1.1 Description
A software package for algebraic, geometric and combinatorial problems on linear spaces. Available at www.4ti2.de.

1.2 License
4ti2 is released under a GPL v2 license.

1.3 Upstream Contact

• Raymond Hemmecke, TU Munich, Germany
• Matthias Köppe, UC Davis, CA, USA

1.4 Dependencies
GLPK, GMP.
2.1 Description

Alabaster is a visually clean, responsive, configurable theme for the Sphinx documentation system. It is Python 2+3 compatible.

It began as a third-party theme, and is still maintained separately, but as of Sphinx 1.3, Alabaster is an install-time dependency of Sphinx and is selected as the default theme.

Live examples of this theme can be seen on paramiko.org, fabfile.org and pyinvoke.org.
3.1 Description

Disable App Nap on OS X 10.9
4.1 Description

Arb is a C library for arbitrary-precision floating-point ball arithmetic, developed by Fredrik Johansson (fredrik.johansson@gmail.com). It supports efficient high-precision computation with polynomials, power series, matrices and special functions over the real and complex numbers, with automatic, rigorous error control.

4.2 License

GNU General Public License v2+

4.3 Upstream Contact

- Fredrik Johansson: fredrik.johansson@gmail.com

4.4 Dependencies

- FLINT
- MPIR or GMP
- MPFR

4.5 Special Update/Build Instructions
5.1 Description

This spkg builds ATLAS for Sage.

5.2 License

3-clause BSD

5.3 Upstream Contact

- Atlas devel mailing list.
- Clint Whaley has frequently answered questions from the Sage project

5.4 Dependencies

- Python

5.5 Special Update/Build Instructions

- src/lapack-x.y.z.tgz: The netlib lapack tarball. If you update this, make sure you also update the LA-
PACK_TARBALL variable in spkg-install.
- src/ATLAS-lib: We are using a dummy autotools/libtools project to repack the static ATLAS libraries into
shared libraries.
- src/ARCHS: We ship some archdef tarballs to speed ATLAS build.
- spkg-install: If you update atlas to a new version make sure that the ATLAS_OSTYPE, ATLAS_MACHTYPE,
and ATLAS_ISAEXT variables in spkg-install remain in sync with atlas’ CONFIG/include/atlconf.h
- The package is never installed on OS X, unless you set SAGE_ATLAS_ARCH.
5.5.1 Patches

- patches/detect.patch: Fix Itanium2 support on modern RHEL 5 and SLES 10 systems, work around -m64 issue on Itanium2, and correctly detect number and speed of CPUs on a bunch of systems.

- patches/arm_hard_floats.patch: make sure soft floats are not enforced on ARM.

- patches/Makefile.patch: fix clean target.

- patches/do_not_force_mutex.patch: always use assembly over mutex since the mutex version fails to build a shared library. See #15045 for details.

- patches/glibc_scanf_workaround.patch: Workaround for the scanf bug in glibc-2.18 that breaks the atlas auto-tuning system.

5.5.2 Configuration

The package can be configured via three environment variables:

- SAGE_ATLAS_LIB=path
  
  If this environment variable is set, the libraries libatlas, libcblas, liblapack, and libf77blas from the directory “path” are used and ATLAS is not compiled from source. The libraries can be either static (endin in .a) or shared libraries (ending in .so or .dylib).

- SAGE_ATLAS_ARCH=arch[,isaext1][,isaext2]...[,isaextN]
  
  The given architectural default and instruction set extensions are used instead of the empirical tuning. Available architectures are

  POWER3, POWER4, POWER5, PPCG4, PPCG5, POWER6, POWER7, IBMz9, IBMz10, IBMz196, x86x87, x86SSE1, x86SSE2, x86SSE3, P5, P5MMX, PPRO, PII, PIII, PM, CoreSolo, CoreDuo, Core2Solo, Core2, Corei1, Corei2, Atom, P4, P4E, Efficeon, K7, HAMMER, AMD64K10h, AMDDOZER, UNKNOWNx86, IA64Itan, IA64Itan2, USI, USII, USIII, USIV, UST1, UST2, UnknownUS, MIPSRI1xK, MIPSICE9, ARMv6, ARMv7

  and instruction set extensions are

  VSX, AltiVec, AVXMAC, AVXFMA4, AVX, SSE3, SSE2, SSE1, 3DNow, NEON

  In addition, you can also set

  - SAGE_ATLAS_ARCH=fast picks defaults for a modern (2-3 year old) CPU of your processor line, and

  - SAGE_ATLAS_ARCH=base picks defaults that should work for a ~10 year old CPU.

  For example,

  SAGE_ATLAS_ARCH=Corei2,AVX,SSE3,SSE2,SSE1

  would be appropriate for a Core i7 CPU.

  - If SAGE_ATLAS_SAVE_ARCHDEF = is given, then a new archdef file is created and saved to the given path.
6.1 Description

attrs is the Python package that will bring back the joy of writing classes by relieving you from the drudgery of implementing object protocols (aka dunder methods).

6.2 License

MIT License

6.3 Upstream Contact

Home page: https://www.attrs.org

6.4 Dependencies

Python
7.1 Description

Awali is a software platform dedicated to the computation of, and with, finite state machines. Here finite state machines is to be understood in the broadest possible sense: finite automata with output — often called transducers then — or even more generally finite automata with multiplicity, that is, automata that not only accept, or recognize, sequences of symbols but compute for every such sequence a ‘value’ that is associated with it and which can be taken in any semiring. Hence the variety of situations that can thus be modelled.

7.2 License

• Cython
• ncurses
• graphviz must be installed from your distro, and available in the path.
7.5 Special Update/Build Instructions

• None
8.1 Description

Internationalization utilities

A collection of tools for internationalizing Python applications.
9.1 Description

barvinok is a library for counting the number of integer points in parametric and non-parametric polytopes as well as projections of such sets.

9.2 License

GPL v2

9.3 Upstream Contact

- http://groups.google.com/group/isl-development
10.1 Description

Benzene is a program for the efficient generation of all nonisomorphic fusenes and benzenoids with a given number of faces. Fusenes are planar polycyclic hydrocarbons with all bounded faces hexagons. Benzenoids are fusenes that are subgraphs of the hexagonal lattice.

10.2 License

Benzene is licensed under the GNU General Public License v2 or later (June 2007)

10.3 Upstream Contact

Benzene was written by Gunnar Brinkmann and Gilles Caporossi. This version was adapted by Gunnar Brinkmann and Nico Van Cleemput for Grinvin. http://www.grinvin.org/

10.4 Dependencies

11.1 Description

An easy safelist-based HTML-sanitizing tool.

11.2 License

Apache License v2

11.3 Upstream Contact

Home Page: https://github.com/mozilla/bleach

11.4 Dependencies

Python, html5lib, six
BLISS 0.73+DEBIAN-1

12.1 Description

bliss is an open source tool for computing automorphism groups and canonical forms of graphs.

12.2 License

LGPL

12.3 Upstream Contact

Bliss is currently being maintained by Tommi Junttila and Petteri Kaski.
http://www.tcs.tkk.fi/Software/bliss/index.html

We apply patches generated from https://github.com/mkoeppe/bliss (branch apply_debian_patches) as our upstream. This tracks the patches from the Debian package, adding an autotools build system and adjusting the include file locations.

12.4 Dependencies

None
13.1 Description

Boost provides free peer-reviewed portable C++ source libraries.

13.2 License

Boost software license (GPL compatible)

13.3 Upstream Contact

Home page: http://boost.org

13.4 Dependencies

None
14.1 Description

Boost provides free peer-reviewed portable C++ source libraries.

We emphasize libraries that work well with the C++ Standard Library. Boost libraries are intended to be widely useful, and usable across a broad spectrum of applications. The Boost license encourages both commercial and non-commercial use.

We aim to establish “existing practice” and provide reference implementations so that Boost libraries are suitable for eventual standardization. Ten Boost libraries are already included in the C++ Standards Committee’s Library Technical Report (TR1) and will be in the new C++0x Standard now being finalized. C++0x will also include several more Boost libraries in addition to those from TR1. More Boost libraries are proposed for TR2.

Website: http://www.boost.org/

14.2 License

Boost Software License - see http://www.boost.org/users/license.html

14.3 Upstream Contact

See mailing list page at http://www.boost.org/community/groups.html

14.4 Dependencies

None
15.1 Description

BRiAl is the successor to PolyBoRi.

The core of PolyBoRi is a C++ library, which provides high-level data types for Boolean polynomials and monomials, exponent vectors, as well as for the underlying polynomial rings and subsets of the powerset of the Boolean variables. As a unique approach, binary decision diagrams are used as internal storage type for polynomial structures. On top of this C++-library we provide a Python interface. This allows parsing of complex polynomial systems, as well as sophisticated and extendable strategies for Gröbner base computation. PolyBoRi features a powerful reference implementation for Gröbner basis computation.

15.2 License

GPL version 2 or later

15.3 Upstream Contact

https://github.com/BRiAl/BRiAl
16.1 Description

Buckygen is a program for the efficient generation of all nonisomorphic fullerenes. These are triangulations where all vertices have degree 5 or 6. Or if the dual representation is used: cubic plane graphs where all faces are pentagons or hexagons.

16.2 License

Buckygen is licensed under the GNU General Public License v3 (June 2007).

16.3 Upstream Contact

Buckygen was mainly written by Jan Goedgebeur, jan.goedgebeur[at]ugent.be. http://caagt.ugent.be/buckygen/

16.4 Dependencies

• None
17.1 Description

bzip2 is a freely available, patent free, high-quality data compressor. It typically compresses files to within 10% to 15% of the best available techniques (the PPM family of statistical compressors), whilst being around twice as fast at compression and six times faster at decompression.

17.2 License

BSD-style

17.3 Upstream Contact

- Website http://bzip.org/
- Author: Julian Seward <julian@bzip.org>

17.4 Dependencies

None

17.5 Special Update/Build Instructions

This package must not be bzip2 compressed, so create it using

```
tar c bzip2-1.0.6 | gzip --best >bzip2-1.0.6.spkg
```

The build system has been autotoolized based on a patch by the Suse folk at http://ftp.uni-kl.de/pub/linux/suse/people/sbrabec/bzip2/for_downstream/bzip2-1.0.6-autoconfiscated.patch

See patches/autotools and spkg-src for details.
18.1 Description

The Computational Infrastructure for Operations Research (COIN-OR**, or simply COIN) project is an initiative to spur the development of open-source software for the operations research community.

The COIN Branch and Cut solver (CBC) is an open-source mixed-integer program (MIP) solver written in C++. CBC is intended to be used primarily as a callable library to create customized branch-and-cut solvers. A basic, stand-alone executable version is also available. CBC is an active open-source project led by John Forrest at www.coin-or.org.

