Packages and Features

Release 10.3

The Sage Development Team

Mar 20, 2024
## CONTENTS

1 Standard Packages .......................... 1
2 Optional Packages .......................... 9
3 Features .................................... 15
4 Distribution Packages of the Sage Library 53
5 Experimental Packages ....................... 55
6 All External Packages ......................... 57
Python Module Index .......................... 609
Index ......................................... 611
CHAPTER
ONE

STANDARD PACKAGES

The Sage distribution includes most programs and libraries on which Sage depends. It installs them automatically if it does not find equivalent system packages.

- _prereq: Represents system packages required for installing SageMath from source
- alabaster: Default theme for the Sphinx documentation system
- anyio: High level compatibility layer for multiple asynchronous event loop implementations
- appdirs: A small Python module for determining appropriate platform-specific dirs, e.g. a "user data dir".
- appnope: Disable App Nap on macOS >= 10.9
- argon2_cffi: The secure Argon2 password hashing algorithm
- argon2_cffi_bindings: Low-level CFFI bindings for Argon2
- arrow: Better dates & times for Python
- asttokens: Annotate AST trees with source code positions
- async_lru: Simple LRU cache for asyncio
- attrs: Decorator for Python classes with attributes
- babel: Internationalization utilities
- beautifulsoup4: Screen-scraping library
- beniget: Extract semantic information about static Python code
- bleach: An HTML-sanitizing tool
- boost_cropped: Portable C++ libraries (subset needed for Sage)
- brial: Boolean Ring Algebra implementation using binary decision diagrams
- bzip2: High-quality data compressor
- cachetools: Extensible memoizing collections and decorators
- calver: setuptools extension for CalVer package versions
- cddlib: Double description method for polyhedral representation conversion
- certifi: Python package for providing Mozilla’s CA Bundle
- cffi: Foreign Function Interface for Python calling C code
- chardet: Universal encoding detector for Python 3
- charset_normalizer: The Real First Universal Charset Detector. Open, modern and actively maintained alternative to Chardet.
• cliquer: Routines for clique searching
• cmake: A cross-platform build system generator
• colorama: Cross-platform colored terminal text.
• combinatorial_designs: Data from the Handbook of Combinatorial Designs
• comm: Jupyter Python Comm implementation, for usage in ipykernel, xeus-python etc.
• contourpy: Python library for calculating contours of 2D quadrilateral grids
• conway_polynomials: Python interface to Frank Lübeck’s Conway polynomial database
• cppy: C++ headers for C extension development
• curl: Multiprotocol data transfer library and utility
• cvxopt: Python software for convex optimization
• cycler: Composable cycles
• cypari2: Python interface to the number theory library libpari
• cysignals: Interrupt and signal handling for Cython
• cython: C-Extensions for Python, an optimizing static compiler
• dateutil: Extensions to the standard Python module datetime
• debugpy: An implementation of the Debug Adapter Protocol for Python
• decorator: Python library providing decorators
• defusedxml: Addresses vulnerabilities of XML parsers and XML libraries
• distlib: Distribution utilities
• docutils: Processing plaintext documentation into useful formats, such as HTML or LaTeX
• ecl: An implementation of the Common Lisp language
• eclib: Enumerating and computing with elliptic curves defined over the rational numbers
• ecm: Elliptic curve method for integer factorization
• editables: Editable installations
• elliptic_curves: Databases of elliptic curves
• entrypoints: Discover and load entry points from installed Python packages
• exceptiongroup: Backport of PEP 654 (exception groups)
• executing: Get the currently executing AST node of a frame, and other information
• fastjsonschema: Fastest Python implementation of JSON schema
• fflas_ffpack: Dense linear algebra over word-size finite fields
• filelock: A platform independent file lock
• flint: Fast Library for Number Theory
• flit_core: Distribution-building parts of Flit. See flit package for more information
• fonttools: Tools to manipulate font files
• fplll: Lattice algorithms, including LLL with floating-point orthogonalization
• fpylll: Python interface for FPLLL
• fqdn: Validates fully-qualified domain names against RFC 1123, so that they are acceptable to modern browsers
• freetype: A free, high-quality, and portable font engine
• furo: A clean customizable Sphinx documentation theme
• gap: Groups, Algorithms, Programming - a system for computational discrete algebra
• gast: Python AST that abstracts the underlying Python version
• gc: The Boehm-Demers-Weiser conservative garbage collector
• gcc: The GNU Compiler Collection or other suitable C and C++ compilers
• gengetopt: getopt_long parser generator
• gf2x: Fast arithmetic in GF(2)[x] and searching for irreducible/primitive trinomials
• gfan: Groebner fans and tropical varieties
• gfortran: Fortran compiler from the GNU Compiler Collection
• gic: A general purpose computer algebra system
• givaro: C++ library for arithmetic and algebraic computations
• glpk: GNU Linear Programming Kit
• gmp: Library for arbitrary precision arithmetic
• gmpy2: Python interface to GMP/MPIR, MPFR, and MPC
• gnulib: Modules imported from GnuLib
• gnumake_tokenpool: Jobclient and jobserver for the GNU make tokenpool protocol
• graphs: A database of combinatorial graphs
• gsl: The GNU Scientific Library
• h11: A pure-Python, bring-your-own-I/O implementation of HTTP/1.1
• hatch_fancy_pypi_readme: Fancy PyPI READMEs with Hatch
• hatch_vcs: Hatch plugin for versioning with your preferred VCS
• hatchling: Modern, extensible Python build backend
• httpcore: A minimal low-level HTTP client.
• httpx: The next generation HTTP client.
• iconv: Library for language/country-dependent character encodings
• idna: Internationalized Domain Names in Applications (IDNA)
• imagesize: Getting image size from png/jpeg/jpeg2000/gif file
• iml: Integer Matrix Library
• importlib_metadata: Library to access the metadata for a Python package
• importlib_resources: Read resources from Python packages
• info: stand-alone Info documentation reader
• ipykernel: IPython Kernel for Jupyter
• ipympl: Matplotlib Jupyter Extension
• ipython: Interactive computing environment with an enhanced interactive Python shell
• ipython_genutils: Vestigial utilities from IPython
• ipywidgets: Interactive HTML widgets for Jupyter notebooks and the IPython kernel
• isoduration: Operations with ISO 8601 durations
• jedi: Static analysis tool providing IDE support for Python
• jinja2: General purpose template engine for Python
• jmol: Java viewer for chemical structures in 3D
• json5: A Python implementation of the JSON5 data format.
• jsonpointer: Identify specific nodes in a JSON document (RFC 6901)
• jsonschema: Python implementation of JSON Schema
• jsonschema_specifications: The JSON Schema meta-schemas and vocabularies, exposed as a Registry
• jupyter_client: Jupyter protocol implementation and client libraries
• jupyter_core: Jupyter core package
• jupyter_events: Jupyter Event System library
• jupyter_jsmol: JSmol viewer widget for Jupyter
• jupyter_lsp: Multi-Language Server WebSocket proxy for Jupyter Notebook/Lab server
• jupyter_server: The backend (core services, APIs, REST endpoints) to Jupyter web applications
• jupyter_server_terminals: A Jupyter Server Extension Providing Terminals
• jupyter_sphinx: Jupyter Sphinx Extension
• jupyterlab: JupyterLab computational environment
• jupyterlab_mathjax2: A MathJax Typesetting provider for JupyterLab 4 and above
• jupyterlab_pygments: Pygments theme using JupyterLab CSS variables
• jupyterlab_server: A set of server components for JupyterLab and JupyterLab like applications.
• jupyterlab_widgets: Jupyter interactive widgets for JupyterLab
• kiwisolver: An implementation of the Cassowary constraint solving algorithm
• lcac: L-function calculator
• libatomic_ops: Access hardware-provided atomic memory update operations
• libbraiding: Computing with braids
• libffi: A portable foreign-function interface library
• libgd: Dynamic graphics generation tool
• libhomfly: Compute the homfly polynomial of knots and links
• libzma: General-purpose data compression software
• libpng: Bitmap image support
• linbox: Linear algebra with dense, sparse, structured matrices over the integers and finite fields
• lrcalc: Littlewood-Richardson calculator
• lrcale_python: Littlewood-Richardson calculator
• m4ri: fast arithmetic with dense matrices over GF(2)
• m4rie: Arithmetic with dense matrices over GF(2^e)
• markupsafe: Safely add untrusted strings to HTML/XML markup
• mathjax: A JavaScript library for displaying mathematical formulas
• matplotlib: Python 2D plotting library
• matplotlib_inline: Inline Matplotlib backend for Jupyter
• maxima: System for manipulating symbolic and numerical expressions
• memory_allocator: An extension class to allocate memory easily with Cython
• meson: A high performance build system
• meson_python: Meson Python build backend (PEP 517)
• mistune: A markdown parser in pure Python
• mpc: Arithmetic of complex numbers with arbitrarily high precision and correct rounding
• mpmath: Pure Python library for multiprecision floating-point arithmetic
• nauty: Find automorphism groups of graphs, generate non-isomorphic graphs
• nbclient: A client library for executing notebooks. Formerly nbconvert's ExecutePreprocessor.
• nbconvert: Converting Jupyter Notebooks
• nbformat: The Jupyter Notebook format
• ncurses: Classic terminal output library
• nest_asyncio: Patch asyncio to allow nested event loops
• networkx: Python package for complex networks
• ninja_build: A build system with a focus on speed
• notebook: Jupyter notebook, a web-based notebook environment for interactive computing
• notebook_shim: A shim layer for notebook traits and config
• ntl: A library for doing number theory
• numpy: Package for scientific computing with Python
• openblas: An optimized implementation of BLAS (Basic Linear Algebra Subprograms)
• openssl: Implementation of the SSL and TLS protocols
• overrides: A decorator to automatically detect mismatch when overriding a method.
• packaging: Core utilities for Python packages
• palp: A package for Analyzing Lattice Polytopes
• pandocfilters: A Python module for writing pandoc filters
• pari: Computer algebra system for fast computations in number theory
• pari_galdata: PARI data package needed to compute Galois groups in degrees 8 through 11
• pari_seadata_small: PARI data package needed by ellap for large primes (small version)
• parso: A Python parser
• patch: Applies diffs and patches to files
• patchelf: A small utility to modify the dynamic linker and RPATH of ELF executables
• pathspec: Utility library for gitignore style pattern matching of file paths.
• pexpect: Python module for controlling and automating other programs
• pickleshare: A 'shelve' like datastore with concurrency support
• pillow: Python Imaging Library
• pip: Tool for installing and managing Python packages
• pkgconf: An implementation of the pkg-config spec
• pkgconfig: Python interface to pkg-config
• planarity: Planarity-related graph algorithms
• platformdirs: A small Python module for determining appropriate platform-specific dirs, e.g. a “user data dir”.
• pluggy: plugin and hook calling mechanisms for python
• ply: Python Lex & Yacc
• polytopes_db: Databases of 2- and 3-dimensional reflexive polytopes
• ppl: Parma Polyhedra Library
• pplpy: Python interface to the Parma Polyhedra Library
• pplpy_doc: Python interface to the Parma Polyhedra Library (documentation)
• primecount: Algorithms for counting primes
• primecountpy: Cython interface for C++ primecount library
• primesieve: CLI program and C/C++ library for generating primes
• prometheus_client: Python client for the systems monitoring and alerting toolkit Prometheus
• prompt_toolkit: Interactive command lines for Python
• psutil: Cross-platform lib for process and system monitoring in Python.
• ptyprocess: Python interaction with subprocesses in a pseudoterminal
• pure_eval: Safely evaluate AST nodes without side effects
• py: library with cross-python path, ini-parsing, io, code, log facilities
• pybind11: Create Python bindings to C++ code
• pycparser: Parser of the C language in Python
• pygments: Generic syntax highlighter
• pyrsistent: Persistent data structures in Python
• python3: The Python programming language
• python_json_logger: A python library adding a json log formatter
• pythran: Ahead of Time compiler for numeric kernels
• **pytz**: Timezone definitions for Python
• **pytz_deprecation_shim**: Shims to make deprecation of pytz easier
• **pyyaml**: YAML parser and emitter for Python
• **pyzmq**: Python bindings for the zeromq networking library
• **qhull**: Compute convex hulls, Delaunay triangulations, Voronoi diagrams
• **readline**: Command line editing library
• **referencing**: JSON Referencing + Python
• **requests**: An HTTP library for Python
• **rfc3339_validator**: A pure python RFC3339 validator
• **rfc3986_validator**: Pure python rfc3986 validator
• **rpy2**: Python interface to R
• **rw**: Compute rank-width and rank-decompositions
• **sage_conf**: Configuration module for the SageMath library (distributable version)
• **sage_docbuild**: Build system of the Sage documentation
• **sage-setup**: Build system of the SageMath library
• **sagenb_export**: Convert legacy SageNB notebooks to Jupyter notebooks and other formats
• **sagetex**: Embed code, results of computations, and plots from Sage into LaTeX documents
• **scipy**: Scientific tools for Python
• **send2trash**: Send file to trash natively under Mac OS X, Windows and Linux
• **setuptools**: Build system for Python packages
• **setuptools_scm**: Python build system extension to obtain package version from version control
• **singular**: Computer algebra system for polynomial computations, algebraic geometry, singularity theory
• **six**: Python 2 and 3 compatibility utilities
• **sniffio**: Sniff out which async library your code is running under
• **snowballstemmer**: Stemmer algorithms for natural language processing in Python
• **soupsieve**: A modern CSS selector implementation for Beautiful Soup.
• **sphinx**: Python documentation generator
• **sphinx_basic_ng**: A modern skeleton for Sphinx themes.
• **sphinx_copybutton**: Add a copy button to each of your code cells.
• **sphinx_inline_tabs**: Add inline tabbed content to your Sphinx documentation.
• **sphinxcontrib_applehelp**: Sphinx extension which outputs Apple help book
• **sphinxcontrib_devhelp**: Sphinx extension which outputs Devhelp documents
• **sphinxcontrib_htmlhelp**: Sphinx extension which outputs HTML help book
• **sphinxcontrib_jsmath**: Sphinx extension which renders display math in HTML via JavaScript
• **sphinxcontrib_qthelp**: Sphinx extension which outputs QtHelp documents
• **sphinxcontrib_serializinghtml**: Sphinx extension which outputs serialized HTML files
• `sphinxcontrib_websupport`: Sphinx API for Web apps
• `sqlite`: An SQL database engine
• `stack_data`: Extract data from python stack frames and tracebacks for informative displays
• `suitesparse`: A suite of sparse matrix software
• `symmetrica`: Library for representation theory
• `sympow`: Computes special values of symmetric power elliptic curve L-functions
• `sympy`: Python library for symbolic mathematics
• `tachyon`: A ray tracing system
• `terminado`: Tornado websocket backend for the term.js Javascript terminal emulator library
• `threejs`: JavaScript library to display 3D graphics in the browser
• `tinycss2`: A tiny CSS parser
• `toml`: A lil’ TOML parser
• `tornado`: Python web framework and asynchronous networking library
• `tox`: tox is a generic virtualenv management and test command line tool
• `traitlets`: Traitlets Python configuration system
• `trove_classifiers`: Canonical source for classifiers on PyPI (pypi.org).
• `types_python_dateutil`: Typing stubs for python-dateutil
• `typing_extensions`: Backported and Experimental Type Hints for Python 3.8+
• `tzdata`: Provider of IANA time zone data
• `tzlocal`: Python timezone information for the local timezone
• `uri_template`: RFC 6570 URI Template Processor
• `urllib3`: HTTP library with thread-safe connection pooling, file post, and more.
• `virtualenv`: Virtual Python Environment builder
• `wcwidth`: Measures the displayed width of unicode strings in a terminal
• `webcolors`: A library for working with the color formats defined by HTML and CSS.
• `webencodings`: Character encoding aliases for legacy web content
• `websocket_client`: WebSocket client for Python with low level API options
• `wheel`: A built-package format for Python
• `widgetsnbextension`: Jupyter interactive widgets for Jupyter Notebook
• `xz`: General-purpose data compression software
• `zeromq`: A modern networking library
• `zipp`: A pathlib-compatible zipfile object wrapper
• `zlib`: Data compression library
For additional functionality, you can install some of the following optional packages.

- **4ti2**: Algebraic, geometric and combinatorial problems on linear spaces
- **bootstrap**: Represents system packages required for running the top-level bootstrap script
- **develop**: Represents system packages recommended for development
- **recommended**: Represents system packages recommended for additional functionality
- **sagemath**: Downstream package of Sage in distributions
- **admcmcycles**: Computation in the tautological ring of the moduli space of curves
- **auditwheel_or_delocate**: Repair wheels on Linux or macOS
- **benzene**: Generate fusenes and benzenoids with a given number of faces
- **biopython**: Tools for computational molecular biology
- **bliss**: Computing automorphism groups and canonical forms of graphs
- **buckygen**: Efficient generation of nonisomorphic fullerenes
- **cbc**: COIN-OR branch and cut solver for mixed-integer programs
- **ccache**: A compiler cache
- **clarabel**: Clarabel Conic Interior Point Solver for Rust / Python
- **coxeter3**: Library for Coxeter groups, Bruhat ordering, Kazhdan-Lusztig polynomials
- **cryptominisat**: A SAT solver
- **csdp**: Solver for semidefinite programs
- **cunningham_tables**: List of the prime numbers occurring in the Cunningham table
- **cvxpy**: A domain-specific language for modeling convex optimization problems in Python.
- **cylp**: A Python interface for CLP, CBC, and CGL
- **d3js**: JavaScript library for manipulating documents based on data
- **database_cremona_ellcurve**: Database of elliptic curves
- **database_cubic_hecke**: Ivan Marin’s representations of the cubic Hecke algebra
- **database_jones_numfield**: Table of number fields
- **database_knotinfo**: Content of the KnotInfo and LinkInfo databases as lists of dictionaries
- **database_kohel**: Database of modular and Hilbert polynomials
• `database_mutation_class`: Database of exceptional mutation classes of quivers
• `database_odlyzko_zeta`: Table of zeros of the Riemann zeta function
• `database_stein_watkins`: Database of elliptic curves (full version)
• `database_stein_watkins_mini`: Database of elliptic curves (small version)
• `database_symbolic_data`: Database from the SymbolicData project
• `dot2tex`: Create PGF/TikZ commands from Graphviz output
• `dsdp`: Semidefinite programming solver
• `e_antic`: Real embedded number fields
• `ecos_python`: Embedded Cone Solver (Python wrapper)
• `ffmpeg`: ffmpeg video converter
• `free_fonts`: a free family of scalable outline fonts
• `fricas`: A general purpose computer algebra system
• `frobby`: Computations on monomial ideals
• `gap_jupyter`: Jupyter kernel for GAP
• `gap_packages`: A collection of GAP packages
• `git`: Version control system
• `github_cli`: Command-line interface for GitHub
• `gitpython`: GitPython is a python library used to interact with Git repositories
• `glucose`: A SAT solver
• `gp2c`: A compiler for translating GP routines to C
• `graphviz`: Graph visualization software
• `hypothesis`: A library for property-based testing
• `igraph`: A library for creating and manipulating graphs
• `ImageMagick`: A collection of tools and libraries for many image file formats
• `isl`: Sets and relations of integer points bounded by affine constraints
• `jupymake`: A Python wrapper for the polymake shell
• `kenzo`: Construct topological spaces and compute homology groups
• `kissat`: SAT solver
• `latte_int`: Count lattice points, compute volumes, and integrate over convex polytopes
• `libgraphviz`: Graph visualization software (callable library)
• `libjpeg`: JPEG image support
• `libnauty`: Find automorphism groups of graphs, generate non-isomorphic graphs (callable library)
• `libogg`: Library for the Ogg multimedia container format
• `libsemigroups`: Library for semigroups and monoids
• `libxml2`: XML parser and toolkit
• `lidia`: A library for computational number theory
• llvm: The LLVM Compiler Infrastructure, including the Clang C/C++/Objective-C compiler
• lrslib: Reverse search algorithm for vertex enumeration and convex hull problems
• mathics: A general-purpose computer algebra system
• mathics_scanner: Character Tables and Tokenizer for Mathics and the Wolfram Language.
• matroid_database: Python interface to matroid database
• mcqd: An exact algorithm for finding a maximum clique in an undirected graph
• meataxe: Library for computing with modular representations
• p_group_cohomology: Modular cohomology rings of finite groups
• mpfrx: Arithmetic of univariate polynomials over arbitrary precision real or complex numbers
• msolve: Multivariate polynomial system solver
• nibabel: Access a multitude of neuroimaging data formats
• normaliz: Computations in affine monoids, vector configurations, lattice polytopes, and rational cones
• notedown: Create IPython notebooks from markdown
• onetbb: oneAPI Threading Building Blocks
• ore_algebra: Ore algebra
• osqp_python: The Operator Splitting QP Solver (Python wrapper)
• p_group_cohomology: Modular cohomology rings of finite groups
• palettable: Color palettes for Python
• pandoc: A document converter
• pandoc_attributes: A parser and generator for pandoc block attributes
• papilo: Parallel presolve for integer and linear optimization
• pari_elldata: PARI data package for elliptic curves
• pari_galpol: PARI data package for polynomials defining Galois extensions of the rationals
• pari_jupyter: A Jupyter kernel for PARI/GP
• pari_nftables: PARI data package for number fields
• pari_seadata: PARI data package needed by ellap for large primes (full version)
• pdf2svg: PDF to SVG converter
• perl_cpan_polymake_prereq: Represents all Perl packages that are prerequisites for polymake
• perl_mongodb: A prerequisite for polymake’s PolyDB feature
• perl_term_readline_gnu: Perl extension for the GNU Readline/History libraries
• phitigra: A graph editor for SageMath/Jupyter
• pint: Physical quantities module
• plantri: Generate non-isomorphic sphere-embedded graphs
• polymake: Computations with polyhedra, fans, simplicial complexes, matroids, graphs, tropical hypersurfaces
• polytopes_db_4d: Database of 4-dimensional reflexive polytopes
• pybtex: A BibTeX-compatible bibliography processor in Python
• **pycosat**: SAT solver picosat with Python bindings
• **pycryptosat**: Python module of cryptominisat
• **pygraphviz**: Python interface to Graphviz
• **pynormaliz**: Python bindings for the normaliz library
• **pyppeteer**: Headless chrome/chromium automation library
• **pyscipopt**: Python interface and modeling environment for SCIP
• **pytest**: Simple powerful testing with Python
• **pytest_mocker**: Thin-wrapper around the mock package for easier use with pytest
• **pytest_xdist**: pytest xdist plugin for distributed testing and loop-on-failing modes
• **python_build**: A simple, correct PEP517 package builder
• **python_igraph**: Python bindings for igraph
• **pyx**: Generate PostScript, PDF, and SVG files in Python
• **qdlldl_python**: QDLDL, a free LDL factorization routine (Python wrapper)
• **qepcad**: Quantifier elimination by partial cylindrical algebraic decomposition
• **r**: A free software environment for statistical computing and graphics
• **rst2ipynb**: Convert reStructuredText files to Jupyter notebooks
• **rubiks**: Programs for Rubik’s cube
• **saclib**: Computations with real algebraic numbers
• **sage_flatsurf**: computation with flat surfaces
• **sage_numerical_backends_coin**: COIN-OR backend for Sage MixedIntegerLinearProgram
• **sage_numerical_backends_cplex**: Cplex backend for Sage MixedIntegerLinearProgram
• **sage_numerical_backends_gurobi**: Gurobi backend for Sage MixedIntegerLinearProgram
• **sage_sws2rst**: Translate legacy Sage worksheet files (.sws) to reStructuredText (.rst) files
• **scip**: Mixed integer programming solver
• **scip_sdp**: Mixed integer semidefinite programming plugin for SCIP
• **scs**: Splitting conic solver
• **singular_jupyter**: Jupyter kernel for Singular
• **sirocco**: Compute topologically certified root continuation of bivariate polynomials
• **slabbe**: Sébastien Labbé’s Research code
• **snappy**: Topology and geometry of 3-manifolds, with a focus on hyperbolic structures
• **soplex**: Linear optimization solver using the revised simplex method
• **sqlalchemy**: A database abstraction library
• **surface_dynamics**: dynamics on surfaces (measured foliations, interval exchange transformation, Teichmüller flow, etc)
• **symengine**: A C++ symbolic manipulation library
• `symengine_py`: Python wrappers for SymEngine
• `tdlib`: Algorithms for computing tree decompositions
• `texlive`: A comprehensive TeX system
• `texlive_luatex`: LuaTeX packages
• `texttable`: Python module for creating simple ASCII tables
• `tides`: Integration of ODEs
• `topcom`: Compute triangulations of point configurations and oriented matroids
• `xindy`: a general-purpose index processor
3.1 Testing for features of the environment at runtime

A computation can require a certain package to be installed in the runtime environment. Abstractly such a package describes a Feature which can be tested for at runtime. It can be of various kinds, most prominently an Executable in the PATH, a PythonModule, or an additional package for some installed system such as a GapPackage.

AUTHORS:

- Julian Rüth (2016-04-07): Initial version
- Jeroen Demeyer (2018-02-12): Refactoring and clean up

EXAMPLES:

Some generic features are available for common cases. For example, to test for the existence of a binary, one can use an Executable feature:

```
sage: from sage.features import Executable
sage: Executable(name="sh", executable="sh").is_present()
FeatureTestResult('sh', True)
```

Here we test whether the grape GAP package is available:

```
sage: from sage.features.gap import GapPackage
sage: GapPackage("grape", spkg="gap_packages").is_present()  # optional - gap_packages
FeatureTestResult('gap_package_grape', True)
```

Note that a FeatureTestResult acts like a bool in most contexts:

```
sage: if Executable(name="sh", executable="sh").is_present(): "present."
'present.'
```

When one wants to raise an error if the feature is not available, one can use the require method:

```
sage: Executable(name="sh", executable="sh").require()
sage: Executable(name="random", executable="randomOochoz6x", spkg="random", url="http://rand.om").require()  # optional - sage_spkg
Traceback (most recent call last):
... FeatureNotPresentError: random is not available.
Executable 'randomOochoz6x' not found on PATH.
...try to run...sage -i random...
Further installation instructions might be available at http://rand.om.
```
As can be seen above, features try to produce helpful error messages.

```python
class sage.features.CythonFeature(*args, **kwds)

Bases: Feature

A Feature which describes the ability to compile and import a particular piece of Cython code.

To test the presence of name, the cython compiler is run on test_code and the resulting module is imported.

EXAMPLES:

```python
sage: from sage.features import CythonFeature
sage: fabs_test_code = '''
    cdef extern from "<math.h>":
    double fabs(double x)
    assert fabs(-1) == 1
    '''

sage: fabs = CythonFeature("fabs", test_code=fabs_test_code, # ␣
                        spkg="gcc", url="https://gnu.org",
                        type="standard")

sage: fabs.is_present() # ␣
FeatureTestResult('fabs', True)
```

Test various failures:

```python
sage: broken_code = '''this is not a valid Cython program!''

sage: broken = CythonFeature("broken", test_code=broken_code)
sage: broken.is_present()
FeatureTestResult('broken', False)
```

```python
sage: broken_code = '''cdef extern from "no_such_header_file": pass'''

sage: broken = CythonFeature("broken", test_code=broken_code)
sage: broken.is_present()
FeatureTestResult('broken', False)
```

```python
sage: broken_code = '''import no_such_python_module'''

sage: broken = CythonFeature("broken", test_code=broken_code)
sage: broken.is_present()
FeatureTestResult('broken', False)
```

```python
sage: broken_code = '''raise AssertionError("sorry!")'''

sage: broken = CythonFeature("broken", test_code=broken_code)
sage: broken.is_present()
FeatureTestResult('broken', False)
```

```python
class sage.features.Executable(*args, **kwds)

Bases: FileFeature

A feature describing an executable in the PATH.

In an installation of Sage with SAGE_LOCAL different from SAGE_VENV, the executable is searched first in SAGE_VENV/bin, then in SAGE_LOCAL/bin, then in PATH.

