COMPREHENSIVE MODULE LIST

5.1 Comprehensive Module List

Note

This list is currently sorted in alphabetical order w.r.t. the module names. It can be updated semi-automatically by running in `src/sage/combinat`:

```
find -name "*.py*" | sed 's|\.pyx\?$||; s|\./|    sage/combinat/|' | LANG=en_US.UTF-
→8 LC_COLLATE=C sort > /tmp/module_list.rst
```

and copy pasting the result back there.

Todo

See Issue #17421 for desirable improvements.

5.1.1 Abstract Recursive Trees

The purpose of this class is to help implement trees with a specific structure on the children of each node. For instance, one could want to define a tree in which each node sees its children as linearly (see the *Ordered Trees* module) or cyclically ordered.

Tree structures

Conceptually, one can define a tree structure from any object that can contain others. Indeed, a list can contain lists which contain lists which contain lists, and thus define a tree … The same can be done with sets, or any kind of iterable objects.

While any iterable is sufficient to encode trees, it can prove useful to have other methods available like isomorphism tests (see next section), conversions to DiGraphs objects (see *as_digraph()*) or computation of the number of automorphisms constrained by the structure on children. Providing such methods is the whole purpose of the *AbstractTree* class.

As a result, the *AbstractTree* class is not meant to be instantiated, but extended. It is expected that classes extending this one may also inherit from classes representing iterables, for instance `ClonableArray` or `ClonableList`

Constrained Trees

The tree built from a specific container will reflect the properties of the container. Indeed, if `A` is an iterable class whose elements are linearly ordered, a class `B` extending both of *AbstractTree* and `A` will be such that the children of a node will be linearly ordered. If `A` behaves like a set (i.e. if there is no order on the elements it contains), then two trees will be considered as equal if one can be obtained from the other through permutations between the children of a same node (see next section).

Paths and ID

It is expected that each element of a set of children should be identified by its index in the container. This way, any node of the tree can be identified by a word describing a path from the root node.

Canonical labellings

Equality between instances of classes extending both `AbstractTree` and `A` is entirely defined by the equality defined on the elements of `A`. A canonical labelling of such a tree, however, should be such that two trees `a` and `b` satisfying `a == b` have the same canonical labellings. On the other hand, the canonical labellings of trees `a` and `b` satisfying `a != b` are expected to be different.

For this reason, the values returned by the `canonical_labelling` method heavily depend on the data structure used for a node's children and **should be overridden** by most of the classes extending `AbstractTree` if it is incoherent with the data structure.

Authors

- Florent Hivert (2010-2011): initial revision
- Frédéric Chapoton (2011): contributed some methods

class `sage.combinat.abstract_tree.`**`AbstractClonableTree`**

Bases: `AbstractTree`

Abstract Clonable Tree.

An abstract class for trees with clone protocol (see `list_clone`). It is expected that classes extending this one may also inherit from classes like `ClonableArray` or `ClonableList` depending whether one wants to build trees where adding a child is allowed.

> **Note**
>
> Due to the limitation of Cython inheritance, one cannot inherit here from `ClonableElement`, because it would prevent us from later inheriting from `ClonableArray` or `ClonableList`.

How should this class be extended ?

A class extending `AbstractClonableTree` should satisfy the following assumptions:

- An instantiable class extending `AbstractClonableTree` should also extend the `ClonableElement` class or one of its subclasses generally, at least `ClonableArray`.
- To respect the Clone protocol, the `AbstractClonableTree.check()` method should be overridden by the new class.

See also the assumptions in `AbstractTree`.

`check()`

Check that `self` is a correct tree.

This method does nothing. It is implemented here because many extensions of `AbstractClonableTree` also extend `sage.structure.list_clone.ClonableElement`, which requires it.

It should be overridden in subclasses in order to check that the characterizing property of the respective kind of tree holds (eg: two children for binary trees).

EXAMPLES:

```
sage: OrderedTree([[],[[]]]).check()
sage: BinaryTree([[],[[],[]]]).check()
```

```
>>> from sage.all import *
>>> OrderedTree([[],[[]]]).check()
>>> BinaryTree([[],[[],[]]]).check()
```

class sage.combinat.abstract_tree.**AbstractLabelledClonableTree**(*parent*, *children*, *label=None*, *check=True*)

Bases: *AbstractLabelledTree*, *AbstractClonableTree*

Abstract Labelled Clonable Tree.

This class takes care of modification for the label by the clone protocol.

Note

Due to the limitation of Cython inheritance, one cannot inherit here from `ClonableArray`, because it would prevent us to inherit later from `ClonableList`.

map_labels(*f*)

Apply the function f to the labels of `self`.

This method returns a copy of `self` on which the function f has been applied on all labels (a label x is replaced by $f(x)$).

EXAMPLES:

```
sage: LT = LabelledOrderedTree
sage: t = LT([LT([],label=1),LT([],label=7)],label=3); t
3[1[], 7[]]
sage: t.map_labels(lambda z:z+1)
4[2[], 8[]]

sage: LBT = LabelledBinaryTree
sage: bt = LBT([LBT([],label=1),LBT([],label=4)],label=2); bt
2[1[., .], 4[., .]]
sage: bt.map_labels(lambda z:z+1)
3[2[., .], 5[., .]]
```

```
>>> from sage.all import *
>>> LT = LabelledOrderedTree
>>> t = LT([LT([],label=Integer(1)),LT([],label=Integer(7))],
↪label=Integer(3)); t
3[1[], 7[]]
>>> t.map_labels(lambda z:z+Integer(1))
4[2[], 8[]]

>>> LBT = LabelledBinaryTree
>>> bt = LBT([LBT([],label=Integer(1)),LBT([],label=Integer(4))],
↪label=Integer(2)); bt
2[1[., .], 4[., .]]
```

(continues on next page)

(continued from previous page)

```
>>> bt.map_labels(lambda z:z+Integer(1))
3[2[., .], 5[., .]]
```

set_label(*path*, *label*)

Change the label of subtree indexed by `path` to `label`.

INPUT:

- `path` – `None` (default) or a path (list or tuple of children index in the tree)
- `label` – any sage object

OUTPUT: nothing, `self` is modified in place

Note

`self` must be in a mutable state. See `sage.structure.list_clone` for more details about mutability.

EXAMPLES:

```
sage: t = LabelledOrderedTree([[],[[],[]]])
sage: t.set_label((0,), 4)
Traceback (most recent call last):
...
ValueError: object is immutable; please change a copy instead.
sage: with t.clone() as t:
....:     t.set_label((0,), 4)
sage: t
None[4[], None[None[], None[]]]
sage: with t.clone() as t:
....:     t.set_label((1,0), label = 42)
sage: t
None[4[], None[42[], None[]]]
```

```
>>> from sage.all import *
>>> t = LabelledOrderedTree([[],[[],[]]])
>>> t.set_label((Integer(0),), Integer(4))
Traceback (most recent call last):
...
ValueError: object is immutable; please change a copy instead.
>>> with t.clone() as t:
...     t.set_label((Integer(0),), Integer(4))
>>> t
None[4[], None[None[], None[]]]
>>> with t.clone() as t:
...     t.set_label((Integer(1),Integer(0)), label = Integer(42))
>>> t
None[4[], None[42[], None[]]]
```

Todo

Do we want to implement the following syntactic sugar:

```
with t.clone() as tt:
    tt.labels[1,2] = 3 ?
```

set_root_label(*label*)

Set the label of the root of `self`.

INPUT:

- `label` – any Sage object

OUTPUT: none, `self` is modified in place

Note

`self` must be in a mutable state. See `sage.structure.list_clone` for more details about mutability.

EXAMPLES:

```
sage: t = LabelledOrderedTree([[],[[],[]]])
sage: t.set_root_label(3)
Traceback (most recent call last):
...
ValueError: object is immutable; please change a copy instead.
sage: with t.clone() as t:
....:     t.set_root_label(3)
sage: t.label()
3
sage: t
3[None[], None[None[], None[]]]
```

```
>>> from sage.all import *
>>> t = LabelledOrderedTree([[],[[],[]]])
>>> t.set_root_label(Integer(3))
Traceback (most recent call last):
...
ValueError: object is immutable; please change a copy instead.
>>> with t.clone() as t:
...     t.set_root_label(Integer(3))
>>> t.label()
3
>>> t
3[None[], None[None[], None[]]]
```

This also works for binary trees:

```
sage: bt = LabelledBinaryTree([[],[]])
sage: bt.set_root_label(3)
Traceback (most recent call last):
...
ValueError: object is immutable; please change a copy instead.
sage: with bt.clone() as bt:
....:     bt.set_root_label(3)
```

(continues on next page)

(continued from previous page)

```
sage: bt.label()
3
sage: bt
3[None[., .], None[., .]]
```

```
>>> from sage.all import *
>>> bt = LabelledBinaryTree([[],[]])
>>> bt.set_root_label(Integer(3))
Traceback (most recent call last):
...
ValueError: object is immutable; please change a copy instead.
>>> with bt.clone() as bt:
...     bt.set_root_label(Integer(3))
>>> bt.label()
3
>>> bt
3[None[., .], None[., .]]
```

class sage.combinat.abstract_tree.**AbstractLabelledTree**(*parent*, *children*, *label=None*, *check=True*)

Bases: *AbstractTree*

Abstract Labelled Tree.

Typically a class for labelled trees is constructed by inheriting from a class for unlabelled trees and *AbstractLabelledTree*.

How should this class be extended ?

A class extending *AbstractLabelledTree* should respect the following assumptions:

- For a labelled tree `T` the call `T.parent().unlabelled_trees()` should return a parent for unlabelled trees of the same kind: for example,
  - if `T` is a binary labelled tree, `T.parent()` is `LabelledBinaryTrees()` and `T.parent().unlabelled_trees()` is `BinaryTrees()`
  - if `T` is an ordered labelled tree, `T.parent()` is `LabelledOrderedTrees()` and `T.parent().unlabelled_trees()` is `OrderedTrees()`
- In the same vein, the class of `T` should contain an attribute `_UnLabelled` which should be the class for the corresponding unlabelled trees.

See also the assumptions in *AbstractTree*.

See also

AbstractTree

as_digraph()

Return a directed graph version of `self`.

Warning

At this time, the output makes sense only if `self` is a labelled binary tree with no repeated labels and no `None` labels.

EXAMPLES:

```
sage: LT = LabelledOrderedTrees()
sage: t1 = LT([LT([],label=6),LT([],label=1)],label=9)
sage: t1.as_digraph()
Digraph on 3 vertices

sage: t = BinaryTree([[None, None],[[],None]])
sage: lt = t.canonical_labelling()
sage: lt.as_digraph()
Digraph on 4 vertices
```

```
>>> from sage.all import *
>>> LT = LabelledOrderedTrees()
>>> t1 = LT([LT([],label=Integer(6)),LT([],label=Integer(1))],
↪label=Integer(9))
>>> t1.as_digraph()
Digraph on 3 vertices

>>> t = BinaryTree([[None, None],[[],None]])
>>> lt = t.canonical_labelling()
>>> lt.as_digraph()
Digraph on 4 vertices
```

label(*path=None*)

Return the label of `self`.

INPUT:

- `path` – `None` (default) or a path (list or tuple of children index in the tree)

OUTPUT: the label of the subtree indexed by `path`

EXAMPLES:

```
sage: t = LabelledOrderedTree([[],[]], label = 3)
sage: t.label()
3
sage: t[0].label()
sage: t = LabelledOrderedTree([LabelledOrderedTree([], 5),[]], label = 3)
sage: t.label()
3
sage: t[0].label()
5
sage: t[1].label()
sage: t.label([0])
5
```

```
>>> from sage.all import *
>>> t = LabelledOrderedTree([[],[]], label = Integer(3))
>>> t.label()
```

(continues on next page)

(continued from previous page)

```
3
>>> t[Integer(0)].label()
>>> t = LabelledOrderedTree([LabelledOrderedTree([], Integer(5)),[]], label =␣
↪Integer(3))
>>> t.label()
3
>>> t[Integer(0)].label()
5
>>> t[Integer(1)].label()
>>> t.label([Integer(0)])
5
```

labels()

Return the list of labels of `self`.

EXAMPLES:

```
sage: LT = LabelledOrderedTree
sage: t = LT([LT([],label='b'),LT([],label='c')],label='a')
sage: t.labels()
['a', 'b', 'c']

sage: LBT = LabelledBinaryTree
sage: LBT([LBT([],label=1),LBT([],label=4)],label=2).labels()
[2, 1, 4]
```

```
>>> from sage.all import *
>>> LT = LabelledOrderedTree
>>> t = LT([LT([],label='b'),LT([],label='c')],label='a')
>>> t.labels()
['a', 'b', 'c']

>>> LBT = LabelledBinaryTree
>>> LBT([LBT([],label=Integer(1)),LBT([],label=Integer(4))],label=Integer(2)).
↪labels()
[2, 1, 4]
```

leaf_labels()

Return the list of labels of the leaves of `self`.

In case of a labelled binary tree, these "leaves" are not actually the leaves of the binary trees, but the nodes whose both children are leaves!

EXAMPLES:

```
sage: LT = LabelledOrderedTree
sage: t = LT([LT([],label='b'),LT([],label='c')],label='a')
sage: t.leaf_labels()
['b', 'c']

sage: LBT = LabelledBinaryTree
sage: bt = LBT([LBT([],label='b'),LBT([],label='c')],label='a')
sage: bt.leaf_labels()
```

(continues on next page)

(continued from previous page)

```
['b', 'c']
sage: LBT([], label='1').leaf_labels()
['1']
sage: LBT(None).leaf_labels()
[]
```

```
>>> from sage.all import *
>>> LT = LabelledOrderedTree
>>> t = LT([LT([],label='b'),LT([],label='c')],label='a')
>>> t.leaf_labels()
['b', 'c']

>>> LBT = LabelledBinaryTree
>>> bt = LBT([LBT([],label='b'),LBT([],label='c')],label='a')
>>> bt.leaf_labels()
['b', 'c']
>>> LBT([], label='1').leaf_labels()
['1']
>>> LBT(None).leaf_labels()
[]
```

shape()

Return the unlabelled tree associated to `self`.

EXAMPLES:

```
sage: t = LabelledOrderedTree([[],[[]]], label = 25).shape(); t
[[], [[]]]

sage: LabelledBinaryTree([[],[[],[]]], label = 25).shape()
[[., .], [[., .], [., .]]]

sage: LRT = LabelledRootedTree
sage: tb = LRT([],label='b')
sage: LRT([tb, tb], label='a').shape()
[[], []]
```

```
>>> from sage.all import *
>>> t = LabelledOrderedTree([[],[[]]], label = Integer(25)).shape(); t
[[], [[]]]

>>> LabelledBinaryTree([[],[[],[]]], label = Integer(25)).shape()
[[., .], [[., .], [., .]]]

>>> LRT = LabelledRootedTree
>>> tb = LRT([],label='b')
>>> LRT([tb, tb], label='a').shape()
[[], []]
```

class sage.combinat.abstract_tree.**AbstractTree**

Bases: `object`

Abstract Tree.

There is no data structure defined here, as this class is meant to be extended, not instantiated.

How should this class be extended?

A class extending *AbstractTree* should respect several assumptions:

- For a tree `T`, the call `iter(T)` should return an iterator on the children of the root `T`.
- The *canonical_labelling* method should return the same value for trees that are considered equal (see the "canonical labellings" section in the documentation of the *AbstractTree* class).
- For a tree `T` the call `T.parent().labelled_trees()` should return a parent for labelled trees of the same kind: for example,
  - if `T` is a binary tree, `T.parent()` is `BinaryTrees()` and `T.parent().labelled_trees()` is `LabelledBinaryTrees()`
  - if `T` is an ordered tree, `T.parent()` is `OrderedTrees()` and `T.parent().labelled_trees()` is `LabelledOrderedTrees()`

breadth_first_order_traversal(*action=None*)

Run the breadth-first post-order traversal algorithm and subject every node encountered to some procedure `action`. The algorithm is:

```
queue <- [ root ];
while the queue is not empty:
    node <- pop( queue );
    manipulate the node;
    prepend to the queue the list of all subtrees of
        the node (from the rightmost to the leftmost).
```

INPUT:

- `action` – (optional) a function which takes a node as input, and does something during the exploration

OUTPUT:

`None`. (This is *not* an iterator.)

EXAMPLES:

For example, on the following binary tree b:

```
|   ___3____      |
|  /        \     |
| 1         _7_   |
|  \       /   \  |
|   2     5     8 |
|        / \      |
|       4   6     |
```

the breadth-first order traversal algorithm explores b in the following order of nodes: $3, 1, 7, 2, 5, 8, 4, 6$.

canonical_labelling(*shift=1*)

Return a labelled version of `self`.

The actual canonical labelling is currently unspecified. However, it is guaranteed to have labels in $1...n$ where n is the number of nodes of the tree. Moreover, two (unlabelled) trees compare as equal if and only if their canonical labelled trees compare as equal.

EXAMPLES:

```
sage: t = OrderedTree([[], [[], [[], []], [[], []]], [[], []]])
sage: t.canonical_labelling()
1[2[], 3[4[], 5[6[], 7[]], 8[9[], 10[]]], 11[12[], 13[]]]

sage: BinaryTree([]).canonical_labelling()
1[., .]
sage: BinaryTree([[],[[],[]]]).canonical_labelling()
2[1[., .], 4[3[., .], 5[., .]]]
```

```
>>> from sage.all import *
>>> t = OrderedTree([[], [[], [[], []], [[], []]], [[], []]])
>>> t.canonical_labelling()
1[2[], 3[4[], 5[6[], 7[]], 8[9[], 10[]]], 11[12[], 13[]]]

>>> BinaryTree([]).canonical_labelling()
1[., .]
>>> BinaryTree([[],[[],[]]]).canonical_labelling()
2[1[., .], 4[3[., .], 5[., .]]]
```

contour_traversal(*first_action=None*, *middle_action=None*, *final_action=None*, *leaf_action=None*)

Run the counterclockwise countour traversal algorithm (iterative implementation) and subject every node encountered to some procedure `first_action`, `middle_action` or `final_action` each time it reaches it.

ALGORITHM:

- if the root is a leaf, apply $leaf_action$
- **else**
  - apply $first_action$ to the root
  - iteratively apply $middle_action$ to the root and traverse each subtree from the leftmost one to the rightmost one
  - apply $final_action$ to the root

INPUT:

- `first_action` – (optional) a function which takes a node as input, and does something the first time it is reached during exploration
- `middle_action` – (optional) a function which takes a node as input, and does something each time it explore one of its children
- `final_action` – (optional) a function which takes a node as input, and does something the last time it is reached during exploration
- `leaf_action` – (optional) a function which takes a leaf as input, and does something when it is reached during exploration.

OUTPUT:

`None`. (This is *not* an iterator.)

depth()

Return the depth of `self`.

EXAMPLES:

```
sage: OrderedTree().depth()
1
sage: OrderedTree([]).depth()
1
sage: OrderedTree([[],[]]).depth()
2
sage: OrderedTree([[],[[]]]).depth()
3
sage: OrderedTree([[], [[], [[], []], [[], []]], [[], []]]).depth()
4

sage: BinaryTree().depth()
0
sage: BinaryTree([[],[[],[]]]).depth()
3
```

```
>>> from sage.all import *
>>> OrderedTree().depth()
1
>>> OrderedTree([]).depth()
1
>>> OrderedTree([[],[]]).depth()
2
>>> OrderedTree([[],[[]]]).depth()
3
>>> OrderedTree([[], [[], [[], []], [[], []]], [[], []]]).depth()
4

>>> BinaryTree().depth()
0
>>> BinaryTree([[],[[],[]]]).depth()
3
```

iterative_post_order_traversal(*action=None*)

Run the depth-first post-order traversal algorithm (iterative implementation) and subject every node encountered to some procedure `action`. The algorithm is:

```
explore each subtree (by the algorithm) from the
    leftmost one to the rightmost one;
then manipulate the root with function `action` (in the
    case of a binary tree, only if the root is not a leaf).
```

INPUT:

- `action` – (optional) a function which takes a node as input, and does something during the exploration

OUTPUT:

`None`. (This is *not* an iterator.)

See also

- *post_order_traversal_iter()*

iterative_pre_order_traversal(*action=None*)

Run the depth-first pre-order traversal algorithm (iterative implementation) and subject every node encountered to some procedure `action`. The algorithm is:

```
manipulate the root with function `action` (in the case
    of a binary tree, only if the root is not a leaf);
then explore each subtree (by the algorithm) from the
    leftmost one to the rightmost one.
```

INPUT:

- `action` – (optional) a function which takes a node as input, and does something during the exploration

OUTPUT:

`None`. (This is *not* an iterator.)

See also

- *pre_order_traversal_iter()*
- *pre_order_traversal()*

node_number()

Return the number of nodes of `self`.

See also

node_number_at_depth(), *node_number_to_the_right()*

EXAMPLES:

```
sage: OrderedTree().node_number()
1
sage: OrderedTree([]).node_number()
1
sage: OrderedTree([[],[]]).node_number()
3
sage: OrderedTree([[],[[]]]).node_number()
4
sage: OrderedTree([[], [[], [[], []], [[], []]], [[], []]]).node_number()
13
```

```
>>> from sage.all import *
>>> OrderedTree().node_number()
1
>>> OrderedTree([]).node_number()
1
>>> OrderedTree([[],[]]).node_number()
3
>>> OrderedTree([[],[[]]]).node_number()
4
```

(continues on next page)

(continued from previous page)

```
>>> OrderedTree([[], [[], [[], []], [[], []]], [[], []]]).node_number()
13
```

EXAMPLES:

```
sage: BinaryTree(None).node_number()
0
sage: BinaryTree([]).node_number()
1
sage: BinaryTree([[], None]).node_number()
2
sage: BinaryTree([[None, [[], []]], None]).node_number()
5
```

```
>>> from sage.all import *
>>> BinaryTree(None).node_number()
0
>>> BinaryTree([]).node_number()
1
>>> BinaryTree([[], None]).node_number()
2
>>> BinaryTree([[None, [[], []]], None]).node_number()
5
```

node_number_at_depth(*depth*)

Return the number of nodes at a given depth.

This counts all nodes that are at the given depth.

Here the root is considered to have depth 0.

INPUT:

- `depth` – integer

See also

node_number(), *node_number_to_the_right()*, *paths_at_depth()*

EXAMPLES:

```
sage: T = OrderedTree([[[], [[]]], [[], [[[]]]], []])
sage: ascii_art(T)
    ___o____
   /    /  /
  o_   o_ o
 / /  / /
o o  o o
  |    |
  o    o
       |
       o
```

(continues on next page)

(continued from previous page)

```
sage: [T.node_number_at_depth(i) for i in range(6)]
[1, 3, 4, 2, 1, 0]
```

```
>>> from sage.all import *
>>> T = OrderedTree([[[], [[]]], [[], [[[]]]], []])
>>> ascii_art(T)
    ___o____
   /    /  /
  o_   o_ o
 / /  / /
o o  o o
  |    |
  o    o
       |
       o
>>> [T.node_number_at_depth(i) for i in range(Integer(6))]
[1, 3, 4, 2, 1, 0]
```

node_number_to_the_right(*path*)

Return the number of nodes at the same depth and to the right of the node identified by `path`.

This counts the nodes that are at the same depth as the given one, and strictly to its right.

See also

node_number(), *node_number_at_depth()*, *paths_to_the_right()*

EXAMPLES:

```
sage: T = OrderedTree([[[], [[]]], [[], [[[]]]], []])
sage: ascii_art(T)
    ___o____
   /    /  /
  o_   o_ o
 / /  / /
o o  o o
  |    |
  o    o
       |
       o
sage: T.node_number_to_the_right(())
0
sage: T.node_number_to_the_right((0,))
2
sage: T.node_number_to_the_right((0,1))
2
sage: T.node_number_to_the_right((0,1,0))
1

sage: T = OrderedTree([])
sage: T.node_number_to_the_right(())
0
```

```
>>> from sage.all import *
>>> T = OrderedTree([[[], [[]]], [[], [[[]]]], []])
>>> ascii_art(T)
    ___o____

>>> T.node_number_to_the_right((Integer(0),Integer(1),Integer(0)))
1

>>> T = OrderedTree([])
>>> T.node_number_to_the_right(())
0
```

paths()

Return a generator for all paths to nodes of `self`.

OUTPUT:

This method returns a list of sequences of integers. Each of these sequences represents a path from the root node to some node. For instance, $(1, 3, 2, 5, 0, 3)$ represents the node obtained by choosing the 1st child of the root node (in the ordering returned by `iter`), then the 3rd child of its child, then the 2nd child of the latter, etc. (where the labelling of the children is zero-based).

The root element is represented by the empty tuple `()`.

paths_at_depth(), *paths_to_the_right()*

EXAMPLES:

```
sage: list(OrderedTree([]).paths())
[()]
sage: list(OrderedTree([[],[[]]]).paths())
[(), (0,), (1,), (1, 0)]

sage: list(BinaryTree([[],[[],[]]]).paths())
[(), (0,), (1,), (1, 0), (1, 1)]
```

```
>>> from sage.all import *
>>> list(OrderedTree([]).paths())
```

(continues on next page)

(continued from previous page)

```
[()]
>>> list(OrderedTree([[],[[]]]).paths())
[(), (0,), (1,), (1, 0)]

>>> list(BinaryTree([[],[[],[]]]).paths())
[(), (0,), (1,), (1, 0), (1, 1)]
```

paths_at_depth(*depth*, *path=[]*)

Return a generator for all paths at a fixed depth.

This iterates over all paths for nodes that are at the given depth.

Here the root is considered to have depth 0.

INPUT:

- `depth` – integer
- `path` – (optional) list; given path used in the recursion

Warning

The `path` option should not be used directly.

[]

>>> T2 = OrderedTree([])
>>> list(T2.paths_at_depth(Integer(0)))
[()]
```

paths_to_the_right(*path*)

Return a generator of paths for all nodes at the same depth and to the right of the node identified by `path`.

This iterates over the paths for nodes that are at the same depth as the given one, and strictly to its right.

INPUT:

- `path` – any path in the tree

See also

>>> list(g)
```

(continues on next page)

(continued from previous page)

```
[]
```

post_order_traversal(*action=None*)

Run the depth-first post-order traversal algorithm (recursive implementation) and subject every node encountered to some procedure `action`. The algorithm is:

```
explore each subtree (by the algorithm) from the
    leftmost one to the rightmost one;
then manipulate the root with function `action` (in the
    case of a binary tree, only if the root is not a leaf).
```

INPUT:

- `action` – (optional) a function which takes a node as input, and does something during the exploration

OUTPUT:

`None`. (This is *not* an iterator.)

See also:

- *post_order_traversal_iter()*
- *iterative_post_order_traversal()*

post_order_traversal_iter()

The depth-first post-order traversal iterator.

This method iters each node following the depth-first post-order traversal algorithm (recursive implementation). The algorithm is:

```
explore each subtree (by the algorithm) from the
    leftmost one to the rightmost one;
then yield the root (in the case of binary trees, only if
    it is not a leaf).
```

EXAMPLES:

For example on the following binary tree b:

```
|   ___3____       |
|  /        \      |
| 1         _7_    |
|  \       /   \   |
|   2     5     8  |
|        / \       |
|       4   6      |
```

(only the nodes are shown), the depth-first post-order traversal algorithm explores b in the following order of nodes: $2, 1, 4, 6, 5, 8, 7, 3$.

For another example, consider the labelled tree:

```
|      __1_____ |
|     /  /    / |
|    2   6    8_ |
|    |   |   / / |
|    3_  7  9 10 |
|   / /          |
| 4  5           |
```

The algorithm explores this tree in the following order: $4, 5, 3, 2, 7, 6, 9, 10, 8, 1$.

pre_order_traversal(*action=None*)

Run the depth-first pre-order traversal algorithm (recursive implementation) and subject every node encountered to some procedure `action`. The algorithm is:

```
manipulate the root with function `action` (in the case
    of a binary tree, only if the root is not a leaf);
then explore each subtree (by the algorithm) from the
    leftmost one to the rightmost one.
```

INPUT:

- `action` – (optional) a function which takes a node as input, and does something during the exploration

OUTPUT:

`None`. (This is *not* an iterator.)

EXAMPLES:

For example, on the following binary tree b:

```
|    ____3_____        |
|   /          \       |
| 1           _7_      |
|   \        /   \     |
|    2      5      8   |
|          / \         |
|         4    6       |
```

the depth-first pre-order traversal algorithm explores b in the following order of nodes: $3, 1, 2, 7, 5, 4, 6, 8$.

Another example:

```
|      __1_____ |
|     /  /    / |
|    2   6    8_ |
|    |   |   / / |
|    3_  7  9 10 |
|   / /          |
| 4  5           |
```

The algorithm explores this tree in the following order: $1, 2, 3, 4, 5, 6, 7, 8, 9, 10$.

See also

- *pre_order_traversal_iter()*

- *iterative_pre_order_traversal()*

pre_order_traversal_iter()

The depth-first pre-order traversal iterator.

This method iters each node following the depth-first pre-order traversal algorithm (recursive implementation). The algorithm is:

```
yield the root (in the case of binary trees, if it is not
    a leaf);
then explore each subtree (by the algorithm) from the
    leftmost one to the rightmost one.
```

EXAMPLES:

For example, on the following binary tree b:

```
|   ___3____      |
|  /        \     |
| 1         _7_   |
|  \       /   \  |
|   2     5     8 |
|        / \      |
|       4   6     |
```

(only the nodes shown), the depth-first pre-order traversal algorithm explores b in the following order of nodes: $3, 1, 2, 7, 5, 4, 6, 8$.

Another example:

```
|     __1____ |
|    /  /   / |
|   2   6   8_ |
|   |   |  / / |
|   3_  7  9 10 |
|  / /         |
| 4 5          |
```

The algorithm explores this labelled tree in the following order: $1, 2, 3, 4, 5, 6, 7, 8, 9, 10$.

subtrees()

Return a generator for all nonempty subtrees of `self`.

The number of nonempty subtrees of a tree is its number of nodes. (The word "nonempty" makes a difference only in the case of binary trees. For ordered trees, for example, all trees are nonempty.)

EXAMPLES:

```
sage: list(OrderedTree([]).subtrees())
[[]]
sage: list(OrderedTree([[],[[]]]).subtrees())
[[[], [[]]], [], [[]], []]

sage: list(OrderedTree([[],[[]]]).canonical_labelling().subtrees())
[1[2[], 3[4[]]], 2[], 3[4[]], 4[]]
```

(continues on next page)

(continued from previous page)

```
sage: list(BinaryTree([[],[[],[]]]).subtrees())
[[[., .], [[., .], [., .]]], [., .], [[., .], [., .]], [., .], [., .]]

sage: v = BinaryTree([[],[]])
sage: list(v.canonical_labelling().subtrees())
[2[1[., .], 3[., .]], 1[., .], 3[., .]]
```

```
>>> from sage.all import *
>>> list(OrderedTree([]).subtrees())
[[]]
>>> list(OrderedTree([[],[[]]]).subtrees())
[[[], [[]]], [], [[]], []]

>>> list(OrderedTree([[],[[]]]).canonical_labelling().subtrees())
[1[2[], 3[4[]]], 2[], 3[4[]], 4[]]

>>> list(BinaryTree([[],[[],[]]]).subtrees())
[[[., .], [[., .], [., .]]], [., .], [[., .], [., .]], [., .], [., .]]

>>> v = BinaryTree([[],[]])
>>> list(v.canonical_labelling().subtrees())
[2[1[., .], 3[., .]], 1[., .], 3[., .]]
```

to_hexacode()

Transform a tree into a hexadecimal string.

The definition of the hexacode is recursive. The first letter is the valence of the root as a hexadecimal (up to 15), followed by the concatenation of the hexacodes of the subtrees.

This method only works for trees where every vertex has valency at most 15.

See *from_hexacode()* for the reverse transformation.

EXAMPLES:

```
sage: from sage.combinat.abstract_tree import from_hexacode
sage: LT = LabelledOrderedTrees()
sage: from_hexacode('2010', LT).to_hexacode()
'2010'
sage: LT.an_element().to_hexacode()
'3020010'
sage: t = from_hexacode('a0000000000000000', LT)
sage: t.to_hexacode()
'a0000000000'

sage: OrderedTrees(6).an_element().to_hexacode()
'500000'
```

```
>>> from sage.all import *
>>> from sage.combinat.abstract_tree import from_hexacode
>>> LT = LabelledOrderedTrees()
>>> from_hexacode('2010', LT).to_hexacode()
```

(continues on next page)

(continued from previous page)

```
'2010'
>>> LT.an_element().to_hexacode()
'3020010'
>>> t = from_hexacode('a0000000000000000', LT)
>>> t.to_hexacode()
'a0000000000'

>>> OrderedTrees(Integer(6)).an_element().to_hexacode()
'500000'
```

tree_factorial()

Return the tree-factorial of `self`.

Definition:

The tree-factorial $T!$ of a tree T is the product $\prod_{v \in T} \#\text{children}(v)$.

EXAMPLES:

```
sage: LT = LabelledOrderedTrees()
sage: t = LT([LT([],label=6),LT([],label=1)],label=9)
sage: t.tree_factorial()
3

sage: BinaryTree([[],[[],[]]]).tree_factorial()
15
```

```
>>> from sage.all import *
>>> LT = LabelledOrderedTrees()
>>> t = LT([LT([],label=Integer(6)),LT([],label=Integer(1))],label=Integer(9))
>>> t.tree_factorial()
3

>>> BinaryTree([[],[[],[]]]).tree_factorial()
15
```

sage.combinat.abstract_tree.**from_hexacode**(*ch*, *parent=None*, *label='@'*)

Transform a hexadecimal string into a tree.

INPUT:

- `ch` – a hexadecimal string
- `parent` – kind of trees to be produced. If `None`, this will be `LabelledOrderedTrees`
- `label` – a label (default: `'@'`) to be used for every vertex of the tree

See *AbstractTree.to_hexacode()* for the description of the encoding

See `_from_hexacode_aux()` for the actual code

EXAMPLES:

```
sage: from sage.combinat.abstract_tree import from_hexacode
sage: from_hexacode('12000', LabelledOrderedTrees())
@[@[@[], @[]]]
sage: from_hexacode('12000')
```

(continues on next page)

(continued from previous page)

```
@[@[@[], @[]]]

sage: from_hexacode('1200', LabelledOrderedTrees())
@[@[@[], @[]]]
```

```
>>> from sage.all import *
>>> from sage.combinat.abstract_tree import from_hexacode
>>> from_hexacode('12000', LabelledOrderedTrees())
@[@[@[], @[]]]
>>> from_hexacode('12000')
@[@[@[], @[]]]

>>> from_hexacode('1200', LabelledOrderedTrees())
@[@[@[], @[]]]
```

It can happen that only a prefix of the word is used:

```
sage: from_hexacode('a'+14*'0', LabelledOrderedTrees())
@[@[], @[], @[], @[], @[], @[], @[], @[], @[], @[]]
```

```
>>> from sage.all import *
>>> from_hexacode('a'+Integer(14)*'0', LabelledOrderedTrees())
@[@[], @[], @[], @[], @[], @[], @[], @[], @[], @[]]
```

One can choose the label:

```
sage: from_hexacode('1200', LabelledOrderedTrees(), label='o')
o[o[o[], o[]]]
```

```
>>> from sage.all import *
>>> from_hexacode('1200', LabelledOrderedTrees(), label='o')
o[o[o[], o[]]]
```

One can also create other kinds of trees:

```
sage: from_hexacode('1200', OrderedTrees())
[[[], []]]
```

```
>>> from sage.all import *
>>> from_hexacode('1200', OrderedTrees())
[[[], []]]
```

5.1.2 Affine Permutations

class sage.combinat.affine_permutation.**AffinePermutation**(*parent*, *lst*, *check=True*)

Bases: ClonableArray

An affine permutation, represented in the window notation, and considered as a bijection from $\mathbf{Z}$ to $\mathbf{Z}$.

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: p = A([3, -1, 0, 6, 5, 4, 10, 9])
sage: p
Type A affine permutation with window [3, -1, 0, 6, 5, 4, 10, 9]
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> p = A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),␣
↪Integer(4), Integer(10), Integer(9)])
>>> p
Type A affine permutation with window [3, -1, 0, 6, 5, 4, 10, 9]
```

apply_simple_reflection(*i*, *side='right'*)

Apply a simple reflection.

INPUT:

- `i` – integer
- `side` – (default: `'right'`) determines whether to apply the reflection on the `'right'` or `'left'`

EXAMPLES:

```
sage: p = AffinePermutationGroup(['A',7,1])([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.apply_simple_reflection(3)
Type A affine permutation with window [3, -1, 6, 0, 5, 4, 10, 9]
sage: p.apply_simple_reflection(11)
Type A affine permutation with window [3, -1, 6, 0, 5, 4, 10, 9]
sage: p.apply_simple_reflection(3, 'left')
Type A affine permutation with window [4, -1, 0, 6, 5, 3, 10, 9]
sage: p.apply_simple_reflection(11, 'left')
Type A affine permutation with window [4, -1, 0, 6, 5, 3, 10, 9]
```

```
>>> from sage.all import *
>>> p = AffinePermutationGroup(['A',Integer(7),Integer(1)])([Integer(3), -
↪Integer(1), Integer(0), Integer(6), Integer(5), Integer(4), Integer(10),␣
↪Integer(9)])
>>> p.apply_simple_reflection(Integer(3))
Type A affine permutation with window [3, -1, 6, 0, 5, 4, 10, 9]
>>> p.apply_simple_reflection(Integer(11))
Type A affine permutation with window [3, -1, 6, 0, 5, 4, 10, 9]
>>> p.apply_simple_reflection(Integer(3), 'left')
Type A affine permutation with window [4, -1, 0, 6, 5, 3, 10, 9]
>>> p.apply_simple_reflection(Integer(11), 'left')
Type A affine permutation with window [4, -1, 0, 6, 5, 3, 10, 9]
```

grassmannian_quotient(*i=0*, *side='right'*)

Return the Grassmannian quotient.

Factors `self` into a unique product of a Grassmannian and a finite-type element. Returns a tuple containing the Grassmannian and finite elements, in order according to `side`.

INPUT:

- `i` – (default: 0) an element of the index set; the descent checked for

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: p=A([3, -1, 0, 6, 5, 4, 10, 9])
sage: gq=p.grassmannian_quotient()
sage: gq
(Type A affine permutation with window [-1, 0, 3, 4, 5, 6, 9, 10],
 Type A affine permutation with window [3, 1, 2, 6, 5, 4, 8, 7])
sage: gq[0].is_i_grassmannian()
True
sage: 0 not in gq[1].reduced_word()
True
sage: prod(gq)==p
True

sage: gqLeft=p.grassmannian_quotient(side='left')
sage: 0 not in gqLeft[0].reduced_word()
True
sage: gqLeft[1].is_i_grassmannian(side='left')
True
sage: prod(gqLeft)==p
True
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> p=A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),␣
→Integer(4), Integer(10), Integer(9)])
>>> gq=p.grassmannian_quotient()
>>> gq
(Type A affine permutation with window [-1, 0, 3, 4, 5, 6, 9, 10],
 Type A affine permutation with window [3, 1, 2, 6, 5, 4, 8, 7])
>>> gq[Integer(0)].is_i_grassmannian()
True
>>> Integer(0) not in gq[Integer(1)].reduced_word()
True
>>> prod(gq)==p
True

>>> gqLeft=p.grassmannian_quotient(side='left')
>>> Integer(0) not in gqLeft[Integer(0)].reduced_word()
True
>>> gqLeft[Integer(1)].is_i_grassmannian(side='left')
True
>>> prod(gqLeft)==p
True
```

index_set()

Index set of the affine permutation group.

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: A.index_set()
(0, 1, 2, 3, 4, 5, 6, 7)
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> A.index_set()
(0, 1, 2, 3, 4, 5, 6, 7)
```

is_i_grassmannian(*i=0*, *side='right'*)

Test whether `self` is i-grassmannian, i.e., either is the identity or has `i` as the sole descent.

INPUT:

- `i` – an element of the index set
- `side` – determines the side on which to check the descents

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: p=A([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.is_i_grassmannian()
False
sage: q=A.from_word([3,2,1,0])
sage: q.is_i_grassmannian()
True
sage: q=A.from_word([2,3,4,5])
sage: q.is_i_grassmannian(5)
True
sage: q.is_i_grassmannian(2, side='left')
True
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> p=A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),␣
↪Integer(4), Integer(10), Integer(9)])
>>> p.is_i_grassmannian()
False
>>> q=A.from_word([Integer(3),Integer(2),Integer(1),Integer(0)])
>>> q.is_i_grassmannian()
True
>>> q=A.from_word([Integer(2),Integer(3),Integer(4),Integer(5)])
>>> q.is_i_grassmannian(Integer(5))
True
>>> q.is_i_grassmannian(Integer(2), side='left')
True
```

is_one()

Test whether the affine permutation is the identity.

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: p=A([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.is_one()
False
sage: q=A.one()
```

(continues on next page)

(continued from previous page)

```
sage: q.is_one()
True
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> p=A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),␣
↪Integer(4), Integer(10), Integer(9)])
>>> p.is_one()
False
>>> q=A.one()
>>> q.is_one()
True
```

lower_covers(*side='right'*)

Return lower covers of `self`.

The set of affine permutations of one less length related by multiplication by a simple transposition on the indicated side. These are the elements that `self` covers in weak order.

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: p=A([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.lower_covers()
[Type A affine permutation with window [-1, 3, 0, 6, 5, 4, 10, 9],
 Type A affine permutation with window [3, -1, 0, 5, 6, 4, 10, 9],
 Type A affine permutation with window [3, -1, 0, 6, 4, 5, 10, 9],
 Type A affine permutation with window [3, -1, 0, 6, 5, 4, 9, 10]]
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> p=A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),␣
↪Integer(4), Integer(10), Integer(9)])
>>> p.lower_covers()
[Type A affine permutation with window [-1, 3, 0, 6, 5, 4, 10, 9],
 Type A affine permutation with window [3, -1, 0, 5, 6, 4, 10, 9],
 Type A affine permutation with window [3, -1, 0, 6, 4, 5, 10, 9],
 Type A affine permutation with window [3, -1, 0, 6, 5, 4, 9, 10]]
```

reduced_word()

Return a reduced word for the affine permutation.

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: p=A([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.reduced_word()
[0, 7, 4, 1, 0, 7, 5, 4, 2, 1]
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> p=A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),␣
↪Integer(4), Integer(10), Integer(9)])
```

(continues on next page)

(continued from previous page)

```
>>> p.reduced_word()
[0, 7, 4, 1, 0, 7, 5, 4, 2, 1]
```

signature()

Signature of the affine permutation, $(-1)^l$, where l is the length of the permutation.

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: p=A([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.signature()
1
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> p=A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),␣
↪Integer(4), Integer(10), Integer(9)])
>>> p.signature()
1
```

to_weyl_group_element()

The affine Weyl group element corresponding to the affine permutation.

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: p=A([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.to_weyl_group_element()
[ 0 -1  0  1  0  0  1  0]
[ 1 -1  0  1  0  0  1 -1]
[ 1 -1  0  1  0  0  0  0]
[ 0  0  0  1  0  0  0  0]
[ 0  0  0  1  0 -1  1  0]
[ 0  0  0  1 -1  0  1  0]
[ 0  0  0  0  0  0  1  0]
[ 0 -1  1  0  0  0  1  0]
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> p=A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),␣
↪Integer(4), Integer(10), Integer(9)])
>>> p.to_weyl_group_element()
[ 0 -1  0  1  0  0  1  0]
[ 1 -1  0  1  0  0  1 -1]
[ 1 -1  0  1  0  0  0  0]
[ 0  0  0  1  0  0  0  0]
[ 0  0  0  1  0 -1  1  0]
[ 0  0  0  1 -1  0  1  0]
[ 0  0  0  0  0  0  1  0]
[ 0 -1  1  0  0  0  1  0]
```

sage.combinat.affine_permutation.**AffinePermutationGroup**(*cartan_type*)

Wrapper function for specific affine permutation groups.

These are combinatorial implementations of the affine Weyl groups of types A, B, C, D, and G as permutations of the set of all integers. the basic algorithms are derived from [BB2005] and [Eri1995].

EXAMPLES:

```
sage: ct = CartanType(['A',7,1])
sage: A = AffinePermutationGroup(ct)
sage: A
The group of affine permutations of type ['A', 7, 1]
```

```
>>> from sage.all import *
>>> ct = CartanType(['A',Integer(7),Integer(1)])
>>> A = AffinePermutationGroup(ct)
>>> A
The group of affine permutations of type ['A', 7, 1]
```

We define an element of `A`:

```
sage: p = A([3, -1, 0, 6, 5, 4, 10, 9])
sage: p
Type A affine permutation with window [3, -1, 0, 6, 5, 4, 10, 9]
```

```
>>> from sage.all import *
>>> p = A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),␣
↪Integer(4), Integer(10), Integer(9)])
>>> p
Type A affine permutation with window [3, -1, 0, 6, 5, 4, 10, 9]
```

We find the value $p(1)$, considering p as a bijection on the integers. This is the same as calling the `value()` method:

```
sage: p.value(1)
3
sage: p(1) == p.value(1)
True
```

```
>>> from sage.all import *
>>> p.value(Integer(1))
3
>>> p(Integer(1)) == p.value(Integer(1))
True
```

We can also find the position of the integer 3 in p considered as a sequence, equivalent to finding $p^{-1}(3)$:

```
sage: p.position(3)
1
sage: (p^-1)(3)
1
```

```
>>> from sage.all import *
>>> p.position(Integer(3))
1
>>> (p**-Integer(1))(Integer(3))
1
```

Since the affine permutation group is a group, we demonstrate its group properties:

```
sage: A.one()
Type A affine permutation with window [1, 2, 3, 4, 5, 6, 7, 8]

sage: q = A([0, 2, 3, 4, 5, 6, 7, 9])
sage: p * q
Type A affine permutation with window [1, -1, 0, 6, 5, 4, 10, 11]
sage: q * p
Type A affine permutation with window [3, -1, 1, 6, 5, 4, 10, 8]

sage: p^-1
Type A affine permutation with window [0, -1, 1, 6, 5, 4, 10, 11]
sage: p^-1 * p == A.one()
True
sage: p * p^-1 == A.one()
True
```

```
>>> from sage.all import *
>>> A.one()
Type A affine permutation with window [1, 2, 3, 4, 5, 6, 7, 8]

>>> q = A([Integer(0), Integer(2), Integer(3), Integer(4), Integer(5), Integer(6),
↪ Integer(7), Integer(9)])
>>> p * q
Type A affine permutation with window [1, -1, 0, 6, 5, 4, 10, 11]
>>> q * p
Type A affine permutation with window [3, -1, 1, 6, 5, 4, 10, 8]

>>> p**-Integer(1)
Type A affine permutation with window [0, -1, 1, 6, 5, 4, 10, 11]
>>> p**-Integer(1) * p == A.one()
True
>>> p * p**-Integer(1) == A.one()
True
```

If we decide we prefer the Weyl Group implementation of the affine Weyl group, we can easily get it:

```
sage: p.to_weyl_group_element()
[ 0 -1  0  1  0  0  1  0]
[ 1 -1  0  1  0  0  1 -1]
[ 1 -1  0  1  0  0  0  0]
[ 0  0  0  1  0  0  0  0]
[ 0  0  0  1  0 -1  1  0]
[ 0  0  0  1 -1  0  1  0]
[ 0  0  0  0  0  0  1  0]
[ 0 -1  1  0  0  0  1  0]
```

```
>>> from sage.all import *
>>> p.to_weyl_group_element()
[ 0 -1  0  1  0  0  1  0]
[ 1 -1  0  1  0  0  1 -1]
[ 1 -1  0  1  0  0  0  0]
```

(continues on next page)

(continued from previous page)

```
[ 0  0  0  1  0  0  0  0]
[ 0  0  0  1  0 -1  1  0]
[ 0  0  0  1 -1  0  1  0]
[ 0  0  0  0  0  0  1  0]
[ 0 -1  1  0  0  0  1  0]
```

We can find a reduced word and do all of the other things one expects in a Coxeter group:

```
sage: p.has_right_descent(1)
True
sage: p.apply_simple_reflection(1)
Type A affine permutation with window [-1, 3, 0, 6, 5, 4, 10, 9]
sage: p.apply_simple_reflection(0)
Type A affine permutation with window [1, -1, 0, 6, 5, 4, 10, 11]
sage: p.reduced_word()
[0, 7, 4, 1, 0, 7, 5, 4, 2, 1]
sage: p.length()
10
```

```
>>> from sage.all import *
>>> p.has_right_descent(Integer(1))
True
>>> p.apply_simple_reflection(Integer(1))
Type A affine permutation with window [-1, 3, 0, 6, 5, 4, 10, 9]
>>> p.apply_simple_reflection(Integer(0))
Type A affine permutation with window [1, -1, 0, 6, 5, 4, 10, 11]
>>> p.reduced_word()
[0, 7, 4, 1, 0, 7, 5, 4, 2, 1]
>>> p.length()
10
```

The following methods are particular to type A. We can check if the element is fully commutative:

```
sage: p.is_fully_commutative()
False
sage: q.is_fully_commutative()
True
```

```
>>> from sage.all import *
>>> p.is_fully_commutative()
False
>>> q.is_fully_commutative()
True
```

We can also compute the affine Lehmer code of the permutation, a weak composition with $k + 1$ entries:

```
sage: p.to_lehmer_code()
[0, 3, 3, 0, 1, 2, 0, 1]
```

```
>>> from sage.all import *
>>> p.to_lehmer_code()
[0, 3, 3, 0, 1, 2, 0, 1]
```

Once we have the Lehmer code, we can obtain a k-bounded partition by sorting the Lehmer code, and then reading the row lengths. There is a unique 0-Grassmanian (dominant) affine permutation associated to this k-bounded partition, and a k-core as well.

```
sage: p.to_bounded_partition()
[5, 3, 2]
sage: p.to_dominant()
Type A affine permutation with window [-2, -1, 1, 3, 4, 8, 10, 13]
sage: p.to_core()
[5, 3, 2]
```

```
>>> from sage.all import *
>>> p.to_bounded_partition()
[5, 3, 2]
>>> p.to_dominant()
Type A affine permutation with window [-2, -1, 1, 3, 4, 8, 10, 13]
>>> p.to_core()
[5, 3, 2]
```

Finally, we can take a reduced word for p and insert it to find a standard composition tableau associated uniquely to that word:

```
sage: p.tableau_of_word(p.reduced_word())
[[], [1, 6, 9], [2, 7, 10], [], [3], [4, 8], [], [5]]
```

```
>>> from sage.all import *
>>> p.tableau_of_word(p.reduced_word())
[[], [1, 6, 9], [2, 7, 10], [], [3], [4, 8], [], [5]]
```

We can also form affine permutation groups in types B, C, D, and G:

```
sage: B = AffinePermutationGroup(['B',4,1])
sage: B.an_element()
Type B affine permutation with window [-1, 3, 4, 11]

sage: C = AffinePermutationGroup(['C',4,1])
sage: C.an_element()
Type C affine permutation with window [2, 3, 4, 10]

sage: D = AffinePermutationGroup(['D',4,1])
sage: D.an_element()
Type D affine permutation with window [-1, 3, 11, 5]

sage: G = AffinePermutationGroup(['G',2,1])
sage: G.an_element()
Type G affine permutation with window [0, 4, -1, 8, 3, 7]
```

```
>>> from sage.all import *
>>> B = AffinePermutationGroup(['B',Integer(4),Integer(1)])
>>> B.an_element()
Type B affine permutation with window [-1, 3, 4, 11]

>>> C = AffinePermutationGroup(['C',Integer(4),Integer(1)])
```

(continues on next page)

(continued from previous page)

```
>>> C.an_element()
Type C affine permutation with window [2, 3, 4, 10]

>>> D = AffinePermutationGroup(['D',Integer(4),Integer(1)])
>>> D.an_element()
Type D affine permutation with window [-1, 3, 11, 5]

>>> G = AffinePermutationGroup(['G',Integer(2),Integer(1)])
>>> G.an_element()
Type G affine permutation with window [0, 4, -1, 8, 3, 7]
```

class sage.combinat.affine_permutation.**AffinePermutationGroupGeneric**(*cartan_type*)

Bases: UniqueRepresentation, Parent

The generic affine permutation group class, in which we define all type-free methods for the specific affine permutation groups.

cartan_matrix()

Return the Cartan matrix of self.

EXAMPLES:

```
sage: AffinePermutationGroup(['A',7,1]).cartan_matrix()
[ 2 -1  0  0  0  0  0 -1]
[-1  2 -1  0  0  0  0  0]
[ 0 -1  2 -1  0  0  0  0]
[ 0  0 -1  2 -1  0  0  0]
[ 0  0  0 -1  2 -1  0  0]
[ 0  0  0  0 -1  2 -1  0]
[ 0  0  0  0  0 -1  2 -1]
[-1  0  0  0  0  0 -1  2]
```

```
>>> from sage.all import *
>>> AffinePermutationGroup(['A',Integer(7),Integer(1)]).cartan_matrix()
[ 2 -1  0  0  0  0  0 -1]
[-1  2 -1  0  0  0  0  0]
[ 0 -1  2 -1  0  0  0  0]
[ 0  0 -1  2 -1  0  0  0]
[ 0  0  0 -1  2 -1  0  0]
[ 0  0  0  0 -1  2 -1  0]
[ 0  0  0  0  0 -1  2 -1]
[-1  0  0  0  0  0 -1  2]
```

cartan_type()

Return the Cartan type of self.

EXAMPLES:

```
sage: AffinePermutationGroup(['A',7,1]).cartan_type()
['A', 7, 1]
```

```
>>> from sage.all import *
>>> AffinePermutationGroup(['A',Integer(7),Integer(1)]).cartan_type()
['A', 7, 1]
```

classical()

Return the finite permutation group.

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: A.classical()
Symmetric group of order 8! as a permutation group
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> A.classical()
Symmetric group of order 8! as a permutation group
```

from_word(*w*)

Build an affine permutation from a given word. Note: Already in category as `from_reduced_word`, but this is less typing!

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: p=A([3, -1, 0, 6, 5, 4, 10, 9])
sage: A.from_word([0, 7, 4, 1, 0, 7, 5, 4, 2, 1])
Type A affine permutation with window [3, -1, 0, 6, 5, 4, 10, 9]
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> p=A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),
↪Integer(4), Integer(10), Integer(9)])
>>> A.from_word([Integer(0), Integer(7), Integer(4), Integer(1), Integer(0),
↪Integer(7), Integer(5), Integer(4), Integer(2), Integer(1)])
Type A affine permutation with window [3, -1, 0, 6, 5, 4, 10, 9]
```

index_set()

EXAMPLES:

```
sage: AffinePermutationGroup(['A',7,1]).index_set()
(0, 1, 2, 3, 4, 5, 6, 7)
```

```
>>> from sage.all import *
>>> AffinePermutationGroup(['A',Integer(7),Integer(1)]).index_set()
(0, 1, 2, 3, 4, 5, 6, 7)
```

is_crystallographic()

Tells whether the affine permutation group is crystallographic.

EXAMPLES:

```
sage: AffinePermutationGroup(['A',7,1]).is_crystallographic()
True
```

```
>>> from sage.all import *
>>> AffinePermutationGroup(['A',Integer(7),Integer(1)]).is_crystallographic()
True
```

random_element(*n=None*)

Return a random affine permutation of length `n`.

If `n` is not specified, then `n` is chosen as a random nonnegative integer in $[0, 1000]$.

Starts at the identity, then chooses an upper cover at random. Not very uniform: actually constructs a uniformly random reduced word of length n. Thus we most likely get elements with lots of reduced words!

For the actual code, see `sage.categories.coxeter_group.random_element_of_length()`.

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: A.random_element() # random
Type A affine permutation with window [-12, 16, 19, -1, -2, 10, -3, 9]
sage: p = A.random_element(10)
sage: p.length() == 10
True
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> A.random_element() # random
Type A affine permutation with window [-12, 16, 19, -1, -2, 10, -3, 9]
>>> p = A.random_element(Integer(10))
>>> p.length() == Integer(10)
True
```

rank()

Rank of the affine permutation group, equal to $k + 1$.

EXAMPLES:

```
sage: AffinePermutationGroup(['A',7,1]).rank()
8
```

```
>>> from sage.all import *
>>> AffinePermutationGroup(['A',Integer(7),Integer(1)]).rank()
8
```

reflection_index_set()

EXAMPLES:

```
sage: AffinePermutationGroup(['A',7,1]).reflection_index_set()
(0, 1, 2, 3, 4, 5, 6, 7)
```

```
>>> from sage.all import *
>>> AffinePermutationGroup(['A',Integer(7),Integer(1)]).reflection_index_set()
(0, 1, 2, 3, 4, 5, 6, 7)
```

weyl_group()

Return the Weyl Group of the same type as `self`.

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: A.weyl_group()
Weyl Group of type ['A', 7, 1] (as a matrix group acting on the root space)
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> A.weyl_group()
Weyl Group of type ['A', 7, 1] (as a matrix group acting on the root space)
```

class sage.combinat.affine_permutation.**AffinePermutationGroupTypeA**(*cartan_type*)

Bases: *AffinePermutationGroupGeneric*

Element

alias of *AffinePermutationTypeA*

from_lehmer_code(*C*, *typ='decreasing'*, *side='right'*)

Return the affine permutation with the supplied Lehmer code (a weak composition with $k+1$ parts, at least one of which is 0).

INPUT:

- `typ` – `'increasing'` or `'decreasing'` (default: `'decreasing'`); type of product
- `side` – `'right'` or `'left'` (default: `'right'`); whether the decomposition is from the right or left

EXAMPLES:

```
sage: import itertools
sage: A = AffinePermutationGroup(['A',7,1])
sage: p = A([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.to_lehmer_code()
[0, 3, 3, 0, 1, 2, 0, 1]
sage: A.from_lehmer_code(p.to_lehmer_code()) == p
True
sage: orders = ('increasing','decreasing')
sage: sides = ('left','right')
sage: all(A.from_lehmer_code(p.to_lehmer_code(o,s),o,s) == p
....:     for o,s in itertools.product(orders,sides))
True
```

```
>>> from sage.all import *
>>> import itertools
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> p = A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),
→Integer(4), Integer(10), Integer(9)])
>>> p.to_lehmer_code()
[0, 3, 3, 0, 1, 2, 0, 1]
>>> A.from_lehmer_code(p.to_lehmer_code()) == p
True
>>> orders = ('increasing','decreasing')
>>> sides = ('left','right')
>>> all(A.from_lehmer_code(p.to_lehmer_code(o,s),o,s) == p
...     for o,s in itertools.product(orders,sides))
True
```

one()

Return the identity element.

EXAMPLES:

```
sage: AffinePermutationGroup(['A',7,1]).one()
Type A affine permutation with window [1, 2, 3, 4, 5, 6, 7, 8]
```

```
>>> from sage.all import *
>>> AffinePermutationGroup(['A',Integer(7),Integer(1)]).one()
Type A affine permutation with window [1, 2, 3, 4, 5, 6, 7, 8]
```

class sage.combinat.affine_permutation.**AffinePermutationGroupTypeB**(*cartan_type*)

Bases: *AffinePermutationGroupTypeC*

Element

alias of *AffinePermutationTypeB*

class sage.combinat.affine_permutation.**AffinePermutationGroupTypeC**(*cartan_type*)

Bases: *AffinePermutationGroupGeneric*

Element

alias of *AffinePermutationTypeC*

one()

Return the identity element.

EXAMPLES:

```
sage: ct=CartanType(['C',4,1])
sage: C = AffinePermutationGroup(ct)
sage: C.one()
Type C affine permutation with window [1, 2, 3, 4]
sage: C.one()*C.one()==C.one()
True
```

```
>>> from sage.all import *
>>> ct=CartanType(['C',Integer(4),Integer(1)])
>>> C = AffinePermutationGroup(ct)
>>> C.one()
Type C affine permutation with window [1, 2, 3, 4]
>>> C.one()*C.one()==C.one()
True
```

class sage.combinat.affine_permutation.**AffinePermutationGroupTypeD**(*cartan_type*)

Bases: *AffinePermutationGroupTypeC*

Element

alias of *AffinePermutationTypeD*

class sage.combinat.affine_permutation.**AffinePermutationGroupTypeG**(*cartan_type*)

Bases: *AffinePermutationGroupGeneric*

Element

alias of *AffinePermutationTypeG*

one()

Return the identity element.

EXAMPLES:

```
sage: AffinePermutationGroup(['G',2,1]).one()
Type G affine permutation with window [1, 2, 3, 4, 5, 6]
```

```
>>> from sage.all import *
>>> AffinePermutationGroup(['G',Integer(2),Integer(1)]).one()
Type G affine permutation with window [1, 2, 3, 4, 5, 6]
```

class sage.combinat.affine_permutation.**AffinePermutationTypeA**(*parent*, *lst*, *check=True*)

Bases: `AffinePermutation`

apply_simple_reflection_left(*i*)

Apply the simple reflection to the values i, $i + 1$.

EXAMPLES:

```
sage: p = AffinePermutationGroup(['A',7,1])([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.apply_simple_reflection_left(3)
Type A affine permutation with window [4, -1, 0, 6, 5, 3, 10, 9]
sage: p.apply_simple_reflection_left(11)
Type A affine permutation with window [4, -1, 0, 6, 5, 3, 10, 9]
```

```
>>> from sage.all import *
>>> p = AffinePermutationGroup(['A',Integer(7),Integer(1)])([Integer(3), -
↪Integer(1), Integer(0), Integer(6), Integer(5), Integer(4), Integer(10),␣
↪Integer(9)])
>>> p.apply_simple_reflection_left(Integer(3))
Type A affine permutation with window [4, -1, 0, 6, 5, 3, 10, 9]
>>> p.apply_simple_reflection_left(Integer(11))
Type A affine permutation with window [4, -1, 0, 6, 5, 3, 10, 9]
```

apply_simple_reflection_right(*i*)

Apply the simple reflection to positions i, $i + 1$.

INPUT:

- `i` – integer

EXAMPLES:

```
sage: p = AffinePermutationGroup(['A',7,1])([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.apply_simple_reflection_right(3)
Type A affine permutation with window [3, -1, 6, 0, 5, 4, 10, 9]
sage: p.apply_simple_reflection_right(11)
Type A affine permutation with window [3, -1, 6, 0, 5, 4, 10, 9]
```

```
>>> from sage.all import *
>>> p = AffinePermutationGroup(['A',Integer(7),Integer(1)])([Integer(3), -
↪Integer(1), Integer(0), Integer(6), Integer(5), Integer(4), Integer(10),␣
↪Integer(9)])
>>> p.apply_simple_reflection_right(Integer(3))
```

(continues on next page)

(continued from previous page)

```
Type A affine permutation with window [3, -1, 6, 0, 5, 4, 10, 9]
>>> p.apply_simple_reflection_right(Integer(11))
Type A affine permutation with window [3, -1, 6, 0, 5, 4, 10, 9]
```

check()

Check that `self` is an affine permutation.

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: p = A([3, -1, 0, 6, 5, 4, 10, 9])
sage: p
Type A affine permutation with window [3, -1, 0, 6, 5, 4, 10, 9]
sage: q = A([1,2,3])  # indirect doctest
Traceback (most recent call last):
...
ValueError: length of list must be k+1=8
sage: q = A([1,2,3,4,5,6,7,0])  # indirect doctest
Traceback (most recent call last):
...
ValueError: window does not sum to 36
sage: q = A([1,1,3,4,5,6,7,9])  # indirect doctest
Traceback (most recent call last):
...
ValueError: entries must have distinct residues
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> p = A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),␣
↪Integer(4), Integer(10), Integer(9)])
>>> p
Type A affine permutation with window [3, -1, 0, 6, 5, 4, 10, 9]
>>> q = A([Integer(1),Integer(2),Integer(3)])  # indirect doctest
Traceback (most recent call last):
...
ValueError: length of list must be k+1=8
>>> q = A([Integer(1),Integer(2),Integer(3),Integer(4),Integer(5),Integer(6),
↪Integer(7),Integer(0)])  # indirect doctest
Traceback (most recent call last):
...
ValueError: window does not sum to 36
>>> q = A([Integer(1),Integer(1),Integer(3),Integer(4),Integer(5),Integer(6),
↪Integer(7),Integer(9)])  # indirect doctest
Traceback (most recent call last):
...
ValueError: entries must have distinct residues
```

flip_automorphism()

The Dynkin diagram automorphism which fixes s_0 and reverses all other indices.

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: p=A([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.flip_automorphism()
Type A affine permutation with window [0, -1, 5, 4, 3, 9, 10, 6]
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> p=A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),␣
↪Integer(4), Integer(10), Integer(9)])
>>> p.flip_automorphism()
Type A affine permutation with window [0, -1, 5, 4, 3, 9, 10, 6]
```

has_left_descent (*i*)

Determine whether there is a descent at `i`.

INPUT:

- `i` – integer

EXAMPLES:

```
sage: p = AffinePermutationGroup(['A',7,1])([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.has_left_descent(1)
True
sage: p.has_left_descent(9)
True
sage: p.has_left_descent(0)
True
```

```
>>> from sage.all import *
>>> p = AffinePermutationGroup(['A',Integer(7),Integer(1)])([Integer(3), -
↪Integer(1), Integer(0), Integer(6), Integer(5), Integer(4), Integer(10),␣
↪Integer(9)])
>>> p.has_left_descent(Integer(1))
True
>>> p.has_left_descent(Integer(9))
True
>>> p.has_left_descent(Integer(0))
True
```

has_right_descent (*i*)

Determine whether there is a descent at `i`.

INPUT:

- `i` – integer

EXAMPLES:

```
sage: p = AffinePermutationGroup(['A',7,1])([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.has_right_descent(1)
True
sage: p.has_right_descent(9)
True
```

(continues on next page)

(continued from previous page)

```
sage: p.has_right_descent(0)
False
```

```
>>> from sage.all import *
>>> p = AffinePermutationGroup(['A',Integer(7),Integer(1)])([Integer(3), -
↪Integer(1), Integer(0), Integer(6), Integer(5), Integer(4), Integer(10),␣
↪Integer(9)])
>>> p.has_right_descent(Integer(1))
True
>>> p.has_right_descent(Integer(9))
True
>>> p.has_right_descent(Integer(0))
False
```

is_fully_commutative()

Determine whether `self` is fully commutative.

This means that it has no reduced word with a braid.

This uses a specific algorithm.

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: p = A([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.is_fully_commutative()
False
sage: q = A([-3, -2, 0, 7, 9, 2, 11, 12])
sage: q.is_fully_commutative()
True
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> p = A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),␣
↪Integer(4), Integer(10), Integer(9)])
>>> p.is_fully_commutative()
False
>>> q = A([-Integer(3), -Integer(2), Integer(0), Integer(7), Integer(9),␣
↪Integer(2), Integer(11), Integer(12)])
>>> q.is_fully_commutative()
True
```

maximal_cyclic_decomposition(*typ='decreasing'*, *side='right'*, *verbose=False*)

Find the unique maximal decomposition of `self` into cyclically decreasing/increasing elements.

INPUT:

- `typ` – `'increasing'` or `'decreasing'` (default: `'decreasing'`); chooses whether to find increasing or decreasing sets
- `side` – `'right'` or `'left'` (default: `'right'`) chooses whether to find maximal sets starting from the left or the right
- `verbose` – boolean (default: `False`); print extra information while finding the decomposition

EXAMPLES:

```
sage: p = AffinePermutationGroup(['A',7,1])([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.maximal_cyclic_decomposition()
[[0, 7], [4, 1, 0], [7, 5, 4, 2, 1]]
sage: p.maximal_cyclic_decomposition(side='left')
[[1, 0, 7, 5, 4], [1, 0, 5], [2, 1]]
sage: p.maximal_cyclic_decomposition(typ='increasing', side='right')
[[1], [5, 0, 1, 2], [4, 5, 7, 0, 1]]
sage: p.maximal_cyclic_decomposition(typ='increasing', side='left')
[[0, 1, 2, 4, 5], [4, 7, 0, 1], [7]]
```

```
>>> from sage.all import *
>>> p = AffinePermutationGroup(['A',Integer(7),Integer(1)])([Integer(3), -
↪Integer(1), Integer(0), Integer(6), Integer(5), Integer(4), Integer(10),␣
↪Integer(9)])
>>> p.maximal_cyclic_decomposition()
[[0, 7], [4, 1, 0], [7, 5, 4, 2, 1]]
>>> p.maximal_cyclic_decomposition(side='left')
[[1, 0, 7, 5, 4], [1, 0, 5], [2, 1]]
>>> p.maximal_cyclic_decomposition(typ='increasing', side='right')
[[1], [5, 0, 1, 2], [4, 5, 7, 0, 1]]
>>> p.maximal_cyclic_decomposition(typ='increasing', side='left')
[[0, 1, 2, 4, 5], [4, 7, 0, 1], [7]]
```

maximal_cyclic_factor(*typ='decreasing'*, *side='right'*, *verbose=False*)

For an affine permutation x, find the unique maximal subset A of the index set such that $x = yd_A$ is a reduced product.

INPUT:

- `typ` – `'increasing'` or `'decreasing'` (default: `'decreasing'`); chooses whether to find increasing or decreasing sets
- `side` – `'right'` or `'left'` (default: `'right'`); chooses whether to find maximal sets starting from the left or the right
- `verbose` – boolean; if `True`, outputs information about how the cyclically increasing element was found

EXAMPLES:

```
sage: p = AffinePermutationGroup(['A',7,1])([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.maximal_cyclic_factor()
[7, 5, 4, 2, 1]
sage: p.maximal_cyclic_factor(side='left')
[1, 0, 7, 5, 4]
sage: p.maximal_cyclic_factor('increasing','right')
[4, 5, 7, 0, 1]
sage: p.maximal_cyclic_factor('increasing','left')
[0, 1, 2, 4, 5]
```

```
>>> from sage.all import *
>>> p = AffinePermutationGroup(['A',Integer(7),Integer(1)])([Integer(3), -
↪Integer(1), Integer(0), Integer(6), Integer(5), Integer(4), Integer(10),␣
↪Integer(9)])
>>> p.maximal_cyclic_factor()
[7, 5, 4, 2, 1]
```

(continues on next page)

(continued from previous page)

```
>>> p.maximal_cyclic_factor(side='left')
[1, 0, 7, 5, 4]
>>> p.maximal_cyclic_factor('increasing','right')
[4, 5, 7, 0, 1]
>>> p.maximal_cyclic_factor('increasing','left')
[0, 1, 2, 4, 5]
```

position(*i*)

Find the position `j` such the `self.value(j) == i`.

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: p = A([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.position(3)
1
sage: p.position(11)
9
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> p = A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),␣
↪Integer(4), Integer(10), Integer(9)])
>>> p.position(Integer(3))
1
>>> p.position(Integer(11))
9
```

promotion()

The Dynkin diagram automorphism which sends s_i to s_{i+1}.

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: p = A([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.promotion()
Type A affine permutation with window [2, 4, 0, 1, 7, 6, 5, 11]
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> p = A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),␣
↪Integer(4), Integer(10), Integer(9)])
>>> p.promotion()
Type A affine permutation with window [2, 4, 0, 1, 7, 6, 5, 11]
```

tableau_of_word(*w*, *typ='decreasing'*, *side='right'*, *alpha=None*)

Finds a tableau on the Lehmer code of `self` corresponding to the given reduced word.

For a full description of this algorithm, see [Den2012].

INPUT:

- `w` – a reduced word for `self`
- `typ` – `'increasing'` or `'decreasing'`; the type of Lehmer code used

- side – 'right' or 'left'
- alpha – a content vector; w should be of type alpha; specifying alpha produces semistandard tableaux

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: p=A([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.tableau_of_word(p.reduced_word())
[[], [1, 6, 9], [2, 7, 10], [], [3], [4, 8], [], [5]]
sage: A = AffinePermutationGroup(['A',7,1])
sage: p=A([3, -1, 0, 6, 5, 4, 10, 9])
sage: w=p.reduced_word()
sage: w
[0, 7, 4, 1, 0, 7, 5, 4, 2, 1]
sage: alpha=[5,3,2]
sage: p.tableau_of_word(p.reduced_word(), alpha=alpha)
[[], [1, 2, 3], [1, 2, 3], [], [1], [1, 2], [], [1]]
sage: p.tableau_of_word(p.reduced_word(), side='left')
[[1, 4, 9], [6], [], [], [3, 7], [8], [], [2, 5, 10]]
sage: p.tableau_of_word(p.reduced_word(), typ='increasing', side='right')
[[9, 10], [1, 2], [], [], [3, 4], [8], [], [5, 6, 7]]
sage: p.tableau_of_word(p.reduced_word(), typ='increasing', side='left')
[[1, 2], [4, 5, 6], [9, 10], [], [3], [7, 8], [], []]
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> p=A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),␣
↪Integer(4), Integer(10), Integer(9)])
>>> p.tableau_of_word(p.reduced_word())
[[], [1, 6, 9], [2, 7, 10], [], [3], [4, 8], [], [5]]
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> p=A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),␣
↪Integer(4), Integer(10), Integer(9)])
>>> w=p.reduced_word()
>>> w
[0, 7, 4, 1, 0, 7, 5, 4, 2, 1]
>>> alpha=[Integer(5),Integer(3),Integer(2)]
>>> p.tableau_of_word(p.reduced_word(), alpha=alpha)
[[], [1, 2, 3], [1, 2, 3], [], [1], [1, 2], [], [1]]
>>> p.tableau_of_word(p.reduced_word(), side='left')
[[1, 4, 9], [6], [], [], [3, 7], [8], [], [2, 5, 10]]
>>> p.tableau_of_word(p.reduced_word(), typ='increasing', side='right')
[[9, 10], [1, 2], [], [], [3, 4], [8], [], [5, 6, 7]]
>>> p.tableau_of_word(p.reduced_word(), typ='increasing', side='left')
[[1, 2], [4, 5, 6], [9, 10], [], [3], [7, 8], [], []]
```

to_bounded_partition(*typ='decreasing'*, *side='right'*)

Return the k-bounded partition associated to the dominant element obtained by sorting the Lehmer code.

INPUT:

- typ – 'increasing' or 'decreasing' (default: 'decreasing'); chooses whether to find increasing or decreasing sets
- side – 'right' or 'left' (default: 'right'); chooses whether to find maximal sets starting from

the left or the right

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',2,1])
sage: p=A.from_lehmer_code([4,1,0])
sage: p.to_bounded_partition()
[2, 1, 1, 1]
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(2),Integer(1)])
>>> p=A.from_lehmer_code([Integer(4),Integer(1),Integer(0)])
>>> p.to_bounded_partition()
[2, 1, 1, 1]
```

to_core (*typ='decreasing'*, *side='right'*)

Return the core associated to the dominant element obtained by sorting the Lehmer code.

INPUT:

- `typ` – `'increasing'` or `'decreasing'` (default: `'decreasing'`.)
- `side` – `'right'` or `'left'` (default: `'right'`.) Chooses whether to find maximal sets starting from the left or the right

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',2,1])
sage: p=A.from_lehmer_code([4,1,0])
sage: p.to_bounded_partition()
[2, 1, 1, 1]
sage: p.to_core()
[4, 2, 1, 1]
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(2),Integer(1)])
>>> p=A.from_lehmer_code([Integer(4),Integer(1),Integer(0)])
>>> p.to_bounded_partition()
[2, 1, 1, 1]
>>> p.to_core()
[4, 2, 1, 1]
```

to_dominant (*typ='decreasing'*, *side='right'*)

Finds the Lehmer code and then sorts it. Returns the affine permutation with the given sorted Lehmer code; this element is 0-dominant.

INPUT:

- `typ` – `'increasing'` or `'decreasing'` (default: `'decreasing'`) chooses whether to find increasing or decreasing sets
- `side` – `'right'` or `'left'` (default: `'right'`) chooses whether to find maximal sets starting from the left or the right

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: p=A([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.to_dominant()
Type A affine permutation with window [-2, -1, 1, 3, 4, 8, 10, 13]
sage: p.to_dominant(typ='increasing', side='left')
Type A affine permutation with window [3, 4, -1, 5, 0, 9, 6, 10]
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> p=A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),␣
↪Integer(4), Integer(10), Integer(9)])
>>> p.to_dominant()
Type A affine permutation with window [-2, -1, 1, 3, 4, 8, 10, 13]
>>> p.to_dominant(typ='increasing', side='left')
Type A affine permutation with window [3, 4, -1, 5, 0, 9, 6, 10]
```

to_lehmer_code(*typ='decreasing'*, *side='right'*)

Return the affine Lehmer code.

There are four such codes; the options `typ` and `side` determine which code is generated. The codes generated are the shape of the maximal cyclic decompositions of `self` according to the given `typ` and `side` options.

INPUT:

- `typ` – `'increasing'` or `'decreasing'` (default: `'decreasing'`); chooses whether to find increasing or decreasing sets
- `side` – `'right'` or `'left'` (default: `'right'`) chooses whether to find maximal sets starting from the left or the right

EXAMPLES:

```
sage: import itertools
sage: A = AffinePermutationGroup(['A',7,1])
sage: p=A([3, -1, 0, 6, 5, 4, 10, 9])
sage: orders = ('increasing','decreasing')
sage: sides = ('left','right')
sage: for o,s in itertools.product(orders, sides):
....:     p.to_lehmer_code(o,s)
[2, 3, 2, 0, 1, 2, 0, 0]
[2, 2, 0, 0, 2, 1, 0, 3]
[3, 1, 0, 0, 2, 1, 0, 3]
[0, 3, 3, 0, 1, 2, 0, 1]
sage: for a in itertools.product(orders, sides):
....:     A.from_lehmer_code(p.to_lehmer_code(a[0],a[1]), a[0],a[1])==p
True
True
True
True
```

```
>>> from sage.all import *
>>> import itertools
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> p=A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),␣
↪Integer(4), Integer(10), Integer(9)])
```

(continues on next page)

(continued from previous page)

```
>>> orders = ('increasing','decreasing')
>>> sides = ('left','right')
>>> for o,s in itertools.product(orders, sides):
...   p.to_lehmer_code(o,s)
[2, 3, 2, 0, 1, 2, 0, 0]
[2, 2, 0, 0, 2, 1, 0, 3]
[3, 1, 0, 0, 2, 1, 0, 3]
[0, 3, 3, 0, 1, 2, 0, 1]
>>> for a in itertools.product(orders, sides):
...   A.from_lehmer_code(p.to_lehmer_code(a[Integer(0)],a[Integer(1)]),
↪a[Integer(0)],a[Integer(1)])==p
True
True
True
True
```

to_type_a()

Return an embedding of `self` into the affine permutation group of type A. (For type A, just returns `self`.)

EXAMPLES:

```
sage: p = AffinePermutationGroup(['A',7,1])([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.to_type_a() is p
True
```

```
>>> from sage.all import *
>>> p = AffinePermutationGroup(['A',Integer(7),Integer(1)])([Integer(3), -
↪Integer(1), Integer(0), Integer(6), Integer(5), Integer(4), Integer(10),
↪Integer(9)])
>>> p.to_type_a() is p
True
```

value(*i*, *base_window=False*)

Return the image of the integer `i` under this permutation.

INPUT:

- `base_window` – boolean; indicating whether `i` is in the base window; if `True`, will run a bit faster, but the method will screw up if `i` is not actually in the index set

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: p = A([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.value(1)
3
sage: p.value(9)
11
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> p = A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),
↪Integer(4), Integer(10), Integer(9)])
```

(continues on next page)

(continued from previous page)

```
>>> p.value(Integer(1))
3
>>> p.value(Integer(9))
11
```

class sage.combinat.affine_permutation.**AffinePermutationTypeB**(*parent*, *lst*, *check=True*)

Bases: *AffinePermutationTypeC*

apply_simple_reflection_left(*i*)

Apply the simple reflection indexed by i on values.

EXAMPLES:

```
sage: B = AffinePermutationGroup(['B',4,1])
sage: p=B([-5,1,6,-2])
sage: p.apply_simple_reflection_left(0)
Type B affine permutation with window [-5, -2, 6, 1]
sage: p.apply_simple_reflection_left(2)
Type B affine permutation with window [-5, 1, 7, -3]
sage: p.apply_simple_reflection_left(4)
Type B affine permutation with window [-4, 1, 6, -2]
```

```
>>> from sage.all import *
>>> B = AffinePermutationGroup(['B',Integer(4),Integer(1)])
>>> p=B([-Integer(5),Integer(1),Integer(6),-Integer(2)])
>>> p.apply_simple_reflection_left(Integer(0))
Type B affine permutation with window [-5, -2, 6, 1]
>>> p.apply_simple_reflection_left(Integer(2))
Type B affine permutation with window [-5, 1, 7, -3]
>>> p.apply_simple_reflection_left(Integer(4))
Type B affine permutation with window [-4, 1, 6, -2]
```

apply_simple_reflection_right(*i*)

Apply the simple reflection indexed by i on positions.

EXAMPLES:

```
sage: B = AffinePermutationGroup(['B',4,1])
sage: p=B([-5,1,6,-2])
sage: p.apply_simple_reflection_right(1)
Type B affine permutation with window [1, -5, 6, -2]
sage: p.apply_simple_reflection_right(0)
Type B affine permutation with window [-1, 5, 6, -2]
sage: p.apply_simple_reflection_right(4)
Type B affine permutation with window [-5, 1, 6, 11]
```

```
>>> from sage.all import *
>>> B = AffinePermutationGroup(['B',Integer(4),Integer(1)])
>>> p=B([-Integer(5),Integer(1),Integer(6),-Integer(2)])
>>> p.apply_simple_reflection_right(Integer(1))
Type B affine permutation with window [1, -5, 6, -2]
>>> p.apply_simple_reflection_right(Integer(0))
Type B affine permutation with window [-1, 5, 6, -2]
```

(continues on next page)

(continued from previous page)

```
>>> p.apply_simple_reflection_right(Integer(4))
Type B affine permutation with window [-5, 1, 6, 11]
```

check()

Check that `self` is an affine permutation.

EXAMPLES:

```
sage: B = AffinePermutationGroup(['B',4,1])
sage: x = B([-5,1,6,-2])
sage: x
Type B affine permutation with window [-5, 1, 6, -2]
```

```
>>> from sage.all import *
>>> B = AffinePermutationGroup(['B',Integer(4),Integer(1)])
>>> x = B([-Integer(5),Integer(1),Integer(6),-Integer(2)])
>>> x
Type B affine permutation with window [-5, 1, 6, -2]
```

has_left_descent(*i*)

Determines whether there is a descent at `i`.

INPUT:

- `i` – integer

EXAMPLES:

```
sage: B = AffinePermutationGroup(['B',4,1])
sage: p=B([-5,1,6,-2])
sage: [p.has_left_descent(i) for i in B.index_set()]
[True, True, False, False, True]
```

```
>>> from sage.all import *
>>> B = AffinePermutationGroup(['B',Integer(4),Integer(1)])
>>> p=B([-Integer(5),Integer(1),Integer(6),-Integer(2)])
>>> [p.has_left_descent(i) for i in B.index_set()]
[True, True, False, False, True]
```

has_right_descent(*i*)

Determines whether there is a descent at index `i`.

INPUT:

- `i` – integer

EXAMPLES:

```
sage: B = AffinePermutationGroup(['B',4,1])
sage: p = B([-5,1,6,-2])
sage: [p.has_right_descent(i) for i in B.index_set()]
[True, False, False, True, False]
```

```
>>> from sage.all import *
>>> B = AffinePermutationGroup(['B',Integer(4),Integer(1)])
>>> p = B([-Integer(5),Integer(1),Integer(6),-Integer(2)])
>>> [p.has_right_descent(i) for i in B.index_set()]
[True, False, False, True, False]
```

class sage.combinat.affine_permutation.**AffinePermutationTypeC**(*parent*, *lst*, *check=True*)

Bases: `AffinePermutation`

apply_simple_reflection_left(*i*)

Apply the simple reflection indexed by `i` on values.

EXAMPLES:

```
sage: C = AffinePermutationGroup(['C',4,1])
sage: x = C([-1,5,3,7])
sage: for i in C.index_set(): x.apply_simple_reflection_left(i)
Type C affine permutation with window [1, 5, 3, 7]
Type C affine permutation with window [-2, 5, 3, 8]
Type C affine permutation with window [-1, 5, 2, 6]
Type C affine permutation with window [-1, 6, 4, 7]
Type C affine permutation with window [-1, 4, 3, 7]
```

```
>>> from sage.all import *
>>> C = AffinePermutationGroup(['C',Integer(4),Integer(1)])
>>> x = C([-Integer(1),Integer(5),Integer(3),Integer(7)])
>>> for i in C.index_set(): x.apply_simple_reflection_left(i)
Type C affine permutation with window [1, 5, 3, 7]
Type C affine permutation with window [-2, 5, 3, 8]
Type C affine permutation with window [-1, 5, 2, 6]
Type C affine permutation with window [-1, 6, 4, 7]
Type C affine permutation with window [-1, 4, 3, 7]
```

apply_simple_reflection_right(*i*)

Apply the simple reflection indexed by `i` on positions.

EXAMPLES:

```
sage: C = AffinePermutationGroup(['C',4,1])
sage: x=C([-1,5,3,7])
sage: for i in C.index_set(): x.apply_simple_reflection_right(i)
Type C affine permutation with window [1, 5, 3, 7]
Type C affine permutation with window [5, -1, 3, 7]
Type C affine permutation with window [-1, 3, 5, 7]
Type C affine permutation with window [-1, 5, 7, 3]
Type C affine permutation with window [-1, 5, 3, 2]
```

```
>>> from sage.all import *
>>> C = AffinePermutationGroup(['C',Integer(4),Integer(1)])
>>> x=C([-Integer(1),Integer(5),Integer(3),Integer(7)])
>>> for i in C.index_set(): x.apply_simple_reflection_right(i)
Type C affine permutation with window [1, 5, 3, 7]
Type C affine permutation with window [5, -1, 3, 7]
```

(continues on next page)

(continued from previous page)

```
Type C affine permutation with window [-1, 3, 5, 7]
Type C affine permutation with window [-1, 5, 7, 3]
Type C affine permutation with window [-1, 5, 3, 2]
```

check()

Check that `self` is an affine permutation.

EXAMPLES:

```
sage: C = AffinePermutationGroup(['C',4,1])
sage: x = C([-1,5,3,7])
sage: x
Type C affine permutation with window [-1, 5, 3, 7]
```

```
>>> from sage.all import *
>>> C = AffinePermutationGroup(['C',Integer(4),Integer(1)])
>>> x = C([-Integer(1),Integer(5),Integer(3),Integer(7)])
>>> x
Type C affine permutation with window [-1, 5, 3, 7]
```

has_left_descent(*i*)

Determine whether there is a descent at `i`.

INPUT:

- `i` – integer

EXAMPLES:

```
sage: C = AffinePermutationGroup(['C',4,1])
sage: x = C([-1,5,3,7])
sage: for i in C.index_set(): x.has_left_descent(i)
True
False
True
False
True
```

```
>>> from sage.all import *
>>> C = AffinePermutationGroup(['C',Integer(4),Integer(1)])
>>> x = C([-Integer(1),Integer(5),Integer(3),Integer(7)])
>>> for i in C.index_set(): x.has_left_descent(i)
True
False
True
False
True
```

has_right_descent(*i*)

Determine whether there is a descent at index `i`.

INPUT:

- `i` – integer

EXAMPLES:

```
sage: C = AffinePermutationGroup(['C',4,1])
sage: x = C([-1,5,3,7])
sage: for i in C.index_set(): x.has_right_descent(i)
True
False
True
False
True
```

```
>>> from sage.all import *
>>> C = AffinePermutationGroup(['C',Integer(4),Integer(1)])
>>> x = C([-Integer(1),Integer(5),Integer(3),Integer(7)])
>>> for i in C.index_set(): x.has_right_descent(i)
True
False
True
False
True
```

position(i)

Find the position j such the `self.value(j)=i`.

EXAMPLES:

```
sage: C = AffinePermutationGroup(['C',4,1])
sage: x = C.one()
sage: all(x.position(i) == i for i in range(-10,10))
True
```

```
>>> from sage.all import *
>>> C = AffinePermutationGroup(['C',Integer(4),Integer(1)])
>>> x = C.one()
>>> all(x.position(i) == i for i in range(-Integer(10),Integer(10)))
True
```

to_type_a()

Return an embedding of `self` into the affine permutation group of type A.

EXAMPLES:

```
sage: C = AffinePermutationGroup(['C',4,1])
sage: x = C([-1,5,3,7])
sage: x.to_type_a()
Type A affine permutation with window [-1, 5, 3, 7, 2, 6, 4, 10, 9]
```

```
>>> from sage.all import *
>>> C = AffinePermutationGroup(['C',Integer(4),Integer(1)])
>>> x = C([-Integer(1),Integer(5),Integer(3),Integer(7)])
>>> x.to_type_a()
Type A affine permutation with window [-1, 5, 3, 7, 2, 6, 4, 10, 9]
```

value(*i*)

Return the image of the integer `i` under this permutation.

EXAMPLES:

```
sage: C = AffinePermutationGroup(['C',4,1])
sage: x = C.one()
sage: all(x.value(i) == i for i in range(-10,10))
True
```

```
>>> from sage.all import *
>>> C = AffinePermutationGroup(['C',Integer(4),Integer(1)])
>>> x = C.one()
>>> all(x.value(i) == i for i in range(-Integer(10),Integer(10)))
True
```

class sage.combinat.affine_permutation.**AffinePermutationTypeD**(*parent*, *lst*, *check=True*)

Bases: *AffinePermutationTypeC*

apply_simple_reflection_left(*i*)

Apply simple reflection indexed by `i` on values.

EXAMPLES:

```
sage: D = AffinePermutationGroup(['D',4,1])
sage: p=D([1,-6,5,-2])
sage: p.apply_simple_reflection_left(0)
Type D affine permutation with window [-2, -6, 5, 1]
sage: p.apply_simple_reflection_left(1)
Type D affine permutation with window [2, -6, 5, -1]
sage: p.apply_simple_reflection_left(4)
Type D affine permutation with window [1, -4, 3, -2]
```

```
>>> from sage.all import *
>>> D = AffinePermutationGroup(['D',Integer(4),Integer(1)])
>>> p=D([Integer(1),-Integer(6),Integer(5),-Integer(2)])
>>> p.apply_simple_reflection_left(Integer(0))
Type D affine permutation with window [-2, -6, 5, 1]
>>> p.apply_simple_reflection_left(Integer(1))
Type D affine permutation with window [2, -6, 5, -1]
>>> p.apply_simple_reflection_left(Integer(4))
Type D affine permutation with window [1, -4, 3, -2]
```

apply_simple_reflection_right(*i*)

Apply the simple reflection indexed by `i` on positions.

EXAMPLES:

```
sage: D = AffinePermutationGroup(['D',4,1])
sage: p=D([1,-6,5,-2])
sage: p.apply_simple_reflection_right(0)
Type D affine permutation with window [6, -1, 5, -2]
sage: p.apply_simple_reflection_right(1)
Type D affine permutation with window [-6, 1, 5, -2]
```

(continues on next page)

(continued from previous page)

```
sage: p.apply_simple_reflection_right(4)
Type D affine permutation with window [1, -6, 11, 4]
```

```
>>> from sage.all import *
>>> D = AffinePermutationGroup(['D',Integer(4),Integer(1)])
>>> p=D([Integer(1),-Integer(6),Integer(5),-Integer(2)])
>>> p.apply_simple_reflection_right(Integer(0))
Type D affine permutation with window [6, -1, 5, -2]
>>> p.apply_simple_reflection_right(Integer(1))
Type D affine permutation with window [-6, 1, 5, -2]
>>> p.apply_simple_reflection_right(Integer(4))
Type D affine permutation with window [1, -6, 11, 4]
```

check()

Check that `self` is an affine permutation.

EXAMPLES:

```
sage: D = AffinePermutationGroup(['D',4,1])
sage: p = D([1,-6,5,-2])
sage: p
Type D affine permutation with window [1, -6, 5, -2]
```

```
>>> from sage.all import *
>>> D = AffinePermutationGroup(['D',Integer(4),Integer(1)])
>>> p = D([Integer(1),-Integer(6),Integer(5),-Integer(2)])
>>> p
Type D affine permutation with window [1, -6, 5, -2]
```

has_left_descent(*i*)

Determine whether there is a descent at `i`.

INPUT:

- `i` – integer

EXAMPLES:

```
sage: D = AffinePermutationGroup(['D',4,1])
sage: p=D([1,-6,5,-2])
sage: [p.has_left_descent(i) for i in D.index_set()]
[True, True, False, True, True]
```

```
>>> from sage.all import *
>>> D = AffinePermutationGroup(['D',Integer(4),Integer(1)])
>>> p=D([Integer(1),-Integer(6),Integer(5),-Integer(2)])
>>> [p.has_left_descent(i) for i in D.index_set()]
[True, True, False, True, True]
```

has_right_descent(*i*)

Determine whether there is a descent at index `i`.

INPUT:

- `i` – integer

EXAMPLES:

```
sage: D = AffinePermutationGroup(['D',4,1])
sage: p=D([1,-6,5,-2])
sage: [p.has_right_descent(i) for i in D.index_set()]
[True, True, False, True, False]
```

```
>>> from sage.all import *
>>> D = AffinePermutationGroup(['D',Integer(4),Integer(1)])
>>> p=D([Integer(1),-Integer(6),Integer(5),-Integer(2)])
>>> [p.has_right_descent(i) for i in D.index_set()]
[True, True, False, True, False]
```

class sage.combinat.affine_permutation.**AffinePermutationTypeG**(*parent*, *lst*, *check=True*)

Bases: *AffinePermutation*

apply_simple_reflection_left(*i*)

Apply simple reflection indexed by i on values.

EXAMPLES:

```
sage: G = AffinePermutationGroup(['G',2,1])
sage: p=G([2, 10, -5, 12, -3, 5])
sage: p.apply_simple_reflection_left(0)
Type G affine permutation with window [0, 10, -7, 14, -3, 7]
sage: p.apply_simple_reflection_left(1)
Type G affine permutation with window [1, 9, -4, 11, -2, 6]
sage: p.apply_simple_reflection_left(2)
Type G affine permutation with window [3, 11, -5, 12, -4, 4]
```

```
>>> from sage.all import *
>>> G = AffinePermutationGroup(['G',Integer(2),Integer(1)])
>>> p=G([Integer(2), Integer(10), -Integer(5), Integer(12), -Integer(3),␣
↪Integer(5)])
>>> p.apply_simple_reflection_left(Integer(0))
Type G affine permutation with window [0, 10, -7, 14, -3, 7]
>>> p.apply_simple_reflection_left(Integer(1))
Type G affine permutation with window [1, 9, -4, 11, -2, 6]
>>> p.apply_simple_reflection_left(Integer(2))
Type G affine permutation with window [3, 11, -5, 12, -4, 4]
```

apply_simple_reflection_right(*i*)

Apply the simple reflection indexed by `i` on positions.

EXAMPLES:

```
sage: G = AffinePermutationGroup(['G',2,1])
sage: p = G([2, 10, -5, 12, -3, 5])
sage: p.apply_simple_reflection_right(0)
Type G affine permutation with window [-9, -1, -5, 12, 8, 16]
sage: p.apply_simple_reflection_right(1)
Type G affine permutation with window [10, 2, 12, -5, 5, -3]
sage: p.apply_simple_reflection_right(2)
Type G affine permutation with window [2, -5, 10, -3, 12, 5]
```

```
>>> from sage.all import *
>>> G = AffinePermutationGroup(['G',Integer(2),Integer(1)])
>>> p = G([Integer(2), Integer(10), -Integer(5), Integer(12), -Integer(3),␣
↪Integer(5)])
>>> p.apply_simple_reflection_right(Integer(0))
Type G affine permutation with window [-9, -1, -5, 12, 8, 16]
>>> p.apply_simple_reflection_right(Integer(1))
Type G affine permutation with window [10, 2, 12, -5, 5, -3]
>>> p.apply_simple_reflection_right(Integer(2))
Type G affine permutation with window [2, -5, 10, -3, 12, 5]
```

check()

Check that `self` is an affine permutation.

EXAMPLES:

```
sage: G = AffinePermutationGroup(['G',2,1])
sage: p = G([2, 10, -5, 12, -3, 5])
sage: p
Type G affine permutation with window [2, 10, -5, 12, -3, 5]
```

```
>>> from sage.all import *
>>> G = AffinePermutationGroup(['G',Integer(2),Integer(1)])
>>> p = G([Integer(2), Integer(10), -Integer(5), Integer(12), -Integer(3),␣
↪Integer(5)])
>>> p
Type G affine permutation with window [2, 10, -5, 12, -3, 5]
```

has_left_descent(*i*)

Determines whether there is a descent at `i`.

INPUT:

- `i` – integer

EXAMPLES:

```
sage: G = AffinePermutationGroup(['G',2,1])
sage: p = G([2, 10, -5, 12, -3, 5])
sage: [p.has_left_descent(i) for i in G.index_set()]
[False, True, False]
```

```
>>> from sage.all import *
>>> G = AffinePermutationGroup(['G',Integer(2),Integer(1)])
>>> p = G([Integer(2), Integer(10), -Integer(5), Integer(12), -Integer(3),␣
↪Integer(5)])
>>> [p.has_left_descent(i) for i in G.index_set()]
[False, True, False]
```

has_right_descent(*i*)

Determines whether there is a descent at index i.

INPUT:

- `i` – integer

EXAMPLES:

```
sage: G = AffinePermutationGroup(['G',2,1])
sage: p = G([2, 10, -5, 12, -3, 5])
sage: [p.has_right_descent(i) for i in G.index_set()]
[False, False, True]
```

```
>>> from sage.all import *
>>> G = AffinePermutationGroup(['G',Integer(2),Integer(1)])
>>> p = G([Integer(2), Integer(10), -Integer(5), Integer(12), -Integer(3),␣
↪Integer(5)])
>>> [p.has_right_descent(i) for i in G.index_set()]
[False, False, True]
```

position(*i*)

Find the position `j` such the `self.value(j) == i`.

EXAMPLES:

```
sage: G = AffinePermutationGroup(['G',2,1])
sage: p = G([2, 10, -5, 12, -3, 5])
sage: [p.position(i) for i in p]
[1, 2, 3, 4, 5, 6]
```

```
>>> from sage.all import *
>>> G = AffinePermutationGroup(['G',Integer(2),Integer(1)])
>>> p = G([Integer(2), Integer(10), -Integer(5), Integer(12), -Integer(3),␣
↪Integer(5)])
>>> [p.position(i) for i in p]
[1, 2, 3, 4, 5, 6]
```

to_type_a()

Return an embedding of `self` into the affine permutation group of type A.

EXAMPLES:

```
sage: G = AffinePermutationGroup(['G',2,1])
sage: p = G([2, 10, -5, 12, -3, 5])
sage: p.to_type_a()
Type A affine permutation with window [2, 10, -5, 12, -3, 5]
```

```
>>> from sage.all import *
>>> G = AffinePermutationGroup(['G',Integer(2),Integer(1)])
>>> p = G([Integer(2), Integer(10), -Integer(5), Integer(12), -Integer(3),␣
↪Integer(5)])
>>> p.to_type_a()
Type A affine permutation with window [2, 10, -5, 12, -3, 5]
```

value(*i*, *base_window=False*)

Return the image of the integer `i` under this permutation.

INPUT:

- `base_window` – boolean indicating whether `i` is between 1 and $k+1$; if `True`, will run a bit faster, but the method will screw up if `i` is not actually in the index set

EXAMPLES:

```
sage: G = AffinePermutationGroup(['G',2,1])
sage: p=G([2, 10, -5, 12, -3, 5])
sage: [p.value(i) for i in [1..12]]
[2, 10, -5, 12, -3, 5, 8, 16, 1, 18, 3, 11]
```

```
>>> from sage.all import *
>>> G = AffinePermutationGroup(['G',Integer(2),Integer(1)])
>>> p=G([Integer(2), Integer(10), -Integer(5), Integer(12), -Integer(3),␣
↪Integer(5)])
>>> [p.value(i) for i in (ellipsis_range(Integer(1),Ellipsis,Integer(12)))]
[2, 10, -5, 12, -3, 5, 8, 16, 1, 18, 3, 11]
```

5.1.5 Alternating Sign Matrices

AUTHORS:

- Mike Hansen (2007): Initial version
- Pierre Cange, Luis Serrano (2012): Added monotone triangles
- Travis Scrimshaw (2013-28-03): Added element class for ASM's and made `MonotoneTriangles` inherit from `GelfandTsetlinPatterns`
- Jessica Striker (2013): Added additional methods
- Vincent Delecroix (2017): cleaning

class `sage.combinat.alternating_sign_matrix.`**`AlternatingSignMatrices`**`(n)`

Bases: `UniqueRepresentation`, `Parent`

Class of all $n \times n$ alternating sign matrices.

An alternating sign matrix of size n is an $n \times n$ matrix of 0's, 1's and -1's such that the sum of each row and column is 1 and the nonzero entries in each row and column alternate in sign.

Alternating sign matrices of size n are in bijection with `monotone triangles` with n rows.

INPUT:

- `n` – integer; the size of the matrices

EXAMPLES:

This will create an instance to manipulate the alternating sign matrices of size 3:

```
sage: A = AlternatingSignMatrices(3)
sage: A
Alternating sign matrices of size 3
sage: A.cardinality()
7
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
>>> A
Alternating sign matrices of size 3
>>> A.cardinality()
7
```

Notably, this implementation allows to make a lattice of it:

```
sage: L = A.lattice()
sage: L
Finite lattice containing 7 elements
sage: L.category()
Category of facade finite enumerated lattice posets
```

```
>>> from sage.all import *
>>> L = A.lattice()
>>> L
Finite lattice containing 7 elements
>>> L.category()
Category of facade finite enumerated lattice posets
```

Element

alias of *AlternatingSignMatrix*

cardinality()

Return the cardinality of `self`.

The number of $n \times n$ alternating sign matrices is equal to

$$\prod_{k=0}^{n-1} \frac{(3k+1)!}{(n+k)!} = \frac{1!4!7!10!\cdots(3n-2)!}{n!(n+1)!(n+2)!(n+3)!\cdots(2n-1)!}$$

EXAMPLES:

```
sage: [AlternatingSignMatrices(n).cardinality() for n in range(11)]
[1, 1, 2, 7, 42, 429, 7436, 218348, 10850216, 911835460, 129534272700]
```

```
>>> from sage.all import *
>>> [AlternatingSignMatrices(n).cardinality() for n in range(Integer(11))]
[1, 1, 2, 7, 42, 429, 7436, 218348, 10850216, 911835460, 129534272700]
```

cover_relations()

Iterate on the cover relations between the alternating sign matrices.

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: for (a,b) in A.cover_relations():
....:     eval('a, b')
(
[1 0 0]  [0 1 0]
[0 1 0]  [1 0 0]
[0 0 1], [0 0 1]
)
(
[1 0 0]  [1 0 0]
[0 1 0]  [0 0 1]
[0 0 1], [0 1 0]
)
(
```

(continues on next page)

(continued from previous page)

```
[0 1 0]   [ 0  1  0]
[1 0 0]   [ 1 -1  1]
[0 0 1], [ 0  1  0]
)
(
[1 0 0]   [ 0  1  0]
[0 0 1]   [ 1 -1  1]

first()

Return the first alternating sign matrix.

EXAMPLES:

```
sage: AlternatingSignMatrices(5).first()
[1 0 0 0 0]
[0 1 0 0 0]
[0 0 1 0 0]
[0 0 0 1 0]
[0 0 0 0 1]
```

```
>>> from sage.all import *
>>> AlternatingSignMatrices(Integer(5)).first()
[1 0 0 0 0]
[0 1 0 0 0]
[0 0 1 0 0]
[0 0 0 1 0]
[0 0 0 0 1]
```

from_contre_tableau(*comps*)

Return an alternating sign matrix from a contre-tableau.

EXAMPLES:

```
sage: ASM = AlternatingSignMatrices(3)
sage: ASM.from_contre_tableau([[1, 2, 3], [1, 2], [1]])
[0 0 1]
[0 1 0]
[1 0 0]
```

(continues on next page)

(continued from previous page)

```
sage: ASM.from_contre_tableau([[1, 2, 3], [2, 3], [3]])
[1 0 0]
[0 1 0]
[0 0 1]
```

```
>>> from sage.all import *
>>> ASM = AlternatingSignMatrices(Integer(3))
>>> ASM.from_contre_tableau([[Integer(1), Integer(2), Integer(3)],␣
↪[Integer(1), Integer(2)], [Integer(1)]])
[0 0 1]
[0 1 0]
[1 0 0]
>>> ASM.from_contre_tableau([[Integer(1), Integer(2), Integer(3)],␣
↪[Integer(2), Integer(3)], [Integer(3)]])
[1 0 0]
[0 1 0]
[0 0 1]
```

from_corner_sum(*corner*)

Return an alternating sign matrix from a corner sum matrix.

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: A.from_corner_sum(matrix([[0,0,0,0],[0,1,1,1],[0,1,2,2],[0,1,2,3]]))
[1 0 0]
[0 1 0]
[0 0 1]
sage: A.from_corner_sum(matrix([[0,0,0,0],[0,0,1,1],[0,1,1,2],[0,1,2,3]]))
[ 0  1  0]
[ 1 -1  1]
[ 0  1  0]
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
>>> A.from_corner_sum(matrix([[Integer(0),Integer(0),Integer(0),Integer(0)],
↪[Integer(0),Integer(1),Integer(1),Integer(1)],[Integer(0),Integer(1),
↪Integer(2),Integer(2)],[Integer(0),Integer(1),Integer(2),Integer(3)]]))
[1 0 0]
[0 1 0]
[0 0 1]
>>> A.from_corner_sum(matrix([[Integer(0),Integer(0),Integer(0),Integer(0)],
↪[Integer(0),Integer(0),Integer(1),Integer(1)],[Integer(0),Integer(1),
↪Integer(1),Integer(2)],[Integer(0),Integer(1),Integer(2),Integer(3)]]))
[ 0  1  0]
[ 1 -1  1]
[ 0  1  0]
```

from_height_function(*height*)

Return an alternating sign matrix from a height function.

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: A.from_height_function(matrix([[0,1,2,3],[1,2,1,2],[2,3,2,1],[3,2,1,
↪0]]))
[0 0 1]
[1 0 0]
[0 1 0]
sage: A.from_height_function(matrix([[0,1,2,3],[1,2,1,2],[2,1,2,1],[3,2,1,
↪0]]))
[ 0  1  0]
[ 1 -1  1]
[ 0  1  0]
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
>>> A.from_height_function(matrix([[Integer(0),Integer(1),Integer(2),
↪Integer(3)],[Integer(1),Integer(2),Integer(1),Integer(2)],[Integer(2),
↪Integer(3),Integer(2),Integer(1)],[Integer(3),Integer(2),Integer(1),
↪Integer(0)]]))
[0 0 1]
[1 0 0]
[0 1 0]
>>> A.from_height_function(matrix([[Integer(0),Integer(1),Integer(2),
↪Integer(3)],[Integer(1),Integer(2),Integer(1),Integer(2)],[Integer(2),
↪Integer(1),Integer(2),Integer(1)],[Integer(3),Integer(2),Integer(1),
↪Integer(0)]]))
[ 0  1  0]
[ 1 -1  1]
[ 0  1  0]
```

from_monotone_triangle(*triangle*, *check=True*)

Return an alternating sign matrix from a monotone triangle.

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: A.from_monotone_triangle([[3, 2, 1], [2, 1], [1]])
[1 0 0]
[0 1 0]
[0 0 1]
sage: A.from_monotone_triangle([[3, 2, 1], [3, 2], [3]])
[0 0 1]
[0 1 0]
[1 0 0]

sage: A.from_monotone_triangle([[3, 2, 1], [2, 2], [1]])
Traceback (most recent call last):
...
ValueError: not a valid triangle
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
>>> A.from_monotone_triangle([[Integer(3), Integer(2), Integer(1)],␣
```

(continues on next page)

(continued from previous page)

```
↪[Integer(2), Integer(1)], [Integer(1)]])
[1 0 0]
[0 1 0]
[0 0 1]
>>> A.from_monotone_triangle([[Integer(3), Integer(2), Integer(1)],␣
↪[Integer(3), Integer(2)], [Integer(3)]])
[0 0 1]
[0 1 0]
[1 0 0]

>>> A.from_monotone_triangle([[Integer(3), Integer(2), Integer(1)],␣
↪[Integer(2), Integer(2)], [Integer(1)]])
Traceback (most recent call last):
...
ValueError: not a valid triangle
```

gyration_orbit_sizes()

Return the sizes of gyration orbits of `self`.

EXAMPLES:

```
sage: AlternatingSignMatrices(3).gyration_orbit_sizes()
[3, 2, 2]
sage: AlternatingSignMatrices(4).gyration_orbit_sizes()
[4, 8, 2, 8, 8, 8, 2, 2]

sage: A = AlternatingSignMatrices(5)
sage: li = [5,10,10,10,10,10,2,5,10,10,10,10,10,10,10,10,10,10,10,10,
....: 4,10,10,10,10,10,10,4,5,10,10,10,10,10,10,10,2,4,5,10,10,10,10,10,10,
....: 4,5,10,10,2,2]
sage: A.gyration_orbit_sizes() == li
True
```

```
>>> from sage.all import *
>>> AlternatingSignMatrices(Integer(3)).gyration_orbit_sizes()
[3, 2, 2]
>>> AlternatingSignMatrices(Integer(4)).gyration_orbit_sizes()
[4, 8, 2, 8, 8, 8, 2, 2]

>>> A = AlternatingSignMatrices(Integer(5))
>>> li = [Integer(5),Integer(10),Integer(10),Integer(10),Integer(10),
↪Integer(10),Integer(2),Integer(5),Integer(10),Integer(10),Integer(10),
↪Integer(10),Integer(10),Integer(10),Integer(10),Integer(10),Integer(10),
↪Integer(10),Integer(10),Integer(10),
... Integer(4),Integer(10),Integer(10),Integer(10),Integer(10),Integer(10),
↪Integer(10),Integer(4),Integer(5),Integer(10),Integer(10),Integer(10),
↪Integer(10),Integer(10),Integer(10),Integer(10),Integer(2),Integer(4),
↪Integer(5),Integer(10),Integer(10),Integer(10),Integer(10),Integer(10),
↪Integer(10),
... Integer(4),Integer(5),Integer(10),Integer(10),Integer(2),Integer(2)]
>>> A.gyration_orbit_sizes() == li
```

(continues on next page)

(continued from previous page)

```
True
```

gyration_orbits()

Return the list of gyration orbits of `self`.

EXAMPLES:

```
sage: AlternatingSignMatrices(3).gyration_orbits()
((
  [1 0 0]  [0 0 1]  [ 0  1  0]
  [0 1 0]  [0 1 0]  [ 1 -1  1]
  [0 0 1], [1 0 0], [ 0  1  0]
 ),
 (
  [0 1 0]  [1 0 0]
  [1 0 0]  [0 0 1]
  [0 0 1], [0 1 0]
 ),
 (
  [0 0 1]  [0 1 0]
  [1 0 0]  [0 0 1]
  [0 1 0], [1 0 0]
 ))
```

```
>>> from sage.all import *
>>> AlternatingSignMatrices(Integer(3)).gyration_orbits()
((
  [1 0 0]  [0 0 1]  [ 0  1  0]
  [0 1 0]  [0 1 0]  [ 1 -1  1]
  [0 0 1], [1 0 0], [ 0  1  0]
 ),
 (
  [0 1 0]  [1 0 0]
  [1 0 0]  [0 0 1]
  [0 0 1], [0 1 0]
 ),
 (
  [0 0 1]  [0 1 0]
  [1 0 0]  [0 0 1]
  [0 1 0], [1 0 0]
 ))
```

last()

Return the last alternating sign matrix.

EXAMPLES:

```
sage: AlternatingSignMatrices(5).last()
[0 0 0 0 1]
[0 0 0 1 0]
[0 0 1 0 0]
[0 1 0 0 0]
[1 0 0 0 0]
```

```
>>> from sage.all import *
>>> AlternatingSignMatrices(Integer(5)).last()
[0 0 0 0 1]
[0 0 0 1 0]
[0 0 1 0 0]
[0 1 0 0 0]
[1 0 0 0 0]
```

lattice()

Return the lattice of the alternating sign matrices of size n, created by `LatticePoset`.

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: L = A.lattice()
sage: L
Finite lattice containing 7 elements
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
>>> L = A.lattice()
>>> L
Finite lattice containing 7 elements
```

matrix_space()

Return the underlying matrix space.

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: A.matrix_space()
Full MatrixSpace of 3 by 3 dense matrices over Integer Ring
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
>>> A.matrix_space()
Full MatrixSpace of 3 by 3 dense matrices over Integer Ring
```

random_element()

Return a uniformly random alternating sign matrix.

EXAMPLES:

```
sage: AlternatingSignMatrices(7).random_element()   # random
[ 0  0  0  0  1  0  0]
[ 0  0  1  0 -1  0  1]
[ 0  0  0  0  1  0  0]
[ 0  1 -1  0  0  1  0]
[ 1 -1  1  0  0  0  0]
[ 0  0  0  1  0  0  0]
[ 0  1  0  0  0  0  0]
sage: a = AlternatingSignMatrices(5).random_element()
sage: bool(a.number_negative_ones()) or a.is_permutation()
True
```

```
>>> from sage.all import *
>>> AlternatingSignMatrices(Integer(7)).random_element()  # random
[ 0  0  0  0  1  0  0]
[ 0  0  1  0 -1  0  1]
[ 0  0  0  0  1  0  0]
[ 0  1 -1  0  0  1  0]
[ 1 -1  1  0  0  0  0]
[ 0  0  0  1  0  0  0]
[ 0  1  0  0  0  0  0]
>>> a = AlternatingSignMatrices(Integer(5)).random_element()
>>> bool(a.number_negative_ones()) or a.is_permutation()
True
```

This is done using a modified version of Propp and Wilson's "coupling from the past" algorithm. It creates a uniformly random Gelfand-Tsetlin triangle with top row $[n, n-1, \ldots 2, 1]$, and then converts it to an alternating sign matrix.

size()

Return the size of the matrices in `self`.

class sage.combinat.alternating_sign_matrix.**AlternatingSignMatrix**(*parent*, *asm*)

Bases: `Element`

An alternating sign matrix.

An alternating sign matrix is a square matrix of 0's, 1's and -1's such that the sum of each row and column is 1 and the nonzero entries in each row and column alternate in sign.

These were introduced in [MRR1983].

ASM_compatible(B)

Return `True` if `self` and `B` are compatible alternating sign matrices in the sense of [EKLP1992]. (If `self` is of size n, `B` must be of size $n+1$.)

In [EKLP1992], there is a notion of a pair of ASM's with sizes differing by 1 being compatible, in the sense that they can be combined to encode a tiling of the Aztec Diamond.

EXAMPLES:

```
sage: A = AlternatingSignMatrix(matrix([[0,0,1,0],[0,1,-1,1],[1,0,0,0],[0,0,1,
↪0]]))
sage: B = AlternatingSignMatrix(matrix([[0,0,1,0,0],[0,0,0,1,0],[1,0,0,-1,1],
↪[0,1,0,0,0],[0,0,0,1,0]]))
sage: A.ASM_compatible(B)
True
sage: A = AlternatingSignMatrix(matrix([[0,1,0],[1,-1,1],[0,1,0]]))
sage: B = AlternatingSignMatrix(matrix([[0,0,1,0],[0,0,0,1],[1,0,0,0],[0,1,0,
↪0]]))
sage: A.ASM_compatible(B)
False
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrix(matrix([[Integer(0),Integer(0),Integer(1),
↪Integer(0)],[Integer(0),Integer(1),-Integer(1),Integer(1)],[Integer(1),
↪Integer(0),Integer(0),Integer(0)],[Integer(0),Integer(0),Integer(1),
↪Integer(0)]]))
```

(continues on next page)

(continued from previous page)

```
>>> B = AlternatingSignMatrix(matrix([[Integer(0),Integer(0),Integer(1),
↪Integer(0),Integer(0)],[Integer(0),Integer(0),Integer(0),Integer(1),
↪Integer(0)],[Integer(1),Integer(0),Integer(0),-Integer(1),Integer(1)],
↪[Integer(0),Integer(1),Integer(0),Integer(0),Integer(0)],[Integer(0),
↪Integer(0),Integer(0),Integer(1),Integer(0)]]))
>>> A.ASM_compatible(B)
True
>>> A = AlternatingSignMatrix(matrix([[Integer(0),Integer(1),Integer(0)],
↪[Integer(1),-Integer(1),Integer(1)],[Integer(0),Integer(1),Integer(0)]]))
>>> B = AlternatingSignMatrix(matrix([[Integer(0),Integer(0),Integer(1),
↪Integer(0)],[Integer(0),Integer(0),Integer(0),Integer(1)],[Integer(1),
↪Integer(0),Integer(0),Integer(0)],[Integer(0),Integer(1),Integer(0),
↪Integer(0)]]))
>>> A.ASM_compatible(B)
False
```

ASM_compatible_bigger()

Return all ASM's compatible with `self` that are of size one greater than `self`.

Given an $n \times n$ alternating sign matrix A, there are as many ASM's of size $n + 1$ compatible with A as 2 raised to the power of the number of 1s in A [EKLP1992].

EXAMPLES:

```
sage: A = AlternatingSignMatrix([[1,0],[0,1]])
sage: A.ASM_compatible_bigger()
[
[ 0  1  0]  [1 0 0]  [0 1 0]  [1 0 0]
[ 1 -1  1]  [0 0 1]  [1 0 0]  [0 1 0]
[ 0  1  0], [0 1 0], [0 0 1], [0 0 1]
]
sage: B = AlternatingSignMatrix([[0,1],[1,0]])
sage: B.ASM_compatible_bigger()
[
[0 0 1]  [0 0 1]  [0 1 0]  [ 0  1  0]
[0 1 0]  [1 0 0]  [0 0 1]  [ 1 -1  1]
[1 0 0], [0 1 0], [1 0 0], [ 0  1  0]
]

sage: B = AlternatingSignMatrix([[0,1,0],[1,-1,1],[0,1,0]])
sage: len(B.ASM_compatible_bigger()) == 2**4
True
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrix([[Integer(1),Integer(0)],[Integer(0),
↪Integer(1)]])
>>> A.ASM_compatible_bigger()
[
[ 0  1  0]  [1 0 0]  [0 1 0]  [1 0 0]
[ 1 -1  1]  [0 0 1]  [1 0 0]  [0 1 0]
[ 0  1  0], [0 1 0], [0 0 1], [0 0 1]
]
>>> B = AlternatingSignMatrix([[Integer(0),Integer(1)],[Integer(1),
```

(continues on next page)

(continued from previous page)

```
↪Integer(0)]])
>>> B.ASM_compatible_bigger()
[
[0 0 1]  [0 0 1]  [0 1 0]  [ 0  1  0]
[0 1 0]  [1 0 0]  [0 0 1]  [ 1 -1  1]
[1 0 0], [0 1 0], [1 0 0], [ 0  1  0]
]

>>> B = AlternatingSignMatrix([[Integer(0),Integer(1),Integer(0)],[Integer(1),
↪-Integer(1),Integer(1)],[Integer(0),Integer(1),Integer(0)]])
>>> len(B.ASM_compatible_bigger()) == Integer(2)**Integer(4)
True
```

ASM_compatible_smaller()

Return the list of all ASMs compatible with `self` that are of size one smaller than `self`.

Given an alternating sign matrix A of size n, there are as many ASM's of size $n-1$ compatible with it as 2 raised to the power of the number of -1's in A [EKLP1992].

EXAMPLES:

```
sage: A = AlternatingSignMatrix(matrix([[0,0,1,0],[0,1,-1,1],[1,0,0,0],[0,0,1,
↪0]]))
sage: A.ASM_compatible_smaller()
[
[0 0 1]  [ 0  1  0]
[1 0 0]  [ 1 -1  1]
[0 1 0], [ 0  1  0]
]
sage: B = AlternatingSignMatrix(matrix([[1,0,0],[0,0,1],[0,1,0]]))
sage: B.ASM_compatible_smaller()
[
[1 0]
[0 1]
]
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrix(matrix([[Integer(0),Integer(0),Integer(1),
↪Integer(0)],[Integer(0),Integer(1),-Integer(1),Integer(1)],[Integer(1),
↪Integer(0),Integer(0),Integer(0)],[Integer(0),Integer(0),Integer(1),
↪Integer(0)]]))
>>> A.ASM_compatible_smaller()
[
[0 0 1]  [ 0  1  0]
[1 0 0]  [ 1 -1  1]
[0 1 0], [ 0  1  0]
]
>>> B = AlternatingSignMatrix(matrix([[Integer(1),Integer(0),Integer(0)],
↪[Integer(0),Integer(0),Integer(1)],[Integer(0),Integer(1),Integer(0)]]))
>>> B.ASM_compatible_smaller()
[
[1 0]
[0 1]
```

(continues on next page)

(continued from previous page)

```
]
```

corner_sum_matrix()

Return the corner sum matrix of `self`.

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: A([[1, 0, 0],[0, 1, 0],[0, 0, 1]]).corner_sum_matrix()
[0 0 0 0]
[0 1 1 1]
[0 1 2 2]
[0 1 2 3]
sage: asm = A([[0, 1, 0],[1, -1, 1],[0, 1, 0]])
sage: asm.corner_sum_matrix()
[0 0 0 0]
[0 0 1 1]
[0 1 1 2]
[0 1 2 3]
sage: asm = A([[0, 0, 1],[1, 0, 0],[0, 1, 0]])
sage: asm.corner_sum_matrix()
[0 0 0 0]
[0 0 0 1]
[0 1 1 2]
[0 1 2 3]
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
>>> A([[Integer(1), Integer(0), Integer(0)],[Integer(0), Integer(1),␣
↪Integer(0)],[Integer(0), Integer(0), Integer(1)]]).corner_sum_matrix()
[0 0 0 0]
[0 1 1 1]
[0 1 2 2]
[0 1 2 3]
>>> asm = A([[Integer(0), Integer(1), Integer(0)],[Integer(1), -Integer(1),␣
↪Integer(1)],[Integer(0), Integer(1), Integer(0)]])
>>> asm.corner_sum_matrix()
[0 0 0 0]
[0 0 1 1]
[0 1 1 2]
[0 1 2 3]
>>> asm = A([[Integer(0), Integer(0), Integer(1)],[Integer(1), Integer(0),␣
↪Integer(0)],[Integer(0), Integer(1), Integer(0)]])
>>> asm.corner_sum_matrix()
[0 0 0 0]
[0 0 0 1]
[0 1 1 2]
[0 1 2 3]
```

gyration()

Return the alternating sign matrix obtained by applying gyration to the height function in bijection with `self`.

Gyration acts on height functions as follows. Go through the entries of the matrix, first those for which the sum of the row and column indices is even, then for those for which it is odd, and increment or decrement the squares by 2 wherever possible such that the resulting matrix is still a height function. Gyration was first defined in [Wie2000] as an action on fully-packed loops.

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: A([[1, 0, 0],[0, 1, 0],[0, 0, 1]]).gyration()
[0 0 1]
[0 1 0]
[1 0 0]
sage: asm = A([[0, 1, 0],[1, -1, 1],[0, 1, 0]])
sage: asm.gyration()
[1 0 0]
[0 1 0]
[0 0 1]
sage: asm = A([[0, 0, 1],[1, 0, 0],[0, 1, 0]])
sage: asm.gyration()
[0 1 0]
[0 0 1]
[1 0 0]
sage: A = AlternatingSignMatrices(3)
sage: A([[1, 0, 0],[0, 1, 0],[0, 0, 1]]).gyration().gyration()
[ 0  1  0]

↪gyration_orbit())
12
```

height_function()

Return the height function from `self`.

A height function corresponding to an $n \times n$ ASM is an $(n+1) \times (n+1)$ matrix such that the first row is $0, 1, \ldots, n$, the last row is $n, n-1, \ldots, 1, 0$, and the difference between adjacent entries is 1.

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: A([[1, 0, 0],[0, 1, 0],[0, 0, 1]]).height_function()
[0 1 2 3]
[1 0 1 2]
[2 1 0 1]
[3 2 1 0]
sage: asm = A([[0, 1, 0],[1, -1, 1],[0, 1, 0]])
sage: asm.height_function()
[0 1 2 3]
[1 2 1 2]
[2 1 2 1]
[3 2 1 0]
sage: asm = A([[0, 0, 1],[1, 0, 0],[0, 1, 0]])
sage: asm.height_function()
[0 1 2 3]
[1 2 1 2]
[2 3 2 1]
[3 2 1 0]

sage: A = AlternatingSignMatrices(4)
sage: all(A.from_height_function(a.height_function()) == a for a in A)
True
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
>>> A([[Integer(1), Integer(0), Integer(0)],[Integer(0), Integer(1),␣
→Integer(0)],[Integer(0), Integer(0), Integer(1)]]).height_function()
[0 1 2 3]
[1 0 1 2]
[2 1 0 1]
[3 2 1 0]
>>> asm = A([[Integer(0), Integer(1), Integer(0)],[Integer(1), -Integer(1),␣
→Integer(1)],[Integer(0), Integer(1), Integer(0)]])
>>> asm.height_function()
[0 1 2 3]
[1 2 1 2]
[2 1 2 1]
[3 2 1 0]
>>> asm = A([[Integer(0), Integer(0), Integer(1)],[Integer(1), Integer(0),␣
→Integer(0)],[Integer(0), Integer(1), Integer(0)]])
>>> asm.height_function()
[0 1 2 3]
[1 2 1 2]
[2 3 2 1]
[3 2 1 0]

>>> A = AlternatingSignMatrices(Integer(4))
>>> all(A.from_height_function(a.height_function()) == a for a in A)
True
```

inversion_number()

Return the inversion number of `self`.

If we denote the entries of the alternating sign matrix as $a_{i,j}$, the inversion number is defined as $\sum_{i>k}\sum_{j<l} a_{i,j}a_{k,l}$. When restricted to permutation matrices, this gives the usual inversion number of the permutation.

This definition is equivalent to the one given in [MRR1983].

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: A([[1, 0, 0],[0, 1, 0],[0, 0, 1]]).inversion_number()
0
sage: asm = A([[0, 0, 1],[1, 0, 0],[0, 1, 0]])
sage: asm.inversion_number()
2
sage: asm = A([[0, 1, 0],[1, -1, 1],[0, 1, 0]])
sage: asm.inversion_number()
2
sage: P = Permutations(5)
sage: all(p.number_of_inversions()==AlternatingSignMatrix(p.to_matrix()).
↪inversion_number() for p in P)
True
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
>>> A([[Integer(1), Integer(0), Integer(0)],[Integer(0), Integer(1),␣
↪Integer(0)],[Integer(0), Integer(0), Integer(1)]]).inversion_number()
0
>>> asm = A([[Integer(0), Integer(0), Integer(1)],[Integer(1), Integer(0),␣
↪Integer(0)],[Integer(0), Integer(1), Integer(0)]])
>>> asm.inversion_number()
2
>>> asm = A([[Integer(0), Integer(1), Integer(0)],[Integer(1), -Integer(1),␣
↪Integer(1)],[Integer(0), Integer(1), Integer(0)]])
>>> asm.inversion_number()
2
>>> P = Permutations(Integer(5))
>>> all(p.number_of_inversions()==AlternatingSignMatrix(p.to_matrix()).
↪inversion_number() for p in P)
True
```

is_permutation()

Return `True` if `self` is a permutation matrix and `False` otherwise.

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: asm = A([[0,1,0],[1,0,0],[0,0,1]])
sage: asm.is_permutation()
True
sage: asm = A([[0,1,0],[1,-1,1],[0,1,0]])
sage: asm.is_permutation()
False
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
>>> asm = A([[Integer(0),Integer(1),Integer(0)],[Integer(1),Integer(0),
↪Integer(0)],[Integer(0),Integer(0),Integer(1)]])
>>> asm.is_permutation()
True
>>> asm = A([[Integer(0),Integer(1),Integer(0)],[Integer(1),-Integer(1),
↪Integer(1)],[Integer(0),Integer(1),Integer(0)]])
>>> asm.is_permutation()
False
```

left_key()

Return the left key of the alternating sign matrix `self`.

The left key of an alternating sign matrix was defined by Lascoux in [Lasc] and is obtained by successively removing all the -1's until what remains is a permutation matrix. This notion corresponds to the notion of left key for semistandard tableaux. So our algorithm proceeds as follows: we map `self` to its corresponding monotone triangle, view that monotone triangle as a semistandard tableau, take its left key, and then map back through monotone triangles to the permutation matrix which is the left key.

See also [Ava2007].

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: A([[0,0,1],[1,0,0],[0,1,0]]).left_key()
[0 0 1]
[1 0 0]
[0 1 0]
sage: t = A([[0,1,0],[1,-1,1],[0,1,0]]).left_key(); t
[1 0 0]
[0 0 1]
[0 1 0]
sage: parent(t)
Alternating sign matrices of size 3
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
>>> A([[Integer(0),Integer(0),Integer(1)],[Integer(1),Integer(0),Integer(0)],
↪[Integer(0),Integer(1),Integer(0)]]).left_key()
[0 0 1]
[1 0 0]
[0 1 0]
>>> t = A([[Integer(0),Integer(1),Integer(0)],[Integer(1),-Integer(1),
↪Integer(1)],[Integer(0),Integer(1),Integer(0)]]).left_key(); t
[1 0 0]
[0 0 1]
[0 1 0]
>>> parent(t)
Alternating sign matrices of size 3
```

left_key_as_permutation()

Return the permutation of the left key of `self`.

See also

- *left_key()*

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: A([[0,0,1],[1,0,0],[0,1,0]]).left_key_as_permutation()
[3, 1, 2]
sage: t = A([[0,1,0],[1,-1,1],[0,1,0]]).left_key_as_permutation(); t
[1, 3, 2]
sage: parent(t)
Standard permutations
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
>>> A([[Integer(0),Integer(0),Integer(1)],[Integer(1),Integer(0),Integer(0)],
↪[Integer(0),Integer(1),Integer(0)]]).left_key_as_permutation()
[3, 1, 2]
>>> t = A([[Integer(0),Integer(1),Integer(0)],[Integer(1),-Integer(1),
↪Integer(1)],[Integer(0),Integer(1),Integer(0)]]).left_key_as_permutation();
↪t
[1, 3, 2]
>>> parent(t)
Standard permutations
```

link_pattern()

Return the link pattern corresponding to the fully packed loop corresponding to `self`.

EXAMPLES:

We can extract the underlying link pattern (a non-crossing partition) from a fully packed loop:

```
sage: A = AlternatingSignMatrix([[0, 1, 0], [1, -1, 1], [0, 1, 0]])
sage: A.link_pattern()
[(1, 2), (3, 6), (4, 5)]

sage: B = AlternatingSignMatrix([[1, 0, 0], [0, 1, 0], [0, 0, 1]])
sage: B.link_pattern()
[(1, 6), (2, 5), (3, 4)]
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrix([[Integer(0), Integer(1), Integer(0)],
↪[Integer(1), -Integer(1), Integer(1)], [Integer(0), Integer(1),
↪Integer(0)]])
>>> A.link_pattern()
[(1, 2), (3, 6), (4, 5)]

>>> B = AlternatingSignMatrix([[Integer(1), Integer(0), Integer(0)],
↪[Integer(0), Integer(1), Integer(0)], [Integer(0), Integer(0), Integer(1)]])
>>> B.link_pattern()
[(1, 6), (2, 5), (3, 4)]
```

number_negative_ones()

Return the number of entries in `self` equal to -1.

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: asm = A([[0,1,0],[1,0,0],[0,0,1]])
sage: asm.number_negative_ones()
0
sage: asm = A([[0,1,0],[1,-1,1],[0,1,0]])
sage: asm.number_negative_ones()
1
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
>>> asm = A([[Integer(0),Integer(1),Integer(0)],[Integer(1),Integer(0),
↪Integer(0)],[Integer(0),Integer(0),Integer(1)]])
>>> asm.number_negative_ones()
0
>>> asm = A([[Integer(0),Integer(1),Integer(0)],[Integer(1),-Integer(1),
↪Integer(1)],[Integer(0),Integer(1),Integer(0)]])
>>> asm.number_negative_ones()
1
```

rotate_ccw()

Return the counterclockwise quarter turn rotation of `self`.

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: A([[1, 0, 0],[0, 1, 0],[0, 0, 1]]).rotate_ccw()
[0 0 1]
[0 1 0]
[1 0 0]
sage: asm = A([[0, 0, 1],[1, 0, 0],[0, 1, 0]])
sage: asm.rotate_ccw()
[1 0 0]
[0 0 1]
[0 1 0]
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
>>> A([[Integer(1), Integer(0), Integer(0)],[Integer(0), Integer(1),␣
↪Integer(0)],[Integer(0), Integer(0), Integer(1)]]).rotate_ccw()
[0 0 1]
[0 1 0]
[1 0 0]
>>> asm = A([[Integer(0), Integer(0), Integer(1)],[Integer(1), Integer(0),␣
↪Integer(0)],[Integer(0), Integer(1), Integer(0)]])
>>> asm.rotate_ccw()
[1 0 0]
[0 0 1]
[0 1 0]
```

rotate_cw()

Return the clockwise quarter turn rotation of self.

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: A([[1, 0, 0],[0, 1, 0],[0, 0, 1]]).rotate_cw()
[0 0 1]
[0 1 0]
[1 0 0]
sage: asm = A([[0, 0, 1],[1, 0, 0],[0, 1, 0]])
sage: asm.rotate_cw()
[0 1 0]
[1 0 0]
[0 0 1]
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
>>> A([[Integer(1), Integer(0), Integer(0)],[Integer(0), Integer(1),␣
↪Integer(0)],[Integer(0), Integer(0), Integer(1)]]).rotate_cw()
[0 0 1]
[0 1 0]
[1 0 0]
>>> asm = A([[Integer(0), Integer(0), Integer(1)],[Integer(1), Integer(0),␣
↪Integer(0)],[Integer(0), Integer(1), Integer(0)]])
>>> asm.rotate_cw()
[0 1 0]
[1 0 0]
[0 0 1]
```

to_dyck_word(*algorithm*)

Return a Dyck word determined by the specified algorithm.

The algorithm 'last_diagonal' uses the last diagonal of the monotone triangle corresponding to self. The algorithm 'link_pattern' returns the Dyck word in bijection with the link pattern of the fully packed loop.

Note that these two algorithms in general yield different Dyck words for a given alternating sign matrix.

INPUT:

- algorithm – either 'last_diagonal' or 'link_pattern'

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: A([[0,1,0],[1,0,0],[0,0,1]]).to_dyck_word(algorithm = 'last_diagonal')
[1, 1, 0, 0, 1, 0]
sage: d = A([[0,1,0],[1,-1,1],[0,1,0]]).to_dyck_word(algorithm = 'last_
↪diagonal'); d
[1, 1, 0, 1, 0, 0]
sage: parent(d)
Complete Dyck words
sage: A = AlternatingSignMatrices(3)
sage: asm = A([[0,1,0],[1,0,0],[0,0,1]])
sage: asm.to_dyck_word(algorithm = 'link_pattern')
[1, 0, 1, 0, 1, 0]
```

(continues on next page)

(continued from previous page)

```

Traceback (most recent call last):
...
ValueError: unknown algorithm 'notamethod'
```

to_fully_packed_loop()

Return the fully packed loop configuration from `self`.

See also

FullyPackedLoop

EXAMPLES:

```
sage: asm = AlternatingSignMatrix([[1,0,0],[0,1,0],[0,0,1]])
sage: fpl = asm.to_fully_packed_loop()
sage: fpl
    |         |
    |         |
    +    + -- +
    |    |
    |    |
 -- +    +    + --
         |    |
         |    |
    + -- +    +
    |         |
    |         |
```

```
>>> from sage.all import *
>>> asm = AlternatingSignMatrix([[Integer(1),Integer(0),Integer(0)],
↪[Integer(0),Integer(1),Integer(0)],[Integer(0),Integer(0),Integer(1)]])
>>> fpl = asm.to_fully_packed_loop()
>>> fpl
    |         |
    |         |
    +    + -- +
    |    |
    |    |
 -- +    +    + --
         |    |
         |    |
    + -- +    +
    |         |
    |         |
```

to_matrix()

Return `self` as a regular matrix.

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: asm = A([[1, 0, 0],[0, 1, 0],[0, 0, 1]])
sage: m = asm.to_matrix(); m
[1 0 0]
[0 1 0]
[0 0 1]
```

(continues on next page)

(continued from previous page)

```
sage: m.parent()
Full MatrixSpace of 3 by 3 dense matrices over Integer Ring
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
>>> asm = A([[Integer(1), Integer(0), Integer(0)],[Integer(0), Integer(1),␣
→Integer(0)],[Integer(0), Integer(0), Integer(1)]])
>>> m = asm.to_matrix(); m
[1 0 0]
[0 1 0]
[0 0 1]
>>> m.parent()
Full MatrixSpace of 3 by 3 dense matrices over Integer Ring
```

to_monotone_triangle()

Return a monotone triangle from `self`.

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: A([[1, 0, 0],[0, 1, 0],[0, 0, 1]]).to_monotone_triangle()
[[3, 2, 1], [2, 1], [1]]
sage: asm = A([[0, 1, 0],[1, -1, 1],[0, 1, 0]])
sage: asm.to_monotone_triangle()
[[3, 2, 1], [3, 1], [2]]
sage: asm = A([[0, 0, 1],[1, 0, 0],[0, 1, 0]])
sage: asm.to_monotone_triangle()
[[3, 2, 1], [3, 1], [3]]
sage: A.from_monotone_triangle(asm.to_monotone_triangle()) == asm
True
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
>>> A([[Integer(1), Integer(0), Integer(0)],[Integer(0), Integer(1),␣
→Integer(0)],[Integer(0), Integer(0), Integer(1)]]).to_monotone_triangle()
[[3, 2, 1], [2, 1], [1]]
>>> asm = A([[Integer(0), Integer(1), Integer(0)],[Integer(1), -Integer(1),␣
→Integer(1)],[Integer(0), Integer(1), Integer(0)]])
>>> asm.to_monotone_triangle()
[[3, 2, 1], [3, 1], [2]]
>>> asm = A([[Integer(0), Integer(0), Integer(1)],[Integer(1), Integer(0),␣
→Integer(0)],[Integer(0), Integer(1), Integer(0)]])
>>> asm.to_monotone_triangle()
[[3, 2, 1], [3, 1], [3]]
>>> A.from_monotone_triangle(asm.to_monotone_triangle()) == asm
True
```

to_permutation()

Return the corresponding permutation if `self` is a permutation matrix.

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: asm = A([[0,1,0],[1,0,0],[0,0,1]])
sage: p = asm.to_permutation(); p
[2, 1, 3]
sage: parent(p)
Standard permutations
sage: asm = A([[0,1,0],[1,-1,1],[0,1,0]])
sage: asm.to_permutation()
Traceback (most recent call last):
...
ValueError: not a permutation matrix
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
>>> asm = A([[Integer(0),Integer(1),Integer(0)],[Integer(1),Integer(0),
↪Integer(0)],[Integer(0),Integer(0),Integer(1)]])
>>> p = asm.to_permutation(); p
[2, 1, 3]
>>> parent(p)
Standard permutations
>>> asm = A([[Integer(0),Integer(1),Integer(0)],[Integer(1),-Integer(1),
↪Integer(1)],[Integer(0),Integer(1),Integer(0)]])
>>> asm.to_permutation()
Traceback (most recent call last):
...
ValueError: not a permutation matrix
```

to_semistandard_tableau()

Return the semistandard tableau corresponding the monotone triangle corresponding to `self`.

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: A([[0,0,1],[1,0,0],[0,1,0]]).to_semistandard_tableau()
[[1, 1, 3], [2, 3], [3]]
sage: t = A([[0,1,0],[1,-1,1],[0,1,0]]).to_semistandard_tableau(); t
[[1, 1, 2], [2, 3], [3]]
sage: parent(t)
Semistandard tableaux
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
>>> A([[Integer(0),Integer(0),Integer(1)],[Integer(1),Integer(0),Integer(0)],
↪[Integer(0),Integer(1),Integer(0)]]).to_semistandard_tableau()
[[1, 1, 3], [2, 3], [3]]
>>> t = A([[Integer(0),Integer(1),Integer(0)],[Integer(1),-Integer(1),
↪Integer(1)],[Integer(0),Integer(1),Integer(0)]]).to_semistandard_tableau();␣
↪t
[[1, 1, 2], [2, 3], [3]]
>>> parent(t)
Semistandard tableaux
```

to_six_vertex_model()

Return the six vertex model configuration from `self`.

This method calls `sage.combinat.six_vertex_model.from_alternating_sign_matrix()`.

EXAMPLES:

```
sage: asm = AlternatingSignMatrix([[0,1,0],[1,-1,1],[0,1,0]])
sage: asm.to_six_vertex_model()
    ^    ^    ^
    |    |    |
--> # -> # <- # <--
    ^    |    ^
    |    V    |
--> # <- # -> # <--
    |    ^    |
    V    |    V
--> # -> # <- # <--
    |    |    |
    V    V    V
```

```
>>> from sage.all import *
>>> asm = AlternatingSignMatrix([[Integer(0),Integer(1),Integer(0)],
↪[Integer(1),-Integer(1),Integer(1)],[Integer(0),Integer(1),Integer(0)]])
>>> asm.to_six_vertex_model()
    ^    ^    ^
    |    |    |
--> # -> # <- # <--
    ^    |    ^
    |    V    |
--> # <- # -> # <--
    |    ^    |
    V    |    V
--> # -> # <- # <--
    |    |    |
    V    V    V
```

transpose()

Return `self` transposed.

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: A([[1, 0, 0],[0, 1, 0],[0, 0, 1]]).transpose()
[1 0 0]
[0 1 0]
[0 0 1]
sage: asm = A([[0, 0, 1],[1, 0, 0],[0, 1, 0]])
sage: asm.transpose()
[0 1 0]
[0 0 1]
[1 0 0]
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
```

(continues on next page)

(continued from previous page)

```
>>> A([[Integer(1), Integer(0), Integer(0)],[Integer(0), Integer(1),␣
↪Integer(0)],[Integer(0), Integer(0), Integer(1)]]).transpose()
[1 0 0]
[0 1 0]
[0 0 1]
>>> asm = A([[Integer(0), Integer(0), Integer(1)],[Integer(1), Integer(0),␣
↪Integer(0)],[Integer(0), Integer(1), Integer(0)]])
>>> asm.transpose()
[0 1 0]
[0 0 1]
[1 0 0]
```

class sage.combinat.alternating_sign_matrix.**ContreTableaux**

Bases: Parent

Factory class for the combinatorial class of contre tableaux of size n.

EXAMPLES:

```
sage: ct4 = ContreTableaux(4); ct4
Contre tableaux of size 4
sage: ct4.cardinality()
42
```

```
>>> from sage.all import *
>>> ct4 = ContreTableaux(Integer(4)); ct4
Contre tableaux of size 4
>>> ct4.cardinality()
42
```

class sage.combinat.alternating_sign_matrix.**ContreTableaux_n**(*n*)

Bases: *ContreTableaux*

cardinality()

EXAMPLES:

```
sage: [ContreTableaux(n).cardinality() for n in range(11)]
[1, 1, 2, 7, 42, 429, 7436, 218348, 10850216, 911835460, 129534272700]
```

```
>>> from sage.all import *
>>> [ContreTableaux(n).cardinality() for n in range(Integer(11))]
[1, 1, 2, 7, 42, 429, 7436, 218348, 10850216, 911835460, 129534272700]
```

class sage.combinat.alternating_sign_matrix.**MonotoneTriangles**(*n*)

Bases: *GelfandTsetlinPatternsTopRow*

Monotone triangles with n rows.

A monotone triangle is a number triangle $(a_{i,j})_{1 \leq i \leq n, 1 \leq j \leq i}$ on $\{1, \ldots, n\}$ such that:

- $a_{i,j} < a_{i,j+1}$
- $a_{i+1,j} < a_{i,j} \leq a_{i+1,j+1}$

This notably requires that the bottom column is `[1,...,n]`.

Alternatively a monotone triangle is a strict Gelfand-Tsetlin pattern with top row $(n, \ldots, 2, 1)$.

INPUT:

- `n` – the number of rows in the monotone triangles

EXAMPLES:

This represents the monotone triangles with base `[3,2,1]`:

```
sage: M = MonotoneTriangles(3)
sage: M
Monotone triangles with 3 rows
sage: M.cardinality()
7
```

```
>>> from sage.all import *
>>> M = MonotoneTriangles(Integer(3))
>>> M
Monotone triangles with 3 rows
>>> M.cardinality()
7
```

The monotone triangles are a lattice:

```
sage: M.lattice()
Finite lattice containing 7 elements
```

```
>>> from sage.all import *
>>> M.lattice()
Finite lattice containing 7 elements
```

Monotone triangles can be converted to alternating sign matrices and back:

```
sage: M = MonotoneTriangles(5)
sage: A = AlternatingSignMatrices(5)
sage: all(A.from_monotone_triangle(m).to_monotone_triangle() == m for m in M)
True
```

```
>>> from sage.all import *
>>> M = MonotoneTriangles(Integer(5))
>>> A = AlternatingSignMatrices(Integer(5))
>>> all(A.from_monotone_triangle(m).to_monotone_triangle() == m for m in M)
True
```

cardinality()

Cardinality of `self`.

The number of monotone triangles with n rows is equal to

$$\prod_{k=0}^{n-1} \frac{(3k+1)!}{(n+k)!} = \frac{1!4!7!10!\cdots(3n-2)!}{n!(n+1)!(n+2)!(n+3)!\cdots(2n-1)!}$$

EXAMPLES:

```
sage: M = MonotoneTriangles(4)
sage: M.cardinality()
42
```

```
>>> from sage.all import *
>>> M = MonotoneTriangles(Integer(4))
>>> M.cardinality()
42
```

cover_relations()

Iterate on the cover relations in the set of monotone triangles with n rows.

EXAMPLES:

```
sage: M = MonotoneTriangles(3)
sage: for (a,b) in M.cover_relations():
....:     eval('a, b')
([[3, 2, 1], [2, 1], [1]], [[3, 2, 1], [2, 1], [2]])
([[3, 2, 1], [2, 1], [1]], [[3, 2, 1], [3, 1], [1]])
([[3, 2, 1], [2, 1], [2]], [[3, 2, 1], [3, 1], [2]])
([[3, 2, 1], [3, 1], [1]], [[3, 2, 1], [3, 1], [2]])
([[3, 2, 1], [3, 1], [2]], [[3, 2, 1], [3, 1], [3]])
([[3, 2, 1], [3, 1], [2]], [[3, 2, 1], [3, 2], [2]])
([[3, 2, 1], [3, 1], [3]], [[3, 2, 1], [3, 2], [3]])
([[3, 2, 1], [3, 2], [2]], [[3, 2, 1], [3, 2], [3]])
```

```
>>> from sage.all import *
>>> M = MonotoneTriangles(Integer(3))
>>> for (a,b) in M.cover_relations():
...     eval('a, b')
([[3, 2, 1], [2, 1], [1]], [[3, 2, 1], [2, 1], [2]])
([[3, 2, 1], [2, 1], [1]], [[3, 2, 1], [3, 1], [1]])
([[3, 2, 1], [2, 1], [2]], [[3, 2, 1], [3, 1], [2]])
([[3, 2, 1], [3, 1], [1]], [[3, 2, 1], [3, 1], [2]])
([[3, 2, 1], [3, 1], [2]], [[3, 2, 1], [3, 1], [3]])
([[3, 2, 1], [3, 1], [2]], [[3, 2, 1], [3, 2], [2]])
([[3, 2, 1], [3, 1], [3]], [[3, 2, 1], [3, 2], [3]])
([[3, 2, 1], [3, 2], [2]], [[3, 2, 1], [3, 2], [3]])
```

lattice()

Return the lattice of the monotone triangles with n rows.

EXAMPLES:

```
sage: M = MonotoneTriangles(3)
sage: P = M.lattice()
sage: P
Finite lattice containing 7 elements
```

```
>>> from sage.all import *
>>> M = MonotoneTriangles(Integer(3))
>>> P = M.lattice()
```

(continues on next page)

(continued from previous page)

```
>>> P
Finite lattice containing 7 elements
```

class sage.combinat.alternating_sign_matrix.**TruncatedStaircases**

Bases: Parent

Factory class for the combinatorial class of truncated staircases of size n with last column last_column.

EXAMPLES:

```
sage: t4 = TruncatedStaircases(4, [2,3]); t4
Truncated staircases of size 4 with last column [2, 3]
sage: t4.cardinality()
4
```

```
>>> from sage.all import *
>>> t4 = TruncatedStaircases(Integer(4), [Integer(2),Integer(3)]); t4
Truncated staircases of size 4 with last column [2, 3]
>>> t4.cardinality()
4
```

class sage.combinat.alternating_sign_matrix.**TruncatedStaircases_nlastcolumn**(*n*, *last_column*)

Bases: *TruncatedStaircases*

cardinality()

EXAMPLES:

```
sage: T = TruncatedStaircases(4, [2,3])
sage: T.cardinality()
4
```

```
>>> from sage.all import *
>>> T = TruncatedStaircases(Integer(4), [Integer(2),Integer(3)])
>>> T.cardinality()
4
```

5.1.6 Backtracking

This library contains a generic tool for constructing large sets whose elements can be enumerated by exploring a search space with a (lazy) tree or graph structure.

- *GenericBacktracker*: Depth first search through a tree described by a children function, with branch pruning, etc.

This module has mostly been superseded by RecursivelyEnumeratedSet.

class sage.combinat.backtrack.**GenericBacktracker**(*initial_data*, *initial_state*)

Bases: object

A generic backtrack tool for exploring a search space organized as a tree, with branch pruning, etc.

See also RecursivelyEnumeratedSet_forest for handling simple special cases.

class sage.combinat.backtrack.**PositiveIntegerSemigroup**

Bases: UniqueRepresentation, RecursivelyEnumeratedSet_forest

The commutative additive semigroup of positive integers.

This class provides an example of algebraic structure which inherits from RecursivelyEnumeratedSet_forest. It builds the positive integers a la Peano, and endows it with its natural commutative additive semigroup structure.

EXAMPLES:

```
sage: from sage.combinat.backtrack import PositiveIntegerSemigroup
sage: PP = PositiveIntegerSemigroup()
sage: PP.category()
Join of Category of monoids and Category of commutative additive semigroups and␣
↪Category of infinite enumerated sets and Category of facade sets
sage: PP.cardinality()
+Infinity
sage: PP.one()
1
sage: PP.an_element()
1
sage: some_elements = list(PP.some_elements()); some_elements
[1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22,␣
↪23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42,␣
↪43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62,␣
↪63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82,␣
↪83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, 100]
```

```
>>> from sage.all import *
>>> from sage.combinat.backtrack import PositiveIntegerSemigroup
>>> PP = PositiveIntegerSemigroup()
>>> PP.category()
Join of Category of monoids and Category of commutative additive semigroups and␣
↪Category of infinite enumerated sets and Category of facade sets
>>> PP.cardinality()
+Infinity
>>> PP.one()
1
>>> PP.an_element()
1
>>> some_elements = list(PP.some_elements()); some_elements
[1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22,␣
↪23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42,␣
↪43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62,␣
↪63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82,␣
↪83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, 100]
```

children(*x*)

Return the single child x+1 of the integer x.

EXAMPLES:

```
sage: from sage.combinat.backtrack import PositiveIntegerSemigroup
sage: PP = PositiveIntegerSemigroup()
```

(continues on next page)

(continued from previous page)

```
sage: list(PP.children(1))
[2]
sage: list(PP.children(42))
[43]
```

```
>>> from sage.all import *
>>> from sage.combinat.backtrack import PositiveIntegerSemigroup
>>> PP = PositiveIntegerSemigroup()
>>> list(PP.children(Integer(1)))
[2]
>>> list(PP.children(Integer(42)))
[43]
```

one()

Return the unit of `self`.

EXAMPLES:

```
sage: from sage.combinat.backtrack import PositiveIntegerSemigroup
sage: PP = PositiveIntegerSemigroup()
sage: PP.one()
1
```

```
>>> from sage.all import *
>>> from sage.combinat.backtrack import PositiveIntegerSemigroup
>>> PP = PositiveIntegerSemigroup()
>>> PP.one()
1
```

roots()

Return the single root of `self`.

EXAMPLES:

```
sage: from sage.combinat.backtrack import PositiveIntegerSemigroup
sage: PP = PositiveIntegerSemigroup()
sage: list(PP.roots())
[1]
```

```
>>> from sage.all import *
>>> from sage.combinat.backtrack import PositiveIntegerSemigroup
>>> PP = PositiveIntegerSemigroup()
>>> list(PP.roots())
[1]
```

5.1.7 Baxter permutations

class sage.combinat.baxter_permutations.**BaxterPermutations**

Bases: `UniqueRepresentation`, `Parent`

The combinatorial class of Baxter permutations.

A Baxter permutation is a permutation avoiding the generalized permutation patterns $2-41-3$ and $3-14-2$. In other words, a permutation σ is a Baxter permutation if for any subword $u := u_1 u_2 u_3 u_4$ of σ such that the letters u_2 and u_3 are adjacent in σ, the standardized version of u is neither 2413 nor 3142.

See [Gir2012] for a study of Baxter permutations.

INPUT:

- `n` – nonnegative integer (default: `None`); the size of the permutations

OUTPUT:

Return the combinatorial class of the Baxter permutations of size `n` if `n` is not `None`. Otherwise, return the combinatorial class of all Baxter permutations.

EXAMPLES:

```
sage: BaxterPermutations(5)
Baxter permutations of size 5
sage: BaxterPermutations()
Baxter permutations
```

```
>>> from sage.all import *
>>> BaxterPermutations(Integer(5))
Baxter permutations of size 5
>>> BaxterPermutations()
Baxter permutations
```

class sage.combinat.baxter_permutations.**BaxterPermutations_all**(*n=None*)

Bases: `DisjointUnionEnumeratedSets`, *`BaxterPermutations`*

The enumerated set of all Baxter permutations.

See *`BaxterPermutations`* for the definition of Baxter permutations.

EXAMPLES:

```
sage: from sage.combinat.baxter_permutations import BaxterPermutations_all
sage: BaxterPermutations_all()
Baxter permutations
```

```
>>> from sage.all import *
>>> from sage.combinat.baxter_permutations import BaxterPermutations_all
>>> BaxterPermutations_all()
Baxter permutations
```

to_pair_of_twin_binary_trees(*p*)

Apply a bijection between Baxter permutations of size `self._n` and the set of pairs of twin binary trees with `self._n` nodes.

INPUT:

- `p` – a Baxter permutation

OUTPUT:

The pair of twin binary trees (T_L, T_R) where T_L (resp. T_R) is obtained by inserting the letters of `p` from left to right (resp. right to left) following the binary search tree insertion algorithm. This is called the *Baxter P-symbol* in [Gir2012] Definition 4.1.

Note

This method only works when `p` is a permutation. For words with repeated letters, it would return two "right binary search trees" (in the terminology of [Gir2012]), which conflicts with the definition in [Gir2012].

EXAMPLES:

```
sage: BP = BaxterPermutations()
sage: BP.to_pair_of_twin_binary_trees(Permutation([]))                          #␣
↪needs sage.graphs
(., .)
sage: BP.to_pair_of_twin_binary_trees(Permutation([1, 2, 3]))                   #␣
↪needs sage.graphs
(1[., 2[., 3[., .]]], 3[2[1[., .], .], .])
sage: BP.to_pair_of_twin_binary_trees(Permutation([3, 4, 1, 2]))                #␣
↪needs sage.graphs
(3[1[., 2[., .]], 4[., .]], 2[1[., .], 4[3[., .], .]])
```

```
>>> from sage.all import *
>>> BP = BaxterPermutations()
>>> BP.to_pair_of_twin_binary_trees(Permutation([]))                          #␣
↪needs sage.graphs
(., .)
>>> BP.to_pair_of_twin_binary_trees(Permutation([Integer(1), Integer(2),␣
↪Integer(3)]))                 # needs sage.graphs
(1[., 2[., 3[., .]]], 3[2[1[., .], .], .])
>>> BP.to_pair_of_twin_binary_trees(Permutation([Integer(3), Integer(4),␣
↪Integer(1), Integer(2)]))              # needs sage.graphs
(3[1[., 2[., .]], 4[., .]], 2[1[., .], 4[3[., .], .]])
```

class sage.combinat.baxter_permutations.**BaxterPermutations_size**(*n*)

Bases: *BaxterPermutations*

The enumerated set of Baxter permutations of a given size.

See *BaxterPermutations* for the definition of Baxter permutations.

EXAMPLES:

```
sage: from sage.combinat.baxter_permutations import BaxterPermutations_size
sage: BaxterPermutations_size(5)
Baxter permutations of size 5
```

```
>>> from sage.all import *
>>> from sage.combinat.baxter_permutations import BaxterPermutations_size
>>> BaxterPermutations_size(Integer(5))
Baxter permutations of size 5
```

cardinality()

Return the number of Baxter permutations of size `self._n`.

For any positive integer n, the number of Baxter permutations of size n equals

$$\sum_{k=1}^{n} \frac{\binom{n+1}{k-1}\binom{n+1}{k}\binom{n+1}{k+1}}{\binom{n+1}{1}\binom{n+1}{2}}.$$

This is OEIS sequence A001181.

EXAMPLES:

```
sage: [BaxterPermutations(n).cardinality() for n in range(13)]
[1, 1, 2, 6, 22, 92, 422, 2074, 10754, 58202, 326240, 1882960, 11140560]

sage: BaxterPermutations(3r).cardinality()
6
sage: parent(_)
Integer Ring
```

```
>>> from sage.all import *
>>> [BaxterPermutations(n).cardinality() for n in range(Integer(13))]
[1, 1, 2, 6, 22, 92, 422, 2074, 10754, 58202, 326240, 1882960, 11140560]

>>> BaxterPermutations(3).cardinality()
6
>>> parent(_)
Integer Ring
```

5.1.8 A bijectionist's toolkit

AUTHORS:

- Alexander Grosz, Tobias Kietreiber, Stephan Pfannerer and Martin Rubey (2020-2022): Initial version

Quick reference

set_statistics()	Declare statistics that are preserved by the bijection.
set_value_restrictions()	Restrict the values of the statistic on an element.
set_constant_blocks()	Declare that the statistic is constant on some sets.
set_distributions()	Restrict the distribution of values of the statistic on some elements.
set_intertwining_relations()	Declare that the statistic intertwines with other maps.
set_quadratic_relation()	Declare that the statistic satisfies a certain relation.
set_homomesic()	Declare that the statistic is homomesic with respect to a given set partition.
statistics_table()	Print a table collecting information on the given statistics.
statistics_fibers()	Collect elements with the same statistics.
constant_blocks()	Return the blocks on which the statistic is constant.
solutions_iterator()	Iterate over all possible solutions.
possible_values()	Return all possible values for a given element.
minimal_subdistributions_iterator()	Iterate over the minimal subdistributions.
minimal_subdistributions_blocks_iterator()	Iterate over the minimal subdistributions.

A guided tour

Consider the following combinatorial statistics on a permutation:

- wex, the number of weak excedences,
- fix, the number of fixed points,
- des, the number of descents (after appending 0),
- adj, the number of adjacencies (after appending 0), and
- $llis$, the length of a longest increasing subsequence.

Moreover, let rot be action of rotation on a permutation, i.e., the conjugation with the long cycle.

It is known that there must exist a statistic s on permutations, which is equidistributed with $llis$ but additionally invariant under rot. However, at least very small cases do not contradict the possibility that one can even find a statistic s, invariant under rot and such that $(s, wex, fix) \sim (llis, des, adj)$. Let us check this for permutations of size at most 3:

```
sage: N = 3
sage: A = B = [pi for n in range(N+1) for pi in Permutations(n)]
sage: def alpha1(p): return len(p.weak_excedences())
sage: def alpha2(p): return len(p.fixed_points())
sage: def beta1(p): return len(p.descents(final_descent=True)) if p else 0
sage: def beta2(p): return len([e for (e, f) in zip(p, p[1:]+[0]) if e == f+1])
sage: tau = Permutation.longest_increasing_subsequence_length
sage: def rotate_permutation(p):
....:     cycle = Permutation(tuple(range(1, len(p)+1)))
....:     return Permutation([cycle.inverse()(p(cycle(i))) for i in range(1,
↪len(p)+1)])
```

(continues on next page)

(continued from previous page)

```
sage: bij = Bijectionist(A, B, tau)
sage: bij.set_statistics((len, len), (alpha1, beta1), (alpha2, beta2))
sage: a, b = bij.statistics_table()
sage: table(a, header_row=True, frame=True)

 [3, 2, 1]: 2}
```

On the other hand, we can check that there is no rotation invariant statistic on non-crossing set partitions which is equidistributed with the Strahler number on ordered trees:

```
sage: N = 8
sage: A = [SetPartition(d.to_noncrossing_partition()) for n in range(N) for d in␣
```

(continues on next page)

(continued from previous page)

```
↪DyckWords(n)]
sage: B = [t for n in range(1, N+1) for t in OrderedTrees(n)]
sage: def theta(m): return SetPartition([[i % m.size() + 1 for i in b] for b in m])
```

```
>>> from sage.all import *
>>> N = Integer(8)
>>> A = [SetPartition(d.to_noncrossing_partition()) for n in range(N) for d in␣
↪DyckWords(n)]
>>> B = [t for n in range(Integer(1), N+Integer(1)) for t in OrderedTrees(n)]
>>> def theta(m): return SetPartition([[i % m.size() + Integer(1) for i in b] for b␣
↪in m])
```

Code for the Strahler number can be obtained from FindStat. The following code is equivalent to `tau = findstat(397)`:

```
sage: def tau(T):
....:     if len(T) == 0:
....:         return 1
....:     else:
....:         l = [tau(S) for S in T]
....:         m = max(l)
....:         if l.count(m) == 1:
....:             return m
....:         else:
....:             return m+1
sage: bij = Bijectionist(A, B, tau)
sage: bij.set_statistics((lambda a: a.size(), lambda b: b.node_number()-1))
sage: from sage.combinat.cyclic_sieving_phenomenon import orbit_decomposition
sage: bij.set_constant_blocks(orbit_decomposition(A, theta))
sage: list(bij.solutions_iterator())
[]
```

```
>>> from sage.all import *
>>> def tau(T):
...     if len(T) == Integer(0):
...         return Integer(1)
...     else:
...         l = [tau(S) for S in T]
...         m = max(l)
...         if l.count(m) == Integer(1):
...             return m
...         else:
...             return m+Integer(1)
>>> bij = Bijectionist(A, B, tau)
>>> bij.set_statistics((lambda a: a.size(), lambda b: b.node_number()-Integer(1)))
>>> from sage.combinat.cyclic_sieving_phenomenon import orbit_decomposition
>>> bij.set_constant_blocks(orbit_decomposition(A, theta))
>>> list(bij.solutions_iterator())
[]
```

Next we demonstrate how to search for a bijection, instead An example identifying s and S:

```
sage: N = 4
sage: A = [dyck_word for n in range(1, N) for dyck_word in DyckWords(n)]
sage: B = [binary_tree for n in range(1, N) for binary_tree in BinaryTrees(n)]
sage: concat_path = lambda D1, D2: DyckWord(list(D1) + list(D2))
sage: concat_tree = lambda B1, B2: concat_path(B1.to_dyck_word(),
....:                                          B2.to_dyck_word()).to_binary_tree()
sage: bij = Bijectionist(A, B)
sage: bij.set_intertwining_relations((2, concat_path, concat_tree))
sage: bij.set_statistics((lambda d: d.semilength(), lambda t: t.node_number()))
sage: for D in sorted(bij.minimal_subdistributions_iterator(), key=lambda x:␣
↪(len(x[0][0]), x)):
....:     ascii_art(D)
( [ /\ ], [ o ] )
(           [ o   ] )
(           [  \  ] )
( [ /\/\ ], [   o ] )
(           [   o ] )
( [  /\  ]  [  /  ] )
( [ /  \ ], [ o   ] )
(             [ o     ] )
(             [  \    ] )
(             [   o   ] )
(             [    \  ] )
( [ /\/\/\ ], [     o ] )
(             [ o   ] )
(             [  \  ] )
(             [   o ] )
( [    /\  ]  [  /  ] )
( [ /\/  \ ], [ o   ] )
(             [   o   ] )
( [  /\    ]  [  / \  ] )
( [ /  \/\ ], [ o   o ] )
(                     [   o,      o ] )
(                     [  /      /  ] )
( [           /\   ]  [ o      o   ] )
( [  /\/\    /  \  ]  [  \    /    ] )
( [ /    \, /    \ ], [   o  o     ] )
```

```
>>> from sage.all import *
>>> N = Integer(4)

2: Mp00018oMp00140 (quality [100])
```

class sage.combinat.bijectionist.**Bijectionist**(*A*, *B*, *tau=None*, *alpha_beta=()*, *P=None*, *pi_rho=()*, *phi_psi=()*, *Q=None*, *elements_distributions=()*, *value_restrictions=()*, *solver=None*, *key=None*)

Bases: `SageObject`

A toolbox to list all possible bijections between two finite sets under various constraints.

INPUT:

- `A`, `B` – sets of equal size, given as a list
- `tau` – (optional) a function from `B` to `Z`, in case of `None`, the identity map `lambda x: x` is used
- `alpha_beta` – (optional) a list of pairs of statistics `alpha` from `A` to `W` and `beta` from `B` to `W`

- `P` – (optional) a partition of `A`
- `pi_rho` – (optional) a list of triples `(k, pi, rho)`, where
  - `pi` – a `k`-ary operation composing objects in `A` and
  - `rho` – a `k`-ary function composing statistic values in `Z`
- `elements_distributions` – (optional) a list of pairs `(tA, tZ)`, specifying the distributions of `tA`
- `value_restrictions` – (optional) a list of pairs `(a, tZ)`, restricting the possible values of `a`
- `solver` – (optional) the backend used to solve the mixed integer linear programs

`W` and `Z` can be arbitrary sets. As a natural example we may think of the natural numbers or tuples of integers.

We are looking for a statistic $s : A \to Z$ and a bijection $S : A \to B$ such that

- $s = \tau \circ S$: the statistics s and τ are equidistributed and S is an intertwining bijection.
- $\alpha = \beta \circ S$: the statistics α and β are equidistributed and S is an intertwining bijection.
- s is constant on the blocks of P.
- $s(\pi(a_1, \ldots, a_k)) = \rho(s(a_1), \ldots, s(a_k))$.

Additionally, we may require that

- $s(a) \in Z_a$ for specified sets $Z_a \subseteq Z$, and
- $s|_{\tilde A}$ has a specified distribution for specified sets $\tilde A \subset A$.

If τ is the identity, the two unknown functions s and S coincide. Although we do not exclude other bijective choices for τ, they probably do not make sense.

If we want that S is graded, i.e. if elements of A and B have a notion of size and S should preserve this size, we can add grading statistics as α and β. Since α and β will be equidistributed with S as an intertwining bijection, S will then also be graded.

In summary, we have the following two commutative diagrams, where s and S are unknown functions.

$$\begin{tikzcd} & A \arrow[dl, "\alpha"'] \arrow[d, "S"'] \arrow[dr, "s"] & \\ W & B \arrow[l, "\beta"'] \arrow[r, "\tau"] & Z \end{tikzcd} \qquad \begin{tikzcd} A^k \arrow[r, "\pi"] \arrow[d, "s^k"] & A \arrow[d, "s"] \\ Z^k \arrow[r, "\rho"] & Z \end{tikzcd}$$

> **Note**
>
> If τ is the identity map, the partition P of A necessarily consists only of singletons.

> **Note**
>
> The order of invocation of the methods with prefix `set`, i.e., *`set_statistics()`*, *`set_intertwining_relations()`*, *`set_constant_blocks()`*, etc., is irrelevant. Calling any of these methods a second time overrides the previous specification.

`constant_blocks`(*singletons=False*, *optimal=False*)

Return the set partition P of A such that $s : A \to Z$ is known to be constant on the blocks of P.

INPUT:

- `singletons` – boolean (default: `False`); whether or not to include singleton blocks in the output

- `optimal` – boolean (default: `False`); whether or not to compute the coarsest possible partition

Note: computing the coarsest possible partition may be computationally expensive, but may speed up generating solutions.

EXAMPLES:

```
sage: A = B = ["a", "b", "c"]
sage: bij = Bijectionist(A, B, lambda x: 0)
sage: bij.set_constant_blocks([["a", "b"]])
sage: bij.constant_blocks()
{{'a', 'b'}}

sage: bij.constant_blocks(singletons=True)
{{'a', 'b'}, {'c'}}
```

```
>>> from sage.all import *
>>> A = B = ["a", "b", "c"]
>>> bij = Bijectionist(A, B, lambda x: Integer(0))
>>> bij.set_constant_blocks([["a", "b"]])
>>> bij.constant_blocks()
{{'a', 'b'}}

>>> bij.constant_blocks(singletons=True)
{{'a', 'b'}, {'c'}}
```

minimal_subdistributions_blocks_iterator()

Return all representatives of minimal subsets $\tilde{P}$ of P together with submultisets $\tilde{Z}$ with $s(\tilde{P}) = \tilde{Z}$ as multisets.

Warning: If there are several solutions with the same support (i.e., the sets of block representatives are the same), only one of these will be found, even if the distributions are different, see the doctest below. To find all solutions, use *minimal_subdistributions_iterator()*, which is, however, computationally more expensive.

EXAMPLES:

```
sage: A = B = [permutation for n in range(3) for permutation in␣
↪Permutations(n)]
sage: bij = Bijectionist(A, B, len)
sage: bij.set_statistics((len, len))
sage: for sol in bij.solutions_iterator():
....:     print(sol)
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 2}
sage: sorted(bij.minimal_subdistributions_blocks_iterator())
[([[]], [0]), ([[1]], [1]), ([[1, 2]], [2]), ([[2, 1]], [2])]
```

```
>>> from sage.all import *
>>> A = B = [permutation for n in range(Integer(3)) for permutation in␣
↪Permutations(n)]
>>> bij = Bijectionist(A, B, len)
>>> bij.set_statistics((len, len))
>>> for sol in bij.solutions_iterator():
...     print(sol)
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 2}
>>> sorted(bij.minimal_subdistributions_blocks_iterator())
[([[]], [0]), ([[1]], [1]), ([[1, 2]], [2]), ([[2, 1]], [2])]
```

Another example:

```
sage: N = 2; A = B = [dyck_word for n in range(N+1) for dyck_word in␣
↪DyckWords(n)]
sage: def tau(D): return D.number_of_touch_points()
sage: bij = Bijectionist(A, B, tau)
sage: bij.set_statistics((lambda d: d.semilength(), lambda d: d.semilength()))
sage: for solution in sorted(list(bij.solutions_iterator()), key=lambda d:␣
↪tuple(sorted(d.items()))):
....:     print(solution)
{[]: 0, [1, 0]: 1, [1, 0, 1, 0]: 1, [1, 1, 0, 0]: 2}
{[]: 0, [1, 0]: 1, [1, 0, 1, 0]: 2, [1, 1, 0, 0]: 1}
sage: for subdistribution in bij.minimal_subdistributions_blocks_iterator():
....:     print(subdistribution)
([[]], [0])
([[1, 0]], [1])
([[1, 0, 1, 0], [1, 1, 0, 0]], [1, 2])
```

```
>>> from sage.all import *
>>> N = Integer(2); A = B = [dyck_word for n in range(N+Integer(1)) for dyck_
↪word in DyckWords(n)]
>>> def tau(D): return D.number_of_touch_points()
>>> bij = Bijectionist(A, B, tau)
>>> bij.set_statistics((lambda d: d.semilength(), lambda d: d.semilength()))
>>> for solution in sorted(list(bij.solutions_iterator()), key=lambda d:␣
↪tuple(sorted(d.items()))):
...     print(solution)
{[]: 0, [1, 0]: 1, [1, 0, 1, 0]: 1, [1, 1, 0, 0]: 2}
{[]: 0, [1, 0]: 1, [1, 0, 1, 0]: 2, [1, 1, 0, 0]: 1}
>>> for subdistribution in bij.minimal_subdistributions_blocks_iterator():
...     print(subdistribution)
([[]], [0])
([[1, 0]], [1])
([[1, 0, 1, 0], [1, 1, 0, 0]], [1, 2])
```

An example with two elements of the same block in a subdistribution:

```
sage: A = B = ["a", "b", "c", "d", "e"]
sage: tau = {"a": 1, "b": 1, "c": 2, "d": 2, "e": 3}.get
sage: bij = Bijectionist(A, B, tau)
sage: bij.set_constant_blocks([["a", "b"]])
sage: bij.set_value_restrictions(("a", [1, 2]))
```

(continues on next page)

(continued from previous page)

```
sage: bij.constant_blocks(optimal=True)
{{'a', 'b'}}
sage: list(bij.minimal_subdistributions_blocks_iterator())
[(['b', 'b', 'c', 'd', 'e'], [1, 1, 2, 2, 3])]
```

```
>>> from sage.all import *
>>> A = B = ["a", "b", "c", "d", "e"]
>>> tau = {"a": Integer(1), "b": Integer(1), "c": Integer(2), "d": Integer(2),
↪ "e": Integer(3)}.get
>>> bij = Bijectionist(A, B, tau)
>>> bij.set_constant_blocks([["a", "b"]])
>>> bij.set_value_restrictions(("a", [Integer(1), Integer(2)]))
>>> bij.constant_blocks(optimal=True)
{{'a', 'b'}}
>>> list(bij.minimal_subdistributions_blocks_iterator())
[(['b', 'b', 'c', 'd', 'e'], [1, 1, 2, 2, 3])]
```

An example with overlapping minimal subdistributions:

```
sage: A = B = ["a", "b", "c", "d", "e"]
sage: tau = {"a": 1, "b": 1, "c": 2, "d": 2, "e": 3}.get
sage: bij = Bijectionist(A, B, tau)
sage: bij.set_distributions((["a", "b"], [1, 2]), (["a", "c", "d"], [1, 2,␣
↪3]))
sage: sorted(bij.solutions_iterator(), key=lambda d: tuple(sorted(d.items())))
[{'a': 1, 'b': 2, 'c': 2, 'd': 3, 'e': 1},
 {'a': 1, 'b': 2, 'c': 3, 'd': 2, 'e': 1},
 {'a': 2, 'b': 1, 'c': 1, 'd': 3, 'e': 2},
 {'a': 2, 'b': 1, 'c': 3, 'd': 1, 'e': 2}]
sage: bij.constant_blocks(optimal=True)
{{'a', 'e'}}
sage: list(bij.minimal_subdistributions_blocks_iterator())
[(['a', 'b'], [1, 2]), (['a', 'c', 'd'], [1, 2, 3])]
```

```
>>> from sage.all import *
>>> A = B = ["a", "b", "c", "d", "e"]
>>> tau = {"a": Integer(1), "b": Integer(1), "c": Integer(2), "d": Integer(2),
↪ "e": Integer(3)}.get
>>> bij = Bijectionist(A, B, tau)
>>> bij.set_distributions((["a", "b"], [Integer(1), Integer(2)]), (["a", "c",
↪"d"], [Integer(1), Integer(2), Integer(3)]))
>>> sorted(bij.solutions_iterator(), key=lambda d: tuple(sorted(d.items())))
[{'a': 1, 'b': 2, 'c': 2, 'd': 3, 'e': 1},
 {'a': 1, 'b': 2, 'c': 3, 'd': 2, 'e': 1},
 {'a': 2, 'b': 1, 'c': 1, 'd': 3, 'e': 2},
 {'a': 2, 'b': 1, 'c': 3, 'd': 1, 'e': 2}]
>>> bij.constant_blocks(optimal=True)
{{'a', 'e'}}
>>> list(bij.minimal_subdistributions_blocks_iterator())
[(['a', 'b'], [1, 2]), (['a', 'c', 'd'], [1, 2, 3])]
```

Fedor Petrov's example from https://mathoverflow.net/q/424187:

```
sage: A = B = ["a"+str(i) for i in range(1, 9)] + ["b"+str(i) for i in␣
↪range(3, 9)] + ["d"]
sage: tau = {b: 0 if i < 10 else 1 for i, b in enumerate(B)}.get
sage: bij = Bijectionist(A, B, tau)
sage: bij.set_constant_blocks([["a"+str(i), "b"+str(i)] for i in range(1, 9)␣
↪if "b"+str(i) in A])
sage: d = [0]*8+[1]*4
sage: bij.set_distributions((A[:8] + A[8+2:-1], d), (A[:8] + A[8:-3], d))
sage: sorted([s[a] for a in A] for s in bij.solutions_iterator())
[[0, 0, 0, 0, 1, 1, 0, 0, 0, 0, 1, 1, 0, 0, 1],
 [0, 1, 0, 1, 0, 0, 0, 1, 0, 1, 0, 0, 0, 1, 0],
 [0, 1, 0, 1, 0, 0, 1, 0, 0, 1, 0, 0, 1, 0, 0],
 [0, 1, 1, 0, 0, 0, 0, 1, 1, 0, 0, 0, 0, 1, 0],
 [0, 1, 1, 0, 0, 0, 1, 0, 1, 0, 0, 0, 1, 0, 0],
 [1, 0, 0, 1, 0, 0, 0, 1, 0, 1, 0, 0, 0, 1, 0],
 [1, 0, 0, 1, 0, 0, 1, 0, 0, 1, 0, 0, 1, 0, 0],
 [1, 0, 1, 0, 0, 0, 0, 1, 1, 0, 0, 0, 0, 1, 0],
 [1, 0, 1, 0, 0, 0, 1, 0, 1, 0, 0, 0, 1, 0, 0],
 [1, 1, 0, 0, 0, 1, 0, 0, 0, 0, 0, 1, 0, 0, 1],
 [1, 1, 0, 0, 1, 0, 0, 0, 0, 0, 1, 0, 0, 0, 1]]

sage: sorted(bij.minimal_subdistributions_blocks_iterator())        # random
[(['a1', 'a2', 'a3', 'a4', 'a5', 'a5', 'a6', 'a6', 'a7', 'a7', 'a8', 'a8'],
  [0, 0, 0, 0, 0, 0, 0, 0, 1, 1, 1, 1]),
 (['a3', 'a4', 'd'], [0, 0, 1]),
 (['a7', 'a8', 'd'], [0, 0, 1])]
```

```
>>> from sage.all import *
>>> A = B = ["a"+str(i) for i in range(Integer(1), Integer(9))] + ["b"+str(i)␣
↪for i in range(Integer(3), Integer(9))] + ["d"]
>>> tau = {b: Integer(0) if i < Integer(10) else Integer(1) for i, b in␣
↪enumerate(B)}.get
>>> bij = Bijectionist(A, B, tau)
>>> bij.set_constant_blocks([["a"+str(i), "b"+str(i)] for i in␣
↪range(Integer(1), Integer(9)) if "b"+str(i) in A])
>>> d = [Integer(0)]*Integer(8)+[Integer(1)]*Integer(4)
>>> bij.set_distributions((A[:Integer(8)] + A[Integer(8)+Integer(2):-
↪Integer(1)], d), (A[:Integer(8)] + A[Integer(8):-Integer(3)], d))
>>> sorted([s[a] for a in A] for s in bij.solutions_iterator())
[[0, 0, 0, 0, 1, 1, 0, 0, 0, 0, 1, 1, 0, 0, 1],
 [0, 1, 0, 1, 0, 0, 0, 1, 0, 1, 0, 0, 0, 1, 0],
 [0, 1, 0, 1, 0, 0, 1, 0, 0, 1, 0, 0, 1, 0, 0],
 [0, 1, 1, 0, 0, 0, 0, 1, 1, 0, 0, 0, 0, 1, 0],
 [0, 1, 1, 0, 0, 0, 1, 0, 1, 0, 0, 0, 1, 0, 0],
 [1, 0, 0, 1, 0, 0, 0, 1, 0, 1, 0, 0, 0, 1, 0],
 [1, 0, 0, 1, 0, 0, 1, 0, 0, 1, 0, 0, 1, 0, 0],
 [1, 0, 1, 0, 0, 0, 0, 1, 1, 0, 0, 0, 0, 1, 0],
 [1, 0, 1, 0, 0, 0, 1, 0, 1, 0, 0, 0, 1, 0, 0],
 [1, 1, 0, 0, 0, 1, 0, 0, 0, 0, 0, 1, 0, 0, 1],
 [1, 1, 0, 0, 1, 0, 0, 0, 0, 0, 1, 0, 0, 0, 1]]

>>> sorted(bij.minimal_subdistributions_blocks_iterator())        # random
```

(continues on next page)

(continued from previous page)

```
[(['a1', 'a2', 'a3', 'a4', 'a5', 'a5', 'a6', 'a6', 'a7', 'a7', 'a8', 'a8'],
  [0, 0, 0, 0, 0, 0, 0, 0, 1, 1, 1, 1]),
 (['a3', 'a4', 'd'], [0, 0, 1]),
 (['a7', 'a8', 'd'], [0, 0, 1])]
```

The following solution is not found, because it happens to have the same support as the other:

```
sage: D = set(A).difference(['b7', 'b8', 'd'])
sage: sorted(a.replace("b", "a") for a in D)
['a1', 'a2', 'a3', 'a3', 'a4', 'a4', 'a5', 'a5', 'a6', 'a6', 'a7', 'a8']
sage: set(tuple(sorted(s[a] for a in D)) for s in bij.solutions_iterator())
{(0, 0, 0, 0, 0, 0, 0, 0, 1, 1, 1, 1)}
```

```
>>> from sage.all import *
>>> D = set(A).difference(['b7', 'b8', 'd'])
>>> sorted(a.replace("b", "a") for a in D)
['a1', 'a2', 'a3', 'a3', 'a4', 'a4', 'a5', 'a5', 'a6', 'a6', 'a7', 'a8']
>>> set(tuple(sorted(s[a] for a in D)) for s in bij.solutions_iterator())
{(0, 0, 0, 0, 0, 0, 0, 0, 1, 1, 1, 1)}
```

But it is, by design, included here:

```
sage: sorted(D) in [d for d, _ in bij.minimal_subdistributions_iterator()]
True
```

```
>>> from sage.all import *
>>> sorted(D) in [d for d, _ in bij.minimal_subdistributions_iterator()]
True
```

minimal_subdistributions_iterator()

Return all minimal subsets $\tilde{A}$ of A together with submultisets $\tilde{Z}$ with $s(\tilde{A}) = \tilde{Z}$ as multisets.

EXAMPLES:

```
sage: A = B = [permutation for n in range(3) for permutation in␣
↪Permutations(n)]
sage: bij = Bijectionist(A, B, len)
sage: bij.set_statistics((len, len))
sage: for sol in bij.solutions_iterator():
....:     print(sol)
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 2}
sage: sorted(bij.minimal_subdistributions_iterator())
[([[]], [0]), ([[1]], [1]), ([[1, 2]], [2]), ([[2, 1]], [2])]
```

```
>>> from sage.all import *
>>> A = B = [permutation for n in range(Integer(3)) for permutation in␣
↪Permutations(n)]
>>> bij = Bijectionist(A, B, len)
>>> bij.set_statistics((len, len))
>>> for sol in bij.solutions_iterator():
...     print(sol)
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 2}
```

(continues on next page)

(continued from previous page)

```
>>> sorted(bij.minimal_subdistributions_iterator())
[(([]], [0]), ([[1]], [1]), ([[1, 2]], [2]), ([[2, 1]], [2])]
```

Another example:

```
sage: N = 2; A = B = [dyck_word for n in range(N+1) for dyck_word in␣
↪DyckWords(n)]
sage: def tau(D): return D.number_of_touch_points()
sage: bij = Bijectionist(A, B, tau)
sage: bij.set_statistics((lambda d: d.semilength(), lambda d: d.semilength()))
sage: for solution in sorted(list(bij.solutions_iterator()), key=lambda d:␣
↪tuple(sorted(d.items()))):
....:     print(solution)
{[]: 0, [1, 0]: 1, [1, 0, 1, 0]: 1, [1, 1, 0, 0]: 2}
{[]: 0, [1, 0]: 1, [1, 0, 1, 0]: 2, [1, 1, 0, 0]: 1}
sage: for subdistribution in bij.minimal_subdistributions_iterator():
....:     print(subdistribution)
([[]], [0])
([[1, 0]], [1])
([[1, 0, 1, 0], [1, 1, 0, 0]], [1, 2])
```

```
>>> from sage.all import *
>>> N = Integer(2); A = B = [dyck_word for n in range(N+Integer(1)) for dyck_
↪word in DyckWords(n)]
>>> def tau(D): return D.number_of_touch_points()
>>> bij = Bijectionist(A, B, tau)
>>> bij.set_statistics((lambda d: d.semilength(), lambda d: d.semilength()))
>>> for solution in sorted(list(bij.solutions_iterator()), key=lambda d:␣
↪tuple(sorted(d.items()))):
...     print(solution)
{[]: 0, [1, 0]: 1, [1, 0, 1, 0]: 1, [1, 1, 0, 0]: 2}
{[]: 0, [1, 0]: 1, [1, 0, 1, 0]: 2, [1, 1, 0, 0]: 1}
>>> for subdistribution in bij.minimal_subdistributions_iterator():
...     print(subdistribution)
([[]], [0])
([[1, 0]], [1])
([[1, 0, 1, 0], [1, 1, 0, 0]], [1, 2])
```

An example with two elements of the same block in a subdistribution:

```
sage: A = B = ["a", "b", "c", "d", "e"]
sage: tau = {"a": 1, "b": 1, "c": 2, "d": 2, "e": 3}.get
sage: bij = Bijectionist(A, B, tau)
sage: bij.set_constant_blocks([["a", "b"]])
sage: bij.set_value_restrictions(("a", [1, 2]))
sage: bij.constant_blocks(optimal=True)
{{'a', 'b'}}
sage: list(bij.minimal_subdistributions_iterator())
[(['a', 'b', 'c', 'd', 'e'], [1, 1, 2, 2, 3])]
```

```
>>> from sage.all import *
>>> A = B = ["a", "b", "c", "d", "e"]
```

(continues on next page)

(continued from previous page)

```
>>> tau = {"a": Integer(1), "b": Integer(1), "c": Integer(2), "d": Integer(2),
↪ "e": Integer(3)}.get
>>> bij = Bijectionist(A, B, tau)
>>> bij.set_constant_blocks([["a", "b"]])
>>> bij.set_value_restrictions(("a", [Integer(1), Integer(2)]))
>>> bij.constant_blocks(optimal=True)
{{'a', 'b'}}
>>> list(bij.minimal_subdistributions_iterator())
[(['a', 'b', 'c', 'd', 'e'], [1, 1, 2, 2, 3])]
```

possible_values(*p=None*, *optimal=False*)

Return for each block the values of s compatible with the imposed restrictions.

INPUT:

- `p` – (optional) a block of P, or an element of a block of P, or a list of these
- `optimal` – boolean (default: `False`); whether or not to compute the minimal possible set of statistic values

Note

Computing the minimal possible set of statistic values may be computationally expensive.

Todo

currently, calling this method with `optimal=True` does not update the internal dictionary, because this would interfere with the variables of the MILP.

EXAMPLES:

```
sage: A = B = ["a", "b", "c", "d"]
sage: tau = {"a": 1, "b": 1, "c": 1, "d": 2}.get
sage: bij = Bijectionist(A, B, tau)
sage: bij.set_constant_blocks([["a", "b"]])
sage: bij.possible_values(A)
{'a': {1, 2}, 'b': {1, 2}, 'c': {1, 2}, 'd': {1, 2}}
sage: bij.possible_values(A, optimal=True)
{'a': {1}, 'b': {1}, 'c': {1, 2}, 'd': {1, 2}}
```

```
>>> from sage.all import *
>>> A = B = ["a", "b", "c", "d"]
>>> tau = {"a": Integer(1), "b": Integer(1), "c": Integer(1), "d": Integer(2)}
↪.get
>>> bij = Bijectionist(A, B, tau)
>>> bij.set_constant_blocks([["a", "b"]])
>>> bij.possible_values(A)
{'a': {1, 2}, 'b': {1, 2}, 'c': {1, 2}, 'd': {1, 2}}
>>> bij.possible_values(A, optimal=True)
{'a': {1}, 'b': {1}, 'c': {1, 2}, 'd': {1, 2}}
```

The internal dictionary is not updated:

```
sage: bij.possible_values(A)
{'a': {1, 2}, 'b': {1, 2}, 'c': {1, 2}, 'd': {1, 2}}
```

```
>>> from sage.all import *
>>> bij.possible_values(A)
{'a': {1, 2}, 'b': {1, 2}, 'c': {1, 2}, 'd': {1, 2}}
```

set_constant_blocks(P)

Declare that $s : A \to Z$ is constant on each block of P.

> **Warning**
>
> Any restriction imposed by a previous invocation of *set_constant_blocks()* will be overwritten, including restrictions discovered by *set_intertwining_relations()* and *solutions_iterator()*!

A common example is to use the orbits of a bijection acting on A. This can be achieved using the function *orbit_decomposition()*.

INPUT:

- `P` – set partition of A, singletons may be omitted

EXAMPLES:

Initially the partitions are set to singleton blocks. The current partition can be reviewed using *constant_blocks()*:

```
sage: A = B = 'abcd'
sage: bij = Bijectionist(A, B, lambda x: B.index(x) % 2)
sage: bij.constant_blocks()
{}

sage: bij.set_constant_blocks([['a', 'c']])
sage: bij.constant_blocks()
{{'a', 'c'}}
```

```
>>> from sage.all import *
>>> A = B = 'abcd'
>>> bij = Bijectionist(A, B, lambda x: B.index(x) % Integer(2))
>>> bij.constant_blocks()
{}

>>> bij.set_constant_blocks([['a', 'c']])
>>> bij.constant_blocks()
{{'a', 'c'}}
```

We now add a map that combines some blocks:

```
sage: def pi(p1, p2): return 'abcdefgh'[A.index(p1) + A.index(p2)]
sage: def rho(s1, s2): return (s1 + s2) % 2
sage: bij.set_intertwining_relations((2, pi, rho))
sage: list(bij.solutions_iterator())
```

(continues on next page)

(continued from previous page)

```
[{'a': 0, 'b': 1, 'c': 0, 'd': 1}]
sage: bij.constant_blocks()
{{'a', 'c'}, {'b', 'd'}}
```

```
>>> from sage.all import *
>>> def pi(p1, p2): return 'abcdefgh'[A.index(p1) + A.index(p2)]
>>> def rho(s1, s2): return (s1 + s2) % Integer(2)
>>> bij.set_intertwining_relations((Integer(2), pi, rho))
>>> list(bij.solutions_iterator())
[{'a': 0, 'b': 1, 'c': 0, 'd': 1}]
>>> bij.constant_blocks()
{{'a', 'c'}, {'b', 'd'}}
```

Setting constant blocks overrides any previous assignment:

```
sage: bij.set_constant_blocks([['a', 'b']])
sage: bij.constant_blocks()
{{'a', 'b'}}
```

```
>>> from sage.all import *
>>> bij.set_constant_blocks([['a', 'b']])
>>> bij.constant_blocks()
{{'a', 'b'}}
```

If there is no solution, and the coarsest partition is requested, an error is raised:

```
sage: bij.constant_blocks(optimal=True)
Traceback (most recent call last):
...
StopIteration
```

```
>>> from sage.all import *
>>> bij.constant_blocks(optimal=True)
Traceback (most recent call last):
...
StopIteration
```

set_distributions(**elements_distributions*)

Specify the distribution of s for a subset of elements.

> **Warning**
>
> Any restriction imposed by a previous invocation of `set_distributions()` will be overwritten!

INPUT:

- one or more pairs of $(\tilde{A}, \tilde{Z})$, where $\tilde{A} \subseteq A$ and $\tilde{Z}$ is a list of values in Z of the same size as $\tilde{A}$

This method specifies that $\{s(a) | a \in \tilde{A}\}$ equals $\tilde{Z}$ as a multiset for each of the pairs.

When specifying several distributions, the subsets of A do not have to be disjoint.

ALGORITHM:

We add

$$\sum_{a \in \tilde{A}} x_{p(a),z} t^z = \sum_{z \in \tilde{Z}} t^z,$$

where $p(a)$ is the block containing a, for each given distribution as a vector equation to the MILP.

EXAMPLES:

```
sage: A = B = [permutation for n in range(4) for permutation in␣
↪Permutations(n)]
sage: tau = Permutation.longest_increasing_subsequence_length
sage: bij = Bijectionist(A, B, tau)
sage: bij.set_statistics((len, len))
sage: bij.set_distributions(([Permutation([1, 2, 3]), Permutation([1, 3, 2])],

```

set_homomesic(*Q*)

Assert that the average of s on each block of Q is constant.

INPUT:

- `Q` – set partition of `A`

EXAMPLES:

```
sage: A = B = [1,2,3]
sage: bij = Bijectionist(A, B, lambda b: b % 3)
sage: bij.set_homomesic([[1,2], [3]])
sage: list(bij.solutions_iterator())
[{1: 2, 2: 0, 3: 1}, {1: 0, 2: 2, 3: 1}]
```

```
>>> from sage.all import *
>>> A = B = [Integer(1),Integer(2),Integer(3)]
>>> bij = Bijectionist(A, B, lambda b: b % Integer(3))
>>> bij.set_homomesic([[Integer(1),Integer(2)], [Integer(3)]])
>>> list(bij.solutions_iterator())
[{1: 2, 2: 0, 3: 1}, {1: 0, 2: 2, 3: 1}]
```

set_intertwining_relations(**pi_rho*)

Add restrictions of the form $s(\pi(a_1, \dots, a_k)) = \rho(s(a_1), \dots, s(a_k))$.

> **Warning**
>
> Any restriction imposed by a previous invocation of `set_intertwining_relations()` will be overwritten!

INPUT:

- `pi_rho` – one or more tuples $(k, \pi : A^k \to A, \rho : Z^k \to Z, \tilde{A})$ where $\tilde{A}$ (optional) is a k-ary function that returns true if and only if a k-tuple of objects in A is in the domain of π

ALGORITHM:

The relation

$$s(\pi(a_1, \dots, a_k)) = \rho(s(a_1), \dots, s(a_k))$$

for each pair (π, ρ) implies immediately that $s(\pi(a_1, \dots, a_k))$ only depends on the blocks of $a_1, \dots, a_k$.

The MILP formulation is as follows. Let $a_1, \dots, a_k \in A$ and let $a = \pi(a_1, \dots, a_k)$. Let $z_1, \dots, z_k \in Z$ and let $z = \rho(z_1, \dots, z_k)$. Suppose that $a_i \in p_i$ for all i and that $a \in p$.

We then want to model the implication

$$x_{p_1,z_1} = 1, \dots, x_{p_k,z_k} = 1 \Rightarrow x_{p,z} = 1.$$

We achieve this by requiring

$$x_{p,z} \geq 1 - k + \sum_{i=1}^{k} x_{p_i,z_i}.$$

Note that z must be a possible value of p and each z_i must be a possible value of p_i.

EXAMPLES:

We can concatenate two permutations by increasing the values of the second permutation by the length of the first permutation:

```
sage: def concat(p1, p2): return Permutation(p1 + [i + len(p1) for i in p2])
```

```
>>> from sage.all import *
>>> def concat(p1, p2): return Permutation(p1 + [i + len(p1) for i in p2])
```

We may be interested in statistics on permutations which are equidistributed with the number of fixed points, such that concatenating permutations corresponds to adding statistic values:

```
sage: A = B = [permutation for n in range(4) for permutation in␣
↪Permutations(n)]
sage: bij = Bijectionist(A, B, Permutation.number_of_fixed_points)
sage: bij.set_statistics((len, len))
sage: for solution in sorted(list(bij.solutions_iterator()), key=lambda d:␣
↪tuple(sorted(d.items()))):
....:     print(solution)
...
{[]: 0, [1]: 1, [1, 2]: 0, [2, 1]: 2, [1, 2, 3]: 1, [1, 3, 2]: 0, [2, 1, 3]:␣
↪0, [2, 3, 1]: 1, [3, 1, 2]: 1, [3, 2, 1]: 3}
...
{[]: 0, [1]: 1, [1, 2]: 0, [2, 1]: 2, [1, 2, 3]: 1, [1, 3, 2]: 1, [2, 1, 3]:␣
↪3, [2, 3, 1]: 0, [3, 1, 2]: 0, [3, 2, 1]: 1}
...

sage: bij.set_intertwining_relations((2, concat, lambda x, y: x + y))
sage: for solution in sorted(list(bij.solutions_iterator()), key=lambda d:␣
↪tuple(sorted(d.items()))):
....:     print(solution)
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 1, [2, 1, 3]:␣
↪1, [2, 3, 1]: 0, [3, 1, 2]: 0, [3, 2, 1]: 1}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 1, [2, 1, 3]:␣
↪1, [2, 3, 1]: 0, [3, 1, 2]: 1, [3, 2, 1]: 0}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 1, [2, 1, 3]:␣
↪1, [2, 3, 1]: 1, [3, 1, 2]: 0, [3, 2, 1]: 0}
```

```
>>> from sage.all import *

```

(continues on next page)

(continued from previous page)

```
↪Permutations(n)]
>>> bij = Bijectionist(A, B, Permutation.number_of_fixed_points)
>>> bij.set_statistics((len, len))
>>> for solution in sorted(list(bij.solutions_iterator()), key=lambda d:␣
↪tuple(sorted(d.items()))):
...     print(solution)
...
{[]: 0, [1]: 1, [1, 2]: 0, [2, 1]: 2, [1, 2, 3]: 1, [1, 3, 2]: 0, [2, 1, 3]:␣
↪0, [2, 3, 1]: 1, [3, 1, 2]: 1, [3, 2, 1]: 3}
...
{[]: 0, [1]: 1, [1, 2]: 0, [2, 1]: 2, [1, 2, 3]: 1, [1, 3, 2]: 1, [2, 1, 3]:␣
↪3, [2, 3, 1]: 0, [3, 1, 2]: 0, [3, 2, 1]: 1}
...

>>> bij.set_intertwining_relations((Integer(2), concat, lambda x, y: x + y))
>>> for solution in sorted(list(bij.solutions_iterator()), key=lambda d:␣
↪tuple(sorted(d.items()))):
...     print(solution)
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 1, [2, 1, 3]:␣
↪1, [2, 3, 1]: 0, [3, 1, 2]: 0, [3, 2, 1]: 1}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 1, [2, 1, 3]:␣
↪1, [2, 3, 1]: 0, [3, 1, 2]: 1, [3, 2, 1]: 0}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 1, [2, 1, 3]:␣
↪1, [2, 3, 1]: 1, [3, 1, 2]: 0, [3, 2, 1]: 0}
```

The domain of the composition may be restricted. E.g., if we concatenate only permutations starting with a 1, we obtain fewer forced elements:

```
sage: in_domain = lambda p1, p2: (not p1 or p1(1) == 1) and (not p2 or p2(1)␣
↪== 1)
sage: bij.set_intertwining_relations((2, concat, lambda x, y: x + y, in_
↪domain))
sage: for solution in sorted(list(bij.solutions_iterator()), key=lambda d:␣
↪tuple(sorted(d.items()))):
....:     print(solution)
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 0, [2, 1, 3]:␣
↪0, [2, 3, 1]: 1, [3, 1, 2]: 1, [3, 2, 1]: 1}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 0, [2, 1, 3]:␣
↪1, [2, 3, 1]: 0, [3, 1, 2]: 1, [3, 2, 1]: 1}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 0, [2, 1, 3]:␣
↪1, [2, 3, 1]: 1, [3, 1, 2]: 0, [3, 2, 1]: 1}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 0, [2, 1, 3]:␣

↪0, [2, 3, 1]: 1, [3, 1, 2]: 1, [3, 2, 1]: 1}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 0, [2, 1, 3]:
↪1, [2, 3, 1]: 0, [3, 1, 2]: 1, [3, 2, 1]: 1}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 0, [2, 1, 3]:
↪1, [2, 3, 1]: 1, [3, 1, 2]: 0, [3, 2, 1]: 1}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 0, [2, 1, 3]:
↪1, [2, 3, 1]: 1, [3, 1, 2]: 1, [3, 2, 1]: 0}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 1, [2, 1, 3]:
↪0, [2, 3, 1]: 0, [3, 1, 2]: 1, [3, 2, 1]: 1}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 1, [2, 1, 3]:
↪0, [2, 3, 1]: 1, [3, 1, 2]: 0, [3, 2, 1]: 1}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 1, [2, 1, 3]:
↪0, [2, 3, 1]: 1, [3, 1, 2]: 1, [3, 2, 1]: 0}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 1, [2, 1, 3]:
↪1, [2, 3, 1]: 0, [3, 1, 2]: 0, [3, 2, 1]: 1}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 1, [2, 1, 3]:
↪1, [2, 3, 1]: 0, [3, 1, 2]: 1, [3, 2, 1]: 0}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 1, [2, 1, 3]:
↪1, [2, 3, 1]: 1, [3, 1, 2]: 0, [3, 2, 1]: 0}
```

We can also restrict according to several composition functions. For example, we may additionally concatenate permutations by incrementing the elements of the first:

```
sage: skew_concat = lambda p1, p2: Permutation([i + len(p2) for i in p1] +
↪list(p2))
sage: bij.set_intertwining_relations((2, skew_concat, lambda x, y: x + y))
sage: for solution in sorted(list(bij.solutions_iterator()), key=lambda d:
↪tuple(sorted(d.items()))):
....:     print(solution)
{[]: 0, [1]: 1, [1, 2]: 0, [2, 1]: 2, [1, 2, 3]: 0, [1, 3, 2]: 0, [2, 1, 3]:
↪1, [2, 3, 1]: 1, [3, 1, 2]: 1, [3, 2, 1]: 3}
{[]: 0, [1]: 1, [1, 2]: 0, [2, 1]: 2, [1, 2, 3]: 0, [1, 3, 2]: 1, [2, 1, 3]:
↪0, [2, 3, 1]: 1, [3, 1, 2]: 1, [3, 2, 1]: 3}
{[]: 0, [1]: 1, [1, 2]: 0, [2, 1]: 2, [1, 2, 3]: 1, [1, 3, 2]: 0, [2, 1, 3]:
↪0, [2, 3, 1]: 1, [3, 1, 2]: 1, [3, 2, 1]: 3}
```

```
>>> from sage.all import *
>>> skew_concat = lambda p1, p2: Permutation([i + len(p2) for i in p1] +
↪list(p2))
```

(continues on next page)

(continued from previous page)

```
>>> bij.set_intertwining_relations((Integer(2), skew_concat, lambda x, y: x +␣
↪y))
>>> for solution in sorted(list(bij.solutions_iterator()), key=lambda d:␣
↪tuple(sorted(d.items()))):
...     print(solution)
{[]: 0, [1]: 1, [1, 2]: 0, [2, 1]: 2, [1, 2, 3]: 0, [1, 3, 2]: 0, [2, 1, 3]:␣
↪1, [2, 3, 1]: 1, [3, 1, 2]: 1, [3, 2, 1]: 3}
{[]: 0, [1]: 1, [1, 2]: 0, [2, 1]: 2, [1, 2, 3]: 0, [1, 3, 2]: 1, [2, 1, 3]:␣
↪0, [2, 3, 1]: 1, [3, 1, 2]: 1, [3, 2, 1]: 3}
{[]: 0, [1]: 1, [1, 2]: 0, [2, 1]: 2, [1, 2, 3]: 1, [1, 3, 2]: 0, [2, 1, 3]:␣
↪0, [2, 3, 1]: 1, [3, 1, 2]: 1, [3, 2, 1]: 3}
```

However, this yields no solution:

```
sage: bij.set_intertwining_relations((2, concat, lambda x, y: x + y), (2,␣
↪skew_concat, lambda x, y: x + y))
sage: list(bij.solutions_iterator())
[]
```

```
>>> from sage.all import *
>>> bij.set_intertwining_relations((Integer(2), concat, lambda x, y: x + y),␣
↪(Integer(2), skew_concat, lambda x, y: x + y))
>>> list(bij.solutions_iterator())
[]
```

set_quadratic_relation(**phi_psi*)

Add restrictions of the form $s \circ \psi \circ s = \phi$.

INPUT:

- phi_psi – (optional) a list of pairs (ϕ, ρ) where $\phi : A \to Z$ and $\psi : Z \to A$

ALGORITHM:

We add

$$x_{p(a),z} = x_{p(\psi(z)),\phi(a)}$$

for $a \in A$ and $z \in Z$ to the MILP, where $\phi : A \to Z$ and $\psi : Z \to A$. Note that, in particular, ϕ must be constant on blocks.

EXAMPLES:

```
sage: A = B = DyckWords(3)
sage: bij = Bijectionist(A, B)
sage: bij.set_statistics((lambda D: D.number_of_touch_points(), lambda D: D.
↪number_of_initial_rises()))
sage: ascii_art(sorted(bij.minimal_subdistributions_iterator()))
[ (             [   /\   ] )
[ (             [  /  \  ] )  ( [    /\    /\    ]  [  /\      /\/\  ] )
[ ( [ /\/\/\ ], [ /    \ ] ), ( [ /\/  \, /  \/\ ], [ /  \/\, /    \ ] ),

 ( [           /\   ]                     ) ]
 ( [  /\/\    /  \   ]  [            /\  ] ) ]
 ( [ /    \, /    \ ], [ /\/\/\, /\/  \ ] ) ]
```

(continues on next page)

(continued from previous page)

```

 ( [ /    \ ], [ /\/\/\ ] ) ]
```

set_semi_conjugacy(**pi_rho*)

Add restrictions of the form $s(\pi(a_1, \ldots, a_k)) = \rho(s(a_1), \ldots, s(a_k))$.

> **Warning**
>
> Any restriction imposed by a previous invocation of *set_intertwining_relations()* will be overwritten!

INPUT:

- `pi_rho` – one or more tuples $(k, \pi : A^k \to A, \rho : Z^k \to Z, \tilde{A})$ where $\tilde{A}$ (optional) is a k-ary function that returns true if and only if a k-tuple of objects in A is in the domain of π

ALGORITHM:

The relation

$$s(\pi(a_1, \dots, a_k)) = \rho(s(a_1), \dots, s(a_k))$$

for each pair (π, ρ) implies immediately that $s(\pi(a_1, \dots, a_k))$ only depends on the blocks of $a_1, \dots, a_k$.

The MILP formulation is as follows. Let $a_1, \dots, a_k \in A$ and let $a = \pi(a_1, \dots, a_k)$. Let $z_1, \dots, z_k \in Z$ and let $z = \rho(z_1, \dots, z_k)$. Suppose that $a_i \in p_i$ for all i and that $a \in p$.

We then want to model the implication

$$x_{p_1, z_1} = 1, \dots, x_{p_k, z_k} = 1 \Rightarrow x_{p, z} = 1.$$

We achieve this by requiring

$$x_{p,z} \geq 1 - k + \sum_{i=1}^{k} x_{p_i, z_i}.$$

Note that z must be a possible value of p and each z_i must be a possible value of p_i.

EXAMPLES:

We can concatenate two permutations by increasing the values of the second permutation by the length of the first permutation:

```
sage: def concat(p1, p2): return Permutation(p1 + [i + len(p1) for i in p2])
```

```
>>> from sage.all import *
>>> def concat(p1, p2): return Permutation(p1 + [i + len(p1) for i in p2])
```

We may be interested in statistics on permutations which are equidistributed with the number of fixed points, such that concatenating permutations corresponds to adding statistic values:

```
sage: A = B = [permutation for n in range(4) for permutation in␣
↪Permutations(n)]
sage: bij = Bijectionist(A, B, Permutation.number_of_fixed_points)
sage: bij.set_statistics((len, len))
sage: for solution in sorted(list(bij.solutions_iterator()), key=lambda d:␣
↪tuple(sorted(d.items()))):
....:     print(solution)
...
{[]: 0, [1]: 1, [1, 2]: 0, [2, 1]: 2, [1, 2, 3]: 1, [1, 3, 2]: 0, [2, 1, 3]:␣
↪0, [2, 3, 1]: 1, [3, 1, 2]: 1, [3, 2, 1]: 3}
...
{[]: 0, [1]: 1, [1, 2]: 0, [2, 1]: 2, [1, 2, 3]: 1, [1, 3, 2]: 1, [2, 1, 3]:␣
↪3, [2, 3, 1]: 0, [3, 1, 2]: 0, [3, 2, 1]: 1}
...

sage: bij.set_intertwining_relations((2, concat, lambda x, y: x + y))
sage: for solution in sorted(list(bij.solutions_iterator()), key=lambda d:␣
↪tuple(sorted(d.items()))):
....:     print(solution)
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 1, [2, 1, 3]:␣
```

(continues on next page)

(continued from previous page)

```
↪1, [2, 3, 1]: 0, [3, 1, 2]: 0, [3, 2, 1]: 1}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 1, [2, 1, 3]:␣
↪1, [2, 3, 1]: 0, [3, 1, 2]: 1, [3, 2, 1]: 0}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 1, [2, 1, 3]:␣
↪1, [2, 3, 1]: 1, [3, 1, 2]: 0, [3, 2, 1]: 0}
```

```
>>> from sage.all import *
>>> A = B = [permutation for n in range(Integer(4)) for permutation in␣
↪Permutations(n)]
>>> bij = Bijectionist(A, B, Permutation.number_of_fixed_points)
>>> bij.set_statistics((len, len))
>>> for solution in sorted(list(bij.solutions_iterator()), key=lambda d:␣
↪tuple(sorted(d.items()))):
...     print(solution)
...
{[]: 0, [1]: 1, [1, 2]: 0, [2, 1]: 2, [1, 2, 3]: 1, [1, 3, 2]: 0, [2, 1, 3]:␣
↪0, [2, 3, 1]: 1, [3, 1, 2]: 1, [3, 2, 1]: 3}
...
{[]: 0, [1]: 1, [1, 2]: 0, [2, 1]: 2, [1, 2, 3]: 1, [1, 3, 2]: 1, [2, 1, 3]:␣
↪3, [2, 3, 1]: 0, [3, 1, 2]: 0, [3, 2, 1]: 1}
...

>>> bij.set_intertwining_relations((Integer(2), concat, lambda x, y: x + y))
>>> for solution in sorted(list(bij.solutions_iterator()), key=lambda d:␣
↪tuple(sorted(d.items()))):
...     print(solution)
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 1, [2, 1, 3]:␣
↪1, [2, 3, 1]: 0, [3, 1, 2]: 0, [3, 2, 1]: 1}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 1, [2, 1, 3]:␣
↪1, [2, 3, 1]: 0, [3, 1, 2]: 1, [3, 2, 1]: 0}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 1, [2, 1, 3]:␣
↪1, [2, 3, 1]: 1, [3, 1, 2]: 0, [3, 2, 1]: 0}
```

The domain of the composition may be restricted. E.g., if we concatenate only permutations starting with a 1, we obtain fewer forced elements:

```
sage: in_domain = lambda p1, p2: (not p1 or p1(1) == 1) and (not p2 or p2(1)␣
↪== 1)
sage: bij.set_intertwining_relations((2, concat, lambda x, y: x + y, in_
↪domain))
sage: for solution in sorted(list(bij.solutions_iterator()), key=lambda d:␣
↪tuple(sorted(d.items()))):
....:     print(solution)
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 0, [2, 1, 3]:␣
↪0, [2, 3, 1]: 1, [3, 1, 2]: 1, [3, 2, 1]: 1}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 0, [2, 1, 3]:␣
↪1, [2, 3, 1]: 0, [3, 1, 2]: 1, [3, 2, 1]: 1}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 0, [2, 1, 3]:␣
↪1, [2, 3, 1]: 1, [3, 1, 2]: 0, [3, 2, 1]: 1}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 0, [2, 1, 3]:␣
↪1, [2, 3, 1]: 1, [3, 1, 2]: 1, [3, 2, 1]: 0}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 1, [2, 1, 3]:␣
```

(continues on next page)

(continued from previous page)

```
↪0, [2, 3, 1]: 0, [3, 1, 2]: 1, [3, 2, 1]: 1}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 1, [2, 1, 3]:␣

↪in_domain))
>>> for solution in sorted(list(bij.solutions_iterator()), key=lambda d:␣
↪tuple(sorted(d.items()))):
...     print(solution)
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 0, [2, 1, 3]:␣
↪0, [2, 3, 1]: 1, [3, 1, 2]: 1, [3, 2, 1]: 1}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 0, [2, 1, 3]:␣
↪1, [2, 3, 1]: 0, [3, 1, 2]: 1, [3, 2, 1]: 1}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 0, [2, 1, 3]:␣
↪1, [2, 3, 1]: 1, [3, 1, 2]: 0, [3, 2, 1]: 1}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 0, [2, 1, 3]:␣
↪1, [2, 3, 1]: 1, [3, 1, 2]: 1, [3, 2, 1]: 0}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 1, [2, 1, 3]:␣
↪0, [2, 3, 1]: 0, [3, 1, 2]: 1, [3, 2, 1]: 1}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 1, [2, 1, 3]:␣
↪0, [2, 3, 1]: 1, [3, 1, 2]: 0, [3, 2, 1]: 1}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 1, [2, 1, 3]:␣
↪0, [2, 3, 1]: 1, [3, 1, 2]: 1, [3, 2, 1]: 0}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 1, [2, 1, 3]:␣
↪1, [2, 3, 1]: 0, [3, 1, 2]: 0, [3, 2, 1]: 1}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 1, [2, 1, 3]:␣
↪1, [2, 3, 1]: 0, [3, 1, 2]: 1, [3, 2, 1]: 0}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 1, [2, 1, 3]:␣
↪1, [2, 3, 1]: 1, [3, 1, 2]: 0, [3, 2, 1]: 0}
```

We can also restrict according to several composition functions. For example, we may additionally concatenate permutations by incrementing the elements of the first:

```
sage: skew_concat = lambda p1, p2: Permutation([i + len(p2) for i in p1] +␣
↪list(p2))
sage: bij.set_intertwining_relations((2, skew_concat, lambda x, y: x + y))
sage: for solution in sorted(list(bij.solutions_iterator()), key=lambda d:␣
↪tuple(sorted(d.items()))):
....:     print(solution)
{[]: 0, [1]: 1, [1, 2]: 0, [2, 1]: 2, [1, 2, 3]: 0, [1, 3, 2]: 0, [2, 1, 3]:␣
↪1, [2, 3, 1]: 1, [3, 1, 2]: 1, [3, 2, 1]: 3}
```

(continues on next page)

(continued from previous page)

```
{[]: 0, [1]: 1, [1, 2]: 0, [2, 1]: 2, [1, 2, 3]: 0, [1, 3, 2]: 1, [2, 1, 3]:␣
↪0, [2, 3, 1]: 1, [3, 1, 2]: 1, [3, 2, 1]: 3}
{[]: 0, [1]: 1, [1, 2]: 0, [2, 1]: 2, [1, 2, 3]: 1, [1, 3, 2]: 0, [2, 1, 3]:␣
↪0, [2, 3, 1]: 1, [3, 1, 2]: 1, [3, 2, 1]: 3}
```

```
>>> from sage.all import *
>>> skew_concat = lambda p1, p2: Permutation([i + len(p2) for i in p1] +␣
↪list(p2))
>>> bij.set_intertwining_relations((Integer(2), skew_concat, lambda x, y: x +␣
↪y))
>>> for solution in sorted(list(bij.solutions_iterator()), key=lambda d:␣
↪tuple(sorted(d.items()))):
...     print(solution)
{[]: 0, [1]: 1, [1, 2]: 0, [2, 1]: 2, [1, 2, 3]: 0, [1, 3, 2]: 0, [2, 1, 3]:␣
↪1, [2, 3, 1]: 1, [3, 1, 2]: 1, [3, 2, 1]: 3}
{[]: 0, [1]: 1, [1, 2]: 0, [2, 1]: 2, [1, 2, 3]: 0, [1, 3, 2]: 1, [2, 1, 3]:␣
↪0, [2, 3, 1]: 1, [3, 1, 2]: 1, [3, 2, 1]: 3}
{[]: 0, [1]: 1, [1, 2]: 0, [2, 1]: 2, [1, 2, 3]: 1, [1, 3, 2]: 0, [2, 1, 3]:␣
↪0, [2, 3, 1]: 1, [3, 1, 2]: 1, [3, 2, 1]: 3}
```

However, this yields no solution:

```
sage: bij.set_intertwining_relations((2, concat, lambda x, y: x + y), (2,␣
↪skew_concat, lambda x, y: x + y))
sage: list(bij.solutions_iterator())
[]
```

```
>>> from sage.all import *
>>> bij.set_intertwining_relations((Integer(2), concat, lambda x, y: x + y),␣
↪(Integer(2), skew_concat, lambda x, y: x + y))
>>> list(bij.solutions_iterator())
[]
```

set_statistics(**alpha_beta*)

Set constraints of the form $\alpha = \beta \circ S$.

> **Warning**
>
> Any restriction imposed by a previous invocation of *set_statistics()* will be overwritten!

INPUT:

- alpha_beta – one or more pairs $(\alpha : A \to W, \beta : B \to W)$

If the statistics α and β are not equidistributed, an error is raised.

ALGORITHM:

We add

$$\sum_{a\in A, z\in Z} x_{p(a),z} s^z t^{\alpha(a)} = \sum_{b\in B} s^{\tau(b)} t(\beta(b))$$

as a matrix equation to the MILP.

EXAMPLES:

We look for bijections S on permutations such that the number of weak exceedences of $S(\pi)$ equals the number of descents of π, and statistics s, such that the number of fixed points of $S(\pi)$ equals $s(\pi)$:

```
sage: N = 4; A = B = [permutation for n in range(N) for permutation in␣
↪Permutations(n)]
sage: def wex(p): return len(p.weak_excedences())
sage: def fix(p): return len(p.fixed_points())
sage: def des(p): return len(p.descents(final_descent=True)) if p else 0
sage: def adj(p): return len([e for (e, f) in zip(p, p[1:]+[0]) if e == f+1])
sage: bij = Bijectionist(A, B, fix)
sage: bij.set_statistics((wex, des), (len, len))
sage: for solution in sorted(list(bij.solutions_iterator()), key=lambda d:␣
↪tuple(sorted(d.items()))):
....:     print(solution)

Calling this with non-equidistributed statistics yields an error:

```
sage: bij = Bijectionist(A, B, fix)
sage: bij.set_statistics((wex, fix))
Traceback (most recent call last):
...
ValueError: statistics alpha and beta are not equidistributed
```

```
>>> from sage.all import *
>>> bij = Bijectionist(A, B, fix)
>>> bij.set_statistics((wex, fix))
Traceback (most recent call last):
...
ValueError: statistics alpha and beta are not equidistributed
```

set_value_restrictions(**value_restrictions*)

Restrict the set of possible values $s(a)$ for a given element a.

> **Warning**
>
> Any restriction imposed by a previous invocation of `set_value_restrictions()` will be overwritten!

INPUT:

- `value_restrictions` – one or more pairs $(a \in A, \tilde{Z} \subseteq Z)$

EXAMPLES:

We may want to restrict the value of a given element to a single or multiple values. We do not require that the specified values are in the image of τ. In some cases, the restriction may not be able to provide a better solution, as for size 3 in the following example.

```
sage: A = B = [permutation for n in range(4) for permutation in␣
↪Permutations(n)]
sage: tau = Permutation.longest_increasing_subsequence_length
sage: bij = Bijectionist(A, B, tau)
sage: bij.set_statistics((len, len))
sage: bij.set_value_restrictions((Permutation([1, 2]), [1]),
....:                           (Permutation([3, 2, 1]), [2, 3, 4]))
sage: for sol in sorted(bij.solutions_iterator(), key=lambda d: sorted(d.
↪items())):
....:     print(sol)
{[]: 0, [1]: 1, [1, 2]: 1, [2, 1]: 2, [1, 2, 3]: 1, [1, 3, 2]: 2, [2, 1, 3]:␣
↪2, [2, 3, 1]: 2, [3, 1, 2]: 2, [3, 2, 1]: 3}
{[]: 0, [1]: 1, [1, 2]: 1, [2, 1]: 2, [1, 2, 3]: 1, [1, 3, 2]: 2, [2, 1, 3]:␣

```

However, an error occurs if the set of possible values is empty. In this example, the image of τ under any legal bijection is disjoint to the specified values.

solutions_iterator()

An iterator over all solutions of the problem.

OUTPUT: an iterator over all possible mappings $s : A \to Z$

ALGORITHM:

We solve an integer linear program with a binary variable $x_{p,z}$ for each partition block $p \in P$ and each statistic value $z \in Z$:

- $x_{p,z} = 1$ if and only if $s(a) = z$ for all $a \in p$.

Then we add the constraint $\sum_{x\in V} x < |V|$, where V is the set containing all x with $x = 1$, that is, those indicator variables representing the current solution. Therefore, a solution of this new program must be different from all those previously obtained.

INTEGER LINEAR PROGRAM:

- Let $m_w(p)$, for a block p of P, be the multiplicity of the value w in W under α, that is, the number of elements $a \in p$ with $\alpha(a) = w$.
- Let $n_w(z)$ be the number of elements $b \in B$ with $\beta(b) = w$ and $\tau(b) = z$ for $w \in W$, $z \in Z$.
- Let k be the arity of a pair (π, ρ) in an intertwining relation.

and the following constraints:

- because every block is assigned precisely one value, for all $p \in P$,

$$\sum_z x_{p,z} = 1.$$

- because the statistics s and τ and also α and β are equidistributed, for all $w \in W$ and $z \in Z$,

$$\sum_p m_w(p) x_{p,z} = n_w(z).$$

- for each intertwining relation $s(\pi(a_1, \dots, a_k)) = \rho(s(a_1), \dots, s(a_r))$, and for all k-combinations of blocks $p_i \in P$ such that there exist $(a_1, \dots, a_k) \in p_1 \times \dots \times p_k$ with $\pi(a_1, \dots, a_k) \in W$ and $z = \rho(z_1, \dots, z_k)$,

$$x_{p,z} \geq 1 - k + \sum_{i=1}^{k} x_{p_i, z_i}.$$

- for each distribution restriction, i.e. a set of elements $\tilde{A}$ and a distribution of values given by integers d_z representing the multiplicity of each $z \in Z$, and $r_p = |p \cap \tilde{A}|$ indicating the relative size of block p in the set of elements of the distribution,

$$\sum_p r_p x_{p,z} = d_z.$$

EXAMPLES:

```
sage: A = B = 'abc'
sage: bij = Bijectionist(A, B, lambda x: B.index(x) % 2, solver='GLPK')
sage: next(bij.solutions_iterator())
{'a': 0, 'b': 1, 'c': 0}

sage: list(bij.solutions_iterator())
[{'a': 0, 'b': 1, 'c': 0},
 {'a': 1, 'b': 0, 'c': 0},
 {'a': 0, 'b': 0, 'c': 1}]

sage: N = 4
sage: A = B = [permutation for n in range(N) for permutation in␣
↪Permutations(n)]
```

```
>>> from sage.all import *
>>> A = B = 'abc'
>>> bij = Bijectionist(A, B, lambda x: B.index(x) % Integer(2), solver='GLPK')
>>> next(bij.solutions_iterator())
{'a': 0, 'b': 1, 'c': 0}

>>> list(bij.solutions_iterator())
[{'a': 0, 'b': 1, 'c': 0},
 {'a': 1, 'b': 0, 'c': 0},
 {'a': 0, 'b': 0, 'c': 1}]

>>> N = Integer(4)
>>> A = B = [permutation for n in range(N) for permutation in Permutations(n)]
```

Let τ be the number of non-left-to-right-maxima of a permutation:

```
sage: def tau(pi):
....:     pi = list(pi)
....:     i = count = 0
....:     for j in range(len(pi)):
....:         if pi[j] > i:
```

(continues on next page)

(continued from previous page)

```
....:             i = pi[j]
....:         else:
....:             count += 1
....:     return count
```

```
>>> from sage.all import *
>>> def tau(pi):
...     pi = list(pi)
...     i = count = Integer(0)
...     for j in range(len(pi)):
...         if pi[j] > i:
...             i = pi[j]
...         else:
...             count += Integer(1)
...     return count
```

We look for a statistic which is constant on conjugacy classes:

```
sage: P = [list(a) for n in range(N) for a in Permutations(n).conjugacy_
↪classes()]

sage: bij = Bijectionist(A, B, tau, solver='GLPK')
sage: bij.set_statistics((len, len))
sage: bij.set_constant_blocks(P)
sage: for solution in bij.solutions_iterator():
....:     print(solution)
{[]: 0, [1]: 0, [1, 2]: 1, [2, 1]: 0, [1, 2, 3]: 0, [1, 3, 2]: 1, [2, 1, 3]:␣
↪1, [3, 2, 1]: 1, [2, 3, 1]: 2, [3, 1, 2]: 2}
{[]: 0, [1]: 0, [1, 2]: 0, [2, 1]: 1, [1, 2, 3]: 0, [1, 3, 2]: 1, [2, 1, 3]:␣
↪1, [3, 2, 1]: 1, [2, 3, 1]: 2, [3, 1, 2]: 2}
```

```
>>> from sage.all import *
>>> P = [list(a) for n in range(N) for a in Permutations(n).conjugacy_
↪classes()]

>>> bij = Bijectionist(A, B, tau, solver='GLPK')
>>> bij.set_statistics((len, len))
>>> bij.set_constant_blocks(P)
>>> for solution in bij.solutions_iterator():
...     print(solution)
{[]: 0, [1]: 0, [1, 2]: 1, [2, 1]: 0, [1, 2, 3]: 0, [1, 3, 2]: 1, [2, 1, 3]:␣
↪1, [3, 2, 1]: 1, [2, 3, 1]: 2, [3, 1, 2]: 2}
{[]: 0, [1]: 0, [1, 2]: 0, [2, 1]: 1, [1, 2, 3]: 0, [1, 3, 2]: 1, [2, 1, 3]:␣
↪1, [3, 2, 1]: 1, [2, 3, 1]: 2, [3, 1, 2]: 2}
```

Changing or re-setting problem parameters clears the internal cache. Setting the verbosity prints the MILP which is solved.:

```
sage: set_verbose(2)
sage: bij.set_constant_blocks(P)
sage: _ = list(bij.solutions_iterator())

>>> set_verbose(Integer(0))
```

statistics_fibers()

Return a dictionary mapping statistic values in W to their preimages in A and B.

This is a (computationally) fast way to obtain a first impression which objects in A should be mapped to which objects in B.

EXAMPLES:

```
sage: A = B = [permutation for n in range(4) for permutation in␣
↪Permutations(n)]
sage: tau = Permutation.longest_increasing_subsequence_length
sage: def wex(p): return len(p.weak_excedences())
sage: def fix(p): return len(p.fixed_points())
sage: def des(p): return len(p.descents(final_descent=True)) if p else 0
sage: def adj(p): return len([e for (e, f) in zip(p, p[1:]+[0]) if e == f+1])
sage: bij = Bijectionist(A, B, tau)
sage: bij.set_statistics((len, len), (wex, des), (fix, adj))
sage: table([[key, AB[0], AB[1]] for key, AB in bij.statistics_fibers().
↪items()])
  (0, 0, 0)   [[]]                                   [[]]
  (1, 1, 1)   [[1]]                                  [[1]]
  (2, 2, 2)   [[1, 2]]                               [[2, 1]]
  (2, 1, 0)   [[2, 1]]                               [[1, 2]]
  (3, 3, 3)   [[1, 2, 3]]                            [[3, 2, 1]]
  (3, 2, 1)   [[1, 3, 2], [2, 1, 3], [3, 2, 1]]    [[1, 3, 2], [2, 1, 3], [2,␣
↪3, 1]]
  (3, 2, 0)   [[2, 3, 1]]                            [[3, 1, 2]]
  (3, 1, 0)   [[3, 1, 2]]                            [[1, 2, 3]]
```

```
>>> from sage.all import *
>>> A = B = [permutation for n in range(Integer(4)) for permutation in␣
↪Permutations(n)]
>>> tau = Permutation.longest_increasing_subsequence_length
>>> def wex(p): return len(p.weak_excedences())
>>> def fix(p): return len(p.fixed_points())
>>> def des(p): return len(p.descents(final_descent=True)) if p else␣
↪Integer(0)
>>> def adj(p): return len([e for (e, f) in zip(p,␣
```

(continues on next page)

(continued from previous page)

```
↪p[Integer(1):]+[Integer(0)]) if e == f+Integer(1)])
>>> bij = Bijectionist(A, B, tau)

↪3, 1]]
  (3, 2, 0)   [[2, 3, 1]]                        [[3, 1, 2]]
  (3, 1, 0)   [[3, 1, 2]]                        [[1, 2, 3]]
```

statistics_table(*header=True*)

Provide information about all elements of A with corresponding α values and all elements of B with corresponding β and τ values.

INPUT:

- `header` – boolean (default: `True`); whether to include a header with the standard Greek letters

OUTPUT:

A pair of lists suitable for `table`, where

- the first contains the elements of A together with the values of α
- the second contains the elements of B together with the values of τ and β

EXAMPLES:

```
sage: A = B = [permutation for n in range(4) for permutation in␣
↪Permutations(n)]
sage: tau = Permutation.longest_increasing_subsequence_length
sage: def wex(p): return len(p.weak_excedences())
sage: def fix(p): return len(p.fixed_points())
sage: def des(p): return len(p.descents(final_descent=True)) if p else 0
sage: def adj(p): return len([e for (e, f) in zip(p, p[1:]+[0]) if e == f+1])
sage: bij = Bijectionist(A, B, tau)
sage: bij.set_statistics((wex, des), (fix, adj))
sage: a, b = bij.statistics_table()
sage: table(a, header_row=True, frame=True)

5.1.9 Binary Recurrence Sequences

This class implements several methods relating to general linear binary recurrence sequences, including a sieve to find perfect powers in integral linear binary recurrence sequences.

EXAMPLES:

```
sage: R = BinaryRecurrenceSequence(1,1)        #the Fibonacci sequence
sage: R(137)        #the 137th term of the Fibonacci sequence
19134702400093278081449423917
sage: R(137) == fibonacci(137)
True
sage: [R(i) % 4 for i in range(12)]
[0, 1, 1, 2, 3, 1, 0, 1, 1, 2, 3, 1]
sage: R.period(4)        #the period of the fibonacci sequence modulo 4
6
sage: R.pthpowers(2, 10**10)        # long time (7 seconds) -- in fact these are all␣
↪squares, c.f. [BMS06]
[0, 1, 2, 12]

sage: S = BinaryRecurrenceSequence(8,1)  #a Lucas sequence
sage: S.period(73)
148
sage: S(5) % 73 == S(5 +148) %73
True
sage: S.pthpowers(3, 10**10)    # long time (3 seconds) -- provably finds the indices␣
↪of all 3rd powers less than 10^10
[0, 1, 2]

sage: T = BinaryRecurrenceSequence(2,0,1,2)
sage: [T(i) for i in range(10)]
[1, 2, 4, 8, 16, 32, 64, 128, 256, 512]
sage: T.is_degenerate()
True
sage: T.is_geometric()
True
sage: T.pthpowers(7, 10**30)                                                     #␣
↪needs sage.symbolic
Traceback (most recent call last):

ValueError: the degenerate binary recurrence sequence is geometric or quasigeometric
and has many pth powers
```

AUTHORS:

- Isabel Vogt (2013): initial version

See [SV2013], [BMS2006], and [SS1983].

class sage.combinat.binary_recurrence_sequences.**BinaryRecurrenceSequence**(*b*, *c*, *u0=0*, *u1=1*)

Bases: SageObject

Create a linear binary recurrence sequence defined by initial conditions u_0 and u_1 and recurrence relation $u_{n+2} = b * u_{n+1} + c * u_n$.

INPUT:

- b – integer; (partially determining the recurrence relation)
- c – integer; (partially determining the recurrence relation)
- u0 – integer; (the 0-th term of the binary recurrence sequence)
- u1 – integer; (the 1-st term of the binary recurrence sequence)

OUTPUT: an integral linear binary recurrence sequence defined by u_0, u_1, and $u_{n+2} = bu_{n+1} + cu_n$

See also

fibonacci(), *lucas_number1()*, *lucas_number2()*

EXAMPLES:

```
sage: R = BinaryRecurrenceSequence(3,3,2,1)
sage: R
Binary recurrence sequence defined by: u_n = 3 * u_{n-1} + 3 * u_{n-2};
With initial conditions: u_0 = 2, and u_1 = 1
```

```
>>> from sage.all import *
>>> R = BinaryRecurrenceSequence(Integer(3),Integer(3),Integer(2),Integer(1))
>>> R
Binary recurrence sequence defined by: u_n = 3 * u_{n-1} + 3 * u_{n-2};
With initial conditions: u_0 = 2, and u_1 = 1
```

is_arithmetic()

Decide whether the sequence is degenerate and an arithmetic sequence.

The sequence is arithmetic if and only if $u_1 - u_0 = u_2 - u_1 = u_3 - u_2$.

This corresponds to the matrix $F = [[0, 1], [c, b]]$ being nondiagonalizable and $\alpha/\beta = 1$.

EXAMPLES:

```
sage: S = BinaryRecurrenceSequence(2,-1)
sage: [S(i) for i in range(10)]
[0, 1, 2, 3, 4, 5, 6, 7, 8, 9]
sage: S.is_arithmetic()
True
```

```
>>> from sage.all import *
>>> S = BinaryRecurrenceSequence(Integer(2),-Integer(1))
>>> [S(i) for i in range(Integer(10))]
[0, 1, 2, 3, 4, 5, 6, 7, 8, 9]
>>> S.is_arithmetic()
True
```

is_degenerate()

Decide whether the binary recurrence sequence is degenerate.

Let α and β denote the roots of the characteristic polynomial $p(x) = x^2 - bx - c$. Let $a = u_1 - u_0\beta/(\beta - \alpha)$ and $b = u_1 - u_0\alpha/(\beta - \alpha)$. The sequence is, thus, given by $u_n = a\alpha^n - b\beta^n$. Then we say that the sequence is nondegenerate if and only if $a * b * \alpha * \beta \neq 0$ and α/β is not a root of unity.

More concretely, there are 4 classes of degeneracy, that can all be formulated in terms of the matrix $F = [[0, 1], [c, b]]$.

- F is singular – this corresponds to `c` = 0, and thus $\alpha * \beta = 0$. This sequence is geometric after term `u0` and so we call it `quasigeometric`
- $v = [[u_0], [u_1]]$ is an eigenvector of F – this corresponds to a `geometric` sequence with $a * b = 0$
- F is nondiagonalizable – this corresponds to $\alpha = \beta$. This sequence will be the point-wise product of an arithmetic and geometric sequence.
- F^k is scalar, for some $k > 1$ – this corresponds to α/β a k th root of unity. This sequence is a union of several geometric sequences, and so we again call it `quasigeometric`.

EXAMPLES:

```
sage: S = BinaryRecurrenceSequence(0,1)
sage: S.is_degenerate()
True
sage: S.is_geometric()
False
sage: S.is_quasigeometric()
```

(continues on next page)

(continued from previous page)

```
True

sage: R = BinaryRecurrenceSequence(3,-2)
sage: R.is_degenerate()
False

sage: T = BinaryRecurrenceSequence(2,-1)
sage: T.is_degenerate()
True
sage: T.is_arithmetic()
True
```

```
>>> from sage.all import *
>>> S = BinaryRecurrenceSequence(Integer(0),Integer(1))
>>> S.is_degenerate()
True
>>> S.is_geometric()
False
>>> S.is_quasigeometric()
True

>>> R = BinaryRecurrenceSequence(Integer(3),-Integer(2))
>>> R.is_degenerate()
False

>>> T = BinaryRecurrenceSequence(Integer(2),-Integer(1))
>>> T.is_degenerate()
True
>>> T.is_arithmetic()
True
```

is_geometric()

Decide whether the binary recurrence sequence is geometric - ie a geometric sequence.

This is a subcase of a degenerate binary recurrence sequence, for which $ab = 0$, i.e. $u_n/u_{n-1} = r$ for some value of r.

See *is_degenerate()* for a description of degeneracy and definitions of a and b.

EXAMPLES:

```
sage: S = BinaryRecurrenceSequence(2,0,1,2)
sage: [S(i) for i in range(10)]
[1, 2, 4, 8, 16, 32, 64, 128, 256, 512]
sage: S.is_geometric()
True
```

```
>>> from sage.all import *
>>> S = BinaryRecurrenceSequence(Integer(2),Integer(0),Integer(1),Integer(2))
>>> [S(i) for i in range(Integer(10))]
[1, 2, 4, 8, 16, 32, 64, 128, 256, 512]
>>> S.is_geometric()
True
```

is_quasigeometric()

Decide whether the binary recurrence sequence is degenerate and similar to a geometric sequence, i.e. the union of multiple geometric sequences, or geometric after term `u0`.

If α/β is a k th root of unity, where $k > 1$, then necessarily $k = 2, 3, 4, 6$. Then $F = [[0, 1], [c, b]$ is diagonalizable, and $F^k = [[\alpha^k, 0], [0, \beta^k]]$ is a diagonal matrix. Thus for all values of j mod k, the j mod k terms of u_n form a geometric series.

If α or β is zero, this implies that $c = 0$. This is the case when F is singular. In this case, $u_1, u_2, u_3, ...$ is geometric.

EXAMPLES:

```
sage: S = BinaryRecurrenceSequence(0,1)
sage: [S(i) for i in range(10)]
[0, 1, 0, 1, 0, 1, 0, 1, 0, 1]
sage: S.is_quasigeometric()
True

sage: R = BinaryRecurrenceSequence(3,0)
sage: [R(i) for i in range(10)]
[0, 1, 3, 9, 27, 81, 243, 729, 2187, 6561]
sage: R.is_quasigeometric()
True
```

```
>>> from sage.all import *
>>> S = BinaryRecurrenceSequence(Integer(0),Integer(1))
>>> [S(i) for i in range(Integer(10))]
[0, 1, 0, 1, 0, 1, 0, 1, 0, 1]
>>> S.is_quasigeometric()
True

>>> R = BinaryRecurrenceSequence(Integer(3),Integer(0))
>>> [R(i) for i in range(Integer(10))]
[0, 1, 3, 9, 27, 81, 243, 729, 2187, 6561]
>>> R.is_quasigeometric()
True
```

period(*m*, *eventual*)

Return the period of the binary recurrence sequence modulo an integer `m`.

If n_1 is congruent to n_2 modulo `period(m)`, then u_{n_1} is is congruent to u_{n_2} modulo `m`.

INPUT:

- `m` – integer; modulo which the period of the recurrence relation is calculated
- `eventual` – boolean (default: `False`); if `True`, allow the sequence to be eventually periodic, rather than requiring it to be purely periodic. So n_1 might not be congruent to n_2 modulo `period(m)` unless n_1 and n_2 are large.

OUTPUT: integer (the period of the sequence modulo m)

EXAMPLES:

If $p = \pm 1 \mod 5$, then the period of the Fibonacci sequence mod p is $p-1$ (c.f. Lemma 3.3 of [BMS2006]).

```
sage: R = BinaryRecurrenceSequence(1,1)
sage: R.period(31)
30

sage: [R(i) % 4 for i in range(12)]
[0, 1, 1, 2, 3, 1, 0, 1, 1, 2, 3, 1]
sage: R.period(4)
6
```

```
>>> from sage.all import *
>>> R = BinaryRecurrenceSequence(Integer(1),Integer(1))
>>> R.period(Integer(31))
30

>>> [R(i) % Integer(4) for i in range(Integer(12))]
[0, 1, 1, 2, 3, 1, 0, 1, 1, 2, 3, 1]
>>> R.period(Integer(4))
6
```

This function works for degenerate sequences as well.

```
sage: S = BinaryRecurrenceSequence(2,0,1,2)
sage: S.is_degenerate()
True
sage: S.is_geometric()
True
sage: [S(i) % 17 for i in range(16)]
[1, 2, 4, 8, 16, 15, 13, 9, 1, 2, 4, 8, 16, 15, 13, 9]
sage: S.period(17)
8
```

```
>>> from sage.all import *
>>> S = BinaryRecurrenceSequence(Integer(2),Integer(0),Integer(1),Integer(2))
>>> S.is_degenerate()
True
>>> S.is_geometric()
True
>>> [S(i) % Integer(17) for i in range(Integer(16))]
[1, 2, 4, 8, 16, 15, 13, 9, 1, 2, 4, 8, 16, 15, 13, 9]
>>> S.period(Integer(17))
8
```

Letting `eventual` be `True` allows us to find the period of a sequence that is not purely periodic.

```
sage: T = BinaryRecurrenceSequence(5,12,u0=0,u1=1)
sage: [T(n) % 10 for n in range(20)]
[0, 1, 5, 7, 5, 9, 5, 3, 5, 1, 5, 7, 5, 9, 5, 3, 5, 1, 5, 7]
sage: T.period(10)
Traceback (most recent call last):
...
ValueError: Binary recurrence sequence modulo 10 is not a purely
periodic sequence.
```

(continues on next page)

(continued from previous page)

```
sage: T.period(10,eventual=True)
8
```

```
>>> from sage.all import *
>>> T = BinaryRecurrenceSequence(Integer(5),Integer(12),u0=Integer(0),
↪u1=Integer(1))
>>> [T(n) % Integer(10) for n in range(Integer(20))]
[0, 1, 5, 7, 5, 9, 5, 3, 5, 1, 5, 7, 5, 9, 5, 3, 5, 1, 5, 7]
>>> T.period(Integer(10))
Traceback (most recent call last):
...
ValueError: Binary recurrence sequence modulo 10 is not a purely
periodic sequence.
>>> T.period(Integer(10),eventual=True)
8
```

Note

The answer is cached.

pthpowers (*p*, *Bound*)

Find the indices of proveably all p-th powers in the recurrence sequence bounded by Bound.

Let u_n be a binary recurrence sequence. A `p` th power in u_n is a solution to $u_n = y^p$ for some integer y. There are only finitely many `p` th powers in any recurrence sequence [SS1983].

INPUT:

- `p` – a rational prime integer (the fixed p in $u_n = y^p$)
- `Bound` – a natural number (the maximum index n in $u_n = y^p$ that is checked)

OUTPUT:

A list of the indices of all `p` th powers less bounded by `Bound`. If the sequence is degenerate and there are many `p` th powers, raises `ValueError`.

EXAMPLES:

```
sage: R = BinaryRecurrenceSequence(1,1)        #the Fibonacci sequence
sage: R.pthpowers(2, 10**10)        # long time (7 seconds) -- in fact these␣
↪are all squares, c.f. [BMS2006]_
[0, 1, 2, 12]

sage: S = BinaryRecurrenceSequence(8,1) #a Lucas sequence
sage: S.pthpowers(3,10**10)    # long time (3 seconds) -- provably finds the␣
↪indices of all 3rd powers less than 10^10
[0, 1, 2]

sage: Q = BinaryRecurrenceSequence(3,3,2,1)
sage: Q.pthpowers(11,10**10)          # long time (7.5 seconds)
[1]
```

```
>>> from sage.all import *
>>> R = BinaryRecurrenceSequence(Integer(1),Integer(1))        #the Fibonacci␣
↪sequence
>>> R.pthpowers(Integer(2), Integer(10)**Integer(10))        # long time (7␣
↪seconds) -- in fact these are all squares, c.f. [BMS2006]_
[0, 1, 2, 12]

>>> S = BinaryRecurrenceSequence(Integer(8),Integer(1)) #a Lucas sequence
>>> S.pthpowers(Integer(3),Integer(10)**Integer(10))     # long time (3␣
↪seconds) -- provably finds the indices of all 3rd powers less than 10^10
[0, 1, 2]

>>> Q = BinaryRecurrenceSequence(Integer(3),Integer(3),Integer(2),Integer(1))
>>> Q.pthpowers(Integer(11),Integer(10)**Integer(10))          # long time (7.
↪5 seconds)
[1]
```

If the sequence is degenerate, and there are no `p` th powers, returns []. Otherwise, if there are many `p` th powers, raises `ValueError`.

```
sage: T = BinaryRecurrenceSequence(2,0,1,2)
sage: T.is_degenerate()
True
sage: T.is_geometric()
True

Note

This function is primarily optimized in the range where `Bound` is much larger than `p`.

5.1.10 Binary Trees

This module deals with binary trees as mathematical (in particular immutable) objects.

Note

If you need the data-structure for example to represent sets or hash tables with AVL trees, you should have a look at `sage.misc.sagex_ds`.

AUTHORS:

- Florent Hivert (2010-2011): initial implementation.
- Adrien Boussicault (2015): Hook statistics.

class `sage.combinat.binary_tree.`**`BinaryTree`**(*parent*, *children=None*, *check=True*)

Bases: *`AbstractClonableTree`*, `ClonableArray`

Binary trees.

Binary trees here mean ordered (a.k.a. plane) finite binary trees, where "ordered" means that the children of each node are ordered.

Binary trees contain nodes and leaves, where each node has two children while each leaf has no children. The number of leaves of a binary tree always equals the number of nodes plus 1.

INPUT:

- `children` – `None` (default) or a list, tuple or iterable of length 2 of binary trees or convertible objects. This corresponds to the standard recursive definition of a binary tree as either a leaf or a pair of binary trees. Syntactic sugar allows leaving out all but the outermost calls of the `BinaryTree()` constructor, so that, e. g., `BinaryTree([BinaryTree(None),BinaryTree(None)])` can be shortened to `BinaryTree([None, None])`. It is also allowed to abbreviate `[None, None]` by `[]`.
- `check` – boolean (default: `True`); whether check for binary should be performed or not

EXAMPLES:

```
sage: BinaryTree()
.
```

(continues on next page)

(continued from previous page)

```
sage: BinaryTree(None)
.
sage: BinaryTree([])
[., .]
sage: BinaryTree([None, None])
[., .]
sage: BinaryTree([None, []])
[., [., .]]
sage: BinaryTree([[], None])
[[., .], .]
sage: BinaryTree("[[], .]")
[[., .], .]
sage: BinaryTree([None, BinaryTree([None, None])])
[., [., .]]

sage: BinaryTree([[], None, []])
Traceback (most recent call last):
...
ValueError: this is not a binary tree
```

```
>>> from sage.all import *
>>> BinaryTree()
.
>>> BinaryTree(None)
.
>>> BinaryTree([])

>>> BinaryTree([None, BinaryTree([None, None])])
[., [., .]]

>>> BinaryTree([[], None, []])
Traceback (most recent call last):
...
ValueError: this is not a binary tree
```

as_ordered_tree(*with_leaves=True*)

Return the same tree seen as an ordered tree. By default, leaves are transformed into actual nodes, but this can be avoided by setting the optional variable `with_leaves` to `False`.

EXAMPLES:

```
sage: bt = BinaryTree([]); bt
[., .]
sage: bt.as_ordered_tree()
```

(continues on next page)

(continued from previous page)

```
[[], []]
sage: bt.as_ordered_tree(with_leaves = False)
[]
sage: bt = bt.canonical_labelling(); bt
1[., .]
sage: bt.as_ordered_tree()
1[None[], None[]]
sage: bt.as_ordered_tree(with_leaves=False)
1[]
```

```
>>> from sage.all import *
>>> bt = BinaryTree([]); bt
[., .]
>>> bt.as_ordered_tree()
[[], []]
>>> bt.as_ordered_tree(with_leaves = False)
[]
>>> bt = bt.canonical_labelling(); bt
1[., .]
>>> bt.as_ordered_tree()
1[None[], None[]]
>>> bt.as_ordered_tree(with_leaves=False)
1[]
```

canonical_labelling(*shift=1*)

Return a labelled version of `self`.

The canonical labelling of a binary tree is a certain labelling of the nodes (not the leaves) of the tree. The actual canonical labelling is currently unspecified. However, it is guaranteed to have labels in $1...n$ where n is the number of nodes of the tree. Moreover, two (unlabelled) trees compare as equal if and only if their canonical labelled trees compare as equal.

EXAMPLES:

```
sage: BinaryTree().canonical_labelling()
.
sage: BinaryTree([]).canonical_labelling()
1[., .]
sage: BinaryTree([[[], [[], None]], [[], []]]).canonical_labelling()
5[2[1[., .], 4[3[., .], .]], 7[6[., .], 8[., .]]]
```

```
>>> from sage.all import *
>>> BinaryTree().canonical_labelling()
.
>>> BinaryTree([]).canonical_labelling()
1[., .]
>>> BinaryTree([[[], [[], None]], [[], []]]).canonical_labelling()
5[2[1[., .], 4[3[., .], .]], 7[6[., .], 8[., .]]]
```

canopee()

Return the canopee of `self`.

The *canopee* of a non-empty binary tree T with n internal nodes is the list l of 0 and 1 of length $n-1$ obtained by going along the leaves of T from left to right except the two extremal ones, writing 0 if the leaf is a right leaf and 1 if the leaf is a left leaf.

EXAMPLES:

```
sage: BinaryTree([]).canopee()
[]
sage: BinaryTree([None, []]).canopee()
[1]
sage: BinaryTree([[], None]).canopee()
[0]
sage: BinaryTree([[], []]).canopee()
[0, 1]
sage: BinaryTree([[[], [[], None]], [[], []]]).canopee()
[0, 1, 0, 0, 1, 0, 1]
```

```
>>> from sage.all import *
>>> BinaryTree([]).canopee()
[]
>>> BinaryTree([None, []]).canopee()
[1]
>>> BinaryTree([[], None]).canopee()
[0]
>>> BinaryTree([[], []]).canopee()
[0, 1]
>>> BinaryTree([[[], [[], None]], [[], []]]).canopee()
[0, 1, 0, 0, 1, 0, 1]
```

The number of pairs (t_1, t_2) of binary trees of size n such that the canopee of t_1 is the complementary of the canopee of t_2 is also the number of Baxter permutations (see [DG1994], see also OEIS sequence A001181). We check this in small cases:

```
sage: [len([(u,v) for u in BinaryTrees(n) for v in BinaryTrees(n)
....:       if [1 - x for x in u.canopee()] == v.canopee()])
....:    for n in range(1, 5)]
[1, 2, 6, 22]
```

```
>>> from sage.all import *
>>> [len([(u,v) for u in BinaryTrees(n) for v in BinaryTrees(n)
...       if [Integer(1) - x for x in u.canopee()] == v.canopee()])
...    for n in range(Integer(1), Integer(5))]
[1, 2, 6, 22]
```

Here is a less trivial implementation of this:

```
sage: from sage.sets.finite_set_map_cy import fibers
sage: def baxter(n):
....:     f = fibers(lambda t: tuple(t.canopee()),
....:                   BinaryTrees(n))
....:     return sum(len(f[i])*len(f[tuple(1-x for x in i)])
....:                for i in f)
sage: [baxter(n) for n in range(1, 7)]
[1, 2, 6, 22, 92, 422]
```

```
>>> from sage.all import *
>>> from sage.sets.finite_set_map_cy import fibers
>>> def baxter(n):
...     f = fibers(lambda t: tuple(t.canopee()),
...                   BinaryTrees(n))
...     return sum(len(f[i])*len(f[tuple(Integer(1)-x for x in i)])
...                for i in f)
>>> [baxter(n) for n in range(Integer(1), Integer(7))]
[1, 2, 6, 22, 92, 422]
```

check()

Check that `self` is a binary tree.

EXAMPLES:

```
sage: BinaryTree([[], []])     # indirect doctest
[[., .], [., .]]
sage: BinaryTree([[], [], []]) # indirect doctest
Traceback (most recent call last):
...
ValueError: this is not a binary tree
sage: BinaryTree([[]])         # indirect doctest
Traceback (most recent call last):
...
ValueError: this is not a binary tree
```

```
>>> from sage.all import *
>>> BinaryTree([[], []])     # indirect doctest
[[., .], [., .]]
>>> BinaryTree([[], [], []]) # indirect doctest
Traceback (most recent call last):
...
ValueError: this is not a binary tree
>>> BinaryTree([[]])         # indirect doctest
Traceback (most recent call last):
...
ValueError: this is not a binary tree
```

comb(*side='left'*)

Return the comb of a tree.

There are two combs in a binary tree: a left comb and a right comb.

Consider all the vertices of the leftmost (resp. rightmost) branch of the root. The left (resp. right) comb is the list of right (resp. left) subtrees of each of these vertices.

INPUT:

- `side` – (default: `'left'`) set to `'left'` to obtain a left comb, and to `'right'` to obtain a right comb

OUTPUT: list of binary trees

See also

over_decomposition(), *under_decomposition()*

EXAMPLES:

```
sage: BT = BinaryTree( '.' )
sage: [BT.comb('left'), BT.comb('right')]
[[], []]
sage: BT = BinaryTree( '[.,.]' )
sage: [BT.comb('left'), BT.comb('right')]

[        / \  ]
[       o   o ]
```

dendriform_shuffle(*other*)

Return the list of terms in the dendriform product.

This is the list of all binary trees that can be obtained by identifying the rightmost path in `self` and the leftmost path in `other`. Every term corresponds to a shuffle of the vertices on the rightmost path in `self` and the vertices on the leftmost path in `other`.

EXAMPLES:

```
sage: u = BinaryTree()
sage: g = BinaryTree([])
sage: l = BinaryTree([g, u])
sage: r = BinaryTree([u, g])

sage: list(g.dendriform_shuffle(g))                                    #␣
↪needs sage.combinat
[[[., .], .], [., [., .]]]

sage: list(l.dendriform_shuffle(l))                                    #␣
↪needs sage.combinat
[[[[[., .], .], .], .], [[[., .], [., .]], .],
[[., .], [[., .], .]]]

sage: list(l.dendriform_shuffle(r))                                    #␣
↪needs sage.combinat
[[[[., .], .], [., .]], [[., .], [., [., .]]]]
```

```
>>> from sage.all import *
>>> u = BinaryTree()
>>> g = BinaryTree([])
>>> l = BinaryTree([g, u])
>>> r = BinaryTree([u, g])

>>> list(g.dendriform_shuffle(g))                                    #␣
↪needs sage.combinat
[[[., .], .], [., [., .]]]

>>> list(l.dendriform_shuffle(l))                                    #␣
↪needs sage.combinat
[[[[[., .], .], .], .], [[[., .], [., .]], .],
[[., .], [[., .], .]]]