- Robin Lougee-Heimer

18.4 Project Home Page

- https://projects.coin-or.org/Cbc
19.1 Description

ccache is a compiler cache. It speeds up recompilation by caching previous compilations and detecting when the same compilation is being done again. Supported languages are C, C++, Objective-C and Objective-C++.

19.2 License

GNU General Public License version 3 or later

19.3 Upstream Contact

- Author: Andrew Tridgell
- Website: http://ccache.samba.org/
20.1 Description

The C-library cddlib is a C implementation of the Double Description Method of Motzkin et al. for generating all vertices (i.e. extreme points) and extreme rays of a general convex polyhedron in $\mathbb{R}^d$ given by a system of linear inequalities:

$$P = \{ x=(x_1, \ldots, x_d)^T : b - A x \geq 0 \}$$

where $A$ is a given $m \times d$ real matrix, $b$ is a given $m$-vector and 0 is the $m$-vector of all zeros.

The program can be used for the reverse operation (i.e. convex hull computation). This means that one can move back and forth between an inequality representation and a generator (i.e. vertex and ray) representation of a polyhedron with cdd. Also, cdd can solve a linear programming problem, i.e. a problem of maximizing and minimizing a linear function over $P$.

20.2 License

GPL v2

20.3 Upstream Contact

https://github.com/cddlib/cddlib

20.4 Dependencies

- gmp (or its fork mpir)
21.1 Description

Python package for providing Mozilla’s CA Bundle.

21.4 Dependencies

Python, Setuptools
22.1 Description

Cliquer is a set of C routines for finding cliques in an arbitrary weighted graph. It uses an exact branch-and-bound algorithm recently developed by Patr Ostergard.

22.2 License

GNU General Public License v2

22.3 Upstream Contact

Cliquer was mainly written by Sampo Niskanen, sampo.niskanen@iki.fi (Q=®). http://users.tkk.fi/pat/cliquer.html

22.4 Dependencies

• None

22.5 Patches

• autotoolized - see https://github.com/dimpase/autocliquer
23.1 Description

The “cmake” executable is the CMake command-line interface. It may be used to configure projects in scripts. Project configuration settings may be specified on the command line with the -D option. The -i option will cause cmake to interactively prompt for such settings.

CMake is a cross-platform build system generator. Projects specify their build process with platform-independent CMake listfiles included in each directory of a source tree with the name CMakeLists.txt. Users build a project by using CMake to generate a build system for a native tool on their platform.

Website: www.cmake.org

23.2 License

CMake is distributed under the OSI-approved BSD 3-clause License.

26.4 Dependencies

- None

26.5 Special Update/Build Instructions

The src/ subdirectory is a clone of my mercurial repository at https://bitbucket.org/vbraun/compilerwrapper. You can update the source tree with “hg pull -u”.
CHAPTER TWENTYSEVEN

CONFIGURE

27.1 Description

This package contains a tar archive of auto-generated files. They are shipped with Sage in case you do not have a sufficiently recent autotools version installed.

27.2 License

GPLv3+

27.3 Upstream Contact

Automatically generated by Sage, use trac and/or sage-devel for questions.

27.4 Dependencies

None

27.5 Special Update/Build Instructions

This tarball is automatically generated by Sage whenever you run the $SAGE_ROOT/bootstrap -s or the $SAGE_ROOT/src/bin/sage-update-version script.
28.1 Description

Contains a small database of Conway polynomials.

28.2 Dependencies

- Sage library
29.1 Description

This package wraps Fokko Ducloux’s Coxeter 3 C++ library

Features:

- General Coxeter groups, implemented through the combinatorics of reduced words;
- Reduced expression and normal form computations;
- Bruhat ordering;
- Ordinary Kazhdan-Lusztig polynomials;
- Kazhdan-Lusztig polynomials with unequal parameters;
- Inverse Kazhdan-Lusztig polynomials;
- Cells and W-graphs;

http://math.univ-lyon1.fr/~ducloux/coxeter/coxeter3/english/coxeter3_e.html

This is a patched version done by Mike Hansen 2009-2013 and some fixes by Nicolas M. Thiéry and Jean-Pierre Flori.

29.2 License

GPL

29.3 Upstream Contact

github: https://github.com/tscrim/coxeter

Alas, Fokko Ducloux passed away in 2006.

29.4 Dependencies

None

29.5 Special Update/Build Instructions

The source package was created by running

```
commit=8ac9c71723c8ca57a836d6381aed125261e44e9e
git clone https://github.com/tscrim/coxeter.git
cd coxeter
git archive $commit | bzip2 --best >coxeter-$commit.tar.bz2
```
30.1 Description

CryptoMiniSat is a SAT solver that aims to become a premiere SAT solver with all the features and speed of successful SAT solvers, such as MiniSat and PrecoSat. The long-term goals of CryptoMiniSat are to be an efficient sequential, parallel and distributed solver. There are solvers that are good at one or the other, e.g. ManySat (parallel) or PSolver (distributed), but we wish to excel at all.

CryptoMiniSat 2.5 won the SAT Race 2010 among 20 solvers submitted by researchers and industry.

30.2 License

MIT License

30.3 Upstream Contact

- Authors: Mate Soos
- Email: soos.mate@gmail.com
- Website: http://www.msoos.org/
- Releases: https://github.com/msoos/cryptominisat/releases

30.4 Special Update/Build Instructions

CryptoMiniSat’s tarball downloaded from github is called VERSION.tar.gz and should be renamed to cryptominisat-VERSION.tar.gz
31.1 Description

This is a fast SDP solver written in C, with a callable library namely, an autotool’ed version of CSDP, by Brian Borchers, see https://projects.coin-or.org/Csdp

31.2 License

Common Public License Version 1.0

31.3 Upstream Contact

Dmitrii Pasechnik <dimpase+sage@gmail.com>

31.4 Dependencies

31.5 Special Update/Build Instructions

csdp is an autotool’ed version of CSDP, see https://projects.coin-or.org/Csdp, developed in its own repository at http://github.org/dimpase/csdp.

To update to a new version, you need to bump the version number in configure.ac and rerun autotools (autoreconf -fiv). Any changes should be merged to the upstream repo.

The build is done with NOSHORTS variable defined; this makes it compatible with packages, where NOSHORTS must be defined, e.g. https://github.com/dimpase/pycsdp; also the Sage Cython interface needs NOSHORTS defined.

Detailed steps to build the spkg are as follows. You need

- git
- autotools and libtool (the full autohell suite, version at least 2.67)

With these ready:

- ./spkg-src
- copy the resulting csdp-<version>.tar.gz to SAGE_ROOT/upstream, or somewhere else appropriate
32.1 Description

Multiprotocols data transfer library (and utility).

32.2 License

“MIT style license” : see file “COPYING” at the root of the source tarball, explanations at https://curl.haxx.se/docs/copyright.html.

32.3 Upstream Contact

According to the file README at the root of the tarball, contact is done by mailing https://curl.haxx.se/mail/

32.4 Dependencies

None listed.

32.5 Special Update/Build Instructions

None.
33.1 Description

CVXOPT is a free software package for convex optimization based on the Python programming language. It can be used with the interactive Python interpreter, on the command line by executing Python scripts, or integrated in other software via Python extension modules. Its main purpose is to make the development of software for convex optimization applications straightforward by building on Python’s extensive standard library and on the strengths of Python as a high-level programming language.

33.2 Upstream Contact

- J. Dahl <dahl.joachim@gmail.com>
- L. Vandenberghe <vandenbe@ee.ucla.edu>

Downloaded from http://cvxopt.org

33.3 License

GPLv3 or later. Includes parts under GPLv2, GNU Lesser General Public License, v2.1. See src/LICENSE for more details. (Sage-compatible)

33.4 Dependencies

- GNU patch
- GSL
- GLPK
33.5 Special Update/Build Instructions

- cvxopt.h.patch: Fix building with GCC on Solaris.
- setup.py.patch: look for libraries and includes in $SAGE_LOCAL instead of /usr. Add fortran, blas,… libraries if needed. Build with GSL and GLPK support.
- remove doc/html/, as it can be rebuild by invoking ‘sage -sh’ and running ‘make html’ in doc/
- TODO: Add more tests in spkg-check
- TODO: one might want to enhance the code to allow other Sage random sources, at the moment only GSL is used in CVXOPT-1.1.3 spkg, apparently it will need an unclear to me “with seed(…)” construct.
34.1 Description

Cycler is a small break of of matplotlib to deal with “composable cycles”. It is a required dependency of matplotlib 1.5.0.

34.2 License

BSD

34.3 Upstream Contact

cycler is developed on github: https://github.com/matplotlib/cycler

LGPL version 3 or later

36.3 Upstream Contact

https://github.com/sagemath/cysignals

36.4 Dependencies

- Python
- Cython
- PARI (optional)
37.1 Description

Cython is a language that makes writing C extensions for the Python language as easy as Python itself. Cython is based on the well-known Pyrex, but supports more cutting edge functionality and optimizations.

The Cython language is very close to the Python language, but Cython additionally supports calling C functions and declaring C types on variables and class attributes. This allows the compiler to generate very efficient C code from Cython code.

This makes Cython the ideal language for wrapping for external C libraries, and for fast C modules that speed up the execution of Python code.

39.5 Update Instructions

Get an up-to-date copy of the git repository ecdata from https://github.com/JohnCremona/ecdata.

If the cremona database has already been installed, remove SAGE_DATA/cremona/cremona.db. Then run

The build script expects to find the files in subfolders allcurves, allgens, degphi and allbsd of the ecdata folder. It extracts them and builds the new cremona.db file from the contents.

Finally, copy SAGE_DATA/cremona/cremona.db to the src directory of the spkg.
40.1 Description

54.1 Description

ECL is an implementation of the Common Lisp language as defined by the ANSI X3J13 specification. The most relevant features:

- A bytecodes compiler and interpreter.
- Compiles Lisp also with any C/C++ compiler.
- It can build standalone executables and libraries.
- ASDF, Sockets, Gray streams, MOP, and other useful components.
- Extremely portable.
- A reasonable license.

ECL supports the operating systems Linux, FreeBSD, NetBSD, OpenBSD, Solaris and Windows, running on top of the Intel, Sparc, Alpha and PowerPC processors. Porting to other architectures should be rather easy.

Website: http://ecls.sourceforge.net/

54.2 License

- LGPL V2+ or compatible - for details see
  http://ecls.sourceforge.net/license.html

54.3 Upstream Contact

- the ECL mailing list - see http://ecls.sourceforge.net/resources.html
54.4 Special Update/Build Instructions

- Note: for the time being, ECL is built single threaded library as it seems to interact badly with the pexpect interface and Sage’s signal handling when built multithreaded.

- Do NOT quote SAGE_LOCAL when setting CPPFLAGS and/or LDFLAGS, in spkg-install as this caused the build to break. See http://trac.sagemath.org/sage_trac/ticket/10187#comment:117

- TODO: Add the ECL test suite, and an spkg-check file to run it.