Note: Overwrite is_functional() if you also want to check whether the executable shows proper behaviour.
```
Calls to is_present() are cached. You might want to cache the Executable object to prevent unnecessary calls to the executable.

EXAMPLES:

```python
sage: from sage.features import Executable
sage: Executable(name="sh", executable="sh").is_present()
FeatureTestResult('sh', True)

sage: Executable(name="does-not-exist", executable="does-not-exist-xxxxyxyxyy").is_present()
FeatureTestResult('does-not-exist', False)
```

absolute_filename()

The absolute path of the executable as a string.

EXAMPLES:

```python
sage: from sage.features import Executable
sage: Executable(name="sh", executable="sh").absolute_filename()
'/...bin/sh'
```

A FeatureNotPresentError is raised if the file cannot be found:

```python
sage: Executable(name="does-not-exist", executable="does-not-exist-xxxxyxyxyy").absolute_path()
Traceback (most recent call last):
  ...sage.features.FeatureNotPresentError: does-not-exist is not available.
Executable 'does-not-exist-xxxxyxyxyy' not found on PATH.
```

is_functional()

Return whether an executable in the path is functional.

This method is used internally and can be overridden in subclasses in order to implement a feature test. It should not be called directly. Use Feature.is_present() instead.

EXAMPLES:

The function returns True unless explicitly overwritten:

```python
sage: from sage.features import Executable
sage: Executable(name="sh", executable="sh").is_functional()
FeatureTestResult('sh', True)
```

class sage.features.Feature(*args, **kwds)

A feature of the runtime environment

INPUT:

- name – (string) name of the feature; this should be suitable as an optional tag for the Sage doctester, i.e., lowercase alphanumeric with underscores (_) allowed; features that correspond to Python modules/packages may use periods (.)
- spkg – (string) name of the SPKG providing the feature
- description – (string) optional; plain English description of the feature
- url – a URL for the upstream package providing the feature
Packages and Features, Release 10.3

• type – (string) one of 'standard', 'optional' (default), 'experimental'

Overwrite _is_present() to add feature checks.

EXAMPLES:

```
sage: from sage.features.gap import GapPackage
sage: GapPackage("grape", spkg="gap_packages")  # indirect doctest
Feature('gap_package_grape')
```

For efficiency, features are unique:

```
sage: GapPackage("grape") == GapPackage("grape")
True
```

hide()

Hide this feature. For example this is used when the doctest option --hide is set. Setting an installed feature as hidden pretends that it is not available. To revert this use unhide().

EXAMPLES:

Benzene is an optional SPKG. The following test fails if it is hidden or not installed. Thus, in the second invocation the optional tag is needed:

```
sage: from sage.features.graph_generators import Benzene
sage: Benzene().hide()
sage: len(list(graphs.fusenes(2)))  # indirect doctest
Traceback (most recent call last):
  ... FeatureNotPresentError: benzene is not available.
Feature 'benzene' is hidden.
Use method 'unhide' to make it available again.
sage: Benzene().unhide()
sage: len(list(graphs.fusenes(2)))  # optional - benzene, needs sage.graphs
1
```

is_optional()

Return whether this feature corresponds to an optional SPKG.

EXAMPLES:

```
sage: from sage.features.databases import DatabaseCremona
sage: DatabaseCremona().is_optional()
True
```

is_present()

Return whether the feature is present.

OUTPUT:

A FeatureTestResult which can be used as a boolean and contains additional information about the feature test.

EXAMPLES:

```
sage: from sage.features.gap import GapPackage
sage: GapPackage("grape", spkg="gap_packages").is_present()  # optional - gap_
```

---

\[\text{packages}\]

FeatureTestResult('gap_package_grape', True)

\[\text{sage}\]: GapPackage("NOT_A_PACKAGE", spkg="gap_packages").is_present()

FeatureTestResult('gap_package_NOT_A_PACKAGE', False)

The result is cached:

\[\text{sage}\]: from sage.features import Feature
\[\text{sage}\]: class TestFeature(Feature):
\[\ldots\]:   def _is_present(self):
\[\ldots\]:       print("checking presence")
\[\ldots\]:       return True
\[\text{sage}\]: TestFeature("test").is_present()

checking presence

FeatureTestResult('test', True)

\[\text{sage}\]: TestFeature("test").is_present()

FeatureTestResult('test', True)

\[\text{sage}\]: TestFeature("other").is_present()

checking presence

FeatureTestResult('other', True)

\[\text{sage}\]: TestFeature("other").is_present()

FeatureTestResult('other', True)

\[\text{is_standard}\]()

Return whether this feature corresponds to a standard SPKG.

EXAMPLES:

\[\text{sage}\]: from sage.features.databases import DatabaseCremona
\[\text{sage}\]: DatabaseCremona().is_standard()

False

\[\text{joined_features}\]()

Return a list of features that self is the join of.

OUTPUT:

A (possibly empty) list of instances of Feature.

EXAMPLES:

\[\text{sage}\]: from sage.features.graphviz import Graphviz
\[\text{sage}\]: Graphviz().joined_features()

[Feature('dot'), Feature('neato'), Feature('twopi')]

\[\text{sage}\]: from sage.features.sagemath import sage__rings__function_field
\[\text{sage}\]: sage__rings__function_field().joined_features()

[Feature('sage.rings.function_field.function_field_polymod'),
  Feature('sage.libs.singular'),
  Feature('sage.libs.singular.singular'),
  Feature('sage.interfaces.singular')]

\[\text{sage}\]: from sage.features.interfaces import Mathematica
\[\text{sage}\]: Mathematica().joined_features()

[]

\[\text{require}\]()

Raise a FeatureNotPresentError if the feature is not present.

EXAMPLES:
sage: from sage.features.gap import GapPackage
sage: GapPackage("ve1EeThu").require()  # needs sage.libs.gap
Traceback (most recent call last):
... FeatureNotPresentError: gap_package_ve1EeThu is not available.
'LoadPackage("ve1EeThu")' evaluated to 'fail' in GAP.

resolution()

Return a suggestion on how to make is_present() pass if it did not pass.

OUTPUT:
A string.

EXAMPLES:

sage: from sage.features import Executable
sage: Executable(name="CSDP", spkg="csdp", executable="theta", url="https://github.com/dimpase/csdp").resolution()  # optional - sage_spkg
'...To install CSDP...you can try to run...sage -i csdp...Further... 
installation instructions might be available at https://github.com/dimpase/
...

unhide()

Revert what hide() does.

EXAMPLES:

PolyCyclic is an optional GAP package. The following test fails if it is hidden, regardless of whether it is installed or not:

sage: from sage.features.gap import GapPackage
sage: Polycyclic = GapPackage("polycyclic", spkg="gap_packages")
sage: Polycyclic.hide()
Traceback (most recent call last):
... FeatureNotPresentError: gap_package_polycyclic is not available.
Feature 'gap_package_polycyclic' is hidden.
Use method 'unhide' to make it available again.

After uninding the feature, the test should pass again if PolyCyclic is installed and loaded:

sage: Polycyclic.unhide()
Traceback (most recent call last):
... FeatureNotPresentError: gap_package_polycyclic is not available.
Feature 'gap_package_polycyclic' is hidden.
Use method 'unhide' to make it available again.

exception sage.features.FeatureNotPresentError (feature, reason=None, resolution=None)

Bases: RuntimeError

A missing feature error.

EXAMPLES:
```python
sage: from sage.features import Feature, FeatureTestResult
sage: class Missing(Feature):
....:     def _is_present(self):
....:         return False
sage: Missing(name="missing").require()
Traceback (most recent call last):
... FeatureNotPresentError: missing is not available.
```

**property resolution**

Initialize self. See help(type(self)) for accurate signature.

```python
class sage.features.FeatureTestResult (feature, is_present, reason=None, resolution=None)
```

Bases: object

The result of a `Feature.is_present()` call.

Behaves like a boolean with some extra data which may explain why a feature is not present and how this may be resolved.

**EXAMPLES:**

```python
sage: from sage.features.gap import GapPackage
sage: presence = GapPackage("NOT_A_PACKAGE").is_present(); presence  # indirect
˓→ doctest
FeatureTestResult(gap_package_NOT_A_PACKAGE, False)
sage: bool(presence)
False
```

Explanatory messages might be available as `reason` and `resolution`:

```python
sage: presence.reason  #...
˓→ needs sage.libs.gap
'LoadPackage("NOT_A_PACKAGE")' evaluated to 'fail' in GAP.'
sage: bool(presence.resolution)
False
```

If a feature is not present, `resolution` defaults to `feature.resolution()` if this is defined. If you do not want to use this default you need explicitly set `resolution` to a string:

```python
sage: from sage.features import FeatureTestResult
sage: package = GapPackage("NOT_A_PACKAGE", spkg="no_package")
...
str(FeatureTestResult(package, False).resolution)  # optional - sage_spkg
's...To install gap_package_NOT_A_PACKAGE...you can try to run...sage -i no_
˓→package...'
str(FeatureTestResult(package, False).resolution)  # optional - sage_spkg
's...To install gap_package_NOT_A_PACKAGE...you can try to run...sage -i no_
˓→package...'
sage: FeatureTestResult(package, False, resolution="rtm").resolution
'rtm'
```

**property resolution**

Initialize self. See help(type(self)) for accurate signature.

```python
class sage.features.FileFeature(*args, **kwds)
```

Bases: Feature

Base class for features that describe a file or directory in the file system.

---

**3.1. Testing for features of the environment at runtime**
A subclass should implement a method \texttt{absolute_filename()}. 

**EXAMPLES:**

Two direct concrete subclasses of \texttt{FileFeature} are defined:

```python
sage: from sage.features import StaticFile, Executable, FileFeature
sage: issubclass(StaticFile, FileFeature)  # True
sage: issubclass(Executable, FileFeature)  # True
```

To work with the file described by the feature, use the method \texttt{absolute_filename()}. A \texttt{FeatureNotPresentError} is raised if the file cannot be found:

```python
sage: Executable(name="does-not-exist", executable="does-not-exist-xxxxxyyyyy").
    → absolute_filename()
Traceback (most recent call last):
  ...sage.features.FeatureNotPresentError: does-not-exist is not available.
Executable 'does-not-exist-xxxxxyyyyy' not found on PATH.
```

A \texttt{FileFeature} also provides the \texttt{is_present()} method to test for the presence of the file at run time. This is inherited from the base class \texttt{Feature}:

```python
sage: Executable(name="sh", executable="sh").is_present()  # FeatureTestResult('sh', True)
```

\textbf{\texttt{absolute_filename()}}

The absolute path of the file as a string.

Concrete subclasses must override this abstract method.

\textbf{\texttt{absolute_path()}}

Deprecated alias for \texttt{absolute_filename()}. 

Deprecated to make way for a method of this name returning a \texttt{Path}.

**EXAMPLES:**

```python
sage: from sage.features import Executable
sage: Executable(name="sh", executable="sh").absolute_path()
...doctest:warning...
DeprecationWarning: method absolute_path has been replaced by absolute_filename
See https://github.com/sagemath/sage/issues/31292 for details.
"/...bin/sh"
```

\textbf{class} \texttt{sage.features.PythonModule(*args, **kwds)}

\texttt{Bases: Feature}

A \texttt{Feature} which describes whether a python module can be imported.

**EXAMPLES:**

Not all builds of python include the \texttt{ssl} module, so you could check whether it is available:

```python
sage: from sage.features import PythonModule
sage: PythonModule("ssl").require()  # not tested - output depends on the python...
```

22 Chapter 3. Features
class sage.features.StaticFile(*args, **kwds)

Bases: FileFeature

A Feature which describes the presence of a certain file such as a database.

EXAMPLES:

```python
sage: from sage.features import StaticFile
sage: StaticFile(name="no_such_file", filename="KaT1aihu", #
    optional - sage_spkg
    ....: search_path="/", spkg="some_spkg",
    ....: url="http://random.org").require()
Traceback (most recent call last):
... FeatureNotPresentError: no_such_file is not available.
'KaT1aihu' not found in any of ['/']...
To install no_such_file...you can try to run...sage -i some_spkg...
Further installation instructions might be available at http://random.org.
```

absolute_filename()

The absolute path of the file as a string.

EXAMPLES:

```python
sage: from sage.features import StaticFile
sage: from sage.misc.temporary_file import tmp_dir
sage: dir_with_file = tmp_dir()

sage: file_path = os.path.join(dir_with_file, "file.txt")

sage: open(file_path, "a").close() # make sure the file exists

sage: search_path = ("/foo/bar", dir_with_file) # file is somewhere in the...

sage: feature = StaticFile(name="file", filename="file.txt", search_...
    path=search_path)

sage: feature.absolute_filename() == file_path
True
```

A FeatureNotPresentError is raised if the file cannot be found:

```python
sage: from sage.features import StaticFile
sage: StaticFile(name="no_such_file", filename="KaT1aihu",\n    search_path=(), spkg="some_spkg",\n    url="http://random.org").absolute_filename() # optional - sage_...
Traceback (most recent call last):
... FeatureNotPresentError: no_such_file is not available.
'KaT1aihu' not found in any of []...
To install no_such_file...you can try to run...sage -i some_spkg...
Further installation instructions might be available at http://random.org.
```

class sage.features.TrivialClasscallMetaClass

Bases: type

A trivial version of sage.misc.classcall_metaclass.ClasscallMetaClass without Cython dependencies.

class sage.features.TrivialUniqueRepresentation(*args, **kwds)

Bases: object

A trivial version of UniqueRepresentation without Cython dependencies.
Packages and Features, Release 10.3

sage.features.package_systems()

Return a list of PackageSystem objects representing the available package systems.

The list is ordered by decreasing preference.

EXAMPLES:

```python
sage: from sage.features import package_systems
tsage: package_systems()
# random
[Feature('homebrew'), Feature('sage_spkg'), Feature('pip')]
```

3.2 Join features

```python
class sage.features.join_feature.JoinFeature(*args, **kwds)

Bases: Feature

Join of several Feature instances.

This creates a new feature as the union of the given features. Typically these are executables of an SPKG. For an example, see Rubiks.

Furthermore, this can be the union of a single feature. This is used to map the given feature to a more convenient name to be used in optional tags of doctests. Thus you can equip a feature such as a PythonModule with a tag name that differs from the systematic tag name. As an example for this use case, see Meataxe.

EXAMPLES:

```python
sage: from sage.features import Executable
sage: from sage.features.join_feature import JoinFeature
sage: F = JoinFeature("shell-boolean",
      ....:     (Executable("shell-true", 'true'),
      ....:      Executable("shell-false", 'false')))
```

hide()

Hide this feature and all its joined features.

EXAMPLES:

```python
sage: from sage.features.sagemath import sage__groups
sage: f = sage__groups()
sage: f.hide()
sage: f._features[0].is_present()
FeatureTestResult('sage.groups.perm_gps.permgroup', False)
```
**is_functional()**

Test whether the join feature is functional.

This method is deprecated. Use `Feature.is_present()` instead.

**EXAMPLES:**

```python
sage: from sage.features.latte import Latte
sage: Latte().is_functional()  # optional - latte_int
doctest:warning...
DeprecationWarning: method JoinFeature.is_functional; use is_present instead
See https://github.com/sagemath/sage/issues/33114 for details.
FeatureTestResult('latte_int', True)
```

**unhide()**

Revert what `hide()` does.

**EXAMPLES:**

```python
sage: from sage.features.sagemath import sage__groups
sage: f = sage__groups()
sage: f.hide()
sage: f.is_present()  # optional sage.groups
FeatureTestResult('sage.groups', False)
sage: f._features[0].is_present()  # optional sage.groups
FeatureTestResult('sage.groups.perm_gps.permgroup', False)

sage: f.unhide()
sage: f.is_present()  # optional sage.groups
FeatureTestResult('sage.groups', True)
sage: f._features[0].is_present()  # optional sage.groups
FeatureTestResult('sage.groups.perm_gps.permgroup', True)
```

### 3.3 Enumeration of all defined features

**sage.features.all.all_features()**

Return an iterable of all features.

**EXAMPLES:**

```python
sage: from sage.features.all import all_features
sage: sorted(all_features(), key=lambda f: f.name)  # random
[...Feature('sage.combinat')...]
```

**sage.features.all.module_feature(module_name)**

Find a top-level `Feature` that provides the Python module of the given `module_name`.

Only features known to `all_features()` are considered.

**INPUT:**

- `module_name` – string

**OUTPUT:** a `Feature` or None.

**EXAMPLES:**

-----

25

---
3.4 Features for testing the presence of Python modules in the Sage library

All of these features are present in a monolithic installation of the Sage library, such as the one made by the SageMath distribution.

The features are defined for the purpose of separately testing modularized distributions such as `sagemath-categories` and `sagemath-repl`.

Often, doctests in a module of the Sage library illustrate the interplay with a range of different objects; this is a form of integration testing. These objects may come from modules shipped in other distributions. For example, `sage.structure.element` (shipped by `sagemath-objects`, one of the most fundamental distributions) contains the doctest:
This test cannot pass when the distribution *sagemath-objects* is tested separately (in a virtual environment): In this situation, *SymmetricGroup* is not defined anywhere (and thus not present in the top-level namespace). Hence, we conditionalize this doctest on the presence of the feature *sage.groups*.

```python
sage: G = SymmetricGroup(4) #--
needs sage.groups
sage: g = G([2, 3, 4, 1]) #--
needs sage.groups
sage: g.powers(4) #--
needs sage.groups
[(), (1,2,3,4), (1,3)(2,4), (1,4,3,2)]
```

```
Thistestcannotpasswhenthedistribution sagemath-objects istestedseparately (inavirtualenvironment): Inthissituation, SymmetricGroup isnotdefinedanywhere (andthusnotpresentinthetop-levelnamespace). Hence, weconditionalizethisdocteston thepresenceofthefeature sage.groups.

sage.features.sagemath.all_features()
ReturnfeaturescorrespondingtopartsoftheSagelibrary.

ThesefeaturesarenamedafterPythonpackages/modules(e.g., sage.symbolic), notdistributionpackages(sagemath-symbolics).

Thisdesignismotivatedbyaseparationofconcerns: TheauthorofamodulethatdependsonsomefunctionalityprovidedbyaPythonmoduleusuallyalreadyknowsthenameofthePythonmodule, sowe do not want to force theauthor to also know about the distribution package that provides the Python module.

Instead, weassociate distributionpackages to Pythonmodules in *sage.features.sagemath* via the spkg parameter of *Feature*.

EXAMPLES:

```python
sage: from sage.features.sagemath import all_features
sage: list(all_features())
[...Feature('sage.combinat'), ...]
```

```
class sage.features.sagemath.sage__combinat(*args,**kwds)
    Bases: JoinFeature

A Feature describing the presence of sage.combinat.

EXAMPLES:

Python modules that provide elementary combinatorial objects such as sage.combinat.subset, sage.combinat.composition, sage.combinat.permutation are always available; there is no need for an # optional/needs tag:

```python
sage: Permutation([1,2,3]).is_even()
True
sage: Permutation([6,1,4,5,2,3]).bruhat_inversions()
[[0, 1], [0, 2], [0, 3], [2, 4], [2, 5], [3, 4], [3, 5]]
```

Use # needs sage.combinat for doctests that use any other Python modules from sage.combinat, for example sage.combinat.tableau_tuple:

```python
sage: TableauTuple([[7,8,9],[1,2,3],[4,5,6]]).shape() #--
needs sage.combinat
([3], [], [3, 2, 1])
```

Doctests that use Python modules from sage.combinat that involve trees, graphs, hypergraphs, posets, quivers, combinatorial designs, finite state machines etc. should be marked # needs sage.combinat sage.graphs:
Doctests that use combinatorial modules/algebras, or root systems should use the tag \# needs sage.combinat

```python
sage: L = Poset({0: [1], 1: [2], 2:[3], 3:[4]})  #...
# needs sage.combinat sage.graphs
sage: L.is_chain()  #...
# needs sage.combinat sage.graphs
True
```

Doctests that use lattices, semilattices, or Dynkin diagrams should use the tag \# needs sage.combinat sage.graphs

```python
sage: L = LatticePoset({0: [1,2], 1: [3], 2: [3,4], 3: [5], 4: [5]})  #...
# needs sage.combinat sage.graphs sage.modules
sage: L.meet_irreducibles()  #...
# needs sage.combinat sage.graphs sage.modules
[1, 3, 4]
```

```python
class sage.features.sagemath.sage__geometry__polyhedron(*args, **kwds)
Bases: JoinFeature

A Feature describing the presence of sage.geometry.polyhedron.

EXAMPLES:

Doctests that use polyhedra, cones, geometric complexes, triangulations, etc. should use the tag \# needs sage.
geometry.polyhedron:

```python
sage: co = polytopes.truncated_tetrahedron()  #...
# needs sage.geometry.polyhedron
sage: co.volume()  #...
# needs sage.geometry.polyhedron
184/3
```

Some constructions of polyhedra require additional tags:

```python
sage: perm_a3_reg_nf = polytopes.generalized_permutahedron(['A',3], regular=True, backend='number_field'); perm_a3_reg_nf  
A 3-dimensional polyhedron in AA^3 defined as the convex hull of 24 vertices
```

```python
class sage.features.sagemath.sage__graphs(*args, **kwds)
Bases: JoinFeature

A Feature describing the presence of sage.graphs.

EXAMPLES:

Doctests that use anything from sage.graphs (Graph, DiGraph, ...) should be marked \# needs sage.
graphs. The same applies to any doctest that uses a Poset, cluster algebra quiver, finite state machines, abelian
```
sandpiles, or Dynkin diagrams:

```python
sage: g = graphs.PetersenGraph()  # needs sage.graphs
sage: r, s = g.is_weakly_chordal(certificate=True); r  # needs sage.graphs
False
```

Also any use of tree classes defined in `sage.combinat` (BinaryTree, RootedTree, ...) in doctests should be marked the same.

By way of generalization, any use of `SimplicialComplex` or other abstract complexes from sage.topology, hypergraphs, and combinatorial designs, should be marked # needs sage.graphs as well:

```python
sage: X = SimplicialComplex([[0,1,2], [1,2,3]])  # needs sage.graphs
sage: X.link(Simplex([0]))  # needs sage.graphs
Simplicial complex with vertex set (1, 2) and facets {(1, 2)}
```

On the other hand, matroids are not implemented as posets in Sage but are instead closely tied to linear algebra over fields; hence use # needs sage.modules instead:

```python
sage: # needs sage.modules
sage: M = Matroid(Matrix(QQ, [[1, 0, 0, 0, 1, 1, 1],
...:[0, 1, 0, 1, 0, 1, 1],
...:[0, 0, 1, 1, 1, 0, 1]]))  

sage: N = (M / [2]).delete([3, 4])

sage: sorted(N.groundset())
[0, 1, 5, 6]
```

However, many constructions (and some methods) of matroids do involve graphs:

```python
sage: # needs sage.modules
sage: W = matroids.Wheel(3)  # despite the name, not created via graphs
sage: W.is_isomorphic(N)  # goes through a graph isomorphism test
False
sage: K4 = matroids.CompleteGraphic(4)  # this one is created via graphs
sage: K4.is_isomorphic(W)
True
```

```python
class sage.features.sagemath.sage__groups(*args, **kwds)
```

Bases: `JoinFeature`

A Feature describing the presence of `sage.groups`.

EXCEPTIALS:

Permutations and sets of permutations are always available, but permutation groups are implemented in Sage using the GAP system and require the tag # needs sage.groups:
Packages and Features, Release 10.3

```python
sage: p = Permutation([2,1,4,3])
sage: p.to_permutation_group_element() # needs sage.groups
(1,2)(3,4)
```

```python
class sage.features.sagemath.sage_libs_braiding(*args, **kwds)
    Bases: PythonModule

    A Feature describing the presence of sage.libs.braiding.

    EXAMPLES:
    sage: from sage.features.sagemath import sage_libs_braiding
    sage: sage_libs_braiding().is_present()  # needs sage.libs.braiding
    FeatureTestResult('sage.libs.braiding', True)
```

```python
class sage.features.sagemath.sage_libs_ecl(*args, **kwds)
    Bases: PythonModule

    A Feature describing the presence of sage.libs.ecl.

    EXAMPLES:
    sage: from sage.features.sagemath import sage_libs_ecl
    sage: sage_libs_ecl().is_present()  # optional - sage.libs.ecl
    FeatureTestResult('sage.libs.ecl', True)
```

```python
class sage.features.sagemath.sage_libs_flint(*args, **kwds)
    Bases: JoinFeature

    A sage.features.Feature describing the presence of sage.libs.flint and other modules depending on FLINT and arb.

    In addition to the modularization purposes that this tag serves, it also provides attribution to the upstream project.
```

```python
class sage.features.sagemath.sage_libs_gap(*args, **kwds)
    Bases: JoinFeature

    A sage.features.Feature describing the presence of sage.libs.gap (the library interface to GAP) and sage.interfaces.gap (the pexpect interface to GAP). By design, we do not distinguish between these two, in order to facilitate the conversion of code from the pexpect interface to the library interface.

    See also:
    Features for GAP packages
```

```python
class sage.features.sagemath.sage_libs_linbox(*args, **kwds)
    Bases: JoinFeature

    A sage.features.Feature describing the presence of sage.libs.linbox and other modules depending on Givaro, FFLAS-FFPACK, LinBox.

    In addition to the modularization purposes that this tag serves, it also provides attribution to the upstream project.
```

```python
class sage.features.sagemath.sage_libs_m4ri(*args, **kwds)
    Bases: JoinFeature

    A sage.features.Feature describing the presence of Cython modules depending on the M4RI and/or M4RIe libraries.
```
In addition to the modularization purposes that this tag serves, it also provides attribution to the upstream project.

```python
class sage.features.sagemath.sage__libs__ntl(*args, **kwds)
    Bases: JoinFeature

    A sage.features.Feature describing the presence of sage.libsntl and other modules depending on NTL.
```

In addition to the modularization purposes that this tag serves, it also provides attribution to the upstream project.

```python
class sage.features.sagemath.sage__libs__pari(*args, **kwds)
    Bases: JoinFeature

    A Feature describing the presence of sage.libs.pari.
```

SageMath uses the PARI library (via cypari2) for numerous purposes. Doctests that involves such features should be marked `# needs sage.libs.pari`.

In addition to the modularization purposes that this tag serves, it also provides attribution to the upstream project.

```python
class sage.features.sagemath.sage__libs__singular(*args, **kwds)
    Bases: JoinFeature

    A sage.features.Feature describing the presence of sage.libs.singular (the library interface to Singular) and sage.interfaces.singular (the pexpect interface to Singular). By design, we do not distinguish between these two, in order to facilitate the conversion of code from the pexpect interface to the library interface.

    See also:
    - Feature singular
```

```python
class sage.features.sagemath.sage__modules(*args, **kwds)
    Bases: JoinFeature

    A Feature describing the presence of sage.modules.
```

3.4. Features for testing the presence of Python modules in the Sage library
class sage.features.sagemath.sage__numerical__mip(*args,**kwds)
   Bases: PythonModule
   A Feature describing the presence of sage.numerical.mip.

class sage.features.sagemath.sage__plot(*args,**kwds)
   Bases: JoinFeature
   A Feature describing the presence of sage.plot.

class sage.features.sagemath.sage__rings__complex_double(*args,**kwds)
   Bases: PythonModule
   A Feature describing the presence of sage.rings.complex_double.

class sage.features.sagemath.sage__rings__finite_rings(*args,**kwds)
   Bases: JoinFeature
   A Feature describing the presence of sage.rings.finite_rings; specifically, the element implementations using the PARI library.

class sage.features.sagemath.sage__rings__function_field(*args,**kwds)
   Bases: JoinFeature
   A Feature describing the presence of sage.rings.function_field.

   EXAMPLES:

   Rational function fields are always available:

   sage: K.<x> = FunctionField(QQ)
sage: K.maximal_order()
Maximal order of Rational function field in x over Rational Field

   Use the tag # needs sage.rings.function_field whenever extensions of function fields (by adjoining a root of a univariate polynomial) come into play:

   sage: R.<y> = K[]
sage: L.<y> = K.extension(y^5 - (x^3 + 2*x*y + 1/x)); L
   # needs sage.rings.function_field
   Function field in y defined by y^5 - 2*x*y + (-x^4 - 1)/x

   Such extensions of function fields are implemented using Gröbner bases of polynomial rings; Sage makes essential use of the Singular system for this. (It is not necessary to use the tag # needs sage.libs.singular; it is implied by # needs sage.rings.function_field.)

   class sage.features.sagemath.sage__rings__number_field(*args,**kwds)
   Bases: JoinFeature
   A Feature describing the presence of sage.rings.number_field.

   Number fields are implemented in Sage using a complicated mixture of various libraries, including FLINT, GAP, MPFI, NTL, and PARI.

   EXAMPLES:

   Rational numbers are, of course, always available:

   sage: QQ in NumberFields()
   True

   Doctests that construct algebraic number fields should be marked # needs sage.rings.number_field:
sage: # needs sage.rings.number_field
sage: K.<cuberoot2> = NumberField(x^3 - 2)
sage: L.<cuberoot3> = K.extension(x^3 - 3)
sage: S.<sqrt2> = L.extension(x^2 - 2); S
Number Field in sqrt2 with defining polynomial x^2 - 2 over its base field

sage: # needs sage.rings.number_field
sage: K.<zeta> = CyclotomicField(15)
sage: CC(zeta)
0.913545457642601 + 0.406736643075800*I

Doctests that make use of the algebraic field \texttt{QQbar} or the algebraic real field \texttt{AA} should be marked likewise:

sage: # needs sage.rings.number_field
sage: AA(-1)^(1/3)
-1
sage: QQbar(-1)^(1/3)
0.500000000000000? + 0.866025403784439?*I

Use of the universal cyclotomic field should be marked \# needs sage.libs.gap sage.rings.number_field.

    sage: # needs sage.libs.gap sage.rings.number_field sage: UCF = UniversalCyclotomicField(); UCF
    Universal Cyclotomic Field sage: E = UCF.gen sage: f = E(2) + E(3); f 2*E(3) + E(3)^2 sage: f.galois_conjugates()
    [2*E(3) + E(3)^2, E(3) + 2*E(3)^2]

class sage.features.sagemath.sage__rings__padics(*args, **kwds)
    Bases: JoinFeature
    A Feature describing the presence of \texttt{sage.rings.padics}.

class sage.features.sagemath.sage__rings__polynomial__pbori(*args, **kwds)
    Bases: JoinFeature
    A \texttt{sage.features.Feature} describing the presence of \texttt{sage.rings.polynomial.pbori}.

class sage.features.sagemath.sage__rings__real_double(*args, **kwds)
    Bases: PythonModule
    A Feature describing the presence of \texttt{sage.rings.real_double}.

    EXAMPLES:
    The Real Double Field is basically always available, and no \# optional/needs tag is needed:

    sage: RDF.characteristic()
    0

    The feature exists for use in doctests of Python modules that are shipped by the most fundamental distributions.

    class sage.features.sagemath.sage__rings__real_mpfr(*args, **kwds)
    Bases: JoinFeature
    A Feature describing the presence of \texttt{sage.rings.real_mpfr}.

    class sage.features.sagemath.sage__sat(*args, **kwds)
    Bases: JoinFeature
    A Feature describing the presence of \texttt{sage.sat}.
class sage.features.sagemath.sage__schemes(*args, **kwds)

    Bases: JoinFeature

    A Feature describing the presence of sage.schemes.

class sage.features.sagemath.sage__symbolic(*args, **kwds)

    Bases: JoinFeature

    A Feature describing the presence of sage.symbolic.

    EXAMPLES:
    The symbolics subsystem of Sage will be provided by the distribution sagemath-symbolics, in preparation at github issue #35095. If it is not installed, Sage will be able to provide installation advice:

    sage: from sage.features.sagemath import sage__symbolic
    sage: print(sage__symbolic().resolution())
    # optional - sage_spkg, not tested
    ...To install sagemath_symbolics...you can try to run...
    pip install sagemath-symbolics
    ...

class sage.features.sagemath.sagemath_doc_html(*args, **kwds)

    Bases: StaticFile

    A Feature which describes the presence of the documentation of the Sage library in HTML format.

    Developers often use make build instead of make to avoid the long time it takes to compile the documentation. Although commands such as make ptest build the documentation before testing, other test commands such as make ptestlong-nodoc or ./sage -t --all do not.

    All doctests that refer to the built documentation need to be marked # needs sagemath_doc_html.

3.5 Features for testing the presence of package systems
sage_spkg, conda, pip, debian, fedora etc.

class sage.features.pkg_systems.PackageSystem(*args, **kwds)

    Bases: Feature

    A Feature describing a system package manager.

    EXAMPLES:

    sage: from sage.features.pkg_systems import PackageSystem
    sage: PackageSystem('conda')

spkg_installation_hint (spkgs, prompt, feature)

    Return a string that explains how to install feature.

    EXAMPLES:

    sage: from sage.features.pkg_systems import PackageSystem
    sage: homebrew = PackageSystem('homebrew')
    sage: homebrew.spkg_installation_hint('openblas')  # optional - SAGE_ROOT
    'To install openblas using the homebrew package manager, you can try to run: 
    
    → n!brew install openblas'
class sage.features.pkg_systems.PipPackageSystem(*args, **kwds)
    Bases: PackageSystem
    A Feature describing the Pip package manager.

    EXAMPLES:
    sage: from sage.features.pkg_systems import PipPackageSystem
    sage: PipPackageSystem()
    Feature('pip')

class sage.features.pkg_systems.SagePackageSystem(*args, **kwds)
    Bases: PackageSystem
    A Feature describing the package manager of the SageMath distribution.

    EXAMPLES:
    sage: from sage.features.pkg_systems import SagePackageSystem
    sage: SagePackageSystem()
    Feature('sage_spkg')

3.6 Features for testing the presence of bliss

class sage.features.bliss.Bliss(*args, **kwds)
    Bases: JoinFeature
    A Feature which describes whether the sage.graphs.bliss module is available in this installation of Sage.

    EXAMPLES:
    sage: from sage.features.bliss import Bliss
    sage: Bliss().require()  # optional - bliss

class sage.features.bliss.BlissLibrary(*args, **kwds)
    Bases: CythonFeature
    A Feature which describes whether the Bliss library is present and functional.

    EXAMPLES:
    sage: from sage.features.bliss import BlissLibrary
    sage: BlissLibrary().require()  # optional - libbliss

sage.features.bliss.all_features()
### 3.7 Feature for testing the presence of \texttt{csdp}

```python
class sage.features.csdp.CSDP(*args, **kwds):
    Bases: Executable

    A Feature which checks for the \texttt{theta} binary of \texttt{CSDP}.

    EXAMPLES:
    
    sage: from sage.features.csdp import CSDP
    sage: CSDP().is_present()  # optional - csdp
    FeatureTestResult('csdp', True)

    is_functional()
    
    Check whether \texttt{theta} works on a trivial example.

