Packages and Features

Release 10.6

The Sage Development Team

Apr 01, 2025

CONTENTS

CHAPTER

ONE

STANDARD PACKAGES

The Sage distribution includes most programs and libraries on which Sage depends. It installs them automatically if it does not find equivalent system packages.

1.1 Mathematics

- *brial: Boolean Ring Algebra implementation using binary decision diagrams*
- *cddlib: Double description method for polyhedral representation conversion*
- *cliquer: Routines for clique searching*
- *conway_polynomials: Python interface to Frank Lübeck's Conway polynomial database*
- *cvxopt: Python software for convex optimization*
- *cypari2: Python interface to the number theory library libpari*
- *eclib: Enumerating and computing with elliptic curves defined over the rational numbers*
- *ecm: Elliptic curve method for integer factorization*
- *elliptic_curves: Databases of elliptic curves*
- *fflas_ffpack: Dense linear algebra over word-size finite fields*
- *flint: Fast Library for Number Theory*
- *fplll: Lattice algorithms, including LLL with floating-point orthogonalization*
- *fpylll: Python interface for FPLLL*
- *gap: Groups, Algorithms, Programming - a system for computational discrete algebra*
- *gf2x: Fast arithmetic in GF(2)[x] and searching for irreducible/primitive trinomials*
- *gfan: Groebner fans and tropical varieties*
- *givaro: C++ library for arithmetic and algebraic computations*
- *glpk: GNU Linear Programming Kit*
- *gmp: Library for arbitrary precision arithmetic*
- *gmpy2: Python interface to GMP/MPIR, MPFR, and MPC*
- *graphs: A database of combinatorial graphs*
- *gsl: The GNU Scientific Library*
- *iml: Integer Matrix Library*
- *lcalc: L-function calculator*

- *libbraiding: Computing with braids*
- *libhomfly: Compute the homfly polynomial of knots and links*
- *linbox: Linear algebra with dense, sparse, structured matrices over the integers and finite fields*
- *lrcalc: Littlewood-Richardson calculator*
- *lrcalc_python: Littlewood-Richardson calculator*
- *m4ri: fast arithmetic with dense matrices over GF(2)*
- *m4rie: Arithmetic with dense matrices over GF(2^e)*
- *maxima: System for manipulating symbolic and numerical expressions*
- *mpc: Arithmetic of complex numbers with arbitrarily high precision and correct rounding*
- *mpfi: Multiple precision interval arithmetic library based on MPFR*
- *mpfr: Multiple-precision floating-point computations with correct rounding*
- *mpmath: Pure Python library for multiprecision floating-point arithmetic*
- *nauty: Find automorphism groups of graphs, generate non-isomorphic graphs*
- *networkx: Python package for complex networks*
- *ntl: A library for doing number theory*
- *numpy: Package for scientific computing with Python*
- *openblas: An optimized implementation of BLAS (Basic Linear Algebra Subprograms)*
- *palp: A package for Analyzing Lattice Polytopes*
- *pari: Computer algebra system for fast computations in number theory*
- *pari_galdata: PARI data package needed to compute Galois groups in degrees 8 through 11*
- *pari_seadata_small: PARI data package needed by ellap for large primes (small version)*
- *planarity: Planarity-related graph algorithms*
- *polytopes_db: Databases of 2- and 3-dimensional reflexive polytopes*
- *ppl: Parma Polyhedra Library*
- *pplpy: Python interface to the Parma Polyhedra Library*
- *primecount: Algorithms for counting primes*
- *primecountpy: Cython interface for C++ primecount library*
- *primesieve: CLI program and C/C++ library for generating primes*
- *qhull: Compute convex hulls, Delaunay triangulations, Voronoi diagrams*
- *rpy2: Python interface to R*
- *rw: Compute rank-width and rank-decompositions*
- *scipy: Scientific tools for Python*
- *singular: Computer algebra system for polynomial computations, algebraic geometry, singularity theory*
- *suitesparse: A suite of sparse matrix software*
- *symmetrica: Library for representation theory*
- *sympow: Computes special values of symmetric power elliptic curve L-functions*

- *sympy: Python library for symbolic mathematics*

1.2 Front-end, graphics, document preparation

- *ipympl: Matplotlib Jupyter Extension*
- *ipython: Interactive computing environment with an enhanced interactive Python shell*
- *ipywidgets: Interactive HTML widgets for Jupyter notebooks and the IPython kernel*
- *jupyterlab: JupyterLab computational environment*
- *jupyterlab_widgets: Jupyter interactive widgets for JupyterLab*
- *matplotlib: Python 2D plotting library*
- *matplotlib_inline: Inline Matplotlib backend for Jupyter*
- *nbconvert: Converting Jupyter Notebooks*
- *notebook: Jupyter notebook, a web-based notebook environment for interactive computing*
- *sagenb_export: Convert legacy SageNB notebooks to Jupyter notebooks and other formats*
- *sagetex: Embed code, results of computations, and plots from Sage into LaTeX documents*
- *tachyon: A ray tracing system*
- *threejs: JavaScript library to display 3D graphics in the browser*

1.3 Other dependencies

- *_prereq: Represents system packages required for installing SageMath from source*
- *alabaster: Default theme for the Sphinx documentation system*
- *anyio: High level compatibility layer for multiple asynchronous event loop implementations*
- *appdirs: Small Python module for determining appropriate platform-specific dirs, e.g. a "user data dir"*
- *appnope: Disable App Nap on macOS >= 10.9*
- *argon2_cffi: The secure Argon2 password hashing algorithm*
- *argon2_cffi_bindings: Low-level CFFI bindings for Argon2*
- *arrow: Better dates & times for Python*
- *asttokens: Annotate AST trees with source code positions*
- *async_lru: Simple LRU cache for asyncio*
- *attrs: Decorator for Python classes with attributes*
- *babel: Internationalization utilities*
- *beautifulsoup4: Screen-scraping library*
- *beniget: Extract semantic information about static Python code*
- *bleach: An HTML-sanitizing tool*
- *boost_cropped: Portable C++ libraries (subset needed for Sage)*
- *bzip2: High-quality data compressor*
- *cachetools: Extensible memoizing collections and decorators*

- *calver: Setuptools extension for CalVer package versions*
- *certifi: Python package for providing Mozilla's CA Bundle*
- *cffi: Foreign Function Interface for Python calling C code*
- *chardet: Universal encoding detector for Python 3*
- *charset_normalizer: The Real First Universal Charset Detector. Open, modern and actively maintained alternative to Chardet.*
- *cmake: A cross-platform build system generator*
- *colorama: Cross-platform colored terminal text*
- *comm: Jupyter Python Comm implementation, for usage in ipykernel, xeus-python etc.*
- *contourpy: Python library for calculating contours of 2D quadrilateral grids*
- *cppy: C++ headers for C extension development*
- *curl: Multiprotocol data transfer library and utility*
- *cycler: Composable cycles*
- *cysignals: Interrupt and signal handling for Cython*
- *cython: C-Extensions for Python, an optimizing static compiler*
- *dateutil: Extensions to the standard Python module datetime*
- *debugpy: Implementation of the Debug Adapter Protocol for Python*
- *decorator: Python library providing decorators*
- *defusedxml: Addresses vulnerabilities of XML parsers and XML libraries*
- *distlib: Distribution utilities*
- *docutils: Processing plaintext documentation into useful formats, such as HTML or LaTeX*
- *ecl: An implementation of the Common Lisp language*
- *editables: Editable installations*
- *entrypoints: Discover and load entry points from installed Python packages*
- *exceptiongroup: Backport of PEP 654 (exception groups)*
- *execnet: Rapid multi-Python deployment*
- *executing: Get the currently executing AST node of a frame, and other information*
- *fastjsonschema: Fastest Python implementation of JSON schema*
- *filelock: Platform independent file lock*
- *flit_core: Distribution-building parts of Flit. See flit package for more information*
- *fonttools: Tools to manipulate font files*
- *fqdn: Validates fully-qualified domain names against RFC 1123, so that they are acceptable to modern bowsers*
- *freetype: A free, high-quality, and portable font engine*
- *furo: A clean customizable Sphinx documentation theme*
- *gast: Python AST that abstracts the underlying Python version*
- *gc: The Boehm-Demers-Weiser conservative garbage collector*

- *gcc: The GNU Compiler Collection or other suitable C and C++ compilers*
- *gengetopt: getopt_long parser generator*
- *gfortran: Fortran compiler from the GNU Compiler Collection*
- *gnulib: Modules imported from Gnulib*
- *gnumake_tokenpool: Jobclient and jobserver for the GNU make tokenpool protocol*
- *h11: A pure-Python, bring-your-own-I/O implementation of HTTP/1.1*
- *hatchling: Modern, extensible Python build backend*
- *httpcore: Minimal low-level HTTP client*
- *httpx: The next generation HTTP client.*
- *iconv: Library for language/country-dependent character encodings*
- *idna: Internationalized Domain Names in Applications (IDNA)*
- *imagesize: Getting image size from png/jpeg/jpeg2000/gif file*
- *importlib_metadata: Library to access the metadata for a Python package*
- *importlib_resources: Read resources from Python packages*
- *info: stand-alone Info documentation reader*
- *iniconfig: Brain-dead simple config-ini parsing*
- *ipykernel: IPython Kernel for Jupyter*
- *ipython_genutils: Vestigial utilities from IPython*
- *isoduration: Operations with ISO 8601 durations*
- *jedi: Static analysis tool providing IDE support for Python*
- *jinja2: General purpose template engine for Python*
- *json5: Python implementation of the JSON5 data format*
- *jsonpointer: Identify specific nodes in a JSON document (RFC 6901)*
- *jsonschema: Python implementation of JSON Schema*
- *jsonschema_specifications: The JSON Schema meta-schemas and vocabularies, exposed as a Registry*
- *jupyter_client: Jupyter protocol implementation and client libraries*
- *jupyter_core: Jupyter core package*
- *jupyter_events: Jupyter Event System library*
- *jupyter_lsp: Multi-Language Server WebSocket proxy for Jupyter Notebook/Lab server*
- *jupyter_server: The backend (core services, APIs, REST endpoints) to Jupyter web applications*
- *jupyter_server_terminals: A Jupyter Server Extension Providing Terminals*
- *jupyter_sphinx: Jupyter Sphinx Extension*
- *jupyterlab_mathjax2: A MathJax Typesetting provider for JupyterLab 4 and above*
- *jupyterlab_pygments: Pygments theme using JupyterLab CSS variables*
- *jupyterlab_server: Set of server components for JupyterLab and JupyterLab like applications*
- *kiwisolver: Fast implementation of the Cassowary constraint solver*

- *libatomic_ops: Access hardware-provided atomic memory update operations*
- *libffi: A portable foreign-function interface library*
- *libgd: Dynamic graphics generation tool*
- *liblzma: General-purpose data compression software*
- *libpng: Bitmap image support*
- *markupsafe: Safely add untrusted strings to HTML/XML markup*
- *mathjax: A JavaScript library for displaying mathematical formulas*
- *memory_allocator: An extension class to allocate memory easily with Cython*
- *meson: A high performance build system*
- *meson_python: Meson Python build backend (PEP 517)*
- *mistune: Sane and fast Markdown parser with useful plugins and renderers*
- *nbclient: Client library for executing notebooks. Formerly nbconvert's ExecutePreprocessor*
- *nbformat: The Jupyter Notebook format*
- *ncurses: Classic terminal output library*
- *nest_asyncio: Patch asyncio to allow nested event loops*
- *ninja_build: A build system with a focus on speed*
- *notebook_shim: A shim layer for notebook traits and config*
- *openssl: Implementation of the SSL and TLS protocols*
- *overrides: Decorator to automatically detect mismatch when overriding a method*
- *packaging: Core utilities for Python packages*
- *pandocfilters: A Python module for writing pandoc filters*
- *parso: Python Parser*
- *patch: Applies diffs and patches to files*
- *patchelf: A small utility to modify the dynamic linker and RPATH of ELF executables*
- *pathspec: Utility library for gitignore style pattern matching of file paths*
- *pexpect: Python module for controlling and automating other programs*
- *pickleshare: A 'shelve' like datastore with concurrency support*
- *pillow: Python Imaging Library*
- *pip: Tool for installing and managing Python packages*
- *pkgconf: An implementation of the pkg-config spec*
- *pkgconfig: Python interface to pkg-config*
- *platformdirs: Small Python package for determining appropriate platform-specific dirs, e.g. a "user data dir"*
- *pluggy: Plugin and hook calling mechanisms for python*
- *ply: Python Lex & Yacc*
- *pplpy_doc: Python interface to the Parma Polyhedra Library (documentation)*
- *prometheus_client: Python client for the systems monitoring and alerting toolkit Prometheus*

- *prompt_toolkit: Interactive command lines for Python*
- *psutil: Cross-platform lib for process and system monitoring in Python.*
- *ptyprocess: Python interaction with subprocesses in a pseudoterminal*
- *pure_eval: Safely evaluate AST nodes without side effects*
- *py: Library with cross-python path, ini-parsing, io, code, log facilities*
- *pybind11: Create Python bindings to C++ code*
- *pycparser: Parser of the C language in Python*
- *pygments: Generic syntax highlighter*
- *pyparsing: A Python parsing module*
- *pyproject_api: API to interact with the python pyproject.toml based projects*
- *pyproject_hooks: Wrappers to call pyproject.toml-based build backend hooks.*
- *pyproject_metadata: PEP 621 metadata parsing*
- *pyrsistent: Persistent data structures in Python*
- *pytest: Simple powerful testing with Python*
- *pytest_mock: Thin-wrapper around the mock package for easier use with pytest*
- *pytest_xdist: Pytest xdist plugin for distributed testing, most importantly across multiple CPUs*
- *python3: The Python programming language*
- *python_build: A simple, correct PEP517 package builder*
- *python_json_logger: Python library adding a json log formatter*
- *pythran: Ahead of Time compiler for numeric kernels*
- *pytz: Timezone definitions for Python*
- *pytz_deprecation_shim: Shims to make deprecation of pytz easier*
- *pyyaml: YAML parser and emitter for Python*
- *pyzmq: Python bindings for the zeromq networking library*
- *readline: Command line editing library*
- *referencing: JSON Referencing + Python*
- *requests: An HTTP library for Python*
- *rfc3339_validator: A pure python RFC3339 validator*
- *rfc3986_validator: Pure python rfc3986 validator*
- *sage_conf: Configuration module for the SageMath library (distributable version)*
- *sage_docbuild: Build system of the Sage documentation*
- *sage-setup: Build system of the SageMath library*
- *send2trash: Send file to trash natively under Mac OS X, Windows and Linux*
- *setuptools: Build system for Python packages*
- *setuptools_scm: Python build system extension to obtain package version from version control*
- *six: Python 2 and 3 compatibility utilities*

- *sniffio: Sniff out which async library your code is running under*
- *snowballstemmer: Stemmer algorithms for natural language processing in Python*
- *soupsieve: Modern CSS selector implementation for Beautiful Soup*
- *sphinx: Python documentation generator*
- *sphinx_basic_ng: Modern skeleton for Sphinx themes*
- *sphinx_copybutton: Add a copy button to each of your code cells*
- *sphinx_inline_tabs: Add inline tabbed content to your Sphinx documentation*
- *sphinxcontrib_applehelp: Sphinx extension which outputs Apple help book*
- *sphinxcontrib_devhelp: Sphinx extension which outputs Devhelp documents*
- *sphinxcontrib_htmlhelp: Sphinx extension which outputs HTML help book*
- *sphinxcontrib_jsmath: Sphinx extension which renders display math in HTML via JavaScript*
- *sphinxcontrib_qthelp: Sphinx extension which outputs QtHelp documents*
- *sphinxcontrib_serializinghtml: Sphinx extension which outputs serialized HTML files*
- *sphinxcontrib_websupport: Sphinx API for Web apps*
- *sqlite: An SQL database engine*
- *stack_data: Extract data from python stack frames and tracebacks for informative displays*
- *terminado: Tornado websocket backend for the term.js Javascript terminal emulator library*
- *tinycss2: A tiny CSS parser*
- *tomli: A lil' TOML parser*
- *tornado: Python web framework and asynchronous networking library*
- *tox: tox is a generic virtualenv management and test command line tool*
- *traitlets: Traitlets Python configuration system*
- *trove_classifiers: Canonical source for classifiers on PyPI (pypi.org)*
- *types_python_dateutil: Typing stubs for python-dateutil*
- *typing_extensions: Backported and Experimental Type Hints for Python 3.8+*
- *tzdata: Provider of IANA time zone data*
- *tzlocal: Python timezone information for the local timezone*
- *uri_template: RFC 6570 URI Template Processor*
- *urllib3: HTTP library with thread-safe connection pooling, file post, and more*
- *virtualenv: Virtual Python Environment builder*
- *wcwidth: Measures the displayed width of unicode strings in a terminal*
- *webcolors: Library for working with the color formats defined by HTML and CSS*
- *webencodings: Character encoding aliases for legacy web content*
- *websocket_client: WebSocket client for Python with low level API options*
- *wheel: A built-package format for Python*
- *widgetsnbextension: Jupyter interactive widgets for Jupyter Notebook*

- *xz: General-purpose data compression software*
- *zeromq: A modern networking library*
- *zipp: A pathlib-compatible zipfile object wrapper*
- *zlib: Data compression library*

CHAPTER

TWO

OPTIONAL PACKAGES

For additional functionality, you can install some of the following optional packages.

2.1 Mathematics

- *4ti2: Algebraic, geometric and combinatorial problems on linear spaces*
- *admcycles: Computation in the tautological ring of the moduli space of curves*
- *benzene: Generate fusenes and benzenoids with a given number of faces*
- *bliss: Computing automorphism groups and canonical forms of graphs*
- *buckygen: Efficient generation of nonisomorphic fullerenes*
- *cbc: COIN-OR branch and cut solver for mixed-integer programs*
- *clarabel: Clarabel Conic Interior Point Solver for Rust / Python*
- *coxeter3: Library for Coxeter groups, Bruhat ordering, Kazhdan-Lusztig polynomials*
- *csdp: Solver for semidefinite programs*
- *cunningham_tables: List of the prime numbers occuring in the Cunningham table*
- *cvxpy: Domain-specific language for modeling convex optimization problems in Python*
- *cylp: Python interface for CLP, CBC, and CGL*
- *database_cremona_ellcurve: Database of elliptic curves*
- *database_cubic_hecke: Ivan Marin's representations of the cubic Hecke algebra*
- *database_jones_numfield: Table of number fields*
- *database_knotinfo: Content of the KnotInfo and LinkInfo databases as lists of dictionaries*
- *database_kohel: Database of modular and Hilbert polynomials*
- *database_mutation_class: Database of exceptional mutation classes of quivers*
- *database_odlyzko_zeta: Table of zeros of the Riemann zeta function*
- *database_stein_watkins: Database of elliptic curves (full version)*
- *database_stein_watkins_mini: Database of elliptic curves (small version)*
- *database_symbolic_data: Database from the SymbolicData project*
- *dsdp: Semidefinite programming solver*
- *e_antic: Real embedded number fields*

- *ecos_python: Embedded Cone Solver (Python wrapper)*
- *fricas: A general purpose computer algebra system*
- *frobby: Computations on monomial ideals*
- *gap_jupyter: Jupyter kernel for GAP*
- *gap_packages: A collection of GAP packages*
- *giac: A general purpose computer algebra system*
- *glucose: A SAT solver*
- *gp2c: A compiler for translating GP routines to C*
- *igraph: A library for creating and manipulating graphs*
- *isl: Sets and relations of integer points bounded by affine constraints*
- *jupymake: A Python wrapper for the polymake shell*
- *kenzo: Construct topological spaces and compute homology groups*
- *kissat: SAT solver*
- *latte_int: Count lattice points, compute volumes, and integrate over convex polytopes*
- *libnauty: Find automorphism groups of graphs, generate non-isomorphic graphs (callable library)*
- *libsemigroups: Library for semigroups and monoids*
- *lidia: A library for computational number theory*
- *lrslib: Reverse search algorithm for vertex enumeration and convex hull problems*
- *mathics: General-purpose computer algebra system*
- *matroid_database: Python interface to matroid database*
- *mcqd: An exact algorithm for finding a maximum clique in an undirected graph*
- *meataxe: Library for computing with modular representations*
- *modular_resolution: Modular cohomology rings of finite groups*
- *mpfrcx: Arithmetic of univariate polynomials over arbitrary precision real or complex numbers*
- *msolve: Multivariate polynomial system solver*
- *normaliz: Computations in affine monoids, vector configurations, lattice polytopes, and rational cones*
- *ore_algebra: Ore algebra*
- *osqp_python: The Operator Splitting QP Solver (Python wrapper)*
- *p_group_cohomology: Modular cohomology rings of finite groups*
- *papilo: Parallel presolve for integer and linear optimization*
- *pari_elldata: PARI data package for elliptic curves*
- *pari_galpol: PARI data package for polynomials defining Galois extensions of the rationals*
- *pari_jupyter: Jupyter kernel for PARI/GP*
- *pari_nftables: PARI data package for number fields*
- *pari_seadata: PARI data package needed by ellap for large primes (full version)*
- *phitigra: Graph editor for SageMath/Jupyter*

- *plantri: Generate non-isomorphic sphere-embdedded graphs*
- *polymake: Computations with polyhedra, fans, simplicial complexes, matroids, graphs, tropical hypersurfaces*
- *polytopes_db_4d: Database of 4-dimensional reflexive polytopes*
- *pycosat: SAT solver picosat with Python bindings*
- *pycryptosat: Python module of cryptominisat*
- *pynormaliz: Python bindings for the normaliz library*
- *pyscipopt: Python interface and modeling environment for SCIP*
- *pysingular: A basic Python interface to Singular*
- *python_igraph: Python bindings for igraph*
- *qdldl_python: QDLDL, a free LDL factorization routine (Python wrapper)*
- *qepcad: Quantifier elimination by partial cylindrical algebraic decomposition*
- *r: A free software environment for statistical computing and graphics*
- *rubiks: Programs for Rubik's cube*
- *saclib: Computations with real algebraic numbers*
- *sage_flatsurf: Flat surfaces in SageMath*
- *sage_numerical_backends_coin: COIN-OR backend for Sage MixedIntegerLinearProgram*
- *sage_numerical_backends_cplex: Cplex backend for Sage MixedIntegerLinearProgram*
- *sage_numerical_backends_gurobi: Gurobi backend for Sage MixedIntegerLinearProgram*
- *sbcl: a lisp compiler and runtime system*
- *scip: Mixed integer programming solver*
- *scip_sdp: Mixed integer semidefinite programming plugin for SCIP*
- *scs: Splitting conic solver*
- *singular_jupyter: Jupyter kernel for Singular*
- *sirocco: Compute topologically certified root continuation of bivariate polynomials*
- *slabbe: Sébastien Labbé's Research code*
- *snappy: Topology and geometry of 3-manifolds, with a focus on hyperbolic structures*
- *soplex: Linear optimization solver using the revised simplex method*
- *surface_dynamics: dynamics on surfaces (measured foliations, interval exchange transformation, Teichmüller flow, etc)*
- *symengine: A C++ symbolic manipulation library*
- *symengine_py: Python wrappers for SymEngine*
- *tdlib: Algorithms for computing tree decompositions of graphs*
- *tides: Integration of ODEs*
- *topcom: Compute triangulations of point configurations and oriented matroids*

2.2 Front-end, graphics, document preparation

- *dot2tex: Create PGF/TikZ commands from Graphviz output*
- *graphviz: Graph visualization software*
- *jmol: Java viewer for chemical structures in 3D*
- *jupyter_jsmol: JSmol viewer widget for Jupyter*
- *pandoc: A document converter*
- *pdf2svg: PDF to SVG convertor*
- *pygraphviz: Python interface to Graphviz*
- *rst2ipynb: Convert reStructuredText files to Jupyter notebooks*
- *sage_sws2rst: Translate legacy Sage worksheet files (.sws) to reStructuredText (.rst) files*
- *texlive: A comprehensive TeX system*

2.3 Other dependencies

- *_bootstrap: Represents system packages required for running the top-level bootstrap script*
- *_develop: Represents system packages recommended for development*
- *_recommended: Represents system packages recommended for additional functionality*
- *_sagemath: Downstream package of Sage in distributions*
- *auditwheel_or_delocate: Repair wheels on Linux or macOS*
- *biopython: Tools for computational molecular biology*
- *ccache: A compiler cache*
- *d3js: JavaScript library for manipulating documents based on data*
- *ffmpeg: ffmpeg video converter*
- *free_fonts: a free family of scalable outline fonts*
- *gdb: The GNU Project debugger*
- *git: Version control system*
- *github_cli: Command-line interface for GitHub*
- *gitpython: GitPython is a python library used to interact with Git repositories*
- *hypothesis: A library for property-based testing*
- *imagemagick: A collection of tools and libraries for many image file formats*
- *libgraphviz: Graph visualization software (callable library)*
- *libjpeg: JPEG image support*
- *libogg: Library for the Ogg multimedia container format*
- *libxml2: XML parser and toolkit*
- *llvm: The LLVM Compiler Infrastructure, including the Clang C/C++/Objective-C compiler*
- *nibabel: Access a multitude of neuroimaging data formats*

- *notedown: Create IPython notebooks from markdown*
- *onetbb: oneAPI Threading Building Blocks*
- *pandoc_attributes: A parser and generator for pandoc block attributes*
- *perl_cpan_polymake_prereq: Represents all Perl packages that are prerequisites for polymake*
- *perl_mongodb: A prerequisite for polymake's PolyDB feature*
- *perl_term_readline_gnu: Perl extension for the GNU Readline/History libraries*
- *pybtex: A BibTeX-compatible bibliography processor in Python*
- *pyppeteer: Headless chrome/chromium automation library*
- *python_flint: Bindings for FLINT and Arb*
- *pyx: Generate PostScript, PDF, and SVG files in Python*
- *sqlalchemy: A database abstraction library*
- *texlive_luatex: LuaTeX packages*
- *texttable: Python module for creating simple ASCII tables*
- *valgrind: Memory error detector, call graph generator, runtime profiler*
- *xindy: a general-purpose index processor*

CHAPTER

THREE

FEATURES

3.1 Testing for features of the environment at runtime

A computation can require a certain package to be installed in the runtime environment. Abstractly such a package describes a *Feature* which can be tested for at runtime. It can be of various kinds, most prominently an *Executable* in the PATH, a *PythonModule*, or an additional package for some installed system such as a *GapPackage*.

AUTHORS:

- Julian Rüth (2016-04-07): Initial version
- Jeroen Demeyer (2018-02-12): Refactoring and clean up

EXAMPLES:

Some generic features are available for common cases. For example, to test for the existence of a binary, one can use an *Executable* feature:

```
sage: from sage.features import Executable
sage: Executable(name='sh', executable='sh').is_present()
FeatureTestResult('sh', True)
```

```
>>> from sage.all import *
>>> from sage.features import Executable
>>> Executable(name='sh', executable='sh').is_present()
FeatureTestResult('sh', True)
```

Here we test whether the grape GAP package is available:

```
sage: from sage.features.gap import GapPackage
sage: GapPackage("grape", spkg='gap_packages').is_present()  # optional - gap_package_
↪grape
FeatureTestResult('gap_package_grape', True)
```

```
>>> from sage.all import *
>>> from sage.features.gap import GapPackage
>>> GapPackage("grape", spkg='gap_packages').is_present()  # optional - gap_package_
↪grape
FeatureTestResult('gap_package_grape', True)
```

Note that a *FeatureTestResult* acts like a bool in most contexts:

```
sage: if Executable(name='sh', executable='sh').is_present(): "present."
'present.'
```

```
>>> from sage.all import *
>>> if Executable(name='sh', executable='sh').is_present(): "present."
'present.'
```

When one wants to raise an error if the feature is not available, one can use the `require` method:

```
sage: Executable(name='sh', executable='sh').require()

sage: Executable(name='random', executable='randomOochoz6x', spkg='random', url=
↪'http://rand.om').require() # optional - sage_spkg
Traceback (most recent call last):
...
FeatureNotPresentError: random is not available.
Executable 'randomOochoz6x' not found on PATH.
...try to run...sage -i random...
Further installation instructions might be available at http://rand.om.
```

```
>>> from sage.all import *
>>> Executable(name='sh', executable='sh').require()

>>> Executable(name='random', executable='randomOochoz6x', spkg='random', url='http://
↪rand.om').require() # optional - sage_spkg
Traceback (most recent call last):
...
FeatureNotPresentError: random is not available.
Executable 'randomOochoz6x' not found on PATH.
...try to run...sage -i random...
Further installation instructions might be available at http://rand.om.
```

As can be seen above, features try to produce helpful error messages.

class sage.features.**CythonFeature**(**args*, ***kwds*)

Bases: *Feature*

A *Feature* which describes the ability to compile and import a particular piece of Cython code.

To test the presence of `name`, the cython compiler is run on `test_code` and the resulting module is imported.

EXAMPLES:

```
sage: from sage.features import CythonFeature
sage: fabs_test_code = '''
....: cdef extern from "<math.h>":
....:     double fabs(double x)
....:
....: assert fabs(-1) == 1
....: '''
sage: fabs = CythonFeature("fabs", test_code=fabs_test_code,                    #␣
↪needs sage.misc.cython
....:                      spkg='gcc', url='https://gnu.org',
....:                      type='standard')
sage: fabs.is_present()                                                         #␣
↪needs sage.misc.cython
FeatureTestResult('fabs', True)
```

```
>>> from sage.all import *
>>> from sage.features import CythonFeature
>>> fabs_test_code = '''
... cdef extern from "<math.h>":
...     double fabs(double x)
....:
>>> assert fabs(-Integer(1)) == Integer(1)
... '''
>>> fabs = CythonFeature("fabs", test_code=fabs_test_code,                    #␣
↪needs sage.misc.cython
...                       spkg='gcc', url='https://gnu.org',
...                       type='standard')
>>> fabs.is_present()                                                         #␣
↪needs sage.misc.cython
FeatureTestResult('fabs', True)
```

Test various failures:

```
sage: broken_code = '''this is not a valid Cython program!'''
sage: broken = CythonFeature("broken", test_code=broken_code)
sage: broken.is_present()
FeatureTestResult('broken', False)
```

```
>>> from sage.all import *
>>> broken_code = '''this is not a valid Cython program!'''
>>> broken = CythonFeature("broken", test_code=broken_code)
>>> broken.is_present()
FeatureTestResult('broken', False)
```

```
sage: broken_code = '''cdef extern from "no_such_header_file": pass'''
sage: broken = CythonFeature("broken", test_code=broken_code)
sage: broken.is_present()
FeatureTestResult('broken', False)
```

```
>>> from sage.all import *
>>> broken_code = '''cdef extern from "no_such_header_file": pass'''
>>> broken = CythonFeature("broken", test_code=broken_code)
>>> broken.is_present()
FeatureTestResult('broken', False)
```

```
sage: broken_code = '''import no_such_python_module'''
sage: broken = CythonFeature("broken", test_code=broken_code)
sage: broken.is_present()
FeatureTestResult('broken', False)
```

```
>>> from sage.all import *
>>> broken_code = '''import no_such_python_module'''
>>> broken = CythonFeature("broken", test_code=broken_code)
>>> broken.is_present()
FeatureTestResult('broken', False)
```

```
sage: broken_code = '''raise AssertionError("sorry!")'''
sage: broken = CythonFeature("broken", test_code=broken_code)
sage: broken.is_present()
FeatureTestResult('broken', False)
```

```
>>> from sage.all import *
>>> broken_code = '''raise AssertionError("sorry!")'''
>>> broken = CythonFeature("broken", test_code=broken_code)
>>> broken.is_present()
FeatureTestResult('broken', False)
```

class sage.features.**Executable**(**args*, ***kwds*)

Bases: *FileFeature*

A feature describing an executable in the PATH.

In an installation of Sage with SAGE_LOCAL different from SAGE_VENV, the executable is searched first in SAGE_VENV/bin, then in SAGE_LOCAL/bin, then in PATH.

Note

Overwrite *is_functional()* if you also want to check whether the executable shows proper behaviour.

Calls to is_present() are cached. You might want to cache the *Executable* object to prevent unnecessary calls to the executable.

EXAMPLES:

```
sage: from sage.features import Executable
sage: Executable(name='sh', executable='sh').is_present()
FeatureTestResult('sh', True)
sage: Executable(name='does-not-exist', executable='does-not-exist-xxxxyxyyxyy').
↪is_present()
FeatureTestResult('does-not-exist', False)
```

```
>>> from sage.all import *
>>> from sage.features import Executable
>>> Executable(name='sh', executable='sh').is_present()
FeatureTestResult('sh', True)
>>> Executable(name='does-not-exist', executable='does-not-exist-xxxxyxyyxyy').is_
↪present()
FeatureTestResult('does-not-exist', False)
```

absolute_filename()

The absolute path of the executable as a string.

EXAMPLES:

```
sage: from sage.features import Executable
sage: Executable(name='sh', executable='sh').absolute_filename()
'/...bin/sh'
```

```
>>> from sage.all import *
>>> from sage.features import Executable
>>> Executable(name='sh', executable='sh').absolute_filename()
'/...bin/sh'
```

A *FeatureNotPresentError* is raised if the file cannot be found:

```
sage: Executable(name='does-not-exist', executable='does-not-exist-xxxxyxyyxyy
↪').absolute_filename()
Traceback (most recent call last):
...
sage.features.FeatureNotPresentError: does-not-exist is not available.
Executable 'does-not-exist-xxxxyxyyxyy' not found on PATH.
```

```
>>> from sage.all import *
>>> Executable(name='does-not-exist', executable='does-not-exist-xxxxyxyyxyy
↪').absolute_filename()
Traceback (most recent call last):
...
sage.features.FeatureNotPresentError: does-not-exist is not available.
Executable 'does-not-exist-xxxxyxyyxyy' not found on PATH.
```

is_functional()

Return whether an executable in the path is functional.

This method is used internally and can be overridden in subclasses in order to implement a feature test. It should not be called directly. Use *Feature.is_present()* instead.

EXAMPLES:

The function returns `True` unless explicitly overwritten:

```
sage: from sage.features import Executable
sage: Executable(name='sh', executable='sh').is_functional()
FeatureTestResult('sh', True)
```

```
>>> from sage.all import *
>>> from sage.features import Executable
>>> Executable(name='sh', executable='sh').is_functional()
FeatureTestResult('sh', True)
```

class sage.features.**Feature**(**args*, ***kwds*)

Bases: *TrivialUniqueRepresentation*

A feature of the runtime environment.

INPUT:

- `name` – string; name of the feature. This should be suitable as an optional tag for the Sage doctester, i.e., lowercase alphanumeric with underscores (_) allowed; features that correspond to Python modules/packages may use periods (.)
- `spkg` – string; name of the SPKG providing the feature
- `description` – string (optional); plain English description of the feature
- `url` – a URL for the upstream package providing the feature

- `type` – string; one of `'standard'`, `'optional'` (default), `'experimental'`

Overwrite `_is_present()` to add feature checks.

EXAMPLES:

```
sage: from sage.features.gap import GapPackage
sage: GapPackage("grape", spkg='gap_packages')  # indirect doctest
Feature('gap_package_grape')
```

```
>>> from sage.all import *
>>> from sage.features.gap import GapPackage
>>> GapPackage("grape", spkg='gap_packages')  # indirect doctest
Feature('gap_package_grape')
```

For efficiency, features are unique:

```
sage: GapPackage("grape") is GapPackage("grape")
True
```

```
>>> from sage.all import *
>>> GapPackage("grape") is GapPackage("grape")
True
```

hide()

Hide this feature. For example this is used when the doctest option `--hide` is set. Setting an installed feature as hidden pretends that it is not available. To revert this use *unhide()*.

EXAMPLES:

Benzene is an optional SPKG. The following test fails if it is hidden or not installed. Thus, in the second invocation the optional tag is needed:

```
sage: from sage.features.graph_generators import Benzene
sage: Benzene().hide()
sage: len(list(graphs.fusenes(2)))                                              #␣
↪needs sage.graphs
Traceback (most recent call last):
...
FeatureNotPresentError: benzene is not available.
Feature `benzene` is hidden.
Use method `unhide` to make it available again.

sage: Benzene().unhide()            # optional - benzene, needs sage.graphs
sage: len(list(graphs.fusenes(2)))  # optional - benzene, needs sage.graphs
1
```

```
>>> from sage.all import *
>>> from sage.features.graph_generators import Benzene
>>> Benzene().hide()
>>> len(list(graphs.fusenes(Integer(2))))                                       ␣
↪     # needs sage.graphs
Traceback (most recent call last):
...
FeatureNotPresentError: benzene is not available.
```

(continues on next page)

(continued from previous page)

```
Feature `benzene` is hidden.
Use method `unhide` to make it available again.

>>> Benzene().unhide()            # optional - benzene, needs sage.graphs
>>> len(list(graphs.fusenes(Integer(2))))  # optional - benzene, needs sage.
↪graphs
1
```

is_hidden()

Return whether `self` is present but currently hidden.

EXAMPLES:

sage: from sage.features.sagemath import sage__plot sage: sage__plot().hide() sage: sage__plot().is_hidden() # needs sage.plot True sage: sage__plot().unhide() sage: sage__plot().is_hidden() False

is_optional()

Return whether this feature corresponds to an optional SPKG.

EXAMPLES:

```
sage: from sage.features.databases import DatabaseCremona
sage: DatabaseCremona().is_optional()
True
```

```
>>> from sage.all import *
>>> from sage.features.databases import DatabaseCremona
>>> DatabaseCremona().is_optional()
True
```

is_present()

Return whether the feature is present.

OUTPUT:

A *FeatureTestResult* which can be used as a boolean and contains additional information about the feature test.