>>> list(l.dendriform_shuffle(r))                                    #␣
↪needs sage.combinat
[[[[., .], .], [., .]], [[., .], [., [., .]]]]
```

graph(*with_leaves=True*)

Convert `self` to a digraph.

By default, this graph contains both nodes and leaves, hence is never empty. To obtain a graph which contains only the nodes, the `with_leaves` optional keyword variable has to be set to `False`.

The resulting digraph is endowed with a combinatorial embedding, in order to be displayed correctly.

INPUT:

- `with_leaves` – boolean (default: `True`); whether the resulting graph will be formed from the leaves and the nodes of `self` (if `True`), or only from the nodes of `self` (if `False`)

EXAMPLES:

```
sage: t1 = BinaryTree([[], None])
sage: t1.graph()
```

(continues on next page)

(continued from previous page)

```
Digraph on 5 vertices
sage: t1.graph(with_leaves=False)
Digraph on 2 vertices

sage: t1 = BinaryTree([[], [[], None]])
sage: t1.graph()
Digraph on 9 vertices
sage: t1.graph().edges(sort=True)
[(0, 1, None), (0, 4, None), (1, 2, None), (1, 3, None), (4, 5, None), (4, 8,␣
↪None), (5, 6, None), (5, 7, None)]
sage: t1.graph(with_leaves=False)
Digraph on 4 vertices
sage: t1.graph(with_leaves=False).edges(sort=True)
[(0, 1, None), (0, 2, None), (2, 3, None)]

sage: t1 = BinaryTree()
sage: t1.graph()
Digraph on 1 vertex
sage: t1.graph(with_leaves=False)
Digraph on 0 vertices

sage: BinaryTree([]).graph()
Digraph on 3 vertices
sage: BinaryTree([]).graph(with_leaves=False)
Digraph on 1 vertex

sage: t1 = BinaryTree([[], [[], []]])
sage: t1.graph(with_leaves=False)
Digraph on 5 vertices
sage: t1.graph(with_leaves=False).edges(sort=True)
[(0, 1, None), (0, 2, None), (2, 3, None), (2, 4, None)]
```

```
>>> from sage.all import *
>>> t1 = BinaryTree([[], None])
>>> t1.graph()
Digraph on 5 vertices
>>> t1.graph(with_leaves=False)
Digraph on 2 vertices

>>> t1 = BinaryTree([[], [[], None]])
>>> t1.graph()
Digraph on 9 vertices
>>> t1.graph().edges(sort=True)
[(0, 1, None), (0, 4, None), (1, 2, None), (1, 3, None), (4, 5, None), (4, 8,␣
↪None), (5, 6, None), (5, 7, None)]
>>> t1.graph(with_leaves=False)
Digraph on 4 vertices
>>> t1.graph(with_leaves=False).edges(sort=True)
[(0, 1, None), (0, 2, None), (2, 3, None)]

>>> t1 = BinaryTree()
>>> t1.graph()
```

(continues on next page)

(continued from previous page)

```
Digraph on 1 vertex
>>> t1.graph(with_leaves=False)
Digraph on 0 vertices

>>> BinaryTree([]).graph()
Digraph on 3 vertices
>>> BinaryTree([]).graph(with_leaves=False)
Digraph on 1 vertex

>>> t1 = BinaryTree([[], [[], []]])
>>> t1.graph(with_leaves=False)
Digraph on 5 vertices
>>> t1.graph(with_leaves=False).edges(sort=True)
[(0, 1, None), (0, 2, None), (2, 3, None), (2, 4, None)]
```

hook_number()

Return the number of hooks.

Recalling that a branch is a path from a vertex of the tree to a leaf, the leftmost (resp. rightmost) branch of a vertex v is the branch from v made only of left (resp. right) edges.

The hook of a vertex v is a set of vertices formed by the union of v, and the vertices of its leftmost and rightmost branches.

There is a unique way to partition the set of vertices in hooks. The number of hooks in such a partition is the hook number of the tree.

We can obtain this partition recursively by extracting the root's hook and iterating the processus on each tree of the remaining forest.

EXAMPLES:

```
sage: BT = BinaryTree( '.' )
sage: BT.hook_number()
0
sage: BT = BinaryTree( '[.,.]' )
sage: BT.hook_number()
1
sage: BT = BinaryTree( '[[[.,.], .], [.,.]]' ); ascii_art(BT)
    o
   / \
  o   o
 /
o
sage: BT.hook_number()
1
sage: BT = BinaryTree( '[[[[., [., .]], .], [[., .], [[[., .], [., .]], [., .
↪]]]], [., [[[., .], [[[., .], [., .]], .]], .]]]' )
sage: ascii_art(BT)
        ________o________
       /                  \
    __o__                  o
   /     \                  \
  o     __o___               o
```

(continues on next page)

(continued from previous page)

```
 /     /       \            /
o     o       _o_       __o__
 \           /   \     /     \
  o         o     o   o       o
           / \               /
          o   o             o
                           / \
                          o   o
sage: BT.hook_number()
6
```

```

```

in_order_traversal(*node_action=None*, *leaf_action=None*)

Explore the binary tree `self` using the depth-first infix-order traversal algorithm, executing the `node_action` function whenever traversing a node and executing the `leaf_action` function whenever traversing a leaf.

In more detail, what this method does to a tree T is the following:

```
if the root of `T` is a node:
    apply in_order_traversal to the left subtree of `T`
        (with the same node_action and leaf_action);
    apply node_action to the root of `T`;
    apply in_order_traversal to the right subtree of `T`
        (with the same node_action and leaf_action);
else:
    apply leaf_action to the root of `T`.
```

For example on the following binary tree T, where we denote leaves by $a, b, c, \ldots$ and nodes by $1, 2, 3, \ldots$:

```
|     ____3____          |
|    /         \         |
|   1          __7__     |
|  / \        /     \    |
| a   2      _5_     8   |
|    / \    /   \   / \  |
|   b   c  4     6 h   i |
|         / \   / \      |
|        d   e f   g     |
```

this method first applies `leaf_action` to a, then applies `node_action` to 1, then `leaf_action` to b, then `node_action` to 2, etc., with the vertices being traversed in the order $a, 1, b, 2, c, 3, d, 4, e, 5, f, 6, g, 7, h, 8, i$.

See *in_order_traversal_iter()* for a version of this algorithm which only iterates through the vertices rather than applying any function to them.

INPUT:

- `node_action` – (optional) a function which takes a node in input and does something during the exploration
- `leaf_action` – (optional) a function which takes a leaf in input and does something during the exploration

in_order_traversal_iter()

The depth-first infix-order traversal iterator for the binary tree `self`.

This method iters each vertex (node and leaf alike) of the given binary tree following the depth-first infix order traversal algorithm.

The *depth-first infix order traversal algorithm* iterates through a binary tree as follows:

```
iterate through the left subtree (by the depth-first infix
    order traversal algorithm);
yield the root;
iterate through the right subtree (by the depth-first infix
    order traversal algorithm).
```

For example on the following binary tree T, where we denote leaves by $a, b, c, \ldots$ and nodes by $1, 2, 3, \ldots$:

```
|     ____3____          |
|    /         \         |
|   1          __7__     |
|  / \        /     \    |
```

(continues on next page)

(continued from previous page)

```
| a   2      _5_     8   |
|    / \    /   \   / \  |
|   b   c  4     6 h   i |
|         / \   / \      |
|        d   e f   g     |
```

the depth-first infix-order traversal algorithm iterates through the vertices of T in the following order: $a, 1, b, 2, c, 3, d, 4, e, 5, f, 6, g, 7, h, 8, i$.

See *in_order_traversal()* for a version of this algorithm which not only iterates through, but actually does something at the vertices of tree.

is_complete()

Return `True` if `self` is complete, else return `False`.

In a nutshell, a complete binary tree is a perfect binary tree except possibly in the last level, with all nodes in the last level "flush to the left".

In more detail: A complete binary tree (also called binary heap) is a binary tree in which every level, except possibly the last one (the deepest), is completely filled. At depth n, all nodes must be as far left as possible.

For example:

```
|         ___o___   |
|        /       \  |
|     __o__       o |
|    /     \        |
|   o       o       |
|  / \     / \      |
| o   o   o   o     |
```

is not complete but the following ones are:

```
|     __o__          _o_            ___o___     |
|    /     \        /   \          /       \    |
|   o       o      o     o      __o__       o   |
|  / \     / \    / \          /     \     / \  |
| o   o   o   o, o   o    ,   o       o   o   o |
|                            / \     /          |
|                           o   o   o           |
```

EXAMPLES:

```
sage: def lst(i):
....:     return [bt for bt in BinaryTrees(i) if bt.is_complete()]
sage: for i in range(8): ascii_art(lst(i)) # long time
[   ]
[ o ]
[   o ]
[  /  ]
[ o   ]
[   o   ]
[  / \  ]
[ o   o ]
[     o   ]
```

(continues on next page)

(continued from previous page)

```
[    / \  ]

[  / \      ]
[ o   o     ]
[     __o__   ]
[    /     \  ]
[   o       o ]
[  / \     /  ]
[ o   o   o   ]
[     __o__     ]
[    /     \    ]
[   o       o   ]
[  / \     / \  ]
[ o   o   o   o ]
```

is_empty()

Return whether `self` is empty.

The notion of emptiness employed here is the one which defines a binary tree to be empty if its root is a leaf. There is precisely one empty binary tree.

EXAMPLES:

```
sage: BinaryTree().is_empty()
True
sage: BinaryTree([]).is_empty()
False
sage: BinaryTree([[], None]).is_empty()
False
```

```
>>> from sage.all import *
>>> BinaryTree().is_empty()
True
>>> BinaryTree([]).is_empty()
False
>>> BinaryTree([[], None]).is_empty()
False
```

is_full()

Return `True` if `self` is full, else return `False`.

A full binary tree is a tree in which every node either has two child nodes or has two child leaves.

This is also known as *proper binary tree* or *2-tree* or *strictly binary tree*.

For example:

```
|       __o__   |
|      /     \  |
|     o       o |
|    / \        |
|   o   o       |
|  /     \      |
| o       o     |
```

is not full but the next one is:

```
|         ___o___   |
|        /       \  |
|     __o__       o |
|    /     \        |
|   o       o       |
|  / \     / \      |
| o   o   o   o     |
```

EXAMPLES:

```
sage: BinaryTree([[[[],None],[None,[]]], []]).is_full()
False
sage: BinaryTree([[[[],[]],[[],[]]], []]).is_full()
True
```

(continues on next page)

(continued from previous page)

```
sage: ascii_art([bt for bt in BinaryTrees(5) if bt.is_full()])
[   _o_     ,      _o_   ]
[  /   \          /   \  ]
[ o     o       o     o ]
[      / \     / \       ]
[     o   o   o   o      ]
```

```
>>> from sage.all import *
>>> BinaryTree([[[[],None],[None,[]]], []]).is_full()
False
>>> BinaryTree([[[[],[]],[[],[]]], []]).is_full()
True
>>> ascii_art([bt for bt in BinaryTrees(Integer(5)) if bt.is_full()])
[   _o_     ,      _o_   ]
[  /   \          /   \  ]
[ o     o       o     o ]
[      / \     / \       ]
[     o   o   o   o      ]
```

is_perfect()

Return `True` if `self` is perfect, else return `False`.

A perfect binary tree is a full tree in which all leaves are at the same depth.

For example:

```
|          ___o___    |
|         /       \   |
|      __o__       o  |
|     /     \         |
|    o       o        |
|   / \     / \       |
|  o   o   o   o      |
```

is not perfect but the next one is:

```
|      __o__      |
|     /     \     |
|    o       o    |
|   / \     / \   |
|  o   o   o   o  |
```

EXAMPLES:

```
sage: def lst(i):
....:     return [bt for bt in BinaryTrees(i) if bt.is_perfect()]
sage: for i in range(8): ascii_art(lst(i)) # long time
[   ]
[ o ]
[   ]
[   o   ]
[  / \  ]
[ o   o ]
```

(continues on next page)

(continued from previous page)

```
[   ]
[   ]
[   ]
[      __o__      ]
[     /     \     ]
[    o       o    ]
[   / \     / \   ]
[ o   o   o   o ]
```

```
>>> from sage.all import *
>>> def lst(i):
...     return [bt for bt in BinaryTrees(i) if bt.is_perfect()]
>>> for i in range(Integer(8)): ascii_art(lst(i)) # long time
[   ]
[ o ]
[   ]
[    o    ]
[   / \   ]
[ o   o ]
[   ]
[   ]
[   ]
[      __o__      ]
[     /     \     ]
[    o       o    ]
[   / \     / \   ]
[ o   o   o   o ]
```

left_border_symmetry()

Return the tree where a symmetry has been applied recursively on all left borders. If a tree is made of three trees $[T_1, T_2, T_3]$ on its left border, it becomes $[T_3', T_2', T_1']$ where same symmetry has been applied to T_1, T_2, T_3.

EXAMPLES:

```
sage: BinaryTree().left_border_symmetry()
.
sage: BinaryTree([]).left_border_symmetry()
[., .]
sage: BinaryTree([[None,[]],None]).left_border_symmetry()
[[., .], [., .]]
sage: BinaryTree([[None,[None,[]]],None]).left_border_symmetry()
[[., .], [., [., .]]]
sage: bt = BinaryTree([[None,[None,[]]],None]).canonical_labelling()
sage: bt
4[1[., 2[., 3[., .]]], .]
sage: bt.left_border_symmetry()
1[4[., .], 2[., 3[., .]]]
```

```
>>> from sage.all import *
>>> BinaryTree().left_border_symmetry()
.
```

(continues on next page)

(continued from previous page)

```
>>> BinaryTree([]).left_border_symmetry()
[., .]
>>> BinaryTree([[None,[]],None]).left_border_symmetry()
[[., .], [., .]]
>>> BinaryTree([[None,[None,[]]],None]).left_border_symmetry()
[[., .], [., [., .]]]
>>> bt = BinaryTree([[None,[None,[]]],None]).canonical_labelling()
>>> bt
4[1[., 2[., 3[., .]]], .]
>>> bt.left_border_symmetry()
1[4[., .], 2[., 3[., .]]]
```

left_children_node_number(*direction='left'*)

Return the number of nodes which are left children in `self`.

Every node (except the root) is either the left child or the right child of its parent node. The total number of nodes is 1 plus the number of left-children nodes plus the number of right-children nodes.

INPUT:

- `direction` – either `'left'` (default) or `'right'` ; if set to `'right'`, instead count nodes that are right children

EXAMPLES:

```
sage: bt = BinaryTree([[None,[[],[]]],[None,[[],None]]])
sage: ascii_art(bt)
  __o__
 /     \
o       o
 \       \
  o       o
 / \     /
o   o   o
sage: bt.left_children_node_number('left')
3
sage: bt.left_children_node_number('right')
4

sage: all(5 == 1 + bt.left_children_node_number()
....:             + bt.left_children_node_number('right')
....:     for bt in BinaryTrees(5))
True
```

```
>>> from sage.all import *
>>> bt = BinaryTree([[None,[[],[]]],[None,[[],None]]])
>>> ascii_art(bt)
  __o__
 /     \
o       o
 \       \
  o       o
 / \     /
o   o   o
```

(continues on next page)

(continued from previous page)

```
>>> bt.left_children_node_number('left')
3
>>> bt.left_children_node_number('right')
4

>>> all(Integer(5) == Integer(1) + bt.left_children_node_number()
...                 + bt.left_children_node_number('right')
...         for bt in BinaryTrees(Integer(5)))
True
```

left_right_symmetry()

Return the left-right symmetrized tree of `self`.

EXAMPLES:

```
sage: BinaryTree().left_right_symmetry()
.
sage: BinaryTree([]).left_right_symmetry()
[., .]
sage: BinaryTree([[],None]).left_right_symmetry()
[., [., .]]
sage: BinaryTree([[None, []],None]).left_right_symmetry()
[., [[., .], .]]
```

```
>>> from sage.all import *
>>> BinaryTree().left_right_symmetry()
.
>>> BinaryTree([]).left_right_symmetry()
[., .]
>>> BinaryTree([[],None]).left_right_symmetry()
[., [., .]]
>>> BinaryTree([[None, []],None]).left_right_symmetry()
[., [[., .], .]]
```

left_rotate()

Return the result of left rotation applied to the binary tree `self`.

Left rotation on binary trees is defined as follows: Let T be a binary tree such that the right child of the root of T is a node. Let A be the left child of the root of T, and let B and C be the left and right children of the right child of the root of T. (Keep in mind that nodes of trees are identified with the subtrees consisting of their descendants.) Then, the left rotation of T is the binary tree in which the right child of the root is C, whereas the left child of the root is a node whose left and right children are A and B. In pictures:

```
|    *                          *    |
|   / \                        / \   |
| A    *   -left-rotate->     *    C |
|     / \                    / \     |
|    B    C                 A    B   |
```

where asterisks signify a single node each (but A, B and C might be empty).

For example,

```
|   _o_                       o |
|  /   \                     /  |
| o     o  -left-rotate->   o   |
|      /                   / \  |
|     o                   o   o |
<BLANKLINE>
|       __o__                           o |
|      /     \                         /  |
|     o       o  -left-rotate->       o   |
|    / \                             /    |
|   o   o                           o     |
|  /     \                         / \    |
| o       o                       o   o   |
|                                /     \  |
|                               o       o |
```

Left rotation is the inverse operation to right rotation (*right_rotate()*).

See also:

right_rotate()

EXAMPLES:

```
sage: b = BinaryTree([[],[[],None]]); ascii_art([b])
[   _o_   ]
[  /   \  ]
[ o     o ]
[      /  ]
[     o   ]
sage: ascii_art([b.left_rotate()])
[     o ]
[    /  ]
[   o   ]
[  / \  ]
[ o   o ]
sage: b.left_rotate().right_rotate() == b
True
```

```
>>> from sage.all import *
>>> b = BinaryTree([[],[[],None]]); ascii_art([b])
[   _o_   ]
[  /   \  ]
[ o     o ]
[      /  ]
[     o   ]
>>> ascii_art([b.left_rotate()])
[     o ]
[    /  ]
[   o   ]
[  / \  ]
[ o   o ]
```

(continues on next page)

(continued from previous page)

```
>>> b.left_rotate().right_rotate() == b
True
```

make_leaf()

Modify `self` so that it becomes a leaf (i. e., an empty tree).

> **Note**
>
> `self` must be in a mutable state.

> **See also**
>
> *make_node*

EXAMPLES:

```
sage: t = BinaryTree([None, None])
sage: t.make_leaf()
Traceback (most recent call last):
...
ValueError: object is immutable; please change a copy instead.
sage: with t.clone() as t1:
....:     t1.make_leaf()
sage: t, t1
([., .], .)
```

```
>>> from sage.all import *
>>> t = BinaryTree([None, None])
>>> t.make_leaf()
Traceback (most recent call last):
...
ValueError: object is immutable; please change a copy instead.
>>> with t.clone() as t1:
...     t1.make_leaf()
>>> t, t1
([., .], .)
```

make_node(*child_list=[None, None]*)

Modify `self` so that it becomes a node with children `child_list`.

INPUT:

- `child_list` – a pair of binary trees (or objects convertible to)

> **Note**
>
> `self` must be in a mutable state.

See also

make_leaf

EXAMPLES:

```
sage: t = BinaryTree()
sage: t.make_node([None, None])
Traceback (most recent call last):
...
ValueError: object is immutable; please change a copy instead.
sage: with t.clone() as t1:
....:     t1.make_node([None, None])
sage: t, t1
(., [., .])
sage: with t.clone() as t:
....:     t.make_node([BinaryTree(), BinaryTree(), BinaryTree([])])
Traceback (most recent call last):
...
ValueError: the list must have length 2
sage: with t1.clone() as t2:
....:     t2.make_node([t1, t1])
sage: with t2.clone() as t3:
....:     t3.make_node([t1, t2])
sage: t1, t2, t3
([., .], [[., .], [., .]], [[., .], [[., .], [., .]]])
```

```
>>> from sage.all import *
>>> t = BinaryTree()
>>> t.make_node([None, None])
Traceback (most recent call last):
...
ValueError: object is immutable; please change a copy instead.
>>> with t.clone() as t1:
...     t1.make_node([None, None])
>>> t, t1
(., [., .])
>>> with t.clone() as t:
...     t.make_node([BinaryTree(), BinaryTree(), BinaryTree([])])
Traceback (most recent call last):
...
ValueError: the list must have length 2
>>> with t1.clone() as t2:
...     t2.make_node([t1, t1])
>>> with t2.clone() as t3:
...     t3.make_node([t1, t2])
>>> t1, t2, t3
([., .], [[., .], [., .]], [[., .], [[., .], [., .]]])
```

over(*bt*)

Return `self` over `bt`, where "over" is the `over` (/) operation.

If T and T' are two binary trees, then T over T' (written T/T') is defined as the tree obtained by grafting

T' on the rightmost leaf of T. More precisely, T/T' is defined by identifying the root of the T' with the rightmost leaf of T. See section 4.5 of [HNT2005].

If T is empty, then $T/T' = T'$.

The definition of this "over" operation goes back to Loday-Ronco [LR0102066] (Definition 2.2), but it is denoted by $\backslash$ and called the "under" operation there. In fact, trees in sage have their root at the top, contrary to the trees in [LR0102066] which are growing upwards. For this reason, the names of the over and under operations are swapped, in order to keep a graphical meaning. (Our notation follows that of section 4.5 of [HNT2005].)

See also

under()

EXAMPLES:

Showing only the nodes of a binary tree, here is an example for the over operation:

```
|   o       __o__       _o_         |
|  / \  /  /     \  =  /   \        |
| o   o   o       o   o     o       |
|          \     /           \      |
|           o   o           __o__   |
|                          /     \  |
|                         o       o |
|                          \     /  |
|                           o   o   |
```

A Sage example:

```
sage: b1 = BinaryTree([[],[[],[]]])
sage: b2 = BinaryTree([[None, []],[]])
sage: ascii_art((b1, b2, b1/b2))
(   _o_     ,   _o_  ,   _o_           )
(  /   \       /   \    /   \          )
( o     o     o     o  o     o_        )
(      / \     \            /  \       )
(     o   o     o          o    o      )
(                                \     )
(                               _o_    )
(                              /   \   )
(                             o     o  )
(                              \       )
(                               o      )
```

```
>>> from sage.all import *
>>> b1 = BinaryTree([[],[[],[]]])
>>> b2 = BinaryTree([[None, []],[]])
>>> ascii_art((b1, b2, b1/b2))
(   _o_     ,   _o_  ,   _o_           )
(  /   \       /   \    /   \          )
( o     o     o     o  o     o_        )
(      / \     \            /  \       )
```

(continues on next page)

(continued from previous page)

```
(      o   o    o          o    o       )
(                                \      )
(                               _o_     )
(                              /   \    )
(                             o      o  )
(                              \        )
(                               o       )
```

over_decomposition()

Return the unique maximal decomposition as an over product.

This means that the tree is cut along all edges of its rightmost path.

Beware that the factors are ordered starting from the root.

See also

comb(), *under_decomposition()*

EXAMPLES:

```
sage: g = BinaryTree([])
sage: r = g.over(g); r
[., [., .]]
sage: l = g.under(g); l
[[., .], .]
sage: r.over_decomposition()
[[., .], [., .]]
sage: l.over_decomposition() == [l]
True

sage: x = g.over(l).over(l).over(g).over(g)
sage: ascii_art(x)
 o
               _o_
 /              o     o
     /                o   o
                              o
sage: x.over_decomposition() == [g,l,l,g,g]
True
```

```
>>> from sage.all import *
>>> g = BinaryTree([])
>>> r = g.over(g); r
[., [., .]]
>>> l = g.under(g); l
[[., .], .]
>>> r.over_decomposition()
[[., .], [., .]]
>>> l.over_decomposition() == [l]
True
```

(continues on next page)

(continued from previous page)

```
>>> x = g.over(l).over(l).over(g).over(g)
>>> ascii_art(x)
 o
                _o_
 /               o     o
     /                 o   o
                               o
>>> x.over_decomposition() == [g,l,l,g,g]
True
```

prune()

Return the binary tree obtained by deleting each leaf of `self`.

The operation of pruning is the left inverse of attaching as many leaves as possible to each node of a binary tree. That is to say, for all binary trees `bt`, we have:

```
bt == bt.to_full().prune()
```

However, it is only a right inverse if and only if `bt` is a full binary tree:

```
bt == bt.prune().to_full()
```

OUTPUT: a binary tree

See also

to_full()

EXAMPLES:

```
sage: bt = BinaryTree([[[None, []], [[], []]], None])
sage: ascii_art(bt)
      o
     /
  __o__
 /     \
o       o
 \     / \
  o   o   o
sage: ascii_art(bt.prune())
    o
   /
  o
 / \
o   o
```

```
>>> from sage.all import *
>>> bt = BinaryTree([[[None, []], [[], []]], None])
>>> ascii_art(bt)
      o
     /
  __o__
```

(continues on next page)

(continued from previous page)

```
 /      \
o        o
 \      / \
  o   o   o
>>> ascii_art(bt.prune())
    o
   /
  o
 / \
o   o
```

We check the relationship with `to_full()`:

```
sage: bt = BinaryTree([[[], [[None, []], []]], [[],[]]])
sage: bt == bt.to_full().prune()
True
sage: bt == bt.prune().to_full()
False

sage: bt = BinaryTree([[[], []], [[], [[[], []], []]]])
sage: bt.is_full()
True
sage: bt == bt.prune().to_full()
True
```

```
>>> from sage.all import *
>>> bt = BinaryTree([[[], [[None, []], []]], [[],[]]])
>>> bt == bt.to_full().prune()
True
>>> bt == bt.prune().to_full()
False

>>> bt = BinaryTree([[[], []], [[], [[[], []], []]]])
>>> bt.is_full()
True
>>> bt == bt.prune().to_full()
True
```

Pruning the empty tree is again the empty tree:

```
sage: bt = BinaryTree(None)
sage: bt.prune()
.
```

```
>>> from sage.all import *
>>> bt = BinaryTree(None)
>>> bt.prune()
.
```

q_hook_length_fraction(*q=None*, *q_factor=False*)

Compute the `q`-hook length fraction of the binary tree `self`, with an additional "q-factor" if desired.

If T is a (plane) binary tree and q is a polynomial indeterminate over some ring, then the q-hook length fraction $h_q(T)$ of T is defined by

$$h_q(T) = \frac{[|T|]_q!}{\prod_{t \in T} [|T_t|]_q},$$

where the product ranges over all nodes t of T, where T_t denotes the subtree of T consisting of t and its all descendants, and where for every tree S, we denote by $|S|$ the number of nodes of S. While this definition only shows that $h_q(T)$ is a rational function in T, it is in fact easy to show that $h_q(T)$ is actually a polynomial in T, and thus makes sense when any element of a commutative ring is substituted for q. This can also be explicitly seen from the following recursive formula for $h_q(T)$:

$$h_q(T) = \binom{|T| - 1}{|T_1|}_q h_q(T_1) h_q(T_2),$$

where T is any nonempty binary tree, and T_1 and T_2 are the two child trees of the root of T, and where $\binom{a}{b}_q$ denotes a q-binomial coefficient.

A variation of the q-hook length fraction is the following "q-hook length fraction with q-factor":

$$f_q(T) = h_q(T) \cdot \prod_{t \in T} q^{|T_{\mathrm{right}(t)}|},$$

where for every node t, we denote by $\mathrm{right}(t)$ the right child of t. This $f_q(T)$ differs from $h_q(T)$ only in a multiplicative factor, which is a power of q.

When $q = 1$, both $f_q(T)$ and $h_q(T)$ equal the number of permutations whose binary search tree (see [HNT2005] for the definition) is T (after dropping the labels). For example, there are 20 permutations which give a binary tree of the following shape:

```
|     __o__   |
|    /     \  |
|   o       o |
|  / \     /  |
| o   o   o   |
```

by the binary search insertion algorithm, in accordance with the fact that this tree satisfies $f_1(T) = 20$.

When q is considered as a polynomial indeterminate, $f_q(T)$ is the generating function for all permutations whose binary search tree is T (after dropping the labels) with respect to the number of inversions (i. e., the Coxeter length) of the permutations.

Objects similar to $h_q(T)$ also make sense for general ordered forests (rather than just binary trees), see e. g. [BW1988], Theorem 9.1.

INPUT:

- `q` – a ring element which is to be substituted as q into the q-hook length fraction (by default, this is set to be the indeterminate q in the polynomial ring $\mathbf{Z}[q]$)
- `q_factor` – a Boolean (default: `False`); which determines whether to compute $h_q(T)$ or to compute $f_q(T)$ (namely, $h_q(T)$ is obtained when `q_factor == False`, and $f_q(T)$ is obtained when `q_factor == True`)

EXAMPLES:

Let us start with a simple example. Actually, let us start with the easiest possible example – the binary tree with only one vertex (which is a leaf):

```
sage: b = BinaryTree()
sage: b.q_hook_length_fraction()                                           #␣
↪needs sage.combinat
1
sage: b.q_hook_length_fraction(q_factor=True)                              #␣
↪needs sage.combinat
1
```

```
>>> from sage.all import *
>>> b = BinaryTree()
>>> b.q_hook_length_fraction()                                           #␣
↪needs sage.combinat
1
>>> b.q_hook_length_fraction(q_factor=True)                              #␣
↪needs sage.combinat
1
```

Nothing different for a tree with one node and two leaves:

```
sage: b = BinaryTree([]); b
[., .]
sage: b.q_hook_length_fraction()                                           #␣
↪needs sage.combinat
1
sage: b.q_hook_length_fraction(q_factor=True)                              #␣
↪needs sage.combinat
1
```

```
>>> from sage.all import *
>>> b = BinaryTree([]); b
[., .]
>>> b.q_hook_length_fraction()                                           #␣
↪needs sage.combinat
1
>>> b.q_hook_length_fraction(q_factor=True)                              #␣
↪needs sage.combinat
1
```

Let us get to a more interesting tree:

```
sage: # needs sage.combinat
sage: b = BinaryTree([[[],[]],[[],None]]); b
[[[., .], [., .]], [[., .], .]]
sage: b.q_hook_length_fraction()(q=1)
20
sage: b.q_hook_length_fraction()
q^7 + 2*q^6 + 3*q^5 + 4*q^4 + 4*q^3 + 3*q^2 + 2*q + 1
sage: b.q_hook_length_fraction(q_factor=True)
q^10 + 2*q^9 + 3*q^8 + 4*q^7 + 4*q^6 + 3*q^5 + 2*q^4 + q^3
sage: b.q_hook_length_fraction(q=2)
465
sage: b.q_hook_length_fraction(q=2, q_factor=True)
3720
```

(continues on next page)

(continued from previous page)

```
sage: q = PolynomialRing(ZZ, 'q').gen()
sage: b.q_hook_length_fraction(q=q**2)
q^14 + 2*q^12 + 3*q^10 + 4*q^8 + 4*q^6 + 3*q^4 + 2*q^2 + 1
```

```
>>> from sage.all import *
>>> # needs sage.combinat
>>> b = BinaryTree([[[],[]],[[],None]]); b
[[[., .], [., .]], [[., .], .]]
>>> b.q_hook_length_fraction()(q=Integer(1))
20
>>> b.q_hook_length_fraction()
q^7 + 2*q^6 + 3*q^5 + 4*q^4 + 4*q^3 + 3*q^2 + 2*q + 1
>>> b.q_hook_length_fraction(q_factor=True)
q^10 + 2*q^9 + 3*q^8 + 4*q^7 + 4*q^6 + 3*q^5 + 2*q^4 + q^3
>>> b.q_hook_length_fraction(q=Integer(2))
465
>>> b.q_hook_length_fraction(q=Integer(2), q_factor=True)
3720
>>> q = PolynomialRing(ZZ, 'q').gen()
>>> b.q_hook_length_fraction(q=q**Integer(2))
q^14 + 2*q^12 + 3*q^10 + 4*q^8 + 4*q^6 + 3*q^4 + 2*q^2 + 1
```

Let us check the fact that $f_q(T)$ is the generating function for all permutations whose binary search tree is T (after dropping the labels) with respect to the number of inversions of the permutations:

```
sage: def q_hook_length_fraction_2(T):
....:     P = PolynomialRing(ZZ, 'q')
....:     q = P.gen()
....:     res = P.zero()
....:     for w in T.sylvester_class():
....:         res += q ** Permutation(w).length()
....:     return res
sage: def test_genfun(i):
....:     return all( q_hook_length_fraction_2(T)
....:                 == T.q_hook_length_fraction(q_factor=True)
....:                 for T in BinaryTrees(i) )
sage: test_genfun(4)                                                      #␣
↪needs sage.combinat
True
```

```
>>> from sage.all import *
>>> def q_hook_length_fraction_2(T):
...     P = PolynomialRing(ZZ, 'q')
...     q = P.gen()
...     res = P.zero()
...     for w in T.sylvester_class():
...         res += q ** Permutation(w).length()
...     return res
>>> def test_genfun(i):
...     return all( q_hook_length_fraction_2(T)
...                 == T.q_hook_length_fraction(q_factor=True)
...                 for T in BinaryTrees(i) )
```

(continues on next page)

(continued from previous page)

```
>>> test_genfun(Integer(4))                                    ␣
↪     # needs sage.combinat
True
```

right_rotate()

Return the result of right rotation applied to the binary tree `self`.

Right rotation on binary trees is defined as follows: Let T be a binary tree such that the left child of the root of T is a node. Let C be the right child of the root of T, and let A and B be the left and right children of the left child of the root of T. (Keep in mind that nodes of trees are identified with the subtrees consisting of their descendants.) Then, the right rotation of T is the binary tree in which the left child of the root is A, whereas the right child of the root is a node whose left and right children are B and C. In pictures:

```
|     *                      *     |
|    / \                    / \    |
|   *   C -right-rotate->  A   *   |
|  / \                        / \  |
| A   B                      B   C |
```

where asterisks signify a single node each (but A, B and C might be empty).

For example,

```
|     o                     _o_   |
|    /                     /   \  |
|   o    -right-rotate->  o     o |
|  / \                         /  |
| o   o                       o   |
<BLANKLINE>
|       __o__                         _o__      |
|      /     \                       /    \     |
|     o       o  -right-rotate->    o     _o_   |
|    / \                           /     /   \  |
|   o   o                         o     o     o |
|  /     \                               \      |
| o       o                               o     |
```

Right rotation is the inverse operation to left rotation (*left_rotate()*).

The right rotation operation introduced here is the one defined in Definition 2.1 of [CP2012].

See also

left_rotate()

EXAMPLES:

```
sage: b = BinaryTree([[[],[]], None]); ascii_art([b])
[     o ]
[    /  ]
[   o   ]
[  / \  ]
[ o   o ]
```

(continues on next page)

(continued from previous page)

```
sage: ascii_art([b.right_rotate()])
[   _o_   ]
[  /   \  ]
[ o     o ]
[      /  ]
[     o   ]
sage: b = BinaryTree([[[[],None],[None,[]]], []]); ascii_art([b])
[       __o__   ]
[      /     \  ]
[     o       o ]
[    / \        ]
[   o   o       ]
[  /     \      ]
[ o       o     ]
sage: ascii_art([b.right_rotate()])
[     _o__      ]
[    /    \     ]
[   o     _o_   ]
[  /     /   \  ]
[ o     o     o ]
[        \      ]
[         o     ]
```

```
>>> from sage.all import *
>>> b = BinaryTree([[[],[]], None]); ascii_art([b])
[     o ]
[    /  ]
[   o   ]
[  / \  ]
[ o   o ]
>>> ascii_art([b.right_rotate()])
[   _o_   ]
[  /   \  ]
[ o     o ]
[      /  ]
[     o   ]
>>> b = BinaryTree([[[[],None],[None,[]]], []]); ascii_art([b])
[       __o__   ]
[      /     \  ]
[     o       o ]
[    / \        ]
[   o   o       ]
[  /     \      ]
[ o       o     ]
>>> ascii_art([b.right_rotate()])
[     _o__      ]
[    /    \     ]
[   o     _o_   ]
[  /     /   \  ]
[ o     o     o ]
[        \      ]
[         o     ]
```

show(*with_leaves=False*)

Show the binary tree `show`, with or without leaves depending on the Boolean keyword variable `with_leaves`.

> **Warning**
>
> For a labelled binary tree, the labels shown in the picture are not (in general) the ones given by the labelling!
>
> Use `_latex_()`, `view`, `_ascii_art_()` or `pretty_print` for more faithful representations of the data of the tree.

single_edge_cut_shapes()

Return the list of possible single-edge cut shapes for the binary tree.

This is used in `sage.combinat.interval_posets.TamariIntervalPoset.is_new()`.

OUTPUT:

a list of triples (m, i, n) of integers

This is a list running over all inner edges (i.e., edges joining two non-leaf vertices) of the binary tree. The removal of each inner edge defines two binary trees (connected components), the root-tree and the sub-tree. Thus, to every inner edge, we can assign three positive integers: m is the node number of the root-tree R, and n is the node number of the sub-tree S. The integer i is the index of the leaf of R on which S is grafted to obtain the original tree. The leaves of R are numbered starting from 1 (from left to right), hence $1 \leq i \leq m + 1$.

In fact, each of m and n determines the other, as the total node number of R and S is the node number of `self`.

EXAMPLES:

```
sage: BT = BinaryTrees(3)
sage: [t.single_edge_cut_shapes() for t in BT]
[[(2, 3, 1), (1, 2, 2)],
[(2, 2, 1), (1, 2, 2)],
[(2, 1, 1), (2, 3, 1)],
[(2, 2, 1), (1, 1, 2)],
[(2, 1, 1), (1, 1, 2)]]

sage: BT = BinaryTrees(2)
sage: [t.single_edge_cut_shapes() for t in BT]
[[(1, 2, 1)], [(1, 1, 1)]]

sage: BT = BinaryTrees(1)
sage: [t.single_edge_cut_shapes() for t in BT]

>>> BT = BinaryTrees(Integer(1))
>>> [t.single_edge_cut_shapes() for t in BT]
[[]]
```

sylvester_class(*left_to_right=False*)

Iterate over the sylvester class corresponding to the binary tree `self`.

The sylvester class of a tree T is the set of permutations σ whose right-to-left binary search tree (a notion defined in [HNT2005], Definition 7) is T after forgetting the labels. This is an equivalence class of the sylvester congruence (the congruence on words which holds two words $uacvbw$ and $ucavbw$ congruent whenever a, b, c are letters satisfying $a \leq b < c$, and extends by transitivity) on the symmetric group.

For example the following tree's sylvester class consists of the permutations $(1, 3, 2)$ and $(3, 1, 2)$:

```
[    o    ]
[   / \   ]
[  o   o  ]
```

(only the nodes are drawn here).

The right-to-left binary search tree of a word is constructed by an RSK-like insertion algorithm which proceeds as follows: Start with an empty labelled binary tree, and read the word from right to left. Each time a letter is read from the word, insert this letter in the existing tree using binary search tree insertion (*binary_search_insert()*). This is what the *binary_search_tree()* method computes if it is given the keyword `left_to_right=False`.

Here are two more descriptions of the sylvester class of a binary search tree:

- The sylvester class of a binary search tree T is the set of all linear extensions of the poset corresponding to T (that is, of the poset whose Hasse diagram is T, with the root on top), provided that the nodes of T are labelled with $1, 2, \ldots, n$ in a binary-search-tree way (i.e., every left descendant of a node has a label smaller than that of the node, and every right descendant of a node has a label higher than that of the node).
- The sylvester class of a binary search tree T (with vertex labels $1, 2, \ldots, n$) is the interval $[u, v]$ in the right permutohedron order (*permutohedron_lequal()*), where u is the 312-avoiding permutation corresponding to T (*to_312_avoiding_permutation()*), and where v is the 132-avoiding permutation corresponding to T (*to_132_avoiding_permutation()*).

If the optional keyword variable `left_to_right` is set to `True`, then the *left* sylvester class of `self` is returned instead. This is the set of permutations σ whose left-to-right binary search tree (that is, the result of the *binary_search_tree()* with `left_to_right` set to `True`) is `self`. It is an equivalence class of the left sylvester congruence.

> **Warning**
>
> This method yields the elements of the sylvester class as raw lists, not as permutations!

EXAMPLES:

Verifying the claim that the right-to-left binary search trees of the permutations in the sylvester class of a tree t all equal t:

```
sage: def test_bst_of_sc(n, left_to_right):
....:     for t in BinaryTrees(n):
....:         for p in t.sylvester_class(left_to_right=left_to_right):
....:             p_per = Permutation(p)
....:             tree = p_per.binary_search_tree(left_to_right=left_to_right)
....:             if not BinaryTree(tree) == t:
....:                 return False
....:     return True
sage: test_bst_of_sc(4, False)                                                  #␣
↪needs sage.combinat
True
sage: test_bst_of_sc(5, False)      # long time                                 #␣
↪needs sage.combinat
True
```

```
>>> from sage.all import *
>>> def test_bst_of_sc(n, left_to_right):
...     for t in BinaryTrees(n):
...         for p in t.sylvester_class(left_to_right=left_to_right):
...             p_per = Permutation(p)
...             tree = p_per.binary_search_tree(left_to_right=left_to_right)
...             if not BinaryTree(tree) == t:
...                 return False
...     return True
>>> test_bst_of_sc(Integer(4), False)                                           ␣
↪      # needs sage.combinat
True
>>> test_bst_of_sc(Integer(5), False)      # long time                          ␣
↪      # needs sage.combinat
True
```

The same with the left-to-right version of binary search:

```
sage: test_bst_of_sc(4, True)                                                   #␣
↪needs sage.combinat
True
sage: test_bst_of_sc(5, True)       # long time                                 #␣
↪needs sage.combinat
True
```

```
>>> from sage.all import *
>>> test_bst_of_sc(Integer(4), True)                                            ␣
↪      # needs sage.combinat
True
>>> test_bst_of_sc(Integer(5), True)       # long time                          ␣
↪      # needs sage.combinat
True
```

Checking that the sylvester class is the set of linear extensions of the poset of the tree:

```
sage: all(sorted(t.canonical_labelling().sylvester_class())                    #␣
↪needs sage.combinat sage.modules
....:         == sorted(list(v)
....:                   for v in t.canonical_labelling().to_poset().linear_
↪extensions())
....:     for t in BinaryTrees(4))
True
```

```
>>> from sage.all import *
>>> all(sorted(t.canonical_labelling().sylvester_class())                    #␣
↪needs sage.combinat sage.modules
...         == sorted(list(v)
...                   for v in t.canonical_labelling().to_poset().linear_
↪extensions())
...     for t in BinaryTrees(Integer(4)))
True
```

tamari_greater()

The list of all trees greater or equal to `self` in the Tamari order.

This is the order filter of the Tamari order generated by `self`.

See *tamari_lequal()* for the definition of the Tamari poset.

See also

tamari_smaller()

EXAMPLES:

For example, the tree:

```
|     __o__   |
|    /     \  |
|   o       o |
|  / \     /  |
| o   o   o   |
```

has these trees greater or equal to it:

```
|o          , o         , o         , o         ,  o        ,   o       ,|
| \            \           \           \            \            \       |
|  o            o           o           o           _o_        __o__     |
|   \            \           \           \         /   \      /     \    |
|    o            o           o         _o_       o     o    o       o   |
|     \            \         / \       /   \       \     \    \     /    |
|      o            o       o   o     o     o       o     o    o   o     |
|       \            \           \         /                             |
|        o            o           o       o                              |
|         \          /                                                   |
|          o        o                                                    |
<BLANKLINE>
|   o         ,   o       ,   _o_       ,   _o__      ,   __o__     ,   ___o___   ,|
```

|   o     o      o       o|
|  / \     \    / \     / |
| o   o     o  o   o   o  |
```

tamari_interval(*other*)

Return the Tamari interval between `self` and `other` as a *TamariIntervalPoset*.

A "Tamari interval" is an interval in the Tamari poset. See *tamari_lequal()* for the definition of the Tamari poset.

INPUT:

- `other` – a binary tree greater or equal to `self` in the Tamari order

EXAMPLES:

```
sage: bt = BinaryTree([[None, [[], None]], None])
sage: ip = bt.tamari_interval(BinaryTree([None, [[None, []], None]])); ip
The Tamari interval of size 4 induced by relations [(2, 4), (3, 4), (3, 1),␣
↪(2, 1)]
sage: ip.lower_binary_tree()
[[., [[., .], .]], .]
sage: ip.upper_binary_tree()
[., [[., [., .]], .]]
sage: ip.interval_cardinality()
4
sage: ip.number_of_tamari_inversions()
2
sage: list(ip.binary_trees())
[[., [[., [., .]], .]],
 [[., [., [., .]]], .],
 [., [[[., .], .], .]],
 [[., [[., .], .]], .]]
sage: bt.tamari_interval(BinaryTree([[None,[]],[]]))
Traceback (most recent call last):
...
ValueError: the two binary trees are not comparable on the Tamari lattice
```

```
>>> from sage.all import *
>>> bt = BinaryTree([[None, [[], None]], None])
>>> ip = bt.tamari_interval(BinaryTree([None, [[None, []], None]])); ip
The Tamari interval of size 4 induced by relations [(2, 4), (3, 4), (3, 1),␣
↪(2, 1)]
```

(continues on next page)

(continued from previous page)

```
>>> ip.lower_binary_tree()
[[., [[., .], .]], .]
>>> ip.upper_binary_tree()
[., [[., [., .]], .]]
>>> ip.interval_cardinality()
4
>>> ip.number_of_tamari_inversions()
2
>>> list(ip.binary_trees())
[[., [[., [., .]], .]],
 [[., [., [., .]]], .],
 [., [[[., .], .], .]],
 [[., [[., .], .]], .]]
>>> bt.tamari_interval(BinaryTree([[None,[]],[]]))
Traceback (most recent call last):
...
ValueError: the two binary trees are not comparable on the Tamari lattice
```

tamari_join(*other*)

Return the join of the binary trees `self` and `other` (of equal size) in the n-th Tamari poset (where n is the size of these trees).

The n-th Tamari poset (defined in *tamari_lequal()*) is known to be a lattice, and the map from the n-th symmetric group S_n to the n-th Tamari poset defined by sending every permutation $p \in S_n$ to the binary search tree of p (more precisely, to `p.binary_search_tree_shape()`) is a lattice homomorphism. (See Theorem 6.2 in [Rea2004].)

AUTHORS:

Viviane Pons and Darij Grinberg, 18 June 2014; Frédéric Chapoton, 9 January 2018.

EXAMPLES:

```
sage: a = BinaryTree([None, [None, []]])
sage: b = BinaryTree([None, [[], None]])
sage: c = BinaryTree([[None, []], None])
sage: d = BinaryTree([[[], None], None])
sage: e = BinaryTree([[], []])
sage: a.tamari_join(c) == a
True
sage: b.tamari_join(c) == b
True
sage: c.tamari_join(e) == a
True
sage: d.tamari_join(e) == e
True
sage: e.tamari_join(b) == a
True
```

(continues on next page)

(continued from previous page)

```
sage: e.tamari_join(a) == a
True
```

```
>>> from sage.all import *
>>> a = BinaryTree([None, [None, []]])
>>> b = BinaryTree([None, [[], None]])
>>> c = BinaryTree([[None, []], None])
>>> d = BinaryTree([[[], None], None])
>>> e = BinaryTree([[], []])
>>> a.tamari_join(c) == a
True
>>> b.tamari_join(c) == b
True
>>> c.tamari_join(e) == a
True
>>> d.tamari_join(e) == e
True
>>> e.tamari_join(b) == a
True
>>> e.tamari_join(a) == a
True
```

```
sage: b1 = BinaryTree([None, [[[], None], None]])
sage: b2 = BinaryTree([[[], None], []])
sage: b1.tamari_join(b2)
[., [[., .], [., .]]]
sage: b3 = BinaryTree([[], [[], None]])
sage: b1.tamari_join(b3)
[., [., [[., .], .]]]
sage: b2.tamari_join(b3)
[[., .], [., [., .]]]
```

```
>>> from sage.all import *
>>> b1 = BinaryTree([None, [[[], None], None]])
>>> b2 = BinaryTree([[[], None], []])
>>> b1.tamari_join(b2)

```

tamari_lequal(*t2*)

Return `True` if `self` is less or equal to another binary tree `t2` (of the same size as `self`) in the Tamari order.

The Tamari order on binary trees of size n is the partial order on the set of all binary trees of size n generated by the following requirement: If a binary tree T' is obtained by right rotation (see `right_rotate()`) from a binary tree T, then $T < T'$. This not only is a well-defined partial order, but actually is a lattice structure on the set of binary trees of size n, and is a quotient of the weak order on the n-th symmetric group (also known as the right permutohedron order, see `permutohedron_lequal()`). See [CP2012]. The set of binary trees of size n equipped with the Tamari order is called the n-th Tamari poset.

The Tamari order can equivalently be defined as follows:

If T and S are two binary trees of size n, then the following four statements are equivalent:

- We have $T \leq S$ in the Tamari order.
- There exist elements t and s of the Sylvester classes (`sylvester_class()`) of T and S, respectively, such that $t \leq s$ in the weak order on the symmetric group.
- The 132-avoiding permutation corresponding to T (see `to_132_avoiding_permutation()`) is $\leq$ to the 132-avoiding permutation corresponding to S in the weak order on the symmetric group.
- The 312-avoiding permutation corresponding to T (see `to_312_avoiding_permutation()`) is $\leq$ to the 312-avoiding permutation corresponding to S in the weak order on the symmetric group.

See also

`tamari_smaller()`, `tamari_greater()`, `tamari_pred()`, `tamari_succ()`, `tamari_interval()`

EXAMPLES:

This tree:

```
|       o      |
|      / \     |
|     o   o    |
|    /         |
|   o          |
|  / \         |
| o   o        |
```

is Tamari-$\leq$ to the following tree:

```
|     _o_      |
|    /   \     |
|   o     o    |
|  / \     \   |
| o   o     o  |
```

Checking this:

```
sage: b = BinaryTree([[[[], []], None], []])
sage: c = BinaryTree([[[],[]],[None,[]]])
sage: b.tamari_lequal(c)
True
```

```
>>> from sage.all import *
>>> b = BinaryTree([[[[], []], None], []])
>>> c = BinaryTree([[[],[]],[None,[]]])
>>> b.tamari_lequal(c)
True
```

tamari_meet (*other*, *side='right'*)

Return the meet of the binary trees `self` and `other` (of equal size) in the n-th Tamari poset (where n is the size of these trees).

The n-th Tamari poset (defined in *tamari_lequal()*) is known to be a lattice, and the map from the n-th symmetric group S_n to the n-th Tamari poset defined by sending every permutation $p \in S_n$ to the binary search tree of p (more precisely, to `p.binary_search_tree_shape()`) is a lattice homomorphism. (See Theorem 6.2 in [Rea2004].)

True
```

```
sage: b1 = BinaryTree([None, [[[], None], None]])
sage: b2 = BinaryTree([[[], None], []])
sage: b1.tamari_meet(b2)
[[[[., .], .], .], .]
sage: b3 = BinaryTree([[], [[], None]])
sage: b1.tamari_meet(b3)
[[[[., .], .], .], .]
sage: b2.tamari_meet(b3)
[[[[., .], .], .], .]
```

```
>>> from sage.all import *
>>> b1 = BinaryTree([None, [[[], None], None]])
>>> b2 = BinaryTree([[[], None], []])
>>> b1.tamari_meet(b2)
[[[[., .], .], .], .]
>>> b3 = BinaryTree([[], [[], None]])
>>> b1.tamari_meet(b3)
[[[[., .], .], .], .]
>>> b2.tamari_meet(b3)
[[[[., .], .], .], .]
```

The universal property of the meet operation is satisfied:

```
sage: def test_uni_meet(p, q):
....:     m = p.tamari_meet(q)
....:     if not m.tamari_lequal(p):
....:         return False
....:     if not m.tamari_lequal(q):
....:         return False
....:     for r in p.tamari_smaller():
....:         if r.tamari_lequal(q) and not r.tamari_lequal(m):
....:             return False
....:     return True
sage: all( test_uni_meet(p, q) for p in BinaryTrees(3) for q in␣
↪BinaryTrees(3) )
True
sage: p = BinaryTrees(6).random_element()                                    #␣
↪needs sage.combinat
```

(continues on next page)

(continued from previous page)

```
sage: q = BinaryTrees(6).random_element()                                      #␣
↪needs sage.combinat
sage: test_uni_meet(p, q)                                                      #␣
↪needs sage.combinat
True
```

```
>>> from sage.all import *
>>> def test_uni_meet(p, q):
...     m = p.tamari_meet(q)
...     if not m.tamari_lequal(p):
...         return False
...     if not m.tamari_lequal(q):
...         return False
...     for r in p.tamari_smaller():
...         if r.tamari_lequal(q) and not r.tamari_lequal(m):
...             return False
...     return True
>>> all( test_uni_meet(p, q) for p in BinaryTrees(Integer(3)) for q in␣
↪BinaryTrees(Integer(3)) )
True
>>> p = BinaryTrees(Integer(6)).random_element()                               ␣
↪     # needs sage.combinat
>>> q = BinaryTrees(Integer(6)).random_element()                               ␣
↪     # needs sage.combinat
>>> test_uni_meet(p, q)                                                      #␣
↪needs sage.combinat
True
```

Border cases:

```
sage: b = BinaryTree(None)
sage: b.tamari_meet(b)
.
sage: b = BinaryTree([])
sage: b.tamari_meet(b)
[., .]
```

```
>>> from sage.all import *
>>> b = BinaryTree(None)
>>> b.tamari_meet(b)
.
>>> b = BinaryTree([])
>>> b.tamari_meet(b)
[., .]
```

tamari_pred()

Compute the list of predecessors of `self` in the Tamari poset.

This list is computed by performing all left rotates possible on its nodes.

See *tamari_lequal()* for the definition of the Tamari poset.

EXAMPLES:

For this tree:

```
|     __o__   |
|    /     \  |
|   o       o |
|  / \     /  |
| o   o   o   |
```

the list is:

```
|        o ,       _o_   |
|       /         /   \  |
|     _o_        o     o |
|    /   \      /     /  |
|   o     o    o     o   |
|  / \        /          |
| o   o      o           |
```

tamari_smaller()

The list of all trees smaller or equal to `self` in the Tamari order.

This is the order ideal of the Tamari order generated by `self`.

See *tamari_lequal()* for the definition of the Tamari poset.

> **See also**
>
> *tamari_greater()*

EXAMPLES:

The tree:

```
|     __o__   |
|    /     \  |
|   o       o |
|  / \     /  |
| o   o   o   |
```

has these trees smaller or equal to it:

```
|    __o__  ,       _o_  ,        o ,         o,         o,           o |
|   /     \        /   \         /           /          /            /  |
|  o       o      o     o      _o_          o          o            o   |
| / \     /      /     /      /   \        / \        /            /    |
|o   o   o      o     o      o     o      o   o      o            o     |
|              /            / \          /          /            /      |
|             o            o   o        o          o            o       |
|                                      /          / \          /        |
|                                     o          o   o        o         |
|                                                            /          |
|                                                           o           |
```

tamari_sorting_tuple(*reverse=False*)

Return the Tamari sorting tuple of `self` and the size of `self`.

This is a pair (w, n), where n is the number of nodes of `self`, and w is an n-tuple whose i-th entry is the number of all nodes among the descendants of the right child of the i-th node of `self`. Here, the nodes of `self` are numbered from left to right.

INPUT:

- `reverse` – boolean (default: `False`); if `True`, return instead the result for the left-right symmetric of the binary tree

OUTPUT:

a pair (w, n), where w is a tuple of integers, and n the size

Two binary trees of the same size are comparable in the Tamari order if and only if the associated tuples w are componentwise comparable. (This is essentially the Theorem in [HT1972].) This is used in *tamari_lequal()*.

EXAMPLES:

```
sage: [t.tamari_sorting_tuple() for t in BinaryTrees(3)]
[((2, 1, 0), 3),
 ((2, 0, 0), 3),
 ((0, 1, 0), 3),
 ((1, 0, 0), 3),
 ((0, 0, 0), 3)]

sage: t = BinaryTrees(10).random_element()                                    #␣
↪needs sage.combinat
sage: u = t.left_right_symmetry()                                              #␣
↪needs sage.combinat
sage: t.tamari_sorting_tuple(True) == u.tamari_sorting_tuple()                #␣
↪needs sage.combinat
True
```

```
>>> from sage.all import *
>>> [t.tamari_sorting_tuple() for t in BinaryTrees(Integer(3))]
[((2, 1, 0), 3),
 ((2, 0, 0), 3),
 ((0, 1, 0), 3),
 ((1, 0, 0), 3),
 ((0, 0, 0), 3)]

>>> t = BinaryTrees(Integer(10)).random_element()                             ␣
↪     # needs sage.combinat
>>> u = t.left_right_symmetry()                                              #␣
↪needs sage.combinat
>>> t.tamari_sorting_tuple(True) == u.tamari_sorting_tuple()                #␣
↪needs sage.combinat
True
```

REFERENCES:

- [HT1972]

tamari_succ()

Compute the list of successors of `self` in the Tamari poset.

This is the list of all trees obtained by a right rotate of one of its nodes.

See `tamari_lequal()` for the definition of the Tamari poset.

EXAMPLES:

The list of successors of:

```
|     __o__    |
|    /     \   |
|   o       o  |
|  / \     /   |
| o   o   o    |
```

is:

```
|   _o__     ,   ___o___  ,     _o_     |
|  /    \       /       \      /   \    |
| o     _o_    o         o    o     o   |
|      /   \    \       /    / \     \  |
|     o     o    o     o    o   o     o |
|          /      \                     |
|         o        o                    |
```

to_132_avoiding_permutation()

Return a 132-avoiding permutation corresponding to the binary tree.

The linear extensions of a binary tree form an interval of the weak order called the sylvester class of the tree. This permutation is the maximal element of this sylvester class.

EXAMPLES:

```
sage: bt = BinaryTree([[],[]])
sage: bt.to_132_avoiding_permutation()
[3, 1, 2]
sage: bt = BinaryTree([[[], [[], None]], [[], []]])
sage: bt.to_132_avoiding_permutation()
[8, 6, 7, 3, 4, 1, 2, 5]
```

```
>>> from sage.all import *
>>> bt = BinaryTree([[],[]])
>>> bt.to_132_avoiding_permutation()
[3, 1, 2]
>>> bt = BinaryTree([[[], [[], None]], [[], []]])
>>> bt.to_132_avoiding_permutation()
[8, 6, 7, 3, 4, 1, 2, 5]
```

to_312_avoiding_permutation()

Return a 312-avoiding permutation corresponding to the binary tree.

The linear extensions of a binary tree form an interval of the weak order called the sylvester class of the tree. This permutation is the minimal element of this sylvester class.

EXAMPLES:

```
sage: bt = BinaryTree([[],[]])
sage: bt.to_312_avoiding_permutation()
[1, 3, 2]
```

(continues on next page)

(continued from previous page)

```
sage: bt = BinaryTree([[[], [[], None]], [[], []]])
sage: bt.to_312_avoiding_permutation()
[1, 3, 4, 2, 6, 8, 7, 5]
```

```
>>> from sage.all import *
>>> bt = BinaryTree([[],[]])
>>> bt.to_312_avoiding_permutation()
[1, 3, 2]
>>> bt = BinaryTree([[[], [[], None]], [[], []]])
>>> bt.to_312_avoiding_permutation()
[1, 3, 4, 2, 6, 8, 7, 5]
```

to_dyck_word(*usemap='1L0R'*)

Return the Dyck word associated with `self` using the given map.

INPUT:

- `usemap` – string; either `'1L0R'`, `'1R0L'`, `'L1R0'`, `'R1L0'`

The bijection is defined recursively as follows:

- a leaf is associated to the empty Dyck Word
- a tree with children l, r is associated with the Dyck word described by `usemap` where L and R are respectively the Dyck words associated with the trees l and r.

EXAMPLES:

```
sage: # needs sage.combinat
sage: BinaryTree().to_dyck_word()
[]
sage: BinaryTree([]).to_dyck_word()
[1, 0]
sage: BinaryTree([[[], [[], None]], [[], []]]).to_dyck_word()
[1, 1, 1, 0, 0, 1, 1, 0, 0, 0, 1, 1, 0, 0, 1, 0]
sage: BinaryTree([[None,[]],None]).to_dyck_word()
[1, 1, 0, 1, 0, 0]
sage: BinaryTree([[None,[]],None]).to_dyck_word("1R0L")
[1, 0, 1, 1, 0, 0]
sage: BinaryTree([[None,[]],None]).to_dyck_word("L1R0")
[1, 1, 0, 0, 1, 0]
sage: BinaryTree([[None,[]],None]).to_dyck_word("R1L0")
[1, 1, 0, 1, 0, 0]
sage: BinaryTree([[None,[]],None]).to_dyck_word("R10L")
Traceback (most recent call last):
...
ValueError: R10L is not a correct map
```

```
>>> from sage.all import *
>>> # needs sage.combinat
>>> BinaryTree().to_dyck_word()
[]
>>> BinaryTree([]).to_dyck_word()
[1, 0]
```

(continues on next page)

(continued from previous page)

```
>>> BinaryTree([[[], [[], None]], [[], []]]).to_dyck_word()
[1, 1, 1, 0, 0, 1, 1, 0, 0, 0, 1, 1, 0, 0, 1, 0]
>>> BinaryTree([[None,[]],None]).to_dyck_word()
[1, 1, 0, 1, 0, 0]
>>> BinaryTree([[None,[]],None]).to_dyck_word("1R0L")
[1, 0, 1, 1, 0, 0]
>>> BinaryTree([[None,[]],None]).to_dyck_word("L1R0")
[1, 1, 0, 0, 1, 0]
>>> BinaryTree([[None,[]],None]).to_dyck_word("R1L0")
[1, 1, 0, 1, 0, 0]
>>> BinaryTree([[None,[]],None]).to_dyck_word("R10L")
Traceback (most recent call last):
...
ValueError: R10L is not a correct map
```

to_dyck_word_tamari()

Return the Dyck word associated with `self` in consistency with the Tamari order on Dyck words and binary trees.

The bijection is defined recursively as follows:

- a leaf is associated with an empty Dyck word;
- a tree with children l, r is associated with the Dyck word $T(l)1T(r)0$.

EXAMPLES:

```
sage: # needs sage.combinat
sage: BinaryTree().to_dyck_word_tamari()
[]
sage: BinaryTree([]).to_dyck_word_tamari()
[1, 0]
sage: BinaryTree([[None,[]],None]).to_dyck_word_tamari()
[1, 1, 0, 0, 1, 0]
sage: BinaryTree([[[], [[], None]], [[], []]]).to_dyck_word_tamari()
[1, 0, 1, 1, 0, 1, 0, 0, 1, 1, 0, 1, 1, 0, 0, 0]
```

```
>>> from sage.all import *
>>> # needs sage.combinat
>>> BinaryTree().to_dyck_word_tamari()
[]
>>> BinaryTree([]).to_dyck_word_tamari()
[1, 0]
>>> BinaryTree([[None,[]],None]).to_dyck_word_tamari()
[1, 1, 0, 0, 1, 0]
>>> BinaryTree([[[], [[], None]], [[], []]]).to_dyck_word_tamari()
[1, 0, 1, 1, 0, 1, 0, 0, 1, 1, 0, 1, 1, 0, 0, 0]
```

to_full()

Return the full binary tree constructed from `self`.

Let T be a binary tree with n nodes. We construct a full binary tree F from T by attaching a leaf to each node of T which does not have 2 children. The resulting tree will have $2n + 1$ nodes.

OUTPUT: a full binary tree. See *is_full()* for the definition of full

See also

`prune()`

EXAMPLES:

```
sage: bt = BinaryTree([[None,[]],None])
sage: bt.to_full().is_full()
True
sage: ascii_art(bt)
  o
 /
o
 \
  o
sage: ascii_art(bt.to_full())
     __o___
    /      \
  _o_       o
 /   \
o     o
     / \
    o   o

sage: bt = BinaryTree([[],[]])
sage: ascii_art(bt)
  o
 / \
o   o
sage: ascii_art(bt.to_full())
    __o__
   /     \
  o       o
 / \     / \
o   o   o   o

sage: BinaryTree(None).to_full()
[., .]
```

```
>>> from sage.all import *
>>> bt = BinaryTree([[None,[]],None])
>>> bt.to_full().is_full()
True
>>> ascii_art(bt)
  o
 /
o
 \
  o
>>> ascii_art(bt.to_full())
     __o___
    /      \
```

(continues on next page)

(continued from previous page)

```
  _o_       o
 /   \
o     o
     / \
    o   o

>>> bt = BinaryTree([[],[]])
>>> ascii_art(bt)
  o
 / \
o   o
>>> ascii_art(bt.to_full())
    __o__
   /     \
  o       o
 / \     / \
o   o   o   o

>>> BinaryTree(None).to_full()
[., .]
```

to_ordered_tree_left_branch()

Return an ordered tree of size $n+1$ by the following recursive rule:

- if x is the left child of y, x becomes the left brother of y
- if x is the right child of y, x becomes the last child of y

EXAMPLES:

```
sage: bt = BinaryTree([[],[]])
sage: bt.to_ordered_tree_left_branch()
[[], [[]]]
sage: bt = BinaryTree([[[], [], None]], [[], []]])
sage: bt.to_ordered_tree_left_branch()
[[], [[], []], [[], [[]]]]
```

```
>>> from sage.all import *
>>> bt = BinaryTree([[],[]])
>>> bt.to_ordered_tree_left_branch()
[[], [[]]]
>>> bt = BinaryTree([[[], [], None]], [[], []]])
>>> bt.to_ordered_tree_left_branch()
[[], [[], []], [[], [[]]]]
```

to_ordered_tree_right_branch()

Return an ordered tree of size $n+1$ by the following recursive rule:

- if x is the right child of y, x becomes the right brother of y
- if x is the left child of y, x becomes the first child of y

EXAMPLES:

```
sage: bt = BinaryTree([[],[]])
sage: bt.to_ordered_tree_right_branch()
[[[]], []]
sage: bt = BinaryTree([[[], [[], None]], [[], []]])
sage: bt.to_ordered_tree_right_branch()
[[[[]], [[]]], [[]], []]
```

```
>>> from sage.all import *
>>> bt = BinaryTree([[],[]])
>>> bt.to_ordered_tree_right_branch()
[[[]], []]
>>> bt = BinaryTree([[[], [[], None]], [[], []]])
>>> bt.to_ordered_tree_right_branch()
[[[[]], [[]]], [[]], []]
```

to_poset(*with_leaves=False*, *root_to_leaf=False*)

Return the poset obtained by interpreting the tree as a Hasse diagram.

The default orientation is from leaves to root but you can pass `root_to_leaf=True` to obtain the inverse orientation.

Leaves are ignored by default, but one can set `with_leaves` to `True` to obtain the poset of the complete tree.

INPUT:

- `with_leaves` – boolean (default: `False`); whether the resulting poset will be formed from the leaves and the nodes of `self` (if `True`), or only from the nodes of `self` (if `False`)
- `root_to_leaf` – boolean (default: `False`); whether the poset orientation should be from root to leaves (if `True`) or from leaves to root (if `False`)

EXAMPLES:

```
sage: bt = BinaryTree([])
sage: bt.to_poset()
Finite poset containing 1 elements
sage: bt.to_poset(with_leaves=True)
Finite poset containing 3 elements
sage: P1 = bt.to_poset(with_leaves=True)
sage: len(P1.maximal_elements())
1
sage: len(P1.minimal_elements())
2
sage: bt = BinaryTree([])
sage: P2 = bt.to_poset(with_leaves=True,root_to_leaf=True)
sage: len(P2.maximal_elements())
2
sage: len(P2.minimal_elements())
1
```

```
>>> from sage.all import *
>>> bt = BinaryTree([])
>>> bt.to_poset()
Finite poset containing 1 elements
```

(continues on next page)

(continued from previous page)

```
>>> bt.to_poset(with_leaves=True)
Finite poset containing 3 elements
>>> P1 = bt.to_poset(with_leaves=True)
>>> len(P1.maximal_elements())
1
>>> len(P1.minimal_elements())
2
>>> bt = BinaryTree([])
>>> P2 = bt.to_poset(with_leaves=True,root_to_leaf=True)
>>> len(P2.maximal_elements())
2
>>> len(P2.minimal_elements())
1
```

If the tree is labelled, we use its labelling to label the poset. Otherwise, we use the poset canonical labelling:

```
sage: bt = BinaryTree([[],[None,[]]]).canonical_labelling()
sage: bt
2[1[., .], 3[., 4[., .]]]
sage: bt.to_poset().cover_relations()
[[4, 3], [3, 2], [1, 2]]
```

```
>>> from sage.all import *
>>> bt = BinaryTree([[],[None,[]]]).canonical_labelling()
>>> bt
2[1[., .], 3[., 4[., .]]]
>>> bt.to_poset().cover_relations()
[[4, 3], [3, 2], [1, 2]]
```

Let us check that the empty binary tree is correctly handled:

```
sage: bt = BinaryTree()
sage: bt.to_poset()
Finite poset containing 0 elements
sage: bt.to_poset(with_leaves=True)
Finite poset containing 1 elements
```

```
>>> from sage.all import *
>>> bt = BinaryTree()
>>> bt.to_poset()
Finite poset containing 0 elements
>>> bt.to_poset(with_leaves=True)
Finite poset containing 1 elements
```

to_tilting()

Transform a binary tree into a tilting object.

Let t be a binary tree with n nodes. There exists a unique depiction of t (above the diagonal) such that all leaves are regularly distributed on the diagonal line from $(0, 0)$ to (n, n) and all edges are either horizontal or vertical. This method provides the coordinates of this depiction, with the root as the top-left vertex.

OUTPUT: list of pairs of integers

Every vertex of the binary tree is mapped to a pair of integers. The conventions are the following. The root has coordinates $(0, n)$ where n is the node number. If a vertex is the left (right) son of another vertex, they share the first (second) coordinate.

EXAMPLES:

```
sage: t = BinaryTrees(1)[0]
sage: t.to_tilting()
[(0, 1)]

sage: for t in BinaryTrees(2):
....:     print(t.to_tilting())
[(1, 2), (0, 2)]
[(0, 1), (0, 2)]

sage: from sage.combinat.abstract_tree import from_hexacode
sage: t = from_hexacode('2020222002000', BinaryTrees())
sage: print(t.to_tilting())
[(0, 1), (2, 3), (4, 5), (6, 7), (4, 7), (8, 9), (10, 11),
 (8, 11), (4, 11), (12, 13), (4, 13), (2, 13), (0, 13)]

sage: w = DyckWord([1,1,1,1,0,1,1,0,0,0,1,1,0,1,0,1,1,0,1,1,0,0,0,0,0,0])    #␣
↪needs sage.combinat
sage: t2 = w.to_binary_tree()                                                #␣
↪needs sage.combinat
sage: len(t2.to_tilting()) == t2.node_number()                               #␣
↪needs sage.combinat
True
```

```
>>> from sage.all import *
>>> t = BinaryTrees(Integer(1))[Integer(0)]
>>> t.to_tilting()
[(0, 1)]

>>> for t in BinaryTrees(Integer(2)):
...     print(t.to_tilting())
[(1, 2), (0, 2)]
[(0, 1), (0, 2)]

>>> from sage.combinat.abstract_tree import from_hexacode
>>> t = from_hexacode('2020222002000', BinaryTrees())
>>> print(t.to_tilting())
[(0, 1), (2, 3), (4, 5), (6, 7), (4, 7), (8, 9), (10, 11),
 (8, 11), (4, 11), (12, 13), (4, 13), (2, 13), (0, 13)]

>>> w = DyckWord([Integer(1),Integer(1),Integer(1),Integer(1),Integer(0),
↪Integer(1),Integer(1),Integer(0),Integer(0),Integer(0),Integer(1),
↪Integer(1),Integer(0),Integer(1),Integer(0),Integer(1),Integer(1),
↪Integer(0),Integer(1),Integer(1),Integer(0),Integer(0),Integer(0),
↪Integer(0),Integer(0),Integer(0)])    # needs sage.combinat
>>> t2 = w.to_binary_tree()                                                #␣
↪needs sage.combinat
>>> len(t2.to_tilting()) == t2.node_number()                               #␣
↪needs sage.combinat
True
```

to_undirected_graph(*with_leaves=False*)

Return the undirected graph obtained from the tree nodes and edges.

Leaves are ignored by default, but one can set `with_leaves` to `True` to obtain the graph of the complete tree.

INPUT:

- `with_leaves` – boolean (default: `False`); whether the resulting graph will be formed from the leaves and the nodes of `self` (if `True`), or only from the nodes of `self` (if `False`)

EXAMPLES:

```
sage: bt = BinaryTree([])
sage: bt.to_undirected_graph()
Graph on 1 vertex
sage: bt.to_undirected_graph(with_leaves=True)
Graph on 3 vertices

sage: bt = BinaryTree()
sage: bt.to_undirected_graph()
Graph on 0 vertices
sage: bt.to_undirected_graph(with_leaves=True)
Graph on 1 vertex
```

```
>>> from sage.all import *
>>> bt = BinaryTree([])
>>> bt.to_undirected_graph()
Graph on 1 vertex
>>> bt.to_undirected_graph(with_leaves=True)
Graph on 3 vertices

>>> bt = BinaryTree()
>>> bt.to_undirected_graph()
Graph on 0 vertices
>>> bt.to_undirected_graph(with_leaves=True)
Graph on 1 vertex
```

If the tree is labelled, we use its labelling to label the graph. Otherwise, we use the graph canonical labelling which means that two different trees can have the same graph.

EXAMPLES:

```
sage: bt = BinaryTree([[],[None,[]]])
sage: bt.canonical_labelling().to_undirected_graph() == bt.to_undirected_
↪graph()
False
sage: BinaryTree([[],[]]).to_undirected_graph() == BinaryTree([[[],None],
↪None]).to_undirected_graph()
True
```

```
>>> from sage.all import *
>>> bt = BinaryTree([[],[None,[]]])
>>> bt.canonical_labelling().to_undirected_graph() == bt.to_undirected_graph()
False
```

(continues on next page)

(continued from previous page)

```
>>> BinaryTree([[],[]]).to_undirected_graph() == BinaryTree([[[],None],None]).
↪to_undirected_graph()
True
```

twisting_number()

Return a pair (number of maximal left branches, number of maximal right branches).

Recalling that a branch of a vertex v is a path from a vertex of the tree to a leaf, a left (resp. right) branch is a branch made only of left (resp. right) edges. The length of a branch is the number of edges composing it. A left (resp. right) branch is maximal if it is not included in a strictly longer left (resp. right) branch.

OUTPUT: list of two integers

EXAMPLES:

```
sage: BT = BinaryTree( '.' )
sage: BT.twisting_number()
[0, 0]
sage: BT = BinaryTree( '[.,.]' )
sage: BT.twisting_number()
[0, 0]

  o
 /
o
>>> BT.twisting_number()
[1, 1]
```

under (*bt*)

Return `self` under `bt`, where "under" is the `under` ($\backslash$) operation.

If T and T' are two binary trees, then T under T' (written $T\backslash T'$) is defined as the tree obtained by grafting

T on the leftmost leaf of T'. More precisely, $T \backslash T'$ is defined by identifying the root of T with the leftmost leaf of T'.

If T' is empty, then $T \backslash T' = T$.

The definition of this "under" operation goes back to Loday-Ronco [LR0102066] (Definition 2.2), but it is denoted by $/$ and called the "over" operation there. In fact, trees in sage have their root at the top, contrary to the trees in [LR0102066] which are growing upwards. For this reason, the names of the over and under operations are swapped, in order to keep a graphical meaning. (Our notation follows that of section 4.5 of [HNT2005].)

See also:

over()

EXAMPLES:

Showing only the nodes of a binary tree, here is an example for the under operation:

```
sage: b1 = BinaryTree([[],[]])
sage: b2 = BinaryTree([None,[]])
sage: ascii_art((b1, b2, b1.under(b2)))
(   o  , o  ,     _o_   )
(  / \    \      /   \  )
( o   o    o    o     o )
(              / \      )
(             o   o     )
```

```
>>> from sage.all import *
>>> b1 = BinaryTree([[],[]])
>>> b2 = BinaryTree([None,[]])
>>> ascii_art((b1, b2, b1.under(b2)))
(   o  , o  ,     _o_   )
(  / \    \      /   \  )
( o   o    o    o     o )
(              / \      )
(             o   o     )
```

under_decomposition()

Return the unique maximal decomposition as an under product.

This means that the tree is cut along all edges of its leftmost path.

Beware that the factors are ordered starting from the root.

See also:

comb(), *over_decomposition()*

EXAMPLES:

```
sage: g = BinaryTree([])
sage: r = g.over(g); r
[., [., .]]
```

(continues on next page)

(continued from previous page)

```
sage: l = g.under(g); l
[[., .], .]
sage: l.under_decomposition()
[[., .], [., .]]
sage: r.under_decomposition() == [r]
True

sage: x = r.under(g).under(r).under(g)

  o
>>> x.under_decomposition() == [g,r,g,r]
True
```

class sage.combinat.binary_tree.**BinaryTrees**

Bases: UniqueRepresentation, Parent

Factory for binary trees.

A binary tree is a tree with at most 2 children. The binary trees considered here are also ordered (a.k.a. planar), that is to say, their children are ordered.

A full binary tree is a binary tree with no nodes with 1 child.

INPUT:

- `size` – integer (optional)
- `full` – boolean (optional)

OUTPUT:

The set of all (full if `full=True`) binary trees (of the given `size` if specified).

See also

BinaryTree, *BinaryTree.is_full()*

EXAMPLES:

```
sage: BinaryTrees()
Binary trees

sage: BinaryTrees(2)
Binary trees of size 2

sage: BinaryTrees(full=True)
Full binary trees

sage: BinaryTrees(3, full=True)
Full binary trees of size 3

sage: BinaryTrees(4, full=True)
Traceback (most recent call last):
...
ValueError: n must be 0 or odd
```

```
>>> from sage.all import *
>>> BinaryTrees()
Binary trees

>>> BinaryTrees(Integer(2))
Binary trees of size 2

>>> BinaryTrees(full=True)
Full binary trees

>>> BinaryTrees(Integer(3), full=True)
Full binary trees of size 3

>>> BinaryTrees(Integer(4), full=True)
Traceback (most recent call last):
...
ValueError: n must be 0 or odd
```

Note

This is a factory class whose constructor returns instances of subclasses.

Note

The fact that BinaryTrees is a class instead of a simple callable is an implementation detail. It could be changed in the future and one should not rely on it.

leaf()

Return a leaf tree with `self` as parent.

EXAMPLES:

```
sage: BinaryTrees().leaf()
.
```

```
>>> from sage.all import *
>>> BinaryTrees().leaf()
.
```

class sage.combinat.binary_tree.**BinaryTrees_all**

Bases: `DisjointUnionEnumeratedSets`, *BinaryTrees*

Element

alias of *BinaryTree*

labelled_trees()

Return the set of labelled trees associated to `self`.

EXAMPLES:

```
sage: BinaryTrees().labelled_trees()
Labelled binary trees
```

```
>>> from sage.all import *
>>> BinaryTrees().labelled_trees()
Labelled binary trees
```

unlabelled_trees()

Return the set of unlabelled trees associated to `self`.

EXAMPLES:

```
sage: BinaryTrees().unlabelled_trees()
Binary trees
```

```
>>> from sage.all import *
>>> BinaryTrees().unlabelled_trees()
Binary trees
```

class sage.combinat.binary_tree.**BinaryTrees_size**(*size*)

Bases: *BinaryTrees*

The enumerated sets of binary trees of given size.

cardinality()

The cardinality of `self`.

This is a Catalan number.

random_element()

Return a random `BinaryTree` with uniform probability.

This method generates a random `DyckWord` and then uses a bijection between Dyck words and binary trees.

EXAMPLES:

```
sage: BinaryTrees(5).random_element()  # random                              #␣
↪needs sage.combinat
[., [., [., [., [., .]]]]]
sage: BinaryTrees(0).random_element()                                        #␣
↪needs sage.combinat
.
sage: BinaryTrees(1).random_element()                                        #␣
↪needs sage.combinat
[., .]
```

```
>>> from sage.all import *
>>> BinaryTrees(Integer(5)).random_element()  # random                      ␣
↪    # needs sage.combinat
[., [., [., [., [., .]]]]]
>>> BinaryTrees(Integer(0)).random_element()                                ␣
↪    # needs sage.combinat
.
>>> BinaryTrees(Integer(1)).random_element()                                ␣
↪    # needs sage.combinat
[., .]
```

class sage.combinat.binary_tree.**FullBinaryTrees_all**

Bases: `DisjointUnionEnumeratedSets`, *BinaryTrees*

All full binary trees.

class sage.combinat.binary_tree.**FullBinaryTrees_size**(*size*)

Bases: *BinaryTrees*

Full binary trees of a fixed size (number of nodes).

cardinality()

The cardinality of `self`.

This is a Catalan number.

random_element()

Return a random `FullBinaryTree` with uniform probability.

This method generates a random `DyckWord` of size $(s-1)/2$, where s is the size of `self`, which uses a bijection between Dyck words and binary trees to get a binary tree, and convert it to a full binary tree.

EXAMPLES:

```
sage: BinaryTrees(5, full=True).random_element()  # random                    #␣
↪needs sage.combinat
[[], [[], []]]
sage: BinaryTrees(0, full=True).random_element()                              #␣
↪needs sage.combinat
.
sage: BinaryTrees(1, full=True).random_element()                              #␣
↪needs sage.combinat
[., .]
```

```
>>> from sage.all import *
>>> BinaryTrees(Integer(5), full=True).random_element()  # random            ␣
↪     # needs sage.combinat
[[], [[], []]]
>>> BinaryTrees(Integer(0), full=True).random_element()                      ␣
↪     # needs sage.combinat
.
>>> BinaryTrees(Integer(1), full=True).random_element()                      ␣
↪     # needs sage.combinat
[., .]
```

class sage.combinat.binary_tree.**LabelledBinaryTree**(*parent*, *children*, *label=None*, *check=True*)

Bases: *AbstractLabelledClonableTree*, *BinaryTree*

Labelled binary trees.

A labelled binary tree is a binary tree (see *BinaryTree* for the meaning of this) with a label assigned to each node. The labels need not be integers, nor are they required to be distinct. `None` can be used as a label.

Warning

While it is possible to assign values to leaves (not just nodes) using this class, these labels are disregarded by various methods such as *labels()*, `map_labels()`, and (ironically) *leaf_labels()*.

INPUT:

- `children` – `None` (default) or a list, tuple or iterable of length 2 of labelled binary trees or convertible objects. This corresponds to the standard recursive definition of a labelled binary tree as being either a leaf, or a pair of:
  - a pair of labelled binary trees,
  - and a label.

  (The label is specified in the keyword variable `label`; see below.)

  Syntactic sugar allows leaving out all but the outermost calls of the `LabelledBinaryTree()` constructor, so that, e. g., `LabelledBinaryTree([LabelledBinaryTree(None), LabelledBinaryTree(None)])` can be shortened to `LabelledBinaryTree([None,None])`. However, using this shorthand, it is impossible to label any vertex of the tree other than the root (because there is no way to pass a `label` variable without calling `LabelledBinaryTree` explicitly).

  It is also allowed to abbreviate `[None, None]` by `[]` if one does not want to label the leaves (which one should not do anyway!).

- `label` – (default: `None`) the label to be put on the root of this tree

- `check` – boolean (default: `True`); whether checks should be performed or not

Todo

It is currently not possible to use `LabelledBinaryTree()` as a shorthand for `LabelledBinaryTree(None)` (in analogy to similar syntax in the `BinaryTree` class).

EXAMPLES:

```
sage: LabelledBinaryTree(None)
.
sage: LabelledBinaryTree(None, label='ae')    # not well supported
'ae'
sage: LabelledBinaryTree([])
None[., .]
sage: LabelledBinaryTree([], label=3)    # not well supported
3[., .]
sage: LabelledBinaryTree([None, None])
None[., .]
sage: LabelledBinaryTree([None, None], label=5)
5[., .]
sage: LabelledBinaryTree([None, []])
None[., None[., .]]
sage: LabelledBinaryTree([None, []], label=4)
4[., None[., .]]
sage: LabelledBinaryTree([[], None])
None[None[., .], .]
sage: LabelledBinaryTree("[[], .]", label=False)
False[None[., .], .]
sage: LabelledBinaryTree([None, LabelledBinaryTree([None, None], label=4)],
↪label=3)
3[., 4[., .]]
sage: LabelledBinaryTree([None, BinaryTree([None, None])], label=3)
3[., None[., .]]

sage: LabelledBinaryTree([[], None, []])
Traceback (most recent call last):
...
ValueError: this is not a binary tree

sage: LBT = LabelledBinaryTree
sage: t1 = LBT([[LBT([], label=2), None], None], label=4); t1
4[None[2[., .], .], .]
```

```
>>> from sage.all import *
>>> LabelledBinaryTree(None)
.
>>> LabelledBinaryTree(None, label='ae')    # not well supported
'ae'
>>> LabelledBinaryTree([])
None[., .]
>>> LabelledBinaryTree([], label=Integer(3))    # not well supported
```

(continues on next page)

(continued from previous page)

```
3[., .]
>>> LabelledBinaryTree([None, None])
None[., .]
>>> LabelledBinaryTree([None, None], label=Integer(5))
5[., .]
>>> LabelledBinaryTree([None, []])

>>> t1 = LBT([[LBT([], label=Integer(2)), None], None], label=Integer(4)); t1
4[None[2[., .], .], .]
```

binary_search_insert(*letter*)

Return the result of inserting a letter `letter` into the right strict binary search tree `self`.

INPUT:

- `letter` – any object comparable with the labels of `self`

OUTPUT:

The right strict binary search tree `self` with `letter` inserted into it according to the binary search insertion algorithm.

Note

`self` is supposed to be a binary search tree. This is not being checked!

A right strict binary search tree is defined to be a labelled binary tree such that for each node n with label x, every descendant of the left child of n has a label $\leq x$, and every descendant of the right child of n has a label $> x$. (Here, only nodes count as descendants, and every node counts as its own descendant too.) Leaves are assumed to have no labels.

Given a right strict binary search tree t and a letter i, the result of inserting i into t (denoted $Ins(i,t)$ in the following) is defined recursively as follows:

- If t is empty, then $Ins(i,t)$ is the tree with one node only, and this node is labelled with i.

- Otherwise, let j be the label of the root of t. If $i > j$, then $Ins(i, t)$ is obtained by replacing the right child of t by $Ins(i, r)$ in t, where r denotes the right child of t. If $i \leq j$, then $Ins(i, t)$ is obtained by replacing the left child of t by $Ins(i, l)$ in t, where l denotes the left child of t.

See, for example, [HNT2005] for properties of this algorithm.

Warning

If t is nonempty, then inserting i into t does not change the root label of t. Hence, as opposed to algorithms like Robinson-Schensted-Knuth, binary search tree insertion involves no bumping.

EXAMPLES:

The example from Fig. 2 of [HNT2005]:

```
sage: LBT = LabelledBinaryTree
sage: x = LBT(None)
sage: x
.
sage: x = x.binary_search_insert("b"); x
b[., .]
sage: x = x.binary_search_insert("d"); x
b[., d[., .]]
sage: x = x.binary_search_insert("e"); x
b[., d[., e[., .]]]
sage: x = x.binary_search_insert("a"); x
b[a[., .], d[., e[., .]]]
sage: x = x.binary_search_insert("b"); x
b[a[., b[., .]], d[., e[., .]]]
sage: x = x.binary_search_insert("d"); x
b[a[., b[., .]], d[d[., .], e[., .]]]
sage: x = x.binary_search_insert("a"); x
b[a[a[., .], b[., .]], d[d[., .], e[., .]]]
sage: x = x.binary_search_insert("c"); x
b[a[a[., .], b[., .]], d[d[c[., .], .], e[., .]]]
```

```
>>> from sage.all import *
>>> LBT = LabelledBinaryTree
>>> x = LBT(None)
>>> x
.
>>> x = x.binary_search_insert("b"); x
b[., .]
>>> x = x.binary_search_insert("d"); x
b[., d[., .]]
>>> x = x.binary_search_insert("e"); x
b[., d[., e[., .]]]
>>> x = x.binary_search_insert("a"); x
b[a[., .], d[., e[., .]]]
>>> x = x.binary_search_insert("b"); x
b[a[., b[., .]], d[., e[., .]]]
>>> x = x.binary_search_insert("d"); x
b[a[., b[., .]], d[d[., .], e[., .]]]
```

(continued from previous page)

```
>>> x = x.binary_search_insert("a"); x
b[a[a[., .], b[., .]], d[d[., .], e[., .]]]
>>> x = x.binary_search_insert("c"); x
b[a[a[., .], b[., .]], d[d[c[., .], .], e[., .]]]
```

Other examples:

```
sage: LBT = LabelledBinaryTree
sage: LBT(None).binary_search_insert(3)
3[., .]
sage: LBT([], label = 1).binary_search_insert(3)
1[., 3[., .]]
sage: LBT([], label = 3).binary_search_insert(1)
3[1[., .], .]
sage: res = LBT(None)
sage: for i in [3,1,5,2,4,6]:
....:     res = res.binary_search_insert(i)
sage: res
3[1[., 2[., .]], 5[4[., .], 6[., .]]]
```

```
>>> from sage.all import *
>>> LBT = LabelledBinaryTree
>>> LBT(None).binary_search_insert(Integer(3))
3[., .]
>>> LBT([], label = Integer(1)).binary_search_insert(Integer(3))
1[., 3[., .]]
>>> LBT([], label = Integer(3)).binary_search_insert(Integer(1))
3[1[., .], .]
>>> res = LBT(None)
>>> for i in [Integer(3),Integer(1),Integer(5),Integer(2),Integer(4),
↪Integer(6)]:
...     res = res.binary_search_insert(i)
>>> res
3[1[., 2[., .]], 5[4[., .], 6[., .]]]
```

heap_insert(*l*)

Return the result of inserting a letter `l` into the binary heap (tree) `self`.

A binary heap is a labelled complete binary tree such that for each node, the label at the node is greater or equal to the label of each of its child nodes. (More precisely, this is called a max-heap.)

For example:

```
|      _7_    |
|     /   \   |
|    5      6 |
|   / \       |
| 3    4      |
```

is a binary heap.

See Wikipedia article Binary_heap#Insert for a description of how to insert a letter into a binary heap. The result is another binary heap.

INPUT:

- `letter` – any object comparable with the labels of `self`

Note: `self` is assumed to be a binary heap (tree). No check is performed.

left_rotate()

Return the result of left rotation applied to the labelled binary tree `self`.

Left rotation on labelled binary trees is defined as follows: Let T be a labelled binary tree such that the right child of the root of T is a node. Let A be the left child of the root of T, and let B and C be the left and right children of the right child of the root of T. (Keep in mind that nodes of trees are identified with the subtrees consisting of their descendants.) Furthermore, let x be the label at the root of T, and y be the label at the right child of the root of T. Then, the left rotation of T is the labelled binary tree in which the root is labelled y, the right child of the root is C, whereas the left child of the root is a node labelled x whose left and right children are A and B. In pictures:

```
|     y                    x     |
|    / \                  / \    |
|   x   C <-left-rotate- A   y   |
|  / \                      / \  |
| A   B                    B   C |
```

Left rotation is the inverse operation to right rotation (*right_rotate()*).

right_rotate()

Return the result of right rotation applied to the labelled binary tree `self`.

Right rotation on labelled binary trees is defined as follows: Let T be a labelled binary tree such that the left child of the root of T is a node. Let C be the right child of the root of T, and let A and B be the left and right children of the left child of the root of T. (Keep in mind that nodes of trees are identified with the subtrees consisting of their descendants.) Furthermore, let y be the label at the root of T, and x be the label at the left child of the root of T. Then, the right rotation of T is the labelled binary tree in which the root is labelled x, the left child of the root is A, whereas the right child of the root is a node labelled y whose left and right children are B and C. In pictures:

```
|     y                      x     |
|    / \                    / \    |
|   x   C -right-rotate->  A   y   |
|  / \                        / \  |
| A   B                      B   C |
```

Right rotation is the inverse operation to left rotation (*left_rotate()*).

semistandard_insert(*letter*)

Return the result of inserting a letter `letter` into the semistandard tree `self` using the bumping algorithm.

INPUT:

- `letter` – any object comparable with the labels of `self`

OUTPUT:

The semistandard tree `self` with `letter` inserted into it according to the bumping algorithm.

Note: `self` is supposed to be a semistandard tree. This is not being checked!

A semistandard tree is defined to be a labelled binary tree such that for each node n with label x, every descendant of the left child of n has a label $> x$, and every descendant of the right child of n has a label $\geq x$. (Here, only nodes count as descendants, and every node counts as its own descendant too.) Leaves are assumed to have no labels.

Given a semistandard tree t and a letter i, the result of inserting i into t (denoted $Ins(i, t)$ in the following) is defined recursively as follows:

- If t is empty, then $Ins(i, t)$ is the tree with one node only, and this node is labelled with i.
- Otherwise, let j be the label of the root of t. If $i \geq j$, then $Ins(i, t)$ is obtained by replacing the right child of t by $Ins(i, r)$ in t, where r denotes the right child of t. If $i < j$, then $Ins(i, t)$ is obtained by replacing the label at the root of t by i, and replacing the left child of t by $Ins(j, l)$ in t, where l denotes the left child of t.

This algorithm is similar to the Robinson-Schensted-Knuth insertion algorithm for semistandard Young tableaux.

AUTHORS:

- Darij Grinberg (10 Nov 2013).

EXAMPLES:

```
sage: LBT = LabelledBinaryTree
sage: x = LBT(None)
sage: x
.
sage: x = x.semistandard_insert("b"); x
b[., .]
sage: x = x.semistandard_insert("d"); x
b[., d[., .]]
sage: x = x.semistandard_insert("e"); x
b[., d[., e[., .]]]
sage: x = x.semistandard_insert("a"); x
a[b[., .], d[., e[., .]]]
sage: x = x.semistandard_insert("b"); x
a[b[., .], b[d[., .], e[., .]]]
sage: x = x.semistandard_insert("d"); x
a[b[., .], b[d[., .], d[e[., .], .]]]
sage: x = x.semistandard_insert("a"); x
a[b[., .], a[b[d[., .], .], d[e[., .], .]]]
sage: x = x.semistandard_insert("c"); x
a[b[., .], a[b[d[., .], .], c[d[e[., .], .], .]]]
```

```
>>> from sage.all import *
>>> LBT = LabelledBinaryTree
>>> x = LBT(None)
>>> x
.
>>> x = x.semistandard_insert("b"); x
b[., .]
```

(continues on next page)

(continued from previous page)

```
>>> x = x.semistandard_insert("d"); x
b[., d[., .]]
>>> x = x.semistandard_insert("e"); x
b[., d[., e[., .]]]
>>> x = x.semistandard_insert("a"); x
a[b[., .], d[., e[., .]]]
>>> x = x.semistandard_insert("b"); x
a[b[., .], b[d[., .], e[., .]]]
>>> x = x.semistandard_insert("d"); x
a[b[., .], b[d[., .], d[e[., .], .]]]
>>> x = x.semistandard_insert("a"); x
a[b[., .], a[b[d[., .], .], d[e[., .], .]]]
>>> x = x.semistandard_insert("c"); x
a[b[., .], a[b[d[., .], .], c[d[e[., .], .], .]]]
```

Other examples:

```
sage: LBT = LabelledBinaryTree
sage: LBT(None).semistandard_insert(3)
3[., .]
sage: LBT([], label = 1).semistandard_insert(3)
1[., 3[., .]]
sage: LBT([], label = 3).semistandard_insert(1)
1[3[., .], .]
sage: res = LBT(None)
sage: for i in [3,1,5,2,4,6]:
....:     res = res.semistandard_insert(i)
sage: res
1[3[., .], 2[5[., .], 4[., 6[., .]]]]
```

```
>>> from sage.all import *
>>> LBT = LabelledBinaryTree
>>> LBT(None).semistandard_insert(Integer(3))
3[., .]
>>> LBT([], label = Integer(1)).semistandard_insert(Integer(3))
1[., 3[., .]]
>>> LBT([], label = Integer(3)).semistandard_insert(Integer(1))
1[3[., .], .]
>>> res = LBT(None)
>>> for i in [Integer(3),Integer(1),Integer(5),Integer(2),Integer(4),
↪Integer(6)]:
...     res = res.semistandard_insert(i)
>>> res
1[3[., .], 2[5[., .], 4[., 6[., .]]]]
```

class sage.combinat.binary_tree.**LabelledBinaryTrees**(*category=None*)

Bases: *LabelledOrderedTrees*

This is a parent stub to serve as a factory class for trees with various labels constraints.

Element

alias of *LabelledBinaryTree*

labelled_trees()

Return the set of labelled trees associated to self.

EXAMPLES:

```
sage: LabelledBinaryTrees().labelled_trees()
Labelled binary trees
```

```
>>> from sage.all import *
>>> LabelledBinaryTrees().labelled_trees()
Labelled binary trees
```

unlabelled_trees()

Return the set of unlabelled trees associated to self.

EXAMPLES:

```
sage: LabelledBinaryTrees().unlabelled_trees()
Binary trees
```

```
>>> from sage.all import *
>>> LabelledBinaryTrees().unlabelled_trees()
Binary trees
```

This is used to compute the shape:

```
sage: t = LabelledBinaryTrees().an_element().shape(); t
[[[., .], [., .]], [[., .], [., .]]]
sage: t.parent()
Binary trees
```

```
>>> from sage.all import *
>>> t = LabelledBinaryTrees().an_element().shape(); t
[[[., .], [., .]], [[., .], [., .]]]
>>> t.parent()
Binary trees
```

sage.combinat.binary_tree.**binary_search_tree_shape**(*w*, *left_to_right=True*)

Direct computation of the binary search tree shape of a list of integers.

INPUT:

- w – list of integers
- left_to_right – boolean (default: True)

OUTPUT: a non labelled binary tree

This is used under the same name as a method for permutations.

EXAMPLES:

```
sage: from sage.combinat.binary_tree import binary_search_tree_shape
sage: binary_search_tree_shape([1,4,3,2])
[., [[[., .], .], .]]
sage: binary_search_tree_shape([5,1,3,2])
[[., [[., .], .]], .]
```

```
>>> from sage.all import *
>>> from sage.combinat.binary_tree import binary_search_tree_shape
>>> binary_search_tree_shape([Integer(1),Integer(4),Integer(3),Integer(2)])
[., [[[., .], .], .]]
>>> binary_search_tree_shape([Integer(5),Integer(1),Integer(3),Integer(2)])
[[., [[., .], .]], .]
```

By passing the option `left_to_right=False` one can have the insertion going from right to left:

```
sage: binary_search_tree_shape([1,6,4,2], False)
[[., .], [., [., .]]]
```

```
>>> from sage.all import *
>>> binary_search_tree_shape([Integer(1),Integer(6),Integer(4),Integer(2)], False)
[[., .], [., [., .]]]
```

sage.combinat.binary_tree.**from_tamari_sorting_tuple**(*key*)

Return a binary tree from its Tamari-sorting tuple.

See *tamari_sorting_tuple()*

INPUT:

- `key` – tuple of integers

EXAMPLES:

```
sage: from sage.combinat.binary_tree import from_tamari_sorting_tuple
sage: t = BinaryTrees(60).random_element()                                  #␣
↪needs sage.combinat
sage: from_tamari_sorting_tuple(t.tamari_sorting_tuple()[0]) == t           #␣
↪needs sage.combinat
True
```

```
>>> from sage.all import *
>>> from sage.combinat.binary_tree import from_tamari_sorting_tuple
>>> t = BinaryTrees(Integer(60)).random_element()                              ␣
↪    # needs sage.combinat
>>> from_tamari_sorting_tuple(t.tamari_sorting_tuple()[Integer(0)]) == t       ␣
↪    # needs sage.combinat
True
```

5.1.11 Blob Algebras

AUTHORS:

- Travis Scrimshaw (2020-05-16): Initial version

class sage.combinat.blob_algebra.**BlobAlgebra**(*k*, *q1*, *q2*, *q3*, *base_ring*, *prefix*)

Bases: *CombinatorialFreeModule*

The blob algebra.

The *blob algebra* (also known as the Temperley-Lieb algebra of type B in [ILZ2018], but is a quotient of the Temperley-Lieb algebra of type B defined in [Graham1985]) is a diagram-type algebra introduced in [MS1994] whose basis consists of `Temperley-Lieb diagrams`, noncrossing perfect matchings, that may contain blobs on strands that can be deformed so that the blob touches the left side (which we can think of as a frozen pole).

The form we give here has 3 parameters, the natural one from the `Temperley-Lieb algebra`, one for the idempotent relation, and one for a loop with a blob.

INPUT:

- `k` – the order
- `q1` – the loop parameter
- `q2` – the idempotent parameter
- `q3` – the blob loop parameter

EXAMPLES:

```
sage: R.<q,r,s> = ZZ[]
sage: B4 = algebras.Blob(4, q, r, s)
sage: B = sorted(B4.basis())
sage: B[14]
B({{-4, -3}}, {{-2, -1}, {1, 2}, {3, 4}})
sage: B[40]
B({{3, 4}}, {{-4, -3}, {-2, -1}, {1, 2}})
sage: B[14] * B[40]
q*r*s*B({}, {{-4, -3}, {-2, -1}, {1, 2}, {3, 4}})
```

```
>>> from sage.all import *
>>> R = ZZ['q, r, s']; (q, r, s,) = R._first_ngens(3)
>>> B4 = algebras.Blob(Integer(4), q, r, s)
>>> B = sorted(B4.basis())
>>> B[Integer(14)]
B({{-4, -3}}, {{-2, -1}, {1, 2}, {3, 4}})
>>> B[Integer(40)]
B({{3, 4}}, {{-4, -3}, {-2, -1}, {1, 2}})
>>> B[Integer(14)] * B[Integer(40)]
q*r*s*B({}, {{-4, -3}, {-2, -1}, {1, 2}, {3, 4}})
```

REFERENCES:

- [MS1994]
- [ILZ2018]

one_basis()

Return the index of the basis element 1.

EXAMPLES:

```
sage: R.<q,r,s> = ZZ[]
sage: B4 = algebras.Blob(4, q, r, s)
sage: B4.one_basis()
({}, {{-4, 4}, {-3, 3}, {-2, 2}, {-1, 1}})
```

```
>>> from sage.all import *
>>> R = ZZ['q, r, s']; (q, r, s,) = R._first_ngens(3)
>>> B4 = algebras.Blob(Integer(4), q, r, s)
```

(continues on next page)

(continued from previous page)

```
>>> B4.one_basis()
({}, {{-4, 4}, {-3, 3}, {-2, 2}, {-1, 1}})
```

order()

Return the order of `self`.

The order of a partition algebra is defined as half of the number of nodes in the diagrams.

EXAMPLES:

```
sage: R.<q,r,s> = ZZ[]
sage: B4 = algebras.Blob(4, q, r, s)
sage: B4.order()
4
```

```
>>> from sage.all import *
>>> R = ZZ['q, r, s']; (q, r, s,) = R._first_ngens(3)
>>> B4 = algebras.Blob(Integer(4), q, r, s)
>>> B4.order()
4
```

product_on_basis(*top*, *bot*)

Return the product of the basis elements indexed by `top` and `bot`.

EXAMPLES:

```
sage: R.<q,r,s> = ZZ[]
sage: B4 = algebras.Blob(4, q, r, s)
sage: B = B4.basis()
sage: BD = sorted(B.keys())
sage: BD[14]
({{-4, -3}}, {{-2, -1}, {1, 2}, {3, 4}})
sage: BD[40]
({{3, 4}}, {{-4, -3}, {-2, -1}, {1, 2}})
sage: B4.product_on_basis(BD[14], BD[40])
q*r*s*B({}, {{-4, -3}, {-2, -1}, {1, 2}, {3, 4}})
sage: all(len((x*y).support()) == 1 for x in B for y in B)
True
```

```
>>> from sage.all import *
>>> R = ZZ['q, r, s']; (q, r, s,) = R._first_ngens(3)
>>> B4 = algebras.Blob(Integer(4), q, r, s)
>>> B = B4.basis()
>>> BD = sorted(B.keys())
>>> BD[Integer(14)]
({{-4, -3}}, {{-2, -1}, {1, 2}, {3, 4}})
>>> BD[Integer(40)]
({{3, 4}}, {{-4, -3}, {-2, -1}, {1, 2}})
>>> B4.product_on_basis(BD[Integer(14)], BD[Integer(40)])
q*r*s*B({}, {{-4, -3}, {-2, -1}, {1, 2}, {3, 4}})
>>> all(len((x*y).support()) == Integer(1) for x in B for y in B)
True
```

class sage.combinat.blob_algebra.**BlobDiagram**(*parent*, *marked*, *unmarked*)

Bases: Element

A blob diagram.

A blob diagram consists of a perfect matching of the set $\{1, \ldots, n\} \sqcup \{-1, \ldots, -n\}$ such that the result is a noncrossing matching (a *Temperley-Lieb diagram*), divided into two sets of pairs: one for the pairs with blobs and one for those without. The blobed pairs must either be either the leftmost propagating strand or to the left of it and not nested.

temperley_lieb_diagram()

Return the Temperley-Lieb diagram corresponding to self.

EXAMPLES:

```
sage: from sage.combinat.blob_algebra import BlobDiagrams
sage: BD4 = BlobDiagrams(4)
sage: B = BD4([[1,-3]], [[2,-4], [3,4], [-1,-2]])
sage: B.temperley_lieb_diagram()
{{-4, 2}, {-3, 1}, {-2, -1}, {3, 4}}
```

```
>>> from sage.all import *
>>> from sage.combinat.blob_algebra import BlobDiagrams
>>> BD4 = BlobDiagrams(Integer(4))
>>> B = BD4([[Integer(1),-Integer(3)]], [[Integer(2),-Integer(4)],
↪[Integer(3),Integer(4)], [-Integer(1),-Integer(2)]])
>>> B.temperley_lieb_diagram()
{{-4, 2}, {-3, 1}, {-2, -1}, {3, 4}}
```

class sage.combinat.blob_algebra.**BlobDiagrams**(*n*)

Bases: Parent, UniqueRepresentation

The set of all blob diagrams.

Element

alias of *BlobDiagram*

base_set()

Return the base set of self.

EXAMPLES:

```
sage: from sage.combinat.blob_algebra import BlobDiagrams
sage: BD4 = BlobDiagrams(4)
sage: sorted(BD4.base_set())
[-4, -3, -2, -1, 1, 2, 3, 4]
```

```
>>> from sage.all import *
>>> from sage.combinat.blob_algebra import BlobDiagrams
>>> BD4 = BlobDiagrams(Integer(4))
>>> sorted(BD4.base_set())
[-4, -3, -2, -1, 1, 2, 3, 4]
```

cardinality()

Return the cardinality of self.

EXAMPLES:

```
sage: from sage.combinat.blob_algebra import BlobDiagrams
sage: BD4 = BlobDiagrams(4)
sage: BD4.cardinality()
70
```

```
>>> from sage.all import *
>>> from sage.combinat.blob_algebra import BlobDiagrams
>>> BD4 = BlobDiagrams(Integer(4))
>>> BD4.cardinality()
70
```

order()

Return the order of `self`.

EXAMPLES:

```
sage: from sage.combinat.blob_algebra import BlobDiagrams
sage: BD4 = BlobDiagrams(4)
sage: BD4.order()
4
```

```
>>> from sage.all import *
>>> from sage.combinat.blob_algebra import BlobDiagrams
>>> BD4 = BlobDiagrams(Integer(4))
>>> BD4.order()
4
```

5.1.12 Cartesian Products

class sage.combinat.cartesian_product.**CartesianProduct_iters**(**iters*)

Bases: `EnumeratedSetFromIterator`

Cartesian product of finite sets.

This class will soon be deprecated (see Issue #18411 and Issue #19195). One should instead use the functorial construction `cartesian_product`. The main differences in behavior are:

- construction: `CartesianProduct` takes as many argument as there are factors whereas `cartesian_product` takes a single list (or iterable) of factors;
- representation of elements: elements are represented by plain Python list for `CartesianProduct` versus a custom element class for `cartesian_product`;
- membership testing: because of the above, plain Python lists are not considered as elements of a `cartesian_product`.

All of these is illustrated in the examples below.

EXAMPLES:

```
sage: F1 = ['a', 'b']
sage: F2 = [1, 2, 3, 4]
sage: F3 = Permutations(3)
sage: from sage.combinat.cartesian_product import CartesianProduct_iters
sage: C = CartesianProduct_iters(F1, F2, F3)
```

(continues on next page)

(continued from previous page)

```
sage: c = cartesian_product([F1, F2, F3])

sage: type(C.an_element())
<class 'list'>
sage: type(c.an_element())
<class 'sage.sets.cartesian_product.CartesianProduct_with_category.element_class'>

sage: l = ['a', 1, Permutation([3,2,1])]
sage: l in C
True
sage: l in c
False
sage: elt = c(l)
sage: elt
('a', 1, [3, 2, 1])
sage: elt in c
True
sage: elt.parent() is c
True
```

```
>>> from sage.all import *
>>> F1 = ['a', 'b']
>>> F2 = [Integer(1), Integer(2), Integer(3), Integer(4)]
>>> F3 = Permutations(Integer(3))
>>> from sage.combinat.cartesian_product import CartesianProduct_iters
>>> C = CartesianProduct_iters(F1, F2, F3)
>>> c = cartesian_product([F1, F2, F3])

>>> type(C.an_element())
<class 'list'>
>>> type(c.an_element())
<class 'sage.sets.cartesian_product.CartesianProduct_with_category.element_class'>

>>> l = ['a', Integer(1), Permutation([Integer(3),Integer(2),Integer(1)])]
>>> l in C
True
>>> l in c
False
>>> elt = c(l)
>>> elt
('a', 1, [3, 2, 1])
>>> elt in c
True
>>> elt.parent() is c
True
```

cardinality()

Return the number of elements in the Cartesian product of everything in *iters.

EXAMPLES:

```
sage: from sage.combinat.cartesian_product import CartesianProduct_iters
```

(continues on next page)

(continued from previous page)

```
sage: CartesianProduct_iters(range(2), range(3)).cardinality()
6
sage: CartesianProduct_iters(range(2), range(3)).cardinality()
6
sage: CartesianProduct_iters(range(2), range(3), range(4)).cardinality()
24
```

```
>>> from sage.all import *
>>> from sage.combinat.cartesian_product import CartesianProduct_iters
>>> CartesianProduct_iters(range(Integer(2)), range(Integer(3))).cardinality()
6
>>> CartesianProduct_iters(range(Integer(2)), range(Integer(3))).cardinality()
6
>>> CartesianProduct_iters(range(Integer(2)), range(Integer(3)),
→range(Integer(4))).cardinality()
24
```

This works correctly for infinite objects:

```
sage: CartesianProduct_iters(ZZ, QQ).cardinality()
+Infinity
sage: CartesianProduct_iters(ZZ, []).cardinality()
0
```

```
>>> from sage.all import *
>>> CartesianProduct_iters(ZZ, QQ).cardinality()
+Infinity
>>> CartesianProduct_iters(ZZ, []).cardinality()
0
```

is_finite()

The Cartesian product is finite if all of its inputs are finite, or if any input is empty.

EXAMPLES:

```
sage: from sage.combinat.cartesian_product import CartesianProduct_iters
sage: CartesianProduct_iters(ZZ, []).is_finite()
True
sage: CartesianProduct_iters(4,4).is_finite()
Traceback (most recent call last):
...
ValueError: unable to determine whether this product is finite
```

```
>>> from sage.all import *
>>> from sage.combinat.cartesian_product import CartesianProduct_iters
>>> CartesianProduct_iters(ZZ, []).is_finite()
True
>>> CartesianProduct_iters(Integer(4),Integer(4)).is_finite()
Traceback (most recent call last):
...
ValueError: unable to determine whether this product is finite
```

list()

Return.

EXAMPLES:

```
sage: from sage.combinat.cartesian_product import CartesianProduct_iters
sage: CartesianProduct_iters(range(3), range(3)).list()
[[0, 0], [0, 1], [0, 2], [1, 0], [1, 1], [1, 2], [2, 0], [2, 1], [2, 2]]
sage: CartesianProduct_iters('dog', 'cat').list()
[['d', 'c'],
 ['d', 'a'],
 ['d', 't'],
 ['o', 'c'],
 ['o', 'a'],
 ['o', 't'],
 ['g', 'c'],
 ['g', 'a'],
 ['g', 't']]
```

```
>>> from sage.all import *
>>> from sage.combinat.cartesian_product import CartesianProduct_iters
>>> CartesianProduct_iters(range(Integer(3)), range(Integer(3))).list()
[[0, 0], [0, 1], [0, 2], [1, 0], [1, 1], [1, 2], [2, 0], [2, 1], [2, 2]]
>>> CartesianProduct_iters('dog', 'cat').list()
[['d', 'c'],
 ['d', 'a'],
 ['d', 't'],
 ['o', 'c'],
 ['o', 'a'],
 ['o', 't'],
 ['g', 'c'],
 ['g', 'a'],
 ['g', 't']]
```

random_element()

Return a random element from the Cartesian product of *iters.

EXAMPLES:

```
sage: from sage.combinat.cartesian_product import CartesianProduct_iters
sage: c = CartesianProduct_iters('dog', 'cat').random_element()
sage: c in CartesianProduct_iters('dog', 'cat')
True
```

```
>>> from sage.all import *
>>> from sage.combinat.cartesian_product import CartesianProduct_iters
>>> c = CartesianProduct_iters('dog', 'cat').random_element()
>>> c in CartesianProduct_iters('dog', 'cat')
True
```

unrank(x)

For finite Cartesian products, we can reduce unrank to the constituent iterators.

EXAMPLES:

```
sage: from sage.combinat.cartesian_product import CartesianProduct_iters
sage: C = CartesianProduct_iters(range(1000), range(1000), range(1000))
sage: C[238792368]
[238, 792, 368]
```

```
>>> from sage.all import *
>>> from sage.combinat.cartesian_product import CartesianProduct_iters
>>> C = CartesianProduct_iters(range(Integer(1000)), range(Integer(1000)),␣
→range(Integer(1000)))
>>> C[Integer(238792368)]
[238, 792, 368]
```

Check for Issue #15919:

```
sage: FF = IntegerModRing(29)
sage: C = CartesianProduct_iters(FF, FF, FF)
sage: C.unrank(0)
[0, 0, 0]
```

```
>>> from sage.all import *
>>> FF = IntegerModRing(Integer(29))
>>> C = CartesianProduct_iters(FF, FF, FF)
>>> C.unrank(Integer(0))
[0, 0, 0]
```

AUTHORS:

- Franco Saliola (2012): initial implementation
- Travis Scrimshaw (2018-04-11): added missing doctests and reorganization

class sage.combinat.chas.fsym.**FSymBases**(*parent_with_realization*)

Bases: Category_realization_of_parent

The category of graded bases of $FSym$ and $FSym^*$ indexed by standard tableaux.

class ElementMethods

Bases: object

duality_pairing(*other*)

Compute the pairing between self and an element other of the dual.

EXAMPLES:

```
sage: FSym = algebras.FSym(QQ)
sage: G = FSym.G()
sage: F = G.dual_basis()
sage: elt = G[[1,3],[2]] - 3*G[[1,2],[3]]
sage: elt.duality_pairing(F[[1,3],[2]])
1
sage: elt.duality_pairing(F[[1,2],[3]])
-3
sage: elt.duality_pairing(F[[1,2]])
0
```

```
>>> from sage.all import *
>>> FSym = algebras.FSym(QQ)
>>> G = FSym.G()
>>> F = G.dual_basis()
>>> elt = G[[Integer(1),Integer(3)],[Integer(2)]] -␣
↪Integer(3)*G[[Integer(1),Integer(2)],[Integer(3)]]
>>> elt.duality_pairing(F[[Integer(1),Integer(3)],[Integer(2)]])
1
>>> elt.duality_pairing(F[[Integer(1),Integer(2)],[Integer(3)]])
-3
```

(continues on next page)

(continued from previous page)

```
>>> elt.duality_pairing(F[[Integer(1),Integer(2)]])
0
```

class ParentMethods

Bases: `object`

basis(*degree=None*)

The basis elements (optionally: of the specified degree).

OUTPUT: family

EXAMPLES:

```
sage: FSym = algebras.FSym(QQ)
sage: TG = FSym.G()
sage: TG.basis()
Lazy family (Term map from Standard tableaux to Hopf algebra of standard␣
↪tableaux
 over the Rational Field in the Fundamental basis(i))_{i in Standard␣
↪tableaux}
sage: TG.basis().keys()
Standard tableaux
sage: TG.basis(degree=3).keys()
Standard tableaux of size 3
sage: TG.basis(degree=3).list()
[G[123], G[13|2], G[12|3], G[1|2|3]]
```

```
>>> from sage.all import *
>>> FSym = algebras.FSym(QQ)
>>> TG = FSym.G()
>>> TG.basis()
Lazy family (Term map from Standard tableaux to Hopf algebra of standard␣
↪tableaux
 over the Rational Field in the Fundamental basis(i))_{i in Standard␣
↪tableaux}
>>> TG.basis().keys()
Standard tableaux
>>> TG.basis(degree=Integer(3)).keys()
Standard tableaux of size 3
>>> TG.basis(degree=Integer(3)).list()
[G[123], G[13|2], G[12|3], G[1|2|3]]
```

degree_on_basis(*t*)

Return the degree of a standard tableau in the algebra of free symmetric functions.

This is the size of the tableau `t`.

EXAMPLES:

```
sage: G = algebras.FSym(QQ).G()
sage: t = StandardTableau([[1,3],[2]])
sage: G.degree_on_basis(t)
3
sage: u = StandardTableau([[1,3,4,5],[2]])
```

(continues on next page)

(continued from previous page)

```
sage: G.degree_on_basis(u)
5
```

```
>>> from sage.all import *
>>> G = algebras.FSym(QQ).G()
>>> t = StandardTableau([[Integer(1),Integer(3)],[Integer(2)]])
>>> G.degree_on_basis(t)
3
>>> u = StandardTableau([[Integer(1),Integer(3),Integer(4),Integer(5)],
↪[Integer(2)]])
>>> G.degree_on_basis(u)
5
```

duality_pairing(*x*, *y*)

The canonical pairing between $FSym$ and $FSym^*$.

EXAMPLES:

```
sage: FSym = algebras.FSym(QQ)
sage: G = FSym.G()
sage: F = G.dual_basis()
sage: t1 = StandardTableau([[1,3,5],[2,4]])
sage: t2 = StandardTableau([[1,3],[2,5],[4]])
sage: G.duality_pairing(G[t1], F[t2])
0
sage: G.duality_pairing(G[t1], F[t1])
1
sage: G.duality_pairing(G[t2], F[t2])
1
sage: F.duality_pairing(F[t2], G[t2])
1

sage: z = G[[1,3,5],[2,4]]
sage: all(F.duality_pairing(F[p1] * F[p2], z) == c
....:     for ((p1, p2), c) in z.coproduct())
True
```

```
>>> from sage.all import *
>>> FSym = algebras.FSym(QQ)
>>> G = FSym.G()
>>> F = G.dual_basis()
>>> t1 = StandardTableau([[Integer(1),Integer(3),Integer(5)],[Integer(2),
↪Integer(4)]])
>>> t2 = StandardTableau([[Integer(1),Integer(3)],[Integer(2),Integer(5)],
↪[Integer(4)]])
>>> G.duality_pairing(G[t1], F[t2])
0
>>> G.duality_pairing(G[t1], F[t1])
1
>>> G.duality_pairing(G[t2], F[t2])
1
>>> F.duality_pairing(F[t2], G[t2])
```

(continues on next page)

(continued from previous page)

```
1

>>> z = G[[Integer(1),Integer(3),Integer(5)],[Integer(2),Integer(4)]]
>>> all(F.duality_pairing(F[p1] * F[p2], z) == c
...     for ((p1, p2), c) in z.coproduct())
True
```

duality_pairing_matrix(*basis*, *degree*)

The matrix of scalar products between elements of $FSym$ and elements of $FSym^*$.

INPUT:

- basis – a basis of the dual Hopf algebra
- degree – nonnegative integer

OUTPUT:

- the matrix of scalar products between the basis self and the basis basis in the dual Hopf algebra of degree degree

EXAMPLES:

```
sage: FSym = algebras.FSym(QQ)
sage: G = FSym.G()
sage: G.duality_pairing_matrix(G.dual_basis(), 3)
[1 0 0 0]
[0 1 0 0]
[0 0 1 0]
[0 0 0 1]
```

```
>>> from sage.all import *
>>> FSym = algebras.FSym(QQ)
>>> G = FSym.G()
>>> G.duality_pairing_matrix(G.dual_basis(), Integer(3))
[1 0 0 0]
[0 1 0 0]
[0 0 1 0]
[0 0 0 1]
```

one_basis()

Return the basis index corresponding to 1.

EXAMPLES:

```
sage: FSym = algebras.FSym(QQ)
sage: TG = FSym.G()
sage: TG.one_basis()
[]
```

```
>>> from sage.all import *
>>> FSym = algebras.FSym(QQ)
>>> TG = FSym.G()
>>> TG.one_basis()
[]
```

super_categories()

The super categories of self.

EXAMPLES:

```
sage: from sage.combinat.chas.fsym import FSymBases
sage: FSym = algebras.FSym(ZZ)
sage: bases = FSymBases(FSym)
sage: bases.super_categories()
[Category of realizations of Hopf algebra of standard tableaux over the
↪Integer Ring,
 Join of Category of realizations of Hopf algebras over Integer Ring
     and Category of graded algebras over Integer Ring
     and Category of graded coalgebras over Integer Ring,
 Category of graded connected Hopf algebras with basis over Integer Ring]
```

```
>>> from sage.all import *
>>> from sage.combinat.chas.fsym import FSymBases
>>> FSym = algebras.FSym(ZZ)
>>> bases = FSymBases(FSym)
>>> bases.super_categories()
[Category of realizations of Hopf algebra of standard tableaux over the
↪Integer Ring,
 Join of Category of realizations of Hopf algebras over Integer Ring
     and Category of graded algebras over Integer Ring
     and Category of graded coalgebras over Integer Ring,
 Category of graded connected Hopf algebras with basis over Integer Ring]
```

class sage.combinat.chas.fsym.**FSymBasis_abstract**(*alg*, *graded=True*)

Bases: *CombinatorialFreeModule*, BindableClass

Abstract base class for graded bases of $FSym$ and of $FSym^*$ indexed by standard tableaux.

This must define the following attributes:

- `_prefix` – the basis prefix

some_elements()

Return some elements of `self`.

EXAMPLES:

```
sage: G = algebras.FSym(QQ).G()
sage: G.some_elements()
[G[], G[1], G[12], G[1] + G[1|2], G[] + 1/2*G[1]]
```

```
>>> from sage.all import *
>>> G = algebras.FSym(QQ).G()
>>> G.some_elements()
[G[], G[1], G[12], G[1] + G[1|2], G[] + 1/2*G[1]]
```

class sage.combinat.chas.fsym.**FreeSymmetricFunctions**(*base_ring*)

Bases: UniqueRepresentation, Parent

The free symmetric functions.

The *free symmetric functions* is a combinatorial Hopf algebra defined using tableaux and denoted $FSym$.

Consider the Hopf algebra $FQSym$ (*FreeQuasisymmetricFunctions*) over a commutative ring R, and its bases (F_w) and (G_w) (where w, in both cases, ranges over all permutations in all symmetric groups $S_0, S_1, S_2, \ldots$).

For each word w, let $P(w)$ be the P-tableau of w (that is, the first of the two tableaux obtained by applying the RSK algorithm to w; see `RSK()`). If t is a standard tableau of size n, then we define $\mathcal{G}_t \in FQSym$ to be the sum of the F_w with w ranging over all permutations of $\{1, 2, \ldots, n\}$ satisfying $P(w) = t$. Equivalently, $\mathcal{G}_t$ is the sum of the G_w with w ranging over all permutations of $\{1, 2, \ldots, n\}$ satisfying $Q(w) = t$ (where $Q(w)$ denotes the Q-tableau of w).

The R-linear span of the $\mathcal{G}_t$ (for t ranging over all standard tableaux) is a Hopf subalgebra of $FQSym$, denoted by $FSym$ and known as the *free symmetric functions* or the *Poirier-Reutenauer Hopf algebra of tableaux*. It has been introduced in [PoiReu95], where it was denoted by $(\mathbf{Z}T, *, \delta)$. (What we call $\mathcal{G}_t$ has just been called t in [PoiReu95].) The family $(\mathcal{G}_t)$ (with t ranging over all standard tableaux) is a basis of $FSym$, called the *Fundamental basis*.

EXAMPLES:

As explained above, $FSym$ is constructed as a Hopf subalgebra of $FQSym$:

```
sage: G = algebras.FSym(QQ).G()
sage: F = algebras.FQSym(QQ).F()
sage: G[[1,3],[2]]
G[13|2]
sage: G[[1,3],[2]].to_fqsym()
G[2, 1, 3] + G[3, 1, 2]
sage: F(G[[1,3],[2]])
F[2, 1, 3] + F[2, 3, 1]
```

```
>>> from sage.all import *
>>> G = algebras.FSym(QQ).G()
>>> F = algebras.FQSym(QQ).F()
>>> G[[Integer(1),Integer(3)],[Integer(2)]]
G[13|2]
>>> G[[Integer(1),Integer(3)],[Integer(2)]].to_fqsym()
G[2, 1, 3] + G[3, 1, 2]
>>> F(G[[Integer(1),Integer(3)],[Integer(2)]])
F[2, 1, 3] + F[2, 3, 1]
```

This embedding is a Hopf algebra morphism:

```
sage: all(F(G[t1] * G[t2]) == F(G[t1]) * F(G[t2])
....:     for t1 in StandardTableaux(2)
....:     for t2 in StandardTableaux(3))
True

sage: FF = F.tensor_square()
sage: all(FF(G[t].coproduct()) == F(G[t]).coproduct()
....:     for t in StandardTableaux(4))
True
```

```
>>> from sage.all import *
>>> all(F(G[t1] * G[t2]) == F(G[t1]) * F(G[t2])
...     for t1 in StandardTableaux(Integer(2))
...     for t2 in StandardTableaux(Integer(3)))
True

>>> FF = F.tensor_square()
>>> all(FF(G[t].coproduct()) == F(G[t]).coproduct()
```

(continues on next page)

(continued from previous page)

```
...     for t in StandardTableaux(Integer(4)))
True
```

There is a Hopf algebra map from $FSym$ onto the Hopf algebra of symmetric functions, which maps a tableau t to the Schur function indexed by the shape of t:

```
sage: TG = algebras.FSym(QQ).G()
sage: t = StandardTableau([[1,3],[2,4],[5]])
sage: TG[t]
G[13|24|5]
sage: TG[t].to_symmetric_function()
s[2, 2, 1]
```

```
>>> from sage.all import *
>>> TG = algebras.FSym(QQ).G()
>>> t = StandardTableau([[Integer(1),Integer(3)],[Integer(2),Integer(4)],
↪[Integer(5)]])
>>> TG[t]
G[13|24|5]
>>> TG[t].to_symmetric_function()
s[2, 2, 1]
```

class Fundamental(*alg*, *graded=True*)

Bases: *FSymBasis_abstract*

The Hopf algebra of tableaux on the Fundamental basis.

EXAMPLES:

```
sage: FSym = algebras.FSym(QQ)
sage: TG = FSym.G()
sage: TG
Hopf algebra of standard tableaux over the Rational Field
 in the Fundamental basis
```

```
>>> from sage.all import *
>>> FSym = algebras.FSym(QQ)
>>> TG = FSym.G()
>>> TG
Hopf algebra of standard tableaux over the Rational Field
 in the Fundamental basis
```

Elements of the algebra look like:

```
sage: TG.an_element()
2*G[] + 2*G[1] + 3*G[12]
```

```
>>> from sage.all import *
>>> TG.an_element()
2*G[] + 2*G[1] + 3*G[12]
```

class Element

Bases: IndexedFreeModuleElement

to_fqsym()

Return the image of `self` under the natural inclusion map to $FQSym$.

EXAMPLES:

```
sage: FSym = algebras.FSym(QQ)
sage: G = FSym.G()
sage: t = StandardTableau([[1,3],[2,4],[5]])
sage: G[t].to_fqsym()
G[2, 1, 5, 4, 3] + G[3, 1, 5, 4, 2] + G[3, 2, 5, 4, 1]
 + G[4, 1, 5, 3, 2] + G[4, 2, 5, 3, 1]
```

```
>>> from sage.all import *
>>> FSym = algebras.FSym(QQ)
>>> G = FSym.G()
>>> t = StandardTableau([[Integer(1),Integer(3)],[Integer(2),
↪Integer(4)],[Integer(5)]])
>>> G[t].to_fqsym()
G[2, 1, 5, 4, 3] + G[3, 1, 5, 4, 2] + G[3, 2, 5, 4, 1]
 + G[4, 1, 5, 3, 2] + G[4, 2, 5, 3, 1]
```

to_symmetric_function()

Return the image of `self` under the natural projection map to Sym.

The natural projection map $FSym \to Sym$ sends each standard tableau t to the Schur function s_λ, where λ is the shape of t. This map is a surjective Hopf algebra homomorphism.

EXAMPLES:

```
sage: FSym = algebras.FSym(QQ)
sage: G = FSym.G()
sage: t = StandardTableau([[1,3],[2,4],[5]])
sage: G[t].to_symmetric_function()
s[2, 2, 1]
```

```
>>> from sage.all import *
>>> FSym = algebras.FSym(QQ)
>>> G = FSym.G()
>>> t = StandardTableau([[Integer(1),Integer(3)],[Integer(2),
↪Integer(4)],[Integer(5)]])
>>> G[t].to_symmetric_function()
s[2, 2, 1]
```

coproduct_on_basis(*t*)

Return the coproduct of the basis element indexed by `t`.

EXAMPLES:

```
sage: FSym = algebras.FSym(QQ)
sage: G = FSym.G()
sage: t = StandardTableau([[1,2,5], [3,4]])
sage: G.coproduct_on_basis(t)
G[] # G[125|34] + G[1] # G[12|34] + G[1] # G[124|3]
 + G[1|2] # G[13|2] + G[12] # G[12|3] + G[12] # G[123]
```

(continues on next page)

(continued from previous page)

```
 + G[12|34] # G[1] + G[123] # G[12] + G[125|34] # G[]
 + G[13|2] # G[1|2] + G[13|2] # G[12] + G[134|2] # G[1]
```

```
>>> from sage.all import *
>>> FSym = algebras.FSym(QQ)
>>> G = FSym.G()
>>> t = StandardTableau([[Integer(1),Integer(2),Integer(5)], [Integer(3),
↪Integer(4)]])
>>> G.coproduct_on_basis(t)
G[] # G[125|34] + G[1] # G[12|34] + G[1] # G[124|3]
 + G[1|2] # G[13|2] + G[12] # G[12|3] + G[12] # G[123]
 + G[12|34] # G[1] + G[123] # G[12] + G[125|34] # G[]
 + G[13|2] # G[1|2] + G[13|2] # G[12] + G[134|2] # G[1]
```

dual_basis()

Return the dual basis to `self`.

EXAMPLES:

```
sage: G = algebras.FSym(QQ).G()
sage: G.dual_basis()
Dual Hopf algebra of standard tableaux over the Rational Field
 in the FundamentalDual basis
```

```
>>> from sage.all import *
>>> G = algebras.FSym(QQ).G()
>>> G.dual_basis()
Dual Hopf algebra of standard tableaux over the Rational Field
 in the FundamentalDual basis
```

product_on_basis(*t1*, *t2*)

Return the product of basis elements indexed by `t1` and `t2`.

EXAMPLES:

```
sage: FSym = algebras.FSym(QQ)
sage: G = FSym.G()
sage: t1 = StandardTableau([[1,2], [3]])
sage: t2 = StandardTableau([[1,2,3]])
sage: G.product_on_basis(t1, t2)
G[12456|3] + G[1256|3|4] + G[1256|34] + G[126|35|4]

sage: t1 = StandardTableau([[1],[2]])
sage: t2 = StandardTableau([[1,2]])
sage: G.product_on_basis(t1, t2)
G[134|2] + G[14|2|3]

sage: t1 = StandardTableau([[1,2],[3]])
sage: t2 = StandardTableau([[1],[2]])
sage: G.product_on_basis(t1, t2)
G[12|3|4|5] + G[12|34|5] + G[124|3|5] + G[124|35]
```

```
>>> from sage.all import *
>>> FSym = algebras.FSym(QQ)
>>> G = FSym.G()
>>> t1 = StandardTableau([[Integer(1),Integer(2)], [Integer(3)]])
>>> t2 = StandardTableau([[Integer(1),Integer(2),Integer(3)]])
>>> G.product_on_basis(t1, t2)
G[12456|3] + G[1256|3|4] + G[1256|34] + G[126|35|4]

>>> t1 = StandardTableau([[Integer(1)],[Integer(2)]])
>>> t2 = StandardTableau([[Integer(1),Integer(2)]])
>>> G.product_on_basis(t1, t2)
G[134|2] + G[14|2|3]

>>> t1 = StandardTableau([[Integer(1),Integer(2)],[Integer(3)]])
>>> t2 = StandardTableau([[Integer(1)],[Integer(2)]])
>>> G.product_on_basis(t1, t2)
G[12|3|4|5] + G[12|34|5] + G[124|3|5] + G[124|35]
```

G

alias of *Fundamental*

a_realization()

Return a particular realization of `self` (the Fundamental basis).

EXAMPLES:

```
sage: FSym = algebras.FSym(QQ)
sage: FSym.a_realization()
Hopf algebra of standard tableaux over the Rational Field
 in the Fundamental basis
```

```
>>> from sage.all import *
>>> FSym = algebras.FSym(QQ)
>>> FSym.a_realization()
Hopf algebra of standard tableaux over the Rational Field
 in the Fundamental basis
```

dual()

Return the dual Hopf algebra of $FSym$.

EXAMPLES:

```
sage: algebras.FSym(QQ).dual()
Dual Hopf algebra of standard tableaux over the Rational Field
```

```
>>> from sage.all import *
>>> algebras.FSym(QQ).dual()
Dual Hopf algebra of standard tableaux over the Rational Field
```

class sage.combinat.chas.fsym.**FreeSymmetricFunctions_Dual**(*base_ring*)

Bases: `UniqueRepresentation`, `Parent`

The Hopf dual $FSym^*$ of the free symmetric functions $FSym$.

See *FreeSymmetricFunctions* for the definition of the latter.

Recall that the fundamental basis of $FSym$ consists of the elements $\mathcal{G}_t$ for t ranging over all standard tableaux. The dual basis of this is called the *dual fundamental basis* of $FSym^*$, and is denoted by $(\mathcal{G}_t^*)$. The Hopf dual $FSym^*$ is isomorphic to the Hopf algebra $(\mathbf{Z}T, *', \delta')$ from [PoiReu95]; the isomorphism sends a basis element $\mathcal{G}_t^*$ to t.

EXAMPLES:

```
sage: FSym = algebras.FSym(QQ)
sage: TF = FSym.dual().F()
sage: TF[1,2] * TF[[1],[2]]
F[12|3|4] + F[123|4] + F[124|3] + F[13|2|4] + F[134|2] + F[14|2|3]
sage: TF[[1,2],[3]].coproduct()
F[] # F[12|3] + F[1] # F[1|2] + F[12] # F[1] + F[12|3] # F[]
```

```
>>> from sage.all import *
>>> FSym = algebras.FSym(QQ)
>>> TF = FSym.dual().F()
>>> TF[Integer(1),Integer(2)] * TF[[Integer(1)],[Integer(2)]]
F[12|3|4] + F[123|4] + F[124|3] + F[13|2|4] + F[134|2] + F[14|2|3]
>>> TF[[Integer(1),Integer(2)],[Integer(3)]].coproduct()
F[] # F[12|3] + F[1] # F[1|2] + F[12] # F[1] + F[12|3] # F[]
```

The Hopf algebra $FSym^*$ is a Hopf quotient of $FQSym$; the canonical projection sends F_w (for a permutation w) to $\mathcal{G}_{Q(w)}^*$, where $Q(w)$ is the Q-tableau of w. This projection is implemented as a coercion:

```
sage: FQSym = algebras.FQSym(QQ)
sage: F = FQSym.F()
sage: TF(F[[1, 3, 2]])
F[12|3]
sage: TF(F[[5, 1, 4, 2, 3]])
F[135|2|4]
```

```
>>> from sage.all import *
>>> FQSym = algebras.FQSym(QQ)
>>> F = FQSym.F()
>>> TF(F[[Integer(1), Integer(3), Integer(2)]])

F

alias of *FundamentalDual*

class FundamentalDual(*alg*, *graded=True*)

Bases: *FSymBasis_abstract*

The dual to the Hopf algebra of tableaux, on the fundamental dual basis.

EXAMPLES:

```
sage: FSym = algebras.FSym(QQ)
sage: TF = FSym.dual().F()
sage: TF
Dual Hopf algebra of standard tableaux over the Rational Field
 in the FundamentalDual basis
```

```
>>> from sage.all import *
>>> FSym = algebras.FSym(QQ)
>>> TF = FSym.dual().F()
>>> TF
Dual Hopf algebra of standard tableaux over the Rational Field
 in the FundamentalDual basis
```

Elements of the algebra look like:

```
sage: TF.an_element()
2*F[] + 2*F[1] + 3*F[12]
```

```
>>> from sage.all import *
>>> TF.an_element()
2*F[] + 2*F[1] + 3*F[12]
```

class Element

Bases: `IndexedFreeModuleElement`

to_quasisymmetric_function()

Return the image of `self` under the canonical projection $FSym^* \to QSym$ to the ring of quasi-symmetric functions.

This projection is the adjoint of the canonical injection $NSym \to FSym$ (see `to_fsym()`). It sends each tableau t to the fundamental quasi-symmetric function F_α, where α is the descent composition of t.

EXAMPLES:

```
sage: F = algebras.FSym(QQ).dual().F()
sage: F[[1,3,5],[2,4]].to_quasisymmetric_function()
F[1, 2, 2]
```

```
>>> from sage.all import *
>>> F = algebras.FSym(QQ).dual().F()
>>> F[[Integer(1),Integer(3),Integer(5)],[Integer(2),Integer(4)]].to_
↪quasisymmetric_function()
F[1, 2, 2]
```

coproduct_on_basis(*t*)

EXAMPLES:

```
sage: FSym = algebras.FSym(QQ)
sage: TF = FSym.dual().F()
sage: t = StandardTableau([[1,2,5], [3,4]])
sage: TF.coproduct_on_basis(t)
F[] # F[125|34] + F[1] # F[134|2] + F[12] # F[123]
 + F[12|3] # F[12] + F[12|34] # F[1] + F[125|34] # F[]
```

```
>>> from sage.all import *
>>> FSym = algebras.FSym(QQ)
>>> TF = FSym.dual().F()
>>> t = StandardTableau([[Integer(1),Integer(2),Integer(5)], [Integer(3),
```

(continues on next page)

(continued from previous page)

```
↪Integer(4)]])
>>> TF.coproduct_on_basis(t)
F[] # F[125|34] + F[1] # F[134|2] + F[12] # F[123]
 + F[12|3] # F[12] + F[12|34] # F[1] + F[125|34] # F[]
```

dual_basis()

Return the dual basis to `self`.

EXAMPLES:

```
sage: F = algebras.FSym(QQ).dual().F()
sage: F.dual_basis()
Hopf algebra of standard tableaux over the Rational Field
 in the Fundamental basis
```

```
>>> from sage.all import *
>>> F = algebras.FSym(QQ).dual().F()
>>> F.dual_basis()
Hopf algebra of standard tableaux over the Rational Field
 in the Fundamental basis
```

product_on_basis(*t1*, *t2*)

EXAMPLES:

```
sage: FSym = algebras.FSym(QQ)
sage: TF = FSym.dual().F()
sage: t1 = StandardTableau([[1,2]])
sage: TF.product_on_basis(t1, t1)
F[12|34] + F[123|4] + F[1234] + F[124|3] + F[13|24] + F[134|2]
sage: t0 = StandardTableau([])
sage: TF.product_on_basis(t1, t0) == TF[t1] == TF.product_on_basis(t0, t1)
True
```

```
>>> from sage.all import *
>>> FSym = algebras.FSym(QQ)
>>> TF = FSym.dual().F()
>>> t1 = StandardTableau([[Integer(1),Integer(2)]])
>>> TF.product_on_basis(t1, t1)
F[12|34] + F[123|4] + F[1234] + F[124|3] + F[13|24] + F[134|2]
>>> t0 = StandardTableau([])
>>> TF.product_on_basis(t1, t0) == TF[t1] == TF.product_on_basis(t0, t1)
True
```

a_realization()

Return a particular realization of `self` (the Fundamental dual basis).

EXAMPLES:

```
sage: FSym = algebras.FSym(QQ).dual()
sage: FSym.a_realization()
Dual Hopf algebra of standard tableaux over the Rational Field
 in the FundamentalDual basis
```

```
>>> from sage.all import *
>>> FSym = algebras.FSym(QQ).dual()
>>> FSym.a_realization()
Dual Hopf algebra of standard tableaux over the Rational Field
 in the FundamentalDual basis
```

dual()

Return the dual Hopf algebra of `self`, which is $FSym$.

EXAMPLES:

```
sage: D = algebras.FSym(QQ).dual()
sage: D.dual()
Hopf algebra of standard tableaux over the Rational Field
```

```
>>> from sage.all import *
>>> D = algebras.FSym(QQ).dual()
>>> D.dual()
Hopf algebra of standard tableaux over the Rational Field
```

sage.combinat.chas.fsym.**ascent_set**(*t*)

Return the ascent set of a standard tableau `t` (encoded as a sorted list).

The *ascent set* of a standard tableau t is defined as the set of all entries i of t such that the number $i + 1$ either appears to the right of i or appears in a row above i or does not appear in t at all.

EXAMPLES:

```
sage: from sage.combinat.chas.fsym import ascent_set
sage: t = StandardTableau([[1,3,4,7],[2,5,6],[8]])
sage: ascent_set(t)
[2, 3, 5, 6, 8]
sage: ascent_set(StandardTableau([]))
[]
sage: ascent_set(StandardTableau([[1, 2, 3]]))
[1, 2, 3]
sage: ascent_set(StandardTableau([[1, 2, 4], [3]]))
[1, 3, 4]
sage: ascent_set([[1, 3, 5], [2, 4]])
[2, 4, 5]
```

```
>>> from sage.all import *
>>> from sage.combinat.chas.fsym import ascent_set
>>> t = StandardTableau([[Integer(1),Integer(3),Integer(4),Integer(7)],
↪[Integer(2),Integer(5),Integer(6)],[Integer(8)]])
>>> ascent_set(t)
[2, 3, 5, 6, 8]
>>> ascent_set(StandardTableau([]))
[]
>>> ascent_set(StandardTableau([[Integer(1), Integer(2), Integer(3)]]))
[1, 2, 3]
>>> ascent_set(StandardTableau([[Integer(1), Integer(2), Integer(4)],␣
↪[Integer(3)]]))
[1, 3, 4]
```

(continues on next page)

(continued from previous page)

```
>>> ascent_set([[Integer(1), Integer(3), Integer(5)], [Integer(2), Integer(4)]])
[2, 4, 5]
```

sage.combinat.chas.fsym.**descent_composition**(*t*)

Return the descent composition of a standard tableau t.

This is the composition of the size of t whose partial sums are the elements of the descent set of t (see *descent_set()*).

EXAMPLES:

```
sage: from sage.combinat.chas.fsym import descent_composition
sage: t = StandardTableau([[1,3,4,7],[2,5,6],[8]])
sage: descent_composition(t)
[1, 3, 3, 1]
sage: descent_composition([[1, 3, 5], [2, 4]])
[1, 2, 2]
```

```
>>> from sage.all import *
>>> from sage.combinat.chas.fsym import descent_composition
>>> t = StandardTableau([[Integer(1),Integer(3),Integer(4),Integer(7)],
↪[Integer(2),Integer(5),Integer(6)],[Integer(8)]])
>>> descent_composition(t)
[1, 3, 3, 1]
>>> descent_composition([[Integer(1), Integer(3), Integer(5)], [Integer(2),␣
↪Integer(4)]])
[1, 2, 2]
```

sage.combinat.chas.fsym.**descent_set**(*t*)

Return the descent set of a standard tableau t (encoded as a sorted list).

The *descent set* of a standard tableau t is defined as the set of all entries i of t such that the number $i + 1$ appears in a row below i in t.

EXAMPLES:

```
sage: from sage.combinat.chas.fsym import descent_set
sage: t = StandardTableau([[1,3,4,7],[2,5,6],[8]])
sage: descent_set(t)
[1, 4, 7]
sage: descent_set(StandardTableau([]))
[]
sage: descent_set(StandardTableau([[1, 2, 3]]))
[]
sage: descent_set(StandardTableau([[1, 2, 4], [3]]))
[2]
sage: descent_set([[1, 3, 5], [2, 4]])
[1, 3]
```

```
>>> from sage.all import *
>>> from sage.combinat.chas.fsym import descent_set
>>> t = StandardTableau([[Integer(1),Integer(3),Integer(4),Integer(7)],
↪[Integer(2),Integer(5),Integer(6)],[Integer(8)]])
```

(continues on next page)

(continued from previous page)

```
>>> descent_set(t)
[1, 4, 7]
>>> descent_set(StandardTableau([]))
[]
>>> descent_set(StandardTableau([[Integer(1), Integer(2), Integer(3)]]))
[]
>>> descent_set(StandardTableau([[Integer(1), Integer(2), Integer(4)],␣
↪[Integer(3)]]))
[2]
>>> descent_set([[Integer(1), Integer(3), Integer(5)], [Integer(2), Integer(4)]])
[1, 3]
```

sage.combinat.chas.fsym.**standardize**(*t*)

Return the standard tableau corresponding to a given semistandard tableau `t` with no repeated entries.

> **Note**
>
> This is an optimized version of *Tableau.standardization()* for computations in $FSym$ by using the assumption of no repeated entries in `t`.

EXAMPLES:

```
sage: from sage.combinat.chas.fsym import standardize
sage: t = Tableau([[1,3,5,7],[2,4,8],[9]])
sage: standardize(t)
[[1, 3, 5, 6], [2, 4, 7], [8]]
sage: t = Tableau([[3,8,9,15],[5,10,12],[133]])
sage: standardize(t)
[[1, 3, 4, 7], [2, 5, 6], [8]]
```

```
>>> from sage.all import *
>>> from sage.combinat.chas.fsym import standardize
>>> t = Tableau([[Integer(1),Integer(3),Integer(5),Integer(7)],[Integer(2),
↪Integer(4),Integer(8)],[Integer(9)]])
>>> standardize(t)
[[1, 3, 5, 6], [2, 4, 7], [8]]
>>> t = Tableau([[Integer(3),Integer(8),Integer(9),Integer(15)],[Integer(5),
↪Integer(10),Integer(12)],[Integer(133)]])
>>> standardize(t)
[[1, 3, 4, 7], [2, 5, 6], [8]]
```

5.1.16 Word Quasi-symmetric functions

AUTHORS:

- Travis Scrimshaw (2018-04-09): initial implementation
- Darij Grinberg and Amy Pang (2018-04-12): further bases and methods

class sage.combinat.chas.wqsym.**WQSymBases**(*base*, *graded*)

Bases: `Category_realization_of_parent`

The category of bases of $WQSym$.

class ElementMethods

Bases: `object`

algebraic_complement()

Return the image of the element `self` of $WQSym$ under the algebraic complement involution.

If $u = (u_1, u_2, \ldots, u_n)$ is a packed word that contains the letters $1, 2, \ldots, k$ and no others, then the *complement* of u is defined to be the packed word $\overline{u} := (k + 1 - u_1, k + 1 - u_2, \ldots, k + 1 - u_n)$.

The algebraic complement involution is defined as the linear map $WQSym \to WQSym$ that sends each basis element $\mathbf{M}_u$ of the monomial basis of $WQSym$ to the basis element $\mathbf{M}_{\overline{u}}$. This is a graded algebra automorphism and a coalgebra anti-automorphism of $WQSym$. Denoting by $\overline{f}$ the image of an element $f \in WQSym$ under the algebraic complement involution, it can be shown that every packed word u satisfies

$$\overline{\mathbf{M}_u} = \mathbf{M}_{\overline{u}}, \qquad \overline{X_u} = X_{\overline{u}},$$

where standard notations for classical bases of $WQSym$ are being used (that is, $\mathbf{M}$ for the monomial basis, and X for the characteristic basis).

This can be restated in terms of ordered set partitions: For any ordered set partition $R = (R_1, R_2, \ldots, R_k)$, let R^r denote the ordered set partition $(R_k, R_{k-1}, \ldots, R_1)$; this is known as the *reversal* of R. Then,

$$\overline{\mathbf{M}_A} = \mathbf{M}_{A^r}, \qquad \overline{X_A} = X_{A^r}$$

for any ordered set partition A.

The formula describing algebraic complements on the Q basis (`WordQuasiSymmetricFunctions.StronglyCoarser`) is more complicated, and requires some definitions. We define a partial order $\leq$ on the set of all ordered set partitions as follows: $A \leq B$ if and only if A is strongly finer than B (see `is_strongly_finer()` for a definition of this). The *length* $\ell(R)$ of an ordered set partition R shall be defined as the number of parts of R. Use the notation Q for the Q basis. For any ordered set partition A of $[n]$, we have

$$\overline{Q_A} = \sum_P c_{A,P} Q_P,$$

where the sum is over all ordered set partitions P of $[n]$, and where the coefficient $c_{A,P}$ is defined as follows:

- If there exists an ordered set partition R satisfying $R \leq P$ and $A \leq R^r$, then this R is unique, and $c_{A,P} = (-1)^{\ell(R)-\ell(P)}$.
- If there exists no such R, then $c_{A,P} = 0$.

The formula describing algebraic complements on the Φ basis (`WordQuasiSymmetricFunctions.StronglyFiner`) is identical to the above formula for the Q basis, except that the $\leq$ sign has to be replaced by $\geq$ in the definition of the coefficients $c_{A,P}$. In fact, both formulas are particular cases of a general formula for involutions: Assume that V is an (additive) abelian group, and that I is a poset. For each $i \in I$, let M_i be an element of V. Also, let ω be an involution of the set I (not necessarily order-preserving or order-reversing), and let ω' be an involutive group endomorphism of V such that each $i \in I$ satisfies $\omega'(M_i) = M_{\omega(i)}$. For each $i \in I$, let $F_i = \sum_{j \geq i} M_j$, where we assume that the sum is finite. Then, each $i \in I$ satisfies

$$\omega'(F_i) = \sum_j \sum_{\substack{k \leq j; \\ \omega(k) \geq i}} \mu(k, j) F_j,$$

where μ denotes the Möbius function. This formula becomes particularly useful when the k satisfying $k \leq j$ and $\omega(k) \geq i$ is unique (if it exists). In our situation, V is $WQSym$, and I is the set of ordered set partitions equipped either with the $\leq$ partial order defined above or with its opposite order. The M_i is the $\mathbf{M}_A$, whereas the F_i is either Q_i or Φ_i.

If we denote the star involution (`star_involution()`) of the quasisymmetric functions by $f \mapsto f^*$, and if we let π be the canonical projection $WQSym \to QSym$, then each $f \in WQSym$ satisfies $\pi(\overline{f}) = (\pi(f))^*$.

See also

`coalgebraic_complement()`, `star_involution()`

EXAMPLES:

Recall that the index set for the bases of $WQSym$ is given by ordered set partitions, not packed words. Translated into the language of ordered set partitions, the algebraic complement involution acts on the Monomial basis by reversing the ordered set partition. In other words, we have

$$\overline{\mathbf{M}_{(P_1,P_2,\ldots,P_k)}} = \mathbf{M}_{(P_k,P_{k-1},\ldots,P_1)}$$

for any standard ordered set partition $(P_1, P_2, \ldots, P_k)$. Let us check this in practice:

```
sage: WQSym = algebras.WQSym(ZZ)
sage: M = WQSym.M()
sage: M[[1,3],[2]].algebraic_complement()
M[{2}, {1, 3}]
sage: M[[1,4],[2,5],[3,6]].algebraic_complement()
M[{3, 6}, {2, 5}, {1, 4}]
sage: (3*M[[1]] - 4*M[[]] + 5*M[[1],[2]]).algebraic_complement()
-4*M[] + 3*M[{1}] + 5*M[{2}, {1}]
sage: X = WQSym.X()
sage: X[[1,3],[2]].algebraic_complement()
X[{2}, {1, 3}]
sage: C = WQSym.C()
sage: C[[1,3],[2]].algebraic_complement()
-C[{1, 2, 3}] - C[{1, 3}, {2}] + C[{2}, {1, 3}]
sage: Q = WQSym.Q()
sage: Q[[1,2],[5,6],[3,4]].algebraic_complement()
Q[{3, 4}, {1, 2, 5, 6}] + Q[{3, 4}, {5, 6}, {1, 2}] - Q[{3, 4, 5, 6}, {1,
→2}]
sage: Phi = WQSym.Phi()
sage: Phi[[2], [1,3]].algebraic_complement()
-Phi[{1}, {3}, {2}] + Phi[{1, 3}, {2}] + Phi[{3}, {1}, {2}]
```

```
>>> from sage.all import *
>>> WQSym = algebras.WQSym(ZZ)
>>> M = WQSym.M()
>>> M[[Integer(1),Integer(3)],[Integer(2)]].algebraic_complement()
M[{2}, {1, 3}]
>>> M[[Integer(1),Integer(4)],[Integer(2),Integer(5)],[Integer(3),
→Integer(6)]].algebraic_complement()
M[{3, 6}, {2, 5}, {1, 4}]
>>> (Integer(3)*M[[Integer(1)]] - Integer(4)*M[[]] +
→Integer(5)*M[[Integer(1)],[Integer(2)]]).algebraic_complement()
-4*M[] + 3*M[{1}] + 5*M[{2}, {1}]
```

(continues on next page)

(continued from previous page)

```
>>> X = WQSym.X()
>>> X[[Integer(1),Integer(3)],[Integer(2)]].algebraic_complement()
X[{2}, {1, 3}]
>>> C = WQSym.C()
>>> C[[Integer(1),Integer(3)],[Integer(2)]].algebraic_complement()
-C[{1, 2, 3}] - C[{1, 3}, {2}] + C[{2}, {1, 3}]
>>> Q = WQSym.Q()
>>> Q[[Integer(1),Integer(2)],[Integer(5),Integer(6)],[Integer(3),
↪Integer(4)]].algebraic_complement()
Q[{3, 4}, {1, 2, 5, 6}] + Q[{3, 4}, {5, 6}, {1, 2}] - Q[{3, 4, 5, 6}, {1,␣
↪2}]
>>> Phi = WQSym.Phi()
>>> Phi[[Integer(2)], [Integer(1),Integer(3)]].algebraic_complement()
-Phi[{1}, {3}, {2}] + Phi[{1, 3}, {2}] + Phi[{3}, {1}, {2}]
```

The algebraic complement involution intertwines the antipode and the inverse of the antipode:

```
sage: all( M(I).antipode().algebraic_complement().antipode()  # long time
....:      == M(I).algebraic_complement()
....:      for I in OrderedSetPartitions(4) )
True
```

```
>>> from sage.all import *
>>> all( M(I).antipode().algebraic_complement().antipode()  # long time
...      == M(I).algebraic_complement()
...      for I in OrderedSetPartitions(Integer(4)) )
True
```

Testing the $\pi(\overline{f}) = (\pi(f))^*$ relation:

```
sage: all( M[I].algebraic_complement().to_quasisymmetric_function()
....:      == M[I].to_quasisymmetric_function().star_involution()
....:      for I in OrderedSetPartitions(4) )
True
```

```
>>> from sage.all import *
>>> all( M[I].algebraic_complement().to_quasisymmetric_function()
...      == M[I].to_quasisymmetric_function().star_involution()
...      for I in OrderedSetPartitions(Integer(4)) )
True
```

Todo

Check further commutative squares.

coalgebraic_complement()

Return the image of the element `self` of $WQSym$ under the coalgebraic complement involution.

If $u = (u_1, u_2, \ldots, u_n)$ is a packed word, then the *reversal* of u is defined to be the packed word $(u_n, u_{n-1}, \ldots, u_1)$. This reversal is denoted by u^r.

The coalgebraic complement involution is defined as the linear map $WQSym \to WQSym$ that sends each basis element $\mathbf{M}_u$ of the monomial basis of $WQSym$ to the basis element $\mathbf{M}_{u^r}$. This is a graded coalgebra automorphism and an algebra anti-automorphism of $WQSym$. Denoting by f^r the image of an element $f \in WQSym$ under the coalgebraic complement involution, it can be shown that every packed word u satisfies

$$(\mathbf{M}_u)^r = \mathbf{M}_{u^r}, \qquad (X_u)^r = X_{u^r},$$

where standard notations for classical bases of $WQSym$ are being used (that is, $\mathbf{M}$ for the monomial basis, and X for the characteristic basis).

This can be restated in terms of ordered set partitions: For any ordered set partition R of $[n]$, let $\overline{R}$ denote the complement of R (defined in `complement()`). Then,

$$(\mathbf{M}_A)^r = \mathbf{M}_{\overline{A}}, \qquad (X_A)^r = X_{\overline{A}}$$

for any ordered set partition A.

Recall that $WQSym$ is a subring of the ring of all bounded-degree noncommutative power series in countably many indeterminates. The latter ring has an obvious continuous algebra anti-endomorphism which sends each letter x_i to x_i (and thus sends each monomial $x_{i_1} x_{i_2} \cdots x_{i_n}$ to $x_{i_n} x_{i_{n-1}} \cdots x_{i_1}$). This anti-endomorphism is actually an involution. The coalgebraic complement involution is simply the restriction of this involution to the subring $WQSym$.

The formula describing coalgebraic complements on the Q basis (`WordQuasiSymmetricFunctions.StronglyCoarser`) is more complicated, and requires some definitions. We define a partial order $\leq$ on the set of all ordered set partitions as follows: $A \leq B$ if and only if A is strongly finer than B (see `is_strongly_finer()` for a definition of this). The *length* $\ell(R)$ of an ordered set partition R shall be defined as the number of parts of R. Use the notation Q for the Q basis. For any ordered set partition A of $[n]$, we have

$$(Q_A)^r = \sum_P c_{A,P} Q_P,$$

where the sum is over all ordered set partitions P of $[n]$, and where the coefficient $c_{A,P}$ is defined as follows:

- If there exists an ordered set partition R satisfying $R \leq P$ and $A \leq \overline{R}$, then this R is unique, and $c_{A,P} = (-1)^{\ell(R) - \ell(P)}$.
- If there exists no such R, then $c_{A,P} = 0$.

The formula describing coalgebraic complements on the Φ basis (`WordQuasiSymmetricFunctions.StronglyFiner`) is identical to the above formula for the Q basis, except that the $\leq$ sign has to be replaced by $\geq$ in the definition of the coefficients $c_{A,P}$. In fact, both formulas are particular cases of the general formula for involutions described in the documentation of `algebraic_complement()`.

If we let π be the canonical projection $WQSym \to QSym$, then each $f \in WQSym$ satisfies $\pi(f^r) = \pi(f)$.

-4*M[] + 3*M[{1}] + 5*M[{2}, {1}]
>>> X = WQSym.X()
>>> X[[Integer(1),Integer(3)],[Integer(2)]].coalgebraic_complement()
X[{1, 3}, {2}]
>>> C = WQSym.C()
>>> C[[Integer(1),Integer(3)],[Integer(2)]].coalgebraic_complement()
C[{1, 3}, {2}]
>>> Q = WQSym.Q()
>>> Q[[Integer(1),Integer(2)],[Integer(5),Integer(6)],[Integer(3),
↪Integer(4)]].coalgebraic_complement()
Q[{1, 2, 5, 6}, {3, 4}] + Q[{5, 6}, {1, 2}, {3, 4}] - Q[{5, 6}, {1, 2, 3,␣
```

(continues on next page)

(continued from previous page)

```
↪4}]
>>> Phi = WQSym.Phi()
>>> Phi[[Integer(2)], [Integer(1),Integer(3)]].coalgebraic_complement()
-Phi[{2}, {1}, {3}] + Phi[{2}, {1, 3}] + Phi[{2}, {3}, {1}]
```

The coalgebraic complement involution intertwines the antipode and the inverse of the antipode:

```
sage: all( M(I).antipode().coalgebraic_complement().antipode()  # long␣
↪time
....:      == M(I).coalgebraic_complement()
....:      for I in OrderedSetPartitions(4) )
True
```

```
>>> from sage.all import *
>>> all( M(I).antipode().coalgebraic_complement().antipode()  # long time
...      == M(I).coalgebraic_complement()
...      for I in OrderedSetPartitions(Integer(4)) )
True
```

Testing the $\pi(f^r) = \pi(f)$ relation above:

```
sage: all( M[I].coalgebraic_complement().to_quasisymmetric_function()
....:      == M[I].to_quasisymmetric_function()
....:      for I in OrderedSetPartitions(4) )
True
```

```
>>> from sage.all import *
>>> all( M[I].coalgebraic_complement().to_quasisymmetric_function()
...      == M[I].to_quasisymmetric_function()
...      for I in OrderedSetPartitions(Integer(4)) )
True
```

Todo

Check further commutative squares.

star_involution()

Return the image of the element `self` of $WQSym$ under the star involution.

The star involution is the composition of the algebraic complement involution (*algebraic_complement()*) with the coalgebraic complement involution (*coalgebraic_complement()*). The composition can be performed in either order, as the involutions commute.

The star involution is a graded Hopf algebra anti-automorphism of $WQSym$. Let f^* denote the image of an element $f \in WQSym$ under the star involution. Let $\mathbf{M}$, X, Q and Φ stand for the monomial, characteristic, Q and Phi bases of $WQSym$. For any ordered set partition A of $[n]$, we let A^* denote the complement (*complement()*) of the reversal (*reversed()*) of A. Then, for any ordered set partition A of $[n]$, we have

$$(\mathbf{M}_A)^* = \mathbf{M}_{A^*}, \qquad (X_A)^* = X_{A^*}, \qquad (Q_A)^* = Q_{A^*}, \qquad (\Phi_A)^* = \Phi_{A^*}.$$

The star involution (*star_involution()*) on the ring of noncommutative symmetric functions is a restriction of the star involution on $WQSym$.

If we denote the star involution (*star_involution()*) of the quasisymmetric functions by $f \mapsto f^*$, and if we let π be the canonical projection $WQSym \to QSym$, then each $f \in WQSym$ satisfies $\pi(f^*) = (\pi(f))^*$.

Todo

More commutative diagrams? FQSym and FSym need their own star_involution methods defined first.

algebraic_complement(), *coalgebraic_complement()*

EXAMPLES:

Keep in mind that the default input method for basis keys of $WQSym$ is by entering an ordered set partition, not a packed word. Let us check the basis formulas for the star involution:

```
sage: WQSym = algebras.WQSym(ZZ)
sage: M = WQSym.M()
sage: M[[1,3], [2,4,5]].star_involution()
M[{1, 2, 4}, {3, 5}]
sage: M[[1,3],[2]].star_involution()
M[{2}, {1, 3}]
sage: M[[1,4],[2,5],[3,6]].star_involution()
M[{1, 4}, {2, 5}, {3, 6}]
sage: (3*M[[1]] - 4*M[[]] + 5*M[[1],[2]]).star_involution()
-4*M[] + 3*M[{1}] + 5*M[{1}, {2}]
sage: X = WQSym.X()
sage: X[[1,3],[2]].star_involution()
X[{2}, {1, 3}]
sage: C = WQSym.C()
sage: C[[1,3],[2]].star_involution()
-C[{1, 2, 3}] - C[{1, 3}, {2}] + C[{2}, {1, 3}]
sage: Q = WQSym.Q()
sage: Q[[1,3], [2,4,5]].star_involution()
Q[{1, 2, 4}, {3, 5}]
sage: Phi = WQSym.Phi()
sage: Phi[[1,3], [2,4,5]].star_involution()
Phi[{1, 2, 4}, {3, 5}]
```

```
>>> from sage.all import *
>>> WQSym = algebras.WQSym(ZZ)
>>> M = WQSym.M()
>>> M[[Integer(1),Integer(3)], [Integer(2),Integer(4),Integer(5)]].star_
↪involution()
M[{1, 2, 4}, {3, 5}]
>>> M[[Integer(1),Integer(3)],[Integer(2)]].star_involution()
M[{2}, {1, 3}]
>>> M[[Integer(1),Integer(4)],[Integer(2),Integer(5)],[Integer(3),
↪Integer(6)]].star_involution()
```

(continues on next page)

(continued from previous page)

```
M[{1, 4}, {2, 5}, {3, 6}]
>>> (Integer(3)*M[[Integer(1)]] - Integer(4)*M[[]] +␣
↪Integer(5)*M[[Integer(1)],[Integer(2)]]).star_involution()
-4*M[] + 3*M[{1}] + 5*M[{1}, {2}]
>>> X = WQSym.X()
>>> X[[Integer(1),Integer(3)],[Integer(2)]].star_involution()
X[{2}, {1, 3}]
>>> C = WQSym.C()
>>> C[[Integer(1),Integer(3)],[Integer(2)]].star_involution()
-C[{1, 2, 3}] - C[{1, 3}, {2}] + C[{2}, {1, 3}]
>>> Q = WQSym.Q()
>>> Q[[Integer(1),Integer(3)], [Integer(2),Integer(4),Integer(5)]].star_
↪involution()
Q[{1, 2, 4}, {3, 5}]
>>> Phi = WQSym.Phi()
>>> Phi[[Integer(1),Integer(3)], [Integer(2),Integer(4),Integer(5)]].star_
↪involution()
Phi[{1, 2, 4}, {3, 5}]
```

Testing the formulas for $(Q_A)^*$ and $(\Phi_A)^*$:

```
sage: all(Q[A].star_involution() == Q[A.complement().reversed()] for A in␣
↪OrderedSetPartitions(4))
True
sage: all(Phi[A].star_involution() == Phi[A.complement().reversed()] for␣
↪A in OrderedSetPartitions(4))
True
```

```
>>> from sage.all import *
>>> all(Q[A].star_involution() == Q[A.complement().reversed()] for A in␣
↪OrderedSetPartitions(Integer(4)))
True
>>> all(Phi[A].star_involution() == Phi[A.complement().reversed()] for A␣
↪in OrderedSetPartitions(Integer(4)))
True
```

The star involution commutes with the antipode:

```
sage: all( M(I).antipode().star_involution()   # long time
....:      == M(I).star_involution().antipode()
....:      for I in OrderedSetPartitions(4) )
True
```

```
>>> from sage.all import *
>>> all( M(I).antipode().star_involution()   # long time
...      == M(I).star_involution().antipode()
...      for I in OrderedSetPartitions(Integer(4)) )
True
```

Testing the $\pi(f^*) = (\pi(f))^*$ relation:

```
sage: all( M[I].star_involution().to_quasisymmetric_function()
....:      == M[I].to_quasisymmetric_function().star_involution()
....:      for I in OrderedSetPartitions(4) )
True
```

```
>>> from sage.all import *
>>> all( M[I].star_involution().to_quasisymmetric_function()
...      == M[I].to_quasisymmetric_function().star_involution()
...      for I in OrderedSetPartitions(Integer(4)) )
True
```

Testing the fact that the star involution on the noncommutative symmetric functions is a restriction of the star involution on $WQSym$:

```
sage: NCSF = NonCommutativeSymmetricFunctions(QQ)
sage: R = NCSF.R()
sage: all(R[I].star_involution().to_fqsym().to_wqsym()
....:     == R[I].to_fqsym().to_wqsym().star_involution()
....:     for I in Compositions(4))
True
```

```
>>> from sage.all import *
>>> NCSF = NonCommutativeSymmetricFunctions(QQ)
>>> R = NCSF.R()
>>> all(R[I].star_involution().to_fqsym().to_wqsym()
...     == R[I].to_fqsym().to_wqsym().star_involution()
...     for I in Compositions(Integer(4)))
True
```

Todo

Check further commutative squares.

to_quasisymmetric_function()

The projection of `self` to the ring $QSym$ of quasisymmetric functions.

There is a canonical projection $\pi : WQSym \to QSym$ that sends every element $\mathbf{M}_P$ of the monomial basis of $WQSym$ to the monomial quasisymmetric function M_c, where c is the composition whose parts are the sizes of the blocks of P. This π is a ring homomorphism.

OUTPUT: an element of the quasisymmetric functions in the monomial basis

EXAMPLES:

```
sage: M = algebras.WQSym(QQ).M()
sage: M[[1,3],[2]].to_quasisymmetric_function()
M[2, 1]
sage: (M[[1,3],[2]] + 3*M[[2,3],[1]] - M[[1,2,3],]).to_quasisymmetric_
↪function()
4*M[2, 1] - M[3]
sage: X, Y = M[[1,3],[2]], M[[1,2,3],]
sage: X.to_quasisymmetric_function() * Y.to_quasisymmetric_function() ==␣
```

(continues on next page)

(continued from previous page)

```
↪(X*Y).to_quasisymmetric_function()
True

sage: C = algebras.WQSym(QQ).C()
sage: C[[2,3],[1,4]].to_quasisymmetric_function() == M(C[[2,3],[1,4]]).to_
↪quasisymmetric_function()
True

sage: C2 = algebras.WQSym(GF(2)).C()
sage: C2[[1,2],[3,4]].to_quasisymmetric_function()
M[2, 2]
sage: C2[[2,3],[1,4]].to_quasisymmetric_function()
M[4]
```

```
>>> from sage.all import *
>>> M = algebras.WQSym(QQ).M()
>>> M[[Integer(1),Integer(3)],[Integer(2)]].to_quasisymmetric_function()
M[2, 1]
>>> (M[[Integer(1),Integer(3)],[Integer(2)]] + Integer(3)*M[[Integer(2),
↪Integer(3)],[Integer(1)]] - M[[Integer(1),Integer(2),Integer(3)],]).to_
↪quasisymmetric_function()
4*M[2, 1] - M[3]
>>> X, Y = M[[Integer(1),Integer(3)],[Integer(2)]], M[[Integer(1),
↪Integer(2),Integer(3)],]
>>> X.to_quasisymmetric_function() * Y.to_quasisymmetric_function() ==␣
↪(X*Y).to_quasisymmetric_function()
True

>>> C = algebras.WQSym(QQ).C()
>>> C[[Integer(2),Integer(3)],[Integer(1),Integer(4)]].to_quasisymmetric_
↪function() == M(C[[Integer(2),Integer(3)],[Integer(1),Integer(4)]]).to_
↪quasisymmetric_function()
True

>>> C2 = algebras.WQSym(GF(Integer(2))).C()
>>> C2[[Integer(1),Integer(2)],[Integer(3),Integer(4)]].to_quasisymmetric_
↪function()
M[2, 2]

↪function()
M[4]
```

class ParentMethods

Bases: `object`

degree_on_basis(*t*)

Return the degree of an ordered set partition in the algebra of word quasi-symmetric functions.

This is the sum of the sizes of the blocks of the ordered set partition.

EXAMPLES:

```
sage: A = algebras.WQSym(QQ).M()
sage: u = OrderedSetPartition([[2,1],])
sage: A.degree_on_basis(u)
2
sage: u = OrderedSetPartition([[2], [1]])
sage: A.degree_on_basis(u)
2
```

```
>>> from sage.all import *
>>> A = algebras.WQSym(QQ).M()
>>> u = OrderedSetPartition([[Integer(2),Integer(1)],])
>>> A.degree_on_basis(u)
2
>>> u = OrderedSetPartition([[Integer(2)], [Integer(1)]])
>>> A.degree_on_basis(u)
2
```

is_commutative()

Return whether `self` is commutative.

EXAMPLES:

```
sage: M = algebras.WQSym(ZZ).M()
sage: M.is_commutative()
False
```

```
>>> from sage.all import *
>>> M = algebras.WQSym(ZZ).M()
>>> M.is_commutative()
False
```

is_field(*proof=True*)

Return whether `self` is a field.

EXAMPLES:

```
sage: M = algebras.WQSym(QQ).M()
sage: M.is_field()
False
```

```
>>> from sage.all import *
>>> M = algebras.WQSym(QQ).M()
>>> M.is_field()
False
```

one_basis()

Return the index of the unit.

EXAMPLES:

```
sage: A = algebras.WQSym(QQ).M()
sage: A.one_basis()
[]
```

```
>>> from sage.all import *
>>> A = algebras.WQSym(QQ).M()
>>> A.one_basis()
[]
```

super_categories()

The super categories of `self`.

EXAMPLES:

```
sage: from sage.combinat.chas.wqsym import WQSymBases
sage: WQSym = algebras.WQSym(ZZ)
sage: bases = WQSymBases(WQSym, True)
sage: bases.super_categories()
[Category of realizations of Word Quasi-symmetric functions over Integer Ring,
 Join of Category of realizations of Hopf algebras over Integer Ring
     and Category of graded algebras over Integer Ring
     and Category of graded coalgebras over Integer Ring,
 Category of graded connected Hopf algebras with basis over Integer Ring]

sage: bases = WQSymBases(WQSym, False)
sage: bases.super_categories()
[Category of realizations of Word Quasi-symmetric functions over Integer Ring,
 Join of Category of realizations of Hopf algebras over Integer Ring
     and Category of graded algebras over Integer Ring
     and Category of graded coalgebras over Integer Ring,
 Join of Category of filtered connected Hopf algebras with basis over Integer␣
↪Ring
     and Category of graded algebras over Integer Ring
     and Category of graded coalgebras over Integer Ring]
```

```
>>> from sage.all import *
>>> from sage.combinat.chas.wqsym import WQSymBases
>>> WQSym = algebras.WQSym(ZZ)
>>> bases = WQSymBases(WQSym, True)
>>> bases.super_categories()
[Category of realizations of Word Quasi-symmetric functions over Integer Ring,
 Join of Category of realizations of Hopf algebras over Integer Ring
     and Category of graded algebras over Integer Ring
     and Category of graded coalgebras over Integer Ring,
 Category of graded connected Hopf algebras with basis over Integer Ring]

>>> bases = WQSymBases(WQSym, False)
>>> bases.super_categories()
[Category of realizations of Word Quasi-symmetric functions over Integer Ring,
 Join of Category of realizations of Hopf algebras over Integer Ring
     and Category of graded algebras over Integer Ring
     and Category of graded coalgebras over Integer Ring,

↪Ring
     and Category of graded algebras over Integer Ring
     and Category of graded coalgebras over Integer Ring]
```

class sage.combinat.chas.wqsym.**WQSymBasis_abstract**(*alg*, *graded=True*)

Bases: *CombinatorialFreeModule*, BindableClass

Abstract base class for bases of $WQSym$.

This must define two attributes:

- `_prefix` – the basis prefix
- `_basis_name` – the name of the basis (must match one of the names that the basis can be constructed from $WQSym$)

an_element()

Return an element of `self`.

EXAMPLES:

```
sage: M = algebras.WQSym(QQ).M()
sage: M.an_element()
M[{1}] + 2*M[{1}, {2}]
```

```
>>> from sage.all import *
>>> M = algebras.WQSym(QQ).M()
>>> M.an_element()
M[{1}] + 2*M[{1}, {2}]
```

options = Current options for WordQuasiSymmetricFunctions element - display: normal - objects: compositions

some_elements()

Return some elements of the word quasi-symmetric functions.

EXAMPLES:

```
sage: M = algebras.WQSym(QQ).M()
sage: M.some_elements()
[M[], M[{1}], M[{1, 2}],
 M[{1}] + M[{1}, {2}],
 M[] + 1/2*M[{1}]]
```

```
>>> from sage.all import *
>>> M = algebras.WQSym(QQ).M()
>>> M.some_elements()
[M[], M[{1}], M[{1, 2}],
 M[{1}] + M[{1}, {2}],
 M[] + 1/2*M[{1}]]
```

class sage.combinat.chas.wqsym.**WordQuasiSymmetricFunctions**(R)

Bases: UniqueRepresentation, Parent

The word quasi-symmetric functions.

The ring of word quasi-symmetric functions can be defined as a subring of the ring of all bounded-degree noncommutative power series in countably many indeterminates (i.e., elements in $R\langle\langle x_1, x_2, x_3, \ldots \rangle\rangle$ of bounded degree). Namely, consider words over the alphabet $\{1, 2, 3, \ldots\}$; every noncommutative power series is an infinite R-linear combination of these words. For each such word w, we define the *packing* of w to be the word $\mathrm{pack}(w)$ that is obtained from w by replacing the smallest letter that appears in w by 1, the second-smallest letter that appears in w by 2, etc. (for example, $\mathrm{pack}(4112774) = 3112443$). A word w is said to be *packed* if $\mathrm{pack}(w) = w$. For each packed word u, we define the noncommutative power series $\mathbf{M}_u = \sum w$, where the sum ranges over all words w satisfying $\mathrm{pack}(w) = u$. The span of these power series $\mathbf{M}_u$ is a subring of the ring of all noncommutative power series; it is called the ring of word quasi-symmetric functions, and is denoted by $WQSym$.

For each nonnegative integer n, there is a bijection between packed words of length n and ordered set partitions of $\{1, 2, \ldots, n\}$. Under this bijection, a packed word $u = (u_1, u_2, \ldots, u_n)$ of length n corresponds to the ordered set partition $P = (P_1, P_2, \ldots, P_k)$ of $\{1, 2, \ldots, n\}$ whose i-th part P_i (for each i) is the set of all $j \in \{1, 2, \ldots, n\}$ such that $u_j = i$.

The basis element $\mathbf{M}_u$ is also denoted as $\mathbf{M}_P$ in this situation. The basis $(\mathbf{M}_P)_P$ is called the *Monomial basis* and is implemented as `Monomial`.

Other bases are the cone basis (aka C basis), the characteristic basis (aka X basis), the Q basis and the Phi basis.

Bases of $WQSym$ are implemented (internally) using ordered set partitions. However, the user may access specific basis vectors using either packed words or ordered set partitions. See the examples below, noting especially the section on ambiguities.

$WQSym$ is endowed with a connected graded Hopf algebra structure (see Section 2.2 of [NoThWi08], Section 1.1 of [FoiMal14] and Section 4.3.2 of [MeNoTh11]) given by

$$\Delta(\mathbf{M}_{(P_1,\ldots,P_\ell)}) = \sum_{i=0}^{\ell} \mathbf{M}_{\mathrm{st}(P_1,\ldots,P_i)} \otimes \mathbf{M}_{\mathrm{st}(P_{i+1},\ldots,P_\ell)}.$$

Here, for any ordered set partition $(Q_1, \ldots, Q_k)$ of a finite set Z of integers, we let $\mathrm{st}(Q_1, \ldots, Q_k)$ denote the set partition obtained from Z by replacing the smallest element appearing in it by 1, the second-smallest element by 2, and so on.

A rule for multiplying elements of the monomial basis relies on the *quasi-shuffle product* of two ordered set partitions. The quasi-shuffle product $\Box$ is given by `ShuffleProduct_overlapping` with the + operation in the overlapping of the shuffles being the union of the sets. The product $\mathbf{M}_P \mathbf{M}_Q$ for two ordered set partitions P and Q of $[n]$ and $[m]$ is then given by

$$\mathbf{M}_P \mathbf{M}_Q = \sum_{R \in P \Box Q^+} \mathbf{M}_R,$$

where Q^+ means Q with all numbers shifted upwards by n.

Sometimes, $WQSym$ is also denoted as $NCQSym$.

REFERENCES:

- [FoiMal14]
- [MeNoTh11]
- [NoThWi08]
- [BerZab05]

EXAMPLES:

Constructing the algebra and its Monomial basis:

```
sage: WQSym = algebras.WQSym(ZZ)
sage: WQSym
Word Quasi-symmetric functions over Integer Ring
sage: M = WQSym.M()
sage: M
Word Quasi-symmetric functions over Integer Ring in the Monomial basis
sage: M[[]]
M[]
```

```
>>> from sage.all import *
>>> WQSym = algebras.WQSym(ZZ)
>>> WQSym
Word Quasi-symmetric functions over Integer Ring
>>> M = WQSym.M()
>>> M
Word Quasi-symmetric functions over Integer Ring in the Monomial basis
>>> M[[]]
M[]
```

Calling basis elements using packed words:

```
sage: x = M[1,2,1]; x
M[{1, 3}, {2}]
sage: x == M[[1,2,1]] == M[Word([1,2,1])]
True
sage: y = M[1,1,2] - M[1,2,2]; y
-M[{1}, {2, 3}] + M[{1, 2}, {3}]
```

```
>>> from sage.all import *
>>> x = M[Integer(1),Integer(2),Integer(1)]; x
M[{1, 3}, {2}]
>>> x == M[[Integer(1),Integer(2),Integer(1)]] == M[Word([Integer(1),Integer(2),
↪Integer(1)])]
True
>>> y = M[Integer(1),Integer(1),Integer(2)] - M[Integer(1),Integer(2),Integer(2)];
↪ y
-M[{1}, {2, 3}] + M[{1, 2}, {3}]
```

Calling basis elements using ordered set partitions:

```
sage: z = M[[1,2,3],]; z
M[{1, 2, 3}]
sage: z == M[[[1,2,3]]] == M[OrderedSetPartition([[1,2,3]])]
True
sage: M[[1,2],[3]]
M[{1, 2}, {3}]
```

```
>>> from sage.all import *
>>> z = M[[Integer(1),Integer(2),Integer(3)],]; z
M[{1, 2, 3}]
>>> z == M[[[Integer(1),Integer(2),Integer(3)]]] ==␣
↪M[OrderedSetPartition([[Integer(1),Integer(2),Integer(3)]])]
True
>>> M[[Integer(1),Integer(2)],[Integer(3)]]
M[{1, 2}, {3}]
```

Note that expressions above are output in terms of ordered set partitions, even when input as packed words. Output as packed words can be achieved by modifying the global options. (See `OrderedSetPartitions.options()` for further details.):

```
sage: M.options.objects = "words"
sage: y
```

(continues on next page)

(continued from previous page)

```
-M[1, 2, 2] + M[1, 1, 2]
sage: M.options.display = "compact"
sage: y
-M[122] + M[112]
sage: z
M[111]
```

```
>>> from sage.all import *
>>> M.options.objects = "words"
>>> y
-M[1, 2, 2] + M[1, 1, 2]
>>> M.options.display = "compact"
>>> y
-M[122] + M[112]
>>> z
M[111]
```

The options should be reset to display as ordered set partitions:

```
sage: M.options._reset()
sage: z
M[{1, 2, 3}]
```

```
>>> from sage.all import *
>>> M.options._reset()
>>> z
M[{1, 2, 3}]
```

Illustration of the Hopf algebra structure:

```
sage: M[[2, 3], [5], [6], [4], [1]].coproduct()
M[] # M[{2, 3}, {5}, {6}, {4}, {1}] + M[{1, 2}] # M[{3}, {4}, {2}, {1}]
 + M[{1, 2}, {3}] # M[{3}, {2}, {1}] + M[{1, 2}, {3}, {4}] # M[{2}, {1}]
 + M[{1, 2}, {4}, {5}, {3}] # M[{1}] + M[{2, 3}, {5}, {6}, {4}, {1}] # M[]
sage: _ == M[5,1,1,4,2,3].coproduct()
True
sage: M[[1,1,1]] * M[[1,1,2]]   # packed words
M[{1, 2, 3}, {4, 5}, {6}] + M[{1, 2, 3, 4, 5}, {6}]
 + M[{4, 5}, {1, 2, 3}, {6}] + M[{4, 5}, {1, 2, 3, 6}]
 + M[{4, 5}, {6}, {1, 2, 3}]
sage: M[[1,2,3],].antipode()  # ordered set partition
-M[{1, 2, 3}]
sage: M[[1], [2], [3]].antipode()
-M[{1, 2, 3}] - M[{2, 3}, {1}] - M[{3}, {1, 2}] - M[{3}, {2}, {1}]
sage: x = M[[1],[2],[3]] + 3*M[[2],[1]]
sage: x.counit()
0
sage: x.antipode()
3*M[{1}, {2}] + 3*M[{1, 2}] - M[{1, 2, 3}] - M[{2, 3}, {1}]
 - M[{3}, {1, 2}] - M[{3}, {2}, {1}]
```

```
>>> from sage.all import *
>>> M[[Integer(2), Integer(3)], [Integer(5)], [Integer(6)], [Integer(4)],␣
↪[Integer(1)]].coproduct()
M[] # M[{2, 3}, {5}, {6}, {4}, {1}] + M[{1, 2}] # M[{3}, {4}, {2}, {1}]

```

Ambiguities

Some ambiguity arises when accessing basis vectors with the dictionary syntax, i.e., `M[...]`. A common example is when referencing an ordered set partition with one part. For example, in the expression `M[[1,2]]`, does `[[1, 2]]` refer to an ordered set partition or does `[1,2]` refer to a packed word? We choose the latter: if the received arguments do not behave like a tuple of iterables, then view them as describing a packed word. (In the running example, one argument is received, which behaves as a tuple of integers.) Here are a variety of ways to get the same basis vector:

```
sage: x = M[1,1]; x
M[{1, 2}]
sage: x == M[[1,1]]  # treated as word
True
sage: x == M[[1,2],] == M[[[1,2]]]  # treated as ordered set partitions
True

sage: M[[1,3],[2]]  # treat as ordered set partition
M[{1, 3}, {2}]
sage: M[[1,3],[2]] == M[1,2,1]  # treat as word
True
```

```
>>> from sage.all import *
>>> x = M[Integer(1),Integer(1)]; x
M[{1, 2}]
>>> x == M[[Integer(1),Integer(1)]]  # treated as word
True
```

(continues on next page)

(continued from previous page)

```
>>> x == M[[Integer(1),Integer(2)],] == M[[[Integer(1),Integer(2)]]]  # treated␣
↪as ordered set partitions
True

>>> M[[Integer(1),Integer(3)],[Integer(2)]]  # treat as ordered set partition
M[{1, 3}, {2}]
>>> M[[Integer(1),Integer(3)],[Integer(2)]] == M[Integer(1),Integer(2),
↪Integer(1)]  # treat as word
True
```

Todo

- Dendriform structure.

C

alias of `Cone`

class Characteristic(*alg*)

Bases: `WQSymBasis_abstract`

The Characteristic basis of $WQSym$.

The *Characteristic basis* is a graded basis (X_P) of $WQSym$, indexed by ordered set partitions P. It is defined by

$$X_P = (-1)^{\ell(P)} \mathbf{M}_P,$$

where $(\mathbf{M}_P)_P$ denotes the Monomial basis, and where $\ell(P)$ denotes the number of blocks in an ordered set partition P.

EXAMPLES:

```
sage: WQSym = algebras.WQSym(QQ)
sage: X = WQSym.X(); X
Word Quasi-symmetric functions over Rational Field in the Characteristic basis

sage: X[[[1,2,3]]] * X[[1,2],[3]]
X[{1, 2, 3}, {4, 5}, {6}] - X[{1, 2, 3, 4, 5}, {6}]
 + X[{4, 5}, {1, 2, 3}, {6}] - X[{4, 5}, {1, 2, 3, 6}]
 + X[{4, 5}, {6}, {1, 2, 3}]

sage: X[[1, 4], [3], [2]].coproduct()
X[] # X[{1, 4}, {3}, {2}] + X[{1, 2}] # X[{2}, {1}]
 + X[{1, 3}, {2}] # X[{1}] + X[{1, 4}, {3}, {2}] # X[]

sage: M = WQSym.M()
sage: M(X[[1, 2, 3],])
-M[{1, 2, 3}]
sage: M(X[[1, 3], [2]])
M[{1, 3}, {2}]
sage: X(M[[1, 2, 3],])
-X[{1, 2, 3}]
```

(continues on next page)

(continued from previous page)

>>> X(M[[Integer(1), Integer(3)], [Integer(2)]])
X[{1, 3}, {2}]
```

class Element

Bases: `IndexedFreeModuleElement`

algebraic_complement()

Return the image of the element `self` of $WQSym$ under the algebraic complement involution.

See *WQSymBases.ElementMethods.algebraic_complement()* for a definition of the involution and for examples.

See also

coalgebraic_complement(), *star_involution()*

EXAMPLES:

```
sage: WQSym = algebras.WQSym(ZZ)
sage: X = WQSym.X()
sage: X[[1,2],[5,6],[3,4]].algebraic_complement()
X[{3, 4}, {5, 6}, {1, 2}]
sage: X[[3], [1, 2], [4]].algebraic_complement()
X[{4}, {1, 2}, {3}]
```

```
>>> from sage.all import *
>>> WQSym = algebras.WQSym(ZZ)
>>> X = WQSym.X()
>>> X[[Integer(1),Integer(2)],[Integer(5),Integer(6)],[Integer(3),
↪Integer(4)]].algebraic_complement()
X[{3, 4}, {5, 6}, {1, 2}]
>>> X[[Integer(3)], [Integer(1), Integer(2)], [Integer(4)]].algebraic_
↪complement()
X[{4}, {1, 2}, {3}]
```

coalgebraic_complement()

Return the image of the element `self` of $WQSym$ under the coalgebraic complement involution.

See *WQSymBases.ElementMethods.coalgebraic_complement()* for a definition of the involution and for examples.

See also:

algebraic_complement(), *star_involution()*

EXAMPLES:

```
sage: WQSym = algebras.WQSym(ZZ)
sage: X = WQSym.X()
sage: X[[1,2],[5,6],[3,4]].coalgebraic_complement()
X[{5, 6}, {1, 2}, {3, 4}]
sage: X[[3], [1, 2], [4]].coalgebraic_complement()
X[{2}, {3, 4}, {1}]
```

```
>>> from sage.all import *
>>> WQSym = algebras.WQSym(ZZ)
>>> X = WQSym.X()
>>> X[[Integer(1),Integer(2)],[Integer(5),Integer(6)],[Integer(3),
↪Integer(4)]].coalgebraic_complement()
X[{5, 6}, {1, 2}, {3, 4}]
>>> X[[Integer(3)], [Integer(1), Integer(2)], [Integer(4)]].
↪coalgebraic_complement()
X[{2}, {3, 4}, {1}]
```

star_involution()

Return the image of the element `self` of $WQSym$ under the star involution.

See *WQSymBases.ElementMethods.star_involution()* for a definition of the involution and for examples.

See also:

algebraic_complement(), *coalgebraic_complement()*

EXAMPLES:

```
sage: WQSym = algebras.WQSym(ZZ)
sage: X = WQSym.X()
sage: X[[1,2],[5,6],[3,4]].star_involution()
X[{3, 4}, {1, 2}, {5, 6}]
sage: X[[3], [1, 2], [4]].star_involution()
X[{1}, {3, 4}, {2}]
```

```
>>> from sage.all import *
>>> WQSym = algebras.WQSym(ZZ)
>>> X = WQSym.X()
>>> X[[Integer(1),Integer(2)],[Integer(5),Integer(6)],[Integer(3),
↪Integer(4)]].star_involution()
X[{3, 4}, {1, 2}, {5, 6}]
>>> X[[Integer(3)], [Integer(1), Integer(2)], [Integer(4)]].star_
↪involution()
X[{1}, {3, 4}, {2}]
```

class Cone(*alg*)

Bases: `WQSymBasis_abstract`

The Cone basis of $WQSym$.

Let $(X_P)_P$ denote the Characteristic basis of $WQSym$. Denote the quasi-shuffle of two ordered set partitions A and B by $A \square B$. For an ordered set partition $P = (P_1, \ldots, P_\ell)$, we form a list of ordered set partitions $[P] := (P'_1, \ldots, P'_k)$ as follows. Define a strictly decreasing sequence of integers $\ell + 1 = i_0 > i_1 > \cdots > i_k = 1$ recursively by requiring that $\min P_{i_j} \leq \min P_a$ for all $a < i_{j-1}$. Set $P'_j = (P_{i_j}, \ldots, P_{i_{j-1}-1})$.

The *Cone basis* $(C_P)_P$ is defined by

$$C_P = \sum_Q X_Q,$$

where the sum is over all elements Q of the quasi-shuffle product $P'_1 \square P'_2 \square \cdots \square P'_k$ with $[P] = (P'_1, \ldots, P'_k)$.

EXAMPLES:

```
sage: WQSym = algebras.WQSym(QQ)
sage: C = WQSym.C()
sage: C
Word Quasi-symmetric functions over Rational Field in the Cone basis

sage: X = WQSym.X()
sage: X(C[[2,3],[1,4]])
X[{1, 2, 3, 4}] + X[{1, 4}, {2, 3}] + X[{2, 3}, {1, 4}]
sage: X(C[[1,4],[2,3]])
X[{1, 4}, {2, 3}]
sage: X(C[[2,3],[1],[4]])
X[{1}, {2, 3}, {4}] + X[{1}, {2, 3, 4}] + X[{1}, {4}, {2, 3}]
 + X[{1, 2, 3}, {4}] + X[{2, 3}, {1}, {4}]
sage: X(C[[3], [2, 5], [1, 4]])

 + X[{3}, {1, 4}, {2, 5}] + X[{3}, {2, 5}, {1, 4}]
>>> C(X[[Integer(2),Integer(3)],[Integer(1),Integer(4)]])
-C[{1, 2, 3, 4}] - C[{1, 4}, {2, 3}] + C[{2, 3}, {1, 4}]
```

REFERENCES:

- Section 4 of [Early2017]

Todo

Experiments suggest that `algebraic_complement()`, `coalgebraic_complement()`, and `star_involution()` should have reasonable formulas on the C basis; at least the coefficients of the outputs on any element of the C basis seem to be always $0, 1, -1$. Is this true? What is the formula?

some_elements()

Return some elements of the word quasi-symmetric functions in the Cone basis.

EXAMPLES:

```
sage: C = algebras.WQSym(QQ).C()
sage: C.some_elements()
[C[], C[{1}], C[{1, 2}], C[] + 1/2*C[{1}]]
```

```
>>> from sage.all import *
>>> C = algebras.WQSym(QQ).C()
>>> C.some_elements()
[C[], C[{1}], C[{1, 2}], C[] + 1/2*C[{1}]]
```

M

alias of *Monomial*

class Monomial(*alg*, *graded=True*)

Bases: *WQSymBasis_abstract*

The Monomial basis of $WQSym$.

The family $(\mathbf{M}_u)$, as defined in *WordQuasiSymmetricFunctions* with u ranging over all packed words, is a basis for the free R-module $WQSym$ and called the *Monomial basis*. Here it is labelled using ordered set partitions.

EXAMPLES:

```
sage: WQSym = algebras.WQSym(QQ)
sage: M = WQSym.M(); M
Word Quasi-symmetric functions over Rational Field in the Monomial basis
sage: sorted(M.basis(2))
[M[{1}, {2}], M[{2}, {1}], M[{1, 2}]]
```

```
>>> from sage.all import *
>>> WQSym = algebras.WQSym(QQ)
>>> M = WQSym.M(); M
Word Quasi-symmetric functions over Rational Field in the Monomial basis
>>> sorted(M.basis(Integer(2)))
[M[{1}, {2}], M[{2}, {1}], M[{1, 2}]]
```

coproduct_on_basis(*x*)

Return the coproduct of `self` on the basis element indexed by the ordered set partition `x`.

EXAMPLES:

```
sage: M = algebras.WQSym(QQ).M()

sage: M.coproduct(M.one())  # indirect doctest
M[] # M[]
sage: M.coproduct( M([[1]]) )  # indirect doctest
M[] # M[{1}] + M[{1}] # M[]
sage: M.coproduct( M([[1,2]]) )
M[] # M[{1, 2}] + M[{1, 2}] # M[]
sage: M.coproduct( M([[1], [2]]) )
M[] # M[{1}, {2}] + M[{1}] # M[{1}] + M[{1}, {2}] # M[]
```

```
>>> from sage.all import *
>>> M = algebras.WQSym(QQ).M()

>>> M.coproduct(M.one())  # indirect doctest
M[] # M[]
>>> M.coproduct( M([[Integer(1)]]) )  # indirect doctest
M[] # M[{1}] + M[{1}] # M[]
>>> M.coproduct( M([[Integer(1),Integer(2)]]) )
M[] # M[{1, 2}] + M[{1, 2}] # M[]
>>> M.coproduct( M([[Integer(1)], [Integer(2)]]) )
M[] # M[{1}, {2}] + M[{1}] # M[{1}] + M[{1}, {2}] # M[]
```

product_on_basis (*x*, *y*)

Return the (associative) $*$ product of the basis elements of `self` indexed by the ordered set partitions x and y.

This is the shifted quasi-shuffle product of x and y.

EXAMPLES:

```
sage: A = algebras.WQSym(QQ).M()
sage: x = OrderedSetPartition([[1],[2,3]])
sage: y = OrderedSetPartition([[1,2]])
sage: z = OrderedSetPartition([[1,2],[3]])
sage: A.product_on_basis(x, y)
M[{1}, {2, 3}, {4, 5}] + M[{1}, {2, 3, 4, 5}]
 + M[{1}, {4, 5}, {2, 3}] + M[{1, 4, 5}, {2, 3}]
 + M[{4, 5}, {1}, {2, 3}]
sage: A.product_on_basis(x, z)
M[{1}, {2, 3}, {4, 5}, {6}] + M[{1}, {2, 3, 4, 5}, {6}]
 + M[{1}, {4, 5}, {2, 3}, {6}] + M[{1}, {4, 5}, {2, 3, 6}]
 + M[{1}, {4, 5}, {6}, {2, 3}] + M[{1, 4, 5}, {2, 3}, {6}]
 + M[{1, 4, 5}, {2, 3, 6}] + M[{1, 4, 5}, {6}, {2, 3}]
 + M[{4, 5}, {1}, {2, 3}, {6}] + M[{4, 5}, {1}, {2, 3, 6}]
 + M[{4, 5}, {1}, {6}, {2, 3}] + M[{4, 5}, {1, 6}, {2, 3}]
 + M[{4, 5}, {6}, {1}, {2, 3}]
sage: A.product_on_basis(y, y)
M[{1, 2}, {3, 4}] + M[{1, 2, 3, 4}] + M[{3, 4}, {1, 2}]
```

```
>>> from sage.all import *
>>> A = algebras.WQSym(QQ).M()
>>> x = OrderedSetPartition([[Integer(1)],[Integer(2),Integer(3)]])
>>> y = OrderedSetPartition([[Integer(1),Integer(2)]])
>>> z = OrderedSetPartition([[Integer(1),Integer(2)],[Integer(3)]])
>>> A.product_on_basis(x, y)
M[{1}, {2, 3}, {4, 5}] + M[{1}, {2, 3, 4, 5}]
 + M[{1}, {4, 5}, {2, 3}] + M[{1, 4, 5}, {2, 3}]
 + M[{4, 5}, {1}, {2, 3}]
>>> A.product_on_basis(x, z)
M[{1}, {2, 3}, {4, 5}, {6}] + M[{1}, {2, 3, 4, 5}, {6}]
 + M[{1}, {4, 5}, {2, 3}, {6}] + M[{1}, {4, 5}, {2, 3, 6}]
 + M[{1}, {4, 5}, {6}, {2, 3}] + M[{1, 4, 5}, {2, 3}, {6}]
 + M[{1, 4, 5}, {2, 3, 6}] + M[{1, 4, 5}, {6}, {2, 3}]
 + M[{4, 5}, {1}, {2, 3}, {6}] + M[{4, 5}, {1}, {2, 3, 6}]
 + M[{4, 5}, {1}, {6}, {2, 3}] + M[{4, 5}, {1, 6}, {2, 3}]
 + M[{4, 5}, {6}, {1}, {2, 3}]
>>> A.product_on_basis(y, y)
M[{1, 2}, {3, 4}] + M[{1, 2, 3, 4}] + M[{3, 4}, {1, 2}]
```

Phi

alias of *StronglyFiner*

Q

alias of *StronglyCoarser*

class StronglyCoarser (*alg*)

Bases: *WQSymBasis_abstract*

The Q basis of $WQSym$.

We define a partial order $\leq$ on the set of all ordered set partitions as follows: $A \leq B$ if and only if A is strongly finer than B (see `is_strongly_finer()` for a definition of this).

The *Q basis* $(Q_P)_P$ is a basis of $WQSym$ indexed by ordered set partitions, and is defined by

$$Q_P = \sum \mathbf{M}_W,$$

where the sum is over ordered set partitions W satisfying $P \leq W$.

EXAMPLES:

```
sage: WQSym = algebras.WQSym(QQ)
sage: M = WQSym.M(); Q = WQSym.Q()
sage: Q
Word Quasi-symmetric functions over Rational Field in the Q basis

sage: Q(M[[2,3],[1,4]])
Q[{2, 3}, {1, 4}]
sage: Q(M[[1,2],[3,4]])
Q[{1, 2}, {3, 4}] - Q[{1, 2, 3, 4}]
sage: M(Q[[1,2],[3,4]])
M[{1, 2}, {3, 4}] + M[{1, 2, 3, 4}]
sage: M(Q[[2,3],[1],[4]])

EXAMPLES:

```
sage: WQSym = algebras.WQSym(ZZ)
sage: Q = WQSym.Q()
sage: Q[[1,2],[5,6],[3,4]].algebraic_complement()
Q[{3, 4}, {1, 2, 5, 6}] + Q[{3, 4}, {5, 6}, {1, 2}]
 - Q[{3, 4, 5, 6}, {1, 2}]
sage: Q[[3], [1, 2], [4]].algebraic_complement()
Q[{1, 2, 4}, {3}] + Q[{4}, {1, 2}, {3}] - Q[{4}, {1, 2, 3}]
```

```
>>> from sage.all import *
>>> WQSym = algebras.WQSym(ZZ)
>>> Q = WQSym.Q()
>>> Q[[Integer(1),Integer(2)],[Integer(5),Integer(6)],[Integer(3),
↪Integer(4)]].algebraic_complement()
Q[{3, 4}, {1, 2, 5, 6}] + Q[{3, 4}, {5, 6}, {1, 2}]
 - Q[{3, 4, 5, 6}, {1, 2}]
>>> Q[[Integer(3)], [Integer(1), Integer(2)], [Integer(4)]].algebraic_
↪complement()
Q[{1, 2, 4}, {3}] + Q[{4}, {1, 2}, {3}] - Q[{4}, {1, 2, 3}]
```

coalgebraic_complement()

Return the image of the element `self` of $WQSym$ under the coalgebraic complement involution.

See *WQSymBases.ElementMethods.coalgebraic_complement()* for a definition of the involution and for examples.

See also

algebraic_complement(), *star_involution()*

EXAMPLES:

```
sage: WQSym = algebras.WQSym(ZZ)
sage: Q = WQSym.Q()
sage: Q[[1,2],[5,6],[3,4]].coalgebraic_complement()
Q[{1, 2, 5, 6}, {3, 4}] + Q[{5, 6}, {1, 2}, {3, 4}] - Q[{5, 6}, {1, 2,␣
↪3, 4}]
sage: Q[[3], [1, 2], [4]].coalgebraic_complement()
Q[{2}, {1, 3, 4}] + Q[{2}, {3, 4}, {1}] - Q[{2, 3, 4}, {1}]
```

```
>>> from sage.all import *
>>> WQSym = algebras.WQSym(ZZ)
>>> Q = WQSym.Q()
>>> Q[[Integer(1),Integer(2)],[Integer(5),Integer(6)],[Integer(3),
↪Integer(4)]].coalgebraic_complement()
Q[{1, 2, 5, 6}, {3, 4}] + Q[{5, 6}, {1, 2}, {3, 4}] - Q[{5, 6}, {1, 2,␣
↪3, 4}]
>>> Q[[Integer(3)], [Integer(1), Integer(2)], [Integer(4)]].
↪coalgebraic_complement()
Q[{2}, {1, 3, 4}] + Q[{2}, {3, 4}, {1}] - Q[{2, 3, 4}, {1}]
```

star_involution()

Return the image of the element `self` of $WQSym$ under the star involution.

See *WQSymBases.ElementMethods.star_involution()* for a definition of the involution and for examples.

See also

algebraic_complement(), *coalgebraic_complement()*

EXAMPLES:

```
sage: WQSym = algebras.WQSym(ZZ)
sage: Q = WQSym.Q()
sage: Q[[1,2],[5,6],[3,4]].star_involution()
Q[{3, 4}, {1, 2}, {5, 6}]
sage: Q[[3], [1, 2], [4]].star_involution()
Q[{1}, {3, 4}, {2}]
```

```
>>> from sage.all import *
>>> WQSym = algebras.WQSym(ZZ)
```

(continues on next page)

(continued from previous page)

```
>>> Q = WQSym.Q()
>>> Q[[Integer(1),Integer(2)],[Integer(5),Integer(6)],[Integer(3),
↪Integer(4)]].star_involution()
Q[{3, 4}, {1, 2}, {5, 6}]
>>> Q[[Integer(3)], [Integer(1), Integer(2)], [Integer(4)]].star_
↪involution()
Q[{1}, {3, 4}, {2}]
```

coproduct_on_basis(x)

Return the coproduct of `self` on the basis element indexed by the ordered set partition `x`.

EXAMPLES:

```
sage: Q = algebras.WQSym(QQ).Q()

sage: Q.coproduct(Q.one())  # indirect doctest
Q[] # Q[]
sage: Q.coproduct( Q([[1]]) )  # indirect doctest
Q[] # Q[{1}] + Q[{1}] # Q[]
sage: Q.coproduct( Q([[1,2]]) )
Q[] # Q[{1, 2}] + Q[{1, 2}] # Q[]
sage: Q.coproduct( Q([[1], [2]]) )
Q[] # Q[{1}, {2}] + Q[{1}] # Q[{1}] + Q[{1}, {2}] # Q[]
sage: Q[[1,2],[3],[4]].coproduct()
Q[] # Q[{1, 2}, {3}, {4}] + Q[{1, 2}] # Q[{1}, {2}]
 + Q[{1, 2}, {3}] # Q[{1}] + Q[{1, 2}, {3}, {4}] # Q[]
```

```
>>> from sage.all import *
>>> Q = algebras.WQSym(QQ).Q()

>>> Q.coproduct(Q.one())  # indirect doctest
Q[] # Q[]
>>> Q.coproduct( Q([[Integer(1)]]) )  # indirect doctest
Q[] # Q[{1}] + Q[{1}] # Q[]
>>> Q.coproduct( Q([[Integer(1),Integer(2)]]) )
Q[] # Q[{1, 2}] + Q[{1, 2}] # Q[]
>>> Q.coproduct( Q([[Integer(1)], [Integer(2)]]) )
Q[] # Q[{1}, {2}] + Q[{1}] # Q[{1}] + Q[{1}, {2}] # Q[]
>>> Q[[Integer(1),Integer(2)],[Integer(3)],[Integer(4)]].coproduct()
Q[] # Q[{1, 2}, {3}, {4}] + Q[{1, 2}] # Q[{1}, {2}]
 + Q[{1, 2}, {3}] # Q[{1}] + Q[{1, 2}, {3}, {4}] # Q[]
```

product_on_basis(x, y)

Return the (associative) $*$ product of the basis elements of the Q basis `self` indexed by the ordered set partitions x and y.

This is the shifted shuffle product of x and y.

EXAMPLES:

```
sage: A = algebras.WQSym(QQ).Q()
sage: x = OrderedSetPartition([[1],[2,3]])
sage: y = OrderedSetPartition([[1,2]])
```

(continues on next page)

(continued from previous page)

```
sage: z = OrderedSetPartition([[1,2],[3]])
sage: A.product_on_basis(x, y)
Q[{1}, {2, 3}, {4, 5}] + Q[{1}, {4, 5}, {2, 3}]
 + Q[{4, 5}, {1}, {2, 3}]
sage: A.product_on_basis(x, z)
Q[{1}, {2, 3}, {4, 5}, {6}] + Q[{1}, {4, 5}, {2, 3}, {6}]
 + Q[{1}, {4, 5}, {6}, {2, 3}] + Q[{4, 5}, {1}, {2, 3}, {6}]
 + Q[{4, 5}, {1}, {6}, {2, 3}] + Q[{4, 5}, {6}, {1}, {2, 3}]
sage: A.product_on_basis(y, y)
Q[{1, 2}, {3, 4}] + Q[{3, 4}, {1, 2}]
```

```
>>> from sage.all import *
>>> A = algebras.WQSym(QQ).Q()
>>> x = OrderedSetPartition([[Integer(1)],[Integer(2),Integer(3)]])
>>> y = OrderedSetPartition([[Integer(1),Integer(2)]])
>>> z = OrderedSetPartition([[Integer(1),Integer(2)],[Integer(3)]])
>>> A.product_on_basis(x, y)
Q[{1}, {2, 3}, {4, 5}] + Q[{1}, {4, 5}, {2, 3}]
 + Q[{4, 5}, {1}, {2, 3}]
>>> A.product_on_basis(x, z)
Q[{1}, {2, 3}, {4, 5}, {6}] + Q[{1}, {4, 5}, {2, 3}, {6}]
 + Q[{1}, {4, 5}, {6}, {2, 3}] + Q[{4, 5}, {1}, {2, 3}, {6}]
 + Q[{4, 5}, {1}, {6}, {2, 3}] + Q[{4, 5}, {6}, {1}, {2, 3}]
>>> A.product_on_basis(y, y)
Q[{1, 2}, {3, 4}] + Q[{3, 4}, {1, 2}]
```

some_elements()

Return some elements of the word quasi-symmetric functions in the Q basis.

EXAMPLES:

```
sage: Q = algebras.WQSym(QQ).Q()
sage: Q.some_elements()
[Q[], Q[{1}], Q[{1, 2}], Q[] + 1/2*Q[{1}]]
```

```
>>> from sage.all import *
>>> Q = algebras.WQSym(QQ).Q()
>>> Q.some_elements()
[Q[], Q[{1}], Q[{1, 2}], Q[] + 1/2*Q[{1}]]
```

class StronglyFiner(*alg*)

Bases: `WQSymBasis_abstract`

The Phi basis of $WQSym$.

We define a partial order $\leq$ on the set of all ordered set partitions as follows: $A \leq B$ if and only if A is strongly finer than B (see `is_strongly_finer()` for a definition of this).

The *Phi basis* $(\Phi_P)_P$ is a basis of $WQSym$ indexed by ordered set partitions, and is defined by

$$\Phi_P = \sum \mathbf{M}_W,$$

where the sum is over ordered set partitions W satisfying $W \leq P$.

Novelli and Thibon introduced this basis in [NovThi06] Section 2.7.2, and called it the quasi-ribbon basis. It later reappeared in [MeNoTh11] Section 4.3.2.

EXAMPLES:

```
sage: WQSym = algebras.WQSym(QQ)
sage: M = WQSym.M(); Phi = WQSym.Phi()
sage: Phi
Word Quasi-symmetric functions over Rational Field in the Phi basis

sage: Phi(M[[2,3],[1,4]])
Phi[{2}, {3}, {1}, {4}] - Phi[{2}, {3}, {1, 4}]
 - Phi[{2, 3}, {1}, {4}] + Phi[{2, 3}, {1, 4}]
sage: Phi(M[[1,2],[3,4]])
Phi[{1}, {2}, {3}, {4}] - Phi[{1}, {2}, {3, 4}]
 - Phi[{1, 2}, {3}, {4}] + Phi[{1, 2}, {3, 4}]
sage: M(Phi[[1,2],[3,4]])
M[{1}, {2}, {3}, {4}] + M[{1}, {2}, {3, 4}]
 + M[{1, 2}, {3}, {4}] + M[{1, 2}, {3, 4}]
sage: M(Phi[[2,3],[1],[4]])
M[{2}, {3}, {1}, {4}] + M[{2, 3}, {1}, {4}]
sage: M(Phi[[3], [2, 5], [1, 4]])
M[{3}, {2}, {5}, {1}, {4}] + M[{3}, {2}, {5}, {1, 4}]
 + M[{3}, {2, 5}, {1}, {4}] + M[{3}, {2, 5}, {1, 4}]
sage: M(Phi[[1, 4], [2, 3], [5], [6]])
M[{1}, {4}, {2}, {3}, {5}, {6}] + M[{1}, {4}, {2, 3}, {5}, {6}]
 + M[{1, 4}, {2}, {3}, {5}, {6}] + M[{1, 4}, {2, 3}, {5}, {6}]

sage: Phi[[1],] * Phi[[1, 3], [2]]
Phi[{1, 2, 4}, {3}] + Phi[{2}, {1, 4}, {3}]
 + Phi[{2, 4}, {1, 3}] + Phi[{2, 4}, {3}, {1}]
sage: Phi[[3, 5], [1, 4], [2]].coproduct()
Phi[] # Phi[{3, 5}, {1, 4}, {2}]
 + Phi[{1}] # Phi[{4}, {1, 3}, {2}]
 + Phi[{1, 2}] # Phi[{1, 3}, {2}]
 + Phi[{2, 3}, {1}] # Phi[{2}, {1}]
 + Phi[{2, 4}, {1, 3}] # Phi[{1}]
 + Phi[{3, 5}, {1, 4}, {2}] # Phi[]
```

```
>>> from sage.all import *
>>> WQSym = algebras.WQSym(QQ)
>>> M = WQSym.M(); Phi = WQSym.Phi()
>>> Phi
Word Quasi-symmetric functions over Rational Field in the Phi basis

>>> Phi(M[[Integer(2),Integer(3)],[Integer(1),Integer(4)]])
Phi[{2}, {3}, {1}, {4}] - Phi[{2}, {3}, {1, 4}]
 - Phi[{2, 3}, {1}, {4}] + Phi[{2, 3}, {1, 4}]
>>> Phi(M[[Integer(1),Integer(2)],[Integer(3),Integer(4)]])
Phi[{1}, {2}, {3}, {4}] - Phi[{1}, {2}, {3, 4}]
 - Phi[{1, 2}, {3}, {4}] + Phi[{1, 2}, {3, 4}]

class Element

Bases: `IndexedFreeModuleElement`

algebraic_complement()

Return the image of the element `self` of $WQSym$ under the algebraic complement involution.

See *WQSymBases.ElementMethods.algebraic_complement()* for a definition of the involution and for examples.

See also

coalgebraic_complement(), *star_involution()*

EXAMPLES:

```
sage: WQSym = algebras.WQSym(ZZ)
sage: Phi = WQSym.Phi()
sage: Phi[[1],[2,4],[3]].algebraic_complement()
-Phi[{3}, {2}, {4}, {1}] + Phi[{3}, {2, 4}, {1}] + Phi[{3}, {4}, {2},
↪{1}]
sage: Phi[[1],[2,3],[4]].algebraic_complement()
-Phi[{4}, {2}, {3}, {1}] + Phi[{4}, {2, 3}, {1}] + Phi[{4}, {3}, {2},
↪{1}]
```

```
>>> from sage.all import *
>>> WQSym = algebras.WQSym(ZZ)
>>> Phi = WQSym.Phi()
```

(continues on next page)

(continued from previous page)

```
>>> Phi[[Integer(1)],[Integer(2),Integer(4)],[Integer(3)]].algebraic_
↪complement()
-Phi[{3}, {2}, {4}, {1}] + Phi[{3}, {2, 4}, {1}] + Phi[{3}, {4}, {2},
↪{1}]
>>> Phi[[Integer(1)],[Integer(2),Integer(3)],[Integer(4)]].algebraic_
↪complement()
-Phi[{4}, {2}, {3}, {1}] + Phi[{4}, {2, 3}, {1}] + Phi[{4}, {3}, {2},
↪{1}]
```

coalgebraic_complement()

Return the image of the element `self` of $WQSym$ under the coalgebraic complement involution.

See *WQSymBases.ElementMethods.coalgebraic_complement()* for a definition of the involution and for examples.

See also

algebraic_complement(), *star_involution()*

EXAMPLES:

```
sage: WQSym = algebras.WQSym(ZZ)
sage: Phi = WQSym.Phi()
sage: Phi[[1],[2],[3,4]].coalgebraic_complement()
-Phi[{4}, {3}, {1}, {2}] + Phi[{4}, {3}, {1, 2}] + Phi[{4}, {3}, {2},
↪{1}]
sage: Phi[[2],[1,4],[3]].coalgebraic_complement()
-Phi[{3}, {1}, {4}, {2}] + Phi[{3}, {1, 4}, {2}] + Phi[{3}, {4}, {1},
↪{2}]
```

```
>>> from sage.all import *
>>> WQSym = algebras.WQSym(ZZ)
>>> Phi = WQSym.Phi()
>>> Phi[[Integer(1)],[Integer(2)],[Integer(3),Integer(4)]].coalgebraic_
↪complement()
-Phi[{4}, {3}, {1}, {2}] + Phi[{4}, {3}, {1, 2}] + Phi[{4}, {3}, {2},
↪{1}]
>>> Phi[[Integer(2)],[Integer(1),Integer(4)],[Integer(3)]].coalgebraic_
↪complement()
-Phi[{3}, {1}, {4}, {2}] + Phi[{3}, {1, 4}, {2}] + Phi[{3}, {4}, {1},
↪{2}]
```

star_involution()

Return the image of the element `self` of $WQSym$ under the star involution.

See *WQSymBases.ElementMethods.star_involution()* for a definition of the involution and for examples.

See also

algebraic_complement(), *coalgebraic_complement()*

EXAMPLES:

```
sage: WQSym = algebras.WQSym(ZZ)
sage: Phi = WQSym.Phi()
sage: Phi[[1,2],[5,6],[3,4]].star_involution()
Phi[{3, 4}, {1, 2}, {5, 6}]
sage: Phi[[3], [1, 2], [4]].star_involution()
Phi[{1}, {3, 4}, {2}]
```

```
>>> from sage.all import *
>>> WQSym = algebras.WQSym(ZZ)
>>> Phi = WQSym.Phi()
>>> Phi[[Integer(1),Integer(2)],[Integer(5),Integer(6)],[Integer(3),
↪Integer(4)]].star_involution()
Phi[{3, 4}, {1, 2}, {5, 6}]
>>> Phi[[Integer(3)], [Integer(1), Integer(2)], [Integer(4)]].star_
↪involution()
Phi[{1}, {3, 4}, {2}]
```

coproduct_on_basis(x)

Return the coproduct of `self` on the basis element indexed by the ordered set partition `x`.

The coproduct of the basis element Φ_x indexed by an ordered set partition x of $[n]$ can be computed by the following formula ([NovThi06]):

$$\Delta \Phi_x = \sum \Phi_y \otimes \Phi_z,$$

where the sum ranges over all pairs (y, z) of ordered set partitions y and z such that:

- y and z are ordered set partitions of two complementary subsets of $[n]$;
- x is obtained either by concatenating y and z, or by first concatenating y and z and then merging the two "middle blocks" (i.e., the last block of y and the first block of z); in the latter case, the maximum of the last block of y has to be smaller than the minimum of the first block of z (so that when merging these blocks, their entries don't need to be sorted).

EXAMPLES:

```
sage: Phi = algebras.WQSym(QQ).Phi()

sage: Phi.coproduct(Phi.one())  # indirect doctest
Phi[] # Phi[]
sage: Phi.coproduct( Phi([[1]]) )  # indirect doctest
Phi[] # Phi[{1}] + Phi[{1}] # Phi[]
sage: Phi.coproduct( Phi([[1,2]]) )
Phi[] # Phi[{1, 2}] + Phi[{1}] # Phi[{1}] + Phi[{1, 2}] # Phi[]
sage: Phi.coproduct( Phi([[1], [2]]) )
Phi[] # Phi[{1}, {2}] + Phi[{1}] # Phi[{1}] + Phi[{1}, {2}] # Phi[]
sage: Phi[[1,2],[3],[4]].coproduct()
Phi[] # Phi[{1, 2}, {3}, {4}] + Phi[{1}] # Phi[{1}, {2}, {3}]
 + Phi[{1, 2}] # Phi[{1}, {2}] + Phi[{1, 2}, {3}] # Phi[{1}]
 + Phi[{1, 2}, {3}, {4}] # Phi[]
```

```
>>> from sage.all import *
>>> Phi = algebras.WQSym(QQ).Phi()

>>> Phi.coproduct(Phi.one())  # indirect doctest
```

(continues on next page)

(continued from previous page)

```
Phi[] # Phi[]
>>> Phi.coproduct( Phi([[Integer(1)]]) )  # indirect doctest
Phi[] # Phi[{1}] + Phi[{1}] # Phi[]
>>> Phi.coproduct( Phi([[Integer(1),Integer(2)]]) )
Phi[] # Phi[{1, 2}] + Phi[{1}] # Phi[{1}] + Phi[{1, 2}] # Phi[]
>>> Phi.coproduct( Phi([[Integer(1)], [Integer(2)]]) )
Phi[] # Phi[{1}, {2}] + Phi[{1}] # Phi[{1}] + Phi[{1}, {2}] # Phi[]
>>> Phi[[Integer(1),Integer(2)],[Integer(3)],[Integer(4)]].coproduct()
Phi[] # Phi[{1, 2}, {3}, {4}] + Phi[{1}] # Phi[{1}, {2}, {3}]
 + Phi[{1, 2}] # Phi[{1}, {2}] + Phi[{1, 2}, {3}] # Phi[{1}]
 + Phi[{1, 2}, {3}, {4}] # Phi[]
```

product_on_basis(x, y)

Return the (associative) $*$ product of the basis elements of the Phi basis `self` indexed by the ordered set partitions x and y.

This is obtained by the following algorithm (going back to [NovThi06]):

Let x be an ordered set partition of $[m]$, and y an ordered set partition of $[n]$. Transform x into a list u of all the m elements of $[m]$ by writing out each block of x (in increasing order) and putting bars between each two consecutive blocks; this is called a barred permutation. Do the same for y, but also shift each entry of the resulting barred permutation by m. Let v be the barred permutation of $[m + n] \setminus [m]$ thus obtained. Now, shuffle the two barred permutations u and v (ignoring the bars) in all the $\binom{n+m}{n}$ possible ways. For each shuffle obtained, place bars between some entries of the shuffle, according to the following rule:

- If two consecutive entries of the shuffle both come from u, then place a bar between them if the corresponding entries of u had a bar between them.
- If the first of two consecutive entries of the shuffle comes from v and the second from u, then place a bar between them.

This results in a barred permutation of $[m + n]$. Transform it into an ordered set partition of $[m + n]$, by treating the bars as dividers separating consecutive blocks.

The product $\Phi_x \Phi_y$ is the sum of Φ_p with p ranging over all ordered set partitions obtained this way.

EXAMPLES:

```
sage: A = algebras.WQSym(QQ).Phi()
sage: x = OrderedSetPartition([[1],[2,3]])
sage: y = OrderedSetPartition([[1,2]])
sage: z = OrderedSetPartition([[1,2],[3]])
sage: A.product_on_basis(x, y)
Phi[{1}, {2, 3, 4, 5}] + Phi[{1}, {2, 4}, {3, 5}]
 + Phi[{1}, {2, 4, 5}, {3}] + Phi[{1, 4}, {2, 3, 5}]
 + Phi[{1, 4}, {2, 5}, {3}] + Phi[{1, 4, 5}, {2, 3}]
 + Phi[{4}, {1}, {2, 3, 5}] + Phi[{4}, {1}, {2, 5}, {3}]
 + Phi[{4}, {1, 5}, {2, 3}] + Phi[{4, 5}, {1}, {2, 3}]
sage: A.product_on_basis(x, z)
Phi[{1}, {2, 3, 4, 5}, {6}] + Phi[{1}, {2, 4}, {3, 5}, {6}]
 + Phi[{1}, {2, 4, 5}, {3, 6}] + Phi[{1}, {2, 4, 5}, {6}, {3}]
 + Phi[{1, 4}, {2, 3, 5}, {6}] + Phi[{1, 4}, {2, 5}, {3, 6}]
 + Phi[{1, 4}, {2, 5}, {6}, {3}] + Phi[{1, 4, 5}, {2, 3, 6}]
 + Phi[{1, 4, 5}, {2, 6}, {3}] + Phi[{1, 4, 5}, {6}, {2, 3}]
 + Phi[{4}, {1}, {2, 3, 5}, {6}]
 + Phi[{4}, {1}, {2, 5}, {3, 6}]
```

(continues on next page)

(continued from previous page)

```
 + Phi[{4}, {1}, {2, 5}, {6}, {3}]
 + Phi[{4}, {1, 5}, {2, 3, 6}] + Phi[{4}, {1, 5}, {2, 6}, {3}]
 + Phi[{4}, {1, 5}, {6}, {2, 3}] + Phi[{4, 5}, {1}, {2, 3, 6}]
 + Phi[{4, 5}, {1}, {2, 6}, {3}] + Phi[{4, 5}, {1, 6}, {2, 3}]
 + Phi[{4, 5}, {6}, {1}, {2, 3}]
sage: A.product_on_basis(y, y)
Phi[{1, 2, 3, 4}] + Phi[{1, 3}, {2, 4}] + Phi[{1, 3, 4}, {2}]
 + Phi[{3}, {1, 2, 4}] + Phi[{3}, {1, 4}, {2}]
 + Phi[{3, 4}, {1, 2}]
```

```
>>> from sage.all import *
>>> A = algebras.WQSym(QQ).Phi()
>>> x = OrderedSetPartition([[Integer(1)],[Integer(2),Integer(3)]])
>>> y = OrderedSetPartition([[Integer(1),Integer(2)]])
>>> z = OrderedSetPartition([[Integer(1),Integer(2)],[Integer(3)]])
>>> A.product_on_basis(x, y)
Phi[{1}, {2, 3, 4, 5}] + Phi[{1}, {2, 4}, {3, 5}]
 + Phi[{1}, {2, 4, 5}, {3}] + Phi[{1, 4}, {2, 3, 5}]
 + Phi[{1, 4}, {2, 5}, {3}] + Phi[{1, 4, 5}, {2, 3}]
 + Phi[{4}, {1}, {2, 3, 5}] + Phi[{4}, {1}, {2, 5}, {3}]

 + Phi[{3, 4}, {1, 2}]
```

some_elements()

Return some elements of the word quasi-symmetric functions in the Phi basis.

EXAMPLES:

```
sage: Phi = algebras.WQSym(QQ).Phi()
sage: Phi.some_elements()
[Phi[], Phi[{1}], Phi[{1, 2}], Phi[] + 1/2*Phi[{1}]]
```

```
>>> from sage.all import *
>>> Phi = algebras.WQSym(QQ).Phi()
>>> Phi.some_elements()
[Phi[], Phi[{1}], Phi[{1, 2}], Phi[] + 1/2*Phi[{1}]]
```

X

alias of *Characteristic*

a_realization()

Return a particular realization of `self` (the M-basis).

EXAMPLES:

```
sage: WQSym = algebras.WQSym(QQ)
sage: WQSym.a_realization()
Word Quasi-symmetric functions over Rational Field in the Monomial basis
```

```
>>> from sage.all import *
>>> WQSym = algebras.WQSym(QQ)
>>> WQSym.a_realization()
Word Quasi-symmetric functions over Rational Field in the Monomial basis
```

5.1.17 Cluster algebras and quivers

- A compendium on the cluster algebra and quiver package in Sage [MS2011]
- *Quiver mutation types*
- *Quiver*
- *ClusterSeed*

5.1.18 ClusterSeed

A *cluster seed* is a pair $(B, \mathbf{x})$ with B being a *skew-symmetrizable* $(n + m) \times n$ *-matrix* and with $\mathbf{x}$ being an n-tuple of *independent elements* in the field of rational functions in n variables.

For the compendium on the cluster algebra and quiver package see [MS2011].

See also

For mutation types of cluster seeds, see `sage.combinat.cluster_algebra_quiver.quiver_mutation_type.QuiverMutationType()`. Cluster seeds are closely related to `sage.combinat.cluster_algebra_quiver.quiver.ClusterQuiver()`.

class sage.combinat.cluster_algebra_quiver.cluster_seed.**ClusterSeed**(*data*, *frozen=None*, *is_principal=False*, *user_labels=None*, *user_labels_prefix='x'*)

Bases: SageObject

The *cluster seed* associated to an *exchange matrix*.

INPUT:

- data – can be any of the following:

```
* :class:`QuiverMutationType`
```

  - str – string representing a *QuiverMutationType* or a common quiver type (see Examples)
  - *ClusterQuiver*
  - Matrix – a skew-symmetrizable matrix
  - DiGraph – must be the input data for a quiver
  - List of edges – must be the edge list of a digraph for a quiver

EXAMPLES:

```
sage: S = ClusterSeed(['A',5]); S
A seed for a cluster algebra of rank 5 of type ['A', 5]

sage: S = ClusterSeed(['A',[2,5],1]); S
A seed for a cluster algebra of rank 7 of type ['A', [2, 5], 1]

sage: T = ClusterSeed(S); T
A seed for a cluster algebra of rank 7 of type ['A', [2, 5], 1]

sage: T = ClusterSeed(S._M); T
A seed for a cluster algebra of rank 7

sage: T = ClusterSeed(S.quiver()._digraph); T
A seed for a cluster algebra of rank 7

sage: T = ClusterSeed(S.quiver()._digraph.edges(sort=True)); T
A seed for a cluster algebra of rank 7

sage: S = ClusterSeed(['B',2]); S
A seed for a cluster algebra of rank 2 of type ['B', 2]

sage: S = ClusterSeed(['C',2]); S
A seed for a cluster algebra of rank 2 of type ['B', 2]

sage: S = ClusterSeed(['A', [5,0],1]); S
A seed for a cluster algebra of rank 5 of type ['D', 5]

sage: S = ClusterSeed(['GR',[3,7]]); S
A seed for a cluster algebra of rank 6 of type ['E', 6]
```

A seed for a cluster algebra of rank 4 with 1 frozen variable

>>> S = ClusterSeed(['D', Integer(4)], user_labels=[-Integer(1), Integer(0),
↪Integer(1), Integer(2)]); S
A seed for a cluster algebra of rank 4 of type ['D', 4]
```

LLM_gen_set(*size_limit=-1*)

Produce a list of upper cluster algebra elements corresponding to all vectors in $\{0, 1\}^n$.

INPUT:

- `B` – a skew-symmetric matrix
- `size_limit` – a limit on how many vectors you want the function to return

OUTPUT: an array of elements in the upper cluster algebra

EXAMPLES:

```
sage: B = matrix([[0,1,0],[-1,0,1],[0,-1,0],[1,0,0],[0,1,0],[0,0,1]])
sage: C = ClusterSeed(B)
sage: C.LLM_gen_set()
[1,
 (x1 + x3)/x0,
 (x0*x4 + x2)/x1,
 (x0*x3*x4 + x1*x2 + x2*x3)/(x0*x1),
 (x1*x5 + 1)/x2,
 (x1^2*x5 + x1*x3*x5 + x1 + x3)/(x0*x2),
 (x0*x1*x4*x5 + x0*x4 + x2)/(x1*x2),
 (x0*x1*x3*x4*x5 + x0*x3*x4 + x1*x2 + x2*x3)/(x0*x1*x2)]
```

```
>>> from sage.all import *
>>> B = matrix([[Integer(0),Integer(1),Integer(0)],[-Integer(1),Integer(0),
↪Integer(1)],[Integer(0),-Integer(1),Integer(0)],[Integer(1),Integer(0),
↪Integer(0)],[Integer(0),Integer(1),Integer(0)],[Integer(0),Integer(0),
↪Integer(1)]])
```

(continues on next page)

(continued from previous page)

```
>>> C = ClusterSeed(B)
>>> C.LLM_gen_set()
[1,
 (x1 + x3)/x0,
 (x0*x4 + x2)/x1,
 (x0*x3*x4 + x1*x2 + x2*x3)/(x0*x1),
 (x1*x5 + 1)/x2,
 (x1^2*x5 + x1*x3*x5 + x1 + x3)/(x0*x2),
 (x0*x1*x4*x5 + x0*x4 + x2)/(x1*x2),
 (x0*x1*x3*x4*x5 + x0*x3*x4 + x1*x2 + x2*x3)/(x0*x1*x2)]
```

b_matrix()

Return the B *-matrix* of `self`.

EXAMPLES:

```
sage: ClusterSeed(['A',4]).b_matrix()
[ 0  1  0  0]
[-1  0 -1  0]
[ 0  1  0  1]
[ 0  0 -1  0]

sage: ClusterSeed(['B',4]).b_matrix()
[ 0  1  0  0]
[-1  0 -1  0]
[ 0  1  0  1]
[ 0  0 -2  0]

sage: ClusterSeed(['D',4]).b_matrix()
[ 0  1  0  0]
[-1  0 -1 -1]
[ 0  1  0  0]
[ 0  1  0  0]

sage: ClusterSeed(QuiverMutationType([['A',2],['B',2]])).b_matrix()
[ 0  1  0  0]
[-1  0  0  0]
[ 0  0  0  1]
[ 0  0 -2  0]
```

```
>>> from sage.all import *
>>> ClusterSeed(['A',Integer(4)]).b_matrix()
[ 0  1  0  0]
[-1  0 -1  0]
[ 0  1  0  1]
[ 0  0 -1  0]

>>> ClusterSeed(['B',Integer(4)]).b_matrix()
[ 0  1  0  0]
[-1  0 -1  0]
[ 0  1  0  1]
[ 0  0 -2  0]
```

(continues on next page)

(continued from previous page)

```
>>> ClusterSeed(['D',Integer(4)]).b_matrix()
[ 0  1  0  0]
[-1  0 -1 -1]
[ 0  1  0  0]
[ 0  1  0  0]

>>> ClusterSeed(QuiverMutationType([['A',Integer(2)],['B',Integer(2)]])).b_
↪matrix()
[ 0  1  0  0]
[-1  0  0  0]
[ 0  0  0  1]
[ 0  0 -2  0]
```

b_matrix_class(*depth=+Infinity*, *up_to_equivalence=True*)

Return all B-matrices in the mutation class of `self`.

INPUT:

- `depth` – (default: infinity) integer or infinity, only seeds with distance at most `depth` from `self` are returned
- `up_to_equivalence` – boolean (default: `True`); if `True`, only B-matrices up to equivalence are considered

EXAMPLES:

- for examples see *b_matrix_class_iter()*

b_matrix_class_iter(*depth=+Infinity*, *up_to_equivalence=True*)

Return an iterator through all B-matrices in the mutation class of `self`.

INPUT:

- `depth` – (default: infinity) integer or infinity, only seeds with distance at most `depth` from `self` are returned
- `up_to_equivalence` – boolean (default: `True`); if `True`, only B-matrices up to equivalence are considered

EXAMPLES:

A standard finite type example:

```
sage: S = ClusterSeed(['A',4])
sage: it = S.b_matrix_class_iter()
sage: for T in it: print(T)
[ 0  0  0  1]
[ 0  0  1  1]
[ 0 -1  0  0]
[-1 -1  0  0]
[ 0  0  0  1]
[ 0  0  1  0]
[ 0 -1  0  1]
[-1  0 -1  0]
[ 0  0  1  1]
[ 0  0  0 -1]
```

(continues on next page)

(continued from previous page)

```
[-1  0  0  0]
[-1  1  0  0]
[ 0  0  0  1]
[ 0  0 -1  1]
[ 0  1  0 -1]
[-1 -1  1  0]
[ 0  0  0  1]
[ 0  0 -1  0]
[ 0  1  0 -1]
[-1  0  1  0]
[ 0  0  0 -1]
[ 0  0 -1  1]
[ 0  1  0 -1]
[ 1 -1  1  0]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(4)])
>>> it = S.b_matrix_class_iter()
>>> for T in it: print(T)
[ 0  0  0  1]
[ 0  0  1  1]
[ 0 -1  0  0]
[-1 -1  0  0]
[ 0  0  0  1]
[ 0  0  1  0]
[ 0 -1  0  1]
[-1  0 -1  0]
[ 0  0  1  1]
[ 0  0  0 -1]
[-1  0  0  0]
[-1  1  0  0]
[ 0  0  0  1]
[ 0  0 -1  1]
[ 0  1  0 -1]
[-1 -1  1  0]
[ 0  0  0  1]
[ 0  0 -1  0]
[ 0  1  0 -1]
[-1  0  1  0]
[ 0  0  0 -1]
[ 0  0 -1  1]
[ 0  1  0 -1]
[ 1 -1  1  0]
```

A finite type example with given depth:

```
sage: it = S.b_matrix_class_iter(depth=1)
sage: for T in it: print(T)
[ 0  0  0  1]
[ 0  0  1  1]
[ 0 -1  0  0]
[-1 -1  0  0]
```

(continues on next page)

(continued from previous page)

```
[ 0  0  0  1]
[ 0  0  1  0]
[ 0 -1  0  1]
[-1  0 -1  0]
[ 0  0  1  1]
[ 0  0  0 -1]
[-1  0  0  0]
[-1  1  0  0]
```

```
>>> from sage.all import *
>>> it = S.b_matrix_class_iter(depth=Integer(1))
>>> for T in it: print(T)
[ 0  0  0  1]
[ 0  0  1  1]
[ 0 -1  0  0]
[-1 -1  0  0]
[ 0  0  0  1]
[ 0  0  1  0]
[ 0 -1  0  1]
[-1  0 -1  0]
[ 0  0  1  1]
[ 0  0  0 -1]
[-1  0  0  0]
[-1  1  0  0]
```

Finite type example not considered up to equivalence:

```
sage: S = ClusterSeed(['A',3])
sage: it = S.b_matrix_class_iter(up_to_equivalence=False)
sage: b_matrix_class = list(it)
sage: len(b_matrix_class)
14
sage: b_matrix_class[0]
[ 0  1  0]
[-1  0 -1]
[ 0  1  0]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)])
>>> it = S.b_matrix_class_iter(up_to_equivalence=False)
>>> b_matrix_class = list(it)
>>> len(b_matrix_class)
14
>>> b_matrix_class[Integer(0)]
[ 0  1  0]
[-1  0 -1]
[ 0  1  0]
```

Infinite (but finite mutation) type example:

```
sage: S = ClusterSeed(['A',[1,2],1])
sage: it = S.b_matrix_class_iter()
```

(continues on next page)

(continued from previous page)

```
sage: for T in it: print(T)
[ 0  1  1]
[-1  0  1]
[-1 -1  0]
[ 0 -2  1]
[ 2  0 -1]
[-1  1  0]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',[Integer(1),Integer(2)],Integer(1)])
>>> it = S.b_matrix_class_iter()
>>> for T in it: print(T)
[ 0  1  1]
[-1  0  1]
[-1 -1  0]
[ 0 -2  1]
[ 2  0 -1]
[-1  1  0]
```

Infinite mutation type example:

```
sage: S = ClusterSeed(['E',10])
sage: it = S.b_matrix_class_iter(depth=3)
sage: len ([T for T in it])
266
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['E',Integer(10)])
>>> it = S.b_matrix_class_iter(depth=Integer(3))
>>> len ([T for T in it])
266
```

For a cluster seed from an arbitrarily labelled digraph:

```
sage: dg = DiGraph([['a', 'b'], ['b', 'c']], format='list_of_edges')
sage: S = ClusterSeed(dg, frozen=['b'])
sage: S.b_matrix_class()
[
[ 0  0]  [ 0  0]  [0 0]
[ 0  0]  [ 0  0]  [0 0]
[-1  1], [-1 -1], [1 1]
]
```

```
>>> from sage.all import *
>>> dg = DiGraph([['a', 'b'], ['b', 'c']], format='list_of_edges')
>>> S = ClusterSeed(dg, frozen=['b'])
>>> S.b_matrix_class()
[
[ 0  0]  [ 0  0]  [0 0]
[ 0  0]  [ 0  0]  [0 0]
[-1  1], [-1 -1], [1 1]
]
```

c_matrix(*show_warnings=True*)

Return all *c-vectors* of `self`.

> **Warning**
>
> This method assumes the sign-coherence conjecture and that the input seed is sign-coherent (has an exchange matrix with columns of like signs). Otherwise, computational errors might arise.

EXAMPLES:

```
sage: S = ClusterSeed(['A',3]).principal_extension()
sage: S.mutate([2,1,2])
sage: S.c_matrix()
[ 1  0  0]
[ 0  0 -1]
[ 0 -1  0]

sage: S = ClusterSeed(['A',4])
sage: S.use_g_vectors(False); S.use_fpolys(False)
sage: S.use_c_vectors(False); S.use_d_vectors(False); S.track_mutations(False)
sage: S.c_matrix()
Traceback (most recent call last):
...
ValueError: Unable to calculate c-vectors. Need to use c vectors.
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)]).principal_extension()
>>> S.mutate([Integer(2),Integer(1),Integer(2)])
>>> S.c_matrix()
[ 1  0  0]
[ 0  0 -1]
[ 0 -1  0]

>>> S = ClusterSeed(['A',Integer(4)])
>>> S.use_g_vectors(False); S.use_fpolys(False)
>>> S.use_c_vectors(False); S.use_d_vectors(False); S.track_mutations(False)
>>> S.c_matrix()
Traceback (most recent call last):
...
ValueError: Unable to calculate c-vectors. Need to use c vectors.
```

c_vector(*k*)

Return the `k`-th *c-vector* of `self`. It is obtained as the `k`-th column vector of the bottom part of the `B`-matrix of `self`.

> **Warning**
>
> This method assumes the sign-coherence conjecture and that the input seed is sign-coherent (has an exchange matrix with columns of like signs). Otherwise, computational errors might arise.

EXAMPLES:

```
sage: S = ClusterSeed(['A',3]).principal_extension()
sage: S.mutate([2,1,2])
sage: [S.c_vector(k) for k in range(3)]
[(1, 0, 0), (0, 0, -1), (0, -1, 0)]

sage: S = ClusterSeed(Matrix([[0,1],[-1,0],[1,0],[-1,1]])); S
A seed for a cluster algebra of rank 2 with 2 frozen variables
sage: S.c_vector(0)
(1, 0)

sage: S = ClusterSeed(Matrix([[0,1],[-1,0],[1,0],[-1,1]]))
sage: S.use_c_vectors(bot_is_c=True); S
A seed for a cluster algebra of rank 2 with 2 frozen variables
sage: S.c_vector(0)
(1, -1)
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)]).principal_extension()
>>> S.mutate([Integer(2),Integer(1),Integer(2)])
>>> [S.c_vector(k) for k in range(Integer(3))]
[(1, 0, 0), (0, 0, -1), (0, -1, 0)]

>>> S = ClusterSeed(Matrix([[Integer(0),Integer(1)],[-Integer(1),Integer(0)],
↪[Integer(1),Integer(0)],[-Integer(1),Integer(1)]])); S
A seed for a cluster algebra of rank 2 with 2 frozen variables
>>> S.c_vector(Integer(0))
(1, 0)

>>> S = ClusterSeed(Matrix([[Integer(0),Integer(1)],[-Integer(1),Integer(0)],
↪[Integer(1),Integer(0)],[-Integer(1),Integer(1)]]))
>>> S.use_c_vectors(bot_is_c=True); S
A seed for a cluster algebra of rank 2 with 2 frozen variables
>>> S.c_vector(Integer(0))
(1, -1)
```

cluster()

Return a copy of the *cluster* of `self`.

EXAMPLES:

```
sage: S = ClusterSeed(['A',3])
sage: S.cluster()
[x0, x1, x2]

sage: S.mutate(1)
sage: S.cluster()
[x0, (x0*x2 + 1)/x1, x2]

sage: S.mutate(2)
sage: S.cluster()
[x0, (x0*x2 + 1)/x1, (x0*x2 + x1 + 1)/(x1*x2)]

sage: S.mutate([2,1])
```

(continues on next page)

(continued from previous page)

```
sage: S.cluster()
[x0, x1, x2]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)])
>>> S.cluster()
[x0, x1, x2]

>>> S.mutate(Integer(1))
>>> S.cluster()
[x0, (x0*x2 + 1)/x1, x2]

>>> S.mutate(Integer(2))
>>> S.cluster()
[x0, (x0*x2 + 1)/x1, (x0*x2 + x1 + 1)/(x1*x2)]

>>> S.mutate([Integer(2),Integer(1)])
>>> S.cluster()
[x0, x1, x2]
```

cluster_class(*depth=+Infinity*, *show_depth=False*, *up_to_equivalence=True*)

Return the cluster class of `self` with respect to certain constraints.

INPUT:

- `depth` – (default: infinity) integer, only seeds with distance at most `depth` from `self` are returned
- `return_depth` – (default: `False`) if `True`, ignored if `depth` is set; returns the depth of the mutation class, i.e., the maximal distance from `self` of an element in the mutation class
- `up_to_equivalence` – (default: `True`) if `True`, only clusters up to equivalence are considered

EXAMPLES:

- for examples see *cluster_class_iter()*

cluster_class_iter(*depth=+Infinity*, *show_depth=False*, *up_to_equivalence=True*)

Return an iterator through all clusters in the mutation class of `self`.

INPUT:

- `depth` – (default: infinity) integer or infinity, only seeds with distance at most `depth` from `self` are returned
- `show_depth` – boolean (default: `False`); if `True`, ignored if `depth` is set; returns the depth of the mutation class, i.e., the maximal distance from `self` of an element in the mutation class
- `up_to_equivalence` – boolean (default: `True`); if `True`, only clusters up to equivalence are considered

EXAMPLES:

A standard finite type example:

```
sage: S = ClusterSeed(['A',3])
sage: it = S.cluster_class_iter()
sage: cluster_class = list(it)
sage: len(cluster_class)
```

(continues on next page)

(continued from previous page)

```
14
sage: cluster_class[0]
[x0, x1, x2]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)])
>>> it = S.cluster_class_iter()
>>> cluster_class = list(it)
>>> len(cluster_class)
14
>>> cluster_class[Integer(0)]
[x0, x1, x2]
```

A finite type example with given depth:

```
sage: it = S.cluster_class_iter(depth=1)
sage: for T in it: print(T)
[x0, x1, x2]
[x0, x1, (x1 + 1)/x2]
[x0, (x0*x2 + 1)/x1, x2]
[(x1 + 1)/x0, x1, x2]
```

```
>>> from sage.all import *
>>> it = S.cluster_class_iter(depth=Integer(1))
>>> for T in it: print(T)
[x0, x1, x2]
[x0, x1, (x1 + 1)/x2]
[x0, (x0*x2 + 1)/x1, x2]
[(x1 + 1)/x0, x1, x2]
```

A finite type example where the depth is returned while computing:

```
sage: it = S.cluster_class_iter(show_depth=True)
sage: _ = list(it)
Depth: 0      found: 1          Time: ... s
Depth: 1      found: 4          Time: ... s
Depth: 2      found: 9          Time: ... s
Depth: 3      found: 13         Time: ... s
Depth: 4      found: 14         Time: ... s
```

```
>>> from sage.all import *
>>> it = S.cluster_class_iter(show_depth=True)
>>> _ = list(it)
Depth: 0      found: 1          Time: ... s
Depth: 1      found: 4          Time: ... s
Depth: 2      found: 9          Time: ... s
Depth: 3      found: 13         Time: ... s
Depth: 4      found: 14         Time: ... s
```

Finite type examples not considered up to equivalence:

```
sage: it = S.cluster_class_iter(up_to_equivalence=False)
sage: len([T for T in it])
84

sage: it = ClusterSeed(['A',2]).cluster_class_iter(up_to_equivalence=False)
sage: cluster_class = list(it)
sage: len(cluster_class)
10
sage: cluster_class[0]
[x0, x1]
sage: cluster_class[-1]
[x1, x0]
```

```
>>> from sage.all import *
>>> it = S.cluster_class_iter(up_to_equivalence=False)
>>> len([T for T in it])
84

>>> it = ClusterSeed(['A',Integer(2)]).cluster_class_iter(up_to_
↪equivalence=False)
>>> cluster_class = list(it)
>>> len(cluster_class)
10
>>> cluster_class[Integer(0)]
[x0, x1]
>>> cluster_class[-Integer(1)]
[x1, x0]
```

Infinite type examples:

```
sage: S = ClusterSeed(['A',[1,1],1])
sage: it = S.cluster_class_iter()
sage: next(it)
[x0, x1]
sage: next(it)
[x0, (x0^2 + 1)/x1]
sage: next(it)
[(x1^2 + 1)/x0, x1]
sage: next(it)
[(x0^4 + 2*x0^2 + x1^2 + 1)/(x0*x1^2), (x0^2 + 1)/x1]
sage: next(it)
[(x1^2 + 1)/x0, (x1^4 + x0^2 + 2*x1^2 + 1)/(x0^2*x1)]

sage: it = S.cluster_class_iter(depth=3)
sage: for T in it: print(T)
[x0, x1]
[x0, (x0^2 + 1)/x1]
[(x1^2 + 1)/x0, x1]
[(x0^4 + 2*x0^2 + x1^2 + 1)/(x0*x1^2), (x0^2 + 1)/x1]
[(x1^2 + 1)/x0, (x1^4 + x0^2 + 2*x1^2 + 1)/(x0^2*x1)]
[(x0^4 + 2*x0^2 + x1^2 + 1)/(x0*x1^2), (x0^6 + 3*x0^4 + 2*x0^2*x1^2 + x1^4 +␣
↪3*x0^2 + 2*x1^2 + 1)/(x0^2*x1^3)]
[(x1^6 + x0^4 + 2*x0^2*x1^2 + 3*x1^4 + 2*x0^2 + 3*x1^2 + 1)/(x0^3*x1^2), (x1^
```

(continues on next page)

(continued from previous page)

```
↪4 + x0^2 + 2*x1^2 + 1)/(x0^2*x1)]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',[Integer(1),Integer(1)],Integer(1)])
>>> it = S.cluster_class_iter()
>>> next(it)
[x0, x1]
>>> next(it)
[x0, (x0^2 + 1)/x1]
>>> next(it)
[(x1^2 + 1)/x0, x1]
>>> next(it)
[(x0^4 + 2*x0^2 + x1^2 + 1)/(x0*x1^2), (x0^2 + 1)/x1]
>>> next(it)
[(x1^2 + 1)/x0, (x1^4 + x0^2 + 2*x1^2 + 1)/(x0^2*x1)]

>>> it = S.cluster_class_iter(depth=Integer(3))
>>> for T in it: print(T)
[x0, x1]
[x0, (x0^2 + 1)/x1]
[(x1^2 + 1)/x0, x1]
[(x0^4 + 2*x0^2 + x1^2 + 1)/(x0*x1^2), (x0^2 + 1)/x1]
[(x1^2 + 1)/x0, (x1^4 + x0^2 + 2*x1^2 + 1)/(x0^2*x1)]
[(x0^4 + 2*x0^2 + x1^2 + 1)/(x0*x1^2), (x0^6 + 3*x0^4 + 2*x0^2*x1^2 + x1^4 +␣
↪3*x0^2 + 2*x1^2 + 1)/(x0^2*x1^3)]
[(x1^6 + x0^4 + 2*x0^2*x1^2 + 3*x1^4 + 2*x0^2 + 3*x1^2 + 1)/(x0^3*x1^2), (x1^
↪4 + x0^2 + 2*x1^2 + 1)/(x0^2*x1)]
```

For a cluster seed from an arbitrarily labelled digraph:

```
sage: dg = DiGraph([['a', 'b'], ['b', 'c']], format='list_of_edges')
sage: S = ClusterSeed(dg, frozen=['b'])
sage: S.cluster_class()
[[a, c], [a, (b + 1)/c], [(b + 1)/a, c], [(b + 1)/a, (b + 1)/c]]

sage: S2 = ClusterSeed(dg, frozen=[])
sage: S2.cluster_class()[0]
[a, b, c]
```

```
>>> from sage.all import *
>>> dg = DiGraph([['a', 'b'], ['b', 'c']], format='list_of_edges')
>>> S = ClusterSeed(dg, frozen=['b'])
>>> S.cluster_class()
[[a, c], [a, (b + 1)/c], [(b + 1)/a, c], [(b + 1)/a, (b + 1)/c]]

>>> S2 = ClusterSeed(dg, frozen=[])
>>> S2.cluster_class()[Integer(0)]
[a, b, c]
```

cluster_index(*cluster_str*)

Return the index of a cluster if `use_fpolys` is on.

INPUT:

- `cluster_str` – the string to look for in the cluster

OUTPUT: integer or `None` if the string is not a cluster variable

EXAMPLES:

```
sage: S = ClusterSeed(['A', 4], user_labels=['x', 'y', 'z', 'w']); S.mutate('x
↪')
sage: S.cluster_index('x')
sage: S.cluster_index('(y+1)/x')
0
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A', Integer(4)], user_labels=['x', 'y', 'z', 'w']); S.
↪mutate('x')
>>> S.cluster_index('x')
>>> S.cluster_index('(y+1)/x')
0
```

cluster_variable(*k*)

Generates a cluster variable using F-polynomials.

EXAMPLES:

```
sage: S = ClusterSeed(['A',3])
sage: S.mutate([0,1])
sage: S.cluster_variable(0)
(x1 + 1)/x0
sage: S.cluster_variable(1)
(x0*x2 + x1 + 1)/(x0*x1)
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)])
>>> S.mutate([Integer(0),Integer(1)])
>>> S.cluster_variable(Integer(0))
(x1 + 1)/x0
>>> S.cluster_variable(Integer(1))
(x0*x2 + x1 + 1)/(x0*x1)
```

coefficient(*k*)

Return the *coefficient* of `self` at index `k`, or vertex `k` if `k` is not an index.

EXAMPLES:

```
sage: S = ClusterSeed(['A',3]).principal_extension()
sage: S.mutate([2,1,2])
sage: [S.coefficient(k) for k in range(3)]
[y0, 1/y2, 1/y1]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)]).principal_extension()
>>> S.mutate([Integer(2),Integer(1),Integer(2)])
>>> [S.coefficient(k) for k in range(Integer(3))]
[y0, 1/y2, 1/y1]
```

coefficients()

Return all *coefficients* of `self`.

EXAMPLES:

```
sage: S = ClusterSeed(['A',3]).principal_extension()
sage: S.mutate([2,1,2])
sage: S.coefficients()
[y0, 1/y2, 1/y1]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)]).principal_extension()
>>> S.mutate([Integer(2),Integer(1),Integer(2)])
>>> S.coefficients()
[y0, 1/y2, 1/y1]
```

d_matrix(*show_warnings=True*)

Return the matrix of *d-vectors* of `self`.

EXAMPLES:

```
sage: S = ClusterSeed(['A',4]); S.d_matrix()
[-1  0  0  0]
[ 0 -1  0  0]
[ 0  0 -1  0]
[ 0  0  0 -1]
sage: S.mutate([1,2,1,0,1,3]); S.d_matrix()
[1 1 0 1]
[1 1 1 1]
[1 0 1 1]
[0 0 0 1]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(4)]); S.d_matrix()
[-1  0  0  0]
[ 0 -1  0  0]
[ 0  0 -1  0]
[ 0  0  0 -1]
>>> S.mutate([Integer(1),Integer(2),Integer(1),Integer(0),Integer(1),
↪Integer(3)]); S.d_matrix()
[1 1 0 1]
[1 1 1 1]
[1 0 1 1]
[0 0 0 1]
```

d_vector(*k*)

Return the `k`-th *d-vector* of `self`. This is the exponent vector of the denominator of the `k`-th cluster variable.

EXAMPLES:

```
sage: S = ClusterSeed(['A',3])
sage: S.mutate([2,1,2])
sage: [S.d_vector(k) for k in range(3)]
[(-1, 0, 0), (0, 1, 1), (0, 1, 0)]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)])
>>> S.mutate([Integer(2),Integer(1),Integer(2)])
>>> [S.d_vector(k) for k in range(Integer(3))]
[(-1, 0, 0), (0, 1, 1), (0, 1, 0)]
```

exchangeable_part()

Return the restriction to the principal part (i.e. the exchangeable variables) of `self`.

EXAMPLES:

```
sage: S = ClusterSeed(['A',4])
sage: T = ClusterSeed(S.quiver().digraph().edges(sort=True), frozen=[3])
sage: T.quiver().digraph().edges(sort=True)
[(0, 1, (1, -1)), (2, 1, (1, -1)), (2, 3, (1, -1))]

sage: T.exchangeable_part().quiver().digraph().edges(sort=True)
[(0, 1, (1, -1)), (2, 1, (1, -1))]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(4)])
>>> T = ClusterSeed(S.quiver().digraph().edges(sort=True),␣
↪frozen=[Integer(3)])
>>> T.quiver().digraph().edges(sort=True)
[(0, 1, (1, -1)), (2, 1, (1, -1)), (2, 3, (1, -1))]

>>> T.exchangeable_part().quiver().digraph().edges(sort=True)
[(0, 1, (1, -1)), (2, 1, (1, -1))]
```

f_polynomial(k)

Return the `k`-th *F-polynomial* of `self`. It is obtained from the `k`-th cluster variable by setting all x_i to 1.

Warning

This method assumes the sign-coherence conjecture and that the input seed is sign-coherent (has an exchange matrix with columns of like signs). Otherwise, computational errors might arise.

EXAMPLES:

```
sage: S = ClusterSeed(['A',3]).principal_extension()
sage: S.mutate([2,1,2])
sage: [S.f_polynomial(k) for k in range(3)]
[1, y1*y2 + y2 + 1, y1 + 1]

sage: S = ClusterSeed(Matrix([[0,1],[-1,0],[1,0],[-1,1]]))
sage: S.use_c_vectors(bot_is_c=True); S
A seed for a cluster algebra of rank 2 with 2 frozen variables
sage: T = ClusterSeed(Matrix([[0,1],[-1,0]])).principal_extension(); T
A seed for a cluster algebra of rank 2 with principal coefficients
sage: S.mutate(0)
sage: T.mutate(0)
sage: S.f_polynomials()
```

(continues on next page)

(continued from previous page)

```
[y0 + y1, 1]
sage: T.f_polynomials()
[y0 + 1, 1]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)]).principal_extension()
>>> S.mutate([Integer(2),Integer(1),Integer(2)])
>>> [S.f_polynomial(k) for k in range(Integer(3))]
[1, y1*y2 + y2 + 1, y1 + 1]

>>> S = ClusterSeed(Matrix([[Integer(0),Integer(1)],[-Integer(1),Integer(0)],
↪[Integer(1),Integer(0)],[-Integer(1),Integer(1)]]))
>>> S.use_c_vectors(bot_is_c=True); S
A seed for a cluster algebra of rank 2 with 2 frozen variables
>>> T = ClusterSeed(Matrix([[Integer(0),Integer(1)],[-Integer(1),
↪Integer(0)]])).principal_extension(); T
A seed for a cluster algebra of rank 2 with principal coefficients
>>> S.mutate(Integer(0))
>>> T.mutate(Integer(0))
>>> S.f_polynomials()
[y0 + y1, 1]
>>> T.f_polynomials()
[y0 + 1, 1]
```

f_polynomials()

Return all *F-polynomials* of `self`. These are obtained from the cluster variables by setting all x_i's to 1.

> **Warning**
>
> This method assumes the sign-coherence conjecture and that the input seed is sign-coherent (has an exchange matrix with columns of like signs). Otherwise, computational errors might arise.

EXAMPLES:

```
sage: S = ClusterSeed(['A',3]).principal_extension()
sage: S.mutate([2,1,2])
sage: S.f_polynomials()
[1, y1*y2 + y2 + 1, y1 + 1]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)]).principal_extension()
>>> S.mutate([Integer(2),Integer(1),Integer(2)])
>>> S.f_polynomials()
[1, y1*y2 + y2 + 1, y1 + 1]
```

find_upper_bound(*verbose=False*)

Return the upper bound of the given cluster algebra as a quotient ring.

The upper bound is the intersection of the Laurent polynomial rings of the initial cluster and its neighboring clusters. As such, it always contains both the cluster algebra and the upper cluster algebra. This function uses the algorithm from [MM2015].

When the initial seed is totally coprime (for example, when the unfrozen part of the exchange matrix has full rank), the upper bound is equal to the upper cluster algebra by [BFZ2005].

Warning: The computation time grows rapidly with the size of the seed and the number of steps. For most seeds larger than four vertices, the algorithm may take an infeasible amount of time. Additionally, it will run forever without terminating whenever the upper bound is infinitely-generated (such as the example in [Spe2013]).

INPUT:

- `verbose` – boolean (default: `False`); if `True`, prints output during the computation

EXAMPLES:

- finite type:

```
sage: S = ClusterSeed(['A',3])
sage: S.find_upper_bound()
Quotient of Multivariate Polynomial Ring in x0, x1, x2, x0p, x1p, x2p, z0
 over Rational Field
 by the ideal (x0*x0p - x1 - 1, x1*x1p - x0*x2 - 1, x2*x2p - x1 - 1,
              x0*z0 - x2p, x1*z0 + z0 - x0p*x2p, x2*z0 - x0p,
              x1p*z0 + z0 - x0p*x1p*x2p + x1 + 1)
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)])
>>> S.find_upper_bound()
Quotient of Multivariate Polynomial Ring in x0, x1, x2, x0p, x1p, x2p, z0
 over Rational Field
 by the ideal (x0*x0p - x1 - 1, x1*x1p - x0*x2 - 1, x2*x2p - x1 - 1,
              x0*z0 - x2p, x1*z0 + z0 - x0p*x2p, x2*z0 - x0p,
              x1p*z0 + z0 - x0p*x1p*x2p + x1 + 1)
```

- Markov:

```
sage: B = matrix([[0,2,-2],[-2,0,2],[2,-2,0]])
sage: S = ClusterSeed(B)
sage: S.find_upper_bound()
Quotient of Multivariate Polynomial Ring in x0, x1, x2, x0p, x1p, x2p, z0
 over Rational Field
 by the ideal (x0*x0p - x2^2 - x1^2, x1*x1p - x2^2 - x0^2, x2*x2p - x1^2 -
↪ x0^2,
              x0p*x1p*x2p - x0*x1*x2p - x0*x2*x1p - x1*x2*x0p -␣
↪2*x0*x1*x2,
              x0^3*z0 - x1p*x2p + x1*x2, x0*x1*z0 - x2p - x2,
              x1^3*z0 - x0p*x2p + x0*x2, x0*x2*z0 - x1p - x1,
              x1*x2*z0 - x0p - x0, x2^3*z0 - x0p*x1p + x0*x1)
```

```
>>> from sage.all import *
>>> B = matrix([[Integer(0),Integer(2),-Integer(2)],[-Integer(2),
↪Integer(0),Integer(2)],[Integer(2),-Integer(2),Integer(0)]])
```

(continues on next page)

(continued from previous page)

```
>>> S = ClusterSeed(B)
>>> S.find_upper_bound()
Quotient of Multivariate Polynomial Ring in x0, x1, x2, x0p, x1p, x2p, z0
 over Rational Field
 by the ideal (x0*x0p - x2^2 - x1^2, x1*x1p - x2^2 - x0^2, x2*x2p - x1^2 -
↪ x0^2,
               x0p*x1p*x2p - x0*x1*x2p - x0*x2*x1p - x1*x2*x0p -␣
↪2*x0*x1*x2,
               x0^3*z0 - x1p*x2p + x1*x2, x0*x1*z0 - x2p - x2,
               x1^3*z0 - x0p*x2p + x0*x2, x0*x2*z0 - x1p - x1,
               x1*x2*z0 - x0p - x0, x2^3*z0 - x0p*x1p + x0*x1)
```

first_green_vertex()

Return the first green vertex of `self`.

A vertex is defined to be green if its c-vector has all nonpositive entries. More information on green vertices can be found at [BDP2013]

EXAMPLES:

```
sage: ClusterSeed(['A',3]).principal_extension().first_green_vertex()
0

sage: ClusterSeed(['A',[3,3],1]).principal_extension().first_green_vertex()
0
```

```
>>> from sage.all import *
>>> ClusterSeed(['A',Integer(3)]).principal_extension().first_green_vertex()
0

>>> ClusterSeed(['A',[Integer(3),Integer(3)],Integer(1)]).principal_
↪extension().first_green_vertex()
0
```

first_red_vertex()

Return the first red vertex of `self`.

A vertex is defined to be red if its c-vector has all nonnegative entries. More information on red vertices can be found at [BDP2013].

EXAMPLES:

```
sage: ClusterSeed(['A',3]).principal_extension().first_red_vertex()

sage: ClusterSeed(['A',[3,3],1]).principal_extension().first_red_vertex()

sage: Q = ClusterSeed(['A',[3,3],1]).principal_extension()
sage: Q.mutate(1)
sage: Q.first_red_vertex()
1
```

```
>>> from sage.all import *
>>> ClusterSeed(['A',Integer(3)]).principal_extension().first_red_vertex()
```

(continues on next page)

(continued from previous page)

```
>>> ClusterSeed(['A',[Integer(3),Integer(3)],Integer(1)]).principal_
↪extension().first_red_vertex()

>>> Q = ClusterSeed(['A',[Integer(3),Integer(3)],Integer(1)]).principal_
↪extension()
>>> Q.mutate(Integer(1))
>>> Q.first_red_vertex()
1
```

first_urban_renewal()

Return the first urban renewal vertex.

An urban renewal vertex is one in which there are two arrows pointing toward the vertex and two arrows pointing away.

EXAMPLES:

```
sage: G = ClusterSeed(['GR',[4,9]]); G.first_urban_renewal()
5
```

```
>>> from sage.all import *
>>> G = ClusterSeed(['GR',[Integer(4),Integer(9)]]); G.first_urban_renewal()
5
```

free_vertices()

Return the list of *exchangeable vertices* of `self`.

EXAMPLES:

```
sage: S = ClusterSeed(DiGraph([['a', 'b'], ['c', 'b'], ['c', 'd'], ['e', 'd
↪']]),
....:                         frozen=['b', 'd'])
sage: S.free_vertices()
['a', 'c', 'e']

sage: S = ClusterSeed(DiGraph([[5, 'b']]))
sage: S.free_vertices()
[5, 'b']
```

```
>>> from sage.all import *
>>> S = ClusterSeed(DiGraph([['a', 'b'], ['c', 'b'], ['c', 'd'], ['e', 'd']]),
...                         frozen=['b', 'd'])
>>> S.free_vertices()
['a', 'c', 'e']

>>> S = ClusterSeed(DiGraph([[Integer(5), 'b']]))
>>> S.free_vertices()
[5, 'b']
```

frozen_vertices()

Return the list of *frozen vertices* of `self`.

EXAMPLES:

```
sage: S = ClusterSeed(DiGraph([['a', 'b'], ['c', 'b'], ['c', 'd'], ['e', 'd
↪']]),
....:                         frozen=['b', 'd'])
sage: sorted(S.frozen_vertices())
['b', 'd']
```

```
>>> from sage.all import *
>>> S = ClusterSeed(DiGraph([['a', 'b'], ['c', 'b'], ['c', 'd'], ['e', 'd']]),
...                         frozen=['b', 'd'])
>>> sorted(S.frozen_vertices())
['b', 'd']
```

g_matrix(*show_warnings=True*)

Return the matrix of all *g-vectors* of `self`. These are the degree vectors of the cluster variables after setting all y_i's to 0.

> **Warning**
>
> This method assumes the sign-coherence conjecture and that the input seed is sign-coherent (has an exchange matrix with columns of like signs). Otherwise, computational errors might arise.

EXAMPLES:

```
sage: S = ClusterSeed(['A',3]).principal_extension()
sage: S.mutate([2,1,2])
sage: S.g_matrix()
[ 1  0  0]
[ 0  0 -1]
[ 0 -1  0]

sage: S = ClusterSeed(['A',3])
sage: S.mutate([0,1])
sage: S.g_matrix()
[-1 -1  0]
[ 1  0  0]
[ 0  0  1]

sage: S = ClusterSeed(['A',4])
sage: S.use_g_vectors(False); S.use_fpolys(False); S.g_matrix()
[1 0 0 0]
[0 1 0 0]
[0 0 1 0]
[0 0 0 1]

sage: S = ClusterSeed(['A',4])
sage: S.use_g_vectors(False); S.use_c_vectors(False); S.use_fpolys(False)
sage: S.track_mutations(False); S.g_matrix()
Traceback (most recent call last):
...
ValueError: Unable to calculate g-vectors. Need to use g vectors.
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)]).principal_extension()
>>> S.mutate([Integer(2),Integer(1),Integer(2)])
>>> S.g_matrix()
[ 1  0  0]
[ 0  0 -1]
[ 0 -1  0]

>>> S = ClusterSeed(['A',Integer(3)])
>>> S.mutate([Integer(0),Integer(1)])
>>> S.g_matrix()
[-1 -1  0]
[ 1  0  0]
[ 0  0  1]

>>> S = ClusterSeed(['A',Integer(4)])
>>> S.use_g_vectors(False); S.use_fpolys(False); S.g_matrix()
[1 0 0 0]
[0 1 0 0]
[0 0 1 0]
[0 0 0 1]

>>> S = ClusterSeed(['A',Integer(4)])
>>> S.use_g_vectors(False); S.use_c_vectors(False); S.use_fpolys(False)
>>> S.track_mutations(False); S.g_matrix()
Traceback (most recent call last):
...
ValueError: Unable to calculate g-vectors. Need to use g vectors.
```

g_vector(*k*)

Return the k-th *g-vector* of self. This is the degree vector of the k-th cluster variable after setting all y_i's to 0.

> **Warning**
>
> This method assumes the sign-coherence conjecture and that the input seed is sign-coherent (has an exchange matrix with columns of like signs). Otherwise, computational errors might arise.

EXAMPLES:

```
sage: S = ClusterSeed(['A',3]).principal_extension()
sage: S.mutate([2,1,2])
sage: [S.g_vector(k) for k in range(3)]
[(1, 0, 0), (0, 0, -1), (0, -1, 0)]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)]).principal_extension()
>>> S.mutate([Integer(2),Integer(1),Integer(2)])
>>> [S.g_vector(k) for k in range(Integer(3))]
[(1, 0, 0), (0, 0, -1), (0, -1, 0)]
```

get_upper_cluster_algebra_element(*a*)

Compute an element in the upper cluster algebra of B corresponding to the vector $a \in \mathbf{Z}^n$.

See [LLM2014] for more details.

INPUT:

- B – a skew-symmetric matrix. Must have the same number of columns as the length of the vectors in vd
- a – a vector in $\mathbf{Z}^n$ where n is the number of columns in B

OUTPUT: an element in the upper cluster algebra. Depending on the input it may or may not be irreducible

EXAMPLES:

```
sage: B = matrix([[0,3,-3],[-3,0,3],[3,-3,0],[1,0,0],[0,1,0],[0,0,1]])
sage: C = ClusterSeed(B)
sage: C.get_upper_cluster_algebra_element([1,1,0])
(x0^3*x2^3*x3*x4 + x2^6*x3 + x1^3*x2^3)/(x0*x1)
sage: C.get_upper_cluster_algebra_element([1,1,1])
x0^2*x1^2*x2^2*x3*x4*x5 + x0^2*x1^2*x2^2

sage: B = matrix([[0,3,0],[-3,0,3],[0,-3,0]])
sage: C = ClusterSeed(B)
sage: C.get_upper_cluster_algebra_element([1,1,0])
(x1^3*x2^3 + x0^3 + x2^3)/(x0*x1)
sage: C.get_upper_cluster_algebra_element([1,1,1])
(x0^3*x1^3 + x1^3*x2^3 + x0^3 + x2^3)/(x0*x1*x2)

sage: B = matrix([[0,2],[-3,0],[4,-5]])
sage: C = ClusterSeed(B)
sage: C.get_upper_cluster_algebra_element([1,1])
(x2^9 + x1^3*x2^5 + x0^2*x2^4)/(x0*x1)

sage: B = matrix([[0,3,-5],[-3,0,4],[5,-4,0]])
sage: C = ClusterSeed(B)
sage: C.get_upper_cluster_algebra_element([1,1,1])
x0^4*x1^2*x2^3 + x0^2*x1^3*x2^4
```

```
>>> from sage.all import *
>>> B = matrix([[Integer(0),Integer(3),-Integer(3)],[-Integer(3),Integer(0),
↪Integer(3)],[Integer(3),-Integer(3),Integer(0)],[Integer(1),Integer(0),
↪Integer(0)],[Integer(0),Integer(1),Integer(0)],[Integer(0),Integer(0),
↪Integer(1)]])
>>> C = ClusterSeed(B)
>>> C.get_upper_cluster_algebra_element([Integer(1),Integer(1),Integer(0)])
(x0^3*x2^3*x3*x4 + x2^6*x3 + x1^3*x2^3)/(x0*x1)
>>> C.get_upper_cluster_algebra_element([Integer(1),Integer(1),Integer(1)])
x0^2*x1^2*x2^2*x3*x4*x5 + x0^2*x1^2*x2^2

>>> B = matrix([[Integer(0),Integer(3),Integer(0)],[-Integer(3),Integer(0),
↪Integer(3)],[Integer(0),-Integer(3),Integer(0)]])
>>> C = ClusterSeed(B)
>>> C.get_upper_cluster_algebra_element([Integer(1),Integer(1),Integer(0)])
(x1^3*x2^3 + x0^3 + x2^3)/(x0*x1)
>>> C.get_upper_cluster_algebra_element([Integer(1),Integer(1),Integer(1)])
```

(continues on next page)

(continued from previous page)

```
(x0^3*x1^3 + x1^3*x2^3 + x0^3 + x2^3)/(x0*x1*x2)

>>> B = matrix([[Integer(0),Integer(2)],[-Integer(3),Integer(0)],[Integer(4),-
↪Integer(5)]])
>>> C = ClusterSeed(B)
>>> C.get_upper_cluster_algebra_element([Integer(1),Integer(1)])
(x2^9 + x1^3*x2^5 + x0^2*x2^4)/(x0*x1)

>>> B = matrix([[Integer(0),Integer(3),-Integer(5)],[-Integer(3),Integer(0),
↪Integer(4)],[Integer(5),-Integer(4),Integer(0)]])
>>> C = ClusterSeed(B)
>>> C.get_upper_cluster_algebra_element([Integer(1),Integer(1),Integer(1)])
x0^4*x1^2*x2^3 + x0^2*x1^3*x2^4
```

greedy (*a1*, *a2*, *algorithm='by_recursion'*)

Return the greedy element $x[a_1, a_2]$ assuming that `self` is rank two.

The third input can be `'by_recursion'`, `'by_combinatorics'`, or `'just_numbers'` to specify if the user wants the element computed by the recurrence, combinatorial formula, or wants to set x_1 and x_2 to be one.

See [LLZ2014] for more details.

EXAMPLES:

```
sage: S = ClusterSeed(['R2', [3, 3]])
sage: S.greedy(4, 4)
(x0^12 + x1^12 + 4*x0^9 + 4*x1^9 + 6*x0^6
 + 4*x0^3*x1^3 + 6*x1^6 + 4*x0^3 + 4*x1^3 + 1)/(x0^4*x1^4)
sage: S.greedy(4, 4, 'by_combinatorics')
(x0^12 + x1^12 + 4*x0^9 + 4*x1^9 + 6*x0^6
 + 4*x0^3*x1^3 + 6*x1^6 + 4*x0^3 + 4*x1^3 + 1)/(x0^4*x1^4)
sage: S.greedy(4, 4, 'just_numbers')
35
sage: S = ClusterSeed(['R2', [2, 2]])
sage: S.greedy(1, 2)
(x0^4 + 2*x0^2 + x1^2 + 1)/(x0*x1^2)
sage: S.greedy(1, 2, 'by_combinatorics')
(x0^4 + 2*x0^2 + x1^2 + 1)/(x0*x1^2)
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['R2', [Integer(3), Integer(3)]])
>>> S.greedy(Integer(4), Integer(4))
(x0^12 + x1^12 + 4*x0^9 + 4*x1^9 + 6*x0^6
 + 4*x0^3*x1^3 + 6*x1^6 + 4*x0^3 + 4*x1^3 + 1)/(x0^4*x1^4)
>>> S.greedy(Integer(4), Integer(4), 'by_combinatorics')
(x0^12 + x1^12 + 4*x0^9 + 4*x1^9 + 6*x0^6
 + 4*x0^3*x1^3 + 6*x1^6 + 4*x0^3 + 4*x1^3 + 1)/(x0^4*x1^4)
>>> S.greedy(Integer(4), Integer(4), 'just_numbers')
35
>>> S = ClusterSeed(['R2', [Integer(2), Integer(2)]])
>>> S.greedy(Integer(1), Integer(2))
(x0^4 + 2*x0^2 + x1^2 + 1)/(x0*x1^2)
```

(continues on next page)

(continued from previous page)

```
>>> S.greedy(Integer(1), Integer(2), 'by_combinatorics')
(x0^4 + 2*x0^2 + x1^2 + 1)/(x0*x1^2)
```

green_vertices()

Return the list of green vertices of `self`.

A vertex is defined to be green if its c-vector has all nonpositive entries. More information on green vertices can be found at [BDP2013]

OUTPUT: the green vertices as a list of integers

EXAMPLES:

```
sage: ClusterSeed(['A',3]).principal_extension().green_vertices()
[0, 1, 2]

sage: ClusterSeed(['A',[3,3],1]).principal_extension().green_vertices()
[0, 1, 2, 3, 4, 5]
```

```
>>> from sage.all import *
>>> ClusterSeed(['A',Integer(3)]).principal_extension().green_vertices()
[0, 1, 2]

>>> ClusterSeed(['A',[Integer(3),Integer(3)],Integer(1)]).principal_
↪extension().green_vertices()
[0, 1, 2, 3, 4, 5]
```

ground_field()

Return the *ground field* of the cluster of `self`.

EXAMPLES:

```
sage: S = ClusterSeed(['A',3])
sage: S.ground_field()
Multivariate Polynomial Ring in x0, x1, x2, y0, y1, y2 over Rational Field
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)])
>>> S.ground_field()
Multivariate Polynomial Ring in x0, x1, x2, y0, y1, y2 over Rational Field
```

highest_degree_denominator(*filter=None*)

Return the vertex of the cluster polynomial with highest degree in the denominator.

INPUT:

- `filter` – list or iterable

OUTPUT: integer

EXAMPLES:

```
sage: B = matrix([[0,-1,0,-1,1,1], [1,0,1,0,-1,-1], [0,-1,0,-1,1,1],
....:             [1,0,1,0,-1,-1], [-1,1,-1,1,0,0], [-1,1,-1,1,0,0]])
sage: C = ClusterSeed(B).principal_extension(); C.mutate([0,1,2,4,3,2,5,4,3])
```

(continues on next page)

(continued from previous page)

```
sage: C.highest_degree_denominator()
5
```

```
>>> from sage.all import *
>>> B = matrix([[Integer(0),-Integer(1),Integer(0),-Integer(1),Integer(1),
↪Integer(1)], [Integer(1),Integer(0),Integer(1),Integer(0),-Integer(1),-
↪Integer(1)], [Integer(0),-Integer(1),Integer(0),-Integer(1),Integer(1),
↪Integer(1)],
...             [Integer(1),Integer(0),Integer(1),Integer(0),-Integer(1),-
↪Integer(1)], [-Integer(1),Integer(1),-Integer(1),Integer(1),Integer(0),
↪Integer(0)], [-Integer(1),Integer(1),-Integer(1),Integer(1),Integer(0),
↪Integer(0)]])
>>> C = ClusterSeed(B).principal_extension(); C.mutate([Integer(0),Integer(1),
↪Integer(2),Integer(4),Integer(3),Integer(2),Integer(5),Integer(4),
↪Integer(3)])
>>> C.highest_degree_denominator()
5
```

interact (*fig_size=1*, *circular=True*)

Start an interactive window for cluster seed mutations.

Only in *Jupyter notebook mode*.

INPUT:

- `fig_size` – (default: 1) factor by which the size of the plot is multiplied
- `circular` – boolean (default: `True`); if `True`, the circular plot is chosen, otherwise >>spring<< is used

is_acyclic ()

Return `True` iff `self` is acyclic (i.e., if the underlying quiver is acyclic).

EXAMPLES:

```
sage: ClusterSeed(['A',4]).is_acyclic()
True

sage: ClusterSeed(['A',[2,1],1]).is_acyclic()
True

sage: ClusterSeed([[0,1],[1,2],[2,0]]).is_acyclic()
False
```

```
>>> from sage.all import *
>>> ClusterSeed(['A',Integer(4)]).is_acyclic()
True

>>> ClusterSeed(['A',[Integer(2),Integer(1)],Integer(1)]).is_acyclic()
True

>>> ClusterSeed([[Integer(0),Integer(1)],[Integer(1),Integer(2)],[Integer(2),
↪Integer(0)]]).is_acyclic()
False
```

is_bipartite(*return_bipartition=False*)

Return `True` iff `self` is bipartite (i.e., if the underlying quiver is bipartite).

INPUT:

- `return_bipartition` – boolean (default: `False`); if `True`, the bipartition is returned in the case of `self` being bipartite

EXAMPLES:

```
sage: ClusterSeed(['A',[3,3],1]).is_bipartite()
True

sage: ClusterSeed(['A',[4,3],1]).is_bipartite()
False
```

```
>>> from sage.all import *
>>> ClusterSeed(['A',[Integer(3),Integer(3)],Integer(1)]).is_bipartite()
True

>>> ClusterSeed(['A',[Integer(4),Integer(3)],Integer(1)]).is_bipartite()
False
```

is_finite()

Return `True` if `self` is of finite type.

EXAMPLES:

```
sage: S = ClusterSeed(['A',3])
sage: S.is_finite()
True

sage: S = ClusterSeed(['A',[2,2],1])
sage: S.is_finite()
False
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)])
>>> S.is_finite()
True

>>> S = ClusterSeed(['A',[Integer(2),Integer(2)],Integer(1)])
>>> S.is_finite()
False
```

is_mutation_finite(*nr_of_checks=None*, *return_path=False*)

Return `True` if `self` is of finite mutation type.

INPUT:

- `nr_of_checks` – (default: `None`) number of mutations applied; standard is 500 times the number of vertices of `self`
- `return_path` – boolean (default: `False`); if `True`, in case of `self` not being mutation finite, a path from `self` to a quiver with an edge label $(a, -b)$ and $a * b > 4$ is returned

ALGORITHM:

- A cluster seed is mutation infinite if and only if every $b_{ij} * b_{ji} > -4$. Thus, we apply random mutations in random directions

Warning

- Uses a non-deterministic method by random mutations in various directions.
- In theory, it can return a wrong `True`.

EXAMPLES:

```
sage: S = ClusterSeed(['A',10])
sage: S._mutation_type = None
sage: S.is_mutation_finite()
True

sage: S = ClusterSeed([(0,1),(1,2),(2,3),(3,4),(4,5),(5,6),(6,7),(7,8),(2,9)])
sage: S.is_mutation_finite()
False
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(10)])
>>> S._mutation_type = None
>>> S.is_mutation_finite()
True

>>> S = ClusterSeed([(Integer(0),Integer(1)),(Integer(1),Integer(2)),
↪(Integer(2),Integer(3)),(Integer(3),Integer(4)),(Integer(4),Integer(5)),
↪(Integer(5),Integer(6)),(Integer(6),Integer(7)),(Integer(7),Integer(8)),
↪(Integer(2),Integer(9))])
>>> S.is_mutation_finite()
False
```

m()

Return the number of *frozen variables* of `self`.

EXAMPLES:

```
sage: S = ClusterSeed(['A',3])
sage: S.n()
3

sage: S.m()
0

sage: S = S.principal_extension()
sage: S.m()
3
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)])
>>> S.n()
```

(continues on next page)

(continued from previous page)

```
3

>>> S.m()
0

>>> S = S.principal_extension()
>>> S.m()
3
```

most_decreased_denominator_after_mutation()

Return the vertex that will produce the most decrease in denominator degrees after mutation.

EXAMPLES:

```
sage: S = ClusterSeed(['A',5])
sage: S.mutate([0,2,3,1,2,3,1,2,0,2,3])
sage: S.most_decreased_denominator_after_mutation()
2
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(5)])
>>> S.mutate([Integer(0),Integer(2),Integer(3),Integer(1),Integer(2),
↪Integer(3),Integer(1),Integer(2),Integer(0),Integer(2),Integer(3)])
>>> S.most_decreased_denominator_after_mutation()
2
```

most_decreased_edge_after_mutation()

Return the vertex that will produce the least degrees after mutation.

EXAMPLES:

```
sage: S = ClusterSeed(['A',5])
sage: S.mutate([0,2,3,1,2,3,1,2,0,2,3])
sage: S.most_decreased_edge_after_mutation()
2
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(5)])
>>> S.mutate([Integer(0),Integer(2),Integer(3),Integer(1),Integer(2),
↪Integer(3),Integer(1),Integer(2),Integer(0),Integer(2),Integer(3)])
>>> S.most_decreased_edge_after_mutation()
2
```

mutate(*sequence*, *inplace=True*, *input_type=None*)

Mutate `self` at a vertex or a sequence of vertices.

INPUT:

- `sequence` – a vertex of `self`, an iterator of vertices of `self`, a function which takes in the *ClusterSeed* and returns a vertex or an iterator of vertices, or a string representing a type of vertices to mutate
- `inplace` – boolean (default: `True`); if `False`, the result is returned, otherwise `self` is modified
- `input_type` – (default: `None`) indicates the type of data contained in the sequence

Possible values for vertex types in `sequence` are:

- `'first_source'` – mutates at first found source vertex
- `'sources'` – mutates at all sources
- `'first_sink'` – mutates at first sink
- `'sinks'` – mutates at all sink vertices
- `'green'` – mutates at the first green vertex
- `'red'` – mutates at the first red vertex
- `'urban_renewal'` or `'urban'` – mutates at first urban renewal vertex
- `'all_urban_renewals'` or `'all_urban'` – mutates at all urban renewal vertices

For `input_type`, if no value is given, preference will be given to vertex names, then indices, then cluster variables. If all input is not of the same type, an error is given. Possible values for `input_type` are:

- `'vertices'` – interprets the input sequence as vertices
- `'indices'` – interprets the input sequence as indices
- `'cluster_vars'` – interprets the input sequence as cluster variables. This must be selected if inputting a sequence of cluster variables.

EXAMPLES:

```
sage: S = ClusterSeed(['A',4]); S.b_matrix()
[ 0  1  0  0]
[-1  0 -1  0]
[ 0  1  0  1]
[ 0  0 -1  0]

sage: S.mutate(0); S.b_matrix()
[ 0 -1  0  0]
[ 1  0 -1  0]
[ 0  1  0  1]
[ 0  0 -1  0]

sage: T = S.mutate(0, inplace=False); T
A seed for a cluster algebra of rank 4 of type ['A', 4]

sage: S.mutate(0)
sage: S == T

mutation_analysis(*options=['all']*, *filter=None*)

Run an analysis of all potential mutation options. Note that this might take a long time on large seeds.

