-regular if no e nonzero parts of `self` are equal.

EXAMPLES:

```
sage: KP = KleshchevPartitions(2)
sage: KP([2,1,1]).is_regular()
False
sage: KP = KleshchevPartitions(3)
sage: KP([2,1,1]).is_regular()
True
sage: KP([]).is_regular()
True
```

```
>>> from sage.all import *
>>> KP = KleshchevPartitions(Integer(2))
>>> KP([Integer(2),Integer(1),Integer(1)]).is_regular()
False
>>> KP = KleshchevPartitions(Integer(3))
>>> KP([Integer(2),Integer(1),Integer(1)]).is_regular()
True
>>> KP([]).is_regular()
True
```

is_restricted()

Return `True` if `self` is an e-restricted partition tuple.

A partition tuple is e-restricted if we can get to the empty partition tuple by successively removing a sequence of good cells in the up direction. Equivalently, all partitions are 0-restricted and if $e > 0$ then a partition is

e-restricted if the difference of successive parts of `self` are always strictly less than e.

EXAMPLES:

```
sage: KP = KleshchevPartitions(2, convention='regular')
sage: KP([3,1]).is_restricted()
False
sage: KP = KleshchevPartitions(3, convention='regular')
sage: KP([3,1]).is_restricted()
True
sage: KP([]).is_restricted()
True
```

```
>>> from sage.all import *
>>> KP = KleshchevPartitions(Integer(2), convention='regular')
>>> KP([Integer(3),Integer(1)]).is_restricted()
False
>>> KP = KleshchevPartitions(Integer(3), convention='regular')
>>> KP([Integer(3),Integer(1)]).is_restricted()
True
>>> KP([]).is_restricted()
True
```

mullineux_conjugate()

Return the partition tuple that is the Mullineux conjugate of `self`.

It follows from results in [BK2009], [Mat2015] that if ν is the Mullineux conjugate of the Kleshchev partition tuple μ then the simple module $D^\nu = (D^\mu)^{\text{sgn}}$ is obtained from D^μ by twisting by the sgn-automorphism with is the Iwahori-Hecke algebra analogue of tensoring with the one dimensional sign representation.

EXAMPLES:

```
sage: KP = KleshchevPartitions(3, convention='regular')
sage: KP([5,4,4,3,2]).mullineux_conjugate()
[9, 7, 1, 1]
sage: KP = KleshchevPartitions(3, convention='restricted')
sage: KP([5,4,4,3,2]).mullineux_conjugate()
[3, 2, 2, 2, 2, 2, 2, 1, 1, 1]
sage: KP = KleshchevPartitions(3, [2], convention='regular')
sage: mc = KP([5,4,4,3,2]).mullineux_conjugate(); mc
[9, 7, 1, 1]
sage: mc.parent().multicharge()
(1,)
sage: KP = KleshchevPartitions(3, [2], convention='restricted')
sage: mc = KP([5,4,4,3,2]).mullineux_conjugate(); mc
[3, 2, 2, 2, 2, 2, 2, 1, 1, 1]
sage: mc.parent().multicharge()
(1,)
```

```
>>> from sage.all import *
>>> KP = KleshchevPartitions(Integer(3), convention='regular')
>>> KP([Integer(5),Integer(4),Integer(4),Integer(3),Integer(2)]).mullineux_
↪conjugate()
[9, 7, 1, 1]
```

(continues on next page)

(continued from previous page)

```
>>> KP = KleshchevPartitions(Integer(3), convention='restricted')
>>> KP([Integer(5),Integer(4),Integer(4),Integer(3),Integer(2)]).mullineux_
↪conjugate()
[3, 2, 2, 2, 2, 2, 2, 1, 1, 1]
>>> KP = KleshchevPartitions(Integer(3), [Integer(2)], convention='regular')
>>> mc = KP([Integer(5),Integer(4),Integer(4),Integer(3),Integer(2)]).
↪mullineux_conjugate(); mc
[9, 7, 1, 1]
>>> mc.parent().multicharge()
(1,)
>>> KP = KleshchevPartitions(Integer(3), [Integer(2)], convention='restricted
↪')
>>> mc = KP([Integer(5),Integer(4),Integer(4),Integer(3),Integer(2)]).
↪mullineux_conjugate(); mc
[3, 2, 2, 2, 2, 2, 2, 1, 1, 1]
>>> mc.parent().multicharge()
(1,)
```

normal_cells(*i=None*)

Return a dictionary of the cells of the partition that are normal.

Following [Kle1995], the *normal* cells are computed by reading up (or down) the rows of the partition and marking all of the addable and removable cells of e-residue i and then recursively removing all adjacent pairs of removable and addable cells (in that order) from this list. The removable i-cells that remain at the end of the this process are the normal i-cells.

When computing normal cells you can either read the cells in order from top to bottom (this corresponds to labeling the simple modules of the symmetric group by regular partitions) or from bottom to top (corresponding to labeling the simples by restricted partitions). By default we read down the partition but this can be changed by setting `convention = 'RS'`.

INPUT:

- `i` – (optional) a residue

OUTPUT:

If no residue `i` is specified then a dictionary of normal cells is returned, which gives the normal cells for `0 <= i < e`.

EXAMPLES:

```
sage: KP = KleshchevPartitions(3, convention='regular')
sage: KP([5,4,4,3,2]).normal_cells()
{1: [(2, 3), (0, 4)]}
sage: KP([5,4,4,3,2]).normal_cells(1)
[(2, 3), (0, 4)]
sage: KP = KleshchevPartitions(3, convention='restricted')
sage: KP([5,4,4,3,2]).normal_cells()
{0: [(4, 1)], 2: [(3, 2)]}
sage: KP([5,4,4,3,2]).normal_cells(2)
[(3, 2)]
```

```
>>> from sage.all import *
>>> KP = KleshchevPartitions(Integer(3), convention='regular')
```

(continues on next page)

(continued from previous page)

```
>>> KP([Integer(5),Integer(4),Integer(4),Integer(3),Integer(2)]).normal_
↪cells()
{1: [(2, 3), (0, 4)]}
>>> KP([Integer(5),Integer(4),Integer(4),Integer(3),Integer(2)]).normal_
↪cells(Integer(1))
[(2, 3), (0, 4)]
>>> KP = KleshchevPartitions(Integer(3), convention='restricted')
>>> KP([Integer(5),Integer(4),Integer(4),Integer(3),Integer(2)]).normal_
↪cells()
{0: [(4, 1)], 2: [(3, 2)]}
>>> KP([Integer(5),Integer(4),Integer(4),Integer(3),Integer(2)]).normal_
↪cells(Integer(2))
[(3, 2)]
```

class sage.combinat.partition_kleshchev.**KleshchevPartitionCrystal**(*parent*, *mu*)

Bases: *KleshchevPartition*, *KleshchevCrystalMixin*

Kleshchev partition with the crystal structure.

e(*i*)

Return the action of e_i on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: C = crystals.KleshchevPartitions(3, convention="left regular")
sage: x = C([5,4,1])
sage: x.e(0)
sage: x.e(1)
[5, 4]
```

```
>>> from sage.all import *
>>> C = crystals.KleshchevPartitions(Integer(3), convention="left regular")
>>> x = C([Integer(5),Integer(4),Integer(1)])
>>> x.e(Integer(0))
>>> x.e(Integer(1))
[5, 4]
```

f(*i*)

Return the action of f_i on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: C = crystals.KleshchevPartitions(3, convention="left regular")
sage: x = C([5,4,1])
sage: x.f(0)
[5, 5, 1]
sage: x.f(1)
```

(continues on next page)

(continued from previous page)

```
sage: x.f(2)
[5, 4, 2]
```

```
>>> from sage.all import *
>>> C = crystals.KleshchevPartitions(Integer(3), convention="left regular")
>>> x = C([Integer(5),Integer(4),Integer(1)])
>>> x.f(Integer(0))
[5, 5, 1]
>>> x.f(Integer(1))
>>> x.f(Integer(2))
[5, 4, 2]
```

class sage.combinat.partition_kleshchev.**KleshchevPartitionTuple**(*parent*, *mu*)

Bases: *PartitionTuple*

Abstract base class for Kleshchev partition tuples. See *KleshchevPartitions*.

cogood_cells(*i=None*)

Return a list of the cells of the partition that are cogood.

The cogood i-cell is the 'last' conormal i-cell. As with the conormal cells we can choose to read either up or down the partition as specified by *convention()*.

INPUT:

- `i` – (optional) a residue

OUTPUT:

If no residue `i` is specified then a dictionary of cogood cells is returned, which gives the cogood cells for `0 <= i < e`.

EXAMPLES:

```
sage: KP = KleshchevPartitions(3, [0,1])
sage: pt = KP([[4, 2], [5, 3, 1]])
sage: pt.cogood_cells()
{0: (1, 2, 1), 1: (1, 3, 0)}
sage: pt.cogood_cells(0)
(1, 2, 1)
sage: KP = KleshchevPartitions(4, [0,1], convention="left regular")
sage: pt = KP([[5, 2, 2], [6, 1, 1]])
sage: pt.cogood_cells()
{1: (0, 0, 5), 2: (1, 3, 0)}
sage: pt.cogood_cells(0) is None
True
sage: pt.cogood_cells(1) is None
False
```

```
>>> from sage.all import *
>>> KP = KleshchevPartitions(Integer(3), [Integer(0),Integer(1)])
>>> pt = KP([[Integer(4), Integer(2)], [Integer(5), Integer(3), Integer(1)]])
>>> pt.cogood_cells()
{0: (1, 2, 1), 1: (1, 3, 0)}
>>> pt.cogood_cells(Integer(0))
```

(continues on next page)

(continued from previous page)

```
(1, 2, 1)
>>> KP = KleshchevPartitions(Integer(4), [Integer(0),Integer(1)], convention=
→"left regular")
>>> pt = KP([[Integer(5), Integer(2), Integer(2)], [Integer(6), Integer(1),␣
→Integer(1)]])
>>> pt.cogood_cells()
{1: (0, 0, 5), 2: (1, 3, 0)}
>>> pt.cogood_cells(Integer(0)) is None
True
>>> pt.cogood_cells(Integer(1)) is None
False
```

conormal_cells(*i=None*)

Return a dictionary of the cells of the partition that are conormal.

Following [Kle1995], the *conormal* cells are computed by reading up (or down) the rows of the partition and marking all of the addable and removable cells of e-residue i and then recursively removing all adjacent pairs of removable and addable cells (in that order) from this list. The addable i-cells that remain at the end of the this process are the conormal i-cells.

When computing conormal cells you can either read the cells in order from top to bottom (this corresponds to labeling the simple modules of the symmetric group by regular partitions) or from bottom to top (corresponding to labeling the simples by restricted partitions). By default we read down the partition but this can be changed by setting `convention = 'RS'`.

INPUT:

- `i` – (optional) a residue

OUTPUT:

If no residue `i` is specified then a dictionary of conormal cells is returned, which gives the conormal cells for `0 <= i < e`.

EXAMPLES:

```
sage: KP = KleshchevPartitions(3, [0,1], convention="left regular")
sage: KP([[4, 2], [5, 3, 1]]).conormal_cells()
{0: [(1, 2, 1), (1, 1, 3), (1, 0, 5)],
1: [(1, 3, 0), (0, 2, 0), (0, 1, 2), (0, 0, 4)]}
sage: KP([[4, 2], [5, 3, 1]]).conormal_cells(1)
[(1, 3, 0), (0, 2, 0), (0, 1, 2), (0, 0, 4)]
sage: KP([[4, 2], [5, 3, 1]]).conormal_cells(2)
[]
sage: KP = KleshchevPartitions(3, [0,1], convention="right restricted")
sage: KP([[4, 2], [5, 3, 1]]).conormal_cells(0)
[(1, 0, 5), (1, 1, 3), (1, 2, 1)]
```

```
>>> from sage.all import *
>>> KP = KleshchevPartitions(Integer(3), [Integer(0),Integer(1)], convention=
→"left regular")
>>> KP([[Integer(4), Integer(2)], [Integer(5), Integer(3), Integer(1)]]).
→conormal_cells()
{0: [(1, 2, 1), (1, 1, 3), (1, 0, 5)],
1: [(1, 3, 0), (0, 2, 0), (0, 1, 2), (0, 0, 4)]}
```

(continues on next page)

(continued from previous page)

```
>>> KP([[Integer(4), Integer(2)], [Integer(5), Integer(3), Integer(1)]]).
↪conormal_cells(Integer(1))
[(1, 3, 0), (0, 2, 0), (0, 1, 2), (0, 0, 4)]
>>> KP([[Integer(4), Integer(2)], [Integer(5), Integer(3), Integer(1)]]).
↪conormal_cells(Integer(2))
[]
>>> KP = KleshchevPartitions(Integer(3), [Integer(0),Integer(1)], convention=
↪"right restricted")
>>> KP([[Integer(4), Integer(2)], [Integer(5), Integer(3), Integer(1)]]).
↪conormal_cells(Integer(0))
[(1, 0, 5), (1, 1, 3), (1, 2, 1)]
```

good_cell_sequence()

Return a sequence of good nodes from the empty partition to `self`.

EXAMPLES:

```
sage: KP = KleshchevPartitions(3,[0,1])
sage: KP([[4, 2], [5, 3, 1]]).good_cell_sequence()
[(0, 0, 0), (1, 0, 0), (1, 0, 1), (0, 0, 1), (0, 1, 0),
 (1, 1, 0), (1, 1, 1), (1, 0, 2), (1, 2, 0), (0, 0, 2),
 (0, 1, 1), (1, 0, 3), (0, 0, 3), (1, 1, 2), (1, 0, 4)]
```

```
>>> from sage.all import *
>>> KP = KleshchevPartitions(Integer(3),[Integer(0),Integer(1)])
>>> KP([[Integer(4), Integer(2)], [Integer(5), Integer(3), Integer(1)]]).good_
↪cell_sequence()
[(0, 0, 0), (1, 0, 0), (1, 0, 1), (0, 0, 1), (0, 1, 0),
 (1, 1, 0), (1, 1, 1), (1, 0, 2), (1, 2, 0), (0, 0, 2),
 (0, 1, 1), (1, 0, 3), (0, 0, 3), (1, 1, 2), (1, 0, 4)]
```

good_cells(*i=None*)

Return a list of the cells of the partition tuple which are good.

The good i-cell is the 'first' normal i-cell. As with the normal cells we can choose to read either up or down the partition as specified by *convention()*.

INPUT:

- `i` – (optional) a residue

OUTPUT:

If no residue `i` is specified then a dictionary of good cells is returned, which gives the good cells for `0 <= i < e`.

EXAMPLES:

```
sage: KP = KleshchevPartitions(3, [0,1])
sage: pt = KP([[4, 2], [5, 3, 1]])
sage: pt.good_cells()
{2: (1, 0, 4)}
sage: pt.good_cells(2)
(1, 0, 4)
sage: KP = KleshchevPartitions(4, [0,1], convention="left regular")
```

(continues on next page)

(continued from previous page)

```
sage: pt = KP([[5, 2, 2], [6, 2, 1]])
sage: pt.good_cells()
{0: (0, 0, 4), 2: (1, 0, 5), 3: (0, 2, 1)}
sage: pt.good_cells(1) is None
True
```

```
>>> from sage.all import *
>>> KP = KleshchevPartitions(Integer(3), [Integer(0),Integer(1)])
>>> pt = KP([[Integer(4), Integer(2)], [Integer(5), Integer(3), Integer(1)]])
>>> pt.good_cells()
{2: (1, 0, 4)}
>>> pt.good_cells(Integer(2))
(1, 0, 4)
>>> KP = KleshchevPartitions(Integer(4), [Integer(0),Integer(1)], convention=
↪"left regular")
>>> pt = KP([[Integer(5), Integer(2), Integer(2)], [Integer(6), Integer(2),␣
↪Integer(1)]])
>>> pt.good_cells()
{0: (0, 0, 4), 2: (1, 0, 5), 3: (0, 2, 1)}
>>> pt.good_cells(Integer(1)) is None
True
```

good_residue_sequence()

Return a sequence of good nodes from the empty partition to `self`.

EXAMPLES:

```
sage: KP = KleshchevPartitions(3, [0,1])
sage: KP([[4, 2], [5, 3, 1]]).good_residue_sequence()
[0, 1, 2, 1, 2, 0, 1, 0, 2, 2, 0, 1, 0, 2, 2]
```

```
>>> from sage.all import *
>>> KP = KleshchevPartitions(Integer(3), [Integer(0),Integer(1)])
>>> KP([[Integer(4), Integer(2)], [Integer(5), Integer(3), Integer(1)]]).good_
↪residue_sequence()
[0, 1, 2, 1, 2, 0, 1, 0, 2, 2, 0, 1, 0, 2, 2]
```

is_regular()

Return `True` if `self` is a e-regular partition tuple.

A partition tuple is e-regular if we can get to the empty partition tuple by successively removing a sequence of good cells in the down direction.

EXAMPLES:

```
sage: KP = KleshchevPartitions(2, [0,2], convention="right restricted")
sage: KP([[3,2,1], [2,1,1]]).is_regular()
False
sage: KP = KleshchevPartitions(4, [0,2], convention="right restricted")
sage: KP([[3,2,1], [2,1,1]]).is_regular()
True
sage: KP([[], []]).is_regular()
True
```

```
>>> from sage.all import *
>>> KP = KleshchevPartitions(Integer(2), [Integer(0),Integer(2)], convention=
↪"right restricted")
>>> KP([[Integer(3),Integer(2),Integer(1)], [Integer(2),Integer(1),
↪Integer(1)]]).is_regular()
False
>>> KP = KleshchevPartitions(Integer(4), [Integer(0),Integer(2)], convention=
↪"right restricted")
>>> KP([[Integer(3),Integer(2),Integer(1)], [Integer(2),Integer(1),
↪Integer(1)]]).is_regular()
True
>>> KP([[], []]).is_regular()
True
```

is_restricted()

Return True if self is an e-restricted partition tuple.

A partition tuple is e-restricted if we can get to the empty partition tuple by successively removing a sequence of good cells in the up direction.

EXAMPLES:

```
sage: KP = KleshchevPartitions(2, [0,2], convention="left regular")
sage: KP([[3,2,1], [3,1]]).is_restricted()
False
sage: KP = KleshchevPartitions(3, [0,2], convention="left regular")
sage: KP([[3,2,1], [3,1]]).is_restricted()
True
sage: KP([[], []]).is_restricted()
True
```

```
>>> from sage.all import *
>>> KP = KleshchevPartitions(Integer(2), [Integer(0),Integer(2)], convention=
↪"left regular")
>>> KP([[Integer(3),Integer(2),Integer(1)], [Integer(3),Integer(1)]]).is_
↪restricted()
False
>>> KP = KleshchevPartitions(Integer(3), [Integer(0),Integer(2)], convention=
↪"left regular")
>>> KP([[Integer(3),Integer(2),Integer(1)], [Integer(3),Integer(1)]]).is_
↪restricted()
True
>>> KP([[], []]).is_restricted()
True
```

mullineux_conjugate()

Return the partition that is the Mullineux conjugate of self.

It follows from results in [Kle1996] [Bru1998] that if ν is the Mullineux conjugate of the Kleshchev partition tuple μ then the simple module $D^\nu = (D^\mu)^{\text{sgn}}$ is obtained from D^μ by twisting by the sgn-automorphism with is the Hecke algebra analogue of tensoring with the one dimensional sign representation.

EXAMPLES:

```
sage: KP = KleshchevPartitions(3, [0,1])
sage: mc = KP([[4, 2], [5, 3, 1]]).mullineux_conjugate(); mc
([2, 2, 1, 1], [3, 2, 2, 1, 1])
sage: mc.parent()
Kleshchev partitions with e=3 and multicharge=(0,2)
```

```
>>> from sage.all import *
>>> KP = KleshchevPartitions(Integer(3), [Integer(0),Integer(1)])
>>> mc = KP([[Integer(4), Integer(2)], [Integer(5), Integer(3), Integer(1)]]).
↪mullineux_conjugate(); mc
([2, 2, 1, 1], [3, 2, 2, 1, 1])
>>> mc.parent()
Kleshchev partitions with e=3 and multicharge=(0,2)
```

normal_cells(*i=None*)

Return a dictionary of the removable cells of the partition that are normal.

Following [Kle1995], the *normal* cells are computed by reading up (or down) the rows of the partition and marking all of the addable and removable cells of e-residue i and then recursively removing all adjacent pairs of removable and addable cells (in that order) from this list. The removable i-cells that remain at the end of the this process are the normal i-cells.

When computing normal cells you can either read the cells in order from top to bottom (this corresponds to labeling the simple modules of the symmetric group by regular partitions) or from bottom to top (corresponding to labeling the simples by restricted partitions). By default we read down the partition but this can be changed by setting `convention = 'RS'`.

INPUT:

- `i` – (optional) a residue

OUTPUT:

If no residue `i` is specified then a dictionary of normal cells is returned, which gives the normal cells for `0 <= i < e`.

EXAMPLES:

```
sage: KP = KleshchevPartitions(3, [0,1], convention="left restricted")
sage: KP([[4, 2], [5, 3, 1]]).normal_cells()
{2: [(1, 0, 4), (1, 1, 2), (1, 2, 0)]}
sage: KP([[4, 2], [5, 3, 1]]).normal_cells(1)
[]
sage: KP = KleshchevPartitions(3, [0,1], convention="left regular")
sage: KP([[4, 2], [5, 3, 1]]).normal_cells()
{0: [(0, 1, 1), (0, 0, 3)], 2: [(1, 2, 0), (1, 1, 2), (1, 0, 4)]}
sage: KP = KleshchevPartitions(3, [0,1], convention="right regular")
sage: KP([[4, 2], [5, 3, 1]]).normal_cells()
{2: [(1, 2, 0), (1, 1, 2), (1, 0, 4)]}
sage: KP = KleshchevPartitions(3, [0,1], convention="right restricted")
sage: KP([[4, 2], [5, 3, 1]]).normal_cells()
{0: [(0, 0, 3), (0, 1, 1)], 2: [(1, 0, 4), (1, 1, 2), (1, 2, 0)]}
```

```
>>> from sage.all import *
>>> KP = KleshchevPartitions(Integer(3), [Integer(0),Integer(1)], convention=
```

(continues on next page)

(continued from previous page)

```
↪"left restricted")
>>> KP([[Integer(4), Integer(2)], [Integer(5), Integer(3), Integer(1)]]).
↪normal_cells()
{2: [(1, 0, 4), (1, 1, 2), (1, 2, 0)]}
>>> KP([[Integer(4), Integer(2)], [Integer(5), Integer(3), Integer(1)]]).
↪normal_cells(Integer(1))
[]
>>> KP = KleshchevPartitions(Integer(3), [Integer(0),Integer(1)], convention=
↪"left regular")
>>> KP([[Integer(4), Integer(2)], [Integer(5), Integer(3), Integer(1)]]).
↪normal_cells()
{0: [(0, 1, 1), (0, 0, 3)], 2: [(1, 2, 0), (1, 1, 2), (1, 0, 4)]}
>>> KP = KleshchevPartitions(Integer(3), [Integer(0),Integer(1)], convention=
↪"right regular")
>>> KP([[Integer(4), Integer(2)], [Integer(5), Integer(3), Integer(1)]]).
↪normal_cells()
{2: [(1, 2, 0), (1, 1, 2), (1, 0, 4)]}
>>> KP = KleshchevPartitions(Integer(3), [Integer(0),Integer(1)], convention=
↪"right restricted")
>>> KP([[Integer(4), Integer(2)], [Integer(5), Integer(3), Integer(1)]]).
↪normal_cells()
{0: [(0, 0, 3), (0, 1, 1)], 2: [(1, 0, 4), (1, 1, 2), (1, 2, 0)]}
```

class sage.combinat.partition_kleshchev.**KleshchevPartitionTupleCrystal**(*parent*, *mu*)

Bases: *KleshchevPartitionTuple*, *KleshchevCrystalMixin*

Kleshchev partition tuple with the crystal structure.

e(*i*)

Return the action of e_i on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: C = crystals.KleshchevPartitions(3, [0,2], convention="left regular")
sage: x = C([[5,4,1],[3,2,1,1]])
sage: x.e(0)
sage: x.e(1)
([5, 4, 1], [2, 2, 1, 1])
```

```
>>> from sage.all import *
>>> C = crystals.KleshchevPartitions(Integer(3), [Integer(0),Integer(2)],␣
↪convention="left regular")
>>> x = C([[Integer(5),Integer(4),Integer(1)],[Integer(3),Integer(2),
↪Integer(1),Integer(1)]])
>>> x.e(Integer(0))
>>> x.e(Integer(1))
([5, 4, 1], [2, 2, 1, 1])
```

f(*i*)

Return the action of f_i on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: C = crystals.KleshchevPartitions(3, [0,2], convention="left regular")
sage: x = C([[5,4,1],[3,2,1,1]])
sage: x.f(0)
([5, 5, 1], [3, 2, 1, 1])
sage: x.f(1)
([5, 4, 1], [3, 2, 2, 1])
sage: x.f(2)
```

```
>>> from sage.all import *
>>> C = crystals.KleshchevPartitions(Integer(3), [Integer(0),Integer(2)],␣
↪convention="left regular")
>>> x = C([[Integer(5),Integer(4),Integer(1)],[Integer(3),Integer(2),
↪Integer(1),Integer(1)]])
>>> x.f(Integer(0))
([5, 5, 1], [3, 2, 1, 1])
>>> x.f(Integer(1))
([5, 4, 1], [3, 2, 2, 1])
>>> x.f(Integer(2))
```

class sage.combinat.partition_kleshchev.**KleshchevPartitions**

Bases: *PartitionTuples*

Kleshchev partitions.

A partition (tuple) μ is Kleshchev if it can be recursively obtained by adding a sequence of good nodes to the empty *PartitionTuple* of the same *level()* and multicharge.

There are four different conventions that are used in the literature for Kleshchev partitions, depending on whether we read partitions from top to bottom (regular) or bottom to top (restricted) and whether we read partition tuples from left to right or right to left. All of these conventions are supported:

```
sage: KleshchevPartitions(2, [0,0], size=2, convention='left regular')[:]
[([1], [1]), ([2], [])]
sage: KleshchevPartitions(2, [0,0], size=2, convention='left restricted')[:]
[([1], [1]), ([], [1, 1])]
sage: KleshchevPartitions(2, [0,0], size=2, convention='right regular')[:]
[([1], [1]), ([], [2])]
sage: KleshchevPartitions(2, [0,0], size=2, convention='right restricted')[:]
[([1], [1]), ([1, 1], [])]
```

```
>>> from sage.all import *
>>> KleshchevPartitions(Integer(2), [Integer(0),Integer(0)], size=Integer(2),␣
↪convention='left regular')[:]
[([1], [1]), ([2], [])]
>>> KleshchevPartitions(Integer(2), [Integer(0),Integer(0)], size=Integer(2),␣
↪convention='left restricted')[:]
[([1], [1]), ([], [1, 1])]
>>> KleshchevPartitions(Integer(2), [Integer(0),Integer(0)], size=Integer(2),␣
↪convention='right regular')[:]
```

(continues on next page)

(continued from previous page)

```
[([1], [1]), ([], [2])]
>>> KleshchevPartitions(Integer(2), [Integer(0),Integer(0)], size=Integer(2),␣
↪convention='right restricted')[:]
[([1], [1]), ([1, 1], [])]
```

By default, the `left restricted` convention is used. As a shorthand, `LG`, `LS`, `RG` and `RS`, respectively, can be used to specify the `convention`. With the `left` convention the partition tuples should be ordered with the most dominant partitions in the partition tuple on the left and with the `right` convention the most dominant partition is on the right.

The *KleshchevPartitions* class will automatically convert between these four different conventions:

```
sage: KPlg = KleshchevPartitions(2, [0,0], size=2, convention='left regular')
sage: KPls = KleshchevPartitions(2, [0,0], size=2, convention='left restricted')
sage: [KPlg(mu) for mu in KPls]
[([1], [1]), ([2], [])]
```

```
>>> from sage.all import *
>>> KPlg = KleshchevPartitions(Integer(2), [Integer(0),Integer(0)],␣
↪size=Integer(2), convention='left regular')
>>> KPls = KleshchevPartitions(Integer(2), [Integer(0),Integer(0)],␣
↪size=Integer(2), convention='left restricted')
>>> [KPlg(mu) for mu in KPls]
[([1], [1]), ([2], [])]
```

EXAMPLES:

```
sage: sorted(KleshchevPartitions(5,[3,2,1],1, convention='RS'))
[([], [], [1]), ([], [1], []), ([1], [], [])]
sage: sorted(KleshchevPartitions(5, [3,2,1], 1, convention='LS'))
[([], [], [1]), ([], [1], []), ([1], [], [])]
sage: sorted(KleshchevPartitions(5, [3,2,1], 3))

- [BK2009]
- [Kle2009]

convention()

Return the convention of `self`.

EXAMPLES:

```
sage: KP = KleshchevPartitions(4)
sage: KP.convention()
'restricted'
sage: KP = KleshchevPartitions(6, [4], 3, convention="right regular")
sage: KP.convention()
'regular'
sage: KP = KleshchevPartitions(5, [3,0,1], 1)
sage: KP.convention()
'left restricted'
sage: KP = KleshchevPartitions(5, [3,0,1], 1, convention='right regular')
sage: KP.convention()
'right regular'
```

```
>>> from sage.all import *
>>> KP = KleshchevPartitions(Integer(4))
>>> KP.convention()
'restricted'
>>> KP = KleshchevPartitions(Integer(6), [Integer(4)], Integer(3), convention=
→"right regular")
>>> KP.convention()
'regular'
>>> KP = KleshchevPartitions(Integer(5), [Integer(3),Integer(0),Integer(1)],␣
→Integer(1))
>>> KP.convention()
'left restricted'
>>> KP = KleshchevPartitions(Integer(5), [Integer(3),Integer(0),Integer(1)],␣
→Integer(1), convention='right regular')
>>> KP.convention()
'right regular'
```

multicharge()

Return the multicharge of `self`.

EXAMPLES:

```
sage: KP = KleshchevPartitions(6, [2])
sage: KP.multicharge()
(2,)
sage: KP = KleshchevPartitions(5, [3,0,1], 1, convention='LS')
sage: KP.multicharge()
(3, 0, 1)
```

```
>>> from sage.all import *
>>> KP = KleshchevPartitions(Integer(6), [Integer(2)])
>>> KP.multicharge()
(2,)
>>> KP = KleshchevPartitions(Integer(5), [Integer(3),Integer(0),Integer(1)],␣
↪Integer(1), convention='LS')
>>> KP.multicharge()
(3, 0, 1)
```

class sage.combinat.partition_kleshchev.**KleshchevPartitions_all**(*e*, *multicharge*, *convention*)

Bases: *KleshchevPartitions*

Class of all Kleshchev partitions.

Crystal structure

We consider type $A_{e-1}^{(1)}$ crystals, and let $r = (r_i | r_i \in \mathbf{Z}/e\mathbf{Z})$ be a finite sequence of length k, which is the *level*, and $\lambda = \sum_i \Lambda_{r_i}$. We will model the highest weight $U_q(\mathfrak{g})$-crystal $B(\lambda)$ by a particular subset of partition tuples of level k.

Consider a partition tuple μ with multicharge r. We define $e_i(\mu)$ as the partition tuple obtained after the deletion of the i-`good cell` to μ and 0 if there is no i-good cell. We define $f_i(\mu)$ as the partition tuple obtained by the addition of the i-`cogood cell` to μ and 0 if there is no i-good cell.

The crystal $B(\lambda)$ is the crystal generated by the empty partition tuple. We can compute the weight of an element μ by taking $\lambda - \sum_{i=0}^{n} c_i \alpha_i$ where c_i is the number of cells of n-residue i in μ. Partition tuples in the crystal are known as *Kleshchev partitions*.

Note: We can describe normal (not restricted) Kleshchev partition tuples in $B(\lambda)$ as partition tuples μ such that $\mu^{(t)}_{r_t - r_{t+1} + x} < \mu^{(t+1)}_x$ for all $x \geq 1$ and $1 \leq t \leq k-1$.

INPUT:

- `e` – for type $A_{e-1}^{(1)}$ or 0
- `multicharge` – the multicharge sequence r
- `convention` – (default: `'LS'`) the reading convention

EXAMPLES:

We first do an example of a level 1 crystal:

```
sage: C = crystals.KleshchevPartitions(3, [0], convention="left restricted")
sage: C
Kleshchev partitions with e=3
```

(continues on next page)

(continued from previous page)

```
sage: mg = C.highest_weight_vector()
sage: mg
[]
sage: mg.f(0)
[1]
sage: mg.f(1)
sage: mg.f(2)
sage: mg.f_string([0,2,1,0])
[1, 1, 1, 1]
sage: mg.f_string([0,1,2,0])
[2, 2]
sage: GC = C.subcrystal(max_depth=5).digraph()
sage: B = crystals.LSPaths(['A',2,1], [1,0,0])
sage: GB = B.subcrystal(max_depth=5).digraph()
sage: GC.is_isomorphic(GB, edge_labels=True)
True
```

```
>>> from sage.all import *
>>> C = crystals.KleshchevPartitions(Integer(3), [Integer(0)], convention="left␣
↪restricted")
>>> C
Kleshchev partitions with e=3
>>> mg = C.highest_weight_vector()
>>> mg
[]
>>> mg.f(Integer(0))
[1]
>>> mg.f(Integer(1))
>>> mg.f(Integer(2))
>>> mg.f_string([Integer(0),Integer(2),Integer(1),Integer(0)])
[1, 1, 1, 1]
>>> mg.f_string([Integer(0),Integer(1),Integer(2),Integer(0)])
[2, 2]
>>> GC = C.subcrystal(max_depth=Integer(5)).digraph()
>>> B = crystals.LSPaths(['A',Integer(2),Integer(1)], [Integer(1),Integer(0),
↪Integer(0)])
>>> GB = B.subcrystal(max_depth=Integer(5)).digraph()
>>> GC.is_isomorphic(GB, edge_labels=True)
True
```

Now a higher level crystal:

```
sage: C = crystals.KleshchevPartitions(3, [0,2], convention="right restricted")
sage: mg = C.highest_weight_vector()
sage: mg
([], [])
sage: mg.f(0)
([1], [])
sage: mg.f(2)
([], [1])
sage: mg.f_string([0,1,2,0])
([2, 2], [])
```

(continues on next page)

(continued from previous page)

```
sage: mg.f_string([0,2,1,0])
([1, 1, 1, 1], [])
sage: mg.f_string([2,0,1,0])
([2], [2])
sage: GC = C.subcrystal(max_depth=5).digraph()
sage: B = crystals.LSPaths(['A',2,1], [1,0,1])
sage: GB = B.subcrystal(max_depth=5).digraph()
sage: GC.is_isomorphic(GB, edge_labels=True)
True
```

```
>>> from sage.all import *
>>> C = crystals.KleshchevPartitions(Integer(3), [Integer(0),Integer(2)],␣
↪convention="right restricted")
>>> mg = C.highest_weight_vector()
>>> mg
([], [])
>>> mg.f(Integer(0))
([1], [])
>>> mg.f(Integer(2))
([], [1])
>>> mg.f_string([Integer(0),Integer(1),Integer(2),Integer(0)])
([2, 2], [])
>>> mg.f_string([Integer(0),Integer(2),Integer(1),Integer(0)])
([1, 1, 1, 1], [])
>>> mg.f_string([Integer(2),Integer(0),Integer(1),Integer(0)])
([2], [2])
>>> GC = C.subcrystal(max_depth=Integer(5)).digraph()
>>> B = crystals.LSPaths(['A',Integer(2),Integer(1)], [Integer(1),Integer(0),
↪Integer(1)])
>>> GB = B.subcrystal(max_depth=Integer(5)).digraph()
>>> GC.is_isomorphic(GB, edge_labels=True)
True
```

The ordering of the residues gives a different representation of the higher level crystals (but it is still isomorphic):

```
sage: C2 = crystals.KleshchevPartitions(3, [2,0], convention="right restricted")
sage: mg2 = C2.highest_weight_vector()
sage: mg2.f_string([0,1,2,0])
([2], [2])
sage: mg2.f_string([0,2,1,0])
([1, 1, 1], [1])
sage: mg2.f_string([2,0,1,0])
([2, 1], [1])
sage: GC2 = C2.subcrystal(max_depth=5).digraph()
sage: GC.is_isomorphic(GC2, edge_labels=True)
True
```

```
>>> from sage.all import *
>>> C2 = crystals.KleshchevPartitions(Integer(3), [Integer(2),Integer(0)],␣
↪convention="right restricted")
>>> mg2 = C2.highest_weight_vector()
>>> mg2.f_string([Integer(0),Integer(1),Integer(2),Integer(0)])
```

(continues on next page)

(continued from previous page)

```
([2], [2])
>>> mg2.f_string([Integer(0),Integer(2),Integer(1),Integer(0)])
([1, 1, 1], [1])
>>> mg2.f_string([Integer(2),Integer(0),Integer(1),Integer(0)])
([2, 1], [1])
>>> GC2 = C2.subcrystal(max_depth=Integer(5)).digraph()
>>> GC.is_isomorphic(GC2, edge_labels=True)
True
```

class sage.combinat.partition_kleshchev.**KleshchevPartitions_size**(*e*, *multicharge=(0,)*, *size=0*, *convention='RS'*)

Bases: *KleshchevPartitions*

Kleshchev partitions of a fixed size.

Element

alias of *KleshchevPartitionTuple*

5.1.168 Partition Shifting Algebras

This module contains families of operators that act on partitions or, more generally, integer sequences. In particular, this includes Young's raising operators R_{ij}, which act on integer sequences by adding 1 to the i-th entry and subtracting 1 to the j-th entry. A special case is acting on partitions.

AUTHORS:

- Matthew Lancellotti, George H. Seelinger (2018): Initial version

class sage.combinat.partition_shifting_algebras.**ShiftingOperatorAlgebra**(*base_ring=Univariate Polynomial Ring in t over Rational Field*, *prefix='S'*)

Bases: *CombinatorialFreeModule*

An algebra of shifting operators.

Let R be a commutative ring. The algebra of shifting operators is isomorphic as an R-algebra to the Laurent polynomial ring $R[x_1^\pm, x_2^\pm, x_3^\pm, \ldots]$. Moreover, the monomials of the shifting operator algebra act on any integer sequence $\lambda = (\lambda_1, \lambda_2, \ldots, \lambda_\ell)$ as follows. Let S be our algebra of shifting operators. Then, for any monomial $s = x_1^{a_1} x_2^{a_2} \cdots x_r^{a_r} \in S$ where $a_i \in \mathbf{Z}$ and $r \geq \ell$, we get that $s.\lambda = (\lambda_1 + a_1, \lambda_2 + a_2, \ldots, \lambda_r + a_r)$ where we pad λ with $r - \ell$ zeros. In particular, we can recover Young's raising operator, R_{ij}, for $i < j$, acting on partitions by having $\frac{x_i}{x_j}$ act on a partition λ.

One can extend the action of these shifting operators to a basis of symmetric functions, but at the expense of no longer actually having a well-defined operator. Formally, to extend the action of the shifting operators on a symmetric function basis $B = \{b_\lambda\}_\lambda$, we define an R-module homomorphism $\phi : R[x_1^\pm, x_2^\pm, \ldots] \to B$. Then we compute $x_1^{a_1} \cdots x_r^{a_r}.b_\lambda$ by first computing $(x_1^{a_1} \cdots x_r^{a_r})x_1^{\lambda_1} \cdots x_\ell^{\lambda_\ell}$ and then applying ϕ to the result. For examples of what this looks like with specific bases, see below.

This implementation is consistent with how many references work formally with raising operators. For instance, see exposition surrounding [BMPS2018] Equation (4.1).

We follow the following convention for creating elements: `S(1, 0, -1, 2)` is the shifting operator that raises the first part by 1, lowers the third part by 1, and raises the fourth part by 2.

In addition to acting on partitions (or any integer sequence), the shifting operators can also act on symmetric functions in a basis B when a conversion to B has been registered, preferably using *build_and_register_conversion()*.

For a definition of raising operators, see [BMPS2018] Definition 2.1. See *ij()* to create operators using the notation in [BMPS2018].

INPUT:

- `base_ring` – (default: `QQ['t']`) the base ring
- `prefix` – (default: `'S'`) the label for the shifting operators

EXAMPLES:

```
sage: S = ShiftingOperatorAlgebra()

sage: elm = S[1, -1, 2]; elm
S(1, -1, 2)
sage: elm([5, 4])
[([6, 3, 2], 1)]
```

```
>>> from sage.all import *
>>> S = ShiftingOperatorAlgebra()

>>> elm = S[Integer(1), -Integer(1), Integer(2)]; elm
S(1, -1, 2)
>>> elm([Integer(5), Integer(4)])
[([6, 3, 2], 1)]
```

The shifting operator monomials can act on a complete homogeneous symmetric function or a Schur function:

```
sage: s = SymmetricFunctions(QQ['t']).s()
sage: h = SymmetricFunctions(QQ['t']).h()

sage: elm(s[5, 4])
s[6, 3, 2]
sage: elm(h[5, 4])
h[6, 3, 2]

sage: S[1, -1](s[5, 4])
s[6, 3]
sage: S[1, -1](h[5, 4])
h[6, 3]
```

```
>>> from sage.all import *
>>> s = SymmetricFunctions(QQ['t']).s()
>>> h = SymmetricFunctions(QQ['t']).h()
```

(continues on next page)

(continued from previous page)

```
>>> elm(s[Integer(5), Integer(4)])
s[6, 3, 2]
>>> elm(h[Integer(5), Integer(4)])
h[6, 3, 2]

>>> S[Integer(1), -Integer(1)](s[Integer(5), Integer(4)])
s[6, 3]
>>> S[Integer(1), -Integer(1)](h[Integer(5), Integer(4)])
h[6, 3]
```

In fact, we can extend this action by linearity:

```
sage: elm = (1 - S[1,-1]) * (1 - S[4])
sage: elm == S([]) - S([1, -1]) - S([4]) + S([5, -1])
True
sage: elm(s[2, 2, 1])
s[2, 2, 1] - s[3, 1, 1] - s[6, 2, 1] + s[7, 1, 1]

sage: elm = (1 - S[1,-1]) * (1 - S[0,1,-1])
sage: elm == 1 - S[0,1,-1] - S[1,-1] + S[1,0,-1]
True
sage: elm(s[2, 2, 1])
s[2, 2, 1] - s[3, 1, 1] + s[3, 2]
```

```
>>> from sage.all import *
>>> elm = (Integer(1) - S[Integer(1),-Integer(1)]) * (Integer(1) - S[Integer(4)])
>>> elm == S([]) - S([Integer(1), -Integer(1)]) - S([Integer(4)]) + S([Integer(5),
↪ -Integer(1)])
True
>>> elm(s[Integer(2), Integer(2), Integer(1)])
s[2, 2, 1] - s[3, 1, 1] - s[6, 2, 1] + s[7, 1, 1]

>>> elm = (Integer(1) - S[Integer(1),-Integer(1)]) * (Integer(1) - S[Integer(0),
↪Integer(1),-Integer(1)])
>>> elm == Integer(1) - S[Integer(0),Integer(1),-Integer(1)] - S[Integer(1),-
↪Integer(1)] + S[Integer(1),Integer(0),-Integer(1)]
True
>>> elm(s[Integer(2), Integer(2), Integer(1)])
s[2, 2, 1] - s[3, 1, 1] + s[3, 2]
```

The algebra also comes equipped with homomorphisms to various symmetric function bases; these homomorphisms are how the action of `S` on the specific symmetric function bases is implemented:

```
sage: elm = S([3,1,2]); elm
S(3, 1, 2)
sage: h(elm)
h[3, 2, 1]
sage: s(elm)
0
```

```
>>> from sage.all import *
>>> elm = S([Integer(3),Integer(1),Integer(2)]); elm
S(3, 1, 2)
>>> h(elm)
h[3, 2, 1]
>>> s(elm)
0
```

However, not all homomorphisms are equivalent, so the action is basis dependent:

```
sage: elm = S([3,2,1]); elm
S(3, 2, 1)
sage: h(elm)
h[3, 2, 1]
sage: s(elm)
s[3, 2, 1]
sage: s(elm) == s(h(elm))
False
```

```
>>> from sage.all import *
>>> elm = S([Integer(3),Integer(2),Integer(1)]); elm
S(3, 2, 1)
>>> h(elm)
h[3, 2, 1]
>>> s(elm)
s[3, 2, 1]
>>> s(elm) == s(h(elm))
False
```

We can also use raising operators to implement the Jacobi-Trudi identity:

```
sage: op = (1-S[(1,-1)]) * (1-S[(1,0,-1)]) * (1-S[(0,1,-1)])
sage: s(op(h[3,2,1]))
s[3, 2, 1]
```

```
>>> from sage.all import *
>>> op = (Integer(1)-S[(Integer(1),-Integer(1))]) * (Integer(1)-S[(Integer(1),
↪Integer(0),-Integer(1))]) * (Integer(1)-S[(Integer(0),Integer(1),-Integer(1))])
>>> s(op(h[Integer(3),Integer(2),Integer(1)]))
s[3, 2, 1]
```

class Element

Bases: `IndexedFreeModuleElement`

An element of a *ShiftingOperatorAlgebra*.

build_and_register_conversion(*support_map*, *codomain*)

Build a module homomorphism from a map sending integer sequences to `codomain` and registers the result into Sage's conversion model.

The intended use is to define a morphism from `self` to a basis B of symmetric functions that will be used by *ShiftingOperatorAlgebra* to define the action of the operators on B.

Note

The actions on the complete homogeneous symmetric functions and on the Schur functions by morphisms are already registered.

Warning

Because `ShiftingOperatorAlgebra` inherits from `UniqueRepresentation`, once you register a conversion, this will apply to all instances of `ShiftingOperatorAlgebra` over the same base ring with the same prefix.

INPUT:

- `support_map` – a map from integer sequences to `codomain`
- `codomain` – the codomain of `support_map`, usually a basis of symmetric functions

EXAMPLES:

```
sage: S = ShiftingOperatorAlgebra(QQ)
sage: sym = SymmetricFunctions(QQ)
sage: p = sym.p()
sage: zero_map = lambda part: p.zero()
sage: S.build_and_register_conversion(zero_map, p)
sage: p(2*S([1,0,-1]) + S([2,1,0]) - 3*S([0,1,3]))
0
sage: op = S((1, -1))
sage: op(2*p[4,3] + 5*p[2,2] + 7*p[2]) == p.zero()
True
```

```
>>> from sage.all import *
>>> S = ShiftingOperatorAlgebra(QQ)
>>> sym = SymmetricFunctions(QQ)
>>> p = sym.p()
>>> zero_map = lambda part: p.zero()
>>> S.build_and_register_conversion(zero_map, p)
>>> p(Integer(2)*S([Integer(1),Integer(0),-Integer(1)]) + S([Integer(2),
↪Integer(1),Integer(0)]) - Integer(3)*S([Integer(0),Integer(1),Integer(3)]))
0
>>> op = S((Integer(1), -Integer(1)))
>>> op(Integer(2)*p[Integer(4),Integer(3)] + Integer(5)*p[Integer(2),
↪Integer(2)] + Integer(7)*p[Integer(2)]) == p.zero()
True
```

For a more illustrative example, we can implement a simple (but not mathematically justified!) conversion on the monomial basis:

```
sage: S = ShiftingOperatorAlgebra(QQ)
sage: sym = SymmetricFunctions(QQ)
sage: m = sym.m()
sage: def supp_map(gamma):
....:     gsort = sorted(gamma, reverse=True)
```

(continues on next page)

(continued from previous page)

```
....:     return m(gsort) if gsort in Partitions() else m.zero()
sage: S.build_and_register_conversion(supp_map, m)
sage: op = S.ij(0, 1)
sage: op(2*m[4,3] + 5*m[2,2] + 7*m[2]) == 2*m[5, 2] + 5*m[3, 1]
True
```

```
>>> from sage.all import *
>>> S = ShiftingOperatorAlgebra(QQ)
>>> sym = SymmetricFunctions(QQ)
>>> m = sym.m()
>>> def supp_map(gamma):
...     gsort = sorted(gamma, reverse=True)
...     return m(gsort) if gsort in Partitions() else m.zero()
>>> S.build_and_register_conversion(supp_map, m)
>>> op = S.ij(Integer(0), Integer(1))
>>> op(Integer(2)*m[Integer(4),Integer(3)] + Integer(5)*m[Integer(2),
↪Integer(2)] + Integer(7)*m[Integer(2)]) == Integer(2)*m[Integer(5),␣
↪Integer(2)] + Integer(5)*m[Integer(3), Integer(1)]
True
```

ij(*i*, *j*)

Return the raising operator R_{ij} as notated in [BMPS2018] Definition 2.1.

Shorthand element constructor that allows you to create raising operators using the familiar R_{ij} notation found in [BMPS2018] Definition 2.1, with the exception that indices here are 0-based, not 1-based.

EXAMPLES:

Create the raising operator which raises part 0 and lowers part 2 (indices are 0-based):

```
sage: R = ShiftingOperatorAlgebra()
sage: R.ij(0, 2)
S(1, 0, -1)
```

```
>>> from sage.all import *
>>> R = ShiftingOperatorAlgebra()
>>> R.ij(Integer(0), Integer(2))
S(1, 0, -1)
```

one_basis()

Return the index of the basis element for 1.

EXAMPLES:

```
sage: S = ShiftingOperatorAlgebra()
sage: S.one_basis()
()
```

```
>>> from sage.all import *
>>> S = ShiftingOperatorAlgebra()
>>> S.one_basis()
()
```

product_on_basis(*x*, *y*)

Return the product of basis elements indexed by x and y.

EXAMPLES:

```
sage: S = ShiftingOperatorAlgebra()
sage: S.product_on_basis((0, 5, 2), (3, 2, -2, 5))
S(3, 7, 0, 5)
sage: S.product_on_basis((1, -2, 0, 3, -6), (-1, 2, 2))
S(0, 0, 2, 3, -6)
sage: S.product_on_basis((1, -2, -2), (-1, 2, 2))
S()
```

```
>>> from sage.all import *
>>> S = ShiftingOperatorAlgebra()
>>> S.product_on_basis((Integer(0), Integer(5), Integer(2)), (Integer(3),␣
↪Integer(2), -Integer(2), Integer(5)))
S(3, 7, 0, 5)
>>> S.product_on_basis((Integer(1), -Integer(2), Integer(0), Integer(3), -
↪Integer(6)), (-Integer(1), Integer(2), Integer(2)))
S(0, 0, 2, 3, -6)
>>> S.product_on_basis((Integer(1), -Integer(2), -Integer(2)), (-Integer(1),␣
↪Integer(2), Integer(2)))
S()
```

class sage.combinat.partition_shifting_algebras.**ShiftingSequenceSpace**

Bases: Singleton, Parent

A helper for *ShiftingOperatorAlgebra* that contains all tuples with entries in $\mathbf{Z}$ of finite support with no trailing 0's.

EXAMPLES:

```
sage: from sage.combinat.partition_shifting_algebras import ShiftingSequenceSpace
sage: S = ShiftingSequenceSpace()
sage: (1, -1) in S
True
sage: (1, -1, 0, 9) in S
True
sage: [1, -1] in S
False
sage: (0.5, 1) in S
False
```

```
>>> from sage.all import *
>>> from sage.combinat.partition_shifting_algebras import ShiftingSequenceSpace
>>> S = ShiftingSequenceSpace()
>>> (Integer(1), -Integer(1)) in S
True
>>> (Integer(1), -Integer(1), Integer(0), Integer(9)) in S
True
>>> [Integer(1), -Integer(1)] in S
False
>>> (RealNumber('0.5'), Integer(1)) in S
False
```

check (*seq*)

Verify that `seq` is a valid shifting sequence.

If it is not, raise a `ValueError`.

EXAMPLES:

```
sage: from sage.combinat.partition_shifting_algebras import ShiftingSequenceSpace
sage: S = ShiftingSequenceSpace()
sage: S.check((1, -1))
sage: S.check((1, -1, 0, 9))
sage: S.check([1, -1])
Traceback (most recent call last):
...
ValueError: invalid index [1, -1]
sage: S.check((0.5, 1))
Traceback (most recent call last):
...
ValueError: invalid index (0.500000000000000, 1)
```

```
>>> from sage.all import *
>>> from sage.combinat.partition_shifting_algebras import ShiftingSequenceSpace
>>> S = ShiftingSequenceSpace()
>>> S.check((Integer(1), -Integer(1)))
>>> S.check((Integer(1), -Integer(1), Integer(0), Integer(9)))
>>> S.check([Integer(1), -Integer(1)])
Traceback (most recent call last):
...
ValueError: invalid index [1, -1]
>>> S.check((RealNumber('0.5'), Integer(1)))
Traceback (most recent call last):
...
ValueError: invalid index (0.500000000000000, 1)
```

5.1.169 Partition tuples

A *PartitionTuple* is a tuple of partitions. That is, an ordered k-tuple of partitions $\mu = (\mu^{(1)}, \mu^{(2)}, ..., \mu^{(k)})$. If

$$n = |\mu| = |\mu^{(1)}| + |\mu^{(2)}| + \cdots + |\mu^{(k)}|$$

then we say that μ is a k-partition of n.

In representation theory partition tuples arise as the natural indexing set for the ordinary irreducible representations of:

- the wreath products of cyclic groups with symmetric groups,
- the Ariki-Koike algebras, or the cyclotomic Hecke algebras of the complex reflection groups of type $G(r, 1, n)$,
- the degenerate cyclotomic Hecke algebras of type $G(r, 1, n)$.

When these algebras are not semisimple, partition tuples index an important class of modules for the algebras, which are generalisations of the Specht modules of the symmetric groups.

Tuples of partitions also index the standard basis of the higher level combinatorial Fock spaces. As a consequence, the combinatorics of partition tuples encapsulates the canonical bases of crystal graphs for the irreducible integrable highest weight modules of the (quantized) affine special linear groups and the (quantized) affine general linear groups. By the categorification theorems of Ariki, Varagnolo-Vasserot, Stroppel-Webster and others, in characteristic zero the degenerate and non-degenerate cyclotomic Hecke algebras, via their Khovanov-Lauda-Rouquier grading, categorify the canonical bases of the quantum affine special and general linear groups.

Partitions are naturally in bijection with 1-tuples of partitions. Most of the combinatorial operations defined on partitions extend to partition tuples in a meaningful way. For example, the semisimple branching rules for the Specht modules are described by adding and removing cells from partition tuples and the modular branching rules correspond to adding and removing good and cogood nodes, which is the underlying combinatorics for the associated crystal graphs.

A `PartitionTuple` belongs to `PartitionTuples` and its derived classes. `PartitionTuples` is the parent class for all partitions tuples. Four different classes of tuples of partitions are currently supported:

- `PartitionTuples(level=k,size=n)` are k-tuple of partitions of n.
- `PartitionTuples(level=k)` are k-tuple of partitions.
- `PartitionTuples(size=n)` are tuples of partitions of n.
- `PartitionTuples()` are tuples of partitions.

Note

As with `Partitions`, in sage the cells, or nodes, of partition tuples are 0-based. For example, the (lexicographically) first cell in any non-empty partition tuple is $[0, 0, 0]$.

EXAMPLES:

```
sage: PartitionTuple([[2,2],[1,1],[2]]).cells()
[(0, 0, 0), (0, 0, 1), (0, 1, 0), (0, 1, 1), (1, 0, 0), (1, 1, 0), (2, 0, 0), (2, 0,
→ 1)]
```

```
>>> from sage.all import *
>>> PartitionTuple([[Integer(2),Integer(2)],[Integer(1),Integer(1)],[Integer(2)]]).
→cells()
[(0, 0, 0), (0, 0, 1), (0, 1, 0), (0, 1, 1), (1, 0, 0), (1, 1, 0), (2, 0, 0), (2, 0,
→ 1)]
```

Note

Many `PartitionTuple` methods take the individual coordinates (k, r, c) as their arguments, here k is the component, r is the row index and c is the column index. If your coordinates are in the form `(k,r,c)` then use Python's *-operator.

EXAMPLES:

```
sage: mu=PartitionTuple([[1,1],[2],[2,1]])
sage: [ mu.arm_length(*c) for c in mu.cells()]
[0, 0, 1, 0, 1, 0, 0]
```

```
>>> from sage.all import *
>>> mu=PartitionTuple([[Integer(1),Integer(1)],[Integer(2)],[Integer(2),
→Integer(1)]])
>>> [ mu.arm_length(*c) for c in mu.cells()]
[0, 0, 1, 0, 1, 0, 0]
```

Warning

In sage, if `mu` is a partition tuple then `mu[k]` most naturally refers to the k-th component of `mu`, so we use the convention of the (k, r, c)-th cell in a partition tuple refers to the cell in component k, row r, and column c. In the literature, the cells of a partition tuple are usually written in the form (r, c, k), where r is the row index, c is the column index, and k is the component index.

 ([1], [1, 1]),
 ([], [3]),
 ([], [2, 1]),
 ([], [1, 1, 1])]
```

```
>>> from sage.all import *
>>> PartitionTuples().an_element()
```

(continues on next page)

(continued from previous page)

```
([1, 1, 1, 1], [2, 1, 1], [3, 1], [4])
>>> PartitionTuples(Integer(4)).an_element()
([], [1], [2], [3])
>>> PartitionTuples(size=Integer(5)).an_element()
([1], [1], [1], [1], [1])
>>> PartitionTuples(Integer(4),Integer(5)).an_element()
([1], [], [], [4])
>>> PartitionTuples(Integer(3),Integer(2))[:]                                    ␣
↪              # needs sage.libs.flint
[([2], [], []),
 ([1, 1], [], []),
 ([1], [1], []),
 ([1], [], [1]),
 ([], [2], []),
 ([], [1, 1], []),
 ([], [1], [1]),
 ([], [], [2]),
 ([], [], [1, 1])]
>>> PartitionTuples(Integer(2),Integer(3)).list()                                 ␣
↪              # needs sage.libs.flint
[([3], []),
 ([2, 1], []),
 ([1, 1, 1], []),
 ([2], [1]),
 ([1, 1], [1]),
 ([1], [2]),
 ([1], [1, 1]),
 ([], [3]),
 ([], [2, 1]),
 ([], [1, 1, 1])]
```

One tuples of partitions are naturally in bijection with partitions and, as far as possible, partition tuples attempts to identify one tuples with partitions:

```
sage: Partition([4,3]) == PartitionTuple([[4,3]])
True
sage: Partition([4,3]) == PartitionTuple([4,3])
True
sage: PartitionTuple([4,3])
[4, 3]
sage: Partition([4,3]) in PartitionTuples()
True
```

```
>>> from sage.all import *
>>> Partition([Integer(4),Integer(3)]) == PartitionTuple([[Integer(4),Integer(3)]])
True
>>> Partition([Integer(4),Integer(3)]) == PartitionTuple([Integer(4),Integer(3)])
True
>>> PartitionTuple([Integer(4),Integer(3)])
[4, 3]
>>> Partition([Integer(4),Integer(3)]) in PartitionTuples()
True
```

Partition tuples come equipped with many of the corresponding methods for partitions. For example, it is possible to add and remove cells, to conjugate partition tuples, to work with their diagrams, compare partition tuples in dominance and so:

```
sage: PartitionTuple([[4,1],[],[2,2,1],[3]]).pp()
   ****   -   **   ***
   *          **
              *
sage: PartitionTuple([[4,1],[],[2,2,1],[3]]).conjugate()

Every partition tuple behaves every much like a tuple of partitions:

```
sage: mu = PartitionTuple([[4,1],[],[2,2,1],[3]])
sage: [ nu for nu in mu ]
[[4, 1], [], [2, 2, 1], [3]]
sage: Set([ type(nu) for nu in mu ])
{<class 'sage.combinat.partition.Partitions_all_with_category.element_class'>}
sage: mu[2][2]
1
sage: mu[3]
[3]
sage: mu.components()
[[4, 1], [], [2, 2, 1], [3]]
sage: mu.components() == [ nu for nu in mu ]
True
sage: mu[0]
[4, 1]
sage: mu[1]
[]
sage: mu[2]
[2, 2, 1]
sage: mu[2][0]
2
sage: mu[2][1]
2
sage: mu.level()
4
sage: len(mu)
4
sage: mu.cells()
[(0, 0, 0), (0, 0, 1), (0, 0, 2), (0, 0, 3), (0, 1, 0), (2, 0, 0), (2, 0, 1),
 (2, 1, 0), (2, 1, 1), (2, 2, 0), (3, 0, 0), (3, 0, 1), (3, 0, 2)]

>>> mu.removable_cells()
[(0, 0, 3), (0, 1, 0), (2, 1, 1), (2, 2, 0), (3, 0, 2)]
```

Attached to a partition tuple is the corresponding Young, or parabolic, subgroup:

```
sage: mu.young_subgroup()                                                       #␣
↪needs sage.groups
Permutation Group with generators
 [(), (12,13), (11,12), (8,9), (6,7), (3,4), (2,3), (1,2)]
sage: mu.young_subgroup_generators()                                            #␣
↪needs sage.groups
[1, 2, 3, 6, 8, 11, 12]
```

```
>>> from sage.all import *
>>> mu.young_subgroup()                                                         #␣
↪needs sage.groups
Permutation Group with generators
 [(), (12,13), (11,12), (8,9), (6,7), (3,4), (2,3), (1,2)]
```

(continues on next page)

(continued from previous page)

```
>>> mu.young_subgroup_generators()                                          #␣
↪needs sage.groups
[1, 2, 3, 6, 8, 11, 12]
```

class sage.combinat.partition_tuple.**PartitionTuple**(*parent*, *mu*)

Bases: *CombinatorialElement*

A tuple of *Partition*.

A tuple of partition comes equipped with many of methods available to partitions. The `level` of the PartitionTuple is the length of the tuple.

This is an ordered k-tuple of partitions $\mu = (\mu^{(1)}, \mu^{(2)}, ..., \mu^{(k)})$. If

$$n = |\mu| = |\mu^{(1)}| + |\mu^{(2)}| + \cdots + |\mu^{(k)}|$$

then μ is a k-partition of n.

In representation theory PartitionTuples arise as the natural indexing set for the ordinary irreducible representations of:

- the wreath products of cyclic groups with symmetric groups
- the Ariki-Koike algebras, or the cyclotomic Hecke algebras of the complex reflection groups of type $G(r, 1, n)$
- the degenerate cyclotomic Hecke algebras of type $G(r, 1, n)$

When these algebras are not semisimple, partition tuples index an important class of modules for the algebras which are generalisations of the Specht modules of the symmetric groups.

Tuples of partitions also index the standard basis of the higher level combinatorial Fock spaces. As a consequence, the combinatorics of partition tuples encapsulates the canonical bases of crystal graphs for the irreducible integrable highest weight modules of the (quantized) affine special linear groups and the (quantized) affine general linear groups. By the categorification theorems of Ariki, Varagnolo-Vasserot, Stroppel-Webster and others, in characteristic zero the degenerate and non-degenerate cyclotomic Hecke algebras, via their Khovanov-Lauda-Rouquier grading, categorify the canonical bases of the quantum affine special and general linear groups.

Partitions are naturally in bijection with 1-tuples of partitions. Most of the combinatorial operations defined on partitions extend to PartitionTuples in a meaningful way. For example, the semisimple branching rules for the Specht modules are described by adding and removing cells from partition tuples and the modular branching rules correspond to adding and removing good and cogood nodes, which is the underlying combinatorics for the associated crystal graphs.

Warning

In the literature, the cells of a partition tuple are usually written in the form (r, c, k), where r is the row index, c is the column index, and k is the component index. In sage, if `mu` is a partition tuple then `mu[k]` most naturally refers to the k-th component of `mu`, so we use the convention of the (k, r, c)-th cell in a partition tuple refers to the cell in component k, row r, and column c.

INPUT:

Anything which can reasonably be interpreted as a tuple of partitions. That is, a list or tuple of partitions or valid input to *Partition*.

EXAMPLES:

```
sage: mu=PartitionTuple( [[3,2],[2,1],[],[1,1,1,1]] ); mu
([3, 2], [2, 1], [], [1, 1, 1, 1])
sage: nu=PartitionTuple( ([3,2],[2,1],[],[1,1,1,1]) ); nu
([3, 2], [2, 1], [], [1, 1, 1, 1])

See also

- *PartitionTuples*
- *Partitions*

Element

alias of *Partition*

add_cell(*k*, *r*, *c*)

Return the partition tuple obtained by adding a cell in row r, column c, and component k.

This does not change self.

EXAMPLES:

```
sage: PartitionTuple([[1,1],[4,3],[2,1,1]]).add_cell(0,0,1)
([2, 1], [4, 3], [2, 1, 1])
```

```
>>> from sage.all import *
>>> PartitionTuple([[Integer(1),Integer(1)],[Integer(4),Integer(3)],
↪[Integer(2),Integer(1),Integer(1)]]).add_cell(Integer(0),Integer(0),
↪Integer(1))
([2, 1], [4, 3], [2, 1, 1])
```

addable_cells()

Return a list of the removable cells of this partition tuple.

All indices are of the form (k, r, c), where r is the row-index, c is the column index and k is the component.

EXAMPLES:

```
sage: PartitionTuple([[1,1],[2],[2,1]]).addable_cells()
[(0, 0, 1), (0, 2, 0), (1, 0, 2), (1, 1, 0), (2, 0, 2), (2, 1, 1), (2, 2, 0)]
sage: PartitionTuple([[1,1],[4,3],[2,1,1]]).addable_cells()
[(0, 0, 1), (0, 2, 0), (1, 0, 4), (1, 1, 3), (1, 2, 0), (2, 0, 2), (2, 1, 1),
↪(2, 3, 0)]
```

```
>>> from sage.all import *
>>> PartitionTuple([[Integer(1),Integer(1)],[Integer(2)],[Integer(2),
↪Integer(1)]]).addable_cells()
[(0, 0, 1), (0, 2, 0), (1, 0, 2), (1, 1, 0), (2, 0, 2), (2, 1, 1), (2, 2, 0)]
>>> PartitionTuple([[Integer(1),Integer(1)],[Integer(4),Integer(3)],
↪[Integer(2),Integer(1),Integer(1)]]).addable_cells()
[(0, 0, 1), (0, 2, 0), (1, 0, 4), (1, 1, 3), (1, 2, 0), (2, 0, 2), (2, 1, 1),
↪(2, 3, 0)]
```

arm_length(*k*, *r*, *c*)

Return the length of the arm of cell `(k, r, c)` in `self`.

INPUT:

- `k` – the component
- `r` – the row
- `c` – the cell

OUTPUT: the arm length as an integer

The arm of cell `(k, r, c)` is the number of cells in the `k`-th component which are to the right of the cell in row `r` and column `c`.

EXAMPLES:

```
sage: PartitionTuple([[],[2,1],[2,2,1],[3]]).arm_length(2,0,0)
1
sage: PartitionTuple([[],[2,1],[2,2,1],[3]]).arm_length(2,0,1)
0
sage: PartitionTuple([[],[2,1],[2,2,1],[3]]).arm_length(2,2,0)
0
```

```
>>> from sage.all import *
>>> PartitionTuple([[],[Integer(2),Integer(1)],[Integer(2),Integer(2),
↪Integer(1)],[Integer(3)]]).arm_length(Integer(2),Integer(0),Integer(0))
1
>>> PartitionTuple([[],[Integer(2),Integer(1)],[Integer(2),Integer(2),
↪Integer(1)],[Integer(3)]]).arm_length(Integer(2),Integer(0),Integer(1))
0
>>> PartitionTuple([[],[Integer(2),Integer(1)],[Integer(2),Integer(2),
↪Integer(1)],[Integer(3)]]).arm_length(Integer(2),Integer(2),Integer(0))
0
```

block(*e*, *multicharge*)

Return a dictionary β that determines the block associated to the partition `self` and the *`quantum_characteristic()`* `e`.

INPUT:

- `e` – the quantum characteristic
- `multicharge` – the multicharge (default: $(0,)$)

OUTPUT:

- a dictionary giving the multiplicities of the residues in the partition tuple `self`

In more detail, the value `beta[i]` is equal to the number of nodes of residue `i`. This corresponds to the positive root

$$\sum_{i\in I}\beta_i\alpha_i\in Q^+,$$

a element of the positive root lattice of the corresponding Kac-Moody algebra. See [DJM1998] and [BK2009] for more details.

This is a useful statistics because two Specht modules for a cyclotomic Hecke algebra of type A belong to the same block if and only if they correspond to same element β of the root lattice, given above.

We return a dictionary because when the quantum characteristic is 0, the Cartan type is A_∞, in which case the simple roots are indexed by the integers.

EXAMPLES:

```
sage: PartitionTuple([[2,2],[2,2]]).block(0,(0,0))
{-1: 2, 0: 4, 1: 2}
sage: PartitionTuple([[2,2],[2,2]]).block(2,(0,0))
{0: 4, 1: 4}
sage: PartitionTuple([[2,2],[2,2]]).block(2,(0,1))
{0: 4, 1: 4}
sage: PartitionTuple([[2,2],[2,2]]).block(3,(0,2))
{0: 3, 1: 2, 2: 3}
sage: PartitionTuple([[2,2],[2,2]]).block(3,(0,2))
{0: 3, 1: 2, 2: 3}
sage: PartitionTuple([[2,2],[2,2]]).block(3,(3,2))
{0: 3, 1: 2, 2: 3}
sage: PartitionTuple([[2,2],[2,2]]).block(4,(0,0))
{0: 4, 1: 2, 3: 2}
```

```
>>> from sage.all import *
>>> PartitionTuple([[Integer(2),Integer(2)],[Integer(2),Integer(2)]]).
↪block(Integer(0),(Integer(0),Integer(0)))
{-1: 2, 0: 4, 1: 2}
>>> PartitionTuple([[Integer(2),Integer(2)],[Integer(2),Integer(2)]]).
↪block(Integer(2),(Integer(0),Integer(0)))
{0: 4, 1: 4}
>>> PartitionTuple([[Integer(2),Integer(2)],[Integer(2),Integer(2)]]).
↪block(Integer(2),(Integer(0),Integer(1)))
{0: 4, 1: 4}
>>> PartitionTuple([[Integer(2),Integer(2)],[Integer(2),Integer(2)]]).
↪block(Integer(3),(Integer(0),Integer(2)))
{0: 3, 1: 2, 2: 3}
>>> PartitionTuple([[Integer(2),Integer(2)],[Integer(2),Integer(2)]]).
↪block(Integer(3),(Integer(0),Integer(2)))
{0: 3, 1: 2, 2: 3}
>>> PartitionTuple([[Integer(2),Integer(2)],[Integer(2),Integer(2)]]).
↪block(Integer(3),(Integer(3),Integer(2)))
{0: 3, 1: 2, 2: 3}
>>> PartitionTuple([[Integer(2),Integer(2)],[Integer(2),Integer(2)]]).
↪block(Integer(4),(Integer(0),Integer(0)))
{0: 4, 1: 2, 3: 2}
```

cells()

Return the coordinates of the cells of `self`. Coordinates are given as (component index, row index, column index) and are 0 based.

EXAMPLES:

```
sage: PartitionTuple([[2,1],[1],[1,1,1]]).cells()
[(0, 0, 0), (0, 0, 1), (0, 1, 0), (1, 0, 0), (2, 0, 0), (2, 1, 0), (2, 2, 0)]
```

```
>>> from sage.all import *
>>> PartitionTuple([[Integer(2),Integer(1)],[Integer(1)],[Integer(1),
```

(continues on next page)

(continued from previous page)

```
↪Integer(1),Integer(1)]]).cells()
[(0, 0, 0), (0, 0, 1), (0, 1, 0), (1, 0, 0), (2, 0, 0), (2, 1, 0), (2, 2, 0)]
```

components()

Return a list containing the shape of this partition.

This function exists in order to give a uniform way of iterating over the "components" of partition tuples of level 1 (partitions) and for higher levels.

EXAMPLES:

```
sage: for t in PartitionTuple([[2,1],[3,2],[3]]).components():
....:     print('%s\n' % t.ferrers_diagram())
**
*

***
**

***

sage: for t in PartitionTuple([3,2]).components():
....:     print('%s\n' % t.ferrers_diagram())
***
**
```

```
>>> from sage.all import *
>>> for t in PartitionTuple([[Integer(2),Integer(1)],[Integer(3),Integer(2)],
↪[Integer(3)]]).components():
...     print('%s\n' % t.ferrers_diagram())
**
*
<BLANKLINE>
***
**
<BLANKLINE>
***
<BLANKLINE>
>>> for t in PartitionTuple([Integer(3),Integer(2)]).components():
...     print('%s\n' % t.ferrers_diagram())
***
**
```

conjugate()

Return the conjugate partition tuple of `self`.

The conjugate partition tuple is obtained by reversing the order of the components and then swapping the rows and columns in each component.

EXAMPLES:

```
sage: PartitionTuple([[2,1],[1],[1,1,1]]).conjugate()
([3], [1], [2, 1])
```

```
>>> from sage.all import *
>>> PartitionTuple([[Integer(2),Integer(1)],[Integer(1)],[Integer(1),
↪Integer(1),Integer(1)]]).conjugate()
([3], [1], [2, 1])
```

contains(*mu*)

Return `True` if this partition tuple contains μ.

If $\lambda = (\lambda^{(1)}, \ldots, \lambda^{(l)})$ and $\mu = (\mu^{(1)}, \ldots, \mu^{(m)})$ are two partition tuples then λ contains μ if $m \leq l$ and $\mu^{(i)}_r \leq \lambda^{(i)}_r$ for $1 \leq i \leq m$ and $r \geq 0$.

EXAMPLES:

```
sage: PartitionTuple([[1,1],[2],[2,1]]).contains( PartitionTuple([[1,1],[2],
↪[2,1]]) )
True
```

```
>>> from sage.all import *
>>> PartitionTuple([[Integer(1),Integer(1)],[Integer(2)],[Integer(2),
↪Integer(1)]]).contains( PartitionTuple([[Integer(1),Integer(1)],
↪[Integer(2)],[Integer(2),Integer(1)]]) )
True
```

content(*k*, *r*, *c*, *multicharge*)

Return the content of the cell.

Let m_k = `multicharge[k]`, then the content of a cell is $m_k + c - r$.

If the `multicharge` is a list of integers then it simply offsets the values of the contents in each component. On the other hand, if the `multicharge` belongs to $\mathbf{Z}/e\mathbf{Z}$ then the corresponding e-residue is returned (that is, the content mod e).

As with the content method for partitions, the content of a cell does not technically depend on the partition tuple, but this method is included because it is often useful.

EXAMPLES:

```
sage: PartitionTuple([[2,1],[2],[1,1,1]]).content(0,1,0, [0,0,0])
-1
sage: PartitionTuple([[2,1],[2],[1,1,1]]).content(0,1,0, [1,0,0])
0
sage: PartitionTuple([[2,1],[2],[1,1,1]]).content(2,1,0, [0,0,0])
-1
```

```
>>> from sage.all import *
>>> PartitionTuple([[Integer(2),Integer(1)],[Integer(2)],[Integer(1),
↪Integer(1),Integer(1)]]).content(Integer(0),Integer(1),Integer(0),␣
↪[Integer(0),Integer(0),Integer(0)])
-1
>>> PartitionTuple([[Integer(2),Integer(1)],[Integer(2)],[Integer(1),
↪Integer(1),Integer(1)]]).content(Integer(0),Integer(1),Integer(0),␣
↪[Integer(1),Integer(0),Integer(0)])
0
>>> PartitionTuple([[Integer(2),Integer(1)],[Integer(2)],[Integer(1),
↪Integer(1),Integer(1)]]).content(Integer(2),Integer(1),Integer(0),␣
```

(continues on next page)

(continued from previous page)

```
↪[Integer(0),Integer(0),Integer(0)])
-1
```

and now we return the 3-residue of a cell:

```
sage: multicharge = [IntegerModRing(3)(c) for c in [0,0,0]]
sage: PartitionTuple([[2,1],[2],[1,1,1]]).content(0,1,0, multicharge)
2
```

```
>>> from sage.all import *
>>> multicharge = [IntegerModRing(Integer(3))(c) for c in [Integer(0),
↪Integer(0),Integer(0)]]
>>> PartitionTuple([[Integer(2),Integer(1)],[Integer(2)],[Integer(1),
↪Integer(1),Integer(1)]]).content(Integer(0),Integer(1),Integer(0),
↪multicharge)
2
```

content_tableau(*multicharge*)

Return the tableau which has (k,r,c)th entry equal to the content `multicharge[k]-r+c` of this cell.

As with the content function, by setting the `multicharge` appropriately the tableau containing the residues is returned.

EXAMPLES:

```
sage: PartitionTuple([[2,1],[2],[1,1,1]]).content_tableau([0,0,0])
([[0, 1], [-1]], [[0, 1]], [[0], [-1], [-2]])
sage: PartitionTuple([[2,1],[2],[1,1,1]]).content_tableau([0,0,1]).pp()
    0  1     0  1     1
   -1                 0
                     -1
```

```
>>> from sage.all import *
>>> PartitionTuple([[Integer(2),Integer(1)],[Integer(2)],[Integer(1),
↪Integer(1),Integer(1)]]).content_tableau([Integer(0),Integer(0),Integer(0)])
([[0, 1], [-1]], [[0, 1]], [[0], [-1], [-2]])
>>> PartitionTuple([[Integer(2),Integer(1)],[Integer(2)],[Integer(1),
↪Integer(1),Integer(1)]]).content_tableau([Integer(0),Integer(0),
↪Integer(1)]).pp()
    0  1     0  1     1
   -1                 0
                     -1
```

as with the content function the multicharge can be used to return the tableau containing the residues of the cells:

```
sage: multicharge=[ IntegerModRing(3)(c) for c in [0,0,1] ]
sage: PartitionTuple([[2,1],[2],[1,1,1]]).content_tableau(multicharge).pp()
    0  1     0  1     1
    2                 0
                      2
```

```
>>> from sage.all import *
>>> multicharge=[ IntegerModRing(Integer(3))(c) for c in [Integer(0),
↪Integer(0),Integer(1)] ]
>>> PartitionTuple([[Integer(2),Integer(1)],[Integer(2)],[Integer(1),
↪Integer(1),Integer(1)]]).content_tableau(multicharge).pp()
    0  1      0  1      1
    2                   0
                        2
```

corners()

Return a list of the removable cells of this partition tuple.

All indices are of the form `(k, r, c)`, where `r` is the row-index, `c` is the column index and `k` is the component.

EXAMPLES:

```
sage: PartitionTuple([[1,1],[2],[2,1]]).removable_cells()
[(0, 1, 0), (1, 0, 1), (2, 0, 1), (2, 1, 0)]
sage: PartitionTuple([[1,1],[4,3],[2,1,1]]).removable_cells()
[(0, 1, 0), (1, 0, 3), (1, 1, 2), (2, 0, 1), (2, 2, 0)]
```

```
>>> from sage.all import *
>>> PartitionTuple([[Integer(1),Integer(1)],[Integer(2)],[Integer(2),
↪Integer(1)]]).removable_cells()
[(0, 1, 0), (1, 0, 1), (2, 0, 1), (2, 1, 0)]
>>> PartitionTuple([[Integer(1),Integer(1)],[Integer(4),Integer(3)],
↪[Integer(2),Integer(1),Integer(1)]]).removable_cells()
[(0, 1, 0), (1, 0, 3), (1, 1, 2), (2, 0, 1), (2, 2, 0)]
```

defect(*e*, *multicharge*)

Return the `e`-defect or the `e`-weight `self`.

The e-defect is the number of (connected) e-rim hooks that can be removed from the partition.

The defect of a partition tuple is given by

$$\text{defect}(\beta) = (\Lambda, \beta) - \tfrac{1}{2}(\beta, \beta),$$

where $\Lambda = \sum_r \Lambda_{\kappa_r}$ for the multicharge $(\kappa_1, \ldots, \kappa_\ell)$ and $\beta = \sum_{(r,c)} \alpha_{(c-r) \pmod e}$, with the sum being over the cells in the partition.

INPUT:

- `e` – the quantum characteristic
- `multicharge` – the multicharge (default: $(0,)$)

OUTPUT: a nonnegative integer, which is the defect of the block containing the partition tuple `self`

EXAMPLES:

```
sage: PartitionTuple([[2,2],[2,2]]).defect(0,(0,0))
0
sage: PartitionTuple([[2,2],[2,2]]).defect(2,(0,0))
8
sage: PartitionTuple([[2,2],[2,2]]).defect(2,(0,1))
```

(continues on next page)

(continued from previous page)

```
8
sage: PartitionTuple([[2,2],[2,2]]).defect(3,(0,2))
5
sage: PartitionTuple([[2,2],[2,2]]).defect(3,(0,2))
5
sage: PartitionTuple([[2,2],[2,2]]).defect(3,(3,2))
2
sage: PartitionTuple([[2,2],[2,2]]).defect(4,(0,0))
0
```

```
>>> from sage.all import *
>>> PartitionTuple([[Integer(2),Integer(2)],[Integer(2),Integer(2)]]).
→defect(Integer(0),(Integer(0),Integer(0)))
0
>>> PartitionTuple([[Integer(2),Integer(2)],[Integer(2),Integer(2)]]).
→defect(Integer(2),(Integer(0),Integer(0)))
8
>>> PartitionTuple([[Integer(2),Integer(2)],[Integer(2),Integer(2)]]).
→defect(Integer(2),(Integer(0),Integer(1)))
8
>>> PartitionTuple([[Integer(2),Integer(2)],[Integer(2),Integer(2)]]).
→defect(Integer(3),(Integer(0),Integer(2)))
5
>>> PartitionTuple([[Integer(2),Integer(2)],[Integer(2),Integer(2)]]).
→defect(Integer(3),(Integer(0),Integer(2)))
5
>>> PartitionTuple([[Integer(2),Integer(2)],[Integer(2),Integer(2)]]).
→defect(Integer(3),(Integer(3),Integer(2)))
2
>>> PartitionTuple([[Integer(2),Integer(2)],[Integer(2),Integer(2)]]).
→defect(Integer(4),(Integer(0),Integer(0)))
0
```

degree(*e*)

Return the e-th degree of `self`.

The e-th degree is the sum of the degrees of the standard tableaux of shape λ. The e-th degree is the exponent of $\Phi_e(q)$ in the Gram determinant of the Specht module for a semisimple cyclotomic Hecke algebra of type A with parameter q.

For this calculation the multicharge $(\kappa_1, \ldots, \kappa_l)$ is chosen so that $\kappa_{r+1} - \kappa_r > n$, where n is the `size()` of λ as this ensures that the Hecke algebra is semisimple.

INPUT:

- `e` – integer $e > 1$

OUTPUT: nonnegative integer

EXAMPLES:

```
sage: PartitionTuple([[2,1],[2,2]]).degree(2)
532
sage: PartitionTuple([[2,1],[2,2]]).degree(3)
259
```

(continues on next page)

(continued from previous page)

```
sage: PartitionTuple([[2,1],[2,2]]).degree(4)
196
sage: PartitionTuple([[2,1],[2,2]]).degree(5)
105
sage: PartitionTuple([[2,1],[2,2]]).degree(6)
105
sage: PartitionTuple([[2,1],[2,2]]).degree(7)
0
```

```
>>> from sage.all import *
>>> PartitionTuple([[Integer(2),Integer(1)],[Integer(2),Integer(2)]]).
↪degree(Integer(2))
532
>>> PartitionTuple([[Integer(2),Integer(1)],[Integer(2),Integer(2)]]).
↪degree(Integer(3))
259
>>> PartitionTuple([[Integer(2),Integer(1)],[Integer(2),Integer(2)]]).
↪degree(Integer(4))
196
>>> PartitionTuple([[Integer(2),Integer(1)],[Integer(2),Integer(2)]]).
↪degree(Integer(5))
105
>>> PartitionTuple([[Integer(2),Integer(1)],[Integer(2),Integer(2)]]).
↪degree(Integer(6))
105
>>> PartitionTuple([[Integer(2),Integer(1)],[Integer(2),Integer(2)]]).
↪degree(Integer(7))
0
```

Therefore, the Gram determinant of $S(2,1|2,2)$ when the Hecke parameter q is "generic" is

$$q^N \Phi_2(q)^{532} \Phi_3(q)^{259} \Phi_4(q)^{196} \Phi_5(q)^{105} \Phi_6(q)^{105}$$

for some integer N. Compare with `prime_degree()`.

diagram()

Return a string for the Ferrers diagram of `self`.

EXAMPLES:

```
sage: print(PartitionTuple([[2,1],[3,2],[1,1,1]]).diagram())
   **   ***   *
   *    **    *
              *
sage: print(PartitionTuple([[3,2],[2,1],[],[1,1,1,1]]).diagram())
   ***   **   -   *
   **    *        *
                  *
                  *
sage: PartitionTuples.options(convention='french')
sage: print(PartitionTuple([[3,2],[2,1],[],[1,1,1,1]]).diagram())
                  *
                  *
```

(continues on next page)

(continued from previous page)

```
   **    *        *
   ***   **   _   *
sage: PartitionTuples.options._reset()
```

```
>>> from sage.all import *
>>> print(PartitionTuple([[Integer(2),Integer(1)],[Integer(3),Integer(2)],
↪[Integer(1),Integer(1),Integer(1)]]).diagram())
   **   ***   *
   *    **    *
              *
>>> print(PartitionTuple([[Integer(3),Integer(2)],[Integer(2),Integer(1)],[],
↪[Integer(1),Integer(1),Integer(1),Integer(1)]]).diagram())
   ***   **   _   *
   **    *        *
                  *
                  *
>>> PartitionTuples.options(convention='french')
>>> print(PartitionTuple([[Integer(3),Integer(2)],[Integer(2),Integer(1)],[],
↪[Integer(1),Integer(1),Integer(1),Integer(1)]]).diagram())
                  *
                  *
   **    *        *
   ***   **   _   *
>>> PartitionTuples.options._reset()
```

dominates(*mu*)

Return `True` if the PartitionTuple dominates or equals μ and `False` otherwise.

Given partition tuples $\mu = (\mu^{(1)}, ..., \mu^{(m)})$ and $\nu = (\nu^{(1)}, ..., \nu^{(n)})$ then μ dominates ν if

$$\sum_{k=1}^{l-1} |\mu^{(k)}| + \sum_{r\geq 1} \mu_r^{(l)} \geq \sum_{k=1}^{l-1} |\nu^{(k)}| + \sum_{r\geq 1} \nu_r^{(l)}$$

EXAMPLES:

```
sage: mu=PartitionTuple([[1,1],[2],[2,1]])
sage: nu=PartitionTuple([[1,1],[1,1],[2,1]])
sage: mu.dominates(mu)
True
sage: mu.dominates(nu)
True
sage: nu.dominates(mu)
False
sage: tau=PartitionTuple([[],[2,1],[]])
sage: tau.dominates([[2,1],[],[]])
False
sage: tau.dominates([[],[],[2,1]])
True
```

```
>>> from sage.all import *
>>> mu=PartitionTuple([[Integer(1),Integer(1)],[Integer(2)],[Integer(2),
↪Integer(1)]])
```

(continues on next page)

(continued from previous page)

```
>>> nu=PartitionTuple([[Integer(1),Integer(1)],[Integer(1),Integer(1)],
↪[Integer(2),Integer(1)]])
>>> mu.dominates(mu)
True
>>> mu.dominates(nu)
True
>>> nu.dominates(mu)
False
>>> tau=PartitionTuple([[],[Integer(2),Integer(1)],[]])
>>> tau.dominates([[Integer(2),Integer(1)],[],[]])
False
>>> tau.dominates([[],[],[Integer(2),Integer(1)]])
True
```

down()

Generator (iterator) for the partition tuples that are obtained from `self` by removing a cell.

EXAMPLES:

```
sage: [mu for mu in PartitionTuple([[],[3,1],[1,1]]).down()]
[([], [2, 1], [1, 1]), ([], [3], [1, 1]), ([], [3, 1], [1])]
sage: [mu for mu in PartitionTuple([[],[],[]]).down()]
[]
```

```
>>> from sage.all import *
>>> [mu for mu in PartitionTuple([[],[Integer(3),Integer(1)],[Integer(1),
↪Integer(1)]]).down()]
[([], [2, 1], [1, 1]), ([], [3], [1, 1]), ([], [3, 1], [1])]
>>> [mu for mu in PartitionTuple([[],[],[]]).down()]
[]
```

down_list()

Return a list of the partition tuples that can be formed from `self` by removing a cell.

EXAMPLES:

```
sage: PartitionTuple([[],[3,1],[1,1]]).down_list()
[([], [2, 1], [1, 1]), ([], [3], [1, 1]), ([], [3, 1], [1])]
sage: PartitionTuple([[],[],[]]).down_list()
[]
```

```
>>> from sage.all import *
>>> PartitionTuple([[],[Integer(3),Integer(1)],[Integer(1),Integer(1)]]).down_
↪list()
[([], [2, 1], [1, 1]), ([], [3], [1, 1]), ([], [3, 1], [1])]
>>> PartitionTuple([[],[],[]]).down_list()
[]
```

ferrers_diagram()

Return a string for the Ferrers diagram of `self`.

EXAMPLES:

```
sage: print(PartitionTuple([[2,1],[3,2],[1,1,1]]).diagram())
   **   ***   *
   *    **    *
              *
sage: print(PartitionTuple([[3,2],[2,1],[],[1,1,1,1]]).diagram())
   ***   **   -   *
   **    *        *
                  *
                  *
sage: PartitionTuples.options(convention='french')
sage: print(PartitionTuple([[3,2],[2,1],[],[1,1,1,1]]).diagram())
                  *
                  *
   **    *        *
   ***   **   -   *
sage: PartitionTuples.options._reset()
```

```
>>> from sage.all import *
>>> print(PartitionTuple([[Integer(2),Integer(1)],[Integer(3),Integer(2)],
↪[Integer(1),Integer(1),Integer(1)]]).diagram())
   **   ***   *
   *    **    *
              *
>>> print(PartitionTuple([[Integer(3),Integer(2)],[Integer(2),Integer(1)],[],
↪[Integer(1),Integer(1),Integer(1),Integer(1)]]).diagram())
   ***   **   -   *
   **    *        *
                  *
                  *
>>> PartitionTuples.options(convention='french')
>>> print(PartitionTuple([[Integer(3),Integer(2)],[Integer(2),Integer(1)],[],
↪[Integer(1),Integer(1),Integer(1),Integer(1)]]).diagram())
                  *
                  *
   **    *        *
   ***   **   -   *
>>> PartitionTuples.options._reset()
```

garnir_tableau(**cell*)

Return the Garnir tableau of shape `self` corresponding to the cell `cell`.

If `cell` $= (k, a, c)$ then $(k, a + 1, c)$ must belong to the diagram of the *PartitionTuple*. If this is not the case then we return `False`.

> **Note**
>
> The function also sets `g._garnir_cell` equal to `cell` which is used by some other functions.

The Garnir tableaux play an important role in integral and non-semisimple representation theory because they determine the "straightening" rules for the Specht modules over an arbitrary ring.

The Garnir tableau are the "first" non-standard tableaux which arise when you act by simple transpositions. If (k, a, c) is a cell in the Young diagram of a partition, which is not at the bottom of its column, then the corresponding Garnir tableau has the integers $1, 2, \ldots, n$ entered in order from left to right along the rows of the diagram up to the cell $(k, a, c-1)$, then along the cells $(k, a+1, 1)$ to $(k, a+1, c)$, then (k, a, c) until the end of row a and then continuing from left to right in the remaining positions. The examples below probably make this clearer!