- TODO: Make ECL use Sage’s Boehm GC on MacOS X as well (but perhaps put some changes from ECL’s into Sage’s Boehm GC), then remove the src/src/gc directory, too.
55.1 Description

mwrank is a program written in C++ for computing Mordell-Weil groups of elliptic curves over $\mathbb{Q}$ via 2-descent. It is available as source code in the eclib package, which may be distributed under the GNU General Public License, version 2, or any later version.

mwrank is now only distributed as part of eclib. eclib is also included in Sage, and for most potential users the easiest way to run mwrank is to install Sage (which also of course gives you much much more). I no longer provide a source code distribution of mwrank by itself: use eclib instead.

55.2 License

eclib is licensed GPL v2+.

56.4 Dependencies

• GMP/MPIR (Note: Python is *not* required for ordinary builds.)
• GNU patch

56.5 Special Update/Build Instructions

• GMP-ECM comes with a self-tuning feature; we could support that as an option ($SAGE_TUNE_*=yes$) in the future.
• ECM currently does not (by itself) use the CC and CFLAGS settings from ‘gmp.h’ since we pass (other) options in CFLAGS, and CC is set by Sage and might get set by the user. We now at least partially fix that such that “optimized” code generation options (‘-mcpu=…’, ‘-mtune=…’) are used by gcc. Of course a user can also manually enable them by setting the “global” CFLAGS to e.g. ‘-march=native’ on x86_[64] systems, or ‘-mcpu=…’ and ‘-mtune=…’ on other architectures where “native” isn’t supported. Note that this doesn’t affect the packages’ selection of processor-specific optimized [assembly] code. ‘spkg-install’ already reads the settings from Sage’s and also a system-wide GMP / MPIR now, but doesn’t (yet) use all of them. If SAGE_FAT_BINARY="yes", we should avoid too specific settings of "-mcpu=…", and perhaps pass a more generic ‘--host=…’ to ‘configure’. (MPIR honors ‘--enable-fat’ to some extent, but this option isn’t used on anything other than x86 / x86_64.)
• We currently work around a linker bug on MacOS X 10.5 PPC (with GCC 4.2.1) which breaks ‘configure’ if debug symbols are enabled. This *might* get fixed in later upstream releases.

• We could save some space by removing the src/build.vc10/ directory which isn’t used in Sage. (It gets probably more worth in case also directories / files for later versions of Microsoft Visual C get added.)
57.1 Description

Includes two databases:

6.4.1 Description

From the documentation:

FreeType is a software font engine that is designed to be small, efficient, highly customizable, and portable while capable of producing high-quality output (glyph images). It can be used in graphics libraries, display servers, font conversion tools, text image generation tools, and many other products as well.

Note that FreeType is a font service and doesn’t provide APIs to perform higher-level features like text layout or graphics processing (e.g., colored text rendering, ‘hollowing’, etc.). However, it greatly simplifies these tasks by providing a simple, easy to use, and uniform interface to access the content of font files.

Please note that ‘FreeType’ is also called ‘FreeType 2’, to distinguish it from the old, deprecated ‘FreeType 1’ library, a predecessor no longer maintained and supported.

The package in Sage is called freetype (in lowercase).

6.4.2 License

- FreeType (BSD-like)
- GNU Public License v2

From the documentation:

FreeType is released under two open-source licenses: our own BSD-like FreeType License and the GNU Public License, Version 2. It can thus be used by any kind of projects, be they proprietary or not.

66.1 Description

The software package Frobby provides a number of computations on monomial ideals. The current main feature is the socle of a monomial ideal, which is largely equivalent to computing the maximal standard monomials, the Alexander dual or the irreducible decomposition.

Operations on monomial ideals are much faster than algorithms designed for ideals in general, which is what makes a specialized library for these operations on monomial ideals useful.

68.1 Description

GAP is a system for computational discrete algebra, with particular emphasis on Computational Group Theory. GAP provides a programming language, a library of thousands of functions implementing algebraic algorithms written in the GAP language as well as large data libraries of algebraic objects. See also the overview and the description of the mathematical capabilities. GAP is used in research and teaching for studying groups and their representations, rings, vector spaces, algebras, combinatorial structures, and more. The system, including source, is distributed freely. You can study and easily modify or extend it for your special use.

This is a stripped-down version of GAP. The databases, which are architecture-independent, are in a separate package.

68.2 Upstream Contact

David Joyner, wdjoyner@gmail.com (on the GAP team, but Steve Linton, sal@des.st-and.ac.uk, is basically the lead developer)

68.3 Dependencies

- Readline
- MPIR

68.4 Special Update/Build Instructions

This is a stripped-down version of GAP. The downloading of the sources and removal of unneeded parts is done by the script spkg-src. When you update GAP, please also update and use the spkg-src script.

- Do we really want to copy everything from the build directory???
  You need the full GAP tree to compile/install many GAP packages.

- There’s apparently a command missing (in spkg-install) building the (HTML?) documentation. Earlier changelog entries as well as the description above state the documentation was removed from the upstream sources... Since the (pre-)built HTML documentation is currently included, I’ve commented out some lines in that part of spkg-install. -leif
68.4.1 Patches

- writeandcheck.patch: fix infinite loop in writeandcheck() when writing an error message fails.
69.1 Description

This package installs Jean Michel’s pre-packaged GAP3, which is a minimal GAP3 distribution containing packages that have no equivalent in GAP4.

Below is the full description from Jean Michel’s webpage (accessed 23 July 2015).

A pre-packaged GAP3 with everything you need

To help people who are just interested in GAP3 because they need a package which has not been ported to GAP4, I have prepared an easy-to-install minimal GAP3 distribution containing an up-to-date versions of the packages:

anusq, arep, autag, chevie, cryst, dce, grim, matrix, meataxe, monoid, nq, pcqa, sisyphos, specht, ve, vkcurve.

These packages have been chosen since most have no equivalent in GAP4. They are autoloaded when starting gap.

This distribution includes only partial lists of small groups, 2-groups, 3-groups, character tables from the Atlas and tables of marks. It does not include either the packages:

anupq, grape, kbmag, xgap, cohomolo, gliss, guava, xmod

which have some equivalent in GAP4. You can get these extra features at http://www.math.rwth-aachen.de/~Frank.Luebeck/gap/GAP3

In this distribution:

• The on-line help includes the documentation of the included packages.
• The html documentation (htm/index.html) also does.
• The manual (manual.pdf) also does.
69.2 License

Most parts of the GAP distribution, including the core part of the GAP system, are distributed under the terms of the GNU General Public License (see http://www.gnu.org/licenses/gpl.html or the file GPL in the etc directory of the GAP installation).

- David Joyner, wdjoyner@gmail.com (on the GAP team)
- Steve Linton, sal@dcs.st-and.ac.uk (basically the GAP lead developer)

71.3 Dependencies

- GAP (a standard spkg)

71.4 TODO

The crystallographic group packages are untested/untestable. They rely on polymake and the dependency “cryst” is missing. This needs to be cleaned up.

71.5 Notes

A brief description of each package follows:

cohomolo - The cohomolo package is a GAP interface to some C programs for computing Schur multipliers and covering groups of finite groups and first and second cohomology groups of finite groups acting on finite modules. (Author: Max Horn, Markus Pfeiffer)

CoReLG - Contains functionality for working with real semisimple Lie algebras. (Author: Heiko Dietrich, Paolo Faccin, Willem Adriaan de Graaf)

crime - package to compute the cohomology ring of finite p-groups, induced maps, and Massey products. (Author: Marcus Bishop)
cryst - Computing with crystallographic groups (Authors: Bettina Eick, Franz Gähler, Werner Nickel)

CTblLib - The GAP Character Table Library (Author: Thomas Breuer)

DESIGN is a package for classifying, partitioning and studying block designs. (Author: Leonard H. Soicher)

FactInt is a package providing routines for factoring integers, in particular:

- Pollard’s p-1
- Williams’ p+1
- Elliptic Curves Method (ECM)
- Continued Fraction Algorithm (CFRAC)
- Multiple Polynomial Quadratic Sieve (MPQS)

(Author: Stefan Kohl)

GAPDoc is a package containing a definition of a structure for GAP documentation, based on XML. It also contains conversion programs for producing text-, DVI-, PDF- or HTML-versions of such documents, with hyperlinks if possible. (Authors: Frank Luebeck, Max Neunhoeffer)

GBNP - The GBNP package provides algorithms for computing Grobner bases of noncommutative polynomials with coefficients from a field implemented in GAP and with respect to the “total degree first then lexicographical” ordering. Further provided are some variations, such as a weighted and truncated version and a tracing facility. The word “algorithm” is to be interpreted loosely here: in general one cannot expect such an algorithm to terminate, as it would imply solvability of the word problem for finitely presented (semi)groups. (Authors: A.M. Cohen, J.W. Knopper)

GRAPE is a package for computing with graphs and groups, and is primarily designed for constructing and analysing graphs related to groups, finite geometries, and designs. (Author: Leonard H. Soicher)

GUAVA is included here, and with Sage standard.

HAP (Homological Algebra Programming) is a GAP package providing some functions for group cohomology computation. (Author: Graham Ellis)

HAPcryst - an extension package for HAP, which allows for group cohomology computation for a wider class of groups. (Author: Marc Roeder)

hecke - Provides functions for calculating decomposition matrices of Hecke algebras of the symmetric groups and q-Schur algebras. Hecke is a port of the GAP 3 package Specht 2.4 to GAP 4. (Author: Dmitriy Traytel)

LAGUNA - this package provides functionality for calculation of the normalized unit group of the modular group algebra of the finite p-group and for investigation of Lie algebra associated with group algebras and other associative algebras. (Authors: Victor Bovdi, Alexander Kononovlov, Richard Rossmanith, Csaba Schneider)

liealgebra - A database of Lie algebras (Author: Serena Cicalo’, Willem Adriaan de Graaf, Csaba Schneider)

LiePRing - Database and algorithms for Lie p-rings (Author: Michael Vaughan-Lee, Bettina Eick)

LieRing - contains functionality for working with finitely presented Lie rings and the Lazard correspondence. (Author: Serena Cicalo’, Willem Adriaan de Graaf)

loops - Provides researchers in nonassociative algebra with a computational tool that integrates standard notions of loop theory with libraries of loops and group-theoretical algorithms of GAP. The package also expands GAP toward nonassociative structures. (Authors: Gabor Nagy, Petr Vojtechovsky)

mapclass - The package calculates the mapping class group orbits for a given finite group. (Authors: Adam James, Kay Magaard, Sergey Shpекторov, Helmut Volklein)

polymake - an interface with the (standalone) polymake program used by HAPcryst. (Author: Marc Roeder)

qpa - Quivers and Path Algebras provides data structures and algorithms for doing computations with finite dimensional quotients of path algebras, and finitely generated modules over such algebras. The current version of the QPA
package has data structures for quivers, quotients of path algebras, and modules, homomorphisms and complexes of modules over quotients of path algebras. (Authors: Edward Green, Oeyvind Solberg)

quagroup - Contains functionality for working with quantized enveloping algebras of finite-dimensional semisimple Lie algebras. (Author: Willem Adriaan de Graaf)

repsn - The package provides GAP functions for computing characteristic zero matrix representations of finite groups. (Author: Vahid Dabbaghian)

sla - a package for doing computations with simple Lie algebras (Author: Willem Adriaan de Graaf)