EXAMPLES:

```
sage: from sage.features.gap import GapPackage
sage: GapPackage("grape", spkg='gap_packages').is_present()  # optional - gap_
↪package_grape
FeatureTestResult('gap_package_grape', True)
sage: GapPackage("NOT_A_PACKAGE", spkg='gap_packages').is_present()
FeatureTestResult('gap_package_NOT_A_PACKAGE', False)
```

```
>>> from sage.all import *
>>> from sage.features.gap import GapPackage
>>> GapPackage("grape", spkg='gap_packages').is_present()  # optional - gap_
↪package_grape
FeatureTestResult('gap_package_grape', True)
>>> GapPackage("NOT_A_PACKAGE", spkg='gap_packages').is_present()
FeatureTestResult('gap_package_NOT_A_PACKAGE', False)
```

The result is cached:

```
sage: from sage.features import Feature
sage: class TestFeature(Feature):
....:     def _is_present(self):
....:         print("checking presence")
....:         return True
sage: TestFeature("test").is_present()
checking presence
FeatureTestResult('test', True)
sage: TestFeature("test").is_present()
FeatureTestResult('test', True)
sage: TestFeature("other").is_present()
checking presence
FeatureTestResult('other', True)
sage: TestFeature("other").is_present()
FeatureTestResult('other', True)
```

```
>>> from sage.all import *
>>> from sage.features import Feature
>>> class TestFeature(Feature):
...     def _is_present(self):
...         print("checking presence")
...         return True
>>> TestFeature("test").is_present()
checking presence
FeatureTestResult('test', True)
>>> TestFeature("test").is_present()
FeatureTestResult('test', True)
>>> TestFeature("other").is_present()
checking presence
FeatureTestResult('other', True)
>>> TestFeature("other").is_present()
FeatureTestResult('other', True)
```

is_standard()

Return whether this feature corresponds to a standard SPKG.

EXAMPLES:

```
sage: from sage.features.databases import DatabaseCremona
sage: DatabaseCremona().is_standard()
False
```

```
>>> from sage.all import *
>>> from sage.features.databases import DatabaseCremona
>>> DatabaseCremona().is_standard()
False
```

joined_features()

Return a list of features that `self` is the join of.

OUTPUT:

A (possibly empty) list of instances of *Feature*.

EXAMPLES:

```
sage: from sage.features.graphviz import Graphviz
sage: Graphviz().joined_features()
[Feature('dot'), Feature('neato'), Feature('twopi')]
sage: from sage.features.sagemath import sage__rings__function_field
sage: sage__rings__function_field().joined_features()
[Feature('sage.rings.function_field.function_field_polymod'),
Feature('sage.libs.singular'),
Feature('sage.libs.singular.singular'),
Feature('sage.interfaces.singular')]
sage: from sage.features.interfaces import Mathematica
sage: Mathematica().joined_features()
[]
```

```
>>> from sage.all import *
>>> from sage.features.graphviz import Graphviz
>>> Graphviz().joined_features()
[Feature('dot'), Feature('neato'), Feature('twopi')]
>>> from sage.features.sagemath import sage__rings__function_field
>>> sage__rings__function_field().joined_features()
[Feature('sage.rings.function_field.function_field_polymod'),
Feature('sage.libs.singular'),
Feature('sage.libs.singular.singular'),
Feature('sage.interfaces.singular')]
>>> from sage.features.interfaces import Mathematica
>>> Mathematica().joined_features()
[]
```

require()

Raise a *FeatureNotPresentError* if the feature is not present.

EXAMPLES:

```
sage: from sage.features.gap import GapPackage
sage: GapPackage("ve1EeThu").require()                                      #␣
↪needs sage.libs.gap
Traceback (most recent call last):
...
FeatureNotPresentError: gap_package_ve1EeThu is not available.
`LoadPackage("ve1EeThu")` evaluated to `fail` in GAP.
```

```
>>> from sage.all import *
>>> from sage.features.gap import GapPackage
>>> GapPackage("ve1EeThu").require()                                        #␣
↪needs sage.libs.gap
Traceback (most recent call last):
...
FeatureNotPresentError: gap_package_ve1EeThu is not available.
`LoadPackage("ve1EeThu")` evaluated to `fail` in GAP.
```

resolution()

Return a suggestion on how to make *is_present()* pass if it did not pass.

OUTPUT: string

EXAMPLES:

```
sage: from sage.features import Executable
sage: Executable(name='CSDP', spkg='csdp', executable='theta', url='https://
↪github.com/dimpase/csdp').resolution()  # optional - sage_spkg
'...To install CSDP...you can try to run...sage -i csdp...Further␣
↪installation instructions might be available at https://github.com/dimpase/
↪csdp.'
```

```
>>> from sage.all import *
>>> from sage.features import Executable
>>> Executable(name='CSDP', spkg='csdp', executable='theta', url='https://
↪github.com/dimpase/csdp').resolution()  # optional - sage_spkg
'...To install CSDP...you can try to run...sage -i csdp...Further␣
↪installation instructions might be available at https://github.com/dimpase/
↪csdp.'
```

unhide()

Revert what *hide()* did.

EXAMPLES:

sage: from sage.features.sagemath import sage__plot sage: sage__plot().hide() sage: sage__plot().is_present() FeatureTestResult('sage.plot', False) sage: sage__plot().unhide() # needs sage.plot sage: sage__plot().is_present() # needs sage.plot FeatureTestResult('sage.plot', True)

exception sage.features.**FeatureNotPresentError**(*feature*, *reason=None*, *resolution=None*)

Bases: RuntimeError

A missing feature error.

EXAMPLES:

```
sage: from sage.features import Feature, FeatureTestResult
sage: class Missing(Feature):
....:     def _is_present(self):
....:         return False

sage: Missing(name='missing').require()
Traceback (most recent call last):
...
FeatureNotPresentError: missing is not available.
```

```
>>> from sage.all import *
>>> from sage.features import Feature, FeatureTestResult
>>> class Missing(Feature):
...     def _is_present(self):
...         return False

>>> Missing(name='missing').require()
Traceback (most recent call last):
...
FeatureNotPresentError: missing is not available.
```

property resolution

Initialize self. See help(type(self)) for accurate signature.

class sage.features.**FeatureTestResult**(*feature*, *is_present*, *reason=None*, *resolution=None*)

Bases: object

The result of a *Feature.is_present()* call.

Behaves like a boolean with some extra data which may explain why a feature is not present and how this may be resolved.

EXAMPLES:

```
sage: from sage.features.gap import GapPackage
sage: presence = GapPackage("NOT_A_PACKAGE").is_present(); presence  # indirect␣
↪doctest
FeatureTestResult('gap_package_NOT_A_PACKAGE', False)
sage: bool(presence)
False
```

```
>>> from sage.all import *
>>> from sage.features.gap import GapPackage
>>> presence = GapPackage("NOT_A_PACKAGE").is_present(); presence  # indirect␣
↪doctest
FeatureTestResult('gap_package_NOT_A_PACKAGE', False)
>>> bool(presence)
False
```

Explanatory messages might be available as `reason` and `resolution`:

```
sage: presence.reason                                                          #␣
↪needs sage.libs.gap
'`LoadPackage("NOT_A_PACKAGE")` evaluated to `fail` in GAP.'
sage: bool(presence.resolution)
False
```

```
>>> from sage.all import *
>>> presence.reason                                                            #␣
↪needs sage.libs.gap
'`LoadPackage("NOT_A_PACKAGE")` evaluated to `fail` in GAP.'
>>> bool(presence.resolution)
False
```

If a feature is not present, `resolution` defaults to `feature.resolution()` if this is defined. If you do not want to use this default you need explicitly set `resolution` to a string:

```
sage: from sage.features import FeatureTestResult
sage: package = GapPackage("NOT_A_PACKAGE", spkg='no_package')
sage: str(FeatureTestResult(package, True).resolution)  # optional - sage_spkg
'...To install gap_package_NOT_A_PACKAGE...you can try to run...sage -i no_
↪package...'
sage: str(FeatureTestResult(package, False).resolution) # optional - sage_spkg
'...To install gap_package_NOT_A_PACKAGE...you can try to run...sage -i no_
↪package...'
```

(continues on next page)

(continued from previous page)

```
sage: FeatureTestResult(package, False, resolution='rtm').resolution
'rtm'
```

```
>>> from sage.all import *
>>> from sage.features import FeatureTestResult
>>> package = GapPackage("NOT_A_PACKAGE", spkg='no_package')
>>> str(FeatureTestResult(package, True).resolution)  # optional - sage_spkg
'...To install gap_package_NOT_A_PACKAGE...you can try to run...sage -i no_
↪package...'
>>> str(FeatureTestResult(package, False).resolution) # optional - sage_spkg
'...To install gap_package_NOT_A_PACKAGE...you can try to run...sage -i no_
↪package...'
>>> FeatureTestResult(package, False, resolution='rtm').resolution
'rtm'
```

property resolution

Initialize self. See help(type(self)) for accurate signature.

class sage.features.**FileFeature**(**args*, ***kwds*)

Bases: *Feature*

Base class for features that describe a file or directory in the file system.

A subclass should implement a method *absolute_filename()*.

EXAMPLES:

Two direct concrete subclasses of *FileFeature* are defined:

```
sage: from sage.features import StaticFile, Executable, FileFeature
sage: issubclass(StaticFile, FileFeature)
True
sage: issubclass(Executable, FileFeature)
True
```

```
>>> from sage.all import *
>>> from sage.features import StaticFile, Executable, FileFeature
>>> issubclass(StaticFile, FileFeature)
True
>>> issubclass(Executable, FileFeature)
True
```

To work with the file described by the feature, use the method *absolute_filename()*. A *FeatureNotPresentError* is raised if the file cannot be found:

```
sage: Executable(name='does-not-exist', executable='does-not-exist-xxxxyxyyxyy').
↪absolute_filename()
Traceback (most recent call last):
...
sage.features.FeatureNotPresentError: does-not-exist is not available.
Executable 'does-not-exist-xxxxyxyyxyy' not found on PATH.
```

```
>>> from sage.all import *
>>> Executable(name='does-not-exist', executable='does-not-exist-xxxxyxyyxyy').
```

(continues on next page)

(continued from previous page)

```
↪absolute_filename()
Traceback (most recent call last):
...
sage.features.FeatureNotPresentError: does-not-exist is not available.
Executable 'does-not-exist-xxxxyxyyxyy' not found on PATH.
```

A *FileFeature* also provides the `is_present()` method to test for the presence of the file at run time. This is inherited from the base class *Feature*:

```
sage: Executable(name='sh', executable='sh').is_present()
FeatureTestResult('sh', True)
```

```
>>> from sage.all import *
>>> Executable(name='sh', executable='sh').is_present()
FeatureTestResult('sh', True)
```

absolute_filename()

The absolute path of the file as a string.

Concrete subclasses must override this abstract method.

class sage.features.**PythonModule**(**args*, ***kwds*)

Bases: *Feature*

A *Feature* which describes whether a python module can be imported.

EXAMPLES:

Not all builds of python include the `ssl` module, so you could check whether it is available:

```
sage: from sage.features import PythonModule
sage: PythonModule("ssl").require()  # not tested - output depends on the python␣
↪build
```

```
>>> from sage.all import *
>>> from sage.features import PythonModule
>>> PythonModule("ssl").require()  # not tested - output depends on the python␣
↪build
```

class sage.features.**StaticFile**(**args*, ***kwds*)

Bases: *FileFeature*

A *Feature* which describes the presence of a certain file such as a database.

EXAMPLES:

```
sage: from sage.features import StaticFile
sage: StaticFile(name='no_such_file', filename='KaT1aihu',              #␣
↪optional - sage_spkg
....:            search_path='/', spkg='some_spkg',
....:            url='http://rand.om').require()
Traceback (most recent call last):
...
FeatureNotPresentError: no_such_file is not available.
'KaT1aihu' not found in any of ['/']...
```

(continues on next page)

(continued from previous page)

```
To install no_such_file...you can try to run...sage -i some_spkg...
Further installation instructions might be available at http://rand.om.
```

```
>>> from sage.all import *
>>> from sage.features import StaticFile
>>> StaticFile(name='no_such_file', filename='KaT1aihu',              # optional -
↪ sage_spkg
...            search_path='/', spkg='some_spkg',
...            url='http://rand.om').require()
Traceback (most recent call last):
...
FeatureNotPresentError: no_such_file is not available.
'KaT1aihu' not found in any of ['/']...
To install no_such_file...you can try to run...sage -i some_spkg...
Further installation instructions might be available at http://rand.om.
```

absolute_filename()

The absolute path of the file as a string.

EXAMPLES:

```
sage: from sage.features import StaticFile
sage: from sage.misc.temporary_file import tmp_dir
sage: dir_with_file = tmp_dir()
sage: file_path = os.path.join(dir_with_file, "file.txt")
sage: open(file_path, 'a').close() # make sure the file exists
sage: search_path = ( '/foo/bar', dir_with_file ) # file is somewhere in the␣
↪search path
sage: feature = StaticFile(name='file', filename='file.txt', search_
↪path=search_path)
sage: feature.absolute_filename() == file_path
True
```

```
>>> from sage.all import *
>>> from sage.features import StaticFile
>>> from sage.misc.temporary_file import tmp_dir
>>> dir_with_file = tmp_dir()
>>> file_path = os.path.join(dir_with_file, "file.txt")
>>> open(file_path, 'a').close() # make sure the file exists
>>> search_path = ( '/foo/bar', dir_with_file ) # file is somewhere in the␣
↪search path
>>> feature = StaticFile(name='file', filename='file.txt', search_path=search_
↪path)
>>> feature.absolute_filename() == file_path
True
```

A *FeatureNotPresentError* is raised if the file cannot be found:

```
sage: from sage.features import StaticFile
sage: StaticFile(name='no_such_file', filename='KaT1aihu',  # optional - sage_
↪spkg
....:            search_path=(), spkg='some_spkg',
```

(continues on next page)

(continued from previous page)

```
....:            url='http://rand.om').absolute_filename()
Traceback (most recent call last):
...
FeatureNotPresentError: no_such_file is not available.
'KaT1aihu' not found in any of []...
To install no_such_file...you can try to run...sage -i some_spkg...
Further installation instructions might be available at http://rand.om.
```

```
>>> from sage.all import *
>>> from sage.features import StaticFile
>>> StaticFile(name='no_such_file', filename='KaT1aihu',  # optional - sage_
↪spkg
...            search_path=(), spkg='some_spkg',
...            url='http://rand.om').absolute_filename()
Traceback (most recent call last):
...
FeatureNotPresentError: no_such_file is not available.
'KaT1aihu' not found in any of []...
To install no_such_file...you can try to run...sage -i some_spkg...
Further installation instructions might be available at http://rand.om.
```

class sage.features.**TrivialClasscallMetaClass**

Bases: `type`

A trivial version of `sage.misc.classcall_metaclass.ClasscallMetaclass` without Cython dependencies.

class sage.features.**TrivialUniqueRepresentation**(**args*, ***kwds*)

Bases: `object`

A trivial version of `UniqueRepresentation` without Cython dependencies.

sage.features.**package_systems**()

Return a list of *PackageSystem* objects representing the available package systems.

The list is ordered by decreasing preference.

EXAMPLES:

```
sage: from sage.features import package_systems
sage: package_systems()    # random
[Feature('homebrew'), Feature('sage_spkg'), Feature('pip')]
```

```
>>> from sage.all import *
>>> from sage.features import package_systems
>>> package_systems()    # random
[Feature('homebrew'), Feature('sage_spkg'), Feature('pip')]
```

3.2 Join features

class sage.features.join_feature.**JoinFeature**(**args*, ***kwds*)

Bases: *Feature*

Join of several *Feature* instances.

This creates a new feature as the union of the given features. Typically these are executables of an SPKG. For an example, see *Rubiks*.

Furthermore, this can be the union of a single feature. This is used to map the given feature to a more convenient name to be used in `optional` tags of doctests. Thus you can equip a feature such as a *PythonModule* with a tag name that differs from the systematic tag name. As an example for this use case, see *Meataxe*.

EXAMPLES:

```
sage: from sage.features import Executable
sage: from sage.features.join_feature import JoinFeature
sage: F = JoinFeature("shell-boolean",
....:                 (Executable('shell-true', 'true'),
....:                  Executable('shell-false', 'false')))
sage: F.is_present()
FeatureTestResult('shell-boolean', True)
sage: F = JoinFeature("asdfghjkl",
....:                 (Executable('shell-true', 'true'),
....:                  Executable('xxyyyy', 'xxyyyy-does-not-exist')))
sage: F.is_present()
FeatureTestResult('xxyyyy', False)
```

```
>>> from sage.all import *
>>> from sage.features import Executable
>>> from sage.features.join_feature import JoinFeature
>>> F = JoinFeature("shell-boolean",
...                 (Executable('shell-true', 'true'),
...                  Executable('shell-false', 'false')))
>>> F.is_present()
FeatureTestResult('shell-boolean', True)
>>> F = JoinFeature("asdfghjkl",
...                 (Executable('shell-true', 'true'),
...                  Executable('xxyyyy', 'xxyyyy-does-not-exist')))
>>> F.is_present()
FeatureTestResult('xxyyyy', False)
```

hide()

Hide this feature and all its joined features.

EXAMPLES:

```
sage: from sage.features.sagemath import sage__groups
sage: f = sage__groups()
sage: f.hide()
sage: f._features[0].is_present()
FeatureTestResult('sage.groups.perm_gps.permgroup', False)

sage: f.require()
Traceback (most recent call last):
...
FeatureNotPresentError: sage.groups is not available.
Feature `sage.groups` is hidden.
Use method `unhide` to make it available again.
```

```
>>> from sage.all import *
>>> from sage.features.sagemath import sage__groups
>>> f = sage__groups()
>>> f.hide()
>>> f._features[Integer(0)].is_present()
FeatureTestResult('sage.groups.perm_gps.permgroup', False)

>>> f.require()
Traceback (most recent call last):
...
FeatureNotPresentError: sage.groups is not available.
Feature `sage.groups` is hidden.
Use method `unhide` to make it available again.
```

unhide()

Revert what *hide()* did.

EXAMPLES:

```
sage: from sage.features.sagemath import sage__groups
sage: f = sage__groups()
sage: f.hide()
sage: f.is_present()
FeatureTestResult('sage.groups', False)
sage: f._features[0].is_present()
FeatureTestResult('sage.groups.perm_gps.permgroup', False)

sage: f.unhide()
sage: f.is_present()    # optional sage.groups
FeatureTestResult('sage.groups', True)
sage: f._features[0].is_present() # optional sage.groups
FeatureTestResult('sage.groups.perm_gps.permgroup', True)
```

```
>>> from sage.all import *
>>> from sage.features.sagemath import sage__groups
>>> f = sage__groups()
>>> f.hide()
>>> f.is_present()
FeatureTestResult('sage.groups', False)
>>> f._features[Integer(0)].is_present()
FeatureTestResult('sage.groups.perm_gps.permgroup', False)

>>> f.unhide()
>>> f.is_present()    # optional sage.groups
FeatureTestResult('sage.groups', True)
>>> f._features[Integer(0)].is_present() # optional sage.groups
FeatureTestResult('sage.groups.perm_gps.permgroup', True)
```

3.3 Enumeration of all defined features

sage.features.all.**all_features**()

Return an iterable of all features.

EXAMPLES:

```
sage: from sage.features.all import all_features
sage: sorted(all_features(), key=lambda f: f.name)  # random
[...Feature('sage.combinat')...]
```

```
>>> from sage.all import *
>>> from sage.features.all import all_features
>>> sorted(all_features(), key=lambda f: f.name)  # random
[...Feature('sage.combinat')...]
```

sage.features.all.**module_feature**(*module_name*)

Find a top-level `Feature` that provides the Python module of the given `module_name`.

Only features known to *`all_features()`* are considered.

INPUT:

- `module_name` – string

OUTPUT: a `Feature` or `None`

EXAMPLES:

```
sage: from sage.features.all import module_feature
sage: module_feature('sage.combinat.tableau')                                  #␣
↪needs sage.combinat
Feature('sage.combinat')
sage: module_feature('sage.combinat.posets.poset')                             #␣
↪needs sage.graphs
Feature('sage.graphs')
sage: module_feature('sage.schemes.toric.variety')                             #␣
↪needs sage.geometry.polyhedron
Feature('sage.geometry.polyhedron')
sage: module_feature('scipy')                                                  #␣
↪needs scipy
Feature('scipy')
sage: print(module_feature('sage.structure.element'))
None
sage: print(module_feature('sage.does_not_exist'))
None
```

```
>>> from sage.all import *
>>> from sage.features.all import module_feature
>>> module_feature('sage.combinat.tableau')                                    #␣
↪needs sage.combinat
Feature('sage.combinat')
>>> module_feature('sage.combinat.posets.poset')                               #␣
↪needs sage.graphs
Feature('sage.graphs')
```

(continues on next page)

(continued from previous page)

```
>>> module_feature('sage.schemes.toric.variety')                              #␣
↪needs sage.geometry.polyhedron
Feature('sage.geometry.polyhedron')
>>> module_feature('scipy')                                                   #␣
↪needs scipy
Feature('scipy')
>>> print(module_feature('sage.structure.element'))
None
>>> print(module_feature('sage.does_not_exist'))
None
```

sage.features.all.**name_feature**(*name*, *toplevel=None*)

Find a top-level `Feature` that provides the top-level `name`.

Only features known to *all_features()* are considered.

INPUT:

- `name` – string
- `toplevel` – a module or other namespace

OUTPUT: a `Feature` or `None`

EXAMPLES:

```
sage: from sage.features.all import name_feature
sage: name_feature('QuadraticField')                                          #␣
↪needs sage.rings.number_field
Feature('sage.rings.number_field')
sage: name_feature('line')                                                    #␣
↪needs sage.plot
Feature('sage.plot')
sage: print(name_feature('ZZ'))
None
sage: print(name_feature('does_not_exist'))
None
```

```
>>> from sage.all import *
>>> from sage.features.all import name_feature
>>> name_feature('QuadraticField')                                            #␣
↪needs sage.rings.number_field
Feature('sage.rings.number_field')
>>> name_feature('line')                                                      #␣
↪needs sage.plot
Feature('sage.plot')
>>> print(name_feature('ZZ'))
None
>>> print(name_feature('does_not_exist'))
None
```

3.4 Features for testing the presence of Python modules in the Sage library

All of these features are present in a monolithic installation of the Sage library, such as the one made by the SageMath distribution.

The features are defined for the purpose of separately testing modularized distributions such as *sagemath-categories* and *sagemath-repl*.

Often, doctests in a module of the Sage library illustrate the interplay with a range of different objects; this is a form of integration testing. These objects may come from modules shipped in other distributions. For example, `sage.structure.element` (shipped by *sagemath-objects*, one of the most fundamental distributions) contains the doctest:

```
sage: G = SymmetricGroup(4)                                                 #␣
↪needs sage.groups
sage: g = G([2, 3, 4, 1])                                                   #␣
↪needs sage.groups
sage: g.powers(4)                                                           #␣
↪needs sage.groups
[(), (1,2,3,4), (1,3)(2,4), (1,4,3,2)]
```

```
>>> from sage.all import *
>>> G = SymmetricGroup(Integer(4))                                          ␣
↪     # needs sage.groups
>>> g = G([Integer(2), Integer(3), Integer(4), Integer(1)])                 ␣
↪                                  # needs sage.groups
>>> g.powers(Integer(4))                                                    ␣
↪     # needs sage.groups
[(), (1,2,3,4), (1,3)(2,4), (1,4,3,2)]
```

This test cannot pass when the distribution *sagemath-objects* is tested separately (in a virtual environment): In this situation, `SymmetricGroup` is not defined anywhere (and thus not present in the top-level namespace). Hence, we conditionalize this doctest on the presence of the feature *sage.groups*.

class sage.features.sagemath.**SAGE_SRC**(**args*, ***kwds*)

Bases: *StaticFile*

A *Feature* which describes the presence of the monolithic source tree of the Sage library.

sage.features.sagemath.**all_features**()

Return features corresponding to parts of the Sage library.

These features are named after Python packages/modules (e.g., `sage.symbolic`), not distribution packages (**sagemath-symbolics**).

This design is motivated by a separation of concerns: The author of a module that depends on some functionality provided by a Python module usually already knows the name of the Python module, so we do not want to force the author to also know about the distribution package that provides the Python module.

Instead, we associate distribution packages to Python modules in *sage.features.sagemath* via the `spkg` parameter of *Feature*.

EXAMPLES:

```
sage: from sage.features.sagemath import all_features
sage: list(all_features())
[...Feature('sage.combinat'), ...]
```

```
>>> from sage.all import *
>>> from sage.features.sagemath import all_features
>>> list(all_features())
[...Feature('sage.combinat'), ...]
```

class sage.features.sagemath.**sage__combinat**(**args*, ***kwds*)

Bases: *JoinFeature*

A *Feature* describing the presence of `sage.combinat`.

EXAMPLES:

Python modules that provide elementary combinatorial objects such as `sage.combinat.subset`, `sage.combinat.composition`, `sage.combinat.permutation` are always available; there is no need for an `# optional/needs` tag:

```
sage: Permutation([1,2,3]).is_even()
True
sage: Permutation([6,1,4,5,2,3]).bruhat_inversions()
[[0, 1], [0, 2], [0, 3], [2, 4], [2, 5], [3, 4], [3, 5]]
```

```
>>> from sage.all import *
>>> Permutation([Integer(1),Integer(2),Integer(3)]).is_even()
True
>>> Permutation([Integer(6),Integer(1),Integer(4),Integer(5),Integer(2),
↪Integer(3)]).bruhat_inversions()
[[0, 1], [0, 2], [0, 3], [2, 4], [2, 5], [3, 4], [3, 5]]
```

Use `# needs sage.combinat` for doctests that use any other Python modules from `sage.combinat`, for example `sage.combinat.tableau_tuple`:

```
sage: TableauTuple([[[7,8,9]],[],[[1,2,3],[4,5],[6]]]).shape()                #␣
↪needs sage.combinat
([3], [], [3, 2, 1])
```

```
>>> from sage.all import *
>>> TableauTuple([[[Integer(7),Integer(8),Integer(9)]],[],[[Integer(1),Integer(2),
↪Integer(3)],[Integer(4),Integer(5)],[Integer(6)]]]).shape()                   #␣
↪needs sage.combinat
([3], [], [3, 2, 1])
```

Doctests that use Python modules from `sage.combinat` that involve trees, graphs, hypergraphs, posets, quivers, combinatorial designs, finite state machines etc. should be marked `# needs sage.combinat sage.graphs`:

```
sage: L = Poset({0: [1], 1: [2], 2:[3], 3:[4]})                               #␣
↪needs sage.combinat sage.graphs
sage: L.is_chain()                                                             #␣
↪needs sage.combinat sage.graphs
True
```

```
>>> from sage.all import *
>>> L = Poset({Integer(0): [Integer(1)], Integer(1): [Integer(2)],␣
↪Integer(2):[Integer(3)], Integer(3):[Integer(4)]})                            ␣
↪    # needs sage.combinat sage.graphs
```

(continues on next page)

(continued from previous page)

```
>>> L.is_chain()                                                              #␣
↪needs sage.combinat sage.graphs
True
```

Doctests that use combinatorial modules/algebras, or root systems should use the tag `# needs sage.combinat sage.modules`:

```
sage: # needs sage.combinat sage.modules
sage: A = SchurAlgebra(QQ, 2, 3)
sage: a = A.an_element(); a
2*S((1, 1, 1), (1, 1, 1)) + 2*S((1, 1, 1), (1, 1, 2))
 + 3*S((1, 1, 1), (1, 2, 2))
sage: L = RootSystem(['A',3,1]).root_lattice()
sage: PIR = L.positive_imaginary_roots(); PIR
Positive imaginary roots of type ['A', 3, 1]
```

```
>>> from sage.all import *
>>> # needs sage.combinat sage.modules
>>> A = SchurAlgebra(QQ, Integer(2), Integer(3))
>>> a = A.an_element(); a
2*S((1, 1, 1), (1, 1, 1)) + 2*S((1, 1, 1), (1, 1, 2))
 + 3*S((1, 1, 1), (1, 2, 2))
>>> L = RootSystem(['A',Integer(3),Integer(1)]).root_lattice()
>>> PIR = L.positive_imaginary_roots(); PIR
Positive imaginary roots of type ['A', 3, 1]
```

Doctests that use lattices, semilattices, or Dynkin diagrams should use the tag `# needs sage.combinat sage.graphs sage.modules`:

```
sage: L = LatticePoset({0: [1,2], 1: [3], 2: [3,4], 3: [5], 4: [5]})          #␣
↪needs sage.combinat sage.graphs sage.modules
sage: L.meet_irreducibles()                                                    #␣
↪needs sage.combinat sage.graphs sage.modules
[1, 3, 4]
```

```
>>> from sage.all import *
>>> L = LatticePoset({Integer(0): [Integer(1),Integer(2)], Integer(1):␣
↪[Integer(3)], Integer(2): [Integer(3),Integer(4)], Integer(3): [Integer(5)],␣
↪Integer(4): [Integer(5)]})            # needs sage.combinat sage.graphs sage.
↪modules
>>> L.meet_irreducibles()                                                      #␣
↪needs sage.combinat sage.graphs sage.modules
[1, 3, 4]
```

class sage.features.sagemath.**sage__geometry__polyhedron**(**args*, ***kwds*)

Bases: *JoinFeature*

A *Feature* describing the presence of `sage.geometry.polyhedron`.

EXAMPLES:

Doctests that use polyhedra, cones, geometric complexes, triangulations, etc. should use the tag `# needs sage.geometry.polyhedron`:

```
sage: co = polytopes.truncated_tetrahedron()                                #␣
↪needs sage.geometry.polyhedron
sage: co.volume()                                                           #␣
↪needs sage.geometry.polyhedron
184/3
```

```
>>> from sage.all import *
>>> co = polytopes.truncated_tetrahedron()                                  #␣
↪needs sage.geometry.polyhedron
>>> co.volume()                                                             #␣
↪needs sage.geometry.polyhedron
184/3
```

Some constructions of polyhedra require additional tags:

```
sage: # needs sage.combinat sage.geometry.polyhedron sage.rings.number_field
sage: perm_a3_reg_nf = polytopes.generalized_permutahedron(
....:     ['A',3], regular=True, backend='number_field'); perm_a3_reg_nf
A 3-dimensional polyhedron in AA^3 defined as the convex hull of 24 vertices
```

```
>>> from sage.all import *
>>> # needs sage.combinat sage.geometry.polyhedron sage.rings.number_field
>>> perm_a3_reg_nf = polytopes.generalized_permutahedron(
...     ['A',Integer(3)], regular=True, backend='number_field'); perm_a3_reg_nf
A 3-dimensional polyhedron in AA^3 defined as the convex hull of 24 vertices
```

class sage.features.sagemath.**sage__graphs**(**args*, ***kwds*)

Bases: *JoinFeature*

A *Feature* describing the presence of `sage.graphs`.

EXAMPLES:

Doctests that use anything from `sage.graphs` (`Graph`, `DiGraph`, …) should be marked `# needs sage.graphs`. The same applies to any doctest that uses a `Poset`, cluster algebra quiver, finite state machines, abelian sandpiles, or Dynkin diagrams:

```
sage: g = graphs.PetersenGraph()                                            #␣
↪needs sage.graphs
sage: r, s = g.is_weakly_chordal(certificate=True); r                       #␣
↪needs sage.graphs
False
```

```
>>> from sage.all import *
>>> g = graphs.PetersenGraph()                                              #␣
↪needs sage.graphs
>>> r, s = g.is_weakly_chordal(certificate=True); r                         #␣
↪needs sage.graphs
False
```

Also any use of tree classes defined in `sage.combinat` (`BinaryTree`, `RootedTree`, …) in doctests should be marked the same.

By way of generalization, any use of `SimplicialComplex` or other abstract complexes from `sage.topology`, hypergraphs, and combinatorial designs, should be marked `# needs sage.graphs` as well:

```
sage: X = SimplicialComplex([[0,1,2], [1,2,3]])                                #␣
↪needs sage.graphs
sage: X.link(Simplex([0]))                                                     #␣
↪needs sage.graphs
Simplicial complex with vertex set (1, 2) and facets {(1, 2)}

sage: IncidenceStructure([[1,2,3],[1,4]]).degrees(2)                           #␣
↪needs sage.graphs
{(1, 2): 1, (1, 3): 1, (1, 4): 1, (2, 3): 1, (2, 4): 0, (3, 4): 0}
```

```
>>> from sage.all import *
>>> X = SimplicialComplex([[Integer(0),Integer(1),Integer(2)], [Integer(1),
↪Integer(2),Integer(3)]])                                  # needs sage.graphs
>>> X.link(Simplex([Integer(0)]))                                              ␣
↪     # needs sage.graphs
Simplicial complex with vertex set (1, 2) and facets {(1, 2)}

>>> IncidenceStructure([[Integer(1),Integer(2),Integer(3)],[Integer(1),
↪Integer(4)]]).degrees(Integer(2))                          # needs sage.graphs
{(1, 2): 1, (1, 3): 1, (1, 4): 1, (2, 3): 1, (2, 4): 0, (3, 4): 0}
```

On the other hand, matroids are not implemented as posets in Sage but are instead closely tied to linear algebra over fields; hence use `# needs sage.modules` instead:

```
sage: # needs sage.modules
sage: M = Matroid(Matrix(QQ, [[1, 0, 0, 0, 1, 1, 1],
....:                         [0, 1, 0, 1, 0, 1, 1],
....:                         [0, 0, 1, 1, 1, 0, 1]]))
sage: N = (M / [2]).delete([3, 4])
sage: sorted(N.groundset())
[0, 1, 5, 6]
```

```
>>> from sage.all import *
>>> # needs sage.modules
>>> M = Matroid(Matrix(QQ, [[Integer(1), Integer(0), Integer(0), Integer(0),␣
↪Integer(1), Integer(1), Integer(1)],
...                         [Integer(0), Integer(1), Integer(0), Integer(1),␣
↪Integer(0), Integer(1), Integer(1)],
...                         [Integer(0), Integer(0), Integer(1), Integer(1),␣
↪Integer(1), Integer(0), Integer(1)]]))
>>> N = (M / [Integer(2)]).delete([Integer(3), Integer(4)])
>>> sorted(N.groundset())
[0, 1, 5, 6]
```

However, many constructions (and some methods) of matroids do involve graphs:

```
sage: # needs sage.modules
sage: W = matroids.Wheel(3)     # despite the name, not created via graphs
sage: W.is_isomorphic(N)          # goes through a graph isomorphism test      #␣
↪needs sage.graphs
False
sage: K4 = matroids.CompleteGraphic(4)    # this one is created via graphs     #␣
↪needs sage.graphs
```

(continues on next page)

(continued from previous page)

```
sage: K4.is_isomorphic(W)                                                    #␣
↪needs sage.graphs
True
```

```
>>> from sage.all import *
>>> # needs sage.modules
>>> W = matroids.Wheel(Integer(3))      # despite the name, not created via graphs
>>> W.is_isomorphic(N)            # goes through a graph isomorphism test      #␣
↪needs sage.graphs
False
>>> K4 = matroids.CompleteGraphic(Integer(4))     # this one is created via graphs␣
↪     # needs sage.graphs
>>> K4.is_isomorphic(W)                                                        #␣
↪needs sage.graphs
True
```

class sage.features.sagemath.**sage__groups**(**args*, ***kwds*)

Bases: *JoinFeature*

A *Feature* describing the presence of `sage.groups`.

EXAMPLES:

Permutations and sets of permutations are always available, but permutation groups are implemented in Sage using the *GAP* system and require the tag `# needs sage.groups`:

```
sage: p = Permutation([2,1,4,3])
sage: p.to_permutation_group_element()                                       #␣
↪needs sage.groups
(1,2)(3,4)
```

```
>>> from sage.all import *
>>> p = Permutation([Integer(2),Integer(1),Integer(4),Integer(3)])
>>> p.to_permutation_group_element()                                         #␣
↪needs sage.groups
(1,2)(3,4)
```

class sage.features.sagemath.**sage__libs__braiding**(**args*, ***kwds*)

Bases: *PythonModule*

A *Feature* describing the presence of `sage.libs.braiding`.

EXAMPLES:

```
sage: from sage.features.sagemath import sage__libs__braiding
sage: sage__libs__braiding().is_present()                                    ␣
↪   # needs sage.libs.braiding
FeatureTestResult('sage.libs.braiding', True)
```

```
>>> from sage.all import *
>>> from sage.features.sagemath import sage__libs__braiding
>>> sage__libs__braiding().is_present()                                      ␣
↪ # needs sage.libs.braiding
FeatureTestResult('sage.libs.braiding', True)
```

class sage.features.sagemath.**sage__libs__ecl**(**args*, ***kwds*)

Bases: *PythonModule*

A *Feature* describing the presence of `sage.libs.ecl`.

EXAMPLES:

```
sage: from sage.features.sagemath import sage__libs__ecl
sage: sage__libs__ecl().is_present()                          # optional - sage.
↪libs.ecl
FeatureTestResult('sage.libs.ecl', True)
```

```
>>> from sage.all import *
>>> from sage.features.sagemath import sage__libs__ecl
>>> sage__libs__ecl().is_present()                          # optional - sage.libs.
↪ecl
FeatureTestResult('sage.libs.ecl', True)
```

class sage.features.sagemath.**sage__libs__flint**(**args*, ***kwds*)

Bases: *JoinFeature*

A *sage.features.Feature* describing the presence of `sage.libs.flint` and other modules depending on FLINT.

In addition to the modularization purposes that this tag serves, it also provides attribution to the upstream project.

class sage.features.sagemath.**sage__libs__gap**(**args*, ***kwds*)

Bases: *JoinFeature*

A *sage.features.Feature* describing the presence of `sage.libs.gap` (the library interface to *GAP*) and `sage.interfaces.gap` (the pexpect interface to GAP). By design, we do not distinguish between these two, in order to facilitate the conversion of code from the pexpect interface to the library interface.

See also

Features for GAP packages

class sage.features.sagemath.**sage__libs__giac**(**args*, ***kwds*)

Bases: *JoinFeature*

A *sage.features.Feature* describing the presence of `sage.libs.giac`.

In addition to the modularization purposes that this tag serves, it also provides attribution to the upstream project.

class sage.features.sagemath.**sage__libs__homfly**(**args*, ***kwds*)

Bases: *JoinFeature*

A *sage.features.Feature* describing the presence of `sage.libs.homfly`.