    EXAMPLES:
    
    sage: from sage.features.csdp import CSDP
    sage: CSDP().is_functional()  # optional - csdp
    FeatureTestResult('csdp', True)
```

### 3.8 Features for testing the presence of various databases

```python
class sage.features.databases.DatabaseCremona(*args, **kwds):
    Bases: StaticFile

    A Feature which describes the presence of John Cremona's database of elliptic curves.

    INPUT:
    
    - name -- either 'cremona' (the default) for the full large database or 'cremona_mini' for the small database.

    EXAMPLES:
    
    sage: from sage.features.databases import DatabaseCremona
    sage: DatabaseCremona('cremona_mini').is_present()  # optional - database_cremona_ellcurve
    FeatureTestResult('database_cremona_ellcurve', True)
```

```python
class sage.features.databases.DatabaseCubicHecke(*args, **kwds):
    Bases: PythonModule

    A Feature which describes the presence of the Cubic Hecke algebra database package.

    The home of this database is the web-page Cubic Hecke algebra on 4 strands of Ivan Marin.

    EXAMPLES:
    
    sage: from sage.features.databases import DatabaseCubicHecke
    sage: DatabaseCubicHecke().is_present()  # optional - database_cubic_hecke
    FeatureTestResult('database_cubic_hecke', True)
```
class sage.features.databases.DatabaseEllcurves(*args, **kwds)
Bases: StaticFile

A Feature which describes the presence of William Stein’s database of interesting curves.

EXAMPLES:

```sage
from sage.features.databases import DatabaseEllcurves
bool(DatabaseEllcurves().is_present())  # optional - database_ellcurves
True
```

class sage.features.databases.DatabaseGraphs(*args, **kwds)
Bases: StaticFile

A Feature which describes the presence of the graphs database.

EXAMPLES:

```sage
from sage.features.databases import DatabaseGraphs
bool(DatabaseGraphs().is_present())  # optional - database_graphs
True
```

class sage.features.databases.DatabaseJones(*args, **kwds)
Bases: StaticFile

A Feature which describes the presence of John Jones’s tables of number fields.

EXAMPLES:

```sage
from sage.features.databases import DatabaseJones
bool(DatabaseJones().is_present())  # optional - database_jones_numfield
True
```

class sage.features.databases.DatabaseKnotInfo(*args, **kwds)
Bases: PythonModule

A Feature which describes the presence of the package providing the KnotInfo and LinkInfo databases.

The homes of these databases are the web-pages KnotInfo and LinkInfo.

EXAMPLES:

```sage
from sage.features.databases import DatabaseKnotInfo
DatabaseKnotInfo().is_present()  # optional - database_knotinfo
FeatureTestResult('database_knotinfo', True)
```

class sage.features.databases.DatabaseMatroids(*args, **kwds)
Bases: PythonModule

A Feature which describes the presence of Yoshitake Matsumoto’s Database of Matroids.

EXAMPLES:

```sage
from sage.features.databases import DatabaseMatroids
DatabaseMatroids().is_present()  # optional - matroid_database
FeatureTestResult('matroid_database', True)
```

REFERENCES:

[Mat2012]
class sage.features.databases.DatabaseReflexivePolytopes(*args, **kwds)
    Bases: StaticFile
    A Feature which describes the presence of the PALP databases of reflexive three-dimensional and four-dimensional lattice polytopes.

EXAMPLES:

```python
sage: from sage.features.databases import DatabaseReflexivePolytopes
sage: bool(DatabaseReflexivePolytopes().is_present())  # optional - polytopes_db
True
sage: bool(DatabaseReflexivePolytopes('polytopes_db_4d').is_present())  # optional - polytopes_db_4d
True
```

sage.features.databases.all_features()

sage.features.databases.sage_data_path(data_name)
    Search path for database data_name.

EXAMPLES:

```python
sage: from sage.features.databases import sage_data_path
sage: sage_data_path("cremona")
[.../cremona]
```

3.9 Feature for testing the presence of dvipng

sage.features.dvipng.all_features()

class sage.features.dvipng.dvipng(*args, **kwds)
    Bases: Executable
    A Feature describing the presence of dvipng

EXAMPLES:

```python
sage: from sage.features.dvipng import dvipng
sage: dvipng().is_present()  # optional - dvipng
FeatureTestResult('dvipng', True)
```

3.10 Feature for testing the presence of ffmpeg

class sage.features.ffmpeg.FFmpeg(*args, **kwds)
    Bases: Executable
    A Feature describing the presence of ffmpeg.

EXAMPLES:

```python
sage: from sage.features.ffmpeg import FFmpeg
sage: FFmpeg().is_present()  # optional - ffmpeg
FeatureTestResult('ffmpeg', True)
```
is_functional()

Return whether command ffmpeg in the path is functional.

EXAMPLES:

```python
sage: from sage.features.ffmpeg import FFmpeg
sage: FFmpeg().is_functional()  # optional - ffmpeg
FeatureTestResult('ffmpeg', True)
```

sage.features.ffmpeg.all_features()

### 3.11 Features for testing the presence of 4ti2

**class** sage.features.four_ti_2.FourTi2(*args, **kwds)

**Bases:** JoinFeature

A Feature describing the presence of all 4ti2 executables.

**EXAMPLES:**

```python
sage: from sage.features.four_ti_2 import FourTi2
sage: FourTi2().is_present()  # optional - 4ti2
FeatureTestResult('4ti2', True)
```

**class** sage.features.four_ti_2.FourTi2Executable(*args, **kwds)

**Bases:** Executable

A Feature for the 4ti2 executables.

sage.features.four_ti_2.all_features()

### 3.12 Features for testing the presence of the SageMath interfaces to gap and of GAP packages

**class** sage.features.gap.GapPackage(*args, **kwds)

**Bases:** Feature

A Feature describing the presence of a GAP package.

A GAP package is “present” if it can be loaded, not if it has been loaded.

**See also:**

Feature sage.libs.gap

**EXAMPLES:**

```python
sage: from sage.features.gap import GapPackage
sage: GapPackage("grape", spkg="gap_packages")
Feature('gap_package_grape')
```

sage.features.gap.all_features()
3.13 Features for testing the presence of graph generator programs benzene, buckygen, plantri

```python
class sage.features.graph_generators.Benzene(*args, **kwds):
    Bases: Executable
    
    A Feature which checks for the benzene binary.
    
    EXAMPLES:
    
    sage: from sage.features.graph_generators import Benzene
    sage: Benzene().is_present()  # optional - benzene
    FeatureTestResult('benzene', True)

    is_functional()
    Check whether benzene works on trivial input.
    
    EXAMPLES:
    
    sage: from sage.features.graph_generators import Benzene
    sage: Benzene().is_functional()  # optional - benzene
    FeatureTestResult('benzene', True)

class sage.features.graph_generators.Buckygen(*args, **kwds):
    Bases: Executable
    
    A Feature which checks for the buckygen binary.
    
    EXAMPLES:
    
    sage: from sage.features.graph_generators import Buckygen
    sage: Buckygen().is_present()  # optional - buckygen
    FeatureTestResult('buckygen', True)

    is_functional()
    Check whether buckygen works on trivial input.
    
    EXAMPLES:
    
    sage: from sage.features.graph_generators import Buckygen
    sage: Buckygen().is_functional()  # optional - buckygen
    FeatureTestResult('buckygen', True)

class sage.features.graph_generators.Plantri(*args, **kwds):
    Bases: Executable
    
    A Feature which checks for the plantri binary.
    
    EXAMPLES:
    
    sage: from sage.features.graph_generators import Plantri
    sage: Plantri().is_present()  # optional - plantri
    FeatureTestResult('plantri', True)

    is_functional()
    Check whether plantri works on trivial input.
    
    EXAMPLES:
```
3.14 Features for testing the presence of graphviz

```python
sage: from sage.features.graphviz import Graphviz
sage: Graphviz().is_present()  # optional - graphviz
FeatureTestResult('graphviz', True)
```

```python
sage.features.graphviz.all_features()
```

```python
class sage.features.graphviz.Graphviz(*args, **kwds)
    Bases: JoinFeature
    A Feature describing the presence of the dot, neato, and twopi executables from the graphviz package.
    EXAMPLES:
    ```
    sage: from sage.features.graphviz import Graphviz
    sage: Graphviz().is_present()  # optional - graphviz
    FeatureTestResult('graphviz', True)
    ```
```

sage.features.graphviz.all_features()

```python
class sage.features.graphviz.dot(*args, **kwds)
    Bases: Executable
    A Feature describing the presence of dot.
```

```python
class sage.features.graphviz.neato(*args, **kwds)
    Bases: Executable
    A Feature describing the presence of neato.
```

```python
class sage.features.graphviz.twopi(*args, **kwds)
    Bases: Executable
    A Feature describing the presence of twopi.
```

3.15 Feature for testing the presence of imagemagick

Currently we only check for the presence of convert. When needed, other commands like magick, magick-script, convert, mogrify, identify, composite, montage, compare, etc. could be also checked in this module.

```python
class sage.features.imagemagick.Convert(*args, **kwds)
    Bases: Executable
    A Feature describing the presence of convert.
    EXAMPLES:
    ```
    sage: from sage.features.imagemagick import Convert
    sage: Convert().is_present()  # optional - imagemagick
    FeatureTestResult('convert', True)
    ```
```
is_functional()
    Return whether command convert in the path is functional.

EXAMPLES:

```
sage: from sage.features.imagemagick import Convert
sage: Convert().is_functional()  # optional - imagemagick
FeatureTestResult('convert', True)
```

class sage.features.imagemagick.ImageMagick(*args, **kwds)
Bases: JoinFeature

A Feature describing the presence of ImageMagick

Currently, only the availability of the convert program is checked.

EXAMPLES:

```
sage: from sage.features.imagemagick import ImageMagick
sage: ImageMagick().is_present()  # optional - imagemagick
FeatureTestResult('imagemagick', True)
```

sage.features.imagemagick.all_features()

### 3.16 Features for testing whether interpreter interfaces to magma, maple, mathematica etc. are functional

class sage.features.interfaces.InterfaceFeature(*args, **kwds)
Bases: Feature

A Feature describing whether an Interface is present and functional.

class sage.features.interfaces.Macaulay2(*args, **kwds)
Bases: InterfaceFeature

A Feature describing whether sage.interfaces.macaulay2.Macaulay2 is present and functional.

EXAMPLES:

```
sage: from sage.features.interfaces import Macaulay2
sage: Macaulay2().is_present()  # random
FeatureTestResult('macaulay2', False)
```

class sage.features.interfaces.Magma(*args, **kwds)
Bases: InterfaceFeature

A Feature describing whether sage.interfaces.magma.Magma is present and functional.

EXAMPLES:

```
sage: from sage.features.interfaces import Magma
sage: Magma().is_present()  # random
FeatureTestResult('magma', False)
```
class sage.features.interfaces.Maple(*args, **kwds)
Bases: InterfaceFeature

A Feature describing whether sage.interfaces.maple.Maple is present and functional.

EXAMPLES:

```python
sage: from sage.features.interfaces import Maple
sage: Maple().is_present()  # random
FeatureTestResult('maple', False)
```

class sage.features.interfaces.Mathematica(*args, **kwds)
Bases: InterfaceFeature

A Feature describing whether sage.interfaces.mathematica.Mathematica is present and functional.

EXAMPLES:

```python
sage: from sage.features.interfaces import Mathematica
sage: Mathematica().is_present()  # not tested
FeatureTestResult('mathematica', False)
```

class sage.features.interfaces.Matlab(*args, **kwds)
Bases: InterfaceFeature

A Feature describing whether sage.interfaces.matlab.Matlab is present and functional.

EXAMPLES:

```python
sage: from sage.features.interfaces import Matlab
sage: Matlab().is_present()  # random
FeatureTestResult('matlab', False)
```

class sage.features.interfaces.Octave(*args, **kwds)
Bases: InterfaceFeature

A Feature describing whether sage.interfaces.octave.Octave is present and functional.

EXAMPLES:

```python
sage: from sage.features.interfaces import Octave
sage: Octave().is_present()  # random
FeatureTestResult('octave', False)
```

class sage.features.interfaces.Scilab(*args, **kwds)
Bases: InterfaceFeature

A Feature describing whether sage.interfaces.scilab.Scilab is present and functional.

EXAMPLES:

```python
sage: from sage.features.interfaces import Scilab
sage: Scilab().is_present()  # random
FeatureTestResult('scilab', False)
```

sage.features.interfaces.all_features()

Return features corresponding to interpreter interfaces.

EXAMPLES:

3.16. Features for testing whether interpreter interfaces to magma, maple, mathematica etc. are functional
3.17 Feature for testing if the Internet is available

```
from sage.features.internet import Internet

# optional - internet

from sage.features.internet import Internet
Internet()
```

3.18 Feature for testing the presence of kenzo

```
from sage.features.kenzo import Kenzo
Kenzo().is_present()  # optional - kenzo
```

3.19 Features for testing the presence of \texttt{latex} and equivalent programs

```python
class sage.features.latex.Latex(*args, **kwds):
    Bases: Executable

    A \texttt{Feature} describing the presence of \texttt{latex}

    EXAMPLES:
    
    sage: from sage.features.latex import latex
    sage: latex().is_present()  # optional - latex
    FeatureTestResult('latex', True)

    \texttt{is\_functional}()
    
    Return whether \texttt{latex} in the path is functional.

    EXAMPLES:
    
    sage: from sage.features.latex import latex
    sage: latex().is\_functional()  # optional - latex
    FeatureTestResult('latex', True)

    When the feature is not functional, more information on the reason can be obtained as follows:
    
    sage: result = latex().is\_functional()  # not tested
    sage: print(result.reason)  # not tested
    Running latex on a sample file
    (with command='latex -interaction=nonstopmode tmp_wmpos8ak.tex')
    returned non-zero exit status='1' with stderr='
    and stdout='This is pdfTeX,
    ...
    Runaway argument?
    {document
    ! File ended while scanning use of \end.
    ...
    No pages of output.
    Transcript written on tmp_wmpos8ak.log.'
```

```python
class sage.features.latex.LaTeXPackage(*args, **kwds):
    Bases: TeXFile

    A \texttt{sage.features.Feature} describing the presence of a LaTeX package (.sty file).

    EXAMPLES:
    
    sage: from sage.features.latex import LaTeXPackage
    sage: LaTeXPackage('graphics').is_present()  # optional - latex
    FeatureTestResult('latex_package_graphics', True)
```

```python
class sage.features.latex.TeXFile(*args, **kwds):
    Bases: StaticFile

    A \texttt{sage.features.Feature} describing the presence of a TeX file

    EXAMPLES:
absolute_filename()

The absolute path of the file.

EXAMPLES:

```python
sage: from sage.features.latex import TeXFile
sage: TeXFile('x', 'x.tex').is_present()  # optional - latex
FeatureTestResult('x', True)
```

sage.features.latex.all_features()

class sage.features.latex.dvips(*args, **kwds)

Bases: Executable

A Feature describing the presence of dvips

EXAMPLES:

```python
sage: from sage.features.latex import dvips
sage: dvips().is_present()  # optional - dvips
FeatureTestResult('dvips', True)
```

class sage.features.latex.latex(*args, **kwds)

Bases: LaTeX

A Feature describing the presence of latex

EXAMPLES:

```python
sage: from sage.features.latex import latex
sage: latex().is_present()  # optional - latex
FeatureTestResult('latex', True)
```

class sage.features.latex.lualatex(*args, **kwds)

Bases: LaTeX

A Feature describing the presence of lualatex

EXAMPLES:

```python
sage: from sage.features.latex import lualatex
sage: lualatex().is_present()  # optional - lualatex
FeatureTestResult('lualatex', True)
```

class sage.features.latex.pdflatex(*args, **kwds)

Bases: LaTeX

A Feature describing the presence of pdflatex

EXAMPLES:

```python
sage: from sage.features.latex import pdflatex
sage: pdflatex().is_present()  # optional - pdflatex
FeatureTestResult('pdflatex', True)
```
class sage.features.latex.xelatex(*args, **kwds)
    Bases: LaTeX
    A Feature describing the presence of xelatex
    EXAMPLES:
    sage: from sage.features.latex import xelatex
    sage: xelatex().is_present()  # optional - xelatex
    FeatureTestResult('xelatex', True)

3.20 Features for testing the presence of latte_int

class sage.features.latte.Latte(*args, **kwds)
    Bases: JoinFeature
    A Feature describing the presence of executables from Latte integrale.
    EXAMPLES:
    sage: from sage.features.latte import Latte
    sage: Latte().is_present()  # optional - latte_int
    FeatureTestResult('latte_int', True)

class sage.features.latte.Latte_count(*args, **kwds)
    Bases: Executable
    Feature for the executable count from Latte integrale.

class sage.features.latte.Latte_integrate(*args, **kwds)
    Bases: Executable
    Feature for the executable integrate from Latte integrale.

sage.features.latte.all_features()

3.21 Feature for testing the presence of lrslib

class sage.features.lrs.Lrs(*args, **kwds)
    Bases: Executable
    A Feature describing the presence of the lrs binary which comes as a part of lrslib.
    EXAMPLES:
    sage: from sage.features.lrs import Lrs
    sage: Lrs().is_present()  # optional - lrslib
    FeatureTestResult('lrs', True)

is_functional()
    Test whether lrs works on a trivial input.
    EXAMPLES:
class sage.features.lrs.LrsNash(*args, **kwds)

Bases: Executable

A Feature describing the presence of the \texttt{lrsnash} binary which comes as a part of \texttt{lrslib}.

EXAMPLES:

```python
sage: from sage.features.lrs import LrsNash
sage: LrsNash().is_present()  # optional - lrslib
FeatureTestResult('lrsnash', True)
```

is_functional()

Test whether \texttt{lrsnash} works on a trivial input.

EXAMPLES:

```python
sage: from sage.features.lrs import LrsNash
sage: LrsNash().is_functional()  # optional - lrslib
FeatureTestResult('lrsnash', True)
```

class sage.features.lrs.Lrslib(*args, **kwds)

Bases: JoinFeature

A Feature describing the presence of the executables \texttt{lrs} and \texttt{lrsnash} provided by the \texttt{lrslib} package.

EXAMPLES:

```python
sage: from sage.features.lrs import Lrslib
sage: Lrslib().is_present()  # optional - lrslib
FeatureTestResult('lrslib', True)
```

sage.features.lrs.all_features()

### 3.22 Features for testing the presence of \texttt{mcqd}

class sage.features.mcqd.Mcqd(*args, **kwds)

Bases: JoinFeature

A Feature describing the presence of the \texttt{mcqd} module, which is the SageMath interface to the \texttt{mcqd} library.

EXAMPLES:

```python
sage: from sage.features.mcqd import Mcqd
sage: Mcqd().is_present()  # optional - mcqd
FeatureTestResult('mcqd', True)
```

sage.features.mcqd.all_features()
3.23 Feature for testing the presence of `meataxe`

```python
class sage.features.meataxe.Meataxe(*args, **kwds):
    Bases: JoinFeature

    A Feature describing the presence of the Sage modules that depend on the `meataxe` library.

    EXAMPLES:
    ::

        sage: from sage.features.meataxe import Meataxe
        sage: Meataxe().is_present()  # optional - meataxe
        FeatureTestResult('meataxe', True)
```

```
sage.features.meataxe.all_features()
```

3.24 Features for testing the presence of `MixedIntegerLinearProgram` backends

```python
class sage.features.mip_backends.COIN(*args, **kwds):
    Bases: JoinFeature

    A Feature describing whether the `MixedIntegerLinearProgram` backend COIN is available.

class sage.features.mip_backends.CPLEX(*args, **kwds):
    Bases: MIPBackend

    A Feature describing whether the `MixedIntegerLinearProgram` backend CPLEX is available.

class sage.features.mip_backends.CVXOPT(*args, **kwds):
    Bases: JoinFeature

    A Feature describing whether the `MixedIntegerLinearProgram` backend CVXOPT is available.

class sage.features.mip_backends.Gurobi(*args, **kwds):
    Bases: MIPBackend

    A Feature describing whether the `MixedIntegerLinearProgram` backend Gurobi is available.

class sage.features.mip_backends.MIPBackend(*args, **kwds):
    Bases: Feature

    A Feature describing whether a `MixedIntegerLinearProgram` backend is available.
```

```
sage.features.mip_backends.all_features()
```

3.25 Feature for testing the presence of `pynormaliz`

```python
class sage.features.normaliz.PyNormaliz(*args, **kwds):
    Bases: JoinFeature

    A Feature describing the presence of the Python package `PyNormaliz`.

    EXAMPLES:
    ```
3.26 Feature for testing the presence of pandoc

class sage.features.pandoc.Pandoc(*args, **kwds)
   Bases: Executable

   A Feature describing the presence of pandoc.

   EXAMPLES:

   sage: from sage.features.pandoc import Pandoc
   sage: Pandoc().is_present()  # optional - pandoc
   FeatureTestResult('pandoc', True)

sage.features.pandoc.all_features()

3.27 Feature for testing the presence of pdf2svg

sage.features.pdf2svg.all_features()

class sage.features.pdf2svg.pdf2svg(*args, **kwds)
   Bases: Executable

   A Feature describing the presence of pdf2svg.

   EXAMPLES:

   sage: from sage.features.pdf2svg import pdf2svg
   sage: pdf2svg().is_present()  # optional - pdf2svg
   FeatureTestResult('pdf2svg', True)

sage.features.pdf2svg.all_features()

3.28 Feature for testing the presence of jupymake, the Python interface to polymake

class sage.features.polymake.JuPyMake(*args, **kwds)
   Bases: JoinFeature

   A Feature describing the presence of the JuPyMake module, a Python interface to the polymake library.

   EXAMPLES:

   sage: from sage.features.polymake import JuPyMake
   sage: JuPyMake().is_present()  # optional - jupymake
   FeatureTestResult('jupymake', True)

sage.features.polymake.all_features()
3.29 Features for testing the presence of `rubiks`

```python
class sage.features.rubiks.Rubiks(*args, **kwds)
    Bases: JoinFeature
    A Feature describing the presence of the `cu2, cubex, dikcube, mcube, optimal, and size222` programs from the `rubiks` package.

    EXAMPLES:

    sage: from sage.features.rubiks import Rubiks
    sage: Rubiks().is_present()  # optional - rubiks
    FeatureTestResult('rubiks', True)
```

```python
sage.features.rubiks.all_features()
```

```python
class sage.features.rubiks.cu2(*args, **kwds)
    Bases: Executable
    A Feature describing the presence of `cu2`.

    EXAMPLES:

    sage: from sage.features.rubiks import cu2
    sage: cu2().is_present()  # optional - rubiks
    FeatureTestResult('cu2', True)
```

```python
class sage.features.rubiks.cubex(*args, **kwds)
    Bases: Executable
    A Feature describing the presence of `cubex`.

    EXAMPLES:

    sage: from sage.features.rubiks import cubex
    sage: cubex().is_present()  # optional - rubiks
    FeatureTestResult('cubex', True)
```

```python
class sage.features.rubiks.dikcube(*args, **kwds)
    Bases: Executable
    A Feature describing the presence of `dikcube`.

    EXAMPLES:

    sage: from sage.features.rubiks import dikcube
    sage: dikcube().is_present()  # optional - rubiks
    FeatureTestResult('dikcube', True)
```

```python
class sage.features.rubiks.mcube(*args, **kwds)
    Bases: Executable
    A Feature describing the presence of `mcube`.

    EXAMPLES:

    sage: from sage.features.rubiks import mcube
    sage: mcube().is_present()  # optional - rubiks
    FeatureTestResult('mcube', True)
```
class sage.features.rubiks.optimal(*args, **kwds)
Bases: Executable

A Feature describing the presence of optimal.

EXAMPLES:

```python
sage: from sage.features.rubiks import optimal
sage: optimal().is_present()  # optional - rubiks
FeatureTestResult('optimal', True)
```

class sage.features.rubiks.size222(*args, **kwds)
Bases: Executable

A Feature describing the presence of size222.

EXAMPLES:

```python
sage: from sage.features.rubiks import size222
sage: size222().is_present()  # optional - rubiks
FeatureTestResult('size222', True)
```

### 3.30 Features for testing the presence of `tdlib`

class sage.features.tdlib.Tdlib(*args, **kwds)
Bases: JoinFeature

A Feature describing the presence of the SageMath interface to the `tdlib` library.

sage.features.tdlib.all_features()
CHAPTER FOUR

DISTRIBUTION PACKAGES OF THE SAGE LIBRARY

• sagemath_bliss: Graph (iso/auto)morphisms with bliss
• sagemath_categories: Sage categories and basic rings
• sagemath_coxeter3: Coxeter groups, Bruhat ordering, Kazhdan-Lusztig polynomials with coxeter3
• sagemath_doc_html: SageMath documentation in HTML format
• sagemath_doc_pdf: SageMath documentation in PDF format
• sagemath_environment: System and software environment
• sagemath_mcqd: Finding maximum cliques with mcqd
• sagemath_meataxe: Matrices over small finite fields with meataxe
• sagemath_objects: Sage objects, elements, parents, categories, coercion, metaclasses
• sagemath_repl: IPython kernel, Sage preparser, doctester
• sagemath_sirocco: Certified root continuation with sirocco
• sagemath_tdlib: Tree decompositions with tdlib
CHAPTER
FIVE

EXPERIMENTAL PACKAGES

Some packages that provide additional functionality are marked as “experimental”. Developers are needed in order to improve the integration of these packages into the Sage distribution.

- awali: Computation of/with finite state machines
- barvinok: Projections of integer point sets of parametric polytopes
- cocoalib: Computations in commutative algebra
- deformation: Count points on hypersurfaces using the deformation method
- gambit: Computations on finite, noncooperative games
- gap3: A minimal distribution of GAP 3 containing packages that have no equivalent in GAP 4
- gdb: The GNU Project debugger
- libtheora: Library for the Theora video codec
- lie: Library for the representation theory of complex semisimple Lie groups and algebras
- modular_decomposition: A modular decomposition algorithm
- polylib: Operations on unions of polyhedra
- r_jupyter: Jupyter kernel for R
- surf: Visualization of algebraic curves, algebraic surfaces and hyperplane sections of surfaces
- valgrind: Memory error detector, call graph generator, runtime profiler
6.1 Details of external packages

Packages are in alphabetical order.

6.1.1 4ti2: Algebraic, geometric and combinatorial problems on linear spaces

Description

A software package for algebraic, geometric and combinatorial problems on linear spaces. Available at https://4ti2.github.io/.

License

4ti2 is released under a GPL v2 license.

Upstream Contact

- https://4ti2.github.io/
- Raymond Hemmecke, TU Munich, Germany
- Matthias Köppe, UC Davis, CA, USA

Type

optional

Dependencies

- $(MP_LIBRARY)
- glpk: GNU Linear Programming Kit
- zlib: Data compression library
Version Information

package-version.txt:

1.6.10

Equivalent System Packages

$ sudo pacman -S 4ti2

$ conda install 4ti2

$ apt-cyg install lib4ti2_0 lib4ti2-devel

$ sudo apt-get install 4ti2

$ sudo yum install 4ti2

$ sudo pkg install math/4ti2

$ sudo emerge sci-mathematics/4ti2

$ sudo zypper install 4ti2 4ti2-devel

See https://repology.org/project/4ti2/versions

If the system package is installed, ./configure will check if it can be used.

6.1.2 _bootstrap: Represents system packages required for running the top-level bootstrap script

Description

This optional script package represents the requirements (system packages) that are needed in addition to those represented by the _prereq package in order to run the top-level bootstrap script.

Type

optional
6.1.3 _develop: Represents system packages recommended for development

Description

Script package representing a list of system packages recommended for developers.
Packages and Features, Release 10.3

Type

optional

Dependencies

- _bootstrap: Represents system packages required for running the top-level bootstrap script
- git: Version control system
- github_cli: Command-line interface for GitHub
- pytest: Simple powerful testing with Python
- pytest_xdist: pytest xdist plugin for distributed testing and loop-on-failing modes

Version Information

Equivalent System Packages

$ apk add gnupg-gpgconf openssh-client
$ sudo pacman -S gnupg openssh
$ conda install openssh pycodestyle esbonio
$ apt-cyg install gnupg2
$ sudo apt-get install gpgconf openssh-client
$ sudo yum install gnupg2 openssh
$ sudo pkg install security/gnupg security/openssh-portable
$ sudo emerge app-crypt/gnupg net-misc/openssh
$ brew install gnupg
$ sudo port install gnupg2
$ nix-env --install gnupg openssh
$ sudo zypper install gpg2 openssh
$ sudo slackpkg install gnupg2 openssh
$ sudo xbps-install gnupg2 openssh

See https://repology.org/project/gnupg/versions, https://repology.org/project/openssh/versions

If the system package is installed, `./configure` will check if it can be used.
6.1.4 _prereq: Represents system packages required for installing SageMath from source

Description

This dummy package represents the minimal requirements (system packages) for installing SageMath from source.

In addition to standard POSIX utilities and the bash shell, the following standard command-line development tools must be installed on your computer:

- **make**: GNU make, version 3.80 or later. Version 3.82 or later is recommended.
- **m4**: GNU m4 1.4.2 or later (non-GNU or older versions might also work).
- **perl**: version 5.8.0 or later.
- **ar** and **ranlib**: can be obtained as part of GNU binutils.
- **tar**: GNU tar version 1.17 or later, or BSD tar (as provided on macOS).
- **python**: Python 3.4 or later, or Python 2.7. (This range of versions is a minimal requirement for internal purposes of the SageMath build system, which is referred to as sage-bootstrap-python.)

Other versions of these may work, but they are untested.

On macOS, suitable versions of all of these tools are provided by the Xcode Command Line Tools. To install them, open a terminal window and run `xcode-select --install`; then click “Install” in the pop-up window. If the Xcode Command Line Tools are already installed, you may want to check if they need to be updated by typing `softwareupdate -l`.

On Linux, **ar** and **ranlib** are in the *binutils* package. The other programs are usually located in packages with their respective names.

On Redhat-derived systems not all perl components are installed by default and you might have to install the *perl-ExtUtils-MakeMaker* package.

To check if you have the above prerequisites installed, for example **perl**, type:

```bash
$ command -v perl
```

or:

```bash
$ which perl
```

on the command line. If it gives an error (or returns nothing), then either **perl** is not installed, or it is installed but not in your PATH.

Type

standard

If the system package is installed, ./configure will check if it can be used.
6.1.5 _recommended: Represents system packages recommended for additional functionality

**Description**

Script package representing a list of system packages recommended to be installed for additional functionality.

**Type**

optional

**Dependencies**

- ffmpeg: ffmpeg video converter
- free_fonts: a free family of scalable outline fonts
- git: Version control system
- ImageMagick: A collection of tools and libraries for many image file formats
- libjpeg: JPEG image support
- pandoc: A document converter
- texlive: A comprehensive TeX system
- texlive_luatex: LuaTeX packages
- xindy: a general-purpose index processor

**Version Information**

**Equivalent System Packages**