SONATA (“System Of Nearrings And Their Applications”) is a package which constructs finite nearrings and related objects. (Authors: Erhard Aichinger, Franz Binder, Jürgen Ecker, Peter Mayr, Christof Noebauer)

TORIC is a GAP package for computing with toric varieties. (Author: David Joyner)

75.5 Special Update/Build Instructions

• As some patches touch config/acinclude.m4, we have to touch aclocal.m4, configure, Makefile.in and gf2x/gf2x-config.h.in to prevent autotools to try to regenerate these files.
75.5.1 Patches

- 0001-Trac-15014-Let-gf2x-build-a-shared-library-on-Cygwin.patch: pass -no-undefined flag to libtool.
- 0002-tr-portability.patch: backport upstream fix for non-portable tr use
- 0003-Improve-detection-of-sse2-support.patch: backport upstream improved check for sse2
- 0004-Add-disable-hardware-specific-code.patch: add option -disable-hardware-specific-code to build system. This is partly backported from upstream.
- 0005-Update-autotooled-files.patch: the above patches make changes to code used by autotools for generation of the build system. This patches those files, so that autotools need not be installed.
- 0006-Fix_make_check_not_failing_on_errors.patch: (upstream patch) Fix bug in shell script such that ‘make check’ always fails upon errors.
76.1 Description

Gfan is a software package for computing Groebner fans and tropical varieties. These are polyhedral fans associated to polynomial ideals. The maximal cones of a Groebner fan are in bijection with the marked reduced Groebner bases of its defining ideal. The software computes all marked reduced Groebner bases of an ideal. Their union is a universal Groebner basis. The tropical variety of a polynomial ideal is a certain subcomplex of the Groebner fan. Gfan contains algorithms for computing this complex for general ideals and specialized algorithms for tropical curves, tropical hypersurfaces and tropical varieties of prime ideals. In addition to the above core functions the package contains many tools which are useful in the study of Groebner bases, initial ideals and tropical geometry. The full list of commands can be found in Appendix B of the manual. For ordinary Groebner basis computations Gfan is not competitive in speed compared to programs such as CoCoA, Singular and Macaulay2.

76.2 License

- GPL version 2 or version 3 (according to the gfan website)

81.3 Upstream Contact

- Clement Pernet

81.4 Dependencies

- GNU patch
- GMP/MPIR
82.1 Description

The GLPK (GNU Linear Programming Kit) package is intended for solving large-scale linear programming (LP), mixed integer programming (MIP), and other related problems. It is a set of routines written in ANSI C and organized in the form of a callable library.

GLPK supports the GNU MathProg modelling language, which is a subset of the AMPL language.

The GLPK package includes the following main components:

- primal and dual simplex methods
- primal-dual interior-point method
- branch-and-cut method
- translator for GNU MathProg
- application program interface (API)
- stand-alone LP/MIP solver

82.2 License

The GLPK package is GPL version 3.

82.3 Upstream Contact

GLPK is currently being maintained by:

- Andrew Makhorin (mao@gnu.org, mao@mai2.rcnet.ru)

http://www.gnu.org/software/glpk/#maintainer
82.4 Dependencies

- GMP/MPIR
- zlib

82.5 Special Update/Build Instructions

- `configure` doesn’t support specifying the location of the GMP library to use; only `--with-gmp[=yes]` or `--with-gmp=no` are valid options. (So we *have to* add Sage’s include and library directories to `CPPFLAGS` and `LDFLAGS`, respectively.)

- Do we need the `--disable-static`? The stand-alone solver presumably runs faster when built with a static library; also other (stand-alone) programs using it would. (Instead, we should perhaps use `--enable-static --enable-shared` to go safe.)

82.5.1 Patches

- All patches below are currently used by `spkg-src`
- `src/01-zlib.patch`: don’t build the included zlib library.
- `src/02-cygwin_sharedlib.patch`: Let a shared library be built on Cygwin by passing the `-no-undefined` flag to `libtool`.

The numbering reflect the order in which they have been created from glpk pristine’s sources
83.1 Description

Glucose is a SAT solver.

Citing its website: *The name of the solver is a contraction of the concept of “glue clauses”, a particular kind of clauses that glucose detects and preserves during search. Glucose is heavily based on Minisat, so please do cite Minisat also if you want to cite Glucose.*

83.2 License

- nonparallel glucose: MIT

- GNU patch

112.5 Special Update/Build Instructions

- There is some garbage in the upstream sources which should be removed:

    src/include/.Lexplicit_formula.h.swp
    src/include/.Lvalue.h.swp
    src/include/.DS_Store
    src/include/.DS_Store
    src/include/Lexplicit_formula.h.swap crap
    src/include/lvalue.h.bak

(continues on next page)
• We (and apparently also upstream) currently don’t build Lcalc’s tests (see Makefile), hence there’s no spkg-check. This might change in newer upstream versions.

• The original Makefile uses $(CC) to compile C++ (also using $(CCFLAGS)), which it defines to ‘g++’, and hardcodes ‘g++’ when linking the shared library. (It should use $(CXX) instead, which might *default* to ‘g++’.’) We now (lcalc-1.23.p10) patch the Makefile also to use $(CXX) for compiling and linking C++; $(CXX) now *defaults* to ‘g++’, and $(CC) to ‘gcc’, but both can be overridden by simply setting their respective environment variables. (Same for $(INSTALL_DIR) btw.)

112.6 Patches

• Makefile.patch:
  We change a lot there, since Lcalc doesn’t have a ‘configure’ script, and hence the Makefile is supposed to be edited to customize Lcalc (build options, locations of headers and libraries etc.). Besides that, we
  – put CXXFLAGS into Lcalc’s “CCFLAGS” used for compiling C++,
  – remove some stuff involving LDFLAGS1 and LDFLAGS2, setting just LDFLAGS,
  – use $(MAKE) instead of ‘make’ in the crude build receipts,
  – use CXXFLAG64 when linking the shared library,
  – now use $(CXX) for compiling and linking C++, which *defaults* to ‘g++’, but can be overridden by setting the environment variable of the same name. ($(CC) now *defaults* to ‘gcc’, although currently not really used as far as I can see.)
  – $(INSTALL_DIR) can now be overridden by simply setting the environment variable of the same name.

• Lcommon.h.patch:
  Uncomment the definition of lcalc_to_double(const long double& x). (Necessary for GCC >= 4.6.0, cf. #10892.) Comment from there: The reason is the following code horror from src/src/include/Lcommon.h:
  […] But somebody who is familiar with the codebase should really rewrite lcalc to not redefine the double() cast, thats just fragile and will sooner or later again fail inside some system headers.

• pari-2.7.patch:
  Various changes to port to newer versions of PARI.

• time.h.patch:
  (Patches src/include/Lcommandline_numbertheory.h) Include also <time.h> in Lcommandline_numbertheory.h (at least required on Cygwin, cf. #9845). This should get reported upstream.

• lcalc-1.23_default_parameters_1.patch: Make Lcalc (1.23) build with GCC 4.9

114.4 Upstream Contact

Miguel Marco (mmarco@unizar.es)
115.1 Description

Compilers for high level languages generate code that follow certain conventions. These conventions are necessary, in part, for separate compilation to work. One such convention is the “calling convention”. The “calling convention” is essentially a set of assumptions made by the compiler about where function arguments will be found on entry to a function. A “calling convention” also specifies where the return value for a function is found.

Some programs may not know at the time of compilation what arguments are to be passed to a function. For instance, an interpreter may be told at run-time about the number and types of arguments used to call a given function. Libffi can be used in such programs to provide a bridge from the interpreter program to compiled code.

The libffi library provides a portable, high level programming interface to various calling conventions. This allows a programmer to call any function specified by a call interface description at run time.

FFI stands for Foreign Function Interface. A foreign function interface is the popular name for the interface that allows code written in one language to call code written in another language. The libffi library really only provides the lowest, machine dependent layer of a fully featured foreign function interface. A layer must exist above libffi that handles type conversions for values passed between the two languages.

116.1 Description

GD is an open source code library for the dynamic creation of images by programmers. GD is written in C, and “wrappers” are available for Perl, PHP and other languages. GD creates PNG, JPEG, GIF, WebP, XPM, BMP images, among other formats. GD is commonly used to generate charts, graphics, thumbnails, and most anything else, on the fly. While not restricted to use on the web, the most common applications of GD involve website development.

119.4 Dependencies

This spkg depends on:

• libz

119.5 Special Update/Build Instructions

• On old versions of Darwin, the symbolic links libpng.* created by libpng16 may interfere with a system-wide libPng.dylib.
  – the following is very likely to be obsolete in 2014 —

  This system-wide library is likely to be a different version and on top of that, the symbols exported there are prefixed with “_cg” (for “Core Graphics”). So even if by chance the functionalities of the two libraries were interchangeable, libraries or applications looking for one and being presented the other won’t find the symbols they expect. Note the uppercase “P” which could prevent this conflict; unfortunately, the default filesystem used by Apple is case-insensitive.
Note there would be no problem if the system-wide library was not looked for when Sage is being built or run, but that’s not the case either; it is at least looked for by the “ImageIO” framework:

- when Python is built with Mac OS extensions, fixed in #4008;
- when Mercurial is built because it uses $EDITOR, cf. #4678;
- when R is built and it finds -lpng, cf. #4409 and #11696.

- this is no longer done, as of #27186 —

As not all of these problems are easily dealt with and new ones may arise, we chose to delete the $SAGE_LOCAL/lib/libpng.* symlinks. Therefore, some packages like Tachyon, which by default look for -lpng are patched to look for -lpng16 instead.

GMP.
123.1 Description

LiE is the name of a software package that enables mathematicians and physicists to perform computations of a Lie group theoretic nature. It focuses on the representation theory of complex semisimple (reductive) Lie groups and algebras, and on the structure of their Weyl groups and root systems.

LiE does not compute directly with elements of the Lie groups and algebras themselves; it rather computes with weights, roots, characters and similar objects. Some specialities of LiE are: tensor product decompositions, branching to subgroups, Weyl group orbits, reduced elements in Weyl groups, distinguished coset representatives and much more. These operations have been compiled into the program which results in fast execution: typically one or two orders of magnitude faster than similar programs written in a general purpose program.