> **Note**
>
> Edges are only returned if we have a non-valued quiver. Green and red vertices are only returned if the cluster is principal.

INPUT:

- `options` – (default: `['all']`) a list of mutation options
- `filter` – (default: `None`) a vertex or interval of vertices to limit our search to

Possible options are:

- `'all'` – all options below
- `'edges'` – number of edges (works with skew-symmetric quivers)
- `'edge_diff'` – edges added/deleted (works with skew-symmetric quivers)
- `'green_vertices'` – list of green vertices (works with principals)
- `'green_vertices_diff'` – green vertices added/removed (works with principals)
- `'red_vertices'` – list of red vertices (works with principals)
- `'red_vertices_diff'` – red vertices added/removed (works with principals)
- `'urban_renewals'` – list of urban renewal vertices
- `'urban_renewals_diff'` – urban renewal vertices added/removed
- `'sources'` – list of source vertices
- `'sources_diff'` – source vertices added/removed
- `'sinks'` – list of sink vertices

- `'sinks_diff'` – sink vertices added/removed
- `'denominators'` – list of all denominators of the cluster variables

OUTPUT:

Outputs a dictionary indexed by the vertex numbers. Each vertex will itself also be a dictionary with each desired option included as a key in the dictionary. As an example you would get something similar to: `{0: {'edges': 1}, 1: {'edges': 2}}`. This represents that if you were to do a mutation at the current seed then mutating at vertex 0 would result in a quiver with 1 edge and mutating at vertex 0 would result in a quiver with 2 edges.

EXAMPLES:

```

```

mutation_class(*depth=+Infinity*, *show_depth=False*, *return_paths=False*, *up_to_equivalence=True*, *only_sink_source=False*)

Return the mutation class of `self` with respect to certain constraints.

Note

Vertex labels are not tracked in this method.

See also

mutation_class_iter()

INPUT:

- `depth` – (default: `infinity`) integer, only seeds with distance at most depth from `self` are returned
- `show_depth` – boolean (default: `False`); if `True`, the actual depth of the mutation is shown
- `return_paths` – boolean (default: `False`); if `True`, a shortest path of mutation sequences from self to the given quiver is returned as well
- `up_to_equivalence` – boolean (default: `True`); if `True`, only seeds up to equivalence are considered
- `sink_source` – boolean (default: `False`); if `True`, only mutations at sinks and sources are applied

EXAMPLES:

- for examples see *mutation_class_iter()*

mutation_class_iter(*depth=+Infinity*, *show_depth=False*, *return_paths=False*, *up_to_equivalence=True*, *only_sink_source=False*)

Return an iterator for the mutation class of `self` with respect to certain constraints.

INPUT:

- `depth` – (default: infinity) integer or infinity, only seeds with distance at most `depth` from `self` are returned
- `show_depth` – boolean (default: `False`); if `True`, the current depth of the mutation is shown while computing
- `return_paths` – boolean (default: `False`); if `True`, a shortest path of mutations from `self` to the given quiver is returned as well
- `up_to_equivalence` – boolean (default: `True`); if `True`, only one seed up to simultaneous permutation of rows and columns of the exchange matrix is recorded
- `sink_source` – boolean (default: `False`); if `True`, only mutations at sinks and sources are applied

EXAMPLES:

A standard finite type example:

```
sage: S = ClusterSeed(['A',3])
sage: it = S.mutation_class_iter()
sage: for T in it: print(T)
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
```

(continues on next page)

(continued from previous page)

```
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)])
>>> it = S.mutation_class_iter()
>>> for T in it: print(T)
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
```

A finite type example with given depth:

```
sage: it = S.mutation_class_iter(depth=1)
sage: for T in it: print(T)
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
```

```
>>> from sage.all import *
>>> it = S.mutation_class_iter(depth=Integer(1))
>>> for T in it: print(T)
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
```

A finite type example where the depth is shown while computing:

```
sage: it = S.mutation_class_iter(show_depth=True)
sage: for T in it: pass
Depth: 0     found: 1          Time: ... s
Depth: 1     found: 4          Time: ... s
Depth: 2     found: 9          Time: ... s
Depth: 3     found: 13         Time: ... s
Depth: 4     found: 14         Time: ... s
```

```
>>> from sage.all import *
>>> it = S.mutation_class_iter(show_depth=True)
>>> for T in it: pass
```

(continues on next page)

(continued from previous page)

```
Depth: 0     found: 1          Time: ... s
Depth: 1     found: 4          Time: ... s
Depth: 2     found: 9          Time: ... s
Depth: 3     found: 13         Time: ... s
Depth: 4     found: 14         Time: ... s
```

A finite type example with shortest paths returned:

```
sage: it = S.mutation_class_iter(return_paths=True)
sage: mutation_class = list(it)
sage: len(mutation_class)
14
sage: mutation_class[0]
(A seed for a cluster algebra of rank 3 of type ['A', 3], [])
```

```
>>> from sage.all import *
>>> it = S.mutation_class_iter(return_paths=True)
>>> mutation_class = list(it)
>>> len(mutation_class)
14
>>> mutation_class[Integer(0)]
(A seed for a cluster algebra of rank 3 of type ['A', 3], [])
```

Finite type examples not considered up to equivalence:

```
sage: it = S.mutation_class_iter(up_to_equivalence=False)
sage: len([T for T in it])
84

sage: it = ClusterSeed(['A',2]).mutation_class_iter(return_paths=True,
....:                                                 up_to_equivalence=False)
sage: mutation_class = list(it)
sage: len(mutation_class)
10
sage: mutation_class[0]
(A seed for a cluster algebra of rank 2 of type ['A', 2], [])
```

```
>>> from sage.all import *
>>> it = S.mutation_class_iter(up_to_equivalence=False)
>>> len([T for T in it])
84

>>> it = ClusterSeed(['A',Integer(2)]).mutation_class_iter(return_paths=True,
...                                                 up_to_equivalence=False)
>>> mutation_class = list(it)
>>> len(mutation_class)
10
>>> mutation_class[Integer(0)]
(A seed for a cluster algebra of rank 2 of type ['A', 2], [])
```

Check that Issue #14638 is fixed:

```
sage: S = ClusterSeed(['E',6])
sage: MC = S.mutation_class(depth=7); len(MC)   # long time
534
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['E',Integer(6)])
>>> MC = S.mutation_class(depth=Integer(7)); len(MC)   # long time
534
```

Infinite type examples:

```
sage: S = ClusterSeed(['A',[1,1],1])
sage: it = S.mutation_class_iter()
sage: next(it)
A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1]
sage: next(it)
A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1]
sage: next(it)
A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1]
sage: next(it)
A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1]

sage: it = S.mutation_class_iter(depth=3, return_paths=True)
sage: for T in it: print(T)
(A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1], [])
(A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1], [1])
(A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1], [0])
(A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1], [1, 0])
(A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1], [0, 1])
(A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1], [1, 0, 1])
(A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1], [0, 1, 0])
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',[Integer(1),Integer(1)],Integer(1)])
>>> it = S.mutation_class_iter()
>>> next(it)
A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1]
>>> next(it)
A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1]
>>> next(it)
A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1]
>>> next(it)
A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1]

>>> it = S.mutation_class_iter(depth=Integer(3), return_paths=True)
>>> for T in it: print(T)
(A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1], [])
(A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1], [1])
(A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1], [0])
(A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1], [1, 0])
(A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1], [0, 1])
(A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1], [1, 0, 1])
(A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1], [0, 1, 0])
```

mutation_sequence(*sequence*, *show_sequence=False*, *fig_size=1.2*, *return_output='seed'*)

Return the seeds obtained by mutating `self` at all vertices in `sequence`.

INPUT:

- `sequence` – an iterable of vertices of self
- `show_sequence` – boolean (default: `False`); if `True`, a png containing the associated quivers is shown
- `fig_size` – (default: 1.2) factor by which the size of the plot is multiplied
- `return_output` – (default: `'seed'`) determines what output is to be returned:
  - if `'seed'`, outputs all the cluster seeds obtained by the `sequence` of mutations
  - if `'matrix'`, outputs a list of exchange matrices
  - if `'var'`, outputs a list of new cluster variables obtained at each step

EXAMPLES:

```
sage: S = ClusterSeed(['A',2])
sage: for T in S.mutation_sequence([0,1,0]):
....:     print(T.b_matrix())
[ 0 -1]
[ 1  0]
[ 0  1]
[-1  0]
[ 0 -1]
[ 1  0]

sage: S = ClusterSeed(['A',2])
sage: S.mutation_sequence([0,1,0,1], return_output='var')
[(x1 + 1)/x0, (x0 + x1 + 1)/(x0*x1), (x0 + 1)/x1, x0]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(2)])
>>> for T in S.mutation_sequence([Integer(0),Integer(1),Integer(0)]):
...     print(T.b_matrix())
[ 0 -1]
[ 1  0]
[ 0  1]
[-1  0]
[ 0 -1]
[ 1  0]

>>> S = ClusterSeed(['A',Integer(2)])
>>> S.mutation_sequence([Integer(0),Integer(1),Integer(0),Integer(1)], return_
↪output='var')
[(x1 + 1)/x0, (x0 + x1 + 1)/(x0*x1), (x0 + 1)/x1, x0]
```

mutation_type()

Return the mutation type of each connected component of `self`, if it can be determined.

Otherwise, the mutation type of this component is set to be unknown.

The mutation types of the components are ordered by vertex labels.

Warning

- All finite types can be detected,
- All affine types can be detected, **except** affine type D (the algorithm is not yet implemented)
- All exceptional types can be detected.
- Might fail to work if it is used within different Sage processes simultaneously (that happened in the doctesting).

EXAMPLES:

- finite types:

```
sage: S = ClusterSeed(['A',5])
sage: S._mutation_type = S._quiver._mutation_type = None
sage: S.mutation_type()
['A', 5]

sage: S = ClusterSeed([(0,1),(1,2),(2,3),(3,4)])
sage: S.mutation_type()
['A', 5]

sage: S = ClusterSeed(DiGraph([['a','b'],['c','b'],['c','d'],['e','d']]),
....:                 frozen=['c'])
sage: S.mutation_type()
[ ['A', 2], ['A', 2] ]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(5)])
>>> S._mutation_type = S._quiver._mutation_type = None
>>> S.mutation_type()
['A', 5]

>>> S = ClusterSeed([(Integer(0),Integer(1)),(Integer(1),Integer(2)),
↪(Integer(2),Integer(3)),(Integer(3),Integer(4))])
>>> S.mutation_type()
['A', 5]

>>> S = ClusterSeed(DiGraph([['a','b'],['c','b'],['c','d'],['e','d']]),
...                 frozen=['c'])
>>> S.mutation_type()
[ ['A', 2], ['A', 2] ]
```

- affine types:

```
sage: S = ClusterSeed(['E',8,[1,1]]); S
A seed for a cluster algebra of rank 10 of type ['E', 8, [1, 1]]
sage: S._mutation_type = S._quiver._mutation_type = None; S
A seed for a cluster algebra of rank 10
sage: S.mutation_type() # long time
['E', 8, [1, 1]]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['E',Integer(8),[Integer(1),Integer(1)]]); S
A seed for a cluster algebra of rank 10 of type ['E', 8, [1, 1]]
>>> S._mutation_type = S._quiver._mutation_type = None; S
A seed for a cluster algebra of rank 10
>>> S.mutation_type() # long time
['E', 8, [1, 1]]
```

- the not yet working affine type D:

```
sage: S = ClusterSeed(['D',4,1])
sage: S._mutation_type = S._quiver._mutation_type = None
sage: S.mutation_type() # todo: not implemented
['D', 4, 1]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['D',Integer(4),Integer(1)])
>>> S._mutation_type = S._quiver._mutation_type = None
>>> S.mutation_type() # todo: not implemented
['D', 4, 1]
```

- the exceptional types:

```
sage: S = ClusterSeed(['X',6])
sage: S._mutation_type = S._quiver._mutation_type = None
sage: S.mutation_type() # long time
['X', 6]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['X',Integer(6)])
>>> S._mutation_type = S._quiver._mutation_type = None
>>> S.mutation_type() # long time
['X', 6]
```

- infinite types:

```
sage: S = ClusterSeed(['GR',[4,9]])
sage: S._mutation_type = S._quiver._mutation_type = None
sage: S.mutation_type()
'undetermined infinite mutation type'
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['GR',[Integer(4),Integer(9)]])
>>> S._mutation_type = S._quiver._mutation_type = None
>>> S.mutation_type()
'undetermined infinite mutation type'
```

mutations()

Return the list of mutations `self` has undergone if they are being tracked.

EXAMPLES:

```
sage: S = ClusterSeed(['A',3])
sage: S.mutations()
[]

sage: S.mutate([0,1,0,2])
sage: S.mutations()
[0, 1, 0, 2]

sage: S.track_mutations(False)
sage: S.mutations()
Traceback (most recent call last):
...
ValueError: Not recording mutation sequence.  Need to track mutations.
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)])
>>> S.mutations()
[]

>>> S.mutate([Integer(0),Integer(1),Integer(0),Integer(2)])
>>> S.mutations()
[0, 1, 0, 2]

>>> S.track_mutations(False)
>>> S.mutations()
Traceback (most recent call last):
...
ValueError: Not recording mutation sequence.  Need to track mutations.
```

n()

Return the number of *exchangeable variables* of `self`.

EXAMPLES:

```
sage: S = ClusterSeed(['A', 3])
sage: S.n()
3
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A', Integer(3)])
>>> S.n()
3
```

oriented_exchange_graph()

Return the oriented exchange graph of `self` as a directed graph.

The seed must be a cluster seed for a cluster algebra of finite type with principal coefficients (the corresponding quiver must have mutable vertices $0, 1, ..., n-1$).

EXAMPLES:

```
sage: S = ClusterSeed(['A', 2]).principal_extension()
sage: G = S.oriented_exchange_graph(); G
Digraph on 5 vertices
```

(continues on next page)

(continued from previous page)

```
sage: G.out_degree_sequence()
[2, 1, 1, 1, 0]

sage: S = ClusterSeed(['B', 2]).principal_extension()
sage: G = S.oriented_exchange_graph(); G
Digraph on 6 vertices
sage: G.out_degree_sequence()
[2, 1, 1, 1, 1, 0]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A', Integer(2)]).principal_extension()
>>> G = S.oriented_exchange_graph(); G
Digraph on 5 vertices
>>> G.out_degree_sequence()
[2, 1, 1, 1, 0]

>>> S = ClusterSeed(['B', Integer(2)]).principal_extension()
>>> G = S.oriented_exchange_graph(); G
Digraph on 6 vertices
>>> G.out_degree_sequence()
[2, 1, 1, 1, 1, 0]
```

plot (*circular=False*, *mark=None*, *save_pos=False*, *force_c=False*, *with_greens=False*, *add_labels=False*)

Return the plot of the quiver of `self`.

INPUT:

- `circular` – boolean (default: `False`); if `True`, the circular plot is chosen, otherwise >>spring<< is used
- `mark` – (default: `None`) if set to i, the vertex i is highlighted
- `save_pos` – boolean (default: `False`); if `True`, the positions of the vertices are saved
- `force_c` – boolean (default: `False`); if `True`, will show the frozen vertices even if they were never initialized
- `with_greens` – boolean (default: `False`); if `True`, will display the green vertices in green
- `add_labels` – boolean (default: `False`); if `True`, will use the initial variables as labels

EXAMPLES:

```
sage: S = ClusterSeed(['A',5])
sage: S.plot()                                                          #␣
↪needs sage.plot sage.symbolic
Graphics object consisting of 15 graphics primitives
sage: S.plot(circular=True)                                             #␣
↪needs sage.plot sage.symbolic
Graphics object consisting of 15 graphics primitives
sage: S.plot(circular=True, mark=1)                                     #␣
↪needs sage.plot sage.symbolic
Graphics object consisting of 15 graphics primitives
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(5)])
>>> S.plot()                                                            #␣
↪needs sage.plot sage.symbolic
Graphics object consisting of 15 graphics primitives
>>> S.plot(circular=True)                                               #␣
↪needs sage.plot sage.symbolic
Graphics object consisting of 15 graphics primitives
>>> S.plot(circular=True, mark=Integer(1))                                ␣
↪     # needs sage.plot sage.symbolic
Graphics object consisting of 15 graphics primitives
```

principal_extension()

Return the principal extension of `self`, yielding a $2n \times n$ matrix.

Raises an error if the input seed has a non-square exchange matrix. In this case, the method instead adds n frozen variables to any previously frozen variables. I.e., the seed obtained by adding a frozen variable to every exchangeable variable of `self`.

EXAMPLES:

```
sage: S = ClusterSeed([[0,1],[1,2],[2,3],[2,4]]); S
A seed for a cluster algebra of rank 5

sage: T = S.principal_extension(); T
A seed for a cluster algebra of rank 5 with principal coefficients

sage: T.b_matrix()
[ 0  1  0  0  0]
[-1  0  1  0  0]
[ 0 -1  0  1  1]
[ 0  0 -1  0  0]
[ 0  0 -1  0  0]
[ 1  0  0  0  0]
[ 0  1  0  0  0]
[ 0  0  1  0  0]
[ 0  0  0  1  0]
[ 0  0  0  0  1]

sage: S = ClusterSeed(['A', 4], user_labels=['a', 'b', 'c', 'd'])
sage: T = S.principal_extension()
sage: T.cluster()
[a, b, c, d]
sage: T.coefficients()
[y0, y1, y2, y3]
sage: S2 = ClusterSeed(['A', 4], user_labels={0:'a', 1:'b', 2:'c', 3:'d'})
sage: S2 == S
True
sage: T2 = S2.principal_extension()
sage: T2 == T
True
```

```
>>> from sage.all import *
```

(continues on next page)

(continued from previous page)

```
>>> S = ClusterSeed([[Integer(0),Integer(1)],[Integer(1),Integer(2)],
↪[Integer(2),Integer(3)],[Integer(2),Integer(4)]]); S
A seed for a cluster algebra of rank 5

>>> T = S.principal_extension(); T
A seed for a cluster algebra of rank 5 with principal coefficients

>>> T.b_matrix()
[ 0  1  0  0  0]
[-1  0  1  0  0]
[ 0 -1  0  1  1]
[ 0  0 -1  0  0]
[ 0  0 -1  0  0]
[ 1  0  0  0  0]
[ 0  1  0  0  0]
[ 0  0  1  0  0]
[ 0  0  0  1  0]
[ 0  0  0  0  1]

>>> S = ClusterSeed(['A', Integer(4)], user_labels=['a', 'b', 'c', 'd'])
>>> T = S.principal_extension()
>>> T.cluster()
[a, b, c, d]
>>> T.coefficients()
[y0, y1, y2, y3]
>>> S2 = ClusterSeed(['A', Integer(4)], user_labels={Integer(0):'a',␣
↪Integer(1):'b', Integer(2):'c', Integer(3):'d'})
>>> S2 == S
True
>>> T2 = S2.principal_extension()
>>> T2 == T
True
```

quiver()

Return the *quiver* associated to `self`.

EXAMPLES:

```
sage: S = ClusterSeed(['A',3])
sage: S.quiver()
Quiver on 3 vertices of type ['A', 3]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)])
>>> S.quiver()
Quiver on 3 vertices of type ['A', 3]
```

red_vertices()

Return the list of red vertices of `self`.

A vertex is defined to be red if its c-vector has all nonnegative entries. More information on red vertices can be found at [BDP2013].

OUTPUT: the red vertices as a list of integers

EXAMPLES:

```
sage: ClusterSeed(['A',3]).principal_extension().red_vertices()
[]

sage: ClusterSeed(['A',[3,3],1]).principal_extension().red_vertices()
[]

sage: Q = ClusterSeed(['A',[3,3],1]).principal_extension()
sage: Q.mutate(1)
sage: Q.red_vertices()
[1]
```

```
>>> from sage.all import *
>>> ClusterSeed(['A',Integer(3)]).principal_extension().red_vertices()
[]

>>> ClusterSeed(['A',[Integer(3),Integer(3)],Integer(1)]).principal_
↪extension().red_vertices()
[]

>>> Q = ClusterSeed(['A',[Integer(3),Integer(3)],Integer(1)]).principal_
↪extension()
>>> Q.mutate(Integer(1))
>>> Q.red_vertices()
[1]
```

reorient(*data*)

Reorients `self` with respect to the given total order, or with respect to an iterator of ordered pairs.

> **Warning**
>
> - This operation might change the mutation type of `self`.
> - Ignores ordered pairs (i, j) for which neither (i, j) nor (j, i) is an edge of `self`.

INPUT:

- `data` – an iterator defining a total order on `self.vertices()`, or an iterator of ordered pairs in `self` defining the new orientation of these edges.

EXAMPLES:

```
sage: S = ClusterSeed(['A',[2,3],1])
sage: S.mutation_type()
['A', [2, 3], 1]

sage: S.reorient([(0,1),(2,3)])
sage: S.mutation_type()
['D', 5]

sage: S.reorient([(1,0),(2,3)])
sage: S.mutation_type()
```

(continues on next page)

(continued from previous page)

```
['A', [1, 4], 1]

sage: S.reorient([0,1,2,3,4])
sage: S.mutation_type()
['A', [1, 4], 1]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',[Integer(2),Integer(3)],Integer(1)])
>>> S.mutation_type()
['A', [2, 3], 1]

>>> S.reorient([(Integer(0),Integer(1)),(Integer(2),Integer(3))])
>>> S.mutation_type()
['D', 5]

>>> S.reorient([(Integer(1),Integer(0)),(Integer(2),Integer(3))])
>>> S.mutation_type()
['A', [1, 4], 1]

>>> S.reorient([Integer(0),Integer(1),Integer(2),Integer(3),Integer(4)])
>>> S.mutation_type()
['A', [1, 4], 1]
```

reset_cluster()

Reset the cluster of `self` to the initial cluster.

EXAMPLES:

```
sage: S = ClusterSeed(['A',3])
sage: S.mutate([1,2,1])
sage: S.cluster()
[x0, (x1 + 1)/x2, (x0*x2 + x1 + 1)/(x1*x2)]

sage: S.reset_cluster()
sage: S.cluster()
[x0, x1, x2]

sage: T = S.principal_extension()
sage: T.cluster()
[x0, x1, x2]
sage: T.mutate([1,2,1])
sage: T.cluster()
[x0, (x1*y2 + x0)/x2, (x1*y1*y2 + x0*y1 + x2)/(x1*x2)]

sage: T.reset_cluster()
sage: T.cluster()
[x0, x1, x2]

sage: S = ClusterSeed(['B',3], user_labels=[[1,2],[2,3],[3,4]],
....:                   user_labels_prefix='p')
sage: S.mutate([0,1])
sage: S.cluster()
```

(continues on next page)

(continued from previous page)

```
[(p_2_3 + 1)/p_1_2, (p_1_2*p_3_4^2 + p_2_3 + 1)/(p_1_2*p_2_3), p_3_4]

sage: S.reset_cluster()
sage: S.cluster()
[p_1_2, p_2_3, p_3_4]
sage: S.g_matrix()
[1 0 0]
[0 1 0]
[0 0 1]
sage: S.f_polynomials()
[1, 1, 1]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)])
>>> S.mutate([Integer(1),Integer(2),Integer(1)])
>>> S.cluster()
[x0, (x1 + 1)/x2, (x0*x2 + x1 + 1)/(x1*x2)]

>>> S.reset_cluster()
>>> S.cluster()
[x0, x1, x2]

>>> T = S.principal_extension()
>>> T.cluster()
[x0, x1, x2]
>>> T.mutate([Integer(1),Integer(2),Integer(1)])
>>> T.cluster()
[x0, (x1*y2 + x0)/x2, (x1*y1*y2 + x0*y1 + x2)/(x1*x2)]

>>> T.reset_cluster()
>>> T.cluster()
[x0, x1, x2]

>>> S = ClusterSeed(['B',Integer(3)], user_labels=[[Integer(1),Integer(2)],
↪[Integer(2),Integer(3)],[Integer(3),Integer(4)]],
...                     user_labels_prefix='p')
>>> S.mutate([Integer(0),Integer(1)])
>>> S.cluster()
[(p_2_3 + 1)/p_1_2, (p_1_2*p_3_4^2 + p_2_3 + 1)/(p_1_2*p_2_3), p_3_4]

>>> S.reset_cluster()
>>> S.cluster()
[p_1_2, p_2_3, p_3_4]
>>> S.g_matrix()
[1 0 0]
[0 1 0]
[0 0 1]
>>> S.f_polynomials()
[1, 1, 1]
```

reset_coefficients()

Reset the coefficients of `self` to the frozen variables but keep the current cluster.

This raises an error if the number of frozen variables is different from the number of exchangeable variables.

Warning

This command to be phased out since *use_c_vectors()* does this more effectively.

EXAMPLES:

```
sage: S = ClusterSeed(['A',3]).principal_extension()
sage: S.b_matrix()
[ 0  1  0]
[-1  0 -1]
[ 0  1  0]
[ 1  0  0]
[ 0  1  0]
[ 0  0  1]
sage: S.mutate([1,2,1])
sage: S.b_matrix()
[ 0  1 -1]
[-1  0  1]
[ 1 -1  0]
[ 1  0  0]
[ 0  1 -1]
[ 0  0 -1]
sage: S.reset_coefficients()
sage: S.b_matrix()
[ 0  1 -1]
[-1  0  1]
[ 1 -1  0]
[ 1  0  0]
[ 0  1  0]
[ 0  0  1]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)]).principal_extension()
>>> S.b_matrix()
[ 0  1  0]
[-1  0 -1]
[ 0  1  0]
[ 1  0  0]
[ 0  1  0]
[ 0  0  1]
>>> S.mutate([Integer(1),Integer(2),Integer(1)])
>>> S.b_matrix()
[ 0  1 -1]
[-1  0  1]
[ 1 -1  0]
[ 1  0  0]
[ 0  1 -1]
[ 0  0 -1]
>>> S.reset_coefficients()
>>> S.b_matrix()
```

(continues on next page)

(continued from previous page)

```
[ 0  1 -1]
[-1  0  1]
[ 1 -1  0]
[ 1  0  0]
[ 0  1  0]
[ 0  0  1]
```

save_image(*filename*, *circular=False*, *mark=None*, *save_pos=False*)

Save the plot of the underlying digraph of the quiver of `self`.

INPUT:

- `filename` – the filename the image is saved to
- `circular` – boolean (default: `False`); if `True`, the circular plot is chosen, otherwise >>spring<< is used
- `mark` – (default: `None`) if set to i, the vertex i is highlighted
- `save_pos` – boolean (default: `False`); if `True`, the positions of the vertices are saved

EXAMPLES:

```
sage: S = ClusterSeed(['F',4,[1,2]])
sage: import tempfile
sage: with tempfile.NamedTemporaryFile(suffix='.png') as f:                    #␣
↪needs sage.plot sage.symbolic
....:     S.save_image(f.name)
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['F',Integer(4),[Integer(1),Integer(2)]])
>>> import tempfile
>>> with tempfile.NamedTemporaryFile(suffix='.png') as f:                    #␣
↪needs sage.plot sage.symbolic
...     S.save_image(f.name)
```

set_c_matrix(*data*)

Will force set the c-matrix according to a matrix, a quiver, or a seed.

INPUT:

- `data` – the matrix to set the c-matrix to; also allowed to be a quiver or cluster seed, in which case the b-matrix is used

EXAMPLES:

```
sage: S = ClusterSeed(['A',3])
sage: X = matrix([[0,0,1],[0,1,0],[1,0,0]])
sage: S.set_c_matrix(X)
sage: S.c_matrix()
[0 0 1]
[0 1 0]
[1 0 0]

sage: Y = matrix([[-1,0,1],[0,1,0],[1,0,0]])
sage: S.set_c_matrix(Y)
```

(continues on next page)

(continued from previous page)

```
C matrix does not look to be valid - there exists a column
containing positive and negative entries.
Continuing...

sage: Z = matrix([[1,0,1],[0,1,0],[2,0,2]])
sage: S.set_c_matrix(Z)
C matrix does not look to be valid - not a linearly independent set.
Continuing...
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)])
>>> X = matrix([[Integer(0),Integer(0),Integer(1)],[Integer(0),Integer(1),
↪Integer(0)],[Integer(1),Integer(0),Integer(0)]])
>>> S.set_c_matrix(X)
>>> S.c_matrix()
[0 0 1]
[0 1 0]
[1 0 0]

>>> Y = matrix([[-Integer(1),Integer(0),Integer(1)],[Integer(0),Integer(1),
↪Integer(0)],[Integer(1),Integer(0),Integer(0)]])
>>> S.set_c_matrix(Y)
C matrix does not look to be valid - there exists a column
containing positive and negative entries.
Continuing...

>>> Z = matrix([[Integer(1),Integer(0),Integer(1)],[Integer(0),Integer(1),
↪Integer(0)],[Integer(2),Integer(0),Integer(2)]])
>>> S.set_c_matrix(Z)
C matrix does not look to be valid - not a linearly independent set.
Continuing...
```

set_cluster(*cluster*, *force=False*)

Set the cluster for `self` to `cluster`.

> **Warning**
>
> Initialization may lead to inconsistent data.

INPUT:

- `cluster` – an iterable defining a cluster for `self`

EXAMPLES:

```
sage: S = ClusterSeed(['A',3])
sage: cluster = S.cluster()
sage: S.mutate([1,2,1])
sage: S.cluster()
[x0, (x1 + 1)/x2, (x0*x2 + x1 + 1)/(x1*x2)]
sage: cluster2 = S.cluster()
```

(continues on next page)

(continued from previous page)

```
sage: S.set_cluster(cluster)
Warning: using set_cluster at this point could lead to inconsistent seed data.

sage: S.set_cluster(cluster, force=True)
sage: S.cluster()
[x0, x1, x2]
sage: S.set_cluster(cluster2, force=True)
sage: S.cluster()
[x0, (x1 + 1)/x2, (x0*x2 + x1 + 1)/(x1*x2)]

sage: S = ClusterSeed(['A',3]); S.use_fpolys(False)
sage: S.set_cluster([1,1,1])
Warning: clusters not being tracked so this command is ignored.
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)])
>>> cluster = S.cluster()
>>> S.mutate([Integer(1),Integer(2),Integer(1)])
>>> S.cluster()
[x0, (x1 + 1)/x2, (x0*x2 + x1 + 1)/(x1*x2)]
>>> cluster2 = S.cluster()

>>> S.set_cluster(cluster)
Warning: using set_cluster at this point could lead to inconsistent seed data.

>>> S.set_cluster(cluster, force=True)
>>> S.cluster()
[x0, x1, x2]
>>> S.set_cluster(cluster2, force=True)
>>> S.cluster()
[x0, (x1 + 1)/x2, (x0*x2 + x1 + 1)/(x1*x2)]

>>> S = ClusterSeed(['A',Integer(3)]); S.use_fpolys(False)
>>> S.set_cluster([Integer(1),Integer(1),Integer(1)])
Warning: clusters not being tracked so this command is ignored.
```

show(*fig_size=1*, *circular=False*, *mark=None*, *save_pos=False*, *force_c=False*, *with_greens=False*, *add_labels=False*)

Shows the plot of the quiver of `self`.

INPUT:

- `fig_size` – (default: 1) factor by which the size of the plot is multiplied
- `circular` – boolean (default: `False`); if `True`, the circular plot is chosen, otherwise >>spring<< is used
- `mark` – (default: `None`) if set to i, the vertex i is highlighted
- `save_pos` – boolean (default: `False`); if `True`, the positions of the vertices are saved
- `force_c` – boolean (default: `False`); if `True`, will show the frozen vertices even if they were never initialized
- `with_greens` – boolean (default: `False`); if `True`, will display the green vertices in green

- `add_labels` – boolean (default: `False`); if `True`, will use the initial variables as labels

smallest_c_vector()

Return the vertex with the smallest c-vector.

OUTPUT: integer

EXAMPLES:

```
sage: B = matrix([[0,2], [-2,0]])
sage: C = ClusterSeed(B).principal_extension()
sage: C.mutate(0)
sage: C.smallest_c_vector()
0
```

```
>>> from sage.all import *
>>> B = matrix([[Integer(0),Integer(2)], [-Integer(2),Integer(0)]])
>>> C = ClusterSeed(B).principal_extension()
>>> C.mutate(Integer(0))
>>> C.smallest_c_vector()
0
```

track_mutations(*use=True*)

Begin tracking the mutation path.

Warning

May initialize all other data to ensure that all c-, d-, and g-vectors agree on the start of mutations.

INPUT:

- `use` – boolean (default: `True`); if `True`, will begin filling the mutation path

EXAMPLES:

```
sage: S = ClusterSeed(['A',4]); S.track_mutations(False)
sage: S.mutate(0)
sage: S.mutations()
Traceback (most recent call last):
...
ValueError: Not recording mutation sequence.  Need to track mutations.
sage: S.track_mutations(True)
sage: S.g_matrix()
[1 0 0 0]
[0 1 0 0]
[0 0 1 0]
[0 0 0 1]

sage: S.mutate([0,1])
sage: S.mutations()
[0, 1]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(4)]); S.track_mutations(False)
```

(continues on next page)

(continued from previous page)

```
>>> S.mutate(Integer(0))
>>> S.mutations()
Traceback (most recent call last):
...
ValueError: Not recording mutation sequence.  Need to track mutations.
>>> S.track_mutations(True)
>>> S.g_matrix()
[1 0 0 0]
[0 1 0 0]
[0 0 1 0]
[0 0 0 1]

>>> S.mutate([Integer(0),Integer(1)])
>>> S.mutations()
[0, 1]
```

universal_extension()

Return the universal extension of `self`.

This is the initial seed of the associated cluster algebra with universal coefficients, as defined in section 12 of [FZ2007].

This method works only if `self` is a bipartite, finite-type seed.

Due to some limitations in the current implementation of `CartanType`, we need to construct the set of almost positive coroots by hand. As a consequence their ordering is not the standard one (the rows of the bottom part of the exchange matrix might be a shuffling of those you would expect).

EXAMPLES:

```
sage: S = ClusterSeed(['A',2])
sage: T = S.universal_extension()
sage: T.b_matrix()
[ 0  1]
[-1  0]
[-1  0]
[ 1  0]
[ 1 -1]
[ 0  1]
[ 0 -1]

sage: S = ClusterSeed(['A',3])
sage: T = S.universal_extension()
sage: T.b_matrix()
[ 0  1  0]
[-1  0 -1]
[ 0  1  0]
[-1  0  0]
[ 1  0  0]
[ 1 -1  0]
[ 1 -1  1]
[ 0  1  0]
[ 0 -1  0]
[ 0 -1  1]
```

(continues on next page)

(continued from previous page)

```
[ 0  0 -1]
[ 0  0  1]

sage: S = ClusterSeed(['B',2])
sage: T = S.universal_extension()
sage: T.b_matrix()
[ 0  1]
[-2  0]
[-1  0]
[ 1  0]
[ 1 -1]
[ 2 -1]
[ 0  1]
[ 0 -1]

sage: S = ClusterSeed(['A', 5], user_labels=[-2, -1, 0, 1 ,2])
sage: U = S.universal_extension()
sage: U.b_matrix() == ClusterSeed(['A', 5]).universal_extension().b_matrix()
True
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(2)])
>>> T = S.universal_extension()
>>> T.b_matrix()
[ 0  1]
[-1  0]
[-1  0]
[ 1  0]
[ 1 -1]
[ 0  1]
[ 0 -1]

>>> S = ClusterSeed(['A',Integer(3)])
>>> T = S.universal_extension()
>>> T.b_matrix()
[ 0  1  0]
[-1  0 -1]
[ 0  1  0]
[-1  0  0]
[ 1  0  0]
[ 1 -1  0]
[ 1 -1  1]
[ 0  1  0]
[ 0 -1  0]
[ 0 -1  1]
[ 0  0 -1]
[ 0  0  1]

>>> S = ClusterSeed(['B',Integer(2)])
>>> T = S.universal_extension()
>>> T.b_matrix()
[ 0  1]
```

(continues on next page)

(continued from previous page)

```
[-2  0]
[-1  0]
[ 1  0]
[ 1 -1]
[ 2 -1]
[ 0  1]
[ 0 -1]

>>> S = ClusterSeed(['A', Integer(5)], user_labels=[-Integer(2), -Integer(1),␣
↪Integer(0), Integer(1) ,Integer(2)])
>>> U = S.universal_extension()
>>> U.b_matrix() == ClusterSeed(['A', Integer(5)]).universal_extension().b_
↪matrix()
True
```

urban_renewals (*return_first=False*)

Return the list of the urban renewal vertices of `self`.

An urban renewal vertex is one in which there are two arrows pointing toward the vertex and two arrows pointing away.

INPUT:

- `return_first` – boolean (default: `False`); if `True`, will return the first urban renewal

OUTPUT:

A list of vertices (as integers)

EXAMPLES:

```
sage: G = ClusterSeed(['GR',[4,9]]); G.urban_renewals()
[5, 6]
```

```
>>> from sage.all import *
>>> G = ClusterSeed(['GR',[Integer(4),Integer(9)]]); G.urban_renewals()
[5, 6]
```

use_c_vectors (*use=True*, *bot_is_c=False*, *force=False*)

Reconstruct c-vectors from other data or initialize if no usable data exists.

Warning: Initialization may lead to inconsistent data.

INPUT:

- `use` – boolean (default: `True`); if `True`, will use c-vectors
- `bot_is_c` – boolean (default: `False`); if `True` and `ClusterSeed` `self` has `self._m == self._n`, then will assume bottom half of the extended exchange matrix is the c-matrix. If `True`, lets the `ClusterSeed` know c-vectors can be calculated.

EXAMPLES:

```
sage: S = ClusterSeed(['A',4])
sage: S.use_c_vectors(False); S.use_g_vectors(False)
sage: S.use_fpolys(False); S.track_mutations(False)
sage: S.use_c_vectors(True)
```

(continues on next page)

(continued from previous page)

```
Warning: Initializing c-vectors at this point
could lead to inconsistent seed data.

sage: S.use_c_vectors(True, force=True)
sage: S.c_matrix()
[1 0 0 0]
[0 1 0 0]
[0 0 1 0]
[0 0 0 1]

sage: S = ClusterSeed(['A',4])
sage: S.use_c_vectors(False); S.use_g_vectors(False)
sage: S.use_fpolys(False); S.track_mutations(False)
sage: S.mutate(1)
sage: S.use_c_vectors(True, force=True)
sage: S.c_matrix()
[1 0 0 0]
[0 1 0 0]
[0 0 1 0]
[0 0 0 1]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(4)])
>>> S.use_c_vectors(False); S.use_g_vectors(False)
>>> S.use_fpolys(False); S.track_mutations(False)
>>> S.use_c_vectors(True)
Warning: Initializing c-vectors at this point
could lead to inconsistent seed data.

>>> S.use_c_vectors(True, force=True)
>>> S.c_matrix()
[1 0 0 0]
[0 1 0 0]
[0 0 1 0]
[0 0 0 1]

>>> S = ClusterSeed(['A',Integer(4)])
>>> S.use_c_vectors(False); S.use_g_vectors(False)
>>> S.use_fpolys(False); S.track_mutations(False)
>>> S.mutate(Integer(1))
>>> S.use_c_vectors(True, force=True)
>>> S.c_matrix()
[1 0 0 0]
[0 1 0 0]
[0 0 1 0]
[0 0 0 1]
```

use_d_vectors(*use=True*, *force=False*)

Reconstruct d-vectors from other data or initialize if no usable data exists.

> **Warning**
>
> Initialization may lead to inconsistent data.

INPUT:

- `use` – boolean (default: `True`); if `True`, will use d-vectors

EXAMPLES:

```
sage: S = ClusterSeed(['A',4])
sage: S.use_d_vectors(True)
sage: S.d_matrix()
[-1  0  0  0]
[ 0 -1  0  0]
[ 0  0 -1  0]
[ 0  0  0 -1]

sage: S = ClusterSeed(['A',4]); S.use_d_vectors(False)
sage: S.track_mutations(False); S.mutate(1); S.d_matrix()
[-1  0  0  0]
[ 0  1  0  0]
[ 0  0 -1  0]
[ 0  0  0 -1]
sage: S.use_fpolys(False)
sage: S.d_matrix()
Traceback (most recent call last):
...
ValueError: Unable to calculate d-vectors. Need to use d vectors.

sage: S = ClusterSeed(['A',4]); S.use_d_vectors(False)
sage: S.track_mutations(False); S.mutate(1); S.d_matrix()
[-1  0  0  0]
[ 0  1  0  0]
[ 0  0 -1  0]
[ 0  0  0 -1]
sage: S.use_fpolys(False)
sage: S.use_d_vectors(True)
Warning: Initializing d-vectors at this point
could lead to inconsistent seed data.

sage: S.use_d_vectors(True, force=True)
sage: S.d_matrix()
[-1  0  0  0]
[ 0 -1  0  0]
[ 0  0 -1  0]
[ 0  0  0 -1]

sage: S = ClusterSeed(['A',4]); S.mutate(1); S.d_matrix()
[-1  0  0  0]
[ 0  1  0  0]
[ 0  0 -1  0]
[ 0  0  0 -1]
```

(continues on next page)

(continued from previous page)

```
sage: S = ClusterSeed(['A',4])
sage: S.use_d_vectors(True); S.mutate(1); S.d_matrix()
[-1  0  0  0]
[ 0  1  0  0]
[ 0  0 -1  0]
[ 0  0  0 -1]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(4)])
>>> S.use_d_vectors(True)

```

use_fpolys(*use=True*, *user_labels=None*, *user_labels_prefix=None*)

Use F-polynomials in our Cluster Seed.

Note: This will automatically try to recompute the cluster variables if possible

INPUT:

- `use` – boolean (default: `True`); if `True`, will use F-polynomials
- `user_labels` – (default: `None`) if set, will overwrite the default cluster variable `labels`
- `user_labels_prefix` – (default: `None`) if set, will overwrite the default

EXAMPLES:

```
sage: S = ClusterSeed(['A',4]); S.use_fpolys(False); S._cluster
sage: S.use_fpolys(True)
sage: S.cluster()
[x0, x1, x2, x3]

sage: S = ClusterSeed(['A',4]); S.use_fpolys(False); S.track_mutations(False)
sage: S.mutate(1)
sage: S.use_fpolys(True)
Traceback (most recent call last):
...
ValueError: F-polynomials and Cluster Variables cannot be reconstructed
from given data.
sage: S.cluster()
Traceback (most recent call last):

ValueError: Clusters not being tracked
```

use_g_vectors(*use=True*, *force=False*)

Reconstruct g-vectors from other data or initialize if no usable data exists.

> **Warning**
>
> Initialization may lead to inconsistent data.

INPUT:

- `use` – boolean (default: `True`); if `True`, will use g-vectors

EXAMPLES:

```
sage: S = ClusterSeed(['A',4])
sage: S.use_g_vectors(False); S.use_fpolys(False)
sage: S.use_g_vectors(True)
sage: S.g_matrix()
[1 0 0 0]
[0 1 0 0]
[0 0 1 0]
[0 0 0 1]

sage: S = ClusterSeed(['A',4])

[0 0 1 0]
[0 0 0 1]
```

variable_class(*depth=+Infinity*, *ignore_bipartite_belt=False*)

Return all cluster variables in the mutation class of `self`.

INPUT:

- `depth` – (default: infinity) integer, only seeds with distance at most `depth` from `self` are returned
- `ignore_bipartite_belt` – boolean (default: `False`); if `True`, the algorithm does not use the bipartite belt

EXAMPLES:

- for examples see `variable_class_iter()`

variable_class_iter(*depth=+Infinity*, *ignore_bipartite_belt=False*)

Return an iterator for all cluster variables in the mutation class of `self`.

INPUT:

- `depth` – (default: infinity) integer, only seeds with distance at most `depth` from `self` are returned
- `ignore_bipartite_belt` – boolean (default: `False`); if `True`, the algorithm does not use the bipartite belt

EXAMPLES:

A standard finite type example:

```
sage: S = ClusterSeed(['A',3])
sage: it = S.variable_class_iter()
sage: for T in it: print(T)
x0
x1
x2
(x1 + 1)/x0
(x1^2 + x0*x2 + 2*x1 + 1)/(x0*x1*x2)
(x1 + 1)/x2
(x0*x2 + x1 + 1)/(x0*x1)
(x0*x2 + 1)/x1
(x0*x2 + x1 + 1)/(x1*x2)
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)])
>>> it = S.variable_class_iter()
>>> for T in it: print(T)
x0
x1
x2
(x1 + 1)/x0
(x1^2 + x0*x2 + 2*x1 + 1)/(x0*x1*x2)
(x1 + 1)/x2
(x0*x2 + x1 + 1)/(x0*x1)
(x0*x2 + 1)/x1
(x0*x2 + x1 + 1)/(x1*x2)
```

Finite type examples with given depth:

```
sage: it = S.variable_class_iter(depth=1)
sage: for T in it: print(T)
Found a bipartite seed - restarting the depth counter at zero
```

(continues on next page)

(continued from previous page)

```
and constructing the variable class using its bipartite belt.
x0
x1
x2
(x1 + 1)/x0
(x1^2 + x0*x2 + 2*x1 + 1)/(x0*x1*x2)
(x1 + 1)/x2
(x0*x2 + x1 + 1)/(x0*x1)
(x0*x2 + 1)/x1
(x0*x2 + x1 + 1)/(x1*x2)
```

```
>>> from sage.all import *
>>> it = S.variable_class_iter(depth=Integer(1))
>>> for T in it: print(T)
Found a bipartite seed - restarting the depth counter at zero
and constructing the variable class using its bipartite belt.
x0
x1
x2
(x1 + 1)/x0
(x1^2 + x0*x2 + 2*x1 + 1)/(x0*x1*x2)
(x1 + 1)/x2
(x0*x2 + x1 + 1)/(x0*x1)
(x0*x2 + 1)/x1
(x0*x2 + x1 + 1)/(x1*x2)
```

Note that the notion of *depth* depends on whether a bipartite seed is found or not, or if it is manually ignored:

```
sage: it = S.variable_class_iter(depth=1, ignore_bipartite_belt=True)
sage: for T in it: print(T)
x0
x1
x2
(x1 + 1)/x2
(x0*x2 + 1)/x1
(x1 + 1)/x0

sage: S.mutate([0,1])
sage: it2 = S.variable_class_iter(depth=1)
sage: for T in it2: print(T)
(x1 + 1)/x0
(x0*x2 + x1 + 1)/(x0*x1)
x2
(x1^2 + x0*x2 + 2*x1 + 1)/(x0*x1*x2)
x1
(x0*x2 + 1)/x1
```

```
>>> from sage.all import *
>>> it = S.variable_class_iter(depth=Integer(1), ignore_bipartite_belt=True)
>>> for T in it: print(T)
x0
x1
```

(continues on next page)

(continued from previous page)

```
x2
(x1 + 1)/x2
(x0*x2 + 1)/x1
(x1 + 1)/x0

>>> S.mutate([Integer(0),Integer(1)])
>>> it2 = S.variable_class_iter(depth=Integer(1))
>>> for T in it2: print(T)
(x1 + 1)/x0
(x0*x2 + x1 + 1)/(x0*x1)
x2
(x1^2 + x0*x2 + 2*x1 + 1)/(x0*x1*x2)
x1
(x0*x2 + 1)/x1
```

Infinite type examples:

```
sage: S = ClusterSeed(['A',[1,1],1])
sage: it = S.variable_class_iter(depth=2)
sage: for T in it: print(T)
Found a bipartite seed - restarting the depth counter at zero
and constructing the variable class using its bipartite belt.
x0
x1
(x1^2 + 1)/x0
(x1^4 + x0^2 + 2*x1^2 + 1)/(x0^2*x1)
(x0^4 + 2*x0^2 + x1^2 + 1)/(x0*x1^2)
(x0^2 + 1)/x1
(x1^6 + x0^4 + 2*x0^2*x1^2 + 3*x1^4 + 2*x0^2 + 3*x1^2 + 1)/(x0^3*x1^2)
(x1^8 + x0^6 + 2*x0^4*x1^2 + 3*x0^2*x1^4 + 4*x1^6 + 3*x0^4 + 6*x0^2*x1^2 +
↪6*x1^4 + 3*x0^2 + 4*x1^2 + 1)/(x0^4*x1^3)
(x0^8 + 4*x0^6 + 3*x0^4*x1^2 + 2*x0^2*x1^4 + x1^6 + 6*x0^4 + 6*x0^2*x1^2 +
↪3*x1^4 + 4*x0^2 + 3*x1^2 + 1)/(x0^3*x1^4)
(x0^6 + 3*x0^4 + 2*x0^2*x1^2 + x1^4 + 3*x0^2 + 2*x1^2 + 1)/(x0^2*x1^3)
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',[Integer(1),Integer(1)],Integer(1)])
>>> it = S.variable_class_iter(depth=Integer(2))
>>> for T in it: print(T)
Found a bipartite seed - restarting the depth counter at zero
and constructing the variable class using its bipartite belt.
x0
x1
(x1^2 + 1)/x0
(x1^4 + x0^2 + 2*x1^2 + 1)/(x0^2*x1)
(x0^4 + 2*x0^2 + x1^2 + 1)/(x0*x1^2)
(x0^2 + 1)/x1
(x1^6 + x0^4 + 2*x0^2*x1^2 + 3*x1^4 + 2*x0^2 + 3*x1^2 + 1)/(x0^3*x1^2)
(x1^8 + x0^6 + 2*x0^4*x1^2 + 3*x0^2*x1^4 + 4*x1^6 + 3*x0^4 + 6*x0^2*x1^2 +
↪6*x1^4 + 3*x0^2 + 4*x1^2 + 1)/(x0^4*x1^3)
(x0^8 + 4*x0^6 + 3*x0^4*x1^2 + 2*x0^2*x1^4 + x1^6 + 6*x0^4 + 6*x0^2*x1^2 +
↪3*x1^4 + 4*x0^2 + 3*x1^2 + 1)/(x0^3*x1^4)
```

(continues on next page)

(continued from previous page)

```
(x0^6 + 3*x0^4 + 2*x0^2*x1^2 + x1^4 + 3*x0^2 + 2*x1^2 + 1)/(x0^2*x1^3)
```

x(*k*)

Return the k *-th initial cluster variable* for the associated cluster seed, or the cluster variable of the corresponding vertex in `self.quiver`.

EXAMPLES:

```
sage: S = ClusterSeed(['A', 3])
sage: S.mutate([2, 1])
sage: S.x(0)
x0

sage: S.x(1)
x1

sage: S.x(2)
x2

sage: dg = DiGraph([['a', 'b'], ['b', 'c']], format='list_of_edges')
sage: S = ClusterSeed(dg, frozen=['c'])
sage: S.x(0)
a
sage: S.x('a')
a
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A', Integer(3)])
>>> S.mutate([Integer(2), Integer(1)])
>>> S.x(Integer(0))
x0

>>> S.x(Integer(1))
x1

>>> S.x(Integer(2))
x2

>>> dg = DiGraph([['a', 'b'], ['b', 'c']], format='list_of_edges')
>>> S = ClusterSeed(dg, frozen=['c'])
>>> S.x(Integer(0))
a
>>> S.x('a')
a
```

y(*k*)

Return the k *-th initial coefficient (frozen variable)* for the associated cluster seed, or the cluster variable of the corresponding vertex in `self.quiver`.

EXAMPLES:

```
sage: S = ClusterSeed(['A', 3]).principal_extension()
sage: S.mutate([2, 1])
```

(continues on next page)

(continued from previous page)

```
sage: S.y(0)
y0

sage: S.y(1)
y1

sage: S.y(2)
y2

sage: dg = DiGraph([['a', 'b'], ['b', 'c']], format='list_of_edges')
sage: S = ClusterSeed(dg, frozen=['c'])
sage: S.y(0)
c
sage: S.y('c')
c
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A', Integer(3)]).principal_extension()
>>> S.mutate([Integer(2), Integer(1)])
>>> S.y(Integer(0))
y0

>>> S.y(Integer(1))
y1

>>> S.y(Integer(2))
y2

>>> dg = DiGraph([['a', 'b'], ['b', 'c']], format='list_of_edges')
>>> S = ClusterSeed(dg, frozen=['c'])
>>> S.y(Integer(0))
c
>>> S.y('c')
c
```

class sage.combinat.cluster_algebra_quiver.cluster_seed.**ClusterVariable**(*parent*, *numerator*, *denominator*, *coerce=True*, *reduce=True*, *mutation_type=None*, *variable_type=None*, *xdim=0*)

Bases: `FractionFieldElement`

This class is a thin wrapper for cluster variables in cluster seeds.

It provides the extra feature to store if a variable is frozen or not.

- the associated positive root:

```
sage: S = ClusterSeed(['A',3])
sage: for T in S.variable_class_iter():
```

(continues on next page)

(continued from previous page)

```
....:     print("{} {}".format(T, T.almost_positive_root()))
x0 -alpha[1]
x1 -alpha[2]
x2 -alpha[3]
(x1 + 1)/x0 alpha[1]
(x1^2 + x0*x2 + 2*x1 + 1)/(x0*x1*x2) alpha[1] + alpha[2] + alpha[3]
(x1 + 1)/x2 alpha[3]
(x0*x2 + x1 + 1)/(x0*x1) alpha[1] + alpha[2]
(x0*x2 + 1)/x1 alpha[2]
(x0*x2 + x1 + 1)/(x1*x2) alpha[2] + alpha[3]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)])
>>> for T in S.variable_class_iter():
...     print("{} {}".format(T, T.almost_positive_root()))
x0 -alpha[1]
x1 -alpha[2]
x2 -alpha[3]
(x1 + 1)/x0 alpha[1]
(x1^2 + x0*x2 + 2*x1 + 1)/(x0*x1*x2) alpha[1] + alpha[2] + alpha[3]
(x1 + 1)/x2 alpha[3]
(x0*x2 + x1 + 1)/(x0*x1) alpha[1] + alpha[2]
(x0*x2 + 1)/x1 alpha[2]
(x0*x2 + x1 + 1)/(x1*x2) alpha[2] + alpha[3]
```

almost_positive_root()

Return the *almost positive root* associated to `self` if `self` is of finite type.

EXAMPLES:

```
sage: S = ClusterSeed(['A',3])
sage: for T in S.variable_class_iter():
....:     print("{} {}".format(T, T.almost_positive_root()))
x0 -alpha[1]
x1 -alpha[2]
x2 -alpha[3]
(x1 + 1)/x0 alpha[1]
(x1^2 + x0*x2 + 2*x1 + 1)/(x0*x1*x2) alpha[1] + alpha[2] + alpha[3]
(x1 + 1)/x2 alpha[3]
(x0*x2 + x1 + 1)/(x0*x1) alpha[1] + alpha[2]
(x0*x2 + 1)/x1 alpha[2]
(x0*x2 + x1 + 1)/(x1*x2) alpha[2] + alpha[3]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)])
>>> for T in S.variable_class_iter():
...     print("{} {}".format(T, T.almost_positive_root()))
x0 -alpha[1]
x1 -alpha[2]
x2 -alpha[3]
(x1 + 1)/x0 alpha[1]
(x1^2 + x0*x2 + 2*x1 + 1)/(x0*x1*x2) alpha[1] + alpha[2] + alpha[3]
```

(continues on next page)

(continued from previous page)

```
(x1 + 1)/x2 alpha[3]
(x0*x2 + x1 + 1)/(x0*x1) alpha[1] + alpha[2]
(x0*x2 + 1)/x1 alpha[2]
(x0*x2 + x1 + 1)/(x1*x2) alpha[2] + alpha[3]
```

sage.combinat.cluster_algebra_quiver.cluster_seed.**PathSubset**(*n*, *m*)

Encode a *maximal* Dyck path from $(0,0)$ to (n,m) (for $n \geq m \geq 0$) as a subset of $\{0,1,2,...,2n-1\}$.

The encoding is given by indexing horizontal edges by odd numbers and vertical edges by evens.

The horizontal between (i,j) and $(i+1,j)$ is indexed by the odd number $2*i+1$. The vertical between (i,j) and $(i,j+1)$ is indexed by the even number $2*j$.

EXAMPLES:

```
sage: from sage.combinat.cluster_algebra_quiver.cluster_seed import PathSubset
sage: PathSubset(4,0)
{1, 3, 5, 7}
sage: PathSubset(4,1)
{1, 3, 5, 6, 7}
sage: PathSubset(4,2)
{1, 2, 3, 5, 6, 7}
sage: PathSubset(4,3)
{1, 2, 3, 4, 5, 6, 7}
sage: PathSubset(4,4)
{0, 1, 2, 3, 4, 5, 6, 7}
```

```
>>> from sage.all import *
>>> from sage.combinat.cluster_algebra_quiver.cluster_seed import PathSubset
>>> PathSubset(Integer(4),Integer(0))
{1, 3, 5, 7}
>>> PathSubset(Integer(4),Integer(1))
{1, 3, 5, 6, 7}
>>> PathSubset(Integer(4),Integer(2))
{1, 2, 3, 5, 6, 7}
>>> PathSubset(Integer(4),Integer(3))
{1, 2, 3, 4, 5, 6, 7}
>>> PathSubset(Integer(4),Integer(4))
{0, 1, 2, 3, 4, 5, 6, 7}
```

sage.combinat.cluster_algebra_quiver.cluster_seed.**SetToPath**(*T*)

Rearrange the encoding for a *maximal* Dyck path (as a set) so that it is a list in the proper order of the edges.

EXAMPLES:

```
sage: from sage.combinat.cluster_algebra_quiver.cluster_seed import PathSubset
sage: from sage.combinat.cluster_algebra_quiver.cluster_seed import SetToPath
sage: SetToPath(PathSubset(4,0))
[1, 3, 5, 7]
sage: SetToPath(PathSubset(4,1))
[1, 3, 5, 7, 6]
sage: SetToPath(PathSubset(4,2))
[1, 3, 2, 5, 7, 6]
sage: SetToPath(PathSubset(4,3))
```

(continues on next page)

(continued from previous page)

```
[1, 3, 2, 5, 4, 7, 6]
sage: SetToPath(PathSubset(4,4))
[1, 0, 3, 2, 5, 4, 7, 6]
```

```
>>> from sage.all import *
>>> from sage.combinat.cluster_algebra_quiver.cluster_seed import PathSubset
>>> from sage.combinat.cluster_algebra_quiver.cluster_seed import SetToPath
>>> SetToPath(PathSubset(Integer(4),Integer(0)))
[1, 3, 5, 7]
>>> SetToPath(PathSubset(Integer(4),Integer(1)))
[1, 3, 5, 7, 6]
>>> SetToPath(PathSubset(Integer(4),Integer(2)))
[1, 3, 2, 5, 7, 6]
>>> SetToPath(PathSubset(Integer(4),Integer(3)))
[1, 3, 2, 5, 4, 7, 6]
>>> SetToPath(PathSubset(Integer(4),Integer(4)))
[1, 0, 3, 2, 5, 4, 7, 6]
```

sage.combinat.cluster_algebra_quiver.cluster_seed.**coeff_recurs**(p, q, $a1$, $a2$, b, c)

Coefficients in Laurent expansion of greedy element, as defined by recursion.

EXAMPLES:

```
sage: from sage.combinat.cluster_algebra_quiver.cluster_seed import coeff_recurs
sage: coeff_recurs(1, 1, 5, 5, 3, 3)
10
```

```
>>> from sage.all import *
>>> from sage.combinat.cluster_algebra_quiver.cluster_seed import coeff_recurs
>>> coeff_recurs(Integer(1), Integer(1), Integer(5), Integer(5), Integer(3),␣
→Integer(3))
10
```

sage.combinat.cluster_algebra_quiver.cluster_seed.**get_green_vertices**(C)

Get the green vertices from a matrix.

Will go through each column and return the ones where no entry is greater than 0.

INPUT:

- `C` – the C-matrix to check

EXAMPLES:

```
sage: from sage.combinat.cluster_algebra_quiver.cluster_seed import get_green_
→vertices
sage: S = ClusterSeed(['A',4]); S.mutate([1,2,3,2,0,1,2,0,3])
sage: get_green_vertices(S.c_matrix())
[0, 3]
```

```
>>> from sage.all import *
>>> from sage.combinat.cluster_algebra_quiver.cluster_seed import get_green_
→vertices
>>> S = ClusterSeed(['A',Integer(4)]); S.mutate([Integer(1),Integer(2),Integer(3),
```

(continues on next page)

(continued from previous page)

```
↪Integer(2),Integer(0),Integer(1),Integer(2),Integer(0),Integer(3)])
>>> get_green_vertices(S.c_matrix())
[0, 3]
```

sage.combinat.cluster_algebra_quiver.cluster_seed.**get_red_vertices**(C)

Get the red vertices from a matrix.

Will go through each column and return the ones where no entry is less than 0.

INPUT:

- `C` – the C-matrix to check

EXAMPLES:

```
sage: from sage.combinat.cluster_algebra_quiver.cluster_seed import get_red_
↪vertices
sage: S = ClusterSeed(['A',4]); S.mutate([1,2,3,2,0,1,2,0,3])
sage: get_red_vertices(S.c_matrix())
[1, 2]
```

```
>>> from sage.all import *
>>> from sage.combinat.cluster_algebra_quiver.cluster_seed import get_red_vertices
>>> S = ClusterSeed(['A',Integer(4)]); S.mutate([Integer(1),Integer(2),Integer(3),
↪Integer(2),Integer(0),Integer(1),Integer(2),Integer(0),Integer(3)])
>>> get_red_vertices(S.c_matrix())
[1, 2]
```

sage.combinat.cluster_algebra_quiver.cluster_seed.**is_LeeLiZel_allowable**(T, n, m, b, c)

Check if the subset T contributes to the computation of the greedy element $x[m, n]$ in the rank two (b, c)-cluster algebra.

This uses the conditions of Lee-Li-Zelevinsky's paper [LLZ2014].

EXAMPLES:

```
sage: from sage.combinat.cluster_algebra_quiver.cluster_seed import is_LeeLiZel_
↪allowable
sage: is_LeeLiZel_allowable({1,3,2,5,7,6},4,2,6,6)
False
sage: is_LeeLiZel_allowable({1,2,5},3,3,1,1)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.cluster_algebra_quiver.cluster_seed import is_LeeLiZel_
↪allowable
>>> is_LeeLiZel_allowable({Integer(1),Integer(3),Integer(2),Integer(5),Integer(7),
↪Integer(6)},Integer(4),Integer(2),Integer(6),Integer(6))
False
>>> is_LeeLiZel_allowable({Integer(1),Integer(2),Integer(5)},Integer(3),
↪Integer(3),Integer(1),Integer(1))
True
```

5.1.19 mutation_class

This file contains helper functions for compute the mutation class of a cluster algebra or quiver.

For the compendium on the cluster algebra and quiver package see [MS2011]

5.1.20 Helper functions for mutation types of quivers

This file contains helper functions for detecting the mutation type of a cluster algebra or quiver.

For the compendium on the cluster algebra and quiver package see [MS2011]

AUTHORS:

- Gregg Musiker
- Christian Stump

sage.combinat.cluster_algebra_quiver.mutation_type.**is_mutation_finite**(*M*, *nr_of_checks=None*)

Use a non-deterministic method by random mutations in various directions. Can result in a wrong answer.

Warning

This method modifies the input matrix `M`!

INPUT:

- `nr_of_checks` – number of mutations applied (default: `None`); standard is 500*(number of vertices of self)

ALGORITHM:

A quiver is mutation infinite if and only if every edge label (a,-b) satisfy a*b > 4. Thus, we apply random mutations in random directions

EXAMPLES:

```
sage: from sage.combinat.cluster_algebra_quiver.mutation_type import is_mutation_
↪finite

sage: Q = ClusterQuiver(['A',10])                                          #␣
↪needs sage.modules
sage: M = Q.b_matrix()                                                     #␣
↪needs sage.modules
sage: is_mutation_finite(M)                                                #␣
↪needs sage.modules
(True, None)

sage: # needs sage.modules
sage: Q = ClusterQuiver([(0,1),(1,2),(2,3),(3,4),(4,5),(5,6),(6,7),(7,8),(2,9)])
sage: M = Q.b_matrix()
sage: is_mutation_finite(M)   # random
(False, [9, 6, 9, 8, 9, 4, 0, 4, 5, 2, 1, 0, 1, 0, 7, 1, 9, 2, 5, 7, 8, 6, 3, 0,␣
```

(continues on next page)

(continued from previous page)

```
↪2, 5, 4, 2, 6, 9, 2, 7, 3, 5, 3, 7, 9, 5, 9, 0, 2, 7, 9, 2, 4, 2, 1, 6, 9, 4, 3,
↪ 5, 0, 8, 2, 9, 5, 3, 7, 0, 1, 8, 3, 7, 2, 7, 3, 4, 8, 0, 4, 9, 5, 2, 8, 4, 8,␣
↪1, 7, 8, 9, 1, 5, 0, 8, 7, 4, 8, 9, 8, 0, 7, 4, 7, 1, 2, 8, 6, 1, 3, 9, 3, 9, 1,
↪ 3, 2, 4, 9, 5, 1, 2, 9, 4, 8, 5, 3, 4, 6, 8, 9, 2, 5, 9, 4, 6, 2, 1, 4, 9, 6,␣
↪0, 9, 8, 0, 4, 7, 9, 2, 1, 6])
```

```
>>> from sage.all import *
>>> from sage.combinat.cluster_algebra_quiver.mutation_type import is_mutation_
↪finite

>>> Q = ClusterQuiver(['A',Integer(10)])                                        ␣
↪     # needs sage.modules
>>> M = Q.b_matrix()                                                           #␣
↪needs sage.modules
>>> is_mutation_finite(M)                                                      #␣
↪needs sage.modules
(True, None)

>>> # needs sage.modules
>>> Q = ClusterQuiver([(Integer(0),Integer(1)),(Integer(1),Integer(2)),
↪(Integer(2),Integer(3)),(Integer(3),Integer(4)),(Integer(4),Integer(5)),
↪(Integer(5),Integer(6)),(Integer(6),Integer(7)),(Integer(7),Integer(8)),
↪(Integer(2),Integer(9))])
>>> M = Q.b_matrix()
>>> is_mutation_finite(M)  # random
(False, [9, 6, 9, 8, 9, 4, 0, 4, 5, 2, 1, 0, 1, 0, 7, 1, 9, 2, 5, 7, 8, 6, 3, 0,␣
↪2, 5, 4, 2, 6, 9, 2, 7, 3, 5, 3, 7, 9, 5, 9, 0, 2, 7, 9, 2, 4, 2, 1, 6, 9, 4, 3,
↪ 5, 0, 8, 2, 9, 5, 3, 7, 0, 1, 8, 3, 7, 2, 7, 3, 4, 8, 0, 4, 9, 5, 2, 8, 4, 8,␣
↪1, 7, 8, 9, 1, 5, 0, 8, 7, 4, 8, 9, 8, 0, 7, 4, 7, 1, 2, 8, 6, 1, 3, 9, 3, 9, 1,
↪ 3, 2, 4, 9, 5, 1, 2, 9, 4, 8, 5, 3, 4, 6, 8, 9, 2, 5, 9, 4, 6, 2, 1, 4, 9, 6,␣
↪0, 9, 8, 0, 4, 7, 9, 2, 1, 6])
```

Check that Issue #19495 is fixed:

```
sage: dg = DiGraph(); dg.add_vertex(0); S = ClusterSeed(dg); S                  #␣
↪needs sage.modules
A seed for a cluster algebra of rank 1
sage: S.is_mutation_finite()                                                    #␣
↪needs sage.modules
True
```

```
>>> from sage.all import *
>>> dg = DiGraph(); dg.add_vertex(Integer(0)); S = ClusterSeed(dg); S           ␣
↪     # needs sage.modules
A seed for a cluster algebra of rank 1
>>> S.is_mutation_finite()                                                     #␣
↪needs sage.modules
True
```

sage.combinat.cluster_algebra_quiver.mutation_type.**load_data**(*user=True*)

Load a dict with keys being tuples representing exceptional QuiverMutationTypes, and with values being lists or sets containing all mutation equivalent quivers as dig6 data.

We check

- the data stored by the user (unless `user=False` was given)
- and the data installed by the optional package `database_mutation_class`.

INPUT:

- `user` – boolean (default: `True`); whether to look at user data. If not, only consider the optional package.

EXAMPLES:

```
sage: from sage.combinat.cluster_algebra_quiver.mutation_type import load_data
sage: load_data(2) # random - depends on the data the user has stored
{('G', 2): [('AO', (((0, 1), (1, -3)),)), ('AO', (((0, 1), (3, -1)),))]}
```

```
>>> from sage.all import *
>>> from sage.combinat.cluster_algebra_quiver.mutation_type import load_data
>>> load_data(Integer(2)) # random - depends on the data the user has stored
{('G', 2): [('AO', (((0, 1), (1, -3)),)), ('AO', (((0, 1), (3, -1)),))]}
```

5.1.21 Quiver

A *quiver* is an oriented graph without loops, two-cycles, or multiple edges. The edges are labelled by pairs $(i, -j)$ (with i and j being positive integers) such that the matrix $M = (m_{ab})$ with $m_{ab} = i, m_{ba} = -j$ for an edge $(i, -j)$ between vertices a and b is skew-symmetrizable.

Warning

This is not the standard definition of a quiver. Normally, in cluster algebra theory, a quiver is defined as an oriented graph without loops and two-cycles but with multiple edges allowed; the edges are unlabelled. This notion of quivers, however, can be seen as a particular case of our notion of quivers. Namely, if we have a quiver (in the regular sense of this word) with (precisely) i edges from a to b, then we represent it by a quiver (in our sense of this word) with an edge from a to b labelled by the pair $(i, -i)$.

For the compendium on the cluster algebra and quiver package see [MS2011]

See also

For mutation types of combinatorial quivers, see *`QuiverMutationType()`*. Cluster seeds are closely related to *`ClusterSeed()`*.

class `sage.combinat.cluster_algebra_quiver.quiver.`**`ClusterQuiver`**(*data*, *frozen=None*, *user_labels=None*)

Bases: `SageObject`

The *quiver* associated to an *exchange matrix*.

INPUT:

- `data` – can be any of the following:

```
- :class:`QuiverMutationType`
```

  - `str` – string representing a *QuiverMutationType* or a common quiver type (see Examples)
  - *ClusterQuiver*
  - `Matrix` – a skew-symmetrizable matrix
  - `DiGraph` – must be the input data for a quiver
  - List of edges – must be the edge list of a digraph for a quiver

- `frozen` – (default: `None`) sets the list of frozen variables if the input type is a `DiGraph`, it is ignored otherwise
- `user_labels` – (default: `None`) sets the names of the labels for the vertices of the quiver if the input type is not a `DiGraph`; otherwise it is ignored

EXAMPLES:

From a *QuiverMutationType*:

```
sage: Q = ClusterQuiver(['A',5]); Q
Quiver on 5 vertices of type ['A', 5]

sage: Q = ClusterQuiver(['B',2]); Q
Quiver on 2 vertices of type ['B', 2]

False
>>> Q.mutate([Integer(1),Integer(0)]); MT.standard_quiver() == Q
True

>>> Q = ClusterQuiver(['TR',Integer(3)]); Q
Quiver on 6 vertices of type ['D', 6]
>>> MT = Q.mutation_type(); MT.standard_quiver() == Q
False
```

From a `ClusterQuiver`:

```
sage: Q = ClusterQuiver(['A',[2,5],1]); Q
Quiver on 7 vertices of type ['A', [2, 5], 1]
sage: T = ClusterQuiver(Q); T
Quiver on 7 vertices of type ['A', [2, 5], 1]
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['A',[Integer(2),Integer(5)],Integer(1)]); Q
Quiver on 7 vertices of type ['A', [2, 5], 1]
>>> T = ClusterQuiver(Q); T
Quiver on 7 vertices of type ['A', [2, 5], 1]
```

From a Matrix:

```
sage: Q = ClusterQuiver(['A',[2,5],1]); Q
Quiver on 7 vertices of type ['A', [2, 5], 1]
sage: T = ClusterQuiver(Q._M); T
Quiver on 7 vertices

sage: Q = ClusterQuiver(matrix([[0,1,-1],[-1,0,1],[1,-1,0],[1,2,3]])); Q
Quiver on 4 vertices with 1 frozen vertex
```

(continues on next page)

(continued from previous page)

```
sage: Q = ClusterQuiver(matrix([])); Q
Quiver without vertices
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['A',[Integer(2),Integer(5)],Integer(1)]); Q
Quiver on 7 vertices of type ['A', [2, 5], 1]
>>> T = ClusterQuiver(Q._M); T
Quiver on 7 vertices

>>> Q = ClusterQuiver(matrix([[Integer(0),Integer(1),-Integer(1)],[-Integer(1),
↪Integer(0),Integer(1)],[Integer(1),-Integer(1),Integer(0)],[Integer(1),
↪Integer(2),Integer(3)]])); Q
Quiver on 4 vertices with 1 frozen vertex

>>> Q = ClusterQuiver(matrix([])); Q
Quiver without vertices
```

From a DiGraph:

```
sage: Q = ClusterQuiver(['A',[2,5],1]); Q
Quiver on 7 vertices of type ['A', [2, 5], 1]
sage: T = ClusterQuiver(Q._digraph); T
Quiver on 7 vertices

sage: Q = ClusterQuiver(DiGraph([[1,2],[2,3],[3,4],[4,1]])); Q
Quiver on 4 vertices

sage: Q = ClusterQuiver(DiGraph([['a', 'b'], ['b', 'c'], ['c', 'd'], ['d', 'e']]),
....:           frozen=['c']); Q
Quiver on 5 vertices with 1 frozen vertex
sage: Q.mutation_type()
[ ['A', 2], ['A', 2] ]
sage: Q
Quiver on 5 vertices of type [ ['A', 2], ['A', 2] ]
with 1 frozen vertex
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['A',[Integer(2),Integer(5)],Integer(1)]); Q
Quiver on 7 vertices of type ['A', [2, 5], 1]
>>> T = ClusterQuiver(Q._digraph); T
Quiver on 7 vertices

>>> Q = ClusterQuiver(DiGraph([[Integer(1),Integer(2)],[Integer(2),Integer(3)],
↪[Integer(3),Integer(4)],[Integer(4),Integer(1)]])); Q
Quiver on 4 vertices

>>> Q = ClusterQuiver(DiGraph([['a', 'b'], ['b', 'c'], ['c', 'd'], ['d', 'e']]),
...           frozen=['c']); Q
Quiver on 5 vertices with 1 frozen vertex
>>> Q.mutation_type()
[ ['A', 2], ['A', 2] ]
>>> Q
```

(continues on next page)

(continued from previous page)

```
Quiver on 5 vertices of type [ ['A', 2], ['A', 2] ]
with 1 frozen vertex
```

From a List of edges:

```
sage: Q = ClusterQuiver(['A',[2,5],1]); Q
Quiver on 7 vertices of type ['A', [2, 5], 1]
sage: T = ClusterQuiver(Q._digraph.edges(sort=True)); T
Quiver on 7 vertices

sage: Q = ClusterQuiver([[1, 2], [2, 3], [3, 4], [4, 1]]); Q
Quiver on 4 vertices
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['A',[Integer(2),Integer(5)],Integer(1)]); Q
Quiver on 7 vertices of type ['A', [2, 5], 1]
>>> T = ClusterQuiver(Q._digraph.edges(sort=True)); T
Quiver on 7 vertices

>>> Q = ClusterQuiver([[Integer(1), Integer(2)], [Integer(2), Integer(3)],
↪[Integer(3), Integer(4)], [Integer(4), Integer(1)]]); Q
Quiver on 4 vertices
```

b_matrix()

Return the b-matrix of `self`.

EXAMPLES:

```
sage: ClusterQuiver(['A',4]).b_matrix()
[ 0  1  0  0]
[-1  0 -1  0]
[ 0  1  0  1]
[ 0  0 -1  0]

sage: ClusterQuiver(['B',4]).b_matrix()
[ 0  1  0  0]
[-1  0 -1  0]
[ 0  1  0  1]
[ 0  0 -2  0]

sage: ClusterQuiver(['D',4]).b_matrix()
[ 0  1  0  0]
[-1  0 -1 -1]
[ 0  1  0  0]
[ 0  1  0  0]

sage: ClusterQuiver(QuiverMutationType([['A',2],['B',2]])).b_matrix()
[ 0  1  0  0]
[-1  0  0  0]
[ 0  0  0  1]
[ 0  0 -2  0]
```

```
>>> from sage.all import *
>>> ClusterQuiver(['A',Integer(4)]).b_matrix()
[ 0  1  0  0]
[-1  0 -1  0]
[ 0  1  0  1]
[ 0  0 -1  0]

>>> ClusterQuiver(['B',Integer(4)]).b_matrix()
[ 0  1  0  0]
[-1  0 -1  0]
[ 0  1  0  1]
[ 0  0 -2  0]

>>> ClusterQuiver(['D',Integer(4)]).b_matrix()
[ 0  1  0  0]
[-1  0 -1 -1]
[ 0  1  0  0]
[ 0  1  0  0]

>>> ClusterQuiver(QuiverMutationType([['A',Integer(2)],['B',Integer(2)]])).b_
→matrix()
[ 0  1  0  0]
[-1  0  0  0]
[ 0  0  0  1]
[ 0  0 -2  0]
```

canonical_label(*certificate=False*)

Return the canonical labelling of `self`.

See `sage.graphs.generic_graph.GenericGraph.canonical_label()`.

INPUT:

- `certificate` – boolean (default: `False`); if `True`, the dictionary from `self.vertices()` to the vertices of the returned quiver is returned as well

EXAMPLES:

```
sage: Q = ClusterQuiver(['A',4]); Q.digraph().edges(sort=True)
[(0, 1, (1, -1)), (2, 1, (1, -1)), (2, 3, (1, -1))]

sage: T = Q.canonical_label(); T.digraph().edges(sort=True)
[(0, 3, (1, -1)), (1, 2, (1, -1)), (1, 3, (1, -1))]

sage: T, iso = Q.canonical_label(certificate=True)
sage: T.digraph().edges(sort=True); iso
[(0, 3, (1, -1)), (1, 2, (1, -1)), (1, 3, (1, -1))]
{0: 0, 1: 3, 2: 1, 3: 2}

sage: Q = ClusterQuiver(QuiverMutationType([['B',2],['A',1]])); Q
Quiver on 3 vertices of type [ ['B', 2], ['A', 1] ]

sage: Q.canonical_label()
Quiver on 3 vertices of type [ ['A', 1], ['B', 2] ]
```

(continues on next page)

(continued from previous page)

```
sage: Q.canonical_label(certificate=True)
(Quiver on 3 vertices of type [ ['A', 1], ['B', 2] ], {0: 1, 1: 2, 2: 0})
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['A',Integer(4)]); Q.digraph().edges(sort=True)
[(0, 1, (1, -1)), (2, 1, (1, -1)), (2, 3, (1, -1))]

>>> T = Q.canonical_label(); T.digraph().edges(sort=True)
[(0, 3, (1, -1)), (1, 2, (1, -1)), (1, 3, (1, -1))]

>>> T, iso = Q.canonical_label(certificate=True)
>>> T.digraph().edges(sort=True); iso
[(0, 3, (1, -1)), (1, 2, (1, -1)), (1, 3, (1, -1))]
{0: 0, 1: 3, 2: 1, 3: 2}

>>> Q = ClusterQuiver(QuiverMutationType([['B',Integer(2)],['A',
→Integer(1)]])); Q
Quiver on 3 vertices of type [ ['B', 2], ['A', 1] ]

>>> Q.canonical_label()
Quiver on 3 vertices of type [ ['A', 1], ['B', 2] ]

>>> Q.canonical_label(certificate=True)
(Quiver on 3 vertices of type [ ['A', 1], ['B', 2] ], {0: 1, 1: 2, 2: 0})
```

d_vector_fan()

Return the d-vector fan associated with the quiver.

It is the fan whose maximal cones are generated by the d-matrices of the clusters.

This is a complete simplicial fan (and even smooth when the initial quiver is acyclic). It only makes sense for quivers of finite type.

EXAMPLES:

```
sage: # needs sage.geometry.polyhedron sage.libs.singular
sage: Fd = ClusterQuiver([[1,2]]).d_vector_fan(); Fd
Rational polyhedral fan in 2-d lattice N
sage: Fd.ngenerating_cones()
5
sage: Fd = ClusterQuiver([[1,2],[2,3]]).d_vector_fan(); Fd
Rational polyhedral fan in 3-d lattice N
sage: Fd.ngenerating_cones()
14
sage: Fd.is_smooth()
True
sage: Fd = ClusterQuiver([[1,2],[2,3],[3,1]]).d_vector_fan(); Fd
Rational polyhedral fan in 3-d lattice N
sage: Fd.ngenerating_cones()
14
sage: Fd.is_smooth()
False
```

```
>>> from sage.all import *
>>> # needs sage.geometry.polyhedron sage.libs.singular
>>> Fd = ClusterQuiver([[Integer(1),Integer(2)]]).d_vector_fan(); Fd
Rational polyhedral fan in 2-d lattice N
>>> Fd.ngenerating_cones()
5
>>> Fd = ClusterQuiver([[Integer(1),Integer(2)],[Integer(2),Integer(3)]]).d_
↪vector_fan(); Fd
Rational polyhedral fan in 3-d lattice N
>>> Fd.ngenerating_cones()
14
>>> Fd.is_smooth()
True
>>> Fd = ClusterQuiver([[Integer(1),Integer(2)],[Integer(2),Integer(3)],
↪[Integer(3),Integer(1)]]).d_vector_fan(); Fd
Rational polyhedral fan in 3-d lattice N
>>> Fd.ngenerating_cones()
14
>>> Fd.is_smooth()
False
```

digraph()

Return the underlying digraph of `self`.

EXAMPLES:

```
sage: ClusterQuiver(['A',1]).digraph()
Digraph on 1 vertex
sage: list(ClusterQuiver(['A',1]).digraph())
[0]
sage: ClusterQuiver(['A',1]).digraph().edges(sort=True)
[]

sage: ClusterQuiver(['A',4]).digraph()
Digraph on 4 vertices
sage: ClusterQuiver(['A',4]).digraph().edges(sort=True)
[(0, 1, (1, -1)), (2, 1, (1, -1)), (2, 3, (1, -1))]

sage: ClusterQuiver(['B',4]).digraph()
Digraph on 4 vertices
sage: ClusterQuiver(['A',4]).digraph().edges(sort=True)
[(0, 1, (1, -1)), (2, 1, (1, -1)), (2, 3, (1, -1))]

sage: ClusterQuiver(QuiverMutationType([['A',2],['B',2]])).digraph()
Digraph on 4 vertices

sage: ClusterQuiver(QuiverMutationType([['A',2],['B',2]])).digraph().
↪edges(sort=True)
[(0, 1, (1, -1)), (2, 3, (1, -2))]

sage: ClusterQuiver(['C', 4], user_labels = ['x', 'y', 'z', 'w']).digraph().
↪edges(sort=True)
[('x', 'y', (1, -1)), ('z', 'w', (2, -1)), ('z', 'y', (1, -1))]
```

```
>>> from sage.all import *
>>> ClusterQuiver(['A',Integer(1)]).digraph()
Digraph on 1 vertex
>>> list(ClusterQuiver(['A',Integer(1)]).digraph())
[0]
>>> ClusterQuiver(['A',Integer(1)]).digraph().edges(sort=True)
[]

>>> ClusterQuiver(['A',Integer(4)]).digraph()
Digraph on 4 vertices
>>> ClusterQuiver(['A',Integer(4)]).digraph().edges(sort=True)
[(0, 1, (1, -1)), (2, 1, (1, -1)), (2, 3, (1, -1))]

>>> ClusterQuiver(['B',Integer(4)]).digraph()
Digraph on 4 vertices
>>> ClusterQuiver(['A',Integer(4)]).digraph().edges(sort=True)
[(0, 1, (1, -1)), (2, 1, (1, -1)), (2, 3, (1, -1))]

>>> ClusterQuiver(QuiverMutationType([['A',Integer(2)],['B',Integer(2)]])).
↪digraph()
Digraph on 4 vertices

>>> ClusterQuiver(QuiverMutationType([['A',Integer(2)],['B',Integer(2)]])).
↪digraph().edges(sort=True)
[(0, 1, (1, -1)), (2, 3, (1, -2))]

>>> ClusterQuiver(['C', Integer(4)], user_labels = ['x', 'y', 'z', 'w']).
↪digraph().edges(sort=True)
[('x', 'y', (1, -1)), ('z', 'w', (2, -1)), ('z', 'y', (1, -1))]
```

exchangeable_part()

Return the restriction to the principal part (i.e. exchangeable part) of `self`, the subquiver obtained by deleting the frozen vertices of `self`.

EXAMPLES:

```
sage: Q = ClusterQuiver(['A',4])
sage: T = ClusterQuiver(Q.digraph().edges(sort=True), frozen=[3])
sage: T.digraph().edges(sort=True)
[(0, 1, (1, -1)), (2, 1, (1, -1)), (2, 3, (1, -1))]

sage: T.exchangeable_part().digraph().edges(sort=True)
[(0, 1, (1, -1)), (2, 1, (1, -1))]

sage: Q2 = Q.principal_extension()
sage: Q3 = Q2.principal_extension()
sage: Q2.exchangeable_part() == Q3.exchangeable_part()
True
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['A',Integer(4)])
>>> T = ClusterQuiver(Q.digraph().edges(sort=True), frozen=[Integer(3)])
>>> T.digraph().edges(sort=True)
```

(continues on next page)

(continued from previous page)

```
[(0, 1, (1, -1)), (2, 1, (1, -1)), (2, 3, (1, -1))]

>>> T.exchangeable_part().digraph().edges(sort=True)
[(0, 1, (1, -1)), (2, 1, (1, -1))]

>>> Q2 = Q.principal_extension()
>>> Q3 = Q2.principal_extension()
>>> Q2.exchangeable_part() == Q3.exchangeable_part()
True
```

first_sink()

Return the first vertex of `self` that is a sink.

EXAMPLES:

```
sage: Q = ClusterQuiver(['A',5])
sage: Q.mutate([1,2,4,3,2])
sage: Q.first_sink()
0
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['A',Integer(5)])
>>> Q.mutate([Integer(1),Integer(2),Integer(4),Integer(3),Integer(2)])
>>> Q.first_sink()
0
```

first_source()

Return the first vertex of `self` that is a source.

EXAMPLES:

```
sage: Q = ClusterQuiver(['A',5])
sage: Q.mutate([2,1,3,4,2])
sage: Q.first_source()
1
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['A',Integer(5)])
>>> Q.mutate([Integer(2),Integer(1),Integer(3),Integer(4),Integer(2)])
>>> Q.first_source()
1
```

free_vertices()

Return the list of free vertices of `self`.

EXAMPLES:

```
sage: Q = ClusterQuiver(DiGraph([['a', 'b'], ['c', 'b'], ['c', 'd'], ['e', 'd
↪']]),
....:                       frozen=['b', 'd'])
sage: Q.free_vertices()
['a', 'c', 'e']
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(DiGraph([['a', 'b'], ['c', 'b'], ['c', 'd'], ['e', 'd
↪']]),
...                         frozen=['b', 'd'])
>>> Q.free_vertices()
['a', 'c', 'e']
```

frozen_vertices()

Return the list of frozen vertices of `self`.

EXAMPLES:

```
sage: Q = ClusterQuiver(DiGraph([['a', 'b'], ['c', 'b'], ['c', 'd'], ['e', 'd
↪']]),
....:                         frozen=['b', 'd'])
sage: sorted(Q.frozen_vertices())
['b', 'd']
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(DiGraph([['a', 'b'], ['c', 'b'], ['c', 'd'], ['e', 'd
↪']]),
...                         frozen=['b', 'd'])
>>> sorted(Q.frozen_vertices())
['b', 'd']
```

g_vector_fan()

Return the g-vector fan associated with the quiver.

It is the fan whose maximal cones are generated by the g-matrices of the clusters.

This is a complete simplicial fan. It is only supported for quivers of finite type.

EXAMPLES:

```
sage: Fg = ClusterQuiver([[1,2]]).g_vector_fan(); Fg
Rational polyhedral fan in 2-d lattice N
sage: Fg.ngenerating_cones()
5

sage: Fg = ClusterQuiver([[1,2],[2,3]]).g_vector_fan(); Fg
Rational polyhedral fan in 3-d lattice N
sage: Fg.ngenerating_cones()
14
sage: Fg.is_smooth()
True

sage: Fg = ClusterQuiver([[1,2],[2,3],[3,1]]).g_vector_fan(); Fg
Rational polyhedral fan in 3-d lattice N
sage: Fg.ngenerating_cones()
14
sage: Fg.is_smooth()
True
```

```
>>> from sage.all import *
>>> Fg = ClusterQuiver([[Integer(1),Integer(2)]]).g_vector_fan(); Fg
Rational polyhedral fan in 2-d lattice N
>>> Fg.ngenerating_cones()
5

>>> Fg = ClusterQuiver([[Integer(1),Integer(2)],[Integer(2),Integer(3)]]).g_
↪vector_fan(); Fg
Rational polyhedral fan in 3-d lattice N
>>> Fg.ngenerating_cones()
14
>>> Fg.is_smooth()
True

>>> Fg = ClusterQuiver([[Integer(1),Integer(2)],[Integer(2),Integer(3)],
↪[Integer(3),Integer(1)]]).g_vector_fan(); Fg
Rational polyhedral fan in 3-d lattice N
>>> Fg.ngenerating_cones()
14
>>> Fg.is_smooth()
True
```

interact(*fig_size=1*, *circular=True*)

Start an interactive window for cluster quiver mutations.

Only in *Jupyter notebook mode*.

INPUT:

- `fig_size` – (default: 1) factor by which the size of the plot is multiplied
- `circular` – boolean (default: `True`); if `True`, the circular plot is chosen, otherwise >>spring<< is used

is_acyclic()

Return true if `self` is acyclic.

EXAMPLES:

```
sage: ClusterQuiver(['A',4]).is_acyclic()
True

sage: ClusterQuiver(['A',[2,1],1]).is_acyclic()
True

sage: ClusterQuiver([[0,1],[1,2],[2,0]]).is_acyclic()
False
```

```
>>> from sage.all import *
>>> ClusterQuiver(['A',Integer(4)]).is_acyclic()
True

>>> ClusterQuiver(['A',[Integer(2),Integer(1)],Integer(1)]).is_acyclic()
True

>>> ClusterQuiver([[Integer(0),Integer(1)],[Integer(1),Integer(2)],
```

(continues on next page)

(continued from previous page)

```
↪[Integer(2),Integer(0)]]).is_acyclic()
False
```

is_bipartite(*return_bipartition=False*)

Return `True` if `self` is bipartite.

EXAMPLES:

```
sage: ClusterQuiver(['A',[3,3],1]).is_bipartite()
True

sage: ClusterQuiver(['A',[4,3],1]).is_bipartite()
False
```

```
>>> from sage.all import *
>>> ClusterQuiver(['A',[Integer(3),Integer(3)],Integer(1)]).is_bipartite()
True

>>> ClusterQuiver(['A',[Integer(4),Integer(3)],Integer(1)]).is_bipartite()
False
```

is_finite()

Return `True` if `self` is of finite type.

EXAMPLES:

```
sage: Q = ClusterQuiver(['A',3])
sage: Q.is_finite()
True
sage: Q = ClusterQuiver(['A',[2,2],1])
sage: Q.is_finite()
False
sage: Q = ClusterQuiver([['A',3],['B',3]])
sage: Q.is_finite()
True
sage: Q = ClusterQuiver(['T',[4,4,4]])
sage: Q.is_finite()
False
sage: Q = ClusterQuiver([['A',3],['T',[4,4,4]]])
sage: Q.is_finite()
False
sage: Q = ClusterQuiver([['A',3],['T',[2,2,3]]])
sage: Q.is_finite()
True
sage: Q = ClusterQuiver([['A',3],['D',5]])
sage: Q.is_finite()
True
sage: Q = ClusterQuiver([['A',3],['D',5,1]])
sage: Q.is_finite()
False

sage: Q = ClusterQuiver([[0,1,2],[1,2,2],[2,0,2]])
sage: Q.is_finite()
```

(continues on next page)

(continued from previous page)

```
False

sage: Q = ClusterQuiver([[0,1,2],[1,2,2],[2,0,2],[3,4,1],[4,5,1]])
sage: Q.is_finite()
False
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['A',Integer(3)])
>>> Q.is_finite()
True
>>> Q = ClusterQuiver(['A',[Integer(2),Integer(2)],Integer(1)])
>>> Q.is_finite()
False
>>> Q = ClusterQuiver([['A',Integer(3)],['B',Integer(3)]])
>>> Q.is_finite()
True
>>> Q = ClusterQuiver(['T',[Integer(4),Integer(4),Integer(4)]])
>>> Q.is_finite()
False
>>> Q = ClusterQuiver([['A',Integer(3)],['T',[Integer(4),Integer(4),
↪Integer(4)]]])
>>> Q.is_finite()
False
>>> Q = ClusterQuiver([['A',Integer(3)],['T',[Integer(2),Integer(2),
↪Integer(3)]]])
>>> Q.is_finite()
True
>>> Q = ClusterQuiver([['A',Integer(3)],['D',Integer(5)]])
>>> Q.is_finite()
True
>>> Q = ClusterQuiver([['A',Integer(3)],['D',Integer(5),Integer(1)]])
>>> Q.is_finite()
False

>>> Q = ClusterQuiver([[Integer(0),Integer(1),Integer(2)],[Integer(1),
↪Integer(2),Integer(2)],[Integer(2),Integer(0),Integer(2)]])
>>> Q.is_finite()
False

>>> Q = ClusterQuiver([[Integer(0),Integer(1),Integer(2)],[Integer(1),
↪Integer(2),Integer(2)],[Integer(2),Integer(0),Integer(2)],[Integer(3),
↪Integer(4),Integer(1)],[Integer(4),Integer(5),Integer(1)]])
>>> Q.is_finite()
False
```

is_mutation_finite(*nr_of_checks=None*, *return_path=False*)

Return whether `self` is mutation-finite.

This uses a non-deterministic method by random mutations in various directions. This can result in a wrong answer.

INPUT:

- `nr_of_checks` – (default: `None`) number of mutations applied; Standard is 500*(number of vertices of `self`)

- `return_path` – (default: `False`) if `True`, in case of `self` not being mutation finite, a path from `self` to a quiver with an edge label $(a, -b)$ and $a * b > 4$ is returned

ALGORITHM:

A quiver is mutation infinite if and only if every edge label (a,-b) satisfy a*b > 4. Thus, we apply random mutations in random directions

EXAMPLES:

```
sage: Q = ClusterQuiver(['A',10])
sage: Q._mutation_type = None
sage: Q.is_mutation_finite()
True

sage: Q = ClusterQuiver([(0,1),(1,2),(2,3),(3,4),
....:                    (4,5),(5,6),(6,7),(7,8),(2,9)])
sage: Q.is_mutation_finite()
False
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['A',Integer(10)])
>>> Q._mutation_type = None
>>> Q.is_mutation_finite()
True

>>> Q = ClusterQuiver([(Integer(0),Integer(1)),(Integer(1),Integer(2)),
↪(Integer(2),Integer(3)),(Integer(3),Integer(4)),
...                    (Integer(4),Integer(5)),(Integer(5),Integer(6)),
↪(Integer(6),Integer(7)),(Integer(7),Integer(8)),(Integer(2),Integer(9))])
>>> Q.is_mutation_finite()
False
```

m()

Return the number of frozen vertices of `self`.

EXAMPLES:

```
sage: Q = ClusterQuiver(['A',4])
sage: Q.m()
0

sage: T = ClusterQuiver(Q.digraph().edges(sort=True), frozen=[3])
sage: T.n()
3
sage: T.m()
1
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['A',Integer(4)])
>>> Q.m()
0

```

(continues on next page)

(continued from previous page)

```
>>> T = ClusterQuiver(Q.digraph().edges(sort=True), frozen=[Integer(3)])
>>> T.n()
3
>>> T.m()
1
```

mutate(*data*, *inplace=True*)

Mutate `self` at a sequence of vertices.

INPUT:

- `sequence` – a vertex of `self`, an iterator of vertices of `self`, a function which takes in the ClusterQuiver and returns a vertex or an iterator of vertices, or a string of the parameter wanting to be called on `ClusterQuiver` that will return a vertex or an iterator of vertices
- `inplace` – boolean (default: `True`); if `False`, the result is returned, otherwise `self` is modified

EXAMPLES:

```
sage: Q = ClusterQuiver(['A',4]); Q.b_matrix()
[ 0  1  0  0]
[-1  0 -1  0]
[ 0  1  0  1]
[ 0  0 -1  0]

sage: Q.mutate(0); Q.b_matrix()
[ 0 -1  0  0]
[ 1  0 -1  0]
[ 0  1  0  1]
[ 0  0 -1  0]

sage: T = Q.mutate(0, inplace=False); T
Quiver on 4 vertices of type ['A', 4]

sage: Q.mutate(0)
sage: Q == T
True

sage: Q.mutate([0,1,0])
sage: Q.b_matrix()
[ 0 -1  1  0]
[ 1  0  0  0]
[-1  0  0  1]
[ 0  0 -1  0]

sage: Q = ClusterQuiver(QuiverMutationType([['A',1],['A',3]]))
sage: Q.b_matrix()
[ 0  0  0  0]
[ 0  0  1  0]
[ 0 -1  0 -1]
[ 0  0  1  0]

sage: T = Q.mutate(0,inplace=False)
sage: Q == T
```

(continues on next page)

(continued from previous page)

```
True

sage: Q = ClusterQuiver(['A',3]); Q.b_matrix()
[ 0  1  0]
[-1  0 -1]
[ 0  1  0]
sage: Q.mutate('first_sink'); Q.b_matrix()
[ 0 -1  0]
[ 1  0  1]
[ 0 -1  0]
sage: Q.mutate('first_source'); Q.b_matrix()
[ 0  1  0]
[-1  0 -1]
[ 0  1  0]

sage: dg = DiGraph()
sage: dg.add_vertices(['a','b','c','d','e'])
sage: dg.add_edges([['a','b'], ['b','c'], ['c','d'], ['d','e']])
sage: Q2 = ClusterQuiver(dg, frozen=['c']); Q2.b_matrix()
[ 0  1  0  0]
[-1  0  0  0]
[ 0  0  0  1]
[ 0  0 -1  0]
[ 0 -1  1  0]
sage: Q2.mutate('a'); Q2.b_matrix()
[ 0 -1  0  0]
[ 1  0  0  0]
[ 0  0  0  1]
[ 0  0 -1  0]
[ 0 -1  1  0]

sage: dg = DiGraph([['a', 'b'], ['b', 'c']], format='list_of_edges')
sage: Q = ClusterQuiver(dg);Q
Quiver on 3 vertices
sage: Q.mutate(['a','b'],inplace=False).digraph().edges(sort=True)
[('a', 'b', (1, -1)), ('c', 'b', (1, -1))]
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['A',Integer(4)]); Q.b_matrix()
[ 0  1  0  0]
[-1  0 -1  0]
[ 0  1  0  1]
[ 0  0 -1  0]

>>> Q.mutate(Integer(0)); Q.b_matrix()
[ 0 -1  0  0]
[ 1  0 -1  0]
[ 0  1  0  1]
[ 0  0 -1  0]

>>> T = Q.mutate(Integer(0), inplace=False); T
Quiver on 4 vertices of type ['A', 4]
```

(continues on next page)

(continued from previous page)

```
>>> Q.mutate(Integer(0))
>>> Q == T
True

>>> Q.mutate([Integer(0),Integer(1),Integer(0)])
>>> Q.b_matrix()
[ 0 -1  1  0]
[ 1  0  0  0]
[-1  0  0  1]
[ 0  0 -1  0]

>>> Q = ClusterQuiver(QuiverMutationType([['A',Integer(1)],['A',Integer(3)]]))
>>> Q.b_matrix()
[ 0  0  0  0]
[ 0  0  1  0]
[ 0 -1  0 -1]
[ 0  0  1  0]

>>> T = Q.mutate(Integer(0),inplace=False)
>>> Q == T
True

>>> Q = ClusterQuiver(['A',Integer(3)]); Q.b_matrix()
[ 0  1  0]
[-1  0 -1]
[ 0  1  0]
>>> Q.mutate('first_sink'); Q.b_matrix()
[ 0 -1  0]
[ 1  0  1]
[ 0 -1  0]
>>> Q.mutate('first_source'); Q.b_matrix()
[ 0  1  0]
[-1  0 -1]
[ 0  1  0]

>>> dg = DiGraph()
>>> dg.add_vertices(['a','b','c','d','e'])
>>> dg.add_edges([['a','b'], ['b','c'], ['c','d'], ['d','e']])
>>> Q2 = ClusterQuiver(dg, frozen=['c']); Q2.b_matrix()
[ 0  1  0  0]
[-1  0  0  0]
[ 0  0  0  1]
[ 0  0 -1  0]
[ 0 -1  1  0]
>>> Q2.mutate('a'); Q2.b_matrix()
[ 0 -1  0  0]
[ 1  0  0  0]
[ 0  0  0  1]
[ 0  0 -1  0]
[ 0 -1  1  0]
```

(continues on next page)

(continued from previous page)

```
>>> dg = DiGraph([['a', 'b'], ['b', 'c']], format='list_of_edges')
>>> Q = ClusterQuiver(dg);Q
Quiver on 3 vertices
>>> Q.mutate(['a','b'],inplace=False).digraph().edges(sort=True)
[('a', 'b', (1, -1)), ('c', 'b', (1, -1))]
```

mutation_class(*depth=+Infinity*, *show_depth=False*, *return_paths=False*, *data_type='quiver'*, *up_to_equivalence=True*, *sink_source=False*)

Return the mutation class of `self` together with certain constraints.

INPUT:

- `depth` – (default: `infinity`) integer, only seeds with distance at most depth from `self` are returned
- `show_depth` – boolean (default: `False`); if `True`, the actual depth of the mutation is shown
- `return_paths` – boolean (default: `False`); if `True`, a shortest path of mutation sequences from `self` to the given quiver is returned as well
- `data_type` – (default: `'quiver'`) can be one of the following:
  - `'quiver'` – the quiver is returned
  - `'dig6'` – the dig6-data is returned
  - `'path'` – shortest paths of mutation sequences from `self` are returned
- `sink_source` – boolean (default: `False`); if `True`, only mutations at sinks and sources are applied

EXAMPLES:

```
sage: Q = ClusterQuiver(['A',3])
sage: Ts = Q.mutation_class()
sage: for T in Ts: print(T)
Quiver on 3 vertices of type ['A', 3]
Quiver on 3 vertices of type ['A', 3]
Quiver on 3 vertices of type ['A', 3]
Quiver on 3 vertices of type ['A', 3]

sage: Ts = Q.mutation_class(depth=1)
sage: for T in Ts: print(T)
Quiver on 3 vertices of type ['A', 3]
Quiver on 3 vertices of type ['A', 3]
Quiver on 3 vertices of type ['A', 3]

sage: Ts = Q.mutation_class(show_depth=True)

mutation_class_iter(*depth=+Infinity*, *show_depth=False*, *return_paths=False*, *data_type='quiver'*, *up_to_equivalence=True*, *sink_source=False*)

Return an iterator for the mutation class of `self` together with certain constraints.

INPUT:

- `depth` – integer (default: infinity); only quivers with distance at most depth from `self` are returned.
- `show_depth` – boolean (default: `False`); if `True`, the actual depth of the mutation is shown

- `return_paths` – boolean (default: `False`); if `True`, a shortest path of mutation sequences from `self` to the given quiver is returned as well
- `data_type` – (default: `'quiver'`) can be one of the following:

```
* "quiver"
* "matrix"
* "digraph"
* "dig6"
* "path"
```

- `up_to_equivalence` – boolean (default: `True`); if `True`, only one quiver for each graph-isomorphism class is recorded
- `sink_source` – boolean (default: `False`); if `True`, only mutations at sinks and sources are applied

EXAMPLES:

```
sage: Q = ClusterQuiver(['A',3])
sage: it = Q.mutation_class_iter()
sage: for T in it: print(T)
Quiver on 3 vertices of type ['A', 3]

 Quiver on 3 vertices with 1 frozen vertex]
```

mutation_sequence(*sequence*, *show_sequence=False*, *fig_size=1.2*)

Return a list containing the sequence of quivers obtained from `self` by a sequence of mutations on vertices.

INPUT:

- `sequence` – list or tuple of vertices of `self`
- `show_sequence` – boolean (default: `False`); if `True`, a png containing the mutation sequence is shown
- `fig_size` – (default: 1.2) factor by which the size of the sequence is expanded

EXAMPLES:

```
sage: Q = ClusterQuiver(['A',4])
sage: seq = Q.mutation_sequence([0,1]); seq
[Quiver on 4 vertices of type ['A', 4],
 Quiver on 4 vertices of type ['A', 4],
 Quiver on 4 vertices of type ['A', 4]]
sage: [T.b_matrix() for T in seq]
[
[ 0  1  0  0]  [ 0 -1  0  0]  [ 0  1 -1  0]
[-1  0 -1  0]  [ 1  0 -1  0]  [-1  0  1  0]
[ 0  1  0  1]  [ 0  1  0  1]  [ 1 -1  0  1]
[ 0  0 -1  0], [ 0  0 -1  0], [ 0  0 -1  0]
]
```

```
>>> from sage.all import *

[ 0  1  0  1]  [ 0  1  0  1]  [ 1 -1  0  1]
[ 0  0 -1  0], [ 0  0 -1  0], [ 0  0 -1  0]
```

(continues on next page)

(continued from previous page)

```
]
```

mutation_type()

Return the mutation type of `self`.

Return the mutation_type of each connected component of `self` if it can be determined, otherwise, the mutation type of this component is set to be unknown.

The mutation types of the components are ordered by vertex labels.

If you do many type recognitions, you should consider to save exceptional mutation types using `save_quiver_data()`

WARNING:

- All finite types can be detected,
- All affine types can be detected, EXCEPT affine type D (the algorithm is not yet implemented)
- All exceptional types can be detected.

EXAMPLES:

```
sage: ClusterQuiver(['A',4]).mutation_type()
['A', 4]
sage: ClusterQuiver(['A',(3,1),1]).mutation_type()
['A', [1, 3], 1]
sage: ClusterQuiver(['C',2]).mutation_type()
['B', 2]
sage: ClusterQuiver(['B',4,1]).mutation_type()
['BD', 4, 1]
```

```
>>> from sage.all import *
>>> ClusterQuiver(['A',Integer(4)]).mutation_type()
['A', 4]
>>> ClusterQuiver(['A',(Integer(3),Integer(1)),Integer(1)]).mutation_type()
['A', [1, 3], 1]
>>> ClusterQuiver(['C',Integer(2)]).mutation_type()
['B', 2]
>>> ClusterQuiver(['B',Integer(4),Integer(1)]).mutation_type()
['BD', 4, 1]
```

finite types:

```
sage: Q = ClusterQuiver(['A',5])
sage: Q._mutation_type = None
sage: Q.mutation_type()
['A', 5]

sage: Q = ClusterQuiver([(0,1),(1,2),(2,3),(3,4)])
sage: Q.mutation_type()
['A', 5]

sage: Q = ClusterQuiver(DiGraph([['a', 'b'], ['c', 'b'], ['c', 'd'], ['e', 'd
↪']]),
....:                     frozen=['c'])
```

(continues on next page)

(continued from previous page)

```
sage: Q.mutation_type()
[ ['A', 2], ['A', 2] ]
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['A',Integer(5)])
>>> Q._mutation_type = None
>>> Q.mutation_type()
['A', 5]

>>> Q = ClusterQuiver([(Integer(0),Integer(1)),(Integer(1),Integer(2)),
↪(Integer(2),Integer(3)),(Integer(3),Integer(4))])
>>> Q.mutation_type()
['A', 5]

>>> Q = ClusterQuiver(DiGraph([['a', 'b'], ['c', 'b'], ['c', 'd'], ['e', 'd
↪']]),
...                   frozen=['c'])
>>> Q.mutation_type()
[ ['A', 2], ['A', 2] ]
```

affine types:

```
sage: Q = ClusterQuiver(['E',8,[1,1]]); Q
Quiver on 10 vertices of type ['E', 8, [1, 1]]
sage: Q._mutation_type = None; Q
Quiver on 10 vertices
sage: Q.mutation_type() # long time
['E', 8, [1, 1]]
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['E',Integer(8),[Integer(1),Integer(1)]]); Q
Quiver on 10 vertices of type ['E', 8, [1, 1]]
>>> Q._mutation_type = None; Q
Quiver on 10 vertices
>>> Q.mutation_type() # long time
['E', 8, [1, 1]]
```

the not yet working affine type D (unless user has saved small classical quiver data):

```
sage: Q = ClusterQuiver(['D',4,1])
sage: Q._mutation_type = None
sage: Q.mutation_type() # todo: not implemented
['D', 4, 1]
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['D',Integer(4),Integer(1)])
>>> Q._mutation_type = None
>>> Q.mutation_type() # todo: not implemented
['D', 4, 1]
```

the exceptional types:

```
sage: Q = ClusterQuiver(['X',6])
sage: Q._mutation_type = None
sage: Q.mutation_type() # long time
['X', 6]
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['X',Integer(6)])
>>> Q._mutation_type = None
>>> Q.mutation_type() # long time
['X', 6]
```

examples from page 8 of [Ke2008]:

```
sage: dg = DiGraph(); dg.add_edges([(9,0),(9,4),(4,6),(6,7),(7,8),(8,3),(3,5),
↪(5,6),(8,1),(2,3)])
sage: ClusterQuiver(dg).mutation_type() # long time
['E', 8, [1, 1]]

sage: dg = DiGraph({ 0:[3], 1:[0,4], 2:[0,6], 3:[1,2,7], 4:[3,8], 5:[2], 6:[3,
↪5], 7:[4,6], 8:[7] })
sage: ClusterQuiver(dg).mutation_type() # long time
['E', 8, 1]

sage: dg = DiGraph({ 0:[3,9], 1:[0,4], 2:[0,6], 3:[1,2,7], 4:[3,8], 5:[2],␣
↪6:[3,5], 7:[4,6], 8:[7], 9:[1] })
sage: ClusterQuiver(dg).mutation_type() # long time
['E', 8, [1, 1]]
```

```
>>> from sage.all import *
>>> dg = DiGraph(); dg.add_edges([(Integer(9),Integer(0)),(Integer(9),
↪Integer(4)),(Integer(4),Integer(6)),(Integer(6),Integer(7)),(Integer(7),
↪Integer(8)),(Integer(8),Integer(3)),(Integer(3),Integer(5)),(Integer(5),
↪Integer(6)),(Integer(8),Integer(1)),(Integer(2),Integer(3))])
>>> ClusterQuiver(dg).mutation_type() # long time
['E', 8, [1, 1]]

>>> dg = DiGraph({ Integer(0):[Integer(3)], Integer(1):[Integer(0),
↪Integer(4)], Integer(2):[Integer(0),Integer(6)], Integer(3):[Integer(1),
↪Integer(2),Integer(7)], Integer(4):[Integer(3),Integer(8)],␣
↪Integer(5):[Integer(2)], Integer(6):[Integer(3),Integer(5)],␣
↪Integer(7):[Integer(4),Integer(6)], Integer(8):[Integer(7)] })
>>> ClusterQuiver(dg).mutation_type() # long time
['E', 8, 1]

>>> dg = DiGraph({ Integer(0):[Integer(3),Integer(9)], Integer(1):[Integer(0),
↪Integer(4)], Integer(2):[Integer(0),Integer(6)], Integer(3):[Integer(1),
↪Integer(2),Integer(7)], Integer(4):[Integer(3),Integer(8)],␣
↪Integer(5):[Integer(2)], Integer(6):[Integer(3),Integer(5)],␣
↪Integer(7):[Integer(4),Integer(6)], Integer(8):[Integer(7)],␣
↪Integer(9):[Integer(1)] })
>>> ClusterQuiver(dg).mutation_type() # long time
['E', 8, [1, 1]]
```

infinite types:

```
sage: Q = ClusterQuiver(['GR',[4,9]])
sage: Q._mutation_type = None
sage: Q.mutation_type()
'undetermined infinite mutation type'
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['GR',[Integer(4),Integer(9)]])
>>> Q._mutation_type = None
>>> Q.mutation_type()
'undetermined infinite mutation type'
```

reducible types:

```
sage: Q = ClusterQuiver([['A', 3], ['B', 3]])
sage: Q._mutation_type = None
sage: Q.mutation_type()
[ ['A', 3], ['B', 3] ]

sage: Q = ClusterQuiver([['A', 3], ['T', [4,4,4]]])
sage: Q._mutation_type = None
sage: Q.mutation_type()
[['A', 3], 'undetermined infinite mutation type']

sage: Q = ClusterQuiver([['A', 3], ['B', 3], ['T', [4,4,4]]])
sage: Q._mutation_type = None
sage: Q.mutation_type()
[['A', 3], ['B', 3], 'undetermined infinite mutation type']

sage: Q = ClusterQuiver([[0,1,2],[1,2,2],[2,0,2],[3,4,1],[4,5,1]])
sage: Q.mutation_type()
['undetermined finite mutation type', ['A', 3]]
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver([['A', Integer(3)], ['B', Integer(3)]])
>>> Q._mutation_type = None
>>> Q.mutation_type()
[ ['A', 3], ['B', 3] ]

>>> Q = ClusterQuiver([['A', Integer(3)], ['T', [Integer(4),Integer(4),
↪Integer(4)]]])
>>> Q._mutation_type = None
>>> Q.mutation_type()
[['A', 3], 'undetermined infinite mutation type']

>>> Q = ClusterQuiver([['A', Integer(3)], ['B', Integer(3)], ['T',␣
↪[Integer(4),Integer(4),Integer(4)]]])
>>> Q._mutation_type = None
>>> Q.mutation_type()
[['A', 3], ['B', 3], 'undetermined infinite mutation type']

>>> Q = ClusterQuiver([[Integer(0),Integer(1),Integer(2)],[Integer(1),
```

(continues on next page)

(continued from previous page)

```
↪Integer(2),Integer(2)],[Integer(2),Integer(0),Integer(2)],[Integer(3),
↪Integer(4),Integer(1)],[Integer(4),Integer(5),Integer(1)]])
>>> Q.mutation_type()
['undetermined finite mutation type', ['A', 3]]
```

n()

Return the number of free vertices of `self`.

EXAMPLES:

```
sage: ClusterQuiver(['A',4]).n()
4
sage: ClusterQuiver(['A',(3,1),1]).n()
4
sage: ClusterQuiver(['B',4]).n()
4
sage: ClusterQuiver(['B',4,1]).n()
5
```

```
>>> from sage.all import *
>>> ClusterQuiver(['A',Integer(4)]).n()
4
>>> ClusterQuiver(['A',(Integer(3),Integer(1)),Integer(1)]).n()
4
>>> ClusterQuiver(['B',Integer(4)]).n()
4
>>> ClusterQuiver(['B',Integer(4),Integer(1)]).n()
5
```

number_of_edges()

Return the total number of edges on the quiver.

> **Note**
>
> This only works with non-valued quivers. If used on a non-valued quiver then the positive value is taken to be the number of edges added.

OUTPUT: integer of the number of edges

EXAMPLES:

```
sage: S = ClusterQuiver(['A',4]); S.number_of_edges()
3

sage: S = ClusterQuiver(['B',4]); S.number_of_edges()
3
```

```
>>> from sage.all import *
>>> S = ClusterQuiver(['A',Integer(4)]); S.number_of_edges()
3
```

(continues on next page)

(continued from previous page)

```
>>> S = ClusterQuiver(['B',Integer(4)]); S.number_of_edges()
3
```

plot(*circular=True*, *center=(0, 0)*, *directed=True*, *mark=None*, *save_pos=False*, *greens=[]*)

Return the plot of the underlying digraph of `self`.

INPUT:

- `circular` – boolean (default: `True`); if `True`, the circular plot is chosen, otherwise >>spring<< is used
- `center` – (default: (0,0)) sets the center of the circular plot, otherwise it is ignored
- `directed` – boolean (default: `True`); if `True`, the directed version is shown, otherwise the undirected
- `mark` – (default: `None`) if set to i, the vertex i is highlighted
- `save_pos` – boolean (default: `False`); if `True`, the positions of the vertices are saved
- `greens` – (default: `[]`) if set to a list, will display the green vertices as green

EXAMPLES:

```
sage: Q = ClusterQuiver(['A',5])
sage: Q.plot()                                                          #␣
↪needs sage.plot sage.symbolic
Graphics object consisting of 15 graphics primitives
sage: Q.plot(circular=True)                                             #␣
↪needs sage.plot sage.symbolic
Graphics object consisting of 15 graphics primitives
sage: Q.plot(circular=True, mark=1)                                     #␣
↪needs sage.plot sage.symbolic
Graphics object consisting of 15 graphics primitives
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['A',Integer(5)])
>>> Q.plot()                                                          #␣
↪needs sage.plot sage.symbolic
Graphics object consisting of 15 graphics primitives
>>> Q.plot(circular=True)                                             #␣
↪needs sage.plot sage.symbolic
Graphics object consisting of 15 graphics primitives
>>> Q.plot(circular=True, mark=Integer(1))                              ␣
↪     # needs sage.plot sage.symbolic
Graphics object consisting of 15 graphics primitives
```

poincare_semistable(*theta*, *d*)

Return the Poincaré polynomial of the moduli space of semi-stable representations of dimension vector d.

INPUT:

- `theta` – stability weight, as list or vector of rationals
- `d` – dimension vector, as list or vector of coprime integers

The semi-stability is taken with respect to the slope function

$$\mu(d) = \theta(d)/\dim(d)$$

where d is a dimension vector.

This uses the matrix-inversion algorithm from [Rei2002].

EXAMPLES:

```
sage: Q = ClusterQuiver(['A',2])
sage: Q.poincare_semistable([1,0],[1,0])
1
sage: Q.poincare_semistable([1,0],[1,1])
1

sage: K2 = ClusterQuiver(matrix([[0,2],[-2,0]]))
sage: theta = (1, 0)
sage: K2.poincare_semistable(theta, [1,0])
1
sage: K2.poincare_semistable(theta, [1,1])
v^2 + 1
sage: K2.poincare_semistable(theta, [1,2])
1
sage: K2.poincare_semistable(theta, [1,3])
0

sage: K3 = ClusterQuiver(matrix([[0,3],[-3,0]]))
sage: theta = (1, 0)
sage: K3.poincare_semistable(theta, (2,3))
v^12 + v^10 + 3*v^8 + 3*v^6 + 3*v^4 + v^2 + 1
sage: K3.poincare_semistable(theta, (3,4))(1)
68
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['A',Integer(2)])
>>> Q.poincare_semistable([Integer(1),Integer(0)],[Integer(1),Integer(0)])
1
>>> Q.poincare_semistable([Integer(1),Integer(0)],[Integer(1),Integer(1)])
1

>>> K2 = ClusterQuiver(matrix([[Integer(0),Integer(2)],[-Integer(2),
↪Integer(0)]]))
>>> theta = (Integer(1), Integer(0))
>>> K2.poincare_semistable(theta, [Integer(1),Integer(0)])
1
>>> K2.poincare_semistable(theta, [Integer(1),Integer(1)])
v^2 + 1
>>> K2.poincare_semistable(theta, [Integer(1),Integer(2)])
1
>>> K2.poincare_semistable(theta, [Integer(1),Integer(3)])
0

>>> K3 = ClusterQuiver(matrix([[Integer(0),Integer(3)],[-Integer(3),
↪Integer(0)]]))
>>> theta = (Integer(1), Integer(0))
>>> K3.poincare_semistable(theta, (Integer(2),Integer(3)))
v^12 + v^10 + 3*v^8 + 3*v^6 + 3*v^4 + v^2 + 1
>>> K3.poincare_semistable(theta, (Integer(3),Integer(4)))(Integer(1))
68
```

REFERENCES:

principal_extension(*inplace=False*)

Return the principal extension of `self`, adding n frozen vertices to any previously frozen vertices.

This is the quiver obtained by adding an outgoing edge to every mutable vertex of `self`.

EXAMPLES:

```
sage: Q = ClusterQuiver(['A',2]); Q
Quiver on 2 vertices of type ['A', 2]
sage: T = Q.principal_extension(); T
Quiver on 4 vertices of type ['A', 2] with 2 frozen vertices
sage: T2 = T.principal_extension(); T2
Quiver on 6 vertices of type ['A', 2] with 4 frozen vertices
sage: Q.digraph().edges(sort=True)
[(0, 1, (1, -1))]
sage: T.digraph().edges(sort=True)
[(0, 1, (1, -1)), (2, 0, (1, -1)), (3, 1, (1, -1))]
sage: T2.digraph().edges(sort=True)
[(0, 1, (1, -1)), (2, 0, (1, -1)), (3, 1, (1, -1)),
 (4, 0, (1, -1)), (5, 1, (1, -1))]
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['A',Integer(2)]); Q
Quiver on 2 vertices of type ['A', 2]
>>> T = Q.principal_extension(); T
Quiver on 4 vertices of type ['A', 2] with 2 frozen vertices
>>> T2 = T.principal_extension(); T2
Quiver on 6 vertices of type ['A', 2] with 4 frozen vertices
>>> Q.digraph().edges(sort=True)
[(0, 1, (1, -1))]
>>> T.digraph().edges(sort=True)
[(0, 1, (1, -1)), (2, 0, (1, -1)), (3, 1, (1, -1))]
>>> T2.digraph().edges(sort=True)
[(0, 1, (1, -1)), (2, 0, (1, -1)), (3, 1, (1, -1)),
 (4, 0, (1, -1)), (5, 1, (1, -1))]
```

qmu_save(*filename=None*)

Save `self` in a `.qmu` file.

This file can then be opened in Bernhard Keller's Quiver Applet.

See https://webusers.imj-prg.fr/~bernhard.keller/quivermutation/

INPUT:

- `filename` – the filename the image is saved to

If a filename is not specified, the default name is `from_sage.qmu` in the current sage directory.

EXAMPLES:

```
sage: Q = ClusterQuiver(['F',4,[1,2]])
sage: import tempfile
sage: with tempfile.NamedTemporaryFile(suffix='.qmu') as f:                   #␣
↪needs sage.plot sage.symbolic
....:     Q.qmu_save(f.name)
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['F',Integer(4),[Integer(1),Integer(2)]])
>>> import tempfile
>>> with tempfile.NamedTemporaryFile(suffix='.qmu') as f:                    #␣
↪needs sage.plot sage.symbolic
...     Q.qmu_save(f.name)
```

Make sure we can save quivers with $m! = n$ frozen variables, see Issue #14851:

```
sage: S = ClusterSeed(['A',3])
sage: T1 = S.principal_extension()
sage: Q = T1.quiver()
sage: import tempfile
sage: with tempfile.NamedTemporaryFile(suffix='.qmu') as f:                  #␣
↪needs sage.plot sage.symbolic
....:     Q.qmu_save(f.name)
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)])
>>> T1 = S.principal_extension()
>>> Q = T1.quiver()
>>> import tempfile
>>> with tempfile.NamedTemporaryFile(suffix='.qmu') as f:                    #␣
↪needs sage.plot sage.symbolic
...     Q.qmu_save(f.name)
```

relabel (*relabelling*, *inplace=True*)

Return the quiver after doing a relabelling.

Will relabel the vertices of the quiver.

INPUT:

- `relabelling` – dictionary of labels to move around
- `inplace` – boolean (default: `True`); if `True`, will return a duplicate of the quiver

EXAMPLES:

```
sage: S = ClusterQuiver(['A',4]).relabel({1:'5',2:'go'})
```

```
>>> from sage.all import *
>>> S = ClusterQuiver(['A',Integer(4)]).relabel({Integer(1):'5',Integer(2):'go
↪'})
```

reorient (*data*)

Reorient `self` with respect to the given total order, or with respect to an iterator of edges in `self` to be reverted.

Warning

This operation might change the mutation type of `self`.

INPUT:

- `data` – an iterator defining a total order on `self.vertices()`, or an iterator of edges in `self` to be reoriented.

EXAMPLES:

```
sage: Q = ClusterQuiver(['A',(2,3),1])
sage: Q.mutation_type()
['A', [2, 3], 1]

sage: Q.reorient([(0,1),(1,2),(2,3),(3,4)])
sage: Q.mutation_type()
['D', 5]

sage: Q.reorient([0,1,2,3,4])
sage: Q.mutation_type()
['A', [1, 4], 1]
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['A',(Integer(2),Integer(3)),Integer(1)])
>>> Q.mutation_type()
['A', [2, 3], 1]

>>> Q.reorient([(Integer(0),Integer(1)),(Integer(1),Integer(2)),(Integer(2),
↪Integer(3)),(Integer(3),Integer(4))])
>>> Q.mutation_type()
['D', 5]

>>> Q.reorient([Integer(0),Integer(1),Integer(2),Integer(3),Integer(4)])
>>> Q.mutation_type()
['A', [1, 4], 1]
```

save_image(*filename*, *circular=False*)

Save the plot of the underlying digraph of `self`.

INPUT:

- `filename` – the filename the image is saved to
- `circular` – boolean (default: `False`); if `True`, the circular plot is chosen, otherwise >>spring<< is used

EXAMPLES:

```
sage: Q = ClusterQuiver(['F',4,[1,2]])
sage: import tempfile
sage: with tempfile.NamedTemporaryFile(suffix='.png') as f:                #␣
↪needs sage.plot sage.symbolic
....:     Q.save_image(f.name)
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['F',Integer(4),[Integer(1),Integer(2)]])
>>> import tempfile
>>> with tempfile.NamedTemporaryFile(suffix='.png') as f:                #␣
↪needs sage.plot sage.symbolic
...     Q.save_image(f.name)
```

show(*fig_size=1*, *circular=False*, *directed=True*, *mark=None*, *save_pos=False*, *greens=[]*)

Show the plot of the underlying digraph of `self`.

INPUT:

- `fig_size` – (default: 1) factor by which the size of the plot is multiplied
- `circular` – boolean (default: `False`); if `True`, the circular plot is chosen, otherwise >>spring<< is used
- `directed` – boolean (default: `True`); if `True`, the directed version is shown, otherwise the undirected
- `mark` – boolean (default: `None`); if set to i, the vertex i is highlighted
- `save_pos` – boolean (default: `False`); if `True`, the positions of the vertices are saved
- `greens` – (default: `[]`) if set to a list, will display the green vertices as green

sinks()

Return all vertices of `self` that are sinks.

EXAMPLES:

```
sage: Q = ClusterQuiver(['A',5])
sage: Q.mutate([1,2,4,3,2])
sage: Q.sinks()
[0, 2]

sage: Q = ClusterQuiver(['A',5])
sage: Q.mutate([2,1,3,4,2])
sage: Q.sinks()
[3]
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['A',Integer(5)])
>>> Q.mutate([Integer(1),Integer(2),Integer(4),Integer(3),Integer(2)])
>>> Q.sinks()
[0, 2]

>>> Q = ClusterQuiver(['A',Integer(5)])
>>> Q.mutate([Integer(2),Integer(1),Integer(3),Integer(4),Integer(2)])
>>> Q.sinks()
[3]
```

sources()

Return all vertices of `self` that are sources.

EXAMPLES:

```
sage: Q = ClusterQuiver(['A',5])
sage: Q.mutate([1,2,4,3,2])
sage: Q.sources()
[]

sage: Q = ClusterQuiver(['A',5])
sage: Q.mutate([2,1,3,4,2])
sage: Q.sources()
[1]
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['A',Integer(5)])
>>> Q.mutate([Integer(1),Integer(2),Integer(4),Integer(3),Integer(2)])
>>> Q.sources()
[]

>>> Q = ClusterQuiver(['A',Integer(5)])
>>> Q.mutate([Integer(2),Integer(1),Integer(3),Integer(4),Integer(2)])
>>> Q.sources()
[1]
```

5.1.22 Quiver mutation types

AUTHORS:

- Gregg Musiker (2012, initial version)
- Christian Stump (2012, initial version)
- Hugh Thomas (2012, initial version)

sage.combinat.cluster_algebra_quiver.quiver_mutation_type.**QuiverMutationType**(**args*)

Quiver mutation types **can be seen as a slight generalization of**

generalized Cartan types.

Background on generalized Cartan types can be found at

Wikipedia article Generalized_Cartan_matrix

For the compendium on the cluster algebra and quiver package in Sage see [MS2011]

A B-matrix is a skew-symmetrizable $(n \times n)$-matrix M. I.e., there exists an invertible diagonal matrix D such that DM is skew-symmetric. M can be encoded as a *quiver* by having a directed edge from vertex i to vertex j with label (a, b) if $a = M_{i,j} > 0$ and $b = M_{j,i} < 0$. We consider quivers up to *mutation equivalence*.

To a quiver mutation type we can associate a *generalized Cartan type* by sending M to the generalized Cartan matrix $C(M)$ obtained by replacing all positive entries by their negatives and adding 2's on the main diagonal.

`QuiverMutationType` constructs a quiver mutation type object. For more detail on the possible different types, please see the compendium.

INPUT:

The input consists either of a quiver mutation type, or of a `letter` (a string), a `rank` (one integer or a list/tuple of integers), and an optional `twist` (an integer or a list of integers). There are several different naming conventions for quiver mutation types.

- Finite type – `letter` is a Dynkin type (A-G), and `rank` is the rank.
- Affine type – there is more than one convention for naming affine types.
  - Kac's notation: `letter` is a Dynkin type, `rank` is the rank of the associated finite Dynkin diagram, and `twist` is the twist, which could be 1, 2, or 3. In the special case of affine type A, there is more than one quiver mutation type associated to the Cartan type. In this case only, `rank` is a pair of integers (i,j), giving the number of edges pointing clockwise and the number of edges pointing counter-clockwise. The total number of vertices is given by i+j in this case.
  - Naive notation: `letter` is one of 'BB', 'BC', 'BD', 'CC', 'CD'. The name specifies the two ends of the diagram, which are joined by a path. The total number of vertices is given by `rank +1` (to match the

indexing people expect because these are affine types). In general, `rank` must be large enough for the picture to make sense, but we accept `letter` is `BC` and `rank=1`.

  – Macdonald notation: for the dual of an untwisted affine type (such as ['C', 6, 1]), we accept a twist of -1 (i.e., ['C',6,-1]).

- Elliptic type – `letter` is a Dynkin type, `rank` is the rank of the finite Dynkin diagram, and `twist` is a tuple of two integers. We follow Saito's notation.
- Other shapes:
  – Rank 2: `letter` is 'R2', and `rank` is a pair of integers specifying the label on the unique edge.
  – Triangle: `letter` is `TR`, and `rank` is the number of vertices along a side.
  – T: This defines a quiver shaped like a T. `letter` is 'T', and the `rank` is a triple, whose entries specify the number of vertices along each path from the branch point (counting the branch point).
  – Grassmannian: This defines the cluster algebra (without coefficients) corresponding to the cluster algebra with coefficients which is the coordinate ring of a Grassmannian. `letter` is 'GR'. `rank` is a pair of integers (k, n) with 'k' < 'n' specifying the Grassmannian of k-planes in n-space. This defines a quiver given by a (k-1) x (n-k-1) grid where each square is cyclically oriented.
  – Exceptional mutation finite quivers: The two exceptional mutation finite quivers, found by Derksen-Owen, have `letter` as 'X' and `rank` 6 or 7, equal to the number of vertices.
  – AE, BE, CE, DE: Quivers are built of one end which looks like type (affine A), B, C, or D, and the other end which looks like type E (i.e., it consists of two antennae, one of length one, and one of length two). `letter` is 'AE', 'BE', 'CE', or 'DE', and `rank` is the total number of vertices. Note that 'AE' is of a slightly different form and requires `rank` to be a pair of integers (i,j) just as in the case of affine type A. See Exercise 4.3 in Kac's book Infinite Dimensional Lie Algebras for more details.
  – Infinite type E: It is also possible to obtain infinite-type E quivers by specifying `letter` as 'E' and `rank` as the number of vertices.

REFERENCES:

- A good reference for finite and affine Dynkin diagrams, including Kac's notation, is the Wikipedia article Dynkin_diagram.
- A good reference for the skew-symmetrizable elliptic diagrams is "Cluster algebras of finite mutation type via unfolding" by A. Felikson, M. Shapiro, and P. Tumarkin, [FST2012].

EXAMPLES:

Finite types:

```

['CD', 3, 1]
>>> QuiverMutationType('CD',Integer(5), Integer(1))
['CD', 5, 1]

>>> QuiverMutationType('D',Integer(4), Integer(1))
['D', 4, 1]
>>> QuiverMutationType('D',Integer(6), Integer(1))
['D', 6, 1]

>>> QuiverMutationType('E',Integer(6), Integer(1))
['E', 6, 1]
>>> QuiverMutationType('E',Integer(7), Integer(1))
```

(continues on next page)

(continued from previous page)

```
['E', 7, 1]
>>> QuiverMutationType('E',Integer(8), Integer(1))
['E', 8, 1]

>>> QuiverMutationType('F',Integer(4), Integer(1))
['F', 4, 1]
>>> QuiverMutationType('F',Integer(4),-Integer(1))
['F', 4, -1]

>>> QuiverMutationType('G', Integer(2), Integer(1))
['G', 2, 1]
>>> QuiverMutationType('G', Integer(2),-Integer(1))
['G', 2, -1]
>>> QuiverMutationType('A',Integer(3), Integer(2)) == QuiverMutationType('D',
↪Integer(3), Integer(2))
True
```

Affine types using Kac's Notation:

```
sage: QuiverMutationType('A', 1, 1)
['A', [1, 1], 1]
sage: QuiverMutationType('B',5, 1)
['BD', 5, 1]
sage: QuiverMutationType('C',5, 1)
['CC', 5, 1]
sage: QuiverMutationType('A', 2, 2)
['BC', 1, 1]
sage: QuiverMutationType('A',7, 2)
['CD', 4, 1]
sage: QuiverMutationType('A',8, 2)
['BC', 4, 1]
sage: QuiverMutationType('D',6, 2)

>>> QuiverMutationType('E', Integer(12))
['E', 12]

>>> QuiverMutationType('AE',(Integer(2),Integer(3)))
['AE', [2, 3]]
>>> QuiverMutationType('BE',Integer(5))
['BE', 5]
>>> QuiverMutationType('CE',Integer(5))
['CE', 5]
>>> QuiverMutationType('DE',Integer(6))
['DE', 6]
```

Grassmannian types:

```
sage: QuiverMutationType('GR',(2,4))
['A', 1]
sage: QuiverMutationType('GR',(2,6))
['A', 3]
sage: QuiverMutationType('GR',(3,6))
['D', 4]
sage: QuiverMutationType('GR',(3,7))
['E', 6]
sage: QuiverMutationType('GR',(3,8))
['E', 8]
sage: QuiverMutationType('GR',(3, 10))
['GR', [3, 10]]
```

```
>>> from sage.all import *
>>> QuiverMutationType('GR',(Integer(2),Integer(4)))
['A', 1]
>>> QuiverMutationType('GR',(Integer(2),Integer(6)))
['A', 3]
>>> QuiverMutationType('GR',(Integer(3),Integer(6)))
['D', 4]
>>> QuiverMutationType('GR',(Integer(3),Integer(7)))
['E', 6]
>>> QuiverMutationType('GR',(Integer(3),Integer(8)))
['E', 8]
>>> QuiverMutationType('GR',(Integer(3), Integer(10)))
['GR', [3, 10]]
```

Triangular types:

```
sage: QuiverMutationType('TR', 2)
['A', 3]
sage: QuiverMutationType('TR',3)
['D', 6]
sage: QuiverMutationType('TR',4)
['E', 8, [1, 1]]
sage: QuiverMutationType('TR',5)
['TR', 5]
```

```
>>> from sage.all import *
>>> QuiverMutationType('TR', Integer(2))
['A', 3]

sage: QuiverMutationType('T',(2, 2, 2))
['D', 4]
sage: QuiverMutationType('T',(2, 2,4))
['D', 6]
sage: QuiverMutationType('T',(2,3,3))
['E', 6]
sage: QuiverMutationType('T',(2,3,4))
['E', 7]
sage: QuiverMutationType('T',(2,3,5))
['E', 8]
sage: QuiverMutationType('T',(2,3,6))
['E', 8, 1]
sage: QuiverMutationType('T',(2,3,7))
['E', 10]
sage: QuiverMutationType('T',(3,3,3))
['E', 6, 1]
sage: QuiverMutationType('T',(3,3,4))
['T', [3, 3, 4]]
```

```
>>> from sage.all import *
>>> QuiverMutationType('T',(Integer(1), Integer(1), Integer(1)))
['A', 1]
>>> QuiverMutationType('T',(Integer(1), Integer(1),Integer(4)))
['A', 4]
>>> QuiverMutationType('T',(Integer(1),Integer(4),Integer(4)))
['A', 7]
>>> QuiverMutationType('T',(Integer(2), Integer(2), Integer(2)))
['D', 4]
>>> QuiverMutationType('T',(Integer(2), Integer(2),Integer(4)))
['D', 6]
>>> QuiverMutationType('T',(Integer(2),Integer(3),Integer(3)))
['E', 6]
>>> QuiverMutationType('T',(Integer(2),Integer(3),Integer(4)))
['E', 7]
>>> QuiverMutationType('T',(Integer(2),Integer(3),Integer(5)))
['E', 8]
>>> QuiverMutationType('T',(Integer(2),Integer(3),Integer(6)))
['E', 8, 1]
>>> QuiverMutationType('T',(Integer(2),Integer(3),Integer(7)))
['E', 10]
>>> QuiverMutationType('T',(Integer(3),Integer(3),Integer(3)))
['E', 6, 1]
>>> QuiverMutationType('T',(Integer(3),Integer(3),Integer(4)))
['T', [3, 3, 4]]
```

Reducible types:

```
sage: QuiverMutationType(['A',3],['B',4])
[ ['A', 3], ['B', 4] ]
```

```
>>> from sage.all import *
>>> QuiverMutationType(['A',Integer(3)],['B',Integer(4)])
[ ['A', 3], ['B', 4] ]
```

class sage.combinat.cluster_algebra_quiver.quiver_mutation_type.**QuiverMutationTypeFactory**

Bases: SageObject

samples (*finite=None*, *affine=None*, *elliptic=None*, *mutation_finite=None*)

Return a sample of the available quiver mutations types.

INPUT:

- finite
- affine
- elliptic
- mutation_finite

All four input keywords default values are None. If set to True or False, only these samples are returned.

EXAMPLES:

```
sage: QuiverMutationType.samples()
[['A', 1], ['A', 5], ['B', 2], ['B', 5], ['C', 3],
 ['C', 5], [ ['A', 1], ['A', 1] ], ['D', 5], ['E', 6],
 ['E', 7], ['E', 8], ['F', 4], ['G', 2],
 ['A', [1, 1], 1], ['A', [4, 5], 1], ['D', 4, 1],
 ['BB', 5, 1], ['E', 6, [1, 1]], ['E', 7, [1, 1]],
 ['R2', [1, 5]], ['R2', [3, 5]], ['E', 10], ['BE', 5],
 ['GR', [3, 10]], ['T', [3, 3, 4]]]

sage: QuiverMutationType.samples(finite=True)
[['A', 1], ['A', 5], ['B', 2], ['B', 5], ['C', 3],
 ['C', 5], [ ['A', 1], ['A', 1] ], ['D', 5], ['E', 6],
 ['E', 7], ['E', 8], ['F', 4], ['G', 2]]

sage: QuiverMutationType.samples(affine=True)
[['A', [1, 1], 1], ['A', [4, 5], 1], ['D', 4, 1], ['BB', 5, 1]]

sage: QuiverMutationType.samples(elliptic=True)
[['E', 6, [1, 1]], ['E', 7, [1, 1]]]

sage: QuiverMutationType.samples(mutation_finite=False)
[['R2', [1, 5]], ['R2', [3, 5]], ['E', 10], ['BE', 5],
 ['GR', [3, 10]], ['T', [3, 3, 4]]]
```

```
>>> from sage.all import *
>>> QuiverMutationType.samples()

```

class sage.combinat.cluster_algebra_quiver.quiver_mutation_type.**QuiverMutationType_Irreducible**(*letter*, *rank*, *twist=N*

Bases: *QuiverMutationType_abstract*

The mutation type for a cluster algebra or a quiver. Should not be called directly, but through *QuiverMutationType*.

class_size()

If it is known, the size of the mutation class of all quivers which are mutation equivalent to the standard quiver of `self` (up to isomorphism) is returned.

Otherwise, `NotImplemented` is returned.

Formula for finite type A is taken from Torkildsen - Counting cluster-tilted algebras of type A_n. Formulas for affine type A and finite type D are taken from Bastian, Prellberg, Rubey, Stump - Counting the number of elements in the mutation classes of $\widetilde{A}_n$ quivers. Formulas for finite and affine types B and C are proven but not yet published. Conjectural formulas for several other non-simply-laced affine types are implemented. Exceptional Types (finite, affine, and elliptic) E, F, G, and X are hardcoded.

EXAMPLES:

```
sage: mut_type = QuiverMutationType( ['A',5] ); mut_type
['A', 5]
sage: mut_type.class_size()
19

sage: mut_type = QuiverMutationType( ['A',[10,3], 1] ); mut_type
['A', [3, 10], 1]
sage: mut_type.class_size()
142120

sage: mut_type = QuiverMutationType( ['B',6] ); mut_type
['B', 6]
sage: mut_type.class_size()
```

(continues on next page)

(continued from previous page)

```
132

sage: mut_type = QuiverMutationType( ['BD',6, 1] ); mut_type
['BD', 6, 1]
sage: mut_type.class_size()
Warning: This method uses a formula which has not been proved correct.
504
```

```
>>> from sage.all import *
>>> mut_type = QuiverMutationType( ['A',Integer(5)] ); mut_type
['A', 5]
>>> mut_type.class_size()
19

>>> mut_type = QuiverMutationType( ['A',[Integer(10),Integer(3)], Integer(1)]␣
↪); mut_type
['A', [3, 10], 1]
>>> mut_type.class_size()
142120

>>> mut_type = QuiverMutationType( ['B',Integer(6)] ); mut_type
['B', 6]
>>> mut_type.class_size()
132

>>> mut_type = QuiverMutationType( ['BD',Integer(6), Integer(1)] ); mut_type
['BD', 6, 1]
>>> mut_type.class_size()
Warning: This method uses a formula which has not been proved correct.
504
```

Check that Issue #14048 is fixed:

```
sage: mut_type = QuiverMutationType( ['F',4,(2, 1)] )
sage: mut_type.class_size()
90
```

```
>>> from sage.all import *
>>> mut_type = QuiverMutationType( ['F',Integer(4),(Integer(2), Integer(1))] )
>>> mut_type.class_size()
90
```

dual()

Return the *QuiverMutationType* which is dual to `self`.

EXAMPLES:

```
sage: mut_type = QuiverMutationType('A',5); mut_type
['A', 5]
sage: mut_type.dual()
['A', 5]
```

(continues on next page)

(continued from previous page)

```
sage: mut_type = QuiverMutationType('B',5); mut_type
['B', 5]
sage: mut_type.dual()
['C', 5]
sage: mut_type.dual().dual()
['B', 5]
sage: mut_type.dual().dual() == mut_type
True
```

```
>>> from sage.all import *
>>> mut_type = QuiverMutationType('A',Integer(5)); mut_type
['A', 5]
>>> mut_type.dual()
['A', 5]

>>> mut_type = QuiverMutationType('B',Integer(5)); mut_type
['B', 5]
>>> mut_type.dual()
['C', 5]
>>> mut_type.dual().dual()
['B', 5]
>>> mut_type.dual().dual() == mut_type
True
```

irreducible_components()

Return a list of all irreducible components of `self`.

EXAMPLES:

```
sage: mut_type = QuiverMutationType('A',3); mut_type
['A', 3]
sage: mut_type.irreducible_components()
(['A', 3],)
```

```
>>> from sage.all import *
>>> mut_type = QuiverMutationType('A',Integer(3)); mut_type
['A', 3]
>>> mut_type.irreducible_components()
(['A', 3],)
```

class sage.combinat.cluster_algebra_quiver.quiver_mutation_type.**QuiverMutationType_Reducible**(**args*)

Bases: `QuiverMutationType_abstract`

The mutation type for a cluster algebra or a quiver. Should not be called directly, but through `QuiverMutationType`. Inherits from `QuiverMutationType_abstract`.

class_size()

If it is known, the size of the mutation class of all quivers which are mutation equivalent to the standard quiver of `self` (up to isomorphism) is returned.

Otherwise, `NotImplemented` is returned.

EXAMPLES:

```
sage: mut_type = QuiverMutationType(['A',3],['B',3]); mut_type
[ ['A', 3], ['B', 3] ]
sage: mut_type.class_size()
20

sage: mut_type = QuiverMutationType(['A',3],['B',3],['X',6])
sage: mut_type
[ ['A', 3], ['B', 3], ['X', 6] ]
sage: mut_type.class_size()
100
```

```
>>> from sage.all import *
>>> mut_type = QuiverMutationType(['A',Integer(3)],['B',Integer(3)]); mut_type
[ ['A', 3], ['B', 3] ]
>>> mut_type.class_size()
20

>>> mut_type = QuiverMutationType(['A',Integer(3)],['B',Integer(3)],['X',
↪Integer(6)])
>>> mut_type
[ ['A', 3], ['B', 3], ['X', 6] ]
>>> mut_type.class_size()
100
```

dual()

Return the *QuiverMutationType* which is dual to `self`.

EXAMPLES:

```
sage: mut_type = QuiverMutationType(['A',5],['B',6],['C',5],['D',4]); mut_type
[ ['A', 5], ['B', 6], ['C', 5], ['D', 4] ]
sage: mut_type.dual()
[ ['A', 5], ['C', 6], ['B', 5], ['D', 4] ]
```

```
>>> from sage.all import *
>>> mut_type = QuiverMutationType(['A',Integer(5)],['B',Integer(6)],['C',
↪Integer(5)],['D',Integer(4)]); mut_type
[ ['A', 5], ['B', 6], ['C', 5], ['D', 4] ]
>>> mut_type.dual()
[ ['A', 5], ['C', 6], ['B', 5], ['D', 4] ]
```

irreducible_components()

Return a list of all irreducible components of `self`.

EXAMPLES:

```
sage: mut_type = QuiverMutationType('A',3); mut_type
['A', 3]
sage: mut_type.irreducible_components()
(['A', 3],)

sage: mut_type = QuiverMutationType(['A',3],['B',3]); mut_type
[ ['A', 3], ['B', 3] ]
```

(continues on next page)

(continued from previous page)

```
sage: mut_type.irreducible_components()
(['A', 3], ['B', 3])

sage: mut_type = QuiverMutationType(['A',3],['B',3],['X',6])
sage: mut_type
[ ['A', 3], ['B', 3], ['X', 6] ]
sage: mut_type.irreducible_components()
(['A', 3], ['B', 3], ['X', 6])
```

```
>>> from sage.all import *
>>> mut_type = QuiverMutationType('A',Integer(3)); mut_type
['A', 3]
>>> mut_type.irreducible_components()
(['A', 3],)

>>> mut_type = QuiverMutationType(['A',Integer(3)],['B',Integer(3)]); mut_type
[ ['A', 3], ['B', 3] ]
>>> mut_type.irreducible_components()
(['A', 3], ['B', 3])

>>> mut_type = QuiverMutationType(['A',Integer(3)],['B',Integer(3)],['X',
↪Integer(6)])
>>> mut_type
[ ['A', 3], ['B', 3], ['X', 6] ]
>>> mut_type.irreducible_components()
(['A', 3], ['B', 3], ['X', 6])
```

class sage.combinat.cluster_algebra_quiver.quiver_mutation_type.**QuiverMutationType_abstract**

Bases: UniqueRepresentation, SageObject

EXAMPLES:

```
sage: mut_type1 = QuiverMutationType('A',5)
sage: mut_type2 = QuiverMutationType('A',5)
sage: mut_type3 = QuiverMutationType('A',6)
sage: mut_type1 == mut_type2
True
sage: mut_type1 == mut_type3
False
```

```
>>> from sage.all import *
>>> mut_type1 = QuiverMutationType('A',Integer(5))
>>> mut_type2 = QuiverMutationType('A',Integer(5))
>>> mut_type3 = QuiverMutationType('A',Integer(6))
>>> mut_type1 == mut_type2
True
>>> mut_type1 == mut_type3
False
```

b_matrix()

Return the B-matrix of the standard quiver of `self`.

The conventions for B-matrices agree with Fomin-Zelevinsky (up to a reordering of the simple roots).

EXAMPLES:

```
sage: mut_type = QuiverMutationType(['A',5]); mut_type
['A', 5]
sage: mut_type.b_matrix()                                                    #␣
↪needs sage.modules
[ 0  1  0  0  0]
[-1  0 -1  0  0]
[ 0  1  0  1  0]
[ 0  0 -1  0 -1]
[ 0  0  0  1  0]

sage: mut_type = QuiverMutationType(['A',3],['B',3]); mut_type
[ ['A', 3], ['B', 3] ]
sage: mut_type.b_matrix()                                                    #␣
↪needs sage.modules
[ 0  1  0  0  0  0]
[-1  0 -1  0  0  0]
[ 0  1  0  0  0  0]
[ 0  0  0  0  1  0]
[ 0  0  0 -1  0 -1]
[ 0  0  0  0  2  0]
```

```
>>> from sage.all import *
>>> mut_type = QuiverMutationType(['A',Integer(5)]); mut_type
['A', 5]
>>> mut_type.b_matrix()                                                    #␣
↪needs sage.modules
[ 0  1  0  0  0]
[-1  0 -1  0  0]
[ 0  1  0  1  0]
[ 0  0 -1  0 -1]
[ 0  0  0  1  0]

>>> mut_type = QuiverMutationType(['A',Integer(3)],['B',Integer(3)]); mut_type
[ ['A', 3], ['B', 3] ]
>>> mut_type.b_matrix()                                                    #␣
↪needs sage.modules
[ 0  1  0  0  0  0]
[-1  0 -1  0  0  0]
[ 0  1  0  0  0  0]
[ 0  0  0  0  1  0]
[ 0  0  0 -1  0 -1]
[ 0  0  0  0  2  0]
```

cartan_matrix()

Return the Cartan matrix of `self`.

Note that (up to a reordering of the simple roots) the convention for the definition of Cartan matrix, used here and elsewhere in Sage, agrees with the conventions of Kac, Fulton-Harris, and Fomin-Zelevinsky, but disagrees with the convention of Bourbaki. The (i, j) entry is $2(\alpha_i, \alpha_j)/(\alpha_i, \alpha_i)$.

EXAMPLES:

```
sage: mut_type = QuiverMutationType(['A',5]); mut_type
['A', 5]
sage: mut_type.cartan_matrix()                                          #␣
↪needs sage.modules
[ 2 -1  0  0  0]
[-1  2 -1  0  0]
[ 0 -1  2 -1  0]
[ 0  0 -1  2 -1]
[ 0  0  0 -1  2]

sage: mut_type = QuiverMutationType(['A',3],['B',3]); mut_type
[ ['A', 3], ['B', 3] ]

```

is_affine()

Return `True` if `self` is of affine type.

EXAMPLES:

```
sage: mt = QuiverMutationType(['A', 2])
sage: mt.is_affine()
False

sage: mt = QuiverMutationType(['A',[4, 2], 1])
```

(continues on next page)

(continued from previous page)

```
sage: mt.is_affine()
True
```

```
>>> from sage.all import *
>>> mt = QuiverMutationType(['A', Integer(2)])
>>> mt.is_affine()
False

>>> mt = QuiverMutationType(['A',[Integer(4), Integer(2)], Integer(1)])
>>> mt.is_affine()
True
```

is_elliptic()

Return True if self is of elliptic type.

EXAMPLES:

```
sage: mt = QuiverMutationType(['A', 2])
sage: mt.is_elliptic()
False

sage: mt = QuiverMutationType(['E',6,[1, 1]])
sage: mt.is_elliptic()
True
```

```
>>> from sage.all import *
>>> mt = QuiverMutationType(['A', Integer(2)])
>>> mt.is_elliptic()
False

>>> mt = QuiverMutationType(['E',Integer(6),[Integer(1), Integer(1)]])
>>> mt.is_elliptic()
True
```

is_finite()

Return True if self is of finite type.

This means that the cluster algebra associated to self has only a finite number of cluster variables.

EXAMPLES:

```
sage: mt = QuiverMutationType(['A', 2])
sage: mt.is_finite()
True

sage: mt = QuiverMutationType(['A',[4, 2], 1])
sage: mt.is_finite()
False
```

```
>>> from sage.all import *
>>> mt = QuiverMutationType(['A', Integer(2)])
>>> mt.is_finite()
True
```

(continues on next page)

(continued from previous page)

```
>>> mt = QuiverMutationType(['A',[Integer(4), Integer(2)], Integer(1)])
>>> mt.is_finite()
False
```

is_irreducible()

Return `True` if `self` is irreducible.

EXAMPLES:

```
sage: mt = QuiverMutationType(['A', 2])
sage: mt.is_irreducible()
True
```

```
>>> from sage.all import *
>>> mt = QuiverMutationType(['A', Integer(2)])
>>> mt.is_irreducible()
True
```

is_mutation_finite()

Return `True` if `self` is of finite mutation type.

This means that its mutation class has only finitely many different B-matrices.

EXAMPLES:

```
sage: mt = QuiverMutationType(['D',5, 1])
sage: mt.is_mutation_finite()
True
```

```
>>> from sage.all import *
>>> mt = QuiverMutationType(['D',Integer(5), Integer(1)])
>>> mt.is_mutation_finite()
True
```

is_simply_laced()

Return `True` if `self` is simply laced.

This means that the only arrows that appear in the quiver of `self` are single unlabelled arrows.

EXAMPLES:

```
sage: mt = QuiverMutationType(['A', 2])
sage: mt.is_simply_laced()
True

sage: mt = QuiverMutationType(['B', 2])
sage: mt.is_simply_laced()
False

sage: mt = QuiverMutationType(['A',(1, 1), 1])
sage: mt.is_simply_laced()
False
```

```
>>> from sage.all import *
>>> mt = QuiverMutationType(['A', Integer(2)])
>>> mt.is_simply_laced()
True

>>> mt = QuiverMutationType(['B', Integer(2)])
>>> mt.is_simply_laced()
False

>>> mt = QuiverMutationType(['A',(Integer(1), Integer(1)), Integer(1)])
>>> mt.is_simply_laced()
False
```

is_skew_symmetric()

Return `True` if the B-matrix of `self` is skew-symmetric.

EXAMPLES:

```
sage: mt = QuiverMutationType(['A', 2])
sage: mt.is_skew_symmetric()
True

sage: mt = QuiverMutationType(['B', 2])
sage: mt.is_skew_symmetric()
False

sage: mt = QuiverMutationType(['A',(1, 1), 1])
sage: mt.is_skew_symmetric()
True
```

```
>>> from sage.all import *
>>> mt = QuiverMutationType(['A', Integer(2)])
>>> mt.is_skew_symmetric()
True

>>> mt = QuiverMutationType(['B', Integer(2)])
>>> mt.is_skew_symmetric()
False

>>> mt = QuiverMutationType(['A',(Integer(1), Integer(1)), Integer(1)])
>>> mt.is_skew_symmetric()
True
```

letter()

Return the classification letter of `self`.

EXAMPLES:

```
sage: mut_type = QuiverMutationType( ['A',5] ); mut_type
['A', 5]
sage: mut_type.letter()
'A'
```

(continues on next page)

(continued from previous page)

```
sage: mut_type = QuiverMutationType( ['BC',5, 1] ); mut_type
['BC', 5, 1]
sage: mut_type.letter()
'BC'

sage: mut_type = QuiverMutationType(['A',3],['B',3]); mut_type
[ ['A', 3], ['B', 3] ]
sage: mut_type.letter()
'A x B'

sage: mut_type = QuiverMutationType(['A',3],['B',3],['X',6]); mut_type
[ ['A', 3], ['B', 3], ['X', 6] ]
sage: mut_type.letter()
'A x B x X'
```

```
>>> from sage.all import *
>>> mut_type = QuiverMutationType( ['A',Integer(5)] ); mut_type
['A', 5]
>>> mut_type.letter()
'A'

>>> mut_type = QuiverMutationType( ['BC',Integer(5), Integer(1)] ); mut_type
['BC', 5, 1]
>>> mut_type.letter()
'BC'

>>> mut_type = QuiverMutationType(['A',Integer(3)],['B',Integer(3)]); mut_type
[ ['A', 3], ['B', 3] ]
>>> mut_type.letter()
'A x B'

>>> mut_type = QuiverMutationType(['A',Integer(3)],['B',Integer(3)],['X',
↪Integer(6)]); mut_type
[ ['A', 3], ['B', 3], ['X', 6] ]
>>> mut_type.letter()
'A x B x X'
```

plot(*circular=False*, *directed=True*)

Return the plot of the underlying graph or digraph of `self`.

INPUT:

- `circular` – boolean (default: `False`); if `True`, the circular plot is chosen, otherwise >>spring<< is used
- `directed` – boolean (default: `True`); if `True`, the directed version is shown, otherwise the undirected

EXAMPLES:

```
sage: QMT = QuiverMutationType(['A',5])
sage: pl = QMT.plot()                                                  #␣
↪needs sage.plot sage.symbolic
sage: pl = QMT.plot(circular=True)                                     #␣
↪needs sage.plot sage.symbolic
```

```
>>> from sage.all import *
>>> QMT = QuiverMutationType(['A',Integer(5)])
>>> pl = QMT.plot()                                                          #␣
↪needs sage.plot sage.symbolic
>>> pl = QMT.plot(circular=True)                                             #␣
↪needs sage.plot sage.symbolic
```

properties()

Print a scheme of all properties of `self`.

Most properties have natural definitions for either irreducible or reducible types. `affine` and `elliptic` are only defined for irreducible types.

EXAMPLES:

```
sage: mut_type = QuiverMutationType(['A',3]); mut_type
['A', 3]
sage: mut_type.properties()
['A', 3] has rank 3 and the following properties:
    - irreducible:       True
    - mutation finite:   True
    - simply-laced:      True
    - skew-symmetric:    True
    - finite:            True
    - affine:            False
    - elliptic:          False

sage: mut_type = QuiverMutationType(['B',3]); mut_type
['B', 3]
sage: mut_type.properties()
['B', 3] has rank 3 and the following properties:
    - irreducible:       True
    - mutation finite:   True
    - simply-laced:      False
    - skew-symmetric:    False
    - finite:            True
    - affine:            False
    - elliptic:          False

sage: mut_type = QuiverMutationType(['B',3, 1]); mut_type
['BD', 3, 1]
sage: mut_type.properties()
['BD', 3, 1] has rank 4 and the following properties:
    - irreducible:       True
    - mutation finite:   True
    - simply-laced:      False
    - skew-symmetric:    False
    - finite:            False
    - affine:            True
    - elliptic:          False

sage: mut_type = QuiverMutationType(['E',6,[1, 1]]); mut_type
['E', 6, [1, 1]]
sage: mut_type.properties()
```

(continues on next page)

(continued from previous page)

```
['E', 6, [1, 1]] has rank 8 and the following properties:
    - irreducible:       True
    - mutation finite:   True
    - simply-laced:      False
    - skew-symmetric:    True
    - finite:            False
    - affine:            False
    - elliptic:          True

sage: mut_type = QuiverMutationType(['A',3],['B',3]); mut_type
[ ['A', 3], ['B', 3] ]
sage: mut_type.properties()
[ ['A', 3], ['B', 3] ] has rank 6 and the following properties:
    - irreducible:       False
    - mutation finite:   True
    - simply-laced:      False
    - skew-symmetric:    False
    - finite:            True

sage: mut_type = QuiverMutationType('GR',[4,9]); mut_type
['GR', [4, 9]]
sage: mut_type.properties()
['GR', [4, 9]] has rank 12 and the following properties:
    - irreducible:       True
    - mutation finite:   False
    - simply-laced:      True
    - skew-symmetric:    True
    - finite:            False
    - affine:            False
    - elliptic:          False
```

```
>>> from sage.all import *
>>> mut_type = QuiverMutationType(['A',Integer(3)]); mut_type
['A', 3]
>>> mut_type.properties()
['A', 3] has rank 3 and the following properties:
    - irreducible:       True
    - mutation finite:   True
    - simply-laced:      True
    - skew-symmetric:    True
    - finite:            True
    - affine:            False
    - elliptic:          False

>>> mut_type = QuiverMutationType(['B',Integer(3)]); mut_type
['B', 3]
>>> mut_type.properties()
['B', 3] has rank 3 and the following properties:
    - irreducible:       True
    - mutation finite:   True
    - simply-laced:      False
    - skew-symmetric:    False
```

(continues on next page)

(continued from previous page)

```
    - finite:             True
    - affine:             False
    - elliptic:           False

>>> mut_type = QuiverMutationType(['B',Integer(3), Integer(1)]); mut_type
['BD', 3, 1]
>>> mut_type.properties()
['BD', 3, 1] has rank 4 and the following properties:
    - irreducible:        True
    - mutation finite:    True
    - simply-laced:       False
    - skew-symmetric:     False
    - finite:             False
    - affine:             True
    - elliptic:           False

>>> mut_type = QuiverMutationType(['E',Integer(6),[Integer(1), Integer(1)]]);␣
↪mut_type
['E', 6, [1, 1]]
>>> mut_type.properties()
['E', 6, [1, 1]] has rank 8 and the following properties:
    - irreducible:        True
    - mutation finite:    True
    - simply-laced:       False
    - skew-symmetric:     True
    - finite:             False
    - affine:             False
    - elliptic:           True

>>> mut_type = QuiverMutationType(['A',Integer(3)],['B',Integer(3)]); mut_type
[ ['A', 3], ['B', 3] ]
>>> mut_type.properties()
[ ['A', 3], ['B', 3] ] has rank 6 and the following properties:
    - irreducible:        False
    - mutation finite:    True
    - simply-laced:       False
    - skew-symmetric:     False
    - finite:             True

>>> mut_type = QuiverMutationType('GR',[Integer(4),Integer(9)]); mut_type
['GR', [4, 9]]
>>> mut_type.properties()
['GR', [4, 9]] has rank 12 and the following properties:
    - irreducible:        True
    - mutation finite:    False
    - simply-laced:       True
    - skew-symmetric:     True
    - finite:             False
    - affine:             False
    - elliptic:           False
```

rank()

Return the rank in the standard quiver of `self`.

The rank is the number of vertices.

EXAMPLES:

```
sage: mut_type = QuiverMutationType( ['A',5] ); mut_type
['A', 5]
sage: mut_type.rank()
5

sage: mut_type = QuiverMutationType( ['A',[4,5], 1] ); mut_type
['A', [4, 5], 1]
sage: mut_type.rank()
9

sage: mut_type = QuiverMutationType( ['BC',5, 1] ); mut_type
['BC', 5, 1]
sage: mut_type.rank()
6

sage: mut_type = QuiverMutationType(['A',3],['B',3]); mut_type
[ ['A', 3], ['B', 3] ]
sage: mut_type.rank()
6

sage: mut_type = QuiverMutationType(['A',3],['B',3],['X',6]); mut_type
[ ['A', 3], ['B', 3], ['X', 6] ]
sage: mut_type.rank()
12
```

```
>>> from sage.all import *
>>> mut_type = QuiverMutationType( ['A',Integer(5)] ); mut_type
['A', 5]
>>> mut_type.rank()
5

>>> mut_type = QuiverMutationType( ['A',[Integer(4),Integer(5)], Integer(1)]␣
→); mut_type
['A', [4, 5], 1]
>>> mut_type.rank()
9

>>> mut_type = QuiverMutationType( ['BC',Integer(5), Integer(1)] ); mut_type
['BC', 5, 1]
>>> mut_type.rank()
6

>>> mut_type = QuiverMutationType(['A',Integer(3)],['B',Integer(3)]); mut_type
[ ['A', 3], ['B', 3] ]
>>> mut_type.rank()
6

>>> mut_type = QuiverMutationType(['A',Integer(3)],['B',Integer(3)],['X',
```

(continues on next page)

(continued from previous page)

```
↪Integer(6)]); mut_type
[ ['A', 3], ['B', 3], ['X', 6] ]
>>> mut_type.rank()
12
```

show(*circular=False*, *directed=True*)

Show the plot of the underlying digraph of `self`.

INPUT:

- `circular` – boolean (default: `False`); if `True`, the circular plot is chosen, otherwise >>spring<< is used
- `directed` – boolean (default: `True`); if `True`, the directed version is shown, otherwise the undirected

standard_quiver()

Return the standard quiver of `self`.

EXAMPLES:

```
sage: mut_type = QuiverMutationType( ['A',5] ); mut_type
['A', 5]
sage: mut_type.standard_quiver()                                          #␣
↪needs sage.modules
Quiver on 5 vertices of type ['A', 5]

sage: mut_type = QuiverMutationType( ['A',[5,3], 1] ); mut_type
['A', [3, 5], 1]
sage: mut_type.standard_quiver()                                          #␣
↪needs sage.modules
Quiver on 8 vertices of type ['A', [3, 5], 1]

sage: mut_type = QuiverMutationType(['A',3],['B',3]); mut_type
[ ['A', 3], ['B', 3] ]
sage: mut_type.standard_quiver()                                          #␣
↪needs sage.modules
Quiver on 6 vertices of type [ ['A', 3], ['B', 3] ]

sage: mut_type = QuiverMutationType(['A',3],['B',3],['X',6]); mut_type
[ ['A', 3], ['B', 3], ['X', 6] ]
sage: mut_type.standard_quiver()                                          #␣
↪needs sage.modules
Quiver on 12 vertices of type [ ['A', 3], ['B', 3], ['X', 6] ]
```

```
>>> from sage.all import *
>>> mut_type = QuiverMutationType( ['A',Integer(5)] ); mut_type
['A', 5]
>>> mut_type.standard_quiver()                                          #␣
↪needs sage.modules
Quiver on 5 vertices of type ['A', 5]

>>> mut_type = QuiverMutationType( ['A',[Integer(5),Integer(3)], Integer(1)]␣
↪); mut_type
['A', [3, 5], 1]
```

(continues on next page)

(continued from previous page)

```
>>> mut_type.standard_quiver()                                              #␣
↪needs sage.modules
Quiver on 8 vertices of type ['A', [3, 5], 1]

>>> mut_type = QuiverMutationType(['A',Integer(3)],['B',Integer(3)]); mut_type
[ ['A', 3], ['B', 3] ]
>>> mut_type.standard_quiver()                                              #␣
↪needs sage.modules
Quiver on 6 vertices of type [ ['A', 3], ['B', 3] ]

>>> mut_type = QuiverMutationType(['A',Integer(3)],['B',Integer(3)],['X',
↪Integer(6)]); mut_type
[ ['A', 3], ['B', 3], ['X', 6] ]
>>> mut_type.standard_quiver()                                              #␣
↪needs sage.modules
Quiver on 12 vertices of type [ ['A', 3], ['B', 3], ['X', 6] ]
```

`sage.combinat.cluster_algebra_quiver.quiver_mutation_type.`**`save_quiver_data`**`(`*n*, *up_to=True*, *types='ClassicalExceptional'*, *verbose=True*`)`

Save mutation classes of certain quivers of ranks up to and equal to n or equal to n to `DOT_SAGE/cluster_algebra_quiver/mutation_classes_n.dig6`.

This data will then be used to determine quiver mutation types.

INPUT:

- `n` – the rank (or the upper limit on the rank) of the mutation classes that are being saved
- `up_to` – (default: `True`) if `True`, saves data for ranks smaller than or equal to n; if `False`, saves data for rank exactly n
- `types` – (default: `'ClassicalExceptional'`) if all, saves data for both exceptional mutation-finite quivers and for classical quiver; the input 'Exceptional' or 'Classical' is also allowed to save only part of this data

5.1.23 Cluster complex (or generalized dual associahedron)

EXAMPLES:

A first example of a cluster complex:

```
sage: C = ClusterComplex(['A', 2]); C
Cluster complex of type ['A', 2] with 5 vertices and 5 facets
```

```
>>> from sage.all import *
>>> C = ClusterComplex(['A', Integer(2)]); C
Cluster complex of type ['A', 2] with 5 vertices and 5 facets
```

Its vertices, facets, and minimal non-faces:

```
sage: C.vertices()
(0, 1, 2, 3, 4)

sage: C.facets()
```

(continues on next page)

(continued from previous page)

```
[(0, 1), (0, 4), (1, 2), (2, 3), (3, 4)]

sage: for F in C.facets(): F.cluster()
[(-1, 0), (0, -1)]
[(-1, 0), (0, 1)]
[(0, -1), (1, 0)]
[(1, 0), (1, 1)]
[(1, 1), (0, 1)]

sage: C.minimal_nonfaces()
[[0, 2], [0, 3], [1, 3], [1, 4], [2, 4]]
```

```
>>> from sage.all import *
>>> C.vertices()
(0, 1, 2, 3, 4)

>>> C.facets()
[(0, 1), (0, 4), (1, 2), (2, 3), (3, 4)]

>>> for F in C.facets(): F.cluster()
[(-1, 0), (0, -1)]
[(-1, 0), (0, 1)]
[(0, -1), (1, 0)]
[(1, 0), (1, 1)]
[(1, 1), (0, 1)]

>>> C.minimal_nonfaces()
[[0, 2], [0, 3], [1, 3], [1, 4], [2, 4]]
```

We can do everything we can do on simplicial complexes, e.g. computing its homology:

```
sage: C.homology()
{0: 0, 1: Z}
```

```
>>> from sage.all import *
>>> C.homology()
{0: 0, 1: Z}
```

AUTHORS:

- Christian Stump (2011) Initial version

class sage.combinat.cluster_complex.**ClusterComplex**(*W*, *k*, *coxeter_element*, *algorithm*)

Bases: *SubwordComplex*

A cluster complex (or generalized dual associahedron).

The cluster complex (or generalized dual associahedron) is a simplicial complex constructed from a cluster algebra. Its vertices are the cluster variables and its facets are the clusters, i.e., maximal subsets of compatible cluster variables.

The cluster complex of type A_n is the simplicial complex with vertices being (proper) diagonals in a convex $(n+3)$-gon and with facets being triangulations.

The implementation of the cluster complex depends on its connection to subword complexes, see [CLS2014]. Let

c be a Coxeter element with reduced word $\mathbf{c}$ in a finite Coxeter group W, and let $\mathbf{w}_\circ$ be the c-sorting word for the longest element $w_\circ \in W$.

The `multi-cluster complex` $\Delta(W, k)$ has vertices in one-to-one correspondence with letters in the word $Q = \mathbf{c^k w_\circ}$ and with facets being complements in Q of reduced expressions for $w_\circ$.

For $k = 1$, the multi-cluster complex is isomorphic to the cluster complex as defined above.

EXAMPLES:

A first example of a cluster complex:

```
sage: C = ClusterComplex(['A', 2]); C
Cluster complex of type ['A', 2] with 5 vertices and 5 facets
```

```
>>> from sage.all import *
>>> C = ClusterComplex(['A', Integer(2)]); C
Cluster complex of type ['A', 2] with 5 vertices and 5 facets
```

Its vertices, facets, and minimal non-faces:

```
sage: C.vertices()
(0, 1, 2, 3, 4)

sage: C.facets()
[(0, 1), (0, 4), (1, 2), (2, 3), (3, 4)]

sage: C.minimal_nonfaces()
[[0, 2], [0, 3], [1, 3], [1, 4], [2, 4]]
```

```
>>> from sage.all import *
>>> C.vertices()
(0, 1, 2, 3, 4)

>>> C.facets()
[(0, 1), (0, 4), (1, 2), (2, 3), (3, 4)]

>>> C.minimal_nonfaces()
[[0, 2], [0, 3], [1, 3], [1, 4], [2, 4]]
```

We can do everything we can do on simplicial complexes, e.g. computing its homology:

```
sage: C.homology()
{0: 0, 1: Z}
```

```
>>> from sage.all import *
>>> C.homology()
{0: 0, 1: Z}
```

We can also create a multi-cluster complex:

```
sage: ClusterComplex(['A', 2], k=2)
Multi-cluster complex of type ['A', 2] with 7 vertices and 14 facets
```

```
>>> from sage.all import *
>>> ClusterComplex(['A', Integer(2)], k=Integer(2))
Multi-cluster complex of type ['A', 2] with 7 vertices and 14 facets
```

REFERENCES:

- [CLS2014]

Element

alias of *ClusterComplexFacet*

cyclic_rotation()

Return the operation on the facets of `self` obtained by the cyclic rotation as defined in [CLS2014].

EXAMPLES:

```
sage: ClusterComplex(['A', 2]).cyclic_rotation()
<function ...act at ...>
```

```
>>> from sage.all import *
>>> ClusterComplex(['A', Integer(2)]).cyclic_rotation()
<function ...act at ...>
```

k()

Return the index k of `self`.

EXAMPLES:

```
sage: ClusterComplex(['A', 2]).k()
1
```

```
>>> from sage.all import *
>>> ClusterComplex(['A', Integer(2)]).k()
1
```

minimal_nonfaces()

Return the minimal non-faces of `self`.

EXAMPLES:

```
sage: ClusterComplex(['A', 2]).minimal_nonfaces()
[[0, 2], [0, 3], [1, 3], [1, 4], [2, 4]]
```

```
>>> from sage.all import *
>>> ClusterComplex(['A', Integer(2)]).minimal_nonfaces()
[[0, 2], [0, 3], [1, 3], [1, 4], [2, 4]]
```

class sage.combinat.cluster_complex.**ClusterComplexFacet**(*parent*, *positions*, *facet_test=True*)

Bases: *SubwordComplexFacet*

A cluster (i.e., a facet) of a cluster complex.

cluster()

Return this cluster as a set of almost positive roots.

EXAMPLES:

```
sage: C = ClusterComplex(['A', 2])
sage: F = C((0, 1))
sage: F.cluster()
[(-1, 0), (0, -1)]
```

```
>>> from sage.all import *
>>> C = ClusterComplex(['A', Integer(2)])
>>> F = C((Integer(0), Integer(1)))
>>> F.cluster()
[(-1, 0), (0, -1)]
```

product_of_upper_cluster()

Return the product of the upper cluster in reversed order.

EXAMPLES:

```
sage: C = ClusterComplex(['A', 2])
sage: for F in C: F.product_of_upper_cluster().reduced_word()
[]
[2]
[1]
[1, 2]
[1, 2]
```

```
>>> from sage.all import *
>>> C = ClusterComplex(['A', Integer(2)])
>>> for F in C: F.product_of_upper_cluster().reduced_word()
[]
[2]
[1]
[1, 2]
[1, 2]
```

upper_cluster()

Return the part of the cluster that contains positive roots.

EXAMPLES:

```
sage: C = ClusterComplex(['A', 2])
sage: F = C((0, 1))
sage: F.upper_cluster()
[]
```

```
>>> from sage.all import *
>>> C = ClusterComplex(['A', Integer(2)])
>>> F = C((Integer(0), Integer(1)))
>>> F.upper_cluster()
[]
```

5.1.24 Colored Permutations

Todo

Much of the colored permutations (and element) class can be generalized to $G \wr S_n$

class sage.combinat.colored_permutations.**ColoredPermutation**(*parent*, *colors*, *perm*)

Bases: MultiplicativeGroupElement

A colored permutation.

colors()

Return the colors of self.

EXAMPLES:

```
sage: C = ColoredPermutations(4, 3)
sage: s1,s2,t = C.gens()
sage: x = s1*s2*t
sage: x.colors()
[1, 0, 0]
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(4), Integer(3))
>>> s1,s2,t = C.gens()
>>> x = s1*s2*t
>>> x.colors()
[1, 0, 0]
```

has_left_descent(*i*)

Return True if i is a left descent of self.

Let $p = ((s_1, \ldots s_n), \sigma)$ be a colored permutation. We say p has a left n-descent if $s_n > 0$. If $i < n$, then we say p has a left i-descent if either

- $s_i \neq 0, s_{i+1} = 0$ and $\sigma_i < \sigma_{i+1}$ or
- $s_i = s_{i+1}$ and $\sigma_i > \sigma_{i+1}$.

This notion of a left i-descent is done in order to recursively construct $w(p) = \sigma_i w(\sigma_i^{-1} p)$, where $w(p)$ denotes a reduced word of p.

EXAMPLES:

```
sage: C = ColoredPermutations(2, 4)
sage: s1,s2,s3,s4 = C.gens()
sage: x = s4*s1*s2*s3*s4
sage: [x.has_left_descent(i) for i in C.index_set()]
[True, False, False, True]

sage: C = ColoredPermutations(1, 5)
sage: s1,s2,s3,s4 = C.gens()
sage: x = s4*s1*s2*s3*s4
sage: [x.has_left_descent(i) for i in C.index_set()]
[True, False, False, True]
```

(continues on next page)

(continued from previous page)

```
sage: C = ColoredPermutations(3, 3)
sage: x = C([[2,1,0],[3,1,2]])
sage: [x.has_left_descent(i) for i in C.index_set()]
[False, True, False]

sage: C = ColoredPermutations(4, 4)
sage: x = C([[2,1,0,1],[3,2,4,1]])
sage: [x.has_left_descent(i) for i in C.index_set()]
[False, True, False, True]
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(2), Integer(4))
>>> s1,s2,s3,s4 = C.gens()
>>> x = s4*s1*s2*s3*s4
>>> [x.has_left_descent(i) for i in C.index_set()]
[True, False, False, True]

>>> C = ColoredPermutations(Integer(1), Integer(5))
>>> s1,s2,s3,s4 = C.gens()
>>> x = s4*s1*s2*s3*s4
>>> [x.has_left_descent(i) for i in C.index_set()]
[True, False, False, True]

>>> C = ColoredPermutations(Integer(3), Integer(3))
>>> x = C([[Integer(2),Integer(1),Integer(0)],[Integer(3),Integer(1),
↪Integer(2)]])
>>> [x.has_left_descent(i) for i in C.index_set()]
[False, True, False]

>>> C = ColoredPermutations(Integer(4), Integer(4))
>>> x = C([[Integer(2),Integer(1),Integer(0),Integer(1)],[Integer(3),
↪Integer(2),Integer(4),Integer(1)]])
>>> [x.has_left_descent(i) for i in C.index_set()]
[False, True, False, True]
```

length()

Return the length of `self` in generating reflections.

This is the minimal numbers of generating reflections needed to obtain `self`.

EXAMPLES:

```
sage: C = ColoredPermutations(3, 3)
sage: x = C([[2,1,0],[3,1,2]])
sage: x.length()
7

sage: C = ColoredPermutations(4, 4)
sage: x = C([[2,1,0,1],[3,2,4,1]])
sage: x.length()
12
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(3), Integer(3))
>>> x = C([[Integer(2),Integer(1),Integer(0)],[Integer(3),Integer(1),
↪Integer(2)]])
>>> x.length()
7

>>> C = ColoredPermutations(Integer(4), Integer(4))
>>> x = C([[Integer(2),Integer(1),Integer(0),Integer(1)],[Integer(3),
↪Integer(2),Integer(4),Integer(1)]])
>>> x.length()
12
```

one_line_form()

Return the one line form of `self`.

EXAMPLES:

```
sage: C = ColoredPermutations(4, 3)
sage: s1,s2,t = C.gens()
sage: x = s1*s2*t
sage: x
[[1, 0, 0], [3, 1, 2]]
sage: x.one_line_form()
[(1, 3), (0, 1), (0, 2)]
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(4), Integer(3))
>>> s1,s2,t = C.gens()
>>> x = s1*s2*t
>>> x
[[1, 0, 0], [3, 1, 2]]
>>> x.one_line_form()
[(1, 3), (0, 1), (0, 2)]
```

permutation()

Return the permutation of `self`.

This is obtained by forgetting the colors.

EXAMPLES:

```
sage: C = ColoredPermutations(4, 3)
sage: s1,s2,t = C.gens()
sage: x = s1*s2*t
sage: x.permutation()
[3, 1, 2]
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(4), Integer(3))
>>> s1,s2,t = C.gens()
>>> x = s1*s2*t
>>> x.permutation()
[3, 1, 2]
```

reduced_word()

Return a word in the simple reflections to obtain `self`.

EXAMPLES:

```
sage: C = ColoredPermutations(3, 3)
sage: x = C([[2,1,0],[3,1,2]])
sage: x.reduced_word()
[2, 1, 3, 2, 1, 3, 3]

sage: C = ColoredPermutations(4, 4)
sage: x = C([[2,1,0,1],[3,2,4,1]])
sage: x.reduced_word()
[2, 1, 4, 3, 2, 1, 4, 3, 2, 4, 4, 3]
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(3), Integer(3))
>>> x = C([[Integer(2),Integer(1),Integer(0)],[Integer(3),Integer(1),
↪Integer(2)]])
>>> x.reduced_word()
[2, 1, 3, 2, 1, 3, 3]

>>> C = ColoredPermutations(Integer(4), Integer(4))
>>> x = C([[Integer(2),Integer(1),Integer(0),Integer(1)],[Integer(3),
↪Integer(2),Integer(4),Integer(1)]])
>>> x.reduced_word()
[2, 1, 4, 3, 2, 1, 4, 3, 2, 4, 4, 3]
```

to_matrix()

Return a matrix of `self`.

The colors are mapped to roots of unity.

EXAMPLES:

```
sage: C = ColoredPermutations(4, 3)
sage: s1,s2,t = C.gens()
sage: x = s1*s2*t*s2; x.one_line_form()
[(1, 2), (0, 1), (0, 3)]
sage: M = x.to_matrix(); M                                              #␣
↪needs sage.rings.number_field
[    0     1     0]
[zeta4     0     0]
[    0     0     1]
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(4), Integer(3))
>>> s1,s2,t = C.gens()
>>> x = s1*s2*t*s2; x.one_line_form()
[(1, 2), (0, 1), (0, 3)]
>>> M = x.to_matrix(); M                                                #␣
↪needs sage.rings.number_field
[    0     1     0]
[zeta4     0     0]
[    0     0     1]
```

The matrix multiplication is in the *opposite* order:

```
sage: M == s2.to_matrix()*t.to_matrix()*s2.to_matrix()*s1.to_matrix()        #␣
↪needs sage.rings.number_field
True
```

```
>>> from sage.all import *
>>> M == s2.to_matrix()*t.to_matrix()*s2.to_matrix()*s1.to_matrix()        #␣
↪needs sage.rings.number_field
True
```

class sage.combinat.colored_permutations.**ColoredPermutations**(*m*, *n*)

Bases: *ShephardToddFamilyGroup*

The group of m-colored permutations on $\{1, 2, \ldots, n\}$.

Let S_n be the symmetric group on n letters and C_m be the cyclic group of order m. The m-colored permutation group on n letters is given by $P_n^m = C_m \wr S_n$. This is also the complex reflection group $G(m, 1, n)$.

We define our multiplication by

$$((s_1, \ldots s_n), \sigma) \cdot ((t_1, \ldots, t_n), \tau) = ((s_1 t_{\sigma(1)}, \ldots, s_n t_{\sigma(n)}), \tau\sigma).$$

EXAMPLES:

```
sage: C = ColoredPermutations(4, 3); C
4-colored permutations of size 3
sage: s1,s2,t = C.gens()
sage: (s1, s2, t)
([[0, 0, 0], [2, 1, 3]], [[0, 0, 0], [1, 3, 2]], [[0, 0, 1], [1, 2, 3]])
sage: s1*s2
[[0, 0, 0], [3, 1, 2]]
sage: s1*s2*s1 == s2*s1*s2
True
sage: t^4 == C.one()
True
sage: s2*t*s2
[[0, 1, 0], [1, 2, 3]]
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(4), Integer(3)); C
4-colored permutations of size 3
>>> s1,s2,t = C.gens()
>>> (s1, s2, t)
([[0, 0, 0], [2, 1, 3]], [[0, 0, 0], [1, 3, 2]], [[0, 0, 1], [1, 2, 3]])
>>> s1*s2
[[0, 0, 0], [3, 1, 2]]
>>> s1*s2*s1 == s2*s1*s2
True
>>> t**Integer(4) == C.one()
True
>>> s2*t*s2
[[0, 1, 0], [1, 2, 3]]
```

We can also create a colored permutation by passing an iterable consisting of tuples consisting of `(color, element)`:

```
sage: x = C([(2,1), (3,3), (3,2)]); x
[[2, 3, 3], [1, 3, 2]]
```

```
>>> from sage.all import *
>>> x = C([(Integer(2),Integer(1)), (Integer(3),Integer(3)), (Integer(3),
↪Integer(2))]); x
[[2, 3, 3], [1, 3, 2]]
```

or a list of colors and a permutation:

```
sage: C([[3,3,1], [1,3,2]])
[[3, 3, 1], [1, 3, 2]]
sage: C(([3,3,1], [1,3,2]))
[[3, 3, 1], [1, 3, 2]]
```

```
>>> from sage.all import *
>>> C([[Integer(3),Integer(3),Integer(1)], [Integer(1),Integer(3),Integer(2)]])
[[3, 3, 1], [1, 3, 2]]
>>> C(([Integer(3),Integer(3),Integer(1)], [Integer(1),Integer(3),Integer(2)]))
[[3, 3, 1], [1, 3, 2]]
```

There is also the natural lift from permutations:

```
sage: P = Permutations(3)
sage: C(P.an_element())
[[0, 0, 0], [3, 1, 2]]
```

```
>>> from sage.all import *
>>> P = Permutations(Integer(3))
>>> C(P.an_element())
[[0, 0, 0], [3, 1, 2]]
```

A colored permutation:

```
sage: C(C.an_element()) == C.an_element()
True
```

```
>>> from sage.all import *
>>> C(C.an_element()) == C.an_element()
True
```

REFERENCES:

- Wikipedia article Generalized_symmetric_group
- Wikipedia article Complex_reflection_group

class sage.combinat.colored_permutations.**ShephardToddFamilyGroup**(*m*, *p*, *n*)

Bases: `UniqueRepresentation`, `Parent`

The Shephard-Todd family complex reflection group $G(m, p, n)$ realized as a subgroup of *colored permutations*.

A general complex reflection group is a subgroup of $GL(V)$, where V is a **C** vector space, that is generated by *reflections*, diagonalizable matrices with at most one eigenvalue not equal to 1. The group of colored permutations

$G(m, 1, n)$ are the generalized permutation matrices whose entries are m-th roots of unity. For $p|m$, the group $G(m, p, n)$ is the index p subgroup such that the product of the entries is a m/p-th root of unity.

By the (Chevalley-)Shephard-Todd classification of irreducible finite complex reflection groups, the groups $G(m, p, n)$ (with $G(2, 2, 2)$ being exceptionally reducible since it is the Klein four group) form the only infinite family with an additional 34 exceptional groups G_k, where $4 \leq k \leq 37$. To avoid ambiguities, we refer to $G(m, p, n)$ as the *Shephard-Todd family complex reflection group*.

INPUT:

- m – positive integer
- p – positive integer dividing m
- n – positive integer

>>> groups.misc.ShephardToddFamily(Integer(6), Integer(3), Integer(4))
Complex reflection group G(6, 3, 4)
>>> groups.misc.ShephardToddFamily(Integer(6), Integer(6), Integer(4))
Complex reflection group G(6, 6, 4)
```

Element

alias of *ColoredPermutation*

as_permutation_group()

Return the permutation group corresponding to self.

EXAMPLES:

```
sage: C = ColoredPermutations(4, 3)
sage: C.as_permutation_group()                                          #␣
↪needs sage.groups
Complex reflection group G(4, 1, 3) as a permutation group
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(4), Integer(3))
>>> C.as_permutation_group()                                          #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.groups
Complex reflection group G(4, 1, 3) as a permutation group
```

cardinality()

Return the cardinality of `self`.

EXAMPLES:

```
sage: C = ColoredPermutations(4, 3)
sage: C.cardinality()
384
sage: C.cardinality() == 4**3 * factorial(3)
True
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(4), Integer(3))
>>> C.cardinality()
384
>>> C.cardinality() == Integer(4)**Integer(3) * factorial(Integer(3))
True
```

codegrees()

Return the codegrees of `self`.

Let G be a complex reflection group. The codegrees $d_1^* \leq d_2^* \leq \cdots \leq d_\ell^*$ of G can be defined by:

$$\prod_{i=1}^{\ell}(q - d_i^* - 1) = \sum_{g \in G} \det(g) q^{\dim(V^g)},$$

where V is the natural complex vector space that G acts on and ℓ is the `rank()`.

If $m = 1$, then we are in the special case of the symmetric group and the codegrees are $(n-2, n-3, \ldots 1, 0)$. Otherwise the degrees are $((n-1)m, (n-2)m, \ldots, m, 0)$.

EXAMPLES:

```
sage: C = ColoredPermutations(4, 3)
sage: C.codegrees()
(8, 4, 0)
sage: S = ColoredPermutations(1, 3)
sage: S.codegrees()
(1, 0)
sage: G = groups.misc.ShephardToddFamily(6, 2, 3)
sage: G.codegrees()
(12, 6, 0)
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(4), Integer(3))
>>> C.codegrees()
(8, 4, 0)
>>> S = ColoredPermutations(Integer(1), Integer(3))
>>> S.codegrees()
(1, 0)
```

(continues on next page)

(continued from previous page)

```
>>> G = groups.misc.ShephardToddFamily(Integer(6), Integer(2), Integer(3))
>>> G.codegrees()
(12, 6, 0)
```

coxeter_matrix()

Return the Coxeter matrix of `self`.

When the group is imprimitive and not a Coxeter group, this returns `None`.

EXAMPLES:

```
sage: C = ColoredPermutations(3, 4)
sage: C.coxeter_matrix()                                              #␣

>>> G.coxeter_matrix()
[]

>>> G = groups.misc.ShephardToddFamily(Integer(4), Integer(4), Integer(2))
>>> G.coxeter_matrix()
[1 4]
[4 1]

>>> G = groups.misc.ShephardToddFamily(Integer(7), Integer(7), Integer(2))
>>> G.coxeter_matrix()
[1 7]
```

(continues on next page)

(continued from previous page)

```
[7 1]

>>> G = groups.misc.ShephardToddFamily(Integer(6), Integer(3), Integer(1))
>>> G.coxeter_matrix() is None
True
>>> G = groups.misc.ShephardToddFamily(Integer(6), Integer(3), Integer(4))
>>> G.coxeter_matrix() is None
True
```

degrees()

Return the degrees of `self`.

The degrees of a complex reflection group are the degrees of the fundamental invariants of the ring of polynomial invariants.

If $m = 1$, then we are in the special case of the symmetric group and the degrees are $(2, 3, \ldots, n, n + 1)$. Otherwise the degrees are $(m, 2m, \ldots, nm)$.

EXAMPLES:

```
sage: C = ColoredPermutations(4, 3)
sage: C.degrees()
(4, 8, 12)
sage: S = ColoredPermutations(1, 3)
sage: S.degrees()
(2, 3)
sage: G = groups.misc.ShephardToddFamily(6, 2, 3)
sage: G.degrees()
(6, 9, 12)
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(4), Integer(3))
>>> C.degrees()
(4, 8, 12)
>>> S = ColoredPermutations(Integer(1), Integer(3))
>>> S.degrees()
(2, 3)
>>> G = groups.misc.ShephardToddFamily(Integer(6), Integer(2), Integer(3))
>>> G.degrees()
(6, 9, 12)
```

We now check that the product of the degrees is equal to the cardinality of `self`:

```
sage: prod(C.degrees()) == C.cardinality()
True
sage: prod(S.degrees()) == S.cardinality()
True
sage: prod(G.degrees()) == G.cardinality()
True
```

```
>>> from sage.all import *
>>> prod(C.degrees()) == C.cardinality()
True
```

(continues on next page)

(continued from previous page)

```
>>> prod(S.degrees()) == S.cardinality()
True
>>> prod(G.degrees()) == G.cardinality()
True
```

fixed_point_polynomial(*q=None*)

The fixed point polynomial of `self`.

The fixed point polynomial f_G of a complex reflection group G is counting the dimensions of fixed points subspaces:

$$f_G(q) = \sum_{w \in W} q^{\dim V^w}.$$

Furthermore, let $d_1, d_2, \ldots, d_\ell$ be the degrees of G, where ℓ is the `rank()`. Then the fixed point polynomial is given by

$$f_G(q) = \prod_{i=1}^{\ell} (q + d_i - 1).$$

INPUT:

- `q` – (default: the generator of `ZZ['q']`) the parameter q

EXAMPLES:

```
sage: C = ColoredPermutations(4, 3)
sage: C.fixed_point_polynomial()
q^3 + 21*q^2 + 131*q + 231

sage: S = ColoredPermutations(1, 3)
sage: S.fixed_point_polynomial()
q^2 + 3*q + 2
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(4), Integer(3))
>>> C.fixed_point_polynomial()
q^3 + 21*q^2 + 131*q + 231

>>> S = ColoredPermutations(Integer(1), Integer(3))
>>> S.fixed_point_polynomial()
q^2 + 3*q + 2
```

gens()

Return the generators of `self`.

EXAMPLES:

```
sage: C = ColoredPermutations(4, 3)
sage: C.gens()
([[0, 0, 0], [2, 1, 3]],
 [[0, 0, 0], [1, 3, 2]],
 [[0, 0, 1], [1, 2, 3]])
```

(continues on next page)

(continued from previous page)

```
sage: S = SignedPermutations(4)
sage: S.gens()
([2, 1, 3, 4], [1, 3, 2, 4], [1, 2, 4, 3], [1, 2, 3, -4])
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(4), Integer(3))
>>> C.gens()
([[0, 0, 0], [2, 1, 3]],
 [[0, 0, 0], [1, 3, 2]],
 [[0, 0, 1], [1, 2, 3]])

>>> S = SignedPermutations(Integer(4))
>>> S.gens()
([2, 1, 3, 4], [1, 3, 2, 4], [1, 2, 4, 3], [1, 2, 3, -4])
```

index_set()

Return the index set of `self`.

EXAMPLES:

```
sage: C = ColoredPermutations(3, 4)
sage: C.index_set()
(1, 2, 3, 4)

sage: C = ColoredPermutations(1, 4)
sage: C.index_set()
(1, 2, 3)

sage: G = groups.misc.ShephardToddFamily(6, 6, 4)
sage: G.index_set()
(1, 2, 3, 4)

sage: G = groups.misc.ShephardToddFamily(6, 2, 4)
sage: G.index_set()
(1, 2, 3, 4, 5)

sage: G = groups.misc.ShephardToddFamily(6, 6, 1)
sage: G.index_set()
()

sage: G = groups.misc.ShephardToddFamily(6, 2, 1)
sage: G.index_set()
(1,)
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(3), Integer(4))
>>> C.index_set()
(1, 2, 3, 4)

>>> C = ColoredPermutations(Integer(1), Integer(4))
>>> C.index_set()
(1, 2, 3)
```

(continues on next page)

(continued from previous page)

```
>>> G = groups.misc.ShephardToddFamily(Integer(6), Integer(6), Integer(4))
>>> G.index_set()
(1, 2, 3, 4)

>>> G = groups.misc.ShephardToddFamily(Integer(6), Integer(2), Integer(4))
>>> G.index_set()
(1, 2, 3, 4, 5)

>>> G = groups.misc.ShephardToddFamily(Integer(6), Integer(6), Integer(1))
>>> G.index_set()
()

>>> G = groups.misc.ShephardToddFamily(Integer(6), Integer(2), Integer(1))
>>> G.index_set()
(1,)
```

is_well_generated()

Return if `self` is a well-generated complex reflection group.

A complex reflection group G is well-generated if it is generated by ℓ reflections. Equivalently, G is well-generated if $d_i + d_i^* = d_\ell$ for all $1 \leq i \leq \ell$.

EXAMPLES:

```
sage: C = ColoredPermutations(4, 3)
sage: C.is_well_generated()
True
sage: C = ColoredPermutations(2, 8)
sage: C.is_well_generated()
True
sage: C = ColoredPermutations(1, 4)
sage: C.is_well_generated()
True
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(4), Integer(3))
>>> C.is_well_generated()
True
>>> C = ColoredPermutations(Integer(2), Integer(8))
>>> C.is_well_generated()
True
>>> C = ColoredPermutations(Integer(1), Integer(4))
>>> C.is_well_generated()
True
```

matrix_group()

Return the matrix group corresponding to `self`.

EXAMPLES:

```
sage: C = ColoredPermutations(4, 3)
sage: C.matrix_group()                                                         #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.modules
Matrix group over Cyclotomic Field of order 4 and degree 2 with 3 generators (
[0 1 0]  [1 0 0]  [    1     0     0]
[1 0 0]  [0 0 1]  [    0     1     0]
[0 0 1], [0 1 0], [    0     0 zeta4]
)
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(4), Integer(3))
>>> C.matrix_group()                                                           #␣
↪needs sage.modules
Matrix group over Cyclotomic Field of order 4 and degree 2 with 3 generators (
[0 1 0]  [1 0 0]  [    1     0     0]
[1 0 0]  [0 0 1]  [    0     1     0]
[0 0 1], [0 1 0], [    0     0 zeta4]
)
```

number_of_reflection_hyperplanes()

Return the number of reflection hyperplanes of `self`.

The number of reflection hyperplanes of a complex reflection group is equal to the sum of the codegrees plus the rank.

EXAMPLES:

```
sage: C = ColoredPermutations(1, 2)
sage: C.number_of_reflection_hyperplanes()
1
sage: C = ColoredPermutations(1, 3)
sage: C.number_of_reflection_hyperplanes()
3
sage: C = ColoredPermutations(4, 12)
sage: C.number_of_reflection_hyperplanes()
276
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(1), Integer(2))
>>> C.number_of_reflection_hyperplanes()
1
>>> C = ColoredPermutations(Integer(1), Integer(3))
>>> C.number_of_reflection_hyperplanes()
3
>>> C = ColoredPermutations(Integer(4), Integer(12))
>>> C.number_of_reflection_hyperplanes()
276
```

one()

Return the identity element of `self`.

EXAMPLES:

```
sage: C = ColoredPermutations(4, 3)
sage: C.one()
```

(continues on next page)

(continued from previous page)

```
[[0, 0, 0], [1, 2, 3]]
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(4), Integer(3))
>>> C.one()
[[0, 0, 0], [1, 2, 3]]
```

order()

Return the cardinality of `self`.

EXAMPLES:

```
sage: C = ColoredPermutations(4, 3)
sage: C.cardinality()
384
sage: C.cardinality() == 4**3 * factorial(3)
True
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(4), Integer(3))
>>> C.cardinality()
384
>>> C.cardinality() == Integer(4)**Integer(3) * factorial(Integer(3))
True
```

random_element()

Return an element of `self` at random.

EXAMPLES:

```
sage: C = ColoredPermutations(4, 3)
sage: s = C.random_element(); s  # random
[[0, 2, 1], [2, 1, 3]]
sage: s in C
True
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(4), Integer(3))
>>> s = C.random_element(); s  # random
[[0, 2, 1], [2, 1, 3]]
>>> s in C
True
```

rank()

Return the rank of `self`.

The rank of a complex reflection group is equal to the dimension of the complex vector space the group acts on.

EXAMPLES:

```
sage: C = ColoredPermutations(4, 12)
sage: C.rank()
```

(continues on next page)

(continued from previous page)

```
12
sage: C = ColoredPermutations(7, 4)
sage: C.rank()
4
sage: C = ColoredPermutations(1, 4)
sage: C.rank()
3
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(4), Integer(12))
>>> C.rank()
12
>>> C = ColoredPermutations(Integer(7), Integer(4))
>>> C.rank()
4
>>> C = ColoredPermutations(Integer(1), Integer(4))
>>> C.rank()
3
```

simple_reflection(*i*)

Return the i-th simple reflection of self.

EXAMPLES:

```
sage: C = ColoredPermutations(4, 3)
sage: C.gens()
([[0, 0, 0], [2, 1, 3]], [[0, 0, 0], [1, 3, 2]], [[0, 0, 1], [1, 2, 3]])
sage: C.simple_reflection(2)
[[0, 0, 0], [1, 3, 2]]
sage: C.simple_reflection(3)
[[0, 0, 1], [1, 2, 3]]

sage: S = SignedPermutations(4)
sage: S.simple_reflection(1)
[2, 1, 3, 4]
sage: S.simple_reflection(4)
[1, 2, 3, -4]

sage: G = groups.misc.ShephardToddFamily(4, 2, 3)
sage: list(G.simple_reflections())
[[[0, 0, 0], [2, 1, 3]],
 [[0, 0, 0], [1, 3, 2]],
 [[0, 1, 3], [1, 3, 2]],
 [[0, 0, 2], [1, 2, 3]]]

sage: G = groups.misc.ShephardToddFamily(8, 4, 1)
sage: G.simple_reflections()
Finite family {1: [[4], [1]]}

sage: G = groups.misc.ShephardToddFamily(8, 8, 1)
sage: G.simple_reflections()
Finite family {}
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(4), Integer(3))
>>> C.gens()
([[0, 0, 0], [2, 1, 3]], [[0, 0, 0], [1, 3, 2]], [[0, 0, 1], [1, 2, 3]])
>>> C.simple_reflection(Integer(2))
[[0, 0, 0], [1, 3, 2]]
>>> C.simple_reflection(Integer(3))
[[0, 0, 1], [1, 2, 3]]

>>> S = SignedPermutations(Integer(4))
>>> S.simple_reflection(Integer(1))
[2, 1, 3, 4]
>>> S.simple_reflection(Integer(4))
[1, 2, 3, -4]

>>> G = groups.misc.ShephardToddFamily(Integer(4), Integer(2), Integer(3))
>>> list(G.simple_reflections())
[[[0, 0, 0], [2, 1, 3]],
 [[0, 0, 0], [1, 3, 2]],
 [[0, 1, 3], [1, 3, 2]],
 [[0, 0, 2], [1, 2, 3]]]

>>> G = groups.misc.ShephardToddFamily(Integer(8), Integer(4), Integer(1))
>>> G.simple_reflections()
Finite family {1: [[4], [1]]}

>>> G = groups.misc.ShephardToddFamily(Integer(8), Integer(8), Integer(1))
>>> G.simple_reflections()
Finite family {}
```

class sage.combinat.colored_permutations.**SignedPermutation**(*parent*, *colors*, *perm*)

Bases: *ColoredPermutation*

A signed permutation.

cycle_type()

Return a pair of partitions of `len(self)` corresponding to the signed cycle type of `self`.

A *cycle* is a tuple $C = (c_0, \ldots, c_{k-1})$ with $\pi(c_i) = c_{i+1}$ for $0 \leq i < k$ and $\pi(c_{k-1}) = c_0$. If C is a cycle, $\overline{C} = (-c_0, \ldots, -c_{k-1})$ is also a cycle. A cycle is *negative*, if $C = \overline{C}$ up to cyclic reordering. In this case, k is necessarily even and the length of C is $k/2$. A *positive cycle* is a pair $C\overline{C}$, its length is k.

Let α be the partition whose parts are the lengths of the positive cycles and let β be the partition whose parts are the lengths of the negative cycles. Then (α, β) is the cycle type of π.

EXAMPLES:

```
sage: G = SignedPermutations(7)
sage: pi = G([2, -1, 4, -6, -5, -3, 7])
sage: pi.cycle_type()
([3, 1], [2, 1])

sage: G = SignedPermutations(5)
sage: all(pi.cycle_type().size() == 5 for pi in G)
True
```

(continues on next page)

(continued from previous page)

```
sage: set(pi.cycle_type() for pi in G) == set(PartitionTuples(2, 5))
True
```

```
>>> from sage.all import *
>>> G = SignedPermutations(Integer(7))
>>> pi = G([Integer(2), -Integer(1), Integer(4), -Integer(6), -Integer(5), -
↪Integer(3), Integer(7)])
>>> pi.cycle_type()
([3, 1], [2, 1])

>>> G = SignedPermutations(Integer(5))
>>> all(pi.cycle_type().size() == Integer(5) for pi in G)
True
>>> set(pi.cycle_type() for pi in G) == set(PartitionTuples(Integer(2),
↪Integer(5)))
True
```

has_left_descent (*i*)

Return `True` if `i` is a left descent of `self`.

EXAMPLES:

```
sage: S = SignedPermutations(4)
sage: s1,s2,s3,s4 = S.gens()
sage: x = s4*s1*s2*s3*s4
sage: [x.has_left_descent(i) for i in S.index_set()]
[True, False, False, True]
```

```
>>> from sage.all import *
>>> S = SignedPermutations(Integer(4))
>>> s1,s2,s3,s4 = S.gens()
>>> x = s4*s1*s2*s3*s4
>>> [x.has_left_descent(i) for i in S.index_set()]
[True, False, False, True]
```

order ()

Return the multiplicative order of the signed permutation.

EXAMPLES:

```
sage: pi = SignedPermutations(7)([2,-1,4,-6,-5,-3,7])
sage: pi.to_cycles(singletons=False)
[(1, 2, -1, -2), (3, 4, -6), (-3, -4, 6), (5, -5)]
sage: pi.order()
12
```

```
>>> from sage.all import *
>>> pi = SignedPermutations(Integer(7))([Integer(2),-Integer(1),Integer(4),-
↪Integer(6),-Integer(5),-Integer(3),Integer(7)])
>>> pi.to_cycles(singletons=False)
[(1, 2, -1, -2), (3, 4, -6), (-3, -4, 6), (5, -5)]
>>> pi.order()
12
```

to_cycles(*singletons=True*, *use_min=True*, *negative_cycles=True*)

Return the signed permutation `self` as a list of disjoint cycles.

The cycles are returned in the order of increasing smallest elements, and each cycle is returned as a tuple which starts with its smallest positive element.

INPUT:

- `singletons` – boolean (default: `True`); whether to include singleton cycles or not
- `use_min` – boolean (default: `True`); if `False`, the cycles are returned in the order of increasing *largest* (not smallest) elements, and each cycle starts with its largest element
- `negative_cycles` – boolean (default: `True`); if `False`, for any two cycles $C^{\pm} = \{\pm c_1, \ldots, \pm c_k\}$ such that $C^+ \neq C^-$, this does not include the cycle C^-

Warning

The arugment `negative_cycles` does not refer to the usual definition of a negative cycle; see `cycle_type()`.

EXAMPLES:

```
sage: pi = SignedPermutations(7)([2,-1,4,-6,-5,-3,7])
sage: pi.to_cycles()
[(1, 2, -1, -2), (3, 4, -6), (-3, -4, 6), (5, -5), (7,), (-7,)]
sage: pi.to_cycles(singletons=False)
[(1, 2, -1, -2), (3, 4, -6), (-3, -4, 6), (5, -5)]
sage: pi.to_cycles(negative_cycles=False)
[(1, 2, -1, -2), (3, 4, -6), (5, -5), (7,)]
sage: pi.to_cycles(singletons=False, negative_cycles=False)
[(1, 2, -1, -2), (3, 4, -6), (5, -5)]
sage: pi.to_cycles(use_min=False)
[(7,), (-7,), (6, -3, -4), (-6, 3, 4), (5, -5), (2, -1, -2, 1)]
sage: pi.to_cycles(singletons=False, use_min=False)
[(6, -3, -4), (-6, 3, 4), (5, -5), (2, -1, -2, 1)]
```

```
>>> from sage.all import *
>>> pi = SignedPermutations(Integer(7))([Integer(2),-Integer(1),Integer(4),-
↪Integer(6),-Integer(5),-Integer(3),Integer(7)])
>>> pi.to_cycles()
[(1, 2, -1, -2), (3, 4, -6), (-3, -4, 6), (5, -5), (7,), (-7,)]
>>> pi.to_cycles(singletons=False)
[(1, 2, -1, -2), (3, 4, -6), (-3, -4, 6), (5, -5)]
>>> pi.to_cycles(negative_cycles=False)
[(1, 2, -1, -2), (3, 4, -6), (5, -5), (7,)]
>>> pi.to_cycles(singletons=False, negative_cycles=False)
[(1, 2, -1, -2), (3, 4, -6), (5, -5)]
>>> pi.to_cycles(use_min=False)
[(7,), (-7,), (6, -3, -4), (-6, 3, 4), (5, -5), (2, -1, -2, 1)]
>>> pi.to_cycles(singletons=False, use_min=False)
[(6, -3, -4), (-6, 3, 4), (5, -5), (2, -1, -2, 1)]
```

to_matrix()

Return a matrix of `self`.

EXAMPLES:

```
sage: S = SignedPermutations(4)
sage: s1,s2,s3,s4 = S.gens()
sage: x = s4*s1*s2*s3*s4
sage: M = x.to_matrix(); M                                              #␣
↪needs sage.modules
[ 0  1  0  0]
[ 0  0  1  0]
[ 0  0  0 -1]
[-1  0  0  0]
```

```
>>> from sage.all import *
>>> S = SignedPermutations(Integer(4))
>>> s1,s2,s3,s4 = S.gens()
>>> x = s4*s1*s2*s3*s4
>>> M = x.to_matrix(); M                                              #␣
↪needs sage.modules
[ 0  1  0  0]
[ 0  0  1  0]
[ 0  0  0 -1]
[-1  0  0  0]
```

The matrix multiplication is in the *opposite* order:

```
sage: m1,m2,m3,m4 = [g.to_matrix() for g in S.gens()]                   #␣
↪needs sage.modules
sage: M == m4 * m3 * m2 * m1 * m4                                        #␣
↪needs sage.modules
True
```

```
>>> from sage.all import *
>>> m1,m2,m3,m4 = [g.to_matrix() for g in S.gens()]                   #␣
↪needs sage.modules
>>> M == m4 * m3 * m2 * m1 * m4                                        #␣
↪needs sage.modules
True
```

class sage.combinat.colored_permutations.**SignedPermutations**(*n*)

Bases: *ColoredPermutations*

Group of signed permutations.

The group of signed permutations is also known as the hyperoctahedral group, the Coxeter group of type B_n, and the 2-colored permutation group. Thus it can be constructed as the wreath product $S_2 \wr S_n$.

EXAMPLES:

```
sage: S = SignedPermutations(4)
sage: s1,s2,s3,s4 = S.group_generators()
sage: x = s4*s1*s2*s3*s4; x
[-4, 1, 2, -3]
sage: x^4 == S.one()
True
```

```
>>> from sage.all import *
>>> S = SignedPermutations(Integer(4))
>>> s1,s2,s3,s4 = S.group_generators()
>>> x = s4*s1*s2*s3*s4; x
[-4, 1, 2, -3]
>>> x**Integer(4) == S.one()
True
```

This is a finite Coxeter group of type B_n:

```
sage: S.canonical_representation()                                          #␣
↪needs sage.modules
Finite Coxeter group over Number Field in a with defining polynomial x^2 - 2
 with a = 1.414213562373095? with Coxeter matrix:
[1 3 2 2]
[3 1 3 2]
[2 3 1 4]
[2 2 4 1]
sage: S.long_element()
[-1, -2, -3, -4]
sage: S.long_element().reduced_word()
[1, 2, 1, 3, 2, 1, 4, 3, 2, 1, 4, 3, 2, 4, 3, 4]
```

```
>>> from sage.all import *
>>> S.canonical_representation()                                        #␣
↪needs sage.modules
Finite Coxeter group over Number Field in a with defining polynomial x^2 - 2
 with a = 1.414213562373095? with Coxeter matrix:
[1 3 2 2]
[3 1 3 2]
[2 3 1 4]
[2 2 4 1]
>>> S.long_element()
[-1, -2, -3, -4]
>>> S.long_element().reduced_word()
[1, 2, 1, 3, 2, 1, 4, 3, 2, 1, 4, 3, 2, 4, 3, 4]
```

We can also go between the 2-colored permutation group:

```
sage: C = ColoredPermutations(2, 3)
sage: S = SignedPermutations(3)
sage: S.an_element()
[-3, 1, 2]
sage: C(S.an_element())
[[1, 0, 0], [3, 1, 2]]
sage: S(C(S.an_element())) == S.an_element()
True
sage: S(C.an_element())
[-3, 1, 2]
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(2), Integer(3))
>>> S = SignedPermutations(Integer(3))
```

(continues on next page)

(continued from previous page)

```
>>> S.an_element()
[-3, 1, 2]
>>> C(S.an_element())
[[1, 0, 0], [3, 1, 2]]
>>> S(C(S.an_element())) == S.an_element()
True
>>> S(C.an_element())
[-3, 1, 2]
```

There is also the natural lift from permutations:

```
sage: P = Permutations(3)
sage: x = S(P.an_element()); x
[3, 1, 2]
sage: x.parent()
Signed permutations of 3
```

```
>>> from sage.all import *
>>> P = Permutations(Integer(3))
>>> x = S(P.an_element()); x
[3, 1, 2]
>>> x.parent()
Signed permutations of 3
```

Element

alias of *SignedPermutation*

conjugacy_class_representative(*nu*)

Return a permutation with (signed) cycle type `nu`.

EXAMPLES:

```
sage: G = SignedPermutations(4)
sage: for nu in PartitionTuples(2, 4):
....:     print(nu, G.conjugacy_class_representative(nu))
....:     assert nu == G.conjugacy_class_representative(nu).cycle_type(), nu
([4], []) [2, 3, 4, 1]
([3, 1], []) [2, 3, 1, 4]
([2, 2], []) [2, 1, 4, 3]
([2, 1, 1], []) [2, 1, 3, 4]
([1, 1, 1, 1], []) [1, 2, 3, 4]
([3], [1]) [2, 3, 1, -4]
([2, 1], [1]) [2, 1, 3, -4]
([1, 1, 1], [1]) [1, 2, 3, -4]
([2], [2]) [2, 1, 4, -3]
([2], [1, 1]) [2, 1, -3, -4]
([1, 1], [2]) [1, 2, 4, -3]
([1, 1], [1, 1]) [1, 2, -3, -4]
([1], [3]) [1, 3, 4, -2]
([1], [2, 1]) [1, 3, -2, -4]
```

(continues on next page)

(continued from previous page)

```
([1], [1, 1, 1]) [1, -2, -3, -4]
([], [4]) [2, 3, 4, -1]
([], [3, 1]) [2, 3, -1, -4]
([], [2, 2]) [2, -1, 4, -3]

([2], [2]) [2, 1, 4, -3]
([2], [1, 1]) [2, 1, -3, -4]
([1, 1], [2]) [1, 2, 4, -3]
([1, 1], [1, 1]) [1, 2, -3, -4]
([1], [3]) [1, 3, 4, -2]
([1], [2, 1]) [1, 3, -2, -4]
([1], [1, 1, 1]) [1, -2, -3, -4]
([], [4]) [2, 3, 4, -1]
([], [3, 1]) [2, 3, -1, -4]
([], [2, 2]) [2, -1, 4, -3]
([], [2, 1, 1]) [2, -1, -3, -4]
([], [1, 1, 1, 1]) [-1, -2, -3, -4]
```

long_element(*index_set=None*)

Return the longest element of `self`, or of the parabolic subgroup corresponding to the given `index_set`.

INPUT:

- `index_set` – (optional) a subset (as a list or iterable) of the nodes of the indexing set

EXAMPLES:

```
sage: S = SignedPermutations(4)
sage: S.long_element()
[-1, -2, -3, -4]
```

```
>>> from sage.all import *
>>> S = SignedPermutations(Integer(4))
>>> S.long_element()
[-1, -2, -3, -4]
```

one()

Return the identity element of `self`.

EXAMPLES:

```
sage: S = SignedPermutations(4)
sage: S.one()
[1, 2, 3, 4]
```

```
>>> from sage.all import *
>>> S = SignedPermutations(Integer(4))
>>> S.one()
[1, 2, 3, 4]
```

random_element()

Return an element drawn uniformly at random.

EXAMPLES:

```
sage: C = SignedPermutations(7)
sage: s = C.random_element(); s # random
[7, 6, -4, -5, 2, 3, -1]
sage: s in C
True
```

```
>>> from sage.all import *
>>> C = SignedPermutations(Integer(7))
>>> s = C.random_element(); s # random
[7, 6, -4, -5, 2, 3, -1]
>>> s in C
True
```

simple_reflection(*i*)

Return the `i`-th simple reflection of `self`.

EXAMPLES:

```
sage: S = SignedPermutations(4)
sage: S.simple_reflection(1)
[2, 1, 3, 4]
sage: S.simple_reflection(4)
[1, 2, 3, -4]
```

```
>>> from sage.all import *
>>> S = SignedPermutations(Integer(4))
>>> S.simple_reflection(Integer(1))
[2, 1, 3, 4]
>>> S.simple_reflection(Integer(4))
[1, 2, 3, -4]
```

5.1.25 Combinatorial Functions

This module implements some combinatorial functions, as listed below. For a more detailed description, see the relevant docstrings.

Sequences:

- Bell numbers, *bell_number()*

- Catalan numbers, `catalan_number()` (not to be confused with the Catalan constant)
- Narayana numbers, `narayana_number()`
- Euler numbers, `euler_number()` (Maxima)
- Eulerian numbers, `eulerian_number()`
- Eulerian polynomial, `eulerian_polynomial()`
- Fibonacci numbers, `fibonacci()` (PARI) and `fibonacci_number()` (GAP) The PARI version is better.
- Lucas numbers, `lucas_number1()`, `lucas_number2()`.
- Stirling numbers, `stirling_number1()`, `stirling_number2()`.
- Polygonal numbers, `polygonal_number()`

Set-theoretic constructions:

- Derangements of a multiset, `derangements()` and `number_of_derangements()`.
- Tuples of a multiset, `tuples()` and `number_of_tuples()`. An ordered tuple of length k of set S is a ordered selection with repetitions of S and is represented by a sorted list of length k containing elements from S.
- Unordered tuples of a set, `unordered_tuples()` and `number_of_unordered_tuples()`. An unordered tuple of length k of set S is an unordered selection with repetitions of S and is represented by a sorted list of length k containing elements from S.

Warning

The following function is deprecated and will soon be removed.

- Permutations of a multiset, `permutations()`, `permutations_iterator()`, `number_of_permutations()`. A permutation is a list that contains exactly the same elements but possibly in different order.

Related functions:

- Bernoulli polynomials, `bernoulli_polynomial()`

Implemented in other modules (listed for completeness):

The package `sage.arith` contains the following combinatorial functions:

- `binomial()` the binomial coefficient (wrapped from PARI)
- `factorial()` (wrapped from PARI)
- `falling_factorial()` Definition: for integer $a \geq 0$ we have $x(x-1)\cdots(x-a+1)$. In all other cases we use the GAMMA-function: $\frac{\Gamma(x+1)}{\Gamma(x-a+1)}$.
- `rising_factorial()` Definition: for integer $a \geq 0$ we have $x(x+1)\cdots(x+a-1)$. In all other cases we use the GAMMA-function: $\frac{\Gamma(x+a)}{\Gamma(x)}$.

From other modules:

- `number_of_partitions()` (wrapped from PARI) the *number* of partitions:
- `sage.combinat.q_analogues.gaussian_binomial()` the Gaussian binomial

$$\binom{n}{k}_q = \frac{(1-q^m)(1-q^{m-1})\cdots(1-q^{m-r+1})}{(1-q)(1-q^2)\cdots(1-q^r)}.$$

The `sage.groups.perm_gps.permgroup_elements` contains the following combinatorial functions:

- matrix method of PermutationGroupElement yielding the permutation matrix of the group element.

Todo

GUAVA commands:

- VandermondeMat
- GrayMat returns a list of all different vectors of length n over the field F, using Gray ordering.

Not in GAP:

- Rencontres numbers (Wikipedia article Rencontres_number)

Functions and classes

class `sage.combinat.combinat.`**`CombinatorialElement`**(*parent*, **args*, ***kwds*)

Bases: *`CombinatorialObject`*, `Element`

`CombinatorialElement` is both a *`CombinatorialObject`* and an `Element`. So it represents a list which is an element of some parent.

A `CombinatorialElement` subclass also automatically supports the `__classcall__` mechanism.

Warning

This class is slowly being deprecated. Use `ClonableList` instead.

INPUT:

- `parent` – the `Parent` class for this element
- `lst` – list or any object that can be converted to a list by calling `list()`

EXAMPLES:

```
sage: # needs sage.combinat
sage: from sage.combinat.combinat import CombinatorialElement
sage: e = CombinatorialElement(Partitions(6), [3,2,1])
sage: e == loads(dumps(e))
True
sage: parent(e)
Partitions of the integer 6
sage: list(e)
[3, 2, 1]
```

```
>>> from sage.all import *
>>> # needs sage.combinat
>>> from sage.combinat.combinat import CombinatorialElement
>>> e = CombinatorialElement(Partitions(Integer(6)), [Integer(3),Integer(2),
↪Integer(1)])
>>> e == loads(dumps(e))
True
>>> parent(e)
Partitions of the integer 6
>>> list(e)
[3, 2, 1]
```

Check classcalls:

```
sage: class Foo(CombinatorialElement):                                  #␣
↪needs sage.combinat
....:     @staticmethod
....:     def __classcall__(cls, x):
....:         return x
sage: Foo(17)                                                            #␣
↪needs sage.combinat
17
```

```
>>> from sage.all import *
>>> class Foo(CombinatorialElement):                                   #␣
↪needs sage.combinat
...     @staticmethod
...     def __classcall__(cls, x):
...         return x
>>> Foo(Integer(17))                                                     ␣
↪     # needs sage.combinat
17
```

class sage.combinat.combinat.**CombinatorialObject**(*l*, *copy=True*)

Bases: SageObject

CombinatorialObject provides a thin wrapper around a list. The main differences are that __setitem__ is disabled so that CombinatorialObjects are shallowly immutable, and the intention is that they are semantically immutable.

Because of this, CombinatorialObjects provide a __hash__ function which computes the hash of the string representation of a list and the hash of its parent's class. Thus, each CombinatorialObject should have a unique string representation.

See also

`CombinatorialElement` if you want a combinatorial object which is an element of a parent.

Warning

This class is slowly being deprecated. Use `ClonableList` instead.

INPUT:

- `l` – list or any object that can be converted to a list by calling `list()`
- `copy` – boolean (default: `True`); if `False`, then `l` must be a `list`, which is assigned to `self._list` without copying

EXAMPLES:

```
sage: c = CombinatorialObject([1,2,3])
sage: c == loads(dumps(c))
True
sage: c._list
[1, 2, 3]
sage: c._hash is None
True
```

```
>>> from sage.all import *
>>> c = CombinatorialObject([Integer(1),Integer(2),Integer(3)])
>>> c == loads(dumps(c))
True
>>> c._list
[1, 2, 3]
>>> c._hash is None
True
```

For efficiency, you can specify `copy=False` if you know what you are doing:

```
sage: from sage.combinat.combinat import CombinatorialObject
sage: x = [3, 2, 1]
sage: C = CombinatorialObject(x, copy=False)
sage: C
[3, 2, 1]
sage: x[0] = 5
sage: C
[5, 2, 1]
```

```
>>> from sage.all import *
>>> from sage.combinat.combinat import CombinatorialObject
>>> x = [Integer(3), Integer(2), Integer(1)]
>>> C = CombinatorialObject(x, copy=False)
>>> C
[3, 2, 1]
>>> x[Integer(0)] = Integer(5)
```

(continues on next page)

(continued from previous page)

```
>>> C
[5, 2, 1]
```

index (*key*)

EXAMPLES:

```
sage: c = CombinatorialObject([1,2,3])
sage: c.index(1)
0
sage: c.index(3)
2
```

```
>>> from sage.all import *
>>> c = CombinatorialObject([Integer(1),Integer(2),Integer(3)])
>>> c.index(Integer(1))
0
>>> c.index(Integer(3))
2
```

sage.combinat.combinat.**bell_number** (*n*, *algorithm='flint'*, ***options*)

Return the n-th Bell number.

This is the number of ways to partition a set of n elements into pairwise disjoint nonempty subsets.

INPUT:

- `n` – positive integer
- `algorithm` – (default: `'flint'`) any one of the following:
  - `'dobinski'` – use Dobinski's formula implemented in Sage
  - `'flint'` – wrap FLINT's `arith_bell_number`
  - `'gap'` – wrap GAP's `Bell`
  - `'mpmath'` – wrap mpmath's `bell`

Warning

When using the mpmath algorithm to compute Bell numbers and you specify `prec`, it can return incorrect results due to low precision. See the examples section.

Let B_n denote the n-th Bell number. Dobinski's formula is:

$$B_n = e^{-1} \sum_{k=0}^{\infty} \frac{k^n}{k!}.$$

To show our implementation of Dobinski's method works, suppose that $n \geq 5$ and let k_0 be the smallest positive integer such that $\frac{k_0^n}{k_0!} < 1$. Note that $k_0 > n$ and $k_0 \leq 2n$ because we can prove that $\frac{(2n)^n}{(2n)!} < 1$ by Stirling.

If $k > k_0$, then we have $\frac{k^n}{k!} < \frac{1}{2^{k-k_0}}$. We show this by induction: let $c_k = \frac{k^n}{k!}$, if $k > n$ then

$$\frac{c_{k+1}}{c_k} = \frac{(1+k^{-1})^n}{k+1} < \frac{(1+n^{-1})^n}{n} < \frac{1}{2}.$$

The last inequality can easily be checked numerically for $n \geq 5$.

Using this, we can see that $\frac{c_k}{c_{k_0}} < \frac{1}{2^{k-k_0}}$ for $k > k_0 > n$. So summing this it gives that $\sum_{k=k_0+1}^{\infty} \frac{k^n}{k!} < 1$, and hence

$$B_n = e^{-1}\left(\sum_{k=0}^{k_0} \frac{k^n}{k!} + E_1\right) = e^{-1}\sum_{k=0}^{k_0} \frac{k^n}{k!} + E_2,$$

where $0 < E_1 < 1$ and $0 < E_2 < e^{-1}$. Next we have for any $q > 0$

$$\sum_{k=0}^{k_0} \frac{k^n}{k!} = \frac{1}{q}\sum_{k=0}^{k_0} \left\lfloor \frac{qk^n}{k!} \right\rfloor + \frac{E_3}{q}$$

where $0 \leq E_3 \leq k_0 + 1 \leq 2n + 1$. Let $E_4 = \frac{E_3}{q}$ and let $q = 2n + 1$. We find $0 \leq E_4 \leq 1$. These two bounds give:

$$\begin{aligned} B_n &= \frac{e^{-1}}{q}\sum_{k=0}^{k_0} \left\lfloor \frac{qk^n}{k!} \right\rfloor + e^{-1}E_4 + E_2 \\ &= \frac{e^{-1}}{q}\sum_{k=0}^{k_0} \left\lfloor \frac{qk^n}{k!} \right\rfloor + E_5 \end{aligned}$$

where

$$0 < E_5 = e^{-1}E_4 + E_2 \leq e^{-1} + e^{-1} < \frac{3}{4}.$$

It follows that

$$B_n = \left\lceil \frac{e^{-1}}{q}\sum_{k=0}^{k_0} \left\lfloor \frac{qk^n}{k!} \right\rfloor \right\rceil.$$

Now define

$$b = \sum_{k=0}^{k_0} \left\lfloor \frac{qk^n}{k!} \right\rfloor.$$

This b can be computed exactly using integer arithmetic. To avoid the costly integer division by $k!$, we collect more terms and do only one division, for example with 3 terms:

$$\frac{k^n}{k!} + \frac{(k+1)^n}{(k+1)!} + \frac{(k+2)^n}{(k+2)!} = \frac{k^n(k+1)(k+2) + (k+1)^n(k+2) + (k+2)^n}{(k+2)!}$$

In the implementation, we collect $\sqrt{n}/2$ terms.

To actually compute B_n from b, we let $p = \lfloor \log_2(b) \rfloor + 1$ such that $b < 2^p$ and we compute with p bits of precision. This implies that b (and $q < b$) can be represented exactly.

We compute $\frac{e^{-1}}{q}b$, rounding down, and we must have an absolute error of at most $1/4$ (given that $E_5 < 3/4$). This means that we need a relative error of at most

$$\frac{eq}{4b} > \frac{(eq)/4}{2^p} > \frac{7}{2^p}$$

(assuming $n \geq 5$). With a precision of p bits and rounding down, every rounding has a relative error of at most $2^{1-p} = 2/2^p$. Since we do 3 roundings (b and q do not require rounding), we get a relative error of at most $6/2^p$. All this implies that the precision of p bits is sufficient.

EXAMPLES:

```
sage: # needs sage.libs.flint
sage: bell_number(10)
115975
sage: bell_number(2)
2
sage: bell_number(-10)
Traceback (most recent call last):
...
ArithmeticError: Bell numbers not defined for negative indices
sage: bell_number(1)
1
sage: bell_number(1/3)
Traceback (most recent call last):
...
TypeError: no conversion of this rational to integer
```

```
>>> from sage.all import *
>>> # needs sage.libs.flint
>>> bell_number(Integer(10))
115975
>>> bell_number(Integer(2))
2
>>> bell_number(-Integer(10))
Traceback (most recent call last):
...
ArithmeticError: Bell numbers not defined for negative indices
>>> bell_number(Integer(1))
1
>>> bell_number(Integer(1)/Integer(3))
Traceback (most recent call last):
...
TypeError: no conversion of this rational to integer
```

When using the mpmath algorithm, we are required have mpmath's precision set to at least $\log_2(B_n)$ bits. If upon computing the Bell number the first time, we deem the precision too low, we use our guess to (temporarily) raise mpmath's precision and the Bell number is recomputed.

```
sage: k = bell_number(30, 'mpmath'); k                                      #␣
↪needs mpmath
846749014511809332450147
sage: k == bell_number(30)                                                   #␣
↪needs mpmath sage.libs.flint
True
```

```
>>> from sage.all import *
>>> k = bell_number(Integer(30), 'mpmath'); k                               ␣
↪     # needs mpmath
846749014511809332450147
>>> k == bell_number(Integer(30))                                            ␣
↪     # needs mpmath sage.libs.flint
True
```

If you knows what precision is necessary before computing the Bell number, you can use the `prec` option:

```
sage: k2 = bell_number(30, 'mpmath', prec=30); k2                              #␣
↪needs mpmath
846749014511809332450147
sage: k == k2                                                                   #␣
↪needs mpmath
True
```

```
>>> from sage.all import *
>>> k2 = bell_number(Integer(30), 'mpmath', prec=Integer(30)); k2             ␣
↪                 # needs mpmath
846749014511809332450147
>>> k == k2                                                                    #␣
↪needs mpmath
True
```

Warning

Running mpmath with the precision set too low can result in incorrect results:

```
sage: k = bell_number(30, 'mpmath', prec=15); k                                #␣
↪needs mpmath
846749014511809388871680
sage: k == bell_number(30)                                                     #␣
↪needs mpmath sage.libs.flint
False
```

```
>>> from sage.all import *
>>> k = bell_number(Integer(30), 'mpmath', prec=Integer(15)); k               ␣
↪          # needs mpmath
846749014511809388871680
>>> k == bell_number(Integer(30))
↪# needs mpmath sage.libs.flint
False
```

sage.combinat.combinat.**bell_polynomial**(*n*, *k=None*, *ordinary=False*)

Return the (partial) (exponential/ordinary) bell Polynomial.

The partial (exponential) *Bell polynomial* is defined by the formula

$$B_{n,k}(x_0, x_1, \ldots, x_{n-k}) = \sum_{\substack{j_0+\ldots+j_{n-k}=k \\ 1j_0+\ldots+(n-k+1)j_{n-k}=n}} \frac{n!}{j_0!j_1!\cdots j_{n-k}!} \left(\frac{x_0}{(0+1)!}\right)^{j_0} \left(\frac{x_1}{(1+1)!}\right)^{j_1} \cdots \left(\frac{x_{n-k}}{(n-k+1)!}\right)^{j_{n-k}}.$$

The complete (exponential) Bell Polynomial is defined as

$$B_n(x_0, x_1, \ldots, x_{n-k}) = \sum_{k=0}^{n} B_{n,k}(x_0, x_1, \ldots, x_{n-k}).$$

The ordinary variant of the partial Bell polynomial is defined by

$$\hat{B}_{n,k}(x_0, x_1, \ldots, x_{n-k}) = \sum_{\substack{j_0+\ldots+j_{n-k}=k \\ 1j_0+\ldots+(n-k+1)j_{n-k}=n}} \binom{k}{j_0, j_1, \ldots, j_{n-k}} x_0^{j_0} x_1^{j_1} \cdots x_{n-k}^{j_{n-k}},$$

where we have used the multinomial coefficient. The complete version has the same definition as its exponential counterpart.

If we define $f(z) = \sum_{n=1}^{\infty} x_{n-1} z^n/n!$ then these are alternative definitions for exponential Bell polynomials

$$\exp(f(z)) = \sum_{n=0}^{\infty} B_n(x_0, \ldots, x_{n-1}) \frac{z^n}{n!},$$
$$\frac{f(z)^k}{k!} = \sum_{n=k}^{\infty} B_{n,k}(x_0, \ldots, x_{n-k}) \frac{z^n}{n!}.$$

Defining $g(z) = \sum_{n=1}^{\infty} x_{n-1} z^n$, we have the analoguous alternative definitions

$$\frac{1}{1-f(z)} = \sum_{n=0}^{\infty} \hat{B}_n(x_0, \ldots, x_{n-1}) z^n,$$
$$f(z)^k = \sum_{n=k}^{\infty} \hat{B}_{n,k}(x_0, \ldots, x_{n-k}) z^n,$$

(see reference).

INPUT:

- `k` – (optional) if specified, returns the partial Bell polynomial, otherwise returns the complete Bell polynomial
- `ordinary` – boolean (default: `False`); if `True`, returns the (partial) ordinary Bell polynomial, otherwise returns the (partial) exponential Bell polynomial

EXAMPLES:

The complete and partial Bell polynomials:

```
sage: # needs sage.combinat
sage: bell_polynomial(3)
x0^3 + 3*x0*x1 + x2
sage: bell_polynomial(4)
x0^4 + 6*x0^2*x1 + 3*x1^2 + 4*x0*x2 + x3
sage: bell_polynomial(6, 3)
15*x1^3 + 60*x0*x1*x2 + 15*x0^2*x3
sage: bell_polynomial(6, 6)
x0^6
```

```
>>> from sage.all import *
>>> # needs sage.combinat
>>> bell_polynomial(Integer(3))
x0^3 + 3*x0*x1 + x2
>>> bell_polynomial(Integer(4))
x0^4 + 6*x0^2*x1 + 3*x1^2 + 4*x0*x2 + x3
>>> bell_polynomial(Integer(6), Integer(3))
15*x1^3 + 60*x0*x1*x2 + 15*x0^2*x3
>>> bell_polynomial(Integer(6), Integer(6))
x0^6
```

The ordinary variants are:

```
sage: # needs sage.combinat sage.arith
sage: bell_polynomial(3, ordinary=True)
x0^3 + 2*x0*x1 + x2
sage: bell_polynomial(4, ordinary=True)
x0^4 + 3*x0^2*x1 + x1^2 + 2*x0*x2 + x3
sage: bell_polynomial(6, 3, True)
x1^3 + 6*x0*x1*x2 + 3*x0^2*x3
sage: bell_polynomial(6, 6, True)
x0^6
```

```
>>> from sage.all import *
>>> # needs sage.combinat sage.arith
>>> bell_polynomial(Integer(3), ordinary=True)
x0^3 + 2*x0*x1 + x2
>>> bell_polynomial(Integer(4), ordinary=True)
x0^4 + 3*x0^2*x1 + x1^2 + 2*x0*x2 + x3
>>> bell_polynomial(Integer(6), Integer(3), True)
x1^3 + 6*x0*x1*x2 + 3*x0^2*x3
>>> bell_polynomial(Integer(6), Integer(6), True)
x0^6
```

We verify the alternative definition of the different Bell polynomials using the functions f and g given above:

```
sage: # needs sage.combinat sage.arith
sage: n = 6 # positive integer
sage: k = 4 # positive integer
sage: R.<x> = InfinitePolynomialRing(QQ)
sage: PR = PolynomialRing(QQ, 'x', n)
sage: d = {x[i]: PR.gen(i) for i in range(n)} #substitution dictionnary
sage: L.<z> = LazyPowerSeriesRing(R)
sage: f = L(lambda i: x[i-1]/factorial(i), valuation=1)
sage: all(exp(f)[i].subs(d) * factorial(i) == bell_polynomial(i) for i in␣
↪range(n+1))
True
sage: all((f^k/factorial(k))[i].subs(d) * factorial(i) == bell_polynomial(i, k)␣
↪for i in range(k, n+k))
True
sage: g = L(lambda i: x[i-1], valuation=1)
sage: all((1/(1-g))[i].subs(d) == bell_polynomial(i, ordinary=True) for i in␣
↪range(n+1))
```

(continues on next page)

(continued from previous page)

```
True
sage: all((g^k)[i].subs(d) == bell_polynomial(i, k, True) for i in range(k, n+k))
True
```

```
>>> from sage.all import *
>>> # needs sage.combinat sage.arith
>>> n = Integer(6) # positive integer
>>> k = Integer(4) # positive integer
>>> R = InfinitePolynomialRing(QQ, names=('x',)); (x,) = R._first_ngens(1)
>>> PR = PolynomialRing(QQ, 'x', n)
>>> d = {x[i]: PR.gen(i) for i in range(n)} #substitution dictionnary
>>> L = LazyPowerSeriesRing(R, names=('z',)); (z,) = L._first_ngens(1)
>>> f = L(lambda i: x[i-Integer(1)]/factorial(i), valuation=Integer(1))
>>> all(exp(f)[i].subs(d) * factorial(i) == bell_polynomial(i) for i in␣
↪range(n+Integer(1)))
True
>>> all((f**k/factorial(k))[i].subs(d) * factorial(i) == bell_polynomial(i, k)␣
↪for i in range(k, n+k))
True
>>> g = L(lambda i: x[i-Integer(1)], valuation=Integer(1))
>>> all((Integer(1)/(Integer(1)-g))[i].subs(d) == bell_polynomial(i,␣
↪ordinary=True) for i in range(n+Integer(1)))
True
>>> all((g**k)[i].subs(d) == bell_polynomial(i, k, True) for i in range(k, n+k))
True
```

`sage.combinat.combinat.`**`bernoulli_polynomial`**`(x, n)`

Return the `n`-th Bernoulli polynomial evaluated at `x`.

The generating function for the Bernoulli polynomials is

$$\frac{te^{xt}}{e^t - 1} = \sum_{n=0}^{\infty} B_n(x) \frac{t^n}{n!},$$

and they are given directly by

$$B_n(x) = \sum_{i=0}^{n} \binom{n}{i} B_{n-i} x^i.$$

One has $B_n(x) = -n\zeta(1-n, x)$, where $\zeta(s, x)$ is the Hurwitz zeta function. Thus, in a certain sense, the Hurwitz zeta function generalizes the Bernoulli polynomials to non-integer values of n.

EXAMPLES:

```
sage: # needs sage.libs.flint
sage: y = QQ['y'].0
sage: bernoulli_polynomial(y, 5)
y^5 - 5/2*y^4 + 5/3*y^3 - 1/6*y
sage: bernoulli_polynomial(y, 5)(12)
199870
sage: bernoulli_polynomial(12, 5)
199870
sage: bernoulli_polynomial(y^2 + 1, 5)
y^10 + 5/2*y^8 + 5/3*y^6 - 1/6*y^2
sage: P.<t> = ZZ[]
sage: p = bernoulli_polynomial(t, 6)
sage: p.parent()
Univariate Polynomial Ring in t over Rational Field
```

```
>>> from sage.all import *
>>> # needs sage.libs.flint
>>> y = QQ['y'].gen(0)
>>> bernoulli_polynomial(y, Integer(5))
y^5 - 5/2*y^4 + 5/3*y^3 - 1/6*y
>>> bernoulli_polynomial(y, Integer(5))(Integer(12))
199870
>>> bernoulli_polynomial(Integer(12), Integer(5))
199870
>>> bernoulli_polynomial(y**Integer(2) + Integer(1), Integer(5))
y^10 + 5/2*y^8 + 5/3*y^6 - 1/6*y^2
>>> P = ZZ['t']; (t,) = P._first_ngens(1)
>>> p = bernoulli_polynomial(t, Integer(6))
>>> p.parent()
Univariate Polynomial Ring in t over Rational Field
```

We verify an instance of the formula which is the origin of the Bernoulli polynomials (and numbers):

```
sage: power_sum = sum(k^4 for k in range(10))
sage: 5*power_sum == bernoulli_polynomial(10, 5) - bernoulli(5)                 #␣
↪needs sage.libs.flint
True
```

```
>>> from sage.all import *
>>> power_sum = sum(k**Integer(4) for k in range(Integer(10)))
>>> Integer(5)*power_sum == bernoulli_polynomial(Integer(10), Integer(5)) -␣
↪bernoulli(Integer(5))                          # needs sage.libs.flint
True
```

- Wikipedia article Bernoulli_polynomials

`sage.combinat.combinat.`**`catalan_number`**`(n)`

Return the n-th Catalan number.

The n-th Catalan number is given directly in terms of binomial coefficients by

$$C_n = \frac{1}{n+1}\binom{2n}{n} = \frac{(2n)!}{(n+1)!\,n!} \qquad \text{for} \quad n \geq 0.$$

Consider the set $S = \{1, ..., n\}$. A noncrossing partition of S is a partition in which no two blocks "cross" each other, i.e., if a and b belong to one block and x and y to another, they are not arranged in the order $axby$. C_n is the number of noncrossing partitions of the set S. There are many other interpretations (see REFERENCES).

When $n = -1$, this function returns the limit value $-1/2$. For other $n < 0$ it returns 0.