In addition to the modularization purposes that this tag serves, it also provides attribution to the upstream project.

class sage.features.sagemath.**sage__libs__linbox**(**args*, ***kwds*)

Bases: *JoinFeature*

A *sage.features.Feature* describing the presence of `sage.libs.linbox` and other modules depending on Givaro, FFLAS-FFPACK, LinBox.

In addition to the modularization purposes that this tag serves, it also provides attribution to the upstream project.

class sage.features.sagemath.**sage__libs__m4ri**(**args*, ***kwds*)

Bases: *JoinFeature*

A *sage.features.Feature* describing the presence of Cython modules depending on the M4RI and/or M4RIe libraries.

In addition to the modularization purposes that this tag serves, it also provides attribution to the upstream project.

class sage.features.sagemath.**sage__libs__ntl**(**args*, ***kwds*)

Bases: *JoinFeature*

A *sage.features.Feature* describing the presence of `sage.libs.ntl` and other modules depending on NTL.

In addition to the modularization purposes that this tag serves, it also provides attribution to the upstream project.

class sage.features.sagemath.**sage__libs__pari**(**args*, ***kwds*)

Bases: *JoinFeature*

A *Feature* describing the presence of `sage.libs.pari`.

SageMath uses the *PARI* library (via *cypari2*) for numerous purposes. Doctests that involves such features should be marked `# needs sage.libs.pari`.

In addition to the modularization purposes that this tag serves, it also provides attribution to the upstream project.

EXAMPLES:

```
sage: R.<a> = QQ[]
sage: S.<x> = R[]
sage: f = x^2 + a; g = x^3 + a
sage: r = f.resultant(g); r                                                 #␣
↪needs sage.libs.pari
a^3 + a^2
```

```
>>> from sage.all import *
>>> R = QQ['a']; (a,) = R._first_ngens(1)
>>> S = R['x']; (x,) = S._first_ngens(1)
>>> f = x**Integer(2) + a; g = x**Integer(3) + a
>>> r = f.resultant(g); r                                                   #␣
↪needs sage.libs.pari
a^3 + a^2
```

class sage.features.sagemath.**sage__libs__singular**(**args*, ***kwds*)

Bases: *JoinFeature*

A *sage.features.Feature* describing the presence of `sage.libs.singular` (the library interface to Singular) and `sage.interfaces.singular` (the pexpect interface to Singular). By design, we do not distinguish between these two, in order to facilitate the conversion of code from the pexpect interface to the library interface.

See also

`Feature singular`

class sage.features.sagemath.**sage__modular**(**args*, ***kwds*)

Bases: *JoinFeature*

A *Feature* describing the presence of `sage.modular`.

class sage.features.sagemath.**sage__modules**(**args*, ***kwds*)

Bases: *JoinFeature*

A *Feature* describing the presence of `sage.modules`.

EXAMPLES:

All uses of implementations of vector spaces / free modules in SageMath, whether `sage.modules.free_module.FreeModule`, `sage.combinat.free_module.CombinatorialFreeModule`, `sage.tensor.modules.finite_rank_free_module.FiniteRankFreeModule`, or additive abelian groups, should be marked `# needs sage.modules`.

The same holds for matrices, tensors, algebras, quadratic forms, point lattices, root systems, matrix/affine/Weyl/Coxeter groups, matroids, and ring derivations.

Likewise, all uses of `sage.coding`, `sage.crypto`, and `sage.homology` in doctests should be marked `# needs sage.modules`.

class sage.features.sagemath.**sage__numerical__mip**(**args*, ***kwds*)

Bases: *PythonModule*

A *Feature* describing the presence of `sage.numerical.mip`.

class sage.features.sagemath.**sage__plot**(**args*, ***kwds*)

Bases: *JoinFeature*

A *Feature* describing the presence of `sage.plot`.

class sage.features.sagemath.**sage__rings__complex_double**(**args*, ***kwds*)

Bases: *PythonModule*

A *Feature* describing the presence of `sage.rings.complex_double`.

class sage.features.sagemath.**sage__rings__finite_rings**(**args*, ***kwds*)

Bases: *JoinFeature*

A *Feature* describing the presence of `sage.rings.finite_rings`; specifically, the element implementations using the *PARI* library.

class sage.features.sagemath.**sage__rings__function_field**(**args*, ***kwds*)

Bases: *JoinFeature*

A *Feature* describing the presence of `sage.rings.function_field`.

EXAMPLES:

Rational function fields are always available:

```
sage: K.<x> = FunctionField(QQ)
sage: K.maximal_order()
Maximal order of Rational function field in x over Rational Field
```

```
>>> from sage.all import *
>>> K = FunctionField(QQ, names=('x',)); (x,) = K._first_ngens(1)
>>> K.maximal_order()
Maximal order of Rational function field in x over Rational Field
```

Use the tag `# needs sage.rings.function_field` whenever extensions of function fields (by adjoining a root of a univariate polynomial) come into play:

```
sage: R.<y> = K[]
sage: L.<y> = K.extension(y^5 - (x^3 + 2*x*y + 1/x)); L                    #␣
↪needs sage.rings.function_field
Function field in y defined by y^5 - 2*x*y + (-x^4 - 1)/x
```

```
>>> from sage.all import *
>>> R = K['y']; (y,) = R._first_ngens(1)
>>> L = K.extension(y**Integer(5) - (x**Integer(3) + Integer(2)*x*y + Integer(1)/
↪x), names=('y',)); (y,) = L._first_ngens(1); L                    # needs␣
↪sage.rings.function_field
Function field in y defined by y^5 - 2*x*y + (-x^4 - 1)/x
```

Such extensions of function fields are implemented using Gröbner bases of polynomial rings; Sage makes essential use of the *Singular* system for this. (It is not necessary to use the tag `# needs sage.libs.singular`; it is implied by `# needs sage.rings.function_field`.)

class sage.features.sagemath.**sage__rings__number_field**(**args*, ***kwds*)

Bases: *JoinFeature*

A *Feature* describing the presence of `sage.rings.number_field`.

Number fields are implemented in Sage using a complicated mixture of various libraries, including *FLINT*, *GAP*, *MPFI*, *NTL*, and *PARI*.

EXAMPLES:

Rational numbers are, of course, always available:

```
sage: QQ in NumberFields()
True
```

```
>>> from sage.all import *
>>> QQ in NumberFields()
True
```

Doctests that construct algebraic number fields should be marked `# needs sage.rings.number_field`:

```
sage: # needs sage.rings.number_field
sage: K.<cuberoot2> = NumberField(x^3 - 2)
sage: L.<cuberoot3> = K.extension(x^3 - 3)
sage: S.<sqrt2> = L.extension(x^2 - 2); S
Number Field in sqrt2 with defining polynomial x^2 - 2 over its base field

sage: # needs sage.rings.number_field
sage: K.<zeta> = CyclotomicField(15)
sage: CC(zeta)
0.913545457642601 + 0.406736643075800*I
```

```
>>> from sage.all import *
>>> # needs sage.rings.number_field
>>> K = NumberField(x**Integer(3) - Integer(2), names=('cuberoot2',)); (cuberoot2,
↪) = K._first_ngens(1)
>>> L = K.extension(x**Integer(3) - Integer(3), names=('cuberoot3',)); (cuberoot3,
↪) = L._first_ngens(1)
```

(continues on next page)

(continued from previous page)

```
>>> S = L.extension(x**Integer(2) - Integer(2), names=('sqrt2',)); (sqrt2,) = S._
↪first_ngens(1); S
Number Field in sqrt2 with defining polynomial x^2 - 2 over its base field

>>> # needs sage.rings.number_field
>>> K = CyclotomicField(Integer(15), names=('zeta',)); (zeta,) = K._first_ngens(1)
>>> CC(zeta)
0.913545457642601 + 0.406736643075800*I
```

Doctests that make use of the algebraic field `QQbar` or the algebraic real field `AA` should be marked likewise:

```
sage: # needs sage.rings.number_field
sage: AA(-1)^(1/3)
-1
sage: QQbar(-1)^(1/3)
0.500000000000000? + 0.866025403784439?*I
```

```
>>> from sage.all import *
>>> # needs sage.rings.number_field
>>> AA(-Integer(1))**(Integer(1)/Integer(3))
-1
>>> QQbar(-Integer(1))**(Integer(1)/Integer(3))
0.500000000000000? + 0.866025403784439?*I
```

Use of the universal cyclotomic field should be marked `# needs sage.libs.gap sage.rings.number_field`.

sage: # needs sage.libs.gap sage.rings.number_field sage: UCF = UniversalCyclotomicField(); UCF Universal Cyclotomic Field sage: E = UCF.gen sage: f = E(2) + E(3); f 2*E(3) + E(3)^2 sage: f.galois_conjugates() [2*E(3) + E(3)^2, E(3) + 2*E(3)^2]

class sage.features.sagemath.**sage__rings__padics**(**args*, ***kwds*)

Bases: *JoinFeature*

A *Feature* describing the presence of `sage.rings.padics`.

class sage.features.sagemath.**sage__rings__polynomial__pbori**(**args*, ***kwds*)

Bases: *JoinFeature*

A *sage.features.Feature* describing the presence of `sage.rings.polynomial.pbori`.

class sage.features.sagemath.**sage__rings__real_double**(**args*, ***kwds*)

Bases: *PythonModule*

A *Feature* describing the presence of `sage.rings.real_double`.

EXAMPLES:

The Real Double Field is basically always available, and no `# optional/needs` tag is needed:

```
sage: RDF.characteristic()
0
```

```
>>> from sage.all import *
>>> RDF.characteristic()
0
```

The feature exists for use in doctests of Python modules that are shipped by the most fundamental distributions.

class sage.features.sagemath.**sage__rings__real_mpfr**(**args*, ***kwds*)

Bases: *JoinFeature*

A *Feature* describing the presence of `sage.rings.real_mpfr`.

class sage.features.sagemath.**sage__sat**(**args*, ***kwds*)

Bases: *JoinFeature*

A *Feature* describing the presence of `sage.sat`.

class sage.features.sagemath.**sage__schemes**(**args*, ***kwds*)

Bases: *JoinFeature*

A *Feature* describing the presence of `sage.schemes`.

class sage.features.sagemath.**sage__symbolic**(**args*, ***kwds*)

Bases: *JoinFeature*

A *Feature* describing the presence of `sage.symbolic`.

EXAMPLES:

The symbolics subsystem of Sage will be provided by the distribution sagemath-symbolics, in preparation at Issue #35095. If it is not installed, Sage will be able to provide installation advice:

```
sage: from sage.features.sagemath import sage__symbolic
sage: print(sage__symbolic().resolution())                                  #␣
↪optional - sage_spkg, not tested
...To install sagemath_symbolics...you can try to run...
pip install sagemath-symbolics
...
```

```
>>> from sage.all import *
>>> from sage.features.sagemath import sage__symbolic
>>> print(sage__symbolic().resolution())                                    #␣
↪optional - sage_spkg, not tested
...To install sagemath_symbolics...you can try to run...
pip install sagemath-symbolics
...
```

class sage.features.sagemath.**sagemath_doc_html**(**args*, ***kwds*)

Bases: *StaticFile*

A *Feature* which describes the presence of the documentation of the Sage library in HTML format.

Developers often use `make build` instead of `make` to avoid the long time it takes to compile the documentation. Although commands such as `make ptest` build the documentation before testing, other test commands such as `make ptestlong-nodoc` or `./sage -t --all` do not.

All doctests that refer to the built documentation need to be marked `# needs sagemath_doc_html`.

3.5 Features for testing the presence of package systems `sage_spkg`, `conda`, `pip`, `debian`, `fedora` etc.

class sage.features.pkg_systems.**PackageSystem**(**args*, ***kwds*)

Bases: *Feature*

A *Feature* describing a system package manager.

EXAMPLES:

```
sage: from sage.features.pkg_systems import PackageSystem
sage: PackageSystem('conda')
Feature('conda')
```

```
>>> from sage.all import *
>>> from sage.features.pkg_systems import PackageSystem
>>> PackageSystem('conda')
Feature('conda')
```

spkg_installation_hint(*spkgs*, *prompt*, *feature*)

Return a string that explains how to install `feature`.

EXAMPLES:

```
sage: from sage.features.pkg_systems import PackageSystem
sage: homebrew = PackageSystem('homebrew')
sage: homebrew.spkg_installation_hint('openblas')  # optional - SAGE_ROOT
'To install openblas using the homebrew package manager, you can try to run:\
↪n!brew install openblas'
```

```
>>> from sage.all import *
>>> from sage.features.pkg_systems import PackageSystem
>>> homebrew = PackageSystem('homebrew')
>>> homebrew.spkg_installation_hint('openblas')  # optional - SAGE_ROOT
'To install openblas using the homebrew package manager, you can try to run:\
↪n!brew install openblas'
```

class sage.features.pkg_systems.**PipPackageSystem**(**args*, ***kwds*)

Bases: *PackageSystem*

A *Feature* describing the Pip package manager.

EXAMPLES:

```
sage: from sage.features.pkg_systems import PipPackageSystem
sage: PipPackageSystem()
Feature('pip')
```

```
>>> from sage.all import *
>>> from sage.features.pkg_systems import PipPackageSystem
>>> PipPackageSystem()
Feature('pip')
```

class sage.features.pkg_systems.**SagePackageSystem**(**args*, ***kwds*)

Bases: *PackageSystem*

A *Feature* describing the package manager of the SageMath distribution.

EXAMPLES:

```
sage: from sage.features.pkg_systems import SagePackageSystem
sage: SagePackageSystem()
Feature('sage_spkg')
```

```
>>> from sage.all import *
>>> from sage.features.pkg_systems import SagePackageSystem
>>> SagePackageSystem()
Feature('sage_spkg')
```

3.6 Features for testing the presence of `bliss`

class sage.features.bliss.**Bliss**(**args*, ***kwds*)

Bases: *JoinFeature*

A *Feature* which describes whether the `sage.graphs.bliss` module is available in this installation of Sage.

EXAMPLES:

```
sage: from sage.features.bliss import Bliss
sage: Bliss().require()  # optional - bliss
```

```
>>> from sage.all import *
>>> from sage.features.bliss import Bliss
>>> Bliss().require()  # optional - bliss
```

class sage.features.bliss.**BlissLibrary**(**args*, ***kwds*)

Bases: *CythonFeature*

A *Feature* which describes whether the *Bliss library* is present and functional.

EXAMPLES:

```
sage: from sage.features.bliss import BlissLibrary
sage: BlissLibrary().require()  # optional - libbliss
```

```
>>> from sage.all import *
>>> from sage.features.bliss import BlissLibrary
>>> BlissLibrary().require()  # optional - libbliss
```

sage.features.bliss.**all_features**()

3.7 Feature for testing the presence of `csdp`

class sage.features.csdp.**CSDP**(**args*, ***kwds*)

Bases: *Executable*

A *Feature* which checks for the `theta` binary of *CSDP*.

EXAMPLES:

```
sage: from sage.features.csdp import CSDP
sage: CSDP().is_present()  # optional - csdp
FeatureTestResult('csdp', True)
```

```
>>> from sage.all import *
>>> from sage.features.csdp import CSDP
>>> CSDP().is_present()  # optional - csdp
FeatureTestResult('csdp', True)
```

is_functional()

Check whether `theta` works on a trivial example.

EXAMPLES:

```
sage: from sage.features.csdp import CSDP
sage: CSDP().is_functional()  # optional - csdp
FeatureTestResult('csdp', True)
```

```
>>> from sage.all import *
>>> from sage.features.csdp import CSDP
>>> CSDP().is_functional()  # optional - csdp
FeatureTestResult('csdp', True)
```

sage.features.csdp.**all_features**()

3.8 Features for testing the presence of various databases

class sage.features.databases.**DatabaseCremona**(**args*, ***kwds*)

Bases: *StaticFile*

A *Feature* which describes the presence of *John Cremona's database of elliptic curves*.

INPUT:

- `name` – either `'cremona'` (the default) for the full large database or `'cremona_mini'` for the small database

EXAMPLES:

```
sage: from sage.features.databases import DatabaseCremona
sage: DatabaseCremona('cremona_mini', type='standard').is_present()
FeatureTestResult('database_cremona_mini_ellcurve', True)
sage: DatabaseCremona().is_present()                                    #␣
↪optional - database_cremona_ellcurve
FeatureTestResult('database_cremona_ellcurve', True)
```

```
>>> from sage.all import *
>>> from sage.features.databases import DatabaseCremona
>>> DatabaseCremona('cremona_mini', type='standard').is_present()
FeatureTestResult('database_cremona_mini_ellcurve', True)
>>> DatabaseCremona().is_present()                                    # optional -
↪ database_cremona_ellcurve
FeatureTestResult('database_cremona_ellcurve', True)
```

class sage.features.databases.**DatabaseCubicHecke**(**args*, ***kwds*)

Bases: *PythonModule*

A *Feature* which describes the presence of the *Cubic Hecke algebra database package*.

The home of this database is the web-page Cubic Hecke algebra on 4 strands of Ivan Marin.

EXAMPLES:

```
sage: from sage.features.databases import DatabaseCubicHecke
sage: DatabaseCubicHecke().is_present()  # optional - database_cubic_hecke
FeatureTestResult('database_cubic_hecke', True)
```

```
>>> from sage.all import *
>>> from sage.features.databases import DatabaseCubicHecke
>>> DatabaseCubicHecke().is_present()  # optional - database_cubic_hecke
FeatureTestResult('database_cubic_hecke', True)
```

class sage.features.databases.**DatabaseEllcurves**(**args*, ***kwds*)

Bases: *StaticFile*

A *Feature* which describes the presence of William Stein's database of interesting curves.

EXAMPLES:

```
sage: from sage.features.databases import DatabaseEllcurves
sage: bool(DatabaseEllcurves().is_present())  # optional - database_ellcurves
True
```

```
>>> from sage.all import *
>>> from sage.features.databases import DatabaseEllcurves
>>> bool(DatabaseEllcurves().is_present())  # optional - database_ellcurves
True
```

class sage.features.databases.**DatabaseGraphs**(**args*, ***kwds*)

Bases: *StaticFile*

A *Feature* which describes the presence of the graphs database.

EXAMPLES:

```
sage: from sage.features.databases import DatabaseGraphs
sage: bool(DatabaseGraphs().is_present())  # optional - database_graphs
True
```

```
>>> from sage.all import *
>>> from sage.features.databases import DatabaseGraphs
>>> bool(DatabaseGraphs().is_present())  # optional - database_graphs
True
```

class sage.features.databases.**DatabaseJones**(**args*, ***kwds*)

Bases: *StaticFile*

A *Feature* which describes the presence of *John Jones's tables of number fields*.

EXAMPLES:

```
sage: from sage.features.databases import DatabaseJones
sage: bool(DatabaseJones().is_present())  # optional - database_jones_numfield
True
```

```
>>> from sage.all import *
>>> from sage.features.databases import DatabaseJones
>>> bool(DatabaseJones().is_present())  # optional - database_jones_numfield
True
```

class sage.features.databases.**DatabaseKnotInfo**(**args*, ***kwds*)

Bases: *PythonModule*

A *Feature* which describes the presence of the *package providing the KnotInfo and LinkInfo databases*.

The homes of these databases are the web-pages KnotInfo and LinkInfo.

EXAMPLES:

```
sage: from sage.features.databases import DatabaseKnotInfo
sage: DatabaseKnotInfo().is_present()  # optional - database_knotinfo
FeatureTestResult('database_knotinfo', True)
```

```
>>> from sage.all import *
>>> from sage.features.databases import DatabaseKnotInfo
>>> DatabaseKnotInfo().is_present()  # optional - database_knotinfo
FeatureTestResult('database_knotinfo', True)
```

class sage.features.databases.**DatabaseMatroids**(**args*, ***kwds*)

Bases: *PythonModule*

A *Feature* which describes the presence of *Yoshitake Matsumoto's Database of Matroids*.

EXAMPLES:

```
sage: from sage.features.databases import DatabaseMatroids
sage: DatabaseMatroids().is_present()                                          #␣
↪optional - matroid_database
FeatureTestResult('matroid_database', True)
```

```
>>> from sage.all import *
>>> from sage.features.databases import DatabaseMatroids
>>> DatabaseMatroids().is_present()                                            #␣
↪optional - matroid_database
FeatureTestResult('matroid_database', True)
```

REFERENCES:

[Mat2012]

class sage.features.databases.**DatabaseReflexivePolytopes**(**args*, ***kwds*)

Bases: *StaticFile*

A *Feature* which describes the presence of the *PALP databases of reflexive three-dimensional* and *four-dimensional lattice polytopes*.

EXAMPLES:

```
sage: from sage.features.databases import DatabaseReflexivePolytopes
sage: bool(DatabaseReflexivePolytopes().is_present())                          #␣
↪optional - polytopes_db
```

(continues on next page)

(continued from previous page)

```
True
sage: bool(DatabaseReflexivePolytopes('polytopes_db_4d').is_present())  #␣
↪optional - polytopes_db_4d
True
```

```
>>> from sage.all import *
>>> from sage.features.databases import DatabaseReflexivePolytopes
>>> bool(DatabaseReflexivePolytopes().is_present())                    # optional -
↪ polytopes_db
True
>>> bool(DatabaseReflexivePolytopes('polytopes_db_4d').is_present())  # optional -
↪ polytopes_db_4d
True
```

sage.features.databases.**all_features**()

sage.features.databases.**sage_data_path**(*data_name*)

Search path for database `data_name`.

EXAMPLES:

```
sage: from sage.features.databases import sage_data_path
sage: sage_data_path("cremona")
['.../cremona']
```

```
>>> from sage.all import *
>>> from sage.features.databases import sage_data_path
>>> sage_data_path("cremona")
['.../cremona']
```

3.9 Feature for testing the presence of `dvipng`

sage.features.dvipng.**all_features**()

class sage.features.dvipng.**dvipng**(**args*, ***kwds*)

Bases: *Executable*

A *Feature* describing the presence of `dvipng`.

EXAMPLES:

```
sage: from sage.features.dvipng import dvipng
sage: dvipng().is_present()              # optional - dvipng
FeatureTestResult('dvipng', True)
```

```
>>> from sage.all import *
>>> from sage.features.dvipng import dvipng
>>> dvipng().is_present()              # optional - dvipng
FeatureTestResult('dvipng', True)
```

3.10 Feature for testing the presence of `ffmpeg`

class sage.features.ffmpeg.**FFmpeg**(**args*, ***kwds*)

Bases: *Executable*

A *Feature* describing the presence of *ffmpeg*.

EXAMPLES:

```
sage: from sage.features.ffmpeg import FFmpeg
sage: FFmpeg().is_present()  # optional - ffmpeg
FeatureTestResult('ffmpeg', True)
```

```
>>> from sage.all import *
>>> from sage.features.ffmpeg import FFmpeg
>>> FFmpeg().is_present()  # optional - ffmpeg
FeatureTestResult('ffmpeg', True)
```

is_functional()

Return whether command `ffmpeg` in the path is functional.

EXAMPLES:

```
sage: from sage.features.ffmpeg import FFmpeg
sage: FFmpeg().is_functional()  # optional - ffmpeg
FeatureTestResult('ffmpeg', True)
```

```
>>> from sage.all import *
>>> from sage.features.ffmpeg import FFmpeg
>>> FFmpeg().is_functional()  # optional - ffmpeg
FeatureTestResult('ffmpeg', True)
```

sage.features.ffmpeg.**all_features**()

3.11 Features for testing the presence of `4ti2`

class sage.features.four_ti_2.**FourTi2**(**args*, ***kwds*)

Bases: *JoinFeature*

A *Feature* describing the presence of all *4ti2* executables.

EXAMPLES:

```
sage: from sage.features.four_ti_2 import FourTi2
sage: FourTi2().is_present()  # optional - 4ti2
FeatureTestResult('4ti2', True)
```

```
>>> from sage.all import *
>>> from sage.features.four_ti_2 import FourTi2
>>> FourTi2().is_present()  # optional - 4ti2
FeatureTestResult('4ti2', True)
```

class sage.features.four_ti_2.**FourTi2Executable**(**args*, ***kwds*)

Bases: *Executable*

A *Feature* for the *4ti2* executables.

sage.features.four_ti_2.**all_features**()

3.12 Features for testing the presence of the SageMath interfaces to gap and of GAP packages

class sage.features.gap.**GapPackage**(**args*, ***kwds*)

Bases: *Feature*

A *Feature* describing the presence of a GAP package.

A GAP package is "present" if it *can be* loaded, not if it *has been* loaded.

See also

Feature sage.libs.gap

EXAMPLES:

```
sage: from sage.features.gap import GapPackage
sage: GapPackage("grape", spkg='gap_packages')
Feature('gap_package_grape')
```

```
>>> from sage.all import *
>>> from sage.features.gap import GapPackage
>>> GapPackage("grape", spkg='gap_packages')
Feature('gap_package_grape')
```

sage.features.gap.**all_features**()

3.13 Features for testing the presence of graph generator programs benzene, buckygen, plantri

class sage.features.graph_generators.**Benzene**(**args*, ***kwds*)

Bases: *Executable*

A *Feature* which checks for the *benzene* binary.

EXAMPLES:

```
sage: from sage.features.graph_generators import Benzene
sage: Benzene().is_present()  # optional - benzene
FeatureTestResult('benzene', True)
```

```
>>> from sage.all import *
>>> from sage.features.graph_generators import Benzene
>>> Benzene().is_present()  # optional - benzene
FeatureTestResult('benzene', True)
```

is_functional()

Check whether `benzene` works on trivial input.

EXAMPLES:

```
sage: from sage.features.graph_generators import Benzene
sage: Benzene().is_functional()  # optional - benzene
FeatureTestResult('benzene', True)
```

```
>>> from sage.all import *
>>> from sage.features.graph_generators import Benzene
>>> Benzene().is_functional()  # optional - benzene
FeatureTestResult('benzene', True)
```

class sage.features.graph_generators.**Buckygen**(**args*, ***kwds*)

Bases: *Executable*

A *Feature* which checks for the *buckygen* binary.

EXAMPLES:

```
sage: from sage.features.graph_generators import Buckygen
sage: Buckygen().is_present()  # optional - buckygen
FeatureTestResult('buckygen', True)
```

```
>>> from sage.all import *
>>> from sage.features.graph_generators import Buckygen
>>> Buckygen().is_present()  # optional - buckygen
FeatureTestResult('buckygen', True)
```

is_functional()

Check whether `buckygen` works on trivial input.

EXAMPLES:

```
sage: from sage.features.graph_generators import Buckygen
sage: Buckygen().is_functional()  # optional - buckygen
FeatureTestResult('buckygen', True)
```

```
>>> from sage.all import *
>>> from sage.features.graph_generators import Buckygen
>>> Buckygen().is_functional()  # optional - buckygen
FeatureTestResult('buckygen', True)
```

class sage.features.graph_generators.**Plantri**(**args*, ***kwds*)

Bases: *Executable*

A *Feature* which checks for the *plantri* binary.

EXAMPLES:

```
sage: from sage.features.graph_generators import Plantri
sage: Plantri().is_present()  # optional - plantri
FeatureTestResult('plantri', True)
```

```
>>> from sage.all import *
>>> from sage.features.graph_generators import Plantri
>>> Plantri().is_present()  # optional - plantri
FeatureTestResult('plantri', True)
```

is_functional()

Check whether `plantri` works on trivial input.

EXAMPLES:

```
sage: from sage.features.graph_generators import Plantri
sage: Plantri().is_functional()  # optional - plantri
FeatureTestResult('plantri', True)
```

```
>>> from sage.all import *
>>> from sage.features.graph_generators import Plantri
>>> Plantri().is_functional()  # optional - plantri
FeatureTestResult('plantri', True)
```

sage.features.graph_generators.**all_features**()

3.14 Features for testing the presence of `graphviz`

class sage.features.graphviz.**Graphviz**(**args*, ***kwds*)

Bases: *JoinFeature*

A *Feature* describing the presence of the *dot*, *neato*, and *twopi* executables from the *graphviz* package.

EXAMPLES:

```
sage: from sage.features.graphviz import Graphviz
sage: Graphviz().is_present()  # optional - graphviz
FeatureTestResult('graphviz', True)
```

```
>>> from sage.all import *
>>> from sage.features.graphviz import Graphviz
>>> Graphviz().is_present()  # optional - graphviz
FeatureTestResult('graphviz', True)
```

sage.features.graphviz.**all_features**()

class sage.features.graphviz.**dot**(**args*, ***kwds*)

Bases: *Executable*

A *Feature* describing the presence of `dot`.

class sage.features.graphviz.**neato**(**args*, ***kwds*)

Bases: *Executable*

A *Feature* describing the presence of `neato`.

class sage.features.graphviz.**twopi**(**args*, ***kwds*)

Bases: *Executable*

A *Feature* describing the presence of `twopi`.

3.15 Feature for testing the presence of imagemagick

Currently we only check for the presence of `convert` or `magick`. When needed, other commands like `magick-script`, `mogrify`, `identify`, `composite`, `montage`, `compare`, etc. could be also checked in this module.

class sage.features.imagemagick.**ImageMagick**(**args*, ***kwds*)

Bases: *JoinFeature*

A *Feature* describing the presence of *ImageMagick*

Currently, only the availability of the `magick` (or `convert`) program is checked.

EXAMPLES:

```
sage: from sage.features.imagemagick import ImageMagick
sage: ImageMagick().is_present()  # optional - imagemagick
FeatureTestResult('imagemagick', True)
```

```
>>> from sage.all import *
>>> from sage.features.imagemagick import ImageMagick
>>> ImageMagick().is_present()  # optional - imagemagick
FeatureTestResult('imagemagick', True)
```

class sage.features.imagemagick.**Magick**(**args*, ***kwds*)

Bases: *Executable*

A *Feature* describing the presence of `magick` or the deprecated `convert`.

EXAMPLES:

```
sage: from sage.features.imagemagick import Magick
sage: Magick().is_present()  # optional - imagemagick
FeatureTestResult('magick', True)
```

```
>>> from sage.all import *
>>> from sage.features.imagemagick import Magick
>>> Magick().is_present()  # optional - imagemagick
FeatureTestResult('magick', True)
```

is_functional()

Return whether command `magick` or `convert` in the path is functional.

EXAMPLES:

```
sage: from sage.features.imagemagick import Magick
sage: Magick().is_functional()  # optional - imagemagick
FeatureTestResult('magick', True)
```

```
>>> from sage.all import *
>>> from sage.features.imagemagick import Magick
>>> Magick().is_functional()  # optional - imagemagick
FeatureTestResult('magick', True)
```

sage.features.imagemagick.**all_features**()

3.16 Features for testing whether interpreter interfaces to magma, maple, mathematica etc. are functional

class sage.features.interfaces.**InterfaceFeature**(**args*, ***kwds*)

Bases: *Feature*

A *Feature* describing whether an Interface is present and functional.

class sage.features.interfaces.**Macaulay2**(**args*, ***kwds*)

Bases: *InterfaceFeature*

A *Feature* describing whether sage.interfaces.macaulay2.Macaulay2 is present and functional.

EXAMPLES:

```
sage: from sage.features.interfaces import Macaulay2
sage: Macaulay2().is_present()  # random
FeatureTestResult('macaulay2', False)
```

```
>>> from sage.all import *
>>> from sage.features.interfaces import Macaulay2
>>> Macaulay2().is_present()  # random
FeatureTestResult('macaulay2', False)
```

class sage.features.interfaces.**Magma**(**args*, ***kwds*)

Bases: *InterfaceFeature*

A *Feature* describing whether sage.interfaces.magma.Magma is present and functional.

EXAMPLES:

```
sage: from sage.features.interfaces import Magma
sage: Magma().is_present()  # random
FeatureTestResult('magma', False)
```

```
>>> from sage.all import *
>>> from sage.features.interfaces import Magma
>>> Magma().is_present()  # random
FeatureTestResult('magma', False)
```

class sage.features.interfaces.**Maple**(**args*, ***kwds*)

Bases: *InterfaceFeature*

A *Feature* describing whether sage.interfaces.maple.Maple is present and functional.

EXAMPLES:

```
sage: from sage.features.interfaces import Maple
sage: Maple().is_present()  # random
FeatureTestResult('maple', False)
```

```
>>> from sage.all import *
>>> from sage.features.interfaces import Maple
>>> Maple().is_present()  # random
FeatureTestResult('maple', False)
```

class sage.features.interfaces.**Mathematica**(**args*, ***kwds*)

Bases: *InterfaceFeature*

A *Feature* describing whether sage.interfaces.mathematica.Mathematica is present and functional.

EXAMPLES:

```
sage: from sage.features.interfaces import Mathematica
sage: Mathematica().is_present()  # not tested
FeatureTestResult('mathematica', False)
```

```
>>> from sage.all import *
>>> from sage.features.interfaces import Mathematica
>>> Mathematica().is_present()  # not tested
FeatureTestResult('mathematica', False)
```

class sage.features.interfaces.**Mathics**(**args*, ***kwds*)

Bases: *InterfaceFeature*

A *Feature* describing whether sage.interfaces.mathics.Mathics is present and functional.

EXAMPLES:

```
sage: from sage.features.interfaces import Mathics
sage: Mathics().is_present()  # not tested
FeatureTestResult('mathics', False)
```

```
>>> from sage.all import *
>>> from sage.features.interfaces import Mathics
>>> Mathics().is_present()  # not tested
FeatureTestResult('mathics', False)
```

class sage.features.interfaces.**Matlab**(**args*, ***kwds*)

Bases: *InterfaceFeature*

A *Feature* describing whether sage.interfaces.matlab.Matlab is present and functional.

EXAMPLES:

```
sage: from sage.features.interfaces import Matlab
sage: Matlab().is_present()  # random
FeatureTestResult('matlab', False)
```

```
>>> from sage.all import *
>>> from sage.features.interfaces import Matlab
>>> Matlab().is_present()  # random
FeatureTestResult('matlab', False)
```

class sage.features.interfaces.**Octave**(**args*, ***kwds*)

Bases: *InterfaceFeature*

A *Feature* describing whether sage.interfaces.octave.Octave is present and functional.

EXAMPLES:

```
sage: from sage.features.interfaces import Octave
sage: Octave().is_present()  # random
FeatureTestResult('octave', False)
```

```
>>> from sage.all import *
>>> from sage.features.interfaces import Octave
>>> Octave().is_present()  # random
FeatureTestResult('octave', False)
```

class sage.features.interfaces.**Scilab**(**args*, ***kwds*)

Bases: *InterfaceFeature*

A *Feature* describing whether sage.interfaces.scilab.Scilab is present and functional.

EXAMPLES:

```
sage: from sage.features.interfaces import Scilab
sage: Scilab().is_present()  # random
FeatureTestResult('scilab', False)
```

```
>>> from sage.all import *
>>> from sage.features.interfaces import Scilab
>>> Scilab().is_present()  # random
FeatureTestResult('scilab', False)
```

sage.features.interfaces.**all_features**()

Return features corresponding to interpreter interfaces.

EXAMPLES:

```
sage: from sage.features.interfaces import all_features
sage: list(all_features())
[Feature('magma'),
 Feature('matlab'),
 Feature('mathematica'),
 Feature('mathics'),
 Feature('maple'),
 Feature('macaulay2'),
 Feature('octave'),
 Feature('scilab')]
```

```
>>> from sage.all import *
>>> from sage.features.interfaces import all_features
>>> list(all_features())
[Feature('magma'),
 Feature('matlab'),
 Feature('mathematica'),
 Feature('mathics'),
 Feature('maple'),
 Feature('macaulay2'),
 Feature('octave'),
 Feature('scilab')]
```

3.17 Feature for testing if the Internet is available

class sage.features.internet.**Internet**(**args*, ***kwds*)

Bases: *Feature*

A *Feature* describing if Internet is available.

Failure of connecting to the site "https://www.sagemath.org" within a second is regarded as internet being not available.

EXAMPLES:

```
sage: from sage.features.internet import Internet
sage: Internet()
Feature('internet')
```

```
>>> from sage.all import *
>>> from sage.features.internet import Internet
>>> Internet()
Feature('internet')
```

sage.features.internet.**all_features**()

3.18 Feature for testing the presence of `kenzo`

class sage.features.kenzo.**Kenzo**(**args*, ***kwds*)

Bases: *Feature*

A *Feature* describing the presence of *Kenzo*.

EXAMPLES:

```
sage: from sage.features.kenzo import Kenzo
sage: Kenzo().is_present()  # optional - kenzo
FeatureTestResult('kenzo', True)
```

```
>>> from sage.all import *
>>> from sage.features.kenzo import Kenzo
>>> Kenzo().is_present()  # optional - kenzo
FeatureTestResult('kenzo', True)
```

sage.features.kenzo.**all_features**()

3.19 Features for testing the presence of `latex` and equivalent programs

class sage.features.latex.**LaTeX**(**args*, ***kwds*)

Bases: *Executable*

A *Feature* describing the presence of `latex`.

EXAMPLES:

```
sage: from sage.features.latex import latex
sage: latex().is_present()              # optional - latex
FeatureTestResult('latex', True)
```

```
>>> from sage.all import *
>>> from sage.features.latex import latex
>>> latex().is_present()              # optional - latex
FeatureTestResult('latex', True)
```

is_functional()

Return whether `latex` in the path is functional.

EXAMPLES:

```
sage: from sage.features.latex import latex
sage: latex().is_functional()              # optional - latex
FeatureTestResult('latex', True)
```

```
>>> from sage.all import *
>>> from sage.features.latex import latex
>>> latex().is_functional()              # optional - latex
FeatureTestResult('latex', True)
```

When the feature is not functional, more information on the reason can be obtained as follows:

```
sage: result = latex().is_functional()     # not tested
sage: print(result.reason)                 # not tested
Running latex on a sample file
(with command='latex -interaction=nonstopmode tmp_wmpos8ak.tex')
returned nonzero exit status='1' with stderr=''
and stdout='This is pdfTeX,
...
Runaway argument?
{document
! File ended while scanning use of \end.
...
No pages of output.
Transcript written on tmp_wmpos8ak.log.'
```

```
>>> from sage.all import *
>>> result = latex().is_functional()     # not tested
>>> print(result.reason)                 # not tested
Running latex on a sample file
(with command='latex -interaction=nonstopmode tmp_wmpos8ak.tex')
returned nonzero exit status='1' with stderr=''
and stdout='This is pdfTeX,
...
Runaway argument?
{document
! File ended while scanning use of \end.
...
No pages of output.
Transcript written on tmp_wmpos8ak.log.'
```

class sage.features.latex.**LaTeXPackage**(**args*, ***kwds*)

Bases: *TeXFile*

A *sage.features.Feature* describing the presence of a LaTeX package (`.sty` file).