The LiE programming language makes it possible to customise and extend the package with more mathematical functions. A user manual is provided containing many examples.

LiE establishes an interactive environment from which commands can be given that involve basic programming primitives and powerful built-in functions. These commands are read by an interpreter built into the package and passed to the core of the system. This core consists of programs representing some 100 mathematical functions. The interpreter offers on-line facilities which explain operations and functions, and which give background information about Lie group theoretical concepts and about currently valid definitions and values.

130.6 Patches

131.1 Description

From the Matplotlib website: matplotlib is a python 2D plotting library which produces publication quality figures in a variety of hardcopy formats and interactive environments across platforms. matplotlib can be used in python scripts, the python and ipython shell (ala matlab or mathematica), web application servers, and six graphical user interface toolkits.

131.2 License

The Matplotlib license - see http://matplotlib.sourceforge.net/users/license.html: Matplotlib only uses BSD compatible code, and its license is based on the PSF license. See the Open Source Initiative licenses page for details on individual licenses. Non-BSD compatible licenses (eg LGPL) are acceptable in matplotlib Toolkits. For a discussion of the motivations behind the licencing choice, see Licenses.

131.3 Upstream Contact

The matplotlib mailing lists: see http://sourceforge.net/projects/matplotlib

131.4 Dependencies

- python
- numpy
- setuptools (>= 0.7)
- freetype
- patch (used in spkg-install)
- dateutil
- pyparsing
- tornado
- kiwisolver
131.5 Build Instructions/Changes

- NOTE: To drastically cut down on spkg size, we delete the internal testing images. To do this, we repackage the tarball by removing the contents of lib/matplotlib/tests/baseline_images/*, this is done by the spkg-src script.

- setup.py.patch: disable loading of Tests. Otherwise, setup.py raises an error because it can’t find the deleted files from src/lib/matplotlib/tests/baseline_images/*

- NOTE: as of matplotlib-1.0.0 and Sage 4.6, Sage does not use $HOME/.matplotlib by default. Instead, it sets MPLCONFIGDIR to a subdirectory in $DOT_SAGE, see src/bin/sage-env
132.1 Description

Maxima is a system for the manipulation of symbolic and numerical expressions, including differentiation, integration, Taylor series, Laplace transforms, ordinary differential equations, systems of linear equations, polynomials, and sets, lists, vectors, matrices, and tensors. Maxima yields high precision numeric results by using exact fractions, arbitrary precision integers, and variable precision floating point numbers. Maxima can plot functions and data in two and three dimensions.

For more information, see the Maxima web site

http://maxima.sourceforge.net

132.2 License

Maxima is distributed under the GNU General Public License, with some export restrictions from the U.S. Department of Energy. See the file COPYING.

132.3 Upstream Contact

• The Maxima mailing list - see http://maxima.sourceforge.net/maximalist.html

132.4 Dependencies

• ECL (Embedded Common Lisp)

132.5 Special Update/Build Instructions

1. Go to http://sourceforge.net/projects/maxima/files/Maxima-source/ and download the source tarball maxima-x.y.z.tar.gz; place it in the upstream/ directory.

3. Make sure the patches still apply cleanly, and update them if necessary.

4. Test the resulting package.
All patch files in the patches/ directory are applied. Descriptions of these patches are either in the patch files themselves or below.

- **0001-taylor2-Avoid-blowing-the-stack-when-diff-expand-isn.patch**: Fix for Maxima bug #2520 (abs_integrate fails on abs(sin(x)) and abs(cos(x))). Introduced in Trac #13364 (Upgrade Maxima to 5.29.1).

- **build-fasl.patch**: Build a fasl library for ecl in addition to an executable program. Introduced in Trac #16178 (Build maxima fasl without asdf).

- **infodir.patch**: Correct the path to the Info directory. Introduced in Trac #11348 (maxima test fails when install tree is moved).

- **matrixexp.patch**: Fix matrixexp(matrix([%i*%pi])), which broke after Maxima 5.29.1. Introduced in Trac #13973.

- **maxima.system.patch**: Set `compile-in-constants` to t. Introduced in Trac #11966 (OS X 10.7 Lion: Maxima fails to build).

- **undoing_true_false_printing_patch.patch**: Revert an upstream change causing ‘?’ to be printed around some words. Introduced in Trac #13364 (Upgrade Maxima to 5.29.1).

137.1 Description

From http://www.multiprecision.org/mpc: GNU MPC is a C library for the arithmetic of complex numbers with arbitrarily high precision and correct rounding of the result. It extends the principles of the IEEE-754 standard for fixed precision real floating point numbers to complex numbers, providing well-defined semantics for every operation. At the same time, speed of operation at high precision is a major design goal.

137.2 License

LGPLv3+ for the code and GFDLv1.3+ (with no invariant sections) for the documentation.

137.3 Upstream Contact

The MPC website is located at http://www.multiprecision.org/mpc .

The MPC team can be contacted via the MPC mailing list:

mpc-discuss@lists.gforge.inria.fr

137.4 Dependencies

- MPIR
- MPFR

137.5 Special Update/Build Instructions

- mpc_mul_faster.patch: Patch from Paul Zimmermann to speed up MPC multiplication (for small precisions) by reducing overhead in MPFR operations.
138.1 Description

MPFI is a library for interval arithmetic, which is built upon the MPFR multiple precision floating-point arithmetic. MPFI is intended to be a portable library written in C for arbitrary precision interval arithmetic with intervals represented using MPFR reliable floating-point numbers. It is based on the GNU MP library and on the MPFR library. The purpose of an arbitrary precision interval arithmetic is on the one hand to get “guaranteed” results, thanks to interval computation, and on the other hand to obtain accurate results, thanks to multiple precision arithmetic. The MPFI library is built upon MPFR in order to benefit from the correct rounding provided, for each operation or function, by MPFR. Further advantages of using MPFR are its portability and compliance with the IEEE 754 standard for floating-point arithmetic.

138.2 License

This version of MPFI is released under the GNU Lesser General Public License. It is permitted to link MPFI to non-free programs, as long as when distributing them the MPFI source code and a means to re-link with a modified MPFI is provided.

138.3 Upstream Contact

The MPFI website is located at http://mpfi.gforge.inria.fr/
The MPFI team can be contacted via the MPFI mailing list: mpfi-users@lists.gforge.inria.fr

138.4 Dependencies

- GMP
- MPFR
139.1 Description

The MPFR library is a C library for multiple-precision floating-point computations with correct rounding. MPFR has continuously been supported by the INRIA and the current main authors come from the Caramba and AriC project-teams at Loria (Nancy, France) and LIP (Lyon, France) respectively; see more on the credit page. MPFR is based on the GMP multiple-precision library.

The main goal of MPFR is to provide a library for multiple-precision floating-point computation which is both efficient and has a well-defined semantics. It copies the good ideas from the ANSI/IEEE-754 standard for double-precision floating-point arithmetic (53-bit significand).

139.2 License

MPFR is free. It is distributed under the GNU Lesser General Public License (GNU Lesser GPL), version 3 or later (2.1 or later for MPFR versions until 2.4.x). The library has been registered in France by the Agence de Protection des Programmes under the number IDDN FR 001 120020 00 R P 2000 000 10800, on 15 March 2000. This license guarantees your freedom to share and change MPFR, to make sure MPFR is free for all its users. Unlike the ordinary General Public License, the Lesser GPL enables developers of non-free programs to use MPFR in their programs. If you have written a new function for MPFR or improved an existing one, please share your work!

139.3 Upstream Contact

The MPFR website is located at http://mpfr.org/
The MPFR team can be contacted via the MPFR mailing list: mpfr@loria.fr

139.4 Dependencies

- GMP/MPIR
- GNU patch
139.5 Special Update/Build Instructions

- Make sure MPFR’s settings of $CC$ and $CFLAGS$ still get properly extracted, currently from its `config.log` in the `src/` directory.
- We should remove the configure option `--disable-thread-safe` in case the issues without that have meanwhile been fixed. (Then we should actually pass `--enable-thread-safe`.)

139.6 TODO

- `--disable-thread-safe` should be switched to `--enable-thread-safe`, need to check that this works on the buildbot machines.
140.1 Description

Mpfrcx is a library for the arithmetic of univariate polynomials over arbitrary precision real (Mpfr) or complex (Mpc) numbers, without control on the rounding. For the time being, only the few functions needed to implement the floating point approach to complex multiplication are implemented. On the other hand, these comprise asymptotically fast multiplication routines such as Toom–Cook and the FFT.

140.2 License

MPFR CX is distributed under the Gnu Lesser General Public License, either version 2.1 of the licence, or (at your option) any later version (LGPLv2.1+).

140.3 Upstream Contact

The MPFR CX website is located at http://www.multiprecision.org/mpfr cx.
141.1 Description

MPIR is an open source multiprecision integer library derived from version 5.0.1 of the GMP (GNU Multi Precision) project (which was licensed LGPL v2+).

  - thempirteam@googlemail.com

141.4 Dependencies

- iconv
- GNU patch

141.5 Special Update/Build Instructions

- TODO:
- Perhaps also modify CXXFLAGS (and/or CPPFLAGS).
- We currently don’t use anything of GMP’s/MPIR’s CC setting, and matching with the current compiler ($CC) is perhaps suboptimal.
- Remove some files / directories not needed for Sage from upstream:
  - build.vc* directories (Microsoft Visual C build files)
  - 3.0.0-644faf502c56f97d9accd301965fc57d6ec70868 was created by running the spkg-src script.
142.1 Description

Mpmath is a pure-Python library for multiprecision floating-point arithmetic. It provides an extensive set of transcendental functions, unlimited exponent sizes, complex numbers, interval arithmetic, numerical integration and differentiation, root-finding, linear algebra, and much more. Almost any calculation can be performed just as well at 10-digit or 1000-digit precision, and in many cases mpmath implements asymptotically fast algorithms that scale well for extremely high precision work. If available, mpmath will (optionally) use gmpy to speed up high precision operations.

jupyter nbconvert converts notebooks to various other formats via Jinja templates.
145.1 Description

The Jupyter Notebook format

This package contains the base implementation of the Jupyter Notebook format, and Python APIs for working with notebooks.
146.1 Description

Ncurses (new curses, pronounced “enn-curses”) started as a freely distributable “clone” of System V Release 4.0 (SVr4) curses. It has outgrown the “clone” description, and now contains many features which are not in SVr4 curses. Curses is a pun on the term “cursor optimization”. It is a library of functions that manage an application’s display on character-cell terminals (e.g., VT100).

The name “ncurses” was first used as the name of the curses library in Pavel Curtis’s pcurses, dated 1982. It was apparently developed on a BSD 4.4 system, at Cornell. Parts of pcurses are readily identifiable in n curses, including the basics for the terminfo compiler (named compile in that package):

- the Caps, used to define the terminfo capabilities
- awk scripts MKcaptab.awk, MKnames.awk
- the library modules used for the terminfo compiler.