INPUT:

- n – integer

OUTPUT: integer

EXAMPLES:

```
sage: [catalan_number(i) for i in range(7)]
[1, 1, 2, 5, 14, 42, 132]
sage: x = (QQ[['x']].0).O(8)
sage: (-1/2)*sqrt(1 - 4*x)
-1/2 + x + x^2 + 2*x^3 + 5*x^4 + 14*x^5 + 42*x^6 + 132*x^7 + O(x^8)
sage: [catalan_number(i) for i in range(-7,7)]
[0, 0, 0, 0, 0, 0, -1/2, 1, 1, 2, 5, 14, 42, 132]
sage: [catalan_number(n).mod(2) for n in range(16)]
[1, 1, 0, 1, 0, 0, 0, 1, 0, 0, 0, 0, 0, 0, 0, 1]
```

```
>>> from sage.all import *
>>> [catalan_number(i) for i in range(Integer(7))]
[1, 1, 2, 5, 14, 42, 132]
>>> x = (QQ[['x']].gen(0)).O(Integer(8))
>>> (-Integer(1)/Integer(2))*sqrt(Integer(1) - Integer(4)*x)
-1/2 + x + x^2 + 2*x^3 + 5*x^4 + 14*x^5 + 42*x^6 + 132*x^7 + O(x^8)
>>> [catalan_number(i) for i in range(-Integer(7),Integer(7))]
[0, 0, 0, 0, 0, 0, -1/2, 1, 1, 2, 5, 14, 42, 132]
>>> [catalan_number(n).mod(Integer(2)) for n in range(Integer(16))]
[1, 1, 0, 1, 0, 0, 0, 1, 0, 0, 0, 0, 0, 0, 0, 1]
```

sage.combinat.combinat.**euler_number**(*n*, *algorithm='flint'*)

Return the n-th Euler number.

INPUT:

- n – positive integer
- algorithm – (default: 'flint') any one of the following:
  - 'maxima' – wraps Maxima's euler
  - 'flint' – wrap FLINT's arith_euler_number

EXAMPLES:

```
sage: [euler_number(i) for i in range(10)]                              #␣
↪needs sage.libs.flint
[1, 0, -1, 0, 5, 0, -61, 0, 1385, 0]
sage: x = PowerSeriesRing(QQ, 'x').gen().O(10)
```

(continues on next page)

(continued from previous page)

```
sage: 2/(exp(x)+exp(-x))
1 - 1/2*x^2 + 5/24*x^4 - 61/720*x^6 + 277/8064*x^8 + O(x^10)
sage: [euler_number(i)/factorial(i) for i in range(11)]                    #␣
↪needs sage.libs.flint
[1, 0, -1/2, 0, 5/24, 0, -61/720, 0, 277/8064, 0, -50521/3628800]
sage: euler_number(-1)
Traceback (most recent call last):
...
ValueError: n (=-1) must be a nonnegative integer
```

```
>>> from sage.all import *
>>> [euler_number(i) for i in range(Integer(10))]                          ␣
↪     # needs sage.libs.flint
[1, 0, -1, 0, 5, 0, -61, 0, 1385, 0]
>>> x = PowerSeriesRing(QQ, 'x').gen().O(Integer(10))
>>> Integer(2)/(exp(x)+exp(-x))
1 - 1/2*x^2 + 5/24*x^4 - 61/720*x^6 + 277/8064*x^8 + O(x^10)
>>> [euler_number(i)/factorial(i) for i in range(Integer(11))]             ␣
↪     # needs sage.libs.flint
[1, 0, -1/2, 0, 5/24, 0, -61/720, 0, 277/8064, 0, -50521/3628800]
>>> euler_number(-Integer(1))
Traceback (most recent call last):
...
ValueError: n (=-1) must be a nonnegative integer
```

REFERENCES:

- Wikipedia article Euler_number

`sage.combinat.combinat.`**`eulerian_number`**`(`*k*, *algorithm='recursive'*`)`

Return the Eulerian number of index `(n, k)`.

This is the coefficient of t^k in the Eulerian polynomial $A_n(t)$.

INPUT:

- `n` – integer
- `k` – integer between `0` and `n - 1`
- `algorithm` – `'recursive'` (default) or `'formula'`

OUTPUT: integer

See also

`eulerian_polynomial()`

EXAMPLES:

```
sage: from sage.combinat.combinat import eulerian_number
sage: [eulerian_number(5,i) for i in range(5)]
[1, 26, 66, 26, 1]
```

```
>>> from sage.all import *
>>> from sage.combinat.combinat import eulerian_number
>>> [eulerian_number(Integer(5),i) for i in range(Integer(5))]
[1, 26, 66, 26, 1]
```

sage.combinat.combinat.**eulerian_polynomial**(*algorithm='derivative'*)

Return the Eulerian polynomial of index `n`.

This is the generating polynomial counting permutations in the symmetric group S_n according to their number of descents.

INPUT:

- `n` – integer
- `algorithm` – `'derivative'` (default) or `'coeffs'`

OUTPUT: polynomial in one variable `t`

See also

eulerian_number()

EXAMPLES:

```
sage: from sage.combinat.combinat import eulerian_polynomial
sage: eulerian_polynomial(5)
t^4 + 26*t^3 + 66*t^2 + 26*t + 1
```

```
>>> from sage.all import *
>>> from sage.combinat.combinat import eulerian_polynomial
>>> eulerian_polynomial(Integer(5))
t^4 + 26*t^3 + 66*t^2 + 26*t + 1
```

REFERENCES:

- Wikipedia article Eulerian_number

sage.combinat.combinat.**fibonacci**(*n*, *algorithm='pari'*)

Return the n-th Fibonacci number.

The Fibonacci sequence F_n is defined by the initial conditions $F_1 = F_2 = 1$ and the recurrence relation $F_{n+2} = F_{n+1} + F_n$. For negative n we define $F_n = (-1)^{n+1} F_{-n}$, which is consistent with the recurrence relation.

INPUT:

- `algorithm` – string; one of
  - `'pari'` – (default) use the PARI C library's pari:fibo function
  - `'gap'` – use GAP's Fibonacci function

Note

PARI is tens to hundreds of times faster than GAP here. Moreover, PARI works for every large input whereas GAP does not.

EXAMPLES:

```
sage: fibonacci(10)                                                          #␣
↪needs sage.libs.pari

TypeError: no conversion of this rational to integer
```

`sage.combinat.combinat.`**`fibonacci_sequence`**(*start*, *stop=None*, *algorithm=None*)

Return an iterator over the Fibonacci sequence, for all fibonacci numbers f_n from `n = start` up to (but not including) `n = stop`

INPUT:

- `start` – starting value
- `stop` – stopping value
- `algorithm` – (default: `None`) passed on to fibonacci function (or not passed on if `None`, i.e., use the default)

EXAMPLES:

```
sage: fibs = [i for i in fibonacci_sequence(10, 20)]; fibs                    #␣
↪needs sage.libs.pari
[55, 89, 144, 233, 377, 610, 987, 1597, 2584, 4181]
```

```

sage.combinat.combinat.**lucas_number1**(n, P, Q)

Return the n-th Lucas number "of the first kind" (this is not standard terminology). The Lucas sequence $L^{(1)}_n$ is defined by the initial conditions $L^{(1)}_1 = 0$, $L^{(1)}_2 = 1$ and the recurrence relation $L^{(1)}_{n+2} = P \cdot L^{(1)}_{n+1} - Q \cdot L^{(1)}_n$.

Wraps GAP's `Lucas(...)[1]`.

$P = 1$, $Q = -1$ gives the Fibonacci sequence.

INPUT:

- `n` – integer
- `P`, `Q` – integer or rational numbers

OUTPUT: integer or rational number

EXAMPLES:

```
sage: # needs sage.libs.gap
sage: lucas_number1(5,1,-1)
5
sage: lucas_number1(6,1,-1)
8
sage: lucas_number1(7,1,-1)
13
sage: lucas_number1(7,1,-2)
43
sage: lucas_number1(5,2,3/5)
229/25
sage: lucas_number1(5,2,1.5)
1/4
```

```
>>> from sage.all import *
>>> # needs sage.libs.gap
>>> lucas_number1(Integer(5),Integer(1),-Integer(1))
5
>>> lucas_number1(Integer(6),Integer(1),-Integer(1))
8
>>> lucas_number1(Integer(7),Integer(1),-Integer(1))
13
>>> lucas_number1(Integer(7),Integer(1),-Integer(2))
43
>>> lucas_number1(Integer(5),Integer(2),Integer(3)/Integer(5))
229/25
>>> lucas_number1(Integer(5),Integer(2),RealNumber('1.5'))
1/4
```

There was a conjecture that the sequence L_n defined by $L_{n+2} = L_{n+1} + L_n$, $L_1 = 1$, $L_2 = 3$, has the property that n prime implies that L_n is prime.

```
sage: def lucas(n):
....:     return Integer((5/2)*lucas_number1(n,1,-1) + (1/2)*lucas_number2(n,1,-
↪1))
sage: [[lucas(n), is_prime(lucas(n)), n+1, is_prime(n+1)] for n in range(15)]    #␣

```

Can you use Sage to find a counterexample to the conjecture?

sage.combinat.combinat.**lucas_number2**(n, P, Q)

Return the n-th Lucas number "of the second kind" (this is not standard terminology). The Lucas sequence $L^{(2)}_n$ is defined by the initial conditions $L^{(2)}_1 = 2$, $L^{(2)}_2 = P$ and the recurrence relation $L^{(2)}_{n+2} = P \cdot L^{(2)}_{n+1} - Q \cdot L^{(2)}_n$.

Wraps GAP's Lucas(…)[2].

INPUT:

- n – integer
- P, Q – integer or rational numbers

OUTPUT: integer or rational number

EXAMPLES:

```
sage: [lucas_number2(i,1,-1) for i in range(10)]                              #␣
↪needs sage.libs.gap
[2, 1, 3, 4, 7, 11, 18, 29, 47, 76]
sage: [fibonacci(i-1)+fibonacci(i+1) for i in range(10)]                       #␣
↪needs sage.libs.pari
[2, 1, 3, 4, 7, 11, 18, 29, 47, 76]
```

```
>>> from sage.all import *
>>> [lucas_number2(i,Integer(1),-Integer(1)) for i in range(Integer(10))]                      ␣
↪                           # needs sage.libs.gap
[2, 1, 3, 4, 7, 11, 18, 29, 47, 76]
>>> [fibonacci(i-Integer(1))+fibonacci(i+Integer(1)) for i in range(Integer(10))]␣
↪                           # needs sage.libs.pari
[2, 1, 3, 4, 7, 11, 18, 29, 47, 76]
```

```
sage: # needs sage.libs.gap
sage: n = lucas_number2(5,2,3); n
2
sage: type(n)
<class 'sage.rings.integer.Integer'>
sage: n = lucas_number2(5,2,-3/9); n
418/9
sage: type(n)
<class 'sage.rings.rational.Rational'>
```

```
>>> from sage.all import *
>>> # needs sage.libs.gap
>>> n = lucas_number2(Integer(5),Integer(2),Integer(3)); n
2
>>> type(n)
<class 'sage.rings.integer.Integer'>
>>> n = lucas_number2(Integer(5),Integer(2),-Integer(3)/Integer(9)); n
418/9
>>> type(n)
<class 'sage.rings.rational.Rational'>
```

The case $P = 1$, $Q = -1$ is the Lucas sequence in Brualdi's Introductory Combinatorics, 4th ed., Prentice-Hall, 2004:

```
sage: [lucas_number2(n,1,-1) for n in range(10)]                                     #␣
↪needs sage.libs.gap
[2, 1, 3, 4, 7, 11, 18, 29, 47, 76]
```

```
>>> from sage.all import *
>>> [lucas_number2(n,Integer(1),-Integer(1)) for n in range(Integer(10))]                      ␣
↪                           # needs sage.libs.gap
[2, 1, 3, 4, 7, 11, 18, 29, 47, 76]
```

sage.combinat.combinat.**narayana_number**(n, k)

Return the Narayana number of index `(n, k)`.

For every integer $n \geq 1$, the sum of Narayana numbers $\sum_k N_{n,k}$ is the Catalan number C_n.

INPUT:

- `n` – integer
- `k` – integer between `0` and `n - 1`

OUTPUT: integer

EXAMPLES:

```
sage: from sage.combinat.combinat import narayana_number
sage: [narayana_number(3, i) for i in range(3)]
[1, 3, 1]
sage: sum(narayana_number(7,i) for i in range(7)) == catalan_number(7)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.combinat import narayana_number
>>> [narayana_number(Integer(3), i) for i in range(Integer(3))]
[1, 3, 1]
>>> sum(narayana_number(Integer(7),i) for i in range(Integer(7))) == catalan_
↪number(Integer(7))
True
```

sage.combinat.combinat.**number_of_tuples**(*S*, *k*, *algorithm='naive'*)

Return the size of `tuples(S, k)` when S is a set. More generally, return the size of `tuples(set(S), k)`. (So, unlike `tuples()`, this method removes redundant entries from S.)

INPUT:

- `S` – the base set
- `k` – the length of the tuples
- `algorithm` – can be one of the following:
  - `'naive'` – (default) use the naive counting $|S|^k$
  - `'gap'` – wraps GAP's `NrTuples`

Warning

When using `algorithm='gap'`, `S` must be a list of objects that have string representations that can be interpreted by the GAP interpreter. If `S` consists of at all complicated Sage objects, this function might *not* do what you expect.

EXAMPLES:

```
sage: S = [1,2,3,4,5]
sage: number_of_tuples(S,2)
25
sage: number_of_tuples(S,2, algorithm='gap')                                #␣
↪needs sage.libs.gap
25
sage: S = [1,1,2,3,4,5]
sage: number_of_tuples(S,2)
25
sage: number_of_tuples(S,2, algorithm='gap')                                #␣
↪needs sage.libs.gap
25
sage: number_of_tuples(S,0)
```

(continues on next page)

(continued from previous page)

```
1
sage: number_of_tuples(S,0, algorithm='gap')                                   #␣
↪needs sage.libs.gap
1
```

```
>>> from sage.all import *
>>> S = [Integer(1),Integer(2),Integer(3),Integer(4),Integer(5)]
>>> number_of_tuples(S,Integer(2))
25
>>> number_of_tuples(S,Integer(2), algorithm='gap')                            ␣
↪     # needs sage.libs.gap
25
>>> S = [Integer(1),Integer(1),Integer(2),Integer(3),Integer(4),Integer(5)]
>>> number_of_tuples(S,Integer(2))
25
>>> number_of_tuples(S,Integer(2), algorithm='gap')                            ␣
↪     # needs sage.libs.gap
25
>>> number_of_tuples(S,Integer(0))
1
>>> number_of_tuples(S,Integer(0), algorithm='gap')                            ␣
↪     # needs sage.libs.gap
1
```

sage.combinat.combinat.**number_of_unordered_tuples**(*S*, *k*, *algorithm='naive'*)

Return the size of `unordered_tuples(S, k)` when S is a set.

INPUT:

- `S` – the base set
- `k` – the length of the tuples
- `algorithm` – can be one of the following:
  - `'naive'` – (default) use the naive counting $\binom{|S|+k-1}{k}$
  - `'gap'` – wraps GAP's `NrUnorderedTuples`

Warning

When using `algorithm='gap'`, `S` must be a list of objects that have string representations that can be interpreted by the GAP interpreter. If `S` consists of at all complicated Sage objects, this function might *not* do what you expect.

EXAMPLES:

```
sage: S = [1,2,3,4,5]
sage: number_of_unordered_tuples(S,2)
15
sage: number_of_unordered_tuples(S,2, algorithm='gap')                         #␣
↪needs sage.libs.gap
15
```

(continues on next page)

(continued from previous page)

```
sage: S = [1,1,2,3,4,5]
sage: number_of_unordered_tuples(S,2)
15
sage: number_of_unordered_tuples(S,2, algorithm='gap')                        #␣
↪needs sage.libs.gap
15
sage: number_of_unordered_tuples(S,0)
1
sage: number_of_unordered_tuples(S,0, algorithm='gap')                        #␣
↪needs sage.libs.gap
1
```

```
>>> from sage.all import *
>>> S = [Integer(1),Integer(2),Integer(3),Integer(4),Integer(5)]
>>> number_of_unordered_tuples(S,Integer(2))
15
>>> number_of_unordered_tuples(S,Integer(2), algorithm='gap')                 ␣
↪     # needs sage.libs.gap
15
>>> S = [Integer(1),Integer(1),Integer(2),Integer(3),Integer(4),Integer(5)]
>>> number_of_unordered_tuples(S,Integer(2))
15
>>> number_of_unordered_tuples(S,Integer(2), algorithm='gap')                 ␣
↪     # needs sage.libs.gap
15
>>> number_of_unordered_tuples(S,Integer(0))
1
>>> number_of_unordered_tuples(S,Integer(0), algorithm='gap')                 ␣
↪     # needs sage.libs.gap
1
```

sage.combinat.combinat.**polygonal_number**(*s*, *n*)

Return the n-th s-gonal number.

Polygonal sequences are represented by dots forming a regular polygon. Two famous sequences are the triangular numbers (3rd column of Pascal's Triangle) and the square numbers. The n-th term in a polygonal sequence is defined by

$$P(s,n) = \frac{n^2(s-2) - n(s-4)}{2},$$

where s is the number of sides of the polygon.

INPUT:

- `s` – integer greater than 1; the number of sides of the polygon
- `n` – integer; the index of the returned s-gonal number

OUTPUT: integer

EXAMPLES:

The triangular numbers:

```
sage: [polygonal_number(3, n) for n in range(10)]
[0, 1, 3, 6, 10, 15, 21, 28, 36, 45]

sage: [polygonal_number(3, n) for n in range(-10, 0)]
[45, 36, 28, 21, 15, 10, 6, 3, 1, 0]
```

```
>>> from sage.all import *
>>> [polygonal_number(Integer(3), n) for n in range(Integer(10))]
[0, 1, 3, 6, 10, 15, 21, 28, 36, 45]

>>> [polygonal_number(Integer(3), n) for n in range(-Integer(10), Integer(0))]
[45, 36, 28, 21, 15, 10, 6, 3, 1, 0]
```

The square numbers:

```
sage: [polygonal_number(4, n) for n in range(10)]
[0, 1, 4, 9, 16, 25, 36, 49, 64, 81]
```

```
>>> from sage.all import *
>>> [polygonal_number(Integer(4), n) for n in range(Integer(10))]
[0, 1, 4, 9, 16, 25, 36, 49, 64, 81]
```

The pentagonal numbers:

```
sage: [polygonal_number(5, n) for n in range(10)]
[0, 1, 5, 12, 22, 35, 51, 70, 92, 117]
```

```
>>> from sage.all import *
>>> [polygonal_number(Integer(5), n) for n in range(Integer(10))]
[0, 1, 5, 12, 22, 35, 51, 70, 92, 117]
```

The hexagonal numbers:

```
sage: [polygonal_number(6, n) for n in range(10)]
[0, 1, 6, 15, 28, 45, 66, 91, 120, 153]
```

```
>>> from sage.all import *
>>> [polygonal_number(Integer(6), n) for n in range(Integer(10))]
[0, 1, 6, 15, 28, 45, 66, 91, 120, 153]
```

The input is converted into an integer:

```
sage: polygonal_number(3.0, 2.0)
3
```

```
>>> from sage.all import *
>>> polygonal_number(RealNumber('3.0'), RealNumber('2.0'))
3
```

A non-integer input returns an error:

```
sage: polygonal_number(3.5, 1)                                                  #␣
↪needs sage.rings.real_mpfr
Traceback (most recent call last):
...
TypeError: Attempt to coerce non-integral RealNumber to Integer
```

```
>>> from sage.all import *
>>> polygonal_number(RealNumber('3.5'), Integer(1))                              ␣
↪                     # needs sage.rings.real_mpfr
Traceback (most recent call last):
...
TypeError: Attempt to coerce non-integral RealNumber to Integer
```

s must be greater than 1:

```
sage: polygonal_number(1, 4)
Traceback (most recent call last):
...
ValueError: s (=1) must be greater than 1
```

```
>>> from sage.all import *
>>> polygonal_number(Integer(1), Integer(4))
Traceback (most recent call last):
...
ValueError: s (=1) must be greater than 1
```

REFERENCES:

- Wikipedia article Polygonal_number

sage.combinat.combinat.**stirling_number1**(*n*, *k*, *algorithm='gap'*)

Return the n-th Stirling number $S_1(n, k)$ of the first kind.

This is the number of permutations of n points with k cycles.

See Wikipedia article Stirling_numbers_of_the_first_kind.

INPUT:

- `n` – nonnegative machine-size integer
- `k` – nonnegative machine-size integer
- `algorithm`:
  - `'gap'` – default; use GAP's `Stirling1` function
  - `'flint'` – use flint's `arith_stirling_number_1u` function

EXAMPLES:

```
sage: # needs sage.libs.gap
sage: stirling_number1(3,2)
3
sage: stirling_number1(5,2)
50
sage: 9*stirling_number1(9,5) + stirling_number1(9,4)
269325
```

(continues on next page)

(continued from previous page)

```
sage: stirling_number1(10,5)
269325
```

```
>>> from sage.all import *
>>> # needs sage.libs.gap
>>> stirling_number1(Integer(3),Integer(2))
3
>>> stirling_number1(Integer(5),Integer(2))
50
>>> Integer(9)*stirling_number1(Integer(9),Integer(5)) + stirling_
↪number1(Integer(9),Integer(4))
269325
>>> stirling_number1(Integer(10),Integer(5))
269325
```

Indeed, $S_1(n,k) = S_1(n-1,k-1) + (n-1)S_1(n-1,k)$.

`sage.combinat.combinat.`**`stirling_number2`**`(`*n*, *k*, *algorithm=None*`)`

Return the n-th Stirling number $S_2(n,k)$ of the second kind.

This is the number of ways to partition a set of n elements into k pairwise disjoint nonempty subsets. The n-th Bell number is the sum of the $S_2(n,k)$'s, $k = 0,...,n$.

See Wikipedia article Stirling_numbers_of_the_second_kind.

INPUT:

- `n` – nonnegative machine-size integer
- `k` – nonnegative machine-size integer
- `algorithm`:
  - `None` – default; use native implementation
  - `'flint'` – use flint's `arith_stirling_number_2` function
  - `'gap'` – use GAP's `Stirling2` function
  - `'maxima'` – use Maxima's `stirling2` function

EXAMPLES:

Print a table of the first several Stirling numbers of the second kind:

```
sage: for n in range(10):
....:     for k in range(10):
....:         print(str(stirling_number2(n,k)).rjust(k and 6))
1      0      0      0      0      0      0      0      0      0
0      1      0      0      0      0      0      0      0      0
0      1      1      0      0      0      0      0      0      0
0      1      3      1      0      0      0      0      0      0
0      1      7      6      1      0      0      0      0      0
0      1     15     25     10      1      0      0      0      0
0      1     31     90     65     15      1      0      0      0
0      1     63    301    350    140     21      1      0      0
0      1    127    966   1701   1050    266     28      1      0
0      1    255   3025   7770   6951   2646    462     36      1
```

```
>>> from sage.all import *
>>> for n in range(Integer(10)):
...     for k in range(Integer(10)):
...         print(str(stirling_number2(n,k)).rjust(k and Integer(6)))
1      0      0      0      0      0      0      0      0      0
0      1      0      0      0      0      0      0      0      0
0      1      1      0      0      0      0      0      0      0
0      1      3      1      0      0      0      0      0      0
0      1      7      6      1      0      0      0      0      0
0      1     15     25     10      1      0      0      0      0
0      1     31     90     65     15      1      0      0      0
0      1     63    301    350    140     21      1      0      0
0      1    127    966   1701   1050    266     28      1      0
0      1    255   3025   7770   6951   2646    462     36      1
```

Stirling numbers satisfy $S_2(n,k) = S_2(n-1,k-1) + kS_2(n-1,k)$:

```
sage: 5*stirling_number2(9,5) + stirling_number2(9,4)
42525
sage: stirling_number2(10,5)
42525
```

```
>>> from sage.all import *
>>> Integer(5)*stirling_number2(Integer(9),Integer(5)) + stirling_
→number2(Integer(9),Integer(4))
42525
>>> stirling_number2(Integer(10),Integer(5))
42525
```

sage.combinat.combinat.**tuples**(*S*, *k*, *algorithm='itertools'*)

Return a list of all k-tuples of elements of a given set `S`.

This function accepts the set `S` in the form of any iterable (list, tuple or iterator), and returns a list of k-tuples. If `S` contains duplicate entries, then you should expect the method to return tuples multiple times!

Recall that k-tuples are ordered (in the sense that two k-tuples differing in the order of their entries count as different) and can have repeated entries (even if `S` is a list with no repetition).

INPUT:

- `S` – the base set
- `k` – the length of the tuples
- `algorithm` – can be one of the following:
  - `'itertools'` – (default) use python's itertools
  - `'native'` – use a native Sage implementation

Note

The ordering of the list of tuples depends on the algorithm.

EXAMPLES:

```
sage: S = [1,2]
sage: tuples(S,3)
[(1, 1, 1), (1, 1, 2), (1, 2, 1), (1, 2, 2),
 (2, 1, 1), (2, 1, 2), (2, 2, 1), (2, 2, 2)]
sage: mset = ["s","t","e","i","n"]
sage: tuples(mset, 2)
[('s', 's'), ('s', 't'), ('s', 'e'), ('s', 'i'), ('s', 'n'),
 ('t', 's'), ('t', 't'), ('t', 'e'), ('t', 'i'), ('t', 'n'),
 ('e', 's'), ('e', 't'), ('e', 'e'), ('e', 'i'), ('e', 'n'),
 ('i', 's'), ('i', 't'), ('i', 'e'), ('i', 'i'), ('i', 'n'),
 ('n', 's'), ('n', 't'), ('n', 'e'), ('n', 'i'), ('n', 'n')]
```

```
>>> from sage.all import *
>>> S = [Integer(1),Integer(2)]
>>> tuples(S,Integer(3))
[(1, 1, 1), (1, 1, 2), (1, 2, 1), (1, 2, 2),
 (2, 1, 1), (2, 1, 2), (2, 2, 1), (2, 2, 2)]
>>> mset = ["s","t","e","i","n"]
>>> tuples(mset, Integer(2))
[('s', 's'), ('s', 't'), ('s', 'e'), ('s', 'i'), ('s', 'n'),
 ('t', 's'), ('t', 't'), ('t', 'e'), ('t', 'i'), ('t', 'n'),
 ('e', 's'), ('e', 't'), ('e', 'e'), ('e', 'i'), ('e', 'n'),
 ('i', 's'), ('i', 't'), ('i', 'e'), ('i', 'i'), ('i', 'n'),
 ('n', 's'), ('n', 't'), ('n', 'e'), ('n', 'i'), ('n', 'n')]
```

```
sage: K.<a> = GF(4, 'a')                                                    #␣
↪needs sage.rings.finite_rings
sage: mset = [x for x in K if x != 0]                                       #␣
↪needs sage.rings.finite_rings
sage: tuples(mset, 2)                                                       #␣
↪needs sage.rings.finite_rings
[(a, a), (a, a + 1), (a, 1), (a + 1, a), (a + 1, a + 1),
 (a + 1, 1), (1, a), (1, a + 1), (1, 1)]
```

```
>>> from sage.all import *
>>> K = GF(Integer(4), 'a', names=('a',)); (a,) = K._first_ngens(1)# needs sage.
↪rings.finite_rings
>>> mset = [x for x in K if x != Integer(0)]                                 ␣
↪     # needs sage.rings.finite_rings
>>> tuples(mset, Integer(2))                                                 ␣
↪     # needs sage.rings.finite_rings
[(a, a), (a, a + 1), (a, 1), (a + 1, a), (a + 1, a + 1),
 (a + 1, 1), (1, a), (1, a + 1), (1, 1)]
```

We check that the implementations agree (up to ordering):

```
sage: tuples(S, 3, 'native')
[(1, 1, 1), (2, 1, 1), (1, 2, 1), (2, 2, 1),
 (1, 1, 2), (2, 1, 2), (1, 2, 2), (2, 2, 2)]
```

```
>>> from sage.all import *
>>> tuples(S, Integer(3), 'native')
```

(continues on next page)

(continued from previous page)

```
[(1, 1, 1), (2, 1, 1), (1, 2, 1), (2, 2, 1),
 (1, 1, 2), (2, 1, 2), (1, 2, 2), (2, 2, 2)]
```

Lastly we check on a multiset:

```
sage: S = [1,1,2]
sage: sorted(tuples(S, 3)) == sorted(tuples(S, 3, 'native'))
True
```

```
>>> from sage.all import *
>>> S = [Integer(1),Integer(1),Integer(2)]
>>> sorted(tuples(S, Integer(3))) == sorted(tuples(S, Integer(3), 'native'))
True
```

AUTHORS:

- Jon Hanke (2006-08)

`sage.combinat.combinat.`**`unordered_tuples`**`(`*S*, *k*, *algorithm='itertools'*`)`

Return a list of all unordered tuples of length `k` of the set `S`.

An unordered tuple of length k of set S is a unordered selection with repetitions of S and is represented by a sorted list of length k containing elements from S.

Unlike *`tuples()`*, the result of this method does not depend on how often an element appears in S; only the *set* S is being used. For example, `unordered_tuples([1, 1, 1], 2)` will return `[(1, 1)]`. If you want it to return `[(1, 1), (1, 1), (1, 1)]`, use Python's `itertools.combinations_with_replacement` instead.

INPUT:

- `S` – the base set
- `k` – the length of the tuples
- `algorithm` – can be one of the following:
  - `'itertools'` – (default) use python's itertools
  - `'gap'` – wraps GAP's `UnorderedTuples`

> **Warning**
>
> When using `algorithm='gap'`, `S` must be a list of objects that have string representations that can be interpreted by the GAP interpreter. If `S` consists of at all complicated Sage objects, this function might *not* do what you expect.

EXAMPLES:

```
sage: S = [1,2]
sage: unordered_tuples(S, 3)
[(1, 1, 1), (1, 1, 2), (1, 2, 2), (2, 2, 2)]
```

```
>>> from sage.all import *
>>> S = [Integer(1),Integer(2)]
```

(continues on next page)

(continued from previous page)

```
>>> unordered_tuples(S, Integer(3))
[(1, 1, 1), (1, 1, 2), (1, 2, 2), (2, 2, 2)]
```

We check that this agrees with GAP:

```
sage: unordered_tuples(S, 3, algorithm='gap')                              #␣
↪needs sage.libs.gap
[(1, 1, 1), (1, 1, 2), (1, 2, 2), (2, 2, 2)]
```

```
>>> from sage.all import *
>>> unordered_tuples(S, Integer(3), algorithm='gap')                        ␣
↪     # needs sage.libs.gap
[(1, 1, 1), (1, 1, 2), (1, 2, 2), (2, 2, 2)]
```

We check the result on strings:

```
sage: S = ["a","b","c"]
sage: unordered_tuples(S, 2)
[('a', 'a'), ('a', 'b'), ('a', 'c'), ('b', 'b'), ('b', 'c'), ('c', 'c')]
sage: unordered_tuples(S, 2, algorithm='gap')                              #␣
↪needs sage.libs.gap
[('a', 'a'), ('a', 'b'), ('a', 'c'), ('b', 'b'), ('b', 'c'), ('c', 'c')]
```

```
>>> from sage.all import *
>>> S = ["a","b","c"]
>>> unordered_tuples(S, Integer(2))
[('a', 'a'), ('a', 'b'), ('a', 'c'), ('b', 'b'), ('b', 'c'), ('c', 'c')]
>>> unordered_tuples(S, Integer(2), algorithm='gap')                        ␣
↪     # needs sage.libs.gap
[('a', 'a'), ('a', 'b'), ('a', 'c'), ('b', 'b'), ('b', 'c'), ('c', 'c')]
```

Lastly we check on a multiset:

```
sage: S = [1,1,2]
sage: unordered_tuples(S, 3) == unordered_tuples(S, 3, 'gap')              #␣
↪needs sage.libs.gap
True
sage: unordered_tuples(S, 3)
[(1, 1, 1), (1, 1, 2), (1, 2, 2), (2, 2, 2)]
```

```
>>> from sage.all import *
>>> S = [Integer(1),Integer(1),Integer(2)]
>>> unordered_tuples(S, Integer(3)) == unordered_tuples(S, Integer(3), 'gap')    ␣
↪             # needs sage.libs.gap
True
>>> unordered_tuples(S, Integer(3))
[(1, 1, 1), (1, 1, 2), (1, 2, 2), (2, 2, 2)]
```

sage.combinat.combinat.**unshuffle_iterator**(*a*, *one=1*)

Iterate over the unshuffles of a list (or tuple) a, also yielding the signs of the respective permutations.

If n and k are integers satisfying $0 \leq k \leq n$, then a $(k, n-k)$-*unshuffle* means a permutation $\pi \in S_n$ such that $\pi(1) < \pi(2) < \cdots < \pi(k)$ and $\pi(k+1) < \pi(k+2) < \cdots < \pi(n)$. This method provides, for a list

$a = (a_1, a_2, \ldots, a_n)$ of length n, an iterator yielding all pairs:

$$\Big(\big((a_{\pi(1)}, a_{\pi(2)}, \ldots, a_{\pi(k)}), (a_{\pi(k+1)}, a_{\pi(k+2)}, \ldots, a_{\pi(n)}) \big), (-1)^{\pi} \Big)$$

for all $k \in \{0, 1, \ldots, n\}$ and all $(k, n-k)$-unshuffles π. The optional variable `one` can be set to a different value which results in the $(-1)^{\pi}$ component being multiplied by said value.

The iterator does not yield these in order of increasing k.

EXAMPLES:

```
sage: from sage.combinat.combinat import unshuffle_iterator
sage: list(unshuffle_iterator([1, 3, 4]))
[(((), (1, 3, 4)), 1), (((1,), (3, 4)), 1), (((3,), (1, 4)), -1),
 (((1, 3), (4,)), 1), (((4,), (1, 3)), 1), (((1, 4), (3,)), -1),
 (((3, 4), (1,)), 1), (((1, 3, 4), ()), 1)]
sage: list(unshuffle_iterator([3, 1]))
[(((), (3, 1)), 1), (((3,), (1,)), 1), (((1,), (3,)), -1),
 (((3, 1), ()), 1)]
sage: list(unshuffle_iterator([8]))
[(((), (8,)), 1), (((8,), ()), 1)]
sage: list(unshuffle_iterator([]))
[(((), ()), 1)]
sage: list(unshuffle_iterator([3, 1], 3/2))
[(((), (3, 1)), 3/2), (((3,), (1,)), 3/2), (((1,), (3,)), -3/2),
 (((3, 1), ()), 3/2)]
```

```
>>> from sage.all import *
>>> from sage.combinat.combinat import unshuffle_iterator
>>> list(unshuffle_iterator([Integer(1), Integer(3), Integer(4)]))
[(((), (1, 3, 4)), 1), (((1,), (3, 4)), 1), (((3,), (1, 4)), -1),
 (((1, 3), (4,)), 1), (((4,), (1, 3)), 1), (((1, 4), (3,)), -1),
 (((3, 4), (1,)), 1), (((1, 3, 4), ()), 1)]
>>> list(unshuffle_iterator([Integer(3), Integer(1)]))
[(((), (3, 1)), 1), (((3,), (1,)), 1), (((1,), (3,)), -1),
 (((3, 1), ()), 1)]
>>> list(unshuffle_iterator([Integer(8)]))
[(((), (8,)), 1), (((8,), ()), 1)]
>>> list(unshuffle_iterator([]))
[(((), ()), 1)]
>>> list(unshuffle_iterator([Integer(3), Integer(1)], Integer(3)/Integer(2)))
[(((), (3, 1)), 3/2), (((3,), (1,)), 3/2), (((1,), (3,)), -3/2),
 (((3, 1), ()), 3/2)]
```

5.1.26 Fast computation of combinatorial functions (Cython + mpz)

Currently implemented:

- Stirling numbers of the second kind
- iterators for set partitions
- iterator for Lyndon words
- iterator for perfect matchings
- conjugate of partitions

AUTHORS:

- Fredrik Johansson (2010-10): Stirling numbers of second kind
- Martin Rubey and Travis Scrimshaw (2018): iterators for set partitions, Lyndon words, and perfect matchings

`sage.combinat.combinat_cython.`**`conjugate`**`(p)`

Return the conjugate partition associated to the partition `p` as a list.

EXAMPLES:

```
sage: from sage.combinat.combinat_cython import conjugate
sage: conjugate([2,2])
[2, 2]
sage: conjugate([6,3,1])
[3, 2, 2, 1, 1, 1]
```

```
>>> from sage.all import *
>>> from sage.combinat.combinat_cython import conjugate
>>> conjugate([Integer(2),Integer(2)])
[2, 2]
>>> conjugate([Integer(6),Integer(3),Integer(1)])
[3, 2, 2, 1, 1, 1]
```

`sage.combinat.combinat_cython.`**`lyndon_word_iterator`**`(n, k)`

Generate the Lyndon words of fixed length `k` with `n` letters.

The resulting Lyndon words will be words represented as lists whose alphabet is `range(n)` $(= \{0, 1, \ldots, n-1\})$.

ALGORITHM:

The iterative FKM Algorithm 7.2 from [Rus2003].

EXAMPLES:

```
sage: from sage.combinat.combinat_cython import lyndon_word_iterator
sage: list(lyndon_word_iterator(4, 2))
[[0, 1], [0, 2], [0, 3], [1, 2], [1, 3], [2, 3]]
sage: list(lyndon_word_iterator(2, 4))
[[0, 0, 0, 1], [0, 0, 1, 1], [0, 1, 1, 1]]
```

```
>>> from sage.all import *
>>> from sage.combinat.combinat_cython import lyndon_word_iterator
>>> list(lyndon_word_iterator(Integer(4), Integer(2)))
[[0, 1], [0, 2], [0, 3], [1, 2], [1, 3], [2, 3]]
>>> list(lyndon_word_iterator(Integer(2), Integer(4)))
[[0, 0, 0, 1], [0, 0, 1, 1], [0, 1, 1, 1]]
```

`sage.combinat.combinat_cython.`**`perfect_matchings_iterator`**`(n)`

Iterate over all perfect matchings with `n` parts.

This iterates over all perfect matchings of $\{0, 1, \ldots, 2n-1\}$ using a Gray code for fixed-point-free involutions due to Walsh [Wal2001].

EXAMPLES:

```
sage: from sage.combinat.combinat_cython import perfect_matchings_iterator
sage: list(perfect_matchings_iterator(1))
[[(0, 1)]]
sage: list(perfect_matchings_iterator(2))
[[(0, 1), (2, 3)], [(0, 2), (1, 3)], [(0, 3), (1, 2)]]

sage: list(perfect_matchings_iterator(0))
[[]]
```

```
>>> from sage.all import *
>>> from sage.combinat.combinat_cython import perfect_matchings_iterator
>>> list(perfect_matchings_iterator(Integer(1)))
[[(0, 1)]]
>>> list(perfect_matchings_iterator(Integer(2)))
[[(0, 1), (2, 3)], [(0, 2), (1, 3)], [(0, 3), (1, 2)]]

>>> list(perfect_matchings_iterator(Integer(0)))
[[]]
```

REFERENCES:

- [Wal2001]

sage.combinat.combinat_cython.**set_partition_composition**(*sp1*, *sp2*)

Return a tuple consisting of the composition of the set partitions `sp1` and `sp2` and the number of components removed from the middle rows of the graph.

EXAMPLES:

```
sage: from sage.combinat.combinat_cython import set_partition_composition
sage: sp1 = ((1,-2),(2,-1))
sage: sp2 = ((1,-2),(2,-1))
sage: p, c = set_partition_composition(sp1, sp2)
sage: (SetPartition(p), c) == (SetPartition([[1,-1],[2,-2]]), 0)           #␣
↪needs sage.combinat
True
```

```
>>> from sage.all import *
>>> from sage.combinat.combinat_cython import set_partition_composition
>>> sp1 = ((Integer(1),-Integer(2)),(Integer(2),-Integer(1)))
>>> sp2 = ((Integer(1),-Integer(2)),(Integer(2),-Integer(1)))
>>> p, c = set_partition_composition(sp1, sp2)
>>> (SetPartition(p), c) == (SetPartition([[Integer(1),-Integer(1)],[Integer(2),-
↪Integer(2)]]), Integer(0))               # needs sage.combinat
True
```

5.1.27 Combinations

AUTHORS:

- Mike Hansen (2007): initial implementation
- Vincent Delecroix (2011): cleaning, bug corrections, doctests
- Antoine Genitrini (2020) : new implementation of the lexicographic unranking of combinations

class sage.combinat.combination.**ChooseNK**(*mset*, *k*)

Bases: *Combinations_setk*

sage.combinat.combination.**Combinations**(*mset*, *k=None*)

Return the combinatorial class of combinations of the multiset mset. If k is specified, then it returns the combinatorial class of combinations of mset of size k.

A *combination* of a multiset M is an unordered selection of k objects of M, where every object can appear at most as many times as it appears in M.

The combinatorial classes correctly handle the cases where mset has duplicate elements.

EXAMPLES:

```
sage: C = Combinations(range(4)); C
Combinations of [0, 1, 2, 3]
sage: C.list()
[[],
 [0],
 [1],
 [2],

```

```
>>> from sage.all import *
>>> X = Combinations([Integer(1),Integer(2),Integer(3),Integer(4),Integer(5)],
↪Integer(3))
>>> [x for x in X]
[[1, 2, 3],
 [1, 2, 4],
 [1, 2, 5],
 [1, 3, 4],
 [1, 3, 5],
 [1, 4, 5],
 [2, 3, 4],
 [2, 3, 5],
 [2, 4, 5],
 [3, 4, 5]]
```

It is possible to take combinations of Sage objects:

```
sage: Combinations([vector([1,1]), vector([2,2]), vector([3,3])], 2).list()      #␣
↪needs sage.modules
[[(1, 1), (2, 2)], [(1, 1), (3, 3)], [(2, 2), (3, 3)]]
```

```
>>> from sage.all import *
>>> Combinations([vector([Integer(1),Integer(1)]), vector([Integer(2),
↪Integer(2)]), vector([Integer(3),Integer(3)])], Integer(2)).list()      # needs␣
↪sage.modules
[[(1, 1), (2, 2)], [(1, 1), (3, 3)], [(2, 2), (3, 3)]]
```

class sage.combinat.combination.**Combinations_mset**(*mset*)

Bases: Parent

cardinality()

class sage.combinat.combination.**Combinations_msetk**(*mset*, *k*)

Bases: Parent

cardinality()

Return the size of combinations(mset, k).

IMPLEMENTATION: Wraps GAP's NrCombinations.

EXAMPLES:

```
sage: mset = [1,1,2,3,4,4,5]
sage: Combinations(mset,2).cardinality()                                    #␣
↪needs sage.libs.gap
12
```

```
>>> from sage.all import *
>>> mset = [Integer(1),Integer(1),Integer(2),Integer(3),Integer(4),Integer(4),
↪Integer(5)]
>>> Combinations(mset,Integer(2)).cardinality()                              ␣
↪     # needs sage.libs.gap
12
```

class sage.combinat.combination.**Combinations_set**(*mset*)

Bases: *Combinations_mset*

cardinality()

Return the size of Combinations(set).

EXAMPLES:

```
sage: Combinations(range(16000)).cardinality() == 2^16000
True
```

```
>>> from sage.all import *
>>> Combinations(range(Integer(16000))).cardinality() ==␣
↪Integer(2)**Integer(16000)
True
```

rank(*x*)

EXAMPLES:

```
sage: c = Combinations([1,2,3])
sage: list(range(c.cardinality())) == list(map(c.rank, c))
True
```

```
>>> from sage.all import *
>>> c = Combinations([Integer(1),Integer(2),Integer(3)])
>>> list(range(c.cardinality())) == list(map(c.rank, c))
True
```

unrank(*r*)

EXAMPLES:

```
sage: c = Combinations([1,2,3])
sage: c.list() == list(map(c.unrank, range(c.cardinality())))
True
```

```
>>> from sage.all import *
>>> c = Combinations([Integer(1),Integer(2),Integer(3)])
>>> c.list() == list(map(c.unrank, range(c.cardinality())))
True
```

class sage.combinat.combination.**Combinations_setk**(*mset*, *k*)

Bases: *Combinations_msetk*

cardinality()

Return the size of combinations(set, k).

EXAMPLES:

```
sage: Combinations(range(16000), 5).cardinality()
8732673194560003200
```

```
>>> from sage.all import *
>>> Combinations(range(Integer(16000)), Integer(5)).cardinality()
8732673194560003200
```

list()

EXAMPLES:

```
sage: Combinations([1,2,3,4,5],3).list()
[[1, 2, 3],
 [1, 2, 4],
 [1, 2, 5],
 [1, 3, 4],
 [1, 3, 5],
 [1, 4, 5],
 [2, 3, 4],
 [2, 3, 5],
 [2, 4, 5],
 [3, 4, 5]]
```

```
>>> from sage.all import *
>>> Combinations([Integer(1),Integer(2),Integer(3),Integer(4),Integer(5)],
↪Integer(3)).list()
[[1, 2, 3],
 [1, 2, 4],
 [1, 2, 5],
 [1, 3, 4],
 [1, 3, 5],
 [1, 4, 5],
 [2, 3, 4],
 [2, 3, 5],
 [2, 4, 5],
 [3, 4, 5]]
```

rank(*x*)

EXAMPLES:

```
sage: c = Combinations([1,2,3], 2)
sage: list(range(c.cardinality())) == list(map(c.rank, c.list()))
True
```

```
>>> from sage.all import *
>>> c = Combinations([Integer(1),Integer(2),Integer(3)], Integer(2))
>>> list(range(c.cardinality())) == list(map(c.rank, c.list()))
True
```

unrank(*r*)

EXAMPLES:

```
sage: c = Combinations([1,2,3], 2)
sage: c.list() == list(map(c.unrank, range(c.cardinality())))
True
```

```
>>> from sage.all import *
>>> c = Combinations([Integer(1),Integer(2),Integer(3)], Integer(2))
>>> c.list() == list(map(c.unrank, range(c.cardinality())))
True
```

sage.combinat.combination.**from_rank**(*r*, *n*, *k*)

Return the combination of rank `r` in the subsets of `range(n)` of size `k` when listed in lexicographic order.

The algorithm used is based on factoradics and presented in [DGH2020]. It is there compared to the other from the literature.

EXAMPLES:

```
sage: import sage.combinat.combination as combination
sage: combination.from_rank(0,3,0)
()
sage: combination.from_rank(0,3,1)
(0,)
sage: combination.from_rank(1,3,1)
(1,)
sage: combination.from_rank(2,3,1)
(2,)
sage: combination.from_rank(0,3,2)
(0, 1)
sage: combination.from_rank(1,3,2)
(0, 2)
sage: combination.from_rank(2,3,2)
(1, 2)
sage: combination.from_rank(0,3,3)
(0, 1, 2)
```

```
>>> from sage.all import *
>>> import sage.combinat.combination as combination
>>> combination.from_rank(Integer(0),Integer(3),Integer(0))
()
>>> combination.from_rank(Integer(0),Integer(3),Integer(1))
(0,)
```

(continues on next page)

(continued from previous page)

```
>>> combination.from_rank(Integer(1),Integer(3),Integer(1))
(1,)
>>> combination.from_rank(Integer(2),Integer(3),Integer(1))
(2,)
>>> combination.from_rank(Integer(0),Integer(3),Integer(2))
(0, 1)
>>> combination.from_rank(Integer(1),Integer(3),Integer(2))
(0, 2)
>>> combination.from_rank(Integer(2),Integer(3),Integer(2))
(1, 2)
>>> combination.from_rank(Integer(0),Integer(3),Integer(3))
(0, 1, 2)
```

sage.combinat.combination.**rank**(*comb*, *n*, *check=True*)

Return the rank of `comb` in the subsets of `range(n)` of size `k` where `k` is the length of `comb`.

The algorithm used is based on combinadics and James McCaffrey's MSDN article. See: Wikipedia article Combinadic.

EXAMPLES:

```
sage: import sage.combinat.combination as combination
sage: combination.rank((), 3)
0
sage: combination.rank((0,), 3)
0
sage: combination.rank((1,), 3)
1
sage: combination.rank((2,), 3)
2
sage: combination.rank((0,1), 3)
0
sage: combination.rank((0,2), 3)
1
sage: combination.rank((1,2), 3)
2
sage: combination.rank((0,1,2), 3)
0

sage: combination.rank((0,1,2,3), 3)
Traceback (most recent call last):
...
ValueError: len(comb) must be <= n
sage: combination.rank((0,0), 2)
Traceback (most recent call last):
...
ValueError: comb must be a subword of (0,1,...,n)

sage: combination.rank([1,2], 3)
2
sage: combination.rank([0,1,2], 3)
0
```

```
>>> from sage.all import *
>>> import sage.combinat.combination as combination
>>> combination.rank((), Integer(3))
0
>>> combination.rank((Integer(0),), Integer(3))
0
>>> combination.rank((Integer(1),), Integer(3))
1
>>> combination.rank((Integer(2),), Integer(3))
2
>>> combination.rank((Integer(0),Integer(1)), Integer(3))
0
>>> combination.rank((Integer(0),Integer(2)), Integer(3))
1
>>> combination.rank((Integer(1),Integer(2)), Integer(3))
2
>>> combination.rank((Integer(0),Integer(1),Integer(2)), Integer(3))
0

>>> combination.rank((Integer(0),Integer(1),Integer(2),Integer(3)), Integer(3))
Traceback (most recent call last):
...
ValueError: len(comb) must be <= n
>>> combination.rank((Integer(0),Integer(0)), Integer(2))
Traceback (most recent call last):
...
ValueError: comb must be a subword of (0,1,...,n)

>>> combination.rank([Integer(1),Integer(2)], Integer(3))
2
>>> combination.rank([Integer(0),Integer(1),Integer(2)], Integer(3))
0
```

5.1.28 Combinatorial maps

This module provides a decorator that can be used to add semantic to a Python method by marking it as implementing a *combinatorial map*, that is a map between two enumerated sets:

```
sage: from sage.combinat.combinatorial_map import combinatorial_map
sage: class MyPermutation():
....:     @combinatorial_map()
....:     def reverse(self):
....:         '''
....:         Reverse the permutation
....:         '''
....:         # ... code ...
```

```
>>> from sage.all import *
>>> from sage.combinat.combinatorial_map import combinatorial_map
>>> class MyPermutation():
...     @combinatorial_map()
...     def reverse(self):
```

(continues on next page)

(continued from previous page)

```
...         '''
...         Reverse the permutation
...         '''
...         # ... code ...
```

By default, this decorator is a no-op: it returns the decorated method as is:

```
sage: MyPermutation.reverse
<function MyPermutation.reverse at ...>
```

```
>>> from sage.all import *
>>> MyPermutation.reverse
<function MyPermutation.reverse at ...>
```

See `combinatorial_map_wrapper()` for the various options this decorator can take.

Projects built on top of Sage are welcome to customize locally this hook to instrument the Sage code and exploit this semantic information. Typically, the decorator could be used to populate a database of maps. For a real-life application, see the project $FindStat < http : //findstat.org/ >$. As a basic example, a variant of the decorator is provided as `combinatorial_map_wrapper()`; it wraps the decorated method, so that one can later use `combinatorial_maps_in_class()` to query an object, or class thereof, for all the combinatorial maps that apply to it.

Note

Since decorators are evaluated upon loading Python modules, customizing `combinatorial map` needs to be done before the modules using it are loaded. In the examples below, where we illustrate the customized `combinatorial_map` decorator on the `sage.combinat.permutation` module, we resort to force a reload of this module after dynamically changing `sage.combinat.combinatorial_map.combinatorial_map`. This is good enough for those doctests, but remains fragile.

For real use cases, it is probably best to just edit this source file statically (see below).

class `sage.combinat.combinatorial_map.`**`CombinatorialMap`**(*f*, *order=None*, *name=None*)

Bases: `object`

This is a wrapper class for methods that are *combinatorial maps*.

For further details and doctests, see *Combinatorial maps* and `combinatorial_map_wrapper()`.

name()

Return the name of a combinatorial map. This is used for the string representation of `self`.

EXAMPLES:

```
sage: from sage.combinat.combinatorial_map import combinatorial_map
sage: class CombinatorialClass:
....:     @combinatorial_map(name='map1')
....:     def to_self_1(): pass
....:     @combinatorial_map()
....:     def to_self_2(): pass
sage: CombinatorialClass.to_self_1.name()
'map1'
sage: CombinatorialClass.to_self_2.name()
'to_self_2'
```

```
>>> from sage.all import *
>>> from sage.combinat.combinatorial_map import combinatorial_map
>>> class CombinatorialClass:
...     @combinatorial_map(name='map1')
...     def to_self_1(): pass
...     @combinatorial_map()
...     def to_self_2(): pass
>>> CombinatorialClass.to_self_1.name()
'map1'
>>> CombinatorialClass.to_self_2.name()
'to_self_2'
```

order()

Return the order of `self`, or `None` if the order is not known.

EXAMPLES:

```
sage: from sage.combinat.combinatorial_map import combinatorial_map
sage: class CombinatorialClass:
....:     @combinatorial_map(order=2)
....:     def to_self_1(): pass
....:     @combinatorial_map()
....:     def to_self_2(): pass
sage: CombinatorialClass.to_self_1.order()
2
sage: CombinatorialClass.to_self_2.order() is None
True
```

```
>>> from sage.all import *
>>> from sage.combinat.combinatorial_map import combinatorial_map
>>> class CombinatorialClass:
...     @combinatorial_map(order=Integer(2))
...     def to_self_1(): pass
...     @combinatorial_map()
...     def to_self_2(): pass
>>> CombinatorialClass.to_self_1.order()
2
>>> CombinatorialClass.to_self_2.order() is None
True
```

unbounded_map()

Return the unbounded version of `self`.

You can use this method to return a function which takes as input an element in the domain of the combinatorial map. See the example below.

EXAMPLES:

```
sage: sage.combinat.combinatorial_map.combinatorial_map = sage.combinat.
↪combinatorial_map.combinatorial_map_wrapper
sage: from importlib import reload
sage: _ = reload(sage.combinat.permutation)
sage: from sage.combinat.permutation import Permutation
sage: pi = Permutation([1,3,2])
```

(continues on next page)

(continued from previous page)

```
sage: f = pi.reverse
sage: F = f.unbounded_map()
sage: F(pi)
[2, 3, 1]
```

```
>>> from sage.all import *
>>> sage.combinat.combinatorial_map.combinatorial_map = sage.combinat.
↪combinatorial_map.combinatorial_map_wrapper
>>> from importlib import reload
>>> _ = reload(sage.combinat.permutation)
>>> from sage.combinat.permutation import Permutation
>>> pi = Permutation([Integer(1),Integer(3),Integer(2)])
>>> f = pi.reverse
>>> F = f.unbounded_map()
>>> F(pi)
[2, 3, 1]
```

sage.combinat.combinatorial_map.**combinatorial_map**(*f=None*, *order=None*, *name=None*)

Combinatorial map decorator.

See *Combinatorial maps* for a description of this decorator and its purpose. This default implementation does nothing.

INPUT:

- f – (default: None, if combinatorial_map is used as a decorator) a function
- name – (default: None) the name for nicer outputs on combinatorial maps
- order – (default: None) the order of the combinatorial map, if it is known. Is not used, but might be helpful later

OUTPUT: f unchanged

EXAMPLES:

```
sage: from sage.combinat.combinatorial_map import combinatorial_map_trivial as␣
↪combinatorial_map
sage: class MyPermutation():
....:     @combinatorial_map
....:     def reverse(self):
....:         '''
....:         Reverse the permutation
....:         '''
....:         # ... code ...
....:     @combinatorial_map(name='descent set of permutation')
....:     def descent_set(self):
....:         '''
....:         The descent set of the permutation
....:         '''
....:         # ... code ...

sage: MyPermutation.reverse
<function MyPermutation.reverse at ...>
```

(continues on next page)

(continued from previous page)

```
sage: MyPermutation.descent_set
<function MyPermutation.descent_set at ...>
```

```
>>> from sage.all import *
>>> from sage.combinat.combinatorial_map import combinatorial_map_trivial as␣
↪combinatorial_map
>>> class MyPermutation():
...     @combinatorial_map
...     def reverse(self):
...         '''
...         Reverse the permutation
...         '''
...         # ... code ...
...     @combinatorial_map(name='descent set of permutation')
...     def descent_set(self):
...         '''
...         The descent set of the permutation
...         '''
...         # ... code ...

>>> MyPermutation.reverse
<function MyPermutation.reverse at ...>

>>> MyPermutation.descent_set
<function MyPermutation.descent_set at ...>
```

sage.combinat.combinatorial_map.**combinatorial_map_trivial**(*f=None*, *order=None*, *name=None*)

Combinatorial map decorator.

See *Combinatorial maps* for a description of this decorator and its purpose. This default implementation does nothing.

INPUT:

- f – (default: None, if combinatorial_map is used as a decorator) a function
- name – (default: None) the name for nicer outputs on combinatorial maps
- order – (default: None) the order of the combinatorial map, if it is known. Is not used, but might be helpful later

OUTPUT: f unchanged

EXAMPLES:

```
sage: from sage.combinat.combinatorial_map import combinatorial_map_trivial as␣
↪combinatorial_map
sage: class MyPermutation():
....:     @combinatorial_map
....:     def reverse(self):
....:         '''
....:         Reverse the permutation
....:         '''
....:         # ... code ...
....:     @combinatorial_map(name='descent set of permutation')
```

(continues on next page)

(continued from previous page)

```
....:     def descent_set(self):
....:         '''
....:         The descent set of the permutation
....:         '''
....:         # ... code ...

sage: MyPermutation.reverse
<function MyPermutation.reverse at ...>

sage: MyPermutation.descent_set
<function MyPermutation.descent_set at ...>
```

```
>>> from sage.all import *
>>> from sage.combinat.combinatorial_map import combinatorial_map_trivial as␣
↪combinatorial_map
>>> class MyPermutation():
...     @combinatorial_map
...     def reverse(self):
...         '''
...         Reverse the permutation
...         '''
...         # ... code ...
...     @combinatorial_map(name='descent set of permutation')
...     def descent_set(self):
...         '''
...         The descent set of the permutation
...         '''
...         # ... code ...

>>> MyPermutation.reverse
<function MyPermutation.reverse at ...>

>>> MyPermutation.descent_set
<function MyPermutation.descent_set at ...>
```

sage.combinat.combinatorial_map.**combinatorial_map_wrapper**(*f=None*, *order=None*, *name=None*)

Combinatorial map decorator (basic example).

See *Combinatorial maps* for a description of the `combinatorial_map` decorator and its purpose. This implementation, together with `combinatorial_maps_in_class()` illustrates how to use this decorator as a hook to instrument the Sage code.

INPUT:

- `f` – (default: `None`, if combinatorial_map is used as a decorator) a function
- `name` – (default: `None`) the name for nicer outputs on combinatorial maps
- `order` – (default: `None`) the order of the combinatorial map, if it is known. Is not used, but might be helpful later

OUTPUT: a combinatorial map; this is an instance of the `CombinatorialMap`

EXAMPLES:

We define a class illustrating the use of this implementation of the `combinatorial_map` decorator with its various arguments:

```
sage: from sage.combinat.combinatorial_map import combinatorial_map_wrapper as␣
↪combinatorial_map
sage: class MyPermutation():
....:     @combinatorial_map()
....:     def reverse(self):
....:         '''
....:         Reverse the permutation
....:         '''
....:         pass
....:     @combinatorial_map(order=2)
....:     def inverse(self):
....:         '''
....:         The inverse of the permutation
....:         '''
....:         pass
....:     @combinatorial_map(name='descent set of permutation')
....:     def descent_set(self):
....:         '''
....:         The descent set of the permutation
....:         '''
....:         pass
....:     def major_index(self):
....:         '''
....:         The major index of the permutation
....:         '''
....:         pass
sage: MyPermutation.reverse
Combinatorial map: reverse
sage: MyPermutation.descent_set
Combinatorial map: descent set of permutation
sage: MyPermutation.inverse
Combinatorial map: inverse
```

```
>>> from sage.all import *
>>> from sage.combinat.combinatorial_map import combinatorial_map_wrapper as␣
↪combinatorial_map
>>> class MyPermutation():
...     @combinatorial_map()
...     def reverse(self):
...         '''
...         Reverse the permutation
...         '''
...         pass
...     @combinatorial_map(order=Integer(2))
...     def inverse(self):
...         '''
...         The inverse of the permutation
...         '''
...         pass
...     @combinatorial_map(name='descent set of permutation')
```

(continues on next page)

(continued from previous page)

```
...     def descent_set(self):
...         '''
...         The descent set of the permutation
...         '''
...         pass
...     def major_index(self):
...         '''
...         The major index of the permutation
...         '''
...         pass
>>> MyPermutation.reverse
Combinatorial map: reverse
>>> MyPermutation.descent_set
Combinatorial map: descent set of permutation
>>> MyPermutation.inverse
Combinatorial map: inverse
```

One can now determine all the combinatorial maps associated with a given object as follows:

```
sage: from sage.combinat.combinatorial_map import combinatorial_maps_in_class
sage: X = combinatorial_maps_in_class(MyPermutation); X # random
[Combinatorial map: reverse,
 Combinatorial map: descent set of permutation,
 Combinatorial map: inverse]
```

```
>>> from sage.all import *
>>> from sage.combinat.combinatorial_map import combinatorial_maps_in_class
>>> X = combinatorial_maps_in_class(MyPermutation); X # random
[Combinatorial map: reverse,
 Combinatorial map: descent set of permutation,
 Combinatorial map: inverse]
```

The method `major_index` defined about is not a combinatorial map:

```
sage: MyPermutation.major_index
<function MyPermutation.major_index at ...>
```

```
>>> from sage.all import *
>>> MyPermutation.major_index
<function MyPermutation.major_index at ...>
```

But one can define a function that turns `major_index` into a combinatorial map:

```
sage: def major_index(p):
....:     return p.major_index()
sage: major_index
<function major_index at ...>
sage: combinatorial_map(major_index)
Combinatorial map: major_index
```

```
>>> from sage.all import *
>>> def major_index(p):
```

(continues on next page)

(continued from previous page)

```
...     return p.major_index()
>>> major_index
<function major_index at ...>
>>> combinatorial_map(major_index)
Combinatorial map: major_index
```

sage.combinat.combinatorial_map.**combinatorial_maps_in_class**(*cls*)

Return the combinatorial maps of the class as a list of combinatorial maps.

For further details and doctests, see *Combinatorial maps* and `combinatorial_map_wrapper()`.

EXAMPLES:

```
sage: sage.combinat.combinatorial_map.combinatorial_map = sage.combinat.
↪combinatorial_map.combinatorial_map_wrapper
sage: from importlib import reload
sage: _ = reload(sage.combinat.permutation)
sage: from sage.combinat.combinatorial_map import combinatorial_maps_in_class
sage: p = Permutation([1,3,2,4])
sage: cmaps = combinatorial_maps_in_class(p)
sage: cmaps # random
[Combinatorial map: Robinson-Schensted insertion tableau,
 Combinatorial map: Robinson-Schensted recording tableau,
 Combinatorial map: Robinson-Schensted tableau shape,
 Combinatorial map: complement,
 Combinatorial map: descent composition,
 Combinatorial map: inverse, ...]
sage: p.left_tableau in cmaps
True
sage: p.right_tableau in cmaps
True
sage: p.complement in cmaps
True
```

```
>>> from sage.all import *
>>> sage.combinat.combinatorial_map.combinatorial_map = sage.combinat.
↪combinatorial_map.combinatorial_map_wrapper
>>> from importlib import reload
>>> _ = reload(sage.combinat.permutation)
>>> from sage.combinat.combinatorial_map import combinatorial_maps_in_class
>>> p = Permutation([Integer(1),Integer(3),Integer(2),Integer(4)])
>>> cmaps = combinatorial_maps_in_class(p)

True
```

5.1.29 Integer compositions

A composition c of a nonnegative integer n is a list of positive integers (the *parts* of the composition) with total sum n.

This module provides tools for manipulating compositions and enumerated sets of compositions.

EXAMPLES:

```
sage: Composition([5, 3, 1, 3])
[5, 3, 1, 3]
sage: list(Compositions(4))
[[1, 1, 1, 1], [1, 1, 2], [1, 2, 1], [1, 3], [2, 1, 1], [2, 2], [3, 1], [4]]
```

```
>>> from sage.all import *
>>> Composition([Integer(5), Integer(3), Integer(1), Integer(3)])
[5, 3, 1, 3]
>>> list(Compositions(Integer(4)))
[[1, 1, 1, 1], [1, 1, 2], [1, 2, 1], [1, 3], [2, 1, 1], [2, 2], [3, 1], [4]]
```

AUTHORS:

- Mike Hansen, Nicolas M. Thiéry
- MuPAD-Combinat developers (algorithms and design inspiration)
- Travis Scrimshaw (2013-02-03): Removed `CombinatorialClass`

class sage.combinat.composition.**Composition**(*parent*, *lst*)

Bases: `CombinatorialElement`

Integer compositions.

A composition of a nonnegative integer n is a list $(i_1, \ldots, i_k)$ of positive integers with total sum n.

EXAMPLES:

The simplest way to create a composition is by specifying its entries as a list, tuple (or other iterable):

```
sage: Composition([3,1,2])
[3, 1, 2]
sage: Composition((3,1,2))
[3, 1, 2]
sage: Composition(i for i in range(2,5))
[2, 3, 4]
```

```
>>> from sage.all import *
>>> Composition([Integer(3),Integer(1),Integer(2)])
[3, 1, 2]
>>> Composition((Integer(3),Integer(1),Integer(2)))
[3, 1, 2]
>>> Composition(i for i in range(Integer(2),Integer(5)))
[2, 3, 4]
```

You can also create a composition from its code. The *code* of a composition $(i_1, i_2, \ldots, i_k)$ of n is a list of length n that consists of a 1 followed by $i_1 - 1$ zeros, then a 1 followed by $i_2 - 1$ zeros, and so on.

```
sage: Composition([4,1,2,3,5]).to_code()
[1, 0, 0, 0, 1, 1, 0, 1, 0, 0, 1, 0, 0, 0, 0]
sage: Composition(code=_)
[4, 1, 2, 3, 5]
sage: Composition([3,1,2,3,5]).to_code()
[1, 0, 0, 1, 1, 0, 1, 0, 0, 1, 0, 0, 0, 0]
sage: Composition(code=_)
[3, 1, 2, 3, 5]
```

```
>>> from sage.all import *
>>> Composition([Integer(4),Integer(1),Integer(2),Integer(3),Integer(5)]).to_
↪code()
[1, 0, 0, 0, 1, 1, 0, 1, 0, 0, 1, 0, 0, 0, 0]
>>> Composition(code=_)
[4, 1, 2, 3, 5]
>>> Composition([Integer(3),Integer(1),Integer(2),Integer(3),Integer(5)]).to_
↪code()
[1, 0, 0, 1, 1, 0, 1, 0, 0, 1, 0, 0, 0, 0]
>>> Composition(code=_)
[3, 1, 2, 3, 5]
```

You can also create the composition of n corresponding to a subset of $\{1, 2, \ldots, n-1\}$ under the bijection that maps the composition $(i_1, i_2, \ldots, i_k)$ of n to the subset $\{i_1, i_1 + i_2, i_1 + i_2 + i_3, \ldots, i_1 + \cdots + i_{k-1}\}$ (see `to_subset()`):

```
sage: Composition(from_subset=({1, 2, 4}, 5))
[1, 1, 2, 1]
sage: Composition([1, 1, 2, 1]).to_subset()
{1, 2, 4}
```

```
>>> from sage.all import *
>>> Composition(from_subset=({Integer(1), Integer(2), Integer(4)}, Integer(5)))
[1, 1, 2, 1]
>>> Composition([Integer(1), Integer(1), Integer(2), Integer(1)]).to_subset()
{1, 2, 4}
```

The following notation equivalently specifies the composition from the set $\{i_1 - 1, i_1 + i_2 - 1, i_1 + i_2 + i_3 - 1, \ldots, i_1 + \cdots + i_{k-1} - 1, n - 1\}$ or $\{i_1 - 1, i_1 + i_2 - 1, i_1 + i_2 + i_3 - 1, \ldots, i_1 + \cdots + i_{k-1} - 1\}$ and n. This provides compatibility with Python's 0-indexing.

```
sage: Composition(descents=[1,0,4,8,11])
[1, 1, 3, 4, 3]
sage: Composition(descents=[0,1,3,4])
[1, 1, 2, 1]
sage: Composition(descents=([0,1,3],5))
[1, 1, 2, 1]
sage: Composition(descents=({0,1,3},5))
[1, 1, 2, 1]
```

```
>>> from sage.all import *
>>> Composition(descents=[Integer(1),Integer(0),Integer(4),Integer(8),
↪Integer(11)])
[1, 1, 3, 4, 3]
>>> Composition(descents=[Integer(0),Integer(1),Integer(3),Integer(4)])
[1, 1, 2, 1]
>>> Composition(descents=([Integer(0),Integer(1),Integer(3)],Integer(5)))
[1, 1, 2, 1]
>>> Composition(descents=({Integer(0),Integer(1),Integer(3)},Integer(5)))
[1, 1, 2, 1]
```

An integer composition may be regarded as a sequence. Thus it is an instance of the Python abstract base class `Sequence` allows us to check if objects behave "like" sequences based on implemented methods. Note that `collections.abc.Sequence` is not the same as `sage.structure.sequence.Sequence`:

```
sage: import collections.abc
sage: C = Composition([3,2,3])
sage: isinstance(C, collections.abc.Sequence)
True
sage: issubclass(C.__class__, collections.abc.Sequence)
True
```

```
>>> from sage.all import *
>>> import collections.abc
>>> C = Composition([Integer(3),Integer(2),Integer(3)])
>>> isinstance(C, collections.abc.Sequence)
True
>>> issubclass(C.__class__, collections.abc.Sequence)
True
```

Typically, instances of `collections.abc.Sequence` have a `.count` method. `Composition.count` counts the number of parts of a specified size:

```
sage: C.count(3)
2
```

```
>>> from sage.all import *
>>> C.count(Integer(3))
2
```

EXAMPLES:

```
sage: C = Composition([3,1,2])
sage: TestSuite(C).run()
```

```
>>> from sage.all import *
>>> C = Composition([Integer(3),Integer(1),Integer(2)])
>>> TestSuite(C).run()
```

complement()

Return the complement of the composition `self`.

The complement of a composition I is defined as follows:

If I is the empty composition, then the complement is the empty composition as well. Otherwise, let S be the descent set of I (that is, the subset $\{i_1, i_1 + i_2, \ldots, i_1 + i_2 + \cdots + i_{k-1}\}$ of $\{1, 2, \ldots, |I| - 1\}$, where I is written as $(i_1, i_2, \ldots, i_k)$). Then, the complement of I is defined as the composition of size $|I|$ whose descent set is $\{1, 2, \ldots, |I| - 1\} \setminus S$.

The complement of a composition I also is the reverse composition (`reversed()`) of the conjugate (`conjugate()`) of I.

EXAMPLES:

```
sage: Composition([1, 1, 3, 1, 2, 1, 3]).conjugate()
[1, 1, 3, 3, 1, 3]
sage: Composition([1, 1, 3, 1, 2, 1, 3]).complement()
[3, 1, 3, 3, 1, 1]
```

```
>>> from sage.all import *
>>> Composition([Integer(1), Integer(1), Integer(3), Integer(1), Integer(2),␣
→Integer(1), Integer(3)]).conjugate()
[1, 1, 3, 3, 1, 3]
>>> Composition([Integer(1), Integer(1), Integer(3), Integer(1), Integer(2),␣
→Integer(1), Integer(3)]).complement()
[3, 1, 3, 3, 1, 1]
```

conjugate()

Return the conjugate of the composition `self`.

The conjugate of a composition I is defined as the complement (see `complement()`) of the reverse composition (see `reversed()`) of I.

An equivalent definition of the conjugate goes by saying that the ribbon shape of the conjugate of a composition I is the conjugate of the ribbon shape of I. (The ribbon shape of a composition is returned by `to_skew_partition()`.)

This implementation uses the algorithm from mupad-combinat.

EXAMPLES:

```
sage: Composition([1, 1, 3, 1, 2, 1, 3]).conjugate()
[1, 1, 3, 3, 1, 3]
```

```
>>> from sage.all import *
>>> Composition([Integer(1), Integer(1), Integer(3), Integer(1), Integer(2),␣
→Integer(1), Integer(3)]).conjugate()
[1, 1, 3, 3, 1, 3]
```

The ribbon shape of the conjugate of I is the conjugate of the ribbon shape of I:

```
sage: all( I.conjugate().to_skew_partition()                              #␣
→needs sage.combinat
....:      == I.to_skew_partition().conjugate()
....:      for I in Compositions(4) )
True
```

```
>>> from sage.all import *
>>> all( I.conjugate().to_skew_partition()                                #␣
→needs sage.combinat
```

(continues on next page)

(continued from previous page)

```
...       == I.to_skew_partition().conjugate()
...       for I in Compositions(Integer(4)) )
True
```

count (*n*)

Return the number of parts of size `n`.

EXAMPLES:

```
sage: C = Composition([3,2,3])
sage: C.count(3)
2
sage: C.count(2)
1
sage: C.count(1)
0
```

```
>>> from sage.all import *
>>> C = Composition([Integer(3),Integer(2),Integer(3)])
>>> C.count(Integer(3))
2
>>> C.count(Integer(2))
1
>>> C.count(Integer(1))
0
```

descents (*final_descent=False*)

This gives one fewer than the partial sums of the composition.

This is here to maintain some sort of backward compatibility, even through the original implementation was broken (it gave the wrong answer). The same information can be found in *partial_sums()*.

See also

partial_sums()

INPUT:

- `final_descent` – boolean (default: `False`)

OUTPUT:

- the list of partial sums of `self` with each part decremented by 1. This includes the sum of all entries when `final_descent` is `True`.

EXAMPLES:

```
sage: c = Composition([2,1,3,2])
sage: c.descents()
[1, 2, 5]
sage: c.descents(final_descent=True)
[1, 2, 5, 7]
```

```
>>> from sage.all import *
>>> c = Composition([Integer(2),Integer(1),Integer(3),Integer(2)])
>>> c.descents()
[1, 2, 5]
>>> c.descents(final_descent=True)
[1, 2, 5, 7]
```

fatten(*grouping*)

Return the composition fatter than `self`, obtained by grouping together consecutive parts according to `grouping`.

INPUT:

- `grouping` – a composition whose sum is the length of `self`

EXAMPLES:

Let us start with the composition:

```
sage: c = Composition([4,5,2,7,1])
```

```
>>> from sage.all import *
>>> c = Composition([Integer(4),Integer(5),Integer(2),Integer(7),Integer(1)])
```

With `grouping` equal to $(1, \dots, 1)$, c is left unchanged:

```
sage: c.fatten(Composition([1,1,1,1,1]))
[4, 5, 2, 7, 1]
```

```
>>> from sage.all import *
>>> c.fatten(Composition([Integer(1),Integer(1),Integer(1),Integer(1),
↪Integer(1)]))
[4, 5, 2, 7, 1]
```

With `grouping` equal to (ℓ) where ℓ is the length of c, this yields the coarsest composition above c:

```
sage: c.fatten(Composition([5]))
[19]
```

```
>>> from sage.all import *
>>> c.fatten(Composition([Integer(5)]))
[19]
```

Other values for `grouping` yield (all the) other compositions coarser than c:

```
sage: c.fatten(Composition([2,1,2]))
[9, 2, 8]
sage: c.fatten(Composition([3,1,1]))
[11, 7, 1]
```

```
>>> from sage.all import *
>>> c.fatten(Composition([Integer(2),Integer(1),Integer(2)]))
[9, 2, 8]
>>> c.fatten(Composition([Integer(3),Integer(1),Integer(1)]))
[11, 7, 1]
```

fatter()

Return the set of compositions which are fatter than `self`.

Complexity for generation: $O(|c|)$ memory, $O(|r|)$ time where $|c|$ is the size of `self` and r is the result.

EXAMPLES:

```
sage: C = Composition([4,5,2]).fatter()
sage: C.cardinality()
4
sage: list(C)
[[4, 5, 2], [4, 7], [9, 2], [11]]
```

```
>>> from sage.all import *
>>> C = Composition([Integer(4),Integer(5),Integer(2)]).fatter()
>>> C.cardinality()
4
>>> list(C)
[[4, 5, 2], [4, 7], [9, 2], [11]]
```

Some extreme cases:

```
sage: list(Composition([5]).fatter())
[[5]]
sage: list(Composition([]).fatter())
[[]]
sage: list(Composition([1,1,1,1]).fatter()) == list(Compositions(4))
True
```

```
>>> from sage.all import *
>>> list(Composition([Integer(5)]).fatter())
[[5]]
>>> list(Composition([]).fatter())
[[]]
>>> list(Composition([Integer(1),Integer(1),Integer(1),Integer(1)]).fatter())␣
↪== list(Compositions(Integer(4)))
True
```

finer()

Return the set of compositions which are finer than `self`.

EXAMPLES:

```
sage: C = Composition([3,2]).finer()
sage: C.cardinality()
8
sage: C.list()
[[1, 1, 1, 1, 1], [1, 1, 1, 2], [1, 2, 1, 1], [1, 2, 2], [2, 1, 1, 1], [2, 1,␣
↪2], [3, 1, 1], [3, 2]]

sage: Composition([]).finer()
{[]}
```

```
>>> from sage.all import *
>>> C = Composition([Integer(3),Integer(2)]).finer()
>>> C.cardinality()
8
>>> C.list()
[[1, 1, 1, 1, 1], [1, 1, 1, 2], [1, 2, 1, 1], [1, 2, 2], [2, 1, 1, 1], [2, 1,␣
↪2], [3, 1, 1], [3, 2]]

>>> Composition([]).finer()
{[]}
```

inf(*other*, *check=True*)

Return the meet of `self` with a composition `other` of the same size.

The meet of two compositions I and J of size n is the finest composition of n which is coarser than each of I and J. It can be described as the composition whose descent set is the intersection of the descent sets of I and J.

INPUT:

- `other` – composition of same size as `self`
- `check` – boolean (default: `True`); whether to check the input compositions for having the same size

OUTPUT: the meet of the compositions `self` and `other`

EXAMPLES:

```
sage: Composition([3, 1, 1, 3, 1]).meet([4, 3, 2])
[4, 5]
sage: Composition([9, 6]).meet([1, 3, 6, 3, 2])
[15]
sage: Composition([9, 6]).meet([1, 3, 5, 1, 3, 2])
[9, 6]
sage: Composition([1, 1, 1, 1, 1]).meet([3, 2])
[3, 2]
sage: Composition([4, 2]).meet([3, 3])
[6]
sage: Composition([]).meet([])
[]
sage: Composition([1]).meet([1])
[1]
```

```
>>> from sage.all import *
>>> Composition([Integer(3), Integer(1), Integer(1), Integer(3), Integer(1)]).
↪meet([Integer(4), Integer(3), Integer(2)])
[4, 5]
>>> Composition([Integer(9), Integer(6)]).meet([Integer(1), Integer(3),␣
↪Integer(6), Integer(3), Integer(2)])
[15]
>>> Composition([Integer(9), Integer(6)]).meet([Integer(1), Integer(3),␣
↪Integer(5), Integer(1), Integer(3), Integer(2)])
[9, 6]
>>> Composition([Integer(1), Integer(1), Integer(1), Integer(1), Integer(1)]).
↪meet([Integer(3), Integer(2)])
```

(continues on next page)

(continued from previous page)

```
[3, 2]
>>> Composition([Integer(4), Integer(2)]).meet([Integer(3), Integer(3)])
[6]
>>> Composition([]).meet([])
[]
>>> Composition([Integer(1)]).meet([Integer(1)])
[1]
```

Let us verify on small examples that the meet of I and J is coarser than both of I and J:

```
sage: all( all( I.is_finer(I.meet(J)) and
....:           J.is_finer(I.meet(J))
....:           for J in Compositions(4) )
....:       for I in Compositions(4) )
True
```

```
>>> from sage.all import *
>>> all( all( I.is_finer(I.meet(J)) and
...           J.is_finer(I.meet(J))
...           for J in Compositions(Integer(4)) )
...       for I in Compositions(Integer(4)) )
True
```

and is the finest composition to do so:

```
sage: all( all( all( I.meet(J).is_finer(K)
....:                for K in I.fatter()
....:                if J.is_finer(K) )
....:           for J in Compositions(3) )
....:       for I in Compositions(3) )
True
```

```
>>> from sage.all import *
>>> all( all( all( I.meet(J).is_finer(K)
...                for K in I.fatter()
...                if J.is_finer(K) )
...           for J in Compositions(Integer(3)) )
...       for I in Compositions(Integer(3)) )
True
```

The descent set of the meet of I and J is the intersection of the descent sets of I and J:

```
sage: def test_meet(n):
....:     return all( all( I.to_subset().intersection(J.to_subset())
....:                      == I.meet(J).to_subset()
....:                      for J in Compositions(n) )
....:                 for I in Compositions(n) )
sage: all( test_meet(n) for n in range(1, 5) )
True
```

```
>>> from sage.all import *
>>> def test_meet(n):
```

(continues on next page)

(continued from previous page)

```
...     return all( all( I.to_subset().intersection(J.to_subset())
...                      == I.meet(J).to_subset()
...                      for J in Compositions(n) )
...                 for I in Compositions(n) )
>>> all( test_meet(n) for n in range(Integer(1), Integer(5)) )
True
```

See also

join()

AUTHORS:

- Darij Grinberg (2013-09-05)

is_finer(*co2*)

Return `True` if the composition `self` is finer than the composition `co2`; otherwise, return `False`.

EXAMPLES:

```
sage: Composition([4,1,2]).is_finer([3,1,3])
False
sage: Composition([3,1,3]).is_finer([4,1,2])
False
sage: Composition([1,2,2,1,1,2]).is_finer([5,1,3])
True
sage: Composition([2,2,2]).is_finer([4,2])
True
```

```
>>> from sage.all import *
>>> Composition([Integer(4),Integer(1),Integer(2)]).is_finer([Integer(3),
↪Integer(1),Integer(3)])
False
>>> Composition([Integer(3),Integer(1),Integer(3)]).is_finer([Integer(4),
↪Integer(1),Integer(2)])
False
>>> Composition([Integer(1),Integer(2),Integer(2),Integer(1),Integer(1),
↪Integer(2)]).is_finer([Integer(5),Integer(1),Integer(3)])
True
>>> Composition([Integer(2),Integer(2),Integer(2)]).is_finer([Integer(4),
↪Integer(2)])
True
```

join(*other*, *check=True*)

Return the join of `self` with a composition `other` of the same size.

The join of two compositions I and J of size n is the coarsest composition of n which refines each of I and J. It can be described as the composition whose descent set is the union of the descent sets of I and J. It is also the concatenation of $I_1, I_2, \cdots, I_m$, where $I = I_1 \bullet I_2 \bullet \ldots \bullet I_m$ is the ribbon decomposition of I with respect to J (see *ribbon_decomposition()*).

INPUT:

- `other` – composition of same size as `self`

- `check` – boolean (default: `True`); whether to check the input compositions for having the same size

OUTPUT: the join of the compositions `self` and `other`

EXAMPLES:

```
sage: Composition([3, 1, 1, 3, 1]).join([4, 3, 2])
[3, 1, 1, 2, 1, 1]
sage: Composition([9, 6]).join([1, 3, 6, 3, 2])
[1, 3, 5, 1, 3, 2]
sage: Composition([9, 6]).join([1, 3, 5, 1, 3, 2])
[1, 3, 5, 1, 3, 2]
sage: Composition([1, 1, 1, 1, 1]).join([3, 2])
[1, 1, 1, 1, 1]
sage: Composition([4, 2]).join([3, 3])
[3, 1, 2]
sage: Composition([]).join([])
[]
```

```
>>> from sage.all import *
>>> Composition([Integer(3), Integer(1), Integer(1), Integer(3), Integer(1)]).
↪join([Integer(4), Integer(3), Integer(2)])
[3, 1, 1, 2, 1, 1]
>>> Composition([Integer(9), Integer(6)]).join([Integer(1), Integer(3),␣
↪Integer(6), Integer(3), Integer(2)])
[1, 3, 5, 1, 3, 2]
>>> Composition([Integer(9), Integer(6)]).join([Integer(1), Integer(3),␣
↪Integer(5), Integer(1), Integer(3), Integer(2)])
[1, 3, 5, 1, 3, 2]
>>> Composition([Integer(1), Integer(1), Integer(1), Integer(1), Integer(1)]).
↪join([Integer(3), Integer(2)])
[1, 1, 1, 1, 1]
>>> Composition([Integer(4), Integer(2)]).join([Integer(3), Integer(3)])
[3, 1, 2]
>>> Composition([]).join([])
[]
```

Let us verify on small examples that the join of I and J refines both of I and J:

```
sage: all( all( I.join(J).is_finer(I) and
....:           I.join(J).is_finer(J)
....:           for J in Compositions(4) )
....:       for I in Compositions(4) )
True
```

```
>>> from sage.all import *
>>> all( all( I.join(J).is_finer(I) and
...           I.join(J).is_finer(J)
...           for J in Compositions(Integer(4)) )
...       for I in Compositions(Integer(4)) )
True
```

and is the coarsest composition to do so:

```
sage: all( all( all( K.is_finer(I.join(J))
....:                for K in I.finer()
....:                if K.is_finer(J) )
....:           for J in Compositions(3) )
....:      for I in Compositions(3) )
True
```

```
>>> from sage.all import *
>>> all( all( all( K.is_finer(I.join(J))
...                for K in I.finer()
...                if K.is_finer(J) )
...           for J in Compositions(Integer(3)) )
...      for I in Compositions(Integer(3)) )
True
```

Let us check that the join of I and J is indeed the concatenation of $I_1, I_2, \cdots, I_m$, where $I = I_1 \bullet I_2 \bullet \ldots \bullet I_m$ is the ribbon decomposition of I with respect to J:

```
sage: all( all( Composition.sum(I.ribbon_decomposition(J)[0])
....:           == I.join(J) for J in Compositions(4) )
....:      for I in Compositions(4) )
True
```

```
>>> from sage.all import *
>>> all( all( Composition.sum(I.ribbon_decomposition(J)[Integer(0)])
...           == I.join(J) for J in Compositions(Integer(4)) )
...      for I in Compositions(Integer(4)) )
True
```

Also, the descent set of the join of I and J is the union of the descent sets of I and J:

```
sage: all( all( I.to_subset().union(J.to_subset())
....:           == I.join(J).to_subset()
....:           for J in Compositions(4) )
....:      for I in Compositions(4) )
True
```

```
>>> from sage.all import *
>>> all( all( I.to_subset().union(J.to_subset())
...           == I.join(J).to_subset()
...           for J in Compositions(Integer(4)) )
...      for I in Compositions(Integer(4)) )
True
```

meet(), *ribbon_decomposition()*

AUTHORS:

- Darij Grinberg (2013-09-05)

major_index()

Return the major index of `self`. The major index is defined as the sum of the descents.

EXAMPLES:

```
sage: Composition([1, 1, 3, 1, 2, 1, 3]).major_index()
31
```

```
>>> from sage.all import *
>>> Composition([Integer(1), Integer(1), Integer(3), Integer(1), Integer(2),␣
↪Integer(1), Integer(3)]).major_index()
31
```

meet(*other*, *check=True*)

Return the meet of `self` with a composition `other` of the same size.

The meet of two compositions I and J of size n is the finest composition of n which is coarser than each of I and J. It can be described as the composition whose descent set is the intersection of the descent sets of I and J.

INPUT:

- `other` – composition of same size as `self`
- `check` – boolean (default: `True`); whether to check the input compositions for having the same size

OUTPUT: the meet of the compositions `self` and `other`

EXAMPLES:

```
sage: Composition([3, 1, 1, 3, 1]).meet([4, 3, 2])
[4, 5]
sage: Composition([9, 6]).meet([1, 3, 6, 3, 2])
[15]
sage: Composition([9, 6]).meet([1, 3, 5, 1, 3, 2])
[9, 6]
sage: Composition([1, 1, 1, 1, 1]).meet([3, 2])
[3, 2]
sage: Composition([4, 2]).meet([3, 3])
[6]
sage: Composition([]).meet([])
[]
sage: Composition([1]).meet([1])
[1]
```

```
>>> from sage.all import *
>>> Composition([Integer(3), Integer(1), Integer(1), Integer(3), Integer(1)]).
↪meet([Integer(4), Integer(3), Integer(2)])
[4, 5]
>>> Composition([Integer(9), Integer(6)]).meet([Integer(1), Integer(3),␣
↪Integer(6), Integer(3), Integer(2)])
[15]
>>> Composition([Integer(9), Integer(6)]).meet([Integer(1), Integer(3),␣
↪Integer(5), Integer(1), Integer(3), Integer(2)])
[9, 6]
>>> Composition([Integer(1), Integer(1), Integer(1), Integer(1), Integer(1)]).
```

(continues on next page)

(continued from previous page)

```
↪meet([Integer(3), Integer(2)])
[3, 2]
>>> Composition([Integer(4), Integer(2)]).meet([Integer(3), Integer(3)])
[6]
>>> Composition([]).meet([])
[]
>>> Composition([Integer(1)]).meet([Integer(1)])
[1]
```

Let us verify on small examples that the meet of I and J is coarser than both of I and J:

```
sage: all( all( I.is_finer(I.meet(J)) and
....:           J.is_finer(I.meet(J))
....:           for J in Compositions(4) )
....:       for I in Compositions(4) )
True
```

```
>>> from sage.all import *
>>> all( all( I.is_finer(I.meet(J)) and
...           J.is_finer(I.meet(J))
...           for J in Compositions(Integer(4)) )
...       for I in Compositions(Integer(4)) )
True
```

and is the finest composition to do so:

```
sage: all( all( all( I.meet(J).is_finer(K)
....:                for K in I.fatter()
....:                if J.is_finer(K) )
....:           for J in Compositions(3) )
....:       for I in Compositions(3) )
True
```

```
>>> from sage.all import *
>>> all( all( all( I.meet(J).is_finer(K)
...                for K in I.fatter()
...                if J.is_finer(K) )
...           for J in Compositions(Integer(3)) )
...       for I in Compositions(Integer(3)) )
True
```

The descent set of the meet of I and J is the intersection of the descent sets of I and J:

```
sage: def test_meet(n):
....:     return all( all( I.to_subset().intersection(J.to_subset())
....:                      == I.meet(J).to_subset()
....:                      for J in Compositions(n) )
....:                  for I in Compositions(n) )
sage: all( test_meet(n) for n in range(1, 5) )
True
```

```
>>> from sage.all import *
>>> def test_meet(n):
...     return all( all( I.to_subset().intersection(J.to_subset())
...                      == I.meet(J).to_subset()
...                      for J in Compositions(n) )
...                 for I in Compositions(n) )
>>> all( test_meet(n) for n in range(Integer(1), Integer(5)) )
True
```

join()

AUTHORS:

- Darij Grinberg (2013-09-05)

near_concatenation(*other*)

Return the near-concatenation of two nonempty compositions `self` and `other`.

The near-concatenation $I \odot J$ of two nonempty compositions I and J is defined as the composition $(i_1, i_2, \ldots, i_{n-1}, i_n + j_1, j_2, j_3, \ldots, j_m)$, where $(i_1, i_2, \ldots, i_n) = I$ and $(j_1, j_2, \ldots, j_m) = J$.

This method returns `None` if one of the two input compositions is empty.

EXAMPLES:

```
sage: Composition([1, 1, 3]).near_concatenation(Composition([4, 1, 2]))
[1, 1, 7, 1, 2]
sage: Composition([6]).near_concatenation(Composition([1, 5]))
[7, 5]
sage: Composition([1, 5]).near_concatenation(Composition([6]))
[1, 11]
```

```
>>> from sage.all import *
>>> Composition([Integer(1), Integer(1), Integer(3)]).near_
→concatenation(Composition([Integer(4), Integer(1), Integer(2)]))
[1, 1, 7, 1, 2]
>>> Composition([Integer(6)]).near_concatenation(Composition([Integer(1),␣
→Integer(5)]))
[7, 5]
>>> Composition([Integer(1), Integer(5)]).near_
→concatenation(Composition([Integer(6)]))
[1, 11]
```

partial_sums(*final=True*)

The partial sums of the sequence defined by the entries of the composition.

If $I = (i_1, \ldots, i_m)$ is a composition, then the partial sums of the entries of the composition are $[i_1, i_1 + i_2, \ldots, i_1 + i_2 + \cdots + i_m]$.

INPUT:

- `final` – boolean (default: `True`); whether or not to include the final partial sum, which is always the size of the composition

See also

to_subset()

EXAMPLES:

```
sage: Composition([1,1,3,1,2,1,3]).partial_sums()
[1, 2, 5, 6, 8, 9, 12]
```

```
>>> from sage.all import *
>>> Composition([Integer(1),Integer(1),Integer(3),Integer(1),Integer(2),
↪Integer(1),Integer(3)]).partial_sums()
[1, 2, 5, 6, 8, 9, 12]
```

With `final = False`, the last partial sum is not included:

```
sage: Composition([1,1,3,1,2,1,3]).partial_sums(final=False)
[1, 2, 5, 6, 8, 9]
```

```
>>> from sage.all import *
>>> Composition([Integer(1),Integer(1),Integer(3),Integer(1),Integer(2),
↪Integer(1),Integer(3)]).partial_sums(final=False)
[1, 2, 5, 6, 8, 9]
```

peaks()

Return a list of the peaks of the composition `self`.

The peaks of a composition are the descents which do not immediately follow another descent.

EXAMPLES:

```
sage: Composition([1, 1, 3, 1, 2, 1, 3]).peaks()
[4, 7]
```

```
>>> from sage.all import *
>>> Composition([Integer(1), Integer(1), Integer(3), Integer(1), Integer(2),␣
↪Integer(1), Integer(3)]).peaks()
[4, 7]
```

refinement_splitting(*J*)

Return the refinement splitting of `self` according to `J`.

INPUT:

- `J` – a composition such that `self` is finer than `J`

OUTPUT:

- the unique list of compositions $(I^{(p)})_{p=1,\ldots,m}$, obtained by splitting I, such that $|I^{(p)}| = J_p$ for all $p = 1, \ldots, m$.

See also

refinement_splitting_lengths()

EXAMPLES:

```
sage: Composition([1,2,2,1,1,2]).refinement_splitting([5,1,3])
[[1, 2, 2], [1], [1, 2]]
sage: Composition([]).refinement_splitting([])
[]
sage: Composition([3]).refinement_splitting([2])
Traceback (most recent call last):
...
ValueError: compositions self (= [3]) and J (= [2]) must be of the same size
sage: Composition([2,1]).refinement_splitting([1,2])
Traceback (most recent call last):
...
ValueError: composition J (= [2, 1]) does not refine self (= [1, 2])
```

```
>>> from sage.all import *
>>> Composition([Integer(1),Integer(2),Integer(2),Integer(1),Integer(1),
↪Integer(2)]).refinement_splitting([Integer(5),Integer(1),Integer(3)])
[[1, 2, 2], [1], [1, 2]]
>>> Composition([]).refinement_splitting([])
[]
>>> Composition([Integer(3)]).refinement_splitting([Integer(2)])
Traceback (most recent call last):
...
ValueError: compositions self (= [3]) and J (= [2]) must be of the same size
>>> Composition([Integer(2),Integer(1)]).refinement_splitting([Integer(1),
↪Integer(2)])
Traceback (most recent call last):
...
ValueError: composition J (= [2, 1]) does not refine self (= [1, 2])
```

refinement_splitting_lengths(*J*)

Return the lengths of the compositions in the refinement splitting of `self` according to `J`.

See also

refinement_splitting() for the definition of refinement splitting

EXAMPLES:

```
sage: Composition([1,2,2,1,1,2]).refinement_splitting_lengths([5,1,3])
[3, 1, 2]
sage: Composition([]).refinement_splitting_lengths([])
[]
sage: Composition([3]).refinement_splitting_lengths([2])
Traceback (most recent call last):
...
ValueError: compositions self (= [3]) and J (= [2]) must be of the same size
sage: Composition([2,1]).refinement_splitting_lengths([1,2])
Traceback (most recent call last):
...
ValueError: composition J (= [2, 1]) does not refine self (= [1, 2])
```

```
>>> from sage.all import *
>>> Composition([Integer(1),Integer(2),Integer(2),Integer(1),Integer(1),
↪Integer(2)]).refinement_splitting_lengths([Integer(5),Integer(1),
↪Integer(3)])
[3, 1, 2]
>>> Composition([]).refinement_splitting_lengths([])
[]
>>> Composition([Integer(3)]).refinement_splitting_lengths([Integer(2)])
Traceback (most recent call last):
...
ValueError: compositions self (= [3]) and J (= [2]) must be of the same size
>>> Composition([Integer(2),Integer(1)]).refinement_splitting_
↪lengths([Integer(1),Integer(2)])
Traceback (most recent call last):
...
ValueError: composition J (= [2, 1]) does not refine self (= [1, 2])
```

reversed()

Return the reverse composition of `self`.

The reverse composition of a composition $(i_1, i_2, \ldots, i_k)$ is defined as the composition $(i_k, i_{k-1}, \ldots, i_1)$.

EXAMPLES:

```
sage: Composition([1, 1, 3, 1, 2, 1, 3]).reversed()
[3, 1, 2, 1, 3, 1, 1]
```

```
>>> from sage.all import *
>>> Composition([Integer(1), Integer(1), Integer(3), Integer(1), Integer(2),␣
↪Integer(1), Integer(3)]).reversed()
[3, 1, 2, 1, 3, 1, 1]
```

ribbon_decomposition(*other*, *check=True*)

Return a pair describing the ribbon decomposition of a composition `self` with respect to a composition `other` of the same size.

If I and J are two compositions of the same nonzero size, then the ribbon decomposition of I with respect to J is defined as follows: Write I and J as $I = (i_1, i_2, \ldots, i_n)$ and $J = (j_1, j_2, \ldots, j_m)$. Then, the equality $I = I_1 \bullet I_2 \bullet \ldots \bullet I_m$ holds for a unique m-tuple $(I_1, I_2, \ldots, I_m)$ of compositions such that each I_k has size j_k and for a unique choice of $m-1$ signs $\bullet$ each of which is either the concatenation sign $\cdot$ or the near-concatenation sign $\odot$ (see `__add__()` and `near_concatenation()` for the definitions of these two signs). This m-tuple and this choice of signs together are said to form the ribbon decomposition of I with respect to J. If I and J are empty, then the same definition applies, except that there are 0 rather than $m-1$ signs.

See Section 4.8 of [NCSF1].

INPUT:

- `other` – composition of same size as `self`
- `check` – boolean (default: `True`); whether to check the input compositions for having the same size

OUTPUT:

- a pair `(u, v)`, where `u` is a tuple of compositions (corresponding to the m-tuple $(I_1, I_2, \ldots, I_m)$ in the above definition), and `v` is a tuple of $0`sand`1`s(encodingthechoiceofsigns`\bullet$ in the above definition, with a 0 standing for $\cdot$ and a 1 standing for $\odot$).

EXAMPLES:

```
sage: Composition([3, 1, 1, 3, 1]).ribbon_decomposition([4, 3, 2])
(([3, 1], [1, 2], [1, 1]), (0, 1))
sage: Composition([9, 6]).ribbon_decomposition([1, 3, 6, 3, 2])
(([1], [3], [5, 1], [3], [2]), (1, 1, 1, 1))
sage: Composition([9, 6]).ribbon_decomposition([1, 3, 5, 1, 3, 2])
(([1], [3], [5], [1], [3], [2]), (1, 1, 0, 1, 1))
sage: Composition([1, 1, 1, 1, 1]).ribbon_decomposition([3, 2])
(([1, 1, 1], [1, 1]), (0,))
sage: Composition([4, 2]).ribbon_decomposition([6])
(([4, 2],), ())
sage: Composition([]).ribbon_decomposition([])
((), ())
```

```
>>> from sage.all import *
>>> Composition([Integer(3), Integer(1), Integer(1), Integer(3), Integer(1)]).
↪ribbon_decomposition([Integer(4), Integer(3), Integer(2)])
(([3, 1], [1, 2], [1, 1]), (0, 1))
>>> Composition([Integer(9), Integer(6)]).ribbon_decomposition([Integer(1),␣
↪Integer(3), Integer(6), Integer(3), Integer(2)])
(([1], [3], [5, 1], [3], [2]), (1, 1, 1, 1))
>>> Composition([Integer(9), Integer(6)]).ribbon_decomposition([Integer(1),␣
↪Integer(3), Integer(5), Integer(1), Integer(3), Integer(2)])
(([1], [3], [5], [1], [3], [2]), (1, 1, 0, 1, 1))
>>> Composition([Integer(1), Integer(1), Integer(1), Integer(1), Integer(1)]).
↪ribbon_decomposition([Integer(3), Integer(2)])
(([1, 1, 1], [1, 1]), (0,))
>>> Composition([Integer(4), Integer(2)]).ribbon_decomposition([Integer(6)])
(([4, 2],), ())
>>> Composition([]).ribbon_decomposition([])
((), ())
```

Let us check that the defining property $I = I_1 \bullet I_2 \bullet \ldots \bullet I_m$ is satisfied:

```
sage: def compose_back(u, v):
....:     comp = u[0]
....:     r = len(v)
....:     if len(u) != r + 1:
....:         raise ValueError("something is wrong")
....:     for i in range(r):
....:         if v[i] == 0:
....:             comp += u[i + 1]
....:         else:
....:             comp = comp.near_concatenation(u[i + 1])
....:     return comp
sage: all( all( all( compose_back(*(I.ribbon_decomposition(J))) == I
....:                 for J in Compositions(n) )
....:             for I in Compositions(n) )
....:       for n in range(1, 5) )
True
```

```
>>> from sage.all import *
```

(continues on next page)

(continued from previous page)

```
>>> def compose_back(u, v):
...     comp = u[Integer(0)]
...     r = len(v)
...     if len(u) != r + Integer(1):
...         raise ValueError("something is wrong")
...     for i in range(r):
...         if v[i] == Integer(0):
...             comp += u[i + Integer(1)]
...         else:
...             comp = comp.near_concatenation(u[i + Integer(1)])
...     return comp
>>> all( all( all( compose_back(*(I.ribbon_decomposition(J))) == I
...                for J in Compositions(n) )
...           for I in Compositions(n) )
...      for n in range(Integer(1), Integer(5)) )
True
```

AUTHORS:

- Darij Grinberg (2013-08-29)

shuffle_product(*other*, *overlap=False*)

The (overlapping) shuffles of `self` and `other`.

Suppose $I = (i_1, \ldots, i_k)$ and $J = (j_1, \ldots, j_l)$ are two compositions. A *shuffle* of I and J is a composition of length $k + l$ that contains both I and J as subsequences.

More generally, an *overlapping shuffle* of I and J is obtained by distributing the elements of I and J (preserving the relative ordering of these elements) among the positions of an empty list; an element of I and an element of J are permitted to share the same position, in which case they are replaced by their sum. In particular, a shuffle of I and J is an overlapping shuffle of I and J.

INPUT:

- `other` – composition
- `overlap` – boolean (default: `False`); if `True`, the overlapping shuffle product is returned

OUTPUT:

An enumerated set (allowing for multiplicities)

EXAMPLES:

The shuffle product of $[2, 2]$ and $[1, 1, 3]$:

```
sage: alph = Composition([2,2])
sage: beta = Composition([1,1,3])
sage: S = alph.shuffle_product(beta); S                                 #␣
↪needs sage.combinat
Shuffle product of [2, 2] and [1, 1, 3]
sage: S.list()                                                          #␣
↪needs sage.combinat
[[2, 2, 1, 1, 3], [2, 1, 2, 1, 3], [2, 1, 1, 2, 3], [2, 1, 1, 3, 2],
 [1, 2, 2, 1, 3], [1, 2, 1, 2, 3], [1, 2, 1, 3, 2], [1, 1, 2, 2, 3],
 [1, 1, 2, 3, 2], [1, 1, 3, 2, 2]]
```

```
>>> from sage.all import *
>>> alph = Composition([Integer(2),Integer(2)])
>>> beta = Composition([Integer(1),Integer(1),Integer(3)])
>>> S = alph.shuffle_product(beta); S                                    #␣
↪needs sage.combinat
Shuffle product of [2, 2] and [1, 1, 3]
>>> S.list()                                                             #␣
↪needs sage.combinat
[[2, 2, 1, 1, 3], [2, 1, 2, 1, 3], [2, 1, 1, 2, 3], [2, 1, 1, 3, 2],
 [1, 2, 2, 1, 3], [1, 2, 1, 2, 3], [1, 2, 1, 3, 2], [1, 1, 2, 2, 3],
 [1, 1, 2, 3, 2], [1, 1, 3, 2, 2]]
```

The *overlapping* shuffle product of $[2, 2]$ and $[1, 1, 3]$:

```
sage: alph = Composition([2,2])
sage: beta = Composition([1,1,3])
sage: O = alph.shuffle_product(beta, overlap=True); O                     #␣
↪needs sage.combinat
Overlapping shuffle product of [2, 2] and [1, 1, 3]
sage: O.list()                                                            #␣
↪needs sage.combinat
[[2, 2, 1, 1, 3], [2, 1, 2, 1, 3], [2, 1, 1, 2, 3], [2, 1, 1, 3, 2],
 [1, 2, 2, 1, 3], [1, 2, 1, 2, 3], [1, 2, 1, 3, 2], [1, 1, 2, 2, 3],
 [1, 1, 2, 3, 2], [1, 1, 3, 2, 2],
 [3, 2, 1, 3], [2, 3, 1, 3], [3, 1, 2, 3], [2, 1, 3, 3], [3, 1, 3, 2],
 [2, 1, 1, 5], [1, 3, 2, 3], [1, 2, 3, 3], [1, 3, 3, 2], [1, 2, 1, 5],
 [1, 1, 5, 2], [1, 1, 2, 5],
 [3, 3, 3], [3, 1, 5], [1, 3, 5]]
```

```
>>> from sage.all import *
>>> alph = Composition([Integer(2),Integer(2)])
>>> beta = Composition([Integer(1),Integer(1),Integer(3)])
>>> O = alph.shuffle_product(beta, overlap=True); O                      #␣
↪needs sage.combinat
Overlapping shuffle product of [2, 2] and [1, 1, 3]
>>> O.list()                                                             #␣
↪needs sage.combinat
[[2, 2, 1, 1, 3], [2, 1, 2, 1, 3], [2, 1, 1, 2, 3], [2, 1, 1, 3, 2],
 [1, 2, 2, 1, 3], [1, 2, 1, 2, 3], [1, 2, 1, 3, 2], [1, 1, 2, 2, 3],
 [1, 1, 2, 3, 2], [1, 1, 3, 2, 2],
 [3, 2, 1, 3], [2, 3, 1, 3], [3, 1, 2, 3], [2, 1, 3, 3], [3, 1, 3, 2],
 [2, 1, 1, 5], [1, 3, 2, 3], [1, 2, 3, 3], [1, 3, 3, 2], [1, 2, 1, 5],
 [1, 1, 5, 2], [1, 1, 2, 5],
 [3, 3, 3], [3, 1, 5], [1, 3, 5]]
```

Note that the shuffle product of two compositions can include the same composition more than once since a composition can be a shuffle of two compositions in several ways. For example:

```
sage: # needs sage.combinat
sage: w1 = Composition([1])
sage: S = w1.shuffle_product(w1); S
Shuffle product of [1] and [1]
sage: S.list()
```

(continues on next page)

(continued from previous page)

```
[[1, 1], [1, 1]]
sage: O = w1.shuffle_product(w1, overlap=True); O
Overlapping shuffle product of [1] and [1]
sage: O.list()
[[1, 1], [1, 1], [2]]
```

```
>>> from sage.all import *
>>> # needs sage.combinat
>>> w1 = Composition([Integer(1)])
>>> S = w1.shuffle_product(w1); S
Shuffle product of [1] and [1]
>>> S.list()
[[1, 1], [1, 1]]
>>> O = w1.shuffle_product(w1, overlap=True); O
Overlapping shuffle product of [1] and [1]
>>> O.list()
[[1, 1], [1, 1], [2]]
```

size()

Return the size of `self`, that is the sum of its parts.

EXAMPLES:

```
sage: Composition([7,1,3]).size()
11
```

```
>>> from sage.all import *
>>> Composition([Integer(7),Integer(1),Integer(3)]).size()
11
```

specht_module(*base_ring=None*)

Return the Specht module corresponding to `self`.

EXAMPLES:

```
sage: SM = Composition([1,2,2]).specht_module(QQ); SM                      #␣
↪needs sage.combinat sage.modules
Specht module of [(0, 0), (1, 0), (1, 1), (2, 0), (2, 1)] over Rational Field
sage: s = SymmetricFunctions(QQ).s()                                      #␣
↪needs sage.combinat sage.modules
sage: s(SM.frobenius_image())                                             #␣
↪needs sage.combinat sage.modules
s[2, 2, 1]
```

```
>>> from sage.all import *
>>> SM = Composition([Integer(1),Integer(2),Integer(2)]).specht_module(QQ);␣
↪SM                         # needs sage.combinat sage.modules
Specht module of [(0, 0), (1, 0), (1, 1), (2, 0), (2, 1)] over Rational Field
>>> s = SymmetricFunctions(QQ).s()                                        #␣
↪needs sage.combinat sage.modules
>>> s(SM.frobenius_image())                                               #␣
↪needs sage.combinat sage.modules
s[2, 2, 1]
```

specht_module_dimension(*base_ring=None*)

Return the dimension of the Specht module corresponding to `self`.

INPUT:

- `base_ring` – (default: **Q**) the base ring

EXAMPLES:

```
sage: Composition([1,2,2]).specht_module_dimension()                          #␣
↪needs sage.combinat sage.modules
5
sage: Composition([1,2,2]).specht_module_dimension(GF(2))                     #␣
↪needs sage.combinat sage.modules sage.rings.finite_rings
5
```

```
>>> from sage.all import *
>>> Composition([Integer(1),Integer(2),Integer(2)]).specht_module_dimension()␣
↪                         # needs sage.combinat sage.modules
5
>>> Composition([Integer(1),Integer(2),Integer(2)]).specht_module_
↪dimension(GF(Integer(2)))                        # needs sage.combinat sage.
↪modules sage.rings.finite_rings
5
```

static sum(*compositions*)

Return the concatenation of the given compositions.

INPUT:

- `compositions` – list (or iterable) of compositions

EXAMPLES:

```
sage: Composition.sum([Composition([1, 1, 3]), Composition([4, 1, 2]),␣
↪Composition([3,1])])
[1, 1, 3, 4, 1, 2, 3, 1]
```

```
>>> from sage.all import *
>>> Composition.sum([Composition([Integer(1), Integer(1), Integer(3)]),␣
↪Composition([Integer(4), Integer(1), Integer(2)]), Composition([Integer(3),
↪Integer(1)])])
[1, 1, 3, 4, 1, 2, 3, 1]
```

Any iterable can be provided as input:

```
sage: Composition.sum([Composition([i,i]) for i in [4,1,3]])
[4, 4, 1, 1, 3, 3]
```

```
>>> from sage.all import *
>>> Composition.sum([Composition([i,i]) for i in [Integer(4),Integer(1),
↪Integer(3)]])
[4, 4, 1, 1, 3, 3]
```

Empty inputs are handled gracefully:

```
sage: Composition.sum([]) == Composition([])
True
```

```
>>> from sage.all import *
>>> Composition.sum([]) == Composition([])
True
```

sup(*other*, *check=True*)

Return the join of `self` with a composition `other` of the same size.

The join of two compositions I and J of size n is the coarsest composition of n which refines each of I and J. It can be described as the composition whose descent set is the union of the descent sets of I and J. It is also the concatenation of $I_1, I_2, \cdots, I_m$, where $I = I_1 \bullet I_2 \bullet \ldots \bullet I_m$ is the ribbon decomposition of I with respect to J (see `ribbon_decomposition()`).

INPUT:

- `other` – composition of same size as `self`
- `check` – boolean (default: `True`); whether to check the input compositions for having the same size

OUTPUT: the join of the compositions `self` and `other`

EXAMPLES:

```
sage: Composition([3, 1, 1, 3, 1]).join([4, 3, 2])
[3, 1, 1, 2, 1, 1]
sage: Composition([9, 6]).join([1, 3, 6, 3, 2])
[1, 3, 5, 1, 3, 2]
sage: Composition([9, 6]).join([1, 3, 5, 1, 3, 2])
[1, 3, 5, 1, 3, 2]
sage: Composition([1, 1, 1, 1, 1]).join([3, 2])
[1, 1, 1, 1, 1]
sage: Composition([4, 2]).join([3, 3])
[3, 1, 2]
sage: Composition([]).join([])
[]
```

```
>>> from sage.all import *
>>> Composition([Integer(3), Integer(1), Integer(1), Integer(3), Integer(1)]).
↪join([Integer(4), Integer(3), Integer(2)])
[3, 1, 1, 2, 1, 1]
>>> Composition([Integer(9), Integer(6)]).join([Integer(1), Integer(3),␣
↪Integer(6), Integer(3), Integer(2)])
[1, 3, 5, 1, 3, 2]
>>> Composition([Integer(9), Integer(6)]).join([Integer(1), Integer(3),␣
↪Integer(5), Integer(1), Integer(3), Integer(2)])
[1, 3, 5, 1, 3, 2]
>>> Composition([Integer(1), Integer(1), Integer(1), Integer(1), Integer(1)]).
↪join([Integer(3), Integer(2)])
[1, 1, 1, 1, 1]
>>> Composition([Integer(4), Integer(2)]).join([Integer(3), Integer(3)])
[3, 1, 2]
>>> Composition([]).join([])
[]
```

Let us verify on small examples that the join of I and J refines both of I and J:

```
sage: all( all( I.join(J).is_finer(I) and
....:           I.join(J).is_finer(J)
....:           for J in Compositions(4) )
....:       for I in Compositions(4) )
True
```

```
>>> from sage.all import *
>>> all( all( I.join(J).is_finer(I) and
...           I.join(J).is_finer(J)
...           for J in Compositions(Integer(4)) )
...       for I in Compositions(Integer(4)) )
True
```

and is the coarsest composition to do so:

```
sage: all( all( all( K.is_finer(I.join(J))
....:                for K in I.finer()
....:                if K.is_finer(J) )
....:           for J in Compositions(3) )
....:       for I in Compositions(3) )
True
```

```
>>> from sage.all import *
>>> all( all( all( K.is_finer(I.join(J))
...                for K in I.finer()
...                if K.is_finer(J) )
...           for J in Compositions(Integer(3)) )
...       for I in Compositions(Integer(3)) )
True
```

Let us check that the join of I and J is indeed the concatenation of $I_1, I_2, \cdots, I_m$, where $I = I_1 \bullet I_2 \bullet \ldots \bullet I_m$ is the ribbon decomposition of I with respect to J:

```
sage: all( all( Composition.sum(I.ribbon_decomposition(J)[0])
....:           == I.join(J) for J in Compositions(4) )
....:       for I in Compositions(4) )
True
```

```
>>> from sage.all import *
>>> all( all( Composition.sum(I.ribbon_decomposition(J)[Integer(0)])
...           == I.join(J) for J in Compositions(Integer(4)) )
...       for I in Compositions(Integer(4)) )
True
```

Also, the descent set of the join of I and J is the union of the descent sets of I and J:

```
sage: all( all( I.to_subset().union(J.to_subset())
....:           == I.join(J).to_subset()
....:           for J in Compositions(4) )
....:       for I in Compositions(4) )
True
```

```
>>> from sage.all import *
>>> all( all( I.to_subset().union(J.to_subset())
...           == I.join(J).to_subset()
...           for J in Compositions(Integer(4)) )
...       for I in Compositions(Integer(4)) )
True
```

to_code()

Return the code of the composition `self`.

The code of a composition I is a list of length size(I) of 1s and 0s such that there is a 1 wherever a new part starts. (Exceptional case: When the composition is empty, the code is `[0]`.)

EXAMPLES:

```
sage: Composition([4,1,2,3,5]).to_code()
[1, 0, 0, 0, 1, 1, 0, 1, 0, 0, 1, 0, 0, 0, 0]
```

```
>>> from sage.all import *
>>> Composition([Integer(4),Integer(1),Integer(2),Integer(3),Integer(5)]).to_
↪code()
[1, 0, 0, 0, 1, 1, 0, 1, 0, 0, 1, 0, 0, 0, 0]
```

to_partition()

Return the partition obtained by sorting `self` into decreasing order.

EXAMPLES:

```
sage: Composition([2,1,3]).to_partition()                                    #␣
↪needs sage.combinat
[3, 2, 1]
sage: Composition([4,2,2]).to_partition()                                    #␣
↪needs sage.combinat
[4, 2, 2]
sage: Composition([]).to_partition()                                         #␣
↪needs sage.combinat
[]
```

```
>>> from sage.all import *
>>> Composition([Integer(2),Integer(1),Integer(3)]).to_partition()          ␣
↪                   # needs sage.combinat
[3, 2, 1]
>>> Composition([Integer(4),Integer(2),Integer(2)]).to_partition()          ␣
↪                   # needs sage.combinat
[4, 2, 2]
```

(continues on next page)

(continued from previous page)

```
>>> Composition([]).to_partition()                                          #␣
↪needs sage.combinat
[]
```

to_skew_partition(*overlap=1*)

Return the skew partition obtained from `self`.

This is a skew partition whose rows have the entries of `self` as their length, taken in reverse order (so the first entry of `self` is the length of the lowermost row, etc.). The parameter `overlap` indicates the number of cells on each row that are directly below cells of the previous row. When it is set to 1 (its default value), the result is the ribbon shape of `self`.

EXAMPLES:

```
sage: # needs sage.combinat
sage: Composition([3,4,1]).to_skew_partition()
[6, 6, 3] / [5, 2]
sage: Composition([3,4,1]).to_skew_partition(overlap=0)
[8, 7, 3] / [7, 3]
sage: Composition([]).to_skew_partition()
[] / []
sage: Composition([1,2]).to_skew_partition()
[2, 1] / []
sage: Composition([2,1]).to_skew_partition()
[2, 2] / [1]
```

```
>>> from sage.all import *
>>> # needs sage.combinat
>>> Composition([Integer(3),Integer(4),Integer(1)]).to_skew_partition()
[6, 6, 3] / [5, 2]
>>> Composition([Integer(3),Integer(4),Integer(1)]).to_skew_
↪partition(overlap=Integer(0))
[8, 7, 3] / [7, 3]
>>> Composition([]).to_skew_partition()
[] / []
>>> Composition([Integer(1),Integer(2)]).to_skew_partition()
[2, 1] / []
>>> Composition([Integer(2),Integer(1)]).to_skew_partition()
[2, 2] / [1]
```

to_subset(*final=False*)

The subset corresponding to `self` under the bijection (see below) between compositions of n and subsets of $\{1, 2, \ldots, n-1\}$.

The bijection maps a composition $(i_1, \ldots, i_k)$ of n to $\{i_1, i_1 + i_2, i_1 + i_2 + i_3, \ldots, i_1 + \cdots + i_{k-1}\}$.

INPUT:

- `final` – boolean (default: `False`); whether or not to include the final partial sum, which is always the size of the composition

See also

partial_sums()

EXAMPLES:

```
sage: Composition([1,1,3,1,2,1,3]).to_subset()
{1, 2, 5, 6, 8, 9}
sage: for I in Compositions(3): print(I.to_subset())
{1, 2}
{1}
{2}
{}
```

```
>>> from sage.all import *
>>> Composition([Integer(1),Integer(1),Integer(3),Integer(1),Integer(2),
↪Integer(1),Integer(3)]).to_subset()
{1, 2, 5, 6, 8, 9}
>>> for I in Compositions(Integer(3)): print(I.to_subset())
{1, 2}
{1}
{2}
{}
```

With `final=True`, the sum of all the elements of the composition is included in the subset:

```
sage: Composition([1,1,3,1,2,1,3]).to_subset(final=True)
{1, 2, 5, 6, 8, 9, 12}
```

```
>>> from sage.all import *
>>> Composition([Integer(1),Integer(1),Integer(3),Integer(1),Integer(2),
↪Integer(1),Integer(3)]).to_subset(final=True)
{1, 2, 5, 6, 8, 9, 12}
```

wll_gt(*co2*)

Return `True` if the composition `self` is greater than the composition `co2` with respect to the wll-ordering; otherwise, return `False`.

The wll-ordering is a total order on the set of all compositions defined as follows: A composition I is greater than a composition J if and only if one of the following conditions holds:

- The size of I is greater than the size of J.
- The size of I equals the size of J, but the length of I is greater than the length of J.
- The size of I equals the size of J, and the length of I equals the length of J, but I is lexicographically greater than J.

("wll-ordering" is short for "weight, length, lexicographic ordering".)

EXAMPLES:

```
sage: Composition([4,1,2]).wll_gt([3,1,3])
True
sage: Composition([7]).wll_gt([4,1,2])
False
sage: Composition([8]).wll_gt([4,1,2])
True
sage: Composition([3,2,2,2]).wll_gt([5,2])
True
```

(continues on next page)

(continued from previous page)

```
sage: Composition([]).wll_gt([3])
False
sage: Composition([2,1]).wll_gt([2,1])
False
sage: Composition([2,2,2]).wll_gt([4,2])
True
sage: Composition([4,2]).wll_gt([2,2,2])
False
sage: Composition([1,1,2]).wll_gt([2,2])
True
sage: Composition([2,2]).wll_gt([1,3])
True
sage: Composition([2,1,2]).wll_gt([])
True
```

```
>>> from sage.all import *
>>> Composition([Integer(4),Integer(1),Integer(2)]).wll_gt([Integer(3),
↪Integer(1),Integer(3)])
True
>>> Composition([Integer(7)]).wll_gt([Integer(4),Integer(1),Integer(2)])
False
>>> Composition([Integer(8)]).wll_gt([Integer(4),Integer(1),Integer(2)])
True
>>> Composition([Integer(3),Integer(2),Integer(2),Integer(2)]).wll_
↪gt([Integer(5),Integer(2)])
True
>>> Composition([]).wll_gt([Integer(3)])
False
>>> Composition([Integer(2),Integer(1)]).wll_gt([Integer(2),Integer(1)])
False
>>> Composition([Integer(2),Integer(2),Integer(2)]).wll_gt([Integer(4),
↪Integer(2)])
True
>>> Composition([Integer(4),Integer(2)]).wll_gt([Integer(2),Integer(2),
↪Integer(2)])
False
>>> Composition([Integer(1),Integer(1),Integer(2)]).wll_gt([Integer(2),
↪Integer(2)])
True
>>> Composition([Integer(2),Integer(2)]).wll_gt([Integer(1),Integer(3)])
True
>>> Composition([Integer(2),Integer(1),Integer(2)]).wll_gt([])
True
```

class sage.combinat.composition.**Compositions**(*is_infinite=False*, *category=None*)

Bases: UniqueRepresentation, Parent

Set of integer compositions.

A composition c of a nonnegative integer n is a list of positive integers with total sum n.

See also

- *Composition*
- *Partitions*
- *IntegerVectors*

EXAMPLES:

There are 8 compositions of 4:

```
sage: Compositions(4).cardinality()
8
```

```
>>> from sage.all import *
>>> Compositions(Integer(4)).cardinality()
8
```

Here is the list of them:

```
sage: Compositions(4).list()
[[1, 1, 1, 1], [1, 1, 2], [1, 2, 1], [1, 3], [2, 1, 1], [2, 2], [3, 1], [4]]
```

```
>>> from sage.all import *
>>> Compositions(Integer(4)).list()
[[1, 1, 1, 1], [1, 1, 2], [1, 2, 1], [1, 3], [2, 1, 1], [2, 2], [3, 1], [4]]
```

You can use the `.first()` method to get the 'first' composition of a number:

```
sage: Compositions(4).first()
[1, 1, 1, 1]
```

```
>>> from sage.all import *
>>> Compositions(Integer(4)).first()
[1, 1, 1, 1]
```

You can also calculate the 'next' composition given the current one:

```
sage: Compositions(4).next([1,1,2])
[1, 2, 1]
```

```
>>> from sage.all import *
>>> Compositions(Integer(4)).next([Integer(1),Integer(1),Integer(2)])
[1, 2, 1]
```

If n is not specified, this returns the combinatorial class of all (nonnegative) integer compositions:

```
sage: Compositions()
Compositions of nonnegative integers
sage: [] in Compositions()
True
sage: [2,3,1] in Compositions()
```

(continues on next page)

(continued from previous page)

```
True
sage: [-2,3,1] in Compositions()
False
```

```
>>> from sage.all import *
>>> Compositions()
Compositions of nonnegative integers
>>> [] in Compositions()
True
>>> [Integer(2),Integer(3),Integer(1)] in Compositions()
True
>>> [-Integer(2),Integer(3),Integer(1)] in Compositions()
False
```

If n is specified, it returns the class of compositions of n:

```
sage: Compositions(3)
Compositions of 3
sage: list(Compositions(3))
[[1, 1, 1], [1, 2], [2, 1], [3]]
sage: Compositions(3).cardinality()
4
```

```
>>> from sage.all import *
>>> Compositions(Integer(3))
Compositions of 3
>>> list(Compositions(Integer(3)))
[[1, 1, 1], [1, 2], [2, 1], [3]]
>>> Compositions(Integer(3)).cardinality()
4
```

The following examples show how to test whether or not an object is a composition:

```
sage: [3,4] in Compositions()
True
sage: [3,4] in Compositions(7)
True
sage: [3,4] in Compositions(5)
False
```

```
>>> from sage.all import *
>>> [Integer(3),Integer(4)] in Compositions()
True
>>> [Integer(3),Integer(4)] in Compositions(Integer(7))
True
>>> [Integer(3),Integer(4)] in Compositions(Integer(5))
False
```

Similarly, one can check whether or not an object is a composition which satisfies further constraints:

```
sage: [4,2] in Compositions(6, inner=[2,2])
True
```

(continues on next page)

(continued from previous page)

```
sage: [4,2] in Compositions(6, inner=[2,3])
False
sage: [4,1] in Compositions(5, inner=[2,1], max_slope = 0)
True
```

```
>>> from sage.all import *
>>> [Integer(4),Integer(2)] in Compositions(Integer(6), inner=[Integer(2),
↪Integer(2)])
True
>>> [Integer(4),Integer(2)] in Compositions(Integer(6), inner=[Integer(2),
↪Integer(3)])
False
>>> [Integer(4),Integer(1)] in Compositions(Integer(5), inner=[Integer(2),
↪Integer(1)], max_slope = Integer(0))
True
```

An example with incompatible constraints:

```
sage: [4,2] in Compositions(6, inner=[2,2], min_part=3)
False
```

```
>>> from sage.all import *
>>> [Integer(4),Integer(2)] in Compositions(Integer(6), inner=[Integer(2),
↪Integer(2)], min_part=Integer(3))
False
```

The options `length`, `min_length`, and `max_length` can be used to set length constraints on the compositions. For example, the compositions of 4 of length equal to, at least, and at most 2 are given by:

```
sage: Compositions(4, length=2).list()
[[3, 1], [2, 2], [1, 3]]
sage: Compositions(4, min_length=2).list()
[[3, 1], [2, 2], [2, 1, 1], [1, 3], [1, 2, 1], [1, 1, 2], [1, 1, 1, 1]]
sage: Compositions(4, max_length=2).list()
[[4], [3, 1], [2, 2], [1, 3]]
```

```
>>> from sage.all import *
>>> Compositions(Integer(4), length=Integer(2)).list()
[[3, 1], [2, 2], [1, 3]]
>>> Compositions(Integer(4), min_length=Integer(2)).list()
[[3, 1], [2, 2], [2, 1, 1], [1, 3], [1, 2, 1], [1, 1, 2], [1, 1, 1, 1]]
>>> Compositions(Integer(4), max_length=Integer(2)).list()
[[4], [3, 1], [2, 2], [1, 3]]
```

Setting both `min_length` and `max_length` to the same value is equivalent to setting `length` to this value:

```
sage: Compositions(4, min_length=2, max_length=2).list()
[[3, 1], [2, 2], [1, 3]]
```

```
>>> from sage.all import *
>>> Compositions(Integer(4), min_length=Integer(2), max_length=Integer(2)).list()
[[3, 1], [2, 2], [1, 3]]
```

The options `inner` and `outer` can be used to set part-by-part containment constraints. The list of compositions of 4 bounded above by `[3,1,2]` is given by:

```
sage: list(Compositions(4, outer=[3,1,2]))
[[3, 1], [2, 1, 1], [1, 1, 2]]
```

```
>>> from sage.all import *
>>> list(Compositions(Integer(4), outer=[Integer(3),Integer(1),Integer(2)]))
[[3, 1], [2, 1, 1], [1, 1, 2]]
```

`outer` sets `max_length` to the length of its argument. Moreover, the parts of `outer` may be infinite to clear the constraint on specific parts. This is the list of compositions of 4 of length at most 3 such that the first and third parts are at most 1:

```
sage: Compositions(4, outer=[1,oo,1]).list()
[[1, 3], [1, 2, 1]]
```

```
>>> from sage.all import *
>>> Compositions(Integer(4), outer=[Integer(1),oo,Integer(1)]).list()
[[1, 3], [1, 2, 1]]
```

This is the list of compositions of 4 bounded below by `[1,1,1]`:

```
sage: Compositions(4, inner=[1,1,1]).list()
[[2, 1, 1], [1, 2, 1], [1, 1, 2], [1, 1, 1, 1]]
```

```
>>> from sage.all import *
>>> Compositions(Integer(4), inner=[Integer(1),Integer(1),Integer(1)]).list()
[[2, 1, 1], [1, 2, 1], [1, 1, 2], [1, 1, 1, 1]]
```

The options `min_slope` and `max_slope` can be used to set constraints on the slope, that is the difference `p[i+1]-p[i]` of two consecutive parts. The following is the list of weakly increasing compositions of 4:

```
sage: Compositions(4, min_slope=0).list()
[[4], [2, 2], [1, 3], [1, 1, 2], [1, 1, 1, 1]]
```

```
>>> from sage.all import *
>>> Compositions(Integer(4), min_slope=Integer(0)).list()
[[4], [2, 2], [1, 3], [1, 1, 2], [1, 1, 1, 1]]
```

Here are the weakly decreasing ones:

```
sage: Compositions(4, max_slope=0).list()
[[4], [3, 1], [2, 2], [2, 1, 1], [1, 1, 1, 1]]
```

```
>>> from sage.all import *
>>> Compositions(Integer(4), max_slope=Integer(0)).list()
[[4], [3, 1], [2, 2], [2, 1, 1], [1, 1, 1, 1]]
```

The following is the list of compositions of 4 such that two consecutive parts differ by at most one:

```
sage: Compositions(4, min_slope=-1, max_slope=1).list()
[[4], [2, 2], [2, 1, 1], [1, 2, 1], [1, 1, 2], [1, 1, 1, 1]]
```

```
>>> from sage.all import *
>>> Compositions(Integer(4), min_slope=-Integer(1), max_slope=Integer(1)).list()
[[4], [2, 2], [2, 1, 1], [1, 2, 1], [1, 1, 2], [1, 1, 1, 1]]
```

The constraints can be combined together in all reasonable ways. This is the list of compositions of 5 of length between 2 and 4 such that the difference between consecutive parts is between -2 and 1:

```
sage: Compositions(5, max_slope=1, min_slope=-2, min_length=2, max_length=4).
↪list()
[[3, 2], [3, 1, 1], [2, 3], [2, 2, 1], [2, 1, 2], [2, 1, 1, 1], [1, 2, 2], [1, 2,␣
↪1, 1], [1, 1, 2, 1], [1, 1, 1, 2]]
```

```
>>> from sage.all import *
>>> Compositions(Integer(5), max_slope=Integer(1), min_slope=-Integer(2), min_
↪length=Integer(2), max_length=Integer(4)).list()
[[3, 2], [3, 1, 1], [2, 3], [2, 2, 1], [2, 1, 2], [2, 1, 1, 1], [1, 2, 2], [1, 2,␣
↪1, 1], [1, 1, 2, 1], [1, 1, 1, 2]]
```

We can do the same thing with an outer constraint:

```
sage: Compositions(5, max_slope=1, min_slope=-2, min_length=2, max_length=4,␣
↪outer=[2,5,2]).list()
[[2, 3], [2, 2, 1], [2, 1, 2], [1, 2, 2]]
```

```
>>> from sage.all import *
>>> Compositions(Integer(5), max_slope=Integer(1), min_slope=-Integer(2), min_
↪length=Integer(2), max_length=Integer(4), outer=[Integer(2),Integer(5),
↪Integer(2)]).list()
[[2, 3], [2, 2, 1], [2, 1, 2], [1, 2, 2]]
```

However, providing incoherent constraints may yield strange results. It is up to the user to ensure that the inner and outer compositions themselves satisfy the parts and slope constraints.

Note that setting `min_part=0` is not allowed:

```
sage: Compositions(2, length=3, min_part=0)
Traceback (most recent call last):
...
ValueError: setting min_part=0 is not allowed for Compositions
```

```
>>> from sage.all import *
>>> Compositions(Integer(2), length=Integer(3), min_part=Integer(0))
Traceback (most recent call last):
...
ValueError: setting min_part=0 is not allowed for Compositions
```

Instead you must use `IntegerVectors`:

```
sage: list(IntegerVectors(2, 3))
[[2, 0, 0], [1, 1, 0], [1, 0, 1], [0, 2, 0], [0, 1, 1], [0, 0, 2]]
```

```
>>> from sage.all import *
>>> list(IntegerVectors(Integer(2), Integer(3)))
[[2, 0, 0], [1, 1, 0], [1, 0, 1], [0, 2, 0], [0, 1, 1], [0, 0, 2]]
```

The generation algorithm is constant amortized time, and handled by the generic tool `IntegerListsLex`.

Element

alias of `Composition`

from_code(*code*)

Return the composition from its code. The code of a composition I is a list of length $\mathrm{size}(I)$ consisting of 1s and 0s such that there is a 1 wherever a new part starts. (Exceptional case: When the composition is empty, the code is `[0]`.)

EXAMPLES:

```
sage: Composition([4,1,2,3,5]).to_code()
[1, 0, 0, 0, 1, 1, 0, 1, 0, 0, 1, 0, 0, 0, 0]
sage: Compositions().from_code(_)
[4, 1, 2, 3, 5]
sage: Composition([3,1,2,3,5]).to_code()
[1, 0, 0, 1, 1, 0, 1, 0, 0, 1, 0, 0, 0, 0]
sage: Compositions().from_code(_)
[3, 1, 2, 3, 5]
```

```
>>> from sage.all import *
>>> Composition([Integer(4),Integer(1),Integer(2),Integer(3),Integer(5)]).to_
↪code()
[1, 0, 0, 0, 1, 1, 0, 1, 0, 0, 1, 0, 0, 0, 0]
>>> Compositions().from_code(_)
[4, 1, 2, 3, 5]
>>> Composition([Integer(3),Integer(1),Integer(2),Integer(3),Integer(5)]).to_
↪code()
[1, 0, 0, 1, 1, 0, 1, 0, 0, 1, 0, 0, 0, 0]
>>> Compositions().from_code(_)
[3, 1, 2, 3, 5]
```

from_descents(*descents*, *nps=None*)

Return a composition from the list of descents.

INPUT:

- `descents` – an iterable
- `nps` – integer or `None` (default: `None`)

OUTPUT:

- The composition of `nps` whose descents are listed in `descents`, assuming that `nps` is not `None` (otherwise, the last element of `descents` is removed from `descents`, and `nps` is set to be this last element plus 1).

EXAMPLES:

```
sage: [x-1 for x in Composition([1, 1, 3, 4, 3]).to_subset()]
[0, 1, 4, 8]
```

(continues on next page)

(continued from previous page)

```
sage: Compositions().from_descents([1,0,4,8],12)
[1, 1, 3, 4, 3]
sage: Compositions().from_descents([1,0,4,8,11])
[1, 1, 3, 4, 3]
```

```
>>> from sage.all import *
>>> [x-Integer(1) for x in Composition([Integer(1), Integer(1), Integer(3),␣
↪Integer(4), Integer(3)]).to_subset()]
[0, 1, 4, 8]
>>> Compositions().from_descents([Integer(1),Integer(0),Integer(4),
↪Integer(8)],Integer(12))
[1, 1, 3, 4, 3]
>>> Compositions().from_descents([Integer(1),Integer(0),Integer(4),Integer(8),
↪Integer(11)])
[1, 1, 3, 4, 3]
```

from_subset(S, n)

The composition of n corresponding to the subset `S` of $\{1, 2, \ldots, n-1\}$ under the bijection that maps the composition $(i_1, i_2, \ldots, i_k)$ of n to the subset $\{i_1, i_1 + i_2, i_1 + i_2 + i_3, \ldots, i_1 + \cdots + i_{k-1}\}$ (see *Composition.to_subset()*).

INPUT:

- `S` – an iterable, a subset of $\{1, 2, \ldots, n-1\}$
- `n` – integer

EXAMPLES:

```
sage: Compositions().from_subset([2,1,5,9], 12)
[1, 1, 3, 4, 3]
sage: Compositions().from_subset({2,1,5,9}, 12)
[1, 1, 3, 4, 3]

sage: Compositions().from_subset([], 12)
[12]
sage: Compositions().from_subset([], 0)
[]
```

```
>>> from sage.all import *
>>> Compositions().from_subset([Integer(2),Integer(1),Integer(5),Integer(9)],␣
↪Integer(12))
[1, 1, 3, 4, 3]
>>> Compositions().from_subset({Integer(2),Integer(1),Integer(5),Integer(9)},␣
↪Integer(12))
[1, 1, 3, 4, 3]

>>> Compositions().from_subset([], Integer(12))
[12]
>>> Compositions().from_subset([], Integer(0))
[]
```

class sage.combinat.composition.**Compositions_all**

Bases: *Compositions*

Class of all compositions.

subset(*size=None*)

Return the set of compositions of the given size.

EXAMPLES:

```
sage: C = Compositions()
sage: C.subset(4)
Compositions of 4
sage: C.subset(size=3)
Compositions of 3
```

```
>>> from sage.all import *
>>> C = Compositions()
>>> C.subset(Integer(4))
Compositions of 4
>>> C.subset(size=Integer(3))
Compositions of 3
```

zero()

Return the zero of the additive monoid.

This is the empty composition.

EXAMPLES:

```
sage: C = Compositions()
sage: C.zero()
[]
```

```
>>> from sage.all import *
>>> C = Compositions()
>>> C.zero()
[]
```

class sage.combinat.composition.**Compositions_constraints**(**args*, ***kwds*)

Bases: `IntegerListsLex`

class sage.combinat.composition.**Compositions_n**(*n*)

Bases: `Compositions`

Class of compositions of a fixed n.

cardinality()

Return the number of compositions of n.

random_element()

Return a random `Composition` with uniform probability.

This method generates a random binary word starting with a 1 and then uses the bijection between compositions and their code.

EXAMPLES:

```
sage: Compositions(5).random_element() # random
[2, 1, 1, 1]
sage: Compositions(0).random_element()
[]
sage: Compositions(1).random_element()
[1]
```

```
>>> from sage.all import *
>>> Compositions(Integer(5)).random_element() # random
[2, 1, 1, 1]
>>> Compositions(Integer(0)).random_element()
[]
>>> Compositions(Integer(1)).random_element()
[1]
```

sage.combinat.composition.**composition_iterator_fast**(n)

Iterator over compositions of n yielded as lists.

5.1.30 Signed Compositions

class sage.combinat.composition_signed.**SignedCompositions**(n)

Bases: *Compositions_n*

The class of signed compositions of n.

EXAMPLES:

```
sage: SC3 = SignedCompositions(3); SC3
Signed compositions of 3
sage: SC3.cardinality()
18
sage: len(SC3.list())
18
sage: SC3.first()
[1, 1, 1]
sage: SC3.last()
[-3]
sage: SC3.random_element() # random
[1, -1, 1]
sage: SC3.list()
[[1, 1, 1],
 [1, 1, -1],
 [1, -1, 1],
 [1, -1, -1],
 [-1, 1, 1],
 [-1, 1, -1],
 [-1, -1, 1],
 [-1, -1, -1],
 [1, 2],
 [1, -2],
 [-1, 2],
 [-1, -2],
 [2, 1],
```

(continues on next page)

(continued from previous page)

```
 [2, -1],
 [-2, 1],
 [-2, -1],
 [3],
 [-3]]
```

```
>>> from sage.all import *
>>> SC3 = SignedCompositions(Integer(3)); SC3
Signed compositions of 3
>>> SC3.cardinality()
18
>>> len(SC3.list())
18
>>> SC3.first()
[1, 1, 1]
>>> SC3.last()
[-3]
>>> SC3.random_element() # random
[1, -1, 1]
>>> SC3.list()
[[1, 1, 1],
 [1, 1, -1],
 [1, -1, 1],
 [1, -1, -1],
 [-1, 1, 1],
 [-1, 1, -1],
 [-1, -1, 1],
 [-1, -1, -1],
 [1, 2],
 [1, -2],
 [-1, 2],
 [-1, -2],
 [2, 1],
 [2, -1],
 [-2, 1],
 [-2, -1],
 [3],
 [-3]]
```

cardinality()

Return the number of elements in `self`.

The number of signed compositions of n is equal to

$$\sum_{i=1}^{n+1} \binom{n-1}{i-1} 2^i$$

EXAMPLES:

```
sage: SC4 = SignedCompositions(4)
sage: SC4.cardinality() == len(SC4.list())
True
```

(continues on next page)

(continued from previous page)

```
sage: SignedCompositions(3).cardinality()
18
```

```
>>> from sage.all import *
>>> SC4 = SignedCompositions(Integer(4))
>>> SC4.cardinality() == len(SC4.list())
True
>>> SignedCompositions(Integer(3)).cardinality()
18
```

5.1.31 Composition Tableaux

AUTHORS:

- Chris Berg, Jeff Ferreira (2012-9): Initial version

class sage.combinat.composition_tableau.**CompositionTableau**(*parent*, *t*)

Bases: *CombinatorialElement*

A composition tableau.

A *composition tableau* t of shape $I = (I_1, \ldots, I_\ell)$ is an array of boxes in rows, I_i boxes in row i, filled with positive integers such that:

1) the entries in the rows of t weakly decrease from left to right,
2) the left-most column of t strictly increase from top to bottom.
3) Add zero entries to the rows of t until the resulting array is rectangular of shape $\ell \times m$. For $1 \leq i < j \leq \ell, 2 \leq k \leq m$ and $(t(j,k) \neq 0$, and also if $t(j,k) \geq t(i,k))$ implies $t(j,k) > t(i,k-1)$.

INPUT:

- t – list of lists

EXAMPLES:

```
sage: CompositionTableau([[1],[2,2]])
[[1], [2, 2]]
sage: CompositionTableau([[1],[3,2],[4,4]])
[[1], [3, 2], [4, 4]]
sage: CompositionTableau([])
[]
```

```
>>> from sage.all import *
>>> CompositionTableau([[Integer(1)],[Integer(2),Integer(2)]])
[[1], [2, 2]]
>>> CompositionTableau([[Integer(1)],[Integer(3),Integer(2)],[Integer(4),
↪Integer(4)]])
[[1], [3, 2], [4, 4]]
>>> CompositionTableau([])
[]
```

descent_composition()

Return the composition corresponding to the set of all i that do not have $i+1$ appearing strictly to the left of i in self.

EXAMPLES:

```
sage: CompositionTableau([[1],[3,2],[4,4]]).descent_composition()
[1, 2, 2]
```

```
>>> from sage.all import *
>>> CompositionTableau([[Integer(1)],[Integer(3),Integer(2)],[Integer(4),
↪Integer(4)]]).descent_composition()
[1, 2, 2]
```

descent_set()

Return the set of all i that do *not* have $i+1$ appearing strictly to the left of i in `self`.

EXAMPLES:

```
sage: CompositionTableau([[1],[3,2],[4,4]]).descent_set()
[1, 3]
```

```
>>> from sage.all import *
>>> CompositionTableau([[Integer(1)],[Integer(3),Integer(2)],[Integer(4),
↪Integer(4)]]).descent_set()
[1, 3]
```

is_standard()

Return `True` if `self` is a standard composition tableau and `False` otherwise.

EXAMPLES:

```
sage: CompositionTableau([[1,1],[3,2],[4,4,3]]).is_standard()
False
sage: CompositionTableau([[2,1],[3],[4]]).is_standard()
True
```

```
>>> from sage.all import *
>>> CompositionTableau([[Integer(1),Integer(1)],[Integer(3),Integer(2)],
↪[Integer(4),Integer(4),Integer(3)]]).is_standard()
False
>>> CompositionTableau([[Integer(2),Integer(1)],[Integer(3)],[Integer(4)]]).
↪is_standard()
True
```

pp()

Return a pretty print string of `self`.

EXAMPLES:

```
sage: CompositionTableau([[1],[3,2],[4,4]]).pp()
1
3  2
4  4
```

```
>>> from sage.all import *
>>> CompositionTableau([[Integer(1)],[Integer(3),Integer(2)],[Integer(4),
↪Integer(4)]]).pp()
```

(continues on next page)

(continued from previous page)

```
1
3  2
4  4
```

shape_composition()

Return a Composition object which is the shape of `self`.

EXAMPLES:

```
sage: CompositionTableau([[1,1],[3,2],[4,4,3]]).shape_composition()
[2, 2, 3]
sage: CompositionTableau([[2,1],[3],[4]]).shape_composition()
[2, 1, 1]
```

```
>>> from sage.all import *
>>> CompositionTableau([[Integer(1),Integer(1)],[Integer(3),Integer(2)],
→[Integer(4),Integer(4),Integer(3)]]).shape_composition()
[2, 2, 3]
>>> CompositionTableau([[Integer(2),Integer(1)],[Integer(3)],[Integer(4)]]).
→shape_composition()
[2, 1, 1]
```

shape_partition()

Return a partition which is the shape of `self` sorted into weakly decreasing order.

EXAMPLES:

```
sage: CompositionTableau([[1,1],[3,2],[4,4,3]]).shape_partition()
[3, 2, 2]
sage: CompositionTableau([[2,1],[3],[4]]).shape_partition()
[2, 1, 1]
```

```
>>> from sage.all import *
>>> CompositionTableau([[Integer(1),Integer(1)],[Integer(3),Integer(2)],
→[Integer(4),Integer(4),Integer(3)]]).shape_partition()
[3, 2, 2]
>>> CompositionTableau([[Integer(2),Integer(1)],[Integer(3)],[Integer(4)]]).
→shape_partition()
[2, 1, 1]
```

size()

Return the number of boxes in `self`.

EXAMPLES:

```
sage: CompositionTableau([[1],[3,2],[4,4]]).size()
5
```

```
>>> from sage.all import *
>>> CompositionTableau([[Integer(1)],[Integer(3),Integer(2)],[Integer(4),
→Integer(4)]]).size()
5
```

weight()

Return a composition where entry i is the number of times that i appears in `self`.

EXAMPLES:

```
sage: CompositionTableau([[1],[3,2],[4,4]]).weight()
[1, 1, 1, 2, 0]
```

```
>>> from sage.all import *
>>> CompositionTableau([[Integer(1)],[Integer(3),Integer(2)],[Integer(4),
↪Integer(4)]]).weight()
[1, 1, 1, 2, 0]
```

class sage.combinat.composition_tableau.**CompositionTableaux**(****kwds*)

Bases: `UniqueRepresentation`, `Parent`

Composition tableaux.

INPUT:

- `size` – the size of the composition tableaux
- `shape` – the shape of the composition tableaux
- `max_entry` – the maximum entry for the composition tableaux

The first argument is interpreted as `size` or `shape` depending on whether it is an integer or a composition.

EXAMPLES:

```
sage: CT = CompositionTableaux(3); CT
Composition Tableaux of size 3 and maximum entry 3
sage: list(CT)
[[[1], [2], [3]],
 [[1], [2, 2]],
 [[1], [3, 2]],
 [[1], [3, 3]],
 [[2], [3, 3]],
 [[1, 1], [2]],
 [[1, 1], [3]],
 [[2, 1], [3]],
 [[2, 2], [3]],
 [[1, 1, 1]],
 [[2, 1, 1]],
 [[2, 2, 1]],
 [[2, 2, 2]],
 [[3, 1, 1]],
 [[3, 2, 1]],
 [[3, 2, 2]],
 [[3, 3, 1]],
 [[3, 3, 2]],
 [[3, 3, 3]]]

sage: CT = CompositionTableaux([1,2,1]); CT
Composition tableaux of shape [1, 2, 1] and maximum entry 4
sage: list(CT)
[[[1], [2, 2], [3]],
```

(continues on next page)

(continued from previous page)

```
 [[1], [2, 2], [4]],
 [[1], [3, 2], [4]],
 [[1], [3, 3], [4]],
 [[2], [3, 3], [4]]]

sage: CT = CompositionTableaux(shape=[1,2,1],max_entry=3); CT
Composition tableaux of shape [1, 2, 1] and maximum entry 3
sage: list(CT)
[[[1], [2, 2], [3]]]

sage: CT = CompositionTableaux(2,max_entry=3); CT
Composition Tableaux of size 2 and maximum entry 3
sage: list(CT)
[[[1], [2]],
 [[1], [3]],
 [[2], [3]],
 [[1, 1]],
 [[2, 1]],
 [[2, 2]],
 [[3, 1]],
 [[3, 2]],
 [[3, 3]]]

sage: CT = CompositionTableaux(0); CT
Composition Tableaux of size 0 and maximum entry 0
sage: list(CT)
[[]]
```

```
>>> from sage.all import *
>>> CT = CompositionTableaux(Integer(3)); CT
Composition Tableaux of size 3 and maximum entry 3
>>> list(CT)
[[[1], [2], [3]],
 [[1], [2, 2]],
 [[1], [3, 2]],
 [[1], [3, 3]],
 [[2], [3, 3]],
 [[1, 1], [2]],
 [[1, 1], [3]],
 [[2, 1], [3]],
 [[2, 2], [3]],
 [[1, 1, 1]],
 [[2, 1, 1]],
 [[2, 2, 1]],
 [[2, 2, 2]],
 [[3, 1, 1]],
 [[3, 2, 1]],
 [[3, 2, 2]],
 [[3, 3, 1]],
 [[3, 3, 2]],
 [[3, 3, 3]]]
```

(continues on next page)

(continued from previous page)

```
>>> CT = CompositionTableaux([Integer(1),Integer(2),Integer(1)]); CT
Composition tableaux of shape [1, 2, 1] and maximum entry 4
>>> list(CT)
[[[1], [2, 2], [3]],
 [[1], [2, 2], [4]],
 [[1], [3, 2], [4]],
 [[1], [3, 3], [4]],
 [[2], [3, 3], [4]]]

>>> CT = CompositionTableaux(shape=[Integer(1),Integer(2),Integer(1)],max_
↪entry=Integer(3)); CT
Composition tableaux of shape [1, 2, 1] and maximum entry 3
>>> list(CT)
[[[1], [2, 2], [3]]]

>>> CT = CompositionTableaux(Integer(2),max_entry=Integer(3)); CT
Composition Tableaux of size 2 and maximum entry 3
>>> list(CT)
[[[1], [2]],
 [[1], [3]],
 [[2], [3]],
 [[1, 1]],
 [[2, 1]],
 [[2, 2]],
 [[3, 1]],
 [[3, 2]],
 [[3, 3]]]

>>> CT = CompositionTableaux(Integer(0)); CT
Composition Tableaux of size 0 and maximum entry 0
>>> list(CT)
[[]]
```

Element

alias of *CompositionTableau*

class sage.combinat.composition_tableau.**CompositionTableauxBacktracker**(*shape*, *max_entry=None*)

Bases: *GenericBacktracker*

A backtracker class for generating sets of composition tableaux.

get_next_pos(*ii*, *jj*)

EXAMPLES:

```
sage: from sage.combinat.composition_tableau import␣
↪CompositionTableauxBacktracker
sage: T = CompositionTableau([[2,1],[5,4,3,2],[6],[7,7,6]])
sage: n = CompositionTableauxBacktracker(T.shape_composition())
sage: n.get_next_pos(1,1)
(1, 2)
```

```
>>> from sage.all import *
>>> from sage.combinat.composition_tableau import␣
↪CompositionTableauxBacktracker
>>> T = CompositionTableau([[Integer(2),Integer(1)],[Integer(5),Integer(4),
↪Integer(3),Integer(2)],[Integer(6)],[Integer(7),Integer(7),Integer(6)]])
>>> n = CompositionTableauxBacktracker(T.shape_composition())
>>> n.get_next_pos(Integer(1),Integer(1))
(1, 2)
```

class sage.combinat.composition_tableau.**CompositionTableaux_all**(*max_entry=None*)

Bases: *CompositionTableaux*, DisjointUnionEnumeratedSets

All composition tableaux.

an_element()

Return a particular element of self.

EXAMPLES:

```
sage: CT = CompositionTableaux()
sage: CT.an_element()
[[1, 1], [2]]
```

```
>>> from sage.all import *
>>> CT = CompositionTableaux()
>>> CT.an_element()
[[1, 1], [2]]
```

class sage.combinat.composition_tableau.**CompositionTableaux_shape**(*comp*, *max_entry=None*)

Bases: *CompositionTableaux*

Composition tableaux of a fixed shape comp with a given max entry.

INPUT:

- comp – a composition
- max_entry – nonnegative integer (default: size of comp)

an_element()

Return a particular element of *CompositionTableaux_shape*.

EXAMPLES:

```
sage: CT = CompositionTableaux([1,2,1])
sage: CT.an_element()
[[1], [2, 2], [3]]
```

```
>>> from sage.all import *
>>> CT = CompositionTableaux([Integer(1),Integer(2),Integer(1)])
>>> CT.an_element()
[[1], [2, 2], [3]]
```

class sage.combinat.composition_tableau.**CompositionTableaux_size**(*n*, *max_entry=None*)

Bases: *CompositionTableaux*

Composition tableaux of a fixed size n.

INPUT:

- n – nonnegative integer
- max_entry – nonnegative integer (default: n)

OUTPUT: the class of composition tableaux of size n

5.1.32 Constellations

A constellation is a tuple $(g_0, g_1, \dots, g_k)$ of permutations such that the product $g_0 g_1 \dots g_k$ is the identity. One often assumes that the group generated by $g_0, g_1, \dots, g_k$ acts transitively ([LZ2004] definition 1). Geometrically, it corresponds to a covering of the 2-sphere ramified over k points (the transitivity condition corresponds to the connectivity of the covering).

EXAMPLES:

```
sage: c = Constellation(['(1,2)', '(1,3)', None])
sage: c
Constellation of length 3 and degree 3
g0 (1,2)(3)
g1 (1,3)(2)
g2 (1,3,2)
sage: C = Constellations(3,4); C
Connected constellations of length 3 and degree 4 on {1, 2, 3, 4}
sage: C.cardinality()  # long time
426

sage: C = Constellations(3, 4, domain=('a', 'b', 'c', 'd'))
sage: C
Connected constellations of length 3 and degree 4 on {'a', 'b', 'c', 'd'}
sage: c = C(('a','c'),(('b','c'),('a','d')), None)
sage: c
Constellation of length 3 and degree 4
g0 ('a','c')('b')('d')
g1 ('a','d')('b','c')
g2 ('a','d','c','b')
sage: c.is_connected()
True
sage: c.euler_characteristic()
2
sage: TestSuite(C).run()
```

```
>>> from sage.all import *
>>> c = Constellation(['(1,2)', '(1,3)', None])
>>> c
Constellation of length 3 and degree 3
g0 (1,2)(3)
g1 (1,3)(2)
g2 (1,3,2)
>>> C = Constellations(Integer(3),Integer(4)); C
Connected constellations of length 3 and degree 4 on {1, 2, 3, 4}
>>> C.cardinality()  # long time
426

```

(continues on next page)

(continued from previous page)

```
>>> C = Constellations(Integer(3), Integer(4), domain=('a', 'b', 'c', 'd'))
>>> C
Connected constellations of length 3 and degree 4 on {'a', 'b', 'c', 'd'}
>>> c = C(('a','c'),(('b','c'),('a','d')), None)
>>> c
Constellation of length 3 and degree 4
g0 ('a','c')('b')('d')
g1 ('a','d')('b','c')
g2 ('a','d','c','b')
>>> c.is_connected()
True
>>> c.euler_characteristic()
2
>>> TestSuite(C).run()
```

sage.combinat.constellation.**Constellation**(*g=None*, *mutable=False*, *connected=True*, *check=True*)

Constellation.

INPUT:

- `g` – list of permutations
- `mutable` – boolean (default: `False`); whether the result is mutable or not
- `connected` – boolean (default: `True`); whether the result should be connected
- `check` – boolean (default: `True`); whether or not to check. If it is `True`, then the list `g` must contain no `None`.

EXAMPLES:

Simple initialization:

```
sage: Constellation(['(0,1)','(0,3)(1,2)','(0,3,1,2)'])
Constellation of length 3 and degree 4
g0 (0,1)(2)(3)
g1 (0,3)(1,2)
g2 (0,3,1,2)
```

```
>>> from sage.all import *
>>> Constellation(['(0,1)','(0,3)(1,2)','(0,3,1,2)'])
Constellation of length 3 and degree 4
g0 (0,1)(2)(3)
g1 (0,3)(1,2)
g2 (0,3,1,2)
```

One of the permutation can be omitted:

```
sage: Constellation(['(0,1)', None, '(0,4)(1,2,3)'])
Constellation of length 3 and degree 5
g0 (0,1)(2)(3)(4)
g1 (0,3,2,1,4)
g2 (0,4)(1,2,3)
```

```
>>> from sage.all import *
>>> Constellation(['(0,1)', None, '(0,4)(1,2,3)'])
Constellation of length 3 and degree 5
g0 (0,1)(2)(3)(4)
g1 (0,3,2,1,4)
g2 (0,4)(1,2,3)
```

One can define mutable constellations:

```
sage: Constellation(([0,2,1], [2,1,0], [1,2,0]), mutable=True)
Constellation of length 3 and degree 3
g0 (0)(1,2)
g1 (0,2)(1)
g2 (0,1,2)
```

```
>>> from sage.all import *
>>> Constellation(([Integer(0),Integer(2),Integer(1)], [Integer(2),Integer(1),
↪Integer(0)], [Integer(1),Integer(2),Integer(0)]), mutable=True)
Constellation of length 3 and degree 3
g0 (0)(1,2)
g1 (0,2)(1)
g2 (0,1,2)
```

class sage.combinat.constellation.**Constellation_class**(*parent*, *g*, *connected*, *mutable*, *check*)

Bases: Element

Constellation.

A constellation or a tuple of permutations $(g_0, g_1, ..., g_k)$ such that the product $g_0 g_1 ... g_k$ is the identity.

braid_group_action(*i*)

Act on self as the braid group generator that exchanges position i and $i + 1$.

INPUT:

- i – integer in $[0, n - 1]$ where n is the length of self

EXAMPLES:

```
sage: sigma = lambda c, i: c.braid_group_action(i)

sage: c = Constellation(['(0,1)(2,3,4)','(1,4)',None]); c
Constellation of length 3 and degree 5
g0 (0,1)(2,3,4)
g1 (0)(1,4)(2)(3)
g2 (0,1,3,2,4)
sage: sigma(c, 1)
Constellation of length 3 and degree 5
g0 (0,1)(2,3,4)
g1 (0,1,3,2,4)
g2 (0,3)(1)(2)(4)
```

```
>>> from sage.all import *
>>> sigma = lambda c, i: c.braid_group_action(i)
```

(continues on next page)

(continued from previous page)

```
>>> c = Constellation(['(0,1)(2,3,4)','(1,4)',None]); c
Constellation of length 3 and degree 5
g0 (0,1)(2,3,4)
g1 (0)(1,4)(2)(3)
g2 (0,1,3,2,4)
>>> sigma(c, Integer(1))
Constellation of length 3 and degree 5
g0 (0,1)(2,3,4)
g1 (0,1,3,2,4)
g2 (0,3)(1)(2)(4)
```

Check the commutation relation:

```
sage: c = Constellation(['(0,1)(2,3,4)','(1,4)','(2,5)(0,4)',None])
sage: d = Constellation(['(0,1,3,5)','(2,3,4)','(0,3,5)',None])
sage: c13 = sigma(sigma(c, 0), 2)
sage: c31 = sigma(sigma(c, 2), 0)
sage: c13 == c31
True
sage: d13 = sigma(sigma(d, 0), 2)
sage: d31 = sigma(sigma(d, 2), 0)
sage: d13 == d31
True
```

```
>>> from sage.all import *
>>> c = Constellation(['(0,1)(2,3,4)','(1,4)','(2,5)(0,4)',None])
>>> d = Constellation(['(0,1,3,5)','(2,3,4)','(0,3,5)',None])
>>> c13 = sigma(sigma(c, Integer(0)), Integer(2))
>>> c31 = sigma(sigma(c, Integer(2)), Integer(0))
>>> c13 == c31
True
>>> d13 = sigma(sigma(d, Integer(0)), Integer(2))
>>> d31 = sigma(sigma(d, Integer(2)), Integer(0))
>>> d13 == d31
True
```

Check the braid relation:

```
sage: c121 = sigma(sigma(sigma(c, 1), 2), 1)
sage: c212 = sigma(sigma(sigma(c, 2), 1), 2)
sage: c121 == c212
True
sage: d121 = sigma(sigma(sigma(d, 1), 2), 1)
sage: d212 = sigma(sigma(sigma(d, 2), 1), 2)
sage: d121 == d212
True
```

```
>>> from sage.all import *
>>> c121 = sigma(sigma(sigma(c, Integer(1)), Integer(2)), Integer(1))
>>> c212 = sigma(sigma(sigma(c, Integer(2)), Integer(1)), Integer(2))
>>> c121 == c212
True
```

(continues on next page)

(continued from previous page)

```
>>> d121 = sigma(sigma(sigma(d, Integer(1)), Integer(2)), Integer(1))
>>> d212 = sigma(sigma(sigma(d, Integer(2)), Integer(1)), Integer(2))
>>> d121 == d212
True
```

braid_group_orbit()

Return the graph of the action of the braid group.

The action is considered up to isomorphism of constellation.

EXAMPLES:

```
sage: c = Constellation(['(0,1)(2,3,4)','(1,4)',None]); c
Constellation of length 3 and degree 5
g0 (0,1)(2,3,4)
g1 (0)(1,4)(2)(3)
g2 (0,1,3,2,4)
sage: G = c.braid_group_orbit()
sage: G.num_verts()
4
sage: G.num_edges()
12
```

```
>>> from sage.all import *
>>> c = Constellation(['(0,1)(2,3,4)','(1,4)',None]); c
Constellation of length 3 and degree 5
g0 (0,1)(2,3,4)
g1 (0)(1,4)(2)(3)
g2 (0,1,3,2,4)
>>> G = c.braid_group_orbit()
>>> G.num_verts()
4
>>> G.num_edges()
12
```

connected_components()

Return the connected components.

OUTPUT: list of connected constellations

EXAMPLES:

```
sage: c = Constellation(['(0,1)(2)', None, '(0,1)(2)'], connected=False)
sage: cc = c.connected_components(); cc
[Constellation of length 3 and degree 2
g0 (0,1)
g1 (0)(1)
g2 (0,1),
Constellation of length 3 and degree 1
g0 (0)
g1 (0)
g2 (0)]
sage: all(c2.is_connected() for c2 in cc)
True
```

(continues on next page)

(continued from previous page)

```
sage: c = Constellation(['(0,1,2)', None], connected=False)
sage: c.connected_components()
[Constellation of length 2 and degree 3
g0 (0,1,2)
g1 (0,2,1)]
```

```
>>> from sage.all import *
>>> c = Constellation(['(0,1)(2)', None, '(0,1)(2)'], connected=False)
>>> cc = c.connected_components(); cc
[Constellation of length 3 and degree 2
g0 (0,1)
g1 (0)(1)
g2 (0,1),
Constellation of length 3 and degree 1
g0 (0)
g1 (0)
g2 (0)]
>>> all(c2.is_connected() for c2 in cc)
True

>>> c = Constellation(['(0,1,2)', None], connected=False)
>>> c.connected_components()
[Constellation of length 2 and degree 3
g0 (0,1,2)
g1 (0,2,1)]
```

copy()

Return a copy of `self`.

degree()

Return the degree of the constellation.

The degree of a constellation is the number n that corresponds to the symmetric group $S(n)$ in which the permutations of the constellation are defined.

EXAMPLES:

```
sage: c = Constellation([])
sage: c.degree()
0
sage: c = Constellation(['(0,1)',None])
sage: c.degree()
2
sage: c = Constellation(['(0,1)','(0,3,2)(1,5)',None,'(4,3,2,1)'])
sage: c.degree()
6
```

```
>>> from sage.all import *
>>> c = Constellation([])
>>> c.degree()
0
>>> c = Constellation(['(0,1)',None])
```

(continues on next page)

(continued from previous page)

```
>>> c.degree()
2
>>> c = Constellation(['(0,1)','(0,3,2)(1,5)',None,'(4,3,2,1)'])
>>> c.degree()
6
```

euler_characteristic()

Return the Euler characteristic of the surface.

ALGORITHM:

Hurwitz formula

EXAMPLES:

```
sage: c = Constellation(['(0,1)', '(0,2)', None])
sage: c.euler_characteristic()
2

sage: c = Constellation(['(0,1,2,3)','(1,3,0,2)', '(0,3,1,2)', None])
sage: c.euler_characteristic()
-4
```

```
>>> from sage.all import *
>>> c = Constellation(['(0,1)', '(0,2)', None])
>>> c.euler_characteristic()
2

>>> c = Constellation(['(0,1,2,3)','(1,3,0,2)', '(0,3,1,2)', None])
>>> c.euler_characteristic()
-4
```

g(*i=None*)

Return the permutation g_i of the constellation.

INPUT:

- `i` – integer or `None` (default)

If `None` , return instead the list of all g_i.

EXAMPLES:

```
sage: c = Constellation(['(0,1,2)(3,4)','(0,3)',None])
sage: c.g(0)
(0,1,2)(3,4)
sage: c.g(1)
(0,3)
sage: c.g(2)
(0,4,3,2,1)
sage: c.g()
[(0,1,2)(3,4), (0,3), (0,4,3,2,1)]
```

```
>>> from sage.all import *
>>> c = Constellation(['(0,1,2)(3,4)','(0,3)',None])
```

(continues on next page)

(continued from previous page)

```
>>> c.g(Integer(0))
(0,1,2)(3,4)
>>> c.g(Integer(1))
(0,3)
>>> c.g(Integer(2))
(0,4,3,2,1)
>>> c.g()
[(0,1,2)(3,4), (0,3), (0,4,3,2,1)]
```

genus()

Return the genus of the surface.

EXAMPLES:

```
sage: c = Constellation(['(0,1)', '(0,2)', None])
sage: c.genus()
0

sage: c = Constellation(['(0,1)(2,3,4)','(1,3,4)(2,0)', None])
sage: c.genus()
1
```

```
>>> from sage.all import *
>>> c = Constellation(['(0,1)', '(0,2)', None])
>>> c.genus()
0

>>> c = Constellation(['(0,1)(2,3,4)','(1,3,4)(2,0)', None])
>>> c.genus()
1
```

is_connected()

Test of connectedness.

EXAMPLES:

```
sage: c = Constellation(['(0,1)(2)', None, '(0,1)(2)'], connected=False)
sage: c.is_connected()
False
sage: c = Constellation(['(0,1,2)', None], connected=False)
sage: c.is_connected()
True
```

```
>>> from sage.all import *
>>> c = Constellation(['(0,1)(2)', None, '(0,1)(2)'], connected=False)
>>> c.is_connected()
False
>>> c = Constellation(['(0,1,2)', None], connected=False)
>>> c.is_connected()
True
```

is_isomorphic(*other*, *return_map=False*)

Test of isomorphism.

Return `True` if the constellations are isomorphic (*i.e.* related by a common conjugacy) and return the permutation that conjugate the two permutations if `return_map` is `True` in such a way that `self.relabel(m) == other`.

ALGORITHM:

uses canonical labels obtained from the method `relabel()`.

EXAMPLES:

```
sage: c = Constellation([[1,0,2],[2,1,0],[0,2,1],None])
sage: d = Constellation([[2,1,0],[0,2,1],[1,0,2],None])
sage: answer, mapping = c.is_isomorphic(d,return_map=True)
sage: answer
True
sage: c.relabel(mapping) == d
True
```

```
>>> from sage.all import *
>>> c = Constellation([[Integer(1),Integer(0),Integer(2)],[Integer(2),
↪Integer(1),Integer(0)],[Integer(0),Integer(2),Integer(1)],None])
>>> d = Constellation([[Integer(2),Integer(1),Integer(0)],[Integer(0),
↪Integer(2),Integer(1)],[Integer(1),Integer(0),Integer(2)],None])
>>> answer, mapping = c.is_isomorphic(d,return_map=True)
>>> answer
True
>>> c.relabel(mapping) == d
True
```

is_mutable()

Return `False` as `self` is immutable.

EXAMPLES:

```
sage: c = Constellation(([0,2,1],[2,1,0],[1,2,0]), mutable=False)
sage: c.is_mutable()
False
```

```
>>> from sage.all import *
>>> c = Constellation(([Integer(0),Integer(2),Integer(1)],[Integer(2),
↪Integer(1),Integer(0)],[Integer(1),Integer(2),Integer(0)]), mutable=False)
>>> c.is_mutable()
False
```

length()

Return the number of permutations.

EXAMPLES:

```
sage: c = Constellation(['(0,1)','(0,2)','(0,3)',None])
sage: c.length()
4
sage: c = Constellation(['(0,1,3)',None,'(1,2)'])
sage: c.length()
3
```

```
>>> from sage.all import *
>>> c = Constellation(['(0,1)','(0,2)','(0,3)',None])
>>> c.length()
4
>>> c = Constellation(['(0,1,3)',None,'(1,2)'])
>>> c.length()
3
```

mutable_copy()

Return a mutable copy of `self`.

EXAMPLES:

```
sage: c = Constellation(([0,2,1],[2,1,0],[1,2,0]), mutable=False)
sage: d = c.mutable_copy()
sage: d.is_mutable()
True
```

```
>>> from sage.all import *
>>> c = Constellation(([Integer(0),Integer(2),Integer(1)],[Integer(2),
↪Integer(1),Integer(0)],[Integer(1),Integer(2),Integer(0)]), mutable=False)
>>> d = c.mutable_copy()
>>> d.is_mutable()
True
```

passport(*i=None*)

Return the profile of `self`.

The profile of a constellation is the tuple of partitions associated to the conjugacy classes of the permutations of the constellation.

This is also called the passport.

EXAMPLES:

```
sage: c = Constellation(['(0,1,2)(3,4)','(0,3)',None])
sage: c.profile()
([3, 2], [2, 1, 1, 1], [5])
```

```
>>> from sage.all import *
>>> c = Constellation(['(0,1,2)(3,4)','(0,3)',None])
>>> c.profile()
([3, 2], [2, 1, 1, 1], [5])
```

profile(*i=None*)

Return the profile of `self`.

The profile of a constellation is the tuple of partitions associated to the conjugacy classes of the permutations of the constellation.

This is also called the passport.

EXAMPLES:

```
sage: c = Constellation(['(0,1,2)(3,4)','(0,3)',None])
sage: c.profile()
([3, 2], [2, 1, 1, 1], [5])
```

```
>>> from sage.all import *
>>> c = Constellation(['(0,1,2)(3,4)','(0,3)',None])
>>> c.profile()
([3, 2], [2, 1, 1, 1], [5])
```

relabel(*perm=None*, *return_map=False*)

Relabel `self`.

If `perm` is provided then relabel with respect to `perm`. Otherwise use canonical labels. In that case, if `return_map` is provided, the return also the map used for canonical labels.

Algorithm:

the cycle for g(0) are adjacent and the cycle are joined with respect to the other permutations. The minimum is taken for all possible renumerotations.

EXAMPLES:

```
sage: c = Constellation(['(0,1)(2,3,4)','(1,4)',None]); c
Constellation of length 3 and degree 5
g0 (0,1)(2,3,4)
g1 (0)(1,4)(2)(3)
g2 (0,1,3,2,4)
sage: c2 = c.relabel(); c2
Constellation of length 3 and degree 5
g0 (0,1)(2,3,4)
g1 (0)(1,2)(3)(4)
g2 (0,1,4,3,2)
```

```
>>> from sage.all import *
>>> c = Constellation(['(0,1)(2,3,4)','(1,4)',None]); c
Constellation of length 3 and degree 5
g0 (0,1)(2,3,4)
g1 (0)(1,4)(2)(3)
g2 (0,1,3,2,4)
>>> c2 = c.relabel(); c2
Constellation of length 3 and degree 5
g0 (0,1)(2,3,4)
g1 (0)(1,2)(3)(4)
g2 (0,1,4,3,2)
```

The map returned when the option `return_map` is set to `True` can be used to set the relabelling:

```
sage: c3, perm = c.relabel(return_map=True)
sage: c3 == c2 and c3 == c.relabel(perm=perm)
True

sage: S5 = SymmetricGroup(range(5))
sage: d = c.relabel(S5([4,3,1,0,2])); d
Constellation of length 3 and degree 5
```

(continues on next page)

(continued from previous page)

```
g0 (0,2,1)(3,4)
g1 (0)(1)(2,3)(4)
g2 (0,1,2,4,3)
sage: d.is_isomorphic(c)
True
```

```
>>> from sage.all import *
>>> c3, perm = c.relabel(return_map=True)
>>> c3 == c2 and c3 == c.relabel(perm=perm)
True

>>> S5 = SymmetricGroup(range(Integer(5)))
>>> d = c.relabel(S5([Integer(4),Integer(3),Integer(1),Integer(0),
↪Integer(2)])); d
Constellation of length 3 and degree 5
g0 (0,2,1)(3,4)
g1 (0)(1)(2,3)(4)
g2 (0,1,2,4,3)
>>> d.is_isomorphic(c)
True
```

We check that after a random relabelling the new constellation is isomorphic to the initial one:

```
sage: c = Constellation(['(0,1)(2,3,4)','(1,4)',None])
sage: p = S5.random_element()
sage: cc = c.relabel(perm=p)
sage: cc.is_isomorphic(c)
True
```

```
>>> from sage.all import *
>>> c = Constellation(['(0,1)(2,3,4)','(1,4)',None])
>>> p = S5.random_element()
>>> cc = c.relabel(perm=p)
>>> cc.is_isomorphic(c)
True
```

Check that it works for “non standard” labels:

```
sage: c = Constellation([(('a','b'),('c','d','e')),('b','d'), None])
sage: c.relabel()
Constellation of length 3 and degree 5
g0 ('a','b')('c','d','e')
g1 ('a')('b','c')('d')('e')
g2 ('a','b','e','d','c')
```

```
>>> from sage.all import *
>>> c = Constellation([(('a','b'),('c','d','e')),('b','d'), None])
>>> c.relabel()
Constellation of length 3 and degree 5
g0 ('a','b')('c','d','e')
g1 ('a')('b','c')('d')('e')
g2 ('a','b','e','d','c')
```

set_immutable()

Do nothing, as `self` is already immutable.

EXAMPLES:

```
sage: c = Constellation(([0,2,1],[2,1,0],[1,2,0]), mutable=False)
sage: c.set_immutable()
sage: c.is_mutable()
False
```

```
>>> from sage.all import *
>>> c = Constellation(([Integer(0),Integer(2),Integer(1)],[Integer(2),
↪Integer(1),Integer(0)],[Integer(1),Integer(2),Integer(0)]), mutable=False)
>>> c.set_immutable()
>>> c.is_mutable()
False
```

switch(*i*, *j0*, *j1*)

Perform the multiplication by the transposition $(j0, j1)$ between the permutations g_i and g_{i+1}.

The modification is local in the sense that it modifies g_i and g_{i+1} but does not modify the product $g_i g_{i+1}$. The new constellation is

$$(g_0, \ldots, g_{i-1}, g_i(j0j1), (j0j1)g_{i+1}, g_{i+2}, \ldots, g_k)$$

EXAMPLES:

```
sage: c = Constellation(['(0,1)(2,3,4)','(1,4)',None], mutable=True); c
Constellation of length 3 and degree 5
g0 (0,1)(2,3,4)
g1 (0)(1,4)(2)(3)
g2 (0,1,3,2,4)
sage: c.is_mutable()
True
sage: c.switch(1,2,3); c
Constellation of length 3 and degree 5
g0 (0,1)(2,3,4)
g1 (0)(1,4)(2,3)
g2 (0,1,3,4)(2)
sage: c._check()
sage: c.switch(2,1,3); c
Constellation of length 3 and degree 5
g0 (0,1,4,2,3)
g1 (0)(1,4)(2,3)
g2 (0,3,4)(1)(2)
sage: c._check()
sage: c.switch(0,0,1); c
Constellation of length 3 and degree 5
g0 (0)(1,4,2,3)
g1 (0,4,1)(2,3)
g2 (0,3,4)(1)(2)
sage: c._check()
```

```
>>> from sage.all import *
>>> c = Constellation(['(0,1)(2,3,4)','(1,4)',None], mutable=True); c
Constellation of length 3 and degree 5
g0 (0,1)(2,3,4)
g1 (0)(1,4)(2)(3)
g2 (0,1,3,2,4)
>>> c.is_mutable()
True
>>> c.switch(Integer(1),Integer(2),Integer(3)); c
Constellation of length 3 and degree 5
g0 (0,1)(2,3,4)
g1 (0)(1,4)(2,3)
g2 (0,1,3,4)(2)
>>> c._check()
>>> c.switch(Integer(2),Integer(1),Integer(3)); c
Constellation of length 3 and degree 5
g0 (0,1,4,2,3)
g1 (0)(1,4)(2,3)
g2 (0,3,4)(1)(2)
>>> c._check()
>>> c.switch(Integer(0),Integer(0),Integer(1)); c
Constellation of length 3 and degree 5
g0 (0)(1,4,2,3)
g1 (0,4,1)(2,3)
g2 (0,3,4)(1)(2)
>>> c._check()
```

sage.combinat.constellation.**Constellations**(**data*, ***options*)

Build a set of constellations.

INPUT:

- `profile` – an optional profile
- `length` – an optional length
- `degree` – an optional degree
- `connected` – an optional boolean

EXAMPLES:

```
sage: Constellations(4,2)
Connected constellations of length 4 and degree 2 on {1, 2}

sage: Constellations([[3,2,1],[3,3],[3,3]])
Connected constellations with profile ([3, 2, 1], [3, 3], [3, 3]) on {1, 2, 3, 4,
↪5, 6}
```

```
>>> from sage.all import *
>>> Constellations(Integer(4),Integer(2))
Connected constellations of length 4 and degree 2 on {1, 2}

>>> Constellations([[Integer(3),Integer(2),Integer(1)],[Integer(3),Integer(3)],
↪[Integer(3),Integer(3)]])
```

(continues on next page)

(continued from previous page)

```
Connected constellations with profile ([3, 2, 1], [3, 3], [3, 3]) on {1, 2, 3, 4,␣
↪5, 6}
```

class sage.combinat.constellation.**Constellations_ld**(*length*, *degree*, *sym=None*, *connected=True*)

Bases: UniqueRepresentation, Parent

Constellations of given length and degree.

EXAMPLES:

```
sage: C = Constellations(2,3); C
Connected constellations of length 2 and degree 3 on {1, 2, 3}
sage: C([[2,3,1],[3,1,2]])
Constellation of length 2 and degree 3
g0 (1,2,3)
g1 (1,3,2)
sage: C.cardinality()
2
sage: Constellations(2,3,connected=False).cardinality()
6
```

```
>>> from sage.all import *
>>> C = Constellations(Integer(2),Integer(3)); C
Connected constellations of length 2 and degree 3 on {1, 2, 3}
>>> C([[Integer(2),Integer(3),Integer(1)],[Integer(3),Integer(1),Integer(2)]])
Constellation of length 2 and degree 3
g0 (1,2,3)
g1 (1,3,2)
>>> C.cardinality()
2
>>> Constellations(Integer(2),Integer(3),connected=False).cardinality()
6
```

Element

alias of *Constellation_class*

braid_group_action()

Return a list of graphs that corresponds to the braid group action on `self` up to isomorphism.

OUTPUT: list of graphs

EXAMPLES:

```
sage: C = Constellations(3,3)
sage: C.braid_group_action()
[Looped multi-digraph on 3 vertices,
 Looped multi-digraph on 1 vertex,
 Looped multi-digraph on 3 vertices]
```

```
>>> from sage.all import *
>>> C = Constellations(Integer(3),Integer(3))
>>> C.braid_group_action()
[Looped multi-digraph on 3 vertices,
```

(continues on next page)

(continued from previous page)

```
Looped multi-digraph on 1 vertex,
Looped multi-digraph on 3 vertices]
```

braid_group_orbits()

Return the orbits under the action of braid group.

EXAMPLES:

```
sage: C = Constellations(3,3)
sage: O = C.braid_group_orbits()
sage: len(O)
3
sage: [x.profile() for x in O[0]]
[([1, 1, 1], [3], [3]), ([3], [1, 1, 1], [3]), ([3], [3], [1, 1, 1])]
sage: [x.profile() for x in O[1]]
[([3], [3], [3])]
sage: [x.profile() for x in O[2]]
[([2, 1], [2, 1], [3]), ([2, 1], [3], [2, 1]), ([3], [2, 1], [2, 1])]
```

```
>>> from sage.all import *
>>> C = Constellations(Integer(3),Integer(3))
>>> O = C.braid_group_orbits()
>>> len(O)
3
>>> [x.profile() for x in O[Integer(0)]]
[([1, 1, 1], [3], [3]), ([3], [1, 1, 1], [3]), ([3], [3], [1, 1, 1])]
>>> [x.profile() for x in O[Integer(1)]]
[([3], [3], [3])]
>>> [x.profile() for x in O[Integer(2)]]
[([2, 1], [2, 1], [3]), ([2, 1], [3], [2, 1]), ([3], [2, 1], [2, 1])]
```

is_empty()

Return whether this set of constellations is empty.

EXAMPLES:

```
sage: Constellations(2, 3).is_empty()
False
sage: Constellations(1, 2).is_empty()
True
sage: Constellations(1, 2, connected=False).is_empty()
False
```

```
>>> from sage.all import *
>>> Constellations(Integer(2), Integer(3)).is_empty()
False
>>> Constellations(Integer(1), Integer(2)).is_empty()
True
>>> Constellations(Integer(1), Integer(2), connected=False).is_empty()
False
```

random_element(*mutable=False*)

Return a random element.

This is found by trial and rejection, starting from a random list of permutations.

EXAMPLES:

```
sage: const = Constellations(3,3)
sage: const.random_element()
Constellation of length 3 and degree 3
...
...
...
sage: c = const.random_element()
sage: c.degree() == 3 and c.length() == 3
True
```

```
>>> from sage.all import *
>>> const = Constellations(Integer(3),Integer(3))
>>> const.random_element()
Constellation of length 3 and degree 3
...
...
...
>>> c = const.random_element()
>>> c.degree() == Integer(3) and c.length() == Integer(3)
True
```

class sage.combinat.constellation.**Constellations_p**(*profile*, *domain=None*, *connected=True*)

Bases: UniqueRepresentation, Parent

Constellations with fixed profile.

EXAMPLES:

```
sage: C = Constellations([[3,1],[3,1],[2,2]]); C
Connected constellations with profile ([3, 1], [3, 1], [2, 2]) on {1, 2, 3, 4}
sage: C.cardinality()
24
sage: C.first()
Constellation of length 3 and degree 4
g0 (1)(2,3,4)
g1 (1,2,3)(4)
g2 (1,2)(3,4)
sage: C.last()
Constellation of length 3 and degree 4
g0 (1,4,3)(2)
g1 (1,4,2)(3)
g2 (1,2)(3,4)
```

```
>>> from sage.all import *
>>> C = Constellations([[Integer(3),Integer(1)],[Integer(3),Integer(1)],
↪[Integer(2),Integer(2)]]); C
Connected constellations with profile ([3, 1], [3, 1], [2, 2]) on {1, 2, 3, 4}
>>> C.cardinality()
24
>>> C.first()
```

(continues on next page)

(continued from previous page)

```
Constellation of length 3 and degree 4
g0 (1)(2,3,4)
g1 (1,2,3)(4)
g2 (1,2)(3,4)
>>> C.last()
Constellation of length 3 and degree 4
g0 (1,4,3)(2)
g1 (1,4,2)(3)
g2 (1,2)(3,4)
```

Note that the cardinality can also be computed using characters of the symmetric group (Frobenius formula):

```
sage: P = Partitions(4)
sage: p1 = Partition([3,1])
sage: p2 = Partition([3,1])
sage: p3 = Partition([2,2])
sage: i1 = P.cardinality() - P.rank(p1) - 1
sage: i2 = P.cardinality() - P.rank(p2) - 1
sage: i3 = P.cardinality() - P.rank(p3) - 1
sage: s = 0
sage: for c in SymmetricGroup(4).irreducible_characters():
....:     v = c.values()
....:     s += v[i1] * v[i2] * v[i3] / v[0]
sage: c1 = p1.conjugacy_class_size()
sage: c2 = p2.conjugacy_class_size()
sage: c3 = p3.conjugacy_class_size()
sage: c1 * c2 * c3 / factorial(4)**2 * s
1
```

```
>>> from sage.all import *
>>> P = Partitions(Integer(4))
>>> p1 = Partition([Integer(3),Integer(1)])
>>> p2 = Partition([Integer(3),Integer(1)])
>>> p3 = Partition([Integer(2),Integer(2)])
>>> i1 = P.cardinality() - P.rank(p1) - Integer(1)
>>> i2 = P.cardinality() - P.rank(p2) - Integer(1)
>>> i3 = P.cardinality() - P.rank(p3) - Integer(1)
>>> s = Integer(0)
>>> for c in SymmetricGroup(Integer(4)).irreducible_characters():
...     v = c.values()
...     s += v[i1] * v[i2] * v[i3] / v[Integer(0)]
>>> c1 = p1.conjugacy_class_size()
>>> c2 = p2.conjugacy_class_size()
>>> c3 = p3.conjugacy_class_size()
>>> c1 * c2 * c3 / factorial(Integer(4))**Integer(2) * s
1
```

The number obtained above is up to isomorphism. And we can check:

```
sage: len(C.isomorphism_representatives())
1
```

```
>>> from sage.all import *
>>> len(C.isomorphism_representatives())
1
```

isomorphism_representatives()

Return a set of isomorphism representative of `self`.

EXAMPLES:

```
sage: C = Constellations([[5], [4,1], [3,2]])
sage: C.cardinality()
240
sage: ir = sorted(C.isomorphism_representatives())
sage: len(ir)
2
sage: ir[0]
Constellation of length 3 and degree 5
g0 (1,2,3,4,5)
g1 (1)(2,3,4,5)
g2 (1,5,3)(2,4)
sage: ir[1]
Constellation of length 3 and degree 5
g0 (1,2,3,4,5)
g1 (1)(2,5,3,4)
g2 (1,5)(2,3,4)
```

```
>>> from sage.all import *
>>> C = Constellations([[Integer(5)], [Integer(4),Integer(1)], [Integer(3),
↪Integer(2)]])
>>> C.cardinality()
240
>>> ir = sorted(C.isomorphism_representatives())
>>> len(ir)
2
>>> ir[Integer(0)]
Constellation of length 3 and degree 5
g0 (1,2,3,4,5)
g1 (1)(2,3,4,5)
g2 (1,5,3)(2,4)
>>> ir[Integer(1)]
Constellation of length 3 and degree 5
g0 (1,2,3,4,5)
g1 (1)(2,5,3,4)
g2 (1,5)(2,3,4)
```

sage.combinat.constellation.**perm_conjugate**(p, s)

Return the conjugate of the permutation p by the permutation s.

INPUT:

- `p, s` – two permutations of {0,..,n-1} given by lists of values

OUTPUT: a permutation of {0,..,n-1} given by a list of values

EXAMPLES:

```
sage: from sage.combinat.constellation import perm_conjugate
sage: perm_conjugate([3,1,2,0], [3,2,0,1])
[0, 3, 2, 1]
```

```
>>> from sage.all import *
>>> from sage.combinat.constellation import perm_conjugate
>>> perm_conjugate([Integer(3),Integer(1),Integer(2),Integer(0)], [Integer(3),
↪Integer(2),Integer(0),Integer(1)])
[0, 3, 2, 1]
```

sage.combinat.constellation.**perm_invert**(*p*)

Return the inverse of the permutation p.

INPUT:

- p – a permutation of {0,..,n-1} given by a list of values

OUTPUT: a permutation of {0,..,n-1} given by a list of values

EXAMPLES:

```
sage: from sage.combinat.constellation import perm_invert
sage: perm_invert([3,2,0,1])
[2, 3, 1, 0]
```

```
>>> from sage.all import *
>>> from sage.combinat.constellation import perm_invert
>>> perm_invert([Integer(3),Integer(2),Integer(0),Integer(1)])
[2, 3, 1, 0]
```

sage.combinat.constellation.**perm_sym_domain**(*g*)

Return the domain of a single permutation (before initialization).

EXAMPLES:

```
sage: from sage.combinat.constellation import perm_sym_domain
sage: perm_sym_domain([1,2,3,4])
{1, 2, 3, 4}
sage: perm_sym_domain(((1,2),(0,4)))
{0, 1, 2, 4}
sage: sorted(perm_sym_domain('(1,2,0,5)'))
[0, 1, 2, 5]
```

```
>>> from sage.all import *
>>> from sage.combinat.constellation import perm_sym_domain
>>> perm_sym_domain([Integer(1),Integer(2),Integer(3),Integer(4)])
{1, 2, 3, 4}
>>> perm_sym_domain(((Integer(1),Integer(2)),(Integer(0),Integer(4))))
{0, 1, 2, 4}
>>> sorted(perm_sym_domain('(1,2,0,5)'))
[0, 1, 2, 5]
```

sage.combinat.constellation.**perms_are_connected**(*g*, *n*)

Check that the action of the generated group is transitive.

INPUT:

- g – list of permutations of $[0, n-1]$ (in a SymmetricGroup)
- n – integer

EXAMPLES:

```
sage: from sage.combinat.constellation import perms_are_connected
sage: S = SymmetricGroup(range(3))
sage: perms_are_connected([S([0,1,2]),S([0,2,1])],3)
False
sage: perms_are_connected([S([0,1,2]),S([1,2,0])],3)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.constellation import perms_are_connected
>>> S = SymmetricGroup(range(Integer(3)))
>>> perms_are_connected([S([Integer(0),Integer(1),Integer(2)]),S([Integer(0),
↪Integer(2),Integer(1)])],Integer(3))
False
>>> perms_are_connected([S([Integer(0),Integer(1),Integer(2)]),S([Integer(1),
↪Integer(2),Integer(0)])],Integer(3))
True
```

sage.combinat.constellation.**perms_canonical_labels**(*p*, *e=None*)

Relabel a list with a common conjugation such that two conjugated lists are relabeled the same way.

INPUT:

- p – list of at least 2 permutations
- e – None or a list of integer in the domain of the permutations. If provided, then the renumbering algorithm is only performed from the elements of e.

OUTPUT: a pair made of a list of permutations (as a list of lists) and a list that corresponds to the conjugacy used.

EXAMPLES:

```
sage: from sage.combinat.constellation import perms_canonical_labels
sage: l0 = [[2,0,3,1], [3,1,2,0], [0,2,1,3]]
sage: l, m = perms_canonical_labels(l0); l
[[1, 2, 3, 0], [0, 3, 2, 1], [2, 1, 0, 3]]

sage: S = SymmetricGroup(range(4))
sage: [~S(m) * S(u) * S(m) for u in l0] == list(map(S, l))
True

sage: perms_canonical_labels([])
Traceback (most recent call last):
...
ValueError: input must have length >= 2
```

```
>>> from sage.all import *
>>> from sage.combinat.constellation import perms_canonical_labels
>>> l0 = [[Integer(2),Integer(0),Integer(3),Integer(1)], [Integer(3),Integer(1),
↪Integer(2),Integer(0)], [Integer(0),Integer(2),Integer(1),Integer(3)]]
>>> l, m = perms_canonical_labels(l0); l
```

(continues on next page)

(continued from previous page)

```
[[1, 2, 3, 0], [0, 3, 2, 1], [2, 1, 0, 3]]

>>> S = SymmetricGroup(range(Integer(4)))
>>> [~S(m) * S(u) * S(m) for u in l0] == list(map(S, l))
True

>>> perms_canonical_labels([])
Traceback (most recent call last):
...
ValueError: input must have length >= 2
```

sage.combinat.constellation.**perms_canonical_labels_from**(*x*, *y*, *j0*, *verbose=False*)

Return canonical labels for `x`, `y` that starts at `j0`.

> **Warning**
>
> The group generated by `x` and the elements of `y` should be transitive.

INPUT:

- `x` – list; a permutation of $[0, \ldots, n]$ as a list
- `y` – list of permutations of $[0, \ldots, n]$ as a list of lists
- `j0` – an index in [0, …, n]

OUTPUT: mapping: a permutation that specify the new labels

EXAMPLES:

```
sage: from sage.combinat.constellation import perms_canonical_labels_from
sage: perms_canonical_labels_from([0,1,2],[[1,2,0]], 0)
[0, 1, 2]
sage: perms_canonical_labels_from([1,0,2], [[2,0,1]], 0)
[0, 1, 2]
sage: perms_canonical_labels_from([1,0,2], [[2,0,1]], 1)
[1, 0, 2]
sage: perms_canonical_labels_from([1,0,2], [[2,0,1]], 2)
[2, 1, 0]
```

```
>>> from sage.all import *
>>> from sage.combinat.constellation import perms_canonical_labels_from
>>> perms_canonical_labels_from([Integer(0),Integer(1),Integer(2)],[[Integer(1),
→Integer(2),Integer(0)]], Integer(0))
[0, 1, 2]
>>> perms_canonical_labels_from([Integer(1),Integer(0),Integer(2)], [[Integer(2),
→Integer(0),Integer(1)]], Integer(0))
[0, 1, 2]
>>> perms_canonical_labels_from([Integer(1),Integer(0),Integer(2)], [[Integer(2),
→Integer(0),Integer(1)]], Integer(1))
[1, 0, 2]
>>> perms_canonical_labels_from([Integer(1),Integer(0),Integer(2)], [[Integer(2),
```

(continues on next page)

(continued from previous page)

```
↪Integer(0),Integer(1)]], Integer(2))
[2, 1, 0]
```

sage.combinat.constellation.**perms_sym_init**(*g*, *sym=None*)

Initialize a list of permutations (in the same symmetric group).

OUTPUT:

- `sym` – a symmetric group
- `gg` – list of permutations

EXAMPLES:

```
sage: from sage.combinat.constellation import perms_sym_init
sage: S, g = perms_sym_init([[0,2,1,3], [1,3,2,0]])
sage: S.domain()
{0, 1, 2, 3}
sage: g
[(1,2), (0,1,3)]

sage: S, g = perms_sym_init(['(2,1)', '(0,3)'])
sage: S.domain()
{0, 1, 2, 3}
sage: g
[(1,2), (0,3)]

sage: S, g = perms_sym_init([(1,0), (2,1)])
sage: S.domain()
{0, 1, 2}
sage: g
[(0,1), (1,2)]

sage: S, g = perms_sym_init([((1,0),(2,3)), '(0,1,4)'])
sage: S.domain()
{0, 1, 2, 3, 4}
sage: g
[(0,1)(2,3), (0,1,4)]
```

```
>>> from sage.all import *
>>> from sage.combinat.constellation import perms_sym_init
>>> S, g = perms_sym_init([[Integer(0),Integer(2),Integer(1),Integer(3)],␣
↪[Integer(1),Integer(3),Integer(2),Integer(0)]])
>>> S.domain()
{0, 1, 2, 3}
>>> g
[(1,2), (0,1,3)]

>>> S, g = perms_sym_init(['(2,1)', '(0,3)'])
>>> S.domain()
{0, 1, 2, 3}
>>> g
[(1,2), (0,3)]
```

(continues on next page)

(continued from previous page)

```
>>> S, g = perms_sym_init([(Integer(1),Integer(0)), (Integer(2),Integer(1))])
>>> S.domain()
{0, 1, 2}
>>> g
[(0,1), (1,2)]

>>> S, g = perms_sym_init([((Integer(1),Integer(0)),(Integer(2),Integer(3))), '(0,
↪1,4)'])
>>> S.domain()
{0, 1, 2, 3, 4}
>>> g
[(0,1)(2,3), (0,1,4)]
```

5.1.33 Cores

A k-core is a partition from which no rim hook of size k can be removed. Alternatively, a k-core is an integer partition such that the Ferrers diagram for the partition contains no cells with a hook of size (a multiple of) k.

Authors:

- Anne Schilling and Mike Zabrocki (2011): initial version
- Travis Scrimshaw (2012): Added latex output for Core class

class sage.combinat.core.**Core**(*parent*, *core*)

Bases: *CombinatorialElement*

A k-core is an integer partition from which no rim hook of size k can be removed.

EXAMPLES:

```
sage: c = Core([2,1],4); c
[2, 1]
sage: c = Core([3,1],4); c
Traceback (most recent call last):
...
ValueError: [3, 1] is not a 4-core
```

```
>>> from sage.all import *
>>> c = Core([Integer(2),Integer(1)],Integer(4)); c
[2, 1]
>>> c = Core([Integer(3),Integer(1)],Integer(4)); c
Traceback (most recent call last):
...
ValueError: [3, 1] is not a 4-core
```

affine_symmetric_group_action(*w*, *transposition=False*)

Return the (left) action of the affine symmetric group on self.

INPUT:

- w – tuple of integers $[w_1, \ldots, w_m]$ with $0 \leq w_j < k$. If transposition is set to be True, then $w = [w_0, w_1]$ is interpreted as a transposition t_{w_0,w_1} (see _transposition_to_reduced_word()).
- transposition – boolean (default: False)

The output is the (left) action of the product of the corresponding simple transpositions on `self`, that is $s_{w_1} \cdots s_{w_m}(self)$. See `affine_symmetric_group_simple_action()`.

EXAMPLES:

```
sage: c = Core([4,2],3)
sage: c.affine_symmetric_group_action([0,1,0,2,1])
[8, 6, 4, 2]
sage: c.affine_symmetric_group_action([0,2], transposition=True)
[4, 2, 1, 1]

sage: c = Core([11,8,5,5,3,3,1,1,1],4)
sage: c.affine_symmetric_group_action([2,5],transposition=True)
[11, 8, 7, 6, 5, 4, 3, 2, 1]
```

```
>>> from sage.all import *
>>> c = Core([Integer(4),Integer(2)],Integer(3))
>>> c.affine_symmetric_group_action([Integer(0),Integer(1),Integer(0),
↪Integer(2),Integer(1)])
[8, 6, 4, 2]
>>> c.affine_symmetric_group_action([Integer(0),Integer(2)],␣
↪transposition=True)
[4, 2, 1, 1]

>>> c = Core([Integer(11),Integer(8),Integer(5),Integer(5),Integer(3),
↪Integer(3),Integer(1),Integer(1),Integer(1)],Integer(4))
>>> c.affine_symmetric_group_action([Integer(2),Integer(5)],
↪transposition=True)
[11, 8, 7, 6, 5, 4, 3, 2, 1]
```

affine_symmetric_group_simple_action(*i*)

Return the action of the simple transposition s_i of the affine symmetric group on `self`.

This gives the action of the affine symmetric group of type $A_k^{(1)}$ on the k-core `self`. If `self` has outside (resp. inside) corners of content i modulo k, then these corners are added (resp. removed). Otherwise the action is trivial.

EXAMPLES:

```
sage: c = Core([4,2],3)
sage: c.affine_symmetric_group_simple_action(0)                              #␣
↪needs sage.modules
[3, 1]
sage: c.affine_symmetric_group_simple_action(1)                              #␣
↪needs sage.modules
[5, 3, 1]
sage: c.affine_symmetric_group_simple_action(2)                              #␣
↪needs sage.modules
[4, 2]
```

```
>>> from sage.all import *
>>> c = Core([Integer(4),Integer(2)],Integer(3))
>>> c.affine_symmetric_group_simple_action(Integer(0))                       ␣
↪     # needs sage.modules
```

(continues on next page)

(continued from previous page)

```
[3, 1]
>>> c.affine_symmetric_group_simple_action(Integer(1))                      ␣
↪     # needs sage.modules
[5, 3, 1]
>>> c.affine_symmetric_group_simple_action(Integer(2))                      ␣
↪     # needs sage.modules
[4, 2]
```

This action corresponds to the left action by the i-th simple reflection in the affine symmetric group:

```
sage: c = Core([4,2],3)
sage: W = c.to_grassmannian().parent()                                     #␣
↪needs sage.modules
sage: i = 0
sage: (c.affine_symmetric_group_simple_action(i).to_grassmannian()         #␣
↪needs sage.modules
....:      == W.simple_reflection(i)*c.to_grassmannian())
True
sage: i = 1
sage: (c.affine_symmetric_group_simple_action(i).to_grassmannian()         #␣
↪needs sage.modules
....:      == W.simple_reflection(i)*c.to_grassmannian())
True
```

```
>>> from sage.all import *
>>> c = Core([Integer(4),Integer(2)],Integer(3))
>>> W = c.to_grassmannian().parent()                                     #␣
↪needs sage.modules
>>> i = Integer(0)
>>> (c.affine_symmetric_group_simple_action(i).to_grassmannian()         #␣
↪needs sage.modules
...      == W.simple_reflection(i)*c.to_grassmannian())
True
>>> i = Integer(1)
>>> (c.affine_symmetric_group_simple_action(i).to_grassmannian()         #␣
↪needs sage.modules
...      == W.simple_reflection(i)*c.to_grassmannian())
True
```

contains(*other*)

Check whether `self` contains `other`.

INPUT:

- `other` – another k-core or a list

OUTPUT: boolean

This returns `True` if the Ferrers diagram of `self` contains the Ferrers diagram of `other`.

EXAMPLES:

```
sage: c = Core([4,2],3)
sage: x = Core([4,2,2,1,1],3)
```

(continues on next page)

(continued from previous page)

```
sage: x.contains(c)
True
sage: c.contains(x)
False
```

```
>>> from sage.all import *
>>> c = Core([Integer(4),Integer(2)],Integer(3))
>>> x = Core([Integer(4),Integer(2),Integer(2),Integer(1),Integer(1)],
↪Integer(3))
>>> x.contains(c)
True
>>> c.contains(x)
False
```

k()

Return k of the k-core `self`.

EXAMPLES:

```
sage: c = Core([2,1],4)
sage: c.k()
4
```

```
>>> from sage.all import *
>>> c = Core([Integer(2),Integer(1)],Integer(4))
>>> c.k()
4
```

length()

Return the length of `self`.

The length of a k-core is the size of the corresponding $(k-1)$-bounded partition which agrees with the length of the corresponding Grassmannian element, see `to_grassmannian()`.

EXAMPLES:

```
sage: c = Core([4,2],3); c.length()
4
sage: c.to_grassmannian().length()                                     #␣
↪needs sage.modules
4

sage: Core([9,5,3,2,1,1], 5).length()
13
```

```
>>> from sage.all import *
>>> c = Core([Integer(4),Integer(2)],Integer(3)); c.length()
4
>>> c.to_grassmannian().length()                                     #␣
↪needs sage.modules
4

>>> Core([Integer(9),Integer(5),Integer(3),Integer(2),Integer(1),Integer(1)],␣
```

(continues on next page)

(continued from previous page)

```
↪Integer(5)).length()
13
```

size()

Return the size of self as a partition.

EXAMPLES:

```
sage: Core([2,1],4).size()
3
sage: Core([4,2],3).size()
6
```

```
>>> from sage.all import *
>>> Core([Integer(2),Integer(1)],Integer(4)).size()
3
>>> Core([Integer(4),Integer(2)],Integer(3)).size()
6
```

strong_covers()

Return a list of all elements that cover self in strong order.

EXAMPLES:

```
sage: c = Core([1],3)
sage: c.strong_covers()
[[2], [1, 1]]
sage: c = Core([4,2],3)
sage: c.strong_covers()
[[5, 3, 1], [4, 2, 1, 1]]
```

```
>>> from sage.all import *
>>> c = Core([Integer(1)],Integer(3))
>>> c.strong_covers()
[[2], [1, 1]]
>>> c = Core([Integer(4),Integer(2)],Integer(3))
>>> c.strong_covers()
[[5, 3, 1], [4, 2, 1, 1]]
```

strong_down_list()

Return a list of all elements that are covered by self in strong order.

EXAMPLES:

```
sage: c = Core([1],3)
sage: c.strong_down_list()
[[]]
sage: c = Core([5,3,1],3)
sage: c.strong_down_list()
[[4, 2], [3, 1, 1]]
```

```
>>> from sage.all import *
>>> c = Core([Integer(1)],Integer(3))
```

(continues on next page)

(continued from previous page)

```
>>> c.strong_down_list()
[[]]
>>> c = Core([Integer(5),Integer(3),Integer(1)],Integer(3))
>>> c.strong_down_list()
[[4, 2], [3, 1, 1]]
```

strong_le(*other*)

Strong order (Bruhat) comparison on cores.

INPUT:

- `other` – another k-core

OUTPUT: boolean

This returns whether `self` <= `other` in Bruhat (or strong) order.

EXAMPLES:

```
sage: c = Core([4,2],3)
sage: x = Core([4,2,2,1,1],3)
sage: c.strong_le(x)
True
sage: c.strong_le([4,2,2,1,1])
True

sage: x = Core([4,1],4)
sage: c.strong_le(x)
Traceback (most recent call last):
...
ValueError: the two cores do not have the same k
```

```
>>> from sage.all import *
>>> c = Core([Integer(4),Integer(2)],Integer(3))
>>> x = Core([Integer(4),Integer(2),Integer(2),Integer(1),Integer(1)],
↪Integer(3))
>>> c.strong_le(x)
True
>>> c.strong_le([Integer(4),Integer(2),Integer(2),Integer(1),Integer(1)])
True

>>> x = Core([Integer(4),Integer(1)],Integer(4))
>>> c.strong_le(x)
Traceback (most recent call last):
...
ValueError: the two cores do not have the same k
```

to_bounded_partition()

Bijection between k-cores and $(k-1)$-bounded partitions.

This maps the k-core `self` to the corresponding $(k-1)$-bounded partition. This bijection is achieved by deleting all cells in `self` of hook length greater than k.

EXAMPLES:

```
sage: gamma = Core([9,5,3,2,1,1], 5)
sage: gamma.to_bounded_partition()
[4, 3, 2, 2, 1, 1]
```

```
>>> from sage.all import *
>>> gamma = Core([Integer(9),Integer(5),Integer(3),Integer(2),Integer(1),
↪Integer(1)], Integer(5))
>>> gamma.to_bounded_partition()
[4, 3, 2, 2, 1, 1]
```

to_grassmannian()

Bijection between k-cores and Grassmannian elements in the affine Weyl group of type $A_{k-1}^{(1)}$.

For further details, see the documentation of the method *from_kbounded_to_reduced_word()* and *from_kbounded_to_grassmannian()*.

EXAMPLES:

```
sage: c = Core([3,1,1],3)
sage: w = c.to_grassmannian(); w                                        #␣
↪needs sage.modules
[-1  1  1]
[-2  2  1]
[-2  1  2]
sage: c.parent()
3-Cores of length 4
sage: w.parent()                                                        #␣
↪needs sage.modules
Weyl Group of type ['A', 2, 1] (as a matrix group acting on the root space)

sage: c = Core([],3)
sage: c.to_grassmannian()                                               #␣
↪needs sage.modules
[1 0 0]
[0 1 0]
[0 0 1]
```

```
>>> from sage.all import *
>>> c = Core([Integer(3),Integer(1),Integer(1)],Integer(3))
>>> w = c.to_grassmannian(); w                                        #␣
↪needs sage.modules
[-1  1  1]
[-2  2  1]
[-2  1  2]
>>> c.parent()
3-Cores of length 4
>>> w.parent()                                                        #␣
↪needs sage.modules
Weyl Group of type ['A', 2, 1] (as a matrix group acting on the root space)

>>> c = Core([],Integer(3))
>>> c.to_grassmannian()                                               #␣
↪needs sage.modules
```

(continues on next page)

(continued from previous page)

```
[1 0 0]
[0 1 0]
[0 0 1]
```

to_partition()

Turn the core `self` into the partition identical to `self`.

EXAMPLES:

```
sage: mu = Core([2,1,1],3)
sage: mu.to_partition()
[2, 1, 1]
```

```
>>> from sage.all import *
>>> mu = Core([Integer(2),Integer(1),Integer(1)],Integer(3))
>>> mu.to_partition()
[2, 1, 1]
```

weak_covers()

Return a list of all elements that cover `self` in weak order.

EXAMPLES:

```
sage: c = Core([1],3)
sage: c.weak_covers()                                                    #␣
↪needs sage.modules
[[1, 1], [2]]

sage: c = Core([4,2],3)
sage: c.weak_covers()                                                    #␣
↪needs sage.modules
[[5, 3, 1]]
```

```
>>> from sage.all import *
>>> c = Core([Integer(1)],Integer(3))
>>> c.weak_covers()                                                    #␣
↪needs sage.modules
[[1, 1], [2]]

>>> c = Core([Integer(4),Integer(2)],Integer(3))
>>> c.weak_covers()                                                    #␣
↪needs sage.modules
[[5, 3, 1]]
```

weak_le(*other*)

Weak order comparison on cores.

INPUT:

- `other` – another k-core

OUTPUT: boolean

This returns whether `self` <= `other` in weak order.

EXAMPLES:

```
sage: c = Core([4,2],3)
sage: x = Core([5,3,1],3)
sage: c.weak_le(x)                                                          #␣
↪needs sage.modules
True
sage: c.weak_le([5,3,1])                                                    #␣
↪needs sage.modules
True

sage: x = Core([4,2,2,1,1],3)
sage: c.weak_le(x)                                                          #␣
↪needs sage.modules
False

sage: x = Core([5,3,1],6)
sage: c.weak_le(x)
Traceback (most recent call last):
...
ValueError: the two cores do not have the same k
```

```
>>> from sage.all import *
>>> c = Core([Integer(4),Integer(2)],Integer(3))
>>> x = Core([Integer(5),Integer(3),Integer(1)],Integer(3))
>>> c.weak_le(x)                                                          #␣
↪needs sage.modules
True
>>> c.weak_le([Integer(5),Integer(3),Integer(1)])                         ␣
↪                          # needs sage.modules
True

>>> x = Core([Integer(4),Integer(2),Integer(2),Integer(1),Integer(1)],
↪Integer(3))
>>> c.weak_le(x)                                                          #␣
↪needs sage.modules
False

>>> x = Core([Integer(5),Integer(3),Integer(1)],Integer(6))
>>> c.weak_le(x)
Traceback (most recent call last):
...
ValueError: the two cores do not have the same k
```

sage.combinat.core.**Cores**(*k*, *length=None*, ***kwargs*)

A k-core is a partition from which no rim hook of size k can be removed. Alternatively, a k-core is an integer partition such that the Ferrers diagram for the partition contains no cells with a hook of size (a multiple of) k.

The k-cores generally have two notions of size which are useful for different applications. One is the number of cells in the Ferrers diagram with hook less than k, the other is the total number of cells of the Ferrers diagram. In the implementation in Sage, the first of notion is referred to as the `length` of the k-core and the second is the `size` of the k-core. The class of Cores requires that either the size or the length of the elements in the class is specified.

EXAMPLES:

We create the set of the 4-cores of length 6. Here the length of a k-core is the size of the corresponding $(k-1)$-bounded partition, see also `length()`:

```
sage: C = Cores(4, 6); C
4-Cores of length 6
sage: C.list()
[[6, 3], [5, 2, 1], [4, 1, 1, 1], [4, 2, 2], [3, 3, 1, 1], [3, 2, 1, 1, 1], [2, 2,
↪ 2, 1, 1, 1]]
sage: C.cardinality()
7
sage: C.an_element()
[6, 3]
```

```
>>> from sage.all import *
>>> C = Cores(Integer(4), Integer(6)); C
4-Cores of length 6
>>> C.list()
[[6, 3], [5, 2, 1], [4, 1, 1, 1], [4, 2, 2], [3, 3, 1, 1], [3, 2, 1, 1, 1], [2, 2,
↪ 2, 1, 1, 1]]
>>> C.cardinality()
7
>>> C.an_element()
[6, 3]
```

We may also list the set of 4-cores of size 6, where the size is the number of boxes in the core, see also `size()`:

```
sage: C = Cores(4, size=6); C
4-Cores of size 6
sage: C.list()
[[4, 1, 1], [3, 2, 1], [3, 1, 1, 1]]
sage: C.cardinality()
3
sage: C.an_element()
[4, 1, 1]
```

```
>>> from sage.all import *
>>> C = Cores(Integer(4), size=Integer(6)); C
4-Cores of size 6
>>> C.list()
[[4, 1, 1], [3, 2, 1], [3, 1, 1, 1]]
>>> C.cardinality()
3
>>> C.an_element()
[4, 1, 1]
```

class `sage.combinat.core.`**`Cores_length`**`(k, n)`

Bases: `UniqueRepresentation`, `Parent`

The class of k-cores of length n.

`Element`

alias of `Core`

`from_partition``(part)`

Convert the partition `part` into a core (as the identity map).

This is the inverse method to *to_partition()*.

EXAMPLES:

```
sage: C = Cores(3,4)
sage: c = C.from_partition([4,2]); c
[4, 2]

sage: mu = Partition([2,1,1])
sage: C = Cores(3,3)
sage: C.from_partition(mu).to_partition() == mu
True

sage: mu = Partition([])
sage: C = Cores(3,0)
sage: C.from_partition(mu).to_partition() == mu
True
```

```
>>> from sage.all import *
>>> C = Cores(Integer(3),Integer(4))
>>> c = C.from_partition([Integer(4),Integer(2)]); c
[4, 2]

>>> mu = Partition([Integer(2),Integer(1),Integer(1)])
>>> C = Cores(Integer(3),Integer(3))
>>> C.from_partition(mu).to_partition() == mu
True

>>> mu = Partition([])
>>> C = Cores(Integer(3),Integer(0))
>>> C.from_partition(mu).to_partition() == mu
True
```

list()

Return the list of all k-cores of length n.

EXAMPLES:

```
sage: C = Cores(3,4)
sage: C.list()
[[4, 2], [3, 1, 1], [2, 2, 1, 1]]
```

```
>>> from sage.all import *
>>> C = Cores(Integer(3),Integer(4))
>>> C.list()
[[4, 2], [3, 1, 1], [2, 2, 1, 1]]
```

class sage.combinat.core.**Cores_size**(k, n)

Bases: UniqueRepresentation, Parent

The class of k-cores of size n.

Element

alias of *Core*

from_partition(*part*)

Convert the partition `part` into a core (as the identity map).

This is the inverse method to `to_partition()`.

EXAMPLES:

```
sage: C = Cores(3,size=4)
sage: c = C.from_partition([2,1,1]); c
[2, 1, 1]

sage: mu = Partition([2,1,1])
sage: C = Cores(3,size=4)
sage: C.from_partition(mu).to_partition() == mu
True

sage: mu = Partition([])
sage: C = Cores(3,size=0)
sage: C.from_partition(mu).to_partition() == mu
True
```

```
>>> from sage.all import *
>>> C = Cores(Integer(3),size=Integer(4))
>>> c = C.from_partition([Integer(2),Integer(1),Integer(1)]); c
[2, 1, 1]

>>> mu = Partition([Integer(2),Integer(1),Integer(1)])
>>> C = Cores(Integer(3),size=Integer(4))
>>> C.from_partition(mu).to_partition() == mu
True

>>> mu = Partition([])
>>> C = Cores(Integer(3),size=Integer(0))
>>> C.from_partition(mu).to_partition() == mu
True
```

list()

Return the list of all k-cores of size n.

EXAMPLES:

```
sage: C = Cores(3, size = 4)
sage: C.list()
[[3, 1], [2, 1, 1]]
```

```
>>> from sage.all import *
>>> C = Cores(Integer(3), size = Integer(4))
>>> C.list()
[[3, 1], [2, 1, 1]]
```

5.1.35 Affine Crystals

class sage.combinat.crystals.affine.**AffineCrystalFromClassical**(*cartan_type*, *classical_crystal*, *category=None*)

Bases: `UniqueRepresentation`, `Parent`

This abstract class can be used for affine crystals that are constructed from a classical crystal. The zero arrows can be implemented using different methods (for example using a Dynkin diagram automorphisms or virtual crystals).

This is a helper class, mostly used to implement Kirillov-Reshetikhin crystals (see: *KirillovReshetikhin-Crystal()*).

For general information about crystals see `sage.combinat.crystals`.

INPUT:

- `cartan_type` – the Cartan type of the resulting affine crystal
- `classical_crystal` – instance of a classical crystal

EXAMPLES:

```
sage: n = 2
sage: C = crystals.Tableaux(['A',n],shape=[1])
sage: pr = attrcall("promotion")
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',n,1],C,pr,pr_inverse,1)
sage: A.list()
[[[1]], [[2]], [[3]]]
sage: A.cartan_type()
['A', 2, 1]
sage: A.index_set()
(0, 1, 2)
sage: b = A(rows=[[1]])
sage: b.weight()
-Lambda[0] + Lambda[1]
sage: b.classical_weight()
(1, 0, 0)
sage: [x.s(0) for x in A.list()]
```

(continues on next page)

(continued from previous page)

```
[[[3]], [[2]], [[1]]]
sage: [x.s(1) for x in A.list()]
[[[2]], [[1]], [[3]]]
```

```
>>> from sage.all import *
>>> n = Integer(2)
>>> C = crystals.Tableaux(['A',n],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
>>> A = crystals.AffineFromClassicalAndPromotion(['A',n,Integer(1)],C,pr,pr_
↪inverse,Integer(1))
>>> A.list()
[[[1]], [[2]], [[3]]]
>>> A.cartan_type()
['A', 2, 1]
>>> A.index_set()
(0, 1, 2)
>>> b = A(rows=[[Integer(1)]])
>>> b.weight()
-Lambda[0] + Lambda[1]
>>> b.classical_weight()
(1, 0, 0)
>>> [x.s(Integer(0)) for x in A.list()]
[[[3]], [[2]], [[1]]]
>>> [x.s(Integer(1)) for x in A.list()]
[[[2]], [[1]], [[3]]]
```

Element

alias of *AffineCrystalFromClassicalElement*

cardinality()

Return the cardinality of `self`.

EXAMPLES:

```
sage: C = crystals.Tableaux(['A',3],shape=[1])
sage: pr = attrcall("promotion")
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',3,1],C,pr,pr_inverse,
↪1)
sage: A.cardinality() == C.cardinality()
True
```

```
>>> from sage.all import *
>>> C = crystals.Tableaux(['A',Integer(3)],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
>>> A = crystals.AffineFromClassicalAndPromotion(['A',Integer(3),Integer(1)],
↪C,pr,pr_inverse,Integer(1))
>>> A.cardinality() == C.cardinality()
True
```

lift(*affine_elt*)

Lift an affine crystal element to the corresponding classical crystal element.

EXAMPLES:

```
sage: n = 2
sage: C = crystals.Tableaux(['A',n],shape=[1])
sage: pr = attrcall("promotion")
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',n,1],C,pr,pr_inverse,
↪1)
sage: b = A.list()[0]
sage: A.lift(b)
[[1]]
sage: A.lift(b).parent()
The crystal of tableaux of type ['A', 2] and shape(s) [[1]]
```

```
>>> from sage.all import *
>>> n = Integer(2)
>>> C = crystals.Tableaux(['A',n],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
>>> A = crystals.AffineFromClassicalAndPromotion(['A',n,Integer(1)],C,pr,pr_
↪inverse,Integer(1))
>>> b = A.list()[Integer(0)]
>>> A.lift(b)
[[1]]
>>> A.lift(b).parent()
The crystal of tableaux of type ['A', 2] and shape(s) [[1]]
```

retract(*classical_elt*)

Transform a classical crystal element to the corresponding affine crystal element.

EXAMPLES:

```
sage: n = 2
sage: C = crystals.Tableaux(['A',n],shape=[1])
sage: pr = attrcall("promotion")
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',n,1],C,pr,pr_inverse,
↪1)
sage: t = C(rows=[[1]])
sage: t.parent()
The crystal of tableaux of type ['A', 2] and shape(s) [[1]]
sage: A.retract(t)
[[1]]
sage: A.retract(t).parent() is A
True
```

```
>>> from sage.all import *
>>> n = Integer(2)
>>> C = crystals.Tableaux(['A',n],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
```

(continues on next page)

(continued from previous page)

```
>>> A = crystals.AffineFromClassicalAndPromotion(['A',n,Integer(1)],C,pr,pr_
↪inverse,Integer(1))
>>> t = C(rows=[[Integer(1)]])
>>> t.parent()
The crystal of tableaux of type ['A', 2] and shape(s) [[1]]
>>> A.retract(t)
[[1]]
>>> A.retract(t).parent() is A
True
```

class sage.combinat.crystals.affine.**AffineCrystalFromClassicalAndPromotion**(*cartan_type*, *classical_crystal*, *p_automorphism*, *p_inverse_automorphism*, *dynkin_node*, *category=None*)

Bases: *AffineCrystalFromClassical*

Crystals that are constructed from a classical crystal and a Dynkin diagram automorphism σ. In type A_n, the Dynkin diagram automorphism is $i \to i+1 \pmod{n}+1$ and the corresponding map on the crystal is the promotion operation pr on tableaux. The affine crystal operators are given by $f_0 = \mathrm{pr}^{-1} f_{\sigma(0)} \mathrm{pr}$.

INPUT:

- `cartan_type` – the Cartan type of the resulting affine crystal
- `classical_crystal` – instance of a classical crystal
- `automorphism, inverse_automorphism` – a function on the elements of the `classical_crystal`
- `dynkin_node` – integer specifying the classical node in the image of the zero node under the automorphism sigma

EXAMPLES:

```
sage: n = 2
sage: C = crystals.Tableaux(['A',n],shape=[1])
sage: pr = attrcall("promotion")
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',n,1],C,pr,pr_inverse,1)
sage: A.list()
[[[1]], [[2]], [[3]]]
sage: A.cartan_type()
['A', 2, 1]
sage: A.index_set()
(0, 1, 2)
sage: b = A(rows=[[1]])
sage: b.weight()
-Lambda[0] + Lambda[1]
sage: b.classical_weight()
(1, 0, 0)
```

(continues on next page)

(continued from previous page)

```
sage: [x.s(0) for x in A.list()]
[[[3]], [[2]], [[1]]]
sage: [x.s(1) for x in A.list()]
[[[2]], [[1]], [[3]]]
```

```
>>> from sage.all import *
>>> n = Integer(2)
>>> C = crystals.Tableaux(['A',n],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
>>> A = crystals.AffineFromClassicalAndPromotion(['A',n,Integer(1)],C,pr,pr_
↪inverse,Integer(1))
>>> A.list()
[[[1]], [[2]], [[3]]]
>>> A.cartan_type()
['A', 2, 1]
>>> A.index_set()
(0, 1, 2)
>>> b = A(rows=[[Integer(1)]])
>>> b.weight()
-Lambda[0] + Lambda[1]
>>> b.classical_weight()
(1, 0, 0)
>>> [x.s(Integer(0)) for x in A.list()]
[[[3]], [[2]], [[1]]]
>>> [x.s(Integer(1)) for x in A.list()]
[[[2]], [[1]], [[3]]]
```

Element

alias of *AffineCrystalFromClassicalAndPromotionElement*

automorphism(x)

Give the analogue of the affine Dynkin diagram automorphism on the level of crystals.

EXAMPLES:

```
sage: n = 2
sage: C = crystals.Tableaux(['A',n],shape=[1])
sage: pr = attrcall("promotion")
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',n,1],C,pr,pr_inverse,
↪1)
sage: b = A.list()[0]
sage: A.automorphism(b)
[[2]]
```

```
>>> from sage.all import *
>>> n = Integer(2)
>>> C = crystals.Tableaux(['A',n],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
>>> A = crystals.AffineFromClassicalAndPromotion(['A',n,Integer(1)],C,pr,pr_
```

(continues on next page)

(continued from previous page)

```
↪inverse,Integer(1))
>>> b = A.list()[Integer(0)]
>>> A.automorphism(b)
[[2]]
```

inverse_automorphism(*x*)

Give the analogue of the inverse of the affine Dynkin diagram automorphism on the level of crystals.

EXAMPLES:

```
sage: n = 2
sage: C = crystals.Tableaux(['A',n],shape=[1])
sage: pr = attrcall("promotion")
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',n,1],C,pr,pr_inverse,
↪1)
sage: b = A.list()[0]
sage: A.inverse_automorphism(b)
[[3]]
```

```
>>> from sage.all import *
>>> n = Integer(2)
>>> C = crystals.Tableaux(['A',n],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
>>> A = crystals.AffineFromClassicalAndPromotion(['A',n,Integer(1)],C,pr,pr_
↪inverse,Integer(1))
>>> b = A.list()[Integer(0)]
>>> A.inverse_automorphism(b)
[[3]]
```

class sage.combinat.crystals.affine.**AffineCrystalFromClassicalAndPromotionElement**

Bases: *AffineCrystalFromClassicalElement*

Elements of crystals that are constructed from a classical crystal and a Dynkin diagram automorphism. In type A, the automorphism is the promotion operation on tableaux.

This class is not instantiated directly but rather `__call__`-ed from *AffineCrystalFromClassicalAndPromotion*. The syntax of this is governed by the (classical) crystal.

Since this class inherits from *AffineCrystalFromClassicalElement*, the methods that need to be implemented are *e0()*, *f0()* and possibly *epsilon0()* and *phi0()* if more efficient algorithms exist.

EXAMPLES:

```
sage: n = 2
sage: C = crystals.Tableaux(['A',n],shape=[1])
sage: pr = attrcall("promotion")
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',n,1],C,pr,pr_inverse,1)
sage: b = A(rows=[[1]])
sage: b._repr_()
'[[1]]'
```

```
>>> from sage.all import *
>>> n = Integer(2)
>>> C = crystals.Tableaux(['A',n],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
>>> A = crystals.AffineFromClassicalAndPromotion(['A',n,Integer(1)],C,pr,pr_
↪inverse,Integer(1))
>>> b = A(rows=[[Integer(1)]])
>>> b._repr_()
'[[1]]'
```

e0()

Implement e_0 using the automorphism as $e_0 = \mathrm{pr}^{-1} e_{dynkin_node} \mathrm{pr}$

EXAMPLES:

```
sage: n = 2
sage: C = crystals.Tableaux(['A',n],shape=[1])
sage: pr = attrcall("promotion")
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',n,1],C,pr,pr_inverse,
↪1)
sage: b = A(rows=[[1]])
sage: b.e0()
[[3]]
```

```
>>> from sage.all import *
>>> n = Integer(2)
>>> C = crystals.Tableaux(['A',n],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
>>> A = crystals.AffineFromClassicalAndPromotion(['A',n,Integer(1)],C,pr,pr_
↪inverse,Integer(1))
>>> b = A(rows=[[Integer(1)]])
>>> b.e0()
[[3]]
```

epsilon0()

Implement $epsilon_0$ using the automorphism.

EXAMPLES:

```
sage: n = 2
sage: C = crystals.Tableaux(['A',n],shape=[1])
sage: pr = attrcall("promotion")
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',n,1],C,pr,pr_inverse,
↪1)
sage: [x.epsilon0() for x in A.list()]
[1, 0, 0]
```

```
>>> from sage.all import *
>>> n = Integer(2)
```

(continues on next page)

(continued from previous page)

```
>>> C = crystals.Tableaux(['A',n],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
>>> A = crystals.AffineFromClassicalAndPromotion(['A',n,Integer(1)],C,pr,pr_
↪inverse,Integer(1))
>>> [x.epsilon0() for x in A.list()]
[1, 0, 0]
```

f0()

Implement f_0 using the automorphism as $f_0 = \mathrm{pr}^{-1} f_{dynkin_node} \mathrm{pr}$

EXAMPLES:

```
sage: n = 2
sage: C = crystals.Tableaux(['A',n],shape=[1])
sage: pr = attrcall("promotion")
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',n,1],C,pr,pr_inverse,
↪1)
sage: b = A(rows=[[3]])
sage: b.f0()
[[1]]
```

```
>>> from sage.all import *
>>> n = Integer(2)
>>> C = crystals.Tableaux(['A',n],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
>>> A = crystals.AffineFromClassicalAndPromotion(['A',n,Integer(1)],C,pr,pr_
↪inverse,Integer(1))
>>> b = A(rows=[[Integer(3)]])
>>> b.f0()
[[1]]
```

phi0()

Implement phi_0 using the automorphism.

EXAMPLES:

```
sage: n = 2
sage: C = crystals.Tableaux(['A',n],shape=[1])
sage: pr = attrcall("promotion")
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',n,1],C,pr,pr_inverse,
↪1)
sage: [x.phi0() for x in A.list()]
[0, 0, 1]
```

```
>>> from sage.all import *
>>> n = Integer(2)
>>> C = crystals.Tableaux(['A',n],shape=[Integer(1)])
>>> pr = attrcall("promotion")
```

(continues on next page)

(continued from previous page)

```
>>> pr_inverse = attrcall("promotion_inverse")
>>> A = crystals.AffineFromClassicalAndPromotion(['A',n,Integer(1)],C,pr,pr_
↪inverse,Integer(1))
>>> [x.phi0() for x in A.list()]
[0, 0, 1]
```

class sage.combinat.crystals.affine.**AffineCrystalFromClassicalElement**

Bases: ElementWrapper

Elements of crystals that are constructed from a classical crystal.

The elements inherit many of their methods from the classical crystal using lift and retract.

This class is not instantiated directly but rather `__call__`-ed from *AffineCrystalFromClassical*. The syntax of this is governed by the (classical) crystal.

EXAMPLES:

```
sage: n = 2
sage: C = crystals.Tableaux(['A',n],shape=[1])
sage: pr = attrcall("promotion")
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',n,1],C,pr,pr_inverse,1)
sage: b = A(rows=[[1]])
sage: b._repr_()
'[[1]]'
```

```
>>> from sage.all import *
>>> n = Integer(2)
>>> C = crystals.Tableaux(['A',n],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
>>> A = crystals.AffineFromClassicalAndPromotion(['A',n,Integer(1)],C,pr,pr_
↪inverse,Integer(1))
>>> b = A(rows=[[Integer(1)]])
>>> b._repr_()
'[[1]]'
```

classical_weight()

Return the classical weight corresponding to `self`.

EXAMPLES:

```
sage: n = 2
sage: C = crystals.Tableaux(['A',n],shape=[1])
sage: pr = attrcall("promotion")
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',n,1],C,pr,pr_inverse,
↪1)
sage: b = A(rows=[[1]])
sage: b.classical_weight()
(1, 0, 0)
```

```
>>> from sage.all import *
>>> n = Integer(2)
>>> C = crystals.Tableaux(['A',n],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
>>> A = crystals.AffineFromClassicalAndPromotion(['A',n,Integer(1)],C,pr,pr_
↪inverse,Integer(1))
>>> b = A(rows=[[Integer(1)]])
>>> b.classical_weight()
(1, 0, 0)
```

e(i)

Return the action of e_i on `self`.

EXAMPLES:

```
sage: n = 2
sage: C = crystals.Tableaux(['A',n],shape=[1])
sage: pr = attrcall("promotion")
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',n,1],C,pr,pr_inverse,
↪1)
sage: b = A(rows=[[1]])
sage: b.e(0)
[[3]]
sage: b.e(1)
```

```
>>> from sage.all import *
>>> n = Integer(2)
>>> C = crystals.Tableaux(['A',n],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
>>> A = crystals.AffineFromClassicalAndPromotion(['A',n,Integer(1)],C,pr,pr_
↪inverse,Integer(1))
>>> b = A(rows=[[Integer(1)]])
>>> b.e(Integer(0))
[[3]]
>>> b.e(Integer(1))
```

e0()

Assumes that e_0 is implemented separately.

epsilon(i)

Return the maximal time the crystal operator e_i can be applied to `self`.

EXAMPLES:

```
sage: n = 2
sage: C = crystals.Tableaux(['A',n],shape=[1])
sage: pr = attrcall("promotion")
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',n,1],C,pr,pr_inverse,
↪1)
sage: [x.epsilon(0) for x in A.list()]
```

(continues on next page)

(continued from previous page)

```
[1, 0, 0]
sage: [x.epsilon(1) for x in A.list()]
[0, 1, 0]
```

```
>>> from sage.all import *
>>> n = Integer(2)
>>> C = crystals.Tableaux(['A',n],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
>>> A = crystals.AffineFromClassicalAndPromotion(['A',n,Integer(1)],C,pr,pr_
↪inverse,Integer(1))
>>> [x.epsilon(Integer(0)) for x in A.list()]
[1, 0, 0]
>>> [x.epsilon(Integer(1)) for x in A.list()]
[0, 1, 0]
```

epsilon0()

Uses ε_0 from the super class, but should be implemented if a faster implementation exists.

EXAMPLES:

```
sage: n = 2
sage: C = crystals.Tableaux(['A',n],shape=[1])
sage: pr = attrcall("promotion")
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',n,1],C,pr,pr_inverse,
↪1)
sage: [x.epsilon0() for x in A.list()]
[1, 0, 0]
```

```
>>> from sage.all import *
>>> n = Integer(2)
>>> C = crystals.Tableaux(['A',n],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
>>> A = crystals.AffineFromClassicalAndPromotion(['A',n,Integer(1)],C,pr,pr_
↪inverse,Integer(1))
>>> [x.epsilon0() for x in A.list()]
[1, 0, 0]
```

f(i)

Return the action of f_i on `self`.

EXAMPLES:

```
sage: n = 2
sage: C = crystals.Tableaux(['A',n],shape=[1])
sage: pr = attrcall("promotion")
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',n,1],C,pr,pr_inverse,
↪1)
sage: b = A(rows=[[3]])
```

(continues on next page)

(continued from previous page)

```
sage: b.f(0)
[[1]]
sage: b.f(2)
```

```
>>> from sage.all import *
>>> n = Integer(2)
>>> C = crystals.Tableaux(['A',n],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
>>> A = crystals.AffineFromClassicalAndPromotion(['A',n,Integer(1)],C,pr,pr_
↪inverse,Integer(1))
>>> b = A(rows=[[Integer(3)]])
>>> b.f(Integer(0))
[[1]]
>>> b.f(Integer(2))
```

f0()

Assumes that f_0 is implemented separately.

lift()

Lift an affine crystal element to the corresponding classical crystal element.

EXAMPLES:

```
sage: n = 2
sage: C = crystals.Tableaux(['A',n],shape=[1])
sage: pr = attrcall("promotion")
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',n,1],C,pr,pr_inverse,
↪1)
sage: b = A.list()[0]
sage: b.lift()
[[1]]
sage: b.lift().parent()
The crystal of tableaux of type ['A', 2] and shape(s) [[1]]
```

```
>>> from sage.all import *
>>> n = Integer(2)
>>> C = crystals.Tableaux(['A',n],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
>>> A = crystals.AffineFromClassicalAndPromotion(['A',n,Integer(1)],C,pr,pr_
↪inverse,Integer(1))
>>> b = A.list()[Integer(0)]
>>> b.lift()
[[1]]
>>> b.lift().parent()
The crystal of tableaux of type ['A', 2] and shape(s) [[1]]
```

phi(i)

Return the maximal time the crystal operator f_i can be applied to `self`.

EXAMPLES:

```
sage: n = 2
sage: C = crystals.Tableaux(['A',n],shape=[1])
sage: pr = attrcall("promotion")
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',n,1],C,pr,pr_inverse,
↪1)
sage: [x.phi(0) for x in A.list()]
[0, 0, 1]
sage: [x.phi(1) for x in A.list()]
[1, 0, 0]
```

```
>>> from sage.all import *
>>> n = Integer(2)
>>> C = crystals.Tableaux(['A',n],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
>>> A = crystals.AffineFromClassicalAndPromotion(['A',n,Integer(1)],C,pr,pr_
↪inverse,Integer(1))
>>> [x.phi(Integer(0)) for x in A.list()]
[0, 0, 1]
>>> [x.phi(Integer(1)) for x in A.list()]
[1, 0, 0]
```

phi0()

Uses φ_0 from the super class, but should be implemented if a faster implementation exists.

EXAMPLES:

```
sage: n = 2
sage: C = crystals.Tableaux(['A',n],shape=[1])
sage: pr = attrcall("promotion")
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',n,1],C,pr,pr_inverse,
↪1)
sage: [x.phi0() for x in A.list()]
[0, 0, 1]
```

```
>>> from sage.all import *
>>> n = Integer(2)
>>> C = crystals.Tableaux(['A',n],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
>>> A = crystals.AffineFromClassicalAndPromotion(['A',n,Integer(1)],C,pr,pr_
↪inverse,Integer(1))
>>> [x.phi0() for x in A.list()]
[0, 0, 1]
```

pp()

Method for pretty printing.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',3,2],1,1)
sage: t=K(rows=[[1]])
sage: t.pp()
1
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(3),Integer(2)],Integer(1),
↪Integer(1))
>>> t=K(rows=[[Integer(1)]])
>>> t.pp()
1
```

5.1.36 Affine factorization crystal of type A

class sage.combinat.crystals.affine_factorization.**AffineFactorizationCrystal**(*w*, *n*, *x=None*)

Bases: UniqueRepresentation, Parent

The crystal on affine factorizations with a cut-point, as introduced by [MS2015].

INPUT:

- w – an element in an (affine) Weyl group or a skew shape of k-bounded partitions (if k was specified)
- n – the number of factors in the factorization
- x – (default: None) the cut point; if not specified it is determined as the minimal missing residue in w
- k – (default: None) positive integer, specifies that w is k-bounded or a $k + 1$-core when specified

EXAMPLES:

```
sage: W = WeylGroup(['A',3,1], prefix='s')
sage: w = W.from_reduced_word([2,3,2,1])
sage: B = crystals.AffineFactorization(w,3); B
Crystal on affine factorizations of type A2 associated to s2*s3*s2*s1
sage: B.list()
[(1, s2, s3*s2*s1),
 (1, s3*s2, s3*s1),
 (1, s3*s2*s1, s3),
 (s3, s2, s3*s1),
 (s3, s2*s1, s3),
 (s3*s2, s1, s3),
 (s3*s2*s1, 1, s3),
 (s3*s2*s1, s3, 1),
 (s3*s2, 1, s3*s1),
 (s3*s2, s3, s1),
 (s3*s2, s3*s1, 1),
 (s2, 1, s3*s2*s1),
 (s2, s3, s2*s1),
 (s2, s3*s2, s1),
 (s2, s3*s2*s1, 1)]
```

```
>>> from sage.all import *
>>> W = WeylGroup(['A',Integer(3),Integer(1)], prefix='s')
```

(continues on next page)

(continued from previous page)

```
>>> w = W.from_reduced_word([Integer(2),Integer(3),Integer(2),Integer(1)])
>>> B = crystals.AffineFactorization(w,Integer(3)); B
Crystal on affine factorizations of type A2 associated to s2*s3*s2*s1
>>> B.list()
[(1, s2, s3*s2*s1),
 (1, s3*s2, s3*s1),
 (1, s3*s2*s1, s3),
 (s3, s2, s3*s1),
 (s3, s2*s1, s3),
 (s3*s2, s1, s3),
 (s3*s2*s1, 1, s3),
 (s3*s2*s1, s3, 1),
 (s3*s2, 1, s3*s1),
 (s3*s2, s3, s1),
 (s3*s2, s3*s1, 1),
 (s2, 1, s3*s2*s1),
 (s2, s3, s2*s1),
 (s2, s3*s2, s1),
 (s2, s3*s2*s1, 1)]
```

We can also access the crystal by specifying a skew shape in terms of k-bounded partitions:

```
sage: crystals.AffineFactorization([[3,1,1],[1]], 3, k=3)
Crystal on affine factorizations of type A2 associated to s2*s3*s2*s1
```

```
>>> from sage.all import *
>>> crystals.AffineFactorization([[Integer(3),Integer(1),Integer(1)],
↪[Integer(1)]], Integer(3), k=Integer(3))
Crystal on affine factorizations of type A2 associated to s2*s3*s2*s1
```

We can compute the highest weight elements:

```
sage: hw = [w for w in B if w.is_highest_weight()]
sage: hw
[(1, s2, s3*s2*s1)]
sage: hw[0].weight()
(3, 1, 0)
```

```
>>> from sage.all import *
>>> hw = [w for w in B if w.is_highest_weight()]
>>> hw
[(1, s2, s3*s2*s1)]
>>> hw[Integer(0)].weight()
(3, 1, 0)
```

And show that this crystal is isomorphic to the tableau model of the same weight:

```
sage: C = crystals.Tableaux(['A',2],shape=[3,1])
sage: GC = C.digraph()
sage: GB = B.digraph()
sage: GC.is_isomorphic(GB, edge_labels=True)
True
```

```
>>> from sage.all import *
>>> C = crystals.Tableaux(['A',Integer(2)],shape=[Integer(3),Integer(1)])
>>> GC = C.digraph()
>>> GB = B.digraph()
>>> GC.is_isomorphic(GB, edge_labels=True)
True
```

The crystal operators themselves move elements between adjacent factors:

```
sage: b = hw[0];b
(1, s2, s3*s2*s1)
sage: b.f(1)
(1, s3*s2, s3*s1)
```

```
>>> from sage.all import *
>>> b = hw[Integer(0)];b
(1, s2, s3*s2*s1)
>>> b.f(Integer(1))
(1, s3*s2, s3*s1)
```

The cut point x is not supposed to occur in the reduced words for w:

```
sage: B = crystals.AffineFactorization([[3,2],[2]],4,x=0,k=3)
Traceback (most recent call last):
...
ValueError: x cannot be in reduced word of s0*s3*s2
```

```
>>> from sage.all import *
>>> B = crystals.AffineFactorization([[Integer(3),Integer(2)],[Integer(2)]],
↪Integer(4),x=Integer(0),k=Integer(3))
Traceback (most recent call last):
...
ValueError: x cannot be in reduced word of s0*s3*s2
```

class Element

Bases: `ElementWrapper`

bracketing(*i*)

Removes all bracketed letters between i-th and $i + 1$-th entry.

EXAMPLES:

```
sage: B = crystals.AffineFactorization([[3,1],[1]], 3, k=3, x=4)
sage: W = B.w.parent()
sage: t = B((W.one(),W.from_reduced_word([3]),W.from_reduced_word([2,
↪1]))); t
(1, s3, s2*s1)
sage: t.bracketing(1)
[[3], [2, 1]]
```

```
>>> from sage.all import *
>>> B = crystals.AffineFactorization([[Integer(3),Integer(1)],
↪[Integer(1)]], Integer(3), k=Integer(3), x=Integer(4))
```

(continues on next page)

(continued from previous page)

```
>>> W = B.w.parent()
>>> t = B((W.one(),W.from_reduced_word([Integer(3)]),W.from_reduced_
↪word([Integer(2),Integer(1)]))); t
(1, s3, s2*s1)
>>> t.bracketing(Integer(1))
[[3], [2, 1]]
```

e(*i*)

Return the action of e_i on `self`.

EXAMPLES:

```
sage: B = crystals.AffineFactorization([[3,1],[1]], 4, k=3)
sage: W = B.w.parent()
sage: t = B((W.one(),W.one(),W.from_reduced_word([3]),W.from_reduced_
↪word([2,1]))); t
(1, 1, s3, s2*s1)
sage: t.e(1)
(1, 1, 1, s3*s2*s1)
```

```
>>> from sage.all import *
>>> B = crystals.AffineFactorization([[Integer(3),Integer(1)],
↪[Integer(1)]], Integer(4), k=Integer(3))
>>> W = B.w.parent()
>>> t = B((W.one(),W.one(),W.from_reduced_word([Integer(3)]),W.from_
↪reduced_word([Integer(2),Integer(1)]))); t
(1, 1, s3, s2*s1)
>>> t.e(Integer(1))
(1, 1, 1, s3*s2*s1)
```

f(*i*)

Return the action of f_i on `self`.

EXAMPLES:

```
sage: B = crystals.AffineFactorization([[3,1],[1]], 4, k=3)
sage: W = B.w.parent()
sage: t = B((W.one(),W.one(),W.from_reduced_word([3]),W.from_reduced_
↪word([2,1]))); t
(1, 1, s3, s2*s1)
sage: t.f(2)
(1, s3, 1, s2*s1)
sage: t.f(1)
(1, 1, s3*s2, s1)
```

```
>>> from sage.all import *
>>> B = crystals.AffineFactorization([[Integer(3),Integer(1)],
↪[Integer(1)]], Integer(4), k=Integer(3))
>>> W = B.w.parent()
>>> t = B((W.one(),W.one(),W.from_reduced_word([Integer(3)]),W.from_
↪reduced_word([Integer(2),Integer(1)]))); t
(1, 1, s3, s2*s1)
```

(continues on next page)

(continued from previous page)

```
>>> t.f(Integer(2))
(1, s3, 1, s2*s1)
>>> t.f(Integer(1))
(1, 1, s3*s2, s1)
```

to_tableau()

Return the tableau representation of `self`.

Uses the recording tableau of a minor variation of Edelman-Greene insertion. See Theorem 4.11 in [MS2015].

EXAMPLES:

```
sage: W = WeylGroup(['A',3,1], prefix='s')
sage: w = W.from_reduced_word([2,1,3,2])
sage: B = crystals.AffineFactorization(w,3)
sage: for x in B:
....:     x
....:     x.to_tableau().pp()
(1, s2*s1, s3*s2)
  1  1
  2  2
(s2, s1, s3*s2)
  1  1
  2  3
(s2, s3*s1, s2)
  1  2
  2  3
(s2*s1, 1, s3*s2)
  1  1
  3  3
(s2*s1, s3, s2)
  1  2
  3  3
(s2*s1, s3*s2, 1)
  2  2
  3  3
```

```
>>> from sage.all import *
>>> W = WeylGroup(['A',Integer(3),Integer(1)], prefix='s')
>>> w = W.from_reduced_word([Integer(2),Integer(1),Integer(3),Integer(2)])
>>> B = crystals.AffineFactorization(w,Integer(3))
>>> for x in B:
...     x
...     x.to_tableau().pp()
(1, s2*s1, s3*s2)
  1  1
  2  2
(s2, s1, s3*s2)
  1  1
  2  3
(s2, s3*s1, s2)
  1  2
```

(continues on next page)

(continued from previous page)

```
  2  3
(s2*s1, 1, s3*s2)
  1  1
  3  3
(s2*s1, s3, s2)
  1  2
  3  3
(s2*s1, s3*s2, 1)
  2  2
  3  3
```

class sage.combinat.crystals.affine_factorization.**FactorizationToTableaux**(*parent*, *cartan_type=None*, *virtualization=None*, *scaling_factors=None*)

Bases: CrystalMorphism

is_embedding()

Return True as this is an isomorphism.

EXAMPLES:

```
sage: W = WeylGroup(['A',3,1], prefix='s')
sage: w = W.from_reduced_word([2,1,3,2])
sage: B = crystals.AffineFactorization(w,3)
sage: phi = B._tableaux_isomorphism
sage: phi.is_isomorphism()
True
```

```
>>> from sage.all import *
>>> W = WeylGroup(['A',Integer(3),Integer(1)], prefix='s')
>>> w = W.from_reduced_word([Integer(2),Integer(1),Integer(3),Integer(2)])
>>> B = crystals.AffineFactorization(w,Integer(3))
>>> phi = B._tableaux_isomorphism
>>> phi.is_isomorphism()
True
```

is_isomorphism()

Return True as this is an isomorphism.

EXAMPLES:

```
sage: W = WeylGroup(['A',3,1], prefix='s')
sage: w = W.from_reduced_word([2,1,3,2])
sage: B = crystals.AffineFactorization(w,3)
sage: phi = B._tableaux_isomorphism
sage: phi.is_isomorphism()
True
```

```
>>> from sage.all import *
>>> W = WeylGroup(['A',Integer(3),Integer(1)], prefix='s')
```

(continues on next page)

(continued from previous page)

```
>>> w = W.from_reduced_word([Integer(2),Integer(1),Integer(3),Integer(2)])
>>> B = crystals.AffineFactorization(w,Integer(3))
>>> phi = B._tableaux_isomorphism
>>> phi.is_isomorphism()
True
```

is_surjective()

Return `True` as this is an isomorphism.

EXAMPLES:

```
sage: W = WeylGroup(['A',3,1], prefix='s')
sage: w = W.from_reduced_word([2,1,3,2])
sage: B = crystals.AffineFactorization(w,3)
sage: phi = B._tableaux_isomorphism
sage: phi.is_isomorphism()
True
```

```
>>> from sage.all import *
>>> W = WeylGroup(['A',Integer(3),Integer(1)], prefix='s')
>>> w = W.from_reduced_word([Integer(2),Integer(1),Integer(3),Integer(2)])
>>> B = crystals.AffineFactorization(w,Integer(3))
>>> phi = B._tableaux_isomorphism
>>> phi.is_isomorphism()
True
```

sage.combinat.crystals.affine_factorization.**affine_factorizations**(*w*, *l*, *weight=None*)

Return all factorizations of w into l factors or of weight `weight`.

INPUT:

- `w` – an (affine) permutation or element of the (affine) Weyl group
- `l` – nonnegative integer
- `weight` – (default: `None`) tuple of nonnegative integers specifying the length of the factors

EXAMPLES:

```
sage: W = WeylGroup(['A',3,1], prefix='s')
sage: w = W.from_reduced_word([3,2,3,1,0,1])
sage: from sage.combinat.crystals.affine_factorization import affine_
↪factorizations
sage: affine_factorizations(w,4)
[[s2, s3, s0, s2*s1*s0],
[s2, s3, s2*s0, s1*s0],
[s2, s3, s2*s1*s0, s1],
[s2, s3*s2, s0, s1*s0],
[s2, s3*s2, s1*s0, s1],
[s2, s3*s2*s1, s0, s1],
[s3*s2, s3, s0, s1*s0],
[s3*s2, s3, s1*s0, s1],
[s3*s2, s3*s1, s0, s1],
[s3*s2*s1, s3, s0, s1]]
```

(continues on next page)

(continued from previous page)

```
sage: W = WeylGroup(['A',2], prefix='s')
sage: w0 = W.long_element()
sage: affine_factorizations(w0,3)
[[1, s1, s2*s1],
[1, s2*s1, s2],
[s1, 1, s2*s1],
[s1, s2, s1],
[s1, s2*s1, 1],
[s2, s1, s2],
[s2*s1, 1, s2],
[s2*s1, s2, 1]]
sage: affine_factorizations(w0,3,(0,1,2))

```

5.1.37 Affinization Crystals

class sage.combinat.crystals.affinization.**AffinizationOfCrystal**(B)

Bases: `UniqueRepresentation`, `Parent`

An affinization of a crystal.

Let $\mathfrak{g}$ be a Kac-Moody algebra of affine type. The affinization of a finite $U_q'(\mathfrak{g})$-crystal B is the (infinite) $U_q(\mathfrak{g})$-crystal with underlying set:

$$B^{\mathrm{aff}} = \{b(m) \mid b \in B, m \in \mathbf{Z}\}$$

and crystal structure determined by:

$$e_i(b(m)) = \begin{cases} (e_0 b)(m+1) & i = 0, \\ (e_i b)(m) & i \neq 0, \end{cases}$$
$$f_i(b(m)) = \begin{cases} (f_0 b)(m-1) & i = 0, \\ (f_i b)(m) & i \neq 0, \end{cases}$$
$$\mathrm{wt}(b(m)) = \mathrm{wt}(b) + m\delta.$$

EXAMPLES:

We first construct a Kirillov-Reshetikhin crystal and then take it's corresponding affinization:

```
sage: K = crystals.KirillovReshetikhin(['A',2,1], 2, 2)
sage: A = K.affinization()
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)], Integer(2),␣
→Integer(2))
>>> A = K.affinization()
```

Next we construct an affinization crystal from a tensor product of KR crystals:

```
sage: KT = crystals.TensorProductOfKirillovReshetikhinTableaux(['C',2,1], [[1,2],
→[2,1]])
sage: A = crystals.AffinizationOf(KT)
```

```
>>> from sage.all import *
>>> KT = crystals.TensorProductOfKirillovReshetikhinTableaux(['C',Integer(2),
→Integer(1)], [[Integer(1),Integer(2)],[Integer(2),Integer(1)]])
>>> A = crystals.AffinizationOf(KT)
```

REFERENCES:

- [HK2002] Chapter 10

class Element(*parent*, *b*, *m*)

Bases: `Element`

An element in an affinization crystal.

e(*i*)

Return the action of e_i on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: A = crystals.KirillovReshetikhin(['A',2,1], 2,2).affinization()
sage: mg = A.module_generators[0]
sage: mg.e(0)
[[1, 2], [2, 3]](1)
sage: mg.e(1)
sage: mg.e(0).e(1)
[[1, 1], [2, 3]](1)
```

```
>>> from sage.all import *
>>> A = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)],␣
↪Integer(2),Integer(2)).affinization()
>>> mg = A.module_generators[Integer(0)]
>>> mg.e(Integer(0))
[[1, 2], [2, 3]](1)
>>> mg.e(Integer(1))
>>> mg.e(Integer(0)).e(Integer(1))
[[1, 1], [2, 3]](1)
```

epsilon(*i*)

Return ε_i of `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: A = crystals.KirillovReshetikhin(['A',2,1], 2,2).affinization()
sage: mg = A.module_generators[0]
sage: mg.epsilon(0)
2
sage: mg.epsilon(1)
0
```

```
>>> from sage.all import *
>>> A = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)],␣
↪Integer(2),Integer(2)).affinization()
>>> mg = A.module_generators[Integer(0)]
>>> mg.epsilon(Integer(0))
2
>>> mg.epsilon(Integer(1))
0
```

f(*i*)

Return the action of f_i on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: A = crystals.KirillovReshetikhin(['A',2,1], 2,2).affinization()
sage: mg = A.module_generators[0]
sage: mg.f(2)
[[1, 1], [2, 3]](0)
sage: mg.f(2).f(2).f(0)
sage: mg.f_string([2,1,1])
sage: mg.f_string([2,1])
[[1, 2], [2, 3]](0)
sage: mg.f_string([2,1,0])
[[1, 1], [2, 2]](-1)
```

```
>>> from sage.all import *
>>> A = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)],␣
```

(continues on next page)

(continued from previous page)

```
↪Integer(2),Integer(2)).affinization()
>>> mg = A.module_generators[Integer(0)]
>>> mg.f(Integer(2))
[[1, 1], [2, 3]](0)
>>> mg.f(Integer(2)).f(Integer(2)).f(Integer(0))
>>> mg.f_string([Integer(2),Integer(1),Integer(1)])
>>> mg.f_string([Integer(2),Integer(1)])
[[1, 2], [2, 3]](0)
>>> mg.f_string([Integer(2),Integer(1),Integer(0)])
[[1, 1], [2, 2]](-1)
```

phi (i)

Return φ_i of `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: A = crystals.KirillovReshetikhin(['A',2,1], 2,2).affinization()
sage: mg = A.module_generators[0]
sage: mg.phi(0)
0
sage: mg.phi(2)
2
```

```
>>> from sage.all import *
>>> A = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)],␣
↪Integer(2),Integer(2)).affinization()
>>> mg = A.module_generators[Integer(0)]
>>> mg.phi(Integer(0))
0
>>> mg.phi(Integer(2))
2
```

weight ()

Return the weight of `self`.

The weight wt of an element is:

$$\mathrm{wt}\big(b(m)\big) = \mathrm{wt}(b) + m\delta,$$

where δ is the null root.

EXAMPLES:

```
sage: A = crystals.KirillovReshetikhin(['A',2,1], 2,2).affinization()
sage: mg = A.module_generators[0]
sage: mg.weight()
-2*Lambda[0] + 2*Lambda[2]
sage: mg.e(0).weight()
-Lambda[1] + Lambda[2] + delta
sage: mg.e(0).e(0).weight()
2*Lambda[0] - 2*Lambda[1] + 2*delta
```

```
>>> from sage.all import *
>>> A = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)],
↪Integer(2),Integer(2)).affinization()
>>> mg = A.module_generators[Integer(0)]
>>> mg.weight()
-2*Lambda[0] + 2*Lambda[2]
>>> mg.e(Integer(0)).weight()
-Lambda[1] + Lambda[2] + delta
>>> mg.e(Integer(0)).e(Integer(0)).weight()
2*Lambda[0] - 2*Lambda[1] + 2*delta
```

5.1.38 Alcove paths

AUTHORS:

- Brant Jones (2008): initial version
- Arthur Lubovsky (2013-03-07): rewritten to implement affine type
- Travis Scrimshaw (2016-06-23): implemented $\mathcal{B}(\infty)$

Special thanks to: Nicolas Borie, Anne Schilling, Travis Scrimshaw, and Nicolas Thiéry.

class sage.combinat.crystals.alcove_path.**CrystalOfAlcovePaths**(*starting_weight*, *highest_weight_crystal*)

Bases: `UniqueRepresentation`, `Parent`

Crystal of alcove paths generated from a "straight-line" path to the negative of a given dominant weight.

INPUT:

- `cartan_type` – Cartan type of a finite or affine untwisted root system
- `weight` – dominant weight as a list of (integral) coefficients of the fundamental weights
- `highest_weight_crystal` – (default: `True`) if `True` returns the highest weight crystal. If `False` returns an object which is close to being isomorphic to the tensor product of Kirillov-Reshetikhin crystals of column shape in the following sense: We get all the vertices, but only some of the edges. We'll call the included edges pseudo-Demazure. They are all nonzero edges and the 0-edges not at the end of a 0-string of edges, i.e. not those with $f_0(b) = b'$ with $\varphi_0(b) = 1$. (Whereas Demazure 0-edges are those that are not at the beginning of a zero string.) In this case the weight $[c_1, c_2, \ldots, c_k]$ represents $\sum_{i=1}^k c_i \omega_i$.

Note

If `highest_weight_crystal` = `False`, since we do not get the full crystal, `TestSuite` will fail on the Stembridge axioms.