EXAMPLES:

```
sage: from sage.features.latex import LaTeXPackage
sage: LaTeXPackage('graphics').is_present()  # optional - latex
FeatureTestResult('latex_package_graphics', True)
```

```
>>> from sage.all import *
>>> from sage.features.latex import LaTeXPackage
>>> LaTeXPackage('graphics').is_present()  # optional - latex
FeatureTestResult('latex_package_graphics', True)
```

class sage.features.latex.**TeXFile**(**args*, ***kwds*)

Bases: *StaticFile*

A *sage.features.Feature* describing the presence of a TeX file.

EXAMPLES:

```
sage: from sage.features.latex import TeXFile
sage: TeXFile('x', 'x.tex').is_present()  # optional - latex
FeatureTestResult('x', True)
```

```
>>> from sage.all import *
>>> from sage.features.latex import TeXFile
>>> TeXFile('x', 'x.tex').is_present()  # optional - latex
FeatureTestResult('x', True)
```

absolute_filename()

The absolute path of the file.

EXAMPLES:

```
sage: from sage.features.latex import TeXFile
sage: feature = TeXFile('latex_class_article', 'article.cls')
sage: feature.absolute_filename()  # optional - latex
'.../latex/base/article.cls'
```

```
>>> from sage.all import *
>>> from sage.features.latex import TeXFile
>>> feature = TeXFile('latex_class_article', 'article.cls')
>>> feature.absolute_filename()  # optional - latex
'.../latex/base/article.cls'
```

sage.features.latex.**all_features**()

class sage.features.latex.**dvips**(**args*, ***kwds*)

Bases: *Executable*

A *Feature* describing the presence of `dvips`.

EXAMPLES:

```
sage: from sage.features.latex import dvips
sage: dvips().is_present()              # optional - dvips
FeatureTestResult('dvips', True)
```

```
>>> from sage.all import *
>>> from sage.features.latex import dvips
>>> dvips().is_present()              # optional - dvips
FeatureTestResult('dvips', True)
```

class sage.features.latex.**latex**(**args*, ***kwds*)

Bases: *LaTeX*

A *Feature* describing the presence of `latex`.

EXAMPLES:

```
sage: from sage.features.latex import latex
sage: latex().is_present()              # optional - latex
FeatureTestResult('latex', True)
```

```
>>> from sage.all import *
>>> from sage.features.latex import latex
>>> latex().is_present()              # optional - latex
FeatureTestResult('latex', True)
```

class sage.features.latex.**lualatex**(**args*, ***kwds*)

Bases: *LaTeX*

A *Feature* describing the presence of `lualatex`.

EXAMPLES:

```
sage: from sage.features.latex import lualatex
sage: lualatex().is_present()              # optional - lualatex
FeatureTestResult('lualatex', True)
```

```
>>> from sage.all import *
>>> from sage.features.latex import lualatex
>>> lualatex().is_present()              # optional - lualatex
FeatureTestResult('lualatex', True)
```

class sage.features.latex.**pdflatex**(**args*, ***kwds*)

Bases: *LaTeX*

A *Feature* describing the presence of `pdflatex`.

EXAMPLES:

```
sage: from sage.features.latex import pdflatex
sage: pdflatex().is_present()              # optional - pdflatex
FeatureTestResult('pdflatex', True)
```

```
>>> from sage.all import *
>>> from sage.features.latex import pdflatex
```

(continues on next page)

(continued from previous page)

```
>>> pdflatex().is_present()              # optional - pdflatex
FeatureTestResult('pdflatex', True)
```

class sage.features.latex.**xelatex**(**args*, ***kwds*)

Bases: *LaTeX*

A *Feature* describing the presence of `xelatex`.

EXAMPLES:

```
sage: from sage.features.latex import xelatex
sage: xelatex().is_present()              # optional - xelatex
FeatureTestResult('xelatex', True)
```

```
>>> from sage.all import *
>>> from sage.features.latex import xelatex
>>> xelatex().is_present()              # optional - xelatex
FeatureTestResult('xelatex', True)
```

3.20 Features for testing the presence of `latte_int`

class sage.features.latte.**Latte**(**args*, ***kwds*)

Bases: *JoinFeature*

A *Feature* describing the presence of excecutables from *LattE integrale*.

EXAMPLES:

```
sage: from sage.features.latte import Latte
sage: Latte().is_present()  # optional - latte_int
FeatureTestResult('latte_int', True)
```

```
>>> from sage.all import *
>>> from sage.features.latte import Latte
>>> Latte().is_present()  # optional - latte_int
FeatureTestResult('latte_int', True)
```

class sage.features.latte.**Latte_count**(**args*, ***kwds*)

Bases: *Executable*

Feature for the executable `count` from *LattE integrale*.

class sage.features.latte.**Latte_integrate**(**args*, ***kwds*)

Bases: *Executable*

Feature for the executable `integrate` from *LattE integrale*.

sage.features.latte.**all_features**()

3.21 Feature for testing the presence of `lrslib`

class sage.features.lrs.**Lrs**(**args*, ***kwds*)

Bases: *Executable*

A *Feature* describing the presence of the `lrs` binary which comes as a part of `lrslib`.

EXAMPLES:

```
sage: from sage.features.lrs import Lrs
sage: Lrs().is_present()  # optional - lrslib
FeatureTestResult('lrs', True)
```

```
>>> from sage.all import *
>>> from sage.features.lrs import Lrs
>>> Lrs().is_present()  # optional - lrslib
FeatureTestResult('lrs', True)
```

is_functional()

Test whether `lrs` works on a trivial input.

EXAMPLES:

```
sage: from sage.features.lrs import Lrs
sage: Lrs().is_functional()  # optional - lrslib
FeatureTestResult('lrs', True)
```

```
>>> from sage.all import *
>>> from sage.features.lrs import Lrs
>>> Lrs().is_functional()  # optional - lrslib
FeatureTestResult('lrs', True)
```

class sage.features.lrs.**LrsNash**(**args*, ***kwds*)

Bases: *Executable*

A *Feature* describing the presence of the `lrsnash` binary which comes as a part of `lrslib`.

EXAMPLES:

```
sage: from sage.features.lrs import LrsNash
sage: LrsNash().is_present()  # optional - lrslib
FeatureTestResult('lrsnash', True)
```

```
>>> from sage.all import *
>>> from sage.features.lrs import LrsNash
>>> LrsNash().is_present()  # optional - lrslib
FeatureTestResult('lrsnash', True)
```

is_functional()

Test whether `lrsnash` works on a trivial input.

EXAMPLES:

```
sage: from sage.features.lrs import LrsNash
sage: LrsNash().is_functional()  # optional - lrslib
FeatureTestResult('lrsnash', True)
```

```
>>> from sage.all import *
>>> from sage.features.lrs import LrsNash
>>> LrsNash().is_functional()  # optional - lrslib
FeatureTestResult('lrsnash', True)
```

class sage.features.lrs.**Lrslib**(**args*, ***kwds*)

Bases: *JoinFeature*

A *Feature* describing the presence of the executables *lrs* and *lrsnash* provided by the *lrslib* package.

EXAMPLES:

```
sage: from sage.features.lrs import Lrslib
sage: Lrslib().is_present()  # optional - lrslib
FeatureTestResult('lrslib', True)
```

```
>>> from sage.all import *
>>> from sage.features.lrs import Lrslib
>>> Lrslib().is_present()  # optional - lrslib
FeatureTestResult('lrslib', True)
```

sage.features.lrs.**all_features**()

3.22 Features for testing the presence of mcqd

class sage.features.mcqd.**Mcqd**(**args*, ***kwds*)

Bases: *JoinFeature*

A *Feature* describing the presence of the mcqd module, which is the SageMath interface to the *mcqd* library

EXAMPLES:

```
sage: from sage.features.mcqd import Mcqd
sage: Mcqd().is_present()  # optional - mcqd
FeatureTestResult('mcqd', True)
```

```
>>> from sage.all import *
>>> from sage.features.mcqd import Mcqd
>>> Mcqd().is_present()  # optional - mcqd
FeatureTestResult('mcqd', True)
```

sage.features.mcqd.**all_features**()

3.23 Feature for testing the presence of meataxe

class sage.features.meataxe.**Meataxe**(**args*, ***kwds*)

Bases: *JoinFeature*

A *Feature* describing the presence of the Sage modules that depend on the *meataxe* library.

EXAMPLES:

```
sage: from sage.features.meataxe import Meataxe
sage: Meataxe().is_present()  # optional - meataxe
FeatureTestResult('meataxe', True)
```

```
>>> from sage.all import *
>>> from sage.features.meataxe import Meataxe
>>> Meataxe().is_present()  # optional - meataxe
FeatureTestResult('meataxe', True)
```

sage.features.meataxe.**all_features**()

3.24 Features for testing the presence of `MixedIntegerLinearProgram` backends

class sage.features.mip_backends.**COIN**(**args*, ***kwds*)

Bases: *JoinFeature*

A *Feature* describing whether the `MixedIntegerLinearProgram` backend `COIN` is available.

class sage.features.mip_backends.**CPLEX**(**args*, ***kwds*)

Bases: *MIPBackend*

A *Feature* describing whether the `MixedIntegerLinearProgram` backend `CPLEX` is available.

class sage.features.mip_backends.**CVXOPT**(**args*, ***kwds*)

Bases: *JoinFeature*

A *Feature* describing whether the `MixedIntegerLinearProgram` backend `CVXOPT` is available.

class sage.features.mip_backends.**Gurobi**(**args*, ***kwds*)

Bases: *MIPBackend*

A *Feature* describing whether the `MixedIntegerLinearProgram` backend `Gurobi` is available.

class sage.features.mip_backends.**MIPBackend**(**args*, ***kwds*)

Bases: *Feature*

A *Feature* describing whether a `MixedIntegerLinearProgram` backend is available.

sage.features.mip_backends.**all_features**()

3.25 Feature for testing the presence of `pynormaliz`

class sage.features.normaliz.**PyNormaliz**(**args*, ***kwds*)

Bases: *JoinFeature*

A *Feature* describing the presence of the Python package *PyNormaliz*.

EXAMPLES:

```
sage: from sage.features.normaliz import PyNormaliz
sage: PyNormaliz().is_present()                    # optional - pynormaliz
FeatureTestResult('pynormaliz', True)
```

```
>>> from sage.all import *
>>> from sage.features.normaliz import PyNormaliz
>>> PyNormaliz().is_present()                    # optional - pynormaliz
FeatureTestResult('pynormaliz', True)
```

sage.features.normaliz.**all_features**()

3.26 Feature for testing the presence of pandoc

class sage.features.pandoc.**Pandoc**(**args*, ***kwds*)

Bases: *Executable*

A *Feature* describing the presence of *pandoc*.

EXAMPLES:

```
sage: from sage.features.pandoc import Pandoc
sage: Pandoc().is_present()  # optional - pandoc
FeatureTestResult('pandoc', True)
```

```
>>> from sage.all import *
>>> from sage.features.pandoc import Pandoc
>>> Pandoc().is_present()  # optional - pandoc
FeatureTestResult('pandoc', True)
```

sage.features.pandoc.**all_features**()

3.27 Feature for testing the presence of pdf2svg

sage.features.pdf2svg.**all_features**()

class sage.features.pdf2svg.**pdf2svg**(**args*, ***kwds*)

Bases: *Executable*

A *Feature* describing the presence of *pdf2svg*.

EXAMPLES:

```
sage: from sage.features.pdf2svg import pdf2svg
sage: pdf2svg().is_present()              # optional - pdf2svg
FeatureTestResult('pdf2svg', True)
```

```
>>> from sage.all import *
>>> from sage.features.pdf2svg import pdf2svg
>>> pdf2svg().is_present()              # optional - pdf2svg
FeatureTestResult('pdf2svg', True)
```

3.28 Feature for testing the presence of jupymake, the Python interface to polymake

class sage.features.polymake.**JuPyMake**(**args*, ***kwds*)

Bases: *JoinFeature*

A *Feature* describing the presence of the *JuPyMake* module, a Python interface to the *polymake* library.

EXAMPLES:

```
sage: from sage.features.polymake import JuPyMake
sage: JuPyMake().is_present()  # optional - jupymake
FeatureTestResult('jupymake', True)
```

```
>>> from sage.all import *
>>> from sage.features.polymake import JuPyMake
>>> JuPyMake().is_present()  # optional - jupymake
FeatureTestResult('jupymake', True)
```

sage.features.polymake.**all_features**()

3.29 Features for testing the presence of rubiks

class sage.features.rubiks.**Rubiks**(**args*, ***kwds*)

Bases: *JoinFeature*

A *Feature* describing the presence of the *cu2*, *cubex*, *dikcube*, *mcube*, *optimal*, and *size222* programs from the *rubiks* package.

EXAMPLES:

```
sage: from sage.features.rubiks import Rubiks
sage: Rubiks().is_present()  # optional - rubiks
FeatureTestResult('rubiks', True)
```

```
>>> from sage.all import *
>>> from sage.features.rubiks import Rubiks
>>> Rubiks().is_present()  # optional - rubiks
FeatureTestResult('rubiks', True)
```

sage.features.rubiks.**all_features**()

class sage.features.rubiks.**cu2**(**args*, ***kwds*)

Bases: *Executable*

A *Feature* describing the presence of cu2.

EXAMPLES:

```
sage: from sage.features.rubiks import cu2
sage: cu2().is_present()  # optional - rubiks
FeatureTestResult('cu2', True)
```

```
>>> from sage.all import *
>>> from sage.features.rubiks import cu2
>>> cu2().is_present()  # optional - rubiks
FeatureTestResult('cu2', True)
```

class sage.features.rubiks.**cubex**(**args*, ***kwds*)

Bases: *Executable*

A *Feature* describing the presence of `cubex`.

EXAMPLES:

```
sage: from sage.features.rubiks import cubex
sage: cubex().is_present()  # optional - rubiks
FeatureTestResult('cubex', True)
```

```
>>> from sage.all import *
>>> from sage.features.rubiks import cubex
>>> cubex().is_present()  # optional - rubiks
FeatureTestResult('cubex', True)
```

class sage.features.rubiks.**dikcube**(**args*, ***kwds*)

Bases: *Executable*

A *Feature* describing the presence of `dikcube`.

EXAMPLES:

```
sage: from sage.features.rubiks import dikcube
sage: dikcube().is_present()  # optional - rubiks
FeatureTestResult('dikcube', True)
```

```
>>> from sage.all import *
>>> from sage.features.rubiks import dikcube
>>> dikcube().is_present()  # optional - rubiks
FeatureTestResult('dikcube', True)
```

class sage.features.rubiks.**mcube**(**args*, ***kwds*)

Bases: *Executable*

A *Feature* describing the presence of `mcube`.

EXAMPLES:

```
sage: from sage.features.rubiks import mcube
sage: mcube().is_present()  # optional - rubiks
FeatureTestResult('mcube', True)
```

```
>>> from sage.all import *
>>> from sage.features.rubiks import mcube
>>> mcube().is_present()  # optional - rubiks
FeatureTestResult('mcube', True)
```

class sage.features.rubiks.**optimal**(**args*, ***kwds*)

Bases: *Executable*

A *Feature* describing the presence of `optimal`.

EXAMPLES:

```
sage: from sage.features.rubiks import optimal
sage: optimal().is_present()  # optional - rubiks
FeatureTestResult('optimal', True)
```

```
>>> from sage.all import *
>>> from sage.features.rubiks import optimal
>>> optimal().is_present()  # optional - rubiks
FeatureTestResult('optimal', True)
```

class sage.features.rubiks.**size222**(**args*, ***kwds*)

Bases: *Executable*

A *Feature* describing the presence of `size222`.

EXAMPLES:

```
sage: from sage.features.rubiks import size222
sage: size222().is_present()  # optional - rubiks
FeatureTestResult('size222', True)
```

```
>>> from sage.all import *
>>> from sage.features.rubiks import size222
>>> size222().is_present()  # optional - rubiks
FeatureTestResult('size222', True)
```

3.30 Features for testing the presence of `tdlib`

class sage.features.tdlib.**Tdlib**(**args*, ***kwds*)

Bases: *JoinFeature*

A *Feature* describing the presence of the SageMath interface to the *tdlib* library.

sage.features.tdlib.**all_features**()

3.31 Features for testing the presence of topcom executables

class sage.features.topcom.**TOPCOM**(**args*, ***kwds*)

Bases: *JoinFeature*

A *Feature* describing the presence of the executables which comes as a part of *TOPCOM*.

EXAMPLES:

```
sage: from sage.features.topcom import TOPCOM
sage: TOPCOM().is_present()                                  # optional - topcom
FeatureTestResult('topcom', True)
```

```
>>> from sage.all import *
>>> from sage.features.topcom import TOPCOM
>>> TOPCOM().is_present()                                  # optional - topcom
FeatureTestResult('topcom', True)
```

class sage.features.topcom.**TOPCOMExecutable**(**args*, ***kwds*)

Bases: *Executable*

A *Feature* which checks for executables from the *TOPCOM* package.

EXAMPLES:

```
sage: from sage.features.topcom import TOPCOMExecutable
sage: TOPCOMExecutable('points2allfinetriangs').is_present()     # optional -␣
↪topcom
FeatureTestResult('topcom_points2allfinetriangs', True)
```

```
>>> from sage.all import *
>>> from sage.features.topcom import TOPCOMExecutable
>>> TOPCOMExecutable('points2allfinetriangs').is_present()     # optional - topcom
FeatureTestResult('topcom_points2allfinetriangs', True)
```

sage.features.topcom.**all_features**()

CHAPTER

FOUR

DISTRIBUTION PACKAGES OF THE SAGE LIBRARY

- *sagemath_bliss: Graph (iso/auto)morphisms with bliss*
- *sagemath_categories: Sage categories and basic rings*
- *sagemath_coxeter3: Coxeter groups, Bruhat ordering, Kazhdan-Lusztig polynomials with coxeter3*
- *sagemath_doc_html: SageMath documentation in HTML format*
- *sagemath_doc_pdf: SageMath documentation in PDF format*
- *sagemath_environment: System and software environment*
- *sagemath_giac: Giac integration*
- *sagemath_mcqd: Finding maximum cliques with mcqd*
- *sagemath_meataxe: Matrices over small finite fields with meataxe*
- *sagemath_objects: Sage objects, elements, parents, categories, coercion, metaclasses*
- *sagemath_repl: IPython kernel, Sage preparser, doctester*
- *sagemath_sirocco: Certified root continuation with sirocco*
- *sagemath_tdlib: Tree decompositions with tdlib*

CHAPTER

FIVE

EXPERIMENTAL PACKAGES

Some packages that provide additional functionality are marked as "experimental". Developers are needed in order to improve the integration of these packages into the Sage distribution.

5.1 Mathematics

- *awali: Computation of/with finite state machines*
- *barvinok: Projections of integer point sets of parametric polytopes*
- *cocoalib: Computations in commutative algebra*
- *deformation: Count points on hypersurfaces using the deformation method*
- *gap3: A minimal distribution of GAP 3 containing packages that have no equivalent in GAP 4*
- *lie: Library for the representation theory of complex semisimple Lie groups and algebras*
- *polylib: Operations on unions of polyhedra*
- *r_jupyter: Jupyter kernel for R*
- *surf: Visualization of algebraic curves, algebraic surfaces and hyperplane sections of surfaces*

5.2 Other dependencies

CHAPTER

SIX

ALL EXTERNAL PACKAGES

6.1 Details of external packages

Packages are in alphabetical order.

6.1.1 4ti2: Algebraic, geometric and combinatorial problems on linear spaces

Description

A software package for algebraic, geometric and combinatorial problems on linear spaces. Available at https://4ti2.github.io/.

License

4ti2 is released under a GPL v2 license.

Upstream Contact

- https://4ti2.github.io/
- Raymond Hemmecke, TU Munich, Germany
- Matthias Köppe, UC Davis, CA, USA

Type

optional

Dependencies

- $(MP_LIBRARY)
- *glpk: GNU Linear Programming Kit*
- *zlib: Data compression library*

Version Information

package-version.txt:

```
1.6.10
```

Equivalent System Packages

```
$ sudo pacman -S 4ti2
```

```
$ conda install 4ti2
```

```
$ sudo apt-get install 4ti2
```

```
$ sudo yum install 4ti2 4ti2-devel
```

```
$ sudo pkg install math/4ti2
```

```
$ sudo emerge sci-mathematics/4ti2
```

```
$ sudo zypper install 4ti2 4ti2-devel
```

See https://repology.org/project/4ti2/versions

If the system package is installed, `./configure` will check if it can be used.

6.1.2 _bootstrap: Represents system packages required for running the top-level bootstrap script

Description

This optional script package represents the requirements (system packages) that are needed in addition to those represented by the `_prereq` package in order to run the top-level `bootstrap` script.

Type

optional

Dependencies

Version Information

Equivalent System Packages

```
$ apk add bash gettext-dev autoconf automake libtool pkgconf
```

```
$ sudo pacman -S autoconf automake libtool pkgconf
```

```
$ conda install autoconf automake libtool pkg-config
```

```
$ sudo apt-get install autoconf automake libtool pkg-config
```

```
$ sudo yum install autoconf automake libtool pkg-config
```

```
$ sudo pkg install autoconf automake libtool pkg-config
```

```
$ sudo emerge dev-build/autoconf dev-build/automake dev-build/libtool
```

```
$ brew install autoconf automake libtool pkg-config
```

```
$ sudo port install gettext autoconf automake libtool pkgconfig
```

```
$ nix-env --install autoconf automake libtool pkg-config
```

```
$ sudo zypper install autoconf automake libtool pkgconfig
```

```
$ sudo slackpkg install autoconf automake libtool pkg-config
```

```
$ sudo xbps-install autoconf automake libtool xtools mk-configure \
      pkg-config
```

6.1.3 _develop: Represents system packages recommended for development

Description

Script package representing a list of system packages recommended for developers.

Type

optional

Dependencies

- *_bootstrap: Represents system packages required for running the top-level bootstrap script*
- *git: Version control system*
- *github_cli: Command-line interface for GitHub*
- *pytest: Simple powerful testing with Python*
- *pytest_xdist: Pytest xdist plugin for distributed testing, most importantly across multiple CPUs*

Version Information

Equivalent System Packages

```
$ apk add gnupg-gpgconf openssh-client
```

```
$ sudo pacman -S gnupg openssh
```

```
$ conda install openssh pycodestyle esbonio
```

```
$ sudo apt-get install gpgconf openssh-client
```

```
$ sudo yum install gnupg2 openssh
```

```
$ sudo pkg install security/gnupg security/openssh-portable
```

```
$ sudo emerge app-crypt/gnupg net-misc/openssh
```

```
$ brew install gnupg
```

```
$ sudo port install gnupg2
```

```
$ nix-env --install gnupg openssh
```

```
$ sudo zypper install gpg2 openssh
```

```
$ sudo slackpkg install gnupg2 openssh
```

```
$ sudo xbps-install gnupg2 openssh
```

See https://repology.org/project/gnupg/versions, https://repology.org/project/openssh/versions

If the system package is installed, `./configure` will check if it can be used.

6.1.4 _prereq: Represents system packages required for installing SageMath from source

Description

This dummy package represents the minimal requirements (system packages) for installing SageMath from source.

In addition to standard POSIX utilities and the bash shell, the following standard command-line development tools must be installed on your computer:

- **make**: GNU make, version 3.80 or later. Version 3.82 or later is recommended.
- **m4**: GNU m4 1.4.2 or later (non-GNU or older versions might also work).
- **perl**: version 5.8.0 or later.
- **ar** and **ranlib**: can be obtained as part of GNU binutils.
- **tar**: GNU tar version 1.17 or later, or BSD tar (as provided on macOS).
- **python**: Python 3.4 or later, or Python 2.7. (This range of versions is a minimal requirement for internal purposes of the SageMath build system, which is referred to as `sage-bootstrap-python`.)

Other versions of these may work, but they are untested.

On macOS, suitable versions of all of these tools are provided by the Xcode Command Line Tools. To install them, open a terminal window and run `xcode-select --install`; then click "Install" in the pop-up window. If the Xcode Command Line Tools are already installed, you may want to check if they need to be updated by typing `softwareupdate -l`.

On Linux, `ar` and `ranlib` are in the binutils package. The other programs are usually located in packages with their respective names.

On Redhat-derived systems not all perl components are installed by default and you might have to install the `perl-ExtUtils-MakeMaker` package.

To check if you have the above prerequisites installed, for example `perl`, type:

```
$ command -v perl
```

or:

```
$ which perl
```

on the command line. If it gives an error (or returns nothing), then either `perl` is not installed, or it is installed but not in your PATH.

Type

standard

Dependencies

Version Information

Equivalent System Packages

```
$ apk add binutils make m4 perl python3 tar bc gcc g++ ca-certificates \
      coreutils
```

```
$ sudo pacman -S binutils make m4 perl python tar bc gcc which
```

```
$ conda install compilers make m4 perl python tar bc
```

```
$ sudo apt-get install binutils make m4 perl flex python3 tar bc gcc \
      g++ ca-certificates
```

```
$ sudo yum install binutils make m4 python3 perl \
      perl-ExtUtils-MakeMaker tar gcc gcc-c++ findutils which diffutils \
      perl-IPC-Cmd flex
```

```
$ sudo pkg install gmake automake bash dash python
```

```
$ sudo emerge sys-devel/binutils sys-libs/binutils-libs dev-build/make \
      dev-scheme/guile dev-libs/libffi app-arch/tar sys-devel/gcc \
      dev-libs/mpc sys-libs/glibc sys-kernel/linux-headers \
      dev-lang/perl sys-devel/m4 sys-devel/bc dev-lang/python \
      sys-devel/flex app-misc/ca-certificates dev-libs/libxml2 \
      sys-apps/findutils sys-apps/which sys-apps/diffutils
```

No package needed.

No package needed.

```
$ nix-env --install binutils gnumake gnum4 perl python3 gnutar bc gcc \
      bash
```

```
$ sudo zypper install binutils make m4 gawk perl python3 tar bc which \
      glibc-locale-base gcc gcc-c++ ca-certificates gzip findutils \
      diffutils
```

```
$ sudo slackpkg install binutils make guile gc libffi gcc-13 gcc-g++-13 \
      libmpc glibc kernel-headers perl m4 bc python3 flex \
      ca-certificates libxml2 cyrus-sasl
```

```
$ sudo xbps-install bc binutils gcc libgomp-devel m4 make perl python3 \
      tar bash which diffutils gzip python3-devel bzip2-devel xz \
      liblzma-devel libffi-devel zlib-devel libxcrypt-devel
```

If the system package is installed, `./configure` will check if it can be used.

6.1.5 _recommended: Represents system packages recommended for additional functionality

Description

Script package representing a list of system packages recommended to be installed for additional functionality.

Type

optional

Dependencies

- *ffmpeg: ffmpeg video converter*
- *free_fonts: a free family of scalable outline fonts*
- *git: Version control system*
- *imagemagick: A collection of tools and libraries for many image file formats*
- *libjpeg: JPEG image support*
- *pandoc: A document converter*
- *texlive: A comprehensive TeX system*
- *texlive_luatex: LuaTeX packages*
- *xindy: a general-purpose index processor*

Version Information

Equivalent System Packages

```
$ sudo apt-get install default-jdk libavdevice-dev
```

```
$ brew install texinfo
```

```
$ sudo port install texinfo
```

If the system package is installed, `./configure` will check if it can be used.

6.1.6 _sagemath: Downstream package of Sage in distributions

SageMath is available from various distributions and can be installed by package managers.

This dummy package records the names of the system packages that should be installed to provide a standard installation of SageMath, including documentation and Jupyter.

Downstream Contact

See wiki page Distribution

Type

optional

Dependencies

Version Information

Equivalent System Packages

```
$ sudo pacman -S sagemath sagemath-doc
```

```
$ conda install sage
```

```
$ sudo apt-get install sagemath sagemath-doc sagemath-jupyter
```

```
$ sudo yum install sagemath
```

```
$ sudo pkg install math/sage
```

```
$ brew install sage
```

```
$ nix-env --install sage
```

```
$ sudo xbps-install sagemath
```

See https://repology.org/project/sagemath/versions

6.1.7 admcycles: Computation in the tautological ring of the moduli space of curves

Description

The SageMath package admcycles offers the possibility to compute in the tautological ring of the Deligne-Mumford compactification of the moduli space of curves. Construction for standard generators are provided (psi, kappa and lambda classes) as well as more advanced algebraic construction (double ramification cycle, strata of differentials).

6.1.8 alabaster: Default theme for the Sphinx documentation system

Description

Alabaster is a visually (c)lean, responsive, configurable theme for the Sphinx documentation system. It is Python 2+3 compatible.

It began as a third-party theme, and is still maintained separately, but as of Sphinx 1.3, Alabaster is an install-time dependency of Sphinx and is selected as the default theme.

Live examples of this theme can be seen on paramiko.org, fabfile.org and pyinvoke.org.

6.1.17 attrs: Decorator for Python classes with attributes

Description

attrs is the Python package that will bring back the joy of writing classes by relieving you from the drudgery of implementing object protocols (aka dunder methods).

License

MIT License

Upstream Contact

Home page: https://www.attrs.org

Type

standard

Dependencies

- $(PYTHON)
- *importlib_metadata: Library to access the metadata for a Python package*
- *pip: Tool for installing and managing Python packages*

Version Information

package-version.txt:

```
23.2.0
```

version_requirements.txt:

```
attrs >=19.3.0
```

Equivalent System Packages

```
$ conda install attrs
```

```
$ sudo emerge dev-python/attrs
```

```
$ sudo port install py-attrs
```

```
$ sudo xbps-install python3-attrs
```

See https://repology.org/project/python:attrs/versions

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

6.1.18 auditwheel_or_delocate: Repair wheels on Linux or macOS

Description

This package represents `auditwheel` on Linux and `delocate` on macOS.

(Actually, we install `delocate` also on Linux because our script `make -j list-broken-packages` uses a small subroutine of `delocate` even on Linux.)

License

MIT

BSD 2-clause

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)

Version Information

requirements.txt:

```
delocate
auditwheel; sys_platform != 'darwin'
```

Equivalent System Packages

(none known)

6.1.19 awali: Computation of/with finite state machines

Description

Awali is a software platform dedicated to the computation of, and with, finite state machines. Here finite state machines is to be understood in the broadest possible sense: finite automata with output — often called transducers then — or even more generally finite automata with multiplicity, that is, automata that not only accept, or recognize, sequences of symbols but compute for every such sequence a 'value' that is associated with it and which can be taken in any semiring. Hence the variety of situations that can thus be modellized.

License

- GPL 3.0

Upstream Contact

- Website: http://vaucanson-project.org/Awali/index.html
- Releases: http://files.vaucanson-project.org/tarballs/

Dependencies

- graphviz must be installed from your distro, and available in the path.

Type

experimental

Dependencies

- $(PYTHON)
- *cmake: A cross-platform build system generator*
- *cython: C-Extensions for Python, an optimizing static compiler*
- *nbconvert: Converting Jupyter Notebooks*
- *ncurses: Classic terminal output library*

Version Information

package-version.txt:

```
1.0.2-190218
```

Equivalent System Packages

See https://repology.org/project/awali/versions

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see Issue #27330 for more information.

6.1.20 babel: Internationalization utilities

Description

Internationalization utilities

License

Version Information

package-version.txt:

```
2.14.0
```

version_requirements.txt:

```
babel >=2.11.0
```

Equivalent System Packages

```
$ sudo pacman -S python-babel
```

```
$ conda install babel
```

```
$ sudo apt-get install python3-babel
```

```
$ sudo yum install babel
```

```
$ sudo emerge dev-python/Babel
```

```
$ sudo port install py-babel
```

```
$ sudo zypper install python3\$\{PYTHON_MINOR\}-Babel
```

```
$ sudo xbps-install python3-Babel
```

See https://repology.org/project/python:babel/versions

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

6.1.21 barvinok: Projections of integer point sets of parametric polytopes

Description

barvinok is a library for counting the number of integer points in parametric and non-parametric polytopes as well as projections of such sets.

License

GPL v2

Upstream Contact

- https://sourceforge.net/projects/barvinok/
- https://groups.google.com/group/isl-development

Type

experimental

Dependencies

- *isl: Sets and relations of integer points bounded by affine constraints*
- *ntl: A library for doing number theory*
- *polylib: Operations on unions of polyhedra*

Version Information

package-version.txt:

```
0.41.7
```

Equivalent System Packages

```
$ sudo pkg install math/barvinok
```

```
$ sudo zypper install barvinok pkgconfig\(barvinok\)
```

See https://repology.org/project/barvinok/versions

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see Issue #27330 for more information.

6.1.22 beautifulsoup4: Screen-scraping library

```

See https://repology.org/project/bliss-graphs/versions

If the system package is installed, `./configure` will check if it can be used.

6.1.28 boost_cropped: Portable C++ libraries (subset needed for Sage)

Description

Boost provides free peer-reviewed portable C++ source libraries.

We emphasize libraries that work well with the C++ Standard Library. Boost libraries are intended to be widely useful, and usable across a broad spectrum of applications. The Boost license encourages both commercial and non-commercial use.

We aim to establish "existing practice" and provide reference implementations so that Boost libraries are suitable for eventual standardization. Ten Boost libraries are already included in the C++ Standards Committee's Library Technical Report (TR1) and will be in the new C++0x Standard now being finalized. C++0x will also include several more Boost libraries in addition to those from TR1. More Boost libraries are proposed for TR2.

License

Boost Software License - see http://www.boost.org/users/license.html

```

install the following packages: boost-cpp

```
$ sudo slackpkg install boost
```

```
$ sudo xbps-install boost-devel
```

See https://repology.org/project/boost/versions

If the system package is installed, `./configure` will check if it can be used.

6.1.29 brial: Boolean Ring Algebra implementation using binary decision diagrams

Description

BRiAl ("Boolean Ring Algebra") is the successor to PolyBoRi.

The core of PolyBoRi is a C++ library, which provides high-level data types for Boolean polynomials and monomials, exponent vectors, as well as for the underlying polynomial rings and subsets of the powerset of the Boolean variables. As a unique approach, binary decision diagrams are used as internal storage type for polynomial structures. On top of this C++-library we provide a Python interface. This allows parsing of complex polynomial systems, as well as sophisticated and extendable strategies for Gröbner base computation. PolyBoRi features a powerful reference implementation for Gröbner basis computation.

License

GPL version 2 or later

Upstream Contact

```

```
$ sudo zypper install buckygen
```

See https://repology.org/project/buckygen/versions

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see Issue #27330 for more information.

6.1.31 bzip2: High-quality data compressor

Description

bzip2 is a freely available, patent free, high-quality data compressor.

It typically compresses files to within 10% to 15% of the best available techniques (the PPM family of statistical compressors), whilst being around twice as fast at compression and six times faster at decompression.

License

BSD-style

Upstream Contact

- Website http://bzip.org/
- Author: Julian Seward <julian@bzip.org>

Special Update/Build Instructions

This package must not be bzip2 compressed, so create it using

```
tar c bzip2-1.0.6 | gzip --best >bzip2-1.0.6.spkg
```

The build system has been autotoolized based on a patch by the Suse folk at http://ftp.uni-kl.de/pub/linux/suse/people/sbrabec/bzip2/for_downstream/bzip2-1.0.6-autoconfiscated.patch

See patches/autotools and spkg-src for details.

Type

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see Issue #27330 for more information.

6.1.36 cddlib: Double description method for polyhedral representation conversion

Description

The C-library cddlib is a C implementation of the Double Description Method of Motzkin et al. for generating all vertices (i.e. extreme points) and extreme rays of a general convex polyhedron in R^d given by a system of linear inequalities:

P = { x=(x1, …, xd)^T : b - A x >= 0 }

where A is a given m x d real matrix, b is a given m-vector and 0 is the m-vector of all zeros.

The program can be used for the reverse operation (i.e. convex hull computation). This means that one can move back and forth between an inequality representation and a generator (i.e. vertex and ray) representation of a polyhedron with cdd. Also, cdd can solve a linear programming problem, i.e. a problem of maximizing and minimizing a linear function over P.

See https://repology.org/project/cliquer/versions

If the system package is installed, `./configure` will check if it can be used.

6.1.43 cmake: A cross-platform build system generator

Description

The "cmake" executable is the CMake command-line interface. It may be used to configure projects in scripts. Project configuration settings may be specified on the command line with the -D option. The -i option will cause cmake to interactively prompt for such settings.

CMake is a cross-platform build system generator. Projects specify their build process with platform-independent CMake listfiles included in each directory of a source tree with the name CMakeLists.txt. Users build a project by using CMake to generate a build system for a native tool on their platform.

License

CMake is distributed under the OSI-approved BSD 3-clause License.

6.1.50 coxeter3: Library for Coxeter groups, Bruhat ordering, Kazhdan-Lusztig polynomials

Description

This package wraps Fokko Ducloux's Coxeter 3 C++ library

Features:

- General Coxeter groups, implemented through the combinatorics of reduced words;
- Reduced expression and normal form computations;
- Bruhat ordering;
- Ordinary Kazhdan-Lusztig polynomials;
- Kazhdan-Lusztig polynomials with unequal parameters;
- Inverse Kazhdan-Lusztig polynomials;
- Cells and W-graphs;

http://math.univ-lyon1.fr/~ducloux/coxeter/coxeter3/english/coxeter3_e.html

This is a patched version done by Mike Hansen 2009-2013 and some fixes by Nicolas M. Thiéry and Jean-Pierre Flori.

License

GPL

Upstream Contact

github: https://github.com/tscrim/coxeter

Alas, Fokko Ducloux passed away in 2006.

http://math.univ-lyon1.fr/~ducloux/du_Cloux.html

Special Update/Build Instructions

The source package was created by running

```
commit=8ac9c71723c8ca57a836d6381aed125261e44e9e
git clone https://github.com/tscrim/coxeter.git

```

```
$ sudo yum install python3-cppy
```

```
$ sudo emerge dev-python/cppy
```

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

6.1.52 csdp: Solver for semidefinite programs

Description

This is a fast SDP solver written in C, with a callable library namely, an autotool'ed version of CSDP, by Brian Borchers, see https://projects.coin-or.org/Csdp

License

Common Public License Version 1.0

Upstream Contact

Dmitrii Pasechnik <dimpase+sage@gmail.com>

Special Update/Build Instructions

csdp is an autotool'ed version of CSDP, see https://projects.coin-or.org/Csdp, developed in its own repository at https://github.com/dimpase/csdp.

To update to a new version, you need to bump the version number in configure.ac and rerun autotools (autoreconf -fiv). Any changes should be merged to the upstream repo.

The build is done with NOSHORTS variable defined; this makes it compatible with packages, where NOSHORTS must be defined, e.g. https://github.com/dimpase/pycsdp; also the Sage Cython interface needs NOSHORTS defined.

Detailed steps to build the spkg are as follows. You need

- git
- autotools and libtool (the full autohell suite, version at least 2.67)

With these ready:

- ./spkg-src
- copy the resulting csdp-<version>.tar.gz to SAGE_ROOT/upstream, or somewhere else appropriate

Type

optional

Dependencies

- $(BLAS)

Version Information

package-version.txt:

```
6.2.p1
```

Equivalent System Packages

```
$ sudo pacman -S coin-or-csdp
```

```
$ sudo yum install csdp csdp-devel csdp-tools
```

See https://repology.org/project/coin-or-csdp/versions, https://repology.org/project/csdp/versions

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see Issue #27330 for more information.

6.1.53 cunningham_tables: List of the prime numbers occuring in the Cunningham table

The script read_cunningham_prime_factors.py was used to generate the data set from the file http://cage.ugent.be/~jdemeyer/cunningham/main.gz We include a local copy, main.gz (see comments in the file for details)

Type

optional

```

See https://repology.org/project/curl/versions

If the system package is installed, `./configure` will check if it can be used.