Besides ncurses, parts of pcurses still survive in 2010, in recognizable form in Solaris.

Simon A. King <simon.king@uni-jena.de> David J. Green <david.green@uni-jena.de>

159.5 Acknowledgements

The development of the initial version of this SPKG was funded by the German Science Foundation, DFG project GR 1585/4.1, and was accomplished at the Friedrich Schiller University Jena.

Since version 1.0.1, the further work on this SPKG was funded by Marie Curie grant MTKD-CT-2006-042685 and was pursued at the National University of Ireland, Galway. Since November 2010, it is moved back to Jena.

We thank William Stein for giving us access to various computers on which we could build test the SPKG and on which some huge computations could be completed, and acknowledge the support by National Science Foundation Grant No. DMS-0821725.

We thank Mathieu Dutour Sikirić for hints on how to use GAP more efficiently.

We owe Peter Symonds the idea of using the Poincaré series in a rather efficient completeness criterion.

We are grateful to John Palmieri for his help on making p_group_cohomology work with python-3.

159.6 Dependencies

- The SharedMeatAxe needs to be installed, as a build time dependency.

  This can be met by installing the meataxe spkg

159.7 Testing

Our package provides a very short test suite for David Green’s routines for the computation of minimal projective resolutions. The majority of this package’s tests is formed by doc tests in the Cython code. In fact, any class, method and function is covered by tests.

Note that internet access is required for these tests, as it is attempted to download cohomology rings from a public data base in the web.

The script spkg-check calls sage -t --force_lib on the files in pGroupCohomology.
The documentation of this package is automatically built, if the environment variable SAGE_SPKG_INSTALL_DOCS is yes (do “export SAGE_SPKG_INSTALL_DOCS=yes” on the command line before installation). The documents are put into SAGE_ROOT/local/share/doc/p_group_cohomology/.
160.1 Description

Core utilities for Python packages
161.1 Description

A Package for Analyzing Lattice Polytopes (PALP) is a set of C programs for calculations with lattice polytopes and applications to toric geometry.

It contains routines for vertex and facet enumeration, computation of incidences and symmetries, as well as completion of the set of lattice points in the convex hull of a given set of points. In addition, there are procedures specialised to reflexive polytopes such as the enumeration of reflexive subpolytopes, and applications to toric geometry and string theory, like the computation of Hodge data and fibration structures for toric Calabi-Yau varieties. The package is well tested and optimised in speed as it was used for time consuming tasks such as the classification of reflexive polyhedra in 4 dimensions and the creation and manipulation of very large lists of 5-dimensional polyhedra.

While originally intended for low-dimensional applications, the algorithms work in any dimension and our key routine for vertex and facet enumeration compares well with existing packages.

161.2 License

- When released, GPL 2 was in force.
- There is a link to a web page, which now points to GPL 3, but would have pointed to GPL 2 at the time the package was released.
- Therefore one can deduce the authors were happy for this to be released under GPL 2 or a later version.

165.1 Description

PARI/GP is a widely used computer algebra system designed for fast computations in number theory (factorizations, algebraic number theory, elliptic curves . . . ), but also contains a large number of other useful functions to compute with mathematical entities such as matrices, polynomials, power series, algebraic numbers etc., and a lot of transcendental functions. PARI is also available as a C library to allow for faster computations.

Originally developed by Henri Cohen and his co-workers (Université Bordeaux I, France), PARI is now under the GPL and maintained by Karim Belabas with the help of many volunteer contributors.

165.2 License

179.1 Description

PickleShare - a small ‘shelve’ like datastore with concurrency support

Like shelve, a PickleShareDB object acts like a normal dictionary. Unlike shelve, many processes can access the database simultaneously. Changing a value in database is immediately visible to other processes accessing the same database.

Concurrency is possible because the values are stored in separate files. Hence the “database” is a directory where all files are governed by PickleShare.
180.1 Description

Pillow is the “friendly” PIL fork by Alex Clark and Contributors.

The Python Imaging Library (PIL) adds powerful image processing and graphics capabilities to Python. The library supports many file formats.

184.5 Special Update/Build Instructions

The tarballs can be found at, https://github.com/graph-algorithms/edge-addition-planarity-suite/releases sage tarball is repackaged after running autogen.sh

One change was made to the upstream code:

- extern.patch - declare variables declared in headers as extern.
  https://github.com/graph-algorithms/edge-addition-planarity-suite/pull/3
185.1 Description

Plantri is a program that generates certain types of graphs that are imbedded on the sphere. Exactly one member of each isomorphism class is output, using an amount of memory almost independent of the number of graphs produced. This, together with the exceptionally fast operation and careful validation, makes the program suitable for processing very large numbers of graphs. Isomorphisms are defined with respect to the embeddings, so in some cases outputs may be isomorphic as abstract graphs.

185.2 License

Plantri is distributed without a license.

186.1 Description
The Polyhedral Library (PolyLib for short) operates on objects made up of unions of polyhedra of any dimension. polylib is a C library.

186.2 License
GPL v3

186.3 Upstream Contact
• https://groups.google.com/forum/#!forum/isl-development

186.4 Dependencies
• GMP
**187.1 Description**

polymake is open source software for research in polyhedral geometry. It deals with polytopes, polyhedra and fans as well as simplicial complexes, matroids, graphs, tropical hypersurfaces, and other objects. Supported platforms include various flavors of Linux, Free BSD and Mac OS.

**187.2 License**

- GPL v3

**187.3 Upstream Contact**

- https://polymake.org/

**187.4 Dependencies**

Polymake needs a working installation of Perl, including its shared library and some modules (XML::Writer XML::LibXML XML::LibXSLT Term::ReadLine::Gnu JSON SVG). The Polymake interface in Sage additionally needs File::Slurp. For full functionality including polymake’s polyDB, also the Perl module MongoDB is required.

These are not provided by a Sage package. The script package perl_cpan_polymake_prereq will signal an error at build time if these prerequisites are not met.

The configure script will inform you about the equivalent system packages that you should install. Otherwise, you can use CPAN (see below).

Sage might install the Term::ReadLine::Gnu module, however, when you install polymake, if it is not provided by the system, or if Sage installs its own readline library.

A distribution-independent way to install Perl modules (into a user’s home directory or /usr/local) is using CPAN. This is also the way to install the modules on macOS. For this, if you don’t have root access, you will need the local::lib Perl module installed:

```bash
cpan -i XML::Writer XML::LibXML XML::LibXSLT File::Slurp Term::ReadLine::Gnu JSON SVG MongoDB
```

Several Sage packages should be installed before installing the polymake package to give a more featureful Polymake installation:
sage -i 4ti2 latte_int topcom qhull

Software that would need to be installed manually (no Sage package available) for a more featureful Polymake installation: azove, porta, vinci, SplitsTree4.

Information on missing Polymake prerequisites after installing polymake:

```
$ sage -sh
(sage-sh) $ polymake
polytope> show_unconfigured;
```

### 187.5 Debugging polymake install problems

```
# apt-get install libdevel-trace-perl
$ cd src
$ perl -d:Trace support/configure.pl
```
CHAPTER EIGHT

REFLEXIVE POLYTOPES DATABASES

188.1 Description

This package includes lists of 2- and 3-dimensional reflexive polytopes.

The list of polygons is quite easy to get and it has been known for a while. The list of 3-polytopes was originally obtained by Maximilian Kreuzer and Harald Skarke using their software PALP, which is included into the standard distribution of Sage. To work with lattice and reflexive polytopes from Sage you can use sage.geometry.lattice_polytope module, which relies on PALP for some of its functionality. To get access to the databases of this package, use ReflexivePolytope and ReflexivePolytopes commands.

188.2 License

GPL

188.3 Dependencies

None
Chapter 188. Reflexive Polytopes Databases
189.1 Description

The Parma Polyhedra Library (PPL) provides numerical abstractions especially targeted at applications in the field of analysis and verification of complex systems. These abstractions include convex polyhedra, defined as the intersection of a finite number of (open or closed) halfspaces, each described by a linear inequality (strict or non-strict) with rational coefficients; some special classes of polyhedra shapes that offer interesting complexity/precision tradeoffs; and grids which represent regularly spaced points that satisfy a set of linear congruence relations. The library also supports finite powersets and products of (any kind of) polyhedra and grids, a mixed integer linear programming problem solver using an exact-arithmetic version of the simplex algorithm, a parametric integer programming solver, and primitives for the termination analysis via the automatic synthesis of linear ranking functions.

It is written in C++, but comes with interfaces to C, Java, OCaml, and Prolog. PPL is one of the fastest implementations of polyhedral computations.

Benchmarks are included in this paper: https://arxiv.org/abs/cs/0612085

198.1 Description

Python bindings for Cygwin’s C API. Provides some utilities to help with the Cygwin port. Naturally, this package should only be installed on Cygwin—for other platforms its installation is a no-op.

198.2 Website

https://github.com/embray/PyCygwin
199.1 Description

Pygments is a syntax highlighting package written in Python.

It is a generic syntax highlighter suitable for use in code hosting, forums, wikis or other applications that need to prettify source code. Highlights are:

- a wide range of over 300 languages and other text formats is supported
- special attention is paid to details, increasing quality by a fair amount
- support for new languages and formats are added easily
- a number of output formats, presently HTML, LaTeX, RTF, SVG, all image formats that PIL supports and ANSI sequences
- it is usable as a command-line tool and as a library

199.2 License

Modified BSD

199.3 Upstream Contact

- Author: Georg Brandl
- Home Page: http://pygments.org

199.4 Dependencies

Python
199.5 Special Update/Build Instructions

Patches included:

- `sage_prompt.patch`: patch `pygments/lexers/agile.py` to treat the “sage:” prompt like Python’s “>>>” prompt. This allows a very kludgy patch to be removed from the Sphinx package (see #10118).

210.5 Special Update/Build Instructions

One might need to set MAKE to “make -j1” for this to be built successfully.
211.1 Description

From the README.txt of Qhull:

Qhull computes convex hulls, Delaunay triangulations, Voronoi diagrams, furthest-site Voronoi diagrams, and half-space intersections about a point. It runs in 2-d, 3-d, 4-d, or higher. It implements the Quickhull algorithm for computing convex hulls. Qhull handles round-off errors from floating point arithmetic. It can approximate a convex hull.

The program includes options for hull volume, facet area, partial hulls, input transformations, randomization, tracing, multiple output formats, and execution statistics.

Further notes:

The qhull library is already shipped with the Python library scipy (from version 1.4), see

There is also the Python interface Pyhull available on PyPI https://pypi.python.org/pypi/pyhull (see also documentation at http://pythonhosted.org/pyhull/).