```bash
$ sudo apt-get install default-jdk libavdevice-dev
$ brew install texinfo
$ sudo port install texinfo
```

If the system package is installed, `./configure` will check if it can be used.

6.1.6 _sagemath: Downstream package of Sage in distributions

SageMath is available from various distributions and can be installed by package managers.

This dummy package records the names of the system packages that should be installed to provide a standard installation of SageMath, including documentation and Jupyter.

### 6.1.7 admcycles: Computation in the tautological ring of the moduli space of curves

#### Description

The SageMath package admcycles offers the possibility to compute in the tautological ring of the Deligne-Mumford compactification of the moduli space of curves. Construction for standard generators are provided (psi, kappa and lambda classes) as well as more advanced algebraic construction (double ramification cycle, strata of differentials).

6.1.8 alabaster: Default theme for the Sphinx documentation system

Description

Alabaster is a visually (c)lean, responsive, configurable theme for the Sphinx documentation system. It is Python 2+3 compatible.

It began as a third-party theme, and is still maintained separately, but as of Sphinx 1.3, Alabaster is an install-time dependency of Sphinx and is selected as the default theme.

Live examples of this theme can be seen on paramiko.org, fabfile.org and pyinvoke.org.

delocate
auditwheel; sys_platform != 'darwin'

Equivalent System Packages

(none known)
6.1.19 awali: Computation of/with finite state machines

Description

Awali is a software platform dedicated to the computation of, and with, finite state machines. Here finite state machines is to be understood in the broadest possible sense: finite automata with output — often called transducers then — or even more generally finite automata with multiplicity, that is, automata that not only accept, or recognize, sequences of symbols but compute for every such sequence a ‘value’ that is associated with it and which can be taken in any semiring. Hence the variety of situations that can thus be modelized.

License

- GPL 3.0

Upstream Contact

- Website: http://vaucanson-project.org/Awali/index.html
- Releases: http://files.vaucanson-project.org/tarballs/

Dependencies

- graphviz must be installed from your distro, and available in the path.

Type

experimental

Dependencies

- $(PYTHON)
- cmake: A cross-platform build system generator
- cython: C-Extensions for Python, an optimizing static compiler
- nbconvert: Converting Jupyter Notebooks
- ncurses: Classic terminal output library

Version Information

package-version.txt:

```
1.0.2-190218
```
Equivalent System Packages

See https://repology.org/project/awali/versions

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see github issue #27330 for more information.

6.1.20 babel: Internationalization utilities

6.1.21 barvinok: Projections of integer point sets of parametric polytopes

Description

barvinok is a library for counting the number of integer points in parametric and non-parametric polytopes as well as projections of such sets.

License

GPL v2

Upstream Contact

- https://sourceforge.net/projects/barvinok/
- https://groups.google.com/group/isl-development

Type

experimental
### Dependencies

- **isl**: Sets and relations of integer points bounded by affine constraints
- **ntl**: A library for doing number theory
- **polylib**: Operations on unions of polyhedra

### Version Information

**package-version.txt**:

0.41.7

### Equivalent System Packages

```
$ sudo pkg install math/barvinok

$ sudo zypper install barvinok pkgconfig\(barvinok\)
```

See [https://repology.org/project/barvinok/versions](https://repology.org/project/barvinok/versions)

However, these system packages will not be used for building Sage because `spkg-config.m4` has not been written for this package; see [github issue #27330](https://github.com/sagemath/sage/issues/27330) for more information.

### 6.1.22 beautifulsoup4: Screen-scraping library

#### Description

Screen-scraping library

#### License

MIT

#### Upstream Contact

[https://pypi.org/project/beautifulsoup4/](https://pypi.org/project/beautifulsoup4/)

#### Type

standard
Packages and Features, Release 10.3

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- soupsieve: A modern CSS selector implementation for Beautiful Soup.

Version Information

package-version.txt:

4.12.2

install-requires.txt:

beautifulsoup4

Equivalent System Packages

$ apk add py3-beautifulsoup4
$ sudo pacman -S python-beautifulsoup4
$ conda install beautifulsoup4
$ sudo apt-get install python3-bs4
$ sudo yum install python-beautifulsoup4
$ sudo emerge dev-python/beautifulsoup4
$ sudo port install py-beautifulsoup4
$ sudo zypper install python-beautifulsoup4
$ sudo xbps-install python3-BeautifulSoup4

See https://repology.org/project/python:beautifulsoup4/versions

If the system package is installed and if the (experimental) option --enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.
6.1.23 beniget: Extract semantic information about static Python code

Description

Extract semantic information about static Python code

License

BSD 3-Clause

Upstream Contact

https://pypi.org/project/beniget/

Type

standard

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- gast: Python AST that abstracts the underlying Python version

Version Information

package-version.txt:

0.4.1

install-requires.txt:

beniget

Equivalent System Packages

$ conda install beniget

$ sudo emerge dev-python/beniget

$ sudo xbps-install python3-beniget

If the system package is installed and if the (experimental) option --enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.
6.1.24 benzene: Generate fusenes and benzenoids with a given number of faces

Description

Benzene is a program for the efficient generation of all nonisomorphic fusenes and benzenoids with a given number of faces. Fusenes are planar polycyclic hydrocarbons with all bounded faces hexagons. Benzenoids are fusenes that are subgraphs of the hexagonal lattice.

License

Benzene is licensed under the GNU General Public License v2 or later (June 2007)

Upstream Contact

Benzene was written by Gunnar Brinkmann and Gilles Caporossi. This version was adapted by Gunnar Brinkmann and Nico Van Cleemput for Grinvin.

http://www.grinvin.org/

Type

optional

Dependencies

Version Information

package-version.txt:

20130630

Equivalent System Packages

$ sudo pacman -S benzene

$ sudo zypper install benzene

See https://repology.org/project/benzene/versions

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see github issue #27330 for more information.
6.1.25 biopython: Tools for computational molecular biology

Description

Freely available tools for computational molecular biology.

License

https://pypi.org/project/biopython/
http://biopython.org/

Type

optional

Dependencies

Version Information

requirements.txt:

```
biopython
```

Equivalent System Packages

```
$ conda install biopython
```

```
$ sudo port install py-biopython
```

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see github issue #27330 for more information.

6.1.26 bleach: An HTML-sanitizing tool

Description

An easy safelist-based HTML-sanitizing tool.
License

Apache License v2

Upstream Contact

Home Page: https://github.com/mozilla/bleach

Type

standard

Dependencies

• $(PYTHON)
• $(PYTHON_TOOLCHAIN)
  • six: Python 2 and 3 compatibility utilities
  • webencodings: Character encoding aliases for legacy web content

Version Information

package-version.txt:

6.1.0

install-requires.txt:

bleach >= 5

Equivalent System Packages

$ sudo pacman -S python-bleach

$ conda install bleach

$ sudo apt-get install python3-bleach

$ sudo yum install python-bleach

$ sudo emerge dev-python/bleach

$ sudo port install py-bleach

$ sudo zypper install python3\${PYTHON_MINOR}~bleach

$ sudo xbps-install python3-bleach

6.1. Details of external packages
See https://repology.org/project/python:bleach/versions

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.27 bliss: Computing automorphism groups and canonical forms of graphs

**Description**

bliss is an open source tool for computing automorphism groups and canonical forms of graphs.

**License**

LGPL3

**Upstream Contact**

Bliss is currently being maintained by Tommi Junttila at  
https://users.aalto.fi/~tjunttil/bliss/index.html  
Bliss used to be maintained by Tommi Junttila and Petteri Kaski up to version 0.73 at  
http://www.tcs.tkk.fi/Software/bliss/index.html

**Type**

optional

**Dependencies**

- cmake: A cross-platform build system generator

**Version Information**

package-version.txt:

```
0.77
```

**Equivalent System Packages**

```
$ apk add bliss
$ sudo pacman -S bliss
$ conda install bliss
$ sudo yum install bliss bliss-devel
```
$ sudo emerge sci-libs/bliss

$ sudo zypper install bliss bliss-devel

See https://repology.org/project/bliss-graphs/versions
If the system package is installed, ./configure will check if it can be used.

6.1.28 boost_cropped: Portable C++ libraries (subset needed for Sage)

Description

Boost provides free peer-reviewed portable C++ source libraries.

We emphasize libraries that work well with the C++ Standard Library. Boost libraries are intended to be widely useful, and usable across a broad spectrum of applications. The Boost license encourages both commercial and non-commercial use.

We aim to establish “existing practice” and provide reference implementations so that Boost libraries are suitable for eventual standardization. Ten Boost libraries are already included in the C++ Standards Committee’s Library Technical Report (TR1) and will be in the new C++0x Standard now being finalized. C++0x will also include several more Boost libraries in addition to those from TR1. More Boost libraries are proposed for TR2.

License

Boost Software License - see http://www.boost.org/users/license.html

Upstream Contact

Dependencies

Version Information

package-version.txt:

1.66.0.p0
Equivalent System Packages

$ sudo pacman -S boost
$ conda install boost-cpp
$ apt-cyg install libboost-devel
$ sudo apt-get install libboost-dev
$ sudo yum install boost-devel
$ sudo pkg install devel/boost-libs
$ brew install boost
$ sudo port install boost
$ nix-env --install boost
$ sudo zypper install boost-devel
$ sudo slackpkg install boost
$ sudo xbps-install boost-devel

See https://repology.org/project/boost/versions

If the system package is installed, ./configure will check if it can be used.

6.1.29 brial: Boolean Ring Algebra implementation using binary decision diagrams

Description

BRiAl (“Boolean Ring Algebra”) is the successor to PolyBoRi.

The core of PolyBoRi is a C++ library, which provides high-level data types for Boolean polynomials and monomials, exponent vectors, as well as for the underlying polynomial rings and subsets of the powerset of the Boolean variables. As a unique approach, binary decision diagrams are used as internal storage type for polynomial structures. On top of this C++-library we provide a Python interface. This allows parsing of complex polynomial systems, as well as sophisticated and extendable strategies for Gröbner base computation. PolyBoRi features a powerful reference implementation for Gröbner basis computation.
License

GPL version 2 or later

Upstream Contact

https://github.com/BRiAl/BRiAl

Type

standard

Dependencies

- *boost_cropped*: Portable C++ libraries (subset needed for Sage)
- *libpng*: Bitmap image support
- *m4ri*: fast arithmetic with dense matrices over GF(2)
- *pkgconf*: An implementation of the pkg-config spec

Version Information

package-version.txt:

```
1.2.8
```

Equivalent System Packages

```
$ sudo pacman -S brial
$ conda install brial
$ sudo apt-get install libbrial-dev libbrial-groebner-dev
$ sudo yum install brial brial-devel
$ sudo pkg install math/brial
$ sudo emerge sci-libs/brial
$ nix-env --install brial
$ sudo zypper install brial-devel
$ sudo xbps-install brial-devel
```

See https://repology.org/project/brial/versions

If the system package is installed, `./configure` will check if it can be used.

6.1. Details of external packages
6.1.30 buckygen: Efficient generation of nonisomorphic fullerenes

Description

Buckygen is a program for the efficient generation of all nonisomorphic fullerenes. These are triangulations where all vertices have degree 5 or 6. Or if the dual representation is used: cubic plane graphs where all faces are pentagons or hexagons.

License

Buckygen is licensed under the GNU General Public License v3 (June 2007)

Upstream Contact

Buckygen was mainly written by Jan Goedgebeur, jan.goedgebeur[at]ugent.be.
http://caagt.ugent.be/buckygen/

Type

optional

Dependencies

Version Information

package-version.txt:

1.1

Equivalent System Packages

$ sudo pacman -S buckygen

$ sudo zypper install buckygen

See https://repology.org/project/buckygen/versions

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see github issue #27330 for more information.
6.1.31 bzip2: High-quality data compressor

Description

bzip2 is a freely available, patent free, high-quality data compressor.

It typically compresses files to within 10% to 15% of the best available techniques (the PPM family of statistical compressors), whilst being around twice as fast at compression and six times faster at decompression.

License

BSD-style

Upstream Contact

- Website http://bzip.org/
- Author: Julian Seward <julian@bzip.org>

Special Update/Build Instructions

This package must not be bzip2 compressed, so create it using

```
tar c bzip2-1.0.6 | gzip --best >bzip2-1.0.6.spkg
```

The build system has been autotoolized based on a patch by the Suse folk at http://ftp.uni-kl.de/pub/linux/suse/people/sbrabec/bzip2/for_downstream/bzip2-1.0.6-autoconfiscated.patch

See patches/autotools and spkg-src for details.

Type

standard

Dependencies

- pkgconf: An implementation of the pkg-config spec

Version Information

package-version.txt:

```
1.0.6-20150304.p0
```
Equivalent System Packages

$ apk add bzip2

$ conda install bzip2

$ apt-cyg install bzip2 libbz2-devel

$ sudo apt-get install libbz2-dev bzip2

$ sudo yum install bzip2 bzip2-devel

$ brew install bzip2

$ sudo zypper install bzip2 pkgconfig\(bzip2\)

$ sudo slackpkg install bzip2

$ sudo xbps-install bzip2-devel

See https://repology.org/project/bzip2/versions

If the system package is installed, ./configure will check if it can be used.

6.1.34 cbc: COIN-OR branch and cut solver for mixed-integer programs

Description

The Computational Infrastructure for Operations Research (COIN-OR**, or simply COIN) project is an initiative to spur the development of open-source software for the operations research community.

The COIN Branch and Cut solver (CBC) is an open-source mixed-integer program (MIP) solver written in C++. CBC is intended to be used primarily as a callable library to create customized branch-and-cut solvers. A basic, stand-alone executable version is also available.

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see github issue #27330 for more information.
6.1.36 cddlib: Double description method for polyhedral representation conversion

**Description**

The C-library cddlib is a C implementation of the Double Description Method of Motzkin et al. for generating all vertices (i.e. extreme points) and extreme rays of a general convex polyhedron in $\mathbb{R}^d$ given by a system of linear inequalities:

$$ P = \{ x=(x_1, \ldots, x_d)^T : b - A x \geq 0 \} $$

where $A$ is a given $m \times d$ real matrix, $b$ is a given $m$-vector and $0$ is the $m$-vector of all zeros.

The program can be used for the reverse operation (i.e. convex hull computation). This means that one can move back and forth between an inequality representation and a generator (i.e. vertex and ray) representation of a polyhedron with cdd. Also, cdd can solve a linear programming problem, i.e. a problem of maximizing and minimizing a linear function over $P$.

**License**

6.1.43 cmake: A cross-platform build system generator

Description

The “cmake” executable is the CMake command-line interface. It may be used to configure projects in scripts. Project configuration settings may be specified on the command line with the -D option. The -i option will cause cmake to interactively prompt for such settings.

CMake is a cross-platform build system generator. Projects specify their build process with platform-independent CMake listfiles included in each directory of a source tree with the name CMakeLists.txt. Users build a project by using CMake to generate a build system for a native tool on their platform.

License

CMake is distributed under the OSI-approved BSD 3-clause License.

6.1.51 coxeter3: Library for Coxeter groups, Bruhat ordering, Kazhdan-Lusztig polynomials

Description

This package wraps Fokko Ducloux's Coxeter 3 C++ library

Features:

- General Coxeter groups, implemented through the combinatorics of reduced words;
- Reduced expression and normal form computations;
- Bruhat ordering;
- Ordinary Kazhdan-Lusztig polynomials;
- Kazhdan-Lusztig polynomials with unequal parameters;
- Inverse Kazhdan-Lusztig polynomials;
- Cells and W-graphs;

http://math.univ-lyon1.fr/~ducloux/coxeter/coxeter3/english/coxeter3_e.html

This is a patched version done by Mike Hansen 2009-2013 and some fixes by Nicolas M. Thiéry and Jean-Pierre Flori.

If the system package is installed and if the (experimental) option --enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.
6.1.53 cryptominisat: A SAT solver

Description

CryptoMiniSat is a SAT solver that aims to become a premiere SAT solver with all the features and speed of successful SAT solvers, such as MiniSat and PrecoSat. The long-term goals of CryptoMiniSat are to be an efficient sequential, parallel and distributed solver. There are solvers that are good at one or the other, e.g. ManySat (parallel) or PSolver (distributed), but we wish to excel at all.

CryptoMiniSat 2.5 won the SAT Race 2010 among 20 solvers submitted by researchers and industry.

• Releases: https://github.com/msoos/cryptominisat/releases

Special Update/Build Instructions

CryptoMiniSat’s tarball downloaded from github is called VERSION.tar.gz and should be renamed to cryptominisat-VERSION.tar.gz Its Python module is installed by the pycryptosat spkg.

Type

optional

Dependencies

• $({PYTHON})
• boost_cropped: Portable C++ libraries (subset needed for Sage)
• cmake: A cross-platform build system generator
• libpng: Bitmap image support
• m4ri: fast arithmetic with dense matrices over GF(2)
• zlib: Data compression library
Version Information

package-version.txt:

5.8.0

Equivalent System Packages

$ conda install cryptominisat
$ brew install cryptominisat

See https://repology.org/project/cryptominisat/versions

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see github issue #27330 for more information.

6.1.54 csdp: Solver for semidefinite programs

Description

This is a fast SDP solver written in C, with a callable library namely, an autotool’ed version of CSDP, by Brian Borchers, see https://projects.coin-or.org/Csdp

License

Common Public License Version 1.0

Upstream Contact

Dmitrii Pasechnik <dimpase+sage@gmail.com>

Special Update/Build Instructions

csdp is an autotool’ed version of CSDP, see https://projects.coin-or.org/Csdp, developed in its own repository at https://github.com/dimpase/csdp.

To update to a new version, you need to bump the version number in configure.ac and rerun autotools (autoreconf -fiv). Any changes should be merged to the upstream repo.

The build is done with NOSHORTS variable defined; this makes it compatible with packages, where NOSHORTS must be defined, e.g. https://github.com/dimpase/pycsdp; also the Sage Cython interface needs NOSHORTS defined.

Detailed steps to build the spkg are as follows. You need

- git
- autotools and libtool (the full autohell suite, version at least 2.67)

With these ready:

- ./spkg-src
- copy the resulting csdp-<version>.tar.gz to SAGE_ROOT/upstream, or somewhere else appropriate
Type

optional

Dependencies

• $\text{BLAS}$

Version Information

genuine -g coin-or-csdp

package-version.txt:

6.2.p1

Equivalent System Packages

See https://repology.org/project/coin-or-csdp/versions, https://repology.org/project/csdp/versions

However, these system packages will not be used for building Sage because \text{spkg-configure.m4} has not been written for this package; see github issue #27330 for more information.

6.1.55 cunningham_tables: List of the prime numbers occurring in the Cunningham table

The script read_cunningham_prime_factors.py was used to generate the data set from the file http://cage.ugent.be/~jdemeyer/cunningham/main.gz We include a local copy, main.gz (see comments in the file for details)
Equivalent System Packages

See https://repology.org/project/cunningham-tables/versions

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see github issue #27330 for more information.

6.1.56 curl: Multiprotocol data transfer library and utility

Description

Multiprotocols data transfer library (and utility).

License

“MIT style license”: see file “COPYING” at the root of the source tarball, explanations at https://curl.haxx.se/docs/copyright.html.

Version Information

package-version.txt:

7.84.0

Equivalent System Packages

$ apk add curl

$ conda install curl

$ apt-cyg install libcurl-devel curl

$ sudo apt-get install curl libcurl4-openssl-dev
$ sudo yum install libcurl-devel curl

$ sudo pkg install ftp/curl

$ brew install curl

No package needed.

$ sudo zypper install curl pkgconfig\(libcurl\)

$ sudo slackpkg install curl cyrus-sasl openldap-client libssh2

$ sudo xbps-install curl libcurl-devel

See https://repology.org/project/curl/versions

If the system package is installed, ./configure will check if it can be used.

### 6.1.57 cvxopt: Python software for convex optimization

**Description**

CVXOPT is a free software package for convex optimization based on the Python programming language. It can be used with the interactive Python interpreter, on the command line by executing Python scripts, or integrated in other software via Python extension modules. Its main purpose is to make the development of software for convex optimization applications straightforward by building on Python’s extensive standard library and on the strengths of Python as a high-level programming language.

**Upstream Contact**

If the system package is installed and if the (experimental) option --enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.
6.1.63 cython: C-Extensions for Python, an optimizing static compiler

Description

Cython is a language that makes writing C extensions for the Python language as easy as Python itself. Cython is based on the well-known Pyrex, but supports more cutting edge functionality and optimizations.

The Cython language is very close to the Python language, but Cython additio- nally supports calling C functions and declaring C types on variables and class attributes. This allows the compiler to generate very efficient C code from Cython code.

This makes Cython the ideal language for wrapping for external C libraries, and for fast C modules that speed up the execution of Python code.

License

### 6.1.64 d3js: JavaScript library for manipulating documents based on data

**Description**

D3.js is a JavaScript library for manipulating documents based on data. The file d3.min.js will be placed into the ${SAGE_SHARE}/d3js/ directory.

**License**

BSD 3-Clause License

**Upstream Contact**

- Author: Mike Bostock (http://bost.ocks.org/mike/)
- Home page: http://d3js.org/
Special Update/Build Instructions

Two kind of archives can be downloaded from d3.js website: one with all source code and tests that weights 2.9M (both in zip and tar.gz formats) and one with the final javascript scripts which weights 121K (zip format only). Since testing requires node.js that is not shipped with Sage, we currently ship the final js only. Hence we have to transform it from zip to tar.gz format. Running sage-src should do all the repackaging job.

Type

optional

Dependencies

Version Information

package-version.txt:

3.4.8

Equivalent System Packages

See https://repology.org/project/node:d3/versions

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see github issue #27330 for more information.

6.1.65 database_cremona_ellcurve: Database of elliptic curves

Description

John Cremona's database of elliptic curves

See https://github.com/JohnCremona/ecdata

This is an optional package, not included by default.

License

Public Domain

Upstream Contact

- Author: John Cremona
- Email: john.cremona@gmail.com
- Website: http://homepages.warwick.ac.uk/staff/J.E.Cremona/
Update Instructions

Get an up-to-date copy of the git repository ecdata from https://github.com/JohnCremona/ecdata.

If the cremona database has already been installed, remove SAGE_DATA/cremona/cremona.db. Then run

The build script expects to find the files in subfolders allcurves, allgens, degphi and allbsd of the ecdata folder. It extracts them and builds the new cremona.db file from the contents.

Finally, copy SAGE_DATA/cremona/cremona.db to the src directory of the spkg.

Type

optional

Dependencies

Version Information

package-version.txt:

```
20190911
```

Equivalent System Packages

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see github issue #27330 for more information.

6.1.78 deformation: Count points on hypersurfaces using the deformation method

Description

Deformation is a C library for counting points on hypersurfaces using the deformation method, developed by Sebastian Pancratz.

License

GLPv3

Upstream Contact

- Sebastian Pancratz: sebastian.pancratz@gmail.com, sage-devel@googlegroups.com
- We use the fork at https://github.com/sagemath/deformation the fork uses GMP instead of MPIR, and Flint 2.7+.

Type

experimental

Dependencies

- $(MP_LIBRARY)
- flint: Fast Library for Number Theory
- mpfr: Multiple-precision floating-point computations with correct rounding

Version Information

package-version.txt:

20210503

Equivalent System Packages

See https://repology.org/project/deformation/versions

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see github issue #27330 for more information.
6.1.79 defusedxml: Addresses vulnerabilities of XML parsers and XML libraries

**Description**

defusedxml addresses vulnerabilities of XML parsers and XML libraries.

It became a dependency of nbconvert starting with nbconvert 5.4.

**License**

Python Software Foundation License (PSFL)

**Upstream Contact**

https://pypi.org/project/defusedxml/

**Special Update/Build Instructions**

None.

**Type**

standard

**Dependencies**

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)

**Version Information**

package-version.txt:

```
0.7.1
```

install-requires.txt:

```
defusedxml >=0.6.0
```

**Equivalent System Packages**

```
$ conda install defusedxml
$ sudo emerge dev-python/defusedxml
$ sudo port install py-defusedxml
```
$ sudo xbps-install python3-defusedxml

See https://repology.org/project/python:defusedxml/versions

If the system package is installed and if the (experimental) option --enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.

6.1.80 distlib: Distribution utilities

Description

Distribution utilities

License

PSF-2.0

Upstream Contact

Type

standard

Dependencies

- $(PYTHON)
  - pip: Tool for installing and managing Python packages

Version Information

package-version.txt:

0.3.8

install-requires.txt:

distlib
Equivalent System Packages

$ conda install distlib

$ sudo xbps-install python3-distlib

If the system package is installed, ./configure will check if it can be used.

6.1.81 docutils: Processing plaintext documentation into useful formats, such as HTML or LaTeX

Description

Docutils is a modular system for processing documentation into useful formats, such as HTML, XML, and LaTeX. For input Docutils supports reStructuredText, an easy-to-read, what-you-see-is-what-you-get plaintext markup syntax.

License

public domain, Python, 2-Clause BSD, GPL 3 (see COPYING.txt)

Upstream Contact

https://pypi.org/project/docutils/
Home Page: http://docutils.sourceforge.net/

Type

standard

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)

Version Information

package-version.txt:

0.20.1

install-requires.txt:

docutils >=0.14
**Equivalent System Packages**

$ conda install docutils

$ sudo emerge dev-python/docutils

$ brew install docutils

$ sudo port install py-docutils

$ sudo zypper install python3\${PYTHON_MINOR}-docutils

$ sudo xbps-install python3-docutils

See https://repology.org/project/docutils/versions, https://repology.org/project/python:docutils/versions

If the system package is installed and if the (experimental) option --enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.

**6.1.82 dot2tex: Create PGF/TikZ commands from Graphviz output**

**Description**

dot2tex is a Python module, whose purpose is to give graphs generated by Graphviz a more LaTeX friendly look and feel. This is accomplished by converting xdot output from Graphviz to a series of PSTricks or PGF/TikZ commands.

See https://github.com/kjellmf/dot2tex/

**License**

- MIT

**Upstream Contact**

- Kjell Magne Fauske, km@fauskes.net

**Dependencies**

graphviz (www.graphviz.org) should be installed and in the path (for example via the graphviz spkg).

preview, a LaTeX package for extracting parts of a document.

Self-tests dependencies:

- graphviz
- texlive-latex-base
- texlive-pictures
- texlive-pstricks
Patches

- remove_test_semicolon.patch:
  Remove the failing semicolon test for the open dot2tex issue #5 - https://github.com/kjellmf/dot2tex/issues/5

Special Update/Build Instructions

Make sure corresponding optional doctests still pass:

```
sage -t --long -optional=dot2tex,graphviz,sage src/
```

Type

optional

Dependencies

- `${PYTHON}`
- `${PYTHON_TOOLCHAIN}`
- `pyparsing: A Python parsing module`

Version Information

package-version.txt:

```
2.11.3.p0
```

install-requires.txt:

```
dot2tex >=2.11.3
```

Equivalent System Packages

```
$ sudo pacman -S dot2tex
```

```
$ conda install dot2tex
```

```
$ sudo port install dot2tex
```

See https://repology.org/project/dot2tex/versions, https://repology.org/project/python:dot2tex/versions

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see github issue #27330 for more information.
6.1.83 dsdp: Semidefinite programming solver

Description

Implementation of an interior-point method for semidefinite programming. It provides primal and dual solutions, exploits low-rank structure and sparsity in the data, and has relatively low memory requirements for an interior-point method. It allows feasible and infeasible starting points and provides approximate certificates of infeasibility when no feasible solution exists. The dual-scaling algorithm implemented in this package has a convergence proof and worst-case polynomial complexity under mild assumptions on the data.

License

See https://repology.org/project/dsdp/versions

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see github issue #27330 for more information.

6.1.84 e_antic: Real embedded number fields

Description

e-antic is a C library for exact computations with real embedded number field maintained by Vincent Delecroix.
Website: https://github.com/videlec/e-antic

License

e-antic is licensed GPL v3.

Upstream Contact

- https://github.com/videlec/e-antic

Type

optional

Dependencies

- $(${MP_LIBRARY})
- boost_cropped: Portable C++ libraries (subset needed for Sage)
- flint: Fast Library for Number Theory

Version Information

colorado.txt:

```
2.0.0
```
Equivalent System Packages

```
$ sudo pacman -S e-antic
$ conda install libeantic
$ sudo apt-get install libeantic-dev
$ sudo yum install e-antic-devel
$ sudo pkg install math/e-antic
$ sudo zypper install e-antic-devel
```

See https://repology.org/project/e-antic/versions

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see github issue #27330 for more information.

6.1.85 ecl: An implementation of the Common Lisp language

Description

ECL is an implementation of the Common Lisp language as defined by the ANSI X3J13 specification. The most relevant features:

- A bytecodes compiler and interpreter.
- Compiles Lisp also with any C/C++ compiler.
- It can build standalone executables and libraries.
- ASDF, Sockets, Gray streams, MOP, and other useful components.
- Extremely portable.
- A reasonable license.

ECL supports the operating systems Linux, FreeBSD, NetBSD, OpenBSD, Solaris and Windows, running on top of the Intel, Sparc, Alpha and PowerPC processors. Porting to other architectures should be rather easy.

Website: https://common-lisp.net/project/ecl/

License

- LGPL V2+ or compatible - for details see
  https://common-lisp.net/project/ecl/static/manual/Copyrights.html#Copyright-of-ECL
Upstream Contact

- the ECL mailing list - see https://mailman.common-lisp.net/listinfo/ecl-devel

Special Update/Build Instructions

- Note: for the time being, ECL is built single threaded library as it seems to interact badly with the pexpect interface and Sage’s signal handling when built multithreaded.
- Do NOT quote SAGE_LOCAL when setting CPPFLAGS and/or LDFLAGS, in spkg-install as this caused the build to break. See github issue #10187#comment:117
- TODO: Add the ECL test suite, and an spkg-check file to run it.
- TODO: Make ECL use Sage’s Boehm GC on MacOS X as well (but perhaps put some changes from ECL’s into Sage’s Boehm GC), then remove the src/src/gc directory, too.

Type

standard

Dependencies

- $(MP_LIBRARY)
- gc: The Boehm-Demers-Weiser conservative garbage collector
- info: stand-alone Info documentation reader
- libffi: A portable foreign-function interface library
- readline: Command line editing library

Version Information

package-version.txt:

23.9.9

Equivalent System Packages

$ apk add ecl-dev
$ sudo pacman -S ecl
$ conda install ecl
$ sudo apt-get install ecl
$ sudo yum install ecl
$ sudo pkg install lang/ecl

$ sudo emerge dev-lisp/ecl

$ brew install ecl

$ sudo port install ecl

$ nix-env --install ecl

$ sudo xbps-install ecl

See https://repology.org/project/ecl/versions

If the system package is installed, ./configure will check if it can be used.

6.1.86 eclib: Enumerating and computing with elliptic curves defined over the rational numbers

Description

John Cremona's programs for enumerating and computing with elliptic curves defined over the rational numbers.

mwrank is a program written in C++ for computing Mordell-Weil groups of elliptic curves over Q via 2-descent. It is available as source code in the eclib package, which may be distributed under the GNU General Public License, version 2, or any later version.

mwrank is now only distributed as part of eclib. eclib is also included in Sage, and for most potential users the easiest way to run mwrank is to install Sage (which also of course gives you much much more). I no longer provide a source code distribution of mwrank by itself: use eclib instead.

License

eclib is licensed GPL v2+.

Upstream Contact

- `$ sudo emerge sci-mathematics/eclib\[flint\]`
- `$ nix-env --install eclip`
- `$ sudo xbps-install eclip-devel`

See [https://repology.org/project/eclib/versions](https://repology.org/project/eclib/versions)

If the system package is installed, `.configure` will check if it can be used.

**6.1.87 ecm: Elliptic curve method for integer factorization**

Description

GMP-ECM - Elliptic Curve Method for Integer Factorization

Sources can be obtained from [https://gitlab.inria.fr/zimmerma/ecm](https://gitlab.inria.fr/zimmerma/ecm)
License

LGPL V3+

Upstream Contact

- ecm-discuss@inria.fr

Special Update/Build Instructions

- GMP-ECM comes with a self-tuning feature; we could support that as an option ($SAGE_TUNE_*=yes) in the future.
- ECM currently does not (by itself) use the CC and CFLAGS settings from ‘gmp.h’ since we pass (other) options in CFLAGS, and CC is set by Sage and might get set by the user. We now at least partially fix that such that “optimized” code generation options (‘-mcpu=…’, ‘-mtune=…’) are used by gcc. Of course a user can also manually enable them by setting the “global” CFLAGS to e.g. ‘-march=native’ on x86[_64] systems, or ‘-mcpu=…’ and ‘-mtune=…’ on other architectures where “native” isn’t supported. Note that this doesn’t affect the packages’ selection of processor-specific optimized [assembly] code. ‘spkg-install’ already reads the settings from Sage’s and also a system-wide GMP now, but doesn’t (yet) use all of them. If SAGE_FAT_BINARY=”yes”, we should avoid too specific settings of “-mcpu=…”, and perhaps pass a more generic “-host=…” to ‘configure’.
- We currently work around a linker bug on MacOS X 10.5 PPC (with GCC 4.2.1) which breaks ‘configure’ if debug symbols are enabled. This *might* get fixed in later upstream releases.
- We could save some space by removing the src/build.vc10/ directory which isn’t used in Sage. (It gets probably more worth in case also directories / files for later versions of Microsoft Visual C get added.)

Type

standard

Dependencies

- $(MP_LIBRARY)

(none known)

6.1.104 free_fonts: a free family of scalable outline fonts

Description

This dummy package represents the GNU free fonts: a free family of scalable outline fonts, suitable for general use on computers and for desktop publishing. It is Unicode-encoded for compatibility with all modern operating systems.

We do not have an SPKG for it. The purpose of this dummy package is to associate system package lists with it.

install the following packages: fonts/freefont-ttf

$ sudo zypper install gnu-free-fonts

$ sudo xbps-install freefont-ttf

If the system package is installed, ./configure will check if it can be used.
6.1.105 freetype: A free, high-quality, and portable font engine

Description

From the documentation:

FreeType is a software font engine that is designed to be small, efficient, highly customizable, and portable while capable of producing high-quality output (glyph images). It can be used in graphics libraries, display servers, font conversion tools, text image generation tools, and many other products as well.

Note that FreeType is a font service and doesn’t provide APIs to perform higher-level features like text layout or graphics processing (e.g., colored text rendering, ‘hollowing’, etc.). However, it greatly simplifies these tasks by providing a simple, easy to use, and uniform interface to access the content of font files.

Please note that ‘FreeType’ is also called ‘FreeType 2’, to distinguish it from the old, deprecated ‘FreeType 1’ library, a predecessor no longer maintained and supported.

The package in Sage is called freetype (in lowercase).

License

- FreeType (BSD-like)
- GNU Public License v2

From the documentation:

FreeType is released under two open-source licenses: our own BSD-like FreeType License and the GNU Public License, Version 2. It can thus be used by any kind of projects, be they proprietary or not.

6.1.107 frobby: Computations on monomial ideals

Description

The software package Frobby provides a number of computations on monomial ideals. The current main feature is the socle of a monomial ideal, which is largely equivalent to computing the maximal standard monomials, the Alexander dual or the irreducible decomposition.

Operations on monomial ideals are much faster than algorithms designed for ideals in general, which is what makes a specialized library for these operations on monomial ideals useful.
License

- GPL version 2.0 or later

Upstream Contact

6.1.110 gap: Groups, Algorithms, Programming - a system for computational discrete algebra

Description

GAP is a system for computational discrete algebra, with particular emphasis on Computational Group Theory. GAP provides a programming language, a library of thousands of functions implementing algebraic algorithms written in the GAP language as well as large data libraries of algebraic objects. See also the overview and the description of the mathematical capabilities. GAP is used in research and teaching for studying groups and their representations, rings, vector spaces, algebras, combinatorial structures, and more. The system, including source, is distributed freely. You can study and easily modify or extend it for your special use.

This is a stripped-down version of GAP. The databases, which are architecture-independent, are in a separate package.

Upstream Contact

https://www.gap-system.org

Mailing list at https://mail.gap-system.org/mailman/listinfo/gap
Special Update/Build Instructions

This is a stripped-down version of GAP. The downloading of the sources and removal of unneeded parts is done by the script spkg-src. When you update GAP, please also update and use the spkg-src script.

- Do we really want to copy everything from the build directory???
  You need the full GAP tree to compile/install many GAP packages.
- There’s apparently a command missing (in spkg-install) building the (HTML?) documentation. Earlier changelog entries as well as the description above state the documentation was removed from the upstream sources... Since the (pre-)built HTML documentation is currently included, I've commented out some lines in that part of spkg-install. -leif

6.1. Details of external packages
6.1.111 gap3: A minimal distribution of GAP 3 containing packages that have no equivalent in GAP 4

Description

This package installs Jean Michel's pre-packaged GAP3, which is a minimal GAP3 distribution containing packages that have no equivalent in GAP4.

Below is the full description from Jean Michel’s webpage (accessed 23 July 2015).

A pre-packaged GAP3 with everything you need

To help people who are just interested in GAP3 because they need a package which has not been ported to GAP4, I have prepared an easy-to install minimal GAP3 distribution containing an up-to-date versions of the packages:

anusq, arep, autag, chevie, cryst, dce, grim, matrix, meataxe, monoid, nq, pcqa, sisyphos, specht, ve, vkcurve.

These packages have been chosen since most have no equivalent in GAP4. They are autoloaded when starting gap.

This distribution includes only partial lists of small groups, 2-groups, 3-groups, character tables from the Atlas and tables of marks. It does not include either the packages:

anupq, grape, kbmag, xgap, cohomolo, gliss, guava, xmod

which have some equivalent in GAP4. You can get these extra features at

http://www.math.rwth-aachen.de/~Frank.Luebeck/gap/GAP3

In this distribution:

• The on-line help includes the documentation of the included packages.
• The html documentation (htm/index.html) also does.
• The manual (manual.pdf) also does.

License

Most parts of the GAP distribution, including the core part of the GAP system, are distributed under the terms of the GNU General Public License (see http://www.gnu.org/licenses/gpl.html or the file GPL in the etc directory of the GAP installation).

SPKG Maintainers

6.1.113 gap_packages: A collection of GAP packages

Description

Several “official” and “undeposited” GAP packages available from https://www.gap-system.org/Packages/packages.html

Installing this SPKG will install the corresponding GAP packages, but before you can use them in Sage, they still have to be loaded into either the GAP interface or libgap:

```
sage: gap.eval('LoadPackage("Grape")')  # optional - gap_packages
'true'
sage: libgap.LoadPackage("Grape")  # optional - gap_packages
true
```

Those correspond to:
within the GAP interface and libgap, respectively.

**Upstream Contact**

Mailing list at https://mail.gap-system.org/mailman/listinfo/gap

**Dependencies**

- GAP (a standard spkg)

**TODO**

The crystallographic group packages are untested/untestable. They rely on polymake and the dependency “cryst” is missing. This needs to be cleaned up.

**Notes**

A brief description of each package follows:

cohomolo - The cohomolo package is a GAP interface to some C programs for computing Schur multipliers and covering groups of finite groups and first and second cohomology groups of finite groups acting on finite modules. (Author: Max Horn, Markus Pfeiffer)

CoReLG - Contains functionality for working with real semisimple Lie algebras. (Author: Heiko Dietrich, Paolo Faccin, Willem Adriaan de Graaf)

crime - package to compute the cohomology ring of finite p-groups, induced maps, and Massey products. (Author: Marcus Bishop)

cryst - Computing with crystallographic groups (Authors: Bettina Eick, Franz Gähler, Werner Nickel)

CTblLib - The GAP Character Table Library (Author: Thomas Breuer)

DESIGN is a package for classifying, partitioning and studying block designs. (Author: Leonard H. Soicher)

FactInt is a package providing routines for factoring integers, in particular:

- Pollard’s p-1
- Williams’ p+1
- Elliptic Curves Method (ECM)
- Continued Fraction Algorithm (CFRAC)
- Multiple Polynomial Quadratic Sieve (MPQS)

(Author: Stefan Kohl)

GAPDoc is a package containing a definition of a structure for GAP documentation, based on XML. It also contains conversion programs for producing text-, DVI-, PDF- or HTML-versions of such documents, with hyperlinks if possible. (Authors: Frank Luebeck, Max Neunhoeffer)

GBNP - The GBNP package provides algorithms for computing Grobner bases of noncommutative polynomials with coefficients from a field implemented in GAP and with respect to the “total degree first then lexicographical” ordering. Further provided are some variations, such as a weighted and truncated version and a tracing facility. The word “algorithm”

---

6.1. Details of external packages
is to be interpreted loosely here: in general one cannot expect such an algorithm to terminate, as it would imply solvability of the word problem for finitely presented (semi)groups. (Authors: A.M. Cohen, J.W. Knopper)

GRAPE is a package for computing with graphs and groups, and is primarily designed for constructing and analysing graphs related to groups, finite geometries, and designs. (Author: Leonard H. Soicher)

GUAVA is included here, and with Sage standard.

HAP (Homological Algebra Programming) is a GAP package providing some functions for group cohomology computation. (Author: Graham Ellis)

HAPcryst - an extension package for HAP, which allows for group cohomology computation for a wider class of groups. (Author: Marc Roeder)

hecke - Provides functions for calculating decomposition matrices of Hecke algebras of the symmetric groups and q-Schur algebras. Hecke is a port of the GAP 3 package Specht 2.4 to GAP 4. (Author: Dmitriy Traytel)

LAGUNA - this package provides functionality for calculation of the normalized unit group of the modular group algebra of the finite p-group and for investigation of Lie algebra associated with group algebras and other associative algebras. (Authors: Victor Bovdi, Alexander Konovalov, Richard Rossmanith, Csaba Schneider)

liealgdb - A database of Lie algebras (Author: Serena Cicalo', Willem Adriaan de Graaf, Csaba Schneider)

LiePRing - Database and algorithms for Lie p-rings (Author: Michael Vaughan-Lee, Bettina Eick)

LieRing - contains functionality for working with finitely presented Lie rings and the Lazard correspondence. (Author: Serena Cicalo', Willem Adriaan de Graaf)

loops - Provides researchers in nonassociative algebra with a computational tool that integrates standard notions of loop theory with libraries of loops and group-theoretical algorithms of GAP. The package also expands GAP toward nonassociative structures. (Authors: Gabor Nagy, Petr Vojtechovsky)

mapclass - The package calculates the mapping class group orbits for a given finite group. (Authors: Adam James, Kay Magaard, Sergey Shpectorov, Helmut Volklein)

polymake - an interface with the (standalone) polymake program used by HAPcryst. (Author: Marc Roeder)

qpa - Quivers and Path Algebras provides data structures and algorithms for doing computations with finite dimensional quotients of path algebras, and finitely generated modules over such algebras. The current version of the QPA package has data structures for quivers, quotients of path algebras, and modules, homomorphisms and complexes of modules over quotients of path algebras. (Authors: Edward Green, Oeyvind Solberg)

quagroup - Contains functionality for working with quantized enveloping algebras of finite-dimensional semisimple Lie algebras. (Author: Willem Adriaan de Graaf)

repsn - The package provides GAP functions for computing characteristic zero matrix representations of finite groups. (Author: Vahid Dabbaghian)

sla - a package for doing computations with simple Lie algebras (Author: Willem Adriaan de Graaf)

SONATA (“System Of Nearrings And Their Applications”) is a package which constructs finite nearrings and related objects. (Authors: Erhard Aichinger, Franz Binder, Jürgen Ecker, Peter Mayr, Christof Noebauer)

TORIC is a GAP package for computing with toric varieties. (Author: David Joyner)
Type

### 6.1.116 gcc: The GNU Compiler Collection or other suitable C and C++ compilers

**Description**

This package represents the required C and C++ compilers.

- GCC (GNU Compiler Collection) versions 8.x (>= 8.4.0) to 13.x are supported.
- Clang (LLVM) is also supported.

The required Fortran compiler is represented by the package `gfortran`.

You can pass the names of compilers to use to `./configure` using the environment variables `CC`, `CXX`, and `FC`, for C, C++, and Fortran compilers, respectively.

For example, if your C compiler is `clang`, your C++ compiler is `clang++`, and your Fortran compiler is `flang`, then you would need to run:

```bash
$ ./configure CC=clang CXX=clang++ FC=flang
```

Vendor and versions of the C and C++ compilers should match.

Users of older Linux distributions (in particular, `ubuntu-xenial` or older, `debian-buster` or older, `linuxmint-18` or older) should upgrade their systems before attempting to install Sage from source. Users of `ubuntu-bionic`, `linuxmint-19.x`, and `opensuse-15.x` can install a versioned `gcc` system package and then use:

```bash
$ ./configure CC=gcc-8 CXX=g++-8 FC=gfortran-8
```

or similar. Users on `ubuntu` can also install a modern compiler toolchain using the `ubuntu-toolchain-r ppa`. On `ubuntu-trusty`, also the package `binutils-2.26` is required; after installing it, make it available using `export PATH=/usr/lib/binutils-2.26/bin:$PATH`. Instead of upgrading their distribution, users of `centos-7` can install a modern compiler toolchain using Redhat's `devtoolset`.

This package uses the non-standard default `configure --with-system-gcc=force`, giving an error at configure time when no suitable system compilers are configured.

You can override this using `./configure --without-system-gcc`. In this case, Sage builds and installs the GNU Compiler Collection, including the C, C++ and Fortran compiler. This is not recommended. You will need suitable C and C++ compilers from which GCC can bootstrap itself. There are some known problems with old assemblers, in particular when building the `ecm` and `fflas_ffpack` packages. You should ensure that your assembler understands all instructions for your processor. On Linux, this means you need a recent version of `binutils` (not provided by an SPKG); on macOS you need a recent version of `Xcode`.

(Installing the `gfortran` SPKG becomes a no-op in this case.)

Building Sage from source on Apple Silicon (M1/M2) requires the use of Apple’s Command Line Tools, and those tools include a suitable compiler. Sage’s `gcc` SPKG is not suitable for M1/M2; building it will likely fail.

6.1.120 gfan: Groebner fans and tropical varieties

Description

Gfan is a software package for computing Groebner fans and tropical varieties.

These are polyhedral fans associated to polynomial ideals. The maximal cones of a Groebner fan are in bijection with the marked reduced Groebner bases of its defining ideal. The software computes all marked reduced Groebner bases of an ideal. Their union is a universal Groebner basis. The tropical variety of a polynomial ideal is a certain subcomplex of the Groebner fan. Gfan contains algorithms for computing this complex for general ideals and specialized algorithms for tropical curves, tropical hypersurfaces and tropical varieties of prime ideals. In addition to the above core functions the package contains many tools which are useful in the study of Groebner bases, initial ideals and tropical geometry. The full list of commands can be found in Appendix B of the manual. For ordinary Groebner basis computations Gfan is not competitive in speed compared to programs such as CoCoA, Singular and Macaulay2.
License

6.1.121 gfortran: Fortran compiler from the GNU Compiler Collection

Description

This package represents the required Fortran compiler.

Officially we support gfortran from GNU Compiler Collection (GCC). It has also been reported that using flang (from LLVM) might work.

You can pass the names of compilers to use to ./configure using the environment variables CC, CXX, and FC, for C, C++, and Fortran compilers, respectively.

For example, if your C compiler is clang, your C++ compiler is clang++, and your Fortran compiler is flang, then you would need to run:

$ ./configure CC=clang CXX=clang++ FC=flang

License

GPL version 2 or version 3

Upstream Contact

http://gcc.gnu.org/

Special Update/Build Instructions

None.

Type

standard

Dependencies

- $(MP_LIBRARY)
- mpc: Arithmetic of complex numbers with arbitrarily high precision and correct rounding
- mpfr: Multiple-precision floating-point computations with correct rounding
- xz: General-purpose data compression software
- zlib: Data compression library
Version Information

package-version.txt:
12.2.0

Equivalent System Packages

$ apk add gfortran
$ sudo pacman -S gcc-fortran
$ conda install fortran-compiler
$ apt-cyg install gcc-fortran
$sudo apt-get install gfortran
$ sudo yum install gcc-gfortran
$ sudo pkg install lang/gcc9
$ brew install gfortran
$ sudo port install gcc10 +gfortran
$ sudo zypper install gcc-fortran
$ sudo slackpkg install gcc-gfortran
$ sudo xbps-install gcc-fortran

See https://repology.org/project/gfortran/versions
If the system package is installed, ./configure will check if it can be used.

6.1.122 giac: A general purpose computer algebra system

Description

- Giac is a general purpose Computer algebra system by Bernard Parisse. It consists of:
- a C++ library (libgiac).
- a command line interpreter (icas or giac).
- the built of the FLTK-based GUI (xcas) has been disabled in the spkg-install file.
- The english documentation will be installed in:
• Author’s website with debian, ubuntu, macosx, windows package:
   http://www-fourier.ujf-grenoble.fr/~parisse/giac.html
• The FreeBSD port is math/giacxcas

Licence

GPLv3+

Note: except the French HTML documentation which is freely redistributable for non-commercial only purposes. This document has been removed in the Sage package, see spkg-src

Upstream Contact

• Bernard Parisse: http://www-fourier.ujf-grenoble.fr/~parisse/giac.html
• Source file (giac-x.y.z-t.tar.gz) in:

Dependencies

• gettext, readline
• giac will benefit of ntl, pari, mpfr, gsl, lapack but they should be already installed by sage.
• giac can also benefit of mpfi for arithmetic on intervals.
• The Documentation is pre-built, hevea or latex or … are not needed to install the package.

Special Update/Build Instructions

• Use spkg-src to update this package

Type

standard

Dependencies

• $\$(MP\_LIBRARY)$
• cliquer: Routines for clique searching
• curl: Multiprotocol data transfer library and utility
• ecm: Elliptic curve method for integer factorization
• glpk: GNU Linear Programming Kit
• gsl: The GNU Scientific Library
• libpng: Bitmap image support
• mpfi: Multiple precision interval arithmetic library based on MPFR
• mpfr: Multiple-precision floating-point computations with correct rounding
• ntl: A library for doing number theory
• pari: Computer algebra system for fast computations in number theory
• readline: Command line editing library

Version Information

package-version.txt:

1.9.0.15p0

Equivalent System Packages

$ sudo pacman -S libgiac giac

$ conda install giac

$ sudo apt-get install libgiac-dev xcas

$ sudo yum install giac giac-devel

$ sudo pkg install math/giacxcas

$ nix-env --install giac

$ sudo zypper install giac-devel

$ sudo xbps-install giac-devel

See https://repology.org/project/giac/versions

If the system package is installed, ./configure will check if it can be used.

6.1.123 git: Version control system

Description

Git is a fast, scalable, distributed revision control system with an unusually rich command set that provides both high-operations and full access to internals.

• man git
Upstream Contact

- Website: https://git-scm.com/

Type

optional

Dependencies

Version Information

Equivalent System Packages

```bash
$ sudo pacman -S git
$ conda install git
$ apt-cyg install git
$ sudo apt-get install git
$ sudo yum install git
$ sudo pkg install devel/git
$ brew install git
$ sudo port install git
$ sudo zypper install git
$ sudo slackpkg install git
$ sudo xbps-install git
```

See https://repology.org/project/git/versions

If the system package is installed, `./configure` will check if it can be used.

6.1.124 `github_cli`: Command-line interface for GitHub

Description

`gh` is GitHub on the command line. It brings pull requests, issues, and other GitHub concepts to the terminal next to where you are already working with `git` and your code.
License

6.1.126 givaro: C++ library for arithmetic and algebraic computations

Description

Givaro is a C++ library for arithmetic and algebraic computations. Its main features are implementations of the basic arithmetic of many mathematical entities: Primes fields, Extensions Fields, Finite Fields, Finite Rings, Polynomials, Algebraic numbers, Arbitrary precision integers and rationals (C++ wrappers over gmp) It also provides data-structures and templated classes for the manipulation of basic algebraic objects, such as vectors, matrices (dense, sparse, structured), univariate polynomials (and therefore recursive multivariate).

See https://repology.org/project/givaro/versions

If the system package is installed, ./configure will check if it can be used.
6.1.127 glpk: GNU Linear Programming Kit

Description

The GLPK (GNU Linear Programming Kit) package is intended for solving large-scale linear programming (LP), mixed integer programming (MIP), and other related problems. It is a set of routines written in ANSI C and organized in the form of a callable library.

GLPK supports the GNU MathProg modelling language, which is a subset of the AMPL language.

The GLPK package includes the following main components:

- primal and dual simplex methods
- primal-dual interior-point method
- branch-and-cut method
- translator for GNU MathProg
- application program interface (API)
- stand-alone LP/MIP solver

License

The GLPK package is GPL version 3.

Upstream Contact

GLPK is currently being maintained by:

- Andrew Makhorin (mao@gnu.org, mao@mai2.rcnet.ru)

http://www.gnu.org/software/glpk/#maintainer

Special Update/Build Instructions

- `configure` doesn't support specifying the location of the GMP library to use; only `--with-gmp=yes` or `--with-gmp=no` are valid options. (So we *have to* add Sage's include and library directories to `CPPFLAGS` and `LDFLAGS`, respectively.)
- Do we need the `--disable-static`? The stand-alone solver presumably runs faster when built with a static library; also other (stand-alone) programs using it would. (Instead, we should perhaps use `--enable-static --enable-shared` to go safe.)

Patches

- All patches below are currently used by spkg-src
- src/01-zlib.patch: don't build the included zlib library.
  The numbering reflect the order in which they have been created from glpk pristine's sources
Packages and Features, Release 10.3

$ sudo zypper install glpk glpk-devel
$ sudo xbps-install glpk-devel

See https://repology.org/project/glpk/versions
If the system package is installed, ./configure will check if it can be used.
6.1.128 glucose: A SAT solver

Description

Glucose is a SAT solver.

Citing its website:

The name of the solver is a contraction of the concept of “glue clauses”, a particular kind of clauses that glucose detects and preserves during search. Glucose is heavily based on Minisat, so please do cite Minisat also if you want to cite Glucose.

License

- nonparallel glucose: MIT
- parallel glucose-syrup: MIT modified with:

The parallel version of Glucose (all files modified since Glucose 3.0 releases, 2013) cannot be used in any competitive event (sat competitions/evaluations) without the express permission of the authors (Gilles Audemard / Laurent Simon). This is also the case for any competitive event using Glucose Parallel as an embedded SAT engine (single core or not).

Upstream Contact

Website: http://www.labri.fr/perso/lsimon/glucose/

Special Update/Build Instructions

None.

Type

optional

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see github issue #27330 for more information.

6.1.129 gmp: Library for arbitrary precision arithmetic

Description

GMP is a free library for arbitrary precision arithmetic, operating on signed integers, rational numbers, and floating-point numbers. There is no practical limit to the precision except the ones implied by the available memory in the machine GMP runs on. GMP has a rich set of functions, and the functions have a regular interface.

If the system package is installed and if the (experimental) option --enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.
6.1.149 iml: Integer Matrix Library

Description

IML is a free library of C source code which implements algorithms for computing exact solutions to dense systems of linear equations over the integers. IML is designed to be used with the ATLAS/BLAS library and GMP bignum library. Written in portable C, IML can be used on both 32-bit and 64-bit machines. It can be called from C++.

Website: https://www.cs.uwaterloo.ca/~astorjoh/iml.html

License

- GPLv2+

Upstream Contact

# According to https://pypi.org/project/importlib-resources/,
# version 5.7 provides the features of Python 3.11 importlib.resources
importlib_resources >= 5.7; python_version<"3.11"
Equivalent System Packages

$ conda install importlib-resources

$ sudo apt-get install python3-importlib-resources

$ sudo emerge dev-python/importlib_resources

If the system package is installed and if the (experimental) option --enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.

6.1.152 info: stand-alone Info documentation reader

Description

GNU Info is the stand-alone “info” reader that is part of the GNU Texinfo suite of tools. Several packages (Maxima, Singular, …) install documentation in “info” format, which can be read either with Emacs, the stand-alone “info” reader, and some other software. In particular, the interactive help system of singular_console() uses the info program in environments in which a web browser is not available; if info is not installed, it falls back to a basic pager with limited capabilities.

Website: https://www.gnu.org/software/texinfo/manual/info-stnd/info-stnd.html

License

GPL-3+ (info/*.c comments in the source repository)

Type

standard

Dependencies

- ncurses: Classic terminal output library
- xz: General-purpose data compression software

### 6.1.153 ipykernel: IPython Kernel for Jupyter

#### Description

This package provides the IPython kernel for Jupyter.

#### Type

standard

#### Dependencies

- `${PYTHON}`
- `${PYTHON_TOOLCHAIN}`
- `appnope`: Disable App Nap on macOS >= 10.9
- `comm`: Jupyter Python Comm implementation, for usage in ipykernel, xeus-python etc.
- `debugpy`: An implementation of the Debug Adapter Protocol for Python
- `hatchling`: Modern, extensible Python build backend
- `ipython`: Interactive computing environment with an enhanced interactive Python shell
- `jupyter_client`: Jupyter protocol implementation and client libraries
• jupyter_core: Jupyter core package
• matplotlib_inline: Inline Matplotlib backend for Jupyter
• nest_asyncio: Patch asyncio to allow nested event loops
• packaging: Core utilities for Python packages
• psutil: Cross-platform lib for process and system monitoring in Python.
• pyzmq: Python bindings for the zeromq networking library
• tornado: Python web framework and asynchronous networking library
• traitlets: Traitlets Python configuration system

Version Information

package-version.txt:

6.27.1

install-requires.txt:

ipykernel >=5.2.1

Equivalent System Packages

$ sudo pacman -S python-ipykernel

$ conda install ipykernel

$ sudo apt-get install python3-ipykernel

$ sudo yum install python-ipykernel

$ sudo pkg install devel/py-ipykernel

$ sudo emerge dev-python/ipykernel

$ sudo port install py-ipykernel

$ sudo zypper install python3\${PYTHON_MINOR}-ipykernel

$ sudo xbps-install python3-ipython_ipykernel

See https://repology.org/project/python:ipykernel/versions

If the system package is installed and if the (experimental) option --enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.
6.1.154 ipympl: Matplotlib Jupyter Extension

Description

Matplotlib Jupyter Extension

License

BSD License

Upstream Contact

See https://repology.org/project/python:ipympl/versions

If the system package is installed and if the (experimental) option --enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.

6.1.155 ipython: Interactive computing environment with an enhanced interactive Python shell

Description

Interactive computing environment with an enhanced interactive Python shell

From the IPython website:

IPython is a multiplatform, Free Software project (BSD licensed) that offers:

- An enhanced Python shell designed for efficient interactive work. It includes many enhancements over the default Python shell, including the ability for controlling interactively all major GUI toolkits in a non-blocking manner.

- A library to build customized interactive environments using Python as the basic language (but with the possibility of having extended or alternate syntaxes).

- A system for interactive distributed and parallel computing (this is part of IPython’s new development).

License

BSD

Upstream Contact

$ sudo xbps-install python3-jupyter_ipywidgets

See https://repology.org/project/python:ipywidgets/versions

If the system package is installed and if the (experimental) option --enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.

6.1.158 isl: Sets and relations of integer points bounded by affine constraints

Description

isl is a thread-safe C library for manipulating sets and relations of integer points bounded by affine constraints. The descriptions of the sets and relations may involve both parameters and existentially quantified variables. All computations are performed in exact integer arithmetic using GMP.

License

isl is released under the MIT license, but depends on the LGPL GMP library.

- $ sudo port install py-jedi
- $ sudo xbps-install python3-jedi

See [https://repology.org/project/jedi/versions](https://repology.org/project/jedi/versions), [https://repology.org/project/python:jedi/versions](https://repology.org/project/python:jedi/versions)

If the system package is installed and if the (experimental) option **--enable-system-site-packages** is passed to **./configure**, then **./configure** will check if the system package can be used.
6.1.161 jinja2: General purpose template engine for Python

Description

Jinja2 is a library for Python 2.4 and onwards that is designed to be flexible, fast and secure.

If you have any exposure to other text-based template languages, such as Smarty or Django, you should feel right at home with Jinja2. It's both designer and developer friendly by sticking to Python's principles and adding functionality useful for templating environments.

License

BSD-3-Clause

Upstream Contact

https://pypi.org/project/Jinja2/

Type

standard

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- docutils: Processing plaintext documentation into useful formats, such as HTML or LaTeX
- markupsafe: Safely add untrusted strings to HTML/XML markup

Version Information

package-version.txt:

3.1.3

$ sudo emerge dev-python/jinja

$ sudo port install py-jinja2

$ sudo zypper install python3-$\{PYTHON_MINOR\}-jinja2

$ sudo xbps-install python3-Jinja2

See https://repology.org/project/python:jinja2/versions

If the system package is installed and if the (experimental) option --enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.

6.1.162 jmol: Java viewer for chemical structures in 3D

Description

Java viewer for chemical structures in 3D.
This provides files necessary for Jmol (java).
This package does not install JSmol (javascript), which upstream bundles with Jmol.

License

GPLv2+

Upstream Contact

• http://jmol.sourceforge.net
• Bob Hanson
• e-mail: hansonr@stolaf.edu
• Homepage: https://www.stolaf.edu/people/hansonr/
• Development page: https://github.com/BobHanson/Jmol-SwingJS
• Download page: https://sourceforge.net/projects/jmol/files/Jmol/
Dependencies

No build-time dependencies.
The commandline jmol requires java at runtime.

Special Build Instructions

To avoid depending on `unzip` at build time, we have to repack the tarball, see `spkg-src`. We take the opportunity to remove some unnecessary subdirectories, see http://wiki.jmol.org/index.php/Jmol_JavaScript_Object#In_detail

Type

standard

Dependencies

Version Information

package-version.txt:

14.29.52

Equivalent System Packages

```bash
$ sudo pacman -S jmol
$ conda install jmol
$ sudo port install jmol
$ nix-env --install jmol
$ sudo zypper install jmol
$ sudo xbps-install jmol
$ sudo xbps-install jmol
```

See https://repology.org/project/jmol/versions

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see github issue #27330 for more information.

However, these system packages will not be used for building Sage because spkg-config.m4 has not been written for this package; see github issue #27330 for more information.

6.1.182 kissat: SAT solver

Description

From the package README:

KISSLAT is a "keep it simple and clean bare metal SAT solver" written in C. It is a port of CaDiCaL back to C with improved data structures, better scheduling of inprocessing and optimized algorithms and implementation.

Coincidentally 'kissat' also means 'cats' in Finnish.
From the website:
The Kissat SAT solver is a condensed and improved reimplementation of CaDiCaL in C.
Kissat won first place in the main track of the SAT Competition 2020 and first place on unsatisfiable instances.

6.1.183 kiwisolver: An implementation of the Cassowary constraint solving algorithm

Description

From https://pypi.org/project/kiwisolver/

A fast implementation of the Cassowary constraint solver

Kiwi is an efficient C++ implementation of the Cassowary constraint solving algorithm. Kiwi is an implementation of the algorithm based on the seminal Cassowary paper. It is not a refactoring of the original C++ solver. Kiwi has been designed from the ground up to be lightweight and fast. Kiwi ranges from 10x to 500x faster than the original Cassowary solver with typical use cases gaining a 40x improvement. Memory savings are consistently > 5x.

In addition to the C++ solver, Kiwi ships with hand-rolled Python bindings.

6.1.185 lcalc: L-function calculator

Description

Michael Rubinstein’s L-function calculator.

License

- LGPL V2+

Upstream contact

Michael Rubinstein <mrubinst@uwaterloo.ca>

Sources: http://oto.math.uwaterloo.ca/~mrubinst/L_function_public/L.html

Dependencies

- GMP/MPIR
- MPFR
- PARI
- GNU patch
Special Update/Build Instructions

- There is some garbage in the upstream sources which should be removed:

```
src/include/.Lexplicit_formula.h.swp
src/include/.Lvalue.h.swp
src/include/_DS_Store
src/include/explicit_formula.h.swap.crap
src/include/lvalue.h.bak
src/src/Makefile.old
src/src/.Makefile.old.swp
src/src/_DS_Store
src/src/.DS_Store
src/src/.Lcommandline.ggo.swp
src/src/libfunction.a
```

- We (and apparently also upstream) currently don’t build Lcalc’s tests (see Makefile), hence there’s no spkg-check. This might change in newer upstream versions.

- The original Makefile uses $(CC) to compile C++ (also using $(CCFLAGS)), which it defines to ‘g++’, and hard-codes ‘g++’ when linking the shared library. (It should use $(CXX) instead, which might *default* to ‘g++’.) We now (lcalc-1.23.p10) patch the Makefile also to use $(CXX) for compiling and linking C++; $(CXX) now *defaults* to ‘g++’, and $(CC) to ‘gcc’, but both can be overridden by simply setting their respective environment variables. (Same for $(INSTALL_DIR) btw.)

Patches

- Makefile.patch:

  We change a lot there, since Lcalc doesn’t have a ‘configure’ script, and hence the Makefile is supposed to be edited to customize Lcalc (build options, locations of headers and libraries etc.). Besides that, we
  - put CXXFLAGS into Lcalc’s “CCFLAGS” used for compiling C++,
  - remove some stuff involving LDPATHS and LDLFLAGS2, setting just LDPATHS,
  - use $(MAKE) instead of ‘make’ in the crude build receipts,
  - use CXXFLAG64 when linking the shared library,
  - now use $(CXX) for compiling and linking C++, which *defaults* to ‘g++’, but can be overridden by setting the environment variable of the same name. $(CC) now *defaults* to ‘gcc’, although currently not really used as far as I can see.)
  - $(INSTALL_DIR) can now be overridden by simply setting the environment variable of the same name.

- Lcommon.h.patch:

  Uncomment the definition of lcalc_to_double(const long double& x). (Necessary for GCC >= 4.6.0, cf. #10892.) Comment from there: The reason is the following code horror from src/src/include/Lcommon.h: […] But somebody who is familiar with the codebase should really rewrite lcalc to not redefine the double() cast, thats just fragile and will sooner or later again fail inside some system headers.

- pari-2.7.patch:

  Various changes to port to newer versions of PARI.

- time.h.patch:
(Patches src/include/Lcommandline_numbertheory.h) Include also <time.h> in Lcommandline_numbertheory.h (at least required on Cygwin, cf. #9845). This should get reported upstream.

- lcalc-1.23_default_parameters_1.patch: Make Lcalc (1.23) build with GCC 4.9

**Type**

standard

**Dependencies**

- gengetopt: getopt_long parser generator
- pari: Computer algebra system for fast computations in number theory

**Version Information**

package-version.txt:

2.0.5

6.1.188 libffi: A portable foreign-function interface library

Description

Compilers for high level languages generate code that follow certain conventions. These conventions are necessary, in part, for separate compilation to work. One such convention is the “calling convention”. The “calling convention” is essentially a set of assumptions made by the compiler about where function arguments will be found on entry to a function. A “calling convention” also specifies where the return value for a function is found.

Some programs may not know at the time of compilation what arguments are to be passed to a function. For instance, an interpreter may be told at run-time about the number and types of arguments used to call a given function. Libffi can be used in such programs to provide a bridge from the interpreter program to compiled code.

The libffi library provides a portable, high level programming interface to various calling conventions. This allows a programmer to call any function specified by a call interface description at run time.

FFI stands for Foreign Function Interface. A foreign function interface is the popular name for the interface that allows code written in one language to call code written in another language. The libffi library really only provides the lowest, machine dependent layer of a fully featured foreign function interface. A layer must exist above libffi that handles type conversions for values passed between the two languages.

6.1.189 libgd: Dynamic graphics generation tool

Description

GD is an open source code library for the dynamic creation of images by programmers. GD is written in C, and “wrappers” are available for Perl, PHP and other languages. GD creates PNG, JPEG, GIF, WebP, XPM, BMP images, among other formats. GD is commonly used to generate charts, graphics, thumbnails, and most anything else, on the fly. While not restricted to use on the web, the most common applications of GD involve website development.

6.1.194 libnauty: Find automorphism groups of graphs, generate non-isomorphic graphs (callable library)

Description

Nauty has various tools for finding the automorphism group of a graph, generating non-isomorphic graphs with certain properties, etc.

This script package represents the callable library of nauty.

License

Since version 2.6, nauty license is GPL-compatible, see
http://users.cecs.anu.edu.au/~bdm/nauty/COPYRIGHT.txt
(a copy of this file, called COPYRIGHT, is also present in the tarball)

Special Packaging Instruction

Upstream distribute tarball named nauty$\{version\}.tar.gz. We cannot deal with that so rename it nauty-$\{version\}.tar.gz (notice the “-”) without any changes.

6.1.196 **libpng: Bitmap image support**

**Description**

libpng is the official PNG reference library. It supports almost all PNG features, is extensible, and has been extensively tested for over 13 years. The home site for development versions (i.e., may be buggy or subject to change or include experimental features) is [http://libpng.sourceforge.net/](http://libpng.sourceforge.net/), and the place to go for questions about the library is the png-mng-implement mailing list.

Website: [http://www.libpng.org/pub/png/libpng.html](http://www.libpng.org/pub/png/libpng.html)

**License**

The libpng license - see [http://www.libpng.org/pub/png/src/libpng-LICENSE.txt](http://www.libpng.org/pub/png/src/libpng-LICENSE.txt)

**Upstream Contact**

[https://libpng.sourceforge.io](https://libpng.sourceforge.io)

The png mailing lists - see [http://www.libpng.org/pub/png/pngmisc.html#lists](http://www.libpng.org/pub/png/pngmisc.html#lists)

**Special Update/Build Instructions**

- On old versions of Darwin, the symbolic links libpng.* created by libpng16 may interfere with a system-wide libPng.dylib.
  - the following is very likely to be obsolete in 2014 —

  This system-wide library is likely to be a different version and on top of that, the symbols exported there are prefixed with “_cg” (for “Core Graphics”). So even if by chance the functionalities of the two libraries were interchangeable, libraries or applications looking for one and being presented the other won’t find the symbols they expect. Note the uppercase “P” which could prevent this conflict; unfortunately, the default filesystem used by Apple is case-insensitive.

  Note there would be no problem if the system-wide library was not looked for when Sage is being built or run, but that’s not the case either; it is at least looked for by the “ImageIO” framework:

  - when Python is built with Mac OS extensions, fixed in #4008;
  - when Mercurial is built because it uses $EDITOR, cf. #4678;
  - when R is built and it finds -lpng, cf. #4409 and #11696.

  – this is no longer done, as of #27186 —

As not all of these problems are easily dealt with and new ones may arise, we chose to delete the $SAGE_LOCAL/lib/libpng.* symlinks. Therefore, some packages like Tachyon, which by default look for -lpng are patched to look for -lpng16 instead.
Type

Version Information

package-version.txt:

2.3.0+latte-patches-2019-05-02

Equivalent System Packages

See https://repology.org/project/lidia/versions

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see github issue #27330 for more information.

6.1.201 lie: Library for the representation theory of complex semisimple Lie groups and algebras

Description

LiE is the name of a software package that enables mathematicians and physicists to perform computations of a Lie group theoretic nature. It focuses on the representation theory of complex semisimple (reductive) Lie groups and algebras, and on the structure of their Weyl groups and root systems.

LiE does not compute directly with elements of the Lie groups and algebras themselves; it rather computes with weights, roots, characters and similar objects. Some specialities of LiE are: tensor product decompositions, branching to subgroups, Weyl group orbits, reduced elements in Weyl groups, distinguished coset representatives and much more. These operations have been compiled into the program which results in fast execution: typically one or two orders of magnitude faster than similar programs written in a general purpose program.

The LiE programming language makes it possible to customise and extend the package with more mathematical functions. A user manual is provided containing many examples.

LiE establishes an interactive environment from which commands can be given that involve basic programming primitives and powerful built-in functions. These commands are read by an interpreter built into the package and passed to the core of
the system. This core consists of programs representing some 100 mathematical functions. The interpreter offers on-line facilities which explain operations and functions, and which give background information about Lie group theoretical concepts and about currently valid definitions and values.

(from http://www-math.univ-poitiers.fr/~maavl/LiE/description.html )

**License**

GNU Lesser General Public License (LGPL), version unspecified

**Upstream Contact**

**Dependencies**

- readline
- ncurses
- bison (not included in this package or in Sage!)

6.1.206 lrslib: Reverse search algorithm for vertex enumeration and convex hull problems

Description

lrslib implements the linear reverse search algorithm of Avis and Fukuda.

See the homepage (http://cgm.cs.mcgill.ca/~avis/C/lrs.html) for details.

We use an autotoolized version from https://github.com/mkoeppe/lrslib/tree/autoconfiscation

License

lrslib is released under a GPL v2+ license.

Upstream Contact

David Avis, avis at cs dot mcgill dot edu.
Dependencies

To build and install the “plrs” binary, a multi-thread version of lrs, need to first install the full Boost package (“sage -i boost”).

If the package finds an MPI C++ compiler script (mpic++), it also builds and installs the “mplrs” binary, a distributed version of lrs using MPI.

(Sage currently does not make use of plrs and mplrs.)

Special Update/Build Instructions

Type

optional

If the system package is installed, ./configure will check if it can be used.

6.1.213 matplotlib: Python 2D plotting library

Description

From the Matplotlib website: matplotlib is a python 2D plotting library which produces publication quality figures in a variety of hardcopy formats and interactive environments across platforms. matplotlib can be used in python scripts, the python and ipython shell (ala matlab or mathematica), web application servers, and six graphical user interface toolkits.
License

The Matplotlib license - see http://matplotlib.sourceforge.net/users/license.html: Matplotlib only uses BSD compatible code, and its license is based on the PSF license. See the Open Source Initiative licenses page for details on individual licenses. Non-BSD compatible licenses (e.g. LGPL) are acceptable in matplotlib Toolkits. For a discussion of the motivations behind the licensing choice, see Licenses.

Upstream Contact

https://matplotlib.org

The matplotlib mailing lists: see http://sourceforge.net/projects/matplotlib

Dependencies

- python
- numpy
- setuptools (>= 0.7)
- freetype
- patch (used in spkg-install)
- dateutil
- pyparsing
- tornado
- kiwisolver

Build Instructions/Changes

- NOTE: To drastically cut down on spkg size, we delete the internal testing images. To do this, we repackage the tarball by removing the contents of lib/matplotlib/tests/baseline_images/*, this is done by the spkg-src script.
- setup.py.patch: disable loading of Tests. Otherwise, setup.py raises an error because it can’t find the deleted files from src/lib/matplotlib/tests/baseline_images/*
- NOTE: as of matplotlib-1.0.0 and Sage 4.6, Sage does not use $HOME/.matplotlib by default. Instead, it sets MPLCONFIGDIR to a subdirectory in $DOT_SAGE, see src/bin/sage-env

Type

standard
Packages and Features, Release 10.3

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
  - certifi: Python package for providing Mozilla’s CA Bundle
  - contourpy: Python library for calculating contours of 2D quadrilateral grids
  - cycler: Composable cycles
  - dateutil: Extensions to the standard Python module datetime
  - fonttools: Tools to manipulate font files
  - freetype: A free, high-quality, and portable font engine
  - kiwisolver: An implementation of the Cassowary constraint solving algorithm
  - numpy: Package for scientific computing with Python
  - pillow: Python Imaging Library
  - pyparsing: A Python parsing module
  - qhull: Compute convex hulls, Delaunay triangulations, Voronoi diagrams
  - setuptools_scm: Python build system extension to obtain package version from version control
  - tornado: Python web framework and asynchronous networking library

Version Information

6.1.216 maxima: System for manipulating symbolic and numerical expressions

Description

Maxima is a system for the manipulation of symbolic and numerical expressions, including differentiation, integration, Taylor series, Laplace transforms, ordinary differential equations, systems of linear equations, polynomials, and sets, lists, vectors, matrices, and tensors. Maxima yields high precision numeric results by using exact fractions, arbitrary precision integers, and variable precision floating point numbers. Maxima can plot functions and data in two and three dimensions.

For more information, see the Maxima web site

http://maxima.sourceforge.net

License

Maxima is distributed under the GNU General Public License, with some export restrictions from the U.S. Department of Energy. See the file COPYING.

Upstream Contact

- The Maxima mailing list - see http://maxima.sourceforge.net/maximalist.html

Special Update/Build Instructions

1. Go to http://sourceforge.net/projects/maxima/files/Maxima-source/ and download the source tarball maxima-x.y.z.tar.gz; place it in the upstream/ directory.

3. Make sure the patches still apply cleanly, and update them if necessary.

4. Test the resulting package.

All patch files in the patches/ directory are applied. Descriptions of these patches are either in the patch files themselves or below.

- 0001-taylor2-Avoid-blowing-the-stack-when-diff-expand-isn.patch: Fix for Maxima bug #2520 (abs_integrate fails on abs(sin(x)) and abs(cos(x))). Introduced in Issue #13364 (Upgrade Maxima to 5.29.1).

- build-fasl.patch: Build a fasl library for ecl in addition to an executable program. Introduced in Issue #16178 (Build maxima fasl without asdf).

- infodir.patch: Correct the path to the Info directory.Introduced in Issue #11348 (maxima test fails when install tree is moved).

- matrixexp.patch: Fix matrixexp(matrix([%i*%pi])), which broke after Maxima 5.29.1. Introduced in Issue #13973.

- maxima.system.patch: Set c::*compile-in-constants* to t. Introduced in Issue #11966 (OS X 10.7 Lion: Maxima fails to build).
• undoing_true_false_printing_patch.patch: Revert an upstream change causing "?" to be printed around some words. Introduced in Trac #13364 (Upgrade Maxima to 5.29.1).

Type

standard

Dependencies

• ecl: An implementation of the Common Lisp language
• info: stand-alone Info documentation reader

Upstream Contact

Simon A. King <simon.king@uni-jena.de> David J. Green <david.green@uni-jena.de>

Acknowledgements

The development of the initial version of this SPKG was funded by the German Science Foundation, DFG project GR 1585/4.1, and was accomplished at the Friedrich Schiller University Jena.

Since version 1.0.1, the further work on this SPKG was funded by Marie Curie grant MTKD-CT-2006-042685 and was pursued at the National University of Ireland, Galway. Since November 2010, it is moved back to Jena.

We thank William Stein for giving us access to various computers on which we could build test the SPKG and on which some huge computations could be completed, and acknowledge the support by National Science Foundation Grant No. DMS-0821725.

We thank Mathieu Dutour Sikirić for hints on how to use GAP more efficiently.

We owe Peter Symonds the idea of using the Poincaré series in a rather efficient completeness criterion.

We are greatful to John Palmieri for his help on making p_group_cohomology work with python-3.

Dependencies

- The SharedMeatAxe needs to be installed, as a build time dependency.

  This can be met by installing the meataxe spkg

Testing

Our package provides a very short test suite for David Green's routines for the computation of minimal projective resolutions. The majority of this package's tests is formed by doc tests in the Cython code. In fact, any class, method and function is covered by tests.

Note that internet access is required for these tests, as it is attempted to download cohomology rings from a public data base in the web.

The script spkg-check calls sage -t --force_lib on the files in pGroupCohomology.

6.1. Details of external packages
Documentation

The documentation of this package is automatically built, if the environment variable SAGE_SPKG_INSTALL_DOCS is yes (do “export SAGE_SPKG_INSTALL_DOCS=yes” on the command line before installation). The documents are put into SAGE_ROOT/local/share/doc/p_group_cohomology/.

6.1.225 mpc: Arithmetic of complex numbers with arbitrarily high precision and correct rounding

Description

From https://www.multiprecision.org/mpc: GNU MPC is a C library for the arithmetic of complex numbers with arbitrarily high precision and correct rounding of the result. It extends the principles of the IEEE-754 standard for fixed precision real floating point numbers to complex numbers, providing well-defined semantics for every operation. At the same time, speed of operation at high precision is a major design goal.

License

LGPLv3+ for the code and GFDLv1.3+ (with no invariant sections) for the documentation.
Upstream Contact

The MPC website is located at https://www.multiprecision.org/mpc.
The MPC team can be contacted via the MPC mailing list: mpc-discuss@inria.fr

Special Update/Build Instructions

- mpc_mul_faster.patch: Patch from Paul Zimmermann to speed up MPC multiplication (for small precisions) by reducing overhead in MPFR operations.

Type

standard

Dependencies

- $(MP_LIBRARY)
  - mpfr: Multiple-precision floating-point computations with correct rounding

See https://repology.org/project/gnumpc/versions, https://repology.org/project/libmpc/versions
If the system package is installed, ./configure will check if it can be used.

6.1.226 mpfi: Multiple precision interval arithmetic library based on MPFR

Description
MPFI is a library for interval arithmetic, which is built upon the MPFR multiple precision floating-point arithmetic. MPFI is intended to be a portable library written in C for arbitrary precision interval arithmetic with intervals represented using MPFR reliable floating-point numbers. It is based on the GNU MP library and on the MPFR library. The purpose of an arbitrary precision interval arithmetic is on the one hand to get “guaranteed” results, thanks to interval computation, and on the other hand to obtain accurate results, thanks to multiple precision arithmetic. The MPFI library is built upon MPFR in order to benefit from the correct rounding provided, for each operation or function, by MPFR. Further advantages of using MPFR are its portability and compliance with the IEEE 754 standard for floating-point arithmetic.

License
This version of MPFI is released under the GNU Lesser General Public License. It is permitted to link MPFI to non-free programs, as long as when distributing them the MPFI source code and a means to re-link with a modified MPFI is provided.

Upstream Contact
http://perso.ens-lyon.fr/nathalie.revol/software.html
The MPFI website is located at https://gitlab.inria.fr/mpfi/mpfi
The MPFI team can be contacted via the MPFI mailing list: mpti-users@inria.fr

- $ sudo pkg install math/mpfi
- $ sudo emerge sci-libs/mpfi
- $ brew install mpfi
- $ nix-env --install mpfi
- $ sudo zypper install mpfi-devel
- $ sudo xbps-install mpfi-devel

See https://repology.org/project/mpfi/versions

If the system package is installed, ./configure will check if it can be used.

6.1.227 mpfr: Multiple-precision floating-point computations with correct rounding

Description

The MPFR library is a C library for multiple-precision floating-point computations with correct rounding. MPFR has continuously been supported by the INRIA and the current main authors come from the Caramba and AriC project-teams at Loria (Nancy, France) and LIP (Lyon, France) respectively; see more on the credit page. MPFR is based on the GMP multiple-precision library.

The main goal of MPFR is to provide a library for multiple-precision floating-point computation which is both efficient and has a well-defined semantics. It copies the good ideas from the ANSI/IEEE-754 standard for double-precision floating-point arithmetic (53-bit significand).

License

MPFR is free. It is distributed under the GNU Lesser General Public License (GNU Lesser GPL), version 3 or later (2.1 or later for MPFR versions until 2.4.x). The library has been registered in France by the Agence de Protection des Programmes under the number IDDN FR 001 120020 00 R P 2000 000 10800, on 15 March 2000. This license guarantees your freedom to share and change MPFR, to make sure MPFR is free for all its users. Unlike the ordinary General Public License, the Lesser GPL enables developers of non-free programs to use MPFR in their programs. If you have written a new function for MPFR or improved an existing one, please share your work!
Upstream Contact

The MPFR website is located at http://mpfr.org/
The MPFR team can be contacted via the MPFR mailing list: mpfr@loria.fr

Special Update/Build Instructions

- Make sure MPFR’s settings of CC and CFLAGS still get properly extracted, currently from its config.log in the src/ directory.
- We should remove the configure option --disable-thread-safe in case the issues without that have meanwhile been fixed. (Then we should actually pass --enable-thread-safe.)

TODO

- --disable-thread-safe should be switched to --enable-thread-safe, need to check that this works on the buildbot machines

Type

standard

Dependencies

- $(MP_LIBRARY)

Version Information

package-version.txt:

$ sudo pkg install math/mpfr
See https://repology.org/project/mpfr/versions
If the system package is installed, ./configure will check if it can be used.

6.1.228 mpfrcx: Arithmetic of univariate polynomials over arbitrary precision real or complex numbers

Description

Mprfcx is a library for the arithmetic of univariate polynomials over arbitrary precision real (Mpfr) or complex (Mpc) numbers, without control on the rounding. For the time being, only the few functions needed to implement the floating point approach to complex multiplication are implemented. On the other hand, these comprise asymptotically fast multiplication routines such as Toom–Cook and the FFT.

License

MPFRCX is distributed under the Gnu Lesser General Public License, either version 2.1 of the licence, or (at your option) any later version (LGPLv2.1+).

Upstream Contact

The MPFRCX website is located at http://www.multiprecision.org/mpfrcx .

Type

6.1.229 mpmath: Pure Python library for multiprecision floating-point arithmetic

Description

Mpmath is a pure-Python library for multiprecision floating-point arithmetic. It provides an extensive set of transcendental functions, unlimited exponent sizes, complex numbers, interval arithmetic, numerical integration and differentiation, root-finding, linear algebra, and much more. Almost any calculation can be performed just as well at 10-digit or 1000-digit precision, and in many cases mpmath implements asymptotically fast algorithms that scale well for extremely high precision work. If available, mpmath will (optionally) use gmpy to speed up high precision operations.

6.1.235 ncurses: Classic terminal output library

Description

Ncurses (new curses, pronounced “enn-curses”) started as a freely distributable “clone” of System V Release 4.0 (SVr4) curses. It has outgrown the “clone” description, and now contains many features which are not in SVr4 curses. Curses is a pun on the term “cursor optimization”. It is a library of functions that manage an application’s display on character-cell terminals (e.g., VT100).

The name “ncurses” was first used as the name of the curses library in Pavel Curtis’s pcurses, dated 1982. It was apparently developed on a BSD 4.4 system, at Cornell. Parts of pcurses are readily identifiable in ncurses, including the basics for the terminfo compiler (named compile in that package):

- the Caps, used to define the terminfo capabilities

6.1. Details of external packages
Packages and Features, Release 10.3

- awk scripts MKcaptab.awk, MKnames.awk
- the library modules used for the terminfo compiler.

Besides ncurses, parts of pcurses still survive in 2010, in recognizable form in Solaris.

6.1.249 ore_algebra: Ore algebra

Description
A Sage implementation of Ore algebras, Ore polynomials, and differentially finite functions.
Main features for the most common algebras include basic arithmetic and actions; gcd and lcm; D-finite closure properties; creative telescoping; natural transformations between related algebras; guessing; desingularization; solvers for polynomials, rational functions and (generalized) power series. Univariate differential operators also support the numerical computation of analytic solutions with rigorous error bounds and related features.

Upstream Contact

Simon A. King <simon.king@uni-jena.de> David J. Green <david.green@uni-jena.de>
Acknowledgements

The development of the initial version of this SPKG was funded by the German Science Foundation, DFG project GR 1585/4.1, and was accomplished at the Friedrich Schiller University Jena.

Since version 1.0.1, the further work on this SPKG was funded by Marie Curie grant MTKD-CT-2006-042685 and was pursued at the National University of Ireland, Galway. Since November 2010, it is moved back to Jena.

We thank William Stein for giving us access to various computers on which we could build test the SPKG and on which some huge computations could be completed, and acknowledge the support by National Science Foundation Grant No. DMS-0821725.

We thank Mathieu Dutour Sikirić for hints on how to use GAP more efficiently.

We owe Peter Symonds the idea of using the Poincaré series in a rather efficient completeness criterion.

We are grateful to John Palmieri for his help on making p_group_cohomology work with python-3.

Dependencies

- The SharedMeatAxe needs to be installed, as a build time dependency.

  This can be met by installing the meataxe spkg

Testing

Our package provides a very short test suite for David Green's routines for the computation of minimal projective resolutions. The majority of this package’s tests is formed by doc tests in the Cython code. In fact, any class, method and function is covered by tests.

Note that internet access is required for these tests, as it is attempted to download cohomology rings from a public data base in the web.

The script spkg-check calls sage -t --force_lib on the files in pGroupCohomology.

Documentation

The documentation of this package is automatically built, if the environment variable SAGE_SPKG_INSTALL_DOCS is yes (do "export SAGE_SPKG_INSTALL_DOCS=yes" on the command line before installation). The documents are put into SAGE_ROOT/local/share/doc/p_group_cohomology/.

Type

optional

6.1.255 palp: A package for Analyzing Lattice Polytopes

Description

A Package for Analyzing Lattice Polytopes (PALP) is a set of C programs for calculations with lattice polytopes and applications to toric geometry.

It contains routines for vertex and facet enumeration, computation of incidences and symmetries, as well as completion of the set of lattice points in the convex hull of a given set of points. In addition, there are procedures specialised to reflexive polytopes such as the enumeration of reflexive subpolytopes, and applications to toric geometry and string
theory, like the computation of Hodge data and fibration structures for toric Calabi-Yau varieties. The package is well tested and optimised in speed as it was used for time consuming tasks such as the classification of reflexive polyhedra in 4 dimensions and the creation and manipulation of very large lists of 5-dimensional polyhedra.

While originally intended for low-dimensional applications, the algorithms work in any dimension and our key routine for vertex and facet enumeration compares well with existing packages.

License

- When released, GPL 2 was in force.
- There is a link to a web page, which now points to GPL 3, but would have pointed to GPL 2 at the time the package was released.
- Therefore one can deduce the authors were happy for this to be released under GPL 2 or a later version.

```
2.1.1
```

Equivalent System Packages

(none known)

6.1.260 pari: Computer algebra system for fast computations in number theory

Description

PARI/GP is a widely used computer algebra system designed for fast computations in number theory (factorizations, algebraic number theory, elliptic curves...), but also contains a large number of other useful functions to compute with mathematical entities such as matrices, polynomials, power series, algebraic numbers etc., and a lot of transcendental functions. PARI is also available as a C library to allow for faster computations.

Originally developed by Henri Cohen and his co-workers (Université Bordeaux I, France), PARI is now under the GPL and maintained by Karim Belabas with the help of many volunteer contributors.

License

GPL version 2+

Upstream Contact

If the system package is installed, `./configure` will check if it can be used.

### 6.1.266 pari_seadata: PARI data package needed by ellap for large primes (full version)

#### Description

Needed by ellap for large primes. These polynomials were extracted from the ECHIDNA databases and computed by David R. Kohel. This covers finite fields of cardinality $q$ up to 750 bits. PARI/GP 2.9 contains fallback code to go on when all modular polynomials in the database have been exhausted and can handle larger fields (with an important slowdown).

#### License

GNU General Public License (GPL version 2 or any later version).

#### Upstream Contact

(none known)

6.1.278 pickleshare: A ‘shelve’ like datastore with concurrency support

Description

PickleShare - a small ‘shelve’ like datastore with concurrency support

Like shelve, a PickleShareDB object acts like a normal dictionary. Unlike shelve, many processes can access the database simultaneously. Changing a value in database is immediately visible to other processes accessing the same database.

Concurrency is possible because the values are stored in separate files. Hence the “database” is a directory where all files are governed by PickleShare.

Type

standard

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
Version Information

package-version.txt:

If the system package is installed, ./configure will check if it can be used.

6.1.285 plantri: Generate non-isomorphic sphere-embedded graphs

Description

Plantri is a program that generates certain types of graphs that are imbedded on the sphere.

Exactly one member of each isomorphism class is output, using an amount of memory almost independent of the number of graphs produced. This, together with the exceptionally fast operation and careful validation, makes the program suitable for processing very large numbers of graphs.

Isomorphisms are defined with respect to the embeddings, so in some cases outputs may be isomorphic as abstract graphs.
License

Plantri is distributed without a license.

6.1.289 polylib: Operations on unions of polyhedra

Description

The Polyhedral Library (PolyLib for short) operates on objects made up of unions of polyhedra of any dimension. polylib is a C library.

License

GPL v3

Upstream Contact

- https://groups.google.com/forum/#!forum/isl-development

Type

experimental

Dependencies

- $(MP_LIBRARY)
  - mpfr: Multiple-precision floating-point computations with correct rounding
  - ntl: A library for doing number theory

Version Information

package-version.txt:

5.22.5

Equivalent System Packages

$ sudo port install polylib

$ sudo zypper install polylib pkgconfig\(polylibgmp\)

See https://repology.org/project/polylib/versions

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see github issue #27330 for more information.
6.1.290 polymake: Computations with polyhedra, fans, simplicial complexes, matroids, graphs, tropical hypersurfaces

Description

polymake is open source software for research in polyhedral geometry. It deals with polytopes, polyhedra and fans as well as simplicial complexes, matroids, graphs, tropical hypersurfaces, and other objects. Supported platforms include various flavors of Linux, Free BSD and Mac OS.

License

- GPL v3

Upstream Contact

- https://polymake.org/

Dependencies

Polymake needs a working installation of Perl, including its shared library and some modules (XML::Writer XML::LibXML XML::LibXSLT Term::ReadLine::Gnu JSON SVG). The Polymake interface in Sage additionally needs File::Slurp. For full functionality including polymake’s polyDB, also the Perl module MongoDB is needed.

These are not provided by a Sage package. The dummy package perl_cpan_polymake_prereq will signal an error at build time if the required prerequisites are not met.

The configure script will inform you about the equivalent system packages that you should install. Otherwise, you can use CPAN (see below).

Sage might install the Term::ReadLine::Gnu module, however, when you install polymake, if it is not provided by the system, or if Sage installs its own readline library.

A distribution-independent way to install Perl modules (into a user's home directory or /usr/local) is using CPAN. This is also the way to install the modules on macOS. For this, if you don’t have root access, you will need the local::lib Perl module installed:

```
cpan -i XML::Writer XML::LibXML XML::LibXSLT File::Slurp Term::ReadLine::Gnu JSON SVG...
  → MongoDB
```

Several Sage packages should be installed before installing the polymake package to give a more featureful Polymake installation:

```
sage -i 4ti2 latte_int topcom qhull
```

Software that would need to be installed manually (no Sage package available) for a more featureful Polymake installation: azove, porta, vinci, SplitsTree4.

Information on missing Polymake prerequisites after installing polymake:

```
$ sage -sh
(sage-sh) $ polymake
polytope> show_unconfigured;
```

In order to use Polymake from Sage, you will also need the jupymake package:
Packages and Features, Release 10.3