6.1.55 cvxopt: Python software for convex optimization

Description

CVXOPT is a free software package for convex optimization based on the Python programming language. It can be used with the interactive Python interpreter, on the command line by executing Python scripts, or integrated in other software via Python extension modules. Its main purpose is to make the development of software for convex optimization applications straightforward by building on Python's extensive standard library and on the strengths of Python as a high-level programming language.

6.1.61 cython: C-Extensions for Python, an optimizing static compiler

Description

Cython is a language that makes writing C extensions for the Python language as easy as Python itself. Cython is based on the well-known Pyrex, but supports more cutting edge functionality and optimizations.

The Cython language is very close to the Python language, but Cython additio- nally supports calling C functions and declaring C types on variables and class attributes. This allows the compiler to generate very efficient C code from Cython code.

This makes Cython the ideal language for wrapping for external C libraries, and for fast C modules that speed up the execution of Python code.

6.1.62 d3js: JavaScript library for manipulating documents based on data

Description

D3.js is a JavaScript library for manipulating documents based on data. The file d3.min.js will be placed into the ${SAGE_SHARE}/d3js/ directory.

License

BSD 3-Clause License

Upstream Contact

- Author: Mike Bostock (http://bost.ocks.org/mike/)
- Home page: http://d3js.org/

Special Update/Build Instructions

Two kind of archives can be downloaded from d3.js website: one with all source code and tests that weights 2,9M (both in zip and tar.gz formats) and one with the final javascript scripts which weights 121K (zip format only). Since testing requires node.js that is not shipped with Sage, we currenlty ship the final js only. Hence we have to transform it from zip to tar.gz format. Running sage-src should do all the repackaging job.

Type

optional

Dependencies

Version Information

package-version.txt:

```
3.4.8
```

Equivalent System Packages

See https://repology.org/project/node:d3/versions

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see Issue #27330 for more information.

6.1.63 database_cremona_ellcurve: Database of elliptic curves

Description

John Cremona's database of elliptic curves

See https://github.com/JohnCremona/ecdata

This is an optional package, not included by default.

License

Public Domain

Upstream Contact

- Author: John Cremona
- Email: john.cremona@gmail.com
- Website: http://homepages.warwick.ac.uk/staff/J.E.Cremona/

Update Instructions

Get an up-to-date copy of the git repository ecdata from https://github.com/JohnCremona/ecdata.

If the cremona database has already been installed, remove `SAGE_DATA/cremona/cremona.db`. Then run

The build script expects to find the files in subfolders allcurves, allgens, degphi and allbsd of the ecdata folder. It extracts them and builds the new cremona.db file from the contents.

Finally, copy `SAGE_DATA/cremona/cremona.db` to the src directory of the spkg.

Equivalent System Packages

(none known)

6.1.67 database_kohel: Database of modular and Hilbert polynomials

Description

Database of modular and Hilbert polynomials.

Upstream Contact

- David Kohel <David.Kohel@univ-amu.fr>

Type

optional

Dependencies

Version Information

package-version.txt:

```
20160724
```

Equivalent System Packages

See https://repology.org/project/sage-data-kohel/versions

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see Issue #27330 for more information.

6.1.68 database_mutation_class: Database of exceptional mutation classes of quivers

Description

Contains a database of all exceptional mutation classes of quivers.

Every file in the database is of the form `mutation_classes_n.dig6` for some `n` and

- contains a `cPickle.dump` of a dictionary where
- the keys are tuples representing irreducible exceptional quiver mutation types of rank `n`, and
- the values are all quivers in the given mutation class stored in canonical form as `(dig6,edges)` where
- `dig6` is the dig6 data of the given `DiGraph`, and
- `edges` are the non-simply-laced edges thereof.
- is obtained by running the function

  ```
  sage.combinat.cluster_algebra_quiver.quiver_mutation_type._save_data_dig6(n,
  types='Exceptional', verbose=False)
  ```

SPKG Maintainers

- C. Stump <christian.stump@gmail.com>

Type

optional

Dependencies

Version Information

package-version.txt:

```
1.0
```

Equivalent System Packages

See https://repology.org/project/database-mutation-class/versions

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see Issue #27330 for more information.

6.1.69 database_odlyzko_zeta: Table of zeros of the Riemann zeta function

Description

Table of zeros of the Riemann zeta function by Andrew Odlyzko.

This package contains the file 'zeros6' with the first 2,001,052 zeros of the Riemann zeta function, accurate to within 4*10^(-9).

Type

optional

Dependencies

- $(SAGERUNTIME)

Version Information

package-version.txt:

```
20061209
```

Equivalent System Packages

See https://repology.org/project/sage-data-odlyzko-zeta/versions

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see Issue #27330 for more information.

6.1.70 database_stein_watkins: Database of elliptic curves (full version)

Description

The Stein-Watkins database of elliptic curves (full version)

See http://modular.math.washington.edu/papers/stein-watkins/

This is an optional (huge) package, not included by default.

License

Public Domain

Type

optional

Dependencies

Version Information

package-version.txt:

```

Equivalent System Packages

See https://repology.org/project/database-stein-watkins-mini/versions

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see Issue #27330 for more information.

6.1.72 database_symbolic_data: Database from the SymbolicData project

Description

The SymbolicData project is set out

- to develop concepts and tools for profiling, testing and benchmarking Computer Algebra Software (CAS) and
- to collect and interlink relevant data and activities from different Computer Algebra Communities.

SymbolicData is an

- inter-community project that has its roots in the activities of different Computer Algebra Communities and
- aims at interlinking these activities using modern Semantic Web concepts.

Tools and data are designed to be used both

- on a local site for special testing and profiling purposes
- and to manage a central repository at www.symbolicdata.org.

1.8.1
```

version_requirements.txt:

```
debugpy
```

Equivalent System Packages

```
$ conda install debugpy
```

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

6.1.75 decorator: Python library providing decorators

Description

Better living through Python with decorators

Type

standard

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)

Version Information

package-version.txt:

```
5.1.1
```

version_requirements.txt:

```
decorator >=4.4.0
```

Equivalent System Packages

```
$ sudo pacman -S python-decorator
```

```
$ conda install decorator
```

```
$ sudo apt-get install python3-decorator
```

```
$ sudo yum install python3-decorator
```

```
$ sudo emerge dev-python/decorator
```

```
$ sudo port install py-decorator
```

```
$ sudo zypper install python3\$\{PYTHON_MINOR\}-decorator
```

```
$ sudo xbps-install python3-decorator
```

See https://repology.org/project/python:decorator/versions

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

6.1.76 deformation: Count points on hypersurfaces using the deformation method

Description

Deformation is a C library for counting points on hypersurfaces using the deformation method, developed by Sebastian Pancratz.

License

GLPv3

Upstream Contact

- Sebastian Pancratz: sebastian.pancratz@gmail.com, sage-devel@googlegroups.com
- We use the fork at https://github.com/sagemath/deformation the fork uses GMP instead of MPIR, and Flint 2.7+.

Type

experimental

Dependencies

- $(MP_LIBRARY)
- *flint: Fast Library for Number Theory*
- *mpfr: Multiple-precision floating-point computations with correct rounding*

Version Information

package-version.txt:

```
20210503
```

Equivalent System Packages

See https://repology.org/project/deformation/versions

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see Issue #27330 for more information.

6.1.77 defusedxml: Addresses vulnerabilities of XML parsers and XML libraries

Description

defusedxml addresses vulnerabilities of XML parsers and XML libraries.

It became a dependency of nbconvert starting with nbconvert 5.4.

License

Python Software Foundation License (PSFL)

Upstream Contact

https://pypi.org/project/defusedxml/

Special Update/Build Instructions

None.

Type

standard

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)

Version Information

package-version.txt:

```
0.7.1
```

version_requirements.txt:

```
defusedxml >=0.6.0
```

Equivalent System Packages

```
$ conda install defusedxml
```

```
$ sudo yum install python3-defusedxml
```

```
$ sudo emerge dev-python/defusedxml
```

```
$ sudo port install py-defusedxml
```

```
$ sudo xbps-install python3-defusedxml
```

See https://repology.org/project/python:defusedxml/versions

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

https://pypi.org/project/docutils/

Home Page: http://docutils.sourceforge.net/

Type

standard

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)

Version Information

package-version.txt:

```
0.21.2
```

version_requirements.txt:

```
docutils >=0.14
```

Equivalent System Packages

```
$ conda install docutils
```

```
$ sudo yum install python3-docutils
```

```
$ sudo emerge dev-python/docutils
```

```
$ brew install docutils
```

```
$ sudo port install py-docutils
```

```
$ sudo zypper install python3\$\{PYTHON_MINOR\}-docutils
```

```
$ sudo xbps-install python3-docutils
```

See https://repology.org/project/docutils/versions, https://repology.org/project/python:docutils/versions

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

6.1.80 dot2tex: Create PGF/TikZ commands from Graphviz output

Description

dot2tex is a Python module, whose purpose is to give graphs generated by Graphviz a more LaTeX friendly look and feel. This is accomplished by converting xdot output from Graphviz to a series of PSTricks or PGF/TikZ commands.

See https://github.com/kjellmf/dot2tex/

License

- MIT

Upstream Contact

- Kjell Magne Fauske, km@fauskes.net

Dependencies

graphviz (www.graphviz.org) should be installed and in the path (for example via the graphviz spkg).

preview, a LaTeX package for extracting parts of a document.

Self-tests dependencies:

- graphviz
- texlive-latex-base
- texlive-pictures
- texlive-pstricks

Patches

- remove_test_semicolon.patch:

  Remove the failing semicolon test for the open dot2tex issue #5 - https://github.com/kjellmf/dot2tex/issues/5

Special Update/Build Instructions

Make sure corresponding optional doctests still pass:

    sage -t –long –optional=dot2tex,graphviz,sage src/

Type

optional

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- *pyparsing: A Python parsing module*

Version Information

package-version.txt:

```
2.11.3.p0
```

version_requirements.txt:

```
dot2tex >=2.11.3
```

Equivalent System Packages

```
$ sudo pacman -S dot2tex
```

```
$ conda install dot2tex
```

```
$ sudo yum install dot2tex
```

```
$ sudo port install dot2tex
```

See https://repology.org/project/dot2tex/versions, https://repology.org/project/python:dot2tex/versions

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

6.1.81 dsdp: Semidefinite programming solver

Description

Implementation of an interior-point method for semidefinite programming. It provides primal and dual solutions, exploits low-rank structure and sparsity in the data, and has relatively low memory requirements for an interior-point method. It allows feasible and infeasible starting points and provides approximate certificates of infeasibility when no feasible solution exists. The dual-scaling algorithm implemented in this package has a convergence proof and worst-case polynomial complexity under mild assumptions on the data.

License

Type

optional

Dependencies

- $(BLAS)
- *cmake: A cross-platform build system generator*

Version Information

package-version.txt:

```
5.8
```

Equivalent System Packages

```
$ sudo pacman -S dsdp
```

```
$ conda install dsdp
```

```
$ sudo apt-get install libdsdp-dev
```

```
$ sudo yum install DSDP-devel
```

```
$ sudo pkg install math/dsdp
```

```
$ sudo emerge sci-libs/dsdp
```

```
$ sudo port install DSDP
```

See https://repology.org/project/dsdp/versions

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see Issue #27330 for more information.

6.1.82 e_antic: Real embedded number fields

Description

e-antic is a C library for exact computations with real embedded number field maintained by Vincent Delecroix.

Website: https://github.com/videlec/e-antic

License

e-antic is licensed GPL v3.

Upstream Contact

- https://github.com/videlec/e-antic

Type

optional

Dependencies

- $(MP_LIBRARY)
- *boost_cropped: Portable C++ libraries (subset needed for Sage)*
- *flint: Fast Library for Number Theory*

Version Information

package-version.txt:

```
2.0.2
```

Equivalent System Packages

```
$ sudo pacman -S e-antic
```

```
$ conda install libeantic
```

```
$ sudo apt-get install libeantic-dev
```

```
$ sudo yum install e-antic-devel
```

```
$ sudo pkg install math/e-antic
```

```
$ sudo zypper install e-antic-devel
```

See https://repology.org/project/e-antic/versions

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see Issue #27330 for more information.

6.1.83 ecl: An implementation of the Common Lisp language

Description

ECL is an implementation of the Common Lisp language as defined by the ANSI X3J13 specification. The most relevant features:

- A bytecodes compiler and interpreter.
- Compiles Lisp also with any C/C++ compiler.
- It can build standalone executables and libraries.
- ASDF, Sockets, Gray streams, MOP, and other useful components.
- Extremely portable.
- A reasonable license.

ECL supports the operating systems Linux, FreeBSD, NetBSD, OpenBSD, Solaris and Windows, running on top of the Intel, Sparc, Alpha and PowerPC processors. Porting to other architectures should be rather easy.

Website: https://common-lisp.net/project/ecl/

License

- LGPL V2+ or compatible - for details see

  https://common-lisp.net/project/ecl/static/manual/Copyrights.html#Copyright-of-ECL

Upstream Contact

- the ECL mailing list - see https://mailman.common-lisp.net/listinfo/ecl-devel

Special Update/Build Instructions

- Note: for the time being, ECL is built single threaded library as it seems to interact badly with the pexpect interface and Sage's signal handling when built multithreaded.
- Do NOT quote SAGE_LOCAL when setting CPPFLAGS and/or LDFLAGS, in spkg-install as this caused the build to break. See Issue #10187#comment:117
- TODO: Add the ECL test suite, and an spkg-check file to run it.
- TODO: Make ECL use Sage's Boehm GC on MacOS X as well (but perhaps put some changes from ECL's into Sage's Boehm GC), then remove the src/src/gc directory, too.

Type

standard

Dependencies

- $(MP_LIBRARY)
- *gc: The Boehm-Demers-Weiser conservative garbage collector*
- *info: stand-alone Info documentation reader*
- *libffi: A portable foreign-function interface library*
- *readline: Command line editing library*

Version Information

package-version.txt:

```
24.5.10
```

Equivalent System Packages

```
$ apk add ecl-dev
```

```
$ sudo pacman -S ecl
```

```
$ conda install ecl
```

```
$ sudo apt-get install ecl
```

```
$ sudo yum install ecl
```

```
$ sudo pkg install lang/ecl
```

```
$ sudo emerge dev-lisp/ecl
```

```
$ brew install ecl
```

```
$ sudo port install ecl
```

```
$ nix-env --install ecl
```

```
$ sudo xbps-install ecl
```

See https://repology.org/project/ecl/versions

If the system package is installed, `./configure` will check if it can be used.

6.1.84 eclib: Enumerating and computing with elliptic curves defined over the rational numbers

Description

John Cremona's programs for enumerating and computing with elliptic curves defined over the rational numbers.

mwrank is a program written in C++ for computing Mordell-Weil groups of elliptic curves over Q via 2-descent. It is available as source code in the eclib package, which may be distributed under the GNU General Public License, version 2, or any later version.

mwrank is now only distributed as part of eclib. eclib is also included in Sage, and for most potential users the easiest way to run mwrank is to install Sage (which also of course gives you much much more). I no longer provide a source code distribution of mwrank by itself: use eclib instead.

License

eclib is licensed GPL v2+.

Upstream Contact

- Author: John Cremona
- Email: john.cremona@gmail.com
- Website: https://johncremona.github.io/mwrank/index.html
- Repository: https://github.com/JohnCremona/eclib

Type

standard

Dependencies

- *flint: Fast Library for Number Theory*
- *ntl: A library for doing number theory*
- *pari: Computer algebra system for fast computations in number theory*

Version Information

package-version.txt:

```

```
$ sudo pkg install math/eclib
```

```
$ sudo emerge sci-mathematics/eclib\[flint\]
```

```
$ nix-env --install eclib
```

```
$ sudo xbps-install eclib-devel
```

See https://repology.org/project/eclib/versions

If the system package is installed, `./configure` will check if it can be used.

6.1.85 ecm: Elliptic curve method for integer factorization

Description

GMP-ECM - Elliptic Curve Method for Integer Factorization

Sources can be obtained from https://gitlab.inria.fr/zimmerma/ecm

License

LGPL V3+

Upstream Contact

- ecm-discuss@inria.fr

Special Update/Build Instructions

- GMP-ECM comes with a self-tuning feature; we could support that as an option ($SAGE_TUNE_*=yes) in the future.
- ECM currently does not (by itself) use the CC and CFLAGS settings from 'gmp.h' since we pass (other) options in CFLAGS, and CC is set by Sage and might got set by the user. We now at least partially fix that such that "optimized" code generation options ('-mcpu=…', '-mtune=…') are used by gcc. Of course a user can also manually enable them by setting the "global" CFLAGS to e.g. '-march=native' on x86[_64] systems, or '-mcpu=…' and '-mtune=…' on other architectures where "native" isn't supported. Note that this doesn't affect the packages' selection of processor-specific optimized [assembly] code. 'spkg-install' already reads the settings from Sage's and also a system-wide GMP now, but doesn't (yet) use all of them. If SAGE_FAT_BINARY="yes", we should avoid too specific settings of "-mcpu=…", and perhaps pass a more generic "–host=…" to 'configure'.
- We currently work around a linker bug on MacOS X 10.5 PPC (with GCC 4.2.1) which breaks 'configure' if debug symbols are enabled. This *might* get fixed in later upstream releases.
- We could save some space by removing the `src/build.vc10/` directory which isn't used in Sage. (It gets probably more worth in case also directories / files for later versions of Microsoft Visual C get added.)

Type

standard

Dependencies

- $(MP_LIBRARY)

Version Information

package-version.txt:

If the system package is installed, `./configure` will check if it can be used.

6.1.104 freetype: A free, high-quality, and portable font engine

Description

From the documentation:

FreeType is a software font engine that is designed to be small, efficient, highly customizable, and portable while capable of producing high-quality output (glyph images). It can be used in graphics libraries, display servers, font conversion tools, text image generation tools, and many other products as well.

Note that FreeType is a font service and doesn't provide APIs to perform higher-level features like text layout or graphics processing (e.g., colored text rendering, 'hollowing', etc.). However, it greatly simplifies these tasks by providing a simple, easy to use, and uniform interface to access the content of font files.

Please note that 'FreeType' is also called 'FreeType 2', to distinguish it from the old, deprecated 'FreeType 1' library, a predecessor no longer maintained and supported.

The package in Sage is called freetype (in lowercase).

License

- FreeType (BSD-like)
- GNU Public License v2

From the documentation:

FreeType is released under two open-source licenses: our own BSD-like FreeType License and the GNU Public License, Version 2. It can thus be used by any kind of projects, be they proprietary or not.

If the system package is installed, `./configure` will check if it can be used.

6.1.106 frobby: Computations on monomial ideals

Description

The software package Frobby provides a number of computations on monomial ideals. The current main feature is the socle of a monomial ideal, which is largely equivalent to computing the maximal standard monomials, the Alexander dual or the irreducible decomposition.

Operations on monomial ideals are much faster than algorithms designed for ideals in general, which is what makes a specialized library for these operations on monomial ideals useful.

License

- GPL version 2.0 or later

Upstream Contact

- http://www.broune.com/frobby/
- https://github.com/Macaulay2/frobby

Special Update/Build instructions

Download Frobby at www.broune.com/ and then type "make spkg VER=blah" which wil create an spkg named frobby-VER.spkg in bin/. The files related to doing this is in the sage/ sub-directory of the Frobby source distribution.

Type

optional

Dependencies

- $(MP_LIBRARY)

Version Information

package-version.txt:

```
0.9.0.p2
```

Equivalent System Packages

```
$ sudo yum install frobby libfrobby libfrobby-devel
```

See https://repology.org/project/frobby/versions

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see Issue #27330 for more information.

6.1.108 gap: Groups, Algorithms, Programming - a system for computational discrete algebra

Description

GAP is a system for computational discrete algebra, with particular emphasis on Computational Group Theory. GAP provides a programming language, a library of thousands of functions implementing algebraic algorithms written in the GAP language as well as large data libraries of algebraic objects. See also the overview and the description of the mathematical capabilities. GAP is used in research and teaching for studying groups and their representations, rings, vector spaces, algebras, combinatorial structures, and more. The system, including source, is distributed freely. You can study and easily modify or extend it for your special use.

This is a stripped-down version of GAP. The databases, which are architecture-independent, are in a separate package.

6.1.109 gap3: A minimal distribution of GAP 3 containing packages that have no equivalent in GAP 4

Description

This package installs Jean Michel's pre-packaged GAP3, which is a minimal GAP3 distribution containing packages that have no equivalent in GAP4.

Below is the full description from Jean Michel's webpage (accessed 23 July 2015).

> A pre-packaged GAP3 with everything you need
>
> To help people who are just interested in GAP3 because they need a package which has not been ported to GAP4, I have prepared an easy-to install minimal GAP3 distribution containing an up-to-date versions of the packages:
>
> anusq, arep, autag, chevie, cryst, dce, grim, matrix, meataxe, monoid, nq, pcqa, sisyphos, specht, ve, vkcurve.
>
> These packages have been chosen since most have no equivalent in GAP4. They are autoloaded when starting gap.
>
> This distribution includes only partial lists of small groups, 2-groups, 3-groups, character tables from the Atlas and tables of marks. It does not include either the packages:
>
> anupq, grape, kbmag, xgap, cohomolo, gliss, guava, xmod
>
> which have some equivalent in GAP4. You can get these extra features at
>
> http://www.math.rwth-aachen.de/~Frank.Luebeck/gap/GAP3
>
> In this distribution:

- The on-line help includes the documentation of the included packages.
- The html documentation (htm/index.html) also does.
- The manual (manual.pdf) also does.

License

Most parts of the GAP distribution, including the core part of the GAP system, are distributed under the terms of the GNU General Public License (see http://www.gnu.org/licenses/gpl.html or the file GPL in the etc directory of the GAP installation).

6.1.111 gap_packages: A collection of GAP packages

Description

Several "official" and "undeposited" GAP packages available from https://www.gap-system.org/Packages/packages.html

Installing this SPKG will install the corresponding GAP packages, but before you can use them in Sage, they still have to be loaded into either the GAP interface or libgap:

```
sage: gap.eval('LoadPackage("Grape")')  # optional - gap_packages
'true'
sage: libgap.LoadPackage("Grape")       # optional - gap_packages
true
```

```
>>> from sage.all import *
>>> gap.eval('LoadPackage("Grape")')  # optional - gap_packages
'true'
>>> libgap.LoadPackage("Grape")       # optional - gap_packages
true
```

Those correspond to:

```
gap> LoadPackage("Grape");
```

within the GAP interface and libgap, respectively.

Dependencies

- GAP (a standard spkg)

TODO

The crystallographic group packages are untested/untestable. They rely on polymake and the dependency "cryst" is missing. This needs to be cleaned up.

Notes

A brief description of each package follows:

cohomolo - The cohomolo package is a GAP interface to some C programs for computing Schur multipliers and covering groups of finite groups and first and second cohomology groups of finite groups acting on finite modules. (Author: Max Horn, Markus Pfeiffer)

CoReLG - Contains functionality for working with real semisimple Lie algebras. (Author: Heiko Dietrich, Paolo Faccin, Willem Adriaan de Graaf)

crime - package to compute the cohomology ring of finite p-groups, induced maps, and Massey products. (Author: Marcus Bishop)

cryst - Computing with crystallographic groups (Authors: Bettina Eick, Franz Gähler, Werner Nickel)

CTblLib - The GAP Character Table Library (Author: Thomas Breuer)

DESIGN is a package for classifying, partitioning and studying block designs. (Author: Leonard H. Soicher)

FactInt is a package providing routines for factoring integers, in particular:

- Pollard's p-1
- Williams' p+1
- Elliptic Curves Method (ECM)
- Continued Fraction Algorithm (CFRAC)
- Multiple Polynomial Quadratic Sieve (MPQS)

(Author: Stefan Kohl)

GAPDoc is a package containing a definition of a structure for GAP documentation, based on XML. It also contains conversion programs for producing text-, DVI-, PDF- or HTML-versions of such documents, with hyperlinks if possible. (Authors: Frank Luebeck, Max Neunhoeffer)

GBNP - The GBNP package provides algorithms for computing Grobner bases of noncommutative polynomials with coefficients from a field implemented in GAP and with respect to the "total degree first then lexicographical" ordering. Further provided are some variations, such as a weighted and truncated version and a tracing facility. The word "algorithm" is to be interpreted loosely here: in general one cannot expect such an algorithm to terminate, as it would imply solvability of the word problem for finitely presented (semi)groups. (Authors: A.M. Cohen, J.W. Knopper)

GRAPE is a package for computing with graphs and groups, and is primarily designed for constructing and analysing graphs related to groups, finite geometries, and designs. (Author: Leonard H. Soicher)

GUAVA is included here, and with Sage standard.

HAP (Homological Algebra Programming) is a GAP package providing some functions for group cohomology computation. (Author: Graham Ellis)

HAPcryst - an extension package for HAP, which allows for group cohomology computation for a wider class of groups. (Author: Marc Roeder)

hecke - Provides functions for calculating decomposition matrices of Hecke algebras of the symmetric groups and q-Schur algebras. Hecke is a port of the GAP 3 package Specht 2.4 to GAP 4. (Author: Dmitriy Traytel)

LAGUNA - this package provides functionality for calculation of the normalized unit group of the modular group algebra of the finite p-group and for investigation of Lie algebra associated with group algebras and other associative algebras. (Authors :Victor Bovdi, Alexander Konovalov, Richard Rossmanith, Csaba Schneider)

liealgdb - A database of Lie algebras (Author: Serena Cicalo', Willem Adriaan de Graaf, Csaba Schneider)

LiePRing - Database and algorithms for Lie p-rings (Author: Michael Vaughan-Lee, Bettina Eick)

LieRing - contains functionality for working with finitely presented Lie rings and the Lazard correspondence. (Author: Serena Cicalo', Willem Adriaan de Graaf)

loops - Provides researchers in nonassociative algebra with a computational tool that integrates standard notions of loop theory with libraries of loops and group-theoretical algorithms of GAP. The package also expands GAP toward nonassociative structures. (Authors: Gabor Nagy, Petr Vojtechovsky)

mapclass - The package calculates the mapping class group orbits for a given finite group. (Authors: Adam James, Kay Magaard, Sergey Shpectorov, Helmut Volklein)

polymake - an interface with the (standalone) polymake program used by HAPcryst. (Author: Marc Roeder)

qpa - Quivers and Path Algebras provides data structures and algorithms for doing computations with finite dimensional quotients of path algebras, and finitely generated modules over such algebras. The current version of the QPA package has data structures for quivers, quotients of path algebras, and modules, homomorphisms and complexes of modules over quotients of path algebras. (Authors: Edward Green, Oeyvind Solberg)

quagroup - Contains functionality for working with quantized enveloping algebras of finite-dimensional semisimple Lie algebras. (Author: Willem Adriaan de Graaf)

repsn - The package provides GAP functions for computing characteristic zero matrix representations of finite groups. (Author: Vahid Dabbaghian)

sla - a package for doing computations with simple Lie algebras (Author: Willem Adriaan de Graaf)

SONATA ("System Of Nearrings And Their Applications") is a package which constructs finite nearrings and related objects. (Authors: Erhard Aichinger, Franz Binder, Jürgen Ecker, Peter Mayr, Christof Noebauer)

TORIC is a GAP package for computing with toric varieties. (Author: David Joyner)

Type

optional

Dependencies

- $(SAGERUNTIME)
- *gap: Groups, Algorithms, Programming - a system for computational discrete algebra*
- *libsemigroups: Library for semigroups and monoids*
- *planarity: Planarity-related graph algorithms*

If the system package is installed, `./configure` will check if it can be used.

6.1.114 gcc: The GNU Compiler Collection or other suitable C and C++ compilers

Description

This package represents the required C and C++ compilers.

- GCC (GNU Compiler Collection) versions 8.x (>= 8.4.0) to 13.x are supported.
- Clang (LLVM) is also supported.

The required Fortran compiler is represented by the package `gfortran`.

You can pass the names of compilers to use to `./configure` using the environment variables `CC`, `CXX`, and `FC`, for C, C++, and Fortran compilers, respectively.

For example, if your C compiler is `clang`, your C++ compiler is `clang++`, and your Fortran compiler is `flang`, then you would need to run:

```
$ ./configure CC=clang CXX=clang++ FC=flang
```

Vendor and versions of the C and C++ compilers should match.

Users of older Linux distributions (in particular, `ubuntu-xenial` or older, `debian-buster` or older, `linuxmint-18` or older) should upgrade their systems before attempting to install Sage from source. Users of `ubuntu-bionic`, `linuxmint-19.x`, and `opensuse-15.x` can install a versioned `gcc` system package and then use:

```
$ ./configure CC=gcc-8 CXX=g++-8 FC=gfortran-8
```

or similar. Users on `ubuntu` can also install a modern compiler toolchain using the ubuntu-toolchain-r ppa. On `ubuntu-trusty`, also the package `binutils-2.26` is required; after installing it, make it available using `export PATH="/usr/lib/binutils-2.26/bin:$PATH"`. Instead of upgrading their distribution, users of `centos-7` can install a modern compiler toolchain using Redhat's devtoolset.

This package uses the non-standard default `configure --with-system-gcc=force`, giving an error at `configure` time when no suitable system compilers are configured.

You can override this using `./configure --without-system-gcc`. In this case, Sage builds and installs the GNU Compiler Collection, including the C, C++ and Fortran compiler. This is not recommended. You will need suitable C and C++ compilers from which GCC can bootstrap itself. There are some known problems with old assemblers, in particular when building the `ecm` and `fflas_ffpack` packages. You should ensure that your assembler understands all instructions for your processor. On Linux, this means you need a recent version of `binutils` (not provided by an SPKG); on macOS you need a recent version of Xcode.

(Installing the `gfortran` SPKG becomes a no-op in this case.)

Building Sage from source on Apple Silicon (M1, M2, M3, M4; arm64) requires the use of Apple's Command Line Tools, and those tools include a suitable compiler. Sage's `gcc` SPKG is not suitable for Apple Silicon; building it will likely fail.

6.1.118 gfan: Groebner fans and tropical varieties

Description

Gfan is a software package for computing Groebner fans and tropical varieties.

These are polyhedral fans associated to polynomial ideals. The maximal cones of a Groebner fan are in bijection with the marked reduced Groebner bases of its defining ideal. The software computes all marked reduced Groebner bases of an ideal. Their union is a universal Groebner basis. The tropical variety of a polynomial ideal is a certain subcomplex of the Groebner fan. Gfan contains algorithms for computing this complex for general ideals and specialized algorithms for tropical curves, tropical hypersurfaces and tropical varieties of prime ideals. In addition to the above core functions the package contains many tools which are useful in the study of Groebner bases, initial ideals and tropical geometry. The full list of commands can be found in Appendix B of the manual. For ordinary Groebner basis computations Gfan is not competitive in speed compared to programs such as CoCoA, Singular and Macaulay2.

License

- GPL version 2 or version 3 (according to the gfan website)

6.1.124 givaro: C++ library for arithmetic and algebraic computations

Description

Givaro is a C++ library for arithmetic and algebraic computations. Its main features are implementations of the basic arithmetic of many mathematical entities: Primes fields, Extensions Fields, Finite Fields, Finite Rings, Polynomials, Algebraic numbers, Arbitrary precision integers and rationals (C++ wrappers over gmp) It also provides data-structures and templated classes for the manipulation of basic algebraic objects, such as vectors, matrices (dense, sparse, structured), univariate polynomials (and therefore recursive multivariate).

6.1.125 glpk: GNU Linear Programming Kit

Description

The GLPK (GNU Linear Programming Kit) package is intended for solving large-scale linear programming (LP), mixed integer programming (MIP), and other related problems. It is a set of routines written in ANSI C and organized in the form of a callable library.

GLPK supports the GNU MathProg modelling language, which is a subset of the AMPL language.

The GLPK package includes the following main components:

- primal and dual simplex methods
- primal-dual interior-point method
- branch-and-cut method
- translator for GNU MathProg
- application program interface (API)
- stand-alone LP/MIP solver

License

The GLPK package is GPL version 3.

Upstream Contact

GLPK is currently being maintained by:

- Andrew Makhorin (mao@gnu.org, mao@mai2.rcnet.ru)

http://www.gnu.org/software/glpk/#maintainer

Special Update/Build Instructions

- `configure` doesn't support specifying the location of the GMP library to use; only `--with-gmp[=yes]` or `--with-gmp=no` are valid options. (So we *have to* add Sage's include and library directories to `CPPFLAGS` and `LDFLAGS`, respectively.)
- Do we need the `--disable-static`? The stand-alone solver presumably runs faster when built with a static library; also other (stand-alone) programs using it would. (Instead, we should perhaps use `--enable-static --enable-shared` to go safe.)

Type

standard

Dependencies

- $(MP_LIBRARY)
- *zlib: Data compression library*

Version Information

package-version.txt:

```
5.0.p1
```

$ apk add gmp-dev
```

```
$ conda install gmp
```

```
$ sudo apt-get install libgmp-dev
```

```
$ sudo yum install gmp gmp-devel
```

```
$ sudo pkg install math/gmp
```

```
$ sudo emerge dev-libs/gmp
```

```
$ brew install gmp
```

```
$ sudo port install gmp
```

```
$ sudo zypper install gmp-devel
```

install the following packages: libgmp

```
$ sudo slackpkg install gmp
```

```
$ sudo xbps-install gmp-devel gmpxx-devel
```

See https://repology.org/project/gmp/versions

If the system package is installed, `./configure` will check if it can be used.

6.1.128 gmpy2: Python interface to GMP/MPIR, MPFR, and MPC

Description

GMP/MPIR, MPFR, and MPC interface to Python

gmpy2 is a C-coded Python extension module that supports multiple-precision arithmetic. In addition to supporting GMP or MPIR for multiple-precision integer and rational arithmetic, gmpy2 adds support for the MPFR (correctly rounded real floating-point arithmetic) and MPC (correctly rounded complex floating-point arithmetic) libraries.

License

LGPL-3.0+

Upstream Contact

https://pypi.org/project/gmpy2/

Type

standard

Dependencies

- $(MP_LIBRARY)
- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- *mpc: Arithmetic of complex numbers with arbitrarily high precision and correct rounding*
- *mpfr: Multiple-precision floating-point computations with correct rounding*

Version Information

6.1.131 gp2c: A compiler for translating GP routines to C

Description

The gp2c compiler is a package for translating GP routines into the C programming language, so that they can be compiled and used with the PARI system or the GP calculator.

License

GPL version 2+

Upstream Contact

- http://pari.math.u-bordeaux.fr/

Dependencies

- PARI
- Perl

Type

optional

Dependencies

- *pari: Computer algebra system for fast computations in number theory*

Version Information

package-version.txt:

```
0.0.10.p0
```

Equivalent System Packages

```
$ sudo apt-get install pari-gp2c
```

```
$ sudo yum install gp2c
```

```
$ sudo pkg install math/gp2c
```

```
$ sudo emerge sci-mathematics/gp2c
```

```
$ sudo zypper install gp2c
```

```
$ sudo xbps-install gp2c
```

See https://repology.org/project/gp2c/versions

If the system package is installed, `./configure` will check if it can be used.

6.1.132 graphs: A database of combinatorial graphs

Description

A database of graphs. Created by Emily Kirkman based on the work of Jason Grout. Since April 2012 it also contains the ISGCI graph database.

Upstream Contact

- https://jasongrout.org/graph_database
- For ISGCI:

  H.N. de Ridder (hnridder@graphclasses.org)
- For Andries Brouwer's database:

  The data is taken from from Andries E. Brouwer's website (https://www.win.tue.nl/~aeb/). Anything related to the data should be reported to him directly (aeb@cwi.nl)

  The code used to parse the data and create the .json file is available at https://github.com/nathanncohen/strongly_regular_graphs_database.

Type

standard

Dependencies

Version Information

package-version.txt:

```
20210214.p0
```

Equivalent System Packages

```
$ sudo pacman -S sage-data-graphs
```

```
$ conda install sagemath-db-graphs
```

See https://repology.org/project/sagemath-graphs/versions

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see Issue #27330 for more information.