211.2 Upstream Contact

RPy2

217.1 Description

RPy2 is a redesign and rewrite of rpy. It is providing a low-level interface to R, a proposed high-level interface, including wrappers to graphical libraries, as well as R-like structures and functions.

Website: http://rpy.sourceforge.net/rpy2.html

217.2 License

• GPL 2+
  • Note that we have deleted references to Mozilla PL as an option, which we are allowed to do by the full rpy2 license in order to remain GPL-compatible

217.3 Upstream Contact

• http://rpy.sourceforge.net/maillist.html

217.4 Dependencies

217.5 Special Update/Build Instructions

217.5.1 Patches

• setup.patch: takes care of a few parsing issues.
• cygwin.patch: let rpy2 build on Cygwin.
218.1 Description

The rst2pynb program converts a standalone reStructuredText file to a Jupyter notebook file. This is currently achieved by converting to markdown with pandoc and then to Jupyter notebook using notedown, plus some configuration and tweaks.

218.2 License

BSD 3-Clause License

218.3 Upstream Contact

Authors: Scott Sievert and Nicolas M. Thiéry Home page: https://github.com/nthiery/rst-to-ipynb

218.4 Dependencies

- notedown
- pandoc

218.5 Special Update/Build Instructions

Fetch tarball from https://pypi.python.org/pypi/rst2ipynb/

As it is written in Haskell, pandoc must be installed from the distro.

The main rationale for having a notedown package in Sage (rather than just let pip fetch it) is that the version on pip (1.5.0, 2015-10-07) is outdated and lacks important features / fixes for us.
219.1 Description

There are several programs for working with Rubik’s cubes, by three different people. Look inside the directories under /src to see specific info and licensing. In summary the three contributors are:

Michael Reid (GPL) [link to site]

- optimal - uses many pre-computed tables to find an optimal solution to the 3x3x3 Rubik’s cube

Dik T. Winter (MIT License)

- cube - uses Kociemba’s algorithm to iteratively find a short solution to the 3x3x3 Rubik’s cube
- size222 - solves a 2x2x2 Rubik’s cube

Eric Dietz (GPL) [link to site]

- cu2 - A fast, non-optimal 2x2x2 solver
- cubex - A fast, non-optimal 3x3x3 solver
- mcube - A fast, non-optimal 4x4x4 solver
220.1 Description

221.4 Dependencies

None.
SAGE_SWS2RST

Provides a script `sage - sws2rst`, which translates a Sage worksheet file (.sws) into a reStructuredText (.rst) file.

Sage worksheet files (.sws) are a file format that was used by the now-obsolete Sage notebook (https://github.com/sagemath/sagenb), superseded by the Jupyter notebook. SageNB was dropped in the course of the transition of SageMath to Python 3.

This package was extracted from the SageNB sources in `https://trac.sagemath.org/ticket/28838` to provide a way to convert pedagogical material written available in Sage worksheet format.
223.1 Description

This is a tool to convert SageNB notebooks to other formats, in particular IPython/Jupyter notebooks.

It includes a Jupyter notebook extension to provide a UI for the import of SageNB notebooks.

https://github.com/vbraun/ExportSageNB
224.1 Description

The SageTeX package allows you to embed code, results of computations, and plots from Sage into LaTeX documents.

224.2 License

224.4 Upstream Contact

Author: Dan Drake. Web: https://github.com/sagemath/sagetex

224.5 Dependencies

To install, nothing more than a standard Sage install. The spkg-check script will exit without actually testing anything if it cannot find “latex” in your path.
224.6 Notes

The directory $SAGE_ROOT/local/share/doc/sagetex contains documentation and an example file. See $SAGE_ROOT/local/share/texmf/tex/latex/sagetex for the source code and some possibly useful scripts. If you have problems or suggestions see the sage-support group.

If you want to help develop SageTeX, please clone the github repository (see the “Upstream Contact” above) and send me patches based on that.
225.1 Description

scandir, a better directory iterator and faster os.walk()

scandir() is a directory iteration function like os.listdir(), except that instead of returning a list of bare filenames, it yields DirEntry objects that include file type and stat information along with the name. Using scandir() increases the speed of os.walk() by 2-20 times (depending on the platform and file system) by avoiding unnecessary calls to os.stat() in most cases.
226.1 Description

SCIP is currently one of the fastest non-commercial mixed integer programming (MIP) solvers. It is also a framework for constraint integer programming and branch-cut-and-price. It allows total control of the solution process and the access of detailed information down to the guts of the solver.

226.2 License

ZIB Academic License

The ZIB Academic License allows the use of software distributed under this license without charge for research purposes as a member of a non-commercial and academic institution, e.g., a university. The software is available with its source code.

226.5 Dependencies

cmake
226.6 Special Update/Build Instructions

We do not have permission to redistribute SCIP or SoPlex. Hence, you must download it yourself from http://scip.zib.de and put the tarball scipoptsuite-VERSION.tgz in $SAGE_ROOT/upstream.
227.1 Description

SciPy (pronounced “Sigh Pie”) is open-source software for mathematics, science, and engineering. The SciPy library depends on NumPy, which provides convenient and fast N-dimensional array manipulation. The SciPy library is built to work with NumPy arrays, and provides many user-friendly and efficient numerical routines such as routines for numerical integration and optimization. Together, they run on all popular operating systems, are quick to install, and are free of charge. NumPy and SciPy are easy to use, but powerful enough to be depended upon by some of the world’s leading scientists and engineers.

227.2 License

SciPy’s license is free for both commercial and non-commercial use, under the BSD terms. See http://www.scipy.org/License_Compatibility

227.3 Upstream Contact

http://www.scipy.org/

227.4 Dependencies

- Python, which in Sage has numerous dependencies
- Numpy
- Fortran
- GNU patch
227.5 Special Update/Build Instructions

- None.
228.1 Description

Send file to trash natively under Mac OS X, Windows and Linux.

Send2Trash is a small package that sends files to the Trash (or Recycle Bin) natively and on all platforms. On OS X, it uses native FSMoveObjectToTrashSync Cocoa calls, on Windows, it uses native (and ugly) SHFileOperation win32 calls. On other platforms, if PyGObject and GIO are available, it will use this. Otherwise, it will fallback to its own implementation of the trash specifications from freedesktop.org.

ctypes is used to access native libraries, so no compilation is necessary.

Send2Trash supports Python 2.7 and up (Python 3 is supported).
229.1 Description

setuptools is a collection of enhancements to the Python distutils (for Python 2.6 and up) that allow you to more easily build and distribute Python packages, especially ones that have dependencies on other packages.

Website: http://pypi.python.org/pypi/setuptools/

229.2 License

229.4 Dependencies

• python

229.5 Build Instructions/Changes

The following patches are in the patches subdirectory. The patches are applied during the build process.

• pkg_resources.py.patch: silence worrying about permissions.
• easy_install_lock.patch: lock the easy_install.pth file to allow simultaneous installation
230.1 Description

the blessed package to manage your versions by scm tags
231.1 Description

Simple generic functions (similar to Python’s own `len()`, `pickle.dump()`, etc.)

The `simplegeneric` module lets you define simple single-dispatch generic functions, akin to Python’s built-in generic functions like `len()` `iter()` and so on. However, instead of using specially-named methods, these generic functions use simple lookup tables, akin to those used by e.g. `pickle.dump()` and other generic functions found in the Python standard library.

As you can see from the above examples, generic functions are actually quite common in Python already, but there is no standard way to create simple ones. This library attempts to fill that gap, as generic functions are an excellent alternative to the Visitor pattern, as well as being a great substitute for most common uses of adaptation.

This library tries to be the simplest possible implementation of generic functions, and it therefore eschews the use of multiple or predicate dispatch, as well as avoiding speedup techniques such as C dispatching or code generation. But it has absolutely no dependencies, other than Python 2.4, and the implementation is just a single Python module of less than 100 lines.
232.1 Description

Singular is a computer algebra system for polynomial computations, with special emphasis on commutative and non-commutative algebra, algebraic geometry, and singularity theory.

232.2 License

GPLv2 or GPLv3

232.3 Upstream Contact

libsingular-devel@mathematik.uni-kl.de
http://www.singular.uni-kl.de/

232.4 Dependencies

- GNU patch
- readline
- GMP/MPIR
- MPFR
- NTL
- FLINT
232.5 Special Update/Build Instructions

See spkg-src to create the source tarball.

Other notes:

- If the environment variable SAGE_DEBUG is set to "yes", then omalloc will be replaced by xalloc. The resulting Singular executable and libsingular library will be slower than with omalloc, but allow for easier debugging of memory corruptions.

236.4 Dependencies

Python
237.1 Description

This package provides 16 stemmer algorithms (15 + Poerter English stemmer) generated from Snowball algorithms. It includes following language algorithms:

- Danish
- Dutch
- English (Standard, Porter)
- Finnish
- French
- German
- Hungarian
- Italian
- Norwegian
- Portuguese
- Romanian
- Russian
- Spanish
- Swedish
- Turkish

This is a pure Python stemming library. If PyStemmer is available, this module uses it to accelerate.
238.1 Description

Implements a lazy string for python useful for use with gettext

A module that provides lazy strings for translations. Basically you get an object that appears to be a string but changes the value every time the value is evaluated based on a callable you provide.

For example you can have a global lazy_gettext function that returns a lazy string with the value of the current set language.
239.1 Description

Sphinx is a tool that makes it easy to create intelligent and beautiful documentation for Python projects (or other documents consisting of multiple reStructuredText sources), written by Georg Brandl. It was originally created to translate the new Python documentation, but has now been cleaned up in the hope that it will be useful to many other projects.

239.2 License

CHAPTER ONE

SQLITE

241.1 Description

SQLite is a software library that implements a self-contained, serverless, zero-configuration, transactional SQL database engine.

241.2 License

Public Domain

241.3 Upstream contact

- http://www.sqlite.org

241.4 Dependencies

- readline

241.5 Special Update/Build Instructions

- Use the autoconf version of sqlite.
SuiteSparse is a collection of software to deal with sparse matrix. It is hosted at http://faculty.cse.tamu.edu/davis/suitesparse.html

This spkg does a minimal install of suitesparse disabling the following

- metis
- GraphBLAS (need cmake)
- Mongoose (need cmake)

An external metis package can be used but we just disable its use.

Patches:

- The first patch disable the building of package using cmake.
- The second patch make sure we use sage’s blas/lapack on OS X. By default suitesparse discard any configurations to use the accelerate framework.

The building of metis is disabled by passing MY_METIS_LIB=none to make (any value would have done) We also configure cholmod so it doesn’t require metis by passing CHOLMOD_CONFIG=-DNPARTITION to make.

Other configurations are self explanatory.

License: because SuiteSparse is a collection, it comes with a variety of licenses. Find below a copy of the “LICENSES.txt” shipped with SuiteSparse.