See also

- `Crystals`

EXAMPLES:

The following example appears in Figure 2 of [LP2008]:

```
sage: C = crystals.AlcovePaths(['G',2],[0,1])
sage: G = C.digraph()
sage: GG = DiGraph({
....:     ()        : {(0)           : 2 },
....:     (0)       : {(0,8)         : 1 },
....:     (0,1)     : {(0,1,7)       : 2 },
....:     (0,1,2)   : {(0,1,2,9)     : 1 },
....:     (0,1,2,3) : {(0,1,2,3,4)   : 2 },
....:     (0,1,2,6) : {(0,1,2,3)     : 1 },
....:     (0,1,2,9) : {(0,1,2,6)     : 1 },
....:     (0,1,7)   : {(0,1,2)       : 2 },
....:     (0,1,7,9) : {(0,1,2,9)     : 2 },
....:     (0,5)     : {(0,1)         : 1, (0,5,7) : 2 },
....:     (0,5,7)   : {(0,5,7,9)     : 1 },
....:     (0,5,7,9) : {(0,1,7,9)     : 1 },
....:     (0,8)     : {(0,5)         : 1 },
....:     })
sage: G.is_isomorphic(GG)
True

```

Alcove path crystals are a discrete version of Littelmann paths. We verify that the alcove path crystal is isomorphic to the LS path crystal:

```
sage: C1 = crystals.AlcovePaths(['C',3],[2,1,0])
sage: g1 = C1.digraph() #long time
sage: C2 = crystals.LSPaths(['C',3],[2,1,0])
sage: g2 = C2.digraph() #long time
sage: g1.is_isomorphic(g2, edge_labels=True) #long time
True
```

```
>>> from sage.all import *
>>> C1 = crystals.AlcovePaths(['C',Integer(3)],[Integer(2),Integer(1),Integer(0)])
>>> g1 = C1.digraph() #long time
>>> C2 = crystals.LSPaths(['C',Integer(3)],[Integer(2),Integer(1),Integer(0)])
>>> g2 = C2.digraph() #long time
>>> g1.is_isomorphic(g2, edge_labels=True) #long time
True
```

The preferred initialization method is via explicit weights rather than a Cartan type and the coefficients of the fundamental weights:

```
sage: R = RootSystem(['C',3])
sage: P = R.weight_lattice()
sage: La = P.fundamental_weights()
sage: C = crystals.AlcovePaths(2*La[1]+La[2]); C
Highest weight crystal of alcove paths of type ['C', 3] and weight 2*Lambda[1] +␣
↪Lambda[2]
sage: C1==C
True
```

```
>>> from sage.all import *
>>> R = RootSystem(['C',Integer(3)])
>>> P = R.weight_lattice()
>>> La = P.fundamental_weights()
>>> C = crystals.AlcovePaths(Integer(2)*La[Integer(1)]+La[Integer(2)]); C
Highest weight crystal of alcove paths of type ['C', 3] and weight 2*Lambda[1] +␣
↪Lambda[2]
>>> C1==C
True
```

We now explain the data structure:

```
sage: C = crystals.AlcovePaths(['A',2],[2,0]) ; C
Highest weight crystal of alcove paths of type ['A', 2] and weight 2*Lambda[1]
sage: C._R.lambda_chain()
[(alpha[1], 0), (alpha[1] + alpha[2], 0), (alpha[1], 1), (alpha[1] + alpha[2], 1)]
```

```
>>> from sage.all import *
>>> C = crystals.AlcovePaths(['A',Integer(2)],[Integer(2),Integer(0)]) ; C
Highest weight crystal of alcove paths of type ['A', 2] and weight 2*Lambda[1]
>>> C._R.lambda_chain()
[(alpha[1], 0), (alpha[1] + alpha[2], 0), (alpha[1], 1), (alpha[1] + alpha[2], 1)]
```

The previous list gives the initial "straight line" path from the fundamental alcove A_o to its translation $A_o - \lambda$ where $\lambda = 2\omega_1$ in this example. The initial path for weight λ is called the λ-chain. This path is constructed from the ordered pairs (β, k), by crossing the hyperplane orthogonal to β at height $-k$. We can view a plot of this path as follows:

```
sage: x=C( () )
sage: x.plot() # not tested - outputs a pdf
```

```
>>> from sage.all import *
>>> x=C( () )
>>> x.plot() # not tested - outputs a pdf
```

An element of the crystal is given by a subset of the λ-chain. This subset indicates the hyperplanes where the initial path should be folded. The highest weight element is given by the empty subset.

```
sage: x
()
sage: x.f(1).f(2)
((alpha[1], 1), (alpha[1] + alpha[2], 1))
sage: x.f(1).f(2).integer_sequence()
```

(continues on next page)

(continued from previous page)

```
[2, 3]
sage: C([2,3])
((alpha[1], 1), (alpha[1] + alpha[2], 1))
sage: C([2,3]).is_admissible() #check if a valid vertex
True
sage: C([1,3]).is_admissible() #check if a valid vertex
False
```

```
>>> from sage.all import *
>>> x
()
>>> x.f(Integer(1)).f(Integer(2))
((alpha[1], 1), (alpha[1] + alpha[2], 1))
>>> x.f(Integer(1)).f(Integer(2)).integer_sequence()
[2, 3]
>>> C([Integer(2),Integer(3)])
((alpha[1], 1), (alpha[1] + alpha[2], 1))
>>> C([Integer(2),Integer(3)]).is_admissible() #check if a valid vertex
True
>>> C([Integer(1),Integer(3)]).is_admissible() #check if a valid vertex
False
```

Alcove path crystals now works in affine type (Issue #14143):

```
sage: C = crystals.AlcovePaths(['A',2,1],[1,0,0]) ; C
Highest weight crystal of alcove paths of type ['A', 2, 1] and weight Lambda[0]
sage: x=C(  () )
sage: x.f(0)
((alpha[0], 0),)
sage: C.R
Root system of type ['A', 2, 1]
sage: C.weight
Lambda[0]
```

```
>>> from sage.all import *
>>> C = crystals.AlcovePaths(['A',Integer(2),Integer(1)],[Integer(1),Integer(0),
↪Integer(0)]) ; C
Highest weight crystal of alcove paths of type ['A', 2, 1] and weight Lambda[0]
>>> x=C(  () )
>>> x.f(Integer(0))
((alpha[0], 0),)
>>> C.R
Root system of type ['A', 2, 1]
>>> C.weight
Lambda[0]
```

Test that the tensor products of Kirillov-Reshetikhin crystals minus non-pseudo-Demazure arrows is in bijection with alcove path construction:

```
sage: K = crystals.KirillovReshetikhin(['B',3,1],2,1)
sage: T = crystals.TensorProduct(K,K)
sage: g = T.digraph() #long time
```

(continues on next page)

(continued from previous page)

```
sage: for e in g.edges(sort=False):  #long time
....:     if e[0].phi(0) == 1 and e[2] == 0:
....:         g.delete_edge(e)

sage: C = crystals.AlcovePaths(['B',3,1],[0,2,0], highest_weight_crystal=False)
sage: g2 = C.digraph() #long time
sage: g.is_isomorphic(g2, edge_labels = True) #long time
True
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['B',Integer(3),Integer(1)],Integer(2),
↪Integer(1))
>>> T = crystals.TensorProduct(K,K)
>>> g = T.digraph() #long time
>>> for e in g.edges(sort=False):  #long time
...     if e[Integer(0)].phi(Integer(0)) == Integer(1) and e[Integer(2)] ==␣
↪Integer(0):
...         g.delete_edge(e)

>>> C = crystals.AlcovePaths(['B',Integer(3),Integer(1)],[Integer(0),Integer(2),
↪Integer(0)], highest_weight_crystal=False)
>>> g2 = C.digraph() #long time
>>> g.is_isomorphic(g2, edge_labels = True) #long time
True
```

Note

In type $C_n^{(1)}$, the Kirillov-Reshetikhin crystal is not connected when restricted to pseudo-Demazure arrows, hence the previous example will fail for type $C_n^{(1)}$ crystals.

```
sage: R = RootSystem(['B',3])
sage: P = R.weight_lattice()
sage: La = P.fundamental_weights()
sage: D = crystals.AlcovePaths(2*La[2], highest_weight_crystal=False)
sage: C == D
True
```

```
>>> from sage.all import *
>>> R = RootSystem(['B',Integer(3)])
>>> P = R.weight_lattice()
>>> La = P.fundamental_weights()
>>> D = crystals.AlcovePaths(Integer(2)*La[Integer(2)], highest_weight_
↪crystal=False)
>>> C == D
True
```

Warning

Weights from finite root systems index non-highest weight crystals.

Element

alias of `CrystalOfAlcovePathsElement`

vertices()

Return a list of all the vertices of the crystal.

The vertices are represented as lists of integers recording the folding positions.

One can compute all vertices of the crystal by finding all the admissible subsets of the λ-chain (see method is_admissible, for definition). We use the breadth first search algorithm.

Warning

This method is (currently) only useful for the case when `highest_weight_crystal = False`, where you cannot always reach all vertices of the crystal using crystal operators, starting from the highest weight vertex. This method is typically slower than generating the crystal graph using crystal operators.

EXAMPLES:

```
sage: C = crystals.AlcovePaths(['C', 2], [1, 0])
sage: C.vertices()
[[], [0], [0, 1], [0, 1, 2]]
sage: C = crystals.AlcovePaths(['C', 2, 1], [2, 1], False)
sage: len(C.vertices())
80
```

```
>>> from sage.all import *
>>> C = crystals.AlcovePaths(['C', Integer(2)], [Integer(1), Integer(0)])
>>> C.vertices()
[[], [0], [0, 1], [0, 1, 2]]
>>> C = crystals.AlcovePaths(['C', Integer(2), Integer(1)], [Integer(2),
→Integer(1)], False)
>>> len(C.vertices())
80
```

The number of elements reachable using the crystal operators from the module generator:

```
sage: len(list(C))
55
```

```
>>> from sage.all import *
>>> len(list(C))
55
```

class sage.combinat.crystals.alcove_path.**CrystalOfAlcovePathsElement**

Bases: `ElementWrapper`

Crystal of alcove paths element.

INPUT:

- `data` – list of folding positions in the lambda chain (indexing starts at 0) or a tuple of *RootsWithHeight* giving folding positions in the lambda chain.

EXAMPLES:

```
sage: C = crystals.AlcovePaths(['A',2],[3,2])
sage: x = C ( () )
sage: x.f(1).f(2)
((alpha[1], 2), (alpha[1] + alpha[2], 4))
sage: x.f(1).f(2).integer_sequence()
[8, 9]
sage: C([8,9])
((alpha[1], 2), (alpha[1] + alpha[2], 4))
```

```
>>> from sage.all import *
>>> C = crystals.AlcovePaths(['A',Integer(2)],[Integer(3),Integer(2)])
>>> x = C ( () )
>>> x.f(Integer(1)).f(Integer(2))
((alpha[1], 2), (alpha[1] + alpha[2], 4))
>>> x.f(Integer(1)).f(Integer(2)).integer_sequence()
[8, 9]
>>> C([Integer(8),Integer(9)])
((alpha[1], 2), (alpha[1] + alpha[2], 4))
```

e(i)

Return the i-th crystal raising operator on `self`.

INPUT:

- `i` – element of the index set of the underlying root system

EXAMPLES:

```
sage: C = crystals.AlcovePaths(['A',2],[2,0]); C
Highest weight crystal of alcove paths of type ['A', 2] and weight 2*Lambda[1]
sage: x = C( () )
sage: x.e(1)
sage: x.f(1) == x.f(1).f(2).e(2)
True
```

```
>>> from sage.all import *
>>> C = crystals.AlcovePaths(['A',Integer(2)],[Integer(2),Integer(0)]); C
Highest weight crystal of alcove paths of type ['A', 2] and weight 2*Lambda[1]
>>> x = C( () )
>>> x.e(Integer(1))
>>> x.f(Integer(1)) == x.f(Integer(1)).f(Integer(2)).e(Integer(2))
True
```

epsilon(i)

Return the distance to the start of the i-string.

EXAMPLES:

```
sage: C = crystals.AlcovePaths(['A',2],[1,1])
sage: [c.epsilon(1) for c in C]
```

(continues on next page)

(continued from previous page)

```
[0, 1, 0, 0, 1, 0, 1, 2]
sage: [c.epsilon(2) for c in C]
[0, 0, 1, 2, 1, 1, 0, 0]
```

```
>>> from sage.all import *
>>> C = crystals.AlcovePaths(['A',Integer(2)],[Integer(1),Integer(1)])
>>> [c.epsilon(Integer(1)) for c in C]
[0, 1, 0, 0, 1, 0, 1, 2]
>>> [c.epsilon(Integer(2)) for c in C]
[0, 0, 1, 2, 1, 1, 0, 0]
```

f(*i*)

Return the i-th crystal lowering operator on `self`.

INPUT:

- `i` – element of the index_set of the underlying root_system

EXAMPLES:

```
sage: C=crystals.AlcovePaths(['B',2],[1,1])
sage: x=C(  () )
sage: x.f(1)
((alpha[1], 0),)
sage: x.f(1).f(2)
((alpha[1], 0), (alpha[1] + alpha[2], 2))
```

```
>>> from sage.all import *
>>> C=crystals.AlcovePaths(['B',Integer(2)],[Integer(1),Integer(1)])
>>> x=C(  () )
>>> x.f(Integer(1))
((alpha[1], 0),)
>>> x.f(Integer(1)).f(Integer(2))
((alpha[1], 0), (alpha[1] + alpha[2], 2))
```

integer_sequence()

Return a list of integers corresponding to positions in the λ-chain where it is folded.

Todo

Incorporate this method into the `_repr_` for finite Cartan type.

Note

Only works for finite Cartan types and indexing starts at 0.

EXAMPLES:

```
sage: C = crystals.AlcovePaths(['A',2],[3,2])
sage: x = C( () )
```

(continues on next page)

(continued from previous page)

```
sage: x.f(1).f(2).integer_sequence()
[8, 9]
```

```
>>> from sage.all import *
>>> C = crystals.AlcovePaths(['A',Integer(2)],[Integer(3),Integer(2)])
>>> x = C( () )
>>> x.f(Integer(1)).f(Integer(2)).integer_sequence()
[8, 9]
```

is_admissible()

Diagnostic test to check if `self` is a valid element of the crystal.

If `self.value` is given by

$$(\beta_1, i_1), (\beta_2, i_2), \ldots, (\beta_k, i_k),$$

for highest weight crystals this checks if the sequence

$$1 \rightarrow s_{\beta_1} \rightarrow s_{\beta_1} s_{\beta_2} \rightarrow \cdots \rightarrow s_{\beta_1} s_{\beta_2} \ldots s_{\beta_k}$$

is a path in the Bruhat graph. If `highest_weight_crystal=False`, then the method checks if the above sequence is a path in the quantum Bruhat graph.

EXAMPLES:

```
sage: C = crystals.AlcovePaths(['A',2],[1,1]); C
Highest weight crystal of alcove paths of type ['A', 2] and weight Lambda[1]␣
↪+ Lambda[2]
sage: roots = sorted(C._R._root_lattice.positive_roots()); roots
[alpha[1], alpha[1] + alpha[2], alpha[2]]
sage: r1 = C._R(roots[0],0); r1
(alpha[1], 0)
sage: r2 = C._R(roots[2],0); r2
(alpha[2], 0)
sage: r3 = C._R(roots[1],1); r3
(alpha[1] + alpha[2], 1)
sage: x = C( ( r1,r2) )
sage: x.is_admissible()
True
sage: x = C( (r3,) ); x
((alpha[1] + alpha[2], 1),)
sage: x.is_admissible()
False
sage: C = crystals.AlcovePaths(['C',2,1],[2,1],False)
sage: C([7,8]).is_admissible()
True
sage: C = crystals.AlcovePaths(['A',2],[3,2])
sage: C([2,3]).is_admissible()
True
```

```
>>> from sage.all import *
>>> C = crystals.AlcovePaths(['A',Integer(2)],[Integer(1),Integer(1)]); C
Highest weight crystal of alcove paths of type ['A', 2] and weight Lambda[1]␣
```

(continues on next page)

(continued from previous page)

```
↪+ Lambda[2]
>>> roots = sorted(C._R._root_lattice.positive_roots()); roots
[alpha[1], alpha[1] + alpha[2], alpha[2]]
>>> r1 = C._R(roots[Integer(0)],Integer(0)); r1
(alpha[1], 0)
>>> r2 = C._R(roots[Integer(2)],Integer(0)); r2
(alpha[2], 0)
>>> r3 = C._R(roots[Integer(1)],Integer(1)); r3
(alpha[1] + alpha[2], 1)
>>> x = C( ( r1,r2) )
>>> x.is_admissible()
True
>>> x = C( (r3,) ); x
((alpha[1] + alpha[2], 1),)
>>> x.is_admissible()
False
>>> C = crystals.AlcovePaths(['C',Integer(2),Integer(1)],[Integer(2),
↪Integer(1)],False)
>>> C([Integer(7),Integer(8)]).is_admissible()
True
>>> C = crystals.AlcovePaths(['A',Integer(2)],[Integer(3),Integer(2)])
>>> C([Integer(2),Integer(3)]).is_admissible()
True
```

Todo

Better doctest

path()

Return the path in the (quantum) Bruhat graph corresponding to `self`.

EXAMPLES:

```
sage: C = crystals.AlcovePaths(['B', 3], [3,1,2])
sage: b = C.highest_weight_vector().f_string([1,3,2,1,3,1])
sage: b.path()
[1, s1, s3*s1, s2*s3*s1, s3*s2*s3*s1]
sage: b = C.highest_weight_vector().f_string([2,3,3,2])
sage: b.path()
[1, s2, s3*s2, s2*s3*s2]
sage: b = C.highest_weight_vector().f_string([2,3,3,2,1])
sage: b.path()
[1, s2, s3*s2, s2*s3*s2, s1*s2*s3*s2]
```

```
>>> from sage.all import *
>>> C = crystals.AlcovePaths(['B', Integer(3)], [Integer(3),Integer(1),
↪Integer(2)])
>>> b = C.highest_weight_vector().f_string([Integer(1),Integer(3),Integer(2),
↪Integer(1),Integer(3),Integer(1)])
>>> b.path()
[1, s1, s3*s1, s2*s3*s1, s3*s2*s3*s1]
```

(continues on next page)

(continued from previous page)

```
>>> b = C.highest_weight_vector().f_string([Integer(2),Integer(3),Integer(3),
↪Integer(2)])
>>> b.path()
[1, s2, s3*s2, s2*s3*s2]
>>> b = C.highest_weight_vector().f_string([Integer(2),Integer(3),Integer(3),
↪Integer(2),Integer(1)])
>>> b.path()
[1, s2, s3*s2, s2*s3*s2, s1*s2*s3*s2]
```

phi (i)

Return the distance to the end of the i-string.

This method overrides the generic implementation in the category of crystals since this computation is more efficient.

EXAMPLES:

```
sage: C = crystals.AlcovePaths(['A',2],[1,1])
sage: [c.phi(1) for c in C]
[1, 0, 0, 1, 0, 2, 1, 0]
sage: [c.phi(2) for c in C]
[1, 2, 1, 0, 0, 0, 0, 1]
```

```
>>> from sage.all import *
>>> C = crystals.AlcovePaths(['A',Integer(2)],[Integer(1),Integer(1)])
>>> [c.phi(Integer(1)) for c in C]
[1, 0, 0, 1, 0, 2, 1, 0]
>>> [c.phi(Integer(2)) for c in C]
[1, 2, 1, 0, 0, 0, 0, 1]
```

plot ()

Return a plot self.

Note

Currently only implemented for types A_2, B_2, and C_2.

EXAMPLES:

```
sage: C = crystals.AlcovePaths(['A',2],[2,0])
sage: x = C( () ).f(1).f(2)
sage: x.plot() # Not tested - creates a pdf
```

```
>>> from sage.all import *
>>> C = crystals.AlcovePaths(['A',Integer(2)],[Integer(2),Integer(0)])
>>> x = C( () ).f(Integer(1)).f(Integer(2))
>>> x.plot() # Not tested - creates a pdf
```

weight ()

Return the weight of self.

EXAMPLES:

```
sage: C = crystals.AlcovePaths(['A',2],[2,0])
sage: for i in C: i.weight()
(2, 0, 0)
(1, 1, 0)
(0, 2, 0)
(0, -1, 0)
(-1, 0, 0)
(-2, -2, 0)
sage: B = crystals.AlcovePaths(['A',2,1],[1,0,0])
sage: p = B.module_generators[0].f_string([0,1,2])
sage: p.weight()
Lambda[0] - delta
```

```
>>> from sage.all import *
>>> C = crystals.AlcovePaths(['A',Integer(2)],[Integer(2),Integer(0)])
>>> for i in C: i.weight()
(2, 0, 0)
(1, 1, 0)
(0, 2, 0)
(0, -1, 0)
(-1, 0, 0)
(-2, -2, 0)
>>> B = crystals.AlcovePaths(['A',Integer(2),Integer(1)],[Integer(1),
↪Integer(0),Integer(0)])
>>> p = B.module_generators[Integer(0)].f_string([Integer(0),Integer(1),
↪Integer(2)])
>>> p.weight()
Lambda[0] - delta
```

class sage.combinat.crystals.alcove_path.**InfinityCrystalOfAlcovePaths**(*cartan_type*)

Bases: UniqueRepresentation, Parent

$\mathcal{B}(\infty)$ crystal of alcove paths.

class Element(*parent*, *elt*, *shift*)

Bases: ElementWrapper

Initialize self.

EXAMPLES:

```
sage: A = crystals.infinity.AlcovePaths(['F',4])
sage: mg = A.highest_weight_vector()
sage: x = mg.f_string([2,3,1,4,4,2,3,1])
sage: TestSuite(x).run()
```

```
>>> from sage.all import *
>>> A = crystals.infinity.AlcovePaths(['F',Integer(4)])
>>> mg = A.highest_weight_vector()
>>> x = mg.f_string([Integer(2),Integer(3),Integer(1),Integer(4),Integer(4),
↪Integer(2),Integer(3),Integer(1)])
>>> TestSuite(x).run()
```

e(*i*)

Return the action of e_i on self.

INPUT:

- i – an element of the index set

EXAMPLES:

```
sage: A = crystals.infinity.AlcovePaths(['D',5,1])
sage: mg = A.highest_weight_vector()
sage: x = mg.f_string([1,3,4,2,5,4,5,5])
sage: x.f(4).e(5) == x.e(5).f(4)
True
```

```
>>> from sage.all import *
>>> A = crystals.infinity.AlcovePaths(['D',Integer(5),Integer(1)])
>>> mg = A.highest_weight_vector()
>>> x = mg.f_string([Integer(1),Integer(3),Integer(4),Integer(2),
↪Integer(5),Integer(4),Integer(5),Integer(5)])
>>> x.f(Integer(4)).e(Integer(5)) == x.e(Integer(5)).f(Integer(4))
True
```

epsilon(*i*)

Return ε_i of self.

INPUT:

- i – an element of the index set

EXAMPLES:

```
sage: A = crystals.infinity.AlcovePaths(['A',7,2])
sage: mg = A.highest_weight_vector()
sage: x = mg.f_string([1,0,2,3,4,4,4,2,3,3,3])
sage: [x.epsilon(i) for i in A.index_set()]
[0, 0, 0, 3, 0]
sage: x = mg.f_string([2,2,1,1,0,1,0,2,3,3,3,4])
sage: [x.epsilon(i) for i in A.index_set()]
[1, 2, 0, 1, 1]
```

```
>>> from sage.all import *
>>> A = crystals.infinity.AlcovePaths(['A',Integer(7),Integer(2)])
>>> mg = A.highest_weight_vector()
>>> x = mg.f_string([Integer(1),Integer(0),Integer(2),Integer(3),
↪Integer(4),Integer(4),Integer(4),Integer(2),Integer(3),Integer(3),
↪Integer(3)])
>>> [x.epsilon(i) for i in A.index_set()]
[0, 0, 0, 3, 0]
>>> x = mg.f_string([Integer(2),Integer(2),Integer(1),Integer(1),
↪Integer(0),Integer(1),Integer(0),Integer(2),Integer(3),Integer(3),
↪Integer(3),Integer(4)])
>>> [x.epsilon(i) for i in A.index_set()]
[1, 2, 0, 1, 1]
```

f(*i*)

Return the action of f_i on self.

INPUT:

- i – an element of the index set

EXAMPLES:

```
sage: A = crystals.infinity.AlcovePaths(['E',7,1])
sage: mg = A.highest_weight_vector()
sage: mg.f_string([1,3,5,6,4,2,0,2,1,0,2,4,7,4,2])
((alpha[2], -3), (alpha[5], -1), (alpha[1], -1),
 (alpha[0] + alpha[1], -2),
 (alpha[2] + alpha[4] + alpha[5], -2),
 (alpha[5] + alpha[6], -1), (alpha[1] + alpha[3], -1),
 (alpha[5] + alpha[6] + alpha[7], -1),
 (alpha[0] + alpha[1] + alpha[3], -1),
 (alpha[1] + alpha[3] + alpha[4] + alpha[5], -1))
```

```
>>> from sage.all import *
>>> A = crystals.infinity.AlcovePaths(['E',Integer(7),Integer(1)])
>>> mg = A.highest_weight_vector()
>>> mg.f_string([Integer(1),Integer(3),Integer(5),Integer(6),Integer(4),
↪Integer(2),Integer(0),Integer(2),Integer(1),Integer(0),Integer(2),
↪Integer(4),Integer(7),Integer(4),Integer(2)])
((alpha[2], -3), (alpha[5], -1), (alpha[1], -1),
 (alpha[0] + alpha[1], -2),
 (alpha[2] + alpha[4] + alpha[5], -2),
 (alpha[5] + alpha[6], -1), (alpha[1] + alpha[3], -1),
 (alpha[5] + alpha[6] + alpha[7], -1),
 (alpha[0] + alpha[1] + alpha[3], -1),
 (alpha[1] + alpha[3] + alpha[4] + alpha[5], -1))
```

phi(*i*)

Return φ_i of `self`.

Let $A \in \mathcal{B}(\infty)$ Define $\varphi_i(A) := \varepsilon_i(A) + \langle h_i, \mathrm{wt}(A) \rangle$, where h_i is the i-th simple coroot and $\mathrm{wt}(A)$ is the *weight()* of A.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: A = crystals.infinity.AlcovePaths(['A',8,2])
sage: mg = A.highest_weight_vector()
sage: x = mg.f_string([1,0,2,3,4,4,4,2,3,3,3])
sage: [x.phi(i) for i in A.index_set()]
[1, 1, 1, 3, -2]
sage: x = mg.f_string([2,2,1,1,0,1,0,2,3,3,3,4])
sage: [x.phi(i) for i in A.index_set()]
[4, -1, 0, 0, 2]
```

```
>>> from sage.all import *
>>> A = crystals.infinity.AlcovePaths(['A',Integer(8),Integer(2)])
>>> mg = A.highest_weight_vector()
>>> x = mg.f_string([Integer(1),Integer(0),Integer(2),Integer(3),
↪Integer(4),Integer(4),Integer(4),Integer(2),Integer(3),Integer(3),
↪Integer(3)])
>>> [x.phi(i) for i in A.index_set()]
[1, 1, 1, 3, -2]
>>> x = mg.f_string([Integer(2),Integer(2),Integer(1),Integer(1),
```

(continues on next page)

(continued from previous page)

```
↪Integer(0),Integer(1),Integer(0),Integer(2),Integer(3),Integer(3),
↪Integer(3),Integer(4)])
>>> [x.phi(i) for i in A.index_set()]
[4, -1, 0, 0, 2]
```

projection(*k=None*)

Return the projection `self` onto $B(k\rho)$.

INPUT:

- `k` – (optional) if not given, defaults to the smallest value such that `self` is not `None` under the projection

EXAMPLES:

```
sage: A = crystals.infinity.AlcovePaths(['G',2])
sage: mg = A.highest_weight_vector()
sage: x = mg.f_string([2,1,1,2,2,2,1,1]); x
((alpha[2], -3), (alpha[1] + alpha[2], -3),
 (3*alpha[1] + 2*alpha[2], -1), (2*alpha[1] + alpha[2], -1))
sage: x.projection()
((alpha[2], 0), (alpha[1] + alpha[2], 9),
 (3*alpha[1] + 2*alpha[2], 8), (2*alpha[1] + alpha[2], 14))
sage: x.projection().parent()
Highest weight crystal of alcove paths of type ['G', 2]
 and weight 3*Lambda[1] + 3*Lambda[2]

sage: mg.projection().parent()
Highest weight crystal of alcove paths of type ['G', 2]
 and weight 0
sage: mg.f(1).projection().parent()
Highest weight crystal of alcove paths of type ['G', 2]
 and weight Lambda[1] + Lambda[2]
sage: mg.f(1).f(2).projection().parent()
Highest weight crystal of alcove paths of type ['G', 2]
 and weight Lambda[1] + Lambda[2]
sage: b = mg.f_string([1,2,2,1,2])
sage: b.projection().parent()
Highest weight crystal of alcove paths of type ['G', 2]
 and weight 2*Lambda[1] + 2*Lambda[2]
sage: b.projection(3).parent()
Highest weight crystal of alcove paths of type ['G', 2]
 and weight 3*Lambda[1] + 3*Lambda[2]
sage: b.projection(1)
```

```
>>> from sage.all import *
>>> A = crystals.infinity.AlcovePaths(['G',Integer(2)])
>>> mg = A.highest_weight_vector()
>>> x = mg.f_string([Integer(2),Integer(1),Integer(1),Integer(2),
↪Integer(2),Integer(2),Integer(1),Integer(1)]); x
((alpha[2], -3), (alpha[1] + alpha[2], -3),
 (3*alpha[1] + 2*alpha[2], -1), (2*alpha[1] + alpha[2], -1))
>>> x.projection()
((alpha[2], 0), (alpha[1] + alpha[2], 9),
```

(continues on next page)

(continued from previous page)

```
 (3*alpha[1] + 2*alpha[2], 8), (2*alpha[1] + alpha[2], 14))
>>> x.projection().parent()
Highest weight crystal of alcove paths of type ['G', 2]
 and weight 3*Lambda[1] + 3*Lambda[2]

>>> mg.projection().parent()
Highest weight crystal of alcove paths of type ['G', 2]
 and weight 0
>>> mg.f(Integer(1)).projection().parent()
Highest weight crystal of alcove paths of type ['G', 2]
 and weight Lambda[1] + Lambda[2]
>>> mg.f(Integer(1)).f(Integer(2)).projection().parent()
Highest weight crystal of alcove paths of type ['G', 2]
 and weight Lambda[1] + Lambda[2]
>>> b = mg.f_string([Integer(1),Integer(2),Integer(2),Integer(1),
↪Integer(2)])
>>> b.projection().parent()
Highest weight crystal of alcove paths of type ['G', 2]
 and weight 2*Lambda[1] + 2*Lambda[2]
>>> b.projection(Integer(3)).parent()
Highest weight crystal of alcove paths of type ['G', 2]
 and weight 3*Lambda[1] + 3*Lambda[2]
>>> b.projection(Integer(1))
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: A = crystals.infinity.AlcovePaths(['E',6])
sage: mg = A.highest_weight_vector()
sage: fstr = [1,3,4,2,1,2,3,6,5,3,2,6,2]
sage: x = mg.f_string(fstr)
sage: al = A.weight_lattice_realization().simple_roots()
sage: x.weight() == -sum(al[i]*fstr.count(i) for i in A.index_set())
True
```

```
>>> from sage.all import *
>>> A = crystals.infinity.AlcovePaths(['E',Integer(6)])
>>> mg = A.highest_weight_vector()
>>> fstr = [Integer(1),Integer(3),Integer(4),Integer(2),Integer(1),
↪Integer(2),Integer(3),Integer(6),Integer(5),Integer(3),Integer(2),
↪Integer(6),Integer(2)]
>>> x = mg.f_string(fstr)
>>> al = A.weight_lattice_realization().simple_roots()
>>> x.weight() == -sum(al[i]*fstr.count(i) for i in A.index_set())
True
```

class sage.combinat.crystals.alcove_path.**RootsWithHeight**(*weight*)

Bases: `UniqueRepresentation`, `Parent`

Data structure of the ordered pairs (β, k), where β is a positive root and k is a nonnegative integer. A total order is implemented on this set, and depends on the weight.

INPUT:

- `cartan_type` – Cartan type of a finite or affine untwisted root system
- `weight` – dominant weight as a list of (integral) coefficients of the fundamental weights

EXAMPLES:

```
sage: from sage.combinat.crystals.alcove_path import RootsWithHeight
sage: R = RootsWithHeight(['A',2],[1,1]); R
Roots with height of Cartan type ['A', 2] and dominant weight Lambda[1] +
→Lambda[2]

sage: r1 = R._root_lattice.from_vector(vector([1,0])); r1
alpha[1]
sage: r2 = R._root_lattice.from_vector(vector([1,1])); r2
alpha[1] + alpha[2]

sage: x = R(r1,0); x
(alpha[1], 0)
sage: y = R(r2,1); y
(alpha[1] + alpha[2], 1)
sage: x < y
True
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.alcove_path import RootsWithHeight
>>> R = RootsWithHeight(['A',Integer(2)],[Integer(1),Integer(1)]); R
Roots with height of Cartan type ['A', 2] and dominant weight Lambda[1] +
→Lambda[2]

>>> r1 = R._root_lattice.from_vector(vector([Integer(1),Integer(0)])); r1
alpha[1]
>>> r2 = R._root_lattice.from_vector(vector([Integer(1),Integer(1)])); r2
alpha[1] + alpha[2]

>>> x = R(r1,Integer(0)); x
(alpha[1], 0)
>>> y = R(r2,Integer(1)); y
(alpha[1] + alpha[2], 1)
>>> x < y
True
```

Element

alias of *RootsWithHeightElement*

lambda_chain()

Return the unfolded λ-chain.

Note

Only works in root systems of finite type.

EXAMPLES:

```
sage: from sage.combinat.crystals.alcove_path import RootsWithHeight
sage: R = RootsWithHeight(['A',2],[1,1]); R
Roots with height of Cartan type ['A', 2] and dominant weight Lambda[1] +
→Lambda[2]
sage: R.lambda_chain()
[(alpha[2], 0), (alpha[1] + alpha[2], 0), (alpha[1], 0), (alpha[1] + alpha[2],
→ 1)]
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.alcove_path import RootsWithHeight
>>> R = RootsWithHeight(['A',Integer(2)],[Integer(1),Integer(1)]); R
Roots with height of Cartan type ['A', 2] and dominant weight Lambda[1] +
→Lambda[2]
>>> R.lambda_chain()
[(alpha[2], 0), (alpha[1] + alpha[2], 0), (alpha[1], 0), (alpha[1] + alpha[2],
→ 1)]
```

word()

Give the initial alcove path (λ-chain) in terms of simple roots. Used for plotting the path.

Note

Currently only implemented for finite Cartan types.

EXAMPLES:

```
sage: from sage.combinat.crystals.alcove_path import RootsWithHeight
sage: R = RootsWithHeight(['A',2],[3,2])
sage: R.word()
[2, 1, 2, 0, 1, 2, 1, 0, 1, 2]
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.alcove_path import RootsWithHeight
>>> R = RootsWithHeight(['A',Integer(2)],[Integer(3),Integer(2)])
>>> R.word()
[2, 1, 2, 0, 1, 2, 1, 0, 1, 2]
```

class sage.combinat.crystals.alcove_path.**RootsWithHeightElement**(*parent*, *root*, *height*)

Bases: `Element`

Element of *RootsWithHeight*.

INPUT:

- `root` – a positive root β in our root system
- `height` – integer such that $0 \leq l \leq \langle \lambda, \beta^\vee \rangle$

EXAMPLES:

```
sage: from sage.combinat.crystals.alcove_path import RootsWithHeight
sage: rl = RootSystem(['A',2]).root_lattice()
sage: x = rl.from_vector(vector([1,1])); x
```

(continues on next page)

(continued from previous page)

```
alpha[1] + alpha[2]
sage: R = RootsWithHeight(['A',2],[1,1]); R
Roots with height of Cartan type ['A', 2] and dominant weight Lambda[1] +␣
↪Lambda[2]
sage: y = R(x, 1); y
(alpha[1] + alpha[2], 1)
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.alcove_path import RootsWithHeight
>>> rl = RootSystem(['A',Integer(2)]).root_lattice()
>>> x = rl.from_vector(vector([Integer(1),Integer(1)])); x
alpha[1] + alpha[2]
>>> R = RootsWithHeight(['A',Integer(2)],[Integer(1),Integer(1)]); R
Roots with height of Cartan type ['A', 2] and dominant weight Lambda[1] +␣
↪Lambda[2]
>>> y = R(x, Integer(1)); y
(alpha[1] + alpha[2], 1)
```

sage.combinat.crystals.alcove_path.**compare_graphs**(*g1*, *g2*, *node1*, *node2*)

Compare two edge-labeled `graphs` obtained from `Crystal.digraph()`, starting from the root nodes of each graph.

- `g1` – `graphs`, first digraph
- `g2` – `graphs`, second digraph
- `node1` – element of `g1`
- `node2` – element of `g2`

Traverse `g1` starting at `node1` and compare this graph with the one obtained by traversing `g2` starting with `node2`. If the graphs match (including labels) then return `True`. Return `False` otherwise.

EXAMPLES:

```
sage: from sage.combinat.crystals.alcove_path import compare_graphs
sage: G1 = crystals.Tableaux(['A',3], shape=[1,1]).digraph()
sage: C = crystals.AlcovePaths(['A',3],[0,1,0])
sage: G2 = C.digraph()
sage: compare_graphs(G1, G2, C( () ), G2.vertices(sort=True)[0])
True
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.alcove_path import compare_graphs
>>> G1 = crystals.Tableaux(['A',Integer(3)], shape=[Integer(1),Integer(1)]).
↪digraph()
>>> C = crystals.AlcovePaths(['A',Integer(3)],[Integer(0),Integer(1),Integer(0)])
>>> G2 = C.digraph()
>>> compare_graphs(G1, G2, C( () ), G2.vertices(sort=True)[Integer(0)])
True
```

5.1.40 Benkart-Kang-Kashiwara crystals for the general-linear Lie superalgebra

class sage.combinat.crystals.bkk_crystals.**CrystalOfBKKTableaux**(*ct*, *shape*)

Bases: *CrystalOfWords*

Crystal of tableaux for type $A(m|n)$.

This is an implementation of the tableaux model of the Benkart-Kang-Kashiwara crystal [BKK2000] for the Lie superalgebra $\mathfrak{gl}(m+1, n+1)$.

INPUT:

- `ct` – a super Lie Cartan type of type $A(m|n)$
- `shape` – shape specifying the highest weight; this should be a partition contained in a hook of height $n+1$ and width $m+1$

EXAMPLES:

```
sage: T = crystals.Tableaux(['A', [1,1]], shape = [2,1])
sage: T.cardinality()
20
```

```
>>> from sage.all import *
>>> T = crystals.Tableaux(['A', [Integer(1),Integer(1)]], shape = [Integer(2),
→Integer(1)])
>>> T.cardinality()
20
```

class Element

Bases: *CrystalOfBKKTableauxElement*

genuine_highest_weight_vectors(*index_set=None*)

Return a tuple of genuine highest weight elements.

A *fake highest weight vector* is one which is annihilated by e_i for all i in the index set, but whose weight is not bigger in dominance order than all other elements in the crystal. A *genuine highest weight vector* is a highest weight element that is not fake.

EXAMPLES:

```
sage: B = crystals.Tableaux(['A', [1,1]], shape=[3,2,1])
sage: B.genuine_highest_weight_vectors()
([[-2, -2, -2], [-1, -1], [1]],)
sage: B.highest_weight_vectors()
([[-2, -2, -2], [-1, -1], [1]],
 [[-2, -2, -2], [-1, 2], [1]],
 [[-2, -2, 2], [-1, -1], [1]])
```

```
>>> from sage.all import *
>>> B = crystals.Tableaux(['A', [Integer(1),Integer(1)]], shape=[Integer(3),
↪Integer(2),Integer(1)])
>>> B.genuine_highest_weight_vectors()
([[-2, -2, -2], [-1, -1], [1]],)
>>> B.highest_weight_vectors()
([[-2, -2, -2], [-1, -1], [1]],
 [[-2, -2, -2], [-1, 2], [1]],
 [[-2, -2, 2], [-1, -1], [1]])
```

shape()

Return the shape of `self`.

EXAMPLES:

```
sage: T = crystals.Tableaux(['A', [1, 2]], shape=[2,1])
sage: T.shape()
[2, 1]
```

```
>>> from sage.all import *
>>> T = crystals.Tableaux(['A', [Integer(1), Integer(2)]], shape=[Integer(2),
↪Integer(1)])
>>> T.shape()
[2, 1]
```

5.1.41 Catalog Of Crystals

Let I be an index set and let $(A, \Pi, \Pi^\vee, P, P^\vee)$ be a Cartan datum associated with generalized Cartan matrix $A = (a_{ij})_{i,j\in I}$. An *abstract crystal* associated to this Cartan datum is a set B together with maps

$$e_i, f_i \colon B \to B \cup \{0\}, \qquad \varepsilon_i, \varphi_i \colon B \to \mathbf{Z} \cup \{-\infty\}, \qquad \mathrm{wt}\colon B \to P,$$

subject to the following conditions:

1. $\varphi_i(b) = \varepsilon_i(b) + \langle h_i, \mathrm{wt}(b)\rangle$ for all $b \in B$ and $i \in I$;
2. $\mathrm{wt}(e_i b) = \mathrm{wt}(b) + \alpha_i$ if $e_i b \in B$;
3. $\mathrm{wt}(f_i b) = \mathrm{wt}(b) - \alpha_i$ if $f_i b \in B$;
4. $\varepsilon_i(e_i b) = \varepsilon_i(b) - 1$, $\varphi_i(e_i b) = \varphi_i(b) + 1$ if $e_i b \in B$;
5. $\varepsilon_i(f_i b) = \varepsilon_i(b) + 1$, $\varphi_i(f_i b) = \varphi_i(b) - 1$ if $f_i b \in B$;
6. $f_i b = b'$ if and only if $b = e_i b'$ for $b, b' \in B$ and $i \in I$;
7. if $\varphi_i(b) = -\infty$ for $b \in B$, then $e_i b = f_i b = 0$.

5.1.45 An introduction to crystals

Informally, a crystal $\mathcal{B}$ is an oriented graph with edges colored in some set I such that, for each $i \in I$, each node x has:

- at most one i-successor, denoted $f_i x$;
- at most one i-predecessor, denoted $e_i x$.

By convention, one writes $f_i x = \emptyset$ and $e_i x = \emptyset$ when x has no successor resp. predecessor.

One may think of $\mathcal{B}$ as essentially a deterministic automaton whose dual is also deterministic; in this context, the f_i's and e_i's are respectively the transition functions of the automaton and of its dual, and $\emptyset$ is the sink.

A crystal comes further endowed with a weight function $\mathrm{wt} : \mathcal{B} \to L$ which satisfies appropriate conditions.

In combinatorial representation theory, crystals are used as combinatorial data to model representations of Lie algebra.

Axiomatic definition

Let C be a Cartan type (`CartanType`) with index set I, and L be a realization of the weight lattice of the type C. Let α_i and $\alpha_i^\vee$ denote the simple roots and coroots respectively.

A type C crystal is a non-empty set $\mathcal{B}$ endowed with maps $\mathrm{wt} : \mathcal{B} \to L$, $e_i, f_i : \mathcal{B} \to \mathcal{B} \cup \{\emptyset\}$, and $\varepsilon_i, \varphi_i : \mathcal{B} \to \mathbf{Z} \cup \{-\infty\}$ for $i \in I$ satisfying the following properties for all $i \in I$:

- for $b, b' \in \mathcal{B}$, we have $f_i b' = b$ if and only if $e_i b = b'$;
- if $e_i b \in \mathcal{B}$, then:
  - $\mathrm{wt}(e_i b) = \mathrm{wt}(b) + \alpha_i$,
  - $\varepsilon_i(e_i b) = \varepsilon_i(b) - 1$,
  - $\varphi_i(e_i b) = \varphi_i(b) + 1$;
- if $f_i b \in \mathcal{B}$, then:
  - $\mathrm{wt}(f_i b) = \mathrm{wt}(b) - \alpha_i$,
  - $\varepsilon_i(f_i b) = \varepsilon_i(b) + 1$,
  - $\varphi_i(f_i b) = \varphi_i(b) - 1$;
- $\varphi_i(b) = \varepsilon_i(b) + \langle \alpha_i^\vee, \mathrm{wt}(b) \rangle$,
- if $\varphi_i(b) = -\infty$ for $b \in \mathcal{B}$, then $e_i b = f_i b = \emptyset$.

Some further conditions are required to guarantee that this data indeed models a representation of a Lie algebra. For finite simply laced types a complete characterization is given by Stembridge's local axioms [Ste2003].

EXAMPLES:

We construct the type A_5 crystal on letters (or in representation theoretic terms, the highest weight crystal of type A_5 corresponding to the highest weight Λ_1):

```
sage: C = crystals.Letters(['A',5]); C
The crystal of letters for type ['A', 5]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(5)]); C
The crystal of letters for type ['A', 5]
```

It has a single highest weight element:

```
sage: C.highest_weight_vectors()
(1,)
```

```
>>> from sage.all import *
>>> C.highest_weight_vectors()
(1,)
```

A crystal is an enumerated set (see `EnumeratedSets`); and we can count and list its elements in the usual way:

```
sage: C.cardinality()
6
sage: C.list()
[1, 2, 3, 4, 5, 6]
```

```
>>> from sage.all import *
>>> C.cardinality()
6
>>> C.list()
[1, 2, 3, 4, 5, 6]
```

as well as use it in for loops:

```
sage: [x for x in C]
[1, 2, 3, 4, 5, 6]
```

```
>>> from sage.all import *
>>> [x for x in C]
[1, 2, 3, 4, 5, 6]
```

Here are some more elaborate crystals (see their respective documentations):

```
sage: Tens = crystals.TensorProduct(C, C)
sage: Spin = crystals.Spins(['B', 3])
sage: Tab  = crystals.Tableaux(['A', 3], shape = [2,1,1])
sage: Fast = crystals.FastRankTwo(['B', 2], shape = [3/2, 1/2])
sage: KR = crystals.KirillovReshetikhin(['A',2,1],1,1)
```

```
>>> from sage.all import *
>>> Tens = crystals.TensorProduct(C, C)
>>> Spin = crystals.Spins(['B', Integer(3)])
>>> Tab  = crystals.Tableaux(['A', Integer(3)], shape = [Integer(2),Integer(1),
↪Integer(1)])
>>> Fast = crystals.FastRankTwo(['B', Integer(2)], shape = [Integer(3)/Integer(2),␣
↪Integer(1)/Integer(2)])
>>> KR = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)],Integer(1),
↪Integer(1))
```

One can get (currently) crude plotting via:

```
sage: Tab.plot()                                                              #␣
↪needs sage.plot
Graphics object consisting of 52 graphics primitives
```

```
>>> from sage.all import *
>>> Tab.plot()                                                              #␣
↪needs sage.plot
Graphics object consisting of 52 graphics primitives
```

If dot2tex is installed, one can obtain nice latex pictures via:

```
sage: K = crystals.KirillovReshetikhin(['A',3,1], 1,1)
sage: view(K, pdflatex=True) # optional - dot2tex graphviz, not tested (opens␣
↪external window)
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(3),Integer(1)], Integer(1),
↪Integer(1))
>>> view(K, pdflatex=True) # optional - dot2tex graphviz, not tested (opens external␣
↪window)
```

or with colored edges:

```
sage: K = crystals.KirillovReshetikhin(['A',3,1], 1,1)
sage: G = K.digraph()
sage: G.set_latex_options(color_by_label={0:"black", 1:"red", 2:"blue", 3:"green"})
sage: view(G, pdflatex=True) # optional - dot2tex graphviz, not tested (opens␣
↪external window)
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(3),Integer(1)], Integer(1),
↪Integer(1))
>>> G = K.digraph()
>>> G.set_latex_options(color_by_label={Integer(0):"black", Integer(1):"red",␣
↪Integer(2):"blue", Integer(3):"green"})
>>> view(G, pdflatex=True) # optional - dot2tex graphviz, not tested (opens external␣
↪window)
```

For rank two crystals, there is an alternative method of getting metapost pictures. For more information see `C.metapost?`
.

The overview of crystal features in Sage

Todo

- Vocabulary and conventions:
  - For a classical crystal: connected / highest weight / irreducible
  - …
- Layout instructions for plot() for rank 2 types
- RestrictionOfCrystal

The crystals library in Sage grew up from an initial implementation in MuPAD-Combinat (see <MuPAD-Combinat>/lib/COMBINAT/crystals.mu).

class `sage.combinat.crystals.crystals.`**`CrystalBacktracker`**(*crystal*, *index_set=None*)

Bases: `GenericBacktracker`

Time complexity: $O(nF)$ amortized for each produced element, where n is the size of the index set, and F is the cost of computing e and f operators.

Memory complexity: $O(D)$ where D is the depth of the crystal.

Principle of the algorithm:

Let C be a classical crystal. It's an acyclic graph where each connected component has a unique element without predecessors (the highest weight element for this component). Let's assume for simplicity that C is irreducible (i.e. connected) with highest weight element u.

One can define a natural spanning tree of C by taking u as the root of the tree, and for any other element y taking as ancestor the element x such that there is an i-arrow from x to y with i minimal. Then, a path from u to y describes the lexicographically smallest sequence $i_1, \dots, i_k$ such that $(f_{i_k} \circ f_{i_1})(u) = y$.

Morally, the iterator implemented below just does a depth first search walk through this spanning tree. In practice, this can be achieved recursively as follows: take an element x, and consider in turn each successor $y = f_i(x)$, ignoring those such that $y = f_j(x')$ for some x' and $j < i$ (this can be tested by computing $e_j(y)$ for $j < i$).

EXAMPLES:

```
sage: from sage.combinat.crystals.crystals import CrystalBacktracker
sage: C = crystals.Tableaux(['B',3],shape=[3,2,1])
sage: CB = CrystalBacktracker(C)
sage: len(list(CB))
1617
sage: CB = CrystalBacktracker(C, [1,2])
sage: len(list(CB))
8
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.crystals import CrystalBacktracker
>>> C = crystals.Tableaux(['B',Integer(3)],shape=[Integer(3),Integer(2),
↪Integer(1)])
>>> CB = CrystalBacktracker(C)
>>> len(list(CB))
1617
>>> CB = CrystalBacktracker(C, [Integer(1),Integer(2)])
>>> len(list(CB))
8
```

5.1.46 Direct Sum of Crystals

class sage.combinat.crystals.direct_sum.**DirectSumOfCrystals**(*crystals*, *facade*, *keepkey*, *category*, ***options*)

Bases: DisjointUnionEnumeratedSets

Direct sum of crystals.

Given a list of crystals $B_0, \dots, B_k$ of the same Cartan type, one can form the direct sum $B_0 \oplus \cdots \oplus B_k$.

INPUT:

- `crystals` – list of crystals of the same Cartan type
- `keepkey` – boolean

The option `keepkey` is by default set to `False`, assuming that the crystals are all distinct. In this case the elements of the direct sum are just represented by the elements in the crystals B_i. If the crystals are not all distinct, one should set the `keepkey` option to `True`. In this case, the elements of the direct sum are represented as tuples (i, b) where $b \in B_i$.

EXAMPLES:

```
sage: C = crystals.Letters(['A',2])
sage: C1 = crystals.Tableaux(['A',2],shape=[1,1])
sage: B = crystals.DirectSum([C,C1])
sage: B.list()
[1, 2, 3, [[1], [2]], [[1], [3]], [[2], [3]]]
sage: [b.f(1) for b in B]
[2, None, None, None, [[2], [3]], None]
sage: B.module_generators
(1, [[1], [2]])
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(2)])
>>> C1 = crystals.Tableaux(['A',Integer(2)],shape=[Integer(1),Integer(1)])
>>> B = crystals.DirectSum([C,C1])
>>> B.list()
[1, 2, 3, [[1], [2]], [[1], [3]], [[2], [3]]]
>>> [b.f(Integer(1)) for b in B]
[2, None, None, None, [[2], [3]], None]
>>> B.module_generators
(1, [[1], [2]])
```

```
sage: B = crystals.DirectSum([C,C], keepkey=True)
sage: B.list()
[(0, 1), (0, 2), (0, 3), (1, 1), (1, 2), (1, 3)]
sage: B.module_generators
((0, 1), (1, 1))
sage: b = B( tuple([0,C(1)]) )
sage: b
(0, 1)
sage: b.weight()
(1, 0, 0)
```

```
>>> from sage.all import *
>>> B = crystals.DirectSum([C,C], keepkey=True)
>>> B.list()
[(0, 1), (0, 2), (0, 3), (1, 1), (1, 2), (1, 3)]
>>> B.module_generators
((0, 1), (1, 1))
>>> b = B( tuple([Integer(0),C(Integer(1))]) )
>>> b
(0, 1)
>>> b.weight()
(1, 0, 0)
```

The following is required, because *`DirectSumOfCrystals`* takes the same arguments as `DisjointUnionEnumeratedSets` (which see for details).

class Element

Bases: `ElementWrapper`

A class for elements of direct sums of crystals.

e(*i*)

Return the action of e_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['A',2])
sage: B = crystals.DirectSum([C,C], keepkey=True)
sage: [[b, b.e(2)] for b in B]
[[(0, 1), None], [(0, 2), None], [(0, 3), (0, 2)], [(1, 1), None], [(1,
→2), None], [(1, 3), (1, 2)]]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(2)])
>>> B = crystals.DirectSum([C,C], keepkey=True)
>>> [[b, b.e(Integer(2))] for b in B]
[[(0, 1), None], [(0, 2), None], [(0, 3), (0, 2)], [(1, 1), None], [(1,
→2), None], [(1, 3), (1, 2)]]
```

epsilon(*i*)

EXAMPLES:

```
sage: C = crystals.Letters(['A',2])
sage: B = crystals.DirectSum([C,C], keepkey=True)
sage: b = B( tuple([0,C(2)]) )
sage: b.epsilon(2)
0
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(2)])
>>> B = crystals.DirectSum([C,C], keepkey=True)
>>> b = B( tuple([Integer(0),C(Integer(2))]) )
>>> b.epsilon(Integer(2))
0
```

f(*i*)

Return the action of f_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['A',2])
sage: B = crystals.DirectSum([C,C], keepkey=True)
sage: [[b,b.f(1)] for b in B]
[[(0, 1), (0, 2)], [(0, 2), None], [(0, 3), None], [(1, 1), (1, 2)], [(1,
→2), None], [(1, 3), None]]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(2)])
>>> B = crystals.DirectSum([C,C], keepkey=True)
>>> [[b,b.f(Integer(1))] for b in B]
[[(0, 1), (0, 2)], [(0, 2), None], [(0, 3), None], [(1, 1), (1, 2)], [(1,
→2), None], [(1, 3), None]]
```

phi(*i*)

EXAMPLES:

```
sage: C = crystals.Letters(['A',2])
sage: B = crystals.DirectSum([C,C], keepkey=True)
sage: b = B( tuple([0,C(2)]) )
sage: b.phi(2)
1
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(2)])
>>> B = crystals.DirectSum([C,C], keepkey=True)
>>> b = B( tuple([Integer(0),C(Integer(2))]) )
>>> b.phi(Integer(2))
1
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['A',2])
sage: B = crystals.DirectSum([C,C], keepkey=True)
sage: b = B( tuple([0,C(2)]) )
sage: b
(0, 2)
sage: b.weight()
(0, 1, 0)
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(2)])
>>> B = crystals.DirectSum([C,C], keepkey=True)
>>> b = B( tuple([Integer(0),C(Integer(2))]) )
>>> b
(0, 2)
>>> b.weight()
(0, 1, 0)
```

weight_lattice_realization()

Return the weight lattice realization used to express weights.

The weight lattice realization is the common parent which all weight lattice realizations of the crystals of `self` coerce into.

EXAMPLES:

```
sage: LaZ = RootSystem(['A',2,1]).weight_lattice(extended=True).fundamental_
↪weights()
sage: LaQ = RootSystem(['A',2,1]).weight_space(extended=True).fundamental_
↪weights()
sage: B = crystals.LSPaths(LaQ[1])
sage: B.weight_lattice_realization()
Extended weight space over the Rational Field of the Root system of type ['A',
↪ 2, 1]
```

(continues on next page)

(continued from previous page)

```
sage: C = crystals.AlcovePaths(LaZ[1])
sage: C.weight_lattice_realization()
Extended weight lattice of the Root system of type ['A', 2, 1]
sage: D = crystals.DirectSum([B,C])
sage: D.weight_lattice_realization()
Extended weight space over the Rational Field of the Root system of type ['A',
↪ 2, 1]
```

```
>>> from sage.all import *
>>> LaZ = RootSystem(['A',Integer(2),Integer(1)]).weight_
↪lattice(extended=True).fundamental_weights()
>>> LaQ = RootSystem(['A',Integer(2),Integer(1)]).weight_space(extended=True).
↪fundamental_weights()
>>> B = crystals.LSPaths(LaQ[Integer(1)])
>>> B.weight_lattice_realization()
Extended weight space over the Rational Field of the Root system of type ['A',
↪ 2, 1]
>>> C = crystals.AlcovePaths(LaZ[Integer(1)])
>>> C.weight_lattice_realization()
Extended weight lattice of the Root system of type ['A', 2, 1]
>>> D = crystals.DirectSum([B,C])
>>> D.weight_lattice_realization()
Extended weight space over the Rational Field of the Root system of type ['A',
↪ 2, 1]
```

5.1.47 Elementary Crystals

Let λ be a weight. The crystals T_λ, R_λ, B_i, and C are important objects in the tensor category of crystals. For example, the crystal T_0 is the neutral object in this category; i.e., $T_0 \otimes B \cong B \otimes T_0 \cong B$ for any crystal B. We list some other properties of these crystals:

- The crystal $T_\lambda \otimes B(\infty)$ is the crystal of the Verma module with highest weight λ, where λ is a dominant integral weight.
- Let u_∞ be the highest weight vector of $B(\infty)$ and λ be a dominant integral weight. There is an embedding of crystals $B(\lambda) \longrightarrow T_\lambda \otimes B(\infty)$ sending $u_\lambda \mapsto t_\lambda \otimes u_\infty$ which is not strict, but the embedding $B(\lambda) \longrightarrow C \otimes T_\lambda \otimes B(\infty)$ by $u_\lambda \mapsto c \otimes t_\lambda \otimes u_\infty$ is a strict embedding.
- For any dominant integral weight λ, there is a surjective crystal morphism $\Psi_\lambda \colon R_\lambda \otimes B(\infty) \longrightarrow B(\lambda)$. More precisely, if $B = \{r_\lambda \otimes b \in R_\lambda \otimes B(\infty) : \Psi_\lambda(r_\lambda \otimes b) \neq 0\}$, then $B \cong B(\lambda)$ as crystals.
- For all Cartan types and all weights λ, we have $R_\lambda \cong C \otimes T_\lambda$ as crystals.
- For each i, there is a strict crystal morphism $\Psi_i \colon B(\infty) \longrightarrow B_i \otimes B(\infty)$ defined by $u_\infty \mapsto b_i(0) \otimes u_\infty$, where u_∞ is the highest weight vector of $B(\infty)$.

For more information on $B(\infty)$, see `InfinityCrystalOfTableaux`.

Note

As with `TensorProductOfCrystals`, we are using the opposite of Kashiwara's convention.

REFERENCES:

- [Ka1993]
- [NZ1997]

class sage.combinat.crystals.elementary_crystals.**AbstractSingleCrystalElement**

Bases: Element

Abstract base class for elements in crystals with a single element.

e(i)

Return e_i of self, which is None for all i.

INPUT:

- i – an element of the index set

EXAMPLES:

```
sage: ct = CartanType(['A',2])
sage: la = RootSystem(ct).weight_lattice().fundamental_weights()
sage: T = crystals.elementary.T(ct,la[1])
sage: t = T.highest_weight_vector()
sage: t.e(1)
sage: t.e(2)
```

```
>>> from sage.all import *
>>> ct = CartanType(['A',Integer(2)])
>>> la = RootSystem(ct).weight_lattice().fundamental_weights()
>>> T = crystals.elementary.T(ct,la[Integer(1)])
>>> t = T.highest_weight_vector()
>>> t.e(Integer(1))
>>> t.e(Integer(2))
```

f(i)

Return f_i of self, which is None for all i.

INPUT:

- i – an element of the index set

EXAMPLES:

```
sage: ct = CartanType(['A',2])
sage: la = RootSystem(ct).weight_lattice().fundamental_weights()
sage: T = crystals.elementary.T(ct,la[1])
sage: t = T.highest_weight_vector()
sage: t.f(1)
sage: t.f(2)
```

```
>>> from sage.all import *
>>> ct = CartanType(['A',Integer(2)])
>>> la = RootSystem(ct).weight_lattice().fundamental_weights()
>>> T = crystals.elementary.T(ct,la[Integer(1)])
>>> t = T.highest_weight_vector()
>>> t.f(Integer(1))
>>> t.f(Integer(2))
```

class sage.combinat.crystals.elementary_crystals.**ComponentCrystal**(*cartan_type*, *P*)

Bases: UniqueRepresentation, Parent

The component crystal.

Defined in [Ka1993], the component crystal $C = \{c\}$ is the single element crystal whose crystal structure is defined by

$$\mathrm{wt}(c) = 0, \quad e_i c = f_i c = 0, \quad \varepsilon_i(c) = \varphi_i(c) = 0.$$

Note $C \cong B(0)$, where $B(0)$ is the highest weight crystal of highest weight 0.

INPUT:

- cartan_type – a Cartan type

class Element

Bases: *AbstractSingleCrystalElement*

Element of a component crystal.

epsilon(*i*)

Return ε_i of self, which is 0 for all i.

INPUT:

- i – an element of the index set

EXAMPLES:

```
sage: C = crystals.elementary.Component("C5")
sage: c = C.highest_weight_vector()
sage: [c.epsilon(i) for i in C.index_set()]
[0, 0, 0, 0, 0]
```

```
>>> from sage.all import *
>>> C = crystals.elementary.Component("C5")
>>> c = C.highest_weight_vector()
>>> [c.epsilon(i) for i in C.index_set()]
[0, 0, 0, 0, 0]
```

phi(*i*)

Return φ_i of self, which is 0 for all i.

INPUT:

- i – an element of the index set

EXAMPLES:

```
sage: C = crystals.elementary.Component("C5")
sage: c = C.highest_weight_vector()
sage: [c.phi(i) for i in C.index_set()]
[0, 0, 0, 0, 0]
```

```
>>> from sage.all import *
>>> C = crystals.elementary.Component("C5")
>>> c = C.highest_weight_vector()
>>> [c.phi(i) for i in C.index_set()]
[0, 0, 0, 0, 0]
```

weight()

Return the weight of `self`, which is always 0.

EXAMPLES:

```
sage: C = crystals.elementary.Component("F4")
sage: c = C.highest_weight_vector()
sage: c.weight()
(0, 0, 0, 0)
```

```
>>> from sage.all import *
>>> C = crystals.elementary.Component("F4")
>>> c = C.highest_weight_vector()
>>> c.weight()
(0, 0, 0, 0)
```

cardinality()

Return the cardinality of `self`, which is always 1.

EXAMPLES:

```
sage: C = crystals.elementary.Component("E6")
sage: c = C.highest_weight_vector()
sage: C.cardinality()
1
```

```
>>> from sage.all import *
>>> C = crystals.elementary.Component("E6")
>>> c = C.highest_weight_vector()
>>> C.cardinality()
1
```

weight_lattice_realization()

Return the weight lattice realization of `self`.

EXAMPLES:

```
sage: C = crystals.elementary.Component("A2")
sage: C.weight_lattice_realization()
Ambient space of the Root system of type ['A', 2]

sage: P = RootSystem(['A',2]).weight_lattice()
sage: C = crystals.elementary.Component(P)
sage: C.weight_lattice_realization() is P
True
```

```
>>> from sage.all import *
>>> C = crystals.elementary.Component("A2")
>>> C.weight_lattice_realization()
Ambient space of the Root system of type ['A', 2]

>>> P = RootSystem(['A',Integer(2)]).weight_lattice()
>>> C = crystals.elementary.Component(P)
```

(continues on next page)

(continued from previous page)

```
>>> C.weight_lattice_realization() is P
True
```

class sage.combinat.crystals.elementary_crystals.**ElementaryCrystal**(*cartan_type*, *i*)

Bases: UniqueRepresentation, Parent

The elementary crystal B_i.

For i an element of the index set of type X, the crystal B_i of type X is the set

$$B_i = \{b_i(m) : m \in \mathbf{Z}\},$$

where the crystal structure is given by

$$\begin{aligned} \mathrm{wt}\big(b_i(m)\big) &= m\alpha_i \\ \varphi_j\big(b_i(m)\big) &= \begin{cases} m & \text{if } j = i, \\ -\infty & \text{if } j \neq i, \end{cases} \\ \varepsilon_j\big(b_i(m)\big) &= \begin{cases} -m & \text{if } j = i, \\ -\infty & \text{if } j \neq i, \end{cases} \\ e_j b_i(m) &= \begin{cases} b_i(m+1) & \text{if } j = i, \\ 0 & \text{if } j \neq i, \end{cases} \\ f_j b_i(m) &= \begin{cases} b_i(m-1) & \text{if } j = i, \\ 0 & \text{if } j \neq i. \end{cases} \end{aligned}$$

The *Kashiwara embedding theorem* asserts there is a unique strict crystal embedding of crystals

$$B(\infty) \hookrightarrow B_i \otimes B(\infty),$$

satisfying certain properties (see [Ka1993]). The above embedding may be iterated to obtain a new embedding

$$B(\infty) \hookrightarrow B_{i_N} \otimes B_{i_{N-1}} \otimes \cdots \otimes B_{i_2} \otimes B_{i_1} \otimes B(\infty),$$

which is a foundational object in the study of *polyhedral realizations of crystals* (see, for example, [NZ1997]).

class Element(*parent*, *m*)

Bases: Element

Element of a B_i crystal.

e(*i*)

Return the action of e_i on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: B = crystals.elementary.Elementary(['E',7],1)
sage: B(3).e(1)
4
sage: B(172).e_string([1]*171)
343
sage: B(0).e(2)
```

```
>>> from sage.all import *
>>> B = crystals.elementary.Elementary(['E',Integer(7)],Integer(1))
>>> B(Integer(3)).e(Integer(1))
4
>>> B(Integer(172)).e_string([Integer(1)]*Integer(171))
343
>>> B(Integer(0)).e(Integer(2))
```

epsilon(*i*)

Return ε_i of `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: B = crystals.elementary.Elementary(['F',4],3)
sage: [[B(j).epsilon(i) for i in B.index_set()] for j in range(5)]
[[-inf, -inf, 0, -inf],
 [-inf, -inf, -1, -inf],
 [-inf, -inf, -2, -inf],
 [-inf, -inf, -3, -inf],
 [-inf, -inf, -4, -inf]]
```

```
>>> from sage.all import *
>>> B = crystals.elementary.Elementary(['F',Integer(4)],Integer(3))
>>> [[B(j).epsilon(i) for i in B.index_set()] for j in range(Integer(5))]
[[-inf, -inf, 0, -inf],
 [-inf, -inf, -1, -inf],
 [-inf, -inf, -2, -inf],
 [-inf, -inf, -3, -inf],
 [-inf, -inf, -4, -inf]]
```

f(*i*)

Return the action of f_i on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: B = crystals.elementary.Elementary(['E',7],1)
sage: B(3).f(1)
2
sage: B(172).f_string([1]*171)
1
sage: B(0).e(2)
```

```
>>> from sage.all import *
>>> B = crystals.elementary.Elementary(['E',Integer(7)],Integer(1))
>>> B(Integer(3)).f(Integer(1))
2
>>> B(Integer(172)).f_string([Integer(1)]*Integer(171))
1
>>> B(Integer(0)).e(Integer(2))
```

phi (i)

Return φ_i of `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: B = crystals.elementary.Elementary(['E',8,1],4)
sage: [[B(m).phi(j) for j in B.index_set()] for m in range(44,49)]
[[-inf, -inf, -inf, -inf, 44, -inf, -inf, -inf, -inf],
 [-inf, -inf, -inf, -inf, 45, -inf, -inf, -inf, -inf],
 [-inf, -inf, -inf, -inf, 46, -inf, -inf, -inf, -inf],
 [-inf, -inf, -inf, -inf, 47, -inf, -inf, -inf, -inf],
 [-inf, -inf, -inf, -inf, 48, -inf, -inf, -inf, -inf]]
```

```
>>> from sage.all import *
>>> B = crystals.elementary.Elementary(['E',Integer(8),Integer(1)],
↪Integer(4))
>>> [[B(m).phi(j) for j in B.index_set()] for m in range(Integer(44),
↪Integer(49))]
[[-inf, -inf, -inf, -inf, 44, -inf, -inf, -inf, -inf],
 [-inf, -inf, -inf, -inf, 45, -inf, -inf, -inf, -inf],
 [-inf, -inf, -inf, -inf, 46, -inf, -inf, -inf, -inf],
 [-inf, -inf, -inf, -inf, 47, -inf, -inf, -inf, -inf],
 [-inf, -inf, -inf, -inf, 48, -inf, -inf, -inf, -inf]]
```

weight ()

Return the weight of `self`.

EXAMPLES:

```
sage: B = crystals.elementary.Elementary(['C',14],12)
sage: B(-385).weight()
-385*alpha[12]
```

```
>>> from sage.all import *
>>> B = crystals.elementary.Elementary(['C',Integer(14)],Integer(12))
>>> B(-Integer(385)).weight()
-385*alpha[12]
```

weight_lattice_realization ()

Return a realization of the lattice containing the weights of `self`.

EXAMPLES:

```
sage: B = crystals.elementary.Elementary(['A',4, 1], 2)
sage: B.weight_lattice_realization()
Root lattice of the Root system of type ['A', 4, 1]
```

```
>>> from sage.all import *
>>> B = crystals.elementary.Elementary(['A',Integer(4), Integer(1)],␣
↪Integer(2))
>>> B.weight_lattice_realization()
Root lattice of the Root system of type ['A', 4, 1]
```

class sage.combinat.crystals.elementary_crystals.**RCrystal**(*cartan_type*, *weight*, *dual*)

Bases: UniqueRepresentation, Parent

The crystal R_λ.

For a fixed weight λ, the crystal $R_\lambda = \{r_\lambda\}$ is a single element crystal with the crystal structure defined by

$$\mathrm{wt}(r_\lambda) = \lambda, \quad e_i r_\lambda = f_i r_\lambda = 0, \quad \varepsilon_i(r_\lambda) = -\langle h_i, \lambda \rangle, \quad \varphi_i(r_\lambda) = 0,$$

where $\{h_i\}$ are the simple coroots.

Tensoring R_λ with a crystal B results in shifting the weights of the vertices in B by λ and may also cut a subset out of the original graph of B. That is, $\mathrm{wt}(r_\lambda \otimes b) = \mathrm{wt}(b) + \lambda$, where $b \in B$, provided $r_\lambda \otimes b \neq 0$. For example, the crystal graph of $B(\lambda)$ is the same as the crystal graph of $R_\lambda \otimes B(\infty)$ generated from the component $r_\lambda \otimes u_\infty$.

There is also a dual version of this crystal given by $R^\vee_\lambda = \{r^\vee_\lambda\}$ with the crystal structure defined by

$$\mathrm{wt}(r^\vee_\lambda) = \lambda, \quad e_i r^\vee_\lambda = f_i r^\vee_\lambda = 0, \quad \varepsilon_i(r^\vee_\lambda) = 0, \quad \varphi_i(r^\vee_\lambda) = \langle h_i, \lambda \rangle.$$

INPUT:

- `cartan_type` – a Cartan type
- `weight` – an element of the weight lattice of type `cartan_type`
- `dual` – boolean (default: `False`)

EXAMPLES:

We check by tensoring R_λ with $B(\infty)$ results in a component of $B(\lambda)$:

```
sage: B = crystals.infinity.Tableaux("A2")
sage: R = crystals.elementary.R("A2", B.Lambda()[1]+B.Lambda()[2])
sage: T = crystals.TensorProduct(R, B)
sage: mg = T(R.highest_weight_vector(), B.highest_weight_vector())
sage: S = T.subcrystal(generators=[mg])
sage: sorted([x.weight() for x in S], key=str)
[(0, 1, 2), (0, 2, 1), (1, 0, 2), (1, 1, 1),
 (1, 1, 1), (1, 2, 0), (2, 0, 1), (2, 1, 0)]
sage: C = crystals.Tableaux("A2", shape=[2,1])
sage: sorted([x.weight() for x in C], key=str)
[(0, 1, 2), (0, 2, 1), (1, 0, 2), (1, 1, 1),
 (1, 1, 1), (1, 2, 0), (2, 0, 1), (2, 1, 0)]
sage: GT = T.digraph(subset=S)
sage: GC = C.digraph()
sage: GT.is_isomorphic(GC, edge_labels=True)
True
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux("A2")
>>> R = crystals.elementary.R("A2", B.Lambda()[Integer(1)]+B.Lambda()[Integer(2)])
>>> T = crystals.TensorProduct(R, B)
>>> mg = T(R.highest_weight_vector(), B.highest_weight_vector())
>>> S = T.subcrystal(generators=[mg])
>>> sorted([x.weight() for x in S], key=str)
[(0, 1, 2), (0, 2, 1), (1, 0, 2), (1, 1, 1),
 (1, 1, 1), (1, 2, 0), (2, 0, 1), (2, 1, 0)]
>>> C = crystals.Tableaux("A2", shape=[Integer(2),Integer(1)])
```

(continues on next page)

(continued from previous page)

```
>>> sorted([x.weight() for x in C], key=str)
[(0, 1, 2), (0, 2, 1), (1, 0, 2), (1, 1, 1),
 (1, 1, 1), (1, 2, 0), (2, 0, 1), (2, 1, 0)]
>>> GT = T.digraph(subset=S)
>>> GC = C.digraph()
>>> GT.is_isomorphic(GC, edge_labels=True)
True
```

class Element

Bases: *AbstractSingleCrystalElement*

Element of a R_λ crystal.

epsilon(*i*)

Return ε_i of `self`.

We have $\varepsilon_i(r_\lambda) = -\langle h_i, \lambda \rangle$ for all i, where h_i is a simple coroot.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: la = RootSystem(['A',2]).weight_lattice().fundamental_weights()
sage: R = crystals.elementary.R("A2", la[1])
sage: r = R.highest_weight_vector()
sage: [r.epsilon(i) for i in R.index_set()]
[-1, 0]

sage: R = crystals.elementary.R("A2", la[1], dual=True)
sage: r = R.highest_weight_vector()
sage: [r.epsilon(i) for i in R.index_set()]
[0, 0]
```

```
>>> from sage.all import *
>>> la = RootSystem(['A',Integer(2)]).weight_lattice().fundamental_
↪weights()
>>> R = crystals.elementary.R("A2", la[Integer(1)])
>>> r = R.highest_weight_vector()
>>> [r.epsilon(i) for i in R.index_set()]
[-1, 0]

>>> R = crystals.elementary.R("A2", la[Integer(1)], dual=True)
>>> r = R.highest_weight_vector()
>>> [r.epsilon(i) for i in R.index_set()]
[0, 0]
```

phi(*i*)

Return φ_i of `self`, which is 0 for all i.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: la = RootSystem("C5").weight_lattice().fundamental_weights()
sage: R = crystals.elementary.R("C5", la[4]+la[5])
sage: r = R.highest_weight_vector()
sage: [r.phi(i) for i in R.index_set()]
[0, 0, 0, 0, 0]

sage: R = crystals.elementary.R("C5", la[4]+la[5], dual=True)
sage: r = R.highest_weight_vector()
sage: [r.phi(i) for i in R.index_set()]
[0, 0, 0, 1, 1]
```

```
>>> from sage.all import *
>>> la = RootSystem("C5").weight_lattice().fundamental_weights()
>>> R = crystals.elementary.R("C5", la[Integer(4)]+la[Integer(5)])
>>> r = R.highest_weight_vector()
>>> [r.phi(i) for i in R.index_set()]
[0, 0, 0, 0, 0]

>>> R = crystals.elementary.R("C5", la[Integer(4)]+la[Integer(5)],␣
↪dual=True)
>>> r = R.highest_weight_vector()
>>> [r.phi(i) for i in R.index_set()]
[0, 0, 0, 1, 1]
```

weight()

Return the weight of `self`, which is always λ.

EXAMPLES:

```
sage: ct = CartanType(['C',5])
sage: la = RootSystem(ct).weight_lattice().fundamental_weights()
sage: T = crystals.elementary.T(ct,la[4]+la[5]-la[1]-la[2])
sage: t = T.highest_weight_vector()
sage: t.weight()
-Lambda[1] - Lambda[2] + Lambda[4] + Lambda[5]
```

```
>>> from sage.all import *
>>> ct = CartanType(['C',Integer(5)])
>>> la = RootSystem(ct).weight_lattice().fundamental_weights()
>>> T = crystals.elementary.T(ct,la[Integer(4)]+la[Integer(5)]-
↪la[Integer(1)]-la[Integer(2)])
>>> t = T.highest_weight_vector()
>>> t.weight()
-Lambda[1] - Lambda[2] + Lambda[4] + Lambda[5]
```

cardinality()

Return the cardinality of `self`, which is always 1.

EXAMPLES:

```
sage: La = RootSystem(['C',12]).weight_lattice().fundamental_weights()
sage: R = crystals.elementary.R(['C',12],La[9])
```

(continues on next page)

(continued from previous page)

```
sage: R.cardinality()
1
```

```
>>> from sage.all import *
>>> La = RootSystem(['C',Integer(12)]).weight_lattice().fundamental_weights()
>>> R = crystals.elementary.R(['C',Integer(12)],La[Integer(9)])
>>> R.cardinality()
1
```

weight_lattice_realization()

Return a realization of the lattice containing the weights of `self`.

EXAMPLES:

```
sage: La = RootSystem(['C',12]).weight_lattice().fundamental_weights()
sage: R = crystals.elementary.R(['C',12], La[9])
sage: R.weight_lattice_realization()
Weight lattice of the Root system of type ['C', 12]

sage: ct = CartanMatrix([[2, -4], [-5, 2]])
sage: La = RootSystem(ct).weight_lattice().fundamental_weights()
sage: R = crystals.elementary.R(ct, La[1])
sage: R.weight_lattice_realization()
Weight lattice of the Root system of type
[ 2 -4]
[-5  2]
```

```
>>> from sage.all import *
>>> La = RootSystem(['C',Integer(12)]).weight_lattice().fundamental_weights()
>>> R = crystals.elementary.R(['C',Integer(12)], La[Integer(9)])
>>> R.weight_lattice_realization()
Weight lattice of the Root system of type ['C', 12]

>>> ct = CartanMatrix([[Integer(2), -Integer(4)], [-Integer(5), Integer(2)]])
>>> La = RootSystem(ct).weight_lattice().fundamental_weights()
>>> R = crystals.elementary.R(ct, La[Integer(1)])
>>> R.weight_lattice_realization()
Weight lattice of the Root system of type
[ 2 -4]
[-5  2]
```

class sage.combinat.crystals.elementary_crystals.**TCrystal**(*cartan_type*, *weight*)

Bases: `UniqueRepresentation`, `Parent`

The crystal T_λ.

Let λ be a weight. As defined in [Ka1993] the crystal $T_\lambda = \{t_\lambda\}$ is a single element crystal with the crystal structure defined by

$$\mathrm{wt}(t_\lambda) = \lambda, \quad e_i t_\lambda = f_i t_\lambda = 0, \quad \varepsilon_i(t_\lambda) = \varphi_i(t_\lambda) = -\infty.$$

The crystal T_λ shifts the weights of the vertices in a crystal B by λ when tensored with B, but leaves the graph structure of B unchanged. That is to say, for all $b \in B$, we have $\mathrm{wt}(b \otimes t_\lambda) = \mathrm{wt}(b) + \lambda$.

INPUT:

- `cartan_type` – a Cartan type
- `weight` – an element of the weight lattice of type `cartan_type`

EXAMPLES:

```
sage: ct = CartanType(['A',2])
sage: C = crystals.Tableaux(ct, shape=[1])
sage: for x in C: x.weight()
(1, 0, 0)
(0, 1, 0)
(0, 0, 1)
sage: La = RootSystem(ct).ambient_space().fundamental_weights()
sage: TLa = crystals.elementary.T(ct, 3*(La[1] + La[2]))
sage: TP = crystals.TensorProduct(TLa, C)
sage: for x in TP: x.weight()
(7, 3, 0)
(6, 4, 0)
(6, 3, 1)
sage: G = C.digraph()
sage: H = TP.digraph()
sage: G.is_isomorphic(H,edge_labels=True)
True
```

```
>>> from sage.all import *
>>> ct = CartanType(['A',Integer(2)])
>>> C = crystals.Tableaux(ct, shape=[Integer(1)])
>>> for x in C: x.weight()
(1, 0, 0)
(0, 1, 0)
(0, 0, 1)
>>> La = RootSystem(ct).ambient_space().fundamental_weights()
>>> TLa = crystals.elementary.T(ct, Integer(3)*(La[Integer(1)] + La[Integer(2)]))
>>> TP = crystals.TensorProduct(TLa, C)
>>> for x in TP: x.weight()
(7, 3, 0)
(6, 4, 0)
(6, 3, 1)
>>> G = C.digraph()
>>> H = TP.digraph()
>>> G.is_isomorphic(H,edge_labels=True)
True
```

class Element

Bases: *AbstractSingleCrystalElement*

Element of a T_λ crystal.

epsilon(i)

Return ε_i of `self`, which is $-\infty$ for all i.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: ct = CartanType(['C',5])
sage: la = RootSystem(ct).weight_lattice().fundamental_weights()
sage: T = crystals.elementary.T(ct,la[4]+la[5]-la[1]-la[2])
sage: t = T.highest_weight_vector()
sage: [t.epsilon(i) for i in T.index_set()]
[-inf, -inf, -inf, -inf, -inf]
```

```
>>> from sage.all import *
>>> ct = CartanType(['C',Integer(5)])
>>> la = RootSystem(ct).weight_lattice().fundamental_weights()
>>> T = crystals.elementary.T(ct,la[Integer(4)]+la[Integer(5)]-
↪la[Integer(1)]-la[Integer(2)])
>>> t = T.highest_weight_vector()
>>> [t.epsilon(i) for i in T.index_set()]
[-inf, -inf, -inf, -inf, -inf]
```

phi (i)

Return φ_i of `self`, which is $-\infty$ for all i.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: ct = CartanType(['C',5])
sage: la = RootSystem(ct).weight_lattice().fundamental_weights()
sage: T = crystals.elementary.T(ct,la[4]+la[5]-la[1]-la[2])
sage: t = T.highest_weight_vector()
sage: [t.phi(i) for i in T.index_set()]
[-inf, -inf, -inf, -inf, -inf]
```

```
>>> from sage.all import *
>>> ct = CartanType(['C',Integer(5)])
>>> la = RootSystem(ct).weight_lattice().fundamental_weights()
>>> T = crystals.elementary.T(ct,la[Integer(4)]+la[Integer(5)]-
↪la[Integer(1)]-la[Integer(2)])
>>> t = T.highest_weight_vector()
>>> [t.phi(i) for i in T.index_set()]
[-inf, -inf, -inf, -inf, -inf]
```

weight ()

Return the weight of `self`, which is always λ.

EXAMPLES:

```
sage: ct = CartanType(['C',5])
sage: la = RootSystem(ct).weight_lattice().fundamental_weights()
sage: T = crystals.elementary.T(ct,la[4]+la[5]-la[1]-la[2])
sage: t = T.highest_weight_vector()
sage: t.weight()
-Lambda[1] - Lambda[2] + Lambda[4] + Lambda[5]
```

```
>>> from sage.all import *
>>> ct = CartanType(['C',Integer(5)])
```

(continues on next page)

(continued from previous page)

```
>>> la = RootSystem(ct).weight_lattice().fundamental_weights()
>>> T = crystals.elementary.T(ct,la[Integer(4)]+la[Integer(5)]-
↪la[Integer(1)]-la[Integer(2)])
>>> t = T.highest_weight_vector()
>>> t.weight()
-Lambda[1] - Lambda[2] + Lambda[4] + Lambda[5]
```

cardinality()

Return the cardinality of `self`, which is always 1.

EXAMPLES:

```
sage: La = RootSystem(['C',12]).weight_lattice().fundamental_weights()
sage: T = crystals.elementary.T(['C',12], La[9])
sage: T.cardinality()
1
```

```
>>> from sage.all import *
>>> La = RootSystem(['C',Integer(12)]).weight_lattice().fundamental_weights()
>>> T = crystals.elementary.T(['C',Integer(12)], La[Integer(9)])
>>> T.cardinality()
1
```

weight_lattice_realization()

Return a realization of the lattice containing the weights of `self`.

EXAMPLES:

```
sage: La = RootSystem(['C',12]).weight_lattice().fundamental_weights()
sage: T = crystals.elementary.T(['C',12], La[9])
sage: T.weight_lattice_realization()
Weight lattice of the Root system of type ['C', 12]

sage: ct = CartanMatrix([[2, -4], [-5, 2]])
sage: La = RootSystem(ct).weight_lattice().fundamental_weights()
sage: T = crystals.elementary.T(ct, La[1])
sage: T.weight_lattice_realization()
Weight lattice of the Root system of type
[ 2 -4]
[-5  2]
```

```
>>> from sage.all import *
>>> La = RootSystem(['C',Integer(12)]).weight_lattice().fundamental_weights()
>>> T = crystals.elementary.T(['C',Integer(12)], La[Integer(9)])
>>> T.weight_lattice_realization()
Weight lattice of the Root system of type ['C', 12]

>>> ct = CartanMatrix([[Integer(2), -Integer(4)], [-Integer(5), Integer(2)]])
>>> La = RootSystem(ct).weight_lattice().fundamental_weights()
>>> T = crystals.elementary.T(ct, La[Integer(1)])
>>> T.weight_lattice_realization()
Weight lattice of the Root system of type
```

(continues on next page)

(continued from previous page)

```
[ 2 -4]
[-5  2]
```

5.1.48 Fast Rank Two Crystals

class sage.combinat.crystals.fast_crystals.**FastCrystal**(*ct*, *shape*, *format*)

Bases: UniqueRepresentation, Parent

An alternative implementation of rank 2 crystals. The root operators are implemented in memory by table lookup. This means that in comparison with the CrystalsOfTableaux, these crystals are slow to instantiate but faster for computation. Implemented for types A_2, B_2, and C_2.

INPUT:

- cartan_type – the Cartan type and must be either type A_2, B_2, or C_2
- shape – a shape is of the form [l1,l2] where l1 and l2 are either integers or (in type B_2) half integers such that l1 - l2 is integral. It is assumed that l1 >= l2 >= 0. If l1 and l2 are integers, this will produce a crystal isomorphic to the one obtained by crystals.Tableaux(type, shape=[l1,l2]). Furthermore crystals.FastRankTwo(['B', 2], l1+1/2, l2+1/2) produces a crystal isomorphic to the following crystal T:

```
sage: C = crystals.Tableaux(['B',2], shape=[l1,l2])                    # not tested
sage: D = crystals.Spins(['B',2])                                      # not tested
sage: T = crystals.TensorProduct(C, D, C.list()[0], D.list()[0])   # not tested
```

```
>>> from sage.all import *
>>> C = crystals.Tableaux(['B',Integer(2)], shape=[l1,l2])                  #␣
↪not tested
>>> D = crystals.Spins(['B',Integer(2)])                                    #␣
↪not tested
>>> T = crystals.TensorProduct(C, D, C.list()[Integer(0)], D.
↪list()[Integer(0)])  # not tested
```

- format – (default: 'string') the default representation of elements is in term of theBerenstein-Zelevinsky-Littelmann (BZL) strings [a1, a2, ...] described under metapost in crystals. Alternative representations may be obtained by the options 'dual_string' or 'simple'. In the 'simple' format, the element is represented by and integer, and in the 'dual_string' format, it is represented by the BZL string, but the underlying decomposition of the long Weyl group element into simple reflections is changed.

class Element(*parent*, *value*, *format*)

Bases: Element

EXAMPLES:

```
sage: C = crystals.FastRankTwo(['A',2],shape=[2,1])
sage: c = C(0); c
[0, 0, 0]
sage: C[0].parent()
The fast crystal for A2 with shape [2,1]
sage: TestSuite(c).run()
```

```
>>> from sage.all import *
>>> C = crystals.FastRankTwo(['A',Integer(2)],shape=[Integer(2),Integer(1)])
>>> c = C(Integer(0)); c
[0, 0, 0]
>>> C[Integer(0)].parent()
The fast crystal for A2 with shape [2,1]
>>> TestSuite(c).run()
```

e(i)

Return the action of e_i on `self`.

EXAMPLES:

```
sage: C = crystals.FastRankTwo(['A',2],shape=[2,1])
sage: C(1).e(1)
[0, 0, 0]
sage: C(0).e(1) is None
True
```

```
>>> from sage.all import *
>>> C = crystals.FastRankTwo(['A',Integer(2)],shape=[Integer(2),
↪Integer(1)])
>>> C(Integer(1)).e(Integer(1))
[0, 0, 0]
>>> C(Integer(0)).e(Integer(1)) is None
True
```

f(i)

Return the action of f_i on `self`.

EXAMPLES:

```
sage: C = crystals.FastRankTwo(['A',2],shape=[2,1])
sage: C(6).f(1)
[1, 2, 1]
sage: C(7).f(1) is None
True
```

```
>>> from sage.all import *
>>> C = crystals.FastRankTwo(['A',Integer(2)],shape=[Integer(2),
↪Integer(1)])
>>> C(Integer(6)).f(Integer(1))
[1, 2, 1]
>>> C(Integer(7)).f(Integer(1)) is None
True
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: [v.weight() for v in crystals.FastRankTwo(['A',2], shape=[2,1])]
[(2, 1, 0), (1, 2, 0), (1, 1, 1), (1, 0, 2), (0, 1, 2), (2, 0, 1), (1, 1,␣
```

(continues on next page)

(continued from previous page)

```
↪1), (0, 2, 1)]
sage: [v.weight() for v in crystals.FastRankTwo(['B',2], shape=[1,0])]
[(1, 0), (0, 1), (0, 0), (0, -1), (-1, 0)]
sage: [v.weight() for v in crystals.FastRankTwo(['B',2], shape=[1/2,1/2])]
[(1/2, 1/2), (1/2, -1/2), (-1/2, 1/2), (-1/2, -1/2)]
sage: [v.weight() for v in crystals.FastRankTwo(['C',2], shape=[1,0])]
[(1, 0), (0, 1), (0, -1), (-1, 0)]
sage: [v.weight() for v in crystals.FastRankTwo(['C',2], shape=[1,1])]
[(1, 1), (1, -1), (0, 0), (-1, 1), (-1, -1)]
```

```
>>> from sage.all import *
>>> [v.weight() for v in crystals.FastRankTwo(['A',Integer(2)],␣
↪shape=[Integer(2),Integer(1)])]
[(2, 1, 0), (1, 2, 0), (1, 1, 1), (1, 0, 2), (0, 1, 2), (2, 0, 1), (1, 1,␣
↪1), (0, 2, 1)]
>>> [v.weight() for v in crystals.FastRankTwo(['B',Integer(2)],␣
↪shape=[Integer(1),Integer(0)])]
[(1, 0), (0, 1), (0, 0), (0, -1), (-1, 0)]
>>> [v.weight() for v in crystals.FastRankTwo(['B',Integer(2)],␣
↪shape=[Integer(1)/Integer(2),Integer(1)/Integer(2)])]
[(1/2, 1/2), (1/2, -1/2), (-1/2, 1/2), (-1/2, -1/2)]
>>> [v.weight() for v in crystals.FastRankTwo(['C',Integer(2)],␣
↪shape=[Integer(1),Integer(0)])]
[(1, 0), (0, 1), (0, -1), (-1, 0)]
>>> [v.weight() for v in crystals.FastRankTwo(['C',Integer(2)],␣
↪shape=[Integer(1),Integer(1)])]
[(1, 1), (1, -1), (0, 0), (-1, 1), (-1, -1)]
```

cmp_elements(x, y)

Return `True` if and only if there is a path from x to y in the crystal graph.

Because the crystal graph is classical, it is a directed acyclic graph which can be interpreted as a poset. This function implements the comparison function of this poset.

EXAMPLES:

```
sage: C = crystals.FastRankTwo(['A',2],shape=[2,1])
sage: x = C(0)
sage: y = C(1)
sage: C.cmp_elements(x,y)
-1
sage: C.cmp_elements(y,x)
1
sage: C.cmp_elements(x,x)
0
```

```
>>> from sage.all import *
>>> C = crystals.FastRankTwo(['A',Integer(2)],shape=[Integer(2),Integer(1)])
>>> x = C(Integer(0))
>>> y = C(Integer(1))
>>> C.cmp_elements(x,y)
-1
```

(continues on next page)

(continued from previous page)

```
>>> C.cmp_elements(y,x)
1
>>> C.cmp_elements(x,x)
0
```

digraph()

Return the digraph associated to `self`.

EXAMPLES:

```
sage: C = crystals.FastRankTwo(['A',2],shape=[2,1])
sage: C.digraph()
Digraph on 8 vertices
```

```
>>> from sage.all import *
>>> C = crystals.FastRankTwo(['A',Integer(2)],shape=[Integer(2),Integer(1)])
>>> C.digraph()
Digraph on 8 vertices
```

5.1.49 Fully commutative stable Grothendieck crystal

AUTHORS:

- Jianping Pan (2020-08-31): initial version
- Wencin Poh (2020-08-31): initial version
- Anne Schilling (2020-08-31): initial version

class sage.combinat.crystals.fully_commutative_stable_grothendieck.**DecreasingHeckeFactorization**(*parent*, *t*)

Bases: `Element`

Class of decreasing factorizations in the 0-Hecke monoid.

INPUT:

- `t` – decreasing factorization inputted as list of lists
- `max_value` – maximal value of entries

EXAMPLES:

```
sage: from sage.combinat.crystals.fully_commutative_stable_grothendieck import␣
↪DecreasingHeckeFactorization
sage: t = [[3, 2], [], [2, 1]]
sage: h = DecreasingHeckeFactorization(t, 3); h
(3, 2)()(2, 1)
sage: h.excess
1
sage: h.factors
3
sage: h.max_value
3
sage: h.value
```

(continues on next page)

(continued from previous page)

```
((3, 2), (), (2, 1))

sage: u = [[3, 2, 1], [3], [2, 1]]
sage: h = DecreasingHeckeFactorization(u); h
(3, 2, 1)(3)(2, 1)
sage: h.weight()
(2, 1, 3)
sage: h.parent()
Decreasing Hecke factorizations with 3 factors associated to [2, 1, 3, 2, 1] with␣
↪excess 1
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.fully_commutative_stable_grothendieck import␣
↪DecreasingHeckeFactorization
>>> t = [[Integer(3), Integer(2)], [], [Integer(2), Integer(1)]]
>>> h = DecreasingHeckeFactorization(t, Integer(3)); h
(3, 2)()(2, 1)
>>> h.excess
1
>>> h.factors
3
>>> h.max_value
3
>>> h.value
((3, 2), (), (2, 1))

>>> u = [[Integer(3), Integer(2), Integer(1)], [Integer(3)], [Integer(2),␣
↪Integer(1)]]
>>> h = DecreasingHeckeFactorization(u); h
(3, 2, 1)(3)(2, 1)
>>> h.weight()
(2, 1, 3)
>>> h.parent()
Decreasing Hecke factorizations with 3 factors associated to [2, 1, 3, 2, 1] with␣
↪excess 1
```

to_increasing_hecke_biword()

Return the associated increasing Hecke biword of `self`.

EXAMPLES:

```
sage: from sage.combinat.crystals.fully_commutative_stable_grothendieck␣
↪import DecreasingHeckeFactorization
sage: t = [[2], [], [2, 1],[4, 3, 1]]
sage: h = DecreasingHeckeFactorization(t, 4)
sage: h.to_increasing_hecke_biword()
[[1, 1, 1, 2, 2, 4], [1, 3, 4, 1, 2, 2]]
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.fully_commutative_stable_grothendieck import␣
↪DecreasingHeckeFactorization
>>> t = [[Integer(2)], [], [Integer(2), Integer(1)],[Integer(4), Integer(3),␣
```

(continues on next page)

(continued from previous page)

```
↪Integer(1)]]
>>> h = DecreasingHeckeFactorization(t, Integer(4))
>>> h.to_increasing_hecke_biword()
[[1, 1, 1, 2, 2, 4], [1, 3, 4, 1, 2, 2]]
```

to_word()

Return the word associated to `self` in the 0-Hecke monoid.

EXAMPLES:

```
sage: from sage.combinat.crystals.fully_commutative_stable_grothendieck␣
↪import DecreasingHeckeFactorization
sage: t = [[2], [], [2, 1], [4, 3, 1]]
sage: h = DecreasingHeckeFactorization(t)
sage: h.to_word()
[2, 2, 1, 4, 3, 1]
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.fully_commutative_stable_grothendieck import␣
↪DecreasingHeckeFactorization
>>> t = [[Integer(2)], [], [Integer(2), Integer(1)], [Integer(4), Integer(3),␣
↪Integer(1)]]
>>> h = DecreasingHeckeFactorization(t)
>>> h.to_word()
[2, 2, 1, 4, 3, 1]
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: from sage.combinat.crystals.fully_commutative_stable_grothendieck␣
↪import DecreasingHeckeFactorization
sage: t = [[2], [2, 1], [], [4, 3, 1]]
sage: h = DecreasingHeckeFactorization(t, 6)
sage: h.weight()
(3, 0, 2, 1)
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.fully_commutative_stable_grothendieck import␣
↪DecreasingHeckeFactorization
>>> t = [[Integer(2)], [Integer(2), Integer(1)], [], [Integer(4), Integer(3),␣
↪Integer(1)]]
>>> h = DecreasingHeckeFactorization(t, Integer(6))
>>> h.weight()
(3, 0, 2, 1)
```

class `sage.combinat.crystals.fully_commutative_stable_grothendieck.`**DecreasingHeckeFactorizations**(*w*, *factors*, *excess*)

Bases: `UniqueRepresentation`, `Parent`

Set of decreasing factorizations in the 0-Hecke monoid.

INPUT:

- `w` – an element in the symmetric group
- `factors` – the number of factors in the factorization
- `excess` – the total number of letters in the factorization minus the length of a reduced word for `w`

EXAMPLES:

```
sage: from sage.combinat.crystals.fully_commutative_stable_grothendieck import␣
↪DecreasingHeckeFactorizations
sage: S = SymmetricGroup(3+1)
sage: w = S.from_reduced_word([1, 3, 2, 1])
sage: F = DecreasingHeckeFactorizations(w, 3, 3); F
Decreasing Hecke factorizations with 3 factors associated to [1, 3, 2, 1] with␣
↪excess 3
sage: F.list()
[(3, 1)(3, 1)(3, 2, 1), (3, 1)(3, 2, 1)(2, 1), (3, 2, 1)(2, 1)(2, 1)]
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.fully_commutative_stable_grothendieck import␣
↪DecreasingHeckeFactorizations
>>> S = SymmetricGroup(Integer(3)+Integer(1))
>>> w = S.from_reduced_word([Integer(1), Integer(3), Integer(2), Integer(1)])
>>> F = DecreasingHeckeFactorizations(w, Integer(3), Integer(3)); F
Decreasing Hecke factorizations with 3 factors associated to [1, 3, 2, 1] with␣
↪excess 3
>>> F.list()
[(3, 1)(3, 1)(3, 2, 1), (3, 1)(3, 2, 1)(2, 1), (3, 2, 1)(2, 1)(2, 1)]
```

Element

alias of *DecreasingHeckeFactorization*

list()

Return list of all elements of `self`.

EXAMPLES:

```
sage: from sage.combinat.crystals.fully_commutative_stable_grothendieck␣
↪import DecreasingHeckeFactorizations
sage: S = SymmetricGroup(3+1)
sage: w = S.from_reduced_word([1, 3, 2, 1])
sage: F = DecreasingHeckeFactorizations(w, 3, 3)
sage: F.list()
[(3, 1)(3, 1)(3, 2, 1), (3, 1)(3, 2, 1)(2, 1), (3, 2, 1)(2, 1)(2, 1)]
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.fully_commutative_stable_grothendieck import␣
↪DecreasingHeckeFactorizations
>>> S = SymmetricGroup(Integer(3)+Integer(1))
>>> w = S.from_reduced_word([Integer(1), Integer(3), Integer(2), Integer(1)])
>>> F = DecreasingHeckeFactorizations(w, Integer(3), Integer(3))
>>> F.list()
[(3, 1)(3, 1)(3, 2, 1), (3, 1)(3, 2, 1)(2, 1), (3, 2, 1)(2, 1)(2, 1)]
```

class sage.combinat.crystals.fully_commutative_stable_grothendieck.**FullyCommutativeStableGrothendiec**

Bases: UniqueRepresentation, Parent

The crystal on fully commutative decreasing factorizations in the 0-Hecke monoid, as introduced by [MPPS2020].

INPUT:

- w – an element in the symmetric group or a (skew) shape
- factors – the number of factors in the factorization
- excess – the total number of letters in the factorization minus the length of a reduced word for w
- shape – boolean (default: False); indicator for input w, True if w is entered as a (skew) shape and False otherwise

EXAMPLES:

```
sage: S = SymmetricGroup(3+1)
sage: w = S.from_reduced_word([1, 3, 2])
sage: B = crystals.FullyCommutativeStableGrothendieck(w, 3, 2); B
Fully commutative stable Grothendieck crystal of type A_2 associated to [1, 3, 2]
↪with excess 2
sage: B.list()
[(1)(3, 1)(3, 2),
 (3, 1)(1)(3, 2),
 (3, 1)(3, 1)(2),
 (3)(3, 1)(3, 2),
 (3, 1)(3)(3, 2),
 (3, 1)(3, 2)(2)]
```

```
>>> from sage.all import *
>>> S = SymmetricGroup(Integer(3)+Integer(1))
>>> w = S.from_reduced_word([Integer(1), Integer(3), Integer(2)])
>>> B = crystals.FullyCommutativeStableGrothendieck(w, Integer(3), Integer(2)); B
Fully commutative stable Grothendieck crystal of type A_2 associated to [1, 3, 2]
↪with excess 2
>>> B.list()
[(1)(3, 1)(3, 2),
 (3, 1)(1)(3, 2),
 (3, 1)(3, 1)(2),
 (3)(3, 1)(3, 2),
 (3, 1)(3)(3, 2),
 (3, 1)(3, 2)(2)]
```

We can also access the crystal by specifying a skew shape:

```
sage: crystals.FullyCommutativeStableGrothendieck([[2, 2], [1]], 4, 1, shape=True)
Fully commutative stable Grothendieck crystal of type A_3 associated to [2, 1, 3]
↪with excess 1
```

```
>>> from sage.all import *
>>> crystals.FullyCommutativeStableGrothendieck([[Integer(2), Integer(2)],
→[Integer(1)]], Integer(4), Integer(1), shape=True)
Fully commutative stable Grothendieck crystal of type A_3 associated to [2, 1, 3]
→with excess 1
```

We can compute the highest weight elements:

```
sage: hw = [w for w in B if w.is_highest_weight()]
sage: hw
[(1)(3, 1)(3, 2), (3)(3, 1)(3, 2)]
sage: hw[0].weight()
(2, 2, 1)
```

```
>>> from sage.all import *
>>> hw = [w for w in B if w.is_highest_weight()]
>>> hw
[(1)(3, 1)(3, 2), (3)(3, 1)(3, 2)]
>>> hw[Integer(0)].weight()
(2, 2, 1)
```

The crystal operators themselves move elements between adjacent factors:

```
sage: b = hw[0]; b
(1)(3, 1)(3, 2)
sage: b.f(2)
(3, 1)(1)(3, 2)
```

```
>>> from sage.all import *
>>> b = hw[Integer(0)]; b
(1)(3, 1)(3, 2)
>>> b.f(Integer(2))
(3, 1)(1)(3, 2)
```

class Element(*parent*, *t*)

Bases: *DecreasingHeckeFactorization*

Create an instance self of element t.

This method takes into account the constraints on the word, the number of factors, and excess statistic associated to the parent class.

EXAMPLES:

```
sage: S = SymmetricGroup(3+1)
sage: w = S.from_reduced_word([1, 3, 2])
sage: B = crystals.FullyCommutativeStableGrothendieck(w, 3, 2)
sage: from sage.combinat.crystals.fully_commutative_stable_grothendieck
→import DecreasingHeckeFactorization
sage: h = DecreasingHeckeFactorization([[3, 1], [3], [3, 2]], 4)
sage: u = B(h); u.value
((3, 1), (3,), (3, 2))
sage: v = B([[3, 1], [3], [3, 2]]); v.value
((3, 1), (3,), (3, 2))
```

```
>>> from sage.all import *
>>> S = SymmetricGroup(Integer(3)+Integer(1))
>>> w = S.from_reduced_word([Integer(1), Integer(3), Integer(2)])
>>> B = crystals.FullyCommutativeStableGrothendieck(w, Integer(3), Integer(2))
>>> from sage.combinat.crystals.fully_commutative_stable_grothendieck import␣
↪DecreasingHeckeFactorization
>>> h = DecreasingHeckeFactorization([[Integer(3), Integer(1)], [Integer(3)],␣
↪[Integer(3), Integer(2)]], Integer(4))
>>> u = B(h); u.value
((3, 1), (3,), (3, 2))
>>> v = B([[Integer(3), Integer(1)], [Integer(3)], [Integer(3), Integer(2)]]);
↪ v.value
((3, 1), (3,), (3, 2))
```

bracketing(*i*)

Remove all bracketed letters between i-th and $(i+1)$-th entry.

EXAMPLES:

```
sage: S = SymmetricGroup(4+1)
sage: w = S.from_reduced_word([3, 2, 1, 4, 3])
sage: B = crystals.FullyCommutativeStableGrothendieck(w, 3, 2)
sage: h = B([[3], [4, 2, 1], [4, 3, 1]])
sage: h.bracketing(1)
[[], []]
sage: h.bracketing(2)
[[], [2, 1]]
```

```
>>> from sage.all import *
>>> S = SymmetricGroup(Integer(4)+Integer(1))
>>> w = S.from_reduced_word([Integer(3), Integer(2), Integer(1),␣
↪Integer(4), Integer(3)])
>>> B = crystals.FullyCommutativeStableGrothendieck(w, Integer(3),␣
↪Integer(2))
>>> h = B([[Integer(3)], [Integer(4), Integer(2), Integer(1)],␣
↪[Integer(4), Integer(3), Integer(1)]])
>>> h.bracketing(Integer(1))
[[], []]
>>> h.bracketing(Integer(2))
[[], [2, 1]]
```

e(*i*)

Return the action of e_i on `self` using the rules described in [MPPS2020].

EXAMPLES:

```
sage: S = SymmetricGroup(4+1)
sage: w = S.from_reduced_word([2, 1, 4, 3, 2])
sage: B = crystals.FullyCommutativeStableGrothendieck(w, 4, 3)
sage: h = B([[4, 2], [4, 2, 1], [3, 2], [2]]); h
(4, 2)(4, 2, 1)(3, 2)(2)
sage: h.e(1)
(4, 2)(4, 2, 1)(3)(3, 2)
```

(continues on next page)

(continued from previous page)

```
sage: h.e(2)
(4, 2)(2, 1)(4, 3, 2)(2)
sage: h.e(3)
```

```
>>> from sage.all import *
>>> S = SymmetricGroup(Integer(4)+Integer(1))
>>> w = S.from_reduced_word([Integer(2), Integer(1), Integer(4),␣
↪Integer(3), Integer(2)])
>>> B = crystals.FullyCommutativeStableGrothendieck(w, Integer(4),␣
↪Integer(3))
>>> h = B([[Integer(4), Integer(2)], [Integer(4), Integer(2), Integer(1)],
↪ [Integer(3), Integer(2)], [Integer(2)]]); h
(4, 2)(4, 2, 1)(3, 2)(2)
>>> h.e(Integer(1))
(4, 2)(4, 2, 1)(3)(3, 2)
>>> h.e(Integer(2))
(4, 2)(2, 1)(4, 3, 2)(2)
>>> h.e(Integer(3))
```

f(*i*)

Return the action of f_i on `self` using the rules described in [MPPS2020].

EXAMPLES:

```
sage: S = SymmetricGroup(4+1)
sage: w = S.from_reduced_word([3, 2, 1, 4, 3])
sage: B = crystals.FullyCommutativeStableGrothendieck(w, 4, 3)
sage: h = B([[3, 2], [2, 1], [4, 3], [3, 1]]); h
(3, 2)(2, 1)(4, 3)(3, 1)
sage: h.f(1)
(3, 2)(2, 1)(4, 3, 1)(3)
sage: h.f(2)
sage: h.f(3)
(3, 2, 1)(1)(4, 3)(3, 1)
```

```
>>> from sage.all import *
>>> S = SymmetricGroup(Integer(4)+Integer(1))
>>> w = S.from_reduced_word([Integer(3), Integer(2), Integer(1),␣
↪Integer(4), Integer(3)])
>>> B = crystals.FullyCommutativeStableGrothendieck(w, Integer(4),␣
↪Integer(3))
>>> h = B([[Integer(3), Integer(2)], [Integer(2), Integer(1)],␣
↪[Integer(4), Integer(3)], [Integer(3), Integer(1)]]); h
(3, 2)(2, 1)(4, 3)(3, 1)
>>> h.f(Integer(1))
(3, 2)(2, 1)(4, 3, 1)(3)
>>> h.f(Integer(2))
>>> h.f(Integer(3))
(3, 2, 1)(1)(4, 3)(3, 1)
```

module_generators()

Return generators for `self` as a crystal.

EXAMPLES:

```
sage: S = SymmetricGroup(3+1)
sage: w = S.from_reduced_word([1, 3, 2])
sage: B = crystals.FullyCommutativeStableGrothendieck(w, 3, 2)
sage: B.module_generators
((1)(3, 1)(3, 2), (3)(3, 1)(3, 2))
sage: C = crystals.FullyCommutativeStableGrothendieck(w, 4, 2)
sage: C.module_generators
(()(1)(3, 1)(3, 2),
 ()(3)(3, 1)(3, 2),
 (1)(1)(1)(3, 2),
 (1)(1)(3)(3, 2),
 (1)(3)(3)(3, 2))
```

```
>>> from sage.all import *
>>> S = SymmetricGroup(Integer(3)+Integer(1))
>>> w = S.from_reduced_word([Integer(1), Integer(3), Integer(2)])
>>> B = crystals.FullyCommutativeStableGrothendieck(w, Integer(3), Integer(2))
>>> B.module_generators
((1)(3, 1)(3, 2), (3)(3, 1)(3, 2))
>>> C = crystals.FullyCommutativeStableGrothendieck(w, Integer(4), Integer(2))
>>> C.module_generators
(()(1)(3, 1)(3, 2),
 ()(3)(3, 1)(3, 2),
 (1)(1)(1)(3, 2),
 (1)(1)(3)(3, 2),
 (1)(3)(3)(3, 2))
```

5.1.50 Crystals of Generalized Young Walls

AUTHORS:

- Lucas David-Roesler: Initial version
- Ben Salisbury: Initial version
- Travis Scrimshaw: Initial version

Generalized Young walls are certain generalizations of Young tableaux introduced in [KS2010] and designed to be a realization of the crystals $\mathcal{B}(\infty)$ and $\mathcal{B}(\lambda)$ in type $A_n^{(1)}$.

REFERENCES:

- [KLRS2016]
- [KS2010]

class sage.combinat.crystals.generalized_young_walls.**CrystalOfGeneralizedYoungWalls**(*n*, *La*)

Bases: *InfinityCrystalOfGeneralizedYoungWalls*

The crystal $\mathcal{Y}(\lambda)$ of generalized Young walls of the given type with highest weight λ.

These were characterized in Theorem 4.1 of [KS2010]. See *GeneralizedYoungWall.in_highest_weight_crystal()*.

INPUT:

- n – type $A_n^{(1)}$
- weight – dominant integral weight

EXAMPLES:

```
sage: La = RootSystem(['A',3,1]).weight_lattice(extended=True).fundamental_
↪weights()[1]
sage: YLa = crystals.GeneralizedYoungWalls(3,La)
sage: y = YLa([[0],[1,0,3,2,1],[2,1,0],[3]])
sage: y.pp()
        3|
    0|1|2|
1|2|3|0|1|
        0|
sage: y.weight()
-Lambda[0] + Lambda[2] + Lambda[3] - 3*delta
sage: y.in_highest_weight_crystal(La)
True
sage: y.f(1)
[[0], [1, 0, 3, 2, 1], [2, 1, 0], [3], [], [1]]
sage: y.f(1).f(1)
sage: yy = crystals.infinity.GeneralizedYoungWalls(3)([[0], [1, 0, 3, 2, 1], [2,␣
↪1, 0], [3], [], [1]])
sage: yy.f(1)
[[0], [1, 0, 3, 2, 1], [2, 1, 0], [3], [], [1], [], [], [], [1]]
sage: yyy = yy.f(1)
sage: yyy.in_highest_weight_crystal(La)
False

sage: LS = crystals.LSPaths(['A',3,1],[1,0,0,0])
sage: C = LS.subcrystal(max_depth=4)
sage: G = LS.digraph(subset=C)
sage: P = RootSystem(['A',3,1]).weight_lattice(extended=True)
sage: La = P.fundamental_weights()
sage: YW = crystals.GeneralizedYoungWalls(3,La[0])
sage: CW = YW.subcrystal(max_depth=4)
sage: GW = YW.digraph(subset=CW)
sage: GW.is_isomorphic(G,edge_labels=True)
True
```

```
>>> from sage.all import *
>>> La = RootSystem(['A',Integer(3),Integer(1)]).weight_lattice(extended=True).
↪fundamental_weights()[Integer(1)]
>>> YLa = crystals.GeneralizedYoungWalls(Integer(3),La)
>>> y = YLa([[Integer(0)],[Integer(1),Integer(0),Integer(3),Integer(2),
↪Integer(1)],[Integer(2),Integer(1),Integer(0)],[Integer(3)]])
>>> y.pp()
        3|
    0|1|2|
1|2|3|0|1|
        0|
>>> y.weight()
-Lambda[0] + Lambda[2] + Lambda[3] - 3*delta
```

(continues on next page)

(continued from previous page)

```
>>> y.in_highest_weight_crystal(La)
True
>>> y.f(Integer(1))
[[0], [1, 0, 3, 2, 1], [2, 1, 0], [3], [], [1]]
>>> y.f(Integer(1)).f(Integer(1))
>>> yy = crystals.infinity.GeneralizedYoungWalls(Integer(3))([[Integer(0)],␣
↪[Integer(1), Integer(0), Integer(3), Integer(2), Integer(1)], [Integer(2),␣
↪Integer(1), Integer(0)], [Integer(3)], [], [Integer(1)]])
>>> yy.f(Integer(1))
[[0], [1, 0, 3, 2, 1], [2, 1, 0], [3], [], [1], [], [], [], [1]]
>>> yyy = yy.f(Integer(1))
>>> yyy.in_highest_weight_crystal(La)
False

>>> LS = crystals.LSPaths(['A',Integer(3),Integer(1)],[Integer(1),Integer(0),
↪Integer(0),Integer(0)])
>>> C = LS.subcrystal(max_depth=Integer(4))
>>> G = LS.digraph(subset=C)
>>> P = RootSystem(['A',Integer(3),Integer(1)]).weight_lattice(extended=True)
>>> La = P.fundamental_weights()
>>> YW = crystals.GeneralizedYoungWalls(Integer(3),La[Integer(0)])
>>> CW = YW.subcrystal(max_depth=Integer(4))
>>> GW = YW.digraph(subset=CW)
>>> GW.is_isomorphic(G,edge_labels=True)
True
```

To display the crystal down to a specified depth:

```
sage: S = YLa.subcrystal(max_depth=4)
sage: G = YLa.digraph(subset=S)
sage: view(G) # not tested
```

```
>>> from sage.all import *
>>> S = YLa.subcrystal(max_depth=Integer(4))
>>> G = YLa.digraph(subset=S)
>>> view(G) # not tested
```

Element

alias of *CrystalOfGeneralizedYoungWallsElement*

class sage.combinat.crystals.generalized_young_walls.**CrystalOfGeneralizedYoungWallsElement**(*parent*, *data*)

Bases: *GeneralizedYoungWall*

Element of the highest weight crystal of generalized Young walls.

e(*i*)

Compute the action of e_i restricted to the highest weight crystal.

EXAMPLES:

```
sage: La = RootSystem(['A',2,1]).weight_lattice(extended=True).fundamental_
↪weights()[1]
sage: hwy = crystals.GeneralizedYoungWalls(2,La)([[],[1,0],[2,1]])
sage: hwy.e(1)
[[], [1, 0], [2]]
sage: hwy.e(2)
sage: hwy.e(3)
```

```
>>> from sage.all import *
>>> La = RootSystem(['A',Integer(2),Integer(1)]).weight_
↪lattice(extended=True).fundamental_weights()[Integer(1)]
>>> hwy = crystals.GeneralizedYoungWalls(Integer(2),La)([[],[Integer(1),
↪Integer(0)],[Integer(2),Integer(1)]])
>>> hwy.e(Integer(1))
[[], [1, 0], [2]]
>>> hwy.e(Integer(2))
>>> hwy.e(Integer(3))
```

f(*i*)

Compute the action of f_i restricted to the highest weight crystal.

EXAMPLES:

```
sage: La = RootSystem(['A',2,1]).weight_lattice(extended=True).fundamental_
↪weights()[1]
sage: GYW = crystals.infinity.GeneralizedYoungWalls(2)
sage: y = GYW([[],[1,0],[2,1]])
sage: y.f(1)
[[], [1, 0], [2, 1], [], [1]]
sage: hwy = crystals.GeneralizedYoungWalls(2,La)([[],[1,0],[2,1]])
sage: hwy.f(1)
```

```
>>> from sage.all import *
>>> La = RootSystem(['A',Integer(2),Integer(1)]).weight_
↪lattice(extended=True).fundamental_weights()[Integer(1)]
>>> GYW = crystals.infinity.GeneralizedYoungWalls(Integer(2))
>>> y = GYW([[],[Integer(1),Integer(0)],[Integer(2),Integer(1)]])
>>> y.f(Integer(1))
[[], [1, 0], [2, 1], [], [1]]
>>> hwy = crystals.GeneralizedYoungWalls(Integer(2),La)([[],[Integer(1),
↪Integer(0)],[Integer(2),Integer(1)]])
>>> hwy.f(Integer(1))
```

phi(*i*)

Return the value $\varepsilon_i(Y) + \langle h_i, \mathrm{wt}(Y)\rangle$, where h_i is the i-th simple coroot and Y is `self`.

EXAMPLES:

```
sage: La = RootSystem(['A',3,1]).weight_lattice(extended=True).fundamental_
↪weights()
sage: y = crystals.GeneralizedYoungWalls(3,La[0])([])
sage: y.phi(1)
0
```

(continues on next page)

(continued from previous page)

```
sage: y.phi(2)
0
```

```
>>> from sage.all import *
>>> La = RootSystem(['A',Integer(3),Integer(1)]).weight_
↪lattice(extended=True).fundamental_weights()
>>> y = crystals.GeneralizedYoungWalls(Integer(3),La[Integer(0)])([])
>>> y.phi(Integer(1))
0
>>> y.phi(Integer(2))
0
```

weight()

Return the weight of `self` in the highest weight crystal as an element of the weight lattice $\bigoplus_{i=0}^{n} \mathbf{Z}\Lambda_i$.

EXAMPLES:

```
sage: La = RootSystem(['A',2,1]).weight_lattice(extended=True).fundamental_
↪weights()[1]
sage: hwy = crystals.GeneralizedYoungWalls(2,La)([[],[1,0],[2,1]])
sage: hwy.weight()
Lambda[0] - Lambda[1] + Lambda[2] - delta
```

```
>>> from sage.all import *
>>> La = RootSystem(['A',Integer(2),Integer(1)]).weight_
↪lattice(extended=True).fundamental_weights()[Integer(1)]
>>> hwy = crystals.GeneralizedYoungWalls(Integer(2),La)([[],[Integer(1),
↪Integer(0)],[Integer(2),Integer(1)]])
>>> hwy.weight()
Lambda[0] - Lambda[1] + Lambda[2] - delta
```

class sage.combinat.crystals.generalized_young_walls.**GeneralizedYoungWall**(*parent*, *data*)

Bases: *CombinatorialElement*

A generalized Young wall.

For more information, see *InfinityCrystalOfGeneralizedYoungWalls*.

EXAMPLES:

```
sage: Y = crystals.infinity.GeneralizedYoungWalls(4)
sage: mg = Y.module_generators[0]; mg.pp()
0
sage: mg.f_string([1,2,0,1]).pp()
1|2|
0|1|
   |
```

```
>>> from sage.all import *
>>> Y = crystals.infinity.GeneralizedYoungWalls(Integer(4))
>>> mg = Y.module_generators[Integer(0)]; mg.pp()
0
>>> mg.f_string([Integer(1),Integer(2),Integer(0),Integer(1)]).pp()
```

(continues on next page)

(continued from previous page)

```
1|2|
0|1|
   |
```

Epsilon()

Return $\sum_{i=0}^{n} \varepsilon_i(Y)\Lambda_i$ where Y is `self`.

EXAMPLES:

```
sage: y = crystals.infinity.GeneralizedYoungWalls(3)([[0],[1,0,3,2],[2,1],[3,
↪2,1,0,3,2],[0],[],[2]])
sage: y.Epsilon()
Lambda[0] + 3*Lambda[2]
```

```
>>> from sage.all import *
>>> y = crystals.infinity.GeneralizedYoungWalls(Integer(3))([[Integer(0)],
↪[Integer(1),Integer(0),Integer(3),Integer(2)],[Integer(2),Integer(1)],
↪[Integer(3),Integer(2),Integer(1),Integer(0),Integer(3),Integer(2)],
↪[Integer(0)],[],[Integer(2)]])
>>> y.Epsilon()
Lambda[0] + 3*Lambda[2]
```

Phi()

Return $\sum_{i=0}^{n} \varphi_i(Y)\Lambda_i$ where Y is `self`.

EXAMPLES:

```
sage: y = crystals.infinity.GeneralizedYoungWalls(3)([[0],[1,0,3,2],[2,1],[3,
↪2,1,0,3,2],[0],[],[2]])
sage: y.Phi()
-Lambda[0] + 3*Lambda[1] - Lambda[2] + 3*Lambda[3]

sage: x = crystals.infinity.GeneralizedYoungWalls(3)([[],[1,0,3,2],[2,1],[3,2,
↪1,0,3,2],[],[],[2]])
sage: x.Phi()
2*Lambda[0] + Lambda[1] - Lambda[2] + Lambda[3]
```

```
>>> from sage.all import *
>>> y = crystals.infinity.GeneralizedYoungWalls(Integer(3))([[Integer(0)],
↪[Integer(1),Integer(0),Integer(3),Integer(2)],[Integer(2),Integer(1)],
↪[Integer(3),Integer(2),Integer(1),Integer(0),Integer(3),Integer(2)],
↪[Integer(0)],[],[Integer(2)]])
>>> y.Phi()
-Lambda[0] + 3*Lambda[1] - Lambda[2] + 3*Lambda[3]

>>> x = crystals.infinity.GeneralizedYoungWalls(Integer(3))([[],[Integer(1),
↪Integer(0),Integer(3),Integer(2)],[Integer(2),Integer(1)],[Integer(3),
↪Integer(2),Integer(1),Integer(0),Integer(3),Integer(2)],[],[],[Integer(2)]])
>>> x.Phi()
2*Lambda[0] + Lambda[1] - Lambda[2] + Lambda[3]
```

a(i, k)

Return the number $a_i(k)$ of i-colored boxes in the `k`-th column of `self`.

EXAMPLES:

```
sage: y = crystals.infinity.GeneralizedYoungWalls(3)([[0],[1,0,3,2],[2,1],[3,
→2,1,0,3,2],[0],[],[2]])
sage: y.a(1,2)
1
sage: y.a(0,2)
1
sage: y.a(3,2)
0
```

```
>>> from sage.all import *
>>> y = crystals.infinity.GeneralizedYoungWalls(Integer(3))([[Integer(0)],
→[Integer(1),Integer(0),Integer(3),Integer(2)],[Integer(2),Integer(1)],
→[Integer(3),Integer(2),Integer(1),Integer(0),Integer(3),Integer(2)],
→[Integer(0)],[],[Integer(2)]])
>>> y.a(Integer(1),Integer(2))
1
>>> y.a(Integer(0),Integer(2))
1
>>> y.a(Integer(3),Integer(2))
0
```

column(*k*)

Return the list of boxes from the `k`-th column of `self`.

EXAMPLES:

```
sage: y = crystals.infinity.GeneralizedYoungWalls(3)([[0],[1,0,3,2],[2,1],[3,
→2,1,0,3,2],[0],[],[2]])
sage: y.column(2)
[None, 0, 1, 2, None, None, None]

sage: hw = crystals.infinity.GeneralizedYoungWalls(5)([])
sage: hw.column(1)
[]
```

```
>>> from sage.all import *
>>> y = crystals.infinity.GeneralizedYoungWalls(Integer(3))([[Integer(0)],
→[Integer(1),Integer(0),Integer(3),Integer(2)],[Integer(2),Integer(1)],
→[Integer(3),Integer(2),Integer(1),Integer(0),Integer(3),Integer(2)],
→[Integer(0)],[],[Integer(2)]])
>>> y.column(Integer(2))
[None, 0, 1, 2, None, None, None]

>>> hw = crystals.infinity.GeneralizedYoungWalls(Integer(5))([])
>>> hw.column(Integer(1))
[]
```

content()

Return total number of blocks in `self`.

EXAMPLES:

```
sage: y = crystals.infinity.GeneralizedYoungWalls(2)([[0],[1,0],[2,1,0,2],[],
↪[1]])
sage: y.content()
8

sage: x = crystals.infinity.GeneralizedYoungWalls(3)([[],[1,0,3,2],[2,1],[3,2,
↪1,0,3,2],[],[],[2]])
sage: x.content()
13
```

```
>>> from sage.all import *
>>> y = crystals.infinity.GeneralizedYoungWalls(Integer(2))([[Integer(0)],
↪[Integer(1),Integer(0)],[Integer(2),Integer(1),Integer(0),Integer(2)],[],
↪[Integer(1)]])
>>> y.content()
8

>>> x = crystals.infinity.GeneralizedYoungWalls(Integer(3))([[],[Integer(1),
↪Integer(0),Integer(3),Integer(2)],[Integer(2),Integer(1)],[Integer(3),
↪Integer(2),Integer(1),Integer(0),Integer(3),Integer(2)],[],[],[Integer(2)]])
>>> x.content()
13
```

e(*i*)

Return the application of the Kashiwara raising operator e_i on `self`.

This will remove the i-colored box corresponding to the rightmost $+$ in `self.signature(i)`.

EXAMPLES:

```
sage: x = crystals.infinity.GeneralizedYoungWalls(3)([[],[1,0,3,2],[2,1],[3,2,
↪1,0,3,2],[],[],[2]])
sage: x.e(2)
[[], [1, 0, 3, 2], [2, 1], [3, 2, 1, 0, 3, 2]]
sage: _.e(2)
[[], [1, 0, 3], [2, 1], [3, 2, 1, 0, 3, 2]]
sage: _.e(2)
[[], [1, 0, 3], [2, 1], [3, 2, 1, 0, 3]]
sage: _.e(2)
```

```
>>> from sage.all import *
>>> x = crystals.infinity.GeneralizedYoungWalls(Integer(3))([[],[Integer(1),
↪Integer(0),Integer(3),Integer(2)],[Integer(2),Integer(1)],[Integer(3),
↪Integer(2),Integer(1),Integer(0),Integer(3),Integer(2)],[],[],[Integer(2)]])
>>> x.e(Integer(2))
[[], [1, 0, 3, 2], [2, 1], [3, 2, 1, 0, 3, 2]]
>>> _.e(Integer(2))
[[], [1, 0, 3], [2, 1], [3, 2, 1, 0, 3, 2]]
>>> _.e(Integer(2))
[[], [1, 0, 3], [2, 1], [3, 2, 1, 0, 3]]
>>> _.e(Integer(2))
```

epsilon(*i*)

Return the number of i-colored arrows in the i-string above `self` in the crystal graph.

EXAMPLES:

```
sage: y = crystals.infinity.GeneralizedYoungWalls(3)([[],[1,0,3,2],[2,1],[3,2,
↪1,0,3,2],[],[],[2]])
sage: y.epsilon(1)
0
sage: y.epsilon(2)
3
sage: y.epsilon(0)
0
```

```
>>> from sage.all import *
>>> y = crystals.infinity.GeneralizedYoungWalls(Integer(3))([[],[Integer(1),
↪Integer(0),Integer(3),Integer(2)],[Integer(2),Integer(1)],[Integer(3),
↪Integer(2),Integer(1),Integer(0),Integer(3),Integer(2)],[],[],[Integer(2)]])
>>> y.epsilon(Integer(1))
0
>>> y.epsilon(Integer(2))
3
>>> y.epsilon(Integer(0))
0
```

f(i)

Return the application of the Kashiwara lowering operator f_i on `self`.

This will add an i-colored colored box to the site corresponding to the leftmost plus in `self.signature(i)`.

EXAMPLES:

```
sage: hw = crystals.infinity.GeneralizedYoungWalls(2)([])
sage: hw.f(1)
[[], [1]]
sage: _.f(2)
[[], [1], [2]]
sage: _.f(0)
[[], [1, 0], [2]]
sage: _.f(0)
[[0], [1, 0], [2]]
```

```
>>> from sage.all import *
>>> hw = crystals.infinity.GeneralizedYoungWalls(Integer(2))([])
>>> hw.f(Integer(1))
[[], [1]]
>>> _.f(Integer(2))
[[], [1], [2]]
>>> _.f(Integer(0))
[[], [1, 0], [2]]
>>> _.f(Integer(0))
[[0], [1, 0], [2]]
```

generate_signature(i)

The i-signature of `self` (with whitespace where cancellation occurs) together with the unreduced sequence from $\{+, -\}$. The result also records to the row and column position of the sign.

EXAMPLES:

```
sage: y = crystals.infinity.GeneralizedYoungWalls(2)([[0],[1,0],[2,1,0,2],[],
↪[1]])
sage: y.generate_signature(1)
([['+', 2, 5], ['-', 4, 1]], '  ')
```

```
>>> from sage.all import *
>>> y = crystals.infinity.GeneralizedYoungWalls(Integer(2))([[Integer(0)],
↪[Integer(1),Integer(0)],[Integer(2),Integer(1),Integer(0),Integer(2)],[],
↪[Integer(1)]])
>>> y.generate_signature(Integer(1))
([['+', 2, 5], ['-', 4, 1]], '  ')
```

in_highest_weight_crystal(*La*)

Return a boolean indicating if the generalized Young wall element is in the highest weight crystal cut out by the given highest weight La.

By Theorem 4.1 of [KS2010], a generalized Young wall Y represents a vertex in the highest weight crystal $Y(\lambda)$, with $\lambda = \Lambda_{i_1} + \Lambda_{i_2} + \cdots + \Lambda_{i_\ell}$ a dominant integral weight of level $\ell > 0$, if it satisfies the following condition. For each positive integer k, if there exists $j \in I$ such that $a_j(k) - a_{j-1}(k) > 0$, then for some $p = 1, \ldots, \ell$,

$$j + k \equiv i_p + 1 \bmod n + 1 \text{ and } a_j(k) - a_{j-1}(k) \le \lambda(h_{i_p}),$$

where $\{h_0, h_1, \ldots, h_n\}$ is the set of simple coroots attached to $A_n^{(1)}$.

EXAMPLES:

```
sage: La = RootSystem(['A',2,1]).weight_lattice(extended=True).fundamental_
↪weights()[1]
sage: GYW = crystals.infinity.GeneralizedYoungWalls(2)
sage: y = GYW([[],[1,0],[2,1]])
sage: y.in_highest_weight_crystal(La)
True
sage: x = GYW([[],[1],[2],[],[],[2],[],[],[2]])
sage: x.in_highest_weight_crystal(La)
False
```

```
>>> from sage.all import *
>>> La = RootSystem(['A',Integer(2),Integer(1)]).weight_
↪lattice(extended=True).fundamental_weights()[Integer(1)]
>>> GYW = crystals.infinity.GeneralizedYoungWalls(Integer(2))
>>> y = GYW([[],[Integer(1),Integer(0)],[Integer(2),Integer(1)]])
>>> y.in_highest_weight_crystal(La)
True
>>> x = GYW([[],[Integer(1)],[Integer(2)],[],[],[Integer(2)],[],[],
↪[Integer(2)]])
>>> x.in_highest_weight_crystal(La)
False
```

latex_large()

Generate LaTeX code for self but the output is larger.

This requires TikZ.

EXAMPLES:

```
sage: x = crystals.infinity.GeneralizedYoungWalls(3)([[],[1,0,3,2],[2,1],[3,2,
↪1,0,3,2],[],[],[2]])
sage: x.latex_large()
'\\begin{tikzpicture}[baseline=5,scale=.45] \n \\foreach \\x [count=\\s from␣
↪0] in \n{{},{1,0,3,2},{2,1},{3,2,1,0,3,2},{},{},{2}} \n{\\foreach \\y␣
↪[count=\\t from 0] in \\x {  \\node[font=\\scriptsize] at (-\\t,\\s) {$\\y$}
↪; \n \\draw (-\\t+.5,\\s+.5) to (-\\t-.5,\\s+.5); \n \\draw (-\\t+.5,\\s-.
↪5) to (-\\t-.5,\\s-.5); \n \\draw (-\\t-.5,\\s-.5) to (-\\t-.5,\\s+.5);  } \
↪n \\draw[-,thick] (.5,\\s+1) to (.5,-.5) to (-\\s-1,-.5); } \n \\end
↪{tikzpicture} \n'
```

```
>>> from sage.all import *
>>> x = crystals.infinity.GeneralizedYoungWalls(Integer(3))([[],[Integer(1),
↪Integer(0),Integer(3),Integer(2)],[Integer(2),Integer(1)],[Integer(3),
↪Integer(2),Integer(1),Integer(0),Integer(3),Integer(2)],[],[],[Integer(2)]])
>>> x.latex_large()
'\\begin{tikzpicture}[baseline=5,scale=.45] \n \\foreach \\x [count=\\s from␣
↪0] in \n{{},{1,0,3,2},{2,1},{3,2,1,0,3,2},{},{},{2}} \n{\\foreach \\y␣
↪[count=\\t from 0] in \\x {  \\node[font=\\scriptsize] at (-\\t,\\s) {$\\y$}
↪; \n \\draw (-\\t+.5,\\s+.5) to (-\\t-.5,\\s+.5); \n \\draw (-\\t+.5,\\s-.
↪5) to (-\\t-.5,\\s-.5); \n \\draw (-\\t-.5,\\s-.5) to (-\\t-.5,\\s+.5);  } \
↪n \\draw[-,thick] (.5,\\s+1) to (.5,-.5) to (-\\s-1,-.5); } \n \\end
↪{tikzpicture} \n'
```

number_of_parts()

Return the value of $\mathscr{N}$ on `self`.

In [KLRS2016], the statistic $\mathscr{N}$ was defined on elements in $\mathcal{Y}(\infty)$ which counts how many parts are in the corresponding Kostant partition. Specifically, the computation of $\mathscr{N}(Y)$ is done using the following algorithm:

- If Y has no rows whose right-most box is colored n and such that the length of this row is a multiple of $n+1$, then $\mathscr{N}(Y)$ is the total number of distinct rows in Y, not counting multiplicity.
- Otherwise, search Y for the longest row such that the right-most box is colored n and such that the total number of boxes in the row is $k(n+1)$ for some $k \geq 1$. Replace this row by $n+1$ distinct rows of length k, reordering all rows, if necessary, so that the result is a proper wall. (Note that the resulting wall may no longer be reduced.) Repeat the search and replace process for all other rows of the above form for each $k' < k$. Then $\mathscr{N}(Y)$ is the number of distinct rows, not counting multiplicity, in the wall resulting from this process.

EXAMPLES:

```
sage: Y = crystals.infinity.GeneralizedYoungWalls(3)
sage: y = Y([[0],[],[],[],[0],[],[],[],[0]])
sage: y.number_of_parts()
1

sage: Y = crystals.infinity.GeneralizedYoungWalls(3)
sage: y = Y([[0,3,2],[1,0],[],[],[0,3],[1,0],[],[],[0]])
sage: y.number_of_parts()
4

sage: Y = crystals.infinity.GeneralizedYoungWalls(2)
```

(continues on next page)

(continued from previous page)

```
sage: y = Y([[0,2,1],[1,0],[2,1,0,2,1,0,2,1,0],[],[2,1,0,2,1,0]])
sage: y.number_of_parts()
8
```

```
>>> from sage.all import *
>>> Y = crystals.infinity.GeneralizedYoungWalls(Integer(3))
>>> y = Y([[Integer(0)],[],[],[],[Integer(0)],[],[],[],[Integer(0)]])
>>> y.number_of_parts()
1

>>> Y = crystals.infinity.GeneralizedYoungWalls(Integer(3))
>>> y = Y([[Integer(0),Integer(3),Integer(2)],[Integer(1),Integer(0)],[],[],
↪[Integer(0),Integer(3)],[Integer(1),Integer(0)],[],[],[Integer(0)]])
>>> y.number_of_parts()
4

>>> Y = crystals.infinity.GeneralizedYoungWalls(Integer(2))
>>> y = Y([[Integer(0),Integer(2),Integer(1)],[Integer(1),Integer(0)],
↪[Integer(2),Integer(1),Integer(0),Integer(2),Integer(1),Integer(0),
↪Integer(2),Integer(1),Integer(0)],[],[Integer(2),Integer(1),Integer(0),
↪Integer(2),Integer(1),Integer(0)]])
>>> y.number_of_parts()
8
```

phi(*i*)

Return the value $\varepsilon_i(Y) + \langle h_i, \mathrm{wt}(Y)\rangle$, where h_i is the i-th simple coroot and Y is `self`.

EXAMPLES:

```
sage: y = crystals.infinity.GeneralizedYoungWalls(3)([[0],[1,0,3,2],[2,1],[3,
↪2,1,0,3,2],[0],[],[2]])
sage: y.phi(1)
3
sage: y.phi(2)
-1
```

```
>>> from sage.all import *
>>> y = crystals.infinity.GeneralizedYoungWalls(Integer(3))([[Integer(0)],
↪[Integer(1),Integer(0),Integer(3),Integer(2)],[Integer(2),Integer(1)],
↪[Integer(3),Integer(2),Integer(1),Integer(0),Integer(3),Integer(2)],
↪[Integer(0)],[],[Integer(2)]])
>>> y.phi(Integer(1))
3
>>> y.phi(Integer(2))
-1
```

pp()

Pretty print `self`.

EXAMPLES:

```
sage: y = crystals.infinity.GeneralizedYoungWalls(2)([[0,2,1],[1,0,2,1,0],[],
↪[0],[1,0,2],[],[],[1]])
```

(continues on next page)

(continued from previous page)

```
sage: y.pp()
        1|
         |
         |
    2|0|1|
        0|
         |
0|1|2|0|1|
    1|2|0|
```

```
>>> from sage.all import *
>>> y = crystals.infinity.GeneralizedYoungWalls(Integer(2))([[Integer(0),
↪Integer(2),Integer(1)],[Integer(1),Integer(0),Integer(2),Integer(1),
↪Integer(0)],[],[Integer(0)],[Integer(1),Integer(0),Integer(2)],[],[],
↪[Integer(1)]])
>>> y.pp()
        1|
         |
         |
    2|0|1|
        0|
         |
0|1|2|0|1|
    1|2|0|
```

raw_signature(*i*)

Return the sequence from $\{+, -\}$ obtained from all i-admissible slots and removable i-boxes without canceling any $(+, -)$-pairs. The result also notes the row and column of the sign.

EXAMPLES:

```
sage: x = crystals.infinity.GeneralizedYoungWalls(3)([[],[1,0,3,2],[2,1],[3,2,
↪1,0,3,2],[],[],[2]])
sage: x.raw_signature(2)
[['-', 3, 6], ['-', 1, 4], ['-', 6, 1]]
```

```
>>> from sage.all import *
>>> x = crystals.infinity.GeneralizedYoungWalls(Integer(3))([[],[Integer(1),
↪Integer(0),Integer(3),Integer(2)],[Integer(2),Integer(1)],[Integer(3),
↪Integer(2),Integer(1),Integer(0),Integer(3),Integer(2)],[],[],[Integer(2)]])
>>> x.raw_signature(Integer(2))
[['-', 3, 6], ['-', 1, 4], ['-', 6, 1]]
```

signature(*i*)

Return the i-signature of `self`.

The signature is obtained by reading `self` in columns bottom to top starting from the left. Then add a $-$ at every i-box which may be removed from `self` and still obtain a legal generalized Young wall, and add a $+$ at each site for which an i-box may be added and still obtain a valid generalized Young wall. Then successively cancel any $(+, -)$-pair to obtain a sequence of the form $- \cdots - + \cdots +$. This resulting sequence is the output.

EXAMPLES:

```
sage: y = crystals.infinity.GeneralizedYoungWalls(2)([[0],[1,0],[2,1,0,2],[],
↪[1]])
sage: y.signature(1)
''

sage: x = crystals.infinity.GeneralizedYoungWalls(3)([[],[1,0,3,2],[2,1],[3,2,
↪1,0,3,2],[],[],[2]])
sage: x.signature(2)
'---'
```

```
>>> from sage.all import *
>>> y = crystals.infinity.GeneralizedYoungWalls(Integer(2))([[Integer(0)],
↪[Integer(1),Integer(0)],[Integer(2),Integer(1),Integer(0),Integer(2)],[],
↪[Integer(1)]])
>>> y.signature(Integer(1))
''

>>> x = crystals.infinity.GeneralizedYoungWalls(Integer(3))([[],[Integer(1),
↪Integer(0),Integer(3),Integer(2)],[Integer(2),Integer(1)],[Integer(3),
↪Integer(2),Integer(1),Integer(0),Integer(3),Integer(2)],[],[],[Integer(2)]])
>>> x.signature(Integer(2))
'---'
```

sum_of_weighted_row_lengths()

Return the value of $\mathscr{M}$ on `self`.

Let $\mathcal{Y}_0 \subset \mathcal{Y}(\infty)$ be the set of generalized Young walls which have no rows whose right-most box is colored n. For $Y \in \mathcal{Y}_0$,

$$\mathscr{M}(Y) = \sum_{i=1}^{n} (i+1) M_i(Y),$$

where $M_i(Y)$ is the number of nonempty rows in Y whose right-most box is colored $i-1$.

EXAMPLES:

```
sage: Y = crystals.infinity.GeneralizedYoungWalls(2)
sage: y = Y([[0,2,1,0,2],[1,0,2],[],[0,2],[1,0],[],[0],[1,0]])
sage: y.sum_of_weighted_row_lengths()
15
```

```
>>> from sage.all import *
>>> Y = crystals.infinity.GeneralizedYoungWalls(Integer(2))
>>> y = Y([[Integer(0),Integer(2),Integer(1),Integer(0),Integer(2)],
↪[Integer(1),Integer(0),Integer(2)],[],[Integer(0),Integer(2)],[Integer(1),
↪Integer(0)],[],[Integer(0)],[Integer(1),Integer(0)]])
>>> y.sum_of_weighted_row_lengths()
15
```

weight(*root_lattice=False*)

Return the weight of `self`.

INPUT:

- `root_lattice` – boolean determining whether weight should appear in root lattice or not in extended affine weight lattice

EXAMPLES:

```
sage: x = crystals.infinity.GeneralizedYoungWalls(3)([[],[1,0,3,2],[2,1],[3,2,
↪1,0,3,2],[],[],[2]])
sage: x.weight()
2*Lambda[0] + Lambda[1] - 4*Lambda[2] + Lambda[3] - 2*delta
sage: x.weight(root_lattice=True)
-2*alpha[0] - 3*alpha[1] - 5*alpha[2] - 3*alpha[3]
```

```
>>> from sage.all import *
>>> x = crystals.infinity.GeneralizedYoungWalls(Integer(3))([[],[Integer(1),
↪Integer(0),Integer(3),Integer(2)],[Integer(2),Integer(1)],[Integer(3),
↪Integer(2),Integer(1),Integer(0),Integer(3),Integer(2)],[],[],[Integer(2)]])
>>> x.weight()
2*Lambda[0] + Lambda[1] - 4*Lambda[2] + Lambda[3] - 2*delta
>>> x.weight(root_lattice=True)
-2*alpha[0] - 3*alpha[1] - 5*alpha[2] - 3*alpha[3]
```

class `sage.combinat.crystals.generalized_young_walls.`**`InfinityCrystalOfGeneralizedYoungWalls`**`(`*n*, *category*`)`

Bases: `UniqueRepresentation`, `Parent`

The crystal $\mathcal{Y}(\infty)$ of generalized Young walls of type $A_n^{(1)}$ as defined in [KS2010].

A generalized Young wall is a collection of boxes stacked on a fixed board, such that color of the box at the site located in the j-th row from the bottom and the i-th column from the right is $j-1 \bmod n+1$. There are several growth conditions on elements in $Y \in \mathcal{Y}(\infty)$:

- Walls grow in rows from right to left. That is, for every box $y \in Y$ that is not in the rightmost column, there must be a box immediately to the right of y.
- For all $p > q$ such that $p - q \equiv 0 \bmod n+1$, the p-th row has most as many boxes as the q-th row.
- There does not exist a column in the wall such that if one i-colored box, for every $i = 0, 1, \ldots, n$, is removed from that column, then the result satisfies the above conditions.

There is a crystal structure on $\mathcal{Y}(\infty)$ defined as follows. Define maps

$$e_i,\ f_i \colon \mathcal{Y}(\infty) \longrightarrow \mathcal{Y}(\infty) \sqcup \{0\}, \qquad \varepsilon_i,\ \varphi_i \colon \mathcal{Y}(\infty) \longrightarrow \mathbf{Z}, \qquad \mathrm{wt}\colon \mathcal{Y}(\infty) \longrightarrow \bigoplus_{i=0}^{n} \mathbf{Z}\Lambda_i \oplus \mathbf{Z}\delta,$$

by

$$\mathrm{wt}(Y) = -\sum_{i=0}^{n} m_i(Y)\alpha_i,$$

where $m_i(Y)$ is the number of i-boxes in Y, $\varepsilon_i(Y)$ is the number of $-$ in the i-signature of Y, and

$$\varphi_i(Y) = \varepsilon_i(Y) + \langle h_i, \mathrm{wt}(Y)\rangle.$$

See *`GeneralizedYoungWall.e()`*, *`GeneralizedYoungWall.f()`*, and *`GeneralizedYoungWall.signature()`* for more about e_i, f_i, and i-signatures.

INPUT:

- n – type $A_n^{(1)}$

EXAMPLES:

```
sage: Yinf = crystals.infinity.GeneralizedYoungWalls(3)
sage: y = Yinf([[0],[1,0,3,2],[],[3,2,1],[0],[1,0]])
sage: y.pp()
    0|1|
      0|
  1|2|3|
        |
2|3|0|1|
      0|
sage: y.weight(root_lattice=True)
-4*alpha[0] - 3*alpha[1] - 2*alpha[2] - 2*alpha[3]
sage: y.f(0)
[[0], [1, 0, 3, 2], [], [3, 2, 1], [0], [1, 0], [], [], [0]]
sage: y.e(0).pp()
    0|1|
        |
  1|2|3|
        |
2|3|0|1|
      0|
```

```
>>> from sage.all import *
>>> Yinf = crystals.infinity.GeneralizedYoungWalls(Integer(3))
>>> y = Yinf([[Integer(0)],[Integer(1),Integer(0),Integer(3),Integer(2)],[],
↪[Integer(3),Integer(2),Integer(1)],[Integer(0)],[Integer(1),Integer(0)]])
>>> y.pp()
    0|1|
      0|
  1|2|3|
        |
2|3|0|1|
      0|
>>> y.weight(root_lattice=True)
-4*alpha[0] - 3*alpha[1] - 2*alpha[2] - 2*alpha[3]
>>> y.f(Integer(0))
[[0], [1, 0, 3, 2], [], [3, 2, 1], [0], [1, 0], [], [], [0]]
>>> y.e(Integer(0)).pp()
    0|1|
        |
  1|2|3|
        |
2|3|0|1|
      0|
```

To display the crystal down to depth 3:

```
sage: S = Yinf.subcrystal(max_depth=3)
sage: G = Yinf.digraph(subset=S) # long time
sage: view(G) # not tested
```

```
>>> from sage.all import *
>>> S = Yinf.subcrystal(max_depth=Integer(3))
>>> G = Yinf.digraph(subset=S) # long time
>>> view(G) # not tested
```

Element

alias of *GeneralizedYoungWall*

5.1.51 Highest weight crystals

class sage.combinat.crystals.highest_weight_crystals.**FiniteDimensionalHighestWeightCrystal_TypeE**(*dominant_weight*)

Bases: *TensorProductOfCrystals*

Commonalities for all finite dimensional type E highest weight crystals.

Subclasses should setup an attribute column_crystal in their `__init__` method before calling the `__init__` method of this class.

Element

alias of *TensorProductOfRegularCrystalsElement*

module_generator()

Yield the module generator (or highest weight element) of the classical crystal of given dominant weight in `self`.

EXAMPLES:

```
sage: C=CartanType(['E',6])
sage: La=C.root_system().weight_lattice().fundamental_weights()
sage: T = crystals.HighestWeight(La[2])
sage: T.module_generator()
[[(2, -1), (1,)]]
sage: T = crystals.HighestWeight(0*La[2])
sage: T.module_generator()
[]

sage: C=CartanType(['E',7])
sage: La=C.root_system().weight_lattice().fundamental_weights()
sage: T = crystals.HighestWeight(La[1])
sage: T.module_generator()
[[(-7, 1), (7,)]]
```

```
>>> from sage.all import *
>>> C=CartanType(['E',Integer(6)])
>>> La=C.root_system().weight_lattice().fundamental_weights()
>>> T = crystals.HighestWeight(La[Integer(2)])
>>> T.module_generator()
[[(2, -1), (1,)]]
>>> T = crystals.HighestWeight(Integer(0)*La[Integer(2)])
>>> T.module_generator()
[]
```

(continues on next page)

(continued from previous page)

```
>>> C=CartanType(['E',Integer(7)])
>>> La=C.root_system().weight_lattice().fundamental_weights()
>>> T = crystals.HighestWeight(La[Integer(1)])
>>> T.module_generator()
[[(-7, 1), (7,)]]
```

class sage.combinat.crystals.highest_weight_crystals.**FiniteDimensionalHighestWeightCrystal_TypeE6**(*dom i- nar*

Bases: *FiniteDimensionalHighestWeightCrystal_TypeE*

Class of finite dimensional highest weight crystals of type E_6.

EXAMPLES:

```
sage: C=CartanType(['E',6])
sage: La=C.root_system().weight_lattice().fundamental_weights()
sage: T = crystals.HighestWeight(La[2]); T
Finite dimensional highest weight crystal of type ['E', 6] and highest weight
↪Lambda[2]
sage: B1 = T.column_crystal[1]; B1
The crystal of letters for type ['E', 6]
sage: B6 = T.column_crystal[6]; B6
The crystal of letters for type ['E', 6] (dual)
sage: t = T(B6([-1]),B1([-1,3])); t
[(-1,), (-1, 3)]
sage: [t.epsilon(i) for i in T.index_set()]
[2, 0, 0, 0, 0, 0]
sage: [t.phi(i) for i in T.index_set()]
[0, 0, 1, 0, 0, 0]
sage: TestSuite(t).run()
```

```
>>> from sage.all import *
>>> C=CartanType(['E',Integer(6)])
>>> La=C.root_system().weight_lattice().fundamental_weights()
>>> T = crystals.HighestWeight(La[Integer(2)]); T
Finite dimensional highest weight crystal of type ['E', 6] and highest weight
↪Lambda[2]
>>> B1 = T.column_crystal[Integer(1)]; B1
The crystal of letters for type ['E', 6]
>>> B6 = T.column_crystal[Integer(6)]; B6
The crystal of letters for type ['E', 6] (dual)
>>> t = T(B6([-Integer(1)]),B1([-Integer(1),Integer(3)])); t
[(-1,), (-1, 3)]
>>> [t.epsilon(i) for i in T.index_set()]
[2, 0, 0, 0, 0, 0]
>>> [t.phi(i) for i in T.index_set()]
[0, 0, 1, 0, 0, 0]
>>> TestSuite(t).run()
```

class sage.combinat.crystals.highest_weight_crystals.**FiniteDimensionalHighestWeightCrystal_TypeE7**(*dom i- nar*

Bases: *FiniteDimensionalHighestWeightCrystal_TypeE*

Class of finite dimensional highest weight crystals of type E_7.

EXAMPLES:

```
sage: C=CartanType(['E',7])
sage: La=C.root_system().weight_lattice().fundamental_weights()
sage: T = crystals.HighestWeight(La[1])
sage: T.cardinality()
133
sage: B7 = T.column_crystal[7]; B7
The crystal of letters for type ['E', 7]
sage: t = T(B7([-5, 6]), B7([-2, 3])); t
[(-5, 6), (-2, 3)]
sage: [t.epsilon(i) for i in T.index_set()]
[0, 1, 0, 0, 1, 0, 0]
sage: [t.phi(i) for i in T.index_set()]
[0, 0, 1, 0, 0, 1, 0]
sage: TestSuite(t).run()
```

```
>>> from sage.all import *
>>> C=CartanType(['E',Integer(7)])
>>> La=C.root_system().weight_lattice().fundamental_weights()
>>> T = crystals.HighestWeight(La[Integer(1)])
>>> T.cardinality()
133
>>> B7 = T.column_crystal[Integer(7)]; B7
The crystal of letters for type ['E', 7]
>>> t = T(B7([-Integer(5), Integer(6)]), B7([-Integer(2), Integer(3)])); t
[(-5, 6), (-2, 3)]
>>> [t.epsilon(i) for i in T.index_set()]
[0, 1, 0, 0, 1, 0, 0]
>>> [t.phi(i) for i in T.index_set()]
[0, 0, 1, 0, 0, 1, 0]
>>> TestSuite(t).run()
```

`sage.combinat.crystals.highest_weight_crystals.`**`HighestWeightCrystal`**(*dominant_weight*, *model=None*)

Return the highest weight crystal of highest weight `dominant_weight` of the given `model`.

INPUT:

- `dominant_weight` – a dominant weight
- `model` – (optional) if not specified, then we have the following default models:
  - types A_n, B_n, C_n, D_n, G_2 - *tableaux*
  - types $E_{6,7}$ - *type E finite dimensional crystal*
  - all other types - *LS paths*

  otherwise can be one of the following:

  - `'Tableaux'` - *KN tableaux*
  - `'TypeE'` - *type E finite dimensional crystal*

– 'NakajimaMonomials' - *Nakajima monomials*
– 'LSPaths' - *LS paths*
– 'AlcovePaths' - *alcove paths*
– 'GeneralizedYoungWalls' - *generalized Young walls*
– 'RiggedConfigurations' - *rigged configurations*

EXAMPLES:

```
sage: La = RootSystem(['A',2]).weight_lattice().fundamental_weights()
sage: wt = La[1] + La[2]
sage: crystals.HighestWeight(wt)
The crystal of tableaux of type ['A', 2] and shape(s) [[2, 1]]

sage: La = RootSystem(['C',2]).weight_lattice().fundamental_weights()
sage: wt = 5*La[1] + La[2]
sage: crystals.HighestWeight(wt)
The crystal of tableaux of type ['C', 2] and shape(s) [[6, 1]]

sage: La = RootSystem(['B',2]).weight_lattice().fundamental_weights()
sage: wt = La[1] + La[2]
sage: crystals.HighestWeight(wt)
The crystal of tableaux of type ['B', 2] and shape(s) [[3/2, 1/2]]
```

```
>>> from sage.all import *
>>> La = RootSystem(['A',Integer(2)]).weight_lattice().fundamental_weights()
>>> wt = La[Integer(1)] + La[Integer(2)]
>>> crystals.HighestWeight(wt)
The crystal of tableaux of type ['A', 2] and shape(s) [[2, 1]]

>>> La = RootSystem(['C',Integer(2)]).weight_lattice().fundamental_weights()
>>> wt = Integer(5)*La[Integer(1)] + La[Integer(2)]
>>> crystals.HighestWeight(wt)
The crystal of tableaux of type ['C', 2] and shape(s) [[6, 1]]

>>> La = RootSystem(['B',Integer(2)]).weight_lattice().fundamental_weights()
>>> wt = La[Integer(1)] + La[Integer(2)]
>>> crystals.HighestWeight(wt)
The crystal of tableaux of type ['B', 2] and shape(s) [[3/2, 1/2]]
```

Some type E examples:

```
sage: C = CartanType(['E',6])
sage: La = C.root_system().weight_lattice().fundamental_weights()
sage: T = crystals.HighestWeight(La[1])
sage: T.cardinality()
27
sage: T = crystals.HighestWeight(La[6])
sage: T.cardinality()
27
sage: T = crystals.HighestWeight(La[2])
sage: T.cardinality()
78
```

(continues on next page)

(continued from previous page)

```
sage: T = crystals.HighestWeight(La[4])
sage: T.cardinality()
2925
sage: T = crystals.HighestWeight(La[3])
sage: T.cardinality()
351
sage: T = crystals.HighestWeight(La[5])
sage: T.cardinality()
351

sage: C = CartanType(['E',7])
sage: La = C.root_system().weight_lattice().fundamental_weights()

27664
sage: T = crystals.HighestWeight(La[6])
sage: T.cardinality()
1539
sage: T = crystals.HighestWeight(La[7])
sage: T.cardinality()
56
```

```
>>> from sage.all import *
>>> C = CartanType(['E',Integer(6)])
>>> La = C.root_system().weight_lattice().fundamental_weights()
>>> T = crystals.HighestWeight(La[Integer(1)])
>>> T.cardinality()
27
>>> T = crystals.HighestWeight(La[Integer(6)])
>>> T.cardinality()
27
>>> T = crystals.HighestWeight(La[Integer(2)])
>>> T.cardinality()
78
>>> T = crystals.HighestWeight(La[Integer(4)])
>>> T.cardinality()
2925
>>> T = crystals.HighestWeight(La[Integer(3)])
>>> T.cardinality()
351
```

(continues on next page)

(continued from previous page)

```
>>> T = crystals.HighestWeight(La[Integer(5)])
>>> T.cardinality()
351

>>> C = CartanType(['E',Integer(7)])
>>> La = C.root_system().weight_lattice().fundamental_weights()
>>> T = crystals.HighestWeight(La[Integer(1)])
>>> T.cardinality()
133
>>> T = crystals.HighestWeight(La[Integer(2)])
>>> T.cardinality()
912
>>> T = crystals.HighestWeight(La[Integer(3)])
>>> T.cardinality()
8645
>>> T = crystals.HighestWeight(La[Integer(4)])
>>> T.cardinality()
365750
>>> T = crystals.HighestWeight(La[Integer(5)])
>>> T.cardinality()
27664
>>> T = crystals.HighestWeight(La[Integer(6)])
>>> T.cardinality()
1539
>>> T = crystals.HighestWeight(La[Integer(7)])
>>> T.cardinality()
56
```

An example with an affine type:

```
sage: C = CartanType(['C',2,1])
sage: La = C.root_system().weight_lattice().fundamental_weights()
sage: T = crystals.HighestWeight(La[1])
sage: sorted(T.subcrystal(max_depth=3), key=str)
[(-Lambda[0] + 3*Lambda[1] - Lambda[2] - delta,),
 (-Lambda[0] + Lambda[1] + Lambda[2] - delta,),
 (-Lambda[1] + 2*Lambda[2] - delta,),
 (2*Lambda[0] - Lambda[1],),
 (Lambda[0] + Lambda[1] - Lambda[2],),
 (Lambda[0] - Lambda[1] + Lambda[2],),
 (Lambda[1],)]
```

```
>>> from sage.all import *
>>> C = CartanType(['C',Integer(2),Integer(1)])
>>> La = C.root_system().weight_lattice().fundamental_weights()
>>> T = crystals.HighestWeight(La[Integer(1)])
>>> sorted(T.subcrystal(max_depth=Integer(3)), key=str)
[(-Lambda[0] + 3*Lambda[1] - Lambda[2] - delta,),
 (-Lambda[0] + Lambda[1] + Lambda[2] - delta,),
 (-Lambda[1] + 2*Lambda[2] - delta,),
 (2*Lambda[0] - Lambda[1],),
 (Lambda[0] + Lambda[1] - Lambda[2],),
```

(continues on next page)

(continued from previous page)

```
(Lambda[0] - Lambda[1] + Lambda[2],),
(Lambda[1],)]
```

Using the various models:

```
sage: La = RootSystem(['F',4]).weight_lattice().fundamental_weights()
sage: wt = La[1] + La[4]
sage: crystals.HighestWeight(wt)
The crystal of LS paths of type ['F', 4] and weight Lambda[1] + Lambda[4]
sage: crystals.HighestWeight(wt, model='NakajimaMonomials')
Highest weight crystal of modified Nakajima monomials of
 Cartan type ['F', 4] and highest weight Lambda[1] + Lambda[4]
sage: crystals.HighestWeight(wt, model='AlcovePaths')
Highest weight crystal of alcove paths of type ['F', 4] and weight Lambda[1] +␣
↪Lambda[4]
sage: crystals.HighestWeight(wt, model='RiggedConfigurations')
Crystal of rigged configurations of type ['F', 4] and weight Lambda[1] + Lambda[4]
sage: La = RootSystem(['A',3,1]).weight_lattice().fundamental_weights()
sage: wt = La[0] + La[2]
sage: crystals.HighestWeight(wt, model='GeneralizedYoungWalls')
Highest weight crystal of generalized Young walls of
 Cartan type ['A', 3, 1] and highest weight Lambda[0] + Lambda[2]
```

```
>>> from sage.all import *
>>> La = RootSystem(['F',Integer(4)]).weight_lattice().fundamental_weights()
>>> wt = La[Integer(1)] + La[Integer(4)]
>>> crystals.HighestWeight(wt)
The crystal of LS paths of type ['F', 4] and weight Lambda[1] + Lambda[4]
>>> crystals.HighestWeight(wt, model='NakajimaMonomials')
Highest weight crystal of modified Nakajima monomials of
 Cartan type ['F', 4] and highest weight Lambda[1] + Lambda[4]
>>> crystals.HighestWeight(wt, model='AlcovePaths')
Highest weight crystal of alcove paths of type ['F', 4] and weight Lambda[1] +␣
↪Lambda[4]
>>> crystals.HighestWeight(wt, model='RiggedConfigurations')
Crystal of rigged configurations of type ['F', 4] and weight Lambda[1] + Lambda[4]
>>> La = RootSystem(['A',Integer(3),Integer(1)]).weight_lattice().fundamental_
↪weights()
>>> wt = La[Integer(0)] + La[Integer(2)]
>>> crystals.HighestWeight(wt, model='GeneralizedYoungWalls')
Highest weight crystal of generalized Young walls of
 Cartan type ['A', 3, 1] and highest weight Lambda[0] + Lambda[2]
```

5.1.52 Induced Crystals

We construct a crystal structure on a set induced by a bijection Φ.

AUTHORS:

- Travis Scrimshaw (2014-05-15): Initial implementation

class sage.combinat.crystals.induced_structure.**InducedCrystal**(*X*, *phi*, *inverse*)

Bases: UniqueRepresentation, Parent

A crystal induced from an injection.

Let X be a set and let C be crystal and consider any injection $\Phi : X \to C$. We induce a crystal structure on X by considering Φ to be a crystal morphism.

Alternatively we can induce a crystal structure on some (sub)set of X by considering an injection $\Phi : C \to X$ considered as a crystal morphism. This form is also useful when the set X is not explicitly known.

INPUT:

- `X` – the base set
- `phi` – the map Φ
- `inverse` – (optional) the inverse map Φ^{-1}
- `from_crystal` – boolean (default: `False`); if the induced structure is of the second type $\Phi : C \to X$

EXAMPLES:

We construct a crystal structure of Gelfand-Tsetlin patterns by going through their bijection with semistandard tableaux:

```
sage: D = crystals.Tableaux(['A',3], shapes=PartitionsInBox(4,3))
sage: G = GelfandTsetlinPatterns(4, 3)
sage: phi = lambda x: D(x.to_tableau())
sage: phi_inv = lambda x: G(x.to_tableau())
sage: I = crystals.Induced(G, phi, phi_inv)
sage: I.digraph().is_isomorphic(D.digraph(), edge_labels=True)
True
```

```
>>> from sage.all import *
>>> D = crystals.Tableaux(['A',Integer(3)], shapes=PartitionsInBox(Integer(4),
↪Integer(3)))
>>> G = GelfandTsetlinPatterns(Integer(4), Integer(3))
>>> phi = lambda x: D(x.to_tableau())
>>> phi_inv = lambda x: G(x.to_tableau())
>>> I = crystals.Induced(G, phi, phi_inv)
>>> I.digraph().is_isomorphic(D.digraph(), edge_labels=True)
True
```

Now we construct the above example but inducing the structure going the other way (from tableaux to Gelfand-Tsetlin patterns). This can also give us more information coming from the crystal.

```
sage: D2 = crystals.Tableaux(['A',3], shapes=PartitionsInBox(4,1))
sage: G2 = GelfandTsetlinPatterns(4, 1)
sage: phi2 = lambda x: D2(x.to_tableau())
sage: phi2_inv = lambda x: G2(x.to_tableau())
sage: I2 = crystals.Induced(D2, phi2_inv, phi2, from_crystal=True)
sage: I2.module_generators
([[0, 0, 0, 0], [0, 0, 0], [0, 0], [0]],
 [[1, 0, 0, 0], [1, 0, 0], [1, 0], [1]],
 [[1, 1, 0, 0], [1, 1, 0], [1, 1], [1]],
 [[1, 1, 1, 0], [1, 1, 1], [1, 1], [1]],
 [[1, 1, 1, 1], [1, 1, 1], [1, 1], [1]])
```

```
>>> from sage.all import *
>>> D2 = crystals.Tableaux(['A',Integer(3)], shapes=PartitionsInBox(Integer(4),
↪Integer(1)))
>>> G2 = GelfandTsetlinPatterns(Integer(4), Integer(1))
>>> phi2 = lambda x: D2(x.to_tableau())
>>> phi2_inv = lambda x: G2(x.to_tableau())
>>> I2 = crystals.Induced(D2, phi2_inv, phi2, from_crystal=True)
>>> I2.module_generators
([[0, 0, 0, 0], [0, 0, 0], [0, 0], [0]],
 [[1, 0, 0, 0], [1, 0, 0], [1, 0], [1]],
 [[1, 1, 0, 0], [1, 1, 0], [1, 1], [1]],
 [[1, 1, 1, 0], [1, 1, 1], [1, 1], [1]],
 [[1, 1, 1, 1], [1, 1, 1], [1, 1], [1]])
```

We check an example when the codomain is larger than the domain (although here the crystal structure is trivial):

```
sage: P = Permutations(4)
sage: D = crystals.Tableaux(['A',3], shapes=Partitions(4))
sage: T = crystals.TensorProduct(D, D)
sage: phi = lambda p: T(D(RSK(p)[0]), D(RSK(p)[1]))
sage: phi_inv = lambda d: RSK_inverse(d[0].to_tableau(), d[1].to_tableau(),␣
↪output='permutation')
sage: all(phi_inv(phi(p)) == p for p in P) # Check it really is the inverse
True
sage: I = crystals.Induced(P, phi, phi_inv)
sage: I.digraph()
Digraph on 24 vertices
```

```
>>> from sage.all import *
>>> P = Permutations(Integer(4))
>>> D = crystals.Tableaux(['A',Integer(3)], shapes=Partitions(Integer(4)))
>>> T = crystals.TensorProduct(D, D)
>>> phi = lambda p: T(D(RSK(p)[Integer(0)]), D(RSK(p)[Integer(1)]))
>>> phi_inv = lambda d: RSK_inverse(d[Integer(0)].to_tableau(), d[Integer(1)].to_
↪tableau(), output='permutation')
>>> all(phi_inv(phi(p)) == p for p in P) # Check it really is the inverse
True
>>> I = crystals.Induced(P, phi, phi_inv)
>>> I.digraph()
Digraph on 24 vertices
```

We construct an example without a specified inverse map:

```
sage: X = Words(2,4)
sage: L = crystals.Letters(['A',1])
sage: T = crystals.TensorProduct(*[L]*4)
sage: Phi = lambda x : T(*[L(i) for i in x])
sage: I = crystals.Induced(X, Phi)
sage: I.digraph()
Digraph on 16 vertices
```

```
>>> from sage.all import *
>>> X = Words(Integer(2),Integer(4))
```

(continues on next page)

(continued from previous page)

```
>>> L = crystals.Letters(['A',Integer(1)])
>>> T = crystals.TensorProduct(*[L]*Integer(4))
>>> Phi = lambda x : T(*[L(i) for i in x])
>>> I = crystals.Induced(X, Phi)
>>> I.digraph()
Digraph on 16 vertices
```

class Element

Bases: `ElementWrapper`

An element of an induced crystal.

e(*i*)

Return e_i of `self`.

EXAMPLES:

```
sage: D = crystals.Tableaux(['A',3], shapes=PartitionsInBox(4,3))
sage: G = GelfandTsetlinPatterns(4, 3)
sage: phi = lambda x: D(x.to_tableau())
sage: phi_inv = lambda x: G(x.to_tableau())
sage: I = crystals.Induced(G, phi, phi_inv)
sage: elt = I([[1, 1, 0, 0], [1, 1, 0], [1, 0], [1]])
sage: elt.e(1)
sage: elt.e(2)
[[1, 1, 0, 0], [1, 1, 0], [1, 1], [1]]
sage: elt.e(3)
```

```
>>> from sage.all import *
>>> D = crystals.Tableaux(['A',Integer(3)],␣
↪shapes=PartitionsInBox(Integer(4),Integer(3)))
>>> G = GelfandTsetlinPatterns(Integer(4), Integer(3))
>>> phi = lambda x: D(x.to_tableau())
>>> phi_inv = lambda x: G(x.to_tableau())
>>> I = crystals.Induced(G, phi, phi_inv)
>>> elt = I([[Integer(1), Integer(1), Integer(0), Integer(0)],␣
↪[Integer(1), Integer(1), Integer(0)], [Integer(1), Integer(0)],␣
↪[Integer(1)]])
>>> elt.e(Integer(1))
>>> elt.e(Integer(2))
[[1, 1, 0, 0], [1, 1, 0], [1, 1], [1]]
>>> elt.e(Integer(3))
```

epsilon(*i*)

Return ε_i of `self`.

EXAMPLES:

```
sage: D = crystals.Tableaux(['A',3], shapes=PartitionsInBox(4,3))
sage: G = GelfandTsetlinPatterns(4, 3)
sage: phi = lambda x: D(x.to_tableau())
sage: phi_inv = lambda x: G(x.to_tableau())
sage: I = crystals.Induced(G, phi, phi_inv)
```

(continues on next page)

(continued from previous page)

```
sage: elt = I([[1, 1, 0, 0], [1, 1, 0], [1, 0], [1]])
sage: [elt.epsilon(i) for i in I.index_set()]
[0, 1, 0]
```

```
>>> from sage.all import *
>>> D = crystals.Tableaux(['A',Integer(3)],
↪shapes=PartitionsInBox(Integer(4),Integer(3)))
>>> G = GelfandTsetlinPatterns(Integer(4), Integer(3))
>>> phi = lambda x: D(x.to_tableau())
>>> phi_inv = lambda x: G(x.to_tableau())
>>> I = crystals.Induced(G, phi, phi_inv)
>>> elt = I([[Integer(1), Integer(1), Integer(0), Integer(0)],
↪[Integer(1), Integer(1), Integer(0)], [Integer(1), Integer(0)],
↪[Integer(1)]])
>>> [elt.epsilon(i) for i in I.index_set()]
[0, 1, 0]
```

f (i)

Return f_i of `self`.

EXAMPLES:

```
sage: D = crystals.Tableaux(['A',3], shapes=PartitionsInBox(4,3))
sage: G = GelfandTsetlinPatterns(4, 3)
sage: phi = lambda x: D(x.to_tableau())
sage: phi_inv = lambda x: G(x.to_tableau())
sage: I = crystals.Induced(G, phi, phi_inv)
sage: elt = I([[1, 1, 0, 0], [1, 1, 0], [1, 0], [1]])
sage: elt.f(1)
[[1, 1, 0, 0], [1, 1, 0], [1, 0], [0]]
sage: elt.f(2)
sage: elt.f(3)
[[1, 1, 0, 0], [1, 0, 0], [1, 0], [1]]
```

```
>>> from sage.all import *
>>> D = crystals.Tableaux(['A',Integer(3)],
↪shapes=PartitionsInBox(Integer(4),Integer(3)))
>>> G = GelfandTsetlinPatterns(Integer(4), Integer(3))
>>> phi = lambda x: D(x.to_tableau())
>>> phi_inv = lambda x: G(x.to_tableau())
>>> I = crystals.Induced(G, phi, phi_inv)
>>> elt = I([[Integer(1), Integer(1), Integer(0), Integer(0)],
↪[Integer(1), Integer(1), Integer(0)], [Integer(1), Integer(0)],
↪[Integer(1)]])
>>> elt.f(Integer(1))
[[1, 1, 0, 0], [1, 1, 0], [1, 0], [0]]
>>> elt.f(Integer(2))
>>> elt.f(Integer(3))
[[1, 1, 0, 0], [1, 0, 0], [1, 0], [1]]
```

phi (i)

Return φ_i of `self`.

EXAMPLES:

```
sage: D = crystals.Tableaux(['A',3], shapes=PartitionsInBox(4,3))
sage: G = GelfandTsetlinPatterns(4, 3)
sage: phi = lambda x: D(x.to_tableau())
sage: phi_inv = lambda x: G(x.to_tableau())
sage: I = crystals.Induced(G, phi, phi_inv)
sage: elt = I([[1, 1, 0, 0], [1, 1, 0], [1, 0], [1]])
sage: [elt.phi(i) for i in I.index_set()]
[1, 0, 1]
```

```
>>> from sage.all import *
>>> D = crystals.Tableaux(['A',Integer(3)],␣
↪shapes=PartitionsInBox(Integer(4),Integer(3)))
>>> G = GelfandTsetlinPatterns(Integer(4), Integer(3))
>>> phi = lambda x: D(x.to_tableau())
>>> phi_inv = lambda x: G(x.to_tableau())
>>> I = crystals.Induced(G, phi, phi_inv)
>>> elt = I([[Integer(1), Integer(1), Integer(0), Integer(0)],␣
↪[Integer(1), Integer(1), Integer(0)], [Integer(1), Integer(0)],␣
↪[Integer(1)]])
>>> [elt.phi(i) for i in I.index_set()]
[1, 0, 1]
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: D = crystals.Tableaux(['A',3], shapes=PartitionsInBox(4,3))
sage: G = GelfandTsetlinPatterns(4, 3)
sage: phi = lambda x: D(x.to_tableau())
sage: phi_inv = lambda x: G(x.to_tableau())
sage: I = crystals.Induced(G, phi, phi_inv)
sage: elt = I([[1, 1, 0, 0], [1, 1, 0], [1, 0], [1]])
sage: elt.weight()
(1, 0, 1, 0)
```

```
>>> from sage.all import *
>>> D = crystals.Tableaux(['A',Integer(3)],␣
↪shapes=PartitionsInBox(Integer(4),Integer(3)))
>>> G = GelfandTsetlinPatterns(Integer(4), Integer(3))
>>> phi = lambda x: D(x.to_tableau())
>>> phi_inv = lambda x: G(x.to_tableau())
>>> I = crystals.Induced(G, phi, phi_inv)
>>> elt = I([[Integer(1), Integer(1), Integer(0), Integer(0)],␣
↪[Integer(1), Integer(1), Integer(0)], [Integer(1), Integer(0)],␣
↪[Integer(1)]])
>>> elt.weight()
(1, 0, 1, 0)
```

cardinality()

Return the cardinality of `self`.

EXAMPLES:

```
sage: P = Permutations(4)
sage: D = crystals.Tableaux(['A',3], shapes=Partitions(4))
sage: T = crystals.TensorProduct(D, D)
sage: phi = lambda p: T(D(RSK(p)[0]), D(RSK(p)[1]))
sage: phi_inv = lambda d: RSK_inverse(d[0].to_tableau(), d[1].to_tableau(),␣
↪output='permutation')
sage: I = crystals.Induced(P, phi, phi_inv)
sage: I.cardinality() == factorial(4)
True
```

```
>>> from sage.all import *
>>> P = Permutations(Integer(4))
>>> D = crystals.Tableaux(['A',Integer(3)], shapes=Partitions(Integer(4)))
>>> T = crystals.TensorProduct(D, D)
>>> phi = lambda p: T(D(RSK(p)[Integer(0)]), D(RSK(p)[Integer(1)]))
>>> phi_inv = lambda d: RSK_inverse(d[Integer(0)].to_tableau(), d[Integer(1)].
↪to_tableau(), output='permutation')
>>> I = crystals.Induced(P, phi, phi_inv)
>>> I.cardinality() == factorial(Integer(4))
True
```

class sage.combinat.crystals.induced_structure.**InducedFromCrystal**(*X*, *phi*, *inverse*)

Bases: UniqueRepresentation, Parent

A crystal induced from an injection.

Alternatively we can induce a crystal structure on some (sub)set of X by considering an injection $\Phi : C \to X$ considered as a crystal morphism.

See also

InducedCrystal

INPUT:

- X – the base set
- phi – the map Φ
- inverse – (optional) the inverse map Φ^{-1}

EXAMPLES:

We construct a crystal structure on generalized permutations with a fixed first row by using RSK:

```
sage: C = crystals.Tableaux(['A',3], shape=[2,1])
sage: def psi(x):
....:     ret = RSK_inverse(x.to_tableau(), Tableau([[1,1],[2]]))
....:     return (tuple(ret[0]), tuple(ret[1]))
sage: psi_inv = lambda x: C(RSK(*x)[0])
sage: I = crystals.Induced(C, psi, psi_inv, from_crystal=True)
```

```
>>> from sage.all import *
>>> C = crystals.Tableaux(['A',Integer(3)], shape=[Integer(2),Integer(1)])
>>> def psi(x):
```

(continues on next page)

(continued from previous page)

```
...     ret = RSK_inverse(x.to_tableau(), Tableau([[Integer(1),Integer(1)],
↪[Integer(2)]]))
...     return (tuple(ret[Integer(0)]), tuple(ret[Integer(1)]))
>>> psi_inv = lambda x: C(RSK(*x)[Integer(0)])
>>> I = crystals.Induced(C, psi, psi_inv, from_crystal=True)
```

class Element

Bases: `ElementWrapper`

An element of an induced crystal.

e(*i*)

Return e_i of `self`.

EXAMPLES:

```
sage: D = crystals.Tableaux(['A',3], shapes=PartitionsInBox(4,1))
sage: G = GelfandTsetlinPatterns(4, 1)
sage: def phi(x): return G(x.to_tableau())
sage: def phi_inv(x): return D(G(x).to_tableau())
sage: I = crystals.Induced(D, phi, phi_inv, from_crystal=True)
sage: elt = I([[1, 1, 0, 0], [1, 1, 0], [1, 0], [1]])
sage: elt.e(1)
sage: elt.e(2)
[[1, 1, 0, 0], [1, 1, 0], [1, 1], [1]]
sage: elt.e(3)
```

```
>>> from sage.all import *
>>> D = crystals.Tableaux(['A',Integer(3)],␣
↪shapes=PartitionsInBox(Integer(4),Integer(1)))
>>> G = GelfandTsetlinPatterns(Integer(4), Integer(1))
>>> def phi(x): return G(x.to_tableau())
>>> def phi_inv(x): return D(G(x).to_tableau())
>>> I = crystals.Induced(D, phi, phi_inv, from_crystal=True)
>>> elt = I([[Integer(1), Integer(1), Integer(0), Integer(0)],␣
↪[Integer(1), Integer(1), Integer(0)], [Integer(1), Integer(0)],␣
↪[Integer(1)]])
>>> elt.e(Integer(1))
>>> elt.e(Integer(2))
[[1, 1, 0, 0], [1, 1, 0], [1, 1], [1]]
>>> elt.e(Integer(3))
```

epsilon(*i*)

Return ε_i of `self`.

EXAMPLES:

```
sage: D = crystals.Tableaux(['A',3], shapes=PartitionsInBox(4,1))
sage: G = GelfandTsetlinPatterns(4, 1)
sage: def phi(x): return G(x.to_tableau())
sage: def phi_inv(x): return D(G(x).to_tableau())
sage: I = crystals.Induced(D, phi, phi_inv, from_crystal=True)
sage: elt = I([[1, 1, 0, 0], [1, 1, 0], [1, 0], [1]])
```

(continues on next page)

(continued from previous page)

```
sage: [elt.epsilon(i) for i in I.index_set()]
[0, 1, 0]
```

```
>>> from sage.all import *
>>> D = crystals.Tableaux(['A',Integer(3)],␣
↪shapes=PartitionsInBox(Integer(4),Integer(1)))
>>> G = GelfandTsetlinPatterns(Integer(4), Integer(1))
>>> def phi(x): return G(x.to_tableau())
>>> def phi_inv(x): return D(G(x).to_tableau())
>>> I = crystals.Induced(D, phi, phi_inv, from_crystal=True)
>>> elt = I([[Integer(1), Integer(1), Integer(0), Integer(0)],␣
↪[Integer(1), Integer(1), Integer(0)], [Integer(1), Integer(0)],␣
↪[Integer(1)]])
>>> [elt.epsilon(i) for i in I.index_set()]
[0, 1, 0]
```

f (*i*)

Return f_i of `self`.

EXAMPLES:

```
sage: D = crystals.Tableaux(['A',3], shapes=PartitionsInBox(4,1))
sage: G = GelfandTsetlinPatterns(4, 1)
sage: def phi(x): return G(x.to_tableau())
sage: def phi_inv(x): return D(G(x).to_tableau())
sage: I = crystals.Induced(D, phi, phi_inv, from_crystal=True)
sage: elt = I([[1, 1, 0, 0], [1, 1, 0], [1, 0], [1]])
sage: elt.f(1)
[[1, 1, 0, 0], [1, 1, 0], [1, 0], [0]]
sage: elt.f(2)
sage: elt.f(3)
[[1, 1, 0, 0], [1, 0, 0], [1, 0], [1]]
```

```
>>> from sage.all import *
>>> D = crystals.Tableaux(['A',Integer(3)],␣
↪shapes=PartitionsInBox(Integer(4),Integer(1)))
>>> G = GelfandTsetlinPatterns(Integer(4), Integer(1))
>>> def phi(x): return G(x.to_tableau())
>>> def phi_inv(x): return D(G(x).to_tableau())
>>> I = crystals.Induced(D, phi, phi_inv, from_crystal=True)
>>> elt = I([[Integer(1), Integer(1), Integer(0), Integer(0)],␣
↪[Integer(1), Integer(1), Integer(0)], [Integer(1), Integer(0)],␣
↪[Integer(1)]])
>>> elt.f(Integer(1))
[[1, 1, 0, 0], [1, 1, 0], [1, 0], [0]]
>>> elt.f(Integer(2))
>>> elt.f(Integer(3))
[[1, 1, 0, 0], [1, 0, 0], [1, 0], [1]]
```

phi (*i*)

Return φ_i of `self`.

EXAMPLES:

```
sage: D = crystals.Tableaux(['A',3], shapes=PartitionsInBox(4,1))
sage: G = GelfandTsetlinPatterns(4, 1)
sage: def phi(x): return G(x.to_tableau())
sage: def phi_inv(x): return D(G(x).to_tableau())
sage: I = crystals.Induced(D, phi, phi_inv, from_crystal=True)
sage: elt = I([[1, 1, 0, 0], [1, 1, 0], [1, 0], [1]])
sage: [elt.epsilon(i) for i in I.index_set()]
[0, 1, 0]
```

```
>>> from sage.all import *
>>> D = crystals.Tableaux(['A',Integer(3)],␣
↪shapes=PartitionsInBox(Integer(4),Integer(1)))
>>> G = GelfandTsetlinPatterns(Integer(4), Integer(1))
>>> def phi(x): return G(x.to_tableau())
>>> def phi_inv(x): return D(G(x).to_tableau())
>>> I = crystals.Induced(D, phi, phi_inv, from_crystal=True)
>>> elt = I([[Integer(1), Integer(1), Integer(0), Integer(0)],␣
↪[Integer(1), Integer(1), Integer(0)], [Integer(1), Integer(0)],␣
↪[Integer(1)]])
>>> [elt.epsilon(i) for i in I.index_set()]
[0, 1, 0]
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: D = crystals.Tableaux(['A',3], shapes=PartitionsInBox(4,1))
sage: G = GelfandTsetlinPatterns(4, 1)
sage: def phi(x): return G(x.to_tableau())
sage: def phi_inv(x): return D(G(x).to_tableau())
sage: I = crystals.Induced(D, phi, phi_inv, from_crystal=True)
sage: elt = I([[1, 1, 0, 0], [1, 1, 0], [1, 0], [1]])
sage: elt.weight()
(1, 0, 1, 0)
```

```
>>> from sage.all import *
>>> D = crystals.Tableaux(['A',Integer(3)],␣
↪shapes=PartitionsInBox(Integer(4),Integer(1)))
>>> G = GelfandTsetlinPatterns(Integer(4), Integer(1))
>>> def phi(x): return G(x.to_tableau())
>>> def phi_inv(x): return D(G(x).to_tableau())
>>> I = crystals.Induced(D, phi, phi_inv, from_crystal=True)
>>> elt = I([[Integer(1), Integer(1), Integer(0), Integer(0)],␣
↪[Integer(1), Integer(1), Integer(0)], [Integer(1), Integer(0)],␣
↪[Integer(1)]])
>>> elt.weight()
(1, 0, 1, 0)
```

cardinality()

Return the cardinality of `self`.

EXAMPLES:

```
sage: C = crystals.Tableaux(['A',3], shape=[2,1])
sage: def psi(x):
....:     ret = RSK_inverse(x.to_tableau(), Tableau([[1,1],[2]]))
....:     return (tuple(ret[0]), tuple(ret[1]))
sage: psi_inv = lambda x: C(RSK(*x)[0])
sage: I = crystals.Induced(C, psi, psi_inv, from_crystal=True)
sage: I.cardinality() == C.cardinality()
True
```

```
>>> from sage.all import *
>>> C = crystals.Tableaux(['A',Integer(3)], shape=[Integer(2),Integer(1)])
>>> def psi(x):
...     ret = RSK_inverse(x.to_tableau(), Tableau([[Integer(1),Integer(1)],
↪[Integer(2)]]))
...     return (tuple(ret[Integer(0)]), tuple(ret[Integer(1)]))
>>> psi_inv = lambda x: C(RSK(*x)[Integer(0)])
>>> I = crystals.Induced(C, psi, psi_inv, from_crystal=True)
>>> I.cardinality() == C.cardinality()
True
```

5.1.53 $\mathcal{B}(\infty)$ Crystals of Tableaux in Nonexceptional Types and G_2

A tableau model for $\mathcal{B}(\infty)$. For more information, see *InfinityCrystalOfTableaux*.

AUTHORS:

- Ben Salisbury: Initial version
- Travis Scrimshaw: Initial version

class sage.combinat.crystals.infinity_crystals.**DualInfinityQueerCrystalOfTableaux**(*cartan_type*)

Bases: *CrystalOfWords*

Initialize self.

EXAMPLES:

```
sage: B = crystals.infinity.Tableaux(['A',2])
sage: TestSuite(B).run() # long time
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux(['A',Integer(2)])
>>> TestSuite(B).run() # long time
```

class Element

Bases: *InfinityQueerCrystalOfTableauxElement*

index_set()

Return the index set of self.

EXAMPLES:

```
sage: B = crystals.infinity.Tableaux(["Q",3])
sage: B.index_set()
(1, 2, -1)
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux(["Q",Integer(3)])
>>> B.index_set()
(1, 2, -1)
```

module_generator()

Return the module generator (or highest weight element) of `self`.

The module generator is the unique semistandard hook tableau of shape $(n, n-1, \ldots, 2, 1)$ with weight 0.

EXAMPLES:

```
sage: B = crystals.infinity.Tableaux(["Q",5])
sage: B.module_generator()
[[5, 5, 5, 5, 5], [4, 4, 4, 4], [3, 3, 3], [2, 2], [1]]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux(["Q",Integer(5)])
>>> B.module_generator()
[[5, 5, 5, 5, 5], [4, 4, 4, 4], [3, 3, 3], [2, 2], [1]]
```

class sage.combinat.crystals.infinity_crystals.**InfinityCrystalOfTableaux**(*cartan_type*)

Bases: *CrystalOfWords*

$\mathcal{B}(\infty)$ crystal of tableaux.

A tableaux model $\mathcal{T}(\infty)$ for the crystal $\mathcal{B}(\infty)$ is introduced by Hong and Lee in [HL2008]. This model is currently valid for types A_n, B_n, C_n, D_n, and G_2, and builds on the tableaux model given by Kashiwara and Nakashima [KN1994] in types A_n, B_n, C_n, and D_n, and by Kang and Misra [KM1994] in type G_2.

Note

We are using the English convention for our tableaux.

We say a tableau T is *marginally large* if:

- for each $1 \leq i \leq n$, the leftmost box in the i-th row from the top in T is an i-box,
- for each $1 \leq i \leq n$, the number of i-boxes in the i-th row from the top in T is greater than the total number of boxes in the $(i+1)$-th row by exactly one.

We now will describe this tableaux model type-by-type.

Type A_n

$\mathcal{T}(\infty)$ is the set of marginally large semistandard tableaux with exactly n rows over the alphabet $\{1 \prec 2 \prec \cdots \prec n+1\}$.

Type B_n

$\mathcal{T}(\infty)$ is the set of marginally large semistandard tableaux with exactly n rows over the alphabet $\{1 \prec \cdots \prec n \prec 0 \prec \overline{n} \prec \cdots \prec \overline{1}\}$ and subject to the following constraints:

- for each $1 \leq i \leq n$, the contents of the boxes in the i-th row are $\preceq \overline{i}$,
- the entry 0 can appear at most once in a single row.

Type C_n

$\mathcal{T}(\infty)$ is the set of marginally large semistandard tableaux with exactly n rows over the alphabet $\{1 \prec \cdots \prec n \prec \overline{n} \prec \cdots \prec \overline{1}\}$ and for each $1 \leq i \leq n$, the contents of the boxes in the i-th row are $\preceq \overline{i}$.

Type D_n

$\mathcal{T}(\infty)$ is the set of marginally large semistandard tableaux with exactly $n-1$ rows over the alphabet $\{1 \prec \cdots \prec n, \overline{n} \prec \cdots \prec \overline{1}\}$ and subject to the following constraints:

- for each $1 \leq i \leq n$, the contents of the boxes in the i-th row are $\preceq \overline{i}$,
- the entries n and $\overline{n}$ may not appear simultaneously in a single row.

Type G_2

$\mathcal{T}(\infty)$ is the set of marginally large semistandard tableaux with exactly 2 rows over the ordered alphabet $\{1 \prec 2 \prec 3 \prec 0 \prec \overline{3} \prec \overline{2} \prec \overline{1}\}$ and subject to the following constraints:

- the contents of the boxes in the first row are $\preceq \overline{i}$,
- the contents of the boxes in the second row are $\preceq 3$,
- the entry 0 can appear at most once in the first row and not at all in the second row.

In particular, the shape of the tableaux is not fixed in any instance of $\mathcal{T}(\infty)$; the row lengths of a tableau can be arbitrarily long.

INPUT:

- `cartan_type` – one of `['A',n]`, `['B',n]`, `['C',n]`, `['D',n]`, or `['G',2]`, where `n` is a positive integer

EXAMPLES:

```
sage: B = crystals.infinity.Tableaux(['A',2])
sage: b = B.highest_weight_vector(); b.pp()
1  1
2
sage: b.f_string([2,1,1,2,2,2]).pp()
1  1  1  1  1  2  3
2  3  3  3

sage: B = crystals.infinity.Tableaux(['G',2])
sage: b = B(rows=[[1,1,1,1,1,2,3,3,0,-3,-1,-1,-1],[2,3,3,3]])
sage: b.e_string([2,1,1,1,1,1,1]).pp()
1  1  1  1  2  3  3  3  3 -2 -2 -2
2  3  3
sage: b.e_string([2,1,1,1,1,1,1,1])
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux(['A',Integer(2)])
>>> b = B.highest_weight_vector(); b.pp()
1  1
2
>>> b.f_string([Integer(2),Integer(1),Integer(1),Integer(2),Integer(2),
↪Integer(2)]).pp()
1  1  1  1  1  2  3
2  3  3  3
```

(continues on next page)

(continued from previous page)

```
>>> B = crystals.infinity.Tableaux(['G',Integer(2)])
>>> b = B(rows=[[Integer(1),Integer(1),Integer(1),Integer(1),Integer(1),
↪Integer(2),Integer(3),Integer(3),Integer(0),-Integer(3),-Integer(1),-Integer(1),
↪-Integer(1)],[Integer(2),Integer(3),Integer(3),Integer(3)]])
>>> b.e_string([Integer(2),Integer(1),Integer(1),Integer(1),Integer(1),Integer(1),
↪Integer(1)]).pp()
1  1  1  1  2  3  3  3  3 -2 -2 -2
2  3  3
>>> b.e_string([Integer(2),Integer(1),Integer(1),Integer(1),Integer(1),Integer(1),
↪Integer(1),Integer(1)])
```

We check that a few classical crystals embed into $\mathcal{T}(\infty)$:

```
sage: def crystal_test(B, C):
....:     T = crystals.elementary.T(C.cartan_type(), C.module_generators[0].
↪weight())
....:     TP = crystals.TensorProduct(T, B)

```

class Element

Bases: *InfinityCrystalOfTableauxElement*

Elements in $\mathcal{B}(\infty)$ crystal of tableaux.

content()

Return the content of `self`.

The content $|T|$ of $T \in \mathcal{B}(\infty)$ is the number of blocks added to the highest weight to obtain T with any $\bar{\imath}$-boxes in the i-th row counted with multiplicity 2 provided the underlying Cartan type is of type B, D, or G.

EXAMPLES:

```
sage: B = crystals.infinity.Tableaux("D5")
sage: b = B.highest_weight_vector().f_string([5,4,3,1,1,3,4,5,3,4,5,1,4,5,
↪2,3,5,3,2,4])
sage: b.content()
13

sage: B = crystals.infinity.Tableaux("B2")
sage: b = B(rows=[[1,1,1,1,1,1,2,2,2,-2,-2],[2,0,-2,-2,-2]])
sage: b.content()
12

sage: B = crystals.infinity.Tableaux("C2")
sage: b = B(rows=[[1,1,1,1,1,1,2,2,2,-2,-2],[2,-2,-2,-2]])
sage: b.content()
8
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux("D5")
>>> b = B.highest_weight_vector().f_string([Integer(5),Integer(4),
↪Integer(3),Integer(1),Integer(1),Integer(3),Integer(4),Integer(5),
↪Integer(3),Integer(4),Integer(5),Integer(1),Integer(4),Integer(5),
↪Integer(2),Integer(3),Integer(5),Integer(3),Integer(2),Integer(4)])
>>> b.content()
13

>>> B = crystals.infinity.Tableaux("B2")
>>> b = B(rows=[[Integer(1),Integer(1),Integer(1),Integer(1),Integer(1),
↪Integer(1),Integer(2),Integer(2),Integer(2),-Integer(2),-Integer(2)],
↪[Integer(2),Integer(0),-Integer(2),-Integer(2),-Integer(2)]])
>>> b.content()
12

>>> B = crystals.infinity.Tableaux("C2")
>>> b = B(rows=[[Integer(1),Integer(1),Integer(1),Integer(1),Integer(1),
↪Integer(1),Integer(2),Integer(2),Integer(2),-Integer(2),-Integer(2)],
↪[Integer(2),-Integer(2),-Integer(2),-Integer(2)]])
>>> b.content()
8
```

phi(*i*)

Return φ_i of `self`.

Let $T \in \mathcal{B}(\infty)$ Define $\varphi_i(T) := \varepsilon_i(T) + \langle h_i, \mathrm{wt}(T) \rangle$, where h_i is the i-th simple coroot and $\mathrm{wt}(T)$ is the `weight()` of T.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: B = crystals.infinity.Tableaux("A3")
sage: [B.highest_weight_vector().f_string([1,3,2,3,1,3,2,1]).phi(i) for i␣
↪in B.index_set()]
[-3, 4, -3]
```

(continues on next page)

(continued from previous page)

```
sage: B = crystals.infinity.Tableaux("G2")
sage: [B.highest_weight_vector().f_string([2,2,1,2,1,1,1,2]).phi(i) for i␣
↪in B.index_set()]
[5, -3]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux("A3")
>>> [B.highest_weight_vector().f_string([Integer(1),Integer(3),Integer(2),
↪Integer(3),Integer(1),Integer(3),Integer(2),Integer(1)]).phi(i) for i␣
↪in B.index_set()]
[-3, 4, -3]

>>> B = crystals.infinity.Tableaux("G2")
>>> [B.highest_weight_vector().f_string([Integer(2),Integer(2),Integer(1),
↪Integer(2),Integer(1),Integer(1),Integer(1),Integer(2)]).phi(i) for i␣
↪in B.index_set()]
[5, -3]
```

reduced_form()

Return the reduced form of `self`.

The reduced form of a tableaux $T \in \mathcal{T}(\infty)$ is the (not necessarily semistandard) tableaux obtained from T by removing all i-boxes in the i-th row, subject to the condition that if the row is empty, a $*$ is put as a placeholder. This is described in [BN2010] and [LS2012].

EXAMPLES:

```
sage: B = crystals.infinity.Tableaux(['A',3])
sage: b = B.highest_weight_vector().f_string([2,2,2,3,3,3,3,3])
sage: b.pp()
1  1  1  1  1  1  1  1
2  2  2  2  4  4  4
3  4  4
sage: b.reduced_form()
[['*'], [4, 4, 4], [4, 4]]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux(['A',Integer(3)])
>>> b = B.highest_weight_vector().f_string([Integer(2),Integer(2),
↪Integer(2),Integer(3),Integer(3),Integer(3),Integer(3),Integer(3)])
>>> b.pp()
1  1  1  1  1  1  1  1
2  2  2  2  4  4  4
3  4  4
>>> b.reduced_form()
[['*'], [4, 4, 4], [4, 4]]
```

seg()

Return the statistic seg of `self`.

More precisely, following [LS2012], define a k-segment of a tableau T in $\mathcal{B}(\infty)$ to be a maximal string of k-boxes in a single row of T. Set $\mathrm{seg}'(T)$ to be the number of k-segments in T, as k varies over all possible values. Then $\mathrm{seg}(T)$ is determined type-by-type.

- In types A_n and C_n, define $\mathrm{seg}(T) := \mathrm{seg}'(T)$.
- In types B_n and G_2, set $e(T)$ to be the number of rows in T which contain both a 0-box and an $\bar{\imath}$-box. Define $\mathrm{seg}(T) := \mathrm{seg}'(T) - e(T)$.
- In type D_n, set $d(T)$ to be the number of rows in T which contain an $\bar{\imath}$-box, but no n-box nor $\overline{n}$-box. Define $\mathrm{seg}(T) := \mathrm{seg}'(T) + d(T)$.

EXAMPLES:

```
sage: B = crystals.infinity.Tableaux(['A',3])
sage: b = B.highest_weight_vector().f_string([1,3,2,2,3,1,1,3])
sage: b.pp()
1  1  1  1  1  1  2  2  4
2  2  2  2  3
3  4  4
sage: b.seg()
4

sage: B = crystals.infinity.Tableaux(['D',4])
sage: b = B(rows=[[1,1,1,1,1,1,3,-2,-1],[2,2,2,4,-2],[3,3],[4]])
sage: b.pp()
1  1  1  1  1  1  3 -2 -1
2  2  2  4 -2
3  3
4
sage: b.seg()
6

sage: B = crystals.infinity.Tableaux(['G',2])
sage: b = B.highest_weight_vector().f_string([2,1,1,1,2,1,2,2,1,2,2,2,1,2,
↪2,1])
sage: b.pp()
1  1  1  1  1  1  1  1  2  3  0 -3
2  3  3  3  3  3  3
sage: b.seg()
5
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux(['A',Integer(3)])
>>> b = B.highest_weight_vector().f_string([Integer(1),Integer(3),
↪Integer(2),Integer(2),Integer(3),Integer(1),Integer(1),Integer(3)])
>>> b.pp()
1  1  1  1  1  1  2  2  4
2  2  2  2  3
3  4  4
>>> b.seg()
4

>>> B = crystals.infinity.Tableaux(['D',Integer(4)])
>>> b = B(rows=[[Integer(1),Integer(1),Integer(1),Integer(1),Integer(1),
↪Integer(1),Integer(3),-Integer(2),-Integer(1)],[Integer(2),Integer(2),
↪Integer(2),Integer(4),-Integer(2)],[Integer(3),Integer(3)],
↪[Integer(4)]])
>>> b.pp()
1  1  1  1  1  1  3 -2 -1
```

(continues on next page)

(continued from previous page)

```
2  2  2  4 -2
3  3
4
>>> b.seg()
6

>>> B = crystals.infinity.Tableaux(['G',Integer(2)])
>>> b = B.highest_weight_vector().f_string([Integer(2),Integer(1),
↪Integer(1),Integer(1),Integer(2),Integer(1),Integer(2),Integer(2),
↪Integer(1),Integer(2),Integer(2),Integer(2),Integer(1),Integer(2),
↪Integer(2),Integer(1)])
>>> b.pp()
1  1  1  1  1  1  1  1  2  3  0 -3
2  3  3  3  3  3  3
>>> b.seg()
5
```

weight()

Return the weight of `self`.

From the definition of a crystal and that the highest weight element b_∞ of $\mathcal{B}(\infty)$ is 0, the weight of $T \in \mathcal{B}(\infty)$ can be defined as $\mathrm{wt}(T) := -\sum_j \alpha_{i_j}$ where $\widetilde{e}_{i_1} \cdots \widetilde{e}_{i_\ell} T = b_\infty$ and $\{\alpha_i\}$ is the set of simple roots. (Note that the weight is independent of the path chosen to get to the highest weight.)

However we can also take advantage of the fact that $\rho \colon R_\lambda \otimes \mathcal{B}(\infty) \longrightarrow B(\lambda)$, where λ is the shape of T, preserves the tableau representation of T. Therefore

$$\mathrm{wt}(T) = \mathrm{wt}\bigl(\rho(T)\bigr) - \lambda$$

where $\mathrm{wt}\bigl(\rho(T)\bigr)$ is just the usual weight of the tableau T.

Let Λ_i be the i-th fundamental weight. In type D, the height $n-1$ columns corresponds to $\Lambda_{n-1} + \Lambda_n$ and the in type B, the height n columns corresponds to $2\Lambda_n$.

EXAMPLES:

```
sage: B = crystals.infinity.Tableaux("C7")
sage: b = B.highest_weight_vector().f_string([1,6,4,7,4,2,4,6,2,4,6,7,1,2,
↪4,7])
sage: b.weight()
(-2, -1, 3, -5, 5, -3, -3)
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux("C7")
>>> b = B.highest_weight_vector().f_string([Integer(1),Integer(6),
↪Integer(4),Integer(7),Integer(4),Integer(2),Integer(4),Integer(6),
↪Integer(2),Integer(4),Integer(6),Integer(7),Integer(1),Integer(2),
↪Integer(4),Integer(7)])
>>> b.weight()
(-2, -1, 3, -5, 5, -3, -3)
```

Check that the definitions agree:

```
sage: P = B.weight_lattice_realization()
sage: alpha = P.simple_roots()
sage: b.weight() == -2*alpha[1] - 3*alpha[2] - 5*alpha[4] - 3*alpha[6] -␣
↪3*alpha[7]
True
```

```
>>> from sage.all import *
>>> P = B.weight_lattice_realization()
>>> alpha = P.simple_roots()
>>> b.weight() == -Integer(2)*alpha[Integer(1)] -␣
↪Integer(3)*alpha[Integer(2)] - Integer(5)*alpha[Integer(4)] -␣
↪Integer(3)*alpha[Integer(6)] - Integer(3)*alpha[Integer(7)]
True
```

Check that it works for type B:

```
sage: B = crystals.infinity.Tableaux("B2")
sage: B.highest_weight_vector().weight()
(0, 0)
sage: b = B.highest_weight_vector().f_string([1,2,2,2,1,2])
sage: P = B.weight_lattice_realization()
sage: alpha = P.simple_roots()
sage: b.weight() == -2*alpha[1] - 4*alpha[2]
True
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux("B2")
>>> B.highest_weight_vector().weight()
(0, 0)
>>> b = B.highest_weight_vector().f_string([Integer(1),Integer(2),
↪Integer(2),Integer(2),Integer(1),Integer(2)])
>>> P = B.weight_lattice_realization()
>>> alpha = P.simple_roots()
>>> b.weight() == -Integer(2)*alpha[Integer(1)] -␣
↪Integer(4)*alpha[Integer(2)]
True
```

Check that it works for type D:

```
sage: B = crystals.infinity.Tableaux("D4")
sage: B.highest_weight_vector().weight()
(0, 0, 0, 0)
sage: b = B.highest_weight_vector().f_string([1,4,4,2,4,3,2,4,1,3,2,4])
sage: P = B.weight_lattice_realization()
sage: alpha = P.simple_roots()
sage: b.weight() == -2*alpha[1] - 3*alpha[2] - 2*alpha[3] - 5*alpha[4]
True
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux("D4")
>>> B.highest_weight_vector().weight()
(0, 0, 0, 0)
```

(continues on next page)

(continued from previous page)

```
>>> b = B.highest_weight_vector().f_string([Integer(1),Integer(4),
↪Integer(4),Integer(2),Integer(4),Integer(3),Integer(2),Integer(4),
↪Integer(1),Integer(3),Integer(2),Integer(4)])
>>> P = B.weight_lattice_realization()
>>> alpha = P.simple_roots()
>>> b.weight() == -Integer(2)*alpha[Integer(1)] -␣
↪Integer(3)*alpha[Integer(2)] - Integer(2)*alpha[Integer(3)] -␣
↪Integer(5)*alpha[Integer(4)]
True
```

module_generator()

Return the module generator (or highest weight element) of `self`.

The module generator is the unique tableau of shape $(n, n-1, \ldots, 2, 1)$ with weight 0.

EXAMPLES:

```
sage: T = crystals.infinity.Tableaux(['A',3])
sage: T.module_generator()
[[1, 1, 1], [2, 2], [3]]
```

```
>>> from sage.all import *
>>> T = crystals.infinity.Tableaux(['A',Integer(3)])
>>> T.module_generator()
[[1, 1, 1], [2, 2], [3]]
```

class sage.combinat.crystals.infinity_crystals.**InfinityCrystalOfTableauxTypeD**(*cartan_type*)

Bases: *InfinityCrystalOfTableaux*

$\mathcal{B}(\infty)$ crystal of tableaux for type D_n.

This is the set $\mathcal{T}(\infty)$ of marginally large semistandard tableaux with exactly $n-1$ rows over the alphabet $\{1 \prec \cdots \prec n, \overline{n} \prec \cdots \prec \overline{1}\}$ and subject to the following constraints:

- for each $1 \leq i \leq n$, the contents of the boxes in the i-th row are $\preceq \overline{i}$,
- the entries n and $\overline{n}$ may not appear simultaneously in a single row.

For more information, see *InfinityCrystalOfTableaux*.

EXAMPLES:

```
sage: B = crystals.infinity.Tableaux("D4")
sage: b = B.highest_weight_vector().f_string([4,3,2,1,4])
sage: b.pp()
1  1  1  1  1  1  2
2  2  2  2  3
3 -4 -3
sage: b.weight()
(-1, 0, -2, -1)
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux("D4")
>>> b = B.highest_weight_vector().f_string([Integer(4),Integer(3),Integer(2),
```

(continues on next page)

(continued from previous page)

```
↪Integer(1),Integer(4)])
>>> b.pp()
1  1  1  1  1  1  2
2  2  2  2  3
3 -4 -3
>>> b.weight()
(-1, 0, -2, -1)
```

class Element

Bases: *InfinityCrystalOfTableauxElementTypeD*, *Element*

Elements in $\mathcal{B}(\infty)$ crystal of tableaux for type D_n.

module_generator()

Return the module generator (or highest weight element) of `self`.

The module generator is the unique tableau of shape $(n-1,\ldots,2,1)$ with weight 0.

EXAMPLES:

```
sage: T = crystals.infinity.Tableaux(['D',4])
sage: T.module_generator()
[[1, 1, 1], [2, 2], [3]]
```

```
>>> from sage.all import *
>>> T = crystals.infinity.Tableaux(['D',Integer(4)])
>>> T.module_generator()
[[1, 1, 1], [2, 2], [3]]
```

5.1.54 Crystals of Kac modules of the general-linear Lie superalgebra

class sage.combinat.crystals.kac_modules.**CrystalOfKacModule**(*cartan_type*, *la*, *mu*)

Bases: `UniqueRepresentation`, `Parent`

Crystal of a Kac module.

Let $\mathfrak{g}$ be the general linear Lie superalgebra $\mathfrak{gl}(m|n)$. Let λ and μ be dominant weights for $\mathfrak{gl}_m$ and $\mathfrak{gl}_n$, respectively. Let K be the module $K = \langle f_\alpha \rangle$, where α ranges over all odd positive roots. A *Kac module* is the $U_q(\mathfrak{g})$-module constructed from the highest weight $U_q(\mathfrak{gl}_m \oplus \mathfrak{gl}_n)$-module $V(\lambda,\mu)$ (induced to a $U_q(\mathfrak{g})$-module in the natural way) by

$$K(\lambda,\mu) := K \otimes_L V(\lambda,\mu),$$

where L is the subalgebra generated by e_0 and $U_q(\mathfrak{gl}_m \oplus \mathfrak{gl}_n)$.

The Kac module admits a $U_q(\mathfrak{g})$-crystal structure by taking the crystal structure of K as given by *CrystalOfOddNegativeRoots* and the crystal $B(\lambda,\mu)$ (the natural crystal structure of $V(\lambda,\mu)$).

Note

Our notation differs slightly from [Kwon2012] in that our last tableau is transposed.

EXAMPLES:

```
sage: K = crystals.KacModule(['A', [1,2]], [2], [1,1])
sage: K.cardinality()
576
sage: K.cardinality().factor()
2^6 * 3^2
sage: len(K.cartan_type().root_system().ambient_space().positive_odd_roots())
6
sage: mg = K.module_generator()
sage: mg
({}, [[-2, -2]], [[1], [2]])
sage: mg.weight()
(2, 0, 1, 1, 0)
sage: mg.f(-1)
({}, [[-2, -1]], [[1], [2]])
sage: mg.f(0)
({-e[-1]+e[1]}, [[-2, -2]], [[1], [2]])
sage: mg.f(1)
sage: mg.f(2)
({}, [[-2, -2]], [[1], [3]])

sage: sorted(K.highest_weight_vectors(), key=str)
[({-e[-1]+e[3]}, [[-2, -1]], [[1], [2]]),
 ({-e[-1]+e[3]}, [[-2, -2]], [[1], [2]]),
 ({}, [[-2, -2]], [[1], [2]])]
```

```
>>> from sage.all import *
>>> K = crystals.KacModule(['A', [Integer(1),Integer(2)]], [Integer(2)],
↪[Integer(1),Integer(1)])
>>> K.cardinality()
576
>>> K.cardinality().factor()
2^6 * 3^2
>>> len(K.cartan_type().root_system().ambient_space().positive_odd_roots())
6
>>> mg = K.module_generator()
>>> mg
({}, [[-2, -2]], [[1], [2]])
>>> mg.weight()
(2, 0, 1, 1, 0)
>>> mg.f(-Integer(1))
({}, [[-2, -1]], [[1], [2]])
>>> mg.f(Integer(0))
({-e[-1]+e[1]}, [[-2, -2]], [[1], [2]])
>>> mg.f(Integer(1))
>>> mg.f(Integer(2))
({}, [[-2, -2]], [[1], [3]])

>>> sorted(K.highest_weight_vectors(), key=str)
[({-e[-1]+e[3]}, [[-2, -1]], [[1], [2]]),

 ({-e[-1]+e[2]}, [[-2, -2]], [[1]]),
 ({}, [[-2, -2]], [[1]])]
>>> K.genuine_lowest_weight_vectors()
(({-e[-2]+e[1], -e[-2]+e[2], -e[-1]+e[1], -e[-1]+e[2]}, [[-1, -1]], [[2]]),)
>>> sorted(K.lowest_weight_vectors(), key=str)
[({-e[-1]+e[1], -e[-1]+e[2]}, [[-1, -1]], [[2]]),
 ({-e[-2]+e[1], -e[-2]+e[2], -e[-1]+e[1], -e[-1]+e[2]}, [[-1, -1]], [[2]]),
 ({-e[-2]+e[2], -e[-1]+e[1], -e[-1]+e[2]}, [[-1, -1]], [[1]]),
 ({-e[-2]+e[2], -e[-1]+e[1], -e[-1]+e[2]}, [[-1, -1]], [[2]])]
```

REFERENCES:

- [Kwon2012]

class Element

Bases: `ElementWrapper`

An element of a Kac module crystal.

e(i)

Return the action of the crystal operator e_i on `self`.

EXAMPLES:

```
sage: K = crystals.KacModule(['A', [2,2]], [2,1], [1])
sage: mg = K.module_generator()
sage: mg.e(0)
sage: mg.e(1)
sage: mg.e(-1)
sage: b = mg.f_string([1,0,1,-1,-2,0,1,2,0,-2,-1,-1,-1]); b
({-e[-3]+e[2], -e[-2]+e[1], -e[-2]+e[2]}, [[-3, -1], [-2]], [[3]])
sage: b.e(-2)
sage: b.e(-1)
({-e[-3]+e[2], -e[-2]+e[1], -e[-2]+e[2]}, [[-3, -2], [-2]], [[3]])
sage: b.e(0)
sage: b.e(1)
({-e[-3]+e[1], -e[-2]+e[1], -e[-2]+e[2]}, [[-3, -1], [-2]], [[3]])
sage: b.e(2)
({-e[-3]+e[2], -e[-2]+e[1], -e[-2]+e[2]}, [[-3, -1], [-2]], [[2]])
```

```
>>> from sage.all import *
>>> K = crystals.KacModule(['A', [Integer(2),Integer(2)]], [Integer(2),
↪Integer(1)], [Integer(1)])
>>> mg = K.module_generator()
>>> mg.e(Integer(0))
>>> mg.e(Integer(1))
>>> mg.e(-Integer(1))
>>> b = mg.f_string([Integer(1),Integer(0),Integer(1),-Integer(1),-
↪Integer(2),Integer(0),Integer(1),Integer(2),Integer(0),-Integer(2),-
↪Integer(1),-Integer(1),-Integer(1)]); b
({-e[-3]+e[2], -e[-2]+e[1], -e[-2]+e[2]}, [[-3, -1], [-2]], [[3]])
>>> b.e(-Integer(2))
>>> b.e(-Integer(1))
({-e[-3]+e[2], -e[-2]+e[1], -e[-2]+e[2]}, [[-3, -2], [-2]], [[3]])
>>> b.e(Integer(0))
>>> b.e(Integer(1))
({-e[-3]+e[1], -e[-2]+e[1], -e[-2]+e[2]}, [[-3, -1], [-2]], [[3]])
>>> b.e(Integer(2))
({-e[-3]+e[2], -e[-2]+e[1], -e[-2]+e[2]}, [[-3, -1], [-2]], [[2]])
```

f(*i*)

Return the action of the crystal operator f_i on `self`.

EXAMPLES:

```
sage: K = crystals.KacModule(['A', [2,2]], [2,1], [1])
sage: mg = K.module_generator()
sage: mg.f(-2)
({}, [[-3, -2], [-2]], [[1]])
sage: mg.f(-1)
({}, [[-3, -3], [-1]], [[1]])
sage: mg.f(0)
({-e[-1]+e[1]}, [[-3, -3], [-2]], [[1]])
sage: mg.f(1)
({}, [[-3, -3], [-2]], [[2]])
sage: mg.f(2)
sage: b = mg.f_string([1,0,1,-1,-2,0,1,2,0,-2,-1,2,0]); b
```

(continues on next page)

(continued from previous page)

```
({-e[-3]+e[3], -e[-2]+e[1], -e[-1]+e[1], -e[-1]+e[2]},
 [[-3, -2], [-2]], [[3]])
```

```
>>> from sage.all import *
>>> K = crystals.KacModule(['A', [Integer(2),Integer(2)]], [Integer(2),
↪Integer(1)], [Integer(1)])
>>> mg = K.module_generator()
>>> mg.f(-Integer(2))
({}, [[-3, -2], [-2]], [[1]])
>>> mg.f(-Integer(1))
({}, [[-3, -3], [-1]], [[1]])
>>> mg.f(Integer(0))
({-e[-1]+e[1]}, [[-3, -3], [-2]], [[1]])
>>> mg.f(Integer(1))
({}, [[-3, -3], [-2]], [[2]])
>>> mg.f(Integer(2))
>>> b = mg.f_string([Integer(1),Integer(0),Integer(1),-Integer(1),-
↪Integer(2),Integer(0),Integer(1),Integer(2),Integer(0),-Integer(2),-
↪Integer(1),Integer(2),Integer(0)]); b
({-e[-3]+e[3], -e[-2]+e[1], -e[-1]+e[1], -e[-1]+e[2]},
 [[-3, -2], [-2]], [[3]])
```

weight()

Return weight of `self`.

EXAMPLES:

```
sage: K = crystals.KacModule(['A', [3,2]], [2,1], [5,1])
sage: mg = K.module_generator()
sage: mg.weight()
(2, 1, 0, 0, 5, 1, 0)
sage: mg.weight().is_dominant()
True
sage: mg.f(0).weight()
(2, 1, 0, -1, 6, 1, 0)
sage: b = mg.f_string([2,1,-3,-2,-1,1,1,0,-2,-1,2,1,1,1,0,2,-3,-2,-1])
sage: b.weight()
(0, 0, 0, 1, 1, 4, 3)
```

```
>>> from sage.all import *
>>> K = crystals.KacModule(['A', [Integer(3),Integer(2)]], [Integer(2),
↪Integer(1)], [Integer(5),Integer(1)])
>>> mg = K.module_generator()
>>> mg.weight()
(2, 1, 0, 0, 5, 1, 0)
>>> mg.weight().is_dominant()
True
>>> mg.f(Integer(0)).weight()
(2, 1, 0, -1, 6, 1, 0)
>>> b = mg.f_string([Integer(2),Integer(1),-Integer(3),-Integer(2),-
↪Integer(1),Integer(1),Integer(1),Integer(0),-Integer(2),-Integer(1),
↪Integer(2),Integer(1),Integer(1),Integer(1),Integer(0),Integer(2),-
```

(continues on next page)

(continued from previous page)

```
↪Integer(3),-Integer(2),-Integer(1)])
>>> b.weight()
(0, 0, 0, 1, 1, 4, 3)
```

module_generator()

Return the module generator of `self`.

EXAMPLES:

```
sage: K = crystals.KacModule(['A', [2,1]], [2,1], [1])
sage: K.module_generator()
({}, [[-3, -3], [-2]], [[1]])
```

```
>>> from sage.all import *
>>> K = crystals.KacModule(['A', [Integer(2),Integer(1)]], [Integer(2),
↪Integer(1)], [Integer(1)])
>>> K.module_generator()
({}, [[-3, -3], [-2]], [[1]])
```

class sage.combinat.crystals.kac_modules.**CrystalOfOddNegativeRoots**(*cartan_type*)

Bases: `UniqueRepresentation`, `Parent`

Crystal of the set of odd negative roots.

Let $\mathfrak{g}$ be the general-linear Lie superalgebra $\mathfrak{gl}(m|n)$. This is the crystal structure on the set of negative roots as given by [Kwon2012].

More specifically, this is the crystal basis of the subalgebra of $U_q^-(\mathfrak{g})$ generated by f_α, where α ranges over all odd positive roots. As $\mathbf{Q}(q)$-modules, we have

$$U_q^-(\mathfrak{g}) \cong K \otimes U_q^-(\mathfrak{gl}_m \oplus \mathfrak{gl}_n).$$

EXAMPLES:

```
sage: S = crystals.OddNegativeRoots(['A', [2,1]])
sage: mg = S.module_generator(); mg
{}
sage: mg.f(0)
{-e[-1]+e[1]}
sage: mg.f_string([0,-1,0,1,2,1,0])
{-e[-2]+e[3], -e[-1]+e[1], -e[-1]+e[2]}
```

```
>>> from sage.all import *
>>> S = crystals.OddNegativeRoots(['A', [Integer(2),Integer(1)]])
>>> mg = S.module_generator(); mg
{}
>>> mg.f(Integer(0))
{-e[-1]+e[1]}
>>> mg.f_string([Integer(0),-Integer(1),Integer(0),Integer(1),Integer(2),
↪Integer(1),Integer(0)])
{-e[-2]+e[3], -e[-1]+e[1], -e[-1]+e[2]}
```

class Element

Bases: `ElementWrapper`

An element of the crystal of odd negative roots.

e(*i*)

Return the action of the crystal operator e_i on `self`.

EXAMPLES:

```
sage: S = crystals.OddNegativeRoots(['A', [2,2]])
sage: mg = S.module_generator()
sage: mg.e(0)
sage: mg.e(1)
sage: b = mg.f_string([0,1,2,-1,0])
sage: b.e(-1)
sage: b.e(0)
{-e[-2]+e[3]}
sage: b.e(1)
sage: b.e(2)
{-e[-2]+e[2], -e[-1]+e[1]}
sage: b.e_string([2,1,0,-1,0])
{}
```

```
>>> from sage.all import *
>>> S = crystals.OddNegativeRoots(['A', [Integer(2),Integer(2)]])
>>> mg = S.module_generator()
>>> mg.e(Integer(0))
>>> mg.e(Integer(1))
>>> b = mg.f_string([Integer(0),Integer(1),Integer(2),-Integer(1),
↪Integer(0)])
>>> b.e(-Integer(1))
>>> b.e(Integer(0))
{-e[-2]+e[3]}
>>> b.e(Integer(1))
>>> b.e(Integer(2))
{-e[-2]+e[2], -e[-1]+e[1]}
>>> b.e_string([Integer(2),Integer(1),Integer(0),-Integer(1),Integer(0)])
{}
```

epsilon(*i*)

Return ε_i of `self`.

EXAMPLES:

```
sage: S = crystals.OddNegativeRoots(['A', [2,2]])
sage: mg = S.module_generator()
sage: [mg.epsilon(i) for i in S.index_set()]
[0, 0, 0, 0, 0]
sage: b = mg.f_string([0,1,0,-1,0,-1,-2,-2]); b
{-e[-3]+e[1], -e[-3]+e[2], -e[-1]+e[1]}
sage: [b.epsilon(i) for i in S.index_set()]
[2, 0, 1, 0, 0]
sage: b = mg.f_string([0,1,0,-1,0,-1,-2,-2,2,-1,0]); b
{-e[-3]+e[1], -e[-3]+e[3], -e[-2]+e[1], -e[-1]+e[1]}
sage: [b.epsilon(i) for i in S.index_set()]
[1, 0, 1, 0, 1]
```

```
>>> from sage.all import *
>>> S = crystals.OddNegativeRoots(['A', [Integer(2),Integer(2)]])
>>> mg = S.module_generator()
>>> [mg.epsilon(i) for i in S.index_set()]
[0, 0, 0, 0, 0]
>>> b = mg.f_string([Integer(0),Integer(1),Integer(0),-Integer(1),
↪Integer(0),-Integer(1),-Integer(2),-Integer(2)]); b
{-e[-3]+e[1], -e[-3]+e[2], -e[-1]+e[1]}
>>> [b.epsilon(i) for i in S.index_set()]
[2, 0, 1, 0, 0]
>>> b = mg.f_string([Integer(0),Integer(1),Integer(0),-Integer(1),
↪Integer(0),-Integer(1),-Integer(2),-Integer(2),Integer(2),-Integer(1),
↪Integer(0)]); b
{-e[-3]+e[1], -e[-3]+e[3], -e[-2]+e[1], -e[-1]+e[1]}
>>> [b.epsilon(i) for i in S.index_set()]
[1, 0, 1, 0, 1]
```

f(*i*)

Return the action of the crystal operator f_i on `self`.

EXAMPLES:

```
sage: S = crystals.OddNegativeRoots(['A', [2,2]])
sage: mg = S.module_generator()
sage: mg.f(0)
{-e[-1]+e[1]}
sage: mg.f(1)
sage: b = mg.f_string([0,1,2,-1,0]); b
{-e[-2]+e[3], -e[-1]+e[1]}
sage: b.f(-2)
{-e[-3]+e[3], -e[-1]+e[1]}
sage: b.f(-1)
sage: b.f(0)
sage: b.f(1)
{-e[-2]+e[3], -e[-1]+e[2]}
```

```
>>> from sage.all import *
>>> S = crystals.OddNegativeRoots(['A', [Integer(2),Integer(2)]])
>>> mg = S.module_generator()
>>> mg.f(Integer(0))
{-e[-1]+e[1]}
>>> mg.f(Integer(1))
>>> b = mg.f_string([Integer(0),Integer(1),Integer(2),-Integer(1),
↪Integer(0)]); b
{-e[-2]+e[3], -e[-1]+e[1]}
>>> b.f(-Integer(2))
{-e[-3]+e[3], -e[-1]+e[1]}
>>> b.f(-Integer(1))
>>> b.f(Integer(0))
>>> b.f(Integer(1))
{-e[-2]+e[3], -e[-1]+e[2]}
```

phi(*i*)

Return φ_i of `self`.

EXAMPLES:

```
sage: S = crystals.OddNegativeRoots(['A', [2,2]])
sage: mg = S.module_generator()
sage: [mg.phi(i) for i in S.index_set()]
[0, 0, 1, 0, 0]
sage: b = mg.f(0)
sage: [b.phi(i) for i in S.index_set()]
[0, 1, 0, 1, 0]
sage: b = mg.f_string([0,1,0,-1,0,-1]); b
{-e[-2]+e[1], -e[-2]+e[2], -e[-1]+e[1]}
sage: [b.phi(i) for i in S.index_set()]
[2, 0, 0, 1, 1]
```

```
>>> from sage.all import *
>>> S = crystals.OddNegativeRoots(['A', [Integer(2),Integer(2)]])
>>> mg = S.module_generator()
>>> [mg.phi(i) for i in S.index_set()]
[0, 0, 1, 0, 0]
>>> b = mg.f(Integer(0))
>>> [b.phi(i) for i in S.index_set()]
[0, 1, 0, 1, 0]
>>> b = mg.f_string([Integer(0),Integer(1),Integer(0),-Integer(1),
↪Integer(0),-Integer(1)]); b
{-e[-2]+e[1], -e[-2]+e[2], -e[-1]+e[1]}
>>> [b.phi(i) for i in S.index_set()]
[2, 0, 0, 1, 1]
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: S = crystals.OddNegativeRoots(['A', [2,2]])
sage: mg = S.module_generator()
sage: mg.weight()
(0, 0, 0, 0, 0, 0)
sage: mg.f_string([0,1,2,-1,-2]).weight()
(-1, 0, 0, 0, 0, 1)
sage: mg.f_string([0,1,2,-1,-2,0,1,0,2]).weight()
(-1, 0, -2, 1, 0, 2)
```

```
>>> from sage.all import *
>>> S = crystals.OddNegativeRoots(['A', [Integer(2),Integer(2)]])
>>> mg = S.module_generator()
>>> mg.weight()
(0, 0, 0, 0, 0, 0)
>>> mg.f_string([Integer(0),Integer(1),Integer(2),-Integer(1),-
↪Integer(2)]).weight()
(-1, 0, 0, 0, 0, 1)
>>> mg.f_string([Integer(0),Integer(1),Integer(2),-Integer(1),-Integer(2),
↪Integer(0),Integer(1),Integer(0),Integer(2)]).weight()
(-1, 0, -2, 1, 0, 2)
```

module_generator()

Return the module generator of `self`.

EXAMPLES:

```
sage: S = crystals.OddNegativeRoots(['A', [2,1]])
sage: S.module_generator()
{}
```

```
>>> from sage.all import *
>>> S = crystals.OddNegativeRoots(['A', [Integer(2),Integer(1)]])
>>> S.module_generator()
{}
```

sage.combinat.crystals.kac_modules.**latex_dual**(*elt*)

Return a latex representation of a type A_n crystal tableau `elt` expressed in terms of dual letters.

The dual letter of k is expressed as $\overline{n+2-k}$.

EXAMPLES:

```
sage: from sage.combinat.crystals.kac_modules import latex_dual
sage: T = crystals.Tableaux(['A',2], shape=[2,1])
sage: print(latex_dual(T[0]))
{\def\lr#1{\multicolumn{1}{|@{\hspace{.6ex}}c@{\hspace{.6ex}}|}{\raisebox{-.3ex}{$
↪#1$}}}
\raisebox{-.6ex}{$\begin{array}[b]{*{2}c}\cline{1-2}
\lr{\overline{3}}&\lr{\overline{3}}\\\cline{1-2}
\lr{\overline{2}}\\\cline{1-1}
\end{array}$}
}
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.kac_modules import latex_dual
>>> T = crystals.Tableaux(['A',Integer(2)], shape=[Integer(2),Integer(1)])
>>> print(latex_dual(T[Integer(0)]))
{\def\lr#1{\multicolumn{1}{|@{\hspace{.6ex}}c@{\hspace{.6ex}}|}{\raisebox{-.3ex}{$
↪#1$}}}
\raisebox{-.6ex}{$\begin{array}[b]{*{2}c}\cline{1-2}
\lr{\overline{3}}&\lr{\overline{3}}\\\cline{1-2}
\lr{\overline{2}}\\\cline{1-1}
\end{array}$}
}
```

sage.combinat.crystals.kac_modules.**to_dual_tableau**(*elt*)

Return a type A_n crystal tableau `elt` as a tableau expressed in terms of dual letters.

The dual letter of k is expressed as $\overline{n+2-k}$ represented as $-(n+2-k)$.

EXAMPLES:

```
sage: from sage.combinat.crystals.kac_modules import to_dual_tableau
sage: T = crystals.Tableaux(['A',2], shape=[2,1])
sage: ascii_art([to_dual_tableau(t) for t in T])
[  -3 -3    -3 -2    -3 -1    -3 -1    -2 -1    -3 -3    -3 -2    -2 -2 ]
[  -2   ,   -2   ,   -2   ,   -1   ,   -1   ,   -1   ,   -1   ,   -1     ]
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.kac_modules import to_dual_tableau
>>> T = crystals.Tableaux(['A',Integer(2)], shape=[Integer(2),Integer(1)])
>>> ascii_art([to_dual_tableau(t) for t in T])
[  -3 -3   -3 -2   -3 -1   -3 -1   -2 -1   -3 -3   -3 -2   -2 -2 ]
[  -2    , -2    , -2    , -1    , -1    , -1    , -1    , -1     ]
```

5.1.55 Kirillov-Reshetikhin Crystals

class sage.combinat.crystals.kirillov_reshetikhin.**AmbientRetractMap**(*base*, *ambient*, *pdict_inv*, *index_set*, *similarity_factor_domain=None*, *automorphism=None*)

Bases: Map

The retraction map from the ambient crystal.

Consider a crystal embedding $\phi : X \to Y$, then the elements X can be considered as a subcrystal of the ambient crystal Y. The ambient retract is the partial map $\tilde{\phi} : Y \to X$ such that $\tilde{\phi} \circ \phi$ is the identity on X.

class sage.combinat.crystals.kirillov_reshetikhin.**CrystalDiagramAutomorphism**(*C*, *on_hw*, *index_set=None*, *automorphism=None*, *cache=True*)

Bases: CrystalMorphism

The crystal automorphism induced from the diagram automorphism.

For example, in type $A_n^{(1)}$ this is the promotion operator and in type $D_n^{(1)}$, this corresponds to the automorphism induced from interchanging the 0 and 1 nodes in the Dynkin diagram.

INPUT:

- C – a crystal
- on_hw – a function for the images of the index_set-highest weight elements
- index_set – (default: the empty set) the index set
- automorphism – (default: the identity) the twisting automorphism
- cache – boolean (default: True); cache the result

is_embedding()

Return True as self is a crystal isomorphism.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['A',3,1], 2,2)
sage: K.promotion().is_isomorphism()
True
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(3),Integer(1)], Integer(2),
↪Integer(2))
>>> K.promotion().is_isomorphism()
True
```

is_isomorphism()

Return `True` as `self` is a crystal isomorphism.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['A',3,1], 2,2)
sage: K.promotion().is_isomorphism()
True
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(3),Integer(1)], Integer(2),
↪Integer(2))
>>> K.promotion().is_isomorphism()
True
```

is_strict()

Return `True` as `self` is a crystal isomorphism.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['A',3,1], 2,2)
sage: K.promotion().is_isomorphism()
True
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(3),Integer(1)], Integer(2),
↪Integer(2))
>>> K.promotion().is_isomorphism()
True
```

is_surjective()

Return `True` as `self` is a crystal isomorphism.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['A',3,1], 2,2)
sage: K.promotion().is_isomorphism()
True
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(3),Integer(1)], Integer(2),
↪Integer(2))
>>> K.promotion().is_isomorphism()
True
```

class sage.combinat.crystals.kirillov_reshetikhin.**CrystalOfTableaux_E7**(*cartan_type*, *shapes*)

Bases: *CrystalOfTableaux*

The type E_7 crystal $B(s\Lambda_7)$.

This is a helper class for the corresponding:class:$KRcrystal < sage.combinat.crystals.kirillov_reshetikhin.KR_type_E7 >$ $B^{7,s}$.

module_generator(*shape*)

Return the module generator of `self` with shape `shape`.

Note

Only implemented for single rows (i.e., highest weight $s\Lambda_7$).

EXAMPLES:

```
sage: from sage.combinat.crystals.kirillov_reshetikhin import
↪CrystalOfTableaux_E7
sage: T = CrystalOfTableaux_E7(CartanType(['E',7]), shapes=(Partition([5]),))
sage: T.module_generator([5])
[[(7,), (7,), (7,), (7,), (7,)]]
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.kirillov_reshetikhin import CrystalOfTableaux_
↪E7
>>> T = CrystalOfTableaux_E7(CartanType(['E',Integer(7)]),
↪shapes=(Partition([Integer(5)]),))
>>> T.module_generator([Integer(5)])
[[(7,), (7,), (7,), (7,), (7,)]]
```

class sage.combinat.crystals.kirillov_reshetikhin.**KR_type_A**(*cartan_type*, *r*, *s*)

Bases: *KirillovReshetikhinCrystalFromPromotion*

Class of Kirillov-Reshetikhin crystals of type $A_n^{(1)}$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['A',3,1], 2,2)
sage: b = K(rows=[[1,2],[2,4]])
sage: b.f(0)
[[1, 1], [2, 2]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(3),Integer(1)], Integer(2),
↪Integer(2))
>>> b = K(rows=[[Integer(1),Integer(2)],[Integer(2),Integer(4)]])
>>> b.f(Integer(0))
[[1, 1], [2, 2]]
```

classical_decomposition()

Specifies the classical crystal underlying the KR crystal of type A.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['A',3,1], 2,2)
sage: K.classical_decomposition()
The crystal of tableaux of type ['A', 3] and shape(s) [[2, 2]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(3),Integer(1)], Integer(2),
↪Integer(2))
>>> K.classical_decomposition()
The crystal of tableaux of type ['A', 3] and shape(s) [[2, 2]]
```

dynkin_diagram_automorphism(i)

Specifies the Dynkin diagram automorphism underlying the promotion action on the crystal elements. The automorphism needs to map node 0 to some other Dynkin node.

For type A we use the Dynkin diagram automorphism which $i \mapsto i+1 \mod n+1$, where n is the rank.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['A',3,1], 2,2)
sage: K.dynkin_diagram_automorphism(0)
1
sage: K.dynkin_diagram_automorphism(3)
0
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(3),Integer(1)], Integer(2),
↪Integer(2))
>>> K.dynkin_diagram_automorphism(Integer(0))
1
>>> K.dynkin_diagram_automorphism(Integer(3))
0
```

promotion()

Specifies the promotion operator used to construct the affine type A crystal.

For type A this corresponds to the Dynkin diagram automorphism which $i \mapsto i+1 \mod n+1$, where n is the rank.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['A',3,1], 2,2)
sage: b = K.classical_decomposition()(rows=[[1,2],[3,4]])
sage: K.promotion()(b)
[[1, 3], [2, 4]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(3),Integer(1)], Integer(2),
↪Integer(2))
>>> b = K.classical_decomposition()(rows=[[Integer(1),Integer(2)],[Integer(3),
↪Integer(4)]])
>>> K.promotion()(b)
[[1, 3], [2, 4]]
```

promotion_inverse()

Specifies the inverse promotion operator used to construct the affine type A crystal.

For type A this corresponds to the Dynkin diagram automorphism which $i \mapsto i-1 \mod n+1$, where n is the rank.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['A',3,1], 2,2)
sage: b = K.classical_decomposition()(rows=[[1,3],[2,4]])
sage: K.promotion_inverse()(b)
[[1, 2], [3, 4]]
```

(continues on next page)

(continued from previous page)

```
sage: b = K.classical_decomposition()(rows=[[1,2],[3,3]])
sage: K.promotion_inverse()(K.promotion()(b))
[[1, 2], [3, 3]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(3),Integer(1)], Integer(2),
↪Integer(2))
>>> b = K.classical_decomposition()(rows=[[Integer(1),Integer(3)],[Integer(2),
↪Integer(4)]])
>>> K.promotion_inverse()(b)
[[1, 2], [3, 4]]
>>> b = K.classical_decomposition()(rows=[[Integer(1),Integer(2)],[Integer(3),
↪Integer(3)]])
>>> K.promotion_inverse()(K.promotion()(b))
[[1, 2], [3, 3]]
```

class sage.combinat.crystals.kirillov_reshetikhin.**KR_type_A2**(*cartan_type*, *r*, *s*, *dual=None*)

Bases: *KirillovReshetikhinGenericCrystal*

Class of Kirillov-Reshetikhin crystals $B^{r,s}$ of type $A_{2n}^{(2)}$ for $1 \leq r \leq n$ in the realization with classical subalgebra B_n. The Cartan type in this case is inputted as the dual of $A_{2n}^{(2)}$.

This is an alternative implementation to *KR_type_box* that uses the classical decomposition into type C_n crystals.

EXAMPLES:

```
sage: C = CartanType(['A',4,2]).dual()
sage: K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, 1, 1)
sage: K
Kirillov-Reshetikhin crystal of type ['BC', 2, 2]^* with (r,s)=(1,1)
sage: b = K(rows=[[-1]])
sage: b.f(0)
[[1]]
sage: b.e(0)
```

```
>>> from sage.all import *
>>> C = CartanType(['A',Integer(4),Integer(2)]).dual()
>>> K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, Integer(1),␣
↪Integer(1))
>>> K
Kirillov-Reshetikhin crystal of type ['BC', 2, 2]^* with (r,s)=(1,1)
>>> b = K(rows=[[-Integer(1)]])
>>> b.f(Integer(0))
[[1]]
>>> b.e(Integer(0))
```

We can now check whether the two KR crystals of type $A_4^{(2)}$ (namely the KR crystal and its dual construction) are isomorphic up to relabelling of the edges:

```
sage: C = CartanType(['A',4,2])
sage: K = crystals.KirillovReshetikhin(C,1,1)
sage: Kdual = crystals.KirillovReshetikhin(C.dual(),1,1)
sage: G = K.digraph()
```

(continues on next page)

(continued from previous page)

```
sage: Gdual = Kdual.digraph()
sage: f = {0:2, 1:1, 2:0}
sage: Gnew = DiGraph(); Gnew.add_vertices(Gdual.vertices(sort=True)); Gnew.add_
↪edges([(u,v,f[i]) for (u,v,i) in Gdual.edges(sort=True)])
sage: G.is_isomorphic(Gnew, edge_labels = True)
True
```

```
>>> from sage.all import *
>>> C = CartanType(['A',Integer(4),Integer(2)])
>>> K = crystals.KirillovReshetikhin(C,Integer(1),Integer(1))
>>> Kdual = crystals.KirillovReshetikhin(C.dual(),Integer(1),Integer(1))
>>> G = K.digraph()
>>> Gdual = Kdual.digraph()
>>> f = {Integer(0):Integer(2), Integer(1):Integer(1), Integer(2):Integer(0)}
>>> Gnew = DiGraph(); Gnew.add_vertices(Gdual.vertices(sort=True)); Gnew.add_
↪edges([(u,v,f[i]) for (u,v,i) in Gdual.edges(sort=True)])
>>> G.is_isomorphic(Gnew, edge_labels = True)
True
```

Element

alias of *KR_type_A2Element*

ambient_crystal()

Return the ambient crystal $B^{r,s}$ of type $B_{n+1}^{(1)}$ associated to the Kirillov-Reshetikhin crystal of type $A_{2n}^{(2)}$ dual.

This ambient crystal is used to construct the zero arrows.

EXAMPLES:

```
sage: C = CartanType(['A',4,2]).dual()
sage: K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, 2, 3)
sage: K.ambient_crystal()
Kirillov-Reshetikhin crystal of type ['B', 3, 1] with (r,s)=(2,3)
```

```
>>> from sage.all import *
>>> C = CartanType(['A',Integer(4),Integer(2)]).dual()
>>> K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, Integer(2),␣
↪Integer(3))
>>> K.ambient_crystal()
Kirillov-Reshetikhin crystal of type ['B', 3, 1] with (r,s)=(2,3)
```

ambient_dict_pm_diagrams()

Return a dictionary of all self-dual $\pm$ diagrams for the ambient crystal whose keys are their inner shape.

EXAMPLES:

```
sage: C = CartanType(['A',4,2]).dual()
sage: K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, 1, 1)
sage: K.ambient_dict_pm_diagrams()
{[1]: [[0, 0], [1]]}
sage: K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, 1, 2)
sage: K.ambient_dict_pm_diagrams()
```

(continues on next page)

(continued from previous page)

```
{[]: [[1, 1], [0]], [2]: [[0, 0], [2]]}
sage: K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, 2, 2)
sage: K.ambient_dict_pm_diagrams()
{[]: [[1, 1], [0, 0], [0]],
 [2]: [[0, 0], [1, 1], [0]],
 [2, 2]: [[0, 0], [0, 0], [2]]}
```

```
>>> from sage.all import *
>>> C = CartanType(['A',Integer(4),Integer(2)]).dual()
>>> K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, Integer(1),
↪Integer(1))
>>> K.ambient_dict_pm_diagrams()
{[1]: [[0, 0], [1]]}
>>> K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, Integer(1),
↪Integer(2))
>>> K.ambient_dict_pm_diagrams()
{[]: [[1, 1], [0]], [2]: [[0, 0], [2]]}
>>> K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, Integer(2),
↪Integer(2))
>>> K.ambient_dict_pm_diagrams()
{[]: [[1, 1], [0, 0], [0]],
 [2]: [[0, 0], [1, 1], [0]],
 [2, 2]: [[0, 0], [0, 0], [2]]}
```

ambient_highest_weight_dict()

Return a dictionary of all $\{2, \ldots, n+1\}$-highest weight vectors in the ambient crystal.

The key is the inner shape of their corresponding $\pm$ diagram, or equivalently, their $\{2, \ldots, n+1\}$ weight.

EXAMPLES:

```
sage: C = CartanType(['A',4,2]).dual()
sage: K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, 1, 2)
sage: K.ambient_highest_weight_dict()
{[]: [[1, -1]], [2]: [[2, 2]]}
```

```
>>> from sage.all import *
>>> C = CartanType(['A',Integer(4),Integer(2)]).dual()
>>> K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, Integer(1),
↪Integer(2))
>>> K.ambient_highest_weight_dict()
{[]: [[1, -1]], [2]: [[2, 2]]}
```

classical_decomposition()

Return the classical crystal underlying the Kirillov-Reshetikhin crystal of type $A_{2n}^{(2)}$ with B_n as classical subdiagram.

It is given by $B^{r,s} \cong \bigoplus_\Lambda B(\Lambda)$, where $B(\Lambda)$ is a highest weight crystal of type B_n of highest weight Λ. The sum is over all weights Λ obtained from a rectangle of width s and height r by removing horizontal dominoes. Here we identify the fundamental weight Λ_i with a column of height i.

EXAMPLES:

```
sage: C = CartanType(['A',4,2]).dual()
sage: K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, 2, 2)
sage: K.classical_decomposition()
The crystal of tableaux of type ['B', 2] and shape(s) [[], [2], [2, 2]]
```

```
>>> from sage.all import *
>>> C = CartanType(['A',Integer(4),Integer(2)]).dual()
>>> K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, Integer(2),␣
↪Integer(2))
>>> K.classical_decomposition()
The crystal of tableaux of type ['B', 2] and shape(s) [[], [2], [2, 2]]
```

from_ambient_crystal()

Return a map from the ambient crystal of type $B_{n+1}^{(1)}$ to the Kirillov-Reshetikhin crystal of type $A_{2n}^{(2)}$.

Note that this map is only well-defined on type $A_{2n}^{(2)}$ elements that are in the image under *to_ambient_crystal()*.

EXAMPLES:

```
sage: C = CartanType(['A',4,2]).dual()
sage: K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, 1, 2)
sage: b = K.ambient_crystal()(rows=[[2,2]])
sage: K.from_ambient_crystal()(b)
[[1, 1]]
```

```
>>> from sage.all import *
>>> C = CartanType(['A',Integer(4),Integer(2)]).dual()
>>> K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, Integer(1),␣
↪Integer(2))
>>> b = K.ambient_crystal()(rows=[[Integer(2),Integer(2)]])
>>> K.from_ambient_crystal()(b)
[[1, 1]]
```

highest_weight_dict()

Return a dictionary of the classical highest weight vectors of `self` whose keys are their shape.

EXAMPLES:

```
sage: C = CartanType(['A',4,2]).dual()
sage: K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, 1, 2)
sage: K.highest_weight_dict()
{[]: [], [2]: [[1, 1]]}
```

```
>>> from sage.all import *
>>> C = CartanType(['A',Integer(4),Integer(2)]).dual()
>>> K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, Integer(1),␣
↪Integer(2))
>>> K.highest_weight_dict()
{[]: [], [2]: [[1, 1]]}
```

module_generator()

Return the unique module generator of classical weight $s\Lambda_r$ of a Kirillov-Reshetikhin crystal $B^{r,s}$.

EXAMPLES:

```
sage: ct = CartanType(['A',8,2]).dual()
sage: K = crystals.KirillovReshetikhin(ct, 3, 5)
sage: K.module_generator()
[[1, 1, 1, 1, 1], [2, 2, 2, 2, 2], [3, 3, 3, 3, 3]]
```

```
>>> from sage.all import *
>>> ct = CartanType(['A',Integer(8),Integer(2)]).dual()
>>> K = crystals.KirillovReshetikhin(ct, Integer(3), Integer(5))
>>> K.module_generator()
[[1, 1, 1, 1, 1], [2, 2, 2, 2, 2], [3, 3, 3, 3, 3]]
```

to_ambient_crystal()

Return a map from the Kirillov-Reshetikhin crystal of type $A_{2n}^{(2)}$ to the ambient crystal of type $B_{n+1}^{(1)}$.

EXAMPLES:

```
sage: C = CartanType(['A',4,2]).dual()
sage: K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, 1, 2)
sage: b=K(rows=[[1,1]])
sage: K.to_ambient_crystal()(b)
[[2, 2]]
sage: K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, 2, 2)
sage: b=K(rows=[[1,1]])
sage: K.to_ambient_crystal()(b)
[[1, 2], [2, -1]]
sage: K.to_ambient_crystal()(b).parent()
Kirillov-Reshetikhin crystal of type ['B', 3, 1] with (r,s)=(2,2)
```

```
>>> from sage.all import *
>>> C = CartanType(['A',Integer(4),Integer(2)]).dual()
>>> K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, Integer(1),␣
↪Integer(2))
>>> b=K(rows=[[Integer(1),Integer(1)]])
>>> K.to_ambient_crystal()(b)
[[2, 2]]
>>> K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, Integer(2),␣
↪Integer(2))
>>> b=K(rows=[[Integer(1),Integer(1)]])
>>> K.to_ambient_crystal()(b)
[[1, 2], [2, -1]]
>>> K.to_ambient_crystal()(b).parent()
Kirillov-Reshetikhin crystal of type ['B', 3, 1] with (r,s)=(2,2)
```

class sage.combinat.crystals.kirillov_reshetikhin.**KR_type_A2Element**

Bases: *KirillovReshetikhinGenericCrystalElement*

Class for the elements in the Kirillov-Reshetikhin crystals $B^{r,s}$ of type $A_{2n}^{(2)}$ for $r < n$ with underlying classical algebra B_n.

EXAMPLES:

```
sage: C = CartanType(['A',4,2]).dual()
sage: K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, 1, 2)
sage: type(K.module_generators[0])
<class 'sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2_with_category.
↪element_class'>
```

```
>>> from sage.all import *
>>> C = CartanType(['A',Integer(4),Integer(2)]).dual()
>>> K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, Integer(1),␣
↪Integer(2))
>>> type(K.module_generators[Integer(0)])
<class 'sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2_with_category.
↪element_class'>
```

e0()

Return e_0 on `self` by mapping `self` to the ambient crystal, calculating $e_1 e_0$ there and pulling the element back.

EXAMPLES:

```
sage: C = CartanType(['A',4,2]).dual()
sage: K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, 1, 1)
sage: b = K(rows=[[1]])
sage: b.e(0) # indirect doctest
[[-1]]
```

```
>>> from sage.all import *
>>> C = CartanType(['A',Integer(4),Integer(2)]).dual()
>>> K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, Integer(1),␣
↪Integer(1))
>>> b = K(rows=[[Integer(1)]])
>>> b.e(Integer(0)) # indirect doctest
[[-1]]
```

epsilon0()

Calculate ε_0 of `self` by mapping the element to the ambient crystal and calculating `\varepsilon_1` there.

EXAMPLES:

```
sage: C = CartanType(['A',4,2]).dual()
sage: K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, 1, 1)
sage: b=K(rows=[[1]])
sage: b.epsilon(0) # indirect doctest
1
```

```
>>> from sage.all import *
>>> C = CartanType(['A',Integer(4),Integer(2)]).dual()
>>> K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, Integer(1),␣
↪Integer(1))
>>> b=K(rows=[[Integer(1)]])
>>> b.epsilon(Integer(0)) # indirect doctest
1
```

f0()

Return f_0 on `self` by mapping `self` to the ambient crystal, calculating $f_1 f_0$ there and pulling the element back.

EXAMPLES:

```
sage: C = CartanType(['A',4,2]).dual()
sage: K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, 1, 1)
sage: b = K(rows=[[-1]])
sage: b.f(0) # indirect doctest
[[1]]
```

```
>>> from sage.all import *
>>> C = CartanType(['A',Integer(4),Integer(2)]).dual()
>>> K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, Integer(1),
↪Integer(1))
>>> b = K(rows=[[-Integer(1)]])
>>> b.f(Integer(0)) # indirect doctest
[[1]]
```

phi0()

Calculate φ_0 of `self` by mapping the element to the ambient crystal and calculating φ_1 there.

EXAMPLES:

```
sage: C = CartanType(['A',4,2]).dual()
sage: K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, 1, 1)
sage: b = K(rows=[[-1]])
sage: b.phi(0) # indirect doctest
1
```

```
>>> from sage.all import *
>>> C = CartanType(['A',Integer(4),Integer(2)]).dual()
>>> K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, Integer(1),
↪Integer(1))
>>> b = K(rows=[[-Integer(1)]])
>>> b.phi(Integer(0)) # indirect doctest
1
```

class sage.combinat.crystals.kirillov_reshetikhin.**KR_type_Bn**(*cartan_type*, *r*, *s*, *dual=None*)

Bases: *KirillovReshetikhinGenericCrystal*

Class of Kirillov-Reshetikhin crystals $B^{n,s}$ of type $B_n^{(1)}$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['B',3,1],3,2)
sage: K
Kirillov-Reshetikhin crystal of type ['B', 3, 1] with (r,s)=(3,2)
sage: b = K(rows=[[1],[2],[3]])
sage: b.f(0)
sage: b.e(0)
[[3]]
```

(continues on next page)

(continued from previous page)

```
sage: K = crystals.KirillovReshetikhin(['B',3,1],3,2)
sage: [b.weight() for b in K if b.is_highest_weight([1,2,3])]
[-Lambda[0] + Lambda[1], -2*Lambda[0] + 2*Lambda[3]]
sage: [b.weight() for b in K if b.is_highest_weight([0,2,3])]
[Lambda[0] - Lambda[1], -2*Lambda[1] + 2*Lambda[3]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['B',Integer(3),Integer(1)],Integer(3),
↪Integer(2))
>>> K
Kirillov-Reshetikhin crystal of type ['B', 3, 1] with (r,s)=(3,2)
>>> b = K(rows=[[Integer(1)],[Integer(2)],[Integer(3)]])
>>> b.f(Integer(0))
>>> b.e(Integer(0))
[[3]]

>>> K = crystals.KirillovReshetikhin(['B',Integer(3),Integer(1)],Integer(3),
↪Integer(2))
>>> [b.weight() for b in K if b.is_highest_weight([Integer(1),Integer(2),
↪Integer(3)])]
[-Lambda[0] + Lambda[1], -2*Lambda[0] + 2*Lambda[3]]
>>> [b.weight() for b in K if b.is_highest_weight([Integer(0),Integer(2),
↪Integer(3)])]
[Lambda[0] - Lambda[1], -2*Lambda[1] + 2*Lambda[3]]
```

Element

alias of *KR_type_BnElement*

ambient_crystal()

Return the ambient crystal $B^{n,s}$ of type $A_{2n-1}^{(2)}$ associated to the Kirillov-Reshetikhin crystal.

The ambient crystal is used to construct the zero arrows.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['B',3,1],3,2)
sage: K.ambient_crystal()
Kirillov-Reshetikhin crystal of type ['B', 3, 1]^* with (r,s)=(3,2)
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['B',Integer(3),Integer(1)],Integer(3),
↪Integer(2))
>>> K.ambient_crystal()
Kirillov-Reshetikhin crystal of type ['B', 3, 1]^* with (r,s)=(3,2)
```

ambient_highest_weight_dict()

Return a dictionary of the classical highest weight vectors of the ambient crystal of `self` whose keys are their shape.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['B',3,1],3,2)
sage: K.ambient_highest_weight_dict()
```

(continues on next page)

(continued from previous page)

```
{(2,): [[1, 1]], (2, 1, 1): [[1, 1], [2], [3]], (2, 2, 2): [[1, 1], [2, 2],␣
↪[3, 3]]}

sage: K = crystals.KirillovReshetikhin(['B',3,1],3,3)
sage: K.ambient_highest_weight_dict()
{(3,): [[1, 1, 1]],
 (3, 1, 1): [[1, 1, 1], [2], [3]],
 (3, 2, 2): [[1, 1, 1], [2, 2], [3, 3]],
 (3, 3, 3): [[1, 1, 1], [2, 2, 2], [3, 3, 3]]}
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['B',Integer(3),Integer(1)],Integer(3),
↪Integer(2))
>>> K.ambient_highest_weight_dict()
{(2,): [[1, 1]], (2, 1, 1): [[1, 1], [2], [3]], (2, 2, 2): [[1, 1], [2, 2],␣
↪[3, 3]]}

>>> K = crystals.KirillovReshetikhin(['B',Integer(3),Integer(1)],Integer(3),
↪Integer(3))
>>> K.ambient_highest_weight_dict()
{(3,): [[1, 1, 1]],
 (3, 1, 1): [[1, 1, 1], [2], [3]],
 (3, 2, 2): [[1, 1, 1], [2, 2], [3, 3]],
 (3, 3, 3): [[1, 1, 1], [2, 2, 2], [3, 3, 3]]}
```

classical_decomposition()

Return the classical crystal underlying the Kirillov-Reshetikhin crystal $B^{n,s}$ of type $B_n^{(1)}$.

It is the same as for $r < n$, given by $B^{n,s} \cong \bigoplus_\Lambda B(\Lambda)$, where Λ are weights obtained from a rectangle of width $s/2$ and height n by removing horizontal dominoes. Here we identify the fundamental weight Λ_i with a column of height i for $i < n$ and a column of width $1/2$ for $i = n$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['B',3,1], 3, 2)
sage: K.classical_decomposition()
The crystal of tableaux of type ['B', 3] and shape(s) [[1], [1, 1, 1]]
sage: K = crystals.KirillovReshetikhin(['B',3,1], 3, 3)
sage: K.classical_decomposition()
The crystal of tableaux of type ['B', 3] and shape(s) [[3/2, 1/2, 1/2], [3/2,␣
↪3/2, 3/2]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['B',Integer(3),Integer(1)], Integer(3),␣
↪Integer(2))
>>> K.classical_decomposition()
The crystal of tableaux of type ['B', 3] and shape(s) [[1], [1, 1, 1]]
>>> K = crystals.KirillovReshetikhin(['B',Integer(3),Integer(1)], Integer(3),␣
↪Integer(3))
>>> K.classical_decomposition()
The crystal of tableaux of type ['B', 3] and shape(s) [[3/2, 1/2, 1/2], [3/2,␣
↪3/2, 3/2]]
```

from_ambient_crystal()

Return a map from the ambient crystal of type $A_{2n-1}^{(2)}$ to the Kirillov-Reshetikhin crystal `self`.

Note that this map is only well-defined on elements that are in the image under *to_ambient_crystal()*.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['B',3,1],3,1)
sage: [b == K.from_ambient_crystal()(K.to_ambient_crystal()(b)) for b in K]
[True, True, True, True, True, True, True, True]
sage: b = K.ambient_crystal()(rows=[[1],[2],[-3]])
sage: K.from_ambient_crystal()(b)
[++-, []]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['B',Integer(3),Integer(1)],Integer(3),
↪Integer(1))
>>> [b == K.from_ambient_crystal()(K.to_ambient_crystal()(b)) for b in K]
[True, True, True, True, True, True, True, True]
>>> b = K.ambient_crystal()(rows=[[Integer(1)],[Integer(2)],[-Integer(3)]])
>>> K.from_ambient_crystal()(b)
[++-, []]
```

highest_weight_dict()

Return a dictionary of the classical highest weight vectors of `self` whose keys are 2 times their shape.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['B',3,1],3,2)
sage: K.highest_weight_dict()
{(2,): [[1]], (2, 2, 2): [[1], [2], [3]]}
sage: K = crystals.KirillovReshetikhin(['B',3,1],3,3)
sage: K.highest_weight_dict()
{(3, 1, 1): [+++, [[1]]], (3, 3, 3): [+++, [[1], [2], [3]]]}
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['B',Integer(3),Integer(1)],Integer(3),
↪Integer(2))
>>> K.highest_weight_dict()
{(2,): [[1]], (2, 2, 2): [[1], [2], [3]]}
>>> K = crystals.KirillovReshetikhin(['B',Integer(3),Integer(1)],Integer(3),
↪Integer(3))
>>> K.highest_weight_dict()
{(3, 1, 1): [+++, [[1]]], (3, 3, 3): [+++, [[1], [2], [3]]]}
```

similarity_factor()

Set the similarity factor used to map to the ambient crystal.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['B',3,1],3,2)
sage: K.similarity_factor()
{1: 2, 2: 2, 3: 1}
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['B',Integer(3),Integer(1)],Integer(3),
↪Integer(2))
>>> K.similarity_factor()
{1: 2, 2: 2, 3: 1}
```

to_ambient_crystal()

Return a map from `self` to the ambient crystal of type $A_{2n-1}^{(2)}$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['B',3,1],3,1)
sage: [K.to_ambient_crystal()(b) for b in K]
[[[1], [2], [3]], [[1], [2], [-3]], [[1], [3], [-2]], [[2], [3], [-1]], [[1],␣
↪[-3], [-2]],
[[2], [-3], [-1]], [[3], [-2], [-1]], [[-3], [-2], [-1]]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['B',Integer(3),Integer(1)],Integer(3),
↪Integer(1))
>>> [K.to_ambient_crystal()(b) for b in K]
[[[1], [2], [3]], [[1], [2], [-3]], [[1], [3], [-2]], [[2], [3], [-1]], [[1],␣
↪[-3], [-2]],
[[2], [-3], [-1]], [[3], [-2], [-1]], [[-3], [-2], [-1]]]
```

class sage.combinat.crystals.kirillov_reshetikhin.**KR_type_BnElement**

Bases: *KirillovReshetikhinGenericCrystalElement*

Class for the elements in the Kirillov-Reshetikhin crystals $B^{n,s}$ of type $B_n^{(1)}$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['B', 3, 1], 3, 2)
sage: type(K.module_generators[0])
<class 'sage.combinat.crystals.kirillov_reshetikhin.KR_type_Bn_with_category.
↪element_class'>
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['B', Integer(3), Integer(1)], Integer(3),␣
↪Integer(2))
>>> type(K.module_generators[Integer(0)])
<class 'sage.combinat.crystals.kirillov_reshetikhin.KR_type_Bn_with_category.
↪element_class'>
```

e0()

Return e_0 on `self` by mapping `self` to the ambient crystal, calculating e_0 there and pulling the element back.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['B',3,1],3,1)
sage: b = K.module_generators[0]
sage: b.e(0) # indirect doctest
[--+, []]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['B',Integer(3),Integer(1)],Integer(3),
↪Integer(1))
>>> b = K.module_generators[Integer(0)]
>>> b.e(Integer(0)) # indirect doctest
[--+, []]
```

epsilon0()

Calculate ε_0 of `self` by mapping the element to the ambient crystal and calculating ε_0 there.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['B', 3, 1], 3, 1)
sage: b = K.module_generators[0]
sage: b.epsilon(0) # indirect doctest
1
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['B', Integer(3), Integer(1)],␣
↪Integer(3), Integer(1))
>>> b = K.module_generators[Integer(0)]
>>> b.epsilon(Integer(0)) # indirect doctest
1
```

f0()

Return f_0 on `self` by mapping `self` to the ambient crystal, calculating f_0 there and pulling the element back.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['B', 3, 1], 3, 1)
sage: b = K.module_generators[0]
sage: b.f(0) # indirect doctest
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['B', Integer(3), Integer(1)],␣
↪Integer(3), Integer(1))
>>> b = K.module_generators[Integer(0)]
>>> b.f(Integer(0)) # indirect doctest
```

phi0()

Calculate φ_0 of `self` by mapping the element to the ambient crystal and calculating φ_0 there.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['B', 3, 1], 3, 1)
sage: b = K.module_generators[0]
sage: b.phi(0) # indirect doctest
0
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['B', Integer(3), Integer(1)],␣
↪Integer(3), Integer(1))
```

(continues on next page)

(continued from previous page)

```
>>> b = K.module_generators[Integer(0)]
>>> b.phi(Integer(0)) # indirect doctest
0
```

class sage.combinat.crystals.kirillov_reshetikhin.**KR_type_C**(*cartan_type*, *r*, *s*, *dual=None*)

Bases: *KirillovReshetikhinGenericCrystal*

Class of Kirillov-Reshetikhin crystals $B^{r,s}$ of type $C_n^{(1)}$ for $r < n$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C',2,1], 1,2)
sage: K
Kirillov-Reshetikhin crystal of type ['C', 2, 1] with (r,s)=(1,2)
sage: b = K(rows=[])
sage: b.f(0)
[[1, 1]]
sage: b.e(0)
[[-1, -1]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C',Integer(2),Integer(1)], Integer(1),
↪Integer(2))
>>> K
Kirillov-Reshetikhin crystal of type ['C', 2, 1] with (r,s)=(1,2)
>>> b = K(rows=[])
>>> b.f(Integer(0))
[[1, 1]]
>>> b.e(Integer(0))
[[-1, -1]]
```

Element

alias of *KR_type_CElement*

ambient_crystal()

Return the ambient crystal $B^{r,s}$ of type $A_{2n+1}^{(2)}$ associated to the Kirillov-Reshetikhin crystal of type $C_n^{(1)}$.

This ambient crystal is used to construct the zero arrows.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C',3,1], 2,3)
sage: K.ambient_crystal()
Kirillov-Reshetikhin crystal of type ['B', 4, 1]^* with (r,s)=(2,3)
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C',Integer(3),Integer(1)], Integer(2),
↪Integer(3))
>>> K.ambient_crystal()
Kirillov-Reshetikhin crystal of type ['B', 4, 1]^* with (r,s)=(2,3)
```

ambient_dict_pm_diagrams()

Return a dictionary of all self-dual $\pm$ diagrams for the ambient crystal whose keys are their inner shape.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C',2,1], 1,2)
sage: K.ambient_dict_pm_diagrams()
{[]: [[1, 1], [0]], [2]: [[0, 0], [2]]}
sage: K = crystals.KirillovReshetikhin(['C',3,1], 2,2)
sage: K.ambient_dict_pm_diagrams()
{[]: [[1, 1], [0, 0], [0]],
 [2]: [[0, 0], [1, 1], [0]],
 [2, 2]: [[0, 0], [0, 0], [2]]}
sage: K = crystals.KirillovReshetikhin(['C',3,1], 2,3)
sage: K.ambient_dict_pm_diagrams()
{[1, 1]: [[1, 1], [0, 0], [1]],
 [3, 1]: [[0, 0], [1, 1], [1]],
 [3, 3]: [[0, 0], [0, 0], [3]]}
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C',Integer(2),Integer(1)], Integer(1),
↪Integer(2))
>>> K.ambient_dict_pm_diagrams()
{[]: [[1, 1], [0]], [2]: [[0, 0], [2]]}
>>> K = crystals.KirillovReshetikhin(['C',Integer(3),Integer(1)], Integer(2),
↪Integer(2))
>>> K.ambient_dict_pm_diagrams()
{[]: [[1, 1], [0, 0], [0]],
 [2]: [[0, 0], [1, 1], [0]],
 [2, 2]: [[0, 0], [0, 0], [2]]}
>>> K = crystals.KirillovReshetikhin(['C',Integer(3),Integer(1)], Integer(2),
↪Integer(3))
>>> K.ambient_dict_pm_diagrams()
{[1, 1]: [[1, 1], [0, 0], [1]],
 [3, 1]: [[0, 0], [1, 1], [1]],
 [3, 3]: [[0, 0], [0, 0], [3]]}
```

ambient_highest_weight_dict()

Return a dictionary of all $\{2, \ldots, n+1\}$-highest weight vectors in the ambient crystal.

The key is the inner shape of their corresponding $\pm$ diagram, or equivalently, their $\{2, \ldots, n+1\}$ weight.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C',3,1], 2,2)
sage: K.ambient_highest_weight_dict()
{[]: [[2], [-2]], [2]: [[1, 2], [2, -1]], [2, 2]: [[2, 2], [3, 3]]}
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C',Integer(3),Integer(1)], Integer(2),
↪Integer(2))
>>> K.ambient_highest_weight_dict()
{[]: [[2], [-2]], [2]: [[1, 2], [2, -1]], [2, 2]: [[2, 2], [3, 3]]}
```

classical_decomposition()

Return the classical crystal underlying the Kirillov-Reshetikhin crystal of type $C_n^{(1)}$.