6.1.133 graphviz: Graph visualization software

Description

Graphviz is open source graph visualization software. It has several main graph layout programs. They take descriptions of graphs in a simple text language, and make diagrams in several useful formats.

License

Eclipse Public License 1.0

6.1.134 gsl: The GNU Scientific Library

Description

The GNU Scientific Library

Website: http://www.gnu.org/software/gsl/

From the website above: The GNU Scientific Library (GSL) is a numerical library for C and C++ programmers. It is free software under the GNU General Public License.

The library provides a wide range of mathematical routines such as random number generators, special functions and least-squares fitting. There are over 1000 functions in total with an extensive test suite. If the variable SAGE_CHECK is exported to the value "yes" when building Sage, GSL's test suite is run.

License

- GPL V3

Upstream Contact

- http://www.gnu.org/software/gsl/

GSL mailing lists:

- Bug-gsl <bug-gsl@gnu.org> mailing list – bug reports for the GNU Scientific Library should be sent to bug-gsl@gnu.org
- Help-gsl <help-gsl@gnu.org> users mailing list – for questions about installation, how GSL works and how it is used, or general questions concerning GSL.
- Info-gsl <info-gsl@gnu.org> mailing list – announcements of new releases are made there.

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

6.1.148 info: stand-alone Info documentation reader

Description

GNU Info is the stand-alone "info" reader that is part of the GNU Texinfo suite of tools. Several packages (Maxima, Singular, …) install documentation in "info" format, which can be read either with Emacs, the stand-alone "info" reader, and some other software. In particular, the interactive help system of `singular_console()` uses the `info` program in environments in which a web browser is not available; if `info` is not installed, it falls back to a basic pager with limited capabilities.

Website: https://www.gnu.org/software/texinfo/manual/info-stnd/info-stnd.html

License

GPL-3+ (`info/*.c` comments in the source repository)

Type

6.1.152 ipython: Interactive computing environment with an enhanced interactive Python shell

Description

Interactive computing environment with an enhanced interactive Python shell

From the IPython website:

IPython is a multiplatform, Free Software project (BSD licensed) that offers:

- An enhanced Python shell designed for efficient interactive work. It includes many enhancements over the default Python shell, including the ability for controlling interactively all major GUI toolkits in a non-blocking manner.
- A library to build customized interactive environments using Python as the basic language (but with the possibility of having extended or alternate syntaxes).
- A system for interactive distributed and parallel computing (this is part of IPython's new development).

```

```
$ sudo emerge dev-python/ipywidgets
```

```
$ sudo port install py-ipywidgets
```

```
$ sudo xbps-install python3-jupyter_ipywidgets
```

See https://repology.org/project/python:ipywidgets/versions

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

6.1.155 isl: Sets and relations of integer points bounded by affine constraints

Description

isl is a thread-safe C library for manipulating sets and relations of integer points bounded by affine constraints. The descriptions of the sets and relations may involve both parameters and existentially quantified variables. All computations are performed in exact integer arithmetic using GMP.

License

isl is released under the MIT license, but depends on the LGPL GMP library.

6.1.157 jedi: Static analysis tool providing IDE support for Python

Description

Jedi is a static analysis tool for Python that is typically used in IDEs/editors plugins. Jedi has a focus on autocompletion and goto functionality. Other features include refactoring, code search and finding references.

Type

standard

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- *parso: Python Parser*

Version Information

package-version.txt:

```
0.19.1
```

version_requirements.txt:

```
jedi >=0.17.0
```

Equivalent System Packages

```
$ conda install jedi
```

```
$ sudo yum install python3-jedi
```

```
$ sudo emerge dev-python/jedi
```

```
$ sudo port install py-jedi
```

```
$ sudo xbps-install python3-jedi
```

See https://repology.org/project/jedi/versions, https://repology.org/project/python:jedi/versions

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

6.1.158 jinja2: General purpose template engine for Python

Description

Jinja2 is a library for Python 2.4 and onwards that is designed to be flexible, fast and secure.

If you have any exposure to other text-based template languages, such as Smarty or Django, you should feel right at home with Jinja2. It's both designer and developer friendly by sticking to Python's principles and adding functionality useful for templating environments.

License

BSD-3-Clause

Upstream Contact

https://pypi.org/project/Jinja2/

Type

standard

Dependencies

- $(PYTHON)
- *markupsafe: Safely add untrusted strings to HTML/XML markup*
- *pip: Tool for installing and managing Python packages*

Version Information

package-version.txt:

```
3.1.4
```

src/pyproject.toml:

```
jinja2
```

version_requirements.txt:

```
jinja2 >=3.0
```

Equivalent System Packages

```
$ conda install jinja2
```

```
$ sudo apt-get install python3-jinja2
```

```
$ sudo yum install python3-jinja2
```

```
$ sudo emerge dev-python/jinja
```

```
$ sudo port install py-jinja2
```

```
$ sudo zypper install python3\$\{PYTHON_MINOR\}-jinja2
```

```
$ sudo xbps-install python3-Jinja2
```

See https://repology.org/project/python:jinja2/versions

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

6.1.159 jmol: Java viewer for chemical structures in 3D

Description

Java viewer for chemical structures in 3D.

This provides files necessary for Jmol (java).

This package does not install JSmol (javascript), which upstream bundles with Jmol.

License

GPLv2+

Upstream Contact

- http://jmol.sourceforge.net
- Bob Hanson
- e-mail: hansonr@stolaf.edu
- Homepage: https://www.stolaf.edu/people/hansonr/
- Development page: https://github.com/BobHanson/Jmol-SwingJS
- Download page: https://sourceforge.net/projects/jmol/files/Jmol/

Dependencies

No build-time dependencies.

The commandline jmol requires java at runtime.

Special Build Instructions

To avoid depending on `unzip` at build time, we have to repack the tarball, see `spkg-src`. We take the opportunity to remove some unnecessary subdirectories, see http://wiki.jmol.org/index.php/Jmol_JavaScript_Object#In_detail

Type

optional

Dependencies

Version Information

package-version.txt:

```
14.29.52
```

Equivalent System Packages

```
$ sudo pacman -S jmol
```

```
$ conda install jmol
```

```
$ sudo yum install jmol
```

```
$ sudo port install jmol
```

```
$ nix-env --install jmol
```

```
$ sudo zypper install jmol
```

```
$ sudo xbps-install jmol
```

See https://repology.org/project/jmol/versions

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see Issue #27330 for more information.

1.1.10
```

Equivalent System Packages

See https://repology.org/project/kenzo/versions

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see Issue #27330 for more information.

6.1.179 kissat: SAT solver

Description

From the package README:

```
KISSAT is a "keep it simple and clean bare metal SAT solver" written in C.
It is a port of CaDiCaL back to C with improved data structures, better
scheduling of inprocessing and optimized algorithms and implementation.

Coincidentally 'kissat' also means 'cats' in Finnish.
```

From the website:

```
The Kissat SAT solver is a condensed and improved reimplementation of
CaDiCaL in C.

Kissat won first place in the main track of the SAT Competition 2020 and
first place on unsatisfiable instances.
```

License

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see Issue #27330 for more information.

6.1.180 kiwisolver: Fast implementation of the Cassowary constraint solver

Description

From https://pypi.org/project/kiwisolver/

A fast implementation of the Cassowary constraint solver

Kiwi is an efficient C++ implementation of the Cassowary constraint solving algorithm. Kiwi is an implementation of the algorithm based on the seminal Cassowary paper. It is not a refactoring of the original C++ solver. Kiwi has been designed from the ground up to be lightweight and fast. Kiwi ranges from 10x to 500x faster than the original Cassowary solver with typical use cases gaining a 40x improvement. Memory savings are consistently > 5x.

In addition to the C++ solver, Kiwi ships with hand-rolled Python bindings.

6.1.182 lcalc: L-function calculator

Description

Michael Rubinstein's L-function calculator.

License

- LGPL V2+

Upstream contact

Michael Rubinstein <mrubinst@uwaterloo.ca>

Sources: http://oto.math.uwaterloo.ca/~mrubinst/L_function_public/L.html

Newer beta version 1.3 (not yet in Sage): http://code.google.com/p/l-calc/

Dependencies

- GMP/MPIR
- MPFR
- PARI
- GNU patch

Special Update/Build Instructions

- There is some garbage in the upstream sources which should be removed:

```
src/include/.Lexplicit_formula.h.swp
src/include/.Lvalue.h.swp
src/include/._.DS_Store
src/include/.DS_Store
src/include/Lexplicit_formula.h.swap.crap
src/include/Lvalue.h.bak
src/src/Makefile.old
src/src/.Makefile.old.swp
src/src/._.DS_Store
src/src/.DS_Store
src/src/.Lcommandline.ggo.swp
src/src/libLfunction.a
```

- We (and apparently also upstream) currently don't build Lcalc's tests (see Makefile), hence there's no spkg-check. This might change in newer upstream versions.
- The original Makefile uses $(CC) to compile C++ (also using $(CCFLAGS)), which it defines to 'g++', and hard-codes 'g++' when linking the shared library. (It should use $(CXX) instead, which might *default* to 'g++'.) We now (lcalc-1.23.p10) patch the Makefile also to use $(CXX) for compiling and linking C++; $(CXX) now *defaults* to 'g++', and $(CC) to 'gcc', but both can be overridden by simply setting their respective environment variables. (Same for $(INSTALL_DIR) btw.)

Patches

- Makefile.patch:

  We change a lot there, since Lcalc doesn't have a 'configure' script, and hence the Makefile is supposed to be edited to customize Lcalc (build options, locations of headers and libraries etc.). Besides that, we

  - put CXXFLAGS into Lcalc's "CCFLAGS" used for compiling C++,
  - remove some stuff involving LDFLAGS1 and LDFLAGS2, setting just LDFLAGS,
  - use $(MAKE) instead of 'make' in the crude build receipts,
  - use CXXFLAG64 when linking the shared library,
  - now use $(CXX) for compiling and linking C++, which *defaults* to 'g++', but can be overridden by setting the environment variable of the same name. ($(CC) now *defaults* to 'gcc', although currently not really used as far as I can see.)
  - $(INSTALL_DIR) can now be overridden by simply setting the environment variable of the same name.

- Lcommon.h.patch:

  Uncomment the definition of lcalc_to_double(const long double& x). (Necessary for GCC >= 4.6.0, cf. #10892.) Comment from there: The reason is the following code horror from src/src/include/Lcommon.h: [...] But some-

body who is familiar with the codebase should really rewrite lcalc to not redefine the double() cast, thats just fragile and will sooner or later again fail inside some system headers.

- pari-2.7.patch:

  Various changes to port to newer versions of PARI.

- time.h.patch:

  (Patches src/include/Lcommandline_numbertheory.h) Include also <time.h> in Lcommandline_numbertheory.h (at least required on Cygwin, cf. #9845). This should get reported upstream.

- lcalc-1.23_default_parameters_1.patch: Make Lcalc (1.23) build with GCC 4.9

Type

standard

Dependencies

6.1.185 libffi: A portable foreign-function interface library

Description

Compilers for high level languages generate code that follow certain conventions. These conventions are necessary, in part, for separate compilation to work. One such convention is the "calling convention". The "calling convention" is essentially a set of assumptions made by the compiler about where function arguments will be found on entry to a function. A "calling convention" also specifies where the return value for a function is found.

Some programs may not know at the time of compilation what arguments are to be passed to a function. For instance, an interpreter may be told at run-time about the number and types of arguments used to call a given function. Libffi can be used in such programs to provide a bridge from the interpreter program to compiled code.

The libffi library provides a portable, high level programming interface to various calling conventions. This allows a programmer to call any function specified by a call interface description at run time.

FFI stands for Foreign Function Interface. A foreign function interface is the popular name for the interface that allows code written in one language to call code written in another language. The libffi library really only provides the lowest, machine dependent layer of a fully featured foreign function interface. A layer must exist above libffi that handles type conversions for values passed between the two languages.

6.1.186 libgd: Dynamic graphics generation tool

Description

GD is an open source code library for the dynamic creation of images by programmers. GD is written in C, and "wrappers" are available for Perl, PHP and other languages. GD creates PNG, JPEG, GIF, WebP, XPM, BMP images, among other formats. GD is commonly used to generate charts, graphics, thumbnails, and most anything else, on the fly. While not restricted to use on the web, the most common applications of GD involve website development.

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see Issue #27330 for more information.

6.1.193 libpng: Bitmap image support

Description

libpng is the official PNG reference library. It supports almost all PNG features, is extensible, and has been extensively tested for over 13 years. The home site for development versions (i.e., may be buggy or subject to change or include experimental features) is http://libpng.sourceforge.net/, and the place to go for questions about the library is the png-mng-implement mailing list.

Website: http://www.libpng.org/pub/png/libpng.html

License

The libpng license - see http://www.libpng.org/pub/png/src/libpng-LICENSE.txt

Upstream Contact

https://libpng.sourceforge.io

The png mailing lists - see http://www.libpng.org/pub/png/pngmisc.html#lists

Special Update/Build Instructions

- On old versions of Darwin, the symbolic links libpng.* created by libpng16 may interfere with a system-wide libPng.dylib.

  – the following is very likely to be obsolete in 2014 —

  This system-wide library is likely to be a different version and on top of that, the symbols exported there are prefixed with "_cg" (for "Core Graphics"). So even if by chance the functionalities of the two libraries were interchangeable, libraries or applications looking for one and being presented the other won't find the symbols they expect. Note the uppercase "P" which could prevent this conflict; unfortunately, the default filesystem used by Apple is case-insensitive.

  Note there would be no problem if the system-wide library was not looked for when Sage is being built or run, but that's not the case either; it is at least looked for by the "ImageIO" framework:

  – when Python is built with Mac OS extensions, fixed in #4008;

- when Mercurial is built because it uses $EDITOR, cf. #4678;
- when R is built and it finds `-lpng`, cf. #4409 and #11696.

– this is no longer done, as of #27186 —

As not all of these problems are easily dealt with and new ones may arise, we chose to delete the $SAGE_LOCAL/lib/libpng.* symlinks. Therefore, some packages like Tachyon, which by default look for `-lpng` are patched to look for `-lpng16` instead.

If the system package is installed, `./configure` will check if it can be used.

6.1.196 lidia: A library for computational number theory

Description

A library for computational number theory.

Abandoned upstream and has disappeared from the web at TU Darmstadt.

We use as our new upstream a version minimally maintained for the LattE project.

https://www.math.ucdavis.edu/~latte/software/packages/lidia/current/lidia-2.3.0+latte-patches-2014-10-04.tar.gz

License

lidia is released under the GPL, or so it is claimed. See https://groups.google.com/forum/#!msg/sage-devel/kTxgPSqrbUM/5Txj3_IKhlQJ and https://lists.debian.org/debian-legal/2007/07/msg00120.html

Upstream Contact

Matthias Köppe, UC Davis, CA, USA

Type

optional

Dependencies

- $(MP_LIBRARY)

Version Information

package-version.txt:

```
2.3.0+latte-patches-2019-05-02
```

Equivalent System Packages

See https://repology.org/project/lidia/versions

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see Issue #27330 for more information.

6.1.197 lie: Library for the representation theory of complex semisimple Lie groups and algebras

Description

LiE is the name of a software package that enables mathematicians and physicists to perform computations of a Lie group theoretic nature. It focuses on the representation theory of complex semisimple (reductive) Lie groups and algebras, and on the structure of their Weyl groups and root systems.

LiE does not compute directly with elements of the Lie groups and algebras themselves; it rather computes with weights, roots, characters and similar objects. Some specialities of LiE are: tensor product decompositions, branching to subgroups, Weyl group orbits, reduced elements in Weyl groups, distinguished coset representatives and much more. These operations have been compiled into the program which results in fast execution: typically one or two orders of magnitude faster than similar programs written in a general purpose program.

The LiE programming language makes it possible to customise and extend the package with more mathematical functions. A user manual is provided containing many examples.

LiE establishes an interactive environment from which commands can be given that involve basic programming primitives and powerful built-in functions. These commands are read by an interpreter built into the package and passed to the core of the system. This core consists of programs representing some 100 mathematical functions. The interpreter offers on-line facilities which explain operations and functions, and which give background information about Lie group theoretical concepts and about currently valid definitions and values.

(from http://www-math.univ-poitiers.fr/~maavl/LiE/description.html)

```

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

6.1.202 lrslib: Reverse search algorithm for vertex enumeration and convex hull problems

Description

lrslib implements the linear reverse search algorithm of Avis and Fukuda.

See the homepage (http://cgm.cs.mcgill.ca/~avis/C/lrs.html) for details.

We use an autotoolized version from https://github.com/mkoeppe/lrslib/tree/autoconfiscation

License

lrslib is released under a GPL v2+ license.

Upstream Contact

David Avis, avis at cs dot mcgill dot edu.

Dependencies

To build and install the "plrs" binary, a multi-thread version of lrs, need to first install the full Boost package ("sage -i boost").

If the package finds an MPI C++ compiler script (mpic++), it also builds and installs the "mplrs" binary, a distributed version of lrs using MPI.

(Sage currently does not make use of plrs and mplrs.)

Special Update/Build Instructions

If the system package is installed, `./configure` will check if it can be used.

6.1.208 matplotlib: Python 2D plotting library

Description

From the Matplotlib website: matplotlib is a python 2D plotting library which produces publication quality figures in a variety of hardcopy formats and interactive environments across platforms. matplotlib can be used in python scripts, the python and ipython shell (ala matlab or mathematica), web application servers, and six graphical user interface toolkits.

License

The Matplotlib license - see http://matplotlib.sourceforge.net/users/license.html: Matplotlib only uses BSD compatible code, and its license is based on the PSF license. See the Open Source Initiative licenses page for details on individual licenses. Non-BSD compatible licenses (eg LGPL) are acceptable in matplotlib Toolkits. For a discussion of the motivations behind the licencing choice, see Licenses.

Upstream Contact

https://matplotlib.org

The matplotlib mailing lists: see http://sourceforge.net/projects/matplotlib

Dependencies

- python
- numpy
- setuptools (>= 0.7)
- freetype
- patch (used in spkg-install)
- dateutil
- pyparsing
- tornado
- kiwisolver

Build Instructions/Changes

- NOTE: To drastically cut down on spkg size, we delete the internal testing images. To do this, we repackage the tarball by removing the contents of `lib/matplotlib/tests/baseline_images/*`, this is done by the `spkg-src` script.
- `setup.py.patch`: disable loading of Tests. Otherwise, `setup.py` raises an error because it can't find the deleted files from `src/lib/matplotlib/tests/baseline_images/*`
- NOTE: as of matplotlib-1.0.0 and Sage 4.6, Sage does not use $HOME/.matplotlib by default. Instead, it sets MPLCONFIGDIR to a subdirectory in $DOT_SAGE, see src/bin/sage-env

Type

standard

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- *certifi: Python package for providing Mozilla's CA Bundle*
- *contourpy: Python library for calculating contours of 2D quadrilateral grids*
- *cycler: Composable cycles*
- *dateutil: Extensions to the standard Python module datetime*
- *fonttools: Tools to manipulate font files*
- *freetype: A free, high-quality, and portable font engine*
- *kiwisolver: Fast implementation of the Cassowary constraint solver*
- *numpy: Package for scientific computing with Python*
- *pillow: Python Imaging Library*
- *pyparsing: A Python parsing module*
- *qhull: Compute convex hulls, Delaunay triangulations, Voronoi diagrams*
- *setuptools_scm: Python build system extension to obtain package version from version control*
- *tornado: Python web framework and asynchronous networking library*

6.1.211 maxima: System for manipulating symbolic and numerical expressions

Description

Maxima is a system for the manipulation of symbolic and numerical expressions, including differentiation, integration, Taylor series, Laplace transforms, ordinary differential equations, systems of linear equations, polynomials, and sets, lists, vectors, matrices, and tensors. Maxima yields high precision numeric results by using exact fractions, arbitrary precision integers, and variable precision floating point numbers. Maxima can plot functions and data in two and three dimensions.

For more information, see the Maxima web site

http://maxima.sourceforge.net

License

Maxima is distributed under the GNU General Public License, with some export restrictions from the U.S. Department of Energy. See the file COPYING.

Upstream Contact

- The Maxima mailing list - see http://maxima.sourceforge.net/maximalist.html

Special Update/Build Instructions

1. Go to http://sourceforge.net/projects/maxima/files/Maxima-source/ and download the source tarball maxima-x.y.z.tar.gz; place it in the upstream/ directory.
2. Update package-version.txt and run 'sage –package fix-checksum'.
3. Make sure the patches still apply cleanly, and update them if necessary.
4. Test the resulting package.

All patch files in the patches/ directory are applied. Descriptions of these patches are either in the patch files themselves or below.

- 0001-taylor2-Avoid-blowing-the-stack-when-diff-expand-isn.patch: Fix for Maxima bug #2520 (abs_integrate fails on abs(sin(x)) and abs(cos(x))). Introduced in Issue #13364 (Upgrade Maxima to 5.29.1).
- build-fasl.patch: Build a fasl library for ecl in addition to an executable program. Introduced in Issue #16178 (Build maxima fasl without asdf).
- infodir.patch: Correct the path to the Info directory. Introduced in Issue #11348 (maxima test fails when install tree is moved).
- matrixexp.patch: Fix matrixexp(matrix([%i*%pi])), which broke after Maxima 5.29.1. Introduced in Issue #13973.
- maxima.system.patch: Set `c::*compile-in-constants*` to t. Introduced in Issue #11966 (OS X 10.7 Lion: Maxima fails to build).
- undoing_true_false_printing_patch.patch: Revert an upstream change causing '?' to be printed around some words. Introduced in Trac #13364 (Upgrade Maxima to 5.29.1).

Type

standard

Upstream Contact

Simon A. King <simon.king@uni-jena.de> David J. Green <david.green@uni-jena.de>

Acknowledgements

The development of the initial version of this SPKG was funded by the German Science Foundation, DFG project GR 1585/4.1, and was accomplished at the Friedrich Schiller University Jena.

Since version 1.0.1, the further work on this SPKG was funded by Marie Curie grant MTKD-CT-2006-042685 and was pursued at the National University of Ireland, Galway. Since Novermber 2010, it is moved back to Jena.

We thank William Stein for giving us access to various computers on which we could build test the SPKG and on which some huge computations could be completed, and acknowledge the support by National Science Foundation Grant No. DMS-0821725.

We thank Mathieu Dutour Sikirić for hints on how to use GAP more efficiently.

We owe Peter Symonds the idea of using the Poincaré series in a rather efficient completeness criterion.

We are greatful to John Palmieri for his help on making p_group_cohomology work with python-3.

Dependencies

- The SharedMeatAxe needs to be installed, as a build time dependency.

  This can be met by installing the meataxe spkg

Testing

Our package provides a very short test suite for David Green's routines for the computation of minimal projective resolutions. The majority of this package's tests is formed by doc tests in the Cython code. In fact, any class, method and function is covered by tests.

Note that internet access is required for these tests, as it is attempted to download cohomology rings from a public data base in the web.

The script `spkg-check` calls `sage -t --force_lib` on the files in `pGroupCohomology`.

Documentation

The documentation of this package is automatically built, if the environment variable SAGE_SPKG_INSTALL_DOCS is yes (do "export SAGE_SPKG_INSTALL_DOCS=yes" on the command line before installation). The documents are put into SAGE_ROOT/local/share/doc/p_group_cohomology/.

Type

optional

Dependencies

- *meataxe: Library for computing with modular representations*
- *singular: Computer algebra system for polynomial computations, algebraic geometry, singularity theory*

6.1.219 mpc: Arithmetic of complex numbers with arbitrarily high precision and correct rounding

Description

From https://www.multiprecision.org/mpc: GNU MPC is a C library for the arithmetic of complex numbers with arbitrarily high precision and correct rounding of the result. It extends the principles of the IEEE-754 standard for fixed precision real floating point numbers to complex numbers, providing well-defined semantics for every operation. At the same time, speed of operation at high precision is a major design goal.

License

LGPLv3+ for the code and GFDLv1.3+ (with no invariant sections) for the documentation.

Upstream Contact

The MPC website is located at https://www.multiprecision.org/mpc .

The MPC team can be contacted via the MPC mailing list: mpc-discuss@inria.fr

Special Update/Build Instructions

- mpc_mul_faster.patch: Patch from Paul Zimmermann to speed up MPC multiplication (for small precisions) by reducing overhead in MPFR operations.

Type

standard

Dependencies

- $(MP_LIBRARY)
- *mpfr: Multiple-precision floating-point computations with correct rounding*

Version Information

If the system package is installed, `./configure` will check if it can be used.

6.1.220 mpfi: Multiple precision interval arithmetic library based on MPFR

Description

MPFI is a library for interval arithmetic, which is built upon the MPFR multiple precision floating-point arithmetic.

MPFI is intended to be a portable library written in C for arbitrary precision interval arithmetic with intervals represented using MPFR reliable floating-point numbers. It is based on the GNU MP library and on the MPFR library. The purpose of an arbitrary precision interval arithmetic is on the one hand to get "guaranteed" results, thanks to interval computation, and on the other hand to obtain accurate results, thanks to multiple precision arithmetic. The MPFI library is built upon MPFR in order to benefit from the correct rounding provided, for each operation or function, by MPFR. Further advantages of using MPFR are its portability and compliance with the IEEE 754 standard for floating-point arithmetic.

License

This version of MPFI is released under the GNU Lesser General Public License. It is permitted to link MPFI to non-free programs, as long as when distributing them the MPFI source code and a means to re-link with a modified MPFI is provided.

Upstream Contact

http://perso.ens-lyon.fr/nathalie.revol/software.html

The MPFI website is located at https://gitlab.inria.fr/mpfi/mpfi

The MPFI team can be contacted via the MPFI mailing list: mpfi-users@inria.fr

Type

standard

Dependencies

```

```
$ sudo xbps-install mpfi-devel
```

See https://repology.org/project/mpfi/versions

If the system package is installed, `./configure` will check if it can be used.

6.1.221 mpfr: Multiple-precision floating-point computations with correct rounding

Description

The MPFR library is a C library for multiple-precision floating-point computations with correct rounding. MPFR has continuously been supported by the INRIA and the current main authors come from the Caramba and AriC project-teams at Loria (Nancy, France) and LIP (Lyon, France) respectively; see more on the credit page. MPFR is based on the GMP multiple-precision library.

The main goal of MPFR is to provide a library for multiple-precision floating-point computation which is both efficient and has a well-defined semantics. It copies the good ideas from the ANSI/IEEE-754 standard for double-precision floating-point arithmetic (53-bit significand).

License

MPFR is free. It is distributed under the GNU Lesser General Public License (GNU Lesser GPL), version 3 or later (2.1 or later for MPFR versions until 2.4.x). The library has been registered in France by the Agence de Protection des Programmes under the number IDDN FR 001 120020 00 R P 2000 000 10800, on 15 March 2000. This license guarantees your freedom to share and change MPFR, to make sure MPFR is free for all its users. Unlike the ordinary General Public License, the Lesser GPL enables developers of non-free programs to use MPFR in their programs. If you have written a new function for MPFR or improved an existing one, please share your work!

Upstream Contact

The MPFR website is located at http://mpfr.org/

The MPFR team can be contacted via the MPFR mailing list: mpfr@loria.fr

Special Update/Build Instructions

- Make sure MPFR's settings of `CC` and `CFLAGS` still get properly extracted, currently from its `config.log` in the `src/` directory.
- We should remove the `configure` option `--disable-thread-safe` in case the issues without that have meanwhile been fixed. (Then we should actually pass `--enable-thread-safe`.)

TODO

- `--disable-thread-safe` should be switched to `--enable-thread-safe`, need to check that this works on the buildbot machines

Type

standard

Dependencies

- $(MP_LIBRARY)

Version Information

package-version.txt:

```
4.2.1
```

6.1.222 mpfrcx: Arithmetic of univariate polynomials over arbitrary precision real or complex numbers

Description

Mpfrcx is a library for the arithmetic of univariate polynomials over arbitrary precision real (Mpfr) or complex (Mpc) numbers, without control on the rounding. For the time being, only the few functions needed to implement the floating point approach to complex multiplication are implemented. On the other hand, these comprise asymptotically fast multiplication routines such as Toom–Cook and the FFT.

License

MPFRCX is distributed under the Gnu Lesser General Public License, either version 2.1 of the licence, or (at your option) any later version (LGPLv2.1+).

Upstream Contact

The MPFRCX website is located at http://www.multiprecision.org/mpfrcx .

Type

optional

Dependencies

- $(MP_LIBRARY)
- *mpc: Arithmetic of complex numbers with arbitrarily high precision and correct rounding*
- *mpfr: Multiple-precision floating-point computations with correct rounding*

Version Information

package-version.txt:

```
0.6.3
```

Equivalent System Packages

```
$ sudo zypper install mpfrcx-devel
```

See https://repology.org/project/mpfrcx/versions

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see Issue #27330 for more information.

6.1.223 mpmath: Pure Python library for multiprecision floating-point arithmetic

Description

Mpmath is a pure-Python library for multiprecision floating-point arithmetic. It provides an extensive set of transcendental functions, unlimited exponent sizes, complex numbers, interval arithmetic, numerical integration and differentiation, root-finding, linear algebra, and much more. Almost any calculation can be performed just as well at 10-digit or 1000-digit precision, and in many cases mpmath implements asymptotically fast algorithms that scale well for extremely high precision work. If available, mpmath will (optionally) use gmpy to speed up high precision operations.

6.1.229 ncurses: Classic terminal output library

Description

Ncurses (new curses, pronounced "enn-curses") started as a freely distributable "clone" of System V Release 4.0 (SVr4) curses. It has outgrown the "clone" description, and now contains many features which are not in SVr4 curses. Curses is a pun on the term "cursor optimization". It is a library of functions that manage an application's display on character-cell terminals (e.g., VT100).

The name "ncurses" was first used as the name of the curses library in Pavel Curtis's pcurses, dated 1982. It was apparently developed on a BSD 4.4 system, at Cornell. Parts of pcurses are readily identifiable in ncurses, including the basics for the terminfo compiler (named compile in that package):

- the Caps, used to define the terminfo capabilities
- awk scripts MKcaptab.awk, MKnames.awk
- the library modules used for the terminfo compiler.

Besides ncurses, parts of pcurses still survive in 2010, in recognizable form in Solaris.

See https://repology.org/project/nibabel/versions, https://repology.org/project/python:nibabel/versions

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

6.1.233 ninja_build: A build system with a focus on speed

Description

Ninja is a small build system with a focus on speed.

License

Apache License 2.0

Upstream Contact

https://ninja-build.org/

Type

standard

Dependencies

- $(PYTHON)

Version Information

package-version.txt:

```
1.12.1
```

Equivalent System Packages

```
$ sudo pacman -S ninja
```

```
$ conda install ninja
```

```
$ sudo apt-get install ninja-build
```

```
$ sudo yum install ninja-build
```

```
$ sudo pkg install devel/ninja
```

```
$ sudo emerge dev-build/ninja
```

```
$ brew install ninja
```

```
$ sudo port install ninja
```

```
$ sudo zypper install ninja
```

```
$ sudo xbps-install ninja
```

See https://repology.org/project/ninja/versions

If the system package is installed, `./configure` will check if it can be used.

6.1.234 normaliz: Computations in affine monoids, vector configurations, lattice polytopes, and rational cones

Description

Normaliz is a tool for computations in affine monoids, vector configurations, lattice polytopes, and rational cones.

For more details see http://www.mathematik.uni-osnabrueck.de/normaliz/

License

- GPL v3

Upstream Contact

- normaliz@uos.de
- Winfried Bruns <wbruns@uos.de>
- Christof Söger <csoeger@uos.de>
- see also https://www.normaliz.uni-osnabrueck.de/home/contact/

  and https://github.com/Normaliz

Special Update/Build Instructions

- The spkg currently disables features that require packages SCIP and CoCoA, for which we don't have packages (yet).

Type

optional

Dependencies

- $(MP_LIBRARY)
- *e_antic: Real embedded number fields*
- *flint: Fast Library for Number Theory*
- *libnauty: Find automorphism groups of graphs, generate non-isomorphic graphs (callable library)*

Version Information

package-version.txt:

```
3.10.3
```

Equivalent System Packages

```
$ sudo pacman -S normaliz
```

```
$ conda install normaliz
```

```
$ sudo apt-get install libnormaliz-dev
```

```
$ sudo yum install libnormaliz libnormaliz-devel
```

```
$ sudo emerge sci-mathematics/normaliz
```

```
$ sudo zypper install normaliz-devel
```

See https://repology.org/project/normaliz/versions, https://repology.org/project/libnormaliz/versions

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see Issue #27330 for more information.

6.1.235 notebook: Jupyter notebook, a web-based notebook environment for interactive computing

Description

The Jupyter HTML notebook is a web-based notebook environment for interactive computing.

See https://repology.org/project/openssl/versions

If the system package is installed, `./configure` will check if it can be used.

6.1.243 ore_algebra: Ore algebra

Description

A Sage implementation of Ore algebras, Ore polynomials, and differentially finite functions.

Main features for the most common algebras include basic arithmetic and actions; gcrd and lclm; D-finite closure properties; creative telescoping; natural transformations between related algebras; guessing; desingularization; solvers for polynomials, rational functions and (generalized) power series. Univariate differential operators also support the numerical computation of analytic solutions with rigorous error bounds and related features.

Upstream Contact

Simon A. King <simon.king@uni-jena.de> David J. Green <david.green@uni-jena.de>

Acknowledgements

The development of the initial version of this SPKG was funded by the German Science Foundation, DFG project GR 1585/4.1, and was accomplished at the Friedrich Schiller University Jena.

Since version 1.0.1, the further work on this SPKG was funded by Marie Curie grant MTKD-CT-2006-042685 and was pursued at the National University of Ireland, Galway. Since Novermber 2010, it is moved back to Jena.

We thank William Stein for giving us access to various computers on which we could build test the SPKG and on which some huge computations could be completed, and acknowledge the support by National Science Foundation Grant No. DMS-0821725.

We thank Mathieu Dutour Sikirić for hints on how to use GAP more efficiently.

We owe Peter Symonds the idea of using the Poincaré series in a rather efficient completeness criterion.

We are greatful to John Palmieri for his help on making p_group_cohomology work with python-3.

Dependencies

- The SharedMeatAxe needs to be installed, as a build time dependency.

  This can be met by installing the meataxe spkg

Testing

Our package provides a very short test suite for David Green's routines for the computation of minimal projective resolutions. The majority of this package's tests is formed by doc tests in the Cython code. In fact, any class, method and function is covered by tests.

Note that internet access is required for these tests, as it is attempted to download cohomology rings from a public data base in the web.

The script `spkg-check` calls `sage -t --force_lib` on the files in `pGroupCohomology`.

Documentation

The documentation of this package is automatically built, if the environment variable SAGE_SPKG_INSTALL_DOCS is yes (do "export SAGE_SPKG_INSTALL_DOCS=yes" on the command line before installation). The documents are put into SAGE_ROOT/local/share/doc/p_group_cohomology/.

6.1.248 palp: A package for Analyzing Lattice Polytopes

Description

A Package for Analyzing Lattice Polytopes (PALP) is a set of C programs for calculations with lattice polytopes and applications to toric geometry.

It contains routines for vertex and facet enumeration, computation of incidences and symmetries, as well as completion of the set of lattice points in the convex hull of a given set of points. In addition, there are procedures specialised to reflexive polytopes such as the enumeration of reflexive subpolytopes, and applications to toric geometry and string theory, like the computation of Hodge data and fibration structures for toric Calabi-Yau varieties. The package is well

tested and optimised in speed as it was used for time consuming tasks such as the classification of reflexive polyhedra in 4 dimensions and the creation and manipulation of very large lists of 5-dimensional polyhedra.

While originally intended for low-dimensional applications, the algorithms work in any dimension and our key routine for vertex and facet enumeration compares well with existing packages.

License

- When released, GPL 2 was in force.
- There is a link to a web page, which now points to GPL 3, but would have pointed to GPL 2 at the time the package was released.
- Therefore one can deduce the authors were happy for this to be released under GPL 2 or a later version.

6.1.253 pari: Computer algebra system for fast computations in number theory

Description

PARI/GP is a widely used computer algebra system designed for fast computations in number theory (factorizations, algebraic number theory, elliptic curves…), but also contains a large number of other useful functions to compute with mathematical entities such as matrices, polynomials, power series, algebraic numbers etc., and a lot of transcendental functions. PARI is also available as a C library to allow for faster computations.

Originally developed by Henri Cohen and his co-workers (Université Bordeaux I, France), PARI is now under the GPL and maintained by Karim Belabas with the help of many volunteer contributors.

License

GPL version 2+

```

See https://repology.org/project/pari-nftables/versions

If the system package is installed, `./configure` will check if it can be used.

6.1.259 pari_seadata: PARI data package needed by ellap for large primes (full version)

Description

Needed by ellap for large primes. These polynomials were extracted from the ECHIDNA databases and computed by David R. Kohel. This covers finite fields of cardinality q up to 750 bits. PARI/GP 2.9 contains fallback code to go on when all modular polynomials in the database have been exhausted and can handle larger fields (with an important slowdown).

License

GNU General Public License (GPL version 2 or any later version).

Upstream Contact

http://pari.math.u-bordeaux.fr/

```

See https://repology.org/project/pari-seadata-small/versions

If the system package is installed, `./configure` will check if it can be used.

6.1.261 parso: Python Parser

Description

Parso is a Python parser that supports error recovery and round-trip parsing for different Python versions (in multiple Python versions). Parso is also able to list multiple syntax errors in your python file.

License

MIT

Upstream Contact

https://pypi.org/project/parso/

Type

standard

Dependencies

- $(PYTHON)
- *pip: Tool for installing and managing Python packages*

Version Information

package-version.txt:

```
0.8.4
```

version_requirements.txt:

```
parso >=0.7.0
```

Equivalent System Packages

```
$ conda install parso
```

```
$ sudo yum install python3-parso
```

```
$ sudo emerge dev-python/parso
```

```
$ sudo port install py-parso
```

```
$ sudo xbps-install python3-parso
```

See https://repology.org/project/python:parso/versions

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

6.1.262 patch: Applies diffs and patches to files

Description

'patch' takes a patch file containing a difference listing produced by the 'diff' program and applies those differences to one or more original files, producing patched versions.