243.1 Description

surf is a tool to visualize some real algebraic geometry: plane algebraic curves, algebraic surfaces and hyperplane sections of surfaces. surf is script driven and has (optionally) a nifty GUI using the Gtk widget set. This is used by the Singular Jupyter kernel to produce 3D plots.

243.2 License

GPL version 2 or later

243.3 Upstream Contact

http://surf.sourceforge.net (although the project is essentially dead)

243.4 Dependencies

- cups (optional)
- GNU flex Version 2.5 or higher
- GTK+ Version 1.2.0 or higher (optional)
- POSIX Threads
- GNU MP(gmp) Version 2 or higher
- lib-tiff
- lib-jpeg
- zlib
- ps2pdf (optional)

This package is “experimental” because not all of these dependencies are packaged with Sage.
244.1 Description

Symmetrica is a program developed by Lehrstuhl Mathematik II of the University of Bayreuth. It has routines to handle the following topics:

- ordinary representation theory of the symmetric group and related groups (2/11/04)
- ordinary representation theory of the classical groups
- modular representation theory of the symmetric group
- projective representation theory of the symmetric group
- combinatorics of tableaux
- symmetric functions and polynomials (7/22/04)
- commutative and non commutative Schubert polynomials
- operations of finite groups.
- ordinary representation theory of Hecke algebras of type A_n

For more details check [http://www.algorithm.uni-bayreuth.de/en/research/SYMMETRICA](http://www.algorithm.uni-bayreuth.de/en/research/SYMMETRICA)

Updated package on [https://gitlab.com/sagemath/symmetrica/-/releases](https://gitlab.com/sagemath/symmetrica/-/releases) with changes to modernize the source and the build system.

244.2 License

Public Domain (see the above web site)

244.3 Upstream Contact

- (passed away in 2013) Axel Kohnert - see [http://www.mathe2.uni-bayreuth.de/axel/](http://www.mathe2.uni-bayreuth.de/axel/)
245.1 Description

SYMPOW is a package to compute special values of symmetric power elliptic curve L-functions. It can compute up to about 64 digits of precision.

245.2 License

- See the file src/COPYING

245.3 Upstream Contact

SYMPOW does not appear to be maintained any longer, so there is no upstream web site. Mark Watkins, the package author, now works at Magma. Previous (possibly still usable) email is watkins@maths.usyd.edu.au

245.4 Dependencies

- GNU patch

245.5 Special Update/Build Instructions

- Some of the code is very dubious, and it is anyones guess really what the compiler does with it. For example, the following line exists in src/eulerfactors.c:

  ```c
  if ((HECKE) && (d==1)) return hecke_good(p,ap,m,v);
  ```

  But since hecke_good is defined as returning void, it’s hard to know exactly how this code behaves. I would not be surprised by any bugs that might show up. I (David Kirkby) would personally not trust this code much at all.

- This is a difficult package to maintain. A trac ticket (#9758) has been opened to implement Watkins-Delaunay’s algorithm for computing modular degrees in Sage. Once implemented, it should be possible to remove this package.

- The package is configured such that the data files are in a directory below where ‘sympow’ is installed. If Sage is installed globally, then it will be impossible to create the data files without being root. This has been fixed in the Gentoo Linux distribution. Some information from Christopher can be seen on http://trac.sagemath.org/
This package will generate binary versions of all shipped datafiles, so these will work. However, creating totally new datafiles from scratch will not work.
246.1 Description

SymPy is a Python library for symbolic mathematics. It aims to become a full-featured computer algebra system (CAS) while keeping the code as simple as possible in order to be comprehensible and easily extensible. SymPy is written entirely in Python and does not require any external libraries, except optionally for plotting support.

246.4 Upstream Contact

sympy mailinglist: http://groups.google.com/group/sympy

246.5 Dependencies

- Python 2.5 or later

246.6 Special Update/Build Instructions

- A simple script can be used to ease the updating of the SPKG. See the README.
247.1 Description

Tachyon is a raytracer developed by John E. Stone. Tachyon supports the typical ray tracer features, most of the common geometric primitives, shading and texturing modes, etc. It also supports less common features such as HDR image output, ambient occlusion lighting, and support for various triangle mesh and volumetric texture formats beneficial for molecular visualization (e.g. rendering VMD scenes).

Currently not all of Tachyon’s functionality is exported by the Sage interface.

247.2 License

- John Stone <johns@ks.uiuc.edu>
247.4 Dependencies

This spkg depends on:

- libpng

247.5 Special Update/Build Instructions

- Delete the scenes directory, which has lots of cool examples.
- Delete the msvc directory, which is also large and not used within Sage.
- The CVS subdirectories are currently (almost) empty, but should otherwise be deleted.
- The upstream files had strange permissions, i.e. some source files were executable, while almost all files weren’t world-readable.
- There’s seems to be some crap like `tachyon.html.tar.gz` and a few `.#` files I haven’t [yet] deleted, since they’re not that large.
- TODO: Check whether building multi-threaded versions on MacOS X meanwhile works. (This was said to fail with an old beta.)
- TODO: Use `patch` instead of copying over pre-patched files.
- TODO: [ Optionally] also install some of the documentation.
- TODO: I doubt the CFLAGS set for AIX and HP-UX won’t get overridden by the created Makefile, but that’s a minor issue. -leif

minc_tides.patch changes the size of the name of the temporal files, so there is no problem in systems that use long names. Also solves a bug in the inverse function.
256.1 Description

TOPCOM is a collection of clients to compute Triangulations Of Point Configurations and Oriented Matroids, resp.

The algorithms use only combinatorial data of the point configuration as is given by its oriented matroid. Some basic commands for computing and manipulating oriented matroids can also be accessed by the user.

It was very much inspired by the maple program PUNTOS, which was written by Jesus de Loera. TOPCOM is entirely written in C++, so there is a significant speed up compared to PUNTOS.

261.1 Description

This is an optional spkg. It supports Linux on x86, x86-64, ppc, ppc64 and ARM as well as Darwin (Mac OS X 10.5 and 10.6) on x86 and x86-64.

Valgrind is an instrumentation framework for building dynamic analysis tools. There are Valgrind tools that can automatically detect many memory management and threading bugs, and profile your programs in detail. You can also use Valgrind to build new tools.

The Valgrind distribution currently includes six production-quality tools: a memory error detector, two thread error detectors, a cache and branch-prediction profiler, a call-graph generating cache and branch-prediction profiler, and a heap profiler. It also includes three experimental tools: a heap/stack/global array overrun detector, a second heap profiler that examines how heap blocks are used, and a SimPoint basic block vector generator. It runs on the following platforms: X86/Linux, AMD64/Linux, ARM/Linux, PPC32/Linux, PPC64/Linux, S390X/Linux, ARM/Android (2.3.x), X86/Darwin and AMD64/Darwin (Mac OS X 10.6 and 10.7).

http://tukaani.org/xz/

266.4 Dependencies
267.1 Description

Yasm is a complete rewrite of the NASM assembler under the “new” BSD License (some portions are under other licenses, see COPYING for details).

Yasm currently supports the x86 and AMD64 instruction sets, accepts NASM and GAS assembler syntaxes, outputs binary, ELF32, ELF64, 32 and 64-bit Mach-O, RDOFF2, COFF, Win32, and Win64 object formats, and generates source debugging information in STABS, DWARF 2, and CodeView 8 formats.

Yasm can be easily integrated into Visual Studio 2005/2008 and 2010 for assembly of NASM or GAS syntax code into Win32 or Win64 object files.

See https://yasm.tortall.net

267.2 License

Yasm is licensed under the 2-clause and 3-clause “revised” BSD licenses, with one exception: the Bit::Vector module used by the mainline version of Yasm to implement its large integer and machine-independent floating point support is triple-licensed under the Artistic license, GPL, and LGPL. The “yasm-nextgen” codebase uses a different BSD-licensed implementation and is thus entirely under BSD-equivalent licenses. The full text of the licenses are provided in the Yasm source distribution.

270.5.1 Patches

• cygwin_symbols.patch: remove undefined symbols on Cygwin.
271.1 Description

zn_poly is a C library for polynomial arithmetic in $\mathbb{Z}/n\mathbb{Z}[x]$, where $n$ is any modulus that fits into an unsigned long.

Website: https://gitlab.com/sagemath/zn_poly

Note: Original website is at http://cims.nyu.edu/~harvey/zn_poly/ but is no longer maintained. Sage maintains an “official” continuation of the project at the above link.

271.2 License

GPL V2 or V3. Some of the code has been copied from other projects - see the file src/COPYING for details.

271.3 Upstream Contact

• David Harvey
• E. M. Bray <erik.m.bray@gmail.com>

271.4 Dependencies

• GMP/MPIR
• (some) Python (to create the Makefile)
• GNU patch
• NTL apparently only if we configured zn_poly differently (same for FLINT)
271.5 Special Update/Build Instructions

- Make sure the patches still apply. Especially changes in `makemakefile.py` may also require changes to `spkg-install` (and perhaps also `spkg-check`).
- There's also a `--use-flint` option to `configure`; no idea what it does, and we currently don't use it either.
- TODO:
  - Use `make install` instead of manually “installing” (copying and symlinking) the [shared] libraries and header files. This requires further tweaking of `makemakefile.py`, since it currently only installs a static library and the headers.
  - If everything’s fine, i.e., no problems arise, some comments and especially some code I currently just commented out can certainly be removed. (-leif, 04/2012)
  - The version number “0.9.p11” is used as a doctest in the function `package_versions` in `sage/misc/packages.py`, so if this package gets upgraded, that doctest needs to be changed.

271.5.1 Patches

- All patches from Sage have been merged into upstream. These include:
  - `makemakefile.py.patch`:
    Improves the Python script creating the Makefile for better use at least within Sage; see patch for details. (Last modified at #12433, which added and changed a lot.)
  - `profiler.c.patch, zn_poly.h.patch`:
    Fix potential redefinition of `ulong` (in combination with other headers).
  - `mpn_mulmid-tune.c.patch, mulmid-tune.c.patch, mul-tune.c.patch`:
    Fix “jump into scope of identifier with variably modified type” errors. (See #8771).
  - `mpn_mulmid-test.c.patch`:
    Fix a potential problem when the value of `ZNP_mpn_smp_kara_thresh` is `SIZE_MAX`, this is usually unrealistic but can happen at least on linux on power7 with gcc-4.7.1 (see #14098).
  - `fix_fudge_factor_in_nuss-test.c.patch`:
    As the name says; fix provided by upstream (David Harvey); see #13947.
272.1 Description

This package is intended to be independently reusable in any Python project. It is maintained by the Zope Toolkit project.

This package provides an implementation of “object interfaces” for Python. Interfaces are a mechanism for labeling objects as conforming to a given API or contract. So, this package can be considered as implementation of the Design By Contract methodology support in Python.

For detailed documentation, please see http://docs.zope.org/zope.interface