It is given by $B^{r,s} \cong \bigoplus_\Lambda B(\Lambda)$, where Λ are weights obtained from a rectangle of width s and height r by removing horizontal dominoes. Here we identify the fundamental weight Λ_i with a column of height i.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C',3,1], 2,2)
sage: K.classical_decomposition()
The crystal of tableaux of type ['C', 3] and shape(s) [[], [2], [2, 2]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C',Integer(3),Integer(1)], Integer(2),
↪Integer(2))
>>> K.classical_decomposition()
The crystal of tableaux of type ['C', 3] and shape(s) [[], [2], [2, 2]]
```

from_ambient_crystal()

Return a map from the ambient crystal of type $A_{2n+1}^{(2)}$ to the Kirillov-Reshetikhin crystal of type $C_n^{(1)}$.

Note that this map is only well-defined on type $C_n^{(1)}$ elements that are in the image under `to_ambient_crystal()`.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C',3,1], 2,2)
sage: b = K.ambient_crystal()(rows=[[2,2],[3,3]])
sage: K.from_ambient_crystal()(b)
[[1, 1], [2, 2]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C',Integer(3),Integer(1)], Integer(2),
↪Integer(2))
>>> b = K.ambient_crystal()(rows=[[Integer(2),Integer(2)],[Integer(3),
↪Integer(3)]])
>>> K.from_ambient_crystal()(b)
[[1, 1], [2, 2]]
```

highest_weight_dict()

Return a dictionary of the classical highest weight vectors of `self` whose keys are their shape.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C',3,1], 2,2)
sage: K.highest_weight_dict()
{[]: [], [2]: [[1, 1]], [2, 2]: [[1, 1], [2, 2]]}
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C',Integer(3),Integer(1)], Integer(2),
↪Integer(2))
>>> K.highest_weight_dict()
{[]: [], [2]: [[1, 1]], [2, 2]: [[1, 1], [2, 2]]}
```

to_ambient_crystal()

Return a map from the Kirillov-Reshetikhin crystal of type $C_n^{(1)}$ to the ambient crystal of type $A_{2n+1}^{(2)}$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C',3,1], 2,2)
sage: b=K(rows=[[1,1]])
sage: K.to_ambient_crystal()(b)
[[1, 2], [2, -1]]
sage: b=K(rows=[])
sage: K.to_ambient_crystal()(b)
[[2], [-2]]
sage: K.to_ambient_crystal()(b).parent()
Kirillov-Reshetikhin crystal of type ['B', 4, 1]^* with (r,s)=(2,2)
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C',Integer(3),Integer(1)], Integer(2),
↪Integer(2))
>>> b=K(rows=[[Integer(1),Integer(1)]])
>>> K.to_ambient_crystal()(b)
[[1, 2], [2, -1]]
>>> b=K(rows=[])
>>> K.to_ambient_crystal()(b)
[[2], [-2]]
>>> K.to_ambient_crystal()(b).parent()
Kirillov-Reshetikhin crystal of type ['B', 4, 1]^* with (r,s)=(2,2)
```

class sage.combinat.crystals.kirillov_reshetikhin.**KR_type_CElement**

Bases: *KirillovReshetikhinGenericCrystalElement*

Class for the elements in the Kirillov-Reshetikhin crystals $B^{r,s}$ of type $C_n^{(1)}$ for $r < n$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C', 3, 1], 1, 2)
sage: type(K.module_generators[0])
<class 'sage.combinat.crystals.kirillov_reshetikhin.KR_type_C_with_category.
↪element_class'>
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C', Integer(3), Integer(1)], Integer(1),␣
↪Integer(2))
>>> type(K.module_generators[Integer(0)])
<class 'sage.combinat.crystals.kirillov_reshetikhin.KR_type_C_with_category.
↪element_class'>
```

e0()

Return e_0 on `self` by mapping `self` to the ambient crystal, calculating $e_1 e_0$ there and pulling the element back.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C', 3, 1], 1, 2)
sage: b = K(rows=[])
sage: b.e(0) # indirect doctest
[[-1, -1]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C', Integer(3), Integer(1)],␣
↪Integer(1), Integer(2))
>>> b = K(rows=[])
>>> b.e(Integer(0)) # indirect doctest
[[-1, -1]]
```

epsilon0()

Calculate ε_0 of `self` by mapping the element to the ambient crystal and calculating ε_1 there.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C',2,1], 1,2)
sage: b=K(rows=[[1,1]])
sage: b.epsilon(0) # indirect doctest
2
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C',Integer(2),Integer(1)], Integer(1),
↪Integer(2))
>>> b=K(rows=[[Integer(1),Integer(1)]])
>>> b.epsilon(Integer(0)) # indirect doctest
2
```

f0()

Return f_0 on `self` by mapping `self` to the ambient crystal, calculating $f_1 f_0$ there and pulling the element back.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C', 3, 1], 1, 2)
sage: b = K(rows=[])
sage: b.f(0) # indirect doctest
[[1, 1]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C', Integer(3), Integer(1)],␣
↪Integer(1), Integer(2))
>>> b = K(rows=[])
>>> b.f(Integer(0)) # indirect doctest
[[1, 1]]
```

phi0()

Calculate φ_0 of `self` by mapping the element to the ambient crystal and calculating φ_1 there.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C',2,1], 1,2)
sage: b=K(rows=[[-1,-1]])
sage: b.phi(0) # indirect doctest
2
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C',Integer(2),Integer(1)], Integer(1),
↪Integer(2))
>>> b=K(rows=[[-Integer(1),-Integer(1)]])
>>> b.phi(Integer(0)) # indirect doctest
2
```

class sage.combinat.crystals.kirillov_reshetikhin.**KR_type_Cn**(*cartan_type*, *r*, *s*, *dual=None*)

Bases: *KirillovReshetikhinGenericCrystal*

Class of Kirillov-Reshetikhin crystals $B^{n,s}$ of type $C_n^{(1)}$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C',3,1],3,1)
sage: [[b,b.f(0)] for b in K]
[[[[1], [2], [3]], None], [[[1], [2], [-3]], None],
 [[[1], [3], [-3]], None], [[[2], [3], [-3]], None],
 [[[1], [3], [-2]], None], [[[2], [3], [-2]], None],
 [[[2], [3], [-1]], [[1], [2], [3]]], [[[1], [-3], [-2]], None],
 [[[2], [-3], [-2]], None], [[[2], [-3], [-1]], [[1], [2], [-3]]],
 [[[3], [-3], [-2]], None], [[[3], [-3], [-1]], [[1], [3], [-3]]],
 [[[3], [-2], [-1]], [[1], [3], [-2]]],
 [[[-3], [-2], [-1]], [[1], [-3], [-2]]]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C',Integer(3),Integer(1)],Integer(3),
↪Integer(1))
>>> [[b,b.f(Integer(0))] for b in K]
[[[[1], [2], [3]], None], [[[1], [2], [-3]], None],
 [[[1], [3], [-3]], None], [[[2], [3], [-3]], None],
 [[[1], [3], [-2]], None], [[[2], [3], [-2]], None],
 [[[2], [3], [-1]], [[1], [2], [3]]], [[[1], [-3], [-2]], None],
 [[[2], [-3], [-2]], None], [[[2], [-3], [-1]], [[1], [2], [-3]]],
 [[[3], [-3], [-2]], None], [[[3], [-3], [-1]], [[1], [3], [-3]]],
 [[[3], [-2], [-1]], [[1], [3], [-2]]],
 [[[-3], [-2], [-1]], [[1], [-3], [-2]]]]
```

Element

alias of *KR_type_CnElement*

classical_decomposition()

Specifies the classical crystal underlying the Kirillov-Reshetikhin crystal $B^{n,s}$ of type $C_n^{(1)}$.

The classical decomposition is given by $B^{n,s} \cong B(s\Lambda_n)$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C',3,1],3,2)
sage: K.classical_decomposition()
The crystal of tableaux of type ['C', 3] and shape(s) [[2, 2, 2]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C',Integer(3),Integer(1)],Integer(3),
```

(continues on next page)

(continued from previous page)

```
↪Integer(2))
>>> K.classical_decomposition()
The crystal of tableaux of type ['C', 3] and shape(s) [[2, 2, 2]]
```

from_highest_weight_vector_to_pm_diagram(*b*)

This gives the bijection between an element b in the classical decomposition of the KR crystal that is $2, 3, .., n$-highest weight and $\pm$ diagrams.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C',3,1],3,2)
sage: T = K.classical_decomposition()
sage: b = T(rows=[[2, 2], [3, 3], [-3, -1]])
sage: pm = K.from_highest_weight_vector_to_pm_diagram(b); pm
[[0, 0], [1, 0], [0, 1], [0]]
sage: pm.pp()
.  .
.  +
-  -

sage: hw = [ b for b in T if all(b.epsilon(i)==0 for i in [2,3]) ]
sage: all(K.from_pm_diagram_to_highest_weight_vector(K.from_highest_weight_
↪vector_to_pm_diagram(b)) == b for b in hw)
True
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C',Integer(3),Integer(1)],Integer(3),
↪Integer(2))
>>> T = K.classical_decomposition()
>>> b = T(rows=[[Integer(2), Integer(2)], [Integer(3), Integer(3)], [-
↪Integer(3), -Integer(1)]])
>>> pm = K.from_highest_weight_vector_to_pm_diagram(b); pm
[[0, 0], [1, 0], [0, 1], [0]]
>>> pm.pp()
.  .
.  +
-  -

>>> hw = [ b for b in T if all(b.epsilon(i)==Integer(0) for i in [Integer(2),
↪Integer(3)]) ]
>>> all(K.from_pm_diagram_to_highest_weight_vector(K.from_highest_weight_
↪vector_to_pm_diagram(b)) == b for b in hw)
True
```

from_pm_diagram_to_highest_weight_vector(*pm*)

This gives the bijection between a $\pm$ diagram and an element b in the classical decomposition of the KR crystal that is $\{2, 3, .., n\}$-highest weight.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C',3,1],3,2)
sage: pm = sage.combinat.crystals.kirillov_reshetikhin.PMDiagram([[0, 0], [1,␣
↪0], [0, 1], [0]])
```

(continues on next page)

(continued from previous page)

```
sage: K.from_pm_diagram_to_highest_weight_vector(pm)
[[2, 2], [3, 3], [-3, -1]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C',Integer(3),Integer(1)],Integer(3),
↪Integer(2))
>>> pm = sage.combinat.crystals.kirillov_reshetikhin.PMDiagram([[Integer(0),
↪Integer(0)], [Integer(1), Integer(0)], [Integer(0), Integer(1)],
↪[Integer(0)]])
>>> K.from_pm_diagram_to_highest_weight_vector(pm)
[[2, 2], [3, 3], [-3, -1]]
```

class sage.combinat.crystals.kirillov_reshetikhin.**KR_type_CnElement**

Bases: *KirillovReshetikhinGenericCrystalElement*

Class for the elements in the Kirillov-Reshetikhin crystals $B^{n,s}$ of type $C_n^{(1)}$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C', 3, 1], 3, 2)
sage: type(K.module_generators[0])
<class 'sage.combinat.crystals.kirillov_reshetikhin.KR_type_Cn_with_category.
↪element_class'>
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C', Integer(3), Integer(1)], Integer(3),
↪Integer(2))
>>> type(K.module_generators[Integer(0)])
<class 'sage.combinat.crystals.kirillov_reshetikhin.KR_type_Cn_with_category.
↪element_class'>
```

e0()

Return e_0 on `self` by going to the $\pm$-diagram corresponding to the $\{2, ..., n\}$-highest weight vector in the component of `self`, then applying [Definition 6.1, 4], and pulling back from $\pm$-diagrams.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C', 3, 1], 3, 2)
sage: b = K.module_generators[0]
sage: b.e(0) # indirect doctest
[[1, 2], [2, 3], [3, -1]]
sage: b = K(rows=[[1,2],[2,3],[3,-1]])
sage: b.e(0)
[[2, 2], [3, 3], [-1, -1]]
sage: b=K(rows=[[1, -3], [3, -2], [-3, -1]])
sage: b.e(0)
[[3, -3], [-3, -2], [-1, -1]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C', Integer(3), Integer(1)],
↪Integer(3), Integer(2))
>>> b = K.module_generators[Integer(0)]
```

(continues on next page)

(continued from previous page)

```
>>> b.e(Integer(0)) # indirect doctest
[[1, 2], [2, 3], [3, -1]]
>>> b = K(rows=[[Integer(1),Integer(2)],[Integer(2),Integer(3)],[Integer(3),-
↪Integer(1)]])
>>> b.e(Integer(0))
[[2, 2], [3, 3], [-1, -1]]
>>> b=K(rows=[[Integer(1), -Integer(3)], [Integer(3), -Integer(2)], [-
↪Integer(3), -Integer(1)]])
>>> b.e(Integer(0))
[[3, -3], [-3, -2], [-1, -1]]
```

epsilon0()

Calculate ε_0 of `self` using Lemma 6.1 of [4].

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C', 3, 1], 3, 1)
sage: b = K.module_generators[0]
sage: b.epsilon(0) # indirect doctest
1
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C', Integer(3), Integer(1)],␣
↪Integer(3), Integer(1))
>>> b = K.module_generators[Integer(0)]
>>> b.epsilon(Integer(0)) # indirect doctest
1
```

f0()

Return e_0 on `self` by going to the $\pm$-diagram corresponding to the $\{2, ..., n\}$-highest weight vector in the component of `self`, then applying [Definition 6.1, 4], and pulling back from $\pm$-diagrams.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C',3,1],3,1)
sage: b = K.module_generators[0]
sage: b.f(0) # indirect doctest
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C',Integer(3),Integer(1)],Integer(3),
↪Integer(1))
>>> b = K.module_generators[Integer(0)]
>>> b.f(Integer(0)) # indirect doctest
```

phi0()

Calculate φ_0 of `self`.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C', 3, 1], 3, 1)
sage: b = K.module_generators[0]
sage: b.phi(0) # indirect doctest
0
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C', Integer(3), Integer(1)],␣
↪Integer(3), Integer(1))
>>> b = K.module_generators[Integer(0)]
>>> b.phi(Integer(0)) # indirect doctest
0
```

class sage.combinat.crystals.kirillov_reshetikhin.**KR_type_D_tri1**(*ct*, *s*)

Bases: *KirillovReshetikhinGenericCrystal*

Class of Kirillov-Reshetikhin crystals $B^{1,s}$ of type $D_4^{(3)}$.

The crystal structure was defined in Section 4 of [KMOY2007] using the coordinate representation.

class Element

Bases: *KirillovReshetikhinGenericCrystalElement*

coordinates()

Return `self` as coordinates.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,3], 1, 3)
sage: all(K.from_coordinates(x.coordinates()) == x for x in K)
True
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(3)],␣
↪Integer(1), Integer(3))
>>> all(K.from_coordinates(x.coordinates()) == x for x in K)
True
```

e0()

Return the action of e_0 on `self`.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,3], 1,1)
sage: [x.e0() for x in K]
[[[-1]], [], [[-3]], [[-2]], None, None, None, None]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(3)],␣
↪Integer(1),Integer(1))
>>> [x.e0() for x in K]
[[[-1]], [], [[-3]], [[-2]], None, None, None, None]
```

epsilon0()

Return ε_0 of `self`.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,3], 1, 5)
sage: [mg.epsilon0() for mg in K.module_generators]
[5, 6, 7, 8, 9, 10]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(3)],␣
↪Integer(1), Integer(5))
>>> [mg.epsilon0() for mg in K.module_generators]
[5, 6, 7, 8, 9, 10]
```

f0()

Return the action of f_0 on `self`.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,3], 1,1)
sage: [x.f0() for x in K]
[[[1]], None, None, None, None, [[2]], [[3]], []]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(3)],␣
↪Integer(1),Integer(1))
>>> [x.f0() for x in K]
[[[1]], None, None, None, None, [[2]], [[3]], []]
```

phi0()

Return φ_0 of `self`.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,3], 1, 5)
sage: [mg.phi0() for mg in K.module_generators]
[5, 4, 3, 2, 1, 0]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(3)],␣
↪Integer(1), Integer(5))
>>> [mg.phi0() for mg in K.module_generators]
[5, 4, 3, 2, 1, 0]
```

classical_decomposition()

Return the classical decomposition of `self`.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,3], 1, 5)
sage: K.classical_decomposition()
The crystal of tableaux of type ['G', 2]
 and shape(s) [[], [1], [2], [3], [4], [5]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(3)], Integer(1),␣
↪Integer(5))
>>> K.classical_decomposition()
The crystal of tableaux of type ['G', 2]
 and shape(s) [[], [1], [2], [3], [4], [5]]
```

from_coordinates(*coords*)

Return an element of `self` from the coordinates `coords`.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,3], 1, 5)
sage: K.from_coordinates((0, 2, 3, 1, 0, 1))
[[2, 2, 3, 0, -1]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(3)], Integer(1),␣
↪Integer(5))
>>> K.from_coordinates((Integer(0), Integer(2), Integer(3), Integer(1),␣
↪Integer(0), Integer(1)))
[[2, 2, 3, 0, -1]]
```

class sage.combinat.crystals.kirillov_reshetikhin.**KR_type_Dn_twisted**(*cartan_type*, *r*, *s*, *dual=None*)

Bases: *KirillovReshetikhinGenericCrystal*

Class of Kirillov-Reshetikhin crystals $B^{n,s}$ of type $D_{n+1}^{(2)}$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,2],3,1)
sage: [[b,b.f(0)] for b in K]
[[[+++, []], None], [[++-, []], None], [[+-+, []], None], [[-++, []],
[+++, []]], [[+--, []], None], [[-+-, []], [++-, []]], [[--+, []], [+-+, []]],
[[---, []], [+--, []]]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(2)],Integer(3),
↪Integer(1))
>>> [[b,b.f(Integer(0))] for b in K]
[[[+++, []], None], [[++-, []], None], [[+-+, []], None], [[-++, []],
[+++, []]], [[+--, []], None], [[-+-, []], [++-, []]], [[--+, []], [+-+, []]],
[[---, []], [+--, []]]]
```

Element

alias of *KR_type_Dn_twistedElement*

classical_decomposition()

Return the classical crystal underlying the Kirillov-Reshetikhin crystal $B^{n,s}$ of type $D_{n+1}^{(2)}$.

The classical decomposition is given by $B^{n,s} \cong B(s\Lambda_n)$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,2],3,1)
sage: K.classical_decomposition()
The crystal of tableaux of type ['B', 3] and shape(s) [[1/2, 1/2, 1/2]]
sage: K = crystals.KirillovReshetikhin(['D',4,2],3,2)
sage: K.classical_decomposition()
The crystal of tableaux of type ['B', 3] and shape(s) [[1, 1, 1]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(2)],Integer(3),
↪Integer(1))
>>> K.classical_decomposition()
The crystal of tableaux of type ['B', 3] and shape(s) [[1/2, 1/2, 1/2]]
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(2)],Integer(3),
↪Integer(2))
>>> K.classical_decomposition()
The crystal of tableaux of type ['B', 3] and shape(s) [[1, 1, 1]]
```

from_highest_weight_vector_to_pm_diagram(b)

This gives the bijection between an element b in the classical decomposition of the KR crystal that is $\{2, 3, \ldots, n\}$-highest weight and $\pm$ diagrams.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,2],3,1)
sage: T = K.classical_decomposition()
sage: hw = [ b for b in T if all(b.epsilon(i)==0 for i in [2,3]) ]
sage: [K.from_highest_weight_vector_to_pm_diagram(b) for b in hw]
[[[0, 0], [0, 0], [1, 0], [0]], [[0, 0], [0, 0], [0, 1], [0]]]

sage: K = crystals.KirillovReshetikhin(['D',4,2],3,2)
sage: T = K.classical_decomposition()
sage: hw = [ b for b in T if all(b.epsilon(i)==0 for i in [2,3]) ]
sage: [K.from_highest_weight_vector_to_pm_diagram(b) for b in hw]
[[[0, 0], [0, 0], [2, 0], [0]], [[0, 0], [0, 0], [0, 0], [2]],
 [[0, 0], [2, 0], [0, 0], [0]], [[0, 0], [0, 0], [0, 2], [0]]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(2)],Integer(3),
↪Integer(1))
>>> T = K.classical_decomposition()
>>> hw = [ b for b in T if all(b.epsilon(i)==Integer(0) for i in [Integer(2),
↪Integer(3)]) ]
>>> [K.from_highest_weight_vector_to_pm_diagram(b) for b in hw]
[[[0, 0], [0, 0], [1, 0], [0]], [[0, 0], [0, 0], [0, 1], [0]]]

>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(2)],Integer(3),
↪Integer(2))
>>> T = K.classical_decomposition()
>>> hw = [ b for b in T if all(b.epsilon(i)==Integer(0) for i in [Integer(2),
↪Integer(3)]) ]
>>> [K.from_highest_weight_vector_to_pm_diagram(b) for b in hw]
[[[0, 0], [0, 0], [2, 0], [0]], [[0, 0], [0, 0], [0, 0], [2]],
 [[0, 0], [2, 0], [0, 0], [0]], [[0, 0], [0, 0], [0, 2], [0]]]
```

Note that, since the classical decomposition of this crystal is of type B_n, there can be (at most one) entry 0 in the $\{2, 3, \ldots, n\}$-highest weight elements at height n. In the following implementation this is realized as an empty column of height n since this uniquely specifies the existence of the 0.

EXAMPLES:

```
sage: b = hw[1]
sage: pm = K.from_highest_weight_vector_to_pm_diagram(b)
sage: pm.pp()
.  .
.  .
.  .
```

```
>>> from sage.all import *
>>> b = hw[Integer(1)]
>>> pm = K.from_highest_weight_vector_to_pm_diagram(b)
>>> pm.pp()
.  .
.  .
.  .
```

from_pm_diagram_to_highest_weight_vector(*pm*)

This gives the bijection between a $\pm$ diagram and an element `b` in the classical decomposition of the KR crystal that is $\{2, 3, \ldots, n\}$-highest weight.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,2],3,2)
sage: pm = sage.combinat.crystals.kirillov_reshetikhin.PMDiagram([[0, 0], [0,␣
↪0], [0, 0], [2]])
sage: K.from_pm_diagram_to_highest_weight_vector(pm)
[[2], [3], [0]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(2)],Integer(3),
↪Integer(2))
>>> pm = sage.combinat.crystals.kirillov_reshetikhin.PMDiagram([[Integer(0),␣
↪Integer(0)], [Integer(0), Integer(0)], [Integer(0), Integer(0)],␣
↪[Integer(2)]])
>>> K.from_pm_diagram_to_highest_weight_vector(pm)
[[2], [3], [0]]
```

class sage.combinat.crystals.kirillov_reshetikhin.**KR_type_Dn_twistedElement**

Bases: *KirillovReshetikhinGenericCrystalElement*

Class for the elements in the Kirillov-Reshetikhin crystals $B^{n,s}$ of type $D_{n+1}^{(2)}$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D', 4, 2], 3, 2)
sage: type(K.module_generators[0])
<class 'sage.combinat.crystals.kirillov_reshetikhin.KR_type_Dn_twisted_with_
↪category.element_class'>
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D', Integer(4), Integer(2)], Integer(3),␣
↪Integer(2))
>>> type(K.module_generators[Integer(0)])
<class 'sage.combinat.crystals.kirillov_reshetikhin.KR_type_Dn_twisted_with_
↪category.element_class'>
```

e0()

Return e_0 on `self` by going to the $\pm$-diagram corresponding to the $\{2, \ldots, n\}$-highest weight vector in the component of `self`, then applying [Definition 6.2, 4], and pulling back from $\pm$-diagrams.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D', 4, 2], 3, 3)
sage: b = K.module_generators[0]
sage: b.e(0) # indirect doctest
[+++, [[2], [3], [0]]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D', Integer(4), Integer(2)],␣
↪Integer(3), Integer(3))
>>> b = K.module_generators[Integer(0)]
>>> b.e(Integer(0)) # indirect doctest
[+++, [[2], [3], [0]]]
```

epsilon0()

Calculate ε_0 of `self` using Lemma 6.2 of [4].

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D', 4, 2], 3, 1)
sage: b = K.module_generators[0]
sage: b.epsilon(0) # indirect doctest
1
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D', Integer(4), Integer(2)],␣
↪Integer(3), Integer(1))
>>> b = K.module_generators[Integer(0)]
>>> b.epsilon(Integer(0)) # indirect doctest
1
```

f0()

Return e_0 on `self` by going to the $\pm$-diagram corresponding to the $\{2, \ldots, n\}$-highest weight vector in the component of `self`, then applying [Definition 6.2, 4], and pulling back from $\pm$-diagrams.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,2],3,2)
sage: b = K.module_generators[0]
sage: b.f(0) # indirect doctest
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(2)],Integer(3),
↪Integer(2))
>>> b = K.module_generators[Integer(0)]
>>> b.f(Integer(0)) # indirect doctest
```

phi0()

Calculate φ_0 of `self`.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,2],3,1)
sage: b = K.module_generators[0]
sage: b.phi(0) # indirect doctest
0
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(2)],Integer(3),
↪Integer(1))
>>> b = K.module_generators[Integer(0)]
>>> b.phi(Integer(0)) # indirect doctest
0
```

class sage.combinat.crystals.kirillov_reshetikhin.**KR_type_E6**(*cartan_type*, *r*, *s*)

Bases: *KirillovReshetikhinCrystalFromPromotion*

Class of Kirillov-Reshetikhin crystals of type $E_6^{(1)}$ for $r = 1, 2, 6$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['E',6,1],2,1)
sage: K.module_generator().e(0)
[]
sage: K.module_generator().e(0).f(0)
[[(2, -1), (1,)]]
sage: K = crystals.KirillovReshetikhin(['E',6,1], 1,1)
sage: b = K.module_generator()
sage: b
[(1,)]
sage: b.e(0)
[(-2, 1)]
sage: b = next(t for t in K if t.epsilon(1) == 1 and t.phi(3) == 1 and t.phi(2)␣
↪== 0 and t.epsilon(2) == 0)
sage: b
[(-1, 3)]
sage: b.e(0)
[(-1, -2, 3)]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['E',Integer(6),Integer(1)],Integer(2),
↪Integer(1))
>>> K.module_generator().e(Integer(0))
[]
>>> K.module_generator().e(Integer(0)).f(Integer(0))
[[(2, -1), (1,)]]
>>> K = crystals.KirillovReshetikhin(['E',Integer(6),Integer(1)], Integer(1),
↪Integer(1))
>>> b = K.module_generator()
>>> b
[(1,)]
>>> b.e(Integer(0))
[(-2, 1)]
>>> b = next(t for t in K if t.epsilon(Integer(1)) == Integer(1) and t.
↪phi(Integer(3)) == Integer(1) and t.phi(Integer(2)) == Integer(0) and t.
```

(continues on next page)

(continued from previous page)

```
↪epsilon(Integer(2)) == Integer(0))
>>> b
[(-1, 3)]
>>> b.e(Integer(0))
[(-1, -2, 3)]
```

The elements of the Kirillov-Reshetikhin crystals can be constructed from a classical crystal element using `retract()`.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['E',6,1],2,1)
sage: La = K.cartan_type().classical().root_system().weight_lattice().fundamental_
↪weights()
sage: H = crystals.HighestWeight(La[2])
sage: t = H.module_generator()
sage: t
[[(2, -1), (1,)]]
sage: type(K.retract(t))
<class 'sage.combinat.crystals.kirillov_reshetikhin.KR_type_E6_with_category.
↪element_class'>
sage: K.retract(t).e(0)
[]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['E',Integer(6),Integer(1)],Integer(2),
↪Integer(1))
>>> La = K.cartan_type().classical().root_system().weight_lattice().fundamental_
↪weights()
>>> H = crystals.HighestWeight(La[Integer(2)])
>>> t = H.module_generator()
>>> t
[[(2, -1), (1,)]]
>>> type(K.retract(t))
<class 'sage.combinat.crystals.kirillov_reshetikhin.KR_type_E6_with_category.
↪element_class'>
>>> K.retract(t).e(Integer(0))
[]
```

affine_weight(*b*)

Return the affine level zero weight corresponding to the element `b` of the classical crystal underlying `self`.

For the coefficients to calculate the level, see Table Aff 1 in [Ka1990].

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['E',6,1],2,1)
sage: [K.affine_weight(x.lift()) for x in K
....:  if all(x.epsilon(i) == 0 for i in [2,3,4,5])]
[(0, 0, 0, 0, 0, 0, 0),
 (-2, 0, 1, 0, 0, 0, 0),
 (-1, -1, 0, 0, 0, 1, 0),
 (0, 0, 0, 0, 0, 0, 0),
```

(continues on next page)

(continued from previous page)

```
 (0, 0, 0, 0, 0, 1, -2),
 (0, -1, 1, 0, 0, 0, -1),
 (-1, 0, 0, 1, 0, 0, -1),
 (-1, -1, 0, 0, 1, 0, -1),
 (0, 0, 0, 0, 0, 0, 0),
 (0, -2, 0, 1, 0, 0, 0)]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['E',Integer(6),Integer(1)],Integer(2),
↪Integer(1))
>>> [K.affine_weight(x.lift()) for x in K
...  if all(x.epsilon(i) == Integer(0) for i in [Integer(2),Integer(3),
↪Integer(4),Integer(5)])]
[(0, 0, 0, 0, 0, 0, 0),
 (-2, 0, 1, 0, 0, 0, 0),
 (-1, -1, 0, 0, 0, 1, 0),
 (0, 0, 0, 0, 0, 0, 0),
 (0, 0, 0, 0, 0, 1, -2),
 (0, -1, 1, 0, 0, 0, -1),
 (-1, 0, 0, 1, 0, 0, -1),
 (-1, -1, 0, 0, 1, 0, -1),
 (0, 0, 0, 0, 0, 0, 0),
 (0, -2, 0, 1, 0, 0, 0)]
```

automorphism_on_affine_weight(*weight*)

Act with the Dynkin diagram automorphism on affine weights as outputted by the `affine_weight` method.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['E',6,1],2,1)
sage: sorted([x[0], K.automorphism_on_affine_weight(x[0])]
....:  for x in K.highest_weight_dict().values())
[[(-2, 0, 1, 0, 0, 0, 0), (0, -2, 0, 1, 0, 0, 0)],
 [(-1, 0, 0, 1, 0, 0, -1), (-1, -1, 0, 0, 0, 1, 0)],
 [(0, 0, 0, 0, 0, 0, 0), (0, 0, 0, 0, 0, 0, 0)],
 [(0, 0, 0, 0, 0, 0, 0), (0, 0, 0, 0, 0, 0, 0)],
 [(0, 0, 0, 0, 0, 1, -2), (-2, 0, 1, 0, 0, 0, 0)]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['E',Integer(6),Integer(1)],Integer(2),
↪Integer(1))
>>> sorted([x[Integer(0)], K.automorphism_on_affine_weight(x[Integer(0)])]
...  for x in K.highest_weight_dict().values())
[[(-2, 0, 1, 0, 0, 0, 0), (0, -2, 0, 1, 0, 0, 0)],
 [(-1, 0, 0, 1, 0, 0, -1), (-1, -1, 0, 0, 0, 1, 0)],
 [(0, 0, 0, 0, 0, 0, 0), (0, 0, 0, 0, 0, 0, 0)],
 [(0, 0, 0, 0, 0, 0, 0), (0, 0, 0, 0, 0, 0, 0)],
 [(0, 0, 0, 0, 0, 1, -2), (-2, 0, 1, 0, 0, 0, 0)]]
```

classical_decomposition()

Specifies the classical crystal underlying the KR crystal of type $E_6^{(1)}$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['E',6,1], 2,2)
sage: K.classical_decomposition()
Direct sum of the crystals Family
 (Finite dimensional highest weight crystal of type ['E', 6] and highest␣
↪weight 0,
  Finite dimensional highest weight crystal of type ['E', 6] and highest␣
↪weight Lambda[2],
  Finite dimensional highest weight crystal of type ['E', 6] and highest␣
↪weight 2*Lambda[2])
sage: K = crystals.KirillovReshetikhin(['E',6,1], 1,2)
sage: K.classical_decomposition()
Direct sum of the crystals Family
 (Finite dimensional highest weight crystal of type ['E', 6] and highest␣
↪weight 2*Lambda[1],)
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['E',Integer(6),Integer(1)], Integer(2),
↪Integer(2))
>>> K.classical_decomposition()
Direct sum of the crystals Family
 (Finite dimensional highest weight crystal of type ['E', 6] and highest␣
↪weight 0,
  Finite dimensional highest weight crystal of type ['E', 6] and highest␣
↪weight Lambda[2],
  Finite dimensional highest weight crystal of type ['E', 6] and highest␣
↪weight 2*Lambda[2])
>>> K = crystals.KirillovReshetikhin(['E',Integer(6),Integer(1)], Integer(1),
↪Integer(2))
>>> K.classical_decomposition()
Direct sum of the crystals Family
 (Finite dimensional highest weight crystal of type ['E', 6] and highest␣
↪weight 2*Lambda[1],)
```

dynkin_diagram_automorphism(*i*)

Specifies the Dynkin diagram automorphism underlying the promotion action on the crystal elements.

Here we use the Dynkin diagram automorphism of order 3 which maps node 0 to node 1.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['E',6,1],2,1)
sage: [K.dynkin_diagram_automorphism(i) for i in K.index_set()]
[1, 6, 3, 5, 4, 2, 0]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['E',Integer(6),Integer(1)],Integer(2),
↪Integer(1))
>>> [K.dynkin_diagram_automorphism(i) for i in K.index_set()]
[1, 6, 3, 5, 4, 2, 0]
```

highest_weight_dict()

Return a dictionary between $\{1, 2, 3, 4, 5\}$-highest weight elements, and a tuple of affine weights and its classical component.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['E',6,1],2,1)
sage: sorted(K.highest_weight_dict().items(), key=str)
[([[(2, -1), (1,)]], ((-2, 0, 1, 0, 0, 0, 0), 1)),
 ([[(3, -1, -6), (1,)]], ((-1, 0, 0, 1, 0, 0, -1), 1)),
 ([[(5, -2, -6), (-6, 2)]], ((0, 0, 0, 0, 0, 1, -2), 1)),
 ([[(6, -2), (-6, 2)]], ((0, 0, 0, 0, 0, 0, 0), 1)),
 ([], ((0, 0, 0, 0, 0, 0, 0), 0))]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['E',Integer(6),Integer(1)],Integer(2),
↪Integer(1))
>>> sorted(K.highest_weight_dict().items(), key=str)
[([[(2, -1), (1,)]], ((-2, 0, 1, 0, 0, 0, 0), 1)),
 ([[(3, -1, -6), (1,)]], ((-1, 0, 0, 1, 0, 0, -1), 1)),
 ([[(5, -2, -6), (-6, 2)]], ((0, 0, 0, 0, 0, 1, -2), 1)),
 ([[(6, -2), (-6, 2)]], ((0, 0, 0, 0, 0, 0, 0), 1)),
 ([], ((0, 0, 0, 0, 0, 0, 0), 0))]
```

highest_weight_dict_inv()

Return a dictionary between a tuple of affine weights and a classical component, and $\{2, 3, 4, 5, 6\}$-highest weight elements.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['E',6,1],2,1)
sage: K.highest_weight_dict_inv()
{((-2, 0, 1, 0, 0, 0, 0), 1): [[(2, -1), (1,)]],
 ((-1, -1, 0, 0, 0, 1, 0), 1): [[(5, -3), (-1, 3)]],
 ((0, -2, 0, 1, 0, 0, 0), 1): [[(-1,), (-1, 3)]],
 ((0, 0, 0, 0, 0, 0, 0), 0): [],
 ((0, 0, 0, 0, 0, 0, 0), 1): [[(1, -3), (-1, 3)]]}
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['E',Integer(6),Integer(1)],Integer(2),
↪Integer(1))
>>> K.highest_weight_dict_inv()
{((-2, 0, 1, 0, 0, 0, 0), 1): [[(2, -1), (1,)]],
 ((-1, -1, 0, 0, 0, 1, 0), 1): [[(5, -3), (-1, 3)]],
 ((0, -2, 0, 1, 0, 0, 0), 1): [[(-1,), (-1, 3)]],
 ((0, 0, 0, 0, 0, 0, 0), 0): [],
 ((0, 0, 0, 0, 0, 0, 0), 1): [[(1, -3), (-1, 3)]]}
```

hw_auxiliary()

Return the $2, 3, 4, 5$ highest weight elements of `self`.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['E',6,1],2,1)
sage: K.hw_auxiliary()
([], [[(2, -1), (1,)]],
 [[(5, -3), (-1, 3)]],
 [[(6, -2), (-6, 2)]],
```

(continues on next page)

(continued from previous page)

```
 [[(5, -2, -6), (-6, 2)]],
 [[(-1,), (-6, 2)]],
 [[(3, -1, -6), (1,)]],
 [[(4, -3, -6), (-1, 3)]],
 [[(1, -3), (-1, 3)]],
 [[(-1,), (-1, 3)]])
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['E',Integer(6),Integer(1)],Integer(2),
↪Integer(1))
>>> K.hw_auxiliary()
([], [[(2, -1), (1,)]],
 [[(5, -3), (-1, 3)]],
 [[(6, -2), (-6, 2)]],
 [[(5, -2, -6), (-6, 2)]],
 [[(-1,), (-6, 2)]],
 [[(3, -1, -6), (1,)]],
 [[(4, -3, -6), (-1, 3)]],
 [[(1, -3), (-1, 3)]],
 [[(-1,), (-1, 3)]])
```

promotion()

Specifies the promotion operator used to construct the affine type $E_6^{(1)}$ crystal.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['E',6,1], 2,1)
sage: promotion = K.promotion()
sage: all(promotion(promotion(promotion(b))) == b for b in K.classical_
↪decomposition())
True
sage: K = crystals.KirillovReshetikhin(['E',6,1],1,1)
sage: promotion = K.promotion()
sage: all(promotion(promotion(promotion(b))) == b for b in K.classical_
↪decomposition())
True
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['E',Integer(6),Integer(1)], Integer(2),
↪Integer(1))
>>> promotion = K.promotion()
>>> all(promotion(promotion(promotion(b))) == b for b in K.classical_
↪decomposition())
True
>>> K = crystals.KirillovReshetikhin(['E',Integer(6),Integer(1)],Integer(1),
↪Integer(1))
>>> promotion = K.promotion()
>>> all(promotion(promotion(promotion(b))) == b for b in K.classical_
↪decomposition())
True
```

promotion_inverse()

Return the inverse promotion. Since promotion is of order 3, the inverse promotion is the same as promotion applied twice.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['E',6,1], 2,1)
sage: p = K.promotion()
sage: p_inv = K.promotion_inverse()
sage: all(p_inv(p(b)) == b for b in K.classical_decomposition())
True
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['E',Integer(6),Integer(1)], Integer(2),
↪Integer(1))
>>> p = K.promotion()
>>> p_inv = K.promotion_inverse()
>>> all(p_inv(p(b)) == b for b in K.classical_decomposition())
True
```

promotion_on_highest_weight_vectors()

Return a dictionary of the promotion map on $\{1, 2, 3, 4, 5\}$-highest weight elements to $\{2, 3, 4, 5, 6\}$-highest weight elements in `self`.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['E',6,1], 2, 1)
sage: dic = K.promotion_on_highest_weight_vectors()
sage: sorted(dic.items(), key=str)
[([[(2, -1), (1,)]], [[(-1,), (-1, 3)]]),
 ([[(3, -1, -6), (1,)]], [[(5, -3), (-1, 3)]]),
 ([[(5, -2, -6), (-6, 2)]], [[(2, -1), (1,)]]),
 ([[(6, -2), (-6, 2)]], []),
 ([], [[(1, -3), (-1, 3)]])]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['E',Integer(6),Integer(1)], Integer(2),␣
↪Integer(1))
>>> dic = K.promotion_on_highest_weight_vectors()
>>> sorted(dic.items(), key=str)
[([[(2, -1), (1,)]], [[(-1,), (-1, 3)]]),
 ([[(3, -1, -6), (1,)]], [[(5, -3), (-1, 3)]]),
 ([[(5, -2, -6), (-6, 2)]], [[(2, -1), (1,)]]),
 ([[(6, -2), (-6, 2)]], []),
 ([], [[(1, -3), (-1, 3)]])]
```

promotion_on_highest_weight_vectors_function()

Return a lambda function on `x` defined by `self.promotion_on_highest_weight_vectors()[x]`.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['E',6,1], 2, 1)
sage: f = K.promotion_on_highest_weight_vectors_function()
sage: f(K.module_generator().lift())
[[(-1,), (-1, 3)]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['E',Integer(6),Integer(1)], Integer(2),
↪Integer(1))
>>> f = K.promotion_on_highest_weight_vectors_function()
>>> f(K.module_generator().lift())
[[(-1,), (-1, 3)]]
```

class sage.combinat.crystals.kirillov_reshetikhin.**KR_type_E7**(*ct*, *r*, *s*)

Bases: *KirillovReshetikhinGenericCrystal*

The Kirillov-Reshetikhin crystal $B^{7,s}$ of type $E_7^{(1)}$.

A7_decomposition()

Return the decomposition of `self` into A_7 highest weight crystals.

The A_7 decomposition of $B^{7,s}$ is given by the parameters $m_4, m_5, m_6, m_7 \geq 0$ such that $m_4 + m_5 \leq m_7$ and $s = m_4 + m_5 + m_6 + m_7$. The corresponding A_7 highest weight crystal has highest weight $\lambda = (m_7 - m_4 - m_5)\Lambda_6 + m_5\Lambda_4 + m_6\Lambda_2$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['E',7,1], 7, 3)
sage: K.A7_decomposition()
The crystal of tableaux of type ['A', 7] and shape(s)
 [[3, 3, 3, 3, 3, 3], [3, 3, 2, 2, 2, 2], [3, 3, 1, 1, 1, 1], [3, 3],
  [2, 2, 2, 2, 1, 1], [2, 2, 1, 1], [1, 1, 1, 1, 1, 1], [1, 1]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['E',Integer(7),Integer(1)], Integer(7),
↪Integer(3))
>>> K.A7_decomposition()
The crystal of tableaux of type ['A', 7] and shape(s)
 [[3, 3, 3, 3, 3, 3], [3, 3, 2, 2, 2, 2], [3, 3, 1, 1, 1, 1], [3, 3],
  [2, 2, 2, 2, 1, 1], [2, 2, 1, 1], [1, 1, 1, 1, 1, 1], [1, 1]]
```

class Element

Bases: *KirillovReshetikhinGenericCrystalElement*

e0()

Return the action of e_0 on `self`.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['E',7,1], 7, 2)
sage: mg = K.module_generator()
sage: mg.e0()
[[(7,), (-1, 7)]]
sage: mg.e0().e0()
[[(-1, 7), (-1, 7)]]
sage: mg.e_string([0,0,0]) is None
True
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['E',Integer(7),Integer(1)],
```

(continues on next page)

(continued from previous page)

```
↪Integer(7), Integer(2))
>>> mg = K.module_generator()
>>> mg.e0()
[[(7,), (-1, 7)]]
>>> mg.e0().e0()
[[(-1, 7), (-1, 7)]]
>>> mg.e_string([Integer(0),Integer(0),Integer(0)]) is None
True
```

f0()

Return the action of f_0 on `self`.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['E',7,1], 7, 2)
sage: mg = K.module_generator()
sage: x = mg.f_string([7,6,5,4,3,2,4,5,6,1,3,4,5,2,4,3,1])
sage: x.f0()
[[(7,), (7,)]]
sage: mg.f0() is None
True
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['E',Integer(7),Integer(1)],␣
↪Integer(7), Integer(2))
>>> mg = K.module_generator()
>>> x = mg.f_string([Integer(7),Integer(6),Integer(5),Integer(4),
↪Integer(3),Integer(2),Integer(4),Integer(5),Integer(6),Integer(1),
↪Integer(3),Integer(4),Integer(5),Integer(2),Integer(4),Integer(3),
↪Integer(1)])
>>> x.f0()
[[(7,), (7,)]]
>>> mg.f0() is None
True
```

classical_decomposition()

Return the classical decomposition of `self`.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['E',7,1], 7, 4)
sage: K.classical_decomposition()
The crystal of tableaux of type ['E', 7] and shape(s) [[4]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['E',Integer(7),Integer(1)], Integer(7),␣
↪Integer(4))
>>> K.classical_decomposition()
The crystal of tableaux of type ['E', 7] and shape(s) [[4]]
```

from_A7_crystal()

Return the inclusion of the KR crystal $B^{7,s}$ of type $E_7^{(1)}$ into type A_7 highest weight crystals.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['E',7,1], 7, 2)
sage: K.from_A7_crystal()
['A', 6] -> ['E', 7, 1] Virtual Crystal morphism:
  From: The crystal of tableaux of type ['A', 7] and shape(s)
    [[2, 2, 2, 2, 2, 2], [2, 2, 1, 1, 1, 1], [2, 2], [1, 1, 1, 1], []]
  To:   Kirillov-Reshetikhin crystal of type ['E', 7, 1] with (r,s)=(7,2)
  Defn: ...
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['E',Integer(7),Integer(1)], Integer(7),␣
↪Integer(2))
>>> K.from_A7_crystal()
['A', 6] -> ['E', 7, 1] Virtual Crystal morphism:
  From: The crystal of tableaux of type ['A', 7] and shape(s)
    [[2, 2, 2, 2, 2, 2], [2, 2, 1, 1, 1, 1], [2, 2], [1, 1, 1, 1], []]
  To:   Kirillov-Reshetikhin crystal of type ['E', 7, 1] with (r,s)=(7,2)
  Defn: ...
```

to_A7_crystal()

Return the map decomposing the KR crystal $B^{7,s}$ of type $E_7^{(1)}$ into type A_7 highest weight crystals.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['E',7,1], 7, 2)
sage: K.to_A7_crystal()
['A', 6] relabelled by {1: 1, 2: 3, 3: 4, 4: 5, 5: 6, 6: 7} -> ['A', 7]␣
↪Virtual Crystal morphism:
  From: Kirillov-Reshetikhin crystal of type ['E', 7, 1] with (r,s)=(7,2)
  To:   The crystal of tableaux of type ['A', 7] and shape(s)
    [[2, 2, 2, 2, 2, 2], [2, 2, 1, 1, 1, 1], [2, 2], [1, 1, 1, 1], []]
  Defn: ...
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['E',Integer(7),Integer(1)], Integer(7),␣
↪Integer(2))
>>> K.to_A7_crystal()
['A', 6] relabelled by {1: 1, 2: 3, 3: 4, 4: 5, 5: 6, 6: 7} -> ['A', 7]␣
↪Virtual Crystal morphism:
  From: Kirillov-Reshetikhin crystal of type ['E', 7, 1] with (r,s)=(7,2)
  To:   The crystal of tableaux of type ['A', 7] and shape(s)
    [[2, 2, 2, 2, 2, 2], [2, 2, 1, 1, 1, 1], [2, 2], [1, 1, 1, 1], []]
  Defn: ...
```

class sage.combinat.crystals.kirillov_reshetikhin.**KR_type_box**(*cartan_type*, *r*, *s*)

Bases: *KirillovReshetikhinGenericCrystal*, *AffineCrystalFromClassical*

Class of Kirillov-Reshetikhin crystals $B^{r,s}$ of type $A_{2n}^{(2)}$ for $r \leq n$ and type $D_{n+1}^{(2)}$ for $r < n$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['A',4,2], 1,1)
sage: K
```

(continues on next page)

(continued from previous page)

```
Kirillov-Reshetikhin crystal of type ['BC', 2, 2] with (r,s)=(1,1)
sage: b = K(rows=[])
sage: b.f(0)
[[1]]
sage: b.e(0)
[[-1]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(4),Integer(2)], Integer(1),
↪Integer(1))
>>> K
Kirillov-Reshetikhin crystal of type ['BC', 2, 2] with (r,s)=(1,1)
>>> b = K(rows=[])
>>> b.f(Integer(0))
[[1]]
>>> b.e(Integer(0))
[[-1]]
```

Element

alias of *KR_type_boxElement*

ambient_crystal()

Return the ambient crystal $B^{r,2s}$ of type $C_n^{(1)}$ associated to the Kirillov-Reshetikhin crystal.

The ambient crystal is used to construct the zero arrows.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['A',4,2], 2,2)
sage: K.ambient_crystal()
Kirillov-Reshetikhin crystal of type ['C', 2, 1] with (r,s)=(2,4)
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(4),Integer(2)], Integer(2),
↪Integer(2))
>>> K.ambient_crystal()
Kirillov-Reshetikhin crystal of type ['C', 2, 1] with (r,s)=(2,4)
```

ambient_highest_weight_dict()

Return a dictionary of the classical highest weight vectors of the ambient crystal of `self` whose keys are their shape.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['A',6,2], 2,2)
sage: K.ambient_highest_weight_dict()
{[]: [],
 [2]: [[1, 1]],
 [2, 2]: [[1, 1], [2, 2]],
 [4]: [[1, 1, 1, 1]],
 [4, 2]: [[1, 1, 1, 1], [2, 2]],
 [4, 4]: [[1, 1, 1, 1], [2, 2, 2, 2]]}
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(6),Integer(2)], Integer(2),
↪Integer(2))
>>> K.ambient_highest_weight_dict()
{[]: [],
 [2]: [[1, 1]],
 [2, 2]: [[1, 1], [2, 2]],
 [4]: [[1, 1, 1, 1]],
 [4, 2]: [[1, 1, 1, 1], [2, 2]],
 [4, 4]: [[1, 1, 1, 1], [2, 2, 2, 2]]}
```

classical_decomposition()

Return the classical crystal underlying the Kirillov-Reshetikhin crystal of type $A_{2n}^{(2)}$ and $D_{n+1}^{(2)}$.

It is given by $B^{r,s} \cong \bigoplus_{\Lambda} B(\Lambda)$, where Λ are weights obtained from a rectangle of width s and height r by removing boxes. Here we identify the fundamental weight Λ_i with a column of height i.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['A',4,2], 2,2)
sage: K.classical_decomposition()
The crystal of tableaux of type ['C', 2] and shape(s) [[], [1], [2], [1, 1],␣
↪[2, 1], [2, 2]]
sage: K = crystals.KirillovReshetikhin(['D',4,2], 2,3)
sage: K.classical_decomposition()
The crystal of tableaux of type ['B', 3] and shape(s) [[], [1], [2], [1, 1],␣
↪[3], [2, 1], [3, 1], [2, 2], [3, 2], [3, 3]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(4),Integer(2)], Integer(2),
↪Integer(2))
>>> K.classical_decomposition()
The crystal of tableaux of type ['C', 2] and shape(s) [[], [1], [2], [1, 1],␣
↪[2, 1], [2, 2]]
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(2)], Integer(2),
↪Integer(3))
>>> K.classical_decomposition()
The crystal of tableaux of type ['B', 3] and shape(s) [[], [1], [2], [1, 1],␣
↪[3], [2, 1], [3, 1], [2, 2], [3, 2], [3, 3]]
```

from_ambient_crystal()

Return a map from the ambient crystal of type $C_n^{(1)}$ to the Kirillov-Reshetikhin crystal `self`.

Note that this map is only well-defined on elements that are in the image under *to_ambient_crystal()*.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,2], 1,1)
sage: b = K.ambient_crystal()(rows=[[3,-3]])
sage: K.from_ambient_crystal()(b)
[[0]]
sage: K = crystals.KirillovReshetikhin(['A',4,2], 1,1)
sage: b = K.ambient_crystal()(rows=[])
```

(continues on next page)

(continued from previous page)

```
sage: K.from_ambient_crystal()(b)
[]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(2)], Integer(1),
↪Integer(1))
>>> b = K.ambient_crystal()(rows=[[Integer(3),-Integer(3)]])
>>> K.from_ambient_crystal()(b)
[[0]]
>>> K = crystals.KirillovReshetikhin(['A',Integer(4),Integer(2)], Integer(1),
↪Integer(1))
>>> b = K.ambient_crystal()(rows=[])
>>> K.from_ambient_crystal()(b)
[]
```

highest_weight_dict()

Return a dictionary of the classical highest weight vectors of `self` whose keys are 2 times their shape.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['A',6,2], 2,2)
sage: K.highest_weight_dict()
{[]: [],
 [2]: [[1]],
 [2, 2]: [[1], [2]],
 [4]: [[1, 1]],
 [4, 2]: [[1, 1], [2]],
 [4, 4]: [[1, 1], [2, 2]]}
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(6),Integer(2)], Integer(2),
↪Integer(2))
>>> K.highest_weight_dict()
{[]: [],
 [2]: [[1]],
 [2, 2]: [[1], [2]],
 [4]: [[1, 1]],
 [4, 2]: [[1, 1], [2]],
 [4, 4]: [[1, 1], [2, 2]]}
```

similarity_factor()

Set the similarity factor used to map to the ambient crystal.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['A',6,2], 2,2)
sage: K.similarity_factor()
{1: 2, 2: 2, 3: 2}
sage: K = crystals.KirillovReshetikhin(['D',5,2], 1,1)
sage: K.similarity_factor()
{1: 2, 2: 2, 3: 2, 4: 1}
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(6),Integer(2)], Integer(2),
↪Integer(2))
>>> K.similarity_factor()
{1: 2, 2: 2, 3: 2}
>>> K = crystals.KirillovReshetikhin(['D',Integer(5),Integer(2)], Integer(1),
↪Integer(1))
>>> K.similarity_factor()
{1: 2, 2: 2, 3: 2, 4: 1}
```

to_ambient_crystal()

Return a map from `self` to the ambient crystal of type $C_n^{(1)}$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,2], 1,1)
sage: [K.to_ambient_crystal()(b) for b in K]
[[], [[1, 1]], [[2, 2]], [[3, 3]], [[3, -3]], [[-3, -3]], [[-2, -2]], [[-1, -
↪1]]]
sage: K = crystals.KirillovReshetikhin(['A',4,2], 1,1)
sage: [K.to_ambient_crystal()(b) for b in K]
[[], [[1, 1]], [[2, 2]], [[-2, -2]], [[-1, -1]]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(2)], Integer(1),
↪Integer(1))
>>> [K.to_ambient_crystal()(b) for b in K]
[[], [[1, 1]], [[2, 2]], [[3, 3]], [[3, -3]], [[-3, -3]], [[-2, -2]], [[-1, -
↪1]]]
>>> K = crystals.KirillovReshetikhin(['A',Integer(4),Integer(2)], Integer(1),
↪Integer(1))
>>> [K.to_ambient_crystal()(b) for b in K]
[[], [[1, 1]], [[2, 2]], [[-2, -2]], [[-1, -1]]]
```

class sage.combinat.crystals.kirillov_reshetikhin.**KR_type_boxElement**

Bases: *KirillovReshetikhinGenericCrystalElement*

Class for the elements in the Kirillov-Reshetikhin crystals $B^{r,s}$ of type $A_{2n}^{(2)}$ for $r \leq n$ and type $D_{n+1}^{(2)}$ for $r < n$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['A',4,2],1,2)
sage: type(K.module_generators[0])
<class 'sage.combinat.crystals.kirillov_reshetikhin.KR_type_box_with_category.
↪element_class'>
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(4),Integer(2)],Integer(1),
↪Integer(2))
>>> type(K.module_generators[Integer(0)])
<class 'sage.combinat.crystals.kirillov_reshetikhin.KR_type_box_with_category.
↪element_class'>
```

e0()

Return e_0 on `self` by mapping `self` to the ambient crystal, calculating e_0 there and pulling the element back.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['A',4,2],1,1)
sage: b = K(rows=[])
sage: b.e(0) # indirect doctest
[[-1]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(4),Integer(2)],Integer(1),
↪Integer(1))
>>> b = K(rows=[])
>>> b.e(Integer(0)) # indirect doctest
[[-1]]
```

epsilon0()

Return ε_0 of `self` by mapping the element to the ambient crystal and calculating ε_0 there.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['A',4,2], 1,1)
sage: b = K(rows=[[1]])
sage: b.epsilon(0) # indirect doctest
2
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(4),Integer(2)], Integer(1),
↪Integer(1))
>>> b = K(rows=[[Integer(1)]])
>>> b.epsilon(Integer(0)) # indirect doctest
2
```

f0()

Return f_0 on `self` by mapping `self` to the ambient crystal, calculating f_0 there and pulling the element back.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['A',4,2],1,1)
sage: b = K(rows=[])
sage: b.f(0) # indirect doctest
[[1]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(4),Integer(2)],Integer(1),
↪Integer(1))
>>> b = K(rows=[])
>>> b.f(Integer(0)) # indirect doctest
[[1]]
```

phi0()

Return φ_0 of `self` by mapping the element to the ambient crystal and calculating φ_0 there.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',3,2], 1,1)
sage: b = K(rows=[[-1]])
sage: b.phi(0) # indirect doctest
2
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(3),Integer(2)], Integer(1),
↪Integer(1))
>>> b = K(rows=[[-Integer(1)]])
>>> b.phi(Integer(0)) # indirect doctest
2
```

class sage.combinat.crystals.kirillov_reshetikhin.**KR_type_spin**(*cartan_type*, *r*, *s*)

Bases: *KirillovReshetikhinCrystalFromPromotion*

Class of Kirillov-Reshetikhin crystals $B^{n,s}$ of type $D_n^{(1)}$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,1],4,1); K
Kirillov-Reshetikhin crystal of type ['D', 4, 1] with (r,s)=(4,1)
sage: [[b,b.f(0)] for b in K]
[[[++++, []], None], [[++--, []], None], [[+-+-, []], None],
 [[-++-, []], None], [[+--+, []], None], [[-+-+, []], None],
 [[--++, []], [++++, []]], [[----, []], [++--, []]]]

sage: K = crystals.KirillovReshetikhin(['D',4,1],4,2); K
Kirillov-Reshetikhin crystal of type ['D', 4, 1] with (r,s)=(4,2)
sage: [[b,b.f(0)] for b in K]
[[[[1], [2], [3], [4]], None], [[[1], [2], [-4], [4]], None],

```

classical_decomposition()

Return the classical crystal underlying the Kirillov-Reshetikhin crystal $B^{r,s}$ of type $D_n^{(1)}$ for $r = n-1, n$.

The classical decomposition is given by $B^{n,s} \cong B(s\Lambda_r)$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,1],4,1)
sage: K.classical_decomposition()
The crystal of tableaux of type ['D', 4] and shape(s) [[1/2, 1/2, 1/2, 1/2]]
sage: K = crystals.KirillovReshetikhin(['D',4,1],3,1)
sage: K.classical_decomposition()
The crystal of tableaux of type ['D', 4] and shape(s) [[1/2, 1/2, 1/2, -1/2]]
sage: K = crystals.KirillovReshetikhin(['D',4,1],3,2)
sage: K.classical_decomposition()
The crystal of tableaux of type ['D', 4] and shape(s) [[1, 1, 1, -1]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)],Integer(4),
↪Integer(1))
>>> K.classical_decomposition()
The crystal of tableaux of type ['D', 4] and shape(s) [[1/2, 1/2, 1/2, 1/2]]
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)],Integer(3),
↪Integer(1))
>>> K.classical_decomposition()
The crystal of tableaux of type ['D', 4] and shape(s) [[1/2, 1/2, 1/2, -1/2]]
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)],Integer(3),
↪Integer(2))
>>> K.classical_decomposition()
The crystal of tableaux of type ['D', 4] and shape(s) [[1, 1, 1, -1]]
```

dynkin_diagram_automorphism(*i*)

Specifies the Dynkin diagram automorphism underlying the promotion action on the crystal elements.

Here we use the Dynkin diagram automorphism which interchanges nodes 0 and 1 and leaves all other nodes unchanged.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,1],4,1)
sage: K.dynkin_diagram_automorphism(0)
1
sage: K.dynkin_diagram_automorphism(1)
0
sage: K.dynkin_diagram_automorphism(4)
4
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)],Integer(4),
↪Integer(1))
>>> K.dynkin_diagram_automorphism(Integer(0))
1
>>> K.dynkin_diagram_automorphism(Integer(1))
0
>>> K.dynkin_diagram_automorphism(Integer(4))
4
```

promotion()

Return the promotion operator on $B^{r,s}$ of type $D_n^{(1)}$ for $r = n-1, n$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,1],3,1)
sage: T = K.classical_decomposition()
sage: promotion = K.promotion()
sage: for t in T:
....:     print("{} {}".format(t, promotion(t)))
[+++-, []] [-++-, []]
[++-+, []] [-+-+, []]
[+-++, []] [--++, []]
[-+++, []] [++++, []]
[+---, []] [----, []]
[-+--, []] [++--, []]
[--+-, []] [+-+-, []]
[---+, []] [+--+, []]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)],Integer(3),
↪Integer(1))
>>> T = K.classical_decomposition()
>>> promotion = K.promotion()
>>> for t in T:
...     print("{} {}".format(t, promotion(t)))
[+++-, []] [-++-, []]
[++-+, []] [-+-+, []]
[+-++, []] [--++, []]
[-+++, []] [++++, []]
[+---, []] [----, []]
[-+--, []] [++--, []]
[--+-, []] [+-+-, []]
[---+, []] [+--+, []]
```

promotion_inverse()

Return the inverse promotion operator on $B^{r,s}$ of type $D_n^{(1)}$ for $r = n-1, n$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,1],3,1)
sage: T = K.classical_decomposition()
sage: promotion = K.promotion()
sage: promotion_inverse = K.promotion_inverse()
sage: all(promotion_inverse(promotion(t)) == t for t in T)
True
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)],Integer(3),
↪Integer(1))
>>> T = K.classical_decomposition()
>>> promotion = K.promotion()
>>> promotion_inverse = K.promotion_inverse()
>>> all(promotion_inverse(promotion(t)) == t for t in T)
True
```

promotion_on_highest_weight_vectors()

Return the promotion operator on $\{2, 3, \ldots, n\}$-highest weight vectors.

A $\{2, 3, \ldots, n\}$-highest weight vector in $B(s\Lambda_n)$ of weight $w = (w_1, \ldots, w_n)$ is mapped to a $\{2, 3, \ldots, n\}$-highest weight vector in $B(s\Lambda_{n-1})$ of weight $(-w_1, w_2, \ldots, w_n)$ and vice versa.

See also:

- *promotion_on_highest_weight_vectors_inverse()*
- *promotion()*

EXAMPLES:

```
sage: KR = crystals.KirillovReshetikhin(['D',4,1],4,2)
sage: prom = KR.promotion_on_highest_weight_vectors()
sage: T = KR.classical_decomposition()
sage: HW = [t for t in T if t.is_highest_weight([2,3,4])]
sage: for t in HW:
....:     print("{} {}".format(t, prom[t]))
[[1], [2], [3], [4]] [[2], [3], [4], [-1]]
[[2], [3], [-4], [4]] [[2], [3], [4], [-4]]
[[2], [3], [-4], [-1]] [[1], [2], [3], [-4]]

sage: KR = crystals.KirillovReshetikhin(['D',4,1],4,1)
sage: prom = KR.promotion_on_highest_weight_vectors()
sage: T = KR.classical_decomposition()
sage: HW = [t for t in T if t.is_highest_weight([2,3,4])]
sage: for t in HW:
....:     print("{} {}".format(t, prom[t]))
[++++, []] [-+++, []]
[-++-, []] [+++-, []]
```

```
>>> from sage.all import *
>>> KR = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)],Integer(4),
↪Integer(2))
>>> prom = KR.promotion_on_highest_weight_vectors()
>>> T = KR.classical_decomposition()
>>> HW = [t for t in T if t.is_highest_weight([Integer(2),Integer(3),
↪Integer(4)])]
>>> for t in HW:
...     print("{} {}".format(t, prom[t]))
[[1], [2], [3], [4]] [[2], [3], [4], [-1]]
[[2], [3], [-4], [4]] [[2], [3], [4], [-4]]
[[2], [3], [-4], [-1]] [[1], [2], [3], [-4]]

>>> KR = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)],Integer(4),
↪Integer(1))
>>> prom = KR.promotion_on_highest_weight_vectors()
>>> T = KR.classical_decomposition()
>>> HW = [t for t in T if t.is_highest_weight([Integer(2),Integer(3),
↪Integer(4)])]
>>> for t in HW:
...     print("{} {}".format(t, prom[t]))
[++++, []] [-+++, []]
[-++-, []] [+++-, []]
```

promotion_on_highest_weight_vectors_inverse()

Return the inverse promotion operator on $\{2, 3, \ldots, n\}$-highest weight vectors.

> **See also**
>
> - *promotion_on_highest_weight_vectors()*
> - *promotion_inverse()*

EXAMPLES:

```
sage: KR = crystals.KirillovReshetikhin(['D',4,1],3,2)
sage: prom = KR.promotion_on_highest_weight_vectors()
sage: prom_inv = KR.promotion_on_highest_weight_vectors_inverse()
sage: T = KR.classical_decomposition()
sage: HW = [t for t in T if t.is_highest_weight([2,3,4])]
sage: all(prom_inv[prom[t]] == t for t in HW)
True
```

```
>>> from sage.all import *
>>> KR = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)],Integer(3),
↪Integer(2))
>>> prom = KR.promotion_on_highest_weight_vectors()
>>> prom_inv = KR.promotion_on_highest_weight_vectors_inverse()
>>> T = KR.classical_decomposition()
>>> HW = [t for t in T if t.is_highest_weight([Integer(2),Integer(3),
↪Integer(4)])]
>>> all(prom_inv[prom[t]] == t for t in HW)
True
```

class sage.combinat.crystals.kirillov_reshetikhin.**KR_type_vertical**(*cartan_type*, *r*, *s*)

Bases: *KirillovReshetikhinCrystalFromPromotion*

Class of Kirillov-Reshetikhin crystals $B^{r,s}$ of type $D_n^{(1)}$ for $r \leq n-2$, $B_n^{(1)}$ for $r < n$, and $A_{2n-1}^{(2)}$ for $r \leq n$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,1], 2,2)
sage: b = K(rows=[])
sage: b.f(0)
[[1], [2]]
sage: b.f(0).f(0)
[[1, 1], [2, 2]]
sage: b.e(0)
[[-2], [-1]]
sage: b.e(0).e(0)
[[-2, -2], [-1, -1]]

sage: K = crystals.KirillovReshetikhin(['D',5,1], 3,1)
sage: b = K(rows=[[1]])
sage: b.e(0)
[[3], [-3], [-2]]
```

(continues on next page)

(continued from previous page)

```
sage: K = crystals.KirillovReshetikhin(['B',3,1], 1,1)
sage: [[b,b.f(0)] for b in K]
[[[[1]], None], [[[2]], None], [[[3]], None], [[[0]], None],
 [[[-3]], None], [[[-2]], [[1]]], [[[-1]], [[2]]]]

sage: K = crystals.KirillovReshetikhin(['A',5,2], 1,1)
sage: [[b,b.f(0)] for b in K]
[[[[1]], None], [[[2]], None], [[[3]], None], [[[-3]], None],
 [[[-2]], [[1]]], [[[-1]], [[2]]]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)], Integer(2),
↪Integer(2))
>>> b = K(rows=[])
>>> b.f(Integer(0))
[[1], [2]]
>>> b.f(Integer(0)).f(Integer(0))
[[1, 1], [2, 2]]
>>> b.e(Integer(0))
[[-2], [-1]]
>>> b.e(Integer(0)).e(Integer(0))
[[-2, -2], [-1, -1]]

>>> K = crystals.KirillovReshetikhin(['D',Integer(5),Integer(1)], Integer(3),
↪Integer(1))
>>> b = K(rows=[[Integer(1)]])
>>> b.e(Integer(0))
[[3], [-3], [-2]]

>>> K = crystals.KirillovReshetikhin(['B',Integer(3),Integer(1)], Integer(1),
↪Integer(1))
>>> [[b,b.f(Integer(0))] for b in K]
[[[[1]], None], [[[2]], None], [[[3]], None], [[[0]], None],
 [[[-3]], None], [[[-2]], [[1]]], [[[-1]], [[2]]]]

>>> K = crystals.KirillovReshetikhin(['A',Integer(5),Integer(2)], Integer(1),
↪Integer(1))
>>> [[b,b.f(Integer(0))] for b in K]
[[[[1]], None], [[[2]], None], [[[3]], None], [[[-3]], None],
 [[[-2]], [[1]]], [[[-1]], [[2]]]]
```

classical_decomposition()

Specifies the classical crystal underlying the Kirillov-Reshetikhin crystal of type $D_n^{(1)}$, $B_n^{(1)}$, and $A_{2n-1}^{(2)}$.

It is given by $B^{r,s} \cong \bigoplus_\Lambda B(\Lambda)$, where Λ are weights obtained from a rectangle of width s and height r by removing vertical dominoes. Here we identify the fundamental weight Λ_i with a column of height i.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,1], 2,2)
sage: K.classical_decomposition()
The crystal of tableaux of type ['D', 4] and shape(s) [[], [1, 1], [2, 2]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)], Integer(2),
↪Integer(2))
>>> K.classical_decomposition()
The crystal of tableaux of type ['D', 4] and shape(s) [[], [1, 1], [2, 2]]
```

dynkin_diagram_automorphism(*i*)

Specifies the Dynkin diagram automorphism underlying the promotion action on the crystal elements. The automorphism needs to map node 0 to some other Dynkin node.

Here we use the Dynkin diagram automorphism which interchanges nodes 0 and 1 and leaves all other nodes unchanged.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,1],1,1)
sage: K.dynkin_diagram_automorphism(0)
1
sage: K.dynkin_diagram_automorphism(1)
0
sage: K.dynkin_diagram_automorphism(4)
4
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)],Integer(1),
↪Integer(1))
>>> K.dynkin_diagram_automorphism(Integer(0))
1
>>> K.dynkin_diagram_automorphism(Integer(1))
0
>>> K.dynkin_diagram_automorphism(Integer(4))
4
```

from_highest_weight_vector_to_pm_diagram(*b*)

This gives the bijection between an element b in the classical decomposition of the KR crystal that is $2, 3, \ldots, n$-highest weight and $\pm$ diagrams.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,1], 2,2)
sage: T = K.classical_decomposition()
sage: b = T(rows=[[2],[-2]])
sage: pm = K.from_highest_weight_vector_to_pm_diagram(b); pm
[[1, 1], [0, 0], [0]]
sage: pm.pp()
+
-
sage: b = T(rows=[])
sage: pm=K.from_highest_weight_vector_to_pm_diagram(b); pm
[[0, 2], [0, 0], [0]]
sage: pm.pp()

sage: hw = [ b for b in T if all(b.epsilon(i)==0 for i in [2,3,4]) ]
sage: all(K.from_pm_diagram_to_highest_weight_vector(K.from_highest_weight_
```

(continues on next page)

(continued from previous page)

```
↪vector_to_pm_diagram(b)) == b for b in hw)
True
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)], Integer(2),
↪Integer(2))
>>> T = K.classical_decomposition()
>>> b = T(rows=[[Integer(2)],[-Integer(2)]])
>>> pm = K.from_highest_weight_vector_to_pm_diagram(b); pm
[[1, 1], [0, 0], [0]]
>>> pm.pp()
+
-
>>> b = T(rows=[])
>>> pm=K.from_highest_weight_vector_to_pm_diagram(b); pm
[[0, 2], [0, 0], [0]]
>>> pm.pp()

>>> hw = [ b for b in T if all(b.epsilon(i)==Integer(0) for i in [Integer(2),
↪Integer(3),Integer(4)]) ]
>>> all(K.from_pm_diagram_to_highest_weight_vector(K.from_highest_weight_
↪vector_to_pm_diagram(b)) == b for b in hw)
True
```

from_pm_diagram_to_highest_weight_vector(*pm*)

This gives the bijection between a $\pm$ diagram and an element `b` in the classical decomposition of the KR crystal that is $2, 3, \ldots, n$-highest weight.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,1], 2,2)
sage: pm = sage.combinat.crystals.kirillov_reshetikhin.PMDiagram([[1, 1], [0,␣
↪0], [0]])
sage: K.from_pm_diagram_to_highest_weight_vector(pm)
[[2], [-2]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)], Integer(2),
↪Integer(2))
>>> pm = sage.combinat.crystals.kirillov_reshetikhin.PMDiagram([[Integer(1),␣
↪Integer(1)], [Integer(0), Integer(0)], [Integer(0)]])
>>> K.from_pm_diagram_to_highest_weight_vector(pm)
[[2], [-2]]
```

promotion()

Specifies the promotion operator used to construct the affine type $D_n^{(1)}$ etc. crystal.

This corresponds to the Dynkin diagram automorphism which interchanges nodes 0 and 1, and leaves all other nodes unchanged. On the level of crystals it is constructed using $\pm$ diagrams.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,1], 2,2)
sage: promotion = K.promotion()
sage: b = K.classical_decomposition()(rows=[])
sage: promotion(b)
[[1, 2], [-2, -1]]
sage: b = K.classical_decomposition()(rows=[[1,3],[2,-1]])
sage: promotion(b)
[[1, 3], [2, -1]]
sage: b = K.classical_decomposition()(rows=[[1],[-3]])
sage: promotion(b)
[[2, -3], [-2, -1]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)], Integer(2),
↪Integer(2))
>>> promotion = K.promotion()
>>> b = K.classical_decomposition()(rows=[])
>>> promotion(b)
[[1, 2], [-2, -1]]
>>> b = K.classical_decomposition()(rows=[[Integer(1),Integer(3)],[Integer(2),
↪-Integer(1)]])
>>> promotion(b)
[[1, 3], [2, -1]]
>>> b = K.classical_decomposition()(rows=[[Integer(1)],[-Integer(3)]])
>>> promotion(b)
[[2, -3], [-2, -1]]
```

promotion_inverse()

Return inverse of promotion.

In this case promotion is an involution, so promotion inverse equals promotion.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,1], 2,2)
sage: promotion = K.promotion()
sage: promotion_inverse = K.promotion_inverse()
sage: all( promotion_inverse(promotion(b.lift())) == b.lift() for b in K )
True
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)], Integer(2),
↪Integer(2))
>>> promotion = K.promotion()
>>> promotion_inverse = K.promotion_inverse()
>>> all( promotion_inverse(promotion(b.lift())) == b.lift() for b in K )
True
```

promotion_on_highest_weight_vector(b)

Calculate promotion on a $2, 3, \ldots, n$ highest weight vector b.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,1], 2,2)
sage: T = K.classical_decomposition()
sage: hw = [ b for b in T if all(b.epsilon(i)==0 for i in [2,3,4]) ]
sage: [K.promotion_on_highest_weight_vector(b) for b in hw]
[[[1, 2], [-2, -1]], [[2, 2], [-2, -1]], [[1, 2], [3, -1]],
 [[2], [-2]], [[1, 2], [2, -2]], [[2, 2], [-1, -1]],
 [[2, 2], [3, -1]], [[2, 2], [3, 3]], [], [[1], [2]],
 [[1, 1], [2, 2]], [[2], [-1]], [[1, 2], [2, -1]],
 [[2], [3]], [[1, 2], [2, 3]]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)], Integer(2),
↪Integer(2))
>>> T = K.classical_decomposition()
>>> hw = [ b for b in T if all(b.epsilon(i)==Integer(0) for i in [Integer(2),
↪Integer(3),Integer(4)]) ]
>>> [K.promotion_on_highest_weight_vector(b) for b in hw]
[[[1, 2], [-2, -1]], [[2, 2], [-2, -1]], [[1, 2], [3, -1]],
 [[2], [-2]], [[1, 2], [2, -2]], [[2, 2], [-1, -1]],
 [[2, 2], [3, -1]], [[2, 2], [3, 3]], [], [[1], [2]],
 [[1, 1], [2, 2]], [[2], [-1]], [[1, 2], [2, -1]],
 [[2], [3]], [[1, 2], [2, 3]]]
```

sage.combinat.crystals.kirillov_reshetikhin.**KashiwaraNakashimaTableaux**(*cartan_type*, *r*, *s*)

Return the Kashiwara-Nakashima model for the Kirillov-Reshetikhin crystal $B^{r,s}$ in the given type.

The Kashiwara-Nakashima (KN) model constructs the KR crystal from the KN tableaux model for the corresponding classical crystals. This model is named for the underlying KN tableaux.

Many Kirillov-Reshetikhin crystals are constructed from a classical crystal together with an automorphism p on the level of crystals which corresponds to a Dynkin diagram automorphism mapping node 0 to some other node i. The action of f_0 and e_0 is then constructed using $f_0 = p^{-1} \circ f_i \circ p$.

For example, for type $A_n^{(1)}$ the Kirillov-Reshetikhin crystal $B^{r,s}$ is obtained from the classical crystal $B(s\omega_r)$ using the promotion operator. For other types, see [Shi2002], [Sch2008], and [JS2010].

Other Kirillov-Reshetikhin crystals are constructed using similarity methods. See Section 4 of [FOS2009].

For more information on Kirillov-Reshetikhin crystals, see `KirillovReshetikhinCrystal()`.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['A',3,1], 2, 1)
sage: K2 = crystals.kirillov_reshetikhin.KashiwaraNakashimaTableaux(['A',3,1], 2,␣
↪1)
sage: K is K2
True
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(3),Integer(1)], Integer(2),␣
↪Integer(1))
>>> K2 = crystals.kirillov_reshetikhin.KashiwaraNakashimaTableaux(['A',Integer(3),
↪Integer(1)], Integer(2), Integer(1))
>>> K is K2
True
```

sage.combinat.crystals.kirillov_reshetikhin.**KirillovReshetikhinCrystal**(*cartan_type*, *r*, *s*, *model='KN'*)

Return the Kirillov-Reshetikhin crystal $B^{r,s}$ of the given type in the given model.

For more information about general crystals see *sage.combinat.crystals.crystals*.

There are a variety of models for Kirillov-Reshetikhin crystals. There is one using the classical crystal with *Kashiwara-Nakashima tableaux*. There is one using *rigged configurations*. Another tableaux model comes from the bijection between rigged configurations and tensor products of tableaux called *Kirillov-Reshetikhin tableaux* Lastly there is a model of Kirillov-Reshetikhin crystals for $s = 1$ from crystals of *LS paths*.

INPUT:

- `cartan_type` – an affine Cartan type
- `r` – a label of finite Dynkin diagram
- `s` – positive integer
- `model` – (default: `'KN'`) can be one of the following:
  - `'KN'` or `'KashiwaraNakashimaTableaux'` – use the Kashiwara-Nakashima tableaux model
  - `'KR'` or `'KirillovReshetkihinTableaux'` – use the Kirillov-Reshetkihin tableaux model
  - `'RC'` or `'RiggedConfiguration'` – use the rigged configuration model
  - `'LSPaths'` – use the LS path model

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['A',3,1], 2, 1)
sage: K.index_set()
(0, 1, 2, 3)
sage: K.list()
[[[1], [2]], [[1], [3]], [[2], [3]], [[1], [4]], [[2], [4]], [[3], [4]]]
sage: b=K(rows=[[1],[2]])
sage: b.weight()
-Lambda[0] + Lambda[2]

sage: K = crystals.KirillovReshetikhin(['A',3,1], 2,2)
sage: K.automorphism(K.module_generators[0])
[[2, 2], [3, 3]]
sage: K.module_generators[0].e(0)
[[1, 2], [2, 4]]
sage: K.module_generators[0].f(2)
[[1, 1], [2, 3]]
sage: K.module_generators[0].f(1)
sage: K.module_generators[0].phi(0)
0
sage: K.module_generators[0].phi(1)
0
sage: K.module_generators[0].phi(2)
2
sage: K.module_generators[0].epsilon(0)
2
sage: K.module_generators[0].epsilon(1)
0
sage: K.module_generators[0].epsilon(2)
```

`sage.combinat.crystals.kirillov_reshetikhin.`**`KirillovReshetikhinCrystalFromLSPaths`**(*cartan_type*, *r*, *s=1*)

Single column Kirillov-Reshetikhin crystals.

This yields the single column Kirillov-Reshetikhin crystals from the projected level zero LS paths, see *CrystalOfLSPaths*. This works for all types (even exceptional types). The weight of the canonical element in this crystal is Λ_r. For other implementation see *KirillovReshetikhinCrystal()*.

EXAMPLES:

```
sage: K = crystals.kirillov_reshetikhin.LSPaths(['A',2,1],2) # indirect doctest
sage: KR = crystals.KirillovReshetikhin(['A',2,1],2,1)
sage: G = K.digraph()
sage: GR = KR.digraph()
sage: G.is_isomorphic(GR, edge_labels = True)
True

sage: K = crystals.kirillov_reshetikhin.LSPaths(['C',3,1],2)
sage: KR = crystals.KirillovReshetikhin(['C',3,1],2,1)
sage: G = K.digraph()
sage: GR = KR.digraph()
sage: G.is_isomorphic(GR, edge_labels = True)
True

sage: K = crystals.kirillov_reshetikhin.LSPaths(['E',6,1],1)
sage: KR = crystals.KirillovReshetikhin(['E',6,1],1,1)
sage: G = K.digraph()
sage: GR = KR.digraph()
sage: G.is_isomorphic(GR, edge_labels = True)
True
sage: K.cardinality()
27
```

class sage.combinat.crystals.kirillov_reshetikhin.**KirillovReshetikhinCrystalFromPromotion**(*cartan_type*, *r*, *s*)

Bases: *KirillovReshetikhinGenericCrystal*, *AffineCrystalFromClassicalAndPromotion*

This generic class assumes that the Kirillov-Reshetikhin crystal is constructed from a classical crystal using the `classical_decomposition` and an automorphism `promotion` and its inverse, which corresponds to a Dynkin diagram automorphism `dynkin_diagram_automorphism`.

Each instance using this class needs to implement the methods:

- `classical_decomposition`
- `promotion`
- `promotion_inverse`
- `dynkin_diagram_automorphism`

Element

alias of *KirillovReshetikhinCrystalFromPromotionElement*

class sage.combinat.crystals.kirillov_reshetikhin.**KirillovReshetikhinCrystalFromPromotionElement**

Bases: *AffineCrystalFromClassicalAndPromotionElement*, *KirillovReshetikhinGenericCrystalElement*

Element for a Kirillov-Reshetikhin crystal from promotion.

class sage.combinat.crystals.kirillov_reshetikhin.**KirillovReshetikhinGenericCrystal**(*cartan_type*, *r*, *s*, *dual=None*)

Bases: *AffineCrystalFromClassical*

Generic class for Kirillov-Reshetikhin crystal $B^{r,s}$ of the given type.

Input is a Dynkin node `r`, a positive integer `s`, and a Cartan type `cartan_type`.

Element

alias of *KirillovReshetikhinGenericCrystalElement*

classically_highest_weight_vectors()

Return the classically highest weight vectors of `self`.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D', 4, 1], 2, 2)
sage: K.classically_highest_weight_vectors()
([], [[1], [2]], [[1, 1], [2, 2]])
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D', Integer(4), Integer(1)],␣
↪Integer(2), Integer(2))
>>> K.classically_highest_weight_vectors()
([], [[1], [2]], [[1, 1], [2, 2]])
```

kirillov_reshetikhin_tableaux()

Return the corresponding set of *KirillovReshetikhinTableaux*.

EXAMPLES:

```
sage: KRC = crystals.KirillovReshetikhin(['D', 4, 1], 2, 2)
sage: KRC.kirillov_reshetikhin_tableaux()
Kirillov-Reshetikhin tableaux of type ['D', 4, 1] and shape (2, 2)
```

```
>>> from sage.all import *
>>> KRC = crystals.KirillovReshetikhin(['D', Integer(4), Integer(1)],␣
↪Integer(2), Integer(2))
>>> KRC.kirillov_reshetikhin_tableaux()
Kirillov-Reshetikhin tableaux of type ['D', 4, 1] and shape (2, 2)
```

module_generator()

Return the unique module generator of classical weight $s\Lambda_r$ of a Kirillov-Reshetikhin crystal $B^{r,s}$

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C',2,1],1,2)
sage: K.module_generator()
[[1, 1]]
sage: K = crystals.KirillovReshetikhin(['E',6,1],1,1)
sage: K.module_generator()
[(1,)]

sage: K = crystals.KirillovReshetikhin(['D',4,1],2,1)
sage: K.module_generator()
[[1], [2]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C',Integer(2),Integer(1)],Integer(1),
↪Integer(2))
>>> K.module_generator()
[[1, 1]]
>>> K = crystals.KirillovReshetikhin(['E',Integer(6),Integer(1)],Integer(1),
↪Integer(1))
>>> K.module_generator()
[(1,)]

>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)],Integer(2),
↪Integer(1))
```

(continues on next page)

(continued from previous page)

```
>>> K.module_generator()
[[1], [2]]
```

r()

Return r of the underlying Kirillov-Reshetikhin crystal $B^{r,s}$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,1], 2, 1)
sage: K.r()
2
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)], Integer(2),␣
↪Integer(1))
>>> K.r()
2
```

s()

Return s of the underlying Kirillov-Reshetikhin crystal $B^{r,s}$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,1], 2, 1)
sage: K.s()
1
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)], Integer(2),␣
↪Integer(1))
>>> K.s()
1
```

class
sage.combinat.crystals.kirillov_reshetikhin.**KirillovReshetikhinGenericCrystalElement**

Bases: *AffineCrystalFromClassicalElement*

Abstract class for all Kirillov-Reshetikhin crystal elements.

lusztig_involution()

Return the classical Lusztig involution on `self`.

EXAMPLES:

```
sage: KRC = crystals.KirillovReshetikhin(['D',4,1], 2,2)
sage: elt = KRC(-1,2); elt
[[2], [-1]]
sage: elt.lusztig_involution()
[[1], [-2]]
```

```
>>> from sage.all import *
>>> KRC = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)],␣
↪Integer(2),Integer(2))
```

(continues on next page)

(continued from previous page)

```
>>> elt = KRC(-Integer(1),Integer(2)); elt
[[2], [-1]]
>>> elt.lusztig_involution()
[[1], [-2]]
```

pp()

Pretty print self.

EXAMPLES:

```
sage: C = crystals.KirillovReshetikhin(['D',4,1], 2,1)
sage: C(2,1).pp()
  1
  2
sage: C = crystals.KirillovReshetikhin(['B',3,1], 3,3)
sage: C.module_generators[0].pp()
+ (X)   1
+
+
```

```
>>> from sage.all import *
>>> C = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)], Integer(2),
↪Integer(1))
>>> C(Integer(2),Integer(1)).pp()
  1
  2
>>> C = crystals.KirillovReshetikhin(['B',Integer(3),Integer(1)], Integer(3),
↪Integer(3))
>>> C.module_generators[Integer(0)].pp()
+ (X)   1
+
+
```

to_kirillov_reshetikhin_tableau()

Construct the corresponding *KirillovReshetikhinTableauxElement* from self.

We construct the Kirillov-Reshetikhin tableau element as follows:

1. Let λ be the shape of self.
2. Determine a path $e_{i_1} e_{i_2} \cdots e_{i_k}$ to the highest weight.
3. Apply $f_{i_k} \cdots f_{i_2} f_{i_1}$ to a highest weight KR tableau from filling the shape λ.

EXAMPLES:

```
sage: KRC = crystals.KirillovReshetikhin(['A', 4, 1], 2, 1)
sage: KRC(columns=[[2,1]]).to_kirillov_reshetikhin_tableau()
[[1], [2]]
sage: KRC = crystals.KirillovReshetikhin(['D', 4, 1], 2, 1)
sage: KRC(rows=[]).to_kirillov_reshetikhin_tableau()
[[1], [-1]]
```

```
>>> from sage.all import *
>>> KRC = crystals.KirillovReshetikhin(['A', Integer(4), Integer(1)],␣
↪Integer(2), Integer(1))
>>> KRC(columns=[[Integer(2),Integer(1)]]).to_kirillov_reshetikhin_tableau()
[[1], [2]]
>>> KRC = crystals.KirillovReshetikhin(['D', Integer(4), Integer(1)],␣
↪Integer(2), Integer(1))
>>> KRC(rows=[]).to_kirillov_reshetikhin_tableau()
[[1], [-1]]
```

to_tableau()

Return the *Tableau* corresponding to `self`.

EXAMPLES:

```
sage: C = crystals.KirillovReshetikhin(['D',4,1], 2,1)
sage: t = C(2,1).to_tableau(); t
[[1], [2]]
sage: type(t)
<class 'sage.combinat.tableau.Tableaux_all_with_category.element_class'>
```

```
>>> from sage.all import *
>>> C = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)], Integer(2),
↪Integer(1))
>>> t = C(Integer(2),Integer(1)).to_tableau(); t
[[1], [2]]
>>> type(t)
<class 'sage.combinat.tableau.Tableaux_all_with_category.element_class'>
```

class sage.combinat.crystals.kirillov_reshetikhin.**PMDiagram**(*pm_diagram*, *from_shapes=None*)

Bases: *CombinatorialObject*

Class of $\pm$ diagrams. These diagrams are in one-to-one bijection with X_{n-1} highest weight vectors in an X_n highest weight crystal $X = B, C, D$. See Section 4.1 of [Sch2008].

The input is a list $pm = [[a_0, b_0], [a_1, b_1], ..., [a_{n-1}, b_{n-1}], [b_n]]$ of pairs and a last 1-tuple (or list of length 1). The pair $[a_i, b_i]$ specifies the number of a_i $+$ and b_i $-$ in the i-th row of the $\pm$ diagram if $n - i$ is odd and the number of a_i $\pm$ pairs above row i and b_i columns of height i not containing any $+$ or $-$ if $n - i$ is even.

Setting the option `from_shapes = True` one can also input a $\pm$ diagram in terms of its outer, intermediate, and inner shape by specifying a list `[n, s, outer, intermediate, inner]` where `s` is the width of the $\pm$ diagram, and `outer`, `intermediate`, and `inner` are the outer, intermediate, and inner shapes, respectively.

EXAMPLES:

```
sage: from sage.combinat.crystals.kirillov_reshetikhin import PMDiagram
sage: pm = PMDiagram([[0,1],[1,2],[1]])
sage: pm.pm_diagram
[[0, 1], [1, 2], [1]]
sage: pm._list
[1, 1, 2, 0, 1]
sage: pm.n
2
sage: pm.width
5
```

(continues on next page)

(continued from previous page)

```
sage: pm.pp()
.   .   .   .
.   +   -   -
sage: PMDiagram([2,5,[4,4],[4,2],[4,1]], from_shapes=True)
[[0, 1], [1, 2], [1]]
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.kirillov_reshetikhin import PMDiagram
>>> pm = PMDiagram([[Integer(0),Integer(1)],[Integer(1),Integer(2)],[Integer(1)]])
>>> pm.pm_diagram
[[0, 1], [1, 2], [1]]
>>> pm._list
[1, 1, 2, 0, 1]
>>> pm.n
2
>>> pm.width
5
>>> pm.pp()
.   .   .   .
.   +   -   -
>>> PMDiagram([Integer(2),Integer(5),[Integer(4),Integer(4)],[Integer(4),
↪Integer(2)],[Integer(4),Integer(1)]], from_shapes=True)
[[0, 1], [1, 2], [1]]
```

heights_of_addable_plus()

Return a list with the heights of all addable plus in the $\pm$ diagram.

EXAMPLES:

```
sage: from sage.combinat.crystals.kirillov_reshetikhin import PMDiagram
sage: pm = PMDiagram([[1,2],[1,2],[1,1],[1,1],[1,1],[1]])
sage: pm.heights_of_addable_plus()
[1, 1, 2, 3, 4, 5]
sage: pm = PMDiagram([[1,2],[1,1],[1,1],[1,1],[1]])
sage: pm.heights_of_addable_plus()
[1, 2, 3, 4]
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.kirillov_reshetikhin import PMDiagram
>>> pm = PMDiagram([[Integer(1),Integer(2)],[Integer(1),Integer(2)],
↪[Integer(1),Integer(1)],[Integer(1),Integer(1)],[Integer(1),Integer(1)],
↪[Integer(1)]])
>>> pm.heights_of_addable_plus()
[1, 1, 2, 3, 4, 5]
>>> pm = PMDiagram([[Integer(1),Integer(2)],[Integer(1),Integer(1)],
↪[Integer(1),Integer(1)],[Integer(1),Integer(1)],[Integer(1)]])
>>> pm.heights_of_addable_plus()
[1, 2, 3, 4]
```

heights_of_minus()

Return a list with the heights of all minus in the $\pm$ diagram.

EXAMPLES:

```
sage: from sage.combinat.crystals.kirillov_reshetikhin import PMDiagram
sage: pm = PMDiagram([[1,2],[1,2],[1,1],[1,1],[1,1],[1]])
sage: pm.heights_of_minus()
[5, 5, 3, 3, 1, 1]
sage: pm = PMDiagram([[1,2],[1,1],[1,1],[1,1],[1]])
sage: pm.heights_of_minus()
[4, 4, 2, 2]
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.kirillov_reshetikhin import PMDiagram
>>> pm = PMDiagram([[Integer(1),Integer(2)],[Integer(1),Integer(2)],
↪[Integer(1),Integer(1)],[Integer(1),Integer(1)],[Integer(1),Integer(1)],
↪[Integer(1)]])
>>> pm.heights_of_minus()
[5, 5, 3, 3, 1, 1]
>>> pm = PMDiagram([[Integer(1),Integer(2)],[Integer(1),Integer(1)],
↪[Integer(1),Integer(1)],[Integer(1),Integer(1)],[Integer(1)]])
>>> pm.heights_of_minus()
[4, 4, 2, 2]
```

inner_shape()

Return the inner shape of the pm diagram.

EXAMPLES:

```
sage: from sage.combinat.crystals.kirillov_reshetikhin import PMDiagram
sage: pm = PMDiagram([[0,1],[1,2],[1]])
sage: pm.inner_shape()
[4, 1]
sage: pm = PMDiagram([[1,2],[1,1],[1,1],[1,1],[1]])
sage: pm.inner_shape()
[7, 5, 3, 1]
sage: pm = PMDiagram([[1,2],[1,2],[1,1],[1,1],[1,1],[1]])
sage: pm.inner_shape()
[10, 7, 5, 3, 1]
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.kirillov_reshetikhin import PMDiagram
>>> pm = PMDiagram([[Integer(0),Integer(1)],[Integer(1),Integer(2)],
↪[Integer(1)]])
>>> pm.inner_shape()
[4, 1]
>>> pm = PMDiagram([[Integer(1),Integer(2)],[Integer(1),Integer(1)],
↪[Integer(1),Integer(1)],[Integer(1),Integer(1)],[Integer(1)]])
>>> pm.inner_shape()
[7, 5, 3, 1]
>>> pm = PMDiagram([[Integer(1),Integer(2)],[Integer(1),Integer(2)],
↪[Integer(1),Integer(1)],[Integer(1),Integer(1)],[Integer(1),Integer(1)],
↪[Integer(1)]])
>>> pm.inner_shape()
[10, 7, 5, 3, 1]
```

intermediate_shape()

Return the intermediate shape of the pm diagram (inner shape plus positions of plusses).

EXAMPLES:

```
sage: from sage.combinat.crystals.kirillov_reshetikhin import PMDiagram
sage: pm = PMDiagram([[0,1],[1,2],[1]])
sage: pm.intermediate_shape()
[4, 2]
sage: pm = PMDiagram([[1,2],[1,1],[1,1],[1,1],[1]])
sage: pm.intermediate_shape()
[8, 6, 4, 2]
sage: pm = PMDiagram([[1,2],[1,2],[1,1],[1,1],[1,1],[1]])
sage: pm.intermediate_shape()
[11, 8, 6, 4, 2]
sage: pm = PMDiagram([[1,0],[0,1],[2,0],[0,0],[0]])
sage: pm.intermediate_shape()
[4, 2, 2]
sage: pm = PMDiagram([[1, 0], [0, 0], [0, 0], [0, 0], [0]])
sage: pm.intermediate_shape()
[1]
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.kirillov_reshetikhin import PMDiagram
>>> pm = PMDiagram([[Integer(0),Integer(1)],[Integer(1),Integer(2)],
↪[Integer(1)]])
>>> pm.intermediate_shape()
[4, 2]
>>> pm = PMDiagram([[Integer(1),Integer(2)],[Integer(1),Integer(1)],
↪[Integer(1),Integer(1)],[Integer(1),Integer(1)],[Integer(1)]])
>>> pm.intermediate_shape()
[8, 6, 4, 2]
>>> pm = PMDiagram([[Integer(1),Integer(2)],[Integer(1),Integer(2)],
↪[Integer(1),Integer(1)],[Integer(1),Integer(1)],[Integer(1),Integer(1)],
↪[Integer(1)]])
>>> pm.intermediate_shape()
[11, 8, 6, 4, 2]
>>> pm = PMDiagram([[Integer(1),Integer(0)],[Integer(0),Integer(1)],
↪[Integer(2),Integer(0)],[Integer(0),Integer(0)],[Integer(0)]])
>>> pm.intermediate_shape()
[4, 2, 2]
>>> pm = PMDiagram([[Integer(1), Integer(0)], [Integer(0), Integer(0)],␣
↪[Integer(0), Integer(0)], [Integer(0), Integer(0)], [Integer(0)]])
>>> pm.intermediate_shape()
[1]
```

outer_shape()

Return the outer shape of the $\pm$ diagram.

EXAMPLES:

```
sage: from sage.combinat.crystals.kirillov_reshetikhin import PMDiagram
sage: pm = PMDiagram([[0,1],[1,2],[1]])
sage: pm.outer_shape()
[4, 4]
```

(continues on next page)

(continued from previous page)

```
sage: pm = PMDiagram([[1,2],[1,1],[1,1],[1,1],[1]])
sage: pm.outer_shape()
[8, 8, 4, 4]
sage: pm = PMDiagram([[1,2],[1,2],[1,1],[1,1],[1,1],[1]])
sage: pm.outer_shape()
[13, 8, 8, 4, 4]
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.kirillov_reshetikhin import PMDiagram
>>> pm = PMDiagram([[Integer(0),Integer(1)],[Integer(1),Integer(2)],
↪[Integer(1)]])
>>> pm.outer_shape()
[4, 4]
>>> pm = PMDiagram([[Integer(1),Integer(2)],[Integer(1),Integer(1)],
↪[Integer(1),Integer(1)],[Integer(1),Integer(1)],[Integer(1)]])
>>> pm.outer_shape()
[8, 8, 4, 4]
>>> pm = PMDiagram([[Integer(1),Integer(2)],[Integer(1),Integer(2)],
↪[Integer(1),Integer(1)],[Integer(1),Integer(1)],[Integer(1),Integer(1)],
↪[Integer(1)]])
>>> pm.outer_shape()
[13, 8, 8, 4, 4]
```

pp()

Pretty print `self`.

EXAMPLES:

```
sage: from sage.combinat.crystals.kirillov_reshetikhin import PMDiagram
sage: pm = PMDiagram([[1,0],[0,1],[2,0],[0,0],[0]])
sage: pm.pp()
.  .  .  +
.  .  -  -
+  +
-  -
sage: pm = PMDiagram([[0,2], [0,0], [0]])
sage: pm.pp()
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.kirillov_reshetikhin import PMDiagram
>>> pm = PMDiagram([[Integer(1),Integer(0)],[Integer(0),Integer(1)],
↪[Integer(2),Integer(0)],[Integer(0),Integer(0)],[Integer(0)]])
>>> pm.pp()
.  .  .  +
.  .  -  -
+  +
-  -
>>> pm = PMDiagram([[Integer(0),Integer(2)], [Integer(0),Integer(0)],␣
↪[Integer(0)]])
>>> pm.pp()
```

sigma()

Return sigma on pm diagrams as needed for the analogue of the Dynkin diagram automorphism that interchanges nodes 0 and 1 for type $D_n(1)$, $B_n(1)$, $A_{2n-1}(2)$ for Kirillov-Reshetikhin crystals.

EXAMPLES:

```
sage: pm = sage.combinat.crystals.kirillov_reshetikhin.PMDiagram([[0,1],[1,2],
↪[1]])
sage: pm.sigma()
[[1, 0], [2, 1], [1]]
```

```
>>> from sage.all import *
>>> pm = sage.combinat.crystals.kirillov_reshetikhin.PMDiagram([[Integer(0),
↪Integer(1)],[Integer(1),Integer(2)],[Integer(1)]])
>>> pm.sigma()
[[1, 0], [2, 1], [1]]
```

`sage.combinat.crystals.kirillov_reshetikhin.`**`horizontal_dominoes_removed`**`(r, s)`

Return all partitions obtained from a rectangle of width s and height r by removing horizontal dominoes.

EXAMPLES:

```
sage: sage.combinat.crystals.kirillov_reshetikhin.horizontal_dominoes_removed(2,2)
[[], [2], [2, 2]]
sage: sage.combinat.crystals.kirillov_reshetikhin.horizontal_dominoes_removed(3,2)
[[], [2], [2, 2], [2, 2, 2]]
```

```
>>> from sage.all import *
>>> sage.combinat.crystals.kirillov_reshetikhin.horizontal_dominoes_
↪removed(Integer(2),Integer(2))
[[], [2], [2, 2]]
>>> sage.combinat.crystals.kirillov_reshetikhin.horizontal_dominoes_
↪removed(Integer(3),Integer(2))
[[], [2], [2, 2], [2, 2, 2]]
```

`sage.combinat.crystals.kirillov_reshetikhin.`**`partitions_in_box`**`(r, s)`

Return all partitions in a box of width s and height r.

EXAMPLES:

```
sage: sage.combinat.crystals.kirillov_reshetikhin.partitions_in_box(3,2)
[[], [1], [2], [1, 1], [2, 1], [1, 1, 1], [2, 2], [2, 1, 1],
[2, 2, 1], [2, 2, 2]]
```

```
>>> from sage.all import *
>>> sage.combinat.crystals.kirillov_reshetikhin.partitions_in_box(Integer(3),
↪Integer(2))
[[], [1], [2], [1, 1], [2, 1], [1, 1, 1], [2, 2], [2, 1, 1],
[2, 2, 1], [2, 2, 2]]
```

`sage.combinat.crystals.kirillov_reshetikhin.`**`vertical_dominoes_removed`**`(r, s)`

Return all partitions obtained from a rectangle of width s and height r by removing vertical dominoes.

EXAMPLES:

```
sage: sage.combinat.crystals.kirillov_reshetikhin.vertical_dominoes_removed(2,2)
[[], [1, 1], [2, 2]]
sage: sage.combinat.crystals.kirillov_reshetikhin.vertical_dominoes_removed(3,2)
[[2], [2, 1, 1], [2, 2, 2]]
sage: sage.combinat.crystals.kirillov_reshetikhin.vertical_dominoes_removed(4,2)
[[], [1, 1], [1, 1, 1, 1], [2, 2], [2, 2, 1, 1], [2, 2, 2, 2]]
```

```
>>> from sage.all import *
>>> sage.combinat.crystals.kirillov_reshetikhin.vertical_dominoes_
↪removed(Integer(2),Integer(2))
[[], [1, 1], [2, 2]]
>>> sage.combinat.crystals.kirillov_reshetikhin.vertical_dominoes_
↪removed(Integer(3),Integer(2))
[[2], [2, 1, 1], [2, 2, 2]]
>>> sage.combinat.crystals.kirillov_reshetikhin.vertical_dominoes_
↪removed(Integer(4),Integer(2))
[[], [1, 1], [1, 1, 1, 1], [2, 2], [2, 2, 1, 1], [2, 2, 2, 2]]
```

5.1.56 Kyoto Path Model for Affine Highest Weight Crystals

class sage.combinat.crystals.kyoto_path_model.**KyotoPathModel**(*crystals*, *weight*, *P*)

Bases: *TensorProductOfCrystals*

The Kyoto path model for an affine highest weight crystal.

Note

Here we are using anti-Kashiwara notation and might differ from some of the literature.

Consider a Kac–Moody algebra $\mathfrak{g}$ of affine Cartan type X, and we want to model the $U_q'(\mathfrak{g})$-crystal $B(\lambda)$. First we consider the set of fundamental weights $\{\Lambda_i\}_{i\in I}$ of $\mathfrak{g}$ and let $\{\overline{\Lambda}_i\}_{i\in I_0}$ be the corresponding fundamental weights of the corresponding classical Lie algebra $\mathfrak{g}_0$. To model $B(\lambda)$, we start with a sequence of perfect $U_q'(\mathfrak{g})$-crystals $(B^{(i)})_i$ of level l such that

$$\lambda \in \overline{P}_l^+ = \left\{\mu \in \overline{P}^+ \mid \langle c, \mu\rangle = l\right\}$$

where c is the canonical central element of $U_q'(\mathfrak{g})$ and $\overline{P}^+$ is the nonnegative weight lattice spanned by $\{\overline{\Lambda}_i \mid i \in I\}$.

Next we consider the crystal isomorphism $\Phi_0 : B(\lambda_0) \to B^{(0)} \otimes B(\lambda_1)$ defined by $u_{\lambda_0} \mapsto b_{\lambda_0}^{(0)} \otimes u_{\lambda_1}$ where $b_{\lambda_0}^{(0)}$ is the unique element in $B^{(0)}$ such that $\varphi\left(b_{\lambda_0}^{(0)}\right) = \lambda_0$ and $\lambda_1 = \varepsilon\left(b_{\lambda_0}^{(0)}\right)$ and u_μ is the highest weight element in $B(\mu)$. Iterating this, we obtain the following isomorphism:

$$\Phi_n : B(\lambda) \to B^{(0)} \otimes B^{(1)} \otimes \cdots \otimes B^{(N)} \otimes B(\lambda_{N+1}).$$

We note by Lemma 10.6.2 in [HK2002] that for any $b \in B(\lambda)$ there exists a finite N such that

$$\Phi_N(b) = \left(\bigotimes_{k=0}^{N-1} b^{(k)}\right) \otimes u_{\lambda_N}.$$

Therefore we can model elements $b \in B(\lambda)$ as a $U_q'(\mathfrak{g})$-crystal by considering an infinite list of elements $b^{(k)} \in$

$B^{(k)}$ and defining the crystal structure by:

$$\begin{aligned}\overline{\mathrm{wt}}(b) &= \lambda_N + \sum_{k=0}^{N-1} \overline{\mathrm{wt}}\left(b^{(k)}\right)\\ e_i(b) &= e_i\left(b' \otimes b^{(N)}\right) \otimes u_{\lambda_N},\\ f_i(b) &= f_i\left(b' \otimes b^{(N)}\right) \otimes u_{\lambda_N},\\ \varepsilon_i(b) &= \max\left(\varepsilon_i(b') - \varphi_i\left(b^{(N)}\right), 0\right),\\ \varphi_i(b) &= \varphi_i(b') + \max\left(\varphi_i\left(b^{(N)}\right) - \varepsilon_i(b'), 0\right),\end{aligned}$$

where $b' = b^{(0)} \otimes \cdots \otimes b^{(N-1)}$. To translate this into a finite list, we consider a finite sequence $b^{(0)} \otimes \cdots \otimes b^{(N-1)} \otimes b^{(N)}_{\lambda_N}$ and if

$$f_i\left(b^{(0)} \otimes \cdots b^{(N-1)} \otimes b^{(N)}_{\lambda_N}\right) = b_0 \otimes \cdots \otimes b^{(N-1)} \otimes f_i\left(b^{(N)}_{\lambda_N}\right),$$

then we take the image as $b^{(0)} \otimes \cdots \otimes f_i\left(b^{(N)}_{\lambda_N}\right) \otimes b^{(N+1)}_{\lambda_{N+1}}$. Similarly we remove $b^{(N)}_{\lambda_N}$ if we have $b_0 \otimes \cdots \otimes b^{(N-1)} \otimes b^{(N-1)}_{\lambda_{N-1}} \otimes b^{(N)}_{\lambda_N}$. Additionally if

$$e_i\left(b^{(0)} \otimes \cdots \otimes b^{(N-1)} \otimes b^{(N)}_{\lambda_N}\right) = b^{(0)} \otimes \cdots \otimes b^{(N-1)} \otimes e_i\left(b^{(N)}_{\lambda_N}\right),$$

then we consider this to be 0.

We can then lift the $U_q'(\mathfrak{g})$-crystal structure to a $U_q(\mathfrak{g})$-crystal structure by using a tensor product of the `affinization` of the of crystals $B^{(i)}$ for all i.

INPUT:

- `B` – a single or list of U_q' perfect crystal(s) of level l
- `weight` – a weight in $\overline{P}^+_l$

EXAMPLES:

```
sage: B = crystals.KirillovReshetikhin(['A',2,1], 1,1)
sage: La = RootSystem(['A',2,1]).weight_lattice().fundamental_weights()
sage: C = crystals.KyotoPathModel(B, La[0])
sage: mg = C.module_generators[0]; mg
[[[3]]]
sage: mg.f_string([0,1,2,2])
[[[3]], [[3]], [[1]]]
sage: x = mg.f_string([0,1,2]); x
[[[2]], [[3]], [[1]]]
sage: x.weight()
Lambda[0]
```

```
>>> from sage.all import *
>>> B = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)], Integer(1),
↪Integer(1))
>>> La = RootSystem(['A',Integer(2),Integer(1)]).weight_lattice().fundamental_
↪weights()
>>> C = crystals.KyotoPathModel(B, La[Integer(0)])
```

(continues on next page)

(continued from previous page)

```
>>> mg = C.module_generators[Integer(0)]; mg
[[[3]]]
>>> mg.f_string([Integer(0),Integer(1),Integer(2),Integer(2)])
[[[3]], [[3]], [[1]]]
>>> x = mg.f_string([Integer(0),Integer(1),Integer(2)]); x
[[[2]], [[3]], [[1]]]
>>> x.weight()
Lambda[0]
```

An example of type $A_5^{(2)}$:

```
sage: B = crystals.KirillovReshetikhin(['A',5,2], 1,1)
sage: La = RootSystem(['A',5,2]).weight_lattice().fundamental_weights()
sage: C = crystals.KyotoPathModel(B, La[0])
sage: mg = C.module_generators[0]; mg
[[[-1]]]
sage: mg.f_string([0,2,1,3])
[[[-3]], [[2]], [[-1]]]
sage: mg.f_string([0,2,3,1])
[[[-3]], [[2]], [[-1]]]
```

```
>>> from sage.all import *
>>> B = crystals.KirillovReshetikhin(['A',Integer(5),Integer(2)], Integer(1),
↪Integer(1))
>>> La = RootSystem(['A',Integer(5),Integer(2)]).weight_lattice().fundamental_
↪weights()
>>> C = crystals.KyotoPathModel(B, La[Integer(0)])
>>> mg = C.module_generators[Integer(0)]; mg
[[[-1]]]
>>> mg.f_string([Integer(0),Integer(2),Integer(1),Integer(3)])
[[[-3]], [[2]], [[-1]]]
>>> mg.f_string([Integer(0),Integer(2),Integer(3),Integer(1)])
[[[-3]], [[2]], [[-1]]]
```

An example of type $D_3^{(2)}$:

```
sage: B = crystals.KirillovReshetikhin(['D',3,2], 1,1)
sage: La = RootSystem(['D',3,2]).weight_lattice().fundamental_weights()
sage: C = crystals.KyotoPathModel(B, La[0])
sage: mg = C.module_generators[0]; mg
[[]]
sage: mg.f_string([0,1,2,0])
[[[0]], [[1]], []]
```

```
>>> from sage.all import *
>>> B = crystals.KirillovReshetikhin(['D',Integer(3),Integer(2)], Integer(1),
↪Integer(1))
>>> La = RootSystem(['D',Integer(3),Integer(2)]).weight_lattice().fundamental_
↪weights()
>>> C = crystals.KyotoPathModel(B, La[Integer(0)])
>>> mg = C.module_generators[Integer(0)]; mg
[[]]
```

(continues on next page)

(continued from previous page)

```
>>> mg.f_string([Integer(0),Integer(1),Integer(2),Integer(0)])
[[[0]], [[1]], []]
```

An example using multiple crystals of the same level:

```
sage: B1 = crystals.KirillovReshetikhin(['A',2,1], 1,1)
sage: B2 = crystals.KirillovReshetikhin(['A',2,1], 2,1)
sage: La = RootSystem(['A',2,1]).weight_lattice().fundamental_weights()
sage: C = crystals.KyotoPathModel([B1, B2, B1], La[0])
sage: mg = C.module_generators[0]; mg
[[[3]]]
sage: mg.f_string([0,1,2,2])
[[[3]], [[1], [3]], [[3]]]
sage: mg.f_string([0,1,2,2,2])
sage: mg.f_string([0,1,2,2,1,0])
[[[3]], [[2], [3]], [[1]], [[2]]]
sage: mg.f_string([0,1,2,2,1,0,0,2])
[[[3]], [[1], [2]], [[1]], [[3]], [[1], [3]]]
```

```
>>> from sage.all import *
>>> B1 = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)], Integer(1),
↪Integer(1))
>>> B2 = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)], Integer(2),
↪Integer(1))
>>> La = RootSystem(['A',Integer(2),Integer(1)]).weight_lattice().fundamental_
↪weights()
>>> C = crystals.KyotoPathModel([B1, B2, B1], La[Integer(0)])
>>> mg = C.module_generators[Integer(0)]; mg
[[[3]]]
>>> mg.f_string([Integer(0),Integer(1),Integer(2),Integer(2)])
[[[3]], [[1], [3]], [[3]]]
>>> mg.f_string([Integer(0),Integer(1),Integer(2),Integer(2),Integer(2)])
>>> mg.f_string([Integer(0),Integer(1),Integer(2),Integer(2),Integer(1),
↪Integer(0)])
[[[3]], [[2], [3]], [[1]], [[2]]]
>>> mg.f_string([Integer(0),Integer(1),Integer(2),Integer(2),Integer(1),
↪Integer(0),Integer(0),Integer(2)])
[[[3]], [[1], [2]], [[1]], [[3]], [[1], [3]]]
```

By using the extended weight lattice, the Kyoto path model lifts the perfect crystals to their affinizations:

```
sage: B = crystals.KirillovReshetikhin(['A',2,1], 1,1)
sage: P = RootSystem(['A',2,1]).weight_lattice(extended=True)
sage: La = P.fundamental_weights()
sage: C = crystals.KyotoPathModel(B, La[0])
sage: mg = C.module_generators[0]; mg
[[[3]](0)]
sage: x = mg.f_string([0,1,2]); x
[[[2]](-1), [[3]](0), [[1]](0)]
sage: x.weight()
Lambda[0] - delta
```

```
>>> from sage.all import *
>>> B = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)], Integer(1),
↪Integer(1))
>>> P = RootSystem(['A',Integer(2),Integer(1)]).weight_lattice(extended=True)
>>> La = P.fundamental_weights()
>>> C = crystals.KyotoPathModel(B, La[Integer(0)])
>>> mg = C.module_generators[Integer(0)]; mg
[[[3]](0)]
>>> x = mg.f_string([Integer(0),Integer(1),Integer(2)]); x
[[[2]](-1), [[3]](0), [[1]](0)]
>>> x.weight()
Lambda[0] - delta
```

class Element

Bases: *TensorProductOfRegularCrystalsElement*

An element in the Kyoto path model.

e(*i*)

Return the action of e_i on `self`.

EXAMPLES:

```
sage: B = crystals.KirillovReshetikhin(['A',2,1], 1,1)
sage: La = RootSystem(['A',2,1]).weight_lattice().fundamental_weights()
sage: C = crystals.KyotoPathModel(B, La[0])
sage: mg = C.module_generators[0]
sage: all(mg.e(i) is None for i in C.index_set())
True
sage: mg.f(0).e(0) == mg
True
```

```
>>> from sage.all import *
>>> B = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)],␣
↪Integer(1),Integer(1))
>>> La = RootSystem(['A',Integer(2),Integer(1)]).weight_lattice().
↪fundamental_weights()
>>> C = crystals.KyotoPathModel(B, La[Integer(0)])
>>> mg = C.module_generators[Integer(0)]
>>> all(mg.e(i) is None for i in C.index_set())
True
>>> mg.f(Integer(0)).e(Integer(0)) == mg
True
```

epsilon(*i*)

Return ε_i of `self`.

EXAMPLES:

```
sage: B = crystals.KirillovReshetikhin(['A',2,1], 1,1)
sage: La = RootSystem(['A',2,1]).weight_lattice().fundamental_weights()
sage: C = crystals.KyotoPathModel(B, La[0])
sage: mg = C.module_generators[0]
sage: [mg.epsilon(i) for i in C.index_set()]
```

(continues on next page)

(continued from previous page)

```
[0, 0, 0]
sage: elt = mg.f(0)
sage: [elt.epsilon(i) for i in C.index_set()]
[1, 0, 0]
sage: elt = mg.f_string([0,1,2])
sage: [elt.epsilon(i) for i in C.index_set()]
[0, 0, 1]
sage: elt = mg.f_string([0,1,2,2])
sage: [elt.epsilon(i) for i in C.index_set()]
[0, 0, 2]
```

```
>>> from sage.all import *
>>> B = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)],␣
↪Integer(1),Integer(1))
>>> La = RootSystem(['A',Integer(2),Integer(1)]).weight_lattice().
↪fundamental_weights()
>>> C = crystals.KyotoPathModel(B, La[Integer(0)])
>>> mg = C.module_generators[Integer(0)]
>>> [mg.epsilon(i) for i in C.index_set()]
[0, 0, 0]
>>> elt = mg.f(Integer(0))
>>> [elt.epsilon(i) for i in C.index_set()]
[1, 0, 0]
>>> elt = mg.f_string([Integer(0),Integer(1),Integer(2)])
>>> [elt.epsilon(i) for i in C.index_set()]
[0, 0, 1]
>>> elt = mg.f_string([Integer(0),Integer(1),Integer(2),Integer(2)])
>>> [elt.epsilon(i) for i in C.index_set()]
[0, 0, 2]
```

f(i)

Return the action of f_i on `self`.

EXAMPLES:

```
sage: B = crystals.KirillovReshetikhin(['A',2,1], 1,1)
sage: La = RootSystem(['A',2,1]).weight_lattice().fundamental_weights()
sage: C = crystals.KyotoPathModel(B, La[0])
sage: mg = C.module_generators[0]
sage: mg.f(2)
sage: mg.f(0)
[[[1]], [[2]]]
sage: mg.f_string([0,1,2])
[[[2]], [[3]], [[1]]]
```

```
>>> from sage.all import *
>>> B = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)],␣
↪Integer(1),Integer(1))
>>> La = RootSystem(['A',Integer(2),Integer(1)]).weight_lattice().
↪fundamental_weights()
>>> C = crystals.KyotoPathModel(B, La[Integer(0)])
>>> mg = C.module_generators[Integer(0)]
```

(continues on next page)

(continued from previous page)

```
>>> mg.f(Integer(2))
>>> mg.f(Integer(0))
[[[1]], [[2]]]
>>> mg.f_string([Integer(0),Integer(1),Integer(2)])
[[[2]], [[3]], [[1]]]
```

phi (*i*)

Return φ_i of `self`.

EXAMPLES:

```
sage: B = crystals.KirillovReshetikhin(['A',2,1], 1,1)
sage: La = RootSystem(['A',2,1]).weight_lattice().fundamental_weights()
sage: C = crystals.KyotoPathModel(B, La[0])
sage: mg = C.module_generators[0]
sage: [mg.phi(i) for i in C.index_set()]
[1, 0, 0]
sage: elt = mg.f(0)
sage: [elt.phi(i) for i in C.index_set()]
[0, 1, 1]
sage: elt = mg.f_string([0,1])
sage: [elt.phi(i) for i in C.index_set()]
[0, 0, 2]
```

```
>>> from sage.all import *
>>> B = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)],␣
↪Integer(1),Integer(1))
>>> La = RootSystem(['A',Integer(2),Integer(1)]).weight_lattice().
↪fundamental_weights()
>>> C = crystals.KyotoPathModel(B, La[Integer(0)])
>>> mg = C.module_generators[Integer(0)]
>>> [mg.phi(i) for i in C.index_set()]
[1, 0, 0]
>>> elt = mg.f(Integer(0))
>>> [elt.phi(i) for i in C.index_set()]
[0, 1, 1]
>>> elt = mg.f_string([Integer(0),Integer(1)])
>>> [elt.phi(i) for i in C.index_set()]
[0, 0, 2]
```

truncate (*k=None*)

Truncate `self` to have length `k` and return as an element in a (finite) tensor product of crystals.

INPUT:

- `k` – (optional) the length to truncate to; if not specified, then returns one more than the current non-ground-state elements (i.e. the current list in `self`)

EXAMPLES:

```
sage: B1 = crystals.KirillovReshetikhin(['A',2,1], 1,1)
sage: B2 = crystals.KirillovReshetikhin(['A',2,1], 2,1)
sage: La = RootSystem(['A',2,1]).weight_lattice().fundamental_weights()
sage: C = crystals.KyotoPathModel([B1,B2,B1], La[0])
sage: mg = C.highest_weight_vector()
```

(continues on next page)

(continued from previous page)

```
sage: elt = mg.f_string([0,1,2,2,1,0]); elt
[[[3]], [[2], [3]], [[1]], [[2]]]
sage: t = elt.truncate(); t
[[[3]], [[2], [3]], [[1]], [[2]]]
sage: t.parent() is C.finite_tensor_product(4)
True
sage: elt.truncate(2)
[[[3]], [[2], [3]]]
sage: elt.truncate(10)
[[[3]], [[2], [3]], [[1]], [[2]], [[1], [3]],
 [[2]], [[1]], [[2], [3]], [[1]], [[3]]]
```

```
>>> from sage.all import *
>>> B1 = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)],␣
↪Integer(1),Integer(1))
>>> B2 = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)],␣
↪Integer(2),Integer(1))
>>> La = RootSystem(['A',Integer(2),Integer(1)]).weight_lattice().
↪fundamental_weights()
>>> C = crystals.KyotoPathModel([B1,B2,B1], La[Integer(0)])
>>> mg = C.highest_weight_vector()
>>> elt = mg.f_string([Integer(0),Integer(1),Integer(2),Integer(2),
↪Integer(1),Integer(0)]); elt
[[[3]], [[2], [3]], [[1]], [[2]]]
>>> t = elt.truncate(); t
[[[3]], [[2], [3]], [[1]], [[2]]]
>>> t.parent() is C.finite_tensor_product(Integer(4))
True
>>> elt.truncate(Integer(2))
[[[3]], [[2], [3]]]
>>> elt.truncate(Integer(10))
[[[3]], [[2], [3]], [[1]], [[2]], [[1], [3]],
 [[2]], [[1]], [[2], [3]], [[1]], [[3]]]
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: B = crystals.KirillovReshetikhin(['A',2,1], 1,1)
sage: P = RootSystem(['A',2,1]).weight_lattice(extended=True)
sage: La = P.fundamental_weights()
sage: C = crystals.KyotoPathModel(B, La[0])
sage: mg = C.module_generators[0]
sage: mg.weight()
Lambda[0]
sage: mg.f_string([0,1,2]).weight()
Lambda[0] - delta
```

```
>>> from sage.all import *
>>> B = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)],␣
↪Integer(1),Integer(1))
```

(continues on next page)

(continued from previous page)

```
>>> P = RootSystem(['A',Integer(2),Integer(1)]).weight_
↪lattice(extended=True)
>>> La = P.fundamental_weights()
>>> C = crystals.KyotoPathModel(B, La[Integer(0)])
>>> mg = C.module_generators[Integer(0)]
>>> mg.weight()
Lambda[0]
>>> mg.f_string([Integer(0),Integer(1),Integer(2)]).weight()
Lambda[0] - delta
```

finite_tensor_product(*k*)

Return the finite tensor product of crystals of length `k` from truncating `self`.

EXAMPLES:

```
sage: B1 = crystals.KirillovReshetikhin(['A',2,1], 1,1)
sage: B2 = crystals.KirillovReshetikhin(['A',2,1], 2,1)
sage: La = RootSystem(['A',2,1]).weight_lattice().fundamental_weights()
sage: C = crystals.KyotoPathModel([B1,B2,B1], La[0])
sage: C.finite_tensor_product(5)
Full tensor product of the crystals
 [Kirillov-Reshetikhin crystal of type ['A', 2, 1] with (r,s)=(1,1),
  Kirillov-Reshetikhin crystal of type ['A', 2, 1] with (r,s)=(2,1),
  Kirillov-Reshetikhin crystal of type ['A', 2, 1] with (r,s)=(1,1),
  Kirillov-Reshetikhin crystal of type ['A', 2, 1] with (r,s)=(1,1),
  Kirillov-Reshetikhin crystal of type ['A', 2, 1] with (r,s)=(2,1)]
```

```
>>> from sage.all import *
>>> B1 = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)], Integer(1),
↪Integer(1))
>>> B2 = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)], Integer(2),
↪Integer(1))
>>> La = RootSystem(['A',Integer(2),Integer(1)]).weight_lattice().fundamental_
↪weights()
>>> C = crystals.KyotoPathModel([B1,B2,B1], La[Integer(0)])
>>> C.finite_tensor_product(Integer(5))
Full tensor product of the crystals
 [Kirillov-Reshetikhin crystal of type ['A', 2, 1] with (r,s)=(1,1),
  Kirillov-Reshetikhin crystal of type ['A', 2, 1] with (r,s)=(2,1),
  Kirillov-Reshetikhin crystal of type ['A', 2, 1] with (r,s)=(1,1),
  Kirillov-Reshetikhin crystal of type ['A', 2, 1] with (r,s)=(1,1),
  Kirillov-Reshetikhin crystal of type ['A', 2, 1] with (r,s)=(2,1)]
```

weight_lattice_realization()

Return the weight lattice realization used to express weights.

EXAMPLES:

```
sage: B = crystals.KirillovReshetikhin(['A',2,1], 1,1)
sage: La = RootSystem(['A',2,1]).weight_lattice().fundamental_weights()
sage: C = crystals.KyotoPathModel(B, La[0])
sage: C.weight_lattice_realization()
Weight lattice of the Root system of type ['A', 2, 1]
```

(continues on next page)

(continued from previous page)

```
sage: P = RootSystem(['A',2,1]).weight_lattice(extended=True)
sage: C = crystals.KyotoPathModel(B, P.fundamental_weight(0))
sage: C.weight_lattice_realization()
Extended weight lattice of the Root system of type ['A', 2, 1]
```

```
>>> from sage.all import *
>>> B = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)], Integer(1),
↪Integer(1))
>>> La = RootSystem(['A',Integer(2),Integer(1)]).weight_lattice().fundamental_
↪weights()
>>> C = crystals.KyotoPathModel(B, La[Integer(0)])
>>> C.weight_lattice_realization()
Weight lattice of the Root system of type ['A', 2, 1]

>>> P = RootSystem(['A',Integer(2),Integer(1)]).weight_lattice(extended=True)
>>> C = crystals.KyotoPathModel(B, P.fundamental_weight(Integer(0)))
>>> C.weight_lattice_realization()
Extended weight lattice of the Root system of type ['A', 2, 1]
```

5.1.57 Crystals of letters

class sage.combinat.crystals.letters.**BKKLetter**

Bases: *Letter*

e(*i*)

Return the action of e_i on self.

EXAMPLES:

```
sage: C = crystals.Letters(['A', [2, 1]])
sage: c = C(-2)
sage: c.e(-2)
-3
sage: c = C(1)
sage: c.e(0)
-1
sage: c = C(2)
sage: c.e(1)
1
sage: c.e(-2)
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A', [Integer(2), Integer(1)]])
>>> c = C(-Integer(2))
>>> c.e(-Integer(2))
-3
>>> c = C(Integer(1))
>>> c.e(Integer(0))
-1
>>> c = C(Integer(2))
>>> c.e(Integer(1))
```

(continues on next page)

(continued from previous page)

```
1
>>> c.e(-Integer(2))
```

f(i)

Return the action of f_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['A', [2, 1]])
sage: c = C.an_element()
sage: c.f(-2)
-2
sage: c = C(-1)
sage: c.f(0)
1
sage: c = C(1)
sage: c.f(1)
2
sage: c.f(-2)
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A', [Integer(2), Integer(1)]])
>>> c = C.an_element()
>>> c.f(-Integer(2))
-2
>>> c = C(-Integer(1))
>>> c.f(Integer(0))
1
>>> c = C(Integer(1))
>>> c.f(Integer(1))
2
>>> c.f(-Integer(2))
```

weight()

Return weight of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['A', [2, 1]])
sage: c = C(-1)
sage: c.weight()
(0, 0, 1, 0, 0)
sage: c = C(2)
sage: c.weight()
(0, 0, 0, 0, 1)
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A', [Integer(2), Integer(1)]])
>>> c = C(-Integer(1))
>>> c.weight()
(0, 0, 1, 0, 0)
>>> c = C(Integer(2))
```

(continues on next page)

(continued from previous page)

```
>>> c.weight()
(0, 0, 0, 0, 1)
```

class sage.combinat.crystals.letters.**ClassicalCrystalOfLetters**(*cartan_type*, *element_class*, *element_print_style=None*, *dual=None*)

Bases: UniqueRepresentation, Parent

A generic class for classical crystals of letters.

All classical crystals of letters should be instances of this class or of subclasses. To define a new crystal of letters, one only needs to implement a class for the elements (which subclasses Letter), with appropriate e_i and f_i operations. If the module generator is not 1, one also needs to define the subclass *ClassicalCrystalOfLetters* for the crystal itself.

The basic assumption is that crystals of letters are small, but used intensively as building blocks. Therefore, we explicitly build in memory the list of all elements, the crystal graph and its transitive closure, so as to make the following operations constant time: list, cmp, (todo: phi, epsilon, e, and f with caching)

list()

Return a list of the elements of self.

EXAMPLES:

```
sage: C = crystals.Letters(['A',5])
sage: C.list()
[1, 2, 3, 4, 5, 6]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(5)])
>>> C.list()
[1, 2, 3, 4, 5, 6]
```

lt_elements(*x*, *y*)

Return True if and only if there is a path from x to y in the crystal graph, when x is not equal to y.

Because the crystal graph is classical, it is a directed acyclic graph which can be interpreted as a poset. This function implements the comparison function of this poset.

EXAMPLES:

```
sage: C = crystals.Letters(['A', 5])
sage: x = C(1)
sage: y = C(2)
sage: C.lt_elements(x,y)
True
sage: C.lt_elements(y,x)
False
sage: C.lt_elements(x,x)
False
sage: C = crystals.Letters(['D', 4])
sage: C.lt_elements(C(4),C(-4))
False
sage: C.lt_elements(C(-4),C(4))
False
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A', Integer(5)])
>>> x = C(Integer(1))
>>> y = C(Integer(2))
>>> C.lt_elements(x,y)
True
>>> C.lt_elements(y,x)
False
>>> C.lt_elements(x,x)
False
>>> C = crystals.Letters(['D', Integer(4)])
>>> C.lt_elements(C(Integer(4)),C(-Integer(4)))
False
>>> C.lt_elements(C(-Integer(4)),C(Integer(4)))
False
```

class sage.combinat.crystals.letters.**ClassicalCrystalOfLettersWrapped**(*cartan_type*)

Bases: *ClassicalCrystalOfLetters*

Crystal of letters by wrapping another crystal.

This is used for a crystal of letters of type E_8 and F_4.

This class follows the same output as the other crystal of letters, where b is represented by the "letter" with $\varphi_i(b)$ (resp., ε_i) number of i's (resp., $-i$'s or $\bar{i}$'s). However, this uses an auxiliary crystal to construct these letters to avoid hardcoding the crystal elements and the corresponding edges; in particular, the 248 nodes of E_8.

class sage.combinat.crystals.letters.**CrystalOfBKKLetters**(*ct*, *dual*)

Bases: *ClassicalCrystalOfLetters*

Crystal of letters for Benkart-Kang-Kashiwara supercrystals.

This implements the $\mathfrak{gl}(m|n)$ crystal of Benkart, Kang and Kashiwara [BKK2000].

EXAMPLES:

```
sage: C = crystals.Letters(['A', [1, 1]]); C
The crystal of letters for type ['A', [1, 1]]

sage: C = crystals.Letters(['A', [2,4]], dual=True); C
The crystal of letters for type ['A', [2, 4]] (dual)
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A', [Integer(1), Integer(1)]]); C
The crystal of letters for type ['A', [1, 1]]

>>> C = crystals.Letters(['A', [Integer(2),Integer(4)]], dual=True); C
The crystal of letters for type ['A', [2, 4]] (dual)
```

Element

alias of *BKKLetter*

sage.combinat.crystals.letters.**CrystalOfLetters**(*cartan_type*, *element_print_style=None*, *dual=None*)

Return the crystal of letters of the given type.

For classical types, this is a combinatorial model for the crystal with highest weight Λ_1 (the first fundamental weight).

Any irreducible classical crystal appears as the irreducible component of the tensor product of several copies of this crystal (plus possibly one copy of the spin crystal, see `CrystalOfSpins`). See [KN1994]. Elements of this irreducible component have a fixed shape, and can be fit inside a tableau shape. Otherwise said, any irreducible classical crystal is isomorphic to a crystal of tableaux with cells filled by elements of the crystal of letters (possibly tensored with the crystal of spins).

We also have the crystal of fundamental representation of the general linear Lie superalgebra, which are used as letters inside of tableaux following [BKK2000]. Similarly, all of these crystals appear as a subcrystal of a sufficiently large tensor power of this crystal.

INPUT:

- `T` – a Cartan type

EXAMPLES:

```
sage: C = crystals.Letters(['A',5])
sage: C.list()
[1, 2, 3, 4, 5, 6]
sage: C.cartan_type()
['A', 5]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(5)])
>>> C.list()
[1, 2, 3, 4, 5, 6]
>>> C.cartan_type()
['A', 5]
```

For type E_6, one can also specify how elements are printed. This option is usually set to None and the default representation is used. If one chooses the option 'compact', the elements are printed in the more compact convention with 27 letters `+abcdefghijklmnopqrstuvwxyz` and the 27 letters `-ABCDEFGHIJKLMNOPQRSTUVWXYZ` for the dual crystal.

EXAMPLES:

```
sage: C = crystals.Letters(['E',6], element_print_style = 'compact')
sage: C
The crystal of letters for type ['E', 6]
sage: C.list()
[+, a, b, c, d, e, f, g, h, i, j, k, l, m, n, o, p, q, r, s, t, u, v, w, x, y, z]
sage: C = crystals.Letters(['E',6], element_print_style = 'compact', dual = True)
sage: C
The crystal of letters for type ['E', 6] (dual)
sage: C.list()
[-, A, B, C, D, E, F, G, H, I, J, K, L, M, N, O, P, Q, R, S, T, U, V, W, X, Y, Z]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['E',Integer(6)], element_print_style = 'compact')
>>> C
The crystal of letters for type ['E', 6]
>>> C.list()
[+, a, b, c, d, e, f, g, h, i, j, k, l, m, n, o, p, q, r, s, t, u, v, w, x, y, z]
>>> C = crystals.Letters(['E',Integer(6)], element_print_style = 'compact', dual␣
↪= True)
>>> C
```

(continues on next page)

(continued from previous page)

```
The crystal of letters for type ['E', 6] (dual)
>>> C.list()
[-, A, B, C, D, E, F, G, H, I, J, K, L, M, N, O, P, Q, R, S, T, U, V, W, X, Y, Z]
```

class sage.combinat.crystals.letters.**CrystalOfQueerLetters**(*ct*)

Bases: *ClassicalCrystalOfLetters*

Queer crystal of letters elements.

The index set is of the form $\{-n, \ldots, -1, 1, \ldots, n\}$. For $1 < i \leq n$, the operators e_{-i} and f_{-i} are defined as

$$f_{-i} = s_{w_i^{-1}} f_{-1} s_{w_i}, \quad e_{-i} = s_{w_i^{-1}} e_{-1} s_{w_i},$$

where $w_i = s_2 \cdots s_i s_1 \cdots s_{i-1}$ and s_i is the reflection along the i-string in the crystal. See [GJK+2014].

Element

alias of *QueerLetter_element*

index_set()

Return index set of `self`.

EXAMPLES:

```
sage: Q = crystals.Letters(['Q',3])
sage: Q.index_set()
(1, 2, -2, -1)
```

```
>>> from sage.all import *
>>> Q = crystals.Letters(['Q',Integer(3)])
>>> Q.index_set()
(1, 2, -2, -1)
```

class sage.combinat.crystals.letters.**Crystal_of_letters_type_A_element**

Bases: *Letter*

Type A crystal of letters elements.

e(*i*)

Return the action of e_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['A',4])
sage: [(c,i,c.e(i)) for i in C.index_set() for c in C if c.e(i) is not None]
[(2, 1, 1), (3, 2, 2), (4, 3, 3), (5, 4, 4)]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(4)])
>>> [(c,i,c.e(i)) for i in C.index_set() for c in C if c.e(i) is not None]
[(2, 1, 1), (3, 2, 2), (4, 3, 3), (5, 4, 4)]
```

epsilon(*i*)

Return ε_i of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['A',4])
sage: [(c,i) for i in C.index_set() for c in C if c.epsilon(i) != 0]
[(2, 1), (3, 2), (4, 3), (5, 4)]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(4)])
>>> [(c,i) for i in C.index_set() for c in C if c.epsilon(i) != Integer(0)]
[(2, 1), (3, 2), (4, 3), (5, 4)]
```

f(i)

Return the action of f_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['A',4])
sage: [(c,i,c.f(i)) for i in C.index_set() for c in C if c.f(i) is not None]
[(1, 1, 2), (2, 2, 3), (3, 3, 4), (4, 4, 5)]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(4)])
>>> [(c,i,c.f(i)) for i in C.index_set() for c in C if c.f(i) is not None]
[(1, 1, 2), (2, 2, 3), (3, 3, 4), (4, 4, 5)]
```

phi(i)

Return φ_i of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['A',4])
sage: [(c,i) for i in C.index_set() for c in C if c.phi(i) != 0]
[(1, 1), (2, 2), (3, 3), (4, 4)]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(4)])
>>> [(c,i) for i in C.index_set() for c in C if c.phi(i) != Integer(0)]
[(1, 1), (2, 2), (3, 3), (4, 4)]
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: [v.weight() for v in crystals.Letters(['A',3])]
[(1, 0, 0, 0), (0, 1, 0, 0), (0, 0, 1, 0), (0, 0, 0, 1)]
```

```
>>> from sage.all import *
>>> [v.weight() for v in crystals.Letters(['A',Integer(3)])]
[(1, 0, 0, 0), (0, 1, 0, 0), (0, 0, 1, 0), (0, 0, 0, 1)]
```

class sage.combinat.crystals.letters.**Crystal_of_letters_type_B_element**

Bases: *Letter*

Type B crystal of letters elements.

e(*i*)

Return the action of e_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['B',4])
sage: [(c,i,c.e(i)) for i in C.index_set() for c in C if c.e(i) is not None]
[(2, 1, 1),
 (-1, 1, -2),
 (3, 2, 2),
 (-2, 2, -3),
 (4, 3, 3),
 (-3, 3, -4),
 (0, 4, 4),
 (-4, 4, 0)]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['B',Integer(4)])
>>> [(c,i,c.e(i)) for i in C.index_set() for c in C if c.e(i) is not None]
[(2, 1, 1),
 (-1, 1, -2),
 (3, 2, 2),
 (-2, 2, -3),
 (4, 3, 3),
 (-3, 3, -4),
 (0, 4, 4),
 (-4, 4, 0)]
```

epsilon(*i*)

Return ε_i of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['B',3])
sage: [(c,i) for i in C.index_set() for c in C if c.epsilon(i) != 0]
[(2, 1), (-1, 1), (3, 2), (-2, 2), (0, 3), (-3, 3)]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['B',Integer(3)])
>>> [(c,i) for i in C.index_set() for c in C if c.epsilon(i) != Integer(0)]
[(2, 1), (-1, 1), (3, 2), (-2, 2), (0, 3), (-3, 3)]
```

f(*i*)

Return the actions of f_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['B',4])
sage: [(c,i,c.f(i)) for i in C.index_set() for c in C if c.f(i) is not None]
[(1, 1, 2),
 (-2, 1, -1),
 (2, 2, 3),
 (-3, 2, -2),
 (3, 3, 4),
```

(continues on next page)

(continued from previous page)

```
 (-4, 3, -3),
 (4, 4, 0),
 (0, 4, -4)]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['B',Integer(4)])
>>> [(c,i,c.f(i)) for i in C.index_set() for c in C if c.f(i) is not None]
[(1, 1, 2),
 (-2, 1, -1),
 (2, 2, 3),
 (-3, 2, -2),
 (3, 3, 4),
 (-4, 3, -3),
 (4, 4, 0),
 (0, 4, -4)]
```

phi(*i*)

Return φ_i of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['B',3])
sage: [(c,i) for i in C.index_set() for c in C if c.phi(i) != 0]
[(1, 1), (-2, 1), (2, 2), (-3, 2), (3, 3), (0, 3)]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['B',Integer(3)])
>>> [(c,i) for i in C.index_set() for c in C if c.phi(i) != Integer(0)]
[(1, 1), (-2, 1), (2, 2), (-3, 2), (3, 3), (0, 3)]
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: [v.weight() for v in crystals.Letters(['B',3])]
[(1, 0, 0),
 (0, 1, 0),
 (0, 0, 1),
 (0, 0, 0),
 (0, 0, -1),
 (0, -1, 0),
 (-1, 0, 0)]
```

```
>>> from sage.all import *
>>> [v.weight() for v in crystals.Letters(['B',Integer(3)])]
[(1, 0, 0),
 (0, 1, 0),
 (0, 0, 1),
 (0, 0, 0),
 (0, 0, -1),
 (0, -1, 0),
 (-1, 0, 0)]
```

class sage.combinat.crystals.letters.**Crystal_of_letters_type_C_element**

Bases: *Letter*

Type C crystal of letters elements.

e(i)

Return the action of e_i on self.

EXAMPLES:

```
sage: C = crystals.Letters(['C',4])
sage: [(c,i,c.e(i)) for i in C.index_set() for c in C if c.e(i) is not None]
[(2, 1, 1),
 (-1, 1, -2),
 (3, 2, 2),
 (-2, 2, -3),
 (4, 3, 3),
 (-3, 3, -4),
 (-4, 4, 4)]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['C',Integer(4)])
>>> [(c,i,c.e(i)) for i in C.index_set() for c in C if c.e(i) is not None]
[(2, 1, 1),
 (-1, 1, -2),
 (3, 2, 2),
 (-2, 2, -3),
 (4, 3, 3),
 (-3, 3, -4),
 (-4, 4, 4)]
```

epsilon(i)

Return ε_i of self.

EXAMPLES:

```
sage: C = crystals.Letters(['C',3])
sage: [(c,i) for i in C.index_set() for c in C if c.epsilon(i) != 0]
[(2, 1), (-1, 1), (3, 2), (-2, 2), (-3, 3)]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['C',Integer(3)])
>>> [(c,i) for i in C.index_set() for c in C if c.epsilon(i) != Integer(0)]
[(2, 1), (-1, 1), (3, 2), (-2, 2), (-3, 3)]
```

f(i)

Return the action of f_i on self.

EXAMPLES:

```
sage: C = crystals.Letters(['C',4])
sage: [(c,i,c.f(i)) for i in C.index_set() for c in C if c.f(i) is not None]
[(1, 1, 2), (-2, 1, -1), (2, 2, 3),
 (-3, 2, -2), (3, 3, 4), (-4, 3, -3), (4, 4, -4)]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['C',Integer(4)])
>>> [(c,i,c.f(i)) for i in C.index_set() for c in C if c.f(i) is not None]
[(1, 1, 2), (-2, 1, -1), (2, 2, 3),
 (-3, 2, -2), (3, 3, 4), (-4, 3, -3), (4, 4, -4)]
```

phi(i)

Return φ_i of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['C',3])
sage: [(c,i) for i in C.index_set() for c in C if c.phi(i) != 0]
[(1, 1), (-2, 1), (2, 2), (-3, 2), (3, 3)]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['C',Integer(3)])
>>> [(c,i) for i in C.index_set() for c in C if c.phi(i) != Integer(0)]
[(1, 1), (-2, 1), (2, 2), (-3, 2), (3, 3)]
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: [v.weight() for v in crystals.Letters(['C',3])]
[(1, 0, 0), (0, 1, 0), (0, 0, 1), (0, 0, -1), (0, -1, 0), (-1, 0, 0)]
```

```
>>> from sage.all import *
>>> [v.weight() for v in crystals.Letters(['C',Integer(3)])]
[(1, 0, 0), (0, 1, 0), (0, 0, 1), (0, 0, -1), (0, -1, 0), (-1, 0, 0)]
```

class sage.combinat.crystals.letters.**Crystal_of_letters_type_D_element**

Bases: *Letter*

Type D crystal of letters elements.

e(i)

Return the action of e_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['D',5])
sage: [(c,i,c.e(i)) for i in C.index_set() for c in C if c.e(i) is not None]
[(2, 1, 1),
 (-1, 1, -2),
 (3, 2, 2),
 (-2, 2, -3),
 (4, 3, 3),
 (-3, 3, -4),
 (5, 4, 4),
 (-4, 4, -5),
 (-5, 5, 4),
 (-4, 5, 5)]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['D',Integer(5)])
>>> [(c,i,c.e(i)) for i in C.index_set() for c in C if c.e(i) is not None]
[(2, 1, 1),
 (-1, 1, -2),
 (3, 2, 2),
 (-2, 2, -3),
 (4, 3, 3),
 (-3, 3, -4),
 (5, 4, 4),
 (-4, 4, -5),
 (-5, 5, 4),
 (-4, 5, 5)]
```

epsilon(*i*)

Return ε_i of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['D',4])
sage: [(c,i) for i in C.index_set() for c in C if c.epsilon(i) != 0]
[(2, 1), (-1, 1), (3, 2), (-2, 2), (4, 3), (-3, 3), (-4, 4), (-3, 4)]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['D',Integer(4)])
>>> [(c,i) for i in C.index_set() for c in C if c.epsilon(i) != Integer(0)]
[(2, 1), (-1, 1), (3, 2), (-2, 2), (4, 3), (-3, 3), (-4, 4), (-3, 4)]
```

f(*i*)

Return the action of f_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['D',5])
sage: [(c,i,c.f(i)) for i in C.index_set() for c in C if c.f(i) is not None]
[(1, 1, 2),
 (-2, 1, -1),
 (2, 2, 3),
 (-3, 2, -2),
 (3, 3, 4),
 (-4, 3, -3),
 (4, 4, 5),
 (-5, 4, -4),
 (4, 5, -5),
 (5, 5, -4)]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['D',Integer(5)])
>>> [(c,i,c.f(i)) for i in C.index_set() for c in C if c.f(i) is not None]
[(1, 1, 2),
 (-2, 1, -1),
 (2, 2, 3),
 (-3, 2, -2),
```

(continues on next page)

(continued from previous page)

```
 (3, 3, 4),
 (-4, 3, -3),
 (4, 4, 5),
 (-5, 4, -4),
 (4, 5, -5),
 (5, 5, -4)]
```

phi(*i*)

Return φ_i of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['D',4])
sage: [(c,i) for i in C.index_set() for c in C if c.phi(i) != 0]
[(1, 1), (-2, 1), (2, 2), (-3, 2), (3, 3), (-4, 3), (3, 4), (4, 4)]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['D',Integer(4)])
>>> [(c,i) for i in C.index_set() for c in C if c.phi(i) != Integer(0)]
[(1, 1), (-2, 1), (2, 2), (-3, 2), (3, 3), (-4, 3), (3, 4), (4, 4)]
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: [v.weight() for v in crystals.Letters(['D',4])]
[(1, 0, 0, 0),
 (0, 1, 0, 0),
 (0, 0, 1, 0),
 (0, 0, 0, 1),
 (0, 0, 0, -1),
 (0, 0, -1, 0),
 (0, -1, 0, 0),
 (-1, 0, 0, 0)]
```

```
>>> from sage.all import *
>>> [v.weight() for v in crystals.Letters(['D',Integer(4)])]
[(1, 0, 0, 0),
 (0, 1, 0, 0),
 (0, 0, 1, 0),
 (0, 0, 0, 1),
 (0, 0, 0, -1),
 (0, 0, -1, 0),
 (0, -1, 0, 0),
 (-1, 0, 0, 0)]
```

class sage.combinat.crystals.letters.**Crystal_of_letters_type_E6_element**

Bases: *LetterTuple*

Type E_6 crystal of letters elements. This crystal corresponds to the highest weight crystal $B(\Lambda_1)$.

e(*i*)

Return the action of e_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['E',6])
sage: C((-1,3)).e(1)
(1,)
sage: C((-2,-3,4)).e(2)
(-3, 2)
sage: C((1,)).e(1)
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['E',Integer(6)])
>>> C((-Integer(1),Integer(3))).e(Integer(1))
(1,)
>>> C((-Integer(2),-Integer(3),Integer(4))).e(Integer(2))
(-3, 2)
>>> C((Integer(1),)).e(Integer(1))
```

f(*i*)

Return the action of f_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['E',6])
sage: C((1,)).f(1)
(-1, 3)
sage: C((-6,)).f(1)
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['E',Integer(6)])
>>> C((Integer(1),)).f(Integer(1))
(-1, 3)
>>> C((-Integer(6),)).f(Integer(1))
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: [v.weight() for v in crystals.Letters(['E',6])]
[(0, 0, 0, 0, 0, -2/3, -2/3, 2/3),
 (-1/2, 1/2, 1/2, 1/2, 1/2, -1/6, -1/6, 1/6),
 (1/2, -1/2, 1/2, 1/2, 1/2, -1/6, -1/6, 1/6),
 (1/2, 1/2, -1/2, 1/2, 1/2, -1/6, -1/6, 1/6),
 (-1/2, -1/2, -1/2, 1/2, 1/2, -1/6, -1/6, 1/6),
 (1/2, 1/2, 1/2, -1/2, 1/2, -1/6, -1/6, 1/6),
 (-1/2, -1/2, 1/2, -1/2, 1/2, -1/6, -1/6, 1/6),
 (-1/2, 1/2, -1/2, -1/2, 1/2, -1/6, -1/6, 1/6),
 (1/2, -1/2, -1/2, -1/2, 1/2, -1/6, -1/6, 1/6),
 (0, 0, 0, 0, 1, 1/3, 1/3, -1/3),
 (1/2, 1/2, 1/2, 1/2, -1/2, -1/6, -1/6, 1/6),
 (-1/2, -1/2, 1/2, 1/2, -1/2, -1/6, -1/6, 1/6),
 (-1/2, 1/2, -1/2, 1/2, -1/2, -1/6, -1/6, 1/6),
 (1/2, -1/2, -1/2, 1/2, -1/2, -1/6, -1/6, 1/6),
 (0, 0, 0, 1, 0, 1/3, 1/3, -1/3),
```

(continues on next page)

(continued from previous page)

```
 (-1/2, 1/2, 1/2, -1/2, -1/2, -1/6, -1/6, 1/6),
 (1/2, -1/2, 1/2, -1/2, -1/2, -1/6, -1/6, 1/6),
 (0, 0, 1, 0, 0, 1/3, 1/3, -1/3),
 (1/2, 1/2, -1/2, -1/2, -1/2, -1/6, -1/6, 1/6),
 (0, 1, 0, 0, 0, 1/3, 1/3, -1/3),
 (1, 0, 0, 0, 0, 1/3, 1/3, -1/3),

 (-1/2, -1/2, 1/2, 1/2, -1/2, -1/6, -1/6, 1/6),
 (-1/2, 1/2, -1/2, 1/2, -1/2, -1/6, -1/6, 1/6),
 (1/2, -1/2, -1/2, 1/2, -1/2, -1/6, -1/6, 1/6),
 (0, 0, 0, 1, 0, 1/3, 1/3, -1/3),
 (-1/2, 1/2, 1/2, -1/2, -1/2, -1/6, -1/6, 1/6),
 (1/2, -1/2, 1/2, -1/2, -1/2, -1/6, -1/6, 1/6),
 (0, 0, 1, 0, 0, 1/3, 1/3, -1/3),
 (1/2, 1/2, -1/2, -1/2, -1/2, -1/6, -1/6, 1/6),
 (0, 1, 0, 0, 0, 1/3, 1/3, -1/3),
 (1, 0, 0, 0, 0, 1/3, 1/3, -1/3),
 (0, -1, 0, 0, 0, 1/3, 1/3, -1/3),
 (0, 0, -1, 0, 0, 1/3, 1/3, -1/3),
 (0, 0, 0, -1, 0, 1/3, 1/3, -1/3),
 (0, 0, 0, 0, -1, 1/3, 1/3, -1/3),
 (-1/2, -1/2, -1/2, -1/2, -1/2, -1/6, -1/6, 1/6),
 (-1, 0, 0, 0, 0, 1/3, 1/3, -1/3)]
```

class sage.combinat.crystals.letters.**Crystal_of_letters_type_E6_element_dual**

Bases: *LetterTuple*

Type E_6 crystal of letters elements. This crystal corresponds to the highest weight crystal $B(\Lambda_6)$. This crystal is dual to $B(\Lambda_1)$ of type E_6.

e(*i*)

Return the action of e_i on self.

EXAMPLES:

```
sage: C = crystals.Letters(['E',6], dual = True)
sage: C((-1,)).e(1)
(1, -3)
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['E',Integer(6)], dual = True)
>>> C((-Integer(1),)).e(Integer(1))
(1, -3)
```

f(*i*)

Return the action of f_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['E',6], dual = True)
sage: C((6,)).f(6)
(5, -6)
sage: C((6,)).f(1)
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['E',Integer(6)], dual = True)
>>> C((Integer(6),)).f(Integer(6))
(5, -6)
>>> C((Integer(6),)).f(Integer(1))
```

lift()

Lift an element of `self` to the crystal of letters `crystals.Letters(['E',6])` by taking its inverse weight.

EXAMPLES:

```
sage: C = crystals.Letters(['E',6], dual = True)
sage: b = C.module_generators[0]
sage: b.lift()
(-6,)
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['E',Integer(6)], dual = True)
>>> b = C.module_generators[Integer(0)]
>>> b.lift()
(-6,)
```

retract(*p*)

Retract element `p`, which is an element in `crystals.Letters(['E',6])` to an element in `crystals.Letters(['E',6], dual=True)` by taking its inverse weight.

EXAMPLES:

```
sage: C = crystals.Letters(['E',6])
sage: Cd = crystals.Letters(['E',6], dual = True)
sage: b = Cd.module_generators[0]
sage: p = C((-1,3))
sage: b.retract(p)
(1, -3)
sage: b.retract(None)
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['E',Integer(6)])
>>> Cd = crystals.Letters(['E',Integer(6)], dual = True)
>>> b = Cd.module_generators[Integer(0)]
>>> p = C((-Integer(1),Integer(3)))
>>> b.retract(p)
(1, -3)
>>> b.retract(None)
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['E',6], dual = True)
sage: b=C.module_generators[0]
sage: b.weight()
(0, 0, 0, 0, 1, -1/3, -1/3, 1/3)
sage: [v.weight() for v in C]
[(0, 0, 0, 0, 1, -1/3, -1/3, 1/3),
(0, 0, 0, 1, 0, -1/3, -1/3, 1/3),
(0, 0, 1, 0, 0, -1/3, -1/3, 1/3),
(0, 1, 0, 0, 0, -1/3, -1/3, 1/3),
(-1, 0, 0, 0, 0, -1/3, -1/3, 1/3),
(1, 0, 0, 0, 0, -1/3, -1/3, 1/3),
(1/2, 1/2, 1/2, 1/2, 1/2, 1/6, 1/6, -1/6),
(0, -1, 0, 0, 0, -1/3, -1/3, 1/3),
(-1/2, -1/2, 1/2, 1/2, 1/2, 1/6, 1/6, -1/6),

class sage.combinat.crystals.letters.**Crystal_of_letters_type_E7_element**

Bases: *LetterTuple*

Type E_7 crystal of letters elements. This crystal corresponds to the highest weight crystal $B(\Lambda_7)$.

e(*i*)

Return the action of e_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['E',7])
sage: C((7,)).e(7)
sage: C((-7,6)).e(7)
(7,)
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['E',Integer(7)])
>>> C((Integer(7),)).e(Integer(7))
>>> C((-Integer(7),Integer(6))).e(Integer(7))
(7,)
```

f(*i*)

Return the action of f_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['E',7])
sage: C((-7,)).f(7)
sage: C((7,)).f(7)
(-7, 6)
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['E',Integer(7)])
>>> C((-Integer(7),)).f(Integer(7))
>>> C((Integer(7),)).f(Integer(7))
(-7, 6)
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: [v.weight() for v in crystals.Letters(['E',7])]
[(0, 0, 0, 0, 0, 1, -1/2, 1/2), (0, 0, 0, 0, 1, 0, -1/2, 1/2), (0, 0, 0,
1, 0, 0, -1/2, 1/2), (0, 0, 1, 0, 0, 0, -1/2, 1/2), (0, 1, 0, 0, 0, 0,
-1/2, 1/2), (-1, 0, 0, 0, 0, 0, -1/2, 1/2), (1, 0, 0, 0, 0, 0, -1/2,

```

class sage.combinat.crystals.letters.**Crystal_of_letters_type_G_element**

Bases: *Letter*

Type G_2 crystal of letters elements.

e(i)

Return the action of e_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['G',2])
sage: [(c,i,c.e(i)) for i in C.index_set() for c in C if c.e(i) is not None]
[(2, 1, 1),
 (0, 1, 3),
 (-3, 1, 0),
 (-1, 1, -2),
 (3, 2, 2),
 (-2, 2, -3)]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['G',Integer(2)])
>>> [(c,i,c.e(i)) for i in C.index_set() for c in C if c.e(i) is not None]
[(2, 1, 1),
 (0, 1, 3),
 (-3, 1, 0),
```

(continues on next page)

(continued from previous page)

```
 (-1, 1, -2),
 (3, 2, 2),
 (-2, 2, -3)]
```

epsilon(i)

Return ε_i of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['G',2])
sage: [(c,i,c.epsilon(i)) for i in C.index_set() for c in C if c.epsilon(i) !
↪= 0]
[(2, 1, 1), (0, 1, 1), (-3, 1, 2), (-1, 1, 1), (3, 2, 1), (-2, 2, 1)]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['G',Integer(2)])
>>> [(c,i,c.epsilon(i)) for i in C.index_set() for c in C if c.epsilon(i) !=␣
↪Integer(0)]
[(2, 1, 1), (0, 1, 1), (-3, 1, 2), (-1, 1, 1), (3, 2, 1), (-2, 2, 1)]
```

f(i)

Return the action of f_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['G',2])
sage: [(c,i,c.f(i)) for i in C.index_set() for c in C if c.f(i) is not None]
[(1, 1, 2),
 (3, 1, 0),
 (0, 1, -3),
 (-2, 1, -1),
 (2, 2, 3),
 (-3, 2, -2)]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['G',Integer(2)])
>>> [(c,i,c.f(i)) for i in C.index_set() for c in C if c.f(i) is not None]
[(1, 1, 2),
 (3, 1, 0),
 (0, 1, -3),
 (-2, 1, -1),
 (2, 2, 3),
 (-3, 2, -2)]
```

phi(i)

Return φ_i of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['G',2])
sage: [(c,i,c.phi(i)) for i in C.index_set() for c in C if c.phi(i) != 0]
[(1, 1, 1), (3, 1, 2), (0, 1, 1), (-2, 1, 1), (2, 2, 1), (-3, 2, 1)]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['G',Integer(2)])
>>> [(c,i,c.phi(i)) for i in C.index_set() for c in C if c.phi(i) !=␣
↪Integer(0)]
[(1, 1, 1), (3, 1, 2), (0, 1, 1), (-2, 1, 1), (2, 2, 1), (-3, 2, 1)]
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: [v.weight() for v in crystals.Letters(['G',2])]
[(1, 0, -1), (1, -1, 0), (0, 1, -1), (0, 0, 0), (0, -1, 1), (-1, 1, 0), (-1,␣
↪0, 1)]
```

```
>>> from sage.all import *
>>> [v.weight() for v in crystals.Letters(['G',Integer(2)])]
[(1, 0, -1), (1, -1, 0), (0, 1, -1), (0, 0, 0), (0, -1, 1), (-1, 1, 0), (-1,␣
↪0, 1)]
```

class sage.combinat.crystals.letters.**EmptyLetter**

Bases: `Element`

The affine letter $\emptyset$ thought of as a classical crystal letter in classical type B_n and C_n.

> **Warning**
>
> This is not a classical letter.

Used in the rigged configuration bijections.

e(i)

Return e_i of `self` which is `None`.

EXAMPLES:

```
sage: C = crystals.Letters(['C', 3])
sage: C('E').e(1)
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['C', Integer(3)])
>>> C('E').e(Integer(1))
```

epsilon(i)

Return ε_i of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['C', 3])
sage: C('E').epsilon(1)
0
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['C', Integer(3)])
>>> C('E').epsilon(Integer(1))
0
```

f(*i*)

Return f_i of `self` which is `None`.

EXAMPLES:

```
sage: C = crystals.Letters(['C', 3])
sage: C('E').f(1)
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['C', Integer(3)])
>>> C('E').f(Integer(1))
```

phi(*i*)

Return φ_i of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['C', 3])
sage: C('E').phi(1)
0
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['C', Integer(3)])
>>> C('E').phi(Integer(1))
0
```

value

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['C', 3])
sage: C('E').weight()
(0, 0, 0)
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['C', Integer(3)])
>>> C('E').weight()
(0, 0, 0)
```

class sage.combinat.crystals.letters.**Letter**

Bases: `Element`

A class for letters.

Like `ElementWrapper`, plus delegates `__lt__` (comparison) to the parent.

EXAMPLES:

```
sage: from sage.combinat.crystals.letters import Letter
sage: a = Letter(ZZ, 1)
sage: Letter(ZZ, 1).parent()
Integer Ring

sage: Letter(ZZ, 1)._repr_()
'1'

sage: parent1 = ZZ  # Any fake value ...
sage: parent2 = QQ  # Any fake value ...
sage: l11 = Letter(parent1, 1)
sage: l12 = Letter(parent1, 2)
sage: l21 = Letter(parent2, 1)
sage: l22 = Letter(parent2, 2)
sage: l11 == l11
True
sage: l11 == l12
False
sage: l11 == l21 # not tested
False

sage: C = crystals.Letters(['B', 3])
sage: C(0) != C(0)
False
sage: C(1) != C(-1)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.letters import Letter
>>> a = Letter(ZZ, Integer(1))
>>> Letter(ZZ, Integer(1)).parent()
Integer Ring

>>> Letter(ZZ, Integer(1))._repr_()
'1'

>>> parent1 = ZZ  # Any fake value ...
>>> parent2 = QQ  # Any fake value ...
>>> l11 = Letter(parent1, Integer(1))
>>> l12 = Letter(parent1, Integer(2))
>>> l21 = Letter(parent2, Integer(1))
>>> l22 = Letter(parent2, Integer(2))
>>> l11 == l11
True
>>> l11 == l12
False
>>> l11 == l21 # not tested
False

>>> C = crystals.Letters(['B', Integer(3)])
>>> C(Integer(0)) != C(Integer(0))
False
```

(continues on next page)

(continued from previous page)

```
>>> C(Integer(1)) != C(-Integer(1))
True
```

value

class sage.combinat.crystals.letters.**LetterTuple**

Bases: Element

Abstract class for type E letters.

epsilon(i)

Return ε_i of self.

EXAMPLES:

```
sage: C = crystals.Letters(['E',6])
sage: C((-6,)).epsilon(1)
0
sage: C((-6,)).epsilon(6)
1
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['E',Integer(6)])
>>> C((-Integer(6),)).epsilon(Integer(1))
0
>>> C((-Integer(6),)).epsilon(Integer(6))
1
```

phi(i)

Return φ_i of self.

EXAMPLES:

```
sage: C = crystals.Letters(['E',6])
sage: C((1,)).phi(1)
1
sage: C((1,)).phi(6)
0
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['E',Integer(6)])
>>> C((Integer(1),)).phi(Integer(1))
1
>>> C((Integer(1),)).phi(Integer(6))
0
```

value

class sage.combinat.crystals.letters.**LetterWrapped**

Bases: Element

Element which uses another crystal implementation and converts those elements to a tuple with $\pm i$.

e(*i*)

Return e_i of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['E', 8])
sage: C((-8,)).e(1)
sage: C((-8,)).e(8)
(-7, 8)
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['E', Integer(8)])
>>> C((-Integer(8),)).e(Integer(1))
>>> C((-Integer(8),)).e(Integer(8))
(-7, 8)
```

epsilon(*i*)

Return ε_i of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['E', 8])
sage: C((-8,)).epsilon(1)
0
sage: C((-8,)).epsilon(8)
1
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['E', Integer(8)])
>>> C((-Integer(8),)).epsilon(Integer(1))
0
>>> C((-Integer(8),)).epsilon(Integer(8))
1
```

f(*i*)

Return f_i of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['E', 8])
sage: C((8,)).f(6)
sage: C((8,)).f(8)
(7, -8)
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['E', Integer(8)])
>>> C((Integer(8),)).f(Integer(6))
>>> C((Integer(8),)).f(Integer(8))
(7, -8)
```

phi(*i*)

Return φ_i of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['E', 8])
sage: C((8,)).phi(8)
1
sage: C((8,)).phi(6)
0
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['E', Integer(8)])
>>> C((Integer(8),)).phi(Integer(8))
1
>>> C((Integer(8),)).phi(Integer(6))
0
```

value

class sage.combinat.crystals.letters.**QueerLetter_element**

Bases: *Letter*

Queer supercrystal letters elements.

e(*i*)

Return the action of e_i on self.

EXAMPLES:

```
sage: Q = crystals.Letters(['Q',3])
sage: [(c,i,c.e(i)) for i in Q.index_set() for c in Q if c.e(i) is not None]
[(2, 1, 1), (3, 2, 2), (3, -2, 2), (2, -1, 1)]
```

```
>>> from sage.all import *
>>> Q = crystals.Letters(['Q',Integer(3)])
>>> [(c,i,c.e(i)) for i in Q.index_set() for c in Q if c.e(i) is not None]
[(2, 1, 1), (3, 2, 2), (3, -2, 2), (2, -1, 1)]
```

epsilon(*i*)

Return ε_i of self.

EXAMPLES:

```
sage: Q = crystals.Letters(['Q',3])
sage: [(c,i) for i in Q.index_set() for c in Q if c.epsilon(i) != 0]
[(2, 1), (3, 2), (3, -2), (2, -1)]
```

```
>>> from sage.all import *
>>> Q = crystals.Letters(['Q',Integer(3)])
>>> [(c,i) for i in Q.index_set() for c in Q if c.epsilon(i) != Integer(0)]
[(2, 1), (3, 2), (3, -2), (2, -1)]
```

f(*i*)

Return the action of f_i on self.

EXAMPLES:

```
sage: Q = crystals.Letters(['Q',3])
sage: [(c,i,c.f(i)) for i in Q.index_set() for c in Q if c.f(i) is not None]
[(1, 1, 2), (2, 2, 3), (2, -2, 3), (1, -1, 2)]
```

```
>>> from sage.all import *
>>> Q = crystals.Letters(['Q',Integer(3)])
>>> [(c,i,c.f(i)) for i in Q.index_set() for c in Q if c.f(i) is not None]
[(1, 1, 2), (2, 2, 3), (2, -2, 3), (1, -1, 2)]
```

phi(*i*)

Return φ_i of `self`.

EXAMPLES:

```
sage: Q = crystals.Letters(['Q',3])
sage: [(c,i) for i in Q.index_set() for c in Q if c.phi(i) != 0]
[(1, 1), (2, 2), (2, -2), (1, -1)]
```

```
>>> from sage.all import *
>>> Q = crystals.Letters(['Q',Integer(3)])
>>> [(c,i) for i in Q.index_set() for c in Q if c.phi(i) != Integer(0)]
[(1, 1), (2, 2), (2, -2), (1, -1)]
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: [v.weight() for v in crystals.Letters(['Q',4])]
[(1, 0, 0, 0), (0, 1, 0, 0), (0, 0, 1, 0), (0, 0, 0, 1)]
```

```
>>> from sage.all import *
>>> [v.weight() for v in crystals.Letters(['Q',Integer(4)])]
[(1, 0, 0, 0), (0, 1, 0, 0), (0, 0, 1, 0), (0, 0, 0, 1)]
```

5.1.58 Littelmann paths

AUTHORS:

- Mark Shimozono, Anne Schilling (2012): Initial version
- Anne Schilling (2013): Implemented `CrystalOfProjectedLevelZeroLSPaths`
- Travis Scrimshaw (2016): Implemented `InfinityCrystalOfLSPaths`

class sage.combinat.crystals.littelmann_path.**CrystalOfLSPaths**(*starting_weight*, *starting_weight_parent*)

Bases: `UniqueRepresentation`, `Parent`

Crystal graph of LS paths generated from the straight-line path to a given weight.

INPUT:

- `cartan_type` – (optional) the Cartan type

- `starting_weight` – a weight; if `cartan_type` is given, then the weight should be given as a list of coefficients of the fundamental weights, otherwise it should be given in the `weight_space` basis; for affine highest weight crystals, one needs to use the extended weight space

The crystal class of piecewise linear paths in the weight space, generated from a straight-line path from the origin to a given element of the weight lattice.

EXAMPLES:

```
sage: R = RootSystem(['A',2,1])
sage: La = R.weight_space(extended = True).basis()
sage: B = crystals.LSPaths(La[2]-La[0]); B
The crystal of LS paths of type ['A', 2, 1] and weight -Lambda[0] + Lambda[2]

sage: C = crystals.LSPaths(['A',2,1],[-1,0,1]); C
The crystal of LS paths of type ['A', 2, 1] and weight -Lambda[0] + Lambda[2]
sage: B == C
True
sage: c = C.module_generators[0]; c
(-Lambda[0] + Lambda[2],)
sage: [c.f(i) for i in C.index_set()]
[None, None, (Lambda[1] - Lambda[2],)]

sage: R = C.R; R
Root system of type ['A', 2, 1]
sage: Lambda = R.weight_space().basis(); Lambda
Finite family {0: Lambda[0], 1: Lambda[1], 2: Lambda[2]}
sage: b=C(tuple([-Lambda[0]+Lambda[2]]))
sage: b==c
True
sage: b.f(2)
(Lambda[1] - Lambda[2],)
```

```
>>> from sage.all import *
>>> R = RootSystem(['A',Integer(2),Integer(1)])
>>> La = R.weight_space(extended = True).basis()
>>> B = crystals.LSPaths(La[Integer(2)]-La[Integer(0)]); B
The crystal of LS paths of type ['A', 2, 1] and weight -Lambda[0] + Lambda[2]

>>> C = crystals.LSPaths(['A',Integer(2),Integer(1)],[-Integer(1),Integer(0),
↪Integer(1)]); C
The crystal of LS paths of type ['A', 2, 1] and weight -Lambda[0] + Lambda[2]
>>> B == C
True
>>> c = C.module_generators[Integer(0)]; c
(-Lambda[0] + Lambda[2],)
>>> [c.f(i) for i in C.index_set()]
[None, None, (Lambda[1] - Lambda[2],)]

>>> R = C.R; R
Root system of type ['A', 2, 1]
>>> Lambda = R.weight_space().basis(); Lambda
Finite family {0: Lambda[0], 1: Lambda[1], 2: Lambda[2]}
>>> b=C(tuple([-Lambda[Integer(0)]+Lambda[Integer(2)]]))
```

(continues on next page)

(continued from previous page)

```
>>> b==c
True
>>> b.f(Integer(2))
(Lambda[1] - Lambda[2],)
```

For classical highest weight crystals, we can also compare the results with the tableaux implementation:

```
sage: C = crystals.LSPaths(['A',2],[1,1])
sage: sorted(C, key=str)
[(-2*Lambda[1] + Lambda[2],), (-Lambda[1] + 1/2*Lambda[2], Lambda[1] - 1/
↪2*Lambda[2]),
 (-Lambda[1] + 2*Lambda[2],), (-Lambda[1] - Lambda[2],),
 (1/2*Lambda[1] - Lambda[2], -1/2*Lambda[1] + Lambda[2]), (2*Lambda[1] -␣
↪Lambda[2],),
 (Lambda[1] + Lambda[2],), (Lambda[1] - 2*Lambda[2],)]
sage: C.cardinality()
8
sage: B = crystals.Tableaux(['A',2],shape=[2,1])
sage: B.cardinality()
8
sage: B.digraph().is_isomorphic(C.digraph())
True
```

```
>>> from sage.all import *
>>> C = crystals.LSPaths(['A',Integer(2)],[Integer(1),Integer(1)])
>>> sorted(C, key=str)
[(-2*Lambda[1] + Lambda[2],), (-Lambda[1] + 1/2*Lambda[2], Lambda[1] - 1/
↪2*Lambda[2]),
 (-Lambda[1] + 2*Lambda[2],), (-Lambda[1] - Lambda[2],),
 (1/2*Lambda[1] - Lambda[2], -1/2*Lambda[1] + Lambda[2]), (2*Lambda[1] -␣
↪Lambda[2],),
 (Lambda[1] + Lambda[2],), (Lambda[1] - 2*Lambda[2],)]
>>> C.cardinality()
8
>>> B = crystals.Tableaux(['A',Integer(2)],shape=[Integer(2),Integer(1)])
>>> B.cardinality()
8
>>> B.digraph().is_isomorphic(C.digraph())
True
```

Make sure you use the weight space and not the weight lattice for your weights:

```
sage: R = RootSystem(['A',2,1])
sage: La = R.weight_lattice(extended = True).basis()
sage: B = crystals.LSPaths(La[2]); B
Traceback (most recent call last):
...
ValueError: use the weight space, rather than weight lattice for your weights
```

```
>>> from sage.all import *
>>> R = RootSystem(['A',Integer(2),Integer(1)])
>>> La = R.weight_lattice(extended = True).basis()
```

(continues on next page)

(continued from previous page)

```
>>> B = crystals.LSPaths(La[Integer(2)]); B
Traceback (most recent call last):
...
ValueError: use the weight space, rather than weight lattice for your weights
```

REFERENCES:

- [Li1995b]

class Element

Bases: ElementWrapper

A Littelmann path (crystal element).

compress()

Merge consecutive positively parallel steps present in `self`.

EXAMPLES:

```
sage: C = crystals.LSPaths(['A',2],[1,1])
sage: Lambda = C.R.weight_space().fundamental_weights(); Lambda
Finite family {1: Lambda[1], 2: Lambda[2]}
sage: c = C(tuple([1/2*Lambda[1]+1/2*Lambda[2], 1/2*Lambda[1]+1/
↪2*Lambda[2]]))
sage: c.compress()
(Lambda[1] + Lambda[2],)
```

```
>>> from sage.all import *
>>> C = crystals.LSPaths(['A',Integer(2)],[Integer(1),Integer(1)])
>>> Lambda = C.R.weight_space().fundamental_weights(); Lambda
Finite family {1: Lambda[1], 2: Lambda[2]}
>>> c = C(tuple([Integer(1)/Integer(2)*Lambda[Integer(1)]+Integer(1)/
↪Integer(2)*Lambda[Integer(2)], Integer(1)/
↪Integer(2)*Lambda[Integer(1)]+Integer(1)/
↪Integer(2)*Lambda[Integer(2)]]))
>>> c.compress()
(Lambda[1] + Lambda[2],)
```

dualize()

Return the dualized path of `self`.

EXAMPLES:

```
sage: C = crystals.LSPaths(['A',2],[1,1])
sage: for c in C:
....:     print("{} {}".format(c, c.dualize()))
(Lambda[1] + Lambda[2],) (-Lambda[1] - Lambda[2],)
(-Lambda[1] + 2*Lambda[2],) (Lambda[1] - 2*Lambda[2],)
(1/2*Lambda[1] - Lambda[2], -1/2*Lambda[1] + Lambda[2]) (1/2*Lambda[1] -␣
↪Lambda[2], -1/2*Lambda[1] + Lambda[2])
(Lambda[1] - 2*Lambda[2],) (-Lambda[1] + 2*Lambda[2],)
(-Lambda[1] - Lambda[2],) (Lambda[1] + Lambda[2],)
(2*Lambda[1] - Lambda[2],) (-2*Lambda[1] + Lambda[2],)
(-Lambda[1] + 1/2*Lambda[2], Lambda[1] - 1/2*Lambda[2]) (-Lambda[1] + 1/
```

(continues on next page)

(continued from previous page)

```
↪2*Lambda[2], Lambda[1] - 1/2*Lambda[2])
(-2*Lambda[1] + Lambda[2],) (2*Lambda[1] - Lambda[2],)
```

```
>>> from sage.all import *
>>> C = crystals.LSPaths(['A',Integer(2)],[Integer(1),Integer(1)])
>>> for c in C:
...     print("{} {}".format(c, c.dualize()))
(Lambda[1] + Lambda[2],) (-Lambda[1] - Lambda[2],)
(-Lambda[1] + 2*Lambda[2],) (Lambda[1] - 2*Lambda[2],)
(1/2*Lambda[1] - Lambda[2], -1/2*Lambda[1] + Lambda[2]) (1/2*Lambda[1] -␣
↪Lambda[2], -1/2*Lambda[1] + Lambda[2])
(Lambda[1] - 2*Lambda[2],) (-Lambda[1] + 2*Lambda[2],)
(-Lambda[1] - Lambda[2],) (Lambda[1] + Lambda[2],)
(2*Lambda[1] - Lambda[2],) (-2*Lambda[1] + Lambda[2],)
(-Lambda[1] + 1/2*Lambda[2], Lambda[1] - 1/2*Lambda[2]) (-Lambda[1] + 1/
↪2*Lambda[2], Lambda[1] - 1/2*Lambda[2])
(-2*Lambda[1] + Lambda[2],) (2*Lambda[1] - Lambda[2],)
```

e(*i*, *power=1*, *to_string_end=False*, *length_only=False*)

Return the i-th crystal raising operator on `self`.

INPUT:

- `i` – element of the index set of the underlying root system
- `power` – positive integer (default: 1); specifies the power of the raising operator to be applied
- `to_string_end` – boolean (default: `False`); if `True`, returns the dominant end of the i-string of `self`
- `length_only` – boolean; if `True`, returns the distance to the dominant end of the i-string of `self`

EXAMPLES:

```
sage: C = crystals.LSPaths(['A',2],[1,1])
sage: c = C[2]; c
(1/2*Lambda[1] - Lambda[2], -1/2*Lambda[1] + Lambda[2])
sage: c.e(1)
sage: c.e(2)
(-Lambda[1] + 2*Lambda[2],)
sage: c.e(2,to_string_end=True)
(-Lambda[1] + 2*Lambda[2],)
sage: c.e(1,to_string_end=True)
(1/2*Lambda[1] - Lambda[2], -1/2*Lambda[1] + Lambda[2])
sage: c.e(1,length_only=True)
0
```

```
>>> from sage.all import *
>>> C = crystals.LSPaths(['A',Integer(2)],[Integer(1),Integer(1)])
>>> c = C[Integer(2)]; c
(1/2*Lambda[1] - Lambda[2], -1/2*Lambda[1] + Lambda[2])
>>> c.e(Integer(1))
>>> c.e(Integer(2))
(-Lambda[1] + 2*Lambda[2],)
>>> c.e(Integer(2),to_string_end=True)
(-Lambda[1] + 2*Lambda[2],)
>>> c.e(Integer(1),to_string_end=True)
```

(continues on next page)

(continued from previous page)

```
(1/2*Lambda[1] - Lambda[2], -1/2*Lambda[1] + Lambda[2])
>>> c.e(Integer(1),length_only=True)
0
```

endpoint()

Compute the endpoint of `self`.

EXAMPLES:

```
sage: C = crystals.LSPaths(['A',2],[1,1])
sage: b = C.module_generators[0]
sage: b.endpoint()
Lambda[1] + Lambda[2]
sage: b.f_string([1,2,2,1])
(-Lambda[1] - Lambda[2],)
sage: b.f_string([1,2,2,1]).endpoint()
-Lambda[1] - Lambda[2]
sage: b.f_string([1,2])
(1/2*Lambda[1] - Lambda[2], -1/2*Lambda[1] + Lambda[2])
sage: b.f_string([1,2]).endpoint()
0
sage: b = C([])
sage: b.endpoint()
0
```

```
>>> from sage.all import *
>>> C = crystals.LSPaths(['A',Integer(2)],[Integer(1),Integer(1)])
>>> b = C.module_generators[Integer(0)]
>>> b.endpoint()
Lambda[1] + Lambda[2]
>>> b.f_string([Integer(1),Integer(2),Integer(2),Integer(1)])
(-Lambda[1] - Lambda[2],)
>>> b.f_string([Integer(1),Integer(2),Integer(2),Integer(1)]).endpoint()
-Lambda[1] - Lambda[2]
>>> b.f_string([Integer(1),Integer(2)])
(1/2*Lambda[1] - Lambda[2], -1/2*Lambda[1] + Lambda[2])
>>> b.f_string([Integer(1),Integer(2)]).endpoint()
0
>>> b = C([])
>>> b.endpoint()
0
```

epsilon(i)

Return the distance to the beginning of the i-string.

This method overrides the generic implementation in the category of crystals since this computation is more efficient.

EXAMPLES:

```
sage: C = crystals.LSPaths(['A',2],[1,1])
sage: [c.epsilon(1) for c in C]
[0, 1, 0, 0, 1, 0, 1, 2]
```

(continues on next page)

(continued from previous page)

```
sage: [c.epsilon(2) for c in C]
[0, 0, 1, 2, 1, 1, 0, 0]
```

```
>>> from sage.all import *
>>> C = crystals.LSPaths(['A',Integer(2)],[Integer(1),Integer(1)])
>>> [c.epsilon(Integer(1)) for c in C]
[0, 1, 0, 0, 1, 0, 1, 2]
>>> [c.epsilon(Integer(2)) for c in C]
[0, 0, 1, 2, 1, 1, 0, 0]
```

f(*i*, *power=1*, *to_string_end=False*, *length_only=False*)

Return the i-th crystal lowering operator on `self`.

INPUT:

- `i` – element of the index set of the underlying root system
- `power` – positive integer (default: 1); specifies the power of the lowering operator to be applied
- `to_string_end` – boolean (default: `False`); if `True`, returns the anti-dominant end of the i-string of `self`
- `length_only` – boolean; if `True`, returns the distance to the anti-dominant end of the i-string of `self`

EXAMPLES:

```
sage: C = crystals.LSPaths(['A',2],[1,1])
sage: c = C.module_generators[0]
sage: c.f(1)
(-Lambda[1] + 2*Lambda[2],)
sage: c.f(1,power=2)
sage: c.f(2)
(2*Lambda[1] - Lambda[2],)
sage: c.f(2,to_string_end=True)
(2*Lambda[1] - Lambda[2],)
sage: c.f(2,length_only=True)
1

sage: C = crystals.LSPaths(['A',2,1],[-1,-1,2])
sage: c = C.module_generators[0]
sage: c.f(2,power=2)
(Lambda[0] + Lambda[1] - 2*Lambda[2],)
```

```
>>> from sage.all import *
>>> C = crystals.LSPaths(['A',Integer(2)],[Integer(1),Integer(1)])
>>> c = C.module_generators[Integer(0)]
>>> c.f(Integer(1))
(-Lambda[1] + 2*Lambda[2],)
>>> c.f(Integer(1),power=Integer(2))
>>> c.f(Integer(2))
(2*Lambda[1] - Lambda[2],)
>>> c.f(Integer(2),to_string_end=True)
(2*Lambda[1] - Lambda[2],)
>>> c.f(Integer(2),length_only=True)
1
```

(continues on next page)

(continued from previous page)

```
>>> C = crystals.LSPaths(['A',Integer(2),Integer(1)],[-Integer(1),-
↪Integer(1),Integer(2)])
>>> c = C.module_generators[Integer(0)]
>>> c.f(Integer(2),power=Integer(2))
(Lambda[0] + Lambda[1] - 2*Lambda[2],)
```

phi(*i*)

Return the distance to the end of the i-string.

This method overrides the generic implementation in the category of crystals since this computation is more efficient.

EXAMPLES:

```
sage: C = crystals.LSPaths(['A',2],[1,1])
sage: [c.phi(1) for c in C]
[1, 0, 0, 1, 0, 2, 1, 0]
sage: [c.phi(2) for c in C]
[1, 2, 1, 0, 0, 0, 0, 1]
```

```
>>> from sage.all import *
>>> C = crystals.LSPaths(['A',Integer(2)],[Integer(1),Integer(1)])
>>> [c.phi(Integer(1)) for c in C]
[1, 0, 0, 1, 0, 2, 1, 0]
>>> [c.phi(Integer(2)) for c in C]
[1, 2, 1, 0, 0, 0, 0, 1]
```

reflect_step(*which_step*, *i*)

Apply the i-th simple reflection to the indicated step in `self`.

EXAMPLES:

```
sage: C = crystals.LSPaths(['A',2],[1,1])
sage: b = C.module_generators[0]
sage: b.reflect_step(0,1)
(-Lambda[1] + 2*Lambda[2],)
sage: b.reflect_step(0,2)
(2*Lambda[1] - Lambda[2],)
```

```
>>> from sage.all import *
>>> C = crystals.LSPaths(['A',Integer(2)],[Integer(1),Integer(1)])
>>> b = C.module_generators[Integer(0)]
>>> b.reflect_step(Integer(0),Integer(1))
(-Lambda[1] + 2*Lambda[2],)
>>> b.reflect_step(Integer(0),Integer(2))
(2*Lambda[1] - Lambda[2],)
```

s(*i*)

Compute the reflection of `self` along the i-string.

This method is more efficient than the generic implementation since it uses powers of e and f in the Littelmann model directly.

EXAMPLES:

```
sage: C = crystals.LSPaths(['A',2],[1,1])
sage: c = C.module_generators[0]
sage: c.s(1)
(-Lambda[1] + 2*Lambda[2],)
sage: c.s(2)
(2*Lambda[1] - Lambda[2],)

sage: C = crystals.LSPaths(['A',2,1],[-1,0,1])
sage: c = C.module_generators[0]; c
(-Lambda[0] + Lambda[2],)
sage: c.s(2)
(Lambda[1] - Lambda[2],)
sage: c.s(1)
(-Lambda[0] + Lambda[2],)
sage: c.f(2).s(1)
(Lambda[0] - Lambda[1],)
```

```
>>> from sage.all import *
>>> C = crystals.LSPaths(['A',Integer(2)],[Integer(1),Integer(1)])
>>> c = C.module_generators[Integer(0)]
>>> c.s(Integer(1))
(-Lambda[1] + 2*Lambda[2],)
>>> c.s(Integer(2))
(2*Lambda[1] - Lambda[2],)

>>> C = crystals.LSPaths(['A',Integer(2),Integer(1)],[-Integer(1),
↪Integer(0),Integer(1)])
>>> c = C.module_generators[Integer(0)]; c
(-Lambda[0] + Lambda[2],)
>>> c.s(Integer(2))
(Lambda[1] - Lambda[2],)
>>> c.s(Integer(1))
(-Lambda[0] + Lambda[2],)
>>> c.f(Integer(2)).s(Integer(1))
(Lambda[0] - Lambda[1],)
```

split_step(*which_step*, *r*)

Split the indicated step into two parallel steps of relative lengths r and $1 - r$.

INPUT:

- `which_step` – a position in the tuple `self`
- `r` – a rational number between 0 and 1

EXAMPLES:

```
sage: C = crystals.LSPaths(['A',2],[1,1])
sage: b = C.module_generators[0]
sage: b.split_step(0,1/3)
(1/3*Lambda[1] + 1/3*Lambda[2], 2/3*Lambda[1] + 2/3*Lambda[2])
```

```
>>> from sage.all import *
>>> C = crystals.LSPaths(['A',Integer(2)],[Integer(1),Integer(1)])
>>> b = C.module_generators[Integer(0)]
>>> b.split_step(Integer(0),Integer(1)/Integer(3))
```

(continues on next page)

(continued from previous page)

```
(1/3*Lambda[1] + 1/3*Lambda[2], 2/3*Lambda[1] + 2/3*Lambda[2])
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: B = crystals.LSPaths(['A',1,1],[1,0])
sage: b = B.highest_weight_vector()
sage: b.f(0).weight()
-Lambda[0] + 2*Lambda[1] - delta
```

```
>>> from sage.all import *
>>> B = crystals.LSPaths(['A',Integer(1),Integer(1)],[Integer(1),
↪Integer(0)])
>>> b = B.highest_weight_vector()
>>> b.f(Integer(0)).weight()
-Lambda[0] + 2*Lambda[1] - delta
```

weight_lattice_realization()

Return weight lattice realization of `self`.

EXAMPLES:

```
sage: B = crystals.LSPaths(['B',3],[1,1,0])
sage: B.weight_lattice_realization()
Weight space over the Rational Field of the Root system of type ['B', 3]
sage: B = crystals.LSPaths(['B',3,1],[1,1,1,0])
sage: B.weight_lattice_realization()
Extended weight space over the Rational Field of the Root system of type ['B',
↪ 3, 1]
```

```
>>> from sage.all import *
>>> B = crystals.LSPaths(['B',Integer(3)],[Integer(1),Integer(1),Integer(0)])
>>> B.weight_lattice_realization()
Weight space over the Rational Field of the Root system of type ['B', 3]
>>> B = crystals.LSPaths(['B',Integer(3),Integer(1)],[Integer(1),Integer(1),
↪Integer(1),Integer(0)])
>>> B.weight_lattice_realization()
Extended weight space over the Rational Field of the Root system of type ['B',
↪ 3, 1]
```

class sage.combinat.crystals.littelmann_path.**CrystalOfProjectedLevelZeroLSPaths**(*starting_weight*, *starting_weight_parent*)

Bases: *CrystalOfLSPaths*

Crystal of projected level zero LS paths.

INPUT:

- `weight` – a dominant weight of the weight space of an affine Kac-Moody root system

When `weight` is just a single fundamental weight Λ_r, this crystal is isomorphic to a Kirillov-Reshetikhin (KR) crystal, see also `sage.combinat.crystals.kirillov_reshetikhin.KirillovReshetikhinFromLSPaths()`. For general weights, it is isomorphic to a tensor product of single-column KR crystals.

EXAMPLES:

```
sage: R = RootSystem(['C',3,1])
sage: La = R.weight_space().basis()
sage: LS = crystals.ProjectedLevelZeroLSPaths(La[1]+La[3])
sage: LS.cardinality()
84
sage: GLS = LS.digraph()

sage: K1 = crystals.KirillovReshetikhin(['C',3,1],1,1)
sage: K3 = crystals.KirillovReshetikhin(['C',3,1],3,1)
sage: T = crystals.TensorProduct(K3,K1)
sage: T.cardinality()
84
sage: GT = T.digraph() # long time
sage: GLS.is_isomorphic(GT, edge_labels = True) # long time
True
```

```
>>> from sage.all import *
>>> R = RootSystem(['C',Integer(3),Integer(1)])
>>> La = R.weight_space().basis()
>>> LS = crystals.ProjectedLevelZeroLSPaths(La[Integer(1)]+La[Integer(3)])
>>> LS.cardinality()
84
>>> GLS = LS.digraph()

>>> K1 = crystals.KirillovReshetikhin(['C',Integer(3),Integer(1)],Integer(1),
↪Integer(1))
>>> K3 = crystals.KirillovReshetikhin(['C',Integer(3),Integer(1)],Integer(3),
↪Integer(1))
>>> T = crystals.TensorProduct(K3,K1)
>>> T.cardinality()
84
>>> GT = T.digraph() # long time
>>> GLS.is_isomorphic(GT, edge_labels = True) # long time
True
```

class Element

Bases: *Element*

Element of a crystal of projected level zero LS paths.

energy_function()

Return the energy function of `self`.

The energy function $D(\pi)$ of the level zero LS path $\pi \in \mathbb{B}_{\mathrm{cl}}(\lambda)$ requires a series of definitions; for simplicity the root system is assumed to be untwisted affine.

The LS path π is a piecewise linear map from the unit interval $[0,1]$ to the weight lattice. It is specified by "times" $0 = \sigma_0 < \sigma_1 < \cdots < \sigma_s = 1$ and "direction vectors" $x_u\lambda$ where $x_u \in W/W_J$ for $1 \le u \le s$, and W_J is the stabilizer of λ in the finite Weyl group W. Precisely,

$$\pi(t) = \sum_{u'=1}^{u-1} (\sigma_{u'} - \sigma_{u'-1}) x_{u'} \lambda + (t - \sigma_{u-1}) x_u \lambda$$

for $1 \leq u \leq s$ and $\sigma_{u-1} \leq t \leq \sigma_u$.

For any $x, y \in W/W_J$, let

$$d : x = w_0 \stackrel{\beta_1}{\leftarrow} w_1 \stackrel{\beta_2}{\leftarrow} \cdots \stackrel{\beta_n}{\leftarrow} w_n = y$$

be a shortest directed path in the parabolic quantum Bruhat graph. Define

$$\mathrm{wt}(d) := \sum_{\substack{1 \leq k \leq n \\ \ell(w_{k-1}) < \ell(w_k)}} \beta_k^\vee.$$

It can be shown that $\mathrm{wt}(d)$ depends only on x, y; call its value $\mathrm{wt}(x, y)$. The energy function $D(\pi)$ is defined by

$$D(\pi) = -\sum_{u=1}^{s-1} (1 - \sigma_u) \langle \lambda, \mathrm{wt}(x_u, x_{u+1}) \rangle.$$

For more information, see [LNSSS2013].

Note: In the dual-of-untwisted case the parabolic quantum Bruhat graph that is used is obtained by exchanging the roles of roots and coroots. Moreover, in the computation of the pairing the short roots must be doubled (or tripled for type G). This factor is determined by the translation factor of the corresponding root. Type BC is viewed as untwisted type, whereas the dual of BC is viewed as twisted. Except for the untwisted cases, these formulas are currently still conjectural.

EXAMPLES:

```
sage: R = RootSystem(['C',3,1])
sage: La = R.weight_space().basis()
sage: LS = crystals.ProjectedLevelZeroLSPaths(La[1]+La[3])
sage: b = LS.module_generators[0]
sage: c = b.f(1).f(3).f(2)
sage: c.energy_function()
0
sage: c=b.e(0)
sage: c.energy_function()
1

sage: R = RootSystem(['A',2,1])
sage: La = R.weight_space().basis()
sage: LS = crystals.ProjectedLevelZeroLSPaths(2*La[1])
sage: b = LS.module_generators[0]
sage: c = b.e(0)
sage: c.energy_function()
1
sage: for c in sorted(LS, key=str):
```

(continues on next page)

(continued from previous page)

```
....:     print("{} {}".format(c,c.energy_function()))
(-2*Lambda[0] + 2*Lambda[1],)                    0
(-2*Lambda[1] + 2*Lambda[2],)                    0
(-Lambda[0] + Lambda[1], -Lambda[1] + Lambda[2]) 1
(-Lambda[0] + Lambda[1], Lambda[0] - Lambda[2])  1
(-Lambda[1] + Lambda[2], -Lambda[0] + Lambda[1]) 0
(-Lambda[1] + Lambda[2], Lambda[0] - Lambda[2])  1
(2*Lambda[0] - 2*Lambda[2],)                     0
(Lambda[0] - Lambda[2], -Lambda[0] + Lambda[1])  0
(Lambda[0] - Lambda[2], -Lambda[1] + Lambda[2])  0
```

```
>>> from sage.all import *
>>> R = RootSystem(['C',Integer(3),Integer(1)])
>>> La = R.weight_space().basis()
>>> LS = crystals.ProjectedLevelZeroLSPaths(La[Integer(1)]+La[Integer(3)])
>>> b = LS.module_generators[Integer(0)]
>>> c = b.f(Integer(1)).f(Integer(3)).f(Integer(2))
>>> c.energy_function()
0
>>> c=b.e(Integer(0))
>>> c.energy_function()
1

>>> R = RootSystem(['A',Integer(2),Integer(1)])
>>> La = R.weight_space().basis()
>>> LS = crystals.ProjectedLevelZeroLSPaths(Integer(2)*La[Integer(1)])
>>> b = LS.module_generators[Integer(0)]
>>> c = b.e(Integer(0))
>>> c.energy_function()
1
>>> for c in sorted(LS, key=str):
...     print("{} {}".format(c,c.energy_function()))
(-2*Lambda[0] + 2*Lambda[1],)                    0
(-2*Lambda[1] + 2*Lambda[2],)                    0
(-Lambda[0] + Lambda[1], -Lambda[1] + Lambda[2]) 1
(-Lambda[0] + Lambda[1], Lambda[0] - Lambda[2])  1
(-Lambda[1] + Lambda[2], -Lambda[0] + Lambda[1]) 0
(-Lambda[1] + Lambda[2], Lambda[0] - Lambda[2])  1
(2*Lambda[0] - 2*Lambda[2],)                     0
(Lambda[0] - Lambda[2], -Lambda[0] + Lambda[1])  0
(Lambda[0] - Lambda[2], -Lambda[1] + Lambda[2])  0
```

The next test checks that the energy function is constant on classically connected components:

```
sage: R = RootSystem(['A',2,1])
sage: La = R.weight_space().basis()
sage: LS = crystals.ProjectedLevelZeroLSPaths(2*La[1]+La[2])
sage: G = LS.digraph(index_set=[1,2])
sage: C = G.connected_components(sort=False)
sage: [all(c[0].energy_function()==a.energy_function() for a in c) for c␣
↪in C]
[True, True, True, True]
```

(continues on next page)

(continued from previous page)

```
sage: R = RootSystem(['D',4,2])
sage: La = R.weight_space().basis()
sage: LS = crystals.ProjectedLevelZeroLSPaths(La[2])

↪True, True, True, True]
```

scalar_factors()

Return the scalar factors for `self`.

Each LS path (or `self`) can be written as a piecewise linear map

$$\pi(t) = \sum_{u'=1}^{u-1} (\sigma_{u'} - \sigma_{u'-1})\nu_{u'} + (t - \sigma_{u-1})\nu_u$$

for $0 < \sigma_1 < \sigma_2 < \cdots < \sigma_s = 1$ and $\sigma_{u-1} \leq t \leq \sigma_u$ and $1 \leq u \leq s$. This method returns the tuple of $(\sigma_1, \ldots, \sigma_s)$.

EXAMPLES:

```
sage: R = RootSystem(['C',3,1])
sage: La = R.weight_space().basis()
sage: LS = crystals.ProjectedLevelZeroLSPaths(La[1]+La[3])
sage: b = LS.module_generators[0]
sage: b.scalar_factors()
[1]
sage: c = b.f(1).f(3).f(2)
sage: c.scalar_factors()
[1/3, 1]
```

```
>>> from sage.all import *
>>> R = RootSystem(['C',Integer(3),Integer(1)])
>>> La = R.weight_space().basis()
>>> LS = crystals.ProjectedLevelZeroLSPaths(La[Integer(1)]+La[Integer(3)])
>>> b = LS.module_generators[Integer(0)]
>>> b.scalar_factors()
[1]
>>> c = b.f(Integer(1)).f(Integer(3)).f(Integer(2))
>>> c.scalar_factors()
[1/3, 1]
```

weyl_group_representation()

Transform the weights in the LS path `self` to elements in the Weyl group.

Each LS path can be written as the piecewise linear map:

$$\pi(t) = \sum_{u'=1}^{u-1} (\sigma_{u'} - \sigma_{u'-1})\nu_{u'} + (t - \sigma_{u-1})\nu_u$$

for $0 < \sigma_1 < \sigma_2 < \cdots < \sigma_s = 1$ and $\sigma_{u-1} \leq t \leq \sigma_u$ and $1 \leq u \leq s$. Each weight ν_u is also associated to a Weyl group element. This method returns the list of Weyl group elements associated to the ν_u for $1 \leq u \leq s$.

EXAMPLES:

```
sage: R = RootSystem(['C',3,1])
sage: La = R.weight_space().basis()
sage: LS = crystals.ProjectedLevelZeroLSPaths(La[1]+La[3])
sage: b = LS.module_generators[0]
sage: c = b.f(1).f(3).f(2)
sage: c.weyl_group_representation()
[s2*s1*s3, s1*s3]
```

```
>>> from sage.all import *
>>> R = RootSystem(['C',Integer(3),Integer(1)])
>>> La = R.weight_space().basis()
>>> LS = crystals.ProjectedLevelZeroLSPaths(La[Integer(1)]+La[Integer(3)])
>>> b = LS.module_generators[Integer(0)]
>>> c = b.f(Integer(1)).f(Integer(3)).f(Integer(2))
>>> c.weyl_group_representation()
[s2*s1*s3, s1*s3]
```

classically_highest_weight_vectors()

Return the classically highest weight vectors of `self`.

EXAMPLES:

```
sage: R = RootSystem(['A',2,1])
sage: La = R.weight_space().basis()
sage: LS = crystals.ProjectedLevelZeroLSPaths(2*La[1])
sage: LS.classically_highest_weight_vectors()
((-2*Lambda[0] + 2*Lambda[1],),
 (-Lambda[0] + Lambda[1], -Lambda[1] + Lambda[2]))
```

```
>>> from sage.all import *
>>> R = RootSystem(['A',Integer(2),Integer(1)])
>>> La = R.weight_space().basis()
>>> LS = crystals.ProjectedLevelZeroLSPaths(Integer(2)*La[Integer(1)])
>>> LS.classically_highest_weight_vectors()
((-2*Lambda[0] + 2*Lambda[1],),
 (-Lambda[0] + Lambda[1], -Lambda[1] + Lambda[2]))
```

is_perfect(*level=1*)

Check whether the crystal `self` is perfect (of level `level`).

INPUT:

- `level` – (default: 1) positive integer

A crystal $\mathcal{B}$ is perfect of level ℓ if:

1. $\mathcal{B}$ is isomorphic to the crystal graph of a finite-dimensional $U_q^{'}(\mathfrak{g})$-module.
2. $\mathcal{B} \otimes \mathcal{B}$ is connected.
3. There exists a $\lambda \in X$, such that $\mathrm{wt}(\mathcal{B}) \subset \lambda + \sum_{i\in I} \mathbf{Z}_{\leq 0}\alpha_i$ and there is a unique element in $\mathcal{B}$ of classical weight λ.
4. For all $b \in \mathcal{B}$, $\mathrm{level}(\varepsilon(b)) \geq \ell$.
5. For all Λ dominant weights of level ℓ, there exist unique elements $b_\Lambda, b^\Lambda \in \mathcal{B}$, such that $\varepsilon(b_\Lambda) = \Lambda = \varphi(b^\Lambda)$.

Points (1)-(3) are known to hold. This method checks points (4) and (5).

EXAMPLES:

```
sage: C = CartanType(['C',2,1])
sage: R = RootSystem(C)
sage: La = R.weight_space().basis()
sage: LS = crystals.ProjectedLevelZeroLSPaths(La[1])
```

(continues on next page)

(continued from previous page)

```
sage: LS.is_perfect()
False

>>> LS = crystals.ProjectedLevelZeroLSPaths(La[Integer(1)]+La[Integer(2)])
>>> LS.is_perfect()
True
>>> LS.is_perfect(Integer(2))
False
```

maximal_vector()

Return the maximal vector of `self`.

EXAMPLES:

```
sage: R = RootSystem(['A',2,1])
sage: La = R.weight_space().basis()
sage: LS = crystals.ProjectedLevelZeroLSPaths(2*La[1]+La[2])
sage: LS.maximal_vector()
(-3*Lambda[0] + 2*Lambda[1] + Lambda[2],)
```

```
>>> from sage.all import *
>>> R = RootSystem(['A',Integer(2),Integer(1)])
>>> La = R.weight_space().basis()
>>> LS = crystals.
↪ProjectedLevelZeroLSPaths(Integer(2)*La[Integer(1)]+La[Integer(2)])
>>> LS.maximal_vector()
(-3*Lambda[0] + 2*Lambda[1] + Lambda[2],)
```

one_dimensional_configuration_sum(*q=None*, *group_components=True*)

Compute the one-dimensional configuration sum.

INPUT:

- `q` – (default: `None`) a variable or `None`; if `None`, a variable `q` is set in the code
- `group_components` – boolean (default: `True`); if `True`, then the terms are grouped by classical component

The one-dimensional configuration sum is the sum of the weights of all elements in the crystal weighted by the energy function. For untwisted types it uses the parabolic quantum Bruhat graph, see [LNSSS2013]. In the dual-of-untwisted case, the parabolic quantum Bruhat graph is defined by exchanging the roles of roots and coroots (which is still conjectural at this point).

EXAMPLES:

```
sage: R = RootSystem(['A',2,1])
sage: La = R.weight_space().basis()
sage: LS = crystals.ProjectedLevelZeroLSPaths(2*La[1])
sage: LS.one_dimensional_configuration_sum() # long time
```

(continues on next page)

(continued from previous page)

```
B[-2*Lambda[1] + 2*Lambda[2]] + (q+1)*B[-Lambda[1]]
 + (q+1)*B[Lambda[1] - Lambda[2]] + B[2*Lambda[1]]
 + B[-2*Lambda[2]] + (q+1)*B[Lambda[2]]
sage: R.<t> = ZZ[]
sage: LS.one_dimensional_configuration_sum(t, False) # long time
B[-2*Lambda[1] + 2*Lambda[2]] + (t+1)*B[-Lambda[1]]
 + (t+1)*B[Lambda[1] - Lambda[2]] + B[2*Lambda[1]]
 + B[-2*Lambda[2]] + (t+1)*B[Lambda[2]]
```

```
>>> from sage.all import *
>>> R = RootSystem(['A',Integer(2),Integer(1)])
>>> La = R.weight_space().basis()
>>> LS = crystals.ProjectedLevelZeroLSPaths(Integer(2)*La[Integer(1)])
>>> LS.one_dimensional_configuration_sum() # long time
B[-2*Lambda[1] + 2*Lambda[2]] + (q+1)*B[-Lambda[1]]
 + (q+1)*B[Lambda[1] - Lambda[2]] + B[2*Lambda[1]]
 + B[-2*Lambda[2]] + (q+1)*B[Lambda[2]]
>>> R = ZZ['t']; (t,) = R._first_ngens(1)
>>> LS.one_dimensional_configuration_sum(t, False) # long time
B[-2*Lambda[1] + 2*Lambda[2]] + (t+1)*B[-Lambda[1]]
 + (t+1)*B[Lambda[1] - Lambda[2]] + B[2*Lambda[1]]
 + B[-2*Lambda[2]] + (t+1)*B[Lambda[2]]
```

class sage.combinat.crystals.littelmann_path.**InfinityCrystalOfLSPaths**(*cartan_type*)

Bases: UniqueRepresentation, Parent

LS path model for $\mathcal{B}(\infty)$.

Elements of $\mathcal{B}(\infty)$ are equivalence classes of paths $[\pi]$ in $\mathcal{B}(k\rho)$ for $k \gg 0$, where ρ is the Weyl vector. A canonical representative for an element of $\mathcal{B}(\infty)$ is chosen by taking k to be minimal such that the endpoint of π is strictly dominant but its representative in $\mathcal{B}((k-1)\rho)$ is on the wall of the dominant chamber.

REFERENCES:

- [LZ2011]

class Element

Bases: *Element*

e(*i*, *power=1*, *length_only=False*)

Return the i-th crystal raising operator on `self`.

INPUT:

- `i` – element of the index set
- `power` – (default: 1) positive integer; specifies the power of the lowering operator to be applied
- `length_only` – boolean (default: `False`); if `True`, then return the distance to the anti-dominant end of the i-string of `self`

EXAMPLES:

```
sage: B = crystals.infinity.LSPaths(['B',3,1])
sage: mg = B.module_generator()
sage: mg.e(0)
sage: mg.e(1)
sage: mg.e(2)
sage: x = mg.f_string([1,0,2,1,0,2,1,1,0])
```

(continues on next page)

(continued from previous page)

```
sage: all(x.f(i).e(i) == x for i in B.index_set())
True
sage: all(x.e(i).f(i) == x for i in B.index_set() if x.epsilon(i) > 0)
True
```

```
>>> from sage.all import *
>>> B = crystals.infinity.LSPaths(['B',Integer(3),Integer(1)])
>>> mg = B.module_generator()
>>> mg.e(Integer(0))
>>> mg.e(Integer(1))
>>> mg.e(Integer(2))
>>> x = mg.f_string([Integer(1),Integer(0),Integer(2),Integer(1),
↪Integer(0),Integer(2),Integer(1),Integer(1),Integer(0)])
>>> all(x.f(i).e(i) == x for i in B.index_set())
True
>>> all(x.e(i).f(i) == x for i in B.index_set() if x.epsilon(i) >␣
↪Integer(0))
True
```

f(*i*, *power=1*, *length_only=False*)

Return the i-th crystal lowering operator on `self`.

INPUT:

- `i` – element of the index set
- `power` – (default: 1) positive integer; specifies the power of the lowering operator to be applied
- `length_only` – boolean (default: `False`); if `True`, then return the distance to the anti-dominant end of the i-string of `self`

EXAMPLES:

```
sage: B = crystals.infinity.LSPaths(['D',3,2])
sage: mg = B.highest_weight_vector()
sage: mg.f(1)
(3*Lambda[0] - Lambda[1] + 3*Lambda[2],
 2*Lambda[0] + 2*Lambda[1] + 2*Lambda[2])
sage: mg.f(2)
(Lambda[0] + 2*Lambda[1] - Lambda[2],
 2*Lambda[0] + 2*Lambda[1] + 2*Lambda[2])
sage: mg.f(0)
(-Lambda[0] + 2*Lambda[1] + Lambda[2] - delta,
 2*Lambda[0] + 2*Lambda[1] + 2*Lambda[2])
```

```
>>> from sage.all import *
>>> B = crystals.infinity.LSPaths(['D',Integer(3),Integer(2)])
>>> mg = B.highest_weight_vector()
>>> mg.f(Integer(1))
(3*Lambda[0] - Lambda[1] + 3*Lambda[2],
 2*Lambda[0] + 2*Lambda[1] + 2*Lambda[2])
>>> mg.f(Integer(2))
(Lambda[0] + 2*Lambda[1] - Lambda[2],
 2*Lambda[0] + 2*Lambda[1] + 2*Lambda[2])
>>> mg.f(Integer(0))
(-Lambda[0] + 2*Lambda[1] + Lambda[2] - delta,
```

(continues on next page)

(continued from previous page)

```
2*Lambda[0] + 2*Lambda[1] + 2*Lambda[2])
```

phi(*i*)

Return φ_i of `self`.

Let $\pi \in \mathcal{B}(\infty)$. Define

$$\varphi_i(\pi) := \varepsilon_i(\pi) + \langle h_i, \mathrm{wt}(\pi) \rangle,$$

where h_i is the i-th simple coroot and $\mathrm{wt}(\pi)$ is the *weight()* of π.

INPUT:

- `i` – element of the index set

EXAMPLES:

```
sage: B = crystals.infinity.LSPaths(['D',4])
sage: mg = B.highest_weight_vector()
sage: x = mg.f_string([1,3,4,2,4,3,2,1,4])
sage: [x.phi(i) for i in B.index_set()]
[-1, 4, -2, -3]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.LSPaths(['D',Integer(4)])
>>> mg = B.highest_weight_vector()
>>> x = mg.f_string([Integer(1),Integer(3),Integer(4),Integer(2),
↪Integer(4),Integer(3),Integer(2),Integer(1),Integer(4)])
>>> [x.phi(i) for i in B.index_set()]
[-1, 4, -2, -3]
```

weight()

Return the weight of `self`.

Todo

This is a generic algorithm. We should find a better description and implement it.

EXAMPLES:

```
sage: B = crystals.infinity.LSPaths(['E',6])
sage: mg = B.highest_weight_vector()
sage: f_seq = [1,4,2,6,4,2,3,1,5,5]
sage: x = mg.f_string(f_seq)
sage: x.weight()
-3*Lambda[1] - 2*Lambda[2] + 2*Lambda[3] + Lambda[4] - Lambda[5]

sage: al = B.cartan_type().root_system().weight_space().simple_roots()
sage: x.weight() == -sum(al[i] for i in f_seq)
True
```

```
>>> from sage.all import *
>>> B = crystals.infinity.LSPaths(['E',Integer(6)])
>>> mg = B.highest_weight_vector()
```

(continues on next page)

(continued from previous page)

```
>>> f_seq = [Integer(1),Integer(4),Integer(2),Integer(6),Integer(4),
↪Integer(2),Integer(3),Integer(1),Integer(5),Integer(5)]
>>> x = mg.f_string(f_seq)
>>> x.weight()
-3*Lambda[1] - 2*Lambda[2] + 2*Lambda[3] + Lambda[4] - Lambda[5]

>>> al = B.cartan_type().root_system().weight_space().simple_roots()
>>> x.weight() == -sum(al[i] for i in f_seq)
True
```

module_generator()

Return the module generator (or highest weight element) of `self`.

The module generator is the unique path $\pi_\infty : t \mapsto t\rho$, for $t \in [0, \infty)$.

EXAMPLES:

```
sage: B = crystals.infinity.LSPaths(['A',6,2])
sage: mg = B.module_generator(); mg
(Lambda[0] + Lambda[1] + Lambda[2] + Lambda[3],)
sage: mg.weight()
0
```

```
>>> from sage.all import *
>>> B = crystals.infinity.LSPaths(['A',Integer(6),Integer(2)])
>>> mg = B.module_generator(); mg
(Lambda[0] + Lambda[1] + Lambda[2] + Lambda[3],)
>>> mg.weight()
0
```

weight_lattice_realization()

Return the weight lattice realization of `self`.

EXAMPLES:

```
sage: B = crystals.infinity.LSPaths(['C',4])
sage: B.weight_lattice_realization()
Weight space over the Rational Field of the Root system of type ['C', 4]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.LSPaths(['C',Integer(4)])
>>> B.weight_lattice_realization()
Weight space over the Rational Field of the Root system of type ['C', 4]
```

sage.combinat.crystals.littelmann_path.**positively_parallel_weights**(v, w)

Check whether the vectors `v` and `w` are positive scalar multiples of each other.

EXAMPLES:

```
sage: from sage.combinat.crystals.littelmann_path import positively_parallel_
↪weights
sage: La = RootSystem(['A',5,2]).weight_space(extended=True).fundamental_weights()
sage: rho = sum(La)
```

(continues on next page)

(continued from previous page)

```
sage: positively_parallel_weights(rho, 4*rho)
True
sage: positively_parallel_weights(4*rho, rho)
True
sage: positively_parallel_weights(rho, -rho)
False
sage: positively_parallel_weights(rho, La[1] + La[2])
False
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.littelmann_path import positively_parallel_weights
>>> La = RootSystem(['A',Integer(5),Integer(2)]).weight_space(extended=True).
↪fundamental_weights()
>>> rho = sum(La)
>>> positively_parallel_weights(rho, Integer(4)*rho)
True
>>> positively_parallel_weights(Integer(4)*rho, rho)
True
>>> positively_parallel_weights(rho, -rho)
False
>>> positively_parallel_weights(rho, La[Integer(1)] + La[Integer(2)])
False
```

5.1.59 Crystals of Modified Nakajima Monomials

AUTHORS:

- Arthur Lubovsky: Initial version
- Ben Salisbury: Initial version

Let $Y_{i,k}$, for $i \in I$ and $k \in \mathbf{Z}$, be a commuting set of variables, and let $\mathbf{1}$ be a new variable which commutes with each $Y_{i,k}$. (Here, I represents the index set of a Cartan datum.) One may endow the structure of a crystal on the set $\widehat{\mathcal{M}}$ of monomials of the form

$$M = \prod_{(i,k)\in I\times \mathbf{Z}_{\geq 0}} Y_{i,k}^{y_i(k)}\mathbf{1}.$$

Elements of $\widehat{\mathcal{M}}$ are called *modified Nakajima monomials*. We will omit the $\mathbf{1}$ from the end of a monomial if there exists at least one $y_i(k) \neq 0$. The crystal structure on this set is defined by

$$\begin{aligned}
\mathrm{wt}(M) &= \sum_{i\in I}\Bigl(\sum_{k\geq 0} y_i(k)\Bigr)\Lambda_i,\\
\varphi_i(M) &= \max\Bigl\{\sum_{0\leq j\leq k} y_i(j) : k \geq 0\Bigr\},\\
\varepsilon_i(M) &= \varphi_i(M) - \langle h_i, \mathrm{wt}(M)\rangle,\\
k_f = k_f(M) &= \min\Bigl\{k \geq 0 : \varphi_i(M) = \sum_{0\leq j\leq k} y_i(j)\Bigr\},\\
k_e = k_e(M) &= \max\Bigl\{k \geq 0 : \varphi_i(M) = \sum_{0\leq j\leq k} y_i(j)\Bigr\},
\end{aligned}$$

where $\{h_i : i \in I\}$ and $\{\Lambda_i : i \in I\}$ are the simple coroots and fundamental weights, respectively. With a chosen set of integers $C = (c_{ij})_{i \neq j}$ such that $c_{ij} + c_{ji} = 1$, one defines

$$A_{i,k} = Y_{i,k} Y_{i,k+1} \prod_{j \neq i} Y_{j,k+c_{ji}}^{a_{ji}},$$

where (a_{ij}) is a Cartan matrix. Then

$$e_i M = \begin{cases} 0 & \text{if } \varepsilon_i(M) = 0, \\ A_{i,k_e} M & \text{if } \varepsilon_i(M) > 0, \end{cases}$$
$$f_i M = A_{i,k_f}^{-1} M.$$

It is shown in [KKS2007] that the connected component of $\widehat{\mathcal{M}}$ containing the element $\mathbf{1}$, which we denote by $\mathcal{M}(\infty)$, is crystal isomorphic to the crystal $B(\infty)$.

Let $\widetilde{\mathcal{M}}$ be $\widehat{\mathcal{M}}$ as a set, and with crystal structure defined as on $\widehat{\mathcal{M}}$ with the exception that

$$f_i M = \begin{cases} 0 & \text{if } \varphi_i(M) = 0, \\ A_{i,k_f}^{-1} M & \text{if } \varphi_i(M) > 0. \end{cases}$$

Then Kashiwara [Ka2003] showed that the connected component in $\widetilde{\mathcal{M}}$ containing a monomial M such that $e_i M = 0$, for all $i \in I$, is crystal isomorphic to the irreducible highest weight crystal $B(\mathrm{wt}(M))$.

WARNING:

Monomial crystals depend on the choice of positive integers $C = (c_{ij})_{i \neq j}$ satisfying the condition $c_{ij} + c_{ji} = 1$. We have chosen such integers uniformly such that $c_{ij} = 1$ if $i < j$ and $c_{ij} = 0$ if $i > j$.

class sage.combinat.crystals.monomial_crystals.**CrystalOfNakajimaMonomials**(*ct*, *La*, *c*)

Bases: *InfinityCrystalOfNakajimaMonomials*

Let $\widetilde{\mathcal{M}}$ be $\widehat{\mathcal{M}}$ as a set, and with crystal structure defined as on $\widehat{\mathcal{M}}$ with the exception that

$$f_i M = \begin{cases} 0 & \text{if } \varphi_i(M) = 0, \\ A_{i,k_f}^{-1} M & \text{if } \varphi_i(M) > 0. \end{cases}$$

Then Kashiwara [Ka2003] showed that the connected component in $\widetilde{\mathcal{M}}$ containing a monomial M such that $e_i M = 0$, for all $i \in I$, is crystal isomorphic to the irreducible highest weight crystal $B(\mathrm{wt}(M))$.

INPUT:

- `ct` – a Cartan type
- `La` – an element of the weight lattice

EXAMPLES:

```
sage: La = RootSystem("A2").weight_lattice().fundamental_weights()
sage: M = crystals.NakajimaMonomials("A2",La[1]+La[2])

```

Element

alias of *CrystalOfNakajimaMonomialsElement*

cardinality()

Return the cardinality of `self`.

EXAMPLES:

```
sage: La = RootSystem(['A',2]).weight_lattice().fundamental_weights()
sage: M = crystals.NakajimaMonomials(['A',2], La[1])
sage: M.cardinality()
3

sage: La = RootSystem(['D',4,2]).weight_lattice(extended=True).fundamental_
↪weights()
sage: M = crystals.NakajimaMonomials(['D',4,2], La[1])
sage: M.cardinality()
+Infinity
```

```
>>> from sage.all import *

↪La[Integer(1)])
>>> M.cardinality()
+Infinity
```

class sage.combinat.crystals.monomial_crystals.**CrystalOfNakajimaMonomialsElement**(*parent*, *Y*, *A*)

Bases: *NakajimaMonomial*

Element class for *CrystalOfNakajimaMonomials*.

The f_i operators need to be modified from the version in `monomial_crystalsNakajimaMonomial` in order to create irreducible highest weight realizations. This modified f_i is defined as

$$f_i M = \begin{cases} 0 & \text{if } \varphi_i(M) = 0, \\ A_{i,k_f}^{-1} M & \text{if } \varphi_i(M) > 0. \end{cases}$$

EXAMPLES:

```
sage: La = RootSystem(['A',5,2]).weight_lattice(extended=True).fundamental_
↪weights()
sage: M = crystals.NakajimaMonomials(['A',5,2],3*La[0])
sage: m = M.module_generators[0].f(0); m
Y(0,0)^2 Y(0,1)^-1 Y(2,0)
sage: TestSuite(m).run()
```

```
>>> from sage.all import *
>>> La = RootSystem(['A',Integer(5),Integer(2)]).weight_lattice(extended=True).
↪fundamental_weights()
>>> M = crystals.NakajimaMonomials(['A',Integer(5),Integer(2)],
↪Integer(3)*La[Integer(0)])
>>> m = M.module_generators[Integer(0)].f(Integer(0)); m
Y(0,0)^2 Y(0,1)^-1 Y(2,0)
>>> TestSuite(m).run()
```

f(*i*)

Return the action of f_i on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: La = RootSystem(['A',5,2]).weight_lattice(extended=True).fundamental_
↪weights()
sage: M = crystals.NakajimaMonomials(['A',5,2],3*La[0])
sage: m = M.module_generators[0]
sage: [m.f(i) for i in M.index_set()]
[Y(0,0)^2 Y(0,1)^-1 Y(2,0), None, None, None]
```

```
>>> from sage.all import *
>>> La = RootSystem(['A',Integer(5),Integer(2)]).weight_
↪lattice(extended=True).fundamental_weights()
>>> M = crystals.NakajimaMonomials(['A',Integer(5),Integer(2)],
↪Integer(3)*La[Integer(0)])
>>> m = M.module_generators[Integer(0)]
>>> [m.f(i) for i in M.index_set()]
[Y(0,0)^2 Y(0,1)^-1 Y(2,0), None, None, None]
```

```
sage: M = crystals.infinity.NakajimaMonomials("E8")
sage: M.set_variables('A')
sage: m = M.module_generators[0].f_string([4,2,3,8])
sage: m
A(2,1)^-1 A(3,1)^-1 A(4,0)^-1 A(8,0)^-1

>>> M.set_variables('Y')
```

weight()

Return the weight of `self` as an element of the weight lattice.

EXAMPLES:

```
sage: La = RootSystem("A2").weight_lattice().fundamental_weights()
sage: M = crystals.NakajimaMonomials("A2",La[1]+La[2])
sage: M.module_generators[0].weight()
(2, 1, 0)
```

```
>>> from sage.all import *
>>> La = RootSystem("A2").weight_lattice().fundamental_weights()
>>> M = crystals.NakajimaMonomials("A2",La[Integer(1)]+La[Integer(2)])
>>> M.module_generators[Integer(0)].weight()
(2, 1, 0)
```

class sage.combinat.crystals.monomial_crystals.**InfinityCrystalOfNakajimaMonomials**(*ct*, *c*, *category=None*)

Bases: `UniqueRepresentation`, `Parent`

Crystal $B(\infty)$ in terms of (modified) Nakajima monomials.

Let $Y_{i,k}$, for $i \in I$ and $k \in \mathbf{Z}$, be a commuting set of variables, and let $\mathbf{1}$ be a new variable which commutes with each $Y_{i,k}$. (Here, I represents the index set of a Cartan datum.) One may endow the structure of a crystal on the set $\widehat{\mathcal{M}}$ of monomials of the form

$$M = \prod_{(i,k) \in I \times \mathbf{Z}_{\geq 0}} Y_{i,k}^{y_i(k)} \mathbf{1}.$$

Elements of $\widehat{\mathcal{M}}$ are called *modified Nakajima monomials*. We will omit the $\mathbf{1}$ from the end of a monomial if there exists at least one $y_i(k) \neq 0$. The crystal structure on this set is defined by

$$\begin{aligned}
\mathrm{wt}(M) &= \sum_{i \in I} \Bigl(\sum_{k \geq 0} y_i(k) \Bigr) \Lambda_i, \\
\varphi_i(M) &= \max \Bigl\{ \sum_{0 \leq j \leq k} y_i(j) : k \geq 0 \Bigr\}, \\
\varepsilon_i(M) &= \varphi_i(M) - \langle h_i, \mathrm{wt}(M) \rangle, \\
k_f = k_f(M) &= \min \Bigl\{ k \geq 0 : \varphi_i(M) = \sum_{0 \leq j \leq k} y_i(j) \Bigr\}, \\
k_e = k_e(M) &= \max \Bigl\{ k \geq 0 : \varphi_i(M) = \sum_{0 \leq j \leq k} y_i(j) \Bigr\},
\end{aligned}$$

where $\{h_i : i \in I\}$ and $\{\Lambda_i : i \in I\}$ are the simple coroots and fundamental weights, respectively. With a chosen set of nonnegative integers $C = (c_{ij})_{i \neq j}$ such that $c_{ij} + c_{ji} = 1$, one defines

$$A_{i,k} = Y_{i,k} Y_{i,k+1} \prod_{j \neq i} Y_{j,k+c_{ji}}^{a_{ji}},$$

where $(a_{ij})_{i,j \in I}$ is a Cartan matrix. Then

$$\begin{aligned}
e_i M &= \begin{cases} 0 & \text{if } \varepsilon_i(M) = 0, \\ A_{i,k_e} M & \text{if } \varepsilon_i(M) > 0, \end{cases} \\
f_i M &= A_{i,k_f}^{-1} M.
\end{aligned}$$

It is shown in [KKS2007] that the connected component of $\widehat{\mathcal{M}}$ containing the element $\mathbf{1}$, which we denote by $\mathcal{M}(\infty)$, is crystal isomorphic to the crystal $B(\infty)$.

INPUT:

- `cartan_type` – a Cartan type
- `c` – (optional) the matrix $(c_{ij})_{i,j \in I}$ such that $c_{ii} = 0$ for all $i \in I$, $c_{ij} \in \mathbf{Z}_{>0}$ for all $i, j \in I$, and $c_{ij} + c_{ji} = 1$ for all $i \neq j$; the default is $c_{ij} = 0$ if $i < j$ and 0 otherwise

EXAMPLES:

```
sage: B = crystals.infinity.Tableaux("C3")
sage: S = B.subcrystal(max_depth=4)
sage: G = B.digraph(subset=S) # long time
sage: M = crystals.infinity.NakajimaMonomials("C3") # long time
sage: T = M.subcrystal(max_depth=4) # long time
sage: H = M.digraph(subset=T) # long time
sage: G.is_isomorphic(H,edge_labels=True) # long time
True

sage: M = crystals.infinity.NakajimaMonomials(['A',2,1])
sage: T = M.subcrystal(max_depth=3)
sage: H = M.digraph(subset=T) # long time
```

(continues on next page)

(continued from previous page)

```
sage: Y = crystals.infinity.GeneralizedYoungWalls(2)
sage: YS = Y.subcrystal(max_depth=3)
sage: YG = Y.digraph(subset=YS) # long time
sage: YG.is_isomorphic(H,edge_labels=True) # long time
True

sage: M = crystals.infinity.NakajimaMonomials("D4")
sage: B = crystals.infinity.Tableaux("D4")
sage: MS = M.subcrystal(max_depth=3)
sage: BS = B.subcrystal(max_depth=3)
sage: MG = M.digraph(subset=MS) # long time
sage: BG = B.digraph(subset=BS) # long time
sage: BG.is_isomorphic(MG,edge_labels=True) # long time
True
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux("C3")
>>> S = B.subcrystal(max_depth=Integer(4))
>>> G = B.digraph(subset=S) # long time
>>> M = crystals.infinity.NakajimaMonomials("C3") # long time
>>> T = M.subcrystal(max_depth=Integer(4)) # long time
>>> H = M.digraph(subset=T) # long time
>>> G.is_isomorphic(H,edge_labels=True) # long time
True

>>> M = crystals.infinity.NakajimaMonomials(['A',Integer(2),Integer(1)])
>>> T = M.subcrystal(max_depth=Integer(3))
>>> H = M.digraph(subset=T) # long time
>>> Y = crystals.infinity.GeneralizedYoungWalls(Integer(2))
>>> YS = Y.subcrystal(max_depth=Integer(3))
>>> YG = Y.digraph(subset=YS) # long time
>>> YG.is_isomorphic(H,edge_labels=True) # long time
True

>>> M = crystals.infinity.NakajimaMonomials("D4")
>>> B = crystals.infinity.Tableaux("D4")
>>> MS = M.subcrystal(max_depth=Integer(3))
>>> BS = B.subcrystal(max_depth=Integer(3))
>>> MG = M.digraph(subset=MS) # long time
>>> BG = B.digraph(subset=BS) # long time
>>> BG.is_isomorphic(MG,edge_labels=True) # long time
True
```

Element

alias of *NakajimaMonomial*

c()

Return the matrix c_{ij} of `self`.

EXAMPLES:

```
sage: La = RootSystem(['B',3]).weight_lattice().fundamental_weights()
sage: M = crystals.NakajimaMonomials(La[1]+La[2])
```

(continues on next page)

(continued from previous page)

```
sage: M.c()
[0 1 1]
[0 0 1]
[0 0 0]

sage: c = Matrix([[0,0,1],[1,0,0],[0,1,0]])
sage: La = RootSystem(['A',2,1]).weight_lattice(extended=True).fundamental_
↪weights()
sage: M = crystals.NakajimaMonomials(2*La[1], c=c)
sage: M.c() == c
True
```

```
>>> from sage.all import *
>>> La = RootSystem(['B',Integer(3)]).weight_lattice().fundamental_weights()
>>> M = crystals.NakajimaMonomials(La[Integer(1)]+La[Integer(2)])
>>> M.c()
[0 1 1]
[0 0 1]
[0 0 0]

>>> c = Matrix([[Integer(0),Integer(0),Integer(1)],[Integer(1),Integer(0),
↪Integer(0)],[Integer(0),Integer(1),Integer(0)]])
>>> La = RootSystem(['A',Integer(2),Integer(1)]).weight_
↪lattice(extended=True).fundamental_weights()
>>> M = crystals.NakajimaMonomials(Integer(2)*La[Integer(1)], c=c)
>>> M.c() == c
True
```

cardinality()

Return the cardinality of `self`, which is always ∞.

EXAMPLES:

```
sage: M = crystals.infinity.NakajimaMonomials(['A',5,2])
sage: M.cardinality()
+Infinity
```

```
>>> from sage.all import *
>>> M = crystals.infinity.NakajimaMonomials(['A',Integer(5),Integer(2)])
>>> M.cardinality()
+Infinity
```

get_variables()

Return the type of monomials to use for the element output.

EXAMPLES:

```
sage: M = crystals.infinity.NakajimaMonomials(['A', 4])
sage: M.get_variables()
'Y'
```

```
>>> from sage.all import *
>>> M = crystals.infinity.NakajimaMonomials(['A', Integer(4)])
>>> M.get_variables()
'Y'
```

set_variables(*letter*)

Set the type of monomials to use for the element output.

If the A variables are used, the output is written as $\prod_{i\in I} Y_{i,0}^{\lambda_i} \prod_{i,k} A_{i,k}^{c_{i,k}}$, where $\sum_{i\in I} \lambda_i \Lambda_i$ is the corresponding dominant weight.

INPUT:

- `letter` – can be one of the following:
  - `'Y'` – use $Y_{i,k}$, corresponds to fundamental weights
  - `'A'` – use $A_{i,k}$, corresponds to simple roots

EXAMPLES:

```
sage: M = crystals.infinity.NakajimaMonomials(['A', 4])
sage: elt = M.highest_weight_vector().f_string([2,1,3,2,3,2,4,3])
sage: elt
Y(1,2) Y(2,0)^-1 Y(2,2)^-1 Y(3,0)^-1 Y(3,2)^-1 Y(4,0)
sage: M.set_variables('A')
sage: elt
A(1,1)^-1 A(2,0)^-1 A(2,1)^-2 A(3,0)^-2 A(3,1)^-1 A(4,0)^-1
sage: M.set_variables('Y')
```

```
>>> from sage.all import *
>>> M = crystals.infinity.NakajimaMonomials(['A', Integer(4)])
>>> elt = M.highest_weight_vector().f_string([Integer(2),Integer(1),
↪Integer(3),Integer(2),Integer(3),Integer(2),Integer(4),Integer(3)])
>>> elt
Y(1,2) Y(2,0)^-1 Y(2,2)^-1 Y(3,0)^-1 Y(3,2)^-1 Y(4,0)
>>> M.set_variables('A')
>>> elt
A(1,1)^-1 A(2,0)^-1 A(2,1)^-2 A(3,0)^-2 A(3,1)^-1 A(4,0)^-1
>>> M.set_variables('Y')
```

```
sage: La = RootSystem(['A',2]).weight_lattice().fundamental_weights()
sage: M = crystals.NakajimaMonomials(La[1]+La[2])
sage: lw = M.lowest_weight_vectors()[0]
sage: lw
Y(1,2)^-1 Y(2,1)^-1
sage: M.set_variables('A')
sage: lw
Y(1,0) Y(2,0) A(1,0)^-1 A(1,1)^-1 A(2,0)^-2
sage: M.set_variables('Y')
```

```
>>> from sage.all import *
>>> La = RootSystem(['A',Integer(2)]).weight_lattice().fundamental_weights()
>>> M = crystals.NakajimaMonomials(La[Integer(1)]+La[Integer(2)])
>>> lw = M.lowest_weight_vectors()[Integer(0)]
```

(continues on next page)

(continued from previous page)

```
>>> lw
Y(1,2)^-1 Y(2,1)^-1
>>> M.set_variables('A')
>>> lw
Y(1,0) Y(2,0) A(1,0)^-1 A(1,1)^-1 A(2,0)^-2
>>> M.set_variables('Y')
```

class sage.combinat.crystals.monomial_crystals.**NakajimaMonomial**(*parent*, Y, A)

Bases: Element

An element of the monomial crystal.

Monomials of the form $Y_{i_1,k_1}^{y_1} \cdots Y_{i_t,k_t}^{y_t}$, where $i_1, \ldots, i_t$ are elements of the index set, $k_1, \ldots, k_t$ are nonnegative integers, and $y_1, \ldots, y_t$ are integers.

EXAMPLES:

```
sage: M = crystals.infinity.NakajimaMonomials(['B',3,1])
sage: mg = M.module_generators[0]
sage: mg
1
sage: mg.f_string([1,3,2,0,1,2,3,0,0,1])
Y(0,0)^-1 Y(0,1)^-1 Y(0,2)^-1 Y(0,3)^-1 Y(1,0)^-3
 Y(1,1)^-2 Y(1,2) Y(2,0)^3 Y(2,2) Y(3,0) Y(3,2)^-1
```

```
>>> from sage.all import *
>>> M = crystals.infinity.NakajimaMonomials(['B',Integer(3),Integer(1)])
>>> mg = M.module_generators[Integer(0)]
>>> mg
1
>>> mg.f_string([Integer(1),Integer(3),Integer(2),Integer(0),Integer(1),
↪Integer(2),Integer(3),Integer(0),Integer(0),Integer(1)])
Y(0,0)^-1 Y(0,1)^-1 Y(0,2)^-1 Y(0,3)^-1 Y(1,0)^-3
 Y(1,1)^-2 Y(1,2) Y(2,0)^3 Y(2,2) Y(3,0) Y(3,2)^-1
```

An example using the A variables:

```
sage: M = crystals.infinity.NakajimaMonomials("A3")
sage: M.set_variables('A')
sage: mg = M.module_generators[0]
sage: mg.f_string([1,2,3,2,1])
A(1,0)^-1 A(1,1)^-1 A(2,0)^-2 A(3,0)^-1
sage: mg.f_string([3,2,1])
A(1,2)^-1 A(2,1)^-1 A(3,0)^-1
sage: M.set_variables('Y')
```

```
>>> from sage.all import *
>>> M = crystals.infinity.NakajimaMonomials("A3")
>>> M.set_variables('A')
>>> mg = M.module_generators[Integer(0)]
>>> mg.f_string([Integer(1),Integer(2),Integer(3),Integer(2),Integer(1)])
A(1,0)^-1 A(1,1)^-1 A(2,0)^-2 A(3,0)^-1
>>> mg.f_string([Integer(3),Integer(2),Integer(1)])
```

(continues on next page)

(continued from previous page)

```
A(1,2)^-1 A(2,1)^-1 A(3,0)^-1
>>> M.set_variables('Y')
```

e(*i*)

Return the action of e_i on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: M = crystals.infinity.NakajimaMonomials(['E',7,1])
sage: m = M.module_generators[0].f_string([0,1,4,3])
sage: [m.e(i) for i in M.index_set()]
[None,
 None,
 None,
 Y(0,0)^-1 Y(1,1)^-1 Y(2,1) Y(3,0) Y(3,1) Y(4,0)^-1 Y(4,1)^-1 Y(5,0),
 None,
 None,
 None,
 None]

sage: M = crystals.infinity.NakajimaMonomials("C5")
sage: m = M.module_generators[0].f_string([1,3])
sage: [m.e(i) for i in M.index_set()]
[Y(2,1) Y(3,0)^-1 Y(3,1)^-1 Y(4,0),
 None,
 Y(1,0)^-1 Y(1,1)^-1 Y(2,0),
 None,
 None]

sage: M = crystals.infinity.NakajimaMonomials(['D',4,1])
sage: M.set_variables('A')
sage: m = M.module_generators[0].f_string([4,2,3,0])
sage: [m.e(i) for i in M.index_set()]
[A(2,1)^-1 A(3,1)^-1 A(4,0)^-1,
 None,
 None,
 A(0,2)^-1 A(2,1)^-1 A(4,0)^-1,
 None]
sage: M.set_variables('Y')
```

```
>>> from sage.all import *
>>> M = crystals.infinity.NakajimaMonomials(['E',Integer(7),Integer(1)])
>>> m = M.module_generators[Integer(0)].f_string([Integer(0),Integer(1),
↪Integer(4),Integer(3)])
>>> [m.e(i) for i in M.index_set()]
[None,
 None,
 None,
 Y(0,0)^-1 Y(1,1)^-1 Y(2,1) Y(3,0) Y(3,1) Y(4,0)^-1 Y(4,1)^-1 Y(5,0),
```

(continues on next page)

(continued from previous page)

```
 None,
 None,
 None,
 None]

>>> M = crystals.infinity.NakajimaMonomials("C5")
>>> m = M.module_generators[Integer(0)].f_string([Integer(1),Integer(3)])
>>> [m.e(i) for i in M.index_set()]
[Y(2,1) Y(3,0)^-1 Y(3,1)^-1 Y(4,0),
 None,
 Y(1,0)^-1 Y(1,1)^-1 Y(2,0),
 None,
 None]

>>> M = crystals.infinity.NakajimaMonomials(['D',Integer(4),Integer(1)])
>>> M.set_variables('A')
>>> m = M.module_generators[Integer(0)].f_string([Integer(4),Integer(2),
↪Integer(3),Integer(0)])
>>> [m.e(i) for i in M.index_set()]
[A(2,1)^-1 A(3,1)^-1 A(4,0)^-1,
 None,
 None,
 A(0,2)^-1 A(2,1)^-1 A(4,0)^-1,
 None]
>>> M.set_variables('Y')
```

epsilon(*i*)

Return the value of ε_i on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: M = crystals.infinity.NakajimaMonomials(['G',2,1])
sage: m = M.module_generators[0].f(2)
sage: [m.epsilon(i) for i in M.index_set()]
[0, 0, 1]

sage: M = crystals.infinity.NakajimaMonomials(['C',4,1])
sage: m = M.module_generators[0].f_string([4,2,3])
sage: [m.epsilon(i) for i in M.index_set()]
[0, 0, 0, 1, 0]
```

```
>>> from sage.all import *
>>> M = crystals.infinity.NakajimaMonomials(['G',Integer(2),Integer(1)])
>>> m = M.module_generators[Integer(0)].f(Integer(2))
>>> [m.epsilon(i) for i in M.index_set()]
[0, 0, 1]

>>> M = crystals.infinity.NakajimaMonomials(['C',Integer(4),Integer(1)])
>>> m = M.module_generators[Integer(0)].f_string([Integer(4),Integer(2),
```

(continues on next page)

(continued from previous page)

```
↪Integer(3)])
>>> [m.epsilon(i) for i in M.index_set()]
[0, 0, 0, 1, 0]
```

f(*i*)

Return the action of f_i on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: M = crystals.infinity.NakajimaMonomials("B4")
sage: m = M.module_generators[0].f_string([1,3,4])
sage: [m.f(i) for i in M.index_set()]
[Y(1,0)^-2 Y(1,1)^-2 Y(2,0)^2 Y(2,1) Y(3,0)^-1 Y(4,0) Y(4,1)^-1,
 Y(1,0)^-1 Y(1,1)^-1 Y(1,2) Y(2,0) Y(2,2)^-1 Y(3,0)^-1 Y(3,1) Y(4,0) Y(4,1)^-
↪1,
 Y(1,0)^-1 Y(1,1)^-1 Y(2,0) Y(2,1)^2 Y(3,0)^-2 Y(3,1)^-1 Y(4,0)^3 Y(4,1)^-1,
 Y(1,0)^-1 Y(1,1)^-1 Y(2,0) Y(2,1) Y(3,0)^-1 Y(3,1) Y(4,1)^-2]
```

```
>>> from sage.all import *
>>> M = crystals.infinity.NakajimaMonomials("B4")
>>> m = M.module_generators[Integer(0)].f_string([Integer(1),Integer(3),
↪Integer(4)])
>>> [m.f(i) for i in M.index_set()]
[Y(1,0)^-2 Y(1,1)^-2 Y(2,0)^2 Y(2,1) Y(3,0)^-1 Y(4,0) Y(4,1)^-1,
 Y(1,0)^-1 Y(1,1)^-1 Y(1,2) Y(2,0) Y(2,2)^-1 Y(3,0)^-1 Y(3,1) Y(4,0) Y(4,1)^-
↪1,
 Y(1,0)^-1 Y(1,1)^-1 Y(2,0) Y(2,1)^2 Y(3,0)^-2 Y(3,1)^-1 Y(4,0)^3 Y(4,1)^-1,
 Y(1,0)^-1 Y(1,1)^-1 Y(2,0) Y(2,1) Y(3,0)^-1 Y(3,1) Y(4,1)^-2]
```

phi(*i*)

Return the value of φ_i on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: M = crystals.infinity.NakajimaMonomials(['D',4,3])
sage: m = M.module_generators[0].f(1)
sage: [m.phi(i) for i in M.index_set()]
[1, -1, 1]

sage: M = crystals.infinity.NakajimaMonomials(['C',4,1])
sage: m = M.module_generators[0].f_string([4,2,3])
sage: [m.phi(i) for i in M.index_set()]
[0, 1, -1, 2, -1]
```

```
>>> from sage.all import *
>>> M = crystals.infinity.NakajimaMonomials(['D',Integer(4),Integer(3)])
```

(continues on next page)

(continued from previous page)

```
>>> m = M.module_generators[Integer(0)].f(Integer(1))
>>> [m.phi(i) for i in M.index_set()]
[1, -1, 1]

>>> M = crystals.infinity.NakajimaMonomials(['C',Integer(4),Integer(1)])
>>> m = M.module_generators[Integer(0)].f_string([Integer(4),Integer(2),
↪Integer(3)])
>>> [m.phi(i) for i in M.index_set()]
[0, 1, -1, 2, -1]
```

weight()

Return the weight of `self` as an element of the weight lattice.

EXAMPLES:

```
sage: C = crystals.infinity.NakajimaMonomials(['A',1,1])
sage: v = C.highest_weight_vector()
sage: v.f(1).weight() + v.f(0).weight()
-delta

sage: M = crystals.infinity.NakajimaMonomials(['A',4,2])
sage: m = M.highest_weight_vector().f_string([1,2,0,1])
sage: m.weight()
2*Lambda[0] - Lambda[1] - delta
```

```
>>> from sage.all import *
>>> C = crystals.infinity.NakajimaMonomials(['A',Integer(1),Integer(1)])
>>> v = C.highest_weight_vector()
>>> v.f(Integer(1)).weight() + v.f(Integer(0)).weight()
-delta

>>> M = crystals.infinity.NakajimaMonomials(['A',Integer(4),Integer(2)])
>>> m = M.highest_weight_vector().f_string([Integer(1),Integer(2),Integer(0),
↪Integer(1)])
>>> m.weight()
2*Lambda[0] - Lambda[1] - delta
```

weight_in_root_lattice()

Return the weight of `self` as an element of the root lattice.

EXAMPLES:

```
sage: M = crystals.infinity.NakajimaMonomials(['F',4])
sage: m = M.module_generators[0].f_string([3,3,1,2,4])
sage: m.weight_in_root_lattice()
-alpha[1] - alpha[2] - 2*alpha[3] - alpha[4]

sage: M = crystals.infinity.NakajimaMonomials(['B',3,1])
sage: mg = M.module_generators[0]
sage: m = mg.f_string([1,3,2,0,1,2,3,0,0,1])
sage: m.weight_in_root_lattice()
-3*alpha[0] - 3*alpha[1] - 2*alpha[2] - 2*alpha[3]
```

(continues on next page)

(continued from previous page)

```
sage: M = crystals.infinity.NakajimaMonomials(['C',3,1])
sage: m = M.module_generators[0].f_string([3,0,1,2,0])
sage: m.weight_in_root_lattice()
-2*alpha[0] - alpha[1] - alpha[2] - alpha[3]
```

```
>>> from sage.all import *
>>> M = crystals.infinity.NakajimaMonomials(['F',Integer(4)])
>>> m = M.module_generators[Integer(0)].f_string([Integer(3),Integer(3),
↪Integer(1),Integer(2),Integer(4)])
>>> m.weight_in_root_lattice()
-alpha[1] - alpha[2] - 2*alpha[3] - alpha[4]

>>> M = crystals.infinity.NakajimaMonomials(['B',Integer(3),Integer(1)])
>>> mg = M.module_generators[Integer(0)]
>>> m = mg.f_string([Integer(1),Integer(3),Integer(2),Integer(0),Integer(1),
↪Integer(2),Integer(3),Integer(0),Integer(0),Integer(1)])
>>> m.weight_in_root_lattice()
-3*alpha[0] - 3*alpha[1] - 2*alpha[2] - 2*alpha[3]

>>> M = crystals.infinity.NakajimaMonomials(['C',Integer(3),Integer(1)])
>>> m = M.module_generators[Integer(0)].f_string([Integer(3),Integer(0),
↪Integer(1),Integer(2),Integer(0)])
>>> m.weight_in_root_lattice()
-2*alpha[0] - alpha[1] - alpha[2] - alpha[3]
```

5.1.60 Crystal of Bernstein-Zelevinsky Multisegments

class sage.combinat.crystals.multisegments.**InfinityCrystalOfMultisegments**(*n*)

Bases: Parent, UniqueRepresentation

The type $A_n^{(1)}$ crystal $B(\infty)$ realized using Bernstein-Zelevinsky (BZ) multisegments.

Using (a modified version of the) notation from [JL2009], for $\ell \in \mathbf{Z}_{>0}$ and $i \in \mathbf{Z}/(n+1)\mathbf{Z}$, a segment of length ℓ and head i is the sequence of consecutive residues $[i, i+1, \dots, i+\ell-1]$. The notation for a segment of length ℓ and head i is simplified to $[i; \ell)$. Similarly, a segment of length ℓ and tail i is the sequence of consecutive residues $[i-\ell+1, \dots, i-1, i]$. The latter is denoted simply by $(\ell; i]$. Finally, a multisegment is a formal linear combination of segments, usually written in the form

$$\psi = \sum_{\substack{i \in \mathbf{Z}/(n+1)\mathbf{Z} \\ \ell \in \mathbf{Z}_{>0}}} m_{(\ell;i]} (\ell; i].$$

Such a multisegment is called aperiodic if, for every $\ell > 0$, there exists some $i \in \mathbf{Z}/(n+1)\mathbf{Z}$ such that $(\ell; i]$ does not appear in ψ. Denote the set of all periodic multisegments, together with the empty multisegment $\varnothing$, by Ψ. We define a crystal structure on multisegments as follows. Set $S_{\ell,i} = \sum_{k \geq \ell} (m_{(k;i-1]} - m_{(k;i]})$ and let ℓ_f be the minimal ℓ that attains the value $\min_{\ell > 0} S_{\ell,i}$. Then we have

$$f_i \psi = \begin{cases} \psi + (1; i] & \text{if } \ell_f = 1, \\ \psi + (\ell_f; i] - (\ell_f - 1; i-1] & \text{if } \ell_f > 1. \end{cases}$$

Similarly, let ℓ_e be the maximal ℓ that attains the value $\min_{\ell > 0} S_{\ell,i}$. Then we have

$$e_i \psi = \begin{cases} 0 & \text{if } \min_{\ell > 0} S_{\ell,i} = 0, \\ \psi + (1; i] & \text{if } \ell_e = 1, \\ \psi - (\ell_e; i] + (\ell_e - 1; i-1] & \text{if } \ell_e > 1. \end{cases}$$

Alternatively, the crystal operators may be defined using a signature rule, as detailed in Section 4 of [JL2009] (following [AJL2011]). For $\psi \in \Psi$ and $i \in \mathbf{Z}/(n+1)\mathbf{Z}$, encode all segments in ψ with tail i by the symbol R and all segments in ψ with tail $i-1$ by A. For $\ell > 0$, set $w_{i,\ell} = R^{m_{(\ell;i]}} A^{m_{(\ell;i-1]}}$ and $w_i = \prod_{\ell \geq 1} w_{i,\ell}$. By successively canceling out as many RA factors as possible, set $\widetilde{w}_i = A^{a_i(\psi)} R^{r_i(\psi)}$. If $a_i(\psi) > 0$, denote by $\ell_f > 0$ the length of the rightmost segment A in $\widetilde{w}_i$. If $a_i(\psi) = 0$, set $\ell_f = 0$. Then

$$f_i \psi = \begin{cases} \psi + (1; i] & \text{if } a_i(\psi) = 0, \\ \psi + (\ell_f; i] - (\ell_f - 1; i-1] & \text{if } a_i(\psi) > 0. \end{cases}$$

The rule for computing $e_i \psi$ is similar.

INPUT:

- `n` – for type $A_n^{(1)}$

EXAMPLES:

```
sage: B = crystals.infinity.Multisegments(2)
sage: x = B([(8,1),(6,0),(5,1),(5,0),(4,0),(4,1),(4,1),(3,0),(3,0),(3,1),(3,1),(1,
↪0),(1,2),(1,2)]); x
(8; 1] + (6; 0] + (5; 0] + (5; 1] + (4; 0] + 2 * (4; 1]
 + 2 * (3; 0] + 2 * (3; 1] + (1; 0] + 2 * (1; 2]
sage: x.f(1)
(8; 1] + (6; 0] + (5; 0] + (5; 1] + (4; 0] + 2 * (4; 1]
 + 2 * (3; 0] + 2 * (3; 1] + (2; 1] + 2 * (1; 2]
sage: x.f(1).f(1)
(8; 1] + (6; 0] + (5; 0] + (5; 1] + (4; 0] + 2 * (4; 1]
 + 2 * (3; 0] + 2 * (3; 1] + (2; 1] + (1; 1] + 2 * (1; 2]
sage: x.e(1)
(7; 0] + (6; 0] + (5; 0] + (5; 1] + (4; 0] + 2 * (4; 1]
 + 2 * (3; 0] + 2 * (3; 1] + (1; 0] + 2 * (1; 2]
sage: x.e(1).e(1)
sage: x.f(0)
(8; 1] + (6; 0] + (5; 0] + (5; 1] + (4; 0] + 2 * (4; 1]
 + 2 * (3; 0] + 2 * (3; 1] + (2; 0] + (1; 0] + (1; 2]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Multisegments(Integer(2))
>>> x = B([(Integer(8),Integer(1)),(Integer(6),Integer(0)),(Integer(5),
↪Integer(1)),(Integer(5),Integer(0)),(Integer(4),Integer(0)),(Integer(4),
↪Integer(1)),(Integer(4),Integer(1)),(Integer(3),Integer(0)),(Integer(3),
↪Integer(0)),(Integer(3),Integer(1)),(Integer(3),Integer(1)),(Integer(1),
↪Integer(0)),(Integer(1),Integer(2)),(Integer(1),Integer(2))]); x
(8; 1] + (6; 0] + (5; 0] + (5; 1] + (4; 0] + 2 * (4; 1]
 + 2 * (3; 0] + 2 * (3; 1] + (1; 0] + 2 * (1; 2]
>>> x.f(Integer(1))
(8; 1] + (6; 0] + (5; 0] + (5; 1] + (4; 0] + 2 * (4; 1]
 + 2 * (3; 0] + 2 * (3; 1] + (2; 1] + 2 * (1; 2]
>>> x.f(Integer(1)).f(Integer(1))
(8; 1] + (6; 0] + (5; 0] + (5; 1] + (4; 0] + 2 * (4; 1]
 + 2 * (3; 0] + 2 * (3; 1] + (2; 1] + (1; 1] + 2 * (1; 2]
>>> x.e(Integer(1))
(7; 0] + (6; 0] + (5; 0] + (5; 1] + (4; 0] + 2 * (4; 1]
 + 2 * (3; 0] + 2 * (3; 1] + (1; 0] + 2 * (1; 2]
>>> x.e(Integer(1)).e(Integer(1))
```

(continues on next page)

(continued from previous page)

```
>>> x.f(Integer(0))
(8; 1] + (6; 0] + (5; 0] + (5; 1] + (4; 0] + 2 * (4; 1]
 + 2 * (3; 0] + 2 * (3; 1] + (2; 0] + (1; 0] + (1; 2]
```

We check an $\widehat{\mathfrak{sl}}_2$ example against the generalized Young walls:

```
sage: B = crystals.infinity.Multisegments(1)
sage: G = B.subcrystal(max_depth=4).digraph()
sage: C = crystals.infinity.GeneralizedYoungWalls(1)
sage: GC = C.subcrystal(max_depth=4).digraph()
sage: G.is_isomorphic(GC, edge_labels=True)
True
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Multisegments(Integer(1))
>>> G = B.subcrystal(max_depth=Integer(4)).digraph()
>>> C = crystals.infinity.GeneralizedYoungWalls(Integer(1))
>>> GC = C.subcrystal(max_depth=Integer(4)).digraph()
>>> G.is_isomorphic(GC, edge_labels=True)
True
```

REFERENCES:

- [AJL2011]
- [JL2009]
- [LTV1999]

class Element (*parent*, *value*)

Bases: `ElementWrapper`

An element in a BZ multisegments crystal.

e (*i*)

Return the action of e_i on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: B = crystals.infinity.Multisegments(2)
sage: b = B([(4,2), (3,0), (3,1), (1,1), (1,0)])
sage: b.e(0)
(4; 2] + (3; 0] + (3; 1] + (1; 1]
sage: b.e(1)
sage: b.e(2)
(3; 0] + 2 * (3; 1] + (1; 0] + (1; 1]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Multisegments(Integer(2))
>>> b = B([(Integer(4),Integer(2)), (Integer(3),Integer(0)), (Integer(3),
↪Integer(1)), (Integer(1),Integer(1)), (Integer(1),Integer(0))])
>>> b.e(Integer(0))
(4; 2] + (3; 0] + (3; 1] + (1; 1]
```

(continues on next page)

(continued from previous page)

```
>>> b.e(Integer(1))
>>> b.e(Integer(2))
(3; 0] + 2 * (3; 1] + (1; 0] + (1; 1]
```

epsilon(*i*)

Return ε_i of `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: B = crystals.infinity.Multisegments(2)
sage: b = B([(4,2), (3,0), (3,1), (1,1), (1,0)])
sage: b.epsilon(0)
1
sage: b.epsilon(1)
0
sage: b.epsilon(2)
1
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Multisegments(Integer(2))
>>> b = B([(Integer(4),Integer(2)), (Integer(3),Integer(0)), (Integer(3),
↪Integer(1)), (Integer(1),Integer(1)), (Integer(1),Integer(0))])
>>> b.epsilon(Integer(0))
1
>>> b.epsilon(Integer(1))
0
>>> b.epsilon(Integer(2))
1
```

f(*i*)

Return the action of f_i on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: B = crystals.infinity.Multisegments(2)
sage: b = B([(4,2), (3,0), (3,1), (1,1), (1,0)])
sage: b.f(0)
(4; 2] + (3; 0] + (3; 1] + 2 * (1; 0] + (1; 1]
sage: b.f(1)
(4; 2] + (3; 0] + (3; 1] + (1; 0] + 2 * (1; 1]
sage: b.f(2)
2 * (4; 2] + (3; 0] + (1; 0] + (1; 1]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Multisegments(Integer(2))
>>> b = B([(Integer(4),Integer(2)), (Integer(3),Integer(0)), (Integer(3),
↪Integer(1)), (Integer(1),Integer(1)), (Integer(1),Integer(0))])
>>> b.f(Integer(0))
```

(continues on next page)

(continued from previous page)

```
(4; 2] + (3; 0] + (3; 1] + 2 * (1; 0] + (1; 1]
>>> b.f(Integer(1))
(4; 2] + (3; 0] + (3; 1] + (1; 0] + 2 * (1; 1]
>>> b.f(Integer(2))
2 * (4; 2] + (3; 0] + (1; 0] + (1; 1]
```

phi(*i*)

Return φ_i of `self`.

Let $\psi \in \Psi$. Define $\varphi_i(\psi) := \varepsilon_i(\psi) + \langle h_i, \mathrm{wt}(\psi)\rangle$, where h_i is the i-th simple coroot and $\mathrm{wt}(\psi)$ is the `weight()` of ψ.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: B = crystals.infinity.Multisegments(2)
sage: b = B([(4,2), (3,0), (3,1), (1,1), (1,0)])
sage: b.phi(0)
1
sage: b.phi(1)
0
sage: mg = B.highest_weight_vector()
sage: mg.f(1).phi(0)
1
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Multisegments(Integer(2))
>>> b = B([(Integer(4),Integer(2)), (Integer(3),Integer(0)), (Integer(3),
↪Integer(1)), (Integer(1),Integer(1)), (Integer(1),Integer(0))])
>>> b.phi(Integer(0))
1
>>> b.phi(Integer(1))
0
>>> mg = B.highest_weight_vector()
>>> mg.f(Integer(1)).phi(Integer(0))
1
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: B = crystals.infinity.Multisegments(2)
sage: b = B([(4,2), (3,0), (3,1), (1,1), (1,0)])
sage: b.weight()
-4*delta
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Multisegments(Integer(2))
>>> b = B([(Integer(4),Integer(2)), (Integer(3),Integer(0)), (Integer(3),
↪Integer(1)), (Integer(1),Integer(1)), (Integer(1),Integer(0))])
```

(continues on next page)

(continued from previous page)

```
>>> b.weight()
-4*delta
```

highest_weight_vector()

Return the highest weight vector of `self`.