EXAMPLES:

```
sage: PartitionTuple([[5,3],[2,2],[4,3]]).garnir_tableau((0,0,2)).pp()
     1  2  6  7  8      9 10    13 14 15 16
     3  4  5           11 12    17 18 19
sage: PartitionTuple([[5,3,3],[2,2],[4,3]]).garnir_tableau((0,0,2)).pp()
     1  2  6  7  8     12 13    16 17 18 19
     3  4  5           14 15    20 21 22
     9 10 11
sage: PartitionTuple([[5,3,3],[2,2],[4,3]]).garnir_tableau((0,1,2)).pp()
     1  2  3  4  5     12 13    16 17 18 19
     6  7 11           14 15    20 21 22
     8  9 10
sage: PartitionTuple([[5,3,3],[2,2],[4,3]]).garnir_tableau((1,0,0)).pp()
     1  2  3  4  5     13 14    16 17 18 19
     6  7  8           12 15    20 21 22
     9 10 11
sage: PartitionTuple([[5,3,3],[2,2],[4,3]]).garnir_tableau((1,0,1)).pp()
     1  2  3  4  5     12 15    16 17 18 19
     6  7  8           13 14    20 21 22
     9 10 11
sage: PartitionTuple([[5,3,3],[2,2],[4,3]]).garnir_tableau((2,0,1)).pp()
     1  2  3  4  5     12 13    16 19 20 21
     6  7  8           14 15    17 18 22
     9 10 11
sage: PartitionTuple([[5,3,3],[2,2],[4,3]]).garnir_tableau((2,1,1)).pp()

See also

- *top_garnir_tableau()*

hook_length(*k*, *r*, *c*)

Return the length of the hook of cell `(k, r, c)` in the partition.

The hook of cell `(k, r, c)` is defined as the cells to the right or below (in the English convention). If your coordinates are in the form `(k,r,c)`, use Python's *-operator.

EXAMPLES:

```
sage: mu=PartitionTuple([[1,1],[2],[2,1]])
sage: [ mu.hook_length(*c) for c in mu.cells()]
[2, 1, 2, 1, 3, 1, 1]
```

```
>>> from sage.all import *
>>> mu=PartitionTuple([[Integer(1),Integer(1)],[Integer(2)],[Integer(2),
↪Integer(1)]])
>>> [ mu.hook_length(*c) for c in mu.cells()]
[2, 1, 2, 1, 3, 1, 1]
```

initial_column_tableau()

Return the initial column tableau of shape `self`.

The initial column tableau of shape λ is the standard tableau that has the numbers 1 to n, where n is the *size()* of λ, entered in order from top to bottom, and then left to right, down the columns of each component, starting from the rightmost component and working to the left.

EXAMPLES:

```
sage: PartitionTuple([ [3,1],[3,2] ]).initial_column_tableau()
([[6, 8, 9], [7]], [[1, 3, 5], [2, 4]])
```

```
>>> from sage.all import *
>>> PartitionTuple([ [Integer(3),Integer(1)],[Integer(3),Integer(2)] ]).
↪initial_column_tableau()
([[6, 8, 9], [7]], [[1, 3, 5], [2, 4]])
```

initial_tableau()

Return the *StandardTableauTuple* which has the numbers $1, 2, \ldots, n$, where n is the *size()* of `self`, entered in order from left to right along the rows of each component, where the components are ordered from left to right.

EXAMPLES:

```
sage: PartitionTuple([ [2,1],[3,2] ]).initial_tableau()
([[1, 2], [3]], [[4, 5, 6], [7, 8]])
```

```
>>> from sage.all import *
>>> PartitionTuple([ [Integer(2),Integer(1)],[Integer(3),Integer(2)] ]).
↪initial_tableau()
([[1, 2], [3]], [[4, 5, 6], [7, 8]])
```

leg_length(k, r, c)

Return the length of the leg of cell `(k, r, c)` in `self`.

INPUT:

- `k` – the component
- `r` – the row
- `c` – the cell

OUTPUT: the leg length as an integer

The leg of cell `(k, r, c)` is the number of cells in the `k`-th component which are below the node in row `r` and column `c`.

EXAMPLES:

```
sage: PartitionTuple([[],[2,1],[2,2,1],[3]]).leg_length(2,0,0)
2
sage: PartitionTuple([[],[2,1],[2,2,1],[3]]).leg_length(2,0,1)
1
sage: PartitionTuple([[],[2,1],[2,2,1],[3]]).leg_length(2,2,0)
0
```

```
>>> from sage.all import *
>>> PartitionTuple([[],[Integer(2),Integer(1)],[Integer(2),Integer(2),
↪Integer(1)],[Integer(3)]]).leg_length(Integer(2),Integer(0),Integer(0))
2
>>> PartitionTuple([[],[Integer(2),Integer(1)],[Integer(2),Integer(2),
↪Integer(1)],[Integer(3)]]).leg_length(Integer(2),Integer(0),Integer(1))
```

(continues on next page)

(continued from previous page)

```
1
>>> PartitionTuple([[],[Integer(2),Integer(1)],[Integer(2),Integer(2),
↪Integer(1)],[Integer(3)]]).leg_length(Integer(2),Integer(2),Integer(0))
0
```

level()

Return the level of this partition tuple.

The level is the length of the tuple.

EXAMPLES:

```
sage: PartitionTuple([[2,1,1,0],[2,1]]).level()
2
sage: PartitionTuple([[],[],[2,1,1]]).level()
3
```

```
>>> from sage.all import *
>>> PartitionTuple([[Integer(2),Integer(1),Integer(1),Integer(0)],[Integer(2),
↪Integer(1)]]).level()
2
>>> PartitionTuple([[],[],[Integer(2),Integer(1),Integer(1)]]).level()
3
```

outside_corners()

Return a list of the removable cells of this partition tuple.

All indices are of the form `(k, r, c)`, where `r` is the row-index, `c` is the column index and `k` is the component.

EXAMPLES:

```
sage: PartitionTuple([[1,1],[2],[2,1]]).addable_cells()
[(0, 0, 1), (0, 2, 0), (1, 0, 2), (1, 1, 0), (2, 0, 2), (2, 1, 1), (2, 2, 0)]
sage: PartitionTuple([[1,1],[4,3],[2,1,1]]).addable_cells()
[(0, 0, 1), (0, 2, 0), (1, 0, 4), (1, 1, 3), (1, 2, 0), (2, 0, 2), (2, 1, 1),
↪(2, 3, 0)]
```

```
>>> from sage.all import *
>>> PartitionTuple([[Integer(1),Integer(1)],[Integer(2)],[Integer(2),
↪Integer(1)]]).addable_cells()
[(0, 0, 1), (0, 2, 0), (1, 0, 2), (1, 1, 0), (2, 0, 2), (2, 1, 1), (2, 2, 0)]
>>> PartitionTuple([[Integer(1),Integer(1)],[Integer(4),Integer(3)],
↪[Integer(2),Integer(1),Integer(1)]]).addable_cells()
[(0, 0, 1), (0, 2, 0), (1, 0, 4), (1, 1, 3), (1, 2, 0), (2, 0, 2), (2, 1, 1),
↪(2, 3, 0)]
```

pp()

Pretty print this partition tuple. See `diagram()`.

EXAMPLES:

```
sage: PartitionTuple([[5,5,2,1],[3,2]]).pp()
*****   ***
```

(continues on next page)

(continued from previous page)

```
*****   **
**
*
```

```
>>> from sage.all import *
>>> PartitionTuple([[Integer(5),Integer(5),Integer(2),Integer(1)],[Integer(3),
↪Integer(2)]]).pp()
*****   ***
*****   **
**
*
```

prime_degree(*p*)

Return the p-th prime degree of self.

The degree of a partition λ is the sum of the e-degrees` of the standard tableaux of shape λ (see *degree()*), for e a power of the prime p. The prime degree gives the exponent of p in the Gram determinant of the integral Specht module of the symmetric group.

The p-th degree is the sum of the degrees of the standard tableaux of shape λ. The p-th degree is the exponent of p in the Gram determinant of a semisimple cyclotomic Hecke algebra of type A with parameter $q = 1$.

As with *degree()*, for this calculation the multicharge $(\kappa_1, \ldots, \kappa_l)$ is chosen so that $\kappa_{r+1} - \kappa_r > n$, where n is the *size()* of λ as this ensures that the Hecke algebra is semisimple.

INPUT:

- e – an integer $e > 1$
- multicharge – an l-tuple of integers, where l is the *level()* of self

OUTPUT: nonnegative integer

EXAMPLES:

```
sage: PartitionTuple([[2,1],[2,2]]).prime_degree(2)
728
sage: PartitionTuple([[2,1],[2,2]]).prime_degree(3)
259
sage: PartitionTuple([[2,1],[2,2]]).prime_degree(5)
105
sage: PartitionTuple([[2,1],[2,2]]).prime_degree(7)
0
```

```
>>> from sage.all import *
>>> PartitionTuple([[Integer(2),Integer(1)],[Integer(2),Integer(2)]]).prime_
↪degree(Integer(2))
728
>>> PartitionTuple([[Integer(2),Integer(1)],[Integer(2),Integer(2)]]).prime_
↪degree(Integer(3))
259
>>> PartitionTuple([[Integer(2),Integer(1)],[Integer(2),Integer(2)]]).prime_
↪degree(Integer(5))
105
>>> PartitionTuple([[Integer(2),Integer(1)],[Integer(2),Integer(2)]]).prime_
```

(continues on next page)

(continued from previous page)

```
↪degree(Integer(7))
0
```

Therefore, the Gram determinant of $S(2,1|2,2)$ when $q = 1$ is $2^{728}3^{259}5^{105}$. Compare with `degree()`.

removable_cells()

Return a list of the removable cells of this partition tuple.

All indices are of the form `(k, r, c)`, where `r` is the row-index, `c` is the column index and `k` is the component.

EXAMPLES:

```
sage: PartitionTuple([[1,1],[2],[2,1]]).removable_cells()
[(0, 1, 0), (1, 0, 1), (2, 0, 1), (2, 1, 0)]
sage: PartitionTuple([[1,1],[4,3],[2,1,1]]).removable_cells()
[(0, 1, 0), (1, 0, 3), (1, 1, 2), (2, 0, 1), (2, 2, 0)]
```

```
>>> from sage.all import *
>>> PartitionTuple([[Integer(1),Integer(1)],[Integer(2)],[Integer(2),
↪Integer(1)]]).removable_cells()
[(0, 1, 0), (1, 0, 1), (2, 0, 1), (2, 1, 0)]
>>> PartitionTuple([[Integer(1),Integer(1)],[Integer(4),Integer(3)],
↪[Integer(2),Integer(1),Integer(1)]]).removable_cells()
[(0, 1, 0), (1, 0, 3), (1, 1, 2), (2, 0, 1), (2, 2, 0)]
```

remove_cell(k, r, c)

Return the partition tuple obtained by removing a cell in row `r`, column `c`, and component `k`.

This does not change `self`.

EXAMPLES:

```
sage: PartitionTuple([[1,1],[4,3],[2,1,1]]).remove_cell(0,1,0)
([1], [4, 3], [2, 1, 1])
```

```
>>> from sage.all import *
>>> PartitionTuple([[Integer(1),Integer(1)],[Integer(4),Integer(3)],
↪[Integer(2),Integer(1),Integer(1)]]).remove_cell(Integer(0),Integer(1),
↪Integer(0))
([1], [4, 3], [2, 1, 1])
```

row_standard_tableaux()

Return the *row standard tableau tuples* of shape `self`.

EXAMPLES:

```
sage: PartitionTuple([[],[3,2,2,1],[2,2,1],[3]]).row_standard_tableaux()
Row standard tableau tuples of shape ([], [3, 2, 2, 1], [2, 2, 1], [3])
```

```
>>> from sage.all import *
>>> PartitionTuple([[],[Integer(3),Integer(2),Integer(2),Integer(1)],
↪[Integer(2),Integer(2),Integer(1)],[Integer(3)]]).row_standard_tableaux()
Row standard tableau tuples of shape ([], [3, 2, 2, 1], [2, 2, 1], [3])
```

size()

Return the size of a partition tuple.

EXAMPLES:

```
sage: PartitionTuple([[2,1],[],[2,2]]).size()
7
sage: PartitionTuple([[],[],[1],[3,2,1]]).size()
7
```

```
>>> from sage.all import *
>>> PartitionTuple([[Integer(2),Integer(1)],[],[Integer(2),Integer(2)]]).
↪size()
7
>>> PartitionTuple([[],[],[Integer(1)],[Integer(3),Integer(2),Integer(1)]]).
↪size()
7
```

standard_tableaux()

Return the *standard tableau tuples* of shape `self`.

EXAMPLES:

```
sage: PartitionTuple([[],[3,2,2,1],[2,2,1],[3]]).standard_tableaux()
Standard tableau tuples of shape ([], [3, 2, 2, 1], [2, 2, 1], [3])
```

```
>>> from sage.all import *
>>> PartitionTuple([[],[Integer(3),Integer(2),Integer(2),Integer(1)],
↪[Integer(2),Integer(2),Integer(1)],[Integer(3)]]).standard_tableaux()
Standard tableau tuples of shape ([], [3, 2, 2, 1], [2, 2, 1], [3])
```

to_exp(*k=0*)

Return a tuple of the multiplicities of the parts of a partition.

Use the optional parameter `k` to get a return list of length at least `k`.

EXAMPLES:

```
sage: PartitionTuple([[1,1],[2],[2,1]]).to_exp()
([2], [0, 1], [1, 1])
sage: PartitionTuple([[1,1],[2,2,2,2],[2,1]]).to_exp()
([2], [0, 4], [1, 1])
```

```
>>> from sage.all import *
>>> PartitionTuple([[Integer(1),Integer(1)],[Integer(2)],[Integer(2),
↪Integer(1)]]).to_exp()
([2], [0, 1], [1, 1])
>>> PartitionTuple([[Integer(1),Integer(1)],[Integer(2),Integer(2),Integer(2),
↪Integer(2)],[Integer(2),Integer(1)]]).to_exp()
([2], [0, 4], [1, 1])
```

to_list()

Return `self` as a list of lists.

EXAMPLES:

```
sage: PartitionTuple([[1,1],[4,3],[2,1,1]]).to_list()
[[1, 1], [4, 3], [2, 1, 1]]
```

```
>>> from sage.all import *
>>> PartitionTuple([[Integer(1),Integer(1)],[Integer(4),Integer(3)],
↪[Integer(2),Integer(1),Integer(1)]]).to_list()
[[1, 1], [4, 3], [2, 1, 1]]
```

top_garnir_tableau(*e*, *cell*)

Return the most dominant *standard* tableau which dominates the corresponding Garnir tableau and has the same residue that has shape `self` and is determined by `e` and `cell`.

The Garnir tableau play an important role in integral and non-semisimple representation theory because they determine the "straightening" rules for the Specht modules over an arbitrary ring. The *top Garnir tableaux* arise in the graded representation theory of the symmetric groups and higher level Hecke algebras. They were introduced in [KMR2012].

If the Garnir node is `cell=(k,r,c)` and m and M are the entries in the cells `(k,r,c)` and `(k,r+1,c)`, respectively, in the initial tableau then the top `e`-Garnir tableau is obtained by inserting the numbers $m, m+1, \ldots, M$ in order from left to right first in the cells in row `r+1` which are not in the `e`-Garnir belt, then in the cell in rows `r` and `r+1` which are in the Garnir belt and then, finally, in the remaining cells in row `r` which are not in the Garnir belt. All other entries in the tableau remain unchanged.

If `e = 0`, or if there are no `e`-bricks in either row `r` or `r+1`, then the top Garnir tableau is the corresponding Garnir tableau.

EXAMPLES:

```
sage: PartitionTuple([[3,3,2],[5,4,3,2]]).top_garnir_tableau(2,(1,0,2)).pp()
    1  2  3      9 10 12 13 16
    4  5  6     11 14 15 17
    7  8        18 19 20
                21 22
sage: PartitionTuple([[3,3,2],[5,4,3,2]]).top_garnir_tableau(2,(1,0,1)).pp()
    1  2  3      9 10 11 12 13
    4  5  6     14 15 16 17
    7  8        18 19 20
                21 22
sage: PartitionTuple([[3,3,2],[5,4,3,2]]).top_garnir_tableau(3,(1,0,1)).pp()
    1  2  3      9 12 13 14 15
    4  5  6     10 11 16 17
    7  8        18 19 20
                21 22

sage: PartitionTuple([[3,3,2],[5,4,3,2]]).top_garnir_tableau(3,(3,0,1)).pp()
Traceback (most recent call last):
...

ValueError: (comp, row+1, col) must be inside the diagram
```

See also:

- `garnir_tableau()`

up()

Generator (iterator) for the partition tuples that are obtained from `self` by adding a cell.

EXAMPLES:

```
sage: [mu for mu in PartitionTuple([[],[3,1],[1,1]]).up()]
[([1], [3, 1], [1, 1]), ([], [4, 1], [1, 1]), ([], [3, 2], [1, 1]), ([], [3,␣
↪1, 1], [1, 1]), ([], [3, 1], [2, 1]), ([], [3, 1], [1, 1, 1])]
sage: [mu for mu in PartitionTuple([[],[],[],[]]).up()]
[([1], [], [], []), ([], [1], [], []), ([], [], [1], []), ([], [], [], [1])]
```

```
>>> from sage.all import *
>>> [mu for mu in PartitionTuple([[],[Integer(3),Integer(1)],[Integer(1),
↪Integer(1)]]).up()]
[([1], [3, 1], [1, 1]), ([], [4, 1], [1, 1]), ([], [3, 2], [1, 1]), ([], [3,␣
↪1, 1], [1, 1]), ([], [3, 1], [2, 1]), ([], [3, 1], [1, 1, 1])]
>>> [mu for mu in PartitionTuple([[],[],[],[]]).up()]
[([1], [], [], []), ([], [1], [], []), ([], [], [1], []), ([], [], [], [1])]
```

up_list()

Return a list of the partition tuples that can be formed from `self` by adding a cell.

EXAMPLES:

```
sage: PartitionTuple([[],[3,1],[1,1]]).up_list()
[([1], [3, 1], [1, 1]), ([], [4, 1], [1, 1]), ([], [3, 2], [1, 1]), ([], [3,␣
↪1, 1], [1, 1]), ([], [3, 1], [2, 1]), ([], [3, 1], [1, 1, 1])]
sage: PartitionTuple([[],[],[],[]]).up_list()
[([1], [], [], []), ([], [1], [], []), ([], [], [1], []), ([], [], [], [1])]
```

```
>>> from sage.all import *
>>> PartitionTuple([[],[Integer(3),Integer(1)],[Integer(1),Integer(1)]]).up_
↪list()
[([1], [3, 1], [1, 1]), ([], [4, 1], [1, 1]), ([], [3, 2], [1, 1]), ([], [3,␣
↪1, 1], [1, 1]), ([], [3, 1], [2, 1]), ([], [3, 1], [1, 1, 1])]
>>> PartitionTuple([[],[],[],[]]).up_list()
[([1], [], [], []), ([], [1], [], []), ([], [], [1], []), ([], [], [], [1])]
```

young_subgroup()

Return the corresponding Young, or parabolic, subgroup of the symmetric group.

EXAMPLES:

```
sage: PartitionTuple([[2,1],[4,2],[1]]).young_subgroup()                     #␣
↪needs sage.groups
Permutation Group with generators [(), (8,9), (6,7), (5,6), (4,5), (1,2)]
```

```
>>> from sage.all import *
>>> PartitionTuple([[Integer(2),Integer(1)],[Integer(4),Integer(2)],
↪[Integer(1)]]).young_subgroup()                 # needs sage.groups
Permutation Group with generators [(), (8,9), (6,7), (5,6), (4,5), (1,2)]
```

young_subgroup_generators()

Return an indexing set for the generators of the corresponding Young subgroup.

EXAMPLES:

```
sage: PartitionTuple([[2,1],[4,2],[1]]).young_subgroup_generators()
[1, 4, 5, 6, 8]
```

```
>>> from sage.all import *
>>> PartitionTuple([[Integer(2),Integer(1)],[Integer(4),Integer(2)],
↪[Integer(1)]]).young_subgroup_generators()
[1, 4, 5, 6, 8]
```

class sage.combinat.partition_tuple.**PartitionTuples**

Bases: UniqueRepresentation, Parent

Class of all partition tuples.

For more information about partition tuples, see *PartitionTuple*.

This is a factory class which returns the appropriate parent based on the values of `level`, `size`, and `regular`

INPUT:

- `level` – the length of the tuple
- `size` – the total number of cells

- `regular` – positive integer or a tuple of nonnegative integers; if an integer, the highest multiplicity an entry may have in a component plus 1

If a level k is specified and `regular` is a tuple of integers $\ell_1, \ldots, \ell_k$, then this specifies partition tuples μ such that μ_i is ℓ_i-regular, where 0 here represents ∞-regular partitions (equivalently, partitions without restrictions). If `regular` is an integer ℓ, then we set $\ell_i = \ell$ for all i.

Element

alias of *PartitionTuple*

level()

Return the level or `None` if it is not defined.

EXAMPLES:

```
sage: PartitionTuples().level() is None
True
sage: PartitionTuples(7).level()
7
```

```
>>> from sage.all import *
>>> PartitionTuples().level() is None
True
>>> PartitionTuples(Integer(7)).level()
7
```

options = Current options for Partitions - convention: English - diagram_str: * - display: list - latex: young_diagram - latex_diagram_str: \ast

size()

Return the size or `None` if it is not defined.

EXAMPLES:

```
sage: PartitionTuples().size() is None
True
sage: PartitionTuples(size=7).size()
7
```

```
>>> from sage.all import *
>>> PartitionTuples().size() is None
True
>>> PartitionTuples(size=Integer(7)).size()
7
```

class sage.combinat.partition_tuple.**PartitionTuples_all**

Bases: *PartitionTuples*

Class of partition tuples of a arbitrary level and arbitrary sum.

class sage.combinat.partition_tuple.**PartitionTuples_level**(*level*, *category=None*)

Bases: *PartitionTuples*

Class of partition tuples of a fixed level, but summing to an arbitrary integer.

class sage.combinat.partition_tuple.**PartitionTuples_level_size**(*level*, *size*)

Bases: *PartitionTuples*

Class of partition tuples with a fixed level and a fixed size.

cardinality()

Return the number of `level`-tuples of partitions of size `n`.

Wraps a pari function call using pari:eta.

EXAMPLES:

```
sage: PartitionTuples(2,3).cardinality()                                # needs sage.libs.pari
10
sage: PartitionTuples(2,8).cardinality()                                # needs sage.libs.pari
185
```

```
>>> from sage.all import *
>>> PartitionTuples(Integer(2),Integer(3)).cardinality()                # needs sage.libs.pari
10
>>> PartitionTuples(Integer(2),Integer(8)).cardinality()                # needs sage.libs.pari
185
```

class sage.combinat.partition_tuple.**PartitionTuples_size**(*size*)

Bases: *PartitionTuples*

Class of partition tuples of a fixed size, but arbitrary level.

class sage.combinat.partition_tuple.**RegularPartitionTuples**(*regular*, ***kwds*)

Bases: *PartitionTuples*

Abstract base class for ℓ-regular partition tuples.

class sage.combinat.partition_tuple.**RegularPartitionTuples_all**(*regular*)

Bases: *RegularPartitionTuples*

Class of ℓ-regular partition tuples.

class sage.combinat.partition_tuple.**RegularPartitionTuples_level**(*level*, *regular*)

Bases: *PartitionTuples_level*

Regular Partition tuples of a fixed level.

INPUT:

- `level` – nonnegative integer; the level
- `regular` – positive integer or a tuple of nonnegative integers; if an integer, the highest multiplicity an entry may have in a component plus 1 with 0 representing ∞-regular (equivalently, partitions without restrictions)

`regular` is a tuple of integers $(\ell_1, \ldots, \ell_k)$ that specifies partition tuples μ such that μ_i is ℓ_i-regular. If `regular` is an integer ℓ, then we set $\ell_i = \ell$ for all i.

EXAMPLES:

```
sage: RPT = PartitionTuples(level=4, regular=(2,3,0,2))
sage: RPT[:24]                                                                  #␣

class sage.combinat.partition_tuple.**RegularPartitionTuples_level_size**(*level*, *size*, *regular*)

Bases: *PartitionTuples_level_size*

Class of ℓ-regular partition tuples with a fixed level and a fixed size.

INPUT:

- `level` – nonnegative integer; the level
- `size` – nonnegative integer; the size
- `regular` – positive integer or a tuple of nonnegative integers; if an integer, the highest multiplicity an entry may have in a component plus 1 with 0 representing ∞-regular (equivalently, partitions without restrictions)

`regular` is a tuple of integers $(\ell_1, \ldots, \ell_k)$ that specifies partition tuples μ such that μ_i is ℓ_i-regular. If `regular` is an integer ℓ, then we set $\ell_i = \ell$ for all i.

EXAMPLES:

```
sage: PartitionTuples(level=3, size=7, regular=(2,1,3))[0:24]                 #␣

```

class sage.combinat.partition_tuple.**RegularPartitionTuples_size**(*size*, *regular*)

Bases: *RegularPartitionTuples*

Class of ℓ-regular partition tuples with a fixed size.

5.1.170 Iterators over the partitions of an integer

The iterators generate partitions in either increasing or decreasing lexicographic orders and a partition P is represented either in ascending ($P_i \leq P_{i+1}$) or descending ($P_i \geq P_{i+1}$) orders:

```
sage: from sage.combinat.partitions import ZS1_iterator
sage: for p in ZS1_iterator(4):
....:     print(p)
[4]
[3, 1]
[2, 2]
[2, 1, 1]
[1, 1, 1, 1]
sage: from sage.combinat.partitions import AccelDesc_iterator
sage: for p in AccelDesc_iterator(4):
....:     print(p)
[4]
[3, 1]
[2, 2]
[2, 1, 1]
[1, 1, 1, 1]
sage: from sage.combinat.partitions import ZS2_iterator
sage: for p in ZS2_iterator(4):
....:     print(p)
[1, 1, 1, 1]
[2, 1, 1]
[2, 2]
[3, 1]
[4]
sage: from sage.combinat.partitions import AccelAsc_iterator
sage: for p in AccelAsc_iterator(4):
....:     print(p)
[1, 1, 1, 1]
[1, 1, 2]
[1, 3]
[2, 2]
[4]
```

```
>>> from sage.all import *
>>> from sage.combinat.partitions import ZS1_iterator
>>> for p in ZS1_iterator(Integer(4)):
...     print(p)
[4]
[3, 1]
[2, 2]
[2, 1, 1]
[1, 1, 1, 1]
>>> from sage.combinat.partitions import AccelDesc_iterator
>>> for p in AccelDesc_iterator(Integer(4)):
...     print(p)
[4]
[3, 1]
[2, 2]
[2, 1, 1]
[1, 1, 1, 1]
>>> from sage.combinat.partitions import ZS2_iterator
>>> for p in ZS2_iterator(Integer(4)):
```

(continues on next page)

(continued from previous page)

```
...     print(p)
[1, 1, 1, 1]
[2, 1, 1]
[2, 2]
[3, 1]
[4]
>>> from sage.combinat.partitions import AccelAsc_iterator
>>> for p in AccelAsc_iterator(Integer(4)):
...     print(p)
[1, 1, 1, 1]
[1, 1, 2]
[1, 3]
[2, 2]
[4]
```

For each of these iterators, this module also provides a `next` method that takes a partition as input and return the next partition in the corresponding ordering:

```
sage: from sage.combinat.partitions import ZS1_next
sage: ZS1_next([2, 2])
[2, 1, 1]
sage: from sage.combinat.partitions import AccelDesc_next
sage: AccelDesc_next([2, 2])
[2, 1, 1]
sage: from sage.combinat.partitions import ZS2_next
sage: ZS2_next([2, 2])
[3, 1]
sage: from sage.combinat.partitions import AccelAsc_next
sage: AccelAsc_next([2, 2])
[4]
```

```
>>> from sage.all import *
>>> from sage.combinat.partitions import ZS1_next
>>> ZS1_next([Integer(2), Integer(2)])
[2, 1, 1]
>>> from sage.combinat.partitions import AccelDesc_next
>>> AccelDesc_next([Integer(2), Integer(2)])
[2, 1, 1]
>>> from sage.combinat.partitions import ZS2_next
>>> ZS2_next([Integer(2), Integer(2)])
[3, 1]
>>> from sage.combinat.partitions import AccelAsc_next
>>> AccelAsc_next([Integer(2), Integer(2)])
[4]
```

It is also possible to iterate over the partitions of bounded length:

```
sage: from sage.combinat.partitions import ZS1_iterator_nk
sage: for p in ZS1_iterator_nk(6, 3):
....:     print(p)
[6]
[5, 1]
```

(continues on next page)

(continued from previous page)

```
[4, 2]
[4, 1, 1]
[3, 3]
[3, 2, 1]
[2, 2, 2]
```

```
>>> from sage.all import *
>>> from sage.combinat.partitions import ZS1_iterator_nk
>>> for p in ZS1_iterator_nk(Integer(6), Integer(3)):
...     print(p)
[6]
[5, 1]
[4, 2]
[4, 1, 1]
[3, 3]
[3, 2, 1]
[2, 2, 2]
```

AUTHOR:

- William Stein (2007-07-28): initial version
- Jonathan Bober (2007-07-28): wrote the program `partitions_c.cc` that does all the actual heavy lifting.
- David Coudert (2024-06-01): reshape method `ZS1_iterator()` to ease the implementation of `ZS1_next()` and add iterators and next methods based on `ZS2`, `AccelAsc` and `AccelDesc` from [ZS1998] and [KS2012].

`sage.combinat.partitions.`**`AccelAsc_iterator`**`(n)`

Return an iterator over the partitions of `n`.

The partitions are generated in the increasing lexicographic order and each partition is represented as a list in ascending order (i.e., $p_i \leq p_{i+1}$).

This is an implementation of the `AccelAsc` algorithm found in [KS2012].

See also

`sage.combinat.partitions.ZS1_iterator()`

EXAMPLES:

```
sage: from sage.combinat.partitions import AccelAsc_iterator
sage: for p in AccelAsc_iterator(4):
....:     print(p)
[1, 1, 1, 1]
[1, 1, 2]
[1, 3]
[2, 2]
[4]
sage: next(AccelAsc_iterator(4))
[1, 1, 1, 1]
sage: type(_)
<class 'list'>
```

```
>>> from sage.all import *
>>> from sage.combinat.partitions import AccelAsc_iterator
>>> for p in AccelAsc_iterator(Integer(4)):
...     print(p)
[1, 1, 1, 1]
[1, 1, 2]
[1, 3]
[2, 2]
[4]
>>> next(AccelAsc_iterator(Integer(4)))
[1, 1, 1, 1]
>>> type(_)
<class 'list'>
```

sage.combinat.partitions.**AccelAsc_next**(P)

Return the partition after `P` in the ordering of the `AccelAsc` algorithm.

INPUT:

- `P` – list encoding a partition of an integer n in ascending order (i.e., $P_i \leq P_{i+1}$)

EXAMPLES:

```
sage: from sage.combinat.partitions import AccelAsc_next
sage: P = [1, 1, 1, 1]
sage: while P:
....:     print(P)
....:     P = AccelAsc_next(P)
[1, 1, 1, 1]
[1, 1, 2]
[1, 3]
[2, 2]
[4]
```

```
>>> from sage.all import *
>>> from sage.combinat.partitions import AccelAsc_next
>>> P = [Integer(1), Integer(1), Integer(1), Integer(1)]
>>> while P:
...     print(P)
...     P = AccelAsc_next(P)
[1, 1, 1, 1]
[1, 1, 2]
[1, 3]
[2, 2]
[4]
```

sage.combinat.partitions.**AccelDesc_iterator**(n)

Return an iterator over the partitions of `n`.

The partitions are generated in the increasing lexicographic order and each partition is represented as a list in descending order (i.e., $p_i \geq p_{i+1}$).

This is an implementation of the AccelDesc algorithm found in [KS2012].

See also

sage.combinat.partitions.ZS1_iterator()

EXAMPLES:

```
sage: from sage.combinat.partitions import AccelDesc_iterator
sage: for p in AccelDesc_iterator(4):
....:     print(p)
[4]
[3, 1]
[2, 2]
[2, 1, 1]
[1, 1, 1, 1]
sage: next(AccelDesc_iterator(4))
[4]
sage: type(_)
<class 'list'>
```

```
>>> from sage.all import *
>>> from sage.combinat.partitions import AccelDesc_iterator
>>> for p in AccelDesc_iterator(Integer(4)):
...     print(p)
[4]
[3, 1]
[2, 2]
[2, 1, 1]
[1, 1, 1, 1]
>>> next(AccelDesc_iterator(Integer(4)))
[4]
>>> type(_)
<class 'list'>
```

Check that *ZS1_iterator()* and *AccelDesc_iterator()* generate partitions in the same order:

```
sage: from sage.combinat.partitions import ZS1_iterator
sage: from sage.misc.prandom import randint
sage: n = randint(1, 50)
sage: all(p == q for p, q in zip(ZS1_iterator(n), AccelDesc_iterator(n)))   # long time
True
```

```
>>> from sage.all import *
>>> from sage.combinat.partitions import ZS1_iterator
>>> from sage.misc.prandom import randint
>>> n = randint(Integer(1), Integer(50))
>>> all(p == q for p, q in zip(ZS1_iterator(n), AccelDesc_iterator(n)))   # long time
True
```

sage.combinat.partitions.**AccelDesc_next**(*P*)

Return the partition after P in the ordering of the AccelDesc algorithm.

INPUT:

- `P` – list encoding a partition of an integer n in descending order (i.e., $P_i \geq P_{i+1}$)

EXAMPLES:

```
sage: from sage.combinat.partitions import AccelDesc_iterator, AccelDesc_next
sage: P = [4]
sage: while P:
....:     print(P)
....:     P = AccelDesc_next(P)
[4]
[3, 1]
[2, 2]
[2, 1, 1]
[1, 1, 1, 1]
sage: A = [list(p) for p in Partitions(7)]
sage: all(AccelDesc_next(p) == q for p, q in zip(A, A[1:]))
True
```

```
>>> from sage.all import *
>>> from sage.combinat.partitions import AccelDesc_iterator, AccelDesc_next
>>> P = [Integer(4)]
>>> while P:
...     print(P)
...     P = AccelDesc_next(P)
[4]
[3, 1]
[2, 2]
[2, 1, 1]
[1, 1, 1, 1]
>>> A = [list(p) for p in Partitions(Integer(7))]
>>> all(AccelDesc_next(p) == q for p, q in zip(A, A[Integer(1):]))
True
```

sage.combinat.partitions.**ZS1_iterator**(*n*)

Return an iterator over the partitions of `n`.

The partitions are generated in the decreasing lexicographic order and each partition is represented as a list `P` in descending order (i.e., $P_i \geq P_{i+1}$). The method yields lists and not objects of type *Partition*.

This is an implementation of the ZS1 algorithm found in [ZS1998].

See also

- *sage.combinat.partitions.ZS2_iterator()*
- *sage.combinat.partitions.AccelDesc_iterator()*

EXAMPLES:

```
sage: from sage.combinat.partitions import ZS1_iterator
sage: for p in ZS1_iterator(4):
....:     print(p)
```

(continues on next page)

(continued from previous page)

```
[4]
[3, 1]
[2, 2]
[2, 1, 1]
[1, 1, 1, 1]
sage: next(ZS1_iterator(4))
[4]
sage: type(_)
<class 'list'>
```

```
>>> from sage.all import *
>>> from sage.combinat.partitions import ZS1_iterator
>>> for p in ZS1_iterator(Integer(4)):
...     print(p)
[4]
[3, 1]
[2, 2]
[2, 1, 1]
[1, 1, 1, 1]
>>> next(ZS1_iterator(Integer(4)))
[4]
>>> type(_)
<class 'list'>
```

sage.combinat.partitions.**ZS1_iterator_nk**(n, k)

An iterator for the partitions of n of length at most k (in the decreasing lexicographic order) which returns lists and not objects of type *Partition*.

The algorithm is a mild variation on *ZS1_iterator()*; I would not vow for its speed.

EXAMPLES:

```
sage: from sage.combinat.partitions import ZS1_iterator_nk
sage: it = ZS1_iterator_nk(4, 3)
sage: next(it)
[4]
sage: type(_)
<class 'list'>
```

```
>>> from sage.all import *
>>> from sage.combinat.partitions import ZS1_iterator_nk
>>> it = ZS1_iterator_nk(Integer(4), Integer(3))
>>> next(it)
[4]
>>> type(_)
<class 'list'>
```

sage.combinat.partitions.**ZS1_next**(P)

Return the partition after `P` in the ordering of the ZS1 algorithm.

INPUT:

- `P` – list encoding a partition of an integer n in descending order (i.e., $P_i \geq P_{i+1}$)

EXAMPLES:

```
sage: from sage.combinat.partitions import ZS1_iterator, ZS1_next
sage: P = [4]
sage: while P:
....:     print(P)
....:     P = ZS1_next(P)
[4]
[3, 1]
[2, 2]
[2, 1, 1]
[1, 1, 1, 1]
sage: A = [list(p) for p in Partitions(7)]
sage: all(ZS1_next(p) == q for p, q in zip(A, A[1:]))
True
```

```
>>> from sage.all import *
>>> from sage.combinat.partitions import ZS1_iterator, ZS1_next
>>> P = [Integer(4)]
>>> while P:
...     print(P)
...     P = ZS1_next(P)
[4]
[3, 1]
[2, 2]
[2, 1, 1]
[1, 1, 1, 1]
>>> A = [list(p) for p in Partitions(Integer(7))]
>>> all(ZS1_next(p) == q for p, q in zip(A, A[Integer(1):]))
True
```

sage.combinat.partitions.**ZS2_iterator**(*n*)

Return an iterator over the partitions of n.

The partitions are generated in the increasing lexicographic order and each partition is represented as a list in descending order (i.e., $p_i \geq p_{i+1}$).

This is an implementation of the ZS2 algorithm found in [ZS1998].

See also

sage.combinat.partitions.ZS1_iterator()

EXAMPLES:

```
sage: from sage.combinat.partitions import ZS2_iterator
sage: for p in ZS2_iterator(4):
....:     print(p)
[1, 1, 1, 1]
[2, 1, 1]
[2, 2]
[3, 1]
[4]
sage: next(ZS2_iterator(4))
```

(continues on next page)

(continued from previous page)

```
[1, 1, 1, 1]
sage: type(_)
<class 'list'>
```

```
>>> from sage.all import *
>>> from sage.combinat.partitions import ZS2_iterator
>>> for p in ZS2_iterator(Integer(4)):
...     print(p)
[1, 1, 1, 1]
[2, 1, 1]
[2, 2]
[3, 1]
[4]
>>> next(ZS2_iterator(Integer(4)))
[1, 1, 1, 1]
>>> type(_)
<class 'list'>
```

sage.combinat.partitions.**ZS2_next**(P)

Return the partition after P in the ordering of the ZS2 algorithm.

INPUT:

- P – list encoding a partition of an integer n in descending order (i.e., $P_i \geq P_{i+1}$)

EXAMPLES:

```
sage: from sage.combinat.partitions import ZS2_iterator, ZS2_next
sage: P = [1, 1, 1, 1]
sage: while P:
....:     print(P)
....:     P = ZS2_next(P)
[1, 1, 1, 1]
[2, 1, 1]
[2, 2]
[3, 1]
[4]
```

```
>>> from sage.all import *
>>> from sage.combinat.partitions import ZS2_iterator, ZS2_next
>>> P = [Integer(1), Integer(1), Integer(1), Integer(1)]
>>> while P:
...     print(P)
...     P = ZS2_next(P)
[1, 1, 1, 1]
[2, 1, 1]
[2, 2]
[3, 1]
[4]
```

5.1.171 Perfect matchings

A perfect matching of a set S is a partition into 2-element sets. If S is the set $\{1, ..., n\}$, it is equivalent to fixpoint-free involutions. These simple combinatorial objects appear in different domains such as combinatorics of orthogonal polynomials and of the hyperoctaedral groups (see [MV], [McD] and also [CM]):

AUTHOR:

- Valentin Feray, 2010 : initial version
- Martin Rubey, 2017: inherit from SetPartition, move crossings and nestings to SetPartition

EXAMPLES:

Create a perfect matching:

```
sage: m = PerfectMatching([('a','e'),('b','c'),('d','f')]);m
[('a', 'e'), ('b', 'c'), ('d', 'f')]
```

```
>>> from sage.all import *
>>> m = PerfectMatching([('a','e'),('b','c'),('d','f')]);m
[('a', 'e'), ('b', 'c'), ('d', 'f')]
```

Count its crossings, if the ground set is totally ordered:

```
sage: n = PerfectMatching([3,8,1,7,6,5,4,2]); n
[(1, 3), (2, 8), (4, 7), (5, 6)]
sage: n.number_of_crossings()
1
```

```
>>> from sage.all import *
>>> n = PerfectMatching([Integer(3),Integer(8),Integer(1),Integer(7),Integer(6),
→Integer(5),Integer(4),Integer(2)]); n
[(1, 3), (2, 8), (4, 7), (5, 6)]
>>> n.number_of_crossings()
1
```

List the perfect matchings of a given ground set:

```
sage: PerfectMatchings(4).list()
[[(1, 2), (3, 4)], [(1, 3), (2, 4)], [(1, 4), (2, 3)]]
```

```
>>> from sage.all import *
>>> PerfectMatchings(Integer(4)).list()
[[(1, 2), (3, 4)], [(1, 3), (2, 4)], [(1, 4), (2, 3)]]
```

REFERENCES:

class sage.combinat.perfect_matching.**PerfectMatching**(*parent*, *s*, *check=True*, *sort=True*)

Bases: *SetPartition*

A perfect matching.

A *perfect matching* of a set X is a set partition of X where all parts have size 2.

A perfect matching can be created from a list of pairs or from a fixed point-free involution as follows:

```
sage: m = PerfectMatching([('a','e'),('b','c'),('d','f')]);m
[('a', 'e'), ('b', 'c'), ('d', 'f')]
sage: n = PerfectMatching([3,8,1,7,6,5,4,2]);n
[(1, 3), (2, 8), (4, 7), (5, 6)]
sage: isinstance(m,PerfectMatching)
True
```

```
>>> from sage.all import *
>>> m = PerfectMatching([('a','e'),('b','c'),('d','f')]);m
[('a', 'e'), ('b', 'c'), ('d', 'f')]
>>> n = PerfectMatching([Integer(3),Integer(8),Integer(1),Integer(7),Integer(6),
↪Integer(5),Integer(4),Integer(2)]);n
[(1, 3), (2, 8), (4, 7), (5, 6)]
>>> isinstance(m,PerfectMatching)
True
```

The parent, which is the set of perfect matchings of the ground set, is automatically created:

```
sage: n.parent()
Perfect matchings of {1, 2, 3, 4, 5, 6, 7, 8}
```

```
>>> from sage.all import *
>>> n.parent()
Perfect matchings of {1, 2, 3, 4, 5, 6, 7, 8}
```

If the ground set is ordered, one can, for example, ask if the matching is non crossing:

```
sage: PerfectMatching([(1, 4), (2, 3), (5, 6)]).is_noncrossing()
True
```

```
>>> from sage.all import *
>>> PerfectMatching([(Integer(1), Integer(4)), (Integer(2), Integer(3)),␣
↪(Integer(5), Integer(6))]).is_noncrossing()
True
```

Weingarten_function(*d*, *other=None*)

Return the Weingarten function of two pairings.

This function is the value of some integrals over the orthogonal groups O_N. With the convention of [CM], the method returns $Wg^{O(d)}(other, self)$.

EXAMPLES:

```
sage: var('N')                                                          #␣
↪needs sage.symbolic
N
sage: m = PerfectMatching([(1,3),(2,4)])
sage: n = PerfectMatching([(1,2),(3,4)])
sage: factor(m.Weingarten_function(N, n))                               #␣
↪needs sage.symbolic
-1/((N + 2)*(N - 1)*N)
```

```
>>> from sage.all import *
>>> var('N')                                                          #␣
↪needs sage.symbolic
N
>>> m = PerfectMatching([(Integer(1),Integer(3)),(Integer(2),Integer(4))])
>>> n = PerfectMatching([(Integer(1),Integer(2)),(Integer(3),Integer(4))])
>>> factor(m.Weingarten_function(N, n))                               #␣
↪needs sage.symbolic
-1/((N + 2)*(N - 1)*N)
```

loop_type(*other=None*)

Return the loop type of `self`.

INPUT:

- `other` – a perfect matching of the same set of `self` (if the second argument is empty, the method `an_element()` is called on the parent of the first)

OUTPUT:

If we draw the two perfect matchings simultaneously as edges of a graph, the graph obtained is a union of cycles of even lengths. The function returns the ordered list of the semi-length of these cycles (considered as a partition)

EXAMPLES:

```
sage: m = PerfectMatching([('a','e'),('b','c'),('d','f')])
sage: n = PerfectMatching([('a','b'),('d','f'),('e','c')])
sage: m.loop_type(n)
[2, 1]
```

```
>>> from sage.all import *
>>> m = PerfectMatching([('a','e'),('b','c'),('d','f')])
>>> n = PerfectMatching([('a','b'),('d','f'),('e','c')])
>>> m.loop_type(n)
[2, 1]
```

loops(*other=None*)

Return the loops of `self`.

INPUT:

- `other` – a perfect matching of the same set of `self` (if the second argument is empty, the method `an_element()` is called on the parent of the first)

OUTPUT:

If we draw the two perfect matchings simultaneously as edges of a graph, the graph obtained is a union of cycles of even lengths. The function returns the list of these cycles (each cycle is given as a list).

EXAMPLES:

```
sage: m = PerfectMatching([('a','e'),('b','c'),('d','f')])
sage: n = PerfectMatching([('a','b'),('d','f'),('e','c')])
sage: loops = m.loops(n)
sage: loops # random
[['a', 'e', 'c', 'b'], ['d', 'f']]
```

(continues on next page)

(continued from previous page)

```
sage: o = PerfectMatching([(1, 7), (2, 4), (3, 8), (5, 6)])
sage: p = PerfectMatching([(1, 6), (2, 7), (3, 4), (5, 8)])
sage: o.loops(p)
[[1, 7, 2, 4, 3, 8, 5, 6]]
```

```
>>> from sage.all import *
>>> m = PerfectMatching([('a','e'),('b','c'),('d','f')])
>>> n = PerfectMatching([('a','b'),('d','f'),('e','c')])
>>> loops = m.loops(n)
>>> loops # random
[['a', 'e', 'c', 'b'], ['d', 'f']]

>>> o = PerfectMatching([(Integer(1), Integer(7)), (Integer(2), Integer(4)),␣
↪(Integer(3), Integer(8)), (Integer(5), Integer(6))])
>>> p = PerfectMatching([(Integer(1), Integer(6)), (Integer(2), Integer(7)),␣
↪(Integer(3), Integer(4)), (Integer(5), Integer(8))])
>>> o.loops(p)
[[1, 7, 2, 4, 3, 8, 5, 6]]
```

loops_iterator(*other=None*)

Iterate through the loops of `self`.

INPUT:

- `other` – a perfect matching of the same set of `self` (if the second argument is empty, the method `an_element()` is called on the parent of the first)

OUTPUT:

If we draw the two perfect matchings simultaneously as edges of a graph, the graph obtained is a union of cycles of even lengths. The function returns an iterator for these cycles (each cycle is given as a list).

EXAMPLES:

```
sage: o = PerfectMatching([(1, 7), (2, 4), (3, 8), (5, 6)])
sage: p = PerfectMatching([(1, 6), (2, 7), (3, 4), (5, 8)])
sage: it = o.loops_iterator(p)
sage: next(it)
[1, 7, 2, 4, 3, 8, 5, 6]
sage: next(it)
Traceback (most recent call last):
...
StopIteration
```

```
>>> from sage.all import *
>>> o = PerfectMatching([(Integer(1), Integer(7)), (Integer(2), Integer(4)),␣
↪(Integer(3), Integer(8)), (Integer(5), Integer(6))])
>>> p = PerfectMatching([(Integer(1), Integer(6)), (Integer(2), Integer(7)),␣
↪(Integer(3), Integer(4)), (Integer(5), Integer(8))])
>>> it = o.loops_iterator(p)
>>> next(it)
[1, 7, 2, 4, 3, 8, 5, 6]
>>> next(it)
```

(continues on next page)

(continued from previous page)

```
Traceback (most recent call last):
...
StopIteration
```

number_of_loops(*other=None*)

Return the number of loops of `self`.

INPUT:

- `other` – a perfect matching of the same set of `self` (if the second argument is empty, the method `an_element()` is called on the parent of the first)

OUTPUT:

If we draw the two perfect matchings simultaneously as edges of a graph, the graph obtained is a union of cycles of even lengths. The function returns their numbers.

EXAMPLES:

```
sage: m = PerfectMatching([('a','e'),('b','c'),('d','f')])
sage: n = PerfectMatching([('a','b'),('d','f'),('e','c')])
sage: m.number_of_loops(n)
2
```

```
>>> from sage.all import *
>>> m = PerfectMatching([('a','e'),('b','c'),('d','f')])
>>> n = PerfectMatching([('a','b'),('d','f'),('e','c')])
>>> m.number_of_loops(n)
2
```

partner(*x*)

Return the element in the same pair than `x` in the matching `self`.

EXAMPLES:

```
sage: m = PerfectMatching([(-3, 1), (2, 4), (-2, 7)])
sage: m.partner(4)
2
sage: n = PerfectMatching([('c','b'),('d','f'),('e','a')])
sage: n.partner('c')
'b'
```

```
>>> from sage.all import *
>>> m = PerfectMatching([(-Integer(3), Integer(1)), (Integer(2), Integer(4)),␣
↪(-Integer(2), Integer(7))])
>>> m.partner(Integer(4))
2
>>> n = PerfectMatching([('c','b'),('d','f'),('e','a')])
>>> n.partner('c')
'b'
```

standardization()

Return the standardization of `self`.

See *SetPartition.standardization()* for details.

EXAMPLES:

```
sage: n = PerfectMatching([('c','b'),('d','f'),('e','a')])
sage: n.standardization()
[(1, 5), (2, 3), (4, 6)]
```

```
>>> from sage.all import *
>>> n = PerfectMatching([('c','b'),('d','f'),('e','a')])
>>> n.standardization()
[(1, 5), (2, 3), (4, 6)]
```

to_graph()

Return the graph corresponding to the perfect matching.

OUTPUT: the realization of `self` as a graph

EXAMPLES:

```
sage: PerfectMatching([[1,3], [4,2]]).to_graph().edges(sort=True,              #␣
↪needs sage.graphs
....:                                                    labels=False)
[(1, 3), (2, 4)]
sage: PerfectMatching([[1,4], [3,2]]).to_graph().edges(sort=True,              #␣
↪needs sage.graphs
....:                                                    labels=False)
[(1, 4), (2, 3)]
sage: PerfectMatching([]).to_graph().edges(sort=True, labels=False)            #␣
↪needs sage.graphs
[]
```

```
>>> from sage.all import *
>>> PerfectMatching([[Integer(1),Integer(3)], [Integer(4),Integer(2)]]).to_
↪graph().edges(sort=True,            # needs sage.graphs
...                                                    labels=False)
[(1, 3), (2, 4)]
>>> PerfectMatching([[Integer(1),Integer(4)], [Integer(3),Integer(2)]]).to_
↪graph().edges(sort=True,            # needs sage.graphs
...                                                    labels=False)
[(1, 4), (2, 3)]
>>> PerfectMatching([]).to_graph().edges(sort=True, labels=False)          #␣
↪needs sage.graphs
[]
```

to_noncrossing_set_partition()

Return the noncrossing set partition (on half as many elements) corresponding to the perfect matching if the perfect matching is noncrossing, and otherwise gives an error.

OUTPUT: the realization of `self` as a noncrossing set partition

EXAMPLES:

```
sage: PerfectMatching([[1,3], [4,2]]).to_noncrossing_set_partition()
Traceback (most recent call last):
...
ValueError: matching must be non-crossing
```

(continues on next page)

(continued from previous page)

```
sage: PerfectMatching([[1,4], [3,2]]).to_noncrossing_set_partition()
{{1, 2}}
sage: PerfectMatching([]).to_noncrossing_set_partition()
{}
```

```
>>> from sage.all import *
>>> PerfectMatching([[Integer(1),Integer(3)], [Integer(4),Integer(2)]]).to_
↪noncrossing_set_partition()
Traceback (most recent call last):
...
ValueError: matching must be non-crossing
>>> PerfectMatching([[Integer(1),Integer(4)], [Integer(3),Integer(2)]]).to_
↪noncrossing_set_partition()
{{1, 2}}
>>> PerfectMatching([]).to_noncrossing_set_partition()
{}
```

class sage.combinat.perfect_matching.**PerfectMatchings**(*s*)

Bases: *SetPartitions_set*

Perfect matchings of a ground set.

INPUT:

- s – an iterable of hashable objects or an integer

EXAMPLES:

If the argument s is an integer n, it will be transformed into the set $\{1, \ldots, n\}$:

```
sage: M = PerfectMatchings(6); M
Perfect matchings of {1, 2, 3, 4, 5, 6}
sage: PerfectMatchings([-1, -3, 1, 2])
Perfect matchings of {1, 2, -3, -1}
```

```
>>> from sage.all import *
>>> M = PerfectMatchings(Integer(6)); M
Perfect matchings of {1, 2, 3, 4, 5, 6}
>>> PerfectMatchings([-Integer(1), -Integer(3), Integer(1), Integer(2)])
Perfect matchings of {1, 2, -3, -1}
```

One can ask for the list, the cardinality or an element of a set of perfect matching:

```
sage: PerfectMatchings(4).list()
[[(1, 2), (3, 4)], [(1, 3), (2, 4)], [(1, 4), (2, 3)]]
sage: PerfectMatchings(8).cardinality()
105
sage: M = PerfectMatchings(('a', 'e', 'b', 'f', 'c', 'd'))
sage: x = M.an_element()
sage: x # random
[('a', 'c'), ('b', 'e'), ('d', 'f')]
sage: all(PerfectMatchings(i).an_element() in PerfectMatchings(i)
....:     for i in range(2,11,2))
True
```

```
>>> from sage.all import *
>>> PerfectMatchings(Integer(4)).list()
[[(1, 2), (3, 4)], [(1, 3), (2, 4)], [(1, 4), (2, 3)]]
>>> PerfectMatchings(Integer(8)).cardinality()
105
>>> M = PerfectMatchings(('a', 'e', 'b', 'f', 'c', 'd'))
>>> x = M.an_element()
>>> x # random
[('a', 'c'), ('b', 'e'), ('d', 'f')]
>>> all(PerfectMatchings(i).an_element() in PerfectMatchings(i)
...     for i in range(Integer(2),Integer(11),Integer(2)))
True
```

Element

alias of *PerfectMatching*

Weingarten_matrix(N)

Return the Weingarten matrix corresponding to the set of PerfectMatchings `self`.

It is a useful theoretical tool to compute polynomial integrals over the orthogonal group O_N (see [CM]).

EXAMPLES:

```
sage: M = PerfectMatchings(4).Weingarten_matrix(var('N'))                    #␣
↪needs sage.symbolic
sage: N*(N-1)*(N+2)*M.apply_map(factor)                                      #␣
↪needs sage.symbolic
[N + 1    -1    -1]
[   -1 N + 1    -1]
[   -1    -1 N + 1]
```

```
>>> from sage.all import *
>>> M = PerfectMatchings(Integer(4)).Weingarten_matrix(var('N'))             ␣
↪     # needs sage.symbolic
>>> N*(N-Integer(1))*(N+Integer(2))*M.apply_map(factor)                      ␣
↪                # needs sage.symbolic
[N + 1    -1    -1]
[   -1 N + 1    -1]
[   -1    -1 N + 1]
```

base_set()

Return the base set of `self`.

EXAMPLES:

```
sage: PerfectMatchings(3).base_set()
{1, 2, 3}
```

```
>>> from sage.all import *
>>> PerfectMatchings(Integer(3)).base_set()
{1, 2, 3}
```

base_set_cardinality()

Return the cardinality of the base set of `self`.

EXAMPLES:

```
sage: PerfectMatchings(3).base_set_cardinality()
3
```

```
>>> from sage.all import *
>>> PerfectMatchings(Integer(3)).base_set_cardinality()
3
```

cardinality()

Return the cardinality of the set of perfect matchings `self`.

This is $1 * 3 * 5 * ... * (2n - 1)$, where $2n$ is the size of the ground set.

EXAMPLES:

```
sage: PerfectMatchings(8).cardinality()
105
sage: PerfectMatchings([1,2,3,4]).cardinality()
3
sage: PerfectMatchings(3).cardinality()
0
sage: PerfectMatchings([]).cardinality()
1
```

```
>>> from sage.all import *
>>> PerfectMatchings(Integer(8)).cardinality()
105
>>> PerfectMatchings([Integer(1),Integer(2),Integer(3),Integer(4)]).
↪cardinality()
3
>>> PerfectMatchings(Integer(3)).cardinality()
0
>>> PerfectMatchings([]).cardinality()
1
```

random_element()

Return a random element of `self`.

EXAMPLES:

```
sage: M = PerfectMatchings(('a', 'e', 'b', 'f', 'c', 'd'))
sage: x = M.random_element()
sage: x # random
[('a', 'b'), ('c', 'd'), ('e', 'f')]
```

```
>>> from sage.all import *
>>> M = PerfectMatchings(('a', 'e', 'b', 'f', 'c', 'd'))
>>> x = M.random_element()
>>> x # random
[('a', 'b'), ('c', 'd'), ('e', 'f')]
```

5.1.172 Permutations

The Permutations module. Use `Permutation?` to get information about the Permutation class, and `Permutations?` to get information about the combinatorial class of permutations.

> **Warning**
>
> This file defined *Permutation* which depends upon *CombinatorialElement* despite it being deprecated (see Issue #13742). This is dangerous. In particular, the `Permutation._left_to_right_multiply_on_right()` method (which can be called through multiplication) disables the input checks (see *Permutation()*). This should not happen. Do not trust the results.

What does this file define ?

The main part of this file consists in the definition of permutation objects, i.e. the *Permutation()* method and the *Permutation* class. Global options for elements of the permutation class can be set through the *Permutations.options()* object.

Below are listed all methods and classes defined in this file.

Methods of Permutations objects

left_action_product()	Return the product of `self` with another permutation, in which the other permutation is applied first.
right_action_product()	Return the product of `self` with another permutation, in which `self` is applied first.
size()	Return the size of the permutation `self`.
cycle_string()	Return the disjoint-cycles representation of `self` as string.
next()	Return the permutation that follows `self` in lexicographic order (in the same symmetric group as `self`).
prev()	Return the permutation that comes directly before `self` in lexicographic order (in the same symmetric group as `self`).
to_tableau_by_shape()	Return a tableau of shape `shape` with the entries in `self`.
to_cycles()	Return the permutation `self` as a list of disjoint cycles.
forget_cycles()	Return `self` under the forget cycle map.
to_permutation_group_element()	Return a `PermutationGroupElement` equal to `self`.
signature()	Return the signature of the permutation `sef`.
is_even()	Return `True` if the permutation `self` is even, and `False` otherwise.
to_matrix()	Return a matrix representing the permutation `self`.
rank()	Return the rank of `self` in lexicographic ordering (on the symmetric group containing `self`).
to_inversion_vector()	Return the inversion vector of a permutation `self`.
inversions()	Return a list of the inversions of permutation `self`.
stack_sort()	Return the permutation obtained by sorting `self` through one stack.
to_digraph()	Return a digraph representation of `self`.
show()	Display the permutation as a drawing.
number_of_inversions()	Return the number of inversions in the permutation `self`.
noninversions()	Return the `k`-noninversions in the permutation `self`.
number_of_noninversions()	Return the number of `k`-noninversions in the permutation `self`.
length()	Return the Coxeter length of a permutation `self`.
inverse()	Return the inverse of a permutation `self`.

continues on next page

Table 3 – continued from previous page

ishift()	Return the i-shift of self.
iswitch()	Return the i-switch of self.
runs()	Return a list of the runs in the permutation self.
longest_increasing_subsequence_length()	Return the length of the longest increasing subsequences of self.
longest_increasing_subsequences()	Return the list of the longest increasing subsequences of self.
longest_increasing_subsequences_number()	Return the number of longest increasing subsequences
cycle_type()	Return the cycle type of self as a partition of len(self).
foata_bijection()	Return the image of the permutation self under the Foata bijection ϕ.
foata_bijection_inverse()	Return the image of the permutation self under the inverse of the Foata bijection ϕ.
fundamental_transformation()	Return the image of the permutation self under the Renyi-Foata-Schuetzenberger fundamental transformation.
fundamental_transformation_inverse()	Return the image of the permutation self under the inverse of the Renyi-Foata-Schuetzenberger fundamental transformation.
destandardize()	Return destandardization of self with respect to weight and ordered_alphabet.
to_lehmer_code()	Return the Lehmer code of the permutation self.
to_lehmer_cocode()	Return the Lehmer cocode of self.
reduced_word()	Return the reduced word of the permutation self.
reduced_words()	Return a list of the reduced words of the permutation self.
reduced_words_iterator()	An iterator for the reduced words of the permutation self.
reduced_word_lexmin()	Return a lexicographically minimal reduced word of a permutation self.
fixed_points()	Return a list of the fixed points of the permutation self.
is_derangement()	Return True if the permutation self is a derangement, and False otherwise.
is_simple()	Return True if the permutation self is simple, and False otherwise.
number_of_fixed_points()	Return the number of fixed points of the permutation self.
recoils()	Return the list of the positions of the recoils of the permutation self.
number_of_recoils()	Return the number of recoils of the permutation self.
recoils_composition()	Return the composition corresponding to the recoils of self.
descents()	Return the list of the descents of the permutation self.
idescents()	Return a list of the idescents of self.
idescents_signature()	Return the list obtained by mapping each position in self to -1 if it is an idescent and 1 if it is not an idescent.
number_of_descents()	Return the number of descents of the permutation self.
number_of_idescents()	Return the number of idescents of the permutation self.
descents_composition()	Return the composition corresponding to the descents of self.
descent_polynomial()	Return the descent polynomial of the permutation self.
major_index()	Return the major index of the permutation self.
imajor_index()	Return the inverse major index of the permutation self.
to_major_code()	Return the major code of the permutation self.
peaks()	Return a list of the peaks of the permutation self.
number_of_peaks()	Return the number of peaks of the permutation self.
saliances()	Return a list of the saliances of the permutation self.
number_of_saliances()	Return the number of saliances of the permutation self.
bruhat_lequal()	Return True if self is less or equal to p2 in the Bruhat order.
weak_excedences()	Return all the numbers self[i] such that self[i] >= i+1.

continues on next page

Table 3 – continued from previous page

bruhat_inversions()	Return the list of inversions of self such that the application of this inversion to self decrements its number of inversions.
bruhat_inversions_iterator()	Return an iterator over Bruhat inversions of self.
bruhat_succ()	Return a list of the permutations covering self in the Bruhat order.
bruhat_succ_iterator()	An iterator for the permutations covering self in the Bruhat order.
bruhat_pred()	Return a list of the permutations covered by self in the Bruhat order.
bruhat_pred_iterator()	An iterator for the permutations covered by self in the Bruhat order.
bruhat_smaller()	Return the combinatorial class of permutations smaller than or equal to self in the Bruhat order.
bruhat_greater()	Return the combinatorial class of permutations greater than or equal to self in the Bruhat order.
permutohedron_lequal()	Return True if self is less or equal to p2 in the permutohedron order.
permutohedron_succ()	Return a list of the permutations covering self in the permutohedron order.
permutohedron_pred()	Return a list of the permutations covered by self in the permutohedron order.
permutohedron_smaller()	Return a list of permutations smaller than or equal to self in the permutohedron order.
permutohedron_greater()	Return a list of permutations greater than or equal to self in the permutohedron order.
right_permutohedron_interval_iterator()	Return an iterator over permutations in an interval of the permutohedron order.
right_permutohedron_interval()	Return a list of permutations in an interval of the permutohedron order.
has_pattern()	Test whether the permutation self matches the pattern.
avoids()	Test whether the permutation self avoids the pattern.
pattern_positions()	Return the list of positions where the pattern patt appears in self.
reverse()	Return the permutation obtained by reversing the 1-line notation of self.
complement()	Return the complement of the permutation which is obtained by replacing each value x in the 1-line notation of self with $n - x + 1$.
permutation_poset()	Return the permutation poset of self.
dict()	Return a dictionary corresponding to the permutation self.
action()	Return the action of the permutation self on a list.
robinson_schensted()	Return the pair of standard tableaux obtained by running the Robinson-Schensted Algorithm on self.
left_tableau()	Return the left standard tableau after performing the RSK algorithm.
right_tableau()	Return the right standard tableau after performing the RSK algorithm.
increasing_tree()	Return the increasing tree of self.
increasing_tree_shape()	Return the shape of the increasing tree of self.
binary_search_tree()	Return the binary search tree of self.
sylvester_class()	Iterate over the equivalence class of self under sylvester congruence
RS_partition()	Return the shape of the tableaux obtained by the RSK algorithm.
remove_extra_fixed_points()	Return the permutation obtained by removing any fixed points at the end of self.
retract_plain()	Return the plain retract of self to a smaller symmetric group S_m.
retract_direct_product()	Return the direct-product retract of self to a smaller symmetric group S_m.
retract_okounkov_vershik()	Return the Okounkov-Vershik retract of self to a smaller symmetric group S_m.
hyperoctahedral_double_coset_type()	Return the coset-type of self as a partition.
binary_search_tree_shape()	Return the shape of the binary search tree of self (a non labelled binary tree).

continues on next page

Table 3 – continued from previous page

shifted_concatenation()	Return the right (or left) shifted concatenation of `self` with a permutation `other`.
shifted_shuffle()	Return the shifted shuffle of `self` with a permutation `other`.

Functions defined in this file

from_major_code()	Return the permutation corresponding to major code `mc`.
from_permutation_group_element()	Return a Permutation give a `PermutationGroupElement` `pge`.
from_rank()	Return the permutation with the specified lexicographic rank.
from_inversion_vector()	Return the permutation corresponding to inversion vector `iv`.
from_cycles()	Return the permutation with given disjoint-cycle representation `cycles`.
from_lehmer_code()	Return the permutation with Lehmer code `lehmer`.
from_reduced_word()	Return the permutation corresponding to the reduced word `rw`.
bistochastic_as_sum_of_permutations()	Return a given bistochastic matrix as a nonnegative linear combination of permutations.
bounded_affine_permutation()	Return a partial permutation representing the bounded affine permutation of a matrix.
descents_composition_list()	Return a list of all the permutations in a given descent class (i. e., having a given descents composition).
descents_composition_first()	Return the smallest element of a descent class.
descents_composition_last()	Return the largest element of a descent class.
bruhat_lequal()	Return `True` if `p1` is less or equal to `p2` in the Bruhat order.
permutohedron_lequal()	Return `True` if `p1` is less or equal to `p2` in the permutohedron order.
to_standard()	Return a standard permutation corresponding to the permutation `self`.

AUTHORS:

- Mike Hansen
- Dan Drake (2008-04-07): allow Permutation() to take lists of tuples
- Sébastien Labbé (2009-03-17): added robinson_schensted_inverse
- Travis Scrimshaw:
  - (2012-08-16): `to_standard()` no longer modifies input
  - (2013-01-19): Removed RSK implementation and moved to *rsk*.
  - (2013-07-13): Removed `CombinatorialClass` and moved permutations to the category framework.
- Darij Grinberg (2013-09-07): added methods; ameliorated Issue #14885 by exposing and documenting methods for global-independent multiplication.
- Travis Scrimshaw (2014-02-05): Made *StandardPermutations_n* a finite Weyl group to make it more uniform with `SymmetricGroup`. Added ability to compute the conjugacy classes.
- Trevor K. Karn (2022-08-05): Add `Permutation.n_reduced_words()`
- Amrutha P, Shriya M, Divya Aggarwal (2022-08-16): Added Multimajor Index.

Classes and methods

class sage.combinat.permutation.**Arrangements**

Bases: *Permutations*

An arrangement of a multiset `mset` is an ordered selection without repetitions. It is represented by a list that contains only elements from `mset`, but maybe in a different order.

`Arrangements` returns the combinatorial class of arrangements of the multiset `mset` that contain `k` elements.

EXAMPLES:

```
sage: mset = [1,1,2,3,4,4,5]
sage: Arrangements(mset, 2).list()                                              #␣
↪needs sage.libs.gap

>>> A.cardinality()                                                          #␣
↪needs sage.libs.gap
22
```

class sage.combinat.permutation.**Arrangements_msetk**(*mset*, *k*)

Bases: *Arrangements*, *Permutations_msetk*

Arrangements of length k of a multiset M.

class sage.combinat.permutation.**Arrangements_setk**(*s*, *k*)

Bases: *Arrangements*, *Permutations_setk*

Arrangements of length k of a set S.

class sage.combinat.permutation.**CyclicPermutations**(*mset*)

Bases: *Permutations_mset*

Return the class of all cyclic permutations of mset in cycle notation. These are the same as necklaces.

INPUT:

- mset – a multiset

EXAMPLES:

```
sage: CyclicPermutations(range(4)).list()                                  #␣
↪needs sage.combinat
[[0, 1, 2, 3],
 [0, 1, 3, 2],
 [0, 2, 1, 3],
 [0, 2, 3, 1],
 [0, 3, 1, 2],
 [0, 3, 2, 1]]
sage: CyclicPermutations([1,1,1]).list()                                   #␣
↪needs sage.combinat
[[1, 1, 1]]
```

```
>>> from sage.all import *
>>> CyclicPermutations(range(Integer(4))).list()                           ␣
↪     # needs sage.combinat
[[0, 1, 2, 3],
 [0, 1, 3, 2],
 [0, 2, 1, 3],
 [0, 2, 3, 1],
 [0, 3, 1, 2],
 [0, 3, 2, 1]]
>>> CyclicPermutations([Integer(1),Integer(1),Integer(1)]).list()          ␣
↪                        # needs sage.combinat
[[1, 1, 1]]
```

iterator(*distinct=False*)

EXAMPLES:

```
sage: CyclicPermutations(range(4)).list()  # indirect doctest             #␣
↪needs sage.combinat
[[0, 1, 2, 3],
 [0, 1, 3, 2],
 [0, 2, 1, 3],
 [0, 2, 3, 1],
 [0, 3, 1, 2],
 [0, 3, 2, 1]]
 sage: CyclicPermutations([1,1,1]).list()                                  #␣
↪needs sage.combinat
 [[1, 1, 1]]
 sage: CyclicPermutations([1,1,1]).list(distinct=True)                     #␣
↪needs sage.combinat
 [[1, 1, 1], [1, 1, 1]]
```

```
>>> from sage.all import *
>>> CyclicPermutations(range(Integer(4))).list()  # indirect doctest       ␣
↪     # needs sage.combinat
[[0, 1, 2, 3],
 [0, 1, 3, 2],
 [0, 2, 1, 3],
 [0, 2, 3, 1],
 [0, 3, 1, 2],
 [0, 3, 2, 1]]
>>> CyclicPermutations([Integer(1),Integer(1),Integer(1)]).list()          ␣
↪                        # needs sage.combinat
 [[1, 1, 1]]
>>> CyclicPermutations([Integer(1),Integer(1),Integer(1)]).
↪list(distinct=True)                    # needs sage.combinat
 [[1, 1, 1], [1, 1, 1]]
```

list(*distinct=False*)

EXAMPLES:

```
sage: CyclicPermutations(range(4)).list()                                 #␣
↪needs sage.combinat
[[0, 1, 2, 3],
 [0, 1, 3, 2],
 [0, 2, 1, 3],

 [0, 1, 3, 2],
 [0, 2, 1, 3],
 [0, 2, 3, 1],
 [0, 3, 1, 2],
 [0, 3, 2, 1]]
```

class sage.combinat.permutation.**CyclicPermutationsOfPartition**(*partition*)

Bases: *Permutations*

Combinations of cyclic permutations of each cell of a given partition.

This is the same as a Cartesian product of necklaces.

EXAMPLES:

```
sage: CyclicPermutationsOfPartition([[1,2,3,4],[5,6,7]]).list()           #␣
↪needs sage.combinat
[[[1, 2, 3, 4], [5, 6, 7]],
 [[1, 2, 4, 3], [5, 6, 7]],
 [[1, 3, 2, 4], [5, 6, 7]],
 [[1, 3, 4, 2], [5, 6, 7]],
 [[1, 4, 2, 3], [5, 6, 7]],
```

(continues on next page)

(continued from previous page)

class Element

Bases: `ClonableArray`

A cyclic permutation of a partition.

check()

Check that `self` is a valid element.

EXAMPLES:

```
sage: CP = CyclicPermutationsOfPartition([[1,2,3,4],[5,6,7]])
sage: elt = CP[0]                                                           #␣
↪needs sage.combinat
sage: elt.check()                                                           #␣
↪needs sage.combinat
```

```
>>> from sage.all import *
>>> CP = CyclicPermutationsOfPartition([[Integer(1),Integer(2),Integer(3),
↪Integer(4)],[Integer(5),Integer(6),Integer(7)]])
>>> elt = CP[Integer(0)]                                                    ␣
↪     # needs sage.combinat
>>> elt.check()                                                          #␣
↪needs sage.combinat
```

iterator(*distinct=False*)

AUTHORS:

[[[1, 2, 3], [4, 4, 4]],
 [[1, 3, 2], [4, 4, 4]],
 [[1, 2, 3], [4, 4, 4]],
 [[1, 3, 2], [4, 4, 4]]]
```

list(*distinct=False*)

EXAMPLES:

```
sage: CyclicPermutationsOfPartition([[1,2,3],[4,4,4]]).list()                #␣
↪needs sage.combinat
[[[1, 2, 3], [4, 4, 4]], [[1, 3, 2], [4, 4, 4]]]
sage: CyclicPermutationsOfPartition([[1,2,3],[4,4,4]]).list(distinct=True)   #␣
↪needs sage.combinat
[[[1, 2, 3], [4, 4, 4]],
 [[1, 3, 2], [4, 4, 4]],
 [[1, 2, 3], [4, 4, 4]],
 [[1, 3, 2], [4, 4, 4]]]
```

```
>>> from sage.all import *
>>> CyclicPermutationsOfPartition([[Integer(1),Integer(2),Integer(3)],
↪[Integer(4),Integer(4),Integer(4)]]).list()                  # needs sage.
↪combinat
[[[1, 2, 3], [4, 4, 4]], [[1, 3, 2], [4, 4, 4]]]
>>> CyclicPermutationsOfPartition([[Integer(1),Integer(2),Integer(3)],
↪[Integer(4),Integer(4),Integer(4)]]).list(distinct=True)   # needs sage.
↪combinat
[[[1, 2, 3], [4, 4, 4]],
 [[1, 3, 2], [4, 4, 4]],
 [[1, 2, 3], [4, 4, 4]],
 [[1, 3, 2], [4, 4, 4]]]
```

class sage.combinat.permutation.**PatternAvoider**(*parent*, *patterns*)

Bases: *GenericBacktracker*

EXAMPLES:

```
sage: from sage.combinat.permutation import PatternAvoider
sage: P = Permutations(4)
sage: p = PatternAvoider(P, [[1,2,3]])
sage: loads(dumps(p))
<sage.combinat.permutation.PatternAvoider object at 0x...>
```

```
>>> from sage.all import *
>>> from sage.combinat.permutation import PatternAvoider
>>> P = Permutations(Integer(4))
>>> p = PatternAvoider(P, [[Integer(1),Integer(2),Integer(3)]])
>>> loads(dumps(p))
<sage.combinat.permutation.PatternAvoider object at 0x...>
```

class sage.combinat.permutation.**Permutation**(*parent*, *l*, *algorithm='lex'*, *sjt=None*, *check=True*)

Bases: `CombinatorialElement`

A permutation.

Converts `l` to a permutation on $\{1, 2, \ldots, n\}$.

INPUT:

- `l` – can be any one of the following:
  - an instance of `Permutation`,
  - list of integers, viewed as one-line permutation notation. The construction checks that you give an acceptable entry. To avoid the check, use the `check` option.
  - string, expressing the permutation in cycle notation.
  - list of tuples of integers, expressing the permutation in cycle notation.
  - a `PermutationGroupElement`
  - a pair of two standard tableaux of the same shape. This yields the permutation obtained from the pair using the inverse of the Robinson-Schensted algorithm.
- `check` – boolean (default: `True`); whether to check that input is correct; slows the function down, but ensures that nothing bad happens
- `algorithm` – string (default: `'lex'`); the algorithm used to generate the permutations. Supported algorithms are:
  - `'lex'`: lexicographic order generation, this is the default algorithm
  - `'sjt'`: Steinhaus-Johnson-Trotter algorithm to generate permutations using only transposition of two elements in the list. It is highly recommended to set `check=True` (default value).
- `sjt` – SJT (default: `None`); the `SJT` object holding the permutation internal state. This should only be specified when initializing with non-identity permutation.

Warning

Since Issue #13742 the input is checked for correctness : it is not accepted unless it actually is a permutation on $\{1, \ldots, n\}$. It means that some `Permutation()` objects cannot be created anymore without setting `check=False`, as there is no certainty that its functions can handle them, and this should be fixed in a much better way ASAP (the functions should be rewritten to handle those cases, and new tests be added).

Warning

There are two possible conventions for multiplying permutations, and the one currently enabled in Sage by default is the one which has $(pq)(i) = q(p(i))$ for any permutations $p \in S_n$ and $q \in S_n$ and any $1 \leq i \leq n$. (This equation looks less strange when the action of permutations on numbers is written from the right: then it takes the form $i^{pq} = (i^p)^q$, which is an associativity law). There is an alternative convention, which has $(pq)(i) = p(q(i))$ instead. The conventions can be switched at runtime using `sage.combinat.permutation.Permutations.options()`. It is best for code not to rely on this setting being set to a particular standard, but rather use the methods `left_action_product()` and `right_action_product()` for multiplying permutations (these methods don't depend on the setting). See Issue #14885 for more details.

Note

The `bruhat*` methods refer to the *strong* Bruhat order. To use the *weak* Bruhat order, look under `permutohedron*`.

EXAMPLES:

```
sage: Permutation([2,1])
[2, 1]
sage: Permutation([2, 1, 4, 5, 3])
[2, 1, 4, 5, 3]
sage: Permutation('(1,2)')
[2, 1]
sage: Permutation('(1,2)(3,4,5)')
[2, 1, 4, 5, 3]
sage: Permutation( ((1,2),(3,4,5)) )
[2, 1, 4, 5, 3]
sage: Permutation( [(1,2),(3,4,5)] )
[2, 1, 4, 5, 3]
sage: Permutation( ((1,2)) )
[2, 1]
sage: Permutation( (1,2) )
[2, 1]
sage: Permutation( ((1,2),) )
[2, 1]
sage: Permutation( ((1,),) )

>>> type(p)
<class 'sage.combinat.permutation.StandardPermutations_n_with_category.element_
↪class'>
```

Generate permutations using the Steinhaus-Johnson Trotter algorithm. The output is not in lexicographic order:

```
sage: p = Permutation([1, 2, 3, 4], algorithm='sjt'); p
[1, 2, 3, 4]
sage: p = p.next(); p
[1, 2, 4, 3]
sage: p = p.next(); p
[1, 4, 2, 3]
sage: p = Permutation([1, 2, 3], algorithm='sjt')
sage: for _ in range(6):
....:     p = p.next()
sage: p
False

sage: Permutation([1, 3, 2, 4], algorithm='sjt')
Traceback (most recent call last):
...
ValueError: no internal state directions were given for non-identity
starting permutation for Steinhaus-Johnson-Trotter algorithm
```

```
>>> from sage.all import *
>>> p = Permutation([Integer(1), Integer(2), Integer(3), Integer(4)], algorithm=
↪'sjt'); p
[1, 2, 3, 4]
>>> p = p.next(); p
[1, 2, 4, 3]
>>> p = p.next(); p
[1, 4, 2, 3]
>>> p = Permutation([Integer(1), Integer(2), Integer(3)], algorithm='sjt')
>>> for _ in range(Integer(6)):
...     p = p.next()
>>> p
False

>>> Permutation([Integer(1), Integer(3), Integer(2), Integer(4)], algorithm='sjt')
Traceback (most recent call last):
...
ValueError: no internal state directions were given for non-identity
starting permutation for Steinhaus-Johnson-Trotter algorithm
```

Construction from a string in cycle notation:

```
sage: p = Permutation( '(4,5)' ); p
[1, 2, 3, 5, 4]
```

```
>>> from sage.all import *
>>> p = Permutation( '(4,5)' ); p
[1, 2, 3, 5, 4]
```

The size of the permutation is the maximum integer appearing; add a 1-cycle to increase this:

```
sage: p2 = Permutation( '(4,5)(10)' ); p2
[1, 2, 3, 5, 4, 6, 7, 8, 9, 10]
sage: len(p); len(p2)
5
10
```

```
>>> from sage.all import *
>>> p2 = Permutation( '(4,5)(10)' ); p2
[1, 2, 3, 5, 4, 6, 7, 8, 9, 10]
>>> len(p); len(p2)
5
10
```

We construct a *Permutation* from a `PermutationGroupElement`:

```
sage: g = PermutationGroupElement([2,1,3])                                    #␣
↪needs sage.groups
sage: Permutation(g)                                                          #␣
↪needs sage.groups
[2, 1, 3]
```

```
>>> from sage.all import *
>>> g = PermutationGroupElement([Integer(2),Integer(1),Integer(3)])              ␣
↪                          # needs sage.groups
>>> Permutation(g)                                                              #␣
↪needs sage.groups
[2, 1, 3]
```

From a pair of tableaux of the same shape. This uses the inverse of the Robinson-Schensted algorithm:

```
sage: # needs sage.combinat
sage: p = [[1, 4, 7], [2, 5], [3], [6]]
sage: q = [[1, 2, 5], [3, 6], [4], [7]]
sage: P = Tableau(p)
sage: Q = Tableau(q)
sage: Permutation( (p, q) )
[3, 6, 5, 2, 7, 4, 1]
sage: Permutation( [p, q] )
[3, 6, 5, 2, 7, 4, 1]
sage: Permutation( (P, Q) )
[3, 6, 5, 2, 7, 4, 1]
sage: Permutation( [P, Q] )
[3, 6, 5, 2, 7, 4, 1]
```

```
>>> from sage.all import *
>>> # needs sage.combinat
>>> p = [[Integer(1), Integer(4), Integer(7)], [Integer(2), Integer(5)],␣
↪[Integer(3)], [Integer(6)]]
>>> q = [[Integer(1), Integer(2), Integer(5)], [Integer(3), Integer(6)],␣
↪[Integer(4)], [Integer(7)]]
>>> P = Tableau(p)
>>> Q = Tableau(q)
>>> Permutation( (p, q) )
[3, 6, 5, 2, 7, 4, 1]
>>> Permutation( [p, q] )
[3, 6, 5, 2, 7, 4, 1]
>>> Permutation( (P, Q) )
[3, 6, 5, 2, 7, 4, 1]
>>> Permutation( [P, Q] )
[3, 6, 5, 2, 7, 4, 1]
```

RS_partition()

Return the shape of the tableaux obtained by applying the RSK algorithm to `self`.

EXAMPLES:

```
sage: Permutation([1,4,3,2]).RS_partition()                                     #␣
↪needs sage.combinat
[2, 1, 1]
```

```
>>> from sage.all import *
>>> Permutation([Integer(1),Integer(4),Integer(3),Integer(2)]).RS_partition()␣
↪                                  # needs sage.combinat
[2, 1, 1]
```

absolute_length()

Return the absolute length of `self`

The absolute length is the length of the shortest expression of the element as a product of reflections.

For permutations in the symmetric groups, the absolute length is the size minus the number of its disjoint cycles.

EXAMPLES:

```
sage: Permutation([4,2,3,1]).absolute_length()                              #␣
↪needs sage.combinat
1
```

```
>>> from sage.all import *
>>> Permutation([Integer(4),Integer(2),Integer(3),Integer(1)]).absolute_
↪length()                                       # needs sage.combinat
1
```

action(*a*)

Return the action of the permutation `self` on a list `a`.

The action of a permutation $p \in S_n$ on an n-element list $(a_1, a_2, \ldots, a_n)$ is defined to be $(a_{p(1)}, a_{p(2)}, \ldots, a_{p(n)})$.

EXAMPLES:

```
sage: p = Permutation([2,1,3])
sage: a = list(range(3))
sage: p.action(a)
[1, 0, 2]
sage: b = [1,2,3,4]
sage: p.action(b)
Traceback (most recent call last):
...
ValueError: len(a) must equal len(self)

sage: q = Permutation([2,3,1])
sage: a = list(range(3))
sage: q.action(a)
[1, 2, 0]
```

```
>>> from sage.all import *
>>> p = Permutation([Integer(2),Integer(1),Integer(3)])
>>> a = list(range(Integer(3)))
>>> p.action(a)
[1, 0, 2]
>>> b = [Integer(1),Integer(2),Integer(3),Integer(4)]
>>> p.action(b)
Traceback (most recent call last):
...
ValueError: len(a) must equal len(self)

>>> q = Permutation([Integer(2),Integer(3),Integer(1)])
>>> a = list(range(Integer(3)))
```

(continues on next page)

(continued from previous page)

```
>>> q.action(a)
[1, 2, 0]
```

avoids (*patt*)

Test whether the permutation `self` avoids the pattern `patt`.

EXAMPLES:

```
sage: Permutation([6,2,5,4,3,1]).avoids([4,2,3,1])                          #␣
↪needs sage.combinat
False
sage: Permutation([6,1,2,5,4,3]).avoids([4,2,3,1])                          #␣
↪needs sage.combinat
True
sage: Permutation([6,1,2,5,4,3]).avoids([3,4,1,2])                          #␣
↪needs sage.combinat
True
```

```
>>> from sage.all import *
>>> Permutation([Integer(6),Integer(2),Integer(5),Integer(4),Integer(3),
↪Integer(1)]).avoids([Integer(4),Integer(2),Integer(3),Integer(1)])          ␣
↪                 # needs sage.combinat
False
>>> Permutation([Integer(6),Integer(1),Integer(2),Integer(5),Integer(4),
↪Integer(3)]).avoids([Integer(4),Integer(2),Integer(3),Integer(1)])          ␣
↪                 # needs sage.combinat
True
>>> Permutation([Integer(6),Integer(1),Integer(2),Integer(5),Integer(4),
↪Integer(3)]).avoids([Integer(3),Integer(4),Integer(1),Integer(2)])          ␣
↪                 # needs sage.combinat
True
```

binary_search_tree (*left_to_right=True*)

Return the binary search tree associated to `self`.

If w is a word, then the binary search tree associated to w is defined as the result of starting with an empty binary tree, and then inserting the letters of w one by one into this tree. Here, the insertion is being done according to the method *binary_search_insert()*, and the word w is being traversed from left to right.

A permutation is regarded as a word (using one-line notation), and thus a binary search tree associated to a permutation is defined.

If the optional keyword variable `left_to_right` is set to `False`, the word w is being traversed from right to left instead.

EXAMPLES:

```
sage: Permutation([1,4,3,2]).binary_search_tree()                            #␣
↪needs sage.graphs
1[., 4[3[2[., .], .], .]]
sage: Permutation([4,1,3,2]).binary_search_tree()                            #␣
↪needs sage.graphs
4[1[., 3[2[., .], .]], .]
```

```
>>> from sage.all import *
>>> Permutation([Integer(1),Integer(4),Integer(3),Integer(2)]).binary_search_
↪tree()                                 # needs sage.graphs
1[., 4[3[2[., .], .], .]]
>>> Permutation([Integer(4),Integer(1),Integer(3),Integer(2)]).binary_search_
↪tree()                                 # needs sage.graphs
4[1[., 3[2[., .], .]], .]
```

By passing the option `left_to_right=False` one can have the insertion going from right to left:

```
sage: Permutation([1,4,3,2]).binary_search_tree(False)                     #␣
↪needs sage.graphs
2[1[., .], 3[., 4[., .]]]
sage: Permutation([4,1,3,2]).binary_search_tree(False)                     #␣
↪needs sage.graphs
2[1[., .], 3[., 4[., .]]]
```

```
>>> from sage.all import *
>>> Permutation([Integer(1),Integer(4),Integer(3),Integer(2)]).binary_search_
↪tree(False)                            # needs sage.graphs
2[1[., .], 3[., 4[., .]]]
>>> Permutation([Integer(4),Integer(1),Integer(3),Integer(2)]).binary_search_
↪tree(False)                            # needs sage.graphs
2[1[., .], 3[., 4[., .]]]
```

binary_search_tree_shape(*left_to_right=True*)

Return the shape of the binary search tree of the permutation (a non labelled binary tree).

EXAMPLES:

```
sage: Permutation([1,4,3,2]).binary_search_tree_shape()                    #␣
↪needs sage.graphs
[., [[[., .], .], .]]
sage: Permutation([4,1,3,2]).binary_search_tree_shape()                    #␣
↪needs sage.graphs
[[., [[., .], .]], .]
```

```
>>> from sage.all import *
>>> Permutation([Integer(1),Integer(4),Integer(3),Integer(2)]).binary_search_
↪tree_shape()                           # needs sage.graphs
[., [[[., .], .], .]]
>>> Permutation([Integer(4),Integer(1),Integer(3),Integer(2)]).binary_search_
↪tree_shape()                           # needs sage.graphs
[[., [[., .], .]], .]
```

By passing the option `left_to_right=False` one can have the insertion going from right to left:

```
sage: Permutation([1,4,3,2]).binary_search_tree_shape(False)               #␣
↪needs sage.graphs
[[., .], [., [., .]]]
sage: Permutation([4,1,3,2]).binary_search_tree_shape(False)               #␣
↪needs sage.graphs
[[., .], [., [., .]]]
```

```
>>> from sage.all import *
>>> Permutation([Integer(1),Integer(4),Integer(3),Integer(2)]).binary_search_
↪tree_shape(False)                    # needs sage.graphs
[[., .], [., [., .]]]
>>> Permutation([Integer(4),Integer(1),Integer(3),Integer(2)]).binary_search_
↪tree_shape(False)                    # needs sage.graphs
[[., .], [., [., .]]]
```

bruhat_greater()

Return the combinatorial class of permutations greater than or equal to `self` in the Bruhat order (on the symmetric group containing `self`).

See *bruhat_lequal()* for the definition of the Bruhat order.

EXAMPLES:

```
sage: Permutation([4,1,2,3]).bruhat_greater().list()
[[4, 1, 2, 3],
 [4, 1, 3, 2],
 [4, 2, 1, 3],
 [4, 2, 3, 1],
 [4, 3, 1, 2],
 [4, 3, 2, 1]]
```

```
>>> from sage.all import *
>>> Permutation([Integer(4),Integer(1),Integer(2),Integer(3)]).bruhat_
↪greater().list()
[[4, 1, 2, 3],
 [4, 1, 3, 2],
 [4, 2, 1, 3],
 [4, 2, 3, 1],
 [4, 3, 1, 2],
 [4, 3, 2, 1]]
```

bruhat_inversions()

Return the list of inversions of `self` such that the application of this inversion to `self` decreases its number of inversions by exactly 1.

Equivalently, it returns the list of pairs (i, j) such that $i < j$, such that $p(i) > p(j)$ and such that there exists no k (strictly) between i and j satisfying $p(i) > p(k) > p(j)$.

EXAMPLES:

```
sage: Permutation([5,2,3,4,1]).bruhat_inversions()
[[0, 1], [0, 2], [0, 3], [1, 4], [2, 4], [3, 4]]
sage: Permutation([6,1,4,5,2,3]).bruhat_inversions()
[[0, 1], [0, 2], [0, 3], [2, 4], [2, 5], [3, 4], [3, 5]]
```

```
>>> from sage.all import *
>>> Permutation([Integer(5),Integer(2),Integer(3),Integer(4),Integer(1)]).
↪bruhat_inversions()
[[0, 1], [0, 2], [0, 3], [1, 4], [2, 4], [3, 4]]
>>> Permutation([Integer(6),Integer(1),Integer(4),Integer(5),Integer(2),
```

(continues on next page)

(continued from previous page)

```
↪Integer(3)]).bruhat_inversions()
[[0, 1], [0, 2], [0, 3], [2, 4], [2, 5], [3, 4], [3, 5]]
```

bruhat_inversions_iterator()

Return the iterator for the inversions of `self` such that the application of this inversion to `self` decreases its number of inversions by exactly 1.

EXAMPLES:

```
sage: list(Permutation([5,2,3,4,1]).bruhat_inversions_iterator())
[[0, 1], [0, 2], [0, 3], [1, 4], [2, 4], [3, 4]]
sage: list(Permutation([6,1,4,5,2,3]).bruhat_inversions_iterator())
[[0, 1], [0, 2], [0, 3], [2, 4], [2, 5], [3, 4], [3, 5]]
```

```
>>> from sage.all import *
>>> list(Permutation([Integer(5),Integer(2),Integer(3),Integer(4),
↪Integer(1)]).bruhat_inversions_iterator())
[[0, 1], [0, 2], [0, 3], [1, 4], [2, 4], [3, 4]]
>>> list(Permutation([Integer(6),Integer(1),Integer(4),Integer(5),Integer(2),
↪Integer(3)]).bruhat_inversions_iterator())
[[0, 1], [0, 2], [0, 3], [2, 4], [2, 5], [3, 4], [3, 5]]
```

bruhat_lequal(*p2*)

Return `True` if `self` is less or equal to `p2` in the Bruhat order.

The Bruhat order (also called strong Bruhat order or Chevalley order) on the symmetric group S_n is the partial order on S_n determined by the following condition: If p is a permutation, and i and j are two indices satisfying $p(i) > p(j)$ and $i < j$ (that is, (i, j) is an inversion of p with $i < j$), then $p \circ (i, j)$ (the permutation obtained by first switching i with j and then applying p) is smaller than p in the Bruhat order.

One can show that a permutation $p \in S_n$ is less or equal to a permutation $q \in S_n$ in the Bruhat order if and only if for every $i \in \{0, 1, \cdots, n\}$ and $j \in \{1, 2, \cdots, n\}$, the number of the elements among $p(1), p(2), \cdots, p(j)$ that are greater than i is $\leq$ to the number of the elements among $q(1), q(2), \cdots, q(j)$ that are greater than i.

This method assumes that `self` and `p2` are permutations of the same integer n.

EXAMPLES:

```
sage: Permutation([2,4,3,1]).bruhat_lequal(Permutation([3,4,2,1]))
True

sage: Permutation([2,1,3]).bruhat_lequal(Permutation([2,3,1]))
True
sage: Permutation([2,1,3]).bruhat_lequal(Permutation([3,1,2]))
True
sage: Permutation([2,1,3]).bruhat_lequal(Permutation([1,2,3]))
False
sage: Permutation([1,3,2]).bruhat_lequal(Permutation([2,1,3]))
False
sage: Permutation([1,3,2]).bruhat_lequal(Permutation([2,3,1]))
True
sage: Permutation([2,3,1]).bruhat_lequal(Permutation([1,3,2]))
False
```

(continues on next page)

(continued from previous page)

```
sage: sorted( [len([b for b in Permutations(3) if a.bruhat_lequal(b)])
....:           for a in Permutations(3)] )
[1, 2, 2, 4, 4, 6]

sage: Permutation([]).bruhat_lequal(Permutation([]))
True
```

```
>>> from sage.all import *
>>> Permutation([Integer(2),Integer(4),Integer(3),Integer(1)]).bruhat_
↪lequal(Permutation([Integer(3),Integer(4),Integer(2),Integer(1)]))
True

>>> Permutation([Integer(2),Integer(1),Integer(3)]).bruhat_
↪lequal(Permutation([Integer(2),Integer(3),Integer(1)]))
True
>>> Permutation([Integer(2),Integer(1),Integer(3)]).bruhat_
↪lequal(Permutation([Integer(3),Integer(1),Integer(2)]))
True
>>> Permutation([Integer(2),Integer(1),Integer(3)]).bruhat_
↪lequal(Permutation([Integer(1),Integer(2),Integer(3)]))
False
>>> Permutation([Integer(1),Integer(3),Integer(2)]).bruhat_
↪lequal(Permutation([Integer(2),Integer(1),Integer(3)]))
False
>>> Permutation([Integer(1),Integer(3),Integer(2)]).bruhat_
↪lequal(Permutation([Integer(2),Integer(3),Integer(1)]))
True
>>> Permutation([Integer(2),Integer(3),Integer(1)]).bruhat_
↪lequal(Permutation([Integer(1),Integer(3),Integer(2)]))
False
>>> sorted( [len([b for b in Permutations(Integer(3)) if a.bruhat_lequal(b)])
...           for a in Permutations(Integer(3))] )
[1, 2, 2, 4, 4, 6]

>>> Permutation([]).bruhat_lequal(Permutation([]))
True
```

bruhat_pred()

Return a list of the permutations strictly smaller than `self` in the Bruhat order (on the symmetric group containing `self`) such that there is no permutation between one of those and `self`.

See *bruhat_lequal()* for the definition of the Bruhat order.

EXAMPLES:

```
sage: Permutation([6,1,4,5,2,3]).bruhat_pred()
[[1, 6, 4, 5, 2, 3],
 [4, 1, 6, 5, 2, 3],
 [5, 1, 4, 6, 2, 3],
 [6, 1, 2, 5, 4, 3],
 [6, 1, 3, 5, 2, 4],
 [6, 1, 4, 2, 5, 3],
 [6, 1, 4, 3, 2, 5]]
```

```
>>> from sage.all import *
>>> Permutation([Integer(6),Integer(1),Integer(4),Integer(5),Integer(2),
↪Integer(3)]).bruhat_pred()
[[1, 6, 4, 5, 2, 3],
 [4, 1, 6, 5, 2, 3],
 [5, 1, 4, 6, 2, 3],
 [6, 1, 2, 5, 4, 3],
 [6, 1, 3, 5, 2, 4],
 [6, 1, 4, 2, 5, 3],
 [6, 1, 4, 3, 2, 5]]
```

bruhat_pred_iterator()

An iterator for the permutations strictly smaller than `self` in the Bruhat order (on the symmetric group containing `self`) such that there is no permutation between one of those and `self`.

See *bruhat_lequal()* for the definition of the Bruhat order.

EXAMPLES:

```
sage: [x for x in Permutation([6,1,4,5,2,3]).bruhat_pred_iterator()]
[[1, 6, 4, 5, 2, 3],
 [4, 1, 6, 5, 2, 3],
 [5, 1, 4, 6, 2, 3],
 [6, 1, 2, 5, 4, 3],
 [6, 1, 3, 5, 2, 4],
 [6, 1, 4, 2, 5, 3],
 [6, 1, 4, 3, 2, 5]]
```

```
>>> from sage.all import *
>>> [x for x in Permutation([Integer(6),Integer(1),Integer(4),Integer(5),
↪Integer(2),Integer(3)]).bruhat_pred_iterator()]
[[1, 6, 4, 5, 2, 3],
 [4, 1, 6, 5, 2, 3],
 [5, 1, 4, 6, 2, 3],
 [6, 1, 2, 5, 4, 3],
 [6, 1, 3, 5, 2, 4],
 [6, 1, 4, 2, 5, 3],
 [6, 1, 4, 3, 2, 5]]
```

bruhat_smaller()

Return the combinatorial class of permutations smaller than or equal to `self` in the Bruhat order (on the symmetric group containing `self`).

See *bruhat_lequal()* for the definition of the Bruhat order.

EXAMPLES:

```
sage: Permutation([4,1,2,3]).bruhat_smaller().list()
[[1, 2, 3, 4],
 [1, 2, 4, 3],
 [1, 3, 2, 4],
 [1, 4, 2, 3],
 [2, 1, 3, 4],
 [2, 1, 4, 3],
```

(continues on next page)

(continued from previous page)

```
 [3, 1, 2, 4],
 [4, 1, 2, 3]]
```

```
>>> from sage.all import *
>>> Permutation([Integer(4),Integer(1),Integer(2),Integer(3)]).bruhat_
↪smaller().list()
[[1, 2, 3, 4],
 [1, 2, 4, 3],
 [1, 3, 2, 4],
 [1, 4, 2, 3],
 [2, 1, 3, 4],
 [2, 1, 4, 3],
 [3, 1, 2, 4],
 [4, 1, 2, 3]]
```

bruhat_succ()

Return a list of the permutations strictly greater than `self` in the Bruhat order (on the symmetric group containing `self`) such that there is no permutation between one of those and `self`.

See *bruhat_lequal()* for the definition of the Bruhat order.

EXAMPLES:

```
sage: Permutation([6,1,4,5,2,3]).bruhat_succ()
[[6, 4, 1, 5, 2, 3],
 [6, 2, 4, 5, 1, 3],
 [6, 1, 5, 4, 2, 3],
 [6, 1, 4, 5, 3, 2]]
```

```
>>> from sage.all import *
>>> Permutation([Integer(6),Integer(1),Integer(4),Integer(5),Integer(2),
↪Integer(3)]).bruhat_succ()
[[6, 4, 1, 5, 2, 3],
 [6, 2, 4, 5, 1, 3],
 [6, 1, 5, 4, 2, 3],
 [6, 1, 4, 5, 3, 2]]
```

bruhat_succ_iterator()

An iterator for the permutations that are strictly greater than `self` in the Bruhat order (on the symmetric group containing `self`) such that there is no permutation between one of those and `self`.

See *bruhat_lequal()* for the definition of the Bruhat order.

EXAMPLES:

```
sage: [x for x in Permutation([6,1,4,5,2,3]).bruhat_succ_iterator()]
[[6, 4, 1, 5, 2, 3],
 [6, 2, 4, 5, 1, 3],
 [6, 1, 5, 4, 2, 3],
 [6, 1, 4, 5, 3, 2]]
```

```
>>> from sage.all import *
>>> [x for x in Permutation([Integer(6),Integer(1),Integer(4),Integer(5),
```

(continues on next page)

(continued from previous page)

```
↪Integer(2),Integer(3)]).bruhat_succ_iterator()]
[[6, 4, 1, 5, 2, 3],
 [6, 2, 4, 5, 1, 3],
 [6, 1, 5, 4, 2, 3],
 [6, 1, 4, 5, 3, 2]]
```

complement()

Return the complement of the permutation `self`.

The complement of a permutation $w \in S_n$ is defined as the permutation in S_n sending each i to $n+1-w(i)$.

EXAMPLES:

```
sage: Permutation([1,2,3]).complement()
[3, 2, 1]
sage: Permutation([1, 3, 2]).complement()
[3, 1, 2]
```

```
>>> from sage.all import *
>>> Permutation([Integer(1),Integer(2),Integer(3)]).complement()
[3, 2, 1]
>>> Permutation([Integer(1), Integer(3), Integer(2)]).complement()
[3, 1, 2]
```

cycle_string(*singletons=False*)

Return a string of the permutation in cycle notation.

If `singletons=True`, it includes 1-cycles in the string.

EXAMPLES:

```
sage: Permutation([1,2,3]).cycle_string()
'()'
sage: Permutation([2,1,3]).cycle_string()
'(1,2)'
sage: Permutation([2,3,1]).cycle_string()
'(1,2,3)'
sage: Permutation([2,1,3]).cycle_string(singletons=True)
'(1,2)(3)'
```

```
>>> from sage.all import *
>>> Permutation([Integer(1),Integer(2),Integer(3)]).cycle_string()
'()'
>>> Permutation([Integer(2),Integer(1),Integer(3)]).cycle_string()
'(1,2)'
>>> Permutation([Integer(2),Integer(3),Integer(1)]).cycle_string()
'(1,2,3)'
>>> Permutation([Integer(2),Integer(1),Integer(3)]).cycle_
↪string(singletons=True)
'(1,2)(3)'
```

cycle_tuples(*singletons=True*, *use_min=True*)

Return the permutation `self` as a list of disjoint cycles.

The cycles are returned in the order of increasing smallest elements, and each cycle is returned as a tuple which starts with its smallest element.

If `singletons=False` is given, the list does not contain the singleton cycles.

If `use_min=False` is given, the cycles are returned in the order of increasing *largest* (not smallest) elements, and each cycle starts with its largest element.

EXAMPLES:

```
sage: Permutation([2,1,3,4]).to_cycles()
[(1, 2), (3,), (4,)]
sage: Permutation([2,1,3,4]).to_cycles(singletons=False)
[(1, 2)]
sage: Permutation([2,1,3,4]).to_cycles(use_min=True)
[(1, 2), (3,), (4,)]
sage: Permutation([2,1,3,4]).to_cycles(use_min=False)
[(4,), (3,), (2, 1)]
sage: Permutation([2,1,3,4]).to_cycles(singletons=False, use_min=False)
[(2, 1)]

sage: Permutation([4,1,5,2,6,3]).to_cycles()
[(1, 4, 2), (3, 5, 6)]
sage: Permutation([4,1,5,2,6,3]).to_cycles(use_min=False)
[(6, 3, 5), (4, 2, 1)]

sage: Permutation([6, 4, 5, 2, 3, 1]).to_cycles()
[(1, 6), (2, 4), (3, 5)]
sage: Permutation([6, 4, 5, 2, 3, 1]).to_cycles(use_min=False)
[(6, 1), (5, 3), (4, 2)]
```