The version of 'patch' included is the GNU one. Some of the 'diff' files produced by GNU 'diff' are not acceptable to some versions of the 'patch' command, such as the 'patch' command that comes with Solaris.

License

This program is free software: you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 2, or (at your option) any later version.

Upstream Contact

phitigra>=0.2.6
```

Equivalent System Packages

(none known)

6.1.271 pickleshare: A 'shelve' like datastore with concurrency support

Description

PickleShare - a small 'shelve' like datastore with concurrency support

Like shelve, a PickleShareDB object acts like a normal dictionary. Unlike shelve, many processes can access the database simultaneously. Changing a value in database is immediately visible to other processes accessing the same database.

Concurrency is possible because the values are stored in separate files. Hence the "database" is a directory where all files are governed by PickleShare.

Type

standard

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)

Version Information

package-version.txt:

```
0.7.5
```

version_requirements.txt:

```
pickleshare >=0.7.5
```

Equivalent System Packages

```
$ sudo pacman -S python-pickleshare
```

```

6.1.276 planarity: Planarity-related graph algorithms

Description

This code project provides a library for implementing graph algorithms as well as implementations of several planarity-related graph algorithms. The origin of this project is the reference implementation for the Edge Addition Planarity Algorithm [1], which is now the fastest and simplest linear-time method for planar graph embedding and planarity obstruction isolation (i.e. Kuratowski subgraph isolation).

6.1.277 plantri: Generate non-isomorphic sphere-embdedded graphs

Description

Plantri is a program that generates certain types of graphs that are imbedded on the sphere.

Exactly one member of each isomorphism class is output, using an amount of memory almost independent of the number of graphs produced. This, together with the exceptionally fast operation and careful validation, makes the program suitable for processing very large numbers of graphs.

Isomorphisms are defined with respect to the embeddings, so in some cases outputs may be isomorphic as abstract graphs.

License

Plantri is distributed without a license.

- *ntl: A library for doing number theory*

Version Information

package-version.txt:

```
5.22.5
```

Equivalent System Packages

```
$ sudo port install polylib
```

```
$ sudo zypper install polylib pkgconfig\(polylibgmp\)
```

See https://repology.org/project/polylib/versions

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see Issue #27330 for more information.

6.1.282 polymake: Computations with polyhedra, fans, simplicial complexes, matroids, graphs, tropical hypersurfaces

Description

polymake is open source software for research in polyhedral geometry. It deals with polytopes, polyhedra and fans as well as simplicial complexes, matroids, graphs, tropical hypersurfaces, and other objects. Supported platforms include various flavors of Linux, Free BSD and Mac OS.

License

- GPL v3

Upstream Contact

- https://polymake.org/

Dependencies

Polymake needs a working installation of Perl, including its shared library and some modules (`XML::Writer XML::LibXML XML::LibXSLT Term::ReadLine::Gnu JSON SVG`). The Polymake interface in Sage additionally needs `File::Slurp`. For full functionality including polymake's polyDB, also the Perl module `MongoDB` is needed.

These are not provided by a Sage package. The dummy package `perl_cpan_polymake_prereq` will signal an error at build time if the required prerequisites are not met.

The `configure` script will inform you about the equivalent system packages that you should install. Otherwise, you can use CPAN (see below).

Sage might install the `Term::ReadLine::Gnu` module, however, when you install polymake, if it is not provided by the system, or if Sage installs its own `readline` library.

A distribution-independent way to install Perl modules (into a user's home directory or `/usr/local`) is using CPAN. This is also the way to install the modules on macOS. For this, if you don't have root access, you will need the `local::lib` Perl module installed:

```
cpan -i XML::Writer XML::LibXML XML::LibXSLT File::Slurp Term::ReadLine::Gnu JSON SVG␣
↪MongoDB
```

Before installing the `polymake` package, refer to the SPKG pages for the following packages to ensure a more featureful Polymake installation:

- [4ti2](https://doc.sagemath.org/html/en/reference/spkg/4ti2.html)
- [latte_int](https://doc.sagemath.org/html/en/reference/spkg/latte_int.html)
- [topcom](https://doc.sagemath.org/html/en/reference/spkg/topcom.html)
- [qhull](https://doc.sagemath.org/html/en/reference/spkg/qhull.html)

For additional software that may enhance your Polymake installation (but for which no Sage package is available), you can manually install the following:

- `azove`
- `porta`
- `vinci`
- `SplitsTree4`

Information on missing Polymake prerequisites after installing polymake:

```
$ sage -sh
(sage-sh) $ polymake
polytope> show_unconfigured;
```

In order to use Polymake from Sage, please refer to the [Jupymake SPKG page](https://doc.sagemath.org/html/en/reference/spkg/jupymake.html) for installation instructions.

Debugging polymake install problems

```
# apt-get install libdevel-trace-perl
$ cd src
$ perl -d:Trace support/configure.pl
```

Type

optional

Dependencies

- $(MP_LIBRARY)
- *bliss: Computing automorphism groups and canonical forms of graphs*
- *cddlib: Double description method for polyhedral representation conversion*
- *libxml2: XML parser and toolkit*
- *lrslib: Reverse search algorithm for vertex enumeration and convex hull problems*
- *ninja_build: A build system with a focus on speed*
- *normaliz: Computations in affine monoids, vector configurations, lattice polytopes, and rational cones*
- *perl_cpan_polymake_prereq: Represents all Perl packages that are prerequisites for polymake*
- *perl_term_readline_gnu: Perl extension for the GNU Readline/History libraries*
- *ppl: Parma Polyhedra Library*

If the system package is installed, `./configure` will check if it can be used.

6.1.283 polytopes_db: Databases of 2- and 3-dimensional reflexive polytopes

Description

This package includes lists of 2- and 3-dimensional reflexive polytopes.

The list of polygons is quite easy to get and it has been known for a while. The list of 3-polytopes was originally obtained by Maximilian Kreuzer and Harald Skarke using their software PALP, which is included into the standard distribution of Sage. To work with lattice and reflexive polytopes from Sage you can use sage.geometry.lattice_polytope module, which relies on PALP for some of its functionality. To get access to the databases of this package, use ReflexivePolytope and ReflexivePolytopes commands.

6.1.285 ppl: Parma Polyhedra Library

Description

The Parma Polyhedra Library (PPL) provides numerical abstractions especially targeted at applications in the field of analysis and verification of complex systems. These abstractions include convex polyhedra, defined as the intersection of a finite number of (open or closed) halfspaces, each described by a linear inequality (strict or non-strict) with rational coefficients; some special classes of polyhedra shapes that offer interesting complexity/precision tradeoffs; and grids which represent regularly spaced points that satisfy a set of linear congruence relations. The library also supports finite powersets and products of (any kind of) polyhedra and grids, a mixed integer linear programming problem solver using an exact-arithmetic version of the simplex algorithm, a parametric integer programming solver, and primitives for the termination analysis via the automatic synthesis of linear ranking functions.

It is written in C++, but comes with interfaces to C, Java, OCaml, and Prolog. PPL is one of the fastest implementations of polyhedral computations.

6.1.294 ptyprocess: Python interaction with subprocesses in a pseudoterminal

Description

Launch a subprocess in a pseudo terminal (pty), and interact with both the process and its pty.

Sometimes, piping stdin and stdout is not enough. There might be a password prompt that doesn't read from stdin, output that changes when it's going to a pipe rather than a terminal, or curses-style interfaces that rely on a terminal. If you need to automate these things, running the process in a pseudo terminal (pty) is the answer.

License

6.1.297 pybind11: Create Python bindings to C++ code

Description

pybind11 is a lightweight header-only library that exposes C++ types in Python and vice versa, mainly to create Python bindings of existing C++ code. Its goals and syntax are similar to the excellent [Boost.Python](http://www.boost.org/doc/libs/1_58_0/libs/python/doc/) library by David Abrahams: to minimize boilerplate code in traditional extension modules by inferring type information using compile-time introspection.

License

pybind11 is provided under a BSD-style license that can be found in the `LICENSE` file. By using, distributing, or contributing to this project, you agree to the terms and conditions of this license.

6.1.299 pycosat: SAT solver picosat with Python bindings

Description

PicoSAT is a popular SAT solver written by Armin Biere in pure C. This package provides efficient Python bindings to picosat on the C level, i.e. when importing pycosat, the picosat solver becomes part of the Python process itself. For ease of deployment, the picosat source (namely picosat.c and picosat.h) is included in this project. These files have been extracted from the picosat source.

6.1.301 pycryptosat: Python module of cryptominisat

Description

Build and install pycryptosat (Python frontend to CryptoMiniSat, which will be built if needed too).

CryptoMiniSat is a SAT solver that aims to become a premiere SAT solver with all the features and speed of successful SAT solvers, such as MiniSat and PrecoSat. The long-term goals of CryptoMiniSat are to be an efficient sequential, parallel and distributed solver. There are solvers that are good at one or the other, e.g. ManySat (parallel) or PSolver (distributed), but we wish to excel at all.

CryptoMiniSat 2.5 won the SAT Race 2010 among 20 solvers submitted by researchers and industry.

6.1.302 pygments: Generic syntax highlighter

Description

Pygments is a syntax highlighting package written in Python.

It is a generic syntax highlighter suitable for use in code hosting, forums, wikis or other applications that need to prettify source code. Highlights are:

- a wide range of over 300 languages and other text formats is supported
- special attention is paid to details, increasing quality by a fair amount
- support for new languages and formats are added easily
- a number of output formats, presently HTML, LaTeX, RTF, SVG, all image formats that PIL supports and ANSI sequences
- it is usable as a command-line tool and as a library

6.1.316 python3: The Python programming language

Description

By default, Sage will try to use system's `python3` to set up a virtual environment, a.k.a. venv rather than building a Python 3 installation from scratch.

Sage will accept versions 3.9.x to 3.12.x.

You can also use `--with-python=/path/to/python3_binary` to tell Sage to use `/path/to/python3_binary` to set up the venv. Note that setting up the venv requires a number of Python modules to be available within the Python in question. Currently, as of Sage 10.3, these modules are as follows: `sqlite3`, `ctypes`, `math`, `hashlib`, `socket`, `zlib`, `ssl`, `ensurepip`. For Python >= 3.12, also `setuptools` is required; for older Python versions, `distutils.core` is required. These modules will be checked for by the `configure` script.

Use the `configure` option `--without-system-python3` if you want Python 3 built from scratch.

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see Issue #27330 for more information.

6.1.329 qhull: Compute convex hulls, Delaunay triangulations, Voronoi diagrams

Description

From the README.txt of Qhull:

Qhull computes convex hulls, Delaunay triangulations, Voronoi diagrams, furthest-site Voronoi diagrams, and halfspace intersections about a point. It runs in 2-d, 3-d, 4-d, or higher. It implements the Quickhull algorithm for computing convex hulls. Qhull handles round-off errors from floating point arithmetic. It can approximate a convex hull.

The program includes options for hull volume, facet area, partial hulls, input transformations, randomization, tracing, multiple output formats, and execution statistics.

Further notes:

The qhull library is already shipped with the Python library scipy (from version 1.4), see

- http://docs.scipy.org/doc/scipy/reference/generated/scipy.spatial.ConvexHull.html
- http://docs.scipy.org/doc/scipy/reference/generated/scipy.spatial.Delaunay.html
- http://docs.scipy.org/doc/scipy/reference/generated/scipy.spatial.Voronoi.html

There is also the Python interface Pyhull available on PyPI https://pypi.python.org/pypi/pyhull (see also documentation at http://pythonhosted.org/pyhull/).

Upstream Contact

http://www.qhull.org/html

C. Bradford Barber bradb@shore.net or qhull@qhull.org

Dependencies

Can be compiled with Qt support, but the Sage version currently doesn't try to do this.

License

Not a standard license, but Sage compatible. See the COPYING.txt file in the source directory for details.

Type

If the system package is installed, `./configure` will check if it can be used.

6.1.330 r: A free software environment for statistical computing and graphics

Description

R is a language and environment for statistical computing and graphics. It is a GNU project which is similar to the S language and environment which was developed at Bell Laboratories (formerly AT&T, now Lucent Technologies) by John Chambers and colleagues. R can be considered as a different implementation of S. There are some important differences, but much code written for S runs unaltered under R.

(taken from http://www.r-project.org/)

License

- GPL v2 or GPL v3

Upstream Contact

- https://www.r-project.org
- R mailing list, #R in IRC

Special Installation Instructions

In the Sage distribution, `r` is a "dummy" package: It is here to provide information about equivalent system packages. R cannot be installed using the Sage distribution. Please install it manually, either using one of the system package commands shown here or following the upstream instructions at https://www.r-project.org

Type

optional

Dependencies

Version Information

Equivalent System Packages

```
$ apk add R-dev R

```

```
$ sudo xbps-install R
```

See https://repology.org/project/r/versions

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see Issue #27330 for more information.

6.1.331 r_jupyter: Jupyter kernel for R

Description

This package installs IRkernel, the R Jupyter kernel.

It gets installed via R's package installer on top of Jupyter.

License

MIT

Upstream Contact

- https://github.com/IRkernel/IRkernel
- https://irkernel.github.io/

Dependencies

- R
- notebook

Type

experimental

Dependencies

- *notebook: Jupyter notebook, a web-based notebook environment for interactive computing*
- *rpy2: Python interface to R*

Version Information

Equivalent System Packages

See https://repology.org/project/r:irkernel/versions

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see Issue #27330 for more information.

6.1.332 readline: Command line editing library

Description

The GNU Readline library provides a set of functions for use by applications that allow users to edit command lines as they are typed in. Both Emacs and vi editing modes are available. The Readline library includes additional functions to maintain a list of previously-entered command lines, to recall and perhaps reedit those lines, and perform csh-like history expansion on previous commands.

Website: http://tiswww.case.edu/php/chet/readline/rltop.html

License

- GPL V3+

Upstream Contact

- Chet Ramey at http://cnswww.cns.cwru.edu/~chet

Special Update/Build Instructions

We build readline using ncurses. Readline needs to be told to link with libtinfo (part of ncurses), this is what the patch 0002-ltinfo.patch does.

Patches

- 0001-macports.patch: Changes to shobj.conf for OS/X, from macports:

  https://trac.macports.org/browser/trunk/dports/devel/readline/files/patch-shobj-conf.diff

- 0002-ltinfo.patch: We build readline using ncurses, and for that it needs to be told to link with libtinfo (part of ncurses).

Type

standard

Dependencies

- *ncurses: Classic terminal output library*

Version Information

package-version.txt:

```
8.1.2
```

Equivalent System Packages

```
$ sudo pacman -S readline
```

```
$ conda install readline
```

```
$ sudo apt-get install libreadline-dev
```

```
$ sudo yum install readline-devel
```

```
$ sudo pkg install devel/readline
```

```
$ brew install readline
```

```
$ sudo port install readline
```

```
$ nix-env --install readline
```

```
$ sudo zypper install readline-devel pkgconfig\(readline\)
```

```
$ sudo slackpkg install readline
```

```
$ sudo xbps-install readline-devel
```

See https://repology.org/project/readline/versions

If the system package is installed, `./configure` will check if it can be used.

6.1.337 rpy2: Python interface to R

Description

rpy2 is a redesign and rewrite of rpy. It is providing a low-level interface to R, a proposed high-level interface, including wrappers to graphical libraries, as well as R-like structures and functions.

License

- GPL 2+

Upstream Contact

- https://github.com/rpy2/rpy2

Special Installation Instructions

In the Sage distribution, `rpy2` is a "semi-standard" package: It will be automatically installed by the Sage distribution if a suitable system installation of R is detected by `configure`. (Note that Sage no longer ships and installs its own copy of R.)

Type

standard

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- *cffi: Foreign Function Interface for Python calling C code*
- *jinja2: General purpose template engine for Python*
- *pycparser: Parser of the C language in Python*
- *pytz: Timezone definitions for Python*
- *tzlocal: Python timezone information for the local timezone*

Version Information

package-version.txt:

```
3.4.5
```

version_requirements.txt:

```
rpy2 >=3.3
```

Equivalent System Packages

```
$ sudo pacman -S python-rpy2
```

```
$ sudo pkg install math/py-rpy2
```

```
$ sudo port install py-rpy2
```

```
$ sudo zypper install python3\$\{PYTHON_MINOR\}-rpy2
```

See https://repology.org/project/rpy2/versions

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

6.1.338 rst2ipynb: Convert reStructuredText files to Jupyter notebooks

Description

The rst2pynb program converts a standalone reStructuredText file to a Jupyter notebook file.

This is currently achieved by converting to markdown with pandoc and then to Jupyter notebook using notedown, plus some configuration and tweaks.

License

BSD 3-Clause License

Upstream Contact

Authors: Scott Sievert and Nicolas M. Thiéry Home page: https://github.com/nthiery/rst-to-ipynb

Special Update/Build Instructions

Fetch tarball from https://pypi.python.org/pypi/rst2ipynb/

As it is written in Haskell, pandoc must be installed from the distro.

The main rationale for having a notedown package in Sage (rather than just let pip fetch it) is that the version on pipy (1.5.0, 2015-10-07) is outdated and lacks important features / fixes for us.

Type

optional

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- *notedown: Create IPython notebooks from markdown*
- *pandoc: A document converter*

Version Information

package-version.txt:

```
0.2.3
```

version_requirements.txt:

```
rst2ipynb >=0.2.2
```

Equivalent System Packages

See https://repology.org/project/python:rst2ipynb/versions

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

6.1.339 rubiks: Programs for Rubik's cube

Description

There are several programs for working with Rubik's cubes, by three different people. Look inside the directories under /src to see specific info and licensing. In summary the three contributers are:

Michael Reid (GPL) http://www.cflmath.com/~reid/Rubik/optimal_solver.html

- optimal - uses many pre-computed tables to find an optimal solution to the 3x3x3 Rubik's cube

Dik T. Winter (MIT License)

- cube - uses Kociemba's algorithm to iteratively find a short solution to the 3x3x3 Rubik's cube
- size222 - solves a 2x2x2 Rubik's cube

Eric Dietz (GPL) https://web.archive.org/web/20121212175710/http://www.wrongway.org/?rubiksource

- cu2 - A fast, non-optimal 2x2x2 solver
- cubex - A fast, non-optimal 3x3x3 solver
- mcube - A fast, non-optimal 4x4x4 solver

Type

optional

Dependencies

Version Information

package-version.txt:

```

See https://repology.org/project/saclib/versions

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see Issue #27330 for more information.

6.1.342 sage_conf: Configuration module for the SageMath library (distributable version)

Description

This distribution package provides:

- a single Python module, `sage_conf`, providing configuration information to the SageMath library at the time of its installation and at its runtime
- a console script `sage-config`, for querying the variables of `sage_conf` from the shell
- a sourcable shell script `sage-env-config`, providing additional configuration information in the form of environment variables

The `sage_conf` distribution package is polymorphic: It has several implementations.

sage_conf sdist on PyPI

This implementation of the `sage_conf` distribution package comes from Issue #29039, which added the directory pkgs/sage-conf_pypi.

To install, use `pip install -v sage_conf`. Using `-v` ensures that diagnostic messages are displayed.

On installation (or building a wheel), it invokes `sage_bootstrap` to establish a build tree (`SAGE_ROOT`) and installation tree (`SAGE_LOCAL`) for the SageMath distribution. By default, it uses a subdirectory of `$HOME/.sage` that is specific to the version of the distribution and the version of Python in use. If several virtual environments over the same version of Python install `sage_conf`, they will share these trees.

After installation of `sage_conf`, a wheelhouse containing wheels of various libraries is available; type `ls $(sage-config SAGE_SPKG_WHEELS)` to list them and `pip install $(sage-config SAGE_SPKG_WHEELS)/*.whl` to install them. After this, you can install the Sage library, for example, using `pip install sagemath-standard`.

sage_conf wheels

Prebuilt binary wheels of the `sage_conf` distribution package are available at https://github.com/sagemath/sage-wheels/releases/

This implementation of `sage_conf` comes from Issue #31396, which adds the directory `pkgs/sage-conf_relocatable/`.

On building a wheel, it invokes `sage_bootstrap` to establish a build and installation tree (`SAGE_ROOT`, `SAGE_LOCAL`) in a subdirectory of the directory `/var/tmp/`, whose name is specific to the version of the distribution and the version of Python in use.

The wheel distributes a copy of the prebuilt `SAGE_ROOT` and `SAGE_LOCAL`. Importing `sage_conf` (or using the installed `sage-config` script), makes sure that a symlink from the `/var/tmp` location to the actual persistent installation location is created. As the relocated libraries and programs contain the hardcoded path `SAGE_LOCAL` in various ways (including as rpaths), this symlink is necessary for the prebuilt libraries and programs to work.

`/var/tmp` is a sticky directory on all Linux distributions following the Filesystem Hierarchy Standard, as well as on macOS. On multi-user systems, only one user can use a given version of the distribution; other installation schemes are recommended for systems with multiple Sage users.

sage_conf in the SageMath distribution

The original version of the distribution package `sage_conf` is used internally in the SageMath distribution. It is provided in the directory pkgs/sage-conf. This version of the package is generated by the Sage distribution's `./configure` script.

sage_conf for conda

The version of the distribution package in the directory pkgs/sage-conf_conda may be used in an installation method of SageMath, where all packages are provided by conda. This method is described in https://doc.sagemath.org/html/en/installation/conda.html#using-conda-to-provide-all-dependencies-for-the-sage-library-experimental

sage_conf in downstream distributions

Downstream packagers and advanced developers and users may want to provide their own implementation of the distribution package to support the intended deployment of the SageMath library.

6.1.343 sage_docbuild: Build system of the Sage documentation

About SageMath

> **"Creating a Viable Open Source Alternative to**
> Magma, Maple, Mathematica, and MATLAB"
>
> Copyright (C) 2005-2020 The Sage Development Team
>
> https://www.sagemath.org

SageMath fully supports all major Linux distributions, recent versions of macOS, and Windows (using Windows Subsystem for Linux).

The traditional and recommended way to install SageMath is from source via Sage-the-distribution (https://www.sagemath.org/download-source.html). Sage-the-distribution first builds a large number of open source packages from source (unless it finds suitable versions installed in the system) and then installs the Sage Library (sagelib, implemented in Python and Cython).

About this pip-installable source distribution

This is the build system of the Sage documentation, based on Sphinx.

Type

standard

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- sagelib
- *sphinx: Python documentation generator*

```
10.6
```

version_requirements.txt:

```
sage-setup ~= 10.6
```

Equivalent System Packages

(none known)

6.1.349 sage_sws2rst: Translate legacy Sage worksheet files (.sws) to reStructuredText (.rst) files

Description

Provides a script $sage - sws2rst$, which translates a Sage worksheet file (.sws) into a reStructuredText (.rst) file.

Sage worksheet files (.sws) are a file format that was used by the now-obsolete Sage notebook (https://github.com/sagemath/sagenb), superseded by the Jupyter notebook. SageNB was dropped in the course of the transition of SageMath to Python 3.

This package was extracted from the SageNB sources in Issue #28838 to provide a way to convert pedagogical material written available in Sage worksheet format.

Type

optional

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- *beautifulsoup4: Screen-scraping library*

Version Information

package-version.txt:

```
10.6
```

version_requirements.txt:

```
sage-sws2rst ~= 10.6
```

Equivalent System Packages

(none known)

6.1.350 sagemath_bliss: Graph (iso/auto)morphisms with bliss

About SageMath

> **"Creating a Viable Open Source Alternative to**
> Magma, Maple, Mathematica, and MATLAB"
>
>
>
> https://www.sagemath.org

SageMath fully supports all major Linux distributions, recent versions of macOS, and Windows (Windows Subsystem for Linux).

See https://doc.sagemath.org/html/en/installation/index.html for general installation instructions.

About this pip-installable source distribution

This pip-installable source distribution `sagemath-bliss` is a small optional distribution for use with `sagemath-standard`.

It provides a Cython interface to the `bliss` library for the purpose of computing graph (iso/auto)morphisms.

Type

optional

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- *bliss: Computing automorphism groups and canonical forms of graphs*
- *cysignals: Interrupt and signal handling for Cython*
- *cython: C-Extensions for Python, an optimizing static compiler*
- *pkgconfig: Python interface to pkg-config*
- *sage_conf: Configuration module for the SageMath library (distributable version)*
- *sage-setup: Build system of the SageMath library*
- *sagemath_environment: System and software environment*

Version Information

package-version.txt:

```
10.6
```

version_requirements.txt:

```
sagemath-bliss ~= 10.6
```

Equivalent System Packages

```
$ conda install sagemath-bliss
```

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see Issue #27330 for more information.

6.1.351 sagemath_categories: Sage categories and basic rings

About SageMath

> **"Creating a Viable Open Source Alternative to**
> Magma, Maple, Mathematica, and MATLAB"
>
> Copyright (C) 2005-2024 The Sage Development Team
>
> https://www.sagemath.org

SageMath fully supports all major Linux distributions, recent versions of macOS, and Windows (Windows Subsystem for Linux).

See https://doc.sagemath.org/html/en/installation/index.html for general installation instructions.

About this pip-installable distribution package

The pip-installable distribution package $sagemath-categories$ is a distribution of a small part of the Sage Library.

It provides a small subset of the modules of the Sage library ("sagelib", $sagemath-standard$) that is a superset of $sagemath-objects$ (providing Sage objects, the element/parent framework, categories, the coercion system and the related metaclasses), making various additional categories available without introducing dependencies on additional mathematical libraries.

Dependencies

When building from source, development packages of gmp, $mpfr$, and mpc are needed.

Documentation

- Categories
- Structure
- Coercion
- Classes, Metaclasses

Type

optional

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- *cython: C-Extensions for Python, an optimizing static compiler*
- *pkgconfig: Python interface to pkg-config*
- *python_build: A simple, correct PEP517 package builder*
- *sage-setup: Build system of the SageMath library*
- *sagemath_environment: System and software environment*
- *sagemath_objects: Sage objects, elements, parents, categories, coercion, metaclasses*

Version Information

package-version.txt:

```
10.6
```

version_requirements.txt:

```
sagemath-categories ~= 10.6
```

Equivalent System Packages

(none known)

6.1.352 sagemath_coxeter3: Coxeter groups, Bruhat ordering, Kazhdan-Lusztig polynomials with coxeter3

About SageMath

> **"Creating a Viable Open Source Alternative to**
> Magma, Maple, Mathematica, and MATLAB"
>
> Copyright (C) 2005-2024 The Sage Development Team
>
> https://www.sagemath.org

SageMath fully supports all major Linux distributions, recent versions of macOS, and Windows (Windows Subsystem for Linux).

See https://doc.sagemath.org/html/en/installation/index.html for general installation instructions.

About this pip-installable source distribution

This pip-installable source distribution `sagemath-coxeter3` is a small optional distribution for use with `sagemath-standard`.

It provides a Cython interface to the `coxeter3` library.

Type

optional

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- *coxeter3: Library for Coxeter groups, Bruhat ordering, Kazhdan-Lusztig polynomials*
- *cython: C-Extensions for Python, an optimizing static compiler*
- *pkgconfig: Python interface to pkg-config*
- *sage-setup: Build system of the SageMath library*
- *sagemath_environment: System and software environment*

Version Information

package-version.txt:

```
10.6
```

version_requirements.txt:

```
sagemath-coxeter3 ~= 10.6
```

Equivalent System Packages

(none known)

6.1.353 sagemath_doc_html: SageMath documentation in HTML format

Upon installation, this package builds the SageMath documentation in HTML format.

It is a standard package. It is built on every invocation of `make` or `make all`, but not on `make build`. The documentation build can also be run separately using `make doc-html`.

Type

standard

Dependencies

- $(SAGERUNTIME)
- *conway_polynomials: Python interface to Frank Lübeck's Conway polynomial database*
- *elliptic_curves: Databases of elliptic curves*
- *fpylll: Python interface for FPLLL*
- *furo: A clean customizable Sphinx documentation theme*
- *graphs: A database of combinatorial graphs*
- *ipykernel: IPython Kernel for Jupyter*
- *ipywidgets: Interactive HTML widgets for Jupyter notebooks and the IPython kernel*

- *jupyter_client: Jupyter protocol implementation and client libraries*
- *mathjax: A JavaScript library for displaying mathematical formulas*
- *matplotlib: Python 2D plotting library*
- *maxima: System for manipulating symbolic and numerical expressions*
- *mpmath: Pure Python library for multiprecision floating-point arithmetic*
- *networkx: Python package for complex networks*
- *pillow: Python Imaging Library*
- *pplpy_doc: Python interface to the Parma Polyhedra Library (documentation)*
- *sage_docbuild: Build system of the Sage documentation*
- sagelib
- *scipy: Scientific tools for Python*
- *sphinx: Python documentation generator*
- *sphinx_copybutton: Add a copy button to each of your code cells*
- *sphinx_inline_tabs: Add inline tabbed content to your Sphinx documentation*
- *sympy: Python library for symbolic mathematics*
- *tachyon: A ray tracing system*
- *typing_extensions: Backported and Experimental Type Hints for Python 3.8+*

Version Information

Equivalent System Packages

(none known)

6.1.354 sagemath_doc_pdf: SageMath documentation in PDF format

Upon installation, this package builds the SageMath documentation in PDF format.

It is an optional package. It can be enabled at configuration time using `./configure --enable-sagemath_doc_pdf`. Alternatively, it can be installed by using `make doc-pdf`.

Type

optional

Dependencies

- *free_fonts: a free family of scalable outline fonts*
- *sagemath_doc_html: SageMath documentation in HTML format*
- *texlive: A comprehensive TeX system*
- *texlive_luatex: LuaTeX packages*
- *xindy: a general-purpose index processor*

Version Information

Equivalent System Packages

(none known)

6.1.355 sagemath_environment: System and software environment

About SageMath

> **"Creating a Viable Open Source Alternative to**
> Magma, Maple, Mathematica, and MATLAB"
>
> Copyright (C) 2005-2024 The Sage Development Team
>
> https://www.sagemath.org

SageMath fully supports all major Linux distributions, recent versions of macOS, and Windows (Windows Subsystem for Linux).

See https://doc.sagemath.org/html/en/installation/index.html for general installation instructions.

About this pip-installable distribution package

The pip-installable distribution package $sagemath-environment$ is a distribution of a small part of the Sage Library.

It provides a small, fundamental subset of the modules of the Sage library ("sagelib", $sagemath-standard$), providing the connection to the system and software environment. It also includes the $sage$ script for launching the Sage REPL and accessing various developer tools (see $sage--help$).

Type

optional

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- *python_build: A simple, correct PEP517 package builder*

Version Information

package-version.txt:

```
10.6
```

version_requirements.txt:

```
sagemath-environment ~= 10.6
```

Equivalent System Packages

(none known)

6.1.356 sagemath_giac: Giac integration

This pip-installable source distribution `sagemath-giac` is a small optional distribution for use with `sagemath-standard`.

It provides a Cython interface to the `libgiac` library for the purpose of symbolic integration and certain Groebner basis calculations.

Type

optional

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- *cysignals: Interrupt and signal handling for Cython*
- *cython: C-Extensions for Python, an optimizing static compiler*
- *giac: A general purpose computer algebra system*
- *gmpy2: Python interface to GMP/MPIR, MPFR, and MPC*
- sagelib

Version Information

package-version.txt:

```
0.1.1
```

Equivalent System Packages

(none known)

6.1.357 sagemath_mcqd: Finding maximum cliques with mcqd

About SageMath

> **"Creating a Viable Open Source Alternative to**
> Magma, Maple, Mathematica, and MATLAB"
>
> Copyright (C) 2005-2024 The Sage Development Team
>
> https://www.sagemath.org

SageMath fully supports all major Linux distributions, recent versions of macOS, and Windows (Windows Subsystem for Linux).

See https://doc.sagemath.org/html/en/installation/index.html for general installation instructions.

About this pip-installable source distribution

This pip-installable source distribution `sagemath-mcqd` is a small optional distribution for use with `sagemath-standard`.

It provides a Cython interface to the `mcqd` library, providing a fast exact algorithm for finding a maximum clique in an undirected graph.

Type

optional

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- *cysignals: Interrupt and signal handling for Cython*
- *cython: C-Extensions for Python, an optimizing static compiler*
- *mcqd: An exact algorithm for finding a maximum clique in an undirected graph*
- *memory_allocator: An extension class to allocate memory easily with Cython*
- *pkgconfig: Python interface to pkg-config*
- *sage-setup: Build system of the SageMath library*

Version Information

package-version.txt:

```
10.6
```

version_requirements.txt:

```
sagemath-mcqd ~= 10.6
```

Equivalent System Packages

(none known)

6.1.358 sagemath_meataxe: Matrices over small finite fields with meataxe

About SageMath

> **"Creating a Viable Open Source Alternative to**
> Magma, Maple, Mathematica, and MATLAB"
>
> Copyright (C) 2005-2024 The Sage Development Team
>
> https://www.sagemath.org

SageMath fully supports all major Linux distributions, recent versions of macOS, and Windows (Windows Subsystem for Linux).

See https://doc.sagemath.org/html/en/installation/index.html for general installation instructions.

About this pip-installable source distribution

This pip-installable source distribution `sagemath-meataxe` is a small optional distribution for use with `sagemath-standard`.

This distribution provides the SageMath modules `sage.libs.meataxe` and `sage.matrix.matrix_gfpn_dense`.

It provides a specialized implementation of matrices over the finite field F_q, where q <= 255, using the $SharedMeatAxe < http://users.minet.uni-jena.de/king/SharedMeatAxe/ >$ library.

Type

optional

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- *cysignals: Interrupt and signal handling for Cython*
- *cython: C-Extensions for Python, an optimizing static compiler*
- *meataxe: Library for computing with modular representations*
- *pkgconfig: Python interface to pkg-config*
- *sage-setup: Build system of the SageMath library*
- *sagemath_environment: System and software environment*

Version Information

package-version.txt:

```
10.6
```

version_requirements.txt:

```
sagemath-meataxe ~= 10.6
```

Equivalent System Packages

(none known)

6.1.359 sagemath_objects: Sage objects, elements, parents, categories, coercion, metaclasses

About SageMath

> **"Creating a Viable Open Source Alternative to**
> Magma, Maple, Mathematica, and MATLAB"
>
> Copyright (C) 2005-2024 The Sage Development Team
>
> https://www.sagemath.org

SageMath fully supports all major Linux distributions, recent versions of macOS, and Windows (Windows Subsystem for Linux).

See https://doc.sagemath.org/html/en/installation/index.html for general installation instructions.

About this pip-installable distribution package

The pip-installable distribution package $sagemath-objects$ is a distribution of a small part of the Sage Library.

It provides a small, fundamental subset of the modules of the Sage library ("sagelib", $sagemath-standard$), making Sage objects, the element/parent framework, categories, the coercion system and the related metaclasses available.

Dependencies

When building from source, development packages of gmp, $mpfr$, and mpc are needed.

6.1.360 sagemath_repl: IPython kernel, Sage preparser, doctester

About SageMath

> **"Creating a Viable Open Source Alternative to**
> Magma, Maple, Mathematica, and MATLAB"
>
>
>
> https://www.sagemath.org

SageMath fully supports all major Linux distributions, recent versions of macOS, and Windows (Windows Subsystem for Linux).

See https://doc.sagemath.org/html/en/installation/index.html for general installation instructions.

About this pip-installable distribution package

The pip-installable source distribution $sagemath-repl$ is a distribution of a small part of the Sage Library.

It provides a small, fundamental subset of the modules of the Sage library ("sagelib", $sagemath-standard$), providing the IPython kernel, Sage preparser, and doctester.

Type

optional

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- *ipython: Interactive computing environment with an enhanced interactive Python shell*
- *ipywidgets: Interactive HTML widgets for Jupyter notebooks and the IPython kernel*
- *python_build: A simple, correct PEP517 package builder*
- *sagemath_environment: System and software environment*
- *sagemath_objects: Sage objects, elements, parents, categories, coercion, metaclasses*

6.1.361 sagemath_sirocco: Certified root continuation with sirocco

About SageMath

> **"Creating a Viable Open Source Alternative to**
> Magma, Maple, Mathematica, and MATLAB"
>
> Copyright (C) 2005-2024 The Sage Development Team
>
> https://www.sagemath.org

SageMath fully supports all major Linux distributions, recent versions of macOS, and Windows (Windows Subsystem for Linux).

See https://doc.sagemath.org/html/en/installation/index.html for general installation instructions.

About this pip-installable source distribution

This pip-installable source distribution `sagemath-sirocco` is a small optional distribution for use with `sagemath-standard`.

It provides a Cython interface to the `sirocco` library for the purpose of compute topologically certified root continuation of bivariate polynomials.

Type

optional

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- *cypari2: Python interface to the number theory library libpari*
- *cysignals: Interrupt and signal handling for Cython*
- *cython: C-Extensions for Python, an optimizing static compiler*
- *mpfr: Multiple-precision floating-point computations with correct rounding*
- *pkgconfig: Python interface to pkg-config*
- *sage-setup: Build system of the SageMath library*
- *sagemath_environment: System and software environment*
- *sirocco: Compute topologically certified root continuation of bivariate polynomials*

Version Information

package-version.txt:

```
10.6
```

version_requirements.txt:

```
sagemath-sirocco ~= 10.6
```

Equivalent System Packages

```
$ conda install sagemath-sirocco
```

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see Issue #27330 for more information.

6.1.362 sagemath_tdlib: Tree decompositions with tdlib

About SageMath

> **"Creating a Viable Open Source Alternative to**
> Magma, Maple, Mathematica, and MATLAB"
>
>
>
> https://www.sagemath.org

SageMath fully supports all major Linux distributions, recent versions of macOS, and Windows (Windows Subsystem for Linux).

See https://doc.sagemath.org/html/en/installation/index.html for general installation instructions.

About this pip-installable source distribution

This pip-installable source distribution `sagemath-tdlib` is a small optional distribution for use with `sagemath-standard`.

It provides a Cython interface to the `tdlib` library, providing algorithms concerning tree decompositions.

Type

optional

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- *boost_cropped: Portable C++ libraries (subset needed for Sage)*
- *cysignals: Interrupt and signal handling for Cython*
- *cython: C-Extensions for Python, an optimizing static compiler*
- *pkgconfig: Python interface to pkg-config*
- *sage-setup: Build system of the SageMath library*
- *sagemath_environment: System and software environment*
- *tdlib: Algorithms for computing tree decompositions of graphs*

```
sagemath-tdlib ~= 10.6
```

Equivalent System Packages

(none known)

6.1.363 sagenb_export: Convert legacy SageNB notebooks to Jupyter notebooks and other formats

Description

This is a tool to convert SageNB notebooks to other formats, in particular IPython/Jupyter notebooks.

It includes a Jupyter notebook extension to provide a UI for the import of SageNB notebooks.

Upstream Contact

https://github.com/vbraun/ExportSageNB

Type

standard

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- *ipython: Interactive computing environment with an enhanced interactive Python shell*
- *nbconvert: Converting Jupyter Notebooks*
- *notebook: Jupyter notebook, a web-based notebook environment for interactive computing*
- *six: Python 2 and 3 compatibility utilities*

Version Information

package-version.txt:

```
3.3
```

version_requirements.txt:

```
git+https://github.com/vbraun/ExportSageNB.git
```

Equivalent System Packages

See https://repology.org/project/sagenb-export/versions

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

6.1.364 sagetex: Embed code, results of computations, and plots from Sage into LaTeX documents

Description

The SageTeX package allows you to embed code, results of computations, and plots from Sage into LaTeX documents.

License

The *source code* of the SageTeX package may be redistributed and/or modified under the terms of the GNU General Public License as published by the Free Software Foundation, either version 2 of the License, or (at your option) any later version. To view a copy of this license, see http://www.gnu.org/licenses/ or send a letter to the Free Software Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston, MA 02110-1301, USA.

The *documentation* of the SageTeX package is licensed under the Creative Commons Attribution-Share Alike 3.0 License. SPKG Maintainers

Dan Drake (dr.dan.drake at gmail) and SageMath developers (sage-devel@googlegroups.com)

Upstream Contact

Author: Dan Drake.

Web: https://github.com/sagemath/sagetex

Dependencies

To install, nothing more than a standard Sage install. The `spkg-check` script will exit without actually testing anything if it cannot find "latex" in your path.

Notes

To use SageTeX, both Sage and LaTeX need to know about it. SageTeX comes standard with Sage, so you only need to make sure LaTeX can find what it needs. Full details are in the Sage installation guide at http://doc.sagemath.org/html/en/installation/ and http://doc.sagemath.org/html/en/tutorial/sagetex.html .

The directory `$SAGE_ROOT/venv/share/doc/sagetex` contains documentation and an example file. See `$SAGE_ROOT/venv/share/texmf/tex/latex/sagetex` for the source code and some possibly useful scripts. If you have problems or suggestions see the sage-support group.

If you want to help develop SageTeX, please clone the github repository (see the "Upstream Contact" above) and send me patches based on that.

Type

standard

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- *matplotlib: Python 2D plotting library*
- *maxima: System for manipulating symbolic and numerical expressions*
- *pillow: Python Imaging Library*
- *pyparsing: A Python parsing module*
- *scipy: Scientific tools for Python*
- *tachyon: A ray tracing system*

Version Information

package-version.txt:

```
3.6.1
```

version_requirements.txt:

```
sagetex >=3.5
```

Equivalent System Packages

```
$ conda install sagetex
```

See https://repology.org/project/sagetex/versions

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

6.1.365 sbcl: a lisp compiler and runtime system

Description

Steel Bank Common Lisp (SBCL) is a high performance Common Lisp compiler. It is open source / free software, with a permissive license (see https://www.sbcl.org/history.html). In addition to the compiler and runtime system for ANSI Common Lisp, it provides an interactive environment including a debugger, a statistical profiler, a code coverage tool, and many other extensions.

(taken from https://www.sbcl.org)

License

- a mix of BSD-style and public domain

Upstream Contact

$ nix-env --install sbcl
```

install the following packages: lang/sbcl

```
$ sudo zypper install sbcl
```

```
$ sudo xbps-install sbcl
```

See https://repology.org/project/sbcl/versions

If the system package is installed, `./configure` will check if it can be used.