EXAMPLES:

```
sage: B = crystals.infinity.Multisegments(2)
sage: B.highest_weight_vector()
0
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Multisegments(Integer(2))
>>> B.highest_weight_vector()
0
```

weight_lattice_realization()

Return a realization of the weight lattice of `self`.

EXAMPLES:

```
sage: B = crystals.infinity.Multisegments(2)
sage: B.weight_lattice_realization()
Extended weight lattice of the Root system of type ['A', 2, 1]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Multisegments(Integer(2))
>>> B.weight_lattice_realization()
Extended weight lattice of the Root system of type ['A', 2, 1]
```

5.1.61 Crystal Of Mirković-Vilonen (MV) Polytopes

AUTHORS:

- Dinakar Muthiah, Travis Scrimshaw (2015-05-11): initial version

class sage.combinat.crystals.mv_polytopes.**MVPolytope**(*parent*, *lusztig_datum*, *long_word=None*)

Bases: *PBWCrystalElement*

A Mirković-Vilonen (MV) polytope.

EXAMPLES:

We can create an animation showing how the MV polytope changes under a string of crystal operators:

```
sage: MV = crystals.infinity.MVPolytopes(['C', 2])
sage: u = MV.highest_weight_vector()
sage: L = RootSystem(['C',2,1]).ambient_space()
sage: s = [1,2,1,2,2,2,1,1,1,1,2,1,2,2,1,2]
sage: BB = [[-9, 2], [-10, 2]]
sage: p = L.plot(reflection_hyperplanes=False, bounding_box=BB)  # long time
sage: frames = [p + L.plot_mv_polytope(u.f_string(s[:i]),  # long time
....:                                  circle_size=0.1,
```

(continues on next page)

(continued from previous page)

```
....:                                       wireframe='green',
....:                                       fill='purple',
....:                                       bounding_box=BB)
....:             for i in range(len(s))]
sage: for f in frames:  # long time
....:     f.axes(False)
sage: animate(frames).show(delay=60) # optional -- ImageMagick # long time
```

```
>>> from sage.all import *
>>> MV = crystals.infinity.MVPolytopes(['C', Integer(2)])
>>> u = MV.highest_weight_vector()
>>> L = RootSystem(['C',Integer(2),Integer(1)]).ambient_space()
>>> s = [Integer(1),Integer(2),Integer(1),Integer(2),Integer(2),Integer(2),
↪Integer(1),Integer(1),Integer(1),Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(2),Integer(1),Integer(2)]
>>> BB = [[-Integer(9), Integer(2)], [-Integer(10), Integer(2)]]
>>> p = L.plot(reflection_hyperplanes=False, bounding_box=BB)  # long time
>>> frames = [p + L.plot_mv_polytope(u.f_string(s[:i]),  # long time
...                                   circle_size=RealNumber('0.1'),
...                                   wireframe='green',
...                                   fill='purple',
...                                   bounding_box=BB)
...             for i in range(len(s))]
>>> for f in frames:  # long time
...     f.axes(False)
>>> animate(frames).show(delay=Integer(60)) # optional -- ImageMagick # long time
```

plot(*P=None*, ***options*)

Plot `self`.

INPUT:

- `P` – (optional) a space to realize the polytope; default is the weight lattice realization of the crystal

See also

plot_mv_polytope()

EXAMPLES:

```
sage: MV = crystals.infinity.MVPolytopes(['C', 2])
sage: b = MV.highest_weight_vector().f_string([1,2,1,2,2,2,1,1,1,1,2,1])
sage: b.plot()                                                              #␣
↪needs sage.plot
Graphics object consisting of 12 graphics primitives
```

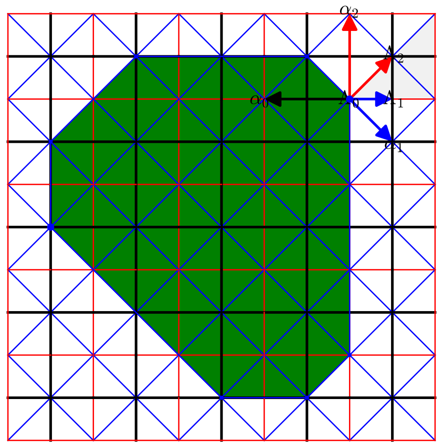
```
>>> from sage.all import *
>>> MV = crystals.infinity.MVPolytopes(['C', Integer(2)])
>>> b = MV.highest_weight_vector().f_string([Integer(1),Integer(2),Integer(1),
↪Integer(2),Integer(2),Integer(2),Integer(1),Integer(1),Integer(1),
↪Integer(1),Integer(2),Integer(1)])
>>> b.plot()                                                              #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.plot
Graphics object consisting of 12 graphics primitives
```

Here is the above example placed inside the ambient space of type C_2:



polytope (*P=None*)

Return a polytope of `self`.

INPUT:

- `P` – (optional) a space to realize the polytope; default is the weight lattice realization of the crystal

EXAMPLES:

```
sage: MV = crystals.infinity.MVPolytopes(['C', 3])
sage: b = MV.module_generators[0].f_string([3,2,3,2,1])
sage: P = b.polytope(); P
A 3-dimensional polyhedron in QQ^3 defined as the convex hull of 6 vertices
sage: P.vertices()
(A vertex at (0, 0, 0),
 A vertex at (0, 1, -1),
 A vertex at (0, 1, 1),
 A vertex at (1, -1, 0),
 A vertex at (1, 1, -2),
 A vertex at (1, 1, 2))
```

```
>>> from sage.all import *
>>> MV = crystals.infinity.MVPolytopes(['C', Integer(3)])
>>> b = MV.module_generators[Integer(0)].f_string([Integer(3),Integer(2),
↪Integer(3),Integer(2),Integer(1)])
>>> P = b.polytope(); P
A 3-dimensional polyhedron in QQ^3 defined as the convex hull of 6 vertices
>>> P.vertices()
(A vertex at (0, 0, 0),
 A vertex at (0, 1, -1),
 A vertex at (0, 1, 1),
 A vertex at (1, -1, 0),
 A vertex at (1, 1, -2),
 A vertex at (1, 1, 2))
```

class sage.combinat.crystals.mv_polytopes.**MVPolytopes**(*cartan_type*)

Bases: *PBWCrystal*

The crystal of Mirković-Vilonen (MV) polytopes.

Let W denote the corresponding Weyl group and $P_{\mathbf{R}} = \mathbf{R} \otimes P$. Let $\Gamma = \{w\Lambda_i \mid w \in W, i \in I\}$. Consider $M = (M_\gamma \in \mathbf{Z})_{\gamma\in\Gamma}$ that satisfy the *tropical Plücker relations* (see Proposition 7.1 of [BZ01]). The *MV polytope* is defined as

$$P(M) = \{\alpha \in P_{\mathbf{R}} \mid \langle \alpha, \gamma \rangle \geq M_\gamma \text{ for all } \gamma \in \Gamma\}.$$

The vertices $\{\mu_w\}_{w\in W}$ are given by

$$\langle \mu_w, \gamma \rangle = M_\gamma$$

and are known as the GGMS datum of the MV polytope.

Each path from μ_e to μ_{w_0} corresponds to a reduced expression $\mathbf{i} = (i_1, \ldots, i_m)$ for w_0 and the corresponding edge lengths $(n_k)_{k=1}^m$ from the Lusztig datum with respect to $\mathbf{i}$. Explicitly, we have

$$n_k = -M_{w_{k-1}\Lambda_{i_k}} - M_{w_k\Lambda_{i_k}} - \sum_{j\neq i} a_{ji} M_{w_k\Lambda_j},$$

$$\mu_{w_k} - \mu_{w_{k-1}} = n_k w_{k-1}\alpha_{i_k},$$

where $w_k = s_{i_1} \cdots s_{i_k}$ and (a_{ji}) is the Cartan matrix.

MV polytopes have a crystal structure that corresponds to the crystal structure, which is isomorphic to $\mathcal{B}(\infty)$ with $\mu_{w_0} = 0$, on *PBW data*. Specifically, we have $f_j P(M)$ as being the unique MV polytope given by shifting μ_e by $-\alpha_j$ and fixing the vertices μ_w when $s_j w < w$ (in Bruhat order) and the weight is given by μ_e. Furthermore, the $*$-involution is given by negating $P(M)$.

INPUT:

- cartan_type – a Cartan type

EXAMPLES:

```
sage: MV = crystals.infinity.MVPolytopes(['B', 3])
sage: hw = MV.highest_weight_vector()
sage: x = hw.f_string([1,2,2,3,3,1,3,3,2,3,2,1,3,1,2,3,1,2,1,3,2]); x
MV polytope with Lusztig datum (1, 1, 1, 3, 1, 0, 0, 1, 1)
```

```
>>> from sage.all import *
>>> MV = crystals.infinity.MVPolytopes(['B', Integer(3)])
>>> hw = MV.highest_weight_vector()
>>> x = hw.f_string([Integer(1),Integer(2),Integer(2),Integer(3),Integer(3),
↪Integer(1),Integer(3),Integer(3),Integer(2),Integer(3),Integer(2),Integer(1),
↪Integer(3),Integer(1),Integer(2),Integer(3),Integer(1),Integer(2),Integer(1),
↪Integer(3),Integer(2)]); x
MV polytope with Lusztig datum (1, 1, 1, 3, 1, 0, 0, 1, 1)
```

Elements are expressed in terms of Lusztig datum for a fixed reduced expression of w_0:

```
sage: MV.default_long_word()
[1, 3, 2, 3, 1, 2, 3, 1, 2]
sage: MV.set_default_long_word([2,1,3,2,1,3,2,3,1])
sage: x
MV polytope with Lusztig datum (3, 1, 1, 0, 1, 0, 1, 3, 4)
sage: MV.set_default_long_word([1, 3, 2, 3, 1, 2, 3, 1, 2])
```

```
>>> from sage.all import *
>>> MV.default_long_word()
[1, 3, 2, 3, 1, 2, 3, 1, 2]
>>> MV.set_default_long_word([Integer(2),Integer(1),Integer(3),Integer(2),
↪Integer(1),Integer(3),Integer(2),Integer(3),Integer(1)])
>>> x
MV polytope with Lusztig datum (3, 1, 1, 0, 1, 0, 1, 3, 4)
>>> MV.set_default_long_word([Integer(1), Integer(3), Integer(2), Integer(3),␣
↪Integer(1), Integer(2), Integer(3), Integer(1), Integer(2)])
```

We can construct elements by giving it Lusztig data (with respect to the default long word reduced expression):

```
sage: MV([1,1,1,3,1,0,0,1,1])
MV polytope with Lusztig datum (1, 1, 1, 3, 1, 0, 0, 1, 1)
```

```
>>> from sage.all import *
>>> MV([Integer(1),Integer(1),Integer(1),Integer(3),Integer(1),Integer(0),
↪Integer(0),Integer(1),Integer(1)])
MV polytope with Lusztig datum (1, 1, 1, 3, 1, 0, 0, 1, 1)
```

We can also construct elements by passing in a reduced expression for a long word:

```
sage: x = MV([1,1,1,3,1,0,0,1,1], [3,2,1,3,2,3,2,1,2]); x
MV polytope with Lusztig datum (1, 1, 1, 0, 1, 0, 5, 1, 1)
sage: x.to_highest_weight()[1]
[1, 2, 2, 2, 2, 2, 1, 3, 3, 3, 3, 2, 3, 2, 3, 3, 2, 3, 3, 2, 1, 3]
```

```
>>> from sage.all import *
>>> x = MV([Integer(1),Integer(1),Integer(1),Integer(3),Integer(1),Integer(0),
↪Integer(0),Integer(1),Integer(1)], [Integer(3),Integer(2),Integer(1),Integer(3),
↪Integer(2),Integer(3),Integer(2),Integer(1),Integer(2)]); x
MV polytope with Lusztig datum (1, 1, 1, 0, 1, 0, 5, 1, 1)
>>> x.to_highest_weight()[Integer(1)]
[1, 2, 2, 2, 2, 2, 1, 3, 3, 3, 3, 2, 3, 2, 3, 3, 2, 3, 3, 2, 1, 3]
```

The highest weight crystal $B(\lambda) \subseteq B(\infty)$ is characterized by the MV polytopes that sit inside of $W\lambda$ (translating $\mu_{w_0} \mapsto \lambda$):

```
sage: MV = crystals.infinity.MVPolytopes(['A',2])
sage: La = MV.weight_lattice_realization().fundamental_weights()
sage: R = crystals.elementary.R(La[1]+La[2])
sage: T = tensor([R, MV])
sage: x = T(R.module_generators[0], MV.highest_weight_vector())
sage: lw = x.to_lowest_weight()[0]; lw
[(2, 1, 0), MV polytope with Lusztig datum (1, 1, 1)]
sage: lw[1].polytope().vertices()
(A vertex at (0, 0, 0),
 A vertex at (0, 1, -1),
 A vertex at (1, -1, 0),
 A vertex at (1, 1, -2),
 A vertex at (2, -1, -1),
 A vertex at (2, 0, -2))
```

```
>>> from sage.all import *
>>> MV = crystals.infinity.MVPolytopes(['A',Integer(2)])
>>> La = MV.weight_lattice_realization().fundamental_weights()
>>> R = crystals.elementary.R(La[Integer(1)]+La[Integer(2)])
>>> T = tensor([R, MV])
>>> x = T(R.module_generators[Integer(0)], MV.highest_weight_vector())
>>> lw = x.to_lowest_weight()[Integer(0)]; lw
[(2, 1, 0), MV polytope with Lusztig datum (1, 1, 1)]
>>> lw[Integer(1)].polytope().vertices()
(A vertex at (0, 0, 0),
 A vertex at (0, 1, -1),
 A vertex at (1, -1, 0),
 A vertex at (1, 1, -2),
 A vertex at (2, -1, -1),
 A vertex at (2, 0, -2))
```

Element

alias of *MVPolytope*

latex_options()

Return the latex options of `self`.

EXAMPLES:

```
sage: MV = crystals.infinity.MVPolytopes(['F', 4])
sage: MV.latex_options()
{'P': Ambient space of the Root system of type ['F', 4],
 'circle_size': 0.1,
 'mark_endpoints': True,
 'projection': True}
```

```
>>> from sage.all import *
>>> MV = crystals.infinity.MVPolytopes(['F', Integer(4)])
```

(continues on next page)

(continued from previous page)

```
>>> MV.latex_options()
{'P': Ambient space of the Root system of type ['F', 4],
 'circle_size': 0.1,
 'mark_endpoints': True,
 'projection': True}
```

set_latex_options(***kwds*)

Set the latex options for the elements of `self`.

INPUT:

- `projection` – the projection; set to `True` to use the default projection of the specified weight lattice realization (initial: `True`)
- `P` – the weight lattice realization to use (initial: the weight lattice realization of `self`)
- `mark_endpoints` – whether to mark the endpoints (initial: `True`)
- `circle_size` – the size of the endpoint circles (initial: 0.1)

EXAMPLES:

```
sage: MV = crystals.infinity.MVPolytopes(['C', 2])
sage: P = RootSystem(['C', 2]).weight_lattice()
sage: b = MV.highest_weight_vector().f_string([1,2,1,2])
sage: latex(b)
\begin{tikzpicture}
\draw (0, 0) -- (0, -2) -- (-1, -3) -- (-1, -3) -- (-2, -2);
\draw (0, 0) -- (-1, 1) -- (-1, 1) -- (-2, 0) -- (-2, -2);
\draw[fill=black] (0, 0) circle (0.1);
\draw[fill=black] (-2, -2) circle (0.1);
\end{tikzpicture}
sage: MV.set_latex_options(P=P, circle_size=float(0.2))
sage: latex(b)
\begin{tikzpicture}
\draw (0, 0) -- (2, -2) -- (2, -3) -- (2, -3) -- (0, -2);
\draw (0, 0) -- (-2, 1) -- (-2, 1) -- (-2, 0) -- (0, -2);
\draw[fill=black] (0, 0) circle (0.2);
\draw[fill=black] (0, -2) circle (0.2);
\end{tikzpicture}
sage: MV.set_latex_options(mark_endpoints=False)
sage: latex(b)
\begin{tikzpicture}
\draw (0, 0) -- (2, -2) -- (2, -3) -- (2, -3) -- (0, -2);
\draw (0, 0) -- (-2, 1) -- (-2, 1) -- (-2, 0) -- (0, -2);
\end{tikzpicture}
sage: MV.set_latex_options(P=MV.weight_lattice_realization(),
....:                      circle_size=0.2,
....:                      mark_endpoints=True)
```

```
>>> from sage.all import *
>>> MV = crystals.infinity.MVPolytopes(['C', Integer(2)])
>>> P = RootSystem(['C', Integer(2)]).weight_lattice()
>>> b = MV.highest_weight_vector().f_string([Integer(1),Integer(2),Integer(1),
↪Integer(2)])
```

(continues on next page)

(continued from previous page)

```
>>> latex(b)
\begin{tikzpicture}
\draw (0, 0) -- (0, -2) -- (-1, -3) -- (-1, -3) -- (-2, -2);
\draw (0, 0) -- (-1, 1) -- (-1, 1) -- (-2, 0) -- (-2, -2);
\draw[fill=black] (0, 0) circle (0.1);
\draw[fill=black] (-2, -2) circle (0.1);
\end{tikzpicture}
>>> MV.set_latex_options(P=P, circle_size=float(RealNumber('0.2')))
>>> latex(b)
\begin{tikzpicture}
\draw (0, 0) -- (2, -2) -- (2, -3) -- (2, -3) -- (0, -2);
\draw (0, 0) -- (-2, 1) -- (-2, 1) -- (-2, 0) -- (0, -2);
\draw[fill=black] (0, 0) circle (0.2);
\draw[fill=black] (0, -2) circle (0.2);
\end{tikzpicture}

>>> latex(b)
\begin{tikzpicture}
\draw (0, 0) -- (2, -2) -- (2, -3) -- (2, -3) -- (0, -2);
\draw (0, 0) -- (-2, 1) -- (-2, 1) -- (-2, 0) -- (0, -2);
\end{tikzpicture}
>>> MV.set_latex_options(P=MV.weight_lattice_realization(),
...                      circle_size=RealNumber('0.2'),
...                      mark_endpoints=True)
```

5.1.62 $\mathcal{B}(\infty)$ Crystal Of PBW Monomials

AUTHORS:

- Dinakar Muthiah (2015-05-11): initial version

See also

For information on PBW datum, see *PBW Data*.

class sage.combinat.crystals.pbw_crystal.**PBWCrystal**(*cartan_type*)

Bases: `Parent`, `UniqueRepresentation`

Crystal of $\mathcal{B}(\infty)$ given by PBW monomials.

A model of the crystal $\mathcal{B}(\infty)$ whose elements are PBW datum up to equivalence by the tropical Plücker relations. The crystal structure on Lusztig data $x = (x_1, \ldots, x_m)$ for the reduced word $s_{i_1} \cdots s_{i_m} = w_0$ is given as follows. Suppose $i_1 = j$, then $f_j x = (x_1 + 1, x_2, \ldots, x_m)$. If $i_1 \neq j$, then we use the tropical Plücker relations to change the reduced expression such that $i'_1 = j$ and then we change back to the original word.

EXAMPLES:

```
sage: PBW = crystals.infinity.PBW(['B', 3])
sage: hw = PBW.highest_weight_vector()
sage: x = hw.f_string([1,2,2,3,3,1,3,3,2,3,2,1,3,1,2,3,1,2,1,3,2]); x
PBW monomial with Lusztig datum (1, 1, 1, 3, 1, 0, 0, 1, 1)
```

```
>>> from sage.all import *
>>> PBW = crystals.infinity.PBW(['B', Integer(3)])
>>> hw = PBW.highest_weight_vector()
>>> x = hw.f_string([Integer(1),Integer(2),Integer(2),Integer(3),Integer(3),
↪Integer(1),Integer(3),Integer(3),Integer(2),Integer(3),Integer(2),Integer(1),
↪Integer(3),Integer(1),Integer(2),Integer(3),Integer(1),Integer(2),Integer(1),
↪Integer(3),Integer(2)]); x
PBW monomial with Lusztig datum (1, 1, 1, 3, 1, 0, 0, 1, 1)
```

Elements are expressed in terms of Lusztig datum for a fixed reduced expression of w_0:

```
sage: PBW.default_long_word()
[1, 3, 2, 3, 1, 2, 3, 1, 2]
sage: PBW.set_default_long_word([2,1,3,2,1,3,2,3,1])
sage: x
PBW monomial with Lusztig datum (3, 1, 1, 0, 1, 0, 1, 3, 4)
sage: PBW.set_default_long_word([1, 3, 2, 3, 1, 2, 3, 1, 2])
```

```
>>> from sage.all import *
>>> PBW.default_long_word()
[1, 3, 2, 3, 1, 2, 3, 1, 2]
>>> PBW.set_default_long_word([Integer(2),Integer(1),Integer(3),Integer(2),
↪Integer(1),Integer(3),Integer(2),Integer(3),Integer(1)])
>>> x
PBW monomial with Lusztig datum (3, 1, 1, 0, 1, 0, 1, 3, 4)
>>> PBW.set_default_long_word([Integer(1), Integer(3), Integer(2), Integer(3),␣
↪Integer(1), Integer(2), Integer(3), Integer(1), Integer(2)])
```

We can construct elements by giving it Lusztig data (with respect to the default long word):

```
sage: PBW([1,1,1,3,1,0,0,1,1])
PBW monomial with Lusztig datum (1, 1, 1, 3, 1, 0, 0, 1, 1)
```

```
>>> from sage.all import *
>>> PBW([Integer(1),Integer(1),Integer(1),Integer(3),Integer(1),Integer(0),
↪Integer(0),Integer(1),Integer(1)])
PBW monomial with Lusztig datum (1, 1, 1, 3, 1, 0, 0, 1, 1)
```

We can also construct elements by passing in a reduced expression for a long word:

```
sage: x = PBW([1,1,1,3,1,0,0,1,1], [3,2,1,3,2,3,2,1,2]); x
PBW monomial with Lusztig datum (1, 1, 1, 0, 1, 0, 5, 1, 1)
sage: x.to_highest_weight()[1]
[1, 2, 2, 2, 2, 2, 1, 3, 3, 3, 3, 2, 3, 2, 3, 3, 2, 3, 3, 2, 1, 3]
```

```
>>> from sage.all import *
>>> x = PBW([Integer(1),Integer(1),Integer(1),Integer(3),Integer(1),Integer(0),
↪Integer(0),Integer(1),Integer(1)], [Integer(3),Integer(2),Integer(1),Integer(3),
↪Integer(2),Integer(3),Integer(2),Integer(1),Integer(2)]); x
PBW monomial with Lusztig datum (1, 1, 1, 0, 1, 0, 5, 1, 1)
>>> x.to_highest_weight()[Integer(1)]
[1, 2, 2, 2, 2, 2, 1, 3, 3, 3, 3, 2, 3, 2, 3, 3, 2, 3, 3, 2, 1, 3]
```

Element

alias of *PBWCrystalElement*

default_long_word()

Return the default long word used to express elements of `self`.

EXAMPLES:

```
sage: B = crystals.infinity.PBW(['E', 6])
sage: B.default_long_word()
[1, 3, 4, 5, 6, 2, 4, 5, 3, 4, 1, 3, 2, 4, 5, 6, 2, 4,
 5, 3, 4, 1, 3, 2, 4, 5, 3, 4, 1, 3, 2, 4, 1, 3, 2, 1]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.PBW(['E', Integer(6)])
>>> B.default_long_word()
[1, 3, 4, 5, 6, 2, 4, 5, 3, 4, 1, 3, 2, 4, 5, 6, 2, 4,
 5, 3, 4, 1, 3, 2, 4, 5, 3, 4, 1, 3, 2, 4, 1, 3, 2, 1]
```

set_default_long_word(*word*)

Set the default long word used to express elements of `self`.

EXAMPLES:

```
sage: B = crystals.infinity.PBW(['C', 3])
sage: B.default_long_word()
[1, 3, 2, 3, 1, 2, 3, 1, 2]
sage: x = B.highest_weight_vector().f_string([2,1,3,2,3,1,2,3,3,1])
sage: x
PBW monomial with Lusztig datum (1, 2, 2, 0, 0, 0, 0, 0, 1)
sage: B.set_default_long_word([2,1,3,2,1,3,2,3,1])
sage: B.default_long_word()
[2, 1, 3, 2, 1, 3, 2, 3, 1]
sage: x
PBW monomial with Lusztig datum (2, 0, 0, 0, 0, 0, 1, 3, 2)
```

```
>>> from sage.all import *
>>> B = crystals.infinity.PBW(['C', Integer(3)])
>>> B.default_long_word()
[1, 3, 2, 3, 1, 2, 3, 1, 2]
>>> x = B.highest_weight_vector().f_string([Integer(2),Integer(1),Integer(3),
↪Integer(2),Integer(3),Integer(1),Integer(2),Integer(3),Integer(3),
↪Integer(1)])
>>> x
PBW monomial with Lusztig datum (1, 2, 2, 0, 0, 0, 0, 0, 1)
>>> B.set_default_long_word([Integer(2),Integer(1),Integer(3),Integer(2),
↪Integer(1),Integer(3),Integer(2),Integer(3),Integer(1)])
>>> B.default_long_word()
[2, 1, 3, 2, 1, 3, 2, 3, 1]
>>> x
PBW monomial with Lusztig datum (2, 0, 0, 0, 0, 0, 1, 3, 2)
```

class sage.combinat.crystals.pbw_crystal.**PBWCrystalElement**(*parent*, *lusztig_datum*, *long_word=None*)

Bases: `Element`

A crystal element in the PBW model.

e(*i*)

Return the action of e_i on `self`.

EXAMPLES:

```
sage: B = crystals.infinity.PBW(['B', 3])
sage: b = B.highest_weight_vector()
sage: c = b.f_string([2,1,3,2,1,3,2,2]); c
PBW monomial with Lusztig datum (0, 1, 0, 1, 0, 0, 0, 1, 2)
sage: c.e(2)
PBW monomial with Lusztig datum (0, 1, 0, 1, 0, 0, 0, 1, 1)
sage: c.e_string([2,2,1,3,2,1,3,2]) == b
True
```

```
>>> from sage.all import *
>>> B = crystals.infinity.PBW(['B', Integer(3)])
>>> b = B.highest_weight_vector()
>>> c = b.f_string([Integer(2),Integer(1),Integer(3),Integer(2),Integer(1),
↪Integer(3),Integer(2),Integer(2)]); c
PBW monomial with Lusztig datum (0, 1, 0, 1, 0, 0, 0, 1, 2)
>>> c.e(Integer(2))
PBW monomial with Lusztig datum (0, 1, 0, 1, 0, 0, 0, 1, 1)
>>> c.e_string([Integer(2),Integer(2),Integer(1),Integer(3),Integer(2),
↪Integer(1),Integer(3),Integer(2)]) == b
True
```

epsilon(*i*)

Return ε_i of `self`.

EXAMPLES:

```
sage: B = crystals.infinity.PBW(["A2"])
sage: s = B((3,0,0), (1,2,1))
sage: s.epsilon(1)
3
sage: s.epsilon(2)
0
```

```
>>> from sage.all import *
>>> B = crystals.infinity.PBW(["A2"])
>>> s = B((Integer(3),Integer(0),Integer(0)), (Integer(1),Integer(2),
↪Integer(1)))
>>> s.epsilon(Integer(1))
3
>>> s.epsilon(Integer(2))
0
```

f(*i*)

Return the action of f_i on `self`.

EXAMPLES:

```
sage: B = crystals.infinity.PBW("D4")
sage: b = B.highest_weight_vector()
sage: c = b.f_string([1,2,3,1,2,3,4]); c
PBW monomial with Lusztig datum (0, 1, 0, 0, 0, 0, 0, 2, 0, 0, 2, 0)
sage: c == b.f_string([1,2,4,1,2,3,3])
True
```

```
>>> from sage.all import *
>>> B = crystals.infinity.PBW("D4")
>>> b = B.highest_weight_vector()
>>> c = b.f_string([Integer(1),Integer(2),Integer(3),Integer(1),Integer(2),
↪Integer(3),Integer(4)]); c
PBW monomial with Lusztig datum (0, 1, 0, 0, 0, 0, 0, 2, 0, 0, 2, 0)
>>> c == b.f_string([Integer(1),Integer(2),Integer(4),Integer(1),Integer(2),
↪Integer(3),Integer(3)])
True
```

lusztig_datum(*word=None*)

Return the Lusztig datum of `self` with respect to the reduced expression of the long word `word`.

EXAMPLES:

```
sage: B = crystals.infinity.PBW(['A', 2])
sage: u = B.highest_weight_vector()
sage: b = u.f_string([2,1,2,2,2,2,1,1,2,1,2,1,2,1,2,2])
sage: b.lusztig_datum()
(6, 0, 10)
sage: b.lusztig_datum(word=[2,1,2])
(4, 6, 0)
```

```
>>> from sage.all import *
>>> B = crystals.infinity.PBW(['A', Integer(2)])
>>> u = B.highest_weight_vector()
>>> b = u.f_string([Integer(2),Integer(1),Integer(2),Integer(2),Integer(2),
↪Integer(2),Integer(1),Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1),Integer(2),Integer(1),Integer(2),Integer(2)])
>>> b.lusztig_datum()
(6, 0, 10)
>>> b.lusztig_datum(word=[Integer(2),Integer(1),Integer(2)])
(4, 6, 0)
```

phi(*i*)

Return φ_i of `self`.

EXAMPLES:

```
sage: B = crystals.infinity.PBW(['A', 2])
sage: s = B((3,0,0), (1,2,1))
sage: s.phi(1)
-3
sage: s.phi(2)
3
```

```
>>> from sage.all import *
>>> B = crystals.infinity.PBW(['A', Integer(2)])
>>> s = B((Integer(3),Integer(0),Integer(0)), (Integer(1),Integer(2),
→Integer(1)))
>>> s.phi(Integer(1))
-3
>>> s.phi(Integer(2))
3
```

star()

Return the starred crystal element corresponding to `self`.

Let b be an element of `self` with Lusztig datum $(b_1,\ldots,b_N)$ with respect to $w_0 = s_{i_1}\cdots s_{i_N}$. Then b^* is the element with Lusztig datum $(b_N,\ldots,b_1)$ with respect to $w_0 = s_{i_N^*}\cdots s_{i_1^*}$, where $i_j^* = \omega(i_j)$ with ω being the *automorphism* given by the action of w_0 on the simple roots.

EXAMPLES:

```
sage: P = crystals.infinity.PBW(['A', 2])
sage: P((1,2,3), (1,2,1)).star() == P((3,2,1), (2,1,2))
True

sage: B = crystals.infinity.PBW(['E', 6])
sage: b = B.highest_weight_vector()
sage: c = b.f_string([1,2,6,3,4,2,5,2,3,4,1,6])
sage: c == c.star().star()
True
```

```
>>> from sage.all import *
>>> P = crystals.infinity.PBW(['A', Integer(2)])
>>> P((Integer(1),Integer(2),Integer(3)), (Integer(1),Integer(2),Integer(1))).
→star() == P((Integer(3),Integer(2),Integer(1)), (Integer(2),Integer(1),
→Integer(2)))
True

>>> B = crystals.infinity.PBW(['E', Integer(6)])
>>> b = B.highest_weight_vector()
>>> c = b.f_string([Integer(1),Integer(2),Integer(6),Integer(3),Integer(4),
→Integer(2),Integer(5),Integer(2),Integer(3),Integer(4),Integer(1),
→Integer(6)])
>>> c == c.star().star()
True
```

weight()

Return weight of `self`.

EXAMPLES:

```
sage: B = crystals.infinity.PBW(['A', 2])
sage: s = B((2,2,2), (1,2,1))
sage: s.weight()
(-4, 0, 4)
```

```
>>> from sage.all import *
>>> B = crystals.infinity.PBW(['A', Integer(2)])
>>> s = B((Integer(2),Integer(2),Integer(2)), (Integer(1),Integer(2),
↪Integer(1)))
>>> s.weight()
(-4, 0, 4)
```

5.1.63 PBW Data

This contains helper classes and functions which encode PBW data in finite type.

AUTHORS:

- Dinakar Muthiah (2015-05): initial version
- Travis Scrimshaw (2016-06): simplified code and converted to Cython

class sage.combinat.crystals.pbw_datum.**PBWData**(*cartan_type*)

Bases: object

Helper class for the set of PBW data.

convert_to_new_long_word(*pbw_datum*, *new_long_word*)

Convert the PBW datum pbw_datum from its long word to new_long_word.

EXAMPLES:

```
sage: from sage.combinat.crystals.pbw_datum import PBWData, PBWDatum
sage: P = PBWData("A2")
sage: datum = PBWDatum(P, (1,2,1), (1,0,1))
sage: new_datum = P.convert_to_new_long_word(datum,(2,1,2))
sage: new_datum
PBW Datum element of type ['A', 2] with long word (2, 1, 2)
 and Lusztig datum (0, 1, 0)
sage: new_datum.long_word
(2, 1, 2)
sage: new_datum.lusztig_datum
(0, 1, 0)
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.pbw_datum import PBWData, PBWDatum
>>> P = PBWData("A2")
>>> datum = PBWDatum(P, (Integer(1),Integer(2),Integer(1)), (Integer(1),
↪Integer(0),Integer(1)))
>>> new_datum = P.convert_to_new_long_word(datum,(Integer(2),Integer(1),
↪Integer(2)))
>>> new_datum
PBW Datum element of type ['A', 2] with long word (2, 1, 2)
 and Lusztig datum (0, 1, 0)
>>> new_datum.long_word
(2, 1, 2)
>>> new_datum.lusztig_datum
(0, 1, 0)
```

class sage.combinat.crystals.pbw_datum.**PBWDatum**(*parent*, *long_word*, *lusztig_datum*)

Bases: object

Helper class which represents a PBW datum.

convert_to_long_word_with_first_letter(*i*)

Return a new PBWDatum equivalent to `self` whose long word begins with `i`.

EXAMPLES:

```
sage: from sage.combinat.crystals.pbw_datum import PBWData, PBWDatum
sage: P = PBWData("A3")
sage: datum = PBWDatum(P, (1,2,1,3,2,1), (1,0,1,4,2,3))
sage: datum.convert_to_long_word_with_first_letter(1)
PBW Datum element of type ['A', 3] with long word (1, 2, 3, 1, 2, 1)
 and Lusztig datum (1, 0, 4, 1, 2, 3)
sage: datum.convert_to_long_word_with_first_letter(2)
PBW Datum element of type ['A', 3] with long word (2, 1, 2, 3, 2, 1)
 and Lusztig datum (0, 1, 0, 4, 2, 3)
sage: datum.convert_to_long_word_with_first_letter(3)
PBW Datum element of type ['A', 3] with long word (3, 1, 2, 3, 1, 2)
 and Lusztig datum (8, 1, 0, 4, 1, 2)
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.pbw_datum import PBWData, PBWDatum
>>> P = PBWData("A3")
>>> datum = PBWDatum(P, (Integer(1),Integer(2),Integer(1),Integer(3),
↪Integer(2),Integer(1)), (Integer(1),Integer(0),Integer(1),Integer(4),
↪Integer(2),Integer(3)))
>>> datum.convert_to_long_word_with_first_letter(Integer(1))
PBW Datum element of type ['A', 3] with long word (1, 2, 3, 1, 2, 1)
 and Lusztig datum (1, 0, 4, 1, 2, 3)
>>> datum.convert_to_long_word_with_first_letter(Integer(2))
PBW Datum element of type ['A', 3] with long word (2, 1, 2, 3, 2, 1)
 and Lusztig datum (0, 1, 0, 4, 2, 3)
>>> datum.convert_to_long_word_with_first_letter(Integer(3))
PBW Datum element of type ['A', 3] with long word (3, 1, 2, 3, 1, 2)
 and Lusztig datum (8, 1, 0, 4, 1, 2)
```

convert_to_new_long_word(*new_long_word*)

Return a new PBWDatum equivalent to `self` whose long word is `new_long_word`.

EXAMPLES:

```
sage: from sage.combinat.crystals.pbw_datum import PBWData, PBWDatum
sage: P = PBWData("A2")
sage: datum = PBWDatum(P, (1,2,1), (1,0,1))
sage: new_datum = datum.convert_to_new_long_word((2,1,2))
sage: new_datum.long_word
(2, 1, 2)
sage: new_datum.lusztig_datum
(0, 1, 0)
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.pbw_datum import PBWData, PBWDatum
>>> P = PBWData("A2")
>>> datum = PBWDatum(P, (Integer(1),Integer(2),Integer(1)), (Integer(1),
```

(continues on next page)

(continued from previous page)

```
↪Integer(0),Integer(1)))
>>> new_datum = datum.convert_to_new_long_word((Integer(2),Integer(1),
↪Integer(2)))
>>> new_datum.long_word
(2, 1, 2)
>>> new_datum.lusztig_datum
(0, 1, 0)
```

is_equivalent_to(*other_pbw_datum*)

Return whether `self` is equivalent to `other_pbw_datum`. modulo the tropical Plücker relations.

EXAMPLES:

```
sage: from sage.combinat.crystals.pbw_datum import PBWData, PBWDatum
sage: P = PBWData("A2")
sage: L1 = PBWDatum(P, (1,2,1), (1,0,1))
sage: L2 = PBWDatum(P, (2,1,2), (0,1,0))
sage: L1.is_equivalent_to(L2)
True
sage: L1 == L2
False
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.pbw_datum import PBWData, PBWDatum
>>> P = PBWData("A2")
>>> L1 = PBWDatum(P, (Integer(1),Integer(2),Integer(1)), (Integer(1),
↪Integer(0),Integer(1)))
>>> L2 = PBWDatum(P, (Integer(2),Integer(1),Integer(2)), (Integer(0),
↪Integer(1),Integer(0)))
>>> L1.is_equivalent_to(L2)
True
>>> L1 == L2
False
```

star()

Return the starred version of `self`, i.e., with reversed `long_word` and `lusztig_datum`

EXAMPLES:

```
sage: from sage.combinat.crystals.pbw_datum import PBWData, PBWDatum
sage: P = PBWData("A2")
sage: L1 = PBWDatum(P, (1,2,1), (1,2,3))
sage: L1.star() == PBWDatum(P, (2,1,2), (3,2,1))
True
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.pbw_datum import PBWData, PBWDatum
>>> P = PBWData("A2")
>>> L1 = PBWDatum(P, (Integer(1),Integer(2),Integer(1)), (Integer(1),
↪Integer(2),Integer(3)))
>>> L1.star() == PBWDatum(P, (Integer(2),Integer(1),Integer(2)), (Integer(3),
↪Integer(2),Integer(1)))
True
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: from sage.combinat.crystals.pbw_datum import PBWData, PBWDatum
sage: P = PBWData("A2")
sage: L = PBWDatum(P, (1,2,1), (1,1,1))
sage: L.weight()
-2*alpha[1] - 2*alpha[2]
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.pbw_datum import PBWData, PBWDatum
>>> P = PBWData("A2")
>>> L = PBWDatum(P, (Integer(1),Integer(2),Integer(1)), (Integer(1),
↪Integer(1),Integer(1)))
>>> L.weight()
-2*alpha[1] - 2*alpha[2]
```

`sage.combinat.crystals.pbw_datum.`**compute_new_lusztig_datum**(*enhanced_braid_chain*, *initial_lusztig_datum*)

Return the Lusztig datum obtained by applying tropical Plücker relations along `enhanced_braid_chain` starting with `initial_lusztig_datum`.

EXAMPLES:

```
sage: from sage.combinat.root_system.braid_move_calculator import␣
↪BraidMoveCalculator
sage: from sage.combinat.crystals.pbw_datum import enhance_braid_move_chain
sage: from sage.combinat.crystals.pbw_datum import compute_new_lusztig_datum
sage: ct = CartanType(['A', 2])
sage: W = CoxeterGroup(ct)
sage: B = BraidMoveCalculator(W)
sage: chain = B.chain_of_reduced_words((1,2,1),(2,1,2))
sage: enhanced_braid_chain = enhance_braid_move_chain(chain, ct)
sage: compute_new_lusztig_datum(enhanced_braid_chain,(1,0,1))
(0, 1, 0)
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.braid_move_calculator import␣
↪BraidMoveCalculator
>>> from sage.combinat.crystals.pbw_datum import enhance_braid_move_chain
>>> from sage.combinat.crystals.pbw_datum import compute_new_lusztig_datum
>>> ct = CartanType(['A', Integer(2)])
>>> W = CoxeterGroup(ct)
>>> B = BraidMoveCalculator(W)
>>> chain = B.chain_of_reduced_words((Integer(1),Integer(2),Integer(1)),
↪(Integer(2),Integer(1),Integer(2)))
>>> enhanced_braid_chain = enhance_braid_move_chain(chain, ct)
>>> compute_new_lusztig_datum(enhanced_braid_chain,(Integer(1),Integer(0),
↪Integer(1)))
(0, 1, 0)
```

`sage.combinat.crystals.pbw_datum.`**enhance_braid_move_chain**(*braid_move_chain*, *cartan_type*)

Return a list of tuples that records the data of the long words in `braid_move_chain` plus the data of the intervals where the braid moves occur and the data of the off-diagonal entries of the 2×2 Cartan submatrices of each braid move.

INPUT:

- `braid_move_chain` – a chain of reduced words in the Weyl group of `cartan_type`
- `cartan_type` – a finite Cartan type

OUTPUT:

A list of 2-tuples `(interval_of_change, cartan_sub_matrix)` where

- `interval_of_change` is the (half-open) interval of indices where the braid move occurs; this is `None` for the first tuple
- `cartan_sub_matrix` is the off-diagonal entries of the 2×2 submatrix of the Cartan matrix corresponding to the braid move; this is `None` for the first tuple

For a matrix:

```
[2 a]
[b 2]
```

the `cartan_sub_matrix` is the pair `(a, b)`.

`sage.combinat.crystals.pbw_datum.`**`tropical_plucker_relation`**`(`*a*, *lusztig_datum*`)`

Apply the tropical Plücker relation of type `a` to `lusztig_datum`.

The relations are obtained by tropicalizing the relations in Proposition 7.1 of [BZ01].

INPUT:

- `a` – a pair `(x, y)` of the off-diagonal entries of a 2×2 Cartan matrix

EXAMPLES:

```
sage: from sage.combinat.crystals.pbw_datum import tropical_plucker_relation
sage: tropical_plucker_relation((0,0), (2,3))
(3, 2)
sage: tropical_plucker_relation((-1,-1), (1,2,3))
(4, 1, 2)
sage: tropical_plucker_relation((-1,-2), (1,2,3,4))
(8, 1, 2, 3)
sage: tropical_plucker_relation((-2,-1), (1,2,3,4))
(6, 1, 2, 3)
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.pbw_datum import tropical_plucker_relation
>>> tropical_plucker_relation((Integer(0),Integer(0)), (Integer(2),Integer(3)))
(3, 2)
>>> tropical_plucker_relation((-Integer(1),-Integer(1)), (Integer(1),Integer(2),
↪Integer(3)))
(4, 1, 2)
>>> tropical_plucker_relation((-Integer(1),-Integer(2)), (Integer(1),Integer(2),
↪Integer(3),Integer(4)))
(8, 1, 2, 3)
```

(continues on next page)

(continued from previous page)

```
>>> tropical_plucker_relation((-Integer(2),-Integer(1)), (Integer(1),Integer(2),
↪Integer(3),Integer(4)))
(6, 1, 2, 3)
```

5.1.64 Polyhedral Realization of $B(\infty)$

class sage.combinat.crystals.polyhedral_realization.**InfinityCrystalAsPolyhedralRealization**(*cartan_type*, *seq*)

Bases: *TensorProductOfCrystals*

The polyhedral realization of $B(\infty)$.

Note

Here we are using anti-Kashiwara notation and might differ from some of the literature.

Consider a Kac-Moody algebra $\mathfrak{g}$ of Cartan type X with index set I, and consider a finite sequence $J = (j_1, j_2, \ldots, j_m)$ whose support equals I. We extend this to an infinite sequence by taking $\bar{J} = J \cdot J \cdot J \cdots$, where $\cdot$ denotes concatenation of sequences. Let

$$B_J = B_{j_m} \otimes \cdots \otimes B_{j_2} \otimes B_{j_1},$$

where B_i is an *ElementaryCrystal*.

As given in Theorem 2.1.1 of [Ka1993], there exists a strict crystal embedding $\Psi_i \colon B(\infty) \to B_i \otimes B(\infty)$ defined by $u_\infty \mapsto b_i(0) \otimes u_\infty$, where $b_i(0) \in B_i$ and u_∞ is the (unique) highest weight element in $B(\infty)$. This is sometimes known as the *Kashiwara embedding* [NZ1997] (though, in [NZ1997], the target of this map is denoted by $\mathbf{Z}_J^\infty$). By iterating this embedding by taking $\Psi_J = \Psi_{j_n} \circ \Psi_{j_{n-1}} \circ \cdots \circ \Psi_{j_1}$, we obtain the following strict crystal embedding:

$$\Psi_J^n \colon B(\infty) \to B_J^{\otimes n} \otimes B(\infty).$$

We note there is a natural analog of Lemma 10.6.2 in [HK2002] that for any $b \in B(\infty)$, there exists a positive integer N such that

$$\Psi_J^N(b) = \left(\bigotimes_{k=1}^{N} b^{(k)} \right) \otimes u_\infty.$$

Therefore we can model elements $b \in B(\infty)$ by considering an infinite list of elements $b^{(k)} \in B_J$ and defining the crystal structure by:

$$\begin{aligned}
\mathrm{wt}(b) &= \sum_{k=1}^{N} \mathrm{wt}(b^{(k)}) \\
e_i(b) &= e_i\left(\left(\bigotimes_{k=1}^{N} b^{(k)} \right) \right) \otimes u_\infty, \\
f_i(b) &= f_i\left(\left(\bigotimes_{k=1}^{N} b^{(k)} \right) \right) \otimes u_\infty, \\
\varepsilon_i(b) &= \max_{e_i^k(b) \neq 0} k, \\
\varphi_i(b) &= \varepsilon_i(b) - \langle \mathrm{wt}(b), h_i^\vee \rangle.
\end{aligned}$$

To translate this into a finite list, we consider a finite sequence $b_1 \otimes \cdots \otimes b_N$ and if

$$f_i\left(b^{(1)} \otimes \cdots b^{(N-1)} \otimes b^{(N)}\right) = b^{(1)} \otimes \cdots \otimes b^{(N-1)} \otimes f_i\left(b^{(N)}\right),$$

then we take the image as $b^{(1)} \otimes \cdots \otimes f_i\left(b^{(N)}\right) \otimes b^{(N+1)}$. Similarly we remove $b^{(N)}$ if we have $b^{(N)} = \bigotimes_{k=1}^{m} b_{j_k}(0)$. Additionally if

$$e_i\left(b^{(1)} \otimes \cdots \otimes b^{(N-1)} \otimes b^{(N)}\right) = b^{(1)} \otimes \cdots \otimes b^{(N-1)} \otimes e_i\left(b^{(N)}\right),$$

then we consider this to be 0.

INPUT:

- `cartan_type` – a Cartan type
- `seq` – (default: `None`) a finite sequence whose support equals the index set of the Cartan type; if `None`, then this is the index set

EXAMPLES:

```
sage: B = crystals.infinity.PolyhedralRealization(['A',2])
sage: mg = B.module_generators[0]; mg
[0, 0]
sage: mg.f_string([2,1,2,2])
[0, -3, -1, 0, 0, 0]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.PolyhedralRealization(['A',Integer(2)])
>>> mg = B.module_generators[Integer(0)]; mg
[0, 0]
>>> mg.f_string([Integer(2),Integer(1),Integer(2),Integer(2)])
[0, -3, -1, 0, 0, 0]
```

An example of type B_2:

```
sage: B = crystals.infinity.PolyhedralRealization(['B',2])
sage: mg = B.module_generators[0]; mg
[0, 0]
sage: mg.f_string([2,1,2,2])
[0, -2, -1, -1, 0, 0]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.PolyhedralRealization(['B',Integer(2)])
>>> mg = B.module_generators[Integer(0)]; mg
[0, 0]
>>> mg.f_string([Integer(2),Integer(1),Integer(2),Integer(2)])
[0, -2, -1, -1, 0, 0]
```

An example of type G_2:

```
sage: B = crystals.infinity.PolyhedralRealization(['G',2])
sage: mg = B.module_generators[0]; mg
[0, 0]
sage: mg.f_string([2,1,2,2])
[0, -3, -1, 0, 0, 0]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.PolyhedralRealization(['G',Integer(2)])
>>> mg = B.module_generators[Integer(0)]; mg
[0, 0]
>>> mg.f_string([Integer(2),Integer(1),Integer(2),Integer(2)])
[0, -3, -1, 0, 0, 0]
```

class Element

Bases: *TensorProductOfCrystalsElement*

An element in the polyhedral realization of $B(\infty)$.

e(*i*)

Return the action of e_i on `self`.

EXAMPLES:

```
sage: B = crystals.infinity.PolyhedralRealization(['A',2])
sage: mg = B.module_generators[0]
sage: all(mg.e(i) is None for i in B.index_set())
True
sage: mg.f(1).e(1) == mg
True
```

```
>>> from sage.all import *
>>> B = crystals.infinity.PolyhedralRealization(['A',Integer(2)])
>>> mg = B.module_generators[Integer(0)]
>>> all(mg.e(i) is None for i in B.index_set())
True
>>> mg.f(Integer(1)).e(Integer(1)) == mg
True
```

epsilon(*i*)

Return ε_i of `self`.

EXAMPLES:

```
sage: B = crystals.infinity.PolyhedralRealization(['A',2,1])
sage: mg = B.module_generators[0]
sage: [mg.epsilon(i) for i in B.index_set()]
[0, 0, 0]
sage: elt = mg.f(0)
sage: [elt.epsilon(i) for i in B.index_set()]
[1, 0, 0]
sage: elt = mg.f_string([0,1,2])
sage: [elt.epsilon(i) for i in B.index_set()]
[0, 0, 1]
sage: elt = mg.f_string([0,1,2,2])
sage: [elt.epsilon(i) for i in B.index_set()]
[0, 0, 2]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.PolyhedralRealization(['A',Integer(2),
↪Integer(1)])
```

(continues on next page)

(continued from previous page)

```
>>> mg = B.module_generators[Integer(0)]
>>> [mg.epsilon(i) for i in B.index_set()]
[0, 0, 0]
>>> elt = mg.f(Integer(0))
>>> [elt.epsilon(i) for i in B.index_set()]
[1, 0, 0]
>>> elt = mg.f_string([Integer(0),Integer(1),Integer(2)])
>>> [elt.epsilon(i) for i in B.index_set()]
[0, 0, 1]
>>> elt = mg.f_string([Integer(0),Integer(1),Integer(2),Integer(2)])
>>> [elt.epsilon(i) for i in B.index_set()]
[0, 0, 2]
```

f (*i*)

Return the action of f_i on `self`.

EXAMPLES:

```
sage: B = crystals.infinity.PolyhedralRealization(['A',2])
sage: mg = B.module_generators[0]
sage: mg.f(1)
[-1, 0, 0, 0]
sage: mg.f_string([1,2,2,1])
[-1, -2, -1, 0, 0, 0]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.PolyhedralRealization(['A',Integer(2)])
>>> mg = B.module_generators[Integer(0)]
>>> mg.f(Integer(1))
[-1, 0, 0, 0]
>>> mg.f_string([Integer(1),Integer(2),Integer(2),Integer(1)])
[-1, -2, -1, 0, 0, 0]
```

phi (*i*)

Return φ_i of `self`.

EXAMPLES:

```
sage: B = crystals.infinity.PolyhedralRealization(['A',2,1])
sage: mg = B.module_generators[0]
sage: [mg.phi(i) for i in B.index_set()]
[0, 0, 0]
sage: elt = mg.f(0)
sage: [elt.phi(i) for i in B.index_set()]
[-1, 1, 1]
sage: elt = mg.f_string([0,1])
sage: [elt.phi(i) for i in B.index_set()]
[-1, 0, 2]
sage: elt = mg.f_string([0,1,2,2])
sage: [elt.phi(i) for i in B.index_set()]
[1, 1, 0]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.PolyhedralRealization(['A',Integer(2),
↪Integer(1)])
>>> mg = B.module_generators[Integer(0)]
>>> [mg.phi(i) for i in B.index_set()]
[0, 0, 0]
>>> elt = mg.f(Integer(0))
>>> [elt.phi(i) for i in B.index_set()]
[-1, 1, 1]
>>> elt = mg.f_string([Integer(0),Integer(1)])
>>> [elt.phi(i) for i in B.index_set()]
[-1, 0, 2]
>>> elt = mg.f_string([Integer(0),Integer(1),Integer(2),Integer(2)])
>>> [elt.phi(i) for i in B.index_set()]
[1, 1, 0]
```

truncate(*k=None*)

Truncate self to have length k and return as an element in a (finite) tensor product of crystals.

INPUT:

- k – (optional) the length of the truncation; if not specified, then returns one more than the current non-ground-state elements (i.e. the current list in self)

EXAMPLES:

```
sage: B = crystals.infinity.PolyhedralRealization(['A',2])
sage: mg = B.module_generators[0]
sage: elt = mg.f_string([1,2,2,1]); elt
[-1, -2, -1, 0, 0, 0]
sage: t = elt.truncate(); t
[-1, -2, -1, 0, 0, 0]
sage: t.parent() is B.finite_tensor_product(6)
True
sage: elt.truncate(2)
[-1, -2]
sage: elt.truncate(10)
[-1, -2, -1, 0, 0, 0, 0, 0, 0, 0]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.PolyhedralRealization(['A',Integer(2)])
>>> mg = B.module_generators[Integer(0)]
>>> elt = mg.f_string([Integer(1),Integer(2),Integer(2),Integer(1)]); elt
[-1, -2, -1, 0, 0, 0]
>>> t = elt.truncate(); t
[-1, -2, -1, 0, 0, 0]
>>> t.parent() is B.finite_tensor_product(Integer(6))
True
>>> elt.truncate(Integer(2))
[-1, -2]
>>> elt.truncate(Integer(10))
[-1, -2, -1, 0, 0, 0, 0, 0, 0, 0]
```

finite_tensor_product(*k*)

Return the finite tensor product of crystals of length k by truncating self.

EXAMPLES:

```
sage: B = crystals.infinity.PolyhedralRealization(['A',2])
sage: B.finite_tensor_product(5)
Full tensor product of the crystals
 [The 1-elementary crystal of type ['A', 2],
  The 2-elementary crystal of type ['A', 2],
  The 1-elementary crystal of type ['A', 2],
  The 2-elementary crystal of type ['A', 2],
  The 1-elementary crystal of type ['A', 2]]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.PolyhedralRealization(['A',Integer(2)])
>>> B.finite_tensor_product(Integer(5))
Full tensor product of the crystals
 [The 1-elementary crystal of type ['A', 2],
  The 2-elementary crystal of type ['A', 2],
  The 1-elementary crystal of type ['A', 2],
  The 2-elementary crystal of type ['A', 2],
  The 1-elementary crystal of type ['A', 2]]
```

5.1.65 Spin Crystals

These are the crystals associated with the three spin representations: the spin representations of odd orthogonal groups (or rather their double covers); and the $+$ and $-$ spin representations of the even orthogonal groups.

We follow Kashiwara and Nakashima (Journal of Algebra 165, 1994) in representing the elements of the spin crystal by sequences of signs $\pm$.

`sage.combinat.crystals.spins.`**`CrystalOfSpins`**`(`*ct*`)`

Return the spin crystal of the given type B.

This is a combinatorial model for the crystal with highest weight Λ_n (the n-th fundamental weight). It has 2^n elements, here called Spins. See also *`CrystalOfLetters()`*, *`CrystalOfSpinsPlus()`*, and *`CrystalOfSpinsMinus()`*.

INPUT:

- `['B', n]` – a Cartan type B_n

EXAMPLES:

```
sage: C = crystals.Spins(['B',3])
sage: C.list()
[+++, ++-, +-+, -++, +--, -+-, --+, ---]
sage: C.cartan_type()
['B', 3]
```

```
>>> from sage.all import *
>>> C = crystals.Spins(['B',Integer(3)])
>>> C.list()
[+++, ++-, +-+, -++, +--, -+-, --+, ---]
>>> C.cartan_type()
['B', 3]
```

```
sage: [x.signature() for x in C]
['+++', '++-', '+-+', '-++', '+--', '-+-', '--+', '---']
```

```
>>> from sage.all import *
>>> [x.signature() for x in C]
['+++', '++-', '+-+', '-++', '+--', '-+-', '--+', '---']
```

sage.combinat.crystals.spins.**CrystalOfSpinsMinus**(*ct*)

Return the minus spin crystal of the given type D.

This is the crystal with highest weight Λ_{n-1} (the $(n-1)$-st fundamental weight).

INPUT:

- `['D', n]` – a Cartan type D_n

EXAMPLES:

```
sage: E = crystals.SpinsMinus(['D',4])
sage: E.list()
[+++-, ++-+, +-++, -+++, +---, -+--, --+-, ---+]
sage: [x.signature() for x in E]
['+++-', '++-+', '+-++', '-+++', '+---', '-+--', '--+-', '---+']
```

```
>>> from sage.all import *
>>> E = crystals.SpinsMinus(['D',Integer(4)])
>>> E.list()
[+++-, ++-+, +-++, -+++, +---, -+--, --+-, ---+]
>>> [x.signature() for x in E]
['+++-', '++-+', '+-++', '-+++', '+---', '-+--', '--+-', '---+']
```

sage.combinat.crystals.spins.**CrystalOfSpinsPlus**(*ct*)

Return the plus spin crystal of the given type D.

This is the crystal with highest weight Λ_n (the n-th fundamental weight).

INPUT:

- `['D', n]` – a Cartan type D_n

EXAMPLES:

```
sage: D = crystals.SpinsPlus(['D',4])
sage: D.list()
[++++, ++--, +-+-, -++-, +--+, -+-+, --++, ----]
```

```
>>> from sage.all import *
>>> D = crystals.SpinsPlus(['D',Integer(4)])
>>> D.list()
[++++, ++--, +-+-, -++-, +--+, -+-+, --++, ----]
```

```
sage: [x.signature() for x in D]
['++++', '++--', '+-+-', '-++-', '+--+', '-+-+', '--++', '----']
```

```
>>> from sage.all import *
>>> [x.signature() for x in D]
['++++', '++--', '+-+-', '-++-', '+--+', '-+-+', '--++', '----']
```

class sage.combinat.crystals.spins.**GenericCrystalOfSpins**(*ct*, *element_class*, *case*)

Bases: `UniqueRepresentation`, `Parent`

A generic crystal of spins.

lt_elements(*x*, *y*)

Return `True` if and only if there is a path from `x` to `y` in the crystal graph.

Because the crystal graph is classical, it is a directed acyclic graph which can be interpreted as a poset. This function implements the comparison function of this poset.

EXAMPLES:

```
sage: C = crystals.Spins(['B',3])
sage: x = C([1,1,1])
sage: y = C([-1,-1,-1])
sage: C.lt_elements(x, y)
True
sage: C.lt_elements(y, x)
False
sage: C.lt_elements(x, x)
False
```

```
>>> from sage.all import *
>>> C = crystals.Spins(['B',Integer(3)])
>>> x = C([Integer(1),Integer(1),Integer(1)])
>>> y = C([-Integer(1),-Integer(1),-Integer(1)])
>>> C.lt_elements(x, y)
True
>>> C.lt_elements(y, x)
False
>>> C.lt_elements(x, x)
False
```

class sage.combinat.crystals.spins.**Spin**

Bases: `Element`

A spin letter in the crystal of spins.

EXAMPLES:

```
sage: C = crystals.Spins(['B',3])
sage: c = C([1,1,1])
sage: c
+++
sage: c.parent()
The crystal of spins for type ['B', 3]

sage: D = crystals.Spins(['B',4])
sage: a = C([1,1,1])
sage: b = C([-1,-1,-1])
```

(continues on next page)

(continued from previous page)

```
sage: c = D([1,1,1,1])
sage: a == a
True
sage: a == b
False
sage: b == c
False
```

```
>>> from sage.all import *
>>> C = crystals.Spins(['B',Integer(3)])
>>> c = C([Integer(1),Integer(1),Integer(1)])
>>> c
+++
>>> c.parent()
The crystal of spins for type ['B', 3]

>>> D = crystals.Spins(['B',Integer(4)])
>>> a = C([Integer(1),Integer(1),Integer(1)])
>>> b = C([-Integer(1),-Integer(1),-Integer(1)])
>>> c = D([Integer(1),Integer(1),Integer(1),Integer(1)])
>>> a == a
True
>>> a == b
False
>>> b == c
False
```

pp()

Pretty print `self` as a column.

EXAMPLES:

```
sage: C = crystals.Spins(['B',3])
sage: b = C([1,1,-1])
sage: b.pp()
+
+
-
```

```
>>> from sage.all import *
>>> C = crystals.Spins(['B',Integer(3)])
>>> b = C([Integer(1),Integer(1),-Integer(1)])
>>> b.pp()
+
+
-
```

signature()

Return the signature of `self`.

EXAMPLES:

```
sage: C = crystals.Spins(['B',3])
sage: C([1,1,1]).signature()
'+++'
sage: C([1,1,-1]).signature()
'++-'
```

```
>>> from sage.all import *
>>> C = crystals.Spins(['B',Integer(3)])
>>> C([Integer(1),Integer(1),Integer(1)]).signature()
'+++'
>>> C([Integer(1),Integer(1),-Integer(1)]).signature()
'++-'
```

value

Return `self` as a tuple with $+1$ and -1.

EXAMPLES:

```
sage: C = crystals.Spins(['B',3])
sage: C([1,1,1]).value
(1, 1, 1)
sage: C([1,1,-1]).value
(1, 1, -1)
```

```
>>> from sage.all import *
>>> C = crystals.Spins(['B',Integer(3)])
>>> C([Integer(1),Integer(1),Integer(1)]).value
(1, 1, 1)
>>> C([Integer(1),Integer(1),-Integer(1)]).value
(1, 1, -1)
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: [v.weight() for v in crystals.Spins(['B',3])]
[(1/2, 1/2, 1/2), (1/2, 1/2, -1/2),
 (1/2, -1/2, 1/2), (-1/2, 1/2, 1/2),
 (1/2, -1/2, -1/2), (-1/2, 1/2, -1/2),
 (-1/2, -1/2, 1/2), (-1/2, -1/2, -1/2)]
```

```
>>> from sage.all import *
>>> [v.weight() for v in crystals.Spins(['B',Integer(3)])]
[(1/2, 1/2, 1/2), (1/2, 1/2, -1/2),
 (1/2, -1/2, 1/2), (-1/2, 1/2, 1/2),
 (1/2, -1/2, -1/2), (-1/2, 1/2, -1/2),
 (-1/2, -1/2, 1/2), (-1/2, -1/2, -1/2)]
```

class sage.combinat.crystals.spins.**Spin_crystal_type_B_element**

Bases: *Spin*

Type B spin representation crystal element

e(*i*)

Return the action of e_i on `self`.

EXAMPLES:

```
sage: C = crystals.Spins(['B',3])
sage: [[C[m].e(i) for i in range(1,4)] for m in range(8)]
[[None, None, None], [None, None, +++], [None, ++-, None], [+-+, None, None],
 [None, None, +-+], [+--, None, -++], [None, -+-, None], [None, None, --+]]
```

```
>>> from sage.all import *
>>> C = crystals.Spins(['B',Integer(3)])
>>> [[C[m].e(i) for i in range(Integer(1),Integer(4))] for m in␣
↪range(Integer(8))]
[[None, None, None], [None, None, +++], [None, ++-, None], [+-+, None, None],
 [None, None, +-+], [+--, None, -++], [None, -+-, None], [None, None, --+]]
```

epsilon(*i*)

Return ε_i of `self`.

EXAMPLES:

```
sage: C = crystals.Spins(['B',3])
sage: [[C[m].epsilon(i) for i in range(1,4)] for m in range(8)]
[[0, 0, 0], [0, 0, 1], [0, 1, 0], [1, 0, 0],
 [0, 0, 1], [1, 0, 1], [0, 1, 0], [0, 0, 1]]
```

```
>>> from sage.all import *
>>> C = crystals.Spins(['B',Integer(3)])
>>> [[C[m].epsilon(i) for i in range(Integer(1),Integer(4))] for m in␣
↪range(Integer(8))]
[[0, 0, 0], [0, 0, 1], [0, 1, 0], [1, 0, 0],
 [0, 0, 1], [1, 0, 1], [0, 1, 0], [0, 0, 1]]
```

f(*i*)

Return the action of f_i on `self`.

EXAMPLES:

```
sage: C = crystals.Spins(['B',3])
sage: [[C[m].f(i) for i in range(1,4)] for m in range(8)]
[[None, None, ++-], [None, +-+, None], [-++, None, +--], [None, None, -+-],
 [-+-, None, None], [None, --+, None], [None, None, ---], [None, None, None]]
```

```
>>> from sage.all import *
>>> C = crystals.Spins(['B',Integer(3)])
>>> [[C[m].f(i) for i in range(Integer(1),Integer(4))] for m in␣
↪range(Integer(8))]
[[None, None, ++-], [None, +-+, None], [-++, None, +--], [None, None, -+-],
 [-+-, None, None], [None, --+, None], [None, None, ---], [None, None, None]]
```

phi(*i*)

Return φ_i of `self`.

EXAMPLES:

```
sage: C = crystals.Spins(['B',3])
sage: [[C[m].phi(i) for i in range(1,4)] for m in range(8)]
[[0, 0, 1], [0, 1, 0], [1, 0, 1], [0, 0, 1],
 [1, 0, 0], [0, 1, 0], [0, 0, 1], [0, 0, 0]]
```

```
>>> from sage.all import *
>>> C = crystals.Spins(['B',Integer(3)])
>>> [[C[m].phi(i) for i in range(Integer(1),Integer(4))] for m in␣
↪range(Integer(8))]
[[0, 0, 1], [0, 1, 0], [1, 0, 1], [0, 0, 1],
 [1, 0, 0], [0, 1, 0], [0, 0, 1], [0, 0, 0]]
```

class sage.combinat.crystals.spins.**Spin_crystal_type_D_element**

Bases: *Spin*

Type D spin representation crystal element

e(*i*)

Return the action of e_i on self.

EXAMPLES:

```
sage: D = crystals.SpinsPlus(['D',4])
sage: [[D.list()[m].e(i) for i in range(1,4)] for m in range(8)]
[[None, None, None], [None, None, None], [None, ++--, None], [+-+-, None,␣
↪None],
 [None, None, +-+-], [+--+, None, -++-], [None, -+-+, None], [None, None,␣
↪None]]
```

```
>>> from sage.all import *
>>> D = crystals.SpinsPlus(['D',Integer(4)])
>>> [[D.list()[m].e(i) for i in range(Integer(1),Integer(4))] for m in␣
↪range(Integer(8))]
[[None, None, None], [None, None, None], [None, ++--, None], [+-+-, None,␣
↪None],
 [None, None, +-+-], [+--+, None, -++-], [None, -+-+, None], [None, None,␣
↪None]]
```

```
sage: E = crystals.SpinsMinus(['D',4])
sage: [[E[m].e(i) for i in range(1,4)] for m in range(8)]
[[None, None, None], [None, None, +++-], [None, ++-+, None], [+-++, None,␣
↪None],
 [None, None, None], [+---, None, None], [None, -+--, None], [None, None, --+-
↪]]
```

```
>>> from sage.all import *
>>> E = crystals.SpinsMinus(['D',Integer(4)])
>>> [[E[m].e(i) for i in range(Integer(1),Integer(4))] for m in␣
↪range(Integer(8))]
[[None, None, None], [None, None, +++-], [None, ++-+, None], [+-++, None,␣
↪None],
 [None, None, None], [+---, None, None], [None, -+--, None], [None, None, --+-
↪]]
```

epsilon (i)

Return ε_i of `self`.

EXAMPLES:

```
sage: C = crystals.SpinsMinus(['D',4])
sage: [[C[m].epsilon(i) for i in C.index_set()] for m in range(8)]
[[0, 0, 0, 0], [0, 0, 1, 0], [0, 1, 0, 0], [1, 0, 0, 0],
 [0, 0, 0, 1], [1, 0, 0, 1], [0, 1, 0, 0], [0, 0, 1, 0]]
```

```
>>> from sage.all import *
>>> C = crystals.SpinsMinus(['D',Integer(4)])
>>> [[C[m].epsilon(i) for i in C.index_set()] for m in range(Integer(8))]
[[0, 0, 0, 0], [0, 0, 1, 0], [0, 1, 0, 0], [1, 0, 0, 0],
 [0, 0, 0, 1], [1, 0, 0, 1], [0, 1, 0, 0], [0, 0, 1, 0]]
```

f (i)

Return the action of f_i on `self`.

EXAMPLES:

```
sage: D = crystals.SpinsPlus(['D',4])
sage: [[D.list()[m].f(i) for i in range(1,4)] for m in range(8)]
[[None, None, None], [None, +-+-, None], [-++-, None, +--+], [None, None, -+-
↪+],
 [-+-+, None, None], [None, --++, None], [None, None, None], [None, None,␣
↪None]]
```

```
>>> from sage.all import *
>>> D = crystals.SpinsPlus(['D',Integer(4)])
>>> [[D.list()[m].f(i) for i in range(Integer(1),Integer(4))] for m in␣
↪range(Integer(8))]
[[None, None, None], [None, +-+-, None], [-++-, None, +--+], [None, None, -+-
↪+],
 [-+-+, None, None], [None, --++, None], [None, None, None], [None, None,␣
↪None]]
```

```
sage: E = crystals.SpinsMinus(['D',4])
sage: [[E[m].f(i) for i in range(1,4)] for m in range(8)]
[[None, None, ++-+], [None, +-++, None], [-+++, None, None], [None, None,␣
↪None],
 [-+--, None, None], [None, --+-, None], [None, None, ---+], [None, None,␣
↪None]]
```

```
>>> from sage.all import *
>>> E = crystals.SpinsMinus(['D',Integer(4)])
>>> [[E[m].f(i) for i in range(Integer(1),Integer(4))] for m in␣
↪range(Integer(8))]
[[None, None, ++-+], [None, +-++, None], [-+++, None, None], [None, None,␣
↪None],
 [-+--, None, None], [None, --+-, None], [None, None, ---+], [None, None,␣
↪None]]
```

phi(*i*)

Return φ_i of `self`.

EXAMPLES:

```
sage: C = crystals.SpinsPlus(['D',4])
sage: [[C[m].phi(i) for i in C.index_set()] for m in range(8)]
[[0, 0, 0, 1], [0, 1, 0, 0], [1, 0, 1, 0], [0, 0, 1, 0],
 [1, 0, 0, 0], [0, 1, 0, 0], [0, 0, 0, 1], [0, 0, 0, 0]]
```

```
>>> from sage.all import *
>>> C = crystals.SpinsPlus(['D',Integer(4)])
>>> [[C[m].phi(i) for i in C.index_set()] for m in range(Integer(8))]
[[0, 0, 0, 1], [0, 1, 0, 0], [1, 0, 1, 0], [0, 0, 1, 0],
 [1, 0, 0, 0], [0, 1, 0, 0], [0, 0, 0, 1], [0, 0, 0, 0]]
```

5.1.66 Star-Crystal Structure On $B(\infty)$

AUTHORS:

- Ben Salisbury: Initial version
- Travis Scrimshaw: Initial version

class sage.combinat.crystals.star_crystal.**StarCrystal**(*Binf*)

Bases: `UniqueRepresentation`, `Parent`

The star-crystal or $*$-crystal version of a highest weight crystal.

The $*$-crystal structure on $B(\infty)$ is the structure induced by the algebra antiautomorphism $*\colon U_q(\mathfrak{g}) \longrightarrow U_q(\mathfrak{g})$ that stabilizes the negative half $U_q^-(\mathfrak{g})$. It is defined by

$$E_i^* = E_i, \quad F_i^* = F_i, \quad q^* = q, \quad (q^h)^* = q^{-h},$$

where E_i and F_i are the Chevalley generators of $U_q(\mathfrak{g})$ and h is an element of the Cartan subalgebra.

The induced operation on the crystal $B(\infty)$ is called the *Kashiwara involution*. Its implementation here is based on the recursive algorithm from Theorem 2.2.1 of [Ka1993], which states that for any $i \in I$ there is a unique strict crystal embedding

$$\Psi_i\colon B(\infty) \longrightarrow B_i \otimes B(\infty)$$

such that

- $u_\infty \mapsto b_i(0) \otimes u_\infty$, where u_∞ is the highest weight vector in $B(\infty)$;
- if $\Psi_i(b) = f_i^m b_i(0) \otimes b_0$, then $\Psi_i(f_i^* b) = f_i^{m+1} b_i(0) \otimes b_0$ and $\varepsilon_i(b^*) = m$;
- the image of Ψ_i is $\{f_i^m b_i(0) \otimes b : \varepsilon_i(b^*) = 0, \ m \geq 0\}$.

Here, B_i is the i-th elementary crystal. See *`ElementaryCrystal`* for more information.

INPUT:

- `Binf` – a crystal from *`catalog_infinity_crystals`*

EXAMPLES:

```
sage: B = crystals.infinity.Tableaux(['A',2])
sage: Bstar = crystals.infinity.Star(B)
sage: mg = Bstar.highest_weight_vector()
sage: mg
[[1, 1], [2]]
sage: mg.f_string([1,2,1,2,2])
[[1, 1, 1, 1, 1, 2, 2], [2, 3, 3, 3]]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux(['A',Integer(2)])
>>> Bstar = crystals.infinity.Star(B)
>>> mg = Bstar.highest_weight_vector()
>>> mg
[[1, 1], [2]]
>>> mg.f_string([Integer(1),Integer(2),Integer(1),Integer(2),Integer(2)])
[[1, 1, 1, 1, 1, 2, 2], [2, 3, 3, 3]]
```

class Element

Bases: `ElementWrapper`

e(i)

Return the action of e_i^* on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: RC = crystals.infinity.RiggedConfigurations(['E',6,1])
sage: RCstar = crystals.infinity.Star(RC)
sage: nuJ = RCstar.module_generators[0].f_string([0,4,6,1,2])
sage: ascii_art(nuJ.e(1))
-1[ ]-1   (/)   0[ ]1   (/)   -1[ ]-1   (/)   -2[ ]-1

sage: M = crystals.infinity.NakajimaMonomials(['B',2,1])
sage: Mstar = crystals.infinity.Star(M)
sage: m = Mstar.module_generators[0].f_string([0,1,2,2,1,0])
sage: m.e(1)
Y(0,0)^-1 Y(0,2)^-1 Y(1,1) Y(1,2)^-1 Y(2,1)^2
```

```
>>> from sage.all import *
>>> RC = crystals.infinity.RiggedConfigurations(['E',Integer(6),
↪Integer(1)])
>>> RCstar = crystals.infinity.Star(RC)
>>> nuJ = RCstar.module_generators[Integer(0)].f_string([Integer(0),
↪Integer(4),Integer(6),Integer(1),Integer(2)])
>>> ascii_art(nuJ.e(Integer(1)))
-1[ ]-1   (/)   0[ ]1   (/)   -1[ ]-1   (/)   -2[ ]-1

>>> M = crystals.infinity.NakajimaMonomials(['B',Integer(2),Integer(1)])
>>> Mstar = crystals.infinity.Star(M)
>>> m = Mstar.module_generators[Integer(0)].f_string([Integer(0),
↪Integer(1),Integer(2),Integer(2),Integer(1),Integer(0)])
>>> m.e(Integer(1))
```

(continues on next page)

(continued from previous page)

```
Y(0,0)^-1 Y(0,2)^-1 Y(1,1) Y(1,2)^-1 Y(2,1)^2
```

epsilon(*i*)

Return ε_i^* of `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: Y = crystals.infinity.GeneralizedYoungWalls(3)
sage: Ystar = crystals.infinity.Star(Y)
sage: y = Ystar.module_generators[0].f_string([0,1,3,2,1,0])
sage: [y.epsilon(i) for i in y.index_set()]
[1, 0, 1, 0]

sage: RC = crystals.infinity.RiggedConfigurations(['E',6,1])
sage: RCstar = crystals.infinity.Star(RC)
sage: nuJ = RCstar.module_generators[0].f_string([0,4,6,1,2])
sage: [nuJ.epsilon(i) for i in nuJ.index_set()]
[0, 1, 1, 0, 0, 0, 1]
```

```
>>> from sage.all import *
>>> Y = crystals.infinity.GeneralizedYoungWalls(Integer(3))
>>> Ystar = crystals.infinity.Star(Y)
>>> y = Ystar.module_generators[Integer(0)].f_string([Integer(0),
↪Integer(1),Integer(3),Integer(2),Integer(1),Integer(0)])
>>> [y.epsilon(i) for i in y.index_set()]
[1, 0, 1, 0]

>>> RC = crystals.infinity.RiggedConfigurations(['E',Integer(6),
↪Integer(1)])
>>> RCstar = crystals.infinity.Star(RC)
>>> nuJ = RCstar.module_generators[Integer(0)].f_string([Integer(0),
↪Integer(4),Integer(6),Integer(1),Integer(2)])
>>> [nuJ.epsilon(i) for i in nuJ.index_set()]
[0, 1, 1, 0, 0, 0, 1]
```

f(*i*)

Return the action of f_i^* on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: T = crystals.infinity.Tableaux("G2")
sage: Tstar = crystals.infinity.Star(T)
sage: t = Tstar.module_generators[0].f_string([1,2,1,1,2])
sage: t
[[1, 1, 1, 2, 0], [2, 3]]

sage: M = crystals.infinity.NakajimaMonomials(['B',2,1])
sage: Mstar = crystals.infinity.Star(M)
sage: m = Mstar.module_generators[0].f_string([0,1,2,2,1,0])
```

(continues on next page)

(continued from previous page)

```
sage: m
Y(0,0)^-1 Y(0,2)^-1 Y(1,0)^-1 Y(1,2)^-1 Y(2,0)^2 Y(2,1)^2
```

```
>>> from sage.all import *
>>> T = crystals.infinity.Tableaux("G2")
>>> Tstar = crystals.infinity.Star(T)
>>> t = Tstar.module_generators[Integer(0)].f_string([Integer(1),
↪Integer(2),Integer(1),Integer(1),Integer(2)])
>>> t
[[1, 1, 1, 2, 0], [2, 3]]

>>> M = crystals.infinity.NakajimaMonomials(['B',Integer(2),Integer(1)])
>>> Mstar = crystals.infinity.Star(M)
>>> m = Mstar.module_generators[Integer(0)].f_string([Integer(0),
↪Integer(1),Integer(2),Integer(2),Integer(1),Integer(0)])
>>> m
Y(0,0)^-1 Y(0,2)^-1 Y(1,0)^-1 Y(1,2)^-1 Y(2,0)^2 Y(2,1)^2
```

jump(*i*)

Return the i-jump of `self`.

For $b \in B(\infty)$,

$$\mathrm{jump}_i(b) = \varepsilon_i(b) + \varepsilon_i^*(b) + \langle h_i, \mathrm{wt}(b) \rangle,$$

where h_i is a simple coroot.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: RC = crystals.infinity.RiggedConfigurations("D4")
sage: RCstar = crystals.infinity.Star(RC)
sage: nu0star = RCstar.module_generators[0]
sage: nustar = nu0star.f_string([2,1,3,4,2])
sage: [nustar.jump(i) for i in RC.index_set()]
[0, 1, 0, 0]
sage: nustar = nu0star.f_string([2,1,3,4,2,2,1,3,2]) # long time
sage: [nustar.jump(i) for i in RC.index_set()] # long time
[1, 0, 1, 2]
```

```
>>> from sage.all import *
>>> RC = crystals.infinity.RiggedConfigurations("D4")
>>> RCstar = crystals.infinity.Star(RC)
>>> nu0star = RCstar.module_generators[Integer(0)]
>>> nustar = nu0star.f_string([Integer(2),Integer(1),Integer(3),
↪Integer(4),Integer(2)])
>>> [nustar.jump(i) for i in RC.index_set()]
[0, 1, 0, 0]
>>> nustar = nu0star.f_string([Integer(2),Integer(1),Integer(3),
↪Integer(4),Integer(2),Integer(2),Integer(1),Integer(3),Integer(2)]) #␣
↪long time
```

(continues on next page)

(continued from previous page)

```
>>> [nustar.jump(i) for i in RC.index_set()] # long time
[1, 0, 1, 2]
```

phi (i)

Return φ_i^* of `self`.

For $b \in B(\infty)$,

$$\varphi_i^*(b) = \varepsilon_i^*(b) + \langle h_i, \mathrm{wt}(b) \rangle,$$

where h_i is a simple coroot.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: T = crystals.infinity.Tableaux("A2")
sage: Tstar = crystals.infinity.Star(T)
sage: t = Tstar.module_generators[0].f_string([1,2,1,1,2])
sage: [t.phi(i) for i in t.index_set()]
[-3, 1]

sage: M = crystals.infinity.NakajimaMonomials(['B',2,1])
sage: Mstar = crystals.infinity.Star(M)
sage: m = Mstar.module_generators[0].f_string([0,1,2,2,1,0])
sage: [m.phi(i) for i in m.index_set()]
[-1, -1, 4]
```

```
>>> from sage.all import *
>>> T = crystals.infinity.Tableaux("A2")
>>> Tstar = crystals.infinity.Star(T)
>>> t = Tstar.module_generators[Integer(0)].f_string([Integer(1),
↪Integer(2),Integer(1),Integer(1),Integer(2)])
>>> [t.phi(i) for i in t.index_set()]
[-3, 1]

>>> M = crystals.infinity.NakajimaMonomials(['B',Integer(2),Integer(1)])
>>> Mstar = crystals.infinity.Star(M)
>>> m = Mstar.module_generators[Integer(0)].f_string([Integer(0),
↪Integer(1),Integer(2),Integer(2),Integer(1),Integer(0)])
>>> [m.phi(i) for i in m.index_set()]
[-1, -1, 4]
```

weight ()

Return the weight of `self`.

EXAMPLES:

```
sage: RC = crystals.infinity.RiggedConfigurations(['E',6,1])
sage: RCstar = crystals.infinity.Star(RC)
sage: nuJ = RCstar.module_generators[0].f_string([0,4,6,1,2])
sage: nuJ.weight()
-Lambda[0] - 2*Lambda[1] + 2*Lambda[3] - Lambda[4]
 + 2*Lambda[5] - 2*Lambda[6] - delta
```

```
>>> from sage.all import *
>>> RC = crystals.infinity.RiggedConfigurations(['E',Integer(6),
↪Integer(1)])
>>> RCstar = crystals.infinity.Star(RC)
>>> nuJ = RCstar.module_generators[Integer(0)].f_string([Integer(0),
↪Integer(4),Integer(6),Integer(1),Integer(2)])
>>> nuJ.weight()
-Lambda[0] - 2*Lambda[1] + 2*Lambda[3] - Lambda[4]
 + 2*Lambda[5] - 2*Lambda[6] - delta
```

5.1.67 Tensor Products of Crystals

Main entry points:

- *TensorProductOfCrystals*
- *CrystalOfTableaux*

AUTHORS:

- Anne Schilling, Nicolas Thiery (2007): Initial version
- Ben Salisbury, Travis Scrimshaw (2013): Refactored tensor products to handle non-regular crystals and created new subclass to take advantage of the regularity
- Travis Scrimshaw (2020): Added queer crystal

class sage.combinat.crystals.tensor_product.**CrystalOfQueerTableaux**(*cartan_type*, *shape*)

Bases: *CrystalOfWords*, *QueerSuperCrystalsMixin*

A queer crystal of the semistandard decomposition tableaux of a given shape.

INPUT:

- `cartan_type` – a Cartan type
- `shape` – a shape

class Element

Bases: *TensorProductOfQueerSuperCrystalsElement*

rows()

Return the list of rows of `self`.

EXAMPLES:

```
sage: B = crystals.Tableaux(['Q',3], shape=[3,2,1])
sage: t = B.an_element()
sage: t.rows()
[[3, 3, 3], [2, 2], [1]]
```

```
>>> from sage.all import *
>>> B = crystals.Tableaux(['Q',Integer(3)], shape=[Integer(3),Integer(2),
↪Integer(1)])
>>> t = B.an_element()
>>> t.rows()
[[3, 3, 3], [2, 2], [1]]
```

class sage.combinat.crystals.tensor_product.**CrystalOfTableaux**(*cartan_type*, *shapes*)

Bases: `CrystalOfWords`

A class for crystals of tableaux with integer valued shapes.

INPUT:

- `cartan_type` – a Cartan type
- `shape` – a partition of length at most `cartan_type.rank()`
- `shapes` – list of such partitions

This constructs a classical crystal with the given Cartan type and highest weight(s) corresponding to the given shape(s).

If the type is D_r, the shape is permitted to have a negative value in the r-th position. Thus if the shape equals $[s_1, \ldots, s_r]$, then s_r may be negative but in any case $s_1 \geq \cdots \geq s_{r-1} \geq |s_r|$. This crystal is related to that of shape $[s_1, \ldots, |s_r|]$ by the outer automorphism of $SO(2r)$.

If the type is D_r or B_r, the shape is permitted to be of length r with all parts of half integer value. This corresponds to having one spin column at the beginning of the tableau. If several shapes are provided, they currently should all or none have this property.

Crystals of tableaux are constructed using an embedding into tensor products following Kashiwara and Nakashima [KN1994]. Sage's tensor product rule for crystals differs from that of Kashiwara and Nakashima by reversing the order of the tensor factors. Sage produces the same crystals of tableaux as Kashiwara and Nakashima. With Sage's convention, the tensor product of crystals is the same as the monoid operation on tableaux and hence the plactic monoid.

See also

`sage.combinat.crystals.crystals` for general help on crystals, and in particular plotting and LaTeX output.

EXAMPLES:

We create the crystal of tableaux for type A_2, with highest weight given by the partition $[2, 1, 1]$:

```
sage: T = crystals.Tableaux(['A',3], shape = [2,1,1])
```

```
>>> from sage.all import *
>>> T = crystals.Tableaux(['A',Integer(3)], shape = [Integer(2),Integer(1),
↪Integer(1)])
```

Here is the list of its elements:

```
sage: T.list()
[[[1, 1], [2], [3]], [[1, 2], [2], [3]], [[1, 3], [2], [3]],
 [[1, 4], [2], [3]], [[1, 4], [2], [4]], [[1, 4], [3], [4]],
 [[2, 4], [3], [4]], [[1, 1], [2], [4]], [[1, 2], [2], [4]],
 [[1, 3], [2], [4]], [[1, 3], [3], [4]], [[2, 3], [3], [4]],
 [[1, 1], [3], [4]], [[1, 2], [3], [4]], [[2, 2], [3], [4]]]
```

```
>>> from sage.all import *
>>> T.list()
[[[1, 1], [2], [3]], [[1, 2], [2], [3]], [[1, 3], [2], [3]],
```

(continues on next page)

(continued from previous page)

```
[[1, 4], [2], [3]], [[1, 4], [2], [4]], [[1, 4], [3], [4]],
[[2, 4], [3], [4]], [[1, 1], [2], [4]], [[1, 2], [2], [4]],
[[1, 3], [2], [4]], [[1, 3], [3], [4]], [[2, 3], [3], [4]],
[[1, 1], [3], [4]], [[1, 2], [3], [4]], [[2, 2], [3], [4]]]
```

Internally, a tableau of a given Cartan type is represented as a tensor product of letters of the same type. The order in which the tensor factors appear is by reading the columns of the tableaux left to right, top to bottom (in French notation). As an example:

```
sage: T = crystals.Tableaux(['A',2], shape = [3,2])
sage: T.module_generators[0]
[[1, 1, 1], [2, 2]]
sage: list(T.module_generators[0])
[2, 1, 2, 1, 1]
```

```
>>> from sage.all import *
>>> T = crystals.Tableaux(['A',Integer(2)], shape = [Integer(3),Integer(2)])
>>> T.module_generators[Integer(0)]
[[1, 1, 1], [2, 2]]
>>> list(T.module_generators[Integer(0)])
[2, 1, 2, 1, 1]
```

To create a tableau, one can use:

```
sage: Tab = crystals.Tableaux(['A',3], shape = [2,2])
sage: Tab(rows=[[1,2],[3,4]])
[[1, 2], [3, 4]]
sage: Tab(columns=[[3,1],[4,2]])
[[1, 2], [3, 4]]
```

```
>>> from sage.all import *
>>> Tab = crystals.Tableaux(['A',Integer(3)], shape = [Integer(2),Integer(2)])
>>> Tab(rows=[[Integer(1),Integer(2)],[Integer(3),Integer(4)]])
[[1, 2], [3, 4]]
>>> Tab(columns=[[Integer(3),Integer(1)],[Integer(4),Integer(2)]])
[[1, 2], [3, 4]]
```

Todo

FIXME:

- Do we want to specify the columns increasingly or decreasingly? That is, should this be `Tab(columns = [[1,3],[2,4]])`?
- Make this fully consistent with `Tableau()`!

We illustrate the use of a shape with a negative last entry in type D:

```
sage: T = crystals.Tableaux(['D',4],shape=[1,1,1,-1])
sage: T.cardinality()
35
sage: TestSuite(T).run()
```

```
>>> from sage.all import *
>>> T = crystals.Tableaux(['D',Integer(4)],shape=[Integer(1),Integer(1),
↪Integer(1),-Integer(1)])
>>> T.cardinality()
35
>>> TestSuite(T).run()
```

We illustrate the construction of crystals of spin tableaux when the partitions have half integer values in type B and D:

```
sage: T = crystals.Tableaux(['B',3],shape=[3/2,1/2,1/2]); T
The crystal of tableaux of type ['B', 3] and shape(s) [[3/2, 1/2, 1/2]]
sage: T.cardinality()
48
sage: T.module_generators
([+++, [[1]]],)
sage: TestSuite(T).run()

sage: T = crystals.Tableaux(['D',3],shape=[3/2,1/2,-1/2]); T
The crystal of tableaux of type ['D', 3] and shape(s) [[3/2, 1/2, -1/2]]
sage: T.cardinality()
20
sage: T.module_generators
([++-, [[1]]],)
sage: TestSuite(T).run()
```

```
>>> from sage.all import *
>>> T = crystals.Tableaux(['B',Integer(3)],shape=[Integer(3)/Integer(2),
↪Integer(1)/Integer(2),Integer(1)/Integer(2)]); T
The crystal of tableaux of type ['B', 3] and shape(s) [[3/2, 1/2, 1/2]]
>>> T.cardinality()
48
>>> T.module_generators
([+++, [[1]]],)
>>> TestSuite(T).run()

>>> T = crystals.Tableaux(['D',Integer(3)],shape=[Integer(3)/Integer(2),
↪Integer(1)/Integer(2),-Integer(1)/Integer(2)]); T
The crystal of tableaux of type ['D', 3] and shape(s) [[3/2, 1/2, -1/2]]
>>> T.cardinality()
20
>>> T.module_generators
([++-, [[1]]],)
>>> TestSuite(T).run()
```

We can also construct the tableaux for $\mathfrak{gl}(m|n)$ as given by [BKK2000]:

```
sage: T = crystals.Tableaux(['A', [1,2]], shape=[4,2,1,1,1])
sage: T.cardinality()
1392
```

```
>>> from sage.all import *
>>> T = crystals.Tableaux(['A', [Integer(1),Integer(2)]], shape=[Integer(4),
```

(continues on next page)

(continued from previous page)

```
↪Integer(2),Integer(1),Integer(1),Integer(1)])
>>> T.cardinality()
1392
```

We can also construct the tableaux for $\mathfrak{q}(n)$ as given by [GJK+2014]:

```
sage: T = crystals.Tableaux(['Q', 3], shape=[3,1])
sage: T.cardinality()
24
```

```
>>> from sage.all import *
>>> T = crystals.Tableaux(['Q', Integer(3)], shape=[Integer(3),Integer(1)])
>>> T.cardinality()
24
```

class Element

Bases: *CrystalOfTableauxElement*

cartan_type()

Return the Cartan type of the associated crystal.

EXAMPLES:

```
sage: T = crystals.Tableaux(['A',3], shape = [2,2])
sage: T.cartan_type()
['A', 3]
```

```
>>> from sage.all import *
>>> T = crystals.Tableaux(['A',Integer(3)], shape = [Integer(2),Integer(2)])
>>> T.cartan_type()
['A', 3]
```

module_generator(*shape*)

This yields the module generator (or highest weight element) of a classical crystal of given shape. The module generator is the unique tableau with equal shape and content.

EXAMPLES:

```
sage: T = crystals.Tableaux(['D',3], shape = [1,1])
sage: T.module_generator([1,1])
[[1], [2]]

sage: T = crystals.Tableaux(['D',4],shape=[2,2,2,-2])
sage: T.module_generator(tuple([2,2,2,-2]))
[[1, 1], [2, 2], [3, 3], [-4, -4]]
sage: T.cardinality()
294
sage: T = crystals.Tableaux(['D',4],shape=[2,2,2,2])
sage: T.module_generator(tuple([2,2,2,2]))
[[1, 1], [2, 2], [3, 3], [4, 4]]
sage: T.cardinality()
294
```

```
>>> from sage.all import *
>>> T = crystals.Tableaux(['D',Integer(3)], shape = [Integer(1),Integer(1)])
>>> T.module_generator([Integer(1),Integer(1)])
[[1], [2]]

>>> T = crystals.Tableaux(['D',Integer(4)],shape=[Integer(2),Integer(2),
→Integer(2),-Integer(2)])
>>> T.module_generator(tuple([Integer(2),Integer(2),Integer(2),-Integer(2)]))
[[1, 1], [2, 2], [3, 3], [-4, -4]]
>>> T.cardinality()
294
>>> T = crystals.Tableaux(['D',Integer(4)],shape=[Integer(2),Integer(2),
→Integer(2),Integer(2)])
>>> T.module_generator(tuple([Integer(2),Integer(2),Integer(2),Integer(2)]))
[[1, 1], [2, 2], [3, 3], [4, 4]]
>>> T.cardinality()
294
```

class sage.combinat.crystals.tensor_product.**CrystalOfWords**

Bases: UniqueRepresentation, Parent

Auxiliary class to provide a call method to create tensor product elements. This class is shared with several tensor product classes and is also used in *CrystalOfTableaux* to allow tableaux of different tensor product structures in column-reading (and hence different shapes) to be considered elements in the same crystal.

class Element

Bases: *TensorProductOfCrystalsElement*

class sage.combinat.crystals.tensor_product.**FullTensorProductOfCrystals**(*crystals*, ***options*)

Bases: *TensorProductOfCrystals*

Full tensor product of crystals.

Todo

Merge this into *TensorProductOfCrystals*.

cardinality()

Return the cardinality of self.

EXAMPLES:

```
sage: C = crystals.Letters(['A',2])
sage: T = crystals.TensorProduct(C,C)
sage: T.cardinality()
9
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(2)])
>>> T = crystals.TensorProduct(C,C)
>>> T.cardinality()
9
```

weight_lattice_realization()

Return the weight lattice realization used to express weights.

The weight lattice realization is the common parent which all weight lattice realizations of the crystals of `self` coerce into.

EXAMPLES:

```
sage: B = crystals.elementary.B(['A',4], 2)
sage: B.weight_lattice_realization()
Root lattice of the Root system of type ['A', 4]
sage: T = crystals.infinity.Tableaux(['A',4])
sage: T.weight_lattice_realization()
Ambient space of the Root system of type ['A', 4]
sage: TP = crystals.TensorProduct(B, T)
sage: TP.weight_lattice_realization()
Ambient space of the Root system of type ['A', 4]
```

```
>>> from sage.all import *
>>> B = crystals.elementary.B(['A',Integer(4)], Integer(2))
>>> B.weight_lattice_realization()
Root lattice of the Root system of type ['A', 4]
>>> T = crystals.infinity.Tableaux(['A',Integer(4)])
>>> T.weight_lattice_realization()
Ambient space of the Root system of type ['A', 4]
>>> TP = crystals.TensorProduct(B, T)
>>> TP.weight_lattice_realization()
Ambient space of the Root system of type ['A', 4]
```

class sage.combinat.crystals.tensor_product.**FullTensorProductOfQueerSuperCrystals**(*crystals*, ***options*)

Bases: *FullTensorProductOfCrystals*, *QueerSuperCrystalsMixin*

Tensor product of queer super crystals.

class Element

Bases: *TensorProductOfQueerSuperCrystalsElement*

class sage.combinat.crystals.tensor_product.**FullTensorProductOfRegularCrystals**(*crystals*, ***options*)

Bases: *FullTensorProductOfCrystals*

Full tensor product of regular crystals.

class Element

Bases: *TensorProductOfRegularCrystalsElement*

class sage.combinat.crystals.tensor_product.**FullTensorProductOfSuperCrystals**(*crystals*, ***options*)

Bases: *FullTensorProductOfCrystals*

Tensor product of super crystals.

EXAMPLES:

```
sage: L = crystals.Letters(['A', [1,1]])
sage: T = tensor([L,L,L])
sage: T.cardinality()
64
```

```
>>> from sage.all import *
>>> L = crystals.Letters(['A', [Integer(1),Integer(1)]])
>>> T = tensor([L,L,L])
>>> T.cardinality()
64
```

class Element

Bases: *TensorProductOfSuperCrystalsElement*

class sage.combinat.crystals.tensor_product.**QueerSuperCrystalsMixin**

Bases: object

Mixin class with methods for a finite queer supercrystal.

index_set()

Return the enlarged index set.

EXAMPLES:

```
sage: Q = crystals.Letters(['Q',3])
sage: T = tensor([Q,Q])
sage: T.index_set()
(-4, -3, -2, -1, 1, 2)
```

```
>>> from sage.all import *
>>> Q = crystals.Letters(['Q',Integer(3)])
>>> T = tensor([Q,Q])
>>> T.index_set()
(-4, -3, -2, -1, 1, 2)
```

class sage.combinat.crystals.tensor_product.**TensorProductOfCrystals**

Bases: *CrystalOfWords*

Tensor product of crystals.

Given two crystals B and B' of the same Cartan type, one can form the tensor product $B \otimes B'$. As a set $B \otimes B'$ is the Cartesian product $B \times B'$. The crystal operators f_i and e_i act on $b \otimes b' \in B \otimes B'$ as follows:

$$f_i(b \otimes b') = \begin{cases} f_i(b) \otimes b' & \text{if } \varepsilon_i(b) \geq \varphi_i(b') \\ b \otimes f_i(b') & \text{otherwise} \end{cases}$$

and

$$e_i(b \otimes b') = \begin{cases} e_i(b) \otimes b' & \text{if } \varepsilon_i(b) > \varphi_i(b') \\ b \otimes e_i(b') & \text{otherwise.} \end{cases}$$

We also define:

$$\varphi_i(b \otimes b') = \max\left(\varphi_i(b), \varphi_i(b') + \langle \alpha_i^\vee, \mathrm{wt}(b) \rangle\right),$$
$$\varepsilon_i(b \otimes b') = \max\left(\varepsilon_i(b'), \varepsilon_i(b) - \langle \alpha_i^\vee, \mathrm{wt}(b') \rangle\right).$$

Note

This is the opposite of Kashiwara's convention for tensor products of crystals.

Since tensor products are associative $(\mathcal{B} \otimes \mathcal{C}) \otimes \mathcal{D} \cong \mathcal{B} \otimes (\mathcal{C} \otimes \mathcal{D})$ via the natural isomorphism $(b \otimes c) \otimes d \mapsto b \otimes (c \otimes d)$, we can generalizing this to arbitrary tensor products. Thus consider $B_N \otimes \cdots \otimes B_1$, where each B_k is an abstract crystal. The underlying set of the tensor product is $B_N \times \cdots \times B_1$, while the crystal structure is given as follows. Let I be the index set, and fix some $i \in I$ and $b_N \otimes \cdots \otimes b_1 \in B_N \otimes \cdots \otimes B_1$. Define

$$a_i(k) := \varepsilon_i(b_k) - \sum_{j=1}^{k-1} \langle \alpha_i^\vee, \mathrm{wt}(b_j) \rangle.$$

Then

$$\begin{aligned}
\mathrm{wt}(b_N \otimes \cdots \otimes b_1) &= \mathrm{wt}(b_N) + \cdots + \mathrm{wt}(b_1), \\
\varepsilon_i(b_N \otimes \cdots \otimes b_1) &= \max_{1 \leq k \leq n} \left(\sum_{j=1}^{k} \varepsilon_i(b_j) - \sum_{j=1}^{k-1} \varphi_i(b_j) \right) \\
&= \max_{1 \leq k \leq N} \big(a_i(k) \big), \\
\varphi_i(b_N \otimes \cdots \otimes b_1) &= \max_{1 \leq k \leq N} \left(\varphi_i(b_N) + \sum_{j=k}^{N-1} \big(\varphi_i(b_j) - \varepsilon_i(b_{j+1}) \big) \right) \\
&= \max_{1 \leq k \leq N} \big(\lambda_i + a_i(k) \big)
\end{aligned}$$

where $\lambda_i = \langle \alpha_i^\vee, \mathrm{wt}(b_N \otimes \cdots \otimes b_1) \rangle$. Then for $k = 1, \ldots, N$ the action of the Kashiwara operators is determined as follows.

- If $a_i(k) > a_i(j)$ for $1 \leq j < k$ and $a_i(k) \geq a_i(j)$ for $k < j \leq N$:

$$e_i(b_N \otimes \cdots \otimes b_1) = b_N \otimes \cdots \otimes e_i b_k \otimes \cdots \otimes b_1.$$

- If $a_i(k) \geq a_i(j)$ for $1 \leq j < k$ and $a_i(k) > a_i(j)$ for $k < j \leq N$:

$$f_i(b_N \otimes \cdots \otimes b_1) = b_N \otimes \cdots \otimes f_i b_k \otimes \cdots \otimes b_1.$$

Note that this is just recursively applying the definition of the tensor product on two crystals. Recall that $\langle \alpha_i^\vee, \mathrm{wt}(b_j) \rangle = \varphi_i(b_j) - \varepsilon_i(b_j)$ by the definition of a crystal.

Regular crystals

Now if all crystals B_k are regular crystals, all ε_i and φ_i are nonnegative and we can define tensor product by the *signature rule*. We start by writing a word in $+$ and $-$ as follows:

$$\underbrace{- \cdots -}_{\varphi_i(b_N) \text{ times}} \quad \underbrace{+ \cdots +}_{\varepsilon_i(b_N) \text{ times}} \quad \cdots \quad \underbrace{- \cdots -}_{\varphi_i(b_1) \text{ times}} \quad \underbrace{+ \cdots +}_{\varepsilon_i(b_1) \text{ times}},$$

and then canceling ordered pairs of $+-$ until the word is in the reduced form:

$$\underbrace{- \cdots -}_{\varphi_i \text{ times}} \quad \underbrace{+ \cdots +}_{\varepsilon_i \text{ times}}.$$

Here e_i acts on the factor corresponding to the leftmost $+$ and f_i on the factor corresponding to the rightmost $-$. If there is no $+$ or $-$ respectively, then the result is 0 (`None`).

EXAMPLES:

We construct the type A_2-crystal generated by $2 \otimes 1 \otimes 1$:

```
sage: C = crystals.Letters(['A',2])
sage: T = crystals.TensorProduct(C,C,C,generators=[[C(2),C(1),C(1)]])
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(2)])
>>> T = crystals.TensorProduct(C,C,C,generators=[[C(Integer(2)),C(Integer(1)),
↪C(Integer(1))]])
```

It has 8 elements:

```
sage: T.list()
[[2, 1, 1], [2, 1, 2], [2, 1, 3], [3, 1, 3],
 [3, 2, 3], [3, 1, 1], [3, 1, 2], [3, 2, 2]]
```

```
>>> from sage.all import *
>>> T.list()
[[2, 1, 1], [2, 1, 2], [2, 1, 3], [3, 1, 3],
 [3, 2, 3], [3, 1, 1], [3, 1, 2], [3, 2, 2]]
```

One can also check the Cartan type of the crystal:

```
sage: T.cartan_type()
['A', 2]
```

```
>>> from sage.all import *
>>> T.cartan_type()
['A', 2]
```

Other examples include crystals of tableaux (which internally are represented as tensor products obtained by reading the tableaux columnwise):

```
sage: C = crystals.Tableaux(['A',3], shape=[1,1,0])
sage: D = crystals.Tableaux(['A',3], shape=[1,0,0])
sage: T = crystals.TensorProduct(C,D, generators=[[C(rows=[[1], [2]]),␣
↪D(rows=[[1]])], [C(rows=[[2], [3]]), D(rows=[[1]])]])
sage: T.cardinality()
24
sage: TestSuite(T).run()
sage: T.module_generators
([[[1], [2]], [[1]]], [[[2], [3]], [[1]]])
sage: [x.weight() for x in T.module_generators]
[(2, 1, 0, 0), (1, 1, 1, 0)]
```

```
>>> from sage.all import *
>>> C = crystals.Tableaux(['A',Integer(3)], shape=[Integer(1),Integer(1),
↪Integer(0)])
>>> D = crystals.Tableaux(['A',Integer(3)], shape=[Integer(1),Integer(0),
↪Integer(0)])
>>> T = crystals.TensorProduct(C,D, generators=[[C(rows=[[Integer(1)],␣
```

(continues on next page)

(continued from previous page)

```
↪[Integer(2)]]), D(rows=[[Integer(1)]])], [C(rows=[[Integer(2)], [Integer(3)]]),␣
↪D(rows=[[Integer(1)]])]])
>>> T.cardinality()
24
>>> TestSuite(T).run()
>>> T.module_generators
([[[1], [2]], [[1]]], [[[2], [3]], [[1]]])
>>> [x.weight() for x in T.module_generators]
[(2, 1, 0, 0), (1, 1, 1, 0)]
```

If no module generators are specified, we obtain the full tensor product:

```
sage: C = crystals.Letters(['A',2])
sage: T = crystals.TensorProduct(C,C)
sage: T.list()
[[1, 1], [1, 2], [1, 3], [2, 1], [2, 2], [2, 3], [3, 1], [3, 2], [3, 3]]
sage: T.cardinality()
9
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(2)])
>>> T = crystals.TensorProduct(C,C)
>>> T.list()
[[1, 1], [1, 2], [1, 3], [2, 1], [2, 2], [2, 3], [3, 1], [3, 2], [3, 3]]
>>> T.cardinality()
9
```

For a tensor product of crystals without module generators, the default implementation of `module_generators` contains all elements in the tensor product of the crystals. If there is a subset of elements in the tensor product that still generates the crystal, this needs to be implemented for the specific crystal separately:

```
sage: T.module_generators.list()
[[1, 1], [1, 2], [1, 3], [2, 1], [2, 2], [2, 3], [3, 1], [3, 2], [3, 3]]
```

```
>>> from sage.all import *
>>> T.module_generators.list()
[[1, 1], [1, 2], [1, 3], [2, 1], [2, 2], [2, 3], [3, 1], [3, 2], [3, 3]]
```

For classical highest weight crystals, it is also possible to list all highest weight elements:

```
sage: C = crystals.Letters(['A',2])
sage: T = crystals.TensorProduct(C,C,C,generators=[[C(2),C(1),C(1)],[C(1),C(2),
↪C(1)]])
sage: T.highest_weight_vectors()
([2, 1, 1], [1, 2, 1])
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(2)])
>>> T = crystals.TensorProduct(C,C,C,generators=[[C(Integer(2)),C(Integer(1)),
↪C(Integer(1))],[C(Integer(1)),C(Integer(2)),C(Integer(1))]])
>>> T.highest_weight_vectors()
([2, 1, 1], [1, 2, 1])
```

Examples with non-regular and infinite crystals (these did not work before Issue #14402):

```
sage: B = crystals.infinity.Tableaux(['D',10])
sage: T = crystals.TensorProduct(B,B)
sage: T
Full tensor product of the crystals
[The infinity crystal of tableaux of type ['D', 10],
 The infinity crystal of tableaux of type ['D', 10]]

sage: B = crystals.infinity.GeneralizedYoungWalls(15)
sage: T = crystals.TensorProduct(B,B,B)
sage: T
Full tensor product of the crystals
[Crystal of generalized Young walls of type ['A', 15, 1],
 Crystal of generalized Young walls of type ['A', 15, 1],
 Crystal of generalized Young walls of type ['A', 15, 1]]

sage: La = RootSystem(['A',2,1]).weight_lattice(extended=True).fundamental_
→weights()
sage: B = crystals.GeneralizedYoungWalls(2,La[0]+La[1])
sage: C = crystals.GeneralizedYoungWalls(2,2*La[2])
sage: D = crystals.GeneralizedYoungWalls(2,3*La[0]+La[2])
sage: T = crystals.TensorProduct(B,C,D)
sage: T
Full tensor product of the crystals
[Highest weight crystal of generalized Young walls of Cartan type ['A', 2, 1] and␣
→highest weight Lambda[0] + Lambda[1],
 Highest weight crystal of generalized Young walls of Cartan type ['A', 2, 1] and␣
→highest weight 2*Lambda[2],
 Highest weight crystal of generalized Young walls of Cartan type ['A', 2, 1] and␣
→highest weight 3*Lambda[0] + Lambda[2]]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux(['D',Integer(10)])
>>> T = crystals.TensorProduct(B,B)
>>> T
Full tensor product of the crystals
[The infinity crystal of tableaux of type ['D', 10],
 The infinity crystal of tableaux of type ['D', 10]]

>>> B = crystals.infinity.GeneralizedYoungWalls(Integer(15))
>>> T = crystals.TensorProduct(B,B,B)
>>> T
Full tensor product of the crystals
[Crystal of generalized Young walls of type ['A', 15, 1],
 Crystal of generalized Young walls of type ['A', 15, 1],
 Crystal of generalized Young walls of type ['A', 15, 1]]

>>> La = RootSystem(['A',Integer(2),Integer(1)]).weight_lattice(extended=True).
→fundamental_weights()
>>> B = crystals.GeneralizedYoungWalls(Integer(2),La[Integer(0)]+La[Integer(1)])
>>> C = crystals.GeneralizedYoungWalls(Integer(2),Integer(2)*La[Integer(2)])
>>> D = crystals.GeneralizedYoungWalls(Integer(2),
```

(continues on next page)

(continued from previous page)

```
↪Integer(3)*La[Integer(0)]+La[Integer(2)])
>>> T = crystals.TensorProduct(B,C,D)
>>> T
Full tensor product of the crystals
[Highest weight crystal of generalized Young walls of Cartan type ['A', 2, 1] and␣
↪highest weight Lambda[0] + Lambda[1],
 Highest weight crystal of generalized Young walls of Cartan type ['A', 2, 1] and␣
↪highest weight 2*Lambda[2],
 Highest weight crystal of generalized Young walls of Cartan type ['A', 2, 1] and␣
↪highest weight 3*Lambda[0] + Lambda[2]]
```

There is also a global option for setting the convention (by default Sage uses anti-Kashiwara):

```
sage: C = crystals.Letters(['A',2])
sage: T = crystals.TensorProduct(C,C)
sage: elt = T(C(1), C(2)); elt
[1, 2]
sage: crystals.TensorProduct.options.convention = "Kashiwara"
sage: elt
[2, 1]
sage: crystals.TensorProduct.options._reset()
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(2)])
>>> T = crystals.TensorProduct(C,C)
>>> elt = T(C(Integer(1)), C(Integer(2))); elt
[1, 2]
>>> crystals.TensorProduct.options.convention = "Kashiwara"
>>> elt
[2, 1]
>>> crystals.TensorProduct.options._reset()
```

options = Current options for TensorProductOfCrystals - convention: antiKashiwara

class sage.combinat.crystals.tensor_product.**TensorProductOfCrystalsWithGenerators**(*crystals*, *generators*, *cartan_type*)

Bases: *TensorProductOfCrystals*

Tensor product of crystals with a generating set.

Todo

Deprecate this class in favor of using `subcrystal()`.

class sage.combinat.crystals.tensor_product.**TensorProductOfRegularCrystalsWithGenerators**(*crystals*, *generators*, *cartan_type*)

Bases: *TensorProductOfCrystalsWithGenerators*

Tensor product of regular crystals with a generating set.

class Element

Bases: *TensorProductOfRegularCrystalsElement*

5.1.68 Tensor Products of Crystal Elements

AUTHORS:

- Anne Schilling, Nicolas Thiery (2007): Initial version
- Ben Salisbury, Travis Scrimshaw (2013): Refactored tensor products to handle non-regular crystals and created new subclass to take advantage of the regularity
- Travis Scrimshaw (2017): Cythonized element classes
- Franco Saliola (2017): Tensor products for crystal of super algebras
- Anne Schilling (2018): Tensor products for crystals of queer super algebras

class sage.combinat.crystals.tensor_product_element.**CrystalOfBKKTableauxElement**

Bases: *TensorProductOfSuperCrystalsElement*

Element class for the crystal of tableaux for Lie superalgebras of [BKK2000].

pp()

Pretty print self.

EXAMPLES:

```
sage: C = crystals.Tableaux(['A',[1,2]], shape=[1,1])
sage: c = C.an_element()
sage: c.pp()
-2
-1
```

```
>>> from sage.all import *
>>> C = crystals.Tableaux(['A',[Integer(1),Integer(2)]], shape=[Integer(1),
↪Integer(1)])
>>> c = C.an_element()
>>> c.pp()
-2
-1
```

to_tableau()

Return the *Tableau* object corresponding to self.

EXAMPLES:

```
sage: C = crystals.Tableaux(['A',[1,2]], shape=[1,1])
sage: c = C.an_element()
sage: c.to_tableau()
[[-2], [-1]]
sage: type(c.to_tableau())
<class 'sage.combinat.tableau.Tableaux_all_with_category.element_class'>
sage: type(c)
<class 'sage.combinat.crystals.bkk_crystals.CrystalOfBKKTableaux_with_
↪category.element_class'>
```

```
>>> from sage.all import *
>>> C = crystals.Tableaux(['A',[Integer(1),Integer(2)]], shape=[Integer(1),
↪Integer(1)])
>>> c = C.an_element()
>>> c.to_tableau()
[[-2], [-1]]
>>> type(c.to_tableau())
<class 'sage.combinat.tableau.Tableaux_all_with_category.element_class'>
>>> type(c)
<class 'sage.combinat.crystals.bkk_crystals.CrystalOfBKKTableaux_with_
↪category.element_class'>
```

class sage.combinat.crystals.tensor_product_element.**CrystalOfTableauxElement**

Bases: *TensorProductOfRegularCrystalsElement*

Element in a crystal of tableaux.

pp()

EXAMPLES:

```
sage: T = crystals.Tableaux(['A',3], shape = [2,2])
sage: t = T(rows=[[1,2],[3,4]])
sage: t.pp()
1  2
3  4
```

```
>>> from sage.all import *
>>> T = crystals.Tableaux(['A',Integer(3)], shape = [Integer(2),Integer(2)])
>>> t = T(rows=[[Integer(1),Integer(2)],[Integer(3),Integer(4)]])
>>> t.pp()
1  2
3  4
```

promotion()

Return the result of applying promotion on `self`.

Promotion for type A crystals of tableaux of rectangular shape. This method only makes sense in type A with rectangular shapes.

EXAMPLES:

```
sage: C = crystals.Tableaux(["A",3], shape = [3,3,3])
sage: t = C(Tableau([[1,1,1],[2,2,3],[3,4,4]]))
sage: t
```

(continues on next page)

(continued from previous page)

```
[[1, 1, 1], [2, 2, 3], [3, 4, 4]]
sage: t.promotion()
[[1, 1, 2], [2, 2, 3], [3, 4, 4]]
sage: t.promotion().parent()
The crystal of tableaux of type ['A', 3] and shape(s) [[3, 3, 3]]
```

```
>>> from sage.all import *
>>> C = crystals.Tableaux(["A",Integer(3)], shape = [Integer(3),Integer(3),
↪Integer(3)])
>>> t = C(Tableau([[Integer(1),Integer(1),Integer(1)],[Integer(2),Integer(2),
↪Integer(3)],[Integer(3),Integer(4),Integer(4)]]))
>>> t
[[1, 1, 1], [2, 2, 3], [3, 4, 4]]
>>> t.promotion()
[[1, 1, 2], [2, 2, 3], [3, 4, 4]]
>>> t.promotion().parent()
The crystal of tableaux of type ['A', 3] and shape(s) [[3, 3, 3]]
```

promotion_inverse()

Return the result of applying inverse promotion on `self`.

Inverse promotion for type A crystals of tableaux of rectangular shape. This method only makes sense in type A with rectangular shapes.

EXAMPLES:

```
sage: C = crystals.Tableaux(["A",3], shape = [3,3,3])
sage: t = C(Tableau([[1,1,1],[2,2,3],[3,4,4]]))
sage: t
[[1, 1, 1], [2, 2, 3], [3, 4, 4]]
sage: t.promotion_inverse()
[[1, 1, 2], [2, 3, 3], [4, 4, 4]]
sage: t.promotion_inverse().parent()
The crystal of tableaux of type ['A', 3] and shape(s) [[3, 3, 3]]
```

```
>>> from sage.all import *
>>> C = crystals.Tableaux(["A",Integer(3)], shape = [Integer(3),Integer(3),
↪Integer(3)])
>>> t = C(Tableau([[Integer(1),Integer(1),Integer(1)],[Integer(2),Integer(2),
↪Integer(3)],[Integer(3),Integer(4),Integer(4)]]))
>>> t
[[1, 1, 1], [2, 2, 3], [3, 4, 4]]
>>> t.promotion_inverse()
[[1, 1, 2], [2, 3, 3], [4, 4, 4]]
>>> t.promotion_inverse().parent()
The crystal of tableaux of type ['A', 3] and shape(s) [[3, 3, 3]]
```

shape()

Return the shape of the tableau corresponding to `self`.

OUTPUT: an instance of *Partition*

See also

to_tableau()

EXAMPLES:

```
sage: C = crystals.Tableaux(["A", 2], shape=[2,1])
sage: x = C.an_element()
sage: x.to_tableau().shape()
[2, 1]
sage: x.shape()
[2, 1]
```

```
>>> from sage.all import *
>>> C = crystals.Tableaux(["A", Integer(2)], shape=[Integer(2),Integer(1)])
>>> x = C.an_element()
>>> x.to_tableau().shape()
[2, 1]
>>> x.shape()
[2, 1]
```

to_tableau()

Return the *Tableau* object corresponding to `self`.

EXAMPLES:

```
sage: T = crystals.Tableaux(['A',3], shape = [2,2])
sage: t = T(rows=[[1,2],[3,4]]).to_tableau(); t
[[1, 2], [3, 4]]
sage: type(t)
<class 'sage.combinat.tableau.Tableaux_all_with_category.element_class'>
sage: type(t[0][0])
<class 'int'>
sage: T = crystals.Tableaux(['D',3], shape = [1,1])
sage: t=T(rows=[[-3],[3]]).to_tableau(); t
[[-3], [3]]
sage: t=T(rows=[[3],[-3]]).to_tableau(); t
[[3], [-3]]
sage: T = crystals.Tableaux(['B',2], shape = [1,1])
sage: t = T(rows=[[0],[0]]).to_tableau(); t
[[0], [0]]
```

```
>>> from sage.all import *
>>> T = crystals.Tableaux(['A',Integer(3)], shape = [Integer(2),Integer(2)])
>>> t = T(rows=[[Integer(1),Integer(2)],[Integer(3),Integer(4)]]).to_
↪tableau(); t
[[1, 2], [3, 4]]
>>> type(t)
<class 'sage.combinat.tableau.Tableaux_all_with_category.element_class'>
>>> type(t[Integer(0)][Integer(0)])
<class 'int'>
>>> T = crystals.Tableaux(['D',Integer(3)], shape = [Integer(1),Integer(1)])
>>> t=T(rows=[[-Integer(3)],[Integer(3)]]).to_tableau(); t
```

(continues on next page)

(continued from previous page)

```
[[-3], [3]]
>>> t=T(rows=[[Integer(3)],[-Integer(3)]]).to_tableau(); t
[[3], [-3]]
>>> T = crystals.Tableaux(['B',Integer(2)], shape = [Integer(1),Integer(1)])
>>> t = T(rows=[[Integer(0)],[Integer(0)]]).to_tableau(); t
[[0], [0]]
```

class sage.combinat.crystals.tensor_product_element.**ImmutableListWithParent**

Bases: `ClonableArray`

A class for lists having a parent.

Specification: any subclass `C` should implement `__init__` which accepts the following form `C(parent, list=list)`

class sage.combinat.crystals.tensor_product_element.**InfinityCrystalOfTableauxElement**

Bases: *CrystalOfTableauxElement*

e(*i*)

Return the action of $\widetilde{e}_i$ on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: B = crystals.infinity.Tableaux(['B',3])
sage: b = B(rows=[[1,1,1,1,1,1,1,2,0,-3,-1,-1,-1,-1],[2,2,2,2,-2,-2],[3,-3,-
↪3]])
sage: b.e(3).pp()
1  1  1  1  1  1  1  2  0 -3 -1 -1 -1 -1
2  2  2  2 -2 -2
3  0 -3
sage: b.e(1).pp()
1  1  1  1  1  1  1  0 -3 -1 -1 -1 -1
2  2  2  2 -2 -2
3 -3 -3
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux(['B',Integer(3)])
>>> b = B(rows=[[Integer(1),Integer(1),Integer(1),Integer(1),Integer(1),
↪Integer(1),Integer(1),Integer(2),Integer(0),-Integer(3),-Integer(1),-
↪Integer(1),-Integer(1),-Integer(1)],[Integer(2),Integer(2),Integer(2),
↪Integer(2),-Integer(2),-Integer(2)],[Integer(3),-Integer(3),-Integer(3)]])
>>> b.e(Integer(3)).pp()
1  1  1  1  1  1  1  2  0 -3 -1 -1 -1 -1
2  2  2  2 -2 -2
3  0 -3
>>> b.e(Integer(1)).pp()
1  1  1  1  1  1  1  0 -3 -1 -1 -1 -1
2  2  2  2 -2 -2
3 -3 -3
```

f(*i*)

Return the action of $\widetilde{f}_i$ on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: B = crystals.infinity.Tableaux(['C',4])
sage: b = B.highest_weight_vector()
sage: b.f(1).pp()
1  1  1  1  2
2  2  2
3  3
4
sage: b.f(3).pp()
1  1  1  1  1
2  2  2  2
3  3  4
4
sage: b.f(3).f(4).pp()
1  1  1  1  1
2  2  2  2
3  3 -4
4
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux(['C',Integer(4)])
>>> b = B.highest_weight_vector()
>>> b.f(Integer(1)).pp()
1  1  1  1  2
2  2  2
3  3
4
>>> b.f(Integer(3)).pp()
1  1  1  1  1
2  2  2  2
3  3  4
4
>>> b.f(Integer(3)).f(Integer(4)).pp()
1  1  1  1  1
2  2  2  2
3  3 -4
4
```

class `sage.combinat.crystals.tensor_product_element.`**InfinityCrystalOfTableauxElementTypeD**

Bases: *InfinityCrystalOfTableauxElement*

e(*i*)

Return the action of $\widetilde{e}_i$ on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: B = crystals.infinity.Tableaux(['D',4])
sage: b = B.highest_weight_vector().f_string([1,4,3,1,2]); b.pp()
1  1  1  1  2  3
2  2  2
3 -3
sage: b.e(2).pp()
1  1  1  1  2  2
2  2  2
3 -3
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux(['D',Integer(4)])
>>> b = B.highest_weight_vector().f_string([Integer(1),Integer(4),Integer(3),
↪Integer(1),Integer(2)]); b.pp()
1  1  1  1  2  3
2  2  2
3 -3
>>> b.e(Integer(2)).pp()
1  1  1  1  2  2
2  2  2
3 -3
```

f(i)

Return the action of $\widetilde{f}_i$ on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: B = crystals.infinity.Tableaux(['D',5])
sage: b = B.highest_weight_vector().f_string([1,4,3,1,5]); b.pp()
1  1  1  1  1  1  2  2
2  2  2  2  2
3  3  3 -5
4  5
sage: b.f(1).pp()
1  1  1  1  1  1  2  2  2
2  2  2  2  2
3  3  3 -5
4  5
sage: b.f(5).pp()
1  1  1  1  1  1  2  2
2  2  2  2  2
3  3  3 -5
4 -4
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux(['D',Integer(5)])
>>> b = B.highest_weight_vector().f_string([Integer(1),Integer(4),Integer(3),
↪Integer(1),Integer(5)]); b.pp()
```

(continues on next page)

(continued from previous page)

```
1  1  1  1  1  1  2  2
2  2  2  2  2
3  3  3 -5
4  5
>>> b.f(Integer(1)).pp()
1  1  1  1  1  1  2  2  2
2  2  2  2  2
3  3  3 -5
4  5
>>> b.f(Integer(5)).pp()
1  1  1  1  1  1  2  2
2  2  2  2  2
3  3  3 -5
4 -4
```

class sage.combinat.crystals.tensor_product_element.**InfinityQueerCrystalOfTableauxElement**

Bases: *TensorProductOfQueerSuperCrystalsElement*

Initialize `self`.

EXAMPLES:

```
sage: B = crystals.infinity.Tableaux(['Q',4])
sage: t = B([[4,4,4,4,2,1],[3,3,3],[2,2],[1]])
sage: t
[[4, 4, 4, 4, 2, 1], [3, 3, 3], [2, 2], [1]]
sage: TestSuite(t).run()
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux(['Q',Integer(4)])
>>> t = B([[Integer(4),Integer(4),Integer(4),Integer(4),Integer(2),Integer(1)],
↪[Integer(3),Integer(3),Integer(3)],[Integer(2),Integer(2)],[Integer(1)]])
>>> t
[[4, 4, 4, 4, 2, 1], [3, 3, 3], [2, 2], [1]]
>>> TestSuite(t).run()
```

e(*i*)

Return the action of e_i on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: B = crystals.infinity.Tableaux(['Q',4])
sage: t = B([[4,4,4,4,4,2,1],[3,3,3,3],[2,2,1],[1]])
sage: t.e(1)
[[4, 4, 4, 4, 4, 4, 2, 1], [3, 3, 3, 3, 3], [2, 2, 1, 1], [1]]
sage: t.e(3)
[[4, 4, 4, 4, 4, 3, 2, 1], [3, 3, 3, 3], [2, 2, 1], [1]]
sage: t.e(-1)
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux(['Q',Integer(4)])
>>> t = B([[Integer(4),Integer(4),Integer(4),Integer(4),Integer(4),Integer(2),
↪Integer(1)],[Integer(3),Integer(3),Integer(3),Integer(3)],[Integer(2),
↪Integer(2),Integer(1)],[Integer(1)]])
>>> t.e(Integer(1))
[[4, 4, 4, 4, 4, 4, 2, 1], [3, 3, 3, 3, 3], [2, 2, 1, 1], [1]]
>>> t.e(Integer(3))
[[4, 4, 4, 4, 4, 3, 2, 1], [3, 3, 3, 3], [2, 2, 1], [1]]
>>> t.e(-Integer(1))
```

epsilon(*i*)

Return ε_i of `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: B = crystals.infinity.Tableaux(['Q',4])
sage: t = B([[4,4,4,4,4,2,1],[3,3,3,3],[2,2,1],[1]])
sage: [t.epsilon(i) for i in B.index_set()]
[-1, 1, -2, 0]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux(['Q',Integer(4)])
>>> t = B([[Integer(4),Integer(4),Integer(4),Integer(4),Integer(4),Integer(2),
↪Integer(1)],[Integer(3),Integer(3),Integer(3),Integer(3)],[Integer(2),
↪Integer(2),Integer(1)],[Integer(1)]])
>>> [t.epsilon(i) for i in B.index_set()]
[-1, 1, -2, 0]
```

f(*i*)

Return the action of f_i on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: B = crystals.infinity.Tableaux(['Q',4])
sage: t = B([[4,4,4,4,4,2,1],[3,3,3,3],[2,2,1],[1]])
sage: t.f(1)
[[4, 4, 4, 4, 4, 2, 2], [3, 3, 3, 3], [2, 2, 1], [1]]
sage: t.f(3)
sage: t.f(-1)
[[4, 4, 4, 4, 4, 2, 2], [3, 3, 3, 3], [2, 2, 1], [1]]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux(['Q',Integer(4)])
>>> t = B([[Integer(4),Integer(4),Integer(4),Integer(4),Integer(4),Integer(2),
↪Integer(1)],[Integer(3),Integer(3),Integer(3),Integer(3)],[Integer(2),
↪Integer(2),Integer(1)],[Integer(1)]])
```

(continues on next page)

(continued from previous page)

```
>>> t.f(Integer(1))
[[4, 4, 4, 4, 4, 2, 2], [3, 3, 3, 3], [2, 2, 1], [1]]
>>> t.f(Integer(3))
>>> t.f(-Integer(1))
[[4, 4, 4, 4, 4, 2, 2], [3, 3, 3, 3], [2, 2, 1], [1]]
```

rows()

Return the list of rows of `self`.

EXAMPLES:

```
sage: B = crystals.infinity.Tableaux(['Q',4])
sage: t = B([[4,4,4,4,4,2,1],[3,3,3,3],[2,2,1],[1]])
sage: t.rows()
[[1, 2, 4, 4, 4, 4, 4], [3, 3, 3, 3], [1, 2, 2], [1]]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux(['Q',Integer(4)])
>>> t = B([[Integer(4),Integer(4),Integer(4),Integer(4),Integer(4),Integer(2),
↪Integer(1)],[Integer(3),Integer(3),Integer(3),Integer(3)],[Integer(2),
↪Integer(2),Integer(1)],[Integer(1)]])
>>> t.rows()
[[1, 2, 4, 4, 4, 4, 4], [3, 3, 3, 3], [1, 2, 2], [1]]
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: B = crystals.infinity.Tableaux(['Q',4])
sage: t = B([[4,4,4,4,4,2,1],[3,3,3,3],[2,2,1],[1]])
sage: t.weight()
(4, 2, 2, 0)
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux(['Q',Integer(4)])
>>> t = B([[Integer(4),Integer(4),Integer(4),Integer(4),Integer(4),Integer(2),
↪Integer(1)],[Integer(3),Integer(3),Integer(3),Integer(3)],[Integer(2),
↪Integer(2),Integer(1)],[Integer(1)]])
>>> t.weight()
(4, 2, 2, 0)
```

class sage.combinat.crystals.tensor_product_element.**TensorProductOfCrystalsElement**

Bases: *ImmutableListWithParent*

A class for elements of tensor products of crystals.

e(i)

Return the action of e_i on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: B = crystals.infinity.Tableaux("D4")
sage: T = crystals.TensorProduct(B,B)
sage: b1 = B.highest_weight_vector().f_string([1,4,3])
sage: b2 = B.highest_weight_vector().f_string([2,2,3,1,4])
sage: t = T(b2, b1)
sage: t.e(1)
[[[1, 1, 1, 1, 1], [2, 2, 3, -3], [3]], [[1, 1, 1, 1, 2], [2, 2, 2], [3, -3]]]
sage: t.e(2)
sage: t.e(3)
[[[1, 1, 1, 1, 1, 2], [2, 2, 3, -4], [3]], [[1, 1, 1, 1, 2], [2, 2, 2], [3, -
↪3]]]
sage: t.e(4)
[[[1, 1, 1, 1, 1, 2], [2, 2, 3, 4], [3]], [[1, 1, 1, 1, 2], [2, 2, 2], [3, -
↪3]]]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux("D4")
>>> T = crystals.TensorProduct(B,B)
>>> b1 = B.highest_weight_vector().f_string([Integer(1),Integer(4),
↪Integer(3)])
>>> b2 = B.highest_weight_vector().f_string([Integer(2),Integer(2),Integer(3),
↪Integer(1),Integer(4)])
>>> t = T(b2, b1)
>>> t.e(Integer(1))
[[[1, 1, 1, 1, 1], [2, 2, 3, -3], [3]], [[1, 1, 1, 1, 2], [2, 2, 2], [3, -3]]]
>>> t.e(Integer(2))
>>> t.e(Integer(3))
[[[1, 1, 1, 1, 1, 2], [2, 2, 3, -4], [3]], [[1, 1, 1, 1, 2], [2, 2, 2], [3, -
↪3]]]
>>> t.e(Integer(4))
[[[1, 1, 1, 1, 1, 2], [2, 2, 3, 4], [3]], [[1, 1, 1, 1, 2], [2, 2, 2], [3, -
↪3]]]
```

epsilon(*i*)

Return ε_i of `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: B = crystals.infinity.Tableaux("G2")
sage: T = crystals.TensorProduct(B,B)
sage: b1 = B.highest_weight_vector().f(2)
sage: b2 = B.highest_weight_vector().f_string([2,2,1])
sage: t = T(b2, b1)
sage: [t.epsilon(i) for i in B.index_set()]
[0, 3]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux("G2")
>>> T = crystals.TensorProduct(B,B)
>>> b1 = B.highest_weight_vector().f(Integer(2))
```

(continues on next page)

(continued from previous page)

```
>>> b2 = B.highest_weight_vector().f_string([Integer(2),Integer(2),
↪Integer(1)])
>>> t = T(b2, b1)
>>> [t.epsilon(i) for i in B.index_set()]
[0, 3]
```

f(*i*)

Return the action of f_i on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: La = RootSystem(['A',3,1]).weight_lattice(extended=True).fundamental_
↪weights()
sage: B = crystals.GeneralizedYoungWalls(3,La[0])
sage: T = crystals.TensorProduct(B,B,B)
sage: b1 = B.highest_weight_vector().f_string([0,3])
sage: b2 = B.highest_weight_vector().f_string([0])
sage: b3 = B.highest_weight_vector()
sage: t = T(b3, b2, b1)
sage: t.f(0)
[[[0]], [[0]], [[0, 3]]]
sage: t.f(1)
[[], [[0]], [[0, 3], [1]]]
sage: t.f(2)
[[], [[0]], [[0, 3, 2]]]
sage: t.f(3)
[[], [[0, 3]], [[0, 3]]]
```

```
>>> from sage.all import *
>>> La = RootSystem(['A',Integer(3),Integer(1)]).weight_
↪lattice(extended=True).fundamental_weights()
>>> B = crystals.GeneralizedYoungWalls(Integer(3),La[Integer(0)])
>>> T = crystals.TensorProduct(B,B,B)
>>> b1 = B.highest_weight_vector().f_string([Integer(0),Integer(3)])
>>> b2 = B.highest_weight_vector().f_string([Integer(0)])
>>> b3 = B.highest_weight_vector()
>>> t = T(b3, b2, b1)
>>> t.f(Integer(0))
[[[0]], [[0]], [[0, 3]]]
>>> t.f(Integer(1))
[[], [[0]], [[0, 3], [1]]]
>>> t.f(Integer(2))
[[], [[0]], [[0, 3, 2]]]
>>> t.f(Integer(3))
[[], [[0, 3]], [[0, 3]]]
```

phi(*i*)

Return φ_i of `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: La = RootSystem(['A',2,1]).weight_lattice(extended=True).fundamental_
↪weights()
sage: B = crystals.GeneralizedYoungWalls(2,La[0]+La[1])
sage: T = crystals.TensorProduct(B,B)
sage: b1 = B.highest_weight_vector().f_string([1,0])
sage: b2 = B.highest_weight_vector().f_string([0,1])
sage: t = T(b2, b1)
sage: [t.phi(i) for i in B.index_set()]
[1, 1, 4]
```

```
>>> from sage.all import *
>>> La = RootSystem(['A',Integer(2),Integer(1)]).weight_
↪lattice(extended=True).fundamental_weights()
>>> B = crystals.GeneralizedYoungWalls(Integer(2),
↪La[Integer(0)]+La[Integer(1)])
>>> T = crystals.TensorProduct(B,B)
>>> b1 = B.highest_weight_vector().f_string([Integer(1),Integer(0)])
>>> b2 = B.highest_weight_vector().f_string([Integer(0),Integer(1)])
>>> t = T(b2, b1)
>>> [t.phi(i) for i in B.index_set()]
[1, 1, 4]
```

pp()

Pretty print `self`.

EXAMPLES:

```
sage: C = crystals.Tableaux(['A',3], shape=[3,1])
sage: D = crystals.Tableaux(['A',3], shape=[1])
sage: E = crystals.Tableaux(['A',3], shape=[2,2,2])
sage: T = crystals.TensorProduct(C,D,E)
sage: T.module_generators[0].pp()
  1  1  1 (X)   1 (X)   1  1
  2                     2  2
                        3  3
```

```
>>> from sage.all import *
>>> C = crystals.Tableaux(['A',Integer(3)], shape=[Integer(3),Integer(1)])
>>> D = crystals.Tableaux(['A',Integer(3)], shape=[Integer(1)])
>>> E = crystals.Tableaux(['A',Integer(3)], shape=[Integer(2),Integer(2),
↪Integer(2)])
>>> T = crystals.TensorProduct(C,D,E)
>>> T.module_generators[Integer(0)].pp()
  1  1  1 (X)   1 (X)   1  1
  2                     2  2
                        3  3
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: B = crystals.infinity.Tableaux("A3")
sage: T = crystals.TensorProduct(B,B)
sage: b1 = B.highest_weight_vector().f_string([2,1,3])
sage: b2 = B.highest_weight_vector().f(1)
sage: t = T(b2, b1)
sage: t
[[[1, 1, 1, 2], [2, 2], [3]], [[1, 1, 1, 1, 2], [2, 2, 4], [3]]]
sage: t.weight()
(-2, 1, 0, 1)
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux("A3")
>>> T = crystals.TensorProduct(B,B)
>>> b1 = B.highest_weight_vector().f_string([Integer(2),Integer(1),
↪Integer(3)])
>>> b2 = B.highest_weight_vector().f(Integer(1))
>>> t = T(b2, b1)
>>> t
[[[1, 1, 1, 2], [2, 2], [3]], [[1, 1, 1, 1, 2], [2, 2, 4], [3]]]
>>> t.weight()
(-2, 1, 0, 1)
```

```
sage: C = crystals.Letters(['A',3])
sage: T = crystals.TensorProduct(C,C)
sage: T(C(1),C(2)).weight()
(1, 1, 0, 0)
sage: T = crystals.Tableaux(['D',4],shape=[])
sage: T.list()[0].weight()
(0, 0, 0, 0)
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(3)])
>>> T = crystals.TensorProduct(C,C)
>>> T(C(Integer(1)),C(Integer(2))).weight()
(1, 1, 0, 0)
>>> T = crystals.Tableaux(['D',Integer(4)],shape=[])
>>> T.list()[Integer(0)].weight()
(0, 0, 0, 0)
```

class sage.combinat.crystals.tensor_product_element.**TensorProductOfQueerSuperCrystalsElement**

Bases: *TensorProductOfRegularCrystalsElement*

Element class for a tensor product of crystals for queer Lie superalgebras.

This implements the tensor product rule for crystals of Grantcharov et al. [GJK+2014]. Given crystals B_1 and B_2 of type $\mathfrak{q}_{n+1}$, we define the tensor product $b_1 \otimes b_2 \in B_1 \otimes B_2$, where $b_1 \in B_1$ and $b_2 \in B_2$, as the following:

In addition to the tensor product rule for type A_n, the tensor product rule for e_{-1} and f_{-1} on $b_1 \otimes b_2$ are given by

$$e_{-1}(b_1 \otimes b_2) = \begin{cases} b_1 \otimes e_{-1} b_2 & \text{if } \operatorname{wt}(b_1)_1 = \operatorname{wt}(b_1)_2 = 0, \\ e_{-1} b_1 \otimes b_2 & \text{otherwise}, \end{cases}$$
$$f_{-1}(b_1 \otimes b_2) = \begin{cases} b_1 \otimes f_{-1} b_2 & \text{if } \operatorname{wt}(b_1)_1 = \operatorname{wt}(b_1)_2 = 0, \\ f_{-1} b_1 \otimes b_2 & \text{otherwise}. \end{cases}$$

For $1 < i \leq n$, the operators e_{-i} and f_{-i} are defined as

$$e_{-i} = s_{w_i^{-1}} e_{-1} s_{w_i}, \quad f_{-i} = s_{w_i^{-1}} f_{-1} s_{w_i}.$$

Here, $w_i = s_2 \cdots s_i s_1 \cdots s_{i-1}$ and s_i is the reflection along the i-string in the crystal. Moreover, for $1 < i \leq n$, we define the operators $e_{-i'}$ and $f_{-i'}$ as

$$e_{-i'} = s_{w_0} f_{-(n+1-i)} s_{w_0}, \quad f_{-i'} = s_{w_0} e_{-(n+1-i)} s_{w_0},$$

where w_0 is the longest element in the symmetric group S_{n+1} generated by $s_1, \ldots, s_n$. In this implementation, we use the integers $-2n, \ldots, -(n+1)$ to respectively denote the indices $-n', \ldots, -1'$.

e (*i*)

Return e_i on `self`.

EXAMPLES:

```
sage: Q = crystals.Letters(['Q', 3])
sage: T = tensor([Q,Q])
sage: t = T(Q(1),Q(1))
sage: t.e(-1)
sage: t = T(Q(2),Q(1))
sage: t.e(-1)
[1, 1]

sage: T = tensor([Q,Q,Q,Q])
sage: t = T(Q(1),Q(3),Q(2),Q(1))
sage: t.e(-2)
[2, 2, 1, 1]
```

```
>>> from sage.all import *
>>> Q = crystals.Letters(['Q', Integer(3)])
>>> T = tensor([Q,Q])
>>> t = T(Q(Integer(1)),Q(Integer(1)))
>>> t.e(-Integer(1))
>>> t = T(Q(Integer(2)),Q(Integer(1)))
>>> t.e(-Integer(1))
[1, 1]

>>> T = tensor([Q,Q,Q,Q])
>>> t = T(Q(Integer(1)),Q(Integer(3)),Q(Integer(2)),Q(Integer(1)))
>>> t.e(-Integer(2))
[2, 2, 1, 1]
```

epsilon (*i*)

Return ε_i on `self`.

EXAMPLES:

```
sage: Q = crystals.Letters(['Q', 3])
sage: T = tensor([Q, Q, Q, Q])
sage: t = T(Q(1), Q(3), Q(2), Q(1))
sage: t.epsilon(-2)
1
```

```
>>> from sage.all import *
>>> Q = crystals.Letters(['Q', Integer(3)])
>>> T = tensor([Q, Q, Q, Q])
>>> t = T(Q(Integer(1)), Q(Integer(3)), Q(Integer(2)), Q(Integer(1)))
>>> t.epsilon(-Integer(2))
1
```

f(i)

Return f_i on `self`.

EXAMPLES:

```
sage: Q = crystals.Letters(['Q', 3])
sage: T = tensor([Q, Q])
sage: t = T(Q(1), Q(1))
sage: t.f(-1)
[2, 1]
```

```
>>> from sage.all import *
>>> Q = crystals.Letters(['Q', Integer(3)])
>>> T = tensor([Q, Q])
>>> t = T(Q(Integer(1)), Q(Integer(1)))
>>> t.f(-Integer(1))
[2, 1]
```

phi(i)

Return φ_i on `self`.

EXAMPLES:

```
sage: Q = crystals.Letters(['Q', 3])
sage: T = tensor([Q, Q, Q, Q])
sage: t = T(Q(1), Q(3), Q(2), Q(1))
sage: t.phi(-2)
0
sage: t.phi(-1)
1
```

```
>>> from sage.all import *
>>> Q = crystals.Letters(['Q', Integer(3)])
>>> T = tensor([Q, Q, Q, Q])
>>> t = T(Q(Integer(1)), Q(Integer(3)), Q(Integer(2)), Q(Integer(1)))
>>> t.phi(-Integer(2))
0
>>> t.phi(-Integer(1))
1
```

class sage.combinat.crystals.tensor_product_element.**TensorProductOfRegularCrystalsElement**

Bases: *TensorProductOfCrystalsElement*

Element class for a tensor product of regular crystals.

e(*i*)

Return the action of e_i on self.

EXAMPLES:

```
sage: C = crystals.Letters(['A',5])
sage: T = crystals.TensorProduct(C,C)
sage: T(C(1),C(2)).e(1) == T(C(1),C(1))
True
sage: T(C(2),C(1)).e(1) is None
True
sage: T(C(2),C(2)).e(1) == T(C(1),C(2))
True
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(5)])
>>> T = crystals.TensorProduct(C,C)
>>> T(C(Integer(1)),C(Integer(2))).e(Integer(1)) == T(C(Integer(1)),
↪C(Integer(1)))
True
>>> T(C(Integer(2)),C(Integer(1))).e(Integer(1)) is None
True
>>> T(C(Integer(2)),C(Integer(2))).e(Integer(1)) == T(C(Integer(1)),
↪C(Integer(2)))
True
```

epsilon(*i*)

Return ε_i of self.

EXAMPLES:

```
sage: C = crystals.Letters(['A',5])
sage: T = crystals.TensorProduct(C,C)
sage: T(C(1),C(1)).epsilon(1)
0
sage: T(C(1),C(2)).epsilon(1)
1
sage: T(C(2),C(1)).epsilon(1)
0
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(5)])
>>> T = crystals.TensorProduct(C,C)
>>> T(C(Integer(1)),C(Integer(1))).epsilon(Integer(1))
0
>>> T(C(Integer(1)),C(Integer(2))).epsilon(Integer(1))
1
>>> T(C(Integer(2)),C(Integer(1))).epsilon(Integer(1))
0
```

f(*i*)

Return the action of f_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['A',5])
sage: T = crystals.TensorProduct(C,C)
sage: T(C(1),C(1)).f(1)
[1, 2]
sage: T(C(1),C(2)).f(1)
[2, 2]
sage: T(C(2),C(1)).f(1) is None
True
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(5)])
>>> T = crystals.TensorProduct(C,C)
>>> T(C(Integer(1)),C(Integer(1))).f(Integer(1))
[1, 2]
>>> T(C(Integer(1)),C(Integer(2))).f(Integer(1))
[2, 2]
>>> T(C(Integer(2)),C(Integer(1))).f(Integer(1)) is None
True
```

phi(*i*)

Return φ_i of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['A',5])
sage: T = crystals.TensorProduct(C,C)
sage: T(C(1),C(1)).phi(1)
2
sage: T(C(1),C(2)).phi(1)
1
sage: T(C(2),C(1)).phi(1)
0
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(5)])
>>> T = crystals.TensorProduct(C,C)
>>> T(C(Integer(1)),C(Integer(1))).phi(Integer(1))
2
>>> T(C(Integer(1)),C(Integer(2))).phi(Integer(1))
1
>>> T(C(Integer(2)),C(Integer(1))).phi(Integer(1))
0
```

position_of_first_unmatched_plus(*i*)

Return the position of the first unmatched $+$ or `None` if there is no unmatched $+$.

EXAMPLES:

```
sage: C = crystals.Letters(['A',5])
sage: T = crystals.TensorProduct(C,C)
sage: T(C(2),C(1)).position_of_first_unmatched_plus(1)
sage: T(C(1),C(2)).position_of_first_unmatched_plus(1)
1
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(5)])
>>> T = crystals.TensorProduct(C,C)
>>> T(C(Integer(2)),C(Integer(1))).position_of_first_unmatched_
↪plus(Integer(1))
>>> T(C(Integer(1)),C(Integer(2))).position_of_first_unmatched_
↪plus(Integer(1))
1
```

position_of_last_unmatched_minus(*i*)

Return the position of the last unmatched $-$ or `None` if there is no unmatched $-$.

EXAMPLES:

```
sage: C = crystals.Letters(['A',5])
sage: T = crystals.TensorProduct(C,C)
sage: T(C(2),C(1)).position_of_last_unmatched_minus(1)
sage: T(C(1),C(2)).position_of_last_unmatched_minus(1)
0
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(5)])
>>> T = crystals.TensorProduct(C,C)
>>> T(C(Integer(2)),C(Integer(1))).position_of_last_unmatched_
↪minus(Integer(1))
>>> T(C(Integer(1)),C(Integer(2))).position_of_last_unmatched_
↪minus(Integer(1))
0
```

positions_of_unmatched_minus(*i*, *dual=False*, *reverse=False*)

EXAMPLES:

```
sage: C = crystals.Letters(['A',5])
sage: T = crystals.TensorProduct(C,C)
sage: T(C(2),C(1)).positions_of_unmatched_minus(1)
[]
sage: T(C(1),C(2)).positions_of_unmatched_minus(1)
[0]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(5)])
>>> T = crystals.TensorProduct(C,C)
>>> T(C(Integer(2)),C(Integer(1))).positions_of_unmatched_minus(Integer(1))
[]
>>> T(C(Integer(1)),C(Integer(2))).positions_of_unmatched_minus(Integer(1))
[0]
```

positions_of_unmatched_plus(*i*)

EXAMPLES:

```
sage: C = crystals.Letters(['A',5])
sage: T = crystals.TensorProduct(C,C)
sage: T(C(2),C(1)).positions_of_unmatched_plus(1)
[]
sage: T(C(1),C(2)).positions_of_unmatched_plus(1)
[1]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(5)])
>>> T = crystals.TensorProduct(C,C)
>>> T(C(Integer(2)),C(Integer(1))).positions_of_unmatched_plus(Integer(1))
[]
>>> T(C(Integer(1)),C(Integer(2))).positions_of_unmatched_plus(Integer(1))
[1]
```

class sage.combinat.crystals.tensor_product_element.**TensorProductOfSuperCrystalsElement**

Bases: *TensorProductOfRegularCrystalsElement*

Element class for a tensor product of crystals for Lie superalgebras.

This implements the tensor product rule for crystals of Lie superalgebras of [BKK2000].

e(*i*)

Return e_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['A', [2, 1]])
sage: T = tensor([C,C])
sage: t = T(C(1),C(1))
sage: t.e(0)
[-1, 1]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A', [Integer(2), Integer(1)]])
>>> T = tensor([C,C])
>>> t = T(C(Integer(1)),C(Integer(1)))
>>> t.e(Integer(0))
[-1, 1]
```

epsilon(*i*)

Return ε_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['A', [2, 1]])
sage: T = tensor([C,C])
sage: t = T(C(1),C(1))
sage: t.epsilon(0)
1
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A', [Integer(2), Integer(1)]])
>>> T = tensor([C,C])
>>> t = T(C(Integer(1)),C(Integer(1)))
>>> t.epsilon(Integer(0))
1
```

f (i)

Return f_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['A', [2, 1]])
sage: T = tensor([C,C])
sage: t = T(C(1),C(1))
sage: t.f(0)
sage: t.f(1)
[1, 2]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A', [Integer(2), Integer(1)]])
>>> T = tensor([C,C])
>>> t = T(C(Integer(1)),C(Integer(1)))
>>> t.f(Integer(0))
>>> t.f(Integer(1))
[1, 2]
```

phi (i)

Return φ_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['A', [2, 1]])
sage: T = tensor([C,C])
sage: t = T(C(1),C(1))
sage: t.phi(0)
0
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A', [Integer(2), Integer(1)]])
>>> T = tensor([C,C])
>>> t = T(C(Integer(1)),C(Integer(1)))
>>> t.phi(Integer(0))
0
```

5.1.69 Cyclic sieving phenomenon

Implementation of the Cyclic Sieving Phenomenon as described by Reiner, Stanton, and White in [RSW2004].

We define the *CyclicSievingPolynomial()* of a finite set S together with cyclic action `cyc_act` (of order n) to be the unique polynomial `P(q)` of order $< n$ such that the triple (S, `cyc_act`, `P(q)`) exhibits the cyclic sieving phenomenon.

AUTHORS:

- Christian Stump

REFERENCES:

`sage.combinat.cyclic_sieving_phenomenon.`**`CyclicSievingCheck`**`(`*L*, *cyc_act*, *f*, *order=None*`)`

Return whether the triple `(L, cyc_act, f)` exhibits the cyclic sieving phenomenon.

If `cyc_act` is None, `L` is expected to contain the orbit lengths.

INPUT:

- `L` – if `cyc_act` is `None`: list of orbit sizes, otherwise list of objects
- `cyc_act` – (default: `None`) bijective function from `L` to `L`
- **`order` – (default: `None`) if set to an integer, this**
  cyclic order of `cyc_act` is used (must be an integer multiple of the order of `cyc_act`) otherwise, the order of `cyc_action` is used

EXAMPLES:

```
sage: from sage.combinat.cyclic_sieving_phenomenon import *
sage: from sage.combinat.q_analogues import q_binomial
sage: S42 = Subsets([1,2,3,4], 2)
sage: def cyc_act(S): return Set(i.mod(4) + 1 for i in S)
sage: cyc_act([1,3])
{2, 4}
sage: cyc_act([1,4])
{1, 2}
sage: p = q_binomial(4,2); p
q^4 + q^3 + 2*q^2 + q + 1
sage: CyclicSievingPolynomial( S42, cyc_act )
q^3 + 2*q^2 + q + 2
sage: CyclicSievingCheck( S42, cyc_act, p )
True
```

```
>>> from sage.all import *
>>> from sage.combinat.cyclic_sieving_phenomenon import *
>>> from sage.combinat.q_analogues import q_binomial
>>> S42 = Subsets([Integer(1),Integer(2),Integer(3),Integer(4)], Integer(2))
>>> def cyc_act(S): return Set(i.mod(Integer(4)) + Integer(1) for i in S)
>>> cyc_act([Integer(1),Integer(3)])
{2, 4}
>>> cyc_act([Integer(1),Integer(4)])
{1, 2}
>>> p = q_binomial(Integer(4),Integer(2)); p
q^4 + q^3 + 2*q^2 + q + 1
>>> CyclicSievingPolynomial( S42, cyc_act )
q^3 + 2*q^2 + q + 2
>>> CyclicSievingCheck( S42, cyc_act, p )
True
```

`sage.combinat.cyclic_sieving_phenomenon.`**`CyclicSievingPolynomial`**`(`*L*, *cyc_act=None*, *order=None*, *get_order=False*`)`

Return the unique polynomial `p` of degree smaller than `order` such that the triple `(L, cyc_act, p)` exhibits the Cyclic Sieving Phenomenon.

If `cyc_act` is None, `L` is expected to contain the orbit lengths.

INPUT:

- L – if cyc_act is None: list of orbit sizes, otherwise list of objects
- cyc_act – (default: None) bijective function from L to L
- **order – (default: None) if set to an integer, this**
  cyclic order of cyc_act is used (must be an integer multiple of the order of cyc_act) otherwise, the order of cyc_action is used
- get_order – (default: False) if True, a tuple [p,n] is returned where p is as above, and n is the order

EXAMPLES:

```
sage: from sage.combinat.cyclic_sieving_phenomenon import CyclicSievingPolynomial
sage: S42 = Subsets([1,2,3,4], 2)
sage: def cyc_act(S): return Set(i.mod(4) + 1 for i in S)
sage: cyc_act([1,3])
{2, 4}
sage: cyc_act([1,4])
{1, 2}
sage: CyclicSievingPolynomial(S42, cyc_act)
q^3 + 2*q^2 + q + 2
sage: CyclicSievingPolynomial(S42, cyc_act, get_order=True)
[q^3 + 2*q^2 + q + 2, 4]
sage: CyclicSievingPolynomial(S42, cyc_act, order=8)
q^6 + 2*q^4 + q^2 + 2
sage: CyclicSievingPolynomial([4,2])
q^3 + 2*q^2 + q + 2
```

```
>>> from sage.all import *
>>> from sage.combinat.cyclic_sieving_phenomenon import CyclicSievingPolynomial
>>> S42 = Subsets([Integer(1),Integer(2),Integer(3),Integer(4)], Integer(2))
>>> def cyc_act(S): return Set(i.mod(Integer(4)) + Integer(1) for i in S)
>>> cyc_act([Integer(1),Integer(3)])
{2, 4}
>>> cyc_act([Integer(1),Integer(4)])
{1, 2}
>>> CyclicSievingPolynomial(S42, cyc_act)
q^3 + 2*q^2 + q + 2
>>> CyclicSievingPolynomial(S42, cyc_act, get_order=True)
[q^3 + 2*q^2 + q + 2, 4]
>>> CyclicSievingPolynomial(S42, cyc_act, order=Integer(8))
q^6 + 2*q^4 + q^2 + 2
>>> CyclicSievingPolynomial([Integer(4),Integer(2)])
q^3 + 2*q^2 + q + 2
```

sage.combinat.cyclic_sieving_phenomenon.**orbit_decomposition**(*L*, *cyc_act*)

Return the orbit decomposition of L by the action of cyc_act.

INPUT:

- L – list
- cyc_act – bijective function from L to L

OUTPUT: list of lists, the orbits under the cyc_act acting on L

EXAMPLES:

```
sage: from sage.combinat.cyclic_sieving_phenomenon import *
sage: S42 = Subsets([1,2,3,4], 2); S42
Subsets of {1, 2, 3, 4} of size 2
sage: def cyc_act(S): return Set(i.mod(4) + 1 for i in S)
sage: cyc_act([1,3])
{2, 4}
sage: cyc_act([1,4])
{1, 2}
sage: orbits = orbit_decomposition(S42, cyc_act)
sage: sorted([sorted(orb, key=sorted) for orb in orbits], key=len)
[[{1, 3}, {2, 4}], [{1, 2}, {1, 4}, {2, 3}, {3, 4}]]
```

```
>>> from sage.all import *
>>> from sage.combinat.cyclic_sieving_phenomenon import *
>>> S42 = Subsets([Integer(1),Integer(2),Integer(3),Integer(4)], Integer(2)); S42
Subsets of {1, 2, 3, 4} of size 2
>>> def cyc_act(S): return Set(i.mod(Integer(4)) + Integer(1) for i in S)
>>> cyc_act([Integer(1),Integer(3)])
{2, 4}
>>> cyc_act([Integer(1),Integer(4)])
{1, 2}
>>> orbits = orbit_decomposition(S42, cyc_act)
>>> sorted([sorted(orb, key=sorted) for orb in orbits], key=len)
[[{1, 3}, {2, 4}], [{1, 2}, {1, 4}, {2, 3}, {3, 4}]]
```

5.1.70 De Bruijn sequences

A De Bruijn sequence is defined as the shortest cyclic sequence that incorporates all substrings of a certain length of an alphabet.

For instance, the $2^3 = 8$ binary strings of length 3 are all included in the following string:

```
sage: DeBruijnSequences(2,3).an_element()
[0, 0, 0, 1, 0, 1, 1, 1]
```

```
>>> from sage.all import *
>>> DeBruijnSequences(Integer(2),Integer(3)).an_element()
[0, 0, 0, 1, 0, 1, 1, 1]
```

They can be obtained as a subsequence of the *cyclic* De Bruijn sequence of parameters $k = 2$ and $n = 3$:

```
sage: seq = DeBruijnSequences(2,3).an_element()
sage: print(Word(seq).string_rep())
00010111
sage: shift = lambda i: [(i+j)%2**3 for j in range(3)]
sage: for i in range(2**3):
....:     w = Word([b if j in shift(i) else '*' for j, b in enumerate(seq)])
....:     print(w.string_rep())
000*****
*001****
**010***
***101**
****011*
```

(continues on next page)

(continued from previous page)

```
*****111
0*****11
00*****1
```

```
>>> from sage.all import *
>>> seq = DeBruijnSequences(Integer(2),Integer(3)).an_element()
>>> print(Word(seq).string_rep())
00010111
>>> shift = lambda i: [(i+j)%Integer(2)**Integer(3) for j in range(Integer(3))]
>>> for i in range(Integer(2)**Integer(3)):
...     w = Word([b if j in shift(i) else '*' for j, b in enumerate(seq)])
...     print(w.string_rep())
000*****
*001****
**010***
***101**
****011*
*****111
0*****11
00*****1
```

This sequence is of length k^n, which is best possible as it is the number of k-ary strings of length n. One can equivalently define a De Bruijn sequence of parameters k and n as a cyclic sequence of length k^n in which all substring of length n are different.

See also Wikipedia article De_Bruijn_sequence.

AUTHOR:

- Eviatar Bach (2011): initial version
- Nathann Cohen (2011): Some work on the documentation and defined the `__contain__` method

class sage.combinat.debruijn_sequence.**DeBruijnSequences**(*k*, *n*)

Bases: UniqueRepresentation, Parent

Represent the De Bruijn sequences of given parameters k and n.

A De Bruijn sequence of parameters k and n is defined as the shortest cyclic sequence that incorporates all substrings of length n a k-ary alphabet.

This class can be used to generate the lexicographically smallest De Bruijn sequence, to count the number of existing De Bruijn sequences or to test whether a given sequence is De Bruijn.

INPUT:

- k – a natural number to define arity; the letters used are the integers $0, \ldots, k-1$
- n – a natural number that defines the length of the substring

EXAMPLES:

Obtaining a De Bruijn sequence:

```
sage: seq = DeBruijnSequences(2, 3).an_element()
sage: seq
[0, 0, 0, 1, 0, 1, 1, 1]
```

```
>>> from sage.all import *
>>> seq = DeBruijnSequences(Integer(2), Integer(3)).an_element()
>>> seq
[0, 0, 0, 1, 0, 1, 1, 1]
```

Testing whether it is indeed one:

```
sage: seq in DeBruijnSequences(2, 3)
True
```

```
>>> from sage.all import *
>>> seq in DeBruijnSequences(Integer(2), Integer(3))
True
```

The total number for these parameters:

```
sage: DeBruijnSequences(2, 3).cardinality()
2
```

```
>>> from sage.all import *
>>> DeBruijnSequences(Integer(2), Integer(3)).cardinality()
2
```

Note

This function only generates one De Bruijn sequence (the smallest lexicographically). Support for generating all possible ones may be added in the future.

an_element()

Return the lexicographically smallest De Bruijn sequence with the given parameters.

ALGORITHM:

The algorithm is described in the book “Combinatorial Generation” by Frank Ruskey. This program is based on a Ruby implementation by Jonas Elfström, which is based on the C program by Joe Sadawa.

EXAMPLES:

```
sage: DeBruijnSequences(2, 3).an_element()
[0, 0, 0, 1, 0, 1, 1, 1]
```

```
>>> from sage.all import *
>>> DeBruijnSequences(Integer(2), Integer(3)).an_element()
[0, 0, 0, 1, 0, 1, 1, 1]
```

cardinality()

Return the number of distinct De Bruijn sequences for the object’s parameters.

EXAMPLES:

```
sage: DeBruijnSequences(2, 5).cardinality()
2048
```

```
>>> from sage.all import *
>>> DeBruijnSequences(Integer(2), Integer(5)).cardinality()
2048
```

ALGORITHM:

The formula for cardinality is $k!^{k^{n-1}}/k^n$ [Ros2002].

sage.combinat.debruijn_sequence.**debruijn_sequence**(*k*, *n*)

The generating function for De Bruijn sequences. This avoids the object creation, so is significantly faster than accessing from DeBruijnSequence. For more information, see the documentation there. The algorithm used is from Frank Ruskey's "Combinatorial Generation".

INPUT:

- `k` – arity; must be an integer
- `n` – substring length; must be an integer

EXAMPLES:

```
sage: from sage.combinat.debruijn_sequence import debruijn_sequence
sage: debruijn_sequence(3, 1)
[0, 1, 2]
```

```
>>> from sage.all import *
>>> from sage.combinat.debruijn_sequence import debruijn_sequence
>>> debruijn_sequence(Integer(3), Integer(1))
[0, 1, 2]
```

sage.combinat.debruijn_sequence.**is_debruijn_sequence**(*seq*, *k*, *n*)

Given a sequence of integer elements in $0, \ldots, k-1$, tests whether it corresponds to a De Bruijn sequence of parameters k and n.

INPUT:

- `seq` – sequence of elements in $0, \ldots, k-1$
- `n`, `k` – integers

EXAMPLES:

```
sage: from sage.combinat.debruijn_sequence import is_debruijn_sequence
sage: s = DeBruijnSequences(2, 3).an_element()
sage: is_debruijn_sequence(s, 2, 3)
True
sage: is_debruijn_sequence(s + [0], 2, 3)
False
sage: is_debruijn_sequence([1] + s[1:], 2, 3)
False
```

```
>>> from sage.all import *
>>> from sage.combinat.debruijn_sequence import is_debruijn_sequence
>>> s = DeBruijnSequences(Integer(2), Integer(3)).an_element()
>>> is_debruijn_sequence(s, Integer(2), Integer(3))
True
>>> is_debruijn_sequence(s + [Integer(0)], Integer(2), Integer(3))
```

(continues on next page)

(continued from previous page)

```
False
>>> is_debruijn_sequence([Integer(1)] + s[Integer(1):], Integer(2), Integer(3))
False
```

5.1.71 Degree sequences

The present module implements the `DegreeSequences` class, whose instances represent the integer sequences of length n:

```
sage: DegreeSequences(6)
Degree sequences on 6 elements
```

```
>>> from sage.all import *
>>> DegreeSequences(Integer(6))
Degree sequences on 6 elements
```

With the object `DegreeSequences(n)`, one can:

- Check whether a sequence is indeed a degree sequence:

```
sage: DS = DegreeSequences(5)
sage: [4, 3, 3, 3, 3] in DS
True
sage: [4, 4, 0, 0, 0] in DS
False
```

```
>>> from sage.all import *
>>> DS = DegreeSequences(Integer(5))
>>> [Integer(4), Integer(3), Integer(3), Integer(3), Integer(3)] in DS
True
>>> [Integer(4), Integer(4), Integer(0), Integer(0), Integer(0)] in DS
False
```

- List all the possible degree sequences of length n:

```
sage: for seq in DegreeSequences(4):
....:     print(seq)
[0, 0, 0, 0]
[1, 1, 0, 0]
[2, 1, 1, 0]
[3, 1, 1, 1]
[1, 1, 1, 1]
[2, 2, 1, 1]
[2, 2, 2, 0]
[3, 2, 2, 1]
[2, 2, 2, 2]
[3, 3, 2, 2]
[3, 3, 3, 3]
```

```
>>> from sage.all import *
>>> for seq in DegreeSequences(Integer(4)):
...     print(seq)
```

(continues on next page)

(continued from previous page)

```
[0, 0, 0, 0]
[1, 1, 0, 0]
[2, 1, 1, 0]
[3, 1, 1, 1]
[1, 1, 1, 1]
[2, 2, 1, 1]
[2, 2, 2, 0]
[3, 2, 2, 1]
[2, 2, 2, 2]
[3, 3, 2, 2]
[3, 3, 3, 3]
```

Note

Given a degree sequence, one can obtain a graph realizing it by using `DegreeSequence()`. For instance:

```
sage: ds = [3, 3, 2, 2, 2, 2, 2, 1, 1, 0]
sage: g = graphs.DegreeSequence(ds)                                        #␣
↪needs networkx sage.graphs
sage: g.degree_sequence()                                                  #␣
↪needs networkx sage.graphs
[3, 3, 2, 2, 2, 2, 2, 1, 1, 0]
```

```
>>> from sage.all import *
>>> ds = [Integer(3), Integer(3), Integer(2), Integer(2), Integer(2), Integer(2),␣
↪Integer(2), Integer(1), Integer(1), Integer(0)]
>>> g = graphs.DegreeSequence(ds)                                        #␣
↪needs networkx sage.graphs
>>> g.degree_sequence()                                                  #␣
↪needs networkx sage.graphs
[3, 3, 2, 2, 2, 2, 2, 1, 1, 0]
```

Definitions

A sequence of integers $d_1, ..., d_n$ is said to be a *degree sequence* (or *graphic* sequence) if there exists a graph in which vertex i is of degree d_i. It is often required to be *non-increasing*, i.e. that $d_1 \geq ... \geq d_n$. Finding a graph with given degree sequence is known as *graph realization problem*.

An integer sequence need not necessarily be a degree sequence. Indeed, in a degree sequence of length n no integer can be larger than $n-1$ – the degree of a vertex is at most $n-1$ – and the sum of them is at most $n(n-1)$.

Degree sequences are completely characterized by a result from Erdős and Gallai:

Erdős and Gallai: *The sequence of integers* $d_1 \geq \cdots \geq d_n$ *is a degree sequence if and only if* $\sum_i d_i$ is even and $\forall i$

$$\sum_{j\leq i} d_j \leq j(j-1) + \sum_{j>i} \min(d_j, i).$$

Alternatively, a degree sequence can be defined recursively:

Havel and Hakimi: *The sequence of integers* $d_1 \geq ... \geq d_n$ *is a degree sequence if and only if* $d_2 - 1, ..., d_{d_1+1} - 1, d_{d_1+2}, ..., d_n$ *is also a degree sequence.*

Or equivalently:

Havel and Hakimi (bis): *If there is a realization of an integer sequence as a graph (i.e. if the sequence is a degree sequence), then it can be realized in such a way that the vertex of maximum degree Δ is adjacent to the Δ vertices of highest degree (except itself, of course).*

Algorithms

Checking whether a given sequence is a degree sequence

This is tested using Erdos and Gallai's criterion. It is also checked that the given sequence is non-increasing and has length n.

Iterating through the sequences of length n

From Havel and Hakimi's recursive definition of a degree sequence, one can build an enumeration algorithm as done in [RCES1994]. It consists in trying to **extend** a current degree sequence on n elements into a degree sequence on $n+1$ elements by adding a vertex of degree larger than those already present in the sequence. This can be seen as **reversing** the reduction operation described in Havel and Hakimi's characterization. This operation can appear in several different ways:

- Extensions of a degree sequence that do **not** change the value of the maximum element
  - If the maximum element of a given degree sequence is 0, then one can remove it to reduce the sequence, following Havel and Hakimi's rule. Conversely, if the maximum element of the (current) sequence is 0, then one can always extend it by adding a new element of degree 0 to the sequence.

$$0,0,0 \xrightarrow{Extension} \mathbf{0},0,0,0 \xrightarrow{Extension} \mathbf{0},0,0,...,0,0,0 \xrightarrow{Reduction} 0,0,0,0 \xrightarrow{Reduction} 0,0,0$$

  - If there are at least $\Delta+1$ elements of (maximum) degree Δ in a given degree sequence, then one can reduce it by removing a vertex of degree Δ and decreasing the values of Δ elements of value Δ to $\Delta-1$. Conversely, if the maximum element of the (current) sequence is $d>0$, then one can add a new element of degree d to the sequence if it can be linked to d elements of (current) degree $d-1$. Those d vertices of degree $d-1$ hence become vertices of degree d, and so d elements of degree $d-1$ are removed from the sequence while $d+1$ elements of degree d are added to it.

$$3,2,2,2,1 \xrightarrow{Extension} \mathbf{3},3,(2+1),(2+1),(2+1),1 = \mathbf{3},3,3,3,3,1 \xrightarrow{Reduction} 3,2,2,2,1$$

- Extension of a degree sequence that changes the value of the maximum element:
  - In the general case, i.e. when the number of elements of value $\Delta, \Delta-1$ is small compared to Δ (i.e. the maximum element of a given degree sequence), reducing a sequence strictly decreases the value of the maximum element. According to Havel and Hakimi's characterization there is only **one** way to reduce a sequence, but reversing this operation is more complicated than in the previous cases. Indeed, the following extensions are perfectly valid according to the reduction rule.

$$\begin{aligned}
2,1,1,0,0 &\xrightarrow{Extension} \mathbf{3},(2+1),(1+1),(1+1),0,0 = 3,3,2,2,0,0 \xrightarrow{Reduction} 2,1,1,0,0\\
2,1,1,0,0 &\xrightarrow{Extension} \mathbf{3},(2+1),(1+1),1,(0+1),0 = 3,3,2,1,1,0 \xrightarrow{Reduction} 2,1,1,0,0\\
2,1,1,0,0 &\xrightarrow{Extension} \mathbf{3},(2+1),1,1,(0+1),(0+1) = 3,3,1,1,1,1 \xrightarrow{Reduction} 2,1,1,0,0\\
&\ldots
\end{aligned}$$

  In order to extend a current degree sequence while strictly increasing its maximum degree, it is equivalent to pick a set I of elements of the degree sequence with $|I|>\Delta$ in such a way that the $(d_i+1)_{i\in I}$ are the $|I|$ maximum elements of the sequence $(d_i + {}^{1 \text{ if } i\in I}_{0 \text{ if } i\notin I})_{1\leq i\leq n}$, and to add to this new sequence an element of value $|I|$. The non-increasing sequence containing the elements $|I|$ and $(d_i + {}^{1 \text{ if } i\in I}_{0 \text{ if } i\notin I})_{1\leq i\leq n}$ can be reduced to $(d_i)_{1\leq i\leq n}$ by Havel and Hakimi's rule.

$$...1,1,2,\mathbf{2},\mathbf{2},2,2,3,3,\underline{3},\mathbf{3},\mathbf{3},\mathbf{4},\mathbf{6},... \xrightarrow{Extension} ...1,1,2,2,2,3,3,\underline{3},\mathbf{3},\mathbf{3},\mathbf{4},\mathbf{4},\mathbf{5},\mathbf{7},...$$

The number of possible sets I having this property (i.e. the number of possible extensions of a sequence) is smaller than it seems. Indeed, by definition, if $j \notin I$ then for all $i \in I$ the inequality $d_j \leq d_i + 1$ holds. Hence, each set I is entirely determined by the largest element d_k of the sequence that it does **not** contain (hence I contains $\{1, ..., k-1\}$), and by the cardinalities of $\{i \in I : d_i = d_k\}$ and $\{i \in I : d_i = d_k - 1\}$.

$$I = \{i \in I : d_i = d_k\} \cup \{i \in I : d_i = d_k - 1\} \cup \{i : d_i > d_k\}.$$

The number of possible extensions is hence at most cubic, and is easily enumerated.

About the implementation

In the actual implementation of the enumeration algorithm, the degree sequence is stored differently for reasons of efficiency.

Indeed, when enumerating all the degree sequences of length n, Sage first allocates an array `seq` of $n+1$ integers where `seq[i]` is the number of elements of value `i` in the current sequence. Obviously, `seq[n]=0` holds in permanence : it is useful to allocate a larger array than necessary to simplify the code. The `seq` array is a global variable.

The recursive function `enum(depth, maximum)` is the one building the list of sequences. It builds the list of degree sequences of length n which *extend* the sequence currently stored in `seq[0]...seq[depth-1]`. When it is called, `maximum` must be set to the maximum value of an element in the partial sequence `seq[0]...seq[depth-1]`.

If during its run the function `enum` heavily works on the content of the `seq` array, the value of `seq` is the **same** before and after the run of `enum`.

Extending the current partial sequence

The two cases for which the maximum degree of the partial sequence does not change are easy to detect. It is (slightly) harder to enumerate all the sets I corresponding to possible extensions of the partial sequence. As said previously, to each set I one can associate an integer `current_box` such that I contains all the i satisfying $d_i > current\_box$. The variable `taken` represents the number of all such elements i, so that when enumerating all possible sets I in the algorithm we have the equality

$$I = \text{taken} + \text{number of elements of value } current\_box + \text{number of elements of value } current\_box - 1.$$

> **Warning**
>
> For the moment, iterating over all degree sequences involves building the list of them first, then iterate on this list. This is obviously bad, as it requires uselessly a **lot** of memory for large values of n.
>
> This should be changed. Updating the code does not require more than a couple of minutes.

class `sage.combinat.degree_sequences.`**`DegreeSequences`**`(n)`

Bases: `object`

Degree Sequences.

An instance of this class represents the degree sequences of graphs on a given number n of vertices. It can be used to list and count them, as well as to test whether a sequence is a degree sequence. For more information, please refer to the documentation of the *`DegreeSequence`* module.

EXAMPLES:

```
sage: DegreeSequences(8)
Degree sequences on 8 elements
sage: [3,3,2,2,2,2,2,2] in DegreeSequences(8)
True
```

```
>>> from sage.all import *
>>> DegreeSequences(Integer(8))
Degree sequences on 8 elements
>>> [Integer(3),Integer(3),Integer(2),Integer(2),Integer(2),Integer(2),Integer(2),
↪Integer(2)] in DegreeSequences(Integer(8))
True
```

5.1.72 Derangements

AUTHORS:

- Alasdair McAndrew (2010-05): Initial version
- Travis Scrimshaw (2013-03-30): Put derangements into category framework

class sage.combinat.derangements.**Derangement**(*parent*, **args*, ***kwds*)

Bases: *CombinatorialElement*

A derangement.

A derangement on a set S is a permutation σ such that $\sigma(x) \neq x$ for all $x \in S$, i.e. σ is a permutation of S with no fixed points.

EXAMPLES:

```
sage: D = Derangements(4)
sage: elt = D([4,3,2,1])
sage: TestSuite(elt).run()
```

```
>>> from sage.all import *
>>> D = Derangements(Integer(4))
>>> elt = D([Integer(4),Integer(3),Integer(2),Integer(1)])
>>> TestSuite(elt).run()
```

to_permutation()

Return the permutation corresponding to `self`.

EXAMPLES:

```
sage: D = Derangements(4)
sage: p = D([4,3,2,1]).to_permutation(); p
[4, 3, 2, 1]
sage: type(p)
<class 'sage.combinat.permutation.StandardPermutations_all_with_category.
↪element_class'>
sage: D = Derangements([1, 3, 3, 4])
sage: D[0].to_permutation()
Traceback (most recent call last):
...
ValueError: can only convert to a permutation for derangements of [1, 2, ...,␣
↪n]
```

```
>>> from sage.all import *
>>> D = Derangements(Integer(4))
>>> p = D([Integer(4),Integer(3),Integer(2),Integer(1)]).to_permutation(); p
[4, 3, 2, 1]
>>> type(p)
<class 'sage.combinat.permutation.StandardPermutations_all_with_category.
→element_class'>
>>> D = Derangements([Integer(1), Integer(3), Integer(3), Integer(4)])
>>> D[Integer(0)].to_permutation()
Traceback (most recent call last):
...
ValueError: can only convert to a permutation for derangements of [1, 2, ...,␣
→n]
```

class sage.combinat.derangements.**Derangements**(*x*)

Bases: UniqueRepresentation, Parent

The class of all derangements of a set or multiset.

A derangement on a set S is a permutation σ such that $\sigma(x) \neq x$ for all $x \in S$, i.e. σ is a permutation of S with no fixed points.

For an integer, or a list or string with all elements distinct, the derangements are obtained by a standard result described in [BV2004]. For a list or string with repeated elements, the derangements are formed by computing all permutations of the input and discarding all non-derangements.

INPUT:

- x – can be an integer which corresponds to derangements of $\{1, 2, 3, \ldots, x\}$, a list, or a string

REFERENCES:

- [BV2004]
- Wikipedia article Derangement

EXAMPLES:

```
sage: D1 = Derangements([2,3,4,5])
sage: D1.list()
[[3, 4, 5, 2],
 [5, 4, 2, 3],
 [3, 5, 2, 4],
 [4, 5, 3, 2],
 [4, 2, 5, 3],
 [5, 2, 3, 4],
 [5, 4, 3, 2],
 [4, 5, 2, 3],
 [3, 2, 5, 4]]
sage: D1.cardinality()
9
sage: D1.random_element() # random
[4, 2, 5, 3]
sage: D2 = Derangements([1,2,3,1,2,3])
sage: D2.cardinality()
10
sage: D2.list()
```

(continues on next page)

(continued from previous page)

```
[[2, 1, 1, 3, 3, 2],
 [2, 1, 2, 3, 3, 1],
 [2, 3, 1, 2, 3, 1],
 [2, 3, 1, 3, 1, 2],
 [2, 3, 2, 3, 1, 1],
 [3, 1, 1, 2, 3, 2],
 [3, 1, 2, 2, 3, 1],
 [3, 1, 2, 3, 1, 2],
 [3, 3, 1, 2, 1, 2],
 [3, 3, 2, 2, 1, 1]]
sage: D2.random_element() # random
[2, 3, 1, 3, 1, 2]
```

```
>>> from sage.all import *
>>> D1 = Derangements([Integer(2),Integer(3),Integer(4),Integer(5)])
>>> D1.list()
[[3, 4, 5, 2],
 [5, 4, 2, 3],
 [3, 5, 2, 4],
 [4, 5, 3, 2],
 [4, 2, 5, 3],
 [5, 2, 3, 4],
 [5, 4, 3, 2],
 [4, 5, 2, 3],
 [3, 2, 5, 4]]
>>> D1.cardinality()
9
>>> D1.random_element() # random

 [2, 3, 2, 3, 1, 1],
 [3, 1, 1, 2, 3, 2],
 [3, 1, 2, 2, 3, 1],
 [3, 1, 2, 3, 1, 2],
 [3, 3, 1, 2, 1, 2],
 [3, 3, 2, 2, 1, 1]]
>>> D2.random_element() # random
[2, 3, 1, 3, 1, 2]
```

Element

alias of `Derangement`

cardinality()

Counts the number of derangements of a positive integer, a list, or a string. The list or string may contain repeated elements. If an integer n is given, the value returned is the number of derangements of $[1, 2, 3, \ldots, n]$.

For an integer, or a list or string with all elements distinct, the value is obtained by the standard result $D_2 = 1, D_3 = 2, D_n = (n-1)(D_{n-1} + D_{n-2})$.

For a list or string with repeated elements, the number of derangements is computed by Macmahon's theorem. If the numbers of repeated elements are $a_1, a_2, \ldots, a_k$ then the number of derangements is given by the coefficient of $x_1 x_2 \cdots x_k$ in the expansion of $\prod_{i=0}^{k} (S - s_i)^{a_i}$ where $S = x_1 + x_2 + \cdots + x_k$.

EXAMPLES:

```
sage: D = Derangements(5)
sage: D.cardinality()
44
sage: D = Derangements([1,44,918,67,254])
sage: D.cardinality()
44
sage: D = Derangements(['A','AT','CAT','CATS','CARTS'])
sage: D.cardinality()
44
sage: D = Derangements('UNCOPYRIGHTABLE')
sage: D.cardinality()
481066515734
sage: D = Derangements([1,1,2,2,3,3])
sage: D.cardinality()
10
sage: D = Derangements('SATTAS')
sage: D.cardinality()
10
sage: D = Derangements([1,1,2,2,2])
sage: D.cardinality()
0
```

```
>>> from sage.all import *
>>> D = Derangements(Integer(5))
>>> D.cardinality()
44
>>> D = Derangements([Integer(1),Integer(44),Integer(918),Integer(67),
↪Integer(254)])
>>> D.cardinality()
44
>>> D = Derangements(['A','AT','CAT','CATS','CARTS'])
>>> D.cardinality()
44
>>> D = Derangements('UNCOPYRIGHTABLE')
>>> D.cardinality()
481066515734
>>> D = Derangements([Integer(1),Integer(1),Integer(2),Integer(2),Integer(3),
↪Integer(3)])
>>> D.cardinality()
10
>>> D = Derangements('SATTAS')
>>> D.cardinality()
10
>>> D = Derangements([Integer(1),Integer(1),Integer(2),Integer(2),Integer(2)])
>>> D.cardinality()
```

(continues on next page)

(continued from previous page)

```
0
```

random_element()

Produce all derangements of a positive integer, a list, or a string. The list or string may contain repeated elements. If an integer n is given, then a random derangements of $[1, 2, 3, \dots, n]$ is returned

For an integer, or a list or string with all elements distinct, the value is obtained by an algorithm described in [MPP2008]. For a list or string with repeated elements the derangement is formed by choosing an element at random from the list of all possible derangements.

OUTPUT:

A single list or string containing a derangement, or an empty list if there are no derangements.

EXAMPLES:

```
sage: D = Derangements(4)
sage: D.random_element() # random
[2, 3, 4, 1]
sage: D = Derangements(['A','AT','CAT','CATS','CARTS','CARETS'])
sage: D.random_element() # random
['AT', 'CARTS', 'A', 'CAT', 'CARETS', 'CATS']
sage: D = Derangements('UNCOPYRIGHTABLE')
sage: D.random_element() # random
['C', 'U', 'I', 'H', 'O', 'G', 'N', 'B', 'E', 'L', 'A', 'R', 'P', 'Y', 'T']
sage: D = Derangements([1,1,1,1,2,2,2,2,3,3,3,3])
sage: D.random_element() # random
[3, 2, 2, 3, 1, 3, 1, 3, 2, 1, 1, 2]
sage: D = Derangements('ESSENCES')
sage: D.random_element() # random
['N', 'E', 'E', 'C', 'S', 'S', 'S', 'E']
sage: D = Derangements([1,1,2,2,2])
sage: D.random_element()
[]
```

```
>>> from sage.all import *
>>> D = Derangements(Integer(4))
>>> D.random_element() # random
[2, 3, 4, 1]
>>> D = Derangements(['A','AT','CAT','CATS','CARTS','CARETS'])
>>> D.random_element() # random
['AT', 'CARTS', 'A', 'CAT', 'CARETS', 'CATS']
>>> D = Derangements('UNCOPYRIGHTABLE')
>>> D.random_element() # random
['C', 'U', 'I', 'H', 'O', 'G', 'N', 'B', 'E', 'L', 'A', 'R', 'P', 'Y', 'T']
>>> D = Derangements([Integer(1),Integer(1),Integer(1),Integer(1),Integer(2),
↪Integer(2),Integer(2),Integer(2),Integer(3),Integer(3),Integer(3),
↪Integer(3)])
>>> D.random_element() # random
[3, 2, 2, 3, 1, 3, 1, 3, 2, 1, 1, 2]
>>> D = Derangements('ESSENCES')
>>> D.random_element() # random
['N', 'E', 'E', 'C', 'S', 'S', 'S', 'E']
>>> D = Derangements([Integer(1),Integer(1),Integer(2),Integer(2),Integer(2)])
```

(continues on next page)

(continued from previous page)

```
>>> D.random_element()
[]
```

5.1.73 Descent Algebras

AUTHORS:

- Travis Scrimshaw (2013-07-28): Initial version

class sage.combinat.descent_algebra.**DescentAlgebra**(*R*, *n*)

Bases: UniqueRepresentation, Parent

Solomon's descent algebra.

The descent algebra Σ_n over a ring R is a subalgebra of the symmetric group algebra RS_n. (The product in the latter algebra is defined by $(pq)(i) = q(p(i))$ for any two permutations p and q in S_n and every $i \in \{1, 2, \ldots, n\}$. The algebra Σ_n inherits this product.)

There are three bases currently implemented for Σ_n:

- the standard basis D_S of (sums of) descent classes, indexed by subsets S of $\{1, 2, \ldots, n-1\}$,
- the subset basis B_p, indexed by compositions p of n,
- the idempotent basis I_p, indexed by compositions p of n, which is used to construct the mutually orthogonal idempotents of the symmetric group algebra.

The idempotent basis is only defined when R is a $\mathbf{Q}$-algebra.

We follow the notations and conventions in [GR1989], apart from the order of multiplication being different from the one used in that article. Schocker's exposition [Sch2004], in turn, uses the same order of multiplication as we are, but has different notations for the bases.

INPUT:

- R – the base ring
- n – nonnegative integer

REFERENCES:

- [GR1989]
- [At1992]
- [MR1995]
- [Sch2004]

EXAMPLES:

```
sage: DA = DescentAlgebra(QQ, 4)
sage: D = DA.D(); D
Descent algebra of 4 over Rational Field in the standard basis
sage: B = DA.B(); B
Descent algebra of 4 over Rational Field in the subset basis
sage: I = DA.I(); I
Descent algebra of 4 over Rational Field in the idempotent basis
sage: basis_B = B.basis()
sage: elt = basis_B[Composition([1,2,1])] + 4*basis_B[Composition([1,3])]; elt
B[1, 2, 1] + 4*B[1, 3]
```

(continues on next page)

(continued from previous page)

```
sage: D(elt)
5*D{} + 5*D{1} + D{1, 3} + D{3}
sage: I(elt)
7/6*I[1, 1, 1, 1] + 2*I[1, 1, 2] + 3*I[1, 2, 1] + 4*I[1, 3]
```

```
>>> from sage.all import *
>>> DA = DescentAlgebra(QQ, Integer(4))
>>> D = DA.D(); D
Descent algebra of 4 over Rational Field in the standard basis
>>> B = DA.B(); B
Descent algebra of 4 over Rational Field in the subset basis
>>> I = DA.I(); I
Descent algebra of 4 over Rational Field in the idempotent basis
>>> basis_B = B.basis()
>>> elt = basis_B[Composition([Integer(1),Integer(2),Integer(1)])] +␣
↪Integer(4)*basis_B[Composition([Integer(1),Integer(3)])]; elt
B[1, 2, 1] + 4*B[1, 3]
>>> D(elt)
5*D{} + 5*D{1} + D{1, 3} + D{3}
>>> I(elt)
7/6*I[1, 1, 1, 1] + 2*I[1, 1, 2] + 3*I[1, 2, 1] + 4*I[1, 3]
```

As syntactic sugar, one can use the notation `D[i,...,l]` to construct elements of the basis; note that for the empty set one must use `D[[]]` due to Python's syntax:

```
sage: D[[]] + D[2] + 2*D[1,2]
D{} + 2*D{1, 2} + D{2}
```

```
>>> from sage.all import *
>>> D[[]] + D[Integer(2)] + Integer(2)*D[Integer(1),Integer(2)]
D{} + 2*D{1, 2} + D{2}
```

The same syntax works for the other bases:

```
sage: I[1,2,1] + 3*I[4] + 2*I[3,1]
I[1, 2, 1] + 2*I[3, 1] + 3*I[4]
```

```
>>> from sage.all import *
>>> I[Integer(1),Integer(2),Integer(1)] + Integer(3)*I[Integer(4)] +␣
↪Integer(2)*I[Integer(3),Integer(1)]
I[1, 2, 1] + 2*I[3, 1] + 3*I[4]
```

class B(*alg*, *prefix='B'*)

Bases: `CombinatorialFreeModule`, `BindableClass`

The subset basis of a descent algebra (indexed by compositions).

The subset basis $(B_S)_{S\subseteq\{1,2,\ldots,n-1\}}$ of Σ_n is formed by

$$B_S = \sum_{T\subseteq S} D_T,$$

where $(D_S)_{S\subseteq\{1,2,\ldots,n-1\}}$ is the *standard basis*. However it is more natural to index the subset basis by compositions of n under the bijection $\{i_1, i_2, \ldots, i_k\} \mapsto (i_1, i_2 - i_1, i_3 - i_2, \ldots, i_k - i_{k-1}, n - i_k)$ (where $i_1 < i_2 < \cdots < i_k$), which is what Sage uses to index the basis.

The basis element B_p is denoted Ξ^p in [Sch2004].

By using compositions of n, the product $B_p B_q$ becomes a sum over the nonnegative-integer matrices M with row sum p and column sum q. The summand corresponding to M is B_c, where c is the composition obtained by reading M row-by-row from left-to-right and top-to-bottom and removing all zeroes. This multiplication rule is commonly called "Solomon's Mackey formula".

EXAMPLES:

```
sage: DA = DescentAlgebra(QQ, 4)
sage: B = DA.B()
sage: list(B.basis())
[B[1, 1, 1, 1], B[1, 1, 2], B[1, 2, 1], B[1, 3],
 B[2, 1, 1], B[2, 2], B[3, 1], B[4]]
```

```
>>> from sage.all import *
>>> DA = DescentAlgebra(QQ, Integer(4))
>>> B = DA.B()
>>> list(B.basis())
[B[1, 1, 1, 1], B[1, 1, 2], B[1, 2, 1], B[1, 3],
 B[2, 1, 1], B[2, 2], B[3, 1], B[4]]
```

one_basis()

Return the identity element which is the composition $[n]$, as per `AlgebrasWithBasis.ParentMethods.one_basis`.

EXAMPLES:

```
sage: DescentAlgebra(QQ, 4).B().one_basis()
[4]
sage: DescentAlgebra(QQ, 0).B().one_basis()
[]

sage: all( U * DescentAlgebra(QQ, 3).B().one() == U
....:      for U in DescentAlgebra(QQ, 3).B().basis() )
True
```

```
>>> from sage.all import *
>>> DescentAlgebra(QQ, Integer(4)).B().one_basis()
[4]
>>> DescentAlgebra(QQ, Integer(0)).B().one_basis()
[]

>>> all( U * DescentAlgebra(QQ, Integer(3)).B().one() == U
...      for U in DescentAlgebra(QQ, Integer(3)).B().basis() )
True
```

product_on_basis(p, q)

Return $B_p B_q$, where p and q are compositions of n.

EXAMPLES:

```
sage: DA = DescentAlgebra(QQ, 4)
sage: B = DA.B()
sage: p = Composition([1,2,1])
sage: q = Composition([3,1])
sage: B.product_on_basis(p, q)
B[1, 1, 1, 1] + 2*B[1, 2, 1]
```

```
>>> from sage.all import *
>>> DA = DescentAlgebra(QQ, Integer(4))
>>> B = DA.B()
>>> p = Composition([Integer(1),Integer(2),Integer(1)])
>>> q = Composition([Integer(3),Integer(1)])
>>> B.product_on_basis(p, q)
B[1, 1, 1, 1] + 2*B[1, 2, 1]
```

to_D_basis(*p*)

Return B_p as a linear combination of D-basis elements.

EXAMPLES:

```
sage: DA = DescentAlgebra(QQ, 4)
sage: B = DA.B()
sage: D = DA.D()
sage: list(map(D, B.basis()))  # indirect doctest
[D{} + D{1} + D{1, 2} + D{1, 2, 3}
  + D{1, 3} + D{2} + D{2, 3} + D{3},
 D{} + D{1} + D{1, 2} + D{2},
 D{} + D{1} + D{1, 3} + D{3},
 D{} + D{1},
 D{} + D{2} + D{2, 3} + D{3},
 D{} + D{2},
 D{} + D{3},
 D{}]
```

```
>>> from sage.all import *
>>> DA = DescentAlgebra(QQ, Integer(4))
>>> B = DA.B()
>>> D = DA.D()
>>> list(map(D, B.basis()))  # indirect doctest
[D{} + D{1} + D{1, 2} + D{1, 2, 3}
  + D{1, 3} + D{2} + D{2, 3} + D{3},
 D{} + D{1} + D{1, 2} + D{2},
 D{} + D{1} + D{1, 3} + D{3},
 D{} + D{1},
 D{} + D{2} + D{2, 3} + D{3},
 D{} + D{2},
 D{} + D{3},
 D{}]
```

to_I_basis(*p*)

Return B_p as a linear combination of I-basis elements.

This is done using the formula

$$B_p = \sum_{q \leq p} \frac{1}{\mathbf{k}!(q,p)} I_q,$$

where $\leq$ is the refinement order and $\mathbf{k}!(q,p)$ is defined as follows: When $q \leq p$, we can write q as a concatenation $q_{(1)}q_{(2)} \cdots q_{(k)}$ with each $q_{(i)}$ being a composition of the i-th entry of p, and then we set $\mathbf{k}!(q,p)$ to be $l(q_{(1)})!l(q_{(2)})! \cdots l(q_{(k)})!$, where $l(r)$ denotes the number of parts of any composition r.

EXAMPLES:

```
sage: DA = DescentAlgebra(QQ, 4)
sage: B = DA.B()
sage: I = DA.I()
sage: list(map(I, B.basis()))  # indirect doctest
[I[1, 1, 1, 1],
 1/2*I[1, 1, 1, 1] + I[1, 1, 2],
 1/2*I[1, 1, 1, 1] + I[1, 2, 1],
 1/6*I[1, 1, 1, 1] + 1/2*I[1, 1, 2] + 1/2*I[1, 2, 1] + I[1, 3],
 1/2*I[1, 1, 1, 1] + I[2, 1, 1],
 1/4*I[1, 1, 1, 1] + 1/2*I[1, 1, 2] + 1/2*I[2, 1, 1] + I[2, 2],
 1/6*I[1, 1, 1, 1] + 1/2*I[1, 2, 1] + 1/2*I[2, 1, 1] + I[3, 1],
 1/24*I[1, 1, 1, 1] + 1/6*I[1, 1, 2] + 1/6*I[1, 2, 1]
  + 1/2*I[1, 3] + 1/6*I[2, 1, 1] + 1/2*I[2, 2] + 1/2*I[3, 1] + I[4]]
```

```
>>> from sage.all import *
>>> DA = DescentAlgebra(QQ, Integer(4))
>>> B = DA.B()
>>> I = DA.I()
>>> list(map(I, B.basis()))  # indirect doctest
[I[1, 1, 1, 1],
 1/2*I[1, 1, 1, 1] + I[1, 1, 2],
 1/2*I[1, 1, 1, 1] + I[1, 2, 1],
 1/6*I[1, 1, 1, 1] + 1/2*I[1, 1, 2] + 1/2*I[1, 2, 1] + I[1, 3],
 1/2*I[1, 1, 1, 1] + I[2, 1, 1],
 1/4*I[1, 1, 1, 1] + 1/2*I[1, 1, 2] + 1/2*I[2, 1, 1] + I[2, 2],
 1/6*I[1, 1, 1, 1] + 1/2*I[1, 2, 1] + 1/2*I[2, 1, 1] + I[3, 1],
 1/24*I[1, 1, 1, 1] + 1/6*I[1, 1, 2] + 1/6*I[1, 2, 1]
  + 1/2*I[1, 3] + 1/6*I[2, 1, 1] + 1/2*I[2, 2] + 1/2*I[3, 1] + I[4]]
```

to_nsym(*p*)

Return B_p as an element in $NSym$, the non-commutative symmetric functions.

This maps B_p to S_p where S denotes the Complete basis of $NSym$.

EXAMPLES:

```
sage: B = DescentAlgebra(QQ, 4).B()
sage: S = NonCommutativeSymmetricFunctions(QQ).Complete()
sage: list(map(S, B.basis()))  # indirect doctest
[S[1, 1, 1, 1],
 S[1, 1, 2],
 S[1, 2, 1],
 S[1, 3],
 S[2, 1, 1],
```

(continues on next page)

(continued from previous page)

```
 S[2, 2],
 S[3, 1],
 S[4]]
```

```
>>> from sage.all import *
>>> B = DescentAlgebra(QQ, Integer(4)).B()
>>> S = NonCommutativeSymmetricFunctions(QQ).Complete()
>>> list(map(S, B.basis()))   # indirect doctest
[S[1, 1, 1, 1],
 S[1, 1, 2],
 S[1, 2, 1],
 S[1, 3],
 S[2, 1, 1],
 S[2, 2],
 S[3, 1],
 S[4]]
```

class D(*alg*, *prefix='D'*)

Bases: *CombinatorialFreeModule*, BindableClass

The standard basis of a descent algebra.

This basis is indexed by $S \subseteq \{1, 2, \ldots, n-1\}$, and the basis vector indexed by S is the sum of all permutations, taken in the symmetric group algebra RS_n, whose descent set is S. We denote this basis vector by D_S.

Occasionally this basis appears in literature but indexed by compositions of n rather than subsets of $\{1, 2, \ldots, n-1\}$. The equivalence between these two indexings is owed to the bijection from the power set of $\{1, 2, \ldots, n-1\}$ to the set of all compositions of n which sends every subset $\{i_1, i_2, \ldots, i_k\}$ of $\{1, 2, \ldots, n-1\}$ (with $i_1 < i_2 < \cdots < i_k$) to the composition $(i_1, i_2 - i_1, \ldots, i_k - i_{k-1}, n - i_k)$.

The basis element corresponding to a composition p (or to the subset of $\{1, 2, \ldots, n-1\}$) is denoted Δ^p in [Sch2004].

EXAMPLES:

```
sage: DA = DescentAlgebra(QQ, 4)
sage: D = DA.D()
sage: list(D.basis())
[D{}, D{1}, D{2}, D{3}, D{1, 2}, D{1, 3}, D{2, 3}, D{1, 2, 3}]

sage: DA = DescentAlgebra(QQ, 0)
sage: D = DA.D()
sage: list(D.basis())
[D{}]
```

```
>>> from sage.all import *
>>> DA = DescentAlgebra(QQ, Integer(4))
>>> D = DA.D()
>>> list(D.basis())
[D{}, D{1}, D{2}, D{3}, D{1, 2}, D{1, 3}, D{2, 3}, D{1, 2, 3}]

>>> DA = DescentAlgebra(QQ, Integer(0))
>>> D = DA.D()
```

(continues on next page)

(continued from previous page)

```
>>> list(D.basis())
[D{}]
```

one_basis()

Return the identity element, as per `AlgebrasWithBasis.ParentMethods.one_basis`.

EXAMPLES:

```
sage: DescentAlgebra(QQ, 4).D().one_basis()
()
sage: DescentAlgebra(QQ, 0).D().one_basis()
()

sage: all( U * DescentAlgebra(QQ, 3).D().one() == U
....:      for U in DescentAlgebra(QQ, 3).D().basis() )
True
```

```
>>> from sage.all import *
>>> DescentAlgebra(QQ, Integer(4)).D().one_basis()
()
>>> DescentAlgebra(QQ, Integer(0)).D().one_basis()
()

>>> all( U * DescentAlgebra(QQ, Integer(3)).D().one() == U
...      for U in DescentAlgebra(QQ, Integer(3)).D().basis() )
True
```

product_on_basis(S, T)

Return $D_S D_T$, where S and T are subsets of $[n-1]$.

EXAMPLES:

```
sage: DA = DescentAlgebra(QQ, 4)
sage: D = DA.D()
sage: D.product_on_basis((1, 3), (2,))
D{} + D{1} + D{1, 2} + 2*D{1, 2, 3} + D{1, 3} + D{2} + D{2, 3} + D{3}
```

```
>>> from sage.all import *
>>> DA = DescentAlgebra(QQ, Integer(4))
>>> D = DA.D()
>>> D.product_on_basis((Integer(1), Integer(3)), (Integer(2),))
D{} + D{1} + D{1, 2} + 2*D{1, 2, 3} + D{1, 3} + D{2} + D{2, 3} + D{3}
```

to_B_basis(S)

Return D_S as a linear combination of B_p-basis elements.

EXAMPLES:

```
sage: DA = DescentAlgebra(QQ, 4)
sage: D = DA.D()
sage: B = DA.B()
sage: list(map(B, D.basis()))  # indirect doctest
[B[4],
```

(continues on next page)

(continued from previous page)

```
 B[1, 3] - B[4],
 B[2, 2] - B[4],
 B[3, 1] - B[4],
 B[1, 1, 2] - B[1, 3] - B[2, 2] + B[4],
 B[1, 2, 1] - B[1, 3] - B[3, 1] + B[4],
 B[2, 1, 1] - B[2, 2] - B[3, 1] + B[4],
 B[1, 1, 1, 1] - B[1, 1, 2] - B[1, 2, 1] + B[1, 3]
  - B[2, 1, 1] + B[2, 2] + B[3, 1] - B[4]]
```

```
>>> from sage.all import *
>>> DA = DescentAlgebra(QQ, Integer(4))
>>> D = DA.D()
>>> B = DA.B()
>>> list(map(B, D.basis()))   # indirect doctest
[B[4],
 B[1, 3] - B[4],
 B[2, 2] - B[4],
 B[3, 1] - B[4],
 B[1, 1, 2] - B[1, 3] - B[2, 2] + B[4],
 B[1, 2, 1] - B[1, 3] - B[3, 1] + B[4],
 B[2, 1, 1] - B[2, 2] - B[3, 1] + B[4],
 B[1, 1, 1, 1] - B[1, 1, 2] - B[1, 2, 1] + B[1, 3]
  - B[2, 1, 1] + B[2, 2] + B[3, 1] - B[4]]
```

to_symmetric_group_algebra_on_basis(S)

Return D_S as a linear combination of basis elements in the symmetric group algebra.

EXAMPLES:

```
sage: D = DescentAlgebra(QQ, 4).D()
sage: [D.to_symmetric_group_algebra_on_basis(tuple(b))
....:  for b in Subsets(3)]
[[1, 2, 3, 4],
 [2, 1, 3, 4] + [3, 1, 2, 4] + [4, 1, 2, 3],
 [1, 3, 2, 4] + [1, 4, 2, 3] + [2, 3, 1, 4]
  + [2, 4, 1, 3] + [3, 4, 1, 2],
 [1, 2, 4, 3] + [1, 3, 4, 2] + [2, 3, 4, 1],
 [3, 2, 1, 4] + [4, 2, 1, 3] + [4, 3, 1, 2],
 [2, 1, 4, 3] + [3, 1, 4, 2] + [3, 2, 4, 1]
  + [4, 1, 3, 2] + [4, 2, 3, 1],
 [1, 4, 3, 2] + [2, 4, 3, 1] + [3, 4, 2, 1],
 [4, 3, 2, 1]]
```

```
>>> from sage.all import *
>>> D = DescentAlgebra(QQ, Integer(4)).D()
>>> [D.to_symmetric_group_algebra_on_basis(tuple(b))
...  for b in Subsets(Integer(3))]
[[1, 2, 3, 4],
 [2, 1, 3, 4] + [3, 1, 2, 4] + [4, 1, 2, 3],
 [1, 3, 2, 4] + [1, 4, 2, 3] + [2, 3, 1, 4]
  + [2, 4, 1, 3] + [3, 4, 1, 2],
 [1, 2, 4, 3] + [1, 3, 4, 2] + [2, 3, 4, 1],
```

(continues on next page)

(continued from previous page)

```
[3, 2, 1, 4] + [4, 2, 1, 3] + [4, 3, 1, 2],
[2, 1, 4, 3] + [3, 1, 4, 2] + [3, 2, 4, 1]
 + [4, 1, 3, 2] + [4, 2, 3, 1],
[1, 4, 3, 2] + [2, 4, 3, 1] + [3, 4, 2, 1],
[4, 3, 2, 1]]
```

class I(*alg*, *prefix='I'*)

Bases: `CombinatorialFreeModule`, `BindableClass`

The idempotent basis of a descent algebra.

The idempotent basis $(I_p)_{p \models n}$ is a basis for Σ_n whenever the ground ring is a $\mathbf{Q}$-algebra. One way to compute it is using the formula (Theorem 3.3 in [GR1989])

$$I_p = \sum_{q \leq p} \frac{(-1)^{l(q)-l(p)}}{\mathbf{k}(q,p)} B_q,$$

where $\leq$ is the refinement order and $l(r)$ denotes the number of parts of any composition r, and where $\mathbf{k}(q,p)$ is defined as follows: When $q \leq p$, we can write q as a concatenation $q_{(1)} q_{(2)} \cdots q_{(k)}$ with each $q_{(i)}$ being a composition of the i-th entry of p, and then we set $\mathbf{k}(q,p)$ to be the product $l(q_{(1)}) l(q_{(2)}) \cdots l(q_{(k)})$.

Let $\lambda(p)$ denote the partition obtained from a composition p by sorting. This basis is called the idempotent basis since for any q such that $\lambda(p) = \lambda(q)$, we have:

$$I_p I_q = s(\lambda) I_p$$

where λ denotes $\lambda(p) = \lambda(q)$, and where $s(\lambda)$ is the stabilizer of λ in S_n. (This is part of Theorem 4.2 in [GR1989].)

It is also straightforward to compute the idempotents E_λ for the symmetric group algebra by the formula (Theorem 3.2 in [GR1989]):

$$E_\lambda = \frac{1}{k!} \sum_{\lambda(p)=\lambda} I_p.$$

Note

The basis elements are not orthogonal idempotents.

EXAMPLES:

```
sage: DA = DescentAlgebra(QQ, 4)
sage: I = DA.I()
sage: list(I.basis())
[I[1, 1, 1, 1], I[1, 1, 2], I[1, 2, 1], I[1, 3], I[2, 1, 1], I[2, 2], I[3, 1],
↪ I[4]]
```

```
>>> from sage.all import *
>>> DA = DescentAlgebra(QQ, Integer(4))
>>> I = DA.I()
>>> list(I.basis())
[I[1, 1, 1, 1], I[1, 1, 2], I[1, 2, 1], I[1, 3], I[2, 1, 1], I[2, 2], I[3, 1],
↪ I[4]]
```

idempotent (*la*)

Return the idempotent corresponding to the partition `la` of n.

EXAMPLES:

```
sage: I = DescentAlgebra(QQ, 4).I()
sage: E = I.idempotent([3,1]); E
1/2*I[1, 3] + 1/2*I[3, 1]
sage: E*E == E
True
sage: E2 = I.idempotent([2,1,1]); E2
1/6*I[1, 1, 2] + 1/6*I[1, 2, 1] + 1/6*I[2, 1, 1]
sage: E2*E2 == E2
True
sage: E*E2 == I.zero()
True
```

```
>>> from sage.all import *
>>> I = DescentAlgebra(QQ, Integer(4)).I()
>>> E = I.idempotent([Integer(3),Integer(1)]); E
1/2*I[1, 3] + 1/2*I[3, 1]
>>> E*E == E
True
>>> E2 = I.idempotent([Integer(2),Integer(1),Integer(1)]); E2
1/6*I[1, 1, 2] + 1/6*I[1, 2, 1] + 1/6*I[2, 1, 1]
>>> E2*E2 == E2
True
>>> E*E2 == I.zero()
True
```

one ()

Return the identity element, which is $B_{[n]}$, in the I basis.

EXAMPLES:

```
sage: DescentAlgebra(QQ, 4).I().one()
1/24*I[1, 1, 1, 1] + 1/6*I[1, 1, 2] + 1/6*I[1, 2, 1]
 + 1/2*I[1, 3] + 1/6*I[2, 1, 1] + 1/2*I[2, 2]
 + 1/2*I[3, 1] + I[4]
sage: DescentAlgebra(QQ, 0).I().one()
I[]
```

```
>>> from sage.all import *
>>> DescentAlgebra(QQ, Integer(4)).I().one()
1/24*I[1, 1, 1, 1] + 1/6*I[1, 1, 2] + 1/6*I[1, 2, 1]
 + 1/2*I[1, 3] + 1/6*I[2, 1, 1] + 1/2*I[2, 2]
 + 1/2*I[3, 1] + I[4]
>>> DescentAlgebra(QQ, Integer(0)).I().one()
I[]
```

one_basis ()

The element 1 is not (generally) a basis vector in the I basis, thus this raises a `TypeError`.

EXAMPLES:

```
sage: DescentAlgebra(QQ, 4).I().one_basis()
Traceback (most recent call last):
...
TypeError: 1 is not a basis element in the I basis
```

```
>>> from sage.all import *
>>> DescentAlgebra(QQ, Integer(4)).I().one_basis()
Traceback (most recent call last):
...
TypeError: 1 is not a basis element in the I basis
```

product_on_basis(*p*, *q*)

Return $I_p I_q$, where p and q are compositions of n.

EXAMPLES:

```
sage: DA = DescentAlgebra(QQ, 4)
sage: I = DA.I()
sage: p = Composition([1,2,1])
sage: q = Composition([3,1])
sage: I.product_on_basis(p, q)
0
sage: I.product_on_basis(p, p)
2*I[1, 2, 1]
```

```
>>> from sage.all import *
>>> DA = DescentAlgebra(QQ, Integer(4))
>>> I = DA.I()
>>> p = Composition([Integer(1),Integer(2),Integer(1)])
>>> q = Composition([Integer(3),Integer(1)])
>>> I.product_on_basis(p, q)
0
>>> I.product_on_basis(p, p)
2*I[1, 2, 1]
```

to_B_basis(*p*)

Return I_p as a linear combination of B-basis elements.

This is computed using the formula (Theorem 3.3 in [GR1989])

$$I_p = \sum_{q \leq p} \frac{(-1)^{l(q)-l(p)}}{\mathbf{k}(q,p)} B_q,$$

where $\leq$ is the refinement order and $l(r)$ denotes the number of parts of any composition r, and where $\mathbf{k}(q,p)$ is defined as follows: When $q \leq p$, we can write q as a concatenation $q_{(1)} q_{(2)} \cdots q_{(k)}$ with each $q_{(i)}$ being a composition of the i-th entry of p, and then we set $\mathbf{k}(q,p)$ to be $l(q_{(1)}) l(q_{(2)}) \cdots l(q_{(k)})$.

EXAMPLES:

```
sage: DA = DescentAlgebra(QQ, 4)
sage: B = DA.B()
sage: I = DA.I()
sage: list(map(B, I.basis()))   # indirect doctest
[B[1, 1, 1, 1],
```

(continues on next page)

(continued from previous page)

```
 -1/2*B[1, 1, 1, 1] + B[1, 1, 2],
 -1/2*B[1, 1, 1, 1] + B[1, 2, 1],
 1/3*B[1, 1, 1, 1] - 1/2*B[1, 1, 2] - 1/2*B[1, 2, 1] + B[1, 3],
 -1/2*B[1, 1, 1, 1] + B[2, 1, 1],
 1/4*B[1, 1, 1, 1] - 1/2*B[1, 1, 2] - 1/2*B[2, 1, 1] + B[2, 2],
 1/3*B[1, 1, 1, 1] - 1/2*B[1, 2, 1] - 1/2*B[2, 1, 1] + B[3, 1],
 -1/4*B[1, 1, 1, 1] + 1/3*B[1, 1, 2] + 1/3*B[1, 2, 1]
  - 1/2*B[1, 3] + 1/3*B[2, 1, 1] - 1/2*B[2, 2]
  - 1/2*B[3, 1] + B[4]]
```

```
>>> from sage.all import *
>>> DA = DescentAlgebra(QQ, Integer(4))
>>> B = DA.B()
>>> I = DA.I()
>>> list(map(B, I.basis()))  # indirect doctest
[B[1, 1, 1, 1],
 -1/2*B[1, 1, 1, 1] + B[1, 1, 2],
 -1/2*B[1, 1, 1, 1] + B[1, 2, 1],
 1/3*B[1, 1, 1, 1] - 1/2*B[1, 1, 2] - 1/2*B[1, 2, 1] + B[1, 3],
 -1/2*B[1, 1, 1, 1] + B[2, 1, 1],
 1/4*B[1, 1, 1, 1] - 1/2*B[1, 1, 2] - 1/2*B[2, 1, 1] + B[2, 2],
 1/3*B[1, 1, 1, 1] - 1/2*B[1, 2, 1] - 1/2*B[2, 1, 1] + B[3, 1],
 -1/4*B[1, 1, 1, 1] + 1/3*B[1, 1, 2] + 1/3*B[1, 2, 1]
  - 1/2*B[1, 3] + 1/3*B[2, 1, 1] - 1/2*B[2, 2]
  - 1/2*B[3, 1] + B[4]]
```

a_realization()

Return a particular realization of `self` (the B-basis).

EXAMPLES:

```
sage: DA = DescentAlgebra(QQ, 4)
sage: DA.a_realization()
Descent algebra of 4 over Rational Field in the subset basis
```

```
>>> from sage.all import *
>>> DA = DescentAlgebra(QQ, Integer(4))
>>> DA.a_realization()
Descent algebra of 4 over Rational Field in the subset basis
```

idempotent

alias of `I`

standard

alias of `D`

subset

alias of `B`

class sage.combinat.descent_algebra.**DescentAlgebraBases**(*base*)

Bases: `Category_realization_of_parent`

The category of bases of a descent algebra.

class ElementMethods

Bases: object

to_symmetric_group_algebra()

Return self in the symmetric group algebra.

EXAMPLES:

```
sage: B = DescentAlgebra(QQ, 4).B()
sage: B[1,3].to_symmetric_group_algebra()
[1, 2, 3, 4] + [2, 1, 3, 4] + [3, 1, 2, 4] + [4, 1, 2, 3]
sage: I = DescentAlgebra(QQ, 4).I()
sage: elt = I(B[1,3])
sage: elt.to_symmetric_group_algebra()
[1, 2, 3, 4] + [2, 1, 3, 4] + [3, 1, 2, 4] + [4, 1, 2, 3]
```

```
>>> from sage.all import *
>>> B = DescentAlgebra(QQ, Integer(4)).B()
>>> B[Integer(1),Integer(3)].to_symmetric_group_algebra()
[1, 2, 3, 4] + [2, 1, 3, 4] + [3, 1, 2, 4] + [4, 1, 2, 3]
>>> I = DescentAlgebra(QQ, Integer(4)).I()
>>> elt = I(B[Integer(1),Integer(3)])
>>> elt.to_symmetric_group_algebra()
[1, 2, 3, 4] + [2, 1, 3, 4] + [3, 1, 2, 4] + [4, 1, 2, 3]
```

class ParentMethods

Bases: object

to_symmetric_group_algebra()

Morphism from self to the symmetric group algebra.

EXAMPLES:

```
sage: D = DescentAlgebra(QQ, 4).D()
sage: D.to_symmetric_group_algebra(D[1,3])
[2, 1, 4, 3] + [3, 1, 4, 2] + [3, 2, 4, 1] + [4, 1, 3, 2] + [4, 2, 3, 1]
sage: B = DescentAlgebra(QQ, 4).B()
sage: B.to_symmetric_group_algebra(B[1,2,1])
[1, 2, 3, 4] + [1, 2, 4, 3] + [1, 3, 4, 2] + [2, 1, 3, 4]
 + [2, 1, 4, 3] + [2, 3, 4, 1] + [3, 1, 2, 4] + [3, 1, 4, 2]
 + [3, 2, 4, 1] + [4, 1, 2, 3] + [4, 1, 3, 2] + [4, 2, 3, 1]
```

```
>>> from sage.all import *
>>> D = DescentAlgebra(QQ, Integer(4)).D()
>>> D.to_symmetric_group_algebra(D[Integer(1),Integer(3)])
[2, 1, 4, 3] + [3, 1, 4, 2] + [3, 2, 4, 1] + [4, 1, 3, 2] + [4, 2, 3, 1]
>>> B = DescentAlgebra(QQ, Integer(4)).B()
>>> B.to_symmetric_group_algebra(B[Integer(1),Integer(2),Integer(1)])
[1, 2, 3, 4] + [1, 2, 4, 3] + [1, 3, 4, 2] + [2, 1, 3, 4]
 + [2, 1, 4, 3] + [2, 3, 4, 1] + [3, 1, 2, 4] + [3, 1, 4, 2]
 + [3, 2, 4, 1] + [4, 1, 2, 3] + [4, 1, 3, 2] + [4, 2, 3, 1]
```

to_symmetric_group_algebra_on_basis(S)

Return the basis element index by S as a linear combination of basis elements in the symmetric group algebra.

EXAMPLES:

```
sage: B = DescentAlgebra(QQ, 3).B()
sage: [B.to_symmetric_group_algebra_on_basis(c)
....:  for c in Compositions(3)]
[[1, 2, 3] + [1, 3, 2] + [2, 1, 3]
  + [2, 3, 1] + [3, 1, 2] + [3, 2, 1],
 [1, 2, 3] + [2, 1, 3] + [3, 1, 2],
 [1, 2, 3] + [1, 3, 2] + [2, 3, 1],
 [1, 2, 3]]
sage: I = DescentAlgebra(QQ, 3).I()
sage: [I.to_symmetric_group_algebra_on_basis(c)
....:  for c in Compositions(3)]
[[1, 2, 3] + [1, 3, 2] + [2, 1, 3] + [2, 3, 1]
  + [3, 1, 2] + [3, 2, 1],
 1/2*[1, 2, 3] - 1/2*[1, 3, 2] + 1/2*[2, 1, 3]
  - 1/2*[2, 3, 1] + 1/2*[3, 1, 2] - 1/2*[3, 2, 1],
 1/2*[1, 2, 3] + 1/2*[1, 3, 2] - 1/2*[2, 1, 3]
  + 1/2*[2, 3, 1] - 1/2*[3, 1, 2] - 1/2*[3, 2, 1],
 1/3*[1, 2, 3] - 1/6*[1, 3, 2] - 1/6*[2, 1, 3]
  - 1/6*[2, 3, 1] - 1/6*[3, 1, 2] + 1/3*[3, 2, 1]]
```

```
>>> from sage.all import *
>>> B = DescentAlgebra(QQ, Integer(3)).B()
>>> [B.to_symmetric_group_algebra_on_basis(c)
...  for c in Compositions(Integer(3))]
[[1, 2, 3] + [1, 3, 2] + [2, 1, 3]
  + [2, 3, 1] + [3, 1, 2] + [3, 2, 1],
 [1, 2, 3] + [2, 1, 3] + [3, 1, 2],
 [1, 2, 3] + [1, 3, 2] + [2, 3, 1],
 [1, 2, 3]]
>>> I = DescentAlgebra(QQ, Integer(3)).I()
>>> [I.to_symmetric_group_algebra_on_basis(c)
...  for c in Compositions(Integer(3))]
[[1, 2, 3] + [1, 3, 2] + [2, 1, 3] + [2, 3, 1]
  + [3, 1, 2] + [3, 2, 1],
 1/2*[1, 2, 3] - 1/2*[1, 3, 2] + 1/2*[2, 1, 3]
  - 1/2*[2, 3, 1] + 1/2*[3, 1, 2] - 1/2*[3, 2, 1],
 1/2*[1, 2, 3] + 1/2*[1, 3, 2] - 1/2*[2, 1, 3]
  + 1/2*[2, 3, 1] - 1/2*[3, 1, 2] - 1/2*[3, 2, 1],
 1/3*[1, 2, 3] - 1/6*[1, 3, 2] - 1/6*[2, 1, 3]
  - 1/6*[2, 3, 1] - 1/6*[3, 1, 2] + 1/3*[3, 2, 1]]
```

super_categories()

The super categories of `self`.

EXAMPLES:

```
sage: from sage.combinat.descent_algebra import DescentAlgebraBases
sage: DA = DescentAlgebra(QQ, 4)
sage: bases = DescentAlgebraBases(DA)
sage: bases.super_categories()
[Category of finite dimensional algebras with basis over Rational Field,
 Category of realizations of Descent algebra of 4 over Rational Field]
```

```
>>> from sage.all import *

5.1.74 Combinatorial designs and incidence structures

All designs can be accessed by `designs.<tab>` and are listed in the design catalog:

- *Catalog of designs*

Design-related classes

- *Incidence structures (i.e. hypergraphs, i.e. set systems)*
- *Covering designs: coverings of t-element subsets of a v-set by k-sets*

Constructions

- *Block designs*
- *Balanced Incomplete Block Designs (BIBD)*
- *Resolvable Balanced Incomplete Block Design (RBIBD)*
- *Group-Divisible Designs (GDD)*
- *Mutually Orthogonal Latin Squares (MOLS)*
- *Orthogonal arrays (OA)*
- *Orthogonal arrays (build recursive constructions)*
- *Orthogonal arrays (find recursive constructions)*
- *Difference families*
- *Difference Matrices*
- *Steiner Quadruple Systems*
- *Two-graphs*
- *Database of small combinatorial designs*
- *Database of generalised quadrangles with spread*

Technical things

- *External Representations of Block Designs*
- *Cython functions for combinatorial designs*
- *Hypergraph isomorphic copy search*
- *Evenly distributed sets in finite fields*

5.1.75 Balanced Incomplete Block Designs (BIBD)

This module gathers everything related to Balanced Incomplete Block Designs. One can build a BIBD (or check that it can be built) with `balanced_incomplete_block_design()`:

```
sage: BIBD = designs.balanced_incomplete_block_design(7,3,1)                  #␣
↪needs sage.schemes
```

```
>>> from sage.all import *
>>> BIBD = designs.balanced_incomplete_block_design(Integer(7),Integer(3),Integer(1))␣
↪                        # needs sage.schemes
```

In particular, Sage can build a $(v, k, 1)$-BIBD when one exists for all $k \leq 5$. The following functions are available:

`balanced_incomplete_block_design()`	Return a BIBD of parameters v, k, λ.
`BIBD_from_TD()`	Return a BIBD through TD-based constructions.
`BIBD_from_difference_family()`	Return the BIBD associated to the difference family `D` on the group `G`.
`BIBD_from_PBD()`	Return a $(v, k, 1)$-BIBD from a (r, K)-PBD where $r = (v-1)/(k-1)$.
`PBD_from_TD()`	Return a $(kt, \{k, t\})$-PBD if $u = 0$ and a $(kt+u, \{k, k+1, t, u\})$-PBD otherwise.
`steiner_triple_system()`	Return a Steiner Triple System.
`v_5_1_BIBD()`	Return a $(v, 5, 1)$-BIBD.
`v_4_1_BIBD()`	Return a $(v, 4, 1)$-BIBD.
`PBD_4_5_8_9_12()`	Return a $(v, \{4, 5, 8, 9, 12\})$-PBD on v elements.
`BIBD_5q_5_for_q_prime_pow`	Return a $(5q, 5, 1)$-BIBD with $q \equiv 1 \pmod 4$ a prime power.

Construction of BIBD when $k = 4$

Decompositions of K_v into K_4 (i.e. $(v, 4, 1)$-BIBD) are built following Douglas Stinson's construction as presented in [Stinson2004] page 167. It is based upon the construction of $(v\{4, 5, 8, 9, 12\})$-PBD (see the doc of `PBD_4_5_8_9_12()`), knowing that a $(v\{4, 5, 8, 9, 12\})$-PBD on v points can always be transformed into a $((k-1)v+1, 4, 1)$-BIBD, which covers all possible cases of $(v, 4, 1)$-BIBD.

Construction of BIBD when $k = 5$

Decompositions of K_v into K_4 (i.e. $(v, 4, 1)$-BIBD) are built following Clayton Smith's construction [ClaytonSmith].

Functions

`sage.combinat.designs.bibd.`**`BIBD`**

alias of `BalancedIncompleteBlockDesign`

`sage.combinat.designs.bibd.`**`BIBD_5q_5_for_q_prime_power`**`(q)`

Return a $(5q, 5, 1)$-BIBD with $q \equiv 1 \pmod 4$ a prime power.

See Theorem 24 [ClaytonSmith].

INPUT:

- `q` – integer; a prime power such that $q \equiv 1 \pmod 4$

EXAMPLES:

```
sage: from sage.combinat.designs.bibd import BIBD_5q_5_for_q_prime_power
sage: for q in [25, 45, 65, 85, 125, 145, 185, 205, 305, 405, 605]: # long time
....:     _ = BIBD_5q_5_for_q_prime_power(q/5)
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.bibd import BIBD_5q_5_for_q_prime_power
>>> for q in [Integer(25), Integer(45), Integer(65), Integer(85), Integer(125),␣
↪Integer(145), Integer(185), Integer(205), Integer(305), Integer(405),␣
↪Integer(605)]: # long time
...     _ = BIBD_5q_5_for_q_prime_power(q/Integer(5))
```

sage.combinat.designs.bibd.**BIBD_from_PBD**(*PBD*, *v*, *k*, *check=True*, *base_cases=None*)

Return a $(v, k, 1)$-BIBD from a (r, K)-PBD where $r = (v - 1)/(k - 1)$.

This is Theorem 7.20 from [Stinson2004].

INPUT:

- v, k – integers
- PBD – a PBD on $r = (v - 1)/(k - 1)$ points, such that for any block of PBD of size s there must exist a $((k - 1)s + 1, k, 1)$-BIBD
- check – boolean (default: True); whether to check that output is correct before returning it. As this is expected to be useless, you may want to disable it whenever you want speed.
- base_cases – caching system, for internal use

EXAMPLES:

```
sage: from sage.combinat.designs.bibd import PBD_4_5_8_9_12
sage: from sage.combinat.designs.bibd import BIBD_from_PBD
sage: from sage.combinat.designs.bibd import is_pairwise_balanced_design
sage: PBD = PBD_4_5_8_9_12(17)                                              #␣
↪needs sage.schemes
sage: bibd = is_pairwise_balanced_design(BIBD_from_PBD(PBD,52,4),52,[4])    #␣
↪needs sage.schemes
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.bibd import PBD_4_5_8_9_12
>>> from sage.combinat.designs.bibd import BIBD_from_PBD
>>> from sage.combinat.designs.bibd import is_pairwise_balanced_design
>>> PBD = PBD_4_5_8_9_12(Integer(17))                                        ␣
↪     # needs sage.schemes
>>> bibd = is_pairwise_balanced_design(BIBD_from_PBD(PBD,Integer(52),Integer(4)),
↪Integer(52),[Integer(4)])        # needs sage.schemes
```

sage.combinat.designs.bibd.**BIBD_from_TD**(*v*, *k*, *existence=False*)

Return a BIBD through TD-based constructions.

INPUT:

- v, k – integers; computes a $(v, k, 1)$-BIBD
- existence – boolean; instead of building the design, return:
  - True – meaning that Sage knows how to build the design
  - Unknown – meaning that Sage does not know how to build the design, but that the design may exist (see sage.misc.unknown)
  - False – meaning that the design does not exist

This method implements three constructions:

- If there exists a $TD(k, v)$ and a $(v, k, 1)$-BIBD then there exists a $(kv, k, 1)$-BIBD.

  The BIBD is obtained from all blocks of the TD, and from the blocks of the $(v, k, 1)$-BIBDs defined over the k groups of the TD.

- If there exists a $TD(k, v)$ and a $(v + 1, k, 1)$-BIBD then there exists a $(kv + 1, k, 1)$-BIBD.

  The BIBD is obtained from all blocks of the TD, and from the blocks of the $(v + 1, k, 1)$-BIBDs defined over the sets $V_1 \cup \infty, \ldots, V_k \cup \infty$ where the $V_1, \ldots, V_k$ are the groups of the TD.

- If there exists a $TD(k, v)$ and a $(v + k, k, 1)$-BIBD then there exists a $(kv + k, k, 1)$-BIBD.

  The BIBD is obtained from all blocks of the TD, and from the blocks of the $(v + k, k, 1)$-BIBDs defined over the sets $V_1 \cup \{\infty_1, \ldots, \infty_k\}, \ldots, V_k \cup \{\infty_1, \ldots, \infty_k\}$ where the $V_1, \ldots, V_k$ are the groups of the TD. By making sure that all copies of the $(v + k, k, 1)$-BIBD contain the block $\{\infty_1, \ldots, \infty_k\}$, the result is also a BIBD.

These constructions can be found in http://www.argilo.net/files/bibd.pdf.

EXAMPLES:

First construction:

```
sage: from sage.combinat.designs.bibd import BIBD_from_TD
sage: BIBD_from_TD(25,5,existence=True)                                    #␣
↪needs sage.schemes
True
sage: _ = BlockDesign(25,BIBD_from_TD(25,5))                               #␣
↪needs sage.schemes
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.bibd import BIBD_from_TD
>>> BIBD_from_TD(Integer(25),Integer(5),existence=True)                    ␣
↪               # needs sage.schemes
True
>>> _ = BlockDesign(Integer(25),BIBD_from_TD(Integer(25),Integer(5)))      ␣
↪                        # needs sage.schemes
```

Second construction:

```
sage: from sage.combinat.designs.bibd import BIBD_from_TD
sage: BIBD_from_TD(21,5,existence=True)                                    #␣
↪needs sage.schemes
True
sage: _ = BlockDesign(21,BIBD_from_TD(21,5))                               #␣
↪needs sage.schemes
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.bibd import BIBD_from_TD
>>> BIBD_from_TD(Integer(21),Integer(5),existence=True)                    ␣
↪               # needs sage.schemes
True
>>> _ = BlockDesign(Integer(21),BIBD_from_TD(Integer(21),Integer(5)))      ␣
↪                        # needs sage.schemes
```

Third construction:

```
sage: from sage.combinat.designs.bibd import BIBD_from_TD
sage: BIBD_from_TD(85,5,existence=True)                                         #␣
↪needs sage.schemes
True
sage: _ = BlockDesign(85,BIBD_from_TD(85,5))                                    #␣
↪needs sage.schemes
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.bibd import BIBD_from_TD
>>> BIBD_from_TD(Integer(85),Integer(5),existence=True)                         ␣
↪                # needs sage.schemes
True
>>> _ = BlockDesign(Integer(85),BIBD_from_TD(Integer(85),Integer(5)))           ␣
↪                         # needs sage.schemes
```

No idea:

```
sage: from sage.combinat.designs.bibd import BIBD_from_TD
sage: BIBD_from_TD(20,5,existence=True)
Unknown
sage: BIBD_from_TD(20,5)
Traceback (most recent call last):
...
NotImplementedError: I do not know how to build a (20,5,1)-BIBD!
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.bibd import BIBD_from_TD
>>> BIBD_from_TD(Integer(20),Integer(5),existence=True)
Unknown
>>> BIBD_from_TD(Integer(20),Integer(5))
Traceback (most recent call last):
...
NotImplementedError: I do not know how to build a (20,5,1)-BIBD!
```

sage.combinat.designs.bibd.**BIBD_from_arc_in_desarguesian_projective_plane**(*n*, *k*, *existence=False*)

Return a $(n,k,1)$-BIBD from a maximal arc in a projective plane.

This function implements a construction from Denniston [Denniston69], who describes a maximal `arc` in a `Desarguesian Projective Plane` of order 2^k. From two powers of two n,q with $n < q$, it produces a $((n-1)(q+1)+1,n,1)$-BIBD.

INPUT:

- `n`, `k` – integers; must be powers of two (among other restrictions)
- `existence` – boolean; whether to return the BIBD obtained through this construction (default), or to merely indicate with a boolean return value whether this method *can* build the requested BIBD.

EXAMPLES:

A $(232,8,1)$-BIBD:

```
sage: from sage.combinat.designs.bibd import BIBD_from_arc_in_desarguesian_
↪projective_plane
```

(continues on next page)

(continued from previous page)

```
sage: from sage.combinat.designs.bibd import BalancedIncompleteBlockDesign
sage: D = BIBD_from_arc_in_desarguesian_projective_plane(232,8)              #␣
↪needs sage.libs.gap sage.modules sage.rings.finite_rings
sage: BalancedIncompleteBlockDesign(232,D)                                   #␣
↪needs sage.libs.gap sage.modules sage.rings.finite_rings
(232,8,1)-Balanced Incomplete Block Design
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.bibd import BIBD_from_arc_in_desarguesian_
↪projective_plane
>>> from sage.combinat.designs.bibd import BalancedIncompleteBlockDesign
>>> D = BIBD_from_arc_in_desarguesian_projective_plane(Integer(232),Integer(8))  ␣
↪              # needs sage.libs.gap sage.modules sage.rings.finite_rings
>>> BalancedIncompleteBlockDesign(Integer(232),D)                                ␣
↪     # needs sage.libs.gap sage.modules sage.rings.finite_rings
(232,8,1)-Balanced Incomplete Block Design
```

A $(120, 8, 1)$-BIBD:

```
sage: D = BIBD_from_arc_in_desarguesian_projective_plane(120,8)              #␣
↪needs sage.libs.gap sage.modules sage.rings.finite_rings
sage: BalancedIncompleteBlockDesign(120,D)                                   #␣
↪needs sage.libs.gap sage.modules sage.rings.finite_rings
(120,8,1)-Balanced Incomplete Block Design
```

```
>>> from sage.all import *
>>> D = BIBD_from_arc_in_desarguesian_projective_plane(Integer(120),Integer(8))  ␣
↪              # needs sage.libs.gap sage.modules sage.rings.finite_rings
>>> BalancedIncompleteBlockDesign(Integer(120),D)                                ␣
↪     # needs sage.libs.gap sage.modules sage.rings.finite_rings
(120,8,1)-Balanced Incomplete Block Design
```

Other parameters:

```
sage: all(BIBD_from_arc_in_desarguesian_projective_plane(n,k,existence=True)
....:     for n,k in
....:       [(120, 8), (232, 8), (456, 8), (904, 8), (496, 16),
....:        (976, 16), (1936, 16), (2016, 32), (4000, 32), (8128, 64)])
True
```

```
>>> from sage.all import *
>>> all(BIBD_from_arc_in_desarguesian_projective_plane(n,k,existence=True)
...     for n,k in
...       [(Integer(120), Integer(8)), (Integer(232), Integer(8)), (Integer(456),␣
↪Integer(8)), (Integer(904), Integer(8)), (Integer(496), Integer(16)),
...        (Integer(976), Integer(16)), (Integer(1936), Integer(16)),␣
↪(Integer(2016), Integer(32)), (Integer(4000), Integer(32)), (Integer(8128),␣
↪Integer(64))])
True
```

Of course, not all can be built this way:

```
sage: BIBD_from_arc_in_desarguesian_projective_plane(7,3,existence=True)
False
sage: BIBD_from_arc_in_desarguesian_projective_plane(7,3)
Traceback (most recent call last):
...
ValueError: This function cannot produce a (7,3,1)-BIBD
```

```
>>> from sage.all import *
>>> BIBD_from_arc_in_desarguesian_projective_plane(Integer(7),Integer(3),
↪existence=True)
False
>>> BIBD_from_arc_in_desarguesian_projective_plane(Integer(7),Integer(3))
Traceback (most recent call last):
...
ValueError: This function cannot produce a (7,3,1)-BIBD
```

REFERENCE:

`sage.combinat.designs.bibd.`**`BIBD_from_difference_family`**`(`*G*, *D*, *lambd=None*, *check=True*`)`

Return the BIBD associated to the difference family `D` on the group `G`.

Let G be a group. A (G,k,λ)-*difference family* is a family $B=\{B_1,B_2,\ldots,B_b\}$ of k-subsets of G such that for each element of $G\backslash\{0\}$ there exists exactly λ pairs of elements (x,y), x and y belonging to the same block, such that $x-y=g$ (or x y^{-1} = g` in multiplicative notation).

If $\{B_1,B_2,\ldots,B_b\}$ is a (G,k,λ)-difference family then its set of translates $\{B_i\cdot g; i\in\{1,\ldots,b\}, g\in G\}$ is a (v,k,λ)-BIBD where v is the cardinality of G.

INPUT:

- `G` – a finite additive Abelian group
- `D` – a difference family on `G` (short blocks are allowed)
- `lambd` – the λ parameter (optional, only used if `check` is `True`)
- `check` – boolean (default: `True`); whether or not we check the output

EXAMPLES:

```
sage: G = Zmod(21)
sage: D = [[0,1,4,14,16]]
sage: sorted(G(x-y) for x in D[0] for y in D[0] if x != y)
[1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20]

sage: from sage.combinat.designs.bibd import BIBD_from_difference_family
sage: BIBD_from_difference_family(G, D)

 [19, 20, 2, 12, 14],
 [20, 0, 3, 13, 15]]
```

class `sage.combinat.designs.bibd.`**`BalancedIncompleteBlockDesign`**(*points*, *blocks*, *k=None*, *lambd=1*, *check=True*, *copy=True*, ***kwds*)

Bases: *`PairwiseBalancedDesign`*

Balanced Incomplete Block Design (BIBD).

INPUT:

- `points` – the underlying set. If `points` is an integer v, then the set is considered to be $\{0, ..., v-1\}$
- `blocks` – collection of blocks

- `k` – integer; size of the blocks. Set to `None` (automatic guess) by default
- `lambd` – integer; value of λ, set to 1 by default
- `check` – boolean; whether to check that the design is a PBD with the right parameters
- `copy` – (use with caution) if set to `False` then `blocks` must be a list of lists of integers. The list will not be copied but will be modified in place (each block is sorted, and the whole list is sorted). Your `blocks` object will become the instance's internal data.

EXAMPLES:

```
sage: b=designs.balanced_incomplete_block_design(9,3); b
(9,3,1)-Balanced Incomplete Block Design
```

```
>>> from sage.all import *
>>> b=designs.balanced_incomplete_block_design(Integer(9),Integer(3)); b
(9,3,1)-Balanced Incomplete Block Design
```

arc(*s*, *solver=2*, *verbose=None*, *integrality_tolerance=0*)

Return the `s`-arc with maximum cardinality.

A s-arc is a subset of points in a BIBD that intersects each block on at most s points. It is one possible generalization of independent set for graphs.

A simple counting shows that the cardinality of a s-arc is at most $(s-1)*r+1$ where r is the number of blocks incident to any point. A s-arc in a BIBD with cardinality $(s-1)*r+1$ is called maximal and is characterized by the following property: it is not empty and each block either contains 0 or s points of this arc. Equivalently, the trace of the BIBD on these points is again a BIBD (with block size s).

For more informations, see Wikipedia article Arc_(projective_geometry).

INPUT:

- `s` – (default: 2) the maximum number of points from the arc in each block
- `solver` – (default: `None`) specify a Mixed Integer Linear Programming (MILP) solver to be used. If set to `None`, the default one is used. For more information on MILP solvers and which default solver is used, see the method `solve` of the class `MixedIntegerLinearProgram`.
- `verbose` – integer (default: 0); sets the level of verbosity. Set to 0 by default, which means quiet.
- `integrality_tolerance` – parameter for use with MILP solvers over an inexact base ring; see `MixedIntegerLinearProgram.get_values()`.

EXAMPLES:

```
sage: # needs sage.schemes
sage: B = designs.balanced_incomplete_block_design(21, 5)
sage: a2 = B.arc(); a2  # random
[5, 9, 10, 12, 15, 20]
sage: len(a2)
6
sage: a4 = B.arc(4); a4  # random
[0, 1, 2, 5, 6, 8, 9, 10, 11, 12, 13, 14, 15, 16, 18, 20]
sage: len(a4)
16
```

```
>>> from sage.all import *
>>> # needs sage.schemes
>>> B = designs.balanced_incomplete_block_design(Integer(21), Integer(5))
>>> a2 = B.arc(); a2  # random
[5, 9, 10, 12, 15, 20]
>>> len(a2)
6
>>> a4 = B.arc(Integer(4)); a4  # random
[0, 1, 2, 5, 6, 8, 9, 10, 11, 12, 13, 14, 15, 16, 18, 20]
>>> len(a4)
16
```

The 2-arc and 4-arc above are maximal. One can check that they intersect the blocks in either 0 or s points. Or equivalently that the traces are again BIBD:

```
sage: r = (21-1)//(5-1)
sage: 1 + r*1
6
sage: 1 + r*3
16

sage: B.trace(a2).is_t_design(2, return_parameters=True)                      #␣
↪needs sage.schemes
(True, (2, 6, 2, 1))
sage: B.trace(a4).is_t_design(2, return_parameters=True)                      #␣
↪needs sage.schemes
(True, (2, 16, 4, 1))
```

```
>>> from sage.all import *
>>> r = (Integer(21)-Integer(1))//(Integer(5)-Integer(1))
>>> Integer(1) + r*Integer(1)
6
>>> Integer(1) + r*Integer(3)
16

>>> B.trace(a2).is_t_design(Integer(2), return_parameters=True)                ␣
↪     # needs sage.schemes
(True, (2, 6, 2, 1))
>>> B.trace(a4).is_t_design(Integer(2), return_parameters=True)                ␣
↪     # needs sage.schemes
(True, (2, 16, 4, 1))
```

Some other examples which are not maximal:

```
sage: # needs sage.numerical.mip
sage: B = designs.balanced_incomplete_block_design(25, 4)
sage: a2 = B.arc(2)
sage: r = (25-1)//(4-1)
sage: len(a2), 1 + r
(8, 9)
sage: sa2 = set(a2)
sage: set(len(sa2.intersection(b)) for b in B.blocks())
{0, 1, 2}
```

(continues on next page)

(continued from previous page)

```
sage: B.trace(a2).is_t_design(2)
False

sage: # needs sage.numerical.mip
sage: a3 = B.arc(3)
sage: len(a3), 1 + 2*r
(15, 17)
sage: sa3 = set(a3)
sage: set(len(sa3.intersection(b)) for b in B.blocks()) == set([0,3])
False
sage: B.trace(a3).is_t_design(3)
False
```

```
>>> from sage.all import *
>>> # needs sage.numerical.mip
>>> B = designs.balanced_incomplete_block_design(Integer(25), Integer(4))
>>> a2 = B.arc(Integer(2))
>>> r = (Integer(25)-Integer(1))//(Integer(4)-Integer(1))
>>> len(a2), Integer(1) + r
(8, 9)
>>> sa2 = set(a2)
>>> set(len(sa2.intersection(b)) for b in B.blocks())
{0, 1, 2}
>>> B.trace(a2).is_t_design(Integer(2))
False

>>> # needs sage.numerical.mip
>>> a3 = B.arc(Integer(3))
>>> len(a3), Integer(1) + Integer(2)*r
(15, 17)
>>> sa3 = set(a3)
>>> set(len(sa3.intersection(b)) for b in B.blocks()) == set([Integer(0),
↪Integer(3)])
False
>>> B.trace(a3).is_t_design(Integer(3))
False
```

sage.combinat.designs.bibd.**BruckRyserChowla_check**(*v*, *k*, *lambd*)

Check whether the parameters passed satisfy the Bruck-Ryser-Chowla theorem.

For more information on the theorem, see the corresponding Wikipedia entry.

INPUT:

- v, k, lambd – integers; parameters to check

OUTPUT: True – the parameters satisfy the theorem

- False – the theorem fails for the given parameters
- Unknown – the preconditions of the theorem are not met

EXAMPLES:

sage: from sage.combinat.designs.bibd import BruckRyserChowla_check sage: BruckRyser-Chowla_check(22,7,2) False

Nonexistence of projective planes of order 6 and 14

sage: from sage.combinat.designs.bibd import BruckRyserChowla_check sage: BruckRyserChowla_check(43,7,1) # needs sage.schemes False sage: BruckRyserChowla_check(211,15,1) # needs sage.schemes False

Existence of symmetric BIBDs with parameters $(79, 13, 2)$ and $(56, 11, 2)$

sage: from sage.combinat.designs.bibd import BruckRyserChowla_check sage: BruckRyserChowla_check(79,13,2) # needs sage.schemes True sage: BruckRyserChowla_check(56,11,2) True

sage.combinat.designs.bibd.**PBD_4_5_8_9_12**(*v*, *check=True*)

Return a $(v, \{4, 5, 8, 9, 12\})$-PBD on v elements.

A $(v, \{4, 5, 8, 9, 12\})$-PBD exists if and only if $v \equiv 0, 1 \pmod 4$. The construction implemented here appears page 168 in [Stinson2004].

INPUT:

- `v` – integer congruent to 0 or 1 modulo 4
- `check` – boolean (default: `True`); whether to check that output is correct before returning it. As this is expected to be useless, you may want to disable it whenever you want speed.

EXAMPLES:

```
sage: designs.balanced_incomplete_block_design(40,4).blocks()   # indirect doctest␣
↪           # needs sage.schemes
[[0, 1, 2, 12], [0, 3, 6, 9], [0, 4, 8, 10],
 [0, 5, 7, 11], [0, 13, 26, 39], [0, 14, 25, 28],
 [0, 15, 27, 38], [0, 16, 22, 32], [0, 17, 23, 34],
...
```

```
>>> from sage.all import *
>>> designs.balanced_incomplete_block_design(Integer(40),Integer(4)).blocks()   #␣
↪indirect doctest           # needs sage.schemes
[[0, 1, 2, 12], [0, 3, 6, 9], [0, 4, 8, 10],
 [0, 5, 7, 11], [0, 13, 26, 39], [0, 14, 25, 28],
 [0, 15, 27, 38], [0, 16, 22, 32], [0, 17, 23, 34],
...
```

Check that Issue #16476 is fixed:

```
sage: from sage.combinat.designs.bibd import PBD_4_5_8_9_12
sage: for v in (0,1,4,5,8,9,12,13,16,17,20,21,24,25):                        #␣
↪needs sage.schemes
....:     _ = PBD_4_5_8_9_12(v)
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.bibd import PBD_4_5_8_9_12
>>> for v in (Integer(0),Integer(1),Integer(4),Integer(5),Integer(8),Integer(9),
↪Integer(12),Integer(13),Integer(16),Integer(17),Integer(20),Integer(21),
↪Integer(24),Integer(25)):                            # needs sage.schemes
...     _ = PBD_4_5_8_9_12(v)
```

sage.combinat.designs.bibd.**PBD_from_TD**(*k*, *t*, *u*)

Return a $(kt, \{k, t\})$-PBD if $u = 0$ and a $(kt + u, \{k, k + 1, t, u\})$-PBD otherwise.

This is theorem 23 from [ClaytonSmith]. The PBD is obtained from the blocks a truncated $TD(k+1,t)$, to which are added the blocks corresponding to the groups of the TD. When $u=0$, a $TD(k,t)$ is used instead.

INPUT:

- k, t, u – integers such that $0 \leq u \leq t$

EXAMPLES:

```
sage: from sage.combinat.designs.bibd import PBD_from_TD
sage: from sage.combinat.designs.bibd import is_pairwise_balanced_design
sage: PBD = PBD_from_TD(2,2,1); PBD
[[0, 2, 4], [0, 3], [1, 2], [1, 3, 4], [0, 1], [2, 3]]
sage: is_pairwise_balanced_design(PBD,2*2+1,[2,3])
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.bibd import PBD_from_TD
>>> from sage.combinat.designs.bibd import is_pairwise_balanced_design
>>> PBD = PBD_from_TD(Integer(2),Integer(2),Integer(1)); PBD
[[0, 2, 4], [0, 3], [1, 2], [1, 3, 4], [0, 1], [2, 3]]
>>> is_pairwise_balanced_design(PBD,Integer(2)*Integer(2)+Integer(1),[Integer(2),
↪Integer(3)])
True
```

class sage.combinat.designs.bibd.**PairwiseBalancedDesign**(*points*, *blocks*, *K=None*, *lambd=1*, *check=True*, *copy=True*, ***kwds*)

Bases: *GroupDivisibleDesign*

Pairwise Balanced Design (PBD).

A Pairwise Balanced Design, or (v,K,λ)-PBD, is a collection $\mathcal{B}$ of blocks defined on a set X of size v, such that any block pair of points $p_1,p_2 \in X$ occurs in exactly λ blocks of $\mathcal{B}$. Besides, for every block $B \in \mathcal{B}$ we must have $|B| \in K$.

INPUT:

- points – the underlying set; if points is an integer v, then the set is considered to be $\{0,...,v-1\}$
- blocks – collection of blocks
- K – list of integers of which the sizes of the blocks must be elements; set to None (automatic guess) by default
- lambd – integer; value of λ, set to 1 by default
- check – boolean; whether to check that the design is a PBD with the right parameters
- copy – (use with caution) if set to False then blocks must be a list of lists of integers. The list will not be copied but will be modified in place (each block is sorted, and the whole list is sorted). Your blocks object will become the instance's internal data.

sage.combinat.designs.bibd.**balanced_incomplete_block_design**(*v*, *k*, *lambd=1*, *existence=False*, *use_LJCR=False*)

Return a BIBD of parameters v,k,λ.

A Balanced Incomplete Block Design of parameters v,k,λ is a collection $\mathcal{C}$ of k-subsets of $V=\{0,\dots,v-1\}$ such that for any two distinct elements $x,y \in V$ there are λ elements $S \in \mathcal{C}$ such that $x,y \in S$.

For more information on BIBD, see the corresponding Wikipedia entry.

INPUT:

- `v`, `k`, `lambd` – integers
- `existence` – boolean; instead of building the design, return:
  - `True` – meaning that Sage knows how to build the design
  - `Unknown` – meaning that Sage does not know how to build the design, but that the design may exist (see `sage.misc.unknown`)
  - `False` – meaning that the design does not exist
- `use_LJCR` – boolean; whether to query the La Jolla Covering Repository for the design when Sage does not know how to build it (see *best_known_covering_design_www()*). This requires internet.

```

sage.combinat.designs.bibd.**biplane**(*n*, *existence=False*)

Return a biplane of order n.

A biplane of order n is a symmetric $(1+\frac{(n+1)(n+2)}{2}, n+2, 2)$-BIBD. A symmetric (or square) (v,k,λ)-BIBD is a (v,k,λ)-BIBD with v blocks.

INPUT:

- n – integer; order of the biplane
- existence – boolean; instead of building the design, return:
  - True – meaning that Sage knows how to build the design
  - Unknown – meaning that Sage does not know how to build the design, but that the design may exist (see sage.misc.unknown)
  - False – meaning that the design does not exist

See also

- *balanced_incomplete_block_design()*

EXAMPLES:

```
sage: designs.biplane(4)                                                    #␣
↪needs sage.rings.finite_rings
(16,6,2)-Balanced Incomplete Block Design
sage: designs.biplane(7, existence=True)                                    #␣
↪needs sage.schemes
True
sage: designs.biplane(11)                                                   #␣
↪needs sage.schemes
(79,13,2)-Balanced Incomplete Block Design
```

```
>>> from sage.all import *
>>> designs.biplane(Integer(4))                                             ␣
↪     # needs sage.rings.finite_rings
(16,6,2)-Balanced Incomplete Block Design
>>> designs.biplane(Integer(7), existence=True)                             ␣
↪     # needs sage.schemes
True
>>> designs.biplane(Integer(11))                                            ␣
↪     # needs sage.schemes
(79,13,2)-Balanced Incomplete Block Design
```

sage.combinat.designs.bibd.**steiner_triple_system**(n)

Return a Steiner Triple System.

A Steiner Triple System (STS) of a set $\{0, ..., n-1\}$ is a family S of 3-sets such that for any $i \neq j$ there exists exactly one set of S in which they are both contained.

It can alternatively be thought of as a factorization of the complete graph K_n with triangles.

A Steiner Triple System of a n-set exists if and only if $n \equiv 1 \pmod 6$ or $n \equiv 3 \pmod 6$, in which case one can be found through Bose's and Skolem's constructions, respectively [AndHonk97].

INPUT:

- n – return a Steiner Triple System of $\{0, ..., n-1\}$

EXAMPLES:

A Steiner Triple System on 9 elements

```
sage: sts = designs.steiner_triple_system(9)
sage: sts
(9,3,1)-Balanced Incomplete Block Design
sage: list(sts)
[[0, 1, 5], [0, 2, 4], [0, 3, 6], [0, 7, 8], [1, 2, 3],
 [1, 4, 7], [1, 6, 8], [2, 5, 8], [2, 6, 7], [3, 4, 8],
 [3, 5, 7], [4, 5, 6]]
```

```
>>> from sage.all import *
>>> sts = designs.steiner_triple_system(Integer(9))
>>> sts
(9,3,1)-Balanced Incomplete Block Design
>>> list(sts)
[[0, 1, 5], [0, 2, 4], [0, 3, 6], [0, 7, 8], [1, 2, 3],
 [1, 4, 7], [1, 6, 8], [2, 5, 8], [2, 6, 7], [3, 4, 8],
 [3, 5, 7], [4, 5, 6]]
```

As any pair of vertices is covered once, its parameters are

```
sage: sts.is_t_design(return_parameters=True)
(True, (2, 9, 3, 1))
```

```
>>> from sage.all import *
>>> sts.is_t_design(return_parameters=True)
(True, (2, 9, 3, 1))
```

An exception is raised for invalid values of n

```
sage: designs.steiner_triple_system(10)
Traceback (most recent call last):
...
EmptySetError: Steiner triple systems only exist for n = 1 mod 6 or n = 3 mod 6
```

```
>>> from sage.all import *
>>> designs.steiner_triple_system(Integer(10))
Traceback (most recent call last):
...
EmptySetError: Steiner triple systems only exist for n = 1 mod 6 or n = 3 mod 6
```

REFERENCE:

`sage.combinat.designs.bibd.`**`v_4_1_BIBD`**`(`*v*, *check=True*`)`

Return a $(v, 4, 1)$-BIBD.

A $(v, 4, 1)$-BIBD is an edge-decomposition of the complete graph K_v into copies of K_4. For more information, see `balanced_incomplete_block_design()`. It exists if and only if $v \equiv 1, 4 \pmod{12}$.

See page 167 of [Stinson2004] for the construction details.

See also

- `balanced_incomplete_block_design()`

INPUT:

- `v` – integer; number of points
- `check` – boolean (default: `True`); whether to check that output is correct before returning it. As this is expected to be useless, you may want to disable it whenever you want speed.

EXAMPLES:

```
sage: from sage.combinat.designs.bibd import v_4_1_BIBD  # long time
sage: for n in range(13,100):                            # long time
....:    if n%12 in [1,4]:
....:       _ = v_4_1_BIBD(n, check = True)
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.bibd import v_4_1_BIBD  # long time
>>> for n in range(Integer(13),Integer(100)):                            # long␣
↪time
...    if n%Integer(12) in [Integer(1),Integer(4)]:
...       _ = v_4_1_BIBD(n, check = True)
```

`sage.combinat.designs.bibd.`**`v_5_1_BIBD`**`(`*v*, *check=True*`)`

Return a $(v, 5, 1)$-BIBD.

This method follows the construction from [ClaytonSmith].

INPUT:

- `v` – integer

See also

- `balanced_incomplete_block_design()`

EXAMPLES:

```
sage: from sage.combinat.designs.bibd import v_5_1_BIBD
sage: i = 0
sage: while i<200:                                                    #␣
↪needs sage.libs.pari sage.schemes
....:    i += 20
```

(continues on next page)

(continued from previous page)

```
....:     _ = v_5_1_BIBD(i+1)
....:     _ = v_5_1_BIBD(i+5)
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.bibd import v_5_1_BIBD
>>> i = Integer(0)
>>> while i<Integer(200):                                                    ␣
↪    # needs sage.libs.pari sage.schemes
...     i += Integer(20)
...     _ = v_5_1_BIBD(i+Integer(1))
...     _ = v_5_1_BIBD(i+Integer(5))
```

5.1.76 Resolvable Balanced Incomplete Block Design (RBIBD)

This module contains everything related to resolvable Balanced Incomplete Block Designs. The constructions implemented here can be obtained through the `designs.<tab>` object:

```
designs.resolvable_balanced_incomplete_block_design(15,3)
```

For Balanced Incomplete Block Design (BIBD) see the module *bibd*. A BIBD is said to be *resolvable* if its blocks can be partitionned into parallel classes, i.e. partitions of its ground set.

The main function of this module is *resolvable_balanced_incomplete_block_design()*, which calls all others.

resolvable_balanced_incomplete_block_design()	Return a resolvable BIBD of parameters v, k.
kirkman_triple_system()	Return a Kirkman Triple System on v points.
v_4_1_rbibd()	Return a $(v, 4, 1)$-RBIBD
PBD_4_7()	Return a $(v, \{4, 7\})$-PBD
PBD_4_7_from_Y()	Return a $(3v + 1, \{4, 7\})$-PBD from a $(v, \{4, 5, 7\}, \mathbf{N} - \{3, 6, 10\})$-GDD.

References:

Functions

sage.combinat.designs.resolvable_bibd.**PBD_4_7**(*v*, *check=True*, *existence=False*)

Return a $(v, \{4, 7\})$-PBD.

For all v such that $n \equiv 1 \pmod 3$ and $n \neq 10, 19, 31$ there exists a $(v, \{4, 7\})$-PBD. This is proved in Proposition IX.4.5 from [BJL99], which this method implements.

This construction of PBD is used by the construction of Kirkman Triple Systems.

EXAMPLES:

```
sage: from sage.combinat.designs.resolvable_bibd import PBD_4_7
sage: PBD_4_7(22)
Pairwise Balanced Design on 22 points with sets of sizes in [4, 7]
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.resolvable_bibd import PBD_4_7
>>> PBD_4_7(Integer(22))
Pairwise Balanced Design on 22 points with sets of sizes in [4, 7]
```

sage.combinat.designs.resolvable_bibd.**PBD_4_7_from_Y**(*gdd*, *check=True*)

Return a $(3v + 1, \{4, 7\})$-PBD from a $(v, \{4, 5, 7\}, \mathbf{N} - \{3, 6, 10\})$-GDD.

This implements Lemma IX.3.11 from [BJL99] (p.625). All points of the GDD are tripled, and a $+\infty$ point is added to the design.

- A group of size $s \in Y = \mathbf{N} - \{3, 6, 10\}$ becomes a set of size $3s$. Adding ∞ to it gives it size $3s + 1$, and this set is then replaced by a $(3s + 1, \{4, 7\})$-PBD.
- A block of size $s \in \{4, 5, 7\}$ becomes a $(3s, \{4, 7\}, \{3\})$-GDD.