```
>>> from sage.all import *
>>> Permutation([Integer(2),Integer(1),Integer(3),Integer(4)]).to_cycles()
[(1, 2), (3,), (4,)]
>>> Permutation([Integer(2),Integer(1),Integer(3),Integer(4)]).to_
→cycles(singletons=False)
[(1, 2)]
>>> Permutation([Integer(2),Integer(1),Integer(3),Integer(4)]).to_cycles(use_
→min=True)
[(1, 2), (3,), (4,)]
>>> Permutation([Integer(2),Integer(1),Integer(3),Integer(4)]).to_cycles(use_
→min=False)
[(4,), (3,), (2, 1)]
>>> Permutation([Integer(2),Integer(1),Integer(3),Integer(4)]).to_
→cycles(singletons=False, use_min=False)
[(2, 1)]

>>> Permutation([Integer(4),Integer(1),Integer(5),Integer(2),Integer(6),
→Integer(3)]).to_cycles()
[(1, 4, 2), (3, 5, 6)]
>>> Permutation([Integer(4),Integer(1),Integer(5),Integer(2),Integer(6),
→Integer(3)]).to_cycles(use_min=False)
[(6, 3, 5), (4, 2, 1)]

>>> Permutation([Integer(6), Integer(4), Integer(5), Integer(2), Integer(3),␣
```

(continues on next page)

(continued from previous page)

```
↪Integer(1)]).to_cycles()
[(1, 6), (2, 4), (3, 5)]
>>> Permutation([Integer(6), Integer(4), Integer(5), Integer(2), Integer(3),␣
↪Integer(1)]).to_cycles(use_min=False)
[(6, 1), (5, 3), (4, 2)]
```

The algorithm is of complexity $O(n)$ where n is the size of the given permutation.

cycle_type()

Return a partition of `len(self)` corresponding to the cycle type of `self`.

This is a non-increasing sequence of the cycle lengths of `self`.

EXAMPLES:

```
sage: Permutation([3,1,2,4]).cycle_type()                                #␣
↪needs sage.combinat
[3, 1]
```

```
>>> from sage.all import *
>>> Permutation([Integer(3),Integer(1),Integer(2),Integer(4)]).cycle_type()  ␣
↪                                 # needs sage.combinat
[3, 1]
```

decreasing_runs(*as_tuple=False*)

Decreasing runs of the permutation.

INPUT:

- `as_tuple` – boolean (default: `False`); choice of output format

OUTPUT: list of lists or a tuple of tuples

See also

runs()

EXAMPLES:

```
sage: s = Permutation([2,8,3,9,6,4,5,1,7])
sage: s.decreasing_runs()
[[2], [8, 3], [9, 6, 4], [5, 1], [7]]
sage: s.decreasing_runs(as_tuple=True)
((2,), (8, 3), (9, 6, 4), (5, 1), (7,))
```

```
>>> from sage.all import *
>>> s = Permutation([Integer(2),Integer(8),Integer(3),Integer(9),Integer(6),
↪Integer(4),Integer(5),Integer(1),Integer(7)])
>>> s.decreasing_runs()
[[2], [8, 3], [9, 6, 4], [5, 1], [7]]
>>> s.decreasing_runs(as_tuple=True)
((2,), (8, 3), (9, 6, 4), (5, 1), (7,))
```

descent_polynomial()

Return the descent polynomial of the permutation self.

The descent polynomial of a permutation p is the product of all the z[p(i)] where i ranges over the descents of p.

A descent of a permutation p is an integer i such that p(i) > p(i+1).

REFERENCES:

- [GS1984]

EXAMPLES:

```
sage: Permutation([2,1,3]).descent_polynomial()
z2
sage: Permutation([4,3,2,1]).descent_polynomial()
z2*z3*z4
```

```
>>> from sage.all import *
>>> Permutation([Integer(2),Integer(1),Integer(3)]).descent_polynomial()
z2
>>> Permutation([Integer(4),Integer(3),Integer(2),Integer(1)]).descent_
↪polynomial()
z2*z3*z4
```

Todo

This docstring needs to be fixed. This is not defined in [GS1984] (the descent monomial in their (7.23) is different).

descents(*final_descent=False*, *side='right'*, *positive=False*, *from_zero=False*, *index_set=None*)

Return the list of the descents of self.

A descent of a permutation p is an integer i such that $p(i) > p(i+1)$.

Warning

By default, the descents are returned as elements in the index set, i.e., starting at 1. If you want them to start at 0, set the keyword from_zero to True.

INPUT:

- final_descent – boolean (default: False); if True, the last position of a non-empty permutation is also considered as a descent
- side – 'right' (default) or 'left'; if 'left', return the descents of the inverse permutation
- positive – boolean (default: False); if True, return the positions that are not descents
- from_zero – boolean (default: False); if True, return the positions starting from 0
- index_set – list (default: [1, ..., n-1] where self is a permutation of n); the index set to check for descents

EXAMPLES:

```
sage: Permutation([3,1,2]).descents()
[1]
sage: Permutation([1,4,3,2]).descents()
[2, 3]
sage: Permutation([1,4,3,2]).descents(final_descent=True)
[2, 3, 4]
sage: Permutation([1,4,3,2]).descents(index_set=[1,2])
[2]
sage: Permutation([1,4,3,2]).descents(from_zero=True)
[1, 2]
```

```
>>> from sage.all import *
>>> Permutation([Integer(3),Integer(1),Integer(2)]).descents()
[1]
>>> Permutation([Integer(1),Integer(4),Integer(3),Integer(2)]).descents()
[2, 3]
>>> Permutation([Integer(1),Integer(4),Integer(3),Integer(2)]).descents(final_
↪descent=True)
[2, 3, 4]
>>> Permutation([Integer(1),Integer(4),Integer(3),Integer(2)]).descents(index_
↪set=[Integer(1),Integer(2)])
[2]
>>> Permutation([Integer(1),Integer(4),Integer(3),Integer(2)]).descents(from_
↪zero=True)
[1, 2]
```

descents_composition()

Return the descent composition of `self`.

The descent composition of a permutation $p \in S_n$ is defined as the composition of n whose descent set equals the descent set of p. Here, the descent set of p is defined as the set of all $i \in \{1, 2, \ldots, n-1\}$ satisfying $p(i) > p(i+1)$. The descent set of a composition $c = (i_1, i_2, \ldots, i_k)$ is defined as the set $\{i_1, i_1 + i_2, i_1 + i_2 + i_3, \ldots, i_1 + i_2 + \cdots + i_{k-1}\}$.

EXAMPLES:

```
sage: Permutation([1,3,2,4]).descents_composition()
[2, 2]
sage: Permutation([4,1,6,7,2,3,8,5]).descents_composition()
[1, 3, 3, 1]
sage: Permutation([]).descents_composition()
[]
```

```
>>> from sage.all import *
>>> Permutation([Integer(1),Integer(3),Integer(2),Integer(4)]).descents_
↪composition()
[2, 2]
>>> Permutation([Integer(4),Integer(1),Integer(6),Integer(7),Integer(2),
↪Integer(3),Integer(8),Integer(5)]).descents_composition()
[1, 3, 3, 1]
>>> Permutation([]).descents_composition()
[]
```

destandardize(*weight*, *ordered_alphabet=None*)

Return destandardization of `self` with respect to `weight` and `ordered_alphabet`.

INPUT:

- `weight` – list or tuple of nonnegative integers that sum to n if `self` is a permutation in S_n
- `ordered_alphabet` – (default: `None`) a list or tuple specifying the ordered alphabet the destandardized word is over

OUTPUT: word over the `ordered_alphabet` which standardizes to `self`

Let $weight = (w_1, w_2, \ldots, w_\ell)$. Then this methods looks for an increasing sequence of $1, 2, \ldots, w_1$ and labels all letters in it by 1, then an increasing sequence of $w_1 + 1, w_1 + 2, \ldots, w_1 + w_2$ and labels all these letters by 2, etc.. If an increasing sequence for the specified `weight` does not exist, an error is returned. The output is a word `w` over the specified ordered alphabet with evaluation `weight` such that `w.standard_permutation()` is `self`.

EXAMPLES:

```
sage: p = Permutation([1,2,5,3,6,4])
sage: p.destandardize([3,1,2])                                          #␣
↪needs sage.combinat
word: 113132
sage: p = Permutation([2,1,3])
sage: p.destandardize([2,1])
Traceback (most recent call last):
...
ValueError: Standardization with weight [2, 1] is not possible!
```

```
>>> from sage.all import *
>>> p = Permutation([Integer(1),Integer(2),Integer(5),Integer(3),Integer(6),
↪Integer(4)])
>>> p.destandardize([Integer(3),Integer(1),Integer(2)])                 ␣
↪                       # needs sage.combinat
word: 113132
>>> p = Permutation([Integer(2),Integer(1),Integer(3)])
>>> p.destandardize([Integer(2),Integer(1)])
Traceback (most recent call last):
...
ValueError: Standardization with weight [2, 1] is not possible!
```

dict()

Return a dictionary corresponding to the permutation.

EXAMPLES:

```
sage: p = Permutation([2,1,3])
sage: d = p.dict()
sage: d[1]
2
sage: d[2]
1
sage: d[3]
3
```

```
>>> from sage.all import *
>>> p = Permutation([Integer(2),Integer(1),Integer(3)])
>>> d = p.dict()
>>> d[Integer(1)]
2
>>> d[Integer(2)]
1
>>> d[Integer(3)]
3
```

fixed_points()

Return a list of the fixed points of `self`.

EXAMPLES:

```
sage: Permutation([1,3,2,4]).fixed_points()
[1, 4]
sage: Permutation([1,2,3,4]).fixed_points()
[1, 2, 3, 4]
```

```
>>> from sage.all import *
>>> Permutation([Integer(1),Integer(3),Integer(2),Integer(4)]).fixed_points()
[1, 4]
>>> Permutation([Integer(1),Integer(2),Integer(3),Integer(4)]).fixed_points()
[1, 2, 3, 4]
```

foata_bijection()

Return the image of the permutation `self` under the Foata bijection ϕ.

The bijection shows that maj (the major index) and inv (the number of inversions) are equidistributed: if $\phi(P) = Q$, then $\mathrm{maj}(P) = \mathrm{inv}(Q)$.

The Foata bijection ϕ is a bijection on the set of words with no two equal letters. It can be defined by induction on the size of the word: Given a word $w_1 w_2 \cdots w_n$, start with $\phi(w_1) = w_1$. At the i-th step, if $\phi(w_1 w_2 \cdots w_i) = v_1 v_2 \cdots v_i$, we define $\phi(w_1 w_2 \cdots w_i w_{i+1})$ by placing w_{i+1} on the end of the word $v_1 v_2 \cdots v_i$ and breaking the word up into blocks as follows. If $w_{i+1} > v_i$, place a vertical line to the right of each v_k for which $w_{i+1} > v_k$. Otherwise, if $w_{i+1} < v_i$, place a vertical line to the right of each v_k for which $w_{i+1} < v_k$. In either case, place a vertical line at the start of the word as well. Now, within each block between vertical lines, cyclically shift the entries one place to the right.

For instance, to compute $\phi([1, 4, 2, 5, 3])$, the sequence of words is

- 1,
- $|1|4 \to 14$,
- $|14|2 \to 412$,
- $|4|1|2|5 \to 4125$,
- $|4|125|3 \to 45123$.

So $\phi([1, 4, 2, 5, 3]) = [4, 5, 1, 2, 3]$.

See section 2 of [FS1978], and the proof of Proposition 1.4.6 in [EnumComb1].

See also

foata_bijection_inverse() for the inverse map.

EXAMPLES:

```
sage: Permutation([1,2,4,3]).foata_bijection()
[4, 1, 2, 3]
sage: Permutation([2,5,1,3,4]).foata_bijection()
[2, 1, 3, 5, 4]

sage: P = Permutation([2,5,1,3,4])
sage: P.major_index() == P.foata_bijection().number_of_inversions()
True

sage: all( P.major_index() == P.foata_bijection().number_of_inversions()
....:      for P in Permutations(4) )
True
```

```
>>> from sage.all import *
>>> Permutation([Integer(1),Integer(2),Integer(4),Integer(3)]).foata_
↪bijection()
[4, 1, 2, 3]
>>> Permutation([Integer(2),Integer(5),Integer(1),Integer(3),Integer(4)]).
↪foata_bijection()
[2, 1, 3, 5, 4]

>>> P = Permutation([Integer(2),Integer(5),Integer(1),Integer(3),Integer(4)])
>>> P.major_index() == P.foata_bijection().number_of_inversions()
True

>>> all( P.major_index() == P.foata_bijection().number_of_inversions()
...      for P in Permutations(Integer(4)) )
True
```

The example from [FS1978]:

```
sage: Permutation([7,4,9,2,6,1,5,8,3]).foata_bijection()
[4, 7, 2, 6, 1, 9, 5, 8, 3]
```

```
>>> from sage.all import *
>>> Permutation([Integer(7),Integer(4),Integer(9),Integer(2),Integer(6),
↪Integer(1),Integer(5),Integer(8),Integer(3)]).foata_bijection()
[4, 7, 2, 6, 1, 9, 5, 8, 3]
```

Border cases:

```
sage: Permutation([]).foata_bijection()
[]
sage: Permutation([1]).foata_bijection()
[1]
```

```
>>> from sage.all import *
>>> Permutation([]).foata_bijection()
[]
>>> Permutation([Integer(1)]).foata_bijection()
[1]
```

foata_bijection_inverse()

Return the image of the permutation `self` under the inverse of the Foata bijection ϕ.

See *foata_bijection()* for the definition of the Foata bijection.

EXAMPLES:

```
sage: Permutation([4, 1, 2, 3]).foata_bijection()
[1, 2, 4, 3]
```

```
>>> from sage.all import *
>>> Permutation([Integer(4), Integer(1), Integer(2), Integer(3)]).foata_
↪bijection()
[1, 2, 4, 3]
```

forget_cycles()

Return the image of `self` under the map which forgets cycles.

Consider a permutation σ written in standard cyclic form:

$$\sigma = (a_{1,1}, \ldots, a_{1,k_1})(a_{2,1}, \ldots, a_{2,k_2}) \cdots (a_{m,1}, \ldots, a_{m,k_m}),$$

where $a_{1,1} < a_{2,1} < \cdots < a_{m,1}$ and $a_{j,1} < a_{j,i}$ for all $1 \leq j \leq m$ and $2 \leq i \leq k_j$ where we include cycles of length 1 as well. The image of the forget cycle map ϕ is given by

$$\phi(\sigma) = [a_{1,1}, \ldots, a_{1,k_1}, a_{2,1}, \ldots, a_{2,k_2}, \ldots, a_{m,1}, \ldots, a_{m,k_m}],$$

considered as a permutation in 1-line notation.

See also

fundamental_transformation(), which is a similar map that is defined by instead taking $a_{j,1} > a_{j,i}$ and is bijective.

EXAMPLES:

```
sage: P = Permutations(5)
sage: x = P([1, 5, 3, 4, 2])
sage: x.forget_cycles()
[1, 2, 5, 3, 4]
```

```
>>> from sage.all import *
>>> P = Permutations(Integer(5))
>>> x = P([Integer(1), Integer(5), Integer(3), Integer(4), Integer(2)])
>>> x.forget_cycles()
[1, 2, 5, 3, 4]
```

We select all permutations with a cycle composition of $[2, 3, 1]$ in S_6:

```
sage: P = Permutations(6)
sage: l = [p for p in P if [len(t) for t in p.to_cycles()] == [1,3,2]]
```

```
>>> from sage.all import *
>>> P = Permutations(Integer(6))
>>> l = [p for p in P if [len(t) for t in p.to_cycles()] == [Integer(1),
↪Integer(3),Integer(2)]]
```

Next we apply ϕ and then take the inverse, and then view the results as a poset under the Bruhat order:

```
sage: l = [p.forget_cycles().inverse() for p in l]
sage: B = Poset([l, lambda x,y: x.bruhat_lequal(y)])                          #␣
↪needs sage.combinat sage.graphs
sage: R.<q> = QQ[]
sage: sum(q^B.rank_function()(x) for x in B)                                  #␣
↪needs sage.combinat sage.graphs
q^5 + 2*q^4 + 3*q^3 + 3*q^2 + 2*q + 1
```

```
>>> from sage.all import *
>>> l = [p.forget_cycles().inverse() for p in l]
>>> B = Poset([l, lambda x,y: x.bruhat_lequal(y)])                          #␣
↪needs sage.combinat sage.graphs
>>> R = QQ['q']; (q,) = R._first_ngens(1)
>>> sum(q**B.rank_function()(x) for x in B)                                 #␣
↪needs sage.combinat sage.graphs
q^5 + 2*q^4 + 3*q^3 + 3*q^2 + 2*q + 1
```

We check the statement in [CC2013] that the posets $C_{[1,3,1,1]}$ and $C_{[1,3,2]}$ are isomorphic:

```
sage: l2 = [p for p in P if [len(t) for t in p.to_cycles()] == [1,3,1,1]]
sage: l2 = [p.forget_cycles().inverse() for p in l2]
sage: B2 = Poset([l2, lambda x,y: x.bruhat_lequal(y)])                        #␣
↪needs sage.combinat sage.graphs
sage: B.is_isomorphic(B2)                                                     #␣
↪needs sage.combinat sage.graphs
True
```

```
>>> from sage.all import *
>>> l2 = [p for p in P if [len(t) for t in p.to_cycles()] == [Integer(1),
↪Integer(3),Integer(1),Integer(1)]]
>>> l2 = [p.forget_cycles().inverse() for p in l2]
>>> B2 = Poset([l2, lambda x,y: x.bruhat_lequal(y)])                        #␣
↪needs sage.combinat sage.graphs
>>> B.is_isomorphic(B2)                                                     #␣
↪needs sage.combinat sage.graphs
True
```

See also:

fundamental_transformation().

fundamental_transformation()

Return the image of the permutation `self` under the Renyi-Foata-Schuetzenberger fundamental transformation.

The fundamental transformation is a bijection from the set of all permutations of $\{1, 2, \ldots, n\}$ to itself, which transforms any such permutation w as follows: Write w in cycle form, with each cycle starting with its highest element, and the cycles being sorted in increasing order of their highest elements. Drop the parentheses in the resulting expression, thus reading it as a one-line notation of a new permutation u. Then, u is the image of w under the fundamental transformation.

See [EnumComb1], Proposition 1.3.1.

See also

fundamental_transformation_inverse() for the inverse map.

forget_cycles() for a similar (but non-bijective) map where each cycle is starting from its lowest element.

EXAMPLES:

```
sage: Permutation([5, 1, 3, 4, 2]).fundamental_transformation()
[3, 4, 5, 2, 1]
sage: Permutations(5)([1, 5, 3, 4, 2]).fundamental_transformation()
[1, 3, 4, 5, 2]
sage: Permutation([8, 4, 7, 2, 9, 6, 5, 1, 3]).fundamental_transformation()
[4, 2, 6, 8, 1, 9, 3, 7, 5]
```

```
>>> from sage.all import *
>>> Permutation([Integer(5), Integer(1), Integer(3), Integer(4), Integer(2)]).
↪fundamental_transformation()
[3, 4, 5, 2, 1]
>>> Permutations(Integer(5))([Integer(1), Integer(5), Integer(3), Integer(4),␣
↪Integer(2)]).fundamental_transformation()
[1, 3, 4, 5, 2]
>>> Permutation([Integer(8), Integer(4), Integer(7), Integer(2), Integer(9),␣
↪Integer(6), Integer(5), Integer(1), Integer(3)]).fundamental_
↪transformation()
[4, 2, 6, 8, 1, 9, 3, 7, 5]
```

Comparison with *forget_cycles()*:

```
sage: P = Permutation([(1,3,4),(2,5)])
sage: P
[3, 5, 4, 1, 2]
sage: P.forget_cycles()
[1, 3, 4, 2, 5]
sage: P.fundamental_transformation()
[4, 1, 3, 5, 2]
```

```
>>> from sage.all import *
>>> P = Permutation([(Integer(1),Integer(3),Integer(4)),(Integer(2),
↪Integer(5))])
```

(continues on next page)

(continued from previous page)

```
>>> P
[3, 5, 4, 1, 2]
>>> P.forget_cycles()
[1, 3, 4, 2, 5]
>>> P.fundamental_transformation()
[4, 1, 3, 5, 2]
```

fundamental_transformation_inverse()

Return the image of the permutation `self` under the inverse of the Renyi-Foata-Schuetzenberger fundamental transformation.

The inverse of the fundamental transformation is a bijection from the set of all permutations of $\{1, 2, \ldots, n\}$ to itself, which transforms any such permutation w as follows: Let $I = \{i_1 < i_2 < \cdots < i_k\}$ be the set of all left-to-right maxima of w (that is, of all indices j such that $w(j)$ is bigger than each of $w(1), w(2), \ldots, w(j-1)$). The image of w under the inverse of the fundamental transformation is the permutation u that sends $w(i-1)$ to $w(i)$ for all $i \notin I$ (notice that this makes sense, since $1 \in I$ whenever $n > 0$), while sending each $w(i_p - 1)$ (with $p \geq 2$) to $w(i_{p-1})$. Here, we set $i_{k+1} = n + 1$.

See [EnumComb1], Proposition 1.3.1.

See also

fundamental_transformation() for the inverse map.

EXAMPLES:

```
sage: Permutation([3, 4, 5, 2, 1]).fundamental_transformation_inverse()
[5, 1, 3, 4, 2]
sage: Permutation([4, 2, 6, 8, 1, 9, 3, 7, 5]).fundamental_transformation_
↪inverse()
[8, 4, 7, 2, 9, 6, 5, 1, 3]
```

```
>>> from sage.all import *
>>> Permutation([Integer(3), Integer(4), Integer(5), Integer(2), Integer(1)]).
↪fundamental_transformation_inverse()
[5, 1, 3, 4, 2]
>>> Permutation([Integer(4), Integer(2), Integer(6), Integer(8), Integer(1),␣
↪Integer(9), Integer(3), Integer(7), Integer(5)]).fundamental_transformation_
↪inverse()
[8, 4, 7, 2, 9, 6, 5, 1, 3]
```

grade()

Return the size of `self`.

EXAMPLES:

```
sage: Permutation([3,4,1,2,5]).size()
5
```

```
>>> from sage.all import *
>>> Permutation([Integer(3),Integer(4),Integer(1),Integer(2),Integer(5)]).
```

(continues on next page)

(continued from previous page)

```
↪size()
5
```

has_nth_root(*n*)

Check if `self` has n-th roots.

An n-th root of the permutation σ is a permutation γ such that $\gamma^n = \sigma$.

Note that the number of n-th roots only depends on the cycle type of `self`.

EXAMPLES:

```
sage: # needs sage.combinat
sage: sigma = Permutations(5).identity()
sage: sigma.has_nth_root(3)
True
sage: sigma = Permutation('(1, 3)')
sage: sigma.has_nth_root(2)
False
```

```
>>> from sage.all import *
>>> # needs sage.combinat
>>> sigma = Permutations(Integer(5)).identity()
>>> sigma.has_nth_root(Integer(3))
True
>>> sigma = Permutation('(1, 3)')
>>> sigma.has_nth_root(Integer(2))
False
```

See also

- *nth_roots()*
- *number_of_nth_roots()*

has_pattern(*patt*)

Test whether the permutation `self` contains the pattern `patt`.

EXAMPLES:

```
sage: Permutation([3,5,1,4,6,2]).has_pattern([1,3,2])                          #␣
↪needs sage.combinat
True
```

```
>>> from sage.all import *
>>> Permutation([Integer(3),Integer(5),Integer(1),Integer(4),Integer(6),
↪Integer(2)]).has_pattern([Integer(1),Integer(3),Integer(2)])                  ␣
↪       # needs sage.combinat
True
```

hyperoctahedral_double_coset_type()

Return the coset-type of `self` as a partition.

self must be a permutation of even size $2n$. The coset-type determines the double class of the permutation, that is its image in $H_n \backslash S_{2n} / H_n$, where H_n is the n-th hyperoctahedral group.

The coset-type is determined as follows. Consider the perfect matching $\{\{1, 2\}, \{3, 4\}, \ldots, \{2n-1, 2n\}\}$ and its image by self, and draw them simultaneously as edges of a graph whose vertices are labeled by $1, 2, \ldots, 2n$. The coset-type is the ordered sequence of the semi-lengths of the cycles of this graph (see Chapter VII of [Mac1995] for more details, particularly Section VII.2).

EXAMPLES:

```
sage: # needs sage.combinat
sage: p = Permutation([3, 4, 6, 1, 5, 7, 2, 8])
sage: p.hyperoctahedral_double_coset_type()
[3, 1]
sage: all(p.hyperoctahedral_double_coset_type() ==
....:     p.inverse().hyperoctahedral_double_coset_type()
....:     for p in Permutations(4))
True
sage: Permutation([]).hyperoctahedral_double_coset_type()
[]
sage: Permutation([3,1,2]).hyperoctahedral_double_coset_type()
Traceback (most recent call last):
...
ValueError: [3, 1, 2] is a permutation of odd size and has no coset-type
```

```
>>> from sage.all import *
>>> # needs sage.combinat
>>> p = Permutation([Integer(3), Integer(4), Integer(6), Integer(1),
↪Integer(5), Integer(7), Integer(2), Integer(8)])
>>> p.hyperoctahedral_double_coset_type()
[3, 1]
>>> all(p.hyperoctahedral_double_coset_type() ==
...     p.inverse().hyperoctahedral_double_coset_type()
...     for p in Permutations(Integer(4)))
True
>>> Permutation([]).hyperoctahedral_double_coset_type()
[]
>>> Permutation([Integer(3),Integer(1),Integer(2)]).hyperoctahedral_double_
↪coset_type()
Traceback (most recent call last):
...
ValueError: [3, 1, 2] is a permutation of odd size and has no coset-type
```

idescents(*final_descent=False*, *from_zero=False*)

Return a list of the idescents of self, that is the list of the descents of self's inverse.

A descent of a permutation p is an integer i such that p(i) > p(i+1).

Warning: By default, the descents are returned as elements in the index set, i.e., starting at 1. If you want them to start at 0, set the keyword from_zero to True.

INPUT:

- `final_descent` – boolean (default: `False`); if `True`, the last position of a non-empty permutation is also considered as a descent
- `from_zero` – boolean (default: `False`); if `False`, return the positions starting from 1

EXAMPLES:

```
sage: Permutation([2,3,1]).idescents()
[1]
sage: Permutation([1,4,3,2]).idescents()
[2, 3]
sage: Permutation([1,4,3,2]).idescents(final_descent=True)
[2, 3, 4]
sage: Permutation([1,4,3,2]).idescents(from_zero=True)
[1, 2]
```

```
>>> from sage.all import *
>>> Permutation([Integer(2),Integer(3),Integer(1)]).idescents()
[1]
>>> Permutation([Integer(1),Integer(4),Integer(3),Integer(2)]).idescents()
[2, 3]
>>> Permutation([Integer(1),Integer(4),Integer(3),Integer(2)]).
↪idescents(final_descent=True)
[2, 3, 4]
>>> Permutation([Integer(1),Integer(4),Integer(3),Integer(2)]).idescents(from_
↪zero=True)
[1, 2]
```

idescents_signature(*final_descent=False*)

Return the list obtained as follows: Each position in `self` is mapped to -1 if it is an idescent and 1 if it is not an idescent.

See *idescents()* for a definition of idescents.

With the `final_descent` option, the last position of a non-empty permutation is also considered as a descent.

EXAMPLES:

```
sage: Permutation([1,4,3,2]).idescents()
[2, 3]
sage: Permutation([1,4,3,2]).idescents_signature()
[1, -1, -1, 1]
```

```
>>> from sage.all import *
>>> Permutation([Integer(1),Integer(4),Integer(3),Integer(2)]).idescents()
[2, 3]
>>> Permutation([Integer(1),Integer(4),Integer(3),Integer(2)]).idescents_
↪signature()
[1, -1, -1, 1]
```

imajor_index(*final_descent=False*)

Return the inverse major index of the permutation `self`, which is the major index of the inverse of `self`.

The major index of a permutation p is the sum of the descents of p. Since our permutation indices are 0-based, we need to add the number of descents.

With the final_descent option, the last position of a non-empty permutation is also considered as a descent.

EXAMPLES:

```
sage: Permutation([2,1,3]).imajor_index()
1
sage: Permutation([3,4,1,2]).imajor_index()
2
sage: Permutation([4,3,2,1]).imajor_index()
6
```

```
>>> from sage.all import *
>>> Permutation([Integer(2),Integer(1),Integer(3)]).imajor_index()
1
>>> Permutation([Integer(3),Integer(4),Integer(1),Integer(2)]).imajor_index()
2
>>> Permutation([Integer(4),Integer(3),Integer(2),Integer(1)]).imajor_index()
6
```

increasing_tree(*compare=<built-in function min>*)

Return the increasing tree associated to self.

EXAMPLES:

```
sage: Permutation([1,4,3,2]).increasing_tree()                               #␣
↪needs sage.graphs
1[., 2[3[4[., .], .], .]]
sage: Permutation([4,1,3,2]).increasing_tree()                               #␣
↪needs sage.graphs
1[4[., .], 2[3[., .], .]]
```

```
>>> from sage.all import *
>>> Permutation([Integer(1),Integer(4),Integer(3),Integer(2)]).increasing_
↪tree()                                # needs sage.graphs
1[., 2[3[4[., .], .], .]]
>>> Permutation([Integer(4),Integer(1),Integer(3),Integer(2)]).increasing_
↪tree()                                # needs sage.graphs
1[4[., .], 2[3[., .], .]]
```

By passing the option compare=max one can have the decreasing tree instead:

```
sage: Permutation([2,3,4,1]).increasing_tree(max)                            #␣
↪needs sage.graphs
4[3[2[., .], .], 1[., .]]
sage: Permutation([2,3,1,4]).increasing_tree(max)                            #␣
↪needs sage.graphs
4[3[2[., .], 1[., .]], .]
```

```
>>> from sage.all import *
>>> Permutation([Integer(2),Integer(3),Integer(4),Integer(1)]).increasing_
↪tree(max)                             # needs sage.graphs
4[3[2[., .], .], 1[., .]]
>>> Permutation([Integer(2),Integer(3),Integer(1),Integer(4)]).increasing_
```

(continues on next page)

(continued from previous page)

```
↪tree(max)                              # needs sage.graphs
4[3[2[., .], 1[., .]], .]
```

increasing_tree_shape(*compare=<built-in function min>*)

Return the shape of the increasing tree associated with the permutation.

EXAMPLES:

```
sage: Permutation([1,4,3,2]).increasing_tree_shape()                   #␣
↪needs sage.graphs
[., [[[., .], .], .]]
sage: Permutation([4,1,3,2]).increasing_tree_shape()                   #␣
↪needs sage.graphs
[[., .], [[., .], .]]
```

```
>>> from sage.all import *
>>> Permutation([Integer(1),Integer(4),Integer(3),Integer(2)]).increasing_
↪tree_shape()                           # needs sage.graphs
[., [[[., .], .], .]]
>>> Permutation([Integer(4),Integer(1),Integer(3),Integer(2)]).increasing_
↪tree_shape()                           # needs sage.graphs
[[., .], [[., .], .]]
```

By passing the option `compare=max` one can have the decreasing tree instead:

```
sage: Permutation([2,3,4,1]).increasing_tree_shape(max)                #␣
↪needs sage.graphs
[[[., .], .], [., .]]
sage: Permutation([2,3,1,4]).increasing_tree_shape(max)                #␣
↪needs sage.graphs
[[[., .], [., .]], .]
```

```
>>> from sage.all import *
>>> Permutation([Integer(2),Integer(3),Integer(4),Integer(1)]).increasing_
↪tree_shape(max)                        # needs sage.graphs
[[[., .], .], [., .]]
>>> Permutation([Integer(2),Integer(3),Integer(1),Integer(4)]).increasing_
↪tree_shape(max)                        # needs sage.graphs
[[[., .], [., .]], .]
```

inverse()

Return the inverse of `self`.

EXAMPLES:

```
sage: Permutation([3,8,5,10,9,4,6,1,7,2]).inverse()
[8, 10, 1, 6, 3, 7, 9, 2, 5, 4]
sage: Permutation([2, 4, 1, 5, 3]).inverse()
[3, 1, 5, 2, 4]
sage: ~Permutation([2, 4, 1, 5, 3])
[3, 1, 5, 2, 4]
```

```
>>> from sage.all import *
>>> Permutation([Integer(3),Integer(8),Integer(5),Integer(10),Integer(9),
↪Integer(4),Integer(6),Integer(1),Integer(7),Integer(2)]).inverse()
[8, 10, 1, 6, 3, 7, 9, 2, 5, 4]
>>> Permutation([Integer(2), Integer(4), Integer(1), Integer(5), Integer(3)]).
↪inverse()
[3, 1, 5, 2, 4]
>>> ~Permutation([Integer(2), Integer(4), Integer(1), Integer(5), Integer(3)])
[3, 1, 5, 2, 4]
```

inversions()

Return a list of the inversions of `self`.

An inversion of a permutation p is a pair (i, j) such that $i < j$ and $p(i) > p(j)$.

EXAMPLES:

```
sage: Permutation([3,2,4,1,5]).inversions()
[(1, 2), (1, 4), (2, 4), (3, 4)]
```

```
>>> from sage.all import *
>>> Permutation([Integer(3),Integer(2),Integer(4),Integer(1),Integer(5)]).
↪inversions()
[(1, 2), (1, 4), (2, 4), (3, 4)]
```

is_derangement()

Return whether `self` is a derangement.

A permutation σ is a derangement if σ has no fixed points.

EXAMPLES:

```
sage: P = Permutation([1,4,2,3])
sage: P.is_derangement()
False
sage: P = Permutation([2,3,1])
sage: P.is_derangement()
True
```

```
>>> from sage.all import *
>>> P = Permutation([Integer(1),Integer(4),Integer(2),Integer(3)])
>>> P.is_derangement()
False
>>> P = Permutation([Integer(2),Integer(3),Integer(1)])
>>> P.is_derangement()
True
```

is_even()

Return `True` if the permutation `self` is even and `False` otherwise.

EXAMPLES:

```
sage: Permutation([1,2,3]).is_even()
True
```

(continues on next page)

(continued from previous page)

```
sage: Permutation([2,1,3]).is_even()
False
```

```
>>> from sage.all import *
>>> Permutation([Integer(1),Integer(2),Integer(3)]).is_even()
True
>>> Permutation([Integer(2),Integer(1),Integer(3)]).is_even()
False
```

is_simple()

Return whether `self` is simple.

A permutation is simple if it does not send any proper sub-interval to a sub-interval.

For instance, `[6,1,3,5,2,4]` is not simple because it maps the interval `[3,4,5,6]` to `[2,3,4,5]`, whereas `[2,6,3,5,1,4]` is simple.

See OEIS sequence A111111

EXAMPLES:

```
sage: g = Permutation([4,2,3,1])
sage: g.is_simple()
False

sage: g = Permutation([6,1,3,5,2,4])
sage: g.is_simple()
False

sage: g = Permutation([2,6,3,5,1,4])
sage: g.is_simple()
True

sage: [len([pi for pi in Permutations(n) if pi.is_simple()])
....:  for n in range(6)]
[1, 1, 2, 0, 2, 6]
```

```
>>> from sage.all import *
>>> g = Permutation([Integer(4),Integer(2),Integer(3),Integer(1)])
>>> g.is_simple()
False

>>> g = Permutation([Integer(6),Integer(1),Integer(3),Integer(5),Integer(2),
↪Integer(4)])
>>> g.is_simple()
False

>>> g = Permutation([Integer(2),Integer(6),Integer(3),Integer(5),Integer(1),
↪Integer(4)])
>>> g.is_simple()
True

>>> [len([pi for pi in Permutations(n) if pi.is_simple()])
```

(continues on next page)

(continued from previous page)

```
...     for n in range(Integer(6))]
[1, 1, 2, 0, 2, 6]
```

ishift (*i*)

Return the i-shift of self. If an i-shift of self can't be performed, then self is returned.

An i-shift can be applied when i is not inbetween $i-1$ and $i+1$. The i-shift moves i to the other side, and leaves the relative positions of $i-1$ and $i+1$ in place. All other entries of the permutations are also left in place.

EXAMPLES:

Here, 2 is to the left of both 1 and 3. A 2-shift can be applied which moves the 2 to the right and leaves 1 and 3 in their same relative order:

```
sage: Permutation([2,1,3]).ishift(2)
[1, 3, 2]
```

```
>>> from sage.all import *
>>> Permutation([Integer(2),Integer(1),Integer(3)]).ishift(Integer(2))
[1, 3, 2]
```

All entries other than i, $i-1$ and $i+1$ are unchanged:

```
sage: Permutation([2,4,1,3]).ishift(2)
[1, 4, 3, 2]
```

```
>>> from sage.all import *
>>> Permutation([Integer(2),Integer(4),Integer(1),Integer(3)]).
→ishift(Integer(2))
[1, 4, 3, 2]
```

Since 2 is between 1 and 3 in [1,2,3], a 2-shift cannot be applied to [1,2,3]

```
sage: Permutation([1,2,3]).ishift(2)
[1, 2, 3]
```

```
>>> from sage.all import *
>>> Permutation([Integer(1),Integer(2),Integer(3)]).ishift(Integer(2))
[1, 2, 3]
```

iswitch (*i*)

Return the i-switch of self. If an i-switch of self can't be performed, then self is returned.

An i-switch can be applied when the subsequence of self formed by the entries $i-1$, i and $i+1$ is neither increasing nor decreasing. In this case, this subsequence is reversed (i. e., its leftmost element and its rightmost element switch places), while all other letters of self are kept in place.

EXAMPLES:

Here, 2 is to the left of both 1 and 3. A 2-switch can be applied which moves the 2 to the right and switches the relative order between 1 and 3:

```
sage: Permutation([2,1,3]).iswitch(2)
[3, 1, 2]
```

```
>>> from sage.all import *
>>> Permutation([Integer(2),Integer(1),Integer(3)]).iswitch(Integer(2))
[3, 1, 2]
```

All entries other than $i-1$, i and $i+1$ are unchanged:

```
sage: Permutation([2,4,1,3]).iswitch(2)
[3, 4, 1, 2]
```

```
>>> from sage.all import *
>>> Permutation([Integer(2),Integer(4),Integer(1),Integer(3)]).
↪iswitch(Integer(2))
[3, 4, 1, 2]
```

Since 2 is between 1 and 3 in `[1,2,3]`, a 2-switch cannot be applied to `[1,2,3]`

```
sage: Permutation([1,2,3]).iswitch(2)
[1, 2, 3]
```

```
>>> from sage.all import *
>>> Permutation([Integer(1),Integer(2),Integer(3)]).iswitch(Integer(2))
[1, 2, 3]
```

left_action_product(*lp*)

Return the permutation obtained by composing `self` with `lp` in such an order that `lp` is applied first and `self` is applied afterwards.

This is usually denoted by either `self * lp` or `lp * self` depending on the conventions used by the author. If the value of a permutation $p \in S_n$ on an integer $i \in \{1, 2, \cdots, n\}$ is denoted by $p(i)$, then this should be denoted by `self * lp` in order to have associativity (i.e., in order to have $(p \cdot q)(i) = p(q(i))$ for all p, q and i). If, on the other hand, the value of a permutation $p \in S_n$ on an integer $i \in \{1, 2, \cdots, n\}$ is denoted by i^p, then this should be denoted by `lp * self` in order to have associativity (i.e., in order to have $i^{p \cdot q} = (i^p)^q$ for all p, q and i).

EXAMPLES:

```
sage: p = Permutation([2,1,3])
sage: q = Permutation([3,1,2])
sage: p.left_action_product(q)
[3, 2, 1]
sage: q.left_action_product(p)
[1, 3, 2]
```

```
>>> from sage.all import *
>>> p = Permutation([Integer(2),Integer(1),Integer(3)])
>>> q = Permutation([Integer(3),Integer(1),Integer(2)])
>>> p.left_action_product(q)
[3, 2, 1]
>>> q.left_action_product(p)
[1, 3, 2]
```

left_tableau()

Return the left standard tableau after performing the RSK algorithm on `self`.

EXAMPLES:

```
sage: Permutation([1,4,3,2]).left_tableau()                                    #␣
↪needs sage.combinat
[[1, 2], [3], [4]]
```

```
>>> from sage.all import *
>>> Permutation([Integer(1),Integer(4),Integer(3),Integer(2)]).left_tableau()␣
↪                               # needs sage.combinat
[[1, 2], [3], [4]]
```

length()

Return the Coxeter length of `self`.

The length of a permutation p is given by the number of inversions of p.

EXAMPLES:

```
sage: Permutation([5, 1, 3, 4, 2]).length()
6
```

```
>>> from sage.all import *
>>> Permutation([Integer(5), Integer(1), Integer(3), Integer(4), Integer(2)]).
↪length()
6
```

longest_increasing_subsequence_length()

Return the length of the longest increasing subsequences of `self`.

EXAMPLES:

```
sage: Permutation([2,3,1,4]).longest_increasing_subsequence_length()
3
sage: all(i.longest_increasing_subsequence_length() == len(RSK(i)[0][0])     #␣
↪needs sage.combinat
....:     for i in Permutations(5))
True
sage: Permutation([]).longest_increasing_subsequence_length()
0
```

```
>>> from sage.all import *
>>> Permutation([Integer(2),Integer(3),Integer(1),Integer(4)]).longest_
↪increasing_subsequence_length()
3
>>> all(i.longest_increasing_subsequence_length() ==␣
↪len(RSK(i)[Integer(0)][Integer(0)])     # needs sage.combinat
...     for i in Permutations(Integer(5)))
True
>>> Permutation([]).longest_increasing_subsequence_length()
0
```

longest_increasing_subsequences()

Return the list of the longest increasing subsequences of `self`.

A theorem of Schensted ([Sch1961]) states that an increasing subsequence of length i ends with the value entered in the i-th column of the p-tableau. The algorithm records which column of the p-tableau each value of the permutation is entered into, creates a digraph to record all increasing subsequences, and reads the paths from a source to a sink; these are the longest increasing subsequences.

EXAMPLES:

```
sage: Permutation([2,3,4,1]).longest_increasing_subsequences()              #␣
↪needs sage.graphs
[[2, 3, 4]]
sage: Permutation([5, 7, 1, 2, 6, 4, 3]).longest_increasing_subsequences()  #␣
↪needs sage.graphs
[[1, 2, 6], [1, 2, 4], [1, 2, 3]]
```

```
>>> from sage.all import *
>>> Permutation([Integer(2),Integer(3),Integer(4),Integer(1)]).longest_
↪increasing_subsequences()              # needs sage.graphs
[[2, 3, 4]]
>>> Permutation([Integer(5), Integer(7), Integer(1), Integer(2), Integer(6),␣
↪Integer(4), Integer(3)]).longest_increasing_subsequences()  # needs sage.
↪graphs
[[1, 2, 6], [1, 2, 4], [1, 2, 3]]
```

Note

This algorithm could be made faster using a balanced search tree for each column instead of sorted lists. See discussion on Issue #31451.

longest_increasing_subsequences_number()

Return the number of increasing subsequences of maximal length in `self`.

The list of longest increasing subsequences of a permutation is given by *longest_increasing_subsequences()*, and the length of these subsequences is given by *longest_increasing_subsequence_length()*.

The algorithm is similar to *longest_increasing_subsequences()*. Namely, the longest increasing subsequences are encoded as increasing sequences in a ranked poset from a smallest to a largest element. Their number can be obtained via dynamic programming: for each v in the poset we compute the number of paths from a smallest element to v.

EXAMPLES:

```
sage: sum(p.longest_increasing_subsequences_number()
....:     for p in Permutations(8))
120770

sage: p = Permutations(50).random_element()
sage: (len(p.longest_increasing_subsequences()) ==                          #␣
↪needs sage.graphs
....:  p.longest_increasing_subsequences_number())
True
```

```
>>> from sage.all import *
>>> sum(p.longest_increasing_subsequences_number()
```

(continues on next page)

(continued from previous page)

```
...     for p in Permutations(Integer(8)))
120770

>>> p = Permutations(Integer(50)).random_element()
>>> (len(p.longest_increasing_subsequences()) ==                    #␣
↪needs sage.graphs
...  p.longest_increasing_subsequences_number())
True
```

major_index(*final_descent=False*)

Return the major index of `self`.

The major index of a permutation p is the sum of the descents of p. Since our permutation indices are 0-based, we need to add the number of descents.

With the `final_descent` option, the last position of a non-empty permutation is also considered as a descent.

EXAMPLES:

```
sage: Permutation([2,1,3]).major_index()
1
sage: Permutation([3,4,1,2]).major_index()
2
sage: Permutation([4,3,2,1]).major_index()
6
```

```
>>> from sage.all import *
>>> Permutation([Integer(2),Integer(1),Integer(3)]).major_index()
1
>>> Permutation([Integer(3),Integer(4),Integer(1),Integer(2)]).major_index()
2
>>> Permutation([Integer(4),Integer(3),Integer(2),Integer(1)]).major_index()
6
```

multi_major_index(*composition*)

Return the multimajor index of this permutation with respect to `composition`.

INPUT:

- `composition` – a composition of the *size()* of this permutation

EXAMPLES:

```
sage: p = Permutation([5, 6, 2, 1, 3, 7, 4])
sage: p.multi_major_index([3, 2, 2])
[2, 0, 1]
sage: p.multi_major_index([7]) == [p.major_index()]
True
sage: p.multi_major_index([1]*7)
[0, 0, 0, 0, 0, 0, 0]
sage: Permutation([]).multi_major_index([])
[]
```

```
>>> from sage.all import *
>>> p = Permutation([Integer(5), Integer(6), Integer(2), Integer(1),␣
↪Integer(3), Integer(7), Integer(4)])
>>> p.multi_major_index([Integer(3), Integer(2), Integer(2)])
[2, 0, 1]
>>> p.multi_major_index([Integer(7)]) == [p.major_index()]
True
>>> p.multi_major_index([Integer(1)]*Integer(7))
[0, 0, 0, 0, 0, 0, 0]
>>> Permutation([]).multi_major_index([])
[]
```

REFERENCES:

- [JS2000]

next()

Return the permutation that follows `self` on the symmetric group containing `self`. If `self` is the last permutation, then `next` returns `False`. If the `algorithm` parameter is specified, the permutations will be generated according to it. Supported algorithms are:

- `lex`: lexicographic order generation, this is the default algorithm.
- `sjt`: Steinhaus-Johnson-Trotter algorithm to generate permutations using only transposition of two elements in the list. It is highly recommended to set `check=True` (default value).

EXAMPLES:

```
sage: p = Permutation([1, 3, 2])
sage: next(p)
[2, 1, 3]
sage: p = Permutation([4,3,2,1])
sage: next(p)
False
sage: p = Permutation([1, 2, 3], algorithm='sjt')
sage: p = next(p); p
[1, 3, 2]
sage: p = next(p); p
[3, 1, 2]
```

```
>>> from sage.all import *
>>> p = Permutation([Integer(1), Integer(3), Integer(2)])
>>> next(p)
[2, 1, 3]
>>> p = Permutation([Integer(4),Integer(3),Integer(2),Integer(1)])
>>> next(p)
False
>>> p = Permutation([Integer(1), Integer(2), Integer(3)], algorithm='sjt')
>>> p = next(p); p
[1, 3, 2]
>>> p = next(p); p
[3, 1, 2]
```

noninversions(k)

Return the list of all `k`-noninversions in `self`.

If k is an integer and $p \in S_n$ is a permutation, then a k-noninversion in p is defined as a strictly increasing sequence $(i_1, i_2, \ldots, i_k)$ of elements of $\{1, 2, \ldots, n\}$ satisfying $p(i_1) < p(i_2) < \cdots < p(i_k)$. (In other words, a k-noninversion in p can be regarded as a k-element subset of $\{1, 2, \ldots, n\}$ on which p restricts to an increasing map.)

EXAMPLES:

```
sage: p = Permutation([3, 2, 4, 1, 5])
sage: p.noninversions(1)
[[3], [2], [4], [1], [5]]
sage: p.noninversions(2)
[[3, 4], [3, 5], [2, 4], [2, 5], [4, 5], [1, 5]]
sage: p.noninversions(3)
[[3, 4, 5], [2, 4, 5]]
sage: p.noninversions(4)
[]
sage: p.noninversions(5)
[]
```

```
>>> from sage.all import *
>>> p = Permutation([Integer(3), Integer(2), Integer(4), Integer(1),␣
↪Integer(5)])
>>> p.noninversions(Integer(1))
[[3], [2], [4], [1], [5]]
>>> p.noninversions(Integer(2))
[[3, 4], [3, 5], [2, 4], [2, 5], [4, 5], [1, 5]]
>>> p.noninversions(Integer(3))
[[3, 4, 5], [2, 4, 5]]
>>> p.noninversions(Integer(4))
[]
>>> p.noninversions(Integer(5))
[]
```

nth_roots(*n*)

Return all n-th roots of `self` (as a generator).

An n-th root of the permutation σ is a permutation γ such that $\gamma^n = \sigma$.

Note that the number of n-th roots only depends on the cycle type of `self`.

EXAMPLES:

```
sage: # needs sage.combinat
sage: sigma = Permutations(5).identity()
sage: list(sigma.nth_roots(3))
[[1, 4, 3, 5, 2], [1, 5, 3, 2, 4], [1, 2, 4, 5, 3], [1, 2, 5, 3, 4],
 [4, 2, 3, 5, 1], [5, 2, 3, 1, 4], [3, 2, 5, 4, 1], [5, 2, 1, 4, 3],
 [2, 5, 3, 4, 1], [5, 1, 3, 4, 2], [2, 3, 1, 4, 5], [3, 1, 2, 4, 5],
 [2, 4, 3, 1, 5], [4, 1, 3, 2, 5], [3, 2, 4, 1, 5], [4, 2, 1, 3, 5],
 [1, 3, 4, 2, 5], [1, 4, 2, 3, 5], [1, 3, 5, 4, 2], [1, 5, 2, 4, 3],
 [1, 2, 3, 4, 5]]
sage: sigma = Permutation('(1, 3)')
sage: list(sigma.nth_roots(2))
[]
```

```
>>> from sage.all import *
>>> # needs sage.combinat
>>> sigma = Permutations(Integer(5)).identity()
>>> list(sigma.nth_roots(Integer(3)))
[[1, 4, 3, 5, 2], [1, 5, 3, 2, 4], [1, 2, 4, 5, 3], [1, 2, 5, 3, 4],
 [4, 2, 3, 5, 1], [5, 2, 3, 1, 4], [3, 2, 5, 4, 1], [5, 2, 1, 4, 3],
 [2, 5, 3, 4, 1], [5, 1, 3, 4, 2], [2, 3, 1, 4, 5], [3, 1, 2, 4, 5],
 [2, 4, 3, 1, 5], [4, 1, 3, 2, 5], [3, 2, 4, 1, 5], [4, 2, 1, 3, 5],
 [1, 3, 4, 2, 5], [1, 4, 2, 3, 5], [1, 3, 5, 4, 2], [1, 5, 2, 4, 3],
 [1, 2, 3, 4, 5]]
>>> sigma = Permutation('(1, 3)')
>>> list(sigma.nth_roots(Integer(2)))
[]
```

For $n \geq 6$, this algorithm begins to be more efficient than naive search (look at all permutations and test their n-th power).

See also

- *has_nth_root()*
- *number_of_nth_roots()*

number_of_descents(*final_descent=False*)

Return the number of descents of `self`.

With the `final_descent` option, the last position of a non-empty permutation is also considered as a descent.

EXAMPLES:

```
sage: Permutation([1,4,3,2]).number_of_descents()
2
sage: Permutation([1,4,3,2]).number_of_descents(final_descent=True)
3
```

```
>>> from sage.all import *
>>> Permutation([Integer(1),Integer(4),Integer(3),Integer(2)]).number_of_
↪descents()
2
>>> Permutation([Integer(1),Integer(4),Integer(3),Integer(2)]).number_of_
↪descents(final_descent=True)
3
```

number_of_fixed_points()

Return the number of fixed points of `self`.

EXAMPLES:

```
sage: Permutation([1,3,2,4]).number_of_fixed_points()
2
sage: Permutation([1,2,3,4]).number_of_fixed_points()
4
```

```
>>> from sage.all import *
>>> Permutation([Integer(1),Integer(3),Integer(2),Integer(4)]).number_of_
↪fixed_points()
2
>>> Permutation([Integer(1),Integer(2),Integer(3),Integer(4)]).number_of_
↪fixed_points()
4
```

number_of_idescents(*final_descent=False*)

Return the number of idescents of `self`.

See `idescents()` for a definition of idescents.

With the `final_descent` option, the last position of a non-empty permutation is also considered as a descent.

EXAMPLES:

```
sage: Permutation([1,4,3,2]).number_of_idescents()
2
sage: Permutation([1,4,3,2]).number_of_idescents(final_descent=True)
3
```

```
>>> from sage.all import *
>>> Permutation([Integer(1),Integer(4),Integer(3),Integer(2)]).number_of_
↪idescents()
2
>>> Permutation([Integer(1),Integer(4),Integer(3),Integer(2)]).number_of_
↪idescents(final_descent=True)
3
```

number_of_inversions()

Return the number of inversions in `self`.

An inversion of a permutation is a pair of elements (i, j) with $i < j$ and $p(i) > p(j)$.

REFERENCES:

- http://mathworld.wolfram.com/PermutationInversion.html

EXAMPLES:

```
sage: Permutation([3, 2, 4, 1, 5]).number_of_inversions()
4
sage: Permutation([1, 2, 6, 4, 7, 3, 5]).number_of_inversions()
6
```

```
>>> from sage.all import *
>>> Permutation([Integer(3), Integer(2), Integer(4), Integer(1), Integer(5)]).
↪number_of_inversions()
4
>>> Permutation([Integer(1), Integer(2), Integer(6), Integer(4), Integer(7),␣
↪Integer(3), Integer(5)]).number_of_inversions()
6
```

number_of_noninversions(*k*)

Return the number of `k`-noninversions in `self`.

If k is an integer and $p \in S_n$ is a permutation, then a k-noninversion in p is defined as a strictly increasing sequence $(i_1, i_2, \ldots, i_k)$ of elements of $\{1, 2, \ldots, n\}$ satisfying $p(i_1) < p(i_2) < \cdots < p(i_k)$. (In other words, a k-noninversion in p can be regarded as a k-element subset of $\{1, 2, \ldots, n\}$ on which p restricts to an increasing map.)

The number of k-noninversions in p has been denoted by $\mathrm{noninv}_k(p)$ in [RSW2011], where conjectures and results regarding this number have been stated.

EXAMPLES:

```
sage: p = Permutation([3, 2, 4, 1, 5])
sage: p.number_of_noninversions(1)
5
sage: p.number_of_noninversions(2)
6
sage: p.number_of_noninversions(3)
2
sage: p.number_of_noninversions(4)
0
sage: p.number_of_noninversions(5)
0
```

```
>>> from sage.all import *
>>> p = Permutation([Integer(3), Integer(2), Integer(4), Integer(1),␣
↪Integer(5)])
>>> p.number_of_noninversions(Integer(1))
5
>>> p.number_of_noninversions(Integer(2))
6
>>> p.number_of_noninversions(Integer(3))
2
>>> p.number_of_noninversions(Integer(4))
0
>>> p.number_of_noninversions(Integer(5))
0
```

The number of 2-noninversions of a permutation $p \in S_n$ is $\binom{n}{2}$ minus its number of inversions:

```
sage: b = binomial(5, 2)                                                    #␣
↪needs sage.symbolic
sage: all( x.number_of_noninversions(2) == b - x.number_of_inversions()     #␣
↪needs sage.symbolic
....:      for x in Permutations(5) )
True
```

```
>>> from sage.all import *
>>> b = binomial(Integer(5), Integer(2))                                     ␣
↪              # needs sage.symbolic
>>> all( x.number_of_noninversions(Integer(2)) == b - x.number_of_
↪inversions()     # needs sage.symbolic
...      for x in Permutations(Integer(5)) )
True
```

We also check some corner cases:

```
sage: all( x.number_of_noninversions(1) == 5 for x in Permutations(5) )
True
sage: all( x.number_of_noninversions(0) == 1 for x in Permutations(5) )
True
sage: Permutation([]).number_of_noninversions(1)
0
sage: Permutation([]).number_of_noninversions(0)
1
sage: Permutation([2, 1]).number_of_noninversions(3)
0
```

```
>>> from sage.all import *
>>> all( x.number_of_noninversions(Integer(1)) == Integer(5) for x in␣
↪Permutations(Integer(5)) )
True
>>> all( x.number_of_noninversions(Integer(0)) == Integer(1) for x in␣
↪Permutations(Integer(5)) )
True
>>> Permutation([]).number_of_noninversions(Integer(1))
0
>>> Permutation([]).number_of_noninversions(Integer(0))
1
>>> Permutation([Integer(2), Integer(1)]).number_of_noninversions(Integer(3))
0
```

number_of_nth_roots(n)

Return the number of n-th roots of `self`.

An n-th root of the permutation σ is a permutation γ such that $\gamma^n = \sigma$.

Note that the number of n-th roots only depends on the cycle type of `self`.

EXAMPLES:

```
sage: # needs sage.combinat
sage: Sigma = Permutations(5).identity()
sage: Sigma.number_of_nth_roots(3)
21
sage: Sigma = Permutation('(1, 3)')
sage: Sigma.number_of_nth_roots(2)
0
```

```
>>> from sage.all import *
>>> # needs sage.combinat
>>> Sigma = Permutations(Integer(5)).identity()
>>> Sigma.number_of_nth_roots(Integer(3))
21
>>> Sigma = Permutation('(1, 3)')
>>> Sigma.number_of_nth_roots(Integer(2))
0
```

See also

- `nth_roots()`
- `has_nth_root()`

number_of_peaks()

Return the number of peaks of the permutation `self`.

A peak of a permutation p is an integer i such that $p(i-1) < p(i)$ and $p(i) > p(i+1)$.

EXAMPLES:

```
sage: Permutation([1,3,2,4,5]).number_of_peaks()
1
sage: Permutation([4,1,3,2,6,5]).number_of_peaks()
2
```

```
>>> from sage.all import *
>>> Permutation([Integer(1),Integer(3),Integer(2),Integer(4),Integer(5)]).
↪number_of_peaks()
1
>>> Permutation([Integer(4),Integer(1),Integer(3),Integer(2),Integer(6),
↪Integer(5)]).number_of_peaks()
2
```

number_of_recoils()

Return the number of recoils of the permutation `self`.

EXAMPLES:

```
sage: Permutation([1,4,3,2]).number_of_recoils()
2
```

```
>>> from sage.all import *
>>> Permutation([Integer(1),Integer(4),Integer(3),Integer(2)]).number_of_
↪recoils()
2
```

number_of_reduced_words()

Return the number of reduced words of `self` without explicitly computing them all.

EXAMPLES:

```
sage: p = Permutation([6,4,2,5,1,8,3,7])
sage: len(p.reduced_words()) == p.number_of_reduced_words()                #␣
↪needs sage.combinat
True
```

```
>>> from sage.all import *
>>> p = Permutation([Integer(6),Integer(4),Integer(2),Integer(5),Integer(1),
↪Integer(8),Integer(3),Integer(7)])
>>> len(p.reduced_words()) == p.number_of_reduced_words()                #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.combinat
True
```

number_of_saliances()

Return the number of saliances of `self`.

A saliance of a permutation p is an integer i such that $p(i) > p(j)$ for all $j > i$.

EXAMPLES:

```
sage: Permutation([2,3,1,5,4]).number_of_saliances()
2
sage: Permutation([5,4,3,2,1]).number_of_saliances()
5
```

```
>>> from sage.all import *
>>> Permutation([Integer(2),Integer(3),Integer(1),Integer(5),Integer(4)]).
↪number_of_saliances()
2
>>> Permutation([Integer(5),Integer(4),Integer(3),Integer(2),Integer(1)]).
↪number_of_saliances()
5
```

order()

Return the order of `self`.

EXAMPLES:

```
sage: sigma = Permutation([3,4,1,2,5])
sage: sigma.order()
2
sage: sigma * sigma
[1, 2, 3, 4, 5]
```

```
>>> from sage.all import *
>>> sigma = Permutation([Integer(3),Integer(4),Integer(1),Integer(2),
↪Integer(5)])
>>> sigma.order()
2
>>> sigma * sigma
[1, 2, 3, 4, 5]
```

pattern_positions(*patt*)

Return the list of positions where the pattern `patt` appears in the permutation `self`.

EXAMPLES:

```
sage: Permutation([3,5,1,4,6,2]).pattern_positions([1,3,2])                #␣
↪needs sage.combinat
[[0, 1, 3], [2, 3, 5], [2, 4, 5]]
```

```
>>> from sage.all import *
>>> Permutation([Integer(3),Integer(5),Integer(1),Integer(4),Integer(6),
```

(continues on next page)

(continued from previous page)

```
↪Integer(2)]).pattern_positions([Integer(1),Integer(3),Integer(2)])              ␣
↪        # needs sage.combinat
[[0, 1, 3], [2, 3, 5], [2, 4, 5]]
```

peaks()

Return a list of the peaks of the permutation `self`.

A peak of a permutation p is an integer i such that $p(i-1) < p(i)$ and $p(i) > p(i+1)$.

EXAMPLES:

```
sage: Permutation([1,3,2,4,5]).peaks()
[1]
sage: Permutation([4,1,3,2,6,5]).peaks()
[2, 4]
sage: Permutation([]).peaks()
[]
```

```
>>> from sage.all import *
>>> Permutation([Integer(1),Integer(3),Integer(2),Integer(4),Integer(5)]).
↪peaks()
[1]
>>> Permutation([Integer(4),Integer(1),Integer(3),Integer(2),Integer(6),
↪Integer(5)]).peaks()
[2, 4]
>>> Permutation([]).peaks()
[]
```

permutation_poset()

Return the permutation poset of `self`.

The permutation poset of a permutation p is the poset with vertices $(i, p(i))$ for $i = 1, 2, \ldots, n$ (where n is the size of p) and order inherited from $\mathbf{Z} \times \mathbf{Z}$.

EXAMPLES:

```
sage: # needs sage.combinat sage.graphs
sage: Permutation([3,1,5,4,2]).permutation_poset().cover_relations()
[[(2, 1), (5, 2)],
 [(2, 1), (3, 5)],
 [(2, 1), (4, 4)],
 [(1, 3), (3, 5)],
 [(1, 3), (4, 4)]]
sage: Permutation([]).permutation_poset().cover_relations()
[]
sage: Permutation([1,3,2]).permutation_poset().cover_relations()
[[(1, 1), (2, 3)], [(1, 1), (3, 2)]]
sage: Permutation([1,2]).permutation_poset().cover_relations()
[[(1, 1), (2, 2)]]
sage: P = Permutation([1,5,2,4,3])
```

```
>>> from sage.all import *
>>> # needs sage.combinat sage.graphs
```

(continues on next page)

(continued from previous page)

```
>>> Permutation([Integer(3),Integer(1),Integer(5),Integer(4),Integer(2)]).
→permutation_poset().cover_relations()
[[(2, 1), (5, 2)],
 [(2, 1), (3, 5)],
 [(2, 1), (4, 4)],
 [(1, 3), (3, 5)],
 [(1, 3), (4, 4)]]
>>> Permutation([]).permutation_poset().cover_relations()
[]
>>> Permutation([Integer(1),Integer(3),Integer(2)]).permutation_poset().cover_
→relations()
[[(1, 1), (2, 3)], [(1, 1), (3, 2)]]
>>> Permutation([Integer(1),Integer(2)]).permutation_poset().cover_relations()
[[(1, 1), (2, 2)]]
>>> P = Permutation([Integer(1),Integer(5),Integer(2),Integer(4),Integer(3)])
```

This should hold for any P:

```
sage: P.permutation_poset().greene_shape() == P.RS_partition()              #␣
→needs sage.combinat sage.graphs
True
```

```
>>> from sage.all import *
>>> P.permutation_poset().greene_shape() == P.RS_partition()              #␣
→needs sage.combinat sage.graphs
True
```

permutohedron_greater(*side='right'*)

Return a list of permutations greater than or equal to `self` in the permutohedron order.

By default, the computations are done in the right permutohedron. If you pass the option `side='left'`, then they will be done in the left permutohedron.

See *permutohedron_lequal()* for the definition of the permutohedron orders.

EXAMPLES:

```
sage: Permutation([4,2,1,3]).permutohedron_greater()
[[4, 2, 1, 3], [4, 2, 3, 1], [4, 3, 2, 1]]
sage: Permutation([4,2,1,3]).permutohedron_greater(side='left')
[[4, 2, 1, 3], [4, 3, 1, 2], [4, 3, 2, 1]]
```

```
>>> from sage.all import *
>>> Permutation([Integer(4),Integer(2),Integer(1),Integer(3)]).permutohedron_
→greater()
[[4, 2, 1, 3], [4, 2, 3, 1], [4, 3, 2, 1]]
>>> Permutation([Integer(4),Integer(2),Integer(1),Integer(3)]).permutohedron_
→greater(side='left')
[[4, 2, 1, 3], [4, 3, 1, 2], [4, 3, 2, 1]]
```

permutohedron_join(*other*, *side='right'*)

Return the join of the permutations `self` and `other` in the right permutohedron order (or, if `side` is set to `'left'`, in the left permutohedron order).

The permutohedron orders (see `permutohedron_lequal()`) are lattices; the join operation refers to this lattice structure. In more elementary terms, the join of two permutations π and ψ in the symmetric group S_n is the permutation in S_n whose set of inversion is the transitive closure of the union of the set of inversions of π with the set of inversions of ψ.

See also

`permutohedron_lequal()`, `permutohedron_meet()`.

ALGORITHM:

It is enough to construct the join of any two permutations π and ψ in S_n with respect to the right weak order. (The join of π and ψ with respect to the left weak order is the inverse of the join of π^{-1} and ψ^{-1} with respect to the right weak order.) Start with an empty list l (denoted `xs` in the actual code). For $i = 1, 2, \ldots, n$ (in this order), we insert i into this list in the rightmost possible position such that any letter in $\{1, 2, ..., i-1\}$ which appears further right than i in either π or ψ (or both) must appear further right than i in the resulting list. After all numbers are inserted, we are left with a list which is precisely the join of π and ψ (in one-line notation). This algorithm is due to Markowsky, [Mar1994] (Theorem 1 (a)).

AUTHORS:

Viviane Pons and Darij Grinberg, 18 June 2014.

EXAMPLES:

```
sage: p = Permutation([3,1,2])
sage: q = Permutation([1,3,2])
sage: p.permutohedron_join(q)
[3, 1, 2]
sage: r = Permutation([2,1,3])
sage: r.permutohedron_join(p)
[3, 2, 1]
```

```
>>> from sage.all import *
>>> p = Permutation([Integer(3),Integer(1),Integer(2)])
>>> q = Permutation([Integer(1),Integer(3),Integer(2)])
>>> p.permutohedron_join(q)
[3, 1, 2]
>>> r = Permutation([Integer(2),Integer(1),Integer(3)])
>>> r.permutohedron_join(p)
[3, 2, 1]
```

```
sage: p = Permutation([3,2,4,1])
sage: q = Permutation([4,2,1,3])
sage: p.permutohedron_join(q)
[4, 3, 2, 1]
sage: r = Permutation([3,1,2,4])
sage: p.permutohedron_join(r)
[3, 2, 4, 1]
sage: q.permutohedron_join(r)
[4, 3, 2, 1]
sage: s = Permutation([1,4,2,3])
sage: s.permutohedron_join(r)
[4, 3, 1, 2]
```

```
>>> from sage.all import *
>>> p = Permutation([Integer(3),Integer(2),Integer(4),Integer(1)])
>>> q = Permutation([Integer(4),Integer(2),Integer(1),Integer(3)])
>>> p.permutohedron_join(q)
[4, 3, 2, 1]
>>> r = Permutation([Integer(3),Integer(1),Integer(2),Integer(4)])
>>> p.permutohedron_join(r)
[3, 2, 4, 1]
>>> q.permutohedron_join(r)
[4, 3, 2, 1]
>>> s = Permutation([Integer(1),Integer(4),Integer(2),Integer(3)])
>>> s.permutohedron_join(r)
[4, 3, 1, 2]
```

The universal property of the join operation is satisfied:

```
sage: def test_uni_join(p, q):
....:     j = p.permutohedron_join(q)
....:     if not p.permutohedron_lequal(j):
....:         return False
....:     if not q.permutohedron_lequal(j):
....:         return False
....:     for r in p.permutohedron_greater():
....:         if q.permutohedron_lequal(r) and not j.permutohedron_lequal(r):
....:             return False
....:     return True
sage: all( test_uni_join(p, q) for p in Permutations(3) for q in␣
↪Permutations(3) )
True
sage: test_uni_join(Permutation([6, 4, 7, 3, 2, 5, 8, 1]), Permutation([7, 3,␣
↪1, 2, 5, 4, 6, 8]))
True
```

```
>>> from sage.all import *
>>> def test_uni_join(p, q):
...     j = p.permutohedron_join(q)
...     if not p.permutohedron_lequal(j):
...         return False
...     if not q.permutohedron_lequal(j):
...         return False
...     for r in p.permutohedron_greater():
...         if q.permutohedron_lequal(r) and not j.permutohedron_lequal(r):
...             return False
...     return True
>>> all( test_uni_join(p, q) for p in Permutations(Integer(3)) for q in␣
↪Permutations(Integer(3)) )
True
>>> test_uni_join(Permutation([Integer(6), Integer(4), Integer(7), Integer(3),
↪ Integer(2), Integer(5), Integer(8), Integer(1)]), Permutation([Integer(7),␣
↪Integer(3), Integer(1), Integer(2), Integer(5), Integer(4), Integer(6),␣
↪Integer(8)]))
True
```

Border cases:

```
sage: p = Permutation([])
sage: p.permutohedron_join(p)
[]
sage: p = Permutation([1])
sage: p.permutohedron_join(p)
[1]
```

```
>>> from sage.all import *
>>> p = Permutation([])
>>> p.permutohedron_join(p)
[]
>>> p = Permutation([Integer(1)])
>>> p.permutohedron_join(p)
[1]
```

The left permutohedron:

```
sage: p = Permutation([3,1,2])
sage: q = Permutation([1,3,2])
sage: p.permutohedron_join(q, side='left')
[3, 2, 1]
sage: r = Permutation([2,1,3])
sage: r.permutohedron_join(p, side='left')
[3, 1, 2]
```

```
>>> from sage.all import *
>>> p = Permutation([Integer(3),Integer(1),Integer(2)])
>>> q = Permutation([Integer(1),Integer(3),Integer(2)])
>>> p.permutohedron_join(q, side='left')
[3, 2, 1]
>>> r = Permutation([Integer(2),Integer(1),Integer(3)])
>>> r.permutohedron_join(p, side='left')
[3, 1, 2]
```

permutohedron_lequal(*p2*, *side='right'*)

Return `True` if `self` is less or equal to `p2` in the permutohedron order.

By default, the computations are done in the right permutohedron. If you pass the option `side='left'`, then they will be done in the left permutohedron.

For every nonnegative integer n, the right (resp. left) permutohedron order (also called the right (resp. left) weak order, or the right (resp. left) weak Bruhat order) is a partial order on the symmetric group S_n. It can be defined in various ways, including the following ones:

- Two permutations u and v in S_n satisfy $u \leq v$ in the right (resp. left) permutohedron order if and only if the (Coxeter) length of the permutation $v^{-1} \circ u$ (resp. of the permutation $u \circ v^{-1}$) equals the length of v minus the length of u. Here, $p \circ q$ means the permutation obtained by applying q first and then p. (Recall that the Coxeter length of a permutation is its number of inversions.)
- Two permutations u and v in S_n satisfy $u \leq v$ in the right (resp. left) permutohedron order if and only if every pair (i, j) of elements of $\{1, 2, \cdots, n\}$ such that $i < j$ and $u^{-1}(i) > u^{-1}(j)$ (resp. $u(i) > u(j)$) also satisfies $v^{-1}(i) > v^{-1}(j)$ (resp. $v(i) > v(j)$).
- A permutation $v \in S_n$ covers a permutation $u \in S_n$ in the right (resp. left) permutohedron order if and

only if we have $v = u \circ (i, i+1)$ (resp. $v = (i, i+1) \circ u$) for some $i \in \{1, 2, \cdots, n-1\}$ satisfying $u(i) < u(i+1)$ (resp. $u^{-1}(i) < u^{-1}(i+1)$). Here, again, $p \circ q$ means the permutation obtained by applying q first and then p.

The right and the left permutohedron order are mutually isomorphic, with the isomorphism being the map sending every permutation to its inverse. Each of these orders endows the symmetric group S_n with the structure of a graded poset (the rank function being the Coxeter length).

Warning

The permutohedron order is not to be mistaken for the strong Bruhat order (`bruhat_lequal()`), despite both orders being occasionally referred to as the Bruhat order.

EXAMPLES:

```
sage: p = Permutation([3,2,1,4])
sage: p.permutohedron_lequal(Permutation([4,2,1,3]))
False
sage: p.permutohedron_lequal(Permutation([4,2,1,3]), side='left')
True
sage: p.permutohedron_lequal(p)
True

sage: Permutation([2,1,3]).permutohedron_lequal(Permutation([2,3,1]))
True
sage: Permutation([2,1,3]).permutohedron_lequal(Permutation([3,1,2]))

[1, 2, 2, 3, 3, 6]

>>> Permutation([]).permutohedron_lequal(Permutation([]))
True
```

permutohedron_meet(*other*, *side='right'*)

Return the meet of the permutations `self` and `other` in the right permutohedron order (or, if `side` is set to `'left'`, in the left permutohedron order).

The permutohedron orders (see *permutohedron_lequal()*) are lattices; the meet operation refers to this lattice structure. It is connected to the join operation by the following simple symmetry property: If π and ψ are two permutations π and ψ in the symmetric group S_n, and if w_0 denotes the permutation $(n, n-1, \ldots, 1) \in S_n$, then

$$\pi \wedge \psi = w_0 \circ ((w_0 \circ \pi) \vee (w_0 \circ \psi)) = ((\pi \circ w_0) \vee (\psi \circ w_0)) \circ w_0$$

and

$$\pi \vee \psi = w_0 \circ ((w_0 \circ \pi) \wedge (w_0 \circ \psi)) = ((\pi \circ w_0) \wedge (\psi \circ w_0)) \circ w_0,$$

where $\wedge$ means meet and $\vee$ means join.

See also

permutohedron_lequal(), *permutohedron_join()*.

AUTHORS:

Viviane Pons and Darij Grinberg, 18 June 2014.

EXAMPLES:

```
sage: p = Permutation([3,1,2])
sage: q = Permutation([1,3,2])
sage: p.permutohedron_meet(q)
[1, 3, 2]
sage: r = Permutation([2,1,3])
sage: r.permutohedron_meet(p)
[1, 2, 3]
```

```
>>> from sage.all import *
>>> p = Permutation([Integer(3),Integer(1),Integer(2)])
>>> q = Permutation([Integer(1),Integer(3),Integer(2)])
>>> p.permutohedron_meet(q)
[1, 3, 2]
>>> r = Permutation([Integer(2),Integer(1),Integer(3)])
>>> r.permutohedron_meet(p)
[1, 2, 3]
```

```
sage: p = Permutation([3,2,4,1])
sage: q = Permutation([4,2,1,3])
sage: p.permutohedron_meet(q)
[2, 1, 3, 4]
sage: r = Permutation([3,1,2,4])
sage: p.permutohedron_meet(r)
[3, 1, 2, 4]
sage: q.permutohedron_meet(r)
[1, 2, 3, 4]
sage: s = Permutation([1,4,2,3])
sage: s.permutohedron_meet(r)
[1, 2, 3, 4]
```

```
>>> from sage.all import *
>>> p = Permutation([Integer(3),Integer(2),Integer(4),Integer(1)])
>>> q = Permutation([Integer(4),Integer(2),Integer(1),Integer(3)])
>>> p.permutohedron_meet(q)
[2, 1, 3, 4]
>>> r = Permutation([Integer(3),Integer(1),Integer(2),Integer(4)])
>>> p.permutohedron_meet(r)
```

(continues on next page)

(continued from previous page)

```
[3, 1, 2, 4]
>>> q.permutohedron_meet(r)
[1, 2, 3, 4]
>>> s = Permutation([Integer(1),Integer(4),Integer(2),Integer(3)])
>>> s.permutohedron_meet(r)
[1, 2, 3, 4]
```

The universal property of the meet operation is satisfied:

```
sage: def test_uni_meet(p, q):
....:     m = p.permutohedron_meet(q)
....:     if not m.permutohedron_lequal(p):
....:         return False
....:     if not m.permutohedron_lequal(q):
....:         return False
....:     for r in p.permutohedron_smaller():
....:         if r.permutohedron_lequal(q) and not r.permutohedron_lequal(m):
....:             return False
....:     return True
sage: all( test_uni_meet(p, q) for p in Permutations(3) for q in␣
↪Permutations(3) )
True
sage: test_uni_meet(Permutation([6, 4, 7, 3, 2, 5, 8, 1]), Permutation([7, 3,␣
↪1, 2, 5, 4, 6, 8]))
True
```

```
>>> from sage.all import *
>>> def test_uni_meet(p, q):
...     m = p.permutohedron_meet(q)
...     if not m.permutohedron_lequal(p):
...         return False
...     if not m.permutohedron_lequal(q):
...         return False
...     for r in p.permutohedron_smaller():

↪Integer(3), Integer(1), Integer(2), Integer(5), Integer(4), Integer(6),␣
↪Integer(8)]))
True
```

Border cases:

```
sage: p = Permutation([])
sage: p.permutohedron_meet(p)
[]
sage: p = Permutation([1])
```

(continues on next page)

(continued from previous page)

```
sage: p.permutohedron_meet(p)
[1]
```

```
>>> from sage.all import *
>>> p = Permutation([])
>>> p.permutohedron_meet(p)
[]
>>> p = Permutation([Integer(1)])
>>> p.permutohedron_meet(p)
[1]
```

The left permutohedron:

```
sage: p = Permutation([3,1,2])
sage: q = Permutation([1,3,2])
sage: p.permutohedron_meet(q, side='left')
[1, 2, 3]
sage: r = Permutation([2,1,3])
sage: r.permutohedron_meet(p, side='left')
[2, 1, 3]
```

```
>>> from sage.all import *
>>> p = Permutation([Integer(3),Integer(1),Integer(2)])
>>> q = Permutation([Integer(1),Integer(3),Integer(2)])
>>> p.permutohedron_meet(q, side='left')
[1, 2, 3]
>>> r = Permutation([Integer(2),Integer(1),Integer(3)])
>>> r.permutohedron_meet(p, side='left')
[2, 1, 3]
```

permutohedron_pred(*side='right'*)

Return a list of the permutations strictly smaller than `self` in the permutohedron order such that there is no permutation between any of those and `self`.

By default, the computations are done in the right permutohedron. If you pass the option `side='left'`, then they will be done in the left permutohedron.

See *permutohedron_lequal()* for the definition of the permutohedron orders.

EXAMPLES:

```
sage: p = Permutation([4,2,1,3])
sage: p.permutohedron_pred()
[[2, 4, 1, 3], [4, 1, 2, 3]]
sage: p.permutohedron_pred(side='left')
[[4, 1, 2, 3], [3, 2, 1, 4]]
```

```
>>> from sage.all import *
>>> p = Permutation([Integer(4),Integer(2),Integer(1),Integer(3)])
>>> p.permutohedron_pred()
[[2, 4, 1, 3], [4, 1, 2, 3]]
>>> p.permutohedron_pred(side='left')
[[4, 1, 2, 3], [3, 2, 1, 4]]
```

permutohedron_smaller(*side='right'*)

Return a list of permutations smaller than or equal to `self` in the permutohedron order.

By default, the computations are done in the right permutohedron. If you pass the option `side='left'`, then they will be done in the left permutohedron.

See *permutohedron_lequal()* for the definition of the permutohedron orders.

EXAMPLES:

```
sage: Permutation([4,2,1,3]).permutohedron_smaller()
[[1, 2, 3, 4],
 [1, 2, 4, 3],
 [1, 4, 2, 3],
 [2, 1, 3, 4],
 [2, 1, 4, 3],
 [2, 4, 1, 3],
 [4, 1, 2, 3],
 [4, 2, 1, 3]]
```

```
>>> from sage.all import *
>>> Permutation([Integer(4),Integer(2),Integer(1),Integer(3)]).permutohedron_
↪smaller()
[[1, 2, 3, 4],
 [1, 2, 4, 3],
 [1, 4, 2, 3],
 [2, 1, 3, 4],
 [2, 1, 4, 3],
 [2, 4, 1, 3],
 [4, 1, 2, 3],
 [4, 2, 1, 3]]
```

```
sage: Permutation([4,2,1,3]).permutohedron_smaller(side='left')
[[1, 2, 3, 4],
 [1, 3, 2, 4],
 [2, 1, 3, 4],
 [2, 3, 1, 4],
 [3, 1, 2, 4],
 [3, 2, 1, 4],
 [4, 1, 2, 3],
 [4, 2, 1, 3]]
```

```
>>> from sage.all import *
>>> Permutation([Integer(4),Integer(2),Integer(1),Integer(3)]).permutohedron_
↪smaller(side='left')
[[1, 2, 3, 4],
 [1, 3, 2, 4],
 [2, 1, 3, 4],
 [2, 3, 1, 4],
 [3, 1, 2, 4],
 [3, 2, 1, 4],
 [4, 1, 2, 3],
 [4, 2, 1, 3]]
```

permutohedron_succ(*side='right'*)

Return a list of the permutations strictly greater than `self` in the permutohedron order such that there is no permutation between any of those and `self`.

By default, the computations are done in the right permutohedron. If you pass the option `side='left'`, then they will be done in the left permutohedron.

See `permutohedron_lequal()` for the definition of the permutohedron orders.

EXAMPLES:

```
sage: p = Permutation([4,2,1,3])
sage: p.permutohedron_succ()
[[4, 2, 3, 1]]
sage: p.permutohedron_succ(side='left')
[[4, 3, 1, 2]]
```

```
>>> from sage.all import *
>>> p = Permutation([Integer(4),Integer(2),Integer(1),Integer(3)])
>>> p.permutohedron_succ()
[[4, 2, 3, 1]]
>>> p.permutohedron_succ(side='left')
[[4, 3, 1, 2]]
```

prev()

Return the permutation that comes directly before `self` in lexicographic order on the symmetric group containing `self`. If `self` is the first permutation, then it returns `False`. Does not support the Steinhaus-Johnson-Trotter algorithm for the moment.

EXAMPLES:

```
sage: p = Permutation([1,2,3])
sage: p.prev()
False
sage: p = Permutation([1,3,2])
sage: p.prev()
[1, 2, 3]
```

```
>>> from sage.all import *
>>> p = Permutation([Integer(1),Integer(2),Integer(3)])
>>> p.prev()
False
>>> p = Permutation([Integer(1),Integer(3),Integer(2)])
>>> p.prev()
[1, 2, 3]
```

Todo

Implement the previous permutation for the Steinhaus-Johnson-Trotter algorithm.

rank()

Return the rank of `self` in the lexicographic ordering on the symmetric group to which `self` belongs.

EXAMPLES:

```
sage: Permutation([1,2,3]).rank()
0
sage: Permutation([1, 2, 4, 6, 3, 5]).rank()
10
sage: perms = Permutations(6).list()
sage: [p.rank() for p in perms] == list(range(factorial(6)))
True
```

```
>>> from sage.all import *
>>> Permutation([Integer(1),Integer(2),Integer(3)]).rank()
0
>>> Permutation([Integer(1), Integer(2), Integer(4), Integer(6), Integer(3),␣
↪Integer(5)]).rank()
10
>>> perms = Permutations(Integer(6)).list()
>>> [p.rank() for p in perms] == list(range(factorial(Integer(6))))
True
```

rank_matrix()

Return the rank matrix of `self`.

Let $P = [P_{ij}]_{i,j=1}^n$ be the permutation matrix of $w \in S_n$. The rank matrix is the $n \times n$ matrix with entries

$$r_w(i,j) = \sum_{a=1}^{i}\sum_{b=1}^{j} P_{ij}.$$

EXAMPLES:

```
sage: w = Permutation([2, 1, 5, 4, 3])
sage: w.to_matrix()
[0 1 0 0 0]
[1 0 0 0 0]
[0 0 0 0 1]
[0 0 0 1 0]
[0 0 1 0 0]
sage: w.rank_matrix()
[0 1 1 1 1]
[1 2 2 2 2]
[1 2 2 2 3]
[1 2 2 3 4]
[1 2 3 4 5]
```

```
>>> from sage.all import *
>>> w = Permutation([Integer(2), Integer(1), Integer(5), Integer(4),␣
↪Integer(3)])
>>> w.to_matrix()
[0 1 0 0 0]
[1 0 0 0 0]
[0 0 0 0 1]
[0 0 0 1 0]
[0 0 1 0 0]
>>> w.rank_matrix()
```

(continues on next page)

(continued from previous page)

```
[0 1 1 1 1]
[1 2 2 2 2]
[1 2 2 2 3]
[1 2 2 3 4]
[1 2 3 4 5]
```

recoils()

Return the list of the positions of the recoils of `self`.

A recoil of a permutation p is an integer i such that $i + 1$ appears to the left of i in p. Here, the positions are being counted starting at 0. (Note that it is the positions, not the recoils themselves, which are being listed.)

EXAMPLES:

```
sage: Permutation([1,4,3,2]).recoils()
[2, 3]
sage: Permutation([]).recoils()
[]
```

```
>>> from sage.all import *
>>> Permutation([Integer(1),Integer(4),Integer(3),Integer(2)]).recoils()
[2, 3]
>>> Permutation([]).recoils()
[]
```

recoils_composition()

Return the recoils composition of `self`.

The recoils composition of a permutation $p \in S_n$ is the composition of n whose descent set is the set of the recoils of p (not their positions). In other words, this is the descents composition of p^{-1}.

EXAMPLES:

```
sage: Permutation([1,3,2,4]).recoils_composition()
[2, 2]
sage: Permutation([]).recoils_composition()
[]
```

```
>>> from sage.all import *
>>> Permutation([Integer(1),Integer(3),Integer(2),Integer(4)]).recoils_
↪composition()
[2, 2]
>>> Permutation([]).recoils_composition()
[]
```

reduced_word()

Return a reduced word of the permutation `self`.

See *reduced_words()* for the definition of reduced words and a way to compute them all.

> **Warning**
>
> This does not respect the multiplication convention.

EXAMPLES:

```
sage: Permutation([3,5,4,6,2,1]).reduced_word()
[2, 1, 4, 3, 2, 4, 3, 5, 4, 5]

Permutation([1]).reduced_word_lexmin()
[]
Permutation([]).reduced_word_lexmin()
[]
```

```
>>> from sage.all import *
>>> Permutation([Integer(3),Integer(5),Integer(4),Integer(6),Integer(2),
↪Integer(1)]).reduced_word()
[2, 1, 4, 3, 2, 4, 3, 5, 4, 5]

Permutation([1]).reduced_word_lexmin()
[]
Permutation([]).reduced_word_lexmin()
[]
```

reduced_word_lexmin()

Return a lexicographically minimal reduced word of the permutation `self`.

See *reduced_words()* for the definition of reduced words and a way to compute them all.

EXAMPLES:

```
sage: Permutation([3,4,2,1]).reduced_word_lexmin()
[1, 2, 1, 3, 2]

Permutation([1]).reduced_word_lexmin()
[]
Permutation([]).reduced_word_lexmin()
[]
```

```
>>> from sage.all import *
>>> Permutation([Integer(3),Integer(4),Integer(2),Integer(1)]).reduced_word_
↪lexmin()
[1, 2, 1, 3, 2]

Permutation([1]).reduced_word_lexmin()
[]
Permutation([]).reduced_word_lexmin()
[]
```

reduced_words()

Return a list of the reduced words of `self`.

The notion of a reduced word is based on the well-known fact that every permutation can be written as a product of adjacent transpositions. In more detail: If n is a nonnegative integer, we can define the transpositions $s_i = (i, i+1) \in S_n$ for all $i \in \{1, 2, \ldots, n-1\}$, and every $p \in S_n$ can then be written as a product $s_{i_1} s_{i_2} \cdots s_{i_k}$ for some sequence $(i_1, i_2, \ldots, i_k)$ of elements of $\{1, 2, \ldots, n-1\}$ (here $\{1, 2, \ldots, n-1\}$ denotes the empty set when $n \leq 1$). Fixing a p, the sequences $(i_1, i_2, \ldots, i_k)$ of smallest length satisfying $p = s_{i_1} s_{i_2} \cdots s_{i_k}$ are called the reduced words of p. (Their length is the Coxeter length of p, and can be computed using *length()*.)

Note that the product of permutations is defined here in such a way that $(pq)(i) = p(q(i))$ for all permutations p and q and each $i \in \{1, 2, \ldots, n\}$ (this is the same convention as in `left_action_product()`, but not the default semantics of the $*$ operator on permutations in Sage). Thus, for instance, $s_2 s_1$ is the permutation obtained by first transposing 1 with 2 and then transposing 2 with 3.

`reduced_word()`, `reduced_word_lexmin()`

EXAMPLES:

```
sage: Permutation([2,1,3]).reduced_words()
[[1]]
sage: Permutation([3,1,2]).reduced_words()
[[2, 1]]
sage: Permutation([3,2,1]).reduced_words()
[[1, 2, 1], [2, 1, 2]]
sage: Permutation([3,2,4,1]).reduced_words()
[[1, 2, 3, 1], [1, 2, 1, 3], [2, 1, 2, 3]]

Permutation([1]).reduced_words()
[[]]
Permutation([]).reduced_words()
[[]]
```

```
>>> from sage.all import *
>>> Permutation([Integer(2),Integer(1),Integer(3)]).reduced_words()
[[1]]
>>> Permutation([Integer(3),Integer(1),Integer(2)]).reduced_words()
[[2, 1]]
>>> Permutation([Integer(3),Integer(2),Integer(1)]).reduced_words()
[[1, 2, 1], [2, 1, 2]]
>>> Permutation([Integer(3),Integer(2),Integer(4),Integer(1)]).reduced_words()
[[1, 2, 3, 1], [1, 2, 1, 3], [2, 1, 2, 3]]

Permutation([1]).reduced_words()
[[]]
Permutation([]).reduced_words()
[[]]
```

reduced_words_iterator()

Return an iterator for the reduced words of `self`.

EXAMPLES:

```
sage: next(Permutation([5,2,3,4,1]).reduced_words_iterator())
[1, 2, 3, 4, 3, 2, 1]
```

```
>>> from sage.all import *
>>> next(Permutation([Integer(5),Integer(2),Integer(3),Integer(4),
↪Integer(1)]).reduced_words_iterator())
[1, 2, 3, 4, 3, 2, 1]
```

remove_extra_fixed_points()

Return the permutation obtained by removing any fixed points at the end of `self`.

However, return `[1]` rather than `[]` if `self` is the identity permutation.

This is mostly a helper method for *sage.combinat.schubert_polynomial*, where it is used to normalize finitary permutations of $\{1, 2, 3, \ldots\}$.

EXAMPLES:

```
sage: Permutation([2,1,3]).remove_extra_fixed_points()
[2, 1]
sage: Permutation([1,2,3,4]).remove_extra_fixed_points()
[1]
sage: Permutation([2,1]).remove_extra_fixed_points()
[2, 1]
sage: Permutation([]).remove_extra_fixed_points()
[1]
```

```
>>> from sage.all import *
>>> Permutation([Integer(2),Integer(1),Integer(3)]).remove_extra_fixed_
→points()
[2, 1]
>>> Permutation([Integer(1),Integer(2),Integer(3),Integer(4)]).remove_extra_
→fixed_points()
[1]
>>> Permutation([Integer(2),Integer(1)]).remove_extra_fixed_points()
[2, 1]
>>> Permutation([]).remove_extra_fixed_points()
[1]
```

retract_plain()

retract_direct_product(*m*)

Return the direct-product retract of the permutation `self` $\in S_n$ to S_m, where $m \leq n$. If this retract is undefined, then `None` is returned.

If $p \in S_n$ is a permutation, and m is a nonnegative integer less or equal to n, then the direct-product retract of p to S_m is defined only if $p([m]) = [m]$, where $[m]$ denotes the interval $\{1, 2, \ldots, m\}$. In this case, it is defined as the permutation written $(p(1), p(2), \ldots, p(m))$ in one-line notation.

EXAMPLES:

```
sage: Permutation([4,1,2,3,5]).retract_direct_product(4)
[4, 1, 2, 3]
sage: Permutation([4,1,2,3,5]).retract_direct_product(3)

sage: Permutation([1,4,2,3,6,5]).retract_direct_product(5)
sage: Permutation([1,4,2,3,6,5]).retract_direct_product(4)
[1, 4, 2, 3]
sage: Permutation([1,4,2,3,6,5]).retract_direct_product(3)
sage: Permutation([1,4,2,3,6,5]).retract_direct_product(2)
```

(continues on next page)

(continued from previous page)

```
sage: Permutation([1,4,2,3,6,5]).retract_direct_product(1)
[1]
sage: Permutation([1,4,2,3,6,5]).retract_direct_product(0)
[]

sage: all( p.retract_direct_product(3) == p for p in Permutations(3) )

retract_plain(), *retract_okounkov_vershik()*

retract_okounkov_vershik(*m*)

Return the Okounkov-Vershik retract of the permutation `self` $\in S_n$ to S_m, where $m \leq n$.

If $p \in S_n$ is a permutation, and m is a nonnegative integer less or equal to n, then the Okounkov-Vershik retract of p to S_m is defined as the permutation in S_m which sends every $i \in \{1, 2, \ldots, m\}$ to $p^{k_i}(i)$, where k_i is the smallest positive integer k satisfying $p^k(i) \leq m$.

In other words, the Okounkov-Vershik retract of p is the permutation whose disjoint cycle decomposition is obtained by removing all letters strictly greater than m from the decomposition of p into disjoint cycles (and removing all cycles which are emptied in the process).

When $m = n-1$, the Okounkov-Vershik retract (as a map $S_n \to S_{n-1}$) is the map $\widetilde{p}_n$ introduced in Section 7 of [VO2005], and appears as (3.20) in [CST2010]. In the general case, the Okounkov-Vershik retract of a permutation in S_n to S_m can be obtained by first taking its Okounkov-Vershik retract to S_{n-1}, then that of the resulting permutation to S_{n-2}, etc. until arriving in S_m.