```
sage -i jupymake
```

Debugging polymake install problems

```
# apt-get install libdevel-trace-perl
$ cd src
$ perl -d:Trace support/configure.pl
```

**Type**

optional

**Dependencies**

- $(MP_LIBRARY)
- bliss: Computing automorphism groups and canonical forms of graphs
- cddlib: Double description method for polyhedral representation conversion
- libxml2: XML parser and toolkit
- lrslib: Reverse search algorithm for vertex enumeration and convex hull problems
- ninja_build: A build system with a focus on speed
- normaliz: Computations in affine monoids, vector configurations, lattice polytopes, and rational cones
- perl_cpan_polymake_prereq: Represents all Perl packages that are prerequisites for polymake
- perl_term_readline_gnu: Perl extension for the GNU Readline/History libraries
- ppl: Parma Polyhedra Library

**Version Information**

package-version.txt:

```
4.11
```

```
$ sudo pacman -S polymake
$ sudo apt-get install polymake libpolymake-dev
$ sudo yum install polymake
$ brew install apaffenholz/polymake/polymake
```
$ nix-env --install polymake

$ sudo zypper install polymake

See https://repology.org/project/polymake/versions

If the system package is installed, ./configure will check if it can be used.

6.1.291 polytopes_db: Databases of 2- and 3-dimensional reflexive polytopes

Description

This package includes lists of 2- and 3-dimensional reflexive polytopes.

The list of polygons is quite easy to get and it has been known for a while. The list of 3-polytopes was originally obtained by Maximilian Kreuzer and Harald Skarke using their software PALP, which is included into the standard distribution of Sage. To work with lattice and reflexive polytopes from Sage you can use sage.geometry.lattice_polytope module, which relies on PALP for some of its functionality. To get access to the databases of this package, use ReflexivePolytope and ReflexivePolytopes commands.

6.1.293 ppl: Parma Polyhedra Library

Description

The Parma Polyhedra Library (PPL) provides numerical abstractions especially targeted at applications in the field of analysis and verification of complex systems. These abstractions include convex polyhedra, defined as the intersection of a finite number of (open or closed) halfspaces, each described by a linear inequality (strict or non-strict) with rational coefficients; some special classes of polyhedra shapes that offer interesting complexity/precision tradeoffs; and grids which represent regularly spaced points that satisfy a set of linear congruence relations. The library also supports finite powersets and products of (any kind of) polyhedra and grids, a mixed integer linear programming problem solver using an exact-arithmetic version of the simplex algorithm, a parametric integer programming solver, and primitives for the termination analysis via the automatic synthesis of linear ranking functions.

It is written in C++, but comes with interfaces to C, Java, OCaml, and Prolog. PPL is one of the fastest implementations of polyhedral computations.

Benchmarks are included in this paper: arXiv cs/0612085

6.1.302 ptyprocess: Python interaction with subprocesses in a pseudoterminal

Description

Launch a subprocess in a pseudo terminal (pty), and interact with both the process and its pty.
Sometimes, piping stdin and stdout is not enough. There might be a password prompt that doesn’t read from stdin, output that changes when it’s going to a pipe rather than a terminal, or curses-style interfaces that rely on a terminal. If you need to automate these things, running the process in a pseudo terminal (pty) is the answer.
License

6.1.305 pybind11: Create Python bindings to C++ code

Description

pybind11 is a lightweight header-only library that exposes C++ types in Python and vice versa, mainly to create Python bindings of existing C++ code. Its goals and syntax are similar to the excellent [Boost.Python](http://www.boost.org/doc/libs/1_58_0/libs/python/doc/) library by David Abrahams: to minimize boilerplate code in traditional extension modules by inferring type information using compile-time introspection.

License

pybind11 is provided under a BSD-style license that can be found in the LICENSE file. By using, distributing, or contributing to this project, you agree to the terms and conditions of this license.

6.1.310 pygments: Generic syntax highlighter

Description

Pygments is a syntax highlighting package written in Python.

It is a generic syntax highlighter suitable for use in code hosting, forums, wikis or other applications that need to prettify source code. Highlights are:

- a wide range of over 300 languages and other text formats is supported
- special attention is paid to details, increasing quality by a fair amount
- support for new languages and formats are added easily
- a number of output formats, presently HTML, LaTeX, RTF, SVG, all image formats that PIL supports and ANSI sequences
- it is usable as a command-line tool and as a library

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see [github issue #27330](https://github.com/sagemath/sage/issues/27330) for more information.

6.1.312 pynormaliz: Python bindings for the normaliz library

Description

The Python module PyNormaliz provides wrappers for normaliz.
License

- GPL v2 or later

Upstream Contact

https://github.com/sebasguts/PyNormaliz

Special Update/Build Instructions

Type
optional

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- normaliz: Computations in affine monoids, vector configurations, lattice polytopes, and rational cones

Version Information

package-version.txt:

2.18.p0

install-requires.txt:

pynormaliz ==2.18

Equivalent System Packages

$ sudo pacman -S python-pynormaliz

$ conda install pynormaliz

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see github issue #27330 for more information.
6.1.313 pyparsing: A Python parsing module

Description
A Python Parsing Module

License
MIT License

Upstream Contact
https://pypi.org/project/pyparsing/

Type
standard

Dependencies

- $(PYTHON)
- pip: Tool for installing and managing Python packages

Version Information

package-version.txt:
3.1.1

install-requires.txt:
pyparsing >=2.3.0

Equivalent System Packages

$ sudo pacman -S python-pyparsing
$ conda install pyparsing
$ sudo pkg install devel/py-pyparsing
$ sudo emerge dev-python/pyparsing
$ sudo zypper install python3\{PYTHON_MINOR\}-pyparsing
$ sudo xbps-install python3-parsing
See https://repology.org/project/pyparsing/versions, https://repology.org/project/python:pyparsing/versions

If the system package is installed and if the (experimental) option --enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.

6.1.314 pypeteer: Headless chrome/chromium automation library

Description

Headless chrome/chromium automation library (unofficial port of puppeteer)

License

MIT

Upstream Contact

https://pypi.org/project/pyppeteer/

Type

optional

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- appdirs: A small Python module for determining appropriate platform-specific dirs, e.g. a “user data dir”.
- certifi: Python package for providing Mozilla’s CA Bundle
- importlib_metadata: Library to access the metadata for a Python package
- urllib3: HTTP library with thread-safe connection pooling, file post, and more.

Version Information

requirements.txt:

pyppeteer
$ conda install pyppeteer

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see [github issue #27330](https://github.com/sagemath/sage/issues/27330) for more information.

6.1.315 **pyproject_api**: API to interact with the python pyproject.toml based projects

**Description**

API to interact with the python pyproject.toml based projects

**License**

**Upstream Contact**

pytest-xdist
```

Equivalent System Packages

```bash
$ conda install pytest-xdist
```

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see github issue #27330 for more information.
6.1.323 python3: The Python programming language

Description

By default, Sage will try to use system's python3 to set up a virtual environment, a.k.a. venv rather than building a Python 3 installation from scratch.

Sage will accept versions 3.9.x to 3.12.x.

You can also use --with-python=/path/to/python3_binary to tell Sage to use /path/to/python3_binary to set up the venv. Note that setting up the venv requires a number of Python modules to be available within the Python in question. Currently, as of Sage 10.3, these modules are as follows: sqlite3, ctypes, math, hashlib, socket, zlib, ssl, ensurepip.

Use the configure option --without-system-python3 if you want Python 3 built from scratch.

Upstream Contact

https://www.python.org

Type

standard

Dependencies

- bzip2: High-quality data compressor
- libffi: A portable foreign-function interface library
- liblzma: General-purpose data compression software
- libpng: Bitmap image support
- openssl: Implementation of the SSL and TLS protocols
- readline: Command line editing library
- sqlite: An SQL database engine
-xz: General-purpose data compression software
- zlib: Data compression library

Version Information

package-version.txt:

3.11.1
Equivalent System Packages

$ apk add python3-dev py3-setuptools

$ apt-cyg install python39-devel python-pip-wheel python-setuptools-wheel

$ sudo apt-get install python3 libpython3-dev python3-setuptools python3-venv

$ sudo yum install python3-devel python-setuptools

$ sudo pkg install lang/python devel/py-setuptools

$ brew install python3 python-setuptools

$ sudo port install python310 py-setuptools

$ sudo zypper install python3\${PYTHON_MINOR}\-devel python3\${PYTHON_MINOR}\-setuptools

$ sudo xbps-install python3-devel python3-setuptools

See https://repology.org/project/python/versions

If the system package is installed, ./configure will check if it can be used.

6.1.324 python_build: A simple, correct PEP517 package builder

Description

build is a simple, correct PEP517 package builder

License

MIT

Upstream Contact

https://pypi.org/project/build/
Packages and Features, Release 10.3

Type

package-version.txt:

1.74
Equivalent System Packages

$ sudo apt-get install qepcad

$ sudo yum install qepcad-B

$ sudo port install qepcad

See https://repology.org/project/qepcad-b/versions

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see github issue #27330 for more information.

6.1.335 qhull: Compute convex hulls, Delaunay triangulations, Voronoi diagrams

Description

From the README.txt of Qhull:

Qhull computes convex hulls, Delaunay triangulations, Voronoi diagrams, furthest-site Voronoi diagrams, and halfspace intersections about a point. It runs in 2-d, 3-d, 4-d, or higher. It implements the Quickhull algorithm for computing convex hulls. Qhull handles round-off errors from floating point arithmetic. It can approximate a convex hull.

The program includes options for hull volume, facet area, partial hulls, input transformations, randomization, tracing, multiple output formats, and execution statistics.

Further notes:

The qhull library is already shipped with the Python library scipy (from version 1.4), see

There is also the Python interface Pyhull available on PyPI https://pypi.python.org/pypi/pyhull (see also documentation at http://pythonhosted.org/pyhull/).

Upstream Contact

http://www.qhull.org/html

C. Bradford Barber bradb@shore.net or qhull@qhull.org

Dependencies

Can be compiled with Qt support, but the Sage version currently doesn’t try to do this.
License

Not a standard license, but Sage compatible. See the COPYING.txt file in the source directory for details.

Type

standard

Dependencies

- *cmake: A cross-platform build system generator*

Version Information

$ sudo pkg install math/qhull
$ sudo emerge media-libs/qhull
$ brew install qhull
```

No package needed.

```
$ nix-env --install qhull
$ sudo zypper install qhull-devel
$ sudo xbps-install qhull libqhull-devel
```

See [https://repology.org/project/qhull/versions](https://repology.org/project/qhull/versions)

If the system package is installed, `./configure` will check if it can be used.
6.1.336  r: A free software environment for statistical computing and graphics

Description

R is a language and environment for statistical computing and graphics. It is a GNU project which is similar to the S language and environment which was developed at Bell Laboratories (formerly AT&T, now Lucent Technologies) by John Chambers and colleagues. R can be considered as a different implementation of S. There are some important differences, but much code written for S runs unaltered under R.

### 6.1.343 rpy2: Python interface to R

**Description**

rpy2 is a redesign and rewrite of rpy. It is providing a low-level interface to R, a proposed high-level interface, including wrappers to graphical libraries, as well as R-like structures and functions.

**License**

- GPL 2+
  - Note that we have deleted references to Mozilla PL as an option, which we are allowed to do by the full rpy2 license in order to remain GPL-compatible

**Upstream Contact**

- https://rpy2.bitbucket.io

**Type**

standard

** Dependencies**

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- `cffi`: Foreign Function Interface for Python calling C code
- `jinja2`: General purpose template engine for Python
- `pycparser`: Parser of the C language in Python
- `pytz`: Timezone definitions for Python
- `r`: A free software environment for statistical computing and graphics
- `tzlocal`: Python timezone information for the local timezone
Version Information

package-version.txt:

3.4.5

install-requires.txt:

rpy2 >=3.3

Equivalent System Packages

$ sudo pacman -S python-rpy

$ conda install rpy2

$ sudo apt-get install python3-rpy

$ sudo pkg install math/py-rpy

$ sudo port install py-rpy

$ sudo zypper install python3\$\{PYTHON_MINOR\}\-rpy

See https://repology.org/project/rpy2/versions

If the system package is installed and if the (experimental) option --enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.

6.1.344 rst2ipynb: Convert reStructuredText files to Jupyter notebooks

Description

The rst2ipynb program converts a standalone reStructuredText file to a Jupyter notebook file. This is currently achieved by converting to markdown with pandoc and then to Jupyter notebook using notedown, plus some configuration and tweaks.

License

BSD 3-Clause License
Upstream Contact

Authors: Scott Sievert and Nicolas M. Thiéry Home page: https://github.com/nthiery/rst-to-ipynb

Special Update/Build Instructions

Fetch tarball from https://pypi.python.org/pypi/rst2ipynb/

As it is written in Haskell, pandoc must be installed from the distro.

The main rationale for having a notedown package in Sage (rather than just let pip fetch it) is that the version on pipy (1.5.0, 2015-10-07) is outdated and lacks important features / fixes for us.

Type

optional

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- notedown: Create IPython notebooks from markdown
- pandoc: A document converter

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see github issue #27330 for more information.
6.1.345 rubiks: Programs for Rubik’s cube

Description

There are several programs for working with Rubik’s cubes, by three different people. Look inside the directories under /src to see specific info and licensing. In summary the three contributors are:

Michael Reid (GPL) http://www.cflmath.com/~reid/Rubik/optimal_solver.html
  - optimal - uses many pre-computed tables to find an optimal solution to the 3x3x3 Rubik’s cube

Dik T. Winter (MIT License)
  - cube - uses Kociemba’s algorithm to iteratively find a short solution to the 3x3x3 Rubik’s cube
  - size222 - solves a 2x2x2 Rubik’s cube

  - cu2 - A fast, non-optimal 2x2x2 solver
  - cubex - A fast, non-optimal 3x3x3 solver
  - mcube - A fast, non-optimal 4x4x4 solver

Type

optional

Dependencies

6.1.348 sage_conf: Configuration module for the SageMath library (distributable version)

Description

This distribution package provides:

- a single Python module, `sage_conf`, providing configuration information to the SageMath library at the time of its installation and at its runtime
- a console script `sage-config`, for querying the variables of `sage_conf` from the shell
- a sourceable shell script `sage-env-config`, providing additional configuration information in the form of environment variables

The `sage_conf` distribution package is polymorphic: It has several implementations.

**sage_conf sdist on PyPI**

This implementation of the `sage_conf` distribution package comes from github issue #29039, which added the directory `pkgs/sage-conf_pypi`.

To install, use `pip install -v sage_conf`. Using `-v` ensures that diagnostic messages are displayed.

On installation (or building a wheel), it invokes `sage_bootstrap` to establish a build tree (`SAGE_ROOT`) and installation tree (`SAGE_LOCAL`) for the SageMath distribution. By default, it uses a subdirectory of `$HOME/.sage` that is specific to the version of the distribution and the version of Python in use. If several virtual environments over the same version of Python install `sage_conf`, they will share these trees.

After installation of `sage_conf`, a wheelhouse containing wheels of various libraries is available; type `ls $(sage-config SAGE_SPKG_WHEELS)` to list them and `pip install $(sage-config SAGE_SPKG_WHEELS)/*.whl` to install them. After this, you can install the Sage library, for example, using `pip install sagemath-standard`.

**sage_conf wheels**

Prebuilt binary wheels of the `sage_conf` distribution package are available at https://github.com/sagemath/sage-wheels/releases/

This implementation of `sage_conf` comes from github issue #31396, which adds the directory `pkgs/sage-conf_relocatable`.

On building a wheel, it invokes `sage_bootstrap` to establish a build and installation tree (`SAGE_ROOT`, `SAGE_LOCAL`) in a subdirectory of the directory `/var/tmp/`, whose name is specific to the version of the distribution and the version of Python in use.

The wheel distributes a copy of the prebuilt `SAGE_ROOT` and `SAGE_LOCAL`. Importing `sage_conf` (or using the installed `sage-config` script), makes sure that a symlink from the `/var/tmp` location to the actual persistent installation location is created. As the relocated libraries and programs contain the hardcoded path `SAGE_LOCAL` in various ways (including as rpaths), this symlink is necessary for the prebuilt libraries and programs to work.

`/var/tmp` is a sticky directory on all Linux distributions following the Filesystem Hierarchy Standard, as well as on macOS. On multi-user systems, only one user can use a given version of the distribution; other installation schemes are recommended for systems with multiple Sage users.
sage_conf in the SageMath distribution

The original version of the distribution package sage_conf is used internally in the SageMath distribution. It is provided in the directory pkgs/sage-conf. This version of the package is generated by the Sage distribution’s ./configure script.

sage_conf for conda

The version of the distribution package in the directory pkgs/sage-conf_conda is used in an experimental installation method of SageMath, where all packages are provided by conda. This method is described in https://doc.sagemath.org/html/en/installation/conda.html#using-conda-to-provide-all-dependencies-for-the-sage-library-experimental

sage_conf in downstream distributions

Downstream packagers and advanced developers and users may want to provide their own implementation of the distribution package to support the intended deployment of the SageMath library.

6.1.349 sage_docbuild: Build system of the Sage documentation

About SageMath

“Creating a Viable Open Source Alternative to
Magma, Maple, Mathematica, and MATLAB”

Copyright (C) 2005-2020 The Sage Development Team

https://www.sagemath.org

SageMath fully supports all major Linux distributions, recent versions of macOS, and Windows (using Windows Subsys-
tem for Linux).

The traditional and recommended way to install SageMath is from source via Sage-the-distribution (https://www.
sagemath.org/download-source.html). Sage-the-distribution first builds a large number of open source packages from
source (unless it finds suitable versions installed in the system) and then installs the Sage Library (sagelib, implemented
in Python and Cython).

About this pip-installable source distribution

This is the build system of the Sage documentation, based on Sphinx.

Type

standard

Dependencies

- ${PYTHON}
- ${PYTHON_TOOLCHAIN}
- sagelib
- sphinx: Python documentation generator

Version Information

package-version.txt:

6.1.355 sage_sws2rst: Translate legacy Sage worksheet files (.sws) to reStructuredText (.rst) files

Description

Provides a script `sage -- sws2rst`, which translates a Sage worksheet file (.sws) into a reStructuredText (.rst) file.

Sage worksheet files (.sws) are a file format that was used by the now-obsolete Sage notebook (https://github.com/sagemath/sagenb), superseded by the Jupyter notebook. SageNB was dropped in the course of the transition of SageMath to Python 3.

This package was extracted from the SageNB sources in github issue #28838 to provide a way to convert pedagogical material written available in Sage worksheet format.

Type

optional

Dependencies

- `$(PYTHON)`
- `$(PYTHON_TOOLCHAIN)`
- `beautifultools: Screen-scraping library`

Version Information

package-version.txt:

```

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see [github issue #27330](https://github.com/sagemath/sage/issues/27330) for more information.

### 6.1.357 sagemath_categories: Sage categories and basic rings

**About SageMath**

“Creating a Viable Open Source Alternative to
Magma, Maple, Mathematica, and MATLAB”

Copyright (C) 2005-2023 The Sage Development Team

https://www.sagemath.org

SageMath fully supports all major Linux distributions, recent versions of macOS, and Windows (Windows Subsystem for Linux).

The traditional and recommended way to install SageMath is from source via Sage-the-distribution ([https://www.sagemath.org/download-source.html](https://www.sagemath.org/download-source.html)). Sage-the-distribution first builds a large number of open source packages from source (unless it finds suitable versions installed in the system) and then installs the Sage Library (sagelib, implemented in Python and Cython).

**About this experimental pip-installable source distribution**

This pip-installable source distribution `sagemath --categories` is an experimental distribution of a small part of the Sage Library. Use at your own risk. It provides a small subset of the modules of the Sage library (“sagelib”, `sagemath -- standard`). It is a superset of the `sagemath -- objects` (providing Sage objects, the element/parent framework, categories, the coercion system and the related metaclasses), making various additional categories available without introducing dependencies on additional mathematical libraries.

**Dependencies**

When building from source, development packages of `gmp`, `mpfr`, and `mpc` are needed.

**Documentation**

- Categories
- Structure
- Coercion
- Classes, Metaclasses
Type

experimental

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- cython: C-Extensions for Python, an optimizing static compiler

6.1.364 sagemath_objects: Sage objects, elements, parents, categories, coercion, metaclasses

About SageMath

“Creating a Viable Open Source Alternative to
    Magma, Maple, Mathematica, and MATLAB”

Copyright (C) 2005-2023 The Sage Development Team

https://www.sagemath.org

SageMath fully supports all major Linux distributions, recent versions of macOS, and Windows (Windows Subsystem for Linux).

The traditional and recommended way to install SageMath is from source via Sage-the-distribution (https://www.sagemath.org/download-source.html). Sage-the-distribution first builds a large number of open source packages from source (unless it finds suitable versions installed in the system) and then installs the Sage Library (sagelib, implemented in Python and Cython).

About this experimental pip-installable source distribution

This pip-installable source distribution sagemath – objects is an experimental distribution of a small part of the Sage Library. Use at your own risk. It provides a small, fundamental subset of the modules of the Sage library (“sagelib”, sagemath – standard), making Sage objects, the element/parent framework, categories, the coercion system and the related metaclasses available.

Dependencies

When building from source, development packages of gmp, mpfr, and mpc are needed.
Packages and Features, Release 10.3

Documentation

• Categories
• Structure
• Coercion
• Classes, Metaclasses

Type

experimental

Dependencies

• $(PYTHON)
• $(PYTHON_TOOLCHAIN)
• cysignals: Interrupt and signal handling for Cython
• cython: C-Extensions for Python, an optimizing static compiler
• gmpy2: Python interface to GMP/MPIR, MPFR, and MPC
• pkgconfig: Python interface to pkg-config
• python_build: A simple, correct PEP517 package builder
• sage-setup: Build system of the SageMath library
• sagemath_environment: System and software environment

6.1.365 sagemath_repl: IPython kernel, Sage preparser, doctester

About SageMath

“Creating a Viable Open Source Alternative to
Magma, Maple, Mathematica, and MATLAB”

Copyright (C) 2005-2023 The Sage Development Team

https://www.sagemath.org

SageMath fully supports all major Linux distributions, recent versions of macOS, and Windows (Windows Subsystem for Linux).

The traditional and recommended way to install SageMath is from source via Sage-the-distribution (https://www.sagemath.org/download-source.html). Sage-the-distribution first builds a large number of open source packages from source (unless it finds suitable versions installed in the system) and then installs the Sage Library (sagelib, implemented in Python and Cython).

About this experimental pip-installable source distribution

This pip-installable source distribution `sagemath − repl` is an experimental distribution of a small part of the Sage Library. Use at your own risk. It provides a small, fundamental subset of the modules of the Sage library (“sagelib”, `sagemath − standard`), providing the IPython kernel, Sage preparser, and doctester.

Type

experimental

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- ipython: Interactive computing environment with an enhanced interactive Python shell
- ipywidgets: Interactive HTML widgets for Jupyter notebooks and the IPython kernel
- python_build: A simple, correct PEP517 package builder
- sagemath_environment: System and software environment
- sagemath_objects: Sage objects, elements, parents, categories, coercion, metaclasses

6.1.366 sagemath_sirocco: Certified root continuation with sirocco

About SageMath

“Creating a Viable Open Source Alternative to
Magma, Maple, Mathematica, and MATLAB”

Copyright (C) 2005-2023 The Sage Development Team

https://www.sagemath.org

SageMath fully supports all major Linux distributions, recent versions of macOS, and Windows (Windows Subsystem for Linux).

The traditional and recommended way to install SageMath is from source via Sage-the-distribution (https://www.sagemath.org/download-source.html). Sage-the-distribution first builds a large number of open source packages from source (unless it finds suitable versions installed in the system) and then installs the Sage Library (sagelib, implemented in Python and Cython).

About this pip-installable source distribution

This pip-installable source distribution sagemath-sirocco is a small optional distribution for use with sage-math-standard.

It provides a Cython interface to the sirocco library for the purpose of compute topologically certified root continuation of bivariate polynomials.

Type

optional

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- cypari2: Python interface to the number theory library libpari
- cysignals: Interrupt and signal handling for Cython
- cython: C-Extensions for Python, an optimizing static compiler
- mpfr: Multiple-precision floating-point computations with correct rounding
- pkgconfig: Python interface to pkg-config
- sage-setup: Build system of the SageMath library
- sagemath_environment: System and software environment
- sirocco: Compute topologically certified root continuation of bivariate polynomials
Version Information

package-version.txt:

10.3

install-requires.txt:

# This file is updated on every release by the sage-update-version script
sagemath-sirocco ~= 10.3

Equivalent System Packages

$ conda install sagemath-sirocco

However, these system packages will not be used for building Sage because `spkg-configure.m4` has not been written for this package; see github issue #27330 for more information.

6.1.367 sagemath_tdlib: Tree decompositions with tdlib

About SageMath

“Creating a Viable Open Source Alternative to
Magma, Maple, Mathematica, and MATLAB”

Copyright (C) 2005-2023 The Sage Development Team

https://www.sagemath.org

SageMath fully supports all major Linux distributions, recent versions of macOS, and Windows (Windows Subsystem for Linux).

The traditional and recommended way to install SageMath is from source via Sage-the-distribution (https://www.sagemath.org/download-source.html). Sage-the-distribution first builds a large number of open source packages from source (unless it finds suitable versions installed in the system) and then installs the Sage Library (sagelib, implemented in Python and Cython).

About this pip-installable source distribution

This pip-installable source distribution `sagemath-tdlib` is a small optional distribution for use with `sagemath-standard`.

It provides a Cython interface to the `tdlib` library, providing algorithms concerning tree decompositions.
Type

optional

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- cysignals: Interrupt and signal handling for Cython
- cython: C-Extensions for Python, an optimizing static compiler
- pkgconfig: Python interface to pkg-config
- sage-setup: Build system of the SageMath library
- sagemath_environment: System and software environment
- tdlib: Algorithms for computing tree decompositions

Version Information

package-version.txt:

10.3

install-requires.txt:

```# This file is updated on every release by the sage-update-version script
sagemath-tdlib ~= 10.3```

Equivalent System Packages

6.1.368 sagenb_export: Convert legacy SageNB notebooks to Jupyter notebooks and other formats

Description

This is a tool to convert SageNB notebooks to other formats, in particular IPython/Jupyter notebooks.

It includes a Jupyter notebook extension to provide a UI for the import of SageNB notebooks.
Upstream Contact

https://github.com/vbraun/ExportSageNB

Type

standard

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- ipython: Interactive computing environment with an enhanced interactive Python shell
- nbconvert: Converting Jupyter Notebooks
- notebook: Jupyter notebook, a web-based notebook environment for interactive computing
- six: Python 2 and 3 compatibility utilities

Version Information

package-version.txt:

3.3

install-requires.txt:

git+https://github.com/vbraun/ExportSageNB.git#egg=sagenb_export

Equivalent System Packages

See https://repology.org/project/sagenb-export/versions

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see github issue #27330 for more information.

6.1.369 sagetex: Embed code, results of computations, and plots from Sage into LaTeX documents

Description

The SageTeX package allows you to embed code, results of computations, and plots from Sage into LaTeX documents.
License

The source code of the SageTeX package may be redistributed and/or modified under the terms of the GNU General Public License as published by the Free Software Foundation, either version 2 of the License, or (at your option) any later version. To view a copy of this license, see http://www.gnu.org/licenses/ or send a letter to the Free Software Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston, MA 02110-1301, USA.

The documentation of the SageTeX package is licensed under the Creative Commons Attribution-Share Alike 3.0 License. SPKG Maintainers

Dan Drake (dr.dan.drake at gmail) and SageMath developers (sage-devel@googlegroups.com)

Upstream Contact

Author: Dan Drake.
Web: https://github.com/sagemath/sagetex

Dependencies

To install, nothing more than a standard Sage install. The spkg-check script will exit without actually testing anything if it cannot find “latex” in your path.

Notes

The directory $SAGE_ROOT/venv/share/doc/sagetex contains documentation and an example file. See $SAGE_ROOT/venv/share/texmf/tex/latex/sagetex for the source code and some possibly useful scripts. If you have problems or suggestions see the sage-support group.

If you want to help develop SageTeX, please clone the github repository (see the “Upstream Contact” above) and send me patches based on that.

Type

standard
Dependencies

- $(PYTHON)
- matplotlib: Python 2D plotting library
- maxima: System for manipulating symbolic and numerical expressions
- pillow: Python Imaging Library
- pyparsing: A Python parsing module
- scipy: Scientific tools for Python
- tachyon: A ray tracing system

Version Information

package-version.txt:

3.6.1

install-requires.txt:

sagetex >=3.5

Equivalent System Packages

$ conda install sagetex

See https://repology.org/project/sagetex/versions

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see github issue #27330 for more information.

6.1.370 scip: Mixed integer programming solver

Description

SCIP is currently one of the fastest open source mixed integer programming (MIP) solvers. It is also a framework for constraint integer programming and branch-cut-and-price. It allows total control of the solution process and the access of detailed information down to the guts of the solver.

License

Apache 2.0
Packages and Features, Release 10.3

Upstream Contact

https://scipopt.org/#scipoptsuite

Dependencies

scip brings its own patched version of the bliss library. This will conflict with the optional package bliss.

Type

optional

Dependencies

- $(MP_LIBRARY)
- cmake: A cross-platform build system generator
- papilo: Parallel presolve for integer and linear optimization
- readline: Command line editing library
- soplex: Linear optimization solver using the revised simplex method
- zlib: Data compression library

Version Information

package-version.txt:

802

Equivalent System Packages

$ conda install scip

See https://repology.org/project/scipoptsuite/versions

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see github issue #27330 for more information.

6.1.371 scip_sdp: Mixed integer semidefinite programming plugin for SCIP

Description

SCIP-SDP allows to solve MISDPs using a nonlinear branch-and-bound approach or a linear programming cutting-plane approach.

- In the first case (the default), the semidefinite programming (SDP) relaxations are solve using interior-point SDP-solvers.
- In the second case, cutting planes based on eigenvector are generated.
SCIP-SDP is based on the branch-and-cut framework SCIP. In addition to providing a constraint handler for SDP-constraints and a relaxator to solve continuous SDP-relaxations using interior-point solvers, SCIP-SDP adds several heuristics and propagators to SCIP.

6.1.372 scipy: Scientific tools for Python

Description

SciPy (pronounced “Sigh Pie”) is open-source software for mathematics, science, and engineering. The SciPy library depends on NumPy, which provides convenient and fast N-dimensional array manipulation. The SciPy library is built to work with NumPy arrays, and provides many user-friendly and efficient numerical routines such as routines for numerical integration and optimization. Together, they run on all popular operating systems, are quick to install, and are free of charge. NumPy and SciPy are easy to use, but powerful enough to be depended upon by some of the world’s leading scientists and engineers.
License

SciPy’s license is free for both commercial and non-commercial use, under the BSD terms. See http://www.scipy.org/License_Compatibility

Upstream Contact

https://www.scipy.org/

Dependencies

- Python, which in Sage has numerous dependencies
- Numpy
- Fortran
- GNU patch

Special Update/Build Instructions

- None.

Type

standard

Dependencies

- $(BLAS)
- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- cython: C-Extensions for Python, an optimizing static compiler
- gfortran: Fortran compiler from the GNU Compiler Collection
- meson_python: Meson Python build backend (PEP 517)
- numpy: Package for scientific computing with Python
- pybind11: Create Python bindings to C++ code
- pythran: Ahead of Time compiler for numeric kernels
Version Information

See https://repology.org/project/python:setuptools/versions

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.376 setuptools_scm: Python build system extension to obtain package version from version control

**Description**

the blessed package to manage your versions by scm tags

**License**

MIT

**Upstream Contact**

https://pypi.org/project/setuptools-scm/

**Type**

standard

**Dependencies**

- `${PYTHON}
- `packaging`: Core utilities for Python packages
- `pip`: Tool for installing and managing Python packages
- `setuptools`: Build system for Python packages
- `tomli`: A lil’ TOML parser
- `typing_extensions`: Backported and Experimental Type Hints for Python 3.8+
Version Information

package-version.txt:
8.0.4

install-requires.txt:
# matplotlib-3.6.2 needs >= 7
setuptools_scm >=7

Equivalent System Packages

$ sudo pacman -S python-setuptools-scm
$ conda install setuptools_scm
$ sudo apt-get install python3-setuptools-scm
$ sudo yum install python-setuptools_scm
$ sudo pkg install devel/py-setuptools_scm
$ sudo emerge dev-python/setuptools-scm
$ sudo port install py-setuptools_scm
$ sudo zypper install python3\$(PYTHON_MINOR)-setuptools_scm
$ sudo xbps-install python3-setuptools_scm

See https://repology.org/project/python:setuptools-scm/versions

If the system package is installed and if the (experimental) option --enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.

6.1.377 singular: Computer algebra system for polynomial computations, algebraic geometry, singularity theory

Description

Singular is a computer algebra system for polynomial computations, with special emphasis on commutative and non-commutative algebra, algebraic geometry, and singularity theory.
License

GPLv2 or GPLv3

Upstream Contact

libsingular-devel@mathematik.uni-kl.de
https://www.singular.uni-kl.de/

Special Update/Build Instructions

Other notes:

- If the environment variable SAGE_DEBUG is set to "yes", then omalloc will be replaced by xalloc. The resulting Singular executable and libsingular library will be slower than with omalloc, but allow for easier debugging of memory corruptions.

Type

standard

Dependencies

- $(MP_LIBRARY)
- cddlib: Double description method for polyhedral representation conversion
- flint: Fast Library for Number Theory
- mpfr: Multiple-precision floating-point computations with correct rounding
- ntl: A library for doing number theory
- readline: Command line editing library

Version Information

- `$(PYTHON)`
- `$(PYTHON_TOOLCHAIN)`
- `alabaster`: Default theme for the Sphinx documentation system
- `babel`: Internationalization utilities
- `docutils`: Processing plaintext documentation into useful formats, such as HTML or LaTeX
- `imagesize`: Getting image size from png/jpeg/jpeg2000/gif file
- `importlib_metadata`: Library to access the metadata for a Python package
- `jinja2`: General purpose template engine for Python
- `packaging`: Core utilities for Python packages
- `pygments`: Generic syntax highlighter
- `requests`: An HTTP library for Python
- `snowballstemmer`: Stemmer algorithms for natural language processing in Python
- `sphinxcontrib_applehelp`: Sphinx extension which outputs Apple help book
- `sphinxcontrib_devhelp`: Sphinx extension which outputs Devhelp documents
• `sphinxcontrib_htmlhelp`: Sphinx extension which outputs HTML help book
• `sphinxcontrib_jsmath`: Sphinx extension which renders display math in HTML via JavaScript
• `sphinxcontrib_qthelp`: Sphinx extension which outputs QtHelp documents
• `sphinxcontrib_serializinghtml`: Sphinx extension which outputs serialized HTML files
• `sphinxcontrib_websupport`: Sphinx API for Web apps

Version Information

`package-version.txt`:

```
7.2.6
```

`install-requires.txt`:

```
sphinx >=5.2, <8
```

Equivalent System Packages

```
$ sudo pacman -S python-sphinx
$ conda install sphinx>=5.2
$ sudo apt-get install sphinx
$ sudo yum install python-sphinx
$ sudo pkg install textproc/py-sphinx
$ sudo emerge dev-python/sphinx
$ brew install sphinx-doc
$ sudo port install py-sphinx
$ sudo zypper install python3\${PYTHON_MINOR}\-Sphinx
$ sudo xbps-install python3-Sphinx
```

See [https://repology.org/project/python:sphinx/versions](https://repology.org/project/python:sphinx/versions)

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.
6.1.388 sphinx_basic_ng: A modern skeleton for Sphinx themes.

Description
A modern skeleton for Sphinx themes.

$ sudo yum install python-sphinx-copybutton
$ sudo pkg install textproc/py-sphinx-copybutton
If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.390 sphinx_inline_tabs: Add inline tabbed content to your Sphinx documentation.

**Description**

Add inline tabbed content to your Sphinx documentation.

**License**

**Upstream Contact**

https://pypi.org/project/sphinx-inline-tabs/

**Type**

standard

**Dependencies**

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- `sphinx`: Python documentation generator

**Version Information**

package-version.txt:

2023.4.21

install-requires.txt:

`sphinx-inline-tabs`
**Equivalent System Packages**

(none known)

### 6.1.391 sphinxcontrib_applehelp: Sphinx extension which outputs Apple help book

**Description**

Sphinx extension which outputs Apple help book

**License**

BSD

**Type**

standard

**Dependencies**

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)

**Version Information**

package-version.txt:

```
1.0.8
```

install-requires.txt:

```
sphinxcontrib_applehelp >=1.0.2
```

**Equivalent System Packages**

```
$ sudo pacman -S python-sphinxcontrib-applehelp
$ conda install sphinxcontrib-applehelp
$ sudo yum install python-sphinxcontrib-applehelp
$ sudo pkg install textproc/py-sphinxcontrib-applehelp
$ sudo emerge dev-python/sphinxcontrib-applehelp
```
6.1.392 sphinxcontrib_devhelp: Sphinx extension which outputs Devhelp documents

**Description**

Sphinx extension which outputs Devhelp documents

**License**

BSD

**Type**

standard

**Dependencies**

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)

**Version Information**

package-version.txt:

1.0.6

install-requires.txt:

sphinxcontrib_devhelp >=1.0.2

See https://repology.org/project/python:sphinxcontrib-applehelp/versions

If the system package is installed and if the (experimental) option --enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.
Equivalent System Packages

$ sudo pacman -S python-sphinxcontrib-devhelp
$ conda install sphinxcontrib-devhelp
$ sudo yum install python-sphinxcontrib-devhelp
$ sudo pkg install textproc/py-sphinxcontrib-devhelp
$ sudo emerge dev-python/sphinxcontrib-devhelp
$ sudo port install py-sphinxcontrib-devhelp
$ sudo zypper install python3$\{PYTHON_MINOR\}-sphinxcontrib-devhelp
$ sudo xbps-install python3-sphinxcontrib-devhelp

See https://repology.org/project/python:sphinxcontrib-devhelp/versions

If the system package is installed and if the (experimental) option --enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.

6.1.393 sphinxcontrib_htmlhelp: Sphinx extension which outputs HTML help book

Description

Sphinx extension which outputs HTML help book

License

BSD

Type

standard

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
## Version Information

**package-version.txt:**

| 2.0.5 |

**install-requires.txt:**

| sphinxcontrib_htmlhelp >=1.0.3 |

## Equivalent System Packages

<table>
<thead>
<tr>

See [https://repology.org/project/python:sphinxcontrib-htmlhelp/versions](https://repology.org/project/python:sphinxcontrib-htmlhelp/versions)

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.394 sphinxcontrib_jmath: Sphinx extension which renders display math in HTML via JavaScript

**Description**

Sphinx extension which renders display math in HTML via JavaScript

**License**

BSD
Upstream Contact

https://pypi.org/project/sphinxcontrib-jsmath/

Type

standard

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)

Version Information

package-version.txt:

| 1.0.1 |

install-requires.txt:

| sphinxcontrib_jsmath >=1.0.1 |

Equivalent System Packages

- $ sudo pacman -S python-sphinxcontrib-jsmath
- $ conda install sphinxcontrib-jsmath
- $ sudo yum install python-sphinxcontrib-jsmath
- $ sudo pkg install textproc/py-sphinxcontrib-jsmath
- $ sudo emerge dev-python/sphinxcontrib-jsmath
- $ sudo port install py37-sphinxcontrib-jsmath
- $ sudo zypper install python3\$(PYTHON_MINOR)\$\{PYTHON_MINOR\}-sphinxcontrib-jsmath
- $ sudo xbps-install python3-sphinxcontrib-jsmath

See https://repology.org/project/python:sphinxcontrib-jsmath/versions

If the system package is installed and if the (experimental) option --enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.
6.1.395  sphinxcontrib_qthelp: Sphinx extension which outputs QtHelp documents

Description
Sphinx extension which outputs QtHelp documents

License
BSD

Type
standard

Dependencies
• $(PYTHON)
• $(PYTHON_TOOLCHAIN)

Version Information
package-version.txt:
1.0.7

install-requires.txt:
sphinxcontrib_qthelp >=1.0.3

Equivalent System Packages
$ sudo pacman -S python-sphinxcontrib-qthelp
$ conda install sphinxcontrib-qthelp
$ sudo yum install python-sphinxcontrib-qthelp
$ sudo pkg install textproc/py-sphinxcontrib-qthelp
$ sudo emerge dev-python/sphinxcontrib-qthelp
$ sudo port install py-sphinxcontrib-qthelp
$ sudo zypper install python3\$(PYTHON_MINOR)-sphinxcontrib-qthelp
$ sudo xbps-install python3-sphinxcontrib-qthelp
See https://repology.org/project/python:sphinxcontrib-qthelp/versions

If the system package is installed and if the (experimental) option --enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.

6.1.396 sphinxcontrib_serializinghtml: Sphinx extension which outputs serialized HTML files

Description

Sphinx extension which outputs serialized HTML files

License

BSD

Type

standard

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)

Version Information

package-version.txt:

1.1.10

install-requires.txt:

sphinxcontrib_serializinghtml >=1.1.5

Equivalent System Packages

$ sudo pacman -S python-sphinxcontrib-serializinghtml

$ conda install sphinxcontrib-serializinghtml

$ sudo yum install python-sphinxcontrib-serializinghtml

$ sudo pkg install textproc/py-sphinxcontrib-serializinghtml

$ sudo emerge dev-python/sphinxcontrib-serializinghtml

6.1. Details of external packages
$ sudo port install py-sphinxcontrib-serializinghtml

$ sudo zypper install python3$(PYTHON_MINOR)-sphinxcontrib-serializinghtml

$ sudo xbps-install python3-sphinxcontrib-serializinghtml

See [https://repology.org/project/python:sphinxcontrib-serializinghtml/versions](https://repology.org/project/python:sphinxcontrib-serializinghtml/versions)

If the system package is installed and if the (experimental) option --enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.

### 6.1.397 sphinxcontrib_websupport: Sphinx API for Web apps

**Description**

sphinxcontrib-websupport provides a Python API to easily integrate Sphinx documentation into your Web application.

**License**

BSD

**Type**

standard

**Dependencies**

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- sphinxcontrib_serializinghtml: Sphinx extension which outputs serialized HTML files

**Version Information**

package-version.txt:

```
1.2.7
```

install-requires.txt:

```
sphinxcontrib_websupport >=1.2.1
```
Equivalent System Packages

$ apk add py3-sphinxcontrib-websupport

$ sudo pacman -S python-sphinxcontrib-websupport

$ conda install sphinxcontrib-websupport

$ sudo apt-get install python3-sphinxcontrib.websupport

$ sudo yum install python-sphinxcontrib-websupport

$ sudo pkg install textproc/py-sphinxcontrib-websupport

$ sudo emerge dev-python/sphinxcontrib-websupport

$ sudo port install py-sphinxcontrib-websupport

$ sudo zypper install python3\${PYTHON_MINOR}\-sphinxcontrib-websupport

See https://repology.org/project/python:sphinxcontrib-websupport/versions

If the system package is installed and if the (experimental) option --enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.

6.1.398 sqlalchemy: A database abstraction library

Description

Database Abstraction Library

License

MIT

Upstream Contact

https://pypi.org/project/SQLAlchemy/

Type

optional
Dependencies

Version Information

requirements.txt:

sqlalchemy

Equivalent System Packages

$ conda install sqlalchemy

$ sudo port install py-sqlalchemy

$ sudo zypper install python3\${PYTHON_MINOR}\-SQLAlchemy

$ sudo xbps-install python3-SQLAlchemy

See https://repology.org/project/python:sqlalchemy/versions

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see github issue #27330 for more information.

6.1.399 sqlite: An SQL database engine

Description

SQLite is a software library that implements a self-contained, serverless, zero-configuration, transactional SQL database engine.

License

Public Domain

Upstream contact

- https://www.sqlite.org

Dependencies

- readline
Special Update/Build Instructions

- Use the autoconf version of sqlite.

Type

standard

Dependencies

- readline: Command line editing library

Version Information

package-version.txt:

| 3.36.0 |

Equivalent System Packages

- `$ apk add sqlite-dev`
- `$ sudo pacman -S sqlite3`
- `$ conda install sqlite`
- `$ apt-cyg install libsqlite3-devel sqlite3`
- `$ sudo apt-get install libsqlite3-dev sqlite3`
- `$ sudo yum install sqlite-devel sqlite3`
- `$ sudo pkg install databases/sqlite3`
- `$ sudo emerge dev-db/sqlite3`
- `$ brew install sqlite`
- `$ sudo port install sqlite3`
- `$ nix-env --install sqlite`
- `$ sudo zypper install pkgconfig\(sqlite3\)`
- `$ sudo slackpkg install sqlite icu4c`
$ sudo xbps-install sqlite-devel

See https://repology.org/project/sqlite/versions

If the system package is installed, ./configure will check if it can be used.

6.1.400 stack_data: Extract data from python stack frames and tracebacks for informative displays

Description

Extract data from python stack frames and tracebacks for informative displays

License

MIT

Upstream Contact

https://pypi.org/project/stack-data/

Type

standard

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- asttokens: Annotate AST trees with source code positions
- executing: Get the currently executing AST node of a frame, and other information
- pure_eval: Safely evaluate AST nodes without side effects

Version Information

package-version.txt:

0.6.3

install-requires.txt:

stack-data
Equivalent System Packages

$ conda install stack_data

$ sudo emerge dev-python/stack-data

If the system package is installed and if the (experimental) option --enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.

6.1.401 suitesparse: A suite of sparse matrix software

SuiteSparse is a collection of software to deal with sparse matrix. It is hosted at http://faculty.cse.tamu.edu/davis/suitesparse.html

This spkg does a minimal install of suitesparse disabling the following

- metis
- GraphBLAS (need cmake)
- Mongoose (need cmake)

An externalmetis package can be used but we just disable its use.

Patches:

- The first patch disable the building of package using cmake.
- The second patch make sure we use sage's blas/lapack on OS X. By default suitesparse discard any configurations to use the accelerate framework.

The building of metis is disabled by passing MY_METIS_LIB=none to make (any value would have done) We also configure cholmod so it doesn't require metis by passing CHOLMOD_CONFIG=-DNPARTITION to make.

Other configurations are self explanatory.

License: because SuiteSparse is a collection, it comes with a variety of licenses. Find below a copy of the “LICENSES.txt” shipped with SuiteSparse.

Mongoose License

Mongoose, Copyright 2018, Timothy A. Davis, Scott P. Kolodziej, William W. Hager, S. Nuri Yeralan
Licensed under the GNU GENERAL PUBLIC LICENSE, Version 3, 29 June 2007

Type

standard

Dependencies

- $(BLAS)
- $(MP_LIBRARY)
- gfortran: Fortran compiler from the GNU Compiler Collection
- mpfr: Multiple-precision floating-point computations with correct rounding

Version Information

package-version.txt:

5.10.1

Equivalent System Packages

- $ apk add suitesparse-dev
- $ sudo pacman -S suitesparse
- $ conda install suitesparse
- $ apt-cyg install libsuitesparseconfig-devel
- $ sudo apt-get install libsuitesparse-dev
- $ sudo yum install suitesparse suitesparse-devel
- $ sudo zypper install math/suitesparse
- $ sudo emerge sci-libs/amd sci-libs/cholmod sci-libs/suitesparseconfig \sci-libs/umfpack

No package needed.

- $ brew install suite-sparse
- $ sudo zypper install suitesparse-devel
$ sudo xbps-install SuiteSparse-devel

See https://repology.org/project/suitesparse/versions

If the system package is installed, ./configure will check if it can be used.

### 6.1.402 surf: Visualization of algebraic curves, algebraic surfaces and hyperplane sections of surfaces

**Description**

surf is a tool to visualize some real algebraic geometry: plane algebraic curves, algebraic surfaces and hyperplane sections of surfaces. surf is script driven and has (optionally) a nifty GUI using the Gtk widget set.

This is used by the Singular Jupyter kernel to produce 3D plots.

**License**

GPL version 2 or later

**Upstream Contact**

http://surf.sourceforge.net (although the project is essentially dead)

**Dependencies**

- cups (optional)
- GNU flex Version 2.5 or higher
- GTK+ Version 1.2.0 or higher (optional)
- POSIX Threads
- GNU MP(gmp) Version 2 or higher
- lib-tiff
- lib-jpeg
- zlib
- ps2pdf (optional)

This package is “experimental” because not all of these dependencies are packaged with Sage.
Type

experimental

Dependencies

- $\$(MP_LIBRARY)$

Version Information

package-version.txt:

1.0.6-gcc6

Equivalent System Packages

$ sudo zypper install surf

See https://repology.org/project/surf-alggeo/versions

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see github issue #27330 for more information.

6.1.403 surface_dynamics: dynamics on surfaces (measured foliations, interval exchange transformation, Teichmüller flow, etc)

Description

Dynamics on surfaces.

License

GPLv2+

Upstream Contact

https://gitlab.com/videlec/surface_dynamics https://pypi.org/project/surface-dynamics/

Type

optional
Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- $(SAGERUNTIME)
- cysignals: Interrupt and signal handling for Cython
- pplpy: Python interface to the Parma Polyhedra Library

Version Information

requirements.txt:

```
surface_dynamics
```

Equivalent System Packages

See https://repology.org/project/python:surface-dynamics/versions

However, these system packages will not be used for building Sage because spkg-configure.m4 has not been written for this package; see github issue #27330 for more information.

6.1.404 symengine: A C++ symbolic manipulation library

Description

SymEngine is a standalone fast C++ symbolic manipulation library.

License

BSD 3-clause

Upstream Contact

https://github.com/symengine/symengine

Type

optional
Dependencies

- $(MP_LIBRARY)
- cmake: A cross-platform build system generator
- ecm: Elliptic curve method for integer factorization
- flint: Fast Library for Number Theory
- mpc: Arithmetic of complex numbers with arbitrarily high precision and correct rounding
- mpfr: Multiple-precision floating-point computations with correct rounding

Version Information

package-version.txt:

0.11.2

Equivalent System Packages

$ sudo pacman -S symengine

$ conda install symengine

$ sudo pkg install math/symengine

$ sudo emerge sci-libs/symengine

$ brew install symengine

$ sudo port install symengine

$ nix-env --install symengine

$ sudo zypper install symengine

See https://repology.org/project/symengine/versions

If the system package is installed, ./configure will check if it can be used.

6.1.405 symengine_py: Python wrappers for SymEngine

Description

Python wrappers for SymEngine
License

symengine.py is MIT licensed and uses several LGPL, BSD-3 and MIT licensed libraries

Upstream Contact

https://github.com/symengine/symengine.py

Type

optional

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- cmake: A cross-platform build system generator
- cython: C-Extensions for Python, an optimizing static compiler
- symengine: A C++ symbolic manipulation library

Version Information

package-version.txt:

0.11.0

install-requires.txt:

symengine.py >= 0.6.1

Equivalent System Packages

$ sudo pacman -S python-symengine

$ conda install python-symengine

$ sudo pkg install math/py-symengine

$ sudo emerge dev-python/symengine

See https://repology.org/project/python:symengine/versions

If the system package is installed and if the (experimental) option --enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.

6.1. Details of external packages
6.1.406 symmetrica: Library for representation theory

Description

Symmetrica is a Collection of C routines for representation theory.
It is a program developed by Lehrstuhl Mathematik II of the University of Bayreuth. It has routines to handle the following topics:

- ordinary representation theory of the symmetric group and related groups (2/11/04)
- ordinary representation theory of the classical groups
- modular representation theory of the symmetric group
- projective representation theory of the symmetric group
- combinatorics of tableaux
- symmetric functions and polynomials (7/22/04)
- commutative and non commutative Schubert polynomials
- operations of finite groups.
- ordinary representation theory of Hecke algebras of type A_n

For more details check http://www.algorithm.uni-bayreuth.de/en/research/SYMMETRICA

Updated package on https://gitlab.com/sagemath/symmetrica/-/releases with changes to modernize the source and the build system.

License

Public Domain (see the above web site)

Upstream Contact

- (passed away in 2013) Axel Kohnert - see http://www.mathe2.uni-bayreuth.de/axel/

Type

standard

Dependencies

- xz: General-purpose data compression software
Version Information

package-version.txt:

3.0.1

Equivalent System Packages

$ sudo pacman -S symmetrica
$ conda install symmetrica
$ sudo apt-get install libsymmetrica2-dev
$ sudo yum install symmetrica-devel
$ sudo pkg install math/symmetrica
$ sudo emerge sci-libs/symmetrica
$ nix-env --install symmetrica
$ sudo xbps-install symmetrica-devel

See https://repology.org/project/symmetrica/versions

If the system package is installed, ./configure will check if it can be used.

6.1.407 sympow: Computes special values of symmetric power elliptic curve L-functions

Description

SYMPOW is a package to compute special values of symmetric power elliptic curve L-functions. It can compute up to about 64 digits of precision.

License

- See the file src/COPYING
Upstream Contact

SYMPOW does not appear to be maintained any longer. Mark Watkins, the package author, now works at Magma. Previous (possibly still usable) email is watkins@maths.usyd.edu.au

New upstream: https://gitlab.com/rezozer/forks/sympow

Dependencies

- GNU patch

Special Update/Build Instructions

- Some of the code is very dubious, and it is anyone's guess really what the compiler does with it. For example, the following line exists in src/eulerfactors.c:
  
  if ((HECKE) && (d==1)) return hecke_good(p,ap,m,v);

  But since hecke_good is defined as returning void, it's hard to know exactly how this code behaves. I would not be surprised by any bugs that might show up. I (David Kirkby) would personally not trust this code much at all.

- This is a difficult package to maintain. A github issue (#9758) has been opened to implement Watkins-Delaunay's algorithm for computing modular degrees in Sage. Once implemented, it should be possible to remove this package.

- The package is configured such that the data files are in a directory below where 'sympow' is installed. If Sage is installed globally, then it will be impossible to create the data files without being root. This has been fixed in the Gentoo Linux distribution. Some information from Christopher can be seen on github issue #9703 This package will generate binary versions of all shipped datafiles, so these will work. However, creating totally new datafiles from scratch will not work.

Type

standard

Dependencies

- pari: Computer algebra system for fast computations in number theory

Version Information

package-version.txt:

| 2.023.6 |
Equivalent System Packages

$ sudo pacman -S sympow
$ conda install sympow
$ sudo apt-get install sympow
$ sudo yum install sympow
$ sudo emerge sci-mathematics/sympow

$ sudo zypper install sympow
$ sudo xbps-install sympow

See https://repology.org/project/sympow/versions

If the system package is installed, ./configure will check if it can be used.

6.1.408 sympy: Python library for symbolic mathematics

Description

SymPy is a Python library for symbolic mathematics. It aims to become a full-featured computer algebra system (CAS) while keeping the code as simple as possible in order to be comprehensible and easily extensible. SymPy is written entirely in Python and does not require any external libraries, except optionally for plotting support.

Website

https://sympy.org/

License

New BSD: http://www.opensource.org/licenses/bsd-license.php

Upstream Contact

sympy mailinglist: http://groups.google.com/group/sympy
Packages and Features, Release 10.3

Dependencies

- Python 2.5 or later

Special Update/Build Instructions

- A simple script can be used to ease the updating of the SPKG. See the README.

Type

standard

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- mpmath: Pure Python library for multiprecision floating-point arithmetic

Version Information

package-version.txt:

```
1.12
```

install-requires.txt:

```
sympy >=1.6, <2.0
```

Equivalent System Packages

```
$ sudo pacman -S python-sympy
$ conda install sympy
$ sudo apt-get install python3-sympy
$ sudo yum install python-sympy
$ sudo emerge dev-python/sympy
$ sudo port install py-sympy
$ sudo zypper install python3\$(PYTHON_MINOR)~sympy
$ sudo xbps-install python3-sympy
```
See https://repology.org/project/python:sympy/versions

If the system package is installed and if the (experimental) option `--enable-system-site-packages` is passed to `./configure`, then `./configure` will check if the system package can be used.

### 6.1.409 tachyon: A ray tracing system

**Description**

Tachyon is a raytracer developed by John E. Stone. Tachyon supports the typical ray tracer features, most of the common geometric primitives, shading and texturing modes, etc. It also supports less common features such as HDR image output, ambient occlusion lighting, and support for various triangle mesh and volumetric texture formats beneficial for molecular visualization (e.g. rendering VMD scenes).

Currently not all of Tachyon’s functionality is exported by the Sage interface.

**License**

Copyright (c) 1994-2010 John E. Stone All rights reserved.

Redistribution and use in source and binary forms, with or without modification, are permitted provided that the following conditions are met:

1. Redistributions of source code must retain the above copyright notice, this list of conditions and the following disclaimer.

3. The name of the author may not be used to endorse or promote products derived from this software without specific prior written permission.

**Upstream Contact**

- [http://jedi.ks.uiuc.edu/~johns/raytracer/](http://jedi.ks.uiuc.edu/~johns/raytracer/)
- John Stone <johns@ks.uiuc.edu>

**Dependencies**

This spkg depends on:

- libpng
Special Update/Build Instructions

- Delete the scenes directory, which has lots of cool examples.
- Delete the msvc directory, which is also large and not used within Sage.
- The CVS subdirectories are currently (almost) empty, but should otherwise be deleted.
- The upstream files had strange permissions, i.e. some source files were executable, while almost all files weren’t world-readable.
- There’s seems to be some crap like tachyon.html.tar.gz and a few .#* files I haven’t [yet] deleted, since they’re not that large.
- TODO: Check whether building multi-threaded versions on MacOS X meanwhile works. (This was said to fail with an old beta.)
- TODO: Use patch instead of copying over pre-patched files.
- TODO: [ Optionally] also install some of the documentation.
- TODO: I doubt the CFLAGS set for AIX and HP-UX won’t get overridden by the created Makefile, but that’s a minor issue. -leif

Type

standard

Dependencies

- libpng: Bitmap image support

Version Information

package-version.txt:

0.98.9.p7

Equivalent System Packages

$ sudo pacman -S tachyon
$ conda install tachyon
$ sudo apt-get install tachyon
$ sudo yum install tachyon tachyon-devel
$ sudo pkg install graphics/tachyon
$ sudo emerge media-gfx/tachyon
$ nix-env --install tachyon

$ sudo zypper install tachyon

$ sudo xbps-install tachyon

See https://repology.org/project/tachyon/versions, https://repology.org/project/tachyon-opengl/versions

If the system package is installed, ./configure will check if it can be used.

6.1.411 terminado: Tornado websocket backend for the term.js Javascript terminal emulator library

Description

This is a Tornado websocket backend for the term.js Javascript terminal emulator library.

It evolved out of pyxterm, which was part of GraphTerm (as lineterm.py), v0.57.0 (2014-07-18), and ultimately derived from the public-domain Ajaxterm code, v0.11 (2008-11-13) (also on Github as part of QWeb).

Type

standard

Dependencies

- $(PYTHON)
- $(PYTHON_TOOLCHAIN)
- hatchling: Modern, extensible Python build backend
- ptyprocess: Python interaction with subprocesses in a pseudoterminal
- tornado: Python web framework and asynchronous networking library
Version Information

If the system package is installed and if the (experimental) option --enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.

6.1.412 texlive: A comprehensive TeX system

Description

TeX Live is an easy way to get up and running with the TeX document production system. It provides a comprehensive TeX system with binaries for most flavors of Unix, including GNU/Linux, and also Windows. It includes all the major TeX-related programs, macro packages, and fonts that are free software, including support for many languages around the world.

This package installs all texlive packages required to build Sage. If necessary, texlive itself is installed.

License

Various FSF-approved free software licenses. See https://www.tug.org/texlive/copying.html for details.

Upstream Contact

Home page: https://www.tug.org/texlive

If the system package is installed and if the (experimental) option --enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.

6.1.419 topcom: Compute triangulations of point configurations and oriented matroids

Description

TOPCOM is a collection of clients to compute Triangulations Of Point Configurations and Oriented Matroids, resp. The algorithms use only combinatorial data of the point configuration as is given by its oriented matroid. Some basic commands for computing and manipulating oriented matroids can also be accessed by the user.

It was very much inspired by the maple program PUNTOS, which was written by Jesus de Loera. TOPCOM is entirely written in C++, so there is a significant speed up compared to PUNTOS.

### 6.1.430 valgrind: Memory error detector, call graph generator, runtime profiler

**Description**

This is an optional spkg. It supports Linux on x86, x86-64, ppc, ppc64 and ARM as well as Darwin (Mac OS X 10.5 and 10.6) on x86 and x86-64.

Valgrind is an instrumentation framework for building dynamic analysis tools. There are Valgrind tools that can automatically detect many memory management and threading bugs, and profile your programs in detail. You can also use Valgrind to build new tools.

The Valgrind distribution currently includes six production-quality tools: a memory error detector, two thread error detectors, a cache and branch-prediction profiler, a call-graph generating cache and branch-prediction profiler, and a heap profiler. It also includes three experimental tools: a heap/stack/global array overrun detector, a second heap profiler that examines how heap blocks are used, and a SimPoint basic block vector generator. It runs on the following platforms: X86/Linux, AMD64/Linux, ARM/Linux, PPC32/Linux, PPC64/Linux, S390X/Linux, ARM/Android (2.3.x), X86/Darwin and AMD64/Darwin (Mac OS X 10.6 and 10.7).

**License**

Valgrind is Open Source / Free Software, and is freely available under the GNU General Public License, version 2.

**Upstream Contact**

- http://www.valgrind.org/

$ sudo zypper install jupyter-widgetsnbextension

$ sudo xbps-install python3-jupyter_widgetsnbextension

If the system package is installed and if the (experimental) option --enable-system-site-packages is passed to ./configure, then ./configure will check if the system package can be used.

6.1.438 xindy: a general-purpose index processor

Description

This dummy package represents xindy: xindy was developed after an impasse had been encountered in the attempt to complete internationalisation of makeindex. Xindy can be used to process indexes for documents marked up using (LA)TEX, Nroff family and SGML-based languages. Xindy is highly configurable, both in markup terms and in terms of the collating order of the text being processed.

We do not have an SPKG for it. The purpose of this dummy package is to associate system package lists with it.
License

GNU General Public License version 2.0 (GPLv2)

Upstream Contact

http://www.xindy.org/

Type

optional

Dependencies

Version Information

Equivalent System Packages

$ sudo apt-get install xindy
$ sudo port install xindy
$ sudo zypper install xindy

See https://repology.org/project/xindy/versions

If the system package is installed, ../configure will check if it can be used.

6.1.439 xz: General-purpose data compression software

Description

XZ Utils is free general-purpose data compression software with a high compression ratio.

License

Some parts public domain, other parts GNU LGPLv2.1, GNU GPLv2, or GNU GPLv3.