This lemma is part of the existence proof of $(v, \{4, 7\})$-PBD as explained in IX.4.5 from [BJL99]).

INPUT:

- `gdd` – a $(v, \{4, 5, 7\}, Y)$-GDD where $Y = \mathbf{N} - \{3, 6, 10\}$
- `check` – boolean (default: `True`); whether to check that output is correct before returning it. As this is expected to be useless, you may want to disable it whenever you want speed.

EXAMPLES:

```
sage: from sage.combinat.designs.resolvable_bibd import PBD_4_7_from_Y
sage: PBD_4_7_from_Y(designs.transversal_design(7,8))                    #␣
↪needs sage.schemes
Pairwise Balanced Design on 169 points with sets of sizes in [4, 7]
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.resolvable_bibd import PBD_4_7_from_Y
>>> PBD_4_7_from_Y(designs.transversal_design(Integer(7),Integer(8)))   ␣
↪             # needs sage.schemes
Pairwise Balanced Design on 169 points with sets of sizes in [4, 7]
```

sage.combinat.designs.resolvable_bibd.**kirkman_triple_system**(*v*, *existence=False*)

Return a Kirkman Triple System on v points.

A Kirkman Triple System $KTS(v)$ is a resolvable Steiner Triple System. It exists if and only if $v \equiv 3 \pmod 6$.

INPUT:

- `n` – integer
- `existence` – boolean (default: `False`); whether to build the $KTS(n)$ or only answer whether it exists

See also

IncidenceStructure.is_resolvable()

EXAMPLES:

A solution to Kirkmman's original problem:

```
sage: kts = designs.kirkman_triple_system(15)
sage: classes = kts.is_resolvable(1)[1]
sage: names = '0123456789abcde'
sage: def to_name(r_s_t):
....:     r, s, t = r_s_t
....:     return ' ' + names[r] + names[s] + names[t] + ' '
```

(continues on next page)

(continued from previous page)

```
sage: rows = ['   '.join(('Day {}'.format(i) for i in range(1,8)))]
sage: rows.extend('   '.join(map(to_name,row)) for row in zip(*classes))
sage: print('\n'.join(rows))
Day 1   Day 2   Day 3   Day 4   Day 5   Day 6   Day 7
 07e     18e     29e     3ae     4be     5ce     6de
 139     24a     35b     46c     05d     167     028

 458     569     06a     01b     12c     23d     347
 acd     7bd     78c     89d     79a     8ab     9bc
```

```
>>> from sage.all import *
>>> kts = designs.kirkman_triple_system(Integer(15))
>>> classes = kts.is_resolvable(Integer(1))[Integer(1)]
>>> names = '0123456789abcde'
>>> def to_name(r_s_t):
...     r, s, t = r_s_t
...     return ' ' + names[r] + names[s] + names[t] + ' '
>>> rows = ['   '.join(('Day {}'.format(i) for i in range(Integer(1),
↪Integer(8))))]
>>> rows.extend('   '.join(map(to_name,row)) for row in zip(*classes))
>>> print('\n'.join(rows))
Day 1   Day 2   Day 3   Day 4   Day 5   Day 6   Day 7
 07e     18e     29e     3ae     4be     5ce     6de
 139     24a     35b     46c     05d     167     028
 26b     03c     14d     257     368     049     15a
 458     569     06a     01b     12c     23d     347
 acd     7bd     78c     89d     79a     8ab     9bc
```

sage.combinat.designs.resolvable_bibd.**resolvable_balanced_incomplete_block_design**(*v*, *k*, *existence=False*)

Return a resolvable BIBD of parameters v, k.

A BIBD is said to be *resolvable* if its blocks can be partitionned into parallel classes, i.e. partitions of the ground set.

INPUT:

- `v`, `k` – integers
- `existence` – boolean; instead of building the design, return:
  - `True` – meaning that Sage knows how to build the design
  - `Unknown` – meaning that Sage does not know how to build the design, but that the design may exist (see `sage.misc.unknown`)
  - `False` – meaning that the design does not exist

See also

- *IncidenceStructure.is_resolvable()*
- *balanced_incomplete_block_design()*

EXAMPLES:

```
sage: KTS15 = designs.resolvable_balanced_incomplete_block_design(15,3)
sage: KTS15
(15,3,1)-Balanced Incomplete Block Design
sage: KTS15.is_resolvable()
True
```

```
>>> from sage.all import *
>>> KTS15 = designs.resolvable_balanced_incomplete_block_design(Integer(15),
↪Integer(3))
>>> KTS15
(15,3,1)-Balanced Incomplete Block Design
>>> KTS15.is_resolvable()
True
```

sage.combinat.designs.resolvable_bibd.**v_4_1_rbibd**(*v*, *existence=False*)

Return a $(v, 4, 1)$-RBIBD.

INPUT:

- `n` – integer
- `existence` – boolean (default: `False`); whether to build the design or only answer whether it exists

See also

- *IncidenceStructure.is_resolvable()*
- *resolvable_balanced_incomplete_block_design()*

Note

A resolvable $(v, 4, 1)$-BIBD exists whenever $1 \equiv 4 \pmod{}12$. This function, however, only implements a construction of $(v, 4, 1)$-BIBD such that $v = 3q + 1 \equiv 1 \pmod 3$ where q is a prime power (see VII.7.5.a from [BJL99]).

EXAMPLES:

```
sage: rBIBD = designs.resolvable_balanced_incomplete_block_design(28,4)
sage: rBIBD.is_resolvable()
True
sage: rBIBD.is_t_design(return_parameters=True)
(True, (2, 28, 4, 1))
```

```
>>> from sage.all import *
>>> rBIBD = designs.resolvable_balanced_incomplete_block_design(Integer(28),
↪Integer(4))
>>> rBIBD.is_resolvable()
True
>>> rBIBD.is_t_design(return_parameters=True)
(True, (2, 28, 4, 1))
```

5.1.77 Group-Divisible Designs (GDD)

This module gathers everything related to Group-Divisible Designs. The constructions defined here can be accessed through `designs.<tab>`:

```
sage: designs.group_divisible_design(14,{4},{2})
Group Divisible Design on 14 points of type 2^7
```

```
>>> from sage.all import *
>>> designs.group_divisible_design(Integer(14),{Integer(4)},{Integer(2)})
Group Divisible Design on 14 points of type 2^7
```

The main function implemented here is *group_divisible_design()* (which calls all others) and the main class is *GroupDivisibleDesign*. The following functions are available:

group_divisible_design()	Return a (v, K, G)-Group Divisible Design.
GDD_4_2()	Return a $(2q, \{4\}, \{2\})$-GDD for q a prime power with $q \equiv 1 \pmod 6$.

Functions

sage.combinat.designs.group_divisible_designs.**GDD_4_2**(*q*, *existence=False*, *check=True*)

Return a $(2q, \{4\}, \{2\})$-GDD for q a prime power with $q \equiv 1 \pmod 6$.

This method implements Lemma VII.5.17 from [BJL99] (p.495).

INPUT:

- `q` – integer
- `existence` – boolean; instead of building the design, return:
  - `True` – meaning that Sage knows how to build the design
  - `Unknown` – meaning that Sage does not know how to build the design, but that the design may exist (see `sage.misc.unknown`)
  - `False` – meaning that the design does not exist
- `check` – boolean (default: `True`); whether to check that output is correct before returning it. As this is expected to be useless, you may want to disable it whenever you want speed.

EXAMPLES:

```
sage: from sage.combinat.designs.group_divisible_designs import GDD_4_2
sage: GDD_4_2(7,existence=True)
True
sage: GDD_4_2(7)
Group Divisible Design on 14 points of type 2^7
sage: GDD_4_2(8,existence=True)
Unknown
sage: GDD_4_2(8)
Traceback (most recent call last):
...
NotImplementedError
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.group_divisible_designs import GDD_4_2
>>> GDD_4_2(Integer(7),existence=True)
True
>>> GDD_4_2(Integer(7))
Group Divisible Design on 14 points of type 2^7
>>> GDD_4_2(Integer(8),existence=True)
Unknown
>>> GDD_4_2(Integer(8))
Traceback (most recent call last):
...
NotImplementedError
```

class sage.combinat.designs.group_divisible_designs.**GroupDivisibleDesign**(*points*, *groups*, *blocks*, *G=None*, *K=None*, *lambd=1*, *check=True*, *copy=True*, ***kwds*)

Bases: *IncidenceStructure*

Group Divisible Design (GDD).

Let K and G be sets of positive integers and let λ be a positive integer. A Group Divisible Design of index λ and order v is a triple $(V, \mathcal{G}, \mathcal{B})$ where:

- V is a set of cardinality v
- $\mathcal{G}$ is a partition of V into groups whose size belongs to G
- $\mathcal{B}$ is a family of subsets of V whose size belongs to K such that any two points $p_1, p_2 \in V$ from different groups appear simultaneously in exactly λ elements of $\mathcal{B}$. Besides, a group and a block intersect on at most one point.

If $K = \{k_1, ..., k_l\}$ and G has exactly m_i groups of cardinality k_i then G is said to have type $k_1^{m_1}...k_l^{m_l}$.

INPUT:

- `points` – the underlying set. If `points` is an integer v, then the set is considered to be $\{0, ..., v-1\}$
- `groups` – the groups of the design. Set to `None` for an automatic guess (this triggers `check=True` and can thus cost some time)
- `blocks` – collection of blocks
- `G` – list of integers of which the sizes of the groups must be elements. Set to `None` (automatic guess) by default
- `K` – list of integers of which the sizes of the blocks must be elements. Set to `None` (automatic guess) by default
- `lambd` – integer (default: 1); value of λ
- `check` – boolean (default: `True`); whether to check that the design is indeed a GDD with the right parameters
- `copy` – (use with caution) if set to `False` then `blocks` must be a list of lists of integers. The list will not be copied but will be modified in place (each block is sorted, and the whole list is sorted). Your `blocks` object will become the instance's internal data.

EXAMPLES:

```
sage: from sage.combinat.designs.group_divisible_designs import␣
↪GroupDivisibleDesign
sage: TD = designs.transversal_design(4,10)
sage: groups = [list(range(i*10,(i+1)*10)) for i in range(4)]
sage: GDD = GroupDivisibleDesign(40,groups,TD); GDD
Group Divisible Design on 40 points of type 10^4
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.group_divisible_designs import GroupDivisibleDesign
>>> TD = designs.transversal_design(Integer(4),Integer(10))
>>> groups = [list(range(i*Integer(10),(i+Integer(1))*Integer(10))) for i in␣
↪range(Integer(4))]
>>> GDD = GroupDivisibleDesign(Integer(40),groups,TD); GDD
Group Divisible Design on 40 points of type 10^4
```

With unspecified groups:

```
sage: # needs sage.schemes
sage: D = designs.transversal_design(4,3).relabel(list('abcdefghiklm'),
↪inplace=False).blocks()
sage: GDD = GroupDivisibleDesign('abcdefghiklm',None,D)
sage: sorted(GDD.groups())
[['a', 'b', 'c'], ['d', 'e', 'f'], ['g', 'h', 'i'], ['k', 'l', 'm']]
```

```
>>> from sage.all import *
>>> # needs sage.schemes
>>> D = designs.transversal_design(Integer(4),Integer(3)).relabel(list(
↪'abcdefghiklm'),inplace=False).blocks()
>>> GDD = GroupDivisibleDesign('abcdefghiklm',None,D)
>>> sorted(GDD.groups())
[['a', 'b', 'c'], ['d', 'e', 'f'], ['g', 'h', 'i'], ['k', 'l', 'm']]
```

groups()

Return the groups of the Group-Divisible Design.

EXAMPLES:

```
sage: from sage.combinat.designs.group_divisible_designs import␣
↪GroupDivisibleDesign
sage: TD = designs.transversal_design(4,10)
sage: groups = [list(range(i*10,(i+1)*10)) for i in range(4)]
sage: GDD = GroupDivisibleDesign(40,groups,TD); GDD
Group Divisible Design on 40 points of type 10^4
sage: GDD.groups()
[[0, 1, 2, 3, 4, 5, 6, 7, 8, 9],
 [10, 11, 12, 13, 14, 15, 16, 17, 18, 19],
 [20, 21, 22, 23, 24, 25, 26, 27, 28, 29],
 [30, 31, 32, 33, 34, 35, 36, 37, 38, 39]]
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.group_divisible_designs import␣
↪GroupDivisibleDesign
```

(continues on next page)

(continued from previous page)

```
>>> TD = designs.transversal_design(Integer(4),Integer(10))
>>> groups = [list(range(i*Integer(10),(i+Integer(1))*Integer(10))) for i in␣
→range(Integer(4))]
>>> GDD = GroupDivisibleDesign(Integer(40),groups,TD); GDD
Group Divisible Design on 40 points of type 10^4
>>> GDD.groups()
[[0, 1, 2, 3, 4, 5, 6, 7, 8, 9],
 [10, 11, 12, 13, 14, 15, 16, 17, 18, 19],
 [20, 21, 22, 23, 24, 25, 26, 27, 28, 29],
 [30, 31, 32, 33, 34, 35, 36, 37, 38, 39]]
```

sage.combinat.designs.group_divisible_designs.**group_divisible_design**(*v*, *K*, *G*, *existence=False*, *check=False*)

Return a (v, K, G)-Group Divisible Design.

A (v, K, G)-GDD is a pair $(\mathcal{G}, \mathcal{B})$ where:

- $\mathcal{G}$ is a partition of $X = \bigcup \mathcal{G}$ where $|X| = v$
- $\forall S \in \mathcal{G}, |S| \in G$
- $\forall S \in \mathcal{B}, |S| \in K$
- $\mathcal{G} \cup \mathcal{B}$ is a $(v, K \cup G)$-PBD

For more information, see the documentation of `GroupDivisibleDesign` or *PairwiseBalancedDesign*.

INPUT:

- `v` – integer
- `K`, `G` – sets of integers
- `existence` – boolean; instead of building the design, return:
  - `True` – meaning that Sage knows how to build the design
  - `Unknown` – meaning that Sage does not know how to build the design, but that the design may exist (see `sage.misc.unknown`)
  - `False` – meaning that the design does not exist
- `check` – boolean (default: `True`); whether to check that output is correct before returning it. As this is expected to be useless, you may want to disable it whenever you want speed.

Note

The GDD returned by this function are defined on `range(v)`, and its groups are sets of consecutive integers.

EXAMPLES:

```
sage: designs.group_divisible_design(14,{4},{2})
Group Divisible Design on 14 points of type 2^7
```

```
>>> from sage.all import *
>>> designs.group_divisible_design(Integer(14),{Integer(4)},{Integer(2)})
Group Divisible Design on 14 points of type 2^7
```

5.1.78 Block designs

A *block design* is a set together with a family of subsets (repeated subsets are allowed) whose members are chosen to satisfy some set of properties that are deemed useful for a particular application. See Wikipedia article Block_design.

REFERENCES:

- Block design from wikipedia: Wikipedia article Block_design
- What is a block design?, http://designtheory.org/library/extrep/extrep-1.1-html/node4.html (in 'The External Representation of Block Designs' by Peter J. Cameron, Peter Dobcsanyi, John P. Morgan, Leonard H. Soicher)

AUTHORS:

- Quentin Honoré (2015): construction of Hughes plane Issue #18527
- Vincent Delecroix (2014): rewrite the part on projective planes Issue #16281
- Peter Dobcsanyi and David Joyner (2007-2008)

  This is a significantly modified form of the module block_design.py (version 0.6) written by Peter Dobcsanyi peter@designtheory.org. Thanks go to Robert Miller for lots of good design suggestions.

Todo

Implement more finite non-Desarguesian plane as in [We07] and Wikipedia article Non-Desarguesian_plane.

Functions and methods

`sage.combinat.designs.block_design.`**`AffineGeometryDesign`**`(`*n*, *d*, *F*, *point_coordinates=True*, *check=True*`)`

Return an affine geometry design.

The affine geometry design $AG_d(n,q)$ is the 2-design whose blocks are the d-vector subspaces in $\mathbf{F}_q^n$. It has parameters

$$v = q^n,\ k = q^d,\ \lambda = \binom{n-1}{d-1}_q$$

where the q-binomial coefficient $\binom{m}{r}_q$ is defined by

$$\binom{m}{r}_q = \frac{(q^m-1)(q^{m-1}-1)\cdots(q^{m-r+1}-1)}{(q^r-1)(q^{r-1}-1)\cdots(q-1)}$$

See also

`ProjectiveGeometryDesign()`

INPUT:

- `n` – integer; the Euclidean dimension. The number of points of the design is $v = |\mathbf{F}_q^n|$
- `d` – integer; the dimension of the (affine) subspaces of $\mathbf{F}_q^n$ which make up the blocks
- `F` – a finite field or a prime power
- `point_coordinates` – boolean (default: `True`); whether we use coordinates in $\mathbf{F}_q^n$ or plain integers for the points of the design

- check – boolean (default: True); whether to check the output

EXAMPLES:

```
sage: # needs sage.combinat
sage: BD = designs.AffineGeometryDesign(3, 1, GF(2))
sage: BD.is_t_design(return_parameters=True)
(True, (2, 8, 2, 1))
sage: BD = designs.AffineGeometryDesign(3, 2, GF(4))
sage: BD.is_t_design(return_parameters=True)
(True, (2, 64, 16, 5))
sage: BD = designs.AffineGeometryDesign(4, 2, GF(3))
sage: BD.is_t_design(return_parameters=True)
(True, (2, 81, 9, 13))
```

```
>>> from sage.all import *
>>> # needs sage.combinat
>>> BD = designs.AffineGeometryDesign(Integer(3), Integer(1), GF(Integer(2)))
>>> BD.is_t_design(return_parameters=True)
(True, (2, 8, 2, 1))
>>> BD = designs.AffineGeometryDesign(Integer(3), Integer(2), GF(Integer(4)))
>>> BD.is_t_design(return_parameters=True)
(True, (2, 64, 16, 5))
>>> BD = designs.AffineGeometryDesign(Integer(4), Integer(2), GF(Integer(3)))
>>> BD.is_t_design(return_parameters=True)
(True, (2, 81, 9, 13))
```

With F an integer instead of a finite field:

```
sage: BD = designs.AffineGeometryDesign(3, 2, 4)
sage: BD.is_t_design(return_parameters=True)
(True, (2, 64, 16, 5))
```

```
>>> from sage.all import *
>>> BD = designs.AffineGeometryDesign(Integer(3), Integer(2), Integer(4))
>>> BD.is_t_design(return_parameters=True)
(True, (2, 64, 16, 5))
```

Testing the option point_coordinates:

```
sage: designs.AffineGeometryDesign(3, 1, GF(2),
....:                              point_coordinates=True).blocks()[0]
[(0, 0, 0), (0, 0, 1)]
sage: designs.AffineGeometryDesign(3, 1, GF(2),
....:                              point_coordinates=False).blocks()[0]
[0, 1]
```

```
>>> from sage.all import *
>>> designs.AffineGeometryDesign(Integer(3), Integer(1), GF(Integer(2)),
...                              point_coordinates=True).blocks()[Integer(0)]
[(0, 0, 0), (0, 0, 1)]
>>> designs.AffineGeometryDesign(Integer(3), Integer(1), GF(Integer(2)),
...                              point_coordinates=False).blocks()[Integer(0)]
[0, 1]
```

sage.combinat.designs.block_design.**CremonaRichmondConfiguration**()

Return the Cremona-Richmond configuration.

The Cremona-Richmond configuration is a set system whose incidence graph is equal to the `TutteCoxeterGraph()`. It is a generalized quadrangle of parameters $(2, 2)$.

For more information, see the Wikipedia article Cremona-Richmond_configuration.

EXAMPLES:

```
sage: H = designs.CremonaRichmondConfiguration(); H                         #␣
↪needs networkx
Incidence structure with 15 points and 15 blocks
sage: g = graphs.TutteCoxeterGraph()                                        #␣
↪needs networkx
sage: H.incidence_graph().is_isomorphic(g)                                  #␣
↪needs networkx
True
```

```
>>> from sage.all import *
>>> H = designs.CremonaRichmondConfiguration(); H                         #␣
↪needs networkx
Incidence structure with 15 points and 15 blocks
>>> g = graphs.TutteCoxeterGraph()                                        #␣
↪needs networkx
>>> H.incidence_graph().is_isomorphic(g)                                  #␣
↪needs networkx
True
```

sage.combinat.designs.block_design.**DesarguesianProjectivePlaneDesign**(*n*, *point_coordinates=True*, *check=True*)

Return the Desarguesian projective plane of order `n` as a 2-design.

The Desarguesian projective plane of order n can also be defined as the projective plane over a field of order n. For more information, have a look at Wikipedia article Projective_plane.

INPUT:

- `n` – integer which must be a power of a prime number
- `point_coordinates` – boolean (default: `True`); whether to label the points with their homogeneous coordinates (default) or with integers
- `check` – boolean (default: `True`); whether to check that output is correct before returning it. As this is expected to be useless, you may want to disable it whenever you want speed.

ValueError: the order of a finite field must be a prime power
```

sage.combinat.designs.block_design.**Hadamard3Design**(*n*)

Return the Hadamard 3-design with parameters $3-(n, \frac{n}{2}, \frac{n}{4}-1)$.

This is the unique extension of the Hadamard 2-design (see *HadamardDesign()*). We implement the description from pp. 12 in [CvL].

INPUT:

- n – integer; a multiple of 4 such that $n > 4$

EXAMPLES:

```
sage: # needs sage.combinat sage.modules
sage: designs.Hadamard3Design(12)
Incidence structure with 12 points and 22 blocks
```

```
>>> from sage.all import *
>>> # needs sage.combinat sage.modules
>>> designs.Hadamard3Design(Integer(12))
Incidence structure with 12 points and 22 blocks
```

We verify that any two blocks of the Hadamard 3-design $3-(8,4,1)$ design meet in 0 or 2 points. More generally, it is true that any two blocks of a Hadamard 3-design meet in 0 or $\frac{n}{4}$ points (for $n > 4$).

```
sage: # needs sage.combinat sage.modules
sage: D = designs.Hadamard3Design(8)
sage: N = D.incidence_matrix()
sage: N.transpose()*N
[4 2 2 2 2 2 2 2 2 2 2 2 2 0]
[2 4 2 2 2 2 2 2 2 2 2 2 0 2]
```

```

REFERENCES:

`sage.combinat.designs.block_design.`**`HadamardDesign`**`(n)`

As described in Section 1, p. 10, in [CvL]. The input n must have the property that there is a Hadamard matrix of order $n + 1$ (and that a construction of that Hadamard matrix has been implemented…).

EXAMPLES:

```
sage: # needs sage.combinat sage.modules
sage: designs.HadamardDesign(7)
Incidence structure with 7 points and 7 blocks
sage: print(designs.HadamardDesign(7))
Incidence structure with 7 points and 7 blocks
```

```
>>> from sage.all import *
>>> # needs sage.combinat sage.modules
>>> designs.HadamardDesign(Integer(7))
Incidence structure with 7 points and 7 blocks
>>> print(designs.HadamardDesign(Integer(7)))
Incidence structure with 7 points and 7 blocks
```

For example, the Hadamard 2-design with $n = 11$ is a design whose parameters are $2 - (11, 5, 2)$. We verify that $NJ = 5J$ for this design.

```
sage: # needs sage.combinat sage.modules
sage: D = designs.HadamardDesign(11); N = D.incidence_matrix()
sage: J = matrix(ZZ, 11, 11, [1]*11*11); N*J
[5 5 5 5 5 5 5 5 5 5 5]
[5 5 5 5 5 5 5 5 5 5 5]
[5 5 5 5 5 5 5 5 5 5 5]
[5 5 5 5 5 5 5 5 5 5 5]

`sage.combinat.designs.block_design.`**`HughesPlane`**`(`*q2*, *check=True*`)`

Return the Hughes projective plane of order `q2`.

Let q be an odd prime, the Hughes plane of order q^2 is a finite projective plane of order q^2 introduced by D. Hughes in [Hu57]. Its construction is as follows.

Let $K = GF(q^2)$ be a finite field with q^2 elements and $F = GF(q) \subset K$ be its unique subfield with q elements. We define a twisted multiplication on K as

$$x \circ y = \begin{cases} x\ y & \text{if y is a square in K} \\ x^q\ y & \text{otherwise} \end{cases}$$

The points of the Hughes plane are the triples (x, y, z) of points in $K^3 \backslash \{0, 0, 0\}$ up to the equivalence relation $(x, y, z) \sim (x \circ k, y \circ k, z \circ k)$ where $k \in K$.

For $a = 1$ or $a \in (K \backslash F)$ we define a block $L(a)$ as the set of triples (x, y, z) so that $x + a \circ y + z = 0$. The rest of the blocks are obtained by letting act the group $GL(3, F)$ by its standard action.

For more information, see Wikipedia article Hughes_plane and [We07].

See also

DesarguesianProjectivePlaneDesign() to build the Desarguesian projective planes

INPUT:

- `q2` – an even power of an odd prime number
- `check` – boolean (default: `True`); whether to check that output is correct before returning it. As this is expected to be useless, you may want to disable it whenever you want speed.

EXAMPLES:

```
sage: H = designs.HughesPlane(9); H
(91,10,1)-Balanced Incomplete Block Design
```

```
>>> from sage.all import *
>>> H = designs.HughesPlane(Integer(9)); H
(91,10,1)-Balanced Incomplete Block Design
```

We prove in the following computations that the Desarguesian plane `H` is not Desarguesian. Let us consider the two triangles $(0,1,10)$ and $(57,70,59)$. We show that the intersection points $D_{0,1} \cap D_{57,70}$, $D_{1,10} \cap D_{70,59}$ and $D_{10,0} \cap D_{59,57}$ are on the same line while $D_{0,70}$, $D_{1,59}$ and $D_{10,57}$ are not concurrent:

```
sage: blocks = H.blocks()
sage: line = lambda p,q: next(b for b in blocks if p in b and q in b)

sage: b_0_1 = line(0, 1)
sage: b_1_10 = line(1, 10)
sage: b_10_0 = line(10, 0)
sage: b_57_70 = line(57, 70)
sage: b_70_59 = line(70, 59)
sage: b_59_57 = line(59, 57)

sage: set(b_0_1).intersection(b_57_70)
{2}
sage: set(b_1_10).intersection(b_70_59)
{73}
sage: set(b_10_0).intersection(b_59_57)
{60}

sage: line(2, 73) == line(73, 60)
True

sage: b_0_57 = line(0, 57)
sage: b_1_70 = line(1, 70)
sage: b_10_59 = line(10, 59)

sage: p = set(b_0_57).intersection(b_1_70)
sage: q = set(b_1_70).intersection(b_10_59)
sage: p == q
False
```

```
>>> from sage.all import *
>>> blocks = H.blocks()
>>> line = lambda p,q: next(b for b in blocks if p in b and q in b)

>>> b_0_1 = line(Integer(0), Integer(1))
>>> b_1_10 = line(Integer(1), Integer(10))
>>> b_10_0 = line(Integer(10), Integer(0))
>>> b_57_70 = line(Integer(57), Integer(70))
>>> b_70_59 = line(Integer(70), Integer(59))
>>> b_59_57 = line(Integer(59), Integer(57))

>>> set(b_0_1).intersection(b_57_70)
{2}
>>> set(b_1_10).intersection(b_70_59)
{73}
>>> set(b_10_0).intersection(b_59_57)
{60}

>>> line(Integer(2), Integer(73)) == line(Integer(73), Integer(60))
True

>>> b_0_57 = line(Integer(0), Integer(57))
>>> b_1_70 = line(Integer(1), Integer(70))
>>> b_10_59 = line(Integer(10), Integer(59))

>>> p = set(b_0_57).intersection(b_1_70)
>>> q = set(b_1_70).intersection(b_10_59)
>>> p == q
False
```

`sage.combinat.designs.block_design.`**`ProjectiveGeometryDesign`**`(`*n*, *d*, *F*, *algorithm=None*, *point_coordinates=True*, *check=True*`)`

Return a projective geometry design.

The projective geometry design $PG_d(n,q)$ has for points the lines of $\mathbf{F}_q^{n+1}$, and for blocks the $(d+1)$-dimensional subspaces of $\mathbf{F}_q^{n+1}$, each of which contains $\frac{|\mathbf{F}_q|^{d+1}-1}{|\mathbf{F}_q|-1}$ lines. It is a 2-design with parameters

$$v = \binom{n+1}{1}_q,\ k = \binom{d+1}{1}_q,\ \lambda = \binom{n-1}{d-1}_q$$

where the q-binomial coefficient $\binom{m}{r}_q$ is defined by

$$\binom{m}{r}_q = \frac{(q^m-1)(q^{m-1}-1)\cdots(q^{m-r+1}-1)}{(q^r-1)(q^{r-1}-1)\cdots(q-1)}$$

See also

AffineGeometryDesign()

INPUT:

- n – the projective dimension
- d – the dimension of the subspaces which make up the blocks
- F – a finite field or a prime power
- algorithm – set to None by default, which results in using Sage's own implementation. In order to use GAP's implementation instead (i.e. its PGPointFlatBlockDesign function) set algorithm="gap". Note that GAP's "design" package must be available in this case, and that it can be installed with the gap_packages spkg.
- point_coordinates – True by default. Ignored and assumed to be False if algorithm="gap". If True, the ground set is indexed by coordinates in $\mathbf{F}_q^{n+1}$. Otherwise the ground set is indexed by integers.
- check – boolean (default: True); whether to check the output

EXAMPLES:

The set of d-dimensional subspaces in a n-dimensional projective space forms 2-designs (or balanced incomplete block designs):

```
sage: PG = designs.ProjectiveGeometryDesign(4, 2, GF(2)); PG                  #␣
↪needs sage.combinat
Incidence structure with 31 points and 155 blocks
sage: PG.is_t_design(return_parameters=True)                                  #␣
↪needs sage.combinat
(True, (2, 31, 7, 7))

sage: PG = designs.ProjectiveGeometryDesign(3, 1, GF(4))                       #␣
↪needs sage.combinat
sage: PG.is_t_design(return_parameters=True)                                  #␣
↪needs sage.combinat
(True, (2, 85, 5, 1))
```

```
>>> from sage.all import *
>>> PG = designs.ProjectiveGeometryDesign(Integer(4), Integer(2), GF(Integer(2)));
↪ PG                       # needs sage.combinat
Incidence structure with 31 points and 155 blocks
>>> PG.is_t_design(return_parameters=True)                                   #␣
↪needs sage.combinat
(True, (2, 31, 7, 7))

>>> PG = designs.ProjectiveGeometryDesign(Integer(3), Integer(1), GF(Integer(4)))␣
↪                          # needs sage.combinat
>>> PG.is_t_design(return_parameters=True)                                   #␣
↪needs sage.combinat
(True, (2, 85, 5, 1))
```

Check with F being a prime power:

```
sage: PG = designs.ProjectiveGeometryDesign(3, 2, 4); PG
Incidence structure with 85 points and 85 blocks
```

```
>>> from sage.all import *
>>> PG = designs.ProjectiveGeometryDesign(Integer(3), Integer(2), Integer(4)); PG
Incidence structure with 85 points and 85 blocks
```

Use coordinates:

```
sage: PG = designs.ProjectiveGeometryDesign(2, 1, GF(3))
sage: PG.blocks()[0]
[(1, 0, 0), (1, 0, 1), (1, 0, 2), (0, 0, 1)]
```

```
>>> from sage.all import *
>>> PG = designs.ProjectiveGeometryDesign(Integer(2), Integer(1), GF(Integer(3)))
>>> PG.blocks()[Integer(0)]
[(1, 0, 0), (1, 0, 1), (1, 0, 2), (0, 0, 1)]
```

Use indexing by integers:

```
sage: PG = designs.ProjectiveGeometryDesign(2, 1, GF(3), point_coordinates=0)
sage: PG.blocks()[0]
[0, 1, 2, 12]
```

```
>>> from sage.all import *
>>> PG = designs.ProjectiveGeometryDesign(Integer(2), Integer(1), GF(Integer(3)),
↪point_coordinates=Integer(0))
>>> PG.blocks()[Integer(0)]
[0, 1, 2, 12]
```

Check that the constructor using gap also works:

```
sage: BD = designs.ProjectiveGeometryDesign(2, 1, GF(2), algorithm='gap')   #
↪optional - gap_package_design
sage: BD.is_t_design(return_parameters=True)                                #
↪optional - gap_package_design
(True, (2, 7, 3, 1))
```

```
>>> from sage.all import *
>>> BD = designs.ProjectiveGeometryDesign(Integer(2), Integer(1), GF(Integer(2)),
↪algorithm='gap')  # optional - gap_package_design
>>> BD.is_t_design(return_parameters=True)                               #
↪optional - gap_package_design
(True, (2, 7, 3, 1))
```

sage.combinat.designs.block_design.**WittDesign**(*n*)

INPUT:

- n – integer in $9, 10, 11, 12, 21, 22, 23, 24$

Wraps GAP Design's WittDesign. If n=24 then this function returns the large Witt design W_{24}, the unique (up to isomorphism) $5-(24, 8, 1)$ design. If n=12 then this function returns the small Witt design W_{12}, the unique (up to isomorphism) $5-(12, 6, 1)$ design. The other values of n return a block design derived from these.

Note

Requires GAP's Design package (included in the gap_packages Sage spkg).

EXAMPLES:

```
sage: # optional - gap_package_design
sage: BD = designs.WittDesign(9)
sage: BD.is_t_design(return_parameters=True)
(True, (2, 9, 3, 1))
sage: BD
Incidence structure with 9 points and 12 blocks
sage: print(BD)
Incidence structure with 9 points and 12 blocks
```

```
>>> from sage.all import *
>>> # optional - gap_package_design
>>> BD = designs.WittDesign(Integer(9))
>>> BD.is_t_design(return_parameters=True)
(True, (2, 9, 3, 1))
>>> BD
Incidence structure with 9 points and 12 blocks
>>> print(BD)
Incidence structure with 9 points and 12 blocks
```

sage.combinat.designs.block_design.**are_hyperplanes_in_projective_geometry_parameters**(*v*, *k*, *lmbda*, *return_parameters=False*)

Return `True` if the parameters `(v,k,lmbda)` are the one of hyperplanes in a (finite Desarguesian) projective space.

In other words, test whether there exists a prime power `q` and an integer `d` greater than two such that:

- $v = (q^{d+1} - 1)/(q - 1) = q^d + q^{d-1} + ... + 1$
- $k = (q^d - 1)/(q - 1) = q^{d-1} + q^{d-2} + ... + 1$
- $lmbda = (q^{d-1} - 1)/(q - 1) = q^{d-2} + q^{d-3} + ... + 1$

If it exists, such a pair `(q,d)` is unique.

INPUT:

- `v`, `k`, `lmbda` – integers

OUTPUT:

- a boolean or, if `return_parameters` is set to `True` a pair `(True, (q,d))` or `(False, (None,None))`.

EXAMPLES:

```
sage: from sage.combinat.designs.block_design import are_hyperplanes_in_
↪projective_geometry_parameters
sage: are_hyperplanes_in_projective_geometry_parameters(40, 13, 4)
True
sage: are_hyperplanes_in_projective_geometry_parameters(40, 13, 4,
....:                                          return_parameters=True)
(True, (3, 3))
```

(continues on next page)

(continued from previous page)

```
sage: PG = designs.ProjectiveGeometryDesign(3, 2, GF(3))                       #␣
↪needs sage.combinat
sage: PG.is_t_design(return_parameters=True)                                   #␣
↪needs sage.combinat
(True, (2, 40, 13, 4))

sage: are_hyperplanes_in_projective_geometry_parameters(15, 3, 1)
False
sage: are_hyperplanes_in_projective_geometry_parameters(15, 3, 1,
....:                                                   return_parameters=True)
(False, (None, None))
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.block_design import are_hyperplanes_in_projective_
↪geometry_parameters
>>> are_hyperplanes_in_projective_geometry_parameters(Integer(40), Integer(13),␣
↪Integer(4))
True
>>> are_hyperplanes_in_projective_geometry_parameters(Integer(40), Integer(13),␣
↪Integer(4),
...                                                   return_parameters=True)
(True, (3, 3))
>>> PG = designs.ProjectiveGeometryDesign(Integer(3), Integer(2), GF(Integer(3)))␣
↪                       # needs sage.combinat
>>> PG.is_t_design(return_parameters=True)                                   #␣
↪needs sage.combinat
(True, (2, 40, 13, 4))

>>> are_hyperplanes_in_projective_geometry_parameters(Integer(15), Integer(3),␣
↪Integer(1))
False
>>> are_hyperplanes_in_projective_geometry_parameters(Integer(15), Integer(3),␣
↪Integer(1),
...                                                   return_parameters=True)
(False, (None, None))
```

sage.combinat.designs.block_design.**normalize_hughes_plane_point**(*p*, *q*)

Return the normalized form of point `p` as a 3-tuple.

In the Hughes projective plane over the finite field K, all triples (xk, yk, zk) with $k \in K$ represent the same point (where the multiplication is over the nearfield built from K). This function chooses a canonical representative among them.

This function is used in `HughesPlane()`.

INPUT:

- `p` – point with the coordinates (x, y, z) (a list, a vector, a tuple…)
- `q` – cardinality of the underlying finite field

EXAMPLES:

```
sage: from sage.combinat.designs.block_design import normalize_hughes_plane_point
sage: K = FiniteField(9,'x')
```

(continues on next page)

(continued from previous page)

```
sage: x = K.gen()
sage: normalize_hughes_plane_point((x, x + 1, x), 9)
(1, x, 1)
sage: normalize_hughes_plane_point(vector((x,x,x)), 9)
(1, 1, 1)
sage: zero = K.zero()
sage: normalize_hughes_plane_point((2*x + 2, zero, zero), 9)
(1, 0, 0)
sage: one = K.one()
sage: normalize_hughes_plane_point((2*x, one, zero), 9)
(2*x, 1, 0)
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.block_design import normalize_hughes_plane_point
>>> K = FiniteField(Integer(9),'x')
>>> x = K.gen()
>>> normalize_hughes_plane_point((x, x + Integer(1), x), Integer(9))
(1, x, 1)
>>> normalize_hughes_plane_point(vector((x,x,x)), Integer(9))
(1, 1, 1)
>>> zero = K.zero()
>>> normalize_hughes_plane_point((Integer(2)*x + Integer(2), zero, zero),␣
↪Integer(9))
(1, 0, 0)
>>> one = K.one()
>>> normalize_hughes_plane_point((Integer(2)*x, one, zero), Integer(9))
(2*x, 1, 0)
```

sage.combinat.designs.block_design.**projective_plane**(*n*, *check=True*, *existence=False*)

Return a projective plane of order `n` as a 2-design.

A finite projective plane is a 2-design with n^2+n+1 lines (or blocks) and n^2+n+1 points. For more information on finite projective planes, see the Wikipedia article Projective_plane#Finite_projective_planes.

If no construction is possible, then the function raises a `EmptySetError`, whereas if no construction is available, the function raises a `NotImplementedError`.

INPUT:

- `n` – the finite projective plane's order

EXAMPLES:

```
sage: # needs sage.schemes
sage: designs.projective_plane(2)
(7,3,1)-Balanced Incomplete Block Design
sage: designs.projective_plane(3)
(13,4,1)-Balanced Incomplete Block Design
sage: designs.projective_plane(4)
(21,5,1)-Balanced Incomplete Block Design
sage: designs.projective_plane(5)

sage.combinat.designs.block_design.**projective_plane_to_OA**(*pplane*, *pt=None*, *check=True*)

Return the orthogonal array built from the projective plane `pplane`.

The orthogonal array $OA(n+1,n,2)$ is obtained from the projective plane `pplane` by removing the point `pt` and the $n+1$ lines that pass through it`. These $n+1$ lines form the $n+1$ groups while the remaining n^2+n lines form the transversals.

INPUT:

- `pplane` – a projective plane as a 2-design
- `pt` – a point in the projective plane `pplane`; if it is not provided, then it is set to $n^2 + n$
- `check` – boolean (default: `True`); whether to check that output is correct before returning it. As this is expected to be useless, you may want to disable it whenever you want speed.

EXAMPLES:

```
sage: from sage.combinat.designs.block_design import projective_plane_to_OA
sage: p2 = designs.DesarguesianProjectivePlaneDesign(2, point_coordinates=False)
sage: projective_plane_to_OA(p2)
[[0, 0, 0], [0, 1, 1], [1, 0, 1], [1, 1, 0]]
sage: p3 = designs.DesarguesianProjectivePlaneDesign(3, point_coordinates=False)
sage: projective_plane_to_OA(p3)
[[0, 0, 0, 0],
 [0, 1, 2, 1],
 [0, 2, 1, 2],
 [1, 0, 2, 2],
 [1, 1, 1, 0],
 [1, 2, 0, 1],
 [2, 0, 1, 1],
 [2, 1, 0, 2],
 [2, 2, 2, 0]]

sage: pp = designs.DesarguesianProjectivePlaneDesign(16, point_coordinates=False)
sage: _ = projective_plane_to_OA(pp, pt=0)
sage: _ = projective_plane_to_OA(pp, pt=3)
sage: _ = projective_plane_to_OA(pp, pt=7)
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.block_design import projective_plane_to_OA
>>> p2 = designs.DesarguesianProjectivePlaneDesign(Integer(2), point_
↪coordinates=False)
>>> projective_plane_to_OA(p2)
[[0, 0, 0], [0, 1, 1], [1, 0, 1], [1, 1, 0]]
>>> p3 = designs.DesarguesianProjectivePlaneDesign(Integer(3), point_
↪coordinates=False)
>>> projective_plane_to_OA(p3)
[[0, 0, 0, 0],
 [0, 1, 2, 1],
 [0, 2, 1, 2],
 [1, 0, 2, 2],
 [1, 1, 1, 0],
 [1, 2, 0, 1],
 [2, 0, 1, 1],
 [2, 1, 0, 2],
 [2, 2, 2, 0]]

>>> pp = designs.DesarguesianProjectivePlaneDesign(Integer(16), point_
↪coordinates=False)
>>> _ = projective_plane_to_OA(pp, pt=Integer(0))
```

```

sage.combinat.designs.block_design.**q3_minus_one_matrix**(K)

Return a companion matrix in $GL(3, K)$ whose multiplicative order is $q^3 - 1$.

This function is used in `HughesPlane()`.

EXAMPLES:

```
sage: from sage.combinat.designs.block_design import q3_minus_one_matrix
sage: m = q3_minus_one_matrix(GF(3))
sage: m.multiplicative_order() == 3**3 - 1
True

sage: m = q3_minus_one_matrix(GF(4, 'a'))
sage: m.multiplicative_order() == 4**3 - 1
True

sage: m = q3_minus_one_matrix(GF(5))
sage: m.multiplicative_order() == 5**3 - 1
True

sage: m = q3_minus_one_matrix(GF(9, 'a'))
sage: m.multiplicative_order() == 9**3 - 1
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.block_design import q3_minus_one_matrix
>>> m = q3_minus_one_matrix(GF(Integer(3)))
>>> m.multiplicative_order() == Integer(3)**Integer(3) - Integer(1)
True

>>> m = q3_minus_one_matrix(GF(Integer(4), 'a'))
>>> m.multiplicative_order() == Integer(4)**Integer(3) - Integer(1)
True

>>> m = q3_minus_one_matrix(GF(Integer(5)))
>>> m.multiplicative_order() == Integer(5)**Integer(3) - Integer(1)
True

>>> m = q3_minus_one_matrix(GF(Integer(9), 'a'))
>>> m.multiplicative_order() == Integer(9)**Integer(3) - Integer(1)
True
```

sage.combinat.designs.block_design.**tdesign_params**(t, v, k, L)

Return the design's parameters: (t, v, b, r, k, L). Note that t must be given.

EXAMPLES:

```
sage: BD = BlockDesign(7, [[0,1,2],[0,3,4],[0,5,6],[1,3,5],[1,4,6],[2,3,6],[2,4,
↪5]])
sage: from sage.combinat.designs.block_design import tdesign_params
```

(continues on next page)

(continued from previous page)

```
sage: tdesign_params(2,7,3,1)
(2, 7, 7, 3, 3, 1)
```

```
>>> from sage.all import *
>>> BD = BlockDesign(Integer(7), [[Integer(0),Integer(1),Integer(2)],[Integer(0),
↪Integer(3),Integer(4)],[Integer(0),Integer(5),Integer(6)],[Integer(1),
↪Integer(3),Integer(5)],[Integer(1),Integer(4),Integer(6)],[Integer(2),
↪Integer(3),Integer(6)],[Integer(2),Integer(4),Integer(5)]])
>>> from sage.combinat.designs.block_design import tdesign_params
>>> tdesign_params(Integer(2),Integer(7),Integer(3),Integer(1))
(2, 7, 7, 3, 3, 1)
```

5.1.79 Covering Arrays (CA)

A Covering Array, denoted $CA(N;t,k,v)$, is an N by k array with entries from a set of v elements with the property that in every selection of t columns, every sequence of t elements appears in at least one row.

An Orthogonal Array, denoted $OA(N;t,k,v)$ is a covering array with the property that every sequence of t-elements appears in exactly one row. (See *sage.combinat.designs.orthogonal_arrays*).

This module collects methods relating to covering arrays, some of which are inherited from orthogonal array methods. This module defines the following functions:

is_covering_array()	Check that an input list of lists is a $CA(N;t,k,v)$.
CA_relabel()	Return a relabelled version of the CA.
CA_standard_label()	Return a version of the CA relabelled to symbols $(0,\dots,n-1)$.
truncate_columns()	Return an array with k columns from a larger one.
Kleitman_Spencer_Katona()	Return a $CA(N;2,k,2)$ using N as input.
column_Kleitman_Spencer_Katona()	Return a $CA(N;2,k,2)$ using k as input.
database_check()	Check if CA can be made from the database of combinatorial designs.
covering_array()	Return a CA with given parameters.

AUTHORS:

- Aaron Dwyer and brett stevens (2022): initial version

sage.combinat.designs.covering_array.**Kleitman_Spencer_Katona**(N)

Return a $CA(N;2,k,2)$ where $k = \binom{N-1}{\lceil N/2 \rceil}$.

INPUT:

- N – the number of rows in the array, must be an integer greater than 3 since any smaller would not produce enough columns for a strength 2 array.

This construction is referenced in [Colb2004] from [KS1973] and [Kat1973]

Construction

Take all distinct binary N-tuples of weight $N/2$ that have a 0 in the first position and place them as columns in an array.

EXAMPLES:

```
sage: from sage.combinat.designs.covering_array import Kleitman_Spencer_Katona
sage: from sage.combinat.designs.designs_pyx import is_covering_array
sage: C = Kleitman_Spencer_Katona(2)
Traceback (most recent call last):
...
ValueError: N must be greater than 3
sage: C = Kleitman_Spencer_Katona(5)
sage: is_covering_array(C,parameters=True)
(True, (5, 2, 4, 2))
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.covering_array import Kleitman_Spencer_Katona
>>> from sage.combinat.designs.designs_pyx import is_covering_array
>>> C = Kleitman_Spencer_Katona(Integer(2))
Traceback (most recent call last):
...
ValueError: N must be greater than 3
>>> C = Kleitman_Spencer_Katona(Integer(5))
>>> is_covering_array(C,parameters=True)
(True, (5, 2, 4, 2))
```

sage.combinat.designs.covering_array.**column_Kleitman_Spencer_Katona**(k)

Return a covering array with k columns using the Kleitman-Spencer-Katona method.

See *Kleitman_Spencer_Katona()*

INPUT:

- k – the number of columns in the array, must be an integer greater than 3 since any smaller is a trivial array for strength 2.

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_covering_array
sage: from sage.combinat.designs.covering_array import column_Kleitman_Spencer_
↪Katona
sage: C = column_Kleitman_Spencer_Katona(20)
sage: is_covering_array(C,parameters=True)
(True, (8, 2, 20, 2))
sage: column_Kleitman_Spencer_Katona(25000)
Traceback (most recent call last):
...
NotImplementedError: not implemented for k > 24310
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_covering_array
>>> from sage.combinat.designs.covering_array import column_Kleitman_Spencer_
↪Katona
>>> C = column_Kleitman_Spencer_Katona(Integer(20))
>>> is_covering_array(C,parameters=True)
```

(continues on next page)

(continued from previous page)

```
(True, (8, 2, 20, 2))
>>> column_Kleitman_Spencer_Katona(Integer(25000))
Traceback (most recent call last):
...
NotImplementedError: not implemented for k > 24310
```

sage.combinat.designs.covering_array.**covering_array**(*strength*, *number_columns*, *levels*)

Build a $CA(N; t, k, v)$ using direct constructions, where N is the smallest size known.

INPUT:

- strength (integer) – the parameter t of the covering array, such that in any selection of t columns of the array, every t-tuple appears at least once.
- levels (integer) – the parameter v which is the number of unique symbols that appear in the covering array.
- number_columns (integer) – the number of columns desired for the covering array.

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_covering_array
sage: from sage.combinat.designs.covering_array import covering_array
sage: C1 = covering_array(2, 7, 3)
sage: is_covering_array(C1,parameters=True)
(True, (12, 2, 7, 3))
sage: C2 = covering_array(2, 11, 2)
sage: is_covering_array(C2,parameters=True)
(True, (7, 2, 11, 2))
sage: C3 = covering_array(2, 8, 7)
sage: is_covering_array(C3,parameters=True)
(True, (49, 2, 8, 7))
sage: C4 = covering_array(2, 50, 7)
No direct construction known and/or implemented for a CA(N; 2, 50, 7)
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_covering_array
>>> from sage.combinat.designs.covering_array import covering_array
>>> C1 = covering_array(Integer(2), Integer(7), Integer(3))
>>> is_covering_array(C1,parameters=True)
(True, (12, 2, 7, 3))
>>> C2 = covering_array(Integer(2), Integer(11), Integer(2))
>>> is_covering_array(C2,parameters=True)
(True, (7, 2, 11, 2))
>>> C3 = covering_array(Integer(2), Integer(8), Integer(7))
>>> is_covering_array(C3,parameters=True)
(True, (49, 2, 8, 7))
>>> C4 = covering_array(Integer(2), Integer(50), Integer(7))
No direct construction known and/or implemented for a CA(N; 2, 50, 7)
```

sage.combinat.designs.covering_array.**database_check**(*number_columns*, *strength*, *levels*)

Check if the database can be used to build a CA with the given parameters. If so return the CA, if not return False.

INPUT:

- strength (integer) – the parameter t of the covering array, such that in any selection of t columns of the array, every t-tuple appears at least once.

- `levels` (integer) – the parameter v which is the number of unique symbols that appear in the covering array.
- `number_columns` (integer) – the number of columns desired for the covering array.

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_covering_array
sage: from sage.combinat.designs.covering_array import database_check
sage: C = database_check(6, 2, 3)
sage: is_covering_array(C, parameters=True)
(True, (12, 2, 6, 3))
sage: database_check(6, 3, 3)
False
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_covering_array
>>> from sage.combinat.designs.covering_array import database_check
>>> C = database_check(Integer(6), Integer(2), Integer(3))
>>> is_covering_array(C, parameters=True)
(True, (12, 2, 6, 3))
>>> database_check(Integer(6), Integer(3), Integer(3))
False
```

`sage.combinat.designs.covering_array.`**`truncate_columns`**(*array*, *k*)

Return a covering array with k columns, obtained by removing excess columns from a larger covering array.

INPUT:

- `array` – the array to be truncated.
- `k` – the number of columns desired. Must be less than the number of columns in `array`.

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_covering_array
sage: from sage.combinat.designs.covering_array import truncate_columns
sage: from sage.combinat.designs.database import ca_11_2_5_3
sage: C = ca_11_2_5_3()
sage: D = truncate_columns(C,7)
Traceback (most recent call last):
...
ValueError: array only has 5 columns
sage: E = truncate_columns(C,4)
sage: is_covering_array(E,parameters=True)
(True, (11, 2, 4, 3))
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_covering_array
>>> from sage.combinat.designs.covering_array import truncate_columns
>>> from sage.combinat.designs.database import ca_11_2_5_3
>>> C = ca_11_2_5_3()
>>> D = truncate_columns(C,Integer(7))
Traceback (most recent call last):
...
ValueError: array only has 5 columns
>>> E = truncate_columns(C,Integer(4))
```

(continues on next page)

(continued from previous page)

```
>>> is_covering_array(E,parameters=True)
(True, (11, 2, 4, 3))
```

5.1.80 Covering designs: coverings of t-element subsets of a v-set by k-sets

A (v, k, t) covering design C is an incidence structure consisting of a set of points P of order v, and a set of blocks B, where each block contains k points of P. Every t-element subset of P must be contained in at least one block.

If every t-set is contained in exactly one block of C, then we have a block design. Following the block design implementation, the standard representation of a covering design uses $P = [0, 1, ..., v - 1]$.

In addition to the parameters and incidence structure for a covering design from this database, we include extra information:

- Best known lower bound on the size of a (v, k, t)-covering design
- Name of the person(s) who produced the design
- Method of construction used
- Date when the design was added to the database

REFERENCES:

AUTHORS:

- Daniel M. Gordon (2008-12-22): initial version

Classes and methods

class sage.combinat.designs.covering_design.**CoveringDesign**(*v=0*, *k=0*, *t=0*, *size=0*, *points=None*, *blocks=None*, *low_bd=0*, *method=''*, *creator=''*, *timestamp=''*)

Bases: `SageObject`

Covering design.

INPUT:

- `v`, `k`, `t` – integer parameters of the covering design
- `size` – integer
- `points` – list of points (default: $[0, ..., v - 1]$)
- `blocks`
- `low_bd` – integer; lower bound for such a design
- `method`, `creator`, `timestamp` – database information

creator()

Return the creator of the covering design.

This field is optional, and is used in a database to give attribution for the covering design It can refer to the person who submitted it, or who originally gave a construction

EXAMPLES:

```
sage: from sage.combinat.designs.covering_design import CoveringDesign
sage: C = CoveringDesign(7, 3, 2, 7, range(7), [[0, 1, 2],
....:     [0, 3, 4], [0, 5, 6], [1, 3, 5], [1, 4, 6], [2, 3, 6],
....:     [2, 4, 5]],0, 'Projective Plane', 'Gino Fano')
sage: C.creator()
'Gino Fano'
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.covering_design import CoveringDesign
>>> C = CoveringDesign(Integer(7), Integer(3), Integer(2), Integer(7),␣
↪range(Integer(7)), [[Integer(0), Integer(1), Integer(2)],
...     [Integer(0), Integer(3), Integer(4)], [Integer(0), Integer(5),␣
↪Integer(6)], [Integer(1), Integer(3), Integer(5)], [Integer(1), Integer(4),␣
↪Integer(6)], [Integer(2), Integer(3), Integer(6)],
...     [Integer(2), Integer(4), Integer(5)]],Integer(0), 'Projective Plane',
↪'Gino Fano')
>>> C.creator()
'Gino Fano'
```

incidence_structure()

Return the incidence structure of this design, without extra parameters.

EXAMPLES:

```
sage: from sage.combinat.designs.covering_design import CoveringDesign
sage: C = CoveringDesign(7, 3, 2, 7, range(7), [[0, 1, 2],
....:     [0, 3, 4], [0, 5, 6], [1, 3, 5], [1, 4, 6],
....:     [2, 3, 6], [2, 4, 5]], 0, 'Projective Plane')
sage: D = C.incidence_structure()
sage: D.ground_set()
[0, 1, 2, 3, 4, 5, 6]
sage: D.blocks()
[[0, 1, 2], [0, 3, 4], [0, 5, 6], [1, 3, 5],
[1, 4, 6], [2, 3, 6], [2, 4, 5]]
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.covering_design import CoveringDesign
>>> C = CoveringDesign(Integer(7), Integer(3), Integer(2), Integer(7),␣
↪range(Integer(7)), [[Integer(0), Integer(1), Integer(2)],
...     [Integer(0), Integer(3), Integer(4)], [Integer(0), Integer(5),␣
↪Integer(6)], [Integer(1), Integer(3), Integer(5)], [Integer(1), Integer(4),␣
↪Integer(6)],
...     [Integer(2), Integer(3), Integer(6)], [Integer(2), Integer(4),␣
↪Integer(5)]], Integer(0), 'Projective Plane')
>>> D = C.incidence_structure()
>>> D.ground_set()
[0, 1, 2, 3, 4, 5, 6]
>>> D.blocks()
[[0, 1, 2], [0, 3, 4], [0, 5, 6], [1, 3, 5],
[1, 4, 6], [2, 3, 6], [2, 4, 5]]
```

is_covering()

Check all t-sets are in fact covered by the blocks of `self`.

Note: This is very slow and wasteful of memory.

EXAMPLES:

```
sage: C = CoveringDesign(7, 3, 2, 7, range(7), [[0, 1, 2],
....:      [0, 3, 4], [0, 5, 6], [1, 3, 5], [1, 4, 6],
....:      [2, 3, 6], [2, 4, 5]], 0, 'Projective Plane')
sage: C.is_covering()
True
sage: C = CoveringDesign(7, 3, 2, 7, range(7), [[0, 1, 2],
....:      [0, 3, 4], [0, 5, 6], [1, 3, 5], [1, 4, 6], [2, 3, 6],
....:      [2, 4, 6]], 0, 'not a covering')    # last block altered
sage: C.is_covering()
False
```

```
>>> from sage.all import *
>>> C = CoveringDesign(Integer(7), Integer(3), Integer(2), Integer(7),␣
↪range(Integer(7)), [[Integer(0), Integer(1), Integer(2)],
...      [Integer(0), Integer(3), Integer(4)], [Integer(0), Integer(5),␣
↪Integer(6)], [Integer(1), Integer(3), Integer(5)], [Integer(1), Integer(4),␣
↪Integer(6)],
...      [Integer(2), Integer(3), Integer(6)], [Integer(2), Integer(4),␣
↪Integer(5)]], Integer(0), 'Projective Plane')
>>> C.is_covering()
True
>>> C = CoveringDesign(Integer(7), Integer(3), Integer(2), Integer(7),␣
↪range(Integer(7)), [[Integer(0), Integer(1), Integer(2)],
...      [Integer(0), Integer(3), Integer(4)], [Integer(0), Integer(5),␣
↪Integer(6)], [Integer(1), Integer(3), Integer(5)], [Integer(1), Integer(4),␣
↪Integer(6)], [Integer(2), Integer(3), Integer(6)],
...      [Integer(2), Integer(4), Integer(6)]], Integer(0), 'not a covering') ␣
↪ # last block altered
>>> C.is_covering()
False
```

k()

Return k, the size of blocks of the covering design.

EXAMPLES:

```
sage: from sage.combinat.designs.covering_design import CoveringDesign
sage: C = CoveringDesign(7, 3, 2, 7, range(7), [[0, 1, 2],
....:      [0, 3, 4], [0, 5, 6], [1, 3, 5], [1, 4, 6],
....:      [2, 3, 6], [2, 4, 5]], 0, 'Projective Plane')
sage: C.k()
3
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.covering_design import CoveringDesign
>>> C = CoveringDesign(Integer(7), Integer(3), Integer(2), Integer(7),␣
```

(continues on next page)

(continued from previous page)

```
↪range(Integer(7)), [[Integer(0), Integer(1), Integer(2)],
...     [Integer(0), Integer(3), Integer(4)], [Integer(0), Integer(5),␣
↪Integer(6)], [Integer(1), Integer(3), Integer(5)], [Integer(1), Integer(4),␣
↪Integer(6)],
...     [Integer(2), Integer(3), Integer(6)], [Integer(2), Integer(4),␣
↪Integer(5)]], Integer(0), 'Projective Plane')
>>> C.k()
3
```

low_bd()

Return a lower bound for the number of blocks a covering design with these parameters could have.

Typically this is the Schonheim bound, but for some parameters better bounds have been shown.

EXAMPLES:

```
sage: from sage.combinat.designs.covering_design import CoveringDesign
sage: C = CoveringDesign(7, 3, 2, 7, range(7), [[0, 1, 2],
....:     [0, 3, 4], [0, 5, 6], [1, 3, 5], [1, 4, 6],
....:     [2, 3, 6], [2, 4, 5]], 0, 'Projective Plane')
sage: C.low_bd()
7
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.covering_design import CoveringDesign
>>> C = CoveringDesign(Integer(7), Integer(3), Integer(2), Integer(7),␣
↪range(Integer(7)), [[Integer(0), Integer(1), Integer(2)],
...     [Integer(0), Integer(3), Integer(4)], [Integer(0), Integer(5),␣
↪Integer(6)], [Integer(1), Integer(3), Integer(5)], [Integer(1), Integer(4),␣
↪Integer(6)],
...     [Integer(2), Integer(3), Integer(6)], [Integer(2), Integer(4),␣
↪Integer(5)]], Integer(0), 'Projective Plane')
>>> C.low_bd()
7
```

method()

Return the method used to create the covering design.

This field is optional, and is used in a database to give information about how coverings were constructed.

EXAMPLES:

```
sage: from sage.combinat.designs.covering_design import CoveringDesign
sage: C = CoveringDesign(7, 3, 2, 7, range(7), [[0, 1, 2],
....:     [0, 3, 4], [0, 5, 6], [1, 3, 5], [1, 4, 6],
....:     [2, 3, 6], [2, 4, 5]], 0, 'Projective Plane')
sage: C.method()
'Projective Plane'
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.covering_design import CoveringDesign
>>> C = CoveringDesign(Integer(7), Integer(3), Integer(2), Integer(7),␣
↪range(Integer(7)), [[Integer(0), Integer(1), Integer(2)],
```

(continues on next page)

(continued from previous page)

```
...     [Integer(0), Integer(3), Integer(4)], [Integer(0), Integer(5),␣
→Integer(6)], [Integer(1), Integer(3), Integer(5)], [Integer(1), Integer(4),␣
→Integer(6)],
...     [Integer(2), Integer(3), Integer(6)], [Integer(2), Integer(4),␣
→Integer(5)]], Integer(0), 'Projective Plane')
>>> C.method()
'Projective Plane'
```

size()

Return the number of blocks in the covering design.

EXAMPLES:

```
sage: from sage.combinat.designs.covering_design import CoveringDesign
sage: C = CoveringDesign(7, 3, 2, 7, range(7), [[0, 1, 2],
....:     [0, 3, 4], [0, 5, 6], [1, 3, 5], [1, 4, 6],
....:     [2, 3, 6], [2, 4, 5]], 0, 'Projective Plane')
sage: C.size()
7
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.covering_design import CoveringDesign
>>> C = CoveringDesign(Integer(7), Integer(3), Integer(2), Integer(7),␣
→range(Integer(7)), [[Integer(0), Integer(1), Integer(2)],
...     [Integer(0), Integer(3), Integer(4)], [Integer(0), Integer(5),␣
→Integer(6)], [Integer(1), Integer(3), Integer(5)], [Integer(1), Integer(4),␣
→Integer(6)],
...     [Integer(2), Integer(3), Integer(6)], [Integer(2), Integer(4),␣
→Integer(5)]], Integer(0), 'Projective Plane')
>>> C.size()
7
```

t()

Return t, the size of sets which must be covered by the blocks of the covering design

EXAMPLES:

```
sage: from sage.combinat.designs.covering_design import CoveringDesign
sage: C = CoveringDesign(7, 3, 2, 7, range(7), [[0, 1, 2],
....:     [0, 3, 4], [0, 5, 6], [1, 3, 5], [1, 4, 6],
....:     [2, 3, 6], [2, 4, 5]], 0, 'Projective Plane')
sage: C.t()
2
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.covering_design import CoveringDesign
>>> C = CoveringDesign(Integer(7), Integer(3), Integer(2), Integer(7),␣
→range(Integer(7)), [[Integer(0), Integer(1), Integer(2)],
...     [Integer(0), Integer(3), Integer(4)], [Integer(0), Integer(5),␣
→Integer(6)], [Integer(1), Integer(3), Integer(5)], [Integer(1), Integer(4),␣
→Integer(6)],
...     [Integer(2), Integer(3), Integer(6)], [Integer(2), Integer(4),␣
```

(continues on next page)

(continued from previous page)

```
↪Integer(5)]], Integer(0), 'Projective Plane')
>>> C.t()
2
```

timestamp()

Return the time that the covering was submitted to the database.

EXAMPLES:

```
sage: from sage.combinat.designs.covering_design import CoveringDesign
sage: C = CoveringDesign(7, 3, 2, 7, range(7), [[0, 1, 2],
....:     [0, 3, 4], [0, 5, 6], [1, 3, 5], [1, 4, 6],
....:     [2, 3, 6], [2, 4, 5]],0, 'Projective Plane',
....:     'Gino Fano', '1892-01-01 00:00:00')
sage: C.timestamp()  # No exact date known; in Fano's 1892 article
'1892-01-01 00:00:00'
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.covering_design import CoveringDesign
>>> C = CoveringDesign(Integer(7), Integer(3), Integer(2), Integer(7),␣
↪range(Integer(7)), [[Integer(0), Integer(1), Integer(2)],
...     [Integer(0), Integer(3), Integer(4)], [Integer(0), Integer(5),␣
↪Integer(6)], [Integer(1), Integer(3), Integer(5)], [Integer(1), Integer(4),␣
↪Integer(6)],
...     [Integer(2), Integer(3), Integer(6)], [Integer(2), Integer(4),␣
↪Integer(5)]],Integer(0), 'Projective Plane',
...     'Gino Fano', '1892-01-01 00:00:00')
>>> C.timestamp()  # No exact date known; in Fano's 1892 article
'1892-01-01 00:00:00'
```

v()

Return v, the number of points in the covering design.

EXAMPLES:

```
sage: from sage.combinat.designs.covering_design import CoveringDesign
sage: C = CoveringDesign(7, 3, 2, 7, range(7), [[0, 1, 2],
....:     [0, 3, 4], [0, 5, 6], [1, 3, 5], [1, 4, 6],
....:     [2, 3, 6], [2, 4, 5]], 0, 'Projective Plane')
sage: C.v()
7
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.covering_design import CoveringDesign
>>> C = CoveringDesign(Integer(7), Integer(3), Integer(2), Integer(7),␣
↪range(Integer(7)), [[Integer(0), Integer(1), Integer(2)],
...     [Integer(0), Integer(3), Integer(4)], [Integer(0), Integer(5),␣
↪Integer(6)], [Integer(1), Integer(3), Integer(5)], [Integer(1), Integer(4),␣
↪Integer(6)],
...     [Integer(2), Integer(3), Integer(6)], [Integer(2), Integer(4),␣
↪Integer(5)]], Integer(0), 'Projective Plane')
>>> C.v()
7
```

sage.combinat.designs.covering_design.**best_known_covering_design_www**(*v*, *k*, *t*, *verbose=False*)

Return the best known (v, k, t) covering design from an online database.

This uses the La Jolla Covering Repository, a database available at https://ljcr.dmgordon.org/cover.html

INPUT:

- v – integer; the size of the point set for the design
- k – integer; the number of points per block
- t – integer; the size of sets covered by the blocks
- verbose – boolean (default: False); print verbose message

OUTPUT:

A *CoveringDesign* object representing the (v, k, t)-covering design with smallest number of blocks available in the database.

EXAMPLES:

```
sage: from sage.combinat.designs.covering_design import (   # optional - internet
....:     best_known_covering_design_www)
sage: C = best_known_covering_design_www(7, 3, 2)   # optional - internet
sage: print(C)                                      # optional - internet
C(7, 3, 2) = 7
Method: lex covering
Submitted on: 1996-12-01 00:00:00
0  1  2
0  3  4
0  5  6
1  3  5
1  4  6
2  3  6
2  4  5
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.covering_design import (   # optional - internet
...     best_known_covering_design_www)
>>> C = best_known_covering_design_www(Integer(7), Integer(3), Integer(2))   #␣
↪optional - internet
>>> print(C)                                      # optional - internet
C(7, 3, 2) = 7
Method: lex covering
Submitted on: 1996-12-01 00:00:00
0  1  2
0  3  4
0  5  6
1  3  5
1  4  6
2  3  6
2  4  5
```

A ValueError is raised if the (v, k, t) parameters are not found in the database.

sage.combinat.designs.covering_design.**schonheim**(*v*, *k*, *t*)

Return the Schonheim lower bound for the size of such a covering design.

INPUT:

- v – integer; size of point set
- k – integer; cardinality of each block
- t – integer; cardinality of sets being covered

OUTPUT:

The Schonheim lower bound for such a covering design's size: $C(v,k,t) \leq \lceil (\frac{v}{k} \lceil \frac{v-1}{k-1} \cdots \lceil \frac{v-t+1}{k-t+1} \rceil \cdots \rceil \rceil$

EXAMPLES:

```
sage: from sage.combinat.designs.covering_design import schonheim
sage: schonheim(10, 3, 2)
17
sage: schonheim(32, 16, 8)
930
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.covering_design import schonheim
>>> schonheim(Integer(10), Integer(3), Integer(2))
17
>>> schonheim(Integer(32), Integer(16), Integer(8))
930
```

sage.combinat.designs.covering_design.**trivial_covering_design**(*v*, *k*, *t*)

Construct a trivial covering design.

INPUT:

- v – integer; size of point set
- k – integer; cardinality of each block
- t – integer; cardinality of sets being covered

OUTPUT:

A trivial (v,k,t) covering design

EXAMPLES:

```
sage: C = trivial_covering_design(8, 3, 1)
sage: print(C)
C(8, 3, 1) = 3
Method: Trivial
0   1   2
0   6   7
3   4   5
sage: C = trivial_covering_design(5, 3, 2)
sage: print(C)
4 <= C(5, 3, 2) <= 10
Method: Trivial
0   1   2
0   1   3
0   1   4
0   2   3
```

(continues on next page)

(continued from previous page)

```
0   2   4
0   3   4
1   2   3
1   2   4
1   3   4
2   3   4
```

```
>>> from sage.all import *
>>> C = trivial_covering_design(Integer(8), Integer(3), Integer(1))
>>> print(C)
C(8, 3, 1) = 3
Method: Trivial
0   1   2
0   6   7
3   4   5
>>> C = trivial_covering_design(Integer(5), Integer(3), Integer(2))
>>> print(C)
4 <= C(5, 3, 2) <= 10
Method: Trivial
0   1   2
0   1   3
0   1   4
0   2   3
0   2   4
0   3   4
1   2   3
1   2   4
1   3   4
2   3   4
```

Note

Cases are:

- $t = 0$: This could be empty, but it's a useful convention to have one block (which is empty if $k = 0$).
- $t = 1$: This contains $\lceil v/k \rceil$ blocks: $[0, ..., k - 1], [k, ..., 2k - 1], ...$. The last block wraps around if k does not divide v.
- anything else: Just use every k-subset of $[0, 1, ..., v - 1]$.

5.1.81 Database of small combinatorial designs

This module implements combinatorial designs that cannot be obtained by more general constructions. Most of them come from the Handbook of Combinatorial Designs [DesignHandbook].

All this would only be a dream without the mathematical knowledge and help of Julian R. Abel.

These functions can all be obtained through the `designs.<tab>` functions.

This module implements:

- `CA(11,2,5,3)`, `CA(12,2,7,3)`, `CA(13,2,9,3)`, `CA(14,2,10,3)`, `CA(15,2,20,3)`, `CA(19,2,6,4)`, `CA(21,2,7,4)`, `CA(29,2,7,5)`, `CA(37,2,4,6)`, `CA(39,2,5,6)`, `CA(41,2,6,6)`

- OA(7,18), OA(9,40), OA(7,66), OA(7,68), OA(8,69), OA(7,74), OA(8,76), OA(11,80), OA(15,112), OA(9,120), OA(9,135), OA(11,160), OA(16,176), OA(11,185), OA(10,205), OA(16,208), OA(15,224), OA(11,254), OA(20,352), OA(20,416), OA(10,469), OA(10,520), OA(12,522), OA(14,524), OA(20,544), OA(17,560), OA(11,640), OA(10,796), OA(15,896), OA(9,1078), OA(25,1262), OA(9,1612), OA(10,1620)
- 2 MOLS of order 10, 5 MOLS of order 12, 4 MOLS of order 14, 4 MOLS of order 15, 3 MOLS of order 18
- $V(m,t)$ **vectors:**
  - $m = 3$ and $t = 2, 4, 6, 10, 12, 14, 20, 24, 26, 32, 34$
  - $m = 4$ and $t = 3, 7, 9, 13, 15, 25$
  - $m = 5$ and $t = 6, 8, 12, 14, 20, 26$
  - $m = 6$ and $t = 5, 7, 11, 13, 17, 21$
  - $m = 7$ and $t = 6, 10, 16, 18$
  - $m = 8$ and $t = 9, 11, 17, 29, 57$
  - $m = 9$ and $t = 12, 14, 18, 20, 22, 30, 34, 42, 44$
  - $m = 10$ and $t = 13, 15, 19, 21, 25, 27, 31, 33, 43, 49, 81, 97, 103, 181, 187, 259, 273, 319, 391, 409$
  - $m = 11$ and $t = 30, 32, 36, 38, 42, 56, 60, 62, 66, 78, 80, 86, 90, 92, 102, 116, 120, 128, 132, 146, 162, 170, 182, 188, 192, 198, 206, 210, 212, 216, 218, 230, 242, 246, 248, 260, 266, 270, 276, 288, 290, 296, 300, 302, 308, 312, 318, 330, 336, 338, 350, 356, 366, 368, 372, 378, 396, 402, 420, 422, 450, 452$
  - $m = 12$ and $t = 33, 35, 45, 51, 55, 59, 61, 63, 69, 71, 73, 83, 85, 89, 91, 93, 101, 103, 115, 119, 121, 129, 133, 135, 139, 141, 145, 149, 155, 161, 169, 171, 185, 189, 191, 195, 199, 203, 213, 223, 229, 233, 243, 253, 255, 259, 265, 269, 271, 275, 281, 289, 293, 295, 301, 303, 309, 311, 321, 323, 335, 341, 355, 363, 379, 383, 385, 399, 401, 405, 409, 411, 413$

Functions

`sage.combinat.designs.database.BIBD_106_6_1()`

Return a (106,6,1)-BIBD.

This constructions appears in II.3.32 from [DesignHandbook].

EXAMPLES:

```
sage: from sage.combinat.designs.database import BIBD_106_6_1
sage: from sage.combinat.designs.bibd import BalancedIncompleteBlockDesign
sage: BalancedIncompleteBlockDesign(106, BIBD_106_6_1())
(106,6,1)-Balanced Incomplete Block Design
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.database import BIBD_106_6_1
>>> from sage.combinat.designs.bibd import BalancedIncompleteBlockDesign
>>> BalancedIncompleteBlockDesign(Integer(106), BIBD_106_6_1())
(106,6,1)-Balanced Incomplete Block Design
```

`sage.combinat.designs.database.BIBD_111_6_1()`

Return a (111,6,1)-BIBD.

This constructions appears in II.3.32 from [DesignHandbook].

EXAMPLES:

```
sage: from sage.combinat.designs.database import BIBD_111_6_1
sage: from sage.combinat.designs.bibd import BalancedIncompleteBlockDesign
sage: BalancedIncompleteBlockDesign(111, BIBD_111_6_1())
(111,6,1)-Balanced Incomplete Block Design
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.database import BIBD_111_6_1
>>> from sage.combinat.designs.bibd import BalancedIncompleteBlockDesign
>>> BalancedIncompleteBlockDesign(Integer(111), BIBD_111_6_1())
(111,6,1)-Balanced Incomplete Block Design
```

`sage.combinat.designs.database.BIBD_126_6_1()`

Return a (126,6,1)-BIBD.

This constructions appears in VI.16.92 from [DesignHandbook].

EXAMPLES:

```
sage: from sage.combinat.designs.database import BIBD_126_6_1
sage: from sage.combinat.designs.bibd import BalancedIncompleteBlockDesign
sage: BalancedIncompleteBlockDesign(126, BIBD_126_6_1())
(126,6,1)-Balanced Incomplete Block Design
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.database import BIBD_126_6_1
>>> from sage.combinat.designs.bibd import BalancedIncompleteBlockDesign
>>> BalancedIncompleteBlockDesign(Integer(126), BIBD_126_6_1())
(126,6,1)-Balanced Incomplete Block Design
```

sage.combinat.designs.database.**BIBD_136_6_1**()

Return a (136,6,1)-BIBD.

This constructions appears in II.3.32 from [DesignHandbook].

EXAMPLES:

```
sage: from sage.combinat.designs.database import BIBD_136_6_1
sage: from sage.combinat.designs.bibd import BalancedIncompleteBlockDesign
sage: BalancedIncompleteBlockDesign(136, BIBD_136_6_1())
(136,6,1)-Balanced Incomplete Block Design
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.database import BIBD_136_6_1
>>> from sage.combinat.designs.bibd import BalancedIncompleteBlockDesign
>>> BalancedIncompleteBlockDesign(Integer(136), BIBD_136_6_1())
(136,6,1)-Balanced Incomplete Block Design
```

sage.combinat.designs.database.**BIBD_141_6_1**()

Return a (141,6,1)-BIBD.

This constructions appears in II.3.32 from [DesignHandbook].

EXAMPLES:

```
sage: from sage.combinat.designs.database import BIBD_141_6_1
sage: from sage.combinat.designs.bibd import BalancedIncompleteBlockDesign
sage: BalancedIncompleteBlockDesign(141, BIBD_141_6_1())
(141,6,1)-Balanced Incomplete Block Design
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.database import BIBD_141_6_1
>>> from sage.combinat.designs.bibd import BalancedIncompleteBlockDesign
>>> BalancedIncompleteBlockDesign(Integer(141), BIBD_141_6_1())
(141,6,1)-Balanced Incomplete Block Design
```

sage.combinat.designs.database.**BIBD_171_6_1**()

Return a (171,6,1)-BIBD.

This constructions appears in II.3.32 from [DesignHandbook].

EXAMPLES:

```
sage: from sage.combinat.designs.database import BIBD_171_6_1
sage: from sage.combinat.designs.bibd import BalancedIncompleteBlockDesign
sage: BalancedIncompleteBlockDesign(171, BIBD_171_6_1())
(171,6,1)-Balanced Incomplete Block Design
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.database import BIBD_171_6_1
>>> from sage.combinat.designs.bibd import BalancedIncompleteBlockDesign
>>> BalancedIncompleteBlockDesign(Integer(171), BIBD_171_6_1())
(171,6,1)-Balanced Incomplete Block Design
```

sage.combinat.designs.database.**BIBD_196_6_1**()

Return a (196,6,1)-BIBD.

This constructions appears in II.3.32 from [DesignHandbook].

EXAMPLES:

```
sage: from sage.combinat.designs.database import BIBD_196_6_1
sage: from sage.combinat.designs.bibd import BalancedIncompleteBlockDesign
sage: BalancedIncompleteBlockDesign(196, BIBD_196_6_1())
(196,6,1)-Balanced Incomplete Block Design
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.database import BIBD_196_6_1
>>> from sage.combinat.designs.bibd import BalancedIncompleteBlockDesign
>>> BalancedIncompleteBlockDesign(Integer(196), BIBD_196_6_1())
(196,6,1)-Balanced Incomplete Block Design
```

sage.combinat.designs.database.**BIBD_201_6_1**()

Return a (201,6,1)-BIBD.

This constructions appears in II.3.32 from [DesignHandbook].

EXAMPLES:

```
sage: from sage.combinat.designs.database import BIBD_201_6_1
sage: from sage.combinat.designs.bibd import BalancedIncompleteBlockDesign
sage: BalancedIncompleteBlockDesign(201, BIBD_201_6_1())
(201,6,1)-Balanced Incomplete Block Design
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.database import BIBD_201_6_1
>>> from sage.combinat.designs.bibd import BalancedIncompleteBlockDesign
>>> BalancedIncompleteBlockDesign(Integer(201), BIBD_201_6_1())
(201,6,1)-Balanced Incomplete Block Design
```

sage.combinat.designs.database.**BIBD_45_9_8**(*from_code=False*)

Return a $(45, 9, 1)$-BIBD.

This BIBD is obtained from the codewords of minimal weight in the `ExtendedQuadraticResidueCode()` of length 48. This construction appears in VII.11.2 from [DesignHandbook], which cites [HT95].

INPUT:

- `from_code` – boolean; whether to build the design from hardcoded data (default) or from the code object (much longer)

EXAMPLES:

```
sage: from sage.combinat.designs.database import BIBD_45_9_8
sage: from sage.combinat.designs.bibd import BalancedIncompleteBlockDesign
sage: B = BalancedIncompleteBlockDesign(45, BIBD_45_9_8(), lambd=8); B
(45,9,8)-Balanced Incomplete Block Design
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.database import BIBD_45_9_8
```

(continues on next page)

(continued from previous page)

```
>>> from sage.combinat.designs.bibd import BalancedIncompleteBlockDesign
>>> B = BalancedIncompleteBlockDesign(Integer(45), BIBD_45_9_8(),␣
↪lambd=Integer(8)); B
(45,9,8)-Balanced Incomplete Block Design
```

REFERENCE:

`sage.combinat.designs.database.BIBD_56_11_2()`

Return a symmetric $(56, 11, 2)$-BIBD.

The construction implemented is given in [Hall71].

> **Note**
>
> A symmetric (v, k, λ) BIBD is a (v, k, λ) BIBD with v blocks.

EXAMPLES:

sage: from sage.combinat.designs.database import BIBD_56_11_2 sage: D = IncidenceStructure(BIBD_56_11_2()) # needs sage.libs.gap sage: D.is_t_design(t=2, v=56, k=11, l=2) # needs sage.libs.gap True

`sage.combinat.designs.database.BIBD_66_6_1()`

Return a (66,6,1)-BIBD.

This BIBD was obtained from La Jolla covering repository (https://dmgordon.org/cover) where it is attributed to Colin Barker.

EXAMPLES:

```
sage: from sage.combinat.designs.database import BIBD_66_6_1
sage: from sage.combinat.designs.bibd import BalancedIncompleteBlockDesign
sage: BalancedIncompleteBlockDesign(66, BIBD_66_6_1())
(66,6,1)-Balanced Incomplete Block Design
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.database import BIBD_66_6_1
>>> from sage.combinat.designs.bibd import BalancedIncompleteBlockDesign
>>> BalancedIncompleteBlockDesign(Integer(66), BIBD_66_6_1())
(66,6,1)-Balanced Incomplete Block Design
```

`sage.combinat.designs.database.BIBD_76_6_1()`

Return a (76,6,1)-BIBD.

This BIBD was obtained from La Jolla covering repository (https://dmgordon.org/cover) where it is attributed to Colin Barker.

EXAMPLES:

```
sage: from sage.combinat.designs.database import BIBD_76_6_1
sage: from sage.combinat.designs.bibd import BalancedIncompleteBlockDesign
sage: BalancedIncompleteBlockDesign(76, BIBD_76_6_1())
(76,6,1)-Balanced Incomplete Block Design
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.database import BIBD_76_6_1
>>> from sage.combinat.designs.bibd import BalancedIncompleteBlockDesign
>>> BalancedIncompleteBlockDesign(Integer(76), BIBD_76_6_1())
(76,6,1)-Balanced Incomplete Block Design
```

sage.combinat.designs.database.**BIBD_79_13_2**()

Return a symmetric $(79, 13, 2)$-BIBD.

The construction implemented is the one described in [Aschbacher71]. A typo in that paper was corrected in [Hall71].

Note

A symmetric (v, k, λ) BIBD is a (v, k, λ) BIBD with v blocks.

EXAMPLES:

sage: from sage.combinat.designs.database import BIBD_79_13_2 sage: D = IncidenceStructure(BIBD_79_13_2()) # needs sage.libs.gap sage: D.is_t_design(t=2, v=79, k=13, l=2) # needs sage.libs.gap True

sage.combinat.designs.database.**BIBD_96_6_1**()

Return a (96,6,1)-BIBD.

This BIBD was obtained from La Jolla covering repository (https://dmgordon.org/cover) where it is attributed to Colin Barker.

EXAMPLES:

```
sage: from sage.combinat.designs.database import BIBD_96_6_1
sage: from sage.combinat.designs.bibd import BalancedIncompleteBlockDesign
sage: BalancedIncompleteBlockDesign(96, BIBD_96_6_1())
(96,6,1)-Balanced Incomplete Block Design
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.database import BIBD_96_6_1
>>> from sage.combinat.designs.bibd import BalancedIncompleteBlockDesign
>>> BalancedIncompleteBlockDesign(Integer(96), BIBD_96_6_1())
(96,6,1)-Balanced Incomplete Block Design
```

sage.combinat.designs.database.**DM_12_6_1**()

Return a $(12, 6, 1)$-difference matrix as built in [Hanani75].

This design is Lemma 3.21 from [Hanani75].

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_difference_matrix
sage: from sage.combinat.designs.database import DM_12_6_1
sage: G,M = DM_12_6_1()
sage: is_difference_matrix(M,G,6,1)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_difference_matrix
>>> from sage.combinat.designs.database import DM_12_6_1
>>> G,M = DM_12_6_1()
>>> is_difference_matrix(M,G,Integer(6),Integer(1))
True
```

Can be obtained from the constructor:

```
sage: _ = designs.difference_matrix(12,6)
```

```
>>> from sage.all import *
>>> _ = designs.difference_matrix(Integer(12),Integer(6))
```

REFERENCES:

sage.combinat.designs.database.**DM_21_6_1**()

Return a $(21, 6, 1)$-difference matrix.

As explained in the Handbook III.3.50 [DesignHandbook].

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_difference_matrix
sage: from sage.combinat.designs.database import DM_21_6_1
sage: G,M = DM_21_6_1()
sage: is_difference_matrix(M,G,6,1)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_difference_matrix
>>> from sage.combinat.designs.database import DM_21_6_1
>>> G,M = DM_21_6_1()
>>> is_difference_matrix(M,G,Integer(6),Integer(1))
True
```

Can be obtained from the constructor:

```
sage: _ = designs.difference_matrix(21,6)                                     #␣
↪needs sage.rings.finite_rings
```

```
>>> from sage.all import *
>>> _ = designs.difference_matrix(Integer(21),Integer(6))                     ␣
↪               # needs sage.rings.finite_rings
```

sage.combinat.designs.database.**DM_24_8_1**()

Return a $(24, 8, 1)$-difference matrix.

As explained in the Handbook III.3.52 [DesignHandbook].

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_difference_matrix
sage: from sage.combinat.designs.database import DM_24_8_1
sage: G,M = DM_24_8_1()
```

(continues on next page)

(continued from previous page)

```
sage: is_difference_matrix(M,G,8,1)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_difference_matrix
>>> from sage.combinat.designs.database import DM_24_8_1
>>> G,M = DM_24_8_1()
>>> is_difference_matrix(M,G,Integer(8),Integer(1))
True
```

Can be obtained from the constructor:

```
sage: _ = designs.difference_matrix(24,8)
```

```
>>> from sage.all import *
>>> _ = designs.difference_matrix(Integer(24),Integer(8))
```

sage.combinat.designs.database.**DM_273_17_1**()

Return a $(273, 17, 1)$-difference matrix.

Given by Julian R. Abel.

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_difference_matrix
sage: from sage.combinat.designs.database import DM_273_17_1
sage: G,M = DM_273_17_1()                                                    #␣
↪needs sage.schemes
sage: is_difference_matrix(M,G,17,1)                                         #␣
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_difference_matrix
>>> from sage.combinat.designs.database import DM_273_17_1
>>> G,M = DM_273_17_1()                                                    #␣
↪needs sage.schemes
>>> is_difference_matrix(M,G,Integer(17),Integer(1))                        ␣
↪               # needs sage.schemes
True
```

Can be obtained from the constructor:

```
sage: _ = designs.difference_matrix(273,17)                                  #␣
↪needs sage.schemes
```

```
>>> from sage.all import *
>>> _ = designs.difference_matrix(Integer(273),Integer(17))                  ␣
↪               # needs sage.schemes
```

sage.combinat.designs.database.**DM_28_6_1**()

Return a $(28, 6, 1)$-difference matrix.

As explained in the Handbook III.3.54 [DesignHandbook].

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_difference_matrix
sage: from sage.combinat.designs.database import DM_28_6_1
sage: G,M = DM_28_6_1()                                                        #␣
↪needs sage.modules
sage: is_difference_matrix(M,G,6,1)                                            #␣
↪needs sage.modules
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_difference_matrix
>>> from sage.combinat.designs.database import DM_28_6_1
>>> G,M = DM_28_6_1()                                                        #␣
↪needs sage.modules
>>> is_difference_matrix(M,G,Integer(6),Integer(1))                          ␣
↪              # needs sage.modules
True
```

Can be obtained from the constructor:

```
sage: _ = designs.difference_matrix(28,6)                                      #␣
↪needs sage.modules
```

```
>>> from sage.all import *
>>> _ = designs.difference_matrix(Integer(28),Integer(6))                    ␣
↪              # needs sage.modules
```

sage.combinat.designs.database.**DM_33_6_1**()

Return a $(33, 6, 1)$-difference matrix.

As explained in the Handbook III.3.56 [DesignHandbook].

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_difference_matrix
sage: from sage.combinat.designs.database import DM_33_6_1
sage: G,M = DM_33_6_1()
sage: is_difference_matrix(M,G,6,1)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_difference_matrix
>>> from sage.combinat.designs.database import DM_33_6_1
>>> G,M = DM_33_6_1()
>>> is_difference_matrix(M,G,Integer(6),Integer(1))
True
```

Can be obtained from the constructor:

```
sage: _ = designs.difference_matrix(33,6)                                      #␣
↪needs sage.rings.finite_rings
```

```
>>> from sage.all import *
>>> _ = designs.difference_matrix(Integer(33),Integer(6))                    ␣
↪              # needs sage.rings.finite_rings
```

sage.combinat.designs.database.**DM_35_6_1**()

Return a $(35, 6, 1)$-difference matrix.

As explained in the Handbook III.3.58 [DesignHandbook].

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_difference_matrix
sage: from sage.combinat.designs.database import DM_35_6_1
sage: G,M = DM_35_6_1()
sage: is_difference_matrix(M,G,6,1)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_difference_matrix
>>> from sage.combinat.designs.database import DM_35_6_1
>>> G,M = DM_35_6_1()
>>> is_difference_matrix(M,G,Integer(6),Integer(1))
True
```

Can be obtained from the constructor:

```
sage: _ = designs.difference_matrix(35,6)                                     #␣
↪needs sage.rings.finite_rings
```

```
>>> from sage.all import *
>>> _ = designs.difference_matrix(Integer(35),Integer(6))                    ␣
↪              # needs sage.rings.finite_rings
```

sage.combinat.designs.database.**DM_36_9_1**()

Return a $(36, 9, 1)$-difference matrix.

As explained in the Handbook III.3.59 [DesignHandbook].

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_difference_matrix
sage: from sage.combinat.designs.database import DM_36_9_1
sage: G,M = DM_36_9_1()                                                       #␣
↪needs sage.modules
sage: is_difference_matrix(M,G,9,1)                                           #␣
↪needs sage.modules
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_difference_matrix
>>> from sage.combinat.designs.database import DM_36_9_1
>>> G,M = DM_36_9_1()                                                       #␣
↪needs sage.modules
>>> is_difference_matrix(M,G,Integer(9),Integer(1))                          ␣
```

(continues on next page)

(continued from previous page)

```
↪              # needs sage.modules
True
```

Can be obtained from the constructor:

```
sage: _ = designs.difference_matrix(36,9)                                   #␣
↪needs sage.modules
```

```
>>> from sage.all import *
>>> _ = designs.difference_matrix(Integer(36),Integer(9))                    ␣
↪              # needs sage.modules
```

sage.combinat.designs.database.**DM_39_6_1**()

Return a $(39, 6, 1)$-difference matrix.

As explained in the Handbook III.3.61 [DesignHandbook].

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_difference_matrix
sage: from sage.combinat.designs.database import DM_39_6_1
sage: G,M = DM_39_6_1()
sage: is_difference_matrix(M,G,6,1)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_difference_matrix
>>> from sage.combinat.designs.database import DM_39_6_1
>>> G,M = DM_39_6_1()
>>> is_difference_matrix(M,G,Integer(6),Integer(1))
True
```

The design is available from the general constructor:

```
sage: designs.difference_matrix(39,6,existence=True)                        #␣
↪needs sage.rings.finite_rings
True
```

```
>>> from sage.all import *
>>> designs.difference_matrix(Integer(39),Integer(6),existence=True)         ␣
↪              # needs sage.rings.finite_rings
True
```

sage.combinat.designs.database.**DM_44_6_1**()

Return a $(44, 6, 1)$-difference matrix.

As explained in the Handbook III.3.64 [DesignHandbook].

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_difference_matrix
sage: from sage.combinat.designs.database import DM_44_6_1
sage: G,M = DM_44_6_1()
```

(continues on next page)

(continued from previous page)

```
sage: is_difference_matrix(M,G,6,1)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_difference_matrix
>>> from sage.combinat.designs.database import DM_44_6_1
>>> G,M = DM_44_6_1()
>>> is_difference_matrix(M,G,Integer(6),Integer(1))
True
```

Can be obtained from the constructor:

```
sage: _ = designs.difference_matrix(44,6)
```

```
>>> from sage.all import *
>>> _ = designs.difference_matrix(Integer(44),Integer(6))
```

sage.combinat.designs.database.**DM_45_7_1**()

Return a $(45, 7, 1)$-difference matrix.

As explained in the Handbook III.3.65 [DesignHandbook].

… whose description contained a very deadly typo, kindly fixed by Julian R. Abel.

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_difference_matrix
sage: from sage.combinat.designs.database import DM_45_7_1
sage: G,M = DM_45_7_1()
sage: is_difference_matrix(M,G,7,1)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_difference_matrix
>>> from sage.combinat.designs.database import DM_45_7_1
>>> G,M = DM_45_7_1()
>>> is_difference_matrix(M,G,Integer(7),Integer(1))
True
```

Can be obtained from the constructor:

```
sage: _ = designs.difference_matrix(45,7)                                   #␣
↪needs sage.rings.finite_rings
```

```
>>> from sage.all import *
>>> _ = designs.difference_matrix(Integer(45),Integer(7))                   ␣
↪               # needs sage.rings.finite_rings
```

sage.combinat.designs.database.**DM_48_9_1**()

Return a $(48, 9, 1)$-difference matrix.

As explained in the Handbook III.3.67 [DesignHandbook].

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_difference_matrix
sage: from sage.combinat.designs.database import DM_48_9_1
sage: G,M = DM_48_9_1()                                                    #␣
↪needs sage.rings.finite_rings
sage: is_difference_matrix(M,G,9,1)                                        #␣
↪needs sage.rings.finite_rings
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_difference_matrix
>>> from sage.combinat.designs.database import DM_48_9_1
>>> G,M = DM_48_9_1()                                                    #␣
↪needs sage.rings.finite_rings
>>> is_difference_matrix(M,G,Integer(9),Integer(1))                        ␣
↪               # needs sage.rings.finite_rings
True
```

Can be obtained from the constructor:

```
sage: _ = designs.difference_matrix(48,9)                                  #␣
↪needs sage.rings.finite_rings
```

```
>>> from sage.all import *
>>> _ = designs.difference_matrix(Integer(48),Integer(9))                  ␣
↪               # needs sage.rings.finite_rings
```

sage.combinat.designs.database.**DM_51_6_1**()

Return a $(51, 6, 1)$-difference matrix.

As explained in the Handbook III.3.69 [DesignHandbook].

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_difference_matrix
sage: from sage.combinat.designs.database import DM_51_6_1
sage: G,M = DM_51_6_1()
sage: is_difference_matrix(M,G,6,1)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_difference_matrix
>>> from sage.combinat.designs.database import DM_51_6_1
>>> G,M = DM_51_6_1()
>>> is_difference_matrix(M,G,Integer(6),Integer(1))
True
```

Can be obtained from the constructor:

```
sage: _ = designs.difference_matrix(51,6)                                  #␣
↪needs sage.rings.finite_rings
```

```
>>> from sage.all import *
>>> _ = designs.difference_matrix(Integer(51),Integer(6))                    ␣
↪             # needs sage.rings.finite_rings
```

sage.combinat.designs.database.**DM_52_6_1**()

Return a $(52, 6, 1)$-difference matrix.

As explained in the Handbook III.3.70 [DesignHandbook].

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_difference_matrix
sage: from sage.combinat.designs.database import DM_52_6_1
sage: G,M = DM_52_6_1()                                                   #␣
↪needs sage.rings.finite_rings
sage: is_difference_matrix(M,G,6,1)                                       #␣
↪needs sage.rings.finite_rings
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_difference_matrix
>>> from sage.combinat.designs.database import DM_52_6_1
>>> G,M = DM_52_6_1()                                                    #␣
↪needs sage.rings.finite_rings
>>> is_difference_matrix(M,G,Integer(6),Integer(1))                      ␣
↪             # needs sage.rings.finite_rings
True
```

Can be obtained from the constructor:

```
sage: _ = designs.difference_matrix(52,6)                                 #␣
↪needs sage.rings.finite_rings
```

```
>>> from sage.all import *
>>> _ = designs.difference_matrix(Integer(52),Integer(6))                    ␣
↪             # needs sage.rings.finite_rings
```

sage.combinat.designs.database.**DM_55_7_1**()

Return a $(55, 7, 1)$-difference matrix.

As explained in the Handbook III.3.72 [DesignHandbook].

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_difference_matrix
sage: from sage.combinat.designs.database import DM_55_7_1
sage: G,M = DM_55_7_1()
sage: is_difference_matrix(M,G,7,1)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_difference_matrix
>>> from sage.combinat.designs.database import DM_55_7_1
>>> G,M = DM_55_7_1()
```

(continues on next page)

(continued from previous page)

```
>>> is_difference_matrix(M,G,Integer(7),Integer(1))
True
```

Can be obtained from the constructor:

```
sage: _ = designs.difference_matrix(55,7)                              #␣
↪needs sage.rings.finite_rings
```

```
>>> from sage.all import *
>>> _ = designs.difference_matrix(Integer(55),Integer(7))              ␣
↪               # needs sage.rings.finite_rings
```

sage.combinat.designs.database.**DM_56_8_1**()

Return a $(56, 8, 1)$-difference matrix.

As explained in the Handbook III.3.73 [DesignHandbook].

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_difference_matrix
sage: from sage.combinat.designs.database import DM_56_8_1
sage: G,M = DM_56_8_1()                                                #␣
↪needs sage.rings.finite_rings
sage: is_difference_matrix(M,G,8,1)                                    #␣
↪needs sage.rings.finite_rings
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_difference_matrix
>>> from sage.combinat.designs.database import DM_56_8_1
>>> G,M = DM_56_8_1()                                                #␣
↪needs sage.rings.finite_rings
>>> is_difference_matrix(M,G,Integer(8),Integer(1))                    ␣
↪               # needs sage.rings.finite_rings
True
```

Can be obtained from the constructor:

```
sage: _ = designs.difference_matrix(56,8)                              #␣
↪needs sage.rings.finite_rings
```

```
>>> from sage.all import *
>>> _ = designs.difference_matrix(Integer(56),Integer(8))              ␣
↪               # needs sage.rings.finite_rings
```

sage.combinat.designs.database.**DM_57_8_1**()

Return a $(57, 8, 1)$-difference matrix.

Given by Julian R. Abel.

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_difference_matrix
sage: from sage.combinat.designs.database import DM_57_8_1
sage: G,M = DM_57_8_1()                                                     #␣
↪needs sage.rings.finite_rings sage.schemes
sage: is_difference_matrix(M,G,8,1)                                         #␣
↪needs sage.rings.finite_rings sage.schemes
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_difference_matrix
>>> from sage.combinat.designs.database import DM_57_8_1
>>> G,M = DM_57_8_1()                                                       #␣
↪needs sage.rings.finite_rings sage.schemes
>>> is_difference_matrix(M,G,Integer(8),Integer(1))                          ␣
↪               # needs sage.rings.finite_rings sage.schemes
True
```

Can be obtained from the constructor:

```
sage: _ = designs.difference_matrix(57,8)                                   #␣
↪needs sage.rings.finite_rings sage.schemes
```

```
>>> from sage.all import *
>>> _ = designs.difference_matrix(Integer(57),Integer(8))                    ␣
↪               # needs sage.rings.finite_rings sage.schemes
```

sage.combinat.designs.database.**DM_60_6_1**()

Return a $(60, 6, 1)$-difference matrix.

As explained in [JulianAbel13].

REFERENCES:

http://onlinelibrary.wiley.com/doi/10.1002/jcd.21384/abstract

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_difference_matrix
sage: from sage.combinat.designs.database import DM_60_6_1
sage: G,M = DM_60_6_1()
sage: is_difference_matrix(M,G,6,1)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_difference_matrix
>>> from sage.combinat.designs.database import DM_60_6_1
>>> G,M = DM_60_6_1()
>>> is_difference_matrix(M,G,Integer(6),Integer(1))
True
```

Can be obtained from the constructor:

```
sage: _ = designs.difference_matrix(60,6)
```

```
>>> from sage.all import *
>>> _ = designs.difference_matrix(Integer(60),Integer(6))
```

sage.combinat.designs.database.**DM_75_8_1**()

Return a $(75, 8, 1)$-difference matrix.

As explained in the Handbook III.3.75 [DesignHandbook].

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_difference_matrix
sage: from sage.combinat.designs.database import DM_75_8_1
sage: G,M = DM_75_8_1()
sage: is_difference_matrix(M,G,8,1)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_difference_matrix
>>> from sage.combinat.designs.database import DM_75_8_1
>>> G,M = DM_75_8_1()
>>> is_difference_matrix(M,G,Integer(8),Integer(1))
True
```

Can be obtained from the constructor:

```
sage: _ = designs.difference_matrix(75,8)                                    #␣
↪needs sage.rings.finite_rings
```

```
>>> from sage.all import *
>>> _ = designs.difference_matrix(Integer(75),Integer(8))                    ␣
↪              # needs sage.rings.finite_rings
```

sage.combinat.designs.database.**DM_993_32_1**()

Return a $(993, 32, 1)$-difference matrix.

Given by Julian R. Abel.

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_difference_matrix
sage: from sage.combinat.designs.database import DM_993_32_1
sage: G,M = DM_993_32_1()                                                    #␣
↪needs sage.schemes
sage: is_difference_matrix(M,G,32,1)                                         #␣
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_difference_matrix
>>> from sage.combinat.designs.database import DM_993_32_1
>>> G,M = DM_993_32_1()                                                    #␣
↪needs sage.schemes
>>> is_difference_matrix(M,G,Integer(32),Integer(1))                        ␣
```

(continues on next page)

(continued from previous page)

```
↪                # needs sage.schemes
True
```

Can be obtained from the constructor:

```
sage: _ = designs.difference_matrix(993,32)                                    #␣
↪needs sage.schemes
```

```
>>> from sage.all import *
>>> _ = designs.difference_matrix(Integer(993),Integer(32))                    ␣
↪                # needs sage.schemes
```

sage.combinat.designs.database.**HigmanSimsDesign**()

Return the Higman-Sims designs, which is a $(176, 50, 14)$-BIBD.

This design is built from a from the `WittDesign` W on 24 points. We define two points a, b, and consider:

- The collection W_a of all blocks of W containing a but not containing b.
- The collection W_b of all blocks of W containing b but not containing a.

The design is then obtained from the incidence structure produced by the blocks $A \in W_a$ and $B \in W_b$ whose intersection has cardinality 2. This construction, due to M.Smith, can be found in [KY04] or in 10.A.(v) of [BL1984].

EXAMPLES:

```
sage: H = designs.HigmanSimsDesign(); H                        # optional - gap_
↪package_design
Incidence structure with 176 points and 176 blocks
sage: H.is_t_design(return_parameters=1)                       # optional - gap_
↪package_design
(True, (2, 176, 50, 14))
```

```
>>> from sage.all import *
>>> H = designs.HigmanSimsDesign(); H                        # optional - gap_
↪package_design
Incidence structure with 176 points and 176 blocks
>>> H.is_t_design(return_parameters=Integer(1))                  # optional -␣
↪gap_package_design
(True, (2, 176, 50, 14))
```

Make sure that the automorphism group of this designs is isomorphic to the automorphism group of the `HigmanSimsGraph()`. Note that the first of those permutation groups acts on 176 points, while the second acts on 100:

```
sage: gH = H.automorphism_group()                              # optional - gap_
↪package_design
sage: gG = graphs.HigmanSimsGraph().automorphism_group()     # optional - gap_
↪package_design
sage: gG.is_isomorphic(gG)                          # long time, optional - gap_
↪package_design
True
```

```
>>> from sage.all import *
>>> gH = H.automorphism_group()                          # optional - gap_
↪package_design
>>> gG = graphs.HigmanSimsGraph().automorphism_group()    # optional - gap_
↪package_design
>>> gG.is_isomorphic(gG)                       # long time, optional - gap_
↪package_design
True
```

REFERENCE:

`sage.combinat.designs.database.`**`MOLS_10_2`**`()`

Return a pair of MOLS of order 10.

Data obtained from http://www.cecm.sfu.ca/organics/papers/lam/paper/html/POLS10/POLS10.html

EXAMPLES:

```
sage: from sage.combinat.designs.latin_squares import are_mutually_orthogonal_
↪latin_squares
sage: from sage.combinat.designs.database import MOLS_10_2
sage: MOLS = MOLS_10_2()                                                    #␣
↪needs sage.modules
sage: print(are_mutually_orthogonal_latin_squares(MOLS))                    #␣
↪needs sage.modules
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.latin_squares import are_mutually_orthogonal_latin_
↪squares
>>> from sage.combinat.designs.database import MOLS_10_2
>>> MOLS = MOLS_10_2()                                                    #␣
↪needs sage.modules
>>> print(are_mutually_orthogonal_latin_squares(MOLS))                    #␣
↪needs sage.modules
True
```

The design is available from the general constructor:

```
sage: designs.orthogonal_arrays.is_available(2,10)
True
```

```
>>> from sage.all import *
>>> designs.orthogonal_arrays.is_available(Integer(2),Integer(10))
True
```

`sage.combinat.designs.database.`**`MOLS_12_5`**`()`

Return 5 MOLS of order 12.

These MOLS have been found by Brendan McKay.

EXAMPLES:

```
sage: from sage.combinat.designs.latin_squares import are_mutually_orthogonal_
↪latin_squares
```

(continues on next page)

(continued from previous page)

```
sage: from sage.combinat.designs.database import MOLS_12_5
sage: MOLS = MOLS_12_5()                                                    #␣
↪needs sage.modules
sage: print(are_mutually_orthogonal_latin_squares(MOLS))                    #␣
↪needs sage.modules
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.latin_squares import are_mutually_orthogonal_latin_
↪squares
>>> from sage.combinat.designs.database import MOLS_12_5
>>> MOLS = MOLS_12_5()                                                    #␣
↪needs sage.modules
>>> print(are_mutually_orthogonal_latin_squares(MOLS))                    #␣
↪needs sage.modules
True
```

sage.combinat.designs.database.**MOLS_14_4**()

Return four MOLS of order 14.

These MOLS were shared by Ian Wanless. The first proof of existence was given in [Todorov12].

EXAMPLES:

```
sage: from sage.combinat.designs.latin_squares import are_mutually_orthogonal_
↪latin_squares
sage: from sage.combinat.designs.database import MOLS_14_4
sage: MOLS = MOLS_14_4()                                                    #␣
↪needs sage.modules
sage: print(are_mutually_orthogonal_latin_squares(MOLS))                    #␣
↪needs sage.modules
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.latin_squares import are_mutually_orthogonal_latin_
↪squares
>>> from sage.combinat.designs.database import MOLS_14_4
>>> MOLS = MOLS_14_4()                                                    #␣
↪needs sage.modules
>>> print(are_mutually_orthogonal_latin_squares(MOLS))                    #␣
↪needs sage.modules
True
```

The design is available from the general constructor:

```
sage: designs.orthogonal_arrays.is_available(4,14)                          #␣
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> designs.orthogonal_arrays.is_available(Integer(4),Integer(14))          ␣
↪                # needs sage.schemes
True
```

REFERENCE:

sage.combinat.designs.database.**MOLS_15_4**()

Return 4 MOLS of order 15.

These MOLS were shared by Ian Wanless.

EXAMPLES:

```
sage: from sage.combinat.designs.latin_squares import are_mutually_orthogonal_
↪latin_squares
sage: from sage.combinat.designs.database import MOLS_15_4
sage: MOLS = MOLS_15_4()                                                    #␣
↪needs sage.modules
sage: print(are_mutually_orthogonal_latin_squares(MOLS))                    #␣
↪needs sage.modules
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.latin_squares import are_mutually_orthogonal_latin_
↪squares
>>> from sage.combinat.designs.database import MOLS_15_4
>>> MOLS = MOLS_15_4()                                                      #␣
↪needs sage.modules
>>> print(are_mutually_orthogonal_latin_squares(MOLS))                      #␣
↪needs sage.modules
True
```

The design is available from the general constructor:

```
sage: designs.orthogonal_arrays.is_available(4,15)                          #␣
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> designs.orthogonal_arrays.is_available(Integer(4),Integer(15))          ␣
↪                # needs sage.schemes
True
```

sage.combinat.designs.database.**MOLS_18_3**()

Return 3 MOLS of order 18.

These MOLS were shared by Ian Wanless.

EXAMPLES:

```
sage: from sage.combinat.designs.latin_squares import are_mutually_orthogonal_
↪latin_squares
sage: from sage.combinat.designs.database import MOLS_18_3
sage: MOLS = MOLS_18_3()                                                    #␣
↪needs sage.modules
sage: print(are_mutually_orthogonal_latin_squares(MOLS))                    #␣
↪needs sage.modules
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.latin_squares import are_mutually_orthogonal_latin_
↪squares
>>> from sage.combinat.designs.database import MOLS_18_3
>>> MOLS = MOLS_18_3()                                                    #␣
↪needs sage.modules
>>> print(are_mutually_orthogonal_latin_squares(MOLS))                    #␣
↪needs sage.modules
True
```

The design is available from the general constructor:

```
sage: designs.orthogonal_arrays.is_available(3,18)
True
```

```
>>> from sage.all import *
>>> designs.orthogonal_arrays.is_available(Integer(3),Integer(18))
True
```

sage.combinat.designs.database.**OA_10_1620**()

Return an OA(10,1620).

This is obtained through the generalized Brouwer-van Rees construction. Indeed, $1620 = 144.11 + (36 = 4.9)$ and there exists an $OA(10, 153) - OA(10, 9)$.

> **Note**
>
> This function should be removed once *find_brouwer_van_rees_with_one_truncated_column()* can handle all incomplete orthogonal arrays obtained through *incomplete_orthogonal_array()*.

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_orthogonal_array
sage: from sage.combinat.designs.database import OA_10_1620
sage: OA = OA_10_1620()                           # not tested -- ~7s
sage: is_orthogonal_array(OA,10,1620,2) # not tested -- ~7s
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_orthogonal_array
>>> from sage.combinat.designs.database import OA_10_1620
>>> OA = OA_10_1620()                           # not tested -- ~7s
>>> is_orthogonal_array(OA,Integer(10),Integer(1620),Integer(2)) # not tested -- ~
↪7s
True
```

The design is available from the general constructor:

```
sage: designs.orthogonal_arrays.is_available(10,1620)                     #␣
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> designs.orthogonal_arrays.is_available(Integer(10),Integer(1620))                    # needs sage.schemes
True
```

sage.combinat.designs.database.**OA_10_205**()

Return an $OA(10, 205)$.

Julian R. Abel shared the following construction, which originally appeared in Theorem 8.7 of [Greig99], and can in Lemmas 5.14-5.16 of [ColDin01]:

> Consider a $PG(2, 4^2)$ containing a Baer subplane (i.e. a $PG(2, 4)$) B and a point $p \in B$. Among the $4^2 + 1 = 17$ lines of $PG(2, 4^2)$ containing p:
>
> - $4 + 1 = 5$ lines intersect B on 5 points
> - $4^2 - 4 = 12$ lines intersect B on 1 point
>
> As those lines are disjoint outside of B we can use them as groups to build a GDD on $16^2 + 16 + 1 - (4^4 + 4 + 1) = 252$ points. By keeping only 9 lines of the second kind, however, we obtain a $(204, \{9, 13, 17\})$-GDD of type 12^5.16^9.
>
> We complete it into a PBD by adding a block $g \cup \{204\}$ for each group g. We then build an OA from this PBD using the fact that all blocks of size 9 are disjoint.

See also

sage.combinat.designs.orthogonal_arrays.OA_from_PBD()

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_orthogonal_array
sage: from sage.combinat.designs.database import OA_10_205
sage: OA = OA_10_205()                                                          # needs sage.schemes
sage: is_orthogonal_array(OA,10,205,2)                                          # needs sage.schemes
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_orthogonal_array
>>> from sage.combinat.designs.database import OA_10_205
>>> OA = OA_10_205()                                                            # needs sage.schemes
>>> is_orthogonal_array(OA,Integer(10),Integer(205),Integer(2))                  # needs sage.schemes
True
```

The design is available from the general constructor:

```
sage: designs.orthogonal_arrays.is_available(10,205)                            # needs sage.schemes
True
```

```
>>> from sage.all import *
>>> designs.orthogonal_arrays.is_available(Integer(10),Integer(205))
↪                # needs sage.schemes
True
```

sage.combinat.designs.database.**OA_10_469**()

Return an OA(10,469).

This construction appears in [Brouwer80]. It is based on the same technique used in *brouwer_separable_design()*.

Julian R. Abel's instructions:

> Brouwer notes that a cyclic $PG(2,37)$ (or $(1407,38,1)$-BIBD) can be obtained with a base block containing $13,9$, and 16 points in each residue class mod 3. Thus, by reducing the $PG(2,37)$ to its points congruent to $0 \pmod 3$ one obtains a $(469,\{9,13,16\})$-PBD which consists in 3 symmetric designs, i.e. 469 blocks of size 9, 469 blocks of size 13, and 469 blocks of size 16.
>
> For each block size s, one can build a matrix with size $s\times 469$ in which each block is a row, and such that each point of the PBD appears once per column. By multiplying a row of an $OA(9,s)-s.OA(9,1)$ with the rows of the matrix one obtains a parallel class of a resolvable $OA(9,469)$.
>
> Add to this the parallel class of all blocks $(0,0,...),(1,1,...),...$ to obtain a resolvable $OA(9,469)$ equivalent to an $OA(10,469)$.

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_orthogonal_array
sage: from sage.combinat.designs.database import OA_10_469
sage: OA = OA_10_469()                       # long time                           #
↪needs sage.schemes
sage: is_orthogonal_array(OA,10,469,2)   # long time                           #
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_orthogonal_array
>>> from sage.combinat.designs.database import OA_10_469
>>> OA = OA_10_469()                       # long time                           #
↪needs sage.schemes
>>> is_orthogonal_array(OA,Integer(10),Integer(469),Integer(2))   # long time
↪                      # needs sage.schemes
True
```

The design is available from the general constructor:

```
sage: designs.orthogonal_arrays.is_available(10,469)                              #
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> designs.orthogonal_arrays.is_available(Integer(10),Integer(469))
↪                # needs sage.schemes
True
```

sage.combinat.designs.database.**OA_10_520**()

Return an OA(10,520).

This design is built by the slightly more general construction *OA_520_plus_x()*.

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_orthogonal_array
sage: from sage.combinat.designs.database import OA_10_520
sage: OA = OA_10_520()                                                    #␣
↪needs sage.schemes
sage: is_orthogonal_array(OA,10,520,2)                                    #␣
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_orthogonal_array
>>> from sage.combinat.designs.database import OA_10_520
>>> OA = OA_10_520()                                                    #␣
↪needs sage.schemes
>>> is_orthogonal_array(OA,Integer(10),Integer(520),Integer(2))          ␣
↪                        # needs sage.schemes
True
```

The design is available from the general constructor:

```
sage: designs.orthogonal_arrays.is_available(10,520)                      #␣
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> designs.orthogonal_arrays.is_available(Integer(10),Integer(520))      ␣
↪                 # needs sage.schemes
True
```

sage.combinat.designs.database.**OA_10_796**()

Return an OA(10,796).

Construction shared by Julian R. Abel, from [AC07]:

> Truncate one block of a $TD(17,47)$ to size 13, then add an extra point. Form a block on each group plus the extra point: we obtain a $(796,\{13,16,17,47,48\})$-PBD in which only the extra point lies in more than one block of size 48 (and each other point lies in exactly 1 such block).
>
> For each block B (of size k say) not containing the extra point, construct a $TD(10,k)-k.TD(k,1)$ on $I(10)XB$. For each block B (of size $k=47$ or 48) containing the extra point, construct a $TD(10,k)-TD(k,1)$ on $I(10)XB$, the size 1 hole being on $I(10)XP$ where P is the extra point. Finally form 1 extra block of size 10 on $I(10)XP$.

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_orthogonal_array
sage: from sage.combinat.designs.database import OA_10_796
sage: OA = OA_10_796()                                                    #␣
↪needs sage.schemes
sage: is_orthogonal_array(OA,10,796,2)                                    #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_orthogonal_array
>>> from sage.combinat.designs.database import OA_10_796
>>> OA = OA_10_796()                                                    #␣
↪needs sage.schemes
>>> is_orthogonal_array(OA,Integer(10),Integer(796),Integer(2))          ␣
↪                         # needs sage.schemes
True
```

The design is available from the general constructor:

```
sage: designs.orthogonal_arrays.is_available(10,796)                     #␣
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> designs.orthogonal_arrays.is_available(Integer(10),Integer(796))     ␣
↪                # needs sage.schemes
True
```

sage.combinat.designs.database.**OA_11_160**()

Return an OA(11,160).

Published by Julian R. Abel in [Ab1995]. Uses the fact that $160 = 2^5 \times 5$ is a product of a power of 2 and a prime number.

See also

sage.combinat.designs.orthogonal_arrays.OA_n_times_2_pow_c_from_matrix()

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_orthogonal_array
sage: from sage.combinat.designs.database import OA_11_160
sage: OA = OA_11_160()                                                   #␣
↪needs sage.rings.finite_rings
sage: is_orthogonal_array(OA,11,160,2)                                   #␣
↪needs sage.rings.finite_rings
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_orthogonal_array
>>> from sage.combinat.designs.database import OA_11_160
>>> OA = OA_11_160()                                                    #␣
↪needs sage.rings.finite_rings
>>> is_orthogonal_array(OA,Integer(11),Integer(160),Integer(2))          ␣
↪                         # needs sage.rings.finite_rings
True
```

The design is available from the general constructor:

```
sage: designs.orthogonal_arrays.is_available(11,160)                          #␣
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> designs.orthogonal_arrays.is_available(Integer(11),Integer(160))           ␣
↪               # needs sage.schemes
True
```

sage.combinat.designs.database.**OA_11_185**()

Return an OA(11,185).

The construction is given in [Greig99]. In Julian R. Abel's words:

> Start with a $PG(2,16)$ with a 7 points Fano subplane; outside this plane there are $7(17-3)=98$ points on a line of the subplane and $273-98-7=168$ other points. Greig notes that the subdesign consisting of these 168 points is a $(168,\{10,12\})-PBD$. Now add the 17 points of a line disjoint from this subdesign (e.g. a line of the Fano subplane). This line will intersect every line of the 168 point subdesign in 1 point. Thus the new line sizes are 11 and 13, plus a unique line of size 17, giving a $(185,\{11,13,17\}$-PBD and an $OA(11,185)$.

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_orthogonal_array
sage: from sage.combinat.designs.database import OA_11_185
sage: OA = OA_11_185()                                                        #␣
↪needs sage.rings.finite_rings
sage: is_orthogonal_array(OA,11,185,2)                                        #␣
↪needs sage.rings.finite_rings
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_orthogonal_array
>>> from sage.combinat.designs.database import OA_11_185
>>> OA = OA_11_185()                                                        #␣
↪needs sage.rings.finite_rings
>>> is_orthogonal_array(OA,Integer(11),Integer(185),Integer(2))                ␣
↪                         # needs sage.rings.finite_rings
True
```

The design is available from the general constructor:

```
sage: designs.orthogonal_arrays.is_available(11,185)                          #␣
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> designs.orthogonal_arrays.is_available(Integer(11),Integer(185))           ␣
↪               # needs sage.schemes
True
```

sage.combinat.designs.database.**OA_11_254**()

Return an OA(11,254).

This constructions appears in [Greig99].

From a cyclic $PG(2,19)$ whose base blocks contains 7,9, and 4 points in the congruence classes mod 3, build a $(254,11,13,16)-PBD$ by ignoring the points of a congruence class. There exist $OA(12,11), OA(12,13), OA(12,16)$, which gives the $OA(11,254)$.

See also:

sage.combinat.designs.orthogonal_arrays.OA_from_PBD()

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_orthogonal_array
sage: from sage.combinat.designs.database import OA_11_254
sage: OA = OA_11_254()                                                    #␣
↪needs sage.schemes
sage: is_orthogonal_array(OA,11,254,2)                                    #␣
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_orthogonal_array
>>> from sage.combinat.designs.database import OA_11_254
>>> OA = OA_11_254()                                                      #␣
↪needs sage.schemes
>>> is_orthogonal_array(OA,Integer(11),Integer(254),Integer(2))          ␣
↪                        # needs sage.schemes
True
```

The design is available from the general constructor:

```
sage: designs.orthogonal_arrays.is_available(11,254)                      #␣
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> designs.orthogonal_arrays.is_available(Integer(11),Integer(254))     ␣
↪               # needs sage.schemes
True
```

sage.combinat.designs.database.**OA_11_640**()

Return an OA(11,640).

Published by Julian R. Abel in [Ab1995] (uses the fact that $640 = 2^7 \times 5$ is the product of a power of 2 and a prime number).

See also:

sage.combinat.designs.orthogonal_arrays.OA_n_times_2_pow_c_from_matrix()

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_orthogonal_array
sage: from sage.combinat.designs.database import OA_11_640
sage: OA = OA_11_640()                          # not tested (too long)              #␣
↪needs sage.rings.finite_rings
sage: is_orthogonal_array(OA,11,640,2)  # not tested (too long)              #␣
↪needs sage.rings.finite_rings
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_orthogonal_array
>>> from sage.combinat.designs.database import OA_11_640
>>> OA = OA_11_640()                          # not tested (too long)              #␣
↪needs sage.rings.finite_rings
>>> is_orthogonal_array(OA,Integer(11),Integer(640),Integer(2))   # not tested␣
↪(too long)                  # needs sage.rings.finite_rings
True
```

The design is available from the general constructor:

```
sage: designs.orthogonal_arrays.is_available(11,640)                           #␣
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> designs.orthogonal_arrays.is_available(Integer(11),Integer(640))          ␣
↪              # needs sage.schemes
True
```

sage.combinat.designs.database.**OA_11_80**()

Return an OA(11,80).

As explained in the Handbook III.3.76 [DesignHandbook]. Uses the fact that $80 = 2^4 \times 5$ and that 5 is prime.

See also

sage.combinat.designs.orthogonal_arrays.OA_n_times_2_pow_c_from_matrix()

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_orthogonal_array
sage: from sage.combinat.designs.database import OA_11_80
sage: OA = OA_11_80()                                                            #␣
↪needs sage.rings.finite_rings sage.schemes
sage: is_orthogonal_array(OA,11,80,2)                                            #␣
↪needs sage.rings.finite_rings sage.schemes
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_orthogonal_array
>>> from sage.combinat.designs.database import OA_11_80
>>> OA = OA_11_80()                                                            #␣
↪needs sage.rings.finite_rings sage.schemes
```

(continues on next page)

(continued from previous page)

```
>>> is_orthogonal_array(OA,Integer(11),Integer(80),Integer(2))                    # needs sage.rings.finite_rings sage.schemes
True
```

The design is available from the general constructor:

```
sage: designs.orthogonal_arrays.is_available(11,80)                    # needs sage.rings.finite_rings sage.schemes
True
```

```
>>> from sage.all import *
>>> designs.orthogonal_arrays.is_available(Integer(11),Integer(80))                    # needs sage.rings.finite_rings sage.schemes
True
```

sage.combinat.designs.database.**OA_12_522**()

Return an OA(12,522).

This design is built by the slightly more general construction *OA_520_plus_x()*.

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_orthogonal_array
sage: from sage.combinat.designs.database import OA_12_522
sage: OA = OA_12_522()                    # needs sage.schemes
sage: is_orthogonal_array(OA,12,522,2)                    # needs sage.schemes
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_orthogonal_array
>>> from sage.combinat.designs.database import OA_12_522
>>> OA = OA_12_522()                    # needs sage.schemes
>>> is_orthogonal_array(OA,Integer(12),Integer(522),Integer(2))                    # needs sage.schemes
True
```

The design is available from the general constructor:

```
sage: designs.orthogonal_arrays.is_available(12,522)                    # needs sage.schemes
True
```

```
>>> from sage.all import *
>>> designs.orthogonal_arrays.is_available(Integer(12),Integer(522))                    # needs sage.schemes
True
```

sage.combinat.designs.database.**OA_14_524**()

Return an OA(14,524).

This design is built by the slightly more general construction *OA_520_plus_x()*.

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_orthogonal_array
sage: from sage.combinat.designs.database import OA_14_524
sage: OA = OA_14_524()                                                          #␣
↪needs sage.schemes
sage: is_orthogonal_array(OA,14,524,2)                                          #␣
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_orthogonal_array
>>> from sage.combinat.designs.database import OA_14_524
>>> OA = OA_14_524()                                                        #␣
↪needs sage.schemes
>>> is_orthogonal_array(OA,Integer(14),Integer(524),Integer(2))               ␣
↪                         # needs sage.schemes
True
```

The design is available from the general constructor:

```
sage: designs.orthogonal_arrays.is_available(14,524)                            #␣
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> designs.orthogonal_arrays.is_available(Integer(14),Integer(524))           ␣
↪               # needs sage.schemes
True
```

sage.combinat.designs.database.**OA_15_112**()

Return an OA(15,112).

Published by Julian R. Abel in [Ab1995]. Uses the fact that $112 = 2^4 \times 7$ and that 7 is prime.

See also

sage.combinat.designs.orthogonal_arrays.OA_n_times_2_pow_c_from_matrix()

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_orthogonal_array
sage: from sage.combinat.designs.database import OA_15_112
sage: OA = OA_15_112()                                                          #␣
↪needs sage.rings.finite_rings sage.schemes
sage: is_orthogonal_array(OA,15,112,2)                                          #␣
↪needs sage.rings.finite_rings sage.schemes
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_orthogonal_array
>>> from sage.combinat.designs.database import OA_15_112
```

(continues on next page)

(continued from previous page)

```
>>> OA = OA_15_112()                                                         #␣
↪needs sage.rings.finite_rings sage.schemes
>>> is_orthogonal_array(OA,Integer(15),Integer(112),Integer(2))              ␣
↪                        # needs sage.rings.finite_rings sage.schemes
True
```

The design is available from the general constructor:

```
sage: designs.orthogonal_arrays.is_available(15,112)                         #␣
↪needs sage.rings.finite_rings sage.schemes
True
```

```
>>> from sage.all import *
>>> designs.orthogonal_arrays.is_available(Integer(15),Integer(112))         ␣
↪               # needs sage.rings.finite_rings sage.schemes
True
```

sage.combinat.designs.database.**OA_15_224**()

Return an OA(15,224).

Published by Julian R. Abel in [Ab1995] (uses the fact that $224 = 2^5 \times 7$ is a product of a power of 2 and a prime number).

See also

sage.combinat.designs.orthogonal_arrays.OA_n_times_2_pow_c_from_matrix()

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_orthogonal_array
sage: from sage.combinat.designs.database import OA_15_224
sage: OA = OA_15_224()                           # not tested (too long)       #␣
↪needs sage.rings.finite_rings
sage: is_orthogonal_array(OA,15,224,2)   # not tested (too long)               #␣
↪needs sage.rings.finite_rings
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_orthogonal_array
>>> from sage.combinat.designs.database import OA_15_224
>>> OA = OA_15_224()                           # not tested (too long)         #␣
↪needs sage.rings.finite_rings
>>> is_orthogonal_array(OA,Integer(15),Integer(224),Integer(2))   # not tested␣
↪(too long)                 # needs sage.rings.finite_rings
True
```

The design is available from the general constructor:

```
sage: designs.orthogonal_arrays.is_available(15,224)                         #␣
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> designs.orthogonal_arrays.is_available(Integer(15),Integer(224))              # needs sage.schemes
True
```

sage.combinat.designs.database.**OA_15_896**()

Return an OA(15,896).

Uses the fact that $896 = 2^7 \times 7$ is the product of a power of 2 and a prime number.

See also:

sage.combinat.designs.orthogonal_arrays.OA_n_times_2_pow_c_from_matrix()

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_orthogonal_array
sage: from sage.combinat.designs.database import OA_15_896
sage: OA = OA_15_896()                       # not tested (too long, ~2min)          # needs sage.rings.finite_rings
sage: is_orthogonal_array(OA,15,896,2)   # not tested (too long)                  # needs sage.rings.finite_rings
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_orthogonal_array
>>> from sage.combinat.designs.database import OA_15_896
>>> OA = OA_15_896()                       # not tested (too long, ~2min)          # needs sage.rings.finite_rings
>>> is_orthogonal_array(OA,Integer(15),Integer(896),Integer(2))  # not tested (too long)              # needs sage.rings.finite_rings
True
```

The design is available from the general constructor:

```
sage: designs.orthogonal_arrays.is_available(15,896)                              # needs sage.schemes
True
```

```
>>> from sage.all import *
>>> designs.orthogonal_arrays.is_available(Integer(15),Integer(896))              # needs sage.schemes
True
```

sage.combinat.designs.database.**OA_16_176**()

Return an OA(16,176).

Published by Julian R. Abel in [Ab1995]. Uses the fact that $176 = 2^4 \times 11$ is a product of a power of 2 and a prime number.

See also:

sage.combinat.designs.orthogonal_arrays.OA_n_times_2_pow_c_from_matrix()

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_orthogonal_array
sage: from sage.combinat.designs.database import OA_16_176
sage: OA = OA_16_176()                                                      #␣
↪needs sage.rings.finite_rings
sage: is_orthogonal_array(OA,16,176,2)                                      #␣
↪needs sage.rings.finite_rings
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_orthogonal_array
>>> from sage.combinat.designs.database import OA_16_176
>>> OA = OA_16_176()                                                      #␣
↪needs sage.rings.finite_rings
>>> is_orthogonal_array(OA,Integer(16),Integer(176),Integer(2))            ␣
↪                     # needs sage.rings.finite_rings
True
```

The design is available from the general constructor:

```
sage: designs.orthogonal_arrays.is_available(16,176)                        #␣
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> designs.orthogonal_arrays.is_available(Integer(16),Integer(176))        ␣
↪                # needs sage.schemes
True
```

sage.combinat.designs.database.**OA_16_208**()

Return an OA(16,208).

Published by Julian R. Abel in [Ab1995]. Uses the fact that $208 = 2^4 \times 13$ is a product of 2 and a prime number.

See also

sage.combinat.designs.orthogonal_arrays.OA_n_times_2_pow_c_from_matrix()

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_orthogonal_array
sage: from sage.combinat.designs.database import OA_16_208
sage: OA = OA_16_208()                  # not tested (too long)             #␣
↪needs sage.rings.finite_rings
sage: is_orthogonal_array(OA,16,208,2)  # not tested (too long)             #␣
↪needs sage.rings.finite_rings
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_orthogonal_array
>>> from sage.combinat.designs.database import OA_16_208
>>> OA = OA_16_208()                    # not tested (too long)            #␣
↪needs sage.rings.finite_rings
>>> is_orthogonal_array(OA,Integer(16),Integer(208),Integer(2))  # not tested␣
↪(too long)               # needs sage.rings.finite_rings
True
```

The design is available from the general constructor:

```
sage: designs.orthogonal_arrays.is_available(16,208)                         #␣
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> designs.orthogonal_arrays.is_available(Integer(16),Integer(208))          ␣
↪              # needs sage.schemes
True
```

sage.combinat.designs.database.**OA_17_560**()

Return an OA(17,560).

This OA is built in Corollary 2.2 of [Thwarts].

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_orthogonal_array
sage: from sage.combinat.designs.database import OA_17_560
sage: OA = OA_17_560()                                                       #␣
↪needs sage.rings.finite_rings sage.schemes
sage: is_orthogonal_array(OA,17,560,2)                                       #␣
↪needs sage.rings.finite_rings sage.schemes
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_orthogonal_array
>>> from sage.combinat.designs.database import OA_17_560
>>> OA = OA_17_560()                                                       #␣
↪needs sage.rings.finite_rings sage.schemes
>>> is_orthogonal_array(OA,Integer(17),Integer(560),Integer(2))             ␣
↪                       # needs sage.rings.finite_rings sage.schemes
True
```

The design is available from the general constructor:

```
sage: designs.orthogonal_arrays.is_available(17,560)                         #␣
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> designs.orthogonal_arrays.is_available(Integer(17),Integer(560))          ␣
↪              # needs sage.schemes
True
```

sage.combinat.designs.database.**OA_20_352**()

Return an OA(20,352).

Published by Julian R. Abel in [Ab1995] (uses the fact that $352 = 2^5 \times 11$ is the product of a power of 2 and a prime number).

See also

sage.combinat.designs.orthogonal_arrays.OA_n_times_2_pow_c_from_matrix()

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_orthogonal_array
sage: from sage.combinat.designs.database import OA_20_352
sage: OA = OA_20_352()                          # not tested (~25s)                #␣
↪needs sage.rings.finite_rings
sage: is_orthogonal_array(OA,20,352,2)  # not tested (~25s)                #␣
↪needs sage.rings.finite_rings
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_orthogonal_array
>>> from sage.combinat.designs.database import OA_20_352
>>> OA = OA_20_352()                          # not tested (~25s)                #␣
↪needs sage.rings.finite_rings
>>> is_orthogonal_array(OA,Integer(20),Integer(352),Integer(2))  # not tested (~
↪25s)                     # needs sage.rings.finite_rings
True
```

The design is available from the general constructor:

```
sage: designs.orthogonal_arrays.is_available(20,352)                           #␣
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> designs.orthogonal_arrays.is_available(Integer(20),Integer(352))           ␣
↪                # needs sage.schemes
True
```

sage.combinat.designs.database.**OA_20_416**()

Return an OA(20,416).

Published by Julian R. Abel in [Ab1995] (uses the fact that $416 = 2^5 \times 13$ is the product of a power of 2 and a prime number).

See also

sage.combinat.designs.orthogonal_arrays.OA_n_times_2_pow_c_from_matrix()

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_orthogonal_array
sage: from sage.combinat.designs.database import OA_20_416
sage: OA = OA_20_416()                        # not tested (~35s)                  #␣
↪needs sage.rings.finite_rings
sage: is_orthogonal_array(OA,20,416,2)  # not tested                               #␣
↪needs sage.rings.finite_rings
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_orthogonal_array
>>> from sage.combinat.designs.database import OA_20_416
>>> OA = OA_20_416()                        # not tested (~35s)                  #␣
↪needs sage.rings.finite_rings
>>> is_orthogonal_array(OA,Integer(20),Integer(416),Integer(2))   # not tested     ␣
↪                         # needs sage.rings.finite_rings
True
```

The design is available from the general constructor:

```
sage: designs.orthogonal_arrays.is_available(20,416)                               #␣
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> designs.orthogonal_arrays.is_available(Integer(20),Integer(416))               ␣
↪               # needs sage.schemes
True
```

sage.combinat.designs.database.**OA_20_544**()

Return an OA(20,544).

Published by Julian R. Abel in [Ab1995] (uses the fact that $544 = 2^5 \times 17$ is the product of a power of 2 and a prime number).

See also

sage.combinat.designs.orthogonal_arrays.OA_n_times_2_pow_c_from_matrix()

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_orthogonal_array

>>> OA = OA_20_544()                        # not tested (too long ~1mn)         #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.rings.finite_rings
>>> is_orthogonal_array(OA,Integer(20),Integer(544),Integer(2))  # not tested    ␣
↪                       # needs sage.rings.finite_rings
True
```

The design is available from the general constructor:

```
sage: designs.orthogonal_arrays.is_available(20,544)                            #␣
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> designs.orthogonal_arrays.is_available(Integer(20),Integer(544))            ␣
↪               # needs sage.schemes
True
```

sage.combinat.designs.database.**OA_25_1262**()

Return an OA(25,1262).

The construction is given in [Greig99]. In Julian R. Abel's words:

> Start with a cyclic $PG(2,43)$ or $(1893,44,1)$-BIBD whose base block contains respectively 12, 13 and 19 point in the residue classes mod 3. In the resulting BIBD, remove one of the three classes: the result is a $(1262,\{25,31,32\})$-PBD, from which the $OA(25,1262)$ is obtained.

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_orthogonal_array
sage: from sage.combinat.designs.database import OA_25_1262
sage: OA = OA_25_1262()                             # not tested -- too long
sage: is_orthogonal_array(OA,25,1262,2) # not tested -- too long
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_orthogonal_array
>>> from sage.combinat.designs.database import OA_25_1262
>>> OA = OA_25_1262()                             # not tested -- too long
>>> is_orthogonal_array(OA,Integer(25),Integer(1262),Integer(2)) # not tested --␣
↪too long
True
```

The design is available from the general constructor:

```
sage: designs.orthogonal_arrays.is_available(25,1262)                           #␣
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> designs.orthogonal_arrays.is_available(Integer(25),Integer(1262))           ␣
↪               # needs sage.schemes
True
```

sage.combinat.designs.database.**OA_520_plus_x**(x)

Return an $OA(10+x,520+x)$.

The construction shared by Julian R. Abel works for `OA(10,520)`, `OA(12,522)`, and `OA(14,524)`.

> Let $n = 520 + x$ and $k = 10 + x$. Build a $TD(17, 31)$. Remove $8 - x$ points contained in a common block, add a new point p and create a block $g_i \cup \{p\}$ for every (possibly truncated) group g_i. The result is a $(520 + x, 9 + x, 16, 17, 31, 32) - PBD$. Note that all blocks of size ≥ 30 only intersect on p, and that the unique block B_9 of size 9 intersects all blocks of size 32 on one point. Now:
>
> - Build an $OA(k, 16) - 16.OA(k, 16)$ for each block of size 16
> - Build an $OA(k, 17) - 17.OA(k, 17)$ for each block of size 17
> - Build an $OA(k, 31) - OA(k, 1)$ for each block of size 31 (with the hole on p).
> - Build an $OA(k, 32) - 2.OA(k, 1)$ for each block B of size 32 (with the holes on p and $B \cap B_9$).
> - Build an $OA(k, 9)$ on B_9.
>
> Only a row $[p, p, ...]$ is missing from the $OA(10 + x, 520 + x)$

This construction is used in `OA(10,520)`, `OA(12,522)`, and `OA(14,524)`.

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_orthogonal_array
sage: from sage.combinat.designs.database import OA_520_plus_x
sage: OA = OA_520_plus_x(0)                    # not tested (already tested in OA_
↪10_520)
sage: is_orthogonal_array(OA,10,520,2)  # not tested (already tested in OA_10_520)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_orthogonal_array
>>> from sage.combinat.designs.database import OA_520_plus_x
>>> OA = OA_520_plus_x(Integer(0))                   # not tested (already tested␣
↪in OA_10_520)
>>> is_orthogonal_array(OA,Integer(10),Integer(520),Integer(2))  # not tested␣
↪(already tested in OA_10_520)
True
```

`sage.combinat.designs.database.`**`OA_7_18`**`()`

Return an OA(7,18).

Proved in [JulianAbel13].

See also

sage.combinat.designs.orthogonal_arrays.OA_from_quasi_difference_matrix()

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_orthogonal_array
sage: from sage.combinat.designs.database import OA_7_18
sage: OA = OA_7_18()
sage: is_orthogonal_array(OA,7,18,2)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_orthogonal_array
>>> from sage.combinat.designs.database import OA_7_18
>>> OA = OA_7_18()
>>> is_orthogonal_array(OA,Integer(7),Integer(18),Integer(2))
True
```

The design is available from the general constructor:

```
sage: designs.orthogonal_arrays.is_available(7,18)                        #␣
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> designs.orthogonal_arrays.is_available(Integer(7),Integer(18))          ␣
↪                # needs sage.schemes
True
```

sage.combinat.designs.database.**OA_7_66**()

Return an OA(7,66).

Construction shared by Julian R. Abel.

See also

sage.combinat.designs.orthogonal_arrays.OA_from_PBD()

EXAMPLES:

```
sage: from sage.combinat.designs.orthogonal_arrays import is_orthogonal_array
sage: from sage.combinat.designs.database import OA_7_66
sage: OA = OA_7_66()                                                      #␣
↪needs sage.schemes
sage: is_orthogonal_array(OA,7,66,2)                                      #␣
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.orthogonal_arrays import is_orthogonal_array
>>> from sage.combinat.designs.database import OA_7_66
>>> OA = OA_7_66()                                                      #␣
↪needs sage.schemes
>>> is_orthogonal_array(OA,Integer(7),Integer(66),Integer(2))            ␣
↪                         # needs sage.schemes
True
```

The design is available from the general constructor:

```
sage: designs.orthogonal_arrays.is_available(7,66)                        #␣
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> designs.orthogonal_arrays.is_available(Integer(7),Integer(66))
↪            # needs sage.schemes
True
```

sage.combinat.designs.database.**OA_7_68**()

Return an OA(7,68).

Construction shared by Julian R. Abel.

See also

sage.combinat.designs.orthogonal_arrays.OA_from_PBD()

EXAMPLES:

```
sage: from sage.combinat.designs.orthogonal_arrays import is_orthogonal_array
sage: from sage.combinat.designs.database import OA_7_68
sage: OA = OA_7_68()                                                          #
↪needs sage.schemes
sage: is_orthogonal_array(OA,7,68,2)                                          #
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.orthogonal_arrays import is_orthogonal_array
>>> from sage.combinat.designs.database import OA_7_68
>>> OA = OA_7_68()                                                          #
↪needs sage.schemes
>>> is_orthogonal_array(OA,Integer(7),Integer(68),Integer(2))
↪                      # needs sage.schemes
True
```

The design is available from the general constructor:

```
sage: designs.orthogonal_arrays.is_available(7,68)                            #
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> designs.orthogonal_arrays.is_available(Integer(7),Integer(68))
↪            # needs sage.schemes
True
```

sage.combinat.designs.database.**OA_7_74**()

Return an OA(7,74).

Construction shared by Julian R. Abel.

See also

sage.combinat.designs.orthogonal_arrays.OA_from_PBD()

EXAMPLES:

```
sage: from sage.combinat.designs.orthogonal_arrays import is_orthogonal_array
sage: from sage.combinat.designs.database import OA_7_74
sage: OA = OA_7_74()                                                    #␣
↪needs sage.schemes
sage: is_orthogonal_array(OA,7,74,2)                                    #␣
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.orthogonal_arrays import is_orthogonal_array
>>> from sage.combinat.designs.database import OA_7_74
>>> OA = OA_7_74()                                                    #␣
↪needs sage.schemes
>>> is_orthogonal_array(OA,Integer(7),Integer(74),Integer(2))          ␣
↪                    # needs sage.schemes
True
```

The design is available from the general constructor:

```
sage: designs.orthogonal_arrays.is_available(7,74)                      #␣
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> designs.orthogonal_arrays.is_available(Integer(7),Integer(74))     ␣
↪            # needs sage.schemes
True
```

sage.combinat.designs.database.**OA_8_69**()

Return an OA(8,69).

Construction shared by Julian R. Abel.

See also

sage.combinat.designs.orthogonal_arrays.OA_from_PBD()

EXAMPLES:

```
sage: from sage.combinat.designs.orthogonal_arrays import is_orthogonal_array
sage: from sage.combinat.designs.database import OA_8_69
sage: OA = OA_8_69()                                                    #␣
↪needs sage.schemes
sage: is_orthogonal_array(OA,8,69,2)                                    #␣
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.orthogonal_arrays import is_orthogonal_array
>>> from sage.combinat.designs.database import OA_8_69
```

(continues on next page)

(continued from previous page)

```
>>> OA = OA_8_69()                                                          #␣
↪needs sage.schemes
>>> is_orthogonal_array(OA,Integer(8),Integer(69),Integer(2))                  ␣
↪                       # needs sage.schemes
True
```

The design is available from the general constructor:

```
sage: designs.orthogonal_arrays.is_available(8,69)                            #␣
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> designs.orthogonal_arrays.is_available(Integer(8),Integer(69))             ␣
↪              # needs sage.schemes
True
```

`sage.combinat.designs.database.`**`OA_8_76`**`()`

Return an OA(8,76).

Construction shared by Julian R. Abel.

See also

sage.combinat.designs.orthogonal_arrays.OA_from_PBD()

EXAMPLES:

```
sage: from sage.combinat.designs.orthogonal_arrays import is_orthogonal_array
sage: from sage.combinat.designs.database import OA_8_76
sage: OA = OA_8_76()                                                          #␣
↪needs sage.schemes
sage: is_orthogonal_array(OA,8,76,2)                                          #␣
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.orthogonal_arrays import is_orthogonal_array
>>> from sage.combinat.designs.database import OA_8_76
>>> OA = OA_8_76()                                                          #␣
↪needs sage.schemes
>>> is_orthogonal_array(OA,Integer(8),Integer(76),Integer(2))                  ␣
↪                       # needs sage.schemes
True
```

The design is available from the general constructor:

```
sage: designs.orthogonal_arrays.is_available(8,76)                            #␣
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> designs.orthogonal_arrays.is_available(Integer(8),Integer(76))              ␣
↪               # needs sage.schemes
True
```

sage.combinat.designs.database.**OA_9_1078**()

Return an OA(9,1078).

This is obtained through the generalized Brouwer-van Rees construction. Indeed, $1078 = 89.11 + (99 = 9.11)$ and there exists an $OA(9, 100) - OA(9, 11)$.

Note: This function should be removed once *find_brouwer_van_rees_with_one_truncated_column()* can handle all incomplete orthogonal arrays obtained through *incomplete_orthogonal_array()*.

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_orthogonal_array
sage: from sage.combinat.designs.database import OA_9_1078
sage: OA = OA_9_1078()                              # not tested -- ~3s
sage: is_orthogonal_array(OA,9,1078,2) # not tested -- ~3s
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_orthogonal_array
>>> from sage.combinat.designs.database import OA_9_1078
>>> OA = OA_9_1078()                              # not tested -- ~3s
>>> is_orthogonal_array(OA,Integer(9),Integer(1078),Integer(2)) # not tested -- ~
↪3s
True
```

The design is available from the general constructor:

```
sage: designs.orthogonal_arrays.is_available(9,1078)                             #␣
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> designs.orthogonal_arrays.is_available(Integer(9),Integer(1078))              ␣
↪               # needs sage.schemes
True
```

sage.combinat.designs.database.**OA_9_120**()

Return an OA(9,120).

Construction shared by Julian R. Abel:

> From a resolvable $(120, 8, 1) - BIBD$, one can obtain 7 $MOLS(120)$ or a resolvable $TD(8, 120)$ by forming a resolvable $TD(8, 8) - 8.TD(8, 1)$ on $I_8 \times B$ for each block B in the BIBD. This gives a $TD(8, 120) - 120TD(8, 1)$ (which is resolvable as the BIBD is resolvable).

> **See also**
>
> *RBIBD_120_8_1()*

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_orthogonal_array
sage: from sage.combinat.designs.database import OA_9_120
sage: OA = OA_9_120()                                                           #␣
↪needs sage.modules sage.schemes
sage: is_orthogonal_array(OA,9,120,2)                                           #␣
↪needs sage.modules sage.schemes
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_orthogonal_array
>>> from sage.combinat.designs.database import OA_9_120
>>> OA = OA_9_120()                                                         #␣
↪needs sage.modules sage.schemes
>>> is_orthogonal_array(OA,Integer(9),Integer(120),Integer(2))                ␣
↪                         # needs sage.modules sage.schemes
True
```

The design is available from the general constructor:

```
sage: designs.orthogonal_arrays.is_available(9,120)                             #␣
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> designs.orthogonal_arrays.is_available(Integer(9),Integer(120))            ␣
↪               # needs sage.schemes
True
```

`sage.combinat.designs.database.`**`OA_9_135`**`()`

Return an OA(9,135).

Construction shared by Julian R. Abel:

> This design can be built by Wilson's method ($135 = 8.16 + 7$) applied to an Orthogonal Array $OA(9 + 7, 16)$ with 7 groups truncated to size 1 in such a way that a block contain 0, 1 or 3 points of the truncated groups.
>
> This is possible, because $PG(2, 2)$ (the projective plane over $GF(2)$) is a subdesign in $PG(2, 16)$ (the projective plane over $GF(16)$); in a cyclic $PG(2, 16)$ or $BIBD(273, 17, 1)$ the points $\equiv 0 \pmod{39}$ form such a subdesign (note that $273 = 16^2 + 16 + 1$ and $273 = 39 \times 7$ and $7 = 2^2 + 2 + 1$).

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_orthogonal_array
sage: from sage.combinat.designs.database import OA_9_135
sage: OA = OA_9_135()                                                           #␣
↪needs sage.rings.finite_rings sage.schemes
sage: is_orthogonal_array(OA,9,135,2)                                           #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.rings.finite_rings sage.schemes
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_orthogonal_array
>>> from sage.combinat.designs.database import OA_9_135
>>> OA = OA_9_135()                                                          #␣
↪needs sage.rings.finite_rings sage.schemes
>>> is_orthogonal_array(OA,Integer(9),Integer(135),Integer(2))               ␣
↪                         # needs sage.rings.finite_rings sage.schemes
True
```

The design is available from the general constructor:

```
sage: designs.orthogonal_arrays.is_available(9,135)                          #␣
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> designs.orthogonal_arrays.is_available(Integer(9),Integer(135))          ␣
↪                # needs sage.schemes
True
```

As this orthogonal array requires a $(273, 17, 1)$ cyclic difference set, we check that it is available:

```
sage: G,D = designs.difference_family(273,17,1); G                           #␣
↪needs sage.libs.pari
Ring of integers modulo 273
```

```
>>> from sage.all import *
>>> G,D = designs.difference_family(Integer(273),Integer(17),Integer(1)); G  ␣
↪                         # needs sage.libs.pari
Ring of integers modulo 273
```

sage.combinat.designs.database.**OA_9_1612**()

Return an OA(9,1612).

This is obtained through the generalized Brouwer-van Rees construction. Indeed, $1612 = 89.17 + (99 = 9.11)$ and there exists an $OA(9, 100) - OA(9, 11)$.

> **Note**
>
> This function should be removed once *find_brouwer_van_rees_with_one_truncated_column()* can handle all incomplete orthogonal arrays obtained through *incomplete_orthogonal_array()*.

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_orthogonal_array
sage: from sage.combinat.designs.database import OA_9_1612
sage: OA = OA_9_1612()                              # not tested -- ~6s
```

(continues on next page)

(continued from previous page)

```
sage: is_orthogonal_array(OA,9,1612,2) # not tested -- ~6s
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_orthogonal_array
>>> from sage.combinat.designs.database import OA_9_1612
>>> OA = OA_9_1612()                              # not tested -- ~6s
>>> is_orthogonal_array(OA,Integer(9),Integer(1612),Integer(2)) # not tested -- ~
↪6s
True
```

The design is available from the general constructor:

```
sage: designs.orthogonal_arrays.is_available(9,1612)                          #␣
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> designs.orthogonal_arrays.is_available(Integer(9),Integer(1612))          ␣
↪               # needs sage.schemes
True
```

sage.combinat.designs.database.**OA_9_40**()

Return an OA(9,40).

As explained in the Handbook III.3.62 [DesignHandbook]. Uses the fact that $40 = 2^3 \times 5$ and that 5 is prime.

See also

sage.combinat.designs.orthogonal_arrays.OA_n_times_2_pow_c_from_matrix()

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_orthogonal_array
sage: from sage.combinat.designs.database import OA_9_40
sage: OA = OA_9_40()                                                          #␣
↪needs sage.rings.finite_rings
sage: is_orthogonal_array(OA,9,40,2)                                          #␣
↪needs sage.rings.finite_rings
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_orthogonal_array
>>> from sage.combinat.designs.database import OA_9_40
>>> OA = OA_9_40()                                                          #␣
↪needs sage.rings.finite_rings
>>> is_orthogonal_array(OA,Integer(9),Integer(40),Integer(2))               ␣
↪                         # needs sage.rings.finite_rings
True
```

The design is available from the general constructor:

```
sage: designs.orthogonal_arrays.is_available(9,40)                              #␣
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> designs.orthogonal_arrays.is_available(Integer(9),Integer(40))              ␣
↪               # needs sage.schemes
True
```

sage.combinat.designs.database.**QDM_19_6_1_1_1**()

Return a $(19, 6; 1, 1; 1)$-quasi-difference matrix.

Used to build an $OA(6, 20)$

Given in the Handbook III.3.49 [DesignHandbook].

EXAMPLES:

```
sage: from sage.combinat.designs.database import QDM_19_6_1_1_1
sage: from sage.combinat.designs.designs_pyx import is_quasi_difference_matrix
sage: G,M = QDM_19_6_1_1_1()
sage: is_quasi_difference_matrix(M,G,6,1,1,1)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.database import QDM_19_6_1_1_1
>>> from sage.combinat.designs.designs_pyx import is_quasi_difference_matrix
>>> G,M = QDM_19_6_1_1_1()
>>> is_quasi_difference_matrix(M,G,Integer(6),Integer(1),Integer(1),Integer(1))
True
```

sage.combinat.designs.database.**QDM_21_5_1_1_1**()

Return a $(21, 5; 1, 1; 1)$-quasi-difference matrix.

Used to build an $OA(5, 22)$

Given in the Handbook III.3.51 [DesignHandbook].

EXAMPLES:

```
sage: from sage.combinat.designs.database import QDM_21_5_1_1_1
sage: from sage.combinat.designs.designs_pyx import is_quasi_difference_matrix
sage: G,M = QDM_21_5_1_1_1()
sage: is_quasi_difference_matrix(M,G,5,1,1,1)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.database import QDM_21_5_1_1_1
>>> from sage.combinat.designs.designs_pyx import is_quasi_difference_matrix
>>> G,M = QDM_21_5_1_1_1()
>>> is_quasi_difference_matrix(M,G,Integer(5),Integer(1),Integer(1),Integer(1))
True
```

sage.combinat.designs.database.**QDM_21_6_1_1_5**()

Return a $(21, 6; 1, 1; 5)$-quasi-difference matrix.

Used to build an $OA(6, 26)$

Given in the Handbook III.3.53 [DesignHandbook].

EXAMPLES:

```
sage: from sage.combinat.designs.database import QDM_21_6_1_1_5
sage: from sage.combinat.designs.designs_pyx import is_quasi_difference_matrix
sage: G,M = QDM_21_6_1_1_5()
sage: is_quasi_difference_matrix(M,G,6,1,1,5)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.database import QDM_21_6_1_1_5
>>> from sage.combinat.designs.designs_pyx import is_quasi_difference_matrix
>>> G,M = QDM_21_6_1_1_5()
>>> is_quasi_difference_matrix(M,G,Integer(6),Integer(1),Integer(1),Integer(5))
True
```

sage.combinat.designs.database.**QDM_25_6_1_1_5**()

Return a $(25, 6; 1, 1; 5)$-quasi-difference matrix.

Used to build an $OA(6, 30)$

Given in the Handbook III.3.55 [DesignHandbook].

EXAMPLES:

```
sage: from sage.combinat.designs.database import QDM_25_6_1_1_5
sage: from sage.combinat.designs.designs_pyx import is_quasi_difference_matrix
sage: G,M = QDM_25_6_1_1_5()                                                  #␣
↪needs sage.modules
sage: is_quasi_difference_matrix(M,G,6,1,1,5)                                 #␣
↪needs sage.modules
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.database import QDM_25_6_1_1_5
>>> from sage.combinat.designs.designs_pyx import is_quasi_difference_matrix
>>> G,M = QDM_25_6_1_1_5()                                                  #␣
↪needs sage.modules
>>> is_quasi_difference_matrix(M,G,Integer(6),Integer(1),Integer(1),Integer(5))  ␣
↪                                 # needs sage.modules
True
```

sage.combinat.designs.database.**QDM_33_6_1_1_1**()

Return a $(33, 6; 1, 1; 1)$-quasi-difference matrix.

Used to build an $OA(6, 34)$

Given in the Handbook III.3.57 [DesignHandbook].

EXAMPLES:

```
sage: from sage.combinat.designs.database import QDM_33_6_1_1_1
sage: from sage.combinat.designs.designs_pyx import is_quasi_difference_matrix
sage: G,M = QDM_33_6_1_1_1()
```

(continues on next page)

(continued from previous page)

```
sage: is_quasi_difference_matrix(M,G,6,1,1,1)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.database import QDM_33_6_1_1_1
>>> from sage.combinat.designs.designs_pyx import is_quasi_difference_matrix
>>> G,M = QDM_33_6_1_1_1()
>>> is_quasi_difference_matrix(M,G,Integer(6),Integer(1),Integer(1),Integer(1))
True
```

sage.combinat.designs.database.**QDM_35_7_1_1_7**()

Return a $(35,7;1,1;7)$-quasi-difference matrix.

Used to build an $OA(7,42)$

As explained in the Handbook III.3.63 [DesignHandbook].

EXAMPLES:

```
sage: from sage.combinat.designs.database import QDM_35_7_1_1_7
sage: from sage.combinat.designs.designs_pyx import is_quasi_difference_matrix
sage: G,M = QDM_35_7_1_1_7()
sage: is_quasi_difference_matrix(M,G,7,1,1,7)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.database import QDM_35_7_1_1_7
>>> from sage.combinat.designs.designs_pyx import is_quasi_difference_matrix
>>> G,M = QDM_35_7_1_1_7()
>>> is_quasi_difference_matrix(M,G,Integer(7),Integer(1),Integer(1),Integer(7))
True
```

sage.combinat.designs.database.**QDM_37_6_1_1_1**()

Return a $(37,6;1,1;1)$-quasi-difference matrix.

Used to build an $OA(6,38)$

Given in the Handbook III.3.60 [DesignHandbook].

EXAMPLES:

```
sage: from sage.combinat.designs.database import QDM_37_6_1_1_1
sage: from sage.combinat.designs.designs_pyx import is_quasi_difference_matrix
sage: G,M = QDM_37_6_1_1_1()
sage: is_quasi_difference_matrix(M,G,6,1,1,1)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.database import QDM_37_6_1_1_1
>>> from sage.combinat.designs.designs_pyx import is_quasi_difference_matrix
>>> G,M = QDM_37_6_1_1_1()
>>> is_quasi_difference_matrix(M,G,Integer(6),Integer(1),Integer(1),Integer(1))
True
```

sage.combinat.designs.database.**QDM_45_7_1_1_9**()

Return a $(45, 7; 1, 1; 9)$-quasi-difference matrix.

Used to build an $OA(7, 54)$

As explained in the Handbook III.3.71 [DesignHandbook].

EXAMPLES:

```
sage: from sage.combinat.designs.database import QDM_45_7_1_1_9
sage: from sage.combinat.designs.designs_pyx import is_quasi_difference_matrix
sage: G,M = QDM_45_7_1_1_9()
sage: is_quasi_difference_matrix(M,G,7,1,1,9)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.database import QDM_45_7_1_1_9
>>> from sage.combinat.designs.designs_pyx import is_quasi_difference_matrix
>>> G,M = QDM_45_7_1_1_9()
>>> is_quasi_difference_matrix(M,G,Integer(7),Integer(1),Integer(1),Integer(9))
True
```

sage.combinat.designs.database.**QDM_54_7_1_1_8**()

Return a $(54, 7; 1, 1; 8)$-quasi-difference matrix.

Used to build an $OA(7, 62)$

As explained in the Handbook III.3.74 [DesignHandbook].

EXAMPLES:

```
sage: from sage.combinat.designs.database import QDM_54_7_1_1_8
sage: from sage.combinat.designs.designs_pyx import is_quasi_difference_matrix
sage: G,M = QDM_54_7_1_1_8()
sage: is_quasi_difference_matrix(M,G,7,1,1,8)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.database import QDM_54_7_1_1_8
>>> from sage.combinat.designs.designs_pyx import is_quasi_difference_matrix
>>> G,M = QDM_54_7_1_1_8()
>>> is_quasi_difference_matrix(M,G,Integer(7),Integer(1),Integer(1),Integer(8))
True
```

sage.combinat.designs.database.**QDM_57_9_1_1_8**()

Return a $(57, 9; 1, 1; 8)$-quasi-difference matrix.

Used to build an $OA(9, 65)$

Construction shared by Julian R. Abel

EXAMPLES:

```
sage: from sage.combinat.designs.database import QDM_57_9_1_1_8
sage: from sage.combinat.designs.designs_pyx import is_quasi_difference_matrix
sage: G,M = QDM_57_9_1_1_8()                                                    #␣
↪needs sage.schemes
```

(continues on next page)

(continued from previous page)

```
sage: is_quasi_difference_matrix(M,G,9,1,1,8)                                   #␣
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.database import QDM_57_9_1_1_8
>>> from sage.combinat.designs.designs_pyx import is_quasi_difference_matrix
>>> G,M = QDM_57_9_1_1_8()                                                      #␣
↪needs sage.schemes
>>> is_quasi_difference_matrix(M,G,Integer(9),Integer(1),Integer(1),Integer(8))  ␣
↪                                 # needs sage.schemes
True
```

sage.combinat.designs.database.**RBIBD_120_8_1**()

Return a resolvable $BIBD(120, 8, 1)$.

This function output a list `L` of 17×15 blocks such that `L[i*15:(i+1)*15]` is a partition of 120.

Construction shared by Julian R. Abel:

> Seiden's method: Start with a cyclic $(273, 17, 1) - BIBD$ and let B be an hyperoval, i.e. a set of 18 points which intersects any block of the BIBD in either 0 points (153 blocks) or 2 points (120 blocks). Dualise this design and take these last 120 blocks as points in the design; blocks in the design will correspond to the $273 - 18 = 255$ non-hyperoval points.
>
> The design is also resolvable. In the original $PG(2, 16)$ take any point T in the hyperoval and consider a block $B1$ containing T. The 15 points in $B1$ that do not belong to the hyperoval correspond to 15 blocks forming a parallel class in the dualised design. The other 16 parallel classes come in a similar way, by using point T and the other 16 blocks containing T.

See also

OA_9_120()

EXAMPLES:

```
sage: from sage.combinat.designs.database import RBIBD_120_8_1
sage: from sage.combinat.designs.bibd import is_pairwise_balanced_design
sage: RBIBD = RBIBD_120_8_1()                                                   #␣
↪needs sage.modules
sage: is_pairwise_balanced_design(RBIBD,120,[8])                                #␣
↪needs sage.modules
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.database import RBIBD_120_8_1
>>> from sage.combinat.designs.bibd import is_pairwise_balanced_design
>>> RBIBD = RBIBD_120_8_1()                                                     #␣
↪needs sage.modules
>>> is_pairwise_balanced_design(RBIBD,Integer(120),[Integer(8)])                ␣
↪              # needs sage.modules
True
```

It is indeed resolvable, and the parallel classes are given by 17 slices of consecutive 15 blocks:

```
sage: for i in range(17):                                                    #␣
↪needs sage.modules
....:     assert len(set(sum(RBIBD[i*15:(i+1)*15],[]))) == 120
```

```
>>> from sage.all import *
>>> for i in range(Integer(17)):                                              ␣
↪     # needs sage.modules
...     assert len(set(sum(RBIBD[i*Integer(15):(i+Integer(1))*Integer(15)],[])))␣
↪== Integer(120)
```

The BIBD is available from the constructor:

```
sage: _ = designs.balanced_incomplete_block_design(120,8)                     #␣
↪needs sage.modules
```

```
>>> from sage.all import *
>>> _ = designs.balanced_incomplete_block_design(Integer(120),Integer(8))      ␣
↪              # needs sage.modules
```

sage.combinat.designs.database.**ca_11_2_5_3**()

Return a CA with the given parameters. This CA is proven to be optimal.

Data obtained from https://zenodo.org/records/1476059

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_covering_array
sage: from sage.combinat.designs.database import ca_11_2_5_3
sage: C = ca_11_2_5_3()
sage: is_covering_array(C,2,3)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_covering_array
>>> from sage.combinat.designs.database import ca_11_2_5_3
>>> C = ca_11_2_5_3()
>>> is_covering_array(C,Integer(2),Integer(3))
True
```

sage.combinat.designs.database.**ca_12_2_7_3**()

Return a CA with the given parameters. This CA is proven to be optimal.

Data obtained from https://zenodo.org/records/1476059

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_covering_array
sage: from sage.combinat.designs.database import ca_12_2_7_3
sage: C = ca_12_2_7_3()
sage: is_covering_array(C,2,3)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_covering_array
>>> from sage.combinat.designs.database import ca_12_2_7_3
>>> C = ca_12_2_7_3()
>>> is_covering_array(C,Integer(2),Integer(3))
True
```

sage.combinat.designs.database.**ca_13_2_9_3**()

Return a CA with the given parameters. This CA is proven to be optimal.

Data obtained from https://zenodo.org/records/1476059

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_covering_array
sage: from sage.combinat.designs.database import ca_13_2_9_3
sage: C = ca_13_2_9_3()
sage: is_covering_array(C,2,3)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_covering_array
>>> from sage.combinat.designs.database import ca_13_2_9_3
>>> C = ca_13_2_9_3()
>>> is_covering_array(C,Integer(2),Integer(3))
True
```

sage.combinat.designs.database.**ca_14_2_10_3**()

Return a CA with the given parameters. This CA is proven to be optimal.

Data obtained from https://zenodo.org/records/1476059

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_covering_array
sage: from sage.combinat.designs.database import ca_14_2_10_3
sage: C = ca_14_2_10_3()
sage: is_covering_array(C,2,3)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_covering_array
>>> from sage.combinat.designs.database import ca_14_2_10_3
>>> C = ca_14_2_10_3()
>>> is_covering_array(C,Integer(2),Integer(3))
True
```

sage.combinat.designs.database.**ca_15_2_20_3**()

Return a CA with the given parameters. This CA is proven to be optimal.

Data obtained from [Nur2004]

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_covering_array
sage: from sage.combinat.designs.database import ca_15_2_20_3
sage: C = ca_15_2_20_3()
sage: is_covering_array(C,2,3)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_covering_array
>>> from sage.combinat.designs.database import ca_15_2_20_3
>>> C = ca_15_2_20_3()
>>> is_covering_array(C,Integer(2),Integer(3))
True
```

sage.combinat.designs.database.**ca_19_2_6_4**()

Return a CA with the given parameters. This CA is proven to be optimal.

Data obtained from https://zenodo.org/records/1476059

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_covering_array
sage: from sage.combinat.designs.database import ca_19_2_6_4
sage: C = ca_19_2_6_4()
sage: is_covering_array(C,2,4)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_covering_array
>>> from sage.combinat.designs.database import ca_19_2_6_4
>>> C = ca_19_2_6_4()
>>> is_covering_array(C,Integer(2),Integer(4))
True
```

sage.combinat.designs.database.**ca_21_2_7_4**()

Return a CA with the given parameters. This CA is proven to be optimal. This CA is also uniform.

Data obtained from https://zenodo.org/records/1476059

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_covering_array
sage: from sage.combinat.designs.database import ca_21_2_7_4
sage: C = ca_21_2_7_4()
sage: is_covering_array(C,2,4)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_covering_array
>>> from sage.combinat.designs.database import ca_21_2_7_4
>>> C = ca_21_2_7_4()
>>> is_covering_array(C,Integer(2),Integer(4))
True
```

sage.combinat.designs.database.**ca_29_2_7_5**()

Return a CA with the given parameters. This CA is proven to be optimal.

Data obtained from https://zenodo.org/records/1476059

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_covering_array
sage: from sage.combinat.designs.database import ca_29_2_7_5
sage: C = ca_29_2_7_5()
sage: is_covering_array(C,2,5)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_covering_array
>>> from sage.combinat.designs.database import ca_29_2_7_5
>>> C = ca_29_2_7_5()
>>> is_covering_array(C,Integer(2),Integer(5))
True
```

sage.combinat.designs.database.**ca_37_2_4_6**()

Return a CA with the given parameters. This CA is proven to be optimal.

Data obtained from https://zenodo.org/records/1476059

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_covering_array
sage: from sage.combinat.designs.database import ca_37_2_4_6
sage: C = ca_37_2_4_6()
sage: is_covering_array(C,2,6)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_covering_array
>>> from sage.combinat.designs.database import ca_37_2_4_6
>>> C = ca_37_2_4_6()
>>> is_covering_array(C,Integer(2),Integer(6))
True
```

sage.combinat.designs.database.**ca_39_2_5_6**()

Return a CA with the given parameters. This CA is proven to be optimal.

Data obtained from https://zenodo.org/records/1476059

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_covering_array
sage: from sage.combinat.designs.database import ca_39_2_5_6
sage: C = ca_39_2_5_6()
sage: is_covering_array(C,2,6)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_covering_array
```

(continues on next page)

(continued from previous page)

```
>>> from sage.combinat.designs.database import ca_39_2_5_6
>>> C = ca_39_2_5_6()
>>> is_covering_array(C,Integer(2),Integer(6))
True
```

sage.combinat.designs.database.**ca_41_2_6_6**()

Return a CA with the given parameters. This CA is proven to be optimal. This CA is also uniform.

Data obtained from https://zenodo.org/records/1476059

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_covering_array
sage: from sage.combinat.designs.database import ca_41_2_6_6
sage: C = ca_41_2_6_6()
sage: is_covering_array(C,2,6)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_covering_array
>>> from sage.combinat.designs.database import ca_41_2_6_6
>>> C = ca_41_2_6_6()
>>> is_covering_array(C,Integer(2),Integer(6))
True
```

sage.combinat.designs.database.**cyclic_shift**(l, i)

sage.combinat.designs.database.**f**()

Return a $(57, 9; 1, 1; 8)$-quasi-difference matrix.

Used to build an $OA(9, 65)$

Construction shared by Julian R. Abel

EXAMPLES:

```
sage: from sage.combinat.designs.database import QDM_57_9_1_1_8
sage: from sage.combinat.designs.designs_pyx import is_quasi_difference_matrix
sage: G,M = QDM_57_9_1_1_8()                                                    #␣
↪needs sage.schemes
sage: is_quasi_difference_matrix(M,G,9,1,1,8)                                   #␣
↪needs sage.schemes
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.database import QDM_57_9_1_1_8
>>> from sage.combinat.designs.designs_pyx import is_quasi_difference_matrix
>>> G,M = QDM_57_9_1_1_8()                                                  #␣
↪needs sage.schemes
>>> is_quasi_difference_matrix(M,G,Integer(9),Integer(1),Integer(1),Integer(8))  ␣
↪                                 # needs sage.schemes
True
```

5.1.82 Catalog of designs

This module gathers all designs that can be reached through `designs.<tab>`. Example with the Witt design on 24 points:

```
sage: designs.WittDesign(24)                          # optional - gap_package_
↪design
Incidence structure with 24 points and 759 blocks
```

```
>>> from sage.all import *
>>> designs.WittDesign(Integer(24))                          # optional - gap_
↪package_design
Incidence structure with 24 points and 759 blocks
```

Or a Steiner Triple System on 19 points:

```
sage: designs.steiner_triple_system(19)
(19,3,1)-Balanced Incomplete Block Design
```

```
>>> from sage.all import *
>>> designs.steiner_triple_system(Integer(19))
(19,3,1)-Balanced Incomplete Block Design
```

La Jolla Covering Repository

The La Jolla Covering Repository (LJCR, see[1]) is an online database of covering designs. As it is frequently updated, it is not included in Sage, but one can query it through *designs.best_known_covering_design_from_LJCR*:

```
sage: C = designs.best_known_covering_design_from_LJCR(7, 3, 2)    # optional -␣
↪internet
sage: C                               # optional - internet
(7, 3, 2)-covering design of size 7
Lower bound: 7
Method: lex covering
Submitted on: 1996-12-01 00:00:00
sage: C.incidence_structure()         # optional - internet
Incidence structure with 7 points and 7 blocks
```

```
>>> from sage.all import *
>>> C = designs.best_known_covering_design_from_LJCR(Integer(7), Integer(3),␣
↪Integer(2))    # optional - internet
>>> C                               # optional - internet
(7, 3, 2)-covering design of size 7
Lower bound: 7
Method: lex covering
Submitted on: 1996-12-01 00:00:00
>>> C.incidence_structure()         # optional - internet
Incidence structure with 7 points and 7 blocks
```

Design constructors

This module gathers the following designs:

[1] La Jolla Covering Repository, https://dmgordon.org/cover

ProjectiveGeometryDesign()
DesarguesianProjectivePlaneDesign()
HughesPlane()
HigmanSimsDesign()
balanced_incomplete_block_design()
resolvable_balanced_incomplete_block_design()
kirkman_triple_system()
AffineGeometryDesign()
CremonaRichmondConfiguration()
WittDesign()
HadamardDesign()
Hadamard3Design()
mutually_orthogonal_latin_squares()
transversal_design()
orthogonal_array()
incomplete_orthogonal_array()
difference_family()
difference_matrix()
steiner_triple_system()
steiner_quadruple_system()
projective_plane()
`biplane()`
gen_quadrangles_with_spread()

And the *designs.best_known_covering_design_from_LJCR* function which queries the LJCR.

Todo

Implement DerivedDesign and ComplementaryDesign.

REFERENCES:

5.1.83 Cython functions for combinatorial designs

This module implements the design methods that need to be somewhat efficient.

Functions

`sage.combinat.designs.designs_pyx.`**`is_covering_array`**(*array*, *strength=None*, *levels=None*, *verbose=False*, *parameters=False*)

Check if the input is a covering array with given strength.

See *sage.combinat.designs.covering_array* for a definition.

INPUT:

- `array` – the Covering Array to be tested
- `strength` – integer; the parameter t of the covering array, such that in any selection of t columns of the array, every t -tuple appears at least once. If set to None then all t > 0 are tested to and the maximal strength is used.
- `levels` – the number of symbols that appear in `array` If set to None, then each unique entry in `array` is counted

- `verbose` – boolean; whether to display some information about the covering array
- `parameters` – boolean; whether to return the parameters of the Covering Array. If set to `True`, the function returns a pair `(boolean_answer,(N,t,k,v))`.

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_covering_array
sage: C = [[1, 1, 1, 0],
....:      [1, 1, 0, 0],
....:      [0, 0, 0]]
sage: is_covering_array(C)
Traceback (most recent call last):
...
ValueError: Not all rows are the same length, row 2 is not the same length as row␣
↪0

sage: C = [[0, 1, 1],
....:      [1, 1, 0],
....:      [1, 0, 1],
....:      [0, 0, 0,]]
sage: is_covering_array(C,strength=4)
Traceback (most recent call last):
...
ValueError: Strength must be equal or less than number of columns

sage: C = [[0, 1, 1],
....:      [1, 1, 1],
....:      [1, 0, 1]]
sage: is_covering_array(C,verbose=True)
A 3 by 3 Covering Array with strength 0 with entries from a symbol set of size 2
True

sage: C = [[0, 0, 0, 0, 0, 0, 0, 0, 0, 0],
....:      [0, 0, 0, 0, 1, 1, 1, 1, 1, 1],
....:      [0, 1, 1, 1, 0, 0, 0, 1, 1, 1],
....:      [1, 0, 1, 1, 0, 1, 1, 0, 0, 1],
....:      [1, 1, 0, 1, 1, 0, 1, 0, 1, 0],
....:      [1, 1, 1, 0, 1, 1, 0, 1, 2, 0]]
sage: is_covering_array(C,levels=2)
Traceback (most recent call last):
...
ValueError: Array should contain integer symbols from 0 to 1

sage: C = [[1, 0, 0, 2, 0, 2, 1, 2, 2, 1, 0, 2, 2],

sage.combinat.designs.designs_pyx.**is_difference_matrix**(*M*, *G*, *k*, *lmbda=1*, *verbose=False*)

Test if M is a (G, k, λ)-difference matrix.

A matrix M is a (G, k, λ)-difference matrix if its entries are element of G, and if for any two rows R, R' of M and $x \in G$ there are exactly λ values i such that $R_i - R'_i = x$.

INPUT:

- `M` – a matrix with entries from `G`
- `G` – a group
- `k` – integer
- `lmbda` – integer (default: 1)
- `verbose` – boolean; whether to print some information when the answer is `False`

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_difference_matrix
sage: q = 3**3
sage: F = GF(q,'x')                                                          #␣
↪needs sage.rings.finite_rings
sage: M = [[x*y for y in F] for x in F]                                      #␣
↪needs sage.rings.finite_rings
sage: is_difference_matrix(M,F,q,verbose=1)                                  #␣
↪needs sage.rings.finite_rings
True

sage: B = [[0, 0, 0, 0, 0, 0, 0, 0, 0, 0],
....:       [0, 1, 2, 3, 4, 2, 3, 4, 0, 1],
....:       [0, 2, 4, 1, 3, 3, 0, 2, 4, 1]]
sage: G = GF(5)
```

(continues on next page)

(continued from previous page)

```
sage: B = [[G(b) for b in R] for R in B]
sage: is_difference_matrix(list(zip(*B)),G,3,2)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_difference_matrix
>>> q = Integer(3)**Integer(3)
>>> F = GF(q,'x')                                                          #␣
↪needs sage.rings.finite_rings
>>> M = [[x*y for y in F] for x in F]                                      #␣
↪needs sage.rings.finite_rings
>>> is_difference_matrix(M,F,q,verbose=Integer(1))                          ␣
↪     # needs sage.rings.finite_rings
True

>>> B = [[Integer(0), Integer(0), Integer(0), Integer(0), Integer(0), Integer(0),␣

>>> G = GF(Integer(5))
>>> B = [[G(b) for b in R] for R in B]
>>> is_difference_matrix(list(zip(*B)),G,Integer(3),Integer(2))
True
```

Bad input:

```
sage: # needs sage.rings.finite_rings
sage: for R in M: R.append(None)
sage: is_difference_matrix(M,F,q,verbose=1)
The matrix has 28 columns but k=27
False
sage: for R in M: _=R.pop(-1)
sage: M.append([None]*3**3)
sage: is_difference_matrix(M,F,q,verbose=1)
The matrix has 28 rows instead of lambda(|G|-1+2u)+mu=1(27-1+2.0)+1=27
False
sage: _= M.pop(-1)
sage: for R in M: R[-1] = 0
sage: is_difference_matrix(M,F,q,verbose=1)
Columns 0 and 26 generate 0 exactly 27 times instead of the expected mu(=1)
False
sage: for R in M: R[-1] = 1
sage: M[-1][-1] = 0
sage: is_difference_matrix(M,F,q,verbose=1)
Columns 0 and 26 do not generate all elements of G exactly lambda(=1) times.
The element x appeared 0 times as a difference.
False
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
```

(continues on next page)

(continued from previous page)

```
>>> for R in M: R.append(None)
>>> is_difference_matrix(M,F,q,verbose=Integer(1))
The matrix has 28 columns but k=27
False
>>> for R in M: _=R.pop(-Integer(1))
>>> M.append([None]*Integer(3)**Integer(3))
>>> is_difference_matrix(M,F,q,verbose=Integer(1))
The matrix has 28 rows instead of lambda(|G|-1+2u)+mu=1(27-1+2.0)+1=27
False
>>> _= M.pop(-Integer(1))
>>> for R in M: R[-Integer(1)] = Integer(0)
>>> is_difference_matrix(M,F,q,verbose=Integer(1))
Columns 0 and 26 generate 0 exactly 27 times instead of the expected mu(=1)
False
>>> for R in M: R[-Integer(1)] = Integer(1)
>>> M[-Integer(1)][-Integer(1)] = Integer(0)
>>> is_difference_matrix(M,F,q,verbose=Integer(1))
Columns 0 and 26 do not generate all elements of G exactly lambda(=1) times.
The element x appeared 0 times as a difference.
False
```

sage.combinat.designs.designs_pyx.**is_group_divisible_design**(*groups*, *blocks*, *v*, *G=None*, *K=None*, *lambd=1*, *verbose=False*)

Check that input is a Group Divisible Design on $\{0, \ldots, v-1\}$.

For more information on Group Divisible Designs, see `GroupDivisibleDesign`.

INPUT:

- `groups` – a partition of X. If set to `None` the groups are guessed automatically, and the function returns `(True, guessed_groups)` instead of `True`
- `blocks` – collection of blocks
- `v` – integers; size of the ground set assumed to be $X = \{0, ..., v-1\}$
- `G` – list of integers of which the sizes of the groups must be elements. Set to `None` (automatic guess) by default
- `K` – list of integers of which the sizes of the blocks must be elements. Set to `None` (automatic guess) by default
- `lambd` – value of λ. Set to 1 by default
- `verbose` – boolean; whether to display some information when the design is not a GDD

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_group_divisible_design
sage: TD = designs.transversal_design(4,10)                                    #␣
↪needs sage.modules
sage: groups = [list(range(i*10,(i+1)*10)) for i in range(4)]
sage: is_group_divisible_design(groups,TD,40,lambd=1)                          #␣
↪needs sage.modules
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_group_divisible_design
>>> TD = designs.transversal_design(Integer(4),Integer(10))                    ␣
```

(continues on next page)

(continued from previous page)

```
↪                # needs sage.modules
>>> groups = [list(range(i*Integer(10),(i+Integer(1))*Integer(10))) for i in␣
↪range(Integer(4))]
>>> is_group_divisible_design(groups,TD,Integer(40),lambd=Integer(1))                ␣
↪                # needs sage.modules
True
```

sage.combinat.designs.designs_pyx.**is_orthogonal_array**(*OA*, *k*, *n*, *t=2*, *verbose=False*, *terminology='OA'*)

Check that the integer matrix OA is an $OA(k, n, t)$.

See `orthogonal_array()` for a definition.

INPUT:

- `OA` – the Orthogonal Array to be tested
- `k`, `n`, `t` – integers; only implemented for $t = 2$
- `verbose` – boolean; whether to display some information when `OA` is not an orthogonal array $OA(k, n)$
- `terminology` – string; how to phrase the information when `verbose = True`. Possible values are "OA", "$MOLS$"

EXAMPLES:

```
sage: # needs sage.schemes
sage: from sage.combinat.designs.designs_pyx import is_orthogonal_array
sage: OA = designs.orthogonal_arrays.build(8,9)
sage: is_orthogonal_array(OA,8,9)
True
sage: is_orthogonal_array(OA,8,10)
False
sage: OA[4][3] = 1
sage: is_orthogonal_array(OA,8,9)
False
sage: is_orthogonal_array(OA,8,9,verbose=True)
Columns 0 and 3 are not orthogonal
False
sage: is_orthogonal_array(OA,8,9, verbose=True, terminology='MOLS')
Squares 0 and 3 are not orthogonal
False
```

```
>>> from sage.all import *
>>> # needs sage.schemes
>>> from sage.combinat.designs.designs_pyx import is_orthogonal_array
>>> OA = designs.orthogonal_arrays.build(Integer(8),Integer(9))
>>> is_orthogonal_array(OA,Integer(8),Integer(9))
True
>>> is_orthogonal_array(OA,Integer(8),Integer(10))
False
>>> OA[Integer(4)][Integer(3)] = Integer(1)
>>> is_orthogonal_array(OA,Integer(8),Integer(9))
False
>>> is_orthogonal_array(OA,Integer(8),Integer(9),verbose=True)
```

(continues on next page)

(continued from previous page)

```
Columns 0 and 3 are not orthogonal
False
>>> is_orthogonal_array(OA,Integer(8),Integer(9), verbose=True, terminology='MOLS
↪')
Squares 0 and 3 are not orthogonal
False
```

sage.combinat.designs.designs_pyx.**is_pairwise_balanced_design**(*blocks*, *v*, *K=None*, *lambd=1*, *verbose=False*)

Check that input is a Pairwise Balanced Design (PBD) on $\{0, \dots, v-1\}$.

For more information on Pairwise Balanced Designs (PBD), see `PairwiseBalancedDesign`.

INPUT:

- `blocks` – collection of blocks
- `v` – integers; size of the ground set assumed to be $X = \{0, ..., v-1\}$
- `K` – list of integers of which the sizes of the blocks must be elements; set to `None` (automatic guess) by default
- `lambd` – value of λ (default: 1)
- `verbose` – boolean; whether to display some information when the design is not a PBD

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_pairwise_balanced_design
sage: sts = designs.steiner_triple_system(9)
sage: is_pairwise_balanced_design(sts,9,[3],1)
True
sage: TD = designs.transversal_design(4,10).blocks()                       #␣
↪needs sage.modules
sage: groups = [list(range(i*10,(i+1)*10)) for i in range(4)]
sage: is_pairwise_balanced_design(TD + groups, 40, [4,10], 1, verbose=True)     #␣
↪needs sage.modules
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.designs_pyx import is_pairwise_balanced_design
>>> sts = designs.steiner_triple_system(Integer(9))
>>> is_pairwise_balanced_design(sts,Integer(9),[Integer(3)],Integer(1))
True
>>> TD = designs.transversal_design(Integer(4),Integer(10)).blocks()          ␣
↪              # needs sage.modules
>>> groups = [list(range(i*Integer(10),(i+Integer(1))*Integer(10))) for i in␣
↪range(Integer(4))]
>>> is_pairwise_balanced_design(TD + groups, Integer(40), [Integer(4),
↪Integer(10)], Integer(1), verbose=True)      # needs sage.modules
True
```

sage.combinat.designs.designs_pyx.**is_projective_plane**(*blocks*, *verbose=False*)

Test whether the blocks form a projective plane on $\{0, ..., v-1\}$.

A *projective plane* is an incidence structure that has the following properties:

1. Given any two distinct points, there is exactly one line incident with both of them.

2. Given any two distinct lines, there is exactly one point incident with both of them.
3. There are four points such that no line is incident with more than two of them.

For more informations, see Wikipedia article Projective_plane.

`is_t_design()` can also check if an incidence structure is a projective plane with the parameters $v = k^2 + k + 1$, $t = 2$ and $l = 1$.

INPUT:

- `blocks` – collection of blocks
- `verbose` – whether to print additional information

EXAMPLES:

```
sage: from sage.combinat.designs.designs_pyx import is_projective_plane
sage: p = designs.projective_plane(4)                                    #␣
↪needs sage.schemes
sage: b = p.blocks()                                                     #␣
↪needs sage.schemes
sage: is_projective_plane(b, verbose=True)                               #␣
↪needs sage.schemes
True

sage: # needs sage.schemes

>>> is_projective_plane([[Integer(1)]], verbose=True)
First block has less than 3 points.
False

>>> # needs sage.schemes
>>> p = designs.projective_plane(Integer(2))
>>> b = p.blocks()
>>> b[Integer(2)].append(Integer(4))
>>> is_projective_plane(b, verbose=True)
a block has size 4 while K=[3]
False
```

sage.combinat.designs.designs_pyx.**is_quasi_difference_matrix**(*M*, *G*, *k*, *lmbda*, *mu*, *u*, *verbose=False*)

Test if the matrix is a $(G, k; \lambda, \mu; u)$-quasi-difference matrix.

Let G be an abelian group of order n. A $(n, k; \lambda, \mu; u)$-quasi-difference matrix (QDM) is a matrix Q_{ij} with $\lambda(n-1+2u)+\mu$ rows and k columns, with each entry either equal to `None` (i.e. the 'missing entries') or to an element of G. Each column contains exactly λu empty entries, and each row contains at most one `None`. Furthermore, for each $1 \leq i < j \leq k$, the multiset

$$\{q_{li} - q_{lj} : 1 \leq l \leq \lambda(n-1+2u)+\mu, \text{ with } q_{li} \text{ and } q_{lj} \text{ not empty}\}$$

contains λ times every nonzero element of G and contains μ times 0.

INPUT:

- `M` – a matrix with entries from `G` (or equal to `None` for missing entries)
- `G` – a group
- `k`, `lmbda`, `mu`, `u` – integers
- `verbose` – boolean; whether to print some information when the answer is `False`

EXAMPLES:

Differences matrices:

```
sage: from sage.combinat.designs.designs_pyx import is_quasi_difference_matrix
sage: q = 3**3
sage: F = GF(q,'x')                                                     #␣
↪needs sage.rings.finite_rings

5.1.84 Difference families

This module gathers everything related to difference families. One can build a difference family (or check that it can be built) with *difference_family()*:

```
sage: G,F = designs.difference_family(13,4,1)                              #␣
↪needs sage.libs.pari sage.modules
```

```
>>> from sage.all import *
>>> G,F = designs.difference_family(Integer(13),Integer(4),Integer(1))
↪                        # needs sage.libs.pari sage.modules
```

It defines the following functions:

are_complementary_difference_sets()	Check if `A` and `B` are complementary difference sets over the group `G`.
are_hadamard_difference_set_parameters()	Check whether `(v,k,lmbda)` is of the form `(4N^2, 2N^2 - N, N^2 - N)`.
are_mcfarland_1973_parameters()	Test whether `(v,k,lmbda)` is a triple that can be obtained from the construction from [McF1973].
block_stabilizer()	Compute the left stabilizer of the block `B` under the action of `G`.
complementary_difference_sets()	Compute complementary difference sets over a group of order $n = 2m + 1$.
complementary_difference_setsI()	Construct complementary difference sets in a group of order $n \cong 3 \mod 4$, n a prime power.
complementary_difference_setsII()	Construct complementary difference sets in a group of order $n = p^t$, where $p \cong 5 \mod 8$ and $t \cong 1, 2, 3 \mod 4$.
complementary_difference_setsIII()	Construct complementary difference sets in a group of order $n = 2m + 1$, where $4m + 3$ is a prime power.
df_q_6_1()	Return a $(q, 6, 1)$-difference family over the finite field K.
difference_family()	Return a (`k`, `l`)-difference family on an Abelian group of cardinality `v`.
get_fixed_relative_difference_set()	Construct an equivalent relative difference set fixed by the size of the set.
group_law()	Return a triple `(identity, operation, inverse)` that define the operations on the group `G`.
hadamard_difference_set_product()	Make a product of two Hadamard difference sets.
is_difference_family()	Check whether `D` forms a difference family in the group `G`.
is_fixed_relative_difference_set()	Check if the relative difference set `R` is fixed by `q`.
is_relative_difference_set()	Check if `R` is a difference set of `G` relative to `H`, with the given parameters.
is_supplementary_difference_set()	Check that the sets in `Ks` are $n - \{v; k_1, ..., k_n; \lambda\}$ supplementary difference sets over group `G` of order `v`.
mcfarland_1973_construction()	Return a difference set.
one_cyclic_tiling()	Given a subset `A` of the cyclic additive group $G = Z/nZ$ return another subset B so that $A + B = G$ and $\|A\|\|B\| = n$ (i.e. any element of G is uniquely expressed as a sum $a + b$ with a in A and b in B).
one_radical_difference_family()	Search for a radical difference family on `K` using dancing links algorithm.
radical_difference_family()	Return a `(v,k,l)`-radical difference family.
radical_difference_set()	Return a difference set made of a cyclotomic coset in the finite field `K` and with parameters `k` and `l`.
relative_difference_set_from_homomorphism()	Construct $R((q^N - 1)/(q - 1), n, q^{N-1}, q^{N-2}d)$ where $nd = q - 1$.

continues on next page

Table 1 – continued from previous page

relative_difference_set_from_m_sequence()	Construct $R((q^N-1)/(q-1), q-1, q^{N-1}, q^{N-2})$ where q is a prime power and $N \geq 2$.
singer_difference_set()	Return a difference set associated to the set of hyperplanes in a projective space of dimension d over $GF(q)$.
skew_spin_goethals_seidel_difference_family()	Construct skew spin type Goethals-Seidel difference family with parameters $(n; k_1, k_2, k_3, k_4; \lambda)$.
skew_supplementary_difference_set()	Construct $4-\{n; n_1, n_2, n_3, n_4; \lambda\}$ supplementary difference sets, where S_1 is skew and $n_1+n_2+n_3+n_4 = n+\lambda$.
skew_supplementary_difference_set_over_polynomial_ring()	Construct skew supplementary difference sets over a polynomial ring of order n.
skew_supplementary_difference_set_with_paley_todd()	Construct $4-\{n; n_1, n_2, n_3, n_4; \lambda\}$ skew supplementary difference sets where S_1 is the Paley-Todd difference set.
spin_goethals_seidel_difference_family()	Construct a spin type Goethals-Seidel difference family with parameters $(n; k_1, k_2, k_3, k_4; \lambda)$.
supplementary_difference_set()	Construct $4-\{2v; v, v+1, v, v; 2v\}$ supplementary difference sets where $q = 2v+1$.
supplementary_difference_set_from_rel_diff_se	Construct $4-\{2v; v, v+1, v, v; 2v\}$ supplementary difference sets where $q = 2v+1$.
supplementary_difference_set_hadamard()	Construct $4-\{n; n_1, n_2, n_3, n_4; \lambda\}$ supplementary difference sets, where $n_1 + n_2 + n_3 + n_4 = n+\lambda$.
turyn_1965_3x3xK()	Return a difference set in either $C_3 \times C_3 \times C_4$ or $C_3 \times C_3 \times C_2 \times C_2$ with parameters $v = 36$, $k = 15$, $\lambda = 6$.
twin_prime_powers_difference_set()	Return a difference set on $GF(p) \times GF(p+2)$.

Functions

sage.combinat.designs.difference_family.**are_complementary_difference_sets**(*G*, *A*, *B*, *verbose=False*)

Check if A and B are complementary difference sets over the group G.

According to [Sze1971], two sets A, B of size m are complementary difference sets over a group G of size $2m+1$ if:

1. they are $2-\{2m+1; m, m; m-1\}$ supplementary difference sets
2. A is skew, i.e. $a \in A$ implies $-a \notin A$

INPUT:

- G – a group of odd order
- A – set of elements of G
- B – set of elements of G
- verbose – boolean (default: False); if True the function will be verbose when the sets do not satisfy the constraints

EXAMPLES:

```
sage: from sage.combinat.designs.difference_family import are_complementary_
↪difference_sets
sage: are_complementary_difference_sets(Zmod(7), [1, 2, 4], [1, 2, 4])
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.difference_family import are_complementary_
↪difference_sets
>>> are_complementary_difference_sets(Zmod(Integer(7)), [Integer(1), Integer(2),␣
↪Integer(4)], [Integer(1), Integer(2), Integer(4)])
True
```

If `verbose=True`, the function will be verbose:

```
sage: are_complementary_difference_sets(Zmod(7), [1, 2, 5], [1, 2, 4],␣
↪verbose=True)
The sets are not supplementary difference sets with lambda = 2
False
```

```
>>> from sage.all import *
>>> are_complementary_difference_sets(Zmod(Integer(7)), [Integer(1), Integer(2),␣
↪Integer(5)], [Integer(1), Integer(2), Integer(4)], verbose=True)
The sets are not supplementary difference sets with lambda = 2
False
```

is_supplementary_difference_set()

sage.combinat.designs.difference_family.**are_hadamard_difference_set_parameters**(*v*, *k*, *lmbda*)

Check whether `(v,k,lmbda)` is of the form `(4N^2, 2N^2 - N, N^2 - N)`.

INPUT:

- `(v, k, lmbda)` – parameters of a difference set

EXAMPLES:

```
sage: from sage.combinat.designs.difference_family import are_hadamard_difference_
↪set_parameters
sage: are_hadamard_difference_set_parameters(36, 15, 6)
True
sage: are_hadamard_difference_set_parameters(60, 13, 5)
False
```

```

(continued from previous page)

```
>>> are_hadamard_difference_set_parameters(Integer(60), Integer(13), Integer(5))
False
```

sage.combinat.designs.difference_family.**are_mcfarland_1973_parameters**(*v*, *k*, *lmbda*, *return_parameters=False*)

Test whether (v,k,lmbda) is a triple that can be obtained from the construction from [McF1973].

See *mcfarland_1973_construction()*.

INPUT:

- v, k, lmbda – integers; parameters of the difference family
- return_parameters – boolean (default: False); if True, return a pair (True, (q, s)) so that (q,s) can be used in the function *mcfarland_1973_construction()* to actually build a (v,k, lmbda)-difference family. Or (False, None) if the construction is not possible

EXAMPLES:

`sage.combinat.designs.difference_family.`**`block_stabilizer`**`(`G, B`)`

Compute the left stabilizer of the block `B` under the action of `G`.

This function return the list of all $x \in G$ such that $x \cdot B = B$ (as a set).

INPUT:

- `G` – a group (additive or multiplicative)
- `B` – a subset of `G`

EXAMPLES:

```
sage: from sage.combinat.designs.difference_family import block_stabilizer

sage: Z8 = Zmod(8)
sage: block_stabilizer(Z8, [Z8(0),Z8(2),Z8(4),Z8(6)])
[0, 2, 4, 6]
sage: block_stabilizer(Z8, [Z8(0),Z8(2)])
[0]
```

(continues on next page)

(continued from previous page)

```
sage: C = cartesian_product([Zmod(4),Zmod(3)])
sage: block_stabilizer(C, [C((0,0)),C((2,0)),C((0,1)),C((2,1))])
[(0, 0), (2, 0)]

sage: b = list(map(Zmod(45),[1, 3, 7, 10, 22, 25, 30, 35, 37, 38, 44]))
sage: block_stabilizer(Zmod(45),b)
[0]
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.difference_family import block_stabilizer

>>> Z8 = Zmod(Integer(8))
>>> block_stabilizer(Z8, [Z8(Integer(0)),Z8(Integer(2)),Z8(Integer(4)),
↪Z8(Integer(6))])
[0, 2, 4, 6]
>>> block_stabilizer(Z8, [Z8(Integer(0)),Z8(Integer(2))])
[0]

>>> C = cartesian_product([Zmod(Integer(4)),Zmod(Integer(3))])
>>> block_stabilizer(C, [C((Integer(0),Integer(0))),C((Integer(2),Integer(0))),
↪C((Integer(0),Integer(1))),C((Integer(2),Integer(1)))])
[(0, 0), (2, 0)]

>>> b = list(map(Zmod(Integer(45)),[Integer(1), Integer(3), Integer(7),
↪Integer(10), Integer(22), Integer(25), Integer(30), Integer(35), Integer(37),
↪Integer(38), Integer(44)]))
>>> block_stabilizer(Zmod(Integer(45)),b)
[0]
```

sage.combinat.designs.difference_family.**complementary_difference_sets**(*n*, *existence=False*, *check=True*)

Compute complementary difference sets over a group of order $n = 2m + 1$.

According to [Sze1971], two sets A, B of size m are complementary difference sets over a group G of size $n = 2m + 1$ if:

1. they are $2 - \{2m + 1; m, m; m - 1\}$ supplementary difference sets
2. A is skew, i.e. $a \in A$ implies $-a \notin A$

This method tries to call `complementary_difference_setsI()`, `complementary_difference_setsII()` or `complementary_difference_setsIII()` if the parameter n satisfies the requirements of one of these functions.

INPUT:

- `n` – integer; the order of the group over which the sets are constructed
- `existence` – boolean (default: `False`); if `True`, only check whether the supplementary difference sets can be constructed
- `check` – boolean (default: `True`); if `True`, check that the sets are complementary difference sets before returning them; setting this to `False` might speed up the computation for large values of `n`

OUTPUT:

If `existence=False`, the function returns group `G` and two complementary difference sets, or raises an error if data for the given `n` is not available. If `existence=True`, the function returns a boolean representing whether complementary difference sets can be constructed for the given `n`.

EXAMPLES:

```
sage: from sage.combinat.designs.difference_family import complementary_
↪difference_sets
sage: complementary_difference_sets(15)                                          #␣
↪needs sage.libs.pari
(Ring of integers modulo 15, [1, 2, 4, 6, 7, 10, 12], [0, 1, 2, 6, 9, 13, 14])
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.difference_family import complementary_difference_
↪sets
>>> complementary_difference_sets(Integer(15))                                     ␣
↪     # needs sage.libs.pari
(Ring of integers modulo 15, [1, 2, 4, 6, 7, 10, 12], [0, 1, 2, 6, 9, 13, 14])
```

If `existence=True`, the function returns a boolean:

```
sage: complementary_difference_sets(15, existence=True)                          #␣
↪needs sage.libs.pari
True
sage: complementary_difference_sets(16, existence=True)
False
```

```
>>> from sage.all import *
>>> complementary_difference_sets(Integer(15), existence=True)                     ␣
↪     # needs sage.libs.pari
True
>>> complementary_difference_sets(Integer(16), existence=True)
False
```

See also

are_complementary_difference_sets()

`sage.combinat.designs.difference_family.`**`complementary_difference_setsI`**`(`*n*, *check=True*`)`

Construct complementary difference sets in a group of order $n \cong 3 \mod 4$, n a prime power.

Let G be a Galois Field of order n, where n satisfies the requirements above. Let A be the set of nonzero quadratic elements in G, and $B = A$. Then A and B are complementary difference sets over a group of order n. This construction is described in [Sze1971].

INPUT:

- `n` – integer; the order of the group G
- `check` – boolean (default: `True`); if `True`, check that the sets are complementary difference sets before returning them

OUTPUT:

The function returns the Galois field of order `n` and the two sets, or raises an error if `n` does not satisfy the requirements of this construction.

EXAMPLES:

```
sage: from sage.combinat.designs.difference_family import complementary_
↪difference_setsI
sage: complementary_difference_setsI(19)
(Finite Field of size 19,
 [1, 4, 5, 6, 7, 9, 11, 16, 17],
 [1, 4, 5, 6, 7, 9, 11, 16, 17])
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.difference_family import complementary_difference_
↪setsI
>>> complementary_difference_setsI(Integer(19))
(Finite Field of size 19,
 [1, 4, 5, 6, 7, 9, 11, 16, 17],
 [1, 4, 5, 6, 7, 9, 11, 16, 17])
```

are_complementary_difference_sets() *complementary_difference_sets()*

sage.combinat.designs.difference_family.**complementary_difference_setsII**(*n*, *check=True*)

Construct complementary difference sets in a group of order $n = p^t$, where $p \cong 5 \mod 8$ and $t \cong 1, 2, 3 \mod 4$.

Consider a finite field G of order n and let ρ be the generator of the corresponding multiplicative group. Then, there are two different constructions, depending on whether t is even or odd.

If $t \cong 2 \mod 4$, let C_0 be the set of nonzero octic residues in G, and let $C_i = \rho^i C_0$ for $1 \leq i \leq 7$. Then, $A = C_0 \cup C_1 \cup C_2 \cup C_3$ and $B = C_0 \cup C_1 \cup C_6 \cup C_7$.

If t is odd, let C_0 be the set of nonzero fourth powers in G, and let $C_i = \rho^i C_0$ for $1 \leq i \leq 3$. Then, $A = C_0 \cup C_1$ and $B = C_0 \cup C_3$.

For more details on this construction, see [Sze1971].

INPUT:

- `n` – integer; the order of the group G
- `check` – boolean (default: `True`); if `True`, check that the sets are complementary difference sets before returning them; setting this to `False` might speed up the computation for large values of `n`

OUTPUT:

The function returns the Galois field of order `n` and the two sets, or raises an error if `n` does not satisfy the requirements of this construction.

EXAMPLES:

```
sage: from sage.combinat.designs.difference_family import complementary_
↪difference_setsII
sage: complementary_difference_setsII(5)                                    #␣
↪needs sage.libs.pari
(Finite Field of size 5, [1, 2], [1, 3])
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.difference_family import complementary_difference_
↪setsII
>>> complementary_difference_setsII(Integer(5))                                  ␣
↪     # needs sage.libs.pari
(Finite Field of size 5, [1, 2], [1, 3])
```

are_complementary_difference_sets() complementary_difference_sets()

`sage.combinat.designs.difference_family.`**`complementary_difference_setsIII`**(*n*, *check=True*)

Construct complementary difference sets in a group of order $n = 2m + 1$, where $4m + 3$ is a prime power.

Consider a finite field G of order n and let ρ be a primite element of this group. Now let Q be the set of nonzero quadratic residues in G, and let $A = \{a|\rho^{2a} - 1 \in Q\}$, $B' = \{b| - (\rho^{2b} + 1) \in Q\}$. Then A and $B = Q \setminus B'$ are complementary difference sets over the ring of integers modulo n. For more details, see [Sz1969].

INPUT:

- `n` – integer; the order of the group over which the sets are constructed
- `check` – boolean (default: `True`); if `True`, check that the sets are complementary difference sets before returning them; setting this to `False` might speed up the computation for large values of `n`

OUTPUT:

The function returns the Galois field of order `n` and the two sets, or raises an error if `n` does not satisfy the requirements of this construction.

EXAMPLES:

```
sage: from sage.combinat.designs.difference_family import complementary_
↪difference_setsIII
sage: complementary_difference_setsIII(11)                                      #␣
↪needs sage.libs.pari
(Ring of integers modulo 11, [1, 2, 5, 7, 8], [0, 1, 3, 8, 10])
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.difference_family import complementary_difference_
↪setsIII
>>> complementary_difference_setsIII(Integer(11))                                ␣
↪     # needs sage.libs.pari
(Ring of integers modulo 11, [1, 2, 5, 7, 8], [0, 1, 3, 8, 10])
```

are_complementary_difference_sets() complementary_difference_sets()

`sage.combinat.designs.difference_family.`**`df_q_6_1`**(*K*, *existence=False*, *check=True*)

Return a $(q, 6, 1)$-difference family over the finite field K.

The construction uses Theorem 11 of [Wi72].

EXAMPLES:

```
sage: # needs sage.rings.finite_rings
sage: from sage.combinat.designs.difference_family import is_difference_family,␣
↪df_q_6_1
sage: prime_powers = [v for v in range(31,500,30) if is_prime_power(v)]
sage: parameters = [v for v in prime_powers
....:                if df_q_6_1(GF(v,'a'), existence=True) is True]
sage: parameters
[31, 151, 181, 211, 241, 271, 331, 361, 421]
sage: for v in parameters:
....:     K = GF(v, 'a')
....:     df = df_q_6_1(K, check=True)
....:     assert is_difference_family(K, df, v, 6, 1)
```

```
>>> from sage.all import *
>>> # needs sage.rings.finite_rings
>>> from sage.combinat.designs.difference_family import is_difference_family, df_
↪q_6_1
>>> prime_powers = [v for v in range(Integer(31),Integer(500),Integer(30)) if is_
↪prime_power(v)]
>>> parameters = [v for v in prime_powers
...                if df_q_6_1(GF(v,'a'), existence=True) is True]
>>> parameters
[31, 151, 181, 211, 241, 271, 331, 361, 421]
>>> for v in parameters:
...     K = GF(v, 'a')
...     df = df_q_6_1(K, check=True)
...     assert is_difference_family(K, df, v, Integer(6), Integer(1))
```

Todo

Do improvements due to Zhen and Wu 1999.

sage.combinat.designs.difference_family.**difference_family**(*v*, *k*, *l=1*, *existence=False*, *explain_construction=False*, *check=True*)

Return a (k, l)-difference family on an Abelian group of cardinality v.

Let G be a finite Abelian group. For a given subset D of G, we define ΔD to be the multi-set of differences $\Delta D = \{x - y; x \in D, y \in D, x \neq y\}$. A (G, k, λ)-*difference family* is a collection of k-subsets of G, $D = \{D_1, D_2, \ldots, D_b\}$ such that the union of the difference sets ΔD_i for $i = 1, ...b$, seen as a multi-set, contains each element of $G \backslash \{0\}$ exactly λ-times.

When there is only one block, i.e. $\lambda(v-1) = k(k-1)$, then a (G, k, λ)-difference family is also called a *difference set*.

See also Wikipedia article Difference_set.

If there is no such difference family, an EmptySetError is raised and if there is no construction at the moment NotImplementedError is raised.

INPUT:

- v, k, l – parameters of the difference family. If l is not provided it is assumed to be 1

- `existence` – if `True`, then return either `True` if Sage knows how to build such design, `Unknown` if it does not and `False` if it knows that the design does not exist
- `explain_construction` – instead of returning a difference family, returns a string that explains the construction used
- `check` – boolean (default: `True`); if `True`, then the result of the computation is checked before being returned. This should not be needed but ensures that the output is correct

OUTPUT:

A pair `(G,D)` made of a group G and a difference family D on that group. Or, if `existence=True` a troolean or if `explain_construction=True` a string.

EXAMPLES:

```
sage: G,D = designs.difference_family(73,4)                                     #␣
↪needs sage.libs.pari

Todo

Implement recursive constructions from Buratti “Recursive for difference matrices and relative difference families” (1998) and Jungnickel “Composition theorems for difference families and regular planes” (1978)

sage.combinat.designs.difference_family.**get_fixed_relative_difference_set**(*G*, *rel_diff_set*, *as_elements=False*)

Construct an equivalent relative difference set fixed by the size of the set.

Given a relative difference set $R(q+1, q-1, q, 1)$, it is possible to find a translation of this set fixed by q (see Section 3 of [Spe1975]). We say that a set is fixed by t if $\{td | d \in R\} = R$.

In addition, the set returned by this function will contain the element 0. This is needed in the construction of supplementary difference sets (see `supplementary_difference_set_from_rel_diff_set()`).

INPUT:

- `G` – a group, of which `rel_diff_set` is a subset

- `rel_diff_set` – the relative difference set
- `as_elements` – boolean (default: `False`); if `True`, the list returned will contain elements of the abelian group (this may slow down the computation considerably)

OUTPUT:

By default, this function returns the set as a list of integers. However, if `as_elements=True` it will return the set as a list containing elements of the abelian group. If no such set can be found, the function will raise an error.

EXAMPLES:

```
sage: from sage.combinat.designs.difference_family import relative_difference_set_
↪from_m_sequence, get_fixed_relative_difference_set
sage: G, s1 = relative_difference_set_from_m_sequence(5, 2, return_group=True)   #␣
↪needs sage.libs.pari sage.modules
sage: get_fixed_relative_difference_set(G, s1)   # random                         #␣
↪needs sage.libs.pari sage.modules
[2, 10, 19, 23, 0]
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.difference_family import relative_difference_set_
↪from_m_sequence, get_fixed_relative_difference_set
>>> G, s1 = relative_difference_set_from_m_sequence(Integer(5), Integer(2),␣
↪return_group=True)  # needs sage.libs.pari sage.modules
>>> get_fixed_relative_difference_set(G, s1)   # random                         #␣
↪needs sage.libs.pari sage.modules
[2, 10, 19, 23, 0]
```

If `as_elements=True`, the result will contain elements of the group:

```
sage: get_fixed_relative_difference_set(G, s1, as_elements=True)   # random       #␣
↪needs sage.libs.pari sage.modules
[(2), (10), (19), (23), (0)]
```

```
>>> from sage.all import *
>>> get_fixed_relative_difference_set(G, s1, as_elements=True)   # random       #␣
↪needs sage.libs.pari sage.modules
[(2), (10), (19), (23), (0)]
```

`sage.combinat.designs.difference_family.`**`group_law`**`(`G`)`

Return a triple `(identity, operation, inverse)` that define the operations on the group `G`.

EXAMPLES:

```
sage: from sage.combinat.designs.difference_family import group_law
sage: group_law(Zmod(3))
(0, <built-in function add>, <built-in function neg>)
sage: group_law(SymmetricGroup(5))                                                #␣
↪needs sage.groups
((), <built-in function mul>, <built-in function inv>)
sage: group_law(VectorSpace(QQ, 3))                                               #␣
↪needs sage.modules
((0, 0, 0), <built-in function add>, <built-in function neg>)
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.difference_family import group_law
>>> group_law(Zmod(Integer(3)))
(0, <built-in function add>, <built-in function neg>)
>>> group_law(SymmetricGroup(Integer(5)))                                    ␣
↪     # needs sage.groups
((), <built-in function mul>, <built-in function inv>)
>>> group_law(VectorSpace(QQ, Integer(3)))                                   ␣
↪     # needs sage.modules
((0, 0, 0), <built-in function add>, <built-in function neg>)
```

sage.combinat.designs.difference_family.**hadamard_difference_set_product**(*G1*, *D1*, *G2*, *D2*)

Make a product of two Hadamard difference sets.

This product construction appears in [Tu1984].

INPUT:

- G1, D1, G2, D2 – two Hadamard difference sets

EXAMPLES:

```
sage: from sage.combinat.designs.difference_family import hadamard_difference_set_
↪product
sage: from sage.combinat.designs.difference_family import is_difference_family

sage: G1,D1 = designs.difference_family(16,6,2)                              #␣
↪needs sage.rings.finite_rings
sage: G2,D2 = designs.difference_family(36,15,6)                             #␣
↪needs sage.rings.finite_rings

sage: G11,D11 = hadamard_difference_set_product(G1,D1,G1,D1)                 #␣
↪needs sage.rings.finite_rings
sage: assert is_difference_family(G11, D11, 256, 120, 56)                    #␣
↪needs sage.rings.finite_rings
sage: assert designs.difference_family(256, 120, 56, existence=True) is True     #␣
↪needs sage.rings.finite_rings

sage: G12,D12 = hadamard_difference_set_product(G1,D1,G2,D2)                 #␣
↪needs sage.rings.finite_rings
sage: assert is_difference_family(G12, D12, 576, 276, 132)                   #␣
↪needs sage.rings.finite_rings
sage: assert designs.difference_family(576, 276, 132, existence=True) is True    #␣
↪needs sage.rings.finite_rings
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.difference_family import hadamard_difference_set_
↪product
>>> from sage.combinat.designs.difference_family import is_difference_family

>>> G1,D1 = designs.difference_family(Integer(16),Integer(6),Integer(2))      ␣
↪                         # needs sage.rings.finite_rings
>>> G2,D2 = designs.difference_family(Integer(36),Integer(15),Integer(6))     ␣
↪                         # needs sage.rings.finite_rings
```

(continues on next page)

(continued from previous page)

```
>>> G11,D11 = hadamard_difference_set_product(G1,D1,G1,D1)                   #␣
↪needs sage.rings.finite_rings
>>> assert is_difference_family(G11, D11, Integer(256), Integer(120),␣
↪Integer(56))                       # needs sage.rings.finite_rings
>>> assert designs.difference_family(Integer(256), Integer(120), Integer(56),␣
↪existence=True) is True     # needs sage.rings.finite_rings

>>> G12,D12 = hadamard_difference_set_product(G1,D1,G2,D2)                   #␣
↪needs sage.rings.finite_rings
>>> assert is_difference_family(G12, D12, Integer(576), Integer(276),␣
↪Integer(132))                      # needs sage.rings.finite_rings
>>> assert designs.difference_family(Integer(576), Integer(276), Integer(132),␣
↪existence=True) is True    # needs sage.rings.finite_rings
```

sage.combinat.designs.difference_family.**hadamard_difference_set_product_parameters**()

Check whether a product construction is available for Hadamard difference set with parameter `N`.

This function looks for two integers N_1 and N_2 greater than 1 and so that $N = 2N_1N_2$ and there exists Hadamard difference set with parameters $(4N_i^2, 2N_i^2 - N_i, N_i^2 - N_i)$. If such pair exists, the output is the pair `(N_1, N_2)` otherwise it is `None`.

INPUT:

- `N` – positive integer

EXAMPLES:

```
sage: from sage.combinat.designs.difference_family import hadamard_difference_set_
↪product_parameters
sage: hadamard_difference_set_product_parameters(8)                          #␣
↪needs sage.rings.finite_rings
(2, 2)
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.difference_family import hadamard_difference_set_
↪product_parameters
>>> hadamard_difference_set_product_parameters(Integer(8))                    ␣
↪     # needs sage.rings.finite_rings
(2, 2)
```

sage.combinat.designs.difference_family.**is_difference_family**(*G*, *D*, *v=None*, *k=None*, *l=None*, *verbose=False*)

Check whether `D` forms a difference family in the group `G`.

INPUT:

- `G` – group of cardinality `v`
- `D` – set of `k`-subsets of `G`
- `v`, `k`, `l` – (optional) parameters of the difference family
- `verbose` – boolean (default: `False`); whether to print additional information

See also

difference_family()

EXAMPLES:

```
sage: from sage.combinat.designs.difference_family import is_difference_family
sage: G = Zmod(21)
sage: D = [[0,1,4,14,16]]
sage: is_difference_family(G, D, 21, 5)
True

sage: G = Zmod(41)
sage: D = [[0,1,4,11,29],[0,2,8,17,21]]
sage: is_difference_family(G, D, verbose=True)
Too few:
  5 is obtained 0 times in blocks []
  14 is obtained 0 times in blocks []
  27 is obtained 0 times in blocks []
  36 is obtained 0 times in blocks []
Too much:
  4 is obtained 2 times in blocks [0, 1]
  13 is obtained 2 times in blocks [0, 1]

  37 is obtained 2 times in blocks [0, 1]
False
sage: D = [[0,1,4,11,29],[0,2,8,17,22]]
sage: is_difference_family(G, D)
True

sage: G = Zmod(61)
sage: D = [[0,1,3,13,34],[0,4,9,23,45],[0,6,17,24,32]]
sage: is_difference_family(G, D)
True

sage: # needs sage.modules
sage: G = AdditiveAbelianGroup([3]*4)
sage: a,b,c,d = G.gens()
sage: D = [[d, -a+d, -c+d, a-b-d, b+c+d],
....:      [c, a+b-d, -b+c, a-b+d, a+b+c],
....:      [-a-b+c+d, a-b-c-d, -a+c-d, b-c+d, a+b],
....:      [-b-d, a+b+d, a-b+c-d, a-b+c, -b+c+d]]
sage: is_difference_family(G, D)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.difference_family import is_difference_family
>>> G = Zmod(Integer(21))
>>> D = [[Integer(0),Integer(1),Integer(4),Integer(14),Integer(16)]]
>>> is_difference_family(G, D, Integer(21), Integer(5))
True
```

(continues on next page)

(continued from previous page)

```
>>> G = Zmod(Integer(41))
>>> D = [[Integer(0),Integer(1),Integer(4),Integer(11),Integer(29)],[Integer(0),
↪Integer(2),Integer(8),Integer(17),Integer(21)]]
>>> is_difference_family(G, D, verbose=True)
Too few:
  5 is obtained 0 times in blocks []
  14 is obtained 0 times in blocks []
  27 is obtained 0 times in blocks []
  36 is obtained 0 times in blocks []
Too much:
  4 is obtained 2 times in blocks [0, 1]
  13 is obtained 2 times in blocks [0, 1]
  28 is obtained 2 times in blocks [0, 1]
  37 is obtained 2 times in blocks [0, 1]
False
>>> D = [[Integer(0),Integer(1),Integer(4),Integer(11),Integer(29)],[Integer(0),
↪Integer(2),Integer(8),Integer(17),Integer(22)]]
>>> is_difference_family(G, D)
True

>>> G = Zmod(Integer(61))
>>> D = [[Integer(0),Integer(1),Integer(3),Integer(13),Integer(34)],[Integer(0),
↪Integer(4),Integer(9),Integer(23),Integer(45)],[Integer(0),Integer(6),
↪Integer(17),Integer(24),Integer(32)]]
>>> is_difference_family(G, D)
True

>>> # needs sage.modules
>>> G = AdditiveAbelianGroup([Integer(3)]*Integer(4))
>>> a,b,c,d = G.gens()
>>> D = [[d, -a+d, -c+d, a-b-d, b+c+d],
...      [c, a+b-d, -b+c, a-b+d, a+b+c],
...      [-a-b+c+d, a-b-c-d, -a+c-d, b-c+d, a+b],
...      [-b-d, a+b+d, a-b+c-d, a-b+c, -b+c+d]]
>>> is_difference_family(G, D)
True
```

The following example has a third block with a non-trivial stabilizer:

```
sage: G = Zmod(15)
sage: D = [[0,1,4],[0,2,9],[0,5,10]]
sage: is_difference_family(G,D,verbose=True)
It is a (15,3,1)-difference family
True
```

```
>>> from sage.all import *
>>> G = Zmod(Integer(15))
>>> D = [[Integer(0),Integer(1),Integer(4)],[Integer(0),Integer(2),Integer(9)],
↪[Integer(0),Integer(5),Integer(10)]]
>>> is_difference_family(G,D,verbose=True)
It is a (15,3,1)-difference family
True
```

The function also supports multiplicative groups (non necessarily Abelian):

```
sage: # needs sage.groups
sage: G = DihedralGroup(8)
sage: x,y = G.gens()
sage: i = G.one()
sage: D1 = [[i,x,x^4], [i,x^2, y*x], [i,x^5,y], [i,x^6,y*x^2], [i,x^7,y*x^5]]
sage: is_difference_family(G, D1, 16, 3, 2)
True
sage: from sage.combinat.designs.bibd import BIBD_from_difference_family
sage: bibd = BIBD_from_difference_family(G, D1, lambd=2)
```

```
>>> from sage.all import *
>>> # needs sage.groups
>>> G = DihedralGroup(Integer(8))
>>> x,y = G.gens()
>>> i = G.one()
>>> D1 = [[i,x,x**Integer(4)], [i,x**Integer(2), y*x], [i,x**Integer(5),y], [i,
↪x**Integer(6),y*x**Integer(2)], [i,x**Integer(7),y*x**Integer(5)]]
>>> is_difference_family(G, D1, Integer(16), Integer(3), Integer(2))
True
>>> from sage.combinat.designs.bibd import BIBD_from_difference_family
>>> bibd = BIBD_from_difference_family(G, D1, lambd=Integer(2))
```

sage.combinat.designs.difference_family.**is_fixed_relative_difference_set**(R, q)

Check if the relative difference set R is fixed by q.

A relative difference set R is fixed by q if $\{qd | d \in R\} = R$ (see Section 3 of [Spe1975]).

INPUT:

- R – list containing elements of an abelian group; the relative difference set
- q – integer

EXAMPLES:

```
sage: # needs sage.modules
sage: from sage.combinat.designs.difference_family import relative_difference_set_
↪from_m_sequence, get_fixed_relative_difference_set, is_fixed_relative_
↪difference_set
sage: G, s1 = relative_difference_set_from_m_sequence(7, 2, return_group=True)   #␣
↪needs sage.libs.pari
sage: s2 = get_fixed_relative_difference_set(G, s1, as_elements=True)            #␣
↪needs sage.libs.pari
sage: is_fixed_relative_difference_set(s2, len(s2))                              #␣
↪needs sage.libs.pari
True
sage: G = AdditiveAbelianGroup([15])
sage: s3 = [G[1], G[2], G[3], G[4]]
sage: is_fixed_relative_difference_set(s3, len(s3))
False
```

```
>>> from sage.all import *
>>> # needs sage.modules
```

(continues on next page)

(continued from previous page)

```
>>> from sage.combinat.designs.difference_family import relative_difference_set_
↪from_m_sequence, get_fixed_relative_difference_set, is_fixed_relative_
↪difference_set
>>> G, s1 = relative_difference_set_from_m_sequence(Integer(7), Integer(2),␣
↪return_group=True)  # needs sage.libs.pari
>>> s2 = get_fixed_relative_difference_set(G, s1, as_elements=True)          #␣
↪needs sage.libs.pari
>>> is_fixed_relative_difference_set(s2, len(s2))                            #␣
↪needs sage.libs.pari
True
>>> G = AdditiveAbelianGroup([Integer(15)])
>>> s3 = [G[Integer(1)], G[Integer(2)], G[Integer(3)], G[Integer(4)]]
>>> is_fixed_relative_difference_set(s3, len(s3))
False
```

If the relative difference set does not contain elements of the group, the method returns false:

```
sage: G, s1 = relative_difference_set_from_m_sequence(7, 2, return_group=True)   #␣
↪needs sage.libs.pari sage.modules
sage: s2 = get_fixed_relative_difference_set(G, s1, as_elements=False)          #␣
↪needs sage.libs.pari sage.modules
sage: is_fixed_relative_difference_set(s2, len(s2))                             #␣
↪needs sage.libs.pari sage.modules
False
```

```
>>> from sage.all import *
>>> G, s1 = relative_difference_set_from_m_sequence(Integer(7), Integer(2),␣
↪return_group=True)  # needs sage.libs.pari sage.modules
>>> s2 = get_fixed_relative_difference_set(G, s1, as_elements=False)         #␣
↪needs sage.libs.pari sage.modules
>>> is_fixed_relative_difference_set(s2, len(s2))                            #␣
↪needs sage.libs.pari sage.modules
False
```

sage.combinat.designs.difference_family.**is_relative_difference_set**(*R*, *G*, *H*, *params*, *verbose=False*)

Check if `R` is a difference set of `G` relative to `H`, with the given parameters.

This function checks that G, H and R have the orders specified in the parameters, and that R satisfies the definition of relative difference set (from [EB1966]): the collection of differences $r - s$, $r, s \in R$, $r \neq s$ contains only elements of G which are not in H, and contains every such element exactly d times.

INPUT:

- `R` – list; the relative diffeence set of length k
- `G` – an additive abelian group of order mn
- `H` – list; a submodule of `G` of order n
- `params` – tuple in the form (m, n, k, d)
- `verbose` – boolean (default: `False`); if `True`, the function will be verbose when the sequences do not satisfy the constraints

EXAMPLES:

```
sage: from sage.combinat.designs.difference_family import _get_submodule_of_order,
↪ relative_difference_set_from_m_sequence, is_relative_difference_set
sage: q, N = 5, 2
sage: params = ((q^N-1) // (q-1), q - 1, q^(N-1), q^(N-2))
sage: G, R = relative_difference_set_from_m_sequence(q, N, return_group=True)    #␣
↪needs sage.libs.pari sage.modules
sage: H = _get_submodule_of_order(G, q - 1)                                      #␣
↪needs sage.libs.pari sage.modules
sage: is_relative_difference_set(R, G, H, params)                                #␣
↪needs sage.libs.pari sage.modules
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.difference_family import _get_submodule_of_order,␣
↪relative_difference_set_from_m_sequence, is_relative_difference_set
>>> q, N = Integer(5), Integer(2)
>>> params = ((q**N-Integer(1)) // (q-Integer(1)), q - Integer(1), q**(N-
↪Integer(1)), q**(N-Integer(2)))
>>> G, R = relative_difference_set_from_m_sequence(q, N, return_group=True)    #␣
↪needs sage.libs.pari sage.modules
>>> H = _get_submodule_of_order(G, q - Integer(1))                               ␣
↪      # needs sage.libs.pari sage.modules
>>> is_relative_difference_set(R, G, H, params)                                #␣
↪needs sage.libs.pari sage.modules
True
```

If we pass the `verbose` argument, the function will explain why it failed:

```
sage: R2 = [G[1], G[2], G[3], G[5], G[6]]                                        #␣
↪needs sage.libs.pari sage.modules
sage: is_relative_difference_set(R2, G, H, params, verbose=True)                 #␣
↪needs sage.libs.pari sage.modules
There is a value in the difference set which is not repeated d times
False
```

```
>>> from sage.all import *
>>> R2 = [G[Integer(1)], G[Integer(2)], G[Integer(3)], G[Integer(5)],␣
↪G[Integer(6)]]                                         # needs sage.libs.pari␣
↪sage.modules
>>> is_relative_difference_set(R2, G, H, params, verbose=True)                 #␣
↪needs sage.libs.pari sage.modules
There is a value in the difference set which is not repeated d times
False
```

sage.combinat.designs.difference_family.**is_supplementary_difference_set**(*Ks*, *v=None*, *lmbda=None*, *G=None*, *verbose=False*)

Check that the sets in `Ks` are $n-\{v; k_1, ..., k_n; \lambda\}$ supplementary difference sets over group `G` of order `v`.

From the definition in [Spe1975]: let $S_1, S_2, ..., S_n$ be n subsets of a group G of order v such that $|S_i| = k_i$. If, for each $g \in G$, $g \neq 0$, the total number of solutions of $a_i - a'_i = g$, with $a_i, a'_i \in S_i$ is λ, then $S_1, S_2, ..., S_n$ are $n-\{v; k_1, ..., k_n; \lambda\}$ supplementary difference sets.

One of the parameters `v` or `G` must always be specified. If `G` is not given, the function will use an `AdditiveAbelianGroup` of order `v`.

INPUT:

- `Ks` – list of sets to be checked
- `v` – integer; the parameter v of the supplementary difference sets
- `lmbda` – integer; the parameter λ of the supplementary difference sets
- `G` – a group of order v
- `verbose` – boolean (default: `False`); if `True`, the function will be verbose when the sets do not satisfy the constraints

EXAMPLES:

```
sage: from sage.combinat.designs.difference_family import supplementary_
↪difference_set_from_rel_diff_set, is_supplementary_difference_set
sage: G, [S1, S2, S3, S4] = supplementary_difference_set_from_rel_diff_set(17)   #␣
↪needs sage.modules sage.rings.finite_rings
sage: is_supplementary_difference_set([S1, S2, S3, S4], lmbda=16, G=G)          #␣
↪needs sage.modules sage.rings.finite_rings
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.difference_family import supplementary_difference_
↪set_from_rel_diff_set, is_supplementary_difference_set
>>> G, [S1, S2, S3, S4] = supplementary_difference_set_from_rel_diff_
↪set(Integer(17))  # needs sage.modules sage.rings.finite_rings
>>> is_supplementary_difference_set([S1, S2, S3, S4], lmbda=Integer(16), G=G)    ␣
↪      # needs sage.modules sage.rings.finite_rings
True
```

The parameter `v` can be given instead of `G`:

```
sage: is_supplementary_difference_set([S1, S2, S3, S4], v=16, lmbda=16)          #␣
↪needs sage.modules sage.rings.finite_rings
True
sage: is_supplementary_difference_set([S1, S2, S3, S4], v=20, lmbda=16)          #␣
↪needs sage.modules sage.rings.finite_rings
False
```

```
>>> from sage.all import *
>>> is_supplementary_difference_set([S1, S2, S3, S4], v=Integer(16),␣
↪lmbda=Integer(16))          # needs sage.modules sage.rings.finite_rings
True
>>> is_supplementary_difference_set([S1, S2, S3, S4], v=Integer(20),␣
↪lmbda=Integer(16))          # needs sage.modules sage.rings.finite_rings
False
```

If `verbose=True`, the function will be verbose:

```
sage: is_supplementary_difference_set([S1, S2, S3, S4], lmbda=14, G=G,          #␣
↪needs sage.modules sage.rings.finite_rings
....:                                 verbose=True)
```

(continues on next page)

(continued from previous page)

```
Number of pairs with difference (1) is 16, but lambda is 14
False
```

```
>>> from sage.all import *
>>> is_supplementary_difference_set([S1, S2, S3, S4], lmbda=Integer(14), G=G,     ␣
↪     # needs sage.modules sage.rings.finite_rings
...                                 verbose=True)
Number of pairs with difference (1) is 16, but lambda is 14
False
```

See also

supplementary_difference_set_from_rel_diff_set()

sage.combinat.designs.difference_family.**mcfarland_1973_construction**(q, s)

Return a difference set.

The difference set returned has the following parameters

$$v = \frac{q^{s+1}(q^{s+1}+q-2)}{q-1}, k = \frac{q^s(q^{s+1}-1)}{q-1}, \lambda = \frac{q^s(q^s-1)}{q-1}$$

This construction is due to [McF1973].

INPUT:

- q, s – integers; parameters for the difference set (see the above formulas for the expression of v, k, l in terms of q and s)

See also

The function *are_mcfarland_1973_parameters()* makes the translation between the parameters (q, s) corresponding to a given triple (v, k, λ).

```

ALGORITHM:

Uses dancing links `sage.combinat.dlx`

`sage.combinat.designs.difference_family.`**`one_radical_difference_family`**(K, k)

Search for a radical difference family on `K` using dancing links algorithm.

For the definition of radical difference family, see `radical_difference_family()`. Here, we consider only radical difference family with $\lambda = 1$.

INPUT:

- `K` – a finite field of cardinality q
- `k` – positive integer so that $k(k-1)$ divides $q-1$

OUTPUT: either a difference family or `None` if it does not exist

ALGORITHM:

The existence of a radical difference family is equivalent to a one dimensional tiling (or packing) problem in a cyclic group. This subsequent problem is solved by a call to the function `one_cyclic_tiling()`.

Let K^* be the multiplicative group of the finite field K. A radical family has the form $\mathcal{B} = \{x_1 B, \ldots, x_k B\}$, where $B = \{x : x^k = 1\}$ (for k odd) or $B = \{x : x^{k-1} = 1\} \cup \{0\}$ (for k even). Equivalently, K^* decomposes as:

$$K^* = \Delta(x_1 B) \cup \cdots \cup \Delta(x_k B) = x_1 \Delta B \cup \cdots \cup x_k \Delta B.$$

We observe that $C = B \backslash 0$ is a subgroup of the (cyclic) group K^*, that can thus be generated by some element r. Furthermore, we observe that ΔB is always a union of cosets of $\pm C$ (which is twice larger than C).

$$\begin{array}{lll} (k \text{ odd}) & \Delta B & = \{r^i - r^j : r^i \neq r^j\} & = \pm C \cdot \{r^i - 1 : 0 < i \leq m\} \\ (k \text{ even}) & \Delta B & = \{r^i - r^j : r^i \neq r^j\} \cup C & = \pm C \cdot \{r^i - 1 : 0 < i < m\} \cup \pm C \end{array}$$

where

$$(k \text{ odd})\ m = (k-1)/2 \quad \text{and} \quad (k \text{ even})\ m = k/2.$$

Consequently, $\mathcal{B} = \{x_1 B, \ldots, x_k B\}$ is a radical difference family if and only if $\{x_1(\Delta B/(\pm C)), \ldots, x_k(\Delta B/(\pm C))\}$ is a partition of the cyclic group $K^*/(\pm C)$.

EXAMPLES:

```
sage: from sage.combinat.designs.difference_family import (
....:     one_radical_difference_family,
....:     is_difference_family)

True
```

sage.combinat.designs.difference_family.**radical_difference_family**(*K*, *k*, *l=1*, *existence=False*, *check=True*)

Return a `(v,k,l)`-radical difference family.

Let fix an integer k and a prime power $q = tk(k-1)+1$. Let K be a field of cardinality q. A $(q,k,1)$-difference family is *radical* if its base blocks are either: a coset of the k-th root of unity for k odd or a coset of $k-1$-th root of unity and 0 if k is even (the number t is the number of blocks of that difference family).

The terminology comes from M. Buratti article [Bu95] but the first constructions go back to R. Wilson [Wi72].

INPUT:

- `K` – a finite field
- `k` – positive integer; the size of the blocks
- `l` – integer (default: 1); the λ parameter
- `existence` – if `True`, then return either `True` if Sage knows how to build such design, `Unknown` if it does not and `False` if it knows that the design does not exist
- `check` – boolean (default: `True`); if `True` then the result of the computation is checked before being returned. This should not be needed but ensures that the output is correct

EXAMPLES:

```
sage: from sage.combinat.designs.difference_family import radical_difference_
↪family

sage: radical_difference_family(GF(73), 9)                                    #
↪needs sage.rings.finite_rings
[[1, 2, 4, 8, 16, 32, 37, 55, 64]]

sage: radical_difference_family(GF(281), 5)                                   #
↪needs sage.rings.finite_rings

sage.combinat.designs.difference_family.**radical_difference_set**(*K*, *k*, *l=1*, *existence=False*, *check=True*)

Return a difference set made of a cyclotomic coset in the finite field `K` and with parameters `k` and `l`.

Most of these difference sets appear in chapter VI.18.48 of the Handbook of combinatorial designs.

EXAMPLES:

```
sage: from sage.combinat.designs.difference_family import radical_difference_set

sage: D = radical_difference_set(GF(7), 3, 1); D                              #␣
↪needs sage.rings.finite_rings
[[1, 2, 4]]
sage: sorted(x-y for x in D[0] for y in D[0] if x != y)                     #␣
↪needs sage.rings.finite_rings
[1, 2, 3, 4, 5, 6]

sage: D = radical_difference_set(GF(16,'a'), 6, 2)                          #␣
↪needs sage.rings.finite_rings
sage: sorted(x-y for x in D[0] for y in D[0] if x != y)                     #␣
↪needs sage.rings.finite_rings

sage.combinat.designs.difference_family.**relative_difference_set_from_homomorphism**(*q*, *N*, *d*, *check=True*, *return_group=False*)

Construct $R((q^N-1)/(q-1), n, q^{N-1}, q^{N-2}d)$ where $nd = q-1$.

Given a prime power q, a number $N \geq 2$ and integers d such that $d|q-1$ we create the relative difference set using the construction from Corollary 5.1.1 of [EB1966].

INPUT:

- `q` – a prime power
- `N` – integer greater than 1
- `d` – integer which divides $q-1$
- `check` – boolean (default: `True`); if `True`, check that the result is a relative difference set before returning it
- `return_group` – boolean (default: `False`); if `True`, the function will also return the group from which the set is created

OUTPUT:

If `return_group=False`, the function return only the relative difference set. Otherwise, it returns a tuple containing the group and the set.

EXAMPLES:

```

sage.combinat.designs.difference_family.**relative_difference_set_from_m_sequence**(*q*, *N*, *check=True*, *return_group=False*)

Construct $R((q^N-1)/(q-1), q-1, q^{N-1}, q^{N-2})$ where `q` is a prime power and $N\geq 2$.

The relative difference set is constructed over the set of additive integers modulo q^N-1, as described in Theorem 5.1 of [EB1966]. Given an m-sequence (a_i) of period q^N-1, the set is: $R=\{i|0\leq i\leq q^{N-1}, a_i=1\}$.

INPUT:

- `q` – a prime power
- `N` – a nonnegative number
- `check` – boolean (default: `True`); if `True`, check that the result is a relative difference set before returning it
- `return_group` – boolean (default: `False`); if `True`, the function will also return the group from which the set is created

OUTPUT:

If `return_group=False`, the function return only the relative difference set. Otherwise, it returns a tuple containing the group and the set.

EXAMPLES:

```
sage: from sage.combinat.designs.difference_family import relative_difference_set_
↪from_m_sequence
sage: relative_difference_set_from_m_sequence(2, 4,              # random      #␣

sage.combinat.designs.difference_family.**singer_difference_set**(q, d)

Return a difference set associated to the set of hyperplanes in a projective space of dimension d over $GF(q)$.

A Singer difference set has parameters:

$$v = \frac{q^{d+1}-1}{q-1}, \quad k = \frac{q^d-1}{q-1}, \quad \lambda = \frac{q^{d-1}-1}{q-1}.$$

The idea of the construction is as follows. One consider the finite field $GF(q^{d+1})$ as a vector space of dimension $d+1$ over $GF(q)$. The set of $GF(q)$-lines in $GF(q^{d+1})$ is a projective plane and its set of hyperplanes form a balanced incomplete block design.

Now, considering a multiplicative generator z of $GF(q^{d+1})$, we get a transitive action of a cyclic group on our projective plane from which it is possible to build a difference set.

The construction is given in details in [Stinson2004], section 3.3.

EXAMPLES:

```
sage: from sage.combinat.designs.difference_family import singer_difference_set,␣
↪is_difference_family
sage: G,D = singer_difference_set(3,2)                                       #␣

sage.combinat.designs.difference_family.**skew_spin_goethals_seidel_difference_family**(*n*, *existence=False*, *check=True*)

Construct skew spin type Goethals-Seidel difference family with parameters $(n; k_1, k_2, k_3, k_4; \lambda)$.

The construction is described in [Djo2024]. This function contains, for each value of n, either a full representation of S_1, S_2 together with the multiplier μ, or a subgroup H, two sets of representatives, and the multiplier.

This data is used to construct the difference family using the functions `_construct_gs_difference_family_from_full()` and `_construct_gs_difference_family_from_compact()`.

INPUT:

- `n` – integer; the parameter of the GS difference family
- `existence` – boolean (default: `False`); if `True`, only check whether the skew difference family can be constructed
- `check` – boolean (default: `True`); if `True`, check that the sets are a skew difference family before returning them; setting this parameter to `False` may speed up the computation considerably

OUTPUT:

If `existence=False`, the function returns the group G of integers modulo `n` and a list containing 4 sets, or raises an error if data for the given `n` is not available. If `existence=True`, the function returns a boolean representing whether the skew difference family can be constructed.

EXAMPLES:

```
sage: from sage.combinat.designs.difference_family import skew_spin_goethals_
↪seidel_difference_family
sage: G, [S1, S2, S3, S4] = skew_spin_goethals_seidel_difference_family(61)
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.difference_family import skew_spin_goethals_seidel_
↪difference_family
>>> G, [S1, S2, S3, S4] = skew_spin_goethals_seidel_difference_family(Integer(61))
```

If existence is `True`, the function returns a boolean:

```
sage: skew_spin_goethals_seidel_difference_family(61, existence=True)
True
sage: skew_spin_goethals_seidel_difference_family(5, existence=True)
False
```

```
>>> from sage.all import *
>>> skew_spin_goethals_seidel_difference_family(Integer(61), existence=True)
True
>>> skew_spin_goethals_seidel_difference_family(Integer(5), existence=True)
False
```

sage.combinat.designs.difference_family.**skew_supplementary_difference_set**(*n*, *existence=False*, *check=True*, *return_group=False*)

Construct $4-\{n; n_1, n_2, n_3, n_4; \lambda\}$ supplementary difference sets, where S_1 is skew and $n_1+n_2+n_3+n_4 = n+\lambda$.

These sets are constructed from available data, as described in [Djo1994a]. The set $S_1 \subset G$ is always skew, i.e. $S_1 \cap (-S_1) = \emptyset$ and $S_1 \cup (-S_1) = G \setminus \{0\}$.

The data is taken from:

- $n = 103, 151$: [Djo1994a]
- $n = 67, 113, 127, 157, 163, 181, 241$: [Djo1992a]
- $n = 37, 43$: [Djo1992b]
- $n = 39, 49, 65, 93, 121, 129, 133, 217, 219, 267$: [Djo1992c]
- $n = 97$: [Djo2008a]
- $n = 109, 145, 247$: [Djo2008b]
- $n = 73$: [Djo2023b]
- $n = 213, 631$: [DGK2014]
- $n = 331$: [DK2016]

Additional skew Supplementary difference sets are built using the function *skew_supplementary_difference_set_over_polynomial_ring()*, and *skew_supplementary_difference_set_with_paley_todd()*.

INPUT:

- `n` – integer; the parameter of the supplementary difference set
- `existence` – boolean (default: `False`); if `True`, only check whether the supplementary difference sets can be constructed
- `check` – boolean (default: `True`); if `True`, check that the sets are supplementary difference sets with S_1 skew before returning them; setting this parameter to `False` may speed up the computation considerably
- `return_group` – boolean (default: `False`); if `True`, the function will also return the group from which the sets are created

OUTPUT:

If `existence=False`, the function returns a list containing 4 sets, or raises an error if data for the given `n` is not available. If `return_group=True` the function will additionally return the group from which the sets are created. If `existence=True`, the function returns a boolean representing whether skew supplementary difference sets can be constructed.

EXAMPLES:

```
sage: from sage.combinat.designs.difference_family import skew_supplementary_
→difference_set
sage: [S1, S2, S3, S4] = skew_supplementary_difference_set(39)
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.difference_family import skew_supplementary_
→difference_set
>>> [S1, S2, S3, S4] = skew_supplementary_difference_set(Integer(39))
```

If `return_group=True`, the function will also return the group:

```
sage: G, [S1, S2, S3, S4] = skew_supplementary_difference_set(103, return_
→group=True)
```

```
>>> from sage.all import *
>>> G, [S1, S2, S3, S4] = skew_supplementary_difference_set(Integer(103), return_
↪group=True)
```

If existence=True, the function returns a boolean:

```
sage: skew_supplementary_difference_set(103, existence=True)
True
sage: skew_supplementary_difference_set(17, existence=True)
False
```

```
>>> from sage.all import *
>>> skew_supplementary_difference_set(Integer(103), existence=True)
True
>>> skew_supplementary_difference_set(Integer(17), existence=True)
False
```

Note

The data for $n = 247$ in [Djo2008b] contains a typo: the set α_2 should contain 223 instead of 233. This can be verified by checking the resulting sets, which are given explicitly in the paper.

sage.combinat.designs.difference_family.**skew_supplementary_difference_set_over_polynomial_ring**(*n*, *existence=False*, *check=True*)

Construct skew supplementary difference sets over a polynomial ring of order n.

The skew supplementary difference sets for $n = 81, 169$ are taken from [Djo1994a].

INPUT:

- n – integer; the parameter of the supplementary difference sets
- existence – boolean (default: False); if True, only check whether the supplementary difference sets can be constructed
- check – boolean (default: True); if True, check that the sets are supplementary difference sets with S_1 skew before returning them; setting this parameter to False may speed up the computation considerably

OUTPUT:

If existence=False, the function returns a Polynomial Ring of order n and a list containing 4 sets, or raises an error if data for the given n is not available. If existence=True, the function returns a boolean representing whether skew supplementary difference sets can be constructed.

EXAMPLES:

```
sage: from sage.combinat.designs.difference_family import skew_supplementary_
↪difference_set_over_polynomial_ring
sage: G, [S1, S2, S3, S4] = skew_supplementary_difference_set_over_polynomial_
↪ring(81)      # needs sage.libs.pari
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.difference_family import skew_supplementary_
↪difference_set_over_polynomial_ring
>>> G, [S1, S2, S3, S4] = skew_supplementary_difference_set_over_polynomial_
↪ring(Integer(81))       # needs sage.libs.pari
```

If existence=True, the function returns a boolean:

```
sage: skew_supplementary_difference_set_over_polynomial_ring(81, existence=True)
True
sage: skew_supplementary_difference_set_over_polynomial_ring(17, existence=True)
False
```

```
>>> from sage.all import *
>>> skew_supplementary_difference_set_over_polynomial_ring(Integer(81),␣
↪existence=True)
True
>>> skew_supplementary_difference_set_over_polynomial_ring(Integer(17),␣
↪existence=True)
False
```

sage.combinat.designs.difference_family.**skew_supplementary_difference_set_with_paley_todd**(*n*, *existence=False*, *check=True*)

Construct $4-\{n;n_1,n_2,n_3,n_4;\lambda\}$ skew supplementary difference sets where S_1 is the Paley-Todd difference set.

The skew SDS returned have the property that $n_1+n_2+n_3+n_4=n+\lambda$.

This construction is described in [DK2016]. The function contains, for each value of n, a set H containing integers modulo n, and four sets J,K,L. Then, these are used to construct $(n;k_2,k_3,k_4;\lambda_2)$ difference family, with $\lambda_2=k_2+k_3+k_4+(3n-1)/4$. Finally, these sets together with the Paley-Todd difference set form a skew supplementary difference set.

INPUT:

- n – integer; the parameter of the supplementary difference set
- existence – boolean (default: False); if True, only check whether the supplementary difference sets can be constructed
- check – boolean (default: True); if True, check that the sets are supplementary difference sets with S_1 skew before returning them; setting this parameter to False may speed up the computation considerably

OUTPUT:

If existence=False, the function returns the group G of integers modulo n and a list containing 4 sets, or raises an error if data for the given n is not available. If existence=True, the function returns a boolean representing whether skew supplementary difference sets can be constructed.

EXAMPLES:

```
sage: from sage.combinat.designs.difference_family import skew_supplementary_
↪difference_set_with_paley_todd
sage: G, [S1, S2, S3, S4] = skew_supplementary_difference_set_with_paley_todd(239)
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.difference_family import skew_supplementary_
↪difference_set_with_paley_todd
>>> G, [S1, S2, S3, S4] = skew_supplementary_difference_set_with_paley_
↪todd(Integer(239))
```

If existence is `True`, the function returns a boolean:

```
sage: skew_supplementary_difference_set_with_paley_todd(239, existence=True)
True
sage: skew_supplementary_difference_set_with_paley_todd(17, existence=True)
False
```

```
>>> from sage.all import *
>>> skew_supplementary_difference_set_with_paley_todd(Integer(239),␣
↪existence=True)
True
>>> skew_supplementary_difference_set_with_paley_todd(Integer(17), existence=True)
False
```

`sage.combinat.designs.difference_family.`**`spin_goethals_seidel_difference_family`**`(`*n*, *existence=False*, *check=True*`)`

Construct a spin type Goethals-Seidel difference family with parameters $(n; k_1, k_2, k_3, k_4; \lambda)$.

The construction is described in [Djo2024]. This function contains, for each value of n, either a full representation of S_1, S_2 together with the multiplier μ, or a subgroup H, two sets of representatives, and the multiplier. This data is used to construct the difference family using the functions `_construct_gs_difference_family_from_full()` and `_construct_gs_difference_family_from_compact()`.

Additionally, this function also checks if a (skew) difference family can be constructed using *`skew_spin_goethals_seidel_difference_family()`*.

INPUT:

- `n` – integer; the parameter of the GS difference family
- `existence` – boolean (default: `False`); if `True`, only check whether the difference family can be constructed
- `check` – boolean (default: `True`); if `True`, check that the sets are a difference family before returning them; setting this parameter to `False` may speed up the computation considerably

OUTPUT:

If `existence=False`, the function returns the group G of integers modulo `n` and a list containing 4 sets, or raises an error if data for the given `n` is not available. If `existence=True`, the function returns a boolean representing whether the difference family can be constructed.

EXAMPLES:

```
sage: from sage.combinat.designs.difference_family import spin_goethals_seidel_
↪difference_family
sage: G, [S1, S2, S3, S4] = spin_goethals_seidel_difference_family(73)
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.difference_family import spin_goethals_seidel_
```

(continues on next page)

(continued from previous page)

```
↪difference_family
>>> G, [S1, S2, S3, S4] = spin_goethals_seidel_difference_family(Integer(73))
```

If existence is `True`, the function returns a boolean:

```
sage: spin_goethals_seidel_difference_family(73, existence=True)
True
sage: spin_goethals_seidel_difference_family(5, existence=True)
False
```

```
>>> from sage.all import *
>>> spin_goethals_seidel_difference_family(Integer(73), existence=True)
True
>>> spin_goethals_seidel_difference_family(Integer(5), existence=True)
False
```

`sage.combinat.designs.difference_family.`**`supplementary_difference_set`**(*q*, *existence=False*, *check=True*)

Construct $4-\{2v; v, v+1, v, v; 2v\}$ supplementary difference sets where $q = 2v + 1$.

This is a deprecated version of *`supplementary_difference_set_from_rel_diff_set()`*, please use that instead.

`sage.combinat.designs.difference_family.`**`supplementary_difference_set_from_rel_diff_set`**(*q*, *existence=False*, *check=True*)

Construct $4-\{2v; v, v+1, v, v; 2v\}$ supplementary difference sets where $q = 2v + 1$.

The sets are created from relative difference sets as detailed in Theorem 3.3 of [Spe1975]. this construction requires that q is an odd prime power and that there exists $s \geq 0$ such that $(q-(2^{s+1}+1))/2^{s+1}$ is an odd prime power.

Note that the construction from [Spe1975] states that the resulting sets are $4-\{2v; v+1, v, v, v; 2v\}$ supplementary difference sets. However, the implementation of that construction returns $4-\{2v; v, v+1, v, v; 2v\}$ supplementary difference sets. This is not important, since the supplementary difference sets are not ordered.

INPUT:

- `q` – an odd prime power
- `existence` – boolean (default: `False`); if `True`, only check whether the supplementary difference sets can be constructed
- `check` – boolean (default: `True`); if `True`, check that the sets are supplementary difference sets before returning them

OUTPUT:

If `existence=False`, the function returns the 4 sets (containing integers), or raises an error if `q` does not satisfy the constraints. If `existence=True`, the function returns a boolean representing whether supplementary difference sets can be constructed.

EXAMPLES:

```
sage: from sage.combinat.designs.difference_family import supplementary_
↪difference_set_from_rel_diff_set
```

(continues on next page)

(continued from previous page)

```
sage: supplementary_difference_set_from_rel_diff_set(17)   #random                    #␣
↪needs sage.libs.pari
(Additive abelian group isomorphic to Z/16,
 [[(1), (5), (6), (7), (9), (13), (14), (15)],
  [(0), (2), (3), (5), (6), (10), (11), (13), (14)],
  [(0), (1), (2), (3), (5), (6), (7), (12)],
  [(0), (2), (3), (5), (6), (7), (9), (12)]])
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.difference_family import supplementary_difference_
↪set_from_rel_diff_set
>>> supplementary_difference_set_from_rel_diff_set(Integer(17))   #random              ␣
↪     # needs sage.libs.pari
(Additive abelian group isomorphic to Z/16,
 [[(1), (5), (6), (7), (9), (13), (14), (15)],
  [(0), (2), (3), (5), (6), (10), (11), (13), (14)],
  [(0), (1), (2), (3), (5), (6), (7), (12)],
  [(0), (2), (3), (5), (6), (7), (9), (12)]])
```

If `existence=True`, the function returns a boolean:

```
sage: supplementary_difference_set_from_rel_diff_set(7, existence=True)
False
sage: supplementary_difference_set_from_rel_diff_set(17, existence=True)
True
```

```
>>> from sage.all import *
>>> supplementary_difference_set_from_rel_diff_set(Integer(7), existence=True)
False
>>> supplementary_difference_set_from_rel_diff_set(Integer(17), existence=True)
True
```

See also

is_supplementary_difference_set()

`sage.combinat.designs.difference_family.`**`supplementary_difference_set_hadamard`**(*n*, *existence=False*, *check=True*)

Construct $4-\{n; n_1, n_2, n_3, n_4; \lambda\}$ supplementary difference sets, where $n_1 + n_2 + n_3 + n_4 = n + \lambda$.

These sets are constructed from available data, as described in [Djo1994a]. The data is taken from:

- $n = 191$: [Djo2008c]
- $n = 239$: [Djo1994b]
- $n = 251$: [DGK2014]

Additional SDS are constructed using *skew_supplementary_difference_set()*.

INPUT:

- `n` – integer; the parameter of the supplementary difference set

- `existence` – boolean (default: `False`); if `True`, only check whether the supplementary difference sets can be constructed
- `check` – boolean (default: `True`); if `True`, check that the sets are supplementary difference sets before returning them; Setting this parameter to `False` may speed up the computation considerably

OUTPUT:

If `existence=False`, the function returns the ring of integers modulo `n` and a list containing the 4 sets, or raises an error if data for the given `n` is not available. If `existence=True`, the function returns a boolean representing whether skew supplementary difference sets can be constructed.

EXAMPLES:

```
sage: from sage.combinat.designs.difference_family import supplementary_
↪difference_set_hadamard
sage: G, [S1, S2, S3, S4] = supplementary_difference_set_hadamard(191)
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.difference_family import supplementary_difference_
↪set_hadamard
>>> G, [S1, S2, S3, S4] = supplementary_difference_set_hadamard(Integer(191))
```

If `existence=True`, the function returns a boolean:

```
sage: supplementary_difference_set_hadamard(191, existence=True)
True
sage: supplementary_difference_set_hadamard(17, existence=True)
False
```

```
>>> from sage.all import *
>>> supplementary_difference_set_hadamard(Integer(191), existence=True)
True
>>> supplementary_difference_set_hadamard(Integer(17), existence=True)
False
```

`sage.combinat.designs.difference_family.`**`turyn_1965_3x3xK`**`(k=4)`

Return a difference set in either $C_3 \times C_3 \times C_4$ or $C_3 \times C_3 \times C_2 \times C_2$ with parameters $v = 36$, $k = 15$, $\lambda = 6$.

This example appears in [Tu1965].

INPUT:

- `k` – either `2` (to get a difference set in $C_3 \times C_3 \times C_2 \times C_2$) or `4` (to get a difference set in $C_3 \times C_3 \times C_3 \times C_4$)

EXAMPLES:

```
sage: from sage.combinat.designs.difference_family import turyn_1965_3x3xK
sage: from sage.combinat.designs.difference_family import is_difference_family
sage: G,D = turyn_1965_3x3xK(4)
sage: assert is_difference_family(G, D, 36, 15, 6)
sage: G,D = turyn_1965_3x3xK(2)
sage: assert is_difference_family(G, D, 36, 15, 6)
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.difference_family import turyn_1965_3x3xK
>>> from sage.combinat.designs.difference_family import is_difference_family
```

(continues on next page)

(continued from previous page)

```
>>> G,D = turyn_1965_3x3xK(Integer(4))
>>> assert is_difference_family(G, D, Integer(36), Integer(15), Integer(6))
>>> G,D = turyn_1965_3x3xK(Integer(2))
>>> assert is_difference_family(G, D, Integer(36), Integer(15), Integer(6))
```

sage.combinat.designs.difference_family.**twin_prime_powers_difference_set**(*p*, *check=True*)

Return a difference set on $GF(p) \times GF(p+2)$.

The difference set is built from the following element of the Cartesian product of finite fields $GF(p) \times GF(p+2)$:

- $(x, 0)$ with any x
- (x, y) with x and y squares
- (x, y) with x and y non-squares

For more information see Wikipedia article Difference_set.

INPUT:

- `check` – boolean (default: `True`); if `True`, then the result of the computation is checked before being returned. This should not be needed but ensures that the output is correct

EXAMPLES:

```
sage: from sage.combinat.designs.difference_family import twin_prime_powers_
↪difference_set
sage: G, D = twin_prime_powers_difference_set(3)
sage: G
The Cartesian product of (Finite Field of size 3, Finite Field of size 5)
sage: D
[[(1, 1), (1, 4), (2, 2), (2, 3), (0, 0), (1, 0), (2, 0)]]
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.difference_family import twin_prime_powers_
↪difference_set
>>> G, D = twin_prime_powers_difference_set(Integer(3))
>>> G
The Cartesian product of (Finite Field of size 3, Finite Field of size 5)
>>> D
[[(1, 1), (1, 4), (2, 2), (2, 3), (0, 0), (1, 0), (2, 0)]]
```

5.1.85 Difference Matrices

This module gathers code related to difference matrices. One can build those objects (or know if they can be built) with *difference_matrix()*:

```
sage: G,DM = designs.difference_matrix(9,5,1)
```

```
>>> from sage.all import *
>>> G,DM = designs.difference_matrix(Integer(9),Integer(5),Integer(1))
```

Functions

sage.combinat.designs.difference_matrices.**difference_matrix**(*g*, *k*, *lmbda=1*, *existence=False*, *check=True*)

Return a (g, k, λ)-difference matrix.

A matrix M is a (g, k, λ)-difference matrix if it has size $\lambda g \times k$, its entries belong to the group G of cardinality g, and for any two rows R, R' of M and $x \in G$ there are exactly λ values i such that $R_i - R'_i = x$.

INPUT:

- `k` – integer; number of columns. If `k` is `None` it is set to the largest value available
- `g` – integer; cardinality of the group G
- `lmbda` – integer (default: 1); number of times each element of G appears as a difference
- `check` – boolean (default: `True`); whether to check that output is correct before returning it. As this is expected to be useless, you may want to disable it whenever you want speed.
- `existence` – boolean; instead of building the design, return:
  - `True` – meaning that Sage knows how to build the design
  - `Unknown` – meaning that Sage does not know how to build the design, but that the design may exist (see `sage.misc.unknown`)
  - `False` – meaning that the design does not exist

Note

When `k=None` and `existence=True` the function returns an integer, i.e. the largest k such that we can build a (g, k, λ)-DM.

EXAMPLES:

```
sage: G,M = designs.difference_matrix(25,10); G
Finite Field in x of size 5^2
sage: designs.difference_matrix(993,None,existence=1)
32
```

```
>>> from sage.all import *
>>> G,M = designs.difference_matrix(Integer(25),Integer(10)); G
Finite Field in x of size 5^2
>>> designs.difference_matrix(Integer(993),None,existence=Integer(1))
32
```

Here we print for each g the maximum possible k for which Sage knows how to build a $(g, k, 1)$-difference matrix:

```
sage: for g in range(2,30):
....:     k_max = designs.difference_matrix(g=g,k=None,existence=True)
....:     print("{:2} {}".format(g, k_max))
....:     _ = designs.difference_matrix(g,k_max)
 2 2
 3 3
 4 4

sage.combinat.designs.difference_matrices.**difference_matrix_product**(*k*, *M1*, *G1*, *lmbda1*, *M2*, *G2*, *lmbda2*, *check=True*)

Return the product of the `(G1, k, lmbda1)` and `(G2, k, lmbda2)` difference matrices `M1` and `M2`.

The result is a $(G1 \times G2, k, \lambda_1 \lambda_2)$-difference matrix.

INPUT:

- `k`, `lmbda1`, `lmbda2` – positive integers
- `G1`, `G2` – groups
- `M1`, `M2` – `(G1, k, lmbda1)` and `(G, k, lmbda2)` difference matrices
- `check` – boolean (default: `True`); whether to check the output before it is returned

EXAMPLES:

```
sage: from sage.combinat.designs.difference_matrices import (
....:     difference_matrix_product,
....:     is_difference_matrix)
sage: G1,M1 = designs.difference_matrix(11,6)
sage: G2,M2 = designs.difference_matrix(7,6)
sage: G,M = difference_matrix_product(6,M1,G1,1,M2,G2,1)
sage: G1
Finite Field of size 11
sage: G2
Finite Field of size 7
sage: G
The Cartesian product of (Finite Field of size 11, Finite Field of size 7)
sage: is_difference_matrix(M,G,6,1)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.designs.difference_matrices import (
...     difference_matrix_product,
...     is_difference_matrix)
>>> G1,M1 = designs.difference_matrix(Integer(11),Integer(6))