EXAMPLES:

```
sage: Permutation([4,1,2,3,5]).retract_okounkov_vershik(4)
[4, 1, 2, 3]
sage: Permutation([4,1,2,3,5]).retract_okounkov_vershik(3)

retract_plain(), *retract_direct_product()*

retract_plain(m)

Return the plain retract of the permutation `self` in S_n to S_m, where $m \leq n$. If this retract is undefined, then `None` is returned.

If $p \in S_n$ is a permutation, and m is a nonnegative integer less or equal to n, then the plain retract of p to S_m is defined only if every $i > m$ satisfies $p(i) = i$. In this case, it is defined as the permutation written $(p(1), p(2), \ldots, p(m))$ in one-line notation.

EXAMPLES:

```
sage: Permutation([4,1,2,3,5]).retract_plain(4)
[4, 1, 2, 3]
sage: Permutation([4,1,2,3,5]).retract_plain(3)

sage: Permutation([1,3,2,4,5,6]).retract_plain(3)
[1, 3, 2]
sage: Permutation([1,3,2,4,5,6]).retract_plain(2)

sage: Permutation([1,2,3,4,5]).retract_plain(1)
[1]
sage: Permutation([1,2,3,4,5]).retract_plain(0)
[]

sage: all( p.retract_plain(3) == p for p in Permutations(3) )
True
```

```
>>> from sage.all import *
>>> Permutation([Integer(4),Integer(1),Integer(2),Integer(3),Integer(5)]).
↪retract_plain(Integer(4))
[4, 1, 2, 3]
>>> Permutation([Integer(4),Integer(1),Integer(2),Integer(3),Integer(5)]).
↪retract_plain(Integer(3))

>>> Permutation([Integer(1),Integer(3),Integer(2),Integer(4),Integer(5),
↪Integer(6)]).retract_plain(Integer(3))
[1, 3, 2]
>>> Permutation([Integer(1),Integer(3),Integer(2),Integer(4),Integer(5),
↪Integer(6)]).retract_plain(Integer(2))

>>> Permutation([Integer(1),Integer(2),Integer(3),Integer(4),Integer(5)]).
↪retract_plain(Integer(1))
[1]
>>> Permutation([Integer(1),Integer(2),Integer(3),Integer(4),Integer(5)]).
↪retract_plain(Integer(0))
[]

>>> all( p.retract_plain(Integer(3)) == p for p in Permutations(Integer(3)) )
True
```

See also

retract_direct_product(), *retract_okounkov_vershik()*, *remove_extra_fixed_points()*

reverse()

Return the permutation obtained by reversing the list.

EXAMPLES:

```
sage: Permutation([3,4,1,2]).reverse()
[2, 1, 4, 3]
```

(continues on next page)

(continued from previous page)

```
sage: Permutation([1,2,3,4,5]).reverse()
[5, 4, 3, 2, 1]
```

```
>>> from sage.all import *
>>> Permutation([Integer(3),Integer(4),Integer(1),Integer(2)]).reverse()
[2, 1, 4, 3]
>>> Permutation([Integer(1),Integer(2),Integer(3),Integer(4),Integer(5)]).
↪reverse()
[5, 4, 3, 2, 1]
```

right_action_product(*rp*)

Return the permutation obtained by composing `self` with `rp` in such an order that `self` is applied first and `rp` is applied afterwards.

This is usually denoted by either `self * rp` or `rp * self` depending on the conventions used by the author. If the value of a permutation $p \in S_n$ on an integer $i \in \{1, 2, \cdots, n\}$ is denoted by $p(i)$, then this should be denoted by `rp * self` in order to have associativity (i.e., in order to have $(p \cdot q)(i) = p(q(i))$ for all p, q and i). If, on the other hand, the value of a permutation $p \in S_n$ on an integer $i \in \{1, 2, \cdots, n\}$ is denoted by i^p, then this should be denoted by `self * rp` in order to have associativity (i.e., in order to have $i^{p \cdot q} = (i^p)^q$ for all p, q and i).

EXAMPLES:

```
sage: p = Permutation([2,1,3])
sage: q = Permutation([3,1,2])
sage: p.right_action_product(q)
[1, 3, 2]
sage: q.right_action_product(p)
[3, 2, 1]
```

```
>>> from sage.all import *
>>> p = Permutation([Integer(2),Integer(1),Integer(3)])
>>> q = Permutation([Integer(3),Integer(1),Integer(2)])
>>> p.right_action_product(q)
[1, 3, 2]
>>> q.right_action_product(p)
[3, 2, 1]
```

right_permutohedron_interval(*other*)

Return the list of the permutations belonging to the right permutohedron interval where `self` is the minimal element and `other` the maximal element.

See *permutohedron_lequal()* for the definition of the permutohedron orders.

EXAMPLES:

```
sage: p = Permutation([2, 1, 4, 5, 3]); q = Permutation([2, 5, 4, 1, 3])
sage: p.right_permutohedron_interval(q)                                    #␣
↪needs sage.graphs sage.modules
[[2, 4, 5, 1, 3], [2, 4, 1, 5, 3], [2, 1, 4, 5, 3],
 [2, 1, 5, 4, 3], [2, 5, 1, 4, 3], [2, 5, 4, 1, 3]]
```

```
>>> from sage.all import *
>>> p = Permutation([Integer(2), Integer(1), Integer(4), Integer(5),␣
↪Integer(3)]); q = Permutation([Integer(2), Integer(5), Integer(4),␣
↪Integer(1), Integer(3)])
>>> p.right_permutohedron_interval(q)                                    #␣
↪needs sage.graphs sage.modules
[[2, 4, 5, 1, 3], [2, 4, 1, 5, 3], [2, 1, 4, 5, 3],
 [2, 1, 5, 4, 3], [2, 5, 1, 4, 3], [2, 5, 4, 1, 3]]
```

right_permutohedron_interval_iterator(*other*)

Return an iterator on the permutations (represented as integer lists) belonging to the right permutohedron interval where `self` is the minimal element and `other` the maximal element.

See `permutohedron_lequal()` for the definition of the permutohedron orders.

EXAMPLES:

```
sage: p = Permutation([2, 1, 4, 5, 3]); q = Permutation([2, 5, 4, 1, 3])
sage: p.right_permutohedron_interval(q)  # indirect doctest              #␣
↪needs sage.graphs sage.modules
[[2, 4, 5, 1, 3], [2, 4, 1, 5, 3], [2, 1, 4, 5, 3],
 [2, 1, 5, 4, 3], [2, 5, 1, 4, 3], [2, 5, 4, 1, 3]]
```

```
>>> from sage.all import *
>>> p = Permutation([Integer(2), Integer(1), Integer(4), Integer(5),␣
↪Integer(3)]); q = Permutation([Integer(2), Integer(5), Integer(4),␣
↪Integer(1), Integer(3)])
>>> p.right_permutohedron_interval(q)  # indirect doctest                #␣
↪needs sage.graphs sage.modules
[[2, 4, 5, 1, 3], [2, 4, 1, 5, 3], [2, 1, 4, 5, 3],
 [2, 1, 5, 4, 3], [2, 5, 1, 4, 3], [2, 5, 4, 1, 3]]
```

right_tableau()

Return the right standard tableau after performing the RSK algorithm on `self`.

EXAMPLES:

```
sage: Permutation([1,4,3,2]).right_tableau()                             #␣
↪needs sage.combinat
[[1, 2], [3], [4]]
```

```
>>> from sage.all import *
>>> Permutation([Integer(1),Integer(4),Integer(3),Integer(2)]).right_
↪tableau()                                # needs sage.combinat
[[1, 2], [3], [4]]
```

robinson_schensted()

Return the pair of standard tableaux obtained by running the Robinson-Schensted algorithm on `self`.

This can also be done by running `RSK()` on `self` (with the optional argument `check_standard=True` to return standard Young tableaux).

EXAMPLES:

```
sage: Permutation([6,2,3,1,7,5,4]).robinson_schensted()                    #␣
↪needs sage.combinat
[[[1, 3, 4], [2, 5], [6, 7]], [[1, 3, 5], [2, 6], [4, 7]]]
```

```
>>> from sage.all import *
>>> Permutation([Integer(6),Integer(2),Integer(3),Integer(1),Integer(7),
↪Integer(5),Integer(4)]).robinson_schensted()                     # needs␣
↪sage.combinat
[[[1, 3, 4], [2, 5], [6, 7]], [[1, 3, 5], [2, 6], [4, 7]]]
```

rothe_diagram()

Return the Rothe diagram of `self`.

EXAMPLES:

```
sage: p = Permutation([4,2,1,3])
sage: D = p.rothe_diagram(); D                                             #␣
↪needs sage.combinat
[(0, 0), (0, 1), (0, 2), (1, 0)]
sage: D.pp()                                                               #␣
↪needs sage.combinat
O O O .
O . . .
. . . .
. . . .
```

```
>>> from sage.all import *
>>> p = Permutation([Integer(4),Integer(2),Integer(1),Integer(3)])
>>> D = p.rothe_diagram(); D                                             #␣
↪needs sage.combinat
[(0, 0), (0, 1), (0, 2), (1, 0)]
>>> D.pp()                                                               #␣
↪needs sage.combinat
O O O .
O . . .
. . . .
. . . .
```

runs(*as_tuple=False*)

Return a list of the runs in the nonempty permutation `self`.

A run in a permutation is defined to be a maximal (with respect to inclusion) nonempty increasing substring (i.e., contiguous subsequence). For instance, the runs in the permutation `[6,1,7,3,4,5,2]` are `[6]`, `[1,7]`, `[3,4,5]` and `[2]`.

Runs in an empty permutation are not defined.

INPUT:

- `as_tuple` – boolean (default: `False`); choice of output format

OUTPUT: list of lists or a tuple of tuples

REFERENCES:

- http://mathworld.wolfram.com/PermutationRun.html

EXAMPLES:

```
sage: Permutation([1,2,3,4]).runs()
[[1, 2, 3, 4]]
sage: Permutation([4,3,2,1]).runs()
[[4], [3], [2], [1]]
sage: Permutation([2,4,1,3]).runs()
[[2, 4], [1, 3]]
sage: Permutation([1]).runs()
[[1]]
```

```
>>> from sage.all import *
>>> Permutation([Integer(1),Integer(2),Integer(3),Integer(4)]).runs()
[[1, 2, 3, 4]]
>>> Permutation([Integer(4),Integer(3),Integer(2),Integer(1)]).runs()
[[4], [3], [2], [1]]
>>> Permutation([Integer(2),Integer(4),Integer(1),Integer(3)]).runs()
[[2, 4], [1, 3]]
>>> Permutation([Integer(1)]).runs()
[[1]]
```

The example from above:

```
sage: Permutation([6,1,7,3,4,5,2]).runs()
[[6], [1, 7], [3, 4, 5], [2]]
sage: Permutation([6,1,7,3,4,5,2]).runs(as_tuple=True)
((6,), (1, 7), (3, 4, 5), (2,))
```

```
>>> from sage.all import *
>>> Permutation([Integer(6),Integer(1),Integer(7),Integer(3),Integer(4),
↪Integer(5),Integer(2)]).runs()
[[6], [1, 7], [3, 4, 5], [2]]
>>> Permutation([Integer(6),Integer(1),Integer(7),Integer(3),Integer(4),
↪Integer(5),Integer(2)]).runs(as_tuple=True)
((6,), (1, 7), (3, 4, 5), (2,))
```

The number of runs in a nonempty permutation equals its number of descents plus 1:

```
sage: all( len(p.runs()) == p.number_of_descents() + 1
....:      for p in Permutations(6) )
True
```

```
>>> from sage.all import *
>>> all( len(p.runs()) == p.number_of_descents() + Integer(1)
...      for p in Permutations(Integer(6)) )
True
```

saliances()

Return a list of the saliances of the permutation `self`.

A saliance of a permutation p is an integer i such that $p(i) > p(j)$ for all $j > i$.

EXAMPLES:

```
sage: Permutation([2,3,1,5,4]).saliances()
[3, 4]
sage: Permutation([5,4,3,2,1]).saliances()
[0, 1, 2, 3, 4]
```

```
>>> from sage.all import *
>>> Permutation([Integer(2),Integer(3),Integer(1),Integer(5),Integer(4)]).
↪saliances()
[3, 4]
>>> Permutation([Integer(5),Integer(4),Integer(3),Integer(2),Integer(1)]).
↪saliances()
[0, 1, 2, 3, 4]
```

schubert_determinant_ideal()

Return the Schubert determinant ideal of `self`.

From Lemma 3.10 [Ful1992], the matrix Schubert variety of a permutation $w \in S_n$ is defined by the ideal

$$I_w = \sum_{(i,j)} I_{r_w(i,j)+1}(i,j),$$

where the sum is over the *essential set*, $[r_w(i,j)]_{i,j}$ is the *rank_matrix()* of w, and $I_k(i,j)$ is the ideal generated by the $k \times k$ minors of the $i \times j$ matrix $[z_{ab}]_{a,b}$.

These ideals are known to be prime of codimension equal to $\ell(w)$ (the length of w) such that R/I_w is Cohen-Macaulay, where R is the polynomial ring $\mathbf{Q}[z_{ab} | 1 \leq a, b \leq n]$ from Prop. 3.10 of [Ful1992].

EXAMPLES:

```
sage: w = Permutation([3, 1, 4, 2])
sage: Iw = w.schubert_determinant_ideal()
sage: Iw.gens()
[z00, z01, -z01*z10 + z00*z11, -z01*z20 + z00*z21, -z11*z20 + z10*z21]
sage: Iw.dimension()
13
sage: Iw.dimension() + w.length()
16
sage: Iw.is_prime()
True

sage: w = Permutation([2, 1, 5, 4, 3])
sage: Iw = w.schubert_determinant_ideal()
sage: Iw.dimension()
21
sage: w.length() + Iw.dimension()
25
sage: Iw.is_prime()
True
```

```
>>> from sage.all import *
>>> w = Permutation([Integer(3), Integer(1), Integer(4), Integer(2)])
>>> Iw = w.schubert_determinant_ideal()
>>> Iw.gens()
[z00, z01, -z01*z10 + z00*z11, -z01*z20 + z00*z21, -z11*z20 + z10*z21]
```

(continues on next page)

(continued from previous page)

```
>>> Iw.dimension()
13
>>> Iw.dimension() + w.length()
16
>>> Iw.is_prime()
True

>>> w = Permutation([Integer(2), Integer(1), Integer(5), Integer(4),␣
→Integer(3)])
>>> Iw = w.schubert_determinant_ideal()
>>> Iw.dimension()
21
>>> w.length() + Iw.dimension()
25
>>> Iw.is_prime()
True
```

shifted_concatenation(*other*, *side='right'*)

Return the right (or left) shifted concatenation of `self` with a permutation `other`. These operations are also known as the Loday-Ronco over and under operations.

INPUT:

- `other` – a permutation, a list, a tuple, or any iterable representing a permutation
- `side` – string (default: `'right'`); `'left'` or `'right'`

OUTPUT:

If `side` is `'right'`, the method returns the permutation obtained by concatenating `self` with the letters of `other` incremented by the size of `self`. This is what is called `side / other` in [LR0102066], and denoted as the "over" operation. Otherwise, i. e., when `side` is `'left'`, the method returns the permutation obtained by concatenating the letters of `other` incremented by the size of `self` with `self`. This is what is called `side \ other` in [LR0102066] (which seems to use the $(\sigma\pi)(i) = \pi(\sigma(i))$ convention for the product of permutations).

EXAMPLES:

```
sage: Permutation([]).shifted_concatenation(Permutation([]), "right")
[]
sage: Permutation([]).shifted_concatenation(Permutation([]), "left")
[]
sage: Permutation([2, 4, 1, 3]).shifted_concatenation(Permutation([3, 1, 2]),
→"right")
[2, 4, 1, 3, 7, 5, 6]
sage: Permutation([2, 4, 1, 3]).shifted_concatenation(Permutation([3, 1, 2]),
→"left")
[7, 5, 6, 2, 4, 1, 3]
```

```
>>> from sage.all import *
>>> Permutation([]).shifted_concatenation(Permutation([]), "right")
[]
>>> Permutation([]).shifted_concatenation(Permutation([]), "left")
[]
>>> Permutation([Integer(2), Integer(4), Integer(1), Integer(3)]).shifted_
```

(continues on next page)

(continued from previous page)

```
↪concatenation(Permutation([Integer(3), Integer(1), Integer(2)]), "right")
[2, 4, 1, 3, 7, 5, 6]
>>> Permutation([Integer(2), Integer(4), Integer(1), Integer(3)]).shifted_
↪concatenation(Permutation([Integer(3), Integer(1), Integer(2)]), "left")
[7, 5, 6, 2, 4, 1, 3]
```

shifted_shuffle(*other*)

Return the shifted shuffle of two permutations `self` and `other`.

INPUT:

- `other` – a permutation, a list, a tuple, or any iterable representing a permutation

OUTPUT:

The list of the permutations appearing in the shifted shuffle of the permutations `self` and `other`.

EXAMPLES:

```
sage: # needs sage.graphs sage.modules
sage: Permutation([]).shifted_shuffle(Permutation([]))
[[]]
sage: Permutation([1, 2, 3]).shifted_shuffle(Permutation([1]))
[[4, 1, 2, 3], [1, 2, 3, 4], [1, 2, 4, 3], [1, 4, 2, 3]]
sage: Permutation([1, 2]).shifted_shuffle(Permutation([2, 1]))
[[4, 1, 3, 2], [4, 3, 1, 2], [1, 4, 3, 2],
 [1, 4, 2, 3], [1, 2, 4, 3], [4, 1, 2, 3]]
sage: Permutation([1]).shifted_shuffle([1])
[[2, 1], [1, 2]]
sage: p = Permutation([3, 1, 5, 4, 2])
sage: len(p.shifted_shuffle(Permutation([2, 1, 4, 3])))
126
```

```
>>> from sage.all import *
>>> # needs sage.graphs sage.modules
>>> Permutation([]).shifted_shuffle(Permutation([]))
[[]]
>>> Permutation([Integer(1), Integer(2), Integer(3)]).shifted_
↪shuffle(Permutation([Integer(1)]))
[[4, 1, 2, 3], [1, 2, 3, 4], [1, 2, 4, 3], [1, 4, 2, 3]]
>>> Permutation([Integer(1), Integer(2)]).shifted_
↪shuffle(Permutation([Integer(2), Integer(1)]))
[[4, 1, 3, 2], [4, 3, 1, 2], [1, 4, 3, 2],
 [1, 4, 2, 3], [1, 2, 4, 3], [4, 1, 2, 3]]
>>> Permutation([Integer(1)]).shifted_shuffle([Integer(1)])
[[2, 1], [1, 2]]
>>> p = Permutation([Integer(3), Integer(1), Integer(5), Integer(4),␣
↪Integer(2)])
>>> len(p.shifted_shuffle(Permutation([Integer(2), Integer(1), Integer(4),␣
↪Integer(3)])))
126
```

The shifted shuffle product is associative. We can test this on an admittedly toy example:

```
sage: all( all( all( sorted(flatten([abs.shifted_shuffle(c)                 #␣
↪needs sage.graphs sage.modules
....:                                 for abs in a.shifted_shuffle(b)]))
....:                  == sorted(flatten([a.shifted_shuffle(bcs)
....:                                    for bcs in b.shifted_shuffle(c)]))
....:                  for c in Permutations(2) )
....:             for b in Permutations(2) )
....:        for a in Permutations(2) )
True
```

```
>>> from sage.all import *
>>> all( all( all( sorted(flatten([abs.shifted_shuffle(c)                 #␣
↪needs sage.graphs sage.modules
...                                 for abs in a.shifted_shuffle(b)]))
...                  == sorted(flatten([a.shifted_shuffle(bcs)
...                                    for bcs in b.shifted_shuffle(c)]))
...                  for c in Permutations(Integer(2)) )
...             for b in Permutations(Integer(2)) )
...        for a in Permutations(Integer(2)) )
True
```

The shifted_shuffle method on permutations gives the same permutations as the shifted_shuffle method on words (but is faster):

```
sage: all( all( sorted(p1.shifted_shuffle(p2))                              #␣
↪needs sage.combinat sage.graphs sage.modules sage.rings.finite_rings
....:             == sorted([Permutation(p) for p in
....:                         Word(p1).shifted_shuffle(Word(p2))])
....:             for p2 in Permutations(3) )
....:        for p1 in Permutations(2) )
True
```

```
>>> from sage.all import *
>>> all( all( sorted(p1.shifted_shuffle(p2))                              #␣
↪needs sage.combinat sage.graphs sage.modules sage.rings.finite_rings
...             == sorted([Permutation(p) for p in
...                         Word(p1).shifted_shuffle(Word(p2))])
...             for p2 in Permutations(Integer(3)) )
...        for p1 in Permutations(Integer(2)) )
True
```

show(*representation='cycles'*, *orientation='landscape'*, ***args*)

Display the permutation as a drawing.

INPUT:

- representation – different kinds of drawings are available
  - 'cycles' – default; the permutation is displayed as a collection of directed cycles
  - 'braid' – the permutation is displayed as segments linking each element $1, ..., n$ to its image on a parallel line

    When using this drawing, it is also possible to display the permutation horizontally (orientation = "landscape", default option) or vertically (orientation = "portrait").

- 'chord-diagram' – the permutation is displayed as a directed graph, all of its vertices being located on a circle

All additional arguments are forwarded to the show subcalls.

EXAMPLES:

```
sage: P20 = Permutations(20)
sage: P20.random_element().show(representation='cycles')                    #␣
↪needs sage.graphs sage.plot
sage: P20.random_element().show(representation='chord-diagram')             #␣
↪needs sage.graphs sage.plot
sage: P20.random_element().show(representation='braid')                     #␣
↪needs sage.plot
sage: P20.random_element().show(representation='braid',                     #␣
↪needs sage.plot
....:                              orientation='portrait')
```

```
>>> from sage.all import *
>>> P20 = Permutations(Integer(20))
>>> P20.random_element().show(representation='cycles')                      #␣
↪needs sage.graphs sage.plot
>>> P20.random_element().show(representation='chord-diagram')               #␣
↪needs sage.graphs sage.plot
>>> P20.random_element().show(representation='braid')                       #␣
↪needs sage.plot
>>> P20.random_element().show(representation='braid',                       #␣
↪needs sage.plot
...                              orientation='portrait')
```

sign()

Return the signature of the permutation self. This is $(-1)^l$, where l is the number of inversions of self.

> **Note**
>
> *sign()* can be used as an alias for *signature()*.

EXAMPLES:

```
sage: Permutation([4, 2, 3, 1, 5]).signature()
-1
sage: Permutation([1,3,2,5,4]).sign()
1
sage: Permutation([]).sign()
1
```

```
>>> from sage.all import *
>>> Permutation([Integer(4), Integer(2), Integer(3), Integer(1), Integer(5)]).
↪signature()
-1
>>> Permutation([Integer(1),Integer(3),Integer(2),Integer(5),Integer(4)]).
↪sign()
1
```

(continues on next page)

(continued from previous page)

```
>>> Permutation([]).sign()
1
```

signature()

Return the signature of the permutation `self`. This is $(-1)^l$, where l is the number of inversions of `self`.

Note

sign() can be used as an alias for *signature()*.

EXAMPLES:

```
sage: Permutation([4, 2, 3, 1, 5]).signature()
-1
sage: Permutation([1,3,2,5,4]).sign()
1
sage: Permutation([]).sign()
1
```

```
>>> from sage.all import *
>>> Permutation([Integer(4), Integer(2), Integer(3), Integer(1), Integer(5)]).
↪signature()
-1
>>> Permutation([Integer(1),Integer(3),Integer(2),Integer(5),Integer(4)]).
↪sign()
1
>>> Permutation([]).sign()
1
```

simion_schmidt(*avoid=[1, 2, 3]*)

Implement the Simion-Schmidt map which sends an arbitrary permutation to a pattern avoiding permutation, where the permutation pattern is one of four length-three patterns. This method also implements the bijection between (for example) `[1,2,3]`- and `[1,3,2]`-avoiding permutations.

INPUT:

- `avoid` – one of the patterns `[1,2,3]`, `[1,3,2]`, `[3,1,2]`, `[3,2,1]`

EXAMPLES:

```
sage: P = Permutations(6)
sage: p = P([4,5,1,6,3,2])
sage: pl = [ [1,2,3], [1,3,2], [3,1,2], [3,2,1] ]
sage: for q in pl:                                                          #␣
↪needs sage.combinat
....:     s = p.simion_schmidt(q)
....:     print("{} {}".format(s, s.has_pattern(q)))
[4, 6, 1, 5, 3, 2] False
[4, 2, 1, 3, 5, 6] False
[4, 5, 3, 6, 2, 1] False
[4, 5, 1, 6, 2, 3] False
```

```
>>> from sage.all import *
>>> P = Permutations(Integer(6))
>>> p = P([Integer(4),Integer(5),Integer(1),Integer(6),Integer(3),Integer(2)])
>>> pl = [ [Integer(1),Integer(2),Integer(3)], [Integer(1),Integer(3),
↪Integer(2)], [Integer(3),Integer(1),Integer(2)], [Integer(3),Integer(2),
↪Integer(1)] ]
>>> for q in pl:                                                          #␣
↪needs sage.combinat
...     s = p.simion_schmidt(q)
...     print("{} {}".format(s, s.has_pattern(q)))
[4, 6, 1, 5, 3, 2] False
[4, 2, 1, 3, 5, 6] False
[4, 5, 3, 6, 2, 1] False
[4, 5, 1, 6, 2, 3] False
```

size()

Return the size of `self`.

EXAMPLES:

```
sage: Permutation([3,4,1,2,5]).size()
5
```

```
>>> from sage.all import *
>>> Permutation([Integer(3),Integer(4),Integer(1),Integer(2),Integer(5)]).
↪size()
5
```

stack_sort()

Return the stack sort of a permutation.

This is another permutation obtained through the process of sorting using one stack. If the result is the identity permutation, the original permutation is *stack-sortable*.

See Wikipedia article Stack-sortable_permutation

EXAMPLES:

```
sage: p = Permutation([2,1,5,3,4,9,7,8,6])
sage: p.stack_sort()
[1, 2, 3, 4, 5, 7, 6, 8, 9]

sage: S5 = Permutations(5)
sage: len([1 for s in S5 if s.stack_sort() == S5.one()])
42
```

```
>>> from sage.all import *
>>> p = Permutation([Integer(2),Integer(1),Integer(5),Integer(3),Integer(4),
↪Integer(9),Integer(7),Integer(8),Integer(6)])
>>> p.stack_sort()
[1, 2, 3, 4, 5, 7, 6, 8, 9]

>>> S5 = Permutations(Integer(5))
```

(continues on next page)

(continued from previous page)

```
>>> len([Integer(1) for s in S5 if s.stack_sort() == S5.one()])
42
```

sylvester_class(*left_to_right=False*)

Iterate over the equivalence class of the permutation `self` under sylvester congruence.

Sylvester congruence is an equivalence relation on the set S_n of all permutations of n. It is defined as the smallest equivalence relation such that every permutation of the form $uacvbw$ with u, v and w being words and a, b and c being letters satisfying $a \leq b < c$ is equivalent to the permutation $ucavbw$. (Here, permutations are regarded as words by way of one-line notation.) This definition comes from [HNT2005], Definition 8, where it is more generally applied to arbitrary words.

The equivalence class of a permutation $p \in S_n$ under sylvester congruence is called the *sylvester class* of p. It is an interval in the right permutohedron order (see `permutohedron_lequal()`) on S_n.

This is related to the `sylvester_class()` method in that the equivalence class of a permutation π under sylvester congruence is the sylvester class of the right-to-left binary search tree of π. However, the present method yields permutations, while the method on labelled binary trees yields plain lists.

If the variable `left_to_right` is set to `True`, the method instead iterates over the equivalence class of `self` with respect to the *left* sylvester congruence. The left sylvester congruence is easiest to define by saying that two permutations are equivalent under it if and only if their reverses (`reverse()`) are equivalent under (standard) sylvester congruence.

EXAMPLES:

The sylvester class of a permutation in S_5:

```
sage: p = Permutation([3, 5, 1, 2, 4])
sage: sorted(p.sylvester_class())                                       #␣
↪needs sage.combinat sage.graphs
[[1, 3, 2, 5, 4],
 [1, 3, 5, 2, 4],
 [1, 5, 3, 2, 4],
 [3, 1, 2, 5, 4],
 [3, 1, 5, 2, 4],
 [3, 5, 1, 2, 4],
 [5, 1, 3, 2, 4],
 [5, 3, 1, 2, 4]]
```

```
>>> from sage.all import *
>>> p = Permutation([Integer(3), Integer(5), Integer(1), Integer(2),␣
↪Integer(4)])
>>> sorted(p.sylvester_class())                                       #␣
↪needs sage.combinat sage.graphs
[[1, 3, 2, 5, 4],
 [1, 3, 5, 2, 4],
 [1, 5, 3, 2, 4],
 [3, 1, 2, 5, 4],
 [3, 1, 5, 2, 4],
 [3, 5, 1, 2, 4],
 [5, 1, 3, 2, 4],
 [5, 3, 1, 2, 4]]
```

The sylvester class of a permutation p contains p:

```
sage: all(p in p.sylvester_class() for p in Permutations(4))                #␣
↪needs sage.combinat sage.graphs
True
```

```
>>> from sage.all import *
>>> all(p in p.sylvester_class() for p in Permutations(Integer(4)))         ␣
↪     # needs sage.combinat sage.graphs
True
```

Small cases:

```
sage: list(Permutation([]).sylvester_class())                               #␣
↪needs sage.combinat sage.graphs
[[]]

sage: list(Permutation([1]).sylvester_class())                              #␣
↪needs sage.combinat sage.graphs
[[1]]
```

```
>>> from sage.all import *
>>> list(Permutation([]).sylvester_class())                               #␣
↪needs sage.combinat sage.graphs
[[]]

>>> list(Permutation([Integer(1)]).sylvester_class())                       ␣
↪     # needs sage.combinat sage.graphs
[[1]]
```

The sylvester classes in S_3:

```
sage: [sorted(p.sylvester_class()) for p in Permutations(3)]                #␣
↪needs sage.combinat sage.graphs
[[[1, 2, 3]],
 [[1, 3, 2], [3, 1, 2]],
 [[2, 1, 3]],
 [[2, 3, 1]],
 [[1, 3, 2], [3, 1, 2]],
 [[3, 2, 1]]]
```

```
>>> from sage.all import *
>>> [sorted(p.sylvester_class()) for p in Permutations(Integer(3))]         ␣
↪     # needs sage.combinat sage.graphs
[[[1, 2, 3]],
 [[1, 3, 2], [3, 1, 2]],
 [[2, 1, 3]],
 [[2, 3, 1]],
 [[1, 3, 2], [3, 1, 2]],
 [[3, 2, 1]]]
```

The left sylvester classes in S_3:

```
sage: [sorted(p.sylvester_class(left_to_right=True))                        #␣
↪needs sage.combinat sage.graphs
```

(continues on next page)

(continued from previous page)

```
....:  for p in Permutations(3)]
[[[1, 2, 3]],
 [[1, 3, 2]],
 [[2, 1, 3], [2, 3, 1]],
 [[2, 1, 3], [2, 3, 1]],
 [[3, 1, 2]],
 [[3, 2, 1]]]
```

```
>>> from sage.all import *
>>> [sorted(p.sylvester_class(left_to_right=True))                         #␣
↪needs sage.combinat sage.graphs
...  for p in Permutations(Integer(3))]
[[[1, 2, 3]],
 [[1, 3, 2]],
 [[2, 1, 3], [2, 3, 1]],
 [[2, 1, 3], [2, 3, 1]],
 [[3, 1, 2]],
 [[3, 2, 1]]]
```

A left sylvester class in S_5:

```
sage: p = Permutation([4, 2, 1, 5, 3])
sage: sorted(p.sylvester_class(left_to_right=True))                         #␣
↪needs sage.combinat sage.graphs
[[4, 2, 1, 3, 5],
 [4, 2, 1, 5, 3],
 [4, 2, 3, 1, 5],
 [4, 2, 3, 5, 1],
 [4, 2, 5, 1, 3],
 [4, 2, 5, 3, 1],
 [4, 5, 2, 1, 3],
 [4, 5, 2, 3, 1]]
```

```
>>> from sage.all import *
>>> p = Permutation([Integer(4), Integer(2), Integer(1), Integer(5),␣
↪Integer(3)])
>>> sorted(p.sylvester_class(left_to_right=True))                          #␣
↪needs sage.combinat sage.graphs
[[4, 2, 1, 3, 5],
 [4, 2, 1, 5, 3],
 [4, 2, 3, 1, 5],
 [4, 2, 3, 5, 1],
 [4, 2, 5, 1, 3],
 [4, 2, 5, 3, 1],
 [4, 5, 2, 1, 3],
 [4, 5, 2, 3, 1]]
```

to_alternating_sign_matrix()

Return a matrix representing the permutation in the *AlternatingSignMatrix* class.

EXAMPLES:

```
sage: m = Permutation([1,2,3]).to_alternating_sign_matrix(); m                  #␣
↪needs sage.combinat sage.modules
[1 0 0]
[0 1 0]
[0 0 1]
sage: parent(m)                                                                  #␣
↪needs sage.combinat sage.modules
Alternating sign matrices of size 3
```

```
>>> from sage.all import *
>>> m = Permutation([Integer(1),Integer(2),Integer(3)]).to_alternating_sign_
↪matrix(); m              # needs sage.combinat sage.modules
[1 0 0]
[0 1 0]
[0 0 1]
>>> parent(m)                                                                   #␣
↪needs sage.combinat sage.modules
Alternating sign matrices of size 3
```

to_cycles(*singletons=True*, *use_min=True*)

Return the permutation `self` as a list of disjoint cycles.

The cycles are returned in the order of increasing smallest elements, and each cycle is returned as a tuple which starts with its smallest element.

If `singletons=False` is given, the list does not contain the singleton cycles.

If `use_min=False` is given, the cycles are returned in the order of increasing *largest* (not smallest) elements, and each cycle starts with its largest element.

EXAMPLES:

```
sage: Permutation([2,1,3,4]).to_cycles()
[(1, 2), (3,), (4,)]
sage: Permutation([2,1,3,4]).to_cycles(singletons=False)
[(1, 2)]
sage: Permutation([2,1,3,4]).to_cycles(use_min=True)
[(1, 2), (3,), (4,)]
sage: Permutation([2,1,3,4]).to_cycles(use_min=False)
[(4,), (3,), (2, 1)]
sage: Permutation([2,1,3,4]).to_cycles(singletons=False, use_min=False)
[(2, 1)]

sage: Permutation([4,1,5,2,6,3]).to_cycles()
[(1, 4, 2), (3, 5, 6)]
sage: Permutation([4,1,5,2,6,3]).to_cycles(use_min=False)
[(6, 3, 5), (4, 2, 1)]

sage: Permutation([6, 4, 5, 2, 3, 1]).to_cycles()
[(1, 6), (2, 4), (3, 5)]
sage: Permutation([6, 4, 5, 2, 3, 1]).to_cycles(use_min=False)
[(6, 1), (5, 3), (4, 2)]
```

```
>>> from sage.all import *
>>> Permutation([Integer(2),Integer(1),Integer(3),Integer(4)]).to_cycles()
[(1, 2), (3,), (4,)]
>>> Permutation([Integer(2),Integer(1),Integer(3),Integer(4)]).to_
↪cycles(singletons=False)
[(1, 2)]
>>> Permutation([Integer(2),Integer(1),Integer(3),Integer(4)]).to_cycles(use_
↪min=True)
[(1, 2), (3,), (4,)]
>>> Permutation([Integer(2),Integer(1),Integer(3),Integer(4)]).to_cycles(use_
↪min=False)
[(4,), (3,), (2, 1)]
>>> Permutation([Integer(2),Integer(1),Integer(3),Integer(4)]).to_
↪cycles(singletons=False, use_min=False)
[(2, 1)]

>>> Permutation([Integer(4),Integer(1),Integer(5),Integer(2),Integer(6),
↪Integer(3)]).to_cycles()
[(1, 4, 2), (3, 5, 6)]
>>> Permutation([Integer(4),Integer(1),Integer(5),Integer(2),Integer(6),
↪Integer(3)]).to_cycles(use_min=False)
[(6, 3, 5), (4, 2, 1)]

>>> Permutation([Integer(6), Integer(4), Integer(5), Integer(2), Integer(3),␣
↪Integer(1)]).to_cycles()
[(1, 6), (2, 4), (3, 5)]
>>> Permutation([Integer(6), Integer(4), Integer(5), Integer(2), Integer(3),␣
↪Integer(1)]).to_cycles(use_min=False)
[(6, 1), (5, 3), (4, 2)]
```

The algorithm is of complexity $O(n)$ where n is the size of the given permutation.

to_digraph()

Return a digraph representation of `self`.

EXAMPLES:

```
sage: d = Permutation([3, 1, 2]).to_digraph()                              #␣
↪needs sage.graphs
sage: d.edges(sort=True, labels=False)                                     #␣
↪needs sage.graphs
[(1, 3), (2, 1), (3, 2)]
sage: P = Permutations(range(1, 10))
sage: d = Permutation(P.random_element()).to_digraph()                     #␣
↪needs sage.graphs
sage: all(c.is_cycle()                                                     #␣
↪needs sage.graphs
....:     for c in d.strongly_connected_components_subgraphs())
True
```

```
>>> from sage.all import *
>>> d = Permutation([Integer(3), Integer(1), Integer(2)]).to_digraph()      ␣
↪                        # needs sage.graphs
```

(continues on next page)

(continued from previous page)

```
>>> d.edges(sort=True, labels=False)                                        #␣
↪needs sage.graphs
[(1, 3), (2, 1), (3, 2)]
>>> P = Permutations(range(Integer(1), Integer(10)))
>>> d = Permutation(P.random_element()).to_digraph()                        #␣
↪needs sage.graphs
>>> all(c.is_cycle()                                                        #␣
↪needs sage.graphs
...     for c in d.strongly_connected_components_subgraphs())
True
```

to_inversion_vector()

Return the inversion vector of `self`.

The inversion vector of a permutation $p \in S_n$ is defined as the vector $(v_1, v_2, \ldots, v_n)$, where v_i is the number of elements larger than i that appear to the left of i in the permutation p.

The algorithm is of complexity $O(n \log(n))$ where n is the size of the given permutation.

EXAMPLES:

```
sage: Permutation([5,9,1,8,2,6,4,7,3]).to_inversion_vector()
[2, 3, 6, 4, 0, 2, 2, 1, 0]
sage: Permutation([8,7,2,1,9,4,6,5,10,3]).to_inversion_vector()
[3, 2, 7, 3, 4, 3, 1, 0, 0, 0]
sage: Permutation([3,2,4,1,5]).to_inversion_vector()
[3, 1, 0, 0, 0]
```

```
>>> from sage.all import *
>>> Permutation([Integer(5),Integer(9),Integer(1),Integer(8),Integer(2),
↪Integer(6),Integer(4),Integer(7),Integer(3)]).to_inversion_vector()
[2, 3, 6, 4, 0, 2, 2, 1, 0]
>>> Permutation([Integer(8),Integer(7),Integer(2),Integer(1),Integer(9),
↪Integer(4),Integer(6),Integer(5),Integer(10),Integer(3)]).to_inversion_
↪vector()
[3, 2, 7, 3, 4, 3, 1, 0, 0, 0]
>>> Permutation([Integer(3),Integer(2),Integer(4),Integer(1),Integer(5)]).to_
↪inversion_vector()
[3, 1, 0, 0, 0]
```

to_lehmer_cocode()

Return the Lehmer cocode of the permutation `self`.

The Lehmer cocode of a permutation p is defined as the list $(c_1, c_2, \ldots, c_n)$, where c_i is the number of $j < i$ such that $p(j) > p(i)$.

EXAMPLES:

```
sage: p = Permutation([2,1,3])
sage: p.to_lehmer_cocode()
[0, 1, 0]
sage: q = Permutation([3,1,2])
sage: q.to_lehmer_cocode()
[0, 1, 1]
```

```
>>> from sage.all import *
>>> p = Permutation([Integer(2),Integer(1),Integer(3)])
>>> p.to_lehmer_cocode()
[0, 1, 0]
>>> q = Permutation([Integer(3),Integer(1),Integer(2)])
>>> q.to_lehmer_cocode()
[0, 1, 1]
```

to_lehmer_code()

Return the Lehmer code of the permutation `self`.

The Lehmer code of a permutation p is defined as the list $[c[1], c[2], ..., c[n]]$, where $c[i]$ is the number of $j > i$ such that $p(j) < p(i)$.

EXAMPLES:

```
sage: p = Permutation([2,1,3])
sage: p.to_lehmer_code()
[1, 0, 0]
sage: q = Permutation([3,1,2])
sage: q.to_lehmer_code()
[2, 0, 0]

sage: Permutation([1]).to_lehmer_code()
[0]
sage: Permutation([]).to_lehmer_code()
[]
```

```
>>> from sage.all import *
>>> p = Permutation([Integer(2),Integer(1),Integer(3)])
>>> p.to_lehmer_code()
[1, 0, 0]
>>> q = Permutation([Integer(3),Integer(1),Integer(2)])
>>> q.to_lehmer_code()
[2, 0, 0]

>>> Permutation([Integer(1)]).to_lehmer_code()
[0]
>>> Permutation([]).to_lehmer_code()
[]
```

to_major_code(*final_descent=False*)

Return the major code of the permutation `self`.

The major code of a permutation p is defined as the sequence $(m_1 - m_2, m_2 - m_3, \ldots, m_n)$, where m_i is the major index of the permutation obtained by erasing all letters smaller than i from p.

With the `final_descent` option, the last position of a non-empty permutation is also considered as a descent. This has an effect on the computation of major indices.

[5, 0, 1, 0, 1, 2, 0, 1, 0]
>>> Permutation([Integer(2),Integer(8),Integer(4),Integer(3),Integer(6),
↪Integer(7),Integer(9),Integer(5),Integer(1)]).to_major_code()
[8, 3, 3, 1, 4, 0, 1, 0, 0]
```

to_matrix()

Return a matrix representing the permutation.

EXAMPLES:

```
sage: Permutation([1,2,3]).to_matrix()                                   #␣
↪needs sage.modules
[1 0 0]
[0 1 0]
[0 0 1]
```

```
>>> from sage.all import *
>>> Permutation([Integer(1),Integer(2),Integer(3)]).to_matrix()            ␣
↪                         # needs sage.modules
[1 0 0]
[0 1 0]
[0 0 1]
```

Alternatively:

```
sage: matrix(Permutation([1,3,2]))                                        #␣
↪needs sage.modules
[1 0 0]
[0 0 1]
[0 1 0]
```

```
>>> from sage.all import *
>>> matrix(Permutation([Integer(1),Integer(3),Integer(2)]))               ␣
↪                         # needs sage.modules
[1 0 0]
[0 0 1]
[0 1 0]
```

Notice that matrix multiplication corresponds to permutation multiplication only when the permutation option mult='r2l'

```
sage: Permutations.options.mult='r2l'
sage: p = Permutation([2,1,3])
```

(continues on next page)

(continued from previous page)

```
sage: q = Permutation([3,1,2])
sage: (p*q).to_matrix()                                                    #␣
↪needs sage.modules
[0 0 1]
[0 1 0]
[1 0 0]
sage: p.to_matrix()*q.to_matrix()                                          #␣
↪needs sage.modules
[0 0 1]
[0 1 0]
[1 0 0]
sage: Permutations.options.mult='l2r'
sage: (p*q).to_matrix()                                                    #␣

[1 0 0]
[0 0 1]
[0 1 0]
```

```
>>> from sage.all import *
>>> Permutations.options.mult='r2l'
>>> p = Permutation([Integer(2),Integer(1),Integer(3)])
>>> q = Permutation([Integer(3),Integer(1),Integer(2)])
>>> (p*q).to_matrix()                                                    #␣
↪needs sage.modules
[0 0 1]
[0 1 0]
[1 0 0]
>>> p.to_matrix()*q.to_matrix()                                          #␣
↪needs sage.modules
[0 0 1]
[0 1 0]
[1 0 0]
>>> Permutations.options.mult='l2r'
>>> (p*q).to_matrix()                                                    #␣
↪needs sage.modules
[1 0 0]
[0 0 1]
[0 1 0]
```

to_permutation_group_element()

Return a PermutationGroupElement equal to `self`.

EXAMPLES:

```
sage: Permutation([2,1,4,3]).to_permutation_group_element()                #␣
↪needs sage.groups
(1,2)(3,4)
sage: Permutation([1,2,3]).to_permutation_group_element()                  #␣
↪needs sage.groups
()
```

```
>>> from sage.all import *
```

(continues on next page)

(continued from previous page)

```
>>> Permutation([Integer(2),Integer(1),Integer(4),Integer(3)]).to_permutation_
↪group_element()                    # needs sage.groups
(1,2)(3,4)
>>> Permutation([Integer(1),Integer(2),Integer(3)]).to_permutation_group_
↪element()                    # needs sage.groups
()
```

to_tableau_by_shape(*shape*)

Return a tableau of shape `shape` with the entries in `self`.

The tableau is such that the reading word (i. e., the word obtained by reading the tableau row by row, starting from the top row in English notation, with each row being read from left to right) is `self`.

EXAMPLES:

```
sage: T = Permutation([3,4,1,2,5]).to_tableau_by_shape([3,2]); T              #␣
↪needs sage.combinat
[[1, 2, 5], [3, 4]]
sage: T.reading_word_permutation()                                           #␣
↪needs sage.combinat
[3, 4, 1, 2, 5]
```

```
>>> from sage.all import *
>>> T = Permutation([Integer(3),Integer(4),Integer(1),Integer(2),Integer(5)]).
↪to_tableau_by_shape([Integer(3),Integer(2)]); T              # needs sage.
↪combinat
[[1, 2, 5], [3, 4]]
>>> T.reading_word_permutation()                                            #␣
↪needs sage.combinat
[3, 4, 1, 2, 5]
```

weak_excedences()

Return all the numbers `self[i]` such that `self[i] >= i+1`.

EXAMPLES:

```
sage: Permutation([1,4,3,2,5]).weak_excedences()
[1, 4, 3, 5]
```

```
>>> from sage.all import *
>>> Permutation([Integer(1),Integer(4),Integer(3),Integer(2),Integer(5)]).
↪weak_excedences()
[1, 4, 3, 5]
```

class sage.combinat.permutation.**Permutations**

Bases: `UniqueRepresentation`, `Parent`

Permutations.

`Permutations(n)` returns the class of permutations of `n`, if `n` is an integer, list, set, or string.

`Permutations(n, k)` returns the class of length-`k` partial permutations of `n` (where `n` is any of the above things); `k` must be a nonnegative integer. A length-k partial permutation of n is defined as a k-tuple of pairwise distinct elements of $\{1, 2, \ldots, n\}$.

Valid keyword arguments are: 'descents', 'bruhat_smaller', 'bruhat_greater', 'recoils_finer', 'recoils_fatter', 'recoils', and 'avoiding'. With the exception of 'avoiding', you cannot specify `n` or `k` along with a keyword.

`Permutations(descents=(list,n))` returns the class of permutations of n with descents in the positions specified by `list`. This uses the slightly nonstandard convention that the images of $1, 2, ..., n$ under the permutation are regarded as positions $0, 1, ..., n-1$, so for example the presence of 1 in `list` signifies that the permutations π should satisfy $\pi(2) > \pi(3)$. Note that `list` is supposed to be a list of positions of the descents, not the descents composition. It does *not* return the class of permutations with descents composition `list`.

`Permutations(bruhat_smaller=p)` and `Permutations(bruhat_greater=p)` return the class of permutations smaller-or-equal or greater-or-equal, respectively, than the given permutation `p` in the Bruhat order. (The Bruhat order is defined in `bruhat_lequal()`. It is also referred to as the *strong* Bruhat order.)

`Permutations(recoils=p)` returns the class of permutations whose recoils composition is `p`. Unlike the `descents=(list, n)` syntax, this actually takes a *composition* as input.

`Permutations(recoils_fatter=p)` and `Permutations(recoils_finer=p)` return the class of permutations whose recoils composition is fatter or finer, respectively, than the given composition `p`.

`Permutations(n, avoiding=P)` returns the class of permutations of `n` avoiding `P`. Here `P` may be a single permutation or a list of permutations; the returned class will avoid all patterns in `P`.

EXAMPLES:

```
sage: p = Permutations(3); p
Standard permutations of 3
sage: p.list()
[[1, 2, 3], [1, 3, 2], [2, 1, 3], [2, 3, 1], [3, 1, 2], [3, 2, 1]]
```

```
>>> from sage.all import *
>>> p = Permutations(Integer(3)); p
Standard permutations of 3
>>> p.list()
[[1, 2, 3], [1, 3, 2], [2, 1, 3], [2, 3, 1], [3, 1, 2], [3, 2, 1]]
```

```
sage: p = Permutations(3, 2); p
Permutations of {1,...,3} of length 2
sage: p.list()
[[1, 2], [1, 3], [2, 1], [2, 3], [3, 1], [3, 2]]
```

```
>>> from sage.all import *
>>> p = Permutations(Integer(3), Integer(2)); p
Permutations of {1,...,3} of length 2
>>> p.list()
[[1, 2], [1, 3], [2, 1], [2, 3], [3, 1], [3, 2]]
```

```
sage: p = Permutations(['c', 'a', 't']); p
Permutations of the set ['c', 'a', 't']
sage: p.list()
[['c', 'a', 't'],
 ['c', 't', 'a'],
 ['a', 'c', 't'],
 ['a', 't', 'c'],
 ['t', 'c', 'a'],
 ['t', 'a', 'c']]
```

```
>>> from sage.all import *
>>> p = Permutations(['c', 'a', 't']); p
Permutations of the set ['c', 'a', 't']
>>> p.list()
[['c', 'a', 't'],
 ['c', 't', 'a'],
 ['a', 'c', 't'],
 ['a', 't', 'c'],
 ['t', 'c', 'a'],
 ['t', 'a', 'c']]
```

```
sage: p = Permutations(['c', 'a', 't'], 2); p
Permutations of the set ['c', 'a', 't'] of length 2
sage: p.list()
[['c', 'a'], ['c', 't'], ['a', 'c'], ['a', 't'], ['t', 'c'], ['t', 'a']]
```

```
>>> from sage.all import *
>>> p = Permutations(['c', 'a', 't'], Integer(2)); p
Permutations of the set ['c', 'a', 't'] of length 2
>>> p.list()
[['c', 'a'], ['c', 't'], ['a', 'c'], ['a', 't'], ['t', 'c'], ['t', 'a']]
```

```
sage: p = Permutations([1,1,2]); p
Permutations of the multi-set [1, 1, 2]
sage: p.list()
[[1, 1, 2], [1, 2, 1], [2, 1, 1]]
```

```
>>> from sage.all import *
>>> p = Permutations([Integer(1),Integer(1),Integer(2)]); p
Permutations of the multi-set [1, 1, 2]
>>> p.list()
[[1, 1, 2], [1, 2, 1], [2, 1, 1]]
```

```
sage: p = Permutations([1,1,2], 2); p
Permutations of the multi-set [1, 1, 2] of length 2
sage: p.list()                                                      #␣

Element

alias of `Permutation`

options = Current options for Permutations - display: list - generator_name: s - latex: list - latex_empty_str: 1 - mult: l2r

class sage.combinat.permutation.**PermutationsNK**(*s*, *k*)

Bases: `Permutations_setk`

This exists solely for unpickling `PermutationsNK` objects created with Sage <= 6.3.

class sage.combinat.permutation.**Permutations_mset**(*mset*)

Bases: `Permutations`

Permutations of a multiset M.

A permutation of a multiset M is represented by a list that contains exactly the same elements as M (with the same multiplicities), but possibly in different order. If M is a proper set there are $|M|!$ such permutations. Otherwise, if the first element appears k_1 times, the second element appears k_2 times and so on, the number of permutations is $|M|!/(k_1!k_2!\ldots)$, which is sometimes called a multinomial coefficient.

EXAMPLES:

```
sage: mset = [1,1,2,2,2]
sage: from sage.combinat.permutation import Permutations_mset
```

(continues on next page)

(continued from previous page)

```
sage: P = Permutations_mset(mset); P
Permutations of the multi-set [1, 1, 2, 2, 2]
sage: sorted(P)
[[1, 1, 2, 2, 2],
 [1, 2, 1, 2, 2],
 [1, 2, 2, 1, 2],
 [1, 2, 2, 2, 1],
 [2, 1, 1, 2, 2],
 [2, 1, 2, 1, 2],
 [2, 1, 2, 2, 1],
 [2, 2, 1, 1, 2],
 [2, 2, 1, 2, 1],
 [2, 2, 2, 1, 1]]

sage: # needs sage.modules
sage: MS = MatrixSpace(GF(2), 2, 2)
sage: A = MS([1,0,1,1])
sage: rows = A.rows()
sage: rows[0].set_immutable()
sage: rows[1].set_immutable()
sage: P = Permutations_mset(rows); P
Permutations of the multi-set [(1, 0), (1, 1)]
sage: sorted(P)
[[(1, 0), (1, 1)], [(1, 1), (1, 0)]]
```

```
>>> from sage.all import *
>>> mset = [Integer(1),Integer(1),Integer(2),Integer(2),Integer(2)]
>>> from sage.combinat.permutation import Permutations_mset
>>> P = Permutations_mset(mset); P
Permutations of the multi-set [1, 1, 2, 2, 2]
>>> sorted(P)
[[1, 1, 2, 2, 2],
 [1, 2, 1, 2, 2],
 [1, 2, 2, 1, 2],
 [1, 2, 2, 2, 1],
 [2, 1, 1, 2, 2],
 [2, 1, 2, 1, 2],
 [2, 1, 2, 2, 1],
 [2, 2, 1, 1, 2],
 [2, 2, 1, 2, 1],
 [2, 2, 2, 1, 1]]

>>> # needs sage.modules
>>> MS = MatrixSpace(GF(Integer(2)), Integer(2), Integer(2))
>>> A = MS([Integer(1),Integer(0),Integer(1),Integer(1)])
>>> rows = A.rows()
>>> rows[Integer(0)].set_immutable()
>>> rows[Integer(1)].set_immutable()
>>> P = Permutations_mset(rows); P
Permutations of the multi-set [(1, 0), (1, 1)]
>>> sorted(P)
[[(1, 0), (1, 1)], [(1, 1), (1, 0)]]
```

class Element

Bases: `ClonableArray`

A permutation of an arbitrary multiset.

check()

Verify that `self` is a valid permutation of the underlying multiset.

EXAMPLES:

```
sage: S = Permutations(['c','a','c'])
sage: elt = S(['c','c','a'])
sage: elt.check()
```

```
>>> from sage.all import *
>>> S = Permutations(['c','a','c'])
>>> elt = S(['c','c','a'])
>>> elt.check()
```

cardinality()

Return the cardinality of the set.

EXAMPLES:

```
sage: Permutations([1,2,2]).cardinality()
3
sage: Permutations([1,1,2,2,2]).cardinality()
10
```

```
>>> from sage.all import *
>>> Permutations([Integer(1),Integer(2),Integer(2)]).cardinality()
3
>>> Permutations([Integer(1),Integer(1),Integer(2),Integer(2),Integer(2)]).
↪cardinality()
10
```

rank(p)

Return the rank of `p` in lexicographic order.

INPUT:

- `p` – a permutation of M

ALGORITHM:

The algorithm uses the recurrence from the solution to exercise 4 in [Knu2011], Section 7.2.1.2:

$$\mathrm{rank}(p_1 \dots p_n) = \mathrm{rank}(p_2 \dots p_n) + \frac{1}{n}\binom{n}{n_1, \dots, n_t} \sum_{j=1}^{t} n_j \left[x_j < p_1\right],$$

where x_j, n_j are the distinct elements of p with their multiplicities, n is the sum of $n_1, \dots, n_t$, $\binom{n}{n_1,\dots,n_t}$ is the multinomial coefficient $\frac{n!}{n_1!\dots n_t!}$, and $\sum_{j=1}^{t} n_j \left[x_j < p_1\right]$ means "the number of elements to the right of the first element that are less than the first element".

EXAMPLES:

```
sage: mset = [1, 1, 2, 3, 4, 5, 5, 6, 9]
sage: p = Permutations(mset)
sage: p.rank(list(sorted(mset)))
0
sage: p.rank(list(reversed(sorted(mset)))) == p.cardinality() - 1
True
sage: p.rank([3, 1, 4, 1, 5, 9, 2, 6, 5])
30991
```

```
>>> from sage.all import *
>>> mset = [Integer(1), Integer(1), Integer(2), Integer(3), Integer(4),␣
↪Integer(5), Integer(5), Integer(6), Integer(9)]
>>> p = Permutations(mset)
>>> p.rank(list(sorted(mset)))
0
>>> p.rank(list(reversed(sorted(mset)))) == p.cardinality() - Integer(1)
True
>>> p.rank([Integer(3), Integer(1), Integer(4), Integer(1), Integer(5),␣
↪Integer(9), Integer(2), Integer(6), Integer(5)])
30991
```

unrank(*r*)

Return the permutation of M having lexicographic rank `r`.

INPUT:

- `r` – integer between `0` and `self.cardinality()-1` inclusive

ALGORITHM:

The algorithm is adapted from the solution to exercise 4 in [Knu2011], Section 7.2.1.2.

EXAMPLES:

```
sage: mset = [1, 1, 2, 3, 4, 5, 5, 6, 9]
sage: p = Permutations(mset)
sage: p.unrank(30991)
[3, 1, 4, 1, 5, 9, 2, 6, 5]
sage: p.rank(p.unrank(10))
10
sage: p.unrank(0) == list(sorted(mset))
True
sage: p.unrank(p.cardinality()-1) == list(reversed(sorted(mset)))
True
```

```
>>> from sage.all import *
>>> mset = [Integer(1), Integer(1), Integer(2), Integer(3), Integer(4),␣
↪Integer(5), Integer(5), Integer(6), Integer(9)]
>>> p = Permutations(mset)
>>> p.unrank(Integer(30991))
[3, 1, 4, 1, 5, 9, 2, 6, 5]
>>> p.rank(p.unrank(Integer(10)))
10
>>> p.unrank(Integer(0)) == list(sorted(mset))
True
```

(continues on next page)

(continued from previous page)

```
>>> p.unrank(p.cardinality()-Integer(1)) == list(reversed(sorted(mset)))
True
```

class sage.combinat.permutation.**Permutations_msetk**(*mset*, *k*)

Bases: *Permutations_mset*

Length-k partial permutations of a multiset.

A length-k partial permutation of a multiset M is represented by a list of length k whose entries are elements of M, appearing in the list with a multiplicity not higher than their respective multiplicity in M.

cardinality()

Return the cardinality of the set.

EXAMPLES:

```
sage: Permutations([1,2,2], 2).cardinality()                              #␣
↪needs sage.libs.gap
3
```

```
>>> from sage.all import *
>>> Permutations([Integer(1),Integer(2),Integer(2)], Integer(2)).
↪cardinality()                                  # needs sage.libs.gap
3
```

class sage.combinat.permutation.**Permutations_nk**(*n*, *k*)

Bases: *Permutations*

Length-k partial permutations of $\{1, 2, \ldots, n\}$.

class Element

Bases: ClonableArray

A length-k partial permutation of $[n]$.

check()

Verify that self is a valid length-k partial permutation of $[n]$.

EXAMPLES:

```
sage: S = Permutations(4, 2)
sage: elt = S([3, 1])
sage: elt.check()
```

```
>>> from sage.all import *
>>> S = Permutations(Integer(4), Integer(2))
>>> elt = S([Integer(3), Integer(1)])
>>> elt.check()
```

cardinality()

EXAMPLES:

```
sage: Permutations(3,0).cardinality()
1
sage: Permutations(3,1).cardinality()
```

(continues on next page)

(continued from previous page)

```
3
sage: Permutations(3,2).cardinality()
6
sage: Permutations(3,3).cardinality()
6
sage: Permutations(3,4).cardinality()
0
```

```
>>> from sage.all import *
>>> Permutations(Integer(3),Integer(0)).cardinality()
1
>>> Permutations(Integer(3),Integer(1)).cardinality()
3
>>> Permutations(Integer(3),Integer(2)).cardinality()
6
>>> Permutations(Integer(3),Integer(3)).cardinality()
6
>>> Permutations(Integer(3),Integer(4)).cardinality()
0
```

random_element()

EXAMPLES:

```
sage: s = Permutations(3,2).random_element()
sage: s in Permutations(3,2)
True
```

```
>>> from sage.all import *
>>> s = Permutations(Integer(3),Integer(2)).random_element()
>>> s in Permutations(Integer(3),Integer(2))
True
```

class sage.combinat.permutation.**Permutations_set**(*s*)

Bases: *Permutations*

Permutations of an arbitrary given finite set.

Here, a "permutation of a finite set S" means a list of the elements of S in which every element of S occurs exactly once. This is not to be confused with bijections from S to S, which are also often called permutations in literature.

class Element

Bases: ClonableArray

A permutation of an arbitrary set.

check()

Verify that `self` is a valid permutation of the underlying set.

EXAMPLES:

```
sage: S = Permutations(['c','a','t'])
sage: elt = S(['t','c','a'])
sage: elt.check()
```

```
>>> from sage.all import *
>>> S = Permutations(['c','a','t'])
>>> elt = S(['t','c','a'])
>>> elt.check()
```

cardinality()

Return the cardinality of the set.

EXAMPLES:

```
sage: Permutations([1,2,3]).cardinality()
6
```

```
>>> from sage.all import *
>>> Permutations([Integer(1),Integer(2),Integer(3)]).cardinality()
6
```

random_element()

EXAMPLES:

```
sage: s = Permutations([1,2,3]).random_element()
sage: s.parent() is Permutations([1,2,3])
True
```

```
>>> from sage.all import *
>>> s = Permutations([Integer(1),Integer(2),Integer(3)]).random_element()
>>> s.parent() is Permutations([Integer(1),Integer(2),Integer(3)])
True
```

class sage.combinat.permutation.**Permutations_setk**(*s*, *k*)

Bases: *Permutations_set*

Length-k partial permutations of an arbitrary given finite set.

Here, a "length-k partial permutation of a finite set S" means a list of length k whose entries are pairwise distinct and all belong to S.

random_element()

EXAMPLES:

```
sage: s = Permutations([1,2,4], 2).random_element()
sage: s in Permutations([1,2,4], 2)
True
```

```
>>> from sage.all import *
>>> s = Permutations([Integer(1),Integer(2),Integer(4)], Integer(2)).random_
↪element()
>>> s in Permutations([Integer(1),Integer(2),Integer(4)], Integer(2))
True
```

class sage.combinat.permutation.**StandardPermutations_all**

Bases: *Permutations*

All standard permutations.

graded_component(*n*)

Return the graded component.

EXAMPLES:

```
sage: P = Permutations()
sage: P.graded_component(4) == Permutations(4)
True
```

```
>>> from sage.all import *
>>> P = Permutations()
>>> P.graded_component(Integer(4)) == Permutations(Integer(4))
True
```

class sage.combinat.permutation.**StandardPermutations_all_avoiding**(*a*)

Bases: *StandardPermutations_all*

All standard permutations avoiding a set of patterns.

patterns()

Return the patterns avoided by this class of permutations.

EXAMPLES:

```
sage: P = Permutations(avoiding=[[2,1,3],[1,2,3]])
sage: P.patterns()
([2, 1, 3], [1, 2, 3])
```

```
>>> from sage.all import *
>>> P = Permutations(avoiding=[[Integer(2),Integer(1),Integer(3)],[Integer(1),
↪Integer(2),Integer(3)]])
>>> P.patterns()
([2, 1, 3], [1, 2, 3])
```

class sage.combinat.permutation.**StandardPermutations_avoiding_12**(*n*)

Bases: *StandardPermutations_avoiding_generic*

cardinality()

Return the cardinality of `self`.

EXAMPLES:

```
sage: P = Permutations(3, avoiding=[1, 2])
sage: P.cardinality()
1
```

```
>>> from sage.all import *
>>> P = Permutations(Integer(3), avoiding=[Integer(1), Integer(2)])
>>> P.cardinality()
1
```

class sage.combinat.permutation.**StandardPermutations_avoiding_123**(*n*)

Bases: *StandardPermutations_avoiding_generic*

cardinality()

EXAMPLES:

```
sage: Permutations(5, avoiding=[1, 2, 3]).cardinality()
42
sage: len( Permutations(5, avoiding=[1, 2, 3]).list() )
42
```

```
>>> from sage.all import *
>>> Permutations(Integer(5), avoiding=[Integer(1), Integer(2), Integer(3)]).
→cardinality()
42
>>> len( Permutations(Integer(5), avoiding=[Integer(1), Integer(2),␣
→Integer(3)]).list() )
42
```

class sage.combinat.permutation.**StandardPermutations_avoiding_132**(*n*)

Bases: *StandardPermutations_avoiding_generic*

cardinality()

EXAMPLES:

```
sage: Permutations(5, avoiding=[1, 3, 2]).cardinality()
42
sage: len( Permutations(5, avoiding=[1, 3, 2]).list() )
42
```

```
>>> from sage.all import *
>>> Permutations(Integer(5), avoiding=[Integer(1), Integer(3), Integer(2)]).
→cardinality()
42
>>> len( Permutations(Integer(5), avoiding=[Integer(1), Integer(3),␣
→Integer(2)]).list() )
42
```

class sage.combinat.permutation.**StandardPermutations_avoiding_21**(*n*)

Bases: *StandardPermutations_avoiding_generic*

cardinality()

Return the cardinality of `self`.

EXAMPLES:

```
sage: P = Permutations(3, avoiding=[2, 1])
sage: P.cardinality()
1
```

```
>>> from sage.all import *
>>> P = Permutations(Integer(3), avoiding=[Integer(2), Integer(1)])
>>> P.cardinality()
1
```

class sage.combinat.permutation.**StandardPermutations_avoiding_213**(*n*)

Bases: *StandardPermutations_avoiding_generic*

cardinality()

EXAMPLES:

```
sage: Permutations(5, avoiding=[2, 1, 3]).cardinality()
42
sage: len( Permutations(5, avoiding=[2, 1, 3]).list() )
42
```

```
>>> from sage.all import *
>>> Permutations(Integer(5), avoiding=[Integer(2), Integer(1), Integer(3)]).
↪cardinality()
42
>>> len( Permutations(Integer(5), avoiding=[Integer(2), Integer(1),␣
↪Integer(3)]).list() )
42
```

class sage.combinat.permutation.**StandardPermutations_avoiding_231**(*n*)

Bases: *StandardPermutations_avoiding_generic*

cardinality()

EXAMPLES:

```
sage: Permutations(5, avoiding=[2, 3, 1]).cardinality()
42
sage: len( Permutations(5, avoiding=[2, 3, 1]).list() )
42
```

```
>>> from sage.all import *
>>> Permutations(Integer(5), avoiding=[Integer(2), Integer(3), Integer(1)]).
↪cardinality()
42
>>> len( Permutations(Integer(5), avoiding=[Integer(2), Integer(3),␣
↪Integer(1)]).list() )
42
```

class sage.combinat.permutation.**StandardPermutations_avoiding_312**(*n*)

Bases: *StandardPermutations_avoiding_generic*

cardinality()

EXAMPLES:

```
sage: Permutations(5, avoiding=[3, 1, 2]).cardinality()
42
sage: len( Permutations(5, avoiding=[3, 1, 2]).list() )
42
```

```
>>> from sage.all import *
>>> Permutations(Integer(5), avoiding=[Integer(3), Integer(1), Integer(2)]).
↪cardinality()
42
>>> len( Permutations(Integer(5), avoiding=[Integer(3), Integer(1),␣
↪Integer(2)]).list() )
42
```

class sage.combinat.permutation.**StandardPermutations_avoiding_321**(*n*)

Bases: *StandardPermutations_avoiding_generic*

cardinality()

EXAMPLES:

```
sage: Permutations(5, avoiding=[3, 2, 1]).cardinality()
42
sage: len( Permutations(5, avoiding=[3, 2, 1]).list() )
42
```

```
>>> from sage.all import *
>>> Permutations(Integer(5), avoiding=[Integer(3), Integer(2), Integer(1)]).
↪cardinality()
42
>>> len( Permutations(Integer(5), avoiding=[Integer(3), Integer(2),␣
↪Integer(1)]).list() )
42
```

class sage.combinat.permutation.**StandardPermutations_avoiding_generic**(*n*, *a*)

Bases: *StandardPermutations_n_abstract*

Generic class for subset of permutations avoiding a set of patterns.

cardinality()

Return the cardinality of `self`.

EXAMPLES:

```
sage: P = Permutations(3, avoiding=[[2, 1, 3],[1,2,3]])
sage: P.cardinality()                                                    #␣
↪needs sage.combinat
4
```

```
>>> from sage.all import *
>>> P = Permutations(Integer(3), avoiding=[[Integer(2), Integer(1),␣
↪Integer(3)],[Integer(1),Integer(2),Integer(3)]])
>>> P.cardinality()                                                    #␣
↪needs sage.combinat
4
```

patterns()

Return the patterns avoided by this class of permutations.

EXAMPLES:

```
sage: P = Permutations(3, avoiding=[[2,1,3],[1,2,3]])
sage: P.patterns()
([2, 1, 3], [1, 2, 3])
```

```
>>> from sage.all import *
>>> P = Permutations(Integer(3), avoiding=[[Integer(2),Integer(1),Integer(3)],
↪[Integer(1),Integer(2),Integer(3)]])
>>> P.patterns()
([2, 1, 3], [1, 2, 3])
```

class sage.combinat.permutation.**StandardPermutations_bruhat_greater**(*p*)

Bases: *Permutations*

Permutations of $\{1, \ldots, n\}$ that are greater than or equal to a permutation p in the Bruhat order.

class sage.combinat.permutation.**StandardPermutations_bruhat_smaller**(*p*)

Bases: *Permutations*

Permutations of $\{1, \ldots, n\}$ that are less than or equal to a permutation p in the Bruhat order.

class sage.combinat.permutation.**StandardPermutations_descents**(*d*, *n*)

Bases: *StandardPermutations_n_abstract*

Permutations of $\{1, \ldots, n\}$ with a fixed set of descents.

cardinality()

Return the cardinality of `self`.

ALGORITHM:

The algorithm described in [Vie1979] is implemented naively.

EXAMPLES:

```
sage: P = Permutations(descents=([1,0,2], 5))
sage: P.cardinality()
4
```

```
>>> from sage.all import *
>>> P = Permutations(descents=([Integer(1),Integer(0),Integer(2)],␣
↪Integer(5)))
>>> P.cardinality()
4
```

first()

Return the first permutation with descents d.

EXAMPLES:

```
sage: Permutations(descents=([1,0,4,8],12)).first()
[3, 2, 1, 4, 6, 5, 7, 8, 10, 9, 11, 12]
```

```
>>> from sage.all import *
>>> Permutations(descents=([Integer(1),Integer(0),Integer(4),Integer(8)],
↪Integer(12))).first()
[3, 2, 1, 4, 6, 5, 7, 8, 10, 9, 11, 12]
```

last()

Return the last permutation with descents d.

EXAMPLES:

```
sage: Permutations(descents=([1,0,4,8],12)).last()
[12, 11, 8, 9, 10, 4, 5, 6, 7, 1, 2, 3]
```

```
>>> from sage.all import *
>>> Permutations(descents=([Integer(1),Integer(0),Integer(4),Integer(8)],
↪Integer(12))).last()
[12, 11, 8, 9, 10, 4, 5, 6, 7, 1, 2, 3]
```

class sage.combinat.permutation.**StandardPermutations_n**(*n*)

Bases: *StandardPermutations_n_abstract*

Permutations of the set $\{1, 2, \ldots, n\}$.

These are also called permutations of size n, or the elements of the n-th symmetric group.

Todo

Have a `reduced_word()` which works in both multiplication conventions.

class Element(*parent*, *l*, *algorithm='lex'*, *sjt=None*, *check=True*)

Bases: *Permutation*

apply_simple_reflection_left(*i*)

Return `self` multiplied by the simple reflection `s[i]` on the left.

This acts by switching the entries in positions i and $i + 1$.

Warning

This ignores the multiplication convention in order to be consistent with other Coxeter operations in permutations (e.g., computing `reduced_word()`).

EXAMPLES:

```
sage: W = Permutations(3)
sage: w = W([2,3,1])
sage: w.apply_simple_reflection_left(1)
[1, 3, 2]
sage: w.apply_simple_reflection_left(2)
[3, 2, 1]
```

```
>>> from sage.all import *
>>> W = Permutations(Integer(3))
>>> w = W([Integer(2),Integer(3),Integer(1)])
>>> w.apply_simple_reflection_left(Integer(1))
[1, 3, 2]
>>> w.apply_simple_reflection_left(Integer(2))
[3, 2, 1]
```

apply_simple_reflection_right(*i*)

Return `self` multiplied by the simple reflection `s[i]` on the right.

This acts by switching the entries i and $i + 1$.

> **Warning:** This ignores the multiplication convention in order to be consistent with other Coxeter operations in permutations (e.g., computing `reduced_word()`).

EXAMPLES:

```
sage: W = Permutations(3)
sage: w = W([2,3,1])
sage: w.apply_simple_reflection_right(1)
[3, 2, 1]
sage: w.apply_simple_reflection_right(2)
[2, 1, 3]
```

```
>>> from sage.all import *
>>> W = Permutations(Integer(3))
>>> w = W([Integer(2),Integer(3),Integer(1)])
>>> w.apply_simple_reflection_right(Integer(1))
[3, 2, 1]
>>> w.apply_simple_reflection_right(Integer(2))
[2, 1, 3]
```

has_left_descent(i)

Check if `i` is a left descent of `self`.

A *left descent* of a permutation $\pi \in S_n$ means an index $i \in \{1, 2, \ldots, n-1\}$ such that $s_i \circ \pi$ has smaller length than π. Thus, a left descent of π is an index $i \in \{1, 2, \ldots, n-1\}$ satisfying $\pi^{-1}(i) > \pi^{-1}(i+1)$.

> **Warning:** The methods `descents()` and `idescents()` behave differently than their Weyl group counterparts. In particular, the indexing is 0-based. This could lead to errors. Instead, construct the descent set as in the example.

> **Warning:** This ignores the multiplication convention in order to be consistent with other Coxeter operations in permutations (e.g., computing `reduced_word()`).

EXAMPLES:

```
sage: P = Permutations(4)
sage: x = P([3, 2, 4, 1])
sage: (~x).descents()
[1, 2]
sage: [i for i in P.index_set() if x.has_left_descent(i)]
[1, 2]
```

```
>>> from sage.all import *
>>> P = Permutations(Integer(4))
```

(continues on next page)

(continued from previous page)

```
>>> x = P([Integer(3), Integer(2), Integer(4), Integer(1)])
>>> (~x).descents()
[1, 2]
>>> [i for i in P.index_set() if x.has_left_descent(i)]
[1, 2]
```

has_right_descent(*i*, *mult=None*)

Check if `i` is a right descent of `self`.

A *right descent* of a permutation $\pi \in S_n$ means an index $i \in \{1, 2, \ldots, n-1\}$ such that $\pi \circ s_i$ has smaller length than π. Thus, a right descent of π is an index $i \in \{1, 2, \ldots, n-1\}$ satisfying $\pi(i) > \pi(i+1)$.

> **Warning**
>
> The methods `descents()` and `idescents()` behave differently than their Weyl group counterparts. In particular, the indexing is 0-based. This could lead to errors. Instead, construct the descent set as in the example.

> **Warning**
>
> This ignores the multiplication convention in order to be consistent with other Coxeter operations in permutations (e.g., computing `reduced_word()`).

EXAMPLES:

```
sage: P = Permutations(4)
sage: x = P([3, 2, 4, 1])
sage: x.descents()
[1, 3]
sage: [i for i in P.index_set() if x.has_right_descent(i)]
[1, 3]
```

```
>>> from sage.all import *
>>> P = Permutations(Integer(4))
>>> x = P([Integer(3), Integer(2), Integer(4), Integer(1)])
>>> x.descents()
[1, 3]
>>> [i for i in P.index_set() if x.has_right_descent(i)]
[1, 3]
```

inverse()

Return the inverse of `self`.

EXAMPLES:

```
sage: P = Permutations(4)
sage: w0 = P([4,3,2,1])
sage: w0.inverse() == w0
True
sage: w0.inverse().parent() is P
```

(continues on next page)

(continued from previous page)

```
True
sage: P([3,2,4,1]).inverse()
[4, 2, 1, 3]
```

```
>>> from sage.all import *
>>> P = Permutations(Integer(4))
>>> w0 = P([Integer(4),Integer(3),Integer(2),Integer(1)])
>>> w0.inverse() == w0
True
>>> w0.inverse().parent() is P
True
>>> P([Integer(3),Integer(2),Integer(4),Integer(1)]).inverse()
[4, 2, 1, 3]
```

algebra(*base_ring*, *category=None*)

Return the symmetric group algebra associated to `self`.

INPUT:

- `base_ring` – a ring
- `category` – a category (default: the category of `self`)

EXAMPLES:

```
sage: # needs sage.groups sage.modules
sage: P = Permutations(4)
sage: A = P.algebra(QQ); A
Symmetric group algebra of order 4 over Rational Field
sage: A.category()
Join of Category of Coxeter group algebras over Rational Field
    and Category of finite group algebras over Rational Field
    and Category of finite dimensional cellular algebras
        with basis over Rational Field
sage: A = P.algebra(QQ, category=Monoids())
sage: A.category()
Category of finite dimensional cellular monoid algebras over Rational Field
```

```
>>> from sage.all import *
>>> # needs sage.groups sage.modules
>>> P = Permutations(Integer(4))
>>> A = P.algebra(QQ); A
Symmetric group algebra of order 4 over Rational Field
>>> A.category()
Join of Category of Coxeter group algebras over Rational Field
    and Category of finite group algebras over Rational Field
    and Category of finite dimensional cellular algebras
        with basis over Rational Field
>>> A = P.algebra(QQ, category=Monoids())
>>> A.category()
Category of finite dimensional cellular monoid algebras over Rational Field
```

as_permutation_group()

Return `self` as a permutation group.

EXAMPLES:

```
sage: P = Permutations(4)
sage: PG = P.as_permutation_group(); PG                                    #␣
↪needs sage.groups
Symmetric group of order 4! as a permutation group

sage: G = SymmetricGroup(4)                                                #␣
↪needs sage.groups
sage: PG is G                                                              #␣
↪needs sage.groups
True
```

```
>>> from sage.all import *
>>> P = Permutations(Integer(4))
>>> PG = P.as_permutation_group(); PG                                    #␣
↪needs sage.groups
Symmetric group of order 4! as a permutation group

>>> G = SymmetricGroup(Integer(4))                                         ␣
↪     # needs sage.groups
>>> PG is G                                                              #␣
↪needs sage.groups
True
```

cardinality()

Return the number of permutations of size n, which is $n!$.

EXAMPLES:

```
sage: Permutations(0).cardinality()
1
sage: Permutations(3).cardinality()
6
sage: Permutations(4).cardinality()
24
```

```
>>> from sage.all import *
>>> Permutations(Integer(0)).cardinality()
1
>>> Permutations(Integer(3)).cardinality()
6
>>> Permutations(Integer(4)).cardinality()
24
```

cartan_type()

Return the Cartan type of `self`.

The symmetric group S_n is a Coxeter group of type A_{n-1}.

EXAMPLES:

```
sage: A = SymmetricGroup([2,3,7]); A.cartan_type()                         #␣
↪needs sage.combinat sage.groups
```

(continues on next page)

(continued from previous page)

```
['A', 2]
sage: A = SymmetricGroup([]); A.cartan_type()                                   #␣
↪needs sage.combinat sage.groups
['A', 0]
```

```
>>> from sage.all import *
>>> A = SymmetricGroup([Integer(2),Integer(3),Integer(7)]); A.cartan_type()    ␣
↪                       # needs sage.combinat sage.groups
['A', 2]
>>> A = SymmetricGroup([]); A.cartan_type()                                   #␣
↪needs sage.combinat sage.groups
['A', 0]
```

codegrees()

Return the codegrees of `self`.

EXAMPLES:

```
sage: Permutations(3).codegrees()
(0, 1)
sage: Permutations(7).codegrees()
(0, 1, 2, 3, 4, 5)
```

```
>>> from sage.all import *
>>> Permutations(Integer(3)).codegrees()
(0, 1)
>>> Permutations(Integer(7)).codegrees()
(0, 1, 2, 3, 4, 5)
```

conjugacy_class(*g*)

Return the conjugacy class of `g` in `self`.

INPUT:

- `g` – a partition or an element of `self`

EXAMPLES:

```
sage: G = Permutations(5)
sage: g = G([2,3,4,1,5])
sage: G.conjugacy_class(g)                                                      #␣
↪needs sage.combinat sage.graphs sage.groups
Conjugacy class of cycle type [4, 1] in Standard permutations of 5
sage: G.conjugacy_class(Partition([2, 1, 1, 1]))                                #␣
↪needs sage.combinat sage.graphs sage.groups
Conjugacy class of cycle type [2, 1, 1, 1] in Standard permutations of 5
```

```
>>> from sage.all import *
>>> G = Permutations(Integer(5))
>>> g = G([Integer(2),Integer(3),Integer(4),Integer(1),Integer(5)])
>>> G.conjugacy_class(g)                                                      #␣
↪needs sage.combinat sage.graphs sage.groups
Conjugacy class of cycle type [4, 1] in Standard permutations of 5
```

(continues on next page)

(continued from previous page)

```
>>> G.conjugacy_class(Partition([Integer(2), Integer(1), Integer(1),␣
↪Integer(1)]))                                  # needs sage.combinat sage.graphs␣
↪sage.groups
Conjugacy class of cycle type [2, 1, 1, 1] in Standard permutations of 5
```

conjugacy_classes()

Return a list of the conjugacy classes of `self`.

EXAMPLES:

```
sage: G = Permutations(4)
sage: G.conjugacy_classes()                                                    #␣
↪needs sage.combinat sage.graphs sage.groups
[Conjugacy class of cycle type [1, 1, 1, 1] in Standard permutations of 4,
 Conjugacy class of cycle type [2, 1, 1] in Standard permutations of 4,
 Conjugacy class of cycle type [2, 2] in Standard permutations of 4,
 Conjugacy class of cycle type [3, 1] in Standard permutations of 4,
 Conjugacy class of cycle type [4] in Standard permutations of 4]
```

```
>>> from sage.all import *
>>> G = Permutations(Integer(4))
>>> G.conjugacy_classes()                                                    #␣
↪needs sage.combinat sage.graphs sage.groups
[Conjugacy class of cycle type [1, 1, 1, 1] in Standard permutations of 4,
 Conjugacy class of cycle type [2, 1, 1] in Standard permutations of 4,
 Conjugacy class of cycle type [2, 2] in Standard permutations of 4,
 Conjugacy class of cycle type [3, 1] in Standard permutations of 4,
 Conjugacy class of cycle type [4] in Standard permutations of 4]
```

conjugacy_classes_iterator()

Iterate over the conjugacy classes of `self`.

EXAMPLES:

```
sage: G = Permutations(4)
sage: list(G.conjugacy_classes_iterator()) == G.conjugacy_classes()          #␣
↪needs sage.combinat sage.graphs sage.groups
True
```

```
>>> from sage.all import *
>>> G = Permutations(Integer(4))
>>> list(G.conjugacy_classes_iterator()) == G.conjugacy_classes()          #␣
↪needs sage.combinat sage.graphs sage.groups
True
```

conjugacy_classes_representatives()

Return a complete list of representatives of conjugacy classes in `self`.

Let S_n be the symmetric group on n letters. The conjugacy classes are indexed by partitions λ of n. The ordering of the conjugacy classes is reverse lexicographic order of the partitions.

EXAMPLES:

```
sage: G = Permutations(5)
sage: G.conjugacy_classes_representatives()                                 #␣
↪needs sage.combinat sage.libs.flint
[[1, 2, 3, 4, 5],
 [2, 1, 3, 4, 5],
 [2, 1, 4, 3, 5],
 [2, 3, 1, 4, 5],
 [2, 3, 1, 5, 4],
 [2, 3, 4, 1, 5],
 [2, 3, 4, 5, 1]]
```

```
>>> from sage.all import *
>>> G = Permutations(Integer(5))
>>> G.conjugacy_classes_representatives()                                 #␣
↪needs sage.combinat sage.libs.flint
[[1, 2, 3, 4, 5],
 [2, 1, 3, 4, 5],
 [2, 1, 4, 3, 5],
 [2, 3, 1, 4, 5],
 [2, 3, 1, 5, 4],
 [2, 3, 4, 1, 5],
 [2, 3, 4, 5, 1]]
```

degree()

Return the degree of `self`.

This is the cardinality n of the set `self` acts on.

EXAMPLES:

```
sage: Permutations(0).degree()
0
sage: Permutations(1).degree()
1
sage: Permutations(5).degree()
5
```

```
>>> from sage.all import *
>>> Permutations(Integer(0)).degree()
0
>>> Permutations(Integer(1)).degree()
1
>>> Permutations(Integer(5)).degree()
5
```

degrees()

Return the degrees of `self`.

These are the degrees of the fundamental invariants of the ring of polynomial invariants.

EXAMPLES:

```
sage: Permutations(3).degrees()
(2, 3)
```

(continues on next page)

(continued from previous page)

```
sage: Permutations(7).degrees()
(2, 3, 4, 5, 6, 7)
```

```
>>> from sage.all import *
>>> Permutations(Integer(3)).degrees()
(2, 3)
>>> Permutations(Integer(7)).degrees()
(2, 3, 4, 5, 6, 7)
```

element_in_conjugacy_classes(*nu*)

Return a permutation with cycle type `nu`.

If the size of `nu` is smaller than the size of permutations in `self`, then some fixed points are added.

EXAMPLES:

```
sage: PP = Permutations(5)
sage: PP.element_in_conjugacy_classes([2,2])                                    #␣
↪needs sage.combinat
[2, 1, 4, 3, 5]
sage: PP.element_in_conjugacy_classes([5, 5])                                   #␣
↪needs sage.combinat
Traceback (most recent call last):
...
ValueError: the size of the partition (=10) should be at most the size of the␣
↪permutations (=5)
```

```
>>> from sage.all import *
>>> PP = Permutations(Integer(5))
>>> PP.element_in_conjugacy_classes([Integer(2),Integer(2)])                     ␣
↪               # needs sage.combinat
[2, 1, 4, 3, 5]
>>> PP.element_in_conjugacy_classes([Integer(5), Integer(5)])                    ␣
↪               # needs sage.combinat
Traceback (most recent call last):
...
ValueError: the size of the partition (=10) should be at most the size of the␣
↪permutations (=5)
```

gens()

Return a set of generators for `self` as a group.

EXAMPLES:

```
sage: P4 = Permutations(4)
sage: P4.gens()
([2, 1, 3, 4], [1, 3, 2, 4], [1, 2, 4, 3])
```

```
>>> from sage.all import *
>>> P4 = Permutations(Integer(4))
>>> P4.gens()
([2, 1, 3, 4], [1, 3, 2, 4], [1, 2, 4, 3])
```

identity()

Return the identity permutation of size n.

EXAMPLES:

```
sage: Permutations(4).identity()
[1, 2, 3, 4]
sage: Permutations(0).identity()
[]
```

```
>>> from sage.all import *
>>> Permutations(Integer(4)).identity()
[1, 2, 3, 4]
>>> Permutations(Integer(0)).identity()
[]
```

index_set()

Return the index set for the descents of the symmetric group `self`.

This is $\{1, 2, \ldots, n-1\}$, where `self` is S_n.

EXAMPLES:

```
sage: P = Permutations(8)
sage: P.index_set()
(1, 2, 3, 4, 5, 6, 7)
```

```
>>> from sage.all import *
>>> P = Permutations(Integer(8))
>>> P.index_set()
(1, 2, 3, 4, 5, 6, 7)
```

one()

Return the identity permutation of size n.

EXAMPLES:

```
sage: Permutations(4).identity()
[1, 2, 3, 4]
sage: Permutations(0).identity()
[]
```

```
>>> from sage.all import *
>>> Permutations(Integer(4)).identity()
[1, 2, 3, 4]
>>> Permutations(Integer(0)).identity()
[]
```

random_element()

EXAMPLES:

```
sage: s = Permutations(4).random_element(); s  # random
[1, 2, 4, 3]
sage: s in Permutations(4)
True
```

```
>>> from sage.all import *
>>> s = Permutations(Integer(4)).random_element(); s   # random
[1, 2, 4, 3]
>>> s in Permutations(Integer(4))
True
```

rank(*p=None*)

Return the rank of `self` or `p` depending on input.

If a permutation `p` is given, return the rank of `p` in `self`. Otherwise return the dimension of the underlying vector space spanned by the (simple) roots.

EXAMPLES:

```
sage: P = Permutations(5)
sage: P.rank()
4

sage: SP3 = Permutations(3)
sage: list(map(SP3.rank, SP3))
[0, 1, 2, 3, 4, 5]
sage: SP0 = Permutations(0)
sage: list(map(SP0.rank, SP0))
[0]
```

```
>>> from sage.all import *
>>> P = Permutations(Integer(5))
>>> P.rank()
4

>>> SP3 = Permutations(Integer(3))
>>> list(map(SP3.rank, SP3))
[0, 1, 2, 3, 4, 5]
>>> SP0 = Permutations(Integer(0))
>>> list(map(SP0.rank, SP0))
[0]
```

reflection(*i*)

Return the reflection indexed by `i` of `self`.

This returns the permutation with cycle $i = (a, b)$.

See also

- `reflections_index_set()`
- `reflections()`

EXAMPLES:

```
sage: P = Permutations(4)
sage: for i in P.reflection_index_set():
....:     print('%s %s'%(i, P.reflection(i)))
```

(continues on next page)

(continued from previous page)

```
(1, 2) [2, 1, 3, 4]
(1, 3) [3, 2, 1, 4]
(1, 4) [4, 2, 3, 1]
(2, 3) [1, 3, 2, 4]
(2, 4) [1, 4, 3, 2]
(3, 4) [1, 2, 4, 3]
```

```
>>> from sage.all import *
>>> P = Permutations(Integer(4))
>>> for i in P.reflection_index_set():
...     print('%s %s'%(i, P.reflection(i)))
(1, 2) [2, 1, 3, 4]
(1, 3) [3, 2, 1, 4]
(1, 4) [4, 2, 3, 1]
(2, 3) [1, 3, 2, 4]
(2, 4) [1, 4, 3, 2]
(3, 4) [1, 2, 4, 3]
```

reflection_index_set()

Return the index set of the reflections of `self`.

See also

- *reflection()*
- reflections()

EXAMPLES:

```
sage: P = Permutations(4)
sage: P.reflection_index_set()
((1, 2), (1, 3), (1, 4), (2, 3), (2, 4), (3, 4))
```

```
>>> from sage.all import *
>>> P = Permutations(Integer(4))
>>> P.reflection_index_set()
((1, 2), (1, 3), (1, 4), (2, 3), (2, 4), (3, 4))
```

simple_reflection(i)

For i in the index set of `self` (that is, for i in $\{1, 2, \ldots, n-1\}$, where `self` is S_n), this returns the elementary transposition $s_i = (i, i + 1)$.

EXAMPLES:

```
sage: P = Permutations(4)
sage: P.simple_reflection(2)
[1, 3, 2, 4]
sage: P.simple_reflections()
Finite family {1: [2, 1, 3, 4], 2: [1, 3, 2, 4], 3: [1, 2, 4, 3]}
```

```
>>> from sage.all import *
>>> P = Permutations(Integer(4))
>>> P.simple_reflection(Integer(2))
[1, 3, 2, 4]
>>> P.simple_reflections()
Finite family {1: [2, 1, 3, 4], 2: [1, 3, 2, 4], 3: [1, 2, 4, 3]}
```

unrank(*r*)

EXAMPLES:

```
sage: SP3 = Permutations(3)
sage: l = list(map(SP3.unrank, range(6)))
sage: l == SP3.list()
True
sage: SP0 = Permutations(0)
sage: l = list(map(SP0.unrank, range(1)))
sage: l == SP0.list()
True
```

```
>>> from sage.all import *
>>> SP3 = Permutations(Integer(3))
>>> l = list(map(SP3.unrank, range(Integer(6))))
>>> l == SP3.list()
True
>>> SP0 = Permutations(Integer(0))
>>> l = list(map(SP0.unrank, range(Integer(1))))
>>> l == SP0.list()
True
```

class sage.combinat.permutation.**StandardPermutations_n_abstract**(*n*, *category=None*)

Bases: *Permutations*

Abstract base class for subsets of permutations of the set $\{1, 2, \ldots, n\}$.

> **Warning**
>
> Anything inheriting from this class should override the `__contains__` method.

class sage.combinat.permutation.**StandardPermutations_recoils**(*recoils*)

Bases: *Permutations*

Permutations of $\{1, \ldots, n\}$ with a fixed recoils composition.

class sage.combinat.permutation.**StandardPermutations_recoilsfatter**(*recoils*)

Bases: *Permutations*

class sage.combinat.permutation.**StandardPermutations_recoilsfiner**(*recoils*)

Bases: *Permutations*

sage.combinat.permutation.**bistochastic_as_sum_of_permutations**(*M*, *check=True*)

Return the positive sum of permutations corresponding to the bistochastic matrix `M`.

A stochastic matrix is a matrix with nonnegative real entries such that the sum of the elements of any row is equal to 1. A bistochastic matrix is a stochastic matrix whose transpose matrix is also stochastic (there are conditions both on the rows and on the columns).

According to the Birkhoff-von Neumann Theorem, any bistochastic matrix can be written as a convex combination of permutation matrices, which also means that the polytope of bistochastic matrices is integer.

As a non-bistochastic matrix can obviously not be written as a convex combination of permutations, this theorem is an equivalence.

This function, given a bistochastic matrix, returns the corresponding decomposition.

INPUT:

- `M` – a bistochastic matrix
- `check` – boolean; set to `True` (default) to check that the matrix is indeed bistochastic

OUTPUT:

- An element of `CombinatorialFreeModule`, which is a free F-module (where F is the ground ring of the given matrix) whose basis is indexed by the permutations.

Note

- In this function, we just assume 1 to be any constant : for us a matrix M is bistochastic if there exists $c > 0$ such that M/c is bistochastic.
- You can obtain a sequence of pairs `(permutation,coeff)`, where `permutation` is a Sage `Permutation` instance, and `coeff` its corresponding coefficient from the result of this function by applying the `list` function.
- If you are interested in the matrix corresponding to a `Permutation` you will be glad to learn about the `Permutation.to_matrix()` method.
- The base ring of the matrix can be anything that can be coerced to `RR`.

See also

- `as_sum_of_permutations()` to use this method through the `Matrix` class.

EXAMPLES:

We create a bistochastic matrix from a convex sum of permutations, then try to deduce the decomposition from the matrix:

```
sage: from sage.combinat.permutation import bistochastic_as_sum_of_permutations

sage: # needs networkx sage.graphs sage.modules
sage: L = []
sage: L.append((9,Permutation([4, 1, 3, 5, 2])))
sage: L.append((6,Permutation([5, 3, 4, 1, 2])))
sage: L.append((3,Permutation([3, 1, 4, 2, 5])))
sage: L.append((2,Permutation([1, 4, 2, 3, 5])))
sage: M = sum([c * p.to_matrix() for (c,p) in L])
sage: decomp = bistochastic_as_sum_of_permutations(M)
sage: print(decomp)
```

(continues on next page)

(continued from previous page)

```
2*B[[1, 4, 2, 3, 5]] + 3*B[[3, 1, 4, 2, 5]]
 + 9*B[[4, 1, 3, 5, 2]] + 6*B[[5, 3, 4, 1, 2]]
```

```
>>> from sage.all import *
>>> from sage.combinat.permutation import bistochastic_as_sum_of_permutations

>>> # needs networkx sage.graphs sage.modules
>>> L = []
>>> L.append((Integer(9),Permutation([Integer(4), Integer(1), Integer(3),␣
↪Integer(5), Integer(2)])))
>>> L.append((Integer(6),Permutation([Integer(5), Integer(3), Integer(4),␣
↪Integer(1), Integer(2)])))
>>> L.append((Integer(3),Permutation([Integer(3), Integer(1), Integer(4),␣
↪Integer(2), Integer(5)])))
>>> L.append((Integer(2),Permutation([Integer(1), Integer(4), Integer(2),␣
↪Integer(3), Integer(5)])))
>>> M = sum([c * p.to_matrix() for (c,p) in L])
>>> decomp = bistochastic_as_sum_of_permutations(M)
>>> print(decomp)
2*B[[1, 4, 2, 3, 5]] + 3*B[[3, 1, 4, 2, 5]]
 + 9*B[[4, 1, 3, 5, 2]] + 6*B[[5, 3, 4, 1, 2]]
```

An exception is raised when the matrix is not positive and bistochastic:

```
sage: # needs sage.modules
sage: M = Matrix([[2,3],[2,2]])
sage: decomp = bistochastic_as_sum_of_permutations(M)
Traceback (most recent call last):
...
ValueError: The matrix is not bistochastic
sage: bistochastic_as_sum_of_permutations(Matrix(GF(7), 2, [2,1,1,2]))
Traceback (most recent call last):
...
ValueError: The base ring of the matrix must have a coercion map to RR
sage: bistochastic_as_sum_of_permutations(Matrix(ZZ, 2, [2,-1,-1,2]))
Traceback (most recent call last):
...
ValueError: The matrix should have nonnegative entries
```

```
>>> from sage.all import *
>>> # needs sage.modules
>>> M = Matrix([[Integer(2),Integer(3)],[Integer(2),Integer(2)]])
>>> decomp = bistochastic_as_sum_of_permutations(M)
Traceback (most recent call last):
...
ValueError: The matrix is not bistochastic
>>> bistochastic_as_sum_of_permutations(Matrix(GF(Integer(7)), Integer(2),␣
↪[Integer(2),Integer(1),Integer(1),Integer(2)]))
Traceback (most recent call last):
...
ValueError: The base ring of the matrix must have a coercion map to RR
>>> bistochastic_as_sum_of_permutations(Matrix(ZZ, Integer(2), [Integer(2),-
```

(continues on next page)

(continued from previous page)

```
↪Integer(1),-Integer(1),Integer(2)]))
Traceback (most recent call last):
...
ValueError: The matrix should have nonnegative entries
```

sage.combinat.permutation.**bounded_affine_permutation**(*A*)

Return the bounded affine permutation of a matrix.

The *bounded affine permutation* of a matrix A with entries in R is a partial permutation of length n, where n is the number of columns of A. The entry in position i is the smallest value j such that column i is in the span of columns $i+1,\ldots,j$, over R, where column indices are taken modulo n. If column i is the zero vector, then the permutation has a fixed point at i.

INPUT:

- `A` – matrix with entries in a ring R

EXAMPLES:

```
sage: from sage.combinat.permutation import bounded_affine_permutation
sage: A = Matrix(ZZ, [[1,0,0,0], [0,1,0,0]])                                    #␣
↪needs sage.modules
sage: bounded_affine_permutation(A)                                             #␣
↪needs sage.libs.flint sage.modules
[5, 6, 3, 4]

sage: A = Matrix(ZZ, [[0,1,0,1,0], [0,0,1,1,0]])                                #␣
↪needs sage.modules
sage: bounded_affine_permutation(A)                                             #␣
↪needs sage.libs.flint sage.modules
[1, 4, 7, 8, 5]
```

```
>>> from sage.all import *
>>> from sage.combinat.permutation import bounded_affine_permutation
>>> A = Matrix(ZZ, [[Integer(1),Integer(0),Integer(0),Integer(0)], [Integer(0),
↪Integer(1),Integer(0),Integer(0)]])                                   # needs␣
↪sage.modules
>>> bounded_affine_permutation(A)                                             #␣
↪needs sage.libs.flint sage.modules
[5, 6, 3, 4]

>>> A = Matrix(ZZ, [[Integer(0),Integer(1),Integer(0),Integer(1),Integer(0)],␣
↪[Integer(0),Integer(0),Integer(1),Integer(1),Integer(0)]])                    ␣
↪          # needs sage.modules
>>> bounded_affine_permutation(A)                                             #␣
↪needs sage.libs.flint sage.modules
[1, 4, 7, 8, 5]
```

REFERENCES:

- [KLS2013]

sage.combinat.permutation.**bruhat_lequal**(*p1*, *p2*)

Return `True` if `p1` is less than `p2` in the Bruhat order.

Algorithm from mupad-combinat.

EXAMPLES:

```
sage: import sage.combinat.permutation as permutation
sage: permutation.bruhat_lequal([2,4,3,1],[3,4,2,1])
True
```

```
>>> from sage.all import *
>>> import sage.combinat.permutation as permutation
>>> permutation.bruhat_lequal([Integer(2),Integer(4),Integer(3),Integer(1)],
↪[Integer(3),Integer(4),Integer(2),Integer(1)])
True
```

sage.combinat.permutation.**descents_composition_first**(*dc*)

Compute the smallest element of a descent class having a descent composition dc.

EXAMPLES:

```
sage: import sage.combinat.permutation as permutation
sage: permutation.descents_composition_first([1,1,3,4,3])
[3, 2, 1, 4, 6, 5, 7, 8, 10, 9, 11, 12]
```

```
>>> from sage.all import *
>>> import sage.combinat.permutation as permutation
>>> permutation.descents_composition_first([Integer(1),Integer(1),Integer(3),
↪Integer(4),Integer(3)])
[3, 2, 1, 4, 6, 5, 7, 8, 10, 9, 11, 12]
```

sage.combinat.permutation.**descents_composition_last**(*dc*)

Return the largest element of a descent class having a descent composition dc.

EXAMPLES:

```
sage: import sage.combinat.permutation as permutation
sage: permutation.descents_composition_last([1,1,3,4,3])
[12, 11, 8, 9, 10, 4, 5, 6, 7, 1, 2, 3]
```

```
>>> from sage.all import *
>>> import sage.combinat.permutation as permutation
>>> permutation.descents_composition_last([Integer(1),Integer(1),Integer(3),
↪Integer(4),Integer(3)])
[12, 11, 8, 9, 10, 4, 5, 6, 7, 1, 2, 3]
```

sage.combinat.permutation.**descents_composition_list**(*dc*)

Return a list of all the permutations that have the descent composition dc.

EXAMPLES:

```
sage: import sage.combinat.permutation as permutation
sage: permutation.descents_composition_list([1,2,2])                    #␣
↪needs sage.graphs sage.modules
[[5, 2, 4, 1, 3],
 [5, 3, 4, 1, 2],
 [4, 3, 5, 1, 2],
 [4, 2, 5, 1, 3],
```

(continues on next page)

(continued from previous page)

```
 [3, 2, 5, 1, 4],
 [2, 1, 5, 3, 4],
 [3, 1, 5, 2, 4],
 [4, 1, 5, 2, 3],
 [5, 1, 4, 2, 3],
 [5, 1, 3, 2, 4],
 [4, 1, 3, 2, 5],
 [3, 1, 4, 2, 5],
 [2, 1, 4, 3, 5],
 [3, 2, 4, 1, 5],
 [4, 2, 3, 1, 5],
 [5, 2, 3, 1, 4]]
```

```
>>> from sage.all import *
>>> import sage.combinat.permutation as permutation
>>> permutation.descents_composition_list([Integer(1),Integer(2),Integer(2)])    ␣
↪                      # needs sage.graphs sage.modules
[[5, 2, 4, 1, 3],
 [5, 3, 4, 1, 2],
 [4, 3, 5, 1, 2],
 [4, 2, 5, 1, 3],
 [3, 2, 5, 1, 4],
 [2, 1, 5, 3, 4],
 [3, 1, 5, 2, 4],
 [4, 1, 5, 2, 3],
 [5, 1, 4, 2, 3],
 [5, 1, 3, 2, 4],
 [4, 1, 3, 2, 5],
 [3, 1, 4, 2, 5],
 [2, 1, 4, 3, 5],
 [3, 2, 4, 1, 5],
 [4, 2, 3, 1, 5],
 [5, 2, 3, 1, 4]]
```

sage.combinat.permutation.**from_cycles**(*n*, *cycles*, *parent=None*)

Return the permutation in the n-th symmetric group whose decomposition into disjoint cycles is `cycles`.

This function checks that its input is correct (i.e. that the cycles are disjoint and their elements integers among $1...n$). It raises an exception otherwise.

Warning: It assumes that the elements are of `int` type.

EXAMPLES:

```
sage: import sage.combinat.permutation as permutation
sage: permutation.from_cycles(4, [[1,2]])
[2, 1, 3, 4]
sage: permutation.from_cycles(4, [[1,2,4]])
[2, 4, 3, 1]
```

(continues on next page)

(continued from previous page)

```
sage: permutation.from_cycles(10, [[3,1],[4,5],[6,8,9]])
[3, 2, 1, 5, 4, 8, 7, 9, 6, 10]
sage: permutation.from_cycles(10, ((2, 5), (6, 1, 3)))
[3, 5, 6, 4, 2, 1, 7, 8, 9, 10]
sage: permutation.from_cycles(4, [])
[1, 2, 3, 4]
sage: permutation.from_cycles(4, [[]])
[1, 2, 3, 4]
sage: permutation.from_cycles(0, [])
[]
```

```
>>> from sage.all import *
>>> import sage.combinat.permutation as permutation
>>> permutation.from_cycles(Integer(4), [[Integer(1),Integer(2)]])
[2, 1, 3, 4]
>>> permutation.from_cycles(Integer(4), [[Integer(1),Integer(2),Integer(4)]])
[2, 4, 3, 1]
>>> permutation.from_cycles(Integer(10), [[Integer(3),Integer(1)],[Integer(4),
↪Integer(5)],[Integer(6),Integer(8),Integer(9)]])
[3, 2, 1, 5, 4, 8, 7, 9, 6, 10]
>>> permutation.from_cycles(Integer(10), ((Integer(2), Integer(5)), (Integer(6),␣
↪Integer(1), Integer(3))))
[3, 5, 6, 4, 2, 1, 7, 8, 9, 10]
>>> permutation.from_cycles(Integer(4), [])
[1, 2, 3, 4]
>>> permutation.from_cycles(Integer(4), [[]])
[1, 2, 3, 4]
>>> permutation.from_cycles(Integer(0), [])
[]
```

Bad input (see Issue #13742):

```
sage: Permutation("(-12,2)(3,4)")
Traceback (most recent call last):
...
ValueError: all elements should be strictly positive integers, but I found -12
sage: Permutation("(1,2)(2,4)")
Traceback (most recent call last):
...
ValueError: the element 2 appears more than once in the input
sage: permutation.from_cycles(4, [[1,18]])
Traceback (most recent call last):
...
ValueError: you claimed that this is a permutation on 1...4, but it contains 18
```

```
>>> from sage.all import *
>>> Permutation("(-12,2)(3,4)")
Traceback (most recent call last):
...
ValueError: all elements should be strictly positive integers, but I found -12
>>> Permutation("(1,2)(2,4)")
Traceback (most recent call last):
```

(continues on next page)

(continued from previous page)

```
...
ValueError: the element 2 appears more than once in the input
>>> permutation.from_cycles(Integer(4), [[Integer(1),Integer(18)]])
Traceback (most recent call last):
...
ValueError: you claimed that this is a permutation on 1...4, but it contains 18
```

sage.combinat.permutation.**from_inversion_vector**(*iv*, *parent=None*)

Return the permutation corresponding to inversion vector iv.

See $sage.combinat.permutation.Permutation.to_inversion_vector$ for a definition of the inversion vector of a permutation.

EXAMPLES:

```
sage: import sage.combinat.permutation as permutation
sage: permutation.from_inversion_vector([3,1,0,0,0])
[3, 2, 4, 1, 5]
sage: permutation.from_inversion_vector([2,3,6,4,0,2,2,1,0])
[5, 9, 1, 8, 2, 6, 4, 7, 3]
sage: permutation.from_inversion_vector([0])
[1]
sage: permutation.from_inversion_vector([])
[]
```

```
>>> from sage.all import *
>>> import sage.combinat.permutation as permutation
>>> permutation.from_inversion_vector([Integer(3),Integer(1),Integer(0),
↪Integer(0),Integer(0)])
[3, 2, 4, 1, 5]
>>> permutation.from_inversion_vector([Integer(2),Integer(3),Integer(6),
↪Integer(4),Integer(0),Integer(2),Integer(2),Integer(1),Integer(0)])
[5, 9, 1, 8, 2, 6, 4, 7, 3]
>>> permutation.from_inversion_vector([Integer(0)])
[1]
>>> permutation.from_inversion_vector([])
[]
```

sage.combinat.permutation.**from_lehmer_cocode**(*lehmer*, *parent=Standard permutations*)

Return the permutation with Lehmer cocode lehmer.

The Lehmer cocode of a permutation p is defined as the list $(c_1, c_2, \ldots, c_n)$, where c_i is the number of $j < i$ such that $p(j) > p(i)$.

EXAMPLES:

```
sage: import sage.combinat.permutation as permutation
sage: lcc = Permutation([2,1,5,4,3]).to_lehmer_cocode(); lcc
[0, 1, 0, 1, 2]
sage: permutation.from_lehmer_cocode(lcc)
[2, 1, 5, 4, 3]
```

```
>>> from sage.all import *
>>> import sage.combinat.permutation as permutation
>>> lcc = Permutation([Integer(2),Integer(1),Integer(5),Integer(4),Integer(3)]).
↪to_lehmer_cocode(); lcc
[0, 1, 0, 1, 2]
>>> permutation.from_lehmer_cocode(lcc)
[2, 1, 5, 4, 3]
```

sage.combinat.permutation.**from_lehmer_code**(*lehmer*, *parent=None*)

Return the permutation with Lehmer code `lehmer`.

EXAMPLES:

```
sage: import sage.combinat.permutation as permutation
sage: lc = Permutation([2,1,5,4,3]).to_lehmer_code(); lc
[1, 0, 2, 1, 0]
sage: permutation.from_lehmer_code(lc)
[2, 1, 5, 4, 3]
```

```
>>> from sage.all import *
>>> import sage.combinat.permutation as permutation
>>> lc = Permutation([Integer(2),Integer(1),Integer(5),Integer(4),Integer(3)]).to_
↪lehmer_code(); lc
[1, 0, 2, 1, 0]
>>> permutation.from_lehmer_code(lc)
[2, 1, 5, 4, 3]
```

sage.combinat.permutation.**from_major_code**(*mc*, *final_descent=False*)

Return the permutation with major code `mc`.

The major code of a permutation is defined in `to_major_code()`.

Warning

This function creates illegal permutations (i.e. `Permutation([9])`, and this is dangerous as the `Permutation()` class is only designed to handle permutations on $1...n$. This will have to be changed when Sage permutations will be able to handle anything, but right now this should be fixed. Be careful with the results.

Warning

If `mc` is not a major index of a permutation, then the return value of this method can be anything. Garbage in, garbage out!

REFERENCES:

- Skandera, M. *An Eulerian Partner for Inversions*. Sem. Lothar. Combin. 46 (2001) B46d.

EXAMPLES:

```
sage: import sage.combinat.permutation as permutation
sage: permutation.from_major_code([5, 0, 1, 0, 1, 2, 0, 1, 0])
[9, 3, 5, 7, 2, 1, 4, 6, 8]
```

(continues on next page)

(continued from previous page)

```
sage: permutation.from_major_code([8, 3, 3, 1, 4, 0, 1, 0, 0])
[2, 8, 4, 3, 6, 7, 9, 5, 1]
sage: Permutation([2,1,6,4,7,3,5]).to_major_code()
[3, 2, 0, 2, 2, 0, 0]
sage: permutation.from_major_code([3, 2, 0, 2, 2, 0, 0])
[2, 1, 6, 4, 7, 3, 5]
```

```
>>> from sage.all import *
>>> import sage.combinat.permutation as permutation
>>> permutation.from_major_code([Integer(5), Integer(0), Integer(1), Integer(0),␣
↪Integer(1), Integer(2), Integer(0), Integer(1), Integer(0)])
[9, 3, 5, 7, 2, 1, 4, 6, 8]
>>> permutation.from_major_code([Integer(8), Integer(3), Integer(3), Integer(1),␣
↪Integer(4), Integer(0), Integer(1), Integer(0), Integer(0)])
[2, 8, 4, 3, 6, 7, 9, 5, 1]
>>> Permutation([Integer(2),Integer(1),Integer(6),Integer(4),Integer(7),
↪Integer(3),Integer(5)]).to_major_code()
[3, 2, 0, 2, 2, 0, 0]
>>> permutation.from_major_code([Integer(3), Integer(2), Integer(0), Integer(2),␣
↪Integer(2), Integer(0), Integer(0)])
[2, 1, 6, 4, 7, 3, 5]
```

sage.combinat.permutation.**from_permutation_group_element**(*pge*, *parent=None*)

Return a *Permutation* given a PermutationGroupElement pge.

EXAMPLES:

```
sage: import sage.combinat.permutation as permutation
sage: pge = PermutationGroupElement([(1,2),(3,4)])                          #␣
↪needs sage.groups
sage: permutation.from_permutation_group_element(pge)                       #␣
↪needs sage.groups
[2, 1, 4, 3]
```

```
>>> from sage.all import *
>>> import sage.combinat.permutation as permutation
>>> pge = PermutationGroupElement([(Integer(1),Integer(2)),(Integer(3),
↪Integer(4))])                              # needs sage.groups
>>> permutation.from_permutation_group_element(pge)                       #␣
↪needs sage.groups
[2, 1, 4, 3]
```

sage.combinat.permutation.**from_rank**(*n*, *rank*)

Return the permutation of the set $\{1, ..., n\}$ with lexicographic rank rank. This is the permutation whose Lehmer code is the factoradic representation of rank. In particular, the permutation with rank 0 is the identity permutation.

The permutation is computed without iterating through all of the permutations with lower rank. This makes it efficient for large permutations.

Note

The variable rank is not checked for being in the interval from 0 to $n! - 1$. When outside this interval, it acts as its residue modulo $n!$.

EXAMPLES:

```
sage: import sage.combinat.permutation as permutation
sage: Permutation([3, 6, 5, 4, 2, 1]).rank()
359
sage: [permutation.from_rank(3, i) for i in range(6)]
[[1, 2, 3], [1, 3, 2], [2, 1, 3], [2, 3, 1], [3, 1, 2], [3, 2, 1]]
sage: Permutations(6)[10]
[1, 2, 4, 6, 3, 5]
sage: permutation.from_rank(6,10)
[1, 2, 4, 6, 3, 5]
```

```
>>> from sage.all import *
>>> import sage.combinat.permutation as permutation
>>> Permutation([Integer(3), Integer(6), Integer(5), Integer(4), Integer(2),␣
↪Integer(1)]).rank()
359
>>> [permutation.from_rank(Integer(3), i) for i in range(Integer(6))]
[[1, 2, 3], [1, 3, 2], [2, 1, 3], [2, 3, 1], [3, 1, 2], [3, 2, 1]]
>>> Permutations(Integer(6))[Integer(10)]
[1, 2, 4, 6, 3, 5]
>>> permutation.from_rank(Integer(6),Integer(10))
[1, 2, 4, 6, 3, 5]
```

sage.combinat.permutation.**from_reduced_word**(*rw*, *parent=None*)

Return the permutation corresponding to the reduced word `rw`.

See *reduced_words()* for a definition of reduced words and the convention on the order of multiplication used.

EXAMPLES:

```
sage: import sage.combinat.permutation as permutation
sage: permutation.from_reduced_word([3,2,3,1,2,3,1])
[3, 4, 2, 1]
sage: permutation.from_reduced_word([])
[]
```

```
>>> from sage.all import *
>>> import sage.combinat.permutation as permutation
>>> permutation.from_reduced_word([Integer(3),Integer(2),Integer(3),Integer(1),
↪Integer(2),Integer(3),Integer(1)])
[3, 4, 2, 1]
>>> permutation.from_reduced_word([])
[]
```

sage.combinat.permutation.**permutohedron_lequal**(*p1*, *p2*, *side='right'*)

Return `True` if `p1` is less than or equal to `p2` in the permutohedron order.

By default, the computations are done in the right permutohedron. If you pass the option `side='left'`, then they will be done in the left permutohedron.

EXAMPLES:

```
sage: import sage.combinat.permutation as permutation
sage: permutation.permutohedron_lequal(Permutation([3,2,1,4]),Permutation([4,2,1,
↪3]))
False
sage: permutation.permutohedron_lequal(Permutation([3,2,1,4]),Permutation([4,2,1,
↪3]), side='left')
True
```

```
>>> from sage.all import *
>>> import sage.combinat.permutation as permutation
>>> permutation.permutohedron_lequal(Permutation([Integer(3),Integer(2),
↪Integer(1),Integer(4)]),Permutation([Integer(4),Integer(2),Integer(1),
↪Integer(3)]))
False
>>> permutation.permutohedron_lequal(Permutation([Integer(3),Integer(2),
↪Integer(1),Integer(4)]),Permutation([Integer(4),Integer(2),Integer(1),
↪Integer(3)]), side='left')
True
```

sage.combinat.permutation.**to_standard**(*p*, *key=None*)

Return a standard permutation corresponding to the iterable `p`.

INPUT:

- `p` – an iterable
- `key` – (optional) a comparison key for the element `x` of `p`

EXAMPLES:

```
sage: # needs sage.combinat
sage: import sage.combinat.permutation as permutation
sage: permutation.to_standard([4,2,7])
[2, 1, 3]
sage: permutation.to_standard([1,2,3])
[1, 2, 3]
sage: permutation.to_standard([])
[]
sage: permutation.to_standard([1,2,3], key=lambda x: -x)
[3, 2, 1]
sage: permutation.to_standard([5,8,2,5], key=lambda x: -x)
[2, 1, 4, 3]
```

```
>>> from sage.all import *
>>> # needs sage.combinat
>>> import sage.combinat.permutation as permutation
>>> permutation.to_standard([Integer(4),Integer(2),Integer(7)])
[2, 1, 3]
>>> permutation.to_standard([Integer(1),Integer(2),Integer(3)])
[1, 2, 3]
>>> permutation.to_standard([])
[]
>>> permutation.to_standard([Integer(1),Integer(2),Integer(3)], key=lambda x: -x)
[3, 2, 1]
```

(continues on next page)

(continued from previous page)

```
>>> permutation.to_standard([Integer(5),Integer(8),Integer(2),Integer(5)],␣
↪key=lambda x: -x)
[2, 1, 4, 3]
```

5.1.173 Permutations (Cython file)

This is a nearly-straightforward implementation of what Knuth calls "Algorithm P" in TAOCP 7.2.1.2. The intent is to be able to enumerate permutation by "plain changes", or multiplication by adjacent transpositions, as a generator. This is useful when a class of objects is inherently enumerated by permutations, but it is faster to swap items in a permutation than construct the next object directly from the next permutation in a list. The backtracking algorithm in sage/graphs/genus.pyx is an example of this.

The lowest level is implemented as a struct with auxiliary methods. This is because Cython does not allow pointers to class instances, so a list of these objects is inherently slower than a list of structs. The author prefers ugly code to slow code.

For those willing to sacrifice a (very small) amount of speed, we provide a class that wraps our struct.

`sage.combinat.permutation_cython.`**`left_action_product`**`(S, lp)`

Return the permutation obtained by composing a permutation `S` with a permutation `lp` in such an order that `lp` is applied first and `S` is applied afterwards.

See also

sage.combinat.permutation.Permutation.left_action_product()

EXAMPLES:

```
sage: p = [2,1,3,4]
sage: q = [3,1,2]
sage: from sage.combinat.permutation_cython import left_action_product
sage: left_action_product(p, q)
[3, 2, 1, 4]
sage: left_action_product(q, p)
[1, 3, 2, 4]
sage: q
[3, 1, 2]
```

```
>>> from sage.all import *
>>> p = [Integer(2),Integer(1),Integer(3),Integer(4)]
>>> q = [Integer(3),Integer(1),Integer(2)]
>>> from sage.combinat.permutation_cython import left_action_product
>>> left_action_product(p, q)
[3, 2, 1, 4]
>>> left_action_product(q, p)
[1, 3, 2, 4]
>>> q
[3, 1, 2]
```

`sage.combinat.permutation_cython.`**`left_action_same_n`**`(S, lp)`

Return the permutation obtained by composing a permutation `S` with a permutation `lp` in such an order that `lp` is applied first and `S` is applied afterwards and `S` and `lp` are of the same length.

See also

sage.combinat.permutation.Permutation.left_action_product()

EXAMPLES:

```
sage: p = [2,1,3]
sage: q = [3,1,2]
sage: from sage.combinat.permutation_cython import left_action_same_n
sage: left_action_same_n(p, q)
[3, 2, 1]
sage: left_action_same_n(q, p)
[1, 3, 2]
```

```
>>> from sage.all import *
>>> p = [Integer(2),Integer(1),Integer(3)]
>>> q = [Integer(3),Integer(1),Integer(2)]
>>> from sage.combinat.permutation_cython import left_action_same_n
>>> left_action_same_n(p, q)
[3, 2, 1]
>>> left_action_same_n(q, p)
[1, 3, 2]
```

sage.combinat.permutation_cython.**map_to_list**(*l*, *values*, *n*)

Build a list by mapping the array `l` using `values`.

Warning

There is no check of the input data at any point. Using wrong types or values with wrong length is likely to result in a Sage crash.

INPUT:

- `l` – array of unsigned int (i.e., type `'I'`)
- `values` – tuple; the values of the permutation
- `n` – integer; the length of the array `l`

OUTPUT: list representing the permutation

EXAMPLES:

```
sage: from array import array
sage: from sage.combinat.permutation_cython import map_to_list
sage: l = array('I', [0, 1, 0, 3, 3, 0, 1])
sage: map_to_list(l, ('a', 'b', 'c', 'd'), 7)
['a', 'b', 'a', 'd', 'd', 'a', 'b']
```

```
>>> from sage.all import *
>>> from array import array
>>> from sage.combinat.permutation_cython import map_to_list
>>> l = array('I', [Integer(0), Integer(1), Integer(0), Integer(3), Integer(3),␣
```

(continues on next page)

(continued from previous page)

```
↪Integer(0), Integer(1)])
>>> map_to_list(l, ('a', 'b', 'c', 'd'), Integer(7))
['a', 'b', 'a', 'd', 'd', 'a', 'b']
```

sage.combinat.permutation_cython.**next_perm**(*l*)

Obtain the next permutation under lex order of `l` by mutating `l`.

Algorithm based on: http://marknelson.us/2002/03/01/next-permutation/

INPUT:

- `l` – array of unsigned int (i.e., type `'I'`)

Warning: This method mutates the array `l`.

OUTPUT: boolean; whether another permutation was obtained

EXAMPLES:

```
sage: from sage.combinat.permutation_cython import next_perm
sage: from array import array
sage: L = array('I', [1, 1, 2, 3])
sage: while next_perm(L):
....:     print(L)
array('I', [1, 1, 3, 2])
array('I', [1, 2, 1, 3])
array('I', [1, 2, 3, 1])
array('I', [1, 3, 1, 2])
array('I', [1, 3, 2, 1])
array('I', [2, 1, 1, 3])
array('I', [2, 1, 3, 1])
array('I', [2, 3, 1, 1])
array('I', [3, 1, 1, 2])
array('I', [3, 1, 2, 1])
array('I', [3, 2, 1, 1])
```

```
>>> from sage.all import *
>>> from sage.combinat.permutation_cython import next_perm
>>> from array import array
>>> L = array('I', [Integer(1), Integer(1), Integer(2), Integer(3)])
>>> while next_perm(L):
...     print(L)
array('I', [1, 1, 3, 2])
array('I', [1, 2, 1, 3])
array('I', [1, 2, 3, 1])
array('I', [1, 3, 1, 2])
array('I', [1, 3, 2, 1])
array('I', [2, 1, 1, 3])
array('I', [2, 1, 3, 1])
array('I', [2, 3, 1, 1])
array('I', [3, 1, 1, 2])
```

(continues on next page)

(continued from previous page)

```
array('I', [3, 1, 2, 1])
array('I', [3, 2, 1, 1])
```

sage.combinat.permutation_cython.**permutation_iterator_transposition_list**(*n*)

Return a list of transposition indices to enumerate the permutations on n letters by adjacent transpositions. Assumes zero-based lists. We artificially limit the argument to $n < 12$ to avoid overflowing 32-bit pointers. While the algorithm works for larger n, the user is encouraged to avoid filling anything more than 4GB of memory with the output of this function.

EXAMPLES:

```

[[1, 2, 3, 4], [1, 3, 2, 4], [3, 1, 2, 4], [3, 2, 1, 4], [2, 3, 1, 4], [2, 1, 3,␣
↪4]]
```

sage.combinat.permutation_cython.**right_action_product**(*S*, *rp*)

Return the permutation obtained by composing a permutation `S` with a permutation `rp` in such an order that `S` is applied first and `rp` is applied afterwards.

See also

sage.combinat.permutation.Permutation.right_action_product()

EXAMPLES:

```
sage: p = [2,1,3,4]
sage: q = [3,1,2]
sage: from sage.combinat.permutation_cython import right_action_product
sage: right_action_product(p, q)
[1, 3, 2, 4]
sage: right_action_product(q, p)
[3, 2, 1, 4]
sage: q
[3, 1, 2]
```

```
>>> from sage.all import *
>>> p = [Integer(2),Integer(1),Integer(3),Integer(4)]
>>> q = [Integer(3),Integer(1),Integer(2)]
>>> from sage.combinat.permutation_cython import right_action_product
>>> right_action_product(p, q)
[1, 3, 2, 4]
>>> right_action_product(q, p)
[3, 2, 1, 4]
>>> q
[3, 1, 2]
```

sage.combinat.permutation_cython.**right_action_same_n**(*S*, *rp*)

Return the permutation obtained by composing a permutation `S` with a permutation `rp` in such an order that `S` is applied first and `rp` is applied afterwards and `S` and `rp` are of the same length.

See also

sage.combinat.permutation.Permutation.right_action_product()

EXAMPLES:

```
sage: p = [2,1,3]
sage: q = [3,1,2]
sage: from sage.combinat.permutation_cython import right_action_same_n
```

(continues on next page)

(continued from previous page)

```

>>> from sage.combinat.permutation_cython import right_action_same_n
>>> right_action_same_n(p, q)
[1, 3, 2]
>>> right_action_same_n(q, p)
[3, 2, 1]
```

5.1.174 Posets

Common posets can be accessed through `posets.<tab>` and are listed in the posets catalog:

- *Catalog of posets and lattices*

Poset-related classes:

- *Finite posets*
- *Finite lattices and semilattices*
- *Linear Extensions of Posets*
- *D-Complete Posets*
- *Forest Posets*
- *Mobile posets*
- *Incidence Algebras*
- *Cartesian products of Posets*
- *Möbius Algebras*
- *Generalized Tamari lattices*
- *Tamari Interval-posets*
- *Shard intersection order*

If you are looking for Poset-related `categories`, see `Posets`, `FinitePosets`, `LatticePosets` and `FiniteLatticePosets`.

5.1.175 Cartesian products of Posets

AUTHORS:

- Daniel Krenn (2015)

class `sage.combinat.posets.cartesian_product.`**`CartesianProductPoset`**(*sets*, *category*, *order=None*, ***kwargs*)

Bases: `CartesianProduct`

A class implementing Cartesian products of posets (and elements thereof). Compared to `CartesianProduct` you are able to specify an order for comparison of the elements.

INPUT:

- `sets` – tuple of parents
- `category` – a subcategory of `Sets().CartesianProducts() & Posets()`
- `order` – string or function specifying an order less or equal; it can be one of the following:
  - `'native'` – elements are ordered by their native ordering, i.e., the order the wrapped elements (tuples) provide
  - `'lex'` – elements are ordered lexicographically
  - `'product'` – an element is less or equal to another element, if less or equal is true for all its components (Cartesian projections)
  - a function which performs the comparison $\leq$; it takes two input arguments and outputs a boolean

Other keyword arguments (`kwargs`) are passed to the constructor of `CartesianProduct`.

EXAMPLES:

```
sage: P = Poset((srange(3), lambda left, right: left <= right))
sage: Cl = cartesian_product((P, P), order='lex')
sage: Cl((1, 1)) <= Cl((2, 0))
True
sage: Cp = cartesian_product((P, P), order='product')
sage: Cp((1, 1)) <= Cp((2, 0))
False
sage: def le_sum(left, right):
....:     return (sum(left) < sum(right) or
....:             sum(left) == sum(right) and left[0] <= right[0])
sage: Cs = cartesian_product((P, P), order=le_sum)
sage: Cs((1, 1)) <= Cs((2, 0))
True
```

```
>>> from sage.all import *
>>> P = Poset((srange(Integer(3)), lambda left, right: left <= right))
>>> Cl = cartesian_product((P, P), order='lex')
>>> Cl((Integer(1), Integer(1))) <= Cl((Integer(2), Integer(0)))
True
>>> Cp = cartesian_product((P, P), order='product')
>>> Cp((Integer(1), Integer(1))) <= Cp((Integer(2), Integer(0)))
False
>>> def le_sum(left, right):
...     return (sum(left) < sum(right) or
...             sum(left) == sum(right) and left[Integer(0)] <= right[Integer(0)])
>>> Cs = cartesian_product((P, P), order=le_sum)
>>> Cs((Integer(1), Integer(1))) <= Cs((Integer(2), Integer(0)))
True
```

See also:

`CartesianProduct`

class Element

Bases: `Element`

le(*left*, *right*)

Test whether `left` is less than or equal to `right`.

INPUT:

- `left` – an element
- `right` – an element

OUTPUT: boolean

Note

This method uses the order defined on creation of this Cartesian product. See `CartesianProductPoset`.

EXAMPLES:

```
sage: P = posets.ChainPoset(10)
sage: def le_sum(left, right):
....:     return (sum(left) < sum(right) or
....:             sum(left) == sum(right) and left[0] <= right[0])
sage: C = cartesian_product((P, P), order=le_sum)
sage: C.le(C((1, 6)), C((6, 1)))
True
sage: C.le(C((6, 1)), C((1, 6)))
False
sage: C.le(C((1, 6)), C((6, 6)))
True
sage: C.le(C((6, 6)), C((1, 6)))
False
```

```
>>> from sage.all import *
>>> P = posets.ChainPoset(Integer(10))
>>> def le_sum(left, right):
...     return (sum(left) < sum(right) or
...             sum(left) == sum(right) and left[Integer(0)] <=␣
↪right[Integer(0)])
>>> C = cartesian_product((P, P), order=le_sum)
>>> C.le(C((Integer(1), Integer(6))), C((Integer(6), Integer(1))))
True
>>> C.le(C((Integer(6), Integer(1))), C((Integer(1), Integer(6))))
False
>>> C.le(C((Integer(1), Integer(6))), C((Integer(6), Integer(6))))
True
>>> C.le(C((Integer(6), Integer(6))), C((Integer(1), Integer(6))))
False
```

le_lex(*left*, *right*)

Test whether `left` is lexicographically smaller or equal to `right`.

INPUT:

- `left` – an element
- `right` – an element

OUTPUT: boolean

EXAMPLES:

```
sage: P = Poset((srange(2), lambda left, right: left <= right))
sage: Q = cartesian_product((P, P), order='lex')
sage: T = [Q((0, 0)), Q((1, 1)), Q((0, 1)), Q((1, 0))]
sage: for a in T:
....:     for b in T:
....:         assert Q.le(a, b) == (a <= b)
....:         print('%s <= %s = %s' % (a, b, a <= b))
(0, 0) <= (0, 0) = True
(0, 0) <= (1, 1) = True
(0, 0) <= (0, 1) = True
(0, 0) <= (1, 0) = True
(1, 1) <= (0, 0) = False
(1, 1) <= (1, 1) = True
(1, 1) <= (0, 1) = False
(1, 1) <= (1, 0) = False
(0, 1) <= (0, 0) = False
(0, 1) <= (1, 1) = True
(0, 1) <= (0, 1) = True
(0, 1) <= (1, 0) = True
(1, 0) <= (0, 0) = False
(1, 0) <= (1, 1) = True
(1, 0) <= (0, 1) = False
(1, 0) <= (1, 0) = True
```

```
>>> from sage.all import *
>>> P = Poset((srange(Integer(2)), lambda left, right: left <= right))
>>> Q = cartesian_product((P, P), order='lex')
>>> T = [Q((Integer(0), Integer(0))), Q((Integer(1), Integer(1))),
→Q((Integer(0), Integer(1))), Q((Integer(1), Integer(0)))]
>>> for a in T:
...     for b in T:
...         assert Q.le(a, b) == (a <= b)
...         print('%s <= %s = %s' % (a, b, a <= b))
(0, 0) <= (0, 0) = True
(0, 0) <= (1, 1) = True
(0, 0) <= (0, 1) = True
(0, 0) <= (1, 0) = True
(1, 1) <= (0, 0) = False
(1, 1) <= (1, 1) = True
(1, 1) <= (0, 1) = False
(1, 1) <= (1, 0) = False
(0, 1) <= (0, 0) = False
(0, 1) <= (1, 1) = True
(0, 1) <= (0, 1) = True
(0, 1) <= (1, 0) = True
(1, 0) <= (0, 0) = False
(1, 0) <= (1, 1) = True
(1, 0) <= (0, 1) = False
(1, 0) <= (1, 0) = True
```

le_native(*left*, *right*)

Test whether `left` is smaller or equal to `right` in the order provided by the elements themselves.

INPUT:

- `left` – an element
- `right` – an element

OUTPUT: boolean

EXAMPLES:

```
sage: P = Poset((srange(2), lambda left, right: left <= right))
sage: Q = cartesian_product((P, P), order='native')
sage: T = [Q((0, 0)), Q((1, 1)), Q((0, 1)), Q((1, 0))]
sage: for a in T:
....:     for b in T:
....:         assert Q.le(a, b) == (a <= b)
....:         print('%s <= %s = %s' % (a, b, a <= b))
(0, 0) <= (0, 0) = True
(0, 0) <= (1, 1) = True
(0, 0) <= (0, 1) = True
(0, 0) <= (1, 0) = True
(1, 1) <= (0, 0) = False
(1, 1) <= (1, 1) = True
(1, 1) <= (0, 1) = False
(1, 1) <= (1, 0) = False
(0, 1) <= (0, 0) = False
(0, 1) <= (1, 1) = True
(0, 1) <= (0, 1) = True
(0, 1) <= (1, 0) = True
(1, 0) <= (0, 0) = False
(1, 0) <= (1, 1) = True
(1, 0) <= (0, 1) = False
(1, 0) <= (1, 0) = True
```

```
>>> from sage.all import *
>>> P = Poset((srange(Integer(2)), lambda left, right: left <= right))
>>> Q = cartesian_product((P, P), order='native')
>>> T = [Q((Integer(0), Integer(0))), Q((Integer(1), Integer(1))),
↪Q((Integer(0), Integer(1))), Q((Integer(1), Integer(0)))]
>>> for a in T:
...     for b in T:
...         assert Q.le(a, b) == (a <= b)
...         print('%s <= %s = %s' % (a, b, a <= b))
(0, 0) <= (0, 0) = True
(0, 0) <= (1, 1) = True
(0, 0) <= (0, 1) = True
(0, 0) <= (1, 0) = True
(1, 1) <= (0, 0) = False
(1, 1) <= (1, 1) = True
(1, 1) <= (0, 1) = False
(1, 1) <= (1, 0) = False
(0, 1) <= (0, 0) = False
(0, 1) <= (1, 1) = True
```

(continues on next page)

(continued from previous page)

```
(0, 1) <= (0, 1) = True
(0, 1) <= (1, 0) = True
(1, 0) <= (0, 0) = False
(1, 0) <= (1, 1) = True
(1, 0) <= (0, 1) = False
(1, 0) <= (1, 0) = True
```

le_product (*left*, *right*)

Test whether `left` is component-wise smaller or equal to `right`.

INPUT:

- `left` – an element
- `right` – an element

OUTPUT: boolean

The comparison is `True` if the result of the comparison in each component is `True`.

EXAMPLES:

```
sage: P = Poset((srange(2), lambda left, right: left <= right))
sage: Q = cartesian_product((P, P), order='product')
sage: T = [Q((0, 0)), Q((1, 1)), Q((0, 1)), Q((1, 0))]
sage: for a in T:
....:     for b in T:
....:         assert Q.le(a, b) == (a <= b)
....:         print('%s <= %s = %s' % (a, b, a <= b))
(0, 0) <= (0, 0) = True
(0, 0) <= (1, 1) = True
(0, 0) <= (0, 1) = True
(0, 0) <= (1, 0) = True
(1, 1) <= (0, 0) = False
(1, 1) <= (1, 1) = True
(1, 1) <= (0, 1) = False
(1, 1) <= (1, 0) = False
(0, 1) <= (0, 0) = False
(0, 1) <= (1, 1) = True
(0, 1) <= (0, 1) = True
(0, 1) <= (1, 0) = False
(1, 0) <= (0, 0) = False
(1, 0) <= (1, 1) = True
(1, 0) <= (0, 1) = False
(1, 0) <= (1, 0) = True
```

```
>>> from sage.all import *
>>> P = Poset((srange(Integer(2)), lambda left, right: left <= right))
>>> Q = cartesian_product((P, P), order='product')
>>> T = [Q((Integer(0), Integer(0))), Q((Integer(1), Integer(1))),
↪Q((Integer(0), Integer(1))), Q((Integer(1), Integer(0)))]
>>> for a in T:
...     for b in T:
...         assert Q.le(a, b) == (a <= b)
...         print('%s <= %s = %s' % (a, b, a <= b))
```

(continues on next page)

(continued from previous page)

```
(0, 0) <= (0, 0) = True
(0, 0) <= (1, 1) = True
(0, 0) <= (0, 1) = True
(0, 0) <= (1, 0) = True
(1, 1) <= (0, 0) = False
(1, 1) <= (1, 1) = True
(1, 1) <= (0, 1) = False
(1, 1) <= (1, 0) = False
(0, 1) <= (0, 0) = False
(0, 1) <= (1, 1) = True
(0, 1) <= (0, 1) = True
(0, 1) <= (1, 0) = False
(1, 0) <= (0, 0) = False
(1, 0) <= (1, 1) = True
(1, 0) <= (0, 1) = False
(1, 0) <= (1, 0) = True
```

5.1.176 D-Complete Posets

AUTHORS:

- Stefan Grosser (06-2020): initial implementation

class sage.combinat.posets.d_complete.**DCompletePoset**(*hasse_diagram*, *elements*, *category*, *facade*, *key*)

Bases: *FiniteJoinSemilattice*

A d-complete poset.

D-complete posets are a class of posets introduced by Proctor in [Proc1999]. It includes common families such as shapes, shifted shapes, and rooted forests. Proctor showed in [PDynk1999] that d-complete posets have decompositions in *irreducible* posets, and showed in [Proc2014] that d-complete posets admit a hook-length formula (see Wikipedia article Hook_length_formula). A complete proof of the hook-length formula can be found in [KY2019].

EXAMPLES:

```
sage: from sage.combinat.posets.poset_examples import Posets
sage: P = Posets.DoubleTailedDiamond(2)
sage: TestSuite(P).run()
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.poset_examples import Posets
>>> P = Posets.DoubleTailedDiamond(Integer(2))
>>> TestSuite(P).run()
```

get_hook(*elmt*)

Return the hook length of the element `elmt`.

EXAMPLES:

```
sage: from sage.combinat.posets.d_complete import DCompletePoset
sage: P = DCompletePoset(DiGraph({0: [1], 1: [2]}))
sage: P.get_hook(1)
2
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.d_complete import DCompletePoset
>>> P = DCompletePoset(DiGraph({Integer(0): [Integer(1)], Integer(1):␣
→[Integer(2)]}))
>>> P.get_hook(Integer(1))
2
```

get_hooks()

Return all the hook lengths as a dictionary.

EXAMPLES:

```
sage: from sage.combinat.posets.d_complete import DCompletePoset
sage: P = DCompletePoset(DiGraph({0: [1, 2], 1: [3], 2: [3], 3: []}))
sage: P.get_hooks()
{0: 1, 1: 2, 2: 2, 3: 3}
sage: from sage.combinat.posets.poset_examples import Posets
sage: YDP321 = Posets.YoungDiagramPoset(Partition([3,2,1]))
sage: P = DCompletePoset(YDP321._hasse_diagram.reverse())
sage: P.get_hooks()
{0: 5, 1: 3, 2: 1, 3: 3, 4: 1, 5: 1}
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.d_complete import DCompletePoset
>>> P = DCompletePoset(DiGraph({Integer(0): [Integer(1), Integer(2)],␣
→Integer(1): [Integer(3)], Integer(2): [Integer(3)], Integer(3): []}))
>>> P.get_hooks()
{0: 1, 1: 2, 2: 2, 3: 3}
>>> from sage.combinat.posets.poset_examples import Posets
>>> YDP321 = Posets.YoungDiagramPoset(Partition([Integer(3),Integer(2),
→Integer(1)]))
>>> P = DCompletePoset(YDP321._hasse_diagram.reverse())
>>> P.get_hooks()
{0: 5, 1: 3, 2: 1, 3: 3, 4: 1, 5: 1}
```

hook_product()

Return the hook product for the poset.

5.1.177 Mobile posets

class sage.combinat.posets.mobile.**MobilePoset**(*hasse_diagram*, *elements*, *category*, *facade*, *key*, *ribbon=None*, *check=True*)

Bases: *FinitePoset*

A mobile poset.

Mobile posets are an extension of d-complete posets which permit a determinant formula for counting linear extensions. They are formed by having a ribbon poset with d-complete posets 'hanging' below it and at most one d-complete poset above it, known as the anchor. See [GGMM2020] for the definition.

EXAMPLES:

```
sage: P = posets.MobilePoset(posets.RibbonPoset(7, [1,3]),                    #␣
→needs sage.combinat sage.modules
```

(continues on next page)

(continued from previous page)

```
....:                          {1: [posets.YoungDiagramPoset([3, 2], dual=True)],
....:                           3: [posets.DoubleTailedDiamond(6)]},
....:                          anchor=(4, 2, posets.ChainPoset(6)))
sage: len(P._ribbon)                                                          #␣
↪needs sage.combinat sage.modules
8
sage: P._anchor                                                               #␣
↪needs sage.combinat sage.modules
(4, 5)
```

```
>>> from sage.all import *
>>> P = posets.MobilePoset(posets.RibbonPoset(Integer(7), [Integer(1),
↪Integer(3)]),                          # needs sage.combinat sage.modules
...                        {Integer(1): [posets.YoungDiagramPoset([Integer(3),␣
↪Integer(2)], dual=True)],
...                         Integer(3): [posets.DoubleTailedDiamond(Integer(6))]},
...                        anchor=(Integer(4), Integer(2), posets.
↪ChainPoset(Integer(6))))
>>> len(P._ribbon)                                                          #␣
↪needs sage.combinat sage.modules
8
>>> P._anchor                                                               #␣
↪needs sage.combinat sage.modules
(4, 5)
```

This example is Example 5.9 in [GGMM2020]:

```
sage: P1 = posets.MobilePoset(posets.RibbonPoset(8, [2,3,4]),
....:                         {4: [posets.ChainPoset(1)]},
....:                         anchor=(3, 0, posets.ChainPoset(1)))
sage: sorted([P1._element_to_vertex(i) for i in P1._ribbon])
[0, 1, 2, 6, 7, 9]
sage: P1._anchor
(3, 2)

>>> EP = posets.MobilePoset(posets.ChainPoset(Integer(0)), {})
Traceback (most recent call last):
...
ValueError: the empty poset is not a mobile poset
```

anchor()

Return the anchor of the mobile poset.

EXAMPLES:

```
sage: from sage.combinat.posets.mobile import MobilePoset
sage: M2 = MobilePoset(Poset([[0,1,2,3,4,5,6,7,8],
....:           [(1,0),(3,0),(2,1),(2,3),(4,3),(5,4),(7,4),(7,8)]]))
sage: M2.anchor()
(4, 3)
sage: M3 = MobilePoset(Posets.RibbonPoset(5, [1,2]))
sage: M3.anchor() is None
True
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.mobile import MobilePoset
>>> M2 = MobilePoset(Poset([[Integer(0),Integer(1),Integer(2),Integer(3),
↪Integer(4),Integer(5),Integer(6),Integer(7),Integer(8)],
...           [(Integer(1),Integer(0)),(Integer(3),Integer(0)),(Integer(2),
↪Integer(1)),(Integer(2),Integer(3)),(Integer(4),Integer(3)),(Integer(5),
↪Integer(4)),(Integer(7),Integer(4)),(Integer(7),Integer(8))]]))
>>> M2.anchor()
(4, 3)
>>> M3 = MobilePoset(Posets.RibbonPoset(Integer(5), [Integer(1),Integer(2)]))
>>> M3.anchor() is None
True
```

ribbon()

Return the ribbon of the mobile poset.

EXAMPLES:

```
sage: from sage.combinat.posets.mobile import MobilePoset
sage: M3 = MobilePoset(Posets.RibbonPoset(5, [1,2]))
sage: sorted(M3.ribbon())
[1, 2, 3, 4]
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.mobile import MobilePoset
>>> M3 = MobilePoset(Posets.RibbonPoset(Integer(5), [Integer(1),Integer(2)]))
>>> sorted(M3.ribbon())
[1, 2, 3, 4]
```

5.1.178 Elements of posets, lattices, semilattices, etc.

class sage.combinat.posets.elements.**JoinSemilatticeElement**(*poset*, *element*, *vertex*)

Bases: *PosetElement*

class sage.combinat.posets.elements.**LatticePosetElement**(*poset*, *element*, *vertex*)

Bases: *MeetSemilatticeElement*, *JoinSemilatticeElement*

class sage.combinat.posets.elements.**MeetSemilatticeElement**(*poset*, *element*, *vertex*)

Bases: *PosetElement*

class sage.combinat.posets.elements.**PosetElement**(*poset*, *element*, *vertex*)

Bases: Element

Establish the parent-child relationship between `poset` and `element`, where `element` is associated to the vertex `vertex` of the Hasse diagram of the poset.

INPUT:

- `poset` – a poset object
- `element` – any object
- `vertex` – a vertex of the Hasse diagram of the poset

5.1.179 Forest Posets

AUTHORS:

- Stefan Grosser (06-2020): initial implementation

class sage.combinat.posets.forest.**ForestPoset**(*hasse_diagram*, *elements*, *category*, *facade*, *key*)

Bases: *FinitePoset*

A forest poset is a poset where the underlying Hasse diagram and is directed acyclic graph.

5.1.180 Hasse diagrams of posets

antichains()	Return all antichains of `self`, organized as a prefix tree.
antichains_iterator()	Return an iterator over the antichains of the poset.

continues on next page

Table 4 – continued from previous page

are_comparable()	Return whether i and j are comparable in the poset.
are_incomparable()	Return whether i and j are incomparable in the poset.
atoms_of_congruence_lattice()	Return atoms of the congruence lattice.
bottom_moebius_function()	Return the value of the Möbius function of the poset on the elements zero and j, where zero is self.bottom(), the unique minimal element of the poset.
cardinality()	Return the number of elements in the poset.
chain_polynomial()	Return the chain polynomial of the poset.
chains()	Return all chains of self, organized as a prefix tree.
closed_interval()	Return a list of the elements z of self such that $x \leq z \leq y$.
common_lower_covers()	Return the list of all common lower covers of vertices.
common_upper_covers()	Return the list of all common upper covers of vertices.
congruence()	Return the congruence start "extended" by parts.
congruences_iterator()	Return an iterator over all congruences of the lattice.
cover_relations()	Return the list of cover relations.
cover_relations_iterator()	Iterate over cover relations.
covers()	Return True if y covers x and False otherwise.
diamonds()	Return the list of diamonds of self.
dual()	Return a poset that is dual to the given poset.
find_nonsemidistributive_elements()	Check if the lattice is semidistributive or not.
find_nonsemimodular_pair()	Return pair of elements showing the lattice is not modular.
find_nontrivial_congruence()	Return a pair that generates non-trivial congruence or None if there is not any.
frattini_sublattice()	Return the list of elements of the Frattini sublattice of the lattice.
greedy_linear_extensions_iterator()	Return an iterator over greedy linear extensions of the Hasse diagram.
has_bottom()	Return True if the poset has a unique minimal element.
has_top()	Return True if the poset contains a unique maximal element, and False otherwise.
interval_iterator()	Return an iterator of the elements z of self such that $x \leq z \leq y$.
is_antichain_of_poset()	Return True if elms is an antichain of the Hasse diagram and False otherwise.
is_bounded()	Return True if the poset contains a unique maximal element and a unique minimal element, and False otherwise.
is_chain()	Return True if the poset is totally ordered, and False otherwise.
is_complemented()	Return an element of the lattice that has no complement.
is_congruence_normal()	Return True if the lattice can be constructed from the one-element lattice with Day doubling constructions of convex subsets.
is_convex_subset()	Return True if S is a convex subset of the poset, and False otherwise.
is_gequal()	Return True if x is greater than or equal to y, and False otherwise.
is_greater_than()	Return True if x is greater than but not equal to y, and False otherwise.
is_join_semilattice()	Return True if self has a join operation, and False otherwise.
is_lequal()	Return True if i is less than or equal to j in the poset, and False otherwise.
is_less_than()	Return True if x is less than but not equal to y in the poset, and False otherwise.
is_linear_extension()	Test if an ordering is a linear extension.
is_linear_interval()	Return whether the interval [t_min, t_max] is linear.
is_meet_semilattice()	Return True if self has a meet operation, and False otherwise.
is_ranked()	Return True if the poset is ranked, and False otherwise.
join_matrix()	Return the matrix of joins of self, when self is a join-semilattice; raise an error otherwise.

continues on next page

Table 4 – continued from previous page

`kappa()`	Return the maximum element greater than the element covered by `a` but not greater than `a`.
`kappa_dual()`	Return the minimum element smaller than the element covering `a` but not smaller than `a`.
`lequal_matrix()`	Return a matrix whose `(i,j)` entry is 1 if `i` is less than `j` in the poset, and 0 otherwise; and redefines `__lt__` to use the boolean version of this matrix.
`linear_extension()`	Return a linear extension.
`linear_extensions()`	Return an iterator over all linear extensions.
`lower_covers_iterator()`	Return the list of elements that are covered by `element`.
`maximal_elements()`	Return a list of the maximal elements of the poset.
`maximal_sublattices()`	Return maximal sublattices of the lattice.
`meet_matrix()`	Return the matrix of meets of `self`, when `self` is a meet-semilattice; raise an error otherwise.
`minimal_elements()`	Return a list of the minimal elements of the poset.
`moebius_function()`	Return the value of the Möbius function of the poset on the elements `i` and `j`.
`moebius_function_matrix()`	Return the matrix of the Möbius function of this poset.
`neutral_elements()`	Return the list of neutral elements of the lattice.
`open_interval()`	Return a list of the elements z of `self` such that $x < z < y$.
`order_filter()`	Return the order filter generated by a list of elements.
`order_ideal()`	Return the order ideal generated by a list of elements.
`order_ideal_cardinality()`	Return the cardinality of the order ideal generated by `elements`.
`orthocomplementations_iterator()`	Return an iterator over orthocomplementations of the lattice.
`prime_elements()`	Return the join-prime and meet-prime elements of the bounded poset.
`principal_congruences_poset()`	Return the poset of join-irreducibles of the congruence lattice.
`principal_order_filter()`	Return the order filter generated by `i`.
`principal_order_ideal()`	Return the order ideal generated by i.
`pseudocomplement()`	Return the pseudocomplement of `element`, if it exists.
`rank()`	Return the rank of `element`, or the rank of the poset if `element` is `None`. (The rank of a poset is the length of the longest chain of elements of the poset.)
`rank_function()`	Return the (normalized) rank function of the poset, if it exists.
`skeleton()`	Return the skeleton of the lattice.
`sublattices_iterator()`	Return an iterator over sublattices of the Hasse diagram.
`supergreedy_linear_extensions_iterator()`	Return an iterator over supergreedy linear extensions of the Hasse diagram.
`top()`	Return the top element of the poset, if it exists.
`upper_covers_iterator()`	Return the list of elements that cover `element`.
`vertical_decomposition()`	Return vertical decomposition of the lattice.

class `sage.combinat.posets.hasse_diagram.`**`HasseDiagram`**(*data=None*, *pos=None*, *loops=None*, *format=None*, *weighted=None*, *data_structure='sparse'*, *vertex_labels=True*, *name=None*, *multiedges=None*, *convert_empty_dict_labels_to_None=None*, *sparse=True*, *immutable=False*, *hash_labels=None*)

Bases: `DiGraph`

The Hasse diagram of a poset. This is just a transitively-reduced, directed, acyclic graph without loops or multiple edges.

Note: We assume that `range(n)` is a linear extension of the poset. That is, `range(n)` is the vertex set and a topological sort of the digraph.

This should not be called directly, use Poset instead; all type checking happens there.

EXAMPLES:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: H = HasseDiagram({0:[1,2],1:[3],2:[3],3:[]}); H
Hasse diagram of a poset containing 4 elements
sage: TestSuite(H).run()
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> H = HasseDiagram({Integer(0):[Integer(1),Integer(2)],Integer(1):[Integer(3)],
↪Integer(2):[Integer(3)],Integer(3):[]}); H
Hasse diagram of a poset containing 4 elements
>>> TestSuite(H).run()
```

antichains(*element_class=<class 'list'>*)

Return all antichains of `self`, organized as a prefix tree.

INPUT:

- `element_class` – (default: `list`) an iterable type

EXAMPLES:

```
sage: # needs sage.modules
sage: P = posets.PentagonPoset()
sage: H = P._hasse_diagram
sage: A = H.antichains()
sage: list(A)
[[], [0], [1], [1, 2], [1, 3], [2], [3], [4]]
sage: A.cardinality()
8
sage: [1,3] in A
True
sage: [1,4] in A
False
```

```
>>> from sage.all import *
>>> # needs sage.modules
>>> P = posets.PentagonPoset()
>>> H = P._hasse_diagram
>>> A = H.antichains()
>>> list(A)
[[], [0], [1], [1, 2], [1, 3], [2], [3], [4]]
>>> A.cardinality()
```

(continues on next page)

(continued from previous page)

```
8
>>> [Integer(1),Integer(3)] in A
True
>>> [Integer(1),Integer(4)] in A
False
```

antichains_iterator()

Return an iterator over the antichains of the poset.

Note

The algorithm is based on Freese-Jezek-Nation p. 226. It does a depth first search through the set of all antichains organized in a prefix tree.

EXAMPLES:

```
sage: # needs sage.modules
sage: P = posets.PentagonPoset()
sage: H = P._hasse_diagram
sage: H.antichains_iterator()
<generator object ...antichains_iterator at ...>
sage: list(H.antichains_iterator())
[[], [4], [3], [2], [1], [1, 3], [1, 2], [0]]
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: H = HasseDiagram({0:[1,2],1:[4],2:[3],3:[4]})
sage: list(H.antichains_iterator())
[[], [4], [3], [2], [1], [1, 3], [1, 2], [0]]
sage: H = HasseDiagram({0:[],1:[],2:[]})
sage: list(H.antichains_iterator())
[[], [2], [1], [1, 2], [0], [0, 2], [0, 1], [0, 1, 2]]
sage: H = HasseDiagram({0:[1],1:[2],2:[3],3:[4]})
sage: list(H.antichains_iterator())
[[], [4], [3], [2], [1], [0]]
```

```
>>> from sage.all import *
>>> # needs sage.modules
>>> P = posets.PentagonPoset()
>>> H = P._hasse_diagram
>>> H.antichains_iterator()
<generator object ...antichains_iterator at ...>
>>> list(H.antichains_iterator())
[[], [4], [3], [2], [1], [1, 3], [1, 2], [0]]
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> H = HasseDiagram({Integer(0):[Integer(1),Integer(2)],
↪Integer(1):[Integer(4)],Integer(2):[Integer(3)],Integer(3):[Integer(4)]})
>>> list(H.antichains_iterator())
[[], [4], [3], [2], [1], [1, 3], [1, 2], [0]]
>>> H = HasseDiagram({Integer(0):[],Integer(1):[],Integer(2):[]})
>>> list(H.antichains_iterator())
[[], [2], [1], [1, 2], [0], [0, 2], [0, 1], [0, 1, 2]]
>>> H = HasseDiagram({Integer(0):[Integer(1)],Integer(1):[Integer(2)],
```

(continues on next page)

(continued from previous page)

```
↪Integer(2):[Integer(3)],Integer(3):[Integer(4)]})
>>> list(H.antichains_iterator())
[[], [4], [3], [2], [1], [0]]
```

are_comparable(*i*, *j*)

Return whether i and j are comparable in the poset.

INPUT:

- i, j – vertices of this Hasse diagram

EXAMPLES:

```
sage: # needs sage.modules
sage: P = posets.PentagonPoset()
sage: H = P._hasse_diagram
sage: H.are_comparable(1,2)
False
sage: V = H.vertices(sort=True)
sage: [ (i,j) for i in V for j in V if H.are_comparable(i,j)]
[(0, 0), (0, 1), (0, 2), (0, 3), (0, 4), (1, 0), (1, 1), (1, 4),
 (2, 0), (2, 2), (2, 3), (2, 4), (3, 0), (3, 2), (3, 3), (3, 4),
 (4, 0), (4, 1), (4, 2), (4, 3), (4, 4)]
```

```
>>> from sage.all import *
>>> # needs sage.modules
>>> P = posets.PentagonPoset()
>>> H = P._hasse_diagram
>>> H.are_comparable(Integer(1),Integer(2))
False
>>> V = H.vertices(sort=True)
>>> [ (i,j) for i in V for j in V if H.are_comparable(i,j)]
[(0, 0), (0, 1), (0, 2), (0, 3), (0, 4), (1, 0), (1, 1), (1, 4),
 (2, 0), (2, 2), (2, 3), (2, 4), (3, 0), (3, 2), (3, 3), (3, 4),
 (4, 0), (4, 1), (4, 2), (4, 3), (4, 4)]
```

are_incomparable(*i*, *j*)

Return whether i and j are incomparable in the poset.

INPUT:

- i, j – vertices of this Hasse diagram

EXAMPLES:

```
sage: # needs sage.modules
sage: P = posets.PentagonPoset()
sage: H = P._hasse_diagram
sage: H.are_incomparable(1,2)
True
sage: V = H.vertices(sort=True)
sage: [ (i,j) for i in V for j in V if H.are_incomparable(i,j)]
[(1, 2), (1, 3), (2, 1), (3, 1)]
```

```
>>> from sage.all import *
>>> # needs sage.modules
>>> P = posets.PentagonPoset()
>>> H = P._hasse_diagram
>>> H.are_incomparable(Integer(1),Integer(2))
True
>>> V = H.vertices(sort=True)
>>> [ (i,j) for i in V for j in V if H.are_incomparable(i,j)]
[(1, 2), (1, 3), (2, 1), (3, 1)]
```

atoms_of_congruence_lattice()

Return atoms of the congruence lattice.

In other words, return "minimal non-trivial" congruences: A congruence is minimal if the only finer (as a partition of set of elements) congruence is the trivial congruence where every block contains only one element.

> **See also**
>
> *congruence()*

OUTPUT:

List of congruences, every congruence as *sage.combinat.set_partition.SetPartition*

EXAMPLES:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: N5 = HasseDiagram({0: [1, 2], 1: [4], 2: [3], 3:[4]})
sage: N5.atoms_of_congruence_lattice()                                      #␣
↪needs sage.combinat sage.modules
[{{0}, {1}, {2, 3}, {4}}]
sage: Hex = HasseDiagram({0: [1, 2], 1: [3], 2: [4], 3: [5], 4: [5]})
sage: Hex.atoms_of_congruence_lattice()                                     #␣
↪needs sage.combinat sage.modules
[{{0}, {1}, {2, 4}, {3}, {5}}, {{0}, {1, 3}, {2}, {4}, {5}}]
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> N5 = HasseDiagram({Integer(0): [Integer(1), Integer(2)], Integer(1):␣
↪[Integer(4)], Integer(2): [Integer(3)], Integer(3):[Integer(4)]})
>>> N5.atoms_of_congruence_lattice()                                      #␣
↪needs sage.combinat sage.modules
[{{0}, {1}, {2, 3}, {4}}]
>>> Hex = HasseDiagram({Integer(0): [Integer(1), Integer(2)], Integer(1):␣
↪[Integer(3)], Integer(2): [Integer(4)], Integer(3): [Integer(5)],␣
↪Integer(4): [Integer(5)]})
>>> Hex.atoms_of_congruence_lattice()                                     #␣
↪needs sage.combinat sage.modules
[{{0}, {1}, {2, 4}, {3}, {5}}, {{0}, {1, 3}, {2}, {4}, {5}}]
```

ALGORITHM:

Every atom is a join-irreducible. Every join-irreducible of $\mathrm{Con}(L)$ is a principal congruence generated by a meet-irreducible element and the only element covering it (and also by a join-irreducible element and the only element covered by it). Hence we check those principal congruences to find the minimal ones.

bottom()

Return the bottom element of the poset, if it exists.

EXAMPLES:

```
sage: P = Poset({0:[3],1:[3],2:[3],3:[4],4:[]})
sage: P.bottom() is None
True
sage: Q = Poset({0:[1],1:[]})
sage: Q.bottom()
0
```

```
>>> from sage.all import *
>>> P = Poset({Integer(0):[Integer(3)],Integer(1):[Integer(3)],
↪Integer(2):[Integer(3)],Integer(3):[Integer(4)],Integer(4):[]})
>>> P.bottom() is None
True
>>> Q = Poset({Integer(0):[Integer(1)],Integer(1):[]})
>>> Q.bottom()
0
```

bottom_moebius_function(*j*)

Return the value of the Möbius function of the poset on the elements `zero` and `j`, where `zero` is `self.bottom()`, the unique minimal element of the poset.

EXAMPLES:

```
sage: P = Poset({0: [1,2]})
sage: hasse = P._hasse_diagram
sage: hasse.bottom_moebius_function(1)
-1
sage: hasse.bottom_moebius_function(2)
-1
sage: P = Poset({0: [1,3], 1:[2], 2:[4], 3:[4]})
sage: hasse = P._hasse_diagram
sage: for i in range(5):
....:   print(hasse.bottom_moebius_function(i))
1
-1
0
-1
1
```

```
>>> from sage.all import *
>>> P = Poset({Integer(0): [Integer(1),Integer(2)]})
>>> hasse = P._hasse_diagram
>>> hasse.bottom_moebius_function(Integer(1))
-1
>>> hasse.bottom_moebius_function(Integer(2))
-1
>>> P = Poset({Integer(0): [Integer(1),Integer(3)], Integer(1):[Integer(2)],␣
↪Integer(2):[Integer(4)], Integer(3):[Integer(4)]})
```

(continues on next page)

(continued from previous page)

```
>>> hasse = P._hasse_diagram
>>> for i in range(Integer(5)):
...     print(hasse.bottom_moebius_function(i))
1
-1
0
-1
1
```

cardinality()

Return the number of elements in the poset.

EXAMPLES:

```
sage: Poset([[1,2,3],[4],[4],[4],[]]).cardinality()
5
```

```
>>> from sage.all import *
>>> Poset([[Integer(1),Integer(2),Integer(3)],[Integer(4)],[Integer(4)],
↪[Integer(4)],[]]).cardinality()
5
```

chain_polynomial()

Return the chain polynomial of the poset.

The coefficient of q^k is the number of chains of k elements in the poset. List of coefficients of this polynomial is also called a *f-vector* of the poset.

EXAMPLES:

```
sage: P = posets.ChainPoset(3)
sage: H = P._hasse_diagram
sage: t = H.chain_polynomial(); t
q^3 + 3*q^2 + 3*q + 1
```

```
>>> from sage.all import *
>>> P = posets.ChainPoset(Integer(3))
>>> H = P._hasse_diagram
>>> t = H.chain_polynomial(); t
q^3 + 3*q^2 + 3*q + 1
```

chains(*element_class=<class 'list'>*, *exclude=None*, *conversion=None*)

Return all chains of `self`, organized as a prefix tree.

INPUT:

- `element_class` – (default: `list`) an iterable type
- `exclude` – elements of the poset to be excluded (default: `None`)
- `conversion` – (default: `None`) used to pass the list of elements of the poset in their fixed order

OUTPUT:

The enumerated set (with a forest structure given by prefix ordering) consisting of all chains of `self`, each of which is given as an `element_class`.

If `conversion` is given, then the chains are converted to chain of elements of this list.

EXAMPLES:

```
sage: # needs sage.modules
sage: P = posets.PentagonPoset()
sage: H = P._hasse_diagram
sage: A = H.chains()
sage: list(A)
[[], [0], [0, 1], [0, 1, 4], [0, 2], [0, 2, 3], [0, 2, 3, 4], [0, 2, 4],
 [0, 3], [0, 3, 4], [0, 4], [1], [1, 4], [2], [2, 3], [2, 3, 4], [2, 4],
 [3], [3, 4], [4]]
sage: A.cardinality()
20
sage: [1,3] in A
False
sage: [1,4] in A
True
```

```
>>> from sage.all import *
>>> # needs sage.modules
>>> P = posets.PentagonPoset()
>>> H = P._hasse_diagram
>>> A = H.chains()
>>> list(A)
[[], [0], [0, 1], [0, 1, 4], [0, 2], [0, 2, 3], [0, 2, 3, 4], [0, 2, 4],
 [0, 3], [0, 3, 4], [0, 4], [1], [1, 4], [2], [2, 3], [2, 3, 4], [2, 4],
 [3], [3, 4], [4]]
>>> A.cardinality()
20
>>> [Integer(1),Integer(3)] in A
False
>>> [Integer(1),Integer(4)] in A
True
```

One can exclude some vertices:

```
sage: # needs sage.modules
sage: list(H.chains(exclude=[4, 3]))
[[], [0], [0, 1], [0, 2], [1], [2]]
```

```
>>> from sage.all import *
>>> # needs sage.modules
>>> list(H.chains(exclude=[Integer(4), Integer(3)]))
[[], [0], [0, 1], [0, 2], [1], [2]]
```

The `element_class` keyword determines how the chains are being returned:

```
sage: P = Poset({1: [2, 3], 2: [4]})
sage: list(P._hasse_diagram.chains(element_class=tuple))
[(), (0,), (0, 1), (0, 1, 2), (0, 2), (0, 3), (1,), (1, 2), (2,), (3,)]
sage: list(P._hasse_diagram.chains())
[[], [0], [0, 1], [0, 1, 2], [0, 2], [0, 3], [1], [1, 2], [2], [3]]
```

```
>>> from sage.all import *
>>> P = Poset({Integer(1): [Integer(2), Integer(3)], Integer(2): [Integer(4)]}
↪)
>>> list(P._hasse_diagram.chains(element_class=tuple))
[(), (0,), (0, 1), (0, 1, 2), (0, 2), (0, 3), (1,), (1, 2), (2,), (3,)]
>>> list(P._hasse_diagram.chains())
[[], [0], [0, 1], [0, 1, 2], [0, 2], [0, 3], [1], [1, 2], [2], [3]]
```

(Note that taking the Hasse diagram has renamed the vertices.)

```
sage: list(P._hasse_diagram.chains(element_class=tuple, exclude=[0]))
[(), (1,), (1, 2), (2,), (3,)]
```

```
>>> from sage.all import *
>>> list(P._hasse_diagram.chains(element_class=tuple, exclude=[Integer(0)]))
[(), (1,), (1, 2), (2,), (3,)]
```

See also

antichains()

closed_interval(*x*, *y*)

Return a list of the elements z of `self` such that $x \leq z \leq y$.

The order is that induced by the ordering in `self.linear_extension`.

INPUT:

- `x` – any element of the poset
- `y` – any element of the poset

Note

The method `_precompute_intervals()` creates a cache which is used if available, making the function very fast.

See also

interval_iterator()

EXAMPLES:

```
sage: uc = [[1,3,2],[4],[4,5,6],[6],[7],[7],[7],[]]
sage: dag = DiGraph(dict(zip(range(len(uc)),uc)))
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: H = HasseDiagram(dag)
sage: I = set([2,5,6,4,7])
sage: I == set(H.interval(2,7))
True
```

```
>>> from sage.all import *
>>> uc = [[Integer(1),Integer(3),Integer(2)],[Integer(4)],[Integer(4),
↪Integer(5),Integer(6)],[Integer(6)],[Integer(7)],[Integer(7)],[Integer(7)],
↪[]]
>>> dag = DiGraph(dict(zip(range(len(uc)),uc)))
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> H = HasseDiagram(dag)
>>> I = set([Integer(2),Integer(5),Integer(6),Integer(4),Integer(7)])
>>> I == set(H.interval(Integer(2),Integer(7)))
True
```

common_lower_covers(*vertices*)

Return the list of all common lower covers of `vertices`.

EXAMPLES:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: H = HasseDiagram({0: [1,2], 1: [3], 2: [3], 3: []})
sage: H.common_lower_covers([1, 2])
[0]

sage: from sage.combinat.posets.poset_examples import Posets
sage: H = Posets.YoungDiagramPoset(Partition([3, 2, 2]))._hasse_diagram     #␣
↪needs sage.combinat sage.modules
sage: H.common_lower_covers([4, 5])                                          #␣
↪needs sage.combinat sage.modules
[3]
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> H = HasseDiagram({Integer(0): [Integer(1),Integer(2)], Integer(1):␣
↪[Integer(3)], Integer(2): [Integer(3)], Integer(3): []})
>>> H.common_lower_covers([Integer(1), Integer(2)])
[0]

>>> from sage.combinat.posets.poset_examples import Posets
>>> H = Posets.YoungDiagramPoset(Partition([Integer(3), Integer(2),␣
↪Integer(2)]))._hasse_diagram     # needs sage.combinat sage.modules
>>> H.common_lower_covers([Integer(4), Integer(5)])                          ␣
↪              # needs sage.combinat sage.modules
[3]
```

common_upper_covers(*vertices*)

Return the list of all common upper covers of `vertices`.

EXAMPLES:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: H = HasseDiagram({0: [1,2], 1: [3], 2: [3], 3: []})
sage: H.common_upper_covers([1, 2])
[3]

sage: from sage.combinat.posets.poset_examples import Posets
```

(continues on next page)

(continued from previous page)

```
sage: H = Posets.YoungDiagramPoset(Partition([3, 2, 2]))._hasse_diagram     #␣
↪needs sage.combinat sage.modules
sage: H.common_upper_covers([4, 5])                                          #␣
↪needs sage.combinat sage.modules
[6]
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> H = HasseDiagram({Integer(0): [Integer(1),Integer(2)], Integer(1):␣
↪[Integer(3)], Integer(2): [Integer(3)], Integer(3): []})
>>> H.common_upper_covers([Integer(1), Integer(2)])
[3]

>>> from sage.combinat.posets.poset_examples import Posets
>>> H = Posets.YoungDiagramPoset(Partition([Integer(3), Integer(2),␣
↪Integer(2)]))._hasse_diagram     # needs sage.combinat sage.modules
>>> H.common_upper_covers([Integer(4), Integer(5)])                          ␣
↪              # needs sage.combinat sage.modules
[6]
```

congruence(*parts*, *start=None*, *stop_pairs=None*)

Return the congruence `start` "extended" by `parts`.

`start` is assumed to be a valid congruence of the lattice, and this is *not* checked.

INPUT:

- `parts` – list of lists; congruences to add
- `start` – a disjoint set; already computed congruence (or `None`)
- `stop_pairs` – list of pairs; list of pairs for stopping computation

OUTPUT:

`None`, if the congruence generated by `start` and `parts` together contains a block that has elements a, b so that `(a, b)` is in the list `stop_pairs`. Otherwise the least congruence that contains a block whose subset is p for every p in `parts` or `start`, given as `sage.sets.disjoint_set.DisjointSet_class`.

ALGORITHM:

Use the quadrilateral argument from page 120 of [Dav1997].

Basically we take one block from todo-list, search quadrilateral blocks up and down against the block, and then complete them to closed intervals and add to todo-list.

EXAMPLES:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: H = HasseDiagram({0: [1, 2], 1: [3], 2: [4], 3: [4]})
sage: cong = H.congruence([[0, 1]]); cong                                    #␣
↪needs sage.modules
{{0, 1, 3}, {2, 4}}
sage: H.congruence([[0, 2]], start=cong)                                     #␣
↪needs sage.modules
{{0, 1, 2, 3, 4}}
```

(continues on next page)

(continued from previous page)

```
sage: H.congruence([[0, 1]], stop_pairs=[(1, 3)]) is None                    #␣
↪needs sage.modules
True
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> H = HasseDiagram({Integer(0): [Integer(1), Integer(2)], Integer(1):␣
↪[Integer(3)], Integer(2): [Integer(4)], Integer(3): [Integer(4)]})
>>> cong = H.congruence([[Integer(0), Integer(1)]]); cong                     ␣
↪               # needs sage.modules
{{0, 1, 3}, {2, 4}}
>>> H.congruence([[Integer(0), Integer(2)]], start=cong)                      ␣
↪               # needs sage.modules
{{0, 1, 2, 3, 4}}

>>> H.congruence([[Integer(0), Integer(1)]], stop_pairs=[(Integer(1),␣
↪Integer(3))]) is None                          # needs sage.modules
True
```

congruences_iterator()

Return an iterator over all congruences of the lattice.

EXAMPLES:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: H = HasseDiagram('GY@OQ?OW@?O?')
sage: it = H.congruences_iterator(); it
<generator object ...>
sage: sorted([cong.number_of_subsets() for cong in it])                       #␣
↪needs sage.combinat sage.modules
[1, 2, 2, 2, 4, 4, 4, 8]
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> H = HasseDiagram('GY@OQ?OW@?O?')
>>> it = H.congruences_iterator(); it
<generator object ...>
>>> sorted([cong.number_of_subsets() for cong in it])                       #␣
↪needs sage.combinat sage.modules
[1, 2, 2, 2, 4, 4, 4, 8]
```

cover_relations()

Return the list of cover relations.

EXAMPLES:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: H = HasseDiagram({0:[2,3], 1:[3,4], 2:[5], 3:[5], 4:[5]})
sage: H.cover_relations()
[(0, 2), (0, 3), (1, 3), (1, 4), (2, 5), (3, 5), (4, 5)]
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> H = HasseDiagram({Integer(0):[Integer(2),Integer(3)],
↪Integer(1):[Integer(3),Integer(4)], Integer(2):[Integer(5)],
↪Integer(3):[Integer(5)], Integer(4):[Integer(5)]})
>>> H.cover_relations()
[(0, 2), (0, 3), (1, 3), (1, 4), (2, 5), (3, 5), (4, 5)]
```

cover_relations_iterator()

Iterate over cover relations.

EXAMPLES:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: H = HasseDiagram({0:[2,3], 1:[3,4], 2:[5], 3:[5], 4:[5]})
sage: list(H.cover_relations_iterator())
[(0, 2), (0, 3), (1, 3), (1, 4), (2, 5), (3, 5), (4, 5)]
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> H = HasseDiagram({Integer(0):[Integer(2),Integer(3)],
↪Integer(1):[Integer(3),Integer(4)], Integer(2):[Integer(5)],
↪Integer(3):[Integer(5)], Integer(4):[Integer(5)]})
>>> list(H.cover_relations_iterator())
[(0, 2), (0, 3), (1, 3), (1, 4), (2, 5), (3, 5), (4, 5)]
```

covers(*x*, *y*)

Return `True` if y covers x and `False` otherwise.

EXAMPLES:

```
sage: Q = Poset([[1,5],[2,6],[3],[4],[],[6,3],[4]])
sage: Q.covers(Q(1),Q(6))
True
sage: Q.covers(Q(1),Q(4))
False
```

```
>>> from sage.all import *
>>> Q = Poset([[Integer(1),Integer(5)],[Integer(2),Integer(6)],[Integer(3)],
↪[Integer(4)],[],[Integer(6),Integer(3)],[Integer(4)]])
>>> Q.covers(Q(Integer(1)),Q(Integer(6)))
True
>>> Q.covers(Q(Integer(1)),Q(Integer(4)))
False
```

coxeter_transformation(*algorithm='cython'*)

Return the matrix of the Auslander-Reiten translation acting on the Grothendieck group of the derived category of modules on the poset, in the basis of simple modules.

INPUT:

- `algorithm` – `'cython'` (default) or `'matrix'`

This uses either a specific matrix code in Cython, or generic matrices.

See also

lequal_matrix(), *moebius_function_matrix()*

EXAMPLES:

```
sage: # needs sage.libs.flint sage.modules
sage: P = posets.PentagonPoset()._hasse_diagram
sage: M = P.coxeter_transformation(); M
[ 0  0  0  0 -1]
[ 0  0  0  1 -1]
[ 0  1  0  0 -1]
[-1  1  1  0 -1]
[-1  1  0  1 -1]
sage: P.__dict__['coxeter_transformation'].clear_cache()
sage: P.coxeter_transformation(algorithm='matrix') == M
True
```

```
>>> from sage.all import *
>>> # needs sage.libs.flint sage.modules
>>> P = posets.PentagonPoset()._hasse_diagram
>>> M = P.coxeter_transformation(); M
[ 0  0  0  0 -1]
[ 0  0  0  1 -1]
[ 0  1  0  0 -1]
[-1  1  1  0 -1]
[-1  1  0  1 -1]
>>> P.__dict__['coxeter_transformation'].clear_cache()
>>> P.coxeter_transformation(algorithm='matrix') == M
True
```

diamonds()

Return the list of diamonds of `self`.

A diamond is the following subgraph of the Hasse diagram:

```
  z
 / \
x   y
 \ /
  w
```

Thus each edge represents a cover relation in the Hasse diagram. We represent his as the tuple (w, x, y, z).

OUTPUT: a tuple with

- a list of all diamonds in the Hasse Diagram,
- a boolean checking that every w, x, y that form a `V`, there is a unique element z, which completes the diamond.

EXAMPLES:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: H = HasseDiagram({0: [1,2], 1: [3], 2: [3], 3: []})
```

(continues on next page)

(continued from previous page)

```
sage: H.diamonds()
([(0, 1, 2, 3)], True)

sage: P = posets.YoungDiagramPoset(Partition([3, 2, 2]))                    #␣
↪needs sage.combinat sage.modules
sage: H = P._hasse_diagram                                                   #␣
↪needs sage.combinat sage.modules
sage: H.diamonds()                                                           #␣
↪needs sage.combinat sage.modules
([(0, 1, 3, 4), (3, 4, 5, 6)], False)
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> H = HasseDiagram({Integer(0): [Integer(1),Integer(2)], Integer(1):␣
↪[Integer(3)], Integer(2): [Integer(3)], Integer(3): []})
>>> H.diamonds()
([(0, 1, 2, 3)], True)

>>> P = posets.YoungDiagramPoset(Partition([Integer(3), Integer(2),␣
↪Integer(2)]))                    # needs sage.combinat sage.modules
>>> H = P._hasse_diagram                                                    #␣
↪needs sage.combinat sage.modules
>>> H.diamonds()                                                            #␣
↪needs sage.combinat sage.modules
([(0, 1, 3, 4), (3, 4, 5, 6)], False)
```

dual()

Return a poset that is dual to the given poset.

This means that it has the same elements but opposite order. The elements are renumbered to ensure that `range(n)` is a linear extension.

EXAMPLES:

```
sage: P = posets.IntegerPartitions(4)                                       #␣
↪needs sage.combinat
sage: H = P._hasse_diagram; H                                               #␣
↪needs sage.combinat
Hasse diagram of a poset containing 5 elements
sage: H.dual()                                                              #␣
↪needs sage.combinat
Hasse diagram of a poset containing 5 elements
```

```
>>> from sage.all import *
>>> P = posets.IntegerPartitions(Integer(4))                                 ␣
↪      # needs sage.combinat
>>> H = P._hasse_diagram; H                                                 #␣
↪needs sage.combinat
Hasse diagram of a poset containing 5 elements
>>> H.dual()                                                                #␣
↪needs sage.combinat
Hasse diagram of a poset containing 5 elements
```

find_nonsemidistributive_elements(*meet_or_join*)

Check if the lattice is semidistributive or not.

INPUT:

- `meet_or_join` – string `'meet'` or `'join'` to decide if to check for join-semidistributivity or meet-semidistributivity

OUTPUT:

- `None` if the lattice is semidistributive OR
- tuple `(u, e, x, y)` such that $u = e \vee x = e \vee y$ but $u \neq e \vee (x \wedge y)$ if `meet_or_join=='join'` and $u = e \wedge x = e \wedge y$ but $u \neq e \wedge (x \vee y)$ if `meet_or_join=='meet'`

EXAMPLES:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: H = HasseDiagram({0:[1, 2], 1:[3, 4], 2:[4, 5], 3:[6],
....:                   4:[6], 5:[6]})
sage: H.find_nonsemidistributive_elements('join') is None                   #␣
↪needs sage.modules
False
sage: H.find_nonsemidistributive_elements('meet') is None                   #␣
↪needs sage.modules
True
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> H = HasseDiagram({Integer(0):[Integer(1), Integer(2)],␣
↪Integer(1):[Integer(3), Integer(4)], Integer(2):[Integer(4), Integer(5)],␣
↪Integer(3):[Integer(6)],
...                   Integer(4):[Integer(6)], Integer(5):[Integer(6)]})
>>> H.find_nonsemidistributive_elements('join') is None                   #␣
↪needs sage.modules
False
>>> H.find_nonsemidistributive_elements('meet') is None                   #␣
↪needs sage.modules
True
```

find_nonsemimodular_pair(*upper*)

Return pair of elements showing the lattice is not modular.

INPUT:

- `upper` – boolean; if `True`, test whether the lattice is upper semimodular. Otherwise test whether the lattice is lower semimodular.

OUTPUT:

`None`, if the lattice is semimodular. Pair (a, b) violating semimodularity otherwise.

EXAMPLES:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: H = HasseDiagram({0:[1, 2], 1:[3, 4], 2:[4, 5], 3:[6], 4:[6], 5:[6]})
sage: H.find_nonsemimodular_pair(upper=True) is None
True
```

(continues on next page)

(continued from previous page)

```
sage: H.find_nonsemimodular_pair(upper=False)
(5, 3)

sage: H_ = HasseDiagram(H.reverse().relabel(lambda x: 6-x, inplace=False))
sage: H_.find_nonsemimodular_pair(upper=True)
(3, 1)
sage: H_.find_nonsemimodular_pair(upper=False) is None
True
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> H = HasseDiagram({Integer(0):[Integer(1), Integer(2)],
↪Integer(1):[Integer(3), Integer(4)], Integer(2):[Integer(4), Integer(5)],
↪Integer(3):[Integer(6)], Integer(4):[Integer(6)], Integer(5):[Integer(6)]})
>>> H.find_nonsemimodular_pair(upper=True) is None
True
>>> H.find_nonsemimodular_pair(upper=False)
(5, 3)

>>> H_ = HasseDiagram(H.reverse().relabel(lambda x: Integer(6)-x,
↪inplace=False))
>>> H_.find_nonsemimodular_pair(upper=True)
(3, 1)
>>> H_.find_nonsemimodular_pair(upper=False) is None
True
```

find_nontrivial_congruence()

Return a pair that generates non-trivial congruence or `None` if there is not any.

EXAMPLES:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: H = HasseDiagram({0: [1, 2], 1: [5], 2: [3, 4], 3: [5], 4: [5]})
sage: H.find_nontrivial_congruence()                                    #
↪needs sage.modules
{{0, 1}, {2, 3, 4, 5}}

sage: H = HasseDiagram({0: [1, 2, 3], 1: [4], 2: [4], 3: [4]})
sage: H.find_nontrivial_congruence() is None                            #
↪needs sage.modules
True
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> H = HasseDiagram({Integer(0): [Integer(1), Integer(2)], Integer(1):
↪[Integer(5)], Integer(2): [Integer(3), Integer(4)], Integer(3):
↪[Integer(5)], Integer(4): [Integer(5)]})
>>> H.find_nontrivial_congruence()                                    #
↪needs sage.modules
{{0, 1}, {2, 3, 4, 5}}

>>> H = HasseDiagram({Integer(0): [Integer(1), Integer(2), Integer(3)],
```

(continues on next page)

(continued from previous page)

```
↪Integer(1): [Integer(4)], Integer(2): [Integer(4)], Integer(3):␣
↪[Integer(4)]})
>>> H.find_nontrivial_congruence() is None                              #␣
↪needs sage.modules
True
```

ALGORITHM:

See https://www.math.hawaii.edu/~ralph/Preprints/conlat.pdf:

If Θ is a join irreducible element of a Con(L), then there is at least one join-irreducible j and one meet-irreducible m such that Θ is both the principal congruence generated by (j^*, j), where j^* is the unique lower cover of j, and the principal congruence generated by (m, m^*), where m^* is the unique upper cover of m.

So, we only check join irreducibles or meet irreducibles, whichever is a smaller set. To optimize more we stop computation whenever it finds a pair that we know to generate one-element congruence.

frattini_sublattice()

Return the list of elements of the Frattini sublattice of the lattice.

EXAMPLES:

```
sage: H = posets.PentagonPoset()._hasse_diagram                          #␣
↪needs sage.modules
sage: H.frattini_sublattice()                                            #␣
↪needs sage.modules
[0, 4]
```

```
>>> from sage.all import *
>>> H = posets.PentagonPoset()._hasse_diagram                           #␣
↪needs sage.modules
>>> H.frattini_sublattice()                                             #␣
↪needs sage.modules
[0, 4]
```

greedy_linear_extensions_iterator()

Return an iterator over greedy linear extensions of the Hasse diagram.

A linear extension $[e_1, e_2, \ldots, e_n]$ is *greedy* if for every i either e_{i+1} covers e_i or all upper covers of e_i have at least one lower cover that is not in $[e_1, e_2, \ldots, e_i]$.

Informally said a linear extension is greedy if it "always goes up when possible" and so has no unnecessary jumps.

EXAMPLES:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: N5 = HasseDiagram({0: [1, 2], 2: [3], 1: [4], 3: [4]})
sage: for l in N5.greedy_linear_extensions_iterator():
....:     print(l)
[0, 1, 2, 3, 4]
[0, 2, 3, 1, 4]
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> N5 = HasseDiagram({Integer(0): [Integer(1), Integer(2)], Integer(2):␣
↪[Integer(3)], Integer(1): [Integer(4)], Integer(3): [Integer(4)]})
>>> for l in N5.greedy_linear_extensions_iterator():
...     print(l)
[0, 1, 2, 3, 4]
[0, 2, 3, 1, 4]
```

has_bottom()

Return True if the poset has a unique minimal element.

EXAMPLES:

```
sage: P = Poset({0:[3],1:[3],2:[3],3:[4],4:[]})
sage: P.has_bottom()
False
sage: Q = Poset({0:[1],1:[]})
sage: Q.has_bottom()
True
```

```
>>> from sage.all import *
>>> P = Poset({Integer(0):[Integer(3)],Integer(1):[Integer(3)],
↪Integer(2):[Integer(3)],Integer(3):[Integer(4)],Integer(4):[]})
>>> P.has_bottom()
False
>>> Q = Poset({Integer(0):[Integer(1)],Integer(1):[]})
>>> Q.has_bottom()
True
```

has_top()

Return True if the poset contains a unique maximal element, and False otherwise.

EXAMPLES:

```
sage: P = Poset({0:[3],1:[3],2:[3],3:[4,5],4:[],5:[]})
sage: P.has_top()
False
sage: Q = Poset({0:[1],1:[]})
sage: Q.has_top()
True
```

```
>>> from sage.all import *
>>> P = Poset({Integer(0):[Integer(3)],Integer(1):[Integer(3)],
↪Integer(2):[Integer(3)],Integer(3):[Integer(4),Integer(5)],Integer(4):[],
↪Integer(5):[]})
>>> P.has_top()
False
>>> Q = Poset({Integer(0):[Integer(1)],Integer(1):[]})
>>> Q.has_top()
True
```

interval(x, y)

Return a list of the elements z of self such that $x \leq z \leq y$.

The order is that induced by the ordering in `self.linear_extension`.

INPUT:

- `x` – any element of the poset
- `y` – any element of the poset

Note: The method `_precompute_intervals()` creates a cache which is used if available, making the function very fast.

See also:

interval_iterator()

EXAMPLES:

```
sage: uc = [[1,3,2],[4],[4,5,6],[6],[7],[7],[7],[]]
sage: dag = DiGraph(dict(zip(range(len(uc)),uc)))
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: H = HasseDiagram(dag)
sage: I = set([2,5,6,4,7])
sage: I == set(H.interval(2,7))
True
```

```
>>> from sage.all import *
>>> uc = [[Integer(1),Integer(3),Integer(2)],[Integer(4)],[Integer(4),
↪Integer(5),Integer(6)],[Integer(6)],[Integer(7)],[Integer(7)],[Integer(7)],
↪[]]
>>> dag = DiGraph(dict(zip(range(len(uc)),uc)))
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> H = HasseDiagram(dag)
>>> I = set([Integer(2),Integer(5),Integer(6),Integer(4),Integer(7)])
>>> I == set(H.interval(Integer(2),Integer(7)))
True
```

interval_iterator(x, y)

Return an iterator of the elements z of `self` such that $x \leq z \leq y$.

INPUT:

- `x` – any element of the poset
- `y` – any element of the poset

See also:

interval()

Note

This becomes much faster when first calling `_leq_storage()`, which precomputes the principal upper ideals.

EXAMPLES:

```
sage: uc = [[1,3,2],[4],[4,5,6],[6],[7],[7],[7],[]]
sage: dag = DiGraph(dict(zip(range(len(uc)),uc)))
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: H = HasseDiagram(dag)
sage: I = set([2,5,6,4,7])
sage: I == set(H.interval_iterator(2,7))
True
```

```
>>> from sage.all import *
>>> uc = [[Integer(1),Integer(3),Integer(2)],[Integer(4)],[Integer(4),
↪Integer(5),Integer(6)],[Integer(6)],[Integer(7)],[Integer(7)],[Integer(7)],
↪[]]
>>> dag = DiGraph(dict(zip(range(len(uc)),uc)))
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> H = HasseDiagram(dag)
>>> I = set([Integer(2),Integer(5),Integer(6),Integer(4),Integer(7)])
>>> I == set(H.interval_iterator(Integer(2),Integer(7)))
True
```

is_antichain_of_poset(*elms*)

Return `True` if `elms` is an antichain of the Hasse diagram and `False` otherwise.

EXAMPLES:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: H = HasseDiagram({0: [1, 2, 3], 1: [4], 2: [4], 3: [4]})
sage: H.is_antichain_of_poset([1, 2, 3])
True
sage: H.is_antichain_of_poset([0, 2, 3])
False
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> H = HasseDiagram({Integer(0): [Integer(1), Integer(2), Integer(3)],␣
↪Integer(1): [Integer(4)], Integer(2): [Integer(4)], Integer(3):␣
↪[Integer(4)]})
>>> H.is_antichain_of_poset([Integer(1), Integer(2), Integer(3)])
True
>>> H.is_antichain_of_poset([Integer(0), Integer(2), Integer(3)])
False
```

is_bounded()

Return `True` if the poset contains a unique maximal element and a unique minimal element, and `False` otherwise.

EXAMPLES:

```
sage: P = Poset({0:[3],1:[3],2:[3],3:[4,5],4:[],5:[]})
sage: P.is_bounded()
False
sage: Q = Poset({0:[1],1:[]})
sage: Q.is_bounded()
True
```

```
>>> from sage.all import *
>>> P = Poset({Integer(0):[Integer(3)],Integer(1):[Integer(3)],
↪Integer(2):[Integer(3)],Integer(3):[Integer(4),Integer(5)],Integer(4):[],
↪Integer(5):[]})
>>> P.is_bounded()
False
>>> Q = Poset({Integer(0):[Integer(1)],Integer(1):[]})
>>> Q.is_bounded()
True
```

is_chain()

Return `True` if the poset is totally ordered, and `False` otherwise.

EXAMPLES:

```
sage: L = Poset({0:[1],1:[2],2:[3],3:[4]})
sage: L.is_chain()
True
sage: V = Poset({0:[1,2]})
sage: V.is_chain()
False
```

```
>>> from sage.all import *
>>> L = Poset({Integer(0):[Integer(1)],Integer(1):[Integer(2)],
↪Integer(2):[Integer(3)],Integer(3):[Integer(4)]})
>>> L.is_chain()
True
>>> V = Poset({Integer(0):[Integer(1),Integer(2)]})
>>> V.is_chain()
False
```

is_complemented()

Return an element of the lattice that has no complement.

If the lattice is complemented, return `None`.

EXAMPLES:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram

sage: H = HasseDiagram({0:[1, 2], 1:[3], 2:[3], 3:[4]})
sage: H.is_complemented()                                                    #␣
↪needs sage.modules
1

sage: H = HasseDiagram({0:[1, 2, 3], 1:[4], 2:[4], 3:[4]})
sage: H.is_complemented() is None                                            #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.modules
True
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram

>>> H = HasseDiagram({Integer(0):[Integer(1), Integer(2)],␣
↪Integer(1):[Integer(3)], Integer(2):[Integer(3)], Integer(3):[Integer(4)]})
>>> H.is_complemented()                                              #␣
↪needs sage.modules
1

>>> H = HasseDiagram({Integer(0):[Integer(1), Integer(2), Integer(3)],␣
↪Integer(1):[Integer(4)], Integer(2):[Integer(4)], Integer(3):[Integer(4)]})
>>> H.is_complemented() is None                                      #␣
↪needs sage.modules
True
```

is_congruence_normal()

Return `True` if the lattice can be constructed from the one-element lattice with Day doubling constructions of convex subsets.

Subsets to double does not need to be lower nor upper pseudo-intervals. On the other hand they must be convex, i.e. doubling a non-convex but municipal subset will give a lattice that returns `False` from this function.

EXAMPLES:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: H = HasseDiagram('IX?Q@?AG?OG?W?O@??')
sage: H.is_congruence_normal()                                         #␣
↪needs sage.combinat sage.modules
True
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> H = HasseDiagram('IX?Q@?AG?OG?W?O@??')
>>> H.is_congruence_normal()                                         #␣
↪needs sage.combinat sage.modules
True
```

The 5-element diamond is the smallest non-example:

```
sage: H = HasseDiagram({0: [1, 2, 3], 1: [4], 2: [4], 3: [4]})
sage: H.is_congruence_normal()                                         #␣
↪needs sage.combinat sage.modules
False
```

```
>>> from sage.all import *
>>> H = HasseDiagram({Integer(0): [Integer(1), Integer(2), Integer(3)],␣
↪Integer(1): [Integer(4)], Integer(2): [Integer(4)], Integer(3):␣
↪[Integer(4)]})
```

(continues on next page)

(continued from previous page)

```
>>> H.is_congruence_normal()                                                    #␣
↪needs sage.combinat sage.modules
False
```

This is done by doubling a non-convex subset:

```
sage: H = HasseDiagram('OQC?a?@CO?G_C@?GA?O??_??@?BO?A_?G??C??_?@???')
sage: H.is_congruence_normal()                                                  #␣
↪needs sage.combinat sage.modules
False
```

```
>>> from sage.all import *
>>> H = HasseDiagram('OQC?a?@CO?G_C@?GA?O??_??@?BO?A_?G??C??_?@???')
>>> H.is_congruence_normal()                                                    #␣
↪needs sage.combinat sage.modules
False
```

ALGORITHM:

See http://www.math.hawaii.edu/~jb/inflation.pdf

is_convex_subset (S)

Return `True` if S is a convex subset of the poset, and `False` otherwise.

A subset S is *convex* in the poset if $b \in S$ whenever $a, c \in S$ and $a \le b \le c$.

EXAMPLES:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: B3 = HasseDiagram({0: [1, 2, 4], 1: [3, 5], 2: [3, 6],
....:                    3: [7], 4: [5, 6], 5: [7], 6: [7]})
sage: B3.is_convex_subset([1, 3, 5, 4])  # Also connected
True
sage: B3.is_convex_subset([1, 3, 4])  # Not connected
True

sage: B3.is_convex_subset([0, 1, 2, 3, 6])  # No, 0 < 4 < 6
False
sage: B3.is_convex_subset([0, 1, 2, 7])  # No, 1 < 3 < 7.
False
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> B3 = HasseDiagram({Integer(0): [Integer(1), Integer(2), Integer(4)],␣
↪Integer(1): [Integer(3), Integer(5)], Integer(2): [Integer(3), Integer(6)],
...                    Integer(3): [Integer(7)], Integer(4): [Integer(5),␣
↪Integer(6)], Integer(5): [Integer(7)], Integer(6): [Integer(7)]})
>>> B3.is_convex_subset([Integer(1), Integer(3), Integer(5), Integer(4)])  #␣
↪Also connected
True
>>> B3.is_convex_subset([Integer(1), Integer(3), Integer(4)])  # Not connected
True

>>> B3.is_convex_subset([Integer(0), Integer(1), Integer(2), Integer(3),␣
```

(continues on next page)

(continued from previous page)

```
↪Integer(6)])  # No, 0 < 4 < 6
False
>>> B3.is_convex_subset([Integer(0), Integer(1), Integer(2), Integer(7)])  #␣
↪No, 1 < 3 < 7.
False
```

is_gequal(*x*, *y*)

Return `True` if `x` is greater than or equal to `y`, and `False` otherwise.

EXAMPLES:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: Q = HasseDiagram({0:[2], 1:[2], 2:[3], 3:[4], 4:[]})
sage: x,y,z = 0,1,4
sage: Q.is_gequal(x,y)
False
sage: Q.is_gequal(y,x)
False
sage: Q.is_gequal(x,z)
False
sage: Q.is_gequal(z,x)
True
sage: Q.is_gequal(z,y)
True
sage: Q.is_gequal(z,z)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> Q = HasseDiagram({Integer(0):[Integer(2)], Integer(1):[Integer(2)],␣
↪Integer(2):[Integer(3)], Integer(3):[Integer(4)], Integer(4):[]})
>>> x,y,z = Integer(0),Integer(1),Integer(4)
>>> Q.is_gequal(x,y)
False
>>> Q.is_gequal(y,x)
False
>>> Q.is_gequal(x,z)
False
>>> Q.is_gequal(z,x)
True
>>> Q.is_gequal(z,y)
True
>>> Q.is_gequal(z,z)
True
```

is_greater_than(*x*, *y*)

Return `True` if `x` is greater than but not equal to `y`, and `False` otherwise.

EXAMPLES:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: Q = HasseDiagram({0:[2], 1:[2], 2:[3], 3:[4], 4:[]})
sage: x,y,z = 0,1,4
```

(continues on next page)

(continued from previous page)

```
sage: Q.is_greater_than(x,y)
False
sage: Q.is_greater_than(y,x)
False
sage: Q.is_greater_than(x,z)
False
sage: Q.is_greater_than(z,x)
True
sage: Q.is_greater_than(z,y)
True
sage: Q.is_greater_than(z,z)
False
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> Q = HasseDiagram({Integer(0):[Integer(2)], Integer(1):[Integer(2)],
↪Integer(2):[Integer(3)], Integer(3):[Integer(4)], Integer(4):[]})
>>> x,y,z = Integer(0),Integer(1),Integer(4)
>>> Q.is_greater_than(x,y)
False
>>> Q.is_greater_than(y,x)
False
>>> Q.is_greater_than(x,z)
False
>>> Q.is_greater_than(z,x)
True
>>> Q.is_greater_than(z,y)
True
>>> Q.is_greater_than(z,z)
False
```

is_join_semilattice()

Return `True` if `self` has a join operation, and `False` otherwise.