6.1.366 scip: Mixed integer programming solver

Description

SCIP is currently one of the fastest open source mixed integer programming (MIP) solvers. It is also a framework for constraint integer programming and branch-cut-and-price. It allows total control of the solution process and the access of detailed information down to the guts of the solver.

License

Apache 2.0

Upstream Contact

https://scipopt.org/#scipoptsuite

Dependencies

scip brings its own patched version of the bliss library. This will conflict with the optional package bliss.

Type

optional

Dependencies

- $(MP_LIBRARY)
- *bliss: Computing automorphism groups and canonical forms of graphs*
- *cmake: A cross-platform build system generator*
- *papilo: Parallel presolve for integer and linear optimization*
- *readline: Command line editing library*
- *soplex: Linear optimization solver using the revised simplex method*
- *zlib: Data compression library*

Version Information

package-version.txt:

```
9.0.1
```

Equivalent System Packages

```
$ conda install scip
```

```
$ sudo yum install scip
```

See https://repology.org/project/scipoptsuite/versions

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see Issue #27330 for more information.

6.1.367 scip_sdp: Mixed integer semidefinite programming plugin for SCIP

Description

SCIP-SDP allows to solve MISDPs using a nonlinear branch-and-bound approach or a linear programming cutting-plane approach.

- In the first case (the default), the semidefinite programming (SDP) relaxations are solve using interior-point SDP-solvers.
- In the second case, cutting planes based on eigenvector are generated.

SCIP-SDP is based on the branch-and-cut framework SCIP. In addition to providing a constraint handler for SDP-constraints and a relaxator to solve continuous SDP-relaxations using interior-point solvers, SCIP-SDP adds several heuristics and propagators to SCIP.

6.1.368 scipy: Scientific tools for Python

Description

SciPy (pronounced "Sigh Pie") is open-source software for mathematics, science, and engineering. The SciPy library depends on NumPy, which provides convenient and fast N-dimensional array manipulation. The SciPy library is built to work with NumPy arrays, and provides many user-friendly and efficient numerical routines such as routines for numerical integration and optimization. Together, they run on all popular operating systems, are quick to install, and are free of charge. NumPy and SciPy are easy to use, but powerful enough to be depended upon by some of the world's leading scientists and engineers.

License

SciPy's license is free for both commercial and non-commercial use, under the BSD terms. See http://www.scipy.org/License_Compatibility

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

6.1.373 singular: Computer algebra system for polynomial computations, algebraic geometry, singularity theory

Description

Singular is a computer algebra system for polynomial computations, with special emphasis on commutative and non-commutative algebra, algebraic geometry, and singularity theory.

License

GPLv2 or GPLv3

Upstream Contact

libsingular-devel@mathematik.uni-kl.de

https://www.singular.uni-kl.de/

Special Update/Build Instructions

Other notes:

- If the environment variable SAGE_DEBUG is set to "yes", then omalloc will be replaced by xalloc. The resulting Singular executable and libsingular library will be slower than with omalloc, but allow for easier debugging of memory corruptions.

Type

standard

Dependencies

- $(MP_LIBRARY)
- *cddlib: Double description method for polyhedral representation conversion*
- *flint: Fast Library for Number Theory*
- *mpfr: Multiple-precision floating-point computations with correct rounding*
- *ntl: A library for doing number theory*
- *readline: Command line editing library*

Version Information

package-version.txt:

```
4.4.0
```

Equivalent System Packages

```
$ sudo pacman -S singular
```

```
$ conda install singular
```

```
$ sudo apt-get install singular singular-doc libsingular4-dev
```

```
$ sudo yum install Singular Singular-devel
```

```
$ sudo pkg install math/singular
```

```
$ sudo emerge sci-mathematics/singular\[readline\]
```

```
$ brew install singular
```

```
$ sudo port install singular
```

```
$ nix-env --install singular
```

```
$ sudo xbps-install singular
```

See https://repology.org/project/singular/versions

If the system package is installed, `./configure` will check if it can be used.

6.1.374 singular_jupyter: Jupyter kernel for Singular

Description

This is a beta version of a jupyter kernel for Singular.

License

```

See https://repology.org/project/python:sphinxcontrib-jsmath/versions

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

6.1.391 sphinxcontrib_qthelp: Sphinx extension which outputs QtHelp documents

Description

Sphinx extension which outputs QtHelp documents

License

BSD

Type

standard

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)

Version Information

package-version.txt:

```
2.0.0
```

version_requirements.txt:

```
sphinxcontrib_qthelp >=1.0.3
```

Equivalent System Packages

```
$ sudo pacman -S python-sphinxcontrib-qthelp
```

```
$ conda install sphinxcontrib-qthelp
```

```
$ sudo yum install python3-sphinxcontrib-qthelp
```

```
$ sudo pkg install textproc/py-sphinxcontrib-qthelp
```

```
$ sudo emerge dev-python/sphinxcontrib-qthelp
```

```
$ sudo port install py-sphinxcontrib-qthelp
```

```
$ sudo zypper install python3\$\{PYTHON_MINOR\}-sphinxcontrib-qthelp
```

```
$ sudo xbps-install python3-sphinxcontrib-qthelp
```

See https://repology.org/project/python:sphinxcontrib-qthelp/versions

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

6.1.392 sphinxcontrib_serializinghtml: Sphinx extension which outputs serialized HTML files

Description

Sphinx extension which outputs serialized HTML files

License

BSD

Type

standard

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)

Version Information

package-version.txt:

```
2.0.0
```

version_requirements.txt:

```
sphinxcontrib_serializinghtml >=1.1.5
```

Equivalent System Packages

```
$ sudo pacman -S python-sphinxcontrib-serializinghtml
```

```
$ conda install sphinxcontrib-serializinghtml
```

```
$ sudo yum install python3-sphinxcontrib-serializinghtml
```

```
$ sudo pkg install textproc/py-sphinxcontrib-serializinghtml
```

```
$ sudo emerge dev-python/sphinxcontrib-serializinghtml
```

```
$ sudo port install py-sphinxcontrib-serializinghtml
```

```
$ sudo zypper install python3\$\{PYTHON_MINOR\}-sphinxcontrib-serializinghtml
```

```
$ sudo xbps-install python3-sphinxcontrib-serializinghtml
```

See https://repology.org/project/python:sphinxcontrib-serializinghtml/versions

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

6.1.393 sphinxcontrib_websupport: Sphinx API for Web apps

Description

sphinxcontrib-websupport provides a Python API to easily integrate Sphinx documentation into your Web application.

License

BSD

Type

standard

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- *sphinxcontrib_serializinghtml: Sphinx extension which outputs serialized HTML files*

Version Information

package-version.txt:

```
2.0.0
```

version_requirements.txt:

```
sphinxcontrib_websupport >=1.2.1
```

Equivalent System Packages

```
$ apk add py3-sphinxcontrib-websupport
```

```
$ sudo pacman -S python-sphinxcontrib-websupport
```

```
$ conda install sphinxcontrib-websupport
```

```
$ sudo apt-get install python3-sphinxcontrib.websupport
```

```
$ sudo yum install python3-sphinxcontrib-websupport
```

```
$ sudo pkg install textproc/py-sphinxcontrib-websupport
```

```
$ sudo emerge dev-python/sphinxcontrib-websupport
```

```
$ sudo port install py-sphinxcontrib-websupport
```

```
$ sudo zypper install python3\$\{PYTHON_MINOR\}-sphinxcontrib-websupport
```

See https://repology.org/project/python:sphinxcontrib-websupport/versions

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

6.1.394 sqlalchemy: A database abstraction library

Description

Database Abstraction Library

License

MIT

Upstream Contact

https://pypi.org/project/SQLAlchemy/

Type

optional

Dependencies

Version Information

requirements.txt:

```
sqlalchemy
```

Equivalent System Packages

```
$ conda install sqlalchemy
```

```
$ sudo yum install python3-sqlalchemy
```

```
$ sudo port install py-sqlalchemy
```

```
$ sudo zypper install python3\$\{PYTHON_MINOR\}-SQLAlchemy
```

```
$ sudo xbps-install python3-SQLAlchemy
```

See https://repology.org/project/python:sqlalchemy/versions

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

6.1.395 sqlite: An SQL database engine

Description

SQLite is a software library that implements a self-contained, serverless, zero-configuration, transactional SQL database engine.

License

Public Domain

Upstream contact

- https://www.sqlite.org

Dependencies

- readline

Special Update/Build Instructions

- Use the autoconf version of sqlite.

Type

standard

Dependencies

- *readline: Command line editing library*

Version Information

package-version.txt:

```
3.36.0
```

Equivalent System Packages

```
$ apk add sqlite-dev
```

```
$ sudo pacman -S sqlite3
```

```
$ conda install sqlite
```

```
$ sudo apt-get install libsqlite3-dev sqlite3
```

```
$ sudo yum install sqlite-devel sqlite
```

```
$ sudo pkg install databases/sqlite3
```

```
$ sudo emerge dev-db/sqlite
```

```
$ brew install sqlite
```

```
$ sudo port install sqlite3
```

```
$ nix-env --install sqlite
```

```
$ sudo zypper install pkgconfig\(sqlite3\)
```

```
$ sudo slackpkg install sqlite icu4c
```

```
$ sudo xbps-install sqlite-devel
```

See https://repology.org/project/sqlite/versions

If the system package is installed, `./configure` will check if it can be used.

6.1.396 stack_data: Extract data from python stack frames and tracebacks for informative displays

Description

Extract data from python stack frames and tracebacks for informative displays

License

MIT

Upstream Contact

https://pypi.org/project/stack-data/

Type

standard

Dependencies

- $(PYTHON)
- *asttokens: Annotate AST trees with source code positions*
- *executing: Get the currently executing AST node of a frame, and other information*
- *pip: Tool for installing and managing Python packages*
- *pure_eval: Safely evaluate AST nodes without side effects*

Version Information

package-version.txt:

```
0.6.3
```

version_requirements.txt:

```
stack-data
```

Equivalent System Packages

```
$ conda install stack_data
```

```
$ sudo yum install python3-stack-data
```

```
$ sudo emerge dev-python/stack-data
```

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

6.1.397 suitesparse: A suite of sparse matrix software

SuiteSparse is a collection of software to deal with sparse matrix. It is hosted at https://people.engr.tamu.edu/davis/suitesparse.html with source code now on github at https://github.com/DrTimothyAldenDavis/SuiteSparse

This spkg does a minimal install of suitesparse, only intalling the following

- AMD
- CAMD
- COLAMD
- CCOLAMD
- CHOLMOD
- UMFPACK

Those are all the packages needed for cvxopt.

Other configurations are self explanatory.

License: because SuiteSparse is a collection, it comes with a variety of licenses. Find below a copy of the "LICENSES.txt" shipped with SuiteSparse.

Mongoose License

Mongoose, Copyright 2018, Timothy A. Davis, Scott P. Kolodziej, William W. Hager, S. Nuri Yeralan Licensed under the GNU GENERAL PUBLIC LICENSE, Version 3, 29 June 2007

Type

standard

Dependencies

- $(BLAS)
- $(MP_LIBRARY)
- *cmake: A cross-platform build system generator*
- *gfortran: Fortran compiler from the GNU Compiler Collection*
- *mpfr: Multiple-precision floating-point computations with correct rounding*

Version Information

package-version.txt:

```
7.8.0
```

Equivalent System Packages

```
$ apk add suitesparse-dev
```

```
$ sudo pacman -S suitesparse
```

```
$ conda install suitesparse
```

```
$ sudo apt-get install libsuitesparse-dev
```

```
$ sudo yum install suitesparse suitesparse-devel
```

```
$ sudo pkg install math/suitesparse
```

```
$ sudo emerge sci-libs/amd sci-libs/cholmod sci-libs/suitesparseconfig \
      sci-libs/umfpack
```

```
$ brew install suite-sparse
```

No package needed.

```
$ sudo zypper install suitesparse-devel
```

install the following packages: suitesparse

```
$ sudo xbps-install SuiteSparse-devel
```

See https://repology.org/project/suitesparse/versions

If the system package is installed, `./configure` will check if it can be used.

6.1.398 surf: Visualization of algebraic curves, algebraic surfaces and hyperplane sections of surfaces

Description

surf is a tool to visualize some real algebraic geometry: plane algebraic curves, algebraic surfaces and hyperplane sections of surfaces. surf is script driven and has (optionally) a nifty GUI using the Gtk widget set.

This is used by the Singular Jupyter kernel to produce 3D plots.

License

GPL version 2 or later

Upstream Contact

http://surf.sourceforge.net (although the project is essentially dead)

Dependencies

- cups (optional)
- GNU flex Version 2.5 or higher
- GTK+ Version 1.2.0 or higher (optional)
- POSIX Threads
- GNU MP(gmp) Version 2 or higher
- lib-tiff
- lib-jpeg
- zlib
- ps2pdf (optional)

This package is “experimental” because not all of these dependencies are packaged with Sage.

Type

experimental

Dependencies

- $(MP_LIBRARY)

Version Information

package-version.txt:

```
1.0.6-gcc6
```

Equivalent System Packages

```
$ sudo apt-get install surf-alggeo
```

```
$ sudo yum install surf-geometry
```

```
$ sudo zypper install surf
```

See https://repology.org/project/surf-alggeo/versions

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see Issue #27330 for more information.

6.1.399 surface_dynamics: dynamics on surfaces (measured foliations, interval exchange transformation, Teichmüller flow, etc)

Description

Dynamics on surfaces.

License

GPLv2+

Upstream Contact

https://gitlab.com/videlec/surface_dynamics https://pypi.org/project/surface-dynamics/

Type

optional

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- $(SAGERUNTIME)
- *cysignals: Interrupt and signal handling for Cython*
- *pplpy: Python interface to the Parma Polyhedra Library*

Version Information

requirements.txt:

```
surface_dynamics
```

Equivalent System Packages

See https://repology.org/project/python:surface-dynamics/versions

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

6.1.400 symengine: A C++ symbolic manipulation library

Description

SymEngine is a standalone fast C++ symbolic manipulation library.

License

BSD 3-clause

Upstream Contact

https://github.com/symengine/symengine

Type

optional

Dependencies

- $(MP_LIBRARY)
- *cmake: A cross-platform build system generator*
- *ecm: Elliptic curve method for integer factorization*
- *flint: Fast Library for Number Theory*
- *mpc: Arithmetic of complex numbers with arbitrarily high precision and correct rounding*
- *mpfr: Multiple-precision floating-point computations with correct rounding*

Version Information

package-version.txt:

```
0.11.2
```

Equivalent System Packages

```
$ sudo pacman -S symengine
```

```
$ conda install symengine
```

```
$ sudo pkg install math/symengine
```

```
$ sudo emerge sci-libs/symengine
```

```
$ brew install symengine
```

```
$ sudo port install symengine
```

```
$ nix-env --install symengine
```

```
$ sudo zypper install symengine
```

See https://repology.org/project/symengine/versions

If the system package is installed, `./configure` will check if it can be used.

6.1.401 symengine_py: Python wrappers for SymEngine

Description

Python wrappers for SymEngine

License

symengine.py is MIT licensed and uses several LGPL, BSD-3 and MIT licensed libraries

Upstream Contact

https://github.com/symengine/symengine.py

Type

optional

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- *cmake: A cross-platform build system generator*
- *cython: C-Extensions for Python, an optimizing static compiler*
- *symengine: A C++ symbolic manipulation library*

Version Information

package-version.txt:

```
0.11.0
```

version_requirements.txt:

```
symengine.py >= 0.6.1
```

Equivalent System Packages

```
$ sudo pacman -S python-symengine
```

```
$ conda install python-symengine
```

```
$ sudo pkg install math/py-symengine
```

```
$ sudo emerge dev-python/symengine
```

See https://repology.org/project/python:symengine/versions

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

6.1.402 symmetrica: Library for representation theory

Description

Symmetrica is a Collection of C routines for representation theory.

It is a program developed by Lehrstuhl Mathematik II of the University of Bayreuth. It has routines to handle the following topics:

- ordinary representation theory of the symmetric group and related groups (2/11/04)
- ordinary representation theory of the classical groups
- modular representation theory of the symmetric group
- projective representation theory of the symmetric group
- combinatorics of tableaux
- symmetric functions and polynomials (7/22/04)
- commutative and non commutative Schubert polynomials
- operations of finite groups.
- ordinary representation theory of Hecke algebras of type A_n

For more details check http://www.algorithm.uni-bayreuth.de/en/research/SYMMETRICA

Updated package on https://gitlab.com/sagemath/symmetrica/-/releases with changes to modernize the source and the build system.

License

Public Domain (see the above web site)

Upstream Contact

- (passed away in 2013) Axel Kohnert - see http://www.mathe2.uni-bayreuth.de/axel/

Type

standard

Dependencies

- *xz: General-purpose data compression software*

Version Information

package-version.txt:

```
3.0.1
```

Equivalent System Packages

```
$ sudo pacman -S symmetrica
```

```
$ conda install symmetrica
```

```
$ sudo apt-get install libsymmetrica2-dev
```

```
$ sudo yum install symmetrica-devel
```

```
$ sudo pkg install math/symmetrica
```

```
$ sudo emerge sci-libs/symmetrica
```

```
$ nix-env --install symmetrica
```

```
$ sudo xbps-install symmetrica-devel
```

See https://repology.org/project/symmetrica/versions

If the system package is installed, `./configure` will check if it can be used.

6.1.403 sympow: Computes special values of symmetric power elliptic curve L-functions

Description

SYMPOW is a package to compute special values of symmetric power elliptic curve L-functions. It can compute up to about 64 digits of precision.

License

- See the file src/COPYING

Upstream Contact

SYMPOW does not appear to be maintained any longer. Mark Watkins, the package author, now works at Magma. Previous (possibly still usable) email is watkins@maths.usyd.edu.au

New upstream: https://gitlab.com/rezozer/forks/sympow

Dependencies

- GNU patch

Special Update/Build Instructions

- Some of the code is very dubious, and it is anyones guess really what the compiler does with it. For example, the following line exists in src/eulerfactors.c:

  if ((HECKE) && (d==1)) return hecke_good(p,ap,m,v);

  But since hecke_good is defined as returning void, it's hard to know exactly how this code behaves. I would not be surprised by any bugs that might show up. I (David Kirkby) would personally not trust this code much at all.

- This is a difficult package to maintain. A github issue (#9758) has been opened to implement Watkins-Delaunay's algorithm for computing modular degrees in Sage. Once implemented, it should be possible to remove this package.
- The package is configured such that the data files are in a directory below where 'sympow' is installed. If Sage is installed globally, then it will be impossible to create the data files without being root. This has been fixed in the Gentoo Linux distribution. Some information from Christopher can be seen on Issue #9703 This package will generate binary versions of all shipped datafiles, so these will work. However, creating totally new datafiles from scratch will not work.

Type

standard

Dependencies

- *pari: Computer algebra system for fast computations in number theory*

Version Information

package-version.txt:

```
2.023.6
```

Equivalent System Packages

```
$ sudo pacman -S sympow
```

```
$ conda install sympow
```

```
$ sudo apt-get install sympow
```

```
$ sudo yum install sympow
```

```
$ sudo emerge sci-mathematics/sympow
```

```
$ nix-env --install sympow
```

```
$ sudo zypper install sympow
```

```
$ sudo xbps-install sympow
```

See https://repology.org/project/sympow/versions

If the system package is installed, `./configure` will check if it can be used.

6.1.404 sympy: Python library for symbolic mathematics

Description

SymPy is a Python library for symbolic mathematics. It aims to become a full-featured computer algebra system (CAS) while keeping the code as simple as possible in order to be comprehensible and easily extensible. SymPy is written entirely in Python and does not require any external libraries, except optionally for plotting support.

Website

https://sympy.org/

License

New BSD: http://www.opensource.org/licenses/bsd-license.php

Upstream Contact

https://pypi.org/project/sympy/

Type

standard

Dependencies

- $(PYTHON)
- *mpmath: Pure Python library for multiprecision floating-point arithmetic*
- *pip: Tool for installing and managing Python packages*

Version Information

package-version.txt:

```
1.13.2
```

version_requirements.txt:

```
sympy >=1.6, <2.0
```

Equivalent System Packages

```
$ sudo pacman -S python-sympy
```

```
$ conda install sympy
```

```
$ sudo apt-get install python3-sympy
```

```
$ sudo yum install python3-sympy
```

```
$ sudo emerge dev-python/sympy
```

```
$ sudo port install py-sympy
```

```
$ sudo zypper install python3\$\{PYTHON_MINOR\}-sympy
```

```
$ sudo xbps-install python3-sympy
```

See https://repology.org/project/python:sympy/versions

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

6.1.405 tachyon: A ray tracing system

Description

Tachyon is a raytracer developed by John E. Stone. Tachyon supports the typical ray tracer features, most of the common geometric primitives, shading and texturing modes, etc. It also supports less common features such as HDR image output, ambient occlusion lighting, and support for various triangle mesh and volumetric texture formats beneficial for molecular visualization (e.g. rendering VMD scenes).

Currently not all of Tachyon's functionality is exported by the Sage interface.

License

Copyright (c) 1994-2010 John E. Stone All rights reserved.

Redistribution and use in source and binary forms, with or without modification, are permitted provided that the following conditions are met:

Upstream Contact

- http://jedi.ks.uiuc.edu/~johns/raytracer/
- http://www.photonlimited.com/~johns/raytracer/
- John Stone <johns@ks.uiuc.edu>

Dependencies

This spkg depends on:

- libpng

Special Update/Build Instructions

- Delete the scenes directory, which has lots of cool examples.
- Delete the msvc directory, which is also large and not used within Sage.
- The CVS subdirectories are currently (almost) empty, but should otherwise be deleted.
- The upstream files had strange permissions, i.e. some source files were executable, while almost all files weren't world-readable.
- There's seems to be some crap like `tachyon.html.tar.gz` and a few `.#*` files I haven't [yet] deleted, since they're not that large.
- TODO: Check whether building multi-threaded versions on MacOS X meanwhile works. (This was said to fail with an old beta.)
- TODO: Use `patch` instead of copying over pre-patched files.
- TODO: [Optionally] also install some of the documentation.
- TODO: I doubt the CFLAGS set for AIX and HP-UX won't get overridden by the created Makefile, but that's a minor issue. -leif

Type

standard

Dependencies

- *libpng: Bitmap image support*

Version Information

package-version.txt:

```
0.99.5.p0
```

Equivalent System Packages

```
$ sudo pacman -S tachyon
```

```
$ conda install tachyon
```

```
$ sudo apt-get install tachyon
```

```
$ sudo yum install tachyon tachyon-devel
```

```
$ sudo pkg install graphics/tachyon
```

```
$ sudo emerge media-gfx/tachyon
```

```
$ nix-env --install tachyon
```

```
$ sudo zypper install tachyon
```

```
$ sudo xbps-install tachyon
```

See https://repology.org/project/tachyon/versions, https://repology.org/project/tachyon-opengl/versions

If the system package is installed, `./configure` will check if it can be used.

6.1.406 tdlib: Algorithms for computing tree decompositions of graphs

Description

This library, now known as treedec, provides algorithms concerning tree decompositions.

License

- GNU General Public License v2
- GNU General Public License v3

Upstream Contact

- https://gitlab.com/freetdi/treedec
- https://github.com/freetdi/tdlib
- https://github.com/felix-salfelder

Type

optional

Dependencies

- *boost_cropped: Portable C++ libraries (subset needed for Sage)*

Version Information

package-version.txt:

```
0.9.3.p0
```

Equivalent System Packages

```
$ sudo pacman -S tdlib
```

```
$ sudo yum install python3-tdlib python3-tdlib-devel
```

See https://repology.org/project/python:tdlib/versions

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see Issue #27330 for more information.

6.1.407 terminado: Tornado websocket backend for the term.js Javascript terminal emulator library

Description

This is a Tornado websocket backend for the term.js Javascript terminal emulator library.

It evolved out of pyxterm, which was part of GraphTerm (as lineterm.py), v0.57.0 (2014-07-18), and ultimately derived from the public-domain Ajaxterm code, v0.11 (2008-11-13) (also on Github as part of QWeb).

Type

standard

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- *hatchling: Modern, extensible Python build backend*
- *ptyprocess: Python interaction with subprocesses in a pseudoterminal*
- *tornado: Python web framework and asynchronous networking library*

Version Information

package-version.txt:

```
0.17.1
```

version_requirements.txt:

```
terminado >=0.8.3
```

Equivalent System Packages

```
$ conda install terminado
```

```
$ sudo emerge dev-python/terminado
```

```
$ sudo port install py-terminado
```

```
$ sudo xbps-install python3-terminado
```

See https://repology.org/project/terminado/versions, https://repology.org/project/python:terminado/versions

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

6.1.408 texlive: A comprehensive TeX system

Description

TeX Live is an easy way to get up and running with the TeX document production system. It provides a comprehensive TeX system with binaries for most flavors of Unix, including GNU/Linux, and also Windows. It includes all the major TeX-related programs, macro packages, and fonts that are free software, including support for many languages around the world.

This package installs all texlive packages required to build Sage. If necessary, texlive itself is installed.

License

Various FSF-approved free software licenses. See https://www.tug.org/texlive/copying.html for details.

- $(PYTHON_TOOLCHAIN)

Version Information

package-version.txt:

```
1.7.0
```

version_requirements.txt:

```
texttable >=1.6.3
```

Equivalent System Packages

```
$ sudo pacman -S python-texttable
```

```
$ conda install texttable
```

```
$ sudo apt-get install python3-texttable
```

```
$ sudo yum install python3-texttable
```

```
$ sudo emerge dev-python/texttable
```

```
$ sudo port install py-texttable
```

```
$ sudo zypper install python3\$\{PYTHON_MINOR\}-texttable
```

```
$ sudo xbps-install python3-texttable
```

See https://repology.org/project/texttable/versions, https://repology.org/project/python:texttable/versions

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

6.1.411 threejs: JavaScript library to display 3D graphics in the browser

Description

Three.js is a JavaScript library to display 3D graphics in the browser.

License

MIT License

Upstream Contact

Home page: http://threejs.org

Dependencies

None.

Special Update/Build Instructions

None.

Type

standard

Dependencies

Version Information

package-version.txt:

```
r122.p0
```

Equivalent System Packages

```
$ conda install threejs-sage=122.\*
```

See https://repology.org/project/threejs/versions, https://repology.org/project/threejs-sage/versions

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see Issue #27330 for more information.

6.1.412 tides: Integration of ODEs

Description

TIDES is a library for integration of ODEs with high precision.

License

GPLv3+

Upstream Contact

- Marcos Rodriguez (marcos@unizar.es)

Dependencies

- gcc
- mpfr
- gmp

Special Update/Build Instructions

minc_tides.patch changes the size of the name of the temporal files, so there is no problem in systems that use long names. Also solves a bug in the inverse function.

Type

optional

Dependencies

- $(MP_LIBRARY)
- *mpfr: Multiple-precision floating-point computations with correct rounding*

Version Information

package-version.txt:

```
2.0.p0
```

Equivalent System Packages

See https://repology.org/project/tides/versions

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see Issue #27330 for more information.

standard

Dependencies

- $(PYTHON)
- *pip: Tool for installing and managing Python packages*

Version Information

package-version.txt:

```
2.0.1
```

version_requirements.txt:

```
tomli
```

Equivalent System Packages

```
$ conda install tomli
```

```
$ sudo yum install python3-tomli
```

```
$ sudo emerge dev-python/tomli
```

```
$ sudo xbps-install python3-tomli
```

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

6.1.415 topcom: Compute triangulations of point configurations and oriented matroids

Description

TOPCOM is a collection of clients to compute Triangulations Of Point Configurations and Oriented Matroids, resp.

The algorithms use only combinatorial data of the point configuration as is given by its oriented matroid. Some basic commands for computing and manipulating oriented matroids can also be accessed by the user.

It was very much inspired by the maple program PUNTOS, which was written by Jesus de Loera. TOPCOM is entirely written in C++, so there is a significant speed up compared to PUNTOS.

6.1.426 valgrind: Memory error detector, call graph generator, runtime profiler

Description

Valgrind is an instrumentation framework for building dynamic analysis tools. There are Valgrind tools that can automatically detect many memory management and threading bugs, and profile your programs in detail. You can also use Valgrind to build new tools.

The Valgrind distribution currently includes six production-quality tools: a memory error detector, two thread error detectors, a cache and branch-prediction profiler, a call-graph generating cache and branch-prediction profiler, and a heap profiler. It also includes three experimental tools: a heap/stack/global array overrun detector, a second heap profiler that examines how heap blocks are used, and a SimPoint basic block vector generator.

License

Valgrind is Open Source / Free Software, and is freely available under the GNU General Public License, version 2.

- *jupyter_core: Jupyter core package*

Version Information

package-version.txt:

```
4.0.9
```

version_requirements.txt:

```
widgetsnbextension
```

Equivalent System Packages

```
$ sudo pacman -S jupyter-widgetsnbextension
```

```
$ conda install widgetsnbextension
```

```
$ sudo yum install python3-widgetsnbextension
```

```
$ sudo pkg install devel/py-widgetsnbextension
```

```
$ sudo emerge dev-python/widgetsnbextension
```

```
$ sudo port install py-widgetsnbextension
```

```
$ sudo zypper install jupyter-widgetsnbextension
```

```
$ sudo xbps-install python3-jupyter_widgetsnbextension
```

See https://repology.org/project/python:widgetsnbextension/versions, https://repology.org/project/jupyter-widgetsnbextension/versions, https://repology.org/project/python:jupyter-widgetsnbextension/versions

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

6.1.434 xindy: a general-purpose index processor

Description

This dummy package represents xindy: xindy was developed after an impasse had been encountered in the attempt to complete internationalisation of makeindex. Xindy can be used to process indexes for documents marked up using (LA)TEX, Nroff family and SGML-based languages. Xindy is highly configurable, both in markup terms and in terms of the collating order of the text being processed.

We do not have an SPKG for it. The purpose of this dummy package is to associate system package lists with it.

License

GNU General Public License version 2.0 (GPLv2)

http://www.xindy.org/

Type

optional

Dependencies

Version Information

Equivalent System Packages

```
$ sudo apt-get install xindy
```

```
$ sudo yum install texlive-xindy
```

```
$ sudo port install xindy
```

```
$ sudo zypper install xindy
```

See https://repology.org/project/xindy/versions

If the system package is installed, `./configure` will check if it can be used.

6.1.435 xz: General-purpose data compression software

Description

XZ Utils is free general-purpose data compression software with a high compression ratio.

License

Some parts public domain, other parts GNU LGPLv2.1, GNU GPLv2, or GNU GPLv3.

Upstream Contact

http://tukaani.org/xz/

Dependencies

Type

standard

Dependencies

Version Information

package-version.txt:

```
5.2.5
```

Equivalent System Packages

```
$ apk add xz
```

```
$ conda install xz
```

```
$ sudo apt-get install xz-utils
```

```
$ sudo yum install xz
```

```
$ brew install xz
```

```
$ sudo port install xz
```

```
$ sudo zypper install xz
```

```
$ sudo slackpkg install xz
```

```
$ sudo xbps-install xz
```

See https://repology.org/project/xz/versions

If the system package is installed, `./configure` will check if it can be used.

6.1.436 zeromq: A modern networking library

Description

A modern networking library. Also known as 0mq or zmq. The same API is provided by http://www.crossroads.io, though we currently use the http://www.zeromq.org implementation.

License

LGPLv3+

Upstream Contact

http://www.zeromq.org

Dependencies

A working compiler.

Special Update/Build Instructions

N/A

Type

Dependencies

Version Information

package-version.txt:

```
4.3.5
```

Equivalent System Packages

```
$ apk add zeromq-dev
```

```
$ sudo pacman -S zeromq
```

```
$ conda install zeromq
```

```
$ sudo apt-get install libzmq3-dev
```

```
$ sudo yum install zeromq zeromq-devel
```

```
$ sudo pkg install net/libzmq4
```

```
$ sudo emerge net-libs/zeromq
```

```
$ brew install zeromq
```

No package needed.

```
$ sudo zypper install pkgconfig\(libzmq\)
```

```
$ sudo xbps-install zeromq-devel
```

See https://repology.org/project/zeromq/versions

If the system package is installed, `./configure` will check if it can be used.

6.1.437 zipp: A pathlib-compatible zipfile object wrapper

Description

A pathlib-compatible Zipfile object wrapper. A backport of the Path object.

License

MIT License

Home page: https://github.com/jaraco/zipp

Dependencies

Python, Setuptools

Type

standard

Dependencies

- $(PYTHON)
- *pip: Tool for installing and managing Python packages*

Version Information

package-version.txt:

```
3.19.0
```

version_requirements.txt:

```
zipp >=0.5.2
```

Equivalent System Packages

```
$ conda install zipp
```

```
$ sudo yum install python3-zipp
```

```
$ sudo emerge dev-python/zipp
```

```
$ sudo port install py-zipp
```

```
$ sudo xbps-install python3-zipp
```

See https://repology.org/project/python:zipp/versions

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

6.1.438 zlib: Data compression library

Description

Massively Spiffy Yet Delicately Unobtrusive Compression Library (Also Free, Not to Mention Unencumbered by Patents)

License

- Modified BSD.

Upstream Contact

- http://www.zlib.net/

Type

standard

Dependencies

Version Information

package-version.txt:

```
1.2.11.p0
```

Equivalent System Packages

```
$ apk add zlib-dev
```

```
$ conda install zlib
```

```
$ sudo apt-get install libz-dev
```

```
$ sudo yum install zlib-devel
```

```
$ brew install zlib
```

```
$ sudo port install zlib
```

```
$ sudo zypper install pkgconfig\(zlib\)
```

install the following packages: zlib

```
$ sudo slackpkg install zlib
```

```
$ sudo xbps-install zlib-devel
```

See https://repology.org/project/zlib/versions

If the system package is installed, `./configure` will check if it can be used.