EXAMPLES:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: H = HasseDiagram({0:[1,3,2],1:[4],2:[4,5,6],3:[6],4:[7],5:[7],6:[7],
↪7:[]})
sage: H.is_join_semilattice()                                          #␣
↪needs sage.modules
True
sage: H = HasseDiagram({0:[2,3],1:[2,3]})
sage: H.is_join_semilattice()                                          #␣
↪needs sage.modules
False
sage: H = HasseDiagram({0:[2,3],1:[2,3],2:[4],3:[4]})
sage: H.is_join_semilattice()                                          #␣
↪needs sage.modules
False
```

```
>>> from sage.all import *
```

(continues on next page)

(continued from previous page)

```
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> H = HasseDiagram({Integer(0):[Integer(1),Integer(3),Integer(2)],
↪Integer(1):[Integer(4)],Integer(2):[Integer(4),Integer(5),Integer(6)],
↪Integer(3):[Integer(6)],Integer(4):[Integer(7)],Integer(5):[Integer(7)],
↪Integer(6):[Integer(7)],Integer(7):[]})
>>> H.is_join_semilattice()                                             #␣
↪needs sage.modules
True
>>> H = HasseDiagram({Integer(0):[Integer(2),Integer(3)],
↪Integer(1):[Integer(2),Integer(3)]})
>>> H.is_join_semilattice()                                             #␣
↪needs sage.modules
False
>>> H = HasseDiagram({Integer(0):[Integer(2),Integer(3)],
↪Integer(1):[Integer(2),Integer(3)],Integer(2):[Integer(4)],
↪Integer(3):[Integer(4)]})
>>> H.is_join_semilattice()                                             #␣
↪needs sage.modules
False
```

is_lequal(*i*, *j*)

Return `True` if i is less than or equal to j in the poset, and `False` otherwise.

> **Note**
>
> If the *lequal_matrix()* has been computed, then this method is redefined to use the cached data (see `_alternate_is_lequal()`).

EXAMPLES:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: H = HasseDiagram({0:[2], 1:[2], 2:[3], 3:[4], 4:[]})
sage: x,y,z = 0, 1, 4
sage: H.is_lequal(x,y)
False
sage: H.is_lequal(y,x)
False
sage: H.is_lequal(x,z)
True
sage: H.is_lequal(y,z)
True
sage: H.is_lequal(z,z)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> H = HasseDiagram({Integer(0):[Integer(2)], Integer(1):[Integer(2)],␣
↪Integer(2):[Integer(3)], Integer(3):[Integer(4)], Integer(4):[]})
>>> x,y,z = Integer(0), Integer(1), Integer(4)
>>> H.is_lequal(x,y)
False
```

(continues on next page)

(continued from previous page)

```
>>> H.is_lequal(y,x)
False
>>> H.is_lequal(x,z)
True
>>> H.is_lequal(y,z)
True
>>> H.is_lequal(z,z)
True
```

is_less_than(*x*, *y*)

Return `True` if `x` is less than but not equal to `y` in the poset, and `False` otherwise.

EXAMPLES:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: H = HasseDiagram({0:[2], 1:[2], 2:[3], 3:[4], 4:[]})
sage: x,y,z = 0, 1, 4
sage: H.is_less_than(x,y)
False
sage: H.is_less_than(y,x)
False
sage: H.is_less_than(x,z)
True
sage: H.is_less_than(y,z)
True
sage: H.is_less_than(z,z)
False
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> H = HasseDiagram({Integer(0):[Integer(2)], Integer(1):[Integer(2)],␣
↪Integer(2):[Integer(3)], Integer(3):[Integer(4)], Integer(4):[]})
>>> x,y,z = Integer(0), Integer(1), Integer(4)
>>> H.is_less_than(x,y)
False
>>> H.is_less_than(y,x)
False
>>> H.is_less_than(x,z)
True
>>> H.is_less_than(y,z)
True
>>> H.is_less_than(z,z)
False
```

is_linear_extension(*lin_ext=None*)

Test if an ordering is a linear extension.

EXAMPLES:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: H = HasseDiagram({0:[1,2],1:[3],2:[3],3:[]})
sage: H.is_linear_extension(list(range(4)))
True
```

(continues on next page)

(continued from previous page)

```
sage: H.is_linear_extension([3,2,1,0])
False
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> H = HasseDiagram({Integer(0):[Integer(1),Integer(2)],
↪Integer(1):[Integer(3)],Integer(2):[Integer(3)],Integer(3):[]})
>>> H.is_linear_extension(list(range(Integer(4))))
True
>>> H.is_linear_extension([Integer(3),Integer(2),Integer(1),Integer(0)])
False
```

is_linear_interval (*t_min*, *t_max*)

Return whether the interval `[t_min, t_max]` is linear.

This means that this interval is a total order.

EXAMPLES::

sage: # needs sage.modules sage: P = posets.PentagonPoset() sage: H = P._hasse_diagram sage: H.is_linear_interval(0, 4) False sage: H.is_linear_interval(0, 3) True sage: H.is_linear_interval(1, 3) False sage: H.is_linear_interval(1, 1) True

is_meet_semilattice ()

Return `True` if `self` has a meet operation, and `False` otherwise.

EXAMPLES:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: H = HasseDiagram({0:[1,3,2],1:[4],2:[4,5,6],3:[6],4:[7],5:[7],6:[7],
↪7:[]})
sage: H.is_meet_semilattice()                                          #␣
↪needs sage.modules
True

sage: H = HasseDiagram({0:[1,2],1:[3],2:[3],3:[]})
sage: H.is_meet_semilattice()                                          #␣
↪needs sage.modules
True

sage: H = HasseDiagram({0:[2,3],1:[2,3]})
sage: H.is_meet_semilattice()                                          #␣
↪needs sage.modules
False

sage: H = HasseDiagram({0:[1,2],1:[3,4],2:[3,4]})
sage: H.is_meet_semilattice()                                          #␣
↪needs sage.modules
False
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> H = HasseDiagram({Integer(0):[Integer(1),Integer(3),Integer(2)],
↪Integer(1):[Integer(4)],Integer(2):[Integer(4),Integer(5),Integer(6)],
```

(continues on next page)

(continued from previous page)

```
↪Integer(3):[Integer(6)],Integer(4):[Integer(7)],Integer(5):[Integer(7)],
↪Integer(6):[Integer(7)],Integer(7):[]})
>>> H.is_meet_semilattice()                                             #␣
↪needs sage.modules
True

>>> H = HasseDiagram({Integer(0):[Integer(1),Integer(2)],
↪Integer(1):[Integer(3)],Integer(2):[Integer(3)],Integer(3):[]})
>>> H.is_meet_semilattice()                                             #␣
↪needs sage.modules
True

>>> H = HasseDiagram({Integer(0):[Integer(2),Integer(3)],
↪Integer(1):[Integer(2),Integer(3)]})
>>> H.is_meet_semilattice()                                             #␣
↪needs sage.modules
False

>>> H = HasseDiagram({Integer(0):[Integer(1),Integer(2)],
↪Integer(1):[Integer(3),Integer(4)],Integer(2):[Integer(3),Integer(4)]})
>>> H.is_meet_semilattice()                                             #␣
↪needs sage.modules
False
```

is_ranked()

Return `True` if the poset is ranked, and `False` otherwise.

A poset is *ranked* if it admits a rank function. For more information about the rank function, see *rank_function()* and `is_graded()`.

EXAMPLES:

```
sage: P = Poset([[1],[2],[3],[4],[]])
sage: P.is_ranked()
True
sage: Q = Poset([[1,5],[2,6],[3],[4],[],[6,3],[4]])
sage: Q.is_ranked()
False
```

```
>>> from sage.all import *
>>> P = Poset([[Integer(1)],[Integer(2)],[Integer(3)],[Integer(4)],[]])
>>> P.is_ranked()
True
>>> Q = Poset([[Integer(1),Integer(5)],[Integer(2),Integer(6)],[Integer(3)],
↪[Integer(4)],[],[Integer(6),Integer(3)],[Integer(4)]])
>>> Q.is_ranked()
False
```

join_matrix()

Return the matrix of joins of `self`, when `self` is a join-semilattice; raise an error otherwise.

The `(x,y)`-entry of this matrix is the join of `x` and `y` in `self`.

This algorithm is modelled after the algorithm of Freese-Jezek-Nation (p217). It can also be found on page

140 of [Gec81].

Note

If `self` is a join-semilattice, then the return of this method is the same as `_join()`. Once the matrix has been computed, it is stored in `_join()`. Delete this attribute if you want to recompute the matrix.

EXAMPLES:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: H = HasseDiagram({0:[1,3,2],1:[4],2:[4,5,6],3:[6],4:[7],5:[7],6:[7],
↪7:[]})
sage: H.join_matrix()                                                   #␣
↪needs sage.modules
[0 1 2 3 4 5 6 7]
[1 1 4 7 4 7 7 7]
[2 4 2 6 4 5 6 7]
[3 7 6 3 7 7 6 7]
[4 4 4 7 4 7 7 7]
[5 7 5 7 7 5 7 7]
[6 7 6 6 7 7 6 7]
[7 7 7 7 7 7 7 7]
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> H = HasseDiagram({Integer(0):[Integer(1),Integer(3),Integer(2)],
↪Integer(1):[Integer(4)],Integer(2):[Integer(4),Integer(5),Integer(6)],
↪Integer(3):[Integer(6)],Integer(4):[Integer(7)],Integer(5):[Integer(7)],
↪Integer(6):[Integer(7)],Integer(7):[]})
>>> H.join_matrix()                                                     #␣
↪needs sage.modules
[0 1 2 3 4 5 6 7]

[2 4 2 6 4 5 6 7]
[3 7 6 3 7 7 6 7]
[4 4 4 7 4 7 7 7]
[5 7 5 7 7 5 7 7]
[6 7 6 6 7 7 6 7]
[7 7 7 7 7 7 7 7]
```

kappa(*a*)

Return the maximum element greater than the element covered by `a` but not greater than `a`.

Define $\kappa(a)$ as the maximum element of $(\uparrow a_*) \setminus (\uparrow a)$, where a_* is the element covered by a. It is always a meet-irreducible element, if it exists.

Note

Element `a` is expected to be join-irreducible, and this is *not* checked.

INPUT:

- `a` – a join-irreducible element of the lattice

OUTPUT:

The element $\kappa(a)$ or `None` if there is not a unique greatest element with given constraints.

EXAMPLES:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: H = HasseDiagram({0: [1, 2, 3], 1: [4], 2: [4, 5], 3: [5], 4: [6], 5:␣
↪[6]})
sage: H.kappa(1)
5
sage: H.kappa(2) is None
True
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> H = HasseDiagram({Integer(0): [Integer(1), Integer(2), Integer(3)],␣
↪Integer(1): [Integer(4)], Integer(2): [Integer(4), Integer(5)], Integer(3):␣
↪[Integer(5)], Integer(4): [Integer(6)], Integer(5): [Integer(6)]})
>>> H.kappa(Integer(1))
5
>>> H.kappa(Integer(2)) is None
True
```

kappa_dual(*a*)

Return the minimum element smaller than the element covering `a` but not smaller than `a`.

Define $\kappa^*(a)$ as the minimum element of $(\downarrow a_*) \setminus (\downarrow a)$, where a_* is the element covering a. It is always a join-irreducible element, if it exists.

> **Note**
>
> Element `a` is expected to be meet-irreducible, and this is *not* checked.

INPUT:

- `a` – a join-irreducible element of the lattice

OUTPUT:

The element $\kappa^*(a)$ or `None` if there is not a unique smallest element with given constraints.

EXAMPLES:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: H = HasseDiagram({0: [1, 2], 1: [3, 4], 2: [4, 5], 3: [6], 4: [6], 5:␣
↪[6]})
sage: H.kappa_dual(3)
2
sage: H.kappa_dual(4) is None
True
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> H = HasseDiagram({Integer(0): [Integer(1), Integer(2)], Integer(1):␣
```

(continues on next page)

(continued from previous page)

```
↪[Integer(3), Integer(4)], Integer(2): [Integer(4), Integer(5)], Integer(3):␣
↪[Integer(6)], Integer(4): [Integer(6)], Integer(5): [Integer(6)]})
>>> H.kappa_dual(Integer(3))
2
>>> H.kappa_dual(Integer(4)) is None
True
```

lequal_matrix(*boolean=False*)

Return a matrix whose `(i,j)` entry is 1 if `i` is less than `j` in the poset, and 0 otherwise; and redefines `__lt__` to use the boolean version of this matrix.

INPUT:

- `boolean` – flag (default: `False`); whether to return a matrix with coefficients in $\mathbf{F}_(2)$ or in $\mathbf{Z}$

↪needs sage.modules
Finite Field of size 2
```

linear_extension()

Return a linear extension.

EXAMPLES:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: H = HasseDiagram({0:[1,2],1:[3],2:[3],3:[]})
sage: H.linear_extension()
[0, 1, 2, 3]
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> H = HasseDiagram({Integer(0):[Integer(1),Integer(2)],
↪Integer(1):[Integer(3)],Integer(2):[Integer(3)],Integer(3):[]})
>>> H.linear_extension()
[0, 1, 2, 3]
```

linear_extensions()

Return an iterator over all linear extensions.

EXAMPLES:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: H = HasseDiagram({0:[1,2],1:[3],2:[3],3:[]})
sage: list(H.linear_extensions())                                          #␣
↪needs sage.modules
[[0, 1, 2, 3], [0, 2, 1, 3]]
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> H = HasseDiagram({Integer(0):[Integer(1),Integer(2)],
↪Integer(1):[Integer(3)],Integer(2):[Integer(3)],Integer(3):[]})
```

(continues on next page)

(continued from previous page)

```
>>> list(H.linear_extensions())                                        #␣
↪needs sage.modules
[[0, 1, 2, 3], [0, 2, 1, 3]]
```

lower_covers_iterator(*element*)

Return the list of elements that are covered by `element`.

EXAMPLES:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: H = HasseDiagram({0:[1,3,2],1:[4],2:[4,5,6],3:[6],4:[7],5:[7],6:[7],
↪7:[]})
sage: list(H.lower_covers_iterator(0))
[]
sage: list(H.lower_covers_iterator(4))
[1, 2]
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> H = HasseDiagram({Integer(0):[Integer(1),Integer(3),Integer(2)],
↪Integer(1):[Integer(4)],Integer(2):[Integer(4),Integer(5),Integer(6)],
↪Integer(3):[Integer(6)],Integer(4):[Integer(7)],Integer(5):[Integer(7)],
↪Integer(6):[Integer(7)],Integer(7):[]})
>>> list(H.lower_covers_iterator(Integer(0)))
[]
>>> list(H.lower_covers_iterator(Integer(4)))
[1, 2]
```

maximal_elements()

Return a list of the maximal elements of the poset.

EXAMPLES:

```
sage: P = Poset({0:[3],1:[3],2:[3],3:[4],4:[]})
sage: P.maximal_elements()
[4]
```

```
>>> from sage.all import *
>>> P = Poset({Integer(0):[Integer(3)],Integer(1):[Integer(3)],
↪Integer(2):[Integer(3)],Integer(3):[Integer(4)],Integer(4):[]})
>>> P.maximal_elements()
[4]
```

maximal_sublattices()

Return maximal sublattices of the lattice.

EXAMPLES:

```
sage: L = posets.PentagonPoset()                                        #␣
↪needs sage.modules
sage: ms = L._hasse_diagram.maximal_sublattices()                       #␣
↪needs sage.modules
sage: sorted(ms, key=sorted)                                            #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.modules
[{0, 1, 2, 4}, {0, 1, 3, 4}, {0, 2, 3, 4}]
```

```
>>> from sage.all import *
>>> L = posets.PentagonPoset()                                              #␣
↪needs sage.modules
>>> ms = L._hasse_diagram.maximal_sublattices()                             #␣
↪needs sage.modules
>>> sorted(ms, key=sorted)                                                  #␣
↪needs sage.modules
[{0, 1, 2, 4}, {0, 1, 3, 4}, {0, 2, 3, 4}]
```

meet_matrix()

Return the matrix of meets of `self`, when `self` is a meet-semilattice; raise an error otherwise.

The `(x,y)`-entry of this matrix is the meet of `x` and `y` in `self`.

This algorithm is modelled after the algorithm of Freese-Jezek-Nation (p217). It can also be found on page 140 of [Gec81].

Note

If `self` is a meet-semilattice, then the return of this method is the same as `_meet()`. Once the matrix has been computed, it is stored in `_meet()`. Delete this attribute if you want to recompute the matrix.

EXAMPLES:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: H = HasseDiagram({0:[1,3,2],1:[4],2:[4,5,6],3:[6],4:[7],5:[7],6:[7],
↪7:[]})
sage: H.meet_matrix()                                                         #␣

[0 0 2 0 2 5 2 5]
[0 0 2 3 2 2 6 6]
[0 1 2 3 4 5 6 7]
```

REFERENCE:

minimal_elements()

Return a list of the minimal elements of the poset.

EXAMPLES:

```
sage: P = Poset({0:[3],1:[3],2:[3],3:[4],4:[]})
sage: P(0) in P.minimal_elements()
True
sage: P(1) in P.minimal_elements()
True
sage: P(2) in P.minimal_elements()
True
```

```
>>> from sage.all import *
>>> P = Poset({Integer(0):[Integer(3)],Integer(1):[Integer(3)],
↪Integer(2):[Integer(3)],Integer(3):[Integer(4)],Integer(4):[]})
>>> P(Integer(0)) in P.minimal_elements()
True
>>> P(Integer(1)) in P.minimal_elements()
True
>>> P(Integer(2)) in P.minimal_elements()
True
```

moebius_function(i, j)

Return the value of the Möbius function of the poset on the elements `i` and `j`.

EXAMPLES:

```
sage: P = Poset([[1,2,3],[4],[4],[4],[]])
sage: H = P._hasse_diagram
sage: H.moebius_function(0,4)
2
sage: for u,v in P.cover_relations_iterator():
....:     if P.moebius_function(u,v) != -1:
....:         print("Bug in moebius_function!")
```

```
>>> from sage.all import *
>>> P = Poset([[Integer(1),Integer(2),Integer(3)],[Integer(4)],[Integer(4)],
↪[Integer(4)],[]])
>>> H = P._hasse_diagram
>>> H.moebius_function(Integer(0),Integer(4))
2
>>> for u,v in P.cover_relations_iterator():
```

(continues on next page)

(continued from previous page)

```
...     if P.moebius_function(u,v) != -Integer(1):
...         print("Bug in moebius_function!")
```

moebius_function_matrix(*algorithm='cython'*)

Return the matrix of the Möbius function of this poset.

This returns the matrix over **Z** whose `(x, y)` entry is the value of the Möbius function of `self` evaluated on `x` and `y`, and redefines *moebius_function()* to use it.

INPUT:

- `algorithm` – `'recursive'`, `'matrix'` or `'cython'` (default)

This uses either the recursive formula, a generic matrix inversion or a specific matrix inversion coded in Cython.

OUTPUT: a dense matrix for the algorithm `cython`, a sparse matrix otherwise

Note: The result is cached in `_moebius_function_matrix()`.

>>> H = HasseDiagram({Integer(0):[Integer(1),Integer(3),Integer(2)],
↪Integer(1):[Integer(4)],Integer(2):[Integer(4),Integer(5),Integer(6)],
↪Integer(3):[Integer(6)],Integer(4):[Integer(7)],Integer(5):[Integer(7)],
↪Integer(6):[Integer(7)],Integer(7):[]})
>>> H.moebius_function_matrix()                                    #␣
↪needs sage.libs.flint sage.modules
[ 1 -1 -1 -1  1  0  1  0]
[ 0  1  0  0 -1  0  0  0]
```

(continues on next page)

(continued from previous page)

```
[ 0  0  1  0 -1 -1 -1  2]
[ 0  0  0  1  0  0 -1  0]
[ 0  0  0  0  1  0  0 -1]
[ 0  0  0  0  0  1  0 -1]
[ 0  0  0  0  0  0  1 -1]
[ 0  0  0  0  0  0  0  1]
```

neutral_elements()

Return the list of neutral elements of the lattice.

An element a in a lattice is neutral if the sublattice generated by a, x and y is distributive for every x, y in the lattice.

EXAMPLES:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: H = HasseDiagram({0: [1, 2], 1: [4], 2: [3], 3: [4, 5],
....:                    4: [6], 5: [6]})
sage: sorted(H.neutral_elements())                                          #␣
↪needs sage.modules
[0, 4, 6]
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> H = HasseDiagram({Integer(0): [Integer(1), Integer(2)], Integer(1):␣
↪[Integer(4)], Integer(2): [Integer(3)], Integer(3): [Integer(4),␣
↪Integer(5)],
...                    Integer(4): [Integer(6)], Integer(5): [Integer(6)]})
>>> sorted(H.neutral_elements())                                          #␣
↪needs sage.modules
[0, 4, 6]
```

ALGORITHM:

Basically we just check the distributivity against all element pairs x, y to see if element a is neutral or not.

If we found that a, x, y is not a distributive triple, we add all three to list of non-neutral elements. If we found a to be neutral, we add it to list of neutral elements. When testing we skip already found neutral elements, as they can't be our x or y.

We skip a, x, y as trivial if it is a chain. We do that by letting x to be a non-comparable to a; y can be any element.

We first try to found x and y from elements not yet tested, so that we could get three birds with one stone.

And last, the top and bottom elements are always neutral and need not be tested.

open_interval(x, y)

Return a list of the elements z of `self` such that $x < z < y$.

The order is that induced by the ordering in `self.linear_extension`.

EXAMPLES:

```
sage: uc = [[1,3,2],[4],[4,5,6],[6],[7],[7],[7],[]]
sage: dag = DiGraph(dict(zip(range(len(uc)),uc)))
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
```

(continues on next page)

(continued from previous page)

```
sage: H = HasseDiagram(dag)
sage: set([5,6,4]) == set(H.open_interval(2,7))
True
sage: H.open_interval(7,2)
[]
```

```
>>> from sage.all import *
>>> uc = [[Integer(1),Integer(3),Integer(2)],[Integer(4)],[Integer(4),
↪Integer(5),Integer(6)],[Integer(6)],[Integer(7)],[Integer(7)],[Integer(7)],
↪[]]
>>> dag = DiGraph(dict(zip(range(len(uc)),uc)))
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> H = HasseDiagram(dag)
>>> set([Integer(5),Integer(6),Integer(4)]) == set(H.open_interval(Integer(2),
↪Integer(7)))
True
>>> H.open_interval(Integer(7),Integer(2))
[]
```

order_filter(*elements*)

Return the order filter generated by a list of elements.

I is an order filter if, for any x in I and y such that $y \geq x$, then y is in I.

EXAMPLES:

```
sage: H = posets.BooleanLattice(4)._hasse_diagram
sage: H.order_filter([3,8])
[3, 7, 8, 9, 10, 11, 12, 13, 14, 15]
```

```
>>> from sage.all import *
>>> H = posets.BooleanLattice(Integer(4))._hasse_diagram
>>> H.order_filter([Integer(3),Integer(8)])
[3, 7, 8, 9, 10, 11, 12, 13, 14, 15]
```

order_ideal(*elements*)

Return the order ideal generated by a list of elements.

I is an order ideal if, for any x in I and y such that $y \leq x$, then y is in I.

EXAMPLES:

```
sage: H = posets.BooleanLattice(4)._hasse_diagram
sage: H.order_ideal([7,10])
[0, 1, 2, 3, 4, 5, 6, 7, 8, 10]
```

```
>>> from sage.all import *
>>> H = posets.BooleanLattice(Integer(4))._hasse_diagram
>>> H.order_ideal([Integer(7),Integer(10)])
[0, 1, 2, 3, 4, 5, 6, 7, 8, 10]
```

order_ideal_cardinality(*elements*)

Return the cardinality of the order ideal generated by `elements`.

I is an order ideal if, for any x in I and y such that $y \le x$, then y is in I.

EXAMPLES:

```
sage: H = posets.BooleanLattice(4)._hasse_diagram
sage: H.order_ideal_cardinality([7,10])
10
```

```
>>> from sage.all import *
>>> H = posets.BooleanLattice(Integer(4))._hasse_diagram
>>> H.order_ideal_cardinality([Integer(7),Integer(10)])
10
```

orthocomplementations_iterator()

Return an iterator over orthocomplementations of the lattice.

OUTPUT: an iterator that gives plain list of integers

EXAMPLES:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: H = HasseDiagram({0:[1,2], 1:[3,4], 3:[5], 4:[5], 2:[6,7],
....:                   6:[8], 7:[8], 5:[9], 8:[9]})
sage: list(H.orthocomplementations_iterator())                          #␣
↪needs sage.groups
[[9, 8, 5, 6, 7, 2, 3, 4, 1, 0], [9, 8, 5, 7, 6, 2, 4, 3, 1, 0]]
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> H = HasseDiagram({Integer(0):[Integer(1),Integer(2)],␣
↪Integer(1):[Integer(3),Integer(4)], Integer(3):[Integer(5)],␣
↪Integer(4):[Integer(5)], Integer(2):[Integer(6),Integer(7)],
...                   Integer(6):[Integer(8)], Integer(7):[Integer(8)],␣
↪Integer(5):[Integer(9)], Integer(8):[Integer(9)]})
>>> list(H.orthocomplementations_iterator())                          #␣
↪needs sage.groups
[[9, 8, 5, 6, 7, 2, 3, 4, 1, 0], [9, 8, 5, 7, 6, 2, 4, 3, 1, 0]]
```

ALGORITHM:

As `DiamondPoset(2*n+2)` has $(2n)!/(n!2^n)$ different orthocomplementations, the complexity of listing all of them is necessarily $O(n!)$.

An orthocomplemented lattice is self-dual, so that for example orthocomplement of an atom is a coatom. This function basically just computes list of possible orthocomplementations for every element (i.e. they must be complements and "duals"), and then tries to fit them all.

prime_elements()

Return the join-prime and meet-prime elements of the bounded poset.

An element x of a poset P is join-prime if the subposet induced by $\{y \in P \mid y \not\geq x\}$ has a top element. Meet-prime is defined dually.

> **Note**
>
> The poset is expected to be bounded, and this is *not* checked.

OUTPUT:

A pair (j, m) where j is a list of join-prime elements and m is a list of meet-prime elements.

EXAMPLES:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: H = HasseDiagram({0: [1, 2], 1: [3], 2: [4], 3: [4]})
sage: H.prime_elements()
([1, 2], [2, 3])
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> H = HasseDiagram({Integer(0): [Integer(1), Integer(2)], Integer(1):␣
↪[Integer(3)], Integer(2): [Integer(4)], Integer(3): [Integer(4)]})
>>> H.prime_elements()
([1, 2], [2, 3])
```

principal_congruences_poset()

Return the poset of join-irreducibles of the congruence lattice.

OUTPUT:

A pair (P, D) where P is a poset and D is a dictionary.

Elements of P are pairs (x, y) such that x is an element of the lattice and y is an element covering it. In the poset (a, b) is less than (c, d) iff the principal congruence generated by (a, b) is refinement of the principal congruence generated by (c, d).

D is a dictionary from pairs (x, y) to the congruence (given as DisjointSet) generated by the pair.

EXAMPLES:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: N5 = HasseDiagram({0: [1, 2], 1: [4], 2: [3], 3: [4]})
sage: P, D = N5.principal_congruences_poset()                              #␣
↪needs sage.combinat sage.modules
sage: P                                                                    #␣
↪needs sage.combinat sage.modules
Finite poset containing 3 elements
sage: P.bottom()                                                           #␣
↪needs sage.combinat sage.modules
(2, 3)
sage: D[(2, 3)]                                                            #␣
↪needs sage.combinat sage.modules
{{0}, {1}, {2, 3}, {4}}
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> N5 = HasseDiagram({Integer(0): [Integer(1), Integer(2)], Integer(1):␣
↪[Integer(4)], Integer(2): [Integer(3)], Integer(3): [Integer(4)]})
>>> P, D = N5.principal_congruences_poset()                              #␣
↪needs sage.combinat sage.modules
>>> P                                                                    #␣
↪needs sage.combinat sage.modules
Finite poset containing 3 elements
```

(continues on next page)

(continued from previous page)

```
>>> P.bottom()                                                                    #␣
↪needs sage.combinat sage.modules
(2, 3)
>>> D[(Integer(2), Integer(3))]                                                    ␣
↪              # needs sage.combinat sage.modules
{{0}, {1}, {2, 3}, {4}}
```

principal_order_filter(*i*)

Return the order filter generated by `i`.

EXAMPLES:

```
sage: H = posets.BooleanLattice(4)._hasse_diagram
sage: H.principal_order_filter(2)
[2, 3, 6, 7, 10, 11, 14, 15]
```

```
>>> from sage.all import *
>>> H = posets.BooleanLattice(Integer(4))._hasse_diagram
>>> H.principal_order_filter(Integer(2))
[2, 3, 6, 7, 10, 11, 14, 15]
```

principal_order_ideal(*i*)

Return the order ideal generated by i.

EXAMPLES:

```
sage: H = posets.BooleanLattice(4)._hasse_diagram
sage: H.principal_order_ideal(6)
[0, 2, 4, 6]
```

```
>>> from sage.all import *
>>> H = posets.BooleanLattice(Integer(4))._hasse_diagram
>>> H.principal_order_ideal(Integer(6))
[0, 2, 4, 6]
```

pseudocomplement(*element*)

Return the pseudocomplement of `element`, if it exists.

The pseudocomplement is the greatest element whose meet with given element is the bottom element. It may not exist, and then the function returns `None`.

INPUT:

- `element` – an element of the lattice

OUTPUT:

An element of the Hasse diagram, i.e. an integer, or `None` if the pseudocomplement does not exist.

EXAMPLES:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: H = HasseDiagram({0: [1, 2], 1: [3], 2: [4], 3: [4]})
sage: H.pseudocomplement(2)                                                        #␣
↪needs sage.modules
```

(continues on next page)

(continued from previous page)

```
3

sage: H = HasseDiagram({0: [1, 2, 3], 1: [4], 2: [4], 3: [4]})
sage: H.pseudocomplement(2) is None                                   #␣
↪needs sage.modules
True
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> H = HasseDiagram({Integer(0): [Integer(1), Integer(2)], Integer(1):␣
↪[Integer(3)], Integer(2): [Integer(4)], Integer(3): [Integer(4)]})
>>> H.pseudocomplement(Integer(2))                                     ␣
↪     # needs sage.modules
3

>>> H = HasseDiagram({Integer(0): [Integer(1), Integer(2), Integer(3)],␣
↪Integer(1): [Integer(4)], Integer(2): [Integer(4)], Integer(3):␣
↪[Integer(4)]})
>>> H.pseudocomplement(Integer(2)) is None                             ␣
↪     # needs sage.modules
True
```

rank(*element=None*)

Return the rank of `element`, or the rank of the poset if `element` is `None`. (The rank of a poset is the length of the longest chain of elements of the poset.)

EXAMPLES:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: H = HasseDiagram({0:[1,3,2],1:[4],2:[4,5,6],3:[6],4:[7],5:[7],6:[7],
↪7:[]})
sage: H.rank(5)
2
sage: H.rank()
3
sage: Q = HasseDiagram({0:[1,2],1:[3],2:[],3:[]})
sage: Q.rank()
2
sage: Q.rank(1)
1
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> H = HasseDiagram({Integer(0):[Integer(1),Integer(3),Integer(2)],
↪Integer(1):[Integer(4)],Integer(2):[Integer(4),Integer(5),Integer(6)],
↪Integer(3):[Integer(6)],Integer(4):[Integer(7)],Integer(5):[Integer(7)],
↪Integer(6):[Integer(7)],Integer(7):[]})
>>> H.rank(Integer(5))
2
>>> H.rank()
3
>>> Q = HasseDiagram({Integer(0):[Integer(1),Integer(2)],
```

(continues on next page)

(continued from previous page)

```
↪Integer(1):[Integer(3)],Integer(2):[],Integer(3):[]})
>>> Q.rank()
2
>>> Q.rank(Integer(1))
1
```

rank_function()

Return the (normalized) rank function of the poset, if it exists.

A *rank function* of a poset P is a function r that maps elements of P to integers and satisfies: $r(x) = r(y) + 1$ if x covers y. The function r is normalized such that its minimum value on every connected component of the Hasse diagram of P is 0. This determines the function r uniquely (when it exists).

OUTPUT:

- a lambda function, if the poset admits a rank function
- `None`, if the poset does not admit a rank function

EXAMPLES:

```
sage: P = Poset([[1,3,2],[4],[4,5,6],[6],[7],[7],[7],[]])
sage: P.rank_function() is not None
True
sage: P = Poset(([1,2,3,4],[[1,4],[2,3],[3,4]]), facade = True)
sage: P.rank_function() is not None
True
sage: P = Poset(([1,2,3,4,5],[[1,2],[2,3],[3,4],[1,5],[5,4]]), facade = True)
sage: P.rank_function() is not None
False
sage: P = Poset(([1,2,3,4,5,6,7,8],[[1,4],[2,3],[3,4],[5,7],[6,7]]), facade =␣
↪True)
sage: f = P.rank_function(); f is not None
True
sage: f(5)
0
sage: f(2)
0
```

```
>>> from sage.all import *
>>> P = Poset([[Integer(1),Integer(3),Integer(2)],[Integer(4)],[Integer(4),
↪Integer(5),Integer(6)],[Integer(6)],[Integer(7)],[Integer(7)],[Integer(7)],
↪[]])
>>> P.rank_function() is not None
True
>>> P = Poset(([Integer(1),Integer(2),Integer(3),Integer(4)],[[Integer(1),
↪Integer(4)],[Integer(2),Integer(3)],[Integer(3),Integer(4)]]), facade =␣
↪True)
>>> P.rank_function() is not None
True
>>> P = Poset(([Integer(1),Integer(2),Integer(3),Integer(4),Integer(5)],
↪[[Integer(1),Integer(2)],[Integer(2),Integer(3)],[Integer(3),Integer(4)],
↪[Integer(1),Integer(5)],[Integer(5),Integer(4)]]), facade = True)
>>> P.rank_function() is not None
```

(continues on next page)

(continued from previous page)

```
False
>>> P = Poset(([Integer(1),Integer(2),Integer(3),Integer(4),Integer(5),
↪Integer(6),Integer(7),Integer(8)],[[Integer(1),Integer(4)],[Integer(2),
↪Integer(3)],[Integer(3),Integer(4)],[Integer(5),Integer(7)],[Integer(6),
↪Integer(7)]]), facade = True)
>>> f = P.rank_function(); f is not None
True
>>> f(Integer(5))
0
>>> f(Integer(2))
0
```

skeleton()

Return the skeleton of the lattice.

The lattice is expected to be pseudocomplemented and non-empty.

The skeleton of the lattice is the subposet induced by those elements that are the pseudocomplement to at least one element.

OUTPUT:

List of elements such that the subposet induced by them is the skeleton of the lattice.

EXAMPLES:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: H = HasseDiagram({0: [1, 2], 1: [3, 4], 2: [4],
....:                   3: [5], 4: [5]})
sage: H.skeleton()                                                    #␣
↪needs sage.modules
[5, 2, 0, 3]
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> H = HasseDiagram({Integer(0): [Integer(1), Integer(2)], Integer(1):␣
↪[Integer(3), Integer(4)], Integer(2): [Integer(4)],
...                   Integer(3): [Integer(5)], Integer(4): [Integer(5)]})
>>> H.skeleton()                                                      #␣
↪needs sage.modules
[5, 2, 0, 3]
```

sublattices_iterator(*elms*, *min_e*)

Return an iterator over sublattices of the Hasse diagram.

INPUT:

- `elms` – elements already in sublattice; use set() at start
- `min_e` – smallest new element to add for new sublattices

OUTPUT: list of sublattices as sets of integers

EXAMPLES:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: H = HasseDiagram({0: [1, 2], 1:[3], 2:[3]})
```

(continues on next page)

(continued from previous page)

```
sage: it = H.sublattices_iterator(set(), 0); it
<generator object ...sublattices_iterator at ...>
sage: next(it)                                                              #␣
↪needs sage.modules
set()
sage: next(it)                                                              #␣
↪needs sage.modules
{0}
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> H = HasseDiagram({Integer(0): [Integer(1), Integer(2)],␣
↪Integer(1):[Integer(3)], Integer(2):[Integer(3)]})
>>> it = H.sublattices_iterator(set(), Integer(0)); it
<generator object ...sublattices_iterator at ...>
>>> next(it)                                                              #␣
↪needs sage.modules
set()
>>> next(it)                                                              #␣
↪needs sage.modules
{0}
```

supergreedy_linear_extensions_iterator()

Return an iterator over supergreedy linear extensions of the Hasse diagram.

A linear extension $[e_1, e_2, \ldots, e_n]$ is *supergreedy* if, for every i and j where $i > j$, e_i covers e_j if for every $i > k > j$ at least one lower cover of e_k is not in $[e_1, e_2, \ldots, e_k]$.

Informally said a linear extension is supergreedy if it "always goes as high possible, and withdraw so less as possible". These are also called depth-first linear extensions.

EXAMPLES:

We show the difference between "only greedy" and supergreedy extensions:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: H = HasseDiagram({0: [1, 2], 2: [3, 4]})
sage: G_ext = list(H.greedy_linear_extensions_iterator())
sage: SG_ext = list(H.supergreedy_linear_extensions_iterator())
sage: [0, 2, 3, 1, 4] in G_ext
True
sage: [0, 2, 3, 1, 4] in SG_ext
False

sage: len(SG_ext)
4
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> H = HasseDiagram({Integer(0): [Integer(1), Integer(2)], Integer(2):␣
↪[Integer(3), Integer(4)]})
>>> G_ext = list(H.greedy_linear_extensions_iterator())
>>> SG_ext = list(H.supergreedy_linear_extensions_iterator())
```

(continues on next page)

(continued from previous page)

```
>>> [Integer(0), Integer(2), Integer(3), Integer(1), Integer(4)] in G_ext
True
>>> [Integer(0), Integer(2), Integer(3), Integer(1), Integer(4)] in SG_ext
False

>>> len(SG_ext)
4
```

top()

Return the top element of the poset, if it exists.

EXAMPLES:

```
sage: P = Poset({0:[3],1:[3],2:[3],3:[4,5],4:[],5:[]})
sage: P.top() is None
True
sage: Q = Poset({0:[1],1:[]})
sage: Q.top()
1
```

```
>>> from sage.all import *
>>> P = Poset({Integer(0):[Integer(3)],Integer(1):[Integer(3)],
↪Integer(2):[Integer(3)],Integer(3):[Integer(4),Integer(5)],Integer(4):[],
↪Integer(5):[]})
>>> P.top() is None
True
>>> Q = Poset({Integer(0):[Integer(1)],Integer(1):[]})
>>> Q.top()
1
```

upper_covers_iterator(*element*)

Return the list of elements that cover `element`.

EXAMPLES:

```
sage: from sage.combinat.posets.hasse_diagram import HasseDiagram
sage: H = HasseDiagram({0:[1,3,2],1:[4],2:[4,5,6],3:[6],4:[7],5:[7],6:[7],
↪7:[]})
sage: list(H.upper_covers_iterator(0))
[1, 2, 3]
sage: list(H.upper_covers_iterator(7))
[]
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.hasse_diagram import HasseDiagram
>>> H = HasseDiagram({Integer(0):[Integer(1),Integer(3),Integer(2)],
↪Integer(1):[Integer(4)],Integer(2):[Integer(4),Integer(5),Integer(6)],
↪Integer(3):[Integer(6)],Integer(4):[Integer(7)],Integer(5):[Integer(7)],
↪Integer(6):[Integer(7)],Integer(7):[]})
>>> list(H.upper_covers_iterator(Integer(0)))
[1, 2, 3]
>>> list(H.upper_covers_iterator(Integer(7)))
[]
```

vertical_decomposition(*return_list=False*)

Return vertical decomposition of the lattice.

This is the backend function for vertical decomposition functions of lattices.

The property of being vertically decomposable is defined for lattices. This is *not* checked, and the function works with any bounded poset.

INPUT:

- `return_list` – boolean (default: `False`); if `False` (the default), return an element that is not the top neither the bottom element of the lattice, but is comparable to all elements of the lattice, if the lattice is vertically decomposable and `None` otherwise. If `True`, return list of decomposition elements.

EXAMPLES:

```
sage: H = posets.BooleanLattice(4)._hasse_diagram
sage: H.vertical_decomposition() is None
True
sage: P = Poset( ([1,2,3,6,12,18,36], attrcall("divides")) )
sage: P._hasse_diagram.vertical_decomposition()
3
sage: P._hasse_diagram.vertical_decomposition(return_list=True)
[3]
```

```
>>> from sage.all import *
>>> H = posets.BooleanLattice(Integer(4))._hasse_diagram
>>> H.vertical_decomposition() is None
True
>>> P = Poset( ([Integer(1),Integer(2),Integer(3),Integer(6),Integer(12),
↪Integer(18),Integer(36)], attrcall("divides")) )
>>> P._hasse_diagram.vertical_decomposition()
3
>>> P._hasse_diagram.vertical_decomposition(return_list=True)
[3]
```

exception sage.combinat.posets.hasse_diagram.**LatticeError**(*fail*, *x*, *y*)

Bases: `ValueError`

Helper exception class to forward elements without meet or join to upper level, so that the user will see “No meet for a and b” instead of “No meet for 1 and 2”.

5.1.181 Incidence Algebras

class sage.combinat.posets.incidence_algebras.**IncidenceAlgebra**(*R*, *P*, *prefix='I'*)

Bases: *CombinatorialFreeModule*

The incidence algebra of a poset.

Let P be a poset and R be a commutative unital associative ring. The *incidence algebra* I_P is the algebra of functions $\alpha\colon P \times P \to R$ such that $\alpha(x, y) = 0$ if $x \not\leq y$ where multiplication is given by convolution:

$$(\alpha * \beta)(x, y) = \sum_{x \leq k \leq y} \alpha(x, k)\beta(k, y).$$

This has a natural basis given by indicator functions for the interval $[a, b]$, i.e. $X_{a,b}(x, y) = \delta_{ax}\delta_{by}$. The incidence algebra is a unital algebra with the identity given by the Kronecker delta $\delta(x, y) = \delta_{xy}$. The Möbius function of P is another element of I_p whose inverse is the ζ function of the poset (so $\zeta(x, y) = 1$ for every interval $[x, y]$).

Todo

Implement the incidence coalgebra.

REFERENCES:

- Wikipedia article Incidence_algebra

class Element

Bases: `IndexedFreeModuleElement`

An element of an incidence algebra.

is_unit()

Return if `self` is a unit.

EXAMPLES:

```
sage: P = posets.BooleanLattice(2)
sage: I = P.incidence_algebra(QQ)
sage: mu = I.moebius()
sage: mu.is_unit()
True
sage: zeta = I.zeta()
sage: zeta.is_unit()
True
sage: x = mu - I.zeta() + I[2,2]
sage: x.is_unit()
False
sage: y = I.moebius() + I.zeta()
sage: y.is_unit()
True
```

```
>>> from sage.all import *
>>> P = posets.BooleanLattice(Integer(2))
>>> I = P.incidence_algebra(QQ)
>>> mu = I.moebius()
>>> mu.is_unit()
True
>>> zeta = I.zeta()
>>> zeta.is_unit()
True
>>> x = mu - I.zeta() + I[Integer(2),Integer(2)]
>>> x.is_unit()
False
>>> y = I.moebius() + I.zeta()
>>> y.is_unit()
True
```

This depends on the base ring:

```
sage: I = P.incidence_algebra(ZZ)
sage: y = I.moebius() + I.zeta()
sage: y.is_unit()
False
```

```
>>> from sage.all import *
>>> I = P.incidence_algebra(ZZ)
>>> y = I.moebius() + I.zeta()
>>> y.is_unit()
False
```

to_matrix()

Return self as a matrix.

We define a matrix $M_{xy} = \alpha(x, y)$ for some element $\alpha \in I_P$ in the incidence algebra I_P and we order the elements $x, y \in P$ by some linear extension of P. This defines an algebra (iso)morphism; in particular, multiplication in the incidence algebra goes to matrix multiplication.

EXAMPLES:

```
sage: P = posets.BooleanLattice(2)
sage: I = P.incidence_algebra(QQ)
sage: I.moebius().to_matrix()
[ 1 -1 -1  1]
[ 0  1  0 -1]
[ 0  0  1 -1]
[ 0  0  0  1]
sage: I.zeta().to_matrix()
[1 1 1 1]
[0 1 0 1]
[0 0 1 1]
[0 0 0 1]
```

```
>>> from sage.all import *
>>> P = posets.BooleanLattice(Integer(2))
>>> I = P.incidence_algebra(QQ)
>>> I.moebius().to_matrix()
[ 1 -1 -1  1]
[ 0  1  0 -1]
[ 0  0  1 -1]
[ 0  0  0  1]
>>> I.zeta().to_matrix()
[1 1 1 1]
[0 1 0 1]
[0 0 1 1]
[0 0 0 1]
```

delta()

Return the element 1 in self (which is the Kronecker delta $\delta(x, y)$).

EXAMPLES:

```
sage: P = posets.BooleanLattice(4)
sage: I = P.incidence_algebra(QQ)
sage: I.one()
I[0, 0] + I[1, 1] + I[2, 2] + I[3, 3] + I[4, 4] + I[5, 5]
 + I[6, 6] + I[7, 7] + I[8, 8] + I[9, 9] + I[10, 10]
 + I[11, 11] + I[12, 12] + I[13, 13] + I[14, 14] + I[15, 15]
```

```
>>> from sage.all import *
>>> P = posets.BooleanLattice(Integer(4))
>>> I = P.incidence_algebra(QQ)
>>> I.one()
I[0, 0] + I[1, 1] + I[2, 2] + I[3, 3] + I[4, 4] + I[5, 5]
 + I[6, 6] + I[7, 7] + I[8, 8] + I[9, 9] + I[10, 10]
 + I[11, 11] + I[12, 12] + I[13, 13] + I[14, 14] + I[15, 15]
```

moebius()

Return the Möbius function of `self`.

EXAMPLES:

```
sage: P = posets.BooleanLattice(2)
sage: I = P.incidence_algebra(QQ)
sage: I.moebius()
I[0, 0] - I[0, 1] - I[0, 2] + I[0, 3] + I[1, 1]
 - I[1, 3] + I[2, 2] - I[2, 3] + I[3, 3]
```

```
>>> from sage.all import *
>>> P = posets.BooleanLattice(Integer(2))
>>> I = P.incidence_algebra(QQ)
>>> I.moebius()
I[0, 0] - I[0, 1] - I[0, 2] + I[0, 3] + I[1, 1]
 - I[1, 3] + I[2, 2] - I[2, 3] + I[3, 3]
```

one()

Return the element 1 in `self` (which is the Kronecker delta $\delta(x, y)$).

EXAMPLES:

```
sage: P = posets.BooleanLattice(4)
sage: I = P.incidence_algebra(QQ)
sage: I.one()
I[0, 0] + I[1, 1] + I[2, 2] + I[3, 3] + I[4, 4] + I[5, 5]
 + I[6, 6] + I[7, 7] + I[8, 8] + I[9, 9] + I[10, 10]
 + I[11, 11] + I[12, 12] + I[13, 13] + I[14, 14] + I[15, 15]
```

```
>>> from sage.all import *
>>> P = posets.BooleanLattice(Integer(4))
>>> I = P.incidence_algebra(QQ)
>>> I.one()
I[0, 0] + I[1, 1] + I[2, 2] + I[3, 3] + I[4, 4] + I[5, 5]
 + I[6, 6] + I[7, 7] + I[8, 8] + I[9, 9] + I[10, 10]
 + I[11, 11] + I[12, 12] + I[13, 13] + I[14, 14] + I[15, 15]
```

poset()

Return the defining poset of `self`.

EXAMPLES:

```
sage: P = posets.BooleanLattice(4)
sage: I = P.incidence_algebra(QQ)
```

(continues on next page)

(continued from previous page)

```
sage: I.poset()
Finite lattice containing 16 elements
sage: I.poset() == P
True
```

```
>>> from sage.all import *
>>> P = posets.BooleanLattice(Integer(4))
>>> I = P.incidence_algebra(QQ)
>>> I.poset()
Finite lattice containing 16 elements
>>> I.poset() == P
True
```

product_on_basis(*A*, *B*)

Return the product of basis elements indexed by `A` and `B`.

EXAMPLES:

```
sage: P = posets.BooleanLattice(4)
sage: I = P.incidence_algebra(QQ)
sage: I.product_on_basis((1, 3), (3, 11))
I[1, 11]
sage: I.product_on_basis((1, 3), (2, 2))
0
```

```
>>> from sage.all import *
>>> P = posets.BooleanLattice(Integer(4))
>>> I = P.incidence_algebra(QQ)
>>> I.product_on_basis((Integer(1), Integer(3)), (Integer(3), Integer(11)))
I[1, 11]
>>> I.product_on_basis((Integer(1), Integer(3)), (Integer(2), Integer(2)))
0
```

reduced_subalgebra(*prefix='R'*)

Return the reduced incidence subalgebra.

EXAMPLES:

```
sage: P = posets.BooleanLattice(4)
sage: I = P.incidence_algebra(QQ)
sage: I.reduced_subalgebra()
Reduced incidence algebra of Finite lattice containing 16 elements
 over Rational Field
```

```
>>> from sage.all import *
>>> P = posets.BooleanLattice(Integer(4))
>>> I = P.incidence_algebra(QQ)
>>> I.reduced_subalgebra()
Reduced incidence algebra of Finite lattice containing 16 elements
 over Rational Field
```

some_elements()

Return a list of elements of `self`.

EXAMPLES:

```
sage: P = posets.BooleanLattice(1)
sage: I = P.incidence_algebra(QQ)
sage: Ielts = I.some_elements(); Ielts # random
[2*I[0, 0] + 2*I[0, 1] + 3*I[1, 1],
 I[0, 0] - I[0, 1] + I[1, 1],
 I[0, 0] + I[0, 1] + I[1, 1]]
sage: [a in I for a in Ielts]
[True, True, True]
```

```
>>> from sage.all import *
>>> P = posets.BooleanLattice(Integer(1))
>>> I = P.incidence_algebra(QQ)
>>> Ielts = I.some_elements(); Ielts # random
[2*I[0, 0] + 2*I[0, 1] + 3*I[1, 1],
 I[0, 0] - I[0, 1] + I[1, 1],
 I[0, 0] + I[0, 1] + I[1, 1]]
>>> [a in I for a in Ielts]
[True, True, True]
```

zeta()

Return the ζ function in `self`.

The ζ function on a poset P is given by

$$\zeta(x, y) = \begin{cases} 1 & x \leq y, \\ 0 & x \not\leq y. \end{cases}$$

EXAMPLES:

```
sage: P = posets.BooleanLattice(4)
sage: I = P.incidence_algebra(QQ)
sage: I.zeta() * I.moebius() == I.one()
True
```

```
>>> from sage.all import *
>>> P = posets.BooleanLattice(Integer(4))
>>> I = P.incidence_algebra(QQ)
>>> I.zeta() * I.moebius() == I.one()
True
```

class sage.combinat.posets.incidence_algebras.**ReducedIncidenceAlgebra**(*I*, *prefix='R'*)

Bases: *CombinatorialFreeModule*

The reduced incidence algebra of a poset.

The reduced incidence algebra R_P is a subalgebra of the incidence algebra I_P where $\alpha(x, y) = \alpha(x', y')$ when $[x, y]$ is isomorphic to $[x', y']$ as posets. Thus the delta, Möbius, and zeta functions are all elements of R_P.

class Element

Bases: `IndexedFreeModuleElement`

An element of a reduced incidence algebra.

is_unit()

Return if `self` is a unit.

EXAMPLES:

```
sage: P = posets.BooleanLattice(4)
sage: R = P.incidence_algebra(QQ).reduced_subalgebra()
sage: x = R.an_element()
sage: x.is_unit()
True
```

```
>>> from sage.all import *
>>> P = posets.BooleanLattice(Integer(4))
>>> R = P.incidence_algebra(QQ).reduced_subalgebra()
>>> x = R.an_element()
>>> x.is_unit()
True
```

lift()

Return the lift of `self` to the ambient space.

EXAMPLES:

```
sage: P = posets.BooleanLattice(2)
sage: I = P.incidence_algebra(QQ)
sage: R = I.reduced_subalgebra()
sage: x = R.an_element(); x
2*R[(0, 0)] + 2*R[(0, 1)] + 3*R[(0, 3)]
sage: x.lift()
2*I[0, 0] + 2*I[0, 1] + 2*I[0, 2] + 3*I[0, 3] + 2*I[1, 1]
 + 2*I[1, 3] + 2*I[2, 2] + 2*I[2, 3] + 2*I[3, 3]
```

```
>>> from sage.all import *
>>> P = posets.BooleanLattice(Integer(2))
>>> I = P.incidence_algebra(QQ)
>>> R = I.reduced_subalgebra()
>>> x = R.an_element(); x
2*R[(0, 0)] + 2*R[(0, 1)] + 3*R[(0, 3)]
>>> x.lift()
2*I[0, 0] + 2*I[0, 1] + 2*I[0, 2] + 3*I[0, 3] + 2*I[1, 1]
 + 2*I[1, 3] + 2*I[2, 2] + 2*I[2, 3] + 2*I[3, 3]
```

to_matrix()

Return `self` as a matrix.

EXAMPLES:

```
sage: P = posets.BooleanLattice(2)
sage: R = P.incidence_algebra(QQ).reduced_subalgebra()
sage: mu = R.moebius()
sage: mu.to_matrix()
[ 1 -1 -1  1]
[ 0  1  0 -1]
[ 0  0  1 -1]
[ 0  0  0  1]
```

```
>>> from sage.all import *
>>> P = posets.BooleanLattice(Integer(2))
>>> R = P.incidence_algebra(QQ).reduced_subalgebra()
>>> mu = R.moebius()
>>> mu.to_matrix()
[ 1 -1 -1  1]
[ 0  1  0 -1]
[ 0  0  1 -1]
[ 0  0  0  1]
```

delta()

Return the Kronecker delta function in `self`.

EXAMPLES:

```
sage: P = posets.BooleanLattice(4)
sage: R = P.incidence_algebra(QQ).reduced_subalgebra()
sage: R.delta()
R[(0, 0)]
```

```
>>> from sage.all import *
>>> P = posets.BooleanLattice(Integer(4))
>>> R = P.incidence_algebra(QQ).reduced_subalgebra()
>>> R.delta()
R[(0, 0)]
```

lift()

Return the lift morphism from `self` to the ambient space.

EXAMPLES:

```
sage: P = posets.BooleanLattice(2)
sage: R = P.incidence_algebra(QQ).reduced_subalgebra()
sage: R.lift
Generic morphism:
  From: Reduced incidence algebra of Finite lattice containing 4 elements␣
↪over Rational Field
  To:   Incidence algebra of Finite lattice containing 4 elements over␣
↪Rational Field
sage: R.an_element() - R.one()
R[(0, 0)] + 2*R[(0, 1)] + 3*R[(0, 3)]
sage: R.lift(R.an_element() - R.one())
I[0, 0] + 2*I[0, 1] + 2*I[0, 2] + 3*I[0, 3] + I[1, 1]
 + 2*I[1, 3] + I[2, 2] + 2*I[2, 3] + I[3, 3]
```

```
>>> from sage.all import *
>>> P = posets.BooleanLattice(Integer(2))
>>> R = P.incidence_algebra(QQ).reduced_subalgebra()
>>> R.lift
Generic morphism:
  From: Reduced incidence algebra of Finite lattice containing 4 elements␣
↪over Rational Field
  To:   Incidence algebra of Finite lattice containing 4 elements over␣
```

(continues on next page)

(continued from previous page)

```
↪Rational Field
>>> R.an_element() - R.one()
R[(0, 0)] + 2*R[(0, 1)] + 3*R[(0, 3)]
>>> R.lift(R.an_element() - R.one())
I[0, 0] + 2*I[0, 1] + 2*I[0, 2] + 3*I[0, 3] + I[1, 1]
 + 2*I[1, 3] + I[2, 2] + 2*I[2, 3] + I[3, 3]
```

moebius()

Return the Möbius function of `self`.

EXAMPLES:

```
sage: P = posets.BooleanLattice(4)
sage: R = P.incidence_algebra(QQ).reduced_subalgebra()
sage: R.moebius()
R[(0, 0)] - R[(0, 1)] + R[(0, 3)] - R[(0, 7)] + R[(0, 15)]
```

```
>>> from sage.all import *
>>> P = posets.BooleanLattice(Integer(4))
>>> R = P.incidence_algebra(QQ).reduced_subalgebra()
>>> R.moebius()
R[(0, 0)] - R[(0, 1)] + R[(0, 3)] - R[(0, 7)] + R[(0, 15)]
```

one_basis()

Return the index of the element 1 in `self`.

EXAMPLES:

```
sage: P = posets.BooleanLattice(4)
sage: R = P.incidence_algebra(QQ).reduced_subalgebra()
sage: R.one_basis()
(0, 0)
```

```
>>> from sage.all import *
>>> P = posets.BooleanLattice(Integer(4))
>>> R = P.incidence_algebra(QQ).reduced_subalgebra()
>>> R.one_basis()
(0, 0)
```

poset()

Return the defining poset of `self`.

EXAMPLES:

```
sage: P = posets.BooleanLattice(4)
sage: R = P.incidence_algebra(QQ).reduced_subalgebra()
sage: R.poset()
Finite lattice containing 16 elements
sage: R.poset() == P
True
```

```
>>> from sage.all import *
>>> P = posets.BooleanLattice(Integer(4))
```

(continues on next page)

(continued from previous page)

```
>>> R = P.incidence_algebra(QQ).reduced_subalgebra()
>>> R.poset()
Finite lattice containing 16 elements
>>> R.poset() == P
True
```

some_elements()

Return a list of elements of `self`.

EXAMPLES:

```
sage: P = posets.BooleanLattice(4)
sage: R = P.incidence_algebra(QQ).reduced_subalgebra()
sage: R.some_elements()
[2*R[(0, 0)] + 2*R[(0, 1)] + 3*R[(0, 3)],
 R[(0, 0)] - R[(0, 1)] + R[(0, 3)] - R[(0, 7)] + R[(0, 15)],
 R[(0, 0)] + R[(0, 1)] + R[(0, 3)] + R[(0, 7)] + R[(0, 15)]]
```

```
>>> from sage.all import *
>>> P = posets.BooleanLattice(Integer(4))
>>> R = P.incidence_algebra(QQ).reduced_subalgebra()
>>> R.some_elements()
[2*R[(0, 0)] + 2*R[(0, 1)] + 3*R[(0, 3)],
 R[(0, 0)] - R[(0, 1)] + R[(0, 3)] - R[(0, 7)] + R[(0, 15)],
 R[(0, 0)] + R[(0, 1)] + R[(0, 3)] + R[(0, 7)] + R[(0, 15)]]
```

zeta()

Return the ζ function in `self`.

The ζ function on a poset P is given by

$$\zeta(x, y) = \begin{cases} 1 & x \leq y, \\ 0 & x \not\leq y. \end{cases}$$

EXAMPLES:

```
sage: P = posets.BooleanLattice(4)
sage: R = P.incidence_algebra(QQ).reduced_subalgebra()
sage: R.zeta()
R[(0, 0)] + R[(0, 1)] + R[(0, 3)] + R[(0, 7)] + R[(0, 15)]
```

```
>>> from sage.all import *
>>> P = posets.BooleanLattice(Integer(4))
>>> R = P.incidence_algebra(QQ).reduced_subalgebra()
>>> R.zeta()
R[(0, 0)] + R[(0, 1)] + R[(0, 3)] + R[(0, 7)] + R[(0, 15)]
```

5.1.182 Finite lattices and semilattices

This module implements finite (semi)lattices. It defines:

LatticePoset()	Construct a lattice.
MeetSemilattice()	Construct a meet semi-lattice.
JoinSemilattice()	Construct a join semi-lattice.
FiniteLatticePoset	A class for finite lattices.
FiniteMeetSemilattice	A class for finite meet semilattices.
FiniteJoinSemilattice	A class for finite join semilattices.

List of (semi)lattice methods

Meet and join

meet()	Return the meet of given elements.
join()	Return the join of given elements.
meet_matrix()	Return the matrix of meets of all elements of the meet semi-lattice.
join_matrix()	Return the matrix of joins of all elements of the join semi-lattice.

Properties of the lattice

is_distributive()	Return `True` if the lattice is distributive.
is_modular()	Return `True` if the lattice is modular.
is_lower_semimodular()	Return `True` if all elements with common upper cover have a common lower cover.
is_upper_semimodular()	Return `True` if all elements with common lower cover have a common upper cover.
is_semidistributive()	Return `True` if the lattice is both join- and meet-semidistributive.
is_join_semidistributive()	Return `True` if the lattice is join-semidistributive.
is_meet_semidistributive()	Return `True` if the lattice is meet-semidistributive.
is_join_distributive()	Return `True` if the lattice is join-distributive.
is_meet_distributive()	Return `True` if the lattice is meet-distributive.
is_atomic()	Return `True` if every element of the lattice can be written as a join of atoms.
is_coatomic()	Return `True` if every element of the lattice can be written as a meet of coatoms.
is_geometric()	Return `True` if the lattice is atomic and upper semimodular.
is_extremal()	Return `True` if the lattice is extremal.
is_complemented()	Return `True` if every element of the lattice has at least one complement.
is_sectionally_complemented()	Return `True` if every interval from the bottom is complemented.
is_cosectionally_complemented()	Return `True` if every interval to the top is complemented.
is_relatively_complemented()	Return `True` if every interval of the lattice is complemented.
is_pseudocomplemented()	Return `True` if every element of the lattice has a (meet-)pseudocomplement.
is_join_pseudocomplemented()	Return `True` if every element of the lattice has a join-pseudocomplement.
is_orthocomplemented()	Return `True` if the lattice has an orthocomplementation.
is_supersolvable()	Return `True` if the lattice is supersolvable.
is_planar()	Return `True` if the lattice has an upward planar drawing.
is_dismantlable()	Return `True` if the lattice is dismantlable.

continues on next page

Table 5 – continued from previous page

is_interval_dismantlable()	Return `True` if the lattice is interval dismantlable.
is_sublattice_dismantlable()	Return `True` if the lattice is sublattice dismantlable.
is_stone()	Return `True` if the lattice is a Stone lattice.
is_trim()	Return `True` if the lattice is a trim lattice.
is_vertically_decomposable()	Return `True` if the lattice is vertically decomposable.
is_simple()	Return `True` if the lattice has no nontrivial congruences.
is_isoform()	Return `True` if all congruences of the lattice consists of isoform blocks.
is_uniform()	Return `True` if all congruences of the lattice consists of equal-sized blocks.
is_regular()	Return `True` if all congruences of lattice are determined by any of the congruence blocks.
is_subdirectly_reducible()	Return `True` if the lattice is a sublattice of the product of smaller lattices.
is_constructible_by_doublings()	Return `True` if the lattice is constructible by doublings from the one-element lattice.
breadth()	Return the breadth of the lattice.

Specific elements

atoms()	Return elements covering the bottom element.
coatoms()	Return elements covered by the top element.
double_irreducibles()	Return double irreducible elements.
join_primes()	Return the join prime elements.
meet_primes()	Return the meet prime elements.
complements()	Return the list of complements of an element, or the dictionary of complements for all elements.
pseudocomplement()	Return the pseudocomplement of an element.
is_modular_element()	Return `True` if given element is modular in the lattice.
is_left_modular_element()	Return `True` if given element is left modular in the lattice.
neutral_elements()	Return neutral elements of the lattice.
canonical_joinands()	Return the canonical joinands of an element.
canonical_meetands()	Return the canonical meetands of an element.

Sublattices

sublattice()	Return sublattice generated by list of elements.
submeetsemilattice()	Return meet-subsemilattice generated by list of elements.
subjoinsemilattice()	Return join-subsemilattice generated by list of elements.
is_sublattice()	Return `True` if the lattice is a sublattice of given lattice.
sublattices()	Return all sublattices of the lattice.
sublattices_lattice()	Return the lattice of sublattices.
isomorphic_sublattices_iterator()	Return an iterator over the sublattices isomorphic to given lattice.
maximal_sublattices()	Return maximal sublattices of the lattice.
frattini_sublattice()	Return the intersection of maximal sublattices of the lattice.
skeleton()	Return the skeleton of the lattice.
center()	Return the sublattice of complemented neutral elements.
vertical_decomposition()	Return the vertical decomposition of the lattice.

Miscellaneous

moebius_algebra()	Return the Möbius algebra of the lattice.
quantum_moebius_algebra()	Return the quantum Möbius algebra of the lattice.
vertical_composition()	Return ordinal sum of lattices with top/bottom element unified.
day_doubling()	Return the lattice with Alan Day's doubling construction of a subset.
adjunct()	Return the adjunct with other lattice.
subdirect_decomposition()	Return the subdirect decomposition of the lattice.
congruence()	Return the congruence generated by lists of elements.
quotient()	Return the quotient lattice by a congruence.
congruences_lattice()	Return the lattice of congruences.

class sage.combinat.posets.lattices.**FiniteJoinSemilattice**(*hasse_diagram*, *elements*, *category*, *facade*, *key*)

Bases: *FinitePoset*

We assume that the argument passed to FiniteJoinSemilattice is the poset of a join-semilattice (i.e. a poset with least upper bound for each pair of elements).

Element

alias of *JoinSemilatticeElement*

coatoms()

Return the list of co-atoms of this (semi)lattice.

A *co-atom* of a lattice is an element covered by the top element.

EXAMPLES:

```
sage: L = posets.DivisorLattice(60)
sage: sorted(L.coatoms())
[12, 20, 30]
```

```
>>> from sage.all import *
>>> L = posets.DivisorLattice(Integer(60))
```

(continues on next page)

(continued from previous page)

```
>>> sorted(L.coatoms())
[12, 20, 30]
```

See also

- Dual function: `atoms()`

join(*x*, *y=None*)

Return the join of given elements in the lattice.

INPUT:

- `x`, `y` – two elements of the (semi)lattice OR
- `x` – list or tuple of elements

EXAMPLES:

```
sage: D = posets.DiamondPoset(5)
sage: D.join(1, 2)
4
sage: D.join(1, 1)
1
sage: D.join(1, 4)
4
sage: D.join(1, 0)
1
```

```
>>> from sage.all import *
>>> D = posets.DiamondPoset(Integer(5))
>>> D.join(Integer(1), Integer(2))
4
>>> D.join(Integer(1), Integer(1))
1
>>> D.join(Integer(1), Integer(4))
4
>>> D.join(Integer(1), Integer(0))
1
```

Using list of elements as an argument. Join of empty list is the bottom element:

```
sage: B4=posets.BooleanLattice(4)
sage: B4.join([2,4,8])
14
sage: B4.join([])
0
```

```
>>> from sage.all import *
>>> B4=posets.BooleanLattice(Integer(4))
>>> B4.join([Integer(2),Integer(4),Integer(8)])
14
```

(continues on next page)

(continued from previous page)

```
>>> B4.join([])
0
```

For non-facade lattices operator + works for join:

```
sage: L = posets.PentagonPoset(facade=False)
sage: L(1)+L(2)
4
```

```
>>> from sage.all import *
>>> L = posets.PentagonPoset(facade=False)
>>> L(Integer(1))+L(Integer(2))
4
```

See also

- Dual function: *meet()*

join_matrix()

Return a matrix whose `(i,j)` entry is `k`, where `self.linear_extension()[k]` is the join (least upper bound) of `self.linear_extension()[i]` and `self.linear_extension()[j]`.

EXAMPLES:

```
sage: P = LatticePoset([[1,3,2],[4],[4,5,6],[6],[7],[7],[7],[]], facade =
↪False)
sage: J = P.join_matrix(); J
[0 1 2 3 4 5 6 7]
[1 1 3 3 7 7 7 7]
[2 3 2 3 4 6 6 7]
[3 3 3 3 7 7 7 7]
[4 7 4 7 4 7 7 7]
[5 7 6 7 7 5 6 7]
[6 7 6 7 7 6 6 7]
[7 7 7 7 7 7 7 7]
sage: J[P(4).vertex,P(3).vertex] == P(7).vertex
True
sage: J[P(5).vertex,P(2).vertex] == P(5).vertex
True
sage: J[P(5).vertex,P(2).vertex] == P(2).vertex
False
```

```
>>> from sage.all import *
>>> P = LatticePoset([[Integer(1),Integer(3),Integer(2)],[Integer(4)],
↪[Integer(4),Integer(5),Integer(6)],[Integer(6)],[Integer(7)],[Integer(7)],
↪[Integer(7)],[]], facade = False)
>>> J = P.join_matrix(); J
[0 1 2 3 4 5 6 7]
[1 1 3 3 7 7 7 7]
[2 3 2 3 4 6 6 7]
```

(continues on next page)

(continued from previous page)

```
[3 3 3 3 7 7 7 7]
[4 7 4 7 4 7 7 7]
[5 7 6 7 7 5 6 7]
[6 7 6 7 7 6 6 7]
[7 7 7 7 7 7 7 7]
>>> J[P(Integer(4)).vertex,P(Integer(3)).vertex] == P(Integer(7)).vertex
True
>>> J[P(Integer(5)).vertex,P(Integer(2)).vertex] == P(Integer(5)).vertex
True
>>> J[P(Integer(5)).vertex,P(Integer(2)).vertex] == P(Integer(2)).vertex
False
```

class sage.combinat.posets.lattices.**FiniteLatticePoset**(*hasse_diagram*, *elements*, *category*, *facade*, *key*)

Bases: *FiniteMeetSemilattice*, *FiniteJoinSemilattice*

We assume that the argument passed to FiniteLatticePoset is the poset of a lattice (i.e. a poset with greatest lower bound and least upper bound for each pair of elements).

Element

alias of *LatticePosetElement*

adjunct(*other*, *a*, *b*)

Return the adjunct of the lattice by `other` on the pair (a, b).

It is assumed that $a < b$ but b does not cover a.

The adjunct of a lattice K to L with respect to pair (a, b) of L is defined such that $x < y$ if

- $x, y \in K$ and $x < y$ in K,
- $x, y \in L$ and $x < y$ in L,
- $x \in L$, $y \in K$ and $x \leq a$ in L, or
- $x \in K$, $y \in L$ and $b \leq y$ in L.

Informally this can be seen as attaching the lattice K to L as a new block between a and b. Dismantlable lattices are exactly those that can be created from chains with this function.

Mathematically, it is only defined when L and K have no common element; here we force that by giving them different names in the resulting lattice.

EXAMPLES:

```
sage: Pnum = posets.PentagonPoset()
sage: Palp = Pnum.relabel(lambda x: chr(ord('a')+x))
sage: PP = Pnum.adjunct(Palp, 0, 3)
sage: PP.atoms()
[(0, 1), (0, 2), (1, 'a')]
sage: PP.coatoms()
[(0, 1), (0, 3)]
```

```
>>> from sage.all import *
>>> Pnum = posets.PentagonPoset()
>>> Palp = Pnum.relabel(lambda x: chr(ord('a')+x))
>>> PP = Pnum.adjunct(Palp, Integer(0), Integer(3))
```

(continues on next page)

(continued from previous page)

```
>>> PP.atoms()
[(0, 1), (0, 2), (1, 'a')]
>>> PP.coatoms()
[(0, 1), (0, 3)]
```

breadth(*certificate=False*)

Return the breadth of the lattice.

The breadth of a lattice is the largest integer n such that any join of elements $x_1, x_2, \ldots, x_{n+1}$ is join of a proper subset of x_i.

This can be also characterized by subposets: a lattice of breadth at least n contains a subposet isomorphic to the Boolean lattice of 2^n elements.

INPUT:

- `certificate` – boolean (default: `False`); whether to return a certificate

OUTPUT:

- If `certificate=True` return the pair (b, a) where b is the breadth and a is an antichain such that the join of a differs from the join of any proper subset of a. If `certificate=False` return just the breadth.

EXAMPLES:

```
sage: D10 = posets.DiamondPoset(10)
sage: D10.breadth()
2

sage: B3 = posets.BooleanLattice(3)
sage: B3.breadth()
3
sage: B3.breadth(certificate=True)
(3, [1, 2, 4])
```

```
>>> from sage.all import *
>>> D10 = posets.DiamondPoset(Integer(10))
>>> D10.breadth()
2

>>> B3 = posets.BooleanLattice(Integer(3))
>>> B3.breadth()
3
>>> B3.breadth(certificate=True)
(3, [1, 2, 4])
```

ALGORITHM:

For a lattice to have breadth at least n, it must have an n-element antichain A with join j. Element j must cover at least n elements. There must also be $n-2$ levels of elements between A and j. So we start by searching elements that could be our j and then just check possible antichains A.

Note

Prior to version 8.1 this function returned just an antichain with `certificate=True`.

canonical_joinands(*e*)

Return the canonical joinands of e.

The canonical joinands of an element e in the lattice L is the subset $S \subseteq L$ such that 1) the join of S is e, and 2) if the join of some other subset S' of is also e, then for every element $s \in S$ there is an element $s' \in S'$ such that $s \leq s'$.

Informally said this is the set of lowest possible elements with given join. It exists for every element if and only if the lattice is join-semidistributive. Canonical joinands are always join-irreducibles.

INPUT:

- `e` – an element of the lattice

OUTPUT: canonical joinands as a list, if it exists; if not, `None`

EXAMPLES:

```
sage: L = LatticePoset({1: [2, 3], 2: [4, 5], 3: [5], 4: [6],
....:                   5: [7], 6: [7]})
sage: L.canonical_joinands(7)
[3, 4]

sage: L = LatticePoset({1: [2, 3], 2: [4, 5], 3: [6], 4: [6],
....: 5: [6]})
sage: L.canonical_joinands(6) is None
True
```

```
>>> from sage.all import *
>>> L = LatticePoset({Integer(1): [Integer(2), Integer(3)], Integer(2):␣
→[Integer(4), Integer(5)], Integer(3): [Integer(5)], Integer(4):␣
→[Integer(6)],
...                   Integer(5): [Integer(7)], Integer(6): [Integer(7)]})
>>> L.canonical_joinands(Integer(7))
[3, 4]

>>> L = LatticePoset({Integer(1): [Integer(2), Integer(3)], Integer(2):␣
→[Integer(4), Integer(5)], Integer(3): [Integer(6)], Integer(4):␣
→[Integer(6)],
... Integer(5): [Integer(6)]})
>>> L.canonical_joinands(Integer(6)) is None
True
```

See also

canonical_meetands()

canonical_meetands(*e*)

Return the canonical meetands of e.

The canonical meetands of an element e in the lattice L is the subset $S \subseteq L$ such that 1) the meet of S is e, and 2) if the meet of some other subset S' of is also e, then for every element $s \in S$ there is an element $s' \in S'$ such that $s \geq s'$.

Informally said this is the set of greatest possible elements with given meet. It exists for every element if and only if the lattice is meet-semidistributive. Canonical meetands are always meet-irreducibles.

INPUT:

- `e` – an element of the lattice

OUTPUT: canonical meetands as a list, if it exists; if not, `None`

EXAMPLES:

```
sage: L = LatticePoset({1: [2, 3], 2: [4], 3: [5, 6], 4: [6],
....:                   5: [7], 6: [7]})
sage: L.canonical_meetands(1)
[5, 4]

sage: L = LatticePoset({1: [2, 3], 2: [4, 5], 3: [6], 4: [6],
....: 5: [6]})
sage: L.canonical_meetands(1) is None
True
```

```
>>> from sage.all import *
>>> L = LatticePoset({Integer(1): [Integer(2), Integer(3)], Integer(2):␣
→[Integer(4)], Integer(3): [Integer(5), Integer(6)], Integer(4):␣
→[Integer(6)],
...                   Integer(5): [Integer(7)], Integer(6): [Integer(7)]})
>>> L.canonical_meetands(Integer(1))
[5, 4]

>>> L = LatticePoset({Integer(1): [Integer(2), Integer(3)], Integer(2):␣
→[Integer(4), Integer(5)], Integer(3): [Integer(6)], Integer(4):␣
→[Integer(6)],
... Integer(5): [Integer(6)]})
>>> L.canonical_meetands(Integer(1)) is None
True
```

See also

canonical_joinands()

center()

Return the center of the lattice.

An element of a lattice is *central* if it is neutral and has a complement. The subposet induced by central elements is a *center* of the lattice. Actually it is a Boolean lattice.

EXAMPLES:

```
sage: L = LatticePoset({1: [2, 3, 4], 2: [6, 7], 3: [8, 9, 7],
....:                   4: [5, 6], 5: [8, 10], 6: [10], 7: [13, 11],
....:                   8: [13, 12], 9: [11, 12], 10: [13],
....:                   11: [14], 12: [14], 13: [14]})
sage: C = L.center(); C
Finite lattice containing 4 elements
sage: C.cover_relations()
```

(continues on next page)

(continued from previous page)

```
[[1, 2], [1, 12], [2, 14], [12, 14]]

sage: L = posets.DivisorLattice(60)
sage: sorted(L.center().list())
[1, 3, 4, 5, 12, 15, 20, 60]
```

```
>>> from sage.all import *
>>> L = LatticePoset({Integer(1): [Integer(2), Integer(3), Integer(4)],
↪Integer(2): [Integer(6), Integer(7)], Integer(3): [Integer(8), Integer(9),
↪Integer(7)],
...                     Integer(4): [Integer(5), Integer(6)], Integer(5):
↪[Integer(8), Integer(10)], Integer(6): [Integer(10)], Integer(7):
↪[Integer(13), Integer(11)],
...                     Integer(8): [Integer(13), Integer(12)], Integer(9):
↪[Integer(11), Integer(12)], Integer(10): [Integer(13)],
...                     Integer(11): [Integer(14)], Integer(12): [Integer(14)],
↪Integer(13): [Integer(14)]})
>>> C = L.center(); C
Finite lattice containing 4 elements
>>> C.cover_relations()
[[1, 2], [1, 12], [2, 14], [12, 14]]

>>> L = posets.DivisorLattice(Integer(60))
>>> sorted(L.center().list())
[1, 3, 4, 5, 12, 15, 20, 60]
```

See also

neutral_elements(), *complements()*

complements(*element=None*)

Return the list of complements of an element in the lattice, or the dictionary of complements for all elements.

Elements x and y are complements if their meet and join are respectively the bottom and the top element of the lattice.

INPUT:

- `element` – an element of the lattice whose complement is returned. If `None` (default) then dictionary of complements for all elements having at least one complement is returned.

EXAMPLES:

```
sage: L = LatticePoset({0:['a','b','c'],'a':[1],'b':[1],'c':[1]})
sage: C = L.complements()
```

```
>>> from sage.all import *
>>> L = LatticePoset({Integer(0):['a','b','c'],'a':[Integer(1)],'b
↪':[Integer(1)],'c':[Integer(1)]})
>>> C = L.complements()
```

Let us check that 'a' and 'b' are complements of each other:

```
sage: 'a' in C['b']
True
sage: 'b' in C['a']
True
```

```
>>> from sage.all import *
>>> 'a' in C['b']
True
>>> 'b' in C['a']
True
```

Full list of complements:

```
sage: L.complements() # random order
{0: [1], 1: [0], 'a': ['b', 'c'], 'b': ['c', 'a'], 'c': ['b', 'a']}

sage: L = LatticePoset({0:[1,2],1:[3],2:[3],3:[4]})
sage: L.complements() # random order
{0: [4], 4: [0]}
sage: L.complements(1)
[]
```

```
>>> from sage.all import *
>>> L.complements() # random order
{0: [1], 1: [0], 'a': ['b', 'c'], 'b': ['c', 'a'], 'c': ['b', 'a']}

>>> L = LatticePoset({Integer(0):[Integer(1),Integer(2)],
↪Integer(1):[Integer(3)],Integer(2):[Integer(3)],Integer(3):[Integer(4)]})
>>> L.complements() # random order
{0: [4], 4: [0]}
>>> L.complements(Integer(1))
[]
```

See also:

is_complemented()

congruence(S)

Return the congruence generated by set of sets S.

A congruence of a lattice is an equivalence relation $\cong$ that is compatible with meet and join; i.e. if $a_1 \cong a_2$ and $b_1 \cong b_2$, then $(a_1$
$veeb_1) \cong (a_2$
$veeb_2)$ and $(a_1 \wedge b_1) \cong (a_2 \wedge b_2)$.

By the congruence generated by set of sets $\{S_1, \ldots, S_n\}$ we mean the least congruence $\cong$ such that for every $x, y \in S_i$ for some i we have $x \cong y$.

INPUT:

- `S` – list of lists; list of element blocks that the congruence will contain

OUTPUT:

Congruence of the lattice as a *sage.combinat.set_partition.SetPartition*.

EXAMPLES:

```
sage: # needs sage.combinat
sage: L = posets.DivisorLattice(12)
sage: cong = L.congruence([[1, 3]])
sage: sorted(sorted(c) for c in cong)
[[1, 3], [2, 6], [4, 12]]
sage: L.congruence([[1, 2], [6, 12]])
{{1, 2, 4}, {3, 6, 12}}

sage: L = LatticePoset({1: [2, 3], 2: [4], 3: [4], 4: [5]})
sage: L.congruence([[1, 2]])                                              #␣
↪needs sage.combinat
{{1, 2}, {3, 4}, {5}}

sage: L = LatticePoset({1: [2, 3], 2: [4, 5, 6], 4: [5], 5: [7, 8],
....:                   6: [8], 3: [9], 7: [10], 8: [10], 9:[10]})
sage: cong = L.congruence([[1, 2]])                                       #␣
↪needs sage.combinat
sage: cong[0]                                                             #␣
↪needs sage.combinat
frozenset({1, 2, 3, 4, 5, 6, 7, 8, 9, 10})
```

```
>>> from sage.all import *
>>> # needs sage.combinat
>>> L = posets.DivisorLattice(Integer(12))
>>> cong = L.congruence([[Integer(1), Integer(3)]])
>>> sorted(sorted(c) for c in cong)
[[1, 3], [2, 6], [4, 12]]
>>> L.congruence([[Integer(1), Integer(2)], [Integer(6), Integer(12)]])
{{1, 2, 4}, {3, 6, 12}}

>>> L = LatticePoset({Integer(1): [Integer(2), Integer(3)], Integer(2):␣
↪[Integer(4)], Integer(3): [Integer(4)], Integer(4): [Integer(5)]})
>>> L.congruence([[Integer(1), Integer(2)]])                              ␣
↪               # needs sage.combinat
{{1, 2}, {3, 4}, {5}}

>>> L = LatticePoset({Integer(1): [Integer(2), Integer(3)], Integer(2):␣
↪[Integer(4), Integer(5), Integer(6)], Integer(4): [Integer(5)], Integer(5):␣
↪[Integer(7), Integer(8)],
...                   Integer(6): [Integer(8)], Integer(3): [Integer(9)],␣
↪Integer(7): [Integer(10)], Integer(8): [Integer(10)],␣
↪Integer(9):[Integer(10)]})
>>> cong = L.congruence([[Integer(1), Integer(2)]])                       ␣
↪               # needs sage.combinat
>>> cong[Integer(0)]                                                      ␣
↪      # needs sage.combinat
frozenset({1, 2, 3, 4, 5, 6, 7, 8, 9, 10})
```

See also

```
quotient()
```

congruences_lattice(*labels='congruence'*)

Return the lattice of congruences.

A congruence of a lattice is a partition of elements to classes compatible with both meet- and join-operation; see `congruence()`. Elements of the *congruence lattice* are congruences ordered by refinement; i.e. if every class of a congruence Θ is contained in some class of Φ, then $\Theta \leq \Phi$ in the congruence lattice.

INPUT:

- `labels` – string; the type of elements in the resulting lattice

OUTPUT: a distributive lattice

- If `labels='congruence'`, then elements of the result will be congruences given as `sage.combinat.set_partition.SetPartition`.
- If `labels='integers'`, result is a lattice on integers isomorphic to the congruence lattice.

EXAMPLES:

```
sage: # needs sage.combinat
sage: N5 = posets.PentagonPoset()
sage: CL = N5.congruences_lattice(); CL
Finite lattice containing 5 elements
sage: CL.atoms()
[{{0}, {1}, {2, 3}, {4}}]
sage: CL.coatoms()
[{{0, 1}, {2, 3, 4}}, {{0, 2, 3}, {1, 4}}]

sage: C4 = posets.ChainPoset(4)
sage: CL = C4.congruences_lattice(labels='integer')                    #␣
↪needs sage.combinat
sage: CL.is_isomorphic(posets.BooleanLattice(3))                       #␣
↪needs sage.combinat
True
```

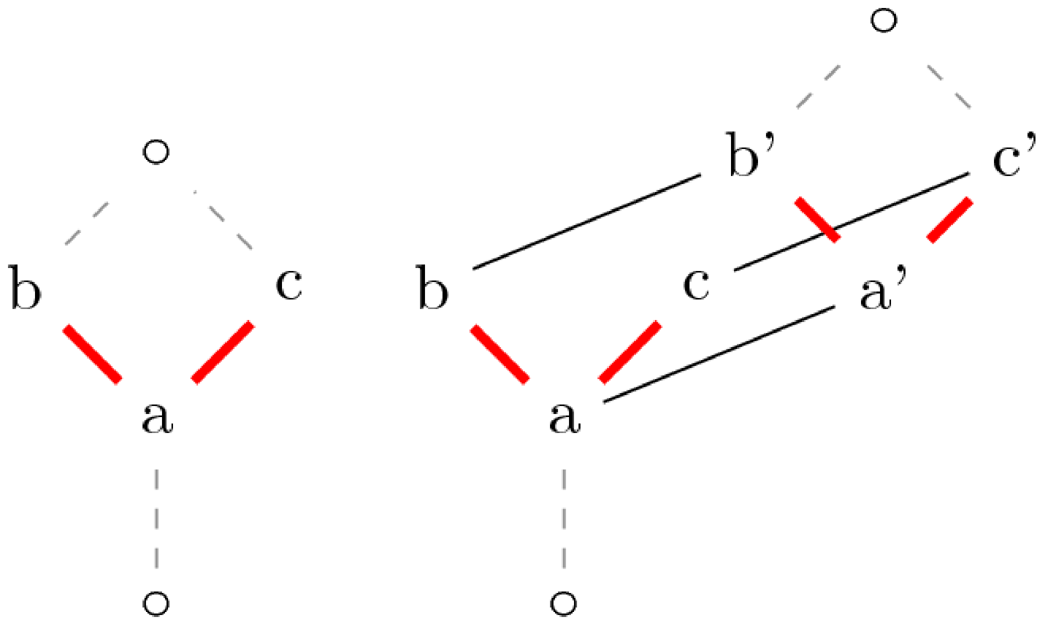
```
>>> from sage.all import *
>>> # needs sage.combinat
>>> N5 = posets.PentagonPoset()
>>> CL = N5.congruences_lattice(); CL
Finite lattice containing 5 elements
>>> CL.atoms()
[{{0}, {1}, {2, 3}, {4}}]
>>> CL.coatoms()
[{{0, 1}, {2, 3, 4}}, {{0, 2, 3}, {1, 4}}]

>>> C4 = posets.ChainPoset(Integer(4))
>>> CL = C4.congruences_lattice(labels='integer')                    #␣
↪needs sage.combinat
>>> CL.is_isomorphic(posets.BooleanLattice(Integer(3)))                ␣
↪     # needs sage.combinat
True
```

day_doubling(S)

Return the lattice with Alan Day's doubling construction of subset S.

The subset S is assumed to be convex (i.e. if $a, c \in S$ and $a < b < c$ in the lattice, then $b \in S$) and connected (i.e. if $a, b \in S$ then there is a chain $a = e_1, e_2, \ldots, e_n = b$ such that e_i either covers or is covered by e_{i+1}).



Alan Day's doubling construction is a specific extension of the lattice. Here we formulate it in a format more suitable for computation.

Let L be a lattice and S a convex subset of it. The resulting lattice $L[S]$ has elements $(e, 0)$ for each $e \in L$ and $(e, 1)$ for each $e \in S$. If $x \leq y$ in L, then in the new lattice we have

- $(x, 0), (x, 1) \leq (y, 0), (y, 1)$
- $(x, 0) \leq (x, 1)$

INPUT:

- `S` – a subset of the lattice

EXAMPLES:

```
sage: L = LatticePoset({1: ['a', 'b', 2], 'a': ['c'], 'b': ['c', 'd'],
....:                   2: [3], 'c': [4], 'd': [4], 3: [4]})
sage: L2 = L.day_doubling(['a', 'b', 'c', 'd']); L2
Finite lattice containing 12 elements
sage: set(L2.upper_covers((1, 0))) == set([(2, 0), ('a', 0), ('b', 0)])
True
sage: set(L2.upper_covers(('b', 0))) == set([('d', 0), ('b', 1), ('c', 0)])
True
```

```
>>> from sage.all import *
>>> L = LatticePoset({Integer(1): ['a', 'b', Integer(2)], 'a': ['c'], 'b': ['c
↪', 'd'],
```

(continues on next page)

(continued from previous page)

```
...                    Integer(2): [Integer(3)], 'c': [Integer(4)], 'd':␣
↪[Integer(4)], Integer(3): [Integer(4)]})
>>> L2 = L.day_doubling(['a', 'b', 'c', 'd']); L2
Finite lattice containing 12 elements
>>> set(L2.upper_covers((Integer(1), Integer(0)))) == set([(Integer(2),␣
↪Integer(0)), ('a', Integer(0)), ('b', Integer(0))])
True
>>> set(L2.upper_covers(('b', Integer(0)))) == set([('d', Integer(0)), ('b',␣
↪Integer(1)), ('c', Integer(0))])
True
```

See also:

is_constructible_by_doublings()

double_irreducibles()

Return the list of double irreducible elements of this lattice.

A *double irreducible* element of a lattice is an element covering and covered by exactly one element. In other words it is neither a meet nor a join of any elements.

EXAMPLES:

```
sage: L = posets.DivisorLattice(12)
sage: sorted(L.double_irreducibles())
[3, 4]

sage: L = posets.BooleanLattice(3)
sage: L.double_irreducibles()
[]
```

```
>>> from sage.all import *
>>> L = posets.DivisorLattice(Integer(12))
>>> sorted(L.double_irreducibles())
[3, 4]

>>> L = posets.BooleanLattice(Integer(3))
>>> L.double_irreducibles()
[]
```

See also:

meet_irreducibles(), join_irreducibles()

feichtner_yuzvinsky_ring(*G*, *use_defining=False*, *base_ring=None*)

Return the Feichtner-Yuzvinsky ring of `self` and `G`.

Let R be a commutative ring, L a lattice, and $G \subseteq L$. The *Feichtner-Yuzvinsky ring* is the quotient of the polynomial ring $R[h_g \mid g \in G]$ by the ideal generated by

- h_a for every atom $a \in L \cap G$ and

- for every antichain A of the subposet G such that $g := \bigvee A \in G$ (with the join taken in L)

$$\prod_{a \in A} (h_g - h_a).$$

This was originally described for G such that (L, G) is a built lattice in the sense of [FY2004] (which has a geometric motivation), but this has been extended to G being an arbitrary subset.

This is not the original definition, which uses the nested subsets of G (see [FY2004] for the definition). However, the original construction, which we call the *defining* presentation and use the variables $\{x_g \mid g \in G\}$, can be recovered by setting $h_g = \sum_{g' \geq g} x_{g'}$ (where $g' \in G$).

INPUT:

- `G` – a subset of elements of `self`
- `use_defining` – boolean (default: `False`); whether or not to use the defining presentation in x_g
- `base_ring` – (default: $\mathbf{Q}$) the base ring

The order on the variables is equal to the ordering of the elements in `G`.

EXAMPLES:

```
sage: B2 = posets.BooleanLattice(2)
sage: FY = B2.feichtner_yuzvinsky_ring(B2[1:])
sage: FY
Quotient of Multivariate Polynomial Ring in h0, h1, h2 over Rational Field
 by the ideal (h0, h1, h0*h1 - h0*h2 - h1*h2 + h2^2)

sage: FY = B2.feichtner_yuzvinsky_ring(B2[1:], use_defining=True)
sage: FY
Quotient of Multivariate Polynomial Ring in x0, x1, x2 over Rational Field
 by the ideal (x0 + x2, x1 + x2, x0*x1)
```

```
>>> from sage.all import *
>>> B2 = posets.BooleanLattice(Integer(2))
>>> FY = B2.feichtner_yuzvinsky_ring(B2[Integer(1):])
>>> FY
Quotient of Multivariate Polynomial Ring in h0, h1, h2 over Rational Field
 by the ideal (h0, h1, h0*h1 - h0*h2 - h1*h2 + h2^2)

>>> FY = B2.feichtner_yuzvinsky_ring(B2[Integer(1):], use_defining=True)
>>> FY
Quotient of Multivariate Polynomial Ring in x0, x1, x2 over Rational Field
 by the ideal (x0 + x2, x1 + x2, x0*x1)
```

We reproduce the example from Section 5 of [Coron2023]:

```
sage: # needs sage.geometry.polyhedron
sage: H.<a,b,c,d> = HyperplaneArrangements(QQ)
sage: Arr = H(a-b, b-c, c-d, d-a)
sage: P = LatticePoset(Arr.intersection_poset())
sage: FY = P.feichtner_yuzvinsky_ring([P.top(),5,1,2,3,4])
sage: FY.defining_ideal().groebner_basis()                                    #␣
↪needs sage.libs.singular
[h0^2 - h0*h1, h1^2, h2, h3, h4, h5]
```

```
>>> from sage.all import *
>>> # needs sage.geometry.polyhedron
>>> H = HyperplaneArrangements(QQ, names=('a', 'b', 'c', 'd',)); (a, b, c, d,
↪) = H._first_ngens(4)
>>> Arr = H(a-b, b-c, c-d, d-a)
>>> P = LatticePoset(Arr.intersection_poset())
>>> FY = P.feichtner_yuzvinsky_ring([P.top(),Integer(5),Integer(1),Integer(2),
↪Integer(3),Integer(4)])
>>> FY.defining_ideal().groebner_basis()                              #␣
↪needs sage.libs.singular
[h0^2 - h0*h1, h1^2, h2, h3, h4, h5]
```

frattini_sublattice()

Return the Frattini sublattice of the lattice.

The Frattini sublattice $\Phi(L)$ is the intersection of all proper maximal sublattices of L. It is also the set of "non-generators" - if the sublattice generated by set S of elements is whole lattice, then also $S \setminus \Phi(L)$ generates whole lattice.

EXAMPLES:

```
sage: L = LatticePoset(( [], [[1,2],[1,17],[1,8],[2,3],[2,22],
....:                          [2,5],[2,7],[17,22],[17,13],[8,7],
....:                          [8,13],[3,16],[3,9],[22,16],[22,18],
....:                          [22,10],[5,18],[5,14],[7,9],[7,14],
....:                          [7,10],[13,10],[16,6],[16,19],[9,19],
....:                          [18,6],[18,33],[14,33],[10,19],
....:                          [10,33],[6,4],[19,4],[33,4]] ))
sage: sorted(L.frattini_sublattice().list())
[1, 2, 4, 10, 19, 22, 33]
```

```
>>> from sage.all import *
>>> L = LatticePoset(( [], [[Integer(1),Integer(2)],[Integer(1),Integer(17)],
↪[Integer(1),Integer(8)],[Integer(2),Integer(3)],[Integer(2),Integer(22)],
...                          [Integer(2),Integer(5)],[Integer(2),Integer(7)],
↪[Integer(17),Integer(22)],[Integer(17),Integer(13)],[Integer(8),Integer(7)],
...                          [Integer(8),Integer(13)],[Integer(3),Integer(16)],
↪[Integer(3),Integer(9)],[Integer(22),Integer(16)],[Integer(22),Integer(18)],
...                          [Integer(22),Integer(10)],[Integer(5),
↪Integer(18)],[Integer(5),Integer(14)],[Integer(7),Integer(9)],[Integer(7),
↪Integer(14)],
...                          [Integer(7),Integer(10)],[Integer(13),
↪Integer(10)],[Integer(16),Integer(6)],[Integer(16),Integer(19)],[Integer(9),
↪Integer(19)],
...                          [Integer(18),Integer(6)],[Integer(18),
↪Integer(33)],[Integer(14),Integer(33)],[Integer(10),Integer(19)],
...                          [Integer(10),Integer(33)],[Integer(6),Integer(4)],
↪[Integer(19),Integer(4)],[Integer(33),Integer(4)]] ))
>>> sorted(L.frattini_sublattice().list())
[1, 2, 4, 10, 19, 22, 33]
```

is_atomic(*certificate=False*)

Return `True` if the lattice is atomic, and `False` otherwise.

A lattice is atomic if every element can be written as a join of atoms.

INPUT:

- `certificate` – boolean (default: `False`); whether to return a certificate

OUTPUT:

- If `certificate=True` return either `(True, None)` or `(False, e)`, where e is a join-irreducible element that is not an atom. If `certificate=False` return `True` or `False`.

EXAMPLES:

```
sage: L = LatticePoset({1: [2, 3, 4], 2: [5], 3:[5], 4:[6], 5:[6]})
sage: L.is_atomic()
True

sage: L = LatticePoset({0: [1, 2], 1: [3], 2: [3], 3:[4]})
sage: L.is_atomic()
False
sage: L.is_atomic(certificate=True)
(False, 4)
```

```
>>> from sage.all import *
>>> L = LatticePoset({Integer(1): [Integer(2), Integer(3), Integer(4)],␣
↪Integer(2): [Integer(5)], Integer(3):[Integer(5)], Integer(4):[Integer(6)],␣
↪Integer(5):[Integer(6)]})
>>> L.is_atomic()
True

>>> L = LatticePoset({Integer(0): [Integer(1), Integer(2)], Integer(1):␣
↪[Integer(3)], Integer(2): [Integer(3)], Integer(3):[Integer(4)]})
>>> L.is_atomic()
False
>>> L.is_atomic(certificate=True)
(False, 4)
```

Note: See [EnumComb1], Section 3.3 for a discussion of atomic lattices.

See also:

- Dual property: *is_coatomic()*
- Stronger properties: *is_sectionally_complemented()*
- Mutually exclusive properties: *is_vertically_decomposable()*

is_coatomic(*certificate=False*)

Return `True` if the lattice is coatomic, and `False` otherwise.

A lattice is coatomic if every element can be written as a meet of coatoms; i.e. if the dual of the lattice is atomic.

INPUT:

- `certificate` – boolean (default: `False`); whether to return a certificate

OUTPUT:

- If `certificate=True` return either `(True, None)` or `(False, e)`, where e is a meet-irreducible element that is not a coatom. If `certificate=False` return `True` or `False`.

EXAMPLES:

```
sage: L = posets.BooleanLattice(3)
sage: L.is_coatomic()
True

sage: L = LatticePoset({1: [2], 2: [3, 4], 3: [5], 4:[5]})
sage: L.is_coatomic()
False
sage: L.is_coatomic(certificate=True)
(False, 1)
```

```
>>> from sage.all import *
>>> L = posets.BooleanLattice(Integer(3))
>>> L.is_coatomic()
True

>>> L = LatticePoset({Integer(1): [Integer(2)], Integer(2): [Integer(3),␣
↪Integer(4)], Integer(3): [Integer(5)], Integer(4):[Integer(5)]})
>>> L.is_coatomic()
False
>>> L.is_coatomic(certificate=True)
(False, 1)
```

See also:

- Dual property: *is_atomic()*
- Stronger properties: *is_cosectionally_complemented()*
- Mutually exclusive properties: *is_vertically_decomposable()*

is_complemented(*certificate=False*)

Return `True` if the lattice is complemented, and `False` otherwise.

A lattice is complemented if every element has at least one complement.

INPUT:

- `certificate` – boolean (default: `False`); whether to return a certificate

OUTPUT:

- If `certificate=True` return either `(True, None)` or `(False, e)`, where `e` is an element without a complement. If `certificate=False` return `True` or `False`.

EXAMPLES:

```
sage: L = LatticePoset({0: [1, 2, 3], 1: [4], 2: [4], 3: [4]})
sage: L.is_complemented()
```

(continues on next page)

(continued from previous page)

```
True

sage: L = LatticePoset({1: [2, 3, 4], 2: [5, 6], 3: [5], 4: [6],
....:                   5: [7], 6: [7]})
sage: L.is_complemented()
False
sage: L.is_complemented(certificate=True)
(False, 2)
```

```
>>> from sage.all import *
>>> L = LatticePoset({Integer(0): [Integer(1), Integer(2), Integer(3)],␣
↪Integer(1): [Integer(4)], Integer(2): [Integer(4)], Integer(3):␣
↪[Integer(4)]})
>>> L.is_complemented()
True

>>> L = LatticePoset({Integer(1): [Integer(2), Integer(3), Integer(4)],␣
↪Integer(2): [Integer(5), Integer(6)], Integer(3): [Integer(5)], Integer(4):␣
↪[Integer(6)],
...                   Integer(5): [Integer(7)], Integer(6): [Integer(7)]})
>>> L.is_complemented()
False
>>> L.is_complemented(certificate=True)
(False, 2)
```

See also:

- Stronger properties: *is_sectionally_complemented()*, *is_cosectionally_complemented()*, *is_orthocomplemented()*
- Other: *complements()*

is_congruence_uniform()

Return whether `self` is congruence uniform.

This is equivalent to being constructible by doubling intervals.

See also:

is_constructible_by_doublings()

EXAMPLES:

```
sage: P = posets.PentagonPoset()
sage: P.is_congruence_uniform()
True
sage: P = posets.DiamondPoset(5)
sage: P.is_congruence_uniform()
False
```

```
>>> from sage.all import *
>>> P = posets.PentagonPoset()
>>> P.is_congruence_uniform()
True
>>> P = posets.DiamondPoset(Integer(5))
>>> P.is_congruence_uniform()
False
```

REFERENCES:

- [Day1979]

is_constructible_by_doublings(*type*)

Return `True` if the lattice is constructible by doublings, and `False` otherwise.

We call a lattice doubling constructible if it can be constructed from the one element lattice by a sequence of Alan Day's doubling constructions.

Lattices constructible by interval doubling are also called *bounded*. Lattices constructible by lower and upper pseudo-interval are called *lower bounded* and *upper bounded*. Lattices constructible by any convex set doubling are called *congruence normal*.

INPUT:

- `type` – string; can be one of the following:
  - `'interval'` – allow only doublings of an interval
  - `'lower'` – allow doublings of lower pseudo-interval; that is, a subset of the lattice with a unique minimal element
  - `'upper'` – allow doublings of upper pseudo-interval; that is, a subset of the lattice with a unique maximal element
  - `'convex'` – allow doubling of any convex set
  - `'any'` – allow doubling of any set

EXAMPLES:

The pentagon can be constructed by doubling intervals; the 5-element diamond can not be constructed by any doublings:

```
sage: posets.PentagonPoset().is_constructible_by_doublings('interval')
True

sage: posets.DiamondPoset(5).is_constructible_by_doublings('any')            #␣
↪needs sage.combinat
False
```

```
>>> from sage.all import *
>>> posets.PentagonPoset().is_constructible_by_doublings('interval')
True

>>> posets.DiamondPoset(Integer(5)).is_constructible_by_doublings('any')      ␣
↪     # needs sage.combinat
False
```

After doubling both upper and lower pseudo-interval a lattice is constructible by convex subset doubling:

```
sage: L = posets.BooleanLattice(2)
sage: L = L.day_doubling([0, 1, 2])  # A lower pseudo-interval
sage: L.is_constructible_by_doublings('interval')
False
sage: L.is_constructible_by_doublings('lower')
True
sage: L = L.day_doubling([(3,0), (1,1), (2,1)])  # An upper pseudo-interval
sage: L.is_constructible_by_doublings('upper')
False
sage: L.is_constructible_by_doublings('convex')                    #␣
↪needs sage.combinat
True
```

```
>>> from sage.all import *
>>> L = posets.BooleanLattice(Integer(2))
>>> L = L.day_doubling([Integer(0), Integer(1), Integer(2)])  # A lower␣
↪pseudo-interval
>>> L.is_constructible_by_doublings('interval')
False
>>> L.is_constructible_by_doublings('lower')
True
>>> L = L.day_doubling([(Integer(3),Integer(0)), (Integer(1),Integer(1)),␣
↪(Integer(2),Integer(1))])  # An upper pseudo-interval
>>> L.is_constructible_by_doublings('upper')
False
>>> L.is_constructible_by_doublings('convex')                    #␣
↪needs sage.combinat
True
```

An example of a lattice that can be constructed by doublings of a non-convex subsets:

```
sage: L = LatticePoset(DiGraph('OQC?a?@CO?G_C@?GA?O??_??@?BO?A_?G??C??_?@???
↪'))
sage: L.is_constructible_by_doublings('convex')
False
sage: L.is_constructible_by_doublings('any')
True
```

```
>>> from sage.all import *
>>> L = LatticePoset(DiGraph('OQC?a?@CO?G_C@?GA?O??_??@?BO?A_?G??C??_?@???'))
>>> L.is_constructible_by_doublings('convex')
False
>>> L.is_constructible_by_doublings('any')
True
```

See also:

- Stronger properties: `is_distributive()` (doubling by interval), `is_join_semidistributive()` (doubling by lower pseudo-intervals), `is_meet_semidistributive()` (doubling by upper pseudo-intervals)
- Mutually exclusive properties: `is_simple()` (doubling by any set)

- Other: *day_doubling()*

ALGORITHM:

According to [HOLM2016] a lattice L is lower bounded if and only if $|\text{Ji}(L)| = |\text{Ji}(\text{Con } L)|$, and so dually $|\text{Mi}(L)| = |\text{Mi}(\text{Con } L)|$ in upper bounded lattices. The same reference gives a test for being constructible by convex or by any subset.

is_cosectionally_complemented(*certificate=False*)

Return `True` if the lattice is cosectionally complemented, and `False` otherwise.

A lattice is *cosectionally complemented* if all intervals to the top element interpreted as sublattices are complemented lattices.

INPUT:

- `certificate` – boolean (default: `False`); whether to return a certificate if the lattice is not cosectionally complemented

OUTPUT:

- If `certificate=False` return `True` or `False`. If `certificate=True` return either `(True, None)` or `(False, (b, e))`, where b is an element so that in the sublattice from b to the top element has no complement for element e.

EXAMPLES:

The smallest sectionally but not cosectionally complemented lattice:

```
sage: L = LatticePoset({1: [2, 3, 4], 2: [5], 3: [5], 4: [6], 5: [6]})
sage: L.is_sectionally_complemented(), L.is_cosectionally_complemented()
(True, False)
```

```
>>> from sage.all import *
>>> L = LatticePoset({Integer(1): [Integer(2), Integer(3), Integer(4)],
↪Integer(2): [Integer(5)], Integer(3): [Integer(5)], Integer(4):
↪[Integer(6)], Integer(5): [Integer(6)]})
>>> L.is_sectionally_complemented(), L.is_cosectionally_complemented()
(True, False)
```

A sectionally and cosectionally but not relatively complemented lattice:

```
sage: L = LatticePoset(DiGraph('MYi@O?P??D?OG?@?O_?C?Q??O?W?@??O??'))
sage: L.is_sectionally_complemented() and L.is_cosectionally_complemented()
True
sage: L.is_relatively_complemented()
False
```

```
>>> from sage.all import *
>>> L = LatticePoset(DiGraph('MYi@O?P??D?OG?@?O_?C?Q??O?W?@??O??'))
>>> L.is_sectionally_complemented() and L.is_cosectionally_complemented()
True
>>> L.is_relatively_complemented()
False
```

Getting a certificate:

```
sage: L = LatticePoset(DiGraph('HW?@D?Q?GE?G@??'))
sage: L.is_cosectionally_complemented(certificate=True)
(False, (2, 7))
```

```
>>> from sage.all import *
>>> L = LatticePoset(DiGraph('HW?@D?Q?GE?G@??'))
>>> L.is_cosectionally_complemented(certificate=True)
(False, (2, 7))
```

See also

- Dual property: *is_sectionally_complemented()*
- Weaker properties: *is_complemented()*, *is_coatomic()*, *is_regular()*
- Stronger properties: *is_relatively_complemented()*

is_dismantlable(*certificate=False*)

Return True if the lattice is dismantlable, and False otherwise.

An n-element lattice L_n is dismantlable if there is a sublattice chain $L_{n-1} \supset L_{n-2}, \supset \cdots, \supset L_0$ so that every L_i is a sublattice of L_{i+1} with one element less, and L_0 is the empty lattice. In other words, a dismantlable lattice can be reduced to empty lattice removing doubly irreducible element one by one.

INPUT:

- certificate – boolean; whether to return a certificate
  - If certificate = False (default), returns True or False accordingly.
  - If certificate = True, returns:
    * (True, elms) when the lattice is dismantlable, where elms is elements listed in a possible removing order.
    * (False, crown) when the lattice is not dismantlable, where crown is a subposet of $2k$ elements $a_1, \ldots, a_k, b_1, \ldots, b_k$ with covering relations $a_i \lessdot b_i$ and $a_i \lessdot b_{i+1}$ for $i \in [1, \ldots, k-1]$, and $a_k \lessdot b_1$.

EXAMPLES:

```
sage: DL12 = LatticePoset((divisors(12), attrcall("divides")))
sage: DL12.is_dismantlable()
True
sage: DL12.is_dismantlable(certificate=True)
(True, [4, 2, 1, 3, 6, 12])

sage: B3 = posets.BooleanLattice(3)
sage: B3.is_dismantlable()
False
sage: B3.is_dismantlable(certificate=True)
(False, Finite poset containing 6 elements)
```

```
>>> from sage.all import *
>>> DL12 = LatticePoset((divisors(Integer(12)), attrcall("divides")))
```

(continues on next page)

(continued from previous page)

```
>>> DL12.is_dismantlable()
True
>>> DL12.is_dismantlable(certificate=True)
(True, [4, 2, 1, 3, 6, 12])

>>> B3 = posets.BooleanLattice(Integer(3))
>>> B3.is_dismantlable()
False
>>> B3.is_dismantlable(certificate=True)
(False, Finite poset containing 6 elements)
```

Every planar lattice is dismantlable. Converse is not true:

```
sage: L = LatticePoset( ([], [[0, 1], [0, 2], [0, 3], [0, 4],
....:                          [1, 7], [2, 6], [3, 5], [4, 5],
....:                          [4, 6], [4, 7], [5, 8], [6, 8],
....:                          [7, 8]]) )
sage: L.is_dismantlable()
True
sage: L.is_planar()
False
```

```
>>> from sage.all import *
>>> L = LatticePoset( ([], [[Integer(0), Integer(1)], [Integer(0),␣
↪Integer(2)], [Integer(0), Integer(3)], [Integer(0), Integer(4)],
...                        [Integer(1), Integer(7)], [Integer(2),␣
↪Integer(6)], [Integer(3), Integer(5)], [Integer(4), Integer(5)],
...                        [Integer(4), Integer(6)], [Integer(4),␣
↪Integer(7)], [Integer(5), Integer(8)], [Integer(6), Integer(8)],
...                        [Integer(7), Integer(8)]]) )
>>> L.is_dismantlable()
True
>>> L.is_planar()
False
```

See also:

- Stronger properties: *is_planar()*
- Weaker properties: *is_sublattice_dismantlable()*

is_distributive(*certificate=False*)

Return `True` if the lattice is distributive, and `False` otherwise.

A lattice $(L, \vee, \wedge)$ is distributive if meet distributes over join: $x \wedge (y \vee z) = (x \wedge y) \vee (x \wedge z)$ for every $x, y, z \in L$ just like $x \cdot (y + z) = x \cdot y + x \cdot z$ in normal arithmetic. For duality in lattices it follows that then also join distributes over meet.

- `certificate` – boolean (default: `False`); whether to return a certificate

OUTPUT:

- If `certificate=True` return either `(True, None)` or `(False, (x, y, z))`, where x, y and z

are elements of the lattice such that $x \wedge (y \vee z) \neq (x \wedge y) \vee (x \wedge z)$. If `certificate=False` return `True` or `False`.

EXAMPLES:

```
sage: L = LatticePoset({1: [2, 3], 2: [4], 3: [4], 4: [5]})
sage: L.is_distributive()
True
sage: L = LatticePoset({1: [2, 3, 4], 2: [5], 3: [6], 4: [6], 5: [6]})
sage: L.is_distributive()
False
sage: L.is_distributive(certificate=True)
(False, (5, 3, 2))
```

```
>>> from sage.all import *
>>> L = LatticePoset({Integer(1): [Integer(2), Integer(3)], Integer(2):␣
↪[Integer(4)], Integer(3): [Integer(4)], Integer(4): [Integer(5)]})
>>> L.is_distributive()
True
>>> L = LatticePoset({Integer(1): [Integer(2), Integer(3), Integer(4)],␣
↪Integer(2): [Integer(5)], Integer(3): [Integer(6)], Integer(4):␣
↪[Integer(6)], Integer(5): [Integer(6)]})
>>> L.is_distributive()
False
>>> L.is_distributive(certificate=True)
(False, (5, 3, 2))
```

See also:

- Weaker properties: *is_modular()*, *is_semidistributive()*, *is_join_distributive()*, *is_meet_distributive()*, *is_subdirectly_reducible()*, *is_trim()*, *is_congruence_uniform()*, *is_extremal()*
- Stronger properties: *is_stone()*

is_extremal()

Return `True` if the lattice is extremal, and `False` otherwise.

A lattice is *extremal* if the number of join-irreducibles is equal to the number of meet-irreducibles and to the number of cover relations in the longest chains.

EXAMPLES:

```
sage: posets.PentagonPoset().is_extremal()
True

sage: P = LatticePoset(posets.SymmetricGroupWeakOrderPoset(3))
sage: P.is_extremal()
False
```

```
>>> from sage.all import *
>>> posets.PentagonPoset().is_extremal()
True
```

(continues on next page)

(continued from previous page)

```
>>> P = LatticePoset(posets.SymmetricGroupWeakOrderPoset(Integer(3)))
>>> P.is_extremal()
False
```

See also

- Stronger properties: `is_distributive()`, `is_trim()`

REFERENCES:

- [Mark1992]

is_geometric()

Return `True` if the lattice is geometric, and `False` otherwise.

A lattice is geometric if it is both atomic and upper semimodular.

EXAMPLES:

Canonical example is the lattice of partitions of finite set ordered by refinement:

```
sage: L = posets.SetPartitions(4)                                   #␣
↪needs sage.combinat
sage: L.is_geometric()                                              #␣
↪needs sage.combinat
True
```

```
>>> from sage.all import *
>>> L = posets.SetPartitions(Integer(4))                            ␣
↪     # needs sage.combinat
>>> L.is_geometric()                                              #␣
↪needs sage.combinat
True
```

Smallest example of geometric lattice that is not modular:

```
sage: L = LatticePoset(DiGraph('K]?@g@S?q?M?@?@?@?@?@?@??'))
sage: L.is_geometric()
True
sage: L.is_modular()
False
```

```
>>> from sage.all import *
>>> L = LatticePoset(DiGraph('K]?@g@S?q?M?@?@?@?@?@?@??'))
>>> L.is_geometric()
True
>>> L.is_modular()
False
```

Two non-examples:

```
sage: L = LatticePoset({1:[2, 3, 4], 2:[5, 6], 3:[5], 4:[6], 5:[7], 6:[7]})
sage: L.is_geometric()  # Graded, but not upper semimodular
False
sage: L = posets.ChainPoset(3)
sage: L.is_geometric()  # Modular, but not atomic
False
```

```
>>> from sage.all import *
>>> L = LatticePoset({Integer(1):[Integer(2), Integer(3), Integer(4)],␣
↪Integer(2):[Integer(5), Integer(6)], Integer(3):[Integer(5)],␣
↪Integer(4):[Integer(6)], Integer(5):[Integer(7)], Integer(6):[Integer(7)]})
>>> L.is_geometric()  # Graded, but not upper semimodular
False
>>> L = posets.ChainPoset(Integer(3))
>>> L.is_geometric()  # Modular, but not atomic
False
```

See also

- Weaker properties: *is_upper_semimodular()*, *is_relatively_complemented()*

is_interval_dismantlable(*certificate=False*)

Return `True` if the lattice is interval dismantlable, and `False` otherwise.

An interval dismantling is a subdivision of a lattice to a principal upper set and a principal lower set. A lattice is *interval dismantlable* if it can be decomposed into 1-element lattices by consecutive interval distmantlings.

A lattice is *minimally interval non-dismantlable* if it is not interval dismantlable, but all of its sublattices are interval dismantlable.

INPUT:

- `certificate` – boolean (default: `False`); whether to return a certificate

OUTPUT:

- if `certificate=False`, return only `True` or `False`
- if `certificate=True`, return either
  - `(True, list)` where `list` is a nested list showing the decomposition; for example `list[1][0]` is a lower part of upper part of the lattice when decomposed twice.
  - `(False, M)` where M is a minimally interval non-dismantlable sublattice of the lattice.

EXAMPLES:

```
sage: L1 = LatticePoset({1: [2, 3], 3: [4, 5], 2: [6], 4: [6], 5: [6]})
sage: L1.is_interval_dismantlable()
True

sage: L2 = LatticePoset({1: [2, 3, 4, 5], 2: [6], 3: [6], 4: [6],
....:                    5: [6, 7], 6: [8], 7: [9, 10], 8:[10], 9:[10]})
sage: L2.is_interval_dismantlable()
False
```

```
>>> from sage.all import *
>>> L1 = LatticePoset({Integer(1): [Integer(2), Integer(3)], Integer(3):␣
↪[Integer(4), Integer(5)], Integer(2): [Integer(6)], Integer(4):␣
↪[Integer(6)], Integer(5): [Integer(6)]})
>>> L1.is_interval_dismantlable()
True

>>> L2 = LatticePoset({Integer(1): [Integer(2), Integer(3), Integer(4),␣
↪Integer(5)], Integer(2): [Integer(6)], Integer(3): [Integer(6)],␣
↪Integer(4): [Integer(6)],
...                     Integer(5): [Integer(6), Integer(7)], Integer(6):␣
↪[Integer(8)], Integer(7): [Integer(9), Integer(10)],␣
↪Integer(8):[Integer(10)], Integer(9):[Integer(10)]})
>>> L2.is_interval_dismantlable()
False
```

To get certificates:

```
sage: L1.is_interval_dismantlable(certificate=True)
(True, [[[1], [2]], [[[3], [5]], [[4], [6]]]])
sage: L2.is_interval_dismantlable(certificate=True)
(False, Finite lattice containing 5 elements)
```

```
>>> from sage.all import *
>>> L1.is_interval_dismantlable(certificate=True)
(True, [[[1], [2]], [[[3], [5]], [[4], [6]]]])
>>> L2.is_interval_dismantlable(certificate=True)
(False, Finite lattice containing 5 elements)
```

See also:

- Stronger properties: *is_join_semidistributive()*, *is_meet_semidistributive()*
- Weaker properties: *is_sublattice_dismantlable()*

is_isoform(*certificate=False*)

Return `True` if the lattice is isoform and `False` otherwise.

A congruence is *isoform* (or *isotype*) if all blocks are isomorphic sublattices. A lattice is isoform if it has only isoform congruences.

INPUT:

- `certificate` – boolean (default: `False`); whether to return a certificate if the lattice is not isoform

OUTPUT:

- If `certificate=True` return either `(True, None)` or `(False, C)`, where C is a non-isoform congruence as a *sage.combinat.set_partition.SetPartition*. If `certificate=False` return `True` or `False`.

EXAMPLES:

```
sage: L = LatticePoset({1: [2, 3, 4], 2: [5, 6], 3: [6, 7],
....:                    4: [7], 5: [8], 6: [8], 7: [8]})
sage: L.is_isoform()                                                    #␣
↪needs sage.combinat
True
```

```
>>> from sage.all import *
>>> L = LatticePoset({Integer(1): [Integer(2), Integer(3), Integer(4)],␣
↪Integer(2): [Integer(5), Integer(6)], Integer(3): [Integer(6), Integer(7)],
...                    Integer(4): [Integer(7)], Integer(5): [Integer(8)],␣
↪Integer(6): [Integer(8)], Integer(7): [Integer(8)]})
>>> L.is_isoform()                                                      #␣
↪needs sage.combinat
True
```

Every isoform lattice is (trivially) uniform, but the converse is not true:

```
sage: L = LatticePoset({1: [2, 3, 6], 2: [4, 5], 3: [5], 4: [9, 8],
....:                    5: [7, 8], 6: [9], 7: [10], 8: [10], 9: [10]})
sage: L.is_isoform(), L.is_uniform()                                    #␣
↪needs sage.combinat
(False, True)

sage: L.is_isoform(certificate=True)                                    #␣
↪needs sage.combinat
(False, {{1, 2, 4, 6, 9}, {3, 5, 7, 8, 10}})
```

```
>>> from sage.all import *
>>> L = LatticePoset({Integer(1): [Integer(2), Integer(3), Integer(6)],␣
↪Integer(2): [Integer(4), Integer(5)], Integer(3): [Integer(5)], Integer(4):␣
↪[Integer(9), Integer(8)],
...                    Integer(5): [Integer(7), Integer(8)], Integer(6):␣
↪[Integer(9)], Integer(7): [Integer(10)], Integer(8): [Integer(10)],␣
↪Integer(9): [Integer(10)]})
>>> L.is_isoform(), L.is_uniform()                                      #␣
↪needs sage.combinat
(False, True)

>>> L.is_isoform(certificate=True)                                      #␣
↪needs sage.combinat
(False, {{1, 2, 4, 6, 9}, {3, 5, 7, 8, 10}})
```

See also:

- Weaker properties: `is_uniform()`
- Stronger properties: `is_simple()`, `is_relatively_complemented()`
- Other: `congruence()`

is_join_distributive(*certificate=False*)

Return `True` if the lattice is join-distributive and `False` otherwise.

A lattice is *join-distributive* if every interval from an element to the join of the element's upper covers is a distributive lattice. Actually this distributive sublattice is then a Boolean lattice.

They are also called as *Dilworth's lattices* and *upper locally distributive lattices*. They can be characterized in many other ways, see [Dil1940].

INPUT:

- `certificate` – boolean (default: `False`); whether to return a certificate

OUTPUT:

- If `certificate=True` return either `(True, None)` or `(False, e)`, where e is an element such that the interval from e to the meet of upper covers of e is not distributive. If `certificate=False` return `True` or `False`.

EXAMPLES:

```
sage: L = LatticePoset({1: [2, 3, 4], 2: [5, 6], 3: [5, 7],
....:                   4: [6, 7], 5: [8, 9], 6: [9], 7: [9, 10],
....:                   8: [11], 9: [11], 10: [11]})
sage: L.is_join_distributive()
True

sage: L = LatticePoset({1: [2], 2: [3, 4], 3: [5], 4: [6],
....:                   5: [7], 6: [7]})
sage: L.is_join_distributive()
False
sage: L.is_join_distributive(certificate=True)
(False, 2)
```

```
>>> from sage.all import *
>>> L = LatticePoset({Integer(1): [Integer(2), Integer(3), Integer(4)],
↪Integer(2): [Integer(5), Integer(6)], Integer(3): [Integer(5), Integer(7)],
...                   Integer(4): [Integer(6), Integer(7)], Integer(5):
↪[Integer(8), Integer(9)], Integer(6): [Integer(9)], Integer(7): [Integer(9),
↪ Integer(10)],
...                   Integer(8): [Integer(11)], Integer(9): [Integer(11)],
↪Integer(10): [Integer(11)]})
>>> L.is_join_distributive()
True

>>> L = LatticePoset({Integer(1): [Integer(2)], Integer(2): [Integer(3),
↪Integer(4)], Integer(3): [Integer(5)], Integer(4): [Integer(6)],
...                   Integer(5): [Integer(7)], Integer(6): [Integer(7)]})
>>> L.is_join_distributive()
False
>>> L.is_join_distributive(certificate=True)
(False, 2)
```

See also:

- Stronger properties: *is_distributive()*

is_join_pseudocomplemented(*certificate=False*)

Return True if the lattice is join-pseudocomplemented, and False otherwise.

A lattice is join-pseudocomplemented if every element e has a join-pseudocomplement e', i.e. the least element such that the join of e and e' is the top element.

INPUT:

- certificate – boolean (default: False); whether to return a certificate

OUTPUT:

- If certificate=True return either (True, None) or (False, e), where e is an element without a join-pseudocomplement. If certificate=False return True or False.

EXAMPLES:

```
sage: L = LatticePoset({1: [2, 5], 2: [3, 6], 3: [4], 4: [7],
....:                   5: [6], 6: [7]})
sage: L.is_join_pseudocomplemented()
True

sage: L = LatticePoset({1: [2, 3], 2: [4, 5, 6], 3: [6], 4: [7],
....:                   5: [7], 6: [7]})
sage: L.is_join_pseudocomplemented()
False
sage: L.is_join_pseudocomplemented(certificate=True)
(False, 4)
```

```
>>> from sage.all import *
>>> L = LatticePoset({Integer(1): [Integer(2), Integer(5)], Integer(2):␣
↪[Integer(3), Integer(6)], Integer(3): [Integer(4)], Integer(4):␣
↪[Integer(7)],
...                   Integer(5): [Integer(6)], Integer(6): [Integer(7)]})
>>> L.is_join_pseudocomplemented()
True

>>> L = LatticePoset({Integer(1): [Integer(2), Integer(3)], Integer(2):␣
↪[Integer(4), Integer(5), Integer(6)], Integer(3): [Integer(6)], Integer(4):␣
↪[Integer(7)],
...                   Integer(5): [Integer(7)], Integer(6): [Integer(7)]})
>>> L.is_join_pseudocomplemented()
False
>>> L.is_join_pseudocomplemented(certificate=True)
(False, 4)
```

See also

- Dual property: *is_pseudocomplemented()*
- Stronger properties: *is_join_semidistributive()*

is_join_semidistributive(*certificate=False*)

Return `True` if the lattice is join-semidistributive, and `False` otherwise.

A lattice is join-semidistributive if for all elements e, x, y in the lattice we have

$$e \vee x = e \vee y \implies e \vee x = e \vee (x \wedge y)$$

INPUT:

- `certificate` – boolean (default: `False`); whether to return a certificate

OUTPUT:

- If `certificate=True` return either `(True, None)` or `(False, (e, x, y))` such that $e \vee x = e \vee y$ but $e \vee x \neq e \vee (x \wedge y)$. If `certificate=False` return `True` or `False`.

EXAMPLES:

```
sage: T4 = posets.TamariLattice(4)
sage: T4.is_join_semidistributive()
True
sage: L = LatticePoset({1:[2, 3], 2:[4, 5], 3:[5, 6],
....:                    4:[7], 5:[7], 6:[7]})
sage: L.is_join_semidistributive()
False
sage: L.is_join_semidistributive(certificate=True)
(False, (5, 4, 6))
```

```
>>> from sage.all import *
>>> T4 = posets.TamariLattice(Integer(4))
>>> T4.is_join_semidistributive()
True
>>> L = LatticePoset({Integer(1):[Integer(2), Integer(3)],
↪Integer(2):[Integer(4), Integer(5)], Integer(3):[Integer(5), Integer(6)],
...                   Integer(4):[Integer(7)], Integer(5):[Integer(7)],
↪Integer(6):[Integer(7)]})
>>> L.is_join_semidistributive()
False
>>> L.is_join_semidistributive(certificate=True)
(False, (5, 4, 6))
```

See also

- Weaker properties: *is_join_pseudocomplemented()*, *is_interval_dismantlable()*
- Stronger properties: *is_semidistributive()*, *is_meet_distributive()*, *is_constructible_by_doublings()* (by lower pseudo-intervals)

is_left_modular_element(*x*)

Return `True` if `x` is a left modular element and `False` otherwise.

INPUT:

- `x` – an element of the lattice

An element x in a lattice L is *left modular* if

$$(y \vee x) \wedge z = y \vee (x \wedge z)$$

for every $y \leq z \in L$.

It is enough to check this condition on all cover relations $y < z$.

EXAMPLES:

```
sage: P = posets.PentagonPoset()
sage: [i for i in P if P.is_left_modular_element(i)]
[0, 2, 3, 4]
```

```
>>> from sage.all import *
>>> P = posets.PentagonPoset()
>>> [i for i in P if P.is_left_modular_element(i)]
[0, 2, 3, 4]
```

See also

- Stronger properties: `is_modular_element()`

is_lower_semimodular(*certificate=False*)

Return `True` if the lattice is lower semimodular and `False` otherwise.

A lattice is lower semimodular if any pair of elements with a common upper cover have also a common lower cover.

INPUT:

- `certificate` – boolean (default: `False`); whether to return a certificate if the lattice is not lower semimodular

OUTPUT:

- If `certificate=False` return `True` or `False`. If `certificate=True` return either `(True, None)` or `(False, (a, b))`, where a and b are covered by their join but do no cover their meet.

See Wikipedia article Semimodular_lattice

EXAMPLES:

```
sage: L = posets.DiamondPoset(5)
sage: L.is_lower_semimodular()
True

sage: L = posets.PentagonPoset()
sage: L.is_lower_semimodular()
False

sage: L = posets.ChainPoset(6)
sage: L.is_lower_semimodular()
True

sage: L = LatticePoset(DiGraph('IS?`?AAOE_@?C?_@??'))
```

(continues on next page)

(continued from previous page)

```
sage: L.is_lower_semimodular(certificate=True)
(False, (4, 2))
```

```
>>> from sage.all import *
>>> L = posets.DiamondPoset(Integer(5))
>>> L.is_lower_semimodular()
True

>>> L = posets.PentagonPoset()
>>> L.is_lower_semimodular()
False

>>> L = posets.ChainPoset(Integer(6))
>>> L.is_lower_semimodular()
True

>>> L = LatticePoset(DiGraph('IS?`?AAOE_@?C?_@??'))
>>> L.is_lower_semimodular(certificate=True)
(False, (4, 2))
```

See also

- Dual property: *is_upper_semimodular()*
- Weaker properties: *is_graded()*
- Stronger properties: *is_modular()*, *is_meet_distributive()*

is_meet_distributive(*certificate=False*)

Return `True` if the lattice is meet-distributive and `False` otherwise.

A lattice is *meet-distributive* if every interval to an element from the meet of the element's lower covers is a distributive lattice. Actually this distributive sublattice is then a Boolean lattice.

They are also called as *lower locally distributive lattices*. They can be characterized in many other ways, see [Dil1940].

INPUT:

- `certificate` – boolean (default: `False`); whether to return a certificate

OUTPUT:

- If `certificate=True` return either `(True, None)` or `(False, e)`, where e is an element such that the interval to e from the meet of lower covers of e is not distributive. If `certificate=False` return `True` or `False`.

EXAMPLES:

```
sage: L = LatticePoset({1: [2, 3, 4], 2: [5], 3: [5, 6, 7],
....:                   4: [7], 5: [9, 8], 6: [10, 8], 7:
....:                   [9, 10], 8: [11], 9: [11], 10: [11]})
sage: L.is_meet_distributive()
True
```

(continues on next page)

(continued from previous page)

```
sage: L = LatticePoset({1: [2, 3], 2: [4], 3: [5], 4: [6],
....:                   5: [6], 6: [7]})
sage: L.is_meet_distributive()
False
sage: L.is_meet_distributive(certificate=True)
(False, 6)
```

```
>>> from sage.all import *
>>> L = LatticePoset({Integer(1): [Integer(2), Integer(3), Integer(4)],␣
↪Integer(2): [Integer(5)], Integer(3): [Integer(5), Integer(6), Integer(7)],
...                   Integer(4): [Integer(7)], Integer(5): [Integer(9),␣
↪Integer(8)], Integer(6): [Integer(10), Integer(8)], Integer(7):
...                   [Integer(9), Integer(10)], Integer(8): [Integer(11)],␣
↪Integer(9): [Integer(11)], Integer(10): [Integer(11)]})
>>> L.is_meet_distributive()
True

>>> L = LatticePoset({Integer(1): [Integer(2), Integer(3)], Integer(2):␣
↪[Integer(4)], Integer(3): [Integer(5)], Integer(4): [Integer(6)],
...                   Integer(5): [Integer(6)], Integer(6): [Integer(7)]})
>>> L.is_meet_distributive()
False
>>> L.is_meet_distributive(certificate=True)
(False, 6)
```

- Stronger properties: *is_distributive()*

is_meet_semidistributive(*certificate=False*)

Return `True` if the lattice is meet-semidistributive, and `False` otherwise.

A lattice is meet-semidistributive if for all elements e, x, y in the lattice we have

$$e \wedge x = e \wedge y \implies e \wedge x = e \wedge (x \vee y)$$

INPUT:

- `certificate` – boolean (default: `False`); whether to return a certificate

OUTPUT:

- If `certificate=True` return either `(True, None)` or `(False, (e, x, y))` such that $e \wedge x = e \wedge y$ but $e \wedge x \neq e \wedge (x \vee y)$. If `certificate=False` return `True` or `False`.

EXAMPLES:

```
sage: L = LatticePoset({1:[2, 3, 4], 2:[4, 5], 3:[5, 6],
....:                   4:[7], 5:[7], 6:[7]})
```

(continues on next page)

(continued from previous page)

```
sage: L.is_meet_semidistributive()
True
sage: L_ = L.dual()
sage: L_.is_meet_semidistributive()
False
sage: L_.is_meet_semidistributive(certificate=True)
(False, (5, 4, 6))
```

```
>>> from sage.all import *
>>> L = LatticePoset({Integer(1):[Integer(2), Integer(3), Integer(4)],␣
↪Integer(2):[Integer(4), Integer(5)], Integer(3):[Integer(5), Integer(6)],
...                   Integer(4):[Integer(7)], Integer(5):[Integer(7)],␣
↪Integer(6):[Integer(7)]})
>>> L.is_meet_semidistributive()
True
>>> L_ = L.dual()
>>> L_.is_meet_semidistributive()
False
>>> L_.is_meet_semidistributive(certificate=True)
(False, (5, 4, 6))
```

See also

- Weaker properties: `is_pseudocomplemented()`, `is_interval_dismantlable()`
- Stronger properties: `is_semidistributive()`, `is_join_distributive()`, `is_constructible_by_doublings()` (by upper pseudo-intervals)

is_modular(*L=None*, *certificate=False*)

Return `True` if the lattice is modular and `False` otherwise.

An element b of a lattice is *modular* if

$$x \vee (a \wedge b) = (x \vee a) \wedge b$$

for every element $x \leq b$ and a. A lattice is modular if every element is modular. There are other equivalent definitions, see Wikipedia article Modular_lattice.

With the parameter `L` this can be used to check that some subset of elements are all modular.

INPUT:

- `L` – (default: `None`) a list of elements to check being modular, if `L` is `None`, then this checks the entire lattice
- `certificate` – boolean (default: `False`); whether to return a certificate

OUTPUT:

- If `certificate=True` return either `(True, None)` or `(False, (x, a, b))`, where a, b and x are elements of the lattice such that $x < b$ but $x \vee (a \wedge b) \neq (x \vee a) \wedge b$. If also L is given then b in the certificate will be an element of L. If `certificate=False` return `True` or `False`.

EXAMPLES:

```
sage: L = posets.DiamondPoset(5)
sage: L.is_modular()
True

sage: L = posets.PentagonPoset()
sage: L.is_modular()
False

sage: L = LatticePoset({1:[2,3],2:[4,5],3:[5,6],4:[7],5:[7],6:[7]})
sage: L.is_modular(certificate=True)
(False, (2, 6, 4))
sage: [L.is_modular([x]) for x in L]
[True, True, False, True, True, False, True]
```

```
>>> from sage.all import *
>>> L = posets.DiamondPoset(Integer(5))
>>> L.is_modular()
True

>>> L = posets.PentagonPoset()
>>> L.is_modular()
False

>>> L = LatticePoset({Integer(1):[Integer(2),Integer(3)],
↪Integer(2):[Integer(4),Integer(5)],Integer(3):[Integer(5),Integer(6)],
↪Integer(4):[Integer(7)],Integer(5):[Integer(7)],Integer(6):[Integer(7)]})
>>> L.is_modular(certificate=True)
(False, (2, 6, 4))
>>> [L.is_modular([x]) for x in L]
[True, True, False, True, True, False, True]
```

See also:

- Weaker properties: *is_upper_semimodular()*, *is_lower_semimodular()*, *is_supersolvable()*
- Stronger properties: *is_distributive()*
- Other: *is_modular_element()*

is_modular_element(*x*)

Return `True` if `x` is a modular element and `False` otherwise.

INPUT:

- `x` – an element of the lattice

An element x in a lattice L is *modular* if $x \leq b$ implies

$$x \vee (a \wedge b) = (x \vee a) \wedge b$$

for every $a, b \in L$.

EXAMPLES:

```
sage: L = LatticePoset({1:[2,3],2:[4,5],3:[5,6],4:[7],5:[7],6:[7]})
sage: L.is_modular()
False
sage: [L.is_modular_element(x) for x in L]
[True, True, False, True, True, False, True]
```

```
>>> from sage.all import *
>>> L = LatticePoset({Integer(1):[Integer(2),Integer(3)],
↪Integer(2):[Integer(4),Integer(5)],Integer(3):[Integer(5),Integer(6)],
↪Integer(4):[Integer(7)],Integer(5):[Integer(7)],Integer(6):[Integer(7)]})
>>> L.is_modular()
False
>>> [L.is_modular_element(x) for x in L]
[True, True, False, True, True, False, True]
```

See also

- Weaker properties: `is_left_modular_element()`
- Other: `is_modular()` to check modularity for the full lattice or some set of elements

is_orthocomplemented(*unique=False*)

Return `True` if the lattice admits an orthocomplementation, and `False` otherwise.

An orthocomplementation of a lattice is a function defined for every element e and marked as $e^{\perp}$ such that 1) they are complements, i.e. $e \vee e^{\perp}$ is the top element and $e \wedge e^{\perp}$ is the bottom element, 2) it is involution, i.e. $(e^{\perp})^{\perp} = e$, and 3) it is order-reversing, i.e. if $a < b$ then $b^{\perp} < a^{\perp}$.

INPUT:

- `unique` – boolean; if `True`, return `True` only if the lattice has exactly one orthocomplementation. If `False` (the default), return `True` when the lattice has at least one orthocomplementation.

EXAMPLES:

```
sage: D5 = posets.DiamondPoset(5)
sage: D5.is_orthocomplemented()
False

sage: D6 = posets.DiamondPoset(6)
sage: D6.is_orthocomplemented()                                              #␣
↪needs sage.groups
True
sage: D6.is_orthocomplemented(unique=True)                                   #␣
↪needs sage.groups
False

sage: hexagon = LatticePoset({0: [1, 2], 1: [3], 2: [4], 3:[5], 4: [5]})
sage: hexagon.is_orthocomplemented(unique=True)                              #␣
↪needs sage.groups
True
```

```
>>> from sage.all import *
>>> D5 = posets.DiamondPoset(Integer(5))
>>> D5.is_orthocomplemented()
False

>>> D6 = posets.DiamondPoset(Integer(6))
>>> D6.is_orthocomplemented()                                          #␣
↪needs sage.groups
True
>>> D6.is_orthocomplemented(unique=True)                               #␣
↪needs sage.groups
False

>>> hexagon = LatticePoset({Integer(0): [Integer(1), Integer(2)], Integer(1):␣
↪[Integer(3)], Integer(2): [Integer(4)], Integer(3):[Integer(5)],␣
↪Integer(4): [Integer(5)]})
>>> hexagon.is_orthocomplemented(unique=True)                          #␣
↪needs sage.groups
True
```

See also

- Weaker properties: *is_complemented()*, is_self_dual()

is_planar()

Return True if the lattice is *upward* planar, and False otherwise.

A lattice is upward planar if its Hasse diagram has a planar drawing in the $\mathbb{R}^2$ plane, in such a way that x is strictly below y (on the vertical axis) whenever $x < y$ in the lattice.

Note that the scientific literature on posets often omits "upward" and shortens it to "planar lattice" (e.g. [GW2014]), which can cause confusion with the notion of graph planarity in graph theory.

Note

Not all lattices which are planar – in the sense of graph planarity – admit such a planar drawing (see example below).

ALGORITHM:

Using the result from [Platt1976], this method returns its result by testing that the Hasse diagram of the lattice is planar (in the sense of graph theory) when an edge is added between the top and bottom elements.

EXAMPLES:

The Boolean lattice of 2^3 elements is not upward planar, even if its covering relations graph is planar:

```
sage: B3 = posets.BooleanLattice(3)
sage: B3.is_planar()
False
sage: G = B3.cover_relations_graph()
```

(continues on next page)

(continued from previous page)

```
sage: G.is_planar()
True
```

```
>>> from sage.all import *
>>> B3 = posets.BooleanLattice(Integer(3))
>>> B3.is_planar()
False
>>> G = B3.cover_relations_graph()
>>> G.is_planar()
True
```

Ordinal product of planar lattices is obviously planar. Same does not apply to Cartesian products:

```
sage: P = posets.PentagonPoset()
sage: Pc = P.product(P)
sage: Po = P.ordinal_product(P)
sage: Pc.is_planar()
False
sage: Po.is_planar()
True
```

```
>>> from sage.all import *
>>> P = posets.PentagonPoset()
>>> Pc = P.product(P)
>>> Po = P.ordinal_product(P)
>>> Pc.is_planar()
False
>>> Po.is_planar()
True
```

See also

- Weaker properties: `is_dismantlable()`

is_pseudocomplemented(*certificate=False*)

Return `True` if the lattice is pseudocomplemented, and `False` otherwise.

A lattice is (meet-)pseudocomplemented if every element e has a pseudocomplement $e^\star$, i.e. the greatest element such that the meet of e and $e^\star$ is the bottom element.

See Wikipedia article Pseudocomplement.

INPUT:

- `certificate` – boolean (default: `False`); whether to return a certificate

OUTPUT:

- If `certificate=True` return either `(True, None)` or `(False, e)`, where `e` is an element without a pseudocomplement. If `certificate=False` return `True` or `False`.

EXAMPLES:

```
sage: L = LatticePoset({1: [2, 5], 2: [3, 6], 3: [4], 4: [7],
....:                   5: [6], 6: [7]})
sage: L.is_pseudocomplemented()
True

sage: L = LatticePoset({1: [2, 3], 2: [4, 5, 6], 3: [6], 4: [7],
....:                   5: [7], 6: [7]})
sage: L.is_pseudocomplemented()
False
sage: L.is_pseudocomplemented(certificate=True)
(False, 3)
```

```
>>> from sage.all import *
>>> L = LatticePoset({Integer(1): [Integer(2), Integer(5)], Integer(2):␣
↪[Integer(3), Integer(6)], Integer(3): [Integer(4)], Integer(4):␣
↪[Integer(7)],
...                   Integer(5): [Integer(6)], Integer(6): [Integer(7)]})
>>> L.is_pseudocomplemented()
True

>>> L = LatticePoset({Integer(1): [Integer(2), Integer(3)], Integer(2):␣
↪[Integer(4), Integer(5), Integer(6)], Integer(3): [Integer(6)], Integer(4):␣
↪[Integer(7)],
...                   Integer(5): [Integer(7)], Integer(6): [Integer(7)]})
>>> L.is_pseudocomplemented()
False
>>> L.is_pseudocomplemented(certificate=True)
(False, 3)
```

See also

- Dual property: *is_join_pseudocomplemented()*
- Stronger properties: *is_meet_semidistributive()*
- Other: *pseudocomplement()*.

ALGORITHM:

According to [Cha92] a lattice is pseudocomplemented if and only if every atom has a pseudocomplement. So we only check those.

is_regular(*certificate=False*)

Return `True` if the lattice is regular and `False` otherwise.

A congruence of a lattice is *regular* if it is generated by any of its parts. A lattice is regular if it has only regular congruences.

INPUT:

- `certificate` – boolean (default: `False`); whether to return a certificate if the lattice is not regular

OUTPUT:

- If `certificate=True` return either `(True, None)` or `(False, (C, p))`, where C is a non-regular congruence as a *sage.combinat.set_partition.SetPartition* and p is a congruence class of C such that the congruence generated by p is not C. If `certificate=False` return `True` or `False`.

EXAMPLES:

```
sage: L = LatticePoset({1: [2, 3, 4], 2: [5, 6], 3: [8, 7], 4: [6, 7],
....:                   5: [8], 6: [9], 7: [9], 8: [9]})
sage: L.is_regular()                                                    #␣
↪needs sage.combinat
True

sage: N5 = posets.PentagonPoset()
sage: N5.is_regular()                                                   #␣
↪needs sage.combinat
False
sage: N5.is_regular(certificate=True)                                   #␣
↪needs sage.combinat
(False, ({{0}, {1}, {2, 3}, {4}}, [0]))
```

```
>>> from sage.all import *
>>> L = LatticePoset({Integer(1): [Integer(2), Integer(3), Integer(4)],␣
↪Integer(2): [Integer(5), Integer(6)], Integer(3): [Integer(8), Integer(7)],␣
↪Integer(4): [Integer(6), Integer(7)],
...                   Integer(5): [Integer(8)], Integer(6): [Integer(9)],␣
↪Integer(7): [Integer(9)], Integer(8): [Integer(9)]})
>>> L.is_regular()                                                      #␣
↪needs sage.combinat
True

>>> N5 = posets.PentagonPoset()
>>> N5.is_regular()                                                     #␣
↪needs sage.combinat
False
>>> N5.is_regular(certificate=True)                                     #␣
↪needs sage.combinat
(False, ({{0}, {1}, {2, 3}, {4}}, [0]))
```

See also:

- Stronger properties: *is_uniform()*, *is_sectionally_complemented()*, *is_cosectionally_complemented()*
- Mutually exclusive properties: *is_vertically_decomposable()*
- Other: *congruence()*

is_relatively_complemented(*certificate=False*)

Return `True` if the lattice is relatively complemented, and `False` otherwise.

A lattice is relatively complemented if every interval of it is a complemented lattice.

INPUT:

- `certificate` – boolean (default: `False`); whether to return a certificate if the lattice is not relatively complemented

OUTPUT:

- If `certificate=True` return either `(True, None)` or `(False, (a, b, c))`, where b is the only element that covers a and is covered by c. If `certificate=False` return `True` or `False`.

EXAMPLES:

```
sage: L = LatticePoset({1: [2, 3, 4, 8], 2: [5, 6], 3: [5, 7],
....:                   4: [6, 7], 5: [9], 6: [9], 7: [9], 8: [9]})
sage: L.is_relatively_complemented()
True

sage: L = posets.PentagonPoset()
sage: L.is_relatively_complemented()
False
```

```
>>> from sage.all import *
>>> L = LatticePoset({Integer(1): [Integer(2), Integer(3), Integer(4),␣
↪Integer(8)], Integer(2): [Integer(5), Integer(6)], Integer(3): [Integer(5),␣
↪Integer(7)],
...                   Integer(4): [Integer(6), Integer(7)], Integer(5):␣
↪[Integer(9)], Integer(6): [Integer(9)], Integer(7): [Integer(9)],␣
↪Integer(8): [Integer(9)]})
>>> L.is_relatively_complemented()
True

>>> L = posets.PentagonPoset()
>>> L.is_relatively_complemented()
False
```

Relatively complemented lattice must be both atomic and coatomic. Implication to other direction does not hold:

```
sage: L = LatticePoset({0: [1, 2, 3, 4, 5], 1: [6, 7], 2: [6, 8],
....:                   3: [7, 8, 9], 4: [9, 11], 5: [9, 10],
....:                   6: [10, 11], 7: [12], 8: [12], 9: [12],
....:                   10: [12], 11: [12]})
sage: L.is_atomic() and L.is_coatomic()
True
sage: L.is_relatively_complemented()
False
```

```
>>> from sage.all import *
>>> L = LatticePoset({Integer(0): [Integer(1), Integer(2), Integer(3),␣
↪Integer(4), Integer(5)], Integer(1): [Integer(6), Integer(7)], Integer(2):␣
↪[Integer(6), Integer(8)],
...                   Integer(3): [Integer(7), Integer(8), Integer(9)],␣
↪Integer(4): [Integer(9), Integer(11)], Integer(5): [Integer(9),␣
↪Integer(10)],
...                   Integer(6): [Integer(10), Integer(11)], Integer(7):␣
↪[Integer(12)], Integer(8): [Integer(12)], Integer(9): [Integer(12)],
...                   Integer(10): [Integer(12)], Integer(11): [Integer(12)]})
>>> L.is_atomic() and L.is_coatomic()
True
```

(continues on next page)

(continued from previous page)

```
>>> L.is_relatively_complemented()
False
```

We can also get a non-complemented 3-element interval:

```
sage: L.is_relatively_complemented(certificate=True)
(False, (1, 6, 11))
```

```
>>> from sage.all import *
>>> L.is_relatively_complemented(certificate=True)
(False, (1, 6, 11))
```

See also:

- Weaker properties: *is_sectionally_complemented()*, *is_cosectionally_complemented()*, *is_isoform()*
- Stronger properties: *is_geometric()*

is_sectionally_complemented(*certificate=False*)

Return `True` if the lattice is sectionally complemented, and `False` otherwise.

A lattice is sectionally complemented if all intervals from the bottom element interpreted as sublattices are complemented lattices.

INPUT:

- `certificate` – boolean (default: `False`); whether to return a certificate if the lattice is not sectionally complemented

OUTPUT:

- If `certificate=False` return `True` or `False`. If `certificate=True` return either `(True, None)` or `(False, (t, e))`, where t is an element so that in the sublattice from the bottom element to t has no complement for element e.

EXAMPLES:

Smallest examples of a complemented but not sectionally complemented lattice and a sectionally complemented but not relatively complemented lattice:

```
sage: L = posets.PentagonPoset()
sage: L.is_complemented()
True
sage: L.is_sectionally_complemented()
False

sage: L = LatticePoset({0: [1, 2, 3], 1: [4], 2: [4], 3: [5], 4: [5]})
sage: L.is_sectionally_complemented()
True
sage: L.is_relatively_complemented()
False
```

```
>>> from sage.all import *
>>> L = posets.PentagonPoset()
>>> L.is_complemented()
True
>>> L.is_sectionally_complemented()
False

>>> L = LatticePoset({Integer(0): [Integer(1), Integer(2), Integer(3)],␣
↪Integer(1): [Integer(4)], Integer(2): [Integer(4)], Integer(3):␣
↪[Integer(5)], Integer(4): [Integer(5)]})
>>> L.is_sectionally_complemented()
True
>>> L.is_relatively_complemented()
False
```

Getting a certificate:

```
sage: L = LatticePoset(DiGraph('HYOgC?C@?C?G@??'))
sage: L.is_sectionally_complemented(certificate=True)
(False, (6, 1))
```

```
>>> from sage.all import *
>>> L = LatticePoset(DiGraph('HYOgC?C@?C?G@??'))
>>> L.is_sectionally_complemented(certificate=True)
(False, (6, 1))
```

See also

- Dual property: `is_cosectionally_complemented()`
- Weaker properties: `is_complemented()`, `is_atomic()`, `is_regular()`
- Stronger properties: `is_relatively_complemented()`

is_semidistributive()

Return `True` if the lattice is both join- and meet-semidistributive, and `False` otherwise.

EXAMPLES:

Tamari lattices are typical examples of semidistributive but not distributive (and hence not modular) lattices:

```
sage: T4 = posets.TamariLattice(4)
sage: T4.is_semidistributive(), T4.is_distributive()
(True, False)
```

```
>>> from sage.all import *
>>> T4 = posets.TamariLattice(Integer(4))
>>> T4.is_semidistributive(), T4.is_distributive()
(True, False)
```

Smallest non-selfdual example:

```
sage: L = LatticePoset({1: [2, 3], 2: [4, 5], 3: [5], 4: [6], 5: [7], 6: [7]})
sage: L.is_semidistributive()
True
```

```
>>> from sage.all import *
>>> L = LatticePoset({Integer(1): [Integer(2), Integer(3)], Integer(2):␣
↪[Integer(4), Integer(5)], Integer(3): [Integer(5)], Integer(4):␣
↪[Integer(6)], Integer(5): [Integer(7)], Integer(6): [Integer(7)]})
>>> L.is_semidistributive()
True
```

The diamond is not semidistributive:

```
sage: L = posets.DiamondPoset(5)
sage: L.is_semidistributive()
False
```

```
>>> from sage.all import *
>>> L = posets.DiamondPoset(Integer(5))
>>> L.is_semidistributive()
False
```

See also

- Weaker properties: *is_join_semidistributive()*, *is_meet_semidistributive()*
- Stronger properties: *is_distributive()*, *is_congruence_uniform()*

is_simple(*certificate=False*)

Return `True` if the lattice is simple and `False` otherwise.

A lattice is *simple* if it has no nontrivial congruences; in other words, for every two distinct elements a and b the principal congruence generated by (a, b) has only one component, i.e. the whole lattice.

INPUT:

- `certificate` – boolean (default: `False`); whether to return a certificate if the lattice is not simple

OUTPUT:

- If `certificate=True` return either `(True, None)` or `(False, c)`, where c is a nontrivial congruence as a *sage.combinat.set_partition.SetPartition*. If `certificate=False` return `True` or `False`.

EXAMPLES:

```
sage: # needs sage.combinat
sage: posets.DiamondPoset(5).is_simple()   # Smallest nontrivial example
True
sage: L = LatticePoset({1: [2, 3], 2: [4, 5], 3: [6], 4: [6], 5: [6]})
sage: L.is_simple()
False
sage: L.is_simple(certificate=True)
(False, {{1, 3}, {2, 4, 5, 6}})
```

```
>>> from sage.all import *
>>> # needs sage.combinat
>>> posets.DiamondPoset(Integer(5)).is_simple()   # Smallest nontrivial example
True
>>> L = LatticePoset({Integer(1): [Integer(2), Integer(3)], Integer(2):␣
↪[Integer(4), Integer(5)], Integer(3): [Integer(6)], Integer(4):␣
↪[Integer(6)], Integer(5): [Integer(6)]})
>>> L.is_simple()
False
>>> L.is_simple(certificate=True)
(False, {{1, 3}, {2, 4, 5, 6}})
```

Two more examples. First is a non-simple lattice without any 2-element congruences:

```
sage: L = LatticePoset({1: [2, 3, 4], 2: [5], 3: [5], 4: [6, 7],
....:                   5: [8], 6: [8], 7: [8]})
sage: L.is_simple()                                                        #␣
↪needs sage.combinat
False
sage: L = LatticePoset({1: [2, 3], 2: [4, 5], 3: [6, 7], 4: [8],
....:                   5: [8], 6: [8], 7: [8]})
sage: L.is_simple()                                                        #␣
↪needs sage.combinat
True
```

```
>>> from sage.all import *
>>> L = LatticePoset({Integer(1): [Integer(2), Integer(3), Integer(4)],␣
↪Integer(2): [Integer(5)], Integer(3): [Integer(5)], Integer(4): [Integer(6),
↪ Integer(7)],
...                   Integer(5): [Integer(8)], Integer(6): [Integer(8)],␣
↪Integer(7): [Integer(8)]})
>>> L.is_simple()                                                        #␣
↪needs sage.combinat
False
>>> L = LatticePoset({Integer(1): [Integer(2), Integer(3)], Integer(2):␣
↪[Integer(4), Integer(5)], Integer(3): [Integer(6), Integer(7)], Integer(4):␣
↪[Integer(8)],
...                   Integer(5): [Integer(8)], Integer(6): [Integer(8)],␣
↪Integer(7): [Integer(8)]})
>>> L.is_simple()                                                        #␣
↪needs sage.combinat
True
```

See also:

- Weaker properties: `is_isoform()`
- Mutually exclusive properties: `is_constructible_by_doublings()` (by any set)
- Other: `congruence()`

is_stone(*certificate=False*)

Return `True` if the lattice is a Stone lattice, and `False` otherwise.

The lattice is expected to be distributive (and hence pseudocomplemented).

A pseudocomplemented lattice is a Stone lattice if

$$e^* \vee e^{**} = \top$$

for every element e of the lattice, where * is the pseudocomplement and $\top$ is the top element of the lattice.

INPUT:

- `certificate` – boolean (default: `False`); whether to return a certificate

OUTPUT:

- If `certificate=True` return either `(True, None)` or `(False, e)` such that $e^* \vee e^{**} \neq \top$. If `certificate=False` return `True` or `False`.

EXAMPLES:

Divisor lattices are canonical example:

```
sage: D72 = posets.DivisorLattice(72)
sage: D72.is_stone()
True
```

```
>>> from sage.all import *
>>> D72 = posets.DivisorLattice(Integer(72))
>>> D72.is_stone()
True
```

A non-example:

```
sage: L = LatticePoset({1: [2, 3], 2: [4], 3: [4], 4: [5]})
sage: L.is_stone()
False
```

```
>>> from sage.all import *
>>> L = LatticePoset({Integer(1): [Integer(2), Integer(3)], Integer(2):
↪[Integer(4)], Integer(3): [Integer(4)], Integer(4): [Integer(5)]})
>>> L.is_stone()
False
```

See also:

- Weaker properties: *is_distributive()*

is_subdirectly_reducible(*certificate=False*)

Return `True` if the lattice is subdirectly reducible.

A lattice M is a *subdirect product* of K and L if it is a sublattice of $K \times L$. Lattice M is *subdirectly reducible* if there exists such lattices K and L so that M is not a sublattice of either.

INPUT:

- `certificate` – boolean (default: `False`); whether to return a certificate

OUTPUT:

- if `certificate=False`, return only `True` or `False`
- if `certificate=True`, return either
  - `(True, (K, L))` such that the lattice is isomorphic to a sublattice of $K \times L$.
  - `(False, (a, b))`, where a and b are elements that are in the same congruence class for every nontrivial congruence of the lattice. Special case: If the lattice has zero or one element, return `(False, None)`.

EXAMPLES:

```
sage: N5 = posets.PentagonPoset()
sage: N5.is_subdirectly_reducible()                                         #␣
↪needs sage.combinat
False

sage: hex = LatticePoset({1: [2, 3], 2: [4], 3: [5], 4: [6], 5: [6]})
sage: hex.is_subdirectly_reducible()                                        #␣
↪needs sage.combinat
True

sage: hex.is_subdirectly_reducible(certificate=True)                        #␣
↪needs sage.combinat
(True,
 (Finite lattice containing 5 elements, Finite lattice containing 5 elements))

sage: N5.is_subdirectly_reducible(certificate=True)                         #␣
↪needs sage.combinat
(False, (2, 3))
sage: res, cert = hex.is_subdirectly_reducible(certificate=True)            #␣
↪needs sage.combinat
sage: cert[0].is_isomorphic(N5)                                             #␣
↪needs sage.combinat
True
```

```
>>> from sage.all import *
>>> N5 = posets.PentagonPoset()
>>> N5.is_subdirectly_reducible()                                       #␣
↪needs sage.combinat
False

>>> hex = LatticePoset({Integer(1): [Integer(2), Integer(3)], Integer(2):␣
↪[Integer(4)], Integer(3): [Integer(5)], Integer(4): [Integer(6)],␣
↪Integer(5): [Integer(6)]})
>>> hex.is_subdirectly_reducible()                                      #␣
↪needs sage.combinat
True

>>> hex.is_subdirectly_reducible(certificate=True)                      #␣
↪needs sage.combinat
(True,
 (Finite lattice containing 5 elements, Finite lattice containing 5 elements))
```

(continues on next page)

(continued from previous page)

```
>>> N5.is_subdirectly_reducible(certificate=True)                    #␣
↪needs sage.combinat
(False, (2, 3))
>>> res, cert = hex.is_subdirectly_reducible(certificate=True)       #␣
↪needs sage.combinat
>>> cert[Integer(0)].is_isomorphic(N5)                                ␣
↪     # needs sage.combinat
True
```

See also

- Stronger properties: *is_distributive()*, *is_vertically_decomposable()*
- Other: *subdirect_decomposition()*

is_sublattice(*other*)

Return `True` if the lattice is a sublattice of `other`, and `False` otherwise.

Lattice K is a sublattice of L if K is an (induced) subposet of L and closed under meet and join of L.

Note

This method does not check whether the lattice is a *isomorphic* (i.e., up to relabeling) sublattice of `other`, but only if `other` directly contains the lattice as an sublattice.

EXAMPLES:

A pentagon sublattice in a non-modular lattice:

```
sage: L = LatticePoset({1: [2, 3], 2: [4, 5], 3: [5, 6], 4: [7], 5: [7], 6:␣
↪[7]})
sage: N5 = LatticePoset({1: [2, 6], 2: [4], 4: [7], 6: [7]})
sage: N5.is_sublattice(L)
True
```

```
>>> from sage.all import *
>>> L = LatticePoset({Integer(1): [Integer(2), Integer(3)], Integer(2):␣
↪[Integer(4), Integer(5)], Integer(3): [Integer(5), Integer(6)], Integer(4):␣
↪[Integer(7)], Integer(5): [Integer(7)], Integer(6): [Integer(7)]})
>>> N5 = LatticePoset({Integer(1): [Integer(2), Integer(6)], Integer(2):␣
↪[Integer(4)], Integer(4): [Integer(7)], Integer(6): [Integer(7)]})
>>> N5.is_sublattice(L)
True
```

This pentagon is a subposet but not closed under join, hence not a sublattice:

```
sage: N5_ = LatticePoset({1: [2, 3], 2: [4], 3: [7], 4: [7]})
sage: N5_.is_induced_subposet(L)
True
sage: N5_.is_sublattice(L)
False
```

```
>>> from sage.all import *
>>> N5_ = LatticePoset({Integer(1): [Integer(2), Integer(3)], Integer(2):␣
↪[Integer(4)], Integer(3): [Integer(7)], Integer(4): [Integer(7)]})
>>> N5_.is_induced_subposet(L)
True
>>> N5_.is_sublattice(L)
False
```

See also

isomorphic_sublattices_iterator()

is_sublattice_dismantlable()

Return `True` if the lattice is sublattice dismantlable, and `False` otherwise.

A sublattice dismantling is a subdivision of a lattice into two non-empty sublattices. A lattice is *sublattice dismantlable* if it can be decomposed into 1-element lattices by consecutive sublattice dismantlings.

EXAMPLES:

The smallest non-example is this (and the dual):

```
sage: P = Poset({1: [11, 12, 13], 2: [11, 14, 15],
....:            3: [12, 14, 16], 4: [13, 15, 16]})
sage: L = LatticePoset(P.with_bounds())
sage: L.is_sublattice_dismantlable()
False
```

```
>>> from sage.all import *
>>> P = Poset({Integer(1): [Integer(11), Integer(12), Integer(13)],␣
↪Integer(2): [Integer(11), Integer(14), Integer(15)],
...            Integer(3): [Integer(12), Integer(14), Integer(16)],␣
↪Integer(4): [Integer(13), Integer(15), Integer(16)]})
>>> L = LatticePoset(P.with_bounds())
>>> L.is_sublattice_dismantlable()
False
```

Here we adjoin a (double-irreducible-)dismantlable lattice as a part to an interval-dismantlable lattice:

```
sage: B3 = posets.BooleanLattice(3)
sage: N5 = posets.PentagonPoset()
sage: L = B3.adjunct(N5, 1, 7)
sage: L.is_dismantlable(), L.is_interval_dismantlable()
(False, False)
sage: L.is_sublattice_dismantlable()
True
```

```
>>> from sage.all import *
>>> B3 = posets.BooleanLattice(Integer(3))
>>> N5 = posets.PentagonPoset()
>>> L = B3.adjunct(N5, Integer(1), Integer(7))
>>> L.is_dismantlable(), L.is_interval_dismantlable()
```

(continues on next page)

(continued from previous page)

```
(False, False)
>>> L.is_sublattice_dismantlable()
True
```

See also:

- Stronger properties: *is_dismantlable()*, *is_interval_dismantlable()*

Todo: Add a certificate-option.

is_supersolvable(*certificate=False*)

Return `True` if the lattice is supersolvable, and `False` otherwise.

A lattice L is *supersolvable* if there exists a maximal chain C such that every $x \in C$ is a modular element in L. Equivalent definition is that the sublattice generated by C and any other chain is distributive.

INPUT:

- `certificate` – boolean (default: `False`); whether to return a certificate

OUTPUT:

- If `certificate=True` return either `(False, None)` or `(True, C)`, where `C` is a maximal chain of modular elements. If `certificate=False` return `True` or `False`.

EXAMPLES:

```
sage: L = posets.DiamondPoset(5)
sage: L.is_supersolvable()
True

sage: L = posets.PentagonPoset()
sage: L.is_supersolvable()
False

sage: L = LatticePoset({1:[2,3],2:[4,5],3:[5,6],4:[7],5:[7],6:[7]})
sage: L.is_supersolvable()
True
sage: L.is_supersolvable(certificate=True)
(True, [1, 2, 5, 7])
sage: L.is_modular()
False

sage: L = LatticePoset({0: [1, 2, 3, 4], 1: [5, 6, 7],
....:                   2: [5, 8, 9], 3: [6, 8, 10], 4: [7, 9, 10],
....:                   5: [11], 6: [11], 7: [11], 8: [11],
....:                   9: [11], 10: [11]})
sage: L.is_supersolvable()
False
```

```
>>> from sage.all import *
>>> L = posets.DiamondPoset(Integer(5))
>>> L.is_supersolvable()
True

>>> L = posets.PentagonPoset()
>>> L.is_supersolvable()
False

>>> L = LatticePoset({Integer(1):[Integer(2),Integer(3)],
↪Integer(2):[Integer(4),Integer(5)],Integer(3):[Integer(5),Integer(6)],
↪Integer(4):[Integer(7)],Integer(5):[Integer(7)],Integer(6):[Integer(7)]})
>>> L.is_supersolvable()
True
>>> L.is_supersolvable(certificate=True)
(True, [1, 2, 5, 7])
>>> L.is_modular()
False

>>> L = LatticePoset({Integer(0): [Integer(1), Integer(2), Integer(3),␣
↪Integer(4)], Integer(1): [Integer(5), Integer(6), Integer(7)],
...                  Integer(2): [Integer(5), Integer(8), Integer(9)],␣
↪Integer(3): [Integer(6), Integer(8), Integer(10)], Integer(4): [Integer(7),␣
↪Integer(9), Integer(10)],
...                  Integer(5): [Integer(11)], Integer(6): [Integer(11)],␣
↪Integer(7): [Integer(11)], Integer(8): [Integer(11)],
...                  Integer(9): [Integer(11)], Integer(10): [Integer(11)]})
>>> L.is_supersolvable()
False
```

See also

- Weaker properties: *is_graded()*
- Stronger properties: *is_modular()*

is_trim(*certificate=False*)

Return whether a lattice is trim.

A lattice is trim if it is extremal and left modular.

This notion is defined in [Thom2006].

INPUT:

- `certificate` – boolean (default: `False`); whether to return instead a maximum chain of left modular elements

EXAMPLES:

```
sage: P = posets.PentagonPoset()
sage: P.is_trim()
True
```

(continues on next page)

(continued from previous page)

```
sage: Q = LatticePoset(posets.SymmetricGroupWeakOrderPoset(3))
sage: Q.is_trim()
False
```

```
>>> from sage.all import *
>>> P = posets.PentagonPoset()
>>> P.is_trim()
True

>>> Q = LatticePoset(posets.SymmetricGroupWeakOrderPoset(Integer(3)))
>>> Q.is_trim()
False
```

See also

- Weaker properties: *is_extremal()*
- Stronger properties: *is_distributive()*

REFERENCES:

is_uniform(*certificate=False*)

Return `True` if the lattice is uniform and `False` otherwise.

A congruence is *uniform* if all blocks have equal number of elements. A lattice is uniform if it has only uniform congruences.

INPUT:

- `certificate` – boolean (default: `False`); whether to return a certificate if the lattice is not uniform

OUTPUT:

- If `certificate=True` return either `(True, None)` or `(False, C)`, where C is a non-uniform congruence as a *sage.combinat.set_partition.SetPartition*. If `certificate=False` return `True` or `False`.

EXAMPLES:

```
sage: L = LatticePoset({1: [2, 3, 4], 2: [6, 7], 3: [5], 4: [5],
....:                   5: [9, 8], 6: [9], 7: [10], 8: [10], 9: [10]})
sage: L.is_uniform()                                                    #␣
↪needs sage.combinat
True
```

```
>>> from sage.all import *
>>> L = LatticePoset({Integer(1): [Integer(2), Integer(3), Integer(4)],␣
↪Integer(2): [Integer(6), Integer(7)], Integer(3): [Integer(5)], Integer(4):␣
↪[Integer(5)],
...                   Integer(5): [Integer(9), Integer(8)], Integer(6):␣
↪[Integer(9)], Integer(7): [Integer(10)], Integer(8): [Integer(10)],␣
↪Integer(9): [Integer(10)]})
>>> L.is_uniform()                                                    #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.combinat
True
```

Every uniform lattice is regular, but the converse is not true:

```
sage: N6 = LatticePoset({1: [2, 3, 5], 2: [4], 3: [4], 5: [6], 4: [6]})
sage: N6.is_uniform(), N6.is_regular()
(False, True)

sage: N6.is_uniform(certificate=True)                                   #␣
↪needs sage.combinat
(False, {{1, 2, 3, 4}, {5, 6}})
```

```
>>> from sage.all import *
>>> N6 = LatticePoset({Integer(1): [Integer(2), Integer(3), Integer(5)],␣
↪Integer(2): [Integer(4)], Integer(3): [Integer(4)], Integer(5):␣
↪[Integer(6)], Integer(4): [Integer(6)]})
>>> N6.is_uniform(), N6.is_regular()
(False, True)

>>> N6.is_uniform(certificate=True)                                    #␣
↪needs sage.combinat
(False, {{1, 2, 3, 4}, {5, 6}})
```

See also

- Weaker properties: *is_regular()*
- Stronger properties: *is_isoform()*
- Other: *congruence()*

is_upper_semimodular(*certificate=False*)

Return `True` if the lattice is upper semimodular and `False` otherwise.

A lattice is upper semimodular if any pair of elements with a common lower cover have also a common upper cover.

INPUT:

- `certificate` – boolean (default: `False`); whether to return a certificate if the lattice is not upper semimodular

OUTPUT:

- If `certificate=False` return `True` or `False`. If `certificate=True` return either `(True, None)` or `(False, (a, b))`, where a and b covers their meet but are not covered by their join.

See Wikipedia article Semimodular_lattice

EXAMPLES:

```
sage: L = posets.DiamondPoset(5)
sage: L.is_upper_semimodular()
```

(continues on next page)

(continued from previous page)

```
True

sage: L = posets.PentagonPoset()
sage: L.is_upper_semimodular()
False

sage: L = LatticePoset(posets.IntegerPartitions(4))                       #␣
↪needs sage.combinat
sage: L.is_upper_semimodular()                                            #␣
↪needs sage.combinat
True

sage: L = LatticePoset({1:[2, 3, 4], 2: [5], 3:[5, 6], 4:[6], 5:[7], 6:[7]})
sage: L.is_upper_semimodular(certificate=True)
(False, (4, 2))
```

```
>>> from sage.all import *
>>> L = posets.DiamondPoset(Integer(5))
>>> L.is_upper_semimodular()
True

>>> L = posets.PentagonPoset()
>>> L.is_upper_semimodular()
False

>>> L = LatticePoset(posets.IntegerPartitions(Integer(4)))                 ␣
↪     # needs sage.combinat
>>> L.is_upper_semimodular()                                             #␣
↪needs sage.combinat
True

>>> L = LatticePoset({Integer(1):[Integer(2), Integer(3), Integer(4)],␣
↪Integer(2): [Integer(5)], Integer(3):[Integer(5), Integer(6)],␣
↪Integer(4):[Integer(6)], Integer(5):[Integer(7)], Integer(6):[Integer(7)]})
>>> L.is_upper_semimodular(certificate=True)
(False, (4, 2))
```

See also:

- Dual property: `is_lower_semimodular()`
- Weaker properties: `is_graded()`
- Stronger properties: `is_modular()`, `is_join_distributive()`, `is_geometric()`

is_vertically_decomposable(*certificate=False*)

Return `True` if the lattice is vertically decomposable, and `False` otherwise.

A lattice is vertically decomposable if it has an element that is comparable to all elements and is neither the bottom nor the top element.

Informally said, a lattice is vertically decomposable if it can be seen as two lattices "glued" by unifying the top element of first lattice to the bottom element of second one.

INPUT:

- `certificate` – boolean (default: `False`); whether to return a certificate

OUTPUT:

- If `certificate=True` return either `(False, None)` or `(True, e)`, where e is an element that is comparable to all other elements and is neither the bottom nor the top element. If `certificate=False` return `True` or `False`.

EXAMPLES:

```
sage: posets.TamariLattice(4).is_vertically_decomposable()
False
sage: L = LatticePoset( ([1, 2, 3, 6, 12, 18, 36],
....:     attrcall("divides")) )
sage: L.is_vertically_decomposable()
True
sage: L.is_vertically_decomposable(certificate=True)
(True, 6)
```

```
>>> from sage.all import *
>>> posets.TamariLattice(Integer(4)).is_vertically_decomposable()
False
>>> L = LatticePoset( ([Integer(1), Integer(2), Integer(3), Integer(6),␣
↪Integer(12), Integer(18), Integer(36)],
...     attrcall("divides")) )
>>> L.is_vertically_decomposable()
True
>>> L.is_vertically_decomposable(certificate=True)
(True, 6)
```

See also:

- Weaker properties: *is_subdirectly_reducible()*
- Mutually exclusive properties: *is_atomic()*, *is_coatomic()*, *is_regular()*
- Other: *vertical_decomposition()*

isomorphic_sublattices_iterator(*other*)

Return an iterator over the sublattices of the lattice isomorphic to `other`.

INPUT:

- `other` – a finite lattice

EXAMPLES:

A non-modular lattice contains a pentagon sublattice:

```
sage: L = LatticePoset({1: [2, 3], 2: [4, 5], 3: [5, 6], 4: [7], 5: [7], 6:␣
↪[7]})
sage: L.is_modular()
False
```

(continues on next page)

(continued from previous page)

```
sage: N5 = posets.PentagonPoset()
sage: N5_in_L = next(L.isomorphic_sublattices_iterator(N5)); N5_in_L
Finite lattice containing 5 elements
sage: N5_in_L.list()
[1, 3, 6, 4, 7]
```

```
>>> from sage.all import *
>>> L = LatticePoset({Integer(1): [Integer(2), Integer(3)], Integer(2):
↪[Integer(4), Integer(5)], Integer(3): [Integer(5), Integer(6)], Integer(4):
↪[Integer(7)], Integer(5): [Integer(7)], Integer(6): [Integer(7)]})
>>> L.is_modular()
False
>>> N5 = posets.PentagonPoset()
>>> N5_in_L = next(L.isomorphic_sublattices_iterator(N5)); N5_in_L
Finite lattice containing 5 elements
>>> N5_in_L.list()
[1, 3, 6, 4, 7]
```

A divisor lattice is modular, hence does not contain the pentagon as sublattice, even if it has the pentagon subposet:

```
sage: D12 = posets.DivisorLattice(12)
sage: D12.has_isomorphic_subposet(N5)
True
sage: list(D12.isomorphic_sublattices_iterator(N5))
[]
```

```
>>> from sage.all import *
>>> D12 = posets.DivisorLattice(Integer(12))
>>> D12.has_isomorphic_subposet(N5)
True
>>> list(D12.isomorphic_sublattices_iterator(N5))
[]
```

See also

sage.combinat.posets.posets.FinitePoset.isomorphic_subposets_iterator()

Warning

This function will return same sublattice as many times as there are automorphism on it. This is due to `subgraph_search_iterator()` returning labelled subgraphs.

join_primes()

Return the join-prime elements of the lattice.

An element x of a lattice L is *join-prime* if $x \leq a \vee b$ implies $x \leq a$ or $x \leq b$ for every $a, b \in L$.

These are also called *coprime* in some books. Every join-prime is join-irreducible; converse holds if and only if the lattice is distributive.

EXAMPLES:

```
sage: L = LatticePoset({1: [2, 3, 4], 2: [5, 6], 3: [5],
....:                   4: [6], 5: [7], 6: [7]})
sage: L.join_primes()
[3, 4]

sage: D12 = posets.DivisorLattice(12)  # Distributive lattice
sage: D12.join_irreducibles() == D12.join_primes()
True
```

```
>>> from sage.all import *
>>> L = LatticePoset({Integer(1): [Integer(2), Integer(3), Integer(4)],␣
↪Integer(2): [Integer(5), Integer(6)], Integer(3): [Integer(5)],
...                   Integer(4): [Integer(6)], Integer(5): [Integer(7)],␣
↪Integer(6): [Integer(7)]})
>>> L.join_primes()
[3, 4]

>>> D12 = posets.DivisorLattice(Integer(12))  # Distributive lattice
>>> D12.join_irreducibles() == D12.join_primes()
True
```

See also

- Dual function: *meet_primes()*
- Other: join_irreducibles()

maximal_sublattices()

Return maximal (proper) sublattices of the lattice.

EXAMPLES:

```
sage: L = LatticePoset(( [], [[1,2],[1,17],[1,8],[2,3],[2,22],
....:                         [2,5],[2,7],[17,22],[17,13],[8,7],
....:                         [8,13],[3,16],[3,9],[22,16],[22,18],
....:                         [22,10],[5,18],[5,14],[7,9],[7,14],
....:                         [7,10],[13,10],[16,6],[16,19],[9,19],
....:                         [18,6],[18,33],[14,33],[10,19],
....:                         [10,33],[6,4],[19,4],[33,4]] ))
sage: maxs = L.maximal_sublattices()
sage: len(maxs)
7
sage: sorted(maxs[0].list())
[1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 14, 16, 18, 19, 22, 33]
```

```
>>> from sage.all import *
>>> L = LatticePoset(( [], [[Integer(1),Integer(2)],[Integer(1),Integer(17)],
↪[Integer(1),Integer(8)],[Integer(2),Integer(3)],[Integer(2),Integer(22)],
...                         [Integer(2),Integer(5)],[Integer(2),Integer(7)],
↪[Integer(17),Integer(22)],[Integer(17),Integer(13)],[Integer(8),Integer(7)],
```

(continues on next page)

(continued from previous page)

```
...                          [Integer(8),Integer(13)],[Integer(3),Integer(16)],
↪[Integer(3),Integer(9)],[Integer(22),Integer(16)],[Integer(22),Integer(18)],
...                          [Integer(22),Integer(10)],[Integer(5),
↪Integer(18)],[Integer(5),Integer(14)],[Integer(7),Integer(9)],[Integer(7),
↪Integer(14)],
...                          [Integer(7),Integer(10)],[Integer(13),

↪Integer(33)],[Integer(14),Integer(33)],[Integer(10),Integer(19)],
...                          [Integer(10),Integer(33)],[Integer(6),Integer(4)],
↪[Integer(19),Integer(4)],[Integer(33),Integer(4)]] ))
>>> maxs = L.maximal_sublattices()
>>> len(maxs)
7
>>> sorted(maxs[Integer(0)].list())
[1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 14, 16, 18, 19, 22, 33]
```

meet_primes()

Return the meet-prime elements of the lattice.

An element x of a lattice L is *meet-prime* if $x \geq a \wedge b$ implies $x \geq a$ or $x \geq b$ for every $a, b \in L$.

These are also called just *prime* in some books. Every meet-prime is meet-irreducible; converse holds if and only if the lattice is distributive.

EXAMPLES:

```
sage: L = LatticePoset({1: [2, 3, 4], 2: [5, 6], 3: [5],
....:                   4: [6], 5: [7], 6: [7]})
sage: L.meet_primes()
[6, 5]

sage: D12 = posets.DivisorLattice(12)
sage: sorted(D12.meet_primes())
[3, 4, 6]
```

```
>>> from sage.all import *
>>> L = LatticePoset({Integer(1): [Integer(2), Integer(3), Integer(4)],␣
↪Integer(2): [Integer(5), Integer(6)], Integer(3): [Integer(5)],
...                   Integer(4): [Integer(6)], Integer(5): [Integer(7)],␣
↪Integer(6): [Integer(7)]})
>>> L.meet_primes()
[6, 5]

>>> D12 = posets.DivisorLattice(Integer(12))
>>> sorted(D12.meet_primes())
[3, 4, 6]
```

See also

- Dual function: *join_primes()*

- Other: `meet_irreducibles()`

moebius_algebra(*R*)

Return the Möbius algebra of `self` over `R`.

OUTPUT: an instance of *sage.combinat.posets.moebius_algebra.MoebiusAlgebra*

EXAMPLES:

```
sage: L = posets.BooleanLattice(4)
sage: L.moebius_algebra(QQ)
Moebius algebra of Finite lattice containing 16 elements over Rational Field
```

```
>>> from sage.all import *
>>> L = posets.BooleanLattice(Integer(4))
>>> L.moebius_algebra(QQ)
Moebius algebra of Finite lattice containing 16 elements over Rational Field
```

neutral_elements()

Return the list of neutral elements of the lattice.

An element e of the lattice L is *neutral* if the sublattice generated by e, x and y is distributive for all $x, y \in L$. It can also be characterized as an element of intersection of maximal distributive sublattices.

EXAMPLES:

```
sage: L = LatticePoset({1: [2, 3], 2: [6], 3: [4, 5, 6], 4: [8],
....:                   5: [7], 6: [7], 7: [8, 9], 8: [10], 9: [10]})
sage: L.neutral_elements()
[1, 3, 8, 10]
```

```
>>> from sage.all import *
>>> L = LatticePoset({Integer(1): [Integer(2), Integer(3)], Integer(2):␣
→[Integer(6)], Integer(3): [Integer(4), Integer(5), Integer(6)], Integer(4):␣
→[Integer(8)],
...                   Integer(5): [Integer(7)], Integer(6): [Integer(7)],␣
→Integer(7): [Integer(8), Integer(9)], Integer(8): [Integer(10)],␣
→Integer(9): [Integer(10)]})
>>> L.neutral_elements()
[1, 3, 8, 10]
```

quantum_moebius_algebra(*q=None*)

Return the quantum Möbius algebra of `self` with parameter `q`.

INPUT:

- `q` – (optional) the deformation parameter q

OUTPUT: an instance of *sage.combinat.posets.moebius_algebra.QuantumMoebiusAlgebra*

EXAMPLES:

```
sage: L = posets.BooleanLattice(4)
sage: L.quantum_moebius_algebra()
Quantum Moebius algebra of Finite lattice containing 16 elements
 with q=q over Univariate Laurent Polynomial Ring in q over Integer Ring
```

```
>>> from sage.all import *
>>> L = posets.BooleanLattice(Integer(4))
>>> L.quantum_moebius_algebra()
Quantum Moebius algebra of Finite lattice containing 16 elements
 with q=q over Univariate Laurent Polynomial Ring in q over Integer Ring
```

quotient(*congruence*, *labels='tuple'*)

Return the quotient lattice by `congruence`.

Let L be a lattice and Θ be a congruence of L with congruence classes $\Theta_1, \Theta_2, \ldots$. The quotient lattice L/Θ is the lattice with elements $\{\Theta_1, \Theta_2, \ldots\}$ and meet and join given by the original lattice. Explicitly, if $e_1 \in \Theta_1$ and $e_2 \in \Theta_2$, such that $e_1 \vee e_2 \in \Theta_3$ then $\Theta_1 \vee \Theta_2 = \Theta_3$ in L/Θ and similarly for meets.

INPUT:

- `congruence` – list of lists; a congruence
- `labels` – string; the elements of the resulting lattice and can be one of the following:
  - `'tuple'` – elements are tuples of elements of the original lattice
  - `'lattice'` – elements are sublattices of the original lattice
  - `'integer'` – elements are labeled by integers

Warning

`congruence` is expected to be a valid congruence of the lattice. This is *not* checked.

EXAMPLES:

```
sage: # needs sage.combinat
sage: L = posets.PentagonPoset()
sage: c = L.congruence([[0, 1]])
sage: I = L.quotient(c); I
Finite lattice containing 2 elements
sage: I.top()
(2, 3, 4)
sage: I = L.quotient(c, labels='lattice')
sage: I.top()
Finite lattice containing 3 elements

sage: # needs sage.combinat
sage: B3 = posets.BooleanLattice(3)
sage: c = B3.congruence([[0,1]])
sage: B2 = B3.quotient(c, labels='integer')
sage: B2.is_isomorphic(posets.BooleanLattice(2))
True
```

```
>>> from sage.all import *
>>> # needs sage.combinat
>>> L = posets.PentagonPoset()
>>> c = L.congruence([[Integer(0), Integer(1)]])
>>> I = L.quotient(c); I
Finite lattice containing 2 elements
```

(continues on next page)

(continued from previous page)

```
>>> I.top()
(2, 3, 4)
>>> I = L.quotient(c, labels='lattice')
>>> I.top()
Finite lattice containing 3 elements

>>> # needs sage.combinat
>>> B3 = posets.BooleanLattice(Integer(3))
>>> c = B3.congruence([[Integer(0),Integer(1)]])
>>> B2 = B3.quotient(c, labels='integer')
>>> B2.is_isomorphic(posets.BooleanLattice(Integer(2)))
True
```

See also

congruence()

skeleton()

Return the skeleton of the lattice.

The lattice is expected to be pseudocomplemented.

The *skeleton* of a pseudocomplemented lattice L, where * is the pseudocomplementation operation, is the subposet induced by $\{e^* \mid e \in L\}$. Actually this poset is a Boolean lattice.

EXAMPLES:

```
sage: D12 = posets.DivisorLattice(12)
sage: S = D12.skeleton(); S
Finite lattice containing 4 elements
sage: S.cover_relations()
[[1, 3], [1, 4], [3, 12], [4, 12]]

sage: T4 = posets.TamariLattice(4)
sage: T4.skeleton().is_isomorphic(posets.BooleanLattice(3))
True
```

```
>>> from sage.all import *
>>> D12 = posets.DivisorLattice(Integer(12))
>>> S = D12.skeleton(); S
Finite lattice containing 4 elements
>>> S.cover_relations()
[[1, 3], [1, 4], [3, 12], [4, 12]]

>>> T4 = posets.TamariLattice(Integer(4))
>>> T4.skeleton().is_isomorphic(posets.BooleanLattice(Integer(3)))
True
```

See also

sage.combinat.posets.lattices.FiniteMeetSemilattice.pseudocomplement().

subdirect_decomposition()

Return the subdirect decomposition of the lattice.

The subdirect decomposition of a lattice L is the list of smaller lattices $L_1, \dots, L_n$ such that L is a sublattice of $L_1 \times \dots \times L_n$, none of L_i can be decomposed further and L is not a sublattice of any L_i. (Except when the list has only one element, i.e. when the lattice is subdirectly irreducible.)

EXAMPLES:

```
sage: posets.ChainPoset(3).subdirect_decomposition()                          #␣
↪needs sage.combinat
[Finite lattice containing 2 elements, Finite lattice containing 2 elements]

sage: # needs sage.combinat
sage: L = LatticePoset({1: [2, 4], 2: [3], 3: [6, 7], 4: [5, 7],
....:                   5: [9, 8], 6: [9], 7: [9], 8: [10], 9: [10]})
sage: Ldecomp = L.subdirect_decomposition()
sage: [fac.cardinality() for fac in Ldecomp]
[2, 5, 7]
sage: Ldecomp[1].is_isomorphic(posets.PentagonPoset())
True
```

```
>>> from sage.all import *
>>> posets.ChainPoset(Integer(3)).subdirect_decomposition()                   ␣
↪     # needs sage.combinat
[Finite lattice containing 2 elements, Finite lattice containing 2 elements]

>>> # needs sage.combinat
>>> L = LatticePoset({Integer(1): [Integer(2), Integer(4)], Integer(2):␣
↪[Integer(3)], Integer(3): [Integer(6), Integer(7)], Integer(4): [Integer(5),
↪ Integer(7)],
...                   Integer(5): [Integer(9), Integer(8)], Integer(6):␣
↪[Integer(9)], Integer(7): [Integer(9)], Integer(8): [Integer(10)],␣
↪Integer(9): [Integer(10)]})
>>> Ldecomp = L.subdirect_decomposition()
>>> [fac.cardinality() for fac in Ldecomp]
[2, 5, 7]
>>> Ldecomp[Integer(1)].is_isomorphic(posets.PentagonPoset())
True
```

sublattice(*elms*)

Return the smallest sublattice containing elements on the given list.

INPUT:

- `elms` – list of elements of the lattice

EXAMPLES:

```
sage: L = LatticePoset(([], [[1,2],[1,17],[1,8],[2,3],[2,22],[2,5],[2,7],[17,
↪22],[17,13],[8,7],[8,13],[3,16],[3,9],[22,16],[22,18],[22,10],[5,18],[5,14],
↪[7,9],[7,14],[7,10],[13,10],[16,6],[16,19],[9,19],[18,6],[18,33],[14,33],
↪[10,19],[10,33],[6,4],[19,4],[33,4]]))
sage: L.sublattice([14, 13, 22]).list()
[1, 2, 8, 7, 14, 17, 13, 22, 10, 33]
```

(continues on next page)

(continued from previous page)

```
sage: L = posets.BooleanLattice(3)
sage: L.sublattice([3,5,6,7])
Finite lattice containing 8 elements
```

```
>>> from sage.all import *
>>> L = LatticePoset(([], [[Integer(1),Integer(2)],[Integer(1),Integer(17)],
↪[Integer(1),Integer(8)],[Integer(2),Integer(3)],[Integer(2),Integer(22)],
↪[Integer(2),Integer(5)],[Integer(2),Integer(7)],[Integer(17),Integer(22)],
↪[Integer(17),Integer(13)],[Integer(8),Integer(7)],[Integer(8),Integer(13)],
↪[Integer(3),Integer(16)],[Integer(3),Integer(9)],[Integer(22),Integer(16)],
↪[Integer(22),Integer(18)],[Integer(22),Integer(10)],[Integer(5),
↪Integer(18)],[Integer(5),Integer(14)],[Integer(7),Integer(9)],[Integer(7),
↪Integer(14)],[Integer(7),Integer(10)],[Integer(13),Integer(10)],
↪[Integer(16),Integer(6)],[Integer(16),Integer(19)],[Integer(9),Integer(19)],
↪[Integer(18),Integer(6)],[Integer(18),Integer(33)],[Integer(14),
↪Integer(33)],[Integer(10),Integer(19)],[Integer(10),Integer(33)],
↪[Integer(6),Integer(4)],[Integer(19),Integer(4)],[Integer(33),Integer(4)]]))
>>> L.sublattice([Integer(14), Integer(13), Integer(22)]).list()
[1, 2, 8, 7, 14, 17, 13, 22, 10, 33]

>>> L = posets.BooleanLattice(Integer(3))
>>> L.sublattice([Integer(3),Integer(5),Integer(6),Integer(7)])
Finite lattice containing 8 elements
```

sublattices()

Return all sublattices of the lattice.

EXAMPLES:

```
sage: L = LatticePoset({1: [2, 3, 4], 2:[5], 3:[5, 6], 4:[6],
....:                   5:[7], 6:[7]})
sage: sublats = L.sublattices(); len(sublats)
54
sage: sublats[3]
Finite lattice containing 4 elements
sage: sublats[3].list()
[1, 2, 3, 5]
```

```
>>> from sage.all import *
>>> L = LatticePoset({Integer(1): [Integer(2), Integer(3), Integer(4)],␣
↪Integer(2):[Integer(5)], Integer(3):[Integer(5), Integer(6)],␣
↪Integer(4):[Integer(6)],
...                   Integer(5):[Integer(7)], Integer(6):[Integer(7)]})
>>> sublats = L.sublattices(); len(sublats)
54
>>> sublats[Integer(3)]
Finite lattice containing 4 elements
>>> sublats[Integer(3)].list()
[1, 2, 3, 5]
```

sublattices_lattice(*labels='lattice'*)

Return the lattice of sublattices.

Every element of the returned lattice is a sublattice and they are ordered by containment; that is, atoms are one-element lattices, coatoms are maximal sublattices of the original lattice and so on.

INPUT:

- `labels` – string; can be one of the following:
  - `'lattice'` (default) elements of the lattice will be lattices that correspond to sublattices of the original lattice
  - `'tuple'` – elements are tuples of elements of the sublattices of the original lattice
  - `'integer'` – elements are plain integers

EXAMPLES:

```
sage: D4 = posets.DiamondPoset(4)
sage: sll = D4.sublattices_lattice(labels='tuple')
sage: sll.coatoms()  # = maximal sublattices of the original lattice
[(0, 1, 3), (0, 2, 3)]

sage: L = posets.DivisorLattice(12)
sage: sll = L.sublattices_lattice()
sage: L.is_dismantlable() == (len(sll.atoms()) == sll.rank())
True
```

```
>>> from sage.all import *
>>> D4 = posets.DiamondPoset(Integer(4))
>>> sll = D4.sublattices_lattice(labels='tuple')
>>> sll.coatoms()  # = maximal sublattices of the original lattice
[(0, 1, 3), (0, 2, 3)]

>>> L = posets.DivisorLattice(Integer(12))
>>> sll = L.sublattices_lattice()
>>> L.is_dismantlable() == (len(sll.atoms()) == sll.rank())
True
```

vertical_composition(*other*, *labels='pairs'*)

Return the vertical composition of the lattice with `other`.

Let L and K be lattices and b_K the bottom element of K. The vertical composition of L and K is the ordinal sum of L and $K \setminus \{b_K\}$. Informally said this is lattices "glued" together with a common element.

Mathematically, it is only defined when L and K have no common element; here we force that by giving them different names in the resulting poset.

INPUT:

- `other` – a lattice
- `labels` – string (default: `'pairs'`); can be one of the following:
  - `'pairs'` – each element `v` in this poset will be named `(0, v)` and each element `u` in `other` will be named `(1, u)` in the result
  - `'integers'` – the elements of the result will be relabeled with consecutive integers

EXAMPLES:

```
sage: L = LatticePoset({'a': ['b', 'c'], 'b': ['d'], 'c': ['d']})
sage: K = LatticePoset({'e': ['f', 'g'], 'f': ['h'], 'g': ['h']})
sage: M = L.vertical_composition(K)
sage: M.list()
[(0, 'a'), (0, 'b'), (0, 'c'), (0, 'd'), (1, 'f'), (1, 'g'), (1, 'h')]
sage: M.upper_covers((0, 'd'))
[(1, 'f'), (1, 'g')]

sage: C2 = posets.ChainPoset(2)
sage: M3 = posets.DiamondPoset(5)
sage: L = C2.vertical_composition(M3, labels='integers')
sage: L.cover_relations()
[[0, 1], [1, 2], [1, 3], [1, 4], [2, 5], [3, 5], [4, 5]]
```

```
>>> from sage.all import *
>>> L = LatticePoset({'a': ['b', 'c'], 'b': ['d'], 'c': ['d']})
>>> K = LatticePoset({'e': ['f', 'g'], 'f': ['h'], 'g': ['h']})
>>> M = L.vertical_composition(K)
>>> M.list()
[(0, 'a'), (0, 'b'), (0, 'c'), (0, 'd'), (1, 'f'), (1, 'g'), (1, 'h')]
>>> M.upper_covers((Integer(0), 'd'))
[(1, 'f'), (1, 'g')]

>>> C2 = posets.ChainPoset(Integer(2))
>>> M3 = posets.DiamondPoset(Integer(5))
>>> L = C2.vertical_composition(M3, labels='integers')
>>> L.cover_relations()
[[0, 1], [1, 2], [1, 3], [1, 4], [2, 5], [3, 5], [4, 5]]
```

See also

vertical_decomposition(), *sage.combinat.posets.posets.FinitePoset.ordinal_sum()*

vertical_decomposition(*elements_only=False*)

Return sublattices from the vertical decomposition of the lattice.

Let $d_1, \ldots, d_n$ be elements (excluding the top and bottom elements) comparable to every element of the lattice. Let b be the bottom element and t be the top element. This function returns either a list $d_1, \ldots, d_n$, or the list of intervals $[b, d_1], [d_1, d_2], \ldots, [d_{n-1}, d_n], [d_n, t]$ as lattices.

Informally said, this returns the lattice split into parts at every single-element "cutting point".

INPUT:

- `elements_only` – if `True`, return the list of decomposing elements as defined above; if `False` (the default), return the list of sublattices so that the lattice is a vertical composition of them.

EXAMPLES:

Number 6 is divided by 1, 2, and 3, and it divides 12, 18 and 36:

```
sage: L = LatticePoset( ([1, 2, 3, 6, 12, 18, 36],
....:     attrcall("divides")) )
```

(continues on next page)

(continued from previous page)

```
sage: parts = L.vertical_decomposition()
sage: [lat.list() for lat in parts]
[[1, 2, 3, 6], [6, 12, 18, 36]]
sage: L.vertical_decomposition(elements_only=True)
[6]
```

```
>>> from sage.all import *
>>> L = LatticePoset( ([Integer(1), Integer(2), Integer(3), Integer(6),␣
↪Integer(12), Integer(18), Integer(36)],
...     attrcall("divides")) )
>>> parts = L.vertical_decomposition()
>>> [lat.list() for lat in parts]
[[1, 2, 3, 6], [6, 12, 18, 36]]
>>> L.vertical_decomposition(elements_only=True)
[6]
```

See also

vertical_composition(), *is_vertically_decomposable()*

class sage.combinat.posets.lattices.**FiniteMeetSemilattice**(*hasse_diagram*, *elements*, *category*, *facade*, *key*)

Bases: *FinitePoset*

Note

We assume that the argument passed to MeetSemilattice is the poset of a meet-semilattice (i.e. a poset with greatest lower bound for each pair of elements).

Element

alias of *MeetSemilatticeElement*

atoms()

Return the list atoms of this (semi)lattice.

An *atom* of a lattice is an element covering the bottom element.

EXAMPLES:

```
sage: L = posets.DivisorLattice(60)
sage: sorted(L.atoms())
[2, 3, 5]
```

```
>>> from sage.all import *
>>> L = posets.DivisorLattice(Integer(60))
>>> sorted(L.atoms())
[2, 3, 5]
```

See also

- Dual function: `coatoms()`

meet(*x*, *y=None*)

Return the meet of given elements in the lattice.

INPUT:

- `x`, `y` – two elements of the (semi)lattice OR
- `x` – list or tuple of elements

EXAMPLES:

```
sage: D = posets.DiamondPoset(5)
sage: D.meet(1, 2)
0
sage: D.meet(1, 1)
1
sage: D.meet(1, 0)
0
sage: D.meet(1, 4)
1
```

```
>>> from sage.all import *
>>> D = posets.DiamondPoset(Integer(5))
>>> D.meet(Integer(1), Integer(2))
0
>>> D.meet(Integer(1), Integer(1))
1
>>> D.meet(Integer(1), Integer(0))
0
>>> D.meet(Integer(1), Integer(4))
1
```

Using list of elements as an argument. Meet of empty list is the bottom element:

```
sage: B4=posets.BooleanLattice(4)
sage: B4.meet([3,5,6])
0
sage: B4.meet([])
15
```

```
>>> from sage.all import *
>>> B4=posets.BooleanLattice(Integer(4))
>>> B4.meet([Integer(3),Integer(5),Integer(6)])
0
>>> B4.meet([])
15
```

For non-facade lattices operator `*` works for meet:

```
sage: L = posets.PentagonPoset(facade=False)
sage: L(1)*L(2)
0
```

```
>>> from sage.all import *
>>> L = posets.PentagonPoset(facade=False)
>>> L(Integer(1))*L(Integer(2))
0
```

See also

- Dual function: *join()*

meet_matrix()

Return a matrix whose `(i,j)` entry is `k`, where `self.linear_extension()[k]` is the meet (greatest lower bound) of `self.linear_extension()[i]` and `self.linear_extension()[j]`.

EXAMPLES:

```
sage: P = LatticePoset([[1,3,2],[4],[4,5,6],[6],[7],[7],[7],[]], facade =␣
↪False)
sage: M = P.meet_matrix(); M
[0 0 0 0 0 0 0 0]
[0 1 0 1 0 0 0 1]
[0 0 2 2 2 0 2 2]
[0 1 2 3 2 0 2 3]
[0 0 2 2 4 0 2 4]
[0 0 0 0 0 5 5 5]
[0 0 2 2 2 5 6 6]
[0 1 2 3 4 5 6 7]
sage: M[P(4).vertex,P(3).vertex] == P(0).vertex
True
sage: M[P(5).vertex,P(2).vertex] == P(2).vertex
True
sage: M[P(5).vertex,P(2).vertex] == P(5).vertex
False
```

```
>>> from sage.all import *
>>> P = LatticePoset([[Integer(1),Integer(3),Integer(2)],[Integer(4)],
↪[Integer(4),Integer(5),Integer(6)],[Integer(6)],[Integer(7)],[Integer(7)],
↪[Integer(7)],[]], facade = False)
>>> M = P.meet_matrix(); M
[0 0 0 0 0 0 0 0]
[0 1 0 1 0 0 0 1]
[0 0 2 2 2 0 2 2]
[0 1 2 3 2 0 2 3]
[0 0 2 2 4 0 2 4]
[0 0 0 0 0 5 5 5]
[0 0 2 2 2 5 6 6]
[0 1 2 3 4 5 6 7]
>>> M[P(Integer(4)).vertex,P(Integer(3)).vertex] == P(Integer(0)).vertex
```

(continues on next page)

(continued from previous page)

```
True
>>> M[P(Integer(5)).vertex,P(Integer(2)).vertex] == P(Integer(2)).vertex
True
>>> M[P(Integer(5)).vertex,P(Integer(2)).vertex] == P(Integer(5)).vertex
False
```

pseudocomplement(*element*)

Return the pseudocomplement of `element`, if it exists.

The (meet-)pseudocomplement is the greatest element whose meet with given element is the bottom element. I.e. in a meet-semilattice with bottom element $\hat{0}$ the pseudocomplement of an element e is the element $e^\star$ such that $e \wedge e^\star = \hat{0}$ and $e' \leq e^\star$ if $e \wedge e' = \hat{0}$.

See Wikipedia article Pseudocomplement.

INPUT:

- `element` – an element of the lattice

OUTPUT:

An element of the lattice or `None` if the pseudocomplement does not exist.

EXAMPLES:

The pseudocomplement's pseudocomplement is not always the original element:

```
sage: L = LatticePoset({1: [2, 3], 2: [4], 3: [5], 4: [6], 5: [6]})
sage: L.pseudocomplement(2)
5
sage: L.pseudocomplement(5)
4
```

```
>>> from sage.all import *
>>> L = LatticePoset({Integer(1): [Integer(2), Integer(3)], Integer(2):␣
↪[Integer(4)], Integer(3): [Integer(5)], Integer(4): [Integer(6)],␣
↪Integer(5): [Integer(6)]})
>>> L.pseudocomplement(Integer(2))
5
>>> L.pseudocomplement(Integer(5))
4
```

An element can have complements but no pseudocomplement, or vice versa:

```
sage: L = LatticePoset({0: [1, 2], 1: [3, 4, 5], 2: [5], 3: [6],
....:                   4: [6], 5: [6]})
sage: L.complements(1), L.pseudocomplement(1)
([], 2)
sage: L.complements(2), L.pseudocomplement(2)
([3, 4], None)
```

```
>>> from sage.all import *
>>> L = LatticePoset({Integer(0): [Integer(1), Integer(2)], Integer(1):␣
↪[Integer(3), Integer(4), Integer(5)], Integer(2): [Integer(5)], Integer(3):␣
↪[Integer(6)],
...                   Integer(4): [Integer(6)], Integer(5): [Integer(6)]})
```

(continues on next page)

(continued from previous page)

```
>>> L.complements(Integer(1)), L.pseudocomplement(Integer(1))
([], 2)
>>> L.complements(Integer(2)), L.pseudocomplement(Integer(2))
([3, 4], None)
```

See also

is_pseudocomplemented()

subjoinsemilattice(*elms*)

Return the smallest join-subsemilattice containing elements on the given list.

INPUT:

- elms – list of elements of the lattice

EXAMPLES:

```
sage: L = posets.DivisorLattice(1000)
sage: L_ = L.subjoinsemilattice([2, 25, 125]); L_
Finite join-semilattice containing 5 elements
sage: sorted(L_.list())
[2, 25, 50, 125, 250]
```

```
>>> from sage.all import *
>>> L = posets.DivisorLattice(Integer(1000))
>>> L_ = L.subjoinsemilattice([Integer(2), Integer(25), Integer(125)]); L_
Finite join-semilattice containing 5 elements
>>> sorted(L_.list())
[2, 25, 50, 125, 250]
```

See also

- Dual function: *submeetsemilattice()*

submeetsemilattice(*elms*)

Return the smallest meet-subsemilattice containing elements on the given list.

INPUT:

- elms – list of elements of the lattice

EXAMPLES:

```
sage: L = posets.DivisorLattice(1000)
sage: L_ = L.submeetsemilattice([200, 250, 125]); L_
Finite meet-semilattice containing 5 elements
sage: L_.list()
[25, 50, 200, 125, 250]
```

```
>>> from sage.all import *
>>> L = posets.DivisorLattice(Integer(1000))
>>> L_ = L.submeetsemilattice([Integer(200), Integer(250), Integer(125)]); L_
Finite meet-semilattice containing 5 elements
>>> L_.list()
[25, 50, 200, 125, 250]
```

See also

- Dual function: `subjoinsemilattice()`

`sage.combinat.posets.lattices.JoinSemilattice(data=None, *args, **options)`

Construct a join semi-lattice from various forms of input data.

INPUT:

- `data`, `*args`, `**options` – data and options that will be passed down to `Poset()` to construct a poset that is also a join semilattice

See also

`Poset()`, `MeetSemilattice()`, `LatticePoset()`

EXAMPLES:

Using data that defines a poset:

```
sage: JoinSemilattice([[1,2],[3],[3]])
Finite join-semilattice containing 3 elements

sage: JoinSemilattice([[1,2],[3],[3]], cover_relations = True)
Finite join-semilattice containing 3 elements
```

```
>>> from sage.all import *
>>> JoinSemilattice([[Integer(1),Integer(2)],[Integer(3)],[Integer(3)]])
Finite join-semilattice containing 3 elements

>>> JoinSemilattice([[Integer(1),Integer(2)],[Integer(3)],[Integer(3)]], cover_
↪relations = True)
Finite join-semilattice containing 3 elements
```

Using a previously constructed poset:

```
sage: P = Poset([[1,2],[3],[3]])
sage: J = JoinSemilattice(P); J
Finite join-semilattice containing 3 elements
sage: type(J)
<class 'sage.combinat.posets.lattices.FiniteJoinSemilattice_with_category'>
```

```
>>> from sage.all import *
>>> P = Poset([[Integer(1),Integer(2)],[Integer(3)],[Integer(3)]])
```

(continues on next page)

(continued from previous page)

```
>>> J = JoinSemilattice(P); J
Finite join-semilattice containing 3 elements
>>> type(J)
<class 'sage.combinat.posets.lattices.FiniteJoinSemilattice_with_category'>
```

If the data is not a lattice, then an error is raised:

```
sage: JoinSemilattice({'a': ['b', 'c'], 'b': ['d', 'e'],
....:                  'c': ['d', 'e'], 'd': ['f'], 'e': ['f']})
Traceback (most recent call last):
...
LatticeError: no join for b and c
```

```
>>> from sage.all import *
>>> JoinSemilattice({'a': ['b', 'c'], 'b': ['d', 'e'],
...                  'c': ['d', 'e'], 'd': ['f'], 'e': ['f']})
Traceback (most recent call last):
...
LatticeError: no join for b and c
```

sage.combinat.posets.lattices.**LatticePoset**(*data=None*, **args*, ***options*)

Construct a lattice from various forms of input data.

INPUT:

- `data`, `*args`, `**options` – data and options that will be passed down to *Poset()* to construct a poset that is also a lattice.

OUTPUT: an instance of *FiniteLatticePoset*

See also

Posets, FiniteLatticePosets, JoinSemiLattice(), MeetSemiLattice()

EXAMPLES:

Using data that defines a poset:

```
sage: LatticePoset([[1,2],[3],[3]])
Finite lattice containing 3 elements

sage: LatticePoset([[1,2],[3],[3]], cover_relations = True)
Finite lattice containing 3 elements
```

```
>>> from sage.all import *
>>> LatticePoset([[Integer(1),Integer(2)],[Integer(3)],[Integer(3)]])
Finite lattice containing 3 elements

>>> LatticePoset([[Integer(1),Integer(2)],[Integer(3)],[Integer(3)]], cover_
↪relations = True)
Finite lattice containing 3 elements
```

Using a previously constructed poset:

```
sage: P = Poset([[1,2],[3],[3]])
sage: L = LatticePoset(P); L
Finite lattice containing 3 elements
sage: type(L)
<class 'sage.combinat.posets.lattices.FiniteLatticePoset_with_category'>
```

```
>>> from sage.all import *
>>> P = Poset([[Integer(1),Integer(2)],[Integer(3)],[Integer(3)]])
>>> L = LatticePoset(P); L
Finite lattice containing 3 elements
>>> type(L)
<class 'sage.combinat.posets.lattices.FiniteLatticePoset_with_category'>
```

If the data is not a lattice, then an error is raised:

```
sage: elms = [1,2,3,4,5,6,7]
sage: rels = [[1,2],[3,4],[4,5],[2,5]]
sage: LatticePoset((elms, rels))
Traceback (most recent call last):
...
ValueError: not a meet-semilattice: no bottom element
```

```
>>> from sage.all import *
>>> elms = [Integer(1),Integer(2),Integer(3),Integer(4),Integer(5),Integer(6),
↪Integer(7)]
>>> rels = [[Integer(1),Integer(2)],[Integer(3),Integer(4)],[Integer(4),
↪Integer(5)],[Integer(2),Integer(5)]]
>>> LatticePoset((elms, rels))
Traceback (most recent call last):
...
ValueError: not a meet-semilattice: no bottom element
```

Creating a facade lattice:

```
sage: L = LatticePoset([[1,2],[3],[3]], facade = True)
sage: L.category()
Category of facade finite enumerated lattice posets
sage: parent(L[0])
Integer Ring
sage: TestSuite(L).run(skip = ['_test_an_element']) # is_parent_of is not yet␣
↪implemented
```

```
>>> from sage.all import *
>>> L = LatticePoset([[Integer(1),Integer(2)],[Integer(3)],[Integer(3)]], facade␣
↪= True)
>>> L.category()
Category of facade finite enumerated lattice posets
>>> parent(L[Integer(0)])
Integer Ring
>>> TestSuite(L).run(skip = ['_test_an_element']) # is_parent_of is not yet␣
↪implemented
```

sage.combinat.posets.lattices.**MeetSemilattice**(*data=None*, **args*, ***options*)

Construct a meet semi-lattice from various forms of input data.

INPUT:

- `data`, `*args`, `**options` – data and options that will be passed down to `Poset()` to construct a poset that is also a meet semilattice.

See also

`Poset()`, `JoinSemilattice()`, `LatticePoset()`

EXAMPLES:

Using data that defines a poset:

```
sage: MeetSemilattice([[1,2],[3],[3]])
Finite meet-semilattice containing 3 elements

sage: MeetSemilattice([[1,2],[3],[3]], cover_relations = True)
Finite meet-semilattice containing 3 elements
```

```
>>> from sage.all import *
>>> MeetSemilattice([[Integer(1),Integer(2)],[Integer(3)],[Integer(3)]])
Finite meet-semilattice containing 3 elements

>>> MeetSemilattice([[Integer(1),Integer(2)],[Integer(3)],[Integer(3)]], cover_
→relations = True)
Finite meet-semilattice containing 3 elements
```

Using a previously constructed poset:

```
sage: P = Poset([[1,2],[3],[3]])
sage: L = MeetSemilattice(P); L
Finite meet-semilattice containing 3 elements
sage: type(L)
<class 'sage.combinat.posets.lattices.FiniteMeetSemilattice_with_category'>
```

```
>>> from sage.all import *
>>> P = Poset([[Integer(1),Integer(2)],[Integer(3)],[Integer(3)]])
>>> L = MeetSemilattice(P); L
Finite meet-semilattice containing 3 elements
>>> type(L)
<class 'sage.combinat.posets.lattices.FiniteMeetSemilattice_with_category'>
```

If the data is not a lattice, then an error is raised:

```
sage: MeetSemilattice({'a': ['b', 'c'], 'b': ['d', 'e'],
....:                  'c': ['d', 'e'], 'd': ['f'], 'e': ['f']})
Traceback (most recent call last):
...
LatticeError: no meet for e and d
```

```
>>> from sage.all import *
>>> MeetSemilattice({'a': ['b', 'c'], 'b': ['d', 'e'],
...                  'c': ['d', 'e'], 'd': ['f'], 'e': ['f']})
Traceback (most recent call last):
...
LatticeError: no meet for e and d
```

5.1.183 Linear Extensions of Posets

This module defines two classes:

- *LinearExtensionOfPoset*
- *LinearExtensionsOfPoset*
- *LinearExtensionsOfPosetWithHooks*
- *LinearExtensionsOfForest*

Classes and methods

class sage.combinat.posets.linear_extensions.**LinearExtensionOfPoset**

Bases: ClonableArray

A linear extension of a finite poset P of size n is a total ordering $\pi := \pi_0\pi_1\dots\pi_{n-1}$ of its elements such that $i < j$ whenever $\pi_i < \pi_j$ in the poset P.

When the elements of P are indexed by $\{1, 2, \dots, n\}$, π denotes a permutation of the elements of P in one-line notation.

INPUT:

- linear_extension – list of the elements of P
- poset – the underlying poset P

See also

Poset, *LinearExtensionsOfPoset*

EXAMPLES:

```
sage: P = Poset(([1,2,3,4], [[1,3],[1,4],[2,3]]),
....:           linear_extension=True, facade=False)
sage: p = P.linear_extension([1,4,2,3]); p
[1, 4, 2, 3]
sage: p.parent()
The set of all linear extensions of
 Finite poset containing 4 elements with distinguished linear extension
sage: p[0], p[1], p[2], p[3]
(1, 4, 2, 3)
```

```
>>> from sage.all import *
>>> P = Poset(([Integer(1),Integer(2),Integer(3),Integer(4)], [[Integer(1),
↪Integer(3)],[Integer(1),Integer(4)],[Integer(2),Integer(3)]]),
...           linear_extension=True, facade=False)
```

(continues on next page)

(continued from previous page)

```
>>> p = P.linear_extension([Integer(1),Integer(4),Integer(2),Integer(3)]); p
[1, 4, 2, 3]
>>> p.parent()
The set of all linear extensions of
 Finite poset containing 4 elements with distinguished linear extension
>>> p[Integer(0)], p[Integer(1)], p[Integer(2)], p[Integer(3)]
(1, 4, 2, 3)
```

Following Schützenberger and later Haiman and Malvenuto-Reutenauer, Stanley [Stan2009] defined a promotion and evacuation operator on any finite poset P using operators τ_i on the linear extensions of P:

```
sage: p.promotion()
[1, 2, 3, 4]
sage: Q = p.promotion().to_poset()
sage: Q.cover_relations()
[[1, 3], [1, 4], [2, 3]]
sage: Q == P
True

sage: p.promotion(3)
[1, 4, 2, 3]
sage: Q = p.promotion(3).to_poset()
sage: Q == P
False
sage: Q.cover_relations()
[[1, 2], [1, 4], [3, 4]]
```

```
>>> from sage.all import *
>>> p.promotion()
[1, 2, 3, 4]
>>> Q = p.promotion().to_poset()
>>> Q.cover_relations()
[[1, 3], [1, 4], [2, 3]]
>>> Q == P
True

>>> p.promotion(Integer(3))
[1, 4, 2, 3]
>>> Q = p.promotion(Integer(3)).to_poset()
>>> Q == P
False
>>> Q.cover_relations()
[[1, 2], [1, 4], [3, 4]]
```

check()

Check whether `self` is indeed a linear extension of the underlying poset.

evacuation()

Compute evacuation on the linear extension of a poset.

Evacuation on a linear extension π of length n is defined as $\pi(\tau_1 \cdots \tau_{n-1})(\tau_1 \cdots \tau_{n-2}) \cdots (\tau_1)$. For more details see [Stan2009].

See also

`tau()`, `promotion()`

EXAMPLES:

```
sage: P = Poset(([1,2,3,4,5,6,7], [[1,2],[1,4],[2,3],[2,5],[3,6],[4,7],[5,
↪6]]))
sage: p = P.linear_extension([1,2,3,4,5,6,7])
sage: p.evacuation()
[1, 4, 2, 3, 7, 5, 6]
sage: p.evacuation().evacuation() == p
True
```

```
>>> from sage.all import *
>>> P = Poset(([Integer(1),Integer(2),Integer(3),Integer(4),Integer(5),
↪Integer(6),Integer(7)], [[Integer(1),Integer(2)],[Integer(1),Integer(4)],
↪[Integer(2),Integer(3)],[Integer(2),Integer(5)],[Integer(3),Integer(6)],
↪[Integer(4),Integer(7)],[Integer(5),Integer(6)]]))
>>> p = P.linear_extension([Integer(1),Integer(2),Integer(3),Integer(4),
↪Integer(5),Integer(6),Integer(7)])
>>> p.evacuation()
[1, 4, 2, 3, 7, 5, 6]
>>> p.evacuation().evacuation() == p
True
```

is_greedy()

Return `True` if the linear extension is greedy.

A linear extension $[e_1, e_2, \ldots, e_n]$ is *greedy* if for every i either e_{i+1} covers e_i or all upper covers of e_i have at least one lower cover that is not in $[e_1, e_2, \ldots, e_i]$.

Informally said a linear extension is greedy if it "always goes up when possible" and so has no unnecessary jumps.

EXAMPLES:

```
sage: P = posets.PentagonPoset()                                        #␣
↪needs sage.modules
sage: for l in P.linear_extensions():                                   #␣
↪needs sage.modules
....:     if not l.is_greedy():
....:         print(l)
[0, 2, 1, 3, 4]
```

```
>>> from sage.all import *
>>> P = posets.PentagonPoset()                                        #␣
↪needs sage.modules
>>> for l in P.linear_extensions():                                   #␣
↪needs sage.modules
...     if not l.is_greedy():
...         print(l)
[0, 2, 1, 3, 4]
```

is_supergreedy()

Return `True` if the linear extension is supergreedy.

A linear extension of a poset P with elements $\{x_1, x_2, ..., x_t\}$ is *super greedy*, if it can be obtained using the following algorithm: choose x_1 to be a minimal element of P; suppose $X = \{x_1, ..., x_i\}$ have been chosen; let M be the set of minimal elements of $P \setminus X$. If there is an element of M which covers an element x_j in X, then let x_{i+1} be one of these such that j is maximal; otherwise, choose x_{i+1} to be any element of M.

Informally, a linear extension is supergreedy if it "always goes up and receedes the least"; in other words, supergreedy linear extensions are depth-first linear extensions. For more details see [KTZ1987].

EXAMPLES:

```
sage: X = [0,1,2,3,4,5,6]
sage: Y = [[0,5],[1,4],[1,5],[3,6],[4,3],[5,6],[6,2]]
sage: P = Poset((X,Y), cover_relations=True, facade=False)
sage: for l in P.linear_extensions():                                    #␣
↪needs sage.modules
....:     if l.is_supergreedy():
....:         print(l)
[1, 4, 3, 0, 5, 6, 2]
[0, 1, 4, 3, 5, 6, 2]
[0, 1, 5, 4, 3, 6, 2]

sage: Q = posets.PentagonPoset()                                         #␣
↪needs sage.modules
sage: for l in Q.linear_extensions():                                    #␣
↪needs sage.modules sage.rings.finite_rings
....:     if not l.is_supergreedy():
....:         print(l)
[0, 2, 1, 3, 4]
```

```
>>> from sage.all import *
>>> X = [Integer(0),Integer(1),Integer(2),Integer(3),Integer(4),Integer(5),
↪Integer(6)]
>>> Y = [[Integer(0),Integer(5)],[Integer(1),Integer(4)],[Integer(1),
↪Integer(5)],[Integer(3),Integer(6)],[Integer(4),Integer(3)],[Integer(5),
↪Integer(6)],[Integer(6),Integer(2)]]
>>> P = Poset((X,Y), cover_relations=True, facade=False)
>>> for l in P.linear_extensions():                                    #␣
↪needs sage.modules
...     if l.is_supergreedy():
...         print(l)
[1, 4, 3, 0, 5, 6, 2]
[0, 1, 4, 3, 5, 6, 2]
[0, 1, 5, 4, 3, 6, 2]

>>> Q = posets.PentagonPoset()                                         #␣
↪needs sage.modules
>>> for l in Q.linear_extensions():                                    #␣
↪needs sage.modules sage.rings.finite_rings
...     if not l.is_supergreedy():
...         print(l)
[0, 2, 1, 3, 4]
```

jump_count()

Return the number of jumps in the linear extension.

A *jump* in a linear extension $[e_1, e_2, \dots, e_n]$ is a pair (e_i, e_{i+1}) such that e_{i+1} does not cover e_i.

See also

- *sage.combinat.posets.posets.FinitePoset.jump_number()*

EXAMPLES:

```
sage: B3 = posets.BooleanLattice(3)
sage: l1 = B3.linear_extension((0, 1, 2, 3, 4, 5, 6, 7))
sage: l1.jump_count()
3
sage: l2 = B3.linear_extension((0, 1, 2, 4, 3, 5, 6, 7))
sage: l2.jump_count()
5
```

```
>>> from sage.all import *
>>> B3 = posets.BooleanLattice(Integer(3))
>>> l1 = B3.linear_extension((Integer(0), Integer(1), Integer(2), Integer(3),␣
↪Integer(4), Integer(5), Integer(6), Integer(7)))
>>> l1.jump_count()
3
>>> l2 = B3.linear_extension((Integer(0), Integer(1), Integer(2), Integer(4),␣
↪Integer(3), Integer(5), Integer(6), Integer(7)))
>>> l2.jump_count()
5
```

poset()

Return the underlying original poset.

EXAMPLES:

```
sage: P = Poset(([1,2,3,4], [[1,2],[2,3],[1,4]]))
sage: p = P.linear_extension([1,2,4,3])
sage: p.poset()
Finite poset containing 4 elements
```

```
>>> from sage.all import *
>>> P = Poset(([Integer(1),Integer(2),Integer(3),Integer(4)], [[Integer(1),
↪Integer(2)],[Integer(2),Integer(3)],[Integer(1),Integer(4)]]))
>>> p = P.linear_extension([Integer(1),Integer(2),Integer(4),Integer(3)])
>>> p.poset()
Finite poset containing 4 elements
```

promotion(*i=1*)

Compute the (generalized) promotion on the linear extension of a poset.

INPUT:

- i – (default: 1) an integer between 1 and $n - 1$, where n is the cardinality of the poset

The i-th generalized promotion operator ∂_i on a linear extension π is defined as $\pi\tau_i\tau_{i+1}\cdots\tau_{n-1}$, where n is the size of the linear extension (or size of the underlying poset).

For more details see [Stan2009].

`tau()`, `evacuation()`

EXAMPLES:

```
sage: P = Poset(([1,2,3,4,5,6,7], [[1,2],[1,4],[2,3],[2,5],[3,6],[4,7],[5,
↪6]]))
sage: p = P.linear_extension([1,2,3,4,5,6,7])
sage: q = p.promotion(4); q
[1, 2, 3, 5, 6, 4, 7]
sage: p.to_poset() == q.to_poset()
False
sage: p.to_poset().is_isomorphic(q.to_poset())
True
```

```
>>> from sage.all import *
>>> P = Poset(([Integer(1),Integer(2),Integer(3),Integer(4),Integer(5),
↪Integer(6),Integer(7)], [[Integer(1),Integer(2)],[Integer(1),Integer(4)],
↪[Integer(2),Integer(3)],[Integer(2),Integer(5)],[Integer(3),Integer(6)],
↪[Integer(4),Integer(7)],[Integer(5),Integer(6)]]))
>>> p = P.linear_extension([Integer(1),Integer(2),Integer(3),Integer(4),
↪Integer(5),Integer(6),Integer(7)])
>>> q = p.promotion(Integer(4)); q
[1, 2, 3, 5, 6, 4, 7]
>>> p.to_poset() == q.to_poset()
False
>>> p.to_poset().is_isomorphic(q.to_poset())
True
```

tau(*i*)

Return the operator τ_i on linear extensions `self` of a poset.

INPUT:

- `i` – integer between 1 and $n-1$, where n is the cardinality of the poset

The operator τ_i on a linear extension π of a poset P interchanges positions i and $i+1$ if the result is again a linear extension of P, and otherwise acts trivially. For more details, see [Stan2009].

EXAMPLES:

```
sage: P = Poset(([1,2,3,4], [[1,3],[1,4],[2,3]]), linear_extension=True)
sage: L = P.linear_extensions()
sage: l = L.an_element(); l
[1, 2, 3, 4]
sage: l.tau(1)
[2, 1, 3, 4]
sage: for p in L:                                                          #␣
↪needs sage.modules
```

1 [1, 4, 2, 3] [1, 4, 2, 3]
2 [1, 4, 2, 3] [1, 2, 4, 3]
3 [1, 4, 2, 3] [1, 4, 2, 3]
1 [1, 2, 4, 3] [2, 1, 4, 3]
2 [1, 2, 4, 3] [1, 4, 2, 3]
3 [1, 2, 4, 3] [1, 2, 3, 4]
```

to_poset()

Return the poset associated to the linear extension `self`.

This method returns the poset obtained from the original poset P by relabelling the i-th element of `self` to the i-th element of the original poset, while keeping the linear extension of the original poset.

For a poset with default linear extension $1, \dots, n$, `self` can be interpreted as a permutation, and the relabelling is done according to the inverse of this permutation.

EXAMPLES:

```
sage: P = Poset(([1,2,3,4], [[1,2],[1,3],[3,4]]), linear_extension=True,␣
↪facade=False)
sage: p = P.linear_extension([1,3,4,2])
sage: Q = p.to_poset(); Q
Finite poset containing 4 elements with distinguished linear extension
sage: P == Q
False
```

```
>>> from sage.all import *
>>> P = Poset(([Integer(1),Integer(2),Integer(3),Integer(4)], [[Integer(1),
↪Integer(2)],[Integer(1),Integer(3)],[Integer(3),Integer(4)]]), linear_
↪extension=True, facade=False)
>>> p = P.linear_extension([Integer(1),Integer(3),Integer(4),Integer(2)])
>>> Q = p.to_poset(); Q
Finite poset containing 4 elements with distinguished linear extension
>>> P == Q
False
```

The default linear extension remains the same:

```
sage: list(P)
[1, 2, 3, 4]
sage: list(Q)
[1, 2, 3, 4]
```

```
>>> from sage.all import *
>>> list(P)
[1, 2, 3, 4]
>>> list(Q)
[1, 2, 3, 4]
```

But the relabelling can be seen on cover relations:

```
sage: P.cover_relations()
[[1, 2], [1, 3], [3, 4]]
sage: Q.cover_relations()
[[1, 2], [1, 4], [2, 3]]

sage: p = P.linear_extension([1,2,3,4])
sage: Q = p.to_poset()
sage: P == Q
True
```

```
>>> from sage.all import *
>>> P.cover_relations()
[[1, 2], [1, 3], [3, 4]]
>>> Q.cover_relations()
[[1, 2], [1, 4], [2, 3]]
```

(continues on next page)

(continued from previous page)

```
>>> p = P.linear_extension([Integer(1),Integer(2),Integer(3),Integer(4)])
>>> Q = p.to_poset()
>>> P == Q
True
```

class sage.combinat.posets.linear_extensions.**LinearExtensionsOfForest**(*poset*, *facade*)

Bases: *LinearExtensionsOfPoset*

Linear extensions such that the poset is a forest.

cardinality()

Use Atkinson's algorithm to compute the number of linear extensions.

EXAMPLES:

```
sage: from sage.combinat.posets.forest import ForestPoset
sage: from sage.combinat.posets.poset_examples import Posets
sage: P = Poset({0: [2], 1: [2], 2: [3, 4], 3: [], 4: []})

↪needs sage.combinat sage.modules
361628701868606400
```

class sage.combinat.posets.linear_extensions.**LinearExtensionsOfPoset**(*poset*, *facade*)

Bases: `UniqueRepresentation`, `Parent`

The set of all linear extensions of a finite poset.

INPUT:

- `poset` – a poset P of size n
- `facade` – boolean (default: `False`)

See also

- `sage.combinat.posets.posets.FinitePoset.linear_extensions()`

EXAMPLES:

```
sage: elms = [1,2,3,4]
sage: rels = [[1,3],[1,4],[2,3]]
sage: P = Poset((elms, rels), linear_extension=True)
sage: L = P.linear_extensions(); L
The set of all linear extensions of
 Finite poset containing 4 elements with distinguished linear extension
sage: L.cardinality()
5
sage: L.list()                                                          #␣
↪needs sage.modules
[[1, 2, 3, 4], [2, 1, 3, 4], [2, 1, 4, 3], [1, 4, 2, 3], [1, 2, 4, 3]]
sage: L.an_element()
[1, 2, 3, 4]
sage: L.poset()
Finite poset containing 4 elements with distinguished linear extension
```

```
>>> from sage.all import *
>>> elms = [Integer(1),Integer(2),Integer(3),Integer(4)]
>>> rels = [[Integer(1),Integer(3)],[Integer(1),Integer(4)],[Integer(2),
↪Integer(3)]]
>>> P = Poset((elms, rels), linear_extension=True)
>>> L = P.linear_extensions(); L
The set of all linear extensions of
 Finite poset containing 4 elements with distinguished linear extension
>>> L.cardinality()
5
>>> L.list()                                                            #␣
↪needs sage.modules
[[1, 2, 3, 4], [2, 1, 3, 4], [2, 1, 4, 3], [1, 4, 2, 3], [1, 2, 4, 3]]
>>> L.an_element()
[1, 2, 3, 4]
>>> L.poset()
Finite poset containing 4 elements with distinguished linear extension
```

Element

alias of `LinearExtensionOfPoset`

cardinality()

Return the number of linear extensions.

EXAMPLES:

```
sage: N = Poset({0: [2, 3], 1: [3]})
sage: N.linear_extensions().cardinality()
5
```

```
>>> from sage.all import *
>>> N = Poset({Integer(0): [Integer(2), Integer(3)], Integer(1): [Integer(3)]}
↪)
>>> N.linear_extensions().cardinality()
5
```

markov_chain_digraph(*action='promotion'*, *labeling='identity'*)

Return the digraph of the action of generalized promotion or tau on `self`.

INPUT:

- `action` – 'promotion' or 'tau' (default: `'promotion'`)
- `labeling` – 'identity' or 'source' (default: `'identity'`)

Todo

- generalize this feature by accepting a family of operators as input
- move up in some appropriate category

This method creates a graph with vertices being the linear extensions of a given finite poset and an edge from π to π' if $\pi' = \pi\partial_i$ where ∂_i is the promotion operator (see `promotion()`) if `action` is set to `promotion` and τ_i (see `tau()`) if `action` is set to `tau`. The label of the edge is i (resp. π_i) if `labeling` is set to `identity` (resp. `source`).

EXAMPLES:

```
sage: P = Poset(([1,2,3,4], [[1,3],[1,4],[2,3]]), linear_extension=True)
sage: L = P.linear_extensions()
sage: G = L.markov_chain_digraph(); G
Looped multi-digraph on 5 vertices
sage: G.vertices(sort=True, key=repr)
[[1, 2, 3, 4], [1, 2, 4, 3], [1, 4, 2, 3], [2, 1, 3, 4], [2, 1, 4, 3]]
sage: G.edges(sort=True, key=repr)
[([1, 2, 3, 4], [1, 2, 3, 4], 4), ([1, 2, 3, 4], [1, 2, 4, 3], 2), ([1, 2, 3,␣
↪4], [1, 2, 4, 3], 3),
 ([1, 2, 3, 4], [2, 1, 4, 3], 1), ([1, 2, 4, 3], [1, 2, 3, 4], 3), ([1, 2, 4,␣
↪3], [1, 2, 4, 3], 4),

>>> G = L.markov_chain_digraph(labeling='source')
>>> G.vertices(sort=True, key=repr)
[[1, 2, 3, 4], [1, 2, 4, 3], [1, 4, 2, 3], [2, 1, 3, 4], [2, 1, 4, 3]]
>>> G.edges(sort=True, key=repr)
[([1, 2, 3, 4], [1, 2, 3, 4], 4), ([1, 2, 3, 4], [1, 2, 4, 3], 2), ([1, 2, 3,
→4], [1, 2, 4, 3], 3),
 ([1, 2, 3, 4], [2, 1, 4, 3], 1), ([1, 2, 4, 3], [1, 2, 3, 4], 4), ([1, 2, 4,
→3], [1, 2, 4, 3], 3),
 ([1, 2, 4, 3], [1, 4, 2, 3], 2), ([1, 2, 4, 3], [2, 1, 3, 4], 1), ([1, 4, 2,
```

(continues on next page)

(continued from previous page)

```
↪3], [1, 2, 3, 4], 1),
 ([1, 4, 2, 3], [1, 2, 3, 4], 4), ([1, 4, 2, 3], [1, 4, 2, 3], 2), ([1, 4, 2,␣
↪3], [1, 4, 2, 3], 3),
 ([2, 1, 3, 4], [1, 2, 4, 3], 2), ([2, 1, 3, 4], [2, 1, 3, 4], 4), ([2, 1, 3,␣
↪4], [2, 1, 4, 3], 1),
 ([2, 1, 3, 4], [2, 1, 4, 3], 3), ([2, 1, 4, 3], [1, 4, 2, 3], 2), ([2, 1, 4,␣
↪3], [2, 1, 3, 4], 1),
 ([2, 1, 4, 3], [2, 1, 3, 4], 4), ([2, 1, 4, 3], [2, 1, 4, 3], 3)]
```

The edges of the graph are by default colored using blue for edge 1, red for edge 2, green for edge 3, and yellow for edge 4:

```
sage: view(G) # optional - dot2tex graphviz, not tested (opens external␣
↪window)
```

```
>>> from sage.all import *
>>> view(G) # optional - dot2tex graphviz, not tested (opens external window)
```

Alternatively, one may get the graph of the action of the `tau` operator:

```
sage: G = L.markov_chain_digraph(action='tau'); G
Looped multi-digraph on 5 vertices
sage: G.vertices(sort=True, key=repr)
[[1, 2, 3, 4], [1, 2, 4, 3], [1, 4, 2, 3], [2, 1, 3, 4], [2, 1, 4, 3]]
sage: G.edges(sort=True, key=repr)
[([1, 2, 3, 4], [1, 2, 3, 4], 2), ([1, 2, 3, 4], [1, 2, 4, 3], 3), ([1, 2, 3,␣
↪4], [2, 1, 3, 4], 1),
 ([1, 2, 4, 3], [1, 2, 3, 4], 3), ([1, 2, 4, 3], [1, 4, 2, 3], 2), ([1, 2, 4,␣
↪3], [2, 1, 4, 3], 1),
 ([1, 4, 2, 3], [1, 2, 4, 3], 2), ([1, 4, 2, 3], [1, 4, 2, 3], 1), ([1, 4, 2,␣
↪3], [1, 4, 2, 3], 3),

markov_chain_transition_matrix(), promotion(), tau()

markov_chain_transition_matrix(*action='promotion'*, *labeling='identity'*)

Return the transition matrix of the Markov chain for the action of generalized promotion or tau on `self`.

INPUT:

- `action` – `'promotion'` or `'tau'` (default: `'promotion'`)
- `labeling` – `'identity'` or `'source'` (default: `'identity'`)

This method yields the transition matrix of the Markov chain defined by the action of the generalized promotion operator ∂_i (resp. τ_i) on the set of linear extensions of a finite poset. Here the transition from the linear extension π to π', where $\pi' = \pi\partial_i$ (resp. $\pi' = \pi\tau_i$) is counted with weight x_i (resp. x_{π_i} if `labeling` is set to `source`).

EXAMPLES:

```
sage: P = Poset(([1,2,3,4], [[1,3],[1,4],[2,3]]), linear_extension=True)
sage: L = P.linear_extensions()
sage: L.markov_chain_transition_matrix()                                    #␣
↪needs sage.modules

```

See also

markov_chain_digraph(), promotion(), tau()

poset()

Return the underlying original poset.

EXAMPLES:

```
sage: P = Poset(([1,2,3,4], [[1,2],[2,3],[1,4]]))
sage: L = P.linear_extensions()
sage: L.poset()
Finite poset containing 4 elements
```

```
>>> from sage.all import *
>>> P = Poset(([Integer(1),Integer(2),Integer(3),Integer(4)], [[Integer(1),
↪Integer(2)],[Integer(2),Integer(3)],[Integer(1),Integer(4)]]))
>>> L = P.linear_extensions()
>>> L.poset()
Finite poset containing 4 elements
```

class sage.combinat.posets.linear_extensions.**LinearExtensionsOfPosetWithHooks**(*poset*, *facade*)

Bases: *LinearExtensionsOfPoset*

Linear extensions such that the poset has well-defined hook lengths (i.e., d-complete).

cardinality()

Count the number of linear extensions using a hook-length formula.

EXAMPLES:

```
sage: from sage.combinat.posets.poset_examples import Posets
sage: P = Posets.YoungDiagramPoset(Partition([3,2]), dual=True)             #␣
↪needs sage.combinat sage.modules

```

5.1.184 Möbius Algebras

class sage.combinat.posets.moebius_algebra.**BasisAbstract**(*R*, *basis_keys=None*, *element_class=None*, *category=None*, *prefix=None*, *names=None*, ***kwds*)

Bases: *CombinatorialFreeModule*, BindableClass

Abstract base class for a basis.

class sage.combinat.posets.moebius_algebra.**MoebiusAlgebra**(*R*, *L*)

Bases: Parent, UniqueRepresentation

The Möbius algebra of a lattice.

Let L be a lattice. The *Möbius algebra* M_L was originally constructed by Solomon [Solomon67] and has a natural basis $\{E_x \mid x \in L\}$ with multiplication given by $E_x \cdot E_y = E_{x \vee y}$. Moreover this has a basis given by orthogonal idempotents $\{I_x \mid x \in L\}$ (so $I_x I_y = \delta_{xy} I_x$ where δ is the Kronecker delta) related to the natural basis by

$$I_x = \sum_{x \leq y} \mu_L(x, y) E_y,$$

where μ_L is the Möbius function of L.

Note

We use the join $\vee$ for our multiplication, whereas [Greene73] and [Etienne98] define the Möbius algebra using the meet $\wedge$. This is done for compatibility with `QuantumMoebiusAlgebra`.

REFERENCES:

class E(*M*, *prefix='E'*)

Bases: `BasisAbstract`

The natural basis of a Möbius algebra.

Let E_x and E_y be basis elements of M_L for some lattice L. Multiplication is given by $E_x E_y = E_{x \vee y}$.

one()

Return the element `1` of `self`.

EXAMPLES:

```
sage: L = posets.BooleanLattice(4)
sage: E = L.moebius_algebra(QQ).E()
sage: E.one()
E[0]
```

```
>>> from sage.all import *
>>> L = posets.BooleanLattice(Integer(4))
>>> E = L.moebius_algebra(QQ).E()
>>> E.one()
E[0]
```

product_on_basis(*x*, *y*)

Return the product of basis elements indexed by `x` and `y`.

EXAMPLES:

```
sage: L = posets.BooleanLattice(4)
sage: E = L.moebius_algebra(QQ).E()
sage: E.product_on_basis(5, 14)
E[15]
sage: E.product_on_basis(2, 8)
E[10]
```

```
>>> from sage.all import *
>>> L = posets.BooleanLattice(Integer(4))
>>> E = L.moebius_algebra(QQ).E()
>>> E.product_on_basis(Integer(5), Integer(14))
E[15]
>>> E.product_on_basis(Integer(2), Integer(8))
E[10]
```

class I(*M*, *prefix='I'*)

Bases: *BasisAbstract*

The (orthogonal) idempotent basis of a Möbius algebra.

Let I_x and I_y be basis elements of M_L for some lattice L. Multiplication is given by $I_x I_y = \delta_{xy} I_x$ where δ_{xy} is the Kronecker delta.

one()

Return the element 1 of self.

EXAMPLES:

```
sage: L = posets.BooleanLattice(4)
sage: I = L.moebius_algebra(QQ).I()
sage: I.one()
I[0] + I[1] + I[2] + I[3] + I[4] + I[5] + I[6] + I[7] + I[8]
 + I[9] + I[10] + I[11] + I[12] + I[13] + I[14] + I[15]
```

```
>>> from sage.all import *
>>> L = posets.BooleanLattice(Integer(4))
>>> I = L.moebius_algebra(QQ).I()
>>> I.one()
I[0] + I[1] + I[2] + I[3] + I[4] + I[5] + I[6] + I[7] + I[8]
 + I[9] + I[10] + I[11] + I[12] + I[13] + I[14] + I[15]
```

product_on_basis(*x*, *y*)

Return the product of basis elements indexed by x and y.

EXAMPLES:

```
sage: L = posets.BooleanLattice(4)
sage: I = L.moebius_algebra(QQ).I()
sage: I.product_on_basis(5, 14)
0
sage: I.product_on_basis(2, 2)
I[2]
```

```
>>> from sage.all import *
>>> L = posets.BooleanLattice(Integer(4))
>>> I = L.moebius_algebra(QQ).I()
>>> I.product_on_basis(Integer(5), Integer(14))
0
>>> I.product_on_basis(Integer(2), Integer(2))
I[2]
```

a_realization()

Return a particular realization of self (the B-basis).

EXAMPLES:

```
sage: L = posets.BooleanLattice(4)
sage: M = L.moebius_algebra(QQ)
sage: M.a_realization()
Moebius algebra of Finite lattice containing 16 elements
 over Rational Field in the natural basis
```

```
>>> from sage.all import *
>>> L = posets.BooleanLattice(Integer(4))
>>> M = L.moebius_algebra(QQ)
>>> M.a_realization()
Moebius algebra of Finite lattice containing 16 elements
 over Rational Field in the natural basis
```

idempotent

alias of `I`

lattice()

Return the defining lattice of `self`.

EXAMPLES:

```
sage: L = posets.BooleanLattice(4)
sage: M = L.moebius_algebra(QQ)
sage: M.lattice()
Finite lattice containing 16 elements
sage: M.lattice() == L
True
```

```
>>> from sage.all import *
>>> L = posets.BooleanLattice(Integer(4))
>>> M = L.moebius_algebra(QQ)
>>> M.lattice()
Finite lattice containing 16 elements
>>> M.lattice() == L
True
```

natural

alias of `E`

class sage.combinat.posets.moebius_algebra.**MoebiusAlgebraBases**(*parent_with_realization*)

Bases: `Category_realization_of_parent`

The category of bases of a Möbius algebra.

INPUT:

- `base` – a Möbius algebra

class ElementMethods

Bases: `object`

class ParentMethods

Bases: `object`

one()

Return the element `1` of `self`.

EXAMPLES:

```
sage: L = posets.BooleanLattice(4)
sage: C = L.quantum_moebius_algebra().C()
sage: all(C.one() * b == b for b in C.basis())
True
```

```
>>> from sage.all import *
>>> L = posets.BooleanLattice(Integer(4))
>>> C = L.quantum_moebius_algebra().C()
>>> all(C.one() * b == b for b in C.basis())
True
```

product_on_basis(*x*, *y*)

Return the product of basis elements indexed by x and y.

EXAMPLES:

```
sage: L = posets.BooleanLattice(4)
sage: C = L.quantum_moebius_algebra().C()
sage: C.product_on_basis(5, 14)
q^3*C[15]
sage: C.product_on_basis(2, 8)
q^4*C[10]
```

```
>>> from sage.all import *
>>> L = posets.BooleanLattice(Integer(4))
>>> C = L.quantum_moebius_algebra().C()
>>> C.product_on_basis(Integer(5), Integer(14))
q^3*C[15]
>>> C.product_on_basis(Integer(2), Integer(8))
q^4*C[10]
```

super_categories()

The super categories of self.

EXAMPLES:

```
sage: from sage.combinat.posets.moebius_algebra import MoebiusAlgebraBases
sage: M = posets.BooleanLattice(4).moebius_algebra(QQ)
sage: bases = MoebiusAlgebraBases(M)
sage: bases.super_categories()
[Category of finite dimensional commutative algebras with basis over Rational␣
↪Field,
 Category of realizations of Moebius algebra of Finite lattice
    containing 16 elements over Rational Field]
```

```
>>> from sage.all import *
>>> from sage.combinat.posets.moebius_algebra import MoebiusAlgebraBases
>>> M = posets.BooleanLattice(Integer(4)).moebius_algebra(QQ)
>>> bases = MoebiusAlgebraBases(M)
>>> bases.super_categories()
[Category of finite dimensional commutative algebras with basis over Rational␣
↪Field,
 Category of realizations of Moebius algebra of Finite lattice
    containing 16 elements over Rational Field]
```

class sage.combinat.posets.moebius_algebra.**QuantumMoebiusAlgebra**(*L*, *q=None*)

Bases: Parent, UniqueRepresentation

The quantum Möbius algebra of a lattice.

Let L be a lattice, and we define the *quantum Möbius algebra* $M_L(q)$ as the algebra with basis $\{E_x \mid x \in L\}$ with multiplication given by

$$E_x E_y = \sum_{z \geq a \geq x \vee y} \mu_L(a, z) q^{\operatorname{crk} a} E_z,$$

where μ_L is the Möbius function of L and crk is the corank function (i.e., $\operatorname{crk} a = \operatorname{rank} L - \operatorname{rank}$ a). At $q = 1$, this reduces to the multiplication formula originally given by Solomon.

class C(*M*, *prefix='C'*)

Bases: `BasisAbstract`

The characteristic basis of a quantum Möbius algebra.

The characteristic basis $\{C_x \mid x \in L\}$ of M_L for some lattice L is defined by

$$C_x = \sum_{a \geq x} P(F^x; q) E_a,$$

where $F^x = \{y \in L \mid y \geq x\}$ is the principal order filter of x and $P(F^x; q)$ is the characteristic polynomial of the (sub)poset F^x.

class E(*M*, *prefix='E'*)

Bases: `BasisAbstract`

The natural basis of a quantum Möbius algebra.

Let E_x and E_y be basis elements of M_L for some lattice L. Multiplication is given by

$$E_x E_y = \sum_{z \geq a \geq x \vee y} \mu_L(a, z) q^{\operatorname{crk} a} E_z,$$

where μ_L is the Möbius function of L and crk is the corank function (i.e., $\operatorname{crk} a = \operatorname{rank} L - \operatorname{rank}$ a).

one()

Return the element `1` of `self`.

EXAMPLES:

```
sage: L = posets.BooleanLattice(4)
sage: E = L.quantum_moebius_algebra().E()
sage: all(E.one() * b == b for b in E.basis())
True
```

```
>>> from sage.all import *
>>> L = posets.BooleanLattice(Integer(4))
>>> E = L.quantum_moebius_algebra().E()
>>> all(E.one() * b == b for b in E.basis())
True
```

product_on_basis(*x*, *y*)

Return the product of basis elements indexed by `x` and `y`.

EXAMPLES:

```
sage: L = posets.BooleanLattice(4)
sage: E = L.quantum_moebius_algebra().E()
sage: E.product_on_basis(5, 14)
```

(continues on next page)

(continued from previous page)

```
E[15]
sage: E.product_on_basis(2, 8)
q^2*E[10] + (q-q^2)*E[11] + (q-q^2)*E[14] + (1-2*q+q^2)*E[15]
```

```
>>> from sage.all import *
>>> L = posets.BooleanLattice(Integer(4))
>>> E = L.quantum_moebius_algebra().E()
>>> E.product_on_basis(Integer(5), Integer(14))
E[15]
>>> E.product_on_basis(Integer(2), Integer(8))
q^2*E[10] + (q-q^2)*E[11] + (q-q^2)*E[14] + (1-2*q+q^2)*E[15]
```

class KL(*M*, *prefix='KL'*)

Bases: `BasisAbstract`

The Kazhdan-Lusztig basis of a quantum Möbius algebra.

The Kazhdan-Lusztig basis $\{B_x \mid x \in L\}$ of M_L for some lattice L is defined by

$$B_x = \sum_{y \geq x} P_{x,y}(q) E_a,$$

where $P_{x,y}(q)$ is the Kazhdan-Lusztig polynomial of L, following the definition given in [EPW14].

EXAMPLES:

We construct some examples of Proposition 4.5 of [EPW14]:

```
sage: M = posets.BooleanLattice(4).quantum_moebius_algebra()
sage: KL = M.KL()
sage: KL[4] * KL[5]
(q^2+q^3)*KL[5] + (q+2*q^2+q^3)*KL[7] + (q+2*q^2+q^3)*KL[13]
 + (1+3*q+3*q^2+q^3)*KL[15]
sage: KL[4] * KL[15]
(1+3*q+3*q^2+q^3)*KL[15]
sage: KL[4] * KL[10]
(q+3*q^2+3*q^3+q^4)*KL[14] + (1+4*q+6*q^2+4*q^3+q^4)*KL[15]
```

```
>>> from sage.all import *
>>> M = posets.BooleanLattice(Integer(4)).quantum_moebius_algebra()
>>> KL = M.KL()
>>> KL[Integer(4)] * KL[Integer(5)]
(q^2+q^3)*KL[5] + (q+2*q^2+q^3)*KL[7] + (q+2*q^2+q^3)*KL[13]
 + (1+3*q+3*q^2+q^3)*KL[15]
>>> KL[Integer(4)] * KL[Integer(15)]
(1+3*q+3*q^2+q^3)*KL[15]
>>> KL[Integer(4)] * KL[Integer(10)]
(q+3*q^2+3*q^3+q^4)*KL[14] + (1+4*q+6*q^2+4*q^3+q^4)*KL[15]
```

a_realization()

Return a particular realization of `self` (the B-basis).

EXAMPLES:

```
sage: L = posets.BooleanLattice(4)
sage: M = L.quantum_moebius_algebra()
sage: M.a_realization()
Quantum Moebius algebra of Finite lattice containing 16 elements
 with q=q over Univariate Laurent Polynomial Ring in q
 over Integer Ring in the natural basis
```

```
>>> from sage.all import *
>>> L = posets.BooleanLattice(Integer(4))
>>> M = L.quantum_moebius_algebra()
>>> M.a_realization()
Quantum Moebius algebra of Finite lattice containing 16 elements
 with q=q over Univariate Laurent Polynomial Ring in q
 over Integer Ring in the natural basis
```

characteristic_basis

alias of `C`

kazhdan_lusztig

alias of `KL`

lattice()

Return the defining lattice of `self`.

EXAMPLES:

```
sage: L = posets.BooleanLattice(4)
sage: M = L.quantum_moebius_algebra()
sage: M.lattice()
Finite lattice containing 16 elements
sage: M.lattice() == L
True
```

```
>>> from sage.all import *
>>> L = posets.BooleanLattice(Integer(4))
>>> M = L.quantum_moebius_algebra()
>>> M.lattice()
Finite lattice containing 16 elements
>>> M.lattice() == L
True
```

natural

alias of `E`

5.1.185 Catalog of posets and lattices

Some common posets can be accessed through the `posets.<tab>` object:

```
sage: posets.PentagonPoset()
Finite lattice containing 5 elements
```

```
>>> from sage.all import *
>>> posets.PentagonPoset()
Finite lattice containing 5 elements
```

Moreover, the set of all posets of order n is represented by `Posets(n)`:

```
sage: Posets(5)
Posets containing 5 elements
```

```
>>> from sage.all import *
>>> Posets(Integer(5))
Posets containing 5 elements
```

The infinite set of all posets can be used to find minimal examples:

```
sage: for P in Posets():
....:     if not P.is_series_parallel():
....:         break
sage: P
Finite poset containing 4 elements
```

```
>>> from sage.all import *
>>> for P in Posets():
...     if not P.is_series_parallel():
...         break
>>> P
Finite poset containing 4 elements
```

Catalog of common posets:

`AntichainPoset()`	Return an antichain on n elements.
`BooleanLattice()`	Return the Boolean lattice on 2^n elements.
`ChainPoset()`	Return a chain on n elements.
`Crown()`	Return the crown poset on $2n$ elements.
`DexterSemilattice()`	Return the Dexter semilattice.
`DiamondPoset()`	Return the lattice of rank two on n elements.
`DivisorLattice()`	Return the divisor lattice of an integer.
`DoubleTailedDiamond()`	Return the double tailed diamond poset on $2n + 2$ elements.
`IntegerCompositions()`	Return the poset of integer compositions of n.
`IntegerPartitions()`	Return the poset of integer partitions of `n`.
`IntegerPartitionsDominanceOrder()`	Return the lattice of integer partitions on the integer n ordered by dominance.
`MobilePoset()`	Return the mobile poset formed by the $ribbon$ with $hangers$ below and an $anchor$ above.
`NoncrossingPartitions()`	Return the poset of noncrossing partitions of a finite Coxeter group `W`.
`PentagonPoset()`	Return the Pentagon poset.
`PermutationPattern()`	Return the Permutation pattern poset.
`PermutationPatternInterval()`	Return an interval in the Permutation pattern poset.
`PermutationPatternOccurrenceInterval()`	Return the occurrence poset for a pair of comparable elements in the Permutation pattern poset.
`PowerPoset()`	Return a power poset.

continues on next page

Table 6 – continued from previous page

`ProductOfChains()`	Return a product of chain posets.
`RandomLattice()`	Return a random lattice on n elements.
`RandomPoset()`	Return a random poset on n elements.
`RibbonPoset()`	Return a ribbon on n elements with descents at $descents$.
`RestrictedIntegerPartitions()`	Return the poset of integer partitions of n, ordered by restricted refinement.
`SetPartitions()`	Return the poset of set partitions of the set $\{1, \dots, n\}$.
`ShardPoset()`	Return the shard intersection order.
`SSTPoset()`	Return the poset on semistandard tableaux of shape s and largest entry f that is ordered by componentwise comparison.
`StandardExample()`	Return the standard example of a poset with dimension n.
`SymmetricGroupAbsoluteOrderPoset()`	The poset of permutations with respect to absolute order.
`SymmetricGroupBruhatIntervalPoset()`	The poset of permutations with respect to Bruhat order.
`SymmetricGroupBruhatOrderPoset()`	The poset of permutations with respect to Bruhat order.
`SymmetricGroupWeakOrderPoset()`	The poset of permutations of $\{1, 2, \dots, n\}$ with respect to the weak order.
`TamariLattice()`	Return the Tamari lattice.
`TetrahedralPoset()`	Return the Tetrahedral poset with $n - 1$ layers based on the input colors.
`UpDownPoset()`	Return the up-down poset on n elements.
`YoungDiagramPoset()`	Return the poset of cells in the Young diagram of a partition.
`YoungsLattice()`	Return Young's Lattice up to rank n.
`YoungsLatticePrincipalOrderIdeal()`	Return the principal order ideal of the partition lam in Young's Lattice.
`YoungFibonacci()`	Return the Young-Fibonacci lattice up to rank n.

Other available posets:

`face_lattice()`	Return the face lattice of a polyhedron.
`face_lattice()`	Return the face lattice of a combinatorial polyhedron.

Constructions

class sage.combinat.posets.poset_examples.**Posets**

Bases: `object`

A collection of posets and lattices.

EXAMPLES:

```
sage: posets.BooleanLattice(3)
Finite lattice containing 8 elements
sage: posets.ChainPoset(3)
Finite lattice containing 3 elements
sage: posets.RandomPoset(17,.15)
Finite poset containing 17 elements
```

```
>>> from sage.all import *
>>> posets.BooleanLattice(Integer(3))
```

(continues on next page)

(continued from previous page)

```
Finite lattice containing 8 elements
>>> posets.ChainPoset(Integer(3))
Finite lattice containing 3 elements
>>> posets.RandomPoset(Integer(17),RealNumber('.15'))
Finite poset containing 17 elements
```

The category of all posets:

```
sage: Posets()
Category of posets
```

```
>>> from sage.all import *
>>> Posets()
Category of posets
```

The enumerated set of all posets on 3 elements, up to an isomorphism:

```
sage: Posets(3)
Posets containing 3 elements
```

```
>>> from sage.all import *
>>> Posets(Integer(3))
Posets containing 3 elements
```

See also:

`Posets`, `FinitePosets`, *`Poset()`*

static AntichainPoset(*n*, *facade=None*)

Return an antichain (a poset with no comparable elements) containing n elements.

INPUT:

- `n` – integer; number of elements
- `facade` – boolean; whether to make the returned poset a facade poset (see `sage.categories.facade_sets`); the default behaviour is the same as the default behaviour of the *`Poset()`* constructor

EXAMPLES:

```
sage: A = posets.AntichainPoset(6); A
Finite poset containing 6 elements
```

```
>>> from sage.all import *
>>> A = posets.AntichainPoset(Integer(6)); A
Finite poset containing 6 elements
```

static BooleanLattice(*n*, *facade=None*, *use_subsets=False*)

Return the Boolean lattice containing 2^n elements.

- `n` – integer; number of elements will be 2^n
- `facade` – boolean; whether to make the returned poset a facade poset (see `sage.categories.facade_sets`); the default behaviour is the same as the default behaviour of the *`Poset()`* constructor

- `use_subsets` – boolean (default: `False`); if `True`, then label the elements by subsets of $\{1, 2, \ldots, n\}$; otherwise label the elements by $0, 1, 2, \ldots, 2^n - 1$

EXAMPLES:

```
sage: posets.BooleanLattice(5)
Finite lattice containing 32 elements

sage: sorted(posets.BooleanLattice(2))
[0, 1, 2, 3]
sage: sorted(posets.BooleanLattice(2, use_subsets=True), key=list)
[{}, {1}, {1, 2}, {2}]
```

```
>>> from sage.all import *
>>> posets.BooleanLattice(Integer(5))
Finite lattice containing 32 elements

>>> sorted(posets.BooleanLattice(Integer(2)))
[0, 1, 2, 3]
>>> sorted(posets.BooleanLattice(Integer(2), use_subsets=True), key=list)
[{}, {1}, {1, 2}, {2}]
```

static ChainPoset(*n*, *facade=None*)

Return a chain (a totally ordered poset) containing n elements.

- `n` – integer; number of elements
- `facade` – boolean; whether to make the returned poset a facade poset (see `sage.categories.facade_sets`); the default behaviour is the same as the default behaviour of the `Poset()` constructor

EXAMPLES:

```
sage: C = posets.ChainPoset(6); C
Finite lattice containing 6 elements
sage: C.linear_extension()
[0, 1, 2, 3, 4, 5]
```

```
>>> from sage.all import *
>>> C = posets.ChainPoset(Integer(6)); C
Finite lattice containing 6 elements
>>> C.linear_extension()
[0, 1, 2, 3, 4, 5]
```

static CoxeterGroupAbsoluteOrderPoset(*W*, *use_reduced_words=True*)

Return the poset of elements of a Coxeter group with respect to absolute order.

INPUT:

- `W` – a Coxeter group
- `use_reduced_words` – boolean (default: `True`); if `True`, then the elements are labeled by their lexicographically minimal reduced word

EXAMPLES:

```
sage: W = CoxeterGroup(['B', 3])                                        #␣
↪needs sage.groups
```

(continues on next page)

(continued from previous page)

```
sage: posets.CoxeterGroupAbsoluteOrderPoset(W)                              #␣
↪needs sage.groups
Finite poset containing 48 elements

sage: W = WeylGroup(['B', 2], prefix='s')                                   #␣
↪needs sage.groups
sage: posets.CoxeterGroupAbsoluteOrderPoset(W, False)                       #␣
↪needs sage.groups
Finite poset containing 8 elements
```

```
>>> from sage.all import *
>>> W = CoxeterGroup(['B', Integer(3)])                                     ␣
↪       # needs sage.groups
>>> posets.CoxeterGroupAbsoluteOrderPoset(W)                              #␣
↪needs sage.groups
Finite poset containing 48 elements

>>> W = WeylGroup(['B', Integer(2)], prefix='s')                            ␣
↪       # needs sage.groups
>>> posets.CoxeterGroupAbsoluteOrderPoset(W, False)                       #␣
↪needs sage.groups
Finite poset containing 8 elements
```

static Crown(*n*, *facade=None*)

Return the crown poset of $2n$ elements.

In this poset every element i for $0 \leq i \leq n-1$ is covered by elements $i+n$ and $i+n+1$, except that $n-1$ is covered by n and $n+1$.

INPUT:

- `n` – number of elements, an integer at least 2
- `facade` – boolean; whether to make the returned poset a facade poset (see `sage.categories.facade_sets`); the default behaviour is the same as the default behaviour of the `Poset()` constructor

EXAMPLES:

```
sage: posets.Crown(3)
Finite poset containing 6 elements
```

```
>>> from sage.all import *
>>> posets.Crown(Integer(3))
Finite poset containing 6 elements
```

static DexterSemilattice(*n*)

Return the n-th Dexter meet-semilattice.

INPUT:

- `n` – nonnegative integer (the index)

OUTPUT: a finite meet-semilattice

The elements of the semilattice are `Dyck paths` in the $(n+1 \times n)$-rectangle.

EXAMPLES:

```
sage: posets.DexterSemilattice(3)
Finite meet-semilattice containing 5 elements

sage: P = posets.DexterSemilattice(4); P
Finite meet-semilattice containing 14 elements
sage: len(P.maximal_chains())
15
sage: len(P.maximal_elements())
4
sage: P.chain_polynomial()
q^5 + 19*q^4 + 47*q^3 + 42*q^2 + 14*q + 1
```

```
>>> from sage.all import *
>>> posets.DexterSemilattice(Integer(3))
Finite meet-semilattice containing 5 elements

>>> P = posets.DexterSemilattice(Integer(4)); P
Finite meet-semilattice containing 14 elements
>>> len(P.maximal_chains())
15
>>> len(P.maximal_elements())
4
>>> P.chain_polynomial()
q^5 + 19*q^4 + 47*q^3 + 42*q^2 + 14*q + 1
```

REFERENCES:

- [Cha18]

static DiamondPoset(*n*, *facade=None*)

Return the lattice of rank two containing `n` elements.

INPUT:

- `n` – number of elements, an integer at least 3
- `facade` – boolean; whether to make the returned poset a facade poset (see `sage.categories.facade_sets`); the default behaviour is the same as the default behaviour of the `Poset()` constructor

EXAMPLES:

```
sage: posets.DiamondPoset(7)
Finite lattice containing 7 elements
```

```
>>> from sage.all import *
>>> posets.DiamondPoset(Integer(7))
Finite lattice containing 7 elements
```

static DivisorLattice(*n*, *facade=None*)

Return the divisor lattice of an integer.

Elements of the lattice are divisors of n and $x < y$ in the lattice if x divides y.

INPUT:

- `n` – integer

- facade – boolean; whether to make the returned poset a facade poset (see sage.categories.facade_sets); the default behaviour is the same as the default behaviour of the Poset() constructor

EXAMPLES:

```
sage: P = posets.DivisorLattice(12)
sage: sorted(P.cover_relations())
[[1, 2], [1, 3], [2, 4], [2, 6], [3, 6], [4, 12], [6, 12]]

sage: P = posets.DivisorLattice(10, facade=False)
sage: P(2) < P(5)
False
```

```
>>> from sage.all import *
>>> P = posets.DivisorLattice(Integer(12))
>>> sorted(P.cover_relations())
[[1, 2], [1, 3], [2, 4], [2, 6], [3, 6], [4, 12], [6, 12]]

>>> P = posets.DivisorLattice(Integer(10), facade=False)
>>> P(Integer(2)) < P(Integer(5))
False
```

static DoubleTailedDiamond(*n*)

Return a double-tailed diamond of $2n + 2$ elements.

INPUT:

- n – positive integer

EXAMPLES:

```
sage: P = posets.DoubleTailedDiamond(2); P
Finite d-complete poset containing 6 elements
sage: P.cover_relations()
[[1, 2], [2, 3], [2, 4], [3, 5], [4, 5], [5, 6]]
```

```
>>> from sage.all import *
>>> P = posets.DoubleTailedDiamond(Integer(2)); P
Finite d-complete poset containing 6 elements
>>> P.cover_relations()
[[1, 2], [2, 3], [2, 4], [3, 5], [4, 5], [5, 6]]
```

static IntegerCompositions(*n*)

Return the poset of integer compositions of the integer n.

A composition of a positive integer n is a list of positive integers that sum to n. The order is reverse refinement: $[p_1, p_2, ..., p_l] < [q_1, q_2, ..., q_m]$ if q consists of an integer composition of p_1, followed by an integer composition of p_2, and so on.

EXAMPLES:

```
sage: P = posets.IntegerCompositions(7); P
Finite poset containing 64 elements
sage: len(P.cover_relations())
192
```

```
>>> from sage.all import *
>>> P = posets.IntegerCompositions(Integer(7)); P
Finite poset containing 64 elements
>>> len(P.cover_relations())
192
```

static IntegerPartitions(*n*)

Return the poset of integer partitions on the integer `n`.

A partition of a positive integer n is a non-increasing list of positive integers that sum to n. If p and q are integer partitions of n, then p covers q if and only if q is obtained from p by joining two parts of p (and sorting, if necessary).

EXAMPLES:

```
sage: P = posets.IntegerPartitions(7); P
Finite poset containing 15 elements
sage: len(P.cover_relations())
28
```

```
>>> from sage.all import *
>>> P = posets.IntegerPartitions(Integer(7)); P
Finite poset containing 15 elements
>>> len(P.cover_relations())
28
```

static IntegerPartitionsDominanceOrder(*n*)

Return the lattice of integer partitions on the integer n ordered by dominance.

That is, if $p = (p_1, \ldots, p_i)$ and $q = (q_1, \ldots, q_j)$ are integer partitions of n, then p is greater than q if and only if $p_1 + \cdots + p_k > q_1 + \cdots + q_k$ for all k.

INPUT:

- `n` – positive integer

EXAMPLES:

```
sage: P = posets.IntegerPartitionsDominanceOrder(6); P
Finite lattice containing 11 elements
sage: P.cover_relations()
[[[1, 1, 1, 1, 1, 1], [2, 1, 1, 1, 1]],
 [[2, 1, 1, 1, 1], [2, 2, 1, 1]],
 [[2, 2, 1, 1], [2, 2, 2]],
 [[2, 2, 1, 1], [3, 1, 1, 1]],
 [[2, 2, 2], [3, 2, 1]],
 [[3, 1, 1, 1], [3, 2, 1]],
 [[3, 2, 1], [3, 3]],
 [[3, 2, 1], [4, 1, 1]],
 [[3, 3], [4, 2]],
 [[4, 1, 1], [4, 2]],
 [[4, 2], [5, 1]],
 [[5, 1], [6]]]
```

```
>>> from sage.all import *
>>> P = posets.IntegerPartitionsDominanceOrder(Integer(6)); P
Finite lattice containing 11 elements
>>> P.cover_relations()
[[[1, 1, 1, 1, 1, 1], [2, 1, 1, 1, 1]],
 [[2, 1, 1, 1, 1], [2, 2, 1, 1]],
 [[2, 2, 1, 1], [2, 2, 2]],
 [[2, 2, 1, 1], [3, 1, 1, 1]],
 [[2, 2, 2], [3, 2, 1]],
 [[3, 1, 1, 1], [3, 2, 1]],
 [[3, 2, 1], [3, 3]],
 [[3, 2, 1], [4, 1, 1]],
 [[3, 3], [4, 2]],
 [[4, 1, 1], [4, 2]],
 [[4, 2], [5, 1]],
 [[5, 1], [6]]]
```

static MobilePoset(*ribbon*, *hangers*, *anchor=None*)

Return a mobile poset with the ribbon `ribbon` and with hanging d-complete posets specified in `hangers` and a d-complete poset attached above, specified in `anchor`.

INPUT:

- `ribbon` – a finite poset that is a ribbon
- `hangers` – dictionary mapping an element on the ribbon to a list of d-complete posets that it covers
- `anchor` – (optional) a `tuple` (`ribbon_elmt`, `anchor_elmt`, `anchor_poset`), where `anchor_elmt` covers `ribbon_elmt`, and `anchor_elmt` is an acyclic element of `anchor_poset`

EXAMPLES:

```
sage: R = Posets.RibbonPoset(5, [1,2])
sage: H = Poset([[5, 6, 7], [(5, 6), (6,7)]])
sage: M = Posets.MobilePoset(R, {3: [H]})
sage: len(M.cover_relations())
7

sage: P = posets.MobilePoset(posets.RibbonPoset(7, [1,3]),
....:         {1: [posets.YoungDiagramPoset([3, 2], dual=True)],
....:          3: [posets.DoubleTailedDiamond(6)]},
....:         anchor=(4, 2, posets.ChainPoset(6)))
sage: len(P.cover_relations())
33
```

```
>>> from sage.all import *
>>> R = Posets.RibbonPoset(Integer(5), [Integer(1),Integer(2)])
>>> H = Poset([[Integer(5), Integer(6), Integer(7)], [(Integer(5),
↪Integer(6)), (Integer(6),Integer(7))]])
>>> M = Posets.MobilePoset(R, {Integer(3): [H]})
>>> len(M.cover_relations())
7

>>> P = posets.MobilePoset(posets.RibbonPoset(Integer(7), [Integer(1),
↪Integer(3)]),
```

(continues on next page)

(continued from previous page)

```
...         {Integer(1): [posets.YoungDiagramPoset([Integer(3), Integer(2)],␣
↪dual=True)],
...          Integer(3): [posets.DoubleTailedDiamond(Integer(6))]},
...         anchor=(Integer(4), Integer(2), posets.ChainPoset(Integer(6))))
>>> len(P.cover_relations())
33
```

static NoncrossingPartitions(*W*)

Return the lattice of noncrossing partitions.

INPUT:

- `W` – a finite Coxeter group or a Weyl group

EXAMPLES:

```
sage: W = CoxeterGroup(['A', 3])                                        #␣
↪needs sage.groups
sage: posets.NoncrossingPartitions(W)                                   #␣
↪needs sage.groups
Finite lattice containing 14 elements

sage: W = WeylGroup(['B', 2], prefix='s')                               #␣
↪needs sage.groups
sage: posets.NoncrossingPartitions(W)                                   #␣
↪needs sage.groups
Finite lattice containing 6 elements
```

```
>>> from sage.all import *
>>> W = CoxeterGroup(['A', Integer(3)])                                  ␣
↪     # needs sage.groups
>>> posets.NoncrossingPartitions(W)                                   #␣
↪needs sage.groups
Finite lattice containing 14 elements

>>> W = WeylGroup(['B', Integer(2)], prefix='s')                         ␣
↪     # needs sage.groups
>>> posets.NoncrossingPartitions(W)                                   #␣
↪needs sage.groups
Finite lattice containing 6 elements
```

static PentagonPoset(*facade=None*)

Return the Pentagon poset.

INPUT:

- `facade` – boolean; whether to make the returned poset a facade poset (see `sage.categories.facade_sets`); the default behaviour is the same as the default behaviour of the *Poset()* constructor

EXAMPLES:

```
sage: P = posets.PentagonPoset(); P
Finite lattice containing 5 elements
sage: P.cover_relations()
[[0, 1], [0, 2], [1, 4], [2, 3], [3, 4]]
```

```
>>> from sage.all import *
>>> P = posets.PentagonPoset(); P
Finite lattice containing 5 elements
>>> P.cover_relations()
[[0, 1], [0, 2], [1, 4], [2, 3], [3, 4]]
```

static PermutationPattern(*n*)

Return the poset of permutations under pattern containment up to rank n.

INPUT:

- n – positive integer

A permutation $u = u_1 \cdots u_n$ contains the pattern $v = v_1 \cdots v_m$ if there is a (not necessarily consecutive) subsequence of u of length m whose entries have the same relative order as v.

See Wikipedia article Permutation_pattern.

EXAMPLES:

```
sage: P4 = posets.PermutationPattern(4); P4
Finite poset containing 33 elements
sage: sorted(P4.lower_covers(Permutation([2,4,1,3])))
[[1, 3, 2], [2, 1, 3], [2, 3, 1], [3, 1, 2]]
```

```
>>> from sage.all import *
>>> P4 = posets.PermutationPattern(Integer(4)); P4
Finite poset containing 33 elements
>>> sorted(P4.lower_covers(Permutation([Integer(2),Integer(4),Integer(1),
↪Integer(3)])))
[[1, 3, 2], [2, 1, 3], [2, 3, 1], [3, 1, 2]]
```

See also

has_pattern()

static PermutationPatternInterval(*bottom*, *top*)

Return the poset consisting of an interval in the poset of permutations under pattern containment between bottom and top.

INPUT:

- bottom, top – permutations where top contains bottom as a pattern

A permutation $u = u_1 \cdots u_n$ contains the pattern $v = v_1 \cdots v_m$ if there is a (not necessarily consecutive) subsequence of u of length m whose entries have the same relative order as v.

See Wikipedia article Permutation_pattern.

EXAMPLES:

```
sage: t = Permutation([2,3,1])
sage: b = Permutation([4,6,2,3,5,1])
sage: R = posets.PermutationPatternInterval(t, b); R
Finite poset containing 14 elements
```

(continues on next page)

(continued from previous page)

```
sage: R.moebius_function(R.bottom(),R.top())
-4
```

```
>>> from sage.all import *
>>> t = Permutation([Integer(2),Integer(3),Integer(1)])
>>> b = Permutation([Integer(4),Integer(6),Integer(2),Integer(3),Integer(5),
↪Integer(1)])
>>> R = posets.PermutationPatternInterval(t, b); R
Finite poset containing 14 elements
>>> R.moebius_function(R.bottom(),R.top())
-4
```

See also

has_pattern(), *PermutationPattern()*

static PermutationPatternOccurrenceInterval(*bottom*, *top*, *pos*)

Return the poset consisting of an interval in the poset of permutations under pattern containment between `bottom` and `top`, where a specified instance of `bottom` in `top` must be maintained.

INPUT:

- **`bottom`, `top` – permutations where `top` contains**
  `bottom` as a pattern
- **`pos` – list of indices indicating a distinguished copy of**
  `bottom` inside `top` (indexed starting at 0)

For further information (and picture illustrating included example), see [ST2010] .

See Wikipedia article Permutation_pattern.

EXAMPLES:

```
sage: t = Permutation([3,2,1])
sage: b = Permutation([6,3,4,5,2,1])
sage: A = posets.PermutationPatternOccurrenceInterval(t, b, (0,2,4)); A
Finite poset containing 8 elements
```

```
>>> from sage.all import *
>>> t = Permutation([Integer(3),Integer(2),Integer(1)])
>>> b = Permutation([Integer(6),Integer(3),Integer(4),Integer(5),Integer(2),
↪Integer(1)])
>>> A = posets.PermutationPatternOccurrenceInterval(t, b, (Integer(0),
↪Integer(2),Integer(4))); A
Finite poset containing 8 elements
```

See also

has_pattern(), *PermutationPattern()*, *PermutationPatternInterval()*

static PowerPoset(*n*)

Return the power poset on n element posets.

Elements of the power poset are all posets on the set $\{0, 1, \ldots, n-1\}$ ordered by extension. That is, the antichain of n elements is the bottom and $P_a \leq P_b$ in the power poset if P_b is an extension of P_a.

These were studied in [Bru1994].

EXAMPLES:

```
sage: P3 = posets.PowerPoset(3); P3
Finite meet-semilattice containing 19 elements
sage: all(P.is_chain() for P in P3.maximal_elements())
True
```

```
>>> from sage.all import *
>>> P3 = posets.PowerPoset(Integer(3)); P3
Finite meet-semilattice containing 19 elements
>>> all(P.is_chain() for P in P3.maximal_elements())
True
```

static ProductOfChains(*chain_lengths*, *facade=None*)

Return a product of chains.

- `chain_lengths` – list of nonnegative integers; number of elements in each chain
- `facade` – boolean; whether to make the returned poset a facade poset (see `sage.categories.facade_sets`); the default behaviour is the same as the default behaviour of the `Poset()` constructor

EXAMPLES:

```
sage: P = posets.ProductOfChains([2, 2]); P
Finite lattice containing 4 elements
sage: P.linear_extension()
[(0, 0), (0, 1), (1, 0), (1, 1)]
sage: P.upper_covers((0,0))
[(0, 1), (1, 0)]
sage: P.lower_covers((1,1))
[(0, 1), (1, 0)]
```

```
>>> from sage.all import *
>>> P = posets.ProductOfChains([Integer(2), Integer(2)]); P
Finite lattice containing 4 elements
>>> P.linear_extension()
[(0, 0), (0, 1), (1, 0), (1, 1)]
>>> P.upper_covers((Integer(0),Integer(0)))
[(0, 1), (1, 0)]
>>> P.lower_covers((Integer(1),Integer(1)))
[(0, 1), (1, 0)]
```

static RandomLattice(*n*, *p*, *properties=None*)

Return a random lattice on `n` elements.

INPUT:

- `n` – number of elements, a nonnegative integer
- `p` – a probability, a positive real number less than one

- `properties` – list of properties for the lattice. Currently implemented:
  - `None`, no restrictions for lattices to create
  - `'planar'`, the lattice has an upward planar drawing
  - `'dismantlable'` (implicated by `'planar'`)
  - `'distributive'` (implicated by `'stone'`)
  - `'stone'`

OUTPUT:

A lattice on n elements. When `properties` is `None`, the probability p roughly measures number of covering relations of the lattice. To create interesting examples, make the probability a little below one, for example 0.9.

Currently parameter `p` has no effect only when `properties` is not `None`.

Note

Results are reproducible in same Sage version only. Underlying algorithm may change in future versions.

EXAMPLES:

```
sage: set_random_seed(0)  # Results are reproducible
sage: L = posets.RandomLattice(8, 0.995); L
Finite lattice containing 8 elements
sage: L.cover_relations()
[[7, 6], [7, 3], [7, 1], ..., [5, 4], [2, 4], [1, 4], [0, 4]]
sage: L = posets.RandomLattice(10, 0, properties=['dismantlable'])
sage: L.is_dismantlable()
True
```

```
>>> from sage.all import *
>>> set_random_seed(Integer(0))  # Results are reproducible
>>> L = posets.RandomLattice(Integer(8), RealNumber('0.995')); L
Finite lattice containing 8 elements
>>> L.cover_relations()
[[7, 6], [7, 3], [7, 1], ..., [5, 4], [2, 4], [1, 4], [0, 4]]
>>> L = posets.RandomLattice(Integer(10), Integer(0), properties=[
↪'dismantlable'])
>>> L.is_dismantlable()
True
```

See also

RandomPoset()

static RandomPoset(*n*, *p*)

Generate a random poset on `n` elements according to a probability `p`.

INPUT:

- `n` – number of elements, a nonnegative integer

- p – a probability, a real number between 0 and 1 (inclusive)

OUTPUT:

A poset on n elements. The probability p roughly measures width/height of the output: $p = 0$ always generates an antichain, $p = 1$ will return a chain. To create interesting examples, keep the probability small, perhaps on the order of $1/n$.

EXAMPLES:

```
sage: set_random_seed(0)  # Results are reproducible
sage: P = posets.RandomPoset(5, 0.3)
sage: P.cover_relations()
[[5, 4], [4, 2], [1, 2]]
```

```
>>> from sage.all import *
>>> set_random_seed(Integer(0))  # Results are reproducible
>>> P = posets.RandomPoset(Integer(5), RealNumber('0.3'))
>>> P.cover_relations()
[[5, 4], [4, 2], [1, 2]]
```

See also

RandomLattice()

static RestrictedIntegerPartitions(*n*)

Return the poset of integer partitions on the integer n ordered by restricted refinement.

That is, if p and q are integer partitions of n, then p covers q if and only if q is obtained from p by joining two distinct parts of p (and sorting, if necessary).

EXAMPLES:

```
sage: P = posets.RestrictedIntegerPartitions(7); P
Finite poset containing 15 elements
sage: len(P.cover_relations())
17
```

```
>>> from sage.all import *
>>> P = posets.RestrictedIntegerPartitions(Integer(7)); P
Finite poset containing 15 elements
>>> len(P.cover_relations())
17
```

static RibbonPoset(*n*, *descents*)

Return a ribbon poset on n vertices with descents at descents.

INPUT:

- n – the number of vertices
- descents – an iterable; the indices on the ribbon where $y > x$

EXAMPLES:

```
sage: R = Posets.RibbonPoset(5, [1,2])
sage: sorted(R.cover_relations())
[[0, 1], [2, 1], [3, 2], [3, 4]]
```

```
>>> from sage.all import *
>>> R = Posets.RibbonPoset(Integer(5), [Integer(1),Integer(2)])
>>> sorted(R.cover_relations())
[[0, 1], [2, 1], [3, 2], [3, 4]]
```

static SSTPoset(*s*, *f=None*)

The lattice poset on semistandard tableaux of shape `s` and largest entry `f` that is ordered by componentwise comparison of the entries.

INPUT:

- `s` – shape of the tableaux
- `f` – integer (default: `None`); the maximum fill number. By default (`None`), the method uses the number of cells in the shape.

Note

This is a basic implementation and most certainly not the most efficient.

EXAMPLES:

```
sage: posets.SSTPoset([2,1])
Finite lattice containing 8 elements

sage: posets.SSTPoset([2,1],4)
Finite lattice containing 20 elements

sage: posets.SSTPoset([2,1],2).cover_relations()
[[[[1, 1], [2]], [[1, 2], [2]]]]

sage: posets.SSTPoset([3,2]).bottom()        # long time (6s on sage.math,␣
↪2012)
[[1, 1, 1], [2, 2]]

sage: posets.SSTPoset([3,2],4).maximal_elements()
[[[3, 3, 4], [4, 4]]]
```

```
>>> from sage.all import *
>>> posets.SSTPoset([Integer(2),Integer(1)])
Finite lattice containing 8 elements

>>> posets.SSTPoset([Integer(2),Integer(1)],Integer(4))
Finite lattice containing 20 elements

>>> posets.SSTPoset([Integer(2),Integer(1)],Integer(2)).cover_relations()
[[[[1, 1], [2]], [[1, 2], [2]]]]

>>> posets.SSTPoset([Integer(3),Integer(2)]).bottom()        # long time (6s␣
```

(continues on next page)

(continued from previous page)

```
↪on sage.math, 2012)
[[1, 1, 1], [2, 2]]

>>> posets.SSTPoset([Integer(3),Integer(2)],Integer(4)).maximal_elements()
[[[3, 3, 4], [4, 4]]]
```

static SetPartitions(*n*)

Return the lattice of set partitions of the set $\{1, \ldots, n\}$ ordered by refinement.

INPUT:

- n – positive integer

EXAMPLES:

```
sage: posets.SetPartitions(4)
Finite lattice containing 15 elements
```

```
>>> from sage.all import *
>>> posets.SetPartitions(Integer(4))
Finite lattice containing 15 elements
```

static ShardPoset(*n*)

Return the shard intersection order on permutations of size n.

This is defined on the set of permutations. To every permutation, one can attach a pre-order, using the descending runs and their relative positions.

The shard intersection order is given by the implication (or refinement) order on the set of pre-orders defined from all permutations.

This can also be seen in a geometrical way. Every pre-order defines a cone in a vector space of dimension n. The shard poset is given by the inclusion of these cones.

See also:

shard_preorder_graph()

EXAMPLES:

```
sage: P = posets.ShardPoset(4); P  # indirect doctest
Finite poset containing 24 elements
sage: P.chain_polynomial()
34*q^4 + 90*q^3 + 79*q^2 + 24*q + 1
sage: P.characteristic_polynomial()
q^3 - 11*q^2 + 23*q - 13
sage: P.zeta_polynomial()
17/3*q^3 - 6*q^2 + 4/3*q
sage: P.is_self_dual()
False
```

```
>>> from sage.all import *
>>> P = posets.ShardPoset(Integer(4)); P  # indirect doctest
```

(continues on next page)

(continued from previous page)

```
Finite poset containing 24 elements
>>> P.chain_polynomial()
34*q^4 + 90*q^3 + 79*q^2 + 24*q + 1
>>> P.characteristic_polynomial()
q^3 - 11*q^2 + 23*q - 13
>>> P.zeta_polynomial()
17/3*q^3 - 6*q^2 + 4/3*q
>>> P.is_self_dual()
False
```

static StandardExample(*n*, *facade=None*)

Return the partially ordered set on $2n$ elements with dimension n.

Let P be the poset on $\{0, 1, 2, \ldots, 2n-1\}$ whose defining relations are that $i < j$ for every $0 \leq i < n \leq j < 2n$ except when $i + n = j$. The poset P is the so-called *standard example* of a poset with dimension n.

INPUT:

- `n` – integer ≥ 2; dimension of the constructed poset
- `facade` – boolean; whether to make the returned poset a facade poset (see `sage.categories.facade_sets`); the default behaviour is the same as the default behaviour of the `Poset()` constructor

OUTPUT: the standard example of a poset of dimension n

EXAMPLES:

```
sage: A = posets.StandardExample(3); A
Finite poset containing 6 elements
sage: A.dimension()                                                    #␣
↪needs networkx
3
```

```
>>> from sage.all import *
>>> A = posets.StandardExample(Integer(3)); A
Finite poset containing 6 elements
>>> A.dimension()                                                    #␣
↪needs networkx
3
```

REFERENCES:

- [Gar2015]
- [Ros1999]

static SymmetricGroupAbsoluteOrderPoset(*n*, *labels='permutations'*)

Return the poset of permutations with respect to absolute order.

INPUT:

- `n` – a positive integer
- `label` – (default: `'permutations'`) a label for the elements of the poset returned by the function; the options are
  - `'permutations'` – labels the elements by their one-line notation
  - `'reduced_words'` – labels the elements by the lexicographically minimal reduced word

– 'cycles' – labels the elements by their expression as a product of cycles

EXAMPLES:

```
sage: posets.SymmetricGroupAbsoluteOrderPoset(4)                              #␣
↪needs sage.groups
Finite poset containing 24 elements
sage: posets.SymmetricGroupAbsoluteOrderPoset(3, labels='cycles')             #␣
↪needs sage.groups
Finite poset containing 6 elements
sage: posets.SymmetricGroupAbsoluteOrderPoset(3, labels='reduced_words')      #␣
↪needs sage.groups
Finite poset containing 6 elements
```

```
>>> from sage.all import *
>>> posets.SymmetricGroupAbsoluteOrderPoset(Integer(4))                        ␣
↪     # needs sage.groups
Finite poset containing 24 elements
>>> posets.SymmetricGroupAbsoluteOrderPoset(Integer(3), labels='cycles')       ␣
↪     # needs sage.groups
Finite poset containing 6 elements
>>> posets.SymmetricGroupAbsoluteOrderPoset(Integer(3), labels='reduced_words
↪')     # needs sage.groups
Finite poset containing 6 elements
```

static SymmetricGroupBruhatIntervalPoset(*start*, *end*)

The poset of permutations with respect to Bruhat order.

INPUT:

- start – list permutation
- end – list permutation (same n, of course)

Note

Must have start <= end.

EXAMPLES:

Any interval is rank symmetric if and only if it avoids these permutations:

```
sage: P1 = posets.SymmetricGroupBruhatIntervalPoset([1,2,3,4], [3,4,1,2])
sage: P2 = posets.SymmetricGroupBruhatIntervalPoset([1,2,3,4], [4,2,3,1])
sage: ranks1 = [P1.rank(v) for v in P1]
sage: ranks2 = [P2.rank(v) for v in P2]
sage: [ranks1.count(i) for i in sorted(set(ranks1))]
[1, 3, 5, 4, 1]
sage: [ranks2.count(i) for i in sorted(set(ranks2))]
[1, 3, 5, 6, 4, 1]
```

```
>>> from sage.all import *
>>> P1 = posets.SymmetricGroupBruhatIntervalPoset([Integer(1),Integer(2),
↪Integer(3),Integer(4)], [Integer(3),Integer(4),Integer(1),Integer(2)])
```

(continues on next page)

(continued from previous page)

```
>>> P2 = posets.SymmetricGroupBruhatIntervalPoset([Integer(1),Integer(2),
↪Integer(3),Integer(4)], [Integer(4),Integer(2),Integer(3),Integer(1)])
>>> ranks1 = [P1.rank(v) for v in P1]
>>> ranks2 = [P2.rank(v) for v in P2]
>>> [ranks1.count(i) for i in sorted(set(ranks1))]
[1, 3, 5, 4, 1]
>>> [ranks2.count(i) for i in sorted(set(ranks2))]
[1, 3, 5, 6, 4, 1]
```

static SymmetricGroupBruhatOrderPoset(*n*)

The poset of permutations with respect to Bruhat order.

EXAMPLES:

```
sage: posets.SymmetricGroupBruhatOrderPoset(4)
Finite poset containing 24 elements
```

```
>>> from sage.all import *
>>> posets.SymmetricGroupBruhatOrderPoset(Integer(4))
Finite poset containing 24 elements
```

static SymmetricGroupWeakOrderPoset(*n*, *labels='permutations'*, *side='right'*)

The poset of permutations of $\{1, 2, \ldots, n\}$ with respect to the weak order (also known as the permutohedron order, cf. `permutohedron_lequal()`).

The optional variable `labels` (default: `'permutations'`) determines the labelling of the elements if $n < 10$. The optional variable `side` (default: `'right'`) determines whether the right or the left permutohedron order is to be used.

EXAMPLES:

```
sage: posets.SymmetricGroupWeakOrderPoset(4)
Finite poset containing 24 elements
```

```
>>> from sage.all import *
>>> posets.SymmetricGroupWeakOrderPoset(Integer(4))
Finite poset containing 24 elements
```

static TamariLattice(*n*, *m=1*)

Return the n-th Tamari lattice.

Using the slope parameter m, one can also get the m-Tamari lattices.

INPUT:

- `n` – nonnegative integer (the index)
- `m` – nonnegative integer (the slope, default: 1)

OUTPUT: a finite lattice

In the usual case, the elements of the lattice are `Dyck paths` in the $(n + 1 \times n)$-rectangle. For a general slope m, the elements are Dyck paths in the $(mn + 1 \times n)$-rectangle.

See Tamari lattice for mathematical background.

EXAMPLES:

```
sage: posets.TamariLattice(3)
Finite lattice containing 5 elements

sage: posets.TamariLattice(3, 2)
Finite lattice containing 12 elements
```

```
>>> from sage.all import *
>>> posets.TamariLattice(Integer(3))
Finite lattice containing 5 elements

>>> posets.TamariLattice(Integer(3), Integer(2))
Finite lattice containing 12 elements
```

REFERENCES:

- [BMFPR2011]

static TetrahedralPoset(*n*, **colors*, ***labels*)

Return the tetrahedral poset based on the input colors.

This method will return the tetrahedral poset with $n - 1$ layers and covering relations based on the input colors of 'green', 'red', 'orange', 'silver', 'yellow' and 'blue' as defined in [Striker2011]. For particular color choices, the order ideals of the resulting tetrahedral poset will be isomorphic to known combinatorial objects.

For example, for the colors 'blue', 'yellow', 'orange', and 'green', the order ideals will be in bijection with alternating sign matrices. For the colors 'yellow', 'orange', and 'green', the order ideals will be in bijection with semistandard Young tableaux of staircase shape. For the colors 'red', 'orange', 'green', and optionally 'yellow', the order ideals will be in bijection with totally symmetric self-complementary plane partitions in a $2n \times 2n \times 2n$ box.

INPUT:

- `n` – defines the number (n-1) of layers in the poset
- `colors` – the colors that define the covering relations of the poset; colors used are 'green', 'red', 'yellow', 'orange', 'silver', and 'blue'
- `labels` – keyword variable used to determine whether the poset is labeled with integers or tuples. To label with integers, the method should be called with `labels='integers'`. Otherwise, the labeling will default to tuples.

EXAMPLES:

```
sage: posets.TetrahedralPoset(4,'green','red','yellow','silver','blue','orange
↪')
Finite poset containing 10 elements

sage: posets.TetrahedralPoset(4,'green','red','yellow','silver','blue','orange
↪',
....:                          labels='integers')
Finite poset containing 10 elements

sage: A = AlternatingSignMatrices(3)
sage: p = A.lattice()
sage: ji = p.join_irreducibles_poset()
sage: tet = posets.TetrahedralPoset(3, 'green','yellow','blue','orange')
```

(continues on next page)

(continued from previous page)

```
sage: ji.is_isomorphic(tet)
True
```

```
>>> from sage.all import *
>>> posets.TetrahedralPoset(Integer(4),'green','red','yellow','silver','blue',
↪'orange')
Finite poset containing 10 elements

>>> posets.TetrahedralPoset(Integer(4),'green','red','yellow','silver','blue',
↪'orange',
...                             labels='integers')
Finite poset containing 10 elements

>>> A = AlternatingSignMatrices(Integer(3))
>>> p = A.lattice()
>>> ji = p.join_irreducibles_poset()
>>> tet = posets.TetrahedralPoset(Integer(3), 'green','yellow','blue','orange
↪')
>>> ji.is_isomorphic(tet)
True
```

static UpDownPoset (*n*, *m=1*)

Return the up-down poset on n elements where every $(m+1)$ step is down and the rest are up.

The case where $m = 1$ is sometimes referred to as the zig-zag poset or the fence.

INPUT:

- `n` – nonnegative integer; number of elements in the poset
- `m` – nonnegative integer (default: 1); how frequently down steps occur

OUTPUT:

The partially ordered set on $\{0, 1, \ldots, n-1\}$ where i covers $i+1$ if m divides $i+1$, and $i+1$ covers i otherwise.

EXAMPLES:

```
sage: P = posets.UpDownPoset(7, 2); P
Finite poset containing 7 elements
sage: sorted(P.cover_relations())
[[0, 1], [1, 2], [3, 2], [3, 4], [4, 5], [6, 5]]
```

```
>>> from sage.all import *
>>> P = posets.UpDownPoset(Integer(7), Integer(2)); P
Finite poset containing 7 elements
>>> sorted(P.cover_relations())
[[0, 1], [1, 2], [3, 2], [3, 4], [4, 5], [6, 5]]
```

Fibonacci numbers as the number of antichains of a poset:

```
sage: [len(posets.UpDownPoset(n).antichains().list()) for n in range(6)]
[1, 2, 3, 5, 8, 13]
```

```
>>> from sage.all import *
>>> [len(posets.UpDownPoset(n).antichains().list()) for n in␣
↪range(Integer(6))]
[1, 2, 3, 5, 8, 13]
```

static YoungDiagramPoset(*lam*, *dual=False*)

Return the poset of cells in the Young diagram of a partition.

INPUT:

- `lam` – a partition
- `dual` – boolean (default: `False`); determines the orientation of the poset. If `True`, then it is a join semilattice, otherwise it is a meet semilattice.

EXAMPLES:

```
sage: P = posets.YoungDiagramPoset(Partition([2, 2])); P
Finite meet-semilattice containing 4 elements

sage: sorted(P.cover_relations())
[[(0, 0), (0, 1)], [(0, 0), (1, 0)], [(0, 1), (1, 1)], [(1, 0), (1, 1)]]

sage: posets.YoungDiagramPoset([3, 2], dual=True)
Finite join-semilattice containing 5 elements
```

```
>>> from sage.all import *
>>> P = posets.YoungDiagramPoset(Partition([Integer(2), Integer(2)])); P
Finite meet-semilattice containing 4 elements

>>> sorted(P.cover_relations())
[[(0, 0), (0, 1)], [(0, 0), (1, 0)], [(0, 1), (1, 1)], [(1, 0), (1, 1)]]

>>> posets.YoungDiagramPoset([Integer(3), Integer(2)], dual=True)
Finite join-semilattice containing 5 elements
```

static YoungFibonacci(*n*)

Return the Young-Fibonacci lattice up to rank n.

Elements of the (infinite) lattice are words with letters '1' and '2'. The covers of a word are the words with another '1' added somewhere not after the first occurrence of an existing '1' and, additionally, the words where the first '1' is replaced by a '2'. The lattice is truncated to have rank n.

See Wikipedia article Young-Fibonacci lattice.

EXAMPLES:

```
sage: Y5 = posets.YoungFibonacci(5); Y5
Finite meet-semilattice containing 20 elements
sage: sorted(Y5.upper_covers(Word('211')))
[word: 1211, word: 2111, word: 221]
```

```
>>> from sage.all import *
>>> Y5 = posets.YoungFibonacci(Integer(5)); Y5
Finite meet-semilattice containing 20 elements
```

(continues on next page)

(continued from previous page)

```
>>> sorted(Y5.upper_covers(Word('211')))
